★ 9 POINTS IN FAVOUR OF STEEL
1. STEEL gives SECURITY
It is the safest form of construction.
2. STEEL is MODERN
Sound engineering in steel results in grace, harmony and good design.
3. STEEL is SPEEDY
Construction in steel saves time and labour.
4. STEEL ENDURES
Steel structures last indefinitely.
5. STEEL is UNIFORM
Constant metallurgical tests ensure quality in structural steel.
6. STEEL is ADAPTABLE
Quick and inexpensive alterations in steel construction are possible.
7. STEEL can be SALVAGED
Fabricated steel can be reclaimed.
8. STEEL is ECONOMICAL
Steel weighs less per strength unit than other structural material.
9. STEEL is RESPONSIBLE
The integrity of steel mills and fabricators guarantees the quality of structural steel.
THE FUTURE RESTS ON STEEL
Use

WHEN BLUEPRINTS
COME TO LIFE—
Your plan for a more efficient power supply can become reality with Babcock built-to-suit boiler units. Each type is a flexible design that is modified to exactly fit the requirements. Besides economical efficiency, other advantages of these boilers include—
Ability to produce dry steam at very high ratings.
Extra large steam output for space occupied.
Adaptability to available head room or floor space.
Gas outlets that eliminate costly breachings and flues.
Efficient combustion. Absence of fly ash, heavy cinders and smoke.
Quick adjustment to utilize any fuel or combination of fuels.
High continuity of service.
All moving parts readily available.
Adaptable to any control, water supply, etc.
Plan now to save money with Babcock equipment. Ask our engineers to help you obtain immediate economies or higher steam output with these power units.

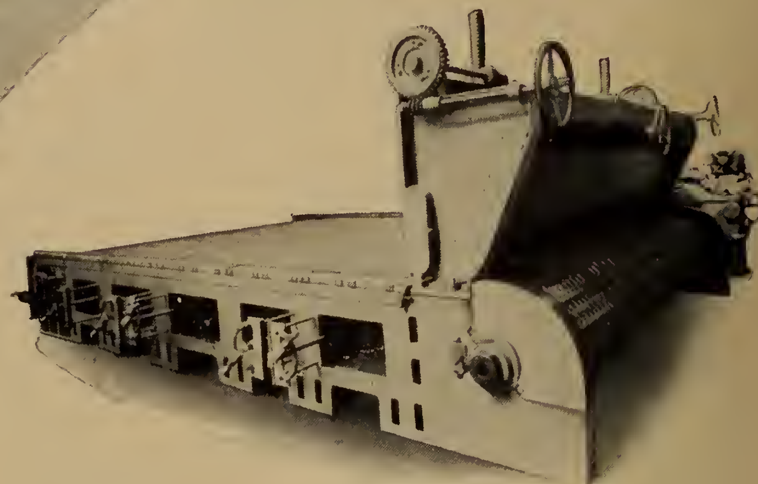
CHAIN GRATE STOKER!



Stokers
made by
Combustion Engineering

- C. S. U.
- TYPE "E"
- SPREADER
- CHAIN-GRATE ✓
- TRAVELLING GRATE
- CONTINUOUS DISCHARGE

You can look forward to the best operating results and utmost economy when C-E installs one of its famous Chain Grate Stokers in your plant.

Particularly suited to the use of free-burning bituminous coals, C-E Chain Grate Stokers come in both forced and natural draft designs. Their grate surface consists of small link castings held together by through rods to form a continuous flexible chain.

This stoker is applicable to the approximate range of capacities from 150 rated boiler h.p. up to units producing 275,000 lb of steam, or more, per hour.

In all sizes, the Chain Grate Stoker may be depended upon to provide maximum economy, efficiency and dependability.

1,000 TONS OF COAL PER HOUR RIDE THIS SHIP-SHORE HIGHWAY OF *Rubber*

THE Canada Steamship Lines' "S. S. Osler" unloads its normal coal cargo of 7,000 tons in seven hours . . . an outstanding example of the efficiency of a modern belt conveyor system.

Two 625-foot Dominion "Giant" Belts, 42 inches wide, run horizontally under the five holds of the ship and carry the coal to two 130 foot belts running at an incline of 20° towards the bow. These discharge into spiral chutes which drop the coal into a pocket where it is picked up by a bucket elevator and lifted a distance of 60 feet at an angle of 70°, through the deck. There the coal discharges into a hopper and is carried down a series of inclined chutes, to a Dominion "Giant" Boom Belt 430 feet long, 52 inches wide. This "highway of rubber" delivers the coal ashore at the rate of 1,000 tons per hour.

For low cost-per-ton haulage in any industry, investigate the many advantages of Dominion Rubber Conveyor Belts. They are *engineered* for each individual job.

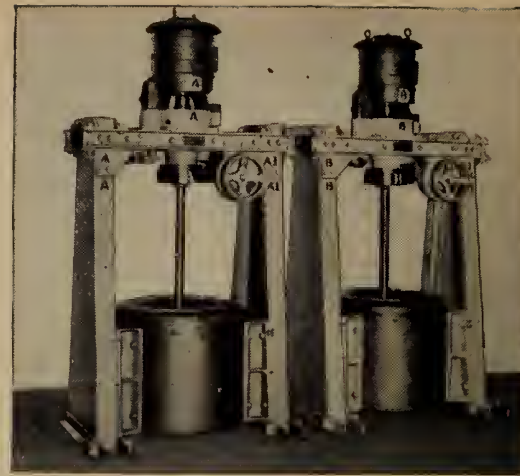
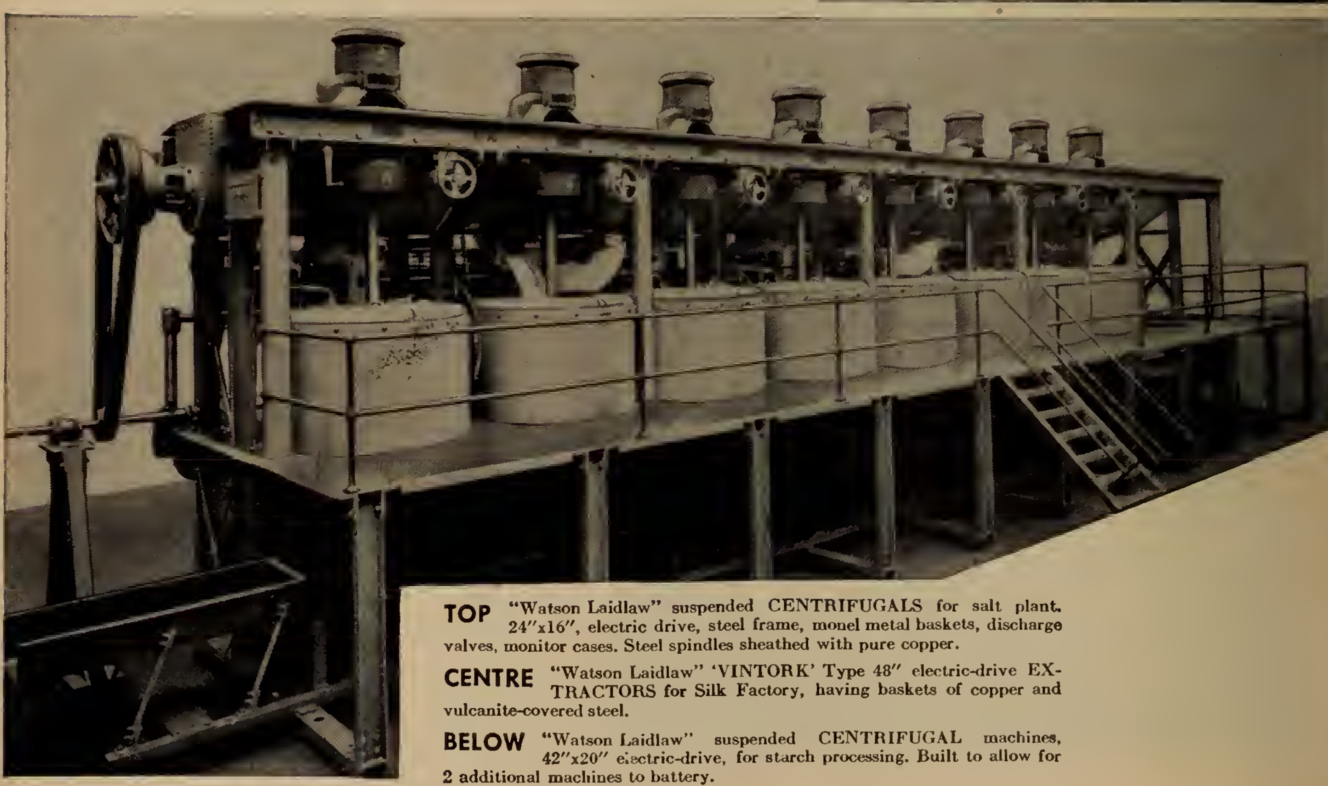
WATSON LAIDLAW CENTRIFUGALS AND EXTRACTORS



FOR SUGAR, TEXTILE, CHEMICAL AND ALLIED INDUSTRIES

Precision-engineered since 1883, thousands of these units are giving satisfactory service the world over. If your business calls for the use of centrifugals or extractors, it will pay you to consult us.

All units are equipped with our "Lancashire Crypto" Motors.



TOP "Watson Laidlaw" suspended CENTRIFUGALS for salt plant. 24"x16", electric drive, steel frame, monel metal baskets, discharge valves, monitor cases. Steel spindles sheathed with pure copper.

CENTRE "Watson Laidlaw" 'VINTORK' Type 48" electric-drive EXTRACTORS for Silk Factory, having baskets of copper and vulcanite-covered steel.

BELOW "Watson Laidlaw" suspended CENTRIFUGAL machines, 42"x20" electric-drive, for starch processing. Built to allow for 2 additional machines to battery.

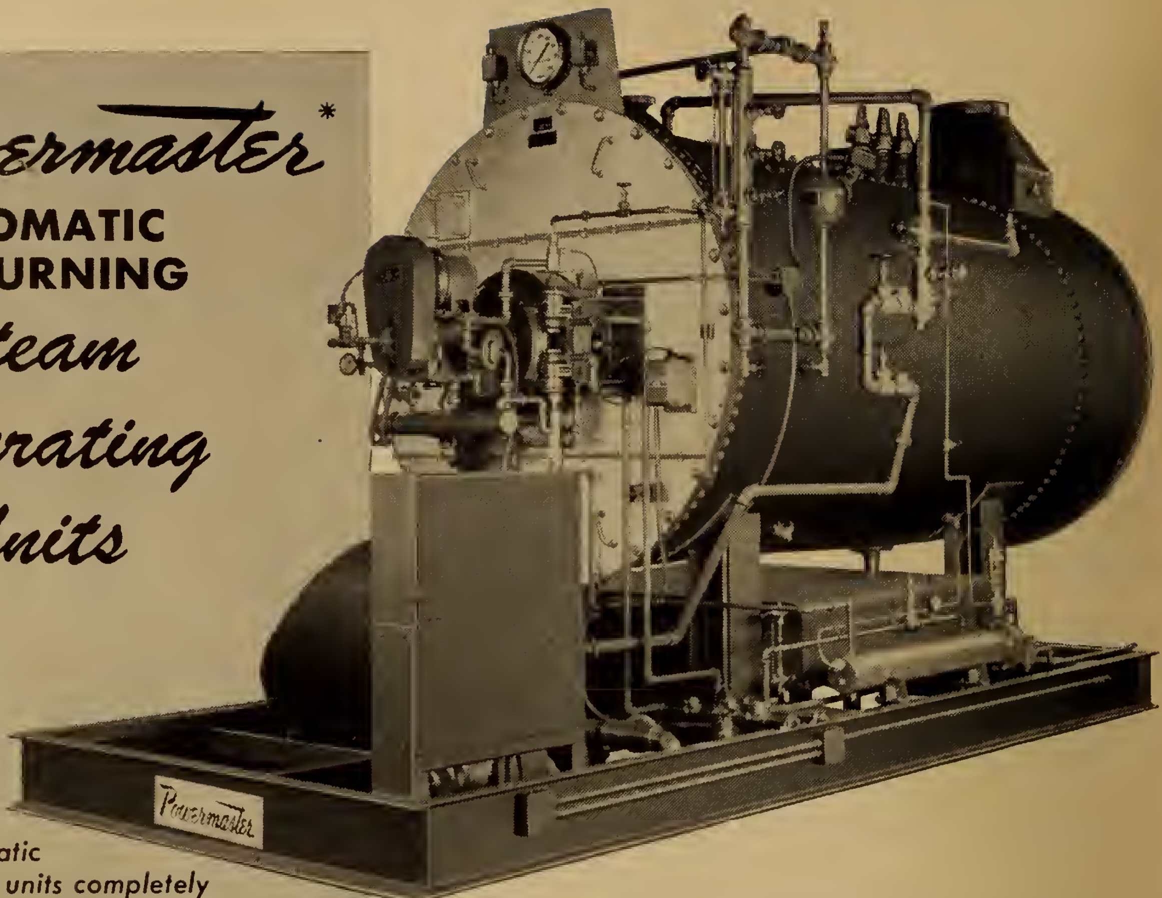
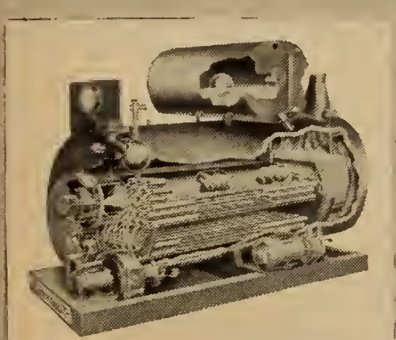
Powermaster*

AUTOMATIC OIL-BURNING *Steam Generating Units*



Fully-automatic "packaged" units completely assembled with boiler — oil burner — condensate return system and automatic control panel.

EFFICIENT DESIGN—This "phantom view" shows the Powermaster's rugged construction and other advantages: its "spinning flame" which promotes complete combustion; its forced-draft operation which eliminates a costly stack, requiring only a small vent to carry off combustion gases; its built-in condensate return system which automatically feeds reclaimed hot water—reducing fuel consumption and prolonging boiler life.



Cut-away of light oil unit

* T.M. REG. U.S. PAT. OFF.

QUICK AUTOMATIC STEAM—Powermaster users report full steam pressure is obtained from a cold start in as little as 18 minutes. No time-consuming preparation. No delays. A flick of the switch starts and stops the Powermaster with minimum manual attention.

LOW FUEL COST—Powermasters are equipped for both light and heavy oil operation, and operate at thermal efficiencies of approximately 80% maintained in everyday use, assuring economical performance.

SPACE SAVING—The Powermaster Unit generates an amount of steam equal to that generated by ordinary boilers requiring double the space. Its forced draft feature, efficient arrangement of heating surface and compact design combine to save valuable plant space.

QUICKLY INSTALLED—Since the Powermaster is assembled, mounted on steel base, pre-tested at the factory and delivered in a complete unit, installation takes only a few hours and can be accomplished with practically no interruption to plant operation.

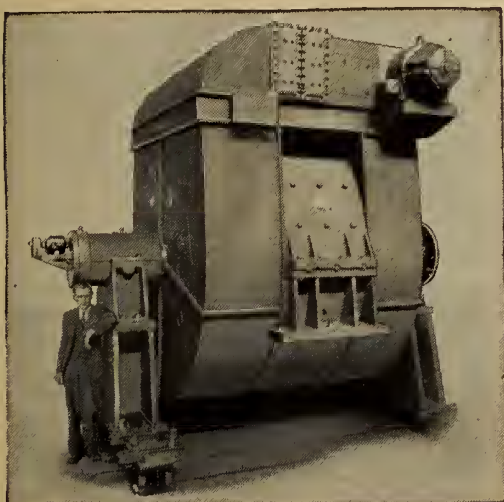
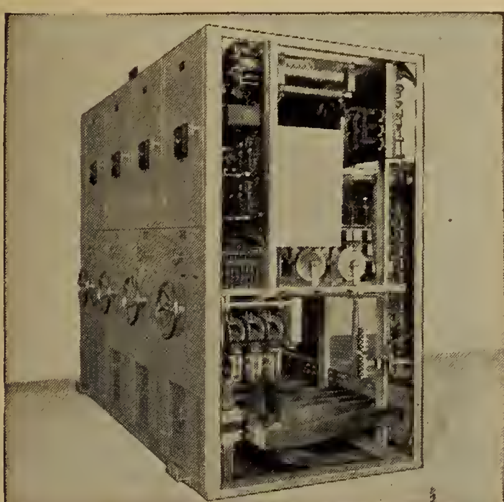
THE ABEGWEIT, largest all-welded vessel (372 feet long) ever built in Canada, is a diesel-electric, quadruple-screw streamliner with a capacity of 19 railway cars, 60 automobiles, and 950 passengers.

Breaking Train Ferry



Each of the four propellers, two forward and two aft is driven by a G-E 3850 hp 128/155 rpm propulsion motor.

One of the eight G-E main generator sets each of whichis rated 1050 kw—325 volt and is driven by a 12 cylinder diesel engine.



Section of the main propulsion control panel which permits unusual flexibility of operation in that power may be concentrated on any one propeller in an emergency.

Additional control apparatus allows remote control of motors from three different stations aboard the Abegweit—the two bridges and a third station below deck.

THE RUSTON VERTICAL DIESEL

Cold-starting, runs at medium speeds. • 90 to 2400 h.p, 75 to 1650 kwh. • Minimum maintenance, very efficient. • Durable and DEPENDABLE

As the white outline indicates, a standard unit of much greater frame size would be required to do the work of Speedaire.

For more horsepower... in less space... at lower cost... use SPEEDAIRE

SPEEDAIRE is Cleveland's new fan-cooled worm-gear speed reducer. Because it is fan-cooled, Speedaire will do more work—will deliver up to *double the horsepower* of standard worm units of equal frame size, at usual motor speeds.

It can be installed economically on many applications where other types have been used heretofore—giving you the advantage of a compact right-angle drive. Speedaire gives the same long, trouble-free service characteristic of all Clevelands. *Write for Catalog 300* for specifications and engineering data.

UNITROL

CENTRALIZED MOTOR CONTROL

Unitrol is the modern method of housing motor control. It is ready made, ready for use, yet built to individual need from unitized, sectionalized members that you can add to, subtract from or re-arrange with complete freedom.

With Unitrol, motor controls need no longer be scattered in out-of-the-way parts of your plant. A Unitrol centre is convenient, easy to service, hard to overlook. You save space, too, because Unitrol can accommodate 2 or 3 times as much control in equivalent floor space.

Cutler-Hammer Unitrol comes complete, either with all wiring and interconnections made, or with provisions for wiring "on the job." Investigate the time and space-saving facts of this centralized Control Centre now. Unitrol is compact, orderly and easily accessible.

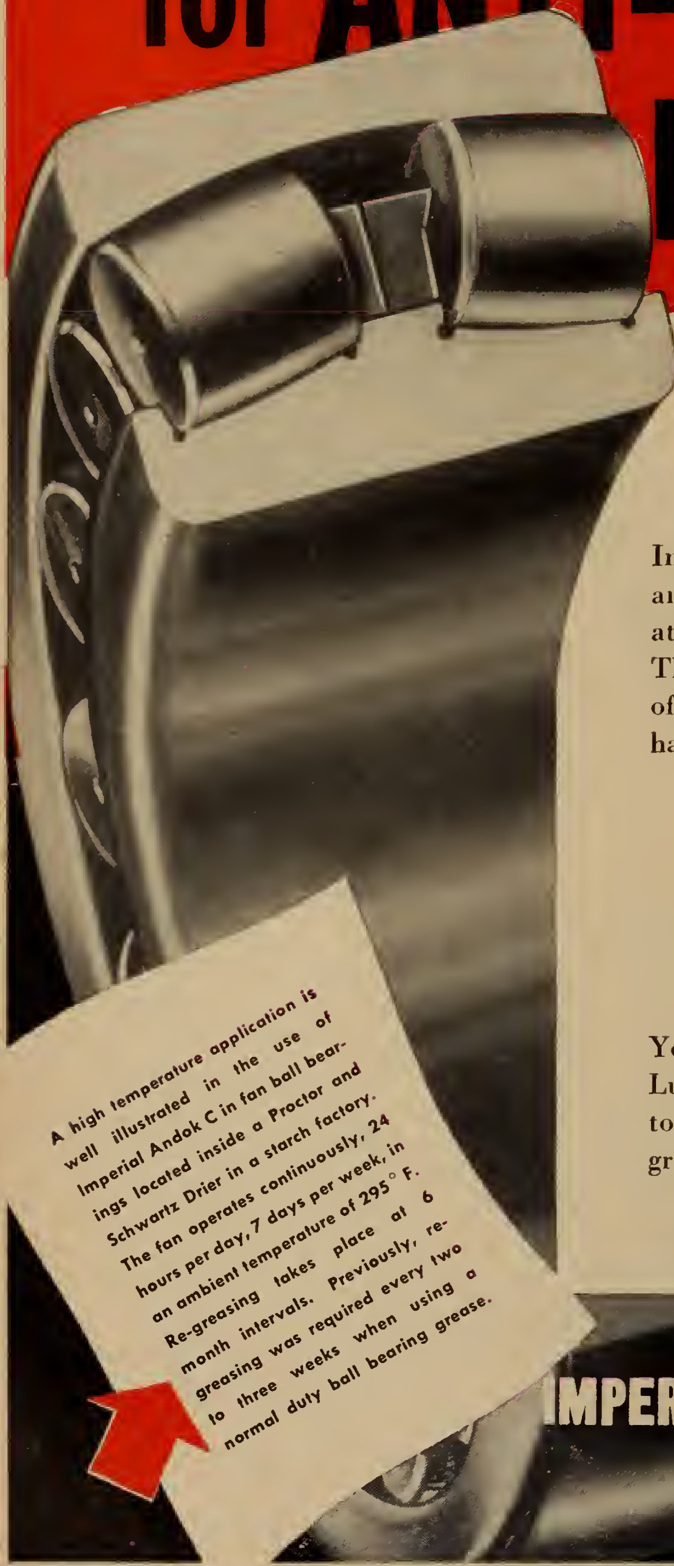
A NEW SERIES OF GREASES

for ANTI-FRICTION BEARINGS



covering operating temperatures from -70° to 300° Fahrenheit!

Imperial Oil Limited presents a range of anti-friction bearing greases covering operating temperatures from -70° to 300° F. These new products are the result of years of research and experimentation. They have the following important qualities:

1—Their consistency remains satisfactory over the entire range of operating temperatures.

2—They are designed to resist oxidation.

3—They withstand the churning action of anti-friction bearings in service.

Your nearest Imperial Oil Industrial Lubrication Representative will be glad to advise you on the selection of the correct grease to meet your requirements.

M.V. "Abegweit"

Prince Edward Island Car Ferry

by

H. H. German, M.E.I.C.

German and Milne, Naval Architects and Marine Surveyors, Montreal

A paper delivered before the Montreal Branch of The Engineering Institute of Canada on December 4, 1947

This paper records an outstanding achievement on the part of Canada's Shipbuilding Industry. Touching on the history of earliest ferry services to the "Island", the author discusses the requirements that had to be met in designing the new car ferry. Passenger accommodation, propellers and shafting, hull, freight car and auto cargo, heeling, trimming and steering equipment, safety and control equipment, engines and propulsion equipment, and electrical, switchboard and control equipment are described in turn. In conclusion credit is given to the builders and the various suppliers and inspection organizations concerned.

The invitation from your Council to present a paper on the Icebreaking Car Ferry *Abegweit* was an honour indeed, although the difficulties in determining the form such a paper should take were realized. There are unusual technical features in this ship which would be interesting to a gathering of naval architects and marine engineers, but which perhaps would lack interest for the members of this Institute. However, after due consideration and some advice from fellow members, it was decided that the paper should be more descriptive than technical.

H. H. German, M.E.I.C.
German and Milne, Montreal.

As the history and development of the Prince Edward Island service was dealt with in a paper on the *Charlottetown*, given before the Institute in 1932, it is not proposed to repeat this, except as is necessary to give those present a clear conception of the strides made in the communication and transportation systems between the Island and the rest of Canada since the days of the early settlers.

History of Early Ferry Service to "The Island"

The initial venture to establish communication with the mainland was undertaken in birch bark canoes which plied between Wood Island and Pictou as far back in 1775. Later came the flat bottomed dories operated by two men, and fitted with runners which enabled them to be pulled over the ice. The next step was an adaptation of the Norwegian " pram " or ice-boat, used as late as 1916, despite other means of communication evolved.

In 1832 the first attempt was made to put a steamer into service, and the *Pocahontas,* a vessel of wooden construction, made the trip between Charlottetown and Pictou twice a week, followed by the *Albert* in 1873, and the *Northern Light,* a steam icebreaking vessel of wood construction in 1877. The *Northern Light* did not prove as successful as was hoped and she was superseded by the *Neptune,* a wooden Newfoundland sealer, after which the *Lansdowne* entered the service.

In 1888 the Federal authorities, who were now responsible for maintenance of service as a result of the stipulation in the Island's agreement to enter Confederation, placed the newly constructed steel icebreaker *Stanley* in service, to be succeeded eleven years later by the *Minto* and in 1909 by the *Earl Grey*. Each of these was an improvement on her predecessor, although frequent and prolonged interruptions in the winter service were still experienced. The type of icebreaker so successful in operation in fields of sheet or solid ice, having a sloping icebreaking bow, proved quite ineffective under the ice conditions. The *Stanley* was built along such lines, but the shape of the bow merely assisted her to cut a channel through the obstruction. On such occasions it was a major operation to get the ship back into the water.

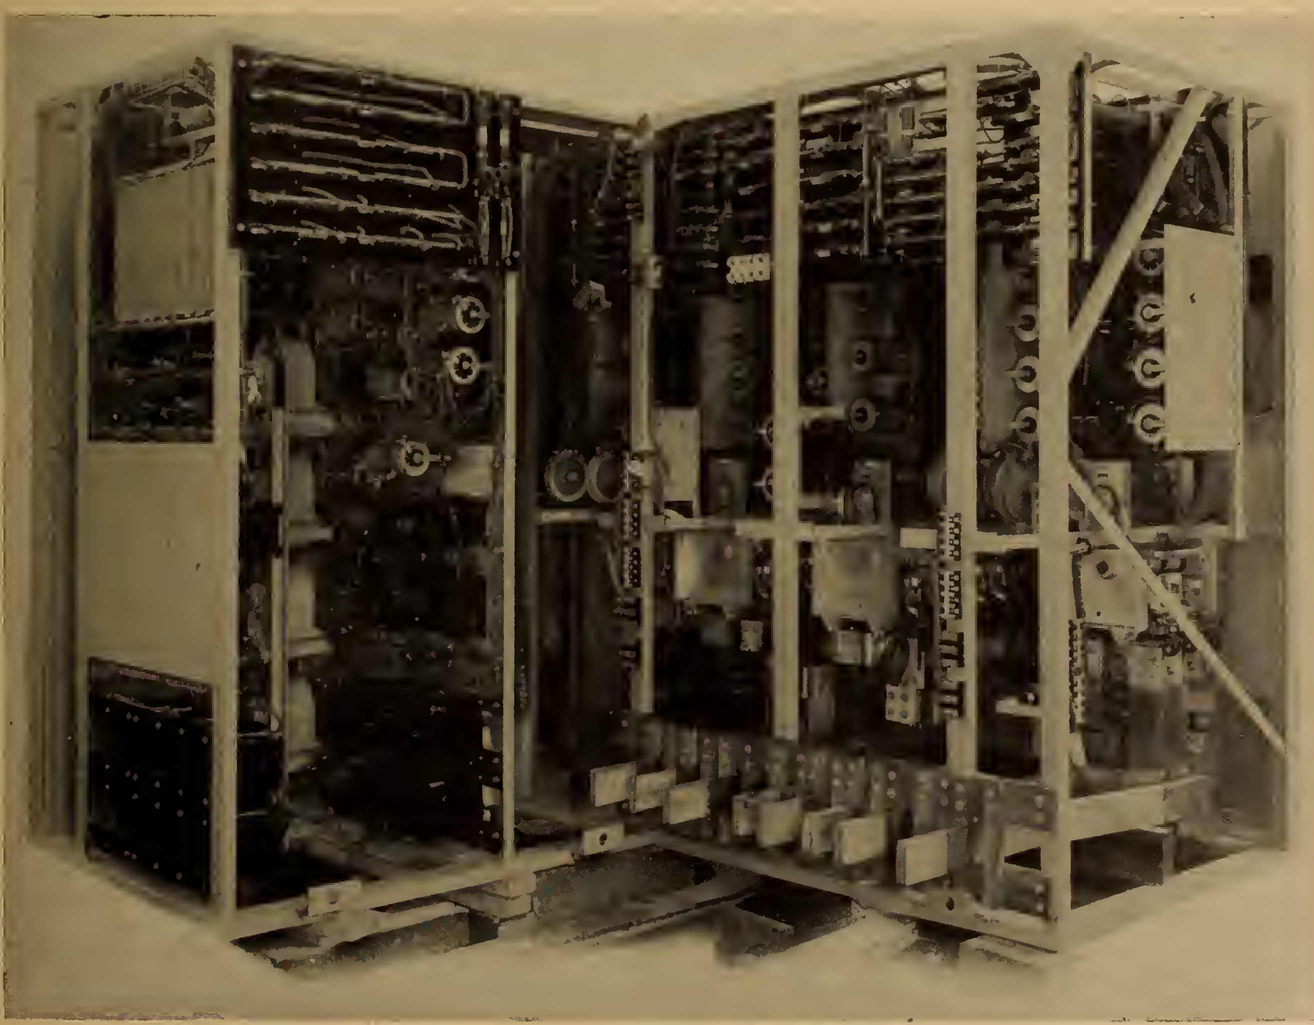
The *Minto* had a different type of bow, designed with the idea of trying to overcome the defects of the *Stanley*. The same difficulties were encountered, however, as despite the increased power, great trouble was experienced in freeing her from the ice, the operation sometimes taking as long as two days.

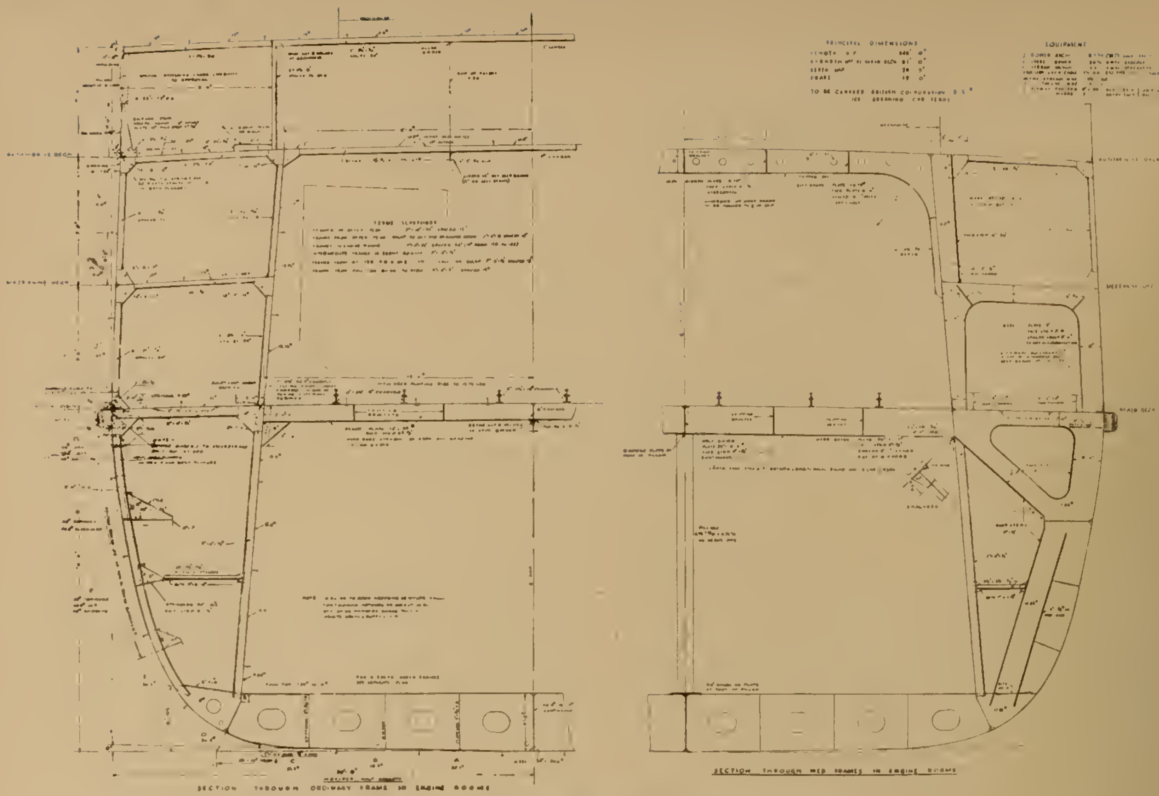
The *Earl Grey* proved to be a decided improvement; she was fitted with rounded sides and her increased power gave her greater flexibility in backing and filling, at the same time permitting her to work with speed in and out of the icefields. Although the rounded sides made it difficult to dock at the terminals, all in all she proved to be a good icebreaker for this service. She was, however, not the final answer to the problem as a whole. The time required for the trip was too long, and considerable produce was spoiled while held up at the terminals and on account of the unsuitable carrying conditions on the ship.

The chief factors responsible for the development of the service from 1915 onwards were the perishable nature of the Island's produce and the impossibility of developing and maintaining trade relations with the outside world under the then existing conditions. Careful and exhaustive study by the Federal authorities of the many and varied problems attendant on the service finally resulted in a steel icebreaking railway car ferry, the *Prince Edward Island*, in 1915, to operate between Port Borden and Cape Tormentine, a distance of approximately eight miles. The new vessel was not as efficient as the *Earl Grey* as an icebreaker. Although she was built with about the same power per ton of displacement, she lost efficiency by being more wall-sided.

The *Charlottetown*, built in 1930-31, was a manifest improvement over the *Prince Edward Island*. Her sides were rounded, and her steam installation was as powerful as possible consistent with the size of her hull. The design of this ship was also influenced by the rapid growth of the automobile trade, which exerted a profound effect on the development of the service. The unfortunate loss of this ship in 1941 occurred at a crucial time and, despite the wartime

An oblique rear view (looking to forward port) of the main propulsion control panel. This is C.G.E. equipment.





MIDSHIP SECTION—M.V. *ABEGWEIT*

curtailment of shipbuilding for other than naval purposes, plans were made to relieve the crisis which would confront the Islanders when commerce and travel would revert to a pre-war basis with every possibility of rapid growth. The ultimate result was the construction of the *Abegweit*, which entered the service in August 1947.

Requirements to Be Met by Designs

The essential qualifications for a ship operating in Northumberland Straits and maintaining year round communication are iceworthiness, speed, dependability and rapid, efficient manoeuvrability.

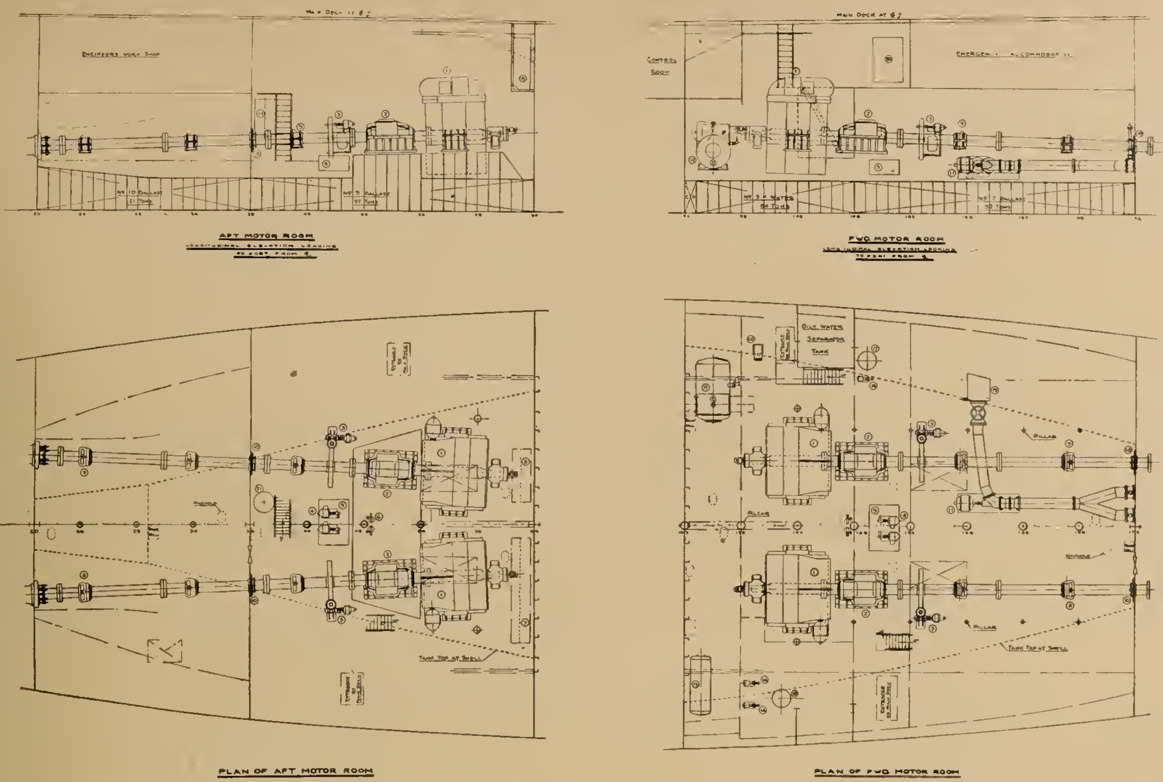
There were many interesting but perplexing problems to be faced in determining the size and general characteristics of this ship. The situation was rendered more difficult since she had to fit the existing terminals, which restricted her length, breadth and operating draft. Consideration was given to the building of new terminals to suit the most efficient design of ship. When it became evident, however, that any changes to existing terminals would mean a long period without safe and adequate service, it was decided to design to suit the existing terminals, as this could be done without much loss of time, at the expense, however, of obtaining the ultimate in ship design.

The harbours at Cape Tormentine and Port Borden are extremely difficult to approach and navigate with such a large ship, but the operation to date of the *Abegweit* indicates that the fitting of four propellers has proved to be a great success, and docking is decidedly easier than with her predecessors.

Little reliable information is available on ice conditions. There are many variables to contend with. Ice formations encountered in the St. Lawrence River, Northumberland Straits, the various harbours of Canada, Hudson's Bay and the Arctic vary to such a degree that an efficient icebreaker for one service would be useless elsewhere. The strength of ice varies from a maximum for clear solid ice to practically zero for slush or frazil ice. In our Canadian lakes, bays and harbours we have sheet ice to contend with, varying from minor thicknesses to as much as three feet in the Great Lakes. For such conditions the design of a ship is simple, but with the broken ice that is swept up and down Northumberland Straits by winds and tides, and packed at times solid to a depth of thirty feet, the characteristics of an icebreaking car ferry for this service must be quite different to those of the average icebreaker.

An analysis of the service from the time of its inception indicated the desirability of packing as much power into the hull as practicable. It called for a type of power which would permit the greatest flexibility of operation. Other requirements were maximum horsepower per cubic foot, and minimum weight per given power. Also needed was an increase of the torque of the propellers, with a decrease in revolutions to permit the maximum propeller thrust with the ship operating in heavy ice. Conversely the greatest thrust was demanded with the ship operating at zero speed. Lastly, rapid transference of power from the bow to the stern propellers, and vice versa, was essential. The answer to all these requirements was unquestionably diesel electric machinery.

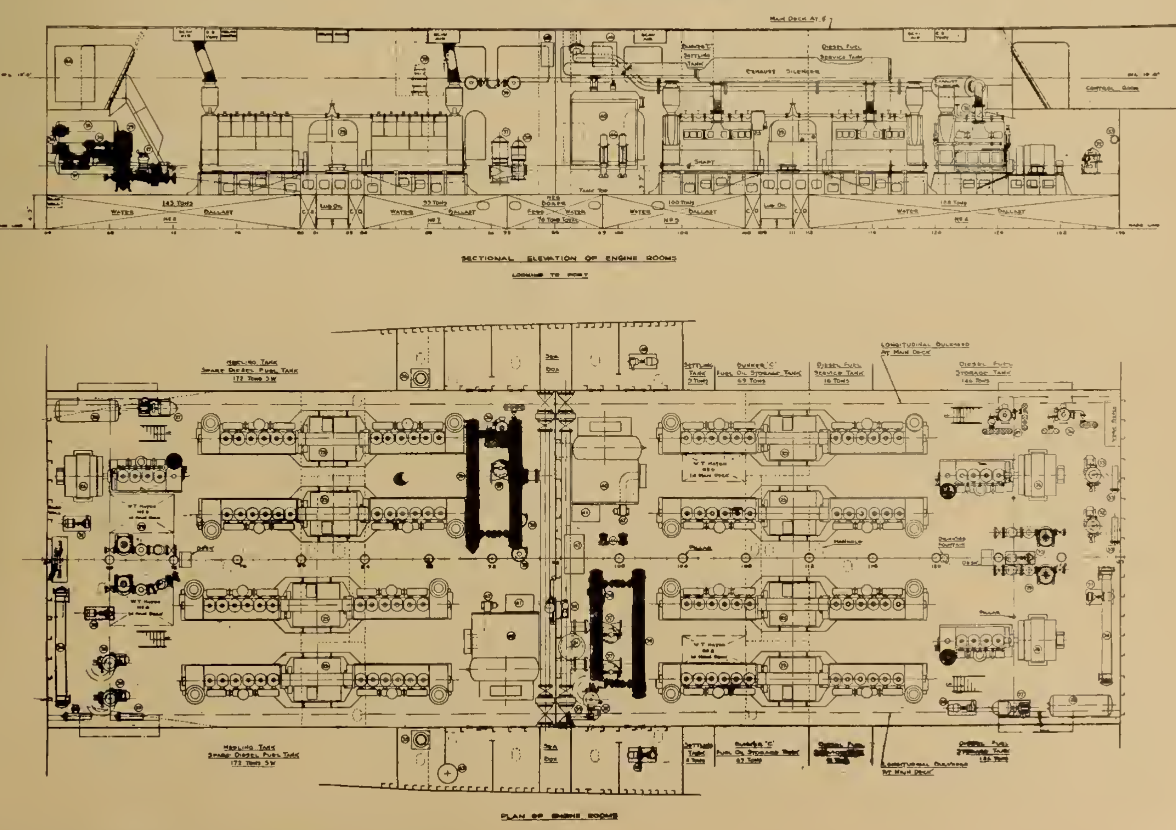
The design of the *Abegweit* parallels the develop-



MOTOR ROOM MACHINERY ARRANGEMENT

Left—Plan and section, aft motor room. *Right*—Plan and section forward motor room. Note—one of the features of this vessel is the fact that there are propellers at the forward and after ends.

ENGINE ROOM ARRANGEMENT



ment of U.S. Coast Guard Service vessels patrolling the ice lanes. Practically all these vessels are equipped with diesel electric machinery. The latest mammoth units in this service are powered with multiple diesel engines operating three propellers in lieu of four as on the *Abegweit*. As these vessels have to operate in the far north, far from repair bases, where utmost reliability is required, it is significant that they are fitted with multiple diesel engines with electrical transmission.

Passenger Accommodation

In addition to housing a complement of sixty-five officers and crew with adequate lounge spaces, all in accordance with latest I.L.O. requirements, the public rooms will seat about 250 day passengers, while emergency sleeping accommodation is provided for about 100 passengers. Seats are also provided on decks. The ship has a Passenger Certificate from the Canadian Board of Steamship Inspection for 950 persons. A higher than average standard of comfort has been provided, first to attract tourist travel to the Island, and secondly to offset the discomfort to passengers if the vessel becomes icebound for any length of time.

Accommodations have been fitted out to a standard comparable to modern passenger liners. The layout of the restaurant meets with the special requirement of serving one hundred passengers in half an hour in the space available. The most modern equipment and labour saving devices have been installed for this purpose, and the restaurant is fitted with stainless steel counters and shelves. Refrigerated compartments for perishable foods are installed, the refrigeration being of freon direct expansion type throughout in association with pipe coils.

Propellers and Shafting

The development of the bow propeller is a point of interest. In the case of the *Saurel* and *Ernest Lapointe,* two icebreakers engaged in the St. Lawrence service, it was discovered that they were more efficient at times when operating astern, backing into the ice with the two stern propellers, than when going ahead. This fact, and the success in service of the bow ice-breaking propeller on the *Prince Edward Island* and the *Charlottetown*, led to the decision to fit four propellers on the *Abegweit*—two forward and two aft.

The greatest precautions were taken in the design of the propeller and shafting installations, particularly the bow propellers, which are subject to severe shock when entering either solid or broken ice. Allowance was made when the thrust blocks were designed for a generous margin of safety, over the normal thrust to be expected in the shafts when working in open water. When considering the shock resulting on entering an ice jam, it was decided the thrust block should be capable of absorbing a direct thrust of 125 tons, in association with propeller revolutions of 25 per minute. These blocks are comparable in size to those fitted on a vessel of approximately the same power as the *Queen Elizabeth*. Shafting was specially designed to take this thrust and journals were fitted to suit.

The propeller design was complicated, and an efficient compromise had to be arrived at in order to achieve the following results: That the pitch, diameter and area would be such that the full developed power on any one shaft could be absorbed in the propellers at full speed in open water; that the propellers would prove efficient in cutting ice; that the propellers would be sufficiently strong to absorb the impact and pressure when operating in ice, but not so strong that the blades would not be broken rather than the main shafting when operating at low revolutions against heavy resistance of ice, all within the limits of torque pre-arranged by the amplidyne settings; that the propellers be of sectional type with an arrangement for adjustment of pitch; and that the propellers be efficient in both directions, the pitch being the same on both sides of the blade, which permits machining and a nearer approach to statical and dynamical balancing.

The propellers are of cast nickel steel—two percent nickel. The intermediate shaft diameters forward and aft are 16 in., and the shafting material is high grade forged steel, which is necessary to keep the tailend or propeller shafts to a minimum diameter. This in turn permits a minimum propeller diameter for the same efficiency, which is somewhat contrary to normal ship propeller design. This is a necessary compromise in this case, as it puts the propellers at the lowest possible point below the waterline, away from the region where blades are most likely to be damaged when striking blocks of ice. The propeller tips have been kept a minimum distance from the shell of the ship. The distance is necessary to prevent jamming of ice blocks between the tips of the propeller and the hull of the ship.

The Hull

The conditions prevailing in Northumberland Straits call for a more efficient service than is usually required of the average icebreaker. An uninterrupted service on an exacting schedule is the prime requisite. Such service entails serious wear and tear on a ship's structure, and it was not uncommon in previous vessels on this run to find them at times literally being kept afloat at the end of the winter season by their internal watertight subdivisions. Many years ago the policy of repairing by welding rivets and seams was adopted which decreased maintenance cost. This, together with the outstanding performance by smaller icebreaking vessels of all-welded construction, dictated the policy of designing an all-welded structure. Maintenance of the hull of the *Abegweit* will cost considerably less than that of her predecessors on this account. Parts of the shell plating are $1\frac{1}{8}$ in. thick and the size and weight of the ship greatly in excess of any vessel previously built in Canada.

Shell plating was fitted flush on the moulded or inner surface, and varying thicknesses of plates were taken up on the outside. All seams and butts of shell surfaces were specially prepared for welding, the thickest plates requiring more than twenty passes with 3/16 in. welding rod. No welding was carried out at temperatures below 10 deg. F. Pre-heating was resorted to at all temperatures below freezing. About a million feet of welding was done, involving 260,000 man hours of labour and 250,000 lbs. of Stelco welding rod. The efficiency of the welding was tested and constant use made of radiography to determine the quality of the work.

To meet requirements of iceworthiness the ship was designed and constructed to withstand contact with ice when using maximum power under way. Horizontal compression loading was taken at not less than 24 tons per linear foot at the waterline. The ship was constructed on the transverse framing system. Substantial transverse web frames were fitted throughout, with longitudinal deck girders and stringers to support the transverse frames. All framing was reinforced by a system of bulkheads, sufficiently strong to serve as main compression units. The scantlings were determined on the basis of the bulkheads being adequate to withstand flooding to 8 ft. above the main deck, added to compression loads due to the railway car deck carrying its full complement of cars.

The maximum of subdivision has been provided for, even beyond the legal requirements for passenger ships. Protection of the machinery spaces is increased by double bottom compartments and full depth side tanks below the car deck. At the fore and after ends of the engine rooms and between the engine and motor room spaces, watertight doors are fitted in bulkheads for protection against flooding. All necessary openings have watertight doors with local and wheelhouse control for their automatic operation in an emergency. All openings in the shell were kept to a minimum. Overboard discharges have been specially designed for a ship operating in ice. The main circulating seachests are fitted with hot water returns from the main engines, so that frazil ice can be kept clear by the hot water. Complete de-icing arrangements have been fitted, and all important outlets have hot water or steam connections. A supply of hot water is provided for hosing down the decks.

Railway Equipment and Automobile Cargo

Of almost equal primary importance to icebreaking efficiency is the ability to carry railway passenger and freight cars, motor trucks, automobiles and passengers. Railway officials, bound as they are by normal railway schedules, are not altogether sympathetic to the tourist whose object is to get his automobile on and off the ship. The passenger who wants comfort in his living quarters is usually more concerned with the restaurant service. On the *Abegweit* a successful compromise appears to have been effected between these somwhat conflicting services.

The railway car deck was designed to withstand live loads incidental to the carrying of a light T4A Canadian National engine with an allowance for impact. Due to the varying deck spans, apertures, pillar supports, etc., strength calculations were made for every deck beam. A great variety of sections was used so uniformity of strength could be maintained without sacrificing too much material. The automobile deck was calculated to withstand the loading of large trucks and buses with maximum live wheel load plus an additional allowance for impact.

As well as electrically driven capstan windlasses for the normal operation of the anchors, the ship is fitted with two electrically driven capstans on the main car deck for hauling railway cars to the car buffers. Two additional capstans are fitted aft to handle the lines while docking. These after capstans are also used to haul the ship close to the shore apron. Electrically operated screen doors are fitted at the after end of the car well, for use during winter operations.

Heeling, Trimming and Steering Equipment

Large capacity heeling pumps are installed, capable of handling 423,000 gallons per hour, to transfer water between wing tanks on either side with despatch. Transference of this water will heel the ship 10 degrees each side of the vertical in one and one-half minutes. A trimming tank is also provided, and a pump having a capacity of 3,130 gallons per minute is fitted in the forward end of the ship. This permits adjusting the depth of the forward propellers below the waterline to suit prevailing ice conditions. The pump and tank are connected with an 18 in. pipe, all valves being motor operated with remote control in the navigating bridge. Large air relief valves are needed to avoid excessive pressures on the divisional bulkheads and crowns of the tanks.

The operating staff use the engines almost exclusively for manoeuvring in the harbour, yet there are occasions when this has to be supplemented by the rudder. The weight of the rudder is over ten tons, and it can be locked in the centre position when the ship is backing and filling in ice. It is activated by an electro-hydraulic four-ram steering gear specially built for icebreaking service, operated by a 45 hp. d.c. motor which will put the helm from hardover to hardover in twenty-four seconds with the vessel at full speed. It can be operated by the quartermaster through a telemotor system either from the navigating bridge forward, or from the docking bridge aft.

Safety and Control Equipment

Nothing has been spared to guard against fire hazards; the machinery spaces can be flooded throughout by carbon dioxide in the event of fire, and the battery of storage bottles can be operated locally, or by remote control from the bridge. A complete fire detection system is operated from the bridge. Lifesaving arrangements and equipment are complete in every respect and in conformity with the latest Canadian Steamship Inspection requirements.

The vessel is heated by auxiliary steam boilers automatically controlled, one in each engine room. On all exposed surfaces of the spaces requiring heat, adequate insulation, generally in the form of asbestos sprayed on the steel structure, has been applied to keep the expense of maintaining a warm ship to a minimum and to eliminate excessive heat in summer. A system of ducts permits the ship to be heated by heat recovered from the machinery spaces. Ventilation is of the latest type on the forced air supply system, controllable both as to quantity and temperature by the engineer.

The most modern navigational aids have been installed, including gyro and magnetic compasses, echo sounding machine, ship-to-shore radio-telephone and radar. Remote control of the propelling motors is fitted both in the navigating and docking bridges. All operating controls have been combined in neat compact console-type control cabinets. It is not necessary to ring telegraphs from the bridge to attract the attention of the engineer, as with previous ships. Direct operation of the motors is carried out by the navigating officer, during the delicate operation of docking and undocking, and in attacking ice formations. This feature should result in a lower maintenance cost in the elimination of errors in judgment, or delayed operation between the master and the engineer.

Numerous protective devices and alarm controls have been incorporated, to render the ship as safe and trouble-free as possible, such as water and lubricating oil alarm and control, fuel oil control, overspeed control, maximum motor field strength control, overload control of engines, watertight door control and fire protection; all have been made as foolproof as the most up-to-date practice permits. Modern and complete engineers' and electricians' workshops and stores are provided to facilitate routine repairs and adjustments without recourse to shore repair shops.

Engines and Propulsion Equipment

The arrangement of machinery on this ship is somewhat unusual, inasmuch as each main propulsion set consists of a twelve-cylinder 1,500 B.H.P. engine, divided into two banks of six cylinders each with the generator mounted between them, and the whole is supported on a common welded steel bedplate of specially fabricated design. This bedplate is in turn welded to the tank top of the ship, since it was decided that any deflection in the tank top, even though transmitted through bedplate to crank shafts, would come within the allowable deflection for crankshafts, and would not prejudice the safe performance of the machinery.

The engines, generators, motors, shafting and propellers on the starboard side form one complete propelling system, while similar equipment on the port side constitutes another complete system. The main propulsion is of diesel electric direct current type with amplidyne voltage control of field excitation, speed and reversal of the propulsion motors. The propulsion equipment comprises four shafts and propellers, two forward and two aft, each with their own propelling motors capable of transmitting individually 3,850 shaft horsepower aft or forward, or, when operating uniformly, giving a distribution of 2,500 shaft horsepower per propeller. Motors are remote controlled from the navigating bridge, the docking bridge or the engine control room. Either one of the port propelling motors can be connected to one, two or three of the port generating sets, and similarly for the starboard units.

The main power supply is from eight twelve-cylinder Dominion Sulzer TS-29 type fresh water cooled diesel engines, direct connected to a generator. The engines are rated to drive the generator at full output continuously, with ten percent overload for two hours, and twenty percent overload for fifteen minutes. The engines are of the vertical compression ignition air-starting full diesel type. Air for combustion can be drawn from the engine compartment, or from the atmosphere. Thus better control of engine room temperatures can be maintained, an important item for electrical equipment, particularly when wide ranges of atmospheric temperatures are encountered. Standard starting controls were furnished with each engine and fuel control stops were provided to prevent dangerous overloading. Governors and governor control equipment were furnished, an independently driven overspeed governor was fitted to each engine.

The temperature of the engine cooling water is thermostatically controlled on each engine. Fresh water is used, and the heat exchangers can operate efficiently with sea water at a maximum temperature of 65 deg. F., while the maximum temperature of the fresh water leaving the engine water jackets is arranged not to exceed 130 deg. F. Thermocouples were furnished for each individual cylinder exhaust outlet for use with permanently installed temperature dial indicators.

The engines are equipped with a barring device for turning the engines by hand. Indicator cocks are provided on each cylinder for attaching a maximum pressure indicator, so that proper adjustment of engines can be readily maintained. Engine controls are mounted on each engine, including an emergency shut-down device.

Electrical Equipment

Three 330 kw. auxiliary engine generator sets are provided for the auxiliary machinery, two in the forward and one in the after engine room. Air is drawn from the engine compartment. Also, for emergency and port use, two 60 kw. diesel generating sets are provided in a compartment above the load water-line at the railway car deck level. All auxiliary services are supplied at 225 volts direct current.

The electrical equipment consists of two separate systems or installations; that pertaining to the main generators, propulsion motors, switchboards and controllers for propulsion and manœuvring of the ship; and that for supplying power for the exciters, motors, pumps, lighting distribution, switchboards, etc.

The main propulsion generators are rated at 1,050 kw., maximum voltage of 325, at a speed of 360 rpm., designed for continuous duty at 35 deg. C. ambient air temperature, for a temperature rise by thermometer of 75 deg. C. in the core and windings, 85 deg. C. bare copper windings and 90 deg. C. commutator. They are totally enclosed with separate ventilation and separate excitation, built on a split frame with a forged flanged shaft having shunt wound commutating windings. The insulation is class " B ", suitable for 1,000 volts to ground. They are cooled by air forced through an enclosed system with precautions against damage through leakage in the air cooler. The air cooler medium is salt water. Alarm circuits are provided in case the generator gets too hot.

The propulsion motors are of the single armature type, designed to absorb the rated horsepower of the shaft at any speed between 128 and 155 rpm. propeller speed, and to be capable of delivering 150 per cent full load torque momentarily at creeping speeds, with a suitable protection device to prevent commutator damage in the event of actual stalling. Each propulsion motor has the following characteristics:

Shaft Horsepower - -	3,850
Speeds - - - - -	128 to 155 rpm.
Voltage - - - - -	960 Maximum

The other characteristics are identical to those of the generators.

The motor bearings are of the pedestal self-aligning type, arranged for flood lubrication with adequate oil seals to prevent the rotor fouling the starter if the bearing is wiped. The motors are provided with carbon dioxide fire extinguishing systems to permit the flooding of the interior air circulating systems in the event of fire.

Switchboard and Controls

The control platform, located on an elevated soundproof enclosure in the forward engine room, contains the propulsion control systems. The control panel boards consist of two L-shaped deadfront semi-steel enclosed units, housing the various distribution and control switches. A number of relays for transfer and signal purposes are used, but the main speed and reversing control does not require any moving parts, static devices being used throughout. Main field and protective contactors do not operate except when generators are being switched. All arrangements are designed to operate the control systems without any moving parts as far as practicable, to minimize maintenance.

Propulsion generator and motor speed controls are maintained by an amplidyne system, operating on the general fields, with five amplidyne sets, one being a spare. Each set includes a motor, generator and amplidyne exciters and is driven by a direct current motor. Protection is provided in the circuits against overloading the engines. A number of other protective features are incorporated, such as electric overload and short circuit protection. The speed controllers have ahead and astern motions. Reversing is accomplished by reversing the amplidyne field connections on the amplidyne controlling the generators. This is done without breaking the circuit, by means of a potentiometer connection.

All connections between the propulsion generators and the switchboards are made with solid copper busbars in lieu of cables, in view of the high voltages and the uncertainty of the ambient temperatures of the engine room. The installation of these connections to suit the practical layout of the ship happens to be in the hottest part of the engine room, with no predetermined means of arriving at possible temperatures to be expected. This feature was the cause of much thought while design details were being worked out, and it is believed to be the first time such an extensive busbar installation has been used in a ship.

The horizontal runs are made of two 4 in. x ½ in. copper bars per polarity spaced ½ in. apart. They are enclosed in a wire mesh trunk having a mesh sufficiently fine to exclude rats, and mounted in slotted arborite boards with clearances to allow for possible deflection of the car deck. To permit longitudinal movement resulting from expansion or contraction due to temperature changes, laminated copper joints are provided, with suitable glands at watertight bulkheads. Vertical runs from the generators are made from two 6 in. x ½ in. copper bars per polarity, insulated for 1,000 volts. Busbars carry 3,200 amps at 960 volts continuously, or 6,400 amps for short periods.

Feeders from the switchboards to the propulsion motors consist of four single core 1,250,000 circular mills basket weave armoured steel braided cables per polarity, suitable to permit free air circulation.

The auxiliary power is distributed from a three-panel generator switchboard to a twenty-circuit enclosed distribution panel, both located in the control room. All air circuit breakers installed on feeders are capable of interrupting 2,500 amps. available under short circuit conditions.

The operating controls are basically developed around the amplidyne system controlling the motor speeds. At each of the three control stations, duplicate control cabinets are installed, one for the motors of each side. These cabinets are fitted with Selsyn telegraphs, indicating lights, speed indicators and alarm systems, and are arranged to make the necessary changes in the motor generator set-up, and automatically allow these changes to be confirmed. By means of transfer switches the greatest flexibility is provided, so that either one of the control positions can be used without fear of signals being transmitted from the other stations. With this complete installation the ship can be operated in a variety of ways in service, and with several combinations of engines. She is thereby equipped for the four very diverse but major operations of running in free water, manoeuvring at the terminals in open water, manoeuvring at the terminals under ice conditions, and operating between ports in any ice conditions.

The electrical work throughout the ship is extensive for, in addition to the motors described, there are one hundred and thirty-five auxiliary motors complete with all necessary power and lighting systems. Approximately 100,000 feet of electrical cables of different sizes, varying from two to sixteen conductors per cable were installed. In all there were about 200,000 man hours of electricians' labour worked into this ship, which may be termed a ship operated by push buttons.

A Credit to Canada's Shipbuilding Industry

The vessel was built to obtain the British Corporation Register of Shipping and Aircraft's highest class for an icebreaking railway car ferry, operating in field and pack ice. She had also to comply with the highest requirements of the Canadian Board of Steamship Inspection. Her size, her design, and the material and labour problems attendant on her construction were a severe test of Canadian initiative and ability.

The successful achievement has no doubt raised the prestige of Canadian shipbuilding. It is a matter of pride to all concerned with the *Abegweit* that she is practically one hundred percent a Canadian accomplishment, excepting a few auxiliaries from Britain, and the amplidyne control equipment manufactured in the United States.

Great credit is due the shipbuilders for their willingness to undertake such an important and exacting contract, which from the welding point of view alone would have taxed the facilities and resources of any large British shipyard. Credit is due also to the manufacturers of the machinery and electrical equipment, to the Canadian Board of Steamship Inspection, to the operating staff of the Canadian National Railways, the British Corporation Register of Shipping & Aircraft, the suppliers of the various items of equipment, and to the operating personnel of the ship, particularly Captain J. R. B. Maguire, and to Commander C. R. Edwards of the Department of Transport who took the responsibility for providing the best and most modern ship possible for the service, and who is to be sincerely commended for his vision and co-operation.

APPENDIX

EQUIPMENT SPECIFICATIONS

Engine and Motor Rooms

Four Propulsion Motors—C.G.E. Co. Ltd.—3,850 hp., 128/155 rpm.

Eight Main Generator Sets—2-6 cyl. 1,500 bhp.—360 rpm. Dom. Sulzer TS29 diesel engines driving 1-1,050 kw., 325 v. C.G.E. Generator.

Three Auxiliary Generator Sets—1-4 cyl. Dom. Sulzer TS29 diesel engine driving 1-330 kw., 225 v. C.G.E. generator.

Two Emergency Generator Sets—1-6 cyl. 1,200 rpm. Gen. Motors model 6-71 diesel engine driving 1-60 kw. G.E. generator.

Five Motor Generator Sets—1-30 hp. d-c. 220 v. 1,800 rpm. motor. Two amplidyne generators, one for generator and one for motor excitation, each rated 25 kw., 1,750 rpm., 250 v. C.G.E. Co. Ltd.

Two Alternator Motor Generator Sets—C.G.E. Co. Ltd.:
- 1-15 hp., 220 v. d-c., 1,800 rpm. motor.
- 1-12.5 kva., 115 v., 3-phase 60 cycle a-c. alternator.
- 1-1,000 watt 125 v. exciter.

Two Air Compressors—C.I.R. Co. Ltd.—5″ x 2½″ x 4″. Type 20-30 cu.ft./min. at 400 psi., 15 hp. at 900 rpm.

Four Air Bottles—D.E.W. Co. Ltd.—W.P. 400 psi. 38 cu.ft. capacity.

Four Lub. Oil Pumps—C.F.M. Co. Ltd.—835 imp. gal. per min. at 75 psi., 75 hp. at 1,750 rpm., vertical centrifugal.

Two Aux. Gen. Lub. Oil Priming Pumps—C.F.M. Co. Ltd., 50 imp. gal./min., 3 hp. at 1,750 rpm.

Three Lub. Oil Purifiers—Alfa-Laval Co. Ltd.—500 imp. gal./hr., 3 hp. at 1,450 rpm.

Two Diesel Fuel Oil Purifiers—Alfa-Laval Co. Ltd., 500 imp. gal./hr., 3 hp. at 1,450 rpm.

Two Heeling Pumps—16″ Fig. 6310A propeller pumps—C.F.M. Co. Ltd.—7,050 U.S. gals./min. at 22 ft. head, 50 hp. at 1,160 rpm.

Two Fire and Bilge Pumps—Vertical centrifugal self-priming—C.F.M. Co. Ltd.—200 imp.gals./min. at 100 psi.—also 300 imp.gals./min. at 35 psi.

Three Salt Water Circ. Pumps—Vertical centrifugal—C.I.R. Co. Ltd.—3,000 imp.gals./min. at 36 ft. head. 40 hp. at 1,260 rpm.

Three Fresh Water Circ. Pumps—Vertical centrifugal—C.I.R. Co. Ltd.—1,000 imp.gals./min. at 75 ft. head. 30 hp. at 1,900 rpm.

Two Heating Boilers—Water tube—Dom. Bridge Co.—6,000 lb. steam/hr. at 100 psi. W.P.

Two Forced Draft Fans—Clarage—2,598 cfm. at 70° F.—1.46 bhp., 1,150 rpm.

Two O.F. to Boiler Pumps—Viking ZGPH—2 hp. at 1,200 rpm.

Two Boiler Feed Pumps—Carruthers-Darling—6 x 4 x 12 vertical Simplex—10,000 lb. of water per hr.

Two Bunker "C" Transfer Pumps—C.F.M. Co. Ltd.—Waterous HD-456 rotary gear pump—60 imp. gals./min., 5 hp. at 1,750 rpm.

One General Service Pump—Vertical centrifugal self-priming C.F.M. Co. Ltd.—200 imp. gals. per min. at 100 psi.—also 300 imp. gals. per min. at 35 psi.

One Diesel Fuel Transfer Pump—Waterous HD-643 rotary gear pump—C.F.M. Co. Ltd.—200 U.S. gals./min. 5 hp. at 1,750 rpm.

One Automatic Make-Up Pump—Burks A 2C-4—240 U.S. gals./hr. 1/6 hp. at 1,725 rpm.

Four Turning Gear—D.E.W. Ltd.—2 hp., 220 v. 1,200 rpm. C.G.E. motors.

Four Motor and Thrust Lub. Oil Pumps—No. 4 B & S. pump, 2 hp., 220 v. d-c., 900 rpm. motor.

Two Motor and Thrust Lub. Oil Tanks—300 imp. gal. each.

Two Lub. Oil Storage Tanks—1,500 imp. gal. each.

Two Dirty Lub. Oil Tanks—750 imp. gal. each.

Two Expansion Tanks—90 imp. gal. each.

One Trimming Pump (reversible)—16″ propeller pump Fig. 5320X horizontal—C.F.M. Co. Ltd.—Capacity 3,130 imp. gals./min. at 15 ft. head. 40 hp. at 1,150 rpm.

One Oily Water Separator—Coast-Guard—10 tons/hr.

One Whistle Air Bottle—D.E.W. Ltd.—W.P. 400 psi. 38 cu. ft. capacity.

Two Domestic F. W. Pumps—Burks A5C—Cap. 550 U.S. gals./hr. 1/3 hp. at 1,725 rpm.

One Domestic F.W. Pump Tank—180 imp. gals.

One Sanitary Pump—Burks A5C—Cap. 550 U.S. gals/hr. 1/3 hp. at 1,725 rpm.

One Sanitary Pump Tank—180 imp. gals.

Four E. R. Vent Fans—Sirocco—6,000 cfm. at 1¼ S.P., 2 hp. at 1,720 rpm.

Two Control Room Supply Fans—Thermotank—5,000 cfm. at 2″ S.P., 3 hp. at 900 rpm.

Two Control Room Exhaust Fans—½ hp., 1,200 cfm.

Four Lub. Oil Coolers—Ross No. 1414 CP.

Four M.E. C.W. Heat Exchangers—Ross No. 1714CP.

Four Motor and Thrust Lub. Oil Coolers—Ross No. CP607.

Two Motor and Thrust Lub. Oil Storage Tanks—200 imp.gal.

Five Steam Heaters for Purifiers—Alfa-Laval Co.

A Transportation Paradox

S. W. FAIRWEATHER
Vice-President, Research and Development, Canadian National Railways, Montreal.

An address delivered before the Montreal Branch of The Engineering Institute of Canada on January 16, 1947.

The author contends that free right-of-way and inadequate regulation for highway transport are not the basic reasons why high cost highway transport has largely captured the door-to-door field in freight transportation from its low cost rail competitor.

Rail rates were originally regulated to curb monopoly. Then they were adjusted for purpose of widening market opportunities and opening up new territory. Haul of bulk commodities such as coal and grain, at low rates, was compensated for by high rates on processed goods. Railways, therefore, operate in a "planned economy" of their own. Highway transport, operating in its "free economy", captures the high-rate haul on processed goods moving over short distances, thus upsetting the "planned economy" of the railways.

The answer, he believes, lies not in raising rail rates on bulk shipments, but in an exhaustive study to determine the best means of assuring that each form of transportation contributes its maximum of service at a minimum of cost. Open competition might be permitted where rail costs are limited by highway costs, but how can this be done and still permit low cost haul of bulk commodities? Assistance to transportation by the state is not a new principle, and such assistance to railways by subsidies on low cost bulk freight is suggested as one possible solution.

The situation with which I propose to deal is one of those cases where facts and logic seem to have parted company. The transportation paradox presents a situation where economic principles seem to operate in reverse, a situation where the usual laws of the market-place do not control supply and demand, a strange topsy-turvy situation which would be amusing if if were not serious. The elements of the paradox are these:

Railway transportation is the cheapest form of land transport for all but short distances. Therefore by the laws of economics railway transportation should be immune from competition except in the short haul field. Conversely, highway transport, except in the short haul field, is from three to five times as expensive as railway transport. Consequently, highway transport should find it impossible to expand its services in the face of its lower price competitor.

The facts, however, belie the logical inference. Competitive highway services have seriously eroded railway traffic. Highway competition has ruined many railways and has brought others to the verge of it. The high cost producer, in apparent defiance of basic economic principles, has captured a market from the low cost competitor, both producing an identical commodity, viz., door-to-door transportation. Hence the paradox! Of course, like all paradoxes, the puzzle results from pertinent factors having been omitted, ignored or misunderstood, and when these are discovered and properly evaluated, the paradox becomes understandable, though the absurdity may remain.

Free Right-of-Way and Unregulated Trucking Rates Not the Main Causes

I suppose, that following these introductory remarks you will expect me to expose the unfairness of the railway having to furnish its own right-of-way, while the State furnishes the highway for the truck; to show that vehicle taxes are inadequate to pay highway costs; that highway commercial operators receive a large bonus through the medium of taxation of pleasure vehicles; that there is inadequate regulation of highway operators, and other such items. Such, however, is not my purpose, because while I agree that these factors do aggravate the condition, they are not the basis and underlying cause of the paradox.

Even if the field were to be cleared of all such factors, stripping from both highway operators and the railway the special considerations one or the other has received, or is receiving, (and the advantages are not necessarily all one-sided), no significant change in the relative costs of transport by the two agencies would result. All that would happen would be that the statement of fact would have to be re-stated, so that instead of saying that highway transport, except for short haul distances, was from three to five times as expensive as railway transport, one would have to state that it was, say, from four to six times as expensive. In other words, these factors which are commonly talked of are not sufficient to explain away the paradox.

Rail Service Not Sold in a Free Market

As is not unusual, the factor which has been overlooked is a commonplace one, so obvious that we marvel that it had not been thought of immediately. It is simply this: The marketing system by which a railway sells transportation differs profoundly from the free market-place, which is predicated by economists as being the true measure of value. Hence the ordinary laws of economics do not operate, and highway operators find a fertile field of opportunity produced by artificial conditions introduced into the marketing of railway transportation. Railways, in fact, do not sell their commodity, transportation, at prices related to cost, not in individual cases at least. Instead they sell transportation on the basis of a rate incorporated in a rate schedule, and the price the consumer pays is compounded of many factors, of which the cost of service in many cases is the least important. The controlling factor is frequently the value of service, a loosely defined term which is given significance only to the extent that the railway had a functional monopoly.

I am leading up to what to some may be a startling conclusion. We have heard much lately of "planned economy", meaning by that a regulated economy, which refuses to be controlled by the vagaries of the laws of supply and demand operating in the free market-place. How many would recognize that in our railways we have an example of a planned economy which was evolved early in the history of the industry, and which has grown to be such an accustomed part of our life that we look upon a railway rate as being a price for a commodity in much the same way as we look upon the price of any other commodity or service?

Our thinking on economic matters is unconsciously controlled by a presumed relationship between price and cost. We normally infer that because a commodity is low in price, the cost of production of it must be low. We are normally justified in assuming a margin of profit between the selling price and the production cost of a commodity, and we tend to fit things together according to this pattern. We assume that if price and cost should vary from this pattern, the situation would be quickly and automatically adjusted. Any attempt, however, to carry this kind of reasoning into the price and value relationship of railway transportation is a fallacy. The essential premise of a free and competitive market is in this case lacking, and the begging of this premise leads to confused thinking. This confusion in thinking is costing Canada not less than $75 millions per year.

Rail Rates Set With View to Widening Markets

Before dealing with that side of our paradox, however, I should like to deal with the history and economic justification of the planned economy of the railway rate structure. It had its genesis in the monopolistic nature of a railway. The railway had a functional monopoly which was not amenable to automatic control by functional competition. Only railways could compete with railways and then only between common points. The inevitable happened! Monopoly exploited its opportunity and railway rate regulations came into being to curb the monopolist. The principle of rate regulation revolved around two ideas, that of a reasonable rate and that there should be " absence of discrimination ".

You will note, however, the complete absence of reference to cost of service. Apart from a none too clearly recognized necessity of balancing over-all costs in relation to over-all revenues if solvency is to be preserved, little attention was paid to costs. The test of an individual rate was merely that it should be reasonable and non-discriminatory.

In the process of controlling the monopolistic features of railroads, another feature of profound importance gradually evolved. Railway rates were adjusted to widen market opportunities by overcoming geographical disabilities, to bring the benefits of settlement and development to remote areas. It is doubtful if in the beginning there was any consciousness of this as a deliberate policy. It was a development which arose from circumstances and had pragmatic sanction. It was a development, however, which made the railway an economic tool of the State, a tool to be used for national development. The mechanics by which the railway rate structure was used to accomplish this purpose are quite interesting. It costs the railway company practically no more to haul a carload of silk one mile than it costs to haul a carload of wheat one mile, the cost in either case is of the order of one cent per ton per mile, but in the case of shipment of wheat it is considered reasonable that the rate charge shall be half a cent per ton mile, whereas in the case of the silk it is considered reasonable that the rate shall be perhaps twenty cents per ton per mile. This is a far cry from the economics of the market-place. It is a planned economy with a vengeance.

Loss on Bulk Haul Made Up on Hauling Processed Goods

A little study will show that to encourage the development of natural resources in far places the reasonable level of rates had been worked out so as to allow of the widest possible expansion in the development of the country, even if in doing so railway rates have to be quoted which are only a fraction of average railway costs. So true is this, that fully 50 per cent of all commodities transported by railway in Canada moved at rates which are less than average railway costs. It is axiomatic that if all rates were on this basis, railway expenses would exceed railway revenues, but the gap was normally bridged by allowing as reasonable, rates which were many times the cost of service, as applied to commodities which are considered able to absorb the cost and still be widely marketed. There is a smaller volume of such commodities than of lower grade commodities, and not more than 25 per cent of the commodities transported by railway in Canada pay more than average cost.

To summarize, the railway moved 50 per cent of commodities at less than average cost, 25 per cent of commodities at average cost and 25 per cent of commodities above average cost. We are faced here with a composite economy. One part of the requirement of the composite economy is that the average revenue, as represented by the average traffic, would equal the average cost of service. The other part of the composite economy is a complex internal system of bonus and taxation, taxes being levied on some commodities far above the cost of service and bonuses given to other types of traffic which are moved below cost of service. This planned economy was beneficial alike to the State and to the railway, because the railway, being a functional monopoly, participated in the growth of the wealth and importance of the State. It is the old story of the circus operator who made up on the swings what he lost on the roundabouts, a satisfactory state of affairs so long as the roundabouts and swings are controlled by one owner. The arrangement, though satisfactory, was none the less artificial, in that it did not conform to the laws of the market-place, and this artificiality became a matter of importance when the railway lost a degree of its functional monopoly, lost it through the development of highway transport.

Highway Transport Disturbs " Planned Economy " of Railways

Let us revert to our earlier statement that the cost of highway transport is from three to five times that of rail transport. This means that if we take the cost of railway transport at an average of one cent per ton mile, highway transport is from three to five cents per ton mile. It follows that all railway traffic moving at rates per ton mile above these figures is vulnerable to highway competition. Now it so happens that the high valued and high rated commodities, which bear a concealed transportation tax, mostly move between the populous centres and over not too great distances. Therein lies the explanation of the rapid growth of highway transport. The smooth-working planned economy has been torn wide open. Revenues which under the planned economy were destined to be used for a bonus to shippers of marginal commodities have been diverted to the pockets of highway operators, who naturally exploit the artificial field of opportunity to the fullest possible extent.

Let us pause to see how the balance sheet adds up, as compared with the previous state of affairs. The shippers and consignees of the goods shipped by highway are happy because they have effected a reduction in freight charges. The highway operator is happy in the growth and profit of his new venture. The railway finds itself stripped not alone of normal profits but also of money needed to balance its outgo on traffic moved at less-than-average cost. The shipper of marginal goods at first is not primarily affected, but soon he may notice, if he is located on a branch line, that the quality of railway service has deteriorated, that railways are unable to supply adequate equipment and, even in extreme cases, that the branch line which serves his farm or his lumber mill is abandoned. It is abandoned for the simple reason that the railway, being unable to balance its books through the handling of traffic, must attempt to do so by curtailing its expenditures.

Paradox Costs Us $75 Millions a Year

Finally, we find society as a whole absorbing in one form or another the extra cost of handling the traffic by highway, as compared with handling it by railway; because the cost to society as a whole must be judged by the cost of service which the planned economy has ignored in detail. The reduction in transportation charges which the shipper or consignee of the high-valued commodity sees is therefore no true economy. On the contrary, since the cost of service by highway has been from three to five times that by railway, there has been an economic loss of from two to four cents per ton mile incurred. This is a penalty for running counter to economic laws, namely the cost of our paradox amounting to $75 millions per year. A curious conditions, is it not? But one not easily remedied.

It might be thought than an obvious solution would be for railways to assert their dominance and reduce their top rates to the cost of service by highway. This would have the effect of destroying highway competition, because no truck could operate and live at these rates, while the railway would still be making a comfortable profit. But do not forget that the rates which are proposed to be reduced have been loaded with the bonuses designed to allow marginal commodities to move to market, and for the railway to reduce the rates on high-valued commodities to a point where highway competition would be destroyed would also eliminate the bonuses. The railway would still be faced with the necessity of moving low-grade commodities at lower than average cost, but would lack the means of doing so.

As an alternative, then, let us adopt the principle that commodities must bear their cost of service, and freight rates must be assessed accordingly. That would surely cure the situation, as the bonus would no longer be necessary. Admittedly so, but it would be the same sort of cure as cutting off a man's head to stop a headache. Do not forget that the railway has been used to extend marketing as widely as possible, and any differential rise in the freight rates on low-grade commodities must be reflected in lowered marketing and a reduction in production, hardly a satisfactory solution of our difficulties. Nor is strict regulation of the highway operator a solution, although such regulation is commendable from the point of view of public convenience and necessity and public safety.

Freight Transport Half Controlled and Half Free

It would not, however, solve the difficulties arising from our paradox, because the operation of highway vehicles on the public highway must in the last analysis be considered as a 'laissez-faire' economy, so long as it is legal for an individual to transport his own goods on the highway in his own vehicle. Under these circumstances an attempt to force rates above cost of service by highway would simply mean that shippers would own their own vehicles. An equally unjustifiable solution would be for the State to prohibit the shipment of goods by highway beyond a prescribed theoretical economic haul. This solution has all the charm of armchair economics, but it is quite impractical and would jeopardize the country in securing the advantages of improvements in the art of highway transport, as determined by experience.

The paradox, in essence, results from a clash between a planned economy and a 'laissez-faire' economy, and as has been shown, other interests than the railway are damaged in this clash. The underlying causes have not been understood, and therefore a rather deplorable condition has been permitted to arise, deplorable, because railways must remain the main factor in land transport. The premise that railways are needed, when viewed in the perspective of the late War, needs no further proof. If such proof were needed, it could be furnished by considering the percentage of the national income which has now to be allotted to railway transport with the percentage which would result if the same service were performed by highway transport. The cost of railway freight transport in 1945 amounted to 5.8 per cent of the national income. Had this same transportation service been performed by highway carrier, the cost would have amounted to 23.2 per cent of the national income. Canada could not possibly afford such a bill of expense for basic transportation, and it is manifest that the preservation of railways as the backbone of the land transportation system is a sheer economic necessity.

Low Rates for Bulk Haul Must Be Maintained

Likewise, it would appear that railways must continue to transport marginal commodities at figures lower than average railway costs, because we are so committed to the benefits of a planned economy, which extends marketing assistance in this manner, that it is unthinkable that the policy should be reversed. The shippers of marginal commodities must continue to receive the benefits of railway service. For reasons mentioned above, however, the top level of railway rates must necessarily have regard to cost of service by highway. The rate structure of the railways must then conform to the value of service for marginal commodities and the cost of highway service for other commodities. The situation which is thereby created is one of economic instability. The cornerstone of the planned railway economy has been shattered. This has been the main contributing factor to the financial difficulties of railways in all countries in the decade before the late War. All countries have been forced to give consideration to this problem, and in one country or another most of the measures I have mentioned have been experimented with without a solution being found.

Must we therefore conclude that the problem is an insolvable one? Must we be reconciled to a condition of continuing economic instability of railways? I do not think so, but it does appear to me that much deeper and closer study of the problem is needed than has so far taken place. There has been a tendency to be misled by the more obvious forms of disparity in the competition of railway and highway services, and to reach a conclusion that if these are adjusted by appropriate regulation, all will be well. The real purpose of my address is to set forth my views that this is not true. I hold that further study is necessary, and that this study should encompass the whole field of the social usefulness of the two forms of transport. The next step would be the devising of ways and means to see that each form of transport should contribute its optimum of service. Here again careful study is necessary, because it is quite possible to do more harm than good if short-sighted or arbitrary policies are adopted.

Subsidies for Handling Bulk Commodities a Solution?

It seems, however, there is some merit in introducing the principle of open competition within the sphere where railway rates are necessarily limited by highway costs. In other words, we might put an end to the artificial field of opportunity and let the normal laws of economics determine the price and value of service, as between railway and highway. The puzzle is how to do so without destroying the ability of the railways to handle marginal commodities. Here is must be recognized that the State has a lively interest in the matter and that possibly the only solution would be a realization that this is so. The State would normally deal with such a situation by assistance in one form or another. Assistance to transportation is not a new principle as applied to railways, waterways or highways. The problem is more one of introducing a degree of logic into the situation and of apportioning the assistance so that the optimum benefit to society would result.

I hold it to be true that the test of a sound transportation economy is the provision of a maximum of service at a minimum of cost when all factors are taken into account. In a modern economy an approximation to this condition cannot be taken for granted. Already, as I have pointed out, artificial conditions have resulted in increasing transportation costs by $75 millions per year in Canada. Careful study should make it possible to recoup much of this loss.

I hope I have made it clear that the clash of the regulated railway economy and the 'laissez-faire' highway economy affects many more interests than the highway operator and the railway. We are not in this case dealing with the struggle between commercial competitors, where the battle will ultimately go to the worthier contestant, with benefit to society as a whole; we are rather witnessing a mutually destructive struggle, where those who seem to gain an advantage do so at the expense of the total economy. The situation is one which calls for an understanding based on careful study and analysis, and it is to be hoped that a solution will be found, which will permit each form of transportation to live and prosper.

Progress of The Electric Locomotive

On its 73-mile electrified section between Wenatchee and Skylomish in the State of Washington, the Great Northern Railway handles heavy freight loads with the worlds' two largest single-cab electric locomotives. These 360-ton giants are 101 ft. long and develop 5,000 hp. with 119,000 lb. tractive effort at 15.75 mph. and up to 180,000 lb. for starting and acceleration.

The 12 axles of each locomotive are arranged in two 4-axle main trucks and two 2-axle guiding trucks. All axles are driven, the twelve 300/600 volt d-c series wound motors being mounted on the axles and rated at 500 hp. each for traction. Regenerative braking to a maximum of 5,750 hp. is provided and allows very heavy trains to be handled on grades without the use of the train air brakes.

Primary power from the trolley is supplied through a single transformer, to two 5-unit motor generator sets one set being mounted in each end of the apparatus compartment. The driving motor of each set is a 25-cycle, 1,350-volt, 750 rpm., single-phase synchronous type and the sets deliver d-c power at 300/600 volts to the 12 traction motors. The two main motors also drive exciters for the traction generators and the traction motors when they are being used for braking. The two motor generator sets are started by applying reduced d-c voltage to the generators to use them as starting motors. The generators may be used in parallel for heavy freight work at low speed or in series-parallel for high speed passenger service.

Auxiliary power is provided by two three-unit motor alternator sets located in the nose compartments of the double-ended cab. The 85-hp. single-phase induction motors of these sets each drive a 62.5 kva. alternator and a 75-volt d-c generator. The d-c generators supply control power, start the main sets by motoring their traction generators and charge batteries. The alternator powers the cooling blowers which supply 2,300 cfm. of air to each of the traction motors.

Also located in the nose compartments, two 2-stage a-c motor driven air compressors have a displacement of 150 cfm. at a reservoir pressure of 130 psi.

The streamlined, double-end superstructure is of all-welded construction, fabricated from steel shapes and plates. The operators' cabs are insulated and fitted with safety glass in all windows.

Main truck axles are side equalized by semi-elliptic springs with additional cushioning provided by helical springs. Additional controlled lateral motion is provided on the two inner axles of the main trucks with spring loaded retaining devices to increase stability on tangent track. A motor-element pantograph relay and ground switch system provide primary circuit protection. Thermal overload relays and thermal trip breakers protect auxiliary circuits with temperature detectors in the synchronous motor windings and the transformer Pyranol coolant.

The Suspended Monorail

for Rapid Transit

A paper presented before the Montreal Branch, Engineering Institute of Canada, on November 6, 1947

by **E. H. Anson**

Gibbs & Hill Inc.,
Consulting Engineers, New York City

Tracing the growth of urban transportation, the author discusses the advantages and disadvantages of mass transportation systems, surface, elevated and underground. By comparison, the advantages of a monorail system are shown. An example of a monorail system successfully used in Germany for 50 years, is given.

The modern conception of the suspended monorail has progressed considerably, and would embody many advantages inherent in the present day P.C.C. streetcar. Simplicity of the structures required for a monorail system is emphasized; the advantages of accessibility, safety and silence of the truck assembly are pointed out. Car body design and construction is outlined; methods of switching and of arrangement of stations are described.

During the 250 years following the founding of Montreal, even the most forward-looking citizen could not foresee the movement of traffic present in the city today. Early street planning was, of course, largely predicated on the movement of small horse-drawn vehicles, and much fewer in number than the vehicles now seen on most of the streets. Naturally, the use of streets for all-day parking was also not foreseen. Yet the basis for street routing and street widths was being formed during this early period.

It is therefore not surprising that the community is now faced with a traffic problem of the first magnitude. Nor is Montreal alone in its difficulties. The same condition obtains today in many cities of Canada and the United States. However, it is not the intention to attempt an analysis of the local situation, but rather to trace generally the nature of these fairly universal problems, and to describe somewhat briefly the Suspended Monorail System of Rapid Transit and its advantageous features as a possible solution.

Surface Transportation

As cities grew and expanded over unforeseen distances, the need for public transportation arose. Various forms of horse cars and horse-drawn stages gave way to the electrically-driven street car. For many years, the tramway lines served the communities' needs satisfactorily. Eventually, however, a demanding competitor for "elbow room" on the streets arrived in the form of the private automobile. Moreover, the passenger who abandoned the street car to drive his own automobile occupied more street space in movement. He also appropriated space at the curb —anywhere from five minutes to all day. Presently, the original electric street car was left behind. The introduction of modern street cars with "agility" of movement comparable to that possessed by competitive automotive traffic did not come any too soon. Possibly some of the older cars were constructed too well. Anyway, they have been a long time wearing out.

But even with the PCC car, with all its fine points of speed, rapid acceleration and braking, the problem was not completely solved. The best tramcar in the world can go no faster than the trailer-truck directly ahead of it. Therefore, where street cars and dense auto traffic must share narrow streets, which are also being used as public garages, something more than a fast street car is desirable.

The auto bus and trolley bus have both put in their bids for consideration. As far as manoeuvrability is concerned, they theoretically improve on the street car, through their ability to load and discharge passengers at the curb. Thus a safety zone, itself a restriction to traffic flow, need not be established. However, the lesser passenger capacity of the bus increases the number of vehicles on the street. Furthermore, curb loading is accomplished at the expense of frequently blocking two lanes of traffic. The driver approaches the curb at a sharp angle leaving the rear of his vehicle out in the second lane, at least partially blocking it. Curb loading also fails if "no parking" restrictions are not strictly observed.

As a solution to the problem of moving large numbers of people into a central district, the private automobile is decidedly a poor answer. The automobile is extremely prodigal of street space. Unlike public conveyances, it must be stored somewhere until the return journey. There is little question but that it is a community responsibility to provide street space for the necessary flow of vehicles, but it is open to question whether parking space should also be provided at public expense. In any case, it is costly to establish adequate parking space. Unfortunately, too, experience has shown that provision of express traffic arteries and other facilities for the automobile tends to defeat its own purpose. The reservoir of potential automotive traffic is so great that partial removal of inconveniences damming its flow only releases a greater movement, and the acute parking problem is still to be solved.

The maximum capacity of a single tramway line with reasonable freedom of movement is about 15,000 passengers per hour, nearly ten times a single lane of automobile traffic. The operation of trains of surface cars helps little as the competitive congestion is still present and even two car trains so extend the required loading spaces that the secondary congestion may well be aggravated. Removal of the tramcar from the street to a completely private right of way increases the load-carrying capacity to approximately 20,000 passengers per hour. The expense of such removal is disproportionate to the resulting gain.

In the face of these conditions, decentralization of activity has been advanced as a solution. Outlying shopping centers are common developments around modern cities. If carried to extremes, this results in drying up much of the life stream of commercial activity required to nourish existing business areas resulting in their decrease in value and tax return to the community. Similarly, the establishment of outlying industrial centers on the outskirts of a large city creates a problem. Either semi-independent communities grow up, or the volume of cross-city traffic is increased.

It is not implied that decentralization in some degree is not desirable, but it is emphasized that decentralization resulting in starving established business areas is undesirable if it can be avoided, and that decentralization, when otherwise justified, often is accompanied by altered, but none the less serious, transportation problems.

Elevated Railway

If a solution cannot be found on the surface the alternatives are to go overhead or underground. The conventional elevated railway appears to have run its course and to be falling into disfavour. The objections to it lie principally in the multiplicity of supporting columns, impeding surface traffic. But far more serious has been the depreciation of abutting property values due to the practical flooring over of the street, shutting off light and air, and to the accompanying noise of operation. Notably in New York City, unsightly elevated structures are being removed as rapidly as other facilities can be provided.

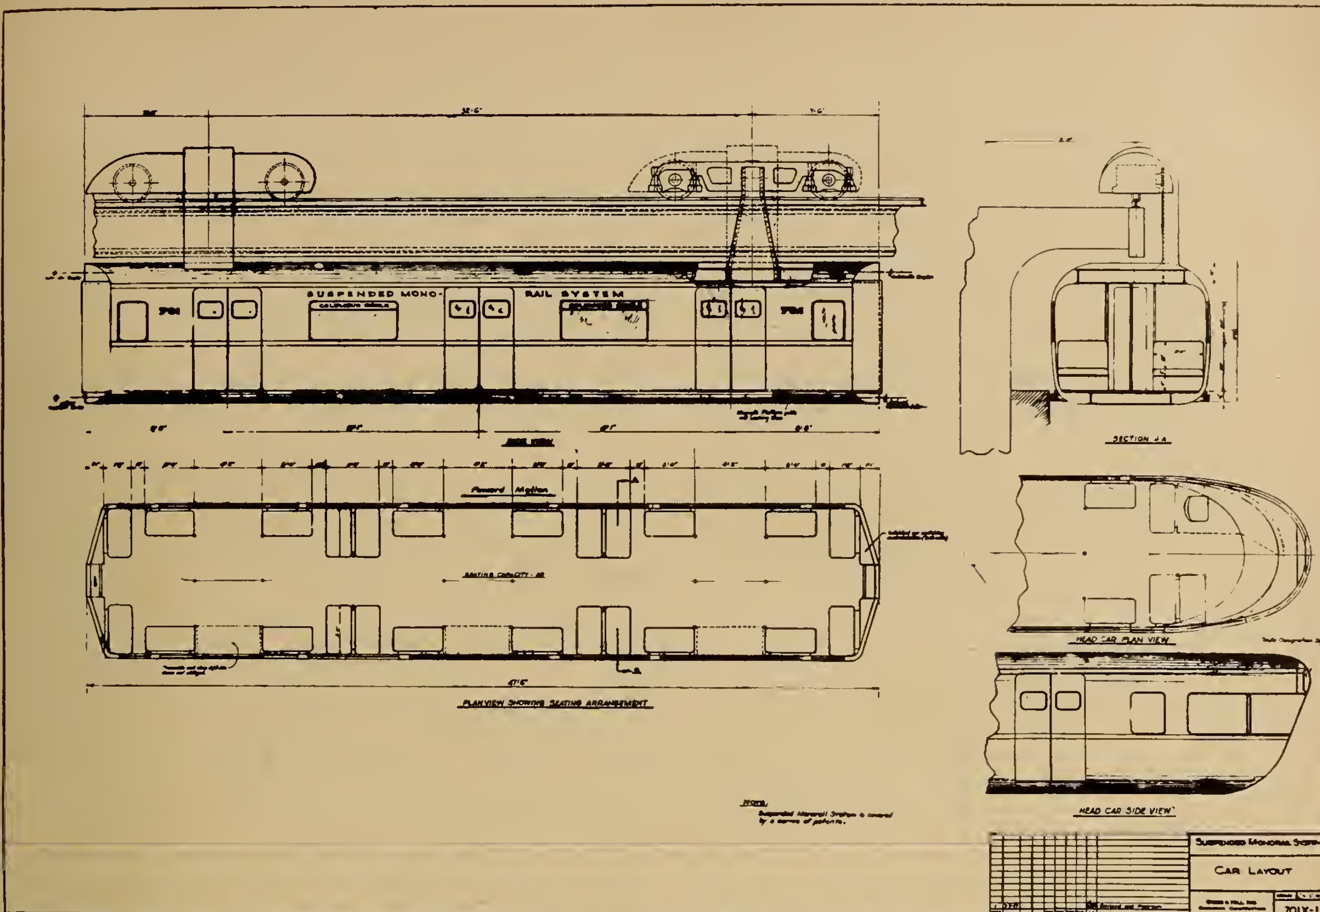
Underground Railway

Technically, the subway presents a good solution. Train operation is possible without offending structures above ground, and little noise-nuisance to abuttors. From the standpoint of noise, air and light, however, the ride cannot be considered attractive.

Economically, the subway is a problem child. The cost of construction is a heavy burden and subterranean operation presents new problems, such as pumping of seepage and flood waters and the handling of possibly panicky crowds on trains in case of accident. It is doubtful whether sufficient potential traffic density exists in any area, including multistoried apartment house areas of New York, to make an entirely self-sustaining subway fare feasible. If the community provides the required structure, there remains the problem of how this burden should be distributed, that is, generally, or to abutting property owners presumably benefiting, or any number of alternatives. Unfortunately, in the last analysis someone must pay heavily, but this problem is political rather than technical. It is practically certain that few, if any, moderate-sized cities can afford the expensive luxury of a subway.

Suspended Monorail

The Suspended Monorail System of Rapid Transit has been offered as a possible solution to many of the more bedeviling problems just outlined. It provides true rapid transit train operation free of competitive traffic interference, and as normally used, an attractive open-air ride, a minimum of overhead structure, and at a cost substantially less than subway construction. Being a mass transportation tool obtainable at reasonable cost, it can provide practical arterial transportation from outlying districts to and through the congested central area of a city, so avoiding the need for that decentralization of business born of desper-



Monorail car layout. Reproduced from a drawing prepared by Gibbs and Hill, Inc.

ation. It is fast enough to provide cross-city rides within reasonable elapsed time.

The Monorail, in common with subways and elevated systems, provides rapid mass transportation away from areas of concentration, thus reducing congestion incident to the requirements of existing large business centers. In this way such a system benefits other traffic movement, as well as providing a quicker journey. An incidental, but important, advantage is the absence of any snow-removal problem. This is equally true of a subway, but not of any form of surface line.

The Monorail is also versatile in that, when desired, it can be operated underground. Therefore, a precipitous hill or a location which justifies such construction presents no impossible problem. Except for platform level the underground construction would be very little different from that of any subway.

Monorail Prototype

In its fundamental form the Suspended Monorail type of operation is not new and untried. Trains of two to five cars, each suspended from two, two-wheeled trucks running on a single overhead rail, have been in operation on the Barmen-Elberfeld-Vohwinkel Railway in Germany since 1901. Over the first 33 years of operation this installation carried an average of 13 or 14 million passengers per year on its 8¼ mile route. The overhead rails are carried by trusses, in turn supported by A-shaped or arch-type bents. An interesting feature of these supports is the fact that for a part of the route the structures span the Wupper River, so utilizing a right of way not otherwise available for wheeled traffic.

Considering that this installation was designed nearly 50 years ago, the maximum regular operating speed of 25 miles per hour is creditable. It was the original conception of the designer, later proven by experience, that safety of operation and possibly passenger comfort would be improved by leaving the cars free to swing sideways and thus assume a position of equilibrium on curves, which are numerous and severe on the route.

It is difficult to say why, with such a successful prototype, the principle has not been seized upon sooner. Probably this is due to the natural human tendency to progress one's own ideas first, and because, until recently, the necessity of obtaining true rapid transit off the street has not been sufficiently pressing.

Modern Suspended Monorail

The modern conception of Suspended Monorail has progressed considerably without the loss of any of the fundamental advantages. Many improvements have been adopted from progress in structure and equipment designs of analogous systems, for example, from the PCC car.

The running rail is supported by a simple box girder of sufficient strength to obviate the necessity of cross bracing between the two rail supports of a double track line. The supporting structure may be an arch-type bent as formerly, or where more suited to the conditions, a single column with suitable cantilever brackets. Thus, any semblance to a floor above the street has been entirely removed.

The car body and electrical equipment are a logical adaptation of the PCC car development. Modern high-strength, light-weight materials are used to the fullest extent found to be economical. All cars are equipped with four modern, high-speed motors, operated in multiple from a single control point for each train. Motorizing all four axles per car not only permits the use of smaller motors, but makes the entire weight available for rapid acceleration and braking rates within conservative values of adhesion. Balancing speeds on level tangent track as high as 50 miles per hour, and corresponding higher maximum safe speeds, are feasible.

Because the center of gravity of the car is well below the point of support, any transverse oscillations tend to dampen out, although on curves outward swinging of the car as a unit is allowed nearly to a position of equilibrium between gravitational and centrifugal forces. This feature increases passenger comfort.

Structures

The supporting structures are susceptible to a variety of treatment, but extremes of decorative treatment are not necessary because the design has been reduced to simple and clean lines. To avoid endless possibilities, only a simple type will be described.

The structural design is based upon an unbalanced loading, consisting of a train of 15-ton cars, each carrying a passenger load of 200 people, amounting to an additional 15 tons, or a total of 30 tons per loaded car, plus an impact of 30 per cent of the total. The horizontal loadings consist of wind load of 30 pounds per square foot on both structures and cars and of the centrifugal force, on a nominal 100-foot radius curve, produced by a constant speed around the curve of 20 miles per hour. Longitudinally the loading corresponds to the force produced on tangent track by an acceleration of 3.4 miles per hour per second, or braking of 3.5 miles per hour per second.

The 100-foot radius curve structure is also designed for the tangential force of acceleration or deceleration at 2.5 miles per hour per second, from a speed of 15 miles per hour combined with the corresponding centrifugal force.

A total temperature range of 140 deg. F is taken in determining the expansion. The basic stress allowed is 20,000 pounds per square inch, increased to 25,000 under maximum wind conditions and to 30,000 pounds per square inch for the combination of maximum wind and greatest expansion.

Except on extremely narrow streets, supporting structures are simple columns approximately 36 inches in the cross-street dimension, by 20 inches; or alternatively of octagonal section 36 inches across flats. The first, or rectangular, columns are suitable for spans of 60 feet; while the octagonal type permits spans up to 78 feet. The rectangular column supports a transverse bracket 20 inches wide by 30 inches deep. For the longer spans, possible with the octagonal columns, the simple transverse bracket is replaced by a spider, having four arms 15 inches wide and 30 inches deep, set at 45 degrees to the street center line. Irrespective of the type of structure, the rail is carried on a sound and vibration-dampening member supported by a 15¾-inch box girder 36 inches deep. The power rail, frequently by force of habit called the "third" rail, is carried upon bracket-supported insulators on the outside of the box girder between the latter and the car hanger arm, from the truck to the car.

Because columns, brackets and girders are made of simple plates and structural shapes, they lend themselves to automatic shop welding. This procedure permits extensive prefabrication which combined with a standard foundation cap results in rapid field erection. In fact, the time of construction is determined largely by the number of foundations constructed simultaneously, as the superstructure erection is simple. Foundations, structures and stations of the Suspended Monorail involve less temporary or permanent interference with existing construction than either a subway or conventional elevated system. They also require less elapsed time for construction.

Truck Assembly

Each of the two trucks supporting a car has two 25-inch wheels and a wheelbase of nine feet, two inches. In addition to the wheel, the short axle somewhat over two feet long carries a brake drum and the driving gear and gear box for one motor. The axle runs in two roller bearings carried by a subframe, which in turn is restrained by pedestal guides and a driving link, and supports the main truck frame through springs. The principle of the truck is similar to the PCC car truck, but adapted to two wheels instead of four.

The wheelbase, being somewhat longer than that of modern street car trucks, warrants some explanation. It permits staggered tandem mounting of the motors with two drive shafts, one passing on either side of the center pin. It provides a long guiding arm leading to low flange pressures and good tracking characteristics. Another important result is the wide distribution of the car weight over the supporting structure.

The motors are of conventional high-speed design driving through shafts and high-ratio, right-angle reduction gears on the driving axles. They are attached to the truck main frame by bolts and hook-shaped safety brackets. All motor weight is thus springborne. Their rating is, of course, dependent upon service requirements, more than ample space being provided in the truck for the maximum probable rating.

The truck is designed to accommodate conventional clasp-type air brakes operating on a special brake drum, with an individual brake cylinder for each axle and mounted on the truck frame. There is no reason, however, why all-electric braking could not be adopted as on the latest projected PCC cars, eliminating compressed air entirely from the car.

One of the important advantages of Monorail equipment is the accessibility of apparatus for maintenance and inspection work. By providing a working platform in the shop, slightly below track level, work on all component parts of the truck can be performed without interference from the car body. Motors are extremely accessible for inspection and maintenance, or may be removed from the truck directly by a low-capacity hoist, without the use of a drop pit moving the truck from under the car body, as required for the street or subway car. Brakes, brake rigging, and drives may be inspected and the latter lubricated without interference from the car body or the danger of getting "an eyeful of dirt." These features not only lead to substantially reduced maintenance costs, but result in the performance of better maintenance work.

The supporting member between the truck center pin and the car body is one of the unusual parts of the equipment. First, by means of a vertical center pin, it provides for rotation, in a horizontal plane, of the truck relative to the car body, thus accommodating horizontal curves. Second, it also permits similar rotation of the truck in a vertical plane to pass through vertical curves of the track. This is accomplished on a cylindrical trunion rather than by a rocking center bearing. Having only one running rail, there is no cross-track rotation for which provision must be made.

The chances of truck derailment are slight, due to the easy guiding characteristics of the truck, and to the absence of an overturning moment, while the tendency of a flange to mount the rail on a curve is also reduced. Despite all this, the car hanger arm is carried over the rail and forms a safety hook designed to catch on the rail in case derailment should occur.

The car hanger arm and truck frame also support a hood over the truck, which serves the dual purpose of sound-deadening and protection of the motors from the weather. In the latter respect, the motors are pampered compared to street car motors which are exposed to wheel wash, high water over the tracks, and the mixture of dirt and water carried into the air under the body by the motion of the street car.

Car Design

The car body of all except the leading unit, to which a streamline nose is added, is approximately 48 feet long, and nine feet six inches wide. The exact weight, although dependent upon the materials used, e.g., stainless steel or aluminum, is approximately 15,000 pounds. The "inverted" construction presents an advantage which might be overlooked. The body is essentially a hollow, nearly tubular beam, suspended at two points on the top. Between these points the relatively heavy backbone provided to absorb buffing stresses from couplers above the end doors, is in compression. The lower side, being in tension, can be relatively light. In the conventional car supported from below, either the main sill is made strong enough to take the entire bending, or if the roof is incorporated into the truss, it must be specially constructed to withstand forces of compression.

The seating arrangement provides for 48 seated passengers per car, 12 riding forward, 12 backward and 24 on longitudinal seats, together with a maximum of standing room. It will be noted there is no aisle space subject to congestion between any seat and the nearest door. Three large, double doors are provided in each side to facilitate the rapid loading and unloading essential to high-speed rapid transit. Communicating doors are provided in the ends of the cars for the small or unusual amount of passing from one car to the next.

The center of gravity of the car body and its supporting members is directly below the center line of the rail. Due to this fact, the car tends to restore itself to its normal position if caused to swing for any reason, cross wind or passage around a curve. A theoretical sideways swing of approximately 20 degrees is permitted by the structure and car body dimensions, which is considered ample for permissible operating speeds on curves, even with cross wind conditions. Where greater swing might be produced by conditions of application, a gyroscopic stabilizer can easily be installed in each car to restrain the swing.

In approaching the platform at a station, the cars must be held in the vertical position. For this purpose, skates are provided on the side at each end of a car which, acting against the forward edge of the platform, supply the necessary guiding. In addition, these skates are electrically energized prior to opening of the car doors, magnetically locking the car against the platform to eliminate swinging of the car if the movement of passengers should otherwise cause such a motion of the car.

Heating and ventilating are combined into a common system. Motor-driven blowers and duct systems, arranged for variable control of the proportion of recirculation and introduction of outside air, deliver all the air required for ventilating the car, suitably heated when the season requires. The air is delivered through outlets below the seats, supplied by under-floor ducts. As window opening is not required for ventilation, each window consists of a single fixed pane of shatter-proof glass.

To keep all air piping and cable runs as short as possible, the air compressor and tanks together with the electrical control equipment are mounted between the roof and the ceiling of the car. Standard PCC car type electrical control is applicable with little or no modification.

A European application. ***Left*—Suspended train going up the main street of Vohwinkel. *Right*—Another section of the same route over the Wupper River in Barmen, Germany**

Track Switching

Due to the presence of the car hanger arm between the trucks and car body, route-switching of trains differs somewhat from conventional railroad practice. The switch for a right hand turn-off consists of a rotating block instead of a switch point. This power-operated block can be locked in either of two positions, the first providing a continuous, straight-through, running rail and space between the tangent and turn-off girders to permit passage of the car hanger arms; while the second position establishes a continuous running rail on the turn-out.

While a somewhat similar rotating block was considered, in place of conventional crossing special-work, when turning left across the opposing track, the fundamental undesirability of grade crossings in rapid transit operation, led to the adoption of grade separation by means of a right hand turn-off and an over or underpass for such movement.

Signal System and Station Arrangement

Block signals are provided, having the proper number of aspects for the operating speeds, similar to those in the most modern subway work.

The stations consist of a combined enclosed waiting room and loading platform, thereby providing much greater passenger comfort than older type elevated station platforms, especially in severe climates. Sliding doors corresponding in size and location to the train doors remain closed until the train is stopped and ready to receive or discharge passengers. Thus, no hazard exists of a passenger falling off a platform.

Because the car floor is less than one foot above the necessary traffic clearance line, the height of the station platform is correspondingly low. Numerous stairways for descent directly to the street level are located along the length of the station. Opposing upward-moving escalators converge at the change booth and turnstile area on a mezzanine level in the center of the station, from which escalators give access to the main platform. Two stations can be located on the outsides of the route or, by spreading the normal spacing between opposing trains, one platform located between the two trains can serve both directions.

At the crossing of two Suspended Monorail routes convenient transfer stations are required. The lower level platform arrangement is much the same as the regular station, with suitably increased capacity to handle passengers for two lines. For part of its length the lower level platform is covered by a mezzanine with numerous access stairways from the lower level platform, provided with escalators, if necessary. This mezzanine can be somewhat wider than the loading level below it, to provide for the concentration of traffic at its center where up and down stairs give access to the crossing upper level platform. The upper level platform can be provided with escalators from the street and with its own change booth and turnstile arrangement if it is desirable to provide for larger crowds than can be handled in common with the turnstiles of the lower level. In any case, direct descent stairs or escalators to the street level are provided.

At points of interchange with other forms of transportation, for example, tramcar or bus feeder routes, the stations are located to fully coordinate the two operations. In general, the surface transportation discharges passengers near the foot of station stairways, while the station platforms provide convenient waiting-room space.

Summary

By virtue of its lower cost, compared with other means of providing true rapid transit, the Suspended Monorail offers the possibility of obtaining needed facilities within the limits of available financing. Such Suspended Monorail facilities can be more rapidly constructed than other similar systems. Although only one previous installation has been made, the technical basis of the construction is sound. The safety record of the one operating installation has been excellent. There have been no accidents on the line, and the few which have occurred at stations would have been effectively prevented by the present improved design. Scheduled speeds of operation are as high as any available rapid transit rendering the same service. Both from the standpoint of patrons and occupants of adjacent property, Suspended Monorail operation is quieter than other systems, and its appearance can be made attractive.

As there are no fundamental technical objections to Suspended Monorail, its consideration as a solution of transit problems is proper. Attention is directed to the fact that the scope of this description has been entirely general. This reflects no uncertainty regarding any particular application, but simply the fact that any specific use must be studied individually, and that details of design, based upon accepted underlying principles, must be developed for each application.

Passenger Service Requirements *for* North Atlantic Operations

by

J. W. Schwab

Trans-Canada Air Lines, Dorval, Que.

A paper presented at the Semi-annual Meeting of the American Society of Mechanical Engineers, at Chicago, Ill., June 15-19, 1947

Pointing out that trans-ocean airline passengers now expect comfort and service comparable with other means of travel, and will choose the airline that gives it, the author deals successively with the questions of seating, air conditioning, noise, lighting, styling, wash rooms, entertainment, catering, safety devices and selection of cabin attendants, based on the experience with trans-Atlantic operations of Trans-Canada Air Lines.

There are two schools of thought existing today among trans-Atlantic passenger air carriers: to carry the maximum number of passengers with the necessary limited passenger service, or to carry a reduced passenger load in luxury airliners. During the past year trans-ocean transportation has been at a premium, so that maximum loads could be obtained under almost any conditions. However, air-minded travellers are already beginning to choose the airline that will give them *service*. Flying has now lost its glamour, and passengers will expect comfort and service comparable to other modes of transportation, and rightly so. If these amenities can be provided with the addition of speed, air travel will be on a solid footing.

Service to the passenger commences the moment a prospective customer walks into the ticket office, and does not finish until he is delivered to his destination. Many departments and personnel are involved in providing this service. This paper, however, will deal with the service requirements aboard the aircraft itself.

Seating and Passenger Comfort

Obviously the most important item in long haul transportation, and the one the passenger comes into the most direct contact with, is his seat. At the present time no airline chair manufacturer has in our opinion developed a satisfactory chair. To properly tackle this problem it should start back àt the aircraft design stage and be developed with one view in mind; passenger comfort. Extensive research has been conducted, and figures are available on the mean seating dimensions necessary for adequate chair support. This work has been well covered by the SAE, and by Professor Ross A. McFarland in his book "Human Factors in Air Transport Design."

In laying out a passenger carrying aircraft, the designer should calculate his interior fuselage diameter by allowing 22 inches per chair plus a three inch arm rest for each chair, and at least an 18 inch aisle space. This would result in a 130 inch diameter machine for a twin double seating arrangement, which has been found to be the most satisfactory.

The ideal chair must be as comfortable in the reclined position as it is in the upright position. To prevent the occupant's clothes from riding up when reclining, the back should pivot about the hips. The front of the seat should drop simultaneously, and provision should be made to raise the feet.

The upholstery chosen must be readily washable with soap and water during flight and be quickly removable in the event of air sickness. The material should not soil, should be porous enough to allow breathing, yet sturdy to withstand hard wear. An important contribution to chair comfort is the pillow, which should be filled with a soft down and be slightly concave to support the head in rest. The arm rests must be free from vibration. This may be accomplished by mounting them with shock rubber. Chairs must be quickly removable units, light weight and strong enough to support a weight of 1,000 pounds. The carpets and mats must be cut in small sections, so that they are quickly removable in the event of an airsick passenger.

Air Conditioning

Much may be done for these unfortunate victims by proper ventilation. The most beneficial results may be achieved by a direct flow of fresh air on the passenger's face. This should be feasible in the upright or reclined position, and available in either a normal or pressurized aircraft. Ventilation ducts must be designed so that they cannot create a draught on the back of a passenger's neck. There must be no recirculation of air in either the normal or pressurized fuselage.

Present day machines with their recirculating air systems develop an objectionable odor which activates air sickness. A properly controlled temperature gradient, both fore and aft and vertical, is necessary and should not permit a variation of more than three or four degrees. However, present day non-pressurized aircraft are difficult to control, due to the natural circulation of air from aft forward. The temperature gradient in a pressurized aircraft will not be disturbed by air leaks, and thus a planned gradient is more feasible. Better sealing methods will be necessary however, to obtain ideal conditions, as the existing rubber seals on doors take a permanent set at low temperatures, permitting air leaks.

To maintain a normal room temperature of from 65 to 70 degrees, heat should be dissipated by both convection and radiant heat from the cabin walls. Wall heating is a necessity in order to prevent heat conduction from the passenger's arm and shoulder, resulting in stiffness or rheumatic pains. Cabin heat may be obtained from either unit heaters or heat exchangers. At the present time electrical heating is not practical, due to the other large loads on the electrical system. In a pressurized aircraft heat is generated by the compression of air and skin friction to such an extent that cabin cooling during the summer months is more of a problem than cabin heat.

Cabin Pressurization

Cabin pressurization has not yet been developed to a satisfactory degree, and will not be until sea level conditions can be maintained at altitudes up to 30,000 feet. Until such time aircraft will be required to carry portable oxygen equipment to supplement this system. All passenger-carrying airliners should be pressurized, both for long and short haul work. They should be able to quickly climb above the weather, reach their destination in smooth air and descend quickly through the rough strata. This rapid climb and descent will only be possible when sea level pressurization has been realized. This type of operation will reduce passenger sickness and discomfort to a minimum.

Because of the small cubic volume of aircraft per passenger, humidification has not been a problem to date. However, with the advent of jet propelled aircraft flying at high altitudes, it will be necessary to supplement the cabin moisture content. This may be accomplished by storing an adequate water supply aboard before take-off, which will involve a costly weight penalty, or by the installation of an exhaust water recovery system. Results obtained by the Consolidated Vultee Aircraft Corporation have proven that a condensing unit is definitely practical when employed on long range flights.

Noise and Vibration

The noise level in all existing aircraft is higher than that desirable for ideal passenger comfort, and the problem is becoming more and more difficult as the power of engines increase. This feature of flight has been under study for some years, the first systematic studies in the United States having been made by Bassett and Zand of the Sperry Gyroscope Company. During the war the Office of Scientific Research and Develoment produced sound level standards for military aircraft, as developed by the Electro-Acoustic Laboratory at Harvard University. An analysis of the noise sources in aircraft has shown that the propeller, exhaust, engine, aero-dynamic and miscellaneous noises are the main contributing factors to cabin noise.

Although great strides have already been made by the industry in noise reduction, we feel that the manufacturer and designer have not truly appreciated this problem. Today we are busy trying to suppress cabin noise caused by existing installations. This problem should be tackled by investigating the trouble at the source. It must be remembered that sounds increase in logarithmic progression, so that to effect an appreciable reduction there must be an equivalent suppression of all contributing factors. Another very important contribution to noise suppression is the sound-proofing installed around the cabin walls. In recent years this has become very effective by the use of fibre glass or " Kapok " sheets, which also act as a heat insulation.

The Consolidated Vultee Company have carried out extensive research along these lines, and have produced some very satisfactory results. By proper sound shielding, cabin noise reduction up to 20 db. may be realized. A concentrated effort should be made to reduce the noise level at voice frequency, having a range of from 12,000 to 24,000 cps. Noise accentuates the feeling of vibration, just as vibration accentuates the noise level.

An all out effort should be made by aircraft designers to reduce the uncomfortable feature of vibration. This may be best accomplished by dynamically balancing all rotating parts of the power plants. Propellers should be statically, dynamically and aerodynamically balanced. All features of the air frame, and accessory equipment attached thereto, should be flight-tested for possible vibration. The engines should be located as far from the fuselage as is aerodynamically possible, and should be rubber shock-mounted. All interior fittings must be fastened securely to the frame, bulkheads and/or floors. An absorption mat of rubber or equivalent should cover all parts of the floor that may come in contact with the passengers, feet. Vibrations may be very easily felt through the soles of thin shoes. Not until recriprocating engines and propellers have been superseded with turbo jets, may we expect a truly satisfactory solution to this problem. However, much may be accomplished if adequate attention is given to this subject.

Lighting Arrangements

Cabin lighting is another very important feature in passenger service requirements. We have found that the most desirable results may be obtained by the installation of indirect dome lights. A rheostat is installed in the circuit which permits the Steward to dim the lights when the majority of passengers wish to sleep. Individual lights must be provided for night reading.

The reading light should be so directed that it illuminates a passenger's reading material either in the upright or reclined position. This light must not interfere with the person sitting alongside, forward or behind. This might possibly be accomplished by a light installed in the seat back, or a narrow beam light from the baggage rack.

Styling and Cabin Arrangements

The subject of cabin styling and cabin arrangement has not yet been developed to a satisfactory measure. Not enough attention has been paid to color dynamics in choosing the materials for cabin interiors in long range aircraft. By proper choice of colors both claustrophobia and fatigue can be reduced. New plastic materials, both of the imitation cloth and leather variety, are proving very satisfactory. This material has good wearing characteristics, is easy to clean and is light in weight. It has been found that dark colors below the window level are the most practical as they do not show heel marks and other defacing action as readily as do the lighter colors.

There are two schools of thought most prevalent on the subject of cabin arrangement. The usual method of a continual seating arrangement is the most generally accepted at the present time. However, this layout tends to lead to monotony and tunnelphobia on long flights. We have found it more advisable to break the compartment up into two sections, the galley and coat room being placed amidships. The aft section has a club seating arrangement with removable tables for card playing, food service, etc. It is advisable to furnish the club area in different colored materials to provide added variety. Passengers find it a pleasant break on long trans-Atlantic flights to be able to walk to a different section of the aircraft for a drink or a game of cards.

At the present rate of traffic demands, this type of layout may not be considered necessary. From a passenger service standpoint, however, this feature of cabin layout is most desirable, and we feel that this arrangement will be a necessity in future long range aircraft. Baggage racks can be improved in many of the present day machines. Care must be taken to insure that the passenger sitting by the window can stand up without hitting his head on the baggage rack.

There is also a difference of opinion with regard to the desirability of sleeping accommodation for long overnight flights. It is questionable if travellers will be willing to pay the increased premium for a berth, as it will be necessary to make up the difference of almost a 50 per cent passenger load reduction. With the event of jets and the resulting increase in speed it is doubtful if trans-Atlantic flights will be of sufficient duration to warrant berths. There may be a period between the present day high traffic demands and the widespread use of jet aircraft, in which it would appear that berths are desirable.

Backward Seating

It is anticipated that in future aircraft a backward seating arrangement will be used. This has the double advantage of affording passengers a better view and an added protection in the event of a forced landing. Contrary to expectations, the results of tests conducted by both the R.A.F. and A.A.F. Transport Commands, showed that passengers do not object to sitting backwards. This is no doubt due to the fact that nothing is going past the windows except at take-off and landing.

With the spine and head supported throughout its length, the body can withstand terrific forces of deceleration. It is possible to bring a body from 200 m.p.h. to a full stop in nine feet without injury when so seated. This seating arrangement is impractical in most existing aircraft, due to the location of the windows. The next best arrangement would therefore be a chair which would fail on one side permitting rotation in the event of an accident. The angular rotation thus employed would absorb a large percentage of the forward deceleration.

Lavatory Facilities

The lavatory facilities, as we have known them in the past, have been strictly of the " out house " variety. However this feature of air travel is at last showing signs of improvement. It is essential that the toilet should be in a separate room from the wash basin or powder room. The ladies' powder room should be equipped with a full length mirror, a cosmetic table with a Kleenex dispenser handy, and with a baby-changing table. The men's washroom should be equipped for shaving.

A continual problem in North Atlantic operations is that of preventing wash water basin drains from freezing. For approximately ten months of the year our aircraft are flying in below-freezing temperatures, often well below zero. All operators on this route are experiencing the same difficulty. Some have solved the problem by installing tanks to retain the waste water, others are providing no water at all. We are now experimenting with polythene plastic tubing in the drainage system, in lieu of aluminum tubing. During the last month of operations, aluminum tubing coated with anti-freeze grease has frozen up, while the plastic tube has remained free. An added feature is that this tubing will expand and then return to its normal diameter if freezing does take place, whereas aluminum tubing will fracture.

Entertainment

Much remains to be done in the field of entertainment. Magazines and newspapers are of course an essential item. Individual music, either canned or radio, should be supplied by a head rest speaker. A control selection installed in the chair wing will enable the traveller to make his own selection. Moving pictures are practical in the long seating arrangement, but we feel that the benefits are controversial, as some passengers do not like pictures. Moreover they may interfere with passengers who wish to sleep or read. If motion pictures are shown they will have to be the best obtainable, in order to be appreciated by the majority of travellers.

Playing cards is an enjoyable pastime and a club seating arrangement with table, cards and score pads should be provided. Writing tables at individual seats are also recommended, to eliminate the " balance-on-the-knee-and-try-to-write " variety. Most trans-Atlantic air lines are serving alcoholic drinks, either free or at a small charge. We have found from our limited experience that cocktails are not popular, and are planning to serve high ball drinks only. The weight of mixes may be appreciatedly reduced by boarding soft drink syrups and preparing them as required.

Catering

Catering has become a major item in air line service. Consideration of cabin layout in the design stage must involve a decision as to the type of food service to be provided. The duration of flying time, that is, the route for which the aircraft is being designed, will determine to a certain extent the type of food service. For a trans-Atlantic flight, air line engineers must provide a galley sufficiently large to stow two main meals and snacks.

There are many types of food service in use today, some providing hot meals, while others of short flight duration provide merely a cold salad menu. For long flights over cold areas of the world a hot meal service is most desirable. Three types of hot meal services now in use over the North Atlantic route are as follows: the " In Flight Cooking System "; the " Hot Casserole System "; and the " Pre-cooked Frozen Meal System ". There are advantages and disadvantages to each of these systems which will be reviewed briefly.

The " In flight cooking " system consists of fresh or partially cooked ingredients, boarded and prepared for service during flight. The taste, texture and appearance of any meal is at its best if served immediately after cooking. Another advantage is that with certain basic ingredients available, various meal combinations can be achieved and prepared according to the individual preferences of a passenger. However, this type of service presents certain disadvantages, and the weight and volume of galley equipment are considerable. Such a service requires from two to four hours to prepare and serve, which makes it almost impossible for all but extremely long flights. The employment of such a meal service also requires that the steward in charge of meal preparation be highly skilled in the culinary arts, which would be reflected in high salaries and would directly affect operating and food costs.

The casserole system is designed to provide precooked meals maintained hot until serving. The heat is retained in a thermos designed to hold a number of nested casseroles, each containing one hot meal, or the casseroles may be kept hot in an insulated electrically heated box which is maintained at a constant temperature. This type of service provides a hot meal at a moment's notice, is easily transported to the aircraft and stowed within the galley structure. However, there is a very definite loss factor involved in this type of service. Meals are cooked prior to departure for a predetermined number of passengers. If the flight should be delayed at the last moment for three or four hours the meals must be replaced with fresh ones. Also, if passengers do not board as expected the meal is wasted. Unless these meals are served a few hours after departure they become most unattractive.

Advantages of Frozen Meal

The third and most recent type of food service, frozen foods, are in the process of replacing the older types of food systems in the airlines. The Maxson Food Systems is one of the pioneers in frozen food for airline use. During the war this company supplied many types of Army and Navy aircraft with pre-cooked flash-frozen meals. Their meals are made up of a potato, vegetable and meat dish, pre-cooked and then quickly frozen into individual portions. The meal is then maintained at 10 below zero degrees Fahrenheit until ready for service. When required, the frozen food pack is placed in an electrically heated oven in the aircraft galley, and when sufficiently hot is served with the other meal ingredients. A large variety of meals may thus be provided, and high quality food is insured. With a 12 plate oven 40 meals an hour may be prepared and served.

The most attractive feature of this food system to the airline operator is the saving that may be effected by retaining meals in the frozen state unless actually required. Any meals left over from a flight may be placed in cold storage and used on subsequent flights. This feature alone results in a saving of many thousands of dollars a year for the airlines.

Safety Devices

Just as all passenger-carrying ships ars required to carry life boats and hold drills, so trans-atlantic aircraft are required to carry emergency equipment and instruct their passengers in its use. Three 15 man life rafts are located in the passenger section of our aircraft. Two in the baggage rack immediately above the window exits, and one in a stowage by the main entrance door. These are of twin tube nylon construction; round type raft, equipped with ditching and survival equipment.

All this equipment is included in the raft package with the exception of one AN/CRT-3 "Gibson Girl" in the rear stowage. At each passenger station is a nylon pneumatic inflation life jacket, enclosed in an easily removable plastic stowage bag. A booklet describing the exits, life jackets, rafts, and action to be taken in the event of an emergency, is available at each seat. Soon after departure the purser steward makes a tour of the aircraft, demonstrating the life jacket and providing such other information as may be deemed necessary.

To ensure the positive notification of all passengers and cabin crew that a ditching is imminent, an emergency warning bell has been installed in the cabin which can be easily activated from the Captain's seat. Flight crews receive regular emergency instructions and carry out monthly evacuation drills.

Cabin Attendants

A most important aspect of passenger service requirements is the flight crew personnel assigned to the passengers, i.e. the cabin attendants. We have found that the most satisfactory service may be obtained from a steward stationed in the galley and bar, and a stewardess in the cabin. All cabin attendants have had years of flying training, either on domestic or trans-Atlantic routes. They are picked from our domestic operations for their tact and efficiency. This has been found advisable due to the number of "first flighters" coming from the old country and the added nervous tension of "flying the Atlantic". During flight the attendants may accomplish considerable "paper work" to speed the passengers' egress through customs. Weekly meetings are held between the stewards and stewardesses and the engineering department, to iron out operational weaknesses in the passenger service equipment.

An attempt has here been made to review the most important aspects of passenger service from a design and operational standpoint. It has been pointed out that of the eleven requirements discussed, few present day aircraft come up to the ideal standards. However, air line companies are beginning to realize the importance of pleasing the public with comfort and service, as well as with a fast and on-schedule operation. Today the reconverted military machines, such as the DC3, have become obsolete, and with the advent of new aircraft specifically designed as luxury passenger carriers we may anticipate great progress towards a truly comfortable and well equipped cabin.

By train, plane and motor — engineers will be going to....

BANFF *for the*

SIXTY-SECOND ANNUAL MEETING

JUNE 2-5, 1948

***at the* BANFF SPRINGS HOTEL**

Why not talk to other engineers about getting together?

A Message
from
The President

THE COMING YEAR will impose new conditions upon Canada and upon Canadian engineers. The restriction on the importation of many articles, which has become necessary because of the serious economic situation, will force us either to do without such articles or to produce them ourselves. Herein lies both a challenge and an opportunity to Canadian industry and to Canadian engineers. Let us meet the challenge and make the most of the opportunity, so that these present difficulties may make Canada stronger and more self-sustaining than she is to-day.

During the past twelve months the standing of our profession, in the eyes of our fellow citizens, has advanced; though not so fast as we could wish. There are still too many people who cannot see in the engineer anything more than a technician, and who are unwilling to concede him the ability to administer, and to direct, as well as to design. Too many of our industrialists, our governments and our other public bodies do not place in Canadian engineers the confidence to which their achievements entitle them. By diligently seeking his own improvement, and by supporting actively those organizations through which he is represented to the general public, the engineer will be making a contribution which should do much to ensure that his profession will, eventually, be accorded the full and complete recognition which its responsibilities and accomplishments deserve.

The Institute continues to show a steady growth, but there are still many engineers who are not members. Our goal should be to have every engineer a member of the Institute and every member of the Institute also a member of his own provincial association. When this has been achieved, the profession will truly be able to speak with a single authoritative voice which will command the fullest respect right up to the national and even the international level.

To all our members, wherever they may be, I wish a happy and a useful year in 1948.

L. F. Grant.

President

—From Month To Month—

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

A New and Useful Publication

A review of current world literature in applied mechanics will be inaugurated in January as a monthly to be known as *Applied Mechanics Reviews*.

It will be offered on a subscription basis and will contain comprehensive reviews of new papers as they appear in 500 of the world's scientific and engineering journals.

It is a non-profit co-operative project. Seven national scientific and professional organizations in the United States and some outside will guide the editorial policy through representation on an Advisory Board. The Engineering Institute of Canada is one of the co-operative societies outside of the United States. The Institution of Mechanical Engineers (England) is another.

The American Society of Mechanical Engineers is the publisher. Dr. L. H. Donnell of the Illinois Institute of Technology wll be the editor and Dr. Stephen Timoshenko will be chairman of the Editorial Associates.

The complete list of societies co-operating with the A.S.M.E. is as follows: The Office of Naval Research, the American Institute of Physics, the American Society of Civil Engineers, the Institute of Aeronautical Sciences, the American Mathematical Society, the Society for Experimental Stress Analysis, the Institution of Mechanical Engineers, and The Engineering Institute of Canada.

Subscription rates are $12.50 per year—with a special price of $9.00 per year to members of the co-operating societies. Orders should be sent direct to The American Society of Mechanical Engineers, 29 W. 39th St., New York 18, N.Y.

Letter from the General Secretary

Dear Friends

Admittedly it is an unusual procedure for an editor to write letters to his own publication but in this instance it is hoped he may be forgiven. I know of no other practical method of reaching the great host of officers and members who have been so kind and thoughtful during my long illness. Each communication that I have received deserves a personal reply, and it would be my greatest pleasure to so acknowledge it, but my own reserves of strength do not yet permit the effort, nor are the stenographic facilities available.

In my ten years of service with the Institute I thought I had learned all there was to know about it, but my recent experience has shown me that I am totally ignorant of what well may be one of its greatest characteristic—humaneness. The interest of so many people from so many places, their wishes to be of help, their deeds of kindness offered and performed, have moved me deeply. I cannot find words to express my appreciation and my gratitude. To each and every one I proffer simply my warmest thanks. Their concern over my affairs was no uncertain factor in my recovery.

May I report that after four months' confinement to home and hospital, I am now able to be back at Headquarters. It will be some time before I have shaken off all signs of the illness, but with the gradual return of my strength and weight, now well under way, I hope to drive out the remaining inconvenient manifestations of a very unpleasant experience.

It is a happy feeling to be back in the office with all the members of the staff who have carried on superbly in my absence, and to see on my desk the familiar signatures of members and officers from all over Canada, who are collectively making the Institute "tick".

May I express the hope that this new year will afford us all further opportunities to work together in the interests of the profession.

Fellowships in School of Mines

Columbia University announces that through the bequest of the late William Campbell, for many years Howe Professor of Metallurgy at Columbia University, several fellowships have been established. They are awarded primarily for graduate study and research in the field of metals.

The stipend of each Campbell Fellowship is fixed at the time of award by recommendation of the Campbell Fellowship Committee and will normally be an amount sufficient to meet the necessary living expenses of the incumbent of the fellowship.

Applications accompanied by certified transcripts of academic records, statements of proposed research projects, proposed fields of graduate studies, and supporting letters of recommendation should be filed with the Secretary of the University before March 1, 1948. Application blanks and announcements will be forwarded to interested persons by the Secretary of the University on request. For further information write to P. B. Bucky, Executive Officer, School of Mines, Columbia University, New York 27, New York.

=The Presidential Tour=

Ajax Division of U. of T.; St. Maurice Valley & Quebec City Branches

Ajax Division

On the 26th of November Colonel Grant with the assistant general secretary visited the Ajax Division of the University of Toronto under the auspices of the Toronto branch and then went directly to the Saint Maurice Valley branch and the Quebec City branch which marked its fortieth anniversary on November 28th and 29th. At Ajax the president surpassed even his own very high standard and his

remarks were received with great enthusiasm by some seven hundred first and second year engineering students.

The meeting had been painstakingly arranged by the executive of the Toronto Junior Section with Harvey Self and Ivan S. Widdifield steering the proceedings to a very satisfactory conclusion. The visitors were entertained at dinner in the staff house and the general meeting was held in the recreation hall

Part of the student audience at Ajax.

adjoining. The aging but no less spectacular film depicting the Tacoma Narrows bridge disaster opened the programme. The speeches which followed were designed to give the students an idea of what they should expect from the profession and its voluntary and licensing organizations, and were undoubtedly highlighted by the president's address. Because of his long and active association with the Institute, President Grant is particularly well qualified to speak of its activities and he has a faculty which we understand is shared by the more popular professors of seeming to know exactly when the moment has arrived to inject a note of humour into his remarks.

Members of other Ontario branches who attended —and participated in the discussions—were Edgar A. Cross, Toronto, E. P. Muntz, Hamilton, H. R. Sills, Peterborough and Professor T. R. Loudon and Dean C. R. Young of the Faculty of Applied Science of the University.

Toronto Branch members at the dinner preceding the Ajax Meeting.

Saint Maurice Valley Branch

From Ajax the president and the assistant general secretary journeyed to the land of power and paper —specifically the meeting of the Saint Maurice Valley branch at Grand'Mère on the evening of November 27th. In passing through Montreal they were joined by Mrs. Grant and Mrs. Laird, Vice-President and Mrs. R. S. Eadie and Councillors R. C. Flitton, C. E. Gelinas, and J. A. Beauchemin with Mrs. Flitton and Mrs. Beauchemin. The party was met in Three Rivers by S. E. Williams, the local manager of the Saint Lawrence Paper Mills Company, J. F. Wickenden of J. F. Wickenden and Company, Three Rivers, and the branch secretary R. E. Kirkpatrick, and proceeded by rail to Grand'Mère. At the Laurentide Inn the branch executive were hosts at an informal luncheon which was highlighted by councillor Viggo Jepsen's recounting of the history of the name Grand'-Mère which was derived from a huge rock in the Saint Maurice River which bears a striking resemblance to an elderly lady—a grandmother. This rock was transported by a very interesting series of oper-

Luncheon at the Laurentide Inn, Grand'Mère, with Councillor C. E. Gelinas and Mrs. Jules A. Beauchemin showing all the accepted indications of enjoyment.

Executive table at luncheon. Councillor Viggo Jepsen, S. E. Williams and Branch Secretary R. E. Kirkpatrick.

ations to a parksite in the centre of the town of Grand'Mère where it now stands as an imposing civic monument.

In the afternoon the visitors and their ladies inspected the plant of the Consolidated Paper Company and were then motored to the Cascade Inn at Shawinigan Falls for the reception which inaugurated the branch meeting. The ladies remained at the inn as guests of the branch ladies committee for dinner and bridge while the members returned to Grand'-Mère for the dinner meeting of the branch. The addresses and discussion which followed were most satisfying and current Institute issues were considered at length.

Above and below—Groups attending the St. Maurice Valley Branch dinner meeting at the Laurentide Inn, Thursday, November 27.

Quebec Branch Celebrates Its Fortieth Anniversary

On Friday, November 28th, following the very delightful meeting of the Valley Branch the president's party drove, through the courtesy of the Consolidated Paper Company, to Three Rivers to proceed to Quebec City for the festivities which had been arranged to mark the fortieth anniversary of the Quebec Branch. The traditions which are a notable heritage of French Canada and which were very much in evidence during the visit to the Valley Branch culminated in Quebec City in an almost overwhelming attention to every last gracious detail. In the stately atmospheres of the Chateau Frontenac, Laval University, The Cercle Universitaire and the caucus rooms of the Parliament Buildings—event

St. Maurice Valley Branch dinner meeting.

succeeded event in an effortless elegance which the visitors will undoubtedly remember for a considerable time to come.

In the afternoon a convocation was held at Laval University for the conferring of the honorary degree of Doctor of Science on Colonel Grant and Mr. Ernest Lavigne, president of the Corporation of Professional Engineers of the Province of Quebec. The proceedings were conducted in French and the addresses of Monseigneur Vandry, Rector of the University, Dr. Grant and Dr. Lavigne are reprinted in full following this account. A particularly fine touch was added to the proceedings by the presentation of a hugh armful of roses to Mrs. Grant as the president assumed the doctorate gown.

The chairman of the Quebec branch and Mrs. P. A. Dupuis entertained at the Cercle Universitaire preceding the grand ball, which took place in the evening at the Chateau Frontenac. During the ball five of the season's debutantes were presented to the President and Mrs. Grant. Dinner was served at midnight in the main dining-room and a feature was the cutting of the huge anniversary cake by Mrs. Grant.

A meeting of Council was held on Saturday, November 29th in one of the caucus chambers of the Legislative buildings with councillors in attendance from points as far distant as Hamilton (J. R. Dunbar) and Moncton (W. C. Macdonald). The minutes of this meeting will be found elsewhere in this issue of the *Journal* and Junior and Student members are requested particularly to read the discussion (page 40) on the question of possible overcrowding of the engineering profession. Those attending the Council meeting were once again guests of Mr. Dupuis at a most delightful luncheon at the Cercle Universitaire and the ladies were entertained at the Quebec Winter Club.

Addresses at Convocation

Monseigneur Ferdinand Vandry, P.A.

Messieurs les Doyens,
Messieurs les Professeurs,
Mesdames et Messieurs,

Le quarantième anniversaire de fondation de la Section québécoise de l'Engineering Institute of Canada est un événement qui méritait d'être signalé. C'est pour marquer ce jubilé que le Conseil national de cet important organisme est venu tenir une réunion à Québec et que le Conseil de la Corporation des Ingénieurs professionnels de la province de Québec a décidé également de tenir dans notre ville ses assises de novembre. Aussi avons-nous été très heureux que ces deux associations si méritantes, qui groupent les ingénieurs les plus renommés de toutes les provinces du Canada, aient accepté de si bonne grâce d'être reçues officiellement à l'Université Laval au cours de leur séjour à Québec. J'ai donc l'extrême plaisir de souhaiter à tous ces hôtes distingués la plus cordiale bienvenue.

Mesdames et Messieurs, l'Institut canadien des Ingénieurs et la Corporation des Ingénieurs professionnels de Québec accomplissent dans notre pays une œuvre de haute valeur scientifique et d'une grande portée sociale et nationale. Les tâches de l'ingénieur, en effet, sont aussi importantes que variées; elles revêtent même un caractère de primordiale importance dans la solution des problèmes qui intéressent l'économie de la nation. Si nos industries de guerre ont compté sur nos ingénieurs pour réaliser les merveilles du génie dont on vante encore l'efficacité, les industries de paix reposent encore en grande partie sur leur talent et leur compétence pour assurer leur prodigieux développement.

Mrs. Flitton, Mrs. J. A. Beauchemin, Councillors J. A. Beauchemin and R. C. Flitton at the Grand Ball at the Chateau Frontenac.

Consciente du rôle magnifique qu'est appelé à jouer l'ingénieur dans notre pays si riche en ressources de toutes sortes, l'Université Laval ne recule devant aucun sacrifice pour assurer aux étudiants dans les différentes branches du Génie à la Faculté des Sciences la formation professionnelle la plus complète et la plus adéquate possible. Aussi est-elle très reconnaissante envers les grandes associations d'ingénieurs du pays pour la collaboration si précieuse qu'elles lui apportent dans l'œuvre de la formation scientifique de nos jeunes.

QUEBEC REGIONAL COUNCIL MEETING

Left to right: **J. A. Beauchemin, J. A. H. Henderson, J. A. Lalonde, G. A. Gaherty, C. E. Gelinas, G. R. Langley, R. C. Flitton, R. S. Eadie, G. F. Layne, President Grant, the Assistant General Secretary, P. A. Dupuis, Miss M. McLaren, J. B. Stirling, W. C. MacDonald, R. G. Cameron, Hector Cimon, C. C. Lindsay, C. A. Robb, E. D. Gray-Donald, Roger Desjardins, Ernest Lavigne, C. A. Peachey, J. R. Dunbar.**

En plus de souligner la valeur personnelle de deux ingénieurs très méritants, l'Université Laval est heureuse ce soir de donner un témoignage sensible de son estime et de sa sympathie pour les associations qu'ils représentent en décernant un doctorat d'honneur au Lt-Colonel LeRoy Fraser Grant, président de l'Engineering Institute of Canada, et à Monsieur Ernest Lavigne, président de la Corporation des Ingénieurs professionnels de la province de Québec.

Né à Toronto en 1884, M. Grant a reçu son instruction primaire d'abord à Berthierville, dans la province de Québec, puis à Brockville, en Ontario. Diplômé " avec mention honorable " du Collège militaire de Kingston en 1905, il obtenait l'année suivante, avec la même distinction, son diplôme de Bachelier ès Sciences de l'Université Queen's.

A sa sortie de l'université, en 1906, il s'enrôle dans l'artillerie royale canadienne et est affecté, comme officier, à la défense du port d'Halifax. En 1907, il quitte l'armée pour se consacrer aux travaux civils du génie: après avoir passé trois ans à Prince-Rupert, où il s'occupe de la construction du chemin de fer Grand Tronc Pacifique, il obtient en 1910 une commission d'arpenteur-géomètre en Colombie Britannique et travaille pendant quatre ans à Vancouver comme ingénieur-conseil.

A la déclaration de la guerre, en 1914, il se rend outre-mer avec les forces expéditionnaires canadiennes comme adjudant du corps canadien de construction de chemins de fer. En 1917, il est promu major et commandant en second du 5è bataillon canadien. Sa bravoure au front lui vaut alors trois citations à l'ordre du jour.

Après la guerre, il retourne en Colombie Britannique où il passera trois ans au service du département des terres et forêts de cette province. En 1921, il est nommé professeur de génie au Collège militaire de Kingston et il remplira cette fonction avec grand succès jusqu'à son retour à l'armée canadienne, en 1939.

Tout en poursuivant la carrière de l'enseignement, le major Grant n'a cessé, en effet, de s'intéresser activement aux choses de l'armée. Après avoir été successivement commandant de la 32è batterie de campagne et de la 9è brigade d'artillerie canadienne, il est promu lieutenant-colonel en 1937. Au cours du dernier conflit, il occupe avec beaucoup de compétence, pendant quatre ans, le poste important de premier officier aux Quartiers généraux du district militaire de Kingston. Ayant atteint l'âge de sa retraite en 1944, il est alors nommé professeur agrégé de génie à la faculté des sciences appliquées de l'Université Queen's de Kingston.

Le Colonel Grant est un universitaire distingué: non seulement il a consacré une grande partie de sa vie à l'enseignement, mais il s'est intéressé de façon toute particulière au sort des étudiants ingénieurs qui lui sont redevables de plusieurs réformes importantes. Il est aussi un ingénieur de grande classe dont la compétence professionnelle a été reconnue par les plus grandes associations du pays: membre de l'Association des ingénieurs professionnels de l'Ontario, de l'Institut professionnel du service civil du Canada et de la Canadian Society of Civil Engineers, il fait également partie de l'Engineering Institute of Canada depuis 1927. Après avoir occupé avec beaucoup de succès et de dévouement plusieurs charges importantes dans ce dernier organisme, il en devenait le Président général au mois de mai dernier.

Pour reconnaître les qualités et les mérites exceptionnels de cet ingénieur et de ce professeur si méritant l'Université Laval a tenu à lui décerner un diplôme de Docteur ès sciences " honoris causa ".

Doctor Grant, it is a very great pleasure for me to bestow upon you, on behalf of Laval University, the honorary degree of Doctor in Science. Your brilliant achievements in the field of applied science and engineering have given you many titles to the admiration and gratitude of your fellow citizens. Our French University of Quebec is very happy to profit by the opportunity of the visit of The Engineering Institute of Canada to honour its outstanding President; it is my duty to add that we are particularly glad to convey to Mrs. Grant our best feelings with our most sincere greetings.

Mesdames et Messieurs, j'ai l'honneur d'inviter le Lieutenant-Colonel LeRoy Fraser Grant, président de l'Engineering Institute of Canada, professeur à l'Université Queen's de Kingston, à venir recevoir le diplôme de Docteur ès Sciences, " honoris causa ", de l'Université Laval, à revêtir la toge et à signer le livre d'or de l'Université.

Monsieur Ernest Lavigne est une figure bien connue du public québécois. Né à Québec, en 1892, il est le fils du regretté Arthur Lavigne, Docteur en Musique de l'Université Laval, qui a accompli chez nous une œuvre remarquable et dont le souvenir est encore vivace dans nos mémoires.

M. Ernest Lavigne est en droit de se glorifier des mérites de son père, qui fut toute sa vie l'un des meilleurs amis du Séminaire de Québec et de l'Université.

Après de brillantes études classiques au Séminaire de Québec, Monsieur Lavigne suivit pendant quatre ans les cours de génie à l'Ecole Polytechnique de Montréal et obtint, en 1916, ses titres universitaires de bachelier ès sciences appliquées et d'ingénieur civil.

Dès sa sortie de l'Université, il entre au service du Ministère des Travaux publics de la province de Québec. Après avoir passé dix ans au service de la construction des ponts, il est nommé, en 1926, Commissaire des incendies de la Province, fonction qu'il occupe encore présentement.

En plus de remplir avec beaucoup de compétence l'importante charge qui lui est assignée dans l'administration provinciale, Monsieur Lavigne s'est toujours dévoué sans compter pour la cause des ingénieurs. Tour à tour membre et officier de toutes les organisations importantes d'ingénieurs du pays, il a rendu dans ce domaine des services signalés. Ancien président de l'Association des prévôts des incendies du Dominion, vice-président de l'Association des diplômés de Polytechnique, membre de l'Institut canadien des Ingénieurs, il est actuellement président de la Corporation des ingénieurs professionnels de la Province de Québec et représentant de cette Corporation dans le Conseil national de l'Institut des Ingénieurs.

A sa rare compétence professionnelle, Monsieur Lavigne joint les hautes qualités d'un gentilhomme accompli. Sa particulière amabilité et sa remarquable sociabilité lui ont valu très tôt un grand nombre d'admirateurs et d'amis. Il est l'un des plus ardents promoteurs des études supérieures dans le domaine des sciences appliquées et il s'est toujours intéressé vivement à l'œuvre de notre faculté des sciences. Le fait que Monsieur Lavigne a été l'un de mes amis d'enfance ne peut qu'ajouter au plaisir que j'éprouve à lui présenter un parchemin de l'Université Laval.

De plus, les services qu'il a rendus au pays au cours de la dernière guerre lui ont valu d'être nommé par le Roi membre de l'Ordre de l'Empire Britannique (O.B.E.).

En décernant ce soir un diplôme d'honneur de l'Université Laval à Monsieur Lavigne, nous avons conscience de remplir un devoir de justice envers l'un de nos compatriotes les plus distingués et les plus méritants.

Mesdames et Messieurs, j'ai l'honneur d'inviter Monsieur Ernest Lavigne, président de la Corporation des ingénieurs professionnels de la province de Québec, à venir recevoir le diplôme de Docteur ès Sciences, " honoris causa ", de l'Université Laval, à revêtir la toge et à signer le livre d'or de l'Université.

Lieut.-Col. L. F. Grant, D.Sc., M.E.I.C.

Monseigneur Vandry, messieurs les doyens et les membres de la faculté, mesdames, messieurs:

Je dois vous remercier des paroles bienveillantes qui ont été prononcées à mon égard, et qui, je pense, sont beaucoup plus que je ne le mérite. Pour un homme qui a dévoué la plus grande partie de sa vie à l'enseignement il n'y a pas de plus grand honneur que le jugement de ses confrères dans le même domaine, aussi c'est avec grand orgueil et bonheur que je reçois le grand honneur qui m'est conféré par cette université. Ce sera toujours une source de satisfaction pour moi que l'Université Laval m'a enrôlé parmi les personnages distinguées qu'elle a honorés et j'espère que je serai digne d'être membre de cette assemblée choisie. En mon nom, et au nom de l'Institut des Ingénieurs du Canada je vous remercie de tout mon cœur.

L'Institut dont j'ai l'honneur d'être le président remonte déjà à plus de soixante années. Organisé au début pour les ingénieurs civils, il devint après la guerre mondiale de dix-neuf cent quatorze une corporation pour les ingénieurs de tous genres dans toutes les parties du Canada. Nous croyons, et je pense avec raison que l'Institut a exercé une influence unifiante dans notre pays parce qu'il a réuni ensemble dans une amitié professionnelle et personnelle les ingénieurs d'un bout à l'autre du Canada.

Il m'est particulièrement inspirant de recevoir ce titre honorifique ici dans la vieille capitale où les premiers jours de notre histoire et des fondateurs de notre pays semblent tout près. Ayant atteint à l'époque de la vie où l'on pense de plus en plus au passé, je me vois espérer, et pas toujours avec confiance, que nous bâtissons pour l'avenir d'une manière digne de ceux qui nous ont précédés. Dans le désordre et la tragédie qui règnent dans le monde, aujourd'hui, les responsabilités qui pèsent sur nous sont lourdes, surtout sur ceux parmi nous dont le devoir est d'enseigner et dans une certaine mesure de guider la jeunesse du pays. Je dis " dans une certaine mesure " parce que la jeunesse d'aujourd'hui est quelquefois difficile à guider. Peut-être quand on pense à l'héritage que lui ont légué ses aînés, ce n'est pas étonnant.

As I see it, if I may with all humility express myself among so many wiser than I, one duty that we owe to our country is to maintain a Canadian individuality. Every country, every race may make its contribution to the good of mankind but it must do it in its own way. We as Canadians can never fulfil our destiny nor make our contribution to civilization by following implicitly in the footsteps of others, no matter how worthy or how admirable the objects of our imitation may be. My generation will not live to see it, but I hope and feel confident that the time will come when Canadian engineering, Canadian architecture and Canadian achievement of every kind will have its own distinctiveness, and that

THE CONVOCATION AT LAVAL UNIVERSITY

Dr. Grant expresses his appreciation of the honour he has received.

while we must not be unmindful of that science and knowledge which is the property of all mankind our children may look upon structures and achievements in the field of engineering and say " That is Canadian; no other people would have done it that way."

As an English-speaking Canadian I have always thought that here is a special task and opportunity for the universities of French-speaking Canada, which are so much less subjected to North American influence than are those in my part of this country. To you we look for originality and for ideas that are peculiarly Canadian.

Comme Canadien de langue anglaise, j'ai toujours pensé qu'une mission spéciale en même temps qu'une occasion magnifique s'offrait aux universités du Canada français, moins sujettes à l'ambiance nord-américaine que ne le sont les institutions semblables dans mon coin du pays: c'est vers vous que nous nous tournons pour la manifestation originale d'idées qui soient singulièrement canadiennes.

Dr. Ernest Lavigne, M.E.I.C.

Monseigneur le Recteur,
Messieurs les doyens,
Mesdames, Messieurs.

De tous les souvenirs qui s'attacheront à mon passage à la présidence de la Corporation des ingénieurs professionnels de la Province de Québec, celui de cette cérémonie sera certainement un des plus chers.

Les paroles bienveillantes que vous avez bien voulu m'adresser, Monseigneur, me touchent vivement et l'allusion aussi généreuse que délicate que vous avez faite à mes modestes activités professionnelles donne, à cette manifestation, un caractère personnel qui m'émeut profondément. Je vous en remercie.

Je réalise fort bien, cependant, et plus que tout autre, que le grand honneur que me fait l'Université Laval en me conférant ce titre de Docteur, je le dois, non pas à mes faibles mérites, mais bien au mérite collectif des 3,000 ingénieurs qui forment le corps professionnel auquel j'appartiens.

L'événement d'aujourd'hui marque une étape glorieuse dans le développement de notre profession d'ingénieur. Car ce n'est pas sans heurts ni sans bien des efforts, voire même sans quelques déboires à l'occasion, que notre corps professionnel s'est développé et que s'est comblée la tranchée qui existait entre la rigoureuse préparation universitaire à la carrière d'ingénieur et la maigre considération dont jouissaient les diplômés de nos universités, alors que la coutume et la routine plaçaient le génie civil plutôt au rang de vocation technique que de profession proprement dite.

Je vois avec fierté et satisfaction dans ce geste que pose l'Université Laval, le couronnement des efforts de mes prédécesseurs, les présidents et autres officiers de la Corporation.

Je me crois justifiable dans une certaine mesure de dire que ce geste de l'Université honore aussi son corps professoral et, par reflet, celui de nos institutions universitaires. Notre Corporation n'est-elle pas, en effet, symboliquement, de par les éléments qui la composent, l'épanouissement de la culture et de l'enseignement que nous avons puisés à l'Université même. Ne pourrait-on pas dire d'elle, comme le poète le dirait peut-être, que c'est le champ de blé dont les épis mûrs rayonnent et ondulent harmonieusement au souffle que féconde et propage l'enseignement universitaire. Et cet enseignement universitaire ce sont vos professeurs distingués et dévoués qui le donnent à nos futurs professionnels.

C'est pourquoi notre Corporation tient l'Université Laval en si haute estime et a tant d'admiration pour l'œuvre magnifique qu'elle accomplit. Nous trouvons merveilleux l'essor prodigieux qu'a pris l'enseignement des sciences appliquées dans le district de Québec depuis à peine un quart de siècle et cela grâce à la création de votre faculté des sciences. Et en parlant de la faculté des sciences de l'Université Laval, je ne puis m'empêcher d'évoquer le nom et la brillante personnalité de Mgr. Alexandre Vachon qui a donné à son développement une impulsion si vigoureuse. Je ne puis non plus m'empêcher, en pensant aux progrès toujours croissants de cette faculté, d'évoquer le nom de son dynamique et si sympathique doyen, mon ami Adrien Pouliot. Et c'est pour moi un grand honneur que de pouvoir leur rendre, en ce moment, au nom de mes confrères ingénieurs le témoignage de notre vive admiration.

Ce progrès dans l'enseignement des sciences appliquées, c'est, dans une certaine mesure, notre corps professionnel qui en récolte les fruits de par la venue dans nos rangs de nouveaux ingénieurs mieux préparés et mieux outillés.

Il est donc indispensable qu'il existe un contact bien intime, un lien bien solide entre nos universités et la Corporation et je me plais à voir, dans la remise de ce doctorat, un geste symbolique prometteur de relations toujours de plus en plus cordiales.

Me serait-il permis, Monseigneur, avant de terminer, de formuler un vœu à l'effet que le corps professoral de nos universités s'emploie, non seulement à munir les futurs ingénieurs de l'outil fondamental et essentiel à leur profession: le savoir technique, mais aussi à leur inculquer le sens de leurs devoirs professionnels et à les former pour le rôle économique et humanitaire qu'ils seront appelés de plus en plus à remplir dans les cadres de notre société d'aujourd'hui.

Je veux témoigner en terminant ma vive et profonde reconnaissance à l'Université Laval pour le titre honorifique qu'elle me confère aujourd'hui. Je lui affirme mon attachement à la cause très noble qu'elle poursuit, celle de donner à notre jeunesse cette haute culture qui forme une élite dont nous, ingénieurs, pouvons avec une certaine fierté, nous réclamer.

Et je formule le vœu, Monseigneur, que se réalisent vos plus chers désirs et surtout celui de l'établissement prochain de votre Cité Universitaire.

Courses at Carleton College

Carleton College, Ottawa, has developed its engineering courses from a small first-year group which met in church basements to a well equipped two-year course which has been approved as equivalent to the first two years in the best Canadian Universities.

Major-General G. R. Turner, chairman of the Ottawa Branch of the Institute, has done a good deal towards bringing the high standards of Carleton's engineering courses into sufficient prominence that the College is now designated by the Institute as " a school of engineering recognized by Council " and its second year students are accepted into third year at the universities which offer the full engineering course.

The credit for this achievement is due mainly to the director of Carleton's science studies, Professor L. N. Richardson.

The Joints of Time

While man is helpless to control the passing of time, he has been interested always in the recording of it. His efforts go beyond the beginning of history and today the average citizen is well satisfied that his predecessors have perfected the system. However, there are people and organizations that see room for improvement, and one at least has shown a tenacity of purpose that is impressive.

The World Calendar Association was organized in 1930 to promote the idea that the calendar should be revised. Since then the Association has studied the problem and has examined many proposals for modification. It has acted as a central body for all similar groups in thirty-two different nations who are dissatisfied with the present irregular calendar.

The Association has gone far in propagating its excellent proposal. It is supported on all sides by influential bodies and outstanding individuals. This summer it succeeded in having a Bill for the U.S. adoption of the calendar presented to the Senate of the United States and a decision is still pending. The United Nations is also considering the subject through its Economic and Social Council, and it is hoped that a decision will be reached at the next session. In the days of the League of Nations the calendar was approved officially by fourteen nations.

The World Calendar follows the present Gregorian calendar in dividing the year into twelve months with the same Gregorian names. The difference lies in the distribution of the number of days over the sequence of months. The year is divided into equal quarters with the first month in each quarter having 31 days and the following two months 30 days. This makes up a total of 364 days. The additional day is provided by adding after Dec. 30 a " year-end day ", which it is believed will become a world holiday. Leap year is taken care of very much in the same way as at present except that it would come directly after June 30.

The advantages claimed for the new calendar are:

1. It provides a perpetual calendar.
2. Holidays become fixed and always come on the same day of the week.
3. It provides absolutely uniform quarters.
4. Each quarter begins on Sunday and ends on Saturday and contains exactly 13 weeks.
5. Month dates always fall on the same week days. Each month has 26 week days plus Sundays.

The following condensed story of the development of calendars is taken from the " Note on the World Calendar " prepared by Trygve Lie, Secretary-General of the United Nations, as part of the material to be presented to the Economic and Social Council at its next session:

History of Calendar Reform

The calendars used in antiquity by the Chaldeans, Assyrians, and Egyptians go back to at least 4000 B.C. China possessed a calendar in the YAO era, 2000 B.C. Most of these calendars used the day, the lunar month and a more or less solar year as units of time; only the Egyptians used the astral year. Ancient Greece also had a highly developed calendar based on the apparent movements of the sun and the moon. Under this system the year always began at a specified position of the sun in relation to the earth and similarly each month began with a full moon. As the solar year consists of a number of days not divisible by the number of days in a lunar month, a systematic adjustment was necessary. The Roman Republican calendar which took the place of the Greek calendar also contained twelve lunar months, but the years did not follow one another immediately. There were a few extra days between the end of one year and the beginning of the next. The Roman Julian calendar was an improvement by establishing a system of twelve non-lunar months totalling 365 days with an extra day every four years to bring the year so determined into line with the solar year.

In 1582 Pope Gregory XIII realized that, owing to an error in the method of calculation of the Julian calendar, the calendar year began with a great lag behind the seasons. He cut out ten days from the calendar of that year and devised a new formula for the leap years. The results of this reform, which was carried out in 1582, gave rise to the so-called Gregorian calendar. This calendar, first used in the Catholic countries of the West, was adopted by Britain and her colonies in 1752, by Sweden in 1753, by Japan in 1873, by China and Albania in 1912, by the Union of Soviet Socialist Republics in 1918, by Roumania and Greece in 1924 and by Turkey in 1927.

The chief stages of calendar reform were:

1. Transition from the lunar system to the combined solar and lunar system.
2. Transition from the combined solar and lunar system to the solar system.
3. Adjustment of the leap year to bring the average year into line with the period of the earth's rotation which had come to be known more accurately.

But the present proposal for calendar reform is quite distinct from earlier reforms. It is not proposed to establish an improved basic system for measuring time or to correct errors that may creep into knowledge of the movements of heavenly bodies; the real grounds are of a practical nature.

Herewith is the proposed World Calendar.

** The Leap-Year World Holiday, W or 31 June (an extra day), follows 30 June in leap years.

The British Export Drive

One of the results of Britain's present economic troubles may be that more British cars will be seen, in the near future, on Canadian and American highways. In October, 1947, the value of exports of British cars, parts and accessories totalled just under 35 million dollars—nearly six times the average monthly figure for 1938.

The post-war British cars for export have been designed with a view to the intended foreign markets. It can be presumed that they may achieve a greater popularity than their pre-war counterparts. Their acceptance in the North American market should be somewhat facilitated by the difficulties attending supply of the domestic product. This opportunity should induce the British manufacturers to set up, and maintain, the best possible service facilities and parts depots. As far as the *Journal* has been able to discover the British tradition of craftsmanship, although rumoured to have suffered under the exigencies of war, has not been lacking in the post-war cars which have, so far, been tested and used in Canada.

Opportunities in the Arctic

In a recent circular letter to Canadian universities, H. L. Keenleyside, Chairman of the Advisory Committee on Arctic Research of the Defence Research Board, draws attention to the greatly enlarged opportunities for major research and development work now opening up in northern Canada.

"Due to the development of modern methods of transportation and to other causes," writes Dr. Keenleyside, " there has recently been a noticeable increase in public activity within the Canadian Arctic. It is anticipated that this trend will continue and that there will be considerable development in the Northwest Territories, the Yukon and other northern areas within the next few years. Departments, and other bodies interested in this part of the country are anxious that this expansion should not be handicapped by lack of qualified personnel of the best type."

Almost all branches of science have an Arctic aspect. In subjects such as medical research, meteorology and geography, whole fields lie almost untouched. Canadian science has a special concern with work of this type. Applications for bursaries and fellowships, therefore, which relate to Arctic aspects of the sciences, are likely to receive sympathetic consideration from the Governmental and private agencies concerned. Dr. Keenleyside's letter contains a survey indicating the types of fellowships, scholarships and bursaries available through both Government and private industry, the nature of the work to be done and the kind of qualifications called for.

Many departments of Government offer openings for service within the Arctic. The most directly concerned are Mines and Resources (Lands and Development Services, and Indian Affairs Branch), National Defence, Transport, Agriculture, Health and Welfare, and the National Research Council. Each is engaged on programmes which include Arctic research, administration, education, health, welfare, communications, radio, transport, geological survey or defence.

Canada's mining development in the North shows no signs of slackening. A constant demand for geologists and mining engineers will exist for many years to come. Trading, transportation and other services, linking the Arctic with the rest of Canada, will continue to offer opportunities for qualified personnel. Problems of construction and communication peculiar to the North will call for civil engineers with specialized training and experience. A partial list of companies and organizations which have interests in the Arctic, is included in the letter.

Those who are not now attending universities, but who desire more detailed information are invited to write to Wing Commander K. C. Maclure, Defence Research Board, National Defence Headquarters, Ottawa.

"Spinning Discs" for Testing Welds and Steel

The Welding Research Council of The Engineering Foundation is sponsoring a "Spinning Disc" method of testing welds and steels at the Massachusetts Institute of Technology.

The equipment consists of an armour plated "whirl pit " forty inches in diameter and nine feet deep. In this, circular steel plates are rotated, at high speed, until they burst.

According to Mr. W. Spraragen, Director of the Welding Research Council, " This is one of the most promising of the new testing methods to provide biaxial stress all the way to fracture—it makes it possible to test thicker welded and unwelded plates than is possible by other methods. The rotating disc method will be used to test materials and welds at extremes of temperature and it is believed that the results will be particularly useful to bridge builders, ship builders and others who fabricate steel for use in extremely low winter temperatures."

The discs are suspended on a flexible steel drive shaft and rotated in a 30-inch vacuum at speeds up to 35,000 r.p.m. Material up to a thickness of 8 inches can be tested.

The whirl pit is made of three heavy pieces of Class-B armour plate lined with lead pig. For welding tests, a small central disc is welded within the outer disc.

It is expected that future tests will provide interesting information on plastic flow and on distribution of plastic strains.

Prizes for Books

Whittlesey House-Science Illustrated, a component of the McGraw Hill Book Company organization has announced the Second Biennial Prize Contest which should be of considerable interest to engineers.

Three prizes, $3,500, $1,000, and $500 are offered, together with advances of $1,000 against royalties, for books on scientific subjects written for the layman. The contest opened December 1, 1947; an outline and 15,000 words is the minimum requirement for the awarding of prizes after November 1, 1948; and the manuscripts must be completed by November 1, 1949. The prizes will be paid in installments during the second year as the winning projects are completed.

Interested readers may apply to Whittlesey House-Science Illustrated, McGraw Hill Book Company Inc., 330 West 42nd Street, New York 18, N.Y., for further information.

Bureau of Technical Personnel

Information and statistics of considerable interest to the E.I.C. membership is contained in bulletins released from time to time by the Bureau of Technical Personnel, Department of Labour, Ottawa, with respect to employment prospects, available supply of young engineers, and other statistical data relative to technical personnel.

1946 Inventory of Engineers

For example, an inventory published a little more than a year ago disclosed about 35,000 technical persons in Canada registered with the bureau; 6,500 civil engineers and foresters, 6,500 chemists and chemical engineers, 4,200 mechanicals, 4,000 electricals, 3,800 miners, geologists, and metallurgists, 1,400 architects, 2,000 physicists and mathematicians and 6,600 miscellaneous such as agriculturists, veterinarians, household scientists, etc. Since this inventory was made, registrations have grown through demobilization to a total of some 40,000. This total includes the bulk of all those registered in the field of engineering and pure science.

This means that the number of engineers and scientists employed in Canada per 1,000 population has grown from 2.14 in 1921, to 3.0 in 1941, and to 4.05 in 1946; in other words, it has almost doubled over the last 25 years.

Age Classifications

But an analysis by the Bureau of registered technical persons by groups and by ages is discouraging for employers and at the same time encouraging for undergraduates. A fifth of the total are close to retirement age. A third are more than 47 years of age, while more than half of them are in their forties and older. This is most noticeable in the ranks of the architects and civil engineers, forty per cent of whom are near retirement, and about 80 per cent of whom are forty plus. Electrical, mechanical, and mining engineers are getting old too. About two-thirds of these groups are forty plus. Moreover, this is a group of men who collectively have lived through two wars, including in the case of many, periods of combat service overseas or overwork at home or both. It can be expected that a considerable percentage of them will become casualties before reaching retirement age.

Survey of Employment Opportunities

In its first report recently issued, covering a year's operation of the Bureau since the dropping of the word " WARTIME " from its title, the Department of Labour summarizes a survey conducted early in 1947 by the Bureau through visits to some 1,500 employers of engineers, as well as to federal and provincial governments, and to professional associations respecting employment by groups which are largely self employed. Conclusions based on preliminary returns from the same survey were published in the May 1947 issue of the *Journal*.

This survey shows an estimated demand over the 5 year period 1947-1951 from employers questioned, for 2,200 civils, 2,100 mechanicals, 1,750 electricals, 1,100 chemicals, 300 metallurgists, and 700 miscellaneous; a total of 9,450. Employers were asked to base their estimates on " full employment ". Those from whom replies were received include most of the large employers.

Output of Engineers from Universities

A survey of Universities indicated that in the same period 12,885 students will graduate in all branches of engineering: in 1947, 1,111; 1948, 1,800; 1949, 3,487; 1950, 3,730 and 1951, 2,757.

About 40 per cent of all who graduate as engineers in 1948 will be veterans; in 1949 about 75 per cent. The Bureau estimates that emigration and diversion to non-engineering fields (teaching, law, commerce, finance, etc.), will reduce the number of these graduates seeking engineering posts in Canada to about 11,000.

The report states that in practically all branches of engineering there is a tendency on the part of employers to indicate greatest need in 1947 (when the supply is actually the smallest) and to taper off as estimates reach into the future.

Percentages of Graduates and of Membership in Professional Bodies

In another more recent bulletin the Bureau gives an analysis of the proportion of registered technical persons who are university graduates and of proportions that are enrolled in various professional bodies. This reveals that 90 per cent of those registered as technical persons had degrees in engineering or science from recognized universities. Of the remaining 10 per cent, 19 out of 20 hold membership in a recognized professional body. The number therefore, who have merely been assessed as having extensive engineering or scientific skill without any degree or membership is something less than 1 per cent.

This same study has also disclosed that a large number of graduates in engineering and science have not yet been enrolled in one of the appropriate professional bodies. In engineering for example, it is found that about 55 per cent of those who have degrees from recognized universities have, to date, been admitted to membership in one of the provincial professional engineering associations. Making some allowance for people who have retired or become incapacitated, this would indicate that the field of potential membership for such associations is something of the order of 75 per cent of their present joint strength.

Similar information was strikingly presented in a number of charts and graphs prepared by Mr. Huet Massue, M.E.I.C., of Montreal, respecting memberships in the E.I.C. and in Provincial Associations of Professional Engineers, which was on display at the Annual General Meeting of the Institute at Toronto, last May.

A Challenge to Professional Associations

These analyses constitute a challenge to the Engineering Institute, as well as to all other professional associations both national and provincial. In view of the fact that membership in provincial associations is mandatory for practicing engineers, the lesson probably applies in greatest measure to national associations, such as the E.I.C. Much could be done by individual branches in fostering local drives for increased membership. Resulting benefits that would accrue to the membership at large in the long run are obvious. The Institute's voice would be made stronger, while increased revenue from additional annual dues would permit wider service to membership.

A Correction

Community Planning Discussion

Carl Klotz, M.E.I.C., advises us that our editor has done him an injustice in a rewording of his discussion of C. A. Meadows' paper, "Standards of Planning of New Neighbourhoods", page 530 of the November *Journal*. Mr. Klotz states that the wording of the fourth paragraph of his discussion is not what was intended and that his original notes actually read as follows:

"There are several kinds of standards. There are Ideal Standards, Investment or Good Practice Standards, and Minimum Standards. By minimum we mean minimum commensurate with public health, safety and welfare. Such minimum standards are found in building by-laws and in zoning or land-use ordinances. Such by-laws, based legally on the police power, must stay within the bounds of public health, safety and welfare. By-laws regulating the cost of buildings can scarcely be considered within these bounds; and except under special charter or statute, by-laws attempting to regulate the appearance of things are ill at ease. It is almost impossible to agree upon aesthetic standards; but grossly unaesthetic constructions or developments, it can well be argued, do involve the public interests sufficiently to warrant some legal standards, or restrictions".

The *Journal* tenders its apologies to Mr. Klotz for any unfavourable impression which the previous wording may have caused.

Meetings of Other Societies

The **Amercian Society of Mechanical Engineers** has scheduled the following meetings for 1948: Spring Meeting, New Orleans, La., March 1-5; Semi-Annual Meeting, Milwaukee, Wis., May 30-June 4; Fall Meeting, September; Annual Meeting, New York, N.Y., November 28-December 3.

The next convention of the **Canadian Section of the American Water Works Association** will be held at Niagara Falls on April 12th to 14th (Monday to Wednesday). The General Brock Hotel will be convention headquarters. Rooms are also reserved at the Fox Head Inn, immediately adjacent to the General Brock.

The programme and the various other events for the meeting are all under preparation, and there is every assurance that this will be an outstanding convention, with good papers and discussions, as well as enjoyable events. The Water Works Equipment Association will, as usual, co-operate fully in all functions.

That the sixth annual conference of the **Society of the Plastics Industry (Canada) Inc.,** will be held in the Mount Royal Hotel, Montreal, February 16th and 17th, was announced by S.P.I. President J. H. McCready, Hale Brothers Limited.

More than 300 representatives of the plastics industry in Canada and the United States are expected to attend the two-day convention. Technical discussions on all phases of the industry will highlight the annual conference. Keynote subjects to be discussed at this international meeting will be marketing and merchandising methods for plastics. Other important topics will be world trade and economics, and greater co-operation within this fast-growing industry.

Principal speaker at the main dinner of the convention will be H. Napier Moore, editor-in-chief of MacLean-Hunter Publications. An important speaker at the sessions on merchandising will be Ephraim Freedman, well-known head of R. H. Macy's Bureau of Standards in New York.

In making the announcement, Mr. McCready issued a general invitation to all interested persons in the industry and affiliated trades to attend the meetings of the convention. General chairman of the Convention Committee is L. C. MacLeod, Monsanto (Canada) Limited. A. E. Byrne, Canadian General Electric Co. Limited is chairman of the Speaker's Committee.

Technical Books for Finland

The library of the excellent technical institute, Teknillinen Korkeakoulu, Finland, was bombed and totally destroyed during the war. The director of the Institute has said that gifts of scientific and technical books and periodicals would be most welcome.

In Finland's remarkable efforts for recovery, the lack of technical library facilities is a serious handicap. It would be a practical act of friendship if contributions were made by Canadian groups and individuals. Any such gifts should be marked for the Institute of Technology, Helsinki, and sent to the Legation of Finland, 2144 Wyoming Ave. N.W., Washington, D.C. Dr. K. T. Jutila, the Finnish Minister, will arrange for their transportation to Finland.

Correspondence

December 17, 1947

Dear Dr. Wright:

The November issue of *The Engineering Journal* reported very fully the transactions of the October Conference of the Institute on community planning.

One of the dominating notes of the Conference was the provision of low cost houses, and the difficulty of compromising the necessary similarity of house unit in order to take advantage of the lower cost of mass production, and the demand for individual designs, was evident in the addresses and in the subsequent discussion of them.

As a contribution to this subject, I would like to quote from a letter from my partner, Dennis Critoph, who has suggested a very likely solution, and I hope that you will be able to broadcast to our members this message to me.

"I have been thinking a good deal about the argument re the undesirability of covering the country with box-like houses, which is the one most frequently put up to me.

Actually the individuality of units in a low priced residential district nowadays even in B.C. is largely an illusion.

In the old towns and villages of England and Europe there was a great deal of variety and interest.

The Vicar lived among his parishioners, the doctor among his patients, the rich man among those whose mortgages he held.

In a village of my boyhood the church was next door to the rectory, and on the other side was the inn and a group of old cottages, then some modern brick houses, then the estate of a retired Colonel and so on.

In these less democratic days, however, the bootlegger and the stockbroker are neighbors in an expensive section of town, while the professional classes, the university faculty, the artisans and the unskilled workers are all carefully segregated.

This practice has far-reaching consequences: socially, in creating misunderstandings between classes: artistically, in creating deadly monotony.

These segregations of similar sized homes produce monotony no matter how each unit wears its roof, its chimney or its entrance: and this is particularly noticeable in the low priced districts in which we are the most interested.

In short, the modern problem of segregation of living units and shortage of housing call for a new and daring solution.

It is variety in the whole community rather than in the units we need. Why not have each group of similar units arranged in varied and dramatic patterns. Let individuality be shown in the community rather than in the unit.

If people could get as good a value in their house as in their car, they would complain no more about the similarity of pattern in the one case than they do in the other. If people wanted cars of bizarre and highly individualized designs, they would have to do without.

Why not face the situation and leave all houses under about fifteen thousand or so to the engineer? Architecture can be a luxury of the wealthy.

It is not a choice for most of us between mass production and individualized design, but appears to be a choice between mass production and shacktown."

Yours very truly,

C. A. Meadows.

Meeting of Council

A regional meeting of the Council of the Institute was held in Room 81a, Parliament Buildings, Quebec City, on Saturday, November 29th, 1947, convening at ten o'clock A.M.

Present: President L. F. Grant (Kingston) in the chair; Vice-Presidents R. S. Eadie (Montreal) and G. F. Layne (Quebec); Councillors J. A. Beauchemin, K. G. Cameron, R. C. Flitton, C. E. Gelinas, C. C. Lindsay, C. A. Peachey, J. B Stirling, all of Montreal, J. R. Dunbar (Hamilton), W. C. MacDonald (Moncton), E. Lavigne (Quebec), also present as president of the Corporation of Professional Engineers of Quebec, and Assistant General Secretary W. D. Laird.

There were also present by invitation—Past Vice-President Hector Cimon (Quebec); Past Councillors J. A. Lalonde and C. A. Robb of Montreal, E. D. Gray-Donald, P. A. Gagnon and A. Lariviere, of Quebec; G. A. Gaherty (Montreal), chairman of the Committee on Prairie Water Problems, G. R. Langley (Peterborough), chairman of the Committee on the Young Engineer; J. A. H. Henderson (Montreal), councillor of the Corporation of Professional Engineers of Quebec, and member of executive, Montreal Branch of the Institute; P. A. Dupuis, chairman, C. H. Boisvert, past-chairman, and Roger Desjardins, secretary-treasurer, Quebec Branch.

Death of Past-President F. A. Gaby: The president informed Council that on hearing of the death of Past-President F. A. Gaby, which had taken place in Toronto on November 14th, he had written to Mrs. Gaby, but he felt that a formal expression of sympathy should be sent by Council. Accordingly, it was unanimously resolved that the following resolution be recorded in the minutes and that a copy be forwarded to Mrs. Gaby:

> "The Council of The Engineering Institute of Canada records its deep regret at the death of Dr. F. A. Gaby, president of the Institute for the year 1935. His was a distinguished career both as an engineer and as a citizen of Canada, and his contributions to the field of hydro-electric development during his long tenure in senior executive positions with the Hydro-Electric Power Commission of Ontario are widely recognized. It was this service which led to his being honoured with the degree of Doctor of Science by the University of Toronto in 1925.
>
> Dr. Gaby was well known to and respected by engineers in many parts of Canada and this Council joins with many others of his friends and associates in extending to Mrs. Gaby and the members of his family its very sincere sympathy."

Honorary Degrees: Mr. Stirling commented on the impressive ceremony which had been held the previous afternoon when that ancient and honorable institution of learning, Laval University, had been pleased to confer upon two outstanding engineers, the president of The Engineering Institute of Canada, and the president of the Corporation of Professional Engineers of Quebec, honorary degrees of Doctor of Science.

On the motion of Mr. Stirling, seconded by Mr. Layne, it was unanimously resolved that the congratulations of the Council of the Institute be extended to Dr. L. F. Grant and Dr. E. Lavigne on this memorable occasion. Dr. Grant asked Dr. Lavigne to stand with him in acknowledgment of this tribute from the Council of the Institute.

Remuneration of Engineers in the Armed Forces—Mr. Laird read the following letter which had been received from the Minister of National Defence:

> "Ottawa,
> October 10th, 1947.
>
> Dear Mr. Wright,
>
> On my return to Ottawa, your letter of September 8, addressed to Mr. Gibson, concerning "responsibility allowance", and in which you ask for specific information as to the reasons why this allowance was not extended to other classes of officers, was brought to my attention.
>
> Whereas there was shortage of doctors and dentists in the Armed Services, in the other professional corps sufficient applications have been received to meet immediate requirements. Moreover, sufficient undergraduates in engineering at the various universities have expressed their intention of applying for commissions to meet the

need. While the Services are generally glad to have other technical officers joining immediately on graduation from the university, this is not the case in peacetime with doctors and dentists. Practically all those joining have had several years of training or practice additional to what is customary in the other professional and technical services.

In view of the national interest of your Institute in this matter, it occurs to me that the members of your Council may like to have a more general picture of the organization of the Defence Forces. Accordingly, I am sending you copies of a paper I prepared on this subject. As you will see, the question of the training of officers is dealt with at page 25.

Yours sincerely,

(signed) Brooke Claxton."

Mr. Laird also read the paragraphs on the training of officers taken from the paper referred to in Mr. Claxton's letter. Considerable discussion took place, during which it was pointed out that both the Military Engineers Association and the R.C.E.M.E. Association are preparing to make further representations to the government on this question of " responsibility allowance " in the pay of engineer officers. The feeling of members present was that the Institute should continue its efforts, either by sending a delegation to Ottawa to interview the Minister, or by supporting these other organizations in the action they are taking.

Mr. Lindsay pointed out that the Institute's Committee on the Engineer in the Armed Services, which had been active during the war, had not been reappointed, and at the request of Council he accepted the chairmanship of a committee with power to add to its numbers, whose duty would be to contact these other organizations and see what arrangements are being made for a delegation to go to Ottawa, and to offer the support and co-operation of the Institute.

E.C.P.D. Annual Meeting—In the temporary absence of the president, Mr. Laird reported on this meeting. Believing that the Engineers' Council for Professional Development (E.C.P.D.) is an excellent example of co-operation among engineering societies, Headquarters and a number of Montreal members exerted particular efforts to make the meeting an outstanding success. The volume of appreciative letters which had been received by the president and by Headquarters could be taken as an indication that the objective had been achieved.

The Montreal Branch and its Ladies Committee had rendered a real contribution in arranging for the entertainment of the large group of ladies who had accompanied the delegates, and also for the entertainment of those who stayed over the weekend in Montreal. Both the president and Headquarters have expressed the Institute's appreciation in this regard.

The business of E.C.P.D. occupied a large part of the two-day meeting and, in accordance with established custom, a report of the proceedings will be published in booklet form early in 1948.

Institute Representation on E.C.P.D.—Mr. Laird reported that Dr. C. R. Young, one of the Institute's representatives on the Engineers Council for Professional Deevlopment (E.C.P.D.), had found that his other duties would not permit him to continue. Dr. J. B .Challies had been asked to serve and had accepted the appointment as the Institute's representative on the Council and on the executive committee, to complete the unexpired portion of Dr. Young's term.

E.C.P.D. Canons of Ethics—Mr. Laird read a letter from Dr. Challies reporting on a meeting of the E.C.P.D. executive committee which he had attended in New York on November 20th. He reported on two matters. First, that the sixteenth annual meeting of E.C.P.D. would be held in Detroit, on Friday and Saturday, October 29th and 30th, 1948. Special invitations will be sent to engineers in the Detroit area who might be interested, and the branches of the Institute in western Ontario will be contacted and kept fully informed.

The second matter of interest to the Institute Council was the unanimous wish of the executive committee that the E.C.P.D. Canons of Ethics, as approved at the last annual meeting in Montreal, be accepted and adopted by the constituent members of E.C.P.D.

Mr. Laird read a letter from Dr. C. R. Young, who had been the Institute's representative on the E.C.P.D. Committee on Ethics, in which he urged that the Institute take the necessary steps towards the adoption of these Canons of Ethics. Dr. Challies also felt that the Institute should adopt these Canons of Ethics although he though there was no necessity for immediate action, since the Institute was the youngest member of E.C.P.D. and might better follow the lead of the more senior member bodies.

Mr. Eadie remarked that in discussing this with the president recently, it had been his impression that the matter would have to go to a letter ballot of the Institute members. Mr. Layne thought it was perhaps a matter which should come before the annual meeting of the Institute.

Dr. Challies had suggested that in order to give the fullest possible consideration to this matter a carefully chosen committee should be appointed to consider the adoption of these Canons of Ethics by the Institute.

Mr. Eadie reminded Council that a committee in Toronto had given a great deal of time and thought to these proposed canons of ethics. Their revised version had been submitted to the E.C.P.D. committee, and he understood that it had been accepted by the committee practically as submitted.

Following further discussion, on the motion of Mr. Eadie, seconded by Mr. Beauchemin, it was unanimously resolved that Dr. deGaspe Beaubien, Dr. J. B. Challies, and Mr. J. A. Vance, the Institute's representatives on E.C.P.D., be appointed a committee, with power to add to their number, to study the matter and advise Council as to what further steps should be taken in regard to these Canons of Ethics.

Ontario Division By-Laws: Mr. Laird presented the report of the scrutineers appointed to canvass the ballot for the adoption of the by-laws of the Ontario Division. A favourable vote had been recorded.

On the motion of Mr. Dunbar, seconded by Mr. Eadie, it was unanimously resolved that the report be accepted, that the scrutineers be thanked for their services and that the ballot papers be destroyed.

Accordingly, the by-laws of the Ontario Division, as submitted to the corporate membership in Ontario, were declared adopted.

Mr. Dunbar pointed out that in framing these bylaws the Ontario Division had been bound by the provisions of the Institute by-laws covering provincial divisions. Some of these the Ontario Division would like to see amended, and while not sufficiently important to warrant a special ballot, he suggested that, if any amendments to the by-laws on other matters were going out in the near future, the Ontario Division would like to be informed so that they might make recommendations regarding amendments to Section 69 and those following which affect provincial divisions.

Secretarial Office in Ontario: Mr. Laird read a letter from Mr. E. R. Graydon, secretary of the Ontario Division, regarding the possible establishment of a secretarial office in Toronto. He reported that Colonel Grant would be in Toronto on December 6th to discuss certain matters with Vice-President Manock, the chairman of the Ontario Division, and he understood that this matter would also be discussed at that time. It was decided to defer action on this letter until the president had had an opportunity of discussing the subject with Mr. Manock.

List of Nominees for Officers—Mr. Laird read a letter from Mr. A. R. Jones advising that he was unable to accept nomination as councillor for the Peterborough Branch for the years 1948 and 1949; also a letter from the Peterborough Branch recommending that Mr. A. L. Malby be nominated for this office, which nomination he had agreed to accept.

On the motion of Mr. Beauchemin, seconded by Mr. Dunbar, it was unanimously resolved that Mr. A. L. Malby be nominated as councillor for the Peterborough Branch for the years 1948 and 1949, his name to appear on the officers' ballot.

Maritime Professional Meeting 1948—Mr. Laird reported that definite plans were now under way for a maritime professional meeting to be held in St. Andrews, New Brunswick, on September 8th, 9th and 10th, 1948. The meeting was being held under the auspices of the New Brunswick and Nova Scotia Associations of Professional Engineers and the maritime branches of the Institute, and it was hoped that members would keep these dates in mind when making their plans for next year.

Annual Meeting—Banff—June 1948 — Mr. Laird reported that definite arrangements had now been completed for the holding of the 1948 annual general and professional meeting in Banff, Alberta, during the first week of June. The meeting was being held under the auspices of the Calgary Branch, and the western branches are hoping that there will be a particularly good attendance from the east. Inquiries are being made as to the possibility of chartering aeroplanes which might cost a little more than train transportation, but would save a great deal of time. Special railway cars will be available from Toronto, Montreal and Ottawa. The question of technical papers is also receiving attention. Suggestions as to suitable topics or possible authors of papers will be appreciated by the committee. An advance announcement, giving all available information, will appear in the February issue of the *Journal*.

Report of Finance Committee

Financial Statement: It was noted that the financial statement to the end of October had been examined and approved.

Pension Plan for the Staff: Mr. Eadie reported that all the details of the pension plan for the Headquarters staff, recommended by the Finance Committee and approved by Council by letter ballot, had been completed ,and he was pleased to report that the plan goes into effect on December 1st and that it has been accepted one hundred per cent by the staff. Council again expressed its thanks and appreciation to Mr. Eadie and the Finance Committee for the great amount of work which had been done in connection with this plan.

Institute Nominating Committee: Mr. Laird read a letter from Mr. Stewart Young, chairman of the Institute's Nominating Committee for 1947, commenting on the procedure followed at the present time in connection with the presidential nomination. In 1935, in view of the fact that by-laws make little reference to the modus operandi of the Nominating Committee, Council has drawn up certain rules for the guidance of the Nominating Committee, and Mr. Young suggested that there might, with advantage, be some revision or modification of the present procedure. In his opinion, the duties of the Nominating Committee should cease with obtaining nominees for the office of president and that the selection from these nominees by the three honorary councillors should be final.

Mr. Laird read the rules drawn up by Council, 5 and 6 of which deal with the presidential nomination as follows:

> 5. In the case of the office of president, a full list of names suggested by the members of the Nominating Committee shall be sent to the three honorary councillors and they, acting under the chairmanship of the senior honorary councillor, shall choose one nominee and obtain his consent to act in the event of his election. The senior honorary councillor shall then notify the chairman of the Nominating Committee of the choice, and the latter shall submit it to the whole Nominating Committee for their confirmation not later than July 15th.
>
> 6. In the event of such nomination not receiving a majority vote another name should be submitted by the honorary councillors and again voted upon by the Nominating Committee.

From the discussion which followed it appeared that the present procedure had been found quite satisfactory. In Mr. Dunbar's opinion, the nomination for president is made by the Nominating Committee and not by the honorary councillors, and he suggested that no action be taken to change the procedure.

Dr. Robb, as a past-councillor who, at one time, had lived at a considerable distance from Headquarters (Edmonton), reported that the procedure now followed by the Institute had made an excellent impression as it had operated over the years. He knew of other organizations which had adopted the procedure used by the Institute and he would not like to see any change.

Mr. Stirling was also in favour of continuing the present procedure. He, too, knew of other organizations which had adopted the same procedure as the Institute.

Following further discussion, on the motion of Mr. Dunbar, seconded by Mr. Peachey, it was unanimously resolved that no change should be made in the procedure and that the president should write Mr. Young informing him of the opinions expressed at this meeting.

Julian C. Smith Medals: Councillors J. R. Dunbar and W. C. MacDonald were appointed scrutineers to open the ballot for the Julian C. Smith Medal. They reported that all ballots had been canvassed and that both candidates, P. L. Pratley, of Montreal, and P. M. Sauder, of Strathmore, Alberta, had received the necessary affirmative votes. On the motion of Mr. MacDonald, seconded by Mr. Lindsay, it was unanimously resolved that the report of the scrutineers be accepted and that the ballot papers be destroyed. Accordingly, Julian C. Smith Medals will be awarded to both these gentlemen.

Appointment of Medal Committees: On the motion of Mr. Beauchemin, seconded by Mr. Peachey, it was unanimously resolved that the membership of the medal committees for the year 1947, as submitted by the chairmen, be approved as follows:

Gzowski Medal Committee: C. G. Moon, Chairman, J. R. Cockburn, L. C. Jacobs, A. W. F. McQueen, C. S. G. Rogers.

Plummer Medal Committee: J. R. Donald, Chairman, R. R. McLaughlin, W. E. Patterson, J. B. Phillips, M. P. Weigel.

Leonard Medal Committee: G. E. Cole, Chairman, A. F. G. Cadenhead, A. E. Cameron, G. M. Furnival, C. R. Boehm.

Keefer Medal Committee: R L. Hearn, Chairman, F. J. Blair, A. C. D. Blanchard.

Ross Medal Committee: D. Anderson, Chairman, J. W. McCammon, K. R. Swinton.

Safety Code for Passenger and Freight Elevators: A letter was presented from the Canadian Standards Association advising that in order that the CSA Standard B-44-1938—Safety Code for Passenger and Freight Elevators, might be brought up to date, the existing committee is being revised in order to embrace a broader list of interests, and the Institute has been invited to nominate a representative to membership on this committee, under the chairmanship of W. J. W. Reid, M.E.I.C., of Hamilton, Ontario.

On the motion of Mr. Stirling, seconded by Mr. Gelinas, it was unanimously resolved that Professor S. D. Lash of Kingston, Ont., be asked to represent the Institute on this committee.

Plaster Bust of Sir Casimir Gzowski: Colonel Grant presented a letter which he had received from Lieut.-Col. H. E. Bates, of Shawinigan Falls, advising that Mrs. John Legg, of Three Rivers, had in her possession, a plaster bust of Sir Casimir Gzowski, one of the founders of the Canadian Society of Civil Engineers, and the originator of the Gzowski Medal, which she, as a great grand-daughter of Sir Casimir, would like to present to The Engineering Institute of Canada.

On the motion of Mr. Flitton, seconded by Mr. Beauchemin, it was unanimously resolved that this plaster bust be gratefully accepted on behalf of the Institute and that the House Committee be charged with the responsibility of finding a suitable location for this gift.

Publication of Articles in the Journal: Mr. Dunbar drew attention to an article by Professor A. L. C. Atkinson, M.E.I.C., published in the September number of *The Enginering Journal,* with a note to the effect that proof of formula would be furnished by the author on request. Mr. Dunbar pointed out that as the Institute does not now publish transactions, *The Engineering Journal* is the only means of publishing and permanently recording new contributions to engineering literature and he felt that in this particular case the proof should have been published with the formula.

Mr. Dunbar had two points to bring up. First—if the Engineering Institute wishes to take its place as a scientific organization there should be some place where original contributions can be permanently preserved. Secondly, that requests for such proof, if not published in the *Journal* should be handled through Headquarters.

Mr. Laird explained that the omission of this proof had been one of a number of ways of saving paper, but the paper shortage was now easing up and it was hoped that from now on it would be possible to include such items in the *Journal.* In this particular case, Professor Atkinson had been approached and his approval of this action obtained.

Following some discussion it was suggested that it might be possible to publish the proof with any discussions which might be received on this paper, and it was agreed that this matter should be referred to the Publication Committee at its next meeting.

Civil Service Commission Qualifications — Mr. Laird read a letter which the president had received from Mr. P. E. Poitras expressing his opinion that The Engineering Institute of Canada would be making a very serious mistake if it were to press the point of the replacement of membership in the Engineering Institute as a qualification for engineers in the Civil Service. He felt that other voluntary societies might object and he suggested that the Institute should work in co-operation with the Dominion Council towards requiring registration in one of the provincial associations as the necessary qualification or failing this, recognition of graduation from a recognized school of engineering.

A copy of Mr. Poitras' letter had been referred to Mr. MacRostie, chairman of the Institute's Committee on the Engineer in the Civil Service, and Mr. Laird read a letter from Mr. MacRostie advising that he had discussed the matter with the chairman of the Civil Service Commission and had received a reply from him referring to previous correspondence with Mr. Wright, and concluding with the following statement:

> "I would like to assure the Institute that there is no question in our minds as to the qualifications of persons who are entitled to become its members, but there is need at the present time for clarification in some of the other associations of engineers and as soon as some degree of clarity can be secured we are prepared to proceed further with the matter."

In the discussion which followed it was admitted that the Institute would not object to university graduation or membership in the Corporation or any of the provincial associations being included as a requirement, but it did object to membership in The Engineering Institute of Canada being deleted from the requirements. It was finally agreed that the president should write to Mr. Poitras along these lines, advising him that the matter is receiving the further consideration of the Council of the Institute.

Possible Overcrowding of the Engineering Profession—The president referred to the letter from the Moncton Branch (already circulated) and said that this was a case of the constructive criticism which Headquarters desired from the branches. He reminded Council, that it had been referred to the Committee on the Young Engineer, and that he had asked Dr. Langley to attend this meeting of Council in order to give a first-hand report.

Dr. Langley said that the letter had been discussed the previous day by the Canadian Committee on Student Guidance (representatives of the E.I.C., C.I.M.M., C.I.C., and Mr Dymond of the Bureau of Technical Personnel). Mr. Dymond thought there was a tremendous deficit of engineers, with which opinion Dr. Langley could not agree. The Canadian Committee on Student Guidance felt that the 1948 and 1949 graduating classes would readily find employment but considered that there was a definite doubt as to 1950 and 1951. Dr. Langley explained that in his opinion there was a close relationship between the absorption of engineers and the quantity of installed horse-power in the country. He considered that any student entering university in 1949, 1950 or 1951 would face much more severe competition than at present. He then asked for an expression of opinion from the Council meeting.

Mr. MacDonald (Moncton), referring to the view (expressed in the Financial Post and by individuals) that an engineering education was valuable for a non-engineering career and that many of the present crop of students did not contemplate entering the profession in the strict sense, said that this led to the conclusion that even plumbers should take engineering courses, and that such a point of view would lower the standing of the profession. He suggested that Council should direct the president to warn high school students of the situation, and also thought that universities should limit entrance by raising standards.

The president pointed out that it was the ex-service men who had created the present large university registration, and that they could not well be refused. Dr. Langley thought that positive action was required only for those entering in the years 1948 and 1949, and that little could be done about the students already in, except possibly to change the final years to engineering administration.

Mr. Eadie said that this year's registration appeared less than last year's and that he did not think the universities would raise their requirements further. Mr. Flitton thought it would be dangerous to discourage young men from entering engineering classes and Mr. Peachey remarked that in 1943 no one would have thought that we needed as many engineers as we do at present, and that this situation might be repeated in the future.

Dr. Langley pointed out that his figures showed a deficiency of engineers up to the present (1947) but subsequently that a 400 per cent increase might need to be absorbed.

In Mr. Lindsay's opinion, the present increase was due to the government grants (to ex-service men). He said that many engineering positions formerly filled by " practical men " were now being filled by university graduates. In his opinion Canada is on the verge of a big development. He thought the situation would take care of itself. Mr. Eadie believed there was a definite place for engineers in the shops, in positions such as foremen and superintendents hitherto filled by men without technical education. He said in 1944 and 1945 industry had set up committees to plan post-war development to take care of a slowing down, but that the prognostications could not have been more wrong. He thought there was a good deal of difficulty in judging all the factors affecting future employment.

Mr. Stirling believed that supply and demand would be a great factor in working things out. He suggested that the Moncton Branch, not being in an industrialized province, might be taking a restricted view. He thought the outlook for engineering in Canada was unlimited and that the Institute should not discourage young men from going into it. A recent survey had shown that 25 per cent of a certain class were very successful outside of engineering. He considered that the Moncton Branch is too pessimistic.

Dr. Langley agreed that this estimate or any others might be wrong. What he was unable to see was a sudden rate of rise in employment for engineers. To employ them at the rate they are graduating we should need a rate of increase of 60 per cent instead of the present 15 per cent (over five years). Were we justified in shirking the question and letting supply and demand take care of it? There was some further discussion, following which the president asked Mr. MacDonald to frame a motion on the subject.

Mr. MacDonald asked that the president be directed to give warning through the press that there will not be enough engineering positions for those entering the engineering colleges, and to use every means in his power to restrict registration. Dr. Langley suggested slightly different wording: that the Engineering Institute does not see a sufficiently increased rate of employment to absorb the present rate of graduation.

After considerable discussion as to the exact form of the motion, it was moved by Mr. MacDonald and seconded by Mr. Cameron that the Council should endorse the resolution passed in Ottawa on November 28th by the Canadian Committee on Student Selection and Guidance (Dr. Langley and representatives of C.I.M.M., C.I.C., and the Director of the Bureau of Technical Personnel), Dr. Langley having reported that this reads as follows:

> " The Canadian Committee on Student Guidance in Science and Engineering anticipate that the graduating classes in engineering from Canadian universities in 1948 and 1949 will be readily absorbed. The picture for subsequent years is not so clear, and engineers carrying on guidance work amongst high school students should therefore employ increased effort toward ensuring that those entering engineering courses have definite aptitude for the profession, and at the same time also make it clear that engineering graduates may have to face much keener competition for the better engineering jobs."

This resolution was carried—nine in favour and one contrary.

Next Meeting of Council: It was decided that the December meeting of Council should be held in Montreal on Saturday, December 20th, and that routine business only would be transacted at that meeting.

January Meeting of Council: An invitation from the Toronto Branch to hold the January meeting in Toronto on Saturday, January 24th, 1948, was considered. The president stated that he would be in New York on January 21st to 23rd, attending the annual meeting of the American Society of Civil Engineers. He had not yet seen the detailed programme but hoped that he would be able to be in Toronto on the morning of the 24th. In any event, he was planning to be there to attend the annual meeting of the Toronto Branch being held that evening. It was left with the president to make a decision as soon as he had definite information regarding his commitments in New York.

On the motion of Mr. Dunbar, seconded by Mr.

Peachey, it was unanimously resolved that a hearty vote of thanks be extended to the officers and members of the Quebec Branch for their splendid hospitality and many kindnesses during the president's visit.

The Council rose at five o'clock P.M.

W. D. Laird,
Assistant General Secretary.

Elections and Transfers: A number of applications were presented for consideration, and on the recommendation of the Admissions Committee, the following elections and transfers were effected:

Members

Grassby, Robert Leigh, B.Eng., (Mech.), McGill, Coal Plants Limited, Winnipeg, Man.
Gwyther, Val M. W., B.A.Sc., (Civil), British Columbia, res. engr. i/c constrn., Bloedel, Stewart & Welch Ltd., Port Alberni, B.C.
Harrington, John Eric, Graduate, Royal Military College, (1937), president, Anglin-Norcross Co., Ltd., Montreal, Que.
Hood, James R., B.Sc., (Chem. Engrg.), Queen's, mech. supervisor's office, Canada Packers Ltd., Toronto, Ont.
Lang, Edwin George Power, R.M.C., Sandhurst, Eng., res. engr., tunnel development, Mississaugi River, H.E.P.C. of Ontario; home, 1441 Drummond St., Montreal, Que.
Milne, Henry Alexander, B.Sc., (Civil), Saskatchewan, asst. design engr., constrn. dept., Sorg Pulp Co., Vancouver, B.C.
Mordell, Donald Louis, B.A., M.A., (Mech. Sciences Tripos), St. John's College ,Cambridge; associate professor, Mechanical Engrg. Dept', McGill University, Montreal, Que.
Rogers, Cecil Gordon, B.A.Sc., (Civil), British Columbia, engr., mtce. cost control, engrg. divn., Consolidated Mining & Smelting Co. of Canada, Ltd., Trail, B.C.
Rooney, Sidney Crawford, B.A.Sc., (Mech.), British Columbia, chief engr. & genl. mgr., pulp, paper and sawmill design, Columba Mill Development Co. Ltd., Vancouver, B.C.
Sutherland, William Collie, Works Officer, R.C.E., B.Sc., (Elect.), Nova Scotia Tech. College, Camps and Defences, R.C.E., Halifax, N.S.
Wood, Leonard Robert, B.A.Sc., (Metall. Engrg.), Toronto, plant engr., Building Products Ltd., Hamilton, Ont.

Juniors

Botham, John Charles, B.Sc., (Metall. Engrg.), Queen's, jr. engr., research Dept., Dominion Steel & Coal Corp., Sydney, N.S.
Ivory, Thomas Henry, B.A.Sc., (Civil), Toronto, Jr. engr. & designer, railway & bridge section, Dept. of Works, City of Toronto, Ont.
Sleigh, Edward Barry, B.A.Sc., (Chem. Engrg.), British Columbia, Shell Oil Co. of British Columbia, Vancouver, B.C.
Walker, William Macfarlane, B.A.Sc., (Elect. Engrg.), British Columbia, ind. power engr., British Columbia Electric Railway, Vancouver, B.C.

Affiliates

Dies, Abram Stuart, B.S.A. (Chemistry), Ontario Agricultural College, chief chemist, Canada Cement Company Limited, Montreal, Que.
Rich, Clifford Earl, Montreal, Que. B.Sc., M.Sc., (Chemistry), Saskatchewan, director research & supt. production, Ogilvie Flour Mills Co., Ltd., Montreal, Que.

By virtue of the cooperative agreements between the Institute and the associations of professional engineers, the following elections and transfers have become effective:

SASKATCHEWAN

Member

Swanson, Roy Arnold, B.Sc., (Civil), Saskatchewan, division engr., Canadian Pacific Raliway Company, Regina, Sask.

Junior

Porter, John Wesley, B.A., (Geology), Saskatchewan, petroleum geologist, Mines Branch, Dept. of Natural Resources, Regina, Sask.

Students

Naylor, John Alden, Univ. of Saskatchewan, Saskatoon, Sask.
Urwin, Arthur Henry, Univ. of Saskatchewan, Saskatoon, Sask.

Junior to Member

Carroll, Arthur Frederick Gascoigne, B.Eng., (Mech.), Saskatchewan, Technical Information Service, National Research Council, Saskatoon, Sask.
Fyfe, John Cuthbert, B.Sc., (Civil), Manitoba, res. engr., Dept., of Highways, Regina, Sask.

NOVA SCOTIA

Members

Hopkins, James Moore, B.Eng., (Elect.), Nova Scotia Tech. Coll., sales engr., Canadian General Electric Co., Halifax, N.S.
Grant, Charles Enoch, instructor elect. engrg., Nova Scotia Technical College, Halifax, N.S.

Junior to Member

Dunbar, George Gray, B.Eng., (Chem.), McGill, chemicals supervisor, Imperial Oil Limited, Dartmouth, N.S.

QUEBEC

Members

Bergeron, Joseph Raoul, woodland divn. engr., Price Brothers & Company, Limited, Chicoutimi, Que.
Marshall, Harold Edward, B.Sc., (Elect.), New Brunswick, mech logging engr., Price Brothers & Co., Ltd., Chicoutimi, Que.
Rosenthal, Henry, Diplom-Ingenieur, Technisce Hochschule,& Darmstadt, Germany, design & development diesel engines & hydraulic machinery, Dominion Engineering Works Limited, Lachine, Que.

At a meeting on November 29, 1947, a number of applications were presented for consideration, and on the recommendation of the Admissions Committee, the following elections and transfers were effected:

Members

Dundas, Kenneth Brooke, B.Eng., (Civil), Saskatchewan, asst, to divn. engr., Canadian Pacific Railway Co., Medicine Hat· Alta.
Lewis, Arthur Henry Ross, Major R.C.E.M.E., B.Sc., (Chem. Engrg.), Queen's, senior instructor, R.C.E.M.E., School, Barriefield, Ontario.
Little, Henry Walsingham, Renfrew, Ont., B.Sc., (Elect.Engrg.), Queen's, mgr. & sec.treas., Hydro Electric Commission, Town of Renfrew, Ont.
Overall, Cyril, B.Sc., (Chem. Engrg.), Tri-State Coll. of Engrg. (not accredited E.C.P.D.), chief dftsman., Carborundum Co., Niagara Falls, N.Y.
Sumner, Joshua, B.Sc., (Civil Engrg.), Manitoba, i/c structl. engrg. design, Green Blankstein Russell, architects & engrs. Winnipeg, Man.

Junior

Eadie, Robert Kenneth, B.Eng., (Elect.), McGill, methods engrg., Northern Electric Co., Montreal, Que.

Affiliate

Powrie, Robert David, B.Arch., Toronto, arch. dftsman., chief engineer's office, Canadian Pacific Railway Co., Montreal, Que.

Transferred from the Class of Junior to that of Member

Ansley, Richard Herbert, B.Sc., (Civil), Manitoba, asst. constrn. engr., Winnipeg Hydro Electric System, Slave Falls, Man.
Archibald, Huestis Everett, B.A.Sc., (Civil), Toronto, township engr., Township of Tech, Kirkland Lake, Ont.
Askwith, Francis Lloyd George, B.Sc., (Elect.), distribution dept., Gatineau Power Co., Ottawa, Ont.
Boultbee, James Greer, B.A.Sc., (Civil); B.Sc., (Forestry), Toronto, constrn. engr., woodlands dept.
Brown, Malcolm Corsan Sutherland, Lt.-Col., R.C.E., Graduate, R.M.C.; B.Sc., (Civil), Queen's, Asst. Director of Works and Accommodation, Army Headquarters, Ottawa, Ont.
Cunningham, Robert Auld, B.Sc., (Civil), field engr., H. G. Acres & Co., Niagara Falls, Ont.
Donaldson, David Rennie, B.A.Sc., (Civil), British Columbia, aircraft stress analyst, Boeing Aircraft Co., Seattle, Wash.
Douglas, Lloyd Robert, B.Sc., (Elect.), Manitoba, engrg., central stn. divn., apparatus dept., Canadian General Electric Co., Toronto, Ont.
Findlay, Allan Cameron, B.Eng., (Mech.), McGill, prod. engr., Standard Brands Limited, Montreal, Que.
Hall, Albert Henry, B.Sc., (Engrg. Physics), Alberta; M.Sc., (Aero.), California Institute of Technology, Ottawa, Ont.
Marantz, Oscar, B.Sc., (Civil), Manitoba, asst. professor of civil engrg., Univ. of Manitoba, Winnipeg, Man.
McArthur, Donald Stewart, B.Sc., (Chem.), Alberta, plant supervisor, Dow Chemical of Canada Ltd., Sarnia, Ont.
Meagher, Robert Douglas, B.Eng., (Chem.Engrg.), McGill, resident engr., British American Oil Co., Montreal, Que.
Paithouski, Nicholas Joseph, B.Sc., (Civil Engrg.), field constrn. engrg., Steel Co. of Canada, Hamilton, Ont.
Padley, Gilbert, B.Sc., (Elect.), Saskatchewan, technical dept., Aluminum Co. of Canada, Kingston, Ont.
Papineau, Marcel L., B.A.Sc., C.E., Ecole Poly., resident engr., Veteran Land Act's Pointe Claire Project, Montreal, Que.

Piercy, Arthur King, B.Sc., (Mech.), Saskatchewan, design, heating, ventilating, etc., Green Blankstein Russell, Winnipeg, Man.

Ring, Alfred Jackson, B.Sc., (Civil), New Brunswick, design engr., H. G. Acres & Co., Niagara Falls, Ont.

Schwartz, Harry H., B.Eng., McGill; S.M., (Elect.), Massachusetts Institute of Tech., Chief engr., Dee Electronics, Montreal, Que.

Tanner, Charles Jewell, B.Sc., (Mining), Queen's, supervisor, hydrate dept., Aluminum Co. of Canada, Ltd., Arvida, Que.

Tuttle, Paul Douglas, B.Eng., (Elect.), McGill, engr., design divn., Hydro Electric Commission, Quebec, Dewittville, Que.

Applications through Associations: By virtue of the cooperative agreements between the Institute and the associations of professional engineers, the following elections and transfers have become effective:

Saskatchewan

Members

Brown, Rex L., B.A.Sc., British Columbia, chief chemist, Imperial Oil Limited, Regina, Sask.

Myers, Walter Manville, B.Mech.Engr., Univ. of Idaho, engr., P.F.R.A., Regina, Sask.

Williams, Alfred John, B.Sc., (Chem.Engrg.), Saskatchewan, director, industrial development, Dept. of Natural Resources, Prov. of Sask., Regina, Sask.

Students

Banfield, Leonard Charles, Univ. of Saskatchewan, Saskatoon, Sask.

Currie, Ross Macham Gourlay, Univ. of Saskatchewan, Saskatoon, Sask.

Hayes, Thomas Patrick, Univ. of Saskatchewan, Saskatoon, Sask.

Jonasson, Raymond Erling, Univ. of Saskatchewan, Saskatoon, Sask.

Leigh, Robert James, Univ. of Saskatchewan, Saskatoon, Sask.

Pugsley, David Hill, Univ. of Saskatchewan, Saskatoon, Sask.

Tasker, Edwin Henry, Univ. of Saskatchewan, Saskatoon, Sask.

Welsh, Ernest Ross, Univ. of Saskatchewan, Saskatoon, Sask.

Wood, George, Univ. of Saskatchewan, Saskatoon, Sask.

Junior to Member

Staples, William Robert, B.Eng., Saskatchewan, post graduate work, Univ. of Illinois, Urbana, Ill.

Quebec

Spence, Douglas Boyle, telephone equipt. engr., Northern Electric Co., Montreal, Que.

Ontario Division

MINUTES OF THE MEETING OF THE BOARD OF MANAGEMENT OF THE ONTARIO DIVISION OF THE ENGINEERING INSTITUTE OF CANADA, HELD AT THE ROYAL YORK HOTEL IN TORONTO, ON MONDAY, NOVEMBER 17, 1947, AT 7.30 P.M.

The meeting was called to order by the Chairman, Mr. Manock, at 7.30 p.m. Those present included: Messrs. Manock, Turner, Graydon, Laughlin, Morrison and Geiger.

The minutes of the Ontario Division Executive Meeting, held at the Royal York Hotel on May 10th, 1947, were read and approved on the motion of Mr. Laughlin, seconded by Mr. Turner.

Mr. Manock reported that the By-Laws of the Ontario Division, which had been approved by the Executive of the Division, were submitted to Council and approved by them on September 20th, 1947. He also reported that these By-Laws, as approved, had been submitted to the members of the Ontario Division by ballot, returnable November 27th.

Mr. Manock then reported that no definite action on an E.I.C. Secretary or Representative for Ontario had been taken by Council. After considerable discussion on this matter, it was resolved on the motion of Mr. Morrison, seconded by Mr. Laughlin: "That this Executive recommend to Council that it give serious consideration to the establishment of a Secretarial Office in Toronto, to conduct those functions of Headquarters as might, more efficiently, be conducted in such an office rather than in Montreal, including, among others: assisting the Branches in Ontario; operating a branch of the E.I.C. employment service; fostering co-operation between the E.I.C. and other technical and professional societies; acting as an office of the Ontario Division."

Mr. Manock then reported that he had approached the Finance Committee of the Institute, and had been asked by them to submit a budget for the balance of this year and for next year. On the motion of Mr. Laughlin, seconded by Mr. Geiger, it was resolved: "That the Finance Committee be asked to allot—$50 for the remainder of 1947, and $200 for 1948, for the work of the Ontario Division".

The Secretary and the Treasurer reported no accounts or bills to be paid.

On the motion of Mr. Geiger, seconded by Mr. Laughlin, it was unanimously resolved: "That the Chairman be given the power to appoint the three members of the Board of Management for the balance of this term of office".

Mr. Manock suggested the following: Mr. Macpherson, Sarnia; Mr. McKillop, London; Mr. Jones, Peterborough; and asked the Secretary to approach them.

The Secretary reported that he had questioned the Toronto Branch Executive as to whether they wished to appoint a new Branch representative since their appointee had been elected Secretary. The Toronto Branch decided that they did not wish to appoint a new representative at this time. The Treasurer, General Turner, reported that the Ottawa Branch had taken no action on a second representative when their original appointee was elected Treasurer.

General Turner suggested that pursuance of a co-operative agreement between the E.I.C. and Association of Professional Engineers for the Province of Ontario, would be of service to all engineers in Ontario and, in particular, the younger men.

The next item on the agenda was the Toronto Branch Memorandum. This memorandum had been referred to the Ontario Division for consideration by the Council of the Institute at the Meeting on May 7th, 1947. Mr. Geiger, the Chairman of the Toronto Branch, was asked to discuss the memorandum.

Mr. Geiger gave the history of the memorandum, and pointed out that some of the points in it have now been acted upon by Council. He suggested that the Ontario Division seek an opinion from all Ontario Branches on the memorandum.

On the motion of Mr. Laughlin, seconded by Mr. Morrison, it was unanimously resolved: "That the Toronto Memorandum, along with the Report of the Committee on Professional Interests on it, be submitted to the Ontario Division Executive, with the announcement that these would be considered at the next Annual Meeting of the Ontario Division, and with the request that the Branch representatives and Councillors jointly present these to their Branch or Branch Executive".

The Meeting was adjourned at 10.15 p.m.

PERSONALS

News of the Personal Activities of Members of the Institute

J. H. Blake, M.E.I.C., has retired after twenty-six years of service to the British Columbia Department of Lands and Forests. He was a marine and structural engineer in the operations division of the Department. Mr. Blake studied mechanical engineering at University of Edinburgh, Scotland, and in the ensuing years worked in marine, railway, mining, civic and whaling activities. Having served in the South African war, he enlisted in the Royal Canadian Engineers at the outset of the First World War and was subsequently released to the Imperial Munitions Board to serve as examiner of ammunitions. He joined the forest service as mechanical inspector with headquarters in Victoria and in 1942 he was appointed marine and structural engineer.

Bruno Grandmont, M.E.I.C., is on retiring leave from the Department of Public Works of Canada. He will retire officially in March, 1948. Mr. Grandmont studied at Ecole Polytechnique, in Montreal, and was graduated in 1914 with the degree of civil engineer and bachelor of applied science. He had worked for the Department of Public Works at Trois Rivières, Que., during summer vacations, and in 1914 he was appointed assistant engineer. In 1916-1917 he was assistant engineer on the construction of the Champlain dry dock at Lauzon, Que. In 1918 he returned to Trois Rivières as acting district engineer, becoming district engineer in 1921. In 1937 he was promoted to district engineer at Rimouski, Que., and in 1944 he was transferred to Quebec, Que., as district engineer and it is from this position that he will retire in March.

Adam P. Linton, M.E.I.C., after completing over thirty-five years' service as chief bridge engineer with the Saskatchewan department of highways, has retired. He is a past president of the Association of Professional Engineers of Saskatchewan and was chairman of the Saskatchewan Branch of the Engineering Institute in 1935 and 1942. He served on the Council of the Institute in 1939. He attended University of Toronto, graduating in 1908, and after a few years spent with the Dominion Bridge Company, he was appointed in 1915 to the position of chief bridge engineer of the department. From 1915 to 1919 Mr. Linton was overseas, serving with the Canadian Railway Troops in France and commanding the 1st Bridging Company of the Canadian Railway Troops in Palestine. On his return to Canada with the rank of major, he had been mentioned in despatches and had been awarded the O.B.E. He served for a time in the militia in Canada with the rank of lieutenant-colonel.

Gilbert H. Bancroft, M.E.I.C., is chief engineer and head of the consulting engineering service of Engineering and Machinery Limited, Vancouver, which company was appointed in October last as Western Canada representatives for Pacific-Western gears and gear products. Pacific-Western Gear Products are so identified because of the association between Western Gear Works and its San Francisco plant, Pacific Gear and Tool Works. Mr. Bancroft joined the company in 1945.

J. S. Bryant, M.E.I.C., who was with the Provincial Electricity Board in Montreal for nine years as an electrical engineer, went in October last to the Carborundum Company at Shawinigan Falls, Que. He came to the Provincial Board from the Southern Canada Power Company, Drummondville, Que.

A. S. Mansbridge, M.E.I.C., has resigned from the Bloedel, Stewart and Welch pulp mill construction project at Port Alberni, B.C., and he is now designing engineer for Pacific Mills Limited, Vancouver, B.C., designing their new wood room at Ocean Falls, B.C. He was with the company in 1932-36, prior to going to Consolidated Mining and Smelting Company, Tadanac, B.C., and the West Kootenay Power and Light Company at Trail and South Slocan, B.C.

J. E. Hanlon, M.E.I.C., is at Powell River, B.C., as engineer on construction of new industrial buildings and on enlargement of old buildings. He was chief engineer on construction of the Scanlon dam in British Columbia which is now completed. He is a University of Toronto graduate, class of 1915, and after service overseas with the Canadian Engineers, his engineering activities took him across Canada and to New York State. He was with Aluminum Company of Canada in Montreal from 1940, and in 1943 he went west to build wireless stations in British Columbia for the Navy.

T. C. Main, M.E.I.C.

E. M. Rensaa, M.E.I.C.

G. R. Henderson, M.E.I.C.

C. G. Southmayd, M.E.I.C., a graduate of the University of Toronto, 1932, is manager of the new hydraulic and engineering division of Canadian Allis Chalmers, Limited, Toronto. He joined the company in 1937 as sales engineer. He had then been associated with J. Fleury's Sons Limited, Aurora, Ont., for five years, where he was general superintendent and purchasing agent of the plant.

W. M. Stobbart, M.E.I.C., is works manager for the Vancouver Division of Dominion Bridge Company Limited. He has been with the bridge company since 1929 when he came from England, where he was educated and where he spent ten years in engineering activities. He was located first at Lachine, Que., as a mechanical designer, and was appointed assistant engineer in 1934.

T. C. MacNabb, M.E.I.C., is the newly elected chairman of the Saint John Branch of the Institute. He is from Revelstoke, B.C., and graduated from the University of Manitoba in 1902. He then joined the staff of the Canadian Pacific Railway Company at Winnipeg and was engaged on various works with that company in many parts of Canada until his retirement in 1946. He worked first on location with the construction department as chainman, rodman and topographer. At Winnipeg, Man., he was successively draughtsman, instrumentman, and resident engineer. In 1908 Mr. MacNabb was made assistant engineer on construction, and the following year division engineer on maintenance. In 1916 he was appointed assistant engineer for Saskatchewan, and a year later he became superintendent at Revelstoke. In 1926 he returned to Winnipeg, Man., to be engineer of construction of the company's western lines. He transferred to Saint John, N.B., as general superintendent of the New Brunswick district, in 1934, and it was from this position that he retired.

M. F. Ker, M.E.I.C., is chairman of the Niagara Peninsula Branch of the Institute for the year 1947-48. A native of Niagara Falls, Ont., he is a graduate of Queen's University, class of 1918. He worked with the H.E.P.C. Laboratory and inspection department after graduation, and in 1921 he became engineer in charge of construction for the township of Stamford, Ont. In that position he has contributed greatly to the industrial development of the section, as the Township Council declared when marking recently the 25th anniversary of his assumption of that position.

Gordon R. Henderson, M.E.I.C., the new chairman of the Sarnia Branch of the Institute, is chief engineer of Polymer Corporation. Born at London, Ont., he is a Queen's University honour graduate in civil engineering, class of 1925. He followed the H.E.P.C. student apprentice course that year and later came to Montreal, to Dominion Engineering Works, to work on hydraulic machine design. From 1929 to 1932 he was with the Power Corporation of Canada working on power installations. He joined Shell Oil Company, Montreal, in 1932, becoming chief engineer of refinery in 1936. He went to England in 1940 where he was in charge of construction of a new refinery of Shell Marketing and Refinery and was chief engineer during the 1st year of operation. He went to Polymer Corporation in 1942 as chief chemical engineer and construction works manager, and in 1944 he became chief engineer.

P. B. Stroyan, M.E.I.C., has been elected chairman of the Vancouver Branch of the Institute. He is from Derby, England, but he studied engineering in Canada at the University of British Columbia, graduating in 1924 with a B.A.Sc. degree. In 1924 he joined Sydney Junkins Company, and from 1926-28 he was with A. E. Coffin & Co., Vancouver general contractors. He then spent several years with the architectural department of the Vancouver School Board. Later, in the employ of various engineering organizations, he was reinforced concrete designer for the Burrard Bridge, Vancouver, designer of grain elevators at Seattle and Vancouver, reinforced concrete designer of Fraser Bridge at New Westminster. In 1935 he was a designer on the plant at Trail, B.C., of the Consolidated Mining and Smelting Company. In 1936 he was clerk of works on school construction for the Vancouver School Board, and a year later he joined the Vancouver Parks Board as assistant superintendent and engineer. He is now superintendent and engineer for the Board of Park Commissioners of Vancouver.

J. H. Legg, M.E.I.C., is in charge of operations for Ferrum Limited, Cap de la Madeleine, Que., a newly incorporated company, which is bringing into operation a plant for the production of iron and steel powders. Mr. Legg was at Shawinigan Falls, Que., as manager for Suzorite Company Limited from 1946, when he transferred from Aluminum Company of Canada Limited, Wakefield, Que.

T. C. Main, M.E.I.C., and **E. M. Rensaa,** M.E.I.C., have formed the general consulting engineering firm of Main and Rensaa at Edmonton, Alta.

Mr. Main spent 35 years with the Canadian National Railways, the early years on reconnaissance, survey and construction. For twenty years he was engineer on water service. In the past 18 years the railway loaned him almost constantly as consulting engineer, first to the government of Bermuda in 1931, then to the Saskatchewan Government in 1932 to study the drought situation, and to the Dominion government in 1935 to help get the Prairie Farm Rehabilitation Act into action. He was finally loaned to Ducks Unlimited as general manager. During 10 years this construction group have built projects that safeguard 1,300,000 acres of water-fowl nesting grounds. He recently resigned as general manager to become their consulting engineer.

Mr. Rensaa graduated in Norway in civil engineering and came to Canada in 1926. In the early 30's he obtained his B.Sc. and M.Sc. degrees from Manitoba University. In the meantime, he worked seven years for the Water Supply department of Canadian National Railways, chiefly as designing engineer, and on survey and construction as well. Later, he spent two years with the Dominion Department of Public Works, chiefly on bridge design. During the depression he went back to Norway and started a consulting practice in Oslo, where his work consisted mainly in designing large reinforced concrete buildings and other structures.

Francis Peacock, M.E.I.C., is president and managing director of Peacock Brothers Limited, Montreal, Canadian sales representatives of the Foxboro Company, of Foxboro, Mass., whose new instrument manufacturing plant is now in operation in Montreal.

The Canadian activities of The Foxboro Company began many years ago, and their association with Peacock Brothers Limited dates back to the year 1911. With the development of Canadian industry, came the increasing demand for industrial instrumentation and the appointment of Peacock Brothers Limited in 1922, as exclusive sales representatives in Canada and Newfoundland. The next logical step, the manufacture of instruments in Canada, followed; and The Foxboro Company Limited was formed in 1933. The company's office and factory were located in one of the Peacock buildings until expansion finally necessitated the building of the new plant which was occupied in November 1947.

K. Y. Lochhead, M.E.I.C., is now with the Cemco Electrical Manufacturing Company in Vancouver. He was formerly associated with the Hudson Bay Company as building superintendent of the Vancouver store. He returned to the Hudson Bay Company on his release in 1946 from the R.C.A.F. He had joined the company in 1933 in Winnipeg, after spending a year after his graduation from McGill University, Montreal, in the mechanical engineering laboratory as a demonstrator.

L. C. Sentance, M.E.I.C., was appointed in November last as assistant manager of works, Canadian Westinghouse Co. Ltd., Hamilton, Ont. In this position he has full charge of manufacturing and production in the electric and air brake divisions. Graduating from the University of Saskatchewan with a Master of Science degree in 1937, he enrolled in the Westinghouse Engineering Apprenticeship course. On completion of this course, nine years ago, he was attached to the general engineering staff as a mechanical engineer. Transferred to the Manufacturing Methods Division in 1944, as manufacturing engineer, he was appointed director of manufacturing methods in 1945, which position he held until his recent promotion.

G. E. Otter, M.E.I.C., is no longer with Fleet Manufacturing and Aircraft Limited, Fort Erie, Ont. He is in Montreal, Que., in the employ of Canadair Limited. He was chief aeronautical engineer of Fleet Aircraft from 1941. He had previously spent three years with DeHavilland Aircraft and Airspeeds (1934) Limited in England after graduation from the University of Toronto in 1938.

E. S. Yuill, M.E.I.C., has accepted employment with The Foxboro Company Limited, Montreal. He was with Northern Electric Company in Montreal, working on design in the Wire and Cable Division from January 1946, when he was released from the R.C.N.V.R., where he served as a Radar Officer. He received a B.Sc. degree from University of Toronto in 1942. He was then an instructor on a radio physics course given to the R.C.A.F. at Sackville, N.B. He received the degree of B.A.Sc. from U. of T. in 1944, specializing in engineering physics.

J. J. Miller, M.E.I.C., has been appointed secretary-treasurer of the Niagara Peninsula Branch of the Institute. He is electrical and mechanical superintendent for the Niagara, St. Catharines and Toronto Railway at St. Catharines, Ont. He was with the Steel Company of Canada at Hamilton from 1939 to 1944, where he was successively junior engineer, supervisor of the ore plant, and technical assistant to the ore plant superintendent. In the last instance he was in charge of development and research of the ore plant. He is from Hamilton, Ont., a graduate of University of Toronto, class of 1939.

J. H. C. MacLure, M.E.I.C., of Canadian Fairbanks Morse, Saint John, N.B., has been appointed secretary-treasurer of the Saint John Branch of the Institute. He is from Winnipeg, Man., and is a graduate of McGill University, class of 1944.

D. L. Rigsby, Jr.E.I.C., the new secretary-treasurer of the Kingston Branch of the Institute is with Aluminum Company of Canada Limited, Kingston. He is from Galt, Ont., and is a Queen's University graduate in mechanical engineering, class of 1940. He was with Sheldon's Limited at Galt, for some months after graduation, and then joined the British Air Commission at Washington, D.C. He was stationed in Montreal for the Commission at Canadian Car and Foundry Company in 1941, and later at the Consolidated Aircraft Corporation at San Diego, Calif. He joined the staff of Aluminum Company of Canada Limited at Kingston, in 1942, to work on production engineering and was later transferred to be engineering expeditor and co-ordinator.

R. E. Davey, Jr.E.I.C., has accepted the position of town engineer for Trenton, Ont. He was divisional operations manager with Canadian Oil Companies Limited, Montreal, since 1946, having come there from the Toronto Transportation Commission. From 1942 to 1945 he was engineer in charge of works and buildings for the Naval Service of the Department of National Defence, Shelburne, N.S.

F. E. Everett, Jr.E.I.C., has accepted employment with Canadian Vickers Limited, Montreal. He graduated from McGill University in 1944 and was an engineer with G. D. Peters and Company of Canada Limited in Montreal until his recent appointment.

F. Lionel Peckover, Jr.E.I.C., who was studying in the field of soil mechanics and foundation engineering at the Graduate School of Engineering of Harvard University, Cambridge, Mass., during the academic year 1946-47, received the degree of master of science (civil engineering) in June 1947. He spent the summer in visiting numerous soil mechanics laboratories and earth construction projects across the continent. In July he rejoined the staff of National Research Council, Ottawa, as assistant research officer in charge of the soil mechanics section of the newly formed Division of Building Research.

F. J. D. Bilodeau, Jr.E.I.C., is employed by Canadian Ingersoll-Rand Company Limited, Montreal, as an application engineer. His duties consist of selling, service, sales promotion work and the engineering connected with the application of such products as air compressors, pneumatic tools, centrifugal pumps, etc. He received his B.Eng. degree in mechanical engineering from McGill University in 1945.

William J. F. Wilson, Jr.E.I.C., is in Ottawa, working as an electrical engineer in the Radio Marine Section of the Dominion Government. He had been at Northern Electric Company, Montreal, a power equipment engineer, since his graduation in 1945 from Queen's University in electrical engineering.

Duart A. MacLean, Jr.E.I.C., is in Victoria, B.C., being employed there as assistant hydraulic engineer, Water Rights Branch, of the Provincial Government. He had previously been with the Department of Mines and Resources, Ottawa, as surveys engineer in the Bureau of Topography and Geology.

J. A. W. Izard, Jr.E.I.C., is with Yarrows, Limited, Victoria, B.C. He had been at Ottawa, a surveys engineer for the Bureau of Topography and Geology of the Department of Mines and Resources. He received the degree of B.Sc. (civil) from University of Manitoba in 1944.

Donald R. Burns, S.E.I.C., who is employed by S. Morgan Smith (Canada) Limited, Toronto, has been sent to York, Penna., to follow the junior engineering training course sponsored by S Morgan Smith Company, the American associates of his firm. He graduated from University of Toronto this year with a B.A.Sc. degree in mechanical engineering.

Lucien Trudel, S.E.I.C., is with the Department of Mines as an electrical engineer on inspection in the mining industry in the Province of Quebec, with headquarters at Noranda, Que. He received his B.A.Sc. degree in 1946 from Laval University, Que., and was posted at Quebec city for the Department for a time.

Henrik Verdier, S.E.I.C., is employed by the Holden Company Limited, Montreal, in the capacity of sales engineer. He has completed requirements for the degree of bachelor of science at Sir George Williams College, Montreal, and has been attending courses at McGill University in economics and government for the past year.

Harold Tapay, Jr.E.I.C., of Nanaimo, B.C., was the recipient of an award in the international "Design for Progress" programme sponsored by the J. Lincoln Arc Welding Foundation of Chicago, to whom papers were submitted from 17 countries. Mr. Tapay is at Heaps Engineering Limited, New Westminster, working on designing and draughting. His prize-winning paper dealt with a fabricated Gangsaw connecting rod which he designed at Heaps Engineering.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Sam Graham Porter

1875-1947

President of The Institute 1931

Members who knew Sam Graham Porter have learned with deep regret of his death in Calgary on November 30.

Elected to the presidency of the Institute in 1931, Mr. Porter was the first Albertan to occupy that high position and his election highlighted the fact that the engineering training provides a sound basis on which a man of suitable personality may develop an executive talent—a fact which daily becomes more apparent as the influences of science and technology become more and more evident in the aspects of the daily life of every citizen. Sam Graham Porter was a particularly able executive engineer who at the time of election to the presidency was manager of the department of natural resources of the Canadian Pacific Railway.

Sam Graham Porter, M.E.I.C.

Mr. Porter acquired a wide experience in the United States in the problems of reclamation and irrigation and he began to apply this experience for the benefit of Canadians when he came to this country in 1913 as irrigation consultant to the Dominion Government. In 1918 he joined the Canadian Pacific Railway which affiliation he maintained until his retirement in 1942. He was a director of the Lacombe and Northwestern Railway, the Canada Colonization Association and the Lethbridge Collieries Limited.

In addition to his enviable technical and executive talent Mr. Porter demonstrated a civic consciousness which might well provide an inspiration for those who would seek to follow in his footsteps. He had been on the Council of the Calgary Board of Trade, the boards of directors of the Calgary Rotary Club and the Y.M.C.A.; he was president of the Lethbridge Rotary Club in 1920 and vice-president of the Lethbridge Board of Trade in 1923-24. He was a member of First Baptist Church in Calgary and in 1942 he headed a division of the Red Cross-Community Chest drive. Mr. Porter's interest in the welfare of the profession was greatly in evidence in his activities on behalf of the Institute and particularly by his unremitting efforts in the movement for the registration and licensing of professional engineers in Canada. For some years a member of the council of the Alberta Association of Professional Engineers, he was vice-president of that organization in 1923-24 and was chairman of a committee of the Institute which studied the relations of the Institute with the Provincial professional associations.

Sam Graham Porter's death leaves a gap in the ranks of the profession which will not too easily be closed. It is safe to assume that he must have derived a considerable satisfaction in seeing the pioneer work of his committee commence to bear fruit in the co-operative agreements which have been affected between the Institute and five of the provincial professional associations of which that in his own province in Alberta is one.

He is survived by his widow, a daughter, Mrs. Jack Stewart of Red Deer, Alberta, and a son, Robert, of Edmonton, and to these The Engineering Institute of Canada extends its most sincere sympathy.

John Hegan Parks, M.E.I.C., died at his home in Calgary, Alberta, on October 21st, 1947. Born in St. John, N.B., in 1874, he entered the Royal Military College at Kingston in 1892. Upon graduation in 1896, he was appointed lieutenant in the 8th Princess Louise Hussars in New Brunswick. At that time, also, he entered the employ of the Canadian Pacific Railway and was in the party sent to survey the Crow's Nest Pass.

Upon the outbreak of the South African War, Mr. Parks resigned from the Hussars and joined the 1st Canadian Mounted Rifles, later known as the Royal Canadian Dragoons, in 1899, as a trooper. He served with this unit in South Africa, and upon their return to Canada, was transferred to the Imperial Military Railway with which he served as a assistant engineer until the end of the War. He stayed in South Africa after the War, and, at the time of leaving in 1909 held the position of district superintendent of the Central South African Railways with headquarters at Johannesburg.

When Mr. Parks returned to Canada, he worked for a short time with the C.N.R. and in private engineering enterprises in Victoria and Vancouver. At the outbreak of the First World War, he joined the Seaforth Highlanders with the rank of captain. He went to France with the 1st Battalion and was wounded at the 1st Battle of Ypres. He was awarded the D.S.O. and mentioned in despatches. In November 1915 he was seconded to the War Office for duty with the Royal Engineers in the Salonica Expeditionary Force and served with this unit until February 1919, during which service he was made an Officer of the British Empire, awarded the Order of White Eagle, 4th Class, by the Serbian Government, and was again mentioned in despatches. At the end of the war he held the rank of lieutenant colonel.

Upon his return to Canada, Colonel Parks purchased an orchard in the Okanagan Valley which he operated until 1924 when he again returned to the engineering field. In 1925 he moved to Calgary where he became district engineer for the Board of Railway Commissioners (now known as Board of Transport Commissioners), which post he held till his retirement in December 1945, after several extensions granted him due to the War.

Mr. Parks was a member of the Military Institute in Calgary. He joined the Engineering Institute in 1902 as an Associate Member, becoming a Member in 1911 and a Life Member in 1940.

Frank Alexander Barbour, M.E.I.C., who was born in Saint John, N.B., in 1869, died suddenly May, 1947, on a private golf course near his home in Framingham Center, Mass.

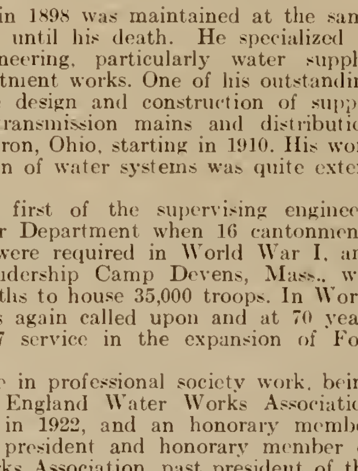
Mr. Barbour graduated from the University of New Brunswick in 1888 with an A.B. Degree. He was at first engaged in railroad survey and construction work in Canada, but went to Boston after a few years. There he did railroad location work in New England and after an engagement on the Sudbury Water Supply for the City of Boston he was connected with the City of Brockton, Mass., on the development of water and sewerage work; and then he met F. H. Snow, with whom he was later associated in private practice in Boston until 1905.

The office established in 1898 was maintained at the same location by Mr. Barbour until his death. He specialized in municipal sanitary engineering, particularly water supply, sewerage and sewage treatment works. One of his outstanding accomplishments was the design and construction of supply works, filtration plant, transmission mains and distribution system for the city of Akron, Ohio, starting in 1910. His work on appraisal and valuation of water systems was quite extensive in later years.

Mr. Barbour was the first of the supervising engineers selected by the U.S. War Department when 16 cantonments for the National Army were required in World War I, and through his energetic leadership Camp Devens, Mass., was constructed in three months to house 35,000 troops. In World War II Mr. Barbour was again called upon and at 70 years of age repeated his 1917 service in the expansion of Fort Devens.

Mr. Barbour was active in professional society work, being a member of the New England Water Works Association since 1894, its president in 1922, and an honorary member since 1934. He was past president and honorary member of the American Water Works Association, past president of the Boston Society of Civil Engineers, life member and past director of the American Society of Civil Engineers, and author of numerous technical articles. Mr. Barbour joined the Engineering Institute in 1904 as a Member, and was awarded Life Membership in 1947.

John B. D'Aeth, M.E.I.C., who was chief engineer of the Dufresne Engineering Company Limited, Montreal, died suddenly on November 25th, 1947, at Trois Rivieres, Que.



John B. D'Aeth, M.E.I.C.

He was born in 1885 at Montego Bay, Jamaica, B.W.I., and he studied at McGill University, Montreal, graduating in 1908 with a B.Sc. degree in civil engineering. On leaving university he returned to Jamaica, where he was engaged on the construction of reinforced concrete buildings following the earthquake of 1907. Later, he went to the Ambursen Hydraulic Construction Company as resident engineer on the development of the Barnett Shoals Hydro Electric Development at Athens, Georgia, after which he returned to Canada, and in 1912-1913 he was field engineer on the construction of the Saskatoon Street Railway.

In 1914, he joined the staff of the Quebec Streams Commission, being engaged on river investigation and survey work, and later he was resident engineer on the construction of the Gouin dam on the Upper St. Maurice river. Upon completion of that project, Mr. D'Aeth joined Fraser Brace, Limited, and was construction engineer on the Big Eddy dam in Ontario for the International Nickel Company and the Great Falls hydro development in Manitoba. Later he became designing engineer for the company, during which time the following works were either wholly or partially designed by that firm and under his direction: the hydro-electric development at Deer Lake, Nfld.; Chelsea and Farmers developments on the Gatineau river; the Big Eddy power house on the Spanish river; the log chute at Aubrey Falls, Ont.; for Carpenter Hixon Company Limited; Island Falls hydro-electric development on the Churchill river for the Hudson Bay Mining and Smelting Company Limited.

Mr. D'Aeth joined Dufresne Engineering Company Limited in Montreal in 1938. At the time of his death he was chief engineer of the company, and was at Trois Rivieres supervising construction work on the new bridges between Three Rivers and Cap de la Madeleine over the St. Lawrence River.

Mr. D'Aeth joined the Institute in 1916 as an associate member and transferred to Member in 1924. Active in the Montreal Branch, he was its chairman in 1936.

Colonel H. R. Lynn, M.E.I.C., of Montreal, whose activities in flame warfare in the recent war are well known, died on November 25th in hospital after a short illness.

Col. H. R. Lynn, M.E.I.C.

Born in Victoria, B.C., in 1890, he studied engineering under the late W. L. Lynn, C.E., M.E., and he worked first for the city of Edmonton sewerage department. In 1915 he went overseas in command of engineering troops (Pioneers). He attained the rank of major in France and commanded railway troops. On his return he was field engineer for Fraser Brace Limited at Edmonton for a time, but he settled in Thetford Mines, Que., in 1920. There he was associated with the Maple Leaf Asbestos Company and the Canada Slate Corporation. He went into partnership with W. K. MacLeod and formed Lynn, MacLeod Engineering Supplies Limited and a subsidiary company, Lynn, MacLeod Metallurgy Limited. Activities were later extended to Trois Rivieres, Ottawa and Montreal.

At the outbreak of the second World War, H. R. Lynn enlisted for active service and proceeded overseas as second-in-command of the 1st Battalion, R.C.E. He was promoted to the rank of lieutenant-colonel and officer commanding the battalion in 1941 and was chosen to develop flame warfare in the Canadian Army in conjunction with the British. His work resulted in the Canadian Ronson Flame Thrower, which brought him the appointment of commander of the Canadian Petroleum Warfare Experimental Unit, R.C.E. The unit produced the first thickened fuels for flame throwers ultimately adopted by the British Army. Colonel Lynn conceived the idea of area incendiarism and developed the unit Aeroflame, a device which laid a carpet of flame from an aircraft over a target. He developed new fuels from collodial magnesium suspended in hydrocarbons, which were used in Aeroflame, the British 9.75 Mortar and the Rocket Mattress, this fuel being unextinguishable and most effective on wet targets such as the jungles of the Pacific and under winter conditions in Europe. He participated in the development of fog dispersal and acted as consulting engineer on such installations in the Aleutians. After his promotion to full colonel in 1943, he was technical adviser to the British Petroleum Warfare Department. He co-ordinated production of the Hays Cable in the U.S., and helped to build the Hays Under-Channel Pipe Line project from England to France.

Colonel Lynn retired from the Army in 1946 and resumed his activities with the Lynn, MacLeod companies in Montreal. He had joined the Engineering Institute in 1920 as an associate member, transferring to member in 1940.

P. J. Jennings, M.E.I.C., who was superintendent of the Banff National Park, Alberta, died on November 14th at his home in Calgary.

Born in Canterbury, Kent, England in 1881, Mr. Jennings studied science in England and was an articled pupil in engineering for three years. In 1903 to 1915 he was assistant engineer engaged on preliminary surveys and estimates and design of water supply dams, pipelines, river crossings, etc., at Port Elizabeth, Cape Colony, South Africa. Later he was resident engineer on the construction of Sand River Dam, and the Bolk River Dam, in South Africa. He came to Canada in 1908, and contracted in Manitoba to build 250 miles of telephone lines. The next year he joined C.P.R.'s irrigation department. He first worked on the construction of the company's irrigation system north of Strathmore, Alta. In 1911 he joined the irrigation branch of the Department of the Interior and remained with the department until retiring in 1946. He had then been superintendent of Banff National Park for fifteen years.

Mr. Jennings served from 1900 to 1902 in the South African campaign, and he joined the 4th Canadian Pioneers as an adjutant when the First World War broke out, serving overseas for three and a half years. He received a mention in despatches and the O.B.E. for service in East Africa along the Abyssinian border, where he met Salomi chiefs to arrange terms of punishment for treachery during the war. He was the first white man to enter that territory in two years. Major Jennings was again awarded the O.B.E. in 1946 for " special and extra services rendered during the war " but, as he had already been awarded the decoration, the second was cancelled.

Major Jennings was one of the original members of the Alberta Military Institute, he was director in 1928 and 1929, and was district intelligence officer at M.D. 13 from 1921 to 1925. He was a Charter Member of the Calgary Branch of the Engineering Institute, chairman of the Branch in 1922-23, and Councillor representing the Branch in 1928. He was also a member of the Alberta Association of Professional Engineers.

Robert H. Stevens, M.E.I.C., of Victoria, B.C., died on August 16th, 1947. He had been, until March, 1947, engineer of the municipality of Esquimalt, B.C. Born in Weymouth, Dorset, England, in 1883, he was articled in 1897-1902 as surveyor and civil engineer in the office of the borough surveyor and engineer of Weymouth. He was then appointed an assistant in the same office, and he spent some time as engineering assistant in the London County Council, Spring Gardens, in London, before coming to Canada in 1908.

He entered the City Waterworks Department in Edmonton, Alta., and remained in its service until 1943. As technical assistant he supervised water main construction, statistics and plans. He made surveys for water waste over the entire system. He resigned as waterworks engineer for the city when he went in 1942 to join the staff of the R.C.A.F., No. 2 Western Command, at Comox, B.C., as assistant waterworks engineer. In 1944 he was appointed municipal engineer for post-war public works for the township of Esquimalt. He continued as engineer for the municipality for two years, also supervising a project of Central Mortgage and Housing Corporation, at Lake Cowichan, B.C.

Mr. Stevens joined the Institute in 1927 as an associate Member, becoming a Member in 1911 and a Life Member in 1940.

NEWS of the BRANCHES

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

CALGARY BRANCH

J. F. Langston, M.E.I.C. - - *Secretary-Treasurer*
T. M. Parry, M.E.I.C. - - - *Branch News Editor*

A regular general meeting of the Calgary branch was held on Thursday, November 13, in the Palliser Hotel, with R. T Hollies in the chair.

At the invitation of the acting chairman, Lieut.-Col. Beaman, O. C. Engineers, Western Command, gave a short talk on the work and organization of the military engineers. He pointed out that the qualifications of the military engineer, professionally, were very similar to those of the civilian engineer. The general organization of this branch of the service, in both the active and the reserve forces, was outlined briefly. Col. Beaman stated that the Alaska Highway was one of the major concerns of the engineers of the Western Command at the present time.

Attention was drawn to the existence of the Military Engineers Association comprised of former, and serving sapper officers, both active and reserve.

In closing, Col. Beaman asked for the support and interest of the Calgary branch of the E.I.C. towards the local units of the reserve army engineers.

A vote of thanks to the speaker on behalf of those present was moved by J. McMillan.

The attention of the meeting was again drawn to the luncheon meetings on Wednesdays, at 12.15 noon, in the Empress Grill.

Four interesting films were then shown. " Scotland, Land of Invention ", dealt with the work of some of the famous inventors in the past of that country—McAdam, Watt, Murdoch, Naismith and others. " One World or None " showed in a thought-provoking manner the effect of the atomic bomb on warfare, compared to previous methods. A third film, " Hydraulics " gave some interesting applications of the behaviour of water under the application of pressures. A different treatment of water under the title of " Water Sports " was covered in the final film.

Following the film showing, an enjoyable smoker was held which gave members and guests a real opportunity of getting together. A count of the attendance indicated that some 100 members and their guests were present.

❖ ❖ ❖

A regular general meeting of the Calgary branch was held on November 27 at the Palliser Hotel, when Professor J. A. Harle presented a paper entitled, **Influence of Short Circuit Testing Stations on Circuit Breaker Design.**

Professor Harle, recently appointed professor of electrical engineering at the University of Alberta, Edmonton, came to Canada after some 27 years of experience in circuit breaker design and testing as a member of the staff of the short circuit testing station of Great Britain.

In his opening remarks, Professor Harle, who was introduced to the gathering by H. Randle of the Calgary Power Company, stated that circuit breaker design in the early days consisted of a lot of guess work. Today, it has advanced to the point, in Great Britain at least, where testing is a routine matter, free of the former excitement of "blow-ups" when units undergoing test, disintegrated violently. Some of the causes of these spectacular failures were traceable to inadequate breaking of the arc, inadequate contact strikes, lack of enclosure strength and mechanical weaknesses.

Mr. Harle illustrated his paper with several graphic slides and photographs of the testing stations and its special facilities. Two interesting films followed, which showed various types of breakers undergoing test. Many cases of failures and their causes were viewed.

During the question period it was indicated that there is no similar station in Canada where breakers may undergo tests to determine whether they meet the adopted standards. Canadian practice is, in general, to accept circuit breakers which have passed American or British requirements.

A vote of thanks to Professor Harle for his interesting paper was moved by R. McKay, superintendent of the Calgary Electric Light Department.

There were 42 members registered, and 9 guests.

EDMONTON BRANCH

W. W. Preston, jr.e.i.c. - *Secretary-Treasurer*

The policy of the Alberta government for protecting the interests of both the owners of the surface rights of her oil land and of all the tax payers of Alberta, was presented by Hon. N. E. Tanner, Minister of Lands and Mines, in his address on **Oil Development in the Province of Alberta,** at the annual joint dinner meeting of the Association of Professional Engineers of Alberta, the Edmonton Branch of the E.I.C., and the Northern Alberta Branch of the Canadian Institute of Mining and Metallurgy. The meeting was held on Friday, December 5th, in the Macdonald Hotel, under the Chairmanship of J. S. Irwin, president of the A.P.E.A. The attendance was about 150.

Mr. Tanner reviewed the practices of the Dominion Government prior to the transfer of the administration of natural resources to the Province in 1930. He outlined the complications concerning the mineral rights and the surface rights, and stated that the Provincial Government now collects royalties only on crown lands, which represent about half the total area producing at the present time.

The policy of the Province, the speaker stated, is based on five points:

1. The Province must help to get development. Until recently, 90 per cent of the Dominion's oil requirements had to be imported.

2. The development must be carried out according to the best engineering practice for the best recovery of the oil. Drilling and production quantities are controlled by the Alberta Natural Gas Conservation Board which has done excellent work since its formation in 1938.

3. No monopolies must be allowed, even for the Government. An oil company may lease land in blocks located corner to corner as in the black squares of a checkerboard. The interlying property may then be rented by any other company by sealed tender.

4. The Province must see that its people obtain a share of the returns. The oil companies must pay a royalty based on production, amounting to from 5 to 15 per cent, and must also pay rent at a dollar an acre per year, on crown land.

5. The owners of the surface rights must be treated justly. When the oil company and the land owner cannot agree, the Arbitration Board may give the oil company the right of entry in return for a payment which the Board considers fair.

In conclusion, the Lands Minister defended the Government's policy of staying out of the oil production business. He claimed that a billion dollars a month is being spent on the search for oil. If no oil were obtained this sum would be lost—a hazard the Government avoids. In terms of total amounts, he said that the oil companies had spent 165 million dollars, and collected only 155 millions—a loss of 10 millions—while the Government collected 16 millions from royalties and rental.

Mr. Tanner was introduced by the Chairman, J. S. Irwin, and was tendered a hearty vote of thanks on a motion of J. Garrett. During the evening Miss Bernice McBeth sang.

HALIFAX BRANCH

J. D. Kline, m.e.i.c. - - *Secretary-treasurer*
M. L. Baker, m.e.i.c. - - *Branch News Editor*

Has the Engineer a Place in Community Planning? was the subject of a timely and interesting address given to the members of the Halifax Branch at the dinner meeting on November 27 in the Lord Nelson Hotel. The speaker was Ira P. Macnab, m.e.i.c., general manager, Halifax Public Service Commission and vice-president of the Nova Scotia Division of the Community Planning Association of Canada.

In his introduction, the speaker gave a resumé of the National Conference on Community Planning which he recently attended in Montreal. In naming the principal speakers at this conference, he pointed out that not only were engineers prominent among the speakers but that each engineer had a wide knowledge of all phases of community life as well.

Mr. Macnab explained that the C.P.A.C., this is, the Community Planning Association of Canada, was the outcome of a conference in 1946 of provincial planning officials and technical experts. Since its formation, the C.P.A.C. has had a rapid growth. By the end of August, 1947, it had organized divisions in British Columbia, Manitoba, Ontario, Quebec, and Nova Scotia, and it was expected, in the near future divisions would be set up in the remaining provinces. The number of individual members in the Association was given as 298, while the number of co-operating agencies, of which the E.I.C. is one, was 15.

The overall picture of Community Planning was then discussed. It cannot be considered as being confined to any one municipality, but must be a joint effort of continuous municipalities. In fact, it is provincial in its scope.

Of the many and varied problems entering into Community Planning, the following were treated at some length.

1. The problem of providing decent living facilities for those who, for financial reasons or otherwise, are inclined to lodge in areas that eventually deteriorate into slums.
2. The problem of providing services, such as streets and street lighting, water, sewers, fire protection, schools, etc., for rapidly growing areas on the outskirts of the larger cities and towns or in the rural areas round about.
3. The problem of sanitation and sewage disposal.
4. The problem of providing safe and adequate transportation.

In addition, provision for education, for places of worship, for public libraries, for public auditoriums, and for recreational facilities are problems that come within the broad field of Community Planning. Many others can be suggested, such as the elimination of heavy street grades, the question of zoning, proper build-codes and building control, and the attraction and location of new industries.

Mr. Macnab emphasized the opportunities that were presented to trained engineers to play a part in Community Planning programmes. He suggested that engineers look on their training not only for the purpose of making a living but as a training which must be used to benefit their fellow men. That the subject is of vital concern to engineers is shown by a study of the activities of the Engineering Institute Council during the last two years.

A vote of thanks to the speaker was moved by H. W. L. Doane and seconded by A. E. Priest. Guests at the dinner, which was attended by about fifty members, were: C. L. Beazley, Deputy Minister of Municipal Affairs for Nova Scotia, and R. T. Donald, president of the Nova Scotia Division of the Community Planning Association of Canada. E. C. O'Leary, chairman of the Halifax Branch, presided.

HAMILTON BRANCH

L. C. Sentance, m.e.i.c. - - - *Secretary-Treasurer*
I. M. Macdonald, jr.e.i.c. - - *Branch News Editor*

The regular monthly meeting of the Hamilton Branch of the Institute was held at the Science Lecture Theatre, McMaster University, on October 23rd, 1947, with approximately 50 members and guests present. Vice-Chairman W. E. Brown presided, and called on Neil Metcalf to introduce Mr. Redfern, the speaker of the evening.

W. Blaine Redfern, m.e.i.c., an honour graduate of the University of Toronto in 1909, has specialized in public health projects for many years, in nearly every community of any size in Ontario. As a member of the firm of consulting engineers, Proctor, Redfern and Laughlin, he is eminently qualified to discuss the latest trends in treatment of sewage and trade wastes.

Mr. Redfern began his address, entitled **Stream and Lake Pollution, and Sewage Treatment Plants,** with a plea for the maintenance of the purity of Canadian waters. Our ideal, he said, should be to keep the waters in the rivers, lakes and streams pure. Lakes and rivers in Ontario provide a cheap means of sewage discharge because of oxidation processes carried on in the water. Of 150 municipalities in Ontario which have sewage systems, only 75 have sewage treatment plants of any description. Describing sewage treatment plants, Mr. Redfern told of the various processes from screening for removing rough materials, to chlorination which he asserted was one of the best instruments for purifying sewage at the disposal of the sanitary engineer. In general, sewage treatment consists of screening, settling, digesting, aeration if more treatment is required, and disposal of the purified product.

At the end of the address, a lively discussion period was enjoyed by those present. Mr. Redfern was called on to answer many general questions concerning sewage disposal. Considerable discussion was held on Hamilton's method of disposal and any effects it may have on the health of the community, and City Engineer W. L. McFaul, and Medical Health Officer Dr. Davey, supplied much interesting information on this topic.

It was moved by Mr. Hollingsworth that the Hamilton Branch of the Institute study Hamilton's sewage disposal system, and support any recommendations for improvements which an appointed committee may submit.

❖ ❖ ❖

The Annual Ladies' Night of the Hamilton Branch took the form of a dinner meeting at the Scottish Rite club on November 17, 1947. One hundred members, guests and ladies were present to enjoy this function, and to hear the speaker of the evening, Mr. Charles B. Pearce.

Mr. Pearce is manager, Laundry Equipment Section, Appliance Division, of Canadian Westinghouse Company. He chose as his topic, **The Electric Home of Tomorrow,** a subject of particular interest to the ladies.

Mr. Pearce began by describing the many features the housewife desires in her home and in the electrical appliances used there. She dreams of an automatic washing machine which she can turn on and leave. When she returns, the clothes have been washed, rinsed and dried enough for ironing. She dreams of an electric range which can be pre-set to cook as she wishes while she goes shopping. She dreams of an electric iron, neither too hot nor too cold, and adjustable for different materials. She dreams of an electric air cleaner which cuts dust in the house to a minimum, so that dusting need not be done more than once a week. She dreams of a heater which will supply hot water continually; of a device for disposing of garbage; and of a machine which will do her ironing. She dreams of beauty as well as utility in all her electrical appliances—porcelain enamel, de luxe and chrome finishes which are durable and easy to keep clean. All these things, and many more, make up the electric home of the future.

" The housewife need dream no more," said Mr. Pearce. All these things are here now, and many are in every day use. Such things as automatic washers, automatic ranges, automatic irons, precipitrons, newly designed water heaters, garbage disposal units, and ironing machines make the housewife's load much lighter, and are a reality, not a dream of the future.

Two interesting films were shown during Mr. Pearce's address. The first, " The Dawn of Better Living ", pictured many of the appliances described by Mr. Pearce; the second, " Music in the Air ", showed a broadcast of the Westinghouse programme starring John Charles Thomas.

LETHBRIDGE BRANCH

Thomas Miard, m.e.i.c. - - *Secretary-Treasurer*
J. A. Haberman, s.e.i.c. - - *Branch News Editor*

On Saturday evening, November 15th, at a meeting of 27 members of the Lethbridge Branch, held at the Marquis hotel, K. K. Balderson of Magrath, Alta., entertained with a talk and slides on living conditions on the island of Trinidad in the Caribbean.

Trinidad, a tropical island 70 miles wide and about 100 miles long, situated off the coast of South America about 30 miles north of Venezuela, is inhabited by about 500,000. This population is made up of one-third African blacks, descendants of early slaves brought to the island by the British, one-third East Indians brought to the island after abolition of slavery, and a remaining third which is a conglomeration of practically all races. The chief industry of this crown colony is sugar cane production, but with the discovery of oil the island became important as a petroleum centre.

The oil industry on the island is controlled by a British Company known as Trinidad Leaseholds Limited, with which company the speaker served. The refinery at Pointe-a-Pierre, whose operation capacity is 50,000 barrels per day, is the largest in the British Empire, and is supplied by Leaseholds' wells at Forrest Reserve, some small independent companies on the island, and to some extent by additional crude oil from nearby Venezuela. The refinery and wells are operated by a staff of about 5,000 of which only about 400 are white, made up mostly of British, Canadians and Americans. This staff is housed in company-owned towns at Pointe-a-Pierre, under conditions well described by Mr. Balderson with the help of fine coloured slides of photographs taken by him while employed as an electrical engineer on the island.

Mr. Balderson's talk, well received by those present, was followed by two interesting reels of pictures shown by courtesy of the Shell Oil Company.

Dinner music by Brown's trio and especially solos by Miss Ella Findlay were much enjoyed features of the programme.

MONTREAL BRANCH

BRANCH DANCE

This dance will be held at the Mount-Royal Hotel Ballroom on February the 13th, 1948. A Buffet Supper will be served and a Bar will be operated in the Brittany Room.

Dress: — Informal — Cost: — $4.00 per couple.

Members are asked to purchase their tickets early and to encourage their friends to attend.

ANNUAL MEETING

The Annual Meeting will take place on January the 22nd, 1948 at E.I.C. Headquarters. It is the intention to keep business down to a minimum with the hope that members will avail themselves of this opportunity to get together for an enjoyable evening.

QUESTIONNAIRE

The Annual Report outlines certain services rendered to the branch membership. The report is accompanied by a questionnaire which the Branch Executive hope will be completed and returned as an indication of what further activities are desired.

Junior Section

The third Annual Dance of the Junior Section was held on Friday November the 28th, in the Ballroom of the Ritz Carlton Hotel with a record attendance of nearly 600 guests. Special guests of the Junior Section included Mr. J. M. Crawford, Chairman of the Montreal Branch and Mrs. Crawford, Mr. J. A. Beauchemin, Past-Chairman of Montreal Branch and Mrs. Beauchemin, Mr. J. B. Sterling, Past-Chairman of Montreal Branch and Mrs. Sterling. The 4 student final contestants at the Annual Students' Night, Guy Perreault and Louis Desrosiers of the Ecole Polytechnique and R. V. Kovacs and J. P. G. Kemp of McGill University were also guests for the evening.

Leo Scharry and Florian G. Leroux were delegates of the Junior Section representing the Junior Engineers at the recent convention of The Quebec Federation of Youth Movements held at the University of Montreal on November the 29th and 30th.

On Monday, December the 8th, R. E. Heartz, vice-presi-

At the Third Annual Dance—Front row: Mrs. J. M. Crawford, Mrs. R. Griesbach, Mlle J. Desjardins, Miss M. Montgomery. Back row: Mr. J. M. Crawford, Bob Griesbach, Leo Scharry, John McPherson.

dent and chief-engineer of the Shawinigan Engineering Company Limited, gave a talk on Developments in Hydro Power. Mr. Heartz dealt specifically with power developments on the St. Maurice River and illustrated his talk with a 40 minute film showing the progress of construction in the carrying out of the La Tuque project. Both the talk and film were much appreciated by those in attendance.

OTTAWA BRANCH

C. G. Biesenthal, m.e.i.c. - *Secretary-Treasurer*
R. C. Purser, m.e.i.c. - - - *Branch News Editor*

At the noon luncheon at the Chateau Laurier on November 13, Col. J. P. Carrière, city manager and chief engineer of Hull, spoke on **City Management—A New Field of Action for Engineers.** He was introduced by Louis-George Trudeau and was thanked by W. F. M. Bryce. Major-General G. R. Turner, chairman of the Ottawa branch, presided.

The speaker compared the city manager system to the method of administration in most business firms, maintaining it was quite simple in principle. Property owners he compared to shareholders in a company, who elected a board of directors—city council—to lay down policy. The council then appoints a trained administrator as city manager.

This system has been adopted in more than 720 cities in America. While varied abilities were needed, more than half of the city managers appointed were engineers. In the province of Quebec this was the case with 24 of the 29 city managers.

" The story of improved government under the manager plan is a story of reduced costs of operation and of increased service, of government removed from politics and operated in a business-like manner," said Colonel Carrière.

❖ ❖ ❖

The Ottawa branch held a smoker on the evening of November 14 at the De Salaberry Armouries, Hull, at which about 200 members and male guests attended. Col. J. P. Carrière. Hull, of the Management Committee, acted as master of ceremonies in the absence of the Branch Chairman, Major-General G. R. Turner, who was called to Toronto.

Entertainment included songs by the Gatineau Troubadours, and a programme of magic as well as other features. A buffet lunch was served.

❖ ❖ ❖

At the noon luncheon November 27, the Ottawa members were treated to a most interesting address by Maj.-Gen. J. F. M. Whitely, commandant of National Defence College, Kingston, on **My Experiences with Eisenhower.**

General Whitely, deputy chief of staff to Eisenhower in North Africa and a member of the general's staff until the end of the war, said he thought Eisenhower's success as supreme commander of the Allied forces was due to the fact that he got " the complete confidence of all those with whom he came in contact ".

Eisenhower's sincerity, singleness of purpose, courage and sense of humour made him a chief who was neither American nor British in the eyes of his men. Gen. Whitely said " Allied unity, to Eisenhower, was not only a belief, it was an obsession. He would brook no opposition to it."

Eisenhower would travel amazing distances, by plane, by ship or by car, to speak personally to troops. A great speaker, he was able to win them regardless of nationality. He was naturally friendly and informal. He treated correspondents, for instance, as members of his staff, with equal privileges and equal responsibility. But he always spoke " straight from the shoulder ".

Gen. Whitely related many incidents of his association with Eisenhower that testified to the supreme commander's great ability as a leader.

SAGUENAY BRANCH

J. E. Dyck, m.e.i.c. - - - *Secretary-Treasurer*

Heliarc Welding was the topic of an address given by J. S. Johnston to the Saguenay Branch of the Institute on November 24, 1947.

Mr. Johnston is process service supervisor with the Dominion Oxygen Company Limited of Montreal.

With the aid of slides, Mr. Johnson discussed the construction and operation of heliarc welding equipment, showing how the use of a flow of such gases as helium or argon around the electrode produced a weld which was absolutely free of scale. The welding, moreover, can be done without the aid of any fluxing material.

The process was first attempted by using helium in conjunction with the electric arc, and from this resulted the present term, *heliarc welding.* Since helium is difficult to get, it has been largely replaced by argon gas.

Heliarc welding is especially suited to welding of such materials as aluminum, stainless steel, copper and brass. The samples of welded plate presented by Mr. Johnston showed uniform welds with good penetration. In cases where automatic welding machine had been used the finished job required no touching up even on very particular work.

At the close of the meeting Mr. Johnston gave a demonstration of heliarc welding on aluminum, giving the meeting an opportunity to see the actual process and to examine the equipment used.

Junior Section

F. H. Duffy, jr.e.i.c. - - - *Secretary-Treasurer*

A meeting of the Junior Section, Saguenay Branch of the Engineering Institute of Canada was held at the Arvida Protestant School at 8.15 p.m., Thursday, December 11, 1947.

H. V. Paige of the Aluminum Company of Canada, Limited addressed the meeting on the subject of **Process Control and Development in a Motion Picture Laboratory.**

Mr. Paige spent some time with the National Film Board and based his address on his experience with this organization. He briefly traced the procedure followed in producing a film after it has been decided upon, and the use of library stock films and location shots to provide a complete picture. A description followed of the processes involved in controlling defects in the picture due to camera faults, improper developing or printing of the negative. The speaker then outlined the work of the development department of the organization. This included testing of new developing solutions and investigation of new or better methods of producing films. While he dealt only with black and white pictures, the speaker in conclusion mentioned the more complicated field of color photography and the rapid expansion of the film industry in countries other than the United States.

The speaker was introduced by the chairman, C. J. Tanner, and thanked on behalf of the Section by T. T. Anderson. The address proved very interesting to everyone attending the meeting.

SAINT JOHN BRANCH

J. H. C. MacLure, m.e.i.c. - - *Secretary-Treasurer*
A. R. Bonnell, m.e.i.c. - - - *Branch News Editor*

The regular monthly meeting of the Saint John Branch was held on Thursday evening, Nov. 20, in the Admiral Beatty Hotel, with the Chairman L. O. Cass presiding.

The guest speaker for the evening was J. L. E. Price, general manager of J. L. E. Price Company Limited, general contractors, Montreal, and chairman of the Canadian Legion Committee on Veterans Housing.

Mr. Price chose as his topic **Modern Housing.** He spoke at length of the problems facing low cost housing, stating that these problems have not yet been solved due mainly to the high cost of labour and materials to federal, provincial and municipal bodies playing " political football ".

Insurance companies, stated Mr. Price, through Housing Enterprises Limited, produced houses far out of reach generally of the income of those needing houses. He thought that under the integrated housing scheme, small contractors could produce a much cheaper house, but this would still be out of reach of people in small income brackets.

Mr. Price suggested that veteran housing could only be solved by a system whereby the veteran built his own home with a 100 per cent government loan at a low interest rate over a period of 30 years.

A vote of thanks was extended to Mr. Price by Packard Campbell. John Flood in seconding the vote of thanks stressed multiple housing as the only solution to low cost housing.

❖ ❖ ❖

The annual meeting of the Saint John Branch was held Wednesday evening, December 10, in the Admiral Beatty Hotel, with the Chairman L. O. Cass presiding.

As usual at the annual meeting, there was no guest speaker. The minutes of the last annual meeting, the annual report and the financial statement for the year were presented by the secretary-treasurer, K. W. Salmon, and discussed. The scrutineers presented their report on the count of the ballots for the election of officers. After brief addresses by the new officers, the meeting adjourned.

SASKATCHEWAN BRANCH

D. W. Houston, M.E.I.C. - *Secretary-Treasurer*
R. Bing-Wo, M.E.I.C. - *Branch News Editor.*

The regular monthly meeting of the Regina branch was held on November 21st, in the Kitchener Hotel, with approximately 55 guests present. H. I. Nicholl was chairman of the meeting. The guest speaker of the evening, J. D. Mollard, air surveys engineer, of the P.F.R.A., was introduced to the audience by G. L. MacKenzie. Mr. Mollard spoke on **Airphoto Interpretation and its Application to Engineering Problems.**

Mr. Mollard explained that some of the techniques involved in the identification of engineering soil areas was acquired from a careful study of all the elements which compose the "soil pattern." Soil patterns are a result of natural and human forces acting on the original material from which the soil was derived. The elements of soil patterns may be altered by changes in climate, but the overall pattern remains the same for a given soil profile regardless of geographical location. Instances were given such as the similarity of loess or wind blown deposits in China, Alaska and South America.

Mr. Mollard went on to explain the formation of eskers, kames, sand dunes, alluviums and moraines and how these appeared in airphotos. The practical application of identifying these forms were shown by the speaker. The use of photo interpretation to Natural Resources surveys was shown in the classification of forest reserves, soil mapping and drainage planning.

Mr. Mollard's talk was well illustrated by slides. A lively discussion and question period followed the talk. M. J. Spratt moved a vote of thanks to the speaker.

TORONTO BRANCH

E. G. Tallman, M.E.I.C. - *Secretary-Treasurer*
E. R. Graydon, M.E.I.C. - *Branch News Editor*

Problems involved in **eliminating overhead wires and cables from streets** were discussed at a meeting of the Engineering Institute of Canada, Toronto Branch, on November 27th. Members of the Toronto Section, American Institute of Electrical Engineers, were guests of the Institute. The meeting, under the chairmanship of D. G. Geiger, and with an attendance of some 170, took the form of a panel discussion by C. E. Schwenger, assistant chief engineer, Toronto Hydro Electric System; W. H. Slinn, division plant engineer, Bell Telephone Company; J. F. Neild, electrical engineer, Toronto Transportation Commission; O. W. Titus, chief engineer, Canada Wire and Cable Company, and Jacob D. Von Maur, consulting engineer, Consumers' Gas Company.

Mr. Von Maur, the opening speaker, pointed out that in Toronto a committee, without legal standing, of engineers representing the various utilities interested in underground construction—Hydro, Bell Telephone, the City, the T.T.C., and the Gas Co. had been set up to manage such matters and that a programme of underground wiring should have to go through this committee. Room underground is congested, and every move will have to be studied in advance, and carefully planned to avoid controversy. A small square of streets in the city might be done first.

Mr. Slinn stated that Bell had removed its poles from 90 per cent of the 572 miles of streets in Toronto, replacing them by a conduit system of 368 trench miles, with 3,100 manholes, yet other forms of wiring had increased. Bell's underground system in Toronto involved 63,500 pairs of wires terminating in the Elgin Building, 393 miles of underground cable, and 90 miles of cable inside buildings.

Mr. Titus expressed particular concern that any underground project should be proceeded with in orderly fashion, on a progressive plan over a 20, 30 or 40 year period. "Is there no practical limitation", he stated, "as to size or voltage to underground cables necessary" 120,000 volts had been used since 1927, and 220,000 volts used in Paris, France, since 1937. Compared with Toronto's six or seven street miles cleared of overhead, he said, Montreal has 83 street miles cleared, while Boston has 200. Baltimore has 17 per cent of its streets cleared, plus about 36 miles of main incoming highway. Pittsburgh has 52 miles cleared. These cities are comparable in size to Toronto. Our record not so good. All the wires must go underground to gain the proper effect.

Mr. Schwenger said Toronto was known as the pole-man's paradise, with over 50,000 Hydro poles, besides the 25,000 already removed. The first step is to place transformers underground and to install lighter poles. The second step is total elimination of poles. An example of the first alternative was Avenue Road here in Toronto. Support was left for street lighting fixtures and an inexpensive street lighting system, which is very important to street lighting cost. With all poles eliminated, there is expense for special standards with underground connections. There is also considerable expense for underground to supply house lighting.

To put wires underground on 572 miles of Toronto streets, he believed, would cost upwards of $150 millions. To eliminate primary feeder poles, the cost would be close to $30 millions. The question was how much we are willing to spend for aesthetic conditions.

Mr. Neild assured the meeting that the T.T.C. would be delighted to see improvements made in Toronto, would comply with any feasible plan, but until the rapid transit scheme is in operation and something is known of the changed travelling habits of the citizens of Toronto, it would be rather hazardous to promise too much on certain streets. The Toronto Railway Company, he said, turned over some 7,000 poles to the T.T.C. Since that time the mileage of their service had been doubled, but only 1,000 poles had been added. Through close co-operation with Toronto Hydro, 6,000 poles have not been erected. In 20 years the T.T.C. had placed about 150,000 feet of underground cable, while they still have 1,300,000 feet of overhead. The city, he thought, would gain little from putting trolley wires underground from an engineering point of view. Underground, they would require double the cross-section to dissipate the heat due to peak hour overloads. Some problem is involved in fire alarms, police signals, etc., which now use the public utilities' poles. There were many hidden costs, and many problems to be worked out.

Mr. Titus recognized that it costs more money "once you get below a load of 7,500 K.V.A. per square mile", to go underground, but above this loading, underground is actually cheaper. The programme for pole removal, he believed, should extend over 50 years, which would mean removal of poles from only three miles of streets a year. When poles are eliminated, however, it did not mean that wires were eliminated. A utility, he said, could not be asked to pay the expense of local underground distribution in residential streets. He felt that many people would be prepared to pay the increased costs for underground service as a local improvement over 15 to 20 years, and some localities have done this already on a limited scale. To this Mr. Schwenger answered that all new systems were watched with a view to keeping costs down. On an underground system, repairs took longer. Overhead is exposed to the elements but there is greater ease of restoring service.

Replying to a remark from the audience as to whether a buried street car trolley was feasible, Mr. Neild said a slot to eliminate trolley wires was an old subject he had worked on back in 1923. It was possible in many places, but was a hazard and a nuisance because people always poke things into slots. Commenting on "back lot" construction, Mr. Schwenger stated that back lot construction had been tried, where residents paid for improvements. After 20 years or more, the poles rot off, and it is almost impossible to change them because of growth. He was definitely opposed to this.

The elimination of overhead wires, he believed, was possible in Toronto. However, he doubted that the elimination of poles was possible. It might be possible for the Bell Telephone Company to run cable in back yards, but Toronto Hydro must still have poles for street lighting. Underground construction is not nearly so subject to breaks and interruptions, but when repairs are necessary, they are slower and more costly. Overhead wires are claimed by some to seriously interfere with fire-fighting operations in congested business districts. The gradual elimination of overhead wiring and poles should be done, but he believed it should be done by some method of advancing money year by year according to a plan, as Montreal has done.

VANCOUVER BRANCH

Alan M. Eyre, Jr.E.I.C. - - *Secretary-Treasurer*
G. W. Allan, M.E.I.C. - - *Branch News Editor*

Some eighty-five members of the Vancouver Branch of the Institute attended a meeting in the Hotel Vancouver, on October 29, to hear C. E. Webb, M.E.I.C., district engineer of the Dominion Water and Power Bureau. The speaker took as his subject **The Columbia Basin Water Resources in Canada,** a review of the investigations now in progress for the International Joint Commission.

This address, which proved extremely interesting, was published in full in the December issue of the *Journal.*

The address was followed by the showing of two motion picture films in technicolor: "The Mother of Rivers", a Canadian National Film; and "Winter Transport in the Big

Bend Area of the Columbia River Basin", filmed by Bill Harland of the Dominion Water Bureau staff.

D. J. McLeod gave an explanatory talk during the showing of these pictures, illustrating clearly the conditions and problems encountered in this project.

The number of questions asked of the speaker during the discussion period was an indication of the interest of his listeners.

VICTORIA BRANCH

S. H. Frame, m.e.i.c. - - - - *Secretary-Treasurer*
Kenneth Reid, m.e.i.c. - - - *Branch News Editor*

The first meeting of the season of the Victoria Branch was addressed by R. Bowering, m.e.i.c., on November 21, 1947. This was the first of a series of meetings to be held the third Friday of each month until June 18, 1948.

Mr. Bowering who is director of the Division of Public Engineering for the Province of British Columbia, gave a very interesting and instructive paper on **Public Health Engineering.**

He devoted the first part of his talk to an historical sketch of the different methods of combatting disease until such time as preventive measures are widely used. It is here that the engineer comes into the public health field, very noticeably, in the wholesale drainage of mosquito-infested swamps, the proper laying of sewers, the conveyance and treatment of water supplies, etc. Mr. Bowering stressed the great importance of this engineering work, and traced the work of the Provincial Health Department in public health engineering.

A discussion of some length followed his address, many questions being asked about the pollution of water, the carrying of disease, alternative preventive measures, etc.

Attending the meeting was Mayor George Muir of Nanaimo and municipal engineers from the Victoria area.

On December 4th the Branch held a luncheon meeting for the purpose of nominating the officers for the coming year, the election to take place at the forthcoming annual meeting.

WINNIPEG BRANCH

R. T. Harland, m.e.i.c. - - - *Secretary-Treasurer*

Electrical Section

L. A. Bateman - - - - - - - - - - *Secretary*
D. C. Bryden - - - - - - - - - *News Editor*

The Electrical Section of the Winnipeg Branch has now received more information on meeting dates and speakers, and the following can now be considered as definite:

January 30—Mr. G. A. Muir, special service engineer, Manitoba Telephone System, will speak on "General Mobile Telephone Service".

February 12—Mr. M. B. Mallett, head of Transformer Design Department, English Electric Company, St. Catharines, Ont., will discuss "Transformer Design".

April 15—Mr. H. R. Sills, A.C. Machines Engineer, Canadian General Electric Co. Ltd., Peterborough, Ont., will speak of "Design of Large A.C. Machines".

THE ASSOCIATION OF PROFESSIONAL ENGINEERS OF NOVA SCOTIA

Max L. Baker, m.e.i.c. - - - - *Correspondent*

Collective bargaining, insofar as it concerns the professional engineer, is an issue giving rise to numerous and lengthy discussions. The Association of Professional Engineers of Nova Scotia has consistently maintained that any collective bargaining proposal for professional workers should be such that complete control would rest with the members of the profession.

New labour legislation—the Trade Union Act—prepared for presentation to the Nova Scotia legislature last spring, followed the same wording for the definition of "employee" as that given in the Federal Bill referred to in the editorial "New Collective Bargaining Legislation" in *The Engineering Journal,* July 1947.

The Council of the Association felt that as there was no provision in the proposed Provincial Bill for engineers to do their own bargaining, it would be in the best interests of the Association to exclude a member of the engineering profession from the definition of "employee". Accordingly, the Council made representation to the Provincial Department of Labour to amend the Bill by adding the word "engineering" to the professions already mentioned therein as excluded from the term "employee": namely, the medical, dental, architectural and legal professions.

The Bill was passed with the recommended amendment and this part of the Act now reads:

> Section 2, sub-section (i)
> "*employee* means a person employed to do skilled or unskilled manual, clerical, or technical work, but this does not include
> (1) a manager or superintendent, or any other person who in the opinion of the Board is employed in a confidential capacity in matters relating to labour relations or who exercises management functions;
> (2) a member of the medical, dental, architectural, engineering, or legal profession qualified to practice under the laws of a province and employed in that capacity;"

As a result of having "collective bargaining" for the engineering profession in Nova Scotia wholly under the jurisdiction of the Association, the Council, under the authority of the Nova Scotia Engineering Profession Act, (Section 6, sub-section j) set up a committee to function as follows:

(a) to provide for the government, discipline, and honour of persons practising professional engineering and those enrolled as Engineers-in-Training within the province.
(b) to negotiate for and on behalf of any member or Engineer-in-Training in any matter pertaining to his welfare as a professional engineer or engineer-in-training.

This Committee, tentatively called the "Industrial Relations Committee", consists of three members who occupy or who have occupied responsible executive positions, three who occupy responsible positions in engineering work, and one Engineer-in-Training or a member who has been a graduate less than five years.

Dr. F. H. Sexton is Chairman of the committee. Members are C. A. Fowler, W. Wilson, G. J. Currie, G. T. Clarke, F. Morrison, J. P. Vaughan.

In general, the duties of the Committee will be to consider claims from registered engineers of unjust treatment, claims for low salaries, discipline of members, special cases brought up for investigation and action, and the handling of public relations of the Association.

Personals

Admitted to Honorary Life Membership in the Association of Professional Engineers of Nova Scotia as from January 1, 1948, are Mr. W. H. Munroe and Dr. F. H. Sexton.

Mr. Karl Whitman has been appointed Association Representative on the Senate of the Nova Scotia Technical College.

BOOK REVIEW

AIR CONDITIONING

Herbert Herkimer and Harold Herkimer, Chemical Publishing Co. Inc., Brooklyn, New York, 1947, 692 pp., illus., 5½ x 8½ in., cloth, $12.00.

Reviewed by ERIC TAIT, M.E.I.C.*

Herbert Herkimer, consulting engineer, has been engaged in the air conditioning industry for more than 30 years and has gathered a collection of notes, data and empirical formulae which has gone into the preparation of this book. Aided by his son, the result is a well rounded text which will be found useful to practising engineers as well as to students of the art.

The first nine chapters cover in detail the theory and basic principles of physics and chemistry applicable to air conditioning. These include the gas laws, properties of matter, change of state, heat transfer, heat transmission factors for building materials, heat factors in cooling, thermodynamics, air and vapour mixtures, as well as a chapter dealing with radiant heating.

The remaining fifteen chapters are concerned with the practical application of the basic principles. Fans ducts and air distribution, heating and cooling loads, dehumidification and humidification, air washers, spray systems and cooling towers, drying, cooling methods and refrigeration, unit air conditioners and central systems, auditorium cooling and by-pass systems, industrial applications and automatic controls are all treated, with a final chapter on estimating costs.

This book is fundamentally of a practical nature and will be found of most use to engineers who are designing air conditioning systems. It is not an all-embracing treatise on the subject but covers the most frequently encountered problems of design and the use of present day equipment. Several tables and empirical "rules of thumb" will be found of value to engineers requiring quick preliminary estimates of capacities and costs of equipment.

It will be noted that most of the illustrations and a considerable amount of the tabular data are taken from the A.S.H.V.E. Guide and A.S.R.E. Data Books. Arithmetical solutions to problems are preferred as opposed to graphical methods with the psychrometric chart. An appendix contains a glossary of air conditioning terms and symbols.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

ASTRONOMICAL NAVIGATION WITHOUT MATHEMATICS:

Lt.-Col. A. L. Mieville, M.E.I.C., D.S.O., M.C. N.Y., Macmillan, 1946. 25 pp., illus., 8½ x 5½ in., paper, 65c.

This little book reduces to the simplest terms the reasoning which enables us to navigate by the stars. Though the principles are based upon the usual mathematical processes, all calculations are reduced to a single sum of addition, and any subjects which might obscure the argument are avoided. This simplified method has been found most useful, since it enables anyone, at a single sitting, to master the elements of navigation and provides a firm ground upon which to base further study.

BRITISH STANDARD FOR COPPER TUBES (HEAVY GAUGE) FOR GENERAL PURPOSES, BS 61: Part 1, 1947:

London, British Standards Institution. 2/-.

This specification is a revision of that part of BS 61: 1913, concerning copper tubes, the threading details being published separately as BS 61, Part 2. In the revision, the thickness of tubes has been co-ordinated with other specifications and a number of slight alterations have been made to the outside diameter of the tubes. The standard applies to seamless copper tubes for screwed connections, and for use at temperatures not in excess of 320° F.

BRITISH STANDARD FOR COPPER TUBES TO BE BURIED UNDERGROUND, BS 1386, 1947:

London, British Standards Institution. 2/-.

This standard applies to copper tubes which are suitable for connection by means of compression fittings or capillary fittings, or by bronze or autogenous welding, and which are to be buried underground for the conveyance of water, town gas, etc. It standardized the tubes on the basis of outside diameter. Special attention is directed to the variable nature of soils and to the need for protection of tubes where they are laid in soils, particularly when the soil is of an acid nature, which has a deleterious effect on metals. Care should also be taken to ensure that the method of jointing and materials used for the joints are suitable for use underground.

BRITISH STANDARD FOR FRACTION-DEFECTIVE CHARTS FOR QUALITY CONTROL, BS 1313, 1947:

London, British Standards Institution. 6/-.

This standard describes the simplest and cheapest form of quality control, by the examination of the fraction defective in samples; it sets out accepted methods which are easy to use and can satisfactorily and profitably replace 100 per cent examination. It shows in this standard that these methods are of wide application, not only in factories but also in stores, or even shops and offices. Every method described in the standard is covered by examples from actual practice and reproductions of many actual control charts are given. A bibliography has been included.

BRITISH STANDARD FOR LOG-SHEETS FOR STEAM BOILER PLANTS, BS 1374, 1947:

London, British Standards Institution. 2/-.

This standard is intended to establish uniformity in practice in recording the performance of boiler plants, because the keeping of a proper log-sheet is an essential step towards assuring economical and efficient operation of the plant. The specification comprises a daily log-sheet and a weekly summary. Notes are given on the use of the log-sheets, including some of the deductions to be drawn from them. The sheets are suitable for a single boiler or for a battery of about six boilers with one economizer, and have been compiled with the object of introducing a simple form of boiler-house record which will provide a continuous check on the performance of the plant and the cost of fuel per 1,000 lbs. of steam generated.

BRITISH STANDARD FOR MEASUREMENT OF PHOTOGRAPHIC TRANSMISSION DENSITY, BS 1384, 1947:

London, British Standards Institution. 4/-.

This is a British reproduction of the American Standards Association Standard Z38.2.5/161-1946. It is intended primarily for photography in monochrome, and recognizes that there is no unique method of density measurement which is universally applicable, and gives in some detail a classification of the various types of density which occur in practice. Three fundamental types of transmission density are distinguished and precisely defined. Since most densitometers are calibrated in terms of diffuse density, which is usually used in expressing the characteristics of photographic materials, this type of density has been specified in detail in the standard, and sub-divided into other types that are dependent upon spectral conditions which are also specified. Three approved standard methods for determining "British Standard Diffuse Density" are given, and fully described.

BRITISH STANDARD FOR POWER DRIVEN CIRCULATORS FOR HEATING PLANTS, BS 1394, 1947:

London, British Standards Institution. 2/-.

The design of power driven circulators varies so greatly that standardization is not possible nor practical. Certain features, however, can be specified, and those dealt with here are centrifugal, axial flow, or mixed flow pumps, which create a flow in water mains for heating purposes, either direct or indirect, or for domestic hot water supplies, and deals only with pumps for water at a temperature not exceeding 200° F. This specification covers direct coupled and belt driven pumps and also sets in which the pumps are integral with the driving unit.

CANADIAN STANDARD ELECTRICAL CODE, PART I (FIFTH EDITION): Essential Requirements and Minimum Standards Governing Electrical Installations for Buildings, Structures and Premises. CSA C22.1—1947.

Ottawa, Canadian Standards Association. $1.

This standard supersedes C22.1-1939, and represents intensive study of current practices and contemporary codes of practice dealing with Inside Wiring Rules. The code is intended to establish essential requirements and minimum equipment for adoption and enforcement by Electrical Inspection Departments throughout Canada. Consideration has been given, not only to prevention of fire hazard and injury to persons and property, but also to proper maintenance and operation. Some of the additions and changes in this new edition have to do with thermoplastic insulated conductors, cellular metal floor raceways, automatically started motors, installation of lighting equipment, and fur and silk storage vaults.

CANADIAN ELECTRICAL CODE (PART III—OVERHEAD SYSTEMS)—RULES, REQUIREMENTS AND SPECIFICATIONS FOR THE CONSTRUCTION OF SUPPLY LINES CROSSING COMMUNICATION LINES. CSA C22.3 No. 1(C)—1947:

Ottawa, Canadian Standards Association, 1947. $1.00.

These specifications are designed to establish a standard of good practice in construction and maintenance of poles, towers, conductors and other similar construction items which collectively form the structure of supply and communication systems at and adjacent to those points where they cross each other.

CANADIAN ELECTRICAL CODE FOR THE CONSTRUCTION AND APPLICATION OF SUPPRESSORS FOR RADIO INTERFERENCE. CSA SPECIFICATION C22.4 —No. 108—1947:

Ottawa, Canadian Standards Association, 1947. 80c.

The purpose of this standard is to set up requirements for the construction, application and installation of suppressors for radio interference. It is divided into five sections. The first outlines general principles of the application of suppressors to electrical circuits and apparatus. The second and third give details of the types, construction and installation of suppressors for use with existing apparatus and new apparatus respectively. The fourth and fifth deal with interference suppressors for internal combustion engines and electric railways. In many cases, the type of suppressors suitable for particular applications are recommended.

CANADIAN STANDARDS ASSOCIATION CODE OF PRACTICE FOR THE USE AND CARE OF CHAIN. CSA B75—1947:

Ottawa, Canadian Standards Association, 1947. 50c.

This standard complies with the many requests that have been put forth for a specification outlining the salient features representing good practice in the use and care of hoisting or lifting chain. It is believed that all details of this Code will find appropriate application in the many usages of chain.

CANADIAN STANDARD SPECIFICATION FOR IRON AND STEEL ARC-WELDING ELECTRODES: 2d. ed. CSA W48—1947:

Ottawa, Canadian Standards Association. 75c.

This specification covers light-coated and heavy-covered metal arc-welding electrodes for the welding of carbon and low alloy steels of weldable quality. The electrodes are classified on the basis of the physical properties of the deposited metal and on the usability characteristics of the electrode. In the preparation of the code, the Canadian Standards Association has incorporated the technical features of the corresponding specification of the American Welding Society, with modifications for the differences in operating conditions between the two countries.

CANADIAN STANDARD WELDING QUALIFICATION CODE FOR THE APPLICATION TO FABRICATING AND CONTRACTING FIRMS, THEIR WELDING PERSONNEL AND EQUIPMENT. CSA W47—1947:

Ottawa, Canadian Standards Association. 75c.

This standard has been prepared by the Canadian Welding Bureau, a new division of the Canadian Standards Association. It is a revision of W47-1938, and deals with the Engineering Personnel, the Supervisory staff, the actual Welding operators, the equipment and facilities, but with each of these as elements in, and of, the Firm contributing to its capacity and efficiency.

HERITAGE OF THE ENGLISH-SPEAKING PEOPLES AND THEIR RESPONSIBILITY:

Gambier, Ohio, Kenyon College, 1946. 190 pp., 9 x 6 in., paper, $2.00.

This book is a collection of the addresses delivered at the conference on the Heritage of the English-speaking Peoples and their Responsibility, held at Kenyon College in October, 1946. Papers were given by men eminent in the fields of letters, political and economic thought, law, and religion, and most of these are incorporated, although unfortunately without the discussions from the floor. Subject matter treated includes the Anglo-American press and journalism in general; the Palestine question; a comparison of Eastern and Western thought and the influence of the English-speaking peoples on both East and West; a discussion of the heritage and responsibility which is the subject of the conference; the necessity of political scepticism; the ethical tradition in English literature; the manifestations of the English language in literature; the law in the United States; the influence of Britain and America in international economic relations; a statement of the achievements of Anglo-American democracy, and the necessity for understanding and planning to avoid destruction of our civilization in the future; our responsibilities in government and the maintenance of individual liberty; and a sermon showing the choice between the way of good and the way of evil. The collection as a whole, within the subject limits to which it is confined, presents a thought-provoking picture of our heritage and responsibility.

ICAO REGIONAL MANUAL; NORTH ATLANTIC (Doc 4500):

Montreal, International Civil Aviation Organization, May 15, 1947, illus., leather.

This Manual is intended to supply that information necessary to supplement, on a regional basis, the PICAO RECOMMENDATIONS FOR STANDARDS, PRACTICES AND PROCEDURES and the PICAO PROCEDURES FOR AIR NAVIGATION SERVICES. It is intended to serve the interests of flight and ground personnel, operational and planning personnel, civil aviation authorities, and those with a general interest in aviation. It contains five major divisions providing data relative to procedures applicable to the region, radio navigational and communication facilities, designated land and water aerodromes, instrument approach and landing charts, and general information. The Manual has been compiled primarily from source material furnished by the various North Atlantic States in response to questionnaires, supplemented by National NOTAMS, civil and military aviation publications and other valid sources. Additions and amendments are supplied from time to time. The Manual is published in the three official ICAO languages —English, French, and Spanish.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

COURS DE MECANIQUES, Tome Premier—Statique.

H. Favro. Dunod, Editeur, Paris; Loeman Freres, Editeurs, Zurich, Switzerland, 1946. 384 pp., diagrs., tables, 9¼ x 6½ in., paper, 820 fr

Intended for use on the college level, this volume is of interest to engineers, physicists and mathematicians who wish to acquire a general idea of classical mechanics. This first volume, of a proposed set of three, is divided into three parts following an introduction that covers fundamental laws and principles. The first part is on the statics of a rigid solid body. The second and third parts are devoted to the statics of an elastic solid body and hydrostatics. Problems are given at the end of each chapter. A knowledge of calculus is assumed.

ELECTRIC MOTOR MAINTENANCE:

W. W. McCullough. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 126 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $2.00.

Reviewing some of the fundamental principles of electric motors, this volume describes the procedures to be followed in the maintenance, repair and inspection of motors. The first part, dealing with mechanical maintenance, covers motor assembly, bearings, current collecting devices, and air gaps. Insulating materials, including their cleaning, drying and testing, are treated in the second part. The operating characteristics of induction, direct current, synchronous, and gear motors are covered in the last part, together with motor-generator sets and electric couplings.

ELECTRONIC TRANSFORMERS AND CIRCUITS:

R. Lee. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 282 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $4.50.

Providing a reference book on the design of transformers for electronic apparatus, this book furnishes electronic equipment engineers with an understanding of the effects of transformer characteristics on electronic circuits. The author assumes familiarity with basic circuit theory and transformer principles. Physical concepts are emphasized, and mathematical proofs are kept to a minimum. A prominent feature is the detailed treatment of important wartime developments in video and pulse transformers.

ELEMENTS OF AEROFOIL AND AIRSCREW THEORY:

H. Glauert. 2 ed. University Press, Cambridge, England; Macmillan, New York, Toronto, 1947. 232 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $3.75 in Canada.

The object of this book is to give an account of aerofoil and airscrew theory in a form suitable for students without a previous knowledge of hydrodynamics. The first five chapters give a brief introduction to those aspects of hydrodynamics which are required for the development of aerofoil theory. The following chapters deal with aerofoil lift, the effect of viscosity and its bearing on aerofoil theory, the theory of aerofoils of finite span, and the development of airscrew theory. Particular changes in the new edition have been made in the theory of viscous motion and the flow of the boundary layer. Complex mathematical analysis has been avoided as far as possible.

FM RADIO HANDBOOK, 1946 Edition:

Edited by M. B. Sleeper. FM Company, Great Barrington, Mass., 1946. 174 pp., illus., diagrs., charts, tables, 11½ x 8¾ in., paper, $2.00; cloth, $4.00.

This first edition of the FM Handbook represents an attempt to compile information on a subject that is still undergoing a period of rapid growth. Only topics on which progress has begun to slow down have been discussed. Thus, such topics as transmitters and communications equipment have been omitted. The history and theory of FM, FM broadcasting and studio techniques, coaxial cables, antennas, selective calling methods, maintenance, alignment of receivers, railroad radio installations, facsimile equipment, and FM standards are among the topics included.

FUNDAMENTALS OF ELECTRICITY AND MAGNETISM:

L. B. Loeb. 3 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 669 pp., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $6.00.

Using calculus and the gaussian system of units, this volume presents the various concepts of electricity and magnetism in terms of experimental observations and the logical deductions and inferences based thereon. In this third edition, the historical survey is reduced to an outline. Some major changes are the introduction of a section on atomic structure, including material on conduction in gases, and the inclusion of new material such as the presentation of the ferromagnetic phenomena from the viewpoint of the theory of domains. In addition, there are sections dealing with the electrical principles underlying the achievement of high-energy electrical particles, including such devices as the betatron, sychrotron, synchrocyclotron, the magnetron and klystron.

INDUSTRIAL MANAGEMENT:

W. R. Spriegel and R. H. Lansburgh. 4th ed. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 656 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $5.00.

Policies and principles of successful management are presented, with the devices necessary for carrying them out, keeping in mind the needs both of the college student and the executive. Throughout the book an effort has been made to show the interdependence of the various major departments of a business. This fourth edition has been thoroughly revised to cover the recent developments in the field, and includes as new material a chapter on maintenance. There is a broadly classified bibliography.

METALLURGY:

C. G. Johnson. 3 ed. American Technical Society, Chicago, Ill.; General Publishing, Toronto; 1946. 418 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $6.75 in Canada.

This textbook is intended to provide a working knowledge of the manufacture and behavior of metals and their alloys. Early chapters discuss the properties of metals, iron and steel production and the theory of alloys. The alloys of steel and of the more important non-ferrous metals are dealt with at some length, and separate chapters are devoted to the shaping and forming of metals, heat treatment, cast iron, and powder metallurgy. Physical metallurgy has been stressed rather than chemical metallurgy for practical reasons.

TEXTBOOK OF THE MATERIALS OF ENGINEERING:

H. F. Moore and others. 7th ed. McGraw-Hill Book Co., New York and London, Toronto, 1947. 500 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

Elementary in character, this book is devoted to the common materials used in structures and machines, together with brief descriptions of their manufacture and fabrication. Primary emphasis is placed on the strength, toughness and stiffness of stress-carrying materials. The revised edition covers many new materials of construction, developed during the war, and new methods of processing them. Additional data on plastics, synthetic rubber testing machines, and methods have been included. Reference material is given at the end of each chapter, and a section of review questions is provided.

THEORY AND DESIGN OF CYLINDRICAL SHELL STRUCTURES (Modern Building Techniques, Bulletin No. 1):

R. S. Jenkins. The O. N. Arup Group of Consulting Engineers, Calquhoun House, London, W.1, May, 1947. 75 pp., diagrs., tables, 9½ x 7 in., paper, 21s.

In addition to a thorough treatment of the design of reinforced concrete cylindrical shell structures, this publication demonstrates the use of matrix calculus as a development in the analytical methods for structures in general. The theoretical treatment is based on Jenkins' equation which enables the designer to deal with unevenly distributed pressures and temperature changes, thus allowing the actual calculations of monents, etc., formerly dealt with arbitrarily. This is the first of a series of bulletins intended to further the exchange of information concerning the science of building.

WATERBURY'S VEST-POCKET HANDBOOK OF ENGINEERING, 4th ed.:

Revised by H. W. Reddick and others. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1947. 386 pp., diagrs., tables, 5½ x 3 in., fabrikoid, $2.50.

This practical pocketbook provides mathematical engineering data under the headings of algebra, trigonometry, mensuration, analytic geometry, differential and integral calculus, theoretical mechanics, mechanics of materials, fluid mechanics, heat engineering, and electrical engineering. New sections added in this edition cover illumination engineering and radio-electronics formulae. Besides the revised tables from the previous edition, the book contains additional ones on the properties of saturated water and steam.

Although not available in the Institute Library, inquiries concerning the following new books will be welcomed there or may be sent direct to the publishers.

APPLIED THERMODYNAMICS:

By V. M. Faires. Macmillan Co., New York, 1947. 480 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $4.75.

The theories of thermodynamics involved in engineering problems are covered in an elementary fashion by this text. It is designed to be understandable to those who have not previously studied heat engines. The revised edition contains a more extensive treatment of the second law of thermodynamics, more material on the internal combustion turbine, and a chapter on heat transfer. Illustrations and equations have been added. The customary material for a thermodynamics course constitutes the main framework of the book.

CAPACITORS, Their Use in Electronic Circuits:

M. Bratherton. D. Van Nostrand Co., New York, 1946. 107 pp., diagrs., charts, 9¼ x 6 in., cloth, $3.00.

Capacitors, or condensers, are considered with reference to the basic factors which control their characteristics and which are conducive to success or failure in electronic circuits. Specifically the book discusses how a capacitor behaves under direct voltage and under alternating voltage, describes the construction and operation of mica, ceramic, air, impregnated paper and electrolytic capacitors, and considers the selection of proper capacitors. A separate chapter briefly notes some synthetic dielectrics of the future.

CHEMICAL ENGINEERING CATALOG, the Process Industries Own Catalog, 1946-47, thirty-first edition.

Reinhold Publishing Corp., 330 W. 42nd St., New York, 1946. 1758 pp., illus., diagrs., charts, tables, 11 x 8 in., cloth, free to companies in the Chemical Industries; $7.50 to foreign countries.

This annual publication provides a collected source of condensed and standardized data about equipment, machinery, raw materials, heavy and fine chemicals, and laboratory supplies used in the industries employing chemical processes of manufacture. Classified indexes to the catalog material are provided, and there is a large trade name index. The technical and scientific book section now catalogs, with brief descriptions, the Reinhold books on chemistry and related topics, and includes separate listings of similar books by three other publishers.

(Continued on page 62)

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

December 31, 1947

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the February meeting.

L. Austin Wright, General Secretary

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professionl responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practlal experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ADAMS—FRED ROBERT, of Vancouver, B.C. Born at Lachine, Que., April 22, 1910. Educ.: B.A.Sc., Toronto, 1936; R.P.E., British Columbia; 1929-30 (summers as well during univ. years), machinist Ingersoll Machine and Tool Co.; 1936-37, engr., testing & experimenting with refrig. units, engrg. dept., Universal Cooler Co., Detroit, Mich.; 1937-39, sales engr., Canada Machinery Corp., Galt, Ont.; with Canadian Liquid Air Co., as follows: 1942-44, asst. engr., engrg. dept. working on oxy-acetylene & elect. welding applications, flame hardening & oxygen-acetylene industrial piping instalns., 1944 to date, district mgr., Vancouver, B.C.

Library Notes

(*Continued from page 60*)

CIRCUIT ANALYSIS by Laboratory Methods:

C. E. Skroder and M. S. Helm. Prentice-Hall, Inc., New York, 1946. 288 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.35.

The object of this book is to provide in a single volume a wide selection of laboratory circuit experiments, including a very comprehensive coverage of the related circuit theory and laws, the theory and limitations of the necessary instruments, and the methods of making measurements. The experiments are presented as problems to induce the student to adopt an analytical approach in determining the experimental data needed, the circuits to be used, the measurements to be made, and the interpretation of the observed and calculated data for a rational solution.

COLLIERY EXPLOSIONS and RECOVERY WORK:

J. W. Whitaker and H. L. Willett. 2 ed. Sir Isaac Pitman & Sons, Ltd., London, Toronto; Pitman Publishing Corp., New York, 1946. 230 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 12s. 6d.

Following descriptions of some typical explosions, this textbook covers the conditions conducive to explosions in collieries, the ways in which they occur, preventive measures, and effective rescue methods. Separate chapters are also devoted to dust sampling and testing, and to inundations, another serious matter in coal mines. This is one of a series of British textbooks covering various aspects of the mining of coal and other stratified deposits.

DICTIONARY OF ELECTRICAL ENGINEERING:

G. W. Stubbings. E. & F. N. Spon, Limited, London, 1945. 219 pp., diagrs., tables, 7½ x 5 in., cloth, 10s.6d.

Composed of definitions of terms relating to the theory and practice of heavy electrical engineering, this small dictionary is intended for the use of students, practical engineers, and all those whose work brings them into contact with the field. A concise explanation of the more important technical terms is given. Since this book is published in England, British terminology is used.

DWELLING HOUSE CONSTRUCTION:

A. G. H. Dietz. D. Van Nostrand Co., New York, 1946. 371 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.00.

A comprehensive guide to frame building construction, this book explains in detail all of the steps involved in the complete erection of a house, from the original inspection of the site to the final coats of paint. Excavation and soils, foundations and footing design, framing details, roofing and flashing, windows and doors, lathing and insulation, etc., are described with numerous illustrative sketches and photographs supplementing the exact directions. Plumbing, heating and wiring are omitted as being separate specialized fields.

ELECTRONS (+ and —), PROTONS, PHOTONS, NEUTRONS, MESOTRONS, AND COSMIC RAYS, revised edition 1947:

R. A. Millikan. University of Chicago Press, Chicago, Ill., 1947. 642 pp., illus., diagrs., charts, maps, tables, 7½ x 5 in., cloth, $6.00.

Continuing the expansion of the author's original small work, "The Electron", this new edition replaces the last fifty pages of the previous edition by some 200 pages of new material under the following headings: release and utilisation of nuclear energy; geomagnetic studies on cosmic rays at low altitudes; discovery and significance of the mesotron; nature and number of the incoming primary rays; and the atom-annihilation hypothesis as to the origin of cosmic rays. The first 400 pages, dealing with the progressive developments in atomic theory, the mechanism of ionization, waves and particles, the neutron, and the release of nuclear energy, remain much the same except for the addition of new knowledge such as values of units, etc.

ELEMENTARY FLUID MECHANICS:

J. K. Vennard. 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 330 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $4.00.

Fundamentals, physical properties, and fluid statics are discussed in the beginning chapters, followed by a chapter on frictionless flow to lay the groundwork for a number of important principles arising therefrom. The principles of similarity and dimensional analysis are similarly considered, as important tools for future use. The discussion of frictional processes leads to flow in pipes and open channels, and fluid measurements are dealt with. Considerable revision, including some condensation and the deletion of certain advanced topics, resulted in a shorter book despite the normal addition of recent developments. The principal change is the expansion of the original chapter on ideal fluid flow.

FUELS, COMBUSTION AND FURNACES. (Chemical Engineering Series):

By J. Griswold. McGraw-Hill Book Co., New York and London, 1946. 496 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $5.50.

Broad in scope, this new book provides an up-to-date chemical engineering text in an important field. It covers the fundamental background and the more essential specific details of the technology, combustion properties, and utilization of fuels, as well as the apparatus and equipment involved. It also introduces the student to petroleum refining technology and engineering, chemical engineering thermodynamics, chemical kinetics, refractories, and the process industries that use furnaces. A bibliography of available films is correlated with the text as supplementary material.

HANDBOOK OF CUPOLA OPERATION:

Published by American Foundrymen's Association, 222 W. Adams St., Chicago 6, Ill., 1946. 470 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.50.

Beginning with a historical summary of the metallurgy of iron, this handbook proceeds to take up in detail the full range of cupola operations. Topics covered include cupola construction, lining, charging equipment, blowing equipment, blast control, fuel, slags and fluxes, thermal equilibrium, and actual operational procedures. There is a twenty-seven page table of specific applications of alloy cast iron and a bibliography of some 500 references,

INTRODUCTION TO ELECTRON OPTICS:

V. E. Cosslett. Clarendon Press, Oxford, England; Oxford University Press, New York and Toronto, 1946. 272 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $6.50.

This book provides a connected treatment of the production, propagation and focusing of electron and ion beams. Its main subject is the theory of electron lenses, including aberrations, and their applications in cathode-ray tubes and electron microscopes. Attention is also paid to other devices employing electron beams in radio and atomic physics. The mathematical treatment has been subordinated to the description of physical principles. Reference lists are appended to each chapter, and a table of electronic data is included.

JOB EVALUATION:

F. H. Johnson, R. W. Boise, Jr., and D. Pratt. John Wiley & Sons, New York; Chapman & Hall, London, 1946. 288 pp., diagrs., charts, tables, 8½ x 5½ in., cloth, $3.75.

This book is designed to explain how a job-evaluation plan functions under actual operating conditions. The first part of the book demonstrates the recommended procedures for establishing the plan, evaluating the jobs, and estimating the cost of the program in terms of increased payroll. Succeeding chapters discuss the methods for assigning workers to the jobs and maintaining the plan in efficient operation. There is a bibliography.

(*Continued on page 68*)

Employment Service

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be inserted upon request after a lapse of one month. Personal interviews by appointment.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER experienced in use of physics and mathematics, under 30 years of age, required by industrial and chemical organization with Headquarters in Montreal. Duties include development work and study explosives and chemistry and hydro-dynamics. Salary open. Apply to File No. 3995-V.

ELECTRICAL

ELECTRICAL ENGINEER with 2 years' experience in industrial electrical maintenance and at least 1 year's supervisory experience, age 20-35, required by chemical organization with headquarters in Montreal. Duties include responsibility of all electrical and instrument maintenance also electrical distribution system and air-conditioning system. Salary open. Apply to File No. 3995-V.

ELECTRICAL ENGINEERS, age 30 to 40, required for the Commercial and Distribution Department of large Hydro-electric Utility. Must have experience in electrical distribution. Salary open. Apply to File No. 4002-V.

ELECTRICAL ENGINEER required for Research Laboratory in Montreal, Knowledge and practical experience in electronics and electric welding desirable. Permanent position. Salary open. Apply to File No. 4004-V.

MECHANICAL

GRADUATE MECHANICAL ENGINEER required by engineering concern in Montreal area engaged in manufacture of hydraulic turbines and mining machinery. Preferably with 5 or more years' experience. Excellent working conditions, free pension, group and health insurance, five-day week, cafeteria service. Salary open. Apply to File No. 3992-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in reinforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3994-V.

MECHANICAL ENGINEER, with 2 or 3 years' experience, preferably bilingual, required as Mechanical Development Engineer by industrial and chemical organization with headquarters in Montreal. Duties will be conducting investigations on existing equipment and a certain amount of plant layout work and draughting. Salary open. Apply to File No. 3995-V.

*MECHANICAL ENGINEER, recent graduate, required by an industrial and chemical organization with headquarters in Montreal. Duties include work assignments of a special nature and studies of a technical nature in connection with maintenance work. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER with 1 to 3 years' experience in production, required as Industrial Engineer by industrial and chemical organization with headquarters in Montreal. Duties include responsibility for conducting methods engineering studies using methods of process charts, time and motion study. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER, required by a Montreal manufacturer of machines and equipment for work consisting of general engineering and design in connection with the manufacture of pulp and paper machinery. Salary open. Apply to File No. 4000-V.

MECHANICAL ENGINEER, required by a textile manufacturing concern near Montreal. Applicant after becoming acquainted with the plant would be expected to act as general follow up man on repair of mechanical and electrical equipment also see that all material necessary is on order or on hand. Salary open. Apply to File No. 4001-V.

*MECHANICAL ENGINEERS required by a specialized industrial plant in Montreal as designers. Must be capable of working in a supervisory capacity in Drawing Office. Salary open. Apply to File No. 4005-V.

MECHANICAL ENGINEER with some experience in production control methods required for a progressive furniture manufacturer in the Eastern Townships. Preferably bilingual. Salary open. Apply to File No. 4006-V.

MECHANICAL ENGINEER, must be bilingual, required by paper company for general duties in line with capabilities and interest. Position in very small community in Province of Quebec. Salary open. Apply to File No. 4020-V.

MECHANICAL ENGINEER required as assistant in Chief Engineers Department by large paper company. Paper experience essential. Some knowledge of French language would be helpful. Must be able to complete investigations and write reports. Age 28-40. Salary $350-$450. Apply to File No. 4022-V.

METALLURGICAL

METALLURGICAL ENGINEER, preferably with lab. experience also some industrial experience would be helpful, required by large transportation company in Montreal. Salary open. Apply to File No. 3998-V.

MISCELLANEOUS

ELECTRICAL OR MECHANICAL ENGINEER, recent graduate, bilingual preferred, required for Public Utility in Quebec City. Salary open. Apply to File No. 3993-V.

GRADUATE ENGINEER, age 32 up, preferably bilingual and with 10 years' experience in industrial design required by chemical organization with headquarters in Montreal. Duties include supervision of Works Design Department, supply draughting and design service for plant, prepare appropriation requests, maintain cost estimating units, etc. Salary open. Apply to File No. 3995-V.

GRADUATE ENGINEER, three to five years' plant experience, required by chemical organization in Montreal. Duties include assisting in developing and carrying out in various plants training programs in subject and related fields for junior industrial engineers. Develop and apply such office routine as may be necessary. Salary open. Apply to File No. 3995-V

MECHANICAL ELECTRICAL OR CIVIL ENGINEER, age 23-30, preferably single and bilingual with some experience in maintenance required by an industrial and chemical organization with headquarters in Montreal. Duties include construction project and design studies. Salary open. Apply to File No. 3995-V.

GRADUATE ENGINEER, with some experience in industrial building design to supervise construction of the railway buildings and allied structures of a large railway terminal project in Montreal. Salary $300 to $350. Apply to File No. 3996-V.

SENIOR ENGINEER for layout work on construction job required by construction firm in Montreal. Location of job around 300 miles west of Montreal. Salary $300 to $350. Apply to File No. 3997-V.

CIVIL OR MECHANICAL ENGINEERS with up to five years' design experience required by an engineering firm in Montreal for hydraulic work. Salary open. Apply to File No. 3999-V.

CIVIL OR MECHANICAL ENGINEER wanted with 5 to 8 years' experience for key position in moderate size plant in Manitoba doing fabrication of Plate Work and Light Steel Work, also Grey Iron Foundry and Machine Shop. This will lead to key position in a growing organization. Salary open. Apply to File No. 4003-V.

JUNIOR SALES ENGINEER, preferably with a few years' sales experience, required by Montreal branch of a firm manufacturing industrial building products. Salary open. Apply to File No. 4007-V.

SALES ENGINEER required by a manufacturer of industrial building products in the Toronto area. Preferably with sales experience and knowledge of building products. Salary open. Apply to File No. 4008-V.

SENIOR SALES ENGINEER required as District Manager by a firm manufacturing industrial products in Ontario. Must have considerable sales experience. Salary open. Apply to File No. 4008-V.

MECHANICAL AND CHEMICAL ENGINEERS, interested in entering the Pulp and Paper industry, required in Newfoundland. Vacancies in Technical Department and studying process work and improved methods of operation. Pulp and paper experience is not necessary. Salary open. Apply to File No. 4009-V.

SAFETY SUPERVISOR required for South America. Age 25-40 years. Single. To supervise safety activities, promote safety first and inspect operations to assure proper installation and use of safety devices. Salary $350. U.S. currency. Apply to File No. 4011-V.

RESERVOIR ENGINEER, required for South America. Age 25-35. Should be experienced in reservoir and production cost analysis. Capable of determining efficient flow rates for reservoirs and wells. Salary approximately $400. U.S. currency. Apply to File No. 4011 V.

MAINTENANCE ENGINEER, required for South America. Age 35-40. Duties include refinery maintenance, inspection of units, metal inspection work. Responsible for engineering calculations, design of equipment and pipefitting work. Salary $375. U.S. currency. Apply to File No. 4011-V.

POWER PLANT SUPERVISOR required for South America. Age 30-40, single preferred. To supervise steam power plant including operating, boiler cleaning and minor repairs. Salary $375. U.S. currency. Apply to File No. 4011-V.

SALES AND SERVICE ENGINEER preferably a graduate in mechanical or chemical engineering required for power plant field in the Toronto area. Possession or ability to obtain an automobile for transportation essential. Starting salary $250 to $325 according to experience. Apply to File No. 4012-V.

ENGINEERING DRAUGHTSMEN, with mechanical background, required by large paper company in the Province of Quebec. Salary $250-$300. Apply to File No. 4019-V.

GRADUATE ENGINEER, required as Assistant to Manager of Sawmill and Woodlands operations. Position located in Ontario. Good commercial sense essential, also some sales ability. Salary $300-$350. Apply to File No. 4021-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph. D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER OR CHEMIST interested in textile dyeing required by an industrial firm in South Western Quebec. Salary open. Apply to File No. 3798-V.

*CHEMICAL METALLURGIST with background in extraction metallurgy and ore dressing (knowledge of mineralogy desirable) and experience in use of petrographic microscope. Required for research work in B.C. Maximum salary $4,000. Apply to File No. 3865-V.

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knowledge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER OR CHEMIST required by a Pulp and Paper Mill in Ontario to develop, install and directly supervise the operation of technical control systems for raw material, inspections process control, quality reporting, inventory, measurement and product satisfaction. Salary open. Apply to File No. 3938-V.

CHEMICAL ENGINEER OR CHEMIST required as Technical Superintendent to administer the Technical Department of a pulp and paper mill in Ontario. Minimum of 5 years in technical or production work in the pulp and paper industry. Salary open. Apply to File No. 3938-V.

CHEMICAL ENGINEER required by Pulp and Paper Mill in Ontario to undertake the solution of manufacturing and technical control problems etc. Preferably experience in the pulp and paper industry. Salary open. Apply to File No. 3938-V.

CHEMICAL ENGINEER, recent graduate, required to study and become experienced with industrial products fabricated from carbon or graphite by firm in Toronto area. Position to eventually lead to sales. Salary $180 to $200. Apply to File No. 3958-V.

CHEMICAL ENGINEER, recent graduate, is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp and paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

*Filled since appearance in advance notice.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Technical and Development Department. Several years' experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

CIVIL

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual, may be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE CIVIL ENGINEER required by a public utility in the Montreal area with three or four years' experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

CIVIL ENGINEERS with some experience on design and field work required by a public Utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEERS required as draughtsmen in bridge department of large transport company. Preferably with experience in steel, concrete and timber construction. Location Montreal. Salary $200-$300. Apply to File No. 3884-V.

CIVIL ENGINEER, required in New Brunswick. Must be qualified designer of miscellaneous public utility buildings in frame and masonry construction. Thorough working knowledge of timber, reinforced concrete and steel framing essential, knowledge of the design of various types of heating system and plumbing. Salary open. Apply to File No. 3887-V.

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewerage Department also construction of a general nature for the Electric Light Department. Salary open. Apply to File No. 3930-V.

CIVIL ENGINEER, required by a Steel Company in Montreal for the design of reinforced concrete frame. Salary open. Apply to File No. 3931-V.

JUNIOR CIVIL ENGINEER, with some structural experience, required for general duties by a textile manufacturing concern near Montreal. Salary around $300. Apply to File No. 3954-V.

GRADUATE CIVIL ENGINEER with some experience in municipal work required as Assistant to the Director of Community Planning of the Province of Saskatchewan. Starting salary $200-$250. Apply to File No. 3957-V.

CIVIL ENGINEER, recent graduate, required to understudy City Engineer of a city in Western Quebec. Salary open. Apply to File No. 3966-V.

JUNIOR ENGINEER, preferably with civil background required for sales and service by a Montreal manufacturer of waterproofing compounds. Salary open. Apply to File No. 3968-V.

CIVIL ENGINEER required in Montreal with considerable experience in design of reinforced concrete and steel structures. Ability to make stability reports of wharves and retaining walls, also draft specifications, prepare estimates and economic studies. Preferably bilingual and veteran with overseas service. Salary not less than $3,480.00. Apply to File No. 3987-V.

CIVIL ENGINEER required in Montreal with general knowledge of reinforced concrete and steel structures. Special knowledge of triangulation surveys, boundry surveys, also laws and procedure to be followed in regard to the purchase, transfer and registration of lands in the Province of Quebec. Must be bilingual. Preferably veteran. Salary not less than $3,480. Apply to File No. 3987-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 30-45, required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Must have sales training in electrical equipment instruments also experience as sales and service engineer. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER, with general knowledge of a.c. and d.c. motors, switchgear, mercury rectifiers, transformers and other electrical apparatus, for sales work in Eastern Canada, age 30 to 35. Salary open. Apply to File No. 3695-V.

*ELECTRICAL DRAUGHTSMEN with several years' experience in industrial layouts for large concern in Eastern Townships. Permanent position and attractive salary available for experienced men. Apply to File No. 3701-V.

*ELECTRICAL ENGINEER, required by an insurance company, preferably with a few years' practical experience for the inspection of boilers. steam plant and allied equipment in Montreal area. Salary open. Apply to File No. 3754-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Preferably bilingual and familiar with rotating electrical equipment. Salary $200. up. Apply to File No. 3761-V.

GRADUATE, ELECTRICAL ENGINEERS, with 3 to 10 years' experience in design operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro-electric power house in Quebec. Salary $225. up according to experience. Apply to File No. 3787-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced. Bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEER with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

SEVERAL EXPERIENCED ELECTRICAL DRAUGHTSMEN, for the design and layout of industrial power and control systems. Required by consulting engineering office in Montreal. Salary open. Good chance for advancement. Apply to File No. 3890-V.

JUNIOR ELECTRICAL ENGINEER, with practical experience in general manufacturing industries, required by an industrial organization in Ontario. Salary open. Apply to File No. 3904-V

ELECTRICAL ENGINEERS, required for sales engineering work in Western Canada. Graduates with some selling experience preferred. Salary open, plus expenses. Apply to File No. 3915-V.

*ELECTRICAL ENGINEER, recent graduate, required in Montreal for general engineering on telephone and radio. Salary $175 to $225. Apply to File No. 3923 V

*Filled since appearance in advance notice.

ELECTRICAL ENGINEER wanted for new Chemical Plant in Western Ontario. Engineer must have had previous Electrical Rectification experience. Salary open. Apply to File No. 3945-V.

JUNIOR ELECTRICAL ENGINEER, age about 30, required as assistant to superintendent of light department in Montreal area. Practical experience in Hydro Distribution and Steam Turbines. General office routine of administrative nature. Salary open. Apply to File No. 3950-V.

GRADUATE ELECTRICAL ENGINEER, age 28-32, required for sales engineering by an industrial firm specializing in products, made of carbon and graphite in Toronto area. Experience in plant maintenance or installation work or Canadian General Electric or Westinghouse test course desirable. Salary $3,000-$3,600. Apply to File No. 3958-V.

ELECTRICAL DRAUGHTSMAN required by a firm of Engineer Contractors in Alberta for layout and plotting with a minimum of supervision. Should be accustomed to working with power lines to 2,300 volts and must be able to do lighting circuits, both overhead and underground. Salary $250. to $300. Apply to File No. 3972-V.

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Quebec for second term, beginning January. Preferably with teaching and practical experience in power, electrical machinery design, lab. etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

RECENT GRADUATE, electrical background, preferably bilingual, required by a Montreal manufacturer of electric motors, generators, ventilating equipment and pumps. Position to eventually lead to sales. Salary open. Apply to File No. 3989-V.

MECHANICAL

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development by government establishment in the Quebec area. Salary from $190. Apply to File No. 3401-V.

MECHANICAL ENGINEER with experience in pulp and paper or mining work required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEERS with at least five years' experience in the pulp and paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

MECHANICAL ENGINEER experienced in heating, ventilating and air-conditioning required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

MECHANICAL ENGINEERS required by a Pulp and Paper Mill at Powell River, B.C. Preferably with experience in plant design in the pulp and paper industry. Salary according to qualifications. Salary open. Apply to File No. 3796-V.

MECHANICAL ENGINEERS with experience in plant layout and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

MECHANICAL ENGINEER, age 35-40 with considerable experience in design and layout of machinery and equipment, required by an organization with Head Office in Montreal. Salary $300-$400. Apply to File No. 3820-V.

MECHANICAL ENGINEER with six to ten years' experience in maintenance and engineering work required by alkali manufacturers in Ontario Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER, required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833 V.

MECHANICAL ENGINEER with knowledge of physical metallurgy heat treatment, ability in stress analysis and design. Required for research work in B.C. Maximum salary $4,000. Apply to File 3865-V.

MECHANICAL ENGINEER, age 30-38, required for Northern Ontario Paper Mill. Preferably with paper mill experience or experience in general layout and design. Knowledge of pumps capacities, piping, conveyors, estimating and structural design essential. Salary open. Apply to File No. 3891-V.

MECHANICAL ENGINEER, bilingual, with 4 or 5 years' experience in sheet metal work required as Plant Manager by a manufacturer in the Province of Quebec. Salary open. Apply to File No. 3894-V.

*MECHANICAL ENGINEER required by a firm of Power House and Building Specialist to act as representative in the Toronto territory. Must be familiar with that district. Preferably manufacturers' agent to act as sub-agent. Salary open. Apply to File No. 3897-V.

RECENT GRADUATE mechanical background, required by a manufacturer in Montreal for work in machine design, possibly for production in the future. Salary $225. Apply to File No. 3901-V.

MECHANICAL ENGINEER, age 25 to 35, experienced in industrial plant layout and machine design required by manufacturing firm in Brantford. Salary open. Apply to File No. 3907-V.

MECHANICAL OR CHEMICAL ENGINEER required by a Pulp and Paper Mill in Ontario to secure continuous optimum performance from all process instruments, maintenance of instruments, etc. Salary open. Apply to File No. 3938-V.

MECHANICAL ENGINEER, recent graduate, with some knowledge of heat exchanges, condensers, or any type of unfired pressure vessels required by an industrial organization in Montreal. Salary open. Apply to File No. 3976-V.

MECHANICAL ENGINEER, recent graduate, bilingual, with some experience in general plant work, required in Montreal. Industrial engineering experience would be useful. Duties include time-study in Standards Department. Salary open. Apply to File No. 3980-V.

MECHANICAL ENGINEER age 25 to 30 is required by a company in Shawinigan Falls to eventually act as Assistant Works Manager when qualified. Salary open. Apply to File No. 3985-V.

MECHANICAL ENGINEER, with experience in plant lay-out and knowledge of reinforced concrete, timber and steel design, required in an industrial manufacturing and processing plant situated 75 miles from both Ottawa and Montreal. Salary open. Apply to File No. 3990-V.

MINING

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MINING ENGINEER with several years' experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

MISCELLANEOUS

MANAGEMENT ENGINEER with business administration and mechanical background, age 30 up, bilingual with at least five years' pratical experience, required by an industrial engineering consultant in Montreal. Salary open. Apply to File No. 3307-V.

STRUCTURAL STEEL DRAUGHTSMEN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

*ASSISTANT PLANT ENGINEER with paper mill experience required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE ENGINEERS, required by an industrial and chemical organization with headquarters in Montreal for all phases of research, design, operation development, production and maintenance. Salaries open. Apply to File No. 3588-V.

DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply by letter with full details. Salary open. Apply to File No. 3628-V.

SALES ENGINEER with wide engineering experience, wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

JUNIOR ENGINEERS, recent graduates up, as designing draughtsmen for a brewing company with headquarters in Montreal. Salary from $200. Apply to File No. 3670-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

CIVIL ENGINEERS AND ASSISTANT HYDRAULIC ENGINEERS required for government organization on West Coast for highway and construction. Salary open. Apply to File No. 3724-V.

*CONSTRUCTION ENGINEER with considerable experience required for the permanent staff of a Montreal inspection company. Salary about $200, Age immaterial. Apply to File No. 3728-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience, required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience, required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

SALES ENGINEER, preferably bilingual required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

GRADUATE ENGINEER, required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel, and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted. Apply to File No. 3780-V.

GRADUATE CIVIL OR MECHANICAL ENGINEERS with 3 to 10 years' experience in design, cost estimates, draughting, and engineering studies for a large hydro-electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

STEAM PLANT ENGINEER, for large concern in Eastern Townships, with at least 5 years' practical experience. Must be familiar with thermo-dynamics, combustion control, steam turbines, mechanical refrigeration, hydraulics, etc. Permanent position and attractive salary for the right man. Apply to File No. 3791-V.

RECENT GRADUATES OR JUNIOR ENGINEERS, with mechanical background, required by a Montreal engineering, fabricating and contracting firm for training purposes leading to sales and service. Area Montreal. Salary $175 up. Apply to File No. 3810-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

DRAUGHTSMAN, preferably with mechanical background, required by a manufacturer in Montreal for design work on electrical equipment. Salary open. Apply to File No. 3829-V.

CITY ENGINEER required by City of Moose Jaw, Saskatchewan. Salary open. Apply to File No. 3856-V.

DRAUGHTSMAN of the following classes:—Architectural, piping layout, equipment layout, mechanical design, steam plant, heating and ventilating, electrical and plumbing required by an industrial organization in Montreal. Salaries open. Apply to File No. 3860-V.

STRUCTURAL STEEL CHECKER AND ONE DETAILER CHECKER, wanted for large fabricating plant in Vancouver, B.C. Age between 30 and 40 years preferred. Must be experienced. Give full information and references. Salary open. Apply to File No. 3862-V.

MECHANICAL, CHEMICAL OR CIVIL ENGINEER, recent graduate up, required for sales and service in Toronto and Alberta by a Montreal manufacturer. Salary open. Apply to File No. 3867-V.

MECHANICAL OR CHEMICAL ENGINEER, recent graduate, required by a firm in Montreal. Ability to do simple drawings, such as layout of piping and instruments. Some experience in oil refinery or chemical plant or pulp and paper would be useful. Position to eventually lead to sales. Salary $200. Apply to File No. 3879-V.

GRADUATE ENGINEERS required for all phases of research, design, operation, and development by an industrial organization with Head Office in Montreal. Salaries open. Apply to File No. 3882-V.

SALES ENGINEERS, required by established Canadian manufacturer of fabricated steel products. Some construction experience an advantage. Wanted for Maritimes, Ontario and Manitoba. Salary open. Apply to File No. 3883-V.

GRADUATE ENGINEER, familiar with industrial processes, metallurgical and chemical engineering as applied to steel, copper, mining and chemical plants. Broad general experience in estimating and designing. Salary open. Toronto area. Apply to File No. 3886-V.

CIVIL OR STRUCTURAL ENGINEER, 24-35 years, required for Northern Ontario Paper Mill. At least 2 years' construction and 2 years' design experience. Opportunity to train junior personnel. Salary not less than $350. Apply to File No. 3891-V.

*INDUSTRIAL ENGINEER, preferably with mechanical background and several years' experience in time study, estimating, etc. Required by a manufacturer in Montreal. Salary $250. up according to experience. Apply to File No. 3893-V.

STRUCTURAL ENGINEER, preferably a graduate civil engineer with experience in the design of mill buildings required by a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 3896-V.

DETAILERS OR JUNIOR DESIGNERS on mechanical or sheet metal design required by an industrial organization in Ontario. Salary open. Apply to File No. 3904-V.

INDUSTRIAL ENGINEERS, with production experience required by a firm of industrial consultants in Montreal. Preferably with experience in time study, cost control, etc. Salary around $400. depending on quallifications. Apply to File No. 3910-V.

RECENT GRADUATES in Electrical or Mechanical Engineering can still be offered the opportunity of being trained by large Hydro-Electric Utility. Very good opportunities for regular employment in various departments at the completion of training period. Minimum salary 1st year $200; 2nd year $215. Apply to File No. 3912-V.

*CIVIL OR MECHANICAL ENGINEER, interested in the sales and engineering of power transmissions, gravity conveyors and grain separators required in Western Canada. Salary open. Apply to File No. 3915-V.

*GRADUATE ENGINEER OR PHYSICIST, bilingual, preferably with knowledge of X-Rays required by Canadian office of worldwide electronic concern to manage X-Ray application engineering activities. Salary $2,700 to $3,600. or more depending on qualifications. Apply to File No. 3917-V.

*JUNIOR ENGINEER with some structural experience required by large milling company with headquarters in Toronto for design work on flour and feed mill buildings and equipment. Salary open. Apply to File No. 3918-V.

*GRADUATE ENGINEER from a recognized university, preferably in the field of applied science, with a few years' of industrial experience and fluently bilingual; possession or ability to obtain an automobile for transportation, essential. Required in Montreal. Salary open. Apply to File No. 3927-V.

GRADUATE ENGINEER, Mechanical, Electrical or Civil, about 30 years of age, required by a large Hydro-Electric Utility in Montreal for Field Testing Hydraulic Turbines. Salary open. Apply to File No. 3932-V.

RECENT GRADUATE required by a Montreal contractor for survey and making of plans. Must be bilingual. Salary $175. up according to experience. Apply to File No. 3933-V.

*RECENT GRADUATE, willing to learn and study in detail the welding industry, required by an industrial organization in Montreal. Salary open. Apply to File No. 3937-V.

TWO METALLURGICAL ENGINEERS AND ONE CHEMICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

SALES ENGINEER required by well known manufacturer of mechanical equipment to solicit industrial accounts throughout the Province of Quebec. Applicants must reply giving full details, age, training, etc. Salary open. Apply to File No. 3951-V.

INDUSTRIAL ENGINEER thoroughly experienced in time study, standard data and wage incentive installation and administration required for firm in Quebec. Salary open. Apply to File No. 3952-V.

JUNIOR ENGINEERS, preferably with mechanical background required for general duties by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 3954-V.

CITY ENGINEER, required by a City in Saskatchewan to take full charge of its utilities which include electric light, power, sewer, water, sidewalk, etc. Salary open. Apply to File No. 3955-V.

GRADUATE ENGINEER experienced in work analysis and job simplification. Should be bilingual and experienced in handling staff. Permanent position in Montreal. Salary $350, with good prospects for advancement. Apply to File No. 3959-V.

INDUSTRIAL ENGINEER to act as assistant in the Engineering Department of Meat Packing firm with plants throughout Canada. Headquarters in Calgary. Requires knowledge of building construction, mechanical maintenance and power plant work. Experience in refrigeration desirable. Salary open. Apply to File No. 3960-V.

JUNIOR ENGINEER preferably chemical background required for Alberta refinery. Duties include plant tests, inspection of equipment and assistance on designs and specifications. Opportunity for supervised training in all phases of refinery operations. Salary open. Apply to File No. 3961-V.

*EXPERIENCED DRAUGHTSMAN required for civil engineering work by a paper company in Eastern Quebec. Duties will include designs and details of buildings, dams and miscellaneous structures required in Woodlands operations. Preferably a single man and bilingual. Salary $225-$300. Apply to File No. 3962-V.

DRAUGHTSMAN preferably with electrical or mechanical background required for industrial plant layout and electrical and mechanical equipment of buildings, required by a firm of consultants in Montreal. Salary open. Apply to File No. 3964-V.

JUNIOR SALES ENGINEERS with production experience required by a firm of industrial consultants in Montreal. Salary $300. depending on qualifications. Apply to File No. 3965-V.

PRODUCTION SUPERVISOR, age 30 to 45 years, with experience in sheet metal fabrication required by established Canadian manufacturer in Ontario. Salary open. Apply to File No. 3970-V.

GRADUATE ENGINEERS, age 20-35, with training in one or more of the following lines—foundation work involving reinforced concrete; structural steel; steam and process piping; oil refinery experience; boilers; pumps and heat exchange equipment and miscellaneous machinery; required by oil company in Montreal. Salary open. Apply to File No. 3974-V.

ENGINEER with estimating and cost experience, able to read blueprints, take stock of and price materials, evaluate general machine and assembly shop operations and fully capable of organizing and installing a Standard Cost System. Required by a manufacturer in Southern Ontario. Salary according to qualifications and ability. Apply to File No. 3977-V.

*JUNIOR ENGINEER with estimating and time study experience covering Tools and Dies and general machine shop work required by a machine and tools manufacturer in Ontario. Some experience in designing and engineering department would be an advantage. Salary open. Apply to File No. 3979-V

*Filled since appearance in advance notice.

GRADUATE ENGINEER, with some experience in a manufacturing industry, required by Hamilton company. Some knowledge of production operations, mill scheduling, job evaluation, time study, job methods, industrial relations would be helpful. Salary open. Apply to File No. 3981-V.

GRADUATE ENGINEER, interested in sales, preferably with electrical background, required in Montreal. Salary around $275. Apply to File No. 3983-V.

*JUNIOR ENGINEERS, required by a Wholesale Coal Importing Company in Montreal for duties, primarily co-operation with Sales Department in combustion service work. Salary open. Apply to File No. 3984-V.

ASSISTANT CITY ENGINEER

Duties include operation of the pumping and filtration plant; sewage disposal plant; incinerator and cleansing branch; asphalt plant also construction of street paving, concrete curbs, sidewalks, sewer and water mains and the building inspection Department.

Salary will be $4.000.-$4.500.

Applications stating full particulars to be addressed to the undersigned at the City Hall, Saskatoon, Saskatchewan.

ANDREW LESLIE (*City Commissioner*)

Experienced Designing Draughtsmen

Preferably with at least 5 years' experience in manufacture of Newsprint or Sulphite pulp.

Applicants must be capable of doing their own fieldwork, preparing layout drawings and also complete estimates. Partial supervision of the construction work involved may be necessary.

Very good salaries and opportunities for advancement. Permanent employment. Apply to File No. 4014-V.

SENIOR CHEMIST PAPER INDUSTRY

Required by leading Paper Manufacturer in Eastern Canada.

Successful applicant should be a University Graduate with some experience in Paper Mill Control work. This position offers plenty of scope for advancement.

Complete details of education and experience should be made in writing to File No. 4013-V.

MECHANICAL ENGINEER for Paper Mill Converting Department

by large Paper Manufacturer in Eastern Canada.

Applicant should be a University Graduate with Production and Mechanical Maintenance experience. Wage incentive plan on light automatic equipment. Position offers good future for applicant with required experience.

Reply stating age, experience, etc., to File No. 4013-V.

Wanted Immediately

Mechanical, structural and electrical engineers as designers, draughtsmen and construction cost estimators for mining, metallurgical, chemical and fertilizer plant design and layout by the Consolidated Mining and Smelting Company of Canada, Limited, Trail, B.C. Reply giving full particulars of education, experience, age, status, salary expected and when available to Manager, Personnel Division, at the above address.

GRADUATE ELECTRICAL ENGINEER

Experienced in Power Station, Transmission and Distribution design and installation. Permanence and advancement depending upon performance. Applicants should state full details of qualifications, when available and salary expected. Address: Engineering Department, Power Corporation of Canada Limited, 355 St. James St. W., Montreal.

Bilingual Graduate

A vacancy exists on the staff of the National Research Council in Ottawa for a University Graduate (bilingual) in Applied Science, preferably Mechanical Engineering. The incumbent of the position will be expected to make literature searches, to prepare replies to technical inquiries on a variety of subjects and to translate technical papers into French. Salary range $3,000-$4,000, depending on experience and qualifications. Apply Personnel Officer, National Research Council, Ottawa.

*Filled since appearance in advance notice.

Situations Wanted

PART TIME WORK—Senior Civil Engineer P.E.Q., M.E.I.C. Montreal area, available part time where consultant or engineer staff short handed. Preliminary plans, estimates, reports, industrial or engineering projects. Apply to File No. 1021-W.

MECHANICAL ENGINEER, B.Sc. Queen's '33, M.E.I.C., M.I.A.S., P.Eng. Que. Married, age 37, over twelve years' experience including design, stress analysis, maintenance, inspection, administration and 5½ years as an R.C.A.F. Engineer Officer. Presently employed, desires permanent position with good future prospects. Preferably in an English speaking locality. Apply to File No. 1042-W.

ELECTRICAL ENGINEER, Jr. E.I.C., P.E. Que., McGill '44, single, bilingual, ex-naval officer, two years' experience as assistant electrical superintendent in a large industrial plant. Desires change in position. Apply to File No. 1450-W.

CIVIL ENGINEER, P. Eng. Jr. E.I.C., McGill, graduate, would like spare time work at design of reinforced concrete or structural steel on a fee basis or otherwise. Also qualified for checking drawings and estimating quantities and cost. At present employed in the Montreal district. Apply to File No. 1552-W.

CHEMICAL ENGINEERING GRADUATE, M.E.I.C., age 26, veteran, single, 2 years' oil refinery experience in South America, experienced in estimating, inspection and maintenance. Desires position in Canada or U.S. Available February 1st. Apply to File No. 1570-W.

GRADUATE MECHANICAL ENGINEER M.E.I.C., P. Eng. Que., M.A.S.T.E. Stuttgart 1924, married. 18 years' experience in experimental work, plant maintenance, aircraft, jig and tool design, mechanical equipment and handling fixtures. Available at short notice. Montreal area preferred. Apply to File No. 1862-W.

ELECTRONICS ENGINEER, Jr. E.I.C., B.E.E., McGill, 1938, S.M.-M.I.T.—1942; P. Eng. Que., with 10 years' general design and supervisory experience in electronics desires position or partnership with consultant or manufacturing firm with view towards exploiting the field of electronics and electronic controls in industry. Location anywhere, but preferably Montreal. Apply to File No. 2492-W.

EXECUTIVE ENGINEER, M.E.I.C., B.A.Sc. R.P.E. (B.C.), Veteran, age 35, married. 15 years' civil engineering and construction, over 7 years' in executive capacity. Interested in position with construction or industrial firm in British Columbia or Ontario. Apply to File No. 2515-W.

GRADUATE CIVIL ENGINEER, Jr. E.I.C., P. Eng. (Ont.) with wide experience in building construction and design, desires spare time employment evenings and weekends on design of reinforced concrete steel and masonry structures, preferably on a fee basis. Location Toronto. Apply to File No. 2581-W.

MECHANICAL ENGINEER, Jr. E.I.C., P.E.Q., B.Sc. Age 32, married. Presently engaged in Montreal area would prefer position in Eastern Ontario. Experience includes machine design, jig, tool and die design, methods engineering, design development, plant layout, engineering department organization. 4½ years' as chief engineer. Also experience in construction industry on building, mechanical and electrical trades. Salary $415. per month. Available one month's notice. Apply to File No. 2682-W.

CHEMICAL ENGINEER, Jr. E.I.C., McGill, age 27, married. Experienced manager, in charge of personnel, production, purchasing. Synthetic resin research, distillation. Plant and laboratory control. Time study. Sales. Available immediately. Bilingual. $4,500. year, last position. Apply to File No. 2850-W.

ELECTRICAL ENGINEER, M.E.I.C., Graduate I.E.E., thorough grounding in cable and transformer manufacture, development and estimating. Also extensive instrument making experience in Government Laboratories. Anxious to contact companies re—openings in application sales, maintenance or production engineering. Age 26, single. Apply to File No. 2876-W.

MECHANICAL ENGINEER, Jr. E.I.C., McGill '44, age 26, bilingual, single, good health. Due to an unusual situation, have not been employed in work of an engineering nature since graduation. Would prefer to locate with organization building custom-built automatic industrial machinery. Available on short notice for assignment in Canada or U.S.A. Apply to File No. 2882-W.

CHEMICAL ENGINEER, Jr. E.I.C., B. Eng., McGill '45, age 24, single. 2½ years' experience in quality control, general office work and for over a year with pulp and paper mill (sulphite) on process control working in conjunction with the foreman. Desires position in production, planning, or sales engineering requiring initiative. Prefer Montreal or vicinity. Available on one month's notice. Apply to File No. 2899-W.

CHEMICAL ENGINEER, B.A.Sc. Toronto '43, Jr. E.I.C., age 28, married; 4 years' experience including chemical process equipment installations, maintenance, manufacturing methods and laboratory control in a large manufacturing company. Interested in a change of employment which would offer more scope in the chemical field. Prefer Ontario location. Available 1 month's notice. Apply to File No. 2901-W.

GRADUATE CIVIL ENGINEER, B.Sc., Alberta, 1947, S.E.I.C., married, desires position doing structural design work. Preferably in reinforced concrete or steel. Two years' experience in draughting and half year practical work in field. West Coast area preferred. But would consider other localities. Presently employed and residing in Edmonton. Apply to File No. 2907-W.

CIVIL ENGINEER, B.A.Sc. (Toronto), S.E.I.C., P. Eng. Ont. with some experience in reinforced concrete and structural steel design including detailing of reinforced concrete and estimating. Would accept part time work during evenings and weekends. At present employed and residing in the Toronto area. Apply to File No. 2910-W.

ENGINEER, (27), graduate of London (England) University, ambitious and energetic with five years' industrial experience, lately Deputy Works Manager in a large chemical works. Familiar with design, production control, costing, job evaluation and factory layout procedure. Handled a great variety of equipment, tactful leader of men, keen and able to get results. Willing to accept responsibility. Living at present in Toronto, Ontario, but willing to go to any part of Canada or abroad. Apply to File No. 2912-W.

SUPERINTENDENT, GRADUATE ENGINEER, P. Eng. (Ont.), M.E.I.C., 12 years' experience with men and cost control in casting, fabricating and machining brass, aluminum and grey iron. Available immediately. Apply to File No. 2913-W.

YOUNG GRADUATE CIVIL ENGINEER, S.E.I.C. Presently employed seeks part time work of such nature that it may be done at home, i.e. Estimates, etc. Apply to File No. 2914-W.

CIVIL ENGINEERING STUDENT, S.E.I.C., 3rd year at McGill University would like part time work with firm in Montreal vicinity, dealing with design or construction of structural steel or reinforced concrete; 25-30 daytime hours per week available, plus evenings if necessary. Experienced in foundation construction. Apply to File No. 2916-W.

GRADUATE ELECTRICAL ENGINEER McGill '24, M.E.I.C., Prof. Eng. (Que.); over 20 years' experience in High Voltage Transmission line, design and construction. Interested in part time or temporary position in general engineering or transmission line work. Location preferably Montreal or in B.C. At present residing in Montreal area, due to certain physical defects the type of work that can be undertaken is limited. Available at once. Apply to File No. 2918-W.

MECHANICAL ENGINEER, M.E.I.C., P. Eng. (Que.) B.A.Sc., Ecole Polytechnique '44. Presently employed with R.C.E.M.E. Canadian Army. To be released from engagement in one month or two. Age 24, married, bilingual, 2 years' experience in automotive engineering, job evaluation, supervision, management and administrative work. Also experience in designing mechanical testing apparatus. Would consider any kind of work with industrial firm. Willing to learn. Apply to File No. 2919-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng. Que., B.Eng. '40 McGill, age 33, married. Presently employed, desires experience in heating and ventilating. Experience with boilers, piping, construction, machine shop and plant maintenance. Available 1 month. Apply to File No. 2922-W.

Library Notes

(Continued from page 62)

KINETIC THEORY of LIQUIDS:

J. Frenkel. Oxford University Press, New York and Toronto; Clarendon Press, Oxford, England, 1946. 488 pp., diagrs., charts, tables, 9½ x 6¼ in., cloth, $13.00.

Considering liquids to be more closely akin to solids than to gases, the author discusses, in the early chapters, the types of disorder in the solid state, purely thermal displacements of atoms, the motion of interstitial atoms and ions, and many types of transition from an ordered to a disordered state as fundamentals of the problem of transition to the liquid phase. Later chapters deal with the specific heats of liquids, diffusion in liquids, surface and allied phenomena, and various properties of solutions and high polymeric substances.

MANUFACTURING PROCESSES:

M. L. Begeman. 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 626 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $5.00.

Beginning with foundry practice and ending with grinding wheels and abrasives, this volume presents the technical fundamentals of the important manufacturing processes, discusses engineering materials, and describes the modern machine tools necessary for processing these materials. New chapters in the present revision deal with special casting methods, powder metallurgy, hot forming and cold forming of metals. The material on welding and plastic molding has been extensively revised. There is also a chapter on inspection and gaging practice.

MATERIALS HANDBOOK:

By G. S. Brady. 6th ed. McGraw-Hill Book Company, New York and London, 1947. 831 pp., charts, maps, tables, 8½ x 5¼ in., cloth, $7.00.

Useful to purchasing executives and product engineers, this book is a descriptive encyclopedia of industrial materials. It contains general information and patented and trade names of some processed and many raw materials. Detailed specifications are not given. The book is divided into two parts. Part I is devoted to definitions; Part II, to a condensed handbook, of general information ranging in scope from economic data to elementary nuclear physics. Statements regarding the characteristics of the materials and nomenclature used are data backed by competent authorities or are common usage of well-known manufacturers.

MECHANICAL LABORATORY METHODS:

F. W. Keator. 5th ed. D. Van Nostrand Co., Toronto, New York and London, 1947. 380 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.50.

Intended for use in connection with undergraduate laboratory courses, this volume contains four parts dealing with the testing of instruments, analysis of combustion, the testing of power plant units, and other tests. Fundamental principles are presented in such a way that the student may apply them to specific cases. This fifth edition is only slightly different from its predecessor. The abridged tables of properties of steam and ammonia have been deleted, and a few new items have been added to the section on instruments.

PLANNING RECOMMENDATIONS FOR THE WASHINGTON SQUARE AREA, prepared for the Washington Square Association:

A. C. Holden. Washington Square Association, 65 Fifth Ave., New York, July 1, 1946. 101 pp., illus., maps, charts, tables, 11 x 8½ in., paper, $1.50.

The recommendations contained in this report have to do with transportation, housing, business locations, parks, and the preservation of public buildings. A physical analysis of the area with numerous descriptive maps and plans, comprises the second section, followed by a functional analysis and synthesis of the factors involved as presented in the first two sections. The whole offers a typical example of an overall planning job.

PETROLEUM PRODUCTION, Vol. 3. Oil Production by Water:

P. J. Jones. Reinhold Publishing Corp., New York, 1947. 271 pp., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

Continuing the series by this author, the present volume is limited to oil production by water, covering the following principal factors: convergence, fluid factors, invasion factors, displacement factors, and well-interference factors. Two contours, called the breakthrough and maximum recovery contours, are used in estimating cumulative oil recovery and producing rates. The applications of these basic factors and limiting features to various types of reservoirs are effectively detailed, using statistical procedures which reduce the numerous variables to a comparative few, and taking into account economic as well as physical conditions.

PHYSICAL PRINCIPLES of WAVE GUIDE TRANSMISSION AND ANTENNA SYSTEMS:

W. H. Watson. Clarendon Press, Oxford, England; Oxford University Press, New York and Toronto, 1947. 208 pp., illus., diagrs., charts, tables, 9½ x 6¼ in., cloth, $7.00.

The aim of this book is to describe the way in which the technique of handling radio frequency transmission-lines has been extended to deal with propagation through hollow metal pipes known as wave guides. The theoretical and mathematical aspects of the control and transmission of microwaves are emphasized, with special attention given to the linear aerial-system consisting of resonant slots cut in the side of a wave guide. Dominant wave propagation and loading characteristics are dealt with early as basic concepts.

PROBLEM of REDUCING VULNERABILITY to ATOMIC BOMBS:

A. J. Coale. Princeton University Press, Princeton, N.J., 1947. 116 pp., tables, 8 x 5¼ in., cloth, $2.00.

The problem as stated is analyzed under four main headings: reduction of vulnerability under an effective agreement on limitation of atomic weapons; reduction of vulnerability when atomic armament is unlimited; technical considerations of atomic weapons and possibilities for defense; the necessity for further research and analysis. The author does not seek to give final answers but rather, by analysis and synthesis, to show the exact nature of the questions awaiting answer, from both the physical and social points of view.

WIND-TUNNEL TESTING:

A. Pope. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 319 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $5.00.

This volume presents an analysis and study of the extensive but scattered technical information published on the subject. The topics covered are design and general consideration of tunnels, testing procedures with scale-model aircraft, extrapolation to full scale, and wind-tunnel-boundary corrections. The design of a propeller-flow straightener system is treated. An appendix discusses the construction of a wind-tunnel-model. A list of references is given at the end of each chapter.

Seen THROUGH THE EYE OF A CUSTOMER!

Enlightened industry aims to satisfy its customers by taking their point of view.

That is a basic principle. . . How should it be applied?

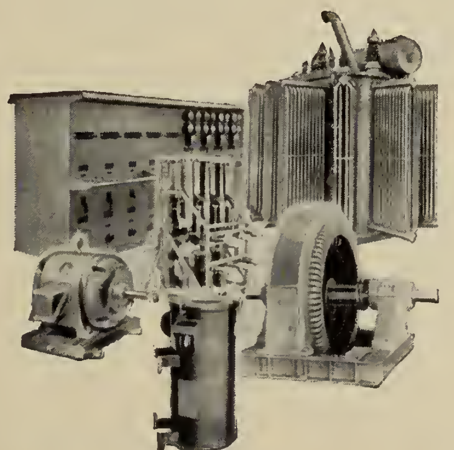
Consider this: A nation is sound only if its industries are sound.

The industries are sound only if their customers are sound.

It is essential therefore that you, the customer, should prosper first.

That is why we of English Electric strive honestly to produce equipment that will add to *your* efficiency, *your* security, *your* progress — for that is the foundation on which our prosperity must be built.

When you think of Power . . .



. . . think of English Electric

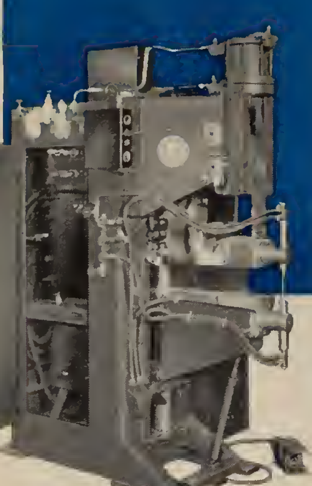
Press ... with ... for hig... spot ... Shown ... dial m...

MEANS "STILL AVAILABLE" ... FULL RANGE OF NATIONAL ELECTRIC WELDERS

Each year Canada takes another step to increase its stature as a nation. Until recently the building of a full line of Resistance Welders was left to others. Now they are made in Canada by English Electric.

The machines shown, and others, were made in St Catharines. Each is designed to speed up a particular production process. If you would like to examine your own operations with a view to reducing costs by use of Resistance Welders, a staff of specialists is available here to advise you.



Medium size air operated Press Type Welder for wide range of spot and projection welding. Also for brazing operations.

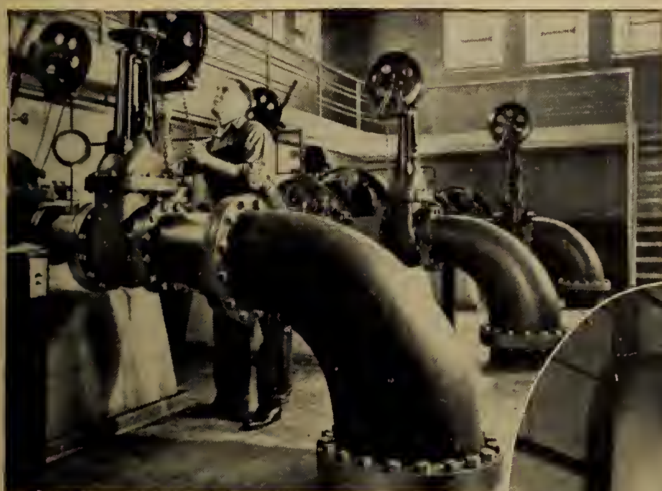
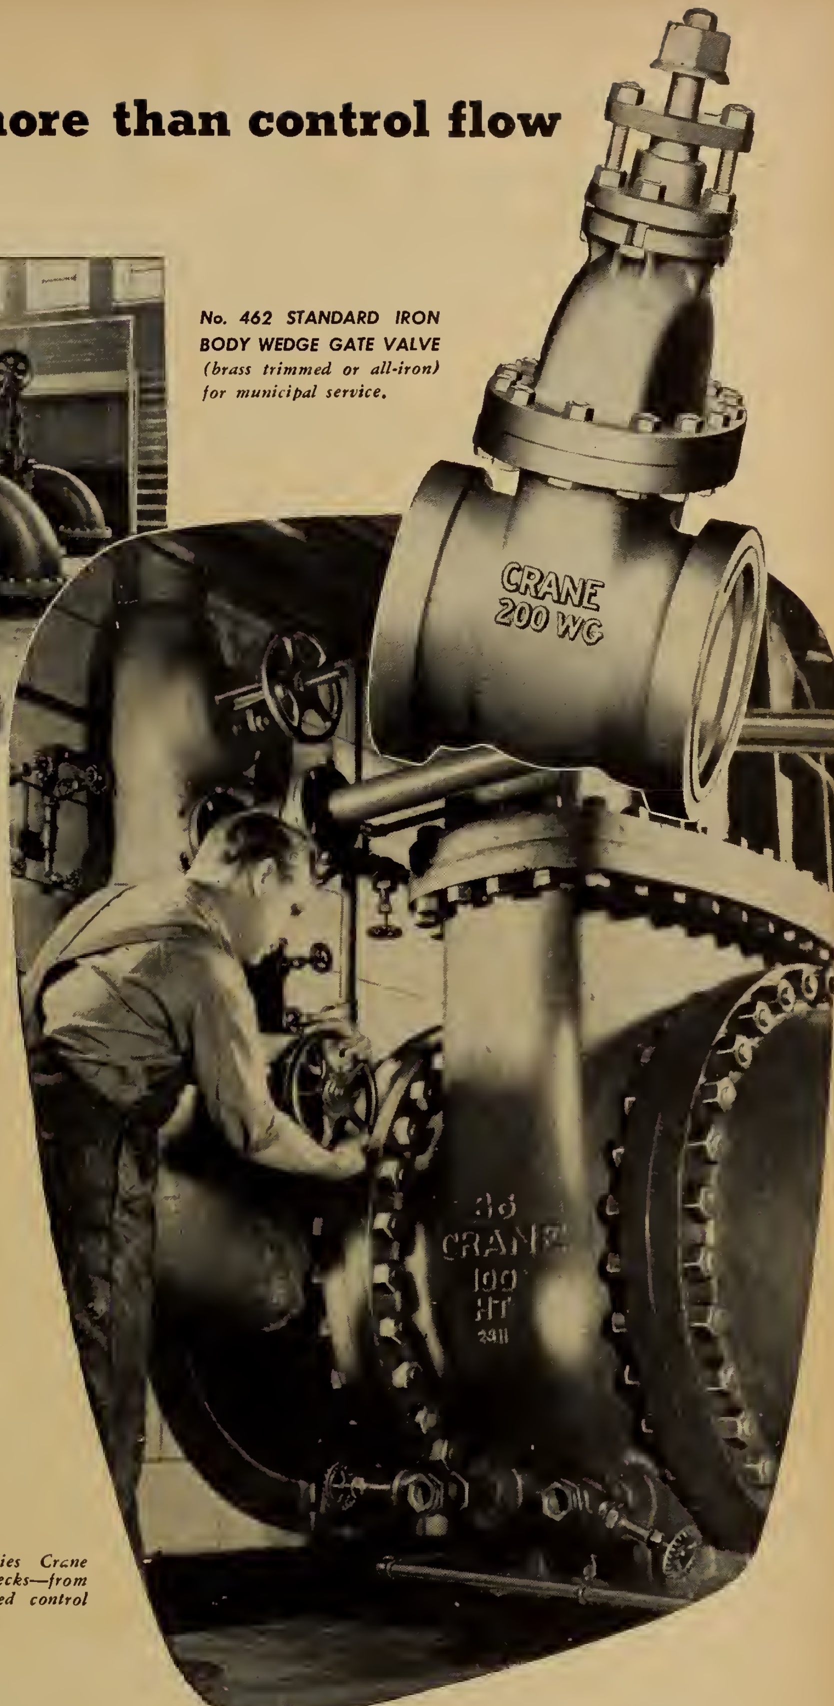
Crane Valves do more than control flow



No. 462 STANDARD IRON BODY WEDGE GATE VALVE *(brass trimmed or all-iron) for municipal service.*



A SUBURBAN TOWN *waterworks equips with Crane. Shown are Crane 10-in. gear and chain wheel operated gate valves on high lift pumps.*

In water and sewage plants the country over, Crane valves do more than just stop and start flow. By doing that job precisely, they safeguard public health. By giving unusually long and faithful service, they hold valve maintenance, repair and replacement costs to the lowest level.

To the men responsible for public water services, Crane valves assure peace of mind under all working conditions. Wouldn't you feel safer with valves and fittings having a reputation for dependability through more than 90 years?

A LARGE CITY *pumping station specifies Crane quality valves—gates, globes, angles, checks—from the smallest to the 36-in. motor-operated control valves to mains.*

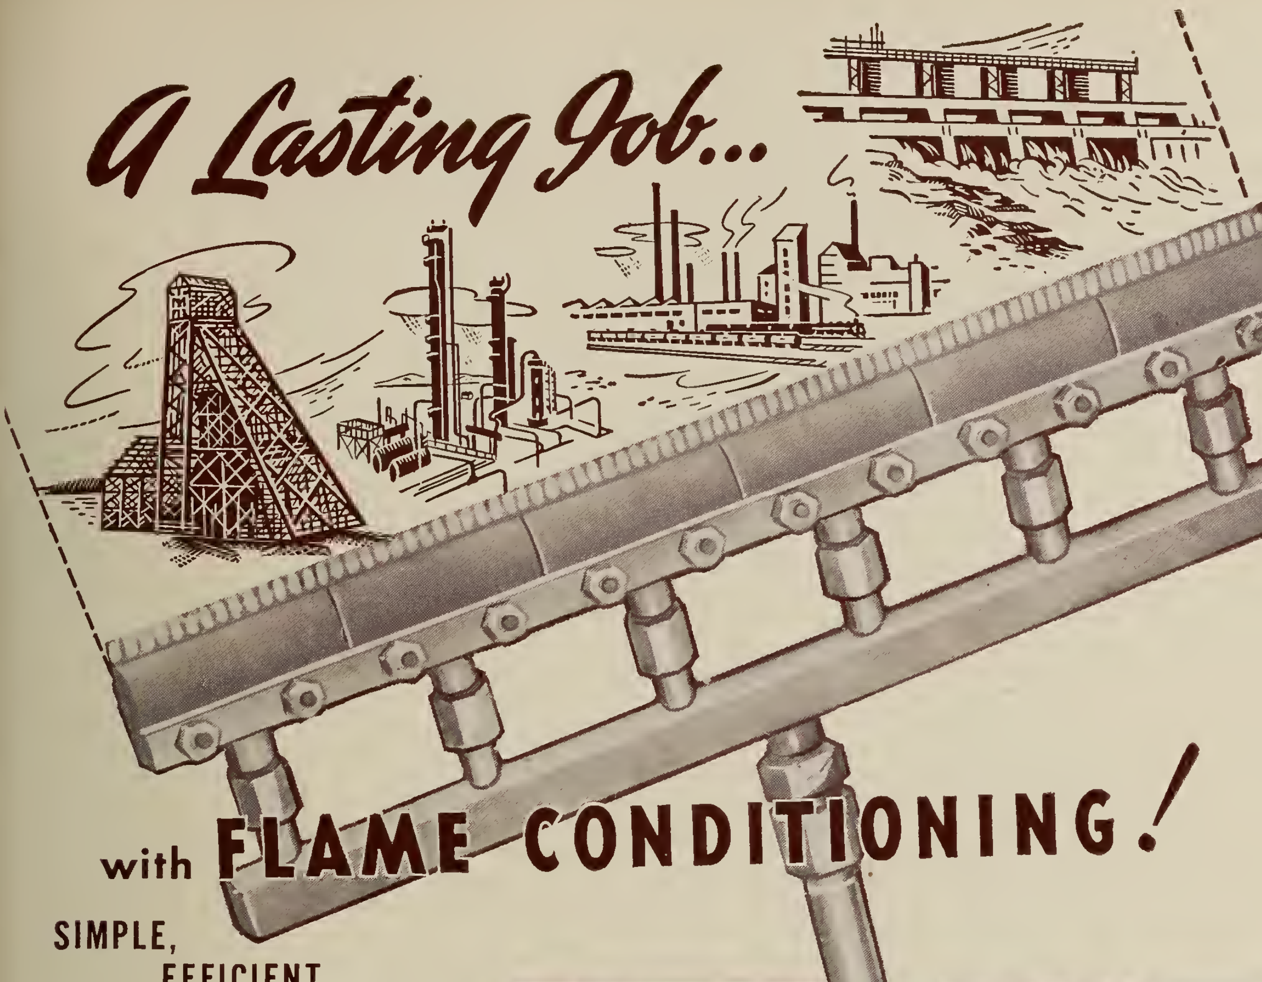
A Lasting Job...

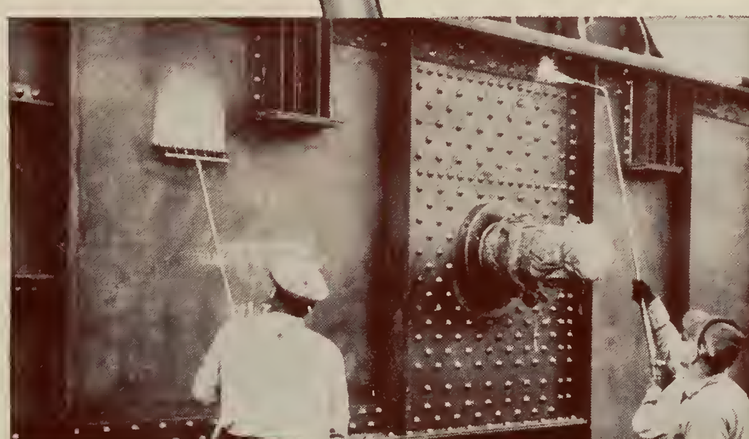


with FLAME CONDITIONING!

SIMPLE, EFFICIENT, ECONOMICAL

For maintenance in mines, industrial plants, shipyards, power plants, and on dams and bridges—anywhere structural steel is exposed to moisture, fumes, etc. — FLAME CONDITIONING is the most modern method of cleaning or preparing steel surfaces for painting.

Intense oxyacetylene flames remove old paint, dirt and rust, explode loose scale, scabs and blisters and drive out moisture. Result is a thoroughly clean, dry surface for perfect bonding of paint, ensuring longer lasting protection. Equipment is standard, portable and flexible.



Paint Burning and Surface Conditioning

The flat surfaces are treated with standard stock flat tips which provide a row of small brushlike flames in close formation. Eight to fifteen linear feet per minute is possible with such tips. For corners, rivet heads, fittings and other projections a standard round tip is used.

The operation is simplicity itself, involving merely the use of the oxyacetylene torch and a wire brush to remove the debris. The process is applicable to new or old structures and has already proved its efficiency and economy on many types of structures throughout the industry.

Please contact any of our branch offices for further details and demonstrations if required.

This photo illustrates one of the three 500 HP 1000 p.s.i. No. 4-RT-6 Stage Cameron Pumps with speed increasing gear and ducts to supply cooling air to the motor from fans.

Steel TAKES A *Shower*

AT 1000 P.S.I.

● High pressure descaling makes good steel cleaner and easier to handle. To provide the high pressure water sprays for descaling hot billets and slabs in the plate and strip mills of a Canadian steel plant, three Cameron No. 4-RT-6 Multi-Stage Centrifugal Pumps were built for the job.

Many times an hour these descaling pumps are called upon to leap from zero to full load in accordance with the rapid opening and closing of the spray control valves. This service places severe strains on every section of a pump, and only pumps designed for heavier than usual duty can stand up under these conditions.

Cameron Class "RT" Multi-Stage Pumps were specially developed for heavy duty performance in steel mills; for hydraulic log barking; for boiler feeding, mine de-watering and other high head duties. They are built by Canadian Ingersoll-Rand in capacities of 150 to 2000 GPM for heads of 1500 to 3000 ft., and are available in semi-steel, bronze or alloy steel, depending on the pressures and liquids handled.

Our engineers will be glad to work with your consulting engineers or mechanical staff in the selection, manufacture and installation of dependable pumps to meet requirements.

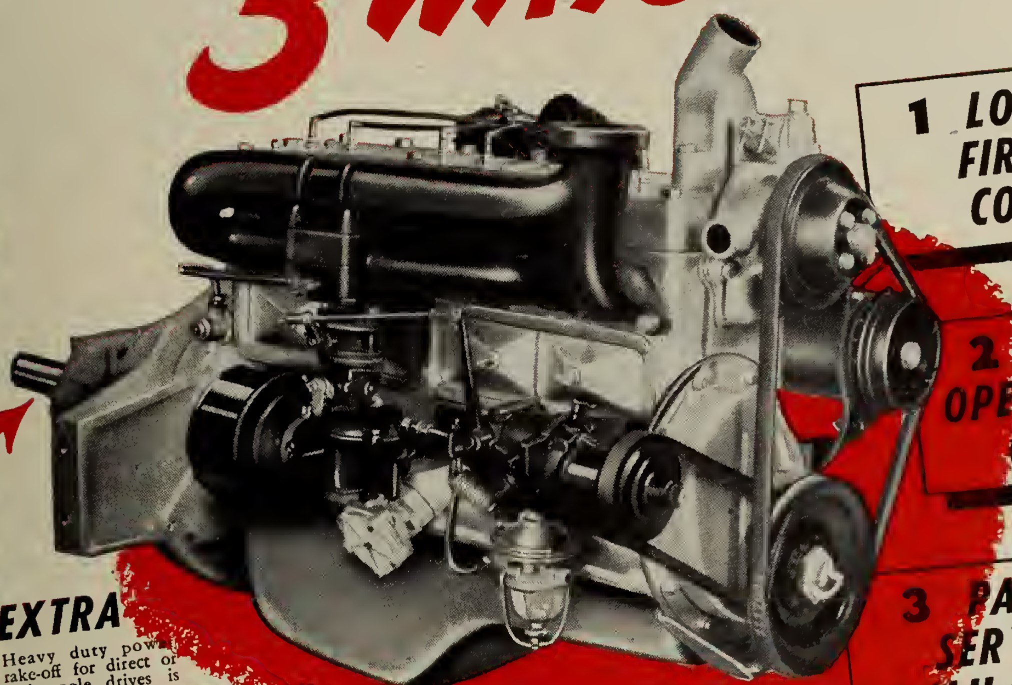
CHRYSLER INDUSTRIAL ENGINES
SAVE YOU MONEY 3 WAYS . . .



1 LOW FIRST COST

2 LOW OPERATING COST

3 PARTS & SERVICE AVAILABILITY

EXTRA
Heavy duty power take-off for direct or right-angle drives is available as extra equipment. Supplied complete on Chrysler Indusrrial Engines

CHRYSLER ANSWERS ALL 9 INDUSTRIAL ENGINE REQUIREMENTS!

Chrysler Industrial Engines bring you three-way economy . . . low first cost . . . low operating cost . . . and nation-wide parts and service availability to eliminate costly tie-ups for repairs. Chrysler Industrial Engines answer all 9 requirements which experts agree are essential to continuous peak performance and saleability of your product . . . (1) adequate power and torque; (2) low first cost; (3) low operating cost; (4) parts and service availability; (5) dependability; (6) facility of installation; (7) flexibility; (8) simplicity of repairs; (9) power your products with famous Chrysler Industrial Engines and you enhance their sales value. Before you buy any industrial engine, send for free booklet, "Power, Coast-to-Coast." Write the Industrial Engine Division, Chrysler Corporation of Canada, Limited, Windsor, Ontario.

EMBLEM OF INCO SERVICE
TRADE MARK
The International Nickel Company of Canada, Limi
25 King St. West, Toronto, Ont.
Dear Sirs:—Please advise us concerning the best typ
steel for the application named below.
Name

Let Inco's DOUBLE SERVICE help you!

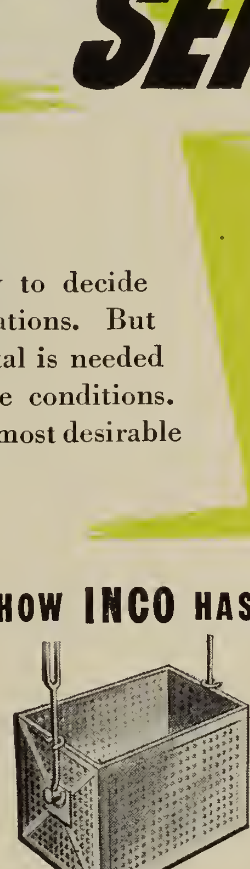
SELECT A SUITABLE METAL

only one factor had to be considered it would be easy to decide hat metal or alloy should be used for specific applications. But it seldom works out that way—especially when a metal is needed to withstand some unusually destructive set of service conditions. Then it is a question of choosing a metal with the most desirable *combination* of essential properties. Our technical staff, with years of accumulated data, will help select a suitable metal to meet *your* service conditions.

2 SELECT A QUALIFIED FABRICATOR

For many years, representatives of International Nickel have worked closely with designers and fabricators of equipment. Our technical staff will be pleased to assist you in selecting a fabricator, qualified to make equipment to your specifications.

HOW INCO HAS HELPED OTHERS



Prior to the introduction of Monel,* much of the pickling equipment in use required constant care and frequent replacement to keep it on the job. Because of Monel's high strength and exceptional corrosion resistance it quickly proved a natural for pickling equipment. Pickling equipment properly designed to take advantage of the properties of Monel and then produced by qualified fabricators resulted in smaller, lighter pickling baskets that carried bigger payloads . . . meant less power required . . . more parts pickled . . . less acid used . . . less expense all the way through. *Let INCO'S DOUBLE SERVICE assist you to solve your equipment problem.*

Assures Heat Comfort

Uncomfortable overheating and underheating in a building is avoided with Dunham Differential Heating. With this system a continuous steam flow is provided but only in amounts and at temperatures for constant heat comfort. It will meet the smallest increments of change in heat demand. Dunham Differential Heating utilizes a continuous flow of flexible steam to maintain true heat comfort.

The comfort and economy of Dunham Differential Heating has been proved in buildings from coast to coast . . . industrial, institutional, commercial and apartment buildings.

Dunham engineers will collaborate on installation of Dunham Differential Heating in new buildings and make recommendations for modernization of present systems. C. A. Dunham Co. Ltd., 1523 Davenport Rd., Toronto 4, Ontario. Sales Offices in Halifax, Quebec City, Montreal, Sherbrooke, Ottawa, Toronto, Hamilton, Winnipeg, Calgary and Vancouver.

FLEXIBLE STEAM is the most easily manageable and transportable means with which to distribute heat. It is quickly variable in temperature and volume, consequently, it can respond precisely to changes in demand for a greater or lesser flow of heat.

The DUNHAM HEATING SERVICE

THE PRIME FUNCTION OF HEAT IN A BUILDING IS TO PROVIDE COMFORT

The Bell Telephone Company of Canada

MR. LAUGHTON'S and the three following papers will present to readers of the *Journal* an excellent general description of the design and construction of a major Canadian post-war engineering achievement. By careful study and application of all possible means of reducing costs—and particularly by substituting prefabrication for on-the-job labour—the designers and builders have achieved what is today a remarkable performance. In the face of acute material shortages, labour difficulties, and skyrocketing costs, the $5 million hotel will be completed only about six months behind the originally scheduled date and—what is even more surprising—at a cost remarkably close to the original estimates. The delay in opening the hotel is almost entirely due to a shutdown in steel erection because of the coal strike in the United States.

The first paper considers the overall picture. The author discusses early stages of planning for use of prefabrication wherever possible to save cost, and the design of furniture for saving space. Extensive use of Arborite, a water-resistant plastic wallboard, is shown. The design and construction of foundation walls and footings is described. Steel erection is briefly referred to. The loading used on prefabricated aerocrete floorslabs is given. A description of the special steel framing sections for internal wall construction, as developed by the General Contractor, is given. The electric installation and wiring are referred to and the use of aluminum for wall facing briefly described. The author estimates a saving of 45 cents per square foot was effected on exterior walls by the use of aluminum facing. Prefabricated bathroom units were used throughout to save time and on-site labour.

The supplementary papers deal with outstanding features of the project. Carl Klotz, M.E.I.C., of the Aluminum Company, discusses the extensive use of aluminum extrusions for external facing to speed erection, reduce costs and modify traditional appearance. Early alternative methods of application are discussed. The alloys used for various portions of the facing are described and chemical compositions and mechanical properties of each given. The extrusion process is explained in detail and the advantages of extrusions outlined. Methods of finishing surfaces are explained. Various other applications of aluminum for the interior of the hotel are enumerated.

J. H. R. Dansereau, P.Eng., of The Dominion Bridge Company considers the steel structure and the particular problems encountered in the design and erection. Loadings are discussed with particular consideration given to the method of handling wind stresses. H. G. Owen of The Bell Telephone Company of Canada describes the "saddle" system of telephone installation.

The Construction
of the
Laurentien Hotel

by
J. A. Laughton, M.E.I.C.
The Wilson Contracting Co. Limited, Montreal

During the war it became apparent that there was a need in Montreal for a new modern hotel. The Ford Hotel Corporation, which operates the Ford Hotel chain in Montreal, Toronto and Ottawa, decided to undertake the venture, and formed the Laurentien Hotel Company to build and operate the new hostelry, which bears the appropriate name of Laurentien Hotel. Plans were laid for the construction of this building as soon as the required materials became available. The Company's personnel, in conjunction with the architects and the staff of the general contractor, then spent considerable time in studying designs of hotels, room layouts and available materials, to take advantage wherever possible of the developments in construction methods and materials which had taken place during the war.

After considering a large number of items with a view to reduction in cost, and keeping the labour involved to a minimum, step by step construction was discarded wherever possible in favour of prefabricated assemblies, such as precast concrete flooring, dry wall bedroom partitions, fibre glass insulation, aluminum external wall facing, plastic decorations and internal wall covering, aluminum trim, prefabricated bathrooms, and slimline cove lighting. All items chosen for use in the building met the standards set by the Building Code in force in the City of Montreal. In meeting these requirements, it was not possible to use all of the materials and construction methods which were considered in the initial planning.

The actual construction of an eleven hundred room hotel and the planning involved for erecting the structure are only part of the details which must be covered. The problems of furniture, draperies, linens, and floor covering are of vital importance. Interior decorators were employed to design special furniture of high utility value to give a maximum of clear floor space in the different rooms. As a result of these studies, a new type of chesterfield-bed was designed, which can be changed from day to night service with a minimum of trouble.

New end tables of convenient height for ash-trays and bedside telephone, a combination dresser and writing desk, cabinets with built-in radios which allow for push-button selection of five different programmes, were developed. All are of modern design and the flat surfaces are covered with cigarette proof and stain proof table top Arborite. Because of the tremendous quantity of plastic required for bathroom walls and ceilings, outside spandrels, furniture covering, wall covering in the lobby and cocktail lounge and the baseboard on the lower three floors, the qualities of Arborite were carefully studied before the final decision to use this new material in the building was made.

The total quantity of Arborite purchased involved nearly a quarter of a million square feet. This material is made from lignin felt paper, the lignin being incorporated by mixing it with the paper stock in the beater. This paper is then laminated by subjecting it to heat and pressure at the same time, incorporating into the laminate a decorative surfacing of colours and patterns, ranging from delicate pastels to reproductions of costly woods.

The net result is a plastic wall board impervious to household temperatures and so repellent to water that the most delicate laboratory equipment is necessary to detect moisture pick-up after twenty-four hours of immersion. The decorative finish eliminates maintenance other than cleaning and for that purpose nothing more is required than a damp cloth.

Foundations

Ground was broken for the foundations in the spring of 1946, and these presented the normal difficulties and problems which would be expected in the foundations required for a building the size of the Laurentien Hotel. The large concentrated loads, which were transmitted by the columns, were carried down to solid rock some 40 to 50 feet below street level. The building has two stories below the street level, the boiler room being 29 ft. below the highest point of the sidewalk. A buttressed retaining wall was built around the building to support the earth pressure for the full height of the excavation. This retaining wall was at the same time the outside wall of both stories below grade.

All retaining walls had to be permanently self-supporting, without counting on the stabilizing action of the earth-fill outside the building. Although conditions exist which would permit bracing one external wall against the opposite wall through the floor structure, it would require that the earth-fill outside of both opposite walls remain undisturbed. Since it was likely that the ground adjacent to the building on three sides might later be excavated, possibly causing damage to the foundations, it was decided to build buttressed reinforced concrete walls.

The buttresses make the retaining walls self-supporting, without using the floors as diaphragms and without counting on the stabilizing effect of the weight of the structure. The buttresses are located in the line of the columns and main steel girders. The internal foundations of the main steel columns are carried to solid rock, and the foundations of the buttresses connected with the foundations of the columns supporting heavy loads have been carried down to rock with concrete caissons, the foundation carrying light loads, and the connecting buttresses have been placed on spread concrete footings.

Before excavation was started, all surrounding buildings were carefully photographed inside and out, and special photographs taken of any visible crack or defect in the existing structures. This was done so that any damage caused through the excavation could be noted and actual damage ascertained. Fortunately, none of the surrounding buildings had additional defects show up while erection was in progress.

Steel Structure

The design of the steel structure by Dominion Bridge Company was performed in 1946 and involved a few problems worthy of mention, as covered by their accompanying article. However, in 1946 decontrol of

Retaining wall and buttresses. August 2, 1946.

Below—Progress of structural steel at February 18, 1947.

prices in the United States, labour disputes, and general difficulties of procuring materials were factors of major significance in the design of a structure involving some 3,521 tons of structural steel. Materials had to be designed and ordered months ahead of time to avoid undue delay in the construction time table. In addition, the architectural requirements such as floor heights, room layout, the use of prefabricated bathrooms and their connection to the steel, the floor system required by the use of aerocrete slabs, and the requirements of the external walls to use of aluminum facing, had to be kept in mind constantly throughout the design of the structure. It was necessary for the Architect and the Dominion Bridge Company to work closely together so that the approval of drawings would not delay the initial planning. The work on the design of the structural steel began in March 1946, in conjunction with the architectural layouts. By the middle of February 1947 the last of some 900 detailed drawings were issued to the steel shops. The steel erection started in late October 1946 and was completed June 15th, 1947.

Aerocrete Floor Slabs

The floor slabs were designed to carry the following live loads; office and public space—100 lbs. per square foot; merchandise, baggage and loading platforms—125 lbs. per square foot; and bedroom floors—40 lbs. per square foot. The slabs used in the lower lobby, lobby and mezzanine floor are precast haydite concrete channel slabs over an average span of approximately 7 ft. 6 in. All other floors were precast Aerocrete.

The steel was carefully laid out in such a way that it was possible for a crew of men to lay all the slabs on a typical floor in 2½ to 3 days. The slabs were immediately grouted into place and used as a working platform for the erection crews. As the construction progressed, screed boards were laid on the aerocrete slabs to the centre line of the bedroom walls, and 1½ inch concrete floor topping was poured between these screeds. The steel channels which were used for the base of the bedroom walls were then attached to the screeds.

Internal Wall Construction

The wall construction is a development of the Wilson Contracting Company Limited, and consists of steel framing sections of four different shapes; a tubular section used as wall stud, a 3 in. channel section which is used as floor and ceiling runner for the studs, furring strips and special corners which can be used to form either external or internal wall corners. This material is made from 20 gauge sheet steel and roll formed to the special shapes and lengths required.

Door frames are of rolled steel manufactured by the Truscon Steel Company with the framing to the size required to match the wall studding and furring strips. All studding and furring are erected on 16 in. centres and the gypsum board applied on the surface. The space between the wall board is insulated with fibre glass for protection against noise. This type of construction has been found economical and extremely fast to erect. It has been possible to install the steel studding required to complete the walls on one floor in five working days with a crew of approximately twenty men. The gyproc is applied and screwed to the steel studs with self-tapping screws on 8 in. centres. Thirty to thirty-five men can apply approximately 50,000 square feet of wall board in one week.

Electrical Installation

A building of this size requires a great lighting and power load and necessitated the installation of a substation having six 200 kva transformers. The Quebec Hydro brings two 3 phase delta, 12,000 volt, 60 cycle lines to the potheads in the sub-station vault. One is a main service, the other a standby to insure continuous electrical service. A manual control panel mechanically controls the disconnect switch that disconnects the main line from the load. A feature of the control panel is the mechanical and electrical control of the 600 amp oil circuit breaker; an interlock prevents both lines from being on at the same time. Protection for the lines is also provided by a set of fuse disconnects, with high rupturing fuses, on each of the fuses branching off for lighting and power. The lighting and 220 volt power load is carried by a bank of three 200 kva transformers, connected delta to star for 3 phase service, 120/208 volts, 1800 amp, secondary. The 550 volt power is carried by a bank of three 200 kva transformers connected delta to delta for 3 phase 3 wire 575 volt 600 amp secondary.

The feeders for lighting and power from the main switchboard to the panels in various locations on the lower floors, and on each of the bedroom floors up to the 23rd, were run in conduit ranging from ¾ in. to 3 in. and using wire from No. 10 to 500 MCM cable. The variety of layouts required is best shown by the fact that there are 14 stores, a beauty parlor, barber shop, dining-rooms, cocktail bars and several offices. In the design of the lighting for the more prominent public spaces, an installation was chosen which is perhaps a first in large buildings in Canada; the slimline lighting. These consist of 6 ft. and 8 ft. slim hot cathode tubes in coves, and will give soft overall lighting of even distribution for the main lobby and restaurants. They will also eliminate the harshness of the ordinary fluorescent lamps.

The bedroom floors have over 12 different types of rooms. There are at least three lamps in each room, one floor lamp and two table lamps, complementing the furniture arrangement. There is no ceiling light, hence one of the table lamps is switched from the door. The different outlets in any one room are not on the same circuit, so if anything should happen to one particular circuit, it could not throw the whole room in darkness. In every way possible, the guests have been provided with electrical conveniences which will add to their enjoyment of the service which the building affords.

Aluminum Wall Facing

The outside walls of the building are in large part faced with aluminum extrusions, backed by 12 in. x 12 in. x 16 in. cinder concrete building blocks. These extrusions consist of sections — flutes, stiles, window jambs, lintels and sills. It was necessary for the general contractor and the Aluminum Company of Canada to work in conjunction over a considerable period of time, in developing the different shapes and widths of extrusions required and the method to be used to attach the aluminum to the building. As over 70,000 square feet of outside wall area was to be covered with aluminum, detailed consideration was given to the method which would be used to hold this material in place.

Initially, it was planned to have brackets attached to the steel structure which would project through the

building blocks to take the type of aluminum extrusion originally planned. However, this was not feasible, as the steel required for the brackets could not be procured in time to meet the erection schedule. It was necessary to change the type of extrusion, and to use horizontal tee irons anchored into the masonry on 9 ft. 3 in. centres. These tees were accurately located and were level from end to end. In addition, the faces of the tees were kept in the same plane throughout the height of the building.

The aluminum extrusions were purchased in 9 ft. 3 in. lengths and shipped to Robert Mitchell Company for anodizing. An anodized flashing was rivetted to the bottom end of each extrusion to cover the space left for expansion between the different tiers on the face of the building. After anodizing and flashing, the material was shipped to the hotel site and cut to exact length and notched to fit over the tee irons. After preparation was completed in the shop, the material was locked between the tee irons and all joints were sealed with mastic. Before locking the aluminum sections on the tee irons, all masonry and exposed tees were thoroughly coated with bituminous paint.

It is felt that the use of aluminum has been highly successful, and although final costs are not complete as yet, at least a saving of forty-five cents per square foot has been effected in using aluminum rather than stone masonry.

Unitility Bathrooms

St. Catharines Steel Products Limited manufactured the bathroom units for the Laurentien Hotel, in accordance with designs as originated by the hotel company's staff, which they had studied over a period of years. Each bathroom was assembled as a complete unit on a production line in their plant at St. Catharines, Ontario. They consist of a welded steel frame, steel floor covered with linoleum, Arborite plastic wall and ceiling, steel door buck, flush doors, and hardware, bath tub, shower fixture, toilet, wash basin, mirror and electric lights; all fixtures are completely piped with the necessary valves and vents. The complete units were brought to the site, and hoisted into place on the steel structure. The bathroom was then bolted to the steel through holes located by Dominion Bridge Company.

In the studies of the system, full consideration was given to the initial cost of the units, as well as to the cost of installation and to the difficulties of handling these units on the site during construction. Careful layouts were made of the bathroom locations, and Dominion Bridge Company was required to supply the holes in the flanges of the beams which support the bathrooms. These holes were so located that they matched the brackets on the bathroom frames. Due to this planning, it was possible for a crew of five men to place on the steel structure an average of 15 bathroom units a day. The bathrooms were placed in pairs, with the pipe shaft between each pair through the height of the building. The piping layout of the unit was made in such a way that all pipes terminated in the pipe shaft. All that was left for the plumbers to do was to run the pipes in the main shaft and connect the hot and cold water, waste and vent pipes for each pair of bathrooms. Streamlined copper pipe was used throughout the building, and it was possible for 30 plumbers to handle the piping requirements for the 1100 rooms.

Design and Construction

The Laurentien Hotel Company employed Messrs. L. A. & P. C. Amos as Architects, C. Davis Goodman as Associate Architect, and G. McL. Pitts as Consulting Architect. The contract for the erection of the building was let to the Wilson Contracting Company Limited, as general contractor, with John Wilson as President, J. A. Grant as Chief Engineer, J. A. Laughton, M.E.I.C., as Staff Engineer, and S. Strachan as Building Superintendent.

□ □ □

Laurentien Aluminum

by

C. O. P. Klotz, M.E.I.C.

The Aluminum Company of Canada, Limited

The extensive use of aluminum in the construction of Montreal's new multi-storey Laurentien Hotel makes possible a title that appropriately associates the hotel with the source of the metal. Within the Laurentian Plateau, on the Saguenay River, lies the planned City of Arvida, the home of the world's largest aluminum smelter and of Shipshaw, the million-horsepower hydroelectric plant necessary to operate the smelter. An abundant source of electrical energy is essential in the reduction of alumina to aluminum; and at Arvida one drainage segment of the Laurentian Shield which so richly provides a wide area of Canada with waterpower and storage basins, is caught and harnessed in its fall to tidewater.

The Laurentien Hotel has no parallel and few precedents anywhere in the world in its extensive use of aluminum extrusions as an external facing. Major portions of each elevation have been thus treated, from mezzanine level upwards to its full 23-storey height. More than 70,000 square feet of wall are faced with aluminum and 200,000 pounds of aluminum were employed if the extruded window sills and lintels are included. The 7-storey laboratory building of the A. O. Smith Corporation* in Milwaukee, Wisconsin, completed in 1931, is one of the few which might be considered precedents, and here the aluminum was more in the nature of mullions between very large glass areas.

Without the closely co-operative joint efforts of the Laurentien Hotel Company, Architect C. Davis Goodman and the Wilson Contracting Company, the development of the aluminum facing would have been impossible. For everyone concerned it represented a firm step forward in the quest for the elusive lightweight curtain-wall construction that removes the anomaly of hoisting and hanging tons of age-old masonry on modern slender steel frames, yet does not sacrifice fire resistance, thermal and sound insulation, and life expectancy. It offered relatively rapid erection, " dry construction ", lower cost than traditional stone facing, and an aesthetically satisfactory treatment of a very modern structure of simple lines free of false ornamentation and of massive obliteration of its true nature.

*See *The Architectural Forum,* Vol. LV, No. 5, November 1931.

Development

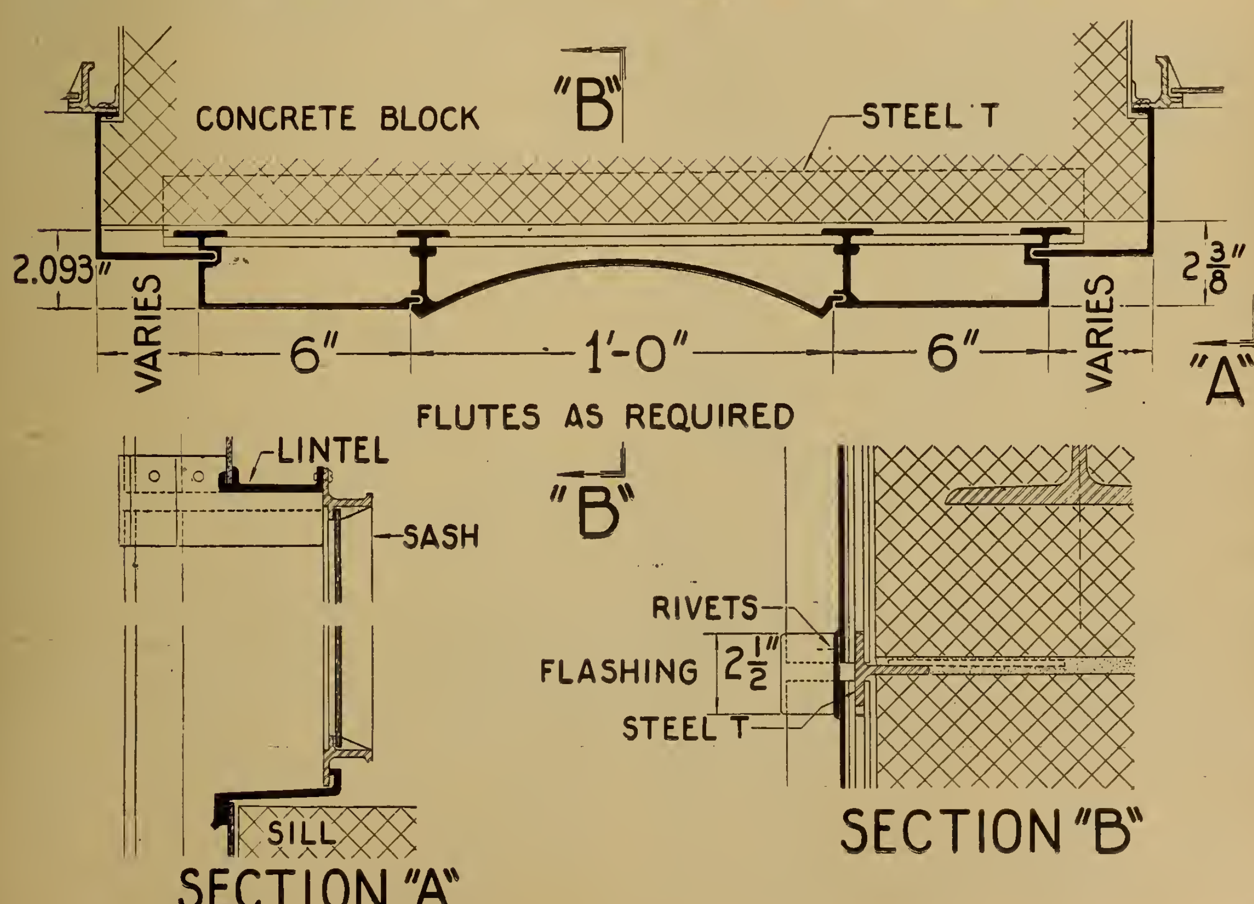
Early suggestions that aluminum spandrels should be employed, and consideration of the reasons for their use, led quickly to an investigation of how aluminum might be employed to construct the walls of the building. The aim was to speed erection, reduce costs and modify traditional appearance. The building by-law respecting fire resistance required the adoption, as a minimum, of 12-inch concrete-block curtain walls. The aluminum would therefore be employed only as a facing material in place of stone or brick; and a 4-inch stone facing was set as the criterion of economic acceptance, since stone was to be employed to some extent in any case.

The possibility of using castings, the traditional form of aluminum spandrels, was soon ruled out on grounds of cost and production time required. Sheet was considered, but in this case the considerable amount of shop work involved in forming and fabricating attractive pans or panels, and the rather unpredictable cost of their erection, turned the tables overwhelmingly in favour of extrusions. Relatively little shop work would be required on these, and they could be readily handled in storey-lengths by one person. It was desirable that each extrusion be wide enough to provide an architectural unit. The adoption of a flute profile 12 inches wide grew from an attractive but much smaller fluted extrusion (originally designed for covering window mullions) and the fact that extrusions much in excess of 12 inches in width are neither very practicable nor possible with present equipment.

In the first proposal for facing the hotel with vertical extrusions the main units, "flutes", were of symmetrical shape, 12 inches in face width and ⅛ inch thick with a rectangular groove on each side to engage a continuous (one storey), extruded aluminum cleat angle having wings or a double tongue on its outstanding leg. These cleats were to be bolted to horizontal steel clip angles built into the masonry backup or riveted to the structural frame. It was decided to erect these in storey lengths of approximately 9 ft.-3 in., the flutes to be bolted to the cleats, at their tops only, so as to allow for expansion and contraction. The method of flashing the horizontal joints at each storey was not decided upon immediately; but extrusion dies were built, extrusions made and a prototype panel erected. This scheme contemplated special aluminum sills and cast aluminum spandrels. The prototype was successful; but it was felt that the bolting of the flutes to the cleats would be difficult and expensive. It was also planned to use two other extrusions, a "stile" and a "jamb" to return the fluted panels into the window-spandrel reveals.

The next development step called for the cleat angle to be extruded integrally with each extrusion, with all vertical joints to be of tongue and groove nature. Each extrusion except the "jamb" was to be bolted fast at its top to the horizontal steel clip angle, slot bolted at its lower end to permit expansion and contraction.

Typical plan and sections of aluminum facing showing method of attachment.



This scheme was an improvement from an erection point of view; but the unsymmetrical nature of such broad extrusions would doubtless introduce production problems and require most careful die design.

Before extrusion dies were built for Scheme 2, the final design illustrated on page 81 was evolved. The unsymmetrical section was retained, but the use of any attachment screws or bolts was eliminated. The integral cleats or legs of the extrusions were altered to a " T " shape with a heavy double bead on the stem. Horizontal steel " T's " were to be anchored in the concrete block back-up at each storey and in line with the window heads, with their faces clear of the back-up by about ⅜ inch. The stem of each extrusion leg was to be cut back or notched at each end, between its rear face and its bead (the slot in the case of the " stile "), so that each extrusion could be fitted on and would clutch the face of the steel " T's " snugly. The extrusions would sit over the upper half of one steel " T " and clasp the lower half of the steel " T " above.

A male and a female " stile " member would be required to make the returns into window reveals; the jamb extrusions would be coped to fit around sills and spandrels and would be fixed to the window frames with self-tapping or machine screws; arborite spandrels would be employed to provide a change of colour and material in the vertical window bands; standard aluminum extruded sills would be used and a special extruded lintel would be made to receive the spandrels. A prototype of Scheme 3 was then erected successfully; and costs, when analysed, were found to be below stone facing. The final item to be decided was the method of flashing the horizontal expansion joints, and a face flashing riveted to the lower end of each extrusion was adopted. This had the desirable effect of creating with the lintels a subordinate horizontal line at each storey. Cover picture, and photos on page 80 and at lower left of page 83, show completed work.

Alloys

The alloy employed for the extruded facing, sills, lintels, and interior trim was Alcan 50S, the facing material being in the heat treated " A33 " temper, the sills and lintels in the " as extruded " condition. Alcan 50S, containing magnesium silicide as the hardening constituent, is the standard architectural alloy. It has good colour, fine finishing and anodizing characteristics, intermediate mechanical properties, excellent corrosion resistance, good welding and brazing characteristics, reasonable machinability, good formability and excellent extrudability. It is a heat-treatable alloy, lending itself to a variety of such treatments; and it is one of the less expensive of the various extrusion alloys. Alcan 50S extrusions are used for all types of architectural purposes such as windows, window sills, doors, thresholds, railings, mullions, pilasters, trim, mouldings and store fronts. When an alloy of generally similar characteristics but higher mechanical properties is desired, Alcan 65S is available. It too is a heat treatable alloy of the magnesium-silicon group; and is a standard structural alloy.

The flashings riveted to the Laurentien facade extrusions were of Alcan 2S-½H sheet, 1-16 inch thick. They were preformed, backpainted with alumilastic sealant and fixed with Alcan 2S rivets. Alcan 2S is commercially pure aluminum, hence non-heat-treatable; and the sheet is produced in four tempers: " O ", annealed; " ½H ", half hard; " ¾H ", three-quarter hard; "H ", full hard. Alcan 3S, containing manganese as an alloying constituent and having higher mechanical properties than 2S, is also a non-heat-treatable alloy produced in similar tempers. Both 2S and 3S sheets are useful for general building purposes including roofing, flashing, ductwork, doors, canopies, panelling, in fact wherever sheet is required for other than structural work. The preference is commonly 3S, and the temper usually employed for ordinary forming requirements is ½H.

Table 1 shows the chemical composition limits for Alcan 2S, Alcan 3S, Alcan 50S and Alcan 65S. Table 2 shows the typical mechanical properties of these alloys.

The " O " temper is soft or fully annealed. " W " temper signifies a " solution heat treatment " which consists of heating the metal to a temperature, below the melting point, at which the alloying constituent goes into solid solution, following with a quick quench in water to retain this condition. Temperatures required vary with the alloy between 800 and 970 deg. F. and must be closely controlled. The " T " temper is produced by the " age hardening " of metal that is in the " W " temper. Alloys such as 50S and 65S require artificial aging by heating to temperatures ranging from 250 deg. to 350 deg. F. for various periods ranging up to 24 hours. This process is known as " precipitation heat treatment " because dissolved constituents are precipitated in extremely fine particles. The " Q " temper in Alcan 50S is obtained by air quenching of the hot extrusion as it leaves the die; and the " A33 " temper results upon furnace aging of " Q " material.

The Extrusion Process

During the war great quantities of extrusions went into aircraft frames. Today, the sword becomes the

ploughshare as extrusions go into peacetime building industry in ever increasing quantities. The figure at the centre of page 83 illustrates the extrusion process diagrammatically. A hot but solid cylindrical ingot is put into the container and pressed with such force against a steel die that the metal flows through and takes the cross section of the opening cut in the die. In practice the pressures on the die range up to 150,000 lb. per sq. in.

The figure at the top of page 83 is a general view of a 5000-ton extrusion press, one of the several Alcan presses ranging in capacity from 1500 to 5000 tons ram pressure. At the extreme left is the cylinder and piston powered by a pneumatic-hydraulic accumulator system which feeds hydraulic fluid against the piston at pressures up to 4750 lb. per sq. in. The crosshead with the pointer on it is a massive guide and support for the piston and ram. Next on the right may be seen the cylindrical ingot container which is electrically heated in order to hold the ingot and die at the proper extrusion temperature. Above the head of the press may be seen a stand for the hydraulic operation of the gate lock while beyond the press on the right is the guillotine. The figure at the bottom of page 83 is a head-on view of an aircraft spar, coming out of a press.

Extrusions really start in the remelting department where metal is melted, and alloys made up in large coke-fired furnaces. From the furnaces, or from holding ladles, cylindrical ingots of various diameters up to 16 inches are cast in either cold molds or by the vertical continuous casting system. The cast ingot usually contains too much metal for a single extrusion and it is cut to the proper lengths on a cold saw. A certain ratio of length to diameter is desirable for best operation of the press, too long an ingot resulting in excessive power consumption and container wear, too short an ingot in poor economy and an excessive loss ratio in butts. Furthermore a reasonable ratio of container bore to cross-sectional area of extruded product must be maintained, hence various lengths and diameters of ingots are prepared.

The extrusion ingots are then preheated at temperatures under 1000 deg. F. for several hours to improve their grain structure, and after cooling are ready for the extrusion department. Here they are reheated to render them more extrudable, and then one is quickly transferred from furnace to press where it is pushed into the container by the ram and the extrusion commenced. It is impracticable to extrude the ingot completely, and a short butt is left. This butt, along with the die and its holder, is pushed out of the press upon completion of the extrusion; the butt is lopped off and the die reset while the ram is withdrawn ready for the next stroke.

Leaving the press, the extrusion is hot and relatively soft, hence distortion may occur as it cools. Solution heat treatment likewise is accompanied by distortion upon quenching. Elimination of such distortion requires straightening operations. Longitudinal stretching beyond the yield point, will often do all that is necessary. This is accomplished in a 'stretcher' not unlike a horizontal version of a laboratory tension testing unit. A similar machine may be used for de-twisting; a hydraulic press may be employed to remove local bows or warping while a roll straightener may be required to true up the cross section.

The Laurentien Hotel flutes were extruded in a 5000-ton press from 16-in. diameter ingots. Extrusions up to 110 feet in length were run, then cut into lengths of about 35 feet for stretching. Due to their unsymmetrical nature, considerable distortion occurred upon cooling, and this was removed by a regulating operation on a roll straightener followed by a stretch on a 385-ton stretcher and completed by another pass through the regulator. Other facade sections were extruded from 11-in. diameter ingots in a 3100-ton press. Upon completion of straightening operations, the extrusions were cut to the ordered length of 9 ft. 3 in. then aged to the "A33" temper in a batch furnace, and thereupon inspected and crated.

ADVANTAGES OF EXTRUSIONS

A broad variety of shapes can be readily and economically extruded in aluminum. The process offers sections that cannot possibly be hot rolled, offers also variations in metal thickness and corner radii that cannot be duplicated in cold roll-forming from strip. While a wide range of extruded standard structural and architectural shapes is available, the designer is not limited to these. He may have special dies built to produce sections of his own design because die costs are relatively low, the average range being between $50.00 and $300.00.

In the production of doors, windows, store-front assemblies, transportation equipment, mouldings, furniture, hardware and many other articles and pieces of equipment, manufacturers can design open or hollow sections to suit their requirements exactly as to profile, strength and function. Extruded sections are not subject to many of the restrictions governing hot or cold rolled shapes. The practical overall width limit is 13 inches, while the minimum practical section thickness is 0.035 inches; and the total cross sectional area should not exceed 25 square inches.

Hot-rolled sections require a heavy capital outlay for rolls. Their outside corners must have relatively liberal radii, inside corners generous fillets. Re-entrant sections cannot be rolled; and complicated or hollow shapes are quite impossible. Extrusions can be produced with sharp corners, re-entrant recesses, wings, flanges, bulb and socket features, tongue and groove edges, dovetail connections, and with wide variations in metal thickness across the section. Die costs are low. A press can be readily set up with a new die so that relatively small quantities of a particular shape can be economically run. All structural sections and most of the rectangular and square bars produced by Alcan are extruded.

In comparing extrusions with shapes cold-rolled from strip, the outstanding difference is that the sectional thickness of the latter cannot be varied except by piling up two or three laminations. On the other hand cold-rolled shapes can be produced in much lighter thicknesses, and it is possible to do certain punching and cutting operations simultaneously with rolling.

The Laurentien Hotel facade extrusions give a good idea of what the extrusion process can offer to the designer. Interlocking, lapping, or tongue and groove features make it possible to provide joints with sheet, castings, or other materials such as glass, or fibreboard. One of the outstanding advantages of the process is the ease with which seamless hollow shapes of oval, rectangular, or irregular nature may be made. The torsional rigidity of a hollow shape is high per volume of metal, and such sections can be easily joined by inserts in the openings, facts taken advantage of by many window manufacturers.

Finishes

Aluminum lends itself readily to a wide variety of mechanical, chemical, electro-chemical and dyed surface finishes. The casual observation of aluminum in household articles such as cooking utensils, toasters, washing machines, vacuum cleaners, venetian blinds and bric-a-brac, in storefronts, in aircraft, in railway coaches, in kitchen and restaurant mouldings, in buildings, will impress this fact.

For many applications the ' as extruded ' finely lined finish is attractive and sufficient. Windows are commonly produced with no further refinement. Coarse lined, fine lined, satin or highly lustrous finishes may be produced using belt sanders, oiling buffing or colouring wheels, or wire or fibre brush wheels. Sandblasting and ball burnishing offer further finishes; while hand brushes or steel wool may even be employed where the number of pieces is not great.

Etched or frosted finishes are readily and inexpensively possible by dipping in a hot alkaline etching solution such as sodium hydroxide. Such surfaces do have a tendency to pick up dirt and finger mark easily unless anodized, an electrochemical process for developing a thin, hard, transparent oxide film on the surface.

Several simple chemical treatments are available for increasing the thickness of the normal oxide film thus giving increased protection against corrosion and abrasion. At the same time these render the surface smudge-free and easier to keep clean, some imparting an opaque or gray to greenish gray colour, others giving a clear film. However the most common method for producing artificially thickened oxide films is anodizing, an electro-chemical treatment in which the aluminum, immersed in a suitable electrolyte, is made the anode of an electrical circuit. Of several electrolytes, chromic acid and sulphuric acid have been most used; and since the latter gives a clear transparent film of excellent uniformity, it is the one commonly used in architectural work.

The sulphuric acid anodizing process, patented and referred to as the " alumilite " process, may be very briefly summarized thus: (1) Racking, aluminum racks being used to support and carry current to the work; (2) Degreasing, cleaning, usually in an alkaline solution, followed by water rinsing; (3) Alumiliting in a sulphuric acid solution of about 15 per cent concentration held in a lead-lined tank, with the aluminum as anode of a circuit operating at about 22 volts and 12 amperes per sq. ft. current density for about 30 minutes; (4) Rinsing in cold water; sealing the amorphous oxide coating in boiling water; (5) rinsing and drying.

The clear oxide film thus built up has a thickness in the order of .0004 in. It enhances and gives a rich depth to the natural colour of the metal, particularly on highly polished surfaces. It not only renders the surface more attractive but makes it easier to keep clean. Dust, soot and dirt are less adherent and more easily wiped or rinsed off. Anodic films are characterized by a minutely porous structure capable of absorbing dies or within which insoluble pigments may be precipitated, and a wide range of colours from pale pastels to deep shades are employed in finishing many products.

The facade extrusions on the Laurentien Hotel were sent directly from the extrusion plant at Kingston, Ontario, to the Robert Mitchell Co. of Montreal where they were cleaned and alumilited without any previous mechanical finish. The preformed sheet flashings were anodized before riveting to the extrusions thus avoiding possible entrapment of acid between the faying surfaces. The flashed extrusions were then delivered to the hotel where they were trimmed to the exact length required, as gauged for each panel by the General Contractor who also did all coping and notching work, using band saws and hack saws.

Other aluminum applications in the Hotel received various finishes such as hand rubbing with steel wool, belt sanding with No. 240 grit to give a fine-lined satin texture, buffing to give a lustrous tone, and painting where colour schemes required it. The storefront extrusions were buffed and alumilited, by the storefront subcontractor, this being a standard practice for such work.

Other Aluminum Applications in the Laurentien Hotel

In the construction of the Laurentien Hotel, and apart from the exterior facing, aluminum has been employed in a variety of ways both utilitarian and ornamental. Mention has already been made of the extruded window sills, a standard Alcan product, used throughout the building; also of the storefronts which incorporate polished and anodized extrusions. Still on the outside of the building is the main entrance canopy which has been made of aluminum sheet and shapes.

Within the building, all the exhaust ventilation ducts serving the hundreds of prefabricated bathrooms as well as large areas on the ground and lower floors were made of Alcan 2S-½H sheet in various gauges, mostly 20 and 22 B.&S. i.e. 0.032 in. and 0.025 in. Alcan 3S-½H is also commonly used for ductwork. It is of interest to note here that the firm which installed this ventilation system, Douglas Brothers, erected a sheet aluminum cornice on the Canada Life Building, Montreal, in 1896 and again on the Canadian National Railways office building on McGill Street in 1901, both of which can be seen to-day, black with city grime but otherwise unchanged. The discovery of an economical process for making aluminum had only taken place 10 years previously in 1886.

Throughout the lobby and mezzanine areas, extruded aluminum trim has been extensively employed while the railings of the main stairs and mezzanine areas are also made up of extrusions panelled with glass. For the railing infill there was specified a fine-lined or satin finish produced by belt sanding, with a highly polished handrail. In the prefabricated bathrooms, we again find aluminum, this time in the form of polished mouldings used in panelling the walls.

Considerable aluminum rigid conduit was employed in the electrical installations, while the heating convectors throughout the hotel have sheet aluminum casings which can be left in their attractive natural colour where colour schemes permit. On exit stairways and shafts, Kalamein doors clad with aluminum sheet have been employed; in the corridors, extruded wire mouldings, painted to suit adjacent colours, have been used; and in the elevators, aluminum trim is again found. Another application developed when the general contractor, in trimming and coping the facade extrusions, found aluminum so easy to cut and handle that he built up attractive stools for certain windows using scrap cuttings. The strength combined with the easy cutting and working characteristics of aluminum alloys frequently brings some astonishment to those not familiar with them.

The Laurentien Hotel presents to-day in Canada greater use of aluminum by designers, and by the building industry generally, than any other structure.

Steel Structure *for the* Laurentien Hotel

by
J. H. R. Dansereau, Jr.E.I.C.
Dominion Bridge Co., Limited

Late in February 1946, the contract was awarded for the design, fabrication and erection of the structural steel for the 1100 room Laurentien Hotel facing Dominion Square in Montreal. The building contains two floors below street level, a ground and a mezzanine floor, nineteen floors of bedrooms, an apartment floor for the managing staff, a mechanical equipment floor, and an elevator penthouse. The completed building rises some 240 feet above street level with some 25 feet underground.

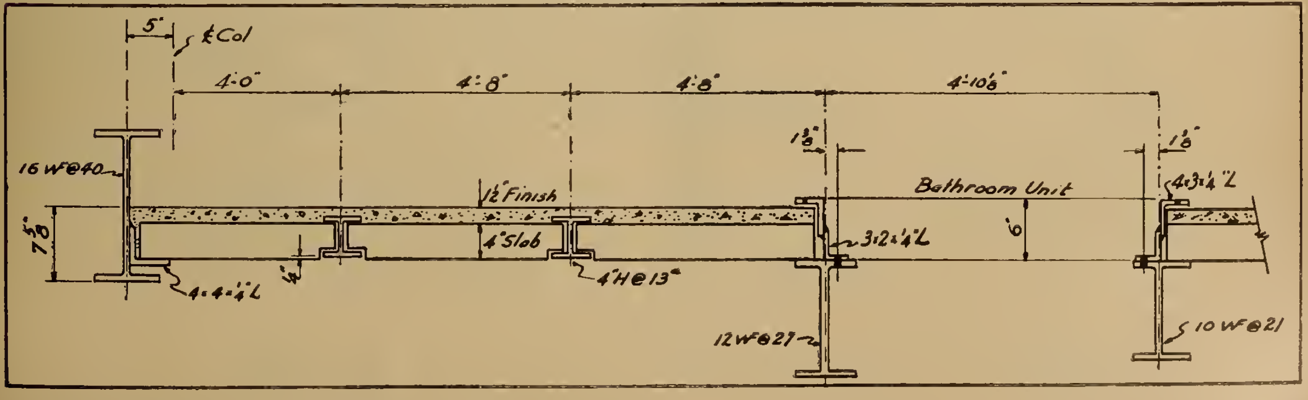
Due to the acute shortage of both skilled and common labour, maximum advantage was taken of prefabrication. With this in mind a unique floor system was developed, using 4 in. precast aerocrete slabs set between 4 in. H beams, which are continuous over the main floor members. The floor finish consists of 1½ inches of concrete poured as a monolithic layer over the entire floor area. A typical cross section of this floor arrangement is shown in Fig. 1. This floor system provides a flush ceiling, the main beams being located in the partitions in all but a few rooms, with the economical advantages of lightness, speed of construction, absence of form work and an extremely low resultant storey height of 9 ft. 3 in. between floor levels. The partitions are of the dry type, preassembled on the site, and the washrooms are prefabricated units shipped from the manufacturer's factory ready to be placed on the structural steel.

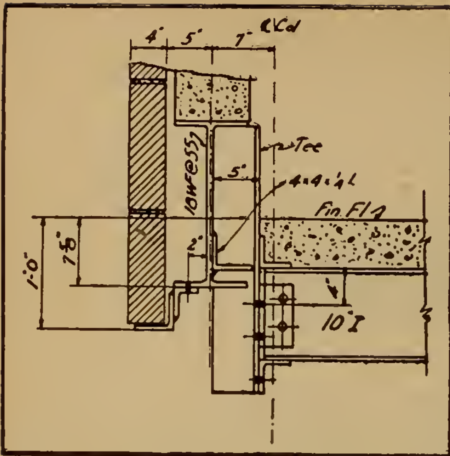
The exterior wall construction at pilasters consists of 4 in. cut stone, backed by 8 inches of concrete blocks, and in the window areas 12 in. concrete block walls faced with aluminum. To comply with city of Montreal by-laws for fire protection, vertical wells of elevators, stairways, laundry chutes, etc. had to be enclosed in block partitions and all main structural members covered with a minimum of 2 in. of fireproofing.

Loading

With these conditions clearly established the design was started March 7th, 1946. So as not to delay the construction time table, the steelwork contractor with the approval of the architects adopted the policy of designing the first tier of the structure, from sub-basement to lobby floor, of immediately available material and of ordering the balance of the required steel to size and length out of monthly mill quotas. In proportioning the sizes of members the allowable unit stresses and live load requirements of the City of Montreal by-laws were used. These unit stresses and loads appear in Table I. The dead loads were determined by the weight of the different architectural elements such as exterior and interior walls, roof and floors. A typical floor panel's dead load was made up of the following items:

Fig. 1—Typical cross section of floor arrangement.





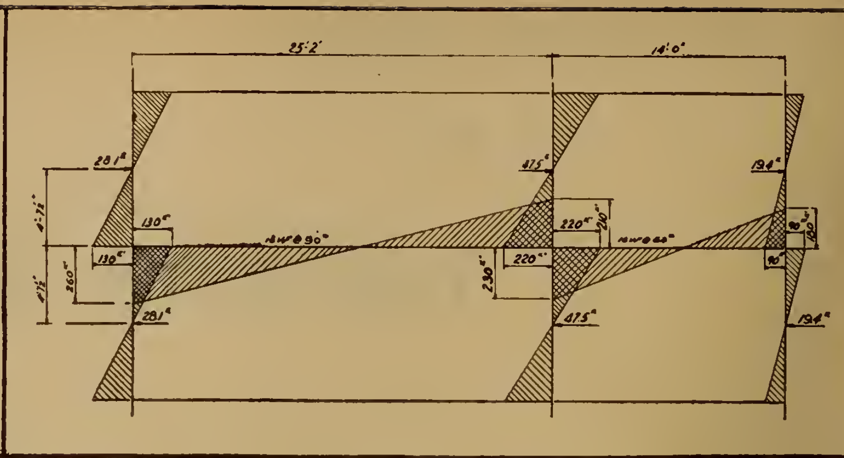


Fig. 2—Typical wall cross section. **Fig. 3**— Wind moment diagram of a typical section through central portion of building.

	lbs. per sq. ft.
1½ in. cement finish and carpet	18
4 in. aerocrete	23
Ceiling, vermiculite plaster	5
Steel including girders, beams and fire-proofing	9
	55

Table I

Unit Stresses

	lbs. per sq. in. (max.)
Compression on columns	15,500
Compression in beams and girders	20,000
Tension in beams and girders	20,000
Tension on rivets (Dead & live load)	15,000
Shear on rivets (Power Driven)	15,000
Shear on rivets (Hand Driven)	10,000
Bearing on rivets (Power Driven)	30,000
Bearing on rivets (Hand Driven)	20,000
Elevator supporting beams	12,000

For members carrying wind only, unit stresses may be increased 25%.

For members carrying combination of dead, live and wind, unit stresses may be increased 50%.

Live Loads

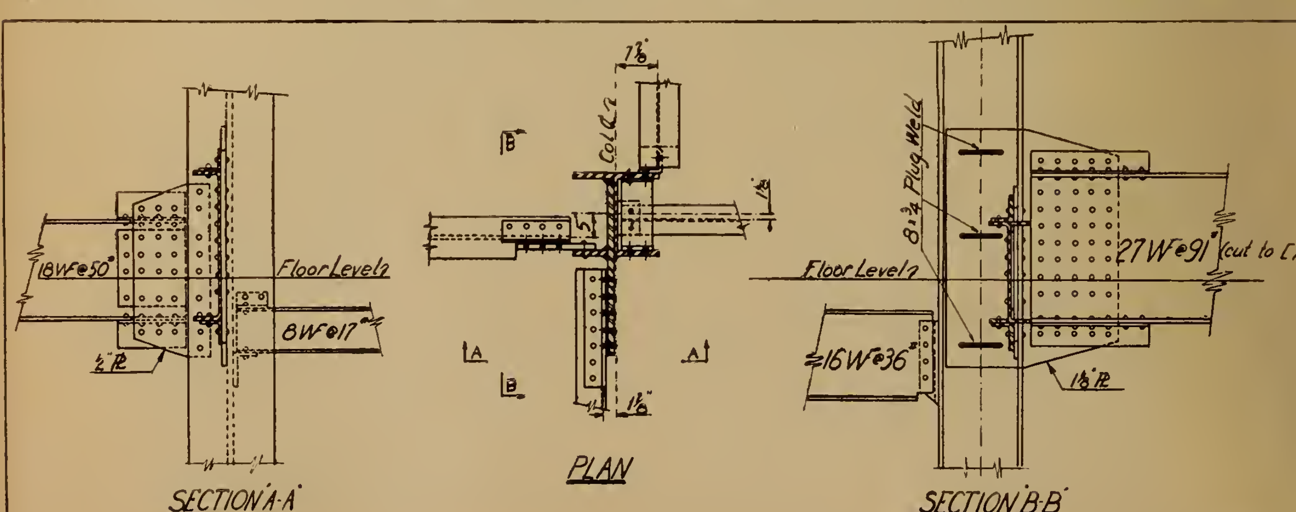
	lbs. per sq. ft.
Bedroom floors	40
Offices and public halls	100
Merchandise and Baggage unloading platforms	125
Wind load	30

Design Procedure

The design procedure adopted was first to calculate the loads on the columns from the floor area and partitions supported by each. Simultaneously floor and spandrel beams were designed as simple beams, and the column loads were checked using actual beam reactions. Wind loads were next applied and the beams together with columns into which they framed redesigned as rigid bents using a moment distribution method. In this connection it was necessary to restrict the depth of structural sections used both across corridors and around prefabricated bathrooms on account of the low storey heights.

Spandrel beam locations were also a problem, since these beams had to be proportioned and placed at each floor in such a way that they would not interfere with window openings of the floor below. For that reason,

Fig. 4—An eccentrically-positioned connection designed for end wind moment and dead and live load vertical shear.



wall supporting beams had to be located above the level of the floor beams framing into them. Special stiffening connections had to be designed to provide the compression flange with proper lateral support. Furthermore these beams had to be set 5 or 7 inches outside of column centre lines to support the stone facing, the outside wall line being generally 1 ft. 2 in. from centre line of column. Figure 2 shows a typical wall cross-section with a spandrel beam and its stiffening connection to floor beams. Column sections were fabricated in 37 foot lengths, equal to 4 storeys in height, and where possible, the same detail design was used on each of these four floors.

Wind Analysis

An item of prime importance in the design of such a 23 storey building is the effect of wind on the structure. The reader will understand the magnitude of the problem when it is realized that the City by-laws required the building to be designed for a wind pressure of 30 lbs. per square foot of projected area, and that the building rises approximately 240 feet above the level of the street. Furthermore, the depth of the central portion and of each wing of the building from wall to wall is about 40 feet for a height of some 200 feet.

Owing to the many novel features of construction used in this building, in which exterior walls are largely composed of 12 in. concrete blocks faced with aluminum, and interior partitions are built of dry prefabricated panels, the bracing effect of walls and partitions was totally neglected. The steel frame was, therefore, calculated to resist the entire wind load. The use of diagonal bracing or knee braces was studied and found impractical, due to the limitations of the building layout and the special wall construction.

Because of the peculiar shape of the building, the open mezzanine floor, the set backs, and the different elevations of the lobby floor to accommodate store concession on the sloping Windsor street face, it was found that the usual methods of wind analysis such as the portal or the cantilever methods were not applicable. The method that was used took full advantage of the various floor slabs as monolithic diaphragms to distribute wind load to each column proportionately to their stiffness ratio.

It was assumed as a fundamental hypothesis that under wind pressure, the floors would act as diaphragms, and would not distort or buckle. Whence any horizontal displacement due to wind load would cause equal lateral displacement of all columns. By maintaining the angle between the beams and columns constant, with properly designed flanged connections, resistance to wind shear is provided and rotation of the joints induced. The amount of joint rotation is dependent on the stiffness of the column and of the beams framing into it. The weaker of these two opposing structural elements is the factor determining the amount of wind shear that each joint absorbs.

The total horizontal pressure was therefore figured for each floor, and divided amongst all the columns in proportion to their stiffness factors, since in all but a few cases, the columns had a smaller stiffness factor than the beams framing into them. Due allowance was made for suitable reduction of the amount of shear taken by columns into which beams framed eccentrically. To reduce the amount of calculations involved, it was assumed in most cases that the points of contra flexture of columns would be midway between adjacent floors. The horizontal shear was applied at this point for wind moment calculations, and the share of wind moment resisted by each beam was determined by moment distribution. Fig. 3 shows a wind moment diagram of a typical section through the central portion of the building.

The design of wind connections developing these computed end moments was complicated by the fact that many beams, for architectural reasons, could not be framed on the centre lines of columns. An eccentrically positioned connection designed for end wind moment, as well as dead and live load vertical shear, is shown in Fig. 4.

Erection Procedure

Erection drawings were made and sent to the architect for approval. Upon receipt of the approved prints, the steel contractor prepared detail drawings, which were issued to the fabricating shops as soon as all details, such as overall dimensions, clearances, rivet pitch, matching connections, etc. of every individual structural member had been checked by experienced draughtsmen.

The fabrication was carried out well on schedule, except for a few unavoidable delays caused by tardy mill deliveries. Careful planning of the shipment of all structural members of this 3,500-ton contract was necessary as there was only a limited storage space at the site, and other building trades were to follow closely behind the steel erectors.

The entire frame was erected with the use of three 12-ton guy derricks, each having a 100-foot mast and a 90-foot boom. The derricks were first assembled at the garage floor level and erected steel up to ground floor. They were then raised to this level, and erection proceeded up to the first bedroom floor. The derricks were subsequently raised every four floors until erection was completed. Two derricks only were required above the seventeenth bedroom floor.

The architects on this project were L. A. & P. C. Amos, and C. D. Goodman, with G. McL. Pitts as Consulting Architect and Engineer, the general contractor was Wilson Contracting Co. The Dominion Bridge Company Ltd was sub-contractor for the structural steel.

The Telephone Installation *in the* Laurentien Hotel

by

H. G. Owen

Bell Telephone Company of Canada

Installing a telephone in every room of the 1,100-room, 23-storey structure was not the only job required to provide telephone service for Montreal's new Laurentien hotel. Miles of wire had to be pulled through ducts in the building, a fully-equipped manual switchboard and dial switching apparatus installed, and new cable facilities provided between the hotel and the Lancaster central office and within the hotel itself. All this involved months of planning and engineering even before the actual work began.

The Bell Telephone Company was first asked to provide service for the new hotel in a letter from the Ford Hotel Company of Canada, in September, 1945. Details of the structure and the location of the switchboard and equipment rooms were not available until some months later, and the final recommendations for the type of service needed were approved by the Ford Hotel Corporation, in June, 1946.

These recommendations called for the installation of a 605-A manual switchboard with positions for five operators on duty at one time, a 740-AX satellite dial private branch exchange (or PBX), 50 central office trunks, and direct tie lines to the Ford Hotel, which is owned by the same company, and to Elgin Management Limited, the parent corporation.

The telephone company received the floor plans for the switchboard and equipment rooms in December, 1946. The switchboard room is located on the Main or Lobby floor, and the dial equipment room in the basement. The two rooms are connected by a private stairway to facilitate maintenance. In order to ensure that telephone equipment would be completed for an anticipated mid-summer opening of the hotel, these rooms had to be ready for equipment installation by March 1. The rooms were prepared and the plaster rapidly dried out with salamanders while the rest of the hotel was still largely unfinished. The Northern Electric Company began installing the equipment on April 7, but the men worked in heavy clothing and it was necessary to use small oil heaters for some weeks to provide reasonably satisfactory working conditions.

The manual switchboard serves the telephones in the 1003 guest rooms and the four apartments on the 23rd floor, and 25 telephones for the various concessions and services in the hotel. The operators also handle all incoming calls to the hotel. This switchboard is equipped with a jack appearance of the dial station lines to permit completion of manually handled calls to the dial equipment. Because of the number of jacks required for manual and dial lines and trunks, and due to the fact that 605-A positions with larger jack field openings were not available, it was necessary to omit all designation strips from the guest room multiple. As the room numbering plan ensures a uniform arrangement for each floor whereby every room with the same number will occupy an identical position on all guest room floors, a special numbering scheme was adopted for the switchboard jacks serving all floors above the twelfth.

The dial equipment serves 58 administration telephones, 45 of which are for intercommunicating calls within the hotel only. This is the first time in The Bell Telephone Company's territory that this combination of a manual switchboard and a satellite dial PBX has been installed in a hotel.

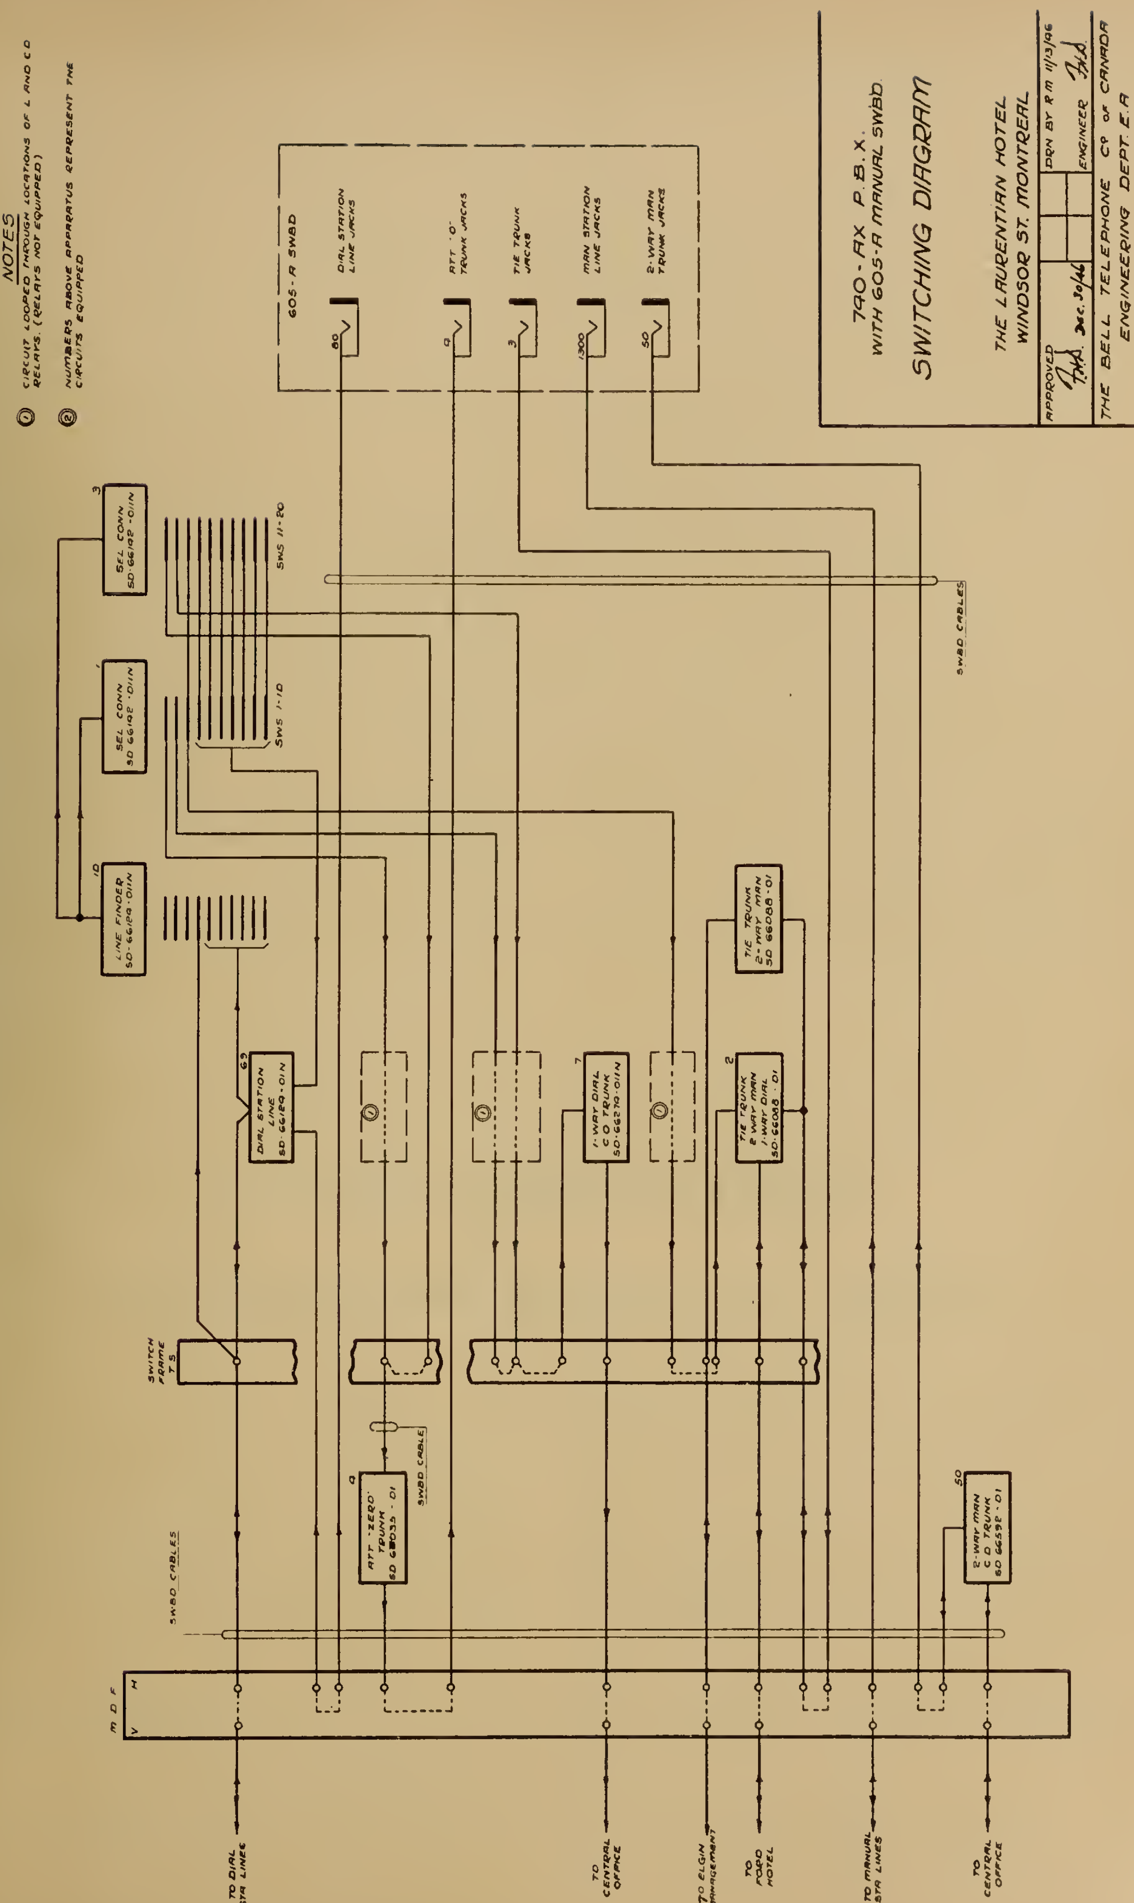
The dial PBX used for the hotel administration is a small two-digit system of the step-by-step type employing linefinders and selector-connectors with a capacity of 79 lines. The equipment operates on 48 volts d-c supplied from the telephone power plant in the equipment room. A separate group of outgoing one-way dial trunks to central office was installed, these being reached by dialing " 9 ". Incoming calls are handled at the main switchboard to which the dial station lines are multipled. Direct tie lines to the Ford Hotel PBX are provided and calls can be made by dialing " 8 ". Communication to Elgin Management Limited is furnished over the lines from the manual switchboard.

The power plant, known as the 110A plant, consists of a full wave regulated tube rectifier with variable plate voltage control, primary 210-250 volts, 60 cycle a-c, output 48 volts, 30 amp d-c. Means are provided automatically to maintain the battery voltage in the floating range 49.5 $\pm$ ½ volts, to prevent the rectifier from overloading and to give the necessary alarms in case of trouble. The 200 amp hour battery has a 6 to 8 hour busy hour reserve.

The ringing machine to provide the ringing current, tones and signals, consists of two panel-mounted converter type machines arranged so that, upon the failure of the regular machine, the load will automatically be transferred to the reserve machine and an alarm given. Both regular and reserve machines operate from battery.

Associated with the installation is a distributing frame on which all lines and trunks from both the

TELEPHONE SWITCHING DIAGRAM



switching equipment and manual switchboard are terminated. The feeder and house cables are likewise terminated on this frame, thus permitting complete flexibility of cross connections between the equipment and house services.

The feeder cable that feeds the hotel is part of the underground cable system providing facilities from the Lancaster central office into the hotel area. From this feeder cable system a 404 pair entrance cable provides facilities for the specific use of the hotel. This cable enters the building in conduit from Stanley Street, runs through the building in metal conduit and is terminated on the distributing frame.

Obviously the number of telephones required in a hotel makes it impractical to place a pair of wires through the building each time a telephone is installed. This necessity is avoided by the installation of a house cable distribution plant which terminates on the distributing frame and permits convenient, efficient connection of telephone equipment at any location in the building. This house cable system, designed to meet the maximum requirements of the hotel, consists of about 2,860,000 feet of wire in lead covered cables ranging in size from 909 pair to 26 pair, and about 125 distribution terminals.

The north section of the hotel, from the third to the twenty-second floor comprising about 400 rooms, is served by a 606-pair main riser cable, and the south section of the hotel, including the twenty-third floor comprising 600 rooms, is served by a 909-pair main riser cable. These cables are run in three and a half inch metal conduits from the telephone equipment room in the basement to splicing rooms on the third floor. Above this floor the riser cables are lashed to strand in riser shafts from which they are brought out and spliced on every third floor in the splicing rooms. The 606 and 909 pair riser cables diminish to 202 and 404 pair cables respectively on the twelfth floor.

On the floors where the riser cables are brought out and spliced, three smaller sized distribution cables, 101 pair in the south riser and 51 pair in the north riser, are brought out to serve that floor, the one above, and the one below. The splices are supported on cable racks which are bolted to the metal wall studs for stability. The distribution cables for the guest room floors of the hotel are run through the wall of the splicing rooms and into aluminum moulding along the corridors to feed distribution terminals which are placed at strategic locations just above the moulding.

From these floor terminals, the wiring to the individual telephone is placed in the aluminum corridor moulding, in picture moulding in the individual rooms and by fishing vertically between the walls. About 150,000 feet of insulated wire were required to complete this part of the installation.

Where it is necessary to cross corridors, separate conduits are provided for cable and wiring. These conduits terminate in the corridor moulding. Thus, all cable and wiring are concealed on the guest room floors of the hotel except for the distribution terminals which when painted to match the walls will be inconspicuous.

The administrative floors of the hotel are served by three separate 101 pair riser cables. These are routed in conduit to seven built-in cabinets in which terminals are placed. From these cabinets, conduits are run to outlet boxes for use in wiring individual sets, switchboards and other telephone equipment.

IMPORTANT!

Change in Annual Meeting Dates

- **Trains from the East arrive in Banff about noon.**
- **More time must be allotted for enjoyment of the superlative recreational facilities at Banff.**
- **THEREFORE the Annual Business Meeting will be held at 8 p.m., Tuesday June 1st, with the Council Meeting convening at 9.30 a.m. of the same day. This will permit the Professional Sessions to commence on Wednesday morning June 2nd with Thursday afternoon and Saturday available for recreation.**

COUNCILLORS *and others invited to attend the Council Meeting should plan to arrive in Banff on Monday, May 31st*

OTHER DELEGATES *should plan to arrive Tuesday, June 1st*

The Geneva Trade Agreements
and
The Engineer

by

H. G. Cochrane, M.E.I.C.

SYNOPSIS

This article draws the attention of the engineering profession to the Geneva Trade Agreement, and to the Draft Charter for the International Trade Organization. It defines their scope and some of their limitations. A summary of the concessions given to and by Canada on tariff reductions for products of forest, mine, quarry and heavy manufacturing industries is given. These are the products of widest interest to the Engineer. An attempt is made to draw a few conclusions with regard to the benefits accruing to Canada from the agreements.

News of the Geneva Trade Agreement on November 17th last probably escaped the notice of a considerable number of Canada's 50,000 engineers and scientists. Many of them who did read the press release, busy as they were with stresses and stopes, with kilowatts and passenger miles, with decibels, " cold fronts " and many other professional interests, were quite happy to leave the details to exporters, revenue officers and federal budgeteers.

But behind the texts of Draft Agreements and Schedules lies vital information which may well affect their own purchases; information which will have considerable impact on the next few National Budgets and will indirectly affect taxation. Moreover, knowledge and conclusions derived from their careful study will, in many cases, also be of definite value to employers and clients of many members of the profession.

This important announcement, as well as comment thereon, so far as Canada was concerned, was unfortunately crowded out of the headlines by the news appearing the following day of the Dominion Government's so called " Austerity Programme ", brought about by Canada's desperate need for conserving U.S. dollars. Action on this restrictive programme had been postponed as long as possible, since Canada was concerned that the Geneva negotiations should be successful, and that no action on Canada's part should prejudice the success of this concerted effort to reduce trade barriers and to foster international trade.

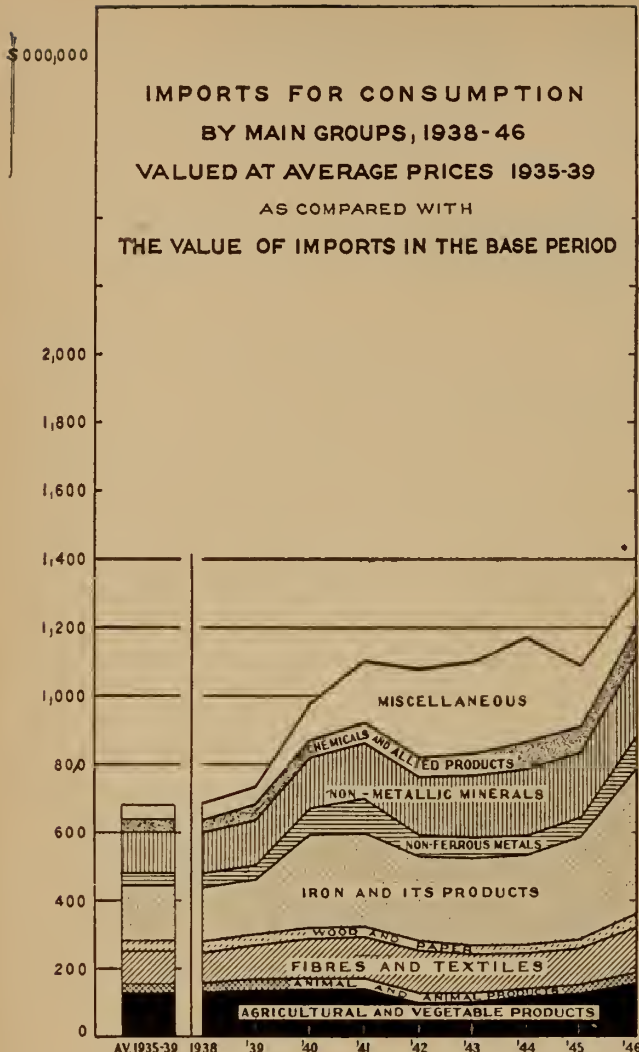
The Canadian Government has declared its intention to administer these " Austerity " controls in a manner consistent with the Geneva Agreement. The use of quantitative restrictions; to safeguard a country's external financial position and balance of international payments, is provided for in article XII of the Agreement. This article takes account of the situation of a country which does not possess sufficient foreign exchange to pay for imports required for normal purchases and consumption, recognizes that such a country may find it necessary to restrict the volume of its imports essential to its economy, and lays down rules for the use of quantitative restrictions in such circumstances.

The " Austerity Programme " is intended to be a temporary expedient, while it is hoped that the Geneva Trade Agreement is something of lasting value. The two may, from a short term aspect, appear to be acting at cross purposes. Yet the ultimate results from the former may well be found to ultimately augment or enhance the benefits accruing from the latter, by virtue of the potential increases in exports of secondary manufactures, and of additional raw products of our natural resources, at the new low rates of duty called for in the Geneva Pact.

Scope and Limitations

The announcement on November 17th featured the " Multilateral General Agreement on Tariffs and Trade ". It concerned agreements between Canada and the United States of America, the United Kingdom, Australia, Benelux, (Belgium, Netherlands and Luxembourg), Brazil, Burma, Chile, Ceylon, China, Cuba, Czechoslovakia, France, Lebanon-Syria, New Zealand, Norway, the Union of South Africa, South Rhodesia, India and Pakistan. The Draft Charter for an International Trade Organization, published earlier, was the outcome of two years of intensive preparation, including six months continuous international negotiations at Geneva, and was unprecedented in scope and importance in the history of international trade, reversing as it does the trend that has persisted over the past thirty years towards trade restrictions and economic isolation. This charter has gone forward for adoption to the World Conference at Havana, now in session.

The General Agreement went into force provisionally on January first 1948 for the countries which have signed the protocol, viz. Australia, Canada, France, Benelux, the United Kingdom and the United States.



(Prepared by the Dominion Bureau of Statistics)

It goes into force definitively only when accepted by parties accounting for eighty five per cent of the total external trade of all signatories. It will remain in force at least until January first 1951.

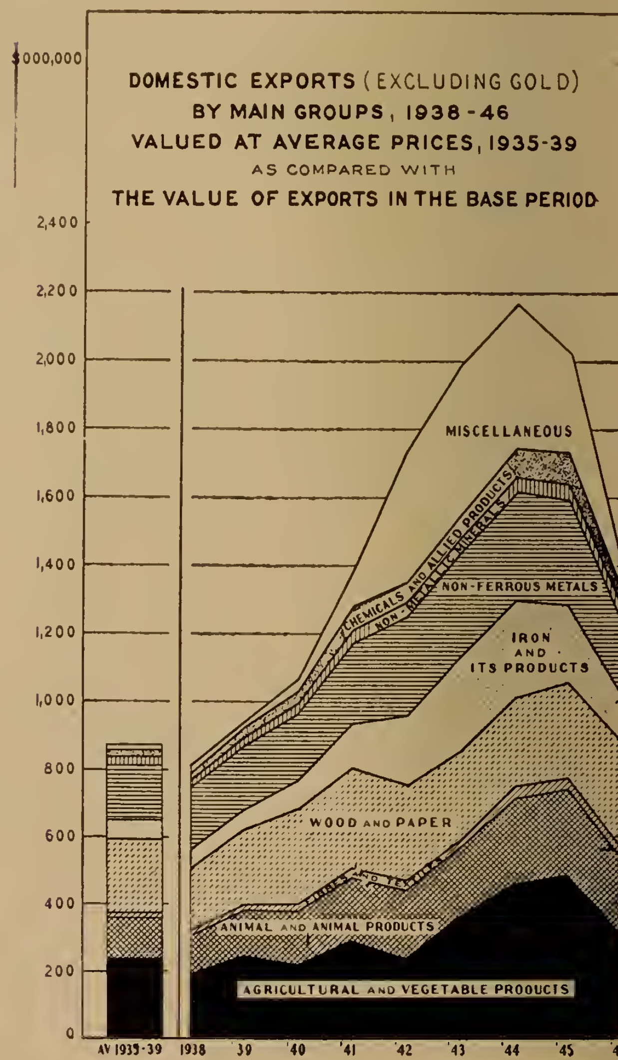
Though the agreement follows the usual prewar trade agreement pattern, it represents a quite new and significant experiment, in that it incorporates multilateral undertakings by which each country binds itself to other signatories. Important articles therein concern most favoured nation treatment, and important export restrictions. Provision for abolition is made in each case, yet modified to suit present world economic conditions. Article eleven, for example, provides that no restrictions other than duties, taxes or other charges shall be instituted or maintained on the importation of any products of any other contracting party or on the export of any product to any other contracting party.

Products of Forests, Mines and Factories Widely Affected

The official Bulletins respecting the Geneva Agreement, together with the related documents, including schedules, are published under the title CANADA TREATY SERIES, 27 and 27A. These are of wide interest to every Canadian citizen, and are available from the King's Printer at Ottawa, at a price of 25 cents each. On first glance at the schedule, it is easy to jump to the conclusion that the widespread reduction in tariffs on foodstuffs, which apply on some 40 per cent of the total value of Canada's principal exports in 1946, far outweigh the benefits accruing from tariff reductions applied on other exports. But such is far from being the case. There are also many items in the schedules dealing with concessions to Canada in the reduction of duties on the export of products of forests, mines and of heavy industries. These apply on items totalling about 45 per cent of the total value of all 1946 exports in the form of raw or partly processed materials, and on about 15 per cent of total 1946 exports in the form of manufactured or processed goods. These are of more than passing interest to engineers generally, and to consulting engineers and those employed in mining, forestry, and heavy industry manufacturing in particular.

Concessions to Canada by Various Countries

Disregarding the concessions on agricultural products, such as livestock and other food stuffs, as having less direct interest to the engineering profession, concessions that affect exports of products of forest, mines, quarries and heavy industry generally are as follows:



(Prepared by the Dominion Bureau of Statistics)

FOREST PRODUCTS

Maximum 50 per cent reductions on U.S. duty, as well as in I.R.C. tax, are made on sawn and dressed soft lumber, and on plywood and veneers (other than birch and maple). Duty is bound free on certain hardwoods. Binding of free entry is assured for poles, ties and firewood. Further reductions are allowed in U.S. duty in many manufactured products of forest origin such as canoes, hockey sticks, staves, lath, shingle bolts, tool handles, etc. Benelux binds free entry for logs, pulpwood and wood pulp and binds rates on veneers, and tongue and groove wood. France reduces duty on logs, pulpwood, veneer leaves, tongue and groove wood and wood pulp. India and Pakistan reduce duties on Douglas fir lumber and wooden ties. The U.S. binds free entry on newsprint and wood pulp and reduces rates on uncoated printing paper. Tariff on rolls for wallboard is bound in case of unfinished board and reduced in the case of finished board.

BASE METALS

The U.S. duty is cut one-third on aluminum metal, and halved on aluminum plates, sheets and scrap; maximum 50 per cent reduction of duties is provided by the U.S. on magnesium, tantalum, calcium, nickel in all forms excepting tubes and tubing, and on zinc sheets, scrap and dross; free entry and maximum reduction on I.R.C. tax applies on all copper, including manufactured products containing over 4 per cent copper. Benelux gives free entry for lead and zinc ores, copper ingots, nickel ingots and plates, zinc ingots, and nepheline syenite; and reduction in duties on feldspar, talc, limestone, lime, brick, cement, corundum and magnesite. Free entry remains on asbestos, gypsum, lignite, stone, sand and gravel, gas, radium and selenite. France binds free entry on ores, and reduces duty on copper, nickel, aluminum and zinc ingots. Free entry is allowed for lead ingots. Czechoslovakia and Norway bind free entry for certain forms of copper, nickel, aluminum and cadmium.

IRON

For entry into the U.S., the 75 cents per ton duty on iron remains. Duties on scrap iron and steel are halved, and reduced on ferro manganese and ferro chrome.

RUBBER

Free entry or reductions in duty are allowed by Benelux, France, India, Norway, Brazil, Chile, China, Cuba and Czechoslovakia on synthetic rubber, belting and tires.

CHEMICALS

The U.S. allows various reductions in duties for various chemicals, carbon-black and gas black, cedar oil, salt, selenium and tellurium compounds, aluminum sulphate, ammonium nitrate, calcium carbide, explosives and ethyl acetate. Benelux binds duty free on blacks and reduces duties on fertilizers. Cuba reduces duty on calcium carbide, while India provides for free entry on penicillin.

MANUFACTURED GOODS

The U.S. tariff is reduced or halved on many metal articles and wares and machinery, and on articles made wholly or in part of natural rubber, carbon, or graphite; on machinery and appliances employing any electric element or device; on electric stoves, articles made of synthetic rubber, aircraft and aircraft parts, pleasure boats, sporting goods, organs, binder twine, agricultural implements, farm tires and whiskey. The U.S. tariff is halved on all metal articles not otherwise named in the Schedule. This is a " basket " item of wide interest to Canadian manufacturers. Benelux gives reductions in duty on rubber and belting, and binds existing tariffs on agricultural instruments, soaps and toilet goods. France binds free entry on synthetic rubber.

Concessions Given by Canada

Concessions granted by Canada to other countries with respect to reductions in tariff on imports or articles other than those of farm origin, or textiles, can be summarized as follows:

PULP, PAPER, BOOKS, ETC.

Duties on periodicals, books, etc. bound at present levels. Tariffs reduced on various manufactured paper products such as forms, labels, bonds, cards, etc. and advertising and printed material. Reductions allowed on tariffs for roofing and felt shingles, paper bags and wall paper. Because of U.S. action in halving I.R.C. code tax on imported lumber, Canada has accepted a 50 per cent reduction in margins of preference on lumber enjoyed by the United Kingdom and other Commonwealth countries.

CHEMICALS

Tariffs on some 20 chemical items are bound at present levels. Reduction in tariffs are allowed on oxalic acid, butyl alcohol, salt cake, glue, edible gelatine, spraying chemicals, certain toilet preparations, motion picture films and negatives, paints, putty and gums, ink, whale oil, certain acids not produced in Canada, toilet soap, varnishes and lacquers.

GLASSWARE AND EARTHENWARE

Reductions are allowed in tariffs on window and plate glass, marble, asbestos goods, incandescent bulbs, drain pipe, sewer pipe and wall tile.

NON-FERROUS METALS AND METAL PRODUCTS

Reduced tariffs are allowed on primary and rolling mill products of aluminum; free entry bound or tariff slightly reduced on zinc products; tariffs on wire of all metals other than steel and aluminum are reduced by a third, and on brass and copper manufactured products by a fifth. Slight reductions apply on nickel plate and electro plate wares.

IRON AND STEEL ROLLING MILL PRODUCTS

Tariffs on tinplate not made in Canada reduced one-third, tariff on flat steels reduced by 30 per cent, on iron and steel castings by ten per cent, on forgings by ten per cent, and on axles and bars by ten per cent. Entry of cast iron pipes, tubes and couplings, springs and chain, farm implements and machinery is bound free; reductions of twenty per cent in tariffs are allowed on crushers, drills, and mining and quarry railway equipment, and of seventeen per cent on machinery, logging cars and cranes for logging operations. Tariffs on lighting fixtures and appliances, on telegraph, telephone and radio equipment are reduced twenty per cent, and on generators and transformers, insulators and electrical appliances, by ten per cent; tariffs on fire fighting equipment and locomotives are reduced fifteen per cent; tariff on mining railway equipment reduced one-third, with free entry if not made in Canada. Tariff on aircraft is reduced by 25 per cent and on aircraft engines by 12½ per cent; tariff on domestic pumps is reduced ten per cent. Slight concessions are given on fencing. All types of motor vehicles are bound against any increase in tariffs.

Overall Benefits Difficult to Assess

An intelligent translation of these various tariff concessions into benefits to Canada's trade accruing from the agreement, is only possible by experts. Generally speaking, however, tariffs appear to be eased on exports of Canada's raw materials other than food, to a somewhat greater extent than on the exports of manufactured goods. On balance the concessions seem to tend toward greater encouragements for Canada's trade with the United States, Benelux, and France, rather than with Britain and other commonwealth countries, at least so far as Canadian products of mine, forest and heavy industry are concerned. For example, it will be observed that U.S. tariff concessions on lumber are at the expense of restrictions in United Kingdom preferences on this product.

Exports of synthetic rubber and certain rubber products are widely encouraged. Entry to the U.S. and Benelux on certain chemicals readily produced in Canada is made easier, while concessions by Canada relate mostly to chemicals not produced in this country. In the case of partly manufactured durable goods, while we allow minor concessions on entry of flat steels, castings, forgings, axles and bars, there is a far wider domestic market than Canadian producers can presently fill.

Entry to the U.S. of our manufactured products made wholly or partly of natural rubber and carbon, and of machinery or equipment employing any electrical device, is made easier, but this is a difficult market for Canada to compete in. Entry to the U.S. on Canadian made boats, sporting goods, pipe organs, will be helped. The concessions we give relate largely to machinery and equipment of a special nature not extensively made in Canada at present. Yet many of them may well be rendered ineffective by " austerity " controls limiting imports, perhaps for a long time to come.

One reason these concessions on manufactures don't show up to advantage is because a few large export items such as wheat, flour, meat, lumber, paper and minerals constitute about eighty per cent of our exports. The effect of tariff reductions on such items dwarfs the benefits from concessions on manufactured goods.

But if some of them may appear trivial, it should not be forgotten that Canada is so dependent on world trade that she is not solely or even primarily concerned with getting tariff reductions. She is far more deeply concerned with general expansion of world trade, so as to alleviate our customer nations' dollar shortages and to enable them to live within their dollar resources.

While the foregoing summary of schedules is far from being a complete one, it catalogues the principal items, and should serve the purpose of directing attention to the type and extent of tariff reductions on articles of forest, mine and quarry, as well as the products of heavy manufacturing industries. These are the items of direct interest to the engineering profession. The well informed engineer of today cannot afford to ignore important developments such as this in the field of economics, one that may well be looked back upon as the turning point in the history of international trade.

Report of Council For the Year 1947

Together with Committee and Branch Reports

In preparing the annual report of Council on the state of the Institute it is always a pleasure to note a substantial increase in membership. With some variation this has held for over ten years, but lately the rate of increase has been accelerating.

Membership

The total membership at the end of 1947 was 9,159, an increase of 752 for the year. Over 1,100 names were added to the list but deaths, resignations and removals held the net gain to the lower figure.

Once again the statement of transfers from one grade to another tells the story of the working of the new by-laws whereby Students are transferred automatically to Juniors, and the transfer of Juniors to Members is expedited. There were 527 Students transferred and 387 Juniors. It is interesting to see that the combined forces of Students and Juniors now total 4,000, or approximately 43 per cent of the total membership.

Rehabilitation and Employment

1947 saw the completion of this service to members overseas. The regular employment service has been unusually active and naturally in the course of ordinary business has had many contacts with members who formerly were included in the rehabilitation field. The funds voluntarily subscribed by members were adequate for the purpose, and were of inestimable value in aiding the Institute to render a really useful service to the men in uniform. This early interest in overseas members has been spoken of as one of the most useful things ever undertaken by the Institute.

The records of the Employment Service indicate that the openings for engineers still far exceed the supply. Throughout the year the ratio between openings and applicants was three to one. As a gauge of the usefulness of this activity and of its task, it is observed that almost 900 interviews took place in 1947. It is recommended that members read the detailed report of the service shown later in this report.

Council Meetings

Eleven meetings of Council were held throughout the year, six in Montreal and the others at Saint John, Toronto (two), Halifax and Quebec. The average attendance of councillors throughout the year was fifteen.

Annual Meeting

Toronto was the location for the 1947 annual meeting and Diamond Jubilee. Once again it proved its suitability for such occasions. The unexcelled facilities of the Royal York Hotel, and the interest, enthusiasm and hospitality of the Toronto members made an unbeatable combination. The innovation of holding the meeting in May instead of in February as has been customary, was well received. It is not likely that Council will go back to the February dates again.

Student Conference

As a feature of the annual meeting the second annual conference of student society representatives was held at Toronto under the chairmanship of Dr. G. R. Langley. Every university at which an engineering degree is given was represented and the conference lasted all day. It is quite apparent that this method of showing a genuine interest in the students is appreciated. The delegates took the first steps towards setting up a permanent organization to work with and to aid the Institute in future conferences.

New Activities

Under this heading there are two events to record. For the first time the Engineers' Council for Professional Development met in Canada and were guests of the Institute at Montreal. Again for the first time, a conference in Community Planning was held in Montreal under the direction of the Institute's committee in co-operation with the first annual meeting of the Community Planning Association of Canada. Both events were successful and it is hoped will be repeated from time to time as opportunity offers.

Ottawa Interests

Throughout the year the Institute followed several matters of importance to the profession that required correspondence, and visits with government officials at Ottawa. These included the perpetual effort to secure just reward for the employee in the civil service, the unfair basis of remuneration in the Navy, the renewal of the tariff on engineers' plans coming into Canada from other countries, and collective bargaining. All issues remain active but there is little progress to report.

Ontario Division

During the year members in Ontario secured authorization from Council and from the membership to set up a provincial division in accordance with the by-laws. The purpose of the division is to promote branch activities, increase membership and to develop close cooperation with other societies. Vice-president W. R. Manock of Fort Erie was elected chairman; J. R. Dunbar, vice-chairman; secretary, E. R. Graydon; and treasurer, Maj. Gen. G. R. Turner.

Roll of the Institute

The membership of all classifications now totals 9159, which again is a record. New names added for the year 1947 amounted to 1101, but deaths, resignations and removals reduce the net figure to a gain of 752.

During the year 1085 candidates were elected to various grades of membership. These were classified as follows: Honorary Member, 1; Members, 197; Juniors, 43; Students, 836; Affiliates, 8. The elections for the previous year totalled 1215. Sixteen reinstatements were effected. Life membership was conferred on 56 members under the revised by-law 26.

Transfers from one grade to another were as follows: Member to Honorary Member, 3; Junior to Member, 387; Student to Member, 7; Student to Junior, 527; Junior to Affiliate, 1, a total of 925.

The names of those elected or transferred are published in the *Journal* each month immediately following their election.

Removals From the Roll

There have been removed from the roll during the year for non-payment of fees and by resignation, 136 Members; 94 Juniors, 37 Students, and 12 Affiliates, a total of 279.

Deceased Members

During the year 1947 the deaths of 70 members of the Institute have been reported as follows:

Members

Affleck, Garnet
Archibald, George DeWolfe
Barbour, Frank A.
Barton, Harold Miall
Bruce, William Joseph
Bury, Bertram Edward
Campbell, Lorne Argyle
Cariss, Carington Carysfort
Carmel, Joseph Edward
Chapleau, Samuel J.
Charlton, Richard M.
Currie, Homer Lindsay
de Hueck, Baron Boris
D'Aeth, John Bancroft
Dickie, Frank Evans
Drysdale, William F.
Evans, E. Ronald
Fetherstonhaugh, William S.
Flanagan, Oliver L.
Fleming, Alex. Greig
Floyd, Edward
Folger, Collamer Coverdale
Gaby, Frederick A.
Ganter, Ernest Linwood
Gaudet, Frederick Mondelet
Grant, Gordon
Gray, Samuel Wilson
Greig, Alex. R.
Hardy, George F.
Hill, George Rixon
Hughes, Henry Thorsby
Irving, T. T.
Jennings, Percy John
Jette, J. Arthur
Johnson, Claude Vernon
Kensit, H. E. M.
Lea, William S.
Lewis, David O.
Lynn, Harold Riviere
McCall, Thos. Lockhart
MacDonald, Peter James
McIntyre, Earl John
Macleod, George
MacNab, Thomas Morrow
Macphail, Jeffrey Burland
Menges, Edwin A. H.
Mitchell, George Breck
Moore, Henry Alex.
Murdock, Charles Russell
Murray, Archibald
Openshaw, John Edward
Parks, John H.
Piche, Joseph Pierre
Porter, Sam G.
Powell, George Giles
Raley, Charles
Reevely, Fred. Richard
Reid, Frederick Blair
Reid, William Murray
Ricker, Herbert A.
Roberts, P. B.
Sinnamon, Alvin Wheeler
Smaill, William
Spence, John James
Stephens, John
Stevens, Robert Herbert
Strickland, Robert
Tripp, George Mason

Juniors

Lee, William Ulysses
Moseson, Stanley Gustav

Total Membership

The membership of the Institute as at December 31st, 1947, totals 9159. The corresponding number for the year 1946 was 8407.

	1946	1947
Honorary Members	16	20
Members	4681	5075
Juniors	1833	1924
Students	1783	2049
Affiliates	94	91
	8407	9159

Respectfully submitted on behalf of the Council,

L. F. Grant, M.E.I.C., *President.*
L. Austin Wright, M.E.I.C., *General Secretary.*

Legislation Committee

The Committee has kept itself advised on all matters which might have led to legislation likely to affect the interests of the Institute or of its members.

It has stood in readiness to consider all suggestions or reports on the matter.

Opportunity would have met a great desire to serve.

Respectfully submitted,

J. A. Beauchemin, M.E.I.C., *Chairman.*

Employment Service

The past year has been one of intense activity in the matter of placements and interviews. The trend continues. and although there is a slight decrease in the number of openings, the ratio of vacancies to engineer applicants available to fill them during 1947 was approximately three to one.

While this condition is typical of many of the professions today, there is no positive indication of how long it may continue. For that reason the Employment Service is more concerned with the lasting value of the work done in effecting placements and making new contacts. Only by the earnest co-operation of members in informing the service in each instance when negotiations between applicants and employers are concluded can the Employment Service achieve its full benefit to all concerned. Applicants should be particularly careful to follow up and clear correspondence between themselves and prospective employers. The prompt closing of files in the Employment Service records will enable the staff to handle efficiently the large volume of work, and thus increase the value of the service to the members.

All possible steps have been taken to systematize the work and, during the latter part of 1947, when unavoidable delays in printing and preparing the *Journal* were experienced, advance bulletins listing "situations vacant" and "situations wanted" were sent out to members to ensure early information. This service continues.

A total of 893 interviews was recorded in 1947, and known placements totalled 178. Many more placements undoubtedly were made through the services of the Employment Section, but no first hand information was available to put these on the official record. In addition, some 400 new job files were opened during the year. Applicants' files open at the year's end numbered 96.

Demand is still at its highest for junior engineers. A recent official survey indicated that, for the next three to four years, very large numbers of engineering graduates may be expected from Canadian universities. One of the main objectives of the Service is to ensure that these young men, many of them student-veterans, are taken care of and, with scores of new firms added to the enquiry files, the outlook is bright.

There has been a close liaison between the Institute and the universities, both in respect to vacancies for engineer graduates and in suggesting applicants to fill university posts that had become available.

More difficulty has been experienced in the placing of older men. Despite a sizable number of successful allocations in this group, a fairly large list of these men still remains. All, however, are working at present.

The Service has had many enquiries from Great Britain regarding employment in Canada. All such enquiries have been answered directly and frankly concerning the situation here. Although it is not the Institute's policy to encourage British engineers to pull up roots and venture here on a gamble, a great many have come and have been placed without difficulty at no detriment to existing applicants.

An encouraging factor in the work has been the favourable letters from engineering firms—some of them among the largest and most exacting in their requirements—regarding the number of applicants and the high professional calibre of these new employees which the Employment Service has been able to send to them.

Respectfully submitted,

(MISS) J. SUMMERS, *Employment Service.*

Board of Examiners

The practice of referring applicants classed as Member with examination to the provincial associations or the Quebec Corporation has proven satisfactory during the past year and the board of examiners has not been called upon at any time.

The board therefore has nothing to report.

R. DEL. FRENCH, M.E.I.C., *Chairman.*

Publication Committee

The past year has been one of great significance for *The Engineering Journal.* There is every reason to believe that the low point of the curve has been passed and that the year 1948 will show a steady improvement.

The most important feature of the year's activities has been the termination of the present advertising contract and the appointment of a new full-time publications manager for the *Journal.* Mr. N. E. D. Sheppard, the former advertising manager in his capacity as president of Canadian Engineering Publications Limited had necessarily to devote the majority of his efforts to his firm's own publications and your Committee believed that the promise of an expanding *Journal* should warrant the appointment of a full time publications manager. The appointment of Mr. E. J. Blandford to this post effective January 1st, 1948, was noted in the December 1947 issue of the *Journal.*

During the year just passed the *Journal* has been seriously affected by rising costs and it has been found necessary to increase the cost of advertising space by 50 per cent—an unprecedented but essential increase and an increase justified by the fact that *Journal* rates per page per thousand of circulation have stood previously at only about one-half the national average for technical publications. In view of increases also announced by many publishers the *Journal's* rates are still only about two-thirds of this average.

The paper situation has shown considerable improvement and the Committee is pleased to announce that the *Journal* will shortly be printed on a good quality coated stock. The committee submits that, as the official organ of the Institute, the *Journal* should be of as high quality as possible and it is considered that coated stock although more costly is essential to this high standard.

Because of the great activity in all branches of engineering, supply of papers for the *Journal* has not presented a serious problem. Plans are in hand for restoration of features which have been deleted due to paper shortages and your committee has already approved other plans for a considerable improvement in the overall layout of the editorial pages.

Due to an increase of approximately 50 per cent in printing and engraving costs which was effective in October, the excess of income over expenses for 1947, is below that of 1946, but the increase in advertising revenue expected in 1948, should, your committee believes, reverse the downward trend although the full effects of the increase will not be felt until late in 1948 when most existing contracts will have expired.

The committee wishes to record its sincere regret on the death of Mr. J. B. Macphail. Although Mr. Macphail's illness prior to his death prevented active participation in the work of the committee his contributions in the past have been valuable. His place will be difficult to fill.

Respectfully submitted,

C. E. GELINAS, M.E.I.C., *Chairman.*

Membership Committee

The new by-laws (Nov. 1946) in respect to the admission and transfer of members have been in force for over a year now. The results are eminently satisfactory. The sweeping readjustment of membership to comply with these by-laws was accomplished smoothly, the operations of the Admissions Committee have relieved Council of much detail work, and the Headquarters routine work has been immeasurably simplified.

Your Committee has been studying the implications of the very able analysis of the Institute presented by Dr. Huet Massue at the last Annual Meeting. The membership of the Institute is not as well balanced as it should be, either geographically or by occupation; nor is the membership as large as the branch coverage should warrant. The Institute is the one engineering body whose membership embraces all occupations of engineers from coast to coast. It is an invaluable medium within which to "make friends and influence people". The comparative value of a medium for meeting people who know, to a medium for learning technical facts, is grossly undervalued by too many engineers. The unique advantages of the Institute in widening one's circle of erudite and influential friends cannot be overemphasized.

Your Committee is working on ways and means of coordinating and expediting the work of the Branch membership committees. These Branch committees have a thankless, tedious job, and upon their voluntary efforts depends, in large measure, the advance or decline of the Institute. It is hoped that developments, underway, may be helpful in making their work easier and more rewarding, and that means will be found to subdivide the work so that their efforts are more profitably directed and that routine chores are taken over by a professional staff.

Respectfully submitted,

H. R. SILLS, M.E.I.C., *Chairman.*

Committee On Industrial Relations

Since the last annual meeting the Committee on Industrial Relations has held meetings on 17th January, 21st February and 8th April, 1947.

During the year the Committee has studied schemes for inducting young engineers into industry and for giving them a general training. It also maintained contact with the committee established to arrange for Canadian participation in the International Management Congress in Stockholm during the summer of 1947, and with the development of the Institute of Industrial Relations of the University of Toronto.

The Committee also received a report on wage and labour matters in Great Britain from one of its members who had recently visited that country.

Respectfully submitted,

WILLS MACLACHLAN, M.E.I.C., *Chairman.*

Committee on Community Planning

Early in the year it was decided to promote a meeting of the Institute in Toronto to discuss the engineering approach to Community Planning. It was suggested that the meeting be held in May or June, 1947.

However, it was discovered that the Community Planning Association of Canada was organizing a convention of its members in Montreal in October, and as many of our members would be attending this meeting, it was decided to make it a joint affair with the Association and the Institute combining.

This meeting proved to be a most successful affair, and the members of the Institute took a prominent part in its proceedings.

During the conference a meeting was held to discuss what should be the Institute's part in Community Planning. Several suggestions were made, one of which was that a hand book should be prepared by the Institute. Another was that a Director of Planning might be engaged to do promotion work in the various branches of the Institute.

A great deal of the discussions at the conference centered on Housing, and it was apparent that this was one of Canada's most important problems at the present time.

This committee is of the opinion that the above suggestions might well be considered by Council. The various branches should be encouraged to set up local committees to promote the science of planning in their communities.

Where permanent planning committees are set up in our cities and towns, members of the Institute should be included in these committees. It is our opinion that city councils would welcome assistance of this kind.

We recommend that in the future, one or more papers should be included in the programme of our annual meetings on the subject of Community Planning.

The subject of Housing is of such great importance that the members of this committee resident in Toronto, were asked to prepare a special report on the Institute's part in its solution. This report is now before the Council of the Institute.

All of which is respectfully submitted,

R. L. Dobbin, M.E.I.C., *Chairman*

Papers Committee

The branches appear to have managed their programmes satisfactorily during the 1947-48 season and the Papers Committee has not been called upon for any assistance.

The committee therefore has nothing to report.

Respectfully submitted,

S. G. Coultis, M.E.I.C., *Chairman.*

Canadian Standards Association

At the Annual Meeting of the CSA held in Montreal on the 28th Nov. 1947 it was announced by the Manager that 23 new Standards had been issued, which number could be sub-divided as follows:

Civil Engineering	6	Welding Section	2
Mechanical Engineering	2	Miscellaneous	1
Electrical Engineering	6	Tentative	6

In addition to these, some 32 current standards had been revised or brought up to date and this latter work included as a major item the publication of the 5th Edition of the Canadian Electrical Code, Part. I.

The Welding Bureau had advanced in organization and usefulness and there is every indication that its prestige was growing with its activity. Besides its primary work of qualifying operators and plants the Bureau is already making itself felt as an agency for the improvement of technique, and the provision of advice on welding procedure and design. Further development along the educational line is confidently looked for and there is every reason to believe that it will soon be widely recognized as furnishing a valuable service to industry and construction. The City of Toronto has recently advised the Bureau that its approval and qualification of firms and work will render such work acceptable to the Municipal Authorities.

Another important standard which is nearing completion is that concerned with Limits and Fits in Engineering Practice. Together with a standard on Drawing Office Practice, this undertaking is of an international character, as both the U.K. and the U.S.A. are co-operating. Activity is also noticeable in the field of standards for metallic alloys including Al. Cu. and Ni. Screw products and various building products are being dealt with by special committees and a new field of "Packaging" is being entered quite heavily. Photographic equipment and materials constitute another new line where the CSA has assumed responsibilities, upon the request of interested parties, for producing standard specifications.

In the electrical field the CSA has become a working member of the International Electrotechnical Commission, having organized a national committee to that end.

Membership in the newly established International Standards Organization has been accepted, which will connect the activities of the CSA with the work of corresponding bodies in 30 nations. This is in addition to the co-operation established between the standardizing bodies of the Commonwealth.

Respecting this international aspect of standardization, it is useful to remember that the CSA maintains stocks of many British and foreign standards on a wide variety of subjects.

The Approvals Division of the CSA continues its successful career and has enlarged its activities to a notable extent in taking over approval of equipment used in connection with fire hazards, oil burners, etc. The recent expansion in quarters has made it possible to separate the detail work of administration of this Division from that of the Standardizing Body, so that the staffs will now be largely independent as to space and personnel.

Financially the CSA has found the expense of operation to be increasing rapidly with new demands and rising costs, but measures looking to a wider support from industry, and a gratifying augmentation in the Government grant are expected to make possible the continuation of all activities on a sound basis.

Respectfully submitted,

P. L. Pratley, M.E.I.C.

Representing E.I.C. on Main and Executive Committees.

Library and House Committee

Three meetings, attended by all members, were held during the calendar year. Preliminary plans and estimates were prepared by Mr. R. F. Shaw for a new building to replace the front part of the existing Headquarters building, utilizing the space to the street line and the whole width of the lot, also retaining the present auditorium. The auditorium would be enlarged into the new building. These plans were submitted to the House Committee of the Montreal Branch and their comments and suggestions were received as well as those of the Headquarters staff.

After further discussion on this subject it was decided that a proposal to renew the whole existing building should be studied, but before doing so the matter was submitted to the Finance Committee to ascertain if means could be found to finance a new building, and to what extent. The Committee is fully cognizant of the needs of Headquarters staff for enlarged facilities, but does not wish to waste time on a preliminary study of a project, the cost of which would impose too great a burden on the Institute.

During the year considerable much needed redecorating was done, as well as improvements made to the ventilating system, and steps taken to have it operated more effectively. A new beaded glass screen for projection purposes was purchased, and more coat hooks provided in the cloak room. Additional chairs for the auditorium were also recommended. The front steps of Headquarters building were found to be in dangerous condition and were repaired in a temporary manner. It is expected that a permanent replacement will be made very shortly.

Library

The Library consists of approximately 13,159 volumes including text books, reference books, periodicals, transactions, etc., some 2,475 feet of shelving and 49 vertical file drawers.

Accessions	1947	1946
New Books	228	101
Proceedings & Transactions	82	33
Reports & Bulletins	447	541
Standards & Tentative Standards	90	91
Pamphlets	152	155

Material including textbooks, transactions, periodicals, etc., but excluding pamphlets, standards and miscellaneous items, to the value of $2,470 has been added to the Library during 1947. Included among our holdings are the 1947 edition of The Encyclopaedia Britannica and also four films which comprise the nucleus of the film library.

We take this opportunity of thanking the publishers and reviewers for their very kind co-operation during the past year. Due to the continued paper shortage in 1947 we were able to publish only 13 signed book reviews, 61 book notes by the Institute Library, and 174 book notes by The Engineering Societies Library. However, this is an increase in signed reviews of 7 over 1946. By publishing reviews and notes of new books in the *Journal,* we bring new publications to the attention of readers, and also acquire considerable new material for the library, thus serving a two-fold purpose.

Again, use made of the Library has shown a marked increase over the previous year. An increase of 1,261 or 30.8 per cent more requests and 1,383 or 52.4 per cent more loans illustrate this point, as do the following statistics:

	1947	1946
Days Open	270½	267½
Evenings		
(5 to 8 p.m. Thursdays—winter months)	24	not open
Inquiries Received		
By Phone	2,531	2,037
In Person	1,592	1,056
By Letter	1,229	998
Total	5,352	4,091

Increase 1,261 or 30.8 per cent.

Circulation	1947	1946
Books Borrowed	1,347	620
Periodicals, etc., Borrowed	1,821	1,348
Pamphlets Borrowed	816	636
Inter-Library Loans Borrowed	36	33
Totals	4,020	2,637

Increase 1,383 or 52.4 per cent.

New Borrowers Added	180	not recorded
Special Services		
Bibliographies Prepared	95	102
Pages	236	229
Photostat Orders	26	18
Prints	177	442
Orders for Members	270	150

The work of reorganizing the Library has progressed considerably. New Library Rules and Regulations have been prepared and these will appear in the Library Notes of *The Engineering Journal,* each month commencing with the February 1948 issue.

The Library Deposits, required before material may be borrowed, have been recorded and a system set up whereby Library deposit cheques may now be deposited, and still held by the Library in the name of the borrower. Old cheques have been returned to members.

All serial material (periodicals, transactions, annual reports, bulletins, etc.) is now being recorded on a Kardex as received. In the near future, we hope to have this material catalogued and analysed, and thus facilitate reference work and use by borrowers. At that time a list will be issued of all titles received currently in the Library. This list should prove of considerable assistance to members.

The subject bibliographies, numbering 359, compiled for members during the past ten years or more have been catalogued and therefore made available for reference purposes.

The new catalogue has been set up using a coloured card system to denote types of material. Only items added to the Library in the past two years have been included in this catalogue to date, and unfortunately no subject work has been possible. The shelf reading is well under way, and with the weeding of the collection, recataloguing and reclassification will be more feasible.

There is still much to be done and although we have been fortunate in adding a third member to our staff, time and space are at a premium.

We wish to draw the following facts to the attention of members:

1. Any member, resident in Canada, may borrow or purchase material from the Library. All carrying charges are payable by the borrower or purchaser.
2. A deposit of $5.00 at par in Montreal, must be made before material may be borrowed. This is a safeguard against loss or non-return of material and is refundable on receipt in the Library of borrowed items.
3. Material may be borrowed for a period of two weeks, and may be renewed on request for a further two weeks.
4. Subject bibliographies will be compiled on request.
5. Extensive literary searches will be made at a charge of $1.50 per hour to members and $2.50 per hour to non-members.
6. For the convenience of members, the reference library will remain open until 8.00 p.m. on Thursdays and until 6.00 p.m. Monday through Friday during the winter season.
7. When requesting information, books, or special services, please indicate *clearly* what is desired.

The Library is for the use of the membership. Inquiries and suggestions are welcome.

Your Committee wishes to express its appreciation of the work of the staff rendered more difficult by reason of lack of adequate space. It is hoped that some solution of the problem of accommodation may be arrived at in the near future.

Respectfully submitted,

R. C. Flitton, m.e.i.c., *Chairman.*

Admissions Committee

The Committee held monthly meetings throughout 1947 and studied a large number of applications which culminated in recommending admissions or transfers of approximately 558 members, not including 119 admitted under cooperative agreement and some 507 Student memberships.

The Committee is gradually building up a fund of experience from which it hopes to establish a set of precedents which will be useful as a guide when considering further admissions and transfers.

Considerable progress has been made in transferring Juniors to Members.

Correspondence has taken place with British and continental engineering institutions in order to assess the value of the courses given in engineering and technical schools in other countries.

The Committee calls attention to the fact that the handling of such a large number of applications and transfers was only made possible by a great deal of hard work and assistance from Headquarters staff.

Respectfully submitted,

C. A. Peachey, m.e.i.c., *Chairman.*

National Construction Council

Following the death of Mr. D. C. Tennant, in February 1947, the undersigned was appointed to represent the Institute on the National Construction Council. During 1947 meetings were held on February 27, April 17, and October 17.

The Council considered the following questions:

(a) Construction costs,
(b) Material Shortages,
(c) Vocational training and apprenticeship,
(d) Removal of tariff on engineers' plans,
(e) Disposal of war surplus building material,
(f) Canadian Welding Bureau,
(g) Housing and Community Planning,

and many others of importance to the construction industry. Representations have been made to government authorities when indicated, and the Council has stood in readiness to advise on questions within the scope of its interests.

Respectfully submitted,

W. E. Bonn, m.e.i.c.,
Representative of the E.I.C.

Finance Committee

During the year 1947, the revenues of the Institute have increased considerably due to the changes in the By-laws which became fully effective a year ago. Revenues have increased due to the higher membership fees, the automatic transfer of Students to Junior membership, and of Juniors to Members, but have been reduced by the conferring of Life Membership on approximately 300 members, and the waiving of transfer fees, all as provided for by the new By-laws.

There was also some increase in the revenue from *Journal* advertising but not as much as was hoped for, and not sufficient to keep up with the continually increasing cost of publication. Further increases in our advertising rates have been authorized and will take effect as contracts are renewed. An improved showing in our publication account is hoped for in 1948.

Expenses have also increased during the year, due principally to the following:

(a) the general increase in cost of operation due to price rises.

(b) an increase of approximately 50 per cent in the rebates to Branches as a result of the increased membership fees.

(c) The payment of the travelling expenses of the President for the first time, from Institute funds.

(d) the cost of the Annual Meeting of the Engineers' Council for Professional Development in Montreal.

(e) our share of the cost of the Conference on Community Planning.

(f) a contribution of $1,000.00 towards the appeal costs in the Perry case. This item is shown under Audit and Legal fees.

Last May, Council instructed your Committee to investigate and recommend a suitable pension plan for our staff. After thorough investigation, your Committee recommended a plan which they believe was equitable and within the financial ability of the Institute to carry. This was approved by Council in October and became effective as of December 1st, 1947. The cost of future service benefits will be carried equally by the employees and the Institute. The cost of past service benefits will be borne wholly by the Institute. The cost of the latter item will be approximately $1,400.00 a year for ten years. The first installment of this

was paid during the last year and in addition, a reserve of $8,000.00 has been set up from 1947 revenue to cover part of the future payments. The pension plan has been well received by the staff.

The Institute has improved its financial position during the year and it is expected that during 1948 it will be possible to further improve its service to the members and still build up its financial position.

R. S. Eadie, *Chairman.*

Treasurer's Report

The audited statements of assets and liabilities and of revenues and expenditures for the year ended December 31st, 1947, are submitted herewith.

In accordance with the usual practice, I have verified the investment securities by inspection and report that they are in order. The market value of these securities as of December 31st, 1947, was approximately $52,045.00 as compared to the cost to the Institute of $49,621.07.

During the past year the following securities were called for redemption:

$1000.00 Bond — Montreal Tramways (cost $950.30)	$1000.00
40 Shares Montreal Light Heat and Power Common Stock (cost $324.50)	$1000.00

and the proceeds reinvested in

$2000.00 Province of Ontario Debentures 2¾% due 1969.

Respectfully submitted,

L. C. Jacobs, M.E.I.C., *Treasurer.*

Audit Certificate

We have audited the books and vouchers of The Engineering Institute of Canada for the year ended 31st December 1947 and have received all the information we required. We have verified the Cash in Banks and the Investment Securities and the revenue therefrom. In our opinion, the Statement of Assets and Liabilities and Statement of Revenue and Expenditure for 1947, as attached, are properly drawn up so as to exhibit a true and correct view of the Institute's affairs as at 31st December 1947 and of its operations for the year ended that date, according to the best of our information and the explanations given to us and as shown by the books.

(Sgd.) RITCHIE, BROWN & CO.,
Chartered Accountants.

STATEMENT OF RECEIPTS AND DISBURSEMENTS
For the Year Ended 31st December 1947

Balance as at 31st December 1946		$18,407.63
Add: Voluntary contributions during year	$ 5,196.87	
Interest on Savings Account	109.02	
		5,305.89
		$23,713.52
Deduct: Sundry Bank Charges	$ 26.95	
Sundry Printing, etc.	121.07	
		148.02
BALANCE AS AT 31ST DECEMBER 1947		$23,565.50
Cash in Canadian Bank of Commerce	$23,066.57	
Loans Outstanding	620.00	
		$23,686.57
Deduct: Owing to Engineering Institute of Canada for expenses advanced		121.07
		$23,565.50

Committee on the Training and Welfare of the Young Engineer

The conference of representatives of undergraduate Engineering Societies, sponsored by the Engineering Institute, was held at the Royal York Hotel, Toronto, on May 10th and produced the following recommendations to the E.I.C.

(a) That the local chapters of the E.I.C. should provide speakers for engineering societies to speak on technical and vocational subjects, and the local chapters and the universities should hold exchange meetings of both a social and business nature.
(b) That the E.I.C. could survey a number of existing industrial films in an effort to build up a film library which could be used to advantage by the engineering societies.
(c) That the students' prizes given by the E.I.C. should be a distinctive badge given to the top five per cent of the graduating engineering class of each university on qualities of ability and leadership.
(d) That a survey should be made to give an outline of the work of all branches of engineering. Such short "case-histories" would be available for the engineering student and should include a classified index giving names of engineers who are engaged locally in the particular field of engineering.

The initiative re (a) was left with the student societies—it being understood that local E.I.C. branches would do their best to supply suitable speakers upon request. So far as we know, no branch has been called upon as yet.

Re (b). A list of available films was obtained from a representative group of Canadian Manufacturers and Utilities, and has been distributed to the Undergraduate Engineering Societies.

Re (c). Council has approved this form of award in principle, and we expect that final approval will be given at the next meeting of Council, so that the awards may be made to the classes graduating in the spring of 1948. This form of award was recommended by your committee at a meeting held on May 8th on the following basis—

(a) To be awarded to the top five per cent or 10 per cent of each senior class in Engineering in all Canadian Universities and Technical Colleges.
(b) Determination of standing — In determining standing, equal weight shall be awarded to Scholarship and Leadership as determined by the Engineering faculty.
(c) The award—One year paid up Junior membership in the Institute plus a distinctive Institute badge.

It is felt that the above form of award will have several advantages—

1—The expenditure by the Institute will be small.
2—It will ensure that the cream of all graduating classes will automatically become members of the Institute.

3—From the viewpoint of employers, the prestige attaching to the winners of this award will ensure priority in the employment field and other advantages, so much so that it is unlikely that winners will drop their E.I.C. membership and the right to wear the distinctive badge.

4—It will be an additional spur to undergraduate effort.

5—It will tend to emphasize the Institute's all embracing interest in the Young Engineer.

Re (d). The guidance literature available today, is excellent, but is almost entirely of a general nature. The variations in the type of work that may be performed by Engineering graduates are so numerous, and so radically different one from the other that there appears to be a need for detailed descriptions of specific jobs. These case-histories of actual jobs should prove very valuable both to students and counsellors.

Your committee at the meeting held May 8th recommended that a number of these case-histories be prepared. The undergraduate conference endorsed the idea (per Item d). The Canadian Committee for Student Guidance in Science & Engineering have approved it, and the E.C.P.D. Guidance Committee are actively promoting it. A suggested framework for these case-histories has been prepared, approved and distributed.

A very important feature, the plan for publication, is not yet settled. The Canadian Committee on Student Guidance in Science and Engineering is asking the Department of Labour to undertake the publication of a guidance booklet, similar to the E.I.C. publication "The Profession of Engineering in Canada" and it is hoped that this publication will include a suitable number of case-histories.

The possibility of an oversupply of engineers as a result of our present abnormal university enrolment, has been a matter of serious concern to everyone concerned with student guidance. The opinion of Council was expressed at their meeting on November 29th — agreeing with the Canadian Committee to the effect that — "It is probable that the graduating classes of 1948 and 1949 will be readily absorbed. The picture for subsequent years is not so clear, and engineers carrying on Guidance work amongst high school students should therefore employ increased effort toward ensuring that those entering Engineering Courses have definite aptitude for the profession, and at the same time also make it clear that Engineering graduates may have to face much keener competition for the better Engineering jobs." Your Committee feels that criticism of our Universities in connection with the abnormal enrolment in Engineering is quite unjustified. There is little disagreement with the Government's position, that it will be to the advantage of the country to provide higher education for those veterans whose ambition lies along such lines and who appeared to be qualified to undertake such studies. The universities' position is quite evidently one of endeavouring to meet the desires of the Government in this regard.

The Guidance work of the E.I.C. Branches varies from very active to inactive. An appeal has been made to the inactive branches, to appoint an individual or committee. Personal contacts however, are the most effective means of stirring up interest and it is probable that a travelling field secretary could perform valuable service to this end.

It seems logical that the guidance work of the Engineering Institute of Canada should be co-ordinated with the corresponding work of the C.I.C., C.I.M.M., the Wartime Bureau of Technical Personnel, and the Canadian Council of Professional Engineers and Scientists. The Canadian Committee is sponsoring an effort to have local committees formed to include the guidance personnel of all these bodies, and to encourage them to hold joint guidance meetings. Your committee is working wholeheartedly to this end.

Respectfully submitted,

G. R. Langley, M.E.I.C., *Chairman.*

Committee on Employment Conditions

Based on the returns of the survey made in 1945, your Committee felt that the Institute's position regarding collective bargaining should be more of an observant nature than an aggressive one.

Bill No. 338 was introduced in the House of Commons of Canada for its first reading on June 17th, 1947. This legislation is meant to replace wartime order-in-council P.C. 1003.

At the request of other engineering and scientific organizations the definition of an employee was broadened to include "technical workers". An employee is now defined as follows: "employee" means a person employed to do skilled or unskilled manual, clerical or technical work, but does not include:

(i) a manager or superintendent, or any other person who, in the opinion of the Board, exercises management functions or is employed in a confidential capacity in matters relating to labour relations.

(ii) a member of the medical, dental, architectural or legal profession qualified to practice under the laws of a province and employed in that capacity".

Representation was made to the Minister of Labour that this situation did not meet with our Institute members' wishes.

This bill was referred to Committee who sat on July 1st and is to undergo its second reading during the present session.

The question of engineers' salaries was not discussed; your present committee having adopted its predecessor's views that nothing could be accomplished by the simple issuance of a schedule.

The possibility of overcrowding of the profession was studied by the Committee on the Training and Welfare of the Young Engineer. Its report was thoroughly discussed at Council Meeting on November 29th, and your Committee endorses the conclusions arrived at.

Respectfully submitted,

G. Martin, M.E.I.C., *Chairman.*

Committee on Professional Interests

The close contact which your Committee initiated with all branches of the Institute in 1946 was maintained in 1947. Almost all branches, the Quebec Corporation and several of the Provincial Associations, were visited by a member of the Committee. The benefit of these contacts cannot be overestimated.

The Ontario Division became a reality early in the year. Organization meetings were held, officers were elected and financial assistance was voted by Council. It is expected that when this Division gets fully under way much benefit will accrue from it.

The Committee has reviewed the activities of the National Construction Council on which, since its inception, the Institute has maintained representation, and has expressed the opinion that it may be well to consider whether continued support serves any useful purpose.

Removal of duties on engineers plans entering Canada, first protested on behalf of the profession by the Institute in July, 1946, continues to receive the attention of this Committee. Other organizations have given the Institute their warm support. The Canadian Construction Association is particularly active in this respect as the free entry of engineers plans has been found to operate to the detriment of the construction industry. It is also against the Government's own interests as outlined in the recent import restrictions. The Government Department concerned has undertaken to give the matter further consideration.

During the year the Canadian Construction Association asked the Institute to support its brief to the Dominion Government concerning the postponement of deferable public projects and the preparation of a shelf of projects to be used should a reactionary trend develop in our economy. It is believed that such action would be not only in the country's interest but of great importance to engineers and architects. The matter was discussed at Council meetings in Montreal, Saint John, Quebec and Halifax, and seems of such importance that it might well become one of the Institute's main objectives. The brief has been endorsed by Council.

The drastic legislation concerning the regulation of professional men which threatened to strike at the roots of the Engineers Act in the Province of Saskatchewan did not materialize. The situation continues, however, to receive the attention of this Committee.

Revisions of by-laws of several co-operating Provincial Associations due to change in Institute fees have been agreed upon.

Active contact has been maintained with the American Founder Societies. Our co-operative agreement with the American Society of Mechanical Engineers was further implemented by the presence of our President, Col. L. F. Grant, at their Annual Meeting in Chicago, at which meeting he was singled out for special honours. The 15th Annual Meeting of the Engineers' Council for Professional Development, held in Montreal in the Fall, was a particularly happy event, it being the first meeting of this eminent engineering organization to be held in Canada. It was the privilege of the Institute, as one of the constituent members of this Council, to be host on this occasion.

A suggestion was received from the Canadian Association of Scientific Workers that a Parliamentary and Scientific Committee be formed along the lines of similar organizations in Great Britain. After exhaustive study your Committee was unable to recommend that the Institute lend its support to this suggestion.

The Committee noted with pleasure the conferring by Laval University of the honorary degree of Doctor of Science upon our President, Col. L. F. Grant. This honour is a tribute both to Dr. Grant and to the Institute.

Respectfully submitted,

J. B. Stirling, m.e.i.c., *Chairman.*

Canadian Radio Technical Planning Board

In view of the fact that the preliminary frequency allocation recommendations of the Planning Board were prepared and submitted to the Department of Transport in May, 1947, for use in connection with the International Telecommunications Conferences in Atlantic City, it was considered that the first phase of the Planning Board's activities had been completed and no further meetings of Panels and Committees were scheduled for the balance of 1947 pending word as to the outcome of the Atlantic City meetings.

The Third Annual Meeting of the Board was held in Montreal on December 5, 1947, and, at that time, it was indicated that the Department of Transport were pleased with the work accomplished by the Board and were anxious that it continue in the same manner as in the past.

Copies of the findings of the Atlantic City Conference are now being printed and, as soon as these are available, they will be circulated to sponsor representatives and Panel and Committee Chairmen for review in the light of the Board's recommendations. It is expected that, when these findings are at hand, activities of the Board will be accelerated with Panel and Committee meetings to discuss the results of the Atlantic City Conference and continue the Board's work of preparing recommendations and assisting the Department of Transport at future international meetings.

Respectfully submitted,

A. B. Hunt, m.e.i.c.,

Institute Representative on the Board.

Committee on Prairie Water Problems

The Committee did not meet during the year. Nevertheless its members kept in touch with developments during this time, and groups of its members carried on informal discussions on such matters as came to their attention.

So far as the St. Mary River and Milk River Development is concerned, terms of an agreement have been discussed and an agreement has been prepared, but has not yet been signed. In the meantime construction of the St. Mary and Pothole dams has been proceeding slowly.

An agreement has also been prepared, providing for an expansion of the Bow River project (Canada Land and Irrigation Co.), to water an additional 175,000 acres, and bringing the total development up to 240,000 acres. Consummation of this agreement and the start of construction is expected at an early date.

Further investigations have been made of the Red Deer project, which is a combined irrigation and power project. It now looks as if this project will receive favourable consideration.

Additional investigations have been carried on regarding the proposed development near Outlook, Sask.

It is gratifying to the members of this committee that one day of the Banff meeting will be devoted to papers on water power and irrigation development, which is a very real problem affecting Canada.

Respectfully submitted,

G. A. Gaherty, m.e.i.c., *Chairman.*

The Ontario Division

During 1947, the Ontario Division of the Engineering Institute of Canada came into existence. In April of 1946, Ontario Councillors had expressed themselves in favour of such a Division and, with Council's approval, Ontario members voted on the question. After a majority of Ontario corporate members had voted in favour of forming the Division, Council authorized its formation, and appointed C. E. Sisson as chairman *pro tem.*

On May 10th, at the Royal York Hotel, the Ontario Division was officially organized, and the Officers were elected, with W. R. Manock being chosen as Chairman.

The first step taken by the officers of the Division was to establish a By-Laws Committee under the chairmanship of S. R. Frost. This committee prepared a set of by-laws to govern the activities of the Division and, after approval by Council, they were submitted to the Ontario membership and approved.

With the by-laws approved, the officers of the Division set to work on the first problem turned over to them by the Council of the Institute. This concerned the memorandum submitted to Council by the Toronto Branch in 1946. The Institute's Committee on Professional Interests had reported on the memorandum in September, 1946, and finally in May, 1947, it was referred to the Ontario Division for discussion and report. Accordingly, copies of both the documents referred to above were sent to all members of the Ontario Division Executive, in December, with the announcement that they would be discussed at the Annual Meeting of the Division.

Respectfully submitted,

E. R. Graydon, m.e.i.c., *Secretary, Ontario Division.*

Julian C. Smith Medal

Carrying out the instructions pertaining to the award of the Julian C. Smith Medal for 1947, the special committee consisting of Past-Presidents E. P. Fetherstonhaugh, J. B. Hayes and myself, has made a selection of two names which have been submitted by letter ballot to all councillors.

As a result, Julian C. Smith Medals for 1947 are being awarded to:

Philip Louis Pratley, Consulting Engineer, Montreal, Quebec.

Penrose Melvin Sauder, General Manager, Western Irrigation District, Strathmore, Alberta.

Respectfully submitted,

L. F. Grant, m.e.i.c., *Chairman.*

Students' and Juniors' Prizes

The reports of the examiners appointed in the various zones to judge the papers submitted for the prizes for Students and Juniors of the Institute were submitted to Council at its meeting on December 20th, 1947, and accepted as follows:

H. N. Ruttan Prize (Western Provinces) to Raymond Pillman, s.e.i.c., for his paper "The Accuracy of a Two-Minute Transit".

John Galbraith Prize (Province of Ontario) to R. N. E. Haughton, s.e.i.c., for his paper "Effects of Lightning on Buried Telephone Cables".

Martin Murphy Prize (Maritime Provinces) to Norman A. Parlee, jr.e.i.c., for his paper "Utilization of Sydney Slag for Engineering and Agriculture".

Phelps Johnson Prize (Province of Quebec—English)—to R. B. Todd, s.e.i.c., for his paper "The Manufacture of .22 Calibre Long Rifle Cartridge".

Ernest Marceau Prize (Province of Quebec—French)—to R. Riopelle, s.e.i.c., for his paper "Etude, Plans et Devis d'un Generateur de Haute Frequence pour le prechauffage dielectrique d'une poudre a mouler thermostable".

Abstracts of Reports from Branches

Note—For Membership and Financial Statements see pages 112 and 113

Border Cities Branch

During the year the Border Cities Branch held eleven executive meetings and ten general meetings. These included a Ladies' Night, a joint meeting with the Association of Professional Engineers of Ontario, the President's Visit, and a golf game and dinner with the Sarnia Branch. The following is a list of the general meetings held during the year. Attendance is noted in brackets.

Jan. 10—**The Gas Turbine** by J. W. Shaw, Allis-Chalmers Mfg. Co., Detroit, Mich. (65)
Feb. 17—**Travelogue on New Zealand and India** by A. H. MacQuarrie, M.E.I.C., Canadian Bridge Co. Ltd., Walkerville, Ont. (125)
(The ladies were present at this meeting.)
Mar. 14—**The Engineer and the State** by Dr. G. B. Langford, President of the Association of Professional Engineers of Ontario (65)
Apr. 11—**Radiant Panel Heating** by J. S. Mitchener, J. T. Wing & Co. Ltd., Windsor, Ont. (35)
May 16—**Television Station Operation** by L. A. Spragg, Chief Television Research Engineer of the Detroit News Television Station WWDT, Detroit, Mich. (32)
Sept. 5—**Presidential Visit** of Lt. Col. L. F. Grant (96)
(The ladies were present at this meeting)
Sept. 20—Golf game and dinner with Sarnia Branch (34)
Oct. 10—**Looking Ahead Through Plexiglass** by R. A. Trumper of the Special Products Division of Hobbs Glass Ltd., London, Ont. (34)
Nov. 14—**Province Wide Frequency Modulation Communication System for Ontario** by Walter G. Ward, Electronics Sales Engineer of the Canadian General Electric Co., Toronto, Ont. (37)
Dec. 12—Annual meeting and election of officers. **Some Observations of South Africa** by F. C. Ansley, M.E.I.C., head of the Construction Design Division of the Engineering Dept., of the Ford Motor Co. of Canada Ltd., Windsor, Ont. (55)

Calgary Branch

The following report of activities is submitted by the Calgary Executive for the Branch Year 1947, the attendance at meetings being shown in brackets.

The Executive met nine times during the year.

Dec. 12—"Search Unending", film on oil exploration with introductory remarks by S. G. Coultis, M.E.I.C., and "Across Canada," film from C.P.R.
Jan. 20—Annual Ladies' Night was held in the Harris Sky Room. Dancing, cards and entertainment were provided. (79)
Jan. 30—**Sewage Disposal** by J. Ivor Strong, M.E.I.C., Assistant City Engineer; and film "Clean Waters" from C.G.E. (24)
Feb. 13—**Dust Control in Terminal Elevators** by Murray Fleming, M.E.I.C. of C. D. Howe Co., Ltd., illustrated with a film. (54)
Mar. 8—Annual Meeting followed by Dinner. Election of officers. (43)
Oct. 2—**Wood Creosoting** by J. H. Palmason, General Manager, Dominion Tar & Chemical Co. Ltd. (64)
Oct. 16—Three films "Basic Electricity", "Basic Electronics", and "Minneapolis Honeywell Electronic Pilot", with introductory remarks by J. P. Rounce, Br. Aff., Manager, Minneapolis-Honeywell Regulator Co. Ltd., at Calgary. (97)
Oct. 30—**The Red Deer Natural Gas Pipeline** by B. W. Snyder, M.E.I.C., Projects Engineer, Canadian Western Natural Gas Co. Ltd., Calgary. (77)
Nov. 13—Colonel Beaman, R.C.E., spoke on present activities of the Canadian Army, and in support of the Calgary Field Squadron, R.C.E. Three films were shown, "Scotland, Land of Invention", "One World or None" and "Aquatic Sports." (100)
Nov. 27—**Short Circuit Testing Stations and their Influence on Breaker Design** by Prof. J. A. Harle, Electrical Engineering Department, University of Alberta. (52)

Cape Breton Branch

The following dinner meetings were held during 1947:

Feb. 21—**Canol Oil** by E. Baillie, manager Asphalt Sales, Imperial Oil Limited, Halifax, N.S. (35)
Mar. 18—Visit of President J. B. Hayes, (26)
Apr. 15—**Bridging the Straits of Canso** by C. P. Disney, Vice President, Intrusion Prepakt Ltd., Toronto, Ont. (114)
Oct. 6—Visit of President L. F. Grant, (20)
Oct. 8—Visit of President L. F. Grant to St. Francis Xavier University, Antigonish.

Cornwall Branch

A very successful year was enjoyed by the Cornwall Branch. For the City Planning Meeting in January, the Councils and Civic Organizations were invited to attend. The S.D. & G. Highland Regiment was invited to the Arctic Meeting. The ladies were invited to attend the inspection of the Canada Starch Plant.

The Cornwall Branch Executive met five times during the year, with an average attendance of six.

The following general meetings were held during the year, with attendance as shown in brackets:—

Jan. 20—**Exercise Musk-Ox, and the Canadian Arctic**—an illustrated lecture by Dr. J. T. Wilson, Professor of Geophysics, University of Toronto. (325)
Feb. 20—**A City Plan for Cornwall**—by N. D. Wilson, Consulting Engineer, Toronto. (175)
Mar. 18—**A Study of Stoker Fuel Beds**—by Otto de Lorenzi, Combustion Engineering Corporation, N.Y., illustrated. (49)
Apr. 22—**Electrical Maintenance** — by Messrs. Eastwood, Nickerson, and Wilson, Cornwall Branch. (39)
Sept. 27—**How Corn Starch is Made** — a tour through the Cardinal plant of the Canada Starch Company. (48)
Oct. 28—**Radiant Heating and Cooling**—an illustrated lecture by G. Lorne Wiggs, Consulting Engineer—Montreal. (40)
Nov. 18—**Laminated Plastics** — lectures and plant tour by members of Howard Smith Paper Mills, Cornwall, (50).
Dec. 18—Annual Meeting — a dinner meeting, with annual reports and installation of officers. (50)

Edmonton Branch

The Edmonton Branch Executive met eight times during the year, with an average attendance of nine.

The general meetings of the Branch, with one exception, were dinner meetings held at the Macdonald Hotel, at 6.30 p.m. The dates, programmes and attendances, which are the figures in brackets, were as follows:

Jan. 10—**The Future for Alberta in Agriculture and Industry, to be Made Possible by Proposed Programme of Water Reclamation.**—a lecture illustrated with coloured slides. The speaker was John R. MacNicol, M.P., of Toronto—a dinner meeting at Merrick's Embassy Room. (69)
Feb. 7—**Engineering Education.** by Dean R. M. Hardy, Faculty of Applied Science, University of Alberta. The annual joint dinner of the Association of Professional Engineers of Alberta, the Edmonton

Branch E.I.C., and the Northern Alberta Branch of the Canadian Institute of Mining and Metallurgy. (102)

Feb. 28—**Design of Winter Landing Gear for Aircraft.**—illustrated lecture by K. Korsak, Engineer, with the Northwest Industries Ltd., of Edmonton. (39).

Apr. 7—**Measuring Wind-Chill,** by Dr. Thomas How, Officer in charge of the Dominion Public Weather Office, in Edmonton. (36)

Apr. 22—**Engineering Organization in Canada** — speaker, J. G. Dale, Registrar of the Association of Professional Engineers of Alberta. This was the Branch Annual Meeting, including reports of retiring officers and election of new officers.—The meeting concluded with a smoker. (58)

Oct. 15—**Glacial Geology of the Barren Lands**—illustrated with coloured slides—speaker, Dr. R. E. Folinsbee, Assistant Professor of Geology at University of Alberta. (48)

Nov. 13—Films "Prospecting for Petroleum", and "Ten Thousand Feet Deep"—loaned by the Shell Oil Company, Inc.; discussed by W. J. Dick and J. A. Allan, (63)

Dec. 5—**Oil Development in the Province of Alberta**—by Hon. N. E. Tanner, Minister of Lands and Mines for Alberta. This was the annual joint dinner of the A.P.E.A., the Edmonton Branch E.I.C., and the Northern Alberta Branch of the C.I.M.M. (150)

Dec. 17—**The Young Engineer's Committee** sponsored a symposium of two papers: **Radiant Heating Design,** by D. Panar, Mechanical Engineer with the Building Branch Department of Public Works of Alberta, and **Radiant Heating at University of Alberta,** by K. Cumming, Engineer, Works Dept., University of Alberta.

Halifax Branch

During the year the Executive of the Halifax Branch held seven business meetings, in addition to the seven monthly hotel dinner gatherings listed below, with attendance shown in brackets.

Jan. 23—Combined Annual Banquet. Speaker, Rev. Dr. Stanley Walker. (245)

Feb. 20—**Reconstruction of the Halifax Reservoir,** by R. M. Doull, General Manager, Canada Gunite Company, Montreal. (82)

Mar. 20—Presidential visit of J. B. Hayes. The ladies were present at this meeting. (139)

Apr. 17—**Bridging the Strait of Canso,** by C. P. Disney, Vice-President, Intrusion Prepakt Ltd., Toronto, Ont. (84)

Oct. 10—Presidential visit of Lieut.-Col. L. F. Grant. (83)

Nov. 27—**Has the Engineer a Place in Community Planning?** by Ira McNab, General Manager, Halifax Public Service Commission. (65)

Dec. 19—Annual Meeting of the Halifax Branch.

Hamilton Branch

During the past year, the Hamilton Branch held the following meetings. Attendance is shown in brackets.

Jan. 9—The Annual Meeting and Dinner was held at the Scottish Rite Club. The guest speaker, E. T. Sterne, chose as his subject, **John Q. Engineer, Citizen.** (85)

Feb. 20—**Canada's Pulp and Paper Industry,** by A. E. H. Fair, president, Alliance Paper Mills, Ltd. (75)

Mar. 20—The Annual Students' and Juniors' Night was held at McMaster University. The following papers were presented—**Modern Engraving Practices,** by W. A. Freeman, S.E.I.C.; **Comparative Costs of Stage and Compound Dies,** by L. C. Galloway, S.E.I.C.; **Lightning Effects on Buried Telephone Cable,** by R. N. E. Haughton, S.E.I.C.; **Some Aspects of Atomic Energy,** by L. A. Cook, JR.E.I.C. (40)

Apr. 18—**Lightning Protection of Industrial Plants,** by E. W. Beck. This meeting was the annual joint gathering of the Toronto Section of the American Institute of Electrical Engineers and the Hamilton Branch. (150)

Sept. 20—The President's Visit. Lieut.-Col L. F Grant spoke on **What the Institute and the Engineer Can Do for Each Other.** (50).

Oct. 2—Plant Visit—Members of the Branch were privileged to visit the Hamilton Works of the Steel Company of Canada. (150)

Oct. 23—**Stream and Lake Pollution, and Sewage Treatment Plants,** by W. Blaine Redfern, M.E.I.C. (50)

Nov. 17—**The Electric Home of Tomorrow,** by C. B. Pearce, Manager, Laundry Equipment Section, Canadian Westinghouse Company. This meeting was the Annual Ladies Night gathering. (103)

Dec. 5—**The Effort to Increase Domestic Supply of Petroleum in Canada,** by John Ness, Imperial Oil Co. (43)

The Executive of the Hamilton Branch held eight meetings, with an average attendance of eight members.

Kingston Branch

The following meetings were held during the year 1947:

Jan. 14—Prof. J. T. Wilson, M.E.I.C., University of Toronto—**Exercise Musk-Ox and the Canadian Arctic** (illustrated).

Feb. 5—J. I. McAskill, Frontenac Wall and Tile Company, Ltd.—**Manufacture of Floor and Wall Tile.**

Feb. 24—Student Papers Night.

Apr. 9—R. M. Doull, M.E.I.C., Canada Gunite Company, Ltd. —**Reconstruction of the Halifax High Service Reservoir** (illustrated),

June 10—Social Evening. Guests of Honour—Col. and Mrs. L. F. Grant.

Sept. 16—L. F. McCaffrey, Allis-Chalmers Manufacturing Company—**The Making and Shaping of Steel,** (Courtesy U.S. Steel Corporation)

Oct. 16—Tour of R.C.E.M.E. Training Centre—Barriefield.

Nov. 19—Tour of Canadian Industries Limited, Nylon Division—Kingston.

Dec. 8—J. B. Cunningham, M.E.I.C., Canadian Locomotive Company—**The Modern Coal Burning Steam Locomotive.**

Kootenay Branch

The following report of activities is submitted by the Executive of the Kootenay Branch for the year 1947. Attendance is shown in brackets for each meeting.

The Executive met five times during the year.

Feb. 21—General business meeting. Film entitled "The Freight Yard" was shown. (16)

Mar. 10—**Electric Boilers** was the topic of F. L. Lawton of the Aluminum Company of Canada Limited. (20)

Apr. 21—General business meeting. Film entitled "Drilling for Oil" shown by A. W. Busby. Comments on Turner Valley oil were made by J. V. Rogers. (17)

June 6—General business meeting. C. E. Marlatt reported on the Annual Meeting of the Institute held in Toronto. (21)

June 21—**Snow Surveys for Forecasting Run-off** was the topic of a talk delivered by R. C. Farrow of the Water Rights Branch, Department of Lands and Forests of British Columbia. (21)

Sept. 19—**St. Mary Dam,** the story of design and construction of an earth-filled dam for irrigation project near Cardston, Alta. The speaker was A. G. Ballantyne. (22)

Dec. 22—General business meeting and luncheon. (18)

Lakehead Branch

The following meetings were held by the Lakehead Branch during the year. Attendance is shown in brackets.

Jan. 15—Dinner meeting at the Prince Arthur Hotel, Port Arthur. T. M. O'Neill, Field Engineer for the Goodyear Rubber Company gave a paper on **Long Haul and Overland Conveying Systems.** A film depicting the use of conveyers in construction of the Davis Dam, was shown. (50)

Feb. 25—Ladies Night. A very successful social evening was held at Winston Hall, West Fort William. Bowling, a movie, dancing and refreshments made up the programme for the evening. (60)

Apr. —Evening meeting held in the Council Chambers, Port Arthur. J. M. Fleming, President of C. D. Howe Company Limited, gave a paper on **Dust Con-**

trol in Modern Elevators. M. F. Mills showed his films on the demolition of Pool Terminal Elevator No. 5. (50)

July 9—The Annual Meeting was held at the Village. Sound films. "Clean Waters", Tomorrow's Timber and Salt From the Earth" were shown. The former film was shown through the courtesy of the Canadian General Electric Company, and the latter through the courtesy of the National Film Board. (40)

Oct. 10—Joint trip, with the Midwest Branch of the Canadian Pulp and Paper Assoc., Technical Section, to Red Rock, Ont., to inspect the mill of the Brompton Pulp and Paper Company, Ltd. The groups were also guests of the company at dinner. (125)

Nov. 19—Dinner meeting at the Royal Edward Hotel in Fort William. Dr. Mel Bartley, Principal of the Lakehead Technical Institute, spoke on the plans and courses to be given in this school. Several films were shown—"Caterpillar Diesel Earth-moving Equipment", courtesy Powell Equipment Company, Ltd., Port Arthur, and "A Day at Polymer and Land from the Sea", courtesy the National Film Board.

Dec. 17—Dinner meeting at the Village. The following films were shown—"The Romance of Glass" and "We Modernize Our Home"—courtesy the Hobbs Glass Company, Ltd. and "Operation Mulberry"—courtesy the National Film Board.

Lethbridge Branch

The Lethbridge Branch held eight regular meetings in 1947, with an average attendance of 44. The Branch Executive met nine times. Topics of addresses at general meetings are listed below:

Jan. 18—W. L. Foss, M.E.I.C., discussed the **St. Mary's Project-Design & Development.** (49)

Feb. 15—Ladies Night—Musical Programme. Films—Toscannini", "History of Electricity", "Road of Cuernavaca", were shown. (55)

Mar. 21—Joint meeting—E.I.C. and A.P.E. Dr. R. M. Hardy, Dean of the Faculty of Applied Science, University of Alberta, spoke of—**Engineering Education.** (52)

Apr. 19—**Meteorology Applied to Aviation**, by D. H. Smith, Officer in charge of Meteorological Division, Department of Transport. (32)

Sept. 29—**Distribution System Protection,** by M. C. Code—Distribution Engineer, Canadian General Electric, Toronto. (58)

Oct. 18—Fire Chief W. H. Short discussed **Fire Protection.** (27)

Oct. 30—Field Tour—visit to Pothole Coulee Dam and St. Mary's River Dam. Tour conducted by Supervising Engineer W. L. Foss, M.E.I.C. (42)

Nov. 15—**Life in the West Indies Oil Fields** by K. K. Balderson, M.E.I.C.—illustrated with slides. (27)

Dec. 17—Ladies' Night—Speaker, A. B. Hogg, K.C.; Subject, O Canada. (39)

London Branch

The Executive of the London Branch is pleased to report the following seven regular and special meetings.

Jan. 29—Annual Dinner—Speaker, Dr. G. H. Turner, Assistant Professor of Psychology at the University of Western Ontario spoke on **Human Relations.**

Feb. 27—**Essential Links in Sanitation**, by V. S. Baker, Plumbing Inspector for the City of London.

Mar. 27—**Conversion to 60 Cycles,** by V. A. McKillop, Assistant General Manager, London Public Utilities Commission.

May 6—Dinner Meeting—Guest Speaker R. C. Manning, Chief Engineer of the Canadian Institute of Steel Construction. His subject was **Steel in Small Houses.**

Sept. 4—President's Visit. Guests of Honour—President and Mrs. L. F. Grant.

Oct. 23—**The Relationship of Conservation to Sound Economics,** by Dr. E. G. Pleva, Ph.D., Associate Professor of Geography at the University of Western Ontario.

Nov. 26—**Operation with the R.A.F. from an Island Base in the Far East,** by P. G. W. Walker, Assistant Engineer, City of St. Thomas.

The Branch Executive and Committees met seven times during the year.

Moncton Branch

Five meetings of the Executive were held during the year. There were six branch meetings held, at which technical subjects were discussed and business transacted as follows:

Feb. 4—A meeting was held in the City Hall. G. R. Murray, Canadian General Electric Company, gave an illustrated address on **The All Electric Home.**

Mar. 12—A dinner meeting was held in the Brunswick Hotel in connection with the official visit to the branch of J. B. Hayes, President of the Institute.

Apr. 9—A meeting was held in the City Hall. E. D. Bent, Cable Development Engineer, Northern Electric Company, addressed the branch on the subject of **The Role of Synthetics in the Design and Manufacture of Electric Cables.**

June 17—A meeting was held for the purpose of nominating branch officers for the year 1947-48.

June 24—The Annual Meeting was held on this date.

Oct. 14—A dinner meeting was held at the Beaver Club. Col. L. F. Grant, President of the Institute, was the guest speaker.

Montreal Branch

The following papers were presented in 1947 (attendances in brackets).

Jan. 9—**Defeating the Buzz Bombs,** by L. T. Thwaites, M.E.I.C. (150)

Jan. 16—**Transportotion Paradox,** by S. W. Fairweather. (160)

Jan. 23—**Education for Industrial Engineers,** by Professor David Porter, M.A.S.M.E. (150)

Jan. 30—Branch Annual General Meeting. (80)

Feb. 6—**The Atom Bomb Test at Bikini,** by Air Vice-Marshall E. W. Stedman, M.E.I.C. (250)

Feb. 13—Smoker. (310)

Feb. 20—**Fluid Drives in Industry,** by J. D. Rosebrough, M.A.S.M.E. (160)

Feb. 27—Student Evening. (110)

Mar. 6—**Reconditioning of Trunk Mains,** by F. Y. Dorrance, M.E.I.C. (110)

Mar. 13—**Loudness and Quality of Musical Tone,** by Dr. Harvey Fletcher, M.A.I.E.E. (Joint meeting with A.I.E.E. and I.R.E. (330)

Mar. 20—**High Voltage D.C. Generators for Nuclear Research,** by T. W. Mouat, M.A.I.E.E. (Joint Meeting with A.I.E.E.) (110)

Mar. 27—**Economics of Water Diversion,** by F. L. Lawton, M.E.I.C. (140)

Apr. 10—**Radiant Heating,** by G. Lorne Wiggs, M.E.I.C. (210)

Apr. 17—**Direct Operating Costs of Transport Aircraft,** by Dr. J. J. Green, M.E.I.C., and H. S. Rees, M.E.I.C.

Oct. 1—Opening Meeting. (260)

Oct. 9—**Research on Reinforced Concrete Structures,** by Professor F. R. Richart. (160)

Oct. 16—**Engineering Street Lighting for Public Protection,** by Stuart R. Williams. (140)

Oct. 23—**Executive Ability and its Development,** by Dr. J. S. A. Bois. (240)

Oct. 30—**Utilization of Wood at Gatineau Mill,** by G. D. Davidson, M.E.I.C. (140)

Nov. 6—**General Description of Suspended Monorail for Rapid Transit,** by E. H. Anson. (150)

Nov. 13—**Mobile Telephone,** by D. J. McDonald. (100)

Nov. 20—**Power Circuit Breakers,** by Dr. G. R. Langley, M.E.I.C. (160)

Nov. 27—**Welding Applications in Structural Plant,** by Gordon Cape, M.E.I.C. (150)

Dec. 4—**Prince Edward Car Ferry, "Abegweit"** by H. H. German, M.E.I.C. (160)

Dec. 11—**Stainless Steel in Industry,** by G. A. Sands. (115)

Junior Section

The Junior Section adhered to its policy of last year by presenting papers on non technical subjects and met with a certain measure of success in that the attendance continued to improve both as to quantity and to the degree of interest shown by those present.

The Executive inaugurated a special students' night at which students presented papers of ten minutes duration and then were subject to criticism on their method of presentation by a professional public speaker. This type of meeting proved to be very popular.

A student membership drive is on, the results of which will not be apparent until the spring of 1948.

Our social evenings continued to be very popular, thanks to the efforts of Maurice Fast, chairman of the Film Committee, and Leo Scharry, chairman of the Entertainment Committee. The third annual dance at the Ritz Carlton Hotel was attended by about five hundred people.

The following meetings were held in 1947. The attendance varied from 40 to 170 persons:

Jan. 13—Annual Meeting—Election of Officers—Films.
Jan. 27—**How to Train Your Mind**—Dr. J. S. A. Bois.
Feb. 10—**Town Planning**—Colin B. McMillan, Jr.E.I.C.
Feb. 24—**Canada's Resources**—Dr. John S. Bates.
Mar. 10—**Appreciation of Music**—Frank Coleman.
Mar. 24—Film Night.
Apr. 7—**Export Trading—Canada's Highway to Prosperity**—D. P. Hatch.
Oct. 6—**The Importance of Selling to the Engineer**—F. W. Bruce.
Oct. 20—**Snow Research in Canada**—Col P. D. Baird and G. Klein.
Nov. 3—**Fundamental Requisites in Supervisors and Supervision**—H. B. Hanna.
Nov. 17—Students' Night—Films.
Nov. 28—Third Annual Dance.
Dec. 8—**Developments in Hydro-Power**—R. E. Heartz.

Niagara Peninsula Branch

The Executive of the Niagara Peninsula Branch of the Engineering Institute of Canada respectfully submit the following report for the year 1947.

The Branch Executive held five executive meeting and one electoral meeting during the year. The programme committee arranged for and conducted the following general meetings.

Jan. 30—Dinner meeting at the Welland House Hotel, St. Catharines, Ont. R. C. McQuire, of the International Nickel Company of Canada, spoke on the subject, **Nickel Smelting and Refining.** Films illustrated the subject.

Feb. 27—A meeting at the Red Casque Inn, Niagara Falls, Ont. This took the form of a joint meeting, with the Association of Professional Engineers of Ontario, when the President of the Association of Professional Engineers, Dr. G. B. Langford, Ph.D., was guest speaker, accompanied by Colonel T. M. Medland of the Association. This was a smoker meeting with lunch and refreshments served.

Mar. 20—A dinner meeting, held at the Queensway Hotel, St. Catharines. J. T. Thwaites, Electronics Division Engineer, of the Canadian Westinghouse Co. Ltd., spoke on the subject, **Atomic Power in Industry.**

Apr. 24—Annual ladies night was held at the Foxhead Hotel, Niagara Falls, Ont. C. B. Pearce, of the Canadian Westinghouse Company, spoke on the subject, **The Electric Home of Tomorrow.** To illustrate his topic, Mr. Pearce showed a most interesting Technicolor film.

June 13—The annual meeting, at the Club Henley, St. Catharines, Ont. President L. F. Grant, addressed the gathering. He was accompanied by the Assistant General Secretary, W. D. Laird.

Sept. 11—This meeting consisted of an inspection of the Decew Falls power development, followed by dinner in the camp dining hall, at 6.30 p.m. J. G. Montague, Hydraulic Engineer, of the Hydro-Electric Power Commission of Ontario, and G. F. Simson, gave an outline of the development of the project.

Oct. 23—A dinner meeting at the Red Casque Inn, Niagara Falls. The speaker was D. O. Robinson, Chief of Technical Staff, Canada Cement Company, whose subject was, **New Developments in Concrete.**

Nov. 20—A dinner meeting at the Queensway Hotel, St. Catharines. R. J. Anderson, Manager, Unionmelt and Heliarc Service, Dominion Oxygen Co. Ltd., spoke on the development of new welding processes. Slides were used to illustrate the discussion.

Ottawa Branch

The Ottawa Branch held the following eleven luncheon meetings, and six evening technical meetings and social functions during the year 1947. Attendance is shown in brackets:

Feb. 13—Luncheon meeting at the Chateau Laurier. Sound film entitled "The Story of Aluminum" was shown. (107)

Mar. 6—Luncheon Meeting at Chateau Laurier. R. A. Gysler, of Canada Cement Company, discussed **Concrete Houses.** Illustrated lecture. (115)

Mar. 18—Evening meeting at the National Research Council Auditorium, **Hydro Development on the Madowoska River,** by J. R. Montague.

Mar. 27—Luncheon meeting at Chateau Laurier. G. D. Mills of Canadian General Electric Company, spoke on **Industrial and Commercial Lighting.** Illustrated lecture. (108)

Apr. 8—Dinner Dance at the Copacabana, sponsored by the Engineers' Wives Association. (74)

Apr. 16—Evening Meeting at the National Museum. **Reconstruction of the Halifax High Service Reservoir,** by R. M. Doull.

Apr. 24—Luncheon meeting at Standish Hall. Edouard Fiset, Town Planner, discussed **The Basic Principles of Town Planning.** (54)

May 8—Luncheon meeting at Chateau Laurier. Dan Gasper of Canada Cement Company, spoke on **Safety Calling Leadership.** (83)

Sept. 25—Luncheon meeting at the Chateau Laurier. His Worship Mayor R. Brunet, O.B.E., Hull, Que., gave a talk entitled **A Contractor Looks Down on Engineers.** (91)

Oct. 9—Evening meeting at National Museum. **The Long Way Home,** by Stewart Richardson. (Combined with Illuminating Engineers Society).

Oct. 9—Luncheon meeting at Chateau Laurier. McNeely Du Bose, of the Aluminum Company of Canada, discussed the **Shipshaw Development.** (81)

Oct. 22—Evening meeting at National Museum. Charles Disney vice-president of Intrusion Prepakt Ltd., spoke on **Prepakt Concrete.**

Oct. 23—Luncheon meeting at Chateau Laurier. Colonel Meuser, R.C.E., Director of Engineers, N.D.H.Q., spoke on **The Corps of Royal Canadian Engineers.** (91)

Nov. 13—Luncheon meeting at Chateau Laurier. Col. J. P. Carriere, City Manager and Chief Engineer, Hull, Que., discussed **City Management, a New Field of Action for Engineers.** (78)

Nov. 14—Evening meeting at the De Salaberry Armouries, Hull, Que. Annual Smoker. (150)

Nov. 27—Luncheon meeting at the Chateau Laurier. **The Eisenhower I Knew,** by Gaj. Gen. J. F. M. Whiteley, Comd. R.M.C. (126)

Dec. 11—Luncheon meeting at the Chateau Laurier. Stewart Graham discussed **The International Commission for Air Navigation.** (94)

Peterborough Branch

Eight executive meetings were held during 1947 with an average attendance of eight. The following summarizes the Branch meetings during the year, with attendance figures in brackets.

Jan. 9—**Canadian Housing Crisis,** by J. C. Smith, Architectural Editor of McLean's Magazine. (41)

Jan. 23—**Timing of Public Investment in Construction,** by H. W. Lea, Co-ordinator of Public Projects, Dominion Government. (32)

Jan. 30—**Job Evaluation,** by F. R. Manual of Stevenson and Kellogg. (60)

Feb. 6—**Paper,** by A. E. H. Fair, President of Alliance Paper Company. (62)

Feb. 12—**New Zealand,** by C. E. Fuller of New Zealand National Electrical and Engineering Company—Luncheon meeting. (57)

Feb. 20—**Exercise Musk-Ox,** by Col. J. T. Wilson, Professor of Geophysics, University of Toronto, Deputy Director of Exercise Musk-Ox. (125)

Mar. 22—**Inductive Co-ordination of Power and Telephone Lines,** by Professor G. A. Wallace of McGill University—Dinner meeting. (101)

Apr. 3—**Cobalt,** by C. R. Whittemore, of Deloro Smelting and Refining Company. (27)
May 1—Annual meeting—addressed by Colonel T. M. Medland on the subject of **The Engineering Profession in Ontario.** (54)
June 21—Annual Field Day—Trip through Deloro Smelting and Refining Co., and picnic at Crowe Lake. (66)
Oct. 6—**Bikini,** by Forrest Nagler. (109)
Oct. 18—Trip to Steel Company of Canada, Hamilton. (40)
Nov. 5—Annual Dinner and presidential visit by Col. L. F. Grant. (61)
Dec. 4—**Planning for Use,** by E. C. S. Cox, Architect, Thorncrest Village. (70)

Quebec Branch

The Executive Committee held six meetings, with an average attendance of ten members, for the transactions of branch business.

The activities of the Branch were varied and very well attended. This year the Branch has celebrated its fortieth anniversary. On this occasion a grand ball was organized on November 28th, with our President, Lt.-Col. L. F. Grant, attending as guest-of-honour. Laval University conferred honorary degrees upon Lt.-Col. L. F. Grant, president of the Institute, and Mr. Ernest Lavigne, president of the Quebec Corporation of Professional Engineers. The Council of the Institute held its November meeting in Quebec. The president met the students of Laval on Saturday, November 29. Hearty thanks to all those who were present.

The programme of activities was as follows (attendance is given in brackets):

Jan. 22—Films—courtesy of the Provincial Service of Cinephotography. (80)
Feb. 3—**Reconstruction of the Halifax Water Reservoir,** R. M. Doull, M.E.I.C., Manager, Canada Gunite Co. Ltd. (50)
Feb. 26—**Some Recent Electrical Developments,** Jules Mercier, M.E.I.C., Canadian General Electric, Quebec. (75)
Mar. 12—**Modern Methods of Masonry Construction and Precast Concrete Construction,** W. Chester Smith, M.E.I.C., The Cookville Co., Toronto. (50)
Apr. 10—Students' night—Talk by Gerard Matte, S.E.I.C. (55)
Apr. 28—Annual meeting of the Branch. (30)
Sept. 4—Annual Golf Tournament of the Branch. (101)
Oct. 29—**Observations de voyage en Chine,** Guy Rinfret, M.E.I.C., General-Superintendent, Shawinigan Engineering Company. (60)
Nov. 28—Grand Ball of the fortieth anniversary of the Branch. Lt.-Col. L. F. Grant, guest of honour. Laval University confers honorary degrees on the President of the Institute and on the President of the Corporation of Professional Engineers of Quebec. (430)
Nov. 29—Council meeting at the Parliament Building. Visit of the President to the science students of Laval. The President meets the Executive of the Branch at a luncheon at the Cercle Universitaire.

Saguenay Branch

During the year the Branch held a total of 5 general meetings.

Feb. 20—**The History of Sulphuric Acid,** by W. H. Deblois of Canadian Industries Limited, Montreal, Que.
Mar. 20—**A Programme for Improvement of Maintenance Methods,** by H. A. Estabrook, of the Aluminum Company of Canada, Limited, Arvida, Que.
June 23—Annual Dinner Meeting held in the Grill Room of the Saguenay Inn for the purpose of meeting the Institute President, L. F. Grant and the presidential party.
Oct. 2—**Cement Dispersion and Air Entrainment in Concrete,** by Lane Knight, Vice-President of The Master Builders Company Limited, Toronto, Ont.
Nov. 24—**Heliarc Welding,** by J. S. Johnston, of the Dominion Oxygen Company Limited, Montreal, Que.

In addition to the above the Junior Section held 9 general meetings.

Saint John Branch

On behalf of the Executive of the Saint John Branch we have the honour of presenting the Annual Report of the Branch for the year ending December 31, 1947.

Six special meetings of the Branch were held during the year, five in the Admiral Beatty Hotel and one in the Royal Hotel in Saint John.

Jan. 23—Annual Joint Dinner Meeting with the N.B. Assocation of Professional Engineers. Speakers were J. N. Flood, **Conditions in London and Brussels;** and D. O. Turnbull, **Modern Methods of Handling Materials at the New Jones-Schofield-Hathaway Warehouse.** (86)
Feb. 18—Dinner Meeting with the presentation of Canadian General Electric Company's "Magic of the Spectrum", by Mr. C. A. Morrison. Ladies Night. (127)
Mar. 18—Dinner Meeting in honor of President J. B. Hayes. The President was the principal speaker. Ladies Night. (79)
Apr. 14—Dinner Meeting at the Royal Hotel. Speaker was E. D. Bent of the Northern Electric Co., on **The Role of Synthetics in the Design and Manufacture of Electric Cables.** (27)
Oct. 15—Dinner Meeting in honor of President L. F. Grant. The President was the principal speaker. Ladies Night. (72)
Nov. 20—Dinner Meeting. J. L. E. Price discussed **Modern Housing.** (36)
Dec. 12—The Annual Meeting of the Branch. A new slate of officers for the year 1948 was brought in. The Annual Report of the executive was presented, as was the Financial Statement. This was a Dinner Meeting. (27)

St. Maurice Valley Branch

Mar. 27—Lecture Meeting held at the Cascade Inn, Shawinigan Falls, Que., to hear a paper entitled **Corrosion of Metals,** presented by L. G. Van de Bogart, research engineer of the Crane Company of Chicago, Ill. (85)
Apr. 17—Annual Meeting of the Branch, held at the Laurentide Inn, Grand'Mere, Que., at which time the members heard a most interesting talk given by Guy R. Rinfret, M.E.I.C., on a recent visit he had made to China. (67)
Oct. 27—Combined Branch golf meet and industrial visit held at the Ki-8-Eb Golf Club in Three Rivers, Que. (85)
Nov. 13—Lecture meeting held with the Canadian Institute of Chemistry at the Cascade Inn, Shawinigan Falls, Que. Film **Operation Pluto** was shown. (100)
Nov. 27—President's Visit. The Branch was pleased to receive the President and his party at a dinner meeting in the Laurentide Inn. Grand'Mere, Que. Colonel Grant, Messrs. Eadie, Flitton, Beauchemin and Laird all spoke briefly after dinner.

Saskatchewan Branch

All meetings were held jointly with the Association of Professional Engineers. The respective programmes were as follows:

Jan. 17—**Soil Mechanics,** by R. Peterson, M.E.I.C.
Feb. 14—Annual Meeting, followed by dinner and address from Hon. J. L. Phelps, Minister of Natural Resources, Saskatchewan Government.
Mar. 14—**Methods of Wood Preserving,** by J. A. Palmason, Canadian Creosoting Co. Ltd.
June 4—Dinner Meeting addressed by delegates to the Annual Meeting of the Dominion Council of Professional Engineers.
Aug. 25—Special Meeting of Executive addressed by Dr. L. Austin Wright, General Secretary, E.I.C.
Oct. 27—**Romance of Railroading,** by F. J. Fryer, Division Superintendent, C.P.R., Regina.
Nov. 25—**Air Photography, its Interpretation and Application to Engineers,** by J. D. A. Mollard, M.E.I.C.
Dec. 19—Sound Film "Sand and Flame".

The average attendance at these meetings was 47. Ten meetings of the executive were held during the year.

Sarnia Branch

This was the second full year of activities for the Sarnia Branch. Nine meetings were held, including a joint golf game with the Windsor Branch in Windsor. Eleven executive meetings were held. The following is a list of the general meetings:

Jan. 17—A dinner meeting at the Polymer Cafeteria at which Dr. J. J. Grebe of the Dow Chemical Company, Midland, Mich., spoke on **The Atomic Bomb Test at Bikini Atoll.**

Feb. 20—Dr. Sidney Smith, the President of the University of Toronto, addressed a joint dinner meeting at which the members of the Sarnia Branch of the Chemical Institute of Canada were the guests of the EIC. The meeting took place at Polymer Cafeteria.

Mar. 27—An informal evening meeting at the Lutheran Church during which the picture **Operation Pluto** was shown through the courtesy of the Drummond McCall Company. Considerable discussion was devoted to Town Planning.

Apr 24—A. H. Frampton, Director of Engineering for the H.E.P.C., addressed a dinner meeting at Polymer Cafeteria, his subject being **The Romance of Niagara Power.**

May 14—This meeting held annually under the sponsorship of the Junior members took place at the Hotel Vendome. Jack Garton, Jr.E.I.C., of Imperial Oil Limited, spoke on **Small Scale Enterprises for Engineers.** A round table discussion followed, led by James Blayney on **The Viewpoint of the Young Engineer.**

Sept. 6—This was the occasion of President Grant's visit to Sarnia, accompanied by his wife and W. L. Saunders of Ottawa. A noon hour luncheon was held at Kenwick-on-the-Lake. Mr. Saunders and Col. Grant addressed the members and their ladies.

Sept. 20—Twenty members of the Sarnia Branch journeyed to Windsor where they were guests of the Windsor Branch at the Lakewood Golf Club for a golf match followed by dinner. A trophy was donated by the Windsor Branch for Annual Competition between the Branches. The first year's competition was won by Sarnia by a narrow margin.

Oct. 23—The E.I.C. were guests at a ladies night meeting at Polymer Cafeteria at which the Chemical Institute of Canada were hosts. C. R. Conquergood, President of the Canada Printing Ink Company, addressed the meeting on **Order in Colour.**

Dec. 4—The annual meeting at which the reports of the various committees were presented and the election of officers for 1948 took place. Following a discussion of local problems, a social evening was enjoyed.

Sault Ste. Marie Branch

Th Sault Ste. Marie Branch of the Engineering Institute of Canada, held six general meetings and three executive meetings during the year of 1947. The general meetings were as follows:

Apr. 4—"Construction, Assembling and Firing of the V-2 Rocket", a movie presented through the courtesy of Lieut.-Col. L. H. Derrer of the Sault Ste. Marie and Sudbury Regiment.

Apr. 25—**Atomic Bomb Tests at Bikini Atoll,** also presented by Lieut.-Col L. H. Derrer.

June 13—Speaker—Col. T. M. Medland of the Association of Professional Engineers.

Sept. 8—Visit of the President. Lieut.-Col. L. F. Grant spoke on—**What the Engineer Can Do for the Institute, and What the Institute Can Do for the Engineer.**

Nov. 28—T. O. O'Neill of the Goodyear Tire & Rubber Company, spoke and showed movies on "Conveyor Belt Systems" as applied to mines and cross country operations.

Dec. 12—Annual Meeting. C. P. Disney of Intrusion Prepakt Limited, spoke on **Bridge Pier Design and Construction Using Steel H Piles and Prepakt Concrete.**

Toronto Branch

The Executive held eleven meetings with an average attendance of ten.

Regular meetings of the Branch are listed below, with attendance given in brackets.

Jan. 11—Ladies Night. (128)

Jan. 23—Student Night (Joint with Junior Section). **The Modern Low Head Propeller Turbine,** by W. M Clarkson. **Boiler Feed Water Conditioning,** by A. J. Prell. **Mechanized Harvesting of Grain,** by D. Dederer. **Engineering Aspects of Aviation Medicine,** by F. J. Humphrey. **The Photo Multiplier Tube,** by F. Weinberg. **The Gas Turbine Locomotive,** by W. G. Ratz. (175)

Feb. 19—**Research in Ontario,** by Dr. R. C. Wallace, Joint with Affiliated Engineering and Allied Societies in Ontario. (220)

Mar. 27—**Labour Relations and the Engineer,** by W. F. Clive Kidd. (82)

Apr. 23—Annual Meeting—Films, "Niagara the Powerful", and "The Telephone Hour". (103)

Oct. 1—**Industrial Research,** by Dr. H B. Speakman. (125)

Oct. 23—**Jet Engine Development in Canada,** by P. B. Dilworth. (160)

Nov. 7—Annual Engineer's Dance. Joint with Affiliated Engineering and Allied Societies in Ontario. (282)

Nov. 27—**Elimination of Overhead Wires and Cables from Streets,** a panel discussion by S. E. Schwenger, J. F. Neild, O. W. Titus, W. H. Slinn and J. D. Von Maur. (123)

Dec. 11—**The Engineer in the World of Tomorrow,** by T. M. Medland. (114)

Junior Section

The primary aims of the Junior Section have resolved themselves into a consideration of the social, economic and professional problems as well as technical problems and also into a concerted effort to promote the interests of the Institute. A special drive to obtain student interest has been launched. The secondary aim has been to point out to non-members of the Institute that they can associate themselves with the Junior Section. The schedule of meetings for the past year follows:

Jan. 23—Student Night. (175)

Feb. 11—**Trends in Labour and Management Relations,** by Mr. Sparrow. (35)

Feb. 27—Plant visit to O'Keefe's Ale Brewery. (80).

Oct. 16—**Engineers—What of the Future?** by E. P. Muntz. (220)

Nov. 13—Plant visit—Leaside Transformer Station. (132)

Nov. 26—Ajax Meeting, President L. F. Grant and Dean Young. (795)

Dec. 10—**Des Joachims Power Develoopment,** by Wm. Hogg Jr.; **Mobile Telephone,** by H. R. Sumner; **Radiant Heating,** by F. W. Chambers; **Planning a New Testing Laboratory,** by W. MacPherson. (90)

All meetings have been made more interesting by the showing of one or two movies.

Vancouver Branch

The following is a brief resumé of the meetings held by the Vancouver Branch during 1947.

Eight meetings were held in all, of which six were addressed by guest speakers and two were field trips. Amongst the guest speakers were T. M. Moran, J. W. A. Fleury, C. E. Webb, and the three student speakers on Student Night. The first field trip was to the new automatic exchange of the B.C. Telephone Company and the second to the shops of the Vancouver Iron Works to observe the construction of a 90-inch pipe and then over to the Great Vancouver Water Board project to see the installation of the pipe.

The average attendance at all meetings was approximately 88, with top attendance approximately 125.

Victoria Branch

During the year there were five meetings of the Executive and ten general meetings of the Branch, two of the latter being visits to industrial plants. The General Secretary Dr. L. Austin Wright was a dinner guest of the executive on August 20th, when an informal discussion was carried on relative to Institute affairs. A list of the general meetings with speakers and subjects follows:

Jan. 29—Addressed by A. G. Graham, Supervisor of the Provincial Regional Planning Division, his subject being **Regional Planning.**

Feb. 19—Addressed by A. L. Carruthers, Deputy Minister of Public Works, Province of British Columbia—subject **The Provincial Highway System.**

Mar. 13—**The Work of Artillery Survey Regiments in the Late War**—R. C. Farrow, Comptroller of Water Rights, B.C. Government.

Apr. 10—**The Canol Pipe Line**—Major General W. W. Foster, C.M.G., D.S.O., Member B.C. Power Commission.

May 15—A Symposium on Soil Mechanics. R. C. Farrow, Comptroller of Water Rights—**Importance of Soil Mechanics and Necessity of Rigid Approval and Inspection of Earth Structures;** J. S. Kendrick, District Engineer Water Rights Branch—**Application of Soil Mechanics to the Construction of Earth Dams;** and P. E. Cook of the British Columbia Research Council—**Testing of Soils.**

June 15 and 16—A visit was made to the B.C. Power Commission's Hydro-Electric Plant at Campbell River, Vancouver Island. Including the ladies, between sixty and seventy visited the project. On the 15th the entire party were luncheon guests of the Commission at Nanaimo, and on the 16th, of the General Construction Company, at the Plant. The visitors were divided into groups and were shown, with descriptive detail, every phase of the project which will ultimately develop 150,000 horse power. In honour of the retiring Premier of British Columbia, the project is to be known as "The John Hart Development". Mr. Hart, in the presence of four hundred guests, opened the Plant on the 15th of December 1947.

Sept. 6—Inspection of the largest passenger ship ever built in Canada—the new $3-million Canadian National Railway's Steamship, *"Prince George"*. E. W. Izard, M.E.I.C., General Manager of Yarrows Limited, and others of his firm conducted the members through the ship at the most interesting period of its construction. The ship, which has nine decks, was launched on October 6, 1947.

Nov. 21—R. Bowering of the Provincial Department of Public Health and Welfare, spoke on **Public Health Engineering.**

Dec. 4—Luncheon nomination meeting, nominating officers for 1948.

These meetings were all well attended and augur well for the successful carrying out of the 1948 programme.

Winnipeg Branch

During the year the executive of the Branch has held nine meetings, the average attendance being 11.

The following are the general meetings held by the Branch:

Jan. 9—**Installation of Distance Relays on the Transmission System of the Winnipeg Electric Co.,** L. M. Hovey, M.E.I.C., Electrical Engineer, Winnipeg Electric Co. (82)

Feb. 6—Annual Meeting of the Branch, reading of reports and installation of new officers.

Feb. 20—**Boat Woods,** by W. J. Patton; and **Tone Control,** by C. M. Fung. These two papers won the prizes offered annually by the Branch for the best student papers in civil and electrical engineering subjects. (38)

Mar. 24—**The Economics of Water Diversion,** F. L. Lawton, M.E.I.C., Electrical Engineer, Aluminum Company of Canada Limited. (76)

May 1—**Trends in Electrical Wire Insulations and High Voltage Power Cables,** O. W. Titus, Chief Engineer, Canada Wire and Cable Co. (76)

Sept 18—**Atomic Energy,** Dr. E. J. Wiggins, Section Head, Engineering Development Section, Chalk River Project, National Research Council. (350)

Oct. 23—**The Modern Trend in House Design,** D. H. L. Evans, Consulting Architect, Western Retail Lumbermen's Association. (68)

Nov. 20—**The State of the Engineering Profession,** J. M. Dymond, Director, Bureau of Technical Personnel, Ottawa. (77)

Electrical Section

During the year the Electrical Section Executive met 10 times in addition to the nine general meetings held as follows:

Jan. 9—The Electrical Section were joined by the Branch for the first meeting of the year for the purpose of hearing the Nominating Committees of both Section and Branch present their reports. L. M. Hovey, Electrical Engineer for the Winnipeg Electric Company spoke on the **Installation of Distance Relays on the Transmission System of the Winnipeg Electric Company.** His talk was illustrated by slides and a model transmission line for demonstrating fault clearance by HZ-211 distance relays. (82)

Feb. 13—The Annual Meeting of the Section. Following reports from retiring chairman H. L. Briggs, and the secretary, the meeting under the direction of the new chairman D. A. McCuaig, heard S. S. Stevens, Director of Communications for Trans-Canada Air-lines, speak on **Electronic Aids to Aviation.** (32)

Apr. 3—**Maintenance of Power Transformers.** Mr. Storey, General Superintendent i/c production for the City of Winnipeg Hydro Electric System. A good discussion period followed the paper. Refreshments served in the Snack Room. (26)

May 1—**Trends in Electrical Wire Insulations and High Voltage Power Cable.** O. W. Titus, Chief Engineer, Canada Wire and Cable Co. Ltd., spoke before a joint meeting of the Section and Branch. His talk was illustrated with slides and samples. Refreshments were served in the Snack Room. (76)

May 6—Wind-Up Dinner and Dance at the Marlborough Hotel. W. F. Sutherland, Merchandising Manager for the City of Winnipeg Hydro Electric System, spoke on **Trends in Modern Electrical Appliances,** followed by a Westinghouse film "The Dawn of Better Living". (64)

Sept. 18—The Section joined with the Branch and the A.P.E.M. to hear Dr. E. J. Wiggins, head of the Engineering Development Section of the Chalk River Project, speak generally on **Atomic Energy.** (350)

Oct. 2—The Electrical Section played host to the Winnipeg Sub-Section of Institute of Radio Engineers to hear E. Kelsey, Consulting Engineer, Electronics Engineering Department, Northern Electric Company, on **Technical Problems in Connection with Establishing a Radio Station.** Refreshments were served in the Snack Room. (60)

Nov. 6—**Operation and Maintenance of Oil Circuit Breakers,** by C. P. Haltalin, Supervisory Engineer for Winnipeg Electric Company. Mr. Haltalin illustrated his talk with slides and provoked one of the best discussion periods to date. The meeting adjourned to the Snack Room for refreshments. (57)

Dec. 11—Nominating Committee report and films. "Beyond the Pylons", introduced by S. G. Harknett of Mumford Medland Company. Discussion by H. L. Briggs and L. M. Hovey. The second film, "Everyday Miracles", was loaned by the Canadian General Electric. Refreshments were served in the Snack Room. (27)

—From Month To Month—

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

An Appeal to Engineers and Scientists

The investments which have been made and will be made by the United States and Canada in the reconstruction of Europe can be taken as an indication that those we have elected to direct our two countries' affairs must really believe we have a stake in the future of the old world.

Our governments are pouring out our resources to confine the extension of the "iron curtain" and it surely behooves the individual citizen, if he believes in the system we are seeking to protect, to look for ways in which he can be of use. During the month of February, Canadians were asked to contribute ten million dollars to the Canadian appeal for Children and they have responded generously. An aspect of this campaign which was not too generally publicized was that the appeal for children had been combined with the drive for basic educational, scientific and cultural supplies which had been planned by the Canadian Council for Reconstruction through UNESCO. A portion of the funds raised will be used to supply equipment for educational and scientific institutions in the ravaged countries of Europe.

These funds will help in meeting the most urgent needs by the purchase and immediate despatch of such basic school supplies as pencils, paper, text books, etc. The Receiving depots which were set up by the Canadian Council are to remain in operation for some considerable time for receipt of donations in kind. The schools and universities of the countries in Europe that were occupied by the enemy are desperately in need of the most elementary supplies. Most of the centres of learning were destroyed and most of the scientific instruments were rendered useless. Libraries were wrecked completely and the young would-be research worker has no reference books or even text books from which to study.

Engineering students who perhaps are needed more than any others in the reconstruction of Europe are being hampered by the lack of draughting sets, electrical and optical instruments, all types of scientific equipment and materials and of text books. While many of the older professional engineers were "liquidated" during the war, so that their knowledge and experience would not be available to help their countries afterwards, the younger men had been almost stopped too in efforts to learn what they can about this practical and essential profession.

The Canadian Council for Reconstruction through UNESCO advises that our members can assist primarily by giving what financial aid they can and also very effectively by donations of books, technical journals, or equipment for which they no longer have need.

Please write, listing what you can give, to the Canadian Council for Reconstruction through UNESCO, at 139½ Sparks Street, Ottawa; you will be advised where to address your actual contribution to the nearest collection point.

The Fiftieth Birthday
of an
Outstanding Canadian Organization

On January 15 of this year the Shawinigan Water and Power Company celebrated the completion of its first 50 years of operations. In a brief commemorative statement, James Wilson, president of the company, noted the phenomenal expansion of the organization from the original 10,000-hp. installation at Shawinigan Falls to the 1,250,000-hp. system, with upwards of 3,800 permanent employees now serving some 225,000 industrial, commercial, domestic and farm customers in the Province of Quebec. Shawinigan interests now include, in addition to the hydro-electric system, a wide range of chemical and plastic products, research facilities probably as extensive as any outside the government research establishments, and an engineering company which not only handles the programmes of the parent company but does considerable outside work on a consulting or contracting basis.

The Shawinigan organization has long been a strong supporter of the Institute, its executives and engineers having devoted a great deal of valuable time to the duties of Institute offices from President down through Council and Committees to the work of the Montreal Branch. The *Journal* takes particular pleasure in extending the warmest congratulations to President Wilson and the entire Shawinigan organization.

Town Planners Organize

Word has been received at Headquarters that the Institute of Professional Town Planners has been organized in Toronto with T. D. Le May, president; John Kitchen, vice-president, and E. Faludi, secretary-treasurer.

The purpose of the organization is "to promote the science and art of town and community planning, and the knowledge of the members in the practice of the profession of town and community planning ".

There are two classes of membership—Honorary Members and Members. The annual fee is $25.00. Membership is open to any one " who shall have been engaged for a period of five years in the active and responsible practice of some phase of community planning or who shall satisfy the council by examination or otherwise that by reason of his professional knowledge he is a person capable of promoting the objects of the Institute ".

The Washington Award

The Washington Award commission, representing five of the major U.S. engineering societies, has announced the selection of Senator Ralph E. Flanders as the recipient of the 1948 award.

The Washington Award is made annually to an outstanding engineer in the United States who has ably served human needs, and was established to encourage among engineers a broader understanding of their opportunities for public usefulness. Herbert Hoover received the first award in 1919, to head a list which includes Ambrose Swasey, Henry Ford, Arthur Compton, Vannevar Bush, Charles Kettering, and others equally outstanding.

Senator Flanders is a mechanical engineer, president of Jones and Lamson Machine Company. He has long been interested in economic and social problems and has written many articles on the subject. The citation of the award reads, " For high technical skill in perfecting the tools of industry and for distinguished service in the field of human relationships ".

Nuclear Research at the Universities

Queen's University has announced the purchase from Canadian General Electric Company of a 70 million electron-volt synchrotron to enable this university to assume a much more effective role in the Canadian programme of Nuclear Research. Only one other large machine of this type is known to be in operation in the world—at the G.E. Research Laboratory in Schenectady.

Technically, the machine is defined as a device for producing extremely high-energy X-rays. It consists essentially of a large electro magnet weighing about eight tons, which produces a magnetic field to guide the electrons around a circular path inside a highly evacuated hollow glass ring. An electrical circuit is adjusted to give the electrons a push each time they go around. Within one two-hundredth of a second, the electrons have acquired an energy corresponding to 70 million volts. Their path is then altered slightly so that they strike a small piece of metal inside the glass ring and extremely penetrating x-rays are produced. These x-rays are many times more powerful than those of more familiar radio-active substances such as radium.

Through the use of this synchrotron, Canadian scientists should be able to enhance their contribution to the research being undertaken on a broad front by nuclear scientists around the world.

Canadian Welding Bureau Lists Qualified Firms

City of Toronto Co-operates

The Canadian Welding Bureau, a division of the Canadian Standards Association, has released its first list of some fifty fabricators and contractors who have met the required conditions of C.S.A. Qualification Code W. 47 and are capable of undertaking work specified to the requirements of Code W. 59—" The Welding of Bridges, Buildings and Machinery ".

Concurrently with the publication of the list, the City of Toronto has approved of structural welding within the city limits if undertaken to the standards of Code W. 59 and by a firm approved by the Bureau. For the Bureau's approval a firm must demonstrate that they have engineering personnel competent to design welded structures and to specify and control the welding procedures used, and supervisory personnel capable of directing these procedures. In addition, proper standards must be submitted and followed and all welding undertaken with suitable equipment and by certified operators.

The Bureau's approvals cover three classifications:

(a) Structural fabrication such as bridges, buildings, handling equipment, containers and machinery which are structurally stressed and where failure might constitute a danger.

(b) Non-structural welding where failure is less hazardous.

(c) Partial or limited approval for recognition of the large group of small shops which cannot meet the engineering requirements of Code W. 47. Such approval requires full competency with respect to operators, supervisors and equipment but not of engineering personnel.

The presently released list is valid until June 30th, 1948, and is subject to cancellation with respect to individual fabricators or contractors at any time. For confirmation as to the approval of any organization reference may be made to the Bureau at 22 College Street, Toronto.

Pulp and Paper Lectures to be Held at McGill

The Pulp and Paper Research Institute of Canada has announced a series of nine illustrated lectures designed to outline the scope of the technical work of the pulp and paper industry in Canada. The lectures are to be given in the lecture theatre of McGill's chemistry building at 5 p.m. every Tuesday beginning January 20, 1948.

Some of the speakers who will contribute to the series will be S. F. Mitchell, O.B.E., M.E.I.C, manager of the Canadian Pulp and Paper Association; H. O. Keay, M.E.I.C., manager of the research laboratories, Consolidated Paper Corporation; Dr. W. Boyd Campbell, director of technical research of the Institute; J. S. Hart, research associate of the Institute; Douglas Jones, Affiliate E.I.C., technical section, Canadian Pulp and Paper Association.

U.S. Office Register for Patent Owners

Provision has recently been made by the United States Patent Office whereby the owners of unexpired U.S. Patents are assisted in establishing contacts with manufacturers.

If the patent owner is prepared to grant licenses under his patent to prospective manufacturers, on reasonable terms, he can have his patent entered in a Patent Register at the Patent Office and it will remain there for the life of the patent unless withdrawn, at any time, by the owner or deleted upon evidence of lack of good faith on his part.

Entry of the patent upon the Register will be published in the Official Gazette of the Patent Office and periodic lists of patents, classified according to the various subject matter, will be sent to trade publications dealing with the various kinds of subject matter for publication. Manufacturers making enquiry at the Patent Office for assistance in finding new products for manufacture, will be furnished with lists of patents on the Register relating to the subject matter in which they are interested and enquiries by manufacturers with respect to specific patents on the Register will be referred to patent owners.

The patent owner, when requesting entry on the Register, must state he will assign his patent or grant licenses on reasonable terms, but the specific terms used need not be stated although they can be if desired.

There is no charge by the Patent Office for the above service.

Meetings of Other Societies

The Annual Meeting of the **Society for Experimental Stress Analysis** will be held at The Roosevelt Hotel, Pittsburgh, Penn., on May 27, 28, 29, 1948.

Inquiries should be addressed to the Society for Experimental Stress Analysis, P.O. Box 168, Cambridge 39, Massachusetts.

The "All Varsity Alumni Night" is planned by the **Alumni Federation of University of Toronto** for March 12 this year. Varsity friends will be gathering in Hart House once again for another grand evening of dancing and campus entertainment.

Mail orders for tickets will be accepted by the Alumni Federation Office at 42 St. George Street as long as tickets remain available.

The Nineteenth Congress of the **International Federation for Housing and Town Planning** will take place in Zurich, Switzerland, during the week, 20-26 June, 1948. All meetings will be in the beautiful, modern Kongresshaus.

Address enquiries to the Secretary, International Federation for Housing and Town Planning, 13 Suffolk Street, Haymarket, London, S.W. 1, England.

The American Society of Tool Engineers has announced developments in the Sixth Annual A.S.T.E. Industrial Exposition to be held in Cleveland, March 15-19, 1948, coincident to the Society's Sixteenth Annual Meeting.

Should information be required on the Exposition, or details regarding the exhibitors, please write to: Jno. M. Cannon, Director of Public Relations, American Society of Tool Engineers, 1666 Penobscot Building, Detroit 26, Michigan.

Meeting of Council

Minutes of a meeting of the Council of the Institute held at Headquarters on Saturday, December 20th, 1947, at eleven o'clock a.m.

Present

President L. F. Grant in the chair; Vice-President R. S. Eadie, Councillors J. A. Beauchemin, K. G. Cameron, R. C. Flitton, C. E. Gelinas, C. A. Peachey, of Montreal, and C. F. Morrison of Toronto; Treasurer L. C. Jacobs, and Assistant General Secretary W. D. Laird.

Death of Past-President S. G. Porter

Council noted with sincere regret the death of Past-President S. G. Porter, of Calgary, which had taken place in that city on November 30th, after a lengthy illness. The president reported that he had written to Mrs. Porter, and on the motion of Mr. Peachey, seconded by Mr. Morrison, it was unanimously resolved that the following resolution be recorded in the minutes and that a copy be forwarded to Mrs. Porter:

> "This Council learns with deep regret of the death in Calgary on November 30th, 1947, of Sam Graham Porter, president of the Institute for the year 1931. Mr. Porter was a most capable executive engineer whose experience in the field of conservation and irrigation enabled him to make an invaluable contribution to the advancement of Canada.
>
> His interest in the welfare of the community was so extensive that his passing will surely be a particular loss to his numerous friends and acquaintances in Calgary. To those, and particularly to Mrs. Porter and his immediate family, this Council extends its sympathy."

In view of the fact that the minutes of the November meeting had only just been circulated, it was decided to withhold confirmation of those minutes until the January meeting.

Report of Finance Committee

PERRY CASE

Mr. Eadie reviewed the Institute's interest and association with the Quebec Corporation in this case, pointing out that at different times the Institute had proposed financial assistance to the Corporation in the costs of defending Mr. Perry. A joint committee had been established to aid in working out the defence, and after the first trial had been lost, the Institute's panel of the committee had pressed particularly for an appeal which had been agreed upon. Subsequently the panel had recommended that the Institute pay a certain portion of the cost to the Corporation of Professional Engineers of Quebec. The Finance Committee now recommended that the proposal of the panel be approved and that the Institute pay to the Corporation the sum of $1,000.00. Upon the motion of Mr. Eadie, seconded by Mr. Cameron, it was unanimously resolved that the Finance Committee's recommendation be approved.

ONTARIO DIVISION REQUEST FOR GRANT

A request was presented from the Ontario Division for a grant of $50.00 towards operating expenses for the year 1947 and $200.00 for the year 1948. On the recommendation of the Finance Committee it was unanimously resolved that Headquarters would pay the expenses of the Division up to $50.00 for 1947, and approximately $200.00 for 1948, such money to be given to the Division in the form of an accountable advance.

CANADIAN COMMITTEE ON STUDENT GUIDANCE

A request from the Canadian Committee on Student Guidance in Science and Engineering for a grant of $25.00 towards the operating expenses for the latter half of 1947 and for the year 1948 had been considered by the Finance Committee. A similar contribution was being made by the Canadian Institute of Mining and Metallurgy and the Chemical Institute of Canada, the other two organizations represented on this joint committee.

The president explained the tie-in between this committee and the Institute's Committee on the Young Engineer, and, following some discussion, on the recommendation of the Finance Committee, it was unanimously agreed that the grant be approved.

Committee on Professional Interests

ALBERTA AGREEMENT

A communication had been received from the chairman of the joint finance committee in Alberta with which he forwarded a copy of the minutes of a meeting of the joint finance committee held on October 14th and which contained three resolutions which would be presented to the Council of the Association of Professional Engineers of Alberta at a meeting to be held early in December. If the Council of the Association accepts these resolutions appropriate representations will be forwarded to the Council of the Institute.

The Committee on Professional Interests had studied these proposals, in consultation with the general secretary who had made a special trip to Calgary in August to discuss these matters with the officers of the Association. On instructions of the committee, the general secretary had written to the chairman of the joint finance committee agreeing in general to the proposals but making certain pertinent recommendations. As soon as these changes have been agreed upon by the Councils of the Institute and the Association the necessary amendments to the agreement can be drawn up and signed by the officers of each organization.

The action of the Committee on Professional Interests as outlined above was approved unanimously.

CANADIAN PARLIAMENTARY AND SCIENTIFIC COMMITTEE

This proposal had been referred by Council to the Committee on Professional Interests for consideration and recommendation and the committee now reports as follows:

> "Your committee has discussed at considerable length the proposal which originally emanated from the Canadian Association of Scientific Workers regarding the setting up of a Parliamentary and Scientific Committee and wishes to recommend that at the present time the Institute take no action in supporting this proposal in view of the fact that it cannot see what objective is to be achieved and because of the fact that the government has at its disposal a National Research Council which is thoroughly competent to deal with matters of a scientific nature and report to the proper authorities when required."

This report was accepted and approved unanimously.

BUDGET ITEM 180E

The following report from the Committee on Professional Interests was approved unanimously and it was agreed that the Minister of Finance should be communicated with immediately:

> "Having in view the recent action by the Dominion government concerning imports from the United States it was thought fitting that the matter of Budget Item 180e be re-opened and that the government be further pressed to have the taxes on engineering plans re-imposed, all as dealt with in our correspondence with the Minister of Finance."

Toronto Branch Councillor

A letter was presented from Mr. S. R. Frost advising that as he was leaving Toronto in order to take up engineering work in New Brunswick he wished to resign as councillor representing the Toronto Branch. Under the circumstances, it was unanimously agreed that Mr. Frost's resignation as councillor be accepted.

On the motion of Mr. Jacobs, seconded by Mr. Beauchemin, on the recommendation of the Toronto Branch executive, it was unanimously resolved that Mr. E. A. Cross be appointed councillor to replace Mr. Frost until the next annual meeting.

On the motion of Mr. Morrison, seconded by Mr. Peachey, on the recommendation of the Toronto Branch executive, it was unanimously resolved that Mr. W. S. Wilson be appointed councillor for the year 1948 to complete Mr. Frost's term of office, this appointment to become effective at the adjourned annual meeting in Banff when the 1948 officers will be inducted.

Annual General Meeting—1948

On the motion of Mr. Eadie, seconded by Mr. Peachey, it was unanimously resolved that the annual general meeting be convened at Headquarters in Montreal on Thursday, January 22nd, 1948, for the transaction of the necessary formal business, including the appointment of scrutineers to canvass the officers' ballot. It was also unanimously agreed that the meeting should be adjourned to reconvene at the Banff Springs Hotel, Banff, Alberta, at eight o'clock p.m., on Tuesday, June 1st, 1948.

The president explained that the present plans were to hold the president's dinner on the evening of Monday, May 31st, the annual Council meeting on Tuesday, June 1st, and the annual business meeting on the evening of Tuesday, June 1st. In this way, Wednesday, Thursday and Friday would be left free for professional sessions and trips. It was pointed out that the time of the adjourned annual meeting could be changed if found necessary.

Students and Juniors Prizes

Mr. Laird read the recommendations received from the chairmen of the examiners for the prizes to Students and Juniors for the prize year 1946-1947. These were approved as follows:

H. N. Ruttan Prize (Western Provinces) to Raymond Pillman, S.E.I.C., for his paper: "The Accuracy of a Two-Minute Transit". John Galbraith Prize (Province of Ontario) to R. N. E. Haughton, S.E.I.C., for his paper: "Effects of Lightning on Buried Telephone Cable". Martin Murphy Prize (Maritime Provinces) to Norman A. Parlee, JR.E.I.C., for his paper: "Utilization of Sydney Slag for Engineering and Agriculture".

In the case of the Phelps Johnson Prize (Province of Quebec—English), Mr. Eadie had recommended that as no award of this prize had been made last year, two awards be made this year.

Mr. Layne, chairman of the examiners for the Ernest Marceau Prize (Province of Quebec—French), inquired as to whether or not it would be in order to make two awards this year as no award of this prize had been made last year.

Discussion followed and it was the general opinion that it would be unwise to award more than one of each prize in any one year. Accordingly, on the motion of Mr. Morrison, seconded by Mr. Jacobs, it was unanimously resolved that only one of each prize should be awarded each year.

Special Awards To Undergraduates

The president reminded Council that at the June meeting a recommendation from the Committee on the Young Engineer that the Institute make special awards to the top five or ten per cent of the graduate classes in Canadian universities had been approved in principle and the committee had been asked to study the matter further and submit details.

A letter was presented from Dr. Langley, chairman of the committee, submitting definite quotations for watch charms or fobs in nickel, gold-filled or solid gold.

Considerable discussion took place, particularly as to the form of badge to be selected and as to whether it should be awarded to the first five or ten per cent of the graduating classes. In view of the diversity of opinions expressed, and of the importance of the decision to be made, it was agreed that the matter should be brought up for consideration at the Toronto meeting of Council on January 24th, and that in the meantime Dr. Langley's letter be circulated to all members of Council so that they may be informed and ready to vote at the January meeting.

Life Memberships

Mr. Laird presented a list of members who, under the terms of Section 26 of the by-laws, are now eligible for life membership. Accordingly, it was unanimously resolved that life membership be conferred upon the following members as of January 1st, 1948:

Arsene Babin, Baie Comeau, Que.; J. Boyd Baird, St. John's, Newfoundand; F. Jno. Bell, Toronto, Ont.; W. D. Black, Hamilton, Ont; Wm. R. Bonnycastle, Vancouver, BC.; Ernest P. Bowman, Guelph, Ont.; Frederick E. Bronson, Ottawa, Ont.; Wm. F. McK. Bryce, Ottawa, Ont; James S. Cameron, Montreal, Que.; Edward G. Carty, Ottawa, Ont.; Richard E. Chadwick, Montreal, Que.; Ashley A. Colter, Fredericton, N.B.; Geo. W. Coward, Argentina, S.A.; Arthur Dick, Montreal, Que.; John W. Doty, New York, N.Y.; John N. Finlayson, Vancouver, B.C.; C. Harry Fox, Winnipeg, Man.; R. DeL. French, Montreal, Que.; Augustin Frigon, Montreal, Que.; LeRoy Fraser Grant, Kingston, Ont.; Philip W. Greene, New York, N.Y.; William B. Greig, Vancouver, B.C.; Daniel Hillman, Montreal, Que.; Thomas H. Hogg, Toronto, Ont.; Frederick C. Jewett, Ottawa, Ont.; Edward B. Jost, Ottawa, Ont.; Leslie G. Jost, Los Angeles, Calif.; J. Colin Kemp, Montreal, Que.; Everett C. Kirkpatrick, Montreal, Que.; Harold R. Little, Montreal, Que.; Hugh A. Lumsden, Hamilton, Ont.; D. H. McDougall, Montreal, Que.; George K. McDougall, Montreal, Que.; Oliver T. Macklem, Kingston, Ont.; A. L. Mieville, London, England; Wm. Alex. Murray, Montreal, Que.; Arthur Benj. Normandin, Quebec, Que.; Bernard E. Norrish, Montreal, Que.; Fred. W. Paulin, Hamilton, Ont.; Thomas E. Price, Winnipeg, Man.; Herbert Wm. Read, Sackville, N.B.; Arthur G. Riddell, Hamilton, Ont.; Charles A. Robb, Montreal, Que.; Alexander K. Robertson, Kaleden, B.C.; Benjamin Russell, Edmonton, Alta.; Max V. Sauer, Montreal, Que.; D. Neville Sharpe, Winnipeg, Man.; James N. Stanley, York Mills, Ont.; Homer W. Sutcliffe, New Liskeard, Ont.; Harry W. Tate, Toronto, Ont.; Clarence P. Van Norman, Toronto, Ont.; Alfred A. Wickenden, Montreal, Que.; R. S. L. Wilson, Edmonton, Alta.; John K. Wyman, Montreal, Que.; Alexander A. Young, Victoria, B.C.; H. R. Younger, Calgary, Alta.

The president informed Council that he and Vice-President Eadie, had had dinner with the general secretary on the previous evening, and he was glad to be able to report that Dr. Wright's condition showed a decided improvement. Dr. Wright was planning to be back at the office for at least part of every day, starting at the first of the year.

It was noted that the next meeting of Council would be held in Toronto on Saturday, January 24th, 1948. On that evening the Toronto Branch is holding its Annual Ladies Night and has extended a cordial invitation to all councillors and their ladies to join with them on that occasion.

The Council rose at twelve forty-five p.m.

W. D. LAIRD,
Assistant General Secretary.

Elections and Transfers

Members

Durdan, Frederick Smith, B.Sc., (Civil), Queen's, field engr., Carborundum Co., Niagara Falls, N.Y.

Forget, Jean Maurice, B.A.Sc., C.E., Ecole Poly., engr., special trackwork, Montreal Tramways Co., Montreal, Que.

ERRATUM

On page 44 of the January *Journal* in the list of new Student members, the following heading appeared:

Students at Carleton College (Ottawa University).

This heading should have read:

Students at Carleton College, Ottawa.

They are entirely separate organizations and were listed as one in error. Our apologies are offered to all concerned.

PERSONALS

News of the Personal Activities of Members of the Institute

Dr. C. R. Young, M.E.I.C., dean of the Faculty of Applied Science and Engineering of the University of Toronto, was awarded the Professional Engineer's Medal at the Annual Meeting of the Association of Professional Engineers of Ontario, in January. He is the second recipient of the medal.

G. H. Ferguson, M.E.I.C., chief of the public health engineering division, Department of National Health and Welfare, has retired after 24 years in the public service. He had been called to Ottawa in 1923 as engineer in charge of developing public health engineering policies for the Federal Department of Health, now the Department of Health and Welfare. There he worked on the national building code, with special attention to the work of the committee on health and sanitation of which he was chairman. During World War II he was actively engaged on public health engineering projects for the armed forces, prisoner of war camps and industrial developments.

Mr. Ferguson, a past-councillor of the Institute, is a graduate of the University of Toronto, and the recipient in World War I, of the Military Cross for gallantry while serving overseas with the R.C.E. Prior to 1923, Mr. Ferguson had been associated successively with the H.E.P.C. of Ontario, the Commission of Conservation of Canada, and the Toronto Transportation Commission.

G. L. Macpherson, M.E.I.C., has been elected president for 1948 of the Association of Professional Engineers of the Province of Ontario. Mr. Macpherson, who is manager of the engineering and development division of Imperial Oil Limited, has been a member of the Association since 1938 and a Councillor for the past four years. During 1947 he held the office of first vice-president. He is also a member of the council of the Engineering Institute,, representing the Sarnia Branch. He is a University of Toronto graduate, and has been associated with Imperial Oil Limited since 1923.

C. M. McKergow, M.E.I.C., was appointed to the standing of emeritus professor by the board of governors of McGill University recently. Professor McKergow, who retired as professor of mechanical engineering in 1947, started his career as a demonstrator in civil engineering in 1903. He was made an associate professor in 1912, and was awarded the Thomas Workman professorship and the chairmanship of the department of mechanical engineering in 1921. He has been active in the Montreal Branch of the Institute, representing it on the Council from 1923 to 1928.

Dr. P. L. Pratley, M.E.I.C., Montreal consulting engineer, has been appointed to study the bridging needs of the city of Edmonton, Alta. Dr. Pratley, who designed the Lion's Gate Bridge over the First Narrows in Vancouver and the Jacques Cartier Bridge over the St. Lawrence, is a consulting engineer for the Dominion Government, and is currently working on the Peace River suspension bridge at Fort St. John, B.C. A past vice-president of the Institute, Dr. Pratley is the Institute representative on the Canadian Standards Association main committee.

Alex Wilson, M.E.I.C., electrical and mechanical engineer, has announced his resignation as manager of the Montreal Office and as a member of the staff of the Canadian Comstock Company Limited. He will resume his former practice as a consulting engineer in Montreal.

C. E. Sisson, M.E.I.C., works engineer of Canadian General Electric Company's Davenport Works recently retired after

G. H. Ferguson, M.E.I.C.

C. E. Sisson, M.E.I.C.

G. L. Macpherson, M.E.I.C.

more than 45 years engineering experience. He had been responsible, during his career, for the design of many of the outstanding transformer installations in Canada.

He was graduated in electrical engineering from the University of Toronto in 1905, and went to the Peterborough Works of C.G.E. He helped to establish and to foster the company's " Test " Course with its industry-wide contribution to the training of young engineers. He is a past-councillor of the Association of Professional Engineers of Ontario, a fellow of the American Institute of Electrical Engineers, and Ontario vice-president of the Engineering Institute.

J. L. Shearer, M.E.I.C., has been elected chairman of the Ottawa Branch of the Institute. He is engineer to the commission, Ottawa Suburban Roads Commission. He is a native of Ottawa and a graduate of Queen's University, Kingston, Ont. From 1928 until 1933 he held various positions in western Canada and on the Pacific coast in connection with municipal engineering construction work. In 1933 he returned to Ottawa and was for two years in charge of construction of large relief sewers being built by the City of Ottawa engineering department. Following this he was employed by N. B. MacRostie, M.E.I.C., civil engineer of Ottawa, in drawing up reports on flood conditions in southern Ontario. After short intervals with Donald-Hunt Limited, Montreal, and the Aluminum Company of Canada Limited, Arvida, Que., he was for two years on the staff of the Ottawa Division of the Ontario Department of Highways. He then was employed by the assessment department of the City of Ottawa, until his appointment to his present position in 1945.

S. R. Frost, M.E.I.C., of Toronto, Ont., is moving to Moncton, N.B., where he is taking a position as manager and director of engineering for a new company known as Atlantic Chemicals Company Limited. Mr. Frost had not completed the term as Councillor of the Institute representing the Toronto Branch. He is past-president of the Association of Professional Engineers of Ontario. Mr. Frost was previously with North American Cyanamid Limited, Toronto, Ont., from which firm he was on loan during the war years to the Wartime Bureau of Technical Personnel, Toronto, and the Wartime Prices and Trade Board, Montreal.

O. W. Titus, M.E.I.C., has been appointed vice-president of English Electrical Company of Canada Limited. He has been twenty-five years in the electrical industry in various sales and engineering capacities—the most recent being chief engineer of Canada Wire and Cable Company Limited, Toronto. He is a graduate of the University of Toronto.

R. K. Wills, M.E.I.C., is now assistant deputy minister of the Department of Public Works of New Brunswick, Fredericton, N.B. He had been district highway engineer for the department, located at Chatham, N.B.

W. E. Brown, M.E.I.C., chairman of the Hamilton Branch of the Institute for the year 1948, was born at Bristol, England. He is a graduate in civil engineering of the University of Toronto, class of 1932. For the first year after graduation he was engaged in highway construction. The following year he joined the staff of B. Greening Wire Company Limited, Hamilton, spending some time in the plant and later being transferred to the engineering department. He was later transferred to his present position as wire rope engineer for the company. Mr. Brown was secretary-treasurer of the Hamilton Branch from 1943 to 1945, and he represented the Institute on the junior section of the Committee on Professional Training of the Engineers' Council for Professional Development for some time.

J. L. Shearer, M.E.I.C.

S. R. Frost, M.E.I.C.

O. W. Titus, M.E.I.C.

W. C. Risley, M.E.I.C., chairman of the Halifax Branch of the Institute for 1948, is president of Rico Engineering Limited of that city. Born at Sydney, N.S., he studied at Acadia University and Nova Scotia Technical College, receiving his degree in mechanical engineering in 1932. He followed the engineering apprentice course of Imperial Oil Company, and was appointed sales engineer at Halifax in 1934. He joined Eastern Engineering Company in the same city in 1937 and the next year operated his own organization, Heating Services Company, there. From 1939 to 1941 he was with Dominion Steel and Coal Company at Sydney, N.S., and in 1941 he went to Ottawa to be a heating engineer (civil service) for the R.C.A.F. He returned to Halifax as a heating officer for the R.C.A.F. and was named mechanical officer for the Eastern Air Command R.C.A.F. in 1944 with the rank of flight lieutenant. He joined Rico Engineering in 1946.

J. M. Wyllie, M.E.I.C., has been elected chairman of the Border Cities Branch of the Institute. He was born at Kincardine, Ont., and attended Windsor Collegiate Institute. He received his training and experience in structural engineering at the Canadian Bridge Company Limited, Walkerville, Ont., spending five years as an apprentice in the draughting department, three years as a structural steel draughtsman, three as a structural steel designer and estimator. He became contracting engineer in 1940. His present position is senior estimator in the structural steel contract department of the Company.

R. H. Wallace, M.E.I.C. the new chairman of the Cornwall Branch of the Institute, is plant superintendent at Cardinal, Ont., for Canada Starch Company Limited. Coming from Staten Island, New York, he attended Royal Military College, Kingston, and McGill University, Montreal, receiving from the latter in 1926 the degree of B.Sc. in mechanical engineering. From 1926 he was with the Laurentide Paper Company, Grand'Mère, Que., and with its successor, the Canada Power and Paper Corporation, until 1932. Before leaving the company he was superintendent of the control department of the Belgo division at Shawinigan Falls, Que. He then joined the staff of the Canada Starch Company, Cardinal, Ont., becoming plant engineer in 1934. He went overseas in World War II with the First Canadian Survey Regiment, R.C.E., returning with the rank of Major, and having been awarded the M.B.E. decoration. He returned to Canada Starch, where his present position is plant superintendent at Cardinal, Ont.

Charles W. Crossland, M.E.I.C., director of development (A), R.C.A.F. Headquarters, has been promoted to the rank of Group Captain. He is a graduate of McGill University, Montreal, and of Massachusetts Institute of Technology. After obtaining an M.Sc. degree, from the latter in 1932, he spent a few years in England with aircraft manufacturing firms. He returned to Canada and became assistant engineer in the aeronautical branch of the department of National Defence at Ottawa. He joined the R.C.A.F. in 1940.

Jean Bastien, M.E.I.C., is district engineer for the Provincial Department of Roads at Quebec City. He was formerly engineer in the Montreal Division. He has been with the Department since 1933, when he graduated from Ecole Polytechnique, Montreal.

R. W. Emery, M.E.I.C., has left his position as resident engineer of the Brompton Pulp and Paper Company, Red Rock, Ont., to serve as project engineer, supervising design and construction of a new sulphate mill and bleach plant at Sault Ste. Marie, Ont., for the Abitibi Power and Paper Company, Limited.

A. W. Ellson Fawkes, M.E.I.C., resigned from the position of city engineer for the city of Moose Jaw, Sask., on December 31, 1947, and is now engaged in private practice in Haney, B.C. He had gone to Moose Jaw in 1938, following service for the Dominion Government as representative for highways and level crossings in the province of Saskatchewan, and municipal engineering service in cities of Ontario and Western Canada.

H. H. Schwartz, M.E.I.C., has entered the consulting field in electrical, electronic and acoustic equipment. He has established offices in Montreal to undertake design and construction of equipment, and has announced the inauguration of a special service for medical electronic instrumentation. Mr. Schwartz received the degree of bachelor of engineering at McGill University in 1938, and that of S.M. (electrical), in 1942, at Massachusetts Institute of Technology, Cambridge.

Major H. Goodfellow, M.E.I.C., has now relinquished his appointment at R.C.E.M.E. Prairie Command, and has recently been appointed deputy assistant adjutant general in the Directorate of Army personnel. His duties with the Directorate include the administration of R.C.E.M.E. personnel.

C. C. Hay, M.E.I.C., is president and general manager of Hi-Way Refineries Limited, Regina, Sask. He has been with the firm since 1941, when he joined as manager. He had previously been a member of the firm of Gibbs Bros. and Hay Limited, contractors, in Lumsden, Sask.

P. J. Croft, M.E.I.C., has been appointed eastern district engineer of Canada Wire and Cable Company Limited, Mr. Croft's headquarters will be in Montreal, to serve Eastern Canada. A graduate of Central Polytechnical Institute, London, England, he spent seven years with Canadian Westinghouse Company Limited, and several as electrical engineer for the Power Corporation of Canada. He joined the electrical engineering staff of Canada Wire and Cable Company Limited in 1945.

G. V. Roney, M.E.I.C., is no longer general manager of Farand and Delorme division of United Steel Corporation, but is president of Leeds Bridge and Iron Works Limited of Montreal and Gananoque, Ont. He is also president of Montreal Metalworked Products Limited. He had joined Farand and Delorme Limited in 1935, after service with bridge and steel companies in the U.S.A. and in Canada.

L. B. Stirling, M.E.I.C., is appointed assistant general superintendent of the operating division of Shawinigan Water and Power Company, Shawinigan Falls, Que. He also retains his previous title of superintendent of the generating division of the company there.

G. G. Wanless, M.E.I.C., took employment in January with the chemical division of the Standard Oil Development Company's Esso Laboratories at Elizabeth, N. J., He had been at Sarnia, Ont., in the research and development department of Polymer Corporation. At Sarnia also, he had been for several years with the St. Clair Processing Corporation.

Lucien Allaire, M.E.I.C., has successfully completed an extension course in municipal public works administration, through the Institute for Training in Municipal Administration conducted by the International City Managers Association of Chicago. Mr. Allaire is assistant engineer for the west division of the Waterworks and Sewerage Department, City of Montreal.

T. Linsey Crossley, M.E.I.C., has been appointed technical supervisor of Champion Paper Mills, Toronto. He is special lecturer on pulp and paper at the University of Toronto. During the war he was employed by Defence Industries Limited, Nitro, Que. Since then he has been on the staffs of the Rehabilitation Institute, Toronto, and the Department of Chemistry, Ontario Agricultural College, Guelph, Ont.

G. G. M. Eastwood, M.E.I.C., has been appointed secretary-treasurer of the Cornwall Branch of the Institute. A native of Cornwall, he studied engineering at the University of Toronto, completing his course in 1937. He joined Canadian Westinghouse Co. Ltd. following the engineers apprenticeship course in 1940, and working as a draughtsman on switchboard layout until 1942. Then for several years he did technical liaison work between the engineering and sales departments. In 1945 he joined Courtauld's (Canada) Limited, at Cornwall, where he is a section engineer.

Max Gershfield, M.E.I.C., is in Chicago, Illinois, employed by M. W. Kellog Company, refinery contractors of New York City. Mr. Gershfield had been in private practice in Winnipeg for some months since leaving War Assets Corporation in Regina, Sask., where he was senior plant clearance engineer.

T. Hermanowicz, M.E.I.C., has taken a new position as metallurgist with Vancouver Engineering Works Limited, Vancouver, B. C. He had previously been with Canadian Liquid Air Company Limited, Montreal, after leaving Sorel Industries Limited, Sorel, Que., where he was chief metallurgist.

Dr. B. B. Hillary, M.E.I.C., is secretary-treasurer of the Sarnia Branch of the Institute. Dr. Hillary is from Vancouver. He attended University of British Columbia, receiving the degrees of B.A. and M.A. in 1934 and 1936. At the University of Toronto he received the degree of Ph.D. in 1939 and remained there until 1941 to do research, teaching and consulting work in chemistry, and engineering studies. He joined Polymer Corporation Limited, Sarnia, in 1942 as assistant engineer and did liaison work between the Rubber Reserve and Polymer during construction of the synthetic rubber plant, and was in charge of co-ordination of plans for the laboratory and other buildings. He went to Dow Chemical of Canada, Limited, in Sarnia, in 1943, as maintenance and process engineer, which position he still holds.

H. D. Keil, M.E.I.C., secretary-treasurer of the Border Cities Branch of the Institute, is planning and scheduling engineer for Canadian Industries Limited at Windsor, Ont. Mr. Keil is from Brooks, Sask., a graduate of University of British Columbia, class of 1937. He followed the engineering apprentice course of Canadian Westinghouse Company at Hamilton, Ont., and remained in that firm until 1940. He then joined Canadian Industries Limited at the Windsor Plant as an electrical engineer.

D. C. McCrady, M.E.I.C., is general foreman of the electrical department of the Steel Company of Canada Limited at Hamilton, Ont. He was formerly with Canadian General Electric Company Limited at Peterborough, Ont., as senior assistant engineer at the Industrial and Central Station of the engineering division.

H. T. Miard, M.E.I.C., the former secretary-treasurer of the Lethbridge Branch of the Institute, has accepted the appointment as assistant district engineer at Nelson, B. C., of the provincial Department of Public Works. In Lethbridge he was assistant district airway engineer for the Department of Transport.

L. A. Petrie, M.E.I.C., has taken a position at Montreal Cottons Limited, Valleyfield, Que. He was a senior engineer with the St. Clair Processing Corporation, Sarnia, Ont., for the past two years.

Rosaire Saintonge, M.E.I.C., has received the appointment as engineer for the city of Thetford Mines, Que. He was previously with Consolidated Paper Corporation Limited at Grand'Mere, Que., in charge of improvements in woods operations.

J. E. Thom, M.E.I.C., the former secretary-treasurer of the Kingston Branch of the Institute, was appointed in November last to the position of assistant superintendent in charge of construction at the University of Toronto. He had been resident engineer at the Kingston Works of Canadian Industries Limited.

I. M. Macdonald, Jr.E.I.C., is the new secretary-treasurer of the Hamilton Branch of the Institute. He is from Saltsprings, N. S., a graduate of Mount Allison University and of Nova Scotia Technical College, receiving the degree of B.Eng. from the latter in 1942. He followed the Canadian Westinghouse apprenticeship course from 1942-1944, and he is now a mechanical engineer for the company.

Paul-Emile Comtois, Jr.E.I.C., has been in French West Africa, since last November, where he is employed by the Aluminum Company of Canada at Bauxite du Midi, at Conakry.

A. B. Extence, Jr.E.I.C., is now employed by the California Refining Company at Perth Amboy, N.J., on economic analysis of the company's operations and proposed investments. In June last he graduated from the Massachusetts Institute of Technology with the degree of master of science in business administration.

John Gargas, Jr.E.I.C., has been in Montreal since January, where he is employed by the Northern Electric Company on power engineering work in the telephone service. He was previously a designing engineer at Dominion Engineering Works, Lachine.

B. F. Junkin, Jr.E.I.C., is in La Paz, Bolivia, where he is employed by the Bolivian Power Company. He was with the Bell Telephone Company in Montreal since his demobilization from the Canadian Navy in 1946.

William Shelson, Jr.E.I.C., is now employed as an assistant stress analyst in the structures section, Propeller Division, of Curtiss-Wright Corporation, Caldwell, N. J. He graduated from the University of Toronto in 1944, and served with the R.C.E.M.E. with the rank of lieutenant. He then studied at the department of engineering mechanics at Pennsylvania State College.

B. R. Lewis, S.E.I.C., who was with the Bell Telephone Company in Montreal, has gone to Toronto to work for the Alliance Tool and Motor Company.

Dr. J. B. Challies, M.E.I.C., vice-president and executive engineer of the Shawinigan Water and Power Company, Montreal, and 50th President (1938) of the Institute, receives from President E. M. Hastings of the American Society of Civil Engineers an honorary membership in that society. On the left is Dr. Arthur Surveyer, 37th president (1924-25) of the Institute, who proposed Dr. Challies for the award at the Annual Meeting of the A.S.C.E. in New York in January.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Dr. W. L. Malcolm, M.E.I.C.

Dr. William Lindsay Malcolm, M.E.I.C., director of the School of Civil Engineering of Cornell University, Ithica, New York, died in hospital on January 18, 1948, following a heart attack. He had been ill only a few days.

Dr. Malcolm was born in Mitchell, Ont., in 1884. In 1902 he entered Queen's University, and he graduate in 1905 in the faculty of Arts. He next enrolled in civil engineering in the School of Mining and took a B.Sc. degree in 1907. After a brief period as city engineer of Stratford, Ont., he returned to Queen's to lecture in mathematics and civil engineering. Later he dropped mathematics and devoted his time wholly to engineering, when he was able to lay the foundations of the courses in municipal engineering which he developed steadily throughout his period at Queen's. In 1908 he took the qualifying examinations for an Ontario Land Surveyor, and in 1912 those for a Dominion Land Surveyor.

The outbreak of war in 1914 found him a captain, and second in command of the Fifth Field Company, Canadian Engineers. He was promoted to the rank of major and just before the Second Canadian Division left England for France, was made officer commanding the 6th Field Company. He remained in that post until 1917, when he was promoted to lieutenant colonel and made C.R.E. of the Fifth Canadian Division which was then training in England. Later he acted as C.R.E. of the Fourth Division and of the Corps Troops.

On demobilization in 1919, he resumed his place at Queen's University as professor of municipal engineering. He taught, as well, part of the surveying and structural engineering. Throughout this period of nearly twenty years, he carried on a general practice of civil engineering and surveying as the vacation period permitted him. He went to Cornell about 1932, to follow graduate studies in the sanitary and structural groups. He secured an M.C.E. degree in 1935, and he continued toward a Ph.D. degree in sanitary engineering, which he gained in 1937. When funds were provided for erection of a modern sanitary engineering laboratory at Queen's, it was designed by Dr. Malcolm, and built in 1937, and is considered one of the most complete on the continent.

It was in 1938 that Dr. Malcolm accepted the appointment as director of the School of Civil Engineering at Cornell.

Dr. Malcolm showed the keenest interest in athletics of all kinds. Tennis and badminton, however, were his chief interests, and he was on two occasions on the team winning the Ontario Senior Doubles championship. He had been President of both the Ontario and Canadian Badminton Associations.

Dr. Malcolm joined the Engineering Institute in 1907 as a Student, transferred to Associate Member in 1909 and to Member in 1920. He attained Life Membership in 1947. He was active in the Kingston Branch, serving as its chairman in 1929 and representing it on the Council of the Institute in 1930. He also held membership in the American Society of Civil Engineers, the American Society of Engineering Education, the New York Sewage Works Association, the Canadian Institute of Sewage and Sanitation, American Water Works Association, Ontario Land Surveyors Association, and the Association of Professional Engineers of Ontario.

O. S. Finnie, M.E.I.C.

Oswald S. Finnie, M.E.I.C., a well-known figure in Canadian mining, and a former official of the Department of the Interior, died at his home in Ottawa, Ont., on January 2nd, 1948. He had been ill for several months.

He had taken an active part in mining enterprises from the Northwest Territories to Eastern Canada. He was born in Arnprior, Ont., in 1876. In 1897 he graduated with a B.Sc. degree from McGill University, and the next year did post-graduate work in geology, mineralogy, and underground surveying.

In 1898 he was appointed to the staff of the Department of the Interior under the late William Ogilvie, Commissioner of the Yukon Territory. The next year he went to Dawson City where he spent some years as mining recorder. Leaving the Government service in 1909, he engaged in private practice until he was prevailed upon to return to the Department in 1910 when. as inspecting engineer of mines, he was entrusted with supervision of field work in mining in the Western Provinces. He also aided in location of oil wells in the Turner Valley and Alberta oil deposits. He was appointed director of Northwest Territories Branch in 1920, with headquarters at Ottawa, and when this branch was later enlarged to administer Yukon affairs Mr. Finnie became a director of the district. He retired in 1931.

During December last, while confined to his bed, Mr. Finnie was presented with an honorary degree when McGill graduates met in Ottawa for their annual reunion. He had been at one time, president of the Ottawa Valley Graduates Society of McGill University.

Mr. Finnie joined the Institute in 1912 as an Associate Member, transferring to Member in 1921 and being granted Life Membership this year. He was active for some years in the Ottawa Branch, serving as chairman of the branch in 1923, and representing the Branch on the Council of the Institute in 1926. He was also a member of the Canadian Institute of Mining and Metallurgy.

Charles Talbot, M.E.I.C., former county engineer and road superintendent of Middlesex County, London, Ont., died in hospital in London on December 24, 1947. A 500-mile network of roads out of London and through Middlesex County is greatly attributable to his effort. Mr. Talbot held the combined post of engineer and road superintendent for 40 years, during which time, under his jurisdiction, the main roads now serving the county were built or adapted to automobile traffic.

He was born in North Dorchester Township, Ont., and came to London in 1899, where, following an early education at Strathroy Collegiate Institute, he entered the office of the Middlesex county engineer. He was appointed county engineer in 1901, succeeding his father to the position. Five years later he was given the added post of road superintendent. He retired in June 1940.

Mr. Talbot joined the Institute in 1921 as an Associate Member, transferring to Member in 1940, and being awarded Life Membership in 1942. Mr. Talbot was active as a member of the Woodmen of the World. He held all offices of the local branch.

J. B. Macphail, M.E.I.C., of the Shawinigan Engineering Company, Montreal, died on December 22, 1947, at his home in Montreal. *The Engineering Journal* has thereby lost a most co-operative member of the Publication Committee. To Mr. Macphail that committee had expressed appreciation in the course of the last year for the excellent work he had done in reviewing papers submitted for publication, and for valuable suggestions of an editorial nature.

J. B. Macphail, M.E.I.C.

Born in Montreal, in 1894, he was educated at Ashbury College, Ottawa, and at McGill University, Montreal, where he obtained a bachelor's degree in arts in 1914. He enlisted in the Canadian Engineers and went overseas in September 1914. There he attained the rank of captain, and was adjutant to the C.R.E. of Corps Troops until his return to Canada in 1919. He then re-entered McGill University to qualify for a B.Sc. degree, which he received in 1921.

After graduation he obtained a position with Messrs. Moran Maurice and Proctor of New York. A year later he joined Shawinigan Engineering Company Limited. and distinguished himself on a Dominion-wide scale as an investigator and designer of hydro-electric plants.

Mr. Macphail was a member of the American Society of Civil Engineers and of the Corporation of Professional Engineers of Quebec. He joined the Engineering Institute as an Associate Member in 1920, transferring to Member in 1940.

C. James Porter, M.E.I.C., prominent electrical engineer of Hamilton, Ont., died on January 7, 1948, in hospital at Kitchener, Ont. For the past seventeen years, Mr. Porter had been with the Steel Company of Canada in Hamilton, where he served as chief electrical engineer.

Born at Port Dover, Ont., in 1885, he was educated there and at the University of Toronto, where he received the degree of B.A.Sc. in 1909. After one post-graduate year in electrical engineering, he went to Portland, Oregon, where for two years he worked for the Mount Hood Railway and Power Company. He later transferred to the Pacific Power and Light Company there, and in 1913 he went to Dallas, Texas, where he was a draughtsman for the Texas Power and Light Company until 1917. He returned to Canada that year, going to Hamilton, Ont., as assistant superintendent of substations for Dominion Power and Transportation Company. He became construction engineer in 1923, and remained until 1930. He joined Steel Company of Canada in Hamilton that year and remained with the company until his death.

Mr. Porter joined the Institute in 1944 as a Member. He was also a member of the Iron and Steel Engineers, Pittsburgh Chapter. In 1940 he served as vice-president of the Niagara District Electric Club and in 1941 he was elected to the presidency of that club.

NEWS of the BRANCHES

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

CALGARY BRANCH

J. F. Langston, M.E.I.C. - - *Secretary-Treasurer*
T. M. Parry, M.E.I.C. - - - *Branch News Editor*

A regular meeting of the Calgary branch was held on Thursday, December 11, at 8.00 p.m. in the Palliser Hotel.

The evening opened with the reading of the minutes of the last meeting. The Chairman M. W. Jennings, then called upon S. G. Coultis, of Calgary, vice-president of the Institute for Western Canada, to pay a few words of tribute to two leading and respected members of the Institute who have passed away during the past few weeks—Major P. J. Jennings, and Mr. Sam Porter. Mr. Coultis drew attention to the fact that Mr. Porter had achieved the high distinction of being President of the Institute—the only member of this branch, and the province to have done so. A few moments of silence were observed.

Varying from the customary procedure, the meeting took the form of a symposium. Four engineers employed in activities at Turner Valley oil and gas fields gave short, concentrated talks on phases of their work.

G. A. Connell, JR.E.I.C., chief petroleum engineer, Royalite Oil Company, dealt with **Drilling and Completion Practices in Turner Valley,** in which he outlined the general drilling practices employed, particularly from the production standpoint. Some interesting statistics on depths of wells, producing zones, number of oil and gas wells, yearly production, etc. were given.

The Gas Gathering System of the Madison Natural Gas Company, was described by H. W. Newby, Branch Affiliate, who is meterman for the company.

Then A. G. A. Piercey, chief chemical engineer of the same company, discussed **Gasoline Extraction in Turner Valley.** From ¼ to 1 gallon of gasoline is derived from each 1000 cu. ft. of gas. Depending upon the daily consumption of gas by customers, 700 to 1300 barrels of gasoline per day are secured. This consumption varies with the season, being highest in winter.

Preparation of Turner Valley Gas for Market, was ably discussed by J. W. Young, M.E.I.C., assistant field superintendent for the company. He dealt with the three chief operations in the preparation—compression, removal of gasoline vapors, and scrubbing, or removal of the hydrogen sulphide.

The four talks were illustrated by photographs, diagrams and flow sheets projected on the screen.

A vote of thanks to the four speakers for their interesting papers was moved by F. K. Beach, of the Alberta Petroleum and Natural Gas Conservation Board. Registered were 54 members and 27 guests.

❖ ❖ ❖

The first general meeting of the new year was held by the Calgary branch on Thursday, January 8, in the Palliser Hotel. There were present 77 members and guests.

The speaker of the evening was C. R. Schadlitzke, Manager of the Automotive and Industrial Lubrication Division, McColl-Frontenac Oil Co. Ltd., whose subject was **Manufacture and Application of Lubricating Oils and Greases.**

Mr. Schadlitzke prefaced his talk with the showing of a very interesting sound picture, in color, dealing with oil development work and its background in Saudi Arabia.

He then gave a comprehensive talk on oil from the manufacturing aspect, with specific references to meeting the requirements of various forms of service such as automotive, refrigeration, transformers, compressors, steam engines and turbines.

Mr. Schadlitzke explained how the key to oil and gasoline refining lay in the fortunate circumstance that each cut in the hydro-carbon series has its own boiling point; that of methane gas is at 62 degrees below zero, with the others at intervals above this.

In refining oil for any particular purpose, the selection of the proper crude oil is very important. Oils from wells in close proximity frequently differ considerably. A product found to behave perfectly in the laboratory does not necessarily do so in service. Oils and greases for special services have to go further along the refining and manufacturing line than do the low-cost lubricants which do not have to cope with special conditions.

For low pour-points, wax removal becomes increasingly important. Dehydration to increase dielectric strength is important in transformer oils. Automotive engine lubrication has to cope with extraordinary problems of cold, heat, dust, operator differences and bad moisture conditions. The use of inhibitors in automotive gasoline and oils which are produced by other than those familiar with the particular content of the fuels and lubricants in which they might be used, was questioned by the speaker on the grounds of necessity, and of possible dangerous reactions. The safe use of inhibitors requires care; each inhibitor must be compatible with the others and the elements of the oil, as well as the metal to be lubricated.

The interest of the assembly in the subject and its absorbing presentation by Mr. Schadlitzke was clearly evidenced by the lengthy question period which followed. A hearty vote of thanks on behalf of those present was moved by J. S. Neil.

Following the meeting, smokes were distributed while members took the opportunity to chat with friends and make new acquaintances.

EDMONTON BRANCH

W. W. Preston, M.E.I.C. - - *Secretary-Treasurer*

What is thought to be the most northern use of radiant heating was described in a symposium of two papers sponsored by the local Young Engineer's Committee, at a special general meeting on Wednesday, December 17, 1947, in the Arts Building of the University of Alberta. D. Panar, mechanical engineer, with the Building Branch Department of Public Works of Alberta, reviewed **Radiant Heating Design**, and E. K. Cummings, engineer, Works Department, University of Alberta, outlined the application of **Radiant Heating at the University of Alberta.** After presenting their papers, the speakers conducted a tour of the University farm buildings, where radiant heating installations were at various stages of completion.

Mr. Panar's paper on design features traced heating from nature's prototype, the human body, which produces a heat flow of about 400 Btu.'s per hour for an average person. The body controls heat flow by four devices—growth of hair, acclimatization, vaso-constriction (ability to regulate blood flow), and emergency controls of perspiration and shivering. Man retards the loss of heat by putting on clothes. His next means of control was to heat his ambient air by an auxiliary source of heat, e.g., a campfire.

Balancing the loss of human heat by the necessary input, Mr. Panar stated, is the basis of radiant heating design. Practice has shown that the heat source should be spread over as large an area as possible. Consequently heated pipes are run back and forth under the surface of a ceiling, usually, or/and the walls and floor of the room to be heated.

A design of a heating panel for a typical room was then worked out. One selects a desired air temperature for the room and estimates a normal lowest outside temperature. From them, and heat transfer factors for the various materials in the room, one calculates a weighted average temperature known as the mean radiant temperature (M.R.T.) This is taken as the temperature to which the radiant heat source must heat a body equivalent to the room. The next step is to compute the temperature of the source and finally provide a system which will produce this temperature.

The second speaker, Mr. Cumming, described the engineering features of the radiant-heated poultry houses at the University of Alberta Farms. He showed plans of the boiler house, the laying, breeding and brooder houses, and explained the unique heat requirements of each. He described the disadvantages of heating by oil stoves, hot air and cast iron radiation. Radiant heating was chosen because the poultry would be less exposed to disease, a lower air temperature could be used, and it was possible to use a central heating system, save labour and reduce fire hazards. The chief disadvantage of radiant heating is its high initial cost. Another bad feature, which may be corrected as more experience is gained, is that the heat emission cannot be adjusted to weather conditions rapidly.

Mr. Cumming described the piping grids used and their fabrication by welding. He also described the system of controls which regulate the radiant heating. These include exterior bulbs which operate, according to the outside temperature, mixing valves, and they permit constant temperatures in the laying and breeding houses by mixing hot water from the central distribution system with return water from the heating coils. Also there are motorized type valves which give variable room temperature in the brooder house.

The speaker claimed that the University of Alberta Poultry Farm is the most modern in Canada, and compares favourably with those in the United States.

Because officers of the Young Engineer's Committee were unable to be present, J. E. Cranswick, branch chairman, conducted the meeting. Attendance was 47.

❖ ❖ ❖

The cause of wood decay and how it can be prevented was explained by J. H. Palmason, General Manager of the Prairie Division of the Dominion Tar and Chemical Company Ltd., in a paper on **Wood Preservation,** presented to the Edmonton Branch, at the Macdonald Hotel on Tuesday, January 13, 1948. Mr. Palmason told of a low form of fungal growth that produces decay if there is proper air, moisture and food supply at the correct temperature. The organisms do not grow, he stated, if *any* of the requirements are lacking. He advocates poisoning the food in the wood cells. In this way only does creosote preserve wood from decay.

The speaker showed drawings of the cellular structure of wood, and of the penetration of preservatives. He also explained diagrammatically various treating processes. These included the non-pressure *Butt* method, and the following three pressure methods: *Bethel,* in which the wood cells are completely filled with preservative; *Lowry,* in which the cells are partially filled; and *Rueping,* in which only the shell of the cell is coated. The aim of the operator, the meeting learned, was to produce optimum penetration with minimum preservative.

In conclusion, Mr. Palmason showed a large number of samples of decayed and treated wood. Other preservatives, e.g. pentachlorophenol and copper napthenate, the speaker remarked, had the advantge of not discoloring wood, but were too expensive for general use, and their complete history is not yet known. Other aspects of his paper, which he presented earlier to the Calgary Branch, are reported on page 561 of the *Journal* for 1947.

Chairman of the local meeting was J. E. Cranswick. The speaker was introduced by W. H. Tye and was accorded a hearty vote of thanks on motion of E. H. Wright. Sixty-five were present for dinner, and several more attended the technical part of the meeting.

LETHBRIDGE BRANCH

E. A. Lawrence, M.E.I.C. - - *Acting Secretary-Treasurer*
J. A. Haberman, S.E.I.C. - - *Branch News Editor*

Members, associates and guests of the Lethbridge Branch of the Institute gathered at the Marquis Hotel on Wednesday evening, December 17, for a Ladies Night banquet presided over by Chairman A. G. Donaldson.

After dinner, R. S. Lawrence led in community singing, which was followed by delightfully rendered solos by Miss Gow and Mr. George Brown Jr. The special speaker for the occasion, A. B. Hogg, K.C., was then introduced by G. S. Brown.

During the course of his humorous, yet thought provoking, address on the subject **O Canada,** Mr. Hogg pointed out that while we hear a great deal about the vast size of our country, on closer examination, we find that over fifty per cent of it is uninhabitable. He suggested that the idea of pushing back the frontiers to populate more of our country should be superseded by one which demands greater development of the areas now populated.

Turning back the pages of history to furnish the best example of what may be accomplished in a small area, Mr. Hogg stressed how Babylon, a mere dot on the map, had been so developed as to command an extremely important position in the world at that time.

To further emphasize his remarks, a comparison was made between the heavily populated, highly industrialized and wealthy area encompassing Chicago and the sparsely settled industry-poor area surrounding Lethbridge.

The speaker singled out the coal industry of this district, indicating some of the many thousands of by-products which could be obtained from this natural resource if intensive research along this line were to be carried out with the ultimate aim of shipping these products to eastern Canada, rather than attempting to transport the raw material such a great distance. Successful completion of this research and subsequent establishing of coal by-product industries would greatly enrich the area.

Mr. Hogg cited the projected and completed irrigation systems as an example of what could be accomplished in furthering the development and thus increasing the wealth of the vicinity. The speaker said we should think, talk and utilize what we now have for Southern Alberta; and for that matter, the populated portion of Canada is an area of great potential wealth.

P. M. Saunder, on behalf of the Branch, tendered a hearty vote of thanks to Mr. Hogg for his very fine address.

MONTREAL BRANCH

Members who replied to the questionnaire which was distributed along with the Annual Report are thanked for their many excellent suggestions and for the interest shown. Results are being considered by the various committees concerned so that action may be taken where possible.

Congratulations are extended to Dr. J. B. Challies who has been made an Honorary Member of the American Society of Civil Engineers. There are only about forty honorary members of this Society, Dr. Challies being one of three Canadians chosen for this distinction.

A Student Guidance Symposium for French-speaking students was held on January 21 under the chairmanship of Henri Gaudefroy. About 175 students were present and heard a most interesting address by Mr. Paul-Emile Piché, mechanical engineer in charge, Public Works Department, City of Montreal.

Gratitude of the Branch is expressed to retiring members of the executive: A. Benoit, J. A. H. Henderson and E. B. Jubien, who have served two years and to S. R. Banks who resigned to move to England after having served one year. The Branch is also grateful to the Chairman and members of the various committees for the excellent work they have done during the year.

Junior Section

Paul-Emile Salvas was elected chairman of the Junior Section for the 1948 season, at the Annual Meeting of the Junior Section on January 23. Mr. Salvas had been the Vice-Chairman during the previous year.

In addition to Mr. Salvas the council will be made up of the other members elected the same night: John D. McPherson, vice-chairman; Léo Scharry, secretary; councillors. Fernand Noiseux, Paul Tourigny, and Joe Galli. W. C. Smith chairman of the Papers Committee, who was elected in January 1947, remains in office during the 1948 season.

Two tentative projects of the Branch Council were presented to the general assembly by Tom Scott and John Bateman. These projects consist of the establishment of a co-operative house for junior members and the organization of study groups within the membership of the Junior Section. Tom Scott and John Bateman, who have conceived both ideas, have already been working for some time on the plans of these projects but wide support of the membership is required to carry them out successfully. Committees will be set up very shortly, whose functions it will be to bring to a complete and definite realization, and as soon as possible the Junior Section Co-operative House and Study Groups.

Due credit should be given to R. J. Griesbach, retiring chairman of the Junior Section, and the members of his council during the 1947 season, for the splendid work they have turned out during the year they have been in office. Preparation of a constitution was a great achievement of last year's council.

"The Story of F.M." and "Beaverships" were two interesting films shown during the recreation period of the annual meeting programme. The first film portrayed in technicolor the triumph of ingenuity to overcome static in conventional radio receiving sets; the second film gave the story behind the design and building of C.P.R. cargo ships.

OTTAWA BRANCH

C. G. Biesenthal, m.e.i.c. - *Secretary-Treasurer*
R. C. Purser, m.e.i.c. - - - *Branch News Editor*

At the last regular noon luncheon of the year 1947, held on December 11, Stuart Graham, superintendent of air regulations, Department of Transport, Civil Air Division, gave a talk on the **International Commission for Air Navigation.** The speaker was introduced by J. A. Wilson, and thanked by D. E. Kennedy. Branch Chairman Major-General G. R. Turner presided.

The need for international co-operation was recognized when 52 nations met in 1944 to draw up a convention on civil aviation. It provided for a permanent organization to guide, and Montreal was chosen as Headquarters. Provision was made for a number of committees, of which air navigation was one. Attendance at the frequent meetings was open to all member states. Methods to be followed in achieving uniformity are deliberated periodically by experts from all states.

Mr. Graham announced ten recommendations of the Air Navigation Committee of the International Civil Aviation Organization designed to promote safety, regularity and efficiency in air operations. These, in brief, are: airworthiness of aircraft; uniform standards for licensing personnel; standardized adequate airdromes; rules of the air; meteorological services with continual co-ordinated study by all states; communications standardized and improved so pilots may land in a fog, using radar, with same confidence they would on a clear day; maps and charts specially prepared for needs of air navigation, and intelligible to all pilots; operations—personnel having wide experience in air operations should determine the various operating limits and the minimum requirements, especially where there is low visibility or where regions are remote from habitation; search and rescue arrangements should be provided for with high degree of standardization; accident investigation to ensure non-repetition of accidents of similar nature.

The diversity of problems that are likely to come up under the head of air navigation are really fantastic. The provision of common standards, however, will have a tendency to promote common thinking which, in turn, should go a long way toward promoting an attitude of peace amongst the various countries.

❖ ❖ ❖

The annual meeting of the Ottawa Branch was held in the auditorium of Carleton College on Thursday night, January 8. Major-General G. R. Turner, chairman for 1947, presided. Reports were presented and election of officers took place.

In line with the usual policy of the Branch, it was decided to donate prizes to leading students in engineering in Carleton College, the Hull and Ottawa technical schools, University of Ottawa, and St. Patrick college. A vote of thanks was extended to the Ottawa newspapers for their support.

Dr. L. F. Grant, m.e.i.c., Kingston, president of the Institute, was present and spoke on the aims of the organization, emphasizing the importance and necessity of close contact between the local branches and national headquarters.

Light refreshments were served at the close of the meeting.

PETERBOROUGH BRANCH

J. M. King, m.e.i.c. - - - *Secretary-Treasurer*
J. C. Allan, m.e.i.c. - - - *Branch News Editor*

Planning for Use—Modern Procedures in Residence Design was the subject of an address by E. C. S. Cox, m.r.a.i.c., before the Peterborough Branch on December 4, 1947.

Mr. Cox explained that he might be classified as a moderate modernist in residence design, and proceeded to explain why he advocated modern procedures as opposed to the traditional. "There is no *modern*. The modern of today is the traditional of tomorrow", Mr. Cox explained. "*Modern* is not a style of architecture; it is rather a relationship between a building and the use to which it is put, between its planning and the living or working habits of the people who occupy it. Design as applied to houses, is an expression of a way of living. To fit the pattern of our life today, we obviously require designing and planning that will satisfy, and complement, and embellish our present manner of keeping house. This end cannot be accomplished by the endless and uninspired copying of designs that were modern generations ago and were created to fulfil the needs of those dead or dying generations".

Mr. Cox went on to a discussion of procedure in house design, stressing the fact that the site dictates the plan and that a house is not an isolated problem but part of a community, and related to its surroundings, so that all should be planned together.

The ideal orientation in this latitude would be to have all principal rooms face south, but this rule must be tempered with regard to view. The old idea that a living room must face a street has, we hope, been completely eliminated from the minds of the majority.

The slope of the lot determines the vertical plan of a house, just as orientation and view determine its horizontal plan.

"Subconsciously we have always wanted large windows and a generous outlook on the world, but the combination of inadequate heating systems and a false sense of modesty have reduced the windows of traditional houses to mere peekholes. . . . Practical advantages of modern heating, adequate insulation, good weatherstripping and double glazing now remove restrictions to the size of window areas".

Under the subject of "Daylighting", Mr. Cox discussed control of glare and excessive sun heat as well as adequate natural light.

Kitchen layouts and built-in furniture were also discussed. Mr. Cox concluded by saying that his remarks intended as an insight into how an architect designs a house. To the layman the only instruction required is—"Get yourself an Architect".

ST. MAURICE VALLEY BRANCH

R. E. Kirkpatrick, M.E.I.C. - - *Secretary-Treasurer*

Subsequent to the President's visit to the Branch in November, Juniors in Three Rivers and in Shawinigan Falls called meetings to obtain some idea of the interest which might be shown in one or two Junior sections. The outcome was that both groups requested permission to put their cases to the meeting of the Branch Executive. An Executive meeting was held on December 12, attended by Junior representatives at which they demonstrated clearly that some form of Junior organization was desirable. The result of the meeting was that two groups were authorized on a trial basis, these two groups to be known as the Shawinigan Falls Junior Section and the Three Rivers Junior Section of the St. Maurice Valley Branch.

Since the executive meeting on December 12, the Junior Sections have both held organizational meetings at which officers were elected and interesting programmes for the rest of the Branch year were lined up. The officers of the Shawinigan Falls Junior Section are, chairman, J. W. Ince; vice-chairman, W. R. T. Wilson; secretary-treasurer, A. B. Rosetti.

The officers of the Three Rivers Junior Section are, chairman, A. T. Farmer; secretary-treasurer, Lloyd G. Symons.

SASKATCHEWAN BRANCH

D. W. Houston, M.E.I.C. - - *Secretary-Treasurer*
R. Bing-Wo, M.E.I.C. - - - *Branch News Editor*

The regular monthly meeting of the Saskatchewan Branch was held on January 16 at the Officers' Mess, in the Armories. The meeting was held jointly with the United Services Institute.

The speaker of the evening was Col. H. W. Love, O.B.E., Director of Works, Canadian Army Headquarters, Ottawa, who spoke on the work of the Royal Canadian Engineers in World War II.

Col. Love explained that the work of the R.C.E. covered all branches of engineering, although most of the work was Civil. There were in general two distinct groups, the Field Engineers and the Works Organization. The field engineers, a flexible unit, worked in the forward areas on rapid road repairs, bridge construction, demolitions, and mine clearing. The works organization did the heavier follow-up engineering work. This group was made up of road construction companies, bomb disposal units, railway units, survey units, and other units trained to do specialized work.

The peacetime R.C.E. is made up of three groups—the reserves, the supplementary reserve, and the active.

The reserve replaces the prewar N.P.A.M. The men volunteer to serve for a three year period. Their training is made up of 45 days per year, during fall, winter and spring, when they train for forward area and field engineering. At a two-week training camp during the summer practical field work is done and heavier equipment is used.

The Supplementary Reserve is a paper army. It is made up of a list of retired active force officers, reserve officers, and specialists who could be called to service in the event of war.

The Active Army is engaged during peacetime, for the most part, in four main types of work: training and field force units; development work; survey service; works service.

The training sites of the R.C.E. are at Chilliwack, B.C. and at Petawawa, Ont. Special courses are given at the camps for the reserve army and the C.O.T.C. during the summer season.

The development work is done at Ottawa. Here new equipment and methods are developed for the army engineers. Civilian equipment is also used and adapted for army use.

The Survey Service is engaged for the most part in the making of maps. The 1 in.=1 mile topographical maps of Canada are an example of the type of work they carry out.

The Works Service composes about 65 per cent of the present strength of the Corps. This service is largely responsible for the administering and maintenance of large amounts of Government property to the value of 300 million dollars. They also design, construct and maintain military buildings during peace time. Where civilian fire prevention service is not available, these are provided by the works service of the R.C.E. The great area in Northern Canada is being opened up by the engineers, who in addition to maintaining the Alaska Highway, also build and maintain emergency landing strips, conduct research work in permafrost, and build all types of bridges with special design features. This area of Canada is providing ideal training grounds for engineering personnel of the army.

Col. Love concluded the very interesting address by expressing the need for co-operation between the civilian engineering profession and the military.

Col. A. C. Garner moved a hearty and unanimous vote of thanks to the speaker.

VICTORIA BRANCH

S. H. Frame, M.E.I.C. - - - - *Secretary-Treasurer*
Jas. H. Blake, M.E.I.C. - - - *Branch News Editor*

The annual meeting of the Victoria Branch was held in the Empress Hotel on Friday, December 19, 1947, when the reports for the past year were presented and the officers elected for 1948. Charles T. Hamilton, consulting engineer of Vancouver, was the guest speaker of the evening and addressed the forty members present on the design and constructional features of the barrel-type roof of Victoria's new Memorial Arena, now under construction.

The meeting was preceded by a dinner at 6.30 p.m. for members of the Institute, which was followed by a short business meeting and election of officers. In presenting his report the Chairman, R. C. Farrow paid tribute to the retiring members of the executive and to the younger engineers for their sustained interest in the activities of the Branch during the past year. He reviewed the activities of 1947 and the prospects for the year 1948.

At the annual meeting of the Victoria Branch of the Institute December 19, 1947, officers were elected for 1948. Members pictured are: standing, Lieut.-Col. H. L. Sherwood (left), R. C. Farrow, chairman; T. A. J. Leach, O. W. Smith, J. H. Blake, S. H. Frame. Seated are: J. N. Anderson (left); Charles T. Hamilton, speaker of the evening, and Ernest Smith.

At the general meeting, which was open to the public at 8 o'clock, the chairman introduced Charles T. Hamilton who told of the unusual design of the barrel-type roof of the new arena building, stating that it was the only one of its kind in Canada, and that only one other, somewhat smaller, is to be found on the west coast of the continent. Some have been built in Eastern U.S.A. considerably larger than the one in Victoria, which is 320 feet in length and 165 feet in width. He explained the technical points in the construction with the aid of a scale model, and said the arena is being built to seat 4,160 persons as an ice arena and an additional 2,700 as an auditorium. The ice surface which is 80 by 200 feet could be de-iced in 1½ hours and replaced overnight. Ice for skating is only ¾-inch thick and about 1 inch thick for ice hockey.

Considerable delay has been experienced in the construction of the arena framework and roof, due partly to shortage of materials. Mr. Hamilton reviewed the various delays but stated that a much better building would result. Mr. Hamilton, who holds the rights for the design in Western Canada, is the engineer and superintendent of construction for the building. A lengthy discussion period followed the address.

The thanks of all present were conveyed to Mr. Hamilton by Mr. Irwin, city engineer of the City of Victoria. It is hoped that the building of this arena will be completed during 1948 in time for the winter hockey season.

❖ ❖ ❖

At Prince Robert House, Victoria, B.C., the Victoria Branch held a successful and interesting meeting on January 16, which featured an address entitled **Our Highway System** by Harry C. Anderson, M.E.I.C., chief engineer of the Provincial Department of Public Works of British Columbia. Also included in the programme was a showing of the film "Operation Pluto", depicting the manufacture and laying of the fuel supply pipe lines across the English Channel during the late war. This film was made available to the Branch through the courtesy of John Davidson of John Davidson and Company, Water-works Supplies, Vancouver, B.C.

Mr. Anderson's address commenced with a historical review of the British Columbia road and highway system of the early days of the Hudson Bay Company's "Brigade Trails", the wagon roads of the horse-drawn vehicle era, to the present day system, expanded in length and improved in methods of construction to meet the demands of heavy, fast traffic.

The Provincial programme of construction and maintenance, which was virtually brought to a standstill during the war years, was outlined and it was stressed that highways between heavily populated centres are being given top priority. A regular net-work, covering the entire Province, with connections to highways to the East and to adjacent States of the U.S.A. to the South, has been planned and is now in course of development at the cost of many millions of dollars. The largest project now nearing completion is the Hope-Princeton Highway which will cost some $8 millions; and this road is on a par with any on the continent in construction, grades, curves and scenic beauty. This work, together with that in hand on the Island Highway on Vancouver Island, should be completed this year.

It was pointed out that the increase in the cost of actual road construction showed an advance of some 20 per cent over 1939 figures as compared with a threefold increase in the cost of bridges, which is mainly due to the piling up of material prices. Another point of interest was the rapid increase in the number of automobiles and heavy freight units, which is so rapid that it is impossible to keep up with their need for more and better roads, with the available supplies of materials, manpower or money. The heavy freight-hauling units will have to be restricted as to size, even more so than in the past, as it is manifestly impossible to build roads which require more expensive construction, and stronger and more costly bridges, suitable for 1 per cent of the vehicular traffic. The present type of construction is more than adequate for 99 per cent.

Commercial signs will be prohibited on all major highways this year and a standard system of road signs, common to all Canada, has been adopted and introduced, to promote safer driving and avoid confusion.

Mr. Anderson's talk was very well received and was followed by a discussion period. The meeting was attended by the Hon. E. C. Carson, Provincial Minister of Public Works, civic officials, members of allied associations, and numerous Branch members.

BOOK REVIEW

GAS TURBINE CONSTRUCTION; INCLUDING OPERATION AND MAINTENANCE

R. T. Sawyer. Prentice-Hall, New York, 1947. 411 pp., illus., diagrs., charts, tables, cloth, $7.00.

Reviewed by

DONALD L. MORDELL, M.E.I.C.*

The art of producing gas turbines is still very fluid. In every type of prime mover there is considerable scope for arrangement of the components to produce various thermodynamic operating cycles, but there is no plant with as great a number of possible—and theoretically justified—arrangements as a gas turbine plant. Until many of these types have been built and thoroughly tested, there can be no standardization of design in the individual components.

The simplest turbine operates on an open cycle with one stage compression and expansion, and yet what tremendous variations are to be found between different designers' conceptions of the same basic engine!

In these circumstances any collected data of different designs is of great value. This has been provided for us by Mr. R. Tom Sawyer in his latest book "Gas Turbine Construction", published by Prentice-Hall. Here the reader will find gathered between two covers practically all the published information on construction and design, varying from jet propulsion engines to generating plants. In some cases the particulars given relate to projects rather than thoroughly tested design and it must be remembered that some may not turn out successfully, but there are sufficient details of plants with exceedingly good records of reliability to enable one to form a good idea of the best designs known at present. The author's collection of data on maintenance and testing is of value in giving some idea of what to expect. It is of interest to note that with the original turbo compressors installed by the Sun Oil Company more than a decade ago, the trouble analysis shows that blade failures accounted for only 9.5% of the total days out of operation. No less than 69% of the days were traceable to bearing and lubrication faults, while 20% might loosely be attributed to human errors or failings.

The sections dealing with operation and testing are valuable. The fact that they relate to particular types does not detract from their significance, as they are illustrative of the general techniques employed and with suitable modification might be applied to many types.

The omission of a discussion on the instrumentation problems which occur in turbine testing might well be rectified in a future edition. The book is attractively printed and, on the whole, well indexed. It will be of interest to every one concerned with the gas turbine, if only to show "what the other fellow did". It is purely descriptive and makes no attempt at being technical. The basic technology of design is no different for the gas turbine than for any other type of engine; the interest lies in observing the compromises selected, particularly by those designers able to draw on a great deal of operating experience.

*Associate Professor, Department of Mechanical Engineering, McGill University, Montreal.

RULES AND REGULATIONS

HOURS

	Oct. 1-May 30	June 1-Sept. 30
Monday to Friday	9 a.m.- 6 p.m.	9 a.m.- 5 p.m.
Thursdays (Oct. 1-Mar. 31)	9 a.m.- 8 p.m.	9 a.m.- 5 p.m.
Saturdays (closed July & August)	9 a.m.-12 noon	9 a.m.-12 noon

BORROWING & PURCHASING

Books, Periodicals, Photostats, Translations, etc., may be borrowed or purchased by any member of The Institute, resident in Canada.

Items may be borrowed for two weeks, exclusive of travel time, and may be renewed for a further two weeks on request.

A Library Deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the borrower, or purchaser. Therefore, except in the case of Library Deposits, payment should not be made in advance.

Non-members may consult the Library, but may not borrow material.

BIBLIOGRAPHIES AND EXTENSIVE LITERARY SEARCHES

Short subject bibliographies will be compiled on request.

Extensive literary searches will be made at a charge of $1.50 per hour to members, $2.50 per hour to non-members.

Please indicate which is required.

Requests must indicate clearly the SPECIFIC SUBJECT and SCOPE desired.

Give all pertinent information possible

BOOK NOTES

The Institute does not assume responsibility for any statements made; these are taken from the preface or the text of the book.

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARD FOR ELECTRONIC-VALVE BASES, CAPS AND HOLDERS. BS 448:1947.

London, British Standards Institution. 7/6.

This is a revision of the 1936 edition, which dealt with dimensions of the British 7-pin and 9-pin valve bases and the corresponding valve holders. In the 1947 edition the scope has been extended to include many other types of valve base which have been introduced in the interim. Such details of the bases of the electronic valves and cathode ray tubes and their associated holders as are necessary to ensure compatibility are covered.

BRITISH STANDARD FOR FUEL OILS FOR BURNERS. BS 742:1947.

London, British Standards Institution, 1947.

This standard, which supplements BS 209, "Fuels for Oil-engines", covers three categories of fuel oils for burners, namely for domestic installations, for marine installations, and for general domestic use. These three categories are subdivided into eight classes and the specification gives information on the application of these classes of oils and on points which must be borne in mind by users of the oils. The properties required for each class are specified and full descriptions of the methods of tests are given in the appendices.

BRITISH STANDARD FOR MIXING VALVES (MANUALLY OPERATED) FOR ABLUTIONARY AND DOMESTIC PURPOSES. BS 1415:1947:

London, British Standards Institution, 1947.

This standard is intended to unify the method of specifying the size of manually-operated mixing valves, to lay down a minimum standard of performance and to provide certain essential safeguards concerning the method of operation. Three sizes are dealt with—½ in., ¾ in., and 1 in.—the size being specified by means of the nominal bore through the inlets in conjunction with the performance requirements. Attention is called to the fact that the satisfactory operation of mixing valves does not depend alone upon the suitability of the design of the valves; several factors concerning the installation as a whole have a marked effect upon performance.

BRITISH STANDARD FOR PIPE FLANGES FOR LAND USE (FOR PRESSURES UP TO 400 FEET HEAD). BS 10: Part I: 1947:

London, British Standards Institution, 1947.

This is a revision of the standard published in 1928 and gives dimensions of flanges made from cast iron, bronze, cast steel, wrought iron and malleable cast iron, for maximum working water pressures up to 400 feet head (173 lb. sq. in.) at a maximum temperature of 212°F. It has been customary to regard this standard as purely dimensional, despite the fact that the flange thicknesses were varied for different materials. A feature of this revision is that the minimum properties of the flange material have been included. A number of sizes have been deleted from the tables and the outside diameters of wrought iron and steel pipes up to 72 in. nominal size have been included.

BRITISH STANDARD FOR PROTECTIVE FILTERS FOR WELDING AND OTHER INDUSTRIAL OPERATIONS. BS 679: 1947.

London, British Standards Institution. 2/-.

This standard covers filters of glass or having glass external surfaces, for eye protection during welding and similar operations, for use either in goggles or in screens. The purpose is to ensure that requirements will provide for adequate protection to wearers, and also permit the most economical production methods compatible with this protection.

CANADIAN STANDARD FIRE HAZARDS SPECIFICATION FOR THE CONSTRUCTION AND TEST OF CLASS I DOMESTIC OIL BURNING APPLIANCES FOR USE AS OR IN FURNACES, WATER HEATERS, CHICKEN BROODERS, ETC. CSA-Z 93. 2-1947.

Ottawa, Canadian Standards Association, 1947.

This specification states the minimum requirements for Class I Domestic Oil Burning Appliances. These are domestic, oil-burning, heating appliances, using a topped or distilled fuel oil—having a flash point of not less than 100°F closed cup, and having a specific gravity of from 28 to 40 degrees Baume —, and intended for stationary installations in locations where the appliance will be unattended and unobserved. The purpose of the standard is to outline essential requirements and minimum standards which must be met to obtain CSA Fire Hazards Listing of domestic oil burning equipment and appliances.

CANADIAN STANDARD FIRE HAZARDS SPECIFICATION FOR THE CONSTRUCTION AND TEST OF CLASS II DOMESTIC OIL BURNING APPLIANCES FOR USE AS OR IN SPACE HEATERS, ETC. CSA-Z 93.3-1947.

Ottawa, Canadian Standards Association, 1947.

This specification states the minimum requirements for Class II Domestic Oil Burning Appliances. These are domestic, oil-burning, heating appliances, using a topped or distilled fuel oil—having a flash point of not less than 100°F closed cup, and having a specific gravity of from 28 to 40 degrees Baume—, and intended for stationary installations in locations where the appliance wil be attended and observed frequently. There are two types of Class II Appliances—conversion type for installation in existing heating units, etc., and complete unit, which is a heating unity with an oil burning appliance installed.

CANADIAN STANDARD FIRE HAZARDS SPECIFICATION FOR THE CONSTRUCTION AND TEST OF CLASS III DOMESTIC OIL BURNING APPLIANCES FOR USE AS OR IN COOKING RANGES, ETC. CSA-Z 93.4-1947.

Ottawa, Canadian Standards Association, 1947.

This specification states the minimum requirements for Class III Domestic Oil Burning Appliances. These are domestic, oil-burning, cooking appliances, using a topped or distilled fuel oil—having a flash point of not less than 100°F closed cup, and having a specific gravity of from 28 to 40 degrees Baume—, and intended for stationary installations in locations where the appliance will be attended and observed frequently.

DYNAMIC MOTION AND TIME STUDY:

James J. Gillespie. London, Elek, 1947. 95 pp., illus., 8½ x 5½ in., cardboard, 7/6.

The author acknowledges the necessity for time and motion in every industry, but asserts that the study of work activity is too often unrelated to work psychology. The book is a text dealing with work psychology from many angles, both theoretical and practical.

ENGINEERING COLLEGE RESEARCH COUNCIL OF THE AMERICAN SOCIETY FOR ENGINEERING EDUCATION:

Directory of Member Institutions and Review of Current Research. Iowa City, Iowa, Engineering College Research Council, 1947. 103 pp., 9 x 6 in., paper, $1.00.

This directory provides a list of universities in the United States, their various engineering departments, and gives a short outline of their research activities in the field of applied science, and the research policies and expenditures of each university.

ENGINEERING STATISTICS; BASIC IDEAS ON THE SUBJECT AS IT IS APPLIED IN PRODUCTION CONTROL AND STANDARDISATION:

G. W. Stubbings. Manchester, Emmott, 1947. 24 pp., illus., 7¼ x 4¾ in., paper, 2/–.

The latest subject to be included in the necessary education of an engineer is statistics, which plays an important part in the modern control of production and which is likely to play an equally important part in the fixing of standards of quality and criteria for acceptance by purchasers. The purpose of this monograph is to deal with some of the conceptions of statistical theory in order to assist the engineer unacquainted with this branch of applied mathematics, to take up the study of its applications to modern engineering problems.

MANUAL OF ALUMINUM CASTING ALLOYS:

Aluminum Research Institute, Chicago, 1947. 78 pp., illus., 9 x 6 in., leather.

This book is intended to be of assistance to Design Engineers, Foundrymen, and users of castings, and contains tabular data on physical and mechanical properties of various sand and permanent mold Aluminum alloys most commonly used; general metallurgy of Aluminum alloys; properties of specific alloys; foundry practice; and heat treatment. The purpose of the discussions in the manual is to aid in the selection of the proper alloy for a given casting, and as a help in the production of high quality castings.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

A.S.T.M. STANDARDS on ADHESIVES. *Sponsored by A.S.-T.M. Committee D-14 on Adhesives; Specifications, Physical Tests, Definitions, July, 1947. American Society for Testing Materials, Philadelphia 3, Pa., 42 pp., diagrs., tables, 9 x 6 in., paper, $1.25 (A.S.T.M. members, $.90).*

A compilation of the American Society for Testing Materials physical tests and definitions relating to adhesives, this booklet also includes three methods of testing rubber adhesives. Tensile properties, the resistance of adhesive bonds to chemical reagents, the peel or stripping strength, and methods for determining the strength properties of adhesives in shear are among the topics covered.

ARCHITECTURAL CONSTRUCTION, the Choice of Structural Design.

T. Crane. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 414 pp., illus., diagrs., charts, tables, 9¾ x 6¼ in. cloth, $6.00.

Of interest to practicing architects and architectural engineers as well as to students, this volume presents a procedure for determining the most suitable basic structural elements for a particular structure. It is intended to fill the void between a descriptive study of materials and types of construction and the final design of individual structural elements. A comprehensive résumé is made of all the better types of construction now available in the American market, with recommendations concerning their specific applications. Many diagrams, tables and photographs illustrate the text.

ELEMENTS of RAILROAD ENGINEERING.

W. G. Raymond, H. E. Riggs and W. C. Sadler. 6th ed. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 442 pp., illus., diagr., charts, tables, 9 x 5¾ in., cloth, $5.00.

The sixth edition of this standard text has been revised and, where necessary, rewritten to include information in line with current practice, particularly with regard to speeds, curves, grades, track structure, division points, and terminal facilities. Two new chapters have been added on streamlined trains and on power and passenger equipment. The four major sections cover the following topics: the railroad industry in general; permanent way; the locomotive and its work; railroad surveys.

Fundamentals of ENGINEERING MECHANICS.

A. Sloane. Prentice-Hall, Inc., New York, 1947. 379 pp., diagrs., tables, 9¼ x 6 in., cloth, $5.65.

This volume deals with the usual material on statics and dynamics which is treated in a text on engineering mechanics. In addition, the principle of virtual work, Mohr's circle as applied to moments of inertia and products of inertia, and a brief introduction to the subject of mechanical vibrations have been included. More attention than is usual is given to engineering kinematics. The text is constructed as a guide for the student to stimulate thinking instead of learning by rote.

HANDBOOK of PERSONNEL MANAGEMENT.

G. D. Halsey. Harper & Brothers, New York and London, 1947. 402 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $5.00.

A discussion of the basic principles and theories of personnel management is presented to enable the reader to evaluate the methods used. This book is devoted to the practical aspects—what the problems and objectives of personnel management are, and how these problems have been solved and these objectives accomplished in many organizations. In this college-level text, such problems as job analysis, induction of new employees, correction and discipline, wage incentives, profit-sharing plans, and labor relations are presented. References are given at the end of each chapter, and an appendix lists sources of information and help in personnel management.

ILLUSTRATED JIG-TOOLING DICTIONARY:

T. G. Thompson and R. A. Peterson. Macmillan Co., New York, Toronto, 1947. 349 pp., illus., diagrs., tables, 9½ x 6 in., cloth, $7.50 (in Canada).

Containing illustrated factual data alphabetically arranged, this volume graphically demonstrates all of the basic equipment of the tool engineer and the actual use of this equipment on the job. Mathematical procedures, tables and formulas, the properties of metals, standards and basic dimensions, and terms used in connection with plastic forming processes, welding, technical drawings and blueprints are included

INDUSTRIAL EXPERIMENTATION.

K. A. Brownlee. Chemical Publishing Co., Brooklyn, New York, 1947. 151 pp., diagrs., charts, tables, 9 x 5½ in., cloth, $3.75.

Of primary interest to those concerned with pilot-plant and plant-scale experiments on chemical manufacturing processes, this volume, British in origin, is a guide to both the planning and interpretation of experiments on an industrial scale and paves the way to efficient quality control. The subject is treated from the practical point of view. Only simple arithmetic is used with the statistical methods discussed and in the practical examples which illustrate the method. The principal additions in this second edition are two new chapters on balanced incomplete blocks and on confounding, covering the problem of restricted block size in factorial experiments.

INDUSTRIAL HEALTH ENGINEERING.

A. D. Brandt. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1947. 395 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $6.00.

Beginning with a discussion of industrial atmospheric contaminants and their significance, this volume proceeds to describe the principles of control available and the types of equipment used: collectors, exhaust systems, respirators, etc. Design data and other aspects of interest to the practical engineer are included. The later chapters deal briefly with ventilation, air conditioning, radiant energy, industrial illumination, industrial noise, and plant sanitation. There is a twelve-page bibliography.

MAGNETIC CONTROL of INDUSTRIAL MOTORS.

G. W. Heumann. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 589 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50.

Of interest to engineers concerned with industrial control equipment, this volume provides exhaustive coverage of electric motor performance, characteristics of control devices, and functions of commonly-used control circuits. Fundamental information is provided as well as information on new devices such as the amplidyne control and a-c hoist controls. Emphasis is placed on considerations governing the selection of controllers to perform specific jobs. A short bibliography follows each chapter.

MODERN TELEGRAPH SYSTEMS and EQUIPMENT.

W. T. Perkins. George Newnes Ltd., London, 1946. 215 pp., illus., diagrs., charts, tables, 7½ x 5 in., cloth, 10s. 6d.

Important developments in telegraph technique during the last decade are described for the use of telecommunication engineers, traffic officers, and students in electricity and radio-communication. These developments cover voice frequency, telex, sub-studio, and varioplex systems, and all types of modern apparatus such as the teleprinter, teletypewriter, and the Creed automatic 5-unit and Morne equipment. A glossary of telegraph terms and definitions is included.

ON UNDERSTANDING SCIENCE, an Historical Approach.

J. B. Conant. Yale University Press, New Haven, Conn.; Geoffrey Cumberlege, Oxford University Press, London, 1947. 145 pp., illus., diagrs., tables, 8¼ x 5¼ in., cloth, $2.00.

The purpose of this volume is to provide the layman with an effective method for finding out what science is and how to understand it. An historical view is given of a number of great scientists, of the knowledge available in each one's generation, of the problems they set out to examine, and of how these problems were solved. The reader follows the scientific method at work, with all its limitations and wonders.

PHYSICAL CHEMISTRY and the TECHNOLOGY of FUELS.

A. W. Gauger, sponsored by Phi Lambda Upsilon and the Dept. of Chemistry, Pennsylvania State College, State College, Pa., 1947. 114 pp., diagrs., charts, tables, 11 x 8½ in., paper, $2.00.

Reviewing the present state of our knowledge of fuels, this volume emphasizes the particular aspects of interest to physical chemists. The book is based on the 21st annual Priestley lecture with the addition of background material on fuels. It is divided into six sections: the composition and properties of fuels; interconversion of solid, liquid and gaseous fuels; gasification of solid and liquid fuels; the physical chemistry of combustion; fuels as chemical raw materials; and the nuclear energy power plant. A brief list of reference material is included

SCOTTISH RAILWAY NETWORK.

J. F. Pownall. Cotterell & Co., 110 Dale End, Birmingham 4, England; Simmons-Boardman Publishing Co., 30 Church St., New York, 1946. 71 pp., diagrs., maps, tables, 10 x 6 in., cloth, 8s. 6d.; $3.00.

This volume covers in detail a proposed plan for the conversion of the Scottish Railway system to provide hourly service, both express and local, by means of spaced control points. The actual changes involving new construction are considered. A map is included which shows existing and needed lines to provide for the schedules worked out in the text.

SOIL MECHANICS, Its Principles and Structural Applications.

D. P. Krynine. 2nd ed. McGraw-Hill Book Co., New York and London, 1947. 511 pp., illus., diagrs., charts, tables, 9 x 5½ in., cloth, $5.50.

Presents the principles used in the design, construction and maintenance of foundations of structures, and of structures made of earth material. The engineering applications of these principles are discussed, field and laboratory soil investigations are described, and the settlement of structures, its causes, prevention, and damage are considered. This revised edition brings both the material and the bibliography up to date and includes new sections on highway and runway subgrade.

Although not available in the Institute Library, inquiries concerning the following new books will be welcomed there or may be sent direct to the publishers.

CONTROLLED ATMOSPHERES FOR THE HEAT TREATMENT OF METALS:

I. Jenkins, with a foreword by C. J. Smithells. Chapman & Hall, London, 1946. 532 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 50s.

The main function of a controlled atmosphere in the heat-treatment of a metal is considered to be the control of the surface chemistry, as distinct from the metallurgy, of the process. This involves the application of certain laws of physical chemistry to various gas-metal and inter-gas reactions. This book brings together the scattered data on these reactions, discusses fundamental principles, and explains the means of translating these principles into practice. The book is arranged in three sections covering respectively the generation, purification and application of controlled atmospheres, including details of industrial equipment.

ELECTRICAL ENGINEERING PROBLEMS (Solutions to Electrical Engineering Problems, Professional Engineer Examinations, New York State).

W. Glendinning, 5123 Bell Boulevard, Bayside, N.Y., 1946. 112 pp., diagrs., tables, 8¾ x 11½ in., paper, $3.00.

This manual provides questions and solutions to the electrical engineering problems of fifteen past examinations in Professional Engineering—Part III, Electrical Engineering, Group D, given to applicants for the license of Professional Engineer in New York State. Useful in preparing for professional engineering and civil service examinations, the material covers various types of problems in d.c. and a.c. machinery and in power and communication systems.

GAS DYNAMICS TABLES FOR AIR.

H. W. Emmons. Dover Publications, Inc., New York, 1947. 46 pp., diagrs., charts, tables, 9¼ x 6 in., paper, $1.75.

After presenting the general relations of gas dynamics and the shock wave equations, the technique of using the five-place tables is explained. There are four groups of Tables as follows: isentropic gas dynamics functions for air, gas dynamics functions for normal shocks, characteristics table, and acoustic velocity-temperature table. Nineteen graphs of tabulated functions follow the tables themselves. The tables were in part produced originally in connection with aircraft research.

GROUND WATER, ITS DEVELOPMENT, USES AND CONSERVATION:

E. W. Bennison with foreword by W. M. Bollenbach. Published by Edward E. Johnson, Inc., St. Paul 4, Minnesota, 1947. 509 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $2.25.

This volume, consisting of a series of articles which originally appeared in the "Johnson National Drillers' Journal" from 1940 to 1946, presents the basic principles of ground water hydrology and wall construction. The techniques in common use in developing and pumping ground water and its subsequent treatment are considered, as well as methods of conservation. Not intended as a scientific treatise, the book provides a wide range of practical information for the well driller or water supply engineer.

MACHINERY'S HANDBOOK:

E. Oberg and F. D. Jones. 13th ed. Industrial Press, New York, Sole distributors for the British Empire: Machinery Publishing Co., Ltd., National House, West St., Brighton 1, England, 1946. 1911 pp., diagrs., charts, tables, 7 x 4½ in., cloth, $6.00.

This standard annual reference book provides essential data and information on machine design and shop practice for the mechanical engineer, draftsman, toolmaker and machinist. New material includes recent or revised engineering standards as well as additional developments reflecting current designing and manufacturing practice. As is customary, the extensive technical and mechanical data are presented in tabular form for convenience of use. Material concerning metallurgical, hydraulic and other allied fields is given, and the whole compilation is covered by a thirty-page index.

MODERN PETROLEUM TECHNOLOGY:

Institute of Petroleum, Manson House, 26 Portland Place, London, W.1, 1946. 466 pp., illus., diagrs., charts, maps, tables, 9¼ x 6 in., cloth, 21s.

In order to make available the knowledge of the expert in one field of petroleum technology to those engaged in other branches of the industry, the British Institute of Petroleum has sponsored this volume with the intention of giving a composite picture of present conditions. Exploration, prospecting, production, refining, chemistry, utilization, distribution, measurements, tests, and economic features of petroleum are the main topics. Large topics, such as refining, are subdivided into the important phases, and different specialists write of the state of knowledge in their own sections. Some of the most important advances, made in wartime and only recently released, are included

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

January 31st, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the March meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ANNANDALE—ALEXANDER, of Trail, B.C. Born at Shotley Bridge, Durham, Eng., Aug. 14, 1891. HARGREAVES—JAMES, of Ottawa, Ont. Born at Watton-at-Stone, Herts., Eng., Oct. 19, 1899. Educ.: Royal Military Academy, Woolwich; 1917-18; Cambridge Univ., 1920-21; R.P.E., Ontario; 1922-23, astronomical & meteor. research, cooperating with Royal Observatory, Greenwich; with W. Wilson & Son (Herts) Ltd., 1924-28, works supvr. 1928-32, director, W. Wilson & Son Ltd. & Wilson-Garner Ltd., Director Highways Colloidal Ltd., after 1928 was i/c of their London office concurrently with duties of managing Highways Colloidal Ltd., mfg. emulsified asphalt, road surfacing materials; 1932, moved to Canada and engaged in farming operations; 1942-45, Ordnance Mech. Engr., R.C.O.C. and R.C.E.M.E. i/c divn. workshop with tech. staff, N.D.H.Q. and last as Engr. I/C experimental workshop and engrg. problems, Field Experimental Stn., Suffield, Alta.; 1946-47, i/c expedition to observe the eclipse of sun at Araxa, M. G. Brazil; at present, private practice as mech. engr. and astronomical research, Ottawa, Ont.

Employment Service

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. Personal interviews by appointment.

Situations Vacant

CHEMICAL

SENIOR CHEMICAL ENGINEER OR CHEMIST, required by leading Paper Manufacturer in Easter Canada. Applicant should have some experience in Paper Mill Control work. This position offers plenty of scope for advancement. Salary open. Apply to File No. 4013-V.

*CHEMICAL ENGINEER OR CHEMIST, preferably with experience in production of chemicals and operation of chemical equipment such as filter presses, evaporators and vacuum jets. Required by an industrial chemical plant in the Quebec area. Salary according to qualifications. Apply to File No. 4039-V.

ELECTRICAL

ELECTRICAL ENGINEER to take charge of hydro electric maintenance involving four or five plants. Salary open. Apply to File No. 4015-V.

ELECTRICAL ENGINEER experienced in Power Station, Transmission and Distribution design and installation. Permanence and advancement depending upon performance. Salary open. Apply to File No. 4024-V.

JUNIOR ELECTRICAL ENGINEER, required by a mining company in Northern Ontario. Salary open. Apply to File No. 4028-V.

ELECTRICAL ENGINEER with minimum of 5 years experience in paper industry, between 35-45 years of age, for responsible position with large newsprint manufacturing concern in Northern Ontario. Salary commensurate with qualifications. Living accommodation assured. Apply to File No. 4032-V.

ELECTRICAL ENGINEERS with some experience in research, design, and development, backgrounds in communications, electronics, power or physics are preferred. Required for the staff of a technical college in N.Y. state. Salary and rank will be commensurate with experience and training. Apply to File No. 4038-V.

MECHANICAL

MECHANICAL ENGINEERS, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

MECHANICAL ENGINEER, required for paper mill converting department of large Paper Manufacturer in Eastern Canada. Preferably with experience in Production and Mechanical maintenance. Salary open. Apply to File No. 4013-V.

*MECHANICAL ENGINEER required for chemical plant in Ontario. Duties include production, maintenance and repairs on equipment as well as engineering the location of new equipment or in relocation of present equipment. Salary $300 to $350 or more if experience warrants it. Apply to File No. 4025-V.

MECHANICAL ENGINEERS required in Ontario by a firm specializing in machine tools. Vacancies exist for Junior Salesman with ability and interest in sales engineering also engineer experienced in Production control. Salaries open. Apply to File No. 4026-V.

MECHANICAL ENGINEER required by a road building and earth moving machinery manufacturer in Ontario. Position to eventually lead to General Plant Superintendent. Preferably veteran. Salary open. (Application by letter only.) Apply to File No. 4029-V.

MECHANICAL DRAUGHTSMAN required by large metallurgical firm in the Maritimes for simple designing, layout and detail drawings for colliery plant, screening equipment, hoists, simple steel structures, etc. Salary $240.00 up depending upon ability. Apply to File No. 4030-V.

MECHANICAL ENGINEER preferably with heating and ventilating experience required in Montreal for design and draughting. Salary depending on experience. Apply to File No. 4034-V.

MISCELLANEOUS

*ENGINEER DRAUGHTSMAN for both design and maintenance work, needed in a Montreal Brewery. A six-month preparatory course will be given on steam refrigeration, operating machinery and instrument control equipment in the plant. Starting salary $215.00. Apply to File No. 3670-V.

STRUCTURAL ENGINEER DRAUGHTSMAN, required by a firm of engineer contractors in Alberta. Duties include structural detailer and requires knowledge of major concrete foundations; to detail structural steel buildings, access tower platforms and miscellaneous small steel structures. Salary $300.00. Apply to File No. 3972-V.

DRAUGHTSMAN required by a firm of engineer contractors in Alberta for layout of pipelines and details in refinery construction. Preferably background of refinery experience or alternately powerhouse piping or heavy industrial draughting. Salary $300.00 Apply to File No. 3972-V.

DESIGNING DRAUGHTSMEN preferably graduates in mechanical or electrical engineering with at least 5 years experience in manufacture of sulphite or newsprint pulp required in Province of Quebec. Good salaries and opportunities for advancement. Permanent employment. Apply to File No. 4014-V.

* Filled since appearance in advance notice.

ASSISTANT CITY ENGINEER with experience in municipal engineering required by Sask. City. Duties include operation of pumping sewage disposal and asphalt plants also building inspection department and concrete construction. Salary $4,000 to $4,500. Apply to File No. 4017-V.

ELECTRICAL OR MECHANICAL ENGINEERS required by large Montreal firm to prepare and analyze specifications for telephone equipment manufacturing and installation. Other types of engineering work also available. Salary open. Please send photo together with particulars of education and experience. Apply to File No. 4018-V.

MECHANICAL, STRUCTURAL AND ELECTRICAL ENGINEERS, required in Trail, B.C., as Designers, Draughtsmen and Construction Cost Estimators for Mining, Metallurgical, Chemical and Fertilizer Plant Design and layout. Salary open. Apply to File No. 4023-V.

ARCHITECTURAL DRAUGHTSMAN experienced in industrial building construction, with natural aptitude for design work, wanted by large industry in Eastern Townships, good salary, permanent position to the right man. Apply to File No. 4031-V.

GRADUATE ENGINEER, CHEMICAL OR MECHANICAL. Age 26 to 29, to act as Sales Engineer for Bituminous Coal Importing Company in Province of Quebec. Previous industrial combustion experience helpful but not essential. Must be prepared to travel. Salary $350.00 per month. Application in confidence. Apply to File No. 4033-V.

PLANT ENGINEER, mechanical background, aged 35 to 40, required to modernize plant in Quebec. Duties include setting up and maintenance of paper machinery. Salary $4,500 to $5,000. Apply to File No. 4035-V.

DESIGNING ENGINEERS OR DRAUGHTSMEN, preferably but not necessarily with experience in Pulp and Paper Mill work required for paper mill in Newfoundland. Salaries $300.00 per month or better depending upon experience and ability. Apply to File No. 4036-V.

CHEMICAL OR MECHANICAL ENGINEER GRADUATE, age not over 26, required by Montreal firm for industrial combustion service. Salary $250.00 per month up, depending upon qualification and previous experience. Application in confidence. Apply to File No. 4037-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, perferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER OR CHEMIST interested in textile dyeing required by an industrial firm in South Western Quebec. Salary open. Apply to File No. 3798-V.

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knowledge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER, recent graduate, required to study and become experienced with industrial products fabricated from carbon or graphite by firm in Toronto area. Position to eventually lead to sales. Salary $180 to $200. Apply to File No. 3958-V.

CHEMICAL ENGINEER, recent graduate, is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp and paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

Chemical or Mechanical Engineer

Age 26 to 29, to act as Sales Engineer for Bituminous Coal Importing Company, in Province of Quebec. Previous industrial combustion experience helpful but not essential. Must be prepared to travel. Salary $350.00 per month. Application in confidence. Apply to File No. 4033-V.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Technical and Development Department. Several years' experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

CHEMICAL ENGINEER, experienced in use of physics and mathematics, under 30 years of age, required by industrial and chemical organization with Headquarters in Montreal. Duties include development work and study explosives and chemistry and hydro-dynamics. Salary open. Apply to File No. 3995-V.

CIVIL

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual, may be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area, with three or four years' experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

CIVIL ENGINEERS with some experience on design and field work required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEERS required as draughtsmen in bridge department of large transport company. Preferably with experience in steel, concrete and timber construction. Location Montreal. Salary $200-$300. Apply to File No. 3884-V.

CIVIL ENGINEER required in New Brunswick. Must be qualified designer of miscellaneous public utility buildings in frame and masonry construction. Thorough working knowedge of timber, reinforced concrete and steel framing essential, knowledge of the design of various types of heating system and plumbing. Salary open. Apply to File No. 3887-V.

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewerage Department, also construction of a general nature for the Electic Light Department. Salary open. Apply to File. No. 3930-V.

CIVIL ENGINEER, required by a Steel Company in Montreal for the design of reinforced concrete frame. Salary open. Apply to File No. 3931-V.

JUNIOR CIVIL ENGINEER, with some structural experience, required for general duties by a textile manufacturing concern near Montreal. Salary around $300. Apply to File No. 3954-V.

GRADUATE CIVIL ENGINEER with some experience in municipal work required as Assistant to the Director of Community Planning of the Province of Saskatchewan. Starting salary $200-$250. Apply to File No. 3957-V.

CIVIL ENGINEER, recent graduate, required to understudy City Engineer of a city in Western Quebec. Salary open. Apply to File No. 3966-V.

JUNIOR ENGINEER, preferably with civil background required for sales and service by a Montreal manufacturer of waterproofing compounds. Salary open. Apply to File No. 3968-V.

CIVIL ENGINEER required in Montreal with considerable experience in design of reinforced concrete and steel structures. Ability to make stability reports of wharves and retaining walls, also draft specifications, prepare estimates and economic studies. Preferably bilingual and veteran with overseas service. Salary not less than $3,480. Apply to File No. 3987-V.

CIVIL ENGINEER required in Montreal with general knowledge of re-inforced concrete and steel structures. Special knowledge of triangulation surveys, boundry surveys, also laws and procedures to be followed in regard to the purchase, transfer and registration of lands in Province of Quebec. Must be bilingual. Preferably veteran. Salary not less than $3,480. Apply to File No. 3987-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 30-45, required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Must have sales training in electrical equipment instruments also experience as sales and service engineer. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER, recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER, with general knowledge of a.c. and d.c. motors, switchgear, mercury rectifiers, transformers and other electrical apparatus, for sales work in Eastern Canada, age 30 to 35. Salary open. Apply to File No. 3695-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Preferably bilingual and familiar with rotating electrical equipment. Salary $200 up. Apply to File No. 3761-V.

GRADUATE ELECTRICAL ENGINEERS, with 3 to 10 years experience in design operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced. Bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEER with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

* Filled since appearance in advance notice.

SEVERAL EXPERIENCED ELECTRICAL DRAUGHTSMEN, for the design and layout of industrial power and control systems. Required by consulting engineering office in Montreal. Salary open. Good chance for advancement. Apply to File No. 3890-V.

JUNIOR ELECTRICAL ENGINEER, with practical experience in general manufacturing industries, required by an industrial organization in Ontario. Salary open. Apply to File No. 3904-V.

ELECTRICAL ENGINEERS, required for sales engineering work in Western Canada. Graduates with some selling experience preferred. Salary open, plus expenses. Apply to File No. 3915-V.

*ELECTRICAL ENGINEER wanted for new Chemical Plant in Western Ontario. Engineer must have had previous Electrical Rectification experience. Salary open. Apply to File No. 3945-V.

JUNIOR ELECTRICAL ENGINEER, age about 30, required as assistant to superintendent of light department in Montreal area. Practical experience in Hydro Distribution and Steam Turbines. General office routine of administrative nature. Salary open. Apply to File No. 3950-V.

*GRADUATE ELECTRICAL ENGINEER, age 28-32, required for sales engineering by an industrial firm specializing in products, made of carbon and graphite in Toronto area. Experience in plant maintenance or installation work or Canadian General Electric or Westinghouse test course desirable. Salary $3,000-$3,600. Apply to File No. 3958-V.

ELECTRICAL DRAUGHTSMAN required by a firm of Engineer Contractors in Alberta for layout and plotting with a minimum of supervision. Should be accustomed to working with power lines to 2,300 volts and must be able to do lighting circuits, both overhead and underground. Salary $250 to $300. Apply to File No. 3972-V.

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Quebec for second term, beginning January. Preferably with teaching and practical experience in power, electrical machinery design, lab. etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

RECENT GRADUATE, electrical background, preferably bilingual, required by a Montreal manufacturer of electric motors, generators, ventilating equipment and pumps. Position to eventually lead to sales. Salary open. Apply to File No. 3989-V.

ELECTRICAL ENGINEER with 2 years experience in industrial electrical maintenance and at least 1 year's supervisory experience, age 20-35, required by chemical organization with headquarters in Montreal. Duties include responsibility of all electrical and instrument maintenance also electrical distribution system and air-conditioning system. Salary open. Apply to File No. 3995-V.

ELECTRICAL ENGINEERS, age 30 to 40, required for the Commercial and Distribution Department of large Hydro Electric Utility. Must have experience in electrical distribution. Salary open. Apply to File No. 4002-V.

*ELECTRICAL ENGINEER required for Research Laboratory in Montreal. Knowledge and practical experience in electronics and electric welding desirable. Permanent position. Salary open. Apply to File No. 4004-V.

ELECTRICAL ENGINEERING GRADUATE

Required with minimum of five years' experience in Paper Industry. Between 35-45 years of age, for responsible position with large newsprint manufacturing concern in Northern Ontario. Salary commensurate with qualifications. Living accommodation assured.

Apply stating experience and background to File No. 4032-V.

GRADUATE ELECTRICAL ENGINEER

Experienced in Power Station, Transmission and Distribution design and installation. Permanence and advancement depending upon performance. Applicants should state full details of qualifications, when available and salary expected. Address: Engineering Department, Power Corporation of Canada Limited, 355 St. James St., W., Montreal.

MECHANICAL

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area in a government establishment. Salary from $190.00. Apply to File No. 3401-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEERS with at least five years' experience in the pulp and paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

MECHANICAL ENGINEER with experience in heating, ventilating and air-conditioning required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

MECHANICAL ENGINEERS required by a Pulp and Paper Mill at Powell River, B.C. Preferably with experience in plant design in the pulp and paper industry. Salary according to qualifications. Salary open. Apply to File No. 3796-V.

MECHANICAL ENGINEERS with experience in plant layout and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

MECHANICAL ENGINEER, age 35-40, with considerable experience in design and layout of machinery and equipment required by an organization with Head Office in Montreal. Salary $300-$400. Apply to File No. 3820-V.

MECHANICAL ENGINEER with six to ten years' experience in maintenance and engineering work required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER, required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with knowledge of physical metallurgy heat treatment, ability in stress analysis and design. Required for research work in B.C. Maximum salary $4,000. Apply to File No. 3865-V.

MECHANICAL ENGINEER, age 30-38, required for northern Ontario Paper Mill. Preferably with paper mill experience or experience in general layout and design. Knowledge of pumps capacities, piping, conveyors, estimating and structural design essential. Salary open. Apply to File No. 3891-V.

MECHANICAL ENGINEER, bilingual, with 4 or 5 years' experience in sheet metal work required as Plant Manager by a manufacturer in the Province of Quebec. Salary open. Apply to File No. 3894-V.

RECENT GRADUATE, mechanical background, required by a manufacturer in Montreal for work in machine design, possibly for production in the future. Salary $225. Apply to File No. 3901-V.

MECHANICAL ENGINEER, age 25 to 35, experienced in industrial plant layout and machine design required by manufacturing firm in Brantford. Salary open. Apply to File No. 3907-V.

MECHANICAL ENGINEER, recent graduate, with some knowledge of heat exchanges, condensers, or any type of unfired pressure vessels required by an industrial organization in Montreal. Salary open. Apply to File No. 3976-V.

MECHANICAL ENGINEER, recent graduate, bilingual, with some experience in general plant work, required in Montreal Industrial engineering experience would be useful. Duties include time-study in Standards Department. Salary open. Apply to File No. 3980-V.

MECHANICAL ENGINEER age 25 to 30 is required by a company in Shawinigan Falls to eventually act as Assistant Works Manager when qualified. Salary open. Apply to File No. 3985-V.

MECHANICAL ENGINEER, with experience in plant lay-out and knowledge of re-inforced concrete, timber and steel design, required in an industrial manufacturing and processing plant, situated 75 miles from both Ottawa and Montreal. Salary open. Apply to File No. 3990-V.

GRADUATE MECHANICAL ENGINEER required by engineering concern in Montreal area engaged in manufacture of hydraulic turbines and mining machinery. Preferably with 5 or more years' experience. Excellent working conditions, free pension, group and health insurance, five day week, cafeteria service. Salary open. Apply to File No. 3992-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in reinforced concrete and structural steel required by a mining company in Northen Ontario. Housing available. Salary open. Apply to File No. 3994-V.

* Filled since appearance in advance notice.

MECHANICAL ENGINEER, with 2 or 3 years' experience, preferably bilingual, required as Mechanical Development Engineer by industrial and chemical organization with headquarters in Montreal. Duties will be conducting investigations on existing equipment and a certain amount of plant layout and draughting. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER with 1 to 3 years' experience in production, required as Industrial Engineer by industrial and chemical organization with headquarters in Montreal. Duties include responsibility for conducting methods, engineering studies, using methods of process charts, time and motion study. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER, required by a Montreal manufacturer of machines and equipment for work consisting of general engineering and design in connection with the manufacture of pulp and paper machinery. Salary open. Apply to File No. 4000-V.

MECHANICAL ENGINEER, required by a textile manufacturing concern near Montreal. Applicant after becoming acquainted with the plant would be expected to act as general follow up man on repair of mechanical and electrical equipment, also see that all material necessary is on order or on hand. Salary open. Apply to File No. 4001-V.

*MECHANICAL ENGINEER with some experience in production control methods required for a progressive furniture manufacturer in the Eastern Townships. Preferably bilingual. Salary open. Apply to File No. 4006-V.

MECHANICAL ENGINEER, must be bilingual, required by paper company for general duties in line with capabilities and interest. Position in very small community in Province of Quebec. Salary open. Apply to File No. 4020-V.

MECHANICAL ENGINEER required as assistant in Chief Engineers Department by large paper company. Paper experience essential. Some knowledge of French language would be helpful. Must be able to complete investigations and write reports. Age 28-40. Salary $350-$450. Apply to File No. 4022-V.

METALLURGICAL

METALLURGICAL ENGINEER, preferably with lab. experience, also some industrial experience would be helpful, required by large transportation company in Montreal. Salary open. Apply to File No. 3998-V.

MINING

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MINING ENGINEER with several years experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

MISCELLANEOUS

MANAGEMENT ENGINEER with business administration and mechanical background, age 30 up, bilingual with at least 5 years practical experience, required by an industrial engineering consultant in Montreal. Salary open. Apply to File No. 3307-V.

STRUCTURAL STEEL DRAUGHTSMAN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS, required by an industrial and chemical organization with headquarters in Montreal for all phases of research, design, operation development, production and maintenance. Salaries open. Apply to File No. 3588-V.

DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply by letter with full details. Salary open. Apply to File No. 3628-V.

SALES ENGINEER with wide engineering experience, wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No 3639-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

CIVIL ENGINEERS and ASSISTANT HYDRAULIC ENGINEERS required for government organization on West Coast for highway and construction. Salary open. Apply to File No. 3724-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience, required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience, required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

SALES ENGINEER, preferably bilingual required by a Montreal firm dealing in building materials. Salary from $200 Apply to File No. 3745-V.

GRADUATE ENGINEER, required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel, and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted Apply to File No. 3780-V.

GRADUATE CIVIL OR MECHANICAL ENGINEERS with 3 to 10 years experience in design, cost estimates, draughting and engineering studies for a large hydro-electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

STEAM PLANT ENGINEER, for large concern in Eastern Townships, with at least 5 years practical experience. Must be familiar with thermo-dynamics, combustion control, steam turbines, mechanical refrigeration, hydraulics, etc. Permanent position and attractive salary for the right man. Apply to File No. 3791-V.

RECENT GRADUATES OR JUNIOR ENGINEERS, with mechanical background, required by a Montreal Engineering, fabricating and contracting firm for training purposes leading to sales and service. Area Montreal. Salary $175 up. Apply to File No. 3810-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open Apply to File No. 3811-V.

* Filled since appearance in advance notice.

DRAUGHTSMEN required by a pulp and paper mill in the Eastern Townships for general draughting and detailing. Three or four years experience preferred but not essential Salary open. Apply to File No. 3823-V.

DRAUGHTSMAN, preferably with mechanical background, required by a manufacturer in Montreal for design work on electrical equipment. Salary open. Apply to File No. 3829-V

CITY ENGINEER required by City of Moose Jaw, Saskatchewan. Salary open. Apply to File No. 3856-V.

DRAUGHTSMAN of the following classes: Architectural, piping layout, equipment layout, mechanical design, steam plant, heating, and ventilating electrical and plumbing required by an industrial organization in Montreal. Salaries open. Apply to File No. 3860-V.

STRUCTURAL STEEL CHECKER AND ONE DETAILER CHECKER, wanted for large fabricating plant in Vancouver, B.C. Age between 30 and 40 years preferred. Must be experienced. Give full information and references. Salary open. Apply to File No. 3862-V.

MECHANICAL CHEMICAL OR CIVIL, recent graduate up, required for sales and service in Toronto by a Montreal manufacturer. Salary open. Apply to File No. 3867-V.

MECHANICAL OR CHEMICAL ENGINEER, recent graduate, required by a firm in Montreal. Ability to do simple drawings, such as layout of piping and instruments. Some experience in oil refinery or chemical plant or pulp and paper would be useful. Position to eventually lead to sales. Salary $200. Apply to File No. 3879-V.

GRADUATE ENGINEERS required for all phases of research, design, operation, and development by an industrial organization with Head Office in Montreal. Salaries open. Apply to File No. 3882-V.

*SALES ENGINEERS, required by established Canadian manufacturer of fabricated steel products. Some construction experience an advantage. Wanted for Maritimes, Ontario and Manitoba. Salary open. Apply to File No. 3883-V.

*GRADUATE ENGINEER, familiar with industrial processes, metallurgical and chemical engineering as applied to steel, copper, mining and chemical plants. Broad general experience in estimating and designing. Salary open. Toronto area. Apply to File No. 3886-V.

CIVIL OR STRUCTURAL ENGINEER, 24-35 years, required for Northern Ontario Paper Mill. At least 2 years construction and 2 years design experience. Opportunity to train junior personnel. Salary not less than $350. Apply to File No. 3891-V.

STRUCTURAL ENGINEER, preferably a graduate civil engineer with experience in the design of mill buildings required by a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 3896-V.

DETAILERS OR JUNIOR DESIGNERS on mechanical or sheet metal design required by an industrial organization in Ontario. Salary open. Apply to File No. 3904-V.

INDUSTRIAL ENGINEERS, with production experience required by a firm of industrial consultants in Montreal. Preferably with experience in time study, cost control etc. Salary around $400 depending on qualifications. Apply to File No. 3910-V.

RECENT GRADUATES in Electrical or Mechanical Engineering can still be offered the opportunity of being trained by large Hydro-Electric Utility. Very good opportunities for regular employment in various departments at the completion of training period. Minimum salary 1st year $200: 2nd year $215. Apply to File No. 3912-V.

GRADUATE ENGINEER, Mechanical, Electrical or Civil, about 30 years of age, required by a large Hydro-Electric Utility in Montreal for Field Testing Hydraulic Turbines. Salary open. Apply to File No. 3932-V.

RECENT GRADUATE required by a Montreal contractor for survey and making of plans. Must be bilingual. Salary $175 up according to experience. Apply to File No. 3933-V.

TWO METALLURGICAL ENGINEERS AND ONE CHEMICAL ENGINEER, required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

SALES ENGINEER required by well known manufacturer of mechanical equipment to solicit industrial accounts throughout the Province of Quebec. Applicants must reply giving full details, age, training, etc. Salary open. Apply to File No. 3951-V.

INDUSTRIAL ENGINEER thoroughly experienced in time study, standard data and wage incentive installation and administration required for firm in Quebec. Salary open. Apply to File No. 3952-V.

JUNIOR ENGINEERS, preferably with mechanical background required for general duties by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 3954-V.

CITY ENGINEER, required by a City in Saskatchewan to take full charge of its utilities which include electric light, power, sewer, water, sidewalk, etc. Salary open. Apply to File No. 3955-V.

*GRADUATE ENGINEER, experienced in work analysis and job simplification. Should be bilingual and experienced in handling staff. Permanent position in Montreal. Salary $350 with good prospects for advancement. Apply to File No. 3959-V.

INDUSTRIAL ENGINEER to act as assistant in the Engineering Department of Meat Packing firm with plants throughout Canada, Headquarters in Calgary. Requires knowledge of building construction, mechanical maintenance and power plant work. Experience in refrigeration desirable. Salary open. Apply to File No. 3960-V.

JUNIOR ENGINEER preferably chemical background required for Alberta refinery. Duties include plant tests, inspection of equipment and assistance on designs and specifications. Opportunity for supervised training in all phases of refinery operations. Salary open. Apply to File No. 3961-V.

Engineer for McGill

McGill University requires for its department of buildings and grounds a junior graduate engineer with civil or mechanical qualifications. Moderate salary with excellent prospects for advancement.

Reply by letter only, giving in first instance full particulars as to age, education, experience, marital status, address and telephone number to FILE NUMBER 4057.

*DRAUGHTSMAN preferably with electrical or mechanical background required for industrial plant layout and electrical and mechanical equipment of buildings, by a firm of consultants in Montreal. Salary open. Apply to File No. 3964-V.

JUNIOR SALES ENGINEERS with production experience required by a firm of industrial consultants in Montreal. Salary $300 depending on qualifications. Apply to File No. 3965-V.

PRODUCTION SUPERVISOR, age 30 to 45 years, with experience in sheet metal fabrication required by established Canadian manufacturer in Ontario. Salary open. Apply to File No. 3970-V.

*GRADUATE ENGINEERS, age 20-35, with training in one or more of the following lines—foundation work involving reinforced concrete; structural steel; steam and process piping; oil refinery experience boilers; pumps and heat exchange equipment and miscellaneous machinery; required by oil company in Montreal. Salary open. Apply to File No. 3974-V.

ENGINEER with estimating and cost experience, able to read blueprints, take off and price materials, evaluate general machine and assembly shop operations and fully capable of organizing and installing a Standard Cost System. Required by a manufacturer in Southern Ontario. Salary according to qualifications and ability. Apply to File No. 3977-V.

GRADUATE ENGINEER, with some experience in a manufacturing industry, required by Hamilton company. Some knowledge of production operations, mill scheduling, job evaluation, time study, job methods, industrial relations would be helpful. Salary open. Apply to File No. 3981-V.

*GRADUATE ENGINEER, interested in sales, preferably with electrical background, required in Montreal. Salary around $275. Apply to File No. 3983-V.

ELECTRICAL OR MECHANICAL ENGINEER, recent graduate, bilingual preferred, required for Public Utility in Quebec City Salary open. Apply to File No. 3993-V.

GRADUATE ENGINEER, age 32 up, preferably bilingual and with 10 years experience in industrial design required by chemical organization with headquarters in Montreal. Duties include supervision of Works Design Department, supply draughting and design service for plant, prepare appropriation requests, maintain cost estimating units etc. Salary open. Apply to File No. 3995-V.

GRADUATE ENGINEER, three to five years plant experience, required by chemical organization in Montreal. Duties include assisting in developing and carrying out in various plants training programs in subject and related fields for junior industrial engineers. Develop and apply such office routine as may be necessary. Salary open. Apply to File 3995-V.

MECHANICAL ELECTRICAL OR CIVIL ENGINEER, age 23-30, preferably single and bilingual with some experience in maintenance required by an industrial and chemical organization with headquarters in Montreal. Duties include construction project and design studies. Salary open. Apply to File No. 3995-V.

GRADUATE ENGINEER, with some experience in industrial building design to supervise construction of the railway buildings and allied structures of a large railway terminal project in Montreal. Salary $300 to $350. Apply to File No. 3996-V.

*SENIOR ENGINEER for layout work on construction job required by construction firm in Montreal. Location of job around 300 miles west of Montreal. Salary $300 to $350. Apply to File No. 3997-V.

CIVIL OR MECHANICAL ENGINEERS with up to five years design experience required by an engineering firm in Montreal for hydraulic work. Salary open. Apply to File No. 3999-V.

CIVIL OR MECHANICAL ENGINEER wanted with 5 to 8 years experience for key position in moderate size plant in Manitoba doing fabrication of Plate Work and Light Steel Work, also Grey Iron Foundry and Machine Shop. This will lead to key position in a growing organization. Salary open. Apply to File No. 4003-V.

JUNIOR SALES ENGINEER, preferably with a few years sales experience required by Montreal branch of a firm manufacturing industrial products. Salary open. Apply to File No. 4007-V.

SALES ENGINEER required by a manufacturer of industrial building products in the Toronto area. Preferably with sales experience and knowledge of building products. Salary open Apply to File No. 4008-V.

* Filled since appearance in advance notice.

CHIEF CHEMIST

To co-ordinate and supervise quality control, research and development work in laboratories of large industrial organization engaged in manufacture and processing of soaps, cosmetics, dentifrices, edible fats and oils, glycerine and frozen foods.

In addition to having a thorough knowledge of all phases of laboratory work and the chemistry of oils and fats, the applicant must have the ability to handle staff and be capable of correlating marketing problems and assuming administrative responsibility.

Apply in writing, giving full particulars of education, experience, present position and age to:

C. R. BAKER, *Technical Director*

Lever Brothers Limited

299 Eastern Avenue, Toronto

General Contractor Requires Chief Engineer

A large firm of General Contractors, with Head Office in Montreal, invites applications for position of Chief Engineer.

Applicants should be graduate engineers, 35 to 45 years of age, with extensive and successful office and field experience in estimating, general designing, making working drawings and engineering supervision on construction of hydro-electric developments, wharf, bridge and heavy foundation construction.

Knowledge of French essential.

Minimum salary $500 per month.

File 4060-V

SENIOR SALES ENGINEER required as District Manager by a firm manufacturing industrial products in Ontario. Must have considerable sales experience. Salary open. Apply to File No 4008-V.

MECHANICAL AND CHEMICAL ENGINEERS, interested in entering the Pulp and Paper industry, required in Newfoundland. Vacancies in Technical Department and studying process work and improved methods of operation. Pulp and paper experience is not necessary. Salary open. Apply to File No. 4009-V.

SAFETY SUPERVISOR required for South America. Age 25-40 years. Single. To supervise safety activities, promote safety first and inspect operations to assure proper installation and use of safety devices. Salary $350 U.S. currency. Apply to File No. 4011-V.

RESERVOIR ENGINEER, required for South America. Age 25-35. Should be experienced in reservoir and production cost analysis. Capable of determining efficient flow rates for reservoirs and wells. Salary approximately $400 U.S. currency. Apply to File No. 4011-V.

MAINTENANCE ENGINEER, required for South America. Age 35-40. Duties include, refinery maintenance, inspection of units, metal inspection work. Responsible for engineering calculations, design of equipment and pipefitting work. Salary $375 U.S. currency. Apply to File No. 4011-V.

POWER PLANT SUPERVISOR required for South America. Age 30-40, single preferred. To supervise steam power plant including operating, boiler cleaning and minor repairs. Salary $375 U.S. currency. Apply to File No. 4011-V.

*SALES AND SERVICE ENGINEER, preferably a graduate in mechanical or chemical engineering required for power plant field in the Toronto area. Possession or ability to obtain an automobile for transportation essential. Starting salary $250 to $325 according to experience. Apply to File No. 4012-V.

*ENGINEERING DRAUGHTSMAN, with mechanical background required by large paper company in the Province of Quebec. Salary $250-$300. Apply to File No. 4019-V.

GRADUATE ENGINEER, required as Assistant to Manager of Sawmill and Woodlands operations. Position located in Ontario. Good commercial sense essential also some sales ability Salary $300-$350. Apply to File No. 4021-V.

Situations Wanted

MECHANICAL AND CIVIL ENGINEER, M.E.I.C., Queen's, 48. 5 years hydro-electric power development construction, 1 year industrial building construction, 2 years sales engineer and estimator architectural iron works concern, 14 years oil refinery on initial construction, on operations and maintenance, last 6 years refinery engineer in charge of maintenance, safety, equipment inspection, design and construction of plant changes and extensions, industrial buildings. Resigned to undertake private venture. Desires to re-enter industry. Apply to File No. 166-W.

MECHANICAL ENGINEER. Jr.E.I.C., McGill University. Eight years experience Tool and Production Methods Engineer. Age 38. Married. Presently employed. Desires employment as Production Manager or Materials Engineer for large company. Preferably Montreal area. Apply to File No. 551-W.

PART TIME WORK — Senior Civil Engineer P.E.Q., M.E.I.C. Montreal area, available part time where consultant or engineer staff short handed. Preliminary plans, estimates, reports, industrial or engineering projects. Apply to File No. 1021-W.

MECHANICAL ENGINEER, B.Sc. Queen's '35, M.E.I.C., M.I.A.S., P. Eng. Que. Married, age 37, over twelve years experience including design, stress analysis, maintenance, inspection, administration and 5½ years as an R.C.A.F. Engineer Officer. Presently employed desires permanent position with good future prospects. Preferably in an English speaking locality. Apply to File No. 1042-W.

ELECTRICAL ENGINEER, Jr.E.I.C., P.E. Que., McGill '44, single, bilingual, ex-naval officer, two years experience as assistant electrical superintendent in a large industrial plant. Desires change in position. Apply to File No. 1450-W.

CIVIL ENGINEER, P. Eng. Jr.E.I.C., McGill graduate, would like spare time work at design of reinforced concrete or structural steel on a fee basis or otherwise. Also qualified for checking drawings and estimating quantities and cost. At present employed in the Montreal district. Apply to File No. 1552-W.

GRADUATE MECHANCIAL ENGINEER, M.E.I.C., P. Eng. Que., M.A.S.T.E. Stuttgart 1924, married. 18 years experience in experimental work, plant maintenance, aircraft, jig and tool design, mechanical equipment and handling fixtures. Available at short notice. Montreal area preferred. Apply to File No. 1862-W.

CIVIL ENGINEER, C.E., B.Sc., M.E.I.C., age 32, married, with experience in road construction; surveying; industrial plant lay-out, including steel tank erection; piping design and installation, equipment installation; building construction such as offices, warehouses, service station; costings; estimates; administrative control. Working knowledge of cost and operational studies, inventory work, material necessary for all types of construction work. Will accept responsible position anywhere. Salary in accordance with responsibility and living conditions. Apply to File No. 1914-W.

ELECTRONICS ENGINEER, Jr.E.I.C., B.E.E., McGill, 1938, S.M.-M.I.T. 1942; P. Eng. Que., with 10 years general design and supervisory experience in electronics desires position or partnership with consultant or manufacturing firm with view towards exploiting the field of electronics and electronic controls in industry. Location anywhere, but preferably Montreal. Apply to File No. 2492-W.

EXECUTIVE ENGINEER, M.E.I.C., B.A.Sc., R.P.E. (B.C.). Veteran, age 35, married. 15 years civil engineering and construction over 7 years in executive capacity. Interested in position with construction or industrial firm in British Columbia or Ontario. Apply to File No. 2515-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.E.Q. B.Sc. Age 32, married. Presently engaged in Montreal area would prefer position in Eastern Ontario. Experience includes machine design, jig, tool and die design, methods engineering, design development, plant layout, engineering department organization. 4½ years as chief engineer. Also experience in construction industry on building, mechanical and electrical trades. Salary $415 per month. Available one month's notice. Apply to File No. 2682-W.

ELECTRICAL ENGINEER, B.Eng. Honors, McGill 1943, Jr.E.I.C., A.I.R.E., P.Eng. (Que.), 26, married, presently employed, desires change to smaller organization with more general scope, broader future responsible outlook, in Ontario or B.C. Experience in heavy manufacturing, radio production, standardization, specification, audio design. Apply to File No. 2727-W.

* Filled since appearance in advance notice.

ELECTRICAL ENGINEER, M.E.I.C., Graduate I.E.E., thorough grounding in cable and transformer manufacture, development and estimating. Also extensive instrument making experience in Government Laboratories. Anxious to contact companies re-openings in application sales, maintenance or production engineering. Age 26, single. Apply to File No. 2876-W.

MECHANICAL ENGINEER, Jr.E.I.C., McGill '44, age 26, bilingual, single, good health. Due to an unusual situation, have not been employed in work of an engineering nature since graduation. Would prefer to locate with organization building custom-built automatic industrial machinery. Available on short notice for assignment in Canada or U.S.A. Apply to File No. 2882-W.

CHEMICAL ENGINEER, Jr. E.I.C., B. Eng., McGill '45, age 24, single. 2½ years experience in quality control general office work and for over a year with pulp and paper mill (sulphite) on process control working in conjunction with the foreman. Desires position in production, planning, or sales engineering requiring initiative. Prefer Montreal or vicinity. Available on one month's notice. Apply to File No. 2899-W.

GRADUATE CIVIL ENGINEER, B.Sc. Alberta, 1947, S.E.I.C., married, desires position doing structural design work. Preferably in reinforced concrete or steel. Two years experience in draughting and half year practical work in field. West Coast area preferred. But would consider other localities. Presently employed and residing in Edmonton. Apply to File No. 2907-W.

CIVIL ENGINEER, B.A.Sc. (Toronto) S.E.I.C., P. Eng. Ont. with some experience in reinforced concrete and structural steel design including detailing of reinforced concrete and estimating. Would accept part time work during evenings and weekends. At present employed and residing in the Toronto area. Apply to File No. 2910-W.

ENGINEER, (27), graduate of London (England) University, ambitious and energetic with five years industrial experience, lately Deputy Works Manager in a large chemical works. Familiar with design, production control, costing, job evaluation and factory lay-out procedure. Handled a great variety of equipment, tactful leader of men, but keen and able to get results. Willing to accept responsibility. Living at present in Toronto, Ontario, but willing to go to any part of Canada or abroad. Apply to File No. 2912-W.

SUPERINTENDENT, GRADUATE ENGINEER, P. Eng. (Ont.), M.E.I.C., 12 years' experience with men and cost control in casting, fabricating and machining brass, aluminum and grey iron. Available immediately. Apply to File No. 2913-W.

YOUNG GRADUATE CIVIL ENGINEER, S.E.I.C. Presently employed seeks part time work of such nature that it may be done at home i.e. Estimates etc. Apply to File No. 2914-W.

CIVIL ENGINEERING STUDENT, S.E.I.C., 3rd year at McGill University would like part time work with firm in Montreal vicinity, dealing with design or construction of structural steel or reinforced concrete; 25-30 daytime hours per week available, plus evenings if necessary. Experienced in foundation construction. Apply to File No. 2916-W.

GRADUATE ELECTRICAL ENGINEER, McGill '24, M.E.I.C., Prof. Eng. Que.; over 20 years experience in High Voltage Transmission line, design and construction. Interested in part time or temporary position in general engineering or transmission line work. Location preferably Montreal or in B.C. At present residing in Montreal area, due to certain physical defects the type of work that can be undertaken is limited. Available at once. Apply to File No. 2918-W.

MECHANICAL ENGINEER, M.E.I.C., P. Eng. (Que.) B.A.Sc., Ecole Polytechnique '44. Presently employed with R.C.E.M.E. Canadian Army. To be released from engagement in one month or two. Age 24, married, bilingual, 2 years experience in automotive engineering, job evaluation, supervision, management and administrative work. Also experience in designing mechanical testing apparatus. Would consider any kind of work with industrial firm. Willing to learn. Apply to File No. 2919-W.

MECHANICAL ENGINEER, M.E.I.C., P. Eng. Que., B. Eng. '40 McGill, age 33, married. Presently employed, desires experience in heating and ventilating. Experience with boilers, piping, construction, machine shop and plant maintenance. Available 1 month. Apply to File No. 2922-W.

GRADUATE MECHANICAL ENGINEER, Ph.D. (London), M.E., A.M.I. Mech. E., age 36, single, 10 years' experience in plant maintenance, plant layout, production control, industrial administration, research and development. At present employed in the Montreal district. Apply to File No. 2929-W.

CIVIL ENGINEER, M.Sc., M.I.T., Jr.E.I.C., interested in part time work in steel and reinforced concrete design. Presently employed as instructor at a Canadian University. Four years practical experience in design. Must be Montreal area. Apply to File No. 2930-W.

GRADUATE, Institution of Mechanical Engineers (England), age 25, seeks position of Junior Engineer with a firm engaged in producing consumer goods. Five years engineering apprentice; one year draughting; and three years as junior metallurgist mainly occupied in solving production problems from a metallurgical aspect. Apply to File No. 2933-W.

GRADUATE ENGINEER, M.E.I.C., age 30, veteran, married. Experience includes maintenance, construction, production, etc. Toronto area preferred. One month's notice. Apply to File No. 2934-W.

BUSINESS & INDUSTRIAL BRIEFS

A Digest of Information received by The Editor

Hobbs Glass Open New Branches

Hobbs Glass Limited has announced that during recent months new branches have been opened at Moncton, Trois Rivieres, Peterborough, Oshawa, Sudbury and Kitchener. These branches have been opened to provide better and faster service in the adjacent communities.

Complete stock will be carried at all points.

For further details communicate with Fred Jones, Director in charge of Sales, Hobbs Glass Limited, London, Ontario.

New Company Formed

A new company, International Rectifier Corporation, has been formed and a plant, at 6809 Victoria Avenue, Los Angeles, California, has been opened. The new firm is equipped for research and manufacture in the field of colorimetric equipment, photo-electric cells and selenium rectifiers.

For further information communicate with the Company at the address given above.

New Type Heater

The Young Radiator Company, Racine, Wisconsin, has announced the introduction of a new type of circular vertical discharge unit heater to be known as the " Vertiflow ". The manufacturer claims that this new type of heater will increase heating efficiency, reduce operating noise to a minimum and save 35% in total unit weight.

For complete details communicate with Young Radiator Company, Racine, Wisconsin.

A New Low Alloy Steel

The Steel Company of Canada Limited, P.O. Box 460, Montreal, Quebec, has announced the introduction of a new Nickel-Copper-Molybdenum steel which will be known as " Steelcoloy ".

The manufacturer states that this new material will be produced in the form of plates, sheets and bars. It is claimed that it possesses sound weldability and great resistance to corrosion, shock and abrasion. It has good tensile and elastic properties.

This new product is particularly recommended for the construction of railway freight, hopper and gondola cars and coaches, mine cars, buses, truck bodies and marine use. For further information communicate with the manufacturer at the address given above.

New Boiler Catalogue

The Dominion Bridge Company Ltd. of Lachine, Que. have produced a new catalogue of Water Tube Boilers.

The catalogue is attractively designed and very informative. It measures 11" by 8½". For copies of the catalogue communicate with the Dominion Bridge Co. Ltd., P.O. Box 280, Montreal, Que. Ask for publication No. B 103.

Toronto Firm Becomes Limited Company

The Hamilton Gear and Machine Company, which has been operating under that name since 1911, is now a Limited Company. There is no change in operation or ownership. The Toronto City authorities are changing the name of Van Horne Street, on which the Company's plant and offices are located, to Dupont Street, so that although this Company has not moved, it now has a new address.

The correct mailing address is The Hamilton Gear and Machine Company Limited, 950 Dupont Street, Toronto 4, Ontario.

B.A. Oil Plans Huge Expansion

W. H. Whiteford, president of the British American Oil Company Limited has announced an expansion programme in Canada, which, he said " will increase the company's overall fuel output by 25 per cent ". At a press conference Mr. Whiteford announced a $15,000,000 expansion programme for the Company's refinery at Montreal to be completed early in 1950. He also announced a $2,500,000 expansion programme at the Company's lubricating oil plant at Clarkson, Ontario, to be completed within, approximately, one year.

English Electric Receives Offer

The Directors of the English Electric Company of Canada Ltd. have approved a proposal made by John Inglis Co. Ltd. which will bring about a closer integration of the companies' operations with economies which should be reflected in improved earnings.

At the time of going to press this matter was being considered by the shareholders of the English Electric Company.

For further details communicate with the English Electric Company of Canada Limited, St. Catharines, Ont.

New Plastic Mortar

A new mortar sealant has been formulated, by the American Flursit Co. Inc. of 635 Rockdale Avenue, Cincinnati 29, Ohio, for use between glass blocks.

The manufacturer claims that it will form a tight flexible bond to the glass and that it can readily be applied with a caulking gun or thinned down, with suitable solvents, to brushing consistency.

For further details communicate with the American Fluresit Co. Inc., at the address given above.

Chain Belt Company Announces New Pavers

The Chain Belt Company of Milwaukee has announced two new Rex Pavers. From an appearance standpoint, they are radically different from their conventional counterparts. They are streamlined and the streamlining has been designed to afford protection and easy access to all working parts. Special mechanical innovations permit the operator to sit comfortably and operate the paver at top speed throughout the day. The manufacturer claims many other advantages for this equipment. For complete details communicate with the Chain Belt Company, 1600 W. Bruce Street, Milwaukee 4, Wis.

Canadian Vickers Limited Manufacturing Tractors

A crawler type tractor and bulldozer is being manufactured by Canadian Vickers Limited, Montreal. The firm has been licensed by Laurentide Equipment Company who will handle distribution. The new tractor will be known as the " Laurentide Beetle ". Dealers and agents are to be appointed.

For specifications and delivery dates please communicate with Laurentide Equipment Company Limited, 440 Beaumont Avenue, Montreal.

International Nickel Promotions

Ralph D. Parker, J. Roy Gordon and Herbert G. Fales have been elected as Assistant Vice-Presidents of The International Nickel Company of Canada Ltd.

Mr. Parker will continue as General Superintendent of the Company's Mining and Smelting Division. Mr. Gordon was previously Technical Assistant to Mr. Beattie, Vice-President and General Manager. Mr. Fales is Vice-President and Director of the International Nickel Company Inc., the United States subsidiary of the Canadian company.

New Battery-Charger Announced By General Electric

A new motor-driven battery-charging unit designed for charging 6-cell lead-acid, and 10-cell Edison batteries has been added to the line of General Electric Battery-charging equipment. Starting, charging and shut-down are performed automatically by the new unit. It can be used on 220 or 440, 3-phase, 60-cycle power supply. For complete details communicate with Canadian General Electric Company Limited, 212 King Street W., Toronto 1, Ontario.

New Booklet on Metal Protection Issued by Arco

A new booklet entitled " Lasting Protection for Metal Surfaces " has just been released by the Arco Company, Cleveland, Ohio. It presents the manufacturer's claims for " Dum Dum " for metal, a new type of water-repellent coating. For copies, communicate with The Arco Company, 7301 Bessemer Avenue, Cleveland 4, Ohio.

Light Weight Aluminum Safety Ventilator

A new light weight, aluminum portable safety ventilator is announced by the United Electric Motor Company, 178 Center Street, New York City. It is called " SAF-T-AIR ". It is motor driven with a capacity of 425 cubic feet per minute and weighs 50 pounds. It is spark proof and can be connected to the nearest lighting or power supply outlet without danger of overloading. It can be used as a blower or exhauster.

Write to the manufacturer for descriptive bulletin number B148.

New Agent Appointed

Adolph Gottscho, Inc., manufacturers of labor-saving marking and code-dating machines have announced the appointment of Richardson Agencies, Ltd., of 454 King Street West, Toronto, and of Vancouver, as their Canadian representatives.

Copies of a brochure illustrating the equipment manufactured by this company may be obtained by application to the Canadian agents.

" Abegweit " Wheelhouse Is Non-Magnetic

The Aluminum Company of Canada Limited have informed the editor of the *Journal* that the Abegweit, the world's largest ice-breaking car ferry, has a wheelhouse constructed of aluminum. Aluminum was specified for this purpose because it is non-magnetic and thus will not affect the compasses and other delicate navigational instruments.

Northern Electric Appointment

L. P. Stiles, assistant Central District Manager of the Northern Electric Co. Ltd., Toronto, will replace W. R. Ostrom as Central District Manager, Toronto. Mr. Ostrom has retired.

" Speedaire "

The Cleveland Worm & Gear Company of Cleveland, Ohio, are featuring a fan-cooled " Speedaire " unit—a new worm gear speed reducer.

The manufacturer states that it is " air conditioned ". It is built with a double-walled housing, and an induction fan; which is installed on the coupling end of the worm shaft and draws a high velocity air stream between the inner and outer walls of the housing. This continuous action removes the heat generated by the unit.

It is claimed that this new unit "doubles the horsepower ", saves space, weight and money. For details communicate with the manufacturers' Canadian agent, Peacock Brothers Limited, Montreal, Que.

An Electric Salt-Bath Furnace

The Canadian General Electric Company of 212 King Street West, Toronto 1, have produced a four page illustrated pamphlet on the Ajax-Hultgren Electric Salt-Bath Furnace.

The furnace operates on an entirely new principle of immersed-electrode design and offers many advantages in installations requiring heat treatment within a broad range from 300 to 2400 deg. F. Write to the manufacturer and ask for illustrated pamphlet No. 4402.

Worthington Appointment

The Worthington Pump and Machinery Corporation, of New Jersey, have announced the appointment of Henry H. Ritchotte as Regional Manager in charge of sales of Worthington Construction Equipment and Mining Products in Canada. Mr. Richotte will make his headquarters in Toronto at the offices of John Inglis Co., Limited.

New Inter-Comm System

The Talk-A-Phone Company, of 1512 S. Pulaski Road, Chicago, 23, Ill. have announced " Elsie ", a new two - station inter - communication system. They claim it is suitable for installation in homes, farms, professional offices, etc. For a complete descriptive folder on this system communicate with the manufacturer.

Grasp the potentials of

AIR PRESSURE

—air working to get free—striving to return to its natural volume

Pushing, forcing, cleaning, turning wheels, drills and grindstones—these are but few of the myriad tasks air will do, always that its power may be released.

Man's technical and engineering best is required to enslave this power giant with safety. Making equipment for compressing air is a job for skilled men with wide experience—the type who, by their precise workmanship for over 85 years, have made Babcock equipment famous for dependability.

Our Engineers will welcome the opportunity to discuss with you your Compressed Air Problems.

BABCOCK

VERTICAL AIR COMPRESSORS

are built to suit your individual requirements and in single and two stage designs for pressures up to 125 lbs. per sq. in.

POWER PLANT CONTROL

(Left) Individual Boiler Panel showing Meters, Recorders, Controllers, Gauges, Selector Valves, Ammeters and Pushbutton Stations.

(Below) View at Front of Boilers showing Boiler Metering and Control Panels.

Canada's largest steam generating boilers, installed in the Polymer Plant at Sarnia, Ontario, are equipped with a complete quota of Bailey meters, three-element air-operated feedwater control, and automatic combustion control. The automatic control of feedwater flow and combustion includes provision for remote manual control by air pressure from the individual boiler panels, of the various factors involved, such as, feedwater flow, fuel feed, forced draft air supply and induced draft fan speed. On certain of the boilers which are equipped to burn refinery gas as well as pulverized coal, the automatic control system governs the burning of these two fuels in the proper proportions and with optimum combustion efficiency, and incorporates necessary safety interlocks.

The generated steam on its way from the boilers to the steam turbines, to the feedwater treating system, and to the main process headers, passes through Bailey reducing and desuperheating stations which automatically control its pressure and temperature as required for each of these services. All of this distributed steam is measured by Bailey steam flow meters which also record its pressure and temperature in the different distribution headers. Bailey meters record the quantity and temperature of the feedwater to the boilers, the desuperheating water, condensate returns and continuous blow-down. The various meters, recorders, controllers, indicators and selector valves are mounted on panels strategically located in the turbine room and water treating plant.

UNDIVIDED RESPONSIBILITY IN DESIGN, MANUFACTURE, INSTALLATION AND SERVICE OF OUR METERS AND EQUIPMENT ENSURES *Lasting Satisfaction to our Customers.*

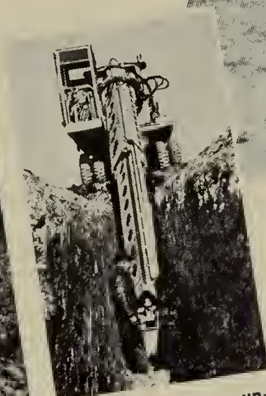
GRÂDALL COMES TO CANADA

Foundations are dug with clean-cut sides and floored to perfect grade, eliminating the expense of extra operations. Utility and sewage trenches can then be dug, with equal efficiency.



Isolated locations, unfavourable terrain, cramped quarters, are no problem for the Gradall.

The Gradall is invaluable for highway work. With its various implements it is suited to a wide variety of road construction and maintenance jobs. Widening, grading, sloping, ripping and loading are routine for the Gradall.

A new and highly efficient tool for the contractor, the Gradall is basically a mobile combination of interchangeable tools operated entirely by hydraulic power. The light, strong, welded boom moves in and out, up and down, tilts 45° each way, and the turntable swings up to 360°. Quick-change scraper blades, digging buckets, rippers, ditching and trenching tools, and loading buckets can be carried with the Gradall and interchanged in less than 15 minutes. Versatility is one of Gradall's major assets . . . it rolls under its own power at truck speed . . . does the excavating, trenching, back-filling, and grading . . . plus " extra dividend " tasks like pipe-laying and light crane work.

The RIGHT INSULATION, correctly applied, NEVER GROWS OLD

ENGINEERING: In planning your insulation job, first call in an experienced insulation engineer. Johns-Manville . . . Insulation Headquarters for more than 75 years . . . maintains a staff of insulation experts. Each man knows how to take the guesswork out of your job . . . make it "*right* the *first* time."

RIGHT INSULATION: Any insulation will save money—but only the *right* one will save the most for the longest period of time. J-M 85% Magnesia is the most widely used of all industrial insulating materials . . . and one of a wide range of J-M insulations for every service and temperature.

CORRECT APPLICATION: No insulation is better than the man who installs it. J-M Insulation Applicators are industry's first choice for completely efficient jobs because: (1) They are trained in all phases of insulation application; (2) They employ skilled mechanics and up-to-date application methods. You can rely on them for thorough, dependable and speedy workmanship.

JOHNS MANVILLE JM PRODUCTS

35 YEARS YOUNG! J-M 85% Magnesia was applied to pipes of this mill, back in 1912. Because this job was *engineered right* and *applied right,* it is still providing dependable insulation . . . still keeping fuel costs low. Get expert help with *your* insulation problem by writing to Canadian Johns-Manville, Toronto, Montreal, Winnipeg or Vancouver.

Generating AIR POWER

Night and day these two 14½" stroke XVHE-2 Air Compressors deliver over 5000 c.f.m. of Air Power at 100 lbs. pressure.

WITH "XVH" *Heavy Duty* COMPRESSORS

- Sizes from 75 to 1000 hp.
- Air cushioned Channel Valves for higher compression efficiency.
- Automatic load control.
- Heavy-duty roller type main bearings for long life.
- Positive pressure lubrication to all moving parts.
- Rigid one-piece frame ensures proper alignment of all parts.
- Suitable for any type of drive.

WHEN you require a compressor for continuous full-load service where large volumes of air or gas are to be handled, install the Canadian Ingersoll-Rand Class "XVH" Compressor.

High overall efficiency and low power consumption are characteristics of this modern, heavy-duty compressor. Freedom from maintenance troubles is assured by self-aligning spherical roller bearings and pressure lubrication to all moving parts. With automatic three- or five-step control the compressor may be locked for any maximum load, thus limiting electrical peaks. For easy starting and stopping, manual control of the regulator is provided.

Wherever AIR POWER goes to work . . . in mines, collieries, steel, textile and paper mills, chemical plants, railroad shops, shipyards and automotive plants . . . C-I-R "XVH" Compressors have proved their many operating advantages and reliability.

Do this

That's the Steelox Joint –

Erect a Structure a Day!

GIVE four men a shipment of ARMCO STEELOX! You will be surprised how quickly they will have the building erected. This special patented ARMCO STEELOX Joint is the reason.

ARMCO STEELOX panels fly together . . . just like cupping your fist . . . and they are strong as a steel ox. They are tough, too . . . tough enough to stand all the weather you want to give them. And STEELOX panels are light, easy-to-handle . . . fire-resistant . . . and take and hold paint. Then when you want the building moved or dismantled, just uncup the STEELOX "fists". It's as easy as that.

See for yourself how easily and economically STEELOX buildings can solve the most difficult building problems. Use them for offices, tool houses, utility buildings . . . wherever you need permanent or semi-permanent buildings. STEELOX Buildings are prefabricated in a wide range of standard sizes. Write for prices and complete information to Armco Drainage & Metal Products of Canada Limited, 358 George St., Guelph, Ontario.

Radiation Safety Measures in an Atomic Energy Plant

by

KARL Z. MORGAN,

Director, Health Physics Division,
Monsanto Chemical Co.,
Clinton Laboratories, Oak Ridge, Tennessee.

A paper presented before the National Safety Congress, Chicago, Illinois, on October 7, 1947

SYNOPSIS—Giving the chronology of scientific discoveries leading to the release of atomic energy in 1942, the author enumerates events leading to the formation of the Health Physics Department, a newly developed and specialized branch of Radiology. Permissible exposures to radiation are discussed, as well as the probable percentages of fatalities for various exposures. The various detection instruments now in use are described, and illustrations given. Methods of detecting radiation in surrounding areas, and of disposal of waste radioactive materials are shown. The author emphasizes the needs for physicists that would arise in the event of an atomic war, to detect radiation.

The Atomic Age was born here in Chicago on December 2, 1942 when the first chain reacting pile was set in operation by man. This, of course, was not the first atomic machine, because the sun and all the stars are believed to maintain their incandescence from heat generated by atomic reactions, perhaps making use of a number of transmutations of the various elements. However, this was a great event in the history of man. It was, in fact, a crowning achievement of about fifty years of scientific effort by men from many nations. Roentgen, a German, had discovered X-rays in 1895; Becquerel, a Frenchman, discovered the radioactivity of uranium the following year; Rutherford, an Englishman, discovered alpha and beta rays in 1897; Villard, a Frenchman, discovered gamma rays in 1898; Chadwick, an Englishman, discovered the neutron in 1932; Anderson, an American, discovered the positron in 1933; Fermi, an Italian, shot deuterons into uranium and observed some peculiar phenomena in 1935; Bohr of Denmark announced the fission of uranium by Hahn, Strassman and Meitner of Germany in 1939, and finally the atomic age was born with the assistance of scientists of many nations in 1942. This date marks the beginning of the end; the end of war through the establishment of international cooperation and world government—or the end of civilization as a result of an atomic war. It is perhaps not unfitting to remind this organization, which is devoted to national safety and to the welfare and happiness of people, that we still have time to act; that we are obligated to direct our every effort toward the establishment of a system of control of weapons of mass destruction and world federal government with sufficient power to prevent war. This is a problem which concerns the safety of the people of all nations. Against the atomic bomb there is no defense; we have no monopoly in manpower or raw materials; there is no lasting secret of importance.

Health Physics—Specialized Branch of Radiology

When the Plutonium Projects were first organized, it was recalled that hundreds of people had been injured and many had been killed during the past two decades by the small quantity of radium in the world which altogether amounted to only about two pounds. Yet here in Chicago, at Oak Ridge and at Hanford, it was proposed to construct atomic piles. It was proposed to engage in a new kind of chemistry which meant working with hundreds of radioactive isotopes, and was equivalent in terms of radiation to operations with many millions of pounds of radium.

The question was asked by some whether or not it was safe to proceed with these plans. They reasoned that if the accidents due to radium exposure in the past should be scaled up in proportion to the potential radiation exposure, then all of the atomic energy workmen and atomic scientists might be killed. It was as a result of these considerations that Dr. E. O. Wollan, then of Chicago, was called on to organize the first Health Physics Department during the summer of 1942. Dr. R. S. Stone of San Francisco shortly afterwards was made Associate Project Director for Health of the Plutonium Projects. Health Physics was a new name applied to a newly developed and specialized branch of Radiology.

The purposes of the Plutonium Project were threefold: (1) Develop chain reacting piles, (2) Separate plutonium chemically and (3) Obtain theoretical and experimental data for effecting an explosive chain reaction. Health Physics had and still has only one goal, to make a study of radiation problems, and to develop means of preventing radiation damage. The need for this science actually began when Roentgen discovered X-rays, because one of the first producers of X-ray tubes, Mr. Grubbe of Chicago, noticed the X-ray damage to his hands as early as 1896, one year after the discovery of X-rays. He then began seeking skin treatment and devising means of preventing further overexposure.

Permissible Exposures

One of the first considerations of Health Physics was to decide how much radiation would be considered a permissible tolerance dose. The International Congress of Radiobiology in 1934 had set tolerance at 200 milliroentgens per day (mr/day), and the American Advisory Committee on X-ray and Radium in 1936 had set tolerance at 100 mr/day for X and gamma radiation. Fortunately, the latter more conservative value was adopted at the beginning of the project in this country. Rather recent chronic experiments, being conducted by E. Lorenz, L. O. Jacobson and others at the University of Chicago, have indicated that this level of 100 mr/day definitely should be considered as a maximum permissible level of radiation exposure. This should not be the amount of radiation a person would be willing to receive routinely each day for the rest of his life. A person exposed continuously to this rate of radiation exposure will experience a certain amount of biological and genetic changes. So far, however, animal experiments and the limited observation on man do not indicate that this level of radiation will produce harmful results due to extended exposures. The Chalk River atomic energy project in Canada has recently chosen half the American permissible dose, or 50 mr/day, as its tolerance value.

All life on this planet is subjected to a continuous bombardment of cosmic rays from remote reaches of space where nature's atomic machines are operating. In addition, the air we breathe and the food we eat contain about fifty natural radioactive isotopes, which become a part of our bodies and continually blast our living cells during the period of our existence. We do not measure radiation damage, therefore, by the fact that it destroys some of our body cells, but rather, we say harm results to man from radiation when cells are destroyed at a rate exceeding the rate of repair, or when sufficient radiation is received to disturb normal body function and development or when the hereditary effects on our children and children's children become readily perceptible.

Admitting these uncertainties, and at the same time recognizing that all men have always been exposed to some radiations, it has been the practice of the laboratories on the Plutonium Project to maintain a factor of safety of ten. As a result very few of their personnel are believed to have averaged an exposure exceeding ten milliroentgens equivalent man per day (mrem/day). This latter unit is defined as that amount of any kind of radiation (alpha, beta, gamma, X or neutron) that produces the same damage to man as one milliroentgen of X or gamma radiation. This new unit was necessary because the roentgen is defined only in terms of X and gamma radiation, and because all these other types of radiation are dealt with in the atomic energy plants. Of course, the mrem is not as easy to use in practice as in theory since, for example, it is difficult to compare the body damage of an erythema resulting from an overexposure to the beta rays of radioactive phosphorus-32 with a leukemia that is caused by overexposure to the penetrating gamma rays from a pile.

Some of the radiations are much more damaging than others, due to the variation in specific ionization. In fact, the tolerance values seem to vary approximately inversely as the cube root of the specific ionization in air. An alpha radiating substance will probably produce no damage when it is on the hands. If it gets inside the body, however, it is about ten times as hazardous as beta or gamma radiation of the same energy dissipation per gram of tissue. The relative effectiveness of radiation in respect to energy absorbed per gram of tissue is expressed in terms of another new project unit called the roentgen equivalent physical (rep). It is defined as that amount of radiation (alpha, beta, gamma, X or neutron) that is absorbed in tissue at the rate of 83 ergs per gram. Table I shows the relative effectiveness of the various types of radiation. The values of flux are only approximate values as indicated.

TABLE I

Tolerance or Maximum Permissible Exposure to Radiation at Clinton Laboratories

Type of Radiation	mr. day	mrep. day*	mrem. day*	Flux for 24 hr Exposure
X or gamma rays	100	100	100	2200 protons of 1 Mev/cm²/sec
beta rays	—	100	100	32 beta/cm²/sec
fast neutrons	—	20	100	66 neutrons of 2 Mev/cm²/sec
thermal neutrons	—	~50	100	1500 neutrons of 0.02 ev/cm²/sec
alpha rays	—	10	100	0.007 alpha/cm²/sec.

*These two units were introduced into project literature by H. M. Parker of Hanford, Washington.

Percent Damage from Overexposure

There is no cure known for overexposure to radiation, and the medical profession can do little to help a person who has been overexposed. The radiosensitivity of persons varies somewhat, perhaps in a manner similar to the variation of susceptibility of persons to sunburn. There is not much quantitative data available regarding man's chances of survival of various doses of total body irradiation. Perhaps when more data is available from Hiroshima and Nagasaki we will have the needed information. For the present discussion, however, I might hazard the guess that the pattern is somewhat as follows:

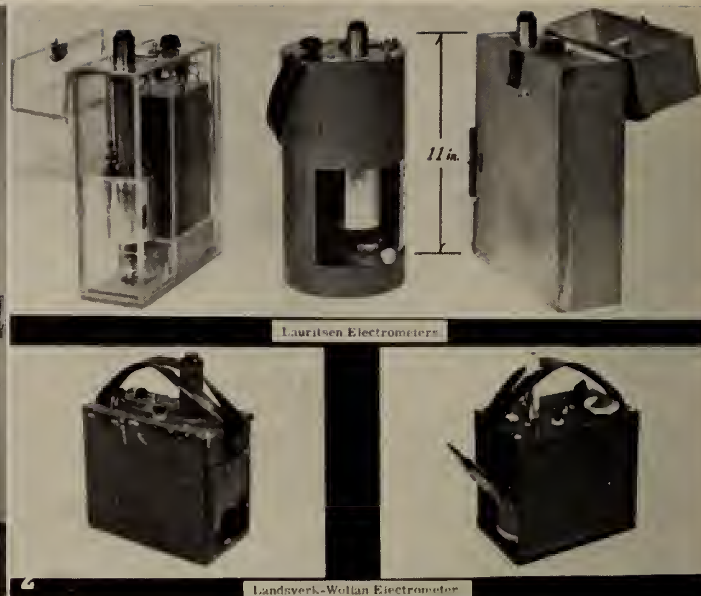
TABLE II

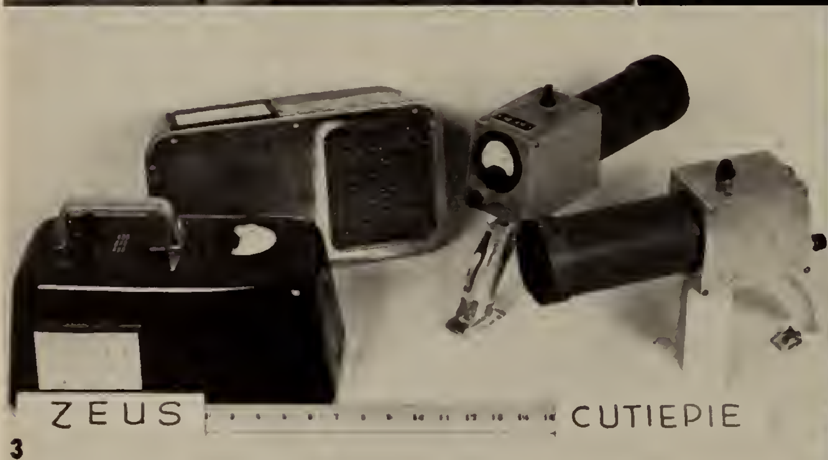
Total Body Exposure to gamma rays in Roentgens	Result
0-50	No readily detectable damage
50-100	Detectable damage
200	Probably kill 10% of persons
400	" " 50% " "
600	" " 75% " "
800	" " 90% " "
1000	" " 95% " "

It should be pointed out here that although a single dose of 200 roentgens might give only one chance in ten of killing a person, if it is followed in a few hours by another dose of 200 roentgens, the result will probably be about the same as a single dose of 400. On the other hand if there is a lapse of a week between the two doses, or if the 400 roentgens is given at the rate of 10 roentgens per day for 40 days, the consequences are much less severe.

Prevention, Not Cure, the Objective

The problems of the health physicist, like those of a safety engineer, are not to effect a cure for those who have been careless and received excessive radiation exposure, but rather it is his responsibility to use





EQUIPMENT OF THE HEALTH PHYSICIST

1. The fish pole meter for detection from safe distances.

2. Electrometers for measurement of beta and gamma radiation.

3. The Zeus and "Cutie Pie" electronic detectors.

4. Portable Geiger counters.

5. A hand and foot Geiger counter.

6. The precipitator (left) and air filter monitor (right) for measurement of air contamination.

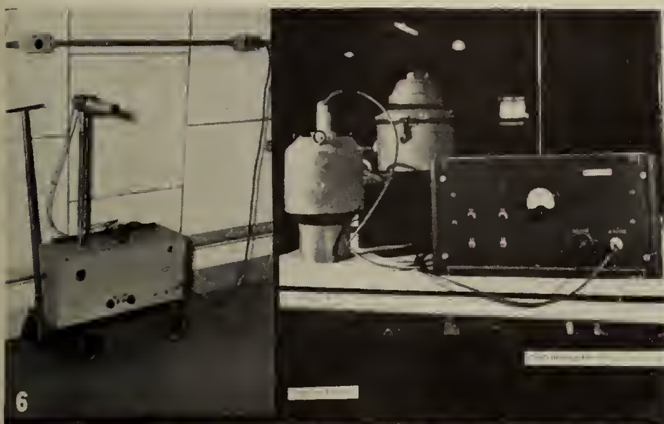
7. A submarine counter.

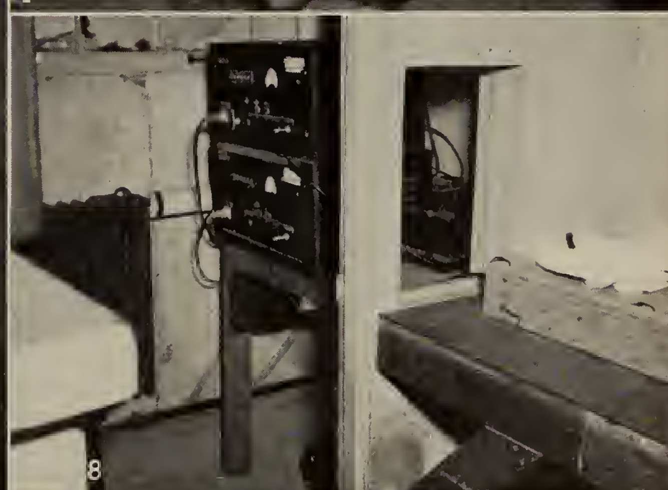
8. Equipment for contamination measurement of clothing.

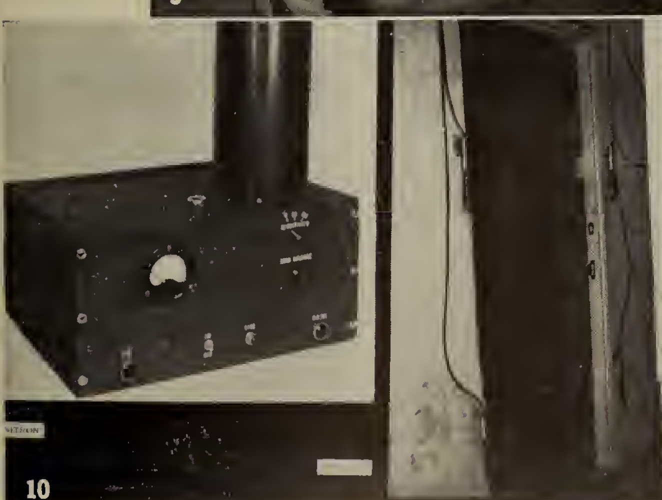
9. Types of film and pocket meters.

10. The "monitron" and "octopus" alarm-sounding meters.

11. Removal of radioactive samples from an atomic pile at Oak Ridge.







every means available to prevent overexposure. The problems of the health physicist differ from those of the safety engineer in that his work has become very specialized and applies only to radiation problems.

Even as late as the fall of 1943, when the Clinton Laboratories pile at Oak Ridge began operating, it was hoped that radiation surveys would be done primarily by operations men, production supervisors and scientific personnel. However, a few nearly serious accidents caused a change in plans, and it became evident that an independent group of Health Physics surveyors should be made available as soon as possible. These men, consisting of junior physicists, chemical engineers, biologists and others were rounded up. They were trained in the proper use of about thirty different instruments; they learned how and when to sample the air to make certain the radioactive argon never exceeded tolerance levels in the air of the pile buildings; they learned how to construct neutron shields that would stop the neutrons without scattering serious amounts of gamma rays; they became familiar with how a properly functioning hood should operate; they became acquainted with the use of the various protective devices such as remote control apparatus, protective clothing, pressure masks, etc.

Instruments for Measuring Local Radiation

Figure 1 shows one of the Health Physics surveyors wearing protective clothing and an army assault type mask. The instrument in his hand is a Fish Pole meter which can be used to measure high radiation levels at a distance or from around a shield, without getting into the beam of radiation. Figures 2 through 10 show other typical instruments which were developed by the Health Physics Department, or with the assistance of other departments of the Plutonium Project. Figure 2 shows various types of Lauritsen and Landsverk-Wollan electrometer mountings. These electrometers are the most reliable of all the survey meters, and serve as the standard instruments for measuring beta and gamma radiation. Some of the electrometer chambers have thin windows which make them suitable for alpha measurements. A few of the electrometer chambers are lined with boron, which makes them very useful for measuring thermal neutrons.

Figure 3 shows two of the most useful electronic instruments. The Zeus has sliding windows of varying thickness so that it can be used to measure alpha, beta and gamma radiation. The Cutie Pie with the pistol grip is useful for measuring beta and gamma radiation over the edge of lead radiation shields, which are frequently placed around hoods in which " hot " work is being carried on. Figure 4 shows three types of portable Geiger Counters. The large one with the loud speaker is called a Walkie Squawkie and the instrument with the ear phones is a Walkie Talkie. The smaller pocket size one is a Simpson low voltage GM counter.

Geiger Counters are very useful as detectors or indicators of the presence of radiation because of their high sensitivity, but contrary to information given in many of the recently published popular news articles, they are not the ideal instruments for radiation surveys. They have many serious limitations, and complete dependence should never be placed on their readings. Figure 5 is a Hand and Foot GM Counter. A person steps up on the platform and places his hands in the two pigeon holes, and the apparatus automatically starts and stops, the five registers on top giving the hand counts on each side of the hands and on the feet in only 24 seconds.

Detecting Radiation in Surrounding Areas

The health physicist's task does not end with his measurements of defects in shielding. It is not complete with his spotting of contamination of table tops, floors, hoods, etc., and his study of experimental arrangements and laboratory techniques that might lead to radiation exposures inside the various buildings. He is responsible for measurements in the neighborhood of the plant, as well as those made inside the buildings. Figure 6 shows two types of instruments for measuring the radioactive material suspended in the air. The instrument on the left is a precipitator, while the one on the right is a continuous air filter monitor. These instruments are used both inside and outside of buildings. Careful measurements are made continuously of the air activity, extending to a distance of several miles from the plant, to make certain that the concentration of radioactive materials suspended in the air does not exceed safe tolerance limits at any time.

In addition, all the waste water is monitored continuously to guarantee that its level of activity is within safe limits. The extremely radioactive waste material is retained in large underground tanks, but the less active waste is sometimes discharged into rivers such as the Clinch at Oak Ridge, Tennessee and the Columbia at Hanford, Washington. The standard maintained by Plutonium Projects is that the radioactive waste, before it enters these rivers, must be so diluted that it is safe for one to drink it exclusively for a life time, or to swim in it 24 hours a day continuously. The latter precaution is to safeguard the fish. In addition to these precautions, the waste water is diluted many more times the moment it enters these rivers. Figure 7 shows a submarine counter for measuring the radioactivity directly in the water, as well as a double pail method of analyzing water samples. The mud in the discharge systems is also analysed for radioactivity, to determine how much radioactive material is retained by the mud. The solid objects that are too contaminated to decontaminate are buried in especially designed and guarded " hot " burial grounds.

Disposal of Waste Radioactive Material

One of the biggest problems connected with the use of radioisotopes by the laboratories outside these Plutonium Projects, which receive radioactive shipments from Clinton Laboratories or produce them with their own cyclotrons and other accelerators, is how to dispose of radioactive waste material. Instructions on proper use and disposal of radioisotopes are furnished users. Improvements in methods of handling are constantly being studied. Health Physics representatives have been instrumental in setting up suitable national regulations for the safe shipment of radioactive materials by rail, plane and motor express. These same representatives no doubt will be called on to assist in setting up additional safeguards for the use of radioisotopes.

One of the most unique operations in an atomic energy Health Physics organization is the decontamination laundry. Here, all clothing used in " hot " areas is washed with detergents and a weak solution of citric acid to remove the radioactive material. Figure 8 shows one of the counting devices used in checking the level of contamination of the clothing before it leaves the laundry.

Personnel Monitoring Service

The operation in Health Physics that is most apparent to regular employees and visitors alike is the personnel monitoring service. A Film Meter and two Pocket Meters are worn by everyone who works in the restricted areas of the Plutonium Projects[1]. The pocket meters are read at the close of each shift, and the films are developed immediately if high pocket meter readings are found—otherwise they are developed only once a week. Regular dental type films are used in the film badge to indicate the beta and gamma ray exposure. The beta exposure is estimated from a measurement of the film density of a portion of the film that was worn in front of an open window in the badge meter. The gamma reading is estimated from a density measurement of a portion of the film that was behind a 1 mm. cadmium shield in the film badge. A special alpha emulsion film is used to detect thermal and fast neutron exposures. The neutrons produce proton recoil tracks in this film, which are counted with the aid of a dark field microscope. The density of these tracks on the portion of the film that was worn behind the cadmium shield is proportional to the fast neutron exposure. The track density on the film that was behind the open window indicates the total neutron exposure capable of producing proton recoils.

Whenever a person receives an exposure in excess of 50mrems/day, both he and his supervisor are notified early the next day so that the exposure will not be repeated. Figure 9 shows some of the types of pocket meters and film meters that are in use on the projects. A very careful record is kept of all the radiation exposure received by each person employed, and this record indicates that most persons are receiving no more excess radiation exposure than they would receive if they lived in Denver, Colorado, because the cosmic ray intensity in Denver is greater than at sea level, due to the elevation and consequently less atmosphere absorption. Less than one per cent of the employees on the project are averaging as much as a tenth of the tolerance dose of radiation.

In addition to all the above instruments, there are a number of alarm type instruments which sound an alarm whenever the radiation in a given area exceeds a predetermined rate. Figure 10 shows two instruments typical of this class. The monitron continually monitors many working areas at Clinton Laboratories and guards against failure of the human element. The octopus consists of GM tubes around a portal so that it rings a bell if a person passes through with contamination on his body or clothing.

Research on New Instruments

All the above efforts are insufficient without the assistance of a research group in Health Physics. One of the most important problems of this group is to develop new types of radiation monitoring instruments as they are needed. For example, there was an urgent need recently for a survey meter suitable for detecting the presence of radioactive carbon-14 contamination. The problem was assigned to the Health Physics research group, and it solved the problem by making

TABLE III

Tolerance Concentration of Radioactive Substances in the Air and Water at Clinton Laboratories

Element	Tolerance Concentration in Air (μc/cc)	Tolerance Concentration in Water (μc/cc)
General β or γ emitters	10^{-7}	5×10^{-4}
General α emitters	3×10^{-11}	10^{-5}
General equations for β or γ submersion tolerance	$\frac{2.1}{E}$	$\frac{1.6}{E}$

The two above equations apply to most of the radioisotopes and can be used in determining tolerance concentrations in cases in which the external exposure is greater than the internal exposure. These equations should not be used in determining the tolerance values of radioisotopes like Sr^{90}, Sr^{89}, Ba^{140} or I^{131} which have a large retention factor in the human body. The term E in these equations is the average energy in Mev.

revisions to the meter called Poppy, which had been initially developed for alpha monitoring. Thus its usefulness was extended to measure the very low energy beta radiation from carbon-14. In general, the problem of this group is to develop such instruments before a dangerous situation exists. Another important task assigned them is to calculate the tolerance levels for the various radioisotopes in the air and in the water. Table III gives the general tolerance levels and Table IV[3] the tolerance levels for some of the particular radioisotopes. Table V[2] indicates the tolerance levels used for hand and shoe counts, laundry counting, body and thyroid counts, table tops, floors, smear tests, boxes for shipment, etc.

The most important part of any successful Health Physics Radiation Protection Programme is the full co-operation and the active participation in the safety efforts by all persons subjected to potential radiation exposure. Radiation is very insidious in its methods of attack, and all kinds of instruments and services of the Health Physicists are not sufficient counteracting agents for carelessness and forgetfulness. In fact, these protection measures have been so successful that some personnel are inclined to become indifferent to this hazard. As a result, educational programmes are conducted occasionally to remind people of why they must be alert constantly and to point out to them their responsibility, not only to themselves, but also for the protection of others with whom and near whom they work.

Figure 11 is a typical scene in the Clinton Pile Building. The six-foot thick concrete pile shield is shown in the background. The square holes in the concrete are plugged to protect the two persons in the foreground. Radioactive samples have just been removed by remote control devices into the lead tunnel and have been transferred with long tongs to the lead shipping containers, in which they will be sent to various research laboratories and hospitals for peacetime research and perhaps for the saving of lives. The Health Physics surveyor in the center is checking the level of the radiation with a Cutie Pie and the instrument on the left is a monitron which sounds an alarm if the radiation reaches the level of 12 mr/hour. Shields, remote control devices, survey meters, Health Physics surveyors, and monitrons are all a vital part of a successful radiation protection programme, but in addition something else is necessary. There is no sub-

[1]Plutonium Projects is used in this discussion to mean the Metallurgical Laboratories of the University of Chicago, Clinton Laboratories of Oak Ridge, and Hanford Works at Richland, Washington.

[2]Table V was given by K. Z. Morgan in *Chemical and Engineering News*, Vol. 25, 51, December 1947.

[3]Table IV was discussed in paper by K. Z. Morgan in *Journal of Physical Chemistry*, Vol. 51, July 1947.

TABLE IV

A comparative Summary of Some of the Values Determined in the Preceding Examples

Ca^{45}	6.15×10^{-5}	150 d.	Ing. or Br.	Bone (.99)	.15 (.4)**	190	400	1.3×10^{-5}	2.1×10^{-7}	1.3×10^{-11}	3.6×10^{-3}	2.2×10^{-7}	0.1 β

The tolerance values in columns 9, 10, 11, 12 and 13 are for continuous exposure. If the exposure is for a 40 hour week, multiply these values by 4.2.

Column 9 is the tolerance concentration rate, P, in μc/sec, to the body organ that will produce a tolerance rate of exposure, after 365 days of consumption.

It should be noted that values given in column 6 depend on the chemical form and in the case of inhalation they depend upon the size particles. Until the most likely forms of these elements in a given laboratory are known, it is difficult to assign typical values of tolerance concentration in columns 10, 11, 12 and 13.

Values in column 9 can be obtained directly from equation 14 or by dividing values in column 8 by the seconds in a year.

Column 8 is the μc in the lung, bone, kidney or blood required to irradiate the organ with 3.65 roentgens of α or 36.5 roentgens of beta-gamma in a year. It is the μc in the thyroid required to irradiate it with 365 roentgens of beta-gamma in a year.

* The Sr-Y activity reaches a maximum after 15 days. The 88 μc is required to produce tolerance exposure rate soon after Sr reaches the bone. Only 20 μc is required to produce tolerance exposure rate on the 15th day. The 34 μc produces an average yearly tolerance dose. (See Fig. 4)

** It is assumed that the fraction reaching the skin by way of the gut is 0.05 and by way of the lungs is 0.1 in the case of S^{35}. For Ca^{45} it is assumed that 0.15 reaches the bone by way of the gut and 0.4 by way of the lung.

TABLE V

TOLERANCE LEVELS OF RADIOACTIVE CONTAMINATION AT CLINTON LABORATORIES

Measurement	Instrument Used	Tolerance Levels
1. Hand	Four fold hand counter Poppy	100 scaler units = 700 counts/min $\simeq$ 1 mr/hr of β and γ. 0 disintegrations/min of α from area of 150 cm^2.
2. Shoe (outside)	Foot counter	30 scaler units = 10,000 counts/min $\simeq$ 14 mr/hr of β and γ.
3. Shoe (inside)	Shoe probe	1,000 counts/min $\simeq$ 1/3 mr/hr of β and γ.
4. Clothing	Laundry counter	500 counts/min $\simeq$ 1/3 mr/hr of β and γ.
5. Clothing, shoes, etc.	Poppy	1,500 disintegrations/min of α from area of 150 cm^2.
6. Body	Poppy	500 disintegrations/min of α from area of 150 cm^2.
7. Thyroid	G. M. Probe counter	800 counts/min with counter against throat ($\sim$1,000 mr/24 hr in thyroid).
8. Table tops, floors, etc.	Poppy	2,000 disintegrations/min of α from area of 150 cm^2.
9. Table tops, floors, etc. but protected from handling	Poppy	10,000 disintegrations/min of α from area of 150 cm^2.
10. Inside intermittently used hood	Poppy	30,000 disintegrations/min of α from area of 150 cm^2. (A hood containing $>$ 1 μ gm of plutonium or isotopes of a similar hazard shall be marked "High Level Hood."
11. Smear tests on table tops, floors, apparatus, etc.	2 sq. in. filter paper smeared over $\sim$ 12 sq. inches and counted with β and γ and α counters.	0 disintegrations/min of α. 200 counts/min of β and γ.
12. Boxes for shipment by air or rail.	Smear tests Electroscope	0 disintegrations/min of α, β and γ. $<$ 50 mr/hr at the surface of package.
13. Truck shipments	Electroscope	50 mr/hr at rear wheels of truck and less than 100 mr/day in cab for trip.
14. All laboratory and operating areas	Electroscopes, C.P. meters, etc.	All areas with radiation $>$ 12.5 mr/hr shall be roped off and have signs posted.

stitute for alertness, caution, and a proper understanding and appreciation of the problems.

Sensitivity to Radiation

In conclusion, we should admit that there is a great deal about radiation and its effects on man that we do not understand completely. It is believed that the damage resulting from overexposure to radiation is proportional to the ionization produced in tissue. It is approximately proportional to the cube root of the specific ionization of the primary particle, and to a limited extent it is proportional to the rate the radiation is received. Some tissue is more sensitive than others, and the damage increases rapidly with the area irradiated. Some of the damaging effects of excessive radiation exposures appear within a few days or weeks. Animals have been killed in a matter of minutes by exposure to many thousands of roentgens. Some of the ill effects, like cancer, which can result from very large accumulated doses of radiation may not be observable for 10 to 20 years after exposure began. The effects on the genes may not be observed until many generations hence.

All these observations compel us to say that alpha, beta, gamma, and neutron radiations present serious hazards. On the other hand, these dangers are no greater than high voltage is to the electrician or a hot iron is to a housewife. These radiations are constantly bombarding all of us from natural sources, as explained earlier. Personnel in the atomic energy plants are engaged in operations in which the intensity of their radiation exposures would be increased enormously if certain precautions just discussed were not taken. Man

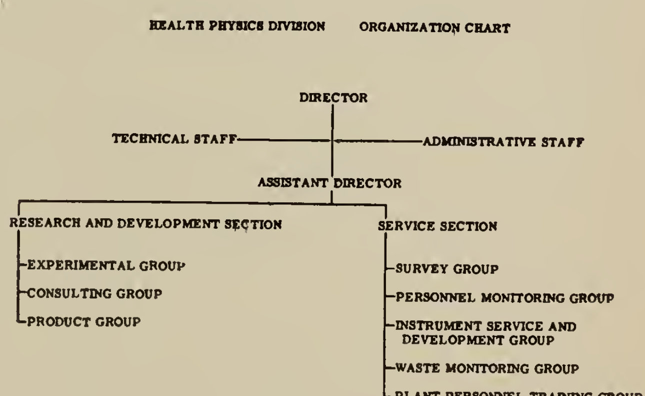

Fig. 12

fears radiation, perhaps because it is a relatively new hazard to human life. If it is handled properly, like other forms of energy, it will bring us happiness and a much better way of life. An induction furnace is not dangerous, so long as it is surrounded by shields and insulating material and equipped with protective devices. The same is true regarding a pile, with the exception that man's reaction to heat warns him of danger when he nears a furnace, while man's senses do not cause him pain when he over-indulges in gamma radiation.

Many Health Physicists Needed

If we do not discharge our responsibilities properly as world citizens; if we do not insist on the establishment of international law and the creation of a world

Rocket Propulsion

A paper specially prepared for
The Engineering Journal by

K. R. STEHLING, S.E.I.C.

President, University of Toronto
Rocket Society

Tracing the history of rockets and showing why modern rockets must have liquid fuel for a propellant, the author discusses the theory of rocket design and shows how the various rocket components are designed. Future potential uses for rockets, both military and scientific, are enumerated and a plea made for Canadian scientists to take more interest in the subject.

History

There are few modern inventions and mechanical developments that are not based on the extensive work and research of scientists and inventors through the ages. The rocket, so often thought to be a product of the 20th century, actually has a history as extensive as gunpowder, and may be traced back many centuries.

Its beginning is not certain. However, the most ancient manuscripts in Chinese literature reveal the apparent use by that people of rockets, as far back as 500 B.C. Wherever the art of pyrotechnics spread, so did the use of the rocket, and with the introduction of gunpowder in Europe the art gradually became a science. Displays of fireworks were often held on a lavish scale, which boosted their manufacture and laid the foundations for the science of rocketry.

The military potential of the rocket was soon recognized, but it was not used on a wide scale in warfare until the beginning of the 19th century. At that time Sir William Congreve, in England, thoroughly investigated its possibilities as a weapon. His resulting designs for powder rockets have been only slightly improved upon since then. Although rockets were used with good effect in various battles of that time, their inaccuracy and instability, coupled with the development of more effective weapons, hastened their growing obsolescence as a military device. It remained for the second World War to revive them in a more fearful and potent form than ever, improved by modern scientific research.

The year 1919 marked the beginning of a new phase of reaction motor development. Professor Goddard of Clark University in the United States successfully burnt a mixture of oxygen and gasoline in a rocket motor with encouraging results. His subsequent researches, and those of others in Europe, laid the foundation of the liquid fuel propulsor, which has lifted the rocket from the level of a toy to the point where thundering giants weighing several tons ascend scores of miles into the ionosphere.

Rockets Need Liquid Fuel

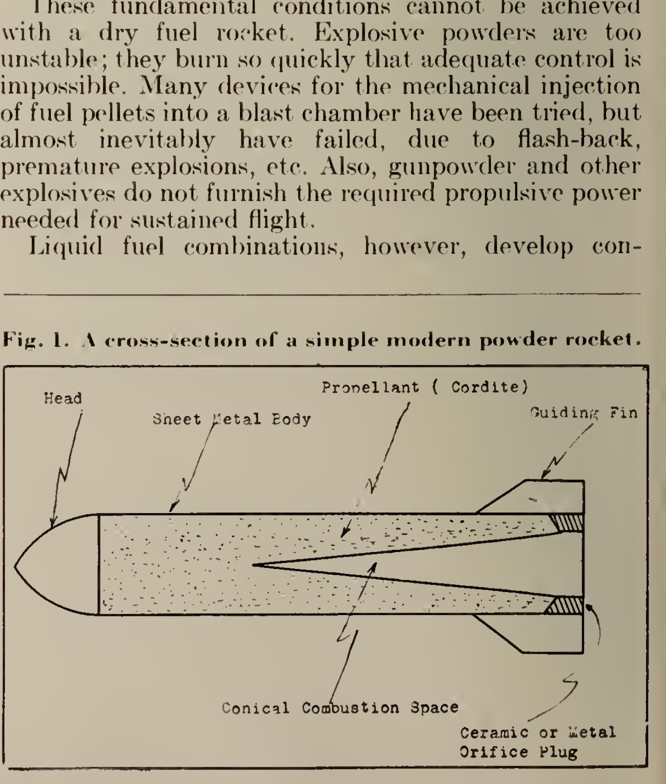
A simple dry fuel rocket usually consists of a tube filled with gun- or smokeless-powder, built and designed on principles established hundreds of years ago. The tube is of some light material and is fireproofed. A conical head of heavier material and a long wooden stick or vanes are attached for balance. A clay plug with an orifice is inserted in the open end of the tube, and the powder is distributed in the form of an open cone. (Fig. 1)

When the powder is ignited, great quantities of gas are created, which exert a back pressure or thrust upon the body of the rocket, as they escape through the clay orifice. Thus, a rocket consists merely of an expansion chamber, designed to withstand the great pressures and temperatures of expanding burning gases. This chamber or "motor" should be scientifically designed to provide for adiabatic expansion, and for the increased exhaust velocity of the ejected gases. The fuel must be gradually introduced into the blast chamber or motor, so that a steady burning or rapidly intermittent explosion occurs. The fuel must be capable of sudden expansion into a much larger volume, yet its flow into the chamber should be controllable if the rocket is to be guided over any great distance.

These fundamental conditions cannot be achieved with a dry fuel rocket. Explosive powders are too unstable; they burn so quickly that adequate control is impossible. Many devices for the mechanical injection of fuel pellets into a blast chamber have been tried, but almost inevitably have failed, due to flash-back, premature explosions, etc. Also, gunpowder and other explosives do not furnish the required propulsive power needed for sustained flight.

Liquid fuel combinations, however, develop con-

Fig. 1. A cross-section of a simple modern powder rocket.



siderably greater thrusts, weight for weight, and higher efficiencies, since a thermodynamically sound expansion chamber may be utilized. Furthermore, since the rate of burning can be varied, the velocity of the rocket can be controlled, a refinement almost impossible to incorporate in a powder rocket. However, the use of liquid fuels has created new problems in chemistry, metallurgy and allied fields which have complicated the work of the research worker, although the rocket (or reaction motor) is basically a very simple device.

The same thermodynamic processes occur in the interior of a rocket engine as those in an automobile cylinder. A fuel (gasoline, alcohol, butane, etc.—liquid) or (carbon and sulphur—solid) is brought into contact with oxygen (liquid, or solid as nitre). The mixture is ignited, the resulting explosive expansion exerts a pressure upon the surrounding walls. However, here there is no piston to push; instead, the gases rush out through an orifice at great speed, pushing the rocket away from them. "This is in accordance with the principle of conservation of momentum; a certain quantity of motion being imparted to the leaving gases, an equal and opposite reaction must act upon the rocket body."

Theory of Rocket Design

For practical purposes, many of the ordinary equations of hydraulics and gas flow may be applied to reaction motor design. A thorough mathematical treatment is both lengthy and complicated. Thus, an empirical equation (derived from Zeuner's equation) for evaluating the reaction developed by a nozzle, assuming a gaseous jet, may be used. It reads:

$$R = 2\,AP_1 \sqrt{1 - \left(\frac{P_2}{P_1}\right)^{\frac{S-1}{S}}} \quad \sqrt{\left(\frac{2}{S+1}\right)^{\frac{2}{S-1}} \frac{S^2}{S^2-1}}$$

where R = reaction in ft. lbs.
A = nozzle area in ft.².
P_1 = abs. initial pressure lb./ft.² of an expanding gas jet.
P_2 = abs. final pressure lb./ft.² of an expanding gas jet.
V_1 = initial specific volume of gas ft.³/lb.
V_2 = final specific volume of gas ft.³/lb.
S = an exponent, experimentally determined for a variety of gases and conditions.

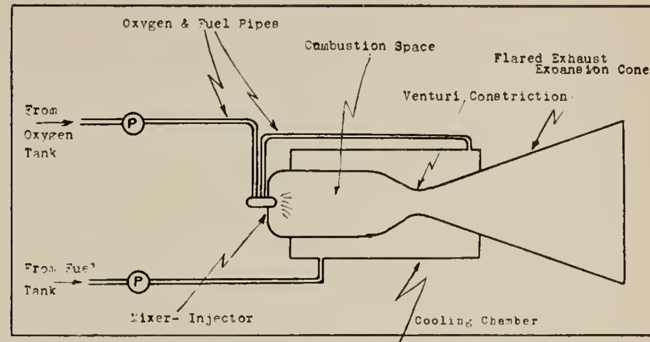


Fig. 2. Simplified diagram of the essential components of a regeneratively cooled rocket motor.

Since the expansion in a rocket nozzle takes place at almost constant entropy (and considering the high temperature prevailing here) the exponent "S" may be taken as $\simeq 1.3$. The exhaust gases consist largely of steam and CO_2. This formula permits the calculation of thrust, and precludes the necessity of measuring exhaust gas velocities directly—an almost impossible feat.

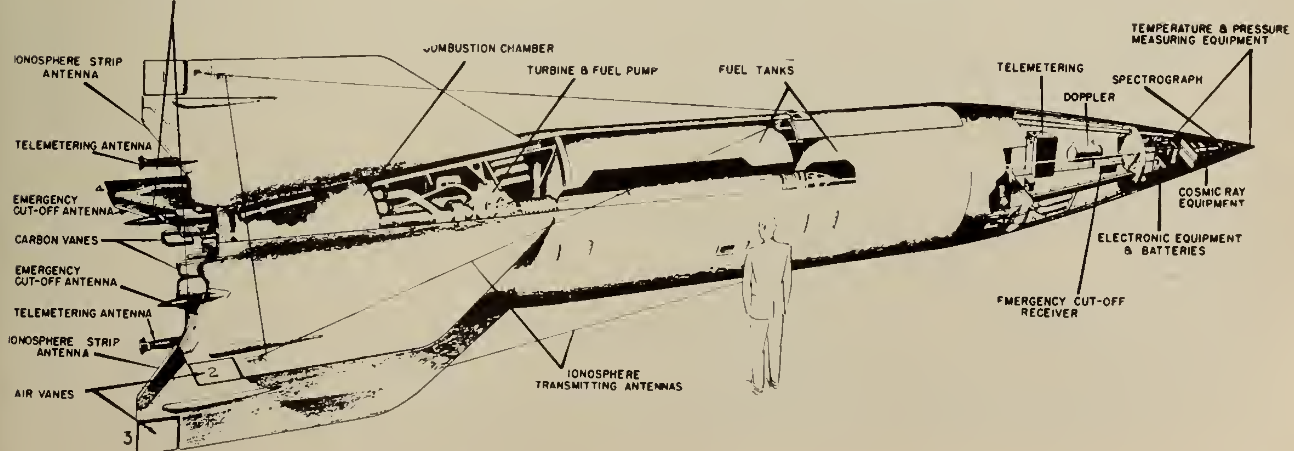
Design

Basically, modern liquid fuel rockets are all very similar, whether the rocket is a small model built by the University of Toronto Rocket Society, or the U.S. Army's converted V-2's. The two most important elements are:

(1) *The fuel reservoir.* This usually consists of two tanks, one containing so-called liquid air or oxygen, the other, some fuel such as alcohol, etc. These liquids are pumped or forced under pressure into the motor, wherein the fuel reacts with the oxygen.

(2) *The motor or blast-chamber.* The term "motor" as used in a rocket is not incongruous. It is true that there are no moving parts as in an aircraft jet engine, nevertheless, like any other motor it is an apparatus wherein force (i.e. expanding gas), is translated into motion, this motion being the forward movement of the rocket. Its thermodynamic characteristics can be calculated and determined experimentally, just as its thermal and mechanical efficiencies can be.

Fig. 3. V-2 equipped for upper atmosphere study. ***Official U.S. Navy diagram***



There are three integral sections in a typical motor:

(a) *The expansion chamber.* A space where the gases are mixed, exploded and expanded initially. Very high temperatures (2000 deg. C) exist in this section, and it is usually lined with some refractory material.

(b) *The constrictor or throat.* Its cross-sectional area must be carefully designed to increase the velocity of the exhaust gases, and yet not to impede their flow unduly.

(c) *The nozzle or expansion cone.* Ideally, a nozzle should be designed to discharge the gases axially, and at the pressure of the surrounding medium, without added frictional re-heating. If the mouth is too small the full expansion is not obtained. If it is too large, turbulences and eddies are set up which cause a back-pressure and decrease the velocity.

For determining the expansion ratio of the flared nozzle, Meyer's empirical equation may be used:

$$\frac{\text{Mouth Area}}{\text{Throat Area}} = 0.172\left(\frac{P_1}{P_2}\right) + 0.7 \left(\text{when } \frac{P_1}{P_2} < 25\right)$$

$$= 0.172\left(\frac{P_1}{P_2}\right)^{0.94} + 0.7 \left(\text{when } \frac{P_1}{P_2} > 25\right)$$

where P_1 = chamber pressure.

P_2 = pressure of surrounding medium.

(The above equation also shows that a rocket is most efficient in vacuum).

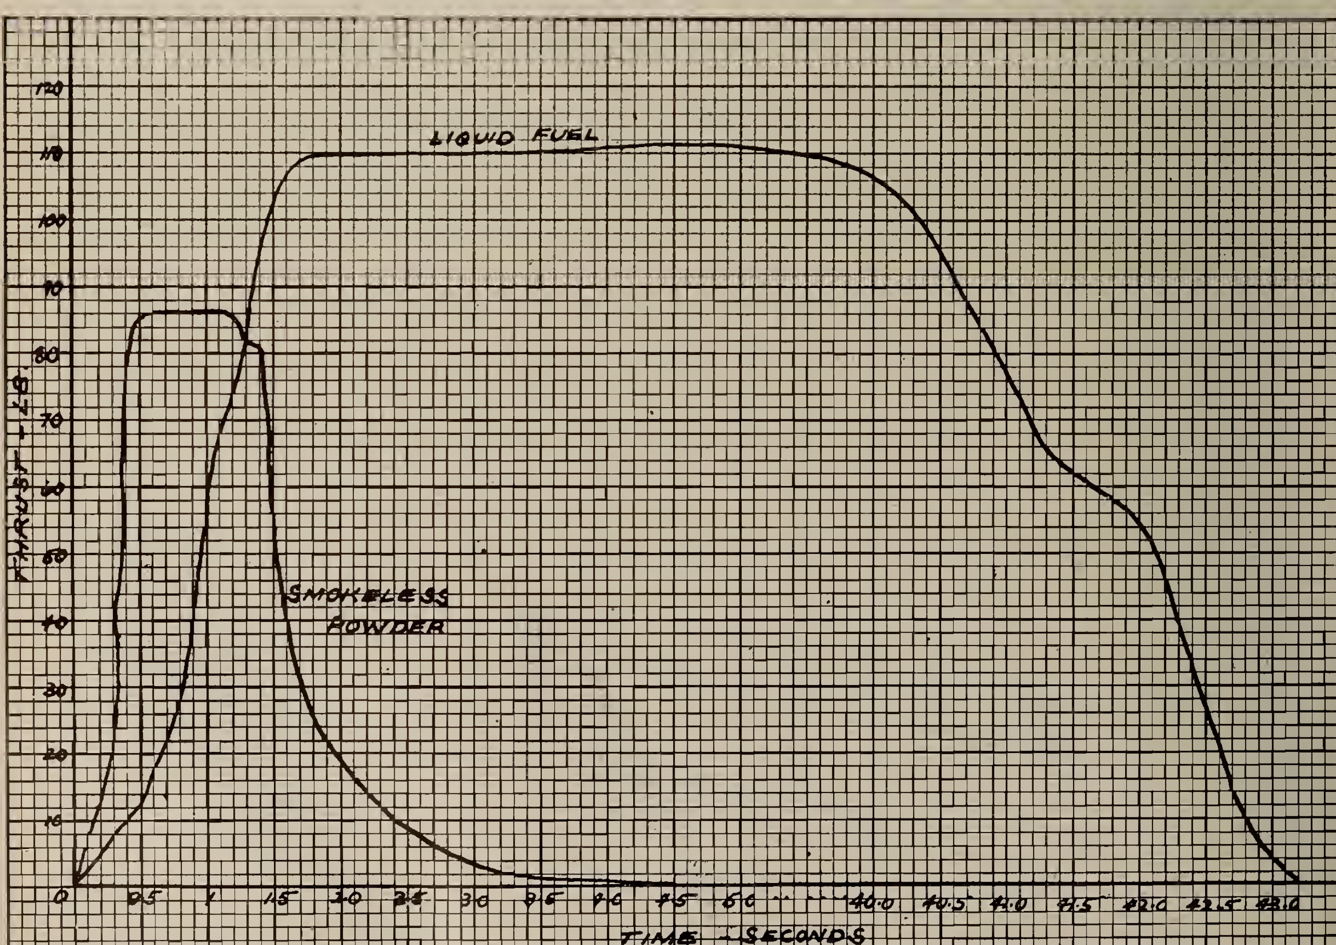
The purpose of the flared nozzle is to develop a high exit velocity for the escaping gas molecules, and consequently, thrust, as resulting from the increase of momentum. (See Fig. 2).

Considerable research with various nozzle shapes and chamber designs has shown that a venturi-shaped motor is the most efficient under most circumstances. Due to the high temperatures encountered, it has been found necessary to cool the motor, especially around the chamber and throat. Water and air cooling have been tried and discarded. Most liquid fuel rocket engines today are regeneratively cooled, i.e.—the fuel is circulated externally around the outer walls and cools the affected areas, being preheated during this process, with a consequent gain in overall efficiency. Also, it is thus possible to construct the motor of some easily machinable metal such as copper or aluminum, which are good heat conductors even though the melting point of these metals is far below the temperature of the burning gas.

To sum up, the motor should have the following properties:

1. High melting point of the metal used. Not less than approx. 1000 deg. C.
2. Good thermal conductivity.
3. High specific tensile strength at high temperatures.
4. Resistance to erosion of exhaust gases.
5. Practical fabrication possibilities.

Fig. 4. A comparison of the duration and amount of thrust between a liquid and dry fuel rocket motor.



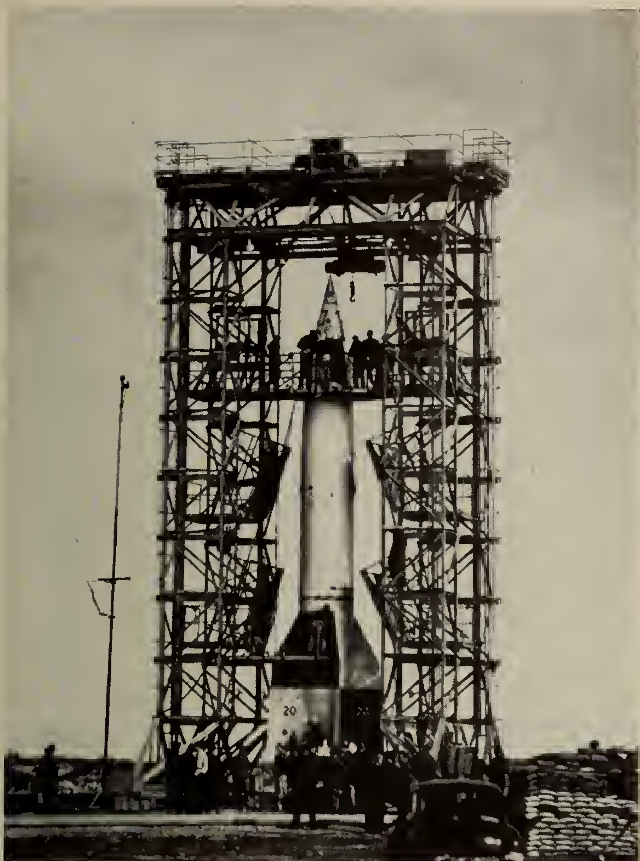


Fig. 5. Final instruments are placed in V-2 by technicians prior to flight into Ionosphere.
U.S.A.A.F. Photo

6. Good thermodynamic design.
7. Reasonably light weight.

It is obvious that the above conditions are difficult to achieve in practice, but present and future research will undoubtedly produce rocket motors far more efficient and durable than any in existence today.

If the thrust of the exhaust gases were acting truly along the longitudinal axis of the rocket, and if there were no atmosphere or gravity to contend with, its motion would be along a straight line. Since these conditions are not met with in practice, it is necessary to stabilize the rocket with some mechanical device such as a gyroscope. This is needed only if great heights and distances are to be attained. The Germans employed elaborate gyroscopic stabilizers along with movable vanes in their V-2's. The Americans are building rockets with movable motors which can change the rocket's direction when it deviates from the normal line of flight.

Future Developments

The science of rocketry is a relatively young one, and there is a great need for extensive research. Consider the problem of fuels. For many years experimenters have burned hydrocarbons, such as gasoline, alcohol and butane, in an atmosphere of pure oxygen carried along as a liquid, in the rocket. Lately, other combinations have been tried, such as aniline and nitric acid, nitromethane (which reacts explosively at certain temperatures) and hydrogen peroxide. (See Table I).

If rockets are to reach greater altitudes, and in fact, escape from the earth, much more powerful fuels than existing ones are required. Most rocket experimenters (or Astronauts) openly or secretly hope that the rocket will some day leave our planet and reach outer space (where it would be most efficient).

Using known or theoretical fuel combinations, none of which permits a greater exhaust velocity than 10,000 ft. per second, it would require a complex rocket weighing hundreds of tons to escape from the gravitational field of the earth, as may be seen in the next paragraph. The most powerful and largest rocket in existence, the V-2, weighs eight tons, and reaches a maximum height of 130 miles, and a maximum velocity of 3,000 m.p.h., truly a great engineering achievement. Therefore, to construct a rocket weighing hundreds of tons, and having a maximum speed of 26,000 m.p.h. (in order to counteract gravity—i.e., a terminal velocity) would seem to be an almost insurmountable feat.

It may be asked how a space rocket can reach the required maximum speed of 26,000 m.p.h. (or seven miles per sec.) if the exhaust jet has a velocity of only two m.p.s. approximately. The answer lies in the construction of a "step-rocket." This is a large multiple rocket, consisting of two or more parts. The first or largest section would carry the other sections. At a

Fig. 6. This 10-ft.-long "GAPA" (Ground to Air Pilotless Aircraft), made by Boeing, is a potential defence against high altitude enemy aircraft.
U.S.A.A.F. Photo

certain altitude, say 100 miles, when the rocket has reached a speed of say two m.p.s., the second section would be ejected. This would have an initial velocity of two m.p.s., plus the velocity it could develop by itself, namely two m.p.s. The second section's final velocity would therefore be four m.p.s. This process can be extended until the desired velocity of seven m.p.s. is reached. Obviously the above system is too cumbersome to be practical, and we may have to wait until atomic energy can be harnessed.

While it is fascinating to speculate upon space and

interplanetary travel, there are more immediate and obvious uses to which rockets may be put. Some such uses are:

Military—the smokeless powder dominates this field, due to its compactness and ease of handling. The Bazooka, A-A rockets, aeroplane rockets, etc., are all potent weapons developed during the late war. The German V's may be the portent of the shape of things to come. The Germans had developed a rocket, the A-8, capable of crossing the Atlantic Ocean. It needs little imagination to foresee the use to which such missiles could be put in any possible future war.

Scientific—High altitude rockets capable of travelling hundreds of miles into the stratosphere can gather invaluable data on cosmic ray activity, weather conditions (useful for long range forecasts), and other phenomena, which, when understood, can shed new light on radio propagation, etc.

Conclusion

Many of the future advances of rocket science will be made by engineers. Canada and the Empire as a whole are lagging in rocket research. From a defensive and scientific viewpoint it will be necessary for Canadians to interest themselves in this useful and portentous science. Why shouldn't we use our native initiative and do more original work, instead of imitating or improving on the work of other countries?

The rocket, a machine unfettered by atmosphere or climate, will surely conquer the vacuous space beyond our atmosphere. To deny this fact is to deny the power of pure and practical science and the ingenuity of man. Interplanetary travel may seem impossible at present; but no more so than did an aeroplane trip across the Atlantic ocean seem in 1910.

Radiation Safety Measures

(*Continued from page 161*)

federal government with sufficient authority to enforce this law, another world war will come, and it will be an atomic war. Millions of people in our big cities will be destroyed and millions less fortunate will be left suffering the consequences. Thousands of Health Physicists would be needed under these trying circumstances to determine what areas in the cities were safe for occupation, whether the city water supply was safe for consumption, whether trains and busses were decontaminated sufficiently for use, etc.

Today there are only about 300 Health Physicists in the U.S. They would not have sufficient instruments to make a good start with this terrible task. Figure 12 shows the Health Physics Organization Chart at Clinton Laboratories. Some writers have suggested that we need an Army furnished with Geiger Counters. I insist that this would be the worst of mistakes. If there were a scarcity of doctors in the Army, we would not furnish several companies with medicine kits and surgical instruments and turn them loose unless the men had had the years of necessary training and unless their instruments were proven to be those needed for the job.

On the other hand, if we can eliminate war, we can expect many new advances in the use of atomic energy. There is probably not a single important industry that will not use atomic energy or some of its products. Many of the secondary advances in pure science as a result of the tools of atomic energy, such as an understanding of photosynthesis, may in the long run be more important than the power application of atomic energy itself. Needless to say, all these peacetime developments will require a better appreciation of radiation protection problems by all concerned.

We must all learn to respect radiation, but not to fear it. The fact that many million man days have been spent on the Plutonium Projects without a single case of radiation damage attests the safety of such work if proper precautions are taken. We are proud of this record, and believe that one of our employees stands a better chance of being struck by lightning than suffering from the effects of excessive radiation. This statement is made with our fingers crossed, and in the knowledge that these standards can be maintained only if Health Physics continue to be vigilant and keeps ever alert to its developing responsibilities.

Opportunities in the Welding Engineering Field

by

Charles E. MacQuigg

Dean, College of Engineering, Ohio State University, Columbus, Ohio

A paper presented before the 47th Annual Convention of the International Acetylene Association, Cincinnati, Ohio, May 20-21, 1947.

This paper outlines the gradual growth of the welding industry and the factors that have contributed to its growth. The opportunities for young engineers in the welding field are discussed and the need for educational activity in this field is stressed. The Welding Engineering Course at Ohio State University is described. The author proposes a systematic study of the field of structural design to permit this field to make fullest use of the weight-saving advantages of welding.

The newer forms of welding, as distinguished from the age-old forge or hammer welds, go back scarcely beyond the memories of those present. It is not strange therefore that the welding engineer is a newcomer in the ranks of the engineering profession. It is true that from the start of autogenous welding almost with the beginning of the present century, technical men have guided the development from an art to a science. Nevertheless it is also true that few if any technical men purposely directed their formal education towards the acquiring of a professional competence, which would supply the elements believed to be so necessary to the designing and making of the highest quality of weldments.

This is not to say that the great welding industry, with all of its multiform accessories and applications, has just been " allowed to happen." But it is evident that, aside from the manipulatory instruction given in our technical schools, the civil engineer was taught too little metallurgy and the metallurgist knew too little of the intricacies of structural design. He could not meet the real need of a rational and truly engineering approach to the development of welding techniques. The engineer who planned to practice welding had perforce to learn the hard way. Let the thought be emphasized that welding has been developed along sound technical lines. It is believed, however, that the time is here when the engineering aspects are more clearly seen and the framework of this field of engineering can be more clearly visualized. It is the purpose of this brief paper to attempt to set down some thoughts which may be helpful to the young engineering student, and indicate a promising field for a professional career.

Growth of the Welding Industry

In the first place, what of the industrial position of welding today? While the major interest of the Association is in the application of gas welding, electric and gas welding do complement each other, and have so many intimate points of contact that what is said here in the discussion of " welding " is in the generic and not the specific sense. Welding will be used in ever increasing applications, but a few principles are fundamental, namely, that the developments must be scientifically and economically correct, and that no fog of prejudice be permitted to cloud engineering judgment.

As at the time of the First World War, the past few years have seen another upward swing in the applications of welding. Inspection of data reflecting the activity in welding sales, as compared with all construction during and since the close of World War II, leads to the conclusion that the falling off in welding was by no means in proportion to the slump in general production. This, in spite of the serious handicaps enforced on welding activity by the shortages of metals. From this one may conclude that, all factors considered, welding has edged still higher, relatively, in the scale of usefulness.

Increase of sales volume alone is hardly as significant as the result of effort to push across new frontiers of application. Among many advantages of the processes in which we are especially interested are simplicity and versatility. Simplicity permits the process to be applied at inaccessible points. With respect to versatility, readily portable containers of oxygen and acetylene with lightweight equipment of hose, gauges and torches, permit that combination of speed and " on the spot " service so essential in emergencies of almost any description. The contribution of this equipment to the work of salvage in those cases of lamentable catastrophes in recent months has made the products of your industry as indispensable as gauze is to the surgeon. Moreover, the same equipment and component gases serve with equal facility for taking apart and for putting together! This can be said of few other tools in common use and with so little effort of operation and expenditure of time, to say nothing of low capital cost and economy of operation.

To these amazing advantages of cutting and welding may be added unique features which the engineer must count among his powerful aides to achieve special ends in modern construction. Such varied uses as in low temperature stress relieving by means of flame, in welded structures as large as ships; flame-cleaning; the use of ring burners in welding of large diameter pipelines; pressure welding; all these can only be mentioned in passing, and many others could be discussed did time permit. These demands for gases at high pressures and in such large quantities call for new techniques in piping and manifolding to accomplish safe and efficient distribution at points of application.

Need for Educational Activity

From this sketchy outline of some of today's state of affairs in the field of welding, it must be apparent that there is a fine chance for constructive engineering talent to become interested in any one of the several areas mentioned. As an example of the possibilities which exist for pioneering, just one case may be cited to illustrate how an idea conceived by a young engineer abroad was developed by scientific research into a useful tool for industry, and especially for a long felt need in transportation. Reference is made to pressure welding, a process invented by a Hungarian engineer, and brought to this country some ten years ago for use particularly in welding rails.

With the healthy and expanding situation sketched above, it is natural to inquire about the type of technical assistance which the welding engineer can contribute to the wider and firmer establishment of welding, and to its growth in, and indispensability to our national economy. We believe that the following fundamental contribution can and should be made by the welding engineer:

He should be able to overcome the ignorance which so lamentably exists even today on the part of design engineers who fail to specify the use of welding where properly indicated in so many kinds of structures. Far too long, it is feared, have our college departments charged with the responsibility of teaching structural design been slow to give proper recognition and emphasis to the place of welding.

Those engineers with responsibility for construction must visualize the design as being built to accommodate the advantages of welding, and not attempt to fit the weld into a strait jacket of design. As a practical detail, this adjustment must always be a matter of " give and take " in working out the most efficient end result. What is meant is, that the completed structure must be patterned to make use of welds, which in turn will be technically correct for the given metal to be joined.

How can this gospel of the proper place of welding be spread? One obvious way is to see that our areas of design teaching are reached, some way or other, not with propaganda but with facts respecting the advantages of welding. It is not enough that sales development be prosecuted through the regular channels of advertising, but some intimate contact must be established with those who are teaching our future engineers. They are the ones who will specify or exclude welding. We cannot expect them to *think* welding unless they have been taught welding theory!

Welding Course at Ohio State University

Through the vision of an alumnus joined with active financial support of this Association, several years ago the University was enabled to establish the first curriculum leading to a degree in Welding Engineering. It may be of interest to you to know something of the pattern that was established and how it has succeeded.

The underlying principle of the Welding Engineering curriculum conforms to that of other curricula of the College, namely, a thorough grounding in the science fundamentals of mathematics, physics and chemistry, to which may be added the equally important subjects of English and engineering drawing. The student then specializes in the principles of the particular branch of engineering which he has selected, and coincidentally with these disciplines a thread of non-technical or " broadening " subjects. Theoretically the pattern for the College is;—84 quarter hours of fundamental courses; 50 hours of " broadening " subjects; 19 hours of required general work, such as military science, physical education, and survey courses; 120 hours of departmental work;—a total of 274 to 280 hours.

Just after getting well started with an interested student group, the war period intervened with the attendant decimation of student attendance. In spite of these vicissitudes, by next month we will have graduated some thirty men and from the best information we have, about 80 per cent of these engineers are engaged in the practice of their specific profession. The last statement indicates a real need for the engineer with the background outlined above.

Proposal for a Research Project

I am going to take this occasion to state a thesis which has been the subject of much of my thought for many years. It has been the topic of discussion with experts far better informed than I in the technical details involved. My belief is that today engineers are not practically or theoretically capitalizing, to anything like the fullest possibilities, the savings in weight which are potential through the use of stronger materials and welded designs. All through industry today are evident savings in weight of material, time of construction, streamlining of design, as the result of welding. The great wonder is that progress is yet so restricted and we can only conclude that the gospel has not yet been sufficiently preached in the places where it will do the most good, i.e., in the classrooms. When structural engineers become as well grounded in the theory and practice of welding as they are in riveted construction, the whole area may be expected to benefit.

It is therefore proposed that a research project be organized and sponsored by a group selected from certain agencies which are properly constituted to have a recognized responsibility in this and related areas of engineering. Such sponsorship could be responsible for the selection of a small group of engineers of unquestioned reputation as advisors on the plan of the research. Among the groups which might probably be interested are a number of technical societies, and corporations, such as those manufacturing steels, welding equipment and supplies, ferroalloys and others. Certain commercial interests might be expected to join actively in the prosecuting of the research. The interest of railroads and shipbuilders is self-evident.

It is suggested here and now that this Association might well act as the catalyst in such a movement. Not only would the manufacturers of welding essentials gain, but the adoption of designs to stronger alloys would be benefited by having the new knowledge. And finally the public would gain in obvious ways through more satisfactory structures, especially where lighter weights result. The public is now ignorantly paying a staggering price for the movement of mobile constructions because of the lack of knowledge of more rational design able to use high tensile alloys fabricated by welding.

Some Mechanical Aspects of Exercise "Musk-Ox"

A paper specially prepared for The Engineering Journal

by

Major A. G. Sangster

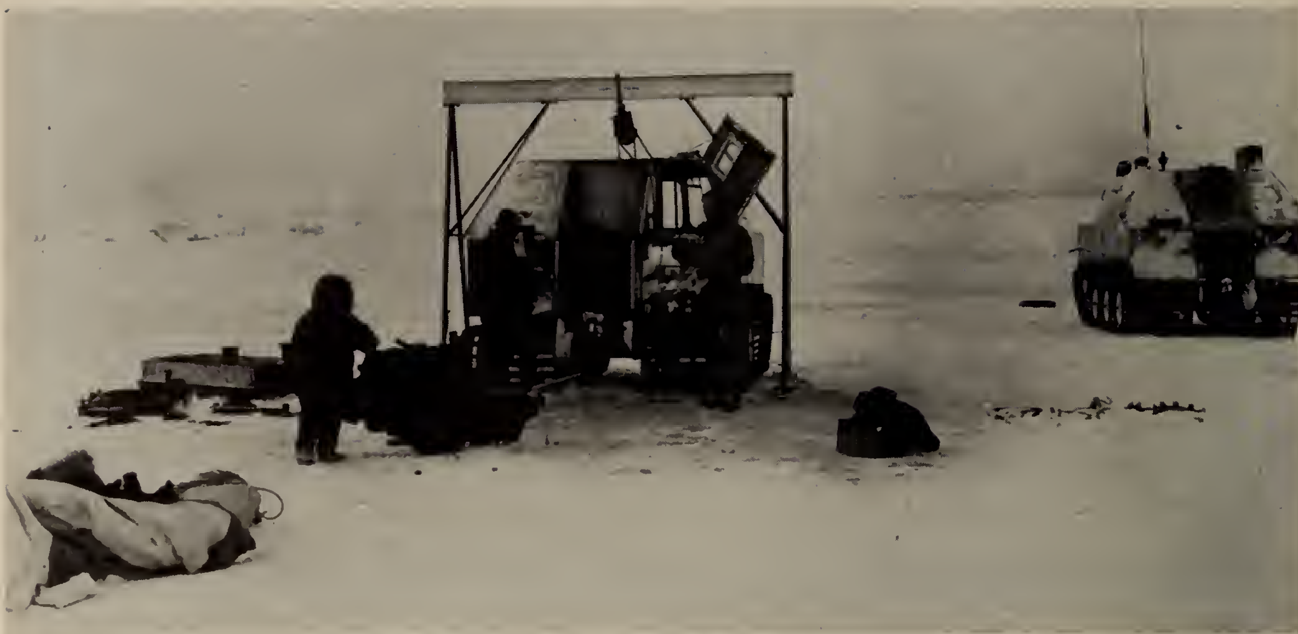
Directorate of Vehicle Development, Department of National Defence

This paper deals with mechanical aspects of the experience gained from Exercise Musk-Ox, and it describes the vehicles and the conditions under which they operated. The problems of lubrication, cooling, starting, and protection from cold are discussed, as well as methods of carrying out maintenance and repairs. The knowledge and experience gained is valuable in the design of suitable vehicles for Northland transportation.

Exercise Musk-Ox was a non-tactical exercise, held by the Canadian Army and the Royal Canadian Air Force, in the Arctic and Sub-Arctic regions of Canada during the period February to May 1946. It consisted of a small party travelling in snowmobiles from Churchill, Man., to Edmonton, Alta., via Cambridge Bay, Coppermine, and Fort Norman, N.W.T. Supporting organizations were established at various bases along the route and the moving party was supplied by air throughout the trip.

One of its primary objectives was the study of mechanical vehicle performance and maintenance under different conditions of cold and terrain encountered in the Canadian North. It had been hoped that much detailed information would be gathered from the trip. It was found that most of the observations were of a qualitative rather than a quantitative nature. Many factors contributed to this; chief among which were the great rush to keep up with the time schedule and the ever-present problem of keeping alive under Arctic conditions.

However, it was established that it was possible to travel by tracked vehicle under conditions of wide variations of temperature and over terrain consisting of barrier ice, wind-packed snow, boulder-strewn ground, mountains, sea-ice and muskeg. This article presents a general picture of the Exercise insofar as



Changing engines on the ice of the Arctic Ocean at Cambridge Bay, using light alloy gantry. ***Canadian Army photo.***

vehicle performance is concerned. Detailed analysis of the effects of the sub-zero conditions on components can be done accurately only under the controlled conditions of a cold-room.

Description of Vehicle

The vehicles used were Canadian built snowmobiles, popularly called "Penguins", and developed from the Bombardier snowmobile which is well-known in and around Valcourt, Que. "Penguin" is a fully tracked vehicle with a gross weight of 5 tons. It has a closed cab, big enough to hold 5 persons in relative mechanical discomfort, but protected from the weather. It is powered by a Cadillac V-8 engine coupled to a hydramatic transmission, essentially the same as the corresponding units currently used in private motor cars. The steering unit is a controlled differential of the "Cletrac" type. The drive sprocket is in front and there is no rear idler. The suspension consists of four pairs of pneumatic tired wheels on each side with no track return rollers. Each pair of bogie wheels is carried on an articulating arm and the bogie arms are arranged in pairs on transverse cross-tubes running through the vehicle and extending on either side of it. A pair of coil springs is located between each pair of bogie arms.

Tracks are made up of longitudinal strips of commercial conveyor belting, joined by transverse metal members shaped to form a path for the wheels to run in. The lower hull is essentially a steel plate box, with the engine at the rear, the differential at the front and the suspension cross-tubes passing through it transversely at points calculated to give suitable wheel spacing and ride stability. The cab consists of a skeleton of aluminium alloy extrusions, a skin of aluminium alloy sheet outside in contact with an inner skin of plywood, and "Thermopane" double windows. This structure is riveted throughout with the exception of the windows, which are bolted in position. Access is through a door at the rear of the vehicle and a hatch in the roof.

Operating Conditions

The first leg of the trip on leaving Churchill, was on the overflow ice of Hudson's Bay. This ice was very rough and restricted speed. Even at low speed the suspension was given a good workout, and the engines had to run in the lower gears, in spite of the low power demand, in order to maintain control. The automatic transmission "hunted" badly on this rough terrain, the sudden torque output variations on gear changes adding to the pitching caused by the rough going.

Heading inland from Eskimo Point, the travelling conditions improved, but from time to time vast boulder fields, partly snow-covered, slowed the vehicles down and the same conditions of "hunting" and pitching prevailed. Intervening stretches of wind-packed snow and lake ice permitted speeds of over 20 m.p.h. for short periods. The terrain became more rolling as the Force moved on.

From Baker Lake to the Arctic the country gradually became more mountainous and the sheltered sides of the hills, where the snow was less windpacked, introduced a traction problem. It frequently became necessary to uncouple the snowmobile from the sleds in order to climb a hill. When the top was reached a cable was used to pull the sled up the slope. It was also observed that in loose snow, steering control, with a towed load, was frequently reduced.

Approaching the Arctic, the party followed frozen river beds for a time until the vehicles began breaking through shell ice. The ice being non-resilient, the value of low ground pressure was lost and although no vehicles were lost, much time was wasted in recovery work. The sea ice of the Arctic Ocean was relatively smooth travelling, with the exception of occasional pressure ridges and their upheavals of ice blocks. From Coppermine south to the Dismal Lakes, the snow changed in texture and was loosely packed. The country became mountainous and the party climbed several thousand feet and crossed numerous deep gullies with steep sides.

On Great Bear Lake, one vehicle broke through the ice at a crack but was recovered. This suggests that in crossing ice, the unit ground pressure is not as critical as the all-up weight of a vehicle. From Ft. Norman south, Exercise Musk-Ox travelled under spring conditions through bush country, and the snow became progressively softer, finally giving way to mud and muskeg. This slowed down the party considerably and the river crossings brought out the importance of waterproofing vehicles for deep wading. Owing to the trees, movement was restricted to tractor trails.

Weather

The lowest temperature encountered was about minus fifty degrees Fahrenheit. For the first thirty days the mercury did not rise above zero degrees Fahrenheit, and it was two months before it rose to the freezing point. The wind was seldom below ten m.p.h., with frequent peaks of 40 m.p.h. or higher. The worst condition was minus forty degrees Fahrenheit with a wind velocity of forty miles per hour. Owing to blowing snow restricting visibility, movement normally ceased when the wind was high. On one occasion movement under these conditions was attempted but we covered only fourteen miles in a day, and that only with the aid of scouts walking ahead on foot. There was no mechanical failure common to all vehicles which was directly attributable to the weather and which prevented movement.

Operation of Components

During halts engines were kept from stiffening by diluting the lubricant with engine fuel. The diluent would boil or burn off to a negligible minimum after a very short run under load, after which time the engine would become warm enough to maintain a suitable viscosity in the lubricant. A 60/40 mixture of glycol and water was used in the radiators, and no trouble occurred which was directly attributable to frozen coolant.

Starting presented no problem, provided that the batteries were properly maintained and kept active by running the engine at a charging speed every 12 hours when halted. Carelessness in dilution, or failure to prime the engine before starting, resulted in some delays. When properly handled the engines would start quickly. However, occasionally a driver would flood the engine and run down the battery by continuous cranking. The battery output when cold was very low and sometimes required a boost from a neighbouring vehicle or a " Chore Horse ". For most of the journey, the engines were running at, or near, governed speed as opposed to the varying speeds at which they normally run in commercial service.

Due to the low vehicle speeds maintained throughout the trip, the transmission operated mainly in its lower gears, with occasional step-ups to 3rd and 4th gears. This gearbox was originally designed to operate mainly in its higher gears, with the lower ratios being used for starting and emergency power demand. This low gear operation constituted a severe abuse of the hydramatic transmission and in the last thousand miles some failures resulted from this overwork.

Track and suspension proved to be reliable, but pneumatic tires lost their resiliency in the extreme cold. Maintaining air pressure was impractical, and it was found that the frozen tire casings were strong enough to carry the load. The body of the vehicle was a windbreak and derived some heat from the engine. Without a heater in operation in the cab, personnel were still required to keep warmly dressed. The hundreds of rivets and bolts used in construction and passing through the skin, provided a direct metal path for heat conduction partly neutralizing the insulating effect of the plywood inner skin.

If the interior of the cab was warm enough to maintain a layer of warmer air next to the inner glass the Thermopane double windows remained clear of frost. Generally speaking, little trouble was encountered at temperatures higher than minus thirty-five degrees Fahrenheit. Many variables such as pressure, relative humidity, and bulk and nature of vehicle load, affect

Improvised shelter for repairs in the middle of Coronation Gulf. *Canadian Army photo.*

this condition also, but quantitative analysis of these factors was not feasible.

Much was learned which only becomes evident as design problems arise. It will remain to be seen how new vehicle designs, based on the lessons of Musk-Ox, will react to Arctic tests. Although much of the component development can be done in a cold room, it is the user trial that gives the final answer, especially in respect of any compromises in vehicle design.

Maintenance and Repairs

All maintenance and repair operations were done in the open without shelter. Occasionally when the windchill was severe and the job was prolonged, a tarpaulin wind-break was improvised, or a snow wall built. Usually, in order to save time, no shelter was used. On the trail the party was broken down to two groups of five vehicles. Each group had a maintenance vehicle at the rear for stragglers, carrying a limited number of light spare parts, some special tools and a technical officer and N.C.O. When additional help was required, drivers assisted. Normal maintenance was done by the driver, assisted as required, by other crew members. Maintenance crews only acted as inspectors except in event of breakdown.

Time was of prime importance if the river crossings at the western end of the trip were to be made. The start was delayed and adverse weather stole further time, so the vehicles were hard pressed all the way. As a result, there were many improvisations on the trail and the maintenance crews, who had to work at night, in addition to doing stop-gap repairs by day, had an average of 3 to 5 hours sleep per night.

One interesting development during Exercise Musk-Ox was the fabrication of a light alloy gantry, used for handling front ends and engines. This consisted of a Duralumin I-beam supported by an "A"-frame at either end. A chain block was suspended from the centre of the I-beam. The whole frame could be assembled in minutes, and was flown in with a replacement engine or axle. Where possible an ice footing was selected, but hard ground with a light snow cover was suitable.

Major repair work was generally saved until the party arrived at a settlement, where the repair crews could work by day and sleep by night. At these points it was usually possible to land a plane and get replacement component assemblies brought in. On occasions, broken-down vehicles were towed in by another vehicle for 50 miles or more. Except in emergencies, no stripping of sub-components was done, replacement of component assemblies being more practical. Probably the most irksome trouble encountered was fuel stoppages. This was largely due to dirt and sludge plugging the fuel filters, but water in the fuel also played its part to an indeterminate extent.

The desirability of having a vehicle designed so that a maximum of maintenance operations can be done without dismounting from the vehicle and exposing oneself to the elements while making repairs, was apparent to all on the trip. A high reliability factor is of course essential to such a vehicle.

Conclusion

Canada's Northland presents a challenge to transportation engineers which can and will be met. So far the demand for ground transportation has not been great enough to interest much capital in the development of suitable vehicles. However, as exploration continues, and the potential mineral wealth of the country becomes more and more evident, the demand for such transport will arise. At that time the knowledge and experience acquired on Exercise Musk-Ox should be of invaluable assistance in the design of a suitable vehicle.

Nomograph for Concrete Slabs With One-way Reinforcing

by

J. Morrow Oxley, M.E.I.C.

Chapman & Oxley, Architects, Toronto

This nomograph has been prepared to give quick and convenient information on reinforced concrete slabs without the necessity of referring to several tables. It gives the effective depth and steel area required for any combination of total load per square foot, effective span and bending moment co-efficient within the limits shown.

It complies with the provision of the National Building Code 1941 and with the codes of a number of Canadian cities.

In operation it requires only two settings of a straight-edge as indicated in the key, or as follows:

First:—locate with straight-edge laid from w' (total load per square ft.) to l (effective span in ft.) the intersection on line $w' l^2$.

Second:—locate with straight-edge laid from this intersection to line c (the application co-efficient) the intersection on line d (effective depth of slab). A_s (the steel area required for balanced reinforcement) will also be found on this line.

As in most cases the intersection on line d will not fall exactly on any depth noted the next greater depth will probably be used, but the steel area can be taken directly from the intersection and the result will be on the side of safety.

Similar nomographs for 2000-lb. and 3000-lb. concretes are available to anyone interested on application to the author, who was assisted in the design and construction of the diagram by L. A. Oxley.

BANFF

The Annual General *and* Professional Meeting

JUNE 1-5 1948

•

Note...

Registration material has been mailed. Please return yours promptly to let us arrange the best meeting ever!

The Arrangements

SPECIAL TRAINS

• Will leave Montreal and Toronto on Saturday evening, May 29th. Delegates may join these trains at the starting points or points west.

PLANES

• Fly T.C.A. to Calgary and join the special train on the morning of Tuesday, June 1st.

CARS

• Many western members will be driving and our hosts — the Calgary Branch — expect to have cars available for touring the magnificent country in the Banff National Park.

ACCOMMODATION

• The entire hotel is reserved and there should be no necessity for crowding. Rates of $15.00 per day single and $12.00 double are all-inclusive and will, therefore, be only slightly — if at all — above the costs of past annual meetings.

—A Programme of Real Interest!

The Programme

● **TUESDAY — June 1**

9.30 a.m.—Registration.

5.00 p.m.—Informal Reception.

8.00 p.m.—Annual General Business Meeting of the Institute.

Trains arrive at Banff in the afternoon and there will be no formal programme until the evening. This will allow for relaxation after the trip and an opportunity for delegates to get acquainted with each other and with the luxurious atmosphere of Banff.

● **WEDNESDAY — June 2**

9.30 a.m.—Morning and afternoon will be devoted to a symposium by the Institute's Committee on Prairie Water Problems. Papers will deal with the St. Mary's Dam and the Milk River Power and Irrigation Project; Benefits of Irrigation and Conservation in the Prairie Provinces and the Conservation measures for the East slopes of the Rockies. There will be an inaugural luncheon, informal dinner and a variety of entertainment in the evening.

● **THURSDAY — June 3**

9.30 a.m.—Symposium on Canada's Petroleum Industry.

Luncheon will be informal and no professional sessions have been arranged for the afternoon—delegates and guests will be free to take advantage of the superlative recreational facilities of Banff. A golf tournament and sightseeing drives will be arranged.

● **FRIDAY — June 4**

9.30 a.m.—A full day of papers of a more specialized nature—to afford engineers in all fields a real inducement to attend the meeting. Some of the subjects which will be treated by eminent authorities will be: Scientific Management, Highway Engineering, Rural Electrification, Community Planning, Electronics, Pulp and Paper, and others still under consideration.

7.30 p.m.—The Annual Banquet.

10.30 p.m.—The Annual Dance.

● **SATURDAY — June 5**

Free for recreation until train departures in the afternoon. A visit to the Cascade Plant of the Calgary Power Company or a motor trip to Lake Louise will probably be arranged. There are numerous other points of great interest to engineers and it will probably be possible to arrange motor or rail trips to these points in conjunction with departures from Banff. Some of the most interesting possibilities are the gigantic plant of the Consolidated Mining and Smelting Company Ltd., at Trail, B.C., the Spiral Tunnels on the C.P.R. main line in the Kicking Horse Canyon, the Bridge River Power Development of the British Columbia Electric Railway Co. near Lillooet, B.C., and the St. Mary's Dam on the Milk River near Lethbridge, Alta.

For the Ladies!

As always, the ladies are welcome and are invited to all functions on the general programme. Special events will be arranged by the ladies' committee.

—FROM MONTH TO MONTH—

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

Life Members

Not many innovations brought about by Council have been as well received as the privilege of Life Membership for all members. Of all the by-law changes authorized by ballot in 1946 this was by far the most popular. Life Membership now becomes an honour and in due course every member becomes eligible for it.

This exalted group now numbers about 500, and each January additional names are added to the list. The great advantage is that a Life Member pays no more annual fees. This is his reward for almost a lifetime of support of the Institute. A person 70 years of age who has been a Corporate Member for 30 years or one who has been a Corporate Member for 35 years regardless of age automatically becomes a member of this new " club ".

It has been a real pleasure to read the letters of acknowledgment as each new " graduate " is notified. Almost without exception at least one reaction is uniform throughout, i.e. each one is pleased to become a Life Member but is surprised to know that so much time has elapsed since he joined. After all it seems that 30 or 35 years passes quickly.

Many members have taken the occasion to say nice things about the Institute and all seem to be satisfied with their experience. Doubtless it would be heartening to young members to see these letters and to know that eventually the burden of fees is lifted. The maintenance of membership is advocated by many, and one letter typical of others says " membership in the Institute has always been a pleasure, a privilege and a benefit ".

The roster of Life Members reads like the " Who's Who " in engineering in Canada. By far the greatest majority are in the vigor of life and occupy the most important positions in industry, government and education. In their new and select classification these senior statesmen of the profession are both honoured and envied by their fellow members.

More Sources of Education

There appears to be a steady and substantial increase in the number of institutions in Canada teaching engineering and science. It is too bad they were not organized in time to meet the avalanche of students coming from the services. The apex of that crescendo has been reached and it is not likely there will be such demands for facilities for many years to come. Under such circumstances it may be that the new colleges will be slow to build up their student bodies.

Carleton College at Ottawa was the first in the field and has helped greatly with the veteran problem. Only the first two years of engineering are taught but arrangements have been made for the completion of the course at McGill.

Ottawa now has a second institution for the study of engineering. Ottawa University has inaugurated courses to cover the first two years and similarly has arranged for their students to complete the courses at other universities. Thus the capital city robs Montreal and Halifax of their distinction of being the only cities in Canada to have two colleges or faculties for the teaching of engineering.

Announcement has been made recently of the inauguration of a science college at Hamilton as one of the activities of McMaster University. It will be known as Hamilton College and will concentrate on science teaching and research.

The Council of the Institute has examined the curricula of the two colleges in Ottawa and has authorized their inclusion in the list of " recognized " institutions.

In view of the difficulties of older institutions in securing competent staff and equipment one may well be concerned with the problem facing these new enterprises, but it will be the wish of all that they shall succeed and that their contributions to the educational attainments of our people shall be substantial.

Progress of Electric Locomotive

A Correction

On page 14 of the January *Journal* we included a note entitled " Progress of the Electric Locomotive ". This item was printed in good faith—but with insufficient research—from a press release and it included unwarranted superlatives in describing 5,000-hp. locomotives as " the world's two largest single-cab electric locomotives ". Our attention has since been directed to bulletins 265 and 266 of the Oerlikon Company of Zurich, Switzerland, in which are described, electric locomotives of 6,000 to 12,000 hp. The latter are articulated, but are nonetheless single locomotives intended to be used only as 12,000-hp. units.

The *Journal* tenders its sincere apologies to the Oerlikon Company and to any other organization whose products may have been treated unfairly by the unfortunate wording of the item.

Correspondence

Dear Mr. Wright:

Mr. J. A. Walker makes the assertion in your November *Journal* that Point Grey was the first Canadian Municipality to enact a zoning law. I am obliged to challenge that statement. In 1896 I drafted a zoning law which was passed by the Nova Scotia Legislature and is still in force. It provided for residences only, fixed a minimum value, minimum distance from street, prohibited hotels, shops, boarding houses etc. in the zone. At the first Canadian Town Planning convention (held in Toronto) it was admitted that our law was the first in America. Halifax learned to walk before Vancouver.

With the best wishes of the season.

Yours sincerely,

F. W. W. Doane, M.E.I.C.

Dear Mr. Wright:

Your letter of 21st January last, enclosing a copy of a letter dated 17th January from Mr. F. W. W. Doane of Halifax, is acknowledged.

It is noted that Mr. Doane challenges an assertion I made in my paper, "The Engineer's Part in Community Planning" which appeared in the November, 1947, issue of the *Journal*. The statement, to the effect that Point Grey was the first Canadian Municipality to enact a Zoning By-law, (Town Planning By-law No. 44, 5th September, 1922) was made, I wish to assure Mr. Doane and your readers, in good faith. Naturally, in making it, I had not heard of the Nova Scotia enabling legislation — on the contrary, I had always been given to understand from legal authorities whom I considered competent, that such was the case. Since I have made this assertion on previous occasions, I am grateful to Mr. Doane for having enlightened me. It is only natural that he should have considerable pride in the fact that his was the first Canadian City to have regulations enforced—in 1896—which were equivalent in meaning and value to a Modern Zoning By-law. As nearly as I can ascertain, the term "zoning", per se, was not used universally until some time after 1912.

Unfortunately I was unable to attend the National (U.S.A.) Conference on City Planning held in Toronto in 1914, as at the time I was in charge of work in Northern British Columbia. It may be of interest to record that two gentlemen who have served for several years on the Vancouver Planning Commission were present at this meeting. They evidently had not heard of, or had not remembered, the prestige that Halifax enjoys with respect to zoning in Canada. Otherwise, I am sure they would have checked me in making this statement.

While there are evidences that the art of zoning was practiced centuries ago, it is generally conceded that its first real development occurred in Germany in 1894. It is recorded however, that the City of Modesto, California, is credited with the first legislation pertaining to zoning. In 1885, it enacted an ordinance somewhat similar to that mentioned by Mr. Doane. In 1903, Boston was authorized by its state legislature to regulate building heights. In 1909, Los Angeles passed an ordinance to protect its residential districts. In 1916, New York City adopted fairly comprehensive zoning regulations and from then on, many cities in the United States and Canada have passed zoning ordinances and by-laws as we know them.

Your courtesy in forwarding a copy of Mr. Doane's letter is much appreciated.

Yours sincerely,

J. Alexander Walker, M.E.I.C.

Meetings of Other Societies

The dates June 21 to 30 have been set for the second **International Conference on Soil Mechanics and Foundation Engineering,** which takes place this year in Rotterdam. Further information can be obtained from the Secretary of the Canadian Committee, F. Lionel Peckover, JR.E.I.C., at the National Research Council, Ottawa.

The third annual congress of the **Canadian Association of Physicists** will be held in Ottawa, May 26 to 29, 1948, at the National Research Council. Chairman of the Congress Committee is F. H. Sanders of the Association.

The 1948 annual meeting of the **American Society for Testing Materials** will take place in Detroit, Mich., June 21-25 inclusive. Headquarters of the Society are at 1916 Race Street, Philadelphia, Pa.

Preliminary programme is now available for the Atlantic City Conference of the **American Water Works Association,** May 3 to 7, 1948. Harry E. Jordan, secretary of A.W.W.A., 500 Fifth Avenue, New York, N.Y., will supply further information.

Meeting of Council

Minutes of a regional meeting of the Council of the Institute held at the Royal York Hotel, Toronto, on Saturday, January 24th, 1948, convening at nine thirty a.m.

Present

President L. F. Grant (Kingston); Vice-Presidents R. S. Eadie (Montreal), W. R. Manock (Fort Erie), and W. L. Saunders (Ottawa); Councillors P. E. Buss (Niagara Peninsula), E. A. Cross (Toronto), J. R. Dunbar (Hamilton), R. C. Flitton (Montreal), Drummond Giles (Cornwall), A. R. Jones (Peterborough), W. H. M. Laughlin (Toronto), V. A. McKillop (London), C. F. Morrison (Toronto), C. A. Peachey (Montreal), J. B. Stirling (Montreal), and General Secretary L. Austin Wright.

There were also present by invitation—Past-President C. R. Young (Toronto), Past Vice-Presidents R. L. Dobbin (Peterborough), E. P. Muntz (Hamilton), and C. E. Sisson (Toronto); Past Councillors H. E. Brandon, J. G. Hall and W. S. Wilson of Toronto, and J. A. Vance of Woodstock; W. E. Brown, chairman, E. G. Wyckoff, immediate past chairman, and W. A. T. Gilmour, councillor-elect, of the Hamilton Branch; M. F. Ker, chairman of the Niagara Peninsula Branch; D. G. Geiger, chairman, R. A. Muller, secretary-treasurer, W. E. Gladney, assistant secretary, and D. D. Whitson, member of executive, of the Toronto Branch; also the following members of the Institute's Committee on Community Planning —A. E. K. Bunnell, J. S. Galbraith, C. A. Meadows, and H. M. Scott, all of Toronto.

Vice-President Eadie took the chair, reporting that as the train from New York on which the President had expected to arrive that morning at eight o'clock was not expected until about noon, it would be necessary to start the meeting without him. Following the usual custom, Mr. Eadie asked each person present to introduce himself to the meeting.

Mr. Eadie explained that certain items on the agenda, in which the president was particularly interested, would be held over until he arrived.

C.I.G.R.E.

The general secretary reported that Mr. R. A. H. Hayes had been approached by the president and had expressed his willingness to act as the Institute's representative on C.I.G.R.E. (International Conference on Large Electric Systems), and it was unanimously resolved that this nomination be approved.

Maritime Professional Meeting

The general secretary reminded councillors of the Maritime Professional Meeting to be held in St. Andrews, N.B., on Wednesday, Thursday and Friday, September 8th, 9th and 10th, 1948. The professional meeting held in Digby, Nova Scotia, in September 1946, had been so successful, that it had been decided at that time to hold such a meeting at least once every two years. Plans were now under way and it was suggested that members should keep these dates in mind when making their plans for the year.

Annual Meeting—Banff—June 1948

The general secretary reported that plans were now proceeding for the annual meeting to be held at the Banff Springs Hotel, Banff, Alberta, during the first week of June. He outlined briefly the proposed programme of events starting with the president's dinner on Monday, May 31st, and continuing through the week until Saturday, with three days of professional sessions. The first draft of the programme is as follows:

Monday, May 31—7.00 p.m. President's Dinner.

Tuesday, June 1—Morning: Council Meeting; Afternoon: Council Meeting; Evening: Annual Business Meeting.

Wednesday, June 2—Morning: Professional Sessions; Noon: Luncheon with speaker; Afternoon: Professional Sessions; Evening: Dinner with speaker. Movies, entertainment, etc.

Thursday, June 3—Morning: Professional Sessions. Noon—No luncheon arrangements; Afternoon: No formal programme—left open for golf, drives, etc. Evening: Entertainment.

Friday, June 4—Morning: Professional sessions. Noon: Luncheon with speaker; Afternoon: Professional Sessions; Dinner: Annual Banquet of the Institute; Evening: Annual Dance.

Saturday, June 5—No programme arrangements—left to individuals to decide. Possibly tour to Lake Louise—golf tournaments.

Civil Service Commission Requirements

The General Secretary reported that there still had been no satisfactory answer to the question placed before the Civil Service Commission by Mr. MacRostie and himself last January. However, he was planning to go to Ottawa again shortly to take up the matter and see if some decision could be reached.

Committee on Professional Interests

Alberta Agreement—At Mr. Stirling's request the general secretary outlined the situation in Alberta where a meeting had been held last August to discuss with the officers of the Association amendments to the joint agreement. Mr. Wright reported that complete agreement had been reached on all points except on the amount of the joint fee for Juniors. The committee had requested that this fee be raised fifty cents beyond that recommended by the Association, the additional amount going to the branch as a rebate.

Mr. Wright reported that the chairman of the joint finance committee, Dean Hardy, had reported that the Alberta association had already printed and issued all the accounts for 1948 and that therefore it would be difficult to make any change.

Mr. Stirling moved that the fees as adopted by the Council of the Association be approved by the Institute for the year 1948. This was seconded by Mr. Flitton and carried unanimously.

Budget Item 180e—Mr. Stirling reviewed briefly the actions of the Institute in proposing to the Minister of Finance that the customs tariff on engineers' plans coming into Canada should be reimposed. He reported that the Canadian Construction Association, at its annual meeting, was preparing to present a resolution to the Minister urging the same thing. He presented a draft of the resolution to Council. He reported further that he understood other delegations were going to interview the Minister and that he hoped the provincial associations would also join in the effort.

Mr. Eadie reported that there had been a meeting of the joint EIC-PEQ Committee at which the whole situation was reviewed. At this meeting Mr. Beaubien had agreed to call on the Minister again in order to press home the wishes of the engineers.

At this point the general secretary presented a letter from Mr. Beaubien reporting on his interview which indicated that there was still some hope of a reimposing of the tariff.

Mr. Saunders questioned whether or not the engineers needed this additional protection and Mr. Eadie pointed out the effect that the change in tariff has had already. He emphasized that there is no endeavour on the part of the Institute to oppose the free entry of plans covering special processes and special equipment but at the moment plans of many kinds were coming in free of duty which could have been made with equal satisfaction by Canadian engineers in Canada. He pointed out, too, that architectural plans still carry the tariff as they were not altered in any way at the time the engineers' tariff was removed.

Mr. Stirling stated that the officers of the Quebec Corporation were very emphatic in their wishes to have the tariff restored. He did not see why the industries which demanded a high tariff to protect their own products should ask the government to remove a tariff which protected the engineers. Finally, on the motion of Mr. Stirling, seconded by Mr. Morrison, it was unanimously resolved that the matter be referred back to the Committee on Professional Interests for further study in co-operation with other interested organizations.

Report of Finance Committee

Financial Statement for 1947: Mr. Eadie, chairman of the Finance Committee, referred to the audited financial statement for the year 1947. This showed a surplus of $1,809.73 as compared to a deficit in 1946 of $1,775.51. He pointed out that an amount of $8,000.00 had been set aside as a reserve to partially cover the past service benefits of the newly instituted pension plan. Another item of $1,000.00 appeared with legal fees. This was the Institute's contribution towards the cost of the appeal in the Brian Perry vs. The Architects case. Following an examination of the statement by the councillors and some further discussion, it was unanimously agreed that the report be accepted.

At this point, Mr. Eadie asked Vice-President Manock to take the chair.

Report of Council, Committee and Branch Reports

The general secretary reported that most of the committee and branch reports for the year 1947 had been received. These will be included in the report of Council and will be published in the February *Journal* and presented to the annual meeting in June.

Mr. Wright read the report on membership which showed a net increase for the year of 752, bringing the total membership up to 9159, another new high in the history of the Institute. During the year, under the provisions of the revised by-laws, over nine hundred members had been transferred from one class of membership to another, over five hundred from Student to Junior and almost four hundred from Junior to Member. It was unanimously resolved that the various reports be received and accepted for publication in the *Journal* and for presentation to the annual meeting.

Nominating Committee

The membership of the Nominating Committee for the year 1948, as submitted by the various branches, was noted. It was unanimously resolved that Mr. W. F. M. Bryce, of Ottawa, be asked to accept the chairmanship of this committee.

ASME-EIC Joint Committee

Mr. John G. Hall outlined the history of the activities of the joint committee pointing out the reason for its formation and the work which it had done in the last four years. The latest meeting was held during the annual meeting of the ASME at Atlantic City at which meeting it was agreed that the membership of the panels for each society should be four instead of three, and that certain further studies should be made with regard to the extension of services by both organizations to students of mechanical engineering at Canadian universities.

Mr. Hall also pointed out that the provisions of the joint agreement included co-operation with the ASME committees on research. It was expected that shortly the Institute's representatives would be appointed for this work.

The general secretary reported that since the annual meeting in Atlantic City he had had a long discussion with Colonel Davies, the secretary of the ASME, at which definite suggestions were evolved with regard to the activities of the students. Colonel Davies felt that where a branch of the Institute interested itself sufficiently in the mechanical student it would not be necessary for the American society to organize a student section of their own. It was proposed that an experiment along this line be made at one of the universities where there are several members of both organizations.

Mr. Hall presented to Council a report of a special committee which had been examining the student situation. This was the basis of the discussions in Atlantic City at which time the recommendatons were accepted. Mr. Hall asked that a panel be reappointed for further activity. It was agreed that Messrs. J. G. Hall, W. A. Newman, and O. W. Ellis be reappointed and that Professor R. C. Wiren be added to make up the full complement.

Harry Bennett Fund

The general secretary announced that Mr. J. B. Macphail of Montreal, one of the three trustees of the Harry Bennett Fund, had died recently and that therefore it became necessary to appoint a successor.

It was pointed out also that Mr. Buchanan's term of office had expired at the end of 1947 but that he was eligible for reappointment. Therefore it was agreed unanimously that Mr. Buchanan be re-elected for a further period of three years and that the appointment of the third trustee be made by the president in consultation with the two remaining trustees.

University of Ottawa

The general secretary presented a letter from the the University of Ottawa asking that their newly organized School of Applied Science be given official recognition by The Engineering Institute of Canada as an engineering school. Official recognition had already been obtained from McGill University, Ecole Polytechnique, and Laval University, where their students are admitted to the third year in the engineering courses.

Dean Young reported that since the letter to the Institute had been written, the University of Toronto had agreed to accept University of Ottawa students in most of the branches of engineering provided they were highly recommended and subject to certain conditions. He thought the Institute would be justified in accepting their students for Student membership in the Institute.

Following some discussion, on the motion of Mr. Morrison, seconded by Mr. Buss, it was unanimously resolved that students in the School of Applied Science at the University of Ottawa be accepted as eligible for student membership in The Engineering Institute of Canada.

Sarnia Branch—Suggestion re Entrance Fee

The general secretary presented a letter from the Sarnia Branch wherein it was suggested that serious consideration be given to lowering the entrance fee "as this was a definite detriment in trying to attract new members". The general secretary pointed out that the usual purpose of the entrance fee was to meet the overhead cost of "processing" an application. A great amount of work was involved and the present ten dollar fee for Members and five dollars for Juniors would not begin to cover it.

The general secretary pointed out that under the recent by-law changes it was possible for a Student to enter the Institute without any entrance fee and transfer to Junior and then to Member without any transfer fee. It was expected that most applications from now on would follow that procedure. It was pointed out also that in five of the provinces persons could join the Institute without an entrance fee because of the workings of the co-operative agreement.

After some further discussion it was agreed unanimously that the information developed at the Council meeting should be forwarded to the Sarnia branch.

Column Research Council of Engineering Foundation

The general secretary reviewed the events which had led up to the forming of the Council and of the Institute's participation in it. He explained that a proposal had come to the Institute recently that along with other constituent members it should subscribe an amount towards meeting the overhead costs. A figure was mentioned of "up to $500". Mr. Wright reported that at the request of the chairman of the Finance Committee he had discussed the proposal with certain officers of other organizations on the Council in the United States and had been informed that they did not propose to make any contribution. After further discussion, it was agreed unanimously that the Institute would not make a contribution.

C.I.M.M. Fiftieth Anniversary

The general secretary informed Council that the Canadian Institute of Mining and Metallurgy was celebrating its fiftieth anniversary in April at Vancouver and suggested that a congratulatory message be sent by the Council. It was agreed unanimously that this procedure should be followed, the nature of the message to be left in the hands of the general secretary.

Ontario Association of Architects

Attention was called to the fact that the Ontario Association of Architects was holding its annual meeting in another hall in the Hotel, and it was agreed unanimously that a message of goodwill should be transmitted from the Council of the Institute to the Council of the Association. Mr. A. E. K. Bunnell, who was to attend the Architects' meeting later in the afternoon, agreed to carry the greetings on behalf of the Institute.

A.S.M.E.-Applied Mechanics Reviews

The general secretary reported that the American Society of Mechanical Engineers was arranging to publish in 1948 *Applied Mechanics Reviews*, a monthly publication containing about two hundred reviews of articles collected from approximately five hundred publications. The ASME was establishing a co-operative advisory board to aid and to guide the publishers. The Engineering Institute of Canada was invited to be one of the co-operating organizations and to name a representative on the board.

The general secretary stated that an announcement about the publication would appear on the inside front cover of the January *Engineering Journal*. Subscription rates were $12.50 a year but to members of the Institute the rate would be $9.00. It was agreed unanimously to accept the offer of the ASME, and to appoint a representative to the board, the determination of this representation to be left with the president.

Engineering Journal

The general secretary informed Council that a complete survey had been made into the finances of the *Journal*. It was shown readily that the increasing costs had made it impossible during the year to show a profit unless the allotment from subscriptions was included as income. He emphasized the necessity of the advertising income more than meeting the cost of publication as this was the only way in which a real profit could be developed. He explained that the rates for advertising had been increased substantially from the beginning of 1948 and that it was expected that the volume of advertising would be increased materially throughout the year. Already more pages of advertising were in the hands of the printer for the January issue than had been the case for the same issue last year.

The general secretary's figures showed that the cost of publishing the *Journal* was not less than $7,000.00 a month. This made the matter of great importance to the Institute. So much money was involved that the entire financial framework of the Institute could be wrecked if the *Journal* is not handled properly. He pointed out that under the new arrangement it was expected that the situation would be corrected within a reasonable period of time.

This was accepted as a progress report.

At this point, President Grant took the chair, explaining that his late arrival was caused by two wrecks ahead of his train from New York.

Request for Grant from Toronto Branch

Mr. Eadie referred to a request from the Toronto branch that a contribution of $50.00 should be given to the Junior Section as a prize to be awarded on Students' Night. The Finance Committee had considered the matter and for several reasons did not approve of the appropriation. However, in view of the fact that this meeting of Council was to be held in Toronto the Finance Committee had asked that the matter be put on the Council agenda for a full discussion.

Several councillors favoured the grant mainly because it was felt that the work of Junior Sections among students should be encouraged.

Mr. Eadie spoke of the good work done by Junior sections. He referred to the Montreal Section pointing out that the branch there was spending something over $400.00 a year on its Junior Section but that the money came entirely out of branch funds.

He pointed out that this request had come up every year for three years and on each of the two previous occasions the grant had been made on the understanding that it was not creating a precedent. The committee felt that in all fairness to the other branches in all parts of Canada it could not approve of the special grant. He expressed the hope that there would be some clarification of the whole subject, particularly in view of the fact that prizes given by the Toronto branch on their student nights were out of proportion to the well established student prizes being given by the Institute itself. He felt that if this contribution were to be given as a regular thing, there should be some integration of it into the prize programme of the Institute.

Finally a motion was submitted by Mr. Stirling that the request of the Toronto branch be granted and that the whole question of students' prizes be reviewed by the Finance Committee and the Committee on the Young Engineer. This was seconded by Mr. Flitton and carried unanimously.

Committee on The Young Engineer

New Awards to Undergraduates: The president explained that this question had been up before Council twice previously. He explained that the proposal was to award distinctive prizes to the top five or ten per cent in the senior year of engineering at all Canadian universities, the selection being based not only on academic standing but also on other qualifications, including leadership. The general secretary outlined the statement of the various awards which had been prepared by Dr. Langley, the chairman of the committee.

Mr. Eadie explained that the matter had been before the Finance Committee and that it had been agreed that it would not be feasible for the Institute to purchase gold-filled or solid gold pins. He emphasized again that such prizes would cost much more than other prizes of the Institute which were already well established.

Mr. Saunders thought that the present arrangement for prize giving was satisfactory and he did not see where the proposal for this new award was going to enhance the situation.

Mr. Wilson enquired as to how the non-academic qualifications were to be determined. He pointed out that if five or ten per cent of the class at Toronto were selected it would be an almost impossible task for the staff to make recommendations with regard to non-academic qualifications. In the present fourth year there would be 130 students to be selected if ten per cent was to be the figure. He thought a great deal of attention should be given to this phase of the subject before a decision was reached.

Finally, it was moved and seconded that authorization be given for the award this year of nickel pins at an estimated cost of approximately $70.00; that the matter of determining qualifications other than academic be given further consideration, and that the whole matter of student awards be reviewed in connection with the other prizes of the Institute. On being put to the meeting the vote resulted in a tie, the deciding vote then being cast by the chairman in favour of the motion.

Committee on Community Planning

In opening this subject Mr. Dobbin, chairman of the committee, presented the annual report of the committee for inclusion in the annual report of Council to appear in the February *Journal*. Mr. Dobbin then explained that a panel of his committee located in Toronto had been established to make a special report to Council as to what the Institute's further interests should be in community planning. He asked Mr. Hew M. Scott, chairman of that panel, to make the report. Mr. Scott reported as follows:

In view of the fact that the main interest during the Institute's recent conference on community planning was related to housing, the panel makes the following recommendations:

RECOMMENDATION I

1. Whereas, individual incentive to build and own houses has been almost destroyed by a variety of causes, and the production of houses at a cost that reasonably may be carried by people in the lower income bracket, is not being undertaken at the present time:
2. Whereas, the underlying reasons for that condition are many and complex, comprising Provincial legislation, municipal enactment, the present system of assessment, and taxation, antiquated methods of construction, and the attitude of Labour, therefore:—

The Toronto panel of the Committee on Community Planning recommends that the Institute supply leadership by preparing a comprehensive outline of the difficulties which exist, legislatively and in industry, and suggest the remedies which should be supplied.

RECOMMENDATION II

1. Whereas, the present need of houses, particularly low cost houses, makes it essential that action to obtain adequate housing should be taken without further delay.
2. Whereas, at this stage of industrial development, the problem of mass house construction may be solved only by the application of scientific methods and industrial processes to the construction of houses.
3. Whereas, at present the house building business is not on an industrial basis, the solution of the problem of the lower priced house is essentially an engineering problem.
4. Whereas, in our opinion, it is the duty of the senior society of the Engineering Profession to accept responsibility for leadership in engineering low cost house construction, which must be established on an industrial basis if the need is to be met.
5. Whereas, Part 5 of the National Housing Act, 1944, authorizes the Federal Government to utilize funds for the purpose of research and investigation in the fields of housing and planning, therefore:—

The Toronto Panel of the E.I.C. Committee of Community Planning recommends that the council of the E.I.C. request financial aid from the federal government for the purpose of enabling the E.I.C. to develop designs and construction methods, appropriate to the different environments found in the national community, and suitable for the construction of houses on a mass production basis.

In submitting these recommendations the Toronto Panel wish to make it clear that it is their considered opinion that the minister in responsible charge of Housing at Ottawa, would welcome the Institute's participation because it is a scientific body outside of politics, and is able, therefore, to relieve the Government of any embarrassment in negotiating for the necessary co-operation of Labour and Management, and also because the E.I.C. is the body most likely to achieve the results that other organizations have, thus far, failed to accomplish.

All of which is respectfully submitted.

The president emphasized that the report broke into two specific sections, the first one dealing with possible leadership which might be supplied by the Institute in attacking the serious difficulties of a legislative nature which were handicapping progress in the housing field. The second proposed that the Institute set up an organization to develop designs and construction methods that would be suitable for the mass production of houses.

In amplifying the recommendations of the panel, Mr. Meadows, a member of the panel, outlined many of the legislative difficulties, recounting in some detail his own experiences in this field. He thought that housing was the country's No. 1 problem, which was being ignored by most people and organizations which might assist in its solution. He thought the Engineering Institute was excellently constituted to provide the leadership such as had been recommended in the panel's report.

The president dealt with the second recommendation, summarizing the situation and asking the panel if it was their intention that the Institute would set up a sort of research group providing funds were made available by the Federal government. On behalf of the panel, Mr. Scott replied that this was the intention.

Mr. Galbraith further expanded the ideas of the panel and described in some detail deplorable conditions which were continued in almost all parts of Canada due to the failure of the authorities to solve the housing problem.

The president again summarized the situation, explaining that as he saw the report it would require the setting up of a committee made up partially at least of full time persons working on designs and methods. He thought, also, the first recommendation would involve the establishment of a committee to study the problem and to consult other bodies in order to determine the best method of providing the leadership.

The members of the panel agreed with the president's summation and contributed some further information based on their personal experiences. Mr. Scott said that in his opinion it was a question of whether or not the Institute felt prepared to accept such responsibilities. He thought the precise recommendations of the panel were of less importance as the method would be determined once the Institute decided to proceed with the task. He explained that the panel had been asked to make specific recommendations and it had now done so and asked that it be dismissed.

The president asked for a further analysis of the responsibilities which the Institute would assume if it took on these duties. Mr. Bunnell agreed with what the previous speakers had said with regard to the unwise basis of assessment, and stated that this situation would have to be bettered before the housing problem could be solved. He thought that as the problem had been placed fairly before Council it should be thought out very carefully before a decision was made. He indicated that other organizations were interested in taxation, such as the Tax Institute of Canada and the Bureau of Municipal Affairs, and he thought that the Institute might with equal appropriateness, give its attention to the subject.

He expressed the hope that the Institute would take the matter to the government and he pointed out that under such circumstances the government officials were very likely to indicate that as far as engineering problems are concerned these are already before a newly established government agency of the National Research Council. He was of the opinion that progress through this agency would be slow in view of the fact that it was just now being established and that certain restrictions might be placed upon it.

He reviewed the problems established by taxation and admitted that he did not know the answers, but he pointed out that the panel had suggested that as a measure of public service the Institute should study these problems and do everything it could to assist in their solution. He thought that the possibility of co-operating with other groups should not be overlooked.

The president stated that he could see that this was a very serious and wide proposal. It appeared that there was a big job that was very badly in need of being done, but whether or not the Institute was in the best position to do it should not be decided until councillors had been given a further opportunity to study it all.

Accordingly, it was moved by Mr. Dunbar, seconded by Mr. McKillop, and approved unanimously that the report be received and distributed as part of the minutes of this meeting and be discussed at the next meeting of Council.

Ontario Division—Secretarial Services

Mr. Manock, chairman of the Division, explained to Council that there had been some discussion as to the possibilities of securing secretarial services for the Ontario Division. These had been outlined in detail by the secretary of the Division in his letter of November 26th addressed to Headquarters, which letter had been presented to Council at the November meeting and held over until the president had had an opportunity of discussing the matter with Mr. Manock, the chairman of the Division.

Mr. Manock stated that he realized that considerable expense would be involved in such an appointment which could not be justified by the work to be done for the Division alone. The officers of the Division now hoped that with the appointment of a field secretary their problems would be solved, providing his headquarters were made in Toronto or some other Ontario centre. He recognized that so far it had not been possible for Council to find the proper person for the work and that therefore no further action could be taken at the moment. He hoped that when the time came to appoint the field secretary the interests of the Ontario Division could be kept in mind.

Mr. Saunders questioned the necessity of a secretary for the Ontario Division. He did not know of any problems that were peculiar to Ontario that would not apply to the membership at large.

The president explained that the problems of the Ontario branches would be simply part of the problems of all the branches that would make up the field of activity of a field secretary.

R.C.E. Proposed Book of Remembrance

The general secretary read parts of a letter written by General G. R. Turner to a councillor of the Institute, which letter had been turned over by the councillor for consideration by the entire Council.

In the preamble General Turner recounted that the fallen Canadian engineers of the First War were commemorated by a Book of Remembrance placed in the Kitchener Memorial Chapel in St. Paul's Cathedral, London. This book was described in *The Engineering Journal* for January 1947, pages 30 and 31. It is now proposed that those who fell in the Second World War are to be commemorated in three different ways.

(a) An Educational Scholarship Fund;

(b) A Granite Cenotaph at Chilliwack, B.C. (Already erected);

(c) A Book of Remembrance to contain the names of the 700 odd members of the Corps who fell in the Second World War. This will be on the lines of that described in the *Journal* and will be placed in St. Paul's along with similar books now in preparation in other parts of the Commonwealth.

General Turner's letter goes on to state that he is chairman of a Dominion committee of the Military Engineers Association of Canada set up for the purpose of raising the necessary funds for Item (c) above.

The following is quoted directly from General Turner's letter:

"The point I would like you to consider, if you will, is whether the E.I.C. might make a subscription of say $500 to $1,000 towards this project. As you know the fallen, particularly the officers, were a cross-section of the engineering profession throughout Canada and it might be that such a subscription from the Institute would react strongly in favour among the members of the engineering profession who are in any way associated with the Army, either Active or Reserve. . . . If you consider that a subscription of some size from the Institute has any merit, perhaps at your convenience you would be good enough to raise the matter at a Council meeting or with the Finance Committee . . ."

The president pointed out the many matters involved in considering this proposal and he asked that further consideration be postponed until the next meeting of Council and that the proposal itself be reported to all councillors so that they would be properly informed for discussion.

Cornwall Branch By-laws

A letter was presented from the Cornwall Branch submitting certain proposed changes in the branch by-laws. Mr. Wright advised that these had been examined and were all connected with branch policy and were in complete conformity with the Institute by-laws. On the motion of Mr. Dunbar, seconded by Mr. Manock, it was unanimously resolved that the proposed amendments to the Cornwall Branch by-laws, as submitted, be approved.

Canadian Standards Association

On the motion of Mr. Eadie, seconded by Mr. Peachey, it was unanimously resolved that Dr. P. L. Pratley be nominated to represent The Engineering Institute of Canada on the Main Committee of the Canadian Standards Association for a three year period, commencing on April 1st, 1948.

Alternate Educational Requirements for Membership

Mr. Peachey explained the procedure which had been followed for many years whereby membership in the three British Institutions, Civil, Mechanical and Electrical, or the passing of their examinations for Associate Membership, had been accepted as qualifying for membership in the Institute, but there appeared to be no minute of Council substantiating this procedure.

Following some discussion, on the motion of Mr. Peachey, seconded by Mr. Dunbar, it was unanimously agreed that persons who have passed Sections A and B of the Associate Membership examinations of any of the three British Institutions, (Electrical, Mechanical and Civil) or who have been given credit for Sections A and B of these examinations would be accepted as meeting the educational requirements for membership in the Institute.

On the motion of Mr. Saunders, seconded by Mr. Manock, it was unanimously resolved that a hearty vote of thanks be extended to the officers of the Toronto Branch for having made it possible for Council to meet in Toronto and for the splendid hospitality which has been extended to members of Council and guests on this occasion.

It was decided that the next meeting of Council would be held in Montreal on Saturday, February 21st, 1948.

The Council rose at five o'clock P.M.

L. Austin Wright,
General Secretary.

Elections and Transfers

Members

Adams, Fred Robert, B.A.Sc., Toronto, dist. mgr., Canadian Liquid Air Co., Vancouver, B.C.

Cazalet, Francis Mott, B.A.Sc., (Mech.), B.C., gas engr., research dept., B.C. Electric Co., Ltd., Vancouver, B.C.

Dawson, Howard Day, municipal engr., Corp. of District of Saanich, Victoria, B.C.

Personals

Notes of the Personal Activities of Members of the Institute

The Canadian Construction Association's executive officers for the year 1948 were elected in January at the annual meeting at Quebec City. Institute members included are:

Allon C. Ross, M.E.I.C., president of the Association. He is president of Ross & Meagher Limited, Ottawa.

Robert Drummond, Affil.E.I.C., of Toronto, is vice-president. Mr. Drummond is managing director of A. W. Robertson Ltd., and was recently elected president of Toronto Builders Exchange.

Fronk Flett, M.E.I.C., Toronto, district manager of Truscon Steel Company of Canada Ltd., Toronto, is Ontario vice-president of the Association.

T. N. Carter, M.E.I.C., is honorary treasurer. He is vice-president and chief engineer of Carter Construction Co. Ltd., Toronto, Ont.

R. C. Pybus, M.E.I.C., is Pacific vice-president. He is western manager of Commonwealth Construction Company Limited in Vancouver.

E. V. Buchonon, M.E.I.C., general manager of the London, Ont., Public Utilities Commission, and general manager of the London and Port Stanley Railway, was confirmed as the recipient of the George Warren Fuller Memorial Award of the Canadian Section of the American Waterworks Association for the year 1948. The honor will be conferred on Mr. Buchanan at the annual meeting of the Canadian Section of the Association at Niagara Falls, Ont., in April. He is a past chairman of the Section, and the citation approved by the Executive of the Section marks "his outstanding service in the administration of waterworks and public utilities, and for development of public relations".

J. H. Johnston, M.E.I.C., district engineer for many years at Peace River, Alta., for the Provincial Department of Public Works, has been promoted to be assistant superintendent of maintenance for the Department at Edmonton, Alta. He had been associated with Peace River country for 36 years, since his graduation from Queen's University, Kingston. He was at first employed on surveying for the Dominion government, and later as resident engineer on highway construction for the Provincial government. He received his appointment as district engineer in 1926.

R. M. Richordson, M.E.I.C., of Saint John, N.B., was elected president of the Association of Professional Engineers of New Brunswick in January. Mr. Richardson is with the New Brunswick Telephone Company Limited, having gone to the Maritimes in 1941 after many years of service with the Bell Telephone Company in Ottawa and Montreal. He joined Bell Telephone soon after graduating from McGill University in 1924 with a B.Sc. degree.

C. K. McLeod, M.E.I.C., Montreal consulting engineer, was named president of the Montreal division of the Navy League of Canada at the Division's recent annual meeting. For the past two years Mr. McLeod had been a member of the League executive.

D. Roy Cameron, M.E.I.C., has retired from the Dominion Forest Service and has accepted a position with the Food and Agriculture Organization of the United Nations. He is located at Geneva, Switzerland, at the European Office of the Organization.

G. W. Holder, M.E.I.C., has been elected chairman of the Sault Ste. Marie Branch of the Institute. He is a field engineer in the engineering department of the Abitibi Power and Paper Company Limited, Sault Ste. Marie. Coming from Ottawa, Ont., he worked on surveying parties as assistant engineer for the federal Department of Public Works from 1912 to 1917. He was draughtsman, instrumentman and resident engineer on the Heyworth Power House and dam at Sault Ste. Marie in 1917-18. He was then associated with Fraser Brace for a time on construction of the Big Eddy dam, and later with G. L. Ramsey, Ontario land surveyor. He then spent a number of years as engineer in charge of storage developments for the Spanish River Pulp and Paper Mills hydraulic department. In 1929 he joined the Abitibi Power and Paper Company Limited, remaining as manager of the Sturgeon Falls, Ont., division until 1941. He then went to the Iroquois Falls, Ont., for the Company. For a time he was on loan to Wartime Prices and Trade Board in Montreal as engineer to the Newsprint Administrator. He returned to Sault Ste. Marie in 1945.

B. G. Bollord, M.E.I.C., is head of the new Radio and Electrical Engineering Division of National Research Council. The creation of the new division was necessitated by the great expansion of research activities in the fields of electronics and electrical engineering.

Mr. Ballard graduated from Queen's University, Kingston, Ont., in 1924 and was with Westinghouse Electric and Manufacturing Company at East Pittsburgh, Pa., until 1930. Then he joined National Research Council staff and has been in charge of the electrical engineering laboratory since that time. During the war his activities were largely devoted to the development of mine sweepers for magnetic mines and the protection of ships against these mines, and it was for his contributions in this field that he was awarded the O.B.E. decoration in 1946.

Dominion and Nova Scotia government authorities have announced the appointment of a board of engineers to review plans of the transport department for betterment of transportation facilities at the Strait of Canso. Members of the board are **Professor D. S. Ellis,** M.E.I.C., dean of the Faculty of Applied Science of Queen's University, Kingston, Ont., and **Dr. Arthur Surveyer,** M.E.I.C., and **Dr. P. L. Pratley,** M.E.I.C., both Montreal consulting engineers. Dean Ellis and Dr. Surveyer are appointed by the Dominion Government, and Dr. Pratley by the Provincial government.

Errata

Two items appearing in the Personals Section of the January issue were found to be incorrect. We apologize to all concerned, and offer the following corrected "Personals":

J. J. Miller, M.E.I.C., the recently appointed secretary-treasurer of the Niagara Peninsula Branch of the Institute, is electrical and mechanical superintendent of the Niagara, St. Catharines and Toronto Railway at St. Catharines, Ont. He is from Winnipeg, Man., a graduate of the University of Manitoba, receiving the degree of B.Sc. in electrical engineering in 1937. He had served a special apprenticeship with Canadian National Railways before and during his university course, and in 1937 he became inspector of air conditioning, at Montreal, to supervise installation and operation over the entire system. In 1944 he worked on developing new methods of maintenance for motive power and car equipment. Later in that year he was made chief electrical supervisor of the electric traction system of C.N.R. In 1945 he accepted his present position at St. Catharines.

J. A. Izord, Jr.E.I.C., has been an assistant superintendent at Yarrows Limited, Victoria, B.C., for the past year. He was demobilized from the Navy in 1945, graduated from McGill University, Montreal, in 1946, with the degree of B.Eng. (chemical), and has been with Yarrows ever since.

E. R. Jarmain, M.E.I.C., chairman of the London Branch of the Institute for 1948 is a native of London. He studied at Beal Technical School there, and at University of Toronto where he received the B.A.Sc. degree in 1930. He later studied chemistry at University of Western Ontario, and also received the degree of M.A. in Business Administration.

He was at Windsor, Ont., a sales engineer for Fuel Saving Equipment and Engineering Company for a time, before becoming manager and production engineer and later proprietor of the Forest City Laundry in London, which he still owns and operates. In 1942 he was chief consultant on laundry and dry cleaning for the Department of Munitions and Supply. He also became associated that year with the Kelco Engineering Limited, as consulting engineer. He is still president of that Company. From 1943 to 1945 he was assistant associate director of War Industries for the Department of Labour, Ottawa. Mr. Jarmain practices as a consultant in design, construction and operation of laundry and dry cleaning plants.

R. N. Coke, M.E.I.C., was elected chairman of the Montreal Branch of the Institute at the annual meeting in January. He is vice-chief engineer and general superintendent, Quebec Hydro-Electric Power Commission, Montreal. Mr. Coke is from Jamaica, B.W.I., a McGill University graduate, having received the degree of B.Sc. in electrical engineering in 1914. He took a position then with the Northern Ontario Light and Power Company but enlisted soon after for service overseas with the armed forces. He returned to Canada in 1919 and joined the engineering department of the Saskatchewan Provincial Telephone Company in Regina. The next year he joined the Bell Telephone Company at Toronto as assistant traffic engineer. In 1921 he went to the staff of Canadian Westinghouse Company at Hamilton, Ont., as erecting engineer, and in 1922 he became associated with Winnipeg Electric Railway Company. He later transferred to the position of electrical engineer for Northwestern Power Company and in 1929 came to Montreal to the staff of the Montreal Light Heat and Power Company. He was assistant general superintendent for some years and received his present position in 1934.

S. R. Muirhead, M.E.I.C., is appointed general manager of Saskatchewan Government Telephones, and deputy minister of telephones for the Province. He joined that department in 1924 on graduating from University of Toronto with the degree of B.A.Sc. He was successively equipment supervisor, plant superintendent, engineer and, prior to his recent appointment, chief engineer.

C. W. Sparrow, M.E.I.C., of Moose Jaw, Sask., succeeds Mr. Muirhead as chief engineer of the Saskatchewan Government Telephones. Mr. Sparrow was formerly transmission and equipment engineer. He is a graduate of the University of Manitoba, class of 1928, receiving the B.Sc. degree in electrical engineering. He entered the employ of the Saskatchewan Government Telephones as an apprentice switchman the same year. He became assistant engineer in 1930 and transmission and equipment engineer in 1940.

Promotions announced in January by the City of Winnipeg Hydro-Electric System included the following Institute members:

H. L. Briggs, M.E.I.C., formerly chief engineer, is now assistant general manager. A past-councillor of the Institute, representing the Winnipeg Branch, Mr. Briggs has been with the Winnipeg Hydro since graduation in 1928 from University of Manitoba with the degree of B.Sc. in electrical engineering.

T. E. Storey, M.E.I.C., formerly general superintendent in charge of production, is now chief engineer. Immediate past-chairman of the Winnipeg Branch of the Institute, Mr. Storey is a University of Manitoba graduate, having received the B.Sc. degree in 1928, and has been with the Hydro ever since.

D. C. Bryden, M.E.I.C., is now general superintendent in charge of production. He is news editor of the Electrical Section of the Winnipeg Branch of the Institute. He graduated from the University of Alberta in 1928, and was with Canadian Westinghouse Company Limited at Hamilton, Ont., until joining the Winnipeg System in 1930.

R. T. Harland, M.E.I.C., who was made electrical design engineer, is secretary-treasurer of the Winnipeg Branch. Mr. Harland received the degree of B.Sc. (electrical) from the University of Manitoba in 1938, and that of S.M. (electrical) from Massachusetts Institute of Technology in 1940. He was with the Winnipeg Hydro for two years prior to service with the R.C.A.F. He returned to his position in 1946.

G. W. Moule, M.E.I.C., is contract engineer. Mr. Moule is another University of Manitoba graduate, class of 1937. He worked in Montreal for Canadian Industries Limited until 1941, when he was transferred to the Winnipeg plant of Defence Industries Limited. He joined Winnipeg Hydro in 1945 as designing engineer.

L. A. Bateman, Jr.E.I.C., is appointed operating engineer. He has been with the Hydro since his graduation in 1942 from University of Manitoba with the degree of B.Sc. in electrical engineering. Mr. Bateman is secretary of the Electrical Section of the Winnipeg Branch.

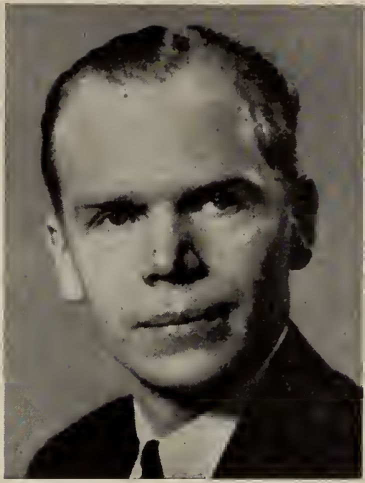
N. J. W. Smith, M.E.I.C., has been appointed secretary-treasurer of the London Branch of the Institute. He is from Toronto, and a graduate of Royal Military College and McGill University, receiving from the latter the degree of B. Eng., in 1932. He followed military engineering courses in England in 1932 and 1933 and served with the R.C.E. in Toronto and Ottawa until 1936. Then, attached to the Royal Engineers, he was in England and Singapore until 1938. He remained in Ottawa for the next three years, and went overseas in 1941 as second in command of the 4th Battalion R.C.E. He was promoted to commanding officer in 1942. He became C.R.E. of 1st Canadian Corps Troops in 1942, and C.R.E. of the 2nd Canadian Infantry division in 1943. In 1945 he received the rank of colonel. Colonel Smith was demobilized in 1946 and entered the employ of McKay-Cocker Construction Limited, in London, Ont.

E. R. Jarmain, M.E.I.C.

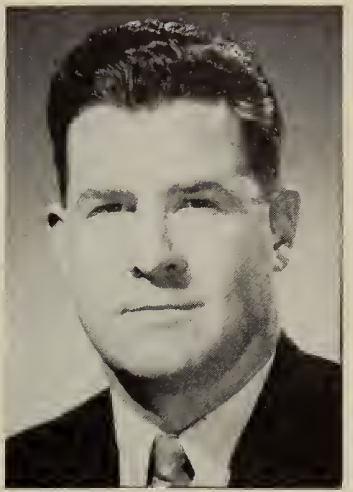
H. L. Briggs, M.E.I.C.

R. N. Coke, M.E.I.C.

T. E. Storey, M.E.I.C.



R. A. Emerson, M.E.I.C.



W. F. McMullen, M.E.I.C.

R. A. Emerson, M.E.I.C., of Vancouver, B.C., has been appointed engineer of track for the Canadian Pacific Railway. He had been stationed at Vancouver since 1944 as assistant district engineer and as district engineer. He graduated from University of Manitoba, and undertook post-graduate studies at Yale University in 1933-34. His career with C.P.R. began permanently in 1935 as a transitman at Kenora, Ont. In 1939 he became roadmaster at Portage, Man., and he was appointed division engineer at Brandon, Man., in 1941, moving to Moose Jaw, Sask., in the same capacity in 1943.

W. F. McMullen, M.E.I.C., has recently returned to Canadian General Electric Company as manager of its Conduit Products Section, following seven months service as a commercial assistant with C.E.M.A. He is a graduate of the University of Toronto, class of 1935. He worked as a demonstrator at that university for a term, and later took the C.G.E. " test " training and served in several departments at Peterborough and Toronto. He served in the recent war with the R.C.A., rising to the command of the 3rd Anti-Tank Regiment, and was mentioned in despatches. Upon demobilization in 1945 he returned to C.G.E., being made manager of the Laundry Equipment Division at the Royce Works.

D. G. Tapley, M.E.I.C., has joined the sales staff of English Electric Company, St. Catharines, Ont. Mr. Tapley is a graduate in electrical engineering from Nova Scotia Technical College. His electrical engineering experience in air conditioning and refrigeration, ventilation and general apparatus sales was acquired in Toronto and Western Canada.

L. G. Scott, M.E.I.C., recently resigned from the position of plant engineer at Canadair Limited in Montreal, and has been appointed superintendent of construction, Retail Stores Department, Hudson's Bay Company, with headquarters at Winnipeg, Man.

W.E. Jefferson, M.E.I.C., has been appointed secretary-treasurer of the Halifax Branch of the Institute. He is from Moschelle, N.S., a graduate of Nova Scotia Technical College in the class of electrical engineering of 1915. He spent some years teaching at Mount Allison University, at King's University, and with the Soldiers Civil Reestablishment Department. In 1921, he entered the engineering branch of the Maritime Telegraph and Telephone Company and now holds the position of chief engineer with that organization.

D. B. Barry, M.E.I.C., was transferred in November last by the Imperial Leaf Tobacco Company of Canada, Limited, from Montreal to Hamilton, Ont., to take up duties there as Ontario district engineer of the Company.

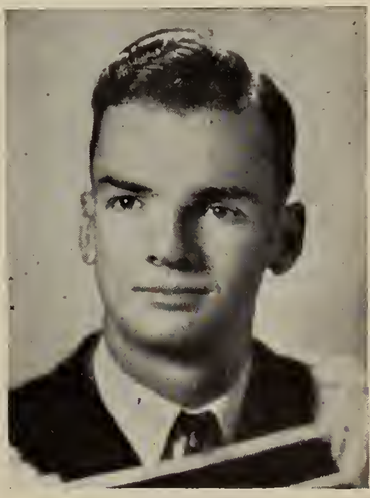
R. P. Fraser, M.E.I.C., is now assistant superintendent of the Light and Power Department of the city of Regina. He had been with the Winnipeg Electric Company since 1935, and had been appointed in 1937 assistant to the distribution engineer. He is a University of Manitoba graduate with the degree of B.Sc., electrical, class of 1931.

J. H. Lemieux, M.E.I.C., is now an active member of the Corporation of Land Surveyors of the Province of Quebec. He is still chief engineer for National Granite Limited of St. Joseph d'Alma, Que., and practices as a consulting engineer in association with Emile Lamarre, M.E.I.C. He intends, also, to practice as a land surveyor.

F. D. Greenwood, JR.E.I.C., the new secretary-treasurer of the Sault Ste. Marie Branch of the Institute is a mechanical engineer and designer with the Chromium Mining and Smelting Corporation Limited, Sault Ste. Marie. He is a graduate of Queen's University, receiving the degree of B.Sc. in mechanical engineering in 1931.

L. P. Doncose, JR.E.I.C., has been working since January 1948 for the Canada and Gulf Terminal Railway Company at Mont Joli, Que., as engineer and assistant superintendent. He has left the service of Canadian National Railways, Quebec, Que., where he was assistant division engineer.

Donald F. Cootes, S.E.I.C., who was selected for one of the 1948-49 Rhodes Scholarships, is in his final year of engineering at McGill University, Montreal.



D. F. Coates, S.E.I.C.

Born at Prince Albert, Sask., he entered McGill engineering, but interrupted his studies to join the R.C.A.F. in 1943. He was discharged as a pilot officer, General List, in 1945.

His goal is to continue studies which will help in a career directed toward the development of Canada's northland. He has already worked in the north. In the spring of 1946 he joined the Geodetic Service of Canada and worked around the Keewatin area. In the spring of 1947 he was picked to head a government party and sent to the James and Hudson Bay area. His schooner was wrecked but he managed to salvage most of the supplies. Chartering a plane, his party carried out its summer mission.

Mr. Coates has interested himself in sports, and has been prominent in student organizations. He represented the engineering faculty on the Students' Executive Council at McGill.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Richard M. Charlton, M.E.I.C., who had been residing at St. Gabriel de Brandon, Que., for some years, died in December 1947 at St. Lambert, Que. Mr. Charlton had been in retirement for several years from a lengthy career in engineering, conducted largely in the Province of Quebec.

He was born at Quebec City in 1871. Early in his career he worked on the railway lines of the province. Before his retirement he was vice-president of the contracting firm of Leger and Charlton, Lachine, Que.

Mr. Charlton joined the Institute in 1905 as an Associate Member, transferring to Member in 1940, and being awarded Life Membership in 1947.

Francis W. Cooper, M.E.I.C., president of Engineering Materials Limited, Montreal, died in Montreal on February 6th, 1948, after a long illness.

He was born in London, Ont., in 1880, and was educated at London schools and at London Collegiate Institute. He attended McGill University, where he obtained his engineering degree in 1901, later entering the service of Canadian Pacific Railway. After considerable service with the railway, he entered the supply field, and formed several companies. He was also associated with various mining companies, holding executive positions and directorates until ill health forced his resignation last year.

Mr. Cooper was president of the Steel Rail Anchor Company, and of Engineering Materials Limited, and vice-president of the P. and M. Company Limited. He joined the Institute in 1907 as an Associate Member, transferring to Member in 1940. He was awarded Life Membership in 1947.

F. C. Dyer, M.E.I.C., formerly of the staff of the University of Toronto, died in Toronto on December 15, 1947. Born in Manchester, England, in 1872, he left home at the age of nineteen and came to Canada, first establishing himself in Manitoba in 1891. There he operated a wheat farm for some years.

He came east to enter Toronto University and graduated in 1909 with the degree of B.A.Sc. Shortly thereafter he joined the staff of the University of Toronto in the Department of Mining Engineering, where he remained until his retirement in 1938 due to ill health. He was then professor of ore dressing. During his long term on the staff, he carried on considerable research, including work on ore dressing and the application of mining methods to seed cleaning processes. When possible, he also did research for leading mining companies, on ore dressing and process design. He did surveys and reports on mining fields and claims, at various times, and carried on a private practice in mining engineering.

After World War I he served on the Soldiers Civil Re-establishment Commission as chief inspector of vocational classes. He was a member of a number of technical and professional associations. He joined the Institute in 1920 as a Member, becoming a Life Member in 1939.

Thomas Lockhart McCall, M.E.I.C., died in February 1947 after completing twenty-five years of service to Dominion Steel & Coal Corporation Ltd., and to the mining industry of Nova Scotia.

He was born in 1885 at Largs, Scotland. He was an articled apprentice in 1903 to Messrs. John and G. H. Geddes, mining engineers of Edinburgh. He trained in coal mining, and in 1910 had became assistant to the managing director of the Ormiston Coal Co. Ltd. In 1913 he became manager of the Malayan Collieries, Ltd., Federated Malay States, developing and equipping the first colliery there.

In 1921 he came to Nova Scotia to become assistant mining engineer for the "Dosco" subsidiaries, the Acadia Coal Company at Stellarton and the Cumberland Coal and Railway Company at Springhill Mines. In 1929 he became chief mining engineer for the coal mines of the Corporation in three counties in Nova Scotia, and the iron-ore mines in Wabana, Newfoundland. He was appointed general manager of the Dominion Coal Company Limited in 1941, still retaining his duties as chief mining engineer for the Corporation. He was compelled in 1946, by ill health, to relinquish his duties.

Mr. McCall was a past-president of the Mining Society of Nova Scotia and past-vice-president of the Canadian Institute of Mining and Metallurgy. He held membership also in the Mining Institute of Scotland, the Institution of Mining Engineers (London), the South Wales Institute of Engineers, The American Institute of Mining and Metallurgical Engineers, and the Association of Professional Engineers of Nova Scotia. He joined the Engineering Institute as a Member in 1930.

He contributed works of importance to the literature of the Canadian mining industry, publication being made in the transactions of the Canadian Institute of Mining and Metallurgy from 1923 to 1944. He was the recipient in 1937 of the Institute's Leonard Medal.

W. H. Kelly, M.E.I.C., civil engineer and general contractor, died suddenly on February 7, 1948, at his residence at Aylmer, Que. Born in Montreal in 1893, he was educated here, graduating from McGill University in civil engineering in 1916.

He was employed for a short time with the Abitibi Power and Paper Company at Iroquois Falls, and then he enlisted in the Engineering Corps and went overseas, with the rank of lieutenant. On his return he was engaged for a short time with his father in the lumber business and then joined the engineering staff of the Riordon Paper Company. He later formed the Canada Construction Company, undertook logging contracts, and built roads for the Quebec Provincial Government. On the firm's dissolution he went into business for himself as a general contractor. He was a specialist in road building and municipal contracting. He carried out many projects of this nature in towns in the Montreal and Ottawa districts, and in recent years installed municipal waterworks at St. Sauveur, Ste. Adele and Morin Heights in the Laurentians. During World War II he constructed roads, buildings and waterworks for air fields and munitions factories in Ontario and Quebec.

Mr. Kelly joined the Institute as an Associate Member in 1937.

Burton L. Parker, M.E.I.C., city engineer of Liverpool, N.S., passed away on February 7th, 1948.

Mr. Parker was born at Stewiacke, N.S., in 1885, and studied at the Nova Scotia Technical College. From 1905 to 1907 he did railway work in western Canada, but he returned to Sydney, N.S., as superintendent of streets and assistant city engineer in 1909. Three years later he worked for the Department of Railways and Canals, Ottawa, as assistant engineer on reconstruction of St. Peters Canal. In 1918 and 1919 he was in private practice as a provincial land surveyor, and for several years he was engineer and manager of lumbering and pulpwood operations at New Glasgow, N.S. In 1922 he started the organization of the pulpwood operation at Guysboro, later purchased by the Sonora Timber Co. Ltd., who appointed him manager of Guysboro district. From 1932-35 he was in private practice as a land and timber limit surveyor. Later he became employed by W. P. Morrison, C.E., in general engineering practice.

Mr. Parker served with the Royal Canadian Air Force in an engineering capacity during the Second World War and came to Liverpool as town engineer following his discharge early in 1946.

Mr. Parker joined the Institute in 1940.

—NEWS of the BRANCHES—

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented

CALGARY BRANCH

J. F. LANGSTON, M.E.I.C. - - *Secretary-Treasurer*
T. M. PARRY, M.E.I.C. - - - *Branch News Editor*

A general meeting of the Calgary branch was held on Thursday, January 22, at 8.00 p.m. in the east dining room of the Palliser Hotel. The chairman, M. W. Jennings, presided.

The minutes of the last meeting were read and adopted, and there being no business requiring attention by the meeting, the programme of the evening was presented. As an item added to the original programme, an interesting film dealing with the development, construction, operation and application of the Fawick Air-flex Clutch was presented to the gathering.

The chairman then called on F. T. Gale, superintendent of rural electrification, Calgary Power Company, who gave an interesting, comprehensive talk on **Farm Electrification**.

In his opening remarks, Mr. Gale pointed out that five major problems to be faced in rural electrification schemes are engineering problems, financing, rates, utilization and social considerations.

Engineering studies must take the responsibility of assuring adequacy of power lines and electrical equipment not only for the present but also for future growth. Also of importance is the adequacy of farm implements and devices to assure use of the electrical energy. A study of density of population per township coupled with a similar study of soil productivity zones indicates a remarkable coincidence between the two in both location and general shape.

Farm electrification system development and expansion is dependent on the present existing network of power lines. The present network in Alberta means that some 40,000 out of 60,000 farms are in sufficient proximity to be embraced by such a system. For various reasons, 15,000 of these farms may be eliminated, leaving some 25,000 as prospective customers.

Twenty million dollars could well be invested in power lines and requisites, with a similar amount for farm wiring and appliances. Instead of the usual spread of time, this money should be spent within the next 7 to 10 years so as to take advantage of the present period of prosperity.

An experimental farm electrification programme started by the two utility companies of the province before the end of the war, now embraces some 2000 farms. Costs of line construction per mile were $634.00; connecting the farmer to the line cost him $250.00, with about $720.00 being necessary to wire and equip the buildings of the average farm. Prospects of continuing price increases on equipment and materials complicate the future picture. The establishment of a rate satisfactory to all concerned, for good times and bad, could be best secured with a plan whereby the farmer capitalized his own portion of the line.

Considerable educational work has been found necessary to make farmers, in general, aware of what electrical power can actually do for them. Electricity should not be considered by them as merely a convenience, but more as a productive tool capable of appreciably increasing farm income.

Mr. Gale continued his talk with the showing of a film entitled, **Farm Life in Wartime,** which pictured numerous applications of electrical power to help in the daily chores and labour of the farmer.

The gathering took advantage of a question period to continue the discussion with Mr. Gale. A hearty vote of thanks to the speaker for his interesting presentation was moved by Jack Dale, of Canadian Utilities Ltd. The register indicated that 63 members and 35 guests had signed for the evening.

CORNWALL BRANCH

G. G. M. EASTWOOD, M.E.I.C. - *Secretary-Treasurer*
T. B. WEBSTER, JR.E.I.C. - - - *Branch News Editor*

An illustrated talk on **Prestressed Concrete Pipe** was presented to the Cornwall Branch on January 20 by R. M. Doull, general manager and director of the Preload Company of Canada and the Canada Gunite Company.

W. P. Nesbitt introduced the speaker, who said that the City of Montreal had contracted for a length of about 2 miles of 84-in. prestressed concrete pipe to provide four intake lines for city water. Designs were made by the Preload Company of Canada and a joint agreement for the manufacture of the pipe was made with the Atlas Construction Company. The latter had built a special plant solely to produce the large prestressed pipes in 18-foot lengths.

A concrete core 5-in. thick is poured around 24 longitudinal prestressed reinforcing steel bars. After setting and steam curing, the core is wound on a specially-developed winding machine where cold drawn steel wire is wound around the core inducing a stress in the concrete of 725 pounds per square inch. After winding, the pipe is sprayed with a ¾-in. covering of Gunite to develop the bonding of the wire and to protect the wire from corrosion.

Mr. Doull outlined the severe tests that were made on the pipe which showed that it was capable of withstanding severe punishment. He quoted figures that indicated an 80 per cent saving in steel compared with the conventional steel diaphragm concrete pipe. Manufacturing operations were clearly illustrated by a technicolour film.

❖ ❖ ❖

The February meeting was held on the 17th, with Chairman R. H. Wallace presiding. The speaker for the evening was J. R. Montague, hydraulic engineer of the Hydro Electric Power Commission of Ontario, who discussed **Power Development on the Madawaska River.**

The talk was illustrated by lantern slides and Kodachrome pictures showing the map of the watershed which has a potential of 330,000 horsepower for power development. There are several possible sites for dams and powerhouses but one development has already been completed at Barrett Shute and another one at Stewartville is being rushed to completion.

The Kodachrome slides showed the stages in the construction of both the Stewartville and Barrett Shute developments. At Stewartville, a tunnel was cut through the rock bank to by-pass the Madawaska River so that a cofferdam could be built to allow for excavating the dam site to bedrock. The Commission has developed a huge automatic concrete mixing machine that is being used to pour 250,000 cubic yards of concrete for the Stewartville dam. Continuous pours as high as 50 feet are made.

The colour pictures of the Barrett Shute project showed the development from the building of the control dam to the construction of the power dam and completed powerhouse. In conclusion, Mr. Montague spoke of the part that Hydro is playing in the development of the country's resources.

EDMONTON BRANCH

W. W. Preston, jr.e.i.c. - - - *Secretary-Treasurer*

Beginning a tour of several western branches with an illustrated lecture entitled **The Joint Use of Poles by Electric Power and Communication Utilities,** D. G. Geiger, western transmission engineer for the Bell Telephone Company of Canada, emphasized to the Edmonton Branch, at a dinner meeting in the Corona Hotel on February 10, that a prime consideration in designing a pole to carry the circuits of two utilities is to protect personnel. This is done by placing the power lines at the top of the pole, and by providing adequate clearances between the wires horizontally and vertically, and by employing de-energizing devices which will act promptly. Mr. Geiger stated that the ideal situation, though uneconomical, would be to put all wiring underground. The practical alternative, he contended, was to reduce the number of poles to a minimum by joint use, and to arrange the wires and attachments on the poles according to recognized safe practices. The need for joint specifications and co-operation of the participating individuals was also pointed out.

Mr. Geiger was introduced by R. E. Phillips to an audience of 61. After a discussion period H. J. Williamson moved a well applauded vote of thanks to the guest speaker. Chairman J. E. Cranswick conducted the meeting.

❖ ❖ ❖

On February 11 the Edmonton Branch executive entertained President Grant at dinner in the University of Alberta cafeteria, just before his address to the Engineering Students' Society of the University. Afterwards the members had a round table discussion in the University Senate Chamber, Arts Building.

Lt.-Col. Grant spent the morning with Edmonton military personnel, and toured the University of Alberta in the afternoon, concluding with a visit to the home of Dean R. M. Hardy, Faculty of Applied Science.

HALIFAX BRANCH

W. E. Jefferson, m.e.i.c. - - *Secretary-Treasurer*

M. L. Baker, m.e.i.c. - - *Branch News Editor*

Two hundred and thirty members of the Engineering Institute of Canada and the Association of Professional Engineers of Nova Scotia met at the Lord Nelson Hotel on January 21 for the annual banquet sponsored jointly by these organizations.

Engineers from all parts of the Province look upon this banquet as their major social function of the year. That it is eagerly anticipated, well supported, and thoroughly enjoyed, is evident from the attendance. W. C. Risley, chairman of the Halifax Branch, E.I.C., conducted the first half of the meeting. Following a short period of silence in memory of members who died during the year, Mr. Risley introduced the guests at the head table. They were: Hon. Harold Connolly, Minister of Industry and Publicity; Mr. J. . Ahern, mayor of Halifax; Dr. A. E. Cameron, president, Nova Scotia Technical College; Dr. F. H. Sexton, retired president, Nova Scotia Technical College; Col. F. W. W. Doane, senior member, Association of Professional Engineers of Nova Scotia; Mr. L. D. McKenna, president, Nova Scotia Technical College Engineering Society; Dr. S. A. Beatty, president, Maritime Branch, Canadian Institute of Chemistry; Dr. C. C. Coffin, president, Nova Scotia Institute of Service; Mr. A. E. Priest, president, Nova Scotia Association of Architects; Mr. Frank Crawshaw, actor, entertainer, and radio star.

The chair was then handed over to J. A. Russell, newly elected President of the Association. As chairman, Mr. Russell took pleasure in the presentation of Honorary Life Membership certificates to the following members of the Association: Dr. F. H. Sexton, and Messrs. W. H. Munroe, J. L. Allan, J. R. Morrison.

Mr. Russell next introduced the guest speaker—the Hon. Harold Connolly, who gave a splendid address. He related numerous incidents of his career in public life, and in a more serious vein he presented a comprehensive picture of the part played in Nova Scotia by his Department and of the importance of the engineer in its development. L. Mitchell moved the vote of thanks to the speaker. This was heartily endorsed by the assembly.

Harry Cochrane and assisting artists provided entertainment. Song and dance numbers interspersed with novelty presentations made up the programme which was enthusiastically enjoyed by all members. K. L. Dawson was Master of Ceremonies.

The committee responsible for all arrangements for the banquet was headed by W. M. Gould with V. M. Coy as secretary.

HAMILTON BRANCH

I. M. Macdonald, jr.e.i.c. - - *Secretary-Treasurer*

Tha Hamilton Branch of the Institute held its annual meeting and dinner on January 23, 1948, at the Refectory, McMaster University, with 115 members and guests attending. After the adoption of the minutes of the previous annual meeting and the treasurer's report, Chairman E. G. Wyckoff announced the executive for 1948. It was also announced that W. D. Black, F. W. Paulin, A. G. Riddell, H. A. Lumsden and E. P. Bowman, all of the Hamilton Branch, are now life members of the Institute.

O. H. Somers of the Standard Gauge Company, Poughkeepsie, N.Y., was then introduced by W. A. Dawson. Mr. Somers chose to speak on **Tools for Dimensional Quality Control,** and confined his remarks to the element of dimension as the criterion of quality in machine processed metal products. All such processes possess the characteristics of variability, either in the form of natural or pure chance, or as unnatural or assignable.

Using a Frequensonar, a pin-ball simulation of a machine process, Mr. Somers demonstrated the influence of both types of variability. This demonstration showed that all machine processes, provided only natural causes are operating, produce quantities of parts which always vary in size according to a general curve. Changes in the process, due to unnatural causes do not change the shape of this curve, but only change its location. This leads to the discovery that the average of five successive samples from a process operating under natural variability will almost always fall between upper and lower control limits. The result of an unnatural variability is disclosed promptly because most of them fall outside the control limits. Charts may be plotted for a machine process to guide the operator in controlling his product.

One hundred per cent inspection is a failure. Spot inspection, following the rules of statistical quality control, substantially improves quality, and lowers inspection costs, since only 2 per cent of finished work is inspected.

In conclusion, Mr. Somers enumerated five rules which constitute the "Tools for Dimensional Quality Control"—

1. Determine the nature of the individual machine variability.
2. Utilize variability to control each process.
3. Balance the cost of quality against the value of quality.
4. Choose a rational degree of inspection.
5. Select suitable instrumentation.

The gavel of office was then turned over to W. E. Brown, who, after final announcements, adjourned the meeting.

MONTREAL BRANCH

Branch Dance

The Branch Dance was held on February 13 in the Ball Room of the Mount Royal Hotel. This proved to be a most enjoyable evening for the 600 people in attendance. Continuous music was provided by two orchestras from 9.30 p.m. to 1.30 a.m. A buffet supper was served at 11.30 p.m. A great deal of credit is due to R. Hobner and his Committee, and to Mrs. R. N. Coke and the following ladies who made such excellent arrangements for the evening: Mme. J. A. Beauchemin, Mme. C. E. Gelinas, Mrs. J. M. Crawford, Mrs. Dan Anderson, Mrs. I. R. Tait, Mrs. E. B. Dubien, Mrs. A. T. E. Smith, Mrs. E. Van Koughnet.

Questionaire

Of the 2,559 questionnaires sent out with the Annual Report, 226 have been returned, 163 by Members, 38 by Juniors and 26 by Students. Over 50 per cent of these replies suggested more plant visits. Amongst other suggestions put forward were requests that the Reading Room be kept open until 10.00 p.m. and that a Club Room be provided. Many of those replying stated their willingness to serve on committee.

The Executive wishes to thank those who answered the questionnaire and to assure them that the suggestions put forward are being carefully studied and that action on these suggestions will be taken wherever possible. In the meantime, the Programme Committee has been asked to arrange more plant visits and to add a Chemical Section to the Committee.

Library

Members are again reminded that the Library is open until 6.00 p.m. each evening and until 8.00 p.m. on Thursday nights. Those desiring to make use of the Reading Room in the evening are requested to make advance arrangements with Headquarters.

BRANCH EXECUTIVE

At the Annual meeting elections resulted in the Branch executive committee listed on the Officers Page of this Journal.

STUDENTS' NIGHT

The Annual Students Night was held on February 26 with an attendance of some 150.

Jean Paul Dagenais, S.E.I.C., and Francois L'Anglais, S.E.I.C., of l'Ecole Polytechnique, and R. M. Dunton and D. L. Townsend of McGill University, were the guest speakers. The meeting was under the chairmanship of Gaetan Ducharme, senior student delegate of L'Ecole Polytechnique.

R. M. Dunton gave a most interesting talk on **The Coal Burning Gas Turbine Locomotive,** illustrating his talk with slides. Francois L'Anglais talked on **High Temperature Curing and Drying of Concrete Blocks.** He also used slides for illustration. D. L. Townsend's subject was **Timber Cruising;** and the last speaker, Jean Paul Dagenais, discussed **Electronic Excitation Sources for Spectographic Analysis,** illustrating his talk with slides.

The judges, Messrs L. O'Sullivan, L. Duchastel and J. Sylvester, awarded the 1st prize of $15.00 to Mr. Dagenais, and the 2nd prize of $10.00 to Mr. Dunton. In accordance with past practice each participant was awarded a year's subscription to the *Journal* and a year's membership in the Institute.

Mr. Derome, junior student delegate of L'Ecole Polytechnique thanked the judges and the speakers.

The meeting was adjourned by the chairman at 10 p.m.

NIAGARA PENINSULA BRANCH

J. J. MILLER, M.E.I.C. - - *Secretary-Treasurer*
C. A. O. DELL, M.E.I.C. - - *Branch News Editor*

Members of the Niagara Peninsula branch and their wives and guests enjoyed a very pleasant evening at the Red Casque Inn near Niagara Falls on Tuesday, January 22. The occasion was Annual Ladies' Night and although the programme had been arranged especially to please the ladies it turned out to be intensely interesting to the men as well.

The speakers were S. T. Hadley, control chemist at the Robin Hood Milling Company's Humbertone mill, and Mrs. Ballantyne, lecturer in home economics for the same company.

Chairman M. F. Ker welcomed the ladies and guests to the meeting and called upon vice-chairman C. L. Mason who introduced the speakers.

Mr. Hadley's subject was **The Selection, Harvesting and Milling of Wheat.** In a short historical outline the speaker noted that except for agriculture itself, milling is man's oldest industry and is indeed the godfather of mechanical engineering because millwrights from the earliest days of the industry up to comparatively recent years have been the only men capable of applying and using mechanical power in engines of production. He traced the different type of flour mills from the first crude grinding stones to the modern present day steel rolls which were invented in Austria in the nineteenth century. The first silk bolting cloth for flour milling was made in Switzerland in 1800 and it is from that country that the best bolting cloths still are obtained. Other materials such as fine woven wire and nylon have been tried for this purpose but to date natural silk is the only one to be used successfully.

Uniformity of product is the most difficult problem in flour milling, because wheat, the raw material, is a biological product and as such varies from variety to variety, from farm to farm, from locality to locality, and from season to season. Because of present practices in the selection, testing, blending and milling of wheat it is possible to obtain uniformity of flour for any one year, but man has not gained sufficient control over the vagaries of nature to enable him to maintain uniformity of this biological product from year to year. It is therefore necessary each year to assess the quality of the wheat supply from the new crop and determine the highest basic quality of product which can be maintained from the available raw material for the year and then mill the grain to produce that quality uniformly for the year.

Mr. Hadley discussed the qualities of various wheats, stating that Western Canada hard red spring wheat is recognized throughout the world as the best available for bread. He also described the milling operation and the ash test for milling accuracy.

A question period followed, and then Mrs. Ballantyne was introduced. Her subject was **The Use of Flour In the Home.** She drew a whimsical picture of the discovery of bread which she envisioned as resulting from a few heads of wheat, rain soaked and then parched by lightning. A stone age huntsman comes upon it and being hungry he eats a few of the grains among other unparched kernels which he had often eaten before. Finding the cooked grain to be more palatable than the raw product he takes some home and orders his wife to cook the grain from then on. And so bread was born.

Mrs. Ballantyne put much emphasis on the thought that cooking is a fine art and one which brings immediate reward. She brought out the fact that our Canadian girls who have grown up during the war years have been denied the full opportunity of acquiring this art and have been at a serious disadvantage because any extra pounds of butter and sugar that may have been around the house during food rationing were certainly not made available for experiments in baking by teen-agers. She called upon the older women to allow their daughters "the run of the kitchen" for one day a week now that food rationing is over, and she promised amazingly good results.

At the end of the programme a buffet lunch was served and each lady found herself the richer by one package of Robin Hood "Velvet" cake flour.

OTTAWA BRANCH

C. G. BIESENTHAL, M.E.I.C. - - *Secretary-Treasurer*
R. C. PURSER, M.E.I.C. - - - - *Branch News Editor*

At the first noon luncheon of the 1948 year, held on February 5, Dr. R. C. Wallace, HON.M.E.I.C., principal of Queen's University, spoke on **The Engineer and the Humanities.** The newly-elected chairman, J. L. Shearer, presided. The speaker was introduced by Dr. C. J. Mackenzie and thanked by the chairman. A number of Carleton College engineering students were present.

" Modern specialists have become exceedingly proficient within the confines of their chosen work ", said Dr. Wallace, " but many have become lop-sided in the broader fields of human relationships ". He outlined three different fields wherein man is linked to the world about him.

First, there is the formal knowledge of the world in which we live with its background of laws and the uniform application to the practical problems of living, of the knowledge we get from it. Secondly, there is the living of men together in the community with its social life and other relationships—the field of social science. And thirdly, there is the individual field of hopes, ideals and aspirations with its striving after beauty and its search into the meaning of life.

If we as professional men become specialists in one line only, said the speaker, our influence in life is less than if we make ourselves more competent in each of these three fields enumerated. The engineer's background in physical science tends to make him get back to facts. But he is developing a sense of beauty too, as is evidenced nowadays in the design of his buildings, bridges, industrial plants and other structures. His work also is impinging on the field of human relationships and he is beginning to realize that there is another side to life, fundamental to its enjoyment, that does not ordinarily come within his compass This is the side of the humanities.

How can we do anything in this field for engineers? The universities are attempting to do something about it. With their science courses they are including more English, more economics, more of the so-called " frills ". They find much more can be done in the final year than in the earlier years. They are having a certain measure of success.

Industrialists, too, are talking about " human engineering ". They are beginning to recognize that personality grows with the width of a man's interests. Specialization these days is necessary for the carrying on of vast undertakings but, from the point of view of human relationships, it is apt to err badly by confining the specialist too closely to some little field of knowledge.

PETERBOROUGH BRANCH

J. M. KING, M.E.I.C. - - - - *Secretary-Treasurer*
J. C. ALLAN, M.E.I.C. - - - - *Branch News Editor*

D. S. Simmins of the Imperial Oil Company delivered an address entitled **Western Canada's Oil** to the Peterborough Branch on January 29.

G. Tollington was in the chair and introduced the speaker, in the absence of J. Osborn who has been transferred to San Francisco.

Mr. Simmins first outlined the organization of the Imperial Oil Co. into Production, Manufacturing and Marketing Departments. Production involves the finding of oil and delivering crude oil to the refineries. Imperial Oil has refineries at Halifax, Montreal, Sarnia, Regina, Calgary and Vancouver. The country is divided into marketing areas fed from these refineries as centres. The refinery at Calgary receives its crude oil from Turner Valley, but it is necessary to bring crude oil for the refinery at Regina by tank car from Texas fields.

During the war the demand for gasoline in Western Canada increased to 10 times the pre-war level because of the demands of the Empire Air Training Plan. However the requirements are still near the war time peak and with the present need for conserving U.S. funds there is considerable urgency to finding Canadian sources of crude oil in the Western Area.

There are wells in the far north at Fort Norman and at one stage of the war the temporary military refinery at Whitehorse was supplied from Fort Norman through a 4-in pipe line. Plans for the erection of a plant to produce gasoline from natural gas near Edmonton were completed before the Leduc field was discovered in 1947. The synthesizing plant was immediately shelved but it was found that it would take three years to complete a new refinery. However, 18 months could be saved and U.S. funds conserved by moving the refinery at Whitehorse to the neighbourhood of Edmonton.

The problems associated with the moving of the heavy equipment over the Alaska Highway were described. The severe winters in the area traversed are being turned to advantage at river crossings and other places where ice bridges can carry heavier loads than the highway bridges.

Mr. Simmins gave his impressions of the Yukon and stressed the importance of cheap gasoline in opening up and developing those remote territories. A film entitled " Research Unending " was shown which illustrated the type of seismographic survey by which the Leduc field was discovered.

SAGUENAY BRANCH

J. E. Dyck, M.E.I.C. - - - *Secretary-Treasurer*

Pulpwood Operations — From The Forest To The Mill was the topic of an address given by J. L. Kelly to the Saguenay Branch of the Engineering Institute on January 29, 1948. Mr. Kelly is presently local manager, South Kenogami Division Price Brothers & Co. Ltd., Chicoutimi, Que.

Mr. Kelly explained in great detail the problems involved in supplying the paper mills with the immense quantities of pulpwood they require. The pulp and paper industry however accounts for only 16 per cent of the annual forest consumption while fuelwood is 22.6 per cent, timber pulpwood for export is 34.1 per cent, and fire, insects and disease destroy 26.6 per cent. The pulp and paper industry has done more to establish a programme for forest management and development for use in perpetuity than all the other users combined

There are 82 pulp and paper companies in Canada operating 109 mills in six provinces. Of the 109 mills, 53 are located in the province of Quebec. In 1946, 4 million tons of newsprint were produced in Canada. This country provides 3 out of every 5 newspapers in the world with its paper requirements.

To provide the pulpwood for this tremendous paper production calls for a large, well organized wood cutting operation in the bush.

Price Brothers and Co. Ltd. have a production of 1500 tons of paper per day, using over 500,000 cords, which will require 1,172,000 man-days of work to cut and deliver the wood to the mill.

The cutting of 200,000 cords per year in a 100 square mile area requires the building of 70 miles of car road, 5 miles of wagon road, 70 miles of telephone line, 90 miles of river cleared, mined, etc., 65 driving dams, 15 truck bridges, 60,000 square feet of depot floor space and 150,000 square feet of jobbers, scalers and drivers camps.

In preparing for bush operation, it is first necessary to survey the district and estimate the wood to be cut in each shanty area. Following this, these shanty areas are contracted for by various jobbers.

The question of supplies is taken care of by the pulp and paper company. These supplies are transported to stores in the bush where they are made available to the jobbers at reasonable prices. This entails the transportation of 13,500 tons of food to the various camps at the scene of operation.

The actual felling of trees and cutting into cordwood is done with the bucksaw. Mechanical saws have been tried but have not proved entirely satisfactory so far. Hauling is done for the main part by single horse and sleigh. This is due to the topography of the district and the fact that small streams suitable for driving four foot cordwood are generally near the scene of the cutting operation. Where hauls are over two miles, trucks or tractors are used as well as the Bombardier Snowmobile. Aluminum sleighs and racks are being experimented with and the results to date have been most satisfactory.

The drive down the streams in the spring is in itself a major operation requiring many skilled men. To drive 200,000 cords of wood requires a crew of 950 men, including 39 foremen, 47 assistant foremen, 45 clerks, 37 cooks, 32 cook helpers, 108 dam guardians, 10 boatmen, 815 drivers, 20 motorboat operators and 10 truck drivers.

Past experience in Price Brothers forest areas has shown that, to prevent log jams a maximum of 2500 cords only can be placed at streams per square mile of drainage area. This can be increased below successive dams along the creek however. After the main drive, the sweep is begun from the head of the river and continued until all the wood is driven to the mouth of the main stream or holding grounds. From here it is delivered as required to the mill pond for daily consumption or to be stacked in block piles for the winter.

Following the address, Mr. Kelly presented two excellent films showing all operations carried out in the bush, modern equipment and the building of good roads into the camps. It was shown that great changes have taken place in the life of the modern lumberjack. Where in former times he went into the bush to remain there until the spring breakup, he now can get out easily by bus at frequent intervals.

The speaker was thanked by B. E. Bauman on behalf of the Branch.

❖ ❖ ❖

Recent Developments in the Uses of Aluminum was the topic of an address given to the Saguenay Branch of the Institute on February 19, 1948, by G. R. Black, of the Sales Development Division of the Aluminum Company of Canada, Limited, Montreal.

Mr. Black pointed out that before the war the bulk of Canadian fabrication of aluminum consisted of cooking utensils, foil, and electric cable. The war completely changed this and great strides were made in forging, casting and extruding aluminum to provide the many products required. The production of aluminum was exceeded only by iron and steel.

Except for a temporary recession after the war, aluminum continued to be in great demand. At the present time, only 10 per cent of total Canadian consumption goes into cooking utensils as against 50 per cent before the war. The building industry consumes 20 per cent of all aluminum used in Canada while the transportation field has come to realize the economy of this strong light metal in the fabrication of railway rolling stock, motor bus bodies, as well as frames, engine parts, etc.

With the aid of slides Mr. Black described how aluminum is being used in the construction of lake boat deckhouses, lifeboats, locomotive cabs, freight car bodies, bus bodies and frames, building flashings and facings, roofing and window sash. Aluminum is also extensively used for piping, conduit, industrial tanks, drums and other containers.

The properties of aluminum alloys have been developed to such an extent that the uses of this metal have become practically unlimited. Research on surface finishes such as anodizing has opened up additional uses for aluminum where a durable surface and a pleasing appearance is required.

In addition to his talk, Mr. Black presented a film on " Fabricating Processes " illustrating the rolling of aluminum sheet as well as forging, casting and extruding this metal.

J. E. Dyck thanked the speaker on behalf of the branch.

Junior Section

F. H. Duffy, Jr.E.I.C. - - - - *Secretary-Treasurer*

A meeting of the Junior Section, Saguenay Branch of the Institute was held at the Arvida Protestant School at 8.15 p.m., February 4, 1948. F. E. Hogg of the Aluminum Company of Canada Limited, addressed the meeting on the subject of **Fabricating Aluminum at Arvida.**

Mr. Hogg, a graduate of the Colorado School of Mines, has had considerable experience in the several fabricating departments of the Aluminum Company of Canada and is presently supervisor in charge of the metallurgical group of the technical department dealing with the fabricating division.

The speaker pointed out that the definition of fabrication as used in the Aluminum Company of Canada, is a very broad term signifying any further working of the aluminum after it leaves the potroom in its molten state. He briefly outlined the types of fabrication at the various plants of the Company and pointed out the different techniques employed. The speaker then outlined the savings which could be made if the heat of the metal, as it comes from the potroom, could be utilized in direct casting of the metal, in the form to be used in the various plants, thus avoiding re-melting. This process had been previously considered but policy has been to cast in a standard form for re-melting elsewhere. This policy is being changed at the present time with a view to providing the ingot in a form satisfactory for each plant without the necessity of re-melting at the plants themselves.

Some of the difficulties in working the metal as it comes from the potroom, without re-melting, were discussed. A brief reference was also made to the construction of the Rod Mill at Arvida. It was finally pointed out that there were arguments for not having further fabrication of the metal in this country, as other countries, to whom the metal is shipped, prefer to have in their own hands as much of the actual fabrication as possible. The basic advantage of casting the ingots in the final form at Arvida is the elimination of the re-melting and re-casting operations and will provide better quality and lower cost in the finished product.

A lively discussion period followed and the number of questions the speaker was called upon to answer showed the interest of those present in this subject. The speaker was introduced by the Chairman, C. J. Tanner and thanked on behalf of the Section by T. T. Anderson.

SAINT JOHN BRANCH

J. H. C. MacLure, m.e.i.c. - - *Secretary-Treasurer*
A. R. Bonnell, m.e.i.c. - - - *Branch News Editor*

The annual joint dinner meeting of the Saint John Branch of the Institute and the New Brunswick Association of Professional Engineers was held Thursday evening, January 29 in the Admiral Beatty Hotel with Chairman T. C. Macnabb presiding.

A toast to the Engineering Institute was proposed by C. L. Mofford, an engineering student at the University of New Brunswick and responded to by J. M. Redding. A toast to the Association was proposed by G. L. Dickson and responded to by R. M. Richardson, newly elected president of the Association.

The guest speaker for the evening, D. O. Robinson, chief engineer, Sales Department, Canada Cement Co., Ltd. was introduced by Chairman T. C. Macnabb. Mr. Robinson had chosen as his topic, **Concrete and Air Entrainment.**

Mr. Robinson stated that the three qualities required in concrete are strength, economy and durability.

A number of years ago when roads were beginning to be kept open for winter traffic, there was ravelling of the surface on concrete pavements. Experiments were made with Portland cement, natural cement, and cement with an addition of beef tallow. Concrete with natural cement was more durable than concrete with Portland cement, but with the addition of beef tallow he Portland cement concrete had the greater durability.

Since the first experiments, a great deal of research has been carried out by the Ontario Department of Highways, with the air entrainment agent, a natural resin, added to the cement, and to the concrete during mixing.

Mr. Robinson stated that the air in the cement, from 3 to 6 per cent for maximum durability, would tend to lower the strength, but with the greater workability attained with the resin added, less water was required, and hence the strength was not lowered.

Since air entrainment in concrete is relatively recent, said Mr. Robinson, not very much information is available as to increased durability.

Following Mr. Robinson's talk the meeting was opened for questioning.

Mr. Macnabb extended a vote of thanks to Mr. Robinson on behalf of the Institute and the Association, following which the meeting adjourned.

VANCOUVER BRANCH

Alan M. Eyre, jr.e.i.c. - - *Secretary-Treasurer*
Stuart Lefeaux, jr.e.i.c. - - *Branch News Editor*

On Wednesday, January 21st the first branch meeting of the year was held in the auditorium of the Medical Dental Building. Approximately one hundred and fifty members and students were favoured with a most interesting and enlightening address on **Aerial Surveys and Mapping** by Dr. Lyle G. Trorey.

Dr. Trorey, who was introduced by J. Alexander Walker of the Vancouver Town Planning Commission, was the Commanding Officer of the Air Survey Company, R.C.E. during the war; he received the M.B.E. for his splendid work on aerial surveying for the allied armies. At present Dr. Trorey is consultant to Aero Surveys Limited of Vancouver, on loan from the Fairey Aviation Company of London, England.

Dr. Trorey explained the geometry of the Multiplex projector, the major item of equipment used in topographical aerial mapping. The Williamson six inch wide-angle air survey camera and the Trorey Anharmonic Rectifier, a product of the war, are also used by his company for aerial surveys.

The speaker enlightened the members on some popular misconceptions regarding aerial surveys. The most amazing revelation was that one hour in the air photographing takes several years of mapping by one man to produce topographical maps. The cost of ground control surveying necessary is 10 to 20 per cent of the total cost. The cost of the aerial photography is approximately 10 per cent of the total cost; the mapping work necessary accounting for the remaining costs. The contour interval obtainable on topography is approximated by height of aircraft in feet divided by 1,000; the accuracy obtainable is one half a contour interval. The horizontal accuracy obtainable may be described as no plotable error.

The major applications of aerial surveys in British Columbia are for small scale forest tree-type maps and large scale topographic maps for logging operation locations. Many engineering uses are found for highway location, damsites, etc.

Many questions were presented and answered to the satisfaction of the members, and Mr. DeJong thanked the speaker for his most informative address.

The Branch News Editor urges readers to advise him of news items regarding Vancouver members. He feels that more items of particular Vancouver interest might be submitted to the "Personals" section of the *Journal.*

WINNIPEG BRANCH

R. T. Harland, m.e.i.c. - - - *Secretary-Treasurer*
R. H. Tivy, jr.e.i.c. - - - - *Branch News Editor*

On Thursday, January 8, the Annual General Meeting of the branch was held, with 54 in attendance. Reports showed the branch to be in sound financial condition and to have a record membership. T. E. Storey retired as chairman after delivering a very capable summary of the year's activities and made way for H. McLeod who is the incoming chairman. Officers elected are listed on the Officer Page of the *Journal.*

Following the business portion of the meeting a talk was given on the subject of **Wood Preservation** by T. N. Miller, who is supervisor of pole preservation for the Manitoba Power Commission.

Mr. Miller dealt briefly with the various types of wood preservation, such as creosote, osmocreo and others, and with the different methods of applying these preservatives to achieve different results for different purposes and different costs.

He mentioned some of the experiences of the Manitoba Power Commission with the methods used in the last three years in preserving Manitoba jackpine poles which are being used currently for the bulk of Manitoba's 80,000-pole-per-year farm electrification programme. The majority of these home grown poles are being cut in the Sandilands Forest Reserve in south-eastern Manitoba and the preservation is done by Dominion Tar and Chemical at Transcona, Man. A discussion period followed and a number of interesting questions were brought up and discussed. The speaker was introduced by J. W. Tomlinson, m.e.i.c., assistant general manager of the Power Commission, and was thanked by G. Fansett.

Electrical Section

L. A. Bateman, jr.e.i.c. - - - - - - *Secretary*
D. C. Bryden, m.e.i.c. - - - - - - *News Editor*

The Electrical Section held two very interesting meetings in January, the first on January 16 when Paul Ross of the Ohio Brass Company spoke on **The Burning of Wood Structures by Leakage Currents.** The lecture was profusely illustrated with coloured slides. Mr. Ross is an acknowledged authority on this subject and his explanations of the cause and cure for this operating trouble were very clear and concise. The meeting found especially interesting his slides illustrating a duplication of outdoor operating conditions in the laboratory. Mr. Ross was very helpful in answering questions in the discussion period following his talk.

❖ ❖ ❖

On January 30, G. A. Muir, special service engineer of the Manitoba Telephone System spoke on **Mobile Telephone Service.** The general public was especially invited to this meeting and turned out in considerable numbers. The Manitoba Telephone System is at present inaugurating two mobile telephone systems, one urban and the other rural, these to be on two separate frequencies. Mr. Muir traced the history of mobile communication and then gave an actual demonstration with communications established between an automobile driving around the city and a regular telephone subscriber. The audience was able to listen in by means of another set of equipment, complete with aerial and loudspeaker, set up in the lecture room. The advantages of this advancement in communication were obvious. His listeners were properly appreciative of the time and effort Mr. Muir had given to provide the demonstration.

❖ ❖ ❖

During 1945, a number of electrical members of the Winnipeg Branch of the Institute met informally to discuss the type of paper presented at the monthly meeting of the branch. It was generally admitted that, as the branch provided papers to cover all branches of engineering, the number of electrical papers that could be presented was relatively small. It was also the feeling of the group that it would not be in the best interest of the members of the branch to increase the number of technical electrical papers, as these might prove uninteresting to nonelectrical men. From these general considerations the idea of an Electrical Section grew. This section would provide an organization for the presentation of purely electrical papers, and to which any member of the Winnipeg Branch might belong.

To properly inaugurate the Electrical Section proved to be a considerable task. It was necessary to re-write the by-laws of the Winnipeg Branch, write by-laws for the Electrical Section, obtain official approval of the revisions from the E.I.C. Council and obtain sanction of the changes from the members of the Winnipeg Branch, by ballot.

The first meeting was held January 14, 1946, when Perry Peterson of the Control Corporation addressed the Winnipeg Branch. H. L. Briggs, one of the members of the original committee was made provisional chairman at that time. Since then the Section has functioned continuously during the winter months. At the inaugural dinner meeting in March, 1946, Mr. Briggs was elected chairman. In 1947 D. H. McCuaig acted as chairman, and in 1948 M. D. Young is chairman.

As an indication of the interest shown in the section, there were eight meetings in 1946 with an average attendance of 46. In 1947 there were nine meetings with an average attendance of 86. The total membership in the section is approximately 100.

Topics discussed included: control and relay problems, electric utility problems, large power equipment and electric cable, radio and communication, electronics, atomic energy, and general.

From the results obtained so far it would appear that the Electrical Section is performing the function for which it was originally designed.

BOOK REVIEWS

WHEN THE STEEL WENT THROUGH: Reminiscences of a Railroad Pioneer

P. Turner Bone. Toronto, Macmillan, 1947. 180 pp., illus., 8¼ x 6 in., cloth, $3.00

Reviewed by Norman Mackintosh*

Autobiographical, and reminiscent, going back to the author's boyhood in Scotland, this book deals principally with personalities and incidents associated with his life and work on Canadian Pacific Railway construction in the early "80's" and thereafter. The fact that the Index consists entirely of a list of over 270 names of persons remembered by the author as friends and associates in his career as a civil engineer, is in itself an indication of the very human and reminiscently historical character of the work. Its technical interest is negligible, for only occasionally does the author refer to his engineering problems or methods, and never primarily as a matter of technical information. Nevertheless, for the practical railway builder interested in early engineering experiences, the little references made to the works being supervised or laid out, will have worth, since a few words by a competent engineer can be enough for a reader of similar calibre.

Mr. Turner Bone's engineering work in the mountain regions advanced the construction of bridges and viaducts built largely of timber, offering a contrast to similar work in the later era of iron and steel. Principally, however, the book is a record of personal contacts with many of the men who built the Canadian Pacific Railway, or had to do with its building. Personalities prominent at the time, and persons obscure then, who afterwards became prominent, are pleasantly referred to; and there is many a mention of humble but congenial helpers in the great undertaking, whose names are now no more than a friendly memory in this warmly human story of personal associations in the days "when the steel went through' for the C.P.R. Though much of the author's work was concerned with timber he was paving the way for the steel. At a later stage his supervision of snow-shed construction dealt with timber also, but for the needs of steel which had by that time "gone through". Other engineering work of his on C.P.R. location and construction in the prairie country, and in Eastern Canada and the State of Maine, provides personalities, experiences, and incidents well remembered by this very vital veteran of civil engineering and Canadian Pacific Railway construction.

Mr. Turner Bone's book—his "first literary venture" at "more than four score years" of age—was still being printed when he died. An introduction by D. C. Coleman, then president of the C.P.R., pays tribute to the value of the author's keen observation and retentive memory, and points out that the book contains "much information" which has "never before found its way into print". This places Mr. Bone's work in its rightful relation to the many books, historical, economic, or romantic which have been written on the subject of the Canadian Pacific Railway. A valuable contribution provided by Mr. Bone's work in relation to other books on the C P.R. is his happy way of giving vignettes of the everyday life of men engaged with him in engineering branches of Canadian Pacific Railway building. Of particular worth also, are the many little touches of light thrown on the characters of men prominent, or who became prominent in association with the construction and completion of the railroad, and during its developing effects on the Canadian West. Illustrations reproduced from the author's collection of very early, and probably irreplaceable photographic prints add to the interest of the volume, but Mr. Bone's own terse word pictures are even more vividly expressive.

Not as a technical treatise, but as a warmly personal and human account of engineering effort, with many entertaining episodes incidental to an immense undertaking, "When the Steel Went Through" is no doubt unique in its appeal for all interested in the early days, and impact on Canadian history, of the construction of the Canadian Pacific Railway.

ARCHITECTS MANUAL OF ENGINEERED SOUND SYSTEMS

Radio Corporation of America, Architectural Relations Sound Equipment Section, Camden, N.J., RCA Victor Co., Montreal, 1947. 288 pp., illus., 11 x 8½ in., leather, $6.00 (in Canada).

This manual covers the installation of sound systems in buildings. It is intended for the use of architects and construction engineers and stresses the fact that modern buildings should allow for the inclusion of sound installations, at some time in the future if not at the time of erection.

The book is divided into two parts, the first being a general treatise on the various aspects of sound systems, and the second the application to specific types of buildings. The authors have placed logically at the beginning a glossary of descriptive definitions. Following this are two American Standards Association specifications (Z32.5—1944 and Z32.9—1943) of Graphical Symbols for Telephone, Telegraph and Radio Use, and Graphical Electrical Symbols for Architectural Plans. These two sections provide the reader with the facts he needs to understand the book. Next are detailed descriptions of the functions, characteristics, specifications and uses of microphones, amplifiers, loudspeakers, controls of all types (mixers, zone switches, relays, control panels), studios and control rooms, sound film projectors, and radio antenna systems. Also in this section is a discussion of acoustics from every angle needed by the architect.

The second part of the manual is entitled "Typical Layouts and Specifications". Its purpose is to apply the theory and details, already given to specific building types. In each case, the applications are graded from simpler to more elaborate types of sound systems. The buildings included are schools, hospitals, churches, auditoriums, stores, industrial plants, and hotels. The authors consider that these specific examples are of much more use to architects and engineers than theoretical data, and they have used numerous illustrations, charts, and architectural drawings to clarify the text.

The manual is the result of intensive research and provides for the first time a comprehensive compilation of data on sound systems. It is written in fairly non-technical language and provides the architect and engineer with an over-all study of standard practices in sound installation as well as providing him with a working guide to specific problems. The authors have succeeded in presenting their material in a clear, concise, and thoroughly logical form. The subdivision of each topic, the use of many charts and illustrations, and the physical format provide a manual that is at once readable and easy to use. The printing is large and clear; the subdivisions of text are easily defined; and the illustrations contain only relevant matter. There is a fairly complete subject index to the volume and thumb guides to the second part. The manual has been compiled from all pertinent data on the subject and should be of invaluable aid to architects and building engineers. N.T

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Catalogue of Scientific Motion Pictures, interim edition:
Information and Program Committee of the Canadian Scientific Film Association, Ottawa, 1947. 138 pp., paper.

Census of Canada, Eighth, Volume VI, 1941:
Ottawa, King's Printer, 1947. 1,042 pp., illus., fabrikoid.

Clay Pipe Engineering Manual:
Clay Sewer Pipe Association, Inc., Columbus, Ohio, 1946 159 pp., illus., fabrikoid.

Compressed Air Handbook; Applications, Equipment, Engineering Data and Test Procedure:
Compressed Air and Gas Institute, New York, c1947. 387 pp., illus., fabrikoid.

Engineering Tests—Civil, Mechanical, and Electrical:
Arthur Liebers. New York, Arco Publishing Company, c1947. 49 pp., illus., paper.

Gas Turbine Construction, including Operation and Maintenance:
R. Tom Sawyer. New York, Prentice-Hall, 1947. 411 pp., illus., cloth.

Heating and Ventilating's Engineering Databook:
Industrial Press, New York, 1948. 549 pp., illus., fabrikoid.

Heritage of the English-Speaking Peoples and Their Responsibility; Addresses at the 2nd Conference, September, 1947:
Kenyon College, Gambier, Ohio, c1948. 268 pp., paper.

Light Metals in Structural Engineering:
L. Dudley. London, Temple Press, 1947. 216 pp., illus., cloth.

Literature Search on the Preservation of Foods by Freezing; First Supplement, January 1946-July 1947:
Betty Anderson and B. H. Weil. Atlanta, Georgia School of Technology, 1948. 670 pp., paper.

Patent Notes for Engineers:
Radio Corporation of America, Princeton, N.J., 1947. 165 pp., illus., cloth.

Nomography:
A. S. Levens. New York, Wiley, c1948. 176 pp., illus., cloth.

LIBRARY REGULATIONS

HOURS

	Oct. 1-May 30	June1-Sept. 30
Monday to Friday	9 a.m.- 6 p.m.	9 a.m.- 5 p.m.
Thursdays (Oct. 1-Mar. 31)	9 a.m.- 8 p.m.	9 a.m.- 5 p.m.
Saturdays (closed July & August)	9 a.m.-12 noon	9 a.m.-12 noon

BORROWING & PURCHASING

Books, Periodicals, Photostats, Translations, etc., may be borrowed or purchased by any member of The Institute, resident in Canada.

Items may be borrowed for two weeks, exclusive of travel time, and may be renewed for a further two weeks on request.

A Library Deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the borrower, or purchaser. Therefore, except in the case of Library Deposits, payment should not be made in advance.

Non-members may consult the Library, but may not borrow material.

BIBLIOGRAPHIES AND EXTENSIVE LITERARY SEARCHES

Short subject bibliographies will be compiled on request.

Extensive literary searches will be made at a charge of $1.50 per hour to members, $2.50 per hour to non-members.

Please indicate which is required.

Requests must indicate clearly the SPECIFIC SUBJECT and SCOPE desired.

Give all pertinent information possible

Canada Year Book, 1947:

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARD FOR MASTIC ASPHALT FLOORING: NATURAL ROCK CONTAINING 6-10 PER CENT BITUMEN. B.S. 1410: 1947.

London, British Standards Institution. 2/6.

This is a further British Standard in the series covering the bituminous flooring materials and covers a type of mastic asphalt flooring composed of natural rock asphalt incorporated with an asphaltic bitumen and refined lake asphalt and the addition of coarse aggregate. The materials covered (specified by composition) are designed for a wide range of uses from light duty floors to heavy duty industrial flooring.

BRITISH STANDARD FOR SAFETY BELTS AND HARNESS. B.S. 1397: 1947.

London, British Standards Institution. 2/6.

In this standard, no attempt has been made to design belts for any particular use, but rather the standard ensures that the materials used and the method of manufacture will produce a belt of ample strength and it also specifies method of test which ensures that the belt is so designed as to run the least possible risk of injury to the wearer in the case of a fall.

BRITISH STANDARDS SPECIFICATION FOR ELECTRIC OVERHEAD TRAVELLING CRANES FOR GENERAL USE IN FACTORIES, WORKSHOPS AND WAREHOUSES. B.S. 466: 1947.

London, British Standards Institution. 4/–.

This specification deals with electric overhead travelling cranes, power driven in all motions, for general use in factories, workshops and warehouses, whether working indoors, under cover or exposed to the weather, but it does not apply to special duty cranes, such as heavy-duty steel works cranes, for which it is intended to prepare a separate standard.

BRITISH STANDARD SPECIFICATION FOR PORTABLE FIRE EXTINGUISHERS OF THE GAS/WATER PRESSURE TYPE (RIVETED CONSTRUCTION). B.S. 1382: 1947.

London, British Standards Institution. 2/–.

This standard contains details of materials and construction of body and pressure container as well as fittings and also gives methods of test and marking. It does not at present include any requirements for welded construction, but it is hoped in the near future to publish a revision which will include various methods of welding.

PRELIMINARY MATHEMATICS FOR ENGINEERS; 3rd ed.

W. S. Ibbetson. London, Spon, 1947. .175 pp, illus., 7½ x 5 in., cloth, 6/6.

This book deals with basic mathematics, and includes arithmetic, algebra, mensuration, the slide rule, and the elements of trigonometry. The author contends that there is no short cut to a true knowledge of mathematics, and that a sound foundation is necessary for every engineer. The purpose of his book is to provide this foundation, and to give the engineer a ground on which to base his future study. The principles are presented in simple form, with many examples and diagrams. Exercises follow each chapter.

TREATISE ON MILLING AND MILLING MACHINES, SECTION TWO, 3rd ed.:

Cincinnati Milling Machine Co., Cincinnati, 1946. 326 pp., illus., paper, $1.00.

This section deals with the milling process, chip formation, surface finish and cutting fluids, power required in milling, and mounting of milling cutters. The purpose is primarily to discuss the fundamental concepts of milling, though it is a practical rather than a theoretical book. It is attractively printed, profusely illustrated, and easily readable.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

AMERICAN SOCIETY FOR TESTING MATERIALS, Proceedings, Volume 46, 1946. Committee Reports, Technical Papers:

American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa., 1947. 1,629 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $12; to A.S.T.M. members, $8.00.

This volume presents the committee reports and the technical papers presented at the 49th annual meeting. All the symposia are not presented in full. Those published elsewhere are summarized. Discussions are included and immediately follow the respective papers. A wide variety of materials and material properties are dealt with.

DATA BOOK FOR CIVIL ENGINEERS, Volume 3; Field Practice:

E. E. Seelye. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 306 pp., illus., diagrs., charts, tables, 8¼ x 5 in., cloth, $4.50.

The third in a series entitled "Data Book for Engineers", this volume is designed to equip the field engineer or inspector for the proper inspection of virtually every type of civil engineering work. It contains outlines of inspection procedure and check lists on concrete, masonry, structural steel, welding, bridges, foundations, pile-driving, timber, soils, grading, bituminous paving, sanitary construction, and pipe laying. Material on the conducting of field tests is presented as well as a detailed discussion of surveying practice.

SECOND INTERNATIONAL CONFERENCE ON SOIL MECHANICS AND FOUNDATION ENGINEERING, ROTTERDAM

June 21-30, 1948

It is anticipated that an enrolment fee of approximately 20 guilders (about $8.00) will be required from those participating in the Conference. The application for participation must reach the Secretary (Oostplantsoen 25, Delft, The Netherlands) before May 1st, 1948.

The *Proceedings* will form an unusually valuable record of developments in the field since the First Conference in 1936. Their cost is expected to be about 75 guilders (about $30.00) per set. In order that a number of sets may be reserved for Canada, those organizations and individuals desiring Proceedings should inform their regional Committee member or the Committee secretary before April 1st of the number they wish. In this way it is hoped to anticipate the needs of everyone with regard to publications of the Conference.

ESSENTIALS OF APPLIED PHYSICS:

R. M. Frye. Prentice-Hall, Inc., New York, 1947. 322 pp., diagrs., tables, 9¼ x 6 in., cloth, $4.35.

An elementary physics textbook requiring a mathematical basis of algebra, geometry and trigonometry. The general procedure of mechanics, heat, sound, electricity and light is followed. Each chapter is summarized on the basis of definitions of the technical terms and laws introduced. The practical electrical units are used, and the electron current is employed exclusively rather than the conventional positive current.

CALLAWAY TEXTILE DICTIONARY:

W. L. Carmichael, G. E. Linton and I. Price. Callaway Mills, La Grange, Georgia, 1947. 392 pp., illus., 8 x 5¼ in., cloth, $4.00.

Designed for use by those in the textile and related industries and professions, this volume comprehensively covers the terminology of textile manufacturing and its products. It includes those products contained within the categories of yarns and woven fabrics, including the dyeing and finishing processes, the major synthetic and natural fibers used, and the steps involved in the production of the completed article.

HIGH VACUA: Principles, Production, and Measurement:

S. Jnanananda. D. Van Nostrand Co., Toronto, New York and London, 1947. 310 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $6.95 in Canada.

The scope of this book ranges from the choice of suitable vacuum-producing and vacuum-measuring apparatus to the most effective means of control and calibration. Many diagrams show constructional details and working methods. The basic principles of all the equipment used are explained, and the kinetic theory of gases is reviewed.

JACOB INTEGRAPH INSTRUCTIONS AND TYPICAL PROBLEMS:

B. C. Jacob, 205 North Mountain St., Bay City, Mich.; photo offset by Polygraphic Company of America, New York, 1947. 126 pp., diagrs., charts, tables, 8¼ x 6 in., paper, apply to author.

The Jacob Integraph is a small transparent triangle having ruled lines and small perforated holes so placed as to make it possible to perform graphically a variety of arithmetical and analytical computations. It may be used with an ordinary tee-square or triangle or as an attachment on a universal drafting machine. The accompanying instruction book gives a detailed explanation first, of the simple fundamental operations; and then, of more complex problems in mechanics and engineering, including a variety of practical applications such as determining bending moments and deflections in beams and shafts, impact or collision values, forces and accelerations, volumes of tanks, etc.

MODERN GAS TURBINE:

R. T. Sawyer. 2 ed. Prentice-Hall, Inc., New York, 1947. 224 pp. illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.00.

Prepared for the use of those interested in the development and applications of the gas turbine, this volume contains fundamental principles of operation, a graphic description of the inventions concerned, and an account of recent uses as supercharger and prime mover. This second edition covers the same material as the first with the addition of material on jet propulsion in the rewritten chapter on the gas turbine as an aircraft prime mover. An appendix of questions on the material in each chapter has been added. There is a bibliography.

SPECIFICATIONS FOR STEEL RAILWAY BRIDGES FOR FIXED SPANS NOT EXCEEDING 400 FEET IN LENGTH:

American Railway Engineering Association, 59 East Van Buren St., Chicago 5, Ill., 1947. 49 pp., diagrs., tables, 9 x 6 in., paper, $0.50.

The specifications are for steel railway bridges with fixed spans not exceeding 400 feet in length. Part I, giving details of design and manufacture, includes proposals, drawings and weighing and shipping information. Parts II and III cover the various types of steel for structural and rivet use, giving chemical and physical properties and certain information concerning alloy steels not appropriate as specification clauses.

SPRING DESIGN AND CALCULATIONS: Compiled by J. A. Roberts.

Technical Research Laboratory, Herbert Terry and Sons, Limited, Redditch, England, 1947. 114 pp., illus., diagrs., charts, tables, 7½ x 4¾ in., cloth, 10s.6d.

This small book gives examples of practical design calculations for a variety of spring types. Belleville washers, retaining rings, and spring driving belts are also covered. Brief chapters are devoted to the power and natural frequency of springs, the surging of valve springs, and combined axial and horizontal loading on compression springs. Helpful hints are given for ordering springs.

SURVIVAL AND RETIREMENT EXPERIENCE WITH WATER WORKS FACILITIES; a Committee Report.

American Water Works Association, 500 Fifth Ave., New York, 1947. 566 pp., charts, tables, 9 x 6 in., cloth, $3.00.

The American Water Works Association, with the co-operation of other associations in this field, has compiled this collection of records relating to the chief items of equipment used in water plants. The comprehensive and detailed tables show the number and length of life of such items of property as have been used and retired, the number and age of those still in service, and the distribution by ages throughout the life span. Twenty-six communities exemplifying rapid, slow and normal growth are cited, representing a geographical range from Canada to Florida and from New York to California.

TABLES OF SPHERICAL BESSEL FUNCTIONS; Volume II: Prepared by the Mathematical Tables Project, National Bureau of Standards:

Columbia University Press, New York, 1947. 328 pp., tables, 10¾ x 7¾ in., cloth, $7.50.

The major part of the present volume is devoted to tables of the spherical Bessel functions $\sqrt{\pi/2x}\ Jv(X)$, for $\pm v$ ranging from 29/2 to 61/2 with from 7 to 10 significant figures. This set of tables complements those previously published for $\pm v$ ranging from 1/2 to 27/2. A discussion of the properties of these functions and the computation methods used also appeared in the previous volume, while both volumes contain interpolation methods and notes on their respective tables.

Although not available in the Institute Library, inquiries concerning the following new books will be welcomed there or may be sent direct to the publishers.

CHEMICAL ENGINEERING CATALOG, the Process Industries' Catalog, 1947-48, 32nd edition.

Reinhold Publishing Corp., New York, 1947. 1,584 pp., illus., diagrs., charts, tables, 11 x 8 in., cloth, $3 in U.S.A. and Canada; $12 foreign (free to chemists).

This annual publication provides a collected group of some 500 condensed manufacturers' catalogs giving data about equipment, machinery, raw materials, heavy and fine chemicals, and laboratory supplies used in chemical process industries. The volume also contains a technical data section, trade name index, and a section on technical and scientific books. A classified index covers equipment, supplies, chemicals and materials.

CONVEYORS AND CRANES

By W. H. Atherton. Pitman Publishing Corp., New York and Chicago, 1947. 357 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $6.00.

This descriptive treatise is intended primarily for those responsible for the selection and application of such equipment. Part I deals, in considerable detail, with the mechanical handling of package goods by conveyors, elevators and stackers; Part II considers machines for handling coal and other loose materials in bulk, including both mechanical and pneumatic grain-handling plants; Part III is devoted to a briefer treatment of heavy cranes, skip hoists, and electric telphers. Fully illustrated, the book also contains graphs, tables, capacity and power formulae for design work.

ELECTRONIC ENGINEERING PRINCIPLES:

By J. D. Ryder. Prentice-Hall, Inc., New York, 1947. 397 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.65.

With the object of supplying the physical fundamentals needed for an understanding of electron tubes, this volume covers theories of conduction, simple atomic structure, and generalized circuit analysis with linear and nonlinear circuit elements. A basic knowledge of alternating current network theory and mathematics through simple differential equations is assumed. The physics involved in emission, space charge, and gaseous conduction phenomena is explained. Theory and applications are closely grouped, and applications are chosen mainly from the industrial field. An appendix contains selected vacuum tube characteristic curves and data. References are given at the end of each chapter.

ELEMENTARY TELEGRAPHY:

By E. Missen. George Newnes Limited, London, 1946. 340 pp., diagrs., tables, 7½ x 5 in., cloth, 12s.6d.

Elementary principles and modern apparatus are the subjects of this volume. The earlier chapters deal with the various codes employed, the principles of the start-stop telegraph system, telegraph relays, and elementary line telegraph transmission. Subsequent sections have been devoted to voice frequency telegraphy, telegraph circuits, signal distortion, and power supplies. Other features are chapters dealing with testing and measuring apparatus and telegraph instrument room equipment.

FLAMEPROOFING TEXTILE FABRICS. (American Chemical Society Monograph Series No. 104.):

By R. W. Little. Reinhold Publishing Corp., New York, 1947. 410 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.75.

Written by specialists in the fields covered, this volume presents a comprehensive survey of the subject. It is based on the findings of war-time investigations. The fundamental mechanisms of thermal degradation of cellulose and the chemical and physical phenomena of flameproofing are considered in the first section. The second section is devoted to the methods employed in the processing and evaluation of flameproofed fabrics. Various applications of flame retarding treatments in the field of textile products are discussed in the last section, with particular reference to military clothing and equipment.

FLIGHT TESTING, Conventional and Jet-Propelled Airplanes:

By B. Hamlin. Macmillan Co., New York, 1946. 147 pp., illus., diagrs., charts, tables, 11 x 8 in., cloth, $5.00.

Standardized methods are given for the analysis and reduction of flight test data to standard conditions; in Part I for conventional airplanes, and in Part II for jet-propelled airplanes. The book also covers basic flight testing formulae, data required and methods for acquiring them, necessary instrumental vibrations, and explanations of essential aerodynamic theories including the theory and general characteristics of turbo-jet engines. All necessary terms and symbols are carefully defined or explained.

FUNDAMENTALS OF ALTERNATING-CURRENT MACHINES:

By A. Pen-Tung Sah. McGraw-Hill Book Company, New York and London, 1946. 466 pp., illus., diagrs., charts, tables, 9 x 5¾ in., cloth, $5.00.

Written from the viewpoint of the operating man rather than that of the design engineer, this book lays particular stress on the operating problems of electrical machines. The student is shown not only how to test his equipment, but also what tests to make in order to obtain quickly and accurately the requisite parameters from which he may compute the performance. Thus design formulas are avoided, while the experimental determination of the machine parameters is given full prominence after the theory is explained. Only those theories and experimental methods capable of being generalized are treated, and for directness the theory is developed from the standpoint of circuits.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

February 28th, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the April meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.
Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.
He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to cooperate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ABBOTT-SMITH—HENRY BANCROFT, of Montreal, Que. Born at Montreal, Jan. 11, 1902. Educ.: B.A.Sc., McGill, 1923; R.P.E., Quebec; 1923-24, test course, C.G.E.; with Shawinigan Water & Co., as follows: 1924-25, power house operator, 1925-27, meterman, 1927-28, field meter tester, 1928-40, asst. to meter engr., 1941-45, asst. meter engr., 1946 to date, supt., records divn., power house sales dept., Montreal, Que.

Library Notes

(*Continued from page 198*)

STRATEGIC MINERALS:

By J. B. DeMille. McGraw-Hill Book Company, New York and London, 1947. 626 pp., tables, 9¼ x 6 in., cloth, $7.50.

This comprehensive manual furnishes a wealth of detailed information on the essential chemical and physical properties of 76 strategic metals and minerals. Treating the subject from the viewpoint of world supply and production, the author gives the sources of these materials and provides pertinent statistics on the domestic and foreign output and distribution of each. The development of new applications for these minerals in industry is discussed, and reference is made to new methods in metallurgy. A brief review of government regulations affecting procurement and production, and a detailed discussion of stockpile directives are supplied.

TECHNICAL DRAWING PROBLEMS:

By F. E. Giesecke, A. Mitchell and H. C. Spencer. 2 ed. Macmillan Company, New York, 1947. 9 pp., text 105 sheets of diagrs., 11 x 9¼ in., paper, ring binder, $2.75.

Containing problems which are designed to cover the important fundamental principles of technical drawing, this volume is not intended for use as a complete course in itself. The problems are divided into units, and references are given under each unit to the section in "Technical Drawing", second edition, by the same authors. Following a section on the use of instruments is one on the geometry of technical drawing. Succeeding sections discuss the construction of letters and numbers, problems on views, identification, revolutions, isometric and oblique drawing, and dimensioning. Problems on fasteners and springs complete the book.

TRICOT FABRIC DESIGN:

By T. H. Johnson, McGraw-Hill Book Company, New York and London, 1946. 124 pp., illus., diagrs., tables, 8¼ x 5½ in., cloth, $2.50.

In the opening chapters the elements and action of the tricot knitting machine are described with illustrative diagrams. Succeeding chapters discuss in detail the formation of the basic pattern types, with drafting and design detail. Separate chapters deal with graphic design and the important topic of runproof construction.

WATER TREATMENT AND PURIFICATION:

By W. J. Ryan. 2 ed. McGraw-Hill Book Co., New York and London, 1946. 270 pp., illus., diagrs., charts, maps, tables, 8¼ x 5½ in., cloth, $2.75.

The purpose of this book is to make available to students, engineers and plant managers a description, under one cover, of the several purification and other processes that are applied to water. The construction and operation of the different types of filtering, softening and treating apparatus are described and illustrated by diagrams and photographs. The chemical reactions occurring in the treatments are also given. In this new edition have been added recent developments such as: organic ion exchange materials for water softening; new embrittlement prevention processes; etc.

Employment Service

The service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. It would therefore be particularly appreciated if employers would make the fullest possible use of these facilities to make known their existing or estimated requirements. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be inserted upon request after a lapse of one month. Personal interviews by appointment.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER required by a major Canadian Company located in Toronto as Technical Service Man. 25 to 35 years old. Definite sales personality. Position will include 6 to 12 months' training. It will carry the responsibility for servicing all types of adhesives to industries throughout Canada. Salary open. Apply to File No. 4044-V.

ELECTRICAL

DESIGNING ELECTRICAL DRAUGHTSMAN with experience on station design and layout required in Montreal by a pulp and paper mill. Experience in pulp and paper industry would be an asset, but not essential. Salary open. Apply to File No. 4046-V.

MISCELLANEOUS

GRADUATE ENGINEERS preferably with about five years light structural and mechanical experience required by growing concern in central Ontario to learn business thoroughly and thereby be in a position to accept responsibility in Engineering Department. Salary open, based on experience and aptitude. Apply to File No. 4045-V.

TOWN ENGINEER required by Town of Weston, Ontario. Position includes the supervision of the Works Department and Building and Plumbing Inspections. Applicants to give full particulars in first letter. Salary open. Apply to File No. 4047-V.

ENGINEERING ASSISTANT to teach some classes in first three years of Engineering course at Dalhousie University, Halifax, Nova Scotia. Appointment for one year, commencing September, 1948, with possibility of permanent re-appointment. Salary open. Apply to File No. 4048-V.

MUNICIPAL ENGINEER, required by a Town in Ontario. Must have electric and water-works experience also be prepared to obtain papers as a land surveyor in order to layout lots in town and to layout a new sub-division. Salary to start $300.00. Apply to File No. 4049-V.

TOWN ENGINEER, required for Town of Fort Erie, Ontario. Duties include the supervision of the Works Department and Building and Plumbing Inspections. Reply giving full particulars. Salary open. Apply to File No. 4050-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experience in installations of Production and Cost Control, Wage Incentives, etc. Free to travel, preferably bilingual. Salary open. Apply to File No. 4052-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

*CHEMICAL ENGINEER OR CHEMIST interested in textile dyeing required by an industrial firm in South Western Quebec. Salary open. Apply to File No. 3798-V.

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knowledge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER, recent graduate, required to study and become experienced with industrial products fabricated from carbon or graphite by firm in Toronto area. Position to eventually lead to sales. Salary $180 to $200. Apply to File No. 3958-V.

CHEMICAL ENGINEER, recent graduate, is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp and paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Technical and Development Department. Several years experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

CHEMICAL ENGINEER, experienced in use of physics and mathematics, under 30 years of age, required by industrial and chemical organization with Headquarters in Montreal. Duties include development work and study explosives and chemistry and hydro-dynamics. Salary open. Apply to File No. 3995-V.

SENIOR CHEMICAL ENGINEER OR CHEMIST, required by leading Paper Manufacturer in Eastern Canada. Applicant should have some experience in Paper Mill Control work. This position offers plenty of scope for advancement. Salary open. Apply to File No. 4013-V.

CIVIL

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual, may be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

CIVIL ENGINEERS with some experience on design and field work required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEERS required as draughtsman in bridge department of large transport company. Preferably with experience in steel, concrete and timber construction. Location Montreal. Salary $200-$300. Apply to File No. 3884-V.

CIVIL ENGINEER, required in New Brunswick. Must be qualified designer of miscellaneous public utility buildings in frame and masonry construction. Thorough working knowledge of timber, reinforced concrete and steel framing essential, knowledge of the design of various types of heating system and plumbing. Salary open. Apply to File No. 3887-V.

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewerage Department also construction of a general nature for the Electric Light Department. Salary open. Apply to File No. 3930-V.

CIVIL ENGINEER, required by a Steel Company in Montreal for the design of reinforced concrete frame. Salary open. Apply to File No. 3931-V.

*JUNIOR CIVIL ENGINEER, with some structural experience, required for general duties by a textile manufacturing concern near Montreal. Salary around $300. Apply to File No. 3954-V.

CIVIL ENGINEER, recent graduate, required to under study City Engineer of a city in Western Quebec. Salary open. Apply to File No. 3966-V.

JUNIOR ENGINEER, preferably with civil background required for sales and service by a Montreal manufacturer of waterproofing compounds. Salary open. Apply to File No. 3968-V.

CIVIL ENGINEER required in Montreal with general knowledge of reinforced concrete and steel structures. Special knowledge of triangulation surveys, boundry surveys, also laws and procedure to be followed in regard to the purchase, transfer and registration of lands in Province of Quebec. Must be bilingual. Preferably veteran. Salary not less than $3,480. Apply to File No. 3987-V.

CIVIL ENGINEER required in Montreal with considerable experience in design of reinforced concrete and steel structures. Ability to make stability reports of wharves and retaining walls, also draft specifications, prepare estimates and economic studies. Preferably bilingual and veteran with overseas service. Salary not less than $3,480. Apply to File No. 3987-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 30-45, required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Must have sales training in electrical equipment instruments also experience as sales and service engineer. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER, recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER, with general knowledge of a.c. and d.c. motors, switchgear, mercury rectifiers, transformers and other electrical apparatus, for sales work in Eastern Canada, age 30 to 35. Salay open. Apply to File No. 3695-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Preferably bilingual and familiar with rotating electrical equipment. Salary $200 up. Apply to File No. 3761-V.

GRADUATE, ELECTRICAL ENGINEERS with 3 to 10 years experience in design operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced. Bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEER with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

*SEVERAL EXPERIENCED ELECTRICAL DRAUGHTSMEN, for the design and layout of industrial power and control systems. Required by consulting engineering office in Montreal. Salary open. Good chance for advancement. Apply to File No. 3890-V.

* Filled since appearance in advance notice.

JUNIOR ELECTRICAL ENGINEER, with practical experience in general manufacturing industries, required by an industrial organization in Ontario. Salary open. Apply to File No. 3904-V.

ELECTRICAL ENGINEERS, required for sales engineering work in Western Canada. Graduates with some selling experience preferred. Salary open, plus expenses. Apply to File No. 3915-V.

JUNIOR ELECTRICAL ENGINEER, age about 30, required as assistant to superintendent of light department in Montreal area. Practical experience in Hydro Distribution and Steam Turbines. General office routine of administrative nature Salary open. Apply to File No. 3950-V.

ELECTRICAL DRAUGHTSMAN, required by a firm of Engineer Contractors in Alberta for layout and plotting with a minimum of supervision. Should be accustomed to working with power lines to 2,300 volts and must be able to do lighting circuits, both overhead and underground. Salary $250 to $300. Apply to File No. 3972-V.

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Quebec for fall 1948 semester. Preferably with teaching and practical experience in power, electrical machinery design, lab. etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

RECENT GRADUATE electrical background, preferably bilingual, required by a Montreal manufacturer of electric motors, generators, ventilating equipment and pumps. Position to eventually lead to sales. Salary open. Apply to File No. 3989-V.

*ELECTRICAL ENGINEER with 2 years experience in industrial electrical maintenance and at least 1 year's supervisory experience, age 20-35, required by chemical organization with headquarters in Montreal. Duties include responsibility of all electrical and instrument maintenance also electrical distribution system and air-conditioning system. Salary open. Apply to File No. 3995-V.

ELECTRICAL ENGINEERS, age 30 to 40, required for the Commercial and Distribution Department of large Hydro Electric Utility. Must have experience in electrical distribution. Salary open. Apply to File No. 4002-V.

*ELECTRICAL ENGINEER to take charge of hydro electric maintenance involving four or five plants. Salary open. Apply to File No. 4015-V.

ELECTRICAL ENGINEER experienced in Power Station, Transmission and Distribution design and installation. Permanence and advancement depending upon performance. Salary open. Apply to File No. 4024-V.

JUNIOR ELECTRICAL ENGINEER, required by a mining company in Northern Ontario. Salary open. Apply to File No. 4028-V.

ELECTRICAL ENGINEER with minimum of 5 years experience in paper industry, between 35-45 years of age, for responsible position with large newsprint manufacturing concern in Northern Ontario. Salary commensurate with qualifications. Living accommodation assured. Apply to File No. 4032-V.

ELECTRICAL ENGINEERS with some experience in research, design, and development, backgrounds in communications, electronics, power or physics are preferred. Required for the staff of a technical college in N.Y. state. Salary and rank will be commensurate with experience and training. Apply to File No. 4038-V.

MECHANICAL

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area in a government establishment. Salary from $190.00. Apply to File No. 3401-V.

MECHANICAL ENGINEERS, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEERS with at least five years experience in the pulp and paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

*MECHANICAL ENGINEER experience in heating, ventilating and air-conditioning required by a consulting engineer in Montreal. Salary open. Apply to File No. 3773-V.

MECHANICAL ENGINEERS required by a Pulp and Paper Mill at Powell River, B.C. Preferably with experience in plant design in the pulp and paper industry. Salary according to qualifications. Salary open. Apply to File No. 3796-V.

MECHANICAL ENGINEERS with experience in plant layout and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

MECHANICAL ENGINEER, age 35-40, with considerable experience in design and layout of machinery and equipment, required by an organization with Head Office in Montreal. Salary $300-$400. Apply to File No. 3820-V.

MECHANICAL ENGINEER with six to ten years experience in maintenance and engineering work required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER, required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with knowledge of physical metallurgy heat treatment, ability in stress analysis and design. Required for research work in B.C. Maximum salary $4,000. Apply to File No. 3865-V.

MECHANICAL ENGINEER, age 30-38, required for northern Ontario Paper Mill. Preferably with paper mill experience or experience in general layout and design. Knowledge of pumps capacities, piping, conveyors, estimating and structural design essential. Salary open. Apply to File No. 3891-V.

MECHANICAL ENGINEER, bilingual, with 4 or 5 years experience in sheet metal work required as Plant Manager by a manufacturer in the Province of Quebec. Salary open. Apply to File No. 3894-V.

RECENT GRADUATE mechanical background, required by a manufacturer in Montreal for work in machine design, possibly for production in the future. Salary $225. Apply to File No. 3901-V.

MECHANICAL ENGINEER, age 25 to 35, experienced in industrial plant layout and machine design required by manufacturing firm in Brantford. Salary open. Apply to File No. 3907-V.

MECHANICAL ENGINEER, recent graduate, with some knowledge of heat exchanges, condensers, or any type of unfired pressure vessels required by an industrial organization in Montreal. Salary open. Apply to File No. 3976-V.

MECHANICAL ENGINEER, recent graduate, bilingual, with some experience in general plant work, required in Montreal. Industrial engineering experience would be useful. Duties include time-study in Standards Department. Salary open. Apply to File No. 3980-V.

MECHANICAL ENGINEER age 25 to 30, is required by a company in Shawinigan Falls to eventually act as Assistant Works Manager when qualified. Salary open. Apply to File No. 3985-V.

MECHANICAL ENGINEER, with experience in plant lay-out and knowledge of reinforced concrete, timber and steel design, required in an industrial manufacturing and processing plant situated 75 miles from both Ottawa and Montreal. Salary open. Apply to File No. 3990-V.

GRADUATE MECHANICAL ENGINEER required by engineering concern in Montreal area engaged in manufacture of hydraulic turbines and mining machinery. Preferably with 5 or more years experience. Excellent working conditions, free pension, group and health insurance, five day week, cafeteria service. Salary open. Apply to File No. 3992-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in reinforced concrete and structural steel required by a mining company in Northern Ontario. Housing available. Salary open. Apply to File No. 3994-V.

MECHANICAL ENGINEER, with 2 or 3 years experience, preferably bilingual, required as Mechanical Development Engineer by industrial and chemical organization with headquarters in Montreal. Duties will be conducting investigations on existing equipment and a certain amount of plant layout work and draughting. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER with 1 to 3 years experience in production, required as Industrial Engineer by industrial and chemical organization with headquarters in Montreal. Duties include responsibility for conducting methods engineering studies using methods of process charts, time and motion study. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER, required by a Montreal manufacturer of machines and equipment for work consisting of general engineering and design in connection with the manufacture of pulp and paper machinery. Salary open. Apply to File No. 4000-V.

*MECHANICAL ENGINEER, required by a textile manufacturing concern near Montreal. Applicant after becoming acquainted with the plant would be expected to act as general follow up man on repair of mechanical and electrical equipment also see that all material necessary is on order or on hand. Salary open. Apply to File No. 4001-V.

*MECHANICAL ENGINEER, required for paper mill converting department of large Paper Manufacturer in Eastern Canada. Preferably with experience in Production and Mechanical Maintenance. Salary open. Apply to File No. 4013-V.

MECHANICAL ENGINEER must be bilingual, required by paper company for general duties in line with capabilities and interest. Position in very small community in Province of Quebec. Salary open. Apply to File No. 4020-V.

MECHANICAL ENGINEER required as assistant in Chief Engineers Department by large paper company. Paper experience essential. Some knowledge of French language would be helpful. Must be able to complete investigations and write reports. Age 28-40. Salary $350-$450. Apply to File No. 4022-V.

MECHANICAL ENGINEERS required in Ontario by a firm specializing in machine tools. Vacancies exist for Junior Salesman with ability and interest in sales engineering also engineer experienced in Production control. Salaries open. Apply to File No. 4026-V.

MECHANICAL ENGINEER required by a road building and earth moving machinery manufacturer in Ontario. Position to eventually lead to General Plant Superintendent. Preferably veteran. Salary open. (Application by letter only.) Apply to File No. 4029-V.

MECHANICAL DRAUGHTSMAN required by a large coal mining firm in the Maritimes for simple designing, layout and detail drawings for colliery plant, screening equipment, hoists, simple steel structures. etc. Salary $240.00 up depending upon ability. Apply to File No. 4030-V.

MECHANICAL ENGINEER preferably with heating and ventilating experience required in Montreal for design and draughting. Salary depending on experience. Apply to File No. 4034-V.

METALLURGICAL

*METALLURGICAL ENGINEER, preferably with lab experience also some industrial experience would be helpful, required by large transportation company in Montreal. Salary open. Apply to File No. 3998-V.

MINING

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No 3818-V.

* Filled since appearance in advance notice.

MINING ENGINEER with several years experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

MISCELLANEOUS

MANAGEMENT ENGINEER with business administration and mechanical background, age 30 up, bilingual with at least 5 years practical experience, required by an industrial engineering consultant in Montreal. Salary open. Apply to File No. 3307-V.

STRUCTURAL STEEL DRAUGHTSMAN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS, required by an industrial and chemical organization with headquarters in Montreal for all phases of research, design, operation development, production and maintenance. Salaries open. Apply to File No. 3588-V.

*DESIGN DRAUGHTSMAN for the design of cranes and hoists of all types, capable of making and checking complete manufacturing detail drawing, required by a manufacturer in Southern Ontario. Apply by letter with full details. Salary open. Apply to File No. 3628-V.

SALES ENGINEER with wide engineering experience, wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

*CIVIL ENGINEERS and ASSISTANT HYDRAULIC ENGINEERS required for government organization on West Coast for highway and construction. Salary open. Apply to File No. 3724-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience, required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience, required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

SALES ENGINEER, preferably bilingual required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

GRADUATE ENGINEER, required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel, and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted. Apply to File No. 3780-V.

GRADUATE CIVIL OR MECHANICAL ENGINEERS with 3 to 10 years experience in design, cost estimates, draughting, and engineering studies for a large hydro-electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

STEAM PLANT ENGINEER, for large concern in Eastern Townships, with at least 5 years practical experience. Must be familiar with thermo-dynamics, combustion control, steam turbines, mechanical refrigeration, hydraulics, etc. Permanent position and attractive salary for the right man. Apply to File No. 3791-V.

RECENT GRADUATES OR JUNIOR ENGINEERS, with mechanical background, required by a Montreal Engineering fabricating and contracting firm for training purposes leading to sales and service. Area Montreal. Salary $175 up. Apply to File No. 3810-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

DRAUGHTSMEN required by a pulp and paper mill in the Eastern Townships for general draughting and detailing. Three or four years experience preferred but not essential. Salary open. Apply to File No. 3823-V.

DRAUGHTSMAN, preferably with mechanical background, required by a manufacturer in Montreal for design work on electrical equipment. Salary open. Apply to File No. 3829-V.

*CITY ENGINEER required by City of Moose Jaw, Saskatchewan. Salary open. Apply to File No. 3856-V.

DRAUGHTSMAN of the following classes: Architectural, piping layout, equipment layout, mechanical design, steam plant heating, and ventilating electrical and plumbing required by an industrial organization in Montreal. Salaries open. Apply to File No. 3860-V.

STRUCTURAL STEEL CHECKER AND ONE DETAILER CHECKER, wanter for large fabricating plant in Vancouver, B.C. Age between 30 and 40 years preferred. Must be experienced. Give full information and references. Salary open. Apply to File No. 3862-V.

MECHANICAL CHEMICAL OR CIVIL, recent graduate up, required for sales and service in Montreal. Salary open. Apply to File No. 3867-V.

GRADUATE ENGINEERS required for all phases of research, design, operation, and development by an industrial organization with Head Office in Montreal. Salaries open. Apply to File No. 3882-V.

CIVIL OR STRUCTURAL ENGINEER, 24-35 years, required for Northern Ontario Paper Mill. At least 2 years construction and 2 years design experience. Opportunity to train junior personnel. Salary not less than $350. Apply to File No. 3891-V.

STRUCTURAL ENGINEER, preferably a graduate civil engineer with experience in the design of mill buildings required by a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 3896-V.

DETAILERS OR JUNIOR DESIGNERS on mechanical or sheet metal design required by an industrial organization in Ontario. Salary open. Apply to File No. 3904-V.

INDUSTRIAL ENGINEERS, with production experience required by a firm of industrial consultants in Montreal. Preferably with experience in time study, cost control, etc. Salary around $400 depending on qualifications. Apply to File No. 3910-V.

RECENT GRADUATES in Electrical or Mechanical Engineering can still be offered the opportunity of being trained by large Hydro-Electric Utility. Very good opportunities for regular employment in various departments at the completion of training period. Minimum salary 1st year $200; 2nd year $215. Apply to File No. 3912-V.

GRADUATE ENGINEER, Mechanical, Electrical or Civil, about 30 years of age, required by a large Hydro-Electric Utility in Montreal for Field Testing Hydraulic Turbines. Salary open. Apply to File No. 3932-V.

RECENT GRADUATE required by a Montreal contractor for survey and making of plans. Must be bilingual. Salary $175 up according to experience. Apply to File No. 3933-V.

TWO METALLURGICAL ENGINEERS AND ONE CHEMICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No 3942-V.

SALES ENGINEER required by well known manufacturer of mechanical equipment to solicit industrial accounts throughout the Province of Quebec. Applicants must reply giving full details, age, training, etc. Salary open. Apply to File No. 3951-V.

INDUSTRIAL ENGINEER thoroughly experienced in time study, standard data and wage incentive installation and administration required for firm in Quebec. Salary open. Apply to File No. 3952-V.

*JUNIOR ENGINEERS, preferably with mechanical background required for general duties by a textile manufacturing concern near Montreal. Salary open. Apply to File No. 3954-V

CITY ENGINEER, required by a City in Saskatchewan to take full charge of its utilities which include electric light, power, sewer, water, sidewalk, etc. Salary open. Apply to File No 3955-V.

*INDUSTRIAL ENGINEER to act as assistant in the Engineering Department of Meat Packing firm with plants throughout Canada, Headquarters in Calgary. Requires knowledge of building construction, mechanical maintenance and power plant work. Experience in refrigeration desirable. Salary open. Apply to File No. 3960-V.

JUNIOR ENGINEER preferably chemical background required for Alberta refinery. Duties include plant tests, inspection of equipment and assistance on designs and specifications. Opportunity for supervised training in all phases of refinery operations. Salary open. Apply to File No. 3961-V.

JUNIOR SALES ENGINEERS with production experience required by a firm of industrial consultants in Montreal. Salary $300 depending on qualifications. Apply to File No. 3965-V.

STRUCTURAL ENGINEER DRAUGHTSMAN, required by a firm of engineer contractors in Alberta. Duties include structural detailer and requires knowledge of major concrete foundations; to detail stuctural steel buildings, access tower platforms and miscellaneous small steel structures. Salary $300.00. Apply to File No. 3972-V.

DRAUGHTSMAN required by a firm of engineer contractors in Alberta for layout of pipelines and details in refinery construction. Preferably background of refinery experience or alternately power-house piping or heavy industrial draughting. Salary $300.00. Apply to File No. 3972-V.

*ENGINEER with estimating and cost experience, able to read blueprints, take of and price materials, evaluate machine and assembly shop operations and fully capable of organizing and installing a Standard Cost System. Required by a manufacturer in Southern Ontario. Salary according to qualifications and ability. Apply to File No. 3977-V.

GRADUATE ENGINEER, with some experience in a manufacturing industry, required by Hamilton company. Some knowledge of production operations, mill scheduling, job evaluation, time study, job methods, industrial relations would be helpful. Salary open. Apply to File No. 3981-V.

*ELECTRICAL OR MECHANICAL ENGINEER, recent graduate, bilingual preferred, required for Public Utility in Quebec City. Salary open. Apply to File No. 3993-V.

GRADUATE ENGINEER, age 32 up, preferably bilingual and with 10 years experience in industrial design required by chemical organization with headquarters in Montreal. Duties include supervision of Works Design Department, supply draughting and design service for plant, prepare appropriation requests, maintain cost estimating units, etc. Salary open. Apply to File No. 3995-V.

GRADUATE ENGINEER, three to 5 years plant experience, required by chemical organization in Montreal. Duties include assisting in developing and carrying out in various plants training programs in subject and related fields for junior industrial engineers. Develop and apply such office routine as may be necessary. Salary open. Apply to File No. 3995-V.

MECHANICAL ELECTRICAL OR CIVIL ENGINEER, age 23-30, preferably single and bilingual with some experience in maintenance required by an industrial and chemical organization with headquarters in Montreal. Duties include construction project and design studies. Salary open. Apply to File No. 3995-V.

* Filled since appearance in advance notice.

*GRADUATE ENGINEER, with some experience in industrial building design to supervise construction of the railway buildings and allied structures of a large railway terminal project in Montreal. Salary $300 to $350. Apply to File No. 3996-V.

*CIVIL OR MECHANICAL ENGINEERS with up to five years design experience required by an engineering firm in Montreal for hydraulic work. Salary open. Apply to File No. 3999-V.

CIVIL OR MECHANICAL ENGINEER wanted with 5 to 8 years experience for key position in moderate size plant in Manitoba doing fabrication of Plate Work and Light Steel Work, also Grey Iron Foundry and Machine Shop. This will lead to key position in a growing organization. Salary open. Apply to File No. 4003-V.

SALES ENGINEER required by a manufacturer of industrial building products in the Toronto area. Preferably with sales experience and knowledge of building products. Salary open. Apply to File No. 4008-V.

SENIOR SALES ENGINEER required as District Manager by a firm manufacturing industrial products in Ontario. Must have considerable sales experience. Salary open. Apply to File No. 4008-V.

MECHANICAL AND CHEMICAL ENGINEERS, interested in entering the Pulp and Paper industry, required in Newfoundland. Vacancies in Technical Department and studying process work and improved methods of operation. Pulp and paper experience is not necessary. Salary open. Apply to File No. 4009-V.

SAFETY SUPERVISOR required for South America. Age 25-40 years. Single. To supervise safety activities, promote safety first and inspect operations to assure proper installation and use of safety devices. Salary $350 U.S. currency. Apply to File No. 4011-V.

RESERVOIR ENGINEER, required for South America. Age 25-35. Should be experienced in reservoir and production cost analysis. Capable of determining efficient flow rates for reservoirs and wells. Salary approximately $400 U.S. currency. Apply to File No. 4011-V.

MAINTENANCE ENGINEER, required for South America. Age 35-40. Duties include, refinery maintenance, inspection of units, metal inspection work. Responsible for engineering calculations, design of equipment and pipefitting work. Salary $375 U.S. currency. Apply to File No. 4011-V.

POWER PLANT SUPERVISOR required for South America. Age 30-40, single preferred. To supervise steam power plant including operating, boiler cleaning and minor repairs. Salary $375 U.S. currency. Apply to File No. 4011-V.

DESIGNING DRAUGHTSMEN preferably graduates in mechanical or electrical engineering with at least 5 years experience in manufacture of sulphite or newsprint pulp required in Province of Quebec. Good salaries and opportunities for advancement. Permanent employment. Apply to File No. 4014-V.

ASSISTANT CITY ENGINEER with experience in municipal engineering required by Sask. City. Duties include operation of pumping sewage disposal and asphalt plants also building inspection department and concrete construction. Salary $4,000 to $4,500. Apply to File No. 4017-V.

ELECTRICAL OR MECHANICAL ENGINEERS required by large Montreal firm to prepare and analyze specifications for telephone equipment manufacturing and installation. Other types of engineering work also available. Salary open. Please send photo together with particulars of education and experience. Apply to File No. 4018-V.

GRADUATE ENGINEER, required as Assistant to Manager of Sawmill and Woodlands operations. Position located in Ontario. Good commercial sense essential also some sales ability Salary $300-$350. Apply to File No. 4021-V.

MECHANICAL, STRUCTURAL AND ELECTRICAL ENGINEERS, required in Trail, B.C., as Designers, Draughtsmen and Construction Cost Estimators for Mining, Metallurgical, Chemical and Fertilizer Plant Design and layout. Salary open. Apply to File No. 4023-V.

ARCHITECTURAL DRAUGHTSMAN experienced in industrial building construction, with natural aptitude for design work, wanted by large industry in Eastern Townships, good salary, permanent position to the right man. Apply to File No. 4031-V.

GRADUATE ENGINEER, CHEMICAL OR MECHANICAL. Age 26 to 29, to act as Sales Engineer for Bituminous Coal Importing Company in Province of Quebec. Previous industrial combustion experience, helpful but not essential. Must be prepared to travel. Salary $350.00 per month. Application in confidence. Apply to File No. 4033-V.

*PLANT ENGINEER, mechanical background, age 35 to 40 required to modernize plant in Quebec. Duties include setting up and maintenance of paper machinery. Salary $4,500 to $5,000. Apply to File No. 4035-V.

DESIGNING ENGINEERS OR DRAUGHTSMEN, preferably but not necessarily with experience in Pulp and Paper Mill work required for paper mill in Newfoundland. Salaries $300.00 per month or better depending upon experience and ability. Apply to File No. 4036-V.

CHEMICAL OR MECHANICAL ENGINEER GRADUATE, age not over 26, required by Montreal firm for industrial combustion service. Salary $250.00 per month up, depending upon qualification and previous experience. Application in confidence. Apply to File No. 4037-V.

SALES ENGINEER for popular line of Diesel Engines, applicants must be specialists on Power Units and Generator Sets Required for permanent employment with well established organization. Apply to File No. 4055-V.

INDUSTRIAL ENGINEER with considerable manufacturing experience. Between 30 and 40 years of age. Required for plant surveys in Province of Quebec. Must be fluently bilingual. Permanent position. Salary according to qualifications. Apply to File No. 4064-V.

* Filled since appearance in advance notice.

Situations Wanted

MECHANICAL AND CIVIL ENGINEER, M.E.I.C., Queen's, age 48, 5 years hydro-electric power development construction, 1 year industrial building construction, 2 years sales engineer and estimator architectural iron works concern, 14 years oil refinery on initial construction, on operations and maintenance, last 6 years refinery engineer in charge of maintenance, safety, equipment inspection, design and construction of plant changes and extensions, industrial buildings. Resigned to undertake private venture. Desires to re-enter industry. Apply to File No. 166-W.

MECHANICAL ENGINEER. Jr.E.I.C., McGill University. Eight years experience Tool and Production Methods Engineer. Age 38. Married. Presently employed. Desires employment as Production Manager or Materials Engineer for large company. Preferably Montreal area. Apply to File No. 551-W.

PART TIME WORK. Senior Civil Engineer P.E.Q., M.E.I.C., Montreal area, available part time where consultant or engineer staff short handed. Preliminary plans, estimates, reports, industrial or engineering projects. Apply to File No. 1021-W.

MECHANICAL ENGINEER, B.Sc., Queen's, '33, M.E.I.C., M.I. A.S., P. Eng, Que. Married, age 37, over twelve years experience including design, stress analysis, maintenance, inspection, administration and 5½ years as an R.C.A.F. Engineer Officer. Presently employed desires permanent position with good future prospects. Preferably in an English speaking locality. Apply to File No. 1042-W.

CIVIL ENGINEER, C.E., B.Sc., M.E.I.C., age 32, married with experience in road construction; surveying; industrial plant lay-out, including steel tank erection; piping design and installation, equipment installation; building construction such as offices, warehouses, service station; costings; estimates; administrative control. Working knowledge of cost and operational studies, inventory work, material necessary for all types of construction work. Will accept responsible position anywhere. Salary in accordance with responsibility and living conditions. Apply to File No. 1914-W.

MECHANICAL ENGINEER, McGill, Jr.E.I.C., P.Eng., Que. Age 26, single, veteran, bilingual. 6 years of varied experience covering general plant maintenance; power-house operation; gasoline and diesel trucks, tractor and locomotive maintenance; residential and some industrial construction. Well versed in Time Study and job evaluation. Position desired in Montreal. Now employed out of town. Available after reasonable notice to present employers. Apply to File No. 2338-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.E.Q., B.Sc. Age 32, married. Presently engaged in Montreal area would prefer position in Eastern Ontario. Experience includes machine design, jig, tool and die design, methods engineering, design development, plant layout, engineering department organization. 4½ years as chief engineer. Also experience in construction industry on building, mechanical and electrical trades. Salary $415 per month. Available one months notice Apply to File No. 2682-W.

ELECTRICAL ENGINEER, B.Eng. Honors, McGill, 1943, Jr.E.I.C., A.I.R.E., P.Eng. (Que.), 26, married, presently employed, desires change to smaller organization with more general scope, broader future, responsible outlook, in Ontario or B.C. Experience in heavy manufacturing, radio production, standardization, specification, audio design. Apply to File No. 2727-W

ELECTRICAL ENGINEER, M.E.I.C., P.E. (N.B.), age 35, married. 12 years experience in electrical machinery including 2 years District Manager of Sub Station in North West Quebec; 3 years Assistant Electrical Superintendent of Gold Mine in North West Quebec; 3 years R.C.E. Electrical Distribution Systems; 2 years teaching in electrical department of a Canadian University. Present teaching position temporary. Apply to File No. 2827-W.

MECHANICAL ENGINEER, Jr.E.I.C., McGill, '44, age 26, bilingual, single, good health. Due to an unusual situation, have not been employed in work of an engineering nature since graduation. Would prefer to locate with organization building custom-built automatic industrial machinery. Available on short notice for assignment in Canada or U.S.A. Apply to File No. 2882-W.

CHEMICAL ENGINEER, Jr.E.I.C., B.Eng., McGill, '45, age 24, single. 2½ years experience in quality control general office work and for over a year with pulp and paper mill (sulphite) on process control working in conjunction with the foreman. Desires position in production, planning, or sales engineering requiring initiative. Prefer Montreal or vicinity. Available on one month's notice. Apply to File No. 2899-W.

CIVIL ENGINEER, Jr.E.I.C., B.A.Sc. (Toronto), P.Eng. (Ont.) with some experience in reinforced concrete and structural steel design including detailing of reinforced concrete and estimating. Would accept part time work during evenings and weekends. At present employed and residing in the Toronto area. Apply to File No. 2910-W.

ENGINEER, (27), graduate of London (England) University, ambitious and energetic with five years industrial experience, lately Deputy Works Manager in a large chemical works. Familiar with design, production control, costing, job evaluation and factory lay-out procedure. Handled a great variety of equipment, tactful leader of men, but keen and able to get results. Willing to accept responsibility. Living at present in Toronto, Ontario, but willing to go to any part of Canada or abroad. Apply to File No. 2912-W.

SUPERINTENDENT GRADUATE ENGINEER, P.Eng. (Ont.), M.E.I.C., 12 years experience with men and cost control in casting, fabricating and machining brass, aluminum and grey iron. Available immediately. Apply to File No. 2913-W.

YOUNG GRADUATE CIVIL ENGINEER, S.E.I.C. Presently employed seeks part time work of such nature that it may be done at home i.e. Estimates, etc. Apply to File No. 2914-W.

CIVIL ENGINEERING STUDENT, S.E.I.C., 3rd year at McGill University would like part time work with firm in Montreal vicinity, dealing with design or construction of structural steel or reinforced concrete; 25-30 daytime hours per week available, plus evenings if necessary. Experienced in foundation construction. Apply to File No. 2916-W.

GRADUATE ELECTRICAL ENGINEER, McGill, '24, M.E.I.C., Prof. Eng., Que.; over 20 years experience in High Voltage Transmission line, design and construction. Interested in part time or temporary position in general engineering or transmission line work. Location preferably Montreal or in B.C. At present residing in Montreal area, due to certain physical defects the type of work that can be undertaken is limited. Available at once. Apply to File No. 2918-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng (Que.), B.A.Sc., Ecole Polytechnique, '44. Presently employed with R.C.E.M.E. Canadian Army. To be released from engagement in one month or two. Age 24, married, bilingual, 2 years experience in automotive engineering, job evaluation, supervision, management and administrative work. Also experience in designing mechanical testing apparatus. Would consider any kind of work with industrial firm. Willing to learn. Apply to File No. 2919-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng., Que., B.Eng., '40, McGill, age 33, married. Presently employed, desires experience in heating and ventilating. Experience with boilers, piping, construction, machine shop and plant maintenance. Available 1 month. Apply to File No. 2922-W.

GRADUATE MECHANICAL ENGINEER, Ph.D. (London), M.E., A.M.I., Mech. E., age 36, single, 10 years' experience in plant maintenance, plant layout, production control, industrial administration, research and development. At present employed in the Montreal district. Apply to File No. 2929-W.

CIVIL ENGINEER, M.Sc., M.I.T., Jr.E.I.C., interested in part time work in steel and reinforced concrete design. Presently employed as instructor at a Canadian University. Four years practical experience in design. Must be Montreal area. Apply to File No. 2930-W.

GRADUATE MECHANICAL AND ELECTRICAL ENGINEER, M.E.I.C., P.Eng. (Ont.), age 39, married. 16 years of experience here and in Europe includes mechanical, electrical and optical design, applications, sales, administration, inspection of production, statistical quality control. Knowledge of foreign languages. Presently engaged in Montreal area, salary $420 per month, would prefer position in Ontario or B.C. Available one month's notice. Apply to File No. 2931-W.

GRADUATE, Institution of Mechanical Engineers (England), age 25, seeks position of Junior Engineer with a firm engaged in producing consumer goods. Five years engineering apprentice; one year draughting; and three years as junior metallurgist mainly occupied in solving production problems from a metallurgical aspect. Apply to File No. 2933-W.

GRADUATE ENGINEER, M.E.I.C., age 30, veteran, married. Experience includes maintenance, construction, production, etc. Toronto area preferred. One month's notice. Apply to File No. 2934-W.

CHEMICAL ENGINEER, S.E.I.C., age 25, experience, process control in rubber and heavy chemicals; engineering in distillery. Presently employed seeks position with greater scope in engineering work. Available one-month's notice. Will travel anywhere. Apply to File No. 2936-W.

MECHANICAL ENGINEER, Jr.E.I.C., B.Eng., McGill, '44, P. Eng., Que., age 24, veteran, proceeding toward Masters Degree, seeks employment for months May to September inclusive, on research or development projects or with consulting engineer. Varied experienced in production, mechanical design and layout work. Would be able to continue project part time after October if necessary. Apply to File No. 2942-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng. (Que.), B.A.Sc., Diploma in Business Administration; age 29, married; seven years industrial engineering and technical sales supervision in electrical industry. Available in May. Industrial marketing, or management engineering. Apply to File No. 2946-W.

CAMBRIDGE GRADUATE ENGINEER, M.E.I.C., P.Eng. (Ont.), age 29, married. With Civil, Aeronautical and Mechanical background. 4½ years R.A.F. Pilot and Instructor and 3½ years practical experience in consulting and municipal engineering on surveys, design estimating and construction work. Requires responsible and progressive position where full use can be made of wide interests. Location Ontario (where presently employed) or Western Canada. Apply to File No. 2943-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Que.) McGill graduate desires spare time work evenings and week-ends on design and detail of reinforced concrete and steel structures. Also qualified to make stress analysis of rigid frames and most statically indeterminate, structures. Location Montreal. Apply to File No. 2947-W.

ELECTRICAL ENGINEERING GRADUATE

Required with minimum of five years' experience in Paper Industry. Between 35-45 years of age, for responsible position with large newsprint manufacturing concern in Northern Ontario. Salary commensurate with qualifications. Living accommodation assured.

Apply stating experience and background to File No. 4032-V.

GRADUATE ELECTRICAL ENGINEER

With a minimum of two years practical experience to assist in electrical engineering design work. Field work on construction and maintenance of structures, service and installation of equipment. To direct small group of assistants, etc. Salary $226.00-$257.00 per month. Apply City of Winnipeg, Central Employment Registry, 4th Floor, 160 Princess Street, Winnipeg, Manitoba.

EMPLOYMENT FOR STUDENTS

The Minister of Labour has announced from Ottawa that the Bureau of Technical Personnel and the Department are continuing the excellent employment service established some years ago by the Bureau to find employment for engineering undergraduates and graduates.

The Minister has written to a great number of employers asking them to examine their requirements for next summer and to report back to the Department. The *Journal* is happy to co-operate with the Department in this worthy effort and urges all the employers who read this page in *The Engineering Journal* to comply at the earliest possible moment with the Minister's request.

Business & Industrial Briefs

A Digest of Information received by The Editor

C.I.L. Appointment

Robert M. Watson has been appointed district sales manager of the explosives division of Canadian Industries Limited, in Edmonton, Alberta. Since joining the Vancouver office of C.I.L. in 1921, Mr. Watson has served in every province with the exception of Saskatchewan. Between 1936 and 1947 he was the local sales manager in Kirkland Lake, Sudbury and Edmonton.

Canadian International Trade Fair

The Canadian International Trade Fair, which was authorized by order-in-council in August, 1946, will be held in Toronto between May 31st and June 12th, 1948.

It is estimated that there will be between 1200 and 1500 individual exhibits from twenty six different countries. Buyers from outside North America are expected to exceed ten thousand and will represent fifty two countries. Toronto hotels are cooperating closely with the Trade Fair officials and all hotel and guest home accommodation for that period will be funnelled through the public relations department of the Canadian International Trade Fair.

Early in February approximately 30,000 invitations to attend the Fair were sent to buyers in Canada and America.

New Foster Wheeler Bulletin

Foster Wheeler Limited of St. Catharines, Ontario, have recently published a new bulletin—CB 47-10—entitled "S-A Steam Generators."

The bulletin is very attractive and most informative in content.

Readers are invited to apply to the Company for copies.

Auto-Filtration Company Appointed Sales Agent

The Hardinge Company, Inc., York, Pa., have announced the appointment of the Auto-Filtration Company of Montreal as sales agent for the Province of Quebec, the Maritime provinces and Newfoundland. These newly appointed agents will sell Hardinge automatic backwash rapid sand filters, clarifiers, flocculators, and digesters. This information should be of particular interest to readers who are employed in the pulp and paper industry, or by municipalities.

C. W. Baker Receives New Appointment

Crawford Gordon Jr., President of English Electric Company of Canada Limited has announced the appointment of C. W. Baker as Engineering Consultant to the vice-president. Mr. Baker is a graduate of Queen's University and he has been actively engaged in electrical engineering for over forty years. For the past fourteen years he has been chief engineer of the Company.

An Industrial Cleaning Cloth

Metal Textile Corporation of Canada Limited, Hamilton, Ontario, have announced the production of a new industrial cleaning cloth which will be marketed under the trade name of "Nickeltex".

It is made of "Z"-nickel, an alloy containing approximately 94% nickel. Special corrosion elements have been added to make it heat treatable for greater wear resistance and strength.

The manufacturers claim that it is superior to other industrial cleaning cloths and that it will be very valuable for use in many types of industry.

Link-Belt Catalogue

"Link-Belt Machinery for Handling and Preparing Sand, Gravel, Stone" is the title of a new 64-page Book No. 2126 published by Link-Belt Limited. For copies please apply to Link-Belt Limited, Eastern Avenue at Leslie and Keating Streets, Toronto, 8. To expedite reply mention the catalogue by number.

Brown, Boveri Handbook

Brown, Boveri (Canada) Limited, of 1111 Beaver Hall Hill, Montreal, 1, Que., have informed the editor of the *Journal* that they have available a supply of a booklet, "A Review of Our Work and Products".

The booklet was produced in Switzerland. It is most informative and profusely illustrated.

It deals with the history of the Brown, Boveri Company at Baden, Switzerland; the research laboratories; range of manufacture; the test plants and lists the products of the company.

For copies please communicate with the Canadian Company.

A Calculator Chart

Howard M. Edmunds Consulting Engineer of 6, East 39th Street, New York 16, N.Y., has announced the development of a new calculator chart known as the "Rapidadd Chart".

It has no moving parts and can be used without removing from the table. It may be used for the addition and subtraction of fractions down to 64ths. It is claimed that a series of fractions may be added successively without writing them down.

The price is moderate.

For details communicate with Mr. Edmunds.

C.G.E. Announcements

A. M. Doyle has been appointed manager of the Apparatus Division of the Company. Mr. Doyle has had extensive experience in the field of power station engineering. He has been with C.G.E. since his graduation from the University of Manitoba in 1928. Previous to his present appointment he was manager of the transformer section of the Company's Apparatus Department.

A twelve-page bulletin on Trolley-Type Mine Haulage Locomotives is now available from the Canadian General Electric Company Limited. The bulletin covers locomotives from 10 to 30 tons and 250 or 500 volts. It should be particularly valuable to mine operators.

Requests for the bulletin may be sent to any C.G.E. office. Refer specifically to Bulletin GEA-4676.

A 28-page booklet on "Formex Magnet Wire" is available. It should be of special interest to Engineers in rewind shops and refrigerator and electric-motor plants. The publication is most comprehensive in content. Refer to any C.G.E. office for a copy quoting bulletin CGEA-3911A.

A 24-page booklet on "Distribution Transformers"—which will be particularly valuable to electrical engineers in utilities, industry, mining and railways—is available. It deals with oil immersed transformers in ratings up to 200 Kva, 15,000 volts, single and three-phase. Apply to your nearest C.G.E. office and request bulletin CGEA-2600A.,

Electrical contractors, consulting engineers, architects and electrical superintendents will be particularly interested in an illustrative pamphlet "Twin-Turret Industrial Fluorescent Luminaire". Apply to the nearest C.G.E. office and refer to the bulletin by number—4399.

New Amalgamated Electric Catalogue

"Lighting Equipment" is the title of a new ten-section catalogue issued by Amalgamated Electric Corporation, Limited, 384 Pape Avenue, Toronto, Ont.

This catalogue is concise, attractive and easy-to-read. It contains complete information on the Company's extensive range of commercial and industrial lighting fixtures and equipment. The over-all dimensions make the publication the right size for shelf or portfolio.

Contact your nearest Amalgamated Electric district office, or the head office in Toronto, for your copy.

A Slide Rule

Pickett & Eckel Inc., 111 South Freemont Avenue, Alhambra, California, have announced the production of a climate-proof all metal Slide Rule.

It is known as the "Ortho-Phase Log Slide Rule".

The manufacturer claims that this instrument has many advantages over those of older type and design. For details write to the Company.

The Northern Electric Five Year Plan

The Northern Electric Company Ltd., have announced a five year plan of expansion which will involve the expenditure of 13 million dollars.

This plan has been developed to extend the Company's production and distribution facilities. Of the amount to be spent approximately $5,000,000 will provide more than 400,000 sq. ft. of additional manufacturing floor space; $5,650,000 will be spent on tools, machinery and material handling equipment and $2,600,000 will establish a number of new distributing premises, as well as enlarge and modernize existing buildings.

Largest unit in the Company's expansion programme is the new wire and cable plant now nearing completion at Lachine, Que.

C. R. Chataway in New Position

John Inglis Company Limited has announced the appointment of C. R. Chataway as district sales manager of the Vancouver office. He is a graduate of the University of Manitoba in Mining. For the past three years Mr. Chataway has been engaged in sales work at the head office of the company in Toronto.

American Can Company Appointment

C. A. Bartells has been appointed assistant manager of manufacture for the American Can Company in Canada. Mr. Bartells has had long service with the Company and until his present appointment he served as superintendent of manufacture for the Pacific division. He will make his headquarters at Hamilton.

Netherlands Shipping Recovery

The Dutch merchant fleet is again in a position to contribute to the credit side of Holland's balance of payments. According to the Netherlands Government Information Bureau, net returns in foreign exchange of Dutch ocean shipping during the period from October 1, 1946 to October 1, 1947 are estimated at between 300 to 350 million guilders.

In the Government release from which our information was obtained it is stated that five hundred and fifty million tons of shipping is being constructed for the Dutch merchant marine.

Link-Belt Appointment

H. J. Harris has been appointed manager of the Vancouver office of Link-Belt Limited. He has succeeded Frank B. Wetherill who has retired.

Mr. Harris has been with the Company since 1924.

X-Ray Examinations for Employees

Using its own modern X-ray equipment the Chrysler Corporation of Canada Limited is giving its more than 4,500 employees in Windsor Ontario a chest examination as a safeguard against tuberculosis. This announcement was made by Dr. John A. MacLennan, the Company's chief medical advisor.

It is claimed that this is one of the largest mass X-ray examinations ever attempted by a Canadian industry and that Chrysler was the first company in Windsor to instal full size hospital-type X-ray equipment.

New Line of Suspension and Strain Hardware

The Canadian Ohio Brass Company Limited, Niagara Falls, Ontario, is producing a new line of suspension and strain hardware, utilizing the non-magnetic quality of aluminum alloy in high voltage clamp design. The new line of clamps will be known as "Cooline". The chief advantages claimed are—direct power saving, reduction in pitting and burning, minimization of low temperature annealing, increase in transmission line amperages.

For complete details please communicate with the Company at the address given above.

John Inglis Co. Controls English Electric Co.

Combining total assets of over $10,500,000 in two well known Canadian engineering firms, John Inglis Co. Limited has acquired full control of English Electric Company of Canada Limited, through an exchange of shares. English Electric will continue to operate in St. Catharines, Ont., as a wholly-owned subsidiary of John Inglis Co. which also controls Production Castings Ltd., at New Toronto. The three companies employ over 2,200 people.

As a result of this merger it is believed that economies can be effected in operations and sales can be further expanded.

New Composite Strip Available

The development of rolled nickel and Monel clad strip was announced by the Superior Steel Corporation, Carnegie, Pennsylvania.

This composite strip is available in widths between one-quarter of an inch and ten and one quarter inches, in coils ranging up to several hundred feet depending upon gauge. In the cold rolled condition it is produced in thicknesses between 10 and 125 one-thousandths of an inch. In the hot rolled condition it is available in thicknesses between 95 thousandths and 1/4 of an inch.

According to a communiqué received by the editor of the "*Journal*" it is impossible to separate the nickel or Monel cladding from the steel base by any other means than the chemical dissolving out of the steel. Separation, it is claimed, cannot be effected by mechanical means or by heating. Because of this fact, the clad strip can be stamped, drawn, spun, bent, spot-welded, or otherwise fabricated in the same manner and with no more difficulty than ordinary low carbon, deep-drawing steel.

For complete details communicate with the International Nickel Company of Canada Ltd., 25 King Street, West Toronto 1, Ont.

Gardner-Denver Co. Announces New Pump

A new Sump Pump known as the VP-4 has just been announced by the Gardner-Denver Co. It has been designed to overcome one of the most common causes of pump failure — breaking of the pump shaft seal because of water pressure.

The design of the pump embodies a new principle. For complete details communicate with your nearest Gardner-Denver agent or directly with the company.

Bell Telephone Developing Metal Lens

The Bell Telephone Company of Canada have stated that an entirely new type of metal lens, for focussing radio waves in radio relay systems, is under development at the Bell Telephone Laboratories.

According to the Company announcement, present plans call for the use of the lens—theoretically capable of handling from 50 to 100 television channels or tens of thousands of simultaneous telephone messages—in the proposed radio relay link which the Bell System is planning between New York and Chicago.

"The Dominion Engineer"

Copies of the Dominion Engineering Company Ltd., publication, "The Dominion Engineer" are available to members of the Institute. Readers who would like to receive the publication regularly are invited to communicate with the Dominion Engineering Co. Ltd., Post Office Box 220, Montreal, Que.

Canadian Car Appointment

Victor M. Drury, president of Canadian Car & Foundry Company, Limited, has announced the appointment of Arthur Hodgkinson, comptroller and treasurer, as a vice-president of the Company, effective February 23, 1948, with the title of vice-president, comptroller and treasurer.

Thirty-One Million C.P.R. Expenditure

According to information received from the Company, the Canadian Pacific Railway has authorized more than $31,000,000 in new equipment orders for 1948. Purchases will include 44 diesel locomotives, 2,100 freight and work cars and 115 passenger cars.

Combined with a carry-over of orders, in excess of $42,000,000, from previous years, for items on which the Road is awaiting delivery, this brings to more than $63,0000,00 the value of motive power and rolling stock contracts outstanding.

W. M. Neal, chairman and president of the Company stated, "thirteen of the diesels will go to the Esquimalt and Nanaimo Railway on Vancouver Island which is being completely dieselized".

Among the companies with which contracts have been placed are, National Steel Car Corp., Hamilton, Ont.; Canadian Car and Foundry Co. Ltd., Montreal; Montreal Locomotive Works and the Angus Shops, Montreal; Eastern Car and Foundry Company, Trenton, N.S.; the Canadian Locomotive Company, Kingston, Ont.

New Haydon Catalogue

Haydon Manufacturing Co. Inc. of 245 East Elm Street, Torrington, Conn., have produced a new catalogue No. 320. The catalogue contains complete information on the Company's timing motors and devices, clock movements and Haydon's time engineering service. Copies of this interesting publication may be obtained on application to the Company at the address given above.

"Business & Industrial Briefs"

This section of the *Journal* is intended to keep readers informed on developments and changes in those business and industrial enterprises, and on new products, which affect the engineer.

If you write with respect to any of the items in this, or other, sections please mention

THE ENGINEERING JOURNAL

KOLLE FLASK TESTS
Fungus uncontrolled — Fungus controlled with Santophen 20

Outstanding killing effectiveness at low concentrations is one of the many reasons for using Santophen 20 (Monsanto's pentachlorophenol) for the preservation of poles, crossarms, ties and structural timbers of all types. The comparative toxicity data shown here indicate the high potency of Santophen 20 in destroying wood-rotting fungi. Lasting protection against termites and other wood-boring insects is provided.

Complete application and formulating data are available in Monsanto's 16-page book, "Wood Preservation with Santophen 20 in Oil Solutions by Pressure Processes." For your copy, write to MONSANTO (CANADA) LIMITED, Montreal-Toronto-Vancouver, or simply return the convenient coupon.

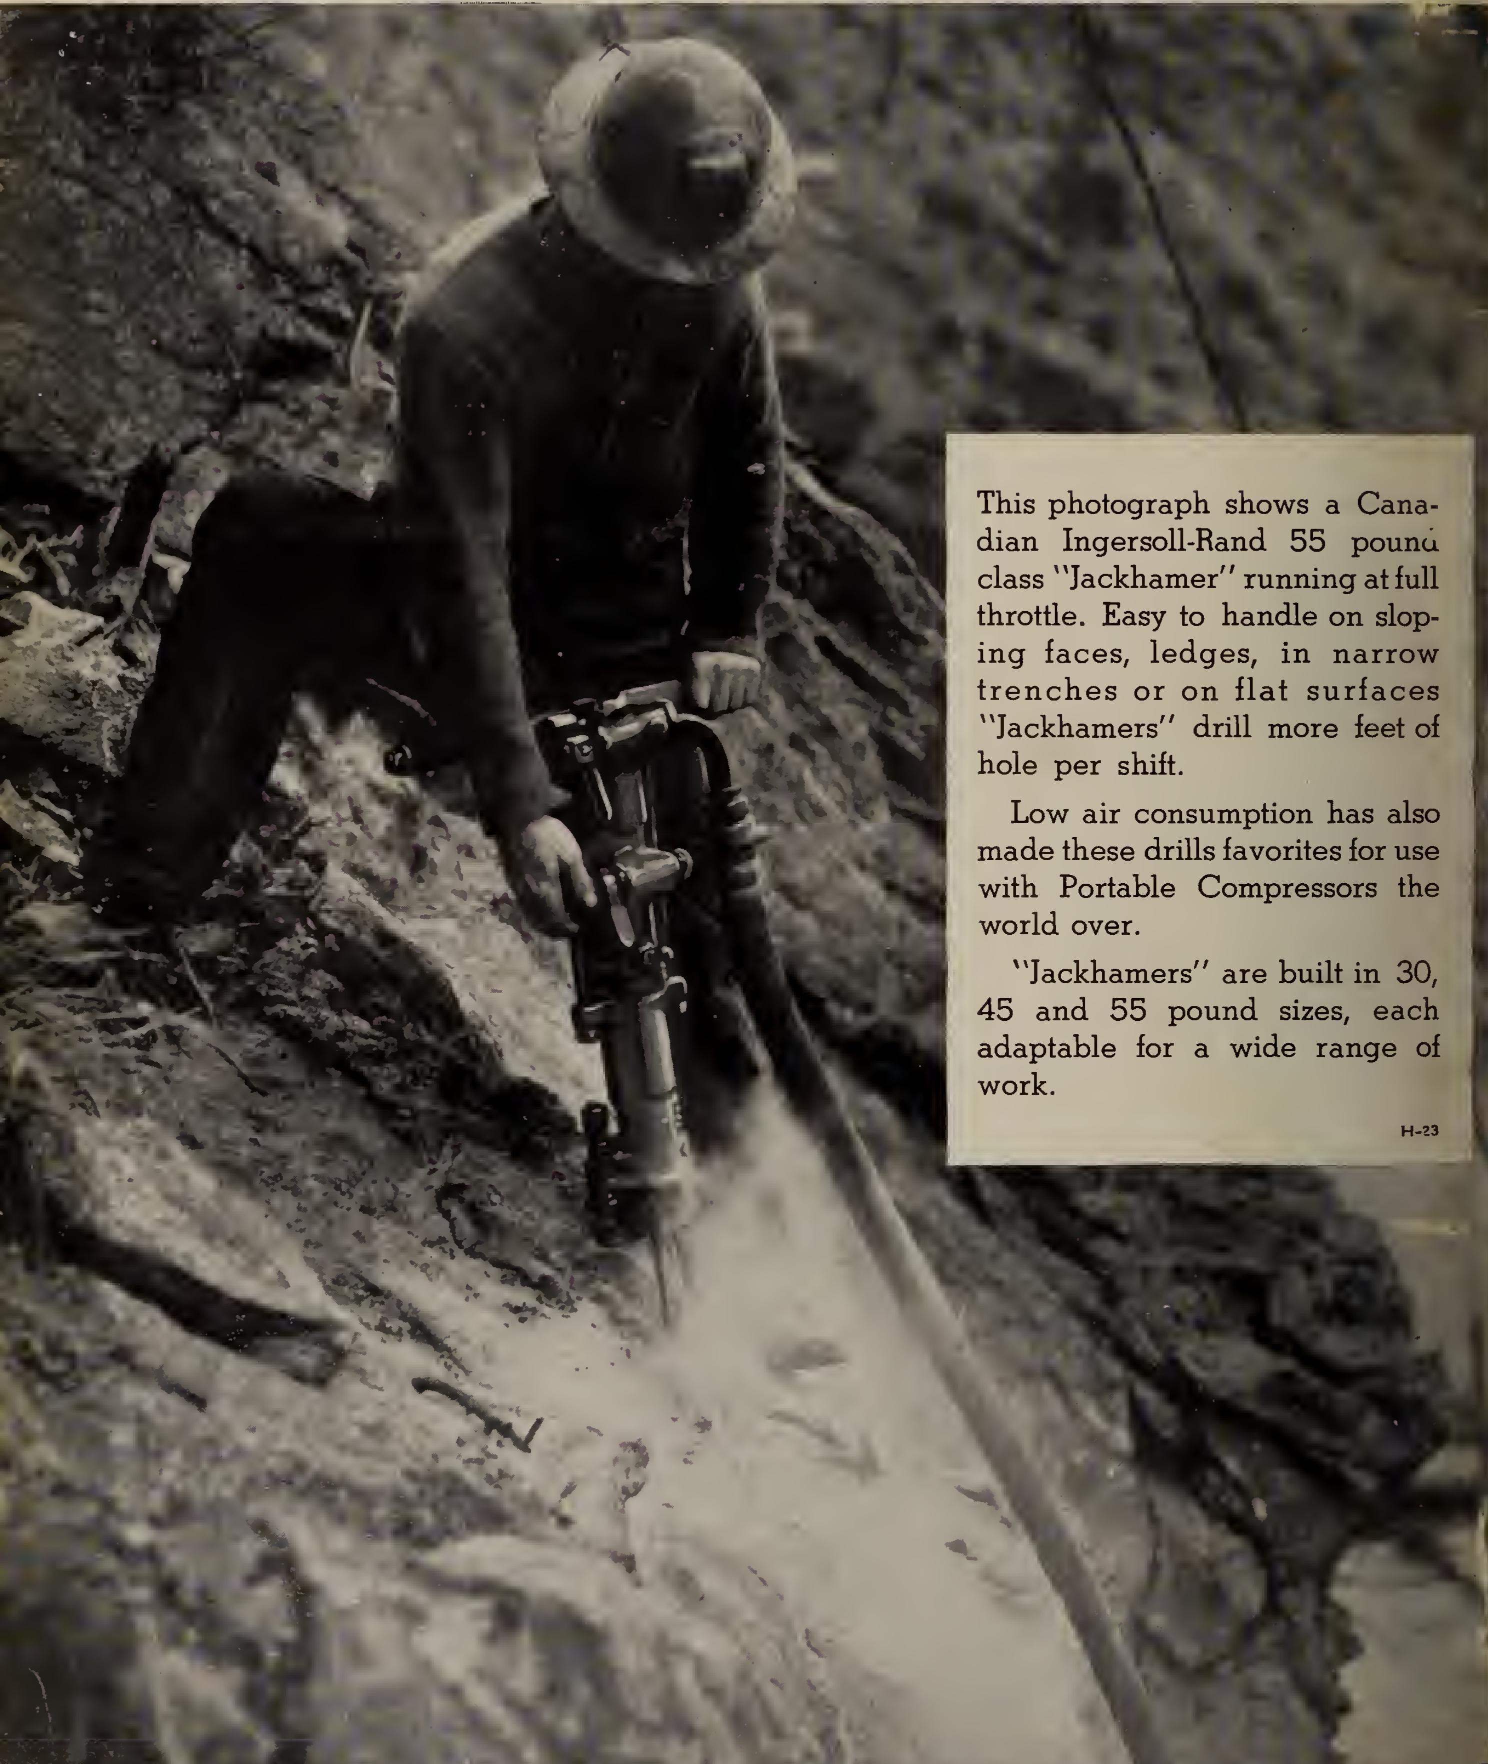
Index to Advertisers

The revenue derived from the sale of advertising space enables the *Institute* to publish the *Journal* on a regular monthly basis. Listed below are the names of the Companies and Individuals whose advertisements appear in this issue.

EASY HANDLING HARD HITTING "JACKHAMERS"



This photograph shows a Canadian Ingersoll-Rand 55 pound class "Jackhamer" running at full throttle. Easy to handle on sloping faces, ledges, in narrow trenches or on flat surfaces "Jackhamers" drill more feet of hole per shift.

Low air consumption has also made these drills favorites for use with Portable Compressors the world over.

"Jackhamers" are built in 30, 45 and 55 pound sizes, each adaptable for a wide range of work.

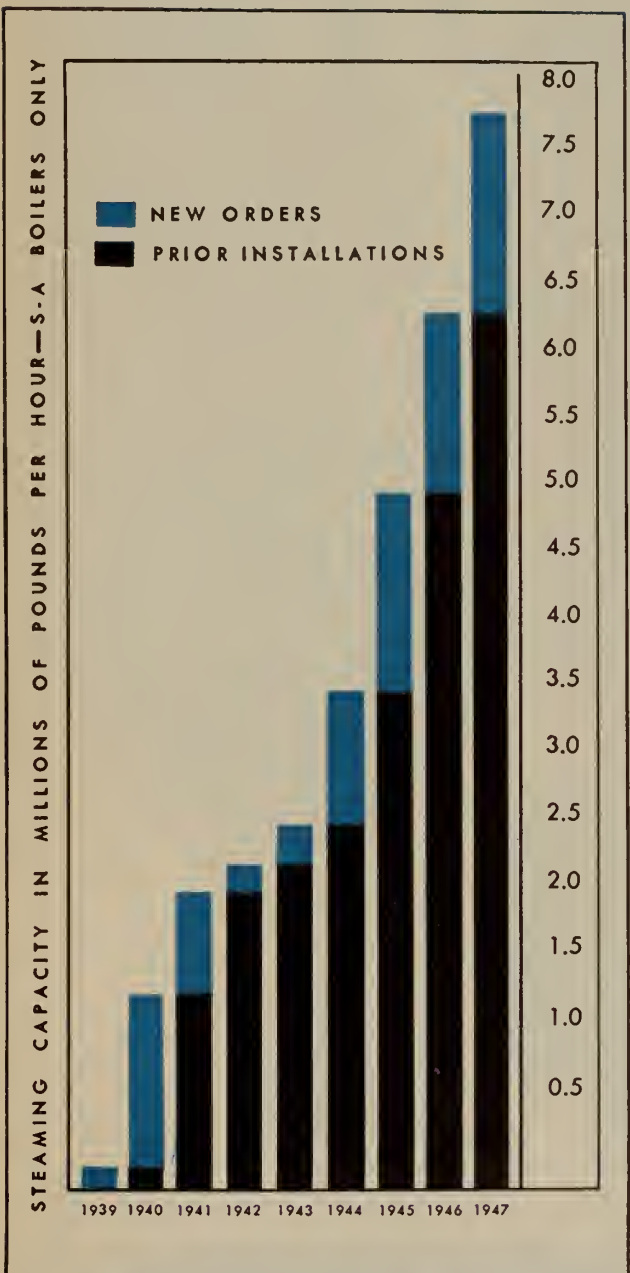
AN INNOVATION

1938 - *The "SA" Boiler was conceived*
1948 - *Nearly 8 million lbs. per hr.*



The Growing Trend Toward SA Boilers in Canada

It was less than 10 years ago that FW Engineers conceived the principle of the "SA" Boiler.

They were looking for an improved boiler that could be standardized and yet adapted to units of all sizes—a design that would eliminate the conventional external waterwall header systems which placed certain limitations on flame travel and furnace volume—a design which would also do away with the complicated inefficient method of convection bank baffling which resulted in high draft losses.

In 1938, after a great deal of study, FW Engineers found the answer to these problems in the "SA" ("S"-ingle Pass, "A" Type) Design as illustrated and described on the opposite page.

In 1948 the "SA" Steam Generator, with its many unique advantages, has been accepted by Canadian steam engineers as illustrated by the accompanying chart showing the rapid yearly increase in installed capacity. Since the first "SA" Boiler was installed in 1939, only the wartime marine boiler program has retarded the sharply rising curve of installed capacity. Repeat orders from satisfied customers have accounted for twenty-seven percent of the nearly eight million pounds of installed steaming capacity.

MADE IN CANADA

"SA" boilers are completely engineered and fabricated in Foster Wheeler's modern plant at St. Catharines, Ontario — erected and serviced by experienced FW field engineers.

94 YEARS OF PROGRESSIVE EXPERIENCE

Experience counts . . . especially in roofing. Convincing proof is the record-making Barrett Bonded Job No. 1 . . . the first of many Barrett "SPECIFICATION" roofs in Canada to outlive its bond without maintenance or repair.

Job No. 1 was no accident. It was the result of many long years of aggressive pioneering in the built-up roofing field. Barrett was the first to promote built-up felt, pitch and gravel roofs. First to use standard specifications. First to establish approved roofers. First to bond built-up roofs. And first to develop almost every major refinement in built-up roofing practice. Refinements that today are accepted as standard in the business. Today, the built-up felt, pitch and gravel roof is considered the finest type of industrial roofing, and the Barrett "SPECIFICATION" roof is regarded as leader in the fiield.

Barrett* Specification* Roofs

Reg'd. Trade Mark

Rely on that reputation. Insist on a Barrett "SPECIFICATION" roof . . . *Canada's No. 1 Roof.*

The built-up felt, pitch and gravel roof as applied by Barrett in the record-making "SPECIFICATION" roof incorporates these special features:

1. Barrett "SPECIFICATION" felt—carefully processed from selected stock . . . must pass rigid tests for tensile strength and durability.
2. Barrett "SPECIFICATION" pitch—specially refined straight-run coal-tar pitch . . . mopped between layers of felt, *heavy-poured* on top.
3. Gravel or slag armoured top embedded in hot pitch protects roof against elements, mechanical damage, wear and tear. It interposes a surface of fireproof rock between building and flying embers.
4. Only these materials, applied by a Barrett Approved Roofer in accordance with time-tested Barrett specifications, and examined by a Barrett Inspector make the Barrett "SPECIFICATION" roof.

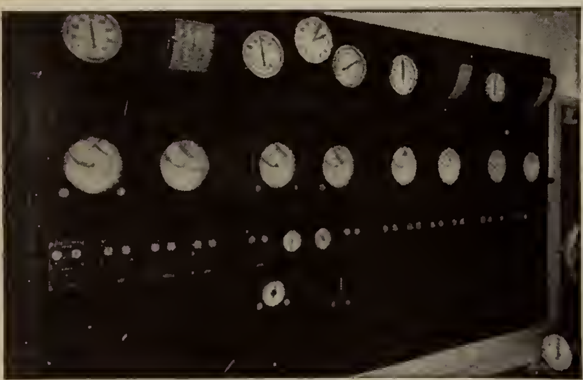
How BAILEY CONTROLS Improve Power Service



Better Power Service in *Your* Plant

There may be opportunities for the improvement of power service as well as for increasing safety, saving fuel and reducing maintenance by the proper application of Bailey Controls. Get the recommendation of your local Bailey Engineer or write for Bulletin 15-C describing Bailey Controls for Steam Plants.

Above is the panel board which automatically controls the gas and oil-fired boilers at B-A Oil's Refinery at Clarkson, Ont.

CONTINUITY

Fewer outages of boilers and prime movers improve continuity of power service.

CAPACITY

In addition to increasing steam generating capacity, Bailey Controls also increase output and efficiency of prime movers by supplying steam at design conditions.

HEAVY LOAD SWINGS

Simultaneous regulation at all points of control accurately and safely takes the boiler through heavy load swings.

PROCESS STEAM

Steam at correct pressures and temperatures for process operation is furnished by combustion and steam temperature controls. Pressure reducing and desuperheating control systems insure adequate low pressure steam. Combustion control usually does away with the need for a steam accumulator.

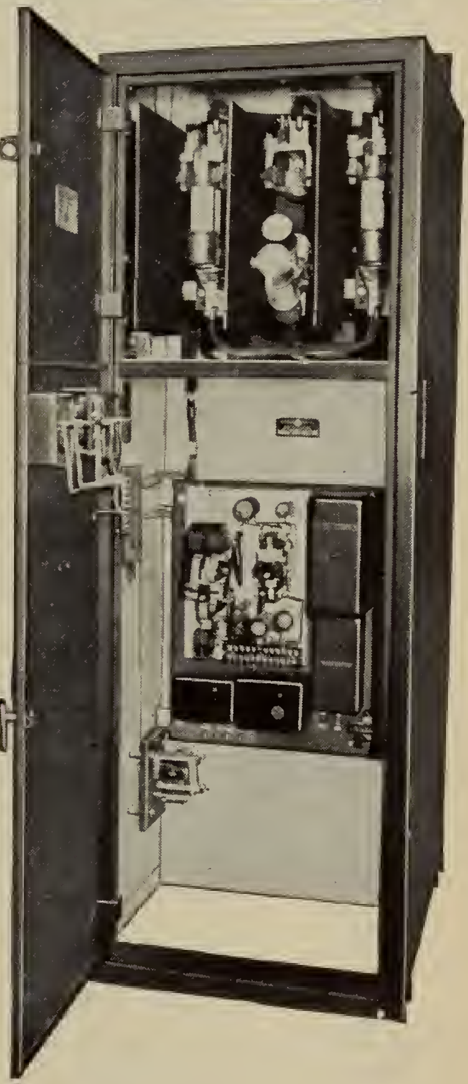
Want ½ CYCLE SHORT-CIRCUIT PROTECTION FOR YOUR MOTORS?

Use

GENERAL ELECTRIC

LIMITAMP CONTROL



Equipped with EJ-2 Fuses
Contactors Good for Years of Constant, Repetitive Service

GENERAL ELECTRIC Limitamp control gives fast, positive short-circuit protection with squirrel-cage, synchronous and wound rotor motors. When a short occurs, the Type EJ-2 current-limiting fuses, cut off the rise in current in less than a quarter cycle.

General Electric Limitamp air-break contactors have a mechanical life of several million operations, contact-tip life is twenty or more times that of comparable oil-immersed tips.

Here are 3 other important advantages

1. OVERLOAD PROTECTION—Isothermic overload relays protect the motor from overheating due to sustained overloads, locked rotor, or single-phasing.

2. PERSONNEL PROTECTION—Totally metal-enclosed controllers give protection to operating personnel.

3. UNDERVOLTAGE PROTECTION—All Limitamp controllers can be furnished with either instantaneous or time-delay undervoltage protection.

INCREASE WATER REVENUE

REDUCE OPERATING COSTS

—WITH A MODERN

Meter Conservation Program

TODAY facts prove that more than 13% of the water used in the average home is used at 1/5 g.p.m. This shows the importance of having your repaired water meters register at least 90% at that rate of flow. Of unaccounted-for water, more is lost through under-registration of meters at low rates of flow than you may realize!

Typical of a number of towns reporting results of a meter-testing program is the case of one small town, which increased revenue over $2500 a year, and at the same time reduced pumpage 2.2%. This saving meant a reduction in the use of critical materials . . . for saving WATER means saving pumpage, power, coal, transportation, chlorine, and productive capacity.

Your Trident representative will be glad to give you the benefit of his experience in connection with modern meter shop operation.

Recommendations for a
METER CONSERVATION PROGRAM

1. Remove all meters after a certain period of time or after a certain total consumption, or combination of both.
2. Test them when brought into the shop for repairs, keeping a record of these tests. Test at rate of flow in gallons per minute.
3. Repair them carefully, especially the chambers and gear trains, keeping a record of repair costs, both parts and labor.
4. Test them after repairs, requiring that all 5/8" meters register 90% accurate at 1/4 gallon per minute rate.

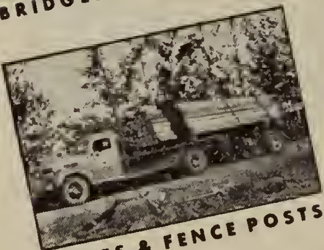
for EFFECTIVE WOOD PRESERVATION *Use* "OSMOSE"

BRIDGES & CULVERTS



POLES & FENCE POSTS

MINES

RAILWAY TIES

THE PROBLEM confronting users of wood, lumber, millwork, poles and posts is that of determining how to obtain increased service life when it is installed under conditions favourable to decay and termite attack.

THE ANSWER to this problem is "Osmose". Since 1935 when a number of Canadian companies first experimented with "Osmose" Wood Preservatives, "Osmose" has achieved national acceptance by over 5,000 satisfied users including Industrial, Power, and Mining Companies and Government Departments.

Throughout the past 12 years actual performance records give positive proof to the claim of 3 to 5 times increased life of the treated wood. To date we are looking back upon a record of having treated more than 300,000,000 bd. ft. of lumber of all descriptions in addition to millions of poles and farm fence posts.

WHY is "Osmose" the answer? Because it does everything a wood preservative is required to do. "Osmose" forces itself upon the moisture or sap in the wood by Osmotic pressure and its chemical properties kill wood-destroying fungi and insects, eliminate decay and have a fire retarding effect. "Osmose" is clean, odorless, paintable and easily applied. Performance records have proved these qualities.

3 TO 5 TIMES ADDED LIFE ASSURED!

Novel Concrete Headframe for Asbestos Mine

by

Per Hall, M.E.I.C.

Designing Engineer, Foundation Company of Canada, Montreal

A paper specially prepared for publication in The Engineering Journal

The author describes a recent innovation in the design and building of mine headframes, using reinforced concrete built with sliding forms. The job conditions calling for such a type of construction are given, and details of both design and construction are discussed.

An interesting and unusual mine headframe has recently been completed for the asbestos mine of the Canadian Johns-Manville Company at Asbestos, Quebec, the world's largest asbestos property. It takes the form of a reinforced concrete cylinder 30 feet in height, with 12-in. walls supported on the mine shaft collar.

Though a number of reinforced-concrete headframes have been erected in the past, it is believed that this headframe, both in conception and with regard to design and the use of sliding forms for its construction, constitutes an innovation in the field of mine structures. Moreover, it offers a number of advantages over the conventional types, viz., elimination of special foundation; elimination of scarce structural steel; use of sliding forms; reduced fire hazard; low maintenance cost; and good basic appearance, which can be accentuated by suitable architectural treatment.

The first three of these features facilitate prompt and speedy construction.

In this particular case, the cost was practically the same as it would have been had structural steel been used. However, this is hardly a fair test, because all the basic conditions had been established to suit a conventional steel headframe, and for this reason it was not possible to exploit all the advantages offered by a reinforced-concrete design. In fact, a rational development of these types of headframes should result in very substantial savings to mine operators.

Sinking the Shaft

In the spring of 1946, the general contractors, The Foundation Company of Canada, had sunk a shaft for the owners to approximately 1000 ft. below the surface, as a part of the Company programme to mine extensive underground ore bodies. This shaft accommodates compartments for two 10-ton skip buckets, one 15-ton cage, a man-way and pipe-way, and a well for the cage counterweight, all within an opening of 13 ft. 6 in. x 18 ft. (Fig. 1). The sinking of the shaft was complicated by the presence of 75 ft. of over-burden, consisting of approximately 3 ft. of mine tailings, 18 ft. of hard dry clay, and 24 ft. of gravel and sand, underlaid by 34 ft. of sticky blue clay immediately above bed rock at Elev. +671. (Fig 2).

An open pit was first excavated to a depth of 30 ft. below the surface. Below this level, water flow made it necessary to complete the balance of the excavation within a cofferdam. 80 pieces of steel sheet piles were driven in a ring of 32 ft. diameter. After considerable difficulties due to the flow of water through the gravel the shaft was successfully bottomed and sealed. From Elev. +671 down to the bottom level at Elev. —249, the shaft was sunk square through serpentine rocks, and provided with a concrete lining of 12 in. minimum thickness flush with the inside of the steel sets, as protection against sloughing or breakage of the rock walls.

Above bed rock Elev. +671, the cofferdam was

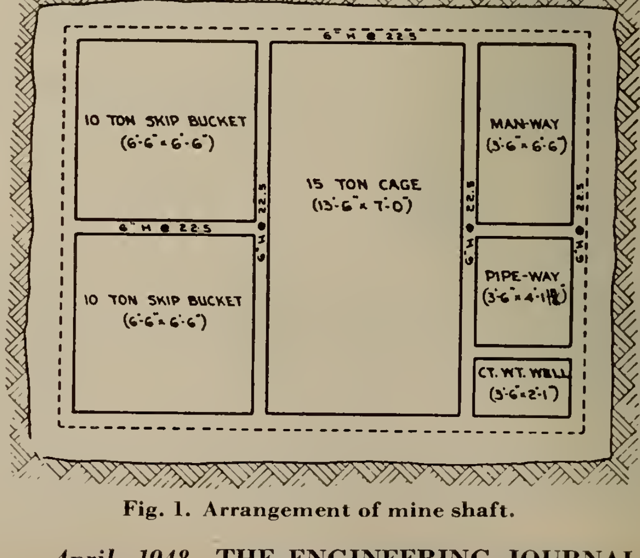

Fig. 1. Arrangement of mine shaft.

filled with concrete to Elev. +720, leaving a 20 ft. x 15 ft. opening concentric with the mine shaft below. A concrete cylinder 26½ ft. I.D. and 30½ ft. O.D. was poured from Elev. +720 to Elev. +747 and topped off with a 4 ft. slab to Elev. +751, with an opening corresponding to the mine shaft.

Basis for Design

In the spring of 1946, when the hoist-house was under construction, plans were prepared for a conventional structural-steel headframe with overhead bins for ore and waste rock, supported on piles driven through the overburden to bedrock. Plans for other mining buildings, including change and collar houses, were also well advanced and the general layout was pretty well established. All surface structures, with the exception of the headframe itself, are founded on spread footings designed for a general bearing value of 2000 lbs. per sq. ft.

However, by May 1946, it became clear that difficulties in obtaining deliveries on steel for this headframe would delay the completion of the project a year or more beyond the scheduled date. Furthermore the prevailing high prices on structural steel would increase the cost substantially.

In view of this, the owners requested the contractors to develop an alternative design for the headframe in reinforced concrete, which could be erected without delay and put in operation by early 1947. All mechanical equipment had been ordered for the steel design and, to avoid delays, it was necessary to design the concrete headframe to match this equipment,

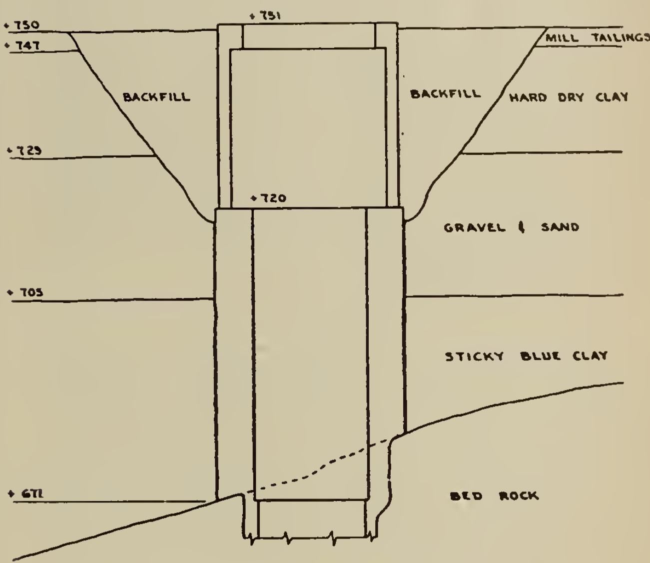

Fig. 2. Ground conditions.

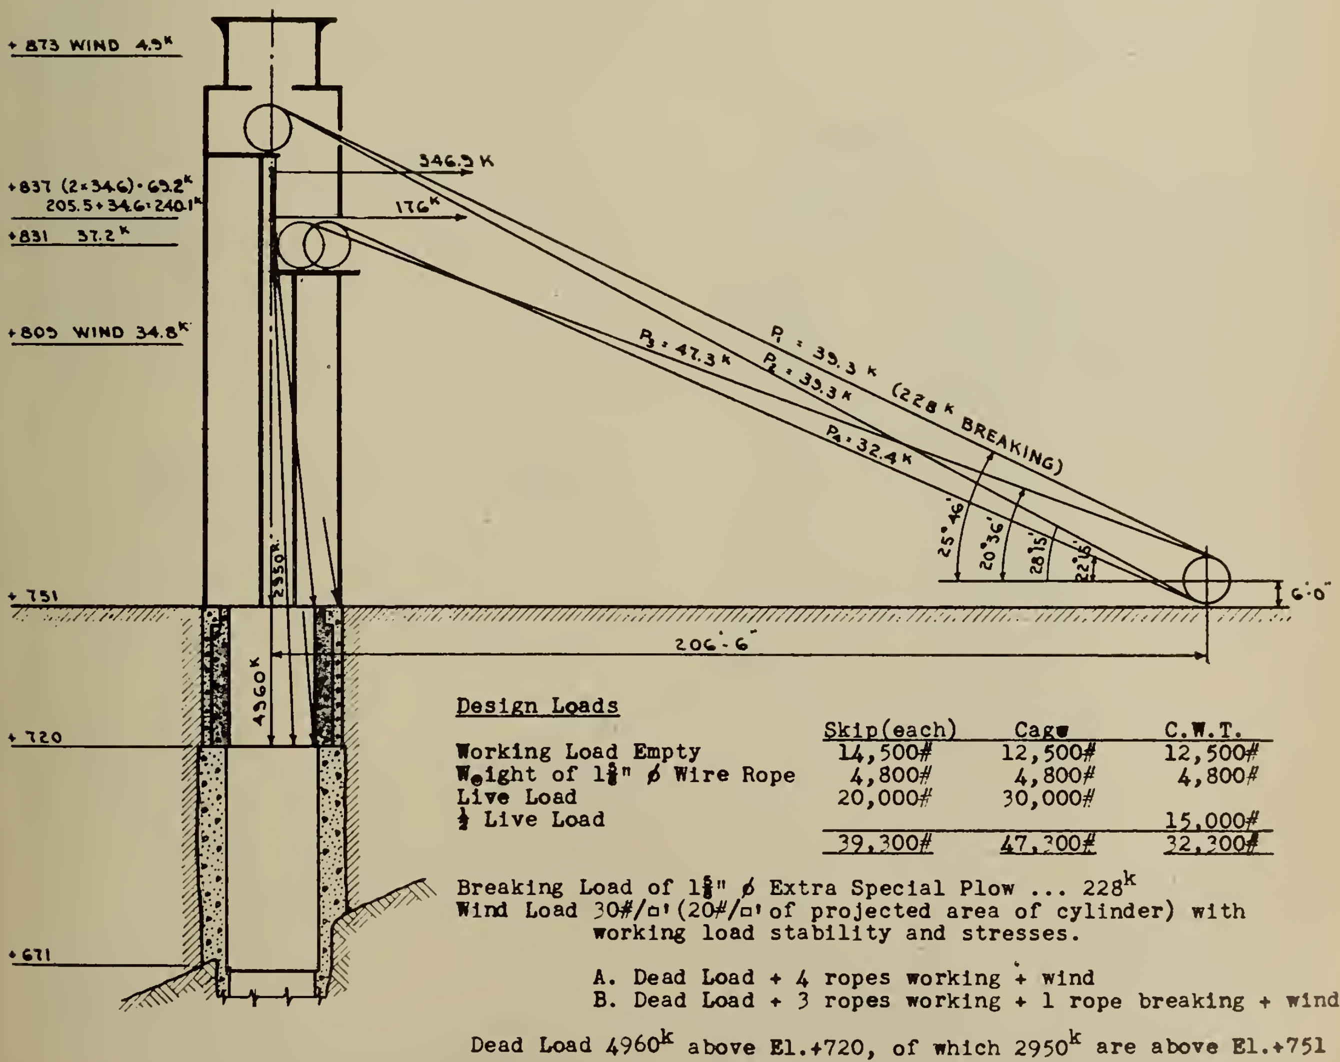

Fig. 3. Stability requirements.

namely two 10-ton skip buckets, and a 15-ton cage with corresponding counterweight, carried by 1⅝ in. extra improved plow-steel hoisting rope. Thus the design was tied down to a rigid set of conditions which had to be met, though in some instances it meant that full advantage could not be taken of the special characteristics of a reinforced-concrete structure.

From the outset, it was realized that a headframe is nothing but an extension of the mine shaft above the surface level to provide necessary height to dump ore into bins. Therefore, it would be logical to choose the same geometrical shape for the superstructure as for the top 79 feet of the shaft. This arrangement would permit the headframe to be supported directly on the shaft collar, eliminating the need for piling or other special foundation.

Design

These considerations led to a design which basically consists of a vertical concrete cylinder 30 feet O.D. with 12 in. walls 115 feet high (Fig. 3). Two partitions, one on each side of the shaft compartments, are incorporated to carry the sheave floors, and provide added stiffness and mass to the structure. The front of the structure facing west is extended into a rectangular pocket between the two partitions, to give room for the dump action of the skip buckets. Moreover, the superstructure is extended down to Elev. +720 inside the concrete cylinder by cutting away part of the collar slab. It is securely keyed to this structural element, just leaving a 13 ft. x 18 ft. opening for the mine shaft. This arrangement adds considerable weight to the base of the superstructure and, though the design does not depend on the fixity derived from having the structure itself surrounded by 30 feet of earth fill, this feature adds to the overall stability and it makes the top of the shaft lining at Elev. +720 serve as a natural foundation for the headframe.

Normal stability requirements, i.e. compensation for the overturning moment caused by working loads and 30 lbs. wind pressure (reduced to 20 lbs. due to circular shape of main structure), are fulfilled by incorporating sufficient weight in the superstructure to keep the component of the forces within the kern area of the base (Fig. 3). Compensating loads have been arranged partly by bringing the superstructure down inside the circular collar to Elev. +720 as described above, and partly by adding extra concrete to the front part of the structure in the form of two triangular buttresses, which at the same time serve to frame a large opening in the front of the headframe.

In addition to the above load case, the design allows for the breaking load of one of the skip

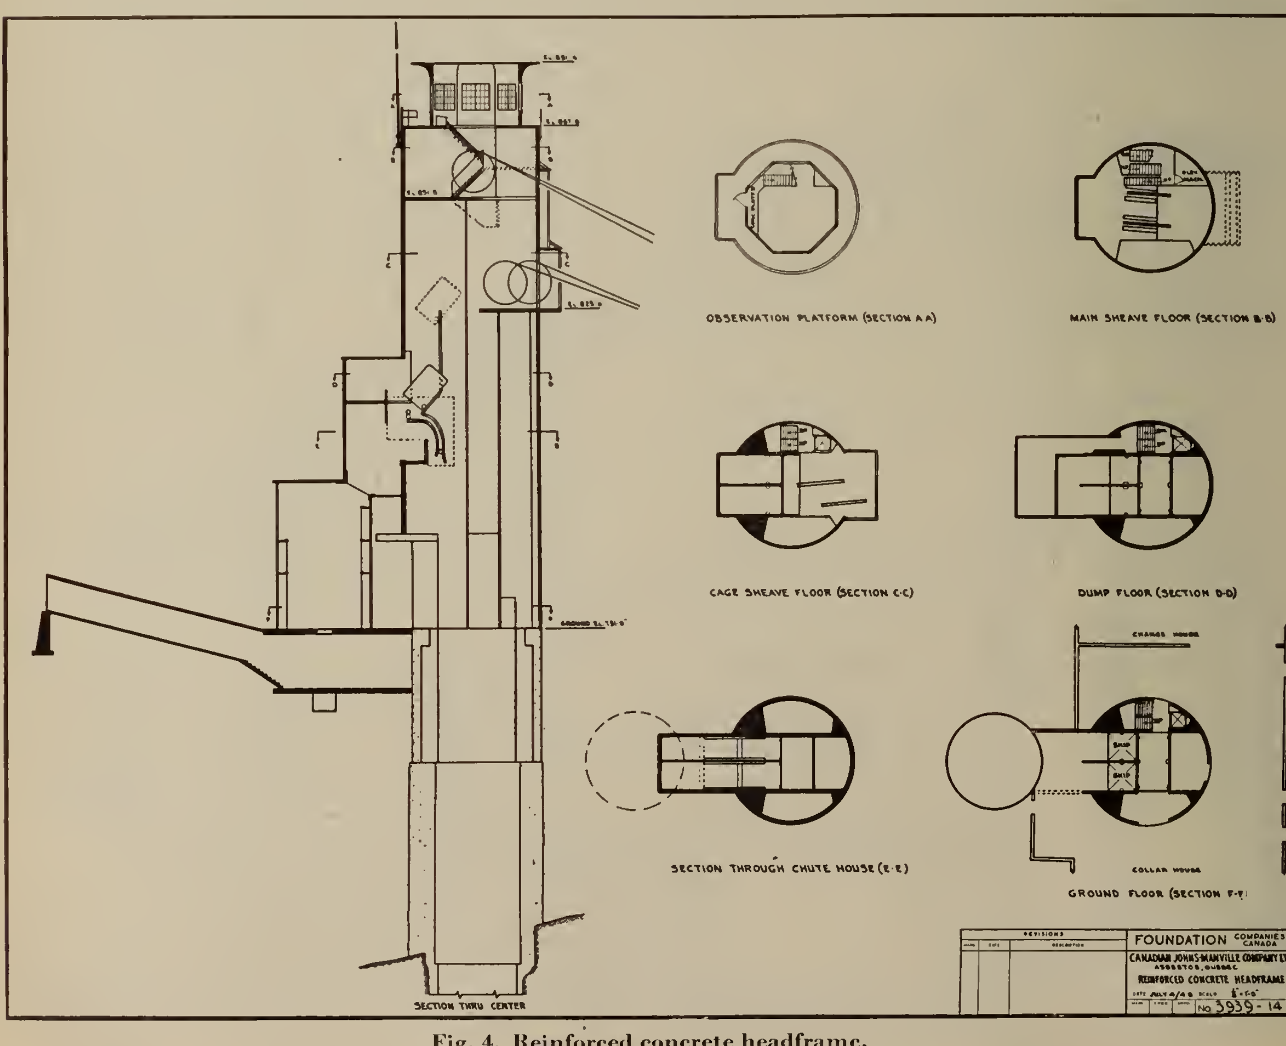

Fig. 4. Reinforced concrete headframe.

Fig. 5. Completed headframe.

The arrangement of partitions leaves two compartments of the shape of circular segments for auxiliary use. The one on the north side of the shaft compartments adjoining the change house serves as combined stair and elevator well and the other, which adjoins the collar house, provides a hoist-way between the sheave floors and the ground floor. An overhead monorail is installed in the ceiling of the monitor, making it a simple matter to take equipment from the sheave floors down for repair or overhaul in the collar house. The elevator in the north compartment provides convenient access to the dump floor, the sheave floors and the observation platform.

Ten openings of different sizes, varying from 25 ft. x 13 ft. 6 in. to some few feet square, had to be provided in the walls. The smaller openings were formed easily by anchoring a box of the required shape in the concrete while the sliding form went by. In the case of the larger openings, it was found convenient to use a double form, consisting of a fixed vertical form anchored in the concrete wall in its proper position and backed up by bulkheads temporarily attached to the sliding form. In several instances, jack rods passed through large openings, in which cases the rods were braced to prevent buckling.

A large number of inserts were required to hold the brackets for the guide timbers for skip buckets, cage and counterweight, and also to hold the dump plates in place. A special design was developed which permitted the successful placing of 186 inserts without hampering the progress of pouring operations. While

ropes, which is equivalent to a force of 228 cos. 25° 46 = 205.5 kips, acting horizontally (857-720) = 137 feet over the base. In this case, maximum stresses of +443 p.s.i. and − 113 p.s.i. develop at Elev. +751, and +267 p.s.i. and − 75 p.s.i at Elev. +720. The tensile stresses are taken care of by reinforcing steel and by dowels at Elev. +720. Actually, this is an unnecessary precaution, because only a sudden shock caused by the abrupt stoppage of a skip bucket could overstress the rope. The impact from this shock would however be of such short duration that it could not overcome the inertia of the headframe.

Construction Methods and Details

From an early stage, it was realized that the silo-like shape of the proposed design would lend itself to the application of sliding forms. All details related to partitions, floors, openings and inserts were developed to avoid any horizontal features which would interfere with the vertical movement of the forms. The result is shown in Fig. 4.

Concrete partitions separate the cage compartment from the rest of the structure, and the two skip compartments from each other. The thickness of these partitions is limited to 6 in. by the steel sets installed throughout the mine shaft. All partitions in the rear half of the headframe are brought up to Elev. +823 to support the cage sheave floor and, in the front half, to Elev. +849 to support the main sheave floor. The sliding forms were stopped at Elev. +866.5 and the work platform served as form for the deck slab which was poured in this elevation. This arrangement permitted the completion of all vertical walls and partitions in one operation. The entire structure is crowned with a 15 ft. high octagonal monitor, through which daylight and fresh air are admitted to the headframe.

Fig. 6. Sliding forms approach the top of the tower as concreting operations reach the final stage.

the primary function of the jack rods is to assure adequate, even lifting of the sliding form, their spacing was, in this case, somewhat influenced by a desire to make use of them as supports for the inserts. However, experience proved that inserts might as well be held in place by special rods held plumb by means of dummy yokes on the sliding form, which would have reduced the number of lifting yokes and thereby brought about better working conditions on a rather crowded working platform.

Model

To gain some preliminary information with respect to the special difficulties that might arise as a result of the rather intricate system of partitions and the great number of relatively large openings in the walls, a model was constructed to scale 1 in. to 2 ft. Though it was not possible to simulate actual job conditions, it was shown that the concrete in the interior 6 in. walls would tend to lift with the forms, and also that special precautions would have to be taken to protect the concrete in free corners. Both conditions developed on the actual job and the difficulties were successfully overcome. Pouring of the superstructure was completed in little over two weeks, the average lift being 7.7 feet per 24 hours.

Building Details

A circular surge bin of 300-ton capacity free flowing ore is erected on the west side of the headframe (Ref. Fig. 4). This bin, which is 20 feet in diameter, is provided with circular shelves spaced so rock dust cones will form to protect the structure against impact and abrasion. The basement under the bin, which contains a Jeffrey feeder and the tail end of a conveyor installation, was developed into a floating raft foundation. A chute house is fitted between the headframe and the top of the surge bin. It is designed as a simple supported bridge span, permitting the surge bin to settle freely as the fill underneath consolidates.

Considerable attention was paid to the aesthetic aspects of the structure. The stovepipe-like appearance of the cylindrical surfaces is broken by suitable fluting and, without departing from the severe functionalism of this installation, some interest has been added to the massive appearance of the main structure by treating the chute house, the observation platform, and the monitor on top of the building, as separate units.

Fig. 7. Interior of headframe.

The sinking of the shaft and erection of surface structures were carried out by the Foundation Company of Canada, Ltd., under the direction of W. U. Smick, vice-president and general superintendent. F. Astels, M.E.I.C., acted as job engineer and the detailing was done by J. N. Galli, JR.E.I.C.

Hydrogen-Peroxide as a Source of Power

A Report on War-time Developments in Germany

by

Dr. René Simard

Imperial Oil Limited, Montreal

The author describes the uses of hydrogen-peroxide for power production as developed by the Germans for secret weapons. Describing the Walter plant set up for its production, he traces the derivatives from commercial peroxide, and their properties, uses, and methods of handling, including Ingolin, the most important of these.

Listing the weapons already in operation or under test which employ Ingolin as a fuel, and describing such in brief, he also lists projected uses for war, and summarizes "Report L-13" by Dr. Schmidt, dated January 1942, which enumerates various peace-time uses for Ingolin as a propellant, to which he adds his own conclusions.

This paper gives a general picture of the uses of hydrogen peroxide for the production of power as developed almost exclusively by the Germans in their various secret weapons, including uses which have peace-time, commercial possibilties. The information was obtained from documents found by the author at the Walter plant in Kiel, Germany in June 1945. As invasion began to threaten Kiel, Walter had all his drawings and reports photographed on micro-film, the originals destroyed and the films buried outside of town, no doubt for intended later use. Only after Admiral Doenitz, as Hitler's successor, had relieved the personnel of their oath of secrecy did they reveal the hiding place of the films and start a policy of full co-operation with the allied investigators.

General Information

Hydrogen peroxide was first put to use by Prof. H. Walter who, with Government help, founded the firm bearing his name in 1935. Thus, four years before the war actually started, the Hitler regime was already willing to subsidize research on secret weapons to be used in the war which they were engineering.

After Walter had sold his new idea to the authorities, he was supplied with approximately $7 millions of government money for capital expenditures and set up a plant at Kiel which with the impetus of war branched out to a total of five separate establishments. The Government further subsidized the firm by paying running costs of another $7 millions a year, regardless of results obtained. The capital had to be reimbursed, using royalties and government payments on a cost-plus basis, and Walter had almost succeeded in doing this when his activities were brought to a sudden end.

The firm employed about 5000 men and was solely concerned in research, development and production of prototypes. There was a total of 10 first-class chemists, physicists, and engineers working on research, and 20 more employed on development work. These top men were backed with a further 30 scientists and technicians on the research side and 250 (including the design staff) on the development side. The rest of the 5000 consisted of industrial workers, clerical staff and auxiliary grades; all in all a pretty formidable organization.

Walter was given a free hand in the development of his ideas, which the Government felt sure would greatly increase the chances of winning the projected, and later, the actual war. The general opinion of investigators after looking into the work of the Walter plant alone, was that, had they been given about six more months, the results would have made the issue of the war a very debatable point. One project alone would have reduced the supplies to England and the continent to a mere trickle. This project, based on the use of hydrogen peroxide, was the manufacture of a submarine capable of a 25-knot speed when submerged, and it was stopped only after operational tests had already been made.

Properties and Manufacture of Hydrogen Peroxide

Hydrogen peroxide H_2O_2, has been widely known as an antiseptic and bleaching agent in the form of a 3 per cent solution in water. This is the solution commonly obtained in drugstores. The commercial peroxide is standardized as a 30 per cent solution, with 50 per cent being available under special orders. Higher concentrations were not produced in America until the war was over, when it became necessary to develop a supply for army experiments with captured German weapons. The pure 100 per cent peroxide is somewhat of a laboratory curiosity, due to the difficulty and danger of its preparation. It is a colourless, slightly viscous liquid with a density almost one and one half times that of water. It freezes at 29.5 deg. F, and boils at an estimated temperature of 305 deg. F. This temperature is estimated because the peroxide explodes 1 or 2 degrees before that. The peroxide used by the Germans was an 80-85 per cent solution, and that form was known at various times under the trade or code names of Oxylene, Aurol, T-Stoff and finally Ingolin (after Walter's daughter Ingol).

Ingolin is a relatively stable product, but it is liable to decompose violently unless it is kept free of impurities and foreign substances, especially organic matter. This property makes its production rather difficult due to the salts which are accumulated in the residue during concentration. Ingolin must be kept free of dust, rust, metallic particles or filings, since any one of these promotes decomposition.

The chemical Warfare Service of the U.S. Army has made a thorough investigation[1] of concentrated peroxide solutions, and has found that the rate of decomposition can be greatly retarded by the use of stabilizing agents in very small quantities. They found that sodium phosphates were the best stabilizers when used at the rate of 100 p.p.m. Larger amounts tend to overcome the stabilizing action due to the increased impurities. The Germans themselves used phosphoric acid and 8-oxyquinoline as stabilizers.

All surfaces which come in contact with Ingolin must be acid treated for the removal of grease, and then soaked in peroxide after such treatment. The materials best suited for handling concentrated peroxide in order of passivity are as follows: Pyrex glass, aluminium (99.6 per cent +), aluminium-magnesium alloys, pure tin, pure tantalum, pure cadmium and stainless steel. Again, according to results of the U.S. Army, Koroseal and polyethylene are suitable for gaskets, while the new silicone greases can be used for lubricants.

Despite all the difficulties inherent to this substance and the rather specialized materials required for its handling, Ingolin has one rather important redeeming feature:—it cannot be detonated by shock, unless organic materials are present.

Ingolin was manufactured in Germany by the electrolytic (anodic) oxidation of potassium or ammonium sulphate, K_2SO_4 or $(NH_4)_2SO_4$. Persulphates are formed in the process, and these are converted to hydrogen peroxide by treatment with steam at high temperatures. The weak solution is then concentrated by vacuum distillation. Great care must be taken towards the end of the distillation, due to the increasing concentration of salts in the residue which can promote a rapid or even explosive decomposition. If a purer product is required, the concentrated peroxide can be further distilled from its impurities.

Ingolin is not in itself a poisonous substance, but its ability to release oxygen quickly makes it a dangerous liquid to handle. Contact with the skin causes severe burns, and necessary precautions include rubber gloves and a thorough washing down with water of any apparatus in which it has been used for test or experiment. Its effects on clothing are varied but uniformly destructive.

Methods of Use

Hydrogen peroxide can be used as a source of power due to its ease of decomposition, its relatively high heat of decomposition (996 B.t.u. per lb.) and the nature of the products formed. These products are water and oxygen, according to the equation: $2H_2O_2 = 2H_2O + O_2$. However, due to the heat developed during decomposition, the theoretical temperature reaches about 900 deg. F, and the water produced is in the form of highly superheated steam. The relative proportions are 62 per cent steam and 38 per cent oxygen. This high concentration of oxygen (almost double that of air) is most advantageous for the production of energy by combustion. Thus two distinct methods of using Ingolin suggest themselves: the so-called "cold" process where the steam-oxygen mixture is used solely to drive a turbine and the "hot" process where the oxygen of the mixture is used after expansion in the turbine to burn an additional fuel. These two basic methods lend themselves to a number of variations. However, whatever the process used, a catalyst is required to ensure steady and complete decomposition of the Ingolin. This catalyst may take various forms, but is invariably a metal salt.

As a rule, four different processes are used, three of which are variants of the "hot" process.

(a) In the "cold" process, Ingolin is decomposed directly over a catalyst and the steam-oxygen mixture used directly to drive a turbine. The theoretical temperature is 900 deg. F, and the pressure can be varied at will before decomposition in the catalyst chamber. In this case the catalyst used can be either calcium or sodium permanganate in solution, or as a solid coating over porous cement or porcelain stones. The calcium solution has the disadvantage of leaving an insoluble residue. The solutions are sometimes compounded with manganese dioxide powder.

(b) Ingolin is mixed with a compound which reacts readily with it, giving a mixture of gases as the products of the reaction. In this case, the catalyst itself is a complex cuprous cyanide of formula $K_3(Cu(CN_4))$, a small quantity of which is dissolved in Helman or C-Stoff (about 0.6 grams per liter). Helman (from Walter's son Helmuth) and C-Stoff are similar mixtures, the active ingredient of which is hydrazine hydrate, $N_2H_4.H_2O$, a compound which is as strongly reducing as hydrogen peroxide is oxidizing. The composition of Helman is 80 per cent hydrazine hydrate and 20 per cent ethyl alcohol, spec. grav. 0.980, heat of combustion 6220 B.t.u. per lb. The other mixture, C-Stoff, is made up of 30 per cent hydrazine hydrate, 57 per cent methyl alcohol and 13 per cent water, spec. grav. 0.915, heat of combustion 7050 B.t.u. per lb.

[1] *Ind. Eng. Chem.* 38, 160-170, 310-320, 627-630 (1946).

Both mixtures contain, in addition, a small quantity of the copper cyanide catalyst. The products of the combustion with the peroxide's liberated oxygen are steam, carbon dioxide and nitrogen, all gases which are expanded through a turbine or through a venturi when used as rocket propellant.

(c) The third method of use decomposes the Ingolin over solid permanganate catalyst stones, and the steam—oxygen mixture is led to a combustion chamber into which is sprayed a normal fuel of the hydrocarbon family. Temperatures of the order of 4000 deg. F can thus be obtained, depending on the fuel used. Although any fuel can be burned in the combustion chambers, the firm of Walter was using decalin, a fully hydrogenated napthalene of formula $C_{10}H_{18}$, in their application for under-water power plants.

(d) The fourth process is a combination of the second and third. The Ingolin is decomposed with Helman and after a definite time which is controlled by the pressure in the combustion chamber, the Helman is shut off and replaced immediately by decalin.

These four processes vary in safety. The safest of all is the first when the solid permanganate catalyst is used. Practically as safe is the third process where the fuel is burnt after the complete decomposition of the Ingolin. Not quite so safe are the first with liquid catalyst and the second where in each case a stoppage in the catalyst flow would cause an accumulation of undecomposed Ingolin, which would explode if the catalyst stoppage became cleared suddenly. The most dangerous process is the fourth where the timing of the Helman cut-off and the start of the fuel injection is very critical. If the fuel is let in at the same time as the Helman, an explosion comparable to H.E. is to be expected. This process was mainly used in torpedoes, and tests had to be made by remote control and the personnel protected by blast walls.

Germany's Practical Uses of Peroxide

As might be expected, a new idea like the use of hydrogen peroxide as a source of power was entirely directed to perfect secret weapons of more or less revolutionary character. In this respect, Germany was ahead of the Allied Powers, being the only one to develop practical uses for hydrogen peroxide, and of course the only one to produce large quantities of highly concentrated peroxide.

Tested Weapons Using Ingolin

Following is a list of weapons built, in operational use, or under test, in which Ingolin has played a part.

(1) *Hs 293 Glider Bomb:*—Simplified system of propulsion, using Ingolin and liquid calcium permanganate as catalyst. The decomposition products are expanded in a venturi nozzle, which is the sole means of propulsion. This weapon had a fair amount of success against our shipping when it first came out but was abandoned or at least seldom used after a while, possibly due to lack of long-range aircraft suitable for its launching and radio control.

(2) *Assisted Take-off (A.T.O.) Unit:*—Uses the same system of rocket propulsion as the Hs 293 Glider Bomb. These units were placed under the fuselage or wings of an aircraft and produced enough thrust to facilitate take-offs of heavily loaded aircraft. The same idea, but not the same rocket fuel was used by the allies, especially for take-offs from aircraft carriers. These units were first used by the Germans in 1941 and invariably operated on the " cold " process. They developed a thrust which varied between 2200 lb. for 45 seconds or 3300 lb. for 30 seconds.

(3) *V-1 Launching device:*—The secret weapon known as V-1 (V for Vergeltungswaffe or Revenge Weapon) was also known only too well as the " Buzz-bomb ". Its propulsion motor used gasoline as fuel, but could only get started when the bomb travelled at speeds above 200 m.p.h. which was also its stalling speed. The 600 hp. motor depended on ram compression to admit air through spring vanes, after which combustion took place and the pressure developed produced a forward thrust against the closed vanes. The combustion gases were exhausted through the tail pipe, and with a decreased pressure in the combustion chamber a new supply of air was allowed in through the vanes. This cycle was repeated about 75 times per second, producting a loud intermittent roar or " buzz " which gave the bomb its popular name.

Since the V-1 was not self-propelled until a speed of 200 m.p.h. forced the vanes to open, a mechanism was devised which would impart to it sufficient speed to allow it to proceed on its own. This launching mechanism used Ingolin and permanganate solution to create gases under pressure, which were the driving force of the apparatus. A brief description of the launching mechanism might be of interest at this point.

The reaction unit was mounted on a wheeled frame which could be fairly easily attached to the launching ramp. The unit consisted of blow-cases for Ingolin and permanganate solution, high-pressure air reservoirs and the mixing or reaction chamber. The solutions were blown into the reaction chamber by the compressed air at 2200 p.s.i. The gases produced by the reaction developed a pressure of 800 p.s.i. behind a piston, which travelled in a cylinder 11½ inches in diameter and 160 ft. long, built into the launching ramp. The evolution of gases was such (15000 c.f.m. at 850 p.s.i.) that the piston travelled the 160 ft. in ¾ of a second, leaving the cylinder at a speed of 250 m.p.h. The instantaneous work done at that time is calculated to be 55000 hp. The acceleration of almost 500 ft. per sec. per sec. is equivalent to about 15 times gravity.

The bomb was placed on a light iron sled with wooden runners which travelled along a track on the ramp. The piston was fitted with a fin protruding through a ½ inch slot along the top of the cylinder, and this fin engaged into a keyway in the belly of the bomb. To reduce the escape of gases through the slot in the cylinder, a 1-inch rod was used to plug the slot behind the piston. This rod was suspended by light wires and the piston was grooved to accommodate it. During its passage along the cylinder, the piston pushed this rod up against the slot and the internal pressure in the cylinder ensured a sufficient seal until the piston shot out of the cylinder and the V-1 was on its deadly mission.

(4) *V2 Rocket:*—This rather awesome missile made use of Ingolin only in a secondary capacity, the main rocket fuels being ethyl alcohol and liquid oxygen. These two liquids were delivered to the burners by individual centrifugal pumps, one on each side of a turbine and all three on the same shaft. The turbine was operated by the decomposition gases of the Ingolin which was blown into a reaction chamber, together with sodium permanganate solution, by the

pressure of compressed nitrogen in metal containers. The power behind this pumping mechanism is shown by the fact that about 1000 gallons of both alcohol and liquid oxygen were pumped and burned during 53 seconds, after which the rocket travelled under its own momentum.

(5) *Me 163 Rocket Fighter Aircraft:*—In this case, the peroxide serves a dual purpose. Part of it is decomposed over solid permanganate catalyst, the products of combustion are expanded into a turbine which drives two pumps. The pumps feed the greater part of the Ingolin and Helman into the burners and the jet nozzle which produces the thrust. This aircraft was capable of almost vertical climb and flew circles around our fastest Mosquitoes. It was used solely for quick interception and had an endurance of about 10 minutes only, at full throttle. The rocket motor was first used on the DFS 194 designed by Lippisch before the war and first flown in 1940. The motor then developed a thrust of 660 lb., using the "cold" process. When Lippisch joined Messerschmidt in 1940 he designed the Me 163A, which used a "cold" motor giving 1650 lb. of thrust and was first flown in 1941. This aircraft, 30 of which were built, was subsequently used for training when the Me 163B was brought out using a "hot" process engine developing 3300 lb. and later 3750 lb. of thrust. The prototype flew in 1943 and it was first used operationally in August 1944. A still later version, the Me 163C had a smaller combustion chamber mounted below the normal one, which was used for cruising to give better efficiency and fuel consumption at cruising speeds, thus increasing the endurance appreciably. The end of the war stopped the development of the Me 263, which was to use two of the twin combustion chamber motors, giving a maximum thrust of 5300 lb. with 880 lb. for cruising on the small combustion chamber.

(6) *U-Boats:*—Five types of U-boats were in the process of development and testing by the Walter firm. Their systems of propulsion varied from the "cold" process of simple decomposition of Ingolin and direct expansion in a turbine, to the various modifications of the "hot" process which includes the combustion of a fuel, usually decalin, in the oxygen-rich decomposition products of Ingolin over solid permanganate catalyst. In the submarine department of the Walter plant, the stern end of a full-size U-boat had been erected, in which was installed an Ingolin-decalin system of propulsion. It was used for tests and training in the operation of the new type of motor.

(7) *Torpedoes:*—Walter's had twelve types of naval torpedoes and three types of aircraft torpedoes in process of development. Most of them worked on process "d" where the dangerous conditions were not likely to endanger the lives of the personnel. All types used turbine and propeller drive except one each of the naval and aircraft types which were actually jet propelled.

(8) *Rocket Propulsive Duct:*—Propulsive ducts are also known as "athodyds" (from aero-Thermodynamic Duct). They are a simplified system of jet propulsion in which the air compressor and its driving turbine are eliminated, leaving only the cylindrical duct into which fuel is injected and burned, exhausting through the tail-pipe and producing the reaction which propels it forward. The compressor in this case is replaced by the ram effect of the duct's travel through the air. Needless to say, the ram compression is obtained only at rather high speeds and, as in the case of the V-1, the propulsive duct must be launched by outside means or, if carried aboard an aircraft, can be switched on after the proper speed is reached.

Thus, this system of propulsion can be useful to extend the range of anti-aircraft guided missiles or as an auxiliary source of power aboard rocket planes to increase the endurance and range. The overall efficiency of a propulsive duct is comparable to that of a rocket or V-1 flying bomb, but only about 1/3 that of a regular gas-turbine jet at the same speed. This system of propulsion was first thought of by Lorin of France in 1913. The firm of Walter had been doing some intensive research and development on propulsive ducts, and the investigation of this work was the reason why, during a stage with Power Jets at Farnborough, England, the author was asked to visit the Kiel plant.

One development of their work brought in the use of Ingolin to increase the ram compression and to facilitate fuel combustion. The apparatus, which was built and ready for test, combined a "cold" process rocket with a normal propulsive duct. The discharge of the rocket was immediately ahead of the duct entry and concentric with it. The high velocity gases (steam and oxygen) entered the duct and sucked in with them through an annular space, a large amount of air. This system increased the ram compression and the mass flow through the duct, both of which have direct influence on the thrust produced, and the high oxygen concentration of the gases allowed more efficient combustion of the fuel which was usually gasoline.

The output of the rocket is important as there is a maximum amount of energy which gives maximum thrust. In other words, the velocity and mass of rocket gases must be such that the suitable amount of air is drawn in. Various rocket venturis were tried, and the 10-mm. throat size was finally adopted, because it gave the lowest specific fuel consumption at a ratio of 1 part of Ingolin to 6-7 parts of entrained air. The Ingolin pressure was 30 atmospheres, which produced a stream of oxygen and steam with a velocity of 3300 f.p.s. (2250 m.p.h.). Under these conditions, the air velocity was about 160 f.p.s. (109 m.p.h.) at the duct entry. This air velocity of course gave the whole apparatus a lead of 109 m.p.h. on the air speed of the aircraft, and allowed it to be used with full efficiency almost on take-off.

The simple propulsive duct designed by Walter developed a gross thrust of about 220 lb. at 625 m.p.h. Compared to that, the net thrust (gross thrust-drag) of the rocket-duct combination obtained in wind-tunnel tests ran from 220 to 265 lb. at speeds from 0 to 540 m.p.h. Thus its net thrust was consistently higher than the gross thrust of the propulsive duct alone.

The maximum thrust of the rocket-duct system was obtained at a ratio of Ingolin to intake air of 1 to 4. However, the minimum specific fuel consumption occurred at a ratio of Ingolin to air of 1 to 6-7, at which point the net thrust drops from 265 lb. to 176 lb.

Walter also tried out another combination by placing the Ingolin rocket in the tail pipe of the propulsive duct instead of in the entry. This did not prove as successful. The rocket sucks air through the inlet as before, but the rocket body is in the stream of hot gases and required special cooling devices to protect it. The structural difficulties were also quite great.

Some results were obtained nevertheless. They showed that the total thrust produced was the sum of the thrust of each component and that these individual thrusts varied with fuel consumption independently of each other. The only advantage of this type of motor besides the increased thrust from two components instead of one, was the slight reduction in skin friction and turbulence at the outlet due to the suction action of the discharge gases.

Walter had found another use for his Ingolin, this time as a possible improvement to the regular gas-turbine system of jet propulsion. His idea was to use a straight Ingolin turbine to drive the usual compressor. This method gives a better compression ratio and thus greater efficiency while the combustion gases (to which is added the steam and oxygen discharge of the turbine) are allowed to give up all their energy in the form of thrust, without having to drive a turbine to run the compressor. Its main disadvantage is that two separate fuels are required for its operation. It generally approximates so closely the normal gas turbine that its development was abandoned in favor of the Jumo 004 engine, which was the first jet propulsion motor to be used in operations.

(9) *Anti-aircraft Shells:*—Four or five types of shells were being developed, the propulsion systems of which were all based on rocket principles utilizing Ingolin. All of these were of the guided missile type.

(10) *Catapults:* — A great deal of research and development work was being done at a separate establishment of the Walter firm, located at Plön in Schleswig. Trials were made by catapulting heavy bodies into a lake, using Ingolin as a source of power instead of compressed air. This is essentially the same idea as the launching mechanism for the V-1, but with added variations.

(11) *Panzerfaust:*—This is the German equivalent of the American "bazooka" and the rocket propulsion used employed Ingolin.

(12) *Acoustic Mine Sweeping Device:*—This is a simple little device which depends on the explosive reaction of Ingolin with B-stoff (pure hydrazine hydrate) to produce sound waves under water. The two fuels are fed from their respective tanks into a flat, cylindrical explosion chamber, which is hollowed out in the shape of a doughnut with a hole on one face only. The inside diameter is only about 6 inches. A spring-loaded lever actuated by a cam causes two plungers to inject the two fuels rapidly into the explosion chamber. They enter the chamber tangentially so that, due to centifugal force, they form a liquid layer on the inside surface. The explosion delay is just long enough to allow complete feed of both fuels, after which their respective non-return valves automatically close. The sharp explosion, which is produced at the rate of one every second (r.p.m. of the cam) is claimed to be effective in exploding acoustic mines at a range of about 1 mile. The explosion gases are allowed to escape through the opening in the face of the explosion chamber. Their escape is facilitated by the scavenging action of compressed air, which is obtained from an air piston actuated by the upward motion of the spring lever, as the spring is compressed by the cam in readiness for the next cycle. The source of power for the cam is a small electric motor. The entire driving mechanism is located on board the mine-sweeping vessel, and the explosion chamber is fixed on the bow of the ship, below the water-line.

Projected Uses for War:

The following is a list of Walter projects which make use of Ingolin as a source of power. Being only undeveloped projects, there is no data available except possibly a short explanation of what was in Walter's mind.

(1) *Ingolin rocket for spinning experiments:*—The idea here was to install a rocket aboard the aircraft probably in various off-center positions in order to study the effect of various moments on the spinning and spin recovery of an aircraft.

(2) *Ingolin propulsion for explosive carriers:*—This idea applies to the " Goliath " or " Beetle " miniature tank which the Germans loaded with explosive and sent over into Allied lines, its progress being controlled by radio. Walter wanted to propel this little tank by his Ingolin driven turbine engine.

(3) *Ingolin propulsion for amphibious tanks:*—This idea is similar to (2) but applies to regular sized tanks which would be able to travel under water.

(4) *Boundary layer control:*—Walter's intentions were to use an Ingolin driven turbine to drive an air pump, through which the boundary layer or wings and fuselage of an aircraft would be sucked in, thus reducing drag and increasing the lift of the wings.

(5) *Rocket propulsion for bombs:*—As if ordinary aircraft bombs were not deadly enough, even when allowed to drop freely, Walter was toying with the idea of installing an Ingolin rocket near the tail end of the bomb in order to give it extra speed and minimize the lack of accuracy which is due to air-currents encountered during its descent.

(6) *Rocket propulsion for artillery shells:*—This is an idea similar to (5), except that it would have to be adapted to long range artillery shells instead of aircraft bombs. This device was meant to increase the range of the shell beyond its normal range as fired by the gun.

(7) *Rocket brake:*—As far as could be ascertained, the idea here was to use an Ingolin rocket in reverse, in order to slow down the rate of descent for airborne torpedoes and mines.

(8) *Depth-charge launching:*—Both the " hot " and " cold " processes were intended to be used to provide enough gas pressure to launch depth-charges from ships.

(9) *Mélot thrust augmentor:*—The Mélot thrust augmentor is a device consisting of short concentric venturis, fitted into each other in series and placed at the outlet of a rocket. Just how Walter intended to use this device is not very clear, but it is known that it was planned to use it both in air and in water.

(10) *Hydroplane vessel propulsion:*—A man named Tietjens had designed a hydroplane boat for the Government which, as far as we know was never used. Walter was thinking of using Ingolin for the propulsion system, either as a straight " cold " process turbine drive or as the fuel burning, " hot " process drive.

(11) *Assault boat propulsion:*—What was said in (10) also applies to a special type of assault boat.

(12) *Depth-keeping mines:*—These mines can be sown in deep water where anchoring would provide difficulties. They are controlled by a water pressure mechanism and Walter intended to use Ingolin rockets to provide upward or downward thrust as required to keep the mine at its predetermined depth.

(13) *Ingolin propelled hurdlers:*—Walter had made a theoretical study of the use of Ingolin to propel or catapult heavy bodies such as beach hurdlers. Two separate devices were planned, one with a thrust of 20 tons, the other with as much as 60 tons of thrust.

(14) *Soundless and flashless long range gun:*—Again here, Walter had thought of the exceptional properties of Ingolin, this time to propel an explosive shell without the noise and flame of the usual gun charge. This of course would have made the location of such a gun almost impossible to trace. The principle was simply to admit Ingolin decomposition gases under very high pressure into the gun cylinder and to accelerate the shell by successive admission of the gases at various points of the cylinder. Each admission of gas was to be timed to coincide with the passage of the shell along the gun's cylinder.

A variation of the above was meant to increase the range of the shell, but without eliminating the standard explosive charge. This system was to have an auxiliary chamber along the gun barrel which, after being filled with Ingolin decomposition gases under very high pressure, would bleed the gases in the gun cylinder behind the shell. Again the gases were to be let in from various stations along the barrel, timed with the shell's passage at each station.

(15) *Torpedo launching:*—It is well known that torpedoes are launched from a submarine by means of compressed air. This requires a fair size air-compressor and air storage. Walter had figured that space could be gained if Ingolin decomposition gases were used instead of air.

(16) *Oxygen for aircraft ventilation:*—What form this idea was to take is unknown. No doubt the principle was based on the fact that the decomposition of Ingolin produces a mixture of 62 per cent steam and 38 per cent oxygen. The oxygen can be concentrated very easily by the simple process of condensing the steam. This oxygen would be very useful in sealed cabins of high flying aircraft.

(17) *Wind-tunnel drive:*—Just the Ingolin decomposition gases can be made to drive a turbine for the production of power to drive pumps in the V-2 and the Me 163, so can it be used to drive the fan of a wind tunnel. As far as is known, no German wind tunnel was ever built or designed to use this type of power supply.

Projected Uses with Peace-time Applications

The following is a list of Walter projects powered by Ingolin, with peace-time uses:

(1) *Increased output of aero-engines:*—This subject is of special peace-time interest, and can be discussed more extensively than the above, since it was the subject of a full report found at Kiel and printed from the micro-film at the author's request. This report bore the Walter number L-13, by a Dr. Schmidt and is dated January 1942. It was left in the hands of Power Jets at Farnborough, England. The following is a summary of this report, which was a theoretical and mathematical analysis of the problem, with no reference to any practical tests or experiments.

The Walter firm had used Ingolin for self-acting mechanisms with outstanding properties of high performance, light weight and a thrust independent of height and speed, but with the noticeable disadvantage of high fuel consumption. The minimum for pure rockets seems to be 5.5 lb. fuel per 1000 lb. thrust. For operations at high speed and altitude, the fuel consumption can be decreased when atmospheric oxygen is used for combustion. Thus, by combining the use of hydrogen peroxide with a normal internal combustion engine, the advantages of peak performance become available without reducing appreciably the range and endurance.

Three methods were investigated theoretically and compared. They differ in the method of use of the peroxide; (a) utilization of the decomposition energy in a turbine whose output is delivered to the engine shaft; burning of fuel with the oxygen of decomposition and expansion in a suitable jet; (b) utilization of the decomposition energy in a turbine which operates an additional supercharger and use of the oxygen in the engine itself or, as in (a); and (c), utilization of the total energy of the peroxide in the engine.

Method (a) is specially useful for flights at low altitudes and for take-off when the engine is under its maximum thermal load while the propeller can absorb more power. Methods (b) and (c) on the other hand, prove to be more favourable for the prevention of power decrease at high altitudes.

Case (a):—The set-up in case (a) is as follows: the motor drives a pump for the peroxide and another for the additional jet fuel. The peroxide is delivered into a decomposition chamber under pressure and the oxygen-steam mixture produced is expanded in a turbine which transmits its output to the engine shaft by suitable gearing. The turbine outlet gases then go to a combustion chamber, where the jet fuel is burned and expanded through a normal venturi.

Calculations show that there is a flat minimum in specific fuel consumption for a turbine back-pressure of 2 atmospheres for speeds of 450 and 670 m.p.h. This back-pressure is therefore used for further calculations. The specific fuel consumption decreases with height and speed, due to the increased thrust of the jet at high speeds and altitudes.

The modern propellers are only a compromise. They cannot be designed only for altitude performance, otherwise their efficiency at sea-level is very poor. If the sea-level output is increased, the conditions improve. For example, if a propeller designed for flight at 50,000 feet could operate with an output 2 or 3 times as great, its efficiency at sea-level would only be decreased slightly.

In the motor-turbine-jet combination, the propeller thrust is much greater than the jet thrust under static conditions, but the two become about equal at speeds above 450 m.p.h. The overall fuel consumption remains under 1 lb. per 1000 lb. of thrust until speeds of 90 m.p.h., which is about 1/5 the fuel consumption of an A.T.O. (assisted take-off) unit.

The report then gives results of calculations made for such a combination motor. Assume an engine with supercharger which gives 1800 hp. at sea level. Its output at 36,000 ft. can be taken as 900 hp. The aircraft speed is 450 m.p.h. at sea-level, and, if the aircraft is ideal, the speed at 36,000 ft. will then be 1000 m.p.h. If a turbine of 1000 shaft hp. and equivalent jet power of 500 hp. is added to the normal engine the turbine will still deliver 1000 hp. at 36,000 ft. but the jet output will have increased to 1600 hp. The take-off power of 3,300 hp. (1800 + 1000 + 500) will thus correspond to 3500 hp. (900 + 1000 + 1600) at altitude, and the performance is then approximately constant throughout. Of special advantage for the propeller is its unloading to the jet as the height increases. Thus, at sea level, the propeller delivers 2800 hp. (1800 + 1000) but only 1900 hp. (900 + 1000) at 36,000 ft., allowing it to be smaller than if it was designed for high altitude efficiency.

Case (b):—This case uses decomposition energy of peroxide to boost the supercharging of the normal engine. Two types are possible. The first type has a motor with a mechanically driven supercharger ahead of which is interposed an auxiliary supercharger driven by a peroxide turbine. The decomposition gases at 20-30 atmospheres and 900 deg. F. are expanded in the turbine to the supercharger pressure. The turbine drives the 2nd stage which feeds the 1st stage. The turbine exhaust, which is rich in oxygen, is mixed with the supercharger air and cooled with it in the air cooler. The end temperature remains above the dew-point of the mixture so that no steam condensation takes place. At high altitude, the over-rich mixture of a Diesel engine will use up the oxygen. With the Otto-cycle engine, special control of the fuel feed must be provided.

The second type of peroxide supercharging is that of an engine with an exhaust turbo-supercharger. The supercharger in this case must be designed for the additional amount of exhaust gases from the peroxide decomposition. With 2-stroke engines especially, it becomes more economical to use the additional volume of exhaust gases in a 2nd stage coupled with the peroxide turbine to drive the additional supercharger stage. This arrangement is very economical because the peroxide is used twice to provide supercharging.

It is also possible to expand the excess energy of the exhaust in a jet. As in case (a) the energy of decomposition of the peroxide can be used to drive the supercharger and the oxygen used to burn extra fuel in a jet.

The fuel consumptions obtainable with auxiliary supercharging were calculated for a Diesel engine with a take-off power of 1100 hp. The climbing power falls from 830 hp. at sea level to 350 hp. at 39,000 ft. In the problem, the output is to be increased by 300 hp. through the use of peroxide. The duration of the peroxide use is to be 45 to 60 minutes, the additional weight, including the fuel is not to exceed 880 lb.

In order to obtain an additional 300 hp., 0.154 lb. per sec. of peroxide will be needed besides 0.044 lb. per sec. of fuel, hence a specific fuel consumption of 2.38 lb. per hp. per hr. This relatively satisfactory value assumes the installation of two turbines, a supercharger stage and a large air cooler. Estimating a weight of 220 lb. for these parts, plus a peroxide pump and decomposition chamber, the weight limit of 880 lb. allows enough peroxide for an endurance of 55 minutes.

Case (c):—This case uses direct injection of peroxide, either mixed with the supercharged air by direct cylinder injection or by atomization. The direct injection would be advantageous for two-stroke engines as it would reduce the loss of peroxide in the scavenging air. Disadvantages would be the additional trouble of control mechanisms and the difficulty of manufacturing a precise metering gear to work at high peroxide pressure. Added to that is the danger of explosion in contact with oil and the very poor lubricating properties of peroxide.

When the peroxide is atomized in the manifold, care must be taken that each cylinder receives the same quantity of peroxide, otherwise dangerous excessive pressures will be produced in individual cylinders. The most promising arrangement seems to be the atomization directly ahead of the inlet valve.

Based on the same requirements as in case (b), an additional 300 hp. can be obtained with 0.22 lb. per sec. of peroxide which, with the fuel consumption of 0.044 lb. per sec. gives an overall specific fuel consumption of 3.15 lb. per hp. per hr. and the endurance is 51 minutes for a total weight of 880 lb., of which only 66 lb. is for the extra gear required. The conclusions drawn from this report are as follows:

1—To compensate for the loss of power with increasing height, the injection of hydrogen peroxide in the inlet manifold shows to best advantage due to its simplicity. Its suitablity must be developed by the motor industry.

2—The use of a peroxide turbine to drive an auxiliary stage of supercharging gives the most economical fuel consumption but requires, among other things, sufficient air cooling.

3—The auxiliary turbine coupled to the engine shaft gives the highest specific fuel consumption but allows a wider range of power increases without overloading the engine thermally. Thus, this combination is well suited to take-off and low altitude flying, but can also be used advantageously at high altitudes as long as the propeller can absorb increased outputs.

4—The specially favourable take-off performance of the above combination would make possible its use instead of A.T.O. units which have much higher rates of fuel consumption and must be jettisoned after use. The motor-turbine combination has the added advantage of making available temporary increases in power during flight.

This necessarily sketchy description of what the Germans were able to do and were seriously planning to do with such a simple chemical as hydrogen peroxide should, even so, be an example of what can be achieved when scientific knowledge and enterprise are allowed facilities and funds for research and development. Let us hope that future German brainwaves will be directed into more peaceful channels than those described in this paper.

APPENDIX

Ingredients Used in German Peroxide Systems

Name	Composition	Sp. Gr.	Heat of Combustion
Oxylene Aurol T-Stoff Ingolin	80% H_2O_2 20% H_2O	1.340	996 Btu/Lb.
Helman	80% N_2H_4/H_2O 20% C_2H_5OH 0.6 gr/li $K_3(Cu(CN)_4)$	0.980	6220 Btu/Lb.

B-Stoff	100% $N_2H_4.H_2O$	1.032	5090 Btu/Lb.
M-Stoff	100% CH_3OH	0.796	9690 Btu/Lb.
Z-Stoff N	Na Mn O_4	Catalyst, solid or in 40% solution	
Z-Stoff C	$Ca(MnO_4)_2$		
Dekalin	$C_{10}H_{18}$	0.896	19650 Btu/Lb.

The EAST PINE BRIDGE

A paper specially prepared for The Engineering Journal

by

H. C. Anderson, M.E.I.C., *Chief Engineer*

and

G. M. Duncan, M.E.I.C., *Bridge Engineer*

Department of Public Works,
Province of British Columbia

After outlining the location of the new John Hart Highway from Prince George to Dawson Creek and progress thereon, the authors describe the site and the design of the East Pine Bridge near the Dawson Creek terminus. Construction of foundations and piers is discussed and methods of erecting the superstructure are given. The latter are of interest due to the remote location and the equipment used for erection.

For a number of years the people of British Columbia have sought access to the vast area of rich farm lands known as the Peace River Block, which, in addition to its farm land, has natural resources such as timber, coal and oil. A chance to realize this ambition has come about through the Province's postwar public construction programme, under which the new Prince George to Dawson Creek highway is being undertaken, now known as the John Hart Highway. It is on this road that the East Pine bridge is located.

The principal town in the Peace River Block of B.C. is Dawson Creek, which is the starting point of the 1,600 miles of Alaska Highway built by the United States Government through Canadian territory during the war. Heretofore connection between British Columbia and the Alaska Highway has been made via Edmonton and Grand Prairie in Alberta. At the southern end of the projected Hart Highway is the thriving northern British Columbia town of Prince George, a Canadian National Railway divisional point, situated at the junction of the Fraser and Nechako Rivers.

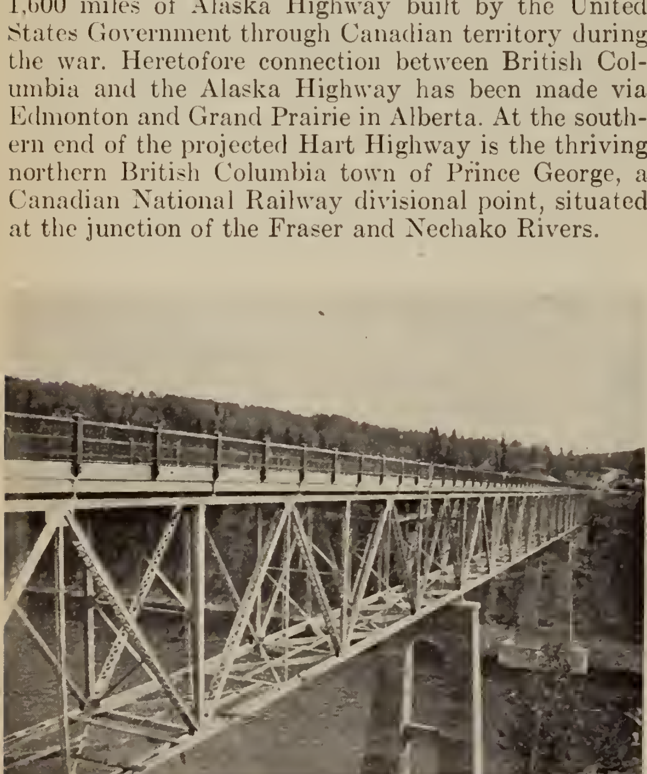

Fig. 1. View of completed bridge looking south, showing trusses, deck and railings.

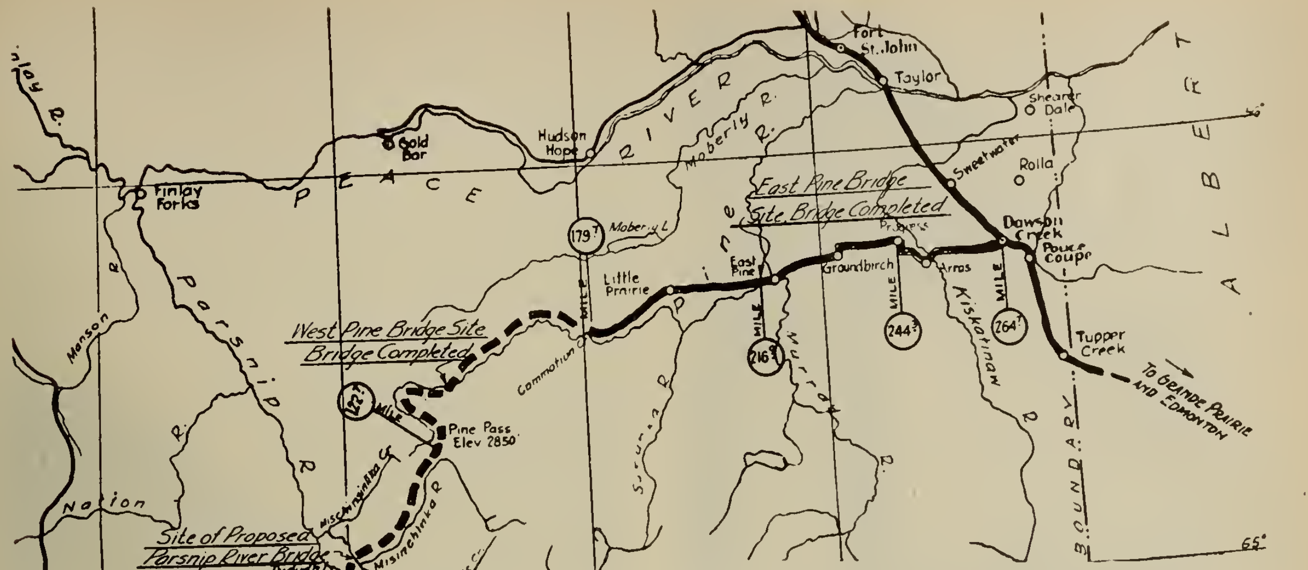
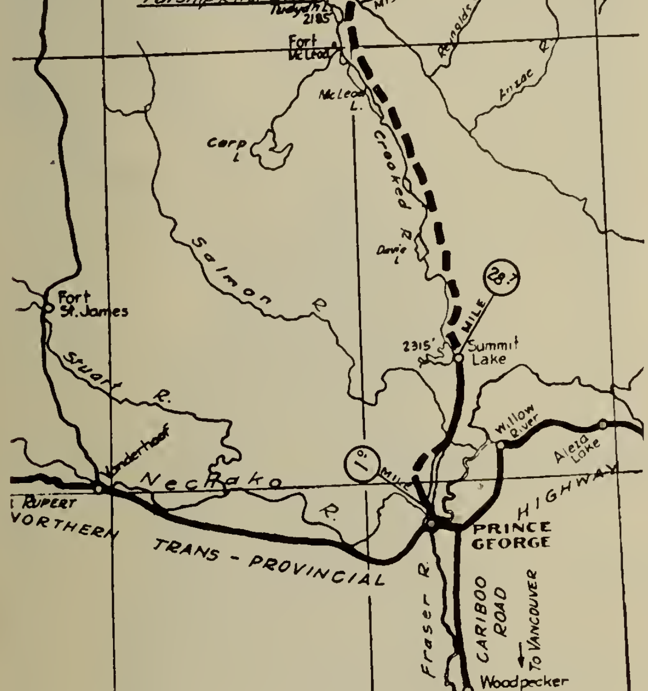
Prince George is also the northern terminus of the famous Cariboo Trail now known as " Highway 16 ", leading from Yale up the Fraser Canyon annd on through early pioneer settlements such as Lytton, Spences Bridge, Clinton and Quesnel, towns founded in the early gold placer and mining days of the 1860's. From Prince George one may now travel westward to Hazelton and on down the Skeena River to Prince Rupert; or one may travel eastward on the Northern Trans-Provincial Highway known as Highway 2, toward Jasper, a portion of which remains to be completed.

The John Hart Highway

The route of the Hart Highway, covering over 280 miles to Dawson Creek, travels north from Prince George, past Summit Lake and along the east bank of the Crooked River to a crossing of the Parsnip immediately below the junction of the Missinchinka, a tributary of the Parsnip. This crossing entails a large steel bridge, yet to be built. From the Parsnip Crossing the route swings north-east along the north bank of the Missinchinka to Pine Pass, the elevation of which is 2,850 feet. From here it follows the south bank of the Pine River to cross on a 120 ft. steel span now constructed at West Pine.





The road from here eastward has now been completed to modern standards, a distance of 50 miles to Commotion Creek, the scene of oil drilling operations some years ago. From Commotion Creek to East Pine the route has to be reconstructed.

At East Pine is a location which contains all the elements of an ideal bridge site. The new highway beyond East Pine is now finished to modern standards.

East Pine Bridge

The Pine River at East Pine is about 450 ft. wide with a shale rock bed, overlaid with a shallow depth of gravel and boulders. The banks are steep at this point and are of rock formation with alternate horizontal layers of shale and sandstone through which the river has croded to an average depth of about 120 feet below the adjacent benches at the bridge abutments.

To suit this crossing a three span continuous deck type Warren Truss with parallel upper and lower chords was chosen as being the most economical type to construct and maintain. The centre span, 280 feet in length, is flanked on either side by a 160 foot span, followed by a simple truss span of 50 feet, triangular in shape, making a symmetrical layout with a total length from north to south abutments of just over 700 feet.

The grade is level across the bridge, and is 102 feet above extreme flood level. The deck is of reinforced concrete construction, 18 feet wide from curb to curb, with crown at the centre of the roadway 1 in. above the gutters. The deck is supported on seven lines of 12 in. steel stringers, riveted to 18 in. floor beams at the panel points, which are 20 ft. apart. The bridge is designed for 15-ton trucks or a live load of U-80 according to C.E.S.A. specifications.

The extreme high water level is 13 feet above the average low water level. River velocities vary between 4 m.p.h. at low water and 10 m.p.h. at high water, with a depth of about 9 ft. at the deepest part of the channel near Pier 2 during the low water period. The river usually attains its maximum flow during May and June, receding gradually until about mid-October when ice conditions may be expected, with the river completely frozen over from November until about the end of March. The hydraulic gradient of the river at the crossing is a little over 1 in 1000 ft. Heretofore this crossing had been made with a reaction ferry, which was difficult to maintain by the Department throughout all seasons of the year.

The steel spans are supported on four reinforced concrete piers and two concrete abutments. The two end piers, each about fourteen feet in height, are founded well back in the solid rock banks of the river. The two main piers are of massive reinforced concrete construction, having shafts set on suitable cutwaters designed to withstand the severe ice shove.

Substructure Footings

Excavations for each main pier measured 60 feet long by 22 feet wide, and varied in depth from 10 to 12 feet. To prepare the foundations for the main piers. it was necessary to first divert the current somewhat toward the centre of the river with a loose rock and earth fill placed upstream, so that large timber cofferdams might be set in their proper position. After setting and filling the cofferdams, the next step was to make them watertight with wakefield pile sheathing

Fig. 2. Looking north from bed of river in August 1947, showing spans almost touching.

sealed at the bottom with cement placed by tremie. The cofferdams were then dewatered and kept dry with two 6 in. pumps and a 3 in. pump, while excavation of the rock bottom was carried out. A derrick and skips were used for handling the excavation.

About 500 yds. of shale was removed from each main pier footing. In this rock were found some fine specimens of fossilized leaves, with here and there traces of a narrow coal seam. Several test holes in each footing were then put down a further 20 ft., disclosing horizontal layers of solid shale rock throughout with no layers of clay or unstable material.

Forms for the footing slab were erected, surrounded by side ditches hewn in the rock to drain all water into each of the four sumps. Pouring of concrete was then commenced in horizontal layers using the cone bucket method, supplied by two half-yard mixers. The design mix for each footing was 3,000 p.s.i. concrete and all concrete was poured " in the dry ". Each of the large footings was of a lozenge shape with overall dimensions of 59 ft. by 20 ft. and approximately 10 ft. thick.

Piers

On top of each footing slab, a large number of hooked tie rod anchors were embedded in the concrete to a definite pattern, in order to fasten the large number of ½ in. steel tie rods used for the internal bracing of the cutwater forms, which were erected and poured in two lifts of 10 ft. in each case. The design mix for the cutwaters was a 4000 p.s.i. concrete to withstand severe ice conditions, also poured by the cone bucket method as chutes were found impracticable.

From the top of the cutwater to the top of each main pier, a height of seventy feet, the setting of forms and placing of concrete was accomplished by means of a derrick hoist and bucket, poured in about 10 ft. lifts and internally braced with tie rods. The pier shafts were reinforced with 28 1-inch vertical rods in each shaft and a suitable number of hoops and transverse horizontal rods at the arches. The shafts were of 3000

Fig. 3. View showing north approach span landing on Pier 3—July 1947. Photo by J. W. Copeman, resident engineer.

p.s.i. concrete while the top coping slab was finished off with a 4000 p.s.i. mix.

The substructure was built by the Northern Construction Company and J. W. Stewart Ltd. of Vancouver on a unit price basis. Quantities involved some 5,000 cu. yds. of rock for the bank piers and abutments; 3800 cu. yds. of concrete in the piers, abutments and deck. Some 25,000 bags of cement or 31 freight car loads were used, as well as 60 tons of reinforcing steel rods and bars.

Superstructure

The superstructure was fabricated and erected by the Dominion Bridge Co. of Vancouver on a unit price basis. The fabrication and erection of the steel, included delivery to the site which involved a 1,500 mile train haul from the Vancouver shops via Edmonton and the Northern Alberta Railway to railhead at Dawson Creek, and thence a road haul by truck of about 50 miles to the final destination at East Pine. Over 460 tons of structural steel were required for the superstructure.

Cantilever erection methods were followed throughout. Erection commenced on June 19, 1947, using a nominal 20-ton capacity truck crane with a 60 ft. boom for handling and erecting the steel. The 50 ft. end span was first erected and decked over with transverse timber planking and a longitudinal plank runway. The crane was then advanced to the first pier. Using the 50 ft. span securely fastened down at the abutment as an anchor arm, 80 ft. of the 160 ft. span was erected as a cantilever, the crane advancing on the timber deck as required. A temporary steel bent 80 ft. high consisting of chords, diagonals and bracing from the center span was then erected on concrete pedestals located half way between the bank pier and main pier. The cantilever arm was landed on it by slackening off on the tie-downs at the abutment. Erection then proceeded to the main pier and when the span was landed there the temporary bent was dismantled.

Erection of the 280 ft. span then continued until the cantilever arm extended 160 ft. from the pier, the 160 ft. side span acting as an anchor arm. Equipment was then transferred across the river by ferry and an identical procedure followed on the other side of the river. To close the main span, the shoreward ends of the 160 ft. spans were lowered to temporary shoes, for a distance sufficient to raise the centre span up to its dead load camber position, and to cause openings between the closing chords of $\frac{5}{8}$ in. on the bottom chord and $1\frac{3}{8}$ in. on the top chord. Closure was made by pulling one half of the bridge forward on its roller bearings to close the bottom chord, and jacking the shore ends of the 160 ft. spans to close the top chord. The shore ends were then jacked up further to set the permanent shoes and induce the requisite stresses in the trusses.

Painting

It was decided to use aluminum paint not only as a preservative and for appearances sake, but also for the purpose of minimizing the effect of expansion and contraction which in this northern area is considerable due to the wide variation in seasonal temperatures. Accordingly all the steelwork received two spray coats of aluminum paint in addition to the usual shop coat of red lead. The steel fences, however, were painted a jade green colour.

Closing operations were completed on August 14, 1947. The spans, which had only been pinned and bolted during erection, were then riveted. Pouring of the concrete deck started before riveting was finished, and was completed by September 20. The bridge was opened for traffic on October 4, 1947. The total cost of the project was in the neighbourhood of $400,000.

From Month To Month

News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

Importation of Engineering Plans

The evidence in favour of restoring the protective tariff on engineers' drawings coming into Canada is growing into a substantial volume. The personal experience of several Canadian consulting engineers shows clearly that the removal of the tariff has encouraged many American industrial firms with plants in Canada to turn over to American engineers the designing of the plant extensions in this country.

This has resulted in loss of business to Canadian engineers and to Canadian industry and also a loss of American dollars in very substantial amounts. Canadian industry stands to lose hundreds of thousands of dollars of business in a number of instances because American engineers naturally enough specify American equipment with which they are familiar.

A specific case was brought to this writer's attention wherein a Canadian engineer examined plans and specifications for a large plant in which over a hundred thousand dollars worth of mechanical equipment of American manufacture was specified by the American engineers. The owners were of the opinion that Canadian manufacturers could not build it, but a study of the project revealed that 98 per cent of the total value could be made readily in Canada. Had these plans been made in Canada such a mistake would not have occurred.

The Institute's officers, in close association with the Corporation of Professional Engineers of Quebec, have been active in following this matter at Ottawa. It is apparent that support for the regulation in its present form is not lacking, but there is some encouragement to believe that relief may be obtained shortly.

One cannot but observe that the industries in Canada which requested and obtained the removal of the tariff, are the same ones that demand a high tariff to protect their own products.

Cry "Culture"

It has become a popular pastime on the part of many people to decry technical education because it was said to lack adequate instruction in the so-called cultural subjects or the humanities. It was said that the engineer was not an educated person. In the beginning these comments seemed to come from persons who were trained in the non-technical fields, but later even engineers joined in the cry.

Fortunately there has developed at last a resistance to these charges. Strong leaders in the profession and in educational fields have taken the "culturists'" arguments to pieces and exposed them in all their emptiness. It has not been difficult to do. However, it may be that the exposé has not caught up to the charges, as is so frequently the case, under which circumstances the *Journal* feels it has a duty to perform.

Leaders in the cry against technical education have overlooked, or failed to appreciate, three things:

(1) Cultural values are not restricted to literature, history and economics. There are great values of equal cultural significance in mathematics and science.

(2) Engineering courses are now so crowded that to add the many "cultural" subjects recommended, it would become necessary to drop some of the present subjects. Nobody has offered a wholly satisfactory proposal for doing this in a four year course, although many attempts have been made.

(3) Culture is not something you can inject into a man's life at any time, like adding salt to porridge. It is something with which he must grow up. If he does not get it at home, and in his early schooling, he will not absorb it in adulthood. One is not likely to suddenly acquire a taste for literature, just because he is exposed to a few hours of instruction during his college years.

Many of the utterances on what constitutes culture are not reasonable. Usually they are wide sweeping statements, which upon analysis prove to be impossible of accomplishment by anyone. This weakness is treated excellently by A. M. Buchan, a teacher of literature at Washington University, in an article appearing in the January issue of the *Journal of Engineering Education* under the title "What is this 'Culture'"? Prof. Buchan quotes from a frequently referred to article written by an executive of a large electrical company—

> No matter how fine a man's technical qualifications may be, in order to take an important

place in industry today he must know people as he never knew them before. He must be able to differentiate between the good and the bad, the true and the false, the worthwhile and the unimportant. He must study and know the reactions of people just as he studies and knows the reactions of material things.

Prof. Buchan then goes on to point out how important are these proposals. He says—

> In another sense, however, these sentences from the article are quite frightening. For they imply that it is possible to know the reactions of people as one knows the reactions of material things. They suggest that a man behind a desk in an office can tell whether another man, sitting before him being interviewed, is good or bad, true or false, worth something or worthless. They imply that a competent executive is able to size up a human situation and not only understand it fully but feel confident enough to say, " I'm sorry, I can't hire you. You're no good!"

Referring generally to statements of how the engineer should be " culturized ", Prof. Buchan says—

> With all respect for these excellent reports and for the many favourable comments on them, I'd like to suggest that the aims are set far too high. What they demand is not a kind of education for engineering students or a form of culture for engineers themselves, but a form of salvation. If these exalted aims are to be retained, the question before us must be stated in different words. It should not be " What is this culture that engineers should cultivate?" but rather " What must the engineer do to be saved?" These aims can scarcely be presented as realizable in terms of fallible human beings, crowded curricula and quite imperfect teachers of the humanities which, presumably, will be the scriptures of this gospel; they seem to consider the process of education as Bunyan considered the progress of Christian—a pilgrimage from a city of destruction to a celestial city. And no education, certainly not the literary kind with which I am reasonably familiar, is able to bear such a responsibility.
>
> Let us look at one or two of these stated objectives and see how even the best forms of training fall short.
>
> One excellent goal proposed is " development of the ability to read, write and speak the English language effectively." This has been, as you know, a goal of English departments from the old days of training in rhetoric to our up-to-date practices—not noticeably an improvement—of theme-writing and training in speech, and yet with all of our experimentation we lag far behind the goal set. Businessmen still complain bitterly about the illiteracy of our students, and neither our talk nor our platform speaking does much credit to teachers of speech and composition. It may be that this ideal of an " effective " use of the language, in speech and writing, has been fostered in the tradition of the great writers and the great orators, and that, trying to do too much, trying to make artists of language out of people who will never need more than a craftsmanlike handling of their tongue, we miss the near goal of literacy in seeking the far one of mastery.

Referring to the value of literature in an engineering curriculum Prof. Buchan has this to say—

> The study of literature, too, is unlike many other studies. One does not acquire a knowledge of literature as one absorbs by persistent effort the facts of history, let us say, or the formulæ of chemistry. One grows up with books, as one grows into friendship; and so to grow into a subject generally takes more time than administrative officials are willing to dole out. . .
>
> Another point must also be made. Although as a lover of literature I hate to make the confession, the influence of great literature is not, as has been commonly assumed, either certain or universal.
>
> For anybody, therefore, who likes to live with certainties and who wants his culture with the union label attached, literature offers little. It offers fear and humility rather than arrogance and display.

Such utterances from a teacher of English will bring comfort to the engineer, and we hope, misgivings to those who without adequate knowledge and study have joined the procession of critics, some of whom have gone so far as to say that the engineer is—

> " a greasy illiterate individual who sure can use a monkey wrench and a slide rule but who is naught but an embarrassment and a liability in polite society ".

A Milestone in Engineering Education

On April 15-18th at the Windsor Hotel in Montreal, there took place an event of particular significance to the profession of engineering in Canada. The oldest school of engineering celebrated its seventy-fifth birthday.

The Ecole Polytechnique, which is the Faculty of Engineering and Applied Science of the University of Montreal, was established in 1873. From a small component of the Plateau Academy in Montreal, it has grown to a large modern unit of 75,000 sq. ft. in the heart of French speaking Montreal. At the present time, the staff numbers about sixty professors instructing a student body of four hundred and fifty of whom seventy are in this year's graduating class. Dr. Augustin Frigon, M.E.I.C., General Manager of the Canadian Broadcasting Corporation is President of the " Corporation de l'Ecole Polytechnique " and Ignace Brouillet, M.E.I.C., is the Dean of Studies.

Throughout the year, the occasion will be celebrated by a variety of activities for the public and the profession. The main events took place at the Windsor Hotel in April where the graduates, the engineering profession, government officials and industry representatives discussed the role and future of Polytechnique and the profession. Among the prominent engineers who participated were J. N. Langelier, M.E.I.C., president of the Graduates Society, Dr. Arthur Surveyer, M.E.I.C. and Dr. deGaspe Beaubien, M.E.I.C., of Montreal, Dr. C. R.

Young, M.E.I.C., Dean of Engineering, University of Toronto, Lieut. Col. L. F. Grant, M.E.I.C., president of The Engineering Institute of Canada, Hector Cimon, M.E.I.C., secretary, Price Bros. & Co. Ltd., Quebec City, C. C. Lindsay, M.E.I.C., consulting engineer and land surveyor, M. D. Barclay Inc., Montreal, and many others.

The warmest congratulations were forthcoming and President Grant conveyed the Institute's felicitations with the presentation of the following congratulatory message:

To Ecole Polytechnique on the occasion of its Seventy-fifth Anniversary, The Engineering Institute of Canada is happy to join with a multitude of others in the celebration of this notable occasion.

On behalf of our council and members we offer congratulations on attaining this distinguished anniversary, and on the outstanding work accomplished in those years. A pioneer in engineering education in this country, Ecole Polytechnique has made great contributions to the profession and to Canada. May its record of success continue and may The Engineering Institute of Canada be privileged to continue its association with it in its broad endeavours.

Collective Bargaining Legislation

The much debated subject of permanent legislation for collective bargaining is showing signs of life again, " back-stage " at Ottawa. It may be that it will be before the House by the time these notes appear.

A Bill similar to No. 338, which was presented last year by the Minister of Labour, is being groomed for presentation at this Sessions. This Bill will apply only to federal activities but it is hoped it will be adopted by the provinces for local application.

At the March meeting of the Council of the Institute the Committee on Employment Conditions recommended that further representation be made to the Minister on behalf of the members of the Institute. A resolution was unanimously approved and transmitted to Mr. Mitchell with the following letter:

February 21, 1948

Hon. Humphrey Mitchell,
Minister of Labour,
Ottawa, Canada

Re: Labour Relations Bill

Dear Mr. Mitchell:

The Council of The Engineering Institute of Canada at council meeting held in Montreal on Saturday, February 21st considered at some length the proposal of a revised or new Bill to provide " for the investigation, conciliation and settlement of industrial disputes ". The Institute's interest in the proposal comes from the evident intention to include professional engineers in the field covered by the legislation. The Institute's membership of over 9,000 is the largest group in Canada to be affected by such a proposal.

In 1944 the Institute conducted a survey of its membership to determine their wishes with regard to collective bargaining. The result showed clearly that the majority did not want to be included in such legislation unless the profession were permitted to control their own bargaining by means of a separate Bill.

Order-in-Council 1003 provided no such privilege, nor does the Bill No. 338 presented last year to replace 1003, make any such provision. Therefore we urge that professional engineers be included in the list of exemptions in the definition of " employee " contained in clause (i), (ii).

In the following resolution passed unanimously on February 21st, the Council of the Institute reaffirms its stand on collective bargaining for engineers—

> THAT in view of the inability of the engineering profession to obtain a specific act for engineers, the Minister of Labour be urged to exclude professional engineers from the group of workers embraced by collective bargaining legislation to be enacted by the Federal Government.

Yours sincerely,

(Signed) L. Austin Wright,
General Secretary

The officers of the Institute have been given encouragement to believe that the exemption will be granted.

Back to Fundamentals in Engineering Education

" The trend today in engineering education is away from undergraduate specialization. This is in spite of the wide current phase of highly detailed diversification, which has expressed itself in a score or more of different engineering curricula accredited by the Engineers' Council for Professional Development. Three quarters of the supply of future engineering graduates will engage in non-technical positions in industry and commerce. As modern engineering practice comes to make more and more use of mathematics, so must the engineering schools lay more and more stress on fundamentals, training our young men for adaptability rather than for informed skilfulness ".

This was the important message given by an eminent leader in education, Dr. Harvey Nathaniel Davis, President of the Stevens Institute of Technology at Hoboken, N.J., in a recent outstanding address before the Faculty of Applied Science of the University of Toronto. The occasion was the presentation of the " First Wallberg Lecture ", inaugurating a series of continuing lectures for the advancement of engineering educational work, as provided in bequests of the late Emil Andrew Wallberg, prominent Canadian engineer of Swedish birth, and bearing his name.

Dr. Davis, who is a shrewd observer, is a graduate of Brown and Harvard. He served the latter for twenty-four years, nine of them as professor of mechanical engineering. Since 1928 he has been president of Stevens. Serving with distinction during the recent war as director of the Office of Production Research of the War Production Board at Washington, he is an honorary member of the Institution of the Mechanical Engineers of Great Britain and honorary member and past president of the American Society of Mechanical Engineers.

More and more, he thinks, must we stress these fundamentals in the more elementary parts of our engineering education, even if, to make room for them, we have to crowd out much of that description of current procedures and practices, of currently used machines or processes, that is so easy to give and so entertaining to listen to. Men so trained have the advantage of knowing, when they graduate, that they don't know much of anything of a practical sort, and are thereby inspired to strive with particular assiduity to learn all they can while they work in whatever field their lot proves to lie.

The engineer's most important task is to keep modern civilization running. He is responsible for the operation and maintenance of the whole material basis of modern living. Equally obvious is his role in *improving* the material basis of civilized living. To the engineer we also owe much of the invention, and practically all of the development, of the machines and other gadgets that make modern living what it is.

Pointing out that the popularity of engineering education today in the United States is providing an abundance of engineering graduates, Dr. Davis expresses the opinion that four graduates per hundred thousand of population will adequately supply the needs of the strictly technical phases of the engineering profession. This applies to Britain and Canada as well. The rest of them he believes, are becoming employed in industry. This is where they are needed, as production men, in personnel service, in time study, in management-employee relations, or as sales or service engineers. The indicated ratio of needs is one technical person to four or five engineers in industry.

The target in engineering education he thinks, should be to graduate yearly twenty or perhaps even thirty cadet engineers per hundred thousand of population, even after the post war bulge has subsided. Perhaps four will be engineers of the traditional type, most of them will be industrial men. If this be so, then, he believes, many subjects such as economics, sociology and the humanities deserve far more attention than are currently given in curricula.

All this is possible only if we are willing to give up the idea of offering much technical specialization in a four-year undergraduate engineering curriculum. This is why many educators believe that specialization should be left for post-graduate work, or for self-education on the job, and that in our undergraduate schools we should stress only the fundamentals, and strive mightily to inculcate self-reliance and adaptability rather than mere technical competence. In other words, they believe that an engineering school can provide the best possible sort of liberal education for life in this twentieth century for an increasingly numerous group of young men who are fitted by temperament, inclination, and early training to take it.

This lecture expresses a thought-provoking point of view, of interest alike to educators, members of the profession and engineering graduates. The foregoing only touches the highlights. The lecture itself is, to use the words of Dean Young of Toronto University, " the best thing that has been said on engineering education for many a day ". Single copies of the full text may be obtained, without charge, on application to the Secretary of the Faculty of Applied Science and Engineering, University of Toronto. Multiple copies will be furnished at cost.

The First Fifty Years

In a country as young as Canada, the completion of 50 years of continuous service is a genuine accomplishment. In April, The Canadian Institute of Mining and Metallurgy joined the small group

R. W. Diamond, president of C.I.M.M.

of those societies that have already attained this enviable record—and, by their presence, will add distinction to the company.

At the February meeting of Council it was the unanimous opinion that the C.I.M.M. should be congratulated. The following message was therefore presented by Vice-President S. G. Coultis to the Jubilee meeting of the C.I.M.M. in Vancouver:

> On the occasion of the semi-centennial celebration of the Canadian Institute of Mining and Metallurgy, the engineering profession throughout Canada will extend greetings and offer congratulations. The Engineering Institute of Canada joins in this tribute to an organization which is foremost in furthering the progress of the profession of mining engineering and the mining industry itself. It is hoped that the past 50 years of accomplishment are but a prologue to greater things and that, in the future these two societies may continue their work together in the interests of engineering and of Canada.

The Jubilee celebrations were marked by a programme of technical and social events at the Hotels Vancouver and Georgia which exceeded the most enthusiastic expectations of its planners and concluded with a trip through the Gulf of Georgia and to British Columbia's principal mining camps. Several of the papers presented at the meeting were published in the March issue of *The Canadian Mining and Metallurgical Bulletin* which was the Jubilee Meeting Number of that publication. In this issue also, commencing on page 119, is a history, admirably written by M. W. Goodwin. of the Mining Institute's fifty years of growth and accomplishment.

Bureau of Technical Personnel

Supply and Demand for New Graduates

The Bureau's 4th Quarterly Report of 1947 disclosed that the year 1947 was one in which graduating classes in engineering were small, at the same time it was a year of greatest demand to date by employers. Early reports from a Department of Labour survey of possible demand for university students for 1948 are encouraging; the survey shows that students employed during vacation last year are being widely re-engaged and in many cases with promise of permanent employment. Further studies on the supply side now indicate about 12,000 graduates for the 5 year period 1947-51 as against a previous estimate of some 12,900.

Architects Employ Students

In Architecture, a sampling survey indicates that a majority of professional architects will employ under - graduates in the coming vacation period, with consideration being given for permanent employment, while at least 200 out of the 500 graduates expected for the 5 year period can be absorbed by employers other than practicing architects. In 1946 it was found that 40 per cent of architects then registered with the Bureau were 56 years of age or over. By 1950 when the first large new class will graduate, this 40 per cent will be 60 years of age or over.

Veteran Enrolment Low

Veterans' enrolment in Commerce courses has been about 40 per cent of enrolments in engineering courses, instead of showing the largest course enrolment as expected. This proportion applies also on current enrolment of non-veteran students. The major outlet for students from this course is accountancy. The second most important outlet is in financial institutions, viz. banks, insurance and trust companies, and investment dealers. The third largest outlet is in large scale manufacturing and merchandising. A small number will also enter the teaching field. Employers are looking for graduates with a general type of education, who can adapt themselves to the particular business processes of their employers. This suggests that a substantial proportion of commerce graduates will be absorbed on the general grounds of useful training, rather than into any type of work specifically related to their courses. The demand for commerce students is substantial and there is a definite trend to a wider use of persons with university training.

Academic Training Important

Undoubtedly many opportunities to become established in a professional career depend definitely on the specific type of academic training that the student has undergone. Nevertheless, many graduates will become employed in places where their academic training is assessed on quite general lines. One consideration however applies to all graduates. A recent U.S. Study of Employer Practice regarding Engineering Graduates, (*Engineering Journal*, April 1947) listed 9 items considered when selecting an engineering employee. The order in which employers placed 8 of these, including scholastic record varied somewhat, but there was agreement throughout that "personality" should head the list.

Salaries of Technical Personnel

Available information on salaries of technical persons is constantly increasing, and it now seems opportune to review the whole question, setting out not only certain established trends in salaries, but also certain principles which govern the economic advancement of engineers and scientists.

Since 1941, the trend in starting salaries on graduation has been steadily upward. When the demands of war industries were just beginning to be felt, the average starting salary for new graduates was around \$125 and \$130 per month. From April 1942 to March 1945 inclusive, the average starting salary was \$160 per month. The graduating class of 1946 went to work at an average of just over \$175 per month and in 1947 at just a shade under \$200. From estimates now being received from employers covering needs for 1948, it seems the upward trend is still in effect.

Obviously the starting salaries for new graduates will always vary widely. Each specific opening has its own set of qualifying conditions. Yet a distribution curve indicating the spread of starting salaries maintains the same general characteristic form. Another significant trend is observed when new graduates' salaries are split up into engineering and non-engineering groups. The latter group embraces chemistry, physics, geology and agriculture. In the period 1942 to 1945, these non-engineering groups averaged \$150 per month against \$167 for the engineering groups. In 1946 figures were \$172 and \$178 respectively. In 1947 there was little if any difference.

At the top there is also evidence of a trend toward higher figures. In all types of financial matters, people are becoming accustomed to thinking in terms of amounts of money which only a few years ago were usually classified as "astronomical". This makes for less hesitancy when dealing with salaries.

Administrative Duties

Another change has been the increased extent to which engineers and scientists have been called upon to assume administrative duties. Rightly or wrongly, an engineer whose duties are predominately administrative will normally earn above the average for his age.

The number of technical persons in senior administrative positions in Canada whose salary is \$10,000 or more has now passed the 1,000 mark, the proportion being about one in thirty in some groups. It has been held that those whose duties are purely administrative should no longer be referred to as engineers or scientists, as they have ceased to perform professional work. In most such cases, however, it is hard to tell when engineering duties are completely abandoned.

Salaries of technical persons in 1941 were lower, on the average, than they were in 1931. The 1947 age-salary curve, like that for 1941, does not give a complete picture. Yet there has been no change in the overall salary pattern. Departures from average, both above and below, become more extensive as age increases.

Meeting of Council

Minutes of a meeting of the Council of the Institute held at Headquarters on Saturday, February 21, 1948, convening at nine thirty a.m.

Present

President L. F. Grant (Kingston) in the chair; Past-President deGaspe Beaubien (Montreal); Vice-Presidents R. S. Eadie (Montreal), G. F. Layne (Quebec), and W. R. Manock (Fort Erie); Councillors P. E. Buss (Thorold), J. R. Dunbar (Hamilton), J. H. Irvine (Ottawa), V. Jepson (Grand'-Mere), C. F. Morrison (Toronto), J. A. Beauchemin, K. G. Cameron, R. C. Flitton, C. E. Gelinas, C. A. Peachey, J. B. Stirling, of Montreal; Treasurer L. C. Jacobs (Montreal), G. A. Gaherty (Montreal), chairman of the Committee on Prairie Water Problems, G. N. Martin (Montreal), chairman of the Committee on Employment Conditions; General Secretary L. Austin Wright, and Assistant General Secretary W. D. Laird.

The president reported that since the January meeting in Toronto he had had the privilege of making a ten day trip to the west and had visited the four western universities. He had received a most enthusiastic reception. At the University of British Columbia there were over seven hundred students at the meeting and at the other universities the halls had been filled. He had found a keen interest in Institute affairs and the arrangements made by the local branches in conjunction with the universities had been excellent.

The minutes of the meeting held on January 24th, 1948, were taken as read and approved.

1948 Annual Meeting Programme

The general secretary outlined the details of the programme which have been determined up to the present time. He explained that the president's dinner would be on the evening of Monday, May 31st, and that the Council meeting would be held on the morning and afternoon of Tuesday, June 1st, followed by the annual meeting of the Institute in the evening of the same day. Professional sessions would be held all day Wednesday with entertainment in the evening. Professional sessions would be held all day Wednesday with entertainment in the evening. Professional sessions would also occupy the morning of Thursday, but the afternoon and evening were held free for relaxation. Professional sessions would take up the entire day, morning and afternoon, of Friday and would be followed by the annual banquet and dance in the evening.

Mr. Wright explained that provision was also being made for a meeting of the officers of branches similar to that which was held for the first time last year at Toronto and for a student conference. " Muriel's Room " would again be a feature.

The papers will include several phases of the prairie water problems involving irrigation, agriculture and power, as arranged by Mr. G. A. Gaherty, chairman of the Institute's committee (who was present at the Council meeting to supply details); a half day session on oil and gas, also rural electrification, community planning, management, and some one of the many interests of Consolidated Mining and Smelting Company Limited.

Arrangements were being made whereby special cars would be available from such centres as Toronto, Montreal and Vancouver, so that members could travel together. If enough cars were occupied it is possible that they might be made up into a special train. All this detailed information will be supplied to members from Headquarters just as soon as sufficient fixed detail is available.

Civil Service Commission Requirements

The general secretary reported that he had had a very satisfactory interview with Mr. George Jackson of the Civil Service Commission relative to the Commission using qualification for membership in the Institute as one of the conditions for engineering appointments in the Service. The Commission had not yet agreed to reinsert the Institute's qualifications in their list of conditions but it was still possible that some such basis may be agreed upon.

With regard to the specific instance of a member of the Institute wherein a hardship had been experienced, Mr. Jackson agreed that if the man's name and address were given to him he would endeavour to get the matter straightened out to everyone's satisfaction.

Budget Item 180e

The general secretary reported that he and Mr. Marc. Boyer, the registrar of the Corporation of Professional Engineers of Quebec, had gone to Ottawa to again urge upon the officials of the Department of Finance that the tariff on engineers' plans, which was removed in June 1946 by Item 180e, be restored.

New Awards to Undergraduates

A letter from Dr. Langley, chairman of the Committee on the Training and Welfare of the Young Engineer, was presented in which he outlined the basis for appraising, on a non-academic basis, the top ten per cent of the students in the third year to which he proposed the awards would be applicable. There was a very broad discussion and some concern was felt that even the revised method would produce a problem for the committee inasmuch as there are now approximately 3800 third year students enrolled in Canada.

Several variations of Dr. Langley's proposal were suggested and discussed but the majority seemed to agree with Professor Morrison's suggestion that nothing but the academic qualifications should be considered in making the awards. Professor Morrison felt that to go beyond this point would be to undertake an almost insurmountable task. Eventually, after further discussion between Messrs. Flitton, Dunbar, Beaubien, Eadie, Peachey and Cameron, the following resolution was made and approved unanimously: " It is resolved that the method of award be left to the committee but Council considers it essential that uniformity across Canada should be obtained and for this reason suggests that the chairman should consult with the deans of the various universities."

Mr. Eadie reported that following the instructions of Council, the Finance Committee had considered in some detail the matter of further awards to undergraduates. Following some discussion, on the motion of Mr. Eadie, seconded by Mr.

Dunbar, it was unanimously resolved that the general secretary be authorized to canvass all branches to secure complete information as to the prizes and awards now being offered by them to Students, Juniors and others, including information as to the source of the money used for such purposes.

Committee on Community Planning

The general secretary reminded Council that the report of the Committee on Community Planning had been presented at the January meeting in Toronto and further consideration had been postponed to this meeting so that all councillors would have an opportunity to familiarize themselves with it. The general secretary then read the two recommendations made by the committee and referred to two communications which had been received on the subject, one from Past-President Shearwood and one from Councillor V. A. McKillop.

The general secretary went on to explain that under instructions from the president he had called on two people in Ottawa who, it was thought, were in the best position to appraise the possibilities of the Institute being able to accomplish the two things recommended by the committee. Resolution number one deals with by-laws and taxation and recommends that the Institute endeavour to provide some leadership in these fields. Mr. Wright's informant stated that a committee to deal with a revised National Building Code was in the process of being formed and that the Institute would be asked to name a representative on it. Beyond this point Mr. Wright's consultant did not see that the Institute would be able to accomplish very much in the field which was described in the resolution.

Resolution number two deals with housing and recommends that the Institute set up a research committee to study the problem in various parts of Canada, dealing particularly with engineering methods whereby houses could be mass produced at low cost. Mr. Wright's consultant in this field stated that the National Research Council has already done a great deal of work on it. Several types of houses have been built and tested and the engineering features of mass production have been worked out in great detail in many different parts of the world.

Under these circumstances the consultant was of the opinion that the Institute would have little chance of accomplishing its objective due primarily to the lack of properly qualified personnel to do the work on a full time basis. He stated that if the Institute had any knowledge of such experienced personnel the National Research Council would be delighted to have the names forwarded to them as they were very short of such technical assistants.

The president referred back to the informal meeting which had followed the Community Planning Conference and expressed the opinion that the terms of reference developed at that meeting for the committee dealt simply with making up recommendations for Council as to ways and means by which the Institute could inform its members more widely on the subject of community planning and develop in them a greater interest in the subject. He was of the opinion that the report of the committee was outside their terms of reference but he did not think it should be turned down solely on that score. He thought consideration should be given to the two recommendations solely on their merits.

A very long and exhaustive discussion on the subject followed, and eventually a resolution was prepared and presented by Mr. Dunbar, seconded by Mr. Stirling, as follows: THAT in the opinion of Council the recommendations of the Committee on Community Planning can best be accomplished under the direction of the National Research Council and other already established agencies which have at their disposal the necessary facilities, and that the Institute co-operate fully with them in their activities in this matter, and that the committee be thanked for its report and at its own request be discharged. This was approved unanimously.

Committee on Employment Conditions

The general secretary reported that when in Ottawa he had discovered that the Labour Relations Bill was being readied for presentation shortly to Parliament. He communicated with certain Ministers in order to secure adequate information and in turn had been advised as to the policy to be followed by the Institute.

Mr. Martin, chairman of the Institute's Committee on Employment Conditions, reported that when Mr. Wright had returned from Ottawa his committee had met to discuss the situation in detail and had decided eventually to recommend to Council that a communication be sent to the Minister of Labour outlining the policy which the Institute had followed from the beginning with regard to collective bargaining and stating that it desired to follow this policy through to the end. Mr. Martin pointed out that on the Institute's questionnaire, the great majority had voted in favour of collective bargaining providing it could be controlled by the engineers through a separate bill, but that, failing this, the majority asked for total exclusion from the legislation.

Mr. Martin pointed out that as Order in Council 1003 and Bill No. 338, which was presented last year, contained no provision for the profession controlling its own collective bargaining, it was apparent that the profession was not to be given the authority for which it had asked and therefore the committee recommended that Council ask the Minister for exclusion from the new bill.

The matter was discussed at considerable length, and eventually it was agreed to approve of the following resolution: THAT in view of the inability of the engineering profession to obtain a specific act for engineers, the Minister of Labour be urged to exclude professional engineers from the group of workers embraced by collective bargaining legislation to be enacted by the Federal Government.

Annual Meeting 1949

The general secretary read a letter from the Quebec Branch inviting the Council to hold the 1949 annual meeting in Quebec City. This had been presented to the last meeting and a decision had been postponed until some consideration could be given to the matter. Following some discussion, particularly as to the date of the meeting on which no definite decision was reached, on the motion of Mr. Flitton, seconded by Mr. Beaubien, it was unanimously resolved that the invitation of the Quebec Branch to hold the 1949 annual meeting in Quebec City be accepted.

ASME Applied Mechanics Reviews

On the motion of Mr. Manock, seconded by Mr. Buss, it was unanimously resolved that Dr. J. J. Green, M.E.I.C., of Ottawa, be appointed as the Institute's representative on the Advisory Board of the ASME Applied Mechanics Reviews. Dr. Green has expressed his willingness to accept this appointment.

RCE Proposed Book of Remembrance

The general secretary explained that this subject had been introduced first at the January Council meeting in Toronto and after some consideration had been put forward for further consideration at this meeting. He explained further that Major-General Guy Turner had written to Mr. Stirling to inquire if the Institute would be interested in sharing in the cost of a Book of Remembrance which it was proposed that the Royal Canadian Engineers would prepare in memory of the members of that service who had lost their lives in the late war. Mr. Stirling had discussed the matter in detail with Mr. Wright and eventually decided that it should be brought before Council for consideration and decision.

The president thought Council should reach a decision which Mr. Stirling could forward to General Turner. He personally would favour the Institute supporting such a project but he thought Council's first duty was to prepare a memorial to our own members. He inquired as to whether or not Council would like a committee set up to give consideration to the Institute memorial and to a policy which might be adopted towards the proposed Book of Remembrance.

The discussion which followed brought out the point that the first duty of the Institute was to provide a memorial for its own members and it was left with Mr. Stirling to inform General Turner of the situation in which the Institute found itself and of its inability to participate in the fund for the Book of Remembrance.

In conclusion, the president suggested that if councillors thought some definite action should be taken now on an Institute memorial they should communicate with the general secretary asking him to put the subject on the agenda for a later meeting.

International Electrotechnical Commission

On the motion of Mr. Beaubien, seconded by Mr. Dunbar, it was unanimously resolved, that, subject to his acceptance, Professor C. V. Christie, of McGill University, be appointed as the Institute's representative on the Canadian National Committee of the Electrotechnical Commission. (Professor Christie has since indicated his willingness to accept this appointment.)

Financial Statement

It was noted that the financial statement to the end of January had been examined and approved.

Students and Juniors Prizes

The recommendations presented by the chairmen of the examiners for the Phelps Johnson Prize and the Ernest Marceau Prize for the year 1947, were unanimously approved as follows:

Phelps Johnson Prize (Province of Quebec—English) to—R. B. Todd, S.E.I.C., for his paper " The Manufacture of .22 Calibre Long Rifle Cartridge ".

Ernest Marceau Prize (Province of Quebec—French) to—R. Riopelle, S.E.I.C., for his paper " Etude, Plans et Devis d'un Generateur de Haute Frequence pour le prechauffage dielectrique d'une poudre a mouler thermostable ".

Engineering Journal

The president explained that he had asked Mr. E. J. Blandford, publication manager of the *Journal*, to report on the advertising situation of that publication. Mr. Blandford gave a general outline of his experiences with the various advertisers and advertising agents and stated that he had found the *Journal* to be very highly regarded by them all. The Institute's decision to handle the advertising through one person alone rather than through a general agency handling several other publications, had been generally approved.

He stated that no unsurmountable difficulties had been met because of the recent increase in advertising rates. Advertisers were impressed with the fact that even at the higher rate the *Journal* still represented the lowest cost per page per reader of any comparable publication in Canada. Mr Blandford was very hopeful that before the end of the year the volume would be increased sufficiently that a substantial net revenue would accrue to the Institute.

International Meeting of Engineering Societies

The general secretary presented a letter signed by the president of the three British Institutions of Civil, Mechanical and Electrical Engineers in which an outline was given for the proposal to hold an international meeting in London in October 1948.

The letter suggested that invitations be sent to societies in Belgium, Denmark, France, Holland, Norway, Sweden, Switzerland, and the United States. It was recommended that the three institutions in England carry the representation for the Commonwealth, otherwise there would be a preponderance of British societies which would overbalance the meeting.

The purpose of the meeting was described as the promotion of international collaboration between engineering societies. The letter asked the Institute if we were agreeable to the proposal and to the Commonwealth representation being limited to the three British Institutions.

After a short discussion it was agreed to approve the proposal, stipulating, however, that the Institute would not be bound by any decisions unless it had an opportunity to discuss them beforehand.

Montreal Branch Facilities

The general secretary reported that the chairman and other officers of the Montreal Branch had called on him on February 19th in order to secure certain information of special interest to the Montreal Branch.

The delegation asked, primarily, the following two questions: (1) Are there any early prospects of branch facilities at Headquarters being improved? (2) As the branch now finds the Headquarters auditorium too small for some of its meetings, is Council prepared to reimburse them for the expense of securing auditorium space elsewhere for approximately three meetings a year?

Mr. Flitton, as chairman of the House Committee, stated he had hoped to meet with the officers of the branch to discuss Headquarters facilities. He commented on the questionnaire which the branch had circulated to the members inquiring as to their wishes with regard to additional accommodation. He spoke of the estimated cost of a new building which had been prepared by his committee, stating that the figure had been prepared for submission to the Finance Committee.

Mr. Eadie stated that the Finance Committee had taken no further action because of the amount of $450,000 was entirely outside the capacity of the Institute to handle. Eventually, after some further discussion, it was agreed that Council should appoint a committee to meet with the officers of the branch. Accordingly, it was moved, seconded and approved unanimously that the Montreal councillors who were past chairmen of the Montreal Branch, together with Mr. Flitton, as chairman of the House Committee, should constitute Council's committee, under the chairmanship of Vice-President Eadie.

Council Agenda

The president reported that while in the west he had received inquiries as to whether or not it would be possible to send out an agenda to councillors in advance of the Council meetings. The general secretary explained that while it would be possible to issue a list of the principal items, it would be difficult to circulate a complete agenda in advance as many important items come up during the last few days before a meeting. It was agreed to include something along that line with the notices of Council meetings.

It was decided that the next meeting of Council would be held in Montreal on Saturday, March 13th, 1948, this early date being necessary because the annual meeting of the Corporation of Professional Engineers of Quebec is being held on March 20th, and Easter Saturday falls on March 27th.

The Council rose at four o'clock p.m.

L. Austin Wright,
General Secretary.

Elections and Transfers

At the meeting of Council held on March 13, 1948, the following elections and transfers were effected:

Admitted as Students

Davies, Llewelyn Bennett, B.A.Sc., (Elect.), B.C., asst. engr., Bell Telephone Co. of Canada, Montreal, Que.

McConnell, Paul Goodwin, B.Sc., (Elect.), Alberta, test course, Canadian General Electric, Peterborough, Ont.

Sadler, Gerald Wesley, B.Sc., (Mech.), Sask., Univ. of Alberta, Edmonton, Alta.

Strickland, Lloyd Boyce, B.Eng., (Elect.), N.S.T.C., test course, Canadian General Electric, Peterborough, Ont.

Students at University of Manitoba

E. K. Christian	M. G. Kunec
E. M. Clark	D. Liberson
D. G. Curiston	L. W. Locke
L. L. Dixon	R. F. MacMillan
K. R. Ebbern	H. G. Mitchell
L. J. Eibner	F. H. Pascoe
Z. M. Ferley	R. J. Pope
A. Ficks	R. F. D. Rice
L. J. Foord	W. L. Saunders
E. H. Hawley	A. T. Sherrett
H. R. Hayman	J. E. Staples
W. C. Heaney	J. M. Sterling
R. W. Hutchinson	W. N. Tivy
C. K. Johnson	C. Tooth
S. T. Johnson	

Students at University of Saskatchewan

K. W. Allcock	M. F. Pardoe
D. J. Anderson	E. Rapp
J. Belzile	W. E. Rubashewsky
G. A. Bernard	O. A. Timm
O. D. Bobyn	W. R. Tinkess
M. E. Erfle	J. D. Turner
E. Lee	

Students at University of Alberta

G. A. Davis	J. R. McEwen
J. S. Harris	T. G. Tustin
A. Garfin	R. A. Underhill
D. I. Hougan	A. R. Walker
A. J. Mair	

Students at University of British Columbia

M. J. J. Dayton	D. H. Jamieson
A. T. Holmes	N. A. Macdougall
J. Lee	J. W. McPhail
R. Linden	

Students at University of Toronto

G. H. Bagshaw	J. S. Mutchmor
G. K. Hopper	C. J. Radford
G. I. Legate	G. S. Warner

Students at Queens University

H. L. Armstrong	B. Miner
C. R. Baker	R. W. Steward
R. P. Blake	A. E. Toole
G. K. Escott	J. A. Walsworth
W. F. Houghton	R. F. Wheelan
J. D. McIlveen	

Students at McGill University

F. B. Agnew	R. M. Johnson

K. I. Fletcher	W. E. Matthews
G. R. C. Fownes	C. A. Northrup
J. W. F. Graham	R. G. Scott
B. B. Hanson	L. A. Wade
E. C. Inch	A. D. Washburn

Students at Nova Scotia Technical College

R. A. Bradley	A. Macdonald
A. J. Callaghan	O. T. McCarthy
W. P. Kerr	W. J. Myatt

Student at Dalhousie University

H. M. Anderson

Student at Carleton College

B. H. Newington

Student at Ottawa University

J. C. Besserer

By virtue of the cooperative agreements between the Institute and the associations of professional engineers, the following elections and transfers have become effective.

Alberta

Member

Young, Roy Effinger, equipt. engr., Alberta Government Telephones, Edmonton, Alta.

Junior to Member

McManus, Leslie Harold, B.Sc., (Civil), Alberta, testing engr., Dept. of Public Works, Alberta, Edmonton, Alta.

Treleaven, Leonard James, B. Eng., (Agri.), Sask., asst. engr., constrn. dept., Alberta Wheat Pool, Calgary, Alta.

Saskatchewan

Junior

Sharpe, William Lloyd, B.Eng., (Civil), Sask., instru'man., Dept. of Highways, Regina, Sask.

Students at University of Saskatchewan

W. H. Abel	C. E. Nickel
K. M. Bayne	W. E. O'Brien
G. H. Bradley	P. J. Olynyk
G. R. Campbell	R. H. Persson
R. F. Comstock	N. Peters
R. P. Dohan	A. B. Platt
J. W. A. Donald	L. T. Raham
L. S. R. Eley	R. J. Riecken
A. Friesen	B. F. Riemer
C. Goodrich	A. S. Ringheim
C. D. Gould	L. H. Ritenburg
I. W. Hamm	S. A. Rokosh
R. J. Hood	J. E. D. Salloum
N. J. Howes	M. D. Smith
G. T. Keith	R. C. Strayer
A. J. Macgillivray	A. H. Sunley
M. D. Mackenzie	I. W. Tweddell
S. D. MacKinnon	G. G. Wellington
B. I. Maduke	G. L. Williamson
G. H. Nagel	D. E. Woodbury

Junior to Member

McLeod, George Carrol, B.Sc., (Civil), Sask., field engr., C. D. Howe Co., Ltd. (home: Saskatoon, Sask.)

Wiles, Alfred Payne, B.Sc., (Engrg. Physics), Sask., lab. instructor, Physics Dept., Univ. of Sask., Saskatoon, Sask.

(Continued foot of page 239)

Personals

Notes of the Personal Activities of Members of the Institute

Dr. C. J. Mackenzie, M.E.I.C., president of the National Research Council, has been appointed chairman of the Canadian Atomic Energy Control Board, succeeding Gen. A. G. L. McNaughton, M.E.I.C. Dr. Mackenzie will continue as head of the Research Council.

J. B. Stirling, M.E.I.C., has been elected president of the Corporation of Professional Engineers of Quebec for the year 1948. He is vice-president of E. G. M. Cape & Co., Montreal, engineering contractors.

Mr. Stirling is a graduate of Queen's University, class of 1911, who worked first on municipal construction projects. After service overseas with the R.C.E. in World War I, Mr. Stirling joined E. G. M. Cape in 1915. He was a field engineer, and later a supervising engineer on construction projects throughout Canada. He became a partner in the firm in 1928 and its vice-president in 1940.

A councillor of the Institute, Mr. Stirling has been chairman of the Committee on Professional Interests since 1944.

J. A. Lalonde, M.E.I.C., Montreal consulting engineer, is vice-president of the Corporation. Mr. Lalonde is a past-councillor and past-treasurer of the Institute, and a past-chairman of the Montreal Branch.

Secretary-treasurer of the Corporation is **L. W. Bladon.** Councillors are **J. A. H. Henderson,** M.E.I.C., and **F. S. Howes,** Montreal; **Leo Dufresne** and **Adrien Pouliot,** M.E.I.C., and **Gerard Letendre,** of Quebec.

J. A. Russell, M.E.I.C., who has been elected president of the Association of Professional Engineers of Nova Scotia for 1947, was councillor of the Institute for the Cape Breton Branch in 1944. He is chief mechanical engineer of Dominion Coal Company Limited, Sydney, N.S.

He came from Birmingham, England, to Canada in 1929 after a number of years employment as a designer on mining machinery and an apprenticeship with a firm of mining machinery manufacturers. He joined Dominion Coal Company as a draughtsman, and the following year was appointed to his present position.

Ernest Mason, M.E.I.C., chief designing engineer of Consolidated Mining and Smelting Company, Trail, B.C., is chairman of the Kootenay Branch of the Institute for the year 1948.

He was born at Bolton, Lancashire, England, and studied at Bolton Technical School and at Manchester College of Technology. He worked first in Canada in 1913-15 as a machinist with B. Greening Wire Company, Hamilton, Ont., and was with Homer and Wilson, Hamilton, in 1916. The next year he returned to England and was a tool designer for Rolls Royce Company for a time before joining Dobson and Barlow, at Bolton, as machine designer. He held positions with Hans Renold Limited at Manchester, with Thomas Ryder and with Chatwood Safe Company of Bolton from 1919 to 1922, returning then to Canada and joining Consolidated Mining and Smelting Company. There he was successively designer, chief draughtsman and assistant to the chief engineer before receiving the appointment to his present position in 1945.

Stewart Young, M.E.I.C., has been elected chairman of the Saskatchewan Branch of the Institute and president of the Association of Professional Engineers of Saskatchewan. He is director of community planning for the government of the Province of Saskatchewan.

Born at Owen Sound, Ont., he received the degree of B.A.Sc. from the University of Toronto in 1912. He joined the Department of Public Works of Saskatchewan that year as assistant surveyor, subsequently becoming district surveyor and resident engineer. In 1924 he was appointed director of town planning in the department of municipal affairs of the Province of Saskatchewan, and he was later director of technical services. He became director of the provincial division of municipal planning, and in 1945 was appointed to his present position.

Mr. Young served on the Institute council representing the Association of Professional Engineers of Saskatchewan in 1946-47. He was registrar for the Association for several years, as well as secretary-treasurer of the Saskatchewan Branch of the Institute.

W. A. Mather, M.E.I.C., seventh president of the Canadian Pacific Railway Company, is the first civil engineer to be elected to that office.

William Allan Mather, whose first railway job was as axeman with a survey gang at the age of 18, was vice-president at Winnipeg from May, 1942, until his election to the presidency March 8 this year.

Upon graduation from McGill University, Montreal, in 1908, he immediately entered C.P.R. He was an axeman, and instrumentman at Kenora, Ont., and

W. A. Mather, M.E.I.C.

a transitman at Laggan, Alta., in his first years with the railway. In 1912 he became acting superintendent at Kenora, after two years as resident engineer at Winnipeg. From then until May of 1933, when he was appointed assistant to the vice-president of the company at Montreal, he served at Kenora as superintendent, as assistant general superintendent at Vancouver, and as general superintendent at Calgary and Moose Jaw.

He assumed the duties of general manager of eastern lines early in 1934 and returned west as general manager of western lines, with headquarters at Winnipeg, late in 1934. While vice-president at Winnipeg his territory was first defined as western lines and then as the prairie region.

Mr. Mather is a director of the Great West Life Assurance Company and of the Calgary and Edmonton Corporation, was a member of the Winnipeg advisory committee of the Royal Trust Company and of the operating committee of the Northern Alberta Railways. He is chairman of Canadian Pacific Air Lines and of Canadian Pacific Steamships.

Wilks, George Haden, B.Sc., (Civil), Sask., civil engr., Ducks Unlimited, Swift Current, Sask.

Student to Junior

Brenan, William Murdoch, B.Sc., (Civil), N.B., designer & dftsman., D. O. Turnbull, consultg. engr., Saint John, N.B.

Shearer, John Alexander, B.Sc., (Civil), N.B., roadmaster, C.P.R., Aroostook. N.B.

R. J. Griesbach, M.E.I.C.

R. J. Griesbach, M.E.I.C., has been appointed general superintendent of the engineering construction department of the Foundation Company of Canada Limited. Mr. Griesbach joined Foundation shortly after graduating from the University of Toronto in civil engineering with the degree of B.A.Sc. in 1924. During his 24 years with the company he has been identified in a supervisory capacity with many major undertakings in the hydro-electric power field, pulp and paper industry, mining construction developments, marine terminal projects, bridges, dams and wharves in Central and Eastern Canada.

T. E. Bate, M.E.I.C., has resigned as assistant engineer, for Canadian National Railways at Fort William, Ont., and has become assistant engineer to Charles E. Garnett, M.E.I.C., president and general manager of Gorman's Limited, Edmonton. Mr. Bate will be in charge of the Elevator Service Company, division of Gorman's Limited, and will take care of the sale and installation of Turnbull passenger and freight elevators throughout Northern Alberta and will also act as sales engineer handling the company's various engineering lines.

George W. Beecroft, M.E.I.C., recently formed in Toronto a new company in the sales engineering field. He represents in Ontario the Fisher Governor Company of Marshalltown, Iowa, manufacturers of automatic control specialties, and Manning, Maxwell and Moore Inc., of Bridgeport, Conn., manufacturers of gauges, valves and industrial instruments. Prior to World War II, he was with Imperial Oil Limited and had extensive experience in their oil fields in South America and in their operations in Canada. Colonel Beecroft served with R.C.E.M.E. in Canada and overseas, and for two years was Services Advisor to the Wartime Bureau of Technical Personnel.

Lucien Allaire, M.E.I.C., was reported inaccurately in the February *Journal* as being assistant manager for the west division of the Waterworks and Sewerage Department, City of Montreal. Mr. Allaire is an engineer in the Sewer Collectors Division of the City of Montreal, and the occasion for our "Personal" was his completion of a course in municipal public works administration.

New Company Formed

A new Montreal company of engineers and contractors was incorporated in January last and came into operation on March 1st. It is the Pentagon Construction Company Limited whose principal officers are as follows:

C. H. Gordon, M.E.I.C., president of the new company, is a graduate of Royal Military College and of McGill University, receiving the degree of B.Sc. from the latter in 1924. After one year's association with Armstrong-Whitworth, he joined Atlas Construction Company Limited and between 1925 and 1940 he served that organization as engineer, secretary-treasurer and vice-president and director. From 1940 to 1945 he was assistant chief engineer and director of shell filling for the Allied War Supplies Corporation of the Department of Munitions and Supply. He then returned to Atlas Construction and was vice-president and managing director until the end of 1947.

C. H. Gordon, M.E.I.C.

H. R. Montgomery, M.E.I.C., vice-president of the Pentagon company, is the former vice-president of Atlas Construction Company Limited. He had been connected with the latter from 1929, and in 1932 had been elected director of the company and of the Belmont Construction Company Limited. He was made vice-president in 1942. Mr. Montgomery was graduated in civil engineering, with honors, from McGill University, Montreal, in 1929. He had also attended Bishops College, Lennoxville, Que.

Frank B. Rolph, M.E.I.C., a director of the Pentagon company is another graduate of Royal Military College and McGill University, receiving the degree of B.Sc. from the latter in 1928. He was for a year a director of Atlas Construction Company Limited, which firm he joined in 1946 as an engineer, after terminating five years service overseas with the Royal Canadian Artillery and being discharged with the rank of major and with D.S.O., E.D., and M.I.D. Before the war he was in London, England, director and plant engineer for Hygrade Corrugated Cases Ltd. He had gone overseas in 1937 as English representative of John S. Metcalfe Company of Chicago, Ill., with whose Montreal office he was associated from 1928 to 1937 as engineer on designing and supervision, and general superintendent. In London, in 1938 and 1939 he was general manager of Ontario Estates Limited.

Alphonse Trudeau, M.E.I.C., director of the Pentagon Construction Co. Ltd., is a graduate of McGill University, class of 1917. After a short time in the service of G. B. Mitchell Company, Mr. Trudeau joined Atlas Construction Company and Belmont Construction Company Limited and up to 1939 held the positions of engineer, superintendent, and director. He was then elected director and vice-president of the two companies, remaining until the organization of the new Pentagon Company.

Leo Galler, M.E.I.C., chief engineer and director of Pentagon Construction Company. Formerly chief engineer and director of the Atlas Construction Company Limited, from 1925 to 1948. Mr. Galler was graduated from the University of Vienna in 1917. He spent the years until 1925 as engineer on various engineering projects in Central Europe, and as owner of a construction company there.

Sigmund Wang, M.E.I.C., is president and manager of Industrial Cellulose Research Limited, Hawkesbury, Ont. That organization now operates the Research and Technical Service Laboratories formerly operated by Canadian International Paper Company, under Mr. Wang's direction.

C. A. Miller, M.E.I.C., has left the employ of Canadian Industries Limited and has joined the Varcum Chemical Corporation (Canada) Limited, Lindsay, Ont., as assistant to the plant manager. He was in Montreal, a project engineer working on design of the Atomic Development Plant at Chalk River, Ont.

A. J. E. Smith, M.E.I.C., is with Central Mortgage and Housing Corporation, and has been assistant supervisor, Ontario Region since February. He resigned from his former position with the Town of Hampstead, Quebec, in May, 1947, and immediately joined the Corporation at head office in Ottawa. He was transferred to Toronto on land assembly and special projects, and was later appointed regional engineer for Ontario in charge of engineering and construction.

E. H. Henderson, M.E.I.C., is now located in Sackville, N.B. He is the maritime distributor for Plibrico Jointless Firebrico Company of New Toronto, Ont., and maritime representative for E. F. Drew and Co. Ltd. He intends to specialize in boiler plant equipment and will form a company to handle the various agencies in the near future. He was previously plant engineer with Halifax Shipyards Limited at Halifax.

Canada Cement Appointments

CANADA CEMENT COMPANY appointments, effected at a February meeting of the board of directors in Montreal included the following Institute members:

F. B. Kilbourn, M.E.I.C., is president. Formerly executive vice-president and general manager, he had been with Canada Cement since 1906. Until 1919 he was in charge of construction and operation of the company's No. 1 plant in Montreal, and was then appointed general superintendent of the company. In 1941, when vice-president and assistant general manager, he was made steel controller by the Minister of Munitions and Supply of Canada.

J. D. Johnson, Affil. E.I.C., president of Canada Cement since 1931, was elected chairman of the board. Mr. Johnson joined the company in 1909 as sales manager of the Toronto office. Ten years later he was appointed general sales manager at Montreal.

J. M. Breen, M.E.I.C., who was assistant general manager since 1947 succeeds Mr. Kilbourn as executive vice-president and general manager. He was also elected a director of the company. He joined Canada Cement in Toronto in 1922, a year after his graduation from the University of Toronto. He was a technical engineer there until his transfer in 1934 as chief of the technical staff at Montreal. His appointment as assistant general manager occurred early in 1947.

E. K. Lewis, M.E.I.C., has been transferred to Montreal by Imperial Oil Limited. and is superintendent of the refinery. Mr. Lewis was in the engineering and development section of the company at Sarnia, Ont.

MacKenzie McMurray, M.E.I.C., and **Rene Dansereau,** JR.E.I.C., have been appointed sales engineers in the boiler division of Dominion Bridge Company.

Mr. McMurray, who will be attached to the company's Ontario Division, with headquarters in Toronto, has the degree of B.A.Sc. in metallurgical engineering from the University of Toronto. He spent some time as a demonstrator in mining engineering at that University before joining Dominion Bridge in 1940. At that time he entered the Sorauren Avenue Munitions Division as metallurgist and chief inspector, retaining this position until the close of plant operations in 1945. He was then engaged in design work, at Toronto, and at the Boiler Division of the company's head office at Lachine.

MacKenzie McMurray, M.E.I.C.

Rene Dansereau, Jr.E.I.C.

Mr. Dansereau has been associated with Dominion Bridge since 1942, with the exception of a period of service overseas as a navigator in the R.C.A.F. He has a B.A.Sc. degree in civil engineering from Ecole Polytechnique, Montreal. He was the recipient of the Ernest Marceau Prize of the Institute in 1943.

R. W. Wright, JR.E.I.C., is manager of Eastern District sales for Canadian Allis-Chalmers Limited, with headquarters in Montreal. He is a graduate of Dalhousie (B.Sc.) and of McGill University (B.Eng.). Following his graduation in 1941 he took the "Test" training of Canadian General Electric Company and during the war served in design and plant engineering with C.G.E. Since that time he has had extensive experience in the engineering, service and sales of Canadian Allis-Chalmers products.

At the February meeting of the Kingston Branch of the Institute, President L. F. Grant received from Professor A. Jackson membership pin representing Life Membership in the Institute.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Martin Wolff, M.E.I.C., of Montreal, who died on March 6, 1948, while vacationing at Hastings, Barbados, B.W.I., was associated with M. D. Barclay, Inc., of Montreal.

Born in 1881, he studied at Clifton College, Bristol, England, and at Central Technical College, London. He served with the Royal Engineers in the South African War, winning the Queen's Medal with five bars, and returned to England in 1902. Resuming his studies in civil and mechanical engineering, he graduated in 1904, and came to Canada in 1906. He served with Canadian railways for eight years. In 1914 he attended the Officer's Training Course in Quebec, Que., qualifying as a lieutenant, and becoming attached to the Department of Militia and Defence, and later to the Imperial Ministry of Munitions at Quebec.

In 1917-22 he was with the Department of Railways and Canals. He was then made assistant engineer in the Bureau of Economics of Canadian National Railways at Montreal. In 1925 he became senior draughtsman at the Cornwall office of the St. Lawrence Waterway Commission, but in 1927 he joined the Gatineau Power Company, Ottawa, as assistant engineer in the Development Branch. From 1928 to 1930 he was with the Laurentide Construction Co. Ltd., Montreal, as office engineer.

He entered the employ of the city of Westmount then, and was engaged on construction of sewerage developments. He joined M. D. Barclay Inc. in 1941. He was later recalled by the City of Westmount to fit out and organize

Martin Wolff, M.E.I.C.

the central control room of their A.R.P service, and upon its completion he returned to the service of M. D. Barclay Inc., acting as assistant civil engineer until he went on leave to the West Indies just prior to his death.

Mr. Wolff was the author of "History of the Canadian National Railways", and of the "History of the Jews in Canada". He had been associated with the Congregation Shearith Israel of Montreal, serving as treasurer for fifteen years, and as chairman of the building committee of the new synagogue. He was chairman of the Archives Committee for the Dominion Council of the Canadian Jewish Congress since its inception in 1934.

Mr. Wolff joined the Institute in 1908 as a Student, transferring to Associate Member in 1911, and to Member in 1940. He had attained Life Membership in 1941.

E. B. Martin, M.E.I.C., city engineer of Moncton, N.B., since 1930, and a member of the engineer staff since 1912, died

E. B. Martin, M.E.I.C.

on February 3, 1948, at his home, after a brief illness.

In his long association with the city of Moncton, where he was born in 1887, Mr. Martin, in his post with the Board of Works Department, had contributed materially to the growth of Moncton and had given freely of his time and energy to bring about many improvements necessary to keep pace with the rapid growth of the city.

On graduating from the University of New Brunswick, Moncton, with the degree of B.Sc. in 1912, he joined the city staff as assistant city engineer, and three years later was granted leave of absence for military service. He served with the R.C.E. in France for four years, with the rank of lieutenant. In 1919, returning from overseas and to civilian life, Mr. Martin returned to city hall, taking the post of street commissioner. In 1930 he became city engineer, in addition to his duties as street commissioner, and held both posts.

He joined the Institute as an Associate Member in 1920, becoming a Member in 1940. He was active in the Moncton Branch, representing it on the Council of the Institute in 1944.

John Stadler, M.E.I.C., widely-known as a consulting engineer, particularly in the pulp and paper industry, died at his home on February 28, 1948. He was a partner in the Montreal firm of Stadler and Hurter.

Born in Bavaria in 1874, he was a graduate in engineering of the Polytechnical Institute at Munich. After a few years with Helios Company, of Cologne, as field engineer on construction of

John Stadler, M.E.I.C.

hydro-electric and industrial plants, he came to the United States of America in 1902. In 1905 he joined the staff of the Shawinigan Water and Power Company; he was superintendent of the Shawinigan Falls power house until 1906 when he joined the Belgo-Canadian Pulp and Paper Company, as plant engineer in full charge of design and construction. In 1913 he became assistant manager of the company, and left in 1923 having remodelled and managed the plant and built extensions to produce 380 tons of newsprint. During this time he also made investigations on pulp, paper and power properties. He went to the Newfoundland Power and Paper Company at Cornerbrook as general manager in 1924. Three years later he was appointed general manager of the Lake St. John Power and Paper Company, Dolbeau, Que.

Since 1929 Mr. Stadler carried on a successful consulting practice in Montreal, specializing in pulp, paper and power. Among corporations to whom Mr. Stadler rendered consulting services on such developments, were the Australian Newsprint Mills Proprietary at Hobart, Tasmania; Bowaters Paper Mills, and Daily Express, London, England; Kymmene Aktiebolag, Kuusankoski, and Papersbruk, Woikka, Finland; Papeteries de la Chapelle, Rouen, France; Papeteries de Belgique, Brussels, Belgium; Powell River Co. Ltd., at Powell River, B.C.; Scott Paper Company, Chester, Pa.

Mr. Stadler was a member of the American Society of Mechanical Engineers, the Corporation of Professional Engineers of Quebec, Technical Association of American Pulp and Paper Industry, and an honorary life member of the Canadian Pulp and Paper Association. He joined the Institute in 1921 as a Member. He was its treasurer in 1941.

News of the Branches

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented at their meetings

Calgary

J. F. Langston, m.e.i.c.
Secretary-Treasurer

T. M. Parry, m.e.i.c.
Branch News Editor

The Calgary branch held a luncheon meeting on Thursday, February 19, in the Palliser Hotel and 50 members were present to hear D. G. Geiger, m.e.i.c., transmission engineer of the Bell Telephone Company of Canada. Mr. Geiger is chairman of the Toronto branch of the Institute. Following luncheon, he was introduced to the gathering by R. MacKay, superintendent of the Calgary Electric Light and Power Department. Mr. Geiger's paper, of particular interest to the many power and communications men present, was entitled, **The Joint Use of Poles by Electric Power and Communication Utilities.**

He pointed out that both of these utilities usually supply the same customers. Where the plant is above the ground, safer and better conditions result if the same poles support circuits of both services. Frequently, economy to both companies is a big factor.

Joint use of poles by power and communication utilities has become increasingly popular on this continent, with several millions of poles in such use. Certain principles and practices for joint use have been established for the partners and the general construction practices and specifications employed in this country are based on the National Electrical Safety Code (5th edition).

The most practical method of establishing the definite procedures necessary to secure the full benefits of joint use is by the use of formal agreements. Such agreements cover introductory statements as to corporate standing, purpose of the agreement, poles to be included or excluded, ownership of the poles involved and basis of rentals, specifications to be followed, advance notice of intended changes by either party and other necessary details. Full cooperation between the parties concerned is the keynote of successful joint use, concluded Mr. Geiger.

The paper was illustrated with slides showing examples of proper specifications and good and bad examples of joint use.

The interest of the gathering in Mr. Geiger's paper was indicated by the long question period which followed. A hearty vote of thanks was moved by R. S. Trowsdale, local manager for Canadian General Electric Company.

Saturday, February 21, saw the "Annual Ladies Night" of the Calgary branch at the Renfrew Club. Some 65 couples, plus a few "stags" enjoyed an evening of conversation, dancing, bridge, entertainment, buffet supper and refreshments. The dance floor took precedent in popularity for the evening as couples enjoyed the music and vocals of a small, but excellent orchestra.

Those attending were welcomed by Branch Chairman M. W. Jennings and Mrs. Jennings. Among the many prominent members noticed among the gay throng were S. G. Coultis, Western Zone vice-president; Councillors J. G. McGregor, and P. M. Sauder.

Cornwall

G. G. M. Eastwood, m.e.i.c.
Secretary-Treasurer

T. B. Webster, jr.e.i.c.
Branch News Editor

On March 16, the Cornwall branch was honoured by the visit of Lt.-Col. L. F. Grant, when a banquet was held in the Cornwallis Hotel. Three vice-presidents and three councillors were also present for the presidential visit, the first since the inauguration of the branch a little more than a year ago.

The branch chairman, R. H. Wallace, introduced Col. Grant who spoke of his previous visits to all the other eastern and central branches. Col. Grant said that the Institute is very favourably regarded by similar organizations in the United States, this position having been attained by the exacting admission requirements, the wide coverage of Canadian engineers' interests, and its attention to the welfare of the young engineer. The President spoke of the continual improvement of the status of the profession in the past 40 years and the realization by industry of the useful service that can be performed by engineers.

Councillor Drummond Giles thanked Col. Grant.

Visiting vice-presidents were W. R. Manock of Fort Erie, R. S. Eadie of Montreal and G. F. Layne of Quebec, and visiting councillors were R. C. Flitton and J. B. Stirling, both of Montreal.

Dr. L. Austin Wright, general secretary, spoke of the work of the Institute, its growth, and the advantages of membership.

Edmonton

W. W. Preston, jr.e.i.c.
Secretary-Treasurer

What has happened and what may happen to Alberta's trees and water resources were described by Robson Black, at a meeting of the Edmonton Branch at the King Edward Hotel, on March 3, 1948. Mr. Black, who is president of the Dominion Forestry Association, spoke on **Why Manage the Resources?**

The paper was prefaced by a description of plans in Great Britain to utilize waste. England, who lost eighty per cent of her trees in the last war is busy replanting. Scotland, whose people are leaving the Highlands in alarming numbers, has undertaken a million-horsepower hydro-electric development in order to provide industries that will attract her population.

The speaker claimed Alberta had a heritage of 90,000 square miles of forest, but has lost three quarters of it in 40 years of exploitation. However, there is hope that the land still retains its recuperative power and that engineering management will bring forth a crop which will be better than the original.

Alberta was compared to Libya and Sweden, each with widely different forest experiences. Libya was a prosperous grain grower until she lost her forests. Without watershed protection, the land was flooded, and lost its fertility. Now Libya is a land with goat herds and a nomadic population. Other countries too have cleared their upper lands and drained their swamps, and shared Libya's experience.

To prevent similar conditions from coming to the Prairies, a body known as the East Slope Conservation Board has been established. This board is neither a government nor commercial organization. It is headed by Major General Kennedy, a first rate forestry engineer, and has been granted several thousand dollars to replace trees on the east slope of the Rockies, and thus control essential water resources. Trees, according to Mr. Black, do the job better than is done by any engineering works.

Sweden is comparable with Alberta in area, soil, moisture and sunlight. Sweden's good management of her forests allows profits from continual forest crops to eliminate taxes.

In conclusion, Mr. Black paid tribute to Alberta's Lands Minister, Hon. N. E. Tanner, for a policy whereby appropriate areas are chosen for settlers and none opened which might prove disastrous to them and to a programme of conservation of essential forest and water resources.

During the general discussion, Mr. Black referred enthusiastically to the prospect of Alberta's poplar trees being used for the production of paper pulp.

Mr. Black was introduced to the meeting, attended by forty-one members and guests, by T. Main, a director in the Dominion Forestry Association. F. R. Burfield Provincial water resources engineer, proposed a vote of thanks to Mr. Black. J. F. Cranswick was chairman of the meeting.

Halifax

W. E. Jefferson, M.E.I.C.
Secretary-Treasurer

M. L. Baker, M.E.I.C.
Branch News Editor

Geological and Mineral Possibilities of the Coast of Labrador was the subject of a most interesting and instructive address given at the February meeting of the Halifax Branch. This meeting was held in the Lord Nelson Hotel on February 24. Sixty members were present. Guests at the dinner were Past-president J. B. Hayes, and Dennis Stairs, vice-president of the Dominion Engineering Co. Ltd. Chairman W. C. Risley presided.

The speaker was Prof. G. Vibert Douglas, head of the Department of Geology at Dalhousie University. At the request of the Government of Newfoundland Prof. Douglas made, during the summers of 1946 and 1947, geological surveys of the coast of Labrador from Point St. Charles to Cape Chidley. The personnel of the parties was made up of Dalhousie University geology and engineering undergraduates.

Slides made from photographs taken on the expedition illustrated the various phases of the subject, including the topography of the coast. No less than five ranges of mountains are distributed along the coast line. They are, beginning at the north: the Torngats, the Kaumajets, the Kiglapaits, the Benedicts, and the Mealys. The highest peak —Mount Cirque—first climbed by the late Prof. A. P. Coleman of Toronto University, has an elevation of 5,500 feet. It is in the Torngats. The area north of the Kaumajets is devoid of trees.

In honor of Dalhousie University, a mountain in the Torngats was named Mount Dalhousie. This name is officially recognized by the Newfoundland government.

The fundamental geological column in the area has been determined. This column, with the younger strata at the top and the older at the bottom, is as follows:

Pleistocene and Recent	Glacial and recent deposits
Cambrian	Sediments — akoses, shales, etc.
Great Unconformity	
Huronian?	Mugford series—volcanics Unconformity Ramah series—sediments and igneous
Unconformity	
	Igneous rocks—granite and gabbro
Laurentian?	Mountain building Sedimentary rocks Basement unknown

Probably the most useful contribution of the expedition to the geology of the area was the discovery of a section on the north side of Tessisoak, west of Nain, which showed the gabbro (anorthosite) cutting the sediments and the relation of the granite to these two rocks. The granite sends sharply marked dykes into the gabbro but has soaked its way into the sediments transforming them into gneisses of the particular kind known as migmatites.

Mineralization on the coast is not widespread. A body of iron pyrites is known to exist at Rowsell Harbor and, in the course of the work, was carefully surveyed and sampled. Prof. Douglas mentioned, however, great iron deposits which lie astride the Labrador-Quebec boundary near the headwaters of the Hamilton River.

In the discussion, which was led by Prof. A. E. Flynn and Dr. A. E. Cameron, questions were asked about the possibilities of further surveys extending inland. The chief difficulty would be in getting supplies and equipment to any base established away from the coastal area. The rivers do not provide transportation, being too shallow or too swift. Prof. Douglas said the ideal way to conduct further surveys would be to use a flying boat to establish a base on the shore of a lake and then use a helicopter for extending out from the base.

E. C. Thomas moved a vote of thanks to the speaker. This was seconded by J. P. Messervey and enthusiastically endorsed by the audience.

Kingston

D. L. Rigsby, M.E.I.C.
Secretary-Treasurer

First-hand account of the Bikini atom bomb experiments was a highlight of a joint meeting of the Engineering Institute Kingston Branch, and the Engineering Society of Queen's University, in February, in Convocation Hall.

Air Vice Marshal E. W. Stedman, who was senior Canadian observer at the Bikini operations, and now adviser to the Defence Research Board, Ottawa, presented a personal and graphic picture of the two controlled atomic bomb explosions at Bikini.

He used a film-strip and a coloured motion picture to illustrate his remarks.

"The possession of the atomic bomb will not, of itself, prevent war, because fear engenders hatred and hatred leads to war," Air Marshal Stedman said in summing up the implications of the pictures he had shown.

"War can be prevented only by spiritual work. We must cultivate the better qualities of man if we are to make war impossible."

His address was sponsored by the Engineering Society. He was introduced by J. C. Davidson and thanked by M. G. Saunders. Norman Simmons, president of the Society, chaired this part of the meeting.

Main section of the Engineering Institute portion of the programme was the presentation of four papers by university students for the annual prizes awarded by the institute.

Winner of first prize was W. H. Finch, who gave a paper on sound recording methods.

Second prize was given to H. L. Armstrong, who presented a paper dealing with some original work on the complex nomograph; third to C. R. Baker, who spoke on controls on the sub-division of land in Ontario; the fourth student speaker was W. S. Bradley, who delivered a paper on the Venturi meter.

Another highlight of the meeting was the presentation of life membership buttons to six veteran members of the Institute. These awards were made by Prof. Arthur Jackson.

Those receiving the tokens were Institute President Lt.-Col. L. F. Grant, O. T. Macklem, T. A. McGinnis, J. M. Campbell and Col. Alex. MacPhail. The latter two were unable to attend the meeting.

C. E. Craig, chairman of the institute, announced that Kingston branch membership had leaped 39 per cent. during the past year and now stood at 169 members.

Kootenay

E. B. Broadhurst, M.E.I.C.
Secretary-Treasurer

The annual meeting of the Kootenay Branch of the Institute was held in the Conference Room on February 27th, 1948 with 24 members present.

Several items of interest were discussed, with chief interest centering around the forthcoming Presidential visit in May. Preparations for this visit are to get under way at once.

The members were extremely interested in low cost housing as outlined in a section of the Council Minutes. It was suggested that a committee be formed to investigate our local housing situation.

Following the business meeting and election of officers a film entitled "The Life of Colonel Crompton" was shown by A. W. Busby.

London

N. J. W. Smith, M.E.I.C.
Secretary-Treasurer

G. N. Scroggie, M.E.I.C.
Branch News Editor

The London Branch of the Institute held its regular monthly meeting on February 24 at the Wolseley Barracks Reserve Force Officers Mess.

Chairman E. R. Jarmain opened the meeting by welcoming members of the Professional Engineers of Ontario and the Military Engineers Association, who were guests.

The meeting took the form of a discussion on **The Engineers' Council for Professional Development.**

J. A. Vance, the first speaker, after giving a definition of E.C.P.D., went on to give a resumé of its history, explaining its general organization, and stressed the point that the E.I.C. is the only Canadian Society that is a member of the E.C.P.D. and that the Canadian representatives are members of various Committees of the Council.

E. V. Buchanan spoke next, giving his impressions of the meeting he had attended, and pointed out that big business men, as well as leaders in the field of education, were taking a real interest in the E.C.P.D. who had raised the standards of many universities and colleges.

The two above named speakers spoke alternately throughout the balance of the meeting, giving the functions of the various committees and their accomplishments in dealing with Professional Recognition, Engineering Schools, Professional Training, etc.

After G. Keegan thanked the speakers for their very informative discussion, refreshments and entertainment were provided to round out a very enjoyable evening.

Montreal

The following appointments to chairmanship of committees have been made by the Branch executive and accepted by the appointees.

Programme Committee, D. G. Elliot; Membership, H. M. Finlayson; Admissions, H. Gaudefroy; Entertainment, R. Hobner; Publicity, A. C. Abbott; Student Guidance, G. B. Moxon; Policy, E. B. Jubien; House, I. R. Tait. Mrs. R. N. Coke has agreed to be convenor of the Ladies' Committee.

Representatives of the Executive Committee meeting with representatives of Council are studying present and future accommodation of the Branch at Institute Headquarters.

R. N. Coke and I. R. Tait have been appointed by the executive as delegates to the Branch Conference which is to be held during the Annual Meeting at Banff in June of this year.

One result of the recent questionnaire is the inclusion of a Chemical Section by the Programme Committee. The Programme Committee is also studying other points put forward by members in regards to future programmes. Members are reminded of Section 11 of the Branch By-Laws which permits special sections to be established under certain stipulated conditions. Members can obtain a copy of the By-Laws on application to Institute Headquarters.

Junior Section

At a regular meeting of the Junior Section held on February 23, Mr. Jacques Perreault, a recognized authority on Union Legislation, spoke on **The Rights of the Workers,** reviewing the progress of organized labour and outlining some of the objectives which labour had obtained.

An innovation this year which proved to be a great success was the Ladies Film Night held on March 7. Three films were shown and the event proved so successful that it has been decided to make arrangements for the holding of a similar event next year.

At a business meeting held on March 15, next year's programme was tentatively discussed. Committees have been set up for the operation of study groups. A Public Speaking class will be organized and a professional instructor engaged. This will be the first study group to operate next year and those wishing further information are requested to get in touch with Jos. Galley, at FI. 4671.

Congratulations are due to R. B. Todd and R. Riopelle, winners of the Phelps Johnson prize and Ernest Marceau prize, respectively.

Niagara Peninsula

J. J. Miller, M.E.I.C.
Secretary-Treasurer

C. A. O. Dell, M.E.I.C.
Branch News Editor

The February meeting was held at The Welland House in St. Catharines on Thursday the 19th.

Chairman M. F. Ker spoke briefly at the outset and introduced one of the new members, C. K. Overall. Several guests from the English Electric Company, were also introduced by P. J. Farmer.

Vice-chairman R. A. Coombes introduced the speaker, D. P. Douglas, electrical inspector of mines for the Province of Ontario. Mr. Douglas spoke interestingly on many special problems which are met with in the use of electricity and electrical equipment in the mining industry in this province. His discussion covered special cable insulations to reduce fire hazard, electrical safety devices on hoisting equipment, transformers and sub-stations. He also spoke highly of the new type of standardized training which is being given to crews from widely separated mines to work together in emergencies. Mr. Douglas stated that safety regulations for mining in the province of Ontario are probably the most rigid in the world, but the mining industry is co-operating in every way, and in many cases owners are going beyond the minimum safety requirements in order to safeguard their workmen.

Following the address a technicolour movie on prospecting was shown.

Announcement was made that the annual joint meeting with the Association of Professional Engineers will be held on March 18 at the Red Casque Inn in Stamford.

At a short business meeting, favourable action was taken on several new membership applications and plans were made for future meetings.

❖ ❖ ❖

A joint meeting of this branch with the members of the Association of Professional Engineers of this district was held on Friday, March 19th. Chairman M. F. Ker presided, and Col. T. M. Medland, representative of the association, was introduced to the gathering by councillor P. E. Buss.

Col. Medland gave a timely resumé of recent developments affecting the official status of the engineer in this province. He pointed out that the membership of the Association has increased from 2,800 in 1944 to 6,377 in 1948. The Association supports The Dominion Council of Professional Engineers who are advocating a uniform system of fees for the various Professional Engineers Associations throughout the country. The Canadian Council of Professional Engineers and Scientists who are working on collective bargaining, and also The Technical Service Council which is at present the only active employment service for engineers in the province.

At a meeting of the branch executive C. L. Mason was appointed to carry out the duties of vice-chairman R. A. Coombes who will be absent for several weeks on a business trip to Vancouver.

Ottawa

C. G. Biesenthal, M.E.I.C.
Secretary-Treasurer

R. C. Purser, M.E.I.C.
Branch News Editor

The Ottawa Branch, at its noon luncheon February 19, heard something about the present oil situation in Canada from John Ness, Toronto, Imperial Oil Limited. The speaker's address was accompanied by the showing of a film "Search Unending" dealing with oil discovery. J. L. Shearer, branch chairman, presided. The speaker was introduced by A. A. Swinnerton, and thanked by Col. J. W. Bishop.

With the exception of our cousins to the south, Canadians use more oil per capita than any other people in the world. We need about 77,000,000 barrels of oil annually. But we only produce one-third of one per cent of the world's production, and of the crude processed at our refineries, only one barrel in every ten comes from a Canadian well. The rest is imported: sixty per cent from United States, and the remainder mostly from Peru, Colombia and Venezuela.

In the early days southwestern Ontario was a heavy producer. In 1894 approximately one million barrels came from Oil Springs, Petrolia, and Bothwell. Today, their output is about 160,000 barrels.

It is estimated that the oil industry has spent $75,000,000 in the search for new fields, not including expenditures on development of proven areas. Prospective oil-bearing formations cover some 560,000 square miles, 90 per cent of which is in the western provinces and the territories.

Turner Valley, discovered in 1914, with further important discoveries in 1924 and 1936 has in some years accounted for as much as 97 per cent of the Dominion's entire output. During the war years it was the mainstay of the Commonwealth Air Training Plan, reaching a peak of production in 1942 with around 10,000,000 barrels. Since then, production has steadily declined to a total of 6,000,000 in 1946. But altogether the Valley has supplied Canada with 100,000,000 barrels of oil and distillate, and has still many years of usefulness on a descending scale.

Norman Wells on the Mackenzie was a war-baby, for although discovered in 1920 it was only as an important cog in the Canol project that it came into its full growth. In 1944, Norman crude to the amount of 1,150,000 barrels went through the Canol pipe line to Whitehorse. Although Norman Wells has a proven reserve of 28,000,000 barrels, it would require perhaps ten times that amount of oil in sight before it would be considered economical to construct pipe lines to bring it out to seaboard. Meantime, however, it helps out with diesel and aeroplane fuel at Yellowknife and other nearby localities.

A third field, at Leduc, shows promise. Imperial Leduc No. 1 was completed as a producer on February 13, 1947. On its first birthday forty producing wells could be counted, with five failures indicating the limits of the field in certain directions. Drilling footage aggregated 53 miles. In the first year of operation, the field provided around 450,000 barrels. An 8-inch pipe line has been laid to the railway at Nisku, eight miles distant, and storage facilities, loading racks and offices constructed. Roadways have been built for year-round traffic; and a new town is taking shape.

Geologists consider the field is proved over a minimum area of 8,100 acres with reserves of at least 100,000,000 barrels. This estimate may, of course, be amended after further drilling. The Imperial Oil is erecting a refinery at Edmonton.

Materials will come from the Whitehorse refinery purchased from the United States Government. This refinery, part of the Canol project, will be dismantled, transported and re-erected at Edmonton. It will form the nucleus of an up-to-date refinery handling from 4,000 to 6,000 barrels daily. Once storage tanks are erected the pipe line will be extended from Nisku, making transhipment by rail unnecessary.

Canada's refineries require over 200,000 barrels of crude daily. Turner Valley, Norman Wells, Leduc and other smaller fields in the West, in Ontario and the Maritimes, with all the good will in the world, cannot hope to meet this demand. "That is why," the speaker concluded, "the drills are constantly probing; that is why there is a 'search unending'."

❖ ❖ ❖

Recently developed materials and their application to the improvement of electrical apparatus were explained by F. R. Benedict, manager of the Industry Engineering Department, Westinghouse Electric Corporation, at an evening meeting, February 24, at the National Research Auditorium, Sussex Street. The meeting was held jointly with the Ottawa sub-section of the American Institute of Electrical Engineers.

The speaker explained the use of various new types of materials and their insulating properties, also difficulties encountered in trying out some of them. For instance, carbons when tried out on submarine switchboards have been known to generate carbon monoxide in sufficient quantity to affect the personnel. This feature has led to the introduction of other materials that do not have the same effect.

Regarding the use of plastics for building motor cars, Mr. Benedict was rather doubtful. Most plastics do not have enough resiliency. Shocks would be terrific and would militate against safety.

The speaker listed a number of new materials and indicated trends in research towards others. Usually it is a case of working toward a definite desired end, though something else may result on the way. Efficient operation of apparatus and machines is, of course, a guiding principle in such research. Reduction in size is also an important consideration and is achieved whenever possible.

❖ ❖ ❖

Canada's ore reserves have been heavily eaten into by the war. A greater need than ever now exists to devise ways and means of making better use of those that remain.

C. S. Parsons, Chief of the Bureau of Mines, Ottawa, speaking before the Ottawa branch at a noon luncheon on March 4, in elaborating this thought said, "Most of the easy finds have been made. Now we must scratch for it."

He cited, as examples of new products developed from Canadian minerals, the rock wool industry and the brucite magnesium industry.

The rock wool industry was established in Canada as a direct result of work in the Bureau's laboratories, he said. In 1947 ten plants devoted to this industry had a production valued at more than $15 millions and employed more than 500 people.

A new plant for the production of brucite limestone in the Wakefield area in Quebec province about 25 miles north of Ottawa owes its origin to a Bureau official, Mr. Parsons said. This official made the discovery of the brucite limestone in the area. Subsequent investigations in the Bureau's laboratories of a process to recover magnesium and hydrated lime made development of the deposit possible.

The Bureau was closely following developments in the production of synthetic liquid fuels from coals and natural gas, Mr. Parsons said. A small-scale pilot plant was now under design at the Bureau's laboratories.

The speaker also disclosed that a large staff of the Bureau is presently assigned to work on the concentrating and treating of radioactive ores for the National Research Council.

Mr. Parsons was introduced by D. E. Kennedy, Chairman of the Junior Section, and was thanked by G. C. MacRostie. The branch chairman, J. L. Shearer, presided.

Peterborough

J. M. King, jr.e.i.c.
Secretary-Treasurer

J. C. Allan, m.e.i.c.
Branch News Editor

Mr. H. A. Blachford, customer relations representative of the Bell Telephone Company of Canada addressed a meeting of the Peterborough Branch on February 19 on the subject of **Micro-waves,** and demonstrated a number of new types of telephone equipment. The basis of the new radio-telephone system is the microwave, which made our wartime radar systems possible. These waves travel at a speed of 186,000 miles per second. Their wavelength is only 1¼ inch, while the waves of commercial radio are about 1,000 feet long. These minute radio waves behave like light waves or rays, and can be reflected from mirrors or metal objects.

In telephony, the microwaves are used to relay telephone conversations from point to point. A great many telephone conversations can be transmitted simultaneously over the beam, the speaker said. In just the same way, a number of conversations are transmitted simultaneously at different frequencies over a pair of telephone wires, making long distance service much more economical than it would be if a pair of wires would carry only a single conversation.

The exploration of the higher radio frequencies has opened up great new possibilities in communications. Previously there were simply not enough frequencies to embark on radio-telephony projects. The higher frequencies have made it possible to provide mobile telephone service whereby motorists can communicate from their cars with any telephone in the main system or with other mobile equipped cars. This service is now in operation in Toronto and Montreal. Radio telephones are also used in ship-to-shore trans-oceanic telephony and in certain areas, such as between Pelee Island and the Ontario mainland.

To what extent radio beam transmission will replace wire transmission in the future is not known. Telephone engineers have pioneered in this new realm of micro-waves to assure that in the future as in the past telephone service will be the best possible at the lowest cost.

Following the lecture demonstration the members were invited to examine the apparatus set-up for demonstration. They were able to repeat the demonstrations and perform other experiments in guiding micro-waves through flexible metal tubes and using sheet metal lenses to concentrate the beam.

Saguenay

J. E. Dyck, m.e.i.c.
Secretary-Treasurer

Junior Section

F. H. Duffy, jr.e.i.c.
Secretary-Treasurer

A meeting of the Section was held at the Arvida Protestant School at 8.15 p.m., Thursday, March 18, 1948.

K. M. MacQuarrie of the Aluminum Company of Canada Limited addressed the meeting on the subject of **Development and Processing of Aluminum Alloys.** He pointed out that, although to any observer operations in any of the fabricating plants look simple, they are actually quite complicated. A system of numbering and lettering is used to designate the various aluminum alloys. Mr. MacQuarrie outlined the types and proportions of alloying metals used with commercially pure aluminum to provide various characteristics in the alloys, and also various methods of fabrication which can be employed with the different alloys. Using a simple typical alloy as an example, the speaker traced the results of various heat treating methods and, by means of diagrams and photomicrographs of the alloys produced, showed the results on the grain structure of proper and improper heat treatment.

A discussion period followed during which the speaker provided answers to the questions presented by those attending the meeting. The speaker was introduced by Chairman C. J. Tanner and thanked on behalf of the Section by S. M. Paterson.

Sarnia

B. B. Hillary, m.e.i.c.
Secretary-Treasurer

Declaring himself in favour of a policy of "orderly decontrol" Kenneth A. Henderson, former Bank of Canada official and a vice-president of Imperial Oil Limited, told a joint meeting of the Engineering Institute of Canada and the Canadian Institute of Chemistry that it is an "imperative necessity" for Canada to contribute "in every possible way" to the reconstruction and recovery of the war-torn and ravaged areas of Western Europe and the United Kingdom. He advocated "liberal trade and financial arrangements to this end."

The meeting, which was held on March 2nd, 1948, in the English Lutheran Church of Our Redeemer, was presided over by branch Chairman Gordon R. Henderson. Prior to the addresses F. Fred Walsh introduced a group of Columbian Squires under the direction of Clair Dillon. They rendered a number of vocal and instrumental Irish numbers. The guest speaker was introduced by Mr. Simmons and the thanks of the gathering was tendered by Andrew Russell.

The speaker gave a broad outline of the principles of governing Canadian finance and affecting the national economy in pre-war days. Then he discussed what changes had taken place during the war, finally relating the two to conditions today.

Saskatchewan

D. W. Houston, M.E.I.C.
Secretary-Treasurer

R. Bingo-Wo, M.E.I.C.
Branch News Editor

The Eighteenth Annual meeting of the Saskatchewan Branch was held on February 27, in the Hotel Saskatchewan, Regina. The business meeting and reports of the various committees were presented during the afternoon session.

The dinner meeting was held at 6.30 p.m. Those seated at the head table were Ross Welsh, representing the Engineering Society of the University of Saskatchewan; H. S. Carpenter, former Deputy Minister of Highways; F. B. Bagshaw, solicitor and legal adviser to the Association of Professional Engineers; Stewart Young, newly elected chairman of the Branch; A. C. Garner; L. A. Thornton; J. B. Mantle, secretary of the Saskatoon Section; Chris Fisher, executive member of the Manitoba Association, from Winnipeg.

The speaker of the evening was F. B. Bagshaw, who discussed **Kipling and the India of Yesterday.** Mr. Bagshaw held the audience enthralled for two hours as he told the story of Rudyard Kipling, his adventures, and the part he played in the history of India. Mr. Bagshaw reviewed most of Kipling's best known works and quoted copiously from his prose and poetry. The address was well interspersed with anecdotes and humorous incidents from the life of Kipling.

A motion of thanks was moved by H. S. Carpenter, and heartily endorsed by the audience.

Vancouver

Alan M. Eyre, Jr.E.I.C.
Secretary-Treasurer

Stuart Lefeaux, Jr.E.I.C.
Branch News Editor

The annual Student Night of the Vancouver branch was held on February 18 in the Medical Dental Auditorium. The chairman turned the meeting over to Allan Fletcher, president of the Student Chapter who gave an account of the eliminations held at U.B.C. to decide on the speakers for the evening.

Don Jamieson, a first year applied science student and Navy veteran, gave a paper on **The Erection of the Pine River Bridge.** This work took place on the John Hart Highway, fifty miles east of Dawson Creek, in the summer of 1947. The bridge is of the Warren continuous truss type with parallel chords of three spans; the center span is two hundred and eighty feet.

The second speaker was Robin Fjarlie a third year agricultural engineering student and R.C.A.F. veteran who gave a talk on **The Oceanography of the Alberni Canal of Vancouver Island.** The need for a thorough investigation of the canal was occasioned by the construction of a sulphite pulp mill at the head of the Canal. The Fisheries Research Board of Canada developed a model of the canal at the Pacific Biological Station in Nanaimo. It was shown that the tonic effluent from the sulphite mill would effect salmon spawning up the Somass River at the head of the canal. Consequently the plant was changed to a kraft-type pulp mill using sulphate and producing a non-tonic effluent.

The final speaker was John McPhail, a third year civil engineering student and R.C.A.F. veteran. His subject was **Three Methods of Road Surfacing.** The speaker confined his remarks to methods used by the Provincial Works Department on Vancouver Island. The *Prime Coat, Seal Coat,* and *Mulch Treatment* were reviewed in detail.

The outstanding ability displayed by the students was commented on by all members present. The judges of the evening were Messrs. Muir, McPherson, and Kelly. They had a most difficult task to choose a winner but decided in favor of Mr. McPhail. Ten dollars in prizes were awarded the student speakers of the evening.

T. W. Berry announced that the H. N. Ruttan Prize for Students and Juniors papers in the Western Provinces had been won by Roy Pillman for his paper on **The Accuracy of a One Minute Transit;** the presentation will be made at the annual meeting at Banff.

❖ ❖ ❖

On Wednesday, March 17, the Vancouver Branch was favoured with a paper on **Town Planning in Vancouver,** a most timely topic. The Chairman introduced the speaker of the evening, J. Alexander Walker, M.E.I.C., who is the executive engineer of the Vancouver Town Planning Commission.

Mr. Walker introduced his subject with a brief history of town planning from its known beginnings in early Egypt. He stressed the fact that town planning affects everyone and that as the general public pays the costs, everyone should be interested.

In December, 1925, the British Columbia Town Planning Act was passed and in March, 1926, the Vancouver Town Planning Commission was formed. The firm of Harland Bartholomew and Associates, town planning consultants of St. Louis, Missouri, was retained to make a comprehensive study of Vancouver's planning needs. The elements of the report presented in 1930 were: economic background, population study, street systems, transit routes, parks, recreation and schools, transport, zoning, regional planning administration.

In 1944 the City Council again retained the consulting firm to revise the 1930 plan in light of the city's rapid expansion. The elements of the plan, at present being circulated, are the same as the 1930 report. The revised plan is hoped to take care of Vancouver's growth over the next twenty-five years.

Mr. Walker stressed the importance of the zoning element in town planning and the ability of sensible town planning to overcome the disasters of decentralization. He outlined some of the beneficial results of the 1930 plan in Vancouver's development.

The last hour of the programme was devoted to questions. Archie Peebles, M.E.I.C., thanked the speaker for his most able address and complimented him on his answering of the questions raised, many of which were on controversial subjects, such as downtown parking and locations for a civic centre.

The chairman introduced Mr. Holmes of Toronto, a visitor in Vancouver, and details of the next meeting was announced by George Allen.

Victoria

S. H. Frame, M.E.I.C.
Secretary-Treasurer

Jas. H. Blake, M.E.I.C.
Branch News Editor

D. G. Geiger, M.E.I.C., transmission engineer of the western area, Bell Telephone Company of Canada, addressed a well attended meeting of the Victoria Branch of the Institute on Friday, February 13, taking as his subject **The Joint use of Poles by Electric Power and Communication Utilities.**

The lecture was illustrated and covered such phases as: construction practices, protective devices, agreements for joint use, co-operation between users; it brought up many of the problems encountered in civic and urban usage.

This able address left the conclusion with the large audience that the joint use of poles has many advantages, both from the standpoint of the utilities and the general public, to the ends that safety, good service and economy may be promoted.

Technical personnel from the majority of the power and communication utilities in the province attended the meeting by invitation, joining the many members and friends of the branch.

Winnipeg

R. T. Harland, M.E.I.C.
Secretary-Treasurer

R. H. Tivy, Jr.E.I.C.
Branch News Editor

Theatre F at the University of Manitoba was crowded by some 107 members and friends of the Winnipeg Branch of the Institute and the Association of Professional Engineers of Manitoba on February 19 when R. E. Heartz, vice-president and chief engineer, Shawinigan Engineering Company, Montreal, Que., spoke on **Important Considerations in the Design and Construction of a Hydro-Electric Development.**

Mr. Heartz dealt with the optimum location for a power development, the economical arrangement of structures, the selection of equipment, and the control of costs during construction. He illustrated all of these points with particular reference to the La Tuque development in Quebec, on which he had a series of lantern slides and a movie entitled "From Rapids to Electricity."

The speaker laid particular emphasis on the necessity for careful scheduling of the work on large long term undertakings such as La Tuque. Among other things he showed how the various phases of the construction had to be done at the correct time because of seasonal water levels.

An interesting question period followed Mr. Heartz' presentation of his paper. The speaker was thanked on behalf of those present by E. V. Caton, chief engineer and manager of power production for the Winnipeg Electric Company. He was introduced by H. L. Briggs.

BOOK REVIEW

CHEMICAL PROCESS PRINCIPLES
Part II—THERMODYNAMICS*

O. A. Hougen and G. M. Watson. N.Y., Wiley; London, Chapman & Hall, 1947. pp. 437-804, illus., 8¾ x 5½ in., cloth, $5.00.

Reviewed by W. H. GAUVIN†

To write a book which will be equally useful to the beginner and to the advanced student is admittedly a difficult undertaking. It is a tribute to the author's clarity and lucidity of presentation that they achieved this dual purpose so successfully. The same logical organization which characterized Hougen and Watson's earlier "Industrial Chemical Calculations" is again evidenced in the present work.

Although the authors obviously attempted to adapt their treatment to both the chemical engineering and the straight chemistry courses, there is little doubt that their emphasis on the industrial applications, the practical nature of their illustrative examples and the engineering viewpoint reflected in their discussions will particularly appeal to the technologist and the chemical engineer. Although given less emphasis, the theoretical aspects of chemical thermodynamics are nevertheless presented, helping the reader to grasp the underlying philosophy of the subject.

This book fills a definite gap between H. C. Weber's "Thermodynamics for Chemical Engineers", intended primarily for the undergraduate student, and B. F. Dodge's "Chemical Engineering Thermodynamics", which is definitely at graduate level. As such, it should make an excellent text-book for third and fourth year courses in Chemical Engineering Thermodynamics. The graduate student will find particular interest in Chapter XIV, "Thermodynamics of Solutions" and Chapter XVII, "Thermodynamics Properties from Molecular Structure", but may have to consult other texts to supplement the remaining chapters.

One of the unique features of this book—and one which greatly enhances its value—results from the authors' conviction that Thermodynamics should be regarded as a tool for the solution of practical problems. They never lose sight of this practical aim and, to that end, they have included a considerable wealth of data, tables, correlations and new generalizations. New methods of approximating thermodynamic properties are also given, which, up to now, could only be obtained through a time-consuming survey of the literature. This feature, combined with the clarity of the numerous illustrative examples, should make this text popular with practising engineers.

Owing to the presentation of this book as part of a series of three volumes, some topics pertaining to the First Law and to Thermochemistry—and which are generally included under the heading of Thermodynamics—will be found in Part I of the series. This, at first sight, might appear to involve the purchase of two books to cover one subject, but the objection is not very serious, considering the logical approach gained from this presentation. Other criticisms: lack of answers to the problems offered at the end of each chapter; no reference to the Thermodynamics of Fluid Flow; inclusion of a Mollier Chart for water would have been helpful.

The book is well bound, well presented, and remarkably free from typographical errors. The table headings are clear and the figures and diagrams both good. The quality of the paper is, however, mediocre.

*Part III—KINETICS AND CATALYSIS *will be reviewed in the May issue of* THE JOURNAL.—*Ed.*

†*Associate Professor, Chemical Engineering, McGill University, Montreal.*

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

ABSTRACTS

FUEL ECONOMY CONFERENCE OF THE WORLD POWER CONFERENCE.

THE HAGUE, SEPTEMBER 1947

The following are official summaries of papers presented at the Fuel Economy Conference. The complete texts of these papers, together with reports of the discussions on the Section in which they were included, will be published in the "Transactions of the Fuel Economy Conference". Enquiries may be presented to Mr. Norman Marr, Canadian Committee, World Power Conference, Laurentian Building, 54 Albert Street, Ottawa, Ontario.

ELECTRIC WARMING OF BUILDINGS IN NORWAY.

Alf O. Hals. The Hague, Fuel Economy Conference of the World Power Conference, 1947. (Fuel Economy Conference. Section C5 Paper No. 2).

An account is given of the development of space heating by electricity in Norway. This originated from the desire to replace imported fuel by water power, but an important consideration is that appropriate electric heating installations lead to an improvement in housing conditions. The various forms of heating apparatus and regulating devices in use are described. Panel and tubular heaters are most commonly used at present. Experience with dwellings has shown that about 3.0 kWh is needed to replace 1 kg. coke in the boilers of a hot water heating plant. In buildings occupied only for a part of the day, this energy consumption may be substantially reduced by automatic operation. Surplus power is to a considerable extent utilized for space heating by means of various kinds of apparatus, especially electrode boilers having fuel-fired boilers as a supplement. When the energy is used in this manner, approximately 5 kWh is needed for replacing 1 kg. coal or coke.

DISTRICT HEATING AND COMBINED POWER-HEAT GENERATION IN DENMARK.

A. K. Bak and N. Chr. Geertsen. The Hague, Fuel Economy Conference of the World Power Conference, 1947. (Fuel Economy Conference Section C5, Paper No. 4).

. . . The city of Copenhagen has had district heating for some twenty years, using both steam and hot water as means of distribution. In the paper are given some details of an investigation, which indicate that considerable savings may be obtained by district heating on a large scale, and as a result of this investigation it has been decided to erect a new combined power-heat plant and further to rebuild an existing plant for power-heat generation. It is estimated that when all areas in Copenhagen suitable for district heating have been covered to the extent of 60 per cent of the total maximum requirements, a total of about 400 million kWh per year may be generated on back pressure operation resulting saving in fuel imports of about 160,000 tons annually.

Where district heating is used for house heating purposes only, hot water distribution with an outgoing water temperature of 70° to 115°C. (158° to 239°F.) is preferred. Steam distribution is used where a higher temperature than can be obtained by hot water is necessary. High pressure hot water with 130° to

180°C. (266° to 356°F.) temperature has not so far been used in Denmark and does not seem to give any advantages compared with the two other systems.

In order to obtain a correct picture of the advantages of district heating, power and heat should each carry their proper share of the costs; a method of dividing these costs is suggested in the paper.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARD FOR COPPER AND BRASS TUBES FOR GAS INSTALLATION WORK AND GAS LIGHTING FITTINGS. BS 1401-3:1947.

London, British Standards Institution. 2/-.

These new standards have been adapted and amended from BS 659, 885, and 886 to suit the special requirements of the Gas Industry. BS 1401 is for copper tubes, plain or screwed as may be required, for installation work and also for gas lighting fittings. BS 1402 is for annealled brass tubes for installation work normally screwed. BS 1403 is for brass tubes for gas lighting fittings normally screwed; these tubes are intended for the manufacture of pendants, brackets and other lighting fittings and are somewhat stiffer than for installation work. Each standard includes tolerances as to size, and prescribes tests.

BRITISH STANDARD FOR ROTARY SHAFT OIL SEAL UNITS (RELATED DIMENSIONS). BS 1399:1947.

London, British Standards Institution. 2/-.

This new British Standard deals with the dimensions associated with the fitting of Rotary Shaft Oil Seal Units. The standard classifies oil seal units and gives a list of units for shaft diameters from 0.25 to 7.0 inches in conjunction with housing diameters from.75 to 8.0 inches. Limits and maximum corner radii in housings, shaft sizes, lead-on chamfers and relative positions of sealing lips are given.

CANADA YEAR BOOK, 1947:

Dominion Bureau of Statistics, Ottawa, 1947. 1239 p., illus., 9 x 6½ in., cloth, $2.00.

The Canada Year Book is the "official statistical annual of the resources, history, institutions, and social and economic conditions of the Dominion". It is a reference book of data on all aspects of Canada. The introduction is written for the purpose of giving a co-ordinated economic picture of the country's conditions. Many charts and statistical tables are included in the text of the book, as well as maps and illustrations. There is some historical material, although the contents are mainly devoted to recent developments in Canadian commerce, finance, government, trade and industry, culture and national defence.

CANADIAN STANDARD SPECIFICATION FOR POWER TRANSFORMERS. CSA C88-1947:

Ottawa, Canadian Standards Association, 1947. $1.00.

In this specification, the term "Power Transformer" applies to 25 and 60 cycle, oil- or liquid-filled transformers, with capacity above 200 kva, in all voltage classes and also in all kva ratings above 15,000 volts. When used for power purposes, the term includes auto-transformers, net-work transformers, and regulating transformers, insofar as it applies.

INTERNATIONAL CIVIL AVIATION ORGANIZATION CONSOLIDATED TABLES OF AGREEMENTS AND CONTRACTS REGISTERED BY THE ORGANIZATION (January 1, 1946-December 31, 1947):

International Civil Aviation Organization, Montreal, 1948. 90 p., 14 x 8½ in., paper, 25c. (ICAO·DOC 5094—LGB/1).

This document is the fourth edition of the consolidated lists of agreements and contracts filed with the Organization up to the end of the year 1947, either during the Interim period or since the establishment of the permanent Organization. In the future, these consolidated lists will be published only at intervals; but supplements to the present document and in the same form will be issued every six months.

SOIL FREEZING AND FROST HEAVING WITH SPECIAL APPLICATION TO ROADS AND RAILROADS:

Fil dr. Gunnar Beskow. Evanston, Ill., Northwestern University, 1947. 145 p., illus., 11 x 8½ in., paper, $3.00. (Swedish Geological Society 26th Year Book No. 3, Series C, No. 375).

This book represents the culmination of exhaustive research sponsored by the Swedish Government over a period of more than ten years. The text covers the fundamental principles of frost action with application to highways and railroads. Translation has been as literal as possible to avoid any misinterpretation of the author's meaning, and the author has written a special supplement for the English translation summarizing progress in frost action in the Scandinavian countries in the last ten years. The book is well illustrated and has many charts and diagrams.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

CLAY PIPE ENGINEERING MANUAL.

Clay Sewer Pipe Association, Inc., 1105 Huntington Bank Bldg., Columbus 15, Ohio, 1946. 159 p., illus., diagrs., tables, maps, 9¼ x 6 in., cloth, $3.00.

Containing engineering reference data applicable to the design of sewers, drains, and other construction projects in which clay pipe is used, this volume provides a practical reference source for the engineer, constructor or user. Sanitary sewer systems and storm water drainage systems are discussed. Subsoil, roadway, airport and railroad drainage systems are considered. A section is included on commonly used constants and tables.

COMPRESSED AIR HANDBOOK. Applications, Equipment, Engineering Data and Test Procedure.

Compressed Air and Gas Institute, 90 West Street, New York, 1947. 387 p., illus., diagrs., charts, tables, 9 x 6 in., cloth, $3.00.

This volume is an authoritative guide for the proper installation, use and maintenance of air compressors and air-actuated equipment. Divided into five parts, the first presents a graphic account of the many common uses of compressed air. The types of machinery used for compressing air are illustrated and described in part two, while part three is devoted to a discussion and illustrations of air-operated devices and mechanisms. Suggestions and data on the selection, installation, operation and care of the compressed air plant are given in part four. The final section contains engineering data and standards established by the Compressed Air and Gas Institute.

ENGINEERING TESTS: CIVIL, MECHANICAL and ELECTRICAL. (Arco Civil Service Series.)

A. Liebers. Arco Publishing Company, 480 Lexington Ave., New York 17, N.Y., 1947. 49 p.; Civil Engineering Test Questions, Sample Examinations, 24 p., diagrs., tables, 10½ x 8 in., paper, $2.50.

This volume presents a careful selection of Civil Service engineering tests with answers, for the use of those who wish to enter public service. The various types of examination questions are demonstrated, acceptable work methods are indicated, and sample examinations with the time limits are included for self-checking.

IMPROVING SUPERVISION.

F. Cushman and R. W. Cushman. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 232 p., tables, 7½ x 5 in., cloth, $2.50.

Of interest to foremen and supervisors, this book contains a composite analysis of their responsibilities in a wide variety of industrial and business organizations. It has been designed for "follow-up" reading in connection with supervisory training programs. The basic philosophy of the whole problem of improving supervision is discussed, and the supervisory job is analyzed. Special emphasis is placed on human relations problems.

LIGHT METALS IN STRUCTURAL ENGINEERING.

L. Dudley. Published for Temple Press Ltd., Bowling Green Lane, London, E.C.1, by The English Universities Press Ltd., St. Paul's House, Warwick Square, London, E.C.4, 1947. 216 p., diagrs., charts, tables, 8¾ x 5½ in., cloth, 30s.

The important principles of the subject of "strength of materials" are covered, with emphasis on the application of these principles to problems involving the use of aluminum, aluminum alloys and magnesium alloys. The book covers much of the information required for the examinations in strength of materials set by the various British professional engineering institutions. Calculus has been used in the explanation of theory, but an understanding of this branch of mathematics is not essential for the majority of the problems and worked examples.

NOMOGRAPHY.

A. S. Levens. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948. 176 p., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $3.00.

Of interest to the scientist and practising engineer, this book presents fundamental principles of the design and theory of an important graphical method. Emphasis is placed on the geometric method of development, and after the theory is explained, short-cuts are described. A knowledge of algebra, plane geometry, and logarithms is assumed. One chapter is devoted to the use of determinants in alignment chart work. Practical examples of charts and a selected bibliography are included.

PATENT NOTES FOR ENGINEERS.

Published by RCA REVIEW, Radio Corporation of America, RCA Laboratories Division, Princeton, New Jersey, 1947. 165 p., diagrs., tables, 9¼ x 5¾ in., cloth, $2.50, plus $0.20 postage if outside of United States.

First in a new series of books on subjects of general engineering interest, this volume represents an effort to bridge the gap between engineers, research workers, and inventors generally, and their patent attorneys. Statutory inventions are treated at length. Practical suggestions are offered for protecting inventions prior to the filing of patent applications and thereafter, including the prosecution of patent applications, interference actions, and ownership questions.

PHILIPS RESISTANCE WELDING HANDBOOK.

Philips Industrial (Philips Lamps Ltd.), Century House, Shaftesbury Ave., London, W.C.2, England, 1947. 210 p., illus., diagrs., charts, tables, 9 x 5½ in., cloth, 10s. 6d.

Dealing with the integration of resistance welding into the general process of production, this manual is of interest to those who wish to know practical applications. It is not intended to be a technical manual for the design of resistance welding machines. Welding equipment and principles, metallurgy of resistance welding, auxiliary equipment, and planning for resistance welding are the main topics covered. The reader should be familiar with the principles of electricity, magnetism, and general engineering.

POWDER METALLURGY, ITS PHYSICS AND PRODUCTION.

P. Schwarzkopf. Macmillan Company, New York, Toronto, 1947. 379 p., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $8.00.

Covering the entire field of powder metallurgy, this volume contains information on the industrial processing of metal powders and the products obtainable. The theories on which powder metallurgy is based are also discussed, as well as the latest developments and future possibilities. The available literature is reviewed, and bibliographies on processing, products, principles and possibilities for the future are included. It is not intended as a text, but rather represents the workbook of an experienced powder metallurgist.

PROBLEMS OF ACCELERATING AIRCRAFT PRODUCTION DURING WORLD WAR II.

A report by T. Lilley and others. Harvard University, Graduate School of Business Administration, Division of Research, Boston, Mass., 1947. 112 p., charts, tables, 11 x 8½ in., paper, $1.50.

This report analyzes the types of time-consuming problems which had to be solved before wartime production goals could be reached. Problems discussed include airframe and engine production, company management, facilities, materials and manpower. The intention is to provide not only a historical survey, but also a helpful guide to the solution of normal administrative problems.

SCIENCE AND ENGINEERING OF NUCLEAR POWER.

C. D. Coryell and others, edited by C. Goodman. Addison-Wesley Press, Inc., Cambridge 42, Mass., 1947. 503 p., diagrs., charts, tables, 11 x 8 in., cloth, $7.50.

A basic treatment of nuclear pile design and its practical application, containing as well the background material necessary for their understanding. Allied subject such as control, monitoring, the chemistry of heavy elements, and fission products are also treated. The appended Segré Isotope chart contains a summary of some of the more important properties of nuclei. Written for the non-specialist, it is of particular interest to engineers dealing with industrial applications of nuclear energy.

SOCIETY FOR EXPERIMENTAL STRESS ANALYSIS, PROCEEDINGS, VOL. 5, NO. 1.

Edited by C. Lipson and W. M. Murray. Society for Experimental Stress Analysis, Central Square Station, P.O. Box 168, Cambridge 39, Mass.; published and distributed by Addison-Wesley Press, Inc., Kendall Square, Cambridge 42 Mass., 1947. 136 p., illus., diagrs., charts, tables, 11¼ x 8½ in., cloth, $6.00.

The fifteen papers contained in this volume deal with various aspects of the following subjects: strain gauges; impact testing; telemetering; X-ray analysis; fatigue and other stresses. Also included are a list of members, and contents pages for volumes II, III and IV.

SPECTROCHEMICAL ABSTRACTS, VOL. III, 1940-1945.

E. H. S. van Someren. July, 1947. Adam Hilger Limited, 98 St. Pancras Way, London, N.W.1, England. 112 p., 9½ x 6 in., paper, 12s. 6d. (obtainable in U.S.A. from The Jarrell-Ash Company, 165 Newbury St., Boston, Mass., $3.50).

The abstracts are listed by subject and author. Indexes to elements in non-metallic and metallic compounds are presented. The subject index includes such topics as biological materials, ceramics, gases and liquids, minerals and ores, metals and non-metallic solids. Apparatus, methods and theory are considered, and reviews, summaries and books are listed with annotations.

STANDARD SPECIFICATIONS FOR HIGHWAY MATERIALS AND METHODS OF SAMPLING AND TESTING. 5th ed.
Part I. Specifications, 272 p.
Part II. Methods of Sampling and Testing, 361 p.

Adopted by American Association of State Highway Officials, 1220 National Press Bldg., Washington, D.C., 1947. Illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.00 per set.

Volume I of this compilation presents specifications for highway materials classified under the following headings: hydraulic cement; bituminous materials; aggregates; brick; expansion joint fillers and asphalt plank; culvert and sewer pipe; bridge paints; reinforcing steel and wire rope; metallic materials for bridges; and miscellaneous. A total of 104 specifications are given, including two new and thirteen revised ones. Volume II covers standard methods of sampling and testing highway materials, again classified under the same headings with the important addition of soil testing. As a result of revision and simplification, all of the test procedures are now in almost complete agreement with the corresponding ones issued by the American Society for Testing Materials. Three new standards bring the total in the present volume up to 106. Lists of specifications and standards in numerical sequence are included.

UNDERSTANDING VECTORS AND PHASE.

J. F. Rider and S. D. Uslan. John F. Rider Publishing, Inc., 404 Fourth Ave., New York 16, N.Y., 1947. 153 p., diagrs., tables, 7¼ x 5¼ in., paper, $0.99.

Intended for those without an engineering background, this book deals with vectors and phase as applied in the field of radio communication. Such knowledge is necessary to the understanding of many of the technical articles in radio magazines which have been written from the theoretical viewpoint. A short bibliography of basic texts in mathematics and communications is presented.

VALVE GEAR DESIGN.

M. C. Turkish, Eaton Manufacturing Co., Wilcox-Rich Division, Detroit, Michigan, 1946. 130 p., illus., diagrs., charts, tables, 10¼ x 7 in., cloth, $6.00.

While the general subject of valve gear mechanisms is covered, emphasis is placed on the mathematical aspects of cam design and performance which occupy some three-fourths of the book. Detailed examples and extensive tables add to its practical value in solving problems encountered in valve gear design. The material presented is based on the author's considerable experience in both the production and research aspects of valve gear for all types of internal-combustion engines.

YEARBOOK OF THE HEATING AND VENTILATING INDUSTRY.

Published by Technitrade Journals Ltd., 8 Southampton Row, London, W.C.1, 1947. 139 p., diagrs., charts, tables, 8¾ x 5½ in., cloth, 5s.

Providing technical, contractual and other trade information, this volume is of interest to architects, engineers and others who have contact with heating and ventilating contractors. Technical articles in this edition are on thermal insulation, district heating, technical education, and standardization. Wage rates and apprenticeships are discussed from the British viewpoint. A list of corporation members, a buyer's guide, and a trade name index are included. Additional technical information is to appear in subsequent issues.

Although not available in the Institute Library, inquiries concerning the following new books will be welcomed there or may be sent direct to the publishers.

ANALYTICAL EXPERIMENTAL PHYSICS.

H. B. Lemon and M. Ference, Jr. University of Chicago Press, Chicago, Ill. rev. ed., 1946. 588 p., illus., diagrs., charts, tables, 12 x 9 in., cloth, $8.00.

The whole range of basic physics is effectively covered in this new textbook. The fundamentals of the major divisions —mechanics; heat; electricity and magnetism; wave motion, sound and light—are covered in detail, with clear, brief treatments of more advanced topics, for example: the production of very low temperatures; nuclear fission; the electron microscope; the scientific aspects of music; etc. The use of successive frames of motion-picture film in demonstrating experiments is a special feature. The text, queries, problems, and illustrations have all been designed to provide a clear, readable presentation of a customarily difficult course in order to stimulate the student's interest. The book is, of necessity, large but provision is made for individual selection of the material to be used.

DIRECTORY OF STEEL FOUNDRIES IN THE UNITED STATES AND CANADA.

Steel Founders' Society of America, 920 Midland Bldg., Cleveland, Ohio, July 1946. 177 p., 9 x 6 in., paper, $10.00.

The steel foundries of the United States and Canada are listed alphabetically in Sections I and II respectively. The information given includes personnel, type and size of castings produced, available melting and annealing equipment, number of employees, and capacity figures. An index of United States foundries by States is included as Section III.

GALVANIZING HANDBOOK:

J. R. Daesen. Reinhold Publishing Corp., New York, 1946. 166 p., illus., diagrs., charts, tables, 10¼ x 7 in., cloth, $5.25.

The basic principles involved in the hot dip galvanizing of iron and steel are presented graphically, with photographic examples (mainly microphotographs) to demonstrate the nature and cause of both satisfactory and defective work. Particular attention is paid to the preparation of the surface to be covered and to the proper control of the galvanizing procedure. The final chapter deals with hot dip coatings with other metals than zinc. In addition to the chapter references a brief bibliography on hot tinning is appended.

MAGNESIUM FABRICATION.

L. B. Harkins. Pitman Publishing Corporation, New York and Chicago, 1947. 149 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $2.75.

This practical handbook presents authoritative data for all phases of the fabrication of magnesium-alloy sheet, extrusions and tubing into the finished product. Important topics covered include machining, forming, heat treating, welding joining, surface finishing and protection. The techniques peculiar to magnesium are emphasized, together with notes on fire control and protection against corrosion. The major producers and fabricators in the industry are listed.

(The) MODERN DIESEL:

O. F. Allen, Prentice-Hall, Inc., New York, 1947. 268 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

Presenting the history and background of the diesel engine, this volume relates its evolution from the first heavy, awkward-looking machine to the light-weight, beautifully designed modern diesel. Essentially descriptive, the text presents no design information, but utilizes some 185 illustrations to show the accomplishments of the early days, the modern diesels, and their applications on land, in the air and on the sea.

PETROLEUM PRODUCTION ENGINEERING, Oil Field Development.

L. C. Uren, 3 ed. McGraw-Hill Book Co., New York and London, 1946. 764 p., illus., diagrs., charts, tables, 9 x 5¾ in., cloth, $7.00.

This standard text covers every phase of petroleum production engineering up to the point at which the wells are ready to produce. It sketches briefly the problems of petroleum exploration, discusses the principles and practices of oil-field development, and describes the methods and equipment used in modern well drilling. Special chapters are devoted to oil-field hydrology, fishing tools and methods, well completion, well records and surveys. A selected bibliography accompanies each chapter, and a list of illustrative motion films is given. Oil field exploitation is dealt with in a companion volume.

PLASTICS FOR ELECTRICAL AND RADIO ENGINEERS.

W. J. Tucker and R. S. Roberts. 2 ed Technical Press, Gloucester Road, Kingston Hill, Surrey, England, 1947. 167 p., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 15s.

This volume covers the chemistry of plastics and their application in the electrical industry. The plastic materials discussed are tabulated and analyzed. The terms and definitions used are explained, and guidance is given in designing and manufacturing plastic materials. Applications in the construction of transformers, coils and many other radio and electrical components are presented, as well as applications in the design and manufacture of sleeving, covered wire and cables.

PLASTICS MOLD DESIGN.

C. C. Sachs and E. H. Snyder. Murray Hill Books, New York and Toronto, 1947. 77 p., plus 14 charts, illus., diagrs., tables, 12¼ x 9 in., fabrikoid, spiral binding, $4.50.

Part I briefly covers drafting-room practice and materials for mold construction. Part II takes up the actual design procedures for compression molding, injection molding, and extrusion dies, including the causes and remedies of faults. A pocket at the back of the book contains a group of full-sized, completely dimensioned working drawings of plastics molds for the use of the student, engineer, or designer.

PRACTICAL EMULSIONS.

H. Bennett. Chemical Publishing Co., Brooklyn, N.Y., 1947. 568 p., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $8.50.

Dealing with emulsions for the practical worker, this book touches only lightly on the theoretical aspects, and concentrates on the art of making and applying emulsions. The material on emulsifying agents, their formulation, equipment used, and dispersing and wetting agents remains much as in the first edition. New material on partial fatty acid esters of polyhydric alcohols, as well as a special section presenting a symposium on industrial emulsions, has been added. These emulsions are used in the leather industry, synthetic latex, polishes, cosmetics, paints, dyeing and coloring. More emulsion formulas have also been included.

PRACTICAL GUIDE TO PREFABRICATED HOUSES.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

March 31st, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the May meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BEAUBIEN—CLAUDE PANET, of Quebec City, Que. Born at Montreal, March 2nd, 1908. Educ.: S.B., (Business & Engrg. Adm.), M.I.T., 1934; with Aluminum Co. of Canada as follows: 1935-36, apprent.; 1936-39, wire mill, rolling mill, reduction plant; 1940-42, mgr., personnel, Shaw. works; 1943-45, mgr., personnel, Arvida; 1945 to date mgr., Quebec sales office, Quebec City.

References: DeG. Beaubien, McN. DuBose, P. E. Radley, R. Brosseau, B. E. Bauman, R. J. Wayland.

CARRUTHERS—V. HALLAM, of Calgary, Alta. Born at Harcourt, N.B., June 27, 1893. Educ.: B.A.Sc., Toronto, 1923; R.P.E., Alberta; 1912-14, rodman, topo., I.C.R., Moncton; 1919-25, (summers), transitman, C.P.R., 1924, (4 mos.), transitman, Illinois Central, Chicago; with C.P.R., as follows: 1925-38, roadmaster, western lines, 1938-46, divn. engr., Revelstoke and Edmonton; 1946 to date, dist. engr., Board of Transport Comm., Calgary, Alta.

References: H. R. Younger, C. H. Fox, R. A. Emerson, J. F. McDougall, D. G. Kilburn.

DUSKES—OSCAR, of Montreal, Que. Born at Montreal, May 10, 1914. Educ.: B.Eng., (Mining), McGill, 1937; Member, C.I.M.M.; 1934-35-36, (summers), Dome Mines, Wright Hargreaves Mines & Geo. Survey; 1937-38, engr. i/c operations in field, Central Chibougamau Mines; 1938-42, surveyor and mining engr., Noranda Mines; 1942-46, Capt., R.C.E.; at present res engr., constrn., C.N.R., Point St. Charles, Montreal, Que.

References: B. Wheelwright, R. O. Stewart, H. F. Finnemore, J. D. Sylvester, W. A. Gilmour.

EDWARDS—BRUCE RUSSEL, of Arvida, Que. Born at Toronto, Ont., Aug. 2, 1917. Educ.: B.A.Sc., (Metall.), Toronto, 1941; with Defence Industries, as follows: 1941-43, asst. supvr., metal and chemical lab., Verdun plant, 1943-45, supvr., 1945-47, sr. supvr., operating dept., Chalk River project; 1947, (6 mos.), sr. supvr., operating dept., National Research Council, Chalk River project; and at present devel'pt. engr., Aluminum Co. of Canada, Arvida, Que.

References: F. D. Nasmith, R. W. Lewis, G. M. Mason, C. J. Tanner.

ENGBLOOM—GUSTAVE ADOLPHE, of Calgary, Alta. Born at Wetaskiwin, Alta., Sept. 19, 1920. Educ.: B.Sc., (Elect.), Alta., 1943; R.P.E., Alta.; 1942, (3 mos.), jr. instructor, Univ. of Alta.; 1943-46, Tech. Officer, D.E.S., Dept. Naval Service, Ottawa; Elect. Officer, H.M.C.S. Micmac; 1946 to date, jr. engr., Calgary Power Ltd.

References: H. Randle, T. D. Stanley, D. A. Hansen, H. B. LeBourveau, F. Tempest.

FAIRFULL—PETER FREDERICK, Constructor Cmdr., R.C.N. (R), of Victoria, B.C. Born at Renfrew, Scot., Jan. 8, 1903. Educ.: Tech. Coll., Paisley, naval arch. course, 1924; 1918-26, apprent. and ship dftsman., Wm. Simons & Co., engrs. and shipbuilders, Scotland; 1926-35, dftsman. and supvrn. of constrn., Chapman & Oxley, architects and engrs., Toronto; 1935-40, res. arch. and bldg. supvr., Toronto Star; 1940-42, chief engr. and chief dftsman., Toronto Shipbldg. Co.; 1942 to date, Res. Naval Overseer on new constrn. and conversion of ships, Dept. National Defence; and at present Mgr., Constructive Dept., H.M.C., Dockyard, Esquimalt, B.C.

FOR TRANSFER FROM JUNIOR

HUNT—FREDERICK ALVIN, of Lakeview, Ont. Born at Wentworth Co. Ontario on March 14, 1918; Educ.: B.Sc. (Civil) Queen's 1940; R.P.E. Ontario; 1940-42, Mtce. inspector, Canadian National Railways, Toronto; 1942-46, Lieut. Royal Canadian Engineers Railway Operating Gp.; 1946 to date, asst. engr., Toronto Terminals Division, Canadian National Railways. (St. 1939, Jr. 1946)

References: M. W. Huggins, D. S. Ellis, E. G. Hewson, E. R. Logie, B. Wheelwright.

LIBRARY NOTES

(Continued from page 252)

one American pre-fabrication experts, the volume presents an overall picture of this field. A history of prefabrication is given and its advantages and problems are discussed. More than 100 photographs show the accomplishments possible using prefabrication technique. Facts about the companies and the type of house they build are noted. A directory of companies specializing in prefabricated houses, and a checklist of things to look for in buying a home are included.

PROTECTIVE AND DECORATIVE COATINGS. Vol. 5, Analysis and Testing Methods.

Edited by J. J. Mattiello. John Wiley & Sons, New York; Chapman & Hall, London, 1946. 662 p., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $7.00.

The fifth in a series, this book considers the industry's problems in analysis and testing. The five sections are by various authorities in the respective fields: 1. "The analysis of resins" describes current procedures and methods, such as radiography, x-ray diffraction, ultraviolet, etc., and shows how the physiochemical properties of resins are employed for analytical purposes; 2. "The chemical analysis of drying oils" is presented as a routine analysis as well as a means of identification; 3. "Laboratory testing of metal finishes" is thoroughly covered; 4. The determination of the "spectral characteristics of pigments in the visual and infra-red bands" by spectrophotometric and photographic methods is described; 5. "Resinography", the graphic study of resins and plastics, is developed as analogous to metallography in the study of metals.

SEQUENTIAL ANALYSIS.

A. Wald. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 212 p., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.00.

A full discussion is offered of the new statistical technique known as the Sequential Probability Ratio Test. The author explains the fundamental theory, the applications and potentialities of this method of analysis. Among the advantages stated, as against other procedures for testing a statistical hypothesis, is that it "controls the possible errors committed by a wrong decision as effectively as the best current procedure based on a predetermined number of observations, yet it substantially reduces the number of observations necessary." Comparison with other procedures is made, and through a discussion of possible approaches to problems a groundwork is provided for further research.

STEAM AND GAS ENGINEERING.

T. E. Butterfield, B. H. Jennings and A. W. Luce. 4th ed. D. Van Nostrand Co., Toronto and New York, 1947. 588 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.00.

This new edition follows the policy of the previous ones in giving the latest facts and best procedures in elementary steam and gas engineering. The considerable revision includes a shifting of the order of presentation of material for a more logical approach; the work on steam turbines is expanded, while the treatment of reciprocating engines is further condensed; and the chapters on thermodynamics, gas properties, and gas cycles have been enlarged. A new chapter on the gas turbine has been introduced. The text provides a full treatment of heat power engineering for students taking only one heat-power course, or an introductory course for those specializing in the field. *(Continued on page 262)*

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield St., Montreal—Telephone BElair 3019—may be arranged *by appointment.*

Situations Vacant

CHEMICAL

CHIEF CHEMIST required to co-ordinate and supervise quality control, research and development work in laboratories of large industrial organization engaged in manufacture and processing of soaps, cosmetics, dentifrices, edible fats and oils, etc. Salary open. Apply to File No. 4068-V.

GRADUATE CHEMICAL ENGINEERS OR CHEMISTS required by an industrial chemical plant in Montreal area. Preferably with experience in production and the operation of chemical equipment such as filters, presses, etc. Must be able to organize work and direct workmen. Salary $200 up. Apply to File No. 4071-V.

ELECTRICAL

ELECTRICAL ENGINEER, recent graduate, with some practical experience required as technical assistant. Must have working knowledge of electrical terms and be capable of writing concise authentic reports of industrial conferences. Salary open. Apply to File No. 4056-V.

ELECTRICAL ENGINEER required by an industrial firm in the Montreal area. Duties include follow up of electrical installations and planning also layout and design. Salary open. Apply to File No. 4061-V.

GRADUATE ELECTRICAL ENGINEER with a minimum of 2 years practical experience to assist in electrical engineering design work. Field work on construction and maintenance of structures, service and installation of equipment. Required by Manitoba City. Salary $226.00 to $257.00. Apply to File No. 4069-V.

ELECTRICAL ENGINEER, required to act as Project Engineer by an industrial organization with Head Office in Montreal. Duties include the design of industrial electrical layouts and the preparation of material requisitions for industrial installations. Salary open. Apply to File No. 4085-V.

MECHANICAL

MECHANICAL ENGINEERS with experience in the design of hydraulic turbines, valves, penstocks, surge tanks and associated equipment required by large manufacturer in Montreal to participate in expanding program of hydro electric development. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEER with minimum of eight years experience in the design of heavy mechanical equipment required by well established firm in Montreal for general supervision and checking. Must be alert and aggressive. Salary open. Apply to File No. 4074-V.

MECHANICAL ENGINEERS with experience in estimating or design required by well known general engineering firm in Montreal. Good future for those with right qualifications. Salary commensurate with ability. Apply to File No. 4074-V.

MISCELLANEOUS

JUNIOR GRADUATE ENGINEER with civil or mechanical qualifications. Moderate salary with excellent prospects for advancement. Required for Canadian University in Montreal for its department of buildings and grounds. Apply to File No. 4057-V.

GRADUATE ENGINEER, preferably mechanical or electrical background, required for drop forging plant operation and production in Province of Ontario, by large steel company with head office in Ontario. Good commercial sense essential. Salary open. Apply to File No. 4062-V.

CHIEF ENGINEER, mechanical background required by a specialized industrial plant in the Montreal area. Work covers mechanical design, preparation of work drawings, bills of materials, specifications and the ordering of all materials for contracts also design of necessary tooling. Minimum salary $450.00. Apply to File No. 4066-V.

POWER STATION OPERATOR with about five years' experience principally in operation and maintenance of turbines and mechanical equipment of hydro-electric plants required by public utility in Brazil. Preferably not over 30 and single but will consider married man without minor dependents. Replies held in strictest confidence. Salary open. Apply to File No. 4073-V.

MECHANICAL OR CIVIL ENGINEER with at least four years experience in stress analysis and vibration required by one of Canada's leading manufacturers of heavy mechanical equipment. Considerable scope for man of proper qualifications. Salary open. Apply to File No. 4074-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and pilot plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knowledge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER, recent graduate, required to study and become experienced with industrial products fabricated from carbon or graphite by firm in Toronto area. Position to eventually lead to sales. Salary $180 to $200. Apply to File No. 3958-V.

CHEMICAL ENGINEER, recent graduate, is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp and paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Technical and Development Department. Several years experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

CHEMICAL ENGINEER, experienced in use of physics and mathematics, under 30 years of age, required by industrial and chemical organization with Headquarters in Montreal. Duties include development work and study explosives and chemistry and hydro-dynamics. Salary open. Apply to File No. 3995-V.

SENIOR CHEMICAL ENGINEER OR CHEMIST, required by leading Paper Manufacturer in Eastern Canada. Applicant should have some experience in Paper Mill Control work. This position offers plenty of scope for advancement. Salary open. Apply to File No. 4013-V.

CHEMICAL ENGINEER required by a major Canadian Company located in Toronto as Technical Service Man. 25 to 35 years old. Definite sales personality. Position will include 6 to 12 months' training. It will carry the responsibility for servicing all types of adhesives to industries throughout Canada. Salary open. Apply to File No. 4044-V.

CIVIL

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual, may be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

CIVIL ENGINEERS with some experience on design and field work required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEERS required as draughtsmen in bridge department of large transport company. Preferably with experience in steel, concrete and timber construction. Location Montreal. Salary $200-$300. Apply to File No. 3884-V.

CIVIL ENGINEER, required in New Brunswick. Must be qualified designer of miscellaneous public utility buildings in frame and masonry construction. Thorough working knowledge of timber, reinforced concrete and steel framing essential, knowledge of the design of various types of heating system and plumbing. Salary open. Apply to File No. 3887-V.

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewerage Department also construction of a general nature for the Electric Light Department. Salary open. Apply to File No. 3930-V.

CIVIL ENGINEER, required by a Steel Company in Montreal for the design of reinforced concrete frame. Salary open. Apply to File No. 3931-V.

CIVIL ENGINEER, recent graduate, required to understudy City Engineer of a city in Western Quebec. Salary open. Apply to File No. 3966-V.

JUNIOR ENGINEER, preferably with civil background required for sales and service by a Montreal manufacturer of waterproofing compounds. Salary open. Apply to File No. 3968-V.

CIVIL ENGINEER required in Montreal with general knowledge of reinforced concrete and steel structures. Special knowledge of triangulation surveys, boundary surveys, also laws and procedure to be followed in regard to the purchase, transfer and registration of lands in Province of Quebec. Must be bilingual. Preferably veteran. Salary not less than $3,480. Apply to File No. 3987-V.

ELECTRICAL

ELECTRICAL ENGINEER, age 30-45, required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Must have sales training in electrical equipment instruments also experience as sales and service engineer. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER, recent graduate, required for the engineering staff of a paper mill in the Lake St. John area. Salary open. Apply to File No. 3507-V.

ELECTRICAL ENGINEER with considerable industrial experience required as a safety engineer by a public utility in the Montreal area. Bilingual preferred. Salary open. Apply to File No. 3654-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Preferably bilingual and familiar with rotating electrical equipment. Salary $200 up. Apply to File No. 3761-V.

GRADUATE ELECTRICAL ENGINEERS with 3 to 10 years experience in design operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced. Bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEER with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

SEVERAL EXPERIENCED ELECTRICAL DRAUGHTSMEN, for the design and layout of industrial power and control systems. Required by consulting engineering office in Montreal. Salary open. Good chance for advancement. Apply to File No. 3890-V.

JUNIOR ELECTRICAL ENGINEER, with practical experience in general manufacturing industries, required by an industrial organization in Ontario. Salary open. Apply to File No. 3904-V.

ELECTRICAL ENGINEERS, required for sales engineering work in Western Canada. Graduates with some selling experience preferred. Salary open, plus expenses. Apply to File No. 3915-V.

ELECTRICAL DRAUGHTSMAN, required by a firm of Engineer Contractors in Alberta for layout and plotting with a minimum of supervision. Should be accustomed to working with power lines to 2,300 volts and must be able to do lighting circuits, both overhead and underground. Salary $250 to $300. Apply to File No. 3972-V.

PROFESSOR IN ELECTRICAL ENGINEERING required by a Canadian University in the Province of Qubeec for fall 1948 semester. Preferably with teaching and practical experience in power, electrical machinery design, lab. etc. Bilingual preferred. Attractive salary available for right man. Apply to File No. 3982-V.

ELECTRICAL ENGINEERS, age 30 to 40, required for the Commercial and Distribution Department of large Hydro Electric Utility. Must have experience in electrical distribution. Salary open. Apply to File No. 4002-V.

ELECTRICAL ENGINEER experienced in Power Station, Transmission and Distribution design and installation. Permanence and advancement depending upon performance. Salary open. Apply to File No. 4024-V.

JUNIOR ELECTRICAL ENGINEER, required by a mining company in Northern Ontario. Salary open. Apply to File No. 4028-V.

ELECTRICAL ENGINEER with minimum of 5 years experience in paper industry, between 35-45 years of age, for responsible position with large newsprint manufacturing concern in Northern Ontario. Salary commensurate with qualifications. Living accommodation assured. Apply to File No. 4032-V.

ELECTRICAL ENGINEERS with some experience in research, design, and development, backgrounds in communications, electronics, power or physics are preferred. Required for the staff of a technical college in N.Y. state. Salary and rank will be commensurate with experience and training. Apply to File No. 4038-V.

DESIGNING ELECTRICAL DRAUGHTSMAN with experience on station design and layout required in Montreal by a pulp and paper mill. Experience in pulp and paper industry would be an asset, but not essential. Salary open. Apply to File No. 4046-V.

MECHANICAL

MECHANICAL ENGINEERS, preferably with design experience, are required for armament research and development in the Quebec area in a government establishment. Salary from $190.00. Apply to File No. 3401-V.

MECHANICAL ENGINEERS, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

JUNIOR MECHANICAL ENGINEER with knowledge of precision machine shop practice and aptitude for research work in metals and plastics required for an organization in Toronto for the production of artificial limbs. Must be veteran. Salary from $225. Apply to File No. 3675-V.

MECHANICAL ENGINEERS with at least five years experience in the pulp and paper industry required by an Ontario Paper Company. Salary open. Apply to File No. 3733-V.

MECHANICAL ENGINEERS required by a Pulp and Paper Mill at Powell River, B.C. Preferably with experience in plant design in the pulp and paper industry. Salary according to qualifications. Apply to File No. 3796-V.

MECHANICAL ENGINEERS with experience in plant layout and design or ventilation problems or general mechanical design, required by a firm in Quebec. Salary from $250. Apply to File No. 3818-V.

MECHANICAL ENGINEER, age 35-40 with considerable experience in design and layout of machinery and equipment, required by an organization with Headquarters in Montreal. Salary $300-$400. Apply to File No. 3820-V.

MECHANICAL ENGINEER with six to ten years experience in maintenance and engineering work required by alkali manufacturers in Ontario. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER, required by a manufacturer in Ontario for the plant operation staff. Salary open. Apply to File No. 3833-V.

MECHANICAL ENGINEER with knowledge of psysical metallurgy heat treatment, ability in stress analysis and design. Required for research work in B.C. Maximum salary $4,000. Apply to File No. 3865-V.

MECHANICAL ENGINEER, age 30-38, required for northern Ontario Paper Mill. Preferably with paper mill experience or experience in general layout and design. Knowledge of pumps capacities, piping, conveyors, estimating and structural design essential. Salary open. Apply to File No. 3891-V.

MECHANICAL ENGINEER, bilingual, with 4 or 5 years experience in sheet metal work required as Plant Manager by a manufacturer in the Province of Quebec. Salary open. Apply to File No. 3894-V.

MECHANICAL ENGINEER, age 25 to 35, experienced in industrial plant layout and machine design required by manufacturing firm in Brantford. Salary open. Apply to File No. 3907-V.

MECHANICAL ENGINEER, recent graduate, with some knowledge of heat exchanges, condensers, or any type of unfired pressure vessels required by an industrial organization in Montreal. Salary open. Apply to File No. 3976-V.

MECHANICAL ENGINEER, recent graduate, bilingual, with some experience in general plant work, required in Montreal. Industrial engineering experience would be useful. Duties include time-study in Standards Department. Salary open. Apply to File No. 3980-V.

MECHANICAL ENGINEER age 25 to 30 is required by a company in Shawinigan Falls to eventually act as Assistant Works Manager when qualified. Salary open. Apply to File No. 3985-V.

MECHANICAL ENGINEER, with experience in plant lay-out and knowledge of reinforced concrete, timber and steel design, required in an industrial manufacturing and processing plant situated 75 miles from both Ottawa and Montreal. Salary open. Apply to File No 3990-V.

MECHANICAL DESIGN DRAUGHTSMAN with experience in reinforced concrete and structural steel required by a mining company in Northern Ontario. Housing, available. Salary open. Apply to File No. 3994-V.

MECHANICAL ENGINEER, with 2 or 3 years experience, preferably bilingual, required as Mechanical Development Engineer by industrial and chemical organization with headquarters in Montreal. Duties will be conducting investigations on existing equipment and a certain amount of plant layout work and draughting. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER with 1 to 3 years experience in production, required as Industrial Engineer by industrial and chemical organization, with headquarters in Montreal. Duties include responsibility for conducting methods engineering studies using methods of process charts, time and motion study. Salary open. Apply to File No. 3995-V.

MECHANICAL ENGINEER, required by a Montreal manufacturer of machines and equipment for work consisting of general engineering and design in connection with the manufacture of pulp and paper machinery. Salary open. Apply to File No. 4000-V.

MECHANICAL ENGINEER must be bilingual, required by paper company for general duties in line with capabilities and interest. Position in very small community in Province of Quebec. Salary open. Apply to File No. 4020-V.

MECHANICAL ENGINEER required as assistant in Chief Engineers Department by large paper company. Paper experience essential. Some knowledge of French language would be helpful. Must be able to complete investigations and write reports. Age 28-40. Salary $350-$450. Apply to File No. 4022-V.

MECHANICAL ENGINEERS required in Ontario by a firm specializing in machine tools. Vacancies exist for Junior Salesman with ability and interest in sales engineering also engineer experienced in Production control. Salaries open. Apply to File No. 4026-V.

MECHANICAL DRAUGHTSMAN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for colliery plant, screening equipment, hoists, simple steel structures, etc. Salary $240.00 up depending upon ability. Apply to File No. 4030-V.

MECHANICAL ENGINEER preferably with heating and ventilating experience required in Montreal for design and draughting. Salary depending on experience. Apply to File No. 4034-V.

MINING

MINING ENGINEERS, with varied experience required by a firm in Quebec for general mine operation, exploitation and development work. Salary from $250. Apply to File No. 3818-V.

MINING ENGINEER with several years experience required by a company engaged in large scale asbestos production in Quebec. Salary open. Apply to File No. 3935-V.

MISCELLANEOUS

STRUCTURAL STEEL DRAUGHTSMAN AND CHECKERS, preferably graduate engineers but any experienced men acceptable, are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

GRADUATE ENGINEERS, required by an industrial and chemical organization with headquarters in Montreal for all phases of research, design, operation development, production and maintenance. Salaries open. Apply to File No. 3588-V.

SALES ENGINEER with wide engineering experience, wanted by a company in Toronto for the sale of textile machinery and construction equipment. Salary open. Apply to File No. 3639-V.

CHEMICAL OR METALLURGICAL ENGINEERS, from recent graduates up, required by a Quebec firm engaged in metal production for employment as production and development engineers. Salaries open. Apply to File No. 3693-V.

MINING AND METALLURGICAL ENGINEER, age about 30, with considerable experience, required by a manufacturer in the St. Maurice Valley. Salary open. Apply to File No. 3723-V.

STRUCTURAL STEEL DETAILER AND CHECKER with considerable experience, required for checking shop details by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

DETAILER AND DESIGNER for reinforcing steel with considerable experience, required by a steel fabricating firm in Montreal. Salary open. Apply to File No. 3740-V.

SALES ENGINEER, preferably bilingual required by a Montreal firm dealing in building materials. Salary from $200. Apply to File No. 3745-V.

GRADUATE ENGINEER, required by an electrical firm in Montreal to organize publicity department and edit trade journal. Salary open. Apply to File No. 3751-V.

STRUCTURAL STEEL DRAUGHTSMAN, qualified to detail and check all classes of structural steel, and to supervise draughtsmen in a large drawing office on the West Coast. Salary open. Apply to File No. 3777-V.

BRIDGE ENGINEER, qualified to be in charge of the design and supervision of the construction of highway bridges. Apply stating qualifications, experience, age and salary wanted. Apply to File No. 3780-V.

GRADUATE CIVIL OR MECHANICAL ENGINEERS with 3 to 10 years experience in design, cost estimates, draughting, and engineering studies for a large hydro-electric power house in Quebec. Salary $225 up, according to experience. Apply to File No. 3787-V.

STEAM PLANT ENGINEER for large concern in Eastern Townships, with at least 5 years practical experience. Must be familiar with thermo-dynamics, combustion control, steam turbines, mechanical refrigeration, hydraulics, etc. Permanent position and attractive salary for the right man. Apply to File No. 3791-V.

RECENT GRADUATES OR JUNIOR ENGINEERS, with mechanical background, required by a Montreal Engineering, fabricating and contracting firm for training purposes leading to sales and service. Area Montreal. Salary $175 up. Apply to File No. 3810-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 3811-V.

DRAUGHTSMAN, preferably with mechanical background, required by a manufacturer in Montreal for design work on electrical equipment. Salary open. Apply to File No. 3829-V.

DRAUGHTSMAN of the following classes: Architectural, piping layout, equipment layout, mechanical design, steam plant, heating, and ventilating electrical and plumbing required by an industrial organization in Montreal. Salaries open. Apply to File No. 3860-V.

STRUCTURAL STEEL CHECKER AND ONE DETAILER CHECKER, wanted for large fabricating plant in Vancouver, B.C. Age between 30 and 40 years preferred. Must be experienced. Give full information and references. Salary open. Apply to File No. 3862-V.

MECHANICAL, CIVIL OR CHEMICAL ENGINEER, recent graduate up, required for sales and service in Montreal Must be bilingual. Salary open. Apply to File No. 3867-V.

GRADUATE ENGINEERS required for all phases of research, design, operation, and development by an industrial organization with Headquarters in Montreal. Salaries open. Apply to File No. 3882-V.

STRUCTURAL ENGINEER, preferably a graduate civil engineer with experience in the design of mill buildings required by a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 3896-V.

DETAILERS OR JUNIOR DESIGNERS on mechanical or sheet metal design required by an industrial organization in Ontario. Salary open. Apply to File No. 3904-V.

INDUSTRIAL ENGINEERS, with production experience required by a firm of industrial consultants in Montreal. Preferably with experience in time study, cost control, etc. Salary around $400 depending on qualifications. Apply to File No. 3910-V.

RECENT GRADUATE required by a Montreal contractor for survey and making of plans. Must be bilingual. Salary $175 up according to experience. Apply to File No. 3933-V.

TWO METALLURGICAL ENGINEERS AND ONE CHEMICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in Research, Development and Production. Salary open. Apply to File No. 3942-V.

SALES ENGINEER required by well known manufacturer of mechanical equipment to solicit industrial accounts throughout the Province of Quebec. Applicants must reply giving full details, age, training, etc. Salary open. Apply to File No. 3951-V.

INDUSTRIAL ENGINEER thoroughly experienced in time study, standard data and wage incentive installation and administration required for firm in Quebec. Salary open. Apply to File No. 3952-V.

CITY ENGINEER, required by a City in Saskatchewan to take full charge of its utilities which include electric light, power, sewer, water, sidewalk, etc. Salary open. Apply to File No. 3955-V.

JUNIOR SALES ENGINEERS with production experience required by a firm of industrial consultants in Montreal. Salary $300 depending on qualifications. Apply to File No. 3965-V.

STRUCTURAL ENGINEER DRAUGHTSMAN, required by a firm of engineer contractors in Alberta. Duties include structural detailer and requires knowledge of major concrete foundations; to detail structural steel buildings, access tower platforms and miscellaneous small steel structures. Salary $300.00. Apply to File No. 3972-V.

DRAUGHTSMAN required by a firm of engineer contractors in Alberta for layout of pipelines and details in refinery construction. Preferably background of refinery experience or alternately powerhouse piping or heavy industrial draughting. Salary $300.00. Apply to File No. 3972-V.

GRADUATE ENGINEER, with some experience in a manufacturing industry, required by Hamilton company. Some knowledge of production operations, mill scheduling, job evaluation, time study, job methods, industrial relations would be helpful. Salary open. Apply to File No. 3981-V.

GRADUATE ENGINEER, age 32 up, preferably bilingual and with 10 years experience in industrial design required by chemical organization with headquarters in Montreal. Duties include supervision of Works Design Departments, supply draughting and design service for plant, prepare appropriation requests, maintain cost estimating units, etc. Salary open. Apply to File No. 3995-V.

GRADUATE ENGINEER, three to 5 years plant experience, required by chemical organization in Montreal. Duties include assisting in developing and carrying out in various plants training programs in subject and related fields for junior industrial engineers. Develop and apply such office routine as may be necessary. Salary open. Apply to File No. 3995-V.

MECHANICAL ELECTRICAL OR CIVIL ENGINEER, age 23-30, preferably single and bilingual with some experience in maintenance required by an industrial and chemical organization with headquarters in Montreal. Duties include construction project and design studies. Salary open. Apply to File No. 3995-V.

CIVIL OR MECHANICAL ENGINEER wanted with 5 to 8 years experience for key position in moderate size plant in Manitoba doing fabrication of Plate Work and Light Steel Work, also Grey Iron Foundry and Machine Shop. This will lead to key position in a growing organization. Salary open. Apply to File No. 4003-V.

MECHANICAL AND CHEMICAL ENGINEERS, interested in entering the Pulp and Paper industry, required in Newfoundland. Vacancies in Technical Department and studying process work and improved methods of operation. Pulp and paper experience is not necessary. Salary open. Apply to File No. 4009-V.

SAFETY SUPERVISOR required for South America. Age 25-40 years. Single. To supervise safety activities, promote safety first and inspect operations to assure proper installation and use of safety devices. Salary $350 U.S. currency. Apply to File No. 4011-V.

RESERVOIR ENGINEER, required for South America. Age 25-35. Should be experienced in reservoir and production cost analysis. Capable of determining efficient flow rates for reservoirs and wells. Salary approximately $400 U.S. currency. Apply to File No. 4011-V.

MAINTENANCE ENGINEER, required for South America. Age 35-40. Duties include, refinery maintenance, inspection of units, metal inspection work. Responsible for engineering calculations, design of equipment and pipefitting work. Salary $375 U.S. currency. Apply to File No. 4011-V.

POWER PLANT SUPERVISOR required for South America. Age 30-40, single preferred. To supervise steam power plant including operating, boiler cleaning and minor repairs. Salary $375 U.S. currency. Apply to File No. 4011-V.

DESIGNING DRAUGHTSMEN preferably graduates in mechanical or electrical engineering with at least 5 years experience in manufacture of sulphite or newsprint pulp required in Province of Quebec. Good salaries and opportunities for advancement. Permanent employment. Apply to File No. 4014-V.

ASSISTANT CITY ENGINEER with experience in municipal engineering required by Sask. City. Duties include operation of pumping sewage disposal and asphalt plants also building inspection department and concrete construction. Salary $4,000 to $4,500. Apply to File No. 4017-V.

ELECTRICAL OR MECHANICAL ENGINEERS required by large Montreal firm to prepare and analyze specifications for telephone equipment manufacturing and installation. Other types of engineering work also available. Salary open. Please send photo together with particulars of education and experience. Apply to File No. 4018-V.

GRADUATE ENGINEER, required as Assistant to Manager of Sawmill and Woodlands operations. Position located in Ontario. Good commercial sense essential also some sales ability. Salary $300-$350. Apply to File No. 4021-V.

MECHANICAL, STRUCTURAL AND ELECTRICAL ENGINEERS, required in Trail, B.C., as Designers, Draughtsmen and Construction Cost Estimators for Mining, Metallurgical, Chemical and Fertilizer Plant Design and layout. Salary open. Apply to File No. 4023-V.

ARCHITECTURAL DRAUGHTSMAN experienced in industrial building construction, with natural aptitude for design work, wanted by large industry in Eastern Townships, good salary, permanent position to the right man. Apply to File No. 4031-V.

DESIGNING ENGINEERS OR DRAUGHTSMEN, preferably but not necessarily with experience in Pulp and Paper Mill work required for paper mill in Newfoundland. Salaries $300.00 per month or better depending upon experience and ability. Apply to File No. 4036-V.

GRADUATE ENGINEERS preferably with about five years light structural and mechanical experience required by growing concern in central Ontario to learn business thoroughly and thereby be in a position to accept responsibility in Engineering Department. Salary open, based on experience and aptitude. Apply to File No. 4045-V.

ENGINEERING ASSISTANT to teach some classes in first three years of Engineering course at Dalhousie University, Halifax, Nova Scotia. Appointment for one year, commencing September, 1948, with possibility of permanent re-appointment. Salary open. Apply to File No. 4048-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experienced in installations of Production and Cost Control, Wage Incentives, etc. Free to travel, preferably bilingual. Salary open. Apply to File No. 4052-V.

SALES ENGINEER for popular line of Diesel Engines, applicants must be specialists on Power Units and Generator Sets. Required for permanent employment with well established organization. Apply to File No. 4055-V.

INDUSTRIAL ENGINEER with considerable manufacturing experience. Between 30 and 40 years of age. Required for plant surveys in Province of Quebec. Must be fluently bilingual. Permanent position. Salary according to qualifications. Apply to File No. 4064-V.

Situations Wanted

MECHANICAL ENGINEER, Jr.E.I.C., McGill University. Eight years experience Tool and Production Methods Engineer. Age 38. Married. Presently employed. Desires employment as Production Manager or Materials Engineer for large company. Preferably Montreal area Apply to File No. 551-W.

MECHANICAL ENGINEER, B.Sc. Queen's '33, M.E.I.C., M.I.A.S., P. Eng., Que. Married, age 37, over twelve years experience including design, stress analysis maintenance, inspection, administration and 5½ years as an R.C.A.F. Engineer Officer. Presently employed desires permanent position with good future prospects. Preferably in an English speaking locality. Apply to File No. 1042-W.

GRADUATE CIVIL ENGINEER, S.E.I.C., B.Sc., Queen's; P. Eng., Que.; would accept part time work during evenings or week-ends at home, preferably on steel construction and reinforced concrete design, estimating and detailing. Residing in Montreal. Apply to File No. 1487-W.

CIVIL ENGINEER, C.E., B.Sc., M.E.I.C., age 32, married with experience in road construction; surveying; industrial plant lay-out, including steel tank erection; piping design and installation, equipment installation; building construction such as offices, warehouses, service station; costings; estimates; administrative control. Working knowledge of cost and operational studies, inventory work, material necessary for all types of construction work. Will accept responsible position anywhere. Salary in accordance with responsibility and living conditions. Apply to File No. 1914-W.

PART TIME WORK: Civil engineer, age 34, R.P.E., M.E.I.C., perfectly bilingual, with post-graduate work at University of Toronto in Public Health Engineering, and at Harvard University in Industrial Hygiene, also experienced in structural and plate work and in municipal engineering, would take work evenings and week-ends, specially in consulting form to industry in problems related to Industrial Hygiene and local exhaust ventilation. Apply to File No. 2272-W.

MECHANICAL ENGINEER, McGill, Jr.E.I.C., P. Eng., Que. Age 26, single, veteran, bilingual. 6 years of varied experience covering general plant maintenance; power-house operation; gasoline and diesel trucks, tractor and locomotive maintenance; residential and some industrial construction. Well versed in Time Study and job evaluation. Position desired in Montreal. Now employed out of town. Available after reasonable notice to present employers. Apply to File No. 2338-W.

ELECTRICAL ENGINEER, B.Eng. Honors, McGill, 1943, Jr.E.I.C., A.I.R.E., P.Eng (Que.), 26, married, presently employed, desires change to smaller organization with more general scope, broader future responsible outlook, in Ontario or B.C. Experience in heavy manufacturing, radio production, standardization, specification, audio design. Apply to File No. 2727-W.

CHEMICAL PROCESS ENGINEER, Jr. E.I.C., McGill, veteran, over four years overseas as Engineer Officer (construction). Two years design, correlation and economic evaluation work on petroleum refining processes with major U.S. oil company. Present salary $4,000. Age 27, married. Desire responsible position in Canada. Apply to File No. 2778-W.

ELECTRICAL ENGINEER, M.E.I.C., P.E (N.B.), age 35, married. 12 years experience in electrical machinery including 2 years District Manager of Sub Station in North West Quebec; 3 years Assistant Electrical Superintendent of Gold Mine in North West Quebec; 3 years R.C.E. Electrical Distribution Systems; 2 years teaching in electrical department of a Canadian University. Present teaching position temporary Apply to File No. 2827-W.

MECHANICAL ENGINEER, S.E.I.C., two years experience in consulting and general engineering work desires position in consulting or industrial work. Montreal or Ottawa preferred. Available on short notice. Apply to File No. 2829-W.

CIVIL ENGINEER, Jr.E.I.C., B.A.Sc. (Toronto), P.Eng. (Ont.), with some experience in reinforced concrete and structural steel design including detailing of reinforced concrete and estimating. Would accept part time work during evenings and week-ends. At present employed and residing in the Toronto area. Apply to File No. 2910-W.

GRADUATE ELECTRICAL ENGINEER, McGill '24; M.E.I.C., Prof. Eng., Que.; over 20 years experience in High Voltage Transmission Line design and construction. Interested in part time or temporary position in general Engineering or transmission line work. Location preferably Montreal or in B.C. At present residing in Montreal area, due to certain physical defects the type of work that can be undertaken is limited. Available at once. Apply to File No. 2918-W.

CIVIL ENGINEER, M.Sc., M.I.T., Jr.E.I.C., interested in part time work in steel and reinforced concrete design. Presently employed as instructor at a Canadian University, four years practical experience in design. Must be Montreal area. Apply to File No. 2930-W.

GRADUATE MECHANICAL AND ELECTRICAL ENGINEER, M.E.I.C., P.Eng. (Ont.) Age 39, married. 16 years of experience here and in Europe includes mechanical, electrical and optical design, applications, sales, administration, inspection of production, statistical quality control. Knowledge of foreign languages. Presently engaged in Montreal area, salary $420 per month, would prefer position in Ontario or B.C. Available one month's notice. Apply to File No. 2931-W.

GRADUATE, Institution of Mechanical Engineers (England), age 25, seeks position of Junior Engineer with a firm engaged in producing consumer goods. Five years engineering apprentice; one year draughting; and three years as junior metallurgist mainly occupied in solving production problems from a metallurgical aspect. Apply to File No. 2933-W.

GRADUATE ENGINEER, M.E.I.C., age 30, veteran, married. Experience includes maintenance, construction, production, etc. Toronto area preferred. One month's notice. Apply to File No. 2934-W.

CHEMICAL ENGINEER, S.E.I.C., age 25, experience, process control in rubber and heavy chemicals; engineering in distillery. Presently employed seeks position with greater scope in engineering work. Available one-month's notice. Will travel anywhere. Apply to File No. 2936-W.

MECHANICAL ENGINEER, Jr.E.I.C., B.Eng., McGill '44, P.Eng., Que. Age 24, veteran, proceeding toward Masters Degree, seeks employment for months May to September inclusive, on research or development projects or with consulting engineer. Varied experience in production, mechanical design and layout work. Would be able to continue project part time after October if necessary. Apply to File No. 2942-W.

CAMBRIDGE GRADUATE ENGINEER, M.E.I.C., P.Eng. (Ont.), age 29, married. With Civil, Aeronautical and Mechanical background. 4½ years R.A.F. Pilot and Instructor and 3½ years practical experience in consulting and municipal engineering on surveys, design estimating and construction work. Requires responsible and progressive position where full use can be made of wide interests. Location Ontario (where presently employed) or Western Canada. Apply to File No. 2943-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng. (Que.), B.A.Sc., Diploma in Business Administration; age 29, married; seven years industrial engineering and technical sales supervision in electrical industry. Available in May. Industrial marketing, or management engineering. Apply to File 2946-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Que.) McGill graduate desires spare time work evenings and week-ends on design and detail of reinforced concrete and steel structures. Also qualified to make stress analysis of rigid frames and most statistically indeterminate, structures. Location Montreal. Apply to File No. 2947-W.

2 STUDENTS, S.E.I.C., both on executive of Junior Section, desire summer employment in Ottawa area. Have 2 years Engineering at Carleton College, specializing in Engineering Physics or Electrical Engineering. Jobs need not be together. Available April 30th, 1948. Both experienced draughtsmen but prefer work at which they can gain fundamental knowledge in Physics. Apply to File No. 2948-W.

ENGINEER, M.E.I.C., B.Sc., P.Eng., Ont. Married, veteran R.C.E.M.E. Officer. Two years in plant chemical and physical control laboratory. Two years as construction engineer, fieldwork and supervisory experience, reinforced concrete, masonry and steel structures. Chiefly interested in position as construction supervisor or concrete research. Apply to File No. 2949-W.

INDUSTRIAL AND PRODUCTION ENGINEER, Jr. E.I.C., P.Eng. (Mechanical) Ont. 5 years' experience in cost reduction and analysis, production planning and scheduling, systems and administration. Background of experience covers both industrial and mechanical engineering. Presently employed, available on six weeks' notice. Age 28. Apply to File No. 2955-W.

STUDENT, S.E.I.C., 3rd year McGill. Interested in summer employment. Field work, surveying or structural draughting preferred. Available June 1st to September 20th, 1948. Apply to File No. 2956-W.

ELECTRICAL ENGINEERING STUDENT, S.E.I.C., third year at McGill University, would like summer employment with firm in Montreal vicinity, experience in installation of all types of A.C. motors, especially in connection with refrigeration systems and wood drying kilns. Willing to take any other employment dealing with electric power. Apply to File No. 2958-W.

CIVIL ENGINEER, P.Eng. Ont., M.E.I.C., would like spare time work at design of reinforced concrete or structural steel on a fee basis or otherwise. At present employed in the Hamilton, Ont., area. Apply to File No. 2964-W.

STRUCTURAL ENGINEER, Jr.E.I.C., B.E. '46, N.S.T.C., S.M. '48, M.I.T. Interested in structural planning, design or construction, or working with consultants. Available June 15. Apply to File No. 2965-W.

MECHANICAL ENGINEER, M.E.I.C., B.Sc., Queen's 1936. Position wanted leading to design and installation of automatic controls and allied equipment; eleven years diversified experience including supervision of plant engineering and maintenance, with four years work on many types of control problems involving measurement and control of such factors as temperature, atmosphere, and flow. Available at one month's notice; Toronto area preferred. Apply to File No. 2966-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng., twelve years experience in the following fields: Automotive, Aircraft and Air Handling Equipment on product design, development and testing, improvement of production. Also on design of special machinery; Maintenance in Paper Converting Mill and six years executive in Sales and Service. Desires position with responsible firm, or partnership with Consultant. Apply to File No. 2967-W.

Mechanical Engineer

Permanent employment opportunity for a professional engineer with shop practice, preferably in automotive equipment, to assist superintendent in technical and eventually administrative capacity. At least 5 years practice. Salary from $3630 to $4950 depending on experience of candidate.

Further particulars may be obtained at the office of the Montreal Civil Service Commission, Room No. 1, City Hall.

Mechanical or Electrical Engineer

Permanent employment opportunity for a professional engineer with practical experience in pumps, motors and electrical apparatus, to take charge eventually of pumping plant personnel and equipment. At least 5 years practice. Salary from $3630 to $4950 depending on experience of candidate.

Further particulars may be obtained at the office of the Montreal Civil Service Commission, Room No. 1, City Hall.

INDUSTRIAL ENGINEERING GRADUATE

With considerable diversified experience, preferably in manufacturing or processing. Between 30 and 40 years of age; must speak French and English fluently. Required by financial organization to undertake business investigations. Permanent position with pension benefits. Salary according to qualifications. Apply to File No. 4088-V.

WANTED

AUTOMOTIVE MECHANICAL SUPERINTENDENT

To re-organize and supervise complete mechanical repair and maintenance activity of large pulpwood operations in northern Quebec.

Equipment consists of several hundred units comprising trucks and vehicles, tractors, boats and miscellaneous powered equipment. Service and repair shops comprise modern main shop and parts department and several smaller shops.

Heated house will be provided for superintendent in small town on operations.

English Canadian with thorough knowledge of the French language would be most adaptable.

Salary over $5,000.

For further information, write stating experience and qualifications to File No. 4091-V.

Business & Industrial Briefs

A Digest of Information received by The Editor

New Equipment and Developments

The Canadian General Electric Company Limited, 212 King St. West, Toronto, Ontario, states that a new, fully-automatic paint machine which cleans, rustproofs, paints and dries a variety of parts in the record time of one hour and 42 minutes has been put into operation by the Control Division of the General Electric Company. It is claimed that up to 12,960 pieces pass through the huge automatic device in an hour. The painter is fully automatic and an even coat free of flaws is achieved. Paint dripping from the parts is caught in the draining section, and flows back into the main paint reservoir, thereby keeping waste to a minimum.

•

Canadian Patent No. 539654, covering a very simple hydraulic pump or motor is available for licensing for manufacture in Canada. For details communicate with Ridley-Industrial Limited, Warwick Road, Kenilworth, Warwickshire, England.

•

Kennametal Inc., Latrobe, Penna., have announced the development of a new two-prong rotary drill bit for drilling nonmetallic minerals such as clay, limestone, stone, slate, etc. Bit sizes are from 1¾ to 3 inches in diameter and it can be used on regular coal augers.

•

Glyco Products Co. Inc., Brooklyn 2, N.Y., offer samples and data of a product known as "Acrawax C". It is claimed that the use of this new synthetic wax as a lubricant for dry drawing high carbon steels has proved more efficient and economical than older methods. Many other unusual advantages are claimed for this product.

The recording of physical motion by air pressure, a new development in the field of instrumentation, is said to feature the "Microtrans" now being commercially introduced by Hagan Corporation of Pittsburgh. According to the manufacturer's claim "Microtrans" translates physical movements of 0 to 0.25 inch into pneumatic pressures over a range of 5 to 30 pounds. As an example of effective application it is claimed that it can be used to record the expansion of turbine rotors, relative to the casing.

•

Three jaw crushers, two vibrating screens and two double-compartment grinding mills recently completed at Canadian Allis-Chalmers' Rockfield Works, have been shipped to the Chinese Government for the Taiwan Fertilizer Company on the island of Formosa. This equipment is needed to enable the Chinese to complete their vitally important agricultural programme. It was purchased by the Canadian Government with funds made available to the distressed countries by U.N.R.R.A.

•

The General Electric Company claims to have developed an X-ray thickness gauge, which automatically and continuously measures the thickness of a moving strip of red-hot steel without physically contacting the steel in any way. It is claimed to be the first instrument of its kind able to perform this job. Previously, thickness measurement of hot steel, moving through rolling mills in strip form, was delayed until the steel had cooled to a temperature at which measurement by hand-held micrometer was possible.

Tracerlab Inc., 55 Oliver Street, Boston 10, Massachusetts, has announced the availability of what is claimed to be the first commercially manufactured automatic sample changer for making radioactivity measurements. For complete information ask the manufacturer for details on SC-6 Automatic Sample Changer.

•

American Wheelabrator & Equipment Corporation, of Mishawaka, Indiana, has announced the development of a new Continuous Wheelabrator Tumblast for high production blast cleaning. The manufacturer claims that by utilizing a combination of tumbling and longitudinal travel of the work, the equipment offers a thorough cleaning and uninterrupted efficiency. For details communicate directly with the manufacturer.

•

Rogers Majestic Limited Leaside, Toronto 2, Ontario, state that a FM two-way radio-telephone, with a 30-watt "Motorola" FM Transmitter was installed on the San Francisco-Oakland Bay Bridge in California, and by hook-up with the service control cars movement of traffic was expedited. Telephones are located on the bridge so that motorists in trouble can report to the dispatcher. Details on the equipment used may be obtained on application to the Rogers Majestic Limited, Toronto.

•

According to the "Northern News", published by the Northern Electric Company Limited, the second phase in the movement of the Electronics Division of the Company from Montreal to Belleville commenced on March 1st. Movement of machinery awaits final completion of the manufacturing area of the modern one-storey plant and it is expected to commence in the very near future. Complete transfer is scheduled for the end of August. Company development in the district is expected to provide employment for upwards of 800 people.

•

The men who keep lonely vigil aboard the pilot ship New Jersey, anchored at sea off the Ambrose Channel, N.J., now have television to help them keep an " eye on the world ".

The vessel is anchored 20 miles from New York City and it is used for two-week periods by pilots waiting to escort large vessels to harbour. Recently the Sandy Hook Pilots Association asked RCA if television could be installed. The Company sent experts to investigate the request and after overcoming many obstacles the installation was completed. It was found that reception was better than on land.

•

A new welding machine, capable of welding such " hard to weld " metals as aluminum, magnesium, stainless steels, copper alloys, Fernico, and Inconel, is available from Canadian General Electric Company, according to a release prepared by the Company. Many special features are claimed.

Appointments and Transfers

The Pyrometer Instrument Co. formerly of Lafayette Street, New York, has moved to Bergenfield, New Jersey.

•

E. R. Watts & Son Ltd. and Adam Hilger Ltd., have merged into one Company registered as Hilger & Watts Limited. Headquarters are in London, England. The Watts Company was founded in 1856 and has specialized in the manufacture of Surveying and Engineers' Measuring Instruments. Hilgers, started in 1874, specializes in instruments for research and industry.

Personnel of the company will be augmented and it is anticipated that approximately 1,300 people will be employed in six factories. A new factory in the Greater London area has been planned and approved.

•

Robert McCreary is now Vice-President and Managing Director of Executone Communication Systems Limited. Mr. McCreary will make his headquarters at the Company's premises, 331 Bartlett Avenue, Toronto, Ont.

•

E. A. Nicholson has been appointed supervisor of the plant clearance division of the War Assets Corporation. R. Martland has been appointed regional supply manager Western region and S. V. Appleby now becomes regional supply supervisor for the Prairie region.

•

Canadian Allis - Chalmers has established the office for its Ontario District Sales at 91 Yonge Street, Toronto. J. C. Boyd, recently appointed manager of the new office, will be responsible for the sales of all equipment manufactured and sold by the Company in Canada.

•

V. Frank Segee, of the Canadian Broadcasting Corporation, has been elected President of the Canadian Industrial Editors Association and Area Vice-President for Canada on the International Council of Industrial Editors. He succeeds E. J. Blandford, Publications Manager of the Engineering Institute of Canada.

•

E. J. Hosack, president and general manager of Standard Tube Co. Ltd. has announced two appointments to the materials handling division at Woodstock, Ont. — G. A. Hutchinson, B.Sc., P.Eng., as Works Manager and D. H. Noy, B.Sc., P.Eng., as Sales Engineer.

A Mechanical Engineering graduate of Queen's University, Mr. Hutchison has had previous experience with Bailey Meter Co. Ltd., Montreal, and Chatco Steel Products, Chatham, Ontario.

Mr. Noy graduated from Royal Military College, Kingston, in 1932 and, as a civil engineer from Queen's University, the following year. He was previously associated with the Lamaque Gold Mines Ltd., Perron Gold Mines Ltd., and P. G. Noy & Sons Ltd., Orillia, Ont.

Catalogues and Brochures

A descriptive bulletin covering the Pullmax Plate Working Machine is available on request to The Canadian Fairbanks-Morse Company Limited, St. Antoine St., Montreal, Que. Pullmax equipment is manufactured in Sweden and The Fairbanks-Morse Company is the Canadian selling agent.

•

Thermidaire Corporation Limited, Long Branch, Toronto 14, Ontario, have available a brochure containing photos of completed installations. The bulletin deals with equipment designed for the treatment of water. For copies ask for brochure of " Photos of Completed Installations."

•

Link-Belt Limited, Easton Ave., at Leslie & Keating, Toronto 8, Ontario, have available copies of folder No. 1874-A which describes the Link-Belt P.I.V. gear, size H-6. This folder is a supplement to book No. 1874 which covers the complete P.I.V. gear line.

•

Nordberg Manufacturing Company, Milwaukee 7, Wisconsin, U.S.A., has announced the publication of Bulletin No. 151 on Symons Intermediate Cone Crushers for Rock, Gravel and Ore reduction. The pamphlet is illustrated and gives specification data and operating information. Copies are available.

•

Minneapolis-Honeywell Regulator Co. Ltd., Leaside, Toronto, Ont., has completed the preparation of a condensed catalogue—No. 8 — January, 1948 — covering automatic controls and industrial instruments. Copies are available.

•

Dow Corning Corporation of Midland, Michigan, have released a 16 page book entitled " Silastic Facts No. 5 ". It deals with Dow Corning Silicone Rubber and several new types of Silastic are described. Many outstanding qualities are claimed for this product. Communicate with Dow Corning Division of Fiberglas (Canada) Limited, Oshawa, Ontario, for copies.

Joy Manufacturing Company, Henry W. Oliver Building, Pittsburgh, 22 Pa., has produced a brochure-type of catalogue listing products for metal and non-metallic mines. For copies ask for bulletin No. M-204.

•

The Shawinigan Water and Power Company, Montreal, P.Q., has produced a handsome brochure to mark the 50th Anniversary of the Company. A limited number of copies are available. Requests for copies should be sent to the Public Relations Department, The Shawinigan Water & Power Company, Dorchester St., at Beaver Hall Hill, Montreal, Que.

•

Canadian General Electric Company Limited, 212 King St. West, Toronto, Ont., have produced a handsome, informative 104 page publication on G-E Arc-Welding Electrodes. Copies of this publication are available to those who have a professional interest in welding equipment.

•

The Canadian Fairbanks-Morse Company Limited, St. Antoine St., Montreal, have available a brochure describing their type "S" Motor Truck Scale. For copies apply directly to the Company.

•

Leeds & Northrup Company, 4911 Stenton Avenue, Philadelphia, Pa., have issued a new bulletin which features equipment which is said to enable refinery operators to "see" the pH of dehydrator water simply by glancing at the indicating scale of a "Micromax recorder." For copies of this 12 page publication ask for bulletin ND44-96-702(1).

•

W. B. Connor Engineering Corp., 114 East 32nd Street, New York 16, N.Y., has published an application data book on their type "H" DOREX Air Recovery Equipment which is used in the "recovery" or conversion of stale, vitiated, or contaminated air to its original freshness, according to a statement received from the manufacturer. For copies of the booklet ask for bulletin 105-A. Address enquiries to Douglas Engineering Company Limited, 190 Murray St., Montreal 3, who are Canadian agents for the manufacturer.

LIBRARY NOTES

(Continued from page 254)

ELECTRIC MACHINERY, 2 vols.

M. Liwschitz-Garik, assisted by C. C. Whipple. D. Van Nostrand Co., New York, Toronto, 1946. Vol. 1, 290 p.; Vol. 2, 576 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, Vol. 1, $4.00; Vol. 2, $6.50.

The author's principal aim is to provide the fundamental link between the basic laws of electrodynamics and the performance characteristics of electric machines. To this and common features are discussed in separate introductory chapters, such as: magnetic circuits of the main flux and of leakage fluxes, losses and cooling, windings and induced emfs, etc. Although written primarily for students, special consideration is given to the demands encountered in practice. A separate index and a list of further references are included in each volume.

ELEMENTS OF ENGINEERING GEOLOGY.

H. Ries and T. L. Watson. 2 ed. rev. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 469 p., illus., diagrs., maps, tables, 9 x 6 in., cloth, $5.00.

The chief change in this new edition is the inclusion of two new chapters, one an expansion of the material on the geology of reservoirs and dams, and the other on historical geology. The revision also includes the modernization of references and problems. The usual geological material, highlighted where it has important bearing on engineering, is well illustrated with maps, charts and references. An appendix giving the addresses and directors of the geological survey offices of the various States and Canadian provinces, is a useful feature of the book.

HOW TO TAKE PHYSICAL INVENTORY:

R. F. Neuschel and H. T. Johnson. McGraw-Hill Book Co., New York and London, 1946. 159 p., charts, 9¼ x 6 in., cloth, $2.00.

A practical guide, this book presents the principles and techniques for planning and taking a physical inventory. It includes the development of the inventory-taking organization and procedures, the selection and training of personnel, the physical preparation for the inventory, and the summarization and verification. The appendix contains a detailed manual of inventory instructions, applying the principles given in the text.

INTRODUCTION TO HEAT ENGINES.

E. A. Allcut. University of Toronto Press, Toronto, Canada, 1946. Paged in sections, illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.25.

The book provides a concise, interesting introduction to the field of heat engines in which the existence of the same general scientific principles in all types is indicated. Each chapter is illustrated by applications to steam engines, turbines, air compressors, and internal combustion engines, their similarities as well as differences being pointed out. An excellent historical survey is given. This second edition has a few revisions and some new illustrations.

SIMPLIFIED CURVE AND SWITCH WORK.

W. F. Rench. 5 ed. Simmons-Boardman Publishing Corp., New York, 1947. 212 p., diagrs., tables, 7½ x 4½ in., fabrikoid, $3.00.

Approximately the first half of this small volume covers string-lining practice for railroad curve work, with chapters on vertical curve and superelevation determinations. With the exception of a special chapter on siding location, the remainder of the book deals with the rules and methods for practical switch connections. The principal object has been to reduce the solutions of problems to their simple arithmetical relations for greater ease of use by trackmen in general. The book covers both standard and narrow-gage switch work.

"Business & Industrial Briefs"

This section of the *Journal* is intended to keep readers informed on developments and changes in those business and industrial enterprises, and on new products, which affect the engineer.

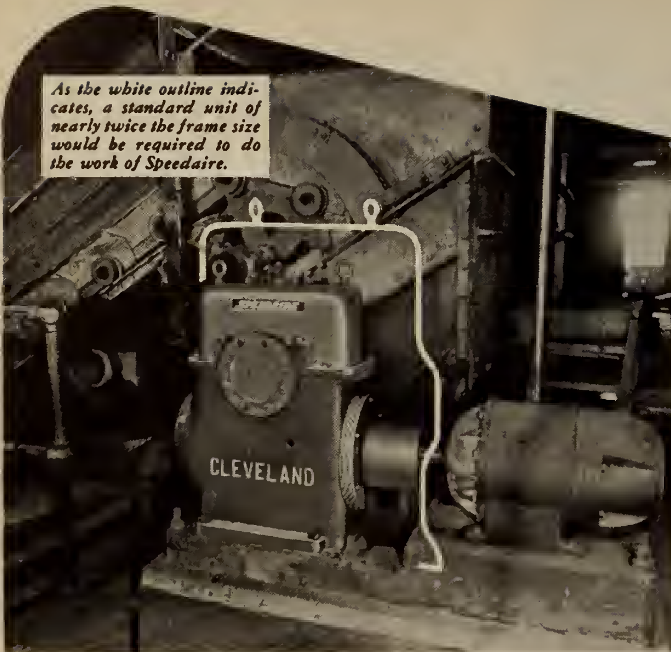
Professional Cards



As the white outline indicates, a standard unit of nearly twice the frame size would be required to do the work of Speedaire.

$330 saving . . . with SPEEDAIRE

IN this Michigan chemical plant, Speedaire is doing a highly satisfactory job on pan conveyors handling limestone. Reducers run cool under heavy loads, unaffected by the lime dust. Their compactness permitted a closer hook-up between machines and motors, saving valuable floor space. And compared to conventional worm-gear reducers, Speedaire saved the company $330 per unit installed.

Speedaire is Cleveland's new fan-cooled worm-gear speed reducer. Because it is fan-cooled, Speedaire will do more work—will deliver up to *double the horsepower* of standard worm units of equal frame size, at usual motor speeds. It can be installed economically on many applications where other types have been used heretofore—giving you the advantages of a compact right-angle drive. Speedaire gives the same long, trouble-free service characteristic of all Clevelands.

For full description, send for Catalog 300. The Cleveland Worm & Gear Company, 3287 East 80th St., Cleveland 4, O.

Affiliate: The Farval Corporation, Centralized Systems of Lubrication. In Canada: Peacock Brothers Limited.

NEW GARLOCK CATALOG

Helps you select the Right Packing

IF YOU BUY or use packings or gaskets you need this new Garlock catalog.

Its 224 pages describe and illustrate packings for high pressures and low pressures—for water, air, steam, acids, solvents, oils and other liquids and gases. So whether you need a packing made of rubber, synthetic rubber, asbestos, cotton, flax, rayon, leather, plastics or metals, this catalog will help you select a Garlock product suitable for your job—a product manufactured in the Garlock factories and measuring up to highest quality standards which Garlock has rigidly maintained for sixty years.

Ask the Garlock representative for your copy or mail the coupon below.

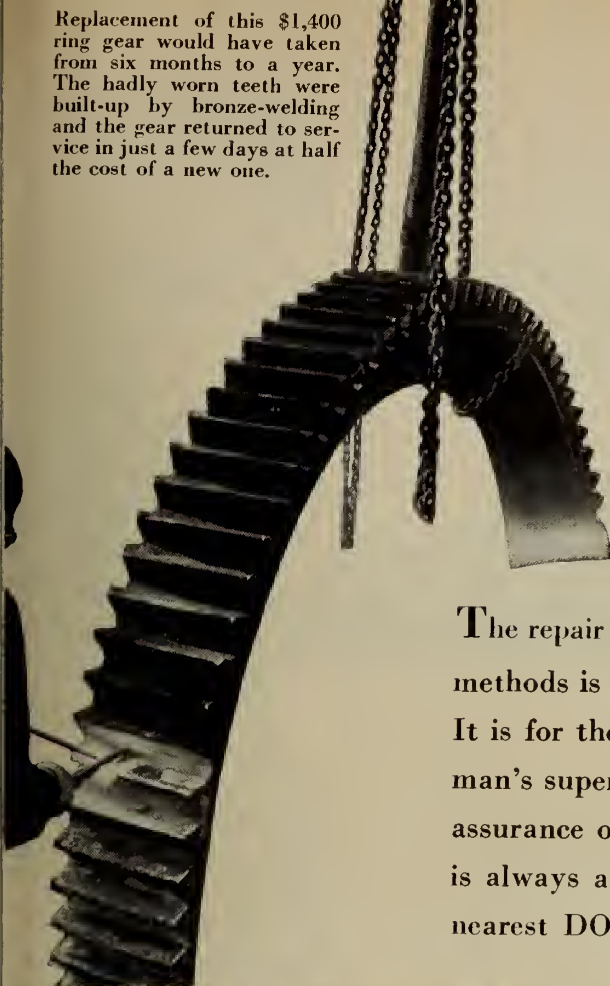
Replacement of this $1,400 ring gear would have taken from six months to a year. The badly worn teeth were built-up by bronze-welding and the gear returned to service in just a few days at half the cost of a new one.



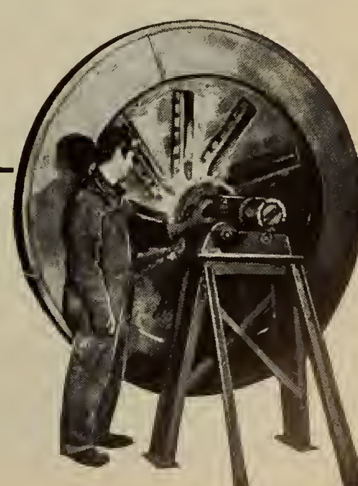
Keeping the "wheels" going 'round

The repair of vast quantities of equipment by oxy-acetylene methods is of course routine for plant maintenance crews. It is for the special job, however, that the DOC serviceman's supervision and work proves so valuable and gives assurance of success. This skilled, specialized assistance is always available to DOC customers. Just phone the nearest DOC office.

Bronze-welding this cast steel cone crusher head saved $1,000. The crack, which ran completely around the head for a distance of 9½ ft., extended through the thickness of the casting in several places. It was veed out by flame-gouging.

This cast iron steam hammer cylinder weighs 4,000 lb. Two large cracks, one on each side of the cylinder wall, were bronze-welded in only 14 hours. A new casting would have taken 16 weeks to obtain and would have cost more than 10 times as much.

Flanges are quickly joined to cast iron pipe sections by bronze-welding. DOC supplies several bronze rods to meet varying service requirements.



Bronze-welding effected a considerable saving of cost and time when four spokes of this huge cast iron pulp-chipper wheel was cracked at the hub.

"Dominion" and "DOC" are trade-marks.

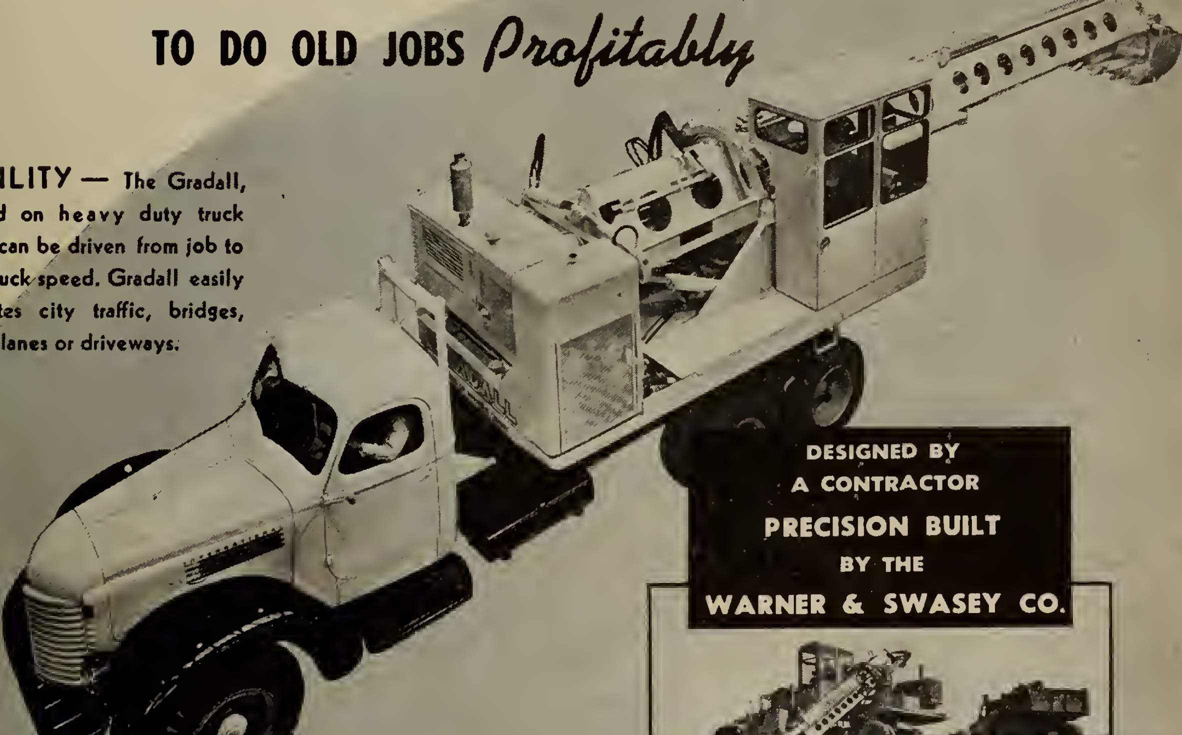
GRÂDALL

THE MACHINE THAT PROVIDES A NEW WAY TO DO OLD JOBS *Profitably*



MOBILITY — The Gradall, mounted on heavy duty truck chassis, can be driven from job to job at truck speed. Gradall easily negotiates city traffic, bridges, country lanes or driveways.

DESIGNED BY A CONTRACTOR
PRECISION BUILT BY THE WARNER & SWASEY CO.

Fast, telescoping action of boom makes digging and loading one continuous operation... loading out dirt in record breaking time.

Gradall's amazing "Arm Action" tilts the boom and tool to neatly chamfer trench edges. The result is a top quality job at no extra cost.

IR AIR POWERED
SCREW DRIVER IS THE ANSWER

MINIMUM SPOILAGE
EASE OF HANDLING
INCREASED PRODUCTION

The picture above shows an Ingersoll-Rand Size OOOBLC air-powered screw driver applying four No. 8 screws that hold the leads to the brick on an automatic waffle iron. This insulating brick is very brittle and torque on the screw must be accurately controlled.

The I-R Screw Driver features a cushion clutch that minimizes rotary impacts and allows delicate torque adjustment. An integral part of the cushion clutch is an engaging clutch which permits the motor to run but rotates the bit only when the operator exerts a slight forward pressure on the screw driver.

Air tools are definitely superior for screw driving. I-R Screw Drivers offer you many advantages . . . small size . . . light weight . . . more power per pound . . . accurate torque adjustment . . . dependability . . . run cool to the touch.

Air-powered screw drivers may be the answer to some of your problems. A reversible model is available in every instance where a reversible tool can be used to greater advantage. Call our nearest branch office for further details or a demonstration.

RESISTANT TO SCOUR

For a Thousand Years!
VITRIFIED CLAY PIPE

Mid-summer conditions in the average combined storm or sanitary sewerage system may vary from minimum to maximum velocity. On a clear Summer day minimum flow permits the inside of the pipe to dry out. Then comes a heavy rain storm, taxing sewers to their utmost. This alternate wetting and drying creates conditions favorable to disintegration unless the pipe is made of Vitrified Clay.

Vitrified Clay Pipe is absolute proof against these vagaries of the weather. In fact, it meets every test—the acid, alkali, crush, water absorption, flow, scour, gas, and all known enemies of sewer pipe. Specify Vitrified Clay Pipe for permanence and economy.

THIS GUTTA PERCHA BELT WRITES ITS OWN SUCCESS STORY

This conveyor belt was installed at Walker Brothers Quarries in 1940. Its job—to carry crushed rock a distance of 150 feet up an incline of 12 degrees. In the first seven years of its life it has handled over 1 million tons of material up to minus 5 inch stone so satisfactorily that Walker Brothers have praised its record in these words—

"This belt up to date has handled approximately one million tons of material and is still in excellent condition. I might say we are well pleased with the performance of this belt; and this is mainly the reason we gave you the orders for all conveying equipment which we have had installed, since that time."

**Gutta Percha Engineering Service is available to Canadian Industry to help meet and beat production problems with Industrialized Rubber. You are invited to make use of it. Just write our nearest branch.*

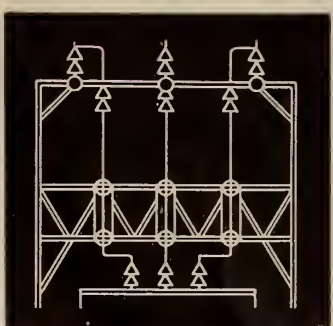
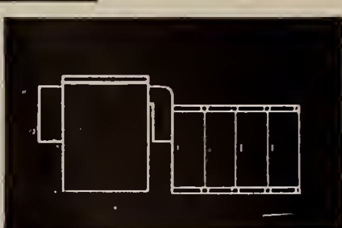
WESTINGHOUSE UNIT SUBSTATIONS

When required, Unit Substations can be supplied with co-ordinated, metal-clad, "Unitized" switchgear for incoming power supplies of 13,800 volts and below.



Prefabricated, overhead, incoming line structures.



Transformer-mounted terminal chambers or switches for use with underground cables.

With rapidly changing load conditions, and the need for economical and reliable distribution . . . it will pay you to investigate the advantages of Westinghouse Unit Substations.

They not only meet today's demands, but provide *flexibility* for future changes. Increased load requirements or changes in the center of loads are easily accommodated. Co-ordinated design plus "Unitized" switchgear permits selecting unit capacities to meet existing needs, yet simplifies expansion as exemplified above. Compactness provides application flexibility—lower real estate costs—pleasing appearance—and greater accessibility. Unit Substations can be located close to the load center. When the load center shifts, they can be easily moved to the new location.

Westinghouse Unit Substations are today's answer to the fast growing loads ahead. For full information, call Westinghouse or write for B-3238, Canadian Westinghouse Company, Limited, Hamilton, Ontario.

Santophen 20 (Monsanto's pentachlorophenol, technical) provides lasting protection against wood-rotting fungi, termites and other wood-boring insects. Properly formulated and applied, it is the proved preservative for poles, crossarms, ties and structural timbers of all types.

Constant and long-lasting effectiveness of Santophen 20 is assured by controlled uniformity, plus the following important characteristics:

- **High Toxicity**
- **Low Volatility**
- **Low Water Solubility**
- **Low Vapor Pressure**

Formulating suggestions, technical data and other valuable information are contained in Monsanto's book, "Wood Preservation with Santophen 20 in Oil Solutions by Pressure Processes." To obtain your copy, write to MONSANTO (CANADA) LIMITED, Montreal — Toronto — Vancouver, or return the convenient coupon.

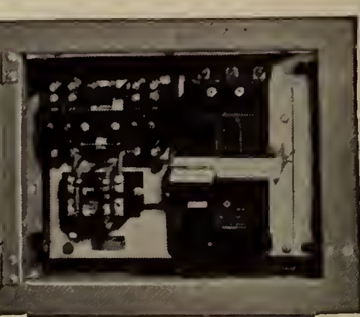
UNITROL

CENTRALIZED MOTOR CONTROL



Unitrol is the modern method of housing motor control. It is ready made, ready for use, yet built to individual need from unitized, sectionalized members that you can add to, subtract from or re-arrange with complete freedom.

With Unitrol, motor controls need no longer be scattered in out-of-the-way parts of your plant. A Unitrol centre is convenient, easy to service, hard to overlook. You save space, too, because Unitrol can accommodate 2 or 3 times as much control in equivalent floor space.

Cutler-Hammer Unitrol comes complete, either with all wiring and interconnections made, or with provisions for wiring "on the job." Investigate the time and space-saving facts of this centralized Control Centre now. Unitrol is compact, orderly and easily accessible.

Faith IN CANADA

When the Aluminum Company of Canada Limited staked over $110,000,000 for the 1,500,000 h.p. Shipshaw Power Development, it showed Faith in Canada.

Today, Shipshaw and Arvida stand as monuments to ALCAN'S men of vision, and to Canadian engineering and construction prowess.

"Foundation" was selected as general contractor for both the Shipshaw extension and the great plant at Arvida, which now has a capacity of 2,000,000 pounds per day, as compared to a daily capacity of 350,000 pounds in 1939.

It is "Foundation's" function to give material form to exercises of Faith in Canada's future such as this by Aluminum Company of Canada, Limited.

A two-way stretch every forty feet

Here's a pipe line that can flex and stretch at every joint without losing its figure. Even earth movement near the riverbank, and the freeze-and-thaw of northern winters will leave it bottle-tight.

Each forty-foot section of strong, shatter-proof steel pipe is cushioned against the stresses of underground service by the flexible Dresser Couplings which join it to its neighbors. The couplings, with their specially compounded rubber gaskets, harmlessly absorb expansion, contraction and other movement . . . assure continued joint tightness.

A Dresser-Coupled steel line makes for speedy installation, too. You use plain-end pipe in standard lengths. No need to waste time lining up ends exactly. Simply slip on the factory-made and tested couplings and tighten the bolts. Any workman who can use a wrench can do it. No guesswork, either. You get a permanently tight joint every time.

And with Dressers, you get the full advantage of modern, glass-smooth pipe linings. Dresser Couplings fit outside the pipe. There is no heat to damage lining—no need for workmen to go inside the pipe.

For top performance and an extra margin of safety, specify a Dresser-Coupled steel line. Detailed information on request.

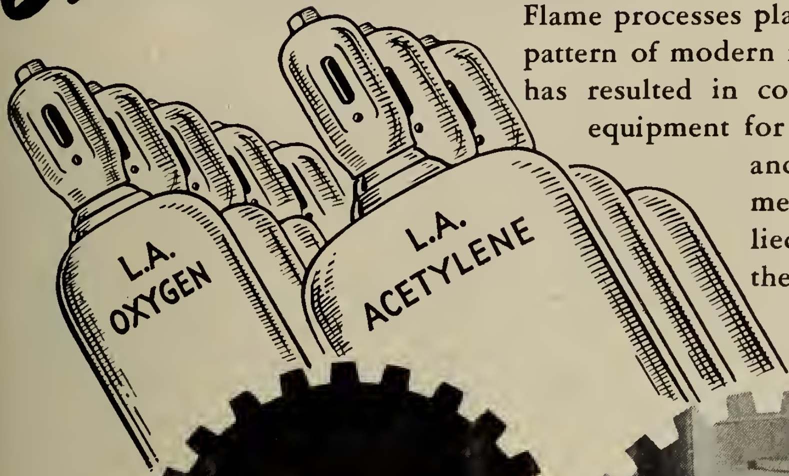
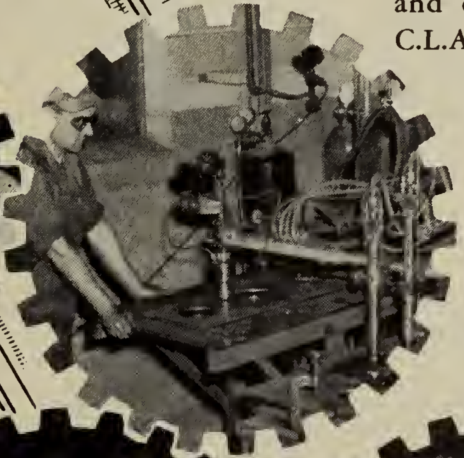
C.L.A. Flame Processes

GEARED TO THE NEEDS OF MODERN INDUSTRY

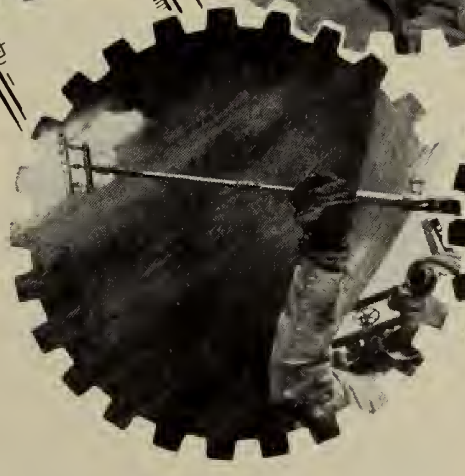


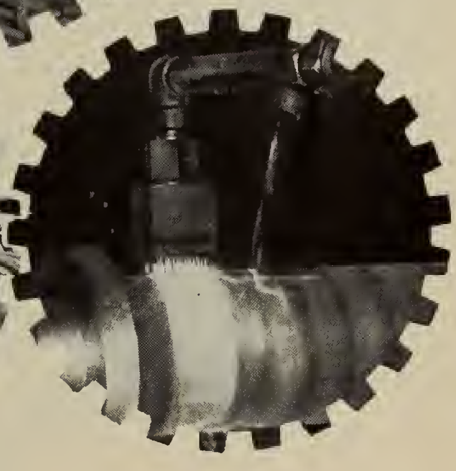
Flame processes play a major role in shaping the complex pattern of modern industry. Canadian Liquid Air research has resulted in constant improvements in methods and equipment for severing, shaping, joining, hardening and cleaning of metals. These developments have kept pace with progress in allied fields . . . in many cases have pointed the way to speedier, more efficient production. Wherever fabrication of metals is being done faster, better and cheaper, look for the C.L.A. trade mark.



FLAME SHAPE CUTTING — for speedy production of simple or intricate shapes either individually or in unlimited quantities.

FLAME SCARFING— extensively used in steel mills to remove cracks, seams and other surface defects from steel billets and slabs, and in foundries to clean out cracks and sand holes in steel castings.





FLAME CONDITIONING — simplest and most efficient method of preparing steel surfaces for painting — quickly and thoroughly removes all paint, dirt, rust, scale and moisture to leave ideal warm, dry surface for painting.

FLAME HARDENING — a highly flexible process giving a hard wear-resisting outer skin to iron and steel parts, while leaving the base metal composition unchanged.

COVER PICTURE

On this month's cover is a view of the gigantic pulp mill of Marathon Paper Mills of Canada Ltd., at the Company's own townsite of Marathon on the shore of Lake Superior, 184 miles east of Port Arthur.

The capacity of the mill is 300 tons per day of bleached pulp and a particular feature is the dynamic color treatment of the whole interior and all equipment. The modern town which overlooks Lake Superior includes, besides housing for employees and their families, a hotel, bank, hospital, school, theatre, community hall, police and fire station, post office and department store.

A Message from The President

I welcome the opportunity of thanking the members of the Institute for the high honour conferred on me in my election as your President for the year 1948. I shall do what I can to overcome geographical obstacles and other well-recognized limitations during my term of office. With the co-operation of the vice-presidents, councillors, committeemen, and the membership at large, I cherish the hope that the rate of progress during the preceding years will be continued.

The history of the first sixty years of the Institute's existence has been set forth on the pages of the *Journal* with clarity and emphasis. That period witnessed the evolution and recognition of engineering as a learned profession. There are no longer any arguments on that subject. It is conceded that the modern world is becoming more and more dependent upon processes that require the knowledge and the skills of trained engineers. The increasing complexity of our civilization is constantly providing new avenues in which engineering skill can be added to scientific knowledge to improve one's art of living.

A study of the early Proceedings indicates that the engineer of those days was concerned mainly with problems of transportation and structures. His interests were centered on problems of raw materials, production, design, fabrication and methods of erection, on the operation of transportation systems. He was not greatly interested in the problems of management, administration, sales, publicity, industrial relations or legislation. Gradually he has associated himself with developments having economic, social and political consequences which effect men and women in all walks of life. Without neglecting the new and difficult technical problems that confronted him, he found time to study methods of overcoming the resistances found in *human* nature, to make studies of industrial relations, with the result that the effectiveness of the profession was raised to new heights. Lord Tweedsmuir, addressing the Institute on the occasion of its fiftieth anniversary, hailed the engineer as the principal empire-builder.

It is a bold man who would attempt to predict the status of the engineer sixty years hence. As the invention of the steam engine brought in a new era vastly different from all preceding ages, so the development of new sources of power may induce corresponding changes in our physical, social and political ways of life. The engineer will play an important role in creating the new order. New branches and sub-branches of engineering will arise, new societies and institutes will appear and The Engineering Institute of Canada will continue to attract to its membership leading engineers of every designation and at the same time continue to enjoy cordial relationships with other professional bodies at home and abroad.

J. N. Finlayson.

President.

Some Standards & Procedures for COMMUNITY PLANNING

by

J. Alexander Walker, M.E.I.C.

Executive Engineer, Vancouver, B.C., Town Planning Commission

A paper presented before the Annual General and Professional Meeting, The Engineering Institute of Canada, Banff, Alberta, June 4, 1948

Listing the factors involved in the selection of a site and in the preliminary planning of a townsite thereon, the author describes the various conditions affecting townsite design, and discusses street systems and types, as well as the relationship to existing railway and harbour facilities, lots and lot dimensions, public utilities, zoning, land use, parks, parkways, and recreation areas. Considerations affecting layout of transit systems are pointed out as well as for the best arrangements of trackage facilities and for airport development.

In presenting this paper, it must be undestood that the "standards" which will be considered as pertaining to the various phases of planning, are not expected to be completely rigid or immutable; rather they should be considered as convenient "yardsticks", by the use of which the work of planning may be more readily expedited and done with a greater degree of assurance. The procedures here outlined are presented with the same objectives in view. It is anticipated and expected that many of both, to be detailed in this thesis, will be subject to challenge and vigorous debate. However, they have been proven over the years as a result of "trial and error" to be as nearly infallible as it is humanly possible to envisage.

As time goes on apace, new inventions will tend to create new modes of living. New ways of living will in turn outmode many of the standards and procedures in the practice of planning that have been considered acceptable up to the present. Furthermore, it is well realized and admitted that there will be conditions encountered wherein the presently accepted standards could not possibly apply.

To better illustrate the application of the numerous "standards", it is proposed to proceed by outlining the steps necessary in the design of a new, complete, self-contained townsite,—the dream of all planners. Most of these standards would apply equally well in the cases of new subdivisions in or near existing municipalities; the resubdivision of land which had been so poorly subdivided as to be impractical of development (usually referred to as "replotting"), and the replanning of established cities.

Townsite Planning

In the initiation of any plan for a well designed townsite or a future city, a thorough study of all the factors involved must be made. The design will depend upon the type of the city,—whether it is a seaport or an inland city; a railway divisional point or a terminal; an industrial centre; the seat of government; a recreational or tourist resort; an educational centre (university); an agricultural centre; a lumbering community; a mining town; or a combination of any two or more of these types. Moreover, the size of the city, whether large or small, and its prospects of growth, rapid or slow, will have to be given consideration. The essential point is to grasp the fundamental reason for the city's being and to plan to the end that the specific reason or reasons for its existence are given every encouragement to thrive. In addition to the main reason for the town's existence or the nature of the predominant industry, the townsite's geographical location, topography, probable character of its population and the natural resources of the country surrounding the site must be given consideration also. The last is most important, as, should there be any likelihood of the natural resources such as timber or minerals, becoming extinct after a few years, the knowledge that there were other resources such as agricultural possibilities, would eliminate much uncertainty relative to the town's future.

It is a comparatively easy matter to design a city when the ultimate population is known within reasonable limits. But real difficulty arises when the design is made for a small community and then an unexpected influx of population occurs. The reverse is also difficult to control, the case where provision is made for a fairly large town and the expected population fails to materialize. In the first instance the streets, utilities and community features become inadequate. In the second, large areas which were reserved for business and industry remain unoccupied and the town presents huge gaps of vacant land. Thoroughfares are unnecessarily wide, and utilities, such as sewers and watermains, are of unnecessarily large capacity. Admittedly any design should be capable of growth and evolution, but the most economical results will be obtained when the planning engineer is given some assurance by the principals or the promoters as to the probable population.

Factors Involved in Selection of Site

Prior to the final choice of the site by the owners, a consultation with an experienced planner should be made, as all too frequently it has been found that a selection of a future townsite by laymen has proved to be very costly to develop. Among the factors to be considered in the selection of site for a future town, the following are extremely important; *The terrain in general;* whether too steep or too level or broken by ravines, etc.; *Soil*—the degree of porosity or imperviousness and its suitability for garden purposes. Other considerations involve the density of timber and brush growth, the amount of solid rock, the depth of the water table, the convenience of the source of water supply, the facilities for sewage disposal, and the facilities for surface drainage. Cognizance must also be taken of the range of temperatures, and of prevailing winds. Finally a complete topographical survey of the site on a large-scale plan must be made, showing contours of at least five-foot intervals, and all physical features of the terrain and existing developments. This is fundamental and importtant.

Conditions Affecting Townsite Design

The three main conditions affecting the whole, and therefore the basic, design of the townsite, are: waterfront, railways, and main highways leading to other communities.

(a) *Waterfront:* If the townsite is situated on a harbour or large river, the business district will be fixed for all time and the town will naturally spread landward, along and back from the water. If the river is small and can be economically bridged, some foresight and consideration must be given to the possible future expansion of the town on the opposite side. The class of shipping—deep sea, lake or river—and its probable volume, will dictate the extent and type of wharf facilities needed and the provision for street access. The matter of coordinating the railway, harbour and shipping facilities must also be given due consideration.

(b) *Railways:* The size of the town will govern its relation to the railway. In some instances, if the town is likely to remain small, practically all of it will be located on one side of the railway. The railway yards and heavy industrial area are then usually placed on the opposite side. If the town straddles the railway, it is usual to locate the railway yards and industry some distance from the business and residential district. Care must be taken to provide for proper street facilities for access to the passenger and freight depots and for safe railway crossings.

(c) *Highways:* The main highway of the district may or may not pass through the site of the proposed town. In spite of the usual protests from merchants, modern practice dictates that the provincial trunk highway should be located to one side of the townsite. It would appear that more consideration for the safety of the inhabitants from heavy through vehicular traffic is now being given than to the probable loss of the business that might have been obtained from through-travellers. Many of the provincial highways now by-pass the town to avoid congestion, thereby lessening traffic dangers within it. In the long run the use of such a marginal thoroughfare has been proven to be sound. However, convenient wide thoroughfares must be provided for easy access to the heart of the town from the trunk highway. The matter of visiting the town or passing by is then left to the individual traveller.

The Street System

The street system of any community may be termed its framework or civic pattern. This framework as a whole may be said to express the individualism or the main characteristic of that community. Indeed, some cities are noted for their street systems owing to their being unusual, and it may be on account of a city having an unusually good and efficient or an unusually poor and inefficient street system, that it is famous.

The whole problem of townsite design has a definite intricate relationship between streets and blocks, and the solution is possible only after due consideration is given to the many factors involved. Modern transit methods (or mass transportation) and the use of the automobile have altered many conceptions of townsite design in vogue in the past.

Streets are primarily highways for traffic and serve a secondary purpose in affording sites for buildings. They also furnish a location for the transportation of water, sewage and gas, and the transmission of power and light, etc. Therefore, it is essential that they should be considered in relation to all of these functions, and in order of their relative importance. As a matter of fact, every decision relative to the street design must be considered important; location, width, direction, subdivision, grade, planting and lighting.

Street Types

Inasmuch as the primary service of streets is the circulation of traffic, it is essential that the street system is so designed as to facilitate traffic movements. For this purpose streets are classified into various types according to the degree of traffic they will bear;

1. *radial thoroughfares,* being arterial highways which not only provide continuous and direct communication between the business centre and all parts of the community, but frequently radiate throughout the surrounding country. They also serve as a connection between the city centre and the provincial highways. 2. *secondary streets;* These streets are usually associated with industrial areas or densely populated residential districts, i.e. apartments. 3. *minor streets.* These local streets serve limited areas only and they are tributary to but do not form part of the major street system, and 4.

boulevards, parkways and similar thoroughfares.

Types of Street Patterns

Relative to the town's framework, there are many types of street patterns which may be used; namely rectangular (the so-called grid system), radial, curvilinear or circumferential, a combination of any two or all of these, and miscellaneous.

Rectangular: This is the most common arrangement, with square or rectangular blocks and with streets perpendicular to each other. It has a simplicity which commends it to the engineer or surveyor who must plan and lay it out, and to the architect who must fit his structures to the abutting building sites. However, owing to its formal design, it frequently tends to monotony and it totally disregards many vital factors such as grades and topographical features, consequently often incurring heavy cuts and fills. It makes no provision for any diagonal traffic flow.

Radial: This fan-shaped street system offers opportunities to proceed in all directions from the centre of the community, and furnishes a directness of route between focal points of special interest. It provides sites for squares and open spaces for public buildings and the like. It aids materially in the distribution of traffic. However, when buildings are erected to the property line on the acute angled lots which the radials create, expensive construction results.

Circumferential streets connect the radial streets, which spread fanwise from the centre of the town, to provide convenient facilities for cross-town and round-the-city communication. The extensive use of radials and circumferential or curved streets results in a concentric arrangement.

Curves should not be used on main traffic arteries except for topographical urgency or to ease a deflection or angle. The deliberate use of curves for the sake of curvature only, is preferable only in minor residential streets as monotony is eliminated and the general aspect of the street enhanced. The surveys, both for land and the installation of utilities, are more costly than for straight streets, but the extra expense is usually justified in the more aesthetic effect obtained.

Miscellaneous: Among other street patterns which have been advocated in theory or actually employed in various towns are the hexagonal system, and the "cul-de-sac" arrangement of which Radburn, New Jersey, is the most notable example. This plan is an attempt to cope with the requirements of a motor age. The large blocks are bounded by major thoroughfares but the homes within the blocks, instead of facing on the streets, are arranged along cul-de-sacs that open off the main highways. In these residential districts traffic hazards and undue noises are thus eliminated.

Table I

—Widths in Feet —

Type	Between Property Lines	Between Curbs	Lanes of Traffic	Parking Permitted
Major	100	72	8	Both Sides
	80	56	6	Both Sides
Secondary	60-66	42	4	Both Sides
Minor	40-50	24	3	One Side
Elevated Viaducts		44 (at least)	4	None

The Ideal Plan

In choosing the most appropriate system of streets the contour of the site must be given careful study and all the factors must get due consideration. Usually it is found that a combination of the above systems will best solve the problems and an experienced planner will intelligently employ the most appropriate to meet the variety of conditions.

In practice, the principle to apply is to endeavour to obtain the most pleasing and efficacious effect at the least cost. The street system should not be a mere pattern on paper. It should be a well-ordered system in which each portion not only is fitted to the contour of the terrain but contributes efficiency to the aggregate result. It should provide for the safe, comfortable and speedy circulation of traffic and be conducive to the economical and efficient installation of utilities. The topography of the site usually precludes the theoretical adaptation of any orthodox street system in its entirety, but the skilled planner can approximate the tried and proven systems to meet the contingencies.

Street Widths

Theoretically, wide major streets, 100 feet between property lines, are located from one to three miles apart, and normal major streets, 80 feet, at one-half mile intervals. However, it is not always practical to obtain this desirable spacing. Streets of secondary importance are from 60 to 66 feet in width and minor residential streets, from 40 to 50 feet wide. Boulevards or parkways range from 100 to 120, or even 150 feet in width. They usually have a generous medial strip and wide boulevards.

Widths between curbs, or ditches, are measured by "lanes" of traffic. Major streets should have always an even number of lanes, 10, 8 or 6, and secondary streets 4 lanes, according to the width of the street allowance. Minor streets may have only a 3-lane roadway but automobile parking should be permitted on one side only. On major streets, the width of the lanes should be generous to allow for the rapid movement of large wide vehicles; trolley coaches, motor busses and trucks, etc. Table I is a summary pertaining to street widths. Local conditions will no doubt warrant more or less variation from these standards.

Major streets should have as straight alignment as possible and have a dominant direction. Curves should have generous radii from 500 to 1,000 feet. Minor streets should intersect major streets at approximately right angles—from 80 to 100 degrees. Corners at street intersections should be rounded, with radii varying from 15 to 40 feet. All streets should have a maximum and minimum grade. For drainage purposes there should be a minimum grade of 0.5 per cent. Maximum grades vary according to the locality, and winter conditions will dictate the safe maximum grades. Major streets should not exceed 8 per cent and minor streets 12 per cent. Business streets should be straight and fairly level for safe, economical and efficient shopping.

Deadends or Cul-de-sacs

Deadends are almost universally discouraged, and have been used only when normal street intersection arrangements are impracticable. However, for residential streets modern practice dictates that they may be used as they discourage through traffic. Cul-de-sacs are dis-favoured for many reasons, chiefly for obstruction to fire fighting. At their terminals a circular, rectangular or square turn-around is essential. The required radius for the roadway turn-about ranges from 30 to 50 feet. It should be ample for delivery and collection trucks. In residential property a diameter of 100 feet (for property lines) has proven satisfactory. Frequently a 12 foot pedestrian lane is extended from the cul-de-sac to the next street. Normally blocked against vehicular traffic, this lane could be used by fire apparatus in cases of emergency.

Relationship to Railways

The regulations of many cities require that where a sub-division is laid out adjacent to a railway right-of-way, a street shall be placed parallel to the railway. Others require that there be from 100 to 150 feet between the street and the railway and that the intervening land be dedicated as a park buffer. If a railway crossing is involved the street arrangement should be made to facilitate the development of a crossing that will be as safe as possible and provide for a future grade separation.

Lanes

The provision for lanes or alleys is extremely debatable. There is little or no argument that lanes of 20 foot widths should be provided in all business and apartment districts, as they are essential for the proper servicing of the buildings. In residential districts lots of a frontage of 60 to 50 feet or less should have lanes to allow for the greater use of the lot for the dwelling in not having to provide a private driveway. On all right-angle turns on 20 foot lanes the interior corner should be truncated at least 10 feet on each side. Lanes are also of great value at the rear of property abutting major streets as the servicing of these lots and the access of automobiles thereto from the rear will not militate against the easy flow of traffic on the major street.

Blocks

The size, shape and proportion of the blocks should be chosen from an economic viewpoint, but they are controlled of course mainly by the location of the roads. A variety of shape and size prevents monotony, and a diversity will of course ensue when a combination of street systems is employed in the general design.

The length of residential blocks varies considerably, but in later years owing to the extended use of the automobile greater lengths are now possible. The long block lessens the number of cross-streets and therefore it is more economical. Whereas at one time blocks of a greater length than 500 or 600 feet were not permitted, those of double this length are now allowed. It is advisable, however, in blocks of 800 feet or more to introduce a pedestrian cross-walk near the middle.

On major streets especially, the blocks should be placed lengthwise to expedite traffic flow. In order to obtain an equitable distribution of sunlight, the orientation of the block frontage as nearly as possible north-west or north-east is preferable. Blocks in industrial areas should be large enough to permit factory units of 300 by 100 feet or an equivalent area. Business blocks are usually from 400 to 500 feet in length.

Lots

The matter of size and shape of lots is debatable, but there are certain principles or standards which are becoming universally accepted. The lots will and should vary with each project. In small towns it is usual to make the lots greater than in larger towns and cities, as city residents usually have so many other interests to occupy their leisure that they have little or no time to indulge in intensive gardening.

All lots should be planned to suit the types of buildings that it is proposed to erect thereon. They should be arranged with regard to the appropriate building development and to the appearance and healthfulness of the buildings to be erected. Although it is not always practicable, all side lines of lots should be perpendicular to straight street lines or radial to curved street lines.

Lot Dimensions

Residential: In fixing the widths, depths and areas of lots for small dwellings in residential areas they should have dimensions that are essential to provide adequate air and light for healthful occupation, and be such that their cost will be within the means of those who require them as sites for homes. They should not be less than 50 feet in width and from 100 to 120 feet or more in depth.

Business: The usual width of a lot for business development is 25 feet and the depth of from 70 to 100 feet.

Apartments: A frontage of at least 60 feet and a depth of 120 feet will allow for front, side and rear yards for apartments.

Corner lots should have an extra width sufficient to permit the maintenance of building lines on both front and side. Lots with double frontage should be avoided except where topographical conditions admit of no other form of planning. It is often advantageous to create double frontage lots in following contour lines on a steep slope, for the reasons that it is usually better and more economical to have two narrow streets than one wide street. Their greatest value is in the use of local streets paralleling a major thoroughfare. The entry and exit to properties from a wide major street will impede greatly the even rapid flow of traffic. Properties abutting heavily travelled roads should be serviced from local parallel streets.

Easements are of considerable advantage for trunk line utilities and should be specified and marked on the townsite plan before it is registered or any lots sold or leased. They are specially useful in keeping pole lines off the streets.

Miscellaneous Considerations

The organization of the town into its component functional parts or use zones must be made at the time when the planner's ideas of the general design, (i.e. the street system), are crystallizing. To make a zoning by-law comprehensive and constructive it must be co-ordinated with a specific system of streets and public utilities. For architectural, public health and financial reasons, variations in street widths should be adapted to variations in heights and densities of buildings and vice versa.

A knowledge of the theory and practice of sewage disposal and water supply and distribution is essential in the design of the street system and the town as a whole. Proper street grades for storm and sanitary sewers must be obtained. Provision for the outlet of the former, and for the disposal of the effluent of the latter must be made also.

In adjusting the street design to the natural conditions and topography, every effort should be made to conserve and accentuate fine trees, running streams, wooded or rocky ravines and other rugged areas unsuitable for development as home or commercial sites.

A point which has long been the subject of controversy is the problem of creating private property along a waterfront, or on the brow of a steep hill from which splendid views may be obtained. In many cases where it has been allowed in the past, the properties later had to be obtained for the public at great cost. It would appear, therefore, that it would be a wise procedure to preserve such sites for the public. If it is impossible to impress the promoters of the townsite with the desirability of this, the planner should attempt a compromise whereby most of the property so situated would be preserved for the public. This could be effected by swinging the marginal road to and from the waterfront or hilltop as it traverses along, and thus provide frequent look-outs.

Zoning

After the design of the framework of the townsite and the subdivision of the blocks into lots have been completed, the zoning districts should be delineated upon the plan and the regulations governing each district should be prepared. Following these, the zoning plan and regulations should be made legal and binding by the proper governmental agencies through the observance of the procedure prescribed by the provincial statutes in that respect.

Zoning is the creation by By-law, of Districts in which injurious or unsuitable buildings and uses of buildings and land are prohibited by law. The first and foremost essential relative to zoning is a sound and comprehensive zoning enabling act. Considerations which should be given in preparing a zoning district plan and zoning regulations are usually prescribed in more or less detail in the statutes. The following excerpt, which is recited as an example, is from the British Columbia Town Planning Act:

"In determining the regulations to be made under this section, the Council shall have due regard to the following considerations:

(a) The promotion of public health, safety, convenience, and welfare:

(b) The prevention of the overcrowding of land and the preservation of the amenity of residential districts:

(c) The securing of adequate provisions for light, air, and reasonable access:

(d) The value of the land and the nature of its use and occupancy:

(e) The character of each district, the character of the buildings already erected, and the peculiar suitability of the district for particular uses:

(f) The conservation of property values and the direction of building development".

Zoning relates to health, safety, morals, good order and the general welfare of the community. Health is conserved by residential buildings being required to have spaces about them on all sides, thus providing light and air. Safety is provided in that fire risks are minimized by the spacing between buildings. Morals are protected by the prevention of overcrowding. Good order and general welfare are maintained because only one type of use is allowed in each district.

With respect to the districts, there are three main classifications; residential, commercial and industrial. Each of these is further subdivided into two or more classes, depending upon the size and nature of the community, and usually each district is given a precise, self-explanatory name. There may be from 5 to 12 use districts, again depending upon the extent and type of the community.

Residential districts are usually subdivided into single-family dwelling, two-family dwelling, and multi-family dwelling (apartment) districts. Frequently the single-family district is divided further into sub-districts, the only difference being the size of the lots or building sites. In some instances an agricultural or country-home district is included in the single-family district.

Commercial districts are divided into two or three districts—depending upon the size of the community—local business, commercial, and general business districts. The latter covers the city's main or "downtown" business area, the commercial district is designed for secondary shopping centres, and the local business district to serve the smaller neighbourhood areas.

Industrial districts are divided into two subdivisions—light and heavy industrial districts. Occasionally in larger cities restricted industrial districts are also established. The attainment of proportion, what may be termed "balanced zoning", is very important and withal, difficult. However, considerable zoning data are now available and the task of proportioning a community is accomplished more readily and more reliably if intelligent use is made of the information. It would be very unwise to attempt to experiment if a precedent, which has operated successfully in other cities, is at the planner's disposal.

Land Use

Table II shows the averages of the various uses, compiled from a survey of conditions existing in 16 North American cities (including Vancouver, B.C.) having populations ranging from 8,000 to 130,000:

Even with this information relative to the percentage of a community required for streets, parks, railways, commerce, industry and

Table II

LAND USE*	Percentage of Total area Occupied	Percentage of Developed Area Occupied	Percentage of Developed Area Occupied Sts. Deducted
Single-Family Dwellings	21.8	36.1	53.8
Two-Family Dwellings	1.3	2.1	3.1
Multi-Family Dwellings	0.7	1.1	1.6
Total Dwelling Areas	23.8	39.3	58.5
Commercial Areas	1.4	2.4	3.6
Light Industry	2.0	3.2	4.8
Heavy Industry	1.7	2.7	4.0
Railroad Property	3.2	5.5	8.2
Combined Industry & Railroad	6.3	10.8	16.2
Streets	20.2	33.6	...
Parks & Playgrounds	4.0	6.3	9.4
Public & Semi-public	4.5	7.6	11.4
Vacant Areas	39.8	..	..

* From "Urban Land Uses" by Harland Bartholomew (Harvard Press).

for residential purposes, the type of community must be analyzed and considered in order to make an intelligent allotment of areas for the various uses.

Another method of computing land uses and allocating areas for the various use districts is, instead of percentages, a certain number of acres per 100 persons of the city's population is allocated for each use. With respect to commercial districts, an approximate "measuring stick" that is frequently used is that 50 feet of business frontage for every 100 persons should be set aside.

District Regulations

Zoning regulations for one district will differ from those in another but they must be uniform for the same type of district. District boundaries should be located at the rear of property rather than along a street. The density of population per gross acre in any district is controlled by the site or lot area per family.

Parks, Recreation and Schools

There is a definite relationship between parks and schools. Parks are essential for the recreational opportunities they offer and they also provide open spaces, especially needed in residential districts. Public school facilities are also an essential part of the city's structure. The school playground is becoming an equally important part of the educational system and ample play area should adjoin each school. It is only logical that these playgrounds should be used throughout the whole year, thus making it unnecessary for another public agency to duplicate the school playground facilities for use during the summer months.

The generally accepted standard for the amount of land that should be set aside for park purposes is one acre for every 100 persons. Parks should be not more than one-half mile apart.

Similarly, elementary schools should be located not more than one mile apart. Junior and Senior high schools may be located from 2 to 2½ miles apart but should be within a block or two of a transit route.

In providing school accommodation for a given population it is important to know the ratio of pupils to population. This ratio varies from 15 to almost 20 per cent. Of the school enrolment, 50 to 55 per cent will attend the elementary schools, about 25 per cent, the junior high schools, and from 20 to 25 per cent, the senior high schools.

With respect to enrolment and area of playgrounds, it has been proven by experience that the following are satisfactory standards:

School Type	Enrolment	Area Grounds (Acres)
Elementary	350- 500	5- 7
Junior High	600- 750	10-15
Senior High	1,000-1,500	15-25

Parkways, scenic drives and boulevards are important links in a park system. They are in reality elongated parks and should be wider than a normal city street and attractively planted and landscaped. A location along waterways or ravines is particularly desirable. Large parks of 50 to 100 acres or more, usually selected on account of outstanding topography, in the outlying portion of the city, are also desirable. They are utilized for golf courses, swimming pools, picnic areas, etc. Much of these parks should be retained in a natural wooded condition.

Transit

In developing a transit system—street cars, trolley coaches or motor buses—to best serve the population, there should be as little duplication as possible and endeavour should be made to locate transit routes in developed areas so that there will not be a greater walking distance than ¼ mile from any transit line. Routes should extend from residential sections to the main centres of employment. A fast schedule is desirable for both passengers and operators. Headways of from 15 to 20-minute intervals between the transit vehicles on the same route are regarded as maximum desirable spacing for satisfactory service except on heavily travelled routes more frequent service should be given. If it should cost from 35 to 40 cents per mile to operate a transit vehicle, it is obvious that it would require at least from 5 to 6 passengers per mile of operation to make the system pay. If a system is successful there is more likelihood of increased and better service.

In the consideration of the grouping of public buildings, generally to form a Civic Centre, the choice of a site should be governed largely by:

Its proximity to the main business district. (It should not be in the heart of the business area but near the periphery thereof); its focal position with respect to the major streets and transit routes; the character of the site and of its surrounding buildings, and the cost of the land and existing improvements.

Transportation

A most important feature is that, harbours and railways being very closely allied, there should be complete co-ordination between them and there should be provision for an adequate system of street service to the waterfront, as well as trackage. Frequently, a rearrangement of trackage will give a much better service to both the operating companies and the city.

Air transportation has had an extremely rapid growth especially since the war. A progressive city must make provision for airport facilities, and steps should be taken to secure sites for future development. Inasmuch as senior governments as well as municipalities have an interest in airports, the problem can be solved only by cooperation of all concerned. In large centres especially, provision should be made for airports, on a metropolitan basis, to accommodate the different types of aircraft. Most of the regulations pertaining to the operation and location of airports and airstrip zoning emanate from the Department of Transport, and the planner must observe them when making provision for airports. These include minimum distances between airports and the permissible heights of buildings in the zones at the ends of runways.

Conclusion

It will be realized that there are many phases of planning upon which further discussion should be given, but time will not permit. In recommending any plan or project the planner must have vision and realism constantly before him. He must have vision in order to take care of possible and probable eventualities, and realism so that the plan will have the approval of those who supply the funds. Even with extensive experience in planning technique and procedure, the planner must also have comprehensive and factual data concerning his project, for only then can his recommendations be on a sound basis.

Research in Canada for National Defence

A paper prepared for presentation at the Annual General and Professional Meeting of The Engineering Institute of Canada, Banff, Alberta, on June 4, 1948

by
H. M. Barrett
Chief Superintendent,
Defence Research Board, Suffield, Alta.

Tracing the growth of Defence Research during the war years, the author shows how this new branch of the Services has been fitted into the peace-time establishment of the armed forces. The objectives of Defence Research are discussed. Canada's progress in developing weapons for chemical warfare is told. Procedure in the development of a typical chemical weapon is followed through from experimentation to testing to manufacture. Examples are given to show how discoveries in chemical warfare research may have practical peacetime applications. Finally it is emphasized that new weapons never do away with the need for a well trained army, navy, and airforce. Preparation for war is possible only during peace, the author warns.

During the first world war although limited contributions were made by Canadian scientists, no organization existed for research on armament development. Canada depended entirely on the well organized establishments in the United Kingdom and the United States. Fortunately these had been maintained on a reasonable scale in the years between World War I and World War II. Although in many ways we entered the war in an unprepared state, certain novel and invaluable developments particularly in the fields of radar and aircraft design were in our possession. It is no exaggeration to state that these developments were in a large measure responsible for the defeat of the German air force in the Battle of Britain.

In the years between the two world wars Canada had developed markedly as an industrial nation. During the same period facilities for research both pure and applied had shown a considerable growth. Although expenditure on research in this country on a per capita basis compared unfavourably with that in Britain and the United States, at the outbreak of war there existed in Canada a large group of scientifically trained personnel. The problem arose as to how these individuals were to be mobilized to make full use of their abilities.

This mobilization was carried out in the first instance in two ways. Canada had the National Research Council Laboratories with a highly trained staff, who were already involved in a small way with certain defence problems. An immediate expansion in this staff occurred and their interests broadened to cover a variety of fields of research including radar and explosives, armament development, submarine detection, fuse design and later atomic energy, to mention only a few. Secondly a group of public spirited citizens made available to the Government a large grant of money to finance war research at any institution in Canada capable of carrying it out. Thus at most universities and at many industrial laboratories research teams were at an early date engaged in a wide diversity of investigations.

As far as the armed forces were concerned they still possessed no research establishments of their own, though they were deeply involved in production problems on armaments and munitions of standardized design. As the war progressed research establishments within the services were built up in many cases with the assistance of small numbers of key personnel from the United Kingdom. The result was that with the cessation of hostilities there existed in Canada fully equipped and staffed establishments for research on chemical, flame and smoke warfare, explosives, armament development, radar, electronics and naval problems. In addition there were several medical research units equipped to handle problems of a medical nature. This list does not include the many problems that were being handled for the services by the National Research Council.

In most of these fields, due to a free and frequent interchange of personnel between Canada, the United States and the United Kingdom, there existed in Canada scientists who had become experts and who were familiar with the latest developments in all three countries. They could thus apply the knowledge accumulated in the much larger establishments existing in the United States and Great Britain, to the problems being investigated in Canada. Canada's contribution to the common research programme was of necessity smaller on a volume basis than that of the United States or the United Kingdom. Yet the work turned out was of a high quality, and Canadians can be justly proud of the very real contribution made by their country in the field of military research.

Peace-time Reorganization of Armed Services

At the end of the war a decision had to be taken as to what was to be done with the facilities for defence research that then existed. It was apparent from the start that maintenance of defence forces on a much larger scale than was considered necessary following World War I was going to be essential for national security. It was further apparent that successful prosecution of any future war would depend largely on possession of the most modern and efficient weapons. Past experience indicated that failure to be fully prepared in every way would undoubtedly be an invitation for aggressive action. With these considerations in view, reorganization of the Department of National Defence was undertaken. For greater economy and efficiency the defence forces were set up under a single Minister, with an establishment for Army, Navy and Airforce sufficient to supply a highly trained nucleus in case of emergency. At the same time great emphasis was placed on the training of a large reserve force in peacetime.

Early last year a fourth service, Defence Research, was instituted as a permanent part of the defence forces of the country. This is primarily a civilian service within the Department of National Defence, consisting of a board serving under a full time chairman. The board consists of five ex officio members and six appointed members. The ex officio members are the Chiefs of Staff of the three services, the President of the National Research Council and the Deputy Minister of National Defence. The appointed members are six top-ranking scientists from Canadian universities and industry. To ensure that research receives adequate consideration at the highest level, the Chairman of the Defence Research Board has been given the status of a Chief of Staff, is a member of the Chiefs of Staff Committee and Defence Council, and attends meetings of the Defence Committee of the Cabinet.

Organization of Defence Research Board

The organization under the Defence Research Board consists of a headquarters staff, advisory committees recruited from experts in all fields of science from the universities and industry across Canada, and research establishments. These establishments are in many cases the ones already mentioned that were built up during the war years. They include the Chemical Defence Research Laboratories in Ottawa, the Canadian Armament Development Establishment at Valcartier, the Naval Research Establishment at Halifax, the Defence Research Establishment at Kingston and the Experimental Station at Suffield. Others, such as the Arctic Research Unit at Churchill, are now being organized. In addition to these permanent establishments arrangements are made to finance defence research at university and other laboratories, including the National Research Council, in fields where, because of staff or equipment, the work can be more economically undertaken.

Objectives for Research

This brief history and outline of the organization of Defence Research in Canada leads to a consideration of its objectives. For security reasons these can obviously only be given in the broadest outline.

It is apparent that Canada with her small population can not hope to develop any of the major weapons of war. The annual budget for defence research in 1947 amounted to approximately 5 per cent of the defence budget, or about $13 millions. This is a large sum when applied to certain types of research or development, but infinitesimal when applied to others. This sum could easily be expended on developing a single new type of aircraft. Development of the atomic bomb involved an expenditure of 150 times this amount. Even if funds were made available for developing major weapons of war, Canada lacks sufficient numbers of scientifically trained personnel to embark on projects of this magnitude. Furthermore the size of her armed forces is insufficient to make it economically feasible to tool up for production of unique weapons no matter how desirable they may be, unless these were acceptable to the armed forces of the United States or the United Kingdom, or both.

This last factor makes it essential that the weapons adopted by the Canadian services are interchangeable from the production standpoint, at least with those of the United States and the United Kingdom. For this reason, should conditions in Canada require that proposed United States or United Kingdom weapons be modified, these modifications will have to be agreed to by all three countries at a very early stage in the weapon's development. Agreement of this type can only be reached rationally if we have in Canada trained individuals working on some aspects of the problem at least, who at the same time are fully familiar with what is being planned in the U.S. and the U.K. It is the intention of the Defence Research Board that this will be the case.

Chemical Warfare

In other specialized fields such as chemical, flame and smoke warfare, Canada built up an enviable reputation during the war and now possesses some of the best testing facilities in the world for weapons in this category. Canada was responsible for major contributions in the use of flame and smoke, more particularly on the tactical side. Although the use of toxic weapons as such was not implemented during the last war, the high state of preparedness existing in the U.K., the U.S. and Canada in this field was in a large measure responsible for Germany's failure to initiate this type of warfare. Due to the discovery and development of new materials during the war that are more toxic by orders of magnitude than the conventional agents, mustard and phosgene, it is more than ever necessary that research in this field be prosecuted fully, and that the search for newer and more effective agents be continued.

It certainly cannot be assumed that because toxic agents were not used in the last war one can afford to be unprepared in this field. The imaginative large scale use of gas by the Germans in world war I, at a period before defence against it was available, could easily have been decisive. Even now the conventional agent, mustard, used on a large scale as a strategic weapon can not be overlooked. We now must be prepared for the employment of agents many more times as toxic and in many cases difficult or impossible to detect. It is of the utmost importance that research on these newer agents be prosecuted now, since experience has shown that when war has started one is forced to seal the design of the best weapon then available in order to produce it in sufficient quantities. It is only in exceptional circumstances that any weapon developed in wartime exerts an effect on the current conflict. There is invariably a period of not less than five years between the completed laboratory stage of an investigation and the large scale production of a weapon.

In spite of the effort expended on military research in Germany during the thirties we know now that Germany initiated this war unprepared. Another year or two spent on the development of guided missiles and jet propelled aircraft, to say nothing of the high speed submarines which were appearing in small numbers at the close of the war, might easily have turned the tide in Germany's favour before the full weight of U.S. production could be brought to bear.

Development of a Chemical Weapon

The last part of this discussion deals with the question, "Of what does defence research consist?" In many ways, particularly in the purely research phase, it does not differ markedly from research in any other field. Like all factors associated with war, however, it is many times more complicated, and requires the close co-operation of experts in many fields. Thus, development of a new chemical warfare weapon, for example, requires a team of chemists, physicists, meteorologists, physiologists, pharmacologists, biochemists, and engineers even at the laboratory level of investigation. As the weapon progresses to the production stage the list of experts increases.

Let us follow the course of development of a hypothetical new weapon in this field. Recorded in the world's chemical literature there are over a million chemical compounds. The files of industrial research laboratories contain many more. Unfortunately the living body is so complex that one can not forecast with any certainty whether a material is toxic or not. On the other hand a reasonable approach is to choose materials which are similar to ones which have already proved to be toxic. This procedure is usually not too successful; more frequently a highly toxic material is accidentally discovered incidental to some totally unrelated investigation. With a hint, however, that an untried material may be useful, it is first necessary to establish quantitatively how toxic this substance is.

Testing

This involves the use of large numbers of animals of as many species as possible. One determines for each species a dose which will consistently kill or incapacitate 50 per cent of a large group. Almost always this dose varies from species to species by a factor of 10 times or more. That is, it may require ten times as much material to kill a goat as it does to kill a monkey or vice versa. It is usually assumed that the sensitivity of man lies within the range of sensitivity of the species tested provided their number is sufficient. If this assumed toxicity for man is appreciably greater than that of the conventional agents, phosgene and mustard, the substance must be considered a potential chemical warfare agent.

A multitude of other factors must be taken into consideration at this stage of the investigation. Can the material be synthesized on a large scale, and how easily? Is it stable to storage and to explosive forces? How easily can it be detected by subjective symptoms or analytical means? How rapidly does it act? Does a respirator give protection? From what type of weapon can it be most efficiently dispersed? Is there a means of treating individuals poisoned with it? What precautions must be taken in large scale manufacture? Some of these and many other questions may require years of intensive effort to find an answer. It is apparent therefore that the early experiments must indicate that the new agent possesses a decided advantage over mustard or phosgene before one is warranted in embarking on this long term investigation.

Manufacture

The problems associated with full scale manufacture can only be solved by constructing expensive pilot plant installations. Likewise the design of weapons is a slow and costly procedure. Before a decision to finally accept any agent is taken, trials must be carried out with the actual production weapon and charging in which animals and sampling devices are used in large numbers to assess the effectiveness of the finished weapon. If the results of such trials are unsuccessful the effort expended is to a large extent wasted. This is not infrequently the case, since it is not ever too certain that the results of trials undertaken on a small scale will predict what will happen when full scale trials are carried out. This is one of the reasons that the development of the atomic bomb represents one of the biggest gambles in history, since in this case a minimum amount of fissionable material had to be produced before any trial at all could be done. Thus the effort of full scale production had to be expended before even an indication could be obtained that the result would be successful.

Discoveries May Be Applied to Other Uses

In spite of the fact that the final weapon may not be an improvement on existing ones all of the work expended is not necessarily useless. For example: during the last war one of the notable contributions to scientific knowledge resulted from a search for a material that would counteract the effects of mustard gas. Although no such material was found, a substance that was therapeutically effective in Lewisite poisoning, (another war gas) and one containing arsenic, was discovered by Dr. Peters at Oxford University.

From the chemical warfare standpoint this discovery was of little importance, since as a war gas Lewisite is so inferior to mustard that it is unlikely that it would be used in war. Further experiments, however, proved that this antidote was extremely effective in controlling poisoning by other arsenic compounds, including many drugs used in the treatment of syphilis. In addition, it proved useful in the treatment of lead and mercury poisoning. Thus a discovery of major medical importance resulted. Although a great deal of military research is applied research, the example given indicates that investigation of any problem brings to light phenomena which, although not having an immediate direct application, can be profitably studied.

Of perhaps more interest are phases of defence research which have immediate peacetime application. A good example of this type of study is given by the work carried out at the Entomological Section at Suffield. In this section, in close collaboration with the Dominion Department of Agriculture, a search for new insecticides is under way as well as new and better methods of applying them. This section is a natural outgrowth of the activities of the station. In view of the fact that new materials of high toxicity to mammals, in particular man, are being continually sought, many of these substances are tested for their toxicities to insects.

At the same time the techniques employed in dispersing chemical warfare agents, including aircraft spray, smoke generation and even bombs, can be usefully used against insect infestations. After all factors have been investigated on the laboratory or pilot scale, actual full scale trials against infested crops are carried out. The economic importance of this type of investigation is obvious. From the purely military standpoint the section investigates means of controlling insects such as mosquitoes, flies and lice which can be vectors of disease.

In this paper an attempt has been made to summarize Canada's position in Defence Research. If undue emphasis is placed on certain phases of the programme, it is only because it is these phases with which the author is most intimately connected and hence most familiar. The question of security makes it impossible to be specific about the types of weapons envisaged, but there is no doubt that Canada is keeping abreast of the latest developments in all fields, and is making original contributions in many.

Armed Services Still Needed

It is not desired to convey the impression that the development of new weapons has outmoded the necessity of a well trained army, navy and airforce. Although the sensational press suggests the next war will be fought by remote control with guided missiles and pilotless aircraft, this state of affairs is a long way in the future. There is little doubt that such weapons will play an increasingly important role, and that any future war will in the end probably be decided as the last one was, by strategic attack on centres of industry, transport and population, yet fully prepared armed forces will be of equal importance. Victory will go to the side that is prepared in every way. Really, the change that has occurred in war is the fact that it has now become total, and that development of weapons of mass destruction — atomic bombs, toxic agents, or, with sufficient air strength, high explosives and incendiaries—now makes it possible to knock out centres of production to prevent adequate supplies reaching the forces in the field. Probably the only guarantee of peace today is that these newer weapons are so mutually destructive to the population as a whole that any nation might well hesitate attacking another which was fully prepared. Let us remember that such preparation will only be possible in the years of peace. After war has started it will be too late.

Correction — April Issue

In the April *Journal,* in the first paragraph of the paper, **Novel Concrete Headframe for Asbestos Mine,** page 214, the structure was described as being 30 feet in height.

This was obviously a typographical error, and the correct height of 115 feet was given elsewhere in the paper. The *Journal* regrets sincerely that this should have occurred.

THE JOHN GALBRAITH PRIZE PAPER

EFFECTS of LIGHTNING on BURIED TELEPHONE CABLE

by

R. N. E. Haughton, Jr.E.I.C.,

Bell Telephone Company of Canada, Toronto, Ont.

The author discusses the theory of lightning, and describes step by step with the aid of diagrams how a flash of lightning is formed. Effects of lightning on buried telephone cable are analysed, and various remedial measures for the avoidance of cable failures are listed, amply explained by the aid of illustrations.

The theory of lightning is a subject that is generally approached with considerable trepidation. The phenomena are extremely vivid and—from the standpoint of the ordinary observer—are inspiring, and many times of great grandeur. Yet from the point of view of the scientific observer, they are somewhat intangible. Observations are difficult to make. The subject still is, and will be for some time, in the stage where it is a problem for the physicist. The engineer usually has the duty of interpreting the work of the physicist into practical values, but in this case the necessity for remedial measures requires that the engineer take what the physicist has found and supplement it with such experimental work as he is able to carry out. Recent progress in the mastery of lightning problems through combined research in the laboratory and field has been so rapid that it seems important at this time to make a review of the present status of the various phases of the subject. The following indicate how rapid the progress has been:

The wave shape of lightning has been pictured by the cathode ray oscilloscope; the time required for a cloud to discharge has been measured by this instrument; the attenuation of lightning waves travelling on a transmission line has been determined; natural lightning has been reproduced in the laboratory where effects on transmission lines and associated equipment have been studied at will; a lightning generator producing over 3.6 x 10^6 volts has been constructed, and waves from this generator have been sent over transmission lines to test full size transformers and other apparatus to determine how to make them highly resistant to lightning. The above list is not complete, but will serve to indicate how much progress has been made.

Theory of Lightning

Modern lightning theory depends for its explanation upon the presence of large numbers of ions in the atmosphere. Many of these ions, both positive and negative, cling to minute particles of dust and extremely small drops of water, to form large ions as opposed to the unattached or small ions. The number of small ions of each sign ranges about from 300 to 1,000 per cubic centimeter, and the large ions from 1,000 to 80,000 per cubic centimeter. The mobility of an ion is the steady velocity that can be obtained under a voltage gradient of one volt per centimeter. The large ions have very low mobility, ranging from .0003 to .0005 centimeter per second. Under a gradient of 10,000 volts per centimeter this would correspond to a velocity of only 3 centimeters per second.

In a study of the behaviour of water drops when exposed to electric fields it was found that a droplet of radius r centimeters becomes elongated until, at a critical field determined by the relation $F\sqrt{r}=3{,}875$, it becomes unstable. This sets a limit to the size of drops in a thunderstorm. No drops greater than .15 centimeter in radius can persist in fields of 10,000 volts per centimeter. Air pressure has no influence upon the field at which this occurs.

The latest theory premises the existence of the normal field which occurs during fair weather. This is generally directed downward in the positive direction. At the surface of the earth it is of the order of one volt per centimeter, and gradually decreases with altitude until at 30,000 feet it is only about .02 volt per centimeter. A relatively large drop of water (say one millimeter radius) in such a field will become polarized by induction, the upper side acquiring a negative charge and the lower side a positive charge. The velocity of fall under the influence of gravity of such a charge will be approximately 590 centimeters per second, which is large with respect to the velocity of the slowly moving ions, even under the maximum field strength of 10,000 volts per centimeter.

At the under surface of the drop a selective action with regard to the slowly moving ions occurs. The negative ions tend to be attracted and the positive ions repelled. No such selection occurs at the upper surface, since the drop is moving far too quickly for the slower, smaller positive ions. As a result of this action the drop accumulates negative charge. With the loss of the negatively charged ions the remaining large ions are predominantly positive. The smaller drops descend with a lower velocity and thus their velocity becomes more nearly equal to that of the velocity of the large ions under the influence of the electric field. It becomes possible then for the small drops of water to pick up positive charge by impact with the positive ions.

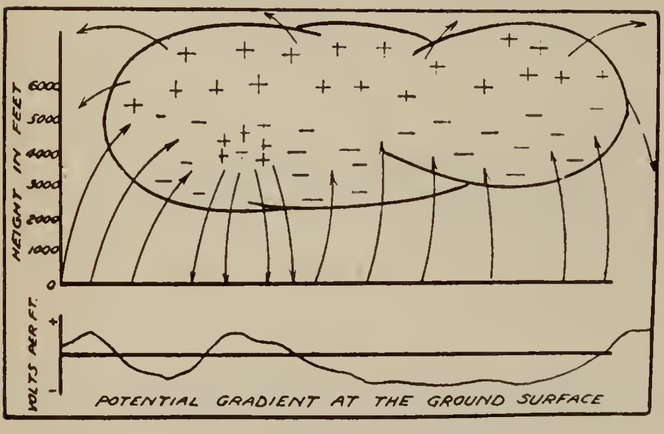

Fig. 1.

Thus the original charges which were distributed at random and produce an essentially neutral space charge, become separated. The large drops carry the negative charges to the lower portions of the cloud and the small drops retain the positive charge in the upper portion. Hence the lower portion of the cloud is negatively charged and the upper portion positively.

To investigate the charge distribution in a more direct manner free balloons equipped with clock-operated apparatus to measure the electric gradient, atmospheric pressure and relative humidity were released during storms. It was found that in general the main body of a thundercloud is negatively charged and the upper part positively charged. A concentration of positive charge appears to exist frequently in the base of the cloud. Fig. 1 offers a satisfactory explanation of practically all the soundings obtained in the investigations. The positive charge at the top of the cloud gives rise to the positive field encountered at the ground as the storm approaches and as it recedes. The negative charge contained in the lower half produces a negative field everywhere under the cloud, except where the local concentrations of positive electricity produce positive fields.

Fig. 2.

The potential gradient diagram in Fig. 1 shows that the approach and recession of a storm is usually accompanied by positive gradients, while the centre of the cloud produces a negative gradient. This is what would occur if the lower portion of the cloud carried negative charge and the upper portion positive charge. Observations have shown quite conclusively that the boundary between the positive electricity in the upper part of the cloud and the negative electricity in the lower is in every case in a region of the cloud where the temperature is well below the freezing point and generally below −10 degrees centigrade. In this part of the cloud, raindrops cannot exist. The precipitation in the upper part of a cloud is in the form of crystals, either needles or plates, which tend to lie horizontally and to fall slowly in a series of nearly horizontal motions, first in one direction and then in another.

It has been suggested that the impact of ice crystals results in the ice becoming negatively charged and the air positively charged. The general settling of the negatively charged ice crystals relatively to the positively charged air would then result in a separation of electricity with the positive charge above the negative. Whatever the explanation may be, there is little doubt that the upper separation of charge in a thunder cloud is in some way connected with the pressure of ice crystals.

The processes occurring within cloud formation are so complicated that it is quite possible that all the foregoing phenomena, the selective attraction by polarized drops, and interactions between wind and ice crystals at subzero temperatures, are involved.

Fig. 3. Damage to cable sheath by lightning.

Field Distribution and Mechanism of Stroke

The field between cloud and ground has been found to be more or less independent of height and of the order of 50 to 100 volts per centimeter. Thus the gradient in the region between cloud and ground is about 1,000,000 volts per thousand feet, so that for 10,000 foot cloud the potential at the cloud base would be of the order of 10,000,000 volts. Taking into consideration the more intense fields near regions of high charge distribution, it is likely that cloud potentials are of the order of 20,000,000 volts.

The electrical charge concentrations within a cloud, of course, must be limited to the bounds of the cloud proper and in most cases are much smaller. In relation to these dimensions the earth can be regarded as infinite in extent. It follows then, from considerations of a flux plot, such as that of Figure 1, that before the discharge the electrical gradient within the cloud must be very much greater than at the earth where the gradient never exceeds about 100 volts per centimeter. Thus the discharge tends to be initiated at the cloud rather than at the ground. As mentioned previously tests have shown that in a region occupied by water droplets of the size expected in clouds the critical breakdown voltage is 10,000 volts per centimeter, a magnitude contrasted with 30,000 volts per centimeter in air without water droplets. This phenomenon likewise tends to initiate the discharge from the cloud. In addition, the lower pressure at the higher altitudes, even if there be no water droplets, decreases the breakdown gradient.

A lightning discharge which usually appears to the eye as a single flash is in reality generally made up of a number of separate strokes that travel down the same path. The interval between these components varies between .005 and .5 second. Each separate stroke consists of a downward leader that starts from the cloud. When the downward leader strikes the ground it is followed by an intense return streamer which consists of a point of intense luminescence travelling from the ground to the cloud.

The leader of the first component stroke of a flash is preceded by a "Pilot Streamer" which represents propagation of the discharge into virgin air having very low ionization. Currents associated with the pilot streamer are small, the majority being of the order of only a few amperes. The luminosity is likewise very low. Its existence is deducted by inference and by an analysis of the mechanism of the discharge. In the following discussions, velocities are given in terms of that of light (approximately 1,000 feet per microsecond) as it is the same as that of waves on transmission lines. It therefore provides a very convenient bench mark when the phenomenon is applied to considerations of the effect upon systems. The most frequent velocity of propagation of the pilot streamer is about 1/20 of one per cent of that of light.

As the pilot streamer proceeds it is accompanied by points of luminescence which travel in jumps, giving rise to the term "stepped leader". The velocity of these steps exceeds one-sixth of that of light and the distance travelled in one step is about 50 meters. The path of each step is essentially straight but each fresh step, in general, takes a different direction. The change in direction at each junction thus gives rise to the tortuous path characteristic of lightning. The electrostatic lines of force from the stroke to ground should form essentially smooth curves, another fact which suggests that the zigzag path must be attributable to some variable condition at the head of the discharge, this condition being either variations in the head itself or variations in space ionization.

As the leader strikes the ground an extremely bright return streamer propagates upward from the earth to the cloud following the same path as the main channel of the downward leader. The charge distributed along the leaders thus is discharged progressively to ground, giving rise to the very large currents usually associated with lightning discharges, currents varying between 1,000 and 200,000 amperes. The rate of propagation, about 10 per cent of that of light, is determined by the rate at which the head of the lightning channel can become sufficiently conducting to accommodate these large currents. The charge that had been lowered from the cloud to the antenna-like system of streamers by this means is further lowered to ground. The former of these processes is relatively slow, requiring a time of the order of 10,000 microseconds, whereas the latter is relatively fast, requiring only about 50 to 100 microseconds. Since the same charge is involved in both stages the difference in time explains the large difference in currents involved in the two stages.

With the development of a high conducting arc path between the charge centre and ground, the potential of the charge centre is lowered considerably. This process may develop high potential differences between this charge centre and another charge centre within the cloud, resulting in the continued progress of streamers into the cloud, and the information and attraction of streamers from the other charge centre. Upon the meeting of two such approaching streamers, a relatively

Fig. 4.

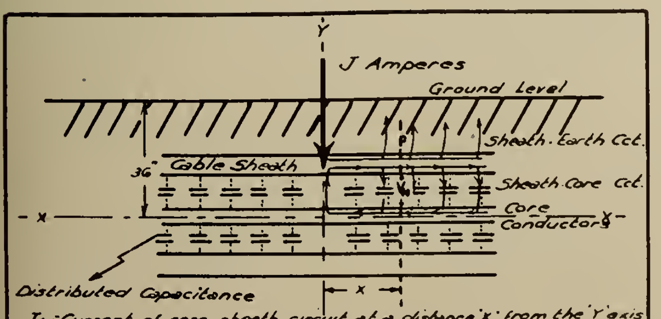

Fig. 5.

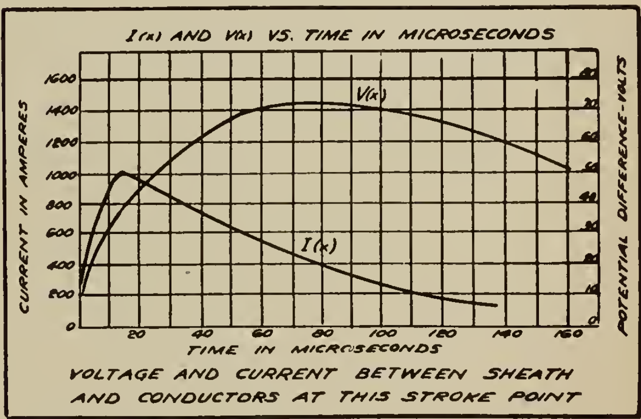

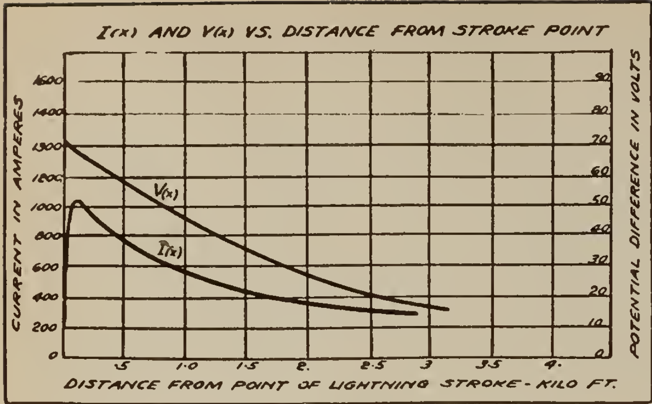

Fig. 6.

low conducting path to ground for the new charge centre is formed. The resulting discharge traverses the same path blazed by the first stroke. The leader streamer of this stroke differs from that of the first stroke in that the stepped phenomenon is absent; there is no branching, and the velocity of propagation is much higher, being of the order of three per cent of that of light. Because of these characteristics this leader is known as a dart leader. Upon reaching the earth, a return streamer travels back to the cloud just as for the first stroke.

The stroke current at the ground is also similar in character to that of the first stroke, rising rapidly from zero to a maximum, falling slowly for several hundred microseconds and then more slowly for a much longer time. The crest magnitude of the stroke is the greatest, probably because the branching of the antennae system of streamers permits a lowering of a larger charge before it is released to earth. This is not always the case, as the second or subsequent strokes are sometimes the greatest.

As the charge in the second charge centre is dissipated by being carried to ground, the streamer in the cloud might tap a third centre and the same process be repeated. In general, approximately half the flashes are of this multiple character. Flashes having as many as 40 component strokes have been observed. The relative time involved in these processes is given in Fig. 2.

In general, the rates of propagation of the discharges discussed vary inversely as the amount of previous ionization of the path. Thus, the initial pilot streamer progressing into virgin air with very little ionization was the slowest, being about 1/20 of one per cent of that of light. The stepped strokes that followed in the path blazed by the pilot streamer have a velocity of the order of 15 per cent of that of light. The return streamer is also quite rapid, as it follows the intense ionization of the initial streamer and has a velocity about 10 per cent of that of light.

Storms versus Metallic Circuits

It is desirable to lay particular stress upon the chief differences between electric phenomena in thunder storms and in engineering practice. We are ordinarily concerned with complete metallic circuits handling large quantities of electricity at constant and relatively low voltages for long intervals of time. On the other hand in a thunder storm the quantities of electricity are small, in the form of isolated electric charges located on water drops forming a volume distribution of electricity. The masses of water drops are so large compared to their charge that for the duration of a lightning stroke the distribution of electric charge remains fixed. The charged water particles are acted upon by the electric field and their slow motions give rise to displacement currents. The actual velocities obtained by the charged particles are sufficiently low to enable the wind to do work upon them against the electric field and thus raise the potential to breakdown of the air when a lightning flash takes place.

The voltages present in thunderstorms may be extremely high, of the order of 10^8 volts and are subject to wide and sudden variations. The quantities of electricity in lightning flashes are small, of the order of 20 coulombs. Yet as the time during which they are mobilized is short, the current in a flash may rise to 200,000 amperes. This may be seen from the following simple analysis.

Let q coulombs of electricity exist on a particle of water. Under the action of the electric field F the charged particle will move from one point to another. Now, by definition, an electric current $I = \frac{dq}{dt} = \frac{\text{coulombs.}}{\text{sec}}$ Since q is constant in our case, and the time element is extremely small during the particle's motion from one point to the other, due to the high electric field F, then $I = \frac{dq}{dt}$ will be high.

Effects of Lightning on Buried Telephone Cable

Practically all of the toll cable installed since 1939 has been buried where possible, in order to secure greater immunity from mechanical damage. It was realized, however, that burying the cable would not prevent damage due to lightning and that, on account of their smaller size, more damage was to be expected on the new carrier cables than on the much larger voice-frequency underground cables then in use. Moreover when damage by lightning does occur, such as fusing of cable pairs, or holes in the sheath, (See Fig. 3) it is not so easy to locate and repair as on aerial cables, since excavations may have to be made at a number of points. Studies have been made of the factors affecting damage of buried cables by lightning. Remedial measures have been devised and put into effect in cases where a high rate of lightning failure was anticipated on new installations, or was experienced with cable already installed. Most of the cable installed was thus provided with extra core insulation, and shield wires were plowed in on many of the new routes.

It was recognized early in these studies that more effective lightning protection might be secured, by providing the lead sheath with a thermoplastic coating of adequate dielectric strength and an outside copper shield. Such cable might be required in such territory where experience has indicated that other types of construction would propably be inadequate. Since such cable has advantages also from the standpoint of corrosion and mechanical protection, it may be used also where lightning is not of such decisive importance.

When lightning strikes, the current spreads in all directions from the point where it enters the ground. If a cable is in the vicinity it will provide a low resistance path, so that much of the current will flow to the cable and in both directions along its sheath to remote points. The flow of current in the ground between the lightning channel and the cable may give rise to such a large voltage drop, that the breakdown voltage of the soil will be exceeded, particularly when the earth resistivity is high. The lightning stroke will then arc directly to the cable from the point where it enters the ground, often at the base of a tree. When this happens practically all the current reaches the cable sheath. Furrows as long as 1,000 feet have been found in the ground along the path of such arcs.

The current entering the sheath near the stroke point is attenuated as it flows toward remote points. The current leaving the sheath must flow through the adjacent soil, and the amount of this leakage current per unit length of cable is, therefore, smaller if the soil resistivity is high than if is it low. Thus the current will travel farther the larger the earth resistivity. The flow of current along the sheath produces a voltage between the sheath and the core conductors, which is largest at the stroke point. This voltage is substantially equal to the resistance drop in the sheath between the stroke point which is sufficiently remote that the current in the sheath is negligible. Since the higher the earth resistivity, the farther will the current travel, this resistance drop will also increase with the earth resistivity. The maximum voltage between sheath and core is thus proportional to the sheath resistance. It is also proportional, as it turns out, to the square root of the earth resistivity. Carrier cables now being used are of smaller size and have a higher sheath resistance than full size voice frequency cables. For this reason they are more subject to lightning damage, particularly when the earth resistivity is high.

Direct Strokes — Current Propagation along Sheath

As mentioned before, a lightning stroke to ground may arc to a buried cable in the vicinity, in which case virtually all of the current will enter the sheath near the stroke point. When a sinusoidal current J (see Fig. 4) enters the sheath at $x = 0$ and the sheath is assumed to extend indefinitely in opposite directions from this point, the sheath current at the distance x is given by the following approximate expression,

$$I_{x)} = \frac{J}{2} e^{-ax}$$

where a is the propagation constant of the sheath-earth circuit and is given by the following expression,

$$a = \frac{I}{V} \left[jw \left(jw + \frac{1}{\sigma} \right) \right]^{1/2}$$

where V = velocity of propagation along sheath.
w = in radians per second
k = capacity of earth in farads per meter
σ = earth resistivity in meter-ohms
$j = \sqrt{-1}$

Direct Strokes—Voltage for Sinusoidal Current

The current along the sheath gives rise to an electric force along the latter. The electric force along the inner surface of the sheath is given by,

$$E_{(x)} = ZI_{(x)} = \frac{J}{2} Ze^{-ax} \quad \text{volts}$$

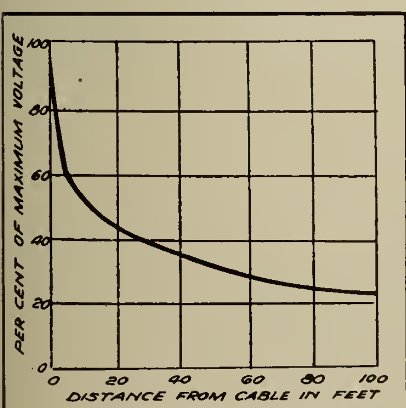
where Z is the mutual impedance of the sheath-earth and core-sheath circuits.

The latter mutual impedance is equal to the ratio of electric force along the inner surface of the sheath at any point to the total current along the sheath at the same point, and for low frequencies equals the direct current resistance of the sheath.

The largest voltage between sheath and core conductors is obtained for $x = 0$, since at this point the entire lightning current J enters the sheath. (See Figs. 5 and 6 for voltage and current curves.)

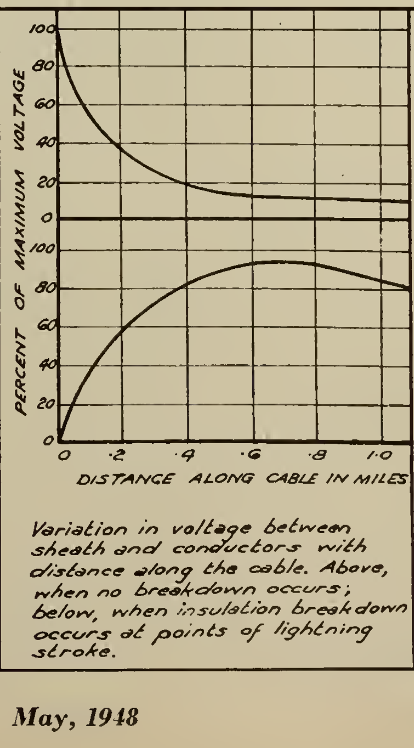
To secure experimental verification of the theory outlined above, tests were made on a typical cable, using a surge generator, which generates a short time surge of current similar to that of a lightning discharge but of much smaller magnitude. A ground was established remote from the cable, and the surge generator was connected between this ground and the cable sheath, and between the remote ground and grounds at distances of 10, 25 and 100 feet from the cable. The voltage between conductors and sheath was then measured for various conditions. The results obtained with the surge generator connected between sheath and remote ground are shown in Fig. 5, which gives both the cur-

Fig. 7.



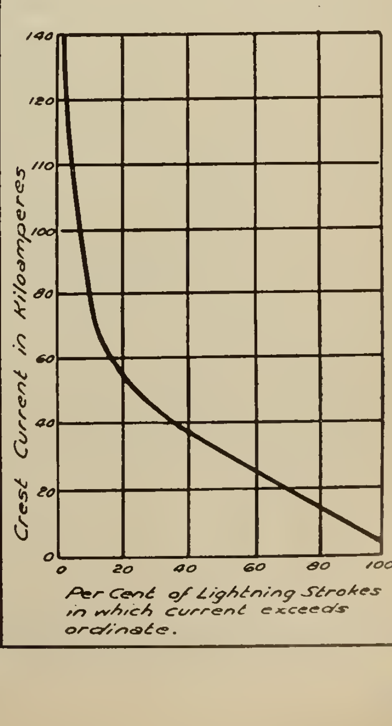
Reduction in voltage between sheath and conductors as the ground representing the point of lightning stroke is moved farther from the cable.

Fig. 8.



Variation in voltage between sheath and conductors with distance along the cable. Above, when no breakdown occurs; below, when insulation breakdown occurs at points of lightning stroke.

Fig. 9.



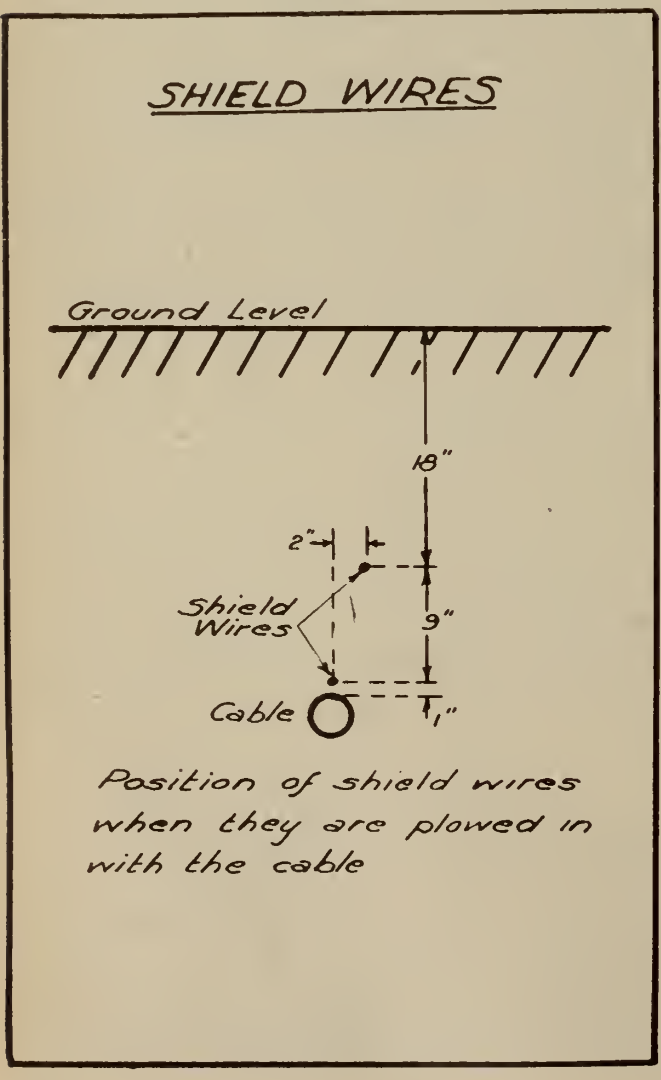
Per Cent of Lightning Strokes in which current exceeds ordinate.

rent flowing into the sheath, and the voltage between conductors and sheath, as they vary with time. Allowing for the difference in the magnitude of the current, such a test would represent an arcing of the lightning directly to the cable.

Voltages between conductors and sheath, when the surge generator was connected between the remote ground and grounds near the cable, are given in Fig. 7. These voltages are plotted as percentages of the maximum voltage shown in Fig. 5. Tests such as these are comparable to lightning strokes to ground at various distances from the cable when arcing to the cables does not occur. The observed voltages are in good agreement with those calculated from theoretical considerations.

The voltages of Fig. 5 were those observed at the point where the current entered the sheath. As the current flows along the sheath it is attenuated, however, with the result that the voltage decreases. The rate of decrease is indicated by the upper curve of Fig. 8 where the voltage is plotted as a percentage of the maximum voltage of Fig. 5. There is some unavoidable variation in the dielectric strength of the core insulation. Thus although the voltage decreases rapidly with distance, actual failure may not occur at this point where the current enters the sheath, but at some distance away, where the dielectric strength of the insulation may happen to be less.

Fig. 10.



When the voltage at the point where current enters the sheath is great enough to break down the insulation, the conductors and sheath are brought to essentially the same potential by the arcing. Under these conditions, the voltage between conductors and sheath will increase with distance along the cable, as shown by the lower curve of Fig. 8. A maximum is reached at some distance from the original fault, and beyond this point the voltage slowly decreases. After a puncture of the insulation where the current enters the sheath, other failures may therefore occur at some distance from this point in either or both directions. A single lightning stroke may thus cause insulation failures over a considerable distance along the cable.

The crest value of the current in a lightning discharge varies over wide limits. Measurements made largely with magnetic links by engineers of the power industry have indicated that a relationship somewhat like that shown in Fig. 9 exists between various values of crest current and the percentage of the total flashes in which they occur. Although measurements of wave shape are not extensive, they indicate that the current reaches its crest value in from 5 to 10 microseconds. They also show that it decays to half its maximum in from 25 to 100 microseconds—the average being about fifty microseconds. This type of wave shape was simulated by the surge generator used in the tests shown in Fig. 5.

For voltages of short duration, such as those arising from lightning strokes, the dielectric strength of normal core insulation is about 2000 volts. Based on the data of Fig. 5, this voltage would be reached for a lightning current of some 28,000 amperes for a cable of the particular size and construction tested and as shown in Fig. 9. A surge of this magnitude occurs in about 50 per cent of the strokes. If the stroke reached the ground 100 feet from the cable instead of arcing directly to it, the lightning current would have to be of the order of 127,000 amperes to cause a breakdown potential between conductor and sheath. Currents of this magnitude estimated from Fig. 9 occur in less than 5 per cent of the strokes.

The application of the various remedial measures depends largely upon a detailed study of the proposed cable route. The important factors in this study are the earth resistivity measurements, the positions of trees which may tend to attract lightning strokes and the probable extent of damage to the cable. Considering also the costs of the various types of measures in conjunction with the above factors, the best engineering solution can be determined.

Remedial Measures—General

It is evident that the rate of cable failures to be expected, and hence the need for remedial measures, depend greatly on the earth resistivity. Experience has indicated that lightning damage is likely to be encountered even when the surface resistivity is fairly low, provided the resistivity beyond depths of 10 or 20 feet or so is very high. On the other hand when the surface layer resistivity is high the lightning stroke may then channel through the surface layer to the good conducting lower layer. Consequently direct strokes are not experienced as frequently, in spite of the high surface resistivity.

Extra Core Insulation

One method of reducing failures caused by lightning strokes to buried cable is to increase the insulation between the cable conductors and the sheath. This does not require extra insulation between individual cable conductors. This has already been done for most new installations. The cable itself, cable stubs, loading cases and gas alarm contactor terminals are all provided with sufficient extra insulation to double the dielectric strength between cable conductors and sheath. Such increased insulation would reduce the number of lightning strokes that could cause failure to about 15 per cent of the total, and would almost entirely eliminate the danger of breakdown when lightning strikes the ground as much as one hundred feet from the cable.

Shield Wires

Another method, which may be employed in addition to the extra insulation where excessive lightning damage would otherwise be expected, is to bury shield wires over the cable. These conduct away part of the lightning current, and thus reduce the amount that flows along the sheath. These wires may be plowed in with the cable, or they may be installed afterward. When wires and cables are plowed in together, one of the practical arrangements is that of Fig. 10. The percentage of the current carried by the wires depends to a greater extent to their inductance relative to that of the sheath than on their resistance. Two wires are employed rather than a single wire of smaller resistance, in order to obtain a lower inductance than would be possible with a single wire.

Surge measurements made after these wires were installed indicated that the wires reduced the voltage between sheath and core conductors about 60 per cent, in substantial agreement with theoretical expectations. The shield wires should thus reduce the number of direct lightning strokes that would be expected to cause failure to about 10 per cent.

Lightning Resistant Cable

Buried cable may be covered by jute, thermoplastic, or rubber for protection against corrosion. The coating may be damaged by rodents or by lightning. Severe corrosion may be experienced at points where the coating is ruptured, particularly when thermoplastic or rubber coating is used. Even when the earth resistivity is low, and protection against core insulation failures due to excessive voltage would not be required, the sheath coating may be damaged rather frequently.

Shield wires may affect a considerable reduction in core insulation failures. They may also prevent damage to the coating in the case of strokes to ground at some distance from the cable. In the case of direct strokes however, arcing between shield wires and the sheath will damage the sheath coating. It may also fuse a hole in the sheath, although there may be no insulation failures due to excessive voltage between the sheath and the cable conductors.

Reduction of damage to the coating and to the sheath occasioned by lightning, rodents or corrosion, and protection against core insulation failures occasioned by excessive voltage or crushing of the sheath, may be secured by providing the sheath with a thermoplastic rubber or rubber coating and an outside copper shield. If various auxiliary equipment connected to the sheath, such as load coils, gas pressure contactors and terminals, are also properly insulated from ground, currents will not enter the sheath, except through the capacitance to the outside shield. The voltage across the core insulation will then be so small that core insulation failures will not occur, unless the voltage between the outside shield and the sheath is large enough to puncture the coating. In estimating in advance the need for specific remedial measures, the probable incidence of lightning strokes to the cable and to ground near the cable is of course an important consideration, in addition to the factors discussed.

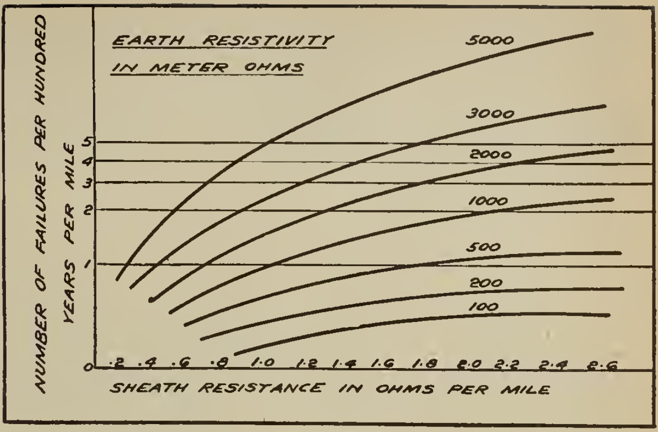


Fig. 11.

From Fig. 11 it is evident that the rate of cable failures to be expected, and hence the need for remedial measures, depends greatly on the earth resistivity. Of particular importance in the majority of cases is the resistivity up to a depth of 10 feet or so. With low resistivity to this or greater depths, the danger of a direct stroke to the cable is small, and if the resistivity is low to considerable depths, a few hundred feet, strokes other than direct strokes are not usually of importance. When, however, the resistivity at depths beyond ten feet or so is very high and the cables are of small size, strokes to ground may cause insulation failures, and this is also true of discharges between clouds. Earth resistivity measurements along new cable routes are now regularly made as a guide in applying protective measures.

Summary

Current in the sheath of buried cables, due to lightning strokes, strokes to ground near the cables, or discharges between clouds, gives rise to voltages between the cable conductors and the sheath. The voltages are practically proportional to the square root of the earth resistivity and to the direct current sheath resistance. For the latter reason they are substantially large for carrier cables (having smaller cross-section and therefore a higher resistance) of the size now used than for the much larger voice frequency cable.

For cables with thermoplastic or rubber coating the voltages between the sheath and the core conductors are much the same as for jute covered cables. The coating of such cable is likely to be damaged by direct strokes and strokes to ground near the cable, in which case corrosion of the sheath may occur at such points.

Based on theoretical lightning expectancy curves, the incidence of lightning troubles increases faster than the sheath resistance or the earth resistivity. When the breakdown voltage of the core insulation is doubled by use of extra core wrap, or when shield wires are installed in situations where lightning damage is anticipated or has been experienced, a substantial reduction in lightning failures is to be expected. Shield wires will, however, not prevent damage to the sheath and the sheath coating.

Where the earth resistivity is high and lightning storms occur frequently, doubled core insulation together with shield wires may not provide sufficient protection, even for cable of substantial size. Protection against various forms of lightning damage may then be secured by use of thermoplastic sheath coating of adequate dielectric strength together with an outside concentric copper shield.

Appendix

Definitions:

r = resistance in ohms
l = inductance in henrys
c = capacitance in farads
g = conductance in mhos
f = frequency in cycles per second of the voltage or current
w = angular frequency in radians per second
$j = \sqrt{-1}$ (a rotation factor)
$z = r + jwl = \sqrt{r^2 + w^2l^2}$ ohms
$y = g + jwc = \sqrt{g^2 + w^2c^2}$ mhos

Direct Strokes—Current Propagation Along Sheath

It was assumed that $I_{(x)} = \frac{J}{2} e^{-ax}$

The derivation of this formula is as follows:
Let P be any point along the cable at x. (See Fig. 4)
Denote by e the potential at P
Denote by i the current at P

let r = resistance of the cable conductor per wire mile
l = inductance " " " " " " "
g = conductance " " " " " " "
c = capacitance " " " " " " "

At a point dx miles to the right of P we have a voltage $e + de$, and a current $i + di$ where

de = voltage drop in dx miles $= -i(r + jwl)\,dx$ volts
and
$di = -l(g + jwc)\,dx$ amps
let $r + jwl = z$ ohms/mile
let $g + jwc = y$ mhos/mile

then (1) $de = -\,i\,z\,dx$ and (2) $di = -eydx$

hence (3) $\frac{de}{dx} = -iz$ and (4) $\frac{di}{dx} = -ey$

differentiate (4) and insert (3) in (4)

$$\frac{d^2i}{dx^2} = -y\frac{de}{dx} \text{ but } \frac{de}{dx} = -iz$$

therefore $\frac{d^2i}{dx^2} = yzi$

now yz is a constant, let it equal a^2

$$\text{now } \frac{d^2i}{dx^2} = a^2i. \quad . \quad . \quad . \quad . \quad . (5)$$

To solve this second order differential equation assume a solution of the form

$i = Ae^{-ax}$ where A is a constant
$e = 2.718.....$

if this is a solution then it must satisfy (5)

differentiate, $\frac{di}{dx} = -aAe^{-ax}$ and $\frac{d^2i}{dx^2} = a^2Ae^{-ax}$

hence putting these two expressions in (5)

$a^2Ae^{-ax} = a^2Ae^{-ax}$

therefore our assumption was correct.

let $A = \frac{J}{2}$ and we have

$$I_{(x)} = \frac{J}{2} e^{-ax}$$

Journal Wins Important Award

Just as this issue was going to press, the Editor was informed by W. B. Saunders, 1948 Contest Chairman of the International Council of Industrial Editors, that the *Journal* had been judged the leader in its class in the International Industrial Publication Contest, which is sponsored by the Association.

Judging was based on accomplishment of purpose, editorial achievement, appearance achievement and production achievement. Out of a possible score of 100 points, the *Journal* was awarded 97 points. 650 publications were submitted for judging.

Power Development
on the
Kootenay River

by

W. J. Tindale, M.E.I.C.

Chief Engineer, West Kootenay Power and Light Company Ltd., Trail, B.C.

A paper presented at the Annual General and Professional Meeting of The Engineering Institute of Canada at Banff, Alberta, June 4th, 1948

This paper records the early mining developments around Rossland, which led to the building of the Trail Smelter, and the resulting demand for power. The watershed and its climate, as well as the Kootenay River and its flow, are discussed.

Outlining the early plants on the Kootenay river, built around the turn of the century, the author enumerates the characteristics common to all the later plants of the West Kootenay Power Co. System, and describes each plant in turn. The value of the additional six feet of storage on Kootenay Lake, provided in 1938, is assessed.

In 1890, two prospectors "Bourgeois and Morris" staked the Centre Star, War Eagle, LeRoi, Virginia and Idaho claims on Red Mountain near the present city of Rossland. These five claims were staked all in one day. Preliminary investigations disclosed high grade gold-copper lodes.

This discovery created intense interest in the mining world, and resulted in a large influx of people, among whom was F. Augustus Heinze, noted mining operator from Butte, Montana. So impressed was Mr. Heinze, that in 1895, he built a Smelter at Trail and also a railway, of 3 foot gauge, from Trail to Rossland. In February 1896 the first furnace was blown in.

This was a period of great rivalry between the Canadian Pacific and Great Northern Railways. In 1896, the Great Northern extended its railway from Northport into Rossland, to give connections with transcontinental lines. In 1898 the Canadian Pacific extended its line from Castlegar to Rossland, and in the same year acquired the Heinze interests.

Development of the Trail Smelter disclosed the necessity for electric power. To produce this power, the West Kootenay Power and Light Co. Ltd., with Sir Charles Ross as President, was formed. After investigation of a site at Lower Bonnington, eleven miles downstream from Nelson, the Company began construction of the first hydro-electric unit on Kootenay river in 1897. Further enlargement of the smelter and the development of electrolytic processes brought about a constantly increasing demand for

Fig. 1 — (above). No. 2 Plant (foreground), completed in 1940 and rated at 84,000 hp., is located at Upper Bonnington Falls. In the background is the City of Nelson plant built in 1905-1906 and enlarged in 1947-48. ***B.C. Government Travel Bureau photo.***

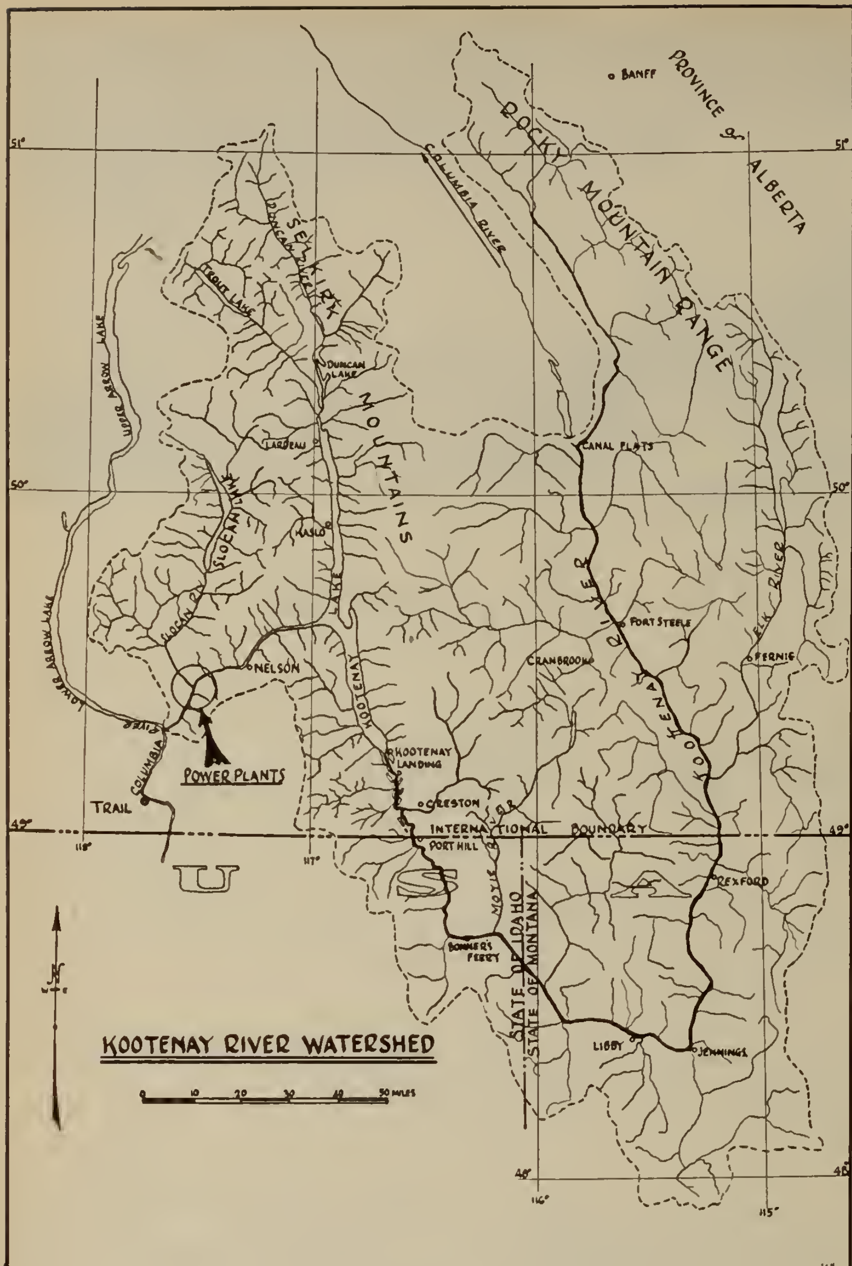

Fig. 2

power, with the result that the West Kootenay Power and Light Co. constructed additional capacity to keep pace with this demand.

The Kootenay River

A brief review of the Kootenay River is of interest before description of the various hydro-electric plants now operating. The Watershed lies inland some 400 miles from the Pacific Coast. It has an area of 19,450 square miles, three quarters of which is in Canada; it contains valuable mineral and timber resources, good agricultural land and splendid tourist resorts. For 175 miles, its eastern boundary follows the Continental Divide, along the backbone of the Canadian Rockies. In the east it embraces thousands of square miles of this range, and in the west thousands of square miles of the Selkirk and Purcell ranges. It is one of the most scenic and mountainous regions in North America; much of the basin is over 4,000 feet elevation, and many of the mountains are over 10,000 feet in height.

The climate has continental characteristics, but its relative mildness compared with similar latitudes further east indicates, to some extent, the moderating influence of the Pacific Ocean. The mean annual temperature in the valleys is roughly 44 deg. F., summer daylight temperatures range from 70 to 100 deg., the night temperatures from 40 to 70 deg. Winter temperatures occasionally drop to zero. Precipitation varies from about 17 inches in the valleys to 70 in. in the high mountains, and is mostly in the form of snowfall.

The Kootenay River

The flow follows an annual cycle marked by considerable regularity. It is low during winter months and increases gradually from March to a peak in June. It decreases more or less gradually after June, dependent on climatic conditions. The average annual flow is about 26,000 c.f.s. and the normal peak flow is roughly 110,000 c.f.s.

The stream, 400 miles in length, rises high in the Canadian Rockies, and from its source flows 60 miles southward parallel to and approximately 10 miles from Columbia River, which flows north from its source in Columbia Lake. Its course may be readily followed by referring to Fig. 2. In its final 21-mile reach to its confluence with the Columbia River near Castlegar, it drops 360 feet, providing the head for all the hydro-electric developments on this section of the river. Kootenay Lake and its west arm, with an area of 175 square miles, is the main reservoir.

Early Power Developments

The knowledge and ability of the late Lorne A. Campbell, General Manager and Electrical Engineer, enabled the many intricate and then new problems of transmission and distribution of power and of operations to be dealt with capably during the earlier stages of development. Much information that proved most valuable in further developments was obtained under his guidance. Mr. Campbell later became President and Managing Director, and under his management four succeeding plants were built.

Judged by today's standards, both No. 1 and No. 2 plants are far from modern. No. 1 Plant, built in 1897-1898, and designed to develop 4,000 hp. under 34-foot head, was constructed to house three Stilwell-Bierce horizontal, Victor type turbines, connected to three C.G.E. 1,100 volt, 60 cycle, 3 phase, 180 r.p.m. generators, each having a direct current exciter of 40 kilowatts, 125 volts, driven by a single runner obtaining water from a pipe connected to the turbine pressure case. Power was stepped up to 22,000 volts, 3 phase, 60 cycle, through banks of air blast transformers, and was delivered 32 miles over two transmission lines of No. 0 medium hard-drawn copper to substations at Trail and Rossland, where it was stepped down for general use. The insulator pins used on pole cross arms were of locust wood boiled in paraffin oil. (Fig. 5.)

Construction of No. 2 Plant was started in 1905 and completed in 1907. It was designed by Ross and Holgate, Consulting Engineers of Montreal, with four generating units having a total capacity of 34,000 hp. under 70-foot head. Two units of 8,000 hp. with I. P. Morris turbines were in operation in 1907 under partial head of 63 feet (later increased to 70). Two additional units with Canadian Allis Chalmers turbines were installed in 1914 and 1916 respectively.

All turbines were of vertical Francis type, each having 3 bronze runners on its vertical shaft direct connected to drive C.G.E. generators with 2,200 volts, 3 phase, 60 cycles and having a total rating of 26,250 kva. Current at 2,200 volts was stepped up to 66,000 volts, 3 phase, 60 cycles, through four banks of oil-insulated water-cooled indoor type transformers having a total rating of 23,125 kva. Power was delivered 81 miles over newly installed 66,000 volt, 3 phase, 60 cycle transmission lines, through Trail, Rossland and Phoenix to Greenwood. An additional bank of 3,750 kva. 3 phase, 2,200 to 22,000 volt transformers was provided to enable No. 2 Plant to operate in parallel with No. 1 Plant for delivery of power to Rossland and Trail.

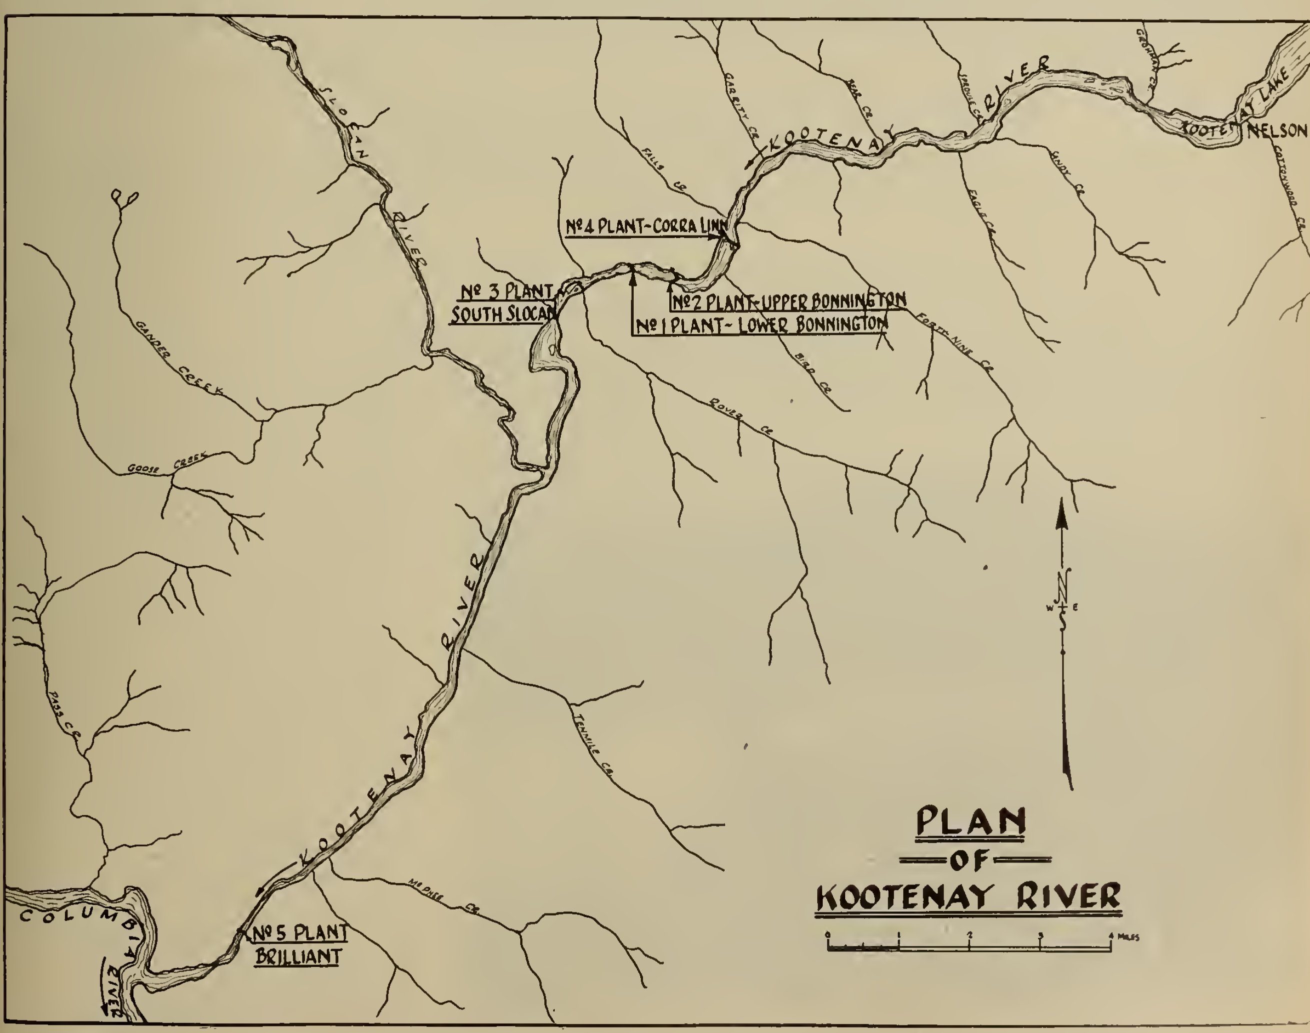
This plant has a remarkable record for continuous and successful operation. The two initial units have been in operation for more than 40 years, and the original 60-inch bronze runners, though becoming worn, are still operating.

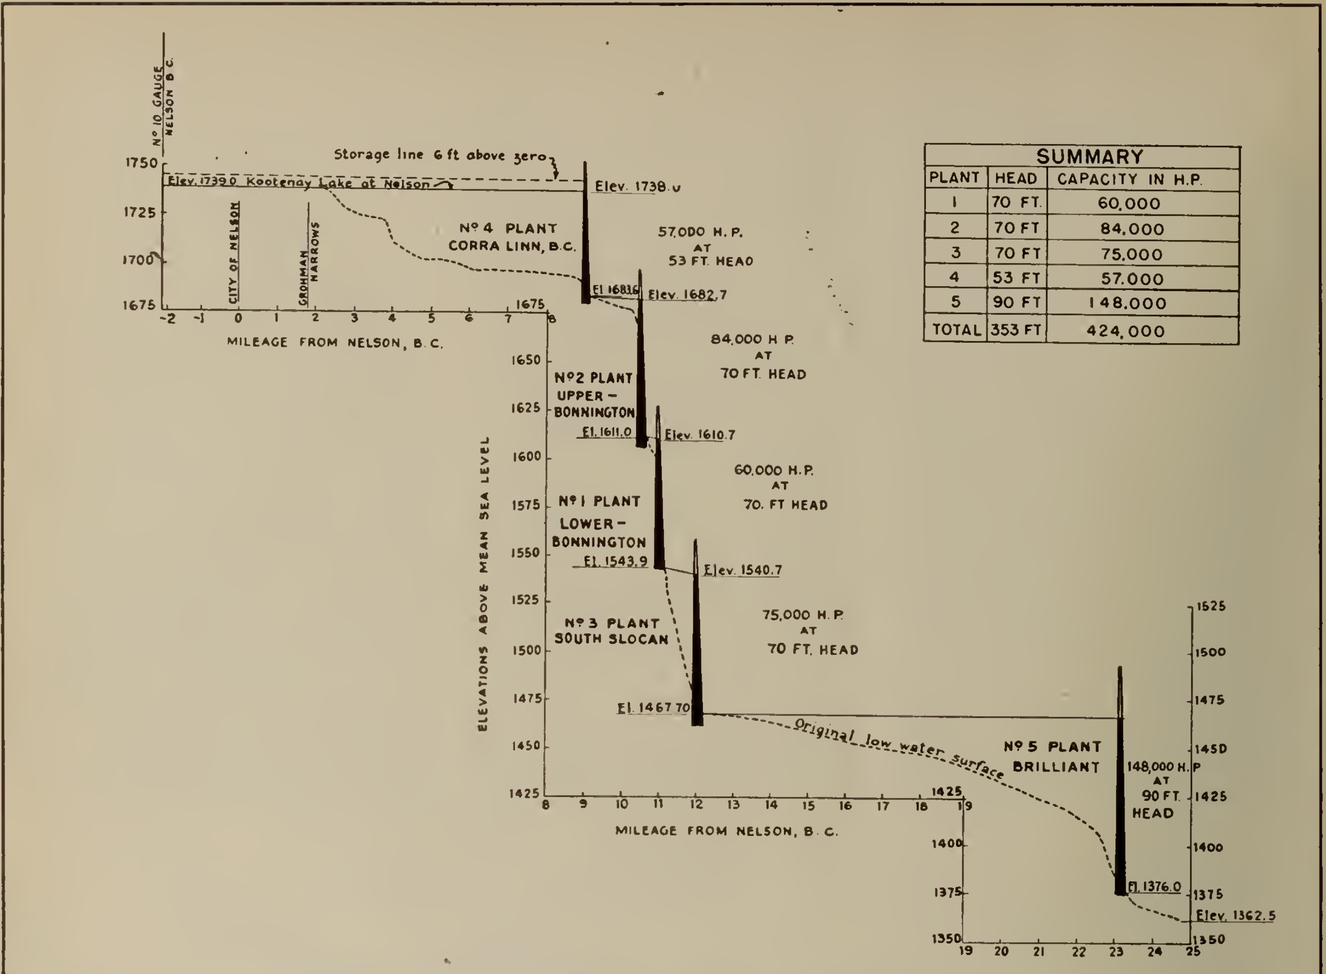
Recent Additions to the System

From 1923 the demand for power steadily increased, not only for the vast operations of the Consolidated Mining and Smelting Company, but also for mining, industrial, irrigation, agricultural and general uses. To meet this rapidly increasing demand, five plants have since been constructed, in the following order: Plants No. 1 (a replacement), No. 3, No. 4, No. 2 Extension and No. 5.

These plants have many common features. All structures are built on solid rock. All plants are designed to discharge safely more flood discharge than the record flood of 1894, estimated at more than 200,000 c.f.s. Power plants with their substructures, superstructures, floors, walls, piers, intakes, headworks, and dams are of monolithic reinforced concrete, provided with copper seal expansion joints where necessary. Steel columns, embedded in building walls, extend up to support crane girders and roof trusses. Water intake passages (two for each turbine) are rectangular, separated at the intake openings and at the trash racks by concrete piers, 6 feet wide, to accommodate recesses for steel head-gates and supports for trash racks. They converge to a

Fig. 3





SUMMARY		
PLANT	HEAD	CAPACITY IN H.P.
1	70 FT.	60,000
2	70 FT	84,000
3	70 FT	75,000
4	53 FT	57,000
5	90 FT	148,000
TOTAL	353 FT	424,000

PROFILE OF KOOTENAY RIVER SHOWING HYDRO ELECTRIC DEVELOPMENTS.

Fig. 4

Fig. 5. The original No. 1 Plant, the first hydro-electric plant on the Kootenay River, was built by the West Kootenay Power and Light Company in 1897-98 and was designed to develop 4,000 hp. In the background is Lower Bonnington Falls. This plant was replaced in 1925 with a new plant of 60,000 hp. capacity.

common entrance of the steel spiral casing, which conducts the water to the turbine runners.

Draft tubes have 6-foot wide piers, extending downstream to divide the exits into two rectangular openings, having recesses to accommodate steel tailrace gates. These are interconnected by a system of piping and valves extending to a single 24-inch vertical pump of 12,000 g.p.m. capacity, directly connected to a 300-hp. vertical motor. The piers and recesses are carried up to the tailrace deck to accommodate a motor-operated travelling gantry. This is used to operate steel tailrace closure gates, when it becomes necessary to inspect or repair runners or draft tubes.

The basements contain generator piers; oil storage and filter tanks, oil, air and water pipes; draft-tube pump motor and other miscellaneous items. The main floors have generators, spare exciter, main control switchboards, governors, governor oil-pressure tanks and pumps, and railroad spurs. All conduit for control wiring and the main leads is embedded in the floor. Roof decks are of concrete, or of fir timber laminated on edge, overlaid with 20-year guarantee roofing.

Operating and Hydraulic Equipment

Headgates operating in recesses in the piers are placed upstream from the trash racks and are operated by motor-driven hoists located on an overhead steel structure. Trash racks of steel bars are cleaned from a special 3-motor, travelling gantry. A power house crane with main and auxiliary hooks travels the full length of each power house for handling all machinery. Air for cooling the generators enters the basement either through filter banks of Midwest type, installed in the downstream wall, or from a washed-air plant, used only in hot weather.

Turbines are vertical Francis type, with single runner, actuated by oil-pressure governors, and direct connected by vertical shaft to flanges on the generator shaft.

Electrical Equipment

Generators deliver power at 3 phase, 60 cycles, to transformers. They have Kingsbury thrust-bearings mounted on the upper bracket arms, carrying the suspended load of the turbine runner and shaft, the hydraulic thrust, the generator rotor and shaft, and the direct connected exciter rotor. Transformers and switch structures have concrete foundations and steel overhead framework, to accommodate transformers, oil-circuit breakers, busses, lightning arresters, gang switches, and outgoing lines. Transformers are the single phase, oil-insulated, water-cooled outdoor type, in banks of three, stepping up generator voltage to 66,000, 3 phase, 60 cycles.

Description of Plants

The No. 1 Replacement Plant was built between 1923-1925. More modern equipment increased the capacity of the original plant to 60,000 hp. The Honourable T. D. Patullo, then Minister of Lands of British Columbia, threw the switch to put this plant in operation on August 1st, 1925. Rock excavation during construction amounted to 160,000 cubic yards and concrete placed was 49,000 cubic yards. The crane has a span of 45 feet, 6 inches, and carries a 120-ton main hook and a 10-ton auxiliary hook.

Fig. 6. Aerial view of No. 3 Plant of the West Kootenay Power and Light Company, showing in the background the new No. 1 Plant. Note the rugged mountainous country through which the Kootenay River flows on its way from the Kootenay Lake to the Columbia River.

The three turbines each have a capacity of 20,000 hp. under 70-foot head, and drive generators of 17,500 kva., 100 r.p.m., 7,200 volts, with a direct current exciter of 150 kilowatts. The current from the generators is stepped up from 7,200 to 66,000 volts through banks of oil-insulated, water-cooled transformers, having a total capacity of 45,000 kva. Oil-circuit breakers protect the transformers and outgoing transmission lines. Modern switchboards and bench boards are conveniently located.

No. 3 Plant located at South Slocan, 5,000 feet downstream from No. 1 Plant, was designed not only to generate more power but also to function as the main control and switching station for all plants. Constructed from 1926 to 1928, the amount of concrete placed was 121,000 cubic yards. A level area to accommodate railway spurs, maintenance and housing structures was created by placement of 170,000 cubic yards of excavated rock behind a 60-foot high, concrete and masonry wall extending 200 yards downstream from the plant.

Its three turbines have a total capacity of 75,000 horsepower under 70-foot head. They are directly connected to the vertical shafts of three generators having a total capacity of 52,500 kva., at 7,200 volts, 100 r.p.m. Each has a direct current exciter of 165 kilowatts, 250 volts. The thrust bearing carries a total suspended load of 535,000 pounds. Power at the generator voltage is stepped up to 66,000 volts for delivery to the transmission lines through three banks of transformers having a total rating of 54,000 kva. The powerhouse crane spans 47 feet 3 inches with a main hook capacity of 120 tons. The auxiliary hook is of 10 tons capacity. The washed-air plant has a capacity of 195,000 cubic feet of air per minute.

No .4 Plant, with the control dam is situated 6,000 feet upstream from No. 2. It was designed not only for production of power but also for control of storage in Kootenay Lake.

Construction started in 1930 and was completed in 1932.

The Government highway bridge crossing the Kootenay, was raised 7 feet requiring the placement of 60,000 cubic yards of fill at the approaches. Construction of the plant necessitated relocation of 3,300 feet of the C.P.R. track, raising it a maximun of eight feet. Excavation for plant and river improvements amounted to 810,000 cubic yards and concrete placed was 141,000 cubic yards.

The dam is 1,700 feet long with a control section 686 feet in length in the direct line of flow, containing 14 sluice gates, each 34 feet wide, 32 feet high and weighing 50 tons apiece. These gates have fixed rollers operating on planed surfaces of steel embedded parts, recessed into the piers. Control of the gates is by two motor-operated screw hoists travelling on an overhead steel structure from which gates can be suspended. For close regulations of flow and water levels both hoists are equipped for operation from push button stations located at the powerhouse switchboard. One hoist is equipped with an auxiliary gas engine, while both may be operated manually. The powerhouse has three turbines of 19,000 hp. 53-foot head direct connected to three generators of 15,000 kva. 7,200 volts, 85.7 r.p.m. having top mounted, 150-kilowatt, 250-volt, direct-current exciters. Transformers are in 3 banks having a total rating of 45,000 kva. The powerhouse crane has a main hook capacity of 120 tons, auxiliary hook is of 10 tons capacity. The washed-air plant has capacity of 180,000 c.f.m.

No. 2 Plant Extension, completed and placed in operation in March 1940, increased the capacity of that plant from 34,000 hp. to 84,000 hp. Construction of this plant raised the production capacity on the river to 276,000 hp. and created a temporary balance of power above the demand.

The two new generating units were identical, having 25,000-hp. turbines, direct connected to 17,500-kva. generators, which delivered power at 7,200 volts to step-up transformers having a total rating of 36,000 kva. The powerhouse crane had capacity of 120 tons with an auxiliary hook of 10 tons capacity. The washed-air plant delivered 225,000 cubic feet of air per minute.

No. 5 Plant. To enable The Consolidated Mining and Smelting Co. Ltd. to increase the output of much-needed war materials, No. 5 Plant, one mile upstream from the Columbia River, was built between April 1942 and August 1944. Its ultimate capacity is 148,000 hp. It was constructed by the Kootenay Engineering Co. for The Consolidated Mining and Smelting Co., but the extensive preliminary research, actual design and detail were carried out by the engineering staff of The West Kootenay Power and Light Co. Ltd. Construction of this plant necessitated relocation of the Canadian Pacific track for 2 miles with a maximum lift of 18 feet. Rock excavated during construction was 410,000 cubic yards, and concrete placed was 212,000 cubic yards.

The structure was designed to accommodate four units, two of which were in operation in August 1944. The turbines are of 37,000 hp. with a 90-foot head, direct connected to generators of 32,000 kva., 13,200 volts, 100 r.p.m., delivering power to banks of 3 - 11,000 kva., 13,200- to 66,000-volt single phase transformers and thence through oil-circuit breakers to the transmission lines. A direct current 265-

Fig. 7. No. 4 Plant and the main control dam for the whole Kootenay River. Completed in 1932, it contains three 19,000-hp. turbines. *Cominco photo.*

Fig. 8. No. 5 Plant, the most recently completed hydro-electric plant on the Kootenay River, is at Brilliant, B.C. Its ultimate capacity will be 148,000 hp. *Cominco photo.*

kilowatt exciter and a 10-kilowatt pilot exciter are mounted on top of each generator. The thrust bearing is a 61-inch Kingsbury bearing, carrying a total suspended load of 865,000 pounds.

From the powerhouse headworks the control dam, 140 feet high, extends across the river and accommodates 8 sluice gates. Each gate has 34 feet clear span, and is 36 feet high. Gates are operated by two overhead hoists, designed and regulated like those of No. 4 Plant. The crane has a main hook capacity of 225 tons and auxiliary hook is of 20 tons capacity. The plant is also equipped with an automatically controlled passenger elevator travelling 200 feet per minute, with a capacity of 2,500 pounds. The washed-air plant, the largest installed on the river, has capacity of 300,000 cubic feet of air per minute.

The main transmission system includes six 60,000-volt lines, extending 26 miles from the main switching station at No. 3 Plant, to large substations at Tadanac and Warfield. Two lines extend 150 miles further westward to the cities, towns and villages, and agricultural areas of the Okanagan valley. Another line extends 50 miles eastward from No. 4 Plant to the Salmo mining area, while yet another extends 16 miles from No. 5 Plant to Tadanac.

City of Nelson Plant. In 1905-1906, the City of Nelson constructed a plant at Upper Bonnington across the river from No. 2 Plant. Its present capacity of about 5,000 hp., through three units, will soon be increased to 11,000 hp. by the addition of a fourth generating unit. Power is delivered to the City at 12,000 volts, 3 phase, 60 cycles over their two transmission lines, each 12 miles in length.

Storage on Kootenay Lake

The granting in 1938 of the right to store an additional 6 feet of water in Kootenay Lake has been of inestimable value. This not only makes possible more uniform power production in low flow months. It also is effective in lowering river flood levels along the dikes which protect some 54,000 acres of reclaimed land in the fertile Kootenay Flats in British Columbia and in the State of Idaho. This was made possible by the excavation of 364,000 cubic yards of material at Grohman Narrows.

The highest total plant head of 365 feet is reached in low flow months. The average total head is 353 feet, falling off to 300 feet under flood flow of 120,000 c.f.s. due to tailrace backwater rise, and due to the necessity of lowering No. 4 Plant forebay for maximum flood lowering upstream. The tailrace backwater rise at Brilliant reaches 30 feet or more in high floods, but eventually the loss of head and the consequent temporary decrease in power capacity will be compensated for by installation of the fourth unit at No. 5 Plant, together with further river improvements.

The total output of power in 1947 from the West Kootenay system was 1,703,278,000 kilowatt hours, with an average output in December of 224,000 kilowatts, and peak output of 248,500 kilowatts. The present installed plant capacity of 350,000 hp. under 353 feet of head, will be greatly exceeded when plans now under way and contemplated are executed.

Engineers May Design Buildings

Engineers generally will be interested in changes made recently in the Saskatchewan legislation for engineers and for architects, particularly in view of the court's decision in Quebec that engineers must not design buildings.

The Saskatchewan architects act of 1942 stated—

"No plans, drawings or specifications for the erection, construction, enlargement or alteration of any building shall be passed, approved or accepted by any person appointed to pass, approve or accept the same, where the total cost of the erection, construction, enlargement or alteration exceeds the sum of $15,000, unless the plans, drawings and specifications have been prepared by or in consultation with a registered or licensed architect."

In March of this year the Saskatchewan Legislature repealed the above restrictive section and at the same time added to the schedule of work that could be done by an engineer under the engineers act, the following:

"The mechanical, electrical, chemical, electro-chemical, mining, or metallurgical treatment of any element whether organic or inorganic and combinations thereof for all purposes whatsoever.

"Factories, warehouses, swimming pools, rinks, garages, cold storage plants, grain elevators and flour mills, hospitals, schools and public buildings.

"All buildings and structures necessary for the proper housing, administration or operation of the works mentioned in paragraphs 1 to 7."

This appears to be a common sense arrangement. Neither group has a monopoly, and therefore the owner may decide for himself whether he wants his work done by an architect or an engineer. After all he is the one who should make this decision.

The Saskatchewan government seems to have been in the mood for cleaning up the entire situation for at the same time amendments were made to The City Act and to The Town Act by the addition to each of the following clause.

"No plans, drawings or specifications for the erection, construction, enlargement or alteration of any building to be used as a place of public assembly with a seating capacity in excess of one hundred and twenty-five persons, and no plans, drawings or specifications for the erection, construction, enlargement or alteration of any other building costing more than $20,000, shall be passed, approved or accepted by any person appointed to pass, approve or accept the same unless the plans, drawings and specifications have been prepared by or in collaboration with an architect or a professional engineer operating within the provisions, respectively, of The Saskatchewan Architects Act, 1942, or The Engineering Profession Act."

Saskatchewan architects and engineers have surely shown the way to the other provinces. At the time, the Quebec case held the stage, word came to the officers of the Institute of differences of opinion and some argument between these groups in several provinces. It appears that the situation remains the same today. Perhaps Saskatchewan's good example will encourage others to tackle this problem and arrive at a sensible and useful understanding that will reflect credit rather than ridicule on both.

Official Course in Welding of Interest to Engineers

The Canadian Welding Bureau, acting as a division of the Canadian Standards Association, has been set up by the combined sponsorship of firms in Canada interested in welding. Its activities are of particular importance to engineers because the standards which it has established and will continue to establish will permit the specification of welding materials and procedures with precision equal to that afforded by specifications for other fabrication processes. The courses to be offered by the bureau are directed primarily to the supervisory or foreman level but many engineers concerned with welding very often find themselves acting as supervisors and could undoubtedly derive benefit from the courses.

C.S.A. Qualification Code W47 requires that approved fabricators employ competent welding personnel. To ensure that this condition is adequately fulfilled with respect to its present members, and to enable others to be certified, the Bureau will undertake a nation-wide programme of welding education. This will be made available to member-firms, prospective members and to individuals who may want to establish or advance themselves in this rapidly developing field.

Both the Canadian Welding Bureau, as an approvals body established by industry for its own self control, and the proposed programme of education are unique Canadian developments with no counterpart elsewhere. Certainly no such nation-wide comprehensive programme of education for an industry has ever before been attempted. The course will take about a year and is not likely to be again available. It is a 'one-time' opportunity.

Combined Correspondence and Lecture Course

Recognizing that industry could ill spare important key men at present to attend a lecture course involving the weeks that would be necessary, the Bureau has devised a scheme whereby the series will be presented first by correspondence and supplemented at intervals with one or two days of lecture sessions in the principal university and industrial cities such as Toronto, Montreal, Winnipeg, Vancouver and others.

These lecture sessions will be held at two to three month intervals and will serve to supplement the course itself by actual demonstration and example, as well as providing a means for discussion, questions and answers.

For distant firms who are unable to send representatives, the Bureau's engineers on their periodic visits will in a measure serve in the same capacity as the original lecturers. Indeed it is expected that the whole programme will be largely handled by the Bureau's personnel but in addition many prominent engineers have promised assistance and lectures in their own special field of welding and welding application.

Although the lecture series will be a valuable part of the course, it will nevertheless be presented fully complete by correspondence and although desirable it will not be necessary to attend the lectures. Likewise examinations are not compulsory but may be sat for only if desired.

Designed to cover the basic principles of welding, the course has been purposely kept simple and direct, covering only the essentials without padding or superfluity. It is equally suitable for the welding operator or the graduate engineer, offering an equivalent amount to each.

However, it will be most directly developed for the foreman or supervisor with the purpose of fitting him to meet the qualification requirements of C.S.A. Code W47.

Course Includes Design and Production Methods

Although these qualifications are of an essentially practical nature dealing with the practice, supervision and technique of welding, it is deemed highly desirable that men in leading positions be more highly trained and it is proposed that the course shall be considerably in advance and excess of these minimum requirements.

Inasmuch as welding is of no importance unless it is competitive with other processes, part of the course will be devoted to production methods and economies, costs and estimating.

At present the courses as well as the time table and schedule for various centres are being worked out. It is anticipated that the first lecture releases will be made in approximately two months' time.

Those apart from the Bureau's Members who may be interested should apply for further details to the Bureau at 22 College Street, Toronto.

Meetings of Other Societies

The twenty-first International Industrial Chemistry Congress will be held at Brussels, Belgium, September 11 to 19, 1948, under the auspices of the **Society of Industrial Chemistry and the Federation of Chemical Industries of Belgium.**

A programme may be procured from the Secretariat of the Congress, c/o Societé de Chimie Industrielle, 28, rue Saint-Dominique, Paris (VII).

Concurrently, September 4 to 20, there will take place at Charleroi, an International Exposition of Pure and Applied Chemistry, and visits thereto form part of the programme of the Congress.

Dr. John Gaillard, mechanical engineer on the staff of the American Standards Association and lecturer at Columbia University, has scheduled a second five-day seminar, June 21 to 25, 1948, in Room 503, Engineering Societies Building, 29 West 39 Street, New York City.

For an outline of the ten lectures and details about registration, write Dr. Gaillard at his home address, 400 West 118 Street, New York 27, N.Y.

The Low-Pressure Industries Division of the **Society of the Plastics Industry** will hold an industry-wide seminar on June 29-30, at the Statler Hotel, Washington, D.C. The seminar is to foster a mutual exchange of information between industry and government bureaux on the latest developments and future requirements in low pressure plastic materials.

The address of the Society is 295 Madison Avenue, New York City.

The 45th Annual Convention of the **American Road Builders Association** and the 1948 Road Show will take place at Soldier Field, Chicago, Ill., July 16 to 24, 1948. The latter is described as the largest display of highway and airport construction equipment ever seen in one place at any time.

Hotel reservations for the Road Show can be made through ARBA Housing Bureau, c/o Convention Housing Bureau, Room 808-105W Madison St., Chicago 2, Ill., U.S.A.

The 21st Annual Meeting of the **Federation of Sewage Works Associations,** is to be held at Detroit, Mich., October 17 to 21, 1948.

Headquarters of the Federation are at 325 Illinois Building, Champaign, Illinois.

Personals

Notes of the Personal Activities of Members of the Institute

An Industrial Defence Advisory Board was established in April by the Canadian Government. It includes the following Institute members:

Major-General N. E. Rodger, M.E.I.C., Quartermaster-General of the Canadian Army, who serves on the Board as one of the three principal supply officers of the Armed Forces. He is a graduate of Royal Military College (with honours), and a bachelor of science, McGill University, Montreal. Appointed to a commission in the Royal Canadian Engineers (Permanent Force) in 1928, at the outbreak of war in 1939 he held the rank of major. He then went from Kingston, Ont., to Canadian Military Headquarters in London, England. In 1941 he became D.A.Q.M.G., First Canadian Infantry Division, and later that year was appointed G.S.O. 2 (Liaison) at headquarters of the 1st Canadian Corps. From December 1941 until September 1942 he was personal assistant to General A. G. L. McNaughton, with the rank of lieutenant-colonel, then being promoted to the rank of brigadier and appointed Brigadier General Staff, C.M.H.Q., London. From November 1943 until February 1944 he commanded the 10th Canadian Infantry Brigade, and then became Brigadier-General Staff, 2nd Canadian Corps, in which capacity he served until the end of hostilities. An appointment to the Canadian Army Staff in Washington, D.C., followed. He was promoted to his present rank and appointed Quartermaster-General of the Canadian Army in March, 1946.

Dr. O. M. Solandt, Affil. E.I.C., Director General of Defence Research and chairman of the Defence Research Board, is also a member of Industrial Defence Advisory Board.

The career of Dr. Solandt, who possesses the degrees of M.A., B.Sc., M.D., and, M.R.C.P., has been in the field of academic science generally. Shortly after the outbreak of war, with the rank of colonel, he was appointed director of the South-West London Blood Supply Depot and continued to act until March, 1941. He was then appointed director of the Medical Research Council Laboratories Experimental Station at Lulworth. In the summer of 1942 he was appointed deputy director of the British Office Operational Research Group, and in May, 1944, became director. In the spring of 1945 he was selected to join Lord Mountbatten's SEAC staff as special scientific adviser.

J. R. Donald, M.E.I.C., is one of the representatives of Industry on the new Canadian Industrial Defence Advisory Board. Mr Donald is president of J. T. Donald & Co., Montreal Chemical Engineers and Consulting Chemists, a firm with which he has been associated since 1922, and he is also president of Donald Inspection Ltd., Inspecting and Testing Engineers, of Montreal, Que.

In World War I he was chief inspector of explosives, Imperial Ministry of Munitions, Ottawa, and in the Second World War (1939) he was appointed chief of the Chemical Division, War Supply Board. From 1940 to 1945 he was Director-General of the Chemicals and Explosives Branches, Allied War Supplies, and in the latter year he was Mr. Howe's personal representative to the Combined Intelligence Objectives Sub-Committee meeting in London, England.

J. G. Notman, M.E.I.C., general manager, Dominion Engineering Works Ltd., Montreal, also represents Industry on the Industrial Defence Advisory Board of Canada. Since 1922, after graduating from McGill University, (B.Sc. in M.E.) Mr. Notman has been associated with the Dominion Engineering Works Limited. In 1941 he was appointed special assistant to the Co-ordinator of Production, Department of Munitions and Supply, and in 1943 he became Assistant Co-ordinator of Production He was also associated with the Department of Reconstruction for a time, resigning from service with the government in November, 1945.

G. A. Cunningham, M.E.I.C., of Imperial Oil Limited is transferred by the company from Welland, Ont., to be manager of industrial sales for the Maritimes Division. He will be located in Halifax, N.S.

C. S. Clendening, M.E.I.C., has been elected president of the Association of Professional Engineers of Alberta. He is project manager of the Lethbridge Northern Irrigation district. He is a Councillor of the Institute, a member of its Prairie Water Problems Committee and of the H. N. Ruttan Prize Committee.

Originally from Walkerton, Ont., Mr. Clendening studied at the University of Toronto, and spent four years with the C.E.F. in World War I. He had completed a number of years in engineering before joining the service. Returning in 1919 to his position as an engineer with the Grand Trunk Pacific Railway he remained two years, after which he went to Lethbridge as resident engineer for the Lethbridge Northern Irrigation District. He was located at Diamond City, Alta., as manager in 1932 and returned to Lethbridge in 1940 to his present position as project manager for Northern Irrigation District.

H. W. McLeod, M.E.I.C., chairman of the Winnipeg Branch of the Institute for the year 1948, is principal assistant engineer, of the engineering department of Canadian Pacific Railway Company at Winnipeg. He has been with C.P.R. since 1906 He is from Saint John, N.B., a graduate in civil engineering of the University of New Brunswick. He worked for the Intercolonial Railway and for Pennsylvania lines before joining C.P.R. at Calgary.

R. T. Hollies, M.E.I.C., chairman of the Calgary Branch of the Institute for the year 1948, is assistant superintendent with the Waterworks Department of the City of Calgary. He received that appointment in 1945 on his return from overseas. He had served from 1940 with the R.C.E., attaining the rank of Captain. He had previously been with the Waterworks Department and was superintendent of the Glenmore Water Supply for the city.

Kenneth B. Dundas, M.E.I.C., is no longer with Canadian Pacific Railway, but is plant engineer and assistant works manager for Dominion Tar and Chemicals Company Limited creosoting plant, Edmonton, Alta. For the railway he was located at Medicine Hat, Alta., as transitman and assistant to the division engineer.

H. W. McLeod, M.E.I.C.

R. T. Hollies, M.E.I.C.

N. R. Crump, M.E.I.C., of Canadian Pacific Railways, who has been vice-president, eastern lines, since early 1947, received the appointment in April as vice-president at Montreal, with jurisdiction over all lines. Mr. Crump, who joined C.P.R. in 1920, became vice-president after a 26-year rise through the ranks, during which time he managed to obtain a university degree in mechanical engineering. It was in the machine shop and motive power department that he worked until 1942, when he moved from Winnipeg to the position of assistant to the vice-president in Montreal. At Toronto headquarters of the eastern region since 1943 he was successively general superintendent of the Ontario District, assistant general manager, and general manager.

D. B. Sommerville, M.E.I.C., recently resigned his position as vice-president of St. Catharines Steel Products Ltd., and director of Canadian Comstock Company Ltd., to form the Canada Construction Company Ltd., Toronto, of which firm he is president. Mr. Sommerville is a graduate of University of Toronto, class of 1935.

(Photo by Albert Dumas)
Ignace Brouillet, M.E.I.C.

Ignace Brouillet, M.E.I.C., has been appointed a member of the National Research Council. He is a member of the firm of Brouillet and Carmel, consulting engineers, Montreal, and is dean of the Faculty of Engineering of University of Montreal (Ecole Polytechnique).

G. W. Moule, M.E.I.C., is the newly elected secretary-treasurer of the Winnipeg Branch of the Institute. He was born at Luton, Bedfordshire, England, but was educated in Canada at The Pas, Man., and at the University of Manitoba. He graduated from the latter in 1937 with the degree of B.Sc. in electrical engineering. He worked for three years at electrical draughting for Canadian Industries Limited, Montreal, and for a time as an electrical engineer for Defence Industries Limited, Montreal. He was transferred to Winnipeg by D.I.L. in 1941, and was a shift super-

N. R. Crump, M.E.I.C.

D. B. Sommerville, M.E.I.C.

visor for a year before returning to Montreal as an electrical engineer. In 1945 he returned to Winnipeg and joined the Winnipeg Hydro as a designing engineer. Quite recently he was appointed contract engineer.

T. M. Parry, M.E.I.C., is secretary-treasurer of the Calgary Branch of the Institute. He is technical vice-president of Western Canada Composite High School, Calgary, Alta. He is from Lancashire, England, but was educated in Canada and graduated from the University of Alberta, in 1929, with the degree of B.Sc. in electrical engineering. He followed the Canadian Westinghouse Company Limited test course at Hamilton, Ont., for a time, but transferred that year to the Bell Telephone Company at London, Ont. He was assistant transmission engineer in the construction department. Three years later he joined Western Canada High School's technical department. He was instructor in automotive mechanics and draughting for six years, and was then named instructor and head of the motor department. He was given his present position in 1941.

G. J. T. Gunn, M.E.I.C., is now with Surveyer, Nenninger and Chênevert, Montreal, employed as an electrical engineer. He was at Bowaters Newfoundland Pulp and Paper Mills Ltd., Corner Brook, since 1946, engaged on the extension of the Mills, on the staff of R. A. Hanrigh, Toronto consulting engineer.

J. P. Millenbach, M.E.I.C., general manager and director of Canadian Malartic Gold Mines Limited, is now at the Toronto offices of the Company. He has been with the Company since 1934.

D. D. C. McGeachy, M.E.I.C., is vice-president and managing director of Canada Vulcanizer and Equipment Co. Limited, London, Ont. He was located at Owen Sound, Ont., employed by Wm. Kennedy and Son, since his return from overseas early in 1946. He then terminated his service with the R.C.N. V.R., with the rank of lieutenant.

D. L. McLaren, M.E.I.C., is division manager of the generator division of Canadian General Electric's apparatus department, Toronto. He has been with C.G.E. since his graduation in 1914 from University of Toronto with the degree of B.A.Sc. He joined the engineering department at Peterborough, but later worked as a sales engineer and an electrical engineer at Toronto.

B. W. Pitfield, M.E.I.C., has resigned from his position as general superintendent of Northwestern Utilities, Limited, Edmonton, to become general manager of Northwest Industries Limited in Edmonton. Northwest Industries is engaged primarily in the repair of civilian and R.C.A.F. planes and in the manufacture of Bellanca Skyrockets.

Neil Carr, JR.E.I.C., has been promoted from the head office engineering department of Burns and Company Limited, Calgary, to become assistant mechanical superintendent of the Burns Vancouver plant. Mr. Carr, is a graduate of McGill University, of Montreal, having received a B.Eng. degree in mechanical engineering in 1946.

A. H. Hoffer, JR.E.I.C., is a member of the General Electric Advanced Engineering Program at Schenectady, N.Y., taking post-graduate study in electronic and electromechanical engineering. Mr. Hoffer graduated from University of Manitoba in 1946, and went to Schenectady that year.

Gordon Rosenthal, JR.E.I.C., who was formerly with the aerodynamics laboratory of National Research Council, Ottawa, is in Montreal. He is an engineer with the Aerodynamics Section of Canadair Limited. He was with N.R.C. since his graduation in 1946 from the University of Toronto.

John W. Langlois, S.E.I.C., is employed by E. B. Ludwig, Construction Company, New Orleans, La. He is responsible for all engineering work carried out by the company.

G. F. McLean, S.E.I.C., has been with Canadian General Electric Company on the student test course, since June last, when he graduated from University of Manitoba, with the degree of B.Sc. in electrical engineering.

John Norison Finlayson

M.E.I.C., A.S.C.E., M.Sc., LL.D.

President

OF

The Engineering Institute of Canada

Dean of the Faculty of Applied Science,
UNIVERSITY OF BRITISH COLUMBIA

•

JOHN NORISON FINLAYSON, M.E.I.C., A.S.C.E., M.SC., LL.D., joined the Institute as a Student member in 1908. He became an Associate Member in 1912, a Member in 1919, and was elected to Life Membership in January of this year.

A native of Pictou County, Nova Scotia, the President was educated at Merigonish Public School, Pictou Academy and McGill University where he was graduated as a B.Sc. in 1908 and gained his M.Sc. the following year.

He has served the Institute as chairman of the Winnipeg Branch, 1928; chairman of the Vancouver Branch, 1941; and as a member of Council 1945-46. He is a member of the American Society of Civil Engineers and a member and past-president of the Association of Professional Engineers Province of Manitoba. During his presidency of that Association a complete revision of the Act respecting the engineering profession was passed by the Manitoba legislature. In 1942-43 he was chairman of the Engineering Bureau of the Vancouver Board of Trade and a member of the council of that body in 1944. While a resident of Vancouver he served as a member and chairman of the Vancouver Section of the Institute of International Affairs, a member of the British Columbia War Metals Research Board, 1942-45, and as a member of the Rehabilitation Section of the Co-ordinating Council for Greater Vancouver.

During his period of residence in Manitoba he acted as chairman of the Land Drainage Arrangement Commission for the Province. This commission was set up to determine the amount of drainage debenture debt for which land was liable under the Land Drainage Act in each municipality.

Following his graduation from McGill the President served that University as a lecturer in mathematics. In 1910 he joined the staff of Waddell & Harrington, Bridge Engineers, Kansas City and acted as the Company's representative during the erection of C.N.R. bridges in British Columbia.

In 1913 he was appointed Professor of Civil Engineering at Dalhousie University.

He acted for a period as a consulting engineer in Halifax and Winnipeg and was responsible for the design of a number of important bridges and buildings.

In 1919 he was appointed Professor and Head of the Department of Civil Engineering at the University of Manitoba and in 1936, Head of the Faculty of Applied Science, University of British Columbia, which appointment he now holds.

Newly Elected Officers of the Institute

J. A. Vance, M.E.I.C., who has been elected vice-president of the Institute for the Province of Ontario, is an engineer and contractor at Woodstock, Ont.

Born in the County of Oxford, Ont., he was educated at the University of Toronto. On the death of his father in 1914 he took over the contracting business and became responsible for the administration, engineering and construction of steel and concrete highway bridges. He is now the proprietor and engineer of the firm of J. A. Vance, contractor, at Woodstock. The business has grown to include the design and construction of factory buildings, sewers, dams and various concrete and steel structures.

Mr. Vance joined the Institute as a Student in 1914, transferring to Junior in 1919. He became an Associate Member in 1924, a Member in 1939. He was re-elected Councillor for the London Branch each consecutive year from 1933 to 1945.

J. A. Vance, M.E.I.C.

Alex Lariviere, M.E.I.C., newly elected vice-president of the Institute for the province of Quebec, is vice-president of the Provincial Transportation and Communication Board, Quebec, Que. He was born at Lotbiniere, Que., and educated at Montreal College, Levis College, and Ecole Polytechnique, graduating from the last in 1913 with the degree of B.A. Sc. in civil engineering. He received his degree in electrical engineering in 1915.

In 1913, Mr. Lariviere was connected with the Montreal Harbour Commission as draughtsman and assistant electrical engineer. From 1913 to 1919 he acted in various capacities as an engineer with the Province of Quebec Roads Department, during which period he was in charge of the construction of the central section of the Montreal-Quebec Highway. He was with J. J. Seguin Electrical Enterprises, Ltd., carrying on electrical contracting business throughout the Province of Quebec, in 1919 and 1920. He was in partnership with Edouard Hamel, consulting engineer, Quebec City, for two years before being appointed, in 1922, engineer for the Quebec Public Service Commission, for which he had been acting in a part time capacity since 1916.

Later appointments by the commission were as follows: chief engineer, 1926; member of the Commission, 1931. He became controller in 1939 of the Provincial Transportation and Communication Board, which replaced the Public Service Commission. The following year when this board was replaced by the Quebec Public Service Board, he became controller for the latter. He was appointed to his present position in 1945.

Mr. Lariviere was Councillor for the Quebec Branch in 1938-1941. He is a past councillor also of the Corporation of Professional Engineers of Quebec. He joined the Institute as a Student in 1910, transferring to Junior in 1914, to Associate Member in 1917 and to Member in 1932.

Photo by Montminy, Que.

A. Lariviere, M.E.I.C.

I. P. Macnab, M.E.I.C., general manager of the Public Service Commission of Halifax, has been elected vice-president of the Institute for the Maritime Provinces.

Born at Malagash, N.S., he studied engineering at Mount Allison University and Nova Scotia Technical College, receiving from the latter, in 1913, the degree of Bachelor of Science in mechanical engineering. Between the years 1901 and 1908 he had served four years as an apprentice machinist and three as a journeyman machinist.

I. P. Macnab, M.E.I.C.

After graduation he was for two years machine shop manager. From 1915 to 1922, with Nova Scotia Light and Power Co., he was successively draughtsman, engineer in charge of construction, general master mechanic, general superintendent Tramways. He was then in consulting practice for two years before going to Monterey, Mexico, as manager of the Venezuela Power Consolidated, steam power plant construction. Returning in 1930, he practiced as a consulting engineer again for two years before becoming a Member of the Nova Scotia Board of Commissioners of Public Utilities. He remained with the Board of Commissioners until March, 1947, when he received the appointment to his present position. Mr. Macnab was a member of Cumberland County Municipal Council in 1932-35. He was chairman of the Civic Planning Commission which prepared the new master plan for the city of Halifax, and is on the Board of Governors of Nova Scotia Technical College.

Mr. Macnab was Councillor of the Institute representing the Halifax Branch in 1939-40. He is vice-president of the Association of Professional Engineers of Nova Scotia. He joined the Institute as a Member in 1919.

S. H. Frame, M.E.I.C., has been elected councillor of the Institute representing the Victoria Branch.

Born in Colchester County, N.S., he studied at Dalhousie University and at McGill, Montreal. He began his engineering career with the Grand Trunk Pacific Railway. He was with the railway for ten years, latterly as resident engineer on construction. This was followed by a short period in Southern Alberta with the Federal Government Hydrometric Surveys. After a few years in municipal engineering with the City

Photo by Ken, Victoria

S. H. Frame, M.E.I.C.

of Calgary he was appointed, in 1918, as assistant engineer on the Canadian Pacific Railway's large irrigation scheme east of Calgary. After ten years on irrigation, in 1928 he became hydraulic engineer on water power investigation for the Department of Lands and Forests of the Province of British Columbia, at Victoria, which position he filled until his retirement in May 1947. He had completed then forty-four years in engineering.

He is a Member of the American Geophysical Union in the Hydrology Section and an Associate Member of the American Society of Civil Engineers. At the beginning of 1948 he was made a Life Member of the Association of Professional Engineers of British Columbia, and also a Life Member of the Engineering Institute.

He joined the Institute as a Student in 1903, becoming an Associate Member in 1911 and a Member in 1936. He served the Victoria Branch as secretary-treasurer for the past year.

R. S. Lawrence, M.E.I.C., has been elected councillor of the Institute, representing the Lethbridge Branch.

He was born at Sydenham, London, England. He studied at the Crystal Palace Engineering School and gained admission to the Institution of Civil Engineers, London, England. He travelled to Angola, Portuguese West Africa in 1909 and was assistant engineer on survey for the Benguella Railway Company. In 1911 he proceeded to Venezuela, South America, where he was assistant engineer for the Bolivar Railway Company, for a year. In Canada from 1913 to 1915 he was surveyor and draughtsman for the City of Calgary, when he enlisted in C.E.F. serving as a lieutenant until 1917. He entered the employ of Canadian Pacific Railway as assistant engineer in the Department of Natural Resources at Lethbridge, Alberta, in 1917 and remained with the firm in the Irrigation Office at Lethbridge until April 1946. With the Alberta Government, Department of Water Resources, Mr. Lawrence is now Superintendent of the northern division of the St. Mary and Milk River Development, Lethbridge.

Mr. Lawrence, who was chairman of the Lethbridge Branch in 1946, joined the Institute as an Associate Member in 1920, transferring to Member in 1940.

R. S. Lawrence, M.E.I.C.

K. W. Mitchell, M.E.I.C., is the newly-elected councillor of the Institute representing the Calgary Branch.

He was born in Edmonton, Alberta, and educated in Calgary public and high schools. He graduated in 1934 from Queen's University with the degree of bachelor of science in civil engineering. He worked for the Ontario Department of Highways for a brief period and then returned to the West, entering the employ of the Canadian Western Natural Gas Company Limited, in Calgary, Alberta, in the fall of 1934 as a junior engineer. He is at present the distribution engineer of that Company, in charge of maintenance, construction and operation of natural gas distribution plants in Calgary and adjacent towns. He is also in charge of all new building operations, as well as maintenance of existing buildings of the Company.

Mr. Mitchell joined the Institute in 1938 as an Associate Member, transferring to Member in 1940. He was secretary-treasurer of the Calgary Branch for two years, and acted as member of the Executive Committee on another occasion, as well as serving on various committees from time to time. He is a member of the Association of Professional Engineers of Alberta, and of the Executive of the Southern Alberta Division of the Navy League of Canada. He is on the board of directors of the Probus Club.

K. W. Mitchell, M.E.I.C.

R. W. Dunlop, M.E.I.C., who has been elected councillor of the Institute representing the Sarnia Branch, was born at Hamilton, Ont.

He received his elementary education in Calgary. The first two years of undergraduate work were done in the University of Alberta, after which he transferred to the University of Toronto and graduated in mechanical engineering in 1927. He returned to Calgary, joining the Imperial Oil Limited, Calgary Refinery. Since then, he has been continuously with Imperial Oil Limited in engineering work, excepting for the period from 1943 to 1946, when he was mechanical superintendent with the St. Clair Processing Corporation in Sarnia, an Imperial subsidiary which operated part of the synthetic rubber plant. On returning from this work, he became group supervisor for construction engineering in the Engineering and Development Division of the Manufacturing Department.

Mr. Dunlop joined the Institute as a Junior in 1928, transferring to Associate Member in 1936, and to Member in 1940.

D. M. Stephens, M.E.I.C., who has been re-elected as councillor of the Institute representing the Winnipeg Branch, is Deputy Minister of Mines and Resources for the province of Manitoba.

D. M. Stephens, M.E.I.C.

Born near Reston, Man., he graduated from the University of Manitoba with the degree of B.Sc. in civil engineering. During 1929-30 he was engaged on topographic, reconnaissance and control surveys in the Churchill river area for the Topographic Surveys Branch, Dominion Department of the Interior. For the next two years he did similar work with the newly organized Department of Mines and Natural Resources, Province of Manitoba. In 1933 he joined the permanent staff of that Department as a technical draughtsman and was subsequently promoted to the position of office engineer in charge of design. After five years with the Department he was granted leave of absence to do other special work, but in 1938 was recalled by the Department and appointed Deputy Minister of Mines and Resources, Province of Manitoba.

R. W. Dunlop, M.E.I.C.

P. E. Buss, M.E.I.C.

Mr. Stephens joined the Institute as a Junior in 1934, transferring to Associate Member in 1935. He became a Member in 1940. He was chairman of the Winnipeg Branch in 1942.

P. E. Buss, M.E.I.C., has been re-elected councillor of the Institute representing the Niagara Peninsula Branch.

Born at Three Rivers, Mich., he received his engineering education at the University of Michigan. During World War I, he served with the United States Army Engineers in France. Mr. Buss was employed on the engineering staff of Provincial Paper Limited on construction of the first sulphate plant at the head of the lakes at Port Arthur, Ont. He later worked on the engineering staff of Dominion Engineering Works, and for a number of years was plant engineer at the Thorold division of Provincial Paper Limited. During 1932-33 he and his brothers carried on experiments in developing the new process for producing rock wool by the spinning method.

Photo by Hubert Beckett
W. A. T. Gilmour, M.E.I.C.

He is now president of Spun Rock Wools Limited at Thorold.

Mr. Buss joined the Institute as an Associate Member in 1927, becoming a Member in 1940. He served as secretary-treasurer in 1931 and as chairman in 1935, of the Niagara Peninsula Branch.

W. A. T. Gilmour, M.E.I.C., newly elected councillor of the Institute representing the Hamilton Branch, is secretary-treasurer and chief engineer of the Smart-Turner Machine Company Limited of that city.

He was born at Hamilton, Ont. He attended McGill University, graduating in 1925 with the degree of B.Sc., mechanical and winning the British Association Medal for applied science. The following year he received a B.Sc. in Electrical Engineering. He joined the staff of The Smart-Turner Machine Co. Limited in 1926 and he was later appointed secretary-treasurer and chief engineer. He served in the Royal Canadian Engineers (Reserve) Hamilton, from 1943 to 1946. He is on the Board of Governors of Appleby College, Oakville, Ont., and is president of the Amity Association of Hamilton.

Mr. Gilmour joined the Institute as a Student in 1924, transferring to Junior in 1930, to Associate Member in 1936 and to Member in 1940.

E. A. Cross, M.E.I.C., newly elected councillor of the Institute for the Toronto Branch, was born at Petersfield, Hants, England.

He attended Birmingham University, graduating in 1909 with the degree of B.Sc. (civil engineering). In 1920 he became associated with Birmingham Canal Navigations, England, as assistant engineer and in 1917, after two years with the Royal Engineers in France, he became research engineer at the Royal Arsenal, Woolwich, England. He returned to Birmingham Canal Navigations as chief assistant engineer in 1919, remaining until 1920.

Photo by Randolph Macdonald, Toronto
E. A. Cross, M.E.I.C.

In the United States in the subsequent two years, Mr. Cross was superintendent of construction for W. L. Stoddart, architect, New York City, on such projects as the Mica Insulating Factory, Schenectady, N.Y., Hotel Sheraton, High Point, N.C. and the Lycoming Hotel, Williamsport, Pa. He then accepted the position of structural engineer for Albert Kahn, Detroit, Mich., remaining until 1927 when he associated himself with Chapman and Oxley, Toronto, as structural engineer. In 1930, Mr. Cross established his private practice as consulting structural engineer in Toronto.

Joining the Institute as an Associate Member in 1925, he transferred to Member in 1935.

L. R. Brown, M.E.I.C., the newly elected councillor of the Institute representing the Sault Ste. Marie Branch, is a contractor in that city.

He was born at Delhi, Ont. He graduated with the degree of B.A. Sc. in 1915 from Toronto University. After some years spent with Algoma Steel Corporation and its associated industries, he became city engineer, Sault Ste. Marie. He remained in that position from 1921 to 1926. Then he became construction engineer Newfoundland Power & Paper Company, Corner Brook. From 1928 to the present he has been engaged in a private capacity in the construction business, since 1934 under the name of L. R. Brown & Co. Limited, general contractors.

Mr. Brown joined the Institute as a Student in 1914, transferring to Associate Member in 1917, and to Member in 1940.

G. R. Turner, M.E.I.C.

Major-General G. R. Turner, who has been elected Councillor of the Institute representing the Ottawa Branch, was born at Four Falls, N.B. and was educated in that province.

He was engaged on railway construction for several years and enlisted in the Engineers at the outbreak of war in August 1914. He had attained the rank of Major by 1918 and had been mentioned in dispatches and awarded the Distinguished Conduct Medal and the Military Cross and bar. In 1920 he was appointed to the R.C.E. (Permanent Force) with the rank of captain and attended the School of Military Engineering, Chatham, England for two years. Returning to Canada, he became instructor in military engineering at Royal Military College, Kingston. He later attended the Staff College at Quetta, India, for two years and in 1927 was appointed district engineer officer at Winnipeg, Man. Two years later he was made Assistant Director of Engineer Service, National Defence Head-

Photo by Salmon Studios, Montreal

Drummond Giles, M.E.I.C.

quarters, Ottawa, with the rank of major and from 1933 to 1937 he served in the General Staff and M.G.O. Branches at N.D.H.Q. Ottawa with the rank of lieutenant-colonel. In 1938 he attended the Imperial Defence College, London, England for a year and on his return was appointed General Staff Officer, grade 1, at M.D. No. 11, Victoria, B.C. His service also included periods of duty at Halifax, St. John, N.B., Quebec and Toronto on Engineer Works.

At the outbreak of World War II he went overseas as General Staff Officer, grade 1, with the 1st Division. On formation of the Canadian Corps in 1940, he was appointed deputy adjutant and quartermaster general of the corps with the rank of brigadier, and on formation of the First Canadian Army of 1942, he received a similar appointment there with the rank of major-general. He was made a Companion of the Most Honourable Order of the Bath in 1943. Returning from overseas service in 1944, he was loaned for several months to the Department of Veterans Affairs as Special Assistant to the Deputy Minister for work on accommodation projects. In 1945 he was made Inspector General of the Army in Western Canada with headquarters in Calgary and, having reached the age limit for service in the postwar Army, was retired in 1946.

Maj.-Gen. Turner joined the Institute as a Student in 1914, tranferring to Junior a year later. He became an Associate Member in 1920 and a Member in 1940. He is past chairman of the Ottawa Branch. Major-Gen. Turner is president of the Ottawa Branch of the Military Engineers Association of Canada.

Drummond Giles, M.E.I.C., has been elected to represent the Cornwall Branch on the Council of the Institute.

A Montrealer by birth, Mr. Giles is executive vice-president of Courtaulds (Canada) Limited, Cornwall. He is a graduate of McGill University, Montreal, having received a B.Sc. degree in 1927. He joined Canadian SKF Limited that year as an engineer at Montreal. He transferred to Toronto two years later as assistant chief engineer, and was made chief engineer in 1930. In Montreal, he was district manager for the Company from 1932 to 1938, and he was then named vice-president. He joined Courtauld's (Canada) Limited, Cornwall, in 1944, relinquishing his post as special assistant to the co-ordinator of production in the Department of Munitions and Supply, Ottawa.

J. M. Crawford, M.E.I.C.

Mr. Giles joined the Institute as a Junior in 1929, transferring to Member, in 1939. He had already held the office of Councillor for the Cornwall Branch since November 1947, completing the term of the late Baron de Hueck.

A. L. Malby, M.E.I.C., has been elected councillor of the Institute representing the Peterborough Branch.

He is from London, England, but received his education at St. Johns Technical High School, Manitoba, and graduated as a bachelor of science in electrical engineering from the University of Manitoba in 1934. Upon graduation he joined the staff of the Canadian General Electric Company Limited, at Peterborough, Ont. For one year he followed the company's test course. He then transferred to the Engineering Service Department, remaining six months. From 1935 to 1942 he was assistant engineer in the Industrial Control Engineering Division. In 1942 he was appointed senior assistant engineer of the Division, and has recently been named division engineer.

Mr. Malby joined the Institute in 1936 as a Junior, transferring to Member in 1942. Recipient in 1941 of the John Galbraith Prize of the Institute, he is a past secretary-treasurer of the Peterborough Branch.

H. F. Finnemore, M.E.I.C.

J. M. Crawford, M.E.I.C., is one of the new Councillors of the Institute representing the Montreal Branch.

He was born at Howick, Que., and holds B.Sc. and M.Eng. degrees from McGill University, Montreal, the latter received in 1932. He demonstrated in the electrical engineering department of the university during the 1929-30 session, and then entered the Shawinigan Water and Power Company, Montreal. He was assistant electrical engineer in 1943, and since 1945 he has been assistant superintendent of the engineering division of the Operating Department of the Company.

Mr. Crawford, immediate past-chairman of the Montreal Branch joined the Institute as a Student in 1928. He transferred to Associate Member in 1935, to Member in 1940.

H. F. Finnemore, M.E.I.C., has been elected as one of the new councillors of the Institute, representing the Montreal Branch.

He was born in Chicago, Ill., but studied engineering in Canada. Graduating from Queen's University with a B.Sc. degree, he enlisted in the First World War with the Canadian Engineers at Kingston, Ont., in 1914. On demobilization in 1918, he joined the Canadian Government Railways at Moncton, N.B., as a draughtsman in the electrical engineering department. Five years later he became assistant electrical engineer in the Canadian National Railways mechanical department at Montreal, and, in 1938, electrical engineer. He was appointed assistant chief

A. L. Malby, M.E.I.C.

electrical engineer in 1943, and chief electrical engineer in May 1945. Mr. Finnemore also has been actively engaged in the development of electric motive power and installations and the introduction of air-conditioning on the Canadian National passenger equipment.

Mr. Finnemore joined the Institute as an Associate Member, in 1921, transferring to Member in 1940. He has served the Institute for several years on the Library and House Committee.

E. D. Gray-Donald, M.E.I.C., is the newly elected councillor of the Institute representing the Quebec Branch. He is chief engineer, Quebec Power Company and Quebec Railway, Light and Power Company.

Born in Amoy, China, in 1900 he was educated at George Watson's College, Edinburgh, Scotland, McGill University, Montreal and Laval University, Quebec, obtaining the degree of B.Sc. (Elect.) at McGill in 1926, and that of M.Sc. at Laval in 1934. He entered the service of the Quebec Power Company and Quebec Railway, Light & Power Company in 1926 as assistant engineer, and his subsequent appointments have been as follows: 1928—assistant superintendent, Power Division; 1930—superintendent, Power Division; 1937—assistant general superintendent; 1938—general superintendent; 1942—chief engineer.

Mr. Gray-Donald joined the Institute as a Student in 1922 and he was transferred to Junior in 1926. He was made an Associate Member in 1934 and was transferred to Member in 1939. Mr. Gray-Donald is president of the Canadian Transit Association, to which post he was elected in 1946, and he is also vice-president of the Canadian Electrical Association, to which position he was elected in 1947.

W. C. MacDonald, M.E.I.C., has been elected as councillor of the Institute representing the Moncton Branch.

Born in Shelburne, N.S., where he received his early education, he studied engineering at St. Francis Xavier University, Antigonish, N.S., and Dalhousie University, Halifax, N.S. He worked first for the National Transcontinental Railway at Edmundston, N.B., as draughtsman, instrumentman and resident engineer. He then joined Canadian Pacific Railway and in 1912-1914 he was resident engineer in the Lake Superior District, Ontario. He came to Montreal in 1914 to a position as engineer for the Cook Construction Company on the Montreal Aqueduct. In 1916 he joined Kennedy and MacDonald Company to work as engineer and superintendent on construction of the St. John and Quebec Railway. From 1918 to 1925 he was an engineer for Bedford Construction Co. Ltd., on construction of Halifax Shipyards, St. John Dry Dock, and Jamaica Government Railway, Jamaica, B.W.I.

He then joined Anglin and Norcross Ltd., and was engineer on construction of the Singer Manufacturing Company plant and railway at Thurso, Que. From 1926 to 1929 Mr. MacDonald was secretary-treasurer in Montreal and in Jamaica, B.W.I., for La Société Générale de Ponts et Chaussées, Limitee, and then until 1937 he had a private practice in engineering and contracting in Kingston, Jamaica. He returned to New Brunswick that year and joined the Department of Public Works as highway engineer, and in 1940 he became resident engineer for the Department of Transport, engaged on surveys and construction of Airports in the Maritimes. At present he is district airway engineer at Moncton, N.B., for the Civil Aviation Division of the Department of Transport.

Mr. MacDonald joined the Institute as an Associate Member in 1919, transferring to Member in 1940.

C. D. Martin, M.E.I.C

W. C. MacDonald, M.E.I.C.

C. D. Martin, M.E.I.C., is the newly-elected Councillor of the Institute representing the Halifax Branch.

Born at Amherst, N.S., he graduated in electrical engineering from the Nova Scotia Technical College in 1938. He entered the services of the Halifax branch of the Northern Electric that year and has remained with the Company. He is Manager of Wire and Cable Sales and Overhead and Underground Sales for the Maritime District, which covers the Maritime provinces and Newfoundland.

Mr. Martin joined the Institute as a Student in 1938, transferring to Junior in 1941, and to Member in the same year. He was chairman of the Branch in 1946.

W. A. MacDonald, M.E.I.C., the newly-elected Councillor of the Institute representing the Cape Breton Branch, is an engineering graduate of Mount Allison University, Sackville, N.B., 1927, and of Nova Scotia Technical College, 1929.

Originally from Halifax, N.S., he worked for Northern Electric Company, in Montreal from 1929 to 1931. He was at first on a course with the Automatic Telephone Engineering Division and later he completed a plant course with the Technical Development department. In 1931 he joined the Provincial Highways Department of Nova Scotia. He did survey work, was an office engineer, and was finally in charge of a survey party on Cabot Trail area in Cape Breton. He left in 1934 to join the Dominion Steel and Coal Corporation, Sydney, N.S., as an assistant to the chief electrical engineer, with charge of field work and new construction projects.

Mr. MacDonald, a member of the Association of Professional Engineers of N.S., joined the Institute as an Associate Member in 1939. He became a Member in 1940.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

James L. Tighe, M.E.I.C., of Holyoke, Mass., died in April, 1947, after a long and distinguished career as a consulting hydraulic engineer in Massachusetts.

He was born in Ireland in 1864. He studied in Canada, receiving the degree of B.A.Sc. from McGill University, Montreal, in 1892. He worked first in Holyoke, Mass., where he was assistant engineer of the city's Water Works. Later, as chief engineer, he proposed, designed and executed extensions to the water supply. He became city engineer of Holyoke, in addition to his previous appointment, in 1899. He was also consulting engineer to the County Commissioners of Hampden Co., Mass., from 1900, dealing with power and water supply dams. He advised individuals and corporations on water power development and water supply.

He remained in Holyoke, and was still in consulting engineering at the time of his death. He had held memberships in the American Society of Civil Engineers, the American Water Works Association, the American Public Health Association, and others. He became a Student member of the Institute in 1890, an Associate Member in 1900 and a Member in 1906. He was awarded Life Membership in 1947.

F. G. McPherson, M.E.I.C., passed away at his home in Bridgewater, N.S., on March 13, 1948. Born in Halifax, in 1881, he attended Dalhousie College for two years. On leaving, he was employed by the Provincial engineer in Nova Scotia as a draughtsman. Then he worked on the construction of the Halifax and South Western Railway. Following this

F. G. McPherson, M.E.I.C.

he had a contract for a railway in Ontario, and from there he went to British Columbia and worked from 1909 to 1914 as resident engineer for MacKenzie and Mann in railway construction. Later he was called east. There he made a survey of the Guysborough Railway, and he was later employed as engineer with the Halifax Harbour Commission. He also spent some time as resident engineer during the construction of the cold storage plants, before being employed by the Department of Highways for several years as engineer for Lunenberg County. He surveyed and was in charge of construction of the Bedford Highway.

Mr. McPherson joined the Institute as an Associate Member in 1907, and transferred to Member in 1940.

Charles Flint, M.E.I.C., who was superintendent of construction in the Department of Transport Air Service, for the past year, died in Ottawa on April 13, 1947.

He was born in Toronto in 1888, and graduated from the School of Practical Science of University of Toronto in 1910. He served with the C.P.R. at Winnipeg as assistant engineer and locating engineer—and at Edmonton, Alta., as resident engineer, maintenance—before joining the Canadian Army. He served four years, returning with the rank of major and decorated with the D.S.O., the Military Cross and the Croix de Guerre. He returned then to C.P.R. at Winnipeg, as assistant engineer. In 1927 he became president of the firm of Duff, Flint and Co., engineers and contractors, and he remained in the consulting firm in Winnipeg for a number of years. From 1941 he was with McNamara Construction Co. Ltd., in Toronto, until 1946, when he was supervisor of veterans placements in Ontario for the Department of Labor, with headquarters in Toronto. He joined the Department of Transport Air Services Branch at Ottawa in 1947.

Mr. Flint joined the Institute in 1909 as a Student. He transferred to Associate Member in 1912 and to Member in 1920.

W. H. G. Flay, M.E.I.C., who was branch manager of Dominion Structural Steel Limited, Ottawa, died at his home in Ottawa on March 16, 1948.

He was born at Exeter, England, in 1885. He received his education there and graduated as a civil engineer. He came to Canada about thirty years ago, and was first employed by the Canadian Pacific Railway in Montreal. He went to Dominion Bridge Company, Lachine, Que., in 1913, and the next year to Imperial Munitions Board, Ottawa, where he was a draughtsman. In 1919 he joined Canadian Nickel Corporation, Deschenes, Que., as a draughtsman. From 1920 he was a structural engineer for the Ottawa School Board, designing reinforced concrete for several buildings, until 1923. Joining Dominion Structural Steel Limited, Ottawa, then, he was manager and director of the Ottawa and District Office at the time of his death.

Mr. Flay joined the Institute as an Associate Member in 1921, transferring to Member in 1940. He was also a member of the Association of Professional Engineers of Ontario.

William Burns, M.E.I.C., of Winnipeg, Man., retired C.N.R. construction engineer, after an active career in railway development in Western Canada, died at Winnipeg on March 27, 1948.

Mr. Burns was born in 1860, at Renfrew, Ont., and began his railway construction career in 1879 on surveys for the Canada Central Railway west from Pembroke, Ont. A few years later, he travelled west as far as Fort McLeod and south to the mining fields of South Dakota. In 1883 he returned to the new Canadian Pacific Railway and continued on location and construction for that Company, largely in the east, until the Crows Nest Pass Railway was begun, when he was entrusted with much of the exploration and location of its most difficult stretches.

In January, 1899, Mr. Burns joined the engineering staff of MacKenzie Mann and Co. on the active construction of the Ontario and Rainy River Railway west from Port Arthur. In the following two years, he continued survey and construction operations in the northern portions of Manitoba and Saskatchewan. By this time the Canadian Northern plans were being laid for a transcontinental road, and Mr. Burns was commissioned to report on the possibilities of routes through the northern passes of the Rocky Mountains.

In the space of one year, thousands of square miles of Western Canada's vast territory were explored for the first time by an experienced railroad engineer. His reports recommended the Yellowhead Pass as the most favourable for a western outlet through the Rocky Mountains, and Fort Churchill as the best port for the terminus of a railway to Hudson Bay. The Canadian Northern main line surveys westerly were completed under his personal direction three years later to the Yellowhead Pass, and the same year the Grand Trunk Pacific, after extensive surveys on other routes, confirmed Mr. Burns' early findings by deciding to use the Yellowhead Pass jointly with the Canadian Northern for a Pacific outlet through the Mountains. The extension to Hudson Bay was later taken over by the Dominion Government and once more the recommendations contained in Mr. Burns' early reports were confirmed, when in 1927 it was finally decided to make Churchill the terminus of the Hudson Bay Railway.

During the next ten years, 1904-14, an extensive branch line programme was undertaken and completed by the Canadian Northern Railway, and Mr. Burns was actively engaged in the field on location and construction of these. In 1918, when the Canadian Northern and the Grand Trunk Pacific were amalgamated into the Canadian National Railways, Mr. Burns was appointed engineer of construction with headquarters at Winnipeg.

Mr. Burns joined the Institute as an Associate Member in 1890, becoming a Member in 1902. He attained Life Membership in 1932, the year in which he retired from railroading.

Andrew R. MacGowan, M.E.I.C., of Seatrain Line, New York City, died in hospital at New Caanan, Conn., on February 22, 1948. He had been superintendent for Seatrain Line in New York for the past several years.

He was born in 1883 in Moncton, N.B. He was educated there and graduated in civil engineering, then becoming a member of the staff of the chief engineer of Intercolonial Railway, Moncton. Later he was advanced to the post of superintendent of the National Transcontinental Division of the railways with headquarters in Edmundston and occupied that position until he resigned in 1916 to accept a superintendency with the Delaware and Hudson Company at Albany, N.Y. He served with the D. and H. until his association with the Seatrain Line commenced some years ago.

Mr. MacGowan joined the Institute in 1903 as a Student. He transferred to Associate Member in 1909 and to Member in 1940. He attained Life Membership in 1947.

Otis Weeks, M.E.I.C., of Ogden, Utah, died in hospital there on January 7th, 1948. Mr. Weeks had been retired for several years from the position of division engineer at Salt Lake for Southern Pacific Railroad.

Mr. Weeks was born in 1875 at Wakefield, Mass. He studied civil engineering at University of Nebraska, receiving the degree of B.S. in 1895. He went to work that year for the Boston and Maine railroad as a section labourer and when he left the company in 1897 he was a foreman. He served as assistant roadmaster for the Maine Central at Bangor, Me., from 1897 to 1900; roadmaster for the Union Pacific at Junction City, Kan., at Oakley, Kan., and Kansas City, from 1899 to 1905; division engineer for the Union Pacific at Denver from 1905 to 1907. He was in Canada as track engineer for the Grand Trunk Pacific from 1907 to 1908, at Portage la Prairie, Man.

In 1908, he became an employee of Utah Copper Company mine in Bingham Canyon as level foreman and soon rose to general foreman of the surface workings. In 1911 he returned to railroading, this time as general foreman for the Southern Pacific at Suisun, Calif., and later as assistant engineer. In 1912 he went to Stockton, Calif., as division engineer, and in 1913 he became division engineer in Ogden. He retired in 1940.

He served in France during World War I as first lieutenant with the 48th engineers.

Mr. Weeks joined the Institute in 1907 as an Associate Member, transferring to Member in 1940. He attained Life Membership in 1947.

NEWS of the BRANCHES

Activities of the Twenty-eight Branches of the Institute and abstracts of papers presented at their meetings

Calgary

J. F. Langston, M.E.I.C.
Secretary-Treasurer

T. M. Parry, M.E.I.C.
Branch News Editor

The last regular meeting of the season was held on Thursday, March 4, at 8.00 p.m. in the Palliser Hotel, with Chairman M. W. Jennings presiding.

After the reading and adoption of the minutes of the previous meeting, time was given by the chairman for some discussion and enquiries concerning the annual general meeting of the Institute to be held in Banff in June.

The speaker of the evening was R. H. Wray, Jr.E.I.C., electrical engineer for the Calgary Transit System, whose paper dealt with the subject **Trolley Coach Operation and Overhead Construction.** He discussed the mechanical and operating principles of Calgary's new trolley coaches which have been in operation here since last summer, giving his hearers an interesting outline of the overhead facilities which must be made available before the coaches can operate.

Positive and negative wires have to be strung overhead so that two parallel trolley wires instead of the customary single one for the street car, have to be provided. Power at 600 volts is supplied by feeder lines, with 400 volts minimum at end of the line. The two lines are 24 inches apart with the nearer (negative) wire 12 feet from the curb in this city. The wire is supported in spans not exceeding 100 feet and sag not over 3 inches. Special fixtures provide a smooth path on curves and intersections.

The vehicles are Canadian Car-Brill trolley coaches, manufactured in Canada at Fort William.The coach is driven by a single, 600-volt, compound-wound, D.C. motor of 140 horse-power, located behind the rear axle. This motor is directly connected by a short propeller shaft to the rear axle which, through double reduction gears, gives a ratio of 11.42 to 1. Operation of the coach is controlled by two foot-pedals—one power pedal and a brake pedal to the left of it. Maximum speed is rated at 43 miles per hour.

After answering many questions put to him by his hearers, Mr. Wray was the recipient of a hearty vote of thanks, moved by F. K. Beach. The meeting, attended by 45 members and 18 guests, was adjourned at 10.10 p.m.

❖ ❖ ❖

The annual meeting of the Calgary branch was held at 4.00 p.m. on Saturday, March 13, in the Palliser Hotel, with retiring Chairman M. W. Jennings presiding.

The meeting opened with the reading of the minutes of the last annual meeting and their adoption. The chairman announced that H. R. Younger had been awarded Life Membership in the Institute. Mr. Younger rose to acknowledge this honor. Also announced was the award to P. M. Sauder of the Julian C. Smith medal for achievement in the development of Canada, the official presentation to be at the annual meeting of the Institute in Banff next June.

Mr. Jennings expressed the appreciation of the chair to all committee chairmen and members for their efficiency and co-operation during the branch year.

Some lengthy discussion took place on the coming visit of the President, and the annual meeting at Banff. Discussion centred around the programme, ways and means of expressing a real western welcome to visiting members, and the place and responsibility of the Calgary branch in the general arrangements.

The retiring chairman then introduced the new officers and executive for 1948-49. S. G. Coultis moved a vote of thanks to the retiring executive.

The incoming chairman, R. T. Hollies thanked the Branch for the honor bestowed upon him and spoke with confidence of the outlook for a busy and interesting year.

The meeting adjourned at 5.35 p.m.

Cornwall

G. G. M. Eastwood, M.E.I.C.
Secretary-Treasurer

T. B. Webster, Jr.E.I.C.
Branch News Editor

The last general meeting of the winter season was held on April 20 when an illustrated lecture **Fluid Drives in Industry** was presented by R. R. Noyes.

In the short business meeting preceding the lecture, R. H. Wallace, branch chairman, reviewed the work of the executive and called on W. P. Nesbitt, chairman of the newly-formed Civic Affairs Committee for a report of its activities. Mr. Nesbitt outlined

Above—D. Ross-Ross, past chairman of the Cornwall Branch; President L. F. Grant; R. H. Wallace, branch chairman; and General Secretary L. Austin Wright. The photo was taken at the banquet of March 16 at Cornwall, which was described in the April *Journal.*

the formation of the committee, its objectives and its current projects.

H. E. Meadd introduced Mr. Noyes who is the Montreal manager of the Canadian Sirocco Company. Mr. Noyes related the history of fluid drives from their application 30 years ago in Germany on marine installations and their adoption on this continent 15 years ago. The speaker showed lantern slides that indicated the action of the basic unit consisting of impeller, fluid vortex and runner.

The drives are of two types—constant speed or variable speed and are used for cushioning shock loads, minimizing motor starting load and obtaining stepless speed variation. Speed range variations up to five to one are obtainable and various methods of control may be employed to suit each application.

Successful installations have been made on textile spinning machines, boiler house fans, feed water pumps and conveyor drives. Mr. Noyes indicated that in some cases power savings realized were sufficient to pay for the fluid drive in three or four years.

The speaker was thanked by Mr. L. Snelgrove at the conclusion of an open discussion.

Edmonton

W. W. Preston, jr.e.i.c.
Secretary-Treasurer

A quick trip along the fourteen hundred miles of the Alaska Highway from Dawson Creek to Fairbanks by means of colour photography, and a running commentary on **Problems Encountered on the Alasko Highway** were assignments handled by Lt.-Col. J. R. B. Jones, D.S.O., O.B.E., senior engineer officer at Western Command when he addressed a joint dinner meeting of the Edmonton Branches of the Engineering Institute of Canada and the Military Engineers' Association of Canada, on April 6, in Merrick's Embassy Room.

Colonel Jones reviewed the highlights of the Highway's history, showing how, at the transfer of the portion of the road between Dawson Creek and the Alaska-Canada border to Canada, in April, 1946, maintenance of the Alaska Highway became a problem of Canadian Army Engineers.

He described the Highway from Dawson Creek to its northern end. Haste in building the road made it necessary to correct many curves, grades, culverts and bridges. Many permanent bridges have been built but many are of a temporary nature and must be replaced. Flash floods, rising thirty feet overnight or carrying fallen trees to the abutments of bridges, keep maintenance workers on the alert. Drainage and construction in cold weather, permafrost, and the operation of machinery present difficulties. Maintenance crews give twenty-four hour service on snow removal from the Highway. For contrast the speaker showed pictures of large colourful flowers grown during the long days at Whitehorse. Another shot showed an experimental farm along the Highway.

Because of the isolated location of the Highway, the army must supply all kinds of services. The organization is divided into operational and administration wings. Under the former, there are eighteen highway maintenance camps, spaced about seventy miles apart, each made up of five to ten families. The crews are largely civilian, but operate under Army engineers. The administrative wing handles buildings and utilities. The power house at Whitehorse, the home of the Army Headquarters, supplies 19,000 k.w.h. per day and 19 million gallons of water per month. The Army Medical Corps operates a fifty-bed hospital for the civilian and military population, and there is a dental clinic. A work shop at Fort Nelson and one at Whitehorse are run by the Royal Electrical and Mechanical Engineers. The Ordinance Corps supplies such things as spare parts and furnishings. The Army Service Corps looks after food rations and ground freight.

The E.I.C. branch chairman, J. E. Cranswick, opened the meeting and then vacated the chair in favour of Lt.-Col. P. L. Debney, m.e.i.c., chairman of the recently formed local branch of the M.E.A.C. Col. Debney introduced Col. Jones. At the conclusion of a discussion period, Capt. R. H. Nicholson, secretary-treasurer of the M.E.A.C. proposed a hearty vote of thanks, which was well applauded. Among the visitors to the joint meeting was Col. H. L. Meuser, director of engineering for the Canadian Army. Attendance was eighty-five.

Kootenay

E. B. Broadhurst
Secretary-Treasurer

A meeting of the Kootenay Branch was held on March 10, with an attendance of 31 members and guests.

The highlight of this meeting was an address by E. W. Henderson of the English Electric Company, whose topic was **Factors Affecting the Design of Electric Motors.**

Using slides to illustrate developments in motor design, Mr. Henderson traced the history of the electric motor back to Tesla in 1888. He pointed out that as Edison in later years had to develop the vacuum pump to carry on his work, the most important phase of Tesla's work with electric motors was the development of polyphase distribution.

The first demonstration of power transmission was made in 1891, by Swiss engineers, by means of Tesla's system at 30,000 volts. The first induction motors were not of squirrel cage type, but were wound rotors.

The speaker made some very interesting comparisons of the horsepower, diameter, and weight of the motor in various stages of development, as follows:

1888 Tesla's motor	5 hp	30″ dia.	1000 lbs.
1897	5 hp	21″ dia.	640 lbs.
1905	5 hp	15″ dia.	210 lbs.
1930	5 hp	13″ dia.	147 lbs.
1948	5 hp	11⅜″ dia.	135 lbs.

Mr. Henderson remarked that manufacturers are inclined to improve their product in performance, economy of manufacture, and appearance or sales appeal. Modern research, the advent of welding and new and better materials have all contributed to a better product. No one man or company is responsible for today's designs. The progress made has been the outgrowth of experience to which all designers have contributed.

❖ ❖ ❖

A luncheon meeting was held on Wednesday, April 21, 1948 with 36 members and visitors in attendance.

The meeting was highlighted by an address by Claire White of the Consolidated Mining and Smelting Co. Ltd., Mines Department, whose topic **Bulk Petrol Supply**, was extremely interesting. Mr. White described events leading up to the development of petrol pumping for supplying the Allied armies invading France. Extensive surveys and experiments were carried out before the operation familiarly known as " Pluto ", was commenced.

His description of pumping, pipe laying and the amounts of materials handled were of great interest to members who engage in peacetime engineering.

Following the address a business meeting was held to discuss the coming visit of the President and General Secretary.

Montreal

The Branch would like to take this opportunity of congratulating: **J. B. Stirling,** m.e.i.c., on his recent election as president of the corporation of Professional Engineers of Quebec; **W. A. Mather,** m.e.i.c., on his recent election as president of the Canadian Pacific Railway; **N. R. Crump,** m.e.i.c., on his recent election as vice-president of the Canadian Pacific Railway in Montreal.

Members are reminded of the Chemical and Industrial Exhibit of the Chemical Institute of Canada which is to be held during the Institute's Convention in Montreal. This exhibit will be shown in Cardy Hall in the Mount Royal

Hotel on Monday, June 7, from 12.00 noon to 10.00 p.m.; Tuesday, June 8, from 10.00 a.m. to 10.00 p.m.; and on Wednesday, June 9, from 10,00 a.m. to 6.00 p.m. Notice of this event was mailed to members early in May and it is not the intention to send out any further notice.

Replies to the Questionnaire indicate the desire on the part of some members for Paper Nights in addition to the usual Thursday Nights, as well as for Papers on non-technical subjects. In response to this request, additional publicity will be given to the Programme of the Junior Section whose meetings are open to all members. The Junior Section has in the past arranged excellent papers and it is hoped that they will receive greater support in the future.

It is planned to hold the opening meeting of the Autumn Session on September 30. It is hoped to repeat the success of last year's meeting by holding it away from Headquarters where the space is insufficient to take care of the large attendance. An attempt will be made to have President-elect, Dean J. N. Finlayson attend.

It is planned to have on October 7th an exhibit consisting of 21 panels of the work of Mr. Robert Maillart, a famous Swiss engineer, on reinforced concrete bridges. J. F. Brett, M.E.I.C., will discuss this work. The exhibit will be on display for about 5 days so that Members and others interested may view it at their leisure. The Branch is indebted to the Canada Cement Company for generously offering to defray the expenses of bringing this exhibit to us.

The following papers were arranged for the first half of 1948 and are listed here for the benefit of interested persons or branches.

Jan. 8—Economical Design of Rural Power Systems — R. F. Quinn. Joint meeting with A.I.E.E.

Jan. 15—The Sperry Cars and Testing Rail in Track—J. W. Dickerson.

Jan. 22—The Weather in War and Peace—G. H. T. Kimble.

Jan. 29—Wage Incentives—J. Keith Louden.

Mar. 4 — 84 in. Drain — Prestressed Concrete Pressure Pipe—R. M. Doull, M.E.I.C.

Mar. 11—Planning Building and Operating Canada's International Shortwave Broadcasting Service — G. W. Olive, O.B.E., D. G. McKinstry, W. A. Nicols, R. D. Cahoon, J. E. Hayes. Joint meeting with I.R.E.

Mar. 18 — Design of Suspension Bridges with respect to Dynamic Wind Action—Dr. O. H. Ammann.

Apr. 1—Automatic Control for Steam Boilers and Industrial Processes—P. S. Dickey.

Apr. 8—Steam Turbine Electric Locomotive for Main Line Service—Charles Kerr Jr.

May 11 — Demonstration of Basic Control Principles—R. N. Pond. Joint meeting with Cdn. Pulp & Paper Co.

June 7—Exhibit of Chemical Institute of Canada.

Junior Section

On April 12, the Junior Section held a meeting to discuss next season's programme. The meeting was under the chairmanship of Paul Salvas.

After some discussion the following programme was tentatively set up.

1. Opening Night.
2. Mr. Maillart's Concrete Exhibits.
3. Fourth Annual Dance to be held in the Ritz-Carlton Hotel on November the 19th, 1948.
4. Ladies Film Night. On this occasion the wives and lady friends of the full membership will be the guests of the Junior Section.
5. An Oyster Party for the Montreal Membership.
6. Study Groups which will sponsor public speaking courses, etc.
7. A debate with each side being made up of a Member of the Senior Section and a Member of the Junior Section.

Items 5, 6 and 7, above, have not been finally decided upon but will probably form a part of next season's programme.

It will be noted that the Junior Section is following its past policy, in that a large proportion of its activities will be of a non-technical nature.

Ottawa

C. G. Biesenthal, M.E.I.C.
Secretary-Treasurer

R. C. Purser, M.E.I.C.
Branch News Editor

The Scientific Development of the North American Arctic was the subject of an address delivered at a noon luncheon before the Ottawa Branch on March 18. The speaker, W/C K. C. Maclure, A.F.C., director of Arctic Research, Defence Research Board, was introduced by Dr. J. J. Green, technical adviser, Air Transport Board. Branch Chairman J. L. Shearer presided.

North of Ottawa a distance of 2100 miles, stated Wing Commander Maclure, there is a small Canadian settlement inhabited by Canadians and Americans. It is the new weather station of Resolute Bay, Cornwallis Island. North of that 380 miles is another Canadian weather station, Eureka Sound, on Ellesmere Island, where four Canadians and four Americans have been living and working for the past year. The most northern coast of Canada reaches further north another 270 miles.

In other words, Cape Columbia, the northern tip of Canada lies over 2600 miles north of Ottawa, or about as far away as Vancouver. To reach Ellesmere Island by air would take about ten hours by fast modern aircraft, or about the time it takes to drive from Ottawa to London, Ontario.

Into this northern land the sudden surge of post-war exploration has been brought about by the long range aircraft. Long range flights, however, are not new, and the speaker traced the history of polar exploration by air from 1897—when Andree tried to reach the North Pole in a balloon from Spitzbergen—to the present day. The most remarkable flights were those of the Russians in 1937. In May of that year they landed on the ice at the North Pole, setting up a weather station, and observers remained there on the ice throughout the summer and following winter.

But it was not until the recent war that aircraft and instruments had de-

MONTREAL BRANCH VISITS DOMINION BRIDGE

On Saturday, May 1, a group of 125 members of the Montreal Branch visited the Lachine Plant of the Dominion Bridge Co. Ltd.

The centre of interest was the new boiler plant, with a peak capacity of 75,000 pounds of steam per hour. This installation will replace the original plant of six H.R.T. boilers which has a combined output of 30,000 p.p.h. The new installation consists of three Dominion Bridge water tube boilers, each with maximum continuous capacity of 23,000 p.p.h. Each boiler can be coal or oil fired. There is also a 4,600-p.p.h. auxiliary boiler.

Shown in the illustration are, among others—extreme right, Mark Bain, M.E.I.C., of the Dominion Bridge Co. Ltd.; second from right Robert White, M.E.I.C, chief engineer, Williams & Wilson Ltd., and immediately behind Mr. Bain is Frank Block, M.E.I.C., of the "Bridge" Company, his collaborator in the supervision of design of the new boilers.

veloped sufficiently for routine Arctic flying to be feasible for normal air crews. Long range aircraft, radar, and precision navigation instruments were the wartime developments that have proved most valuable for Arctic operations. Today, heavy aircraft can fly in almost any weather, anywhere in the Arctic, by day or by night. Nevertheless there are still many problems to be solved.

However, meteorological stations and flights are only one aspect of the present development of the North American Arctic. A great many other types of survey and research must be carried out if white people are to live more comfortably and work more efficiently in the north.

The weather stations give an excellent example of the international co-operation which can take place. Another good example is the Arctic Institute of North America, with offices in Montreal and New York. Canadian and American university men were spread all over the North American Arctic last summer, and will be again this year, on Arctic Institute projects.

Scientists are being required in increasing numbers to investigate and explore the Arctic. Behind them must come the engineers, the doctors, and administrators. Modern scientific methods must be employed, and the best technical qualifications are needed. But it is still a frontier, and it needs men with a pioneer spirit.

❖ ❖ ❖

At a noon luncheon, April 1, the story of the building of the Beaver class ships for Canada's merchant fleet was told by means of a motion picture produced by the C.P.R. The planning and building of a 10,000-ton freight ship on the Clyde river in Scotland was depicted. Included were scenes taken during the war when the merchant fleet was under constant attack by enemy planes.

Branch chairman J. L. Shearer presided. J. D. McNee, C.P.R. city passenger agent who arranged the showing of the film, was one of the guests at the head table.

❖ ❖ ❖

The Ottawa branch held a joint evening meeting with the local sub-section of the American Institute of Electrical Engineers on April 6 at the National Research Auditorium. Bruce R. Prentice, of the General Electric Company, Schenectady, N.Y., spoke on the **Development of Atomic Power**.

Mr. Prentice is assistant to H. A. Winne, vice-president in charge of engineering policy of the General Electric Company, in the general direction of the G-E Nucleonics Project. This project involves fundamental nuclear research, and the development of atomic power for constructive peace-time purposes.

Mr. Prentice dealt with the problem of utilizing the heat which is a by-product of the atomic pile, and converting it into electrical energy. Present barriers to the operation are purely technological and are expected to be solved through extensive research. He said his company expected to have an experimental power station in actual operation within three years.

❖ ❖ ❖

At a noon luncheon on April 15, J. L. E. Price, Montreal, spoke on the subject of **Housing**. Mr. Price is president of J. L. E. Price & Co., Ltd., and chairman of the management committee of the Canadian Construction Association. He was introduced by J. H. Irvine and thanked by R. F. Leggett.

Mr. Price could foresee no immediate cuts in the high cost of building commodities as demand still exceeds supply. Labour, too, is " still on the march " and further increases in wage rates may be expected. Delays in waiting for materials that are slow in coming also help to add to construction costs. He thought ways and means should be found to take more work into the shop where it can be handled by mechanization and by the most expert and dependable labour. The precutting and prefabrication of materials should help. The development of new materials might help too, but so far new materials in the way of light metals or plastics have not brought down costs. " Some day ", said Mr. Price, " we may see a man who will do for housing what Henry Ford did for the automobile ".

He referred to research now being done by the Department of Building Construction of the National Research Council. Toward this research construction interests should extend every possible assistance as we cannot expect the Government to do everything. The problem really will never be solved until every small builder once again will be building homes, preferably on a lump sum plan rather than a cost plus basis. He pointed out that two-thirds of the people requiring housing can only afford to pay from $20 to $40 a month on their dwellings.

More young men should be trained for the building trades. Of all our resources, manpower rates as No. 1. The destiny of Canada rests with them.

Junior Section

The Junior Section was inaugurated at the instigation of the Senior Section Executive during the fall of 1947.

On December 6, 1947, a tour was made through the City of Ottawa Purification Plant. The Ottawa establishment is the first known to successfully treat river water of this type to give clear pure water. After a talk by H. P. Stockwell, M.E.I.C., and Mr. Heeney, a guided tour was made, culminating in a demonstration of the cleaning or flushing technique of a sand filter bed.

A visit was paid to the Canadian International Paper Company plant on Saturday afternoon, January 17, 1948. After a short explanation, by G. D. Davidson, M.E.I.C., of the two processes used in preparing paper, conducted tours were made through the paper and fibre board plants.

The Combined Film and Constitution Discussion Night took place in the National Museum Hall on February 3, at 8 p.m. After the showing of National Film Board Talkies on: Smoke Control, Atomic Theory, Housing, Muskox Expedition, Fishing and Football; the meeting was thrown open for the reading and discussion of the proposed Junior Section Constitution.

On Saturday afternoon, February 14, the Junior Section visited the Hull plant of the Canada Cement Company. T. T. Truesdell and R. F. Haskett of the Company explained the general organization of the plant and the methods employed in the manufacture of Portland Cement.

The First Annual Senior and Junior Sections Joint Luncheon was held in the Chateau Laurier at 12.45 p.m. Thursday, March 4. The executive of the Junior Branch was introduced to the membership. The address by C. S. Parsons, chief of the Bureau of Mines, on **Practical Research** has already been summarized in the Senior Section News.

The Mechanical Engineering Division of the National Research Council of Canada was host to the Junior Section on Saturday afternoon, March 13. After a brief address by the division chief, J. H. Parkin, M.E.I.C., the Junior Section was conducted through each building by the head of the section.

The Junior Section Public Speaking Competition was held in the Auditorium of Carleton College on Wednesday evening, March 24. The contest was divided into two sections, student and graduate. The Student First Prize was won by Mr. Clyde Kennedy, S.E.I.C., of Carleton College on **The Smoke Survey at Trail, B.C.** Cliff Thompson, S.E.I.C., of Carleton College earned the Second Student Prize with **St. Lawrence Seaway Project. Construction Work at Bahrein** by John Watt, JR.E.I.C., won the Graduate First Prize while Lionel Peckover, JR.E.I.C., was awarded the Second Graduate Prize for **A Visit to the Brooklyn Battery Tunnel.** Four students and 8 graduate papers were heard by the Judges—R. F. Legget, M.E.I.C.; W. E. Wakefield, M.E.I.C.; and N. B. MacRostie, M.E.I.C. At the close of the speaking a short film " White Safari—on Expedition Muskox " was shown while the judges were making their decisions.

Peterborough

J. M. King, Jr.E.I.C.
Secretary-Treasurer
J. C. Allan, M.E.I.C.
Branch News Editor

Meteorology and Its Application to Engineering was the subject of an informative and entertaining address delivered to the Peterborough Branch on March 18 by W. J. Green.

The economic aspects of weather forecasting were outlined to show the importance of the subject and some of its unexpected ramifications. Particular reference was made to the use made of weather forecasting by power companies.

A number of standard weather charts for the day were circulated and something of the basis for prediction explained from them. The meaning of the charts and the organization back of them was also discussed.

New trends including the possibility of using dry ice to promote precipitation from clouds were also discussed.

❖ ❖ ❖

Tools for Dimensional Quality Control, was the subject of an address by O. H. Somers of the Standard Gage Co. Inc., Poughkeepsie, N.Y. About 70 members and guests including many inspectors and others interested in dimensional control from the local factories were present.

Mr. Somers' address dealt mainly with statistical methods and was illustrated by the use of several pieces of special equipment, including a Frequensonar.

Following the address there was an exceptionally lively question and answer period.

D. J. Emery thanked the speaker on behalf of the meeting.

Saguenay

J. E. Dyck, M.E.I.C.
Secretary-Treasurer

Research and Industrial Progress was the topic of an address given by G. E. Bourne to the Saguenay Branch of the Institute on April 1, 1948. Mr. Bourne is manager of the Special Products Section, Apparatus Division, Canadian General Electric Company, Toronto, Ont.

He pointed out that the value of research, as a means of introducing new products for manufacture was being realized more than ever, and he stated that governments and private industry have increased considerably their research facilities in recent years.

Mr. Bourne then went on to describe pieces of apparatus developed by C.G.E. in their laboratories, illustrating his descriptions with slides. Most of the apparatus illustrated was of the type used in industry for quick, accurate measurement of elements such as thickness of materials, vibration of machines, r.p.m. of machines, time intervals, color analysis, etc. The vibration indicators measure electrically the frequency and amplitude of vibration of a machine. Electric thickness gauges developed by his company measure down to .00005 in. Tachometers of the photoelectric type can record up to 60,000 r.p.m. Color analysers measure accurately the color intensity of textiles and have been used in grading such foods as tomatoes. Mr. Bourne discussed also the spectrometer, which determines the composition of any compound which can be gasified.

Concluding, Mr. Bourne showed slides illustrating how the research programme of his company began in a small building and has steadily developed into a large modern laboratory.

H. R. Fee thanked the speaker on behalf of the Branch.

Junior Section

F. H. Duffy, Jr.E.I.C.
Secretary-Treasurer

A meeting of the Junior Section, Saguenay Branch of the Engineering Institute of Canada was held at the Saguenay Inn at 8.15 p.m., Wednesday, April 21, 1948. W. A. Dayton, of the Aluminum Company of Canada, Limited, addressed the meeting on the subject of **The Course of Copper and Gold**.

Mr. Dayton spent some time in the Noranda District and gave a very interesting address on the production of copper and gold from the mining of the ore, through the smelter processes, to the finished product. He described the district around Noranda and the locations of the various mines, and provided sketches to show these locations. He also traced the history of the development of the mines, with the various ups and downs due to market conditions and other causes, and provided very interesting descriptions of such items as the method of reclaiming pillars in the open stopes, ventilating of the stopes, and the types of ore obtained.

The speaker then outlined the process used at the smelter to obtain the metals from the ore and gave a general description of the equipment used. Reference was made to the laboratory tests which are used to determine the grade of the ore and finally a brief mention of the methods of refining the ore was made.

A discussion period followed during which the speaker provided answers to the questions presented by those attending the meeting. The speaker was introduced by the Chairman, C. J. Tanner and thanked on behalf of the Section by F. E. Hogg.

This meeting took the form of an informal smoker, and at the close of the discussion period refreshments were served.

Saint John

J. H. C. MacLure, M.E.I.C.
Secretary-Treasurer

A. R. Bonnell, M.E.I.C.
Branch News Editor

The regular monthly dinner meeting of the Saint John Branch of the Institute was held Wednesday, March 24, in the Admiral Beatty Hotel with the chairman T. C. MacNabb presiding.

Austin Wright, who had been in Saint John advising the steering committee of the Maritime Professional Meeting, spoke briefly on the activities of Headquarters in promoting the status of the engineering profession.

The films " Clear Waters " and " Story of F.M. " were shown. The former depicts modern trends in sewage disposal to combat pollution of water in urban areas and at pleasure resorts. The latter shows the advantages held by frequency modulation in radio reception over the older method of broadcasting.

St. Maurice Valley

R. E. Kirkpatrick, M.E.I.C.
Secretary-Treasurer

One hundred engineers, members of the Institute, met at the Cascade Inn on April 16 to hear the results of the election of officers for the coming Branch year, the reports from the Executive, and the lecture of Dr. J. T. Rettaliata on the subject of **Gas Turbines and Jet Propulsion.**

The retiring chairman, E. T. Buchanan, in reviewing the activities of the past year, mentioned that the Branch had held six meetings, its membership had increased and Branch affairs were generally in excellent condition. Junior Sections in Three Rivers and Shawinigan Falls had been formed during the year. By-laws have been re-written and will shortly be submitted to the Branch for approval. R. E. Kirkpatrick, the Secretary-Treasurer, reported on the Branch's finances.

It was then reported that officers for the coming year are: chairman, M. Eaton, vice-chairman, S. E. Williams, committee men, J. M. Jopp (La Tuque), A. S. Holder (Shawinigan Falls), Nesbit Gray (Three Rivers). These members, with J. C. Beique and E. A. Delisle who are completing their second year of office, will compose the Executive for the coming year. G. W. Ince accepted the appointment of Secretary-Treasurer for the coming year.

Dr. J. T. Rettaliata was then introduced by Professor H. O. Keay, as director of mechanical engineering at the Illinois Institute of Technology.

His address, which was thoroughly illustrated by slides, traced from earliest times the history of the present gas turbines, which are now being used in central power stations, locomotive equipment, aeroplanes, etc. In explaining the cycle which was used he showed how air was drawn in, compressed, and passed to a combustion chamber. There a fuel such as kerosene was burned in it, and the large volume of hot gases of combustion were passed through a turbine and exhausted to atmosphere. As the turbine can produce more power than is required by the compressor there is power available for driving other equipment such as electric generators; alternately, if all the energy of the exhaust gases is not absorbed by the turbine these gases can be made to produce a " thrust " by deflecting them out through a nozzle, as is done in the engines powering jet propelled aeroplanes.

Dr. Rettaliata discussed the engines installed in various aircraft during and since the war, and pointed out that planes are now being designed for speeds of the order of 1300 to 1500 miles per hour. In the question period after the address, he was deluged by questions covering every aspect of the subject, from the types of metals required to withstand the very high temperatures encountered, to the type of fuels which had been used and might be used in future engines.

The speaker was thanked by J. W. Whyte.

Saskatchewan

D. W. Houston, M.E.I.C.
Secretary-Treasurer

R. Bingo-Wo, M.E.I.C.
Branch News Editor

The regular monthly meeting of the Saskatchewan Branch was held on Friday, March 19, in the Kitchener Hotel.

E. K. Phillips, past chairman of the Branch, introduced the guest speaker, W. R. Young, of the British American Oil Company, Limited, who spoke on **Expedition Muskox.**

The purpose of the exercise was primarily to test manpower and equipment in an overland route during the winter months, both for civilian and military purposes. The scheme was a combined effort of all arms, the Army, Navy and Airforce of Canada, with some American personnel and equipment participating. The base of operations was Fort Churchill, Man., and the scheme called for a route overland through Canada's north via Grand Prairie, Alta., to Edmonton. The expedition was supplied, on the move, by DC3 aircraft from which food and other material were dropped by parachute. Norsemen aircraft were to be used for emergency evacuation. Two B24 bombers were also held in reserve at Winnipeg and Calgary should a mass evacuation become necessary. These were never used.

The vehicles used on the operation were equipped with Cadillac V8 engines. They were fully rubber tracked with treads 3 feet wide running on steel sprockets. The vehicles weighed 11,000 lb. Four men were assigned to each vehicle which was a self-sustaining unit. Radio facilities were also carried and communication could be carried on between the vehicles, with the base or with aircraft.

Mr. Young continued his interesting address with a detailed description of the entire trip, the rations, clothing, and personal supplies of the personnel. He gave a clear picture of the difficulties encountered, the type of country traversed, and many other incidents over the route. He described the value of the data collected and how these could be used in designing equipment and material for use in the north under winter conditions, for military and civilian purposes.

The interest of the audience was shown by the large number of questions which the speaker was asked to answer.

M. J. Spratt expressed the appreciation of the group for Mr. Young's talk of the evening.

Toronto

R. A. Muller, M.E.I.C.
Secretary-Treasurer

D. D. Whitson, M.E.I.C.
Branch News Editor

On Thursday, February 26, 1948 at the U. of T. Botany Lecture Room, 100 members of the Toronto Branch heard a very interesting paper on **Load Testing Applied to Airport Runway Design** by Dr. Norman W. McLeod of the Dept. of Asphalt Technology of the Imperial Oil Ltd.

Loads of between 50 and 100 tons were applied at numerous points on operating airport runways all across Canada. The loading apparatus therefore had to be mobile, and the method arrived at was simple but ingenious—a tractor-drawn haulage float loaded with available material, such as pig-iron, an army tank, cement bags, etc., was moved over a succession of pre-selected spots. On the spot was cemented a round steel plate covered with a succession of graduated smaller diameter plates to remove the effect of bending in the plate. Then a jack was placed on the plates and operated against the underside of the loaded float above it. Levels were taken by surveying instruments set up to one side. In all cases, the spots were chosen far enough apart so that no "effect" could spread from one spot to another. In all cases the plates were placed at the level of the particular sub-grade, base-course or surface being tested. This involved a great deal of careful excavation and painstaking replacement afterwards, a large expenditure of money, and praiseworthy co-operation by airport authorities.

The results were worked into a formula with which an experienced man can predict bearing capacities with satisfactory accuracy after determining certain data through the use of simple equipment, and can then use a chart to find the proper thickness of base-course and surfacing for highway or runway construction to meet any required loading.

The investigation proved that many existing runways have been constructed with thickness of material far in excess of what was needed, and that some fairly new American runways still are constructed in a wasteful or unnecessarily heavy manner.

Victoria

S. H. Frame, M.E.I.C.
Secretary-Treasurer

Jas. H. Blake, M.E.I.C.
Branch News Editor

J. Ralph Johnston, who is assistant forester in charge of Forest Protection Research and Planning for the British Columbia government, delivered a most interesting address on **Fire Weather and Forecasting in B.C.** to the members of the Victoria Branch of the E.I.C. at Prince Robert House, Victoria, on Friday, March 19. Members of the Canadian Society of Forest Engineers and other allied organizations were present.

Mr. Johnston told of the vital importance of the recognition of the approach of fire weather; he cited the problems encountered in forecasting it and the methods adopted in co-relating the various factors involved. The address was illustrated by numerous graphic charts showing methods of keeping track of temperature, rainfall, humidity of ground cover, advance or retrogression of fire hazard, etc.

Reports from the Dominion Meteorological Stations, the R.A.F., and the B.C. Forest Service weather stations, when co-ordinated, provides every forest district with a daily, or more frequent, report of what is expected in fire weather within the next few hours. This advice is forwarded through the B.C. Forest Service radio network of around 300 stations so that all interested personnel are kept in close touch at all times.

Mr. Johnston showed a very fine coloured film of a trip through Tweedsmuir Park, illustrating the diversity of flowers, game, fish and scenery found in this magnificent playground in the heart of British Columbia. This film was prepared and supplied by the Publicity and Parks Divisions of the B.C. Forest Service.

Vancouver Student Section

Alan M. Eyre, Jr.E.I.C.
Secretary-Treasurer

Stuart Lefeaux, Jr.E.I.C.
Branch News Editor

STUDENTS' NIGHT

Students' Night is an annual affair at which student members present papers before the Vancouver Branch of the Institute. This year John McPhail spoke on **Three Methods of Road Surfacing,** Robin Fjarlie discussed **An Oceanographic Model of the Alberni Canal,** and Don Jamieson described **The Erection of the Pine River Bridge.**

Each student entered in the preliminaries was granted one years' free membership in the Institute by the Vancouver Branch. The wide variety of topics that were presented at these talks proved very interesting to the student audiences and the experience gained by the competing speakers was undoubtedly worthwhile.

FILMS

The following films drew good audiences: "From Rapids to Electricity"—the building of a hydro-electric plant by Shawinigan; "Highways Ahead"—highway development in the United States; "River of Paper"—the making of paper at Powell River, B.C.

ANNUAL SPRING BANQUET

The new executive was installed at the annual spring banquet on March 5. Next year's executive is as follows: honorary president, Professor S. H. de Jong; president, John McPhail; secretary-treasurer, Dick Cook; film representative, Don Jamieson; advertising representative, Ivan Sorenson. The vice-president and recording secretary are to be elected in the fall.

The highlight of the evening was the address of the guest speaker, Sir Charles Wright, wartime Director of Scientific Research for the British Admiralty, who described some of the measures employed in combatting the enemy in the Battle of the Atlantic. He recalled that the Germans were baffled for a long time by the centimeter radar developed by the allies, and that the allies had developed a counter-weapon for rendering ineffective the acoustic torpedo before the Germans put the torpedo into use and were able to employ effective counter methods one week after the acoustic weapon was introduced.

Sir Charles had many interesting and entertaining experiences to relate and provided an extremely profitable and enjoyable evening for the students and guests.

First Aid Course

Noon hour first aid lectures were conducted on the campus by instructors of the St. John Ambulance Association and two nights of practical work and an exam were completed at the Association headquarters. The course proved to be interesting and very successful. Students who wish to go further may take three nights additional work and qualify for an Industrial First Aid Certificate.

Speaker

Mr. T. V. Berry, Councillor for the Vancouver Branch, spoke to the students on **The Engineer in Business** on March 25.

President Grant's Visit

President Grant visited the University in February in the course of his tour of the universities. He was welcomed by more than 600 student engineers. The enthusiasm with which Colonel Grant was applauded gave credit to him as an effective speaker and as a very able and sincere representative of the Engineering Institute of Canada.

Winnipeg

G. W. Moule, M.E.I.C.
Secretary-Treasurer

R. H. Tivy, Jr.E.I.C.
Branch News Editor

Dr. A. E. Berry, director, Sanitary Engineering Division, Department of Health, Province of Ontario, addressed some 73 Winnipeg engineers at a joint meeting of the Winnipeg Branch of the Institute and the Association of Professional Engineers of Manitoba, March 18.

The speaker touched on the various aspects of sanitary engineering, such as waterworks, sewerage, industrial waste and stream pollution, and municipal engineering. Dr. Berry showed lantern slides of the different types of water and sewage plants. He also showed a second set in full color which were taken to show the extent of the pollution of boundary waters between Ontario and the United States.

He mentioned that many small centres in Ontario were now undertaking waterworks installations and in some cases sewers. In the field of water treatment he mentioned in particular the experiment now in progress at the city of Brantford where fluorine is being tried in the water for its effect on the prevention of dental decay. A definite improvement in the teeth of school children has resulted in the two years in which the experiment has been carried out although it was emphasized that the results could not be considered conclusive until the experiment has run its full seven years.

The visitor inspected the newly opened City of Winnipeg refuse incineration plant during his stay in the city and commented favourably upon it. He also said that the Winnipeg sewage disposal plant is still among the up-to-date ones in the Dominion in spite of its having been completed over ten years ago.

Some discussion followed the formal address when Dr. Berry undertook to answer questions put to him from the floor. He was thanked at the end of the meeting by W. D. Hurst, city engineer.

A feature of this meeting was the presentation of Winnipeg Branch prizes to three students from the University of Manitoba. These prizes are awarded annually for the best summer theses and the winners were as follows: P. J. Harris, civil engineering, introduced by Prof. A. E. Macdonald; L. W. Locke, electrical engineering, introduced by Dean Fetherstonhaugh; R. A. Ducker, mechanical engineering, introduced by Prof. N. M. Hall.

Refreshments were served at the close of the meeting, after H. McLeod, branch chairman, addressed a few appropriate and well chosen words to the prizewinners.

❖ ❖ ❖

The regular monthly meeting of the branch was held on April 8 with 53 members and guests in attendance. D. M. Stephens, Deputy Minister of Mines and Natural Resources, Province of Manitoba, presented a paper on **Some Problems in the Development and Administration of Natural Resources.**

If natural resources must be under public administration for their most economical utilization, then well-informed public opinion is necessary and planning must be in terms of decades or centuries, and not for the immediate future. The future economy of Canada relies on the north country, the resources of which are minerals, water power, forests, wild life and fish, and a particular kind of people.

The phases in the development of the mining industry with which a local government are concerned are exploration, transportation, taxation and community planning. Mr. Stephens dealt with each one of these with particular reference to the province of Manitoba. He also discussed forestry in Manitoba, whose adverse factors are low precipitation, short growing season, thin soils, remoteness, large area required to produce the necessary volume of timber, fire hazard, high cost of protection and a low direct return.

Mr. Stephens made interesting observations on several other matters of provincial administration. Beaver and muskrat raising has developed into a considerable industry in Manitoba, and it is expected that the number of pelts obtained this year will be more than double the yield of five years ago, and in ten years time it will have increased two or three times over this year again. In the speaker's opinion more attention should be paid to improving the economic means of the Indians, since without them much of the pioneering and initial development of our natural resources would not have been possible. Manitoba's settled areas are mostly at the bottom of the watersheds and therefore are not advantageously situated with regard to water power. Some thought must also be given to the low cost transportation of fuel from the Rocky Mountain Region. Mr. Stephens stated that co-ordination of the utilization of all resources is necessary to achieve a balanced economy.

The speaker was introduced by M. A. Lyons, and was thanked by C. V. Antenbring.

H. H. G. Moody, guest speaker at the March 12 meeting of the Electrical Section. At his right is Mrs. Fetherstonhaugh; at his left, M. D. Young (hidden) and Mrs. Moody.

Electrical Section

D. C. Bryden, M.E.I.C.
News Editor

Meetings held by the Electrical Section in February and March were as follows:

On February 12, M. B. Mallett, chief engineer, English Electric Company, spoke on **Progress in Transformer Design.** Mr. Mallett is well known for his advanced ideas on transformer design and although his talk was of a general nature, his presentation of ideas stimulated considerable discussion.

On March 4, W. D. Garbutt, technical sales manager, Hackbridge & Hewittic Electric Co. of Canada, outlined **Sixty Years of Rectifier Development.** Mr. Garbutt is very well informed on his subject, and he brought considerable information to the meeting on the manufacture and design of glass bulb rectifiers. His talk was supplemented by a film showing the details of manufacture of this equipment.

The annual Dinner and Dance was held at the Marlborough Hotel, on March 12. M. D. Young presided as Chairman. W. Scrimes opened the formal part of the programme by introducing the guest speaker H. H. G. Moody, architect, who gave a short address on **Modern Trends in Architecture.** The speaker was thanked by J. Greenlaw. A. Thompson proposed a toast to the ladies, which was ably responded to by Mrs. C. D. Osterland.

After the formal part of the meeting was completed, Harold Green and his orchestra provided dance music. The committee in charge of arrangements deserves considerable credit for an excellent programme enjoyed by well over 100 people.

BOOK REVIEW

CHEMICAL PROCESS PRINCIPLES PART III—KINETICS AND CATALYSIS*

O. A. Hougen and K. M. Watson. N.Y., Wiley; London, Chapman and Hall, 1947. 348p., illus., 8¾ x 6 in., cloth, $4.50.

Reviewed by W. H. Gauvin†

Among the recent technical publications, Part III of Hougen and Watson's trilogy on Chemical Process Principles constitutes perhaps the most important addition to a chemical engineer's reference library.

Primarily concerned with the kinetics of industrial reactions and their applications to economic and design problems, this book should be of particular interest to graduate students, technologists, practising engineers and research workers. Except for a few illustrative examples in Chapters XVIII and XIX, the general level of this book is too high for undergraduate work in Chemical Engineering. We should not conclude from this, however, that it cannot be read without considerable effort or extensive preparation: a good grasp of the fundamentals of Thermodynamics and some knowledge of theorical Chemical Kinetics and Kinetic Theory are the only essential prerequisites. Although a few sections undoubtedly require close attention—and those who make the necessary effort will be amply rewarded—the bulk of the treatment exhibits the same clarity and simplicity of exposition which characterize the authors' earlier works.

* *Part II—Thermodynamics—was reviewed in the April issue of The Journal. —Ed.*

† *Associate Professor, Chemical Engineering, McGill University, Montreal.*

The book begins (Chapter XVIII) with a brief discussion of the applicability of Eyring's Theory of Absolute Reaction Rates, in its present stage of development, to process design. The remaining sections of this Chapter deal with the quantitative treatment of design problems involved in homogeneous systems: reactions of simple and complex order, interpretation of laboratory results and pilot-plant data, graphical reactor design. The problems of catalytic reactions—which account for roughly half of the book—are covered in Chapter XIX, which deals mainly with the development of the reaction rate equations, in Chapter XX, on mass and heat transfer in catalytic beds, and in Chapter XXI, on catalytic reactor design. In this last chapter, incidentally, will be found an excellent discussion of the difficult problem of diffusional and temperature gradients between fluid and catalyst. Chapter XXII deals with the treatment of uncatalyzed heterogeneous reactions.

The numerous illustrative examples discussed are no longer drawn exclusively from reactions in the gaseous state—although these predominate in a large measure. Owing to their clarity and extensive treatment, they constitute perhaps the most interesting feature of the whole book. It should be pointed out that this text is essentially concerned with the practical aspects of applied kinetics, and, although written in accordance with the modern theories of absolute reaction rates and surface chemistry, the expert will undoubtedly be disappointed in the theoretical aspects of the development: he will probably deplore the apparent omission of a statistical treatment of reaction rates and of the kinetics of photochemical reactions, the sketchy attention given to chain reactions and reactions in solutions. In view of the uncertainties and complexity of Eyring's method and the extreme difficulty of a quantitative approach to these topics, their omission is quite understandable.

There is little to criticize in this book, except possibly the fact that no answers are given to the problems proposed at the end of each chapter. The book is well bound, and the table headings, figures and diagrams are clear and well presented. Few typographical errors were observed. The quality of the paper is, however, mediocre.

HEATING AND VENTILATING'S ENGINEERING DATABOOK:

Clifford Strock. N.Y., Industrial Press, 1948. 549 pp., illus., 11¼ x 8½ in., fabrikoid, $7.00.

This databook deals with heat and moisture in air; fuels and combustion; piping; air handling and ventilation; heating and heat transmission; cooling and air conditioning; motors and drives; contract law; and mathematical and drafting room standards.

It is intended for use by heating, ventilating and air conditioning engineers, contractors, architects, plant engineers, and engineering students. Its purpose is practical, and emphasis is placed on the data needed in actual design with a minimum amount of text.

Information is included on such subjects as the heat pump, electrothermal storage, snow melting, heating with diesel engines, solar water heating, and radiant (panel) heating. There is a section devoted to the law of contracts, and treats of the validity of contracts, subcontracting, guarantees, distinction between employee and contractor, patent infringement, real estate law, relations with municipalities, "cost plus" contracts, and other legal data of interest to the heating and ventilating engineer. M.B.

ABSTRACTS

AIRPORT RUNWAY EVALUATION IN CANADA:

Norman W. McLeod. Washington, U.S. Highway Research Board, 1947. 133 pp., illus., 9¾ x 6¾ in., paper, $2.00. (U.S. Highway Research Board Research Report No. 4B). Ottawa, Dept. of Transport, 1947. illus., 11 x 8 in., paper.

This paper outlines the results of an investigation of the runways at a number of Canada's principal airports, which was conducted by the Department of Transport during 1945 and 1946. The programme of testing included: a pedological soil survey and the preparation of a pedological soil map for each airport site; field moisture and density tests in place on the base course and on each 6 inch layer of the upper 18 to 24 inches of the subgrade; securing large disturbed samples of base course and of each layer of subgrade for physical and compaction tests in the laboratory, and undisturbed samples for CBR (both field and soaked condition), triaxial compression, shear, and consolidation tests; cone bearing and Housel penetrometer tests on layers of subgrade in the field; plate bearing tests (repetitive) on subgrade, base course, and surface, to determine the load supporting values of the runways, and to obtain information required for the design of either rigid or flexible pavements.

DESIGN OF LARGE VERTICAL-SHAFT WATER-TURBINE-DRIVEN A.C. GENERATORS

E. M. Johnson and C. P. Holder. London, Institution of Electrical Engineers, December 1947. 11 pp., illus.

Abstracted by
Hubert R. Sills, M.E.I.C.*

This paper will probably be of interest to Canadian users and designers of large vertical hydraulic turbine driven generators. In general the design practice outlined by the British authors differs little from that of Canadian or United States designers. The problems and possible solutions differ in emphasis. For instance the author's preference for the true or partial umbrella type machine appears to be influenced more by their conventional setting in their masonry ventilating housings than by reason of the coupling elevation and machine and turbine clearances.

The paper deals with vertical-shaft a.c. generators of large diameter in the speed range 50-500 r.p.m. The influence of turbine and hydraulic characteristics is first considered. This is followed by a discussion of factors which determine the generator dimensions. A brief summary of the considerations affecting rotor design leads to a detailed review of different types of rotor and pole construction and their range of application.

An important feature of this type of machine is the thrust bearing and its support, which carry very heavy loads. Alternative types of bearing and bearing arrangement are therefore examined and their merits compared. Methods of bearing cooling are briefly considered.

In a Section on the special arrangement of air coolers required for this class of generator, reference is made to the use of generator ventilating air for station heating. This is followed by a Section on the arrangement and operation of brakes and jacks.

The stator frame, core and windings; the rotor windings; the exciters and governor generator are briefly considered, and the paper concludes with a short review of special electrical characteristics.

* *Senior Engineer, Engineering Section, Motor and Generator Division, Canadian General Electric Company, Peterborough, Ont.*

LIBRARY REGULATIONS

Hours

	Oct-May	June-Sept
Mon-Fri	9–6	9–5
Thurs (Oct-Mar)	9–8	9–5
Sat (closed Jy-Aug)	9–12	9–12

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Allen's Dictionary of Abbreviations and Symbols:
E. F. Allen. N.Y., Coward-McCann, 1946. 189 pp., cloth.

Asphalt Handbook:
Asphalt Institute, N.Y., 1947. 304 pp., illus., cloth. (Asphalt Institute Construction Series No. 81).

British International Plastics Annual, 1947:
Croome Hill International Ltd., London, 1947. 459 pp., illus., cloth.

Centrifugal and Axial Flow Pumps; Theory, Design, and Applications:
A. J. Stepanoff. N.Y., Wiley, 1948. 428 pp., illus., cloth.

Chamber's Technical Dictionary, rev. ed.:
C. F. Tweney and L. E. C. Hughes. N.Y., Macmillan, 1944. 975 pp., illus., cloth.

Construction Estimates and Costs, 2nd ed.:
H. E. Pulver. N.Y., McGraw-Hill, 1947. 653 pp., illus., cloth.

Construction Specifications:
Asphalt Institute, N.Y., 1947. 303 pp., illus., cloth. (Asphalt Institute Construction Series No. 80).

Diary and Sundry Observations of Thomas Alva Edison:
Dagobert D. Runes, ed. N.Y., Philosophical Library, 1948. 247 pp., illus., cloth.

Dwelling House Construction:
Albert G. H. Dietz. N.Y., Van Nostrand, 1947. 371 pp., illus., cloth.

Frequency Modulation, Volume I:
Alfred N. Goldsmith, etc., ed. Princeton, N.J., Radio Corporation of America, 1948. 515 pp., illus., cloth.

Hot-Dip Galvanizing Practice, 2nd ed.:
William H. Spowers, Jr. Cleveland, Penton, 1947. 188 pp., illus., cloth.

How to Organize and Manage a Small Business:
Nelms Black. Norman, Okla., University of Oklahoma Press, 1946. 367 pp., illus., cloth.

Literature Search on the Solvent Extraction of Oleaginous Materials, with Additional Reference to By-products from the Solvent Extraction of Peanuts:
B. H. Weil, Marjorie Bolen, Nathan Sugarman. Atlanta, Ga., Georgia School of Technology, 1948. 190 pp., fabrikoid. (Georgia School of Technology State Engineering Experiment Station Special Report No. 26).

Manual of Design for Arc Welded Steel Structures:
LaMotte Grover. N.Y., Air Reduction Sales Co., 1947. 281 pp., illus., fabrikoid.

Masonry Simplified:

APRIL JOURNALS NEEDED

Owing to a heavy demand for copies of the April, 1948, issue of the *Journal*, the supply at Headquarters has been exhausted.

If you do not file your copy, will you please send it to:—

The Library,
The Engineering Institute of Canada,
2050 Mansfield Street,
Montreal.

Additional copies will then be available at Headquarters for future reference.

Philip Sporn and A. C. Monteith. N.Y., American Institute of Electrical Engineers, 1947.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARD FOR PICKS, BEATER PICKS AND MATTOCKS. BS 1421:1947:

London, British Standards Institution, 1947. 2/..

This new standard prescribes the detail dimensions of eight implements, comprising navvy picks with chisel and point and double point ends; beater picks with point and fishtail, and point and tee ends; mattocks with point and mattock, cutter and mattock, and chisel and axe ends. For the first time, the eyes of such implements are standardized. In addition, the standard deals with the quality of steel, tolerances on dimensions, hardness and testing.

CONFERENCE GUIDE TO BASIC MANAGEMENT TRAINING; A PROGRAM OF DIRECTED CONFERENCE SUGGESTIONS FOR THE CONFERENCE LEADER:

Arthur Hotchkiss. N.Y., National Foremen's Institute, 1947. 196p., illus., 10½ x 8 in., cloth, $5.50.

This manual is designed as a guide to the direction of conferences on the subject of management and supervisory training. It aims at the solution of basic problems which the supervisor meets in his daily routine. The author stresses that it is essential for supervisors to be informed and stimulated regarding their responsibilities, and further, to actually practice their knowledge. The programme of conferences suggested is an outline and an organization of subjects to be discussed, rather than a series of lectures. It is based upon practical industrial experience as to need, content, method, and time required for the completion of each conference. Thoroughly practical, it gives detailed descriptions of each step to be taken in conducting the meetings. Charts and diagrams are used to clarify points of interest; the amount of time necessary for each activity is allotted; the chairman is told what to say, how to say it, and by what methods to illustrate his points.

DESCRIPTIVE GEOMETRY FOR ARCHITECTS AND BUILDERS:

Leslie A. Lee and R. Fraser Reekie. London, Arnold; Toronto, Longmans, 1945. 224 p., illus., 9 x 5½ in., cloth, $2.25.

The aim of this book is to provide a sound knowledge of the principles of geometry and geometrical drawing, and their various practical applications, for those in the building industry. The author has endeavoured to cover fully the work on which are based the examination questions of the City and Guilds, London (Trades), the Union of Lancashire and Cheshire Institutes, and the Union of Educational Institutes, and examples of their examination questions have been included in the book.

ELECTRONIC THEORY AND CHEMICAL REACTIONS; AN ELEMENTARY TREATMENT:

R. W. Stott. London, Toronto, Longmans, 1943. 112p., illus., 7½ x 5 in., cloth, $1.80.

This book is an elementary introduction to the theory of chemical reactions. Numerous hypotheses for the mechanisms of many reactions based on the Electronic Theory have been tested, and it is the object of this book to present some of the less complicated of these hypotheses in such a way that a beginner may be able to understand them.

ONE TWO THREE. . . INFINITY; FACTS AND SPECULATIONS OF SCIENCE:

George Gamow. N.Y., Viking; Toronto, Macmillan, 1947. 340p., illus., 9 x 6 in., cloth, $5.50.

This book is an attempt to collect interesting facts and theories of modern science in such a way as to give the layman reader a general picture of the universe in its microscopic and macroscopic manifestations, as it presents itself to the eye of the scientist today. There is no attempt to tell the whole story, but the subjects have been selected to survey briefly the entire field of basic scientific knowledge.

PLANNING; SUGGESTIONS FOR CANADIAN COMMUNITIES:

Field Service Department of the Canadian Chamber of Commerce, Montreal, 1947. 64p., illus., 11 x 8¼ in., paper, $1.50.

This book presents an overall view of town planning as it is practised in Canada under existing legislation. The author's purpose is to stimulate and assist the town planning movement by demonstrating the practical possibility of controlling urban development. It is hoped that it will encourage groups and organizations, particularly students, to make surveys of the conditions under which they live and work, and to become conscious of the different aspects of their environment. A bibliography is appended to provide further aid.

REINFORCED CONCRETE DESIGN, 2nd ed.:

G. P. Manning. London, Toronto, Longmans, 1945. 498p., illus., 9 x 5½ in., cloth, $7.00.

This work aims at establishing methods of design suitable for use in a Civil Engineer's office, and is based on the method which the author has found in use and which he has himself used in actual designs. The first part treats of the cross-sections of members and the stresses produced. The second part deals with the questions of members as a whole, and the third part is a discussion of complete structures. Although much of the book has been rewritten in the second edition, most of the revisions are arithmetical.

REPORT OF THE THIRD SESSION OF THE AERODROMES, AIR ROUTES AND GROUND AIDS DIVISION OF THE INTERNATIONAL CIVIL AVIATION ORGANIZATION:

International Civil Aviation Organization, Montreal, 1947. 138p., illus., 14 x 8⅝ in., paper. (DOC 4809, AGA/558).

This report deals with the reclassification and rearrangement of Aerodrome, Air Route and Ground Aid definitions, standards and recommended practices; examination of suggestions for altering existing practice; drafting of new sections; review of the division's work and selection of items to be considered at the next meeting.

REPORT OF "PANEL" OR "RADIANT" HEATED TEST BUILDINGS:

C. D. Niven and A. D. Kent. Ottawa National Reserach Council, 1947. 45p., illus., 11 x 8¼ in., paper, 25c. (NRC No. 1639).

The heat supplied to a floor heated by means of pipes in an air space underneath was measured and compared with the calculated heat loss from the room through the walls, windows and ceiling plus the calculated heat required to warm the ventilation air. The heat supplied to a concrete floor slab placed in contact with the ground was measured and the heat lost to ground and edges deduced by subtracting the calculated heat loss to the room. The two systems of floor heating were compared and a diagram showing isotherms indicated that a floor slab should be insulated on the underside for about four feet back from the edge.

STEEL CASTINGS:

Eric N. Simons. N.Y., Chemical Publishing Co., 1947. 208p., illus., 7½ x 5 in., cloth, $5.00.

In this book the author has attempted to bring together all the widely scattered information on steel castings. His aim is to clarify and simplify, to condense and compress, and to omit excessive detail. The book surveys the subject from raw material to finished product, and includes such aspects of it as melting processes, patterns, moulds and cores, centrifugal casting of steel, heat-treatment, machining. It is intended for designers, engineers, buyers, salesmen, lecturers, and students.

The following notes on new books appear here through the courtesy of The Engineering Societies Library of New York, and may be consulted at the Institute Library.

GAS TURBINES AND JET PROPULSION FOR AIRCRAFT.

G. G. Smith. 4th ed. Aircraft Books, New York, 1946. 256 pp., illus., diagrs., charts, tables, 8¾ x 5½ in. cloth, 12s.6d. ($5.00 in U.S.).

The principles of jet propulsion and the history of its development precede the chapters dealing with gas turbine components and construction systems. British, American, and German gas turbine types are described, and testing and maintenance procedures are dealt with. A discussion of jets versus airscrews is included, and various special types of aircraft are described as well as guided missiles and flying bombs. Separate chapters consider the metallurgical problems connected with gas turbine construction, and present extracts of several papers dealing with the prospects of turbine unit propulsion.

HEATING AND VENTILATING BUYERS' DIRECTORY, 1948 EDITION. Edited by C. Strock.

Industrial Press, 148 Lafayette St., New York; 228 No. La Salle St., Chicago, Ill. 320 pp., illus., 8 x 5½ in., paper, $1.00.

This book covers the fields of air conditioning, piping, heating, refrigeration, ventilation and air sanitation. It is primarily a classified, product directory, listing the sources of equipment, supplies and services. A trade name section includes both current and absolete terms with the name of the manufacturer. Street addresses are given in the alphabetical list of manufacturers.

I. E. S. LIGHTING HANDBOOK, the Standard Lighting Guide.

Illuminating Engineering Society, 51 Madison Ave., New York, 1947. paged in sections, illus., diagrs., charts, tables, 9 x 6 in., cloth, $8.00.

In simple terms and highly condensed style, this book presents the accumulated knowledge of the past forty-one years of lighting progress, evaluated and interpreted by specialists. Both the theoretical aspects and practical applications are considered. Many illustrations and a detailed index aid in the use of the volume. Data on many types of commercially available equipment are included. Classified references to the original literature are grouped at the end of each section.

LITERATURE SEARCH ON THE PRESERVATION OF FOODS BY FREEZING, First Supplement, January 1946-July 1947. (Special Report No. 25.)

B. Anderson and B. H. Weil. Georgia School of Technology, State Engineering Experiment Station, Atlanta, Ga., 1948. 670 pp., 8½ x 5½ in., paper, $3.00.

Some 1300 abstracts of articles and digests of patents are contained in this supplement to the original bibliography issued as Special Report No. 23. In addition to material appearing in 1946-47 on the subjects covered in the earlier list, this issue includes references on the freezing of milk, eggs and other dairy products, previously omitted. The numbering of the items is continued from the earlier publication.

PLANNING FACTORY MAINTENANCE. ("Mechanical World" Monographs, No. 41.)

F. D. Denner. Emmott & Co., Ltd., 31 King St. West and 21 Bedford St., Strand, London, W.C.2, 1947. 29 pp., tables, 6½ x 4 in., paper, 1s.6d.

This small pamphlet presents practical schedules and incentives for the effective maintenance of factory equipment and the efficient continuance of production.

POWER SYSTEM STABILITY. Volume I, Elements of Stability Calculations.

E. W. Kimbark. John Wiley & Sons, New York; Chapman & Hall, London, 1948. 355 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, $6.00.

This first volume of a projected three-volume work covers the elements of the stability problem, the principal factors affecting stability, the simplified methods of making stability calculations, and the practical application of these methods to actual power systems. Information is given on a-c calculating boards (network analyzers), and curves are included which largely eliminate the need for computation of swing curves of two-machine systems. Transient stability is stressed throughout.

PRACTICAL EVALUATION OF RAILROAD MOTIVE POWER:

P. W. Kiefer, published and distributed by Steam Locomotive Research Institute, Inc., Simmons-Boardman, 30 Church St., New York, June 1947. 65 pp., illus., diagrs., charts, tables, 8¾ x 5¼ in., cloth, $2.00.

Backed by experience with steam and Diesel-electric locomotives used in the same service, the author effectively compares, from several fundamental aspects, the service value of these important types. Availability for service, cost, work capacity, and performance efficiency are considered on a basis of factual data, and the derived conclusions are given. A brief note on the gas-turbine locomotive is included.

RADIO AMATEUR'S HANDBOOK, Standard Manual of Amateur Radio Communication, 25th ed.

American Radio Relay League, West Hartford, Conn., 1948. 608 pp., illus., diagrs., charts, tables, 9½ x 6½ in., paper, $2.00; $2.50 foreign.

This annual publication covering the theory, principles and design of short-wave radio has been revised as usual and rearranged for more effective use. New chapters have been added on ultra-high-frequency, microwaves, interference, emergency operation, and assembling a station. The practical value of the book is indicated by the material on general workshop operations and the detailed instructions for the building of various types of equipment. Vacuum-tube characteristics are tabulated as usual, and there is a catalog of products of manufacturers serving the field.

RECORDS AND RESEARCH IN ENGINEERING AND INDUSTRIAL SCIENCE:

J. E. Holmstrom, 2 ed. rev. & enl. Chapman & Hall, Ltd., London, 1947. 366 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, 21s.

Of interest to those who use technical knowledge in their work, this volume shows how to obtain information concerning the work the rest of the world is doing in any field. It shows how data may be collected from technical sources, how to integrate facts and ideas, and how to transmit these facts and ideas to those who need them. Other topics discussed are the nature and methods of technical science, the principles of technical translation, and the various organizations, particularly British, that issue publications themselves or abstract the work of others.

STRESS ANALYSIS AND DESIGN OF ELEMENTARY STRUCTURES.

J. H. Cissel. 2 ed. John Wiley & Sons, New York; Chapman & Hall, London, 1948. 419 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $5.00.

Written primarily as a text for non-civil engineers, this book presents fundamental and practical material such as would generally be of value to an engineer in any field. The section on stress analysis remains substantially the same as in the first edition, but the second section has been rewritten and rearranged in accordance with current practice. A new chapter is included on the design of light-gage steel structures, and the specification material has been revised to conform to recent changes.

(A) SURVEY OF THE PRINCIPLES & PRACTICE OF WAVE GUIDES.

L. G. H. Huxley. University Press, Cambridge, England; Macmillan Co., New York, Toronto, 1947. 328 pp., diagrs., charts, tables, 8½ x 5½ in., cloth, $6.00 (in Canada) (21s. in England).

This book is an introductory summary of the recent developments in the application of wave guides. It considers general background material, progressive electromagnetic waves in wave guides, formulas for field components, wave guide impedances and techniques, and cavity resonators. The first six chapters are based on courses given during the war and use an elementary and physical approach. The last chapter provides a mathematical treatment of selected topics for those who prefer a more formal treatment.

SYMPOSIUM ON pH MEASUREMENT, 49th Annual Meeting, American Society for Testing Materials, Buffalo, N.Y., June 24-28, 1946. Technical Publication No. 73.

American Society for Testing Materials, 1916 Race St., Philadelphia, Pa., 1947. 79 pp., diagrs. charts, tables, 9 x 6 in., paper, $1.50; to A.S.T.M. Members, $1.15.

This compilation presents seven papers on the latest theory and practice in colorimetric and potentiometric methods for making pH and closely related measurements. The following topics are covered: historical review, the fundamentals and theoretical basis for pH determinations, recent advances in principal methods and techniques, and applications to particular fields.

SYMPOSIUM ON MEASUREMENT OF ENTRAINED AIR IN CONCRETE.

American Society for Testing Materials, Philadelphia 3, Pa. 96 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, $1.75. To members $1.30. Authorized Reprint from the Proc., Vol. 47, 1947.)

The nine technical papers included in this symposium cover the various methods that have been developed to measure the air entrained in concrete, this quantity of air being subject to variation from a number of influences. There are also a paper giving an analysis of these methods and one on the effect of sampling errors.

TECHNIQUES IN EXPERIMENTAL ELECTRONICS.

C. H. Bachman. John Wiley & Sons, New York; Chapman & Hall, London, 1948. 252 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $3.50.

Of interest to those engaged in production or research in the field, this book is primarily concerned with controlled beams of charged particles in vacua, or at very low pressures. Such topics as methods of applying and using fluorescent materials, cathode coatings, tungsten characteristics, and vacuum glass blowing techniques are discussed. One chapter is devoted to controls. References to recent articles and books are listed at the end of each chapter. Conduction of electricity in gases is not included.

VADE-MECUN (Radiolampen) 2 Parts 1948.

P. H. Brans. Published by P. H. Brans, Limited, Antwerp, Belgium. 198 pp., Supplement, 96 pp., illus., tables, 11½ x 8 in., paper, apply.

This regularly revised manual covers tubes made all over the world. The type of tube, manufacturer, voltage, and base-connection are given. The tubes are classified according to their heater-voltage with a general index arranged by tube type. A list of manufacturers in Europe, America, Africa, Asia and Oceania is included. Ample directions for the use of the tables are provided.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

(The) COOPERAGE HANDBOOK.

F. P. Hankerson. Chemical Publishing Co., Brooklyn, New York, 1947. 182 pp., illus., diagrs., tables, 8¾ x 5½ in., cloth, $3.75.

Following a brief historical introduction, this book describes the present methods of barrel manufacture, the choice of the proper kind of barrel and lining for various purposes, and the handling and storage of barrels. All expert specifications and I.C.C. regulations are included, as well as other general information.

COURSE OF REINFORCED CONCRETE DESIGN.

T. J. Bray. Chapman & Hall, London, England, 1946. 216 pp., plus 25 charts and graphs, diagrs., 10¼ x 6¾ in., cloth, 25s.

Brief consideration is given in the early chapters to concrete materials, mixes, etc., as introduction to the design information which constitutes the main subject matter. Chapters on loads, stresses, reinforcement, and the various basic components of reinforced concrete structures precede the material dealing with specific types of structures such as foundations, walls, tanks, towers, arches, etc. Various special topics, such as concrete roads, and surfaces, bearing pressures, and the characteristics of aggregates are included in the appendix together with a group of charts and graphs for practical design work.

ELEMENTS OF ACOUSTICAL ENGINEERING.

H. F. Olson, 2 ed. D. Van Nostrand Co., Toronto, New York, London, 1947. 539 p., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50.

Presenting the principles and applications of acoustics for the engineer and applied scientist, this volume covers the important new instruments, designs, developments, and present day practices of acoustical engineering. A large number of useful formulae, tables, and graphs are included together with a consideration of acoustical elements, acoustical radiating system, mechanical vibrating systems, transducers, architectural acoustics, and the characteristics of speech, music and hearing. This second edition has been brought up to date and amplified. Two new chapters on underwater sound and super- and ultrasonics have been added.

ELEMENTS OF AIRCRAFT PROPELLER DESIGN.

F. T. Meacock. E. & F. N. Spon, Ltd., London, S.W.1, 1947. 96 p., illus.,, diagrs., charts, 8½ x 5¼ in., cloth., 12s.6d.

This volume discusses propeller design in general terms with a minimum of technicalities, and requires only an elementary knowledge of aerodynamics. It is not intended as a manual or a handbook on propeller design. Many illustrations supplement the text, and the main trends in the development of propeller design are indicated with their underlying reasons.

FREQUENCY MODULATION ENGINEERING.

C. E. Tibbs, foreword by L. H. Bedford. Chapman & Hall, Ltd. London, 1947. 310 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 28s.

Presenting basic theory, the early chapters deal with the frequency modulation of carrier waves and with interference suppression. Succeeding chapters consider propagation, aerials, transmitters and measurements. The remainder of the book is devoted to a description of the technique and circuits employed for frequency modulation and reception. Actual equipment is described when possible, and working designs with characteristic curves are included in the material on limiters and discriminators.

GEOLOGICAL STRUCTURES AND MAPS, a Practical Course in the Interpretation of Geological Maps for Civil and Mining Engineers:

A. Roberts. Sir Isaac Pitman & Sons, Ltd., London, 1947. 66 p., diagrs., charts, maps, 9¾ x 7 in., cloth, 12s.6d.

Providing a survey of elementary geology, this book is designed to meet the needs of civil and mining engineers whose work entails the interpretation of geological maps. It contains a graded series of exercises in geological mapping. Some of the more important simple structures are illustrated by block diagrams. The graphical method is used in all dip and strike problems.

HEAT-TREATMENT OF STEEL:

E. Gregory and E. N. Simons, with a foreword by C. K. Everitt, Sir Isaac Pitman & Sons, Ltd., London, 1947. 358 p., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $4.00.

Beginning with temperature measurement by means of thermocouples and the various types of pyrometers, this book proceeds to the description of the types and operation of gas, fuel-oil and electric furnaces. Refractories, atmosphere control, heating baths, and quenching equipment are dealt with. The remaining half of the book is devoted to the principles and processes of heat-treatment and their application to all types of steel production, including spheroidizing, austempering, case-hardening, cyaniding, nitriding, and flame and induction surface-hardening.

HIGH-SPEED DIESEL ENGINES.

P. M. Heldt. 5th ed. P. M. Heldt, Nyack, New York, 1947. 479 pp., illus., diagrs. charts, tables, 8½ x 5 in., cloth, $6.00.

The theory, design, application, operation and maintenance of high-speed Diesel engines are presented. In this revised edition, new material is included on the two-stroke engine, recently developed fuels, and cold-starting. A chapter on gas turbines has been added. A number of illustrations of large-scale sectional drawings of complete engines are given.

LEGAL PHASES OF CONSTRUCTION CONTRACTS:

I. V. Werbin. McGraw-Hill Book Co., New York and London, 1946. 267 p., 8½ x 5¼ in., cloth, $2.75.

The author discusses forty-six different legal problems that have arisen in connection with construction contracts, of practical interest to engineers, architects, contractors and attorneys. The book shows the court precedents that have been established on these problems and gives, in many cases, the actual language of the contract provisions and also the facts involved. The intent is to provide the layman without legal training or experience an understanding of the import of the courts' decisions.

LUMBER, Manufacture, Conditioning, Grading, Distribution and Use.

N. C. Brown. John Wiley & Sons, New York; Chapman & Hall, London, 1947. 344 p., illus., diagrs., maps, tables, 8½ x 5½ in., cloth, $4.25.

Of interest to those concerned with wood utilization and intended as a textbook for use in professional forestry schools, this volume covers most of the phases of the industry with the exception of logging. The general manufacturing procedures for converting logs into lumber are analyzed, and equipment, sawing methods, power requirements, and the utilization of by-products are discussed. Conditioning, by air seasoning and by kiln drying, is explained, and the grading process is examined. The distribution of lumber through the manufacturer, retailer and wholesaler, and the utilization of the distributed product are dealt with. Constant emphasis is placed on the necessity for efficient and economical methods in all stages of production.

MACHINE-SHOP ESTIMATING.

W. A. Nordhoff. McGraw-Hill Book Co., New York, 1947. 486 p., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $6.00.

A scientific basis is provided for evaluating the performance of machine-shop operators by showing how to estimate the time that should be required to perform a job. The book lists all of the elements of operations performed in an average machine shop and establishes reasonable time values for their execution by the average operator. All machine operations are fully described; tables supply machinery elements which are generally variable; and sample estimates are shown for practical demonstration purposes.

NAVAL MACHINERY, 1946. 2 Vols.

United States Naval Academy, Annapolis, Maryland. Paged in sections, illus., diagrs., charts, tables, 11 x 8¼ in., cloth, Vol. 1 $4.00; Vol. 2, $4.25.

This 2-volume work, presented as a descriptive treatment of steam engines and machinery to be found aboard ships of the Navy, emphasizes construction details and operating principles. The material is grouped into four parts: Parts I and II, naval boilers and naval steam turbines, are in one volume; Parts III and IV, naval auxiliary machinery and naval reciprocating steam engines, are in the other. The detailed index which appears in both volumes covers all four parts. Twenty-one large, folded plates, relating only to parts I and II are bound in at the back of that volume, adding to the wealth of illustrative diagrams which accompany the text.

ORGANIZATION AND MANAGEMENT IN INDUSTRY AND BUSINESS.

W. B. Cornell, 3 ed. Ronald Press Company, New York, 1947. 819 p., illus., diagrs., charts, tables. 9¼ x 6 in., cloth, $5.00.

Intended for use in schools of commerce and colleges of engineering, this text presents detailed information on the varied subjects included in the field. Broad in scope, the volume covers the topics of organization and operation of a business enterprise, production control, and time study. Concrete examples are given of problems solved for well-known manufacturers. For each topic discussed details of practical value are presented. This third edition has been revised to include up-to-date practices. New approaches to the solution of problems such as those of personnel administration have been added.

REFRACTORIES IN TURBINE BLADES plus Miscellaneous Applications, PB Report 4260.

S. S. Kistler. Office of Technical Services, Dept. of Commerce, Washington, D.C.; Hobart Publishing Co., Box 4127 Chevy Chase Br., Washington, 15 D.C., January 1947. 31 pp., illus., tables, 10½ x 8 in., paper, manifold, $2.00.

This report is concerned with the efforts made by the Germans to produce ceramic substances suitable for combustion turbine blades. The various developments of several important companies are described, with discussion of the physical properties and effectiveness of application.

REVIEW OF METAL LITERATURE, Volume 3, 1946.

Prepared for the members of the American Society for Metals by Battelle Memorial Institute, Columbus, Ohio. American Society for Metals, Cleveland 3, Ohio, 1947. 811 pp., 9¼ x 6 in., cloth, $15.00.

An annotated survey of articles and technical papers appearing in engineering, scientific and industrial journals and books, here and abroad. The subjects covered range from ores and raw materials through industrial uses and applications of the finished product. Technical books in this field are also reviewed. The addresses of the 300 publications covered are given. Cross-references aid in the location of abstracts, and both an author and a detailed subject index are provided.

STATICS.

J. H. Kindle and H. L. Miller. Ginn and Company, Boston, New York, Chicago, Atlanta, Dallas, Columbus, San Francisco, Toronto, London, 1947. 171 pp., diagrs., charts, tables, 9½ x 6 in., cloth, $2.60.

Designed for use in pre-engineering college courses, this book develops a course in statics based on the principles of (1) action and reaction, (2) transmissibility of a force, (3) vector addition of forces, and (4) static equilibrium. A working knowledge of algebra, geometry and trigonometry is assumed. Included are several hundred graded problems and their answers. In examples given in the text, a graphical solution is first obtained and is followed by an analytical solution.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield St., Montreal—Telephone BElair 3019—may be arranged *by appointment.*

Situations Vacant

Chemical

CHEMICAL ENGINEER, age 25 to 35 with experience in the Pulp and Paper Industry, preferably Kraft, required by paper manufacturer in Eastern Ontario for position of Control Superintendent. Salary according to qualifications. Apply to File No. 4099-V.

Civil

CIVIL ENGINEERS required by a Montreal firm for field inspection in Ontario, and North Shore St. Lawrence. Salary open. Apply to File No. 4084-V.

CIVIL ENGINEER with at least two years experience required in a Pulp and Paper Mill in the Province of Quebec. Salary $250 to $300. Apply to File No. 4094-V.

CIVIL ENGINEER required by a Montreal contractor for estimating and general engineering. Age 30 years. Salary $300 up. Apply to File No. 4096-V.

CIVIL ENGINEER required for consulting engineer and surveyor's office in Montreal. Work includes surveying, topographical draughting, preparation of designs and plans of engineering work etc. Must be bilingual. Salary according to experience with future depending on ability. Apply to File No. 4105-V.

JUNIOR CIVIL ENGINEER with not less than 2 or 3 years experience required in Moncton, New Brunswick for architectural and industrial building design. This position offers a wide scope for experience and has good prospects. Salary open. Apply to File No. 4108-V.

Electrical

ELECTRICAL DRAUGHTSMEN required in Montreal should be experienced in the layout of industrial electrical systems which includes 600-volt power circuits, high voltage substations and general industrial lighting systems. Salary open. Apply to File No. 4080-V.

Mechanical

*JUNIOR MECHANICAL ENGINEER with one to two years experience required in Montreal. Salary open. Apply to File No. 4081-V.

MECHANICAL ENGINEER, recent graduate required for training in Industrial Engineering by Pulp and Paper Mill in Southern Ontario. Training period of approximately three months in Time and Motion Study, Work Simplification, Scheduling, Plant Layout etc. Salary $200-$225. Apply to File No. 4083-V.

*MECHANICAL ENGINEER with around three years experience required by a manufacturer in Ontario. Preferably engineers with experience on farm implement design and manufacture or with farm background. Salary open Apply to File 4086-V.

*AUTOMOTIVE MECHANICAL SUPERINTENDENT required to re-organize and supervise complete mechanical repair and maintenance activity of large pulpwood operations in Northern Quebec. Equipment consists of several hundred units comprising trucks and vehicles etc. Salary $5,000. up. Apply to File No. 4091-V.

* Filled since appearance in advance notice.

MECHANICAL ENGINEER required in Montreal with considerable experience in machine shop practice also some administrative experience in shop work. Applicant should be around 35 years of age and bilingual. Salary depending on qualifications. Apply to File No. 4100-V.

Metallurgical

METALLURGICAL ENGINEER required by a farm implement manufacturer in Ontario to take over the necessary duties in new mechanized foundry. Salary open. Apply to File No. 4086-V.

Miscellaneous

MECHANICAL, CHEMICAL OR CIVIL ENGINEER, recent graduate up, required for sales and service in Montreal. Must be bilingual. Salary open. Apply to File 3867-V.

DRAUGHTSMAN preferably with mechanical and structural experience required by engineering firm in Toronto for design of material handling equipment such as belt conveyors also crushing plants and gold mills. Salary $200, to $350. Apply to File No. 4072-V.

SALES ENGINEER required by well known Engineering Supply Co. doing business with Mining and Pulp and Paper Co's. Excellent opportunity for advancement. Travelling not extensive. No experience necessary but desirable. Salary open. Apply to File No. 4079-V.

TOWN ENGINEER required by Town in Ontario. Duties include the supervision of Board of Works and Sanitation Departments as well as acting in an advisory capacity to the Telephone, Electric and Water Utilities. Salary from $250-$300. Apply to File No. 4087-V.

RECENT GRADUATE, mechanical or electrical background required by engineering firm in Montreal. Duties include training in Public Utility in Administration Department. Eventually for South America. Salary $225 to start. Apply to File No. 4089-V.

SALES ENGINEER preferably mechanical graduate, required for sales engineering work on blowers and vacuum pumps. Compressed air experience would be advantageous. Location Montreal. Salary and commission. Apply to File No. 4090-V.

JUNIOR ENGINEER preferably with a few years experience production control and some knowledge of the textile industry required for Montreal area. Salary $250-$275. Apply to File No. 4092-V.

SENIOR INDUSTRIAL ENGINEER with business administration and mechanical background, bilingual, with at least five years experience in production control, wage incentives and cost control required by an industrial engineering consultant in Montreal. Salary open. Apply to File No. 4092-V.

SENIOR DESIGNER with from five to ten years experience and a general knowledge of structural design in relation to buildings and bridges, required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

JUNIOR ENGINEER with from one to five years experience and at least a working knowledge of structural design of buildings, required by a steel company in Southern Ontario. Salary open. Apply to File No. 4093-V.

GRADUATE ENGINEER required by well known insurance brokerage firm in Montreal to be trained for field duties consisting principally of plant surveys, plans and fire engineering work, including automatic sprinkler systems and hydraulics. Splendid opportunities for quick advancement. Salary open. Apply to File No. 4097-V.

*INDUSTRIAL ENGINEER wanted for Toronto area with four to five years experience in time study, production control etc. Preferably with knowledge of sheet metal fabrication. Salary $250. to $275. Apply to File No. 4098-V.

*DRAUGHTSMEN required by firm in Toronto area. Preferably with sheet metal experience. Salary open. Apply to File No. 4098-V.

SALES ENGINEER required by large manufacturer of Air Handling equipment in Toronto area. Applicant should have either industrial or Public Building application and sales experience. Salary open. Apply to File No. 4101-V.

GRADUATE CIVIL OR MECHANICAL ENGINEER with extensive experience in design and layout. Required for senior design duties in Montreal with Public Utility. Salary open. Apply to File No. 4103-V.

MAINTENANCE ENGINEER required in Quebec City to do installation work in heating, ventilating, refrigeration and air-conditioning, gas and diesel motors. Must be bilingual. Salary open. Apply to File No. 4104-V.

JUNIOR ENGINEER required in Quebec City. Preferably with three to five years experience in heating, ventilating and air-conditioning. Salary open. Apply to File No. 4104-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled

Chemical

CHEMICAL ENGINEER OR CHEMIST, preferably with Ph.D., required by a pulp and paper company with plants in Eastern Canada, for research work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER required by a pulp and paper company with plants in Eastern Canada, for mill control and plant work. Salary open. Apply to File No. 3549-V.

CHEMICAL ENGINEER with considerable mechanic and hydraulic experience or mechanical engineer with good chemical knowledge and experience in hydraulics, required by a manufacturer in Ontario. Salary open. Apply to File No. 3928-V.

CHEMICAL ENGINEER, recent graduate is needed by a chemical manufacturing firm situated in the Province of Quebec. Some experience in oil refinery, pulp and paper, or synthetic resin manufacture would be useful. Salary open. Apply to File No. 3978-V.

CHEMICAL ENGINEER OR CHEMIST wanted by large manufacturers of bleached sulphate pulp for their Technical and Development Department. Several years experience preferably in the pulp and paper industry. Mill located in Northern Ontario. Salary open. Apply to File No. 3991-V.

CHEMICAL ENGINEER, experienced in use of physics and mathematics, under 30 years of age, required by industrial and chemical organization with Headquarters in Montreal. Duties include development work and study explosives and chemistry and hydro-dynamics. Salary open. Apply to File No. 3995-V.

SENIOR CHEMICAL ENGINEER OR CHEMIST, required by leading Paper Manufacturer in Eastern Canada. Applicant should have some experience in Paper Mill Control work. This position offers plenty of scope for advancement. Salary open. Apply to File No. 4013-V.

CHEMICAL ENGINEER required by a major Canadian Company located in Toronto as Technical Service Man. 25 to 35 years old. Definite sales personality. Position will include 6 to 12 months' training. It will carry the responsibility for servicing all types of adhesives to industries throughout Canada. Salary open. Apply to File No. 4044-V.

*CHIEF CHEMIST required to co-ordinate and supervise quality control, research and development work in laboratories of large industrial organization engaged in manufacture and processing of soaps, cosmetics, dentifrices, edible fats and oils etc. Salary open. Apply to File No. 4068-V.

GRADUATE CHEMICAL ENGINEERS OR CHEMISTS required by an industrial chemical plant in Montreal area. Preferably with experience in production and the operation of chemical equipment such as filters, presses etc. Must be able to organize work and direct workmen. Salary $200 up. Apply to File No. 4071-V.

Civil

CIVIL ENGINEER to take charge of work in a drainage district in Quebec. Must be bilingual, may be recent graduate. Salary from $200. Apply to File No. 3479-V.

CIVIL ENGINEERS with experience in detailing and designing structural steel and reinforced concrete for manufacturers are required for a steel fabricating company in Manitoba. Salary open. Apply to File No. 3519-V.

CIVIL ENGINEERS, recent graduate up, required by a pulp and paper company with plants in Eastern Canada. Salary open. Apply to File No. 3549-V.

GRADUATE CIVIL ENGINEER, required by a public utility in the Montreal area with three or four years experience in design of reinforced concrete and structural steel. Salary $250-$300. Apply to File No. 3766-V.

CIVIL ENGINEERS with some experience on design and field work required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

CIVIL ENGINEERS required as draughtsman in bridge department of large transport company. Preferably with experience in steel, concrete and timber construction. Salary $200-$300. Apply to File No. 3884-V.

CIVIL ENGINEER required as Town Engineer of a town in the Maritimes. Required to supervise and layout work for Water and Sewerage Department also construction of a general nature for the Electric Light Department. Salary open. Apply to File No. 3930-V.

*CIVIL ENGINEER, recent graduate, required to understudy City Engineer of a city in Western Quebec. Salary open. Apply to File No. 3966-V.

JUNIOR ENGINEER, preferably with civil background required for sales and service by a Montreal manufacturer of waterproofing compounds. Salary open. Apply to File No. 3968-V.

CIVIL ENGINEER required in Montreal with general knowledge of re-inforced concrete and steel structures. Special knowledge of triangulation surveys, boundary surveys, also laws and procedure to be followed in regard to the purchase, transfer and registration of lands in Province of Quebec. Must be bilingual. Preferably veteran. Salary not less than $3,480. Apply to File No. 3987-V.

*Filled since appearance in advance notice.

Electrical

*ELECTRICAL ENGINEER, age 30-45, required as sales engineer in Canada for U.S. firm making special equipment for transport and industry. Must have sales training in electrical equipment instruments also experience as sales and service engineer. Salary open. Apply to File No. 3447-V.

ELECTRICAL ENGINEER, recent graduate up, required by a manufacturer in Montreal, for sales engineering. Must be bilingual and familiar with rotating electrical equipment. Salary $200 up. Apply to File 3761-V.

GRADUATE, ELECTRICAL ENGINEERS, with 3 to 10 years experience in design operation, layout of substations, switching stations, and electrical machinery, together with engineering studies, including draughting for a large hydro electric power house in Quebec. Salary $225 up according to experience. Apply to File No. 3787-V.

ELECTRICAL ENGINEER required for power sales by an electrical utility in Province of Quebec. Preferably experienced. Bilingual. Salary open. Apply to File No. 3802-V.

ELECTRICAL ENGINEER with experience in layout and design of generating and transformer stations, required by a public utility in Toronto. Salary open. Apply to File No. 3813-V.

SEVERAL EXPERIENCED ELECTRICAL DRAUGHTSMEN, for the design and layout of industrial power and control systems. Required by consulting engineering office in Montreal. Salary open. Good chance for advancement. Apply to File No. 3890-V.

ELECTRICAL ENGINEERS, required for sales engineering work in Western Canada. Graduates with some selling experience preferred. Salary open, plus expenses. Apply to File No. 3915-V.

JUNIOR ELECTRICAL ENGINEER, age about 30, required as assistant to superintendent of light department in Montreal area. Practical experience in Hydro Distribution and Steam Turbines. General office routine of administrative nature. Salary open. Apply to File No. 3950-V.
