COVER PICTURE

One of the most spectacular of Canada's industrial achievements in the second World War was the setting up of the synthetic rubber plant of the Polymer Corporation at Sarnia. In peacetime the project would have taken three years to build. Under war pressure in 1942-43, its eight acres of permanent buildings, six miles of sewers, five miles of roads, and complicated mosaic of pipes, conduits, spheres, and towers were completed in a year and eight months. Unlike many war-born enterprises it has continued, even expanded its operations since the war's end, and is now producing synthetic rubber at a rate of over 100,000,000 pounds per year. Designed annual output was 83,600,000 lbs.

The cover photo shows Butadiene pressure storage tanks used in the latter stages of the production of GR-S rubber.

UNIFICATION OF SCREW THREAD STANDARDS

From a Report issued by:

NATIONAL BUREAU OF STANDARDS. U.S. DEPARTMENT OF COMMERCE, WASHINGTON, D.C.

On Thursday, November 18, delegates and representatives from government and industry of Canada, the United Kingdom, and the United States met at the National Bureau of Standards, Washington, D.C., to sign an accord on unification of the American and British standard systems of screw threads. The accord, representing the culmination of 30 years of effort among the three nations, affirms the unification represented in revised publications of the Interdepartmental Screw Thread Committee of the United States of America and of the British Standards Institution, the Canadian Standards Association, and the American Standards Association. These documents fulfil all the requirements for general interchangeability of threaded products made in the three nations. Not only is the accord of major significance in expanding and facilitating commerce between the cooperating nations, but it also is an important step toward the further development and extension of unifying standards in other fields of engineering practice.

The Signatories

Signers of the accord, representing Canada, were C. D. Howe, Hon. M.E.I.C., Minister of Trade and Commerce, and J. G. Morrow, chairman, Canadian Standards Association; W. L. Batt, also an Honorary Member of the Institute, was one of the signatories for the United States. The Unified Standards will be made effective in the Departments of the U.S. Government by inclusion in the next revision of Handbook H28, *Screw Thread Standards for Federal Services*, of the National Bureau of Standards.

Significance of the Accord

The significance of the accord is patent in the field of commerce. Almost all mechanisms and structures of modern technologic societies are held together by fasteners—bolts, nuts, screws, and rivets. For example, to cite an extreme case, there are 122,000 screws in one type of aeroplane. Economic production in the automotive, aircraft, agricultural implement, and other industries using assembly-line methods requires not only a steady supply of components but also that the components, including large numbers of fasteners, be interchangeable so that they can be fitted together without selection, subsequent machining, or hand-fitting of any kind.

Past Difficulties

In the past, international trade in mechanisms of all kinds has been seriously handicapped by the lack of interchangeability of screw thread parts. This has required the manufacturing nation also to supply and distribute such parts along with the equipment it wishes to market in a foreign area. Furthermore, the question of the availability of such parts has acted as a psychological deterrent to purchasers of products from other nations. These limitations on the international commerce of Canada, the United Kingdom, and the United States will gradually disappear as the unified standards are acted upon by the industries of the three Nations in the ensuing years.

During the first world war, the experience of the allied American and British armed forces revealed that the lack of interchangeability of American and British screw threads was a serious problem. In World War II, the high degree of mechanization of all military forces made the problem even more serious than it had been. American industry was required to supply the British with a large volume of war equipment threaded to the British specification. This not only led to considerable delay but was economically disadvantageous. At the same time, American military forces based in England and using equipment with American threads found difficulties in making necessary replacements.

[1] All values represent complete unification among the American, British, and Canadian standards for Unified threads with the exception of those in light face type. The latter will appear in the American publications but do not constitute a part of the Unified system.
[2] Based on the average of the mean minor and pitch diameters of the external thread.

Technical Basis of Accord

The three principal characteristics of screw threads are angle and form of thread, pitch (the combinations of diameter and number of threads per inch for the various thread series), and limiting dimensions (the manufacturing tolerances and allowances) for each grade of thread fit.

The British system, originated by Whitworth in 1845, is based on a thread angle of 55 degrees with a thread form having rounded crests and roots. The American system, developed by Sellers in 1864, has a thread angle of 60 degrees with a thread form having flat crests and roots. The number of threads per inch for the various series of thread diameters was the same in both systems, with the exception of the half-inch coarse thread. Accurate fits between components having different thread angles were impossible. Moreover, the tolerances and allowances varied in the two systems.

The present unification agreement provides a 60-degree angle and a rounded root for screw threads. The crest of the external thread may be flat, as preferred in American practice, or rounded, as preferred by the British. The number of threads per inch for the various series of thread diameters has been unified, and the limiting dimensions for three grades of fit have been agreed upon. Thus, interchangeability of screw thread parts, based on the accord, now becomes feasible.

The Tables

The sizes agreed upon, the threads per inch, and the basic dimensions of the unified coarse and fine thread series are presented in Tables 1 and 2. These and other tables, together with the agreements that (1) the minimum internal thread shall be basic and the allowances (or minimum clearances on the flanks of the threads) shall be applied to the external threads and (2) tolerances shall be in the minus direction on the external thread and plus direction on the internal, assure interchangeability of threaded products. Threaded parts of standard diameters and threads per inch, made in accordance with these principles, will always assemble freely.

There is, however, a further degree of interchangeability attained by agreements on the numerical values for allowances and tolerances, thereby setting limits to the least and greatest amounts of looseness between mating parts. Such agreement provides for identity of sizes (or interchangeability of use) of screw thread gauges used in the different countries for controlling the limits of size of the threads. It also standardizes the grade or grades of fits between mating parts.

Tables 3 and 4 are examples of such standardized limits of size. The particular limits of size for pitch diameters given in these tables, designated class 2A for external threads and 2B for internal threads, constitute the second or medium grade of three standard grades of fit. The additional classes are designated 1A and 1B, and 3A and 3B. Classes 2A and 2B are those which, in the course of their development by industry during the past few years, became rather widely known by the class designations A and B. Class 2A is the recognized standard in the United States for bolts, and screws, while class 2B is for nuts. These classes are also suitable for a wide variety of other applications.

The Basic Formula

The basic formula, from which allowances on all diameters and tolerances on pitch diameter are derived is:

Tolerance (or allowance) =

$$C\left(0.0015\sqrt[3]{D} + 0.0015\sqrt{L_e} + 0.015\sqrt[1.5]{p}\right)$$

In this formula C is a factor which differs for each allowance or tolerance for each class, D is the basic major diameter, L_e is the length of engagement, and p is the pitch. The formula is based on the accuracy of present day threading practice, and is applicable to all reasonable combinations of diameter, pitch, and length of engagement.

The values of the factor C for allowances are as follows:

Class	Factor C
1A	0.450 or 0.300
2A	0.300
3A	0.000

The values of the factor C for pitch diameter tolerances are as follows:

Class	Factor C
1A	1.500
1B	1.950
2A	1.000
2B	1.300
3A	0.750
3B	0.975

The relative difficulties of manufacture were provided for by making the value of the factor C 30 percent greater for internal than for external threads of a given grade of fit.

Important Sub-committee

As suggested in the above discussion and indicated in the footnotes to the tables, a few details remain to be agreed upon. An editing subcommittee, consisting of representatives of the three nations, was appointed by the Sectional Committee B1 on the Standardization and Unification of Screw Threads at its meeting on November 18, 1948. This subcommittee was authorized to resolve, within specified limitations, the differences which remain. Any agreements reached will be incorporated in the American standard without further formal action by the three Governments.

Future Developments

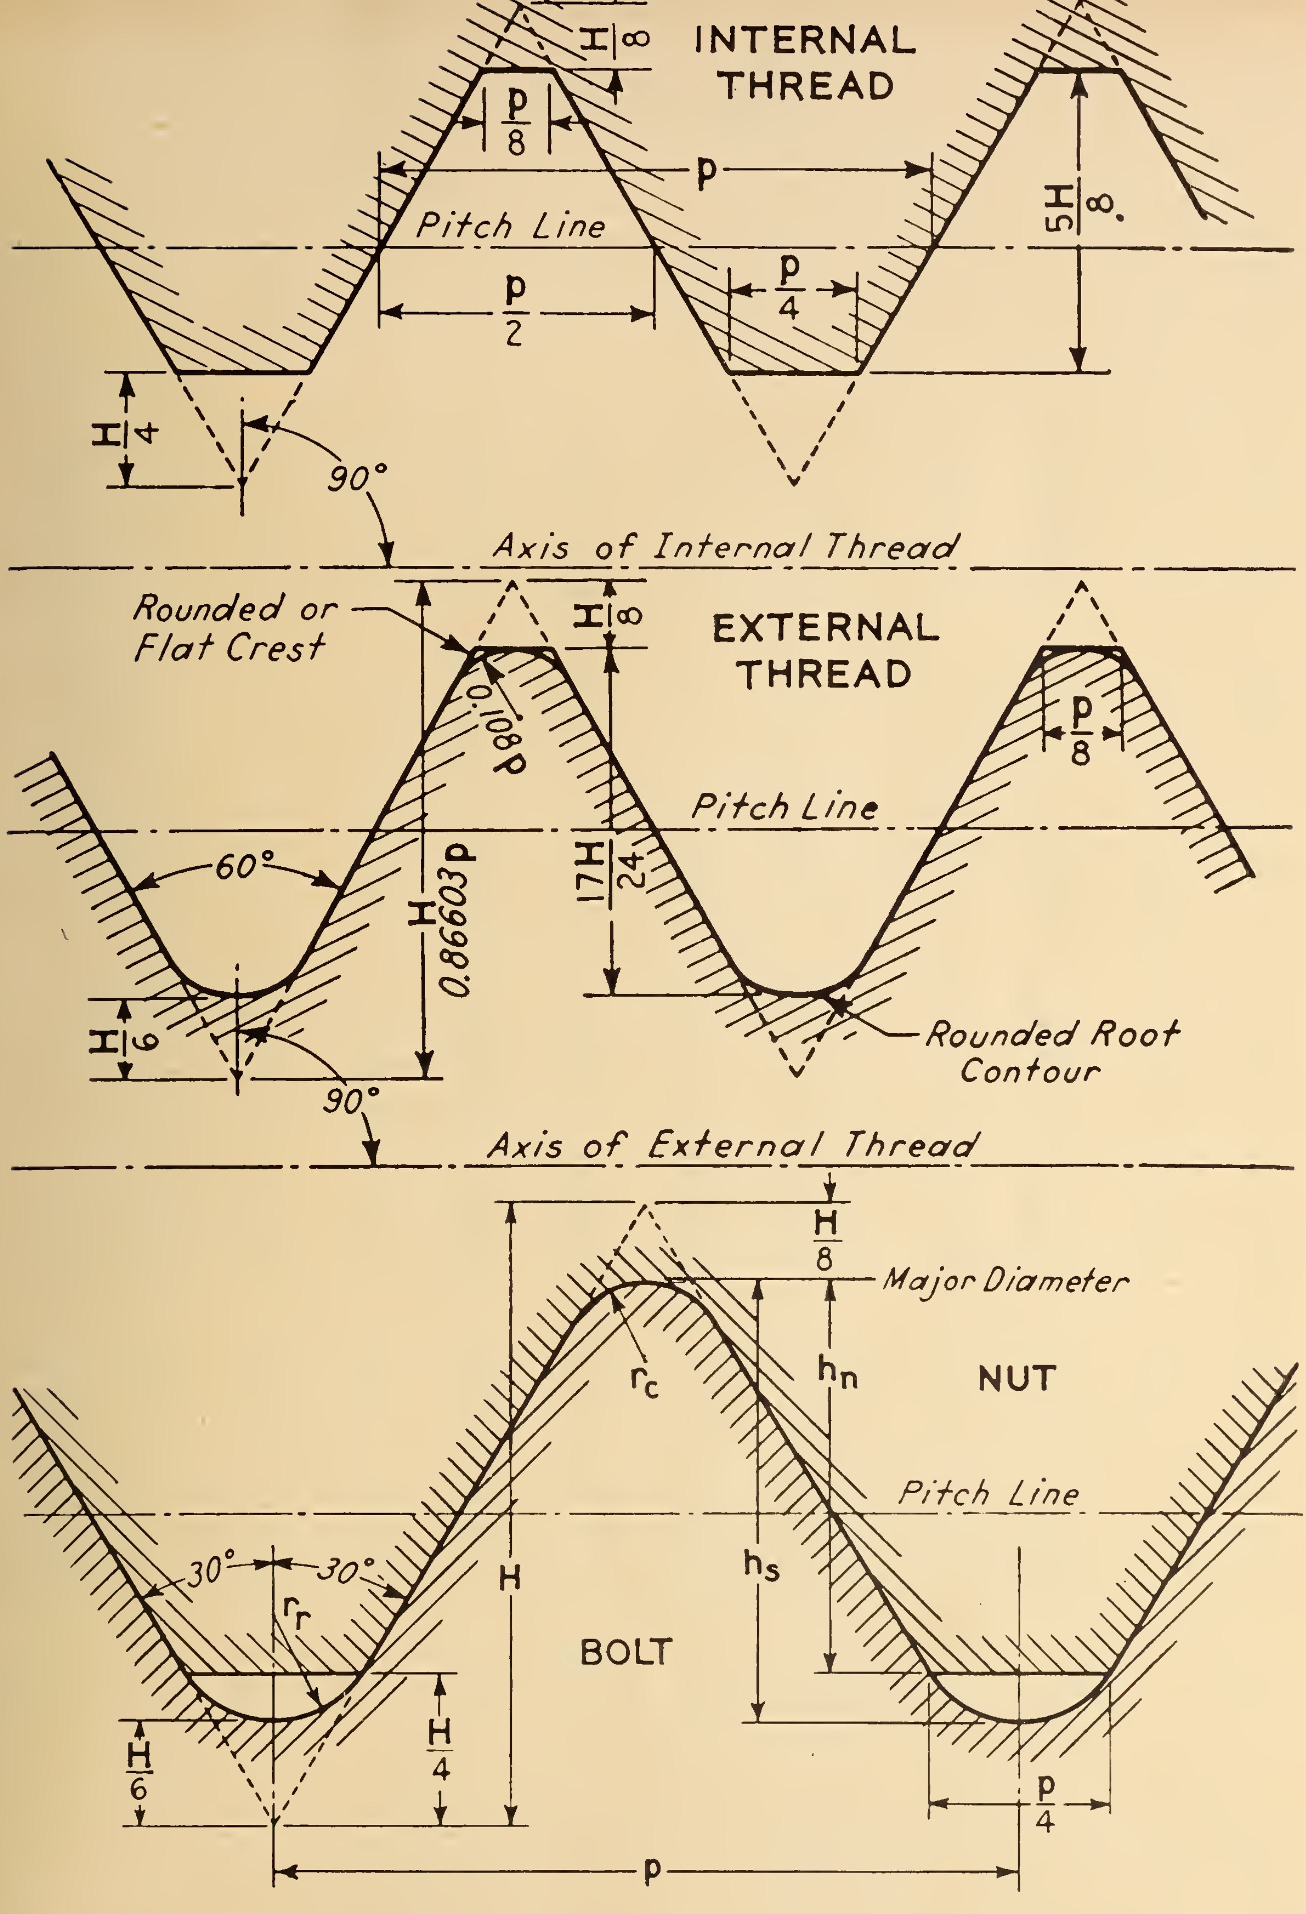
In one sense, the present accord marks the culmination of thirty years of work by the three nations toward the establishment of unification. In another sense, the accord marks the beginning of the realization of the unification. Purchases by the three governments will be based on the new standards, but industrial use within the normal commerce of each of the nations will require a transformation of industrial practices, involving considerations of engineering, design, tooling, and production. Such a change will take time, but the transition should be completed in the next few years.

At the same time, continued screw thread research is important. A screw thread is one of the more complex regular geometrical forms. There are so many variables which enter into the design of a satisfactory threaded fastener that most of the knowledge applied in such design has been empirical rather than theoretical. An immediate result of the Ottawa Conference in 1945 was the establishment of the programme of research to be carried out by the National Bureau of Standards of the United States, the National Physical Laboratory of England, and the National Research Council of Canada.

Cooperation Essential

The present accord calls for a continuance of future cooperation in the field of screw thread standardization. Such cooperation has two aspects: first, the extension of the unification to the other English-speaking nations (all of which use the English system of measurement in manufacture) and, second, the continued development of standards. For standards are not static, and they must keep pace with improvements in materials and methods of production and inspection developed in industry. The reduction of the varieties of fasteners is one of the possibilities which further studies of standards and simplification may yield.

Moreover, the present accord pertains to the most commonly used type of screw thread. Other important types of screw threads remain to be standardized. In the case of Acme and Buttress threads the unification of standards has reached an advanced stage. Further, standardization of drawing room practices within the countries and their unification among the countries are essential if there is to be an interchangeability of blueprints and production drawings. In these and related fields, the three governments and the respective standardization organizations are carrying on continuing programmes.



$H = 0.866025p \qquad \frac{H}{8} = 0.108253p \qquad \frac{H}{6} = 0.144338p \qquad \frac{H}{4} = 0.216506p$

$r_c = 0.108253p \qquad r_r = 0.144338p \qquad h_s = \frac{17H}{24} = 0.613434p \qquad h_n = \frac{5H}{8} = 0.541266p$

[1] All values represent complete unification among the American, British and Canadian standards for Unified threads with the exception of those in light face type. The latter will appear in the American publications but do not constitute a part of the Unified system. However, it is expected that ultimate agreement on certain of these values will be attained.

[2] The values in these tables are based on a length of engagement equal to the nominal diameter.

[3] The minimum minor diameter of the external thread may be determined by subtracting 0.6495p ($=h_b$) from the minimum pitch diameter of the external thread. This minimum diameter is not controlled by gauges but by the form of the threading tools.

[4] The maximum major diameter of the internal thread may be determined by adding 0.7939p ($=1\ 2/9 \times h_b$) to the maximum pitch diameter of the internal thread. This maximum diameter is not controlled by gauges but by the form of the threading tools.

Two Bridges at Three Rivers

by

O. Desjardins
Chief Engineer, Department of Public Works, Province of Quebec.

P. G. A. Brault, M.E.I.C.
Structural Engineer. Dominion Bridge Company, Lachine, Que.

Part I—General Description of the Project

Some months ago Mr. O. Desjardins, chief engineer of Public Works, Province of Quebec, submitted a paper for publication in the *Journal*, dealing with these bridges. Before space permitted publication however, a second paper was forwarded by Mr. P. G. A. Brault, structural engineer, Dominion Bridge Company, dealing more particularly with their design and erection. The publications committee has therefore decided to publish both of these as a joint paper by both authors. Part I covers the historical aspects, tells why new structures were needed, why the present location and types were selected, and gives a description of the substructures. Part II deals with the design and erection of the steel work for the superstructures.

Continuing its programme of construction, the Provincial Department of Public Works of Quebec completed construction in the fall of 1947, on the bridges crossing over the outlet of the St. Maurice river, between Trois-Rivières and Cap de la Madeleine. These bridges are on main highway No. 2, about midway between Montreal and Quebec.

Both of the bridges are built with continuous plate girders, one measuring 1380 ft., the other 640 ft., separated by a roadway fill of 866 ft. over St. Christophe Island. The whole project from end to end extends over a distance of eight tenths of a mile. Each bridge has a 42-ft. roadway, with two 5-ft. sidewalks, the loading capacity corresponding to 20 tons. The estimated cost of the entire crossing is about $3 millions.

The West bridge has six 180-ft. main spans and two 150-ft. flanking spans, while the East bridge has three 140-ft. main spans and two 110-ft. end spans. The bridges and the connecting fill are one continuous tangent. Smooth curves at either end connect with existing streets. The bridges span navigable waters, and sufficient vertical clearance has been provided for water traffic. At low water level, the vertical clearance for navigation is about 41 ft. at the West bridge and 23 ft. at the East bridge.

The superstructure of both bridges is of all-welded construction, and is believed to be the greatest undertaking (2020 ft.) of this type not only in the Province of Quebec but throughout Canada, with the longest spans (180 ft. in the West bridge) yet attempted with welding.

Existing Bridges

These structures replace obsolete bridges which were too weak and narrow to suit present-day traffic. These original bridges were built in 1900, and were then suitable for relatively light traffic. Many years later, they were reinforced so as to be fit to carry a tramway system, but this project was afterwards abandoned on account of increasing traffic requirements, due to modern developments in road transportation.

These bridges serve not only Trois-Rivières and Cap de la Madeleine, but also a large area of the Lower St. Maurice Valley around Shawinigan Falls and Grand'Mère, as well as carrying all the traffic passing this point over the Montreal-Quebec Highway. Traffic, which is extremely heavy, is maintained day and night the year round, and the original 25-ft. roadway was quite inadequate; furthermore, the original bridges were designed only for a 10 ton load capacity, while the actual road loading is nearer 20 tons. There is no other bridge in the vicinity to accommodate such traffic, the nearest being twenty miles upstream.

Alternative Locations for New Bridges

Two locations were considered for the new bridges. Alternative "A" followed about the same alignment as the existing bridges. Alternative " B " was a new alignment close to the old bridges.

Selection of Type

Location " B " was the most favourable in all respects, as well as economical and was therefore chosen, but an arch bridge and continuous plate girders for the West bridge were compared, as the vertical clearance was greater than that at the East bridge. For the East bridge it was agreed that continuous plate girders were preferable, while two main girders or arched ribs proved more satisfactory than four girders or arched ribs. Furthermore, the two main girder system was $100,000 cheaper than the arched rib system. In the substructure of the arch design, the piers and abutments were bigger and would have cost some $200,000 more. Continuous plate girders were therefore chosen for the West bridge.

Even before the preliminary designs were made, the surrounding land was surveyed and information obtained as to river conditions and requirements of navigation. The street pavement on the Trois-Rivières or west side was 20 feet higher than that on the Cap de la Madeleine or east side. At normal stage, the depth of water was 23 feet for the West bridge and 15 feet for the East bridge. The fluctuation between high and low waters was 13 feet. In investigating the soil foundation, borings disclosed a layer of fine sand and clay underlying.

To arrive at convenient span lengths for each bridge, estimates were made of the main spans varying from 140 to 180 feet for the West bridge and from 120 to 150

Fig. 2.

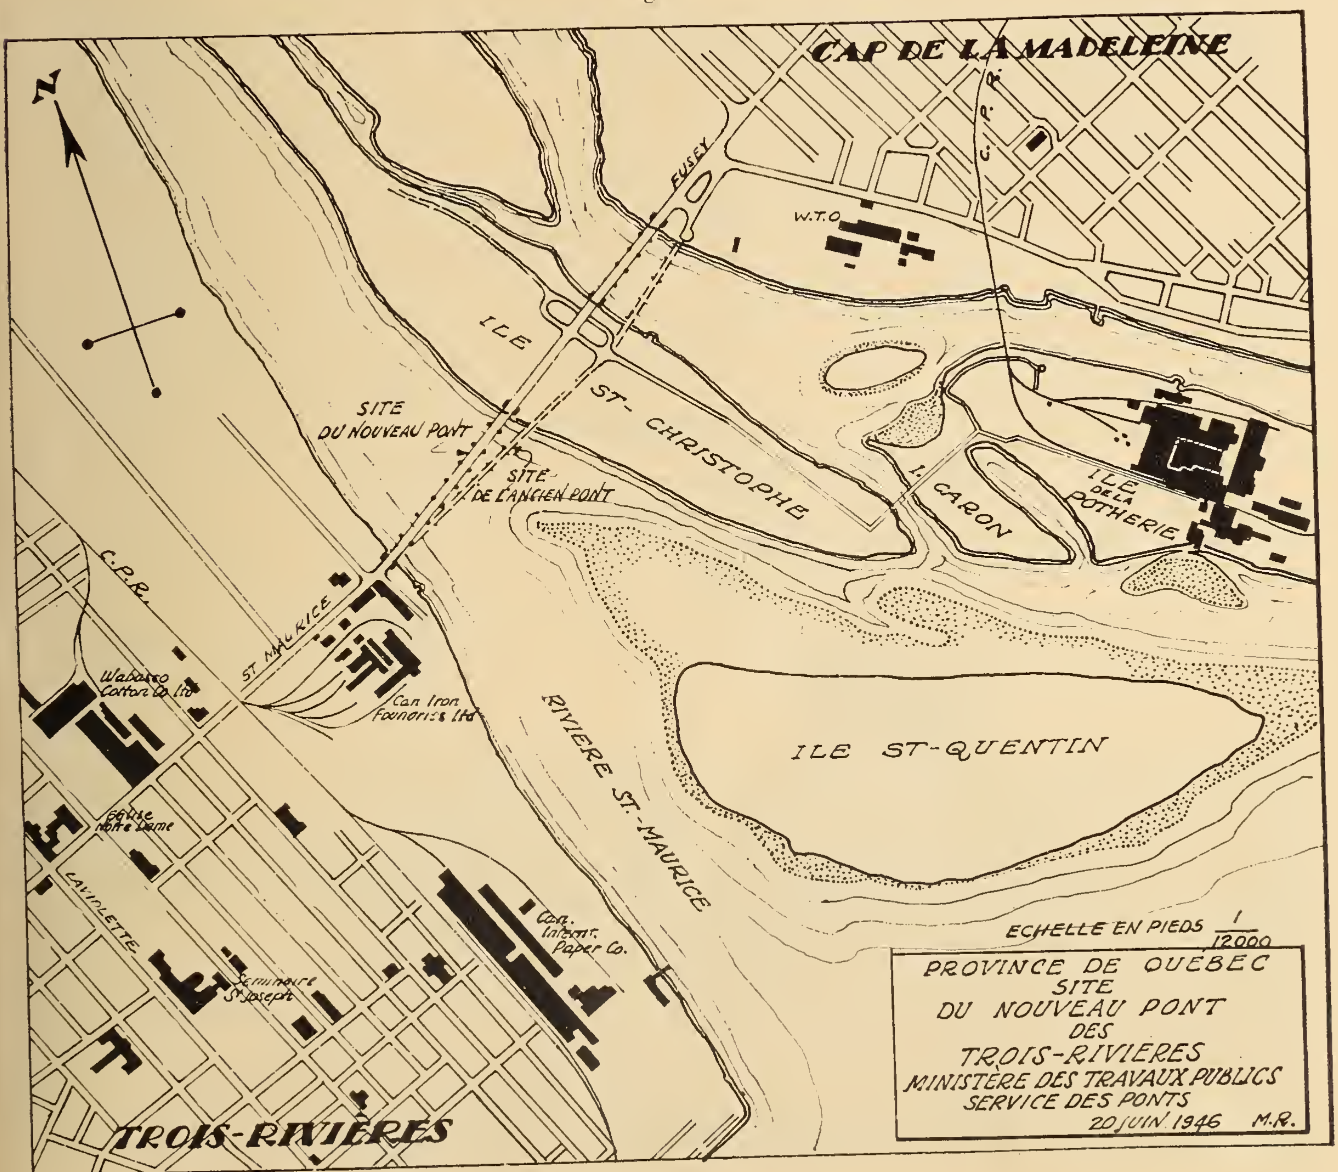

Fig. 3 (left). View showing piers of west bridge. Old structure in background.

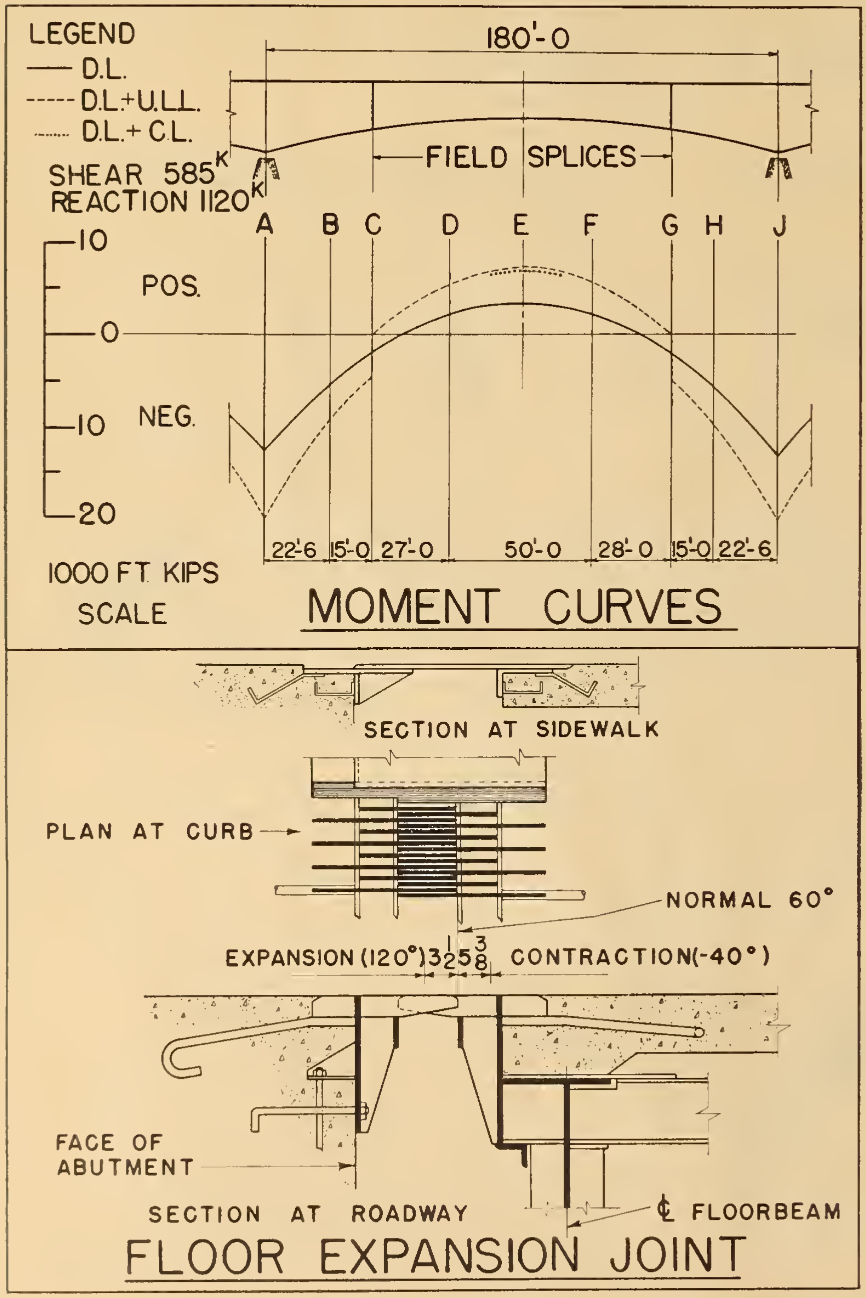
Fig. 4 (right). View of south side of east bridge from St. Christophe Island, showing the piers. October 1947.

Fig. 5 and Fig. 6 (below) illustrate moment curves and floor expansion joint.



feet for the East bridge. The purpose of this was to balance the probable cost of the superstructure against the substructure. In multiple span bridges, these costs should balance. The estimated cost of a pier must as nearly as possible equal the cost of one adjacent span.

Pier Design

After establishing the profile of the roadway, the span lengths, and the depth of the steel superstructure at the piers, the height of each pier and abutment was next determined, taking into account the profile of the river bed. Of the four piers of the East bridge, the two shore ones were 24 feet high and the two main ones 27 feet. At the West bridge, the seven piers varied in height from 40 to 56 feet, with reinforced concrete bents for the upper part of the latter between the support of the steel superstructure to some four feet above high water level. Piers were designed to withstand the dead and live loads thereon, wind pressure on piers and superstructure, forces due to stream current with floating ice and drift, and longitudinal forces at the anchor piers of each bridge.

The length of the piers at the top was established as 32 ft. center to center by economical spacing of the main girders, and sufficient space for pier members was provided. The width of the piers at the top is 5 ft. on the East channel bridge and 6 ft. on the West channel bridge. With the type of superstructure adopted, considerable saving is made in the relatively reduced dimensions of the piers as compared to a superstructure consisting of simple spans, the superstructure being supported only on a pair of pier members instead of two pairs in simple spans.

All piers were provided with ogival cutting edges at each end and steel protection plates upstream, and were designed with a tremie concrete footing.

Abutments

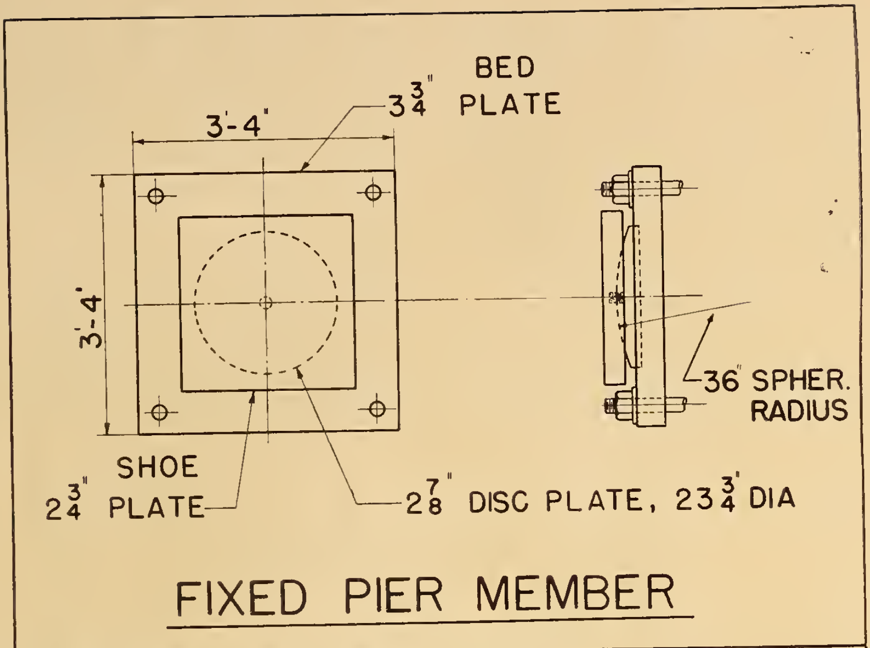
On account of their height, the soft clay foundation, and general appearance, reinforced concrete "U" abutments were designed with a slab on top between the wing-walls, similar to an inverted box. The roadway slab is supported on longitudinal reinforced concrete beams from the ballast wall to a reinforced concrete girder joining the top end of the wing-walls. Vertical walls carry the flooring of the roadway to the footing to which the piles are anchored. Concrete pilasters take the reaction of the superstructure and resist also any possible earth pressure. The rear end between wing-walls is left open to receive the gravel fill of the approaches. Each abutment was built monolithic to act as a unit against the thrust of the fill at the back. Weep holes were provided for the purpose of drainage and also of possible condensation.

Viaduct

To alleviate congestion of traffic on the approach between the two bridges at the road intersection a reinforced concrete underpass viaduct was provided, consisting of a rigid-frame type with cantilever wing-walls. For additional security the end of each wall rests on a column founded on a reinforced-concrete pile.

Appearance and Decoration

An ornamental balustrade was provided to improve the general appearance. Cedar hedges will also be planted along the outside edge



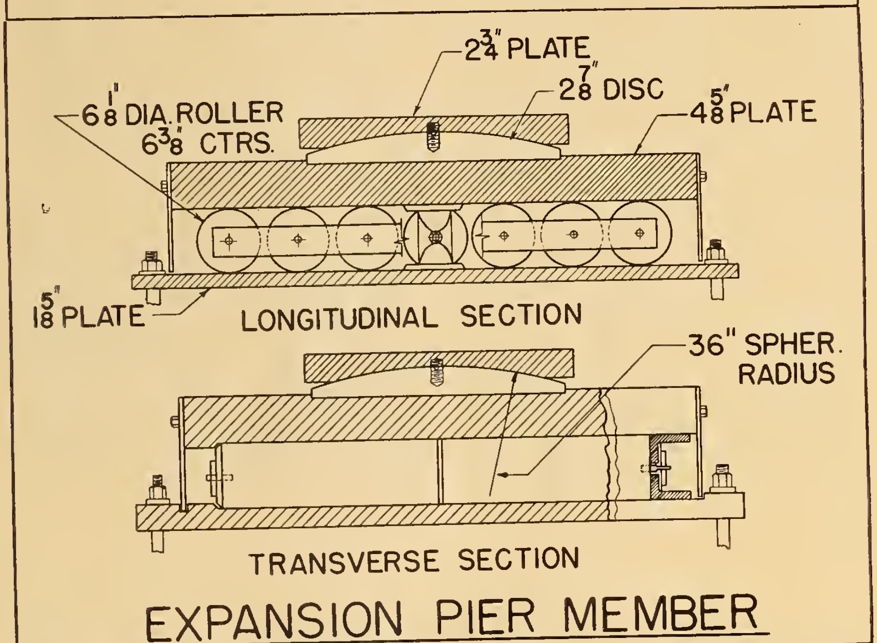


Fig. 7 and Fig. 8 (above) illustrate fixed pier member and expansion pier member.

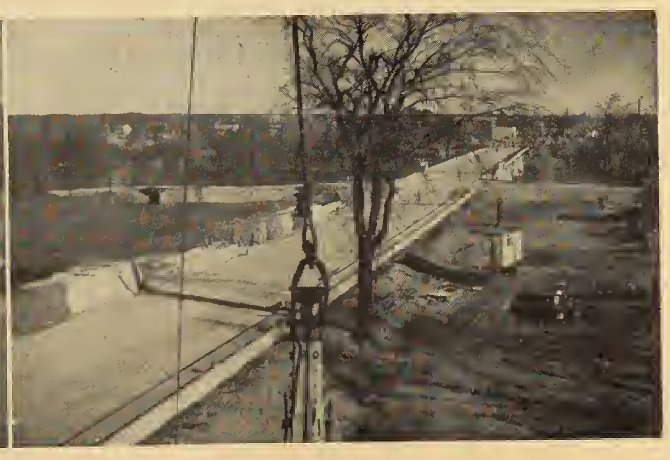
Fig. 9 (below, left). West bridge—Trois Rivières.

Fig. 10 (right). East bridge and St. Christophe Island.



of the sidewalks of the approaches and on the Island fill, while eight dressed masonry pylons are to be erected, two at each end of each bridge; those on the St. Christophe Island will be small, while those at the east and west extremities will be 30 ft. high. A plate located to the right of the end pylons will bear the name of the bridges.

Acknowledgments

This crossing with its bridges was built by the Department of Public Works of the Province of Quebec, under the direction of the Hon. Romeo Lorrain, minister, and Mr. Ivan E. Vallee, deputy minister, acting also as consulting engineer. The design was prepared by the engineering staff of the Department. During construction, Mr. J. M. Reid served as resident engineer.

Construction was carried out by the Dufresne Engineering Company Ltd., of Montreal, acting as agents for the government. The steel superstructure of each bridge was manufactured and erected by the Dominion Bridge Company, Ltd., Lachine, P.Q.

Part II—Design and Erection

The East and West channel crossings of the Three Rivers Highway Bridge are of the all welded continuous girder type of construction. Structurally, they are the acme of simplicity and consist merely of a longitudinally reinforced concrete slab carried on crossbeams at 10 ft. centres which in turn are supported by two continuous girders at 32 ft. centres.

The continuous girders of the West crossing have two end spans of 148 ft. and six intermediate spans of 180 ft. The East crossing has two end spans of 108 ft. and three intermediate spans of 140 ft. The crossings are symmetrical about their straight longitudinal centreline, and provide for a 42 ft. roadway between 9 in. high curbs, as well as a 5 ft. clear sidewalk from curb to steel fence on either side.

The reinforced concrete roadway slab is of a uniform thickness of 8 in., and forms a 3 in. parabolic crown between curbs. The roadway crown is located 12 in. above the crossbeams or main girders which are flush top. The slab is brought to bear on the girder and crossbeam flanges by increasing its thickness at the rate of 2¼ in. in 12 in. from either side of the flange edges.

Design

The steel superstructure is designed to the Canadian Standards Association specifications for steel highway bridges (S6-1938), supplemented by the Province of Quebec general specification for highway bridges (1943).

The allowable tensile stress is 20,000 p.s.i. and the permissible flexural compression is governed by the formula "23,000-300 L/B" with a maximum of 20,000 p.s.i. Allowable web shear is 12,500 p.s.i. All welding is governed by the Canadian Standards Association specification for metallic electric arc welding (W59-1946). This specification permits a unit stress of 20,000 p.s.i. for weldments in compression, and 13,600 p.s.i. for weldments in shear. For welds in tension the allowable unit stress is 85 per cent of normal or 17,000 p.s.i.

On the roadway, the maximum stress produced by either a uniform live load or a concentrated live load is required to be determined. The roadway uniform live load is specified as 100 p.s.f. to the crossbeams, 70 p.s.f. to the main girders of the west crossing and 80 p.s.f. to the main girders of the east crossing. For all uniform loads full span loading only is considered. Adjacent or alternative spans are loaded as necessary to produce maximum stress. The alternative roadway concentrated live load is specified as one 20 ton truck with 30 per cent impact per 9 ft. lane.

Fig. 11. Downstream side view—finished east crossing—looking east.

Only one such series of trucks abreast is considered per crossing. A stationary lateral wind force of 50 p.s.f. on 1½ times the projected area of the unloaded structure is also specified in the design.

Crossbeams

Since the crossbeams and main girders are flush top, the crossbeams are actually in three parts. The cantilevered portions outside the main girders are referred to as floor brackets and that portion between the main girders is referred to as the floorbeam. The floorbrackets extend a total length of 10 ft. 6 in. beyond the main girders and support 5 ft. of the roadway surface as well as the sidewalk, facia, fence and utility conduits. Their shear at the main girder amounts to 18 kips for dead load, 5 kips for uniform live load and 21 kips for truck load and impact, or a total shear of 44 kips. The corresponding cantilever moments are 110 ft. kips for dead load, 38 ft. kips for uniform live load and 73 ft. kips for truck load and impact, that is 221 ft. kips total moment.

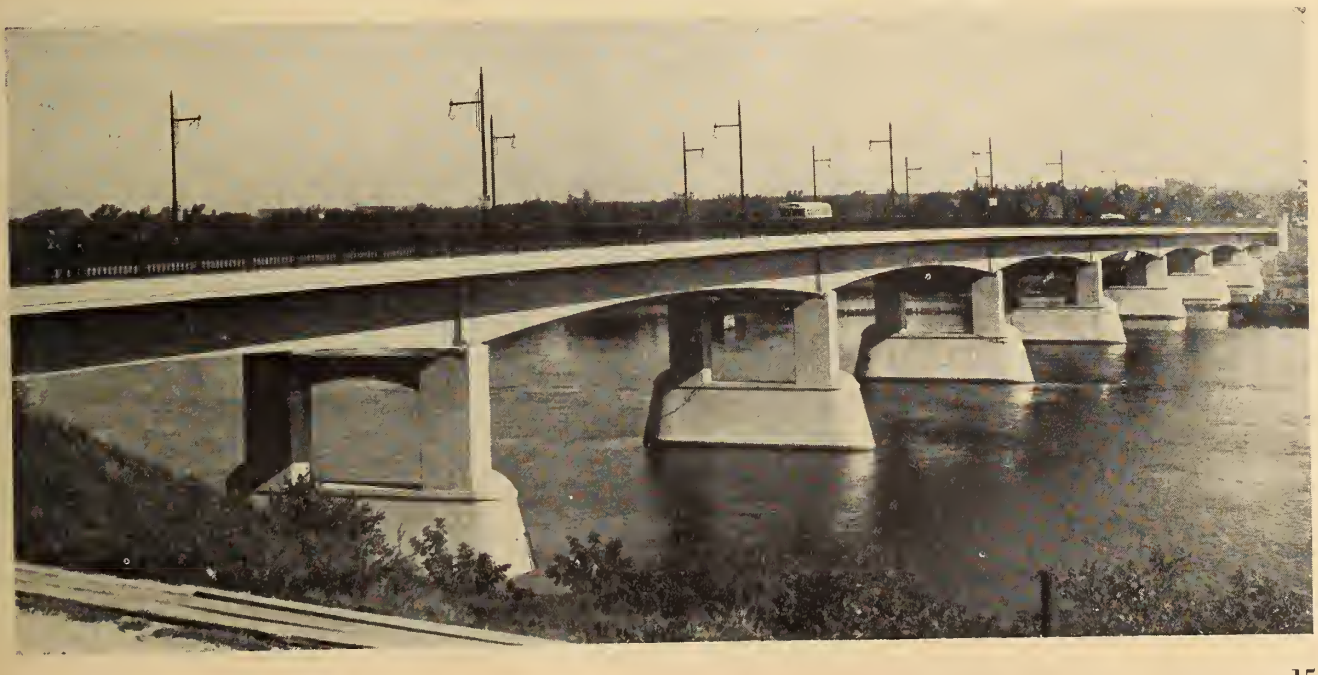
The floor-brackets are of all welded construction and consist of a ⅜ in. web plate with 12 in. by ½ in. top flange plate and 8 in. by ⅜ in. bottom flange plate. At the inner end the depth is made equal to the depth of the floorbeam or 33⅛ in. At the outer end the depth out to out of flange plate is 12 in., the bottom flange being straight and sloping throughout its length. At the main girder the web and bottom flange are milled, as are the ends of the floorbeams themselves, so that the compressive resistance to the cantilever moment is taken in bearing through the web of the main girder. The tensile resistance to the cantilever moment is obtained by carrying the top flange plate clear past the main girder and connecting to the top flange of the floorbeam. The web plate, being coped for a depth of 10 in. at the top to clear the main girder flange, does not contribute to the tensile resistance.

Since holes are required for field assembly, it was deemed economical to field rivet this connection rather than field weld. This rivetting is performed only after the field welding of the web is completed. At the outer edge of the floor bracket, a vertical 6 in. by ⅜ in. plate, welded to both web and flanges, has four rivet holes for connecting the 6 in. vertical leg of the facia shelf angle. The shelf angles are fabricated in two panel lengths and have 2 in. by ¼ in. plates 2 in. long welded on edge at 24 in. centres, placed ¾ in. from the toe of the 3½ in. horizontal leg. These plates serve to bond the lower edge of the concrete facia beam. The shelf angles also serve a particularly useful secondary purpose in facilitating the positioning and alignment of the outer ends of the floor brackets. For these reasons it is suggested that their use be maintained in all future designs of bridges of this type.

The floorbeams are designed as beams freely supported at the main girders and are proportioned for the maximum moment at their centreline. Full advantage is taken of the reduction of dead load moment due to the cantilevered floorbrackets, but for live load moment, no account is taken of any end restraining action which might be effected by such factors as the size of the main girder, knee braces, the action of adjacent floorbeams or the location of the floorbeam with respect to the piers. The bond of the concrete floorslab to the top flange is assumed to hold the floorbeam laterally, but the slab is not assumed to contribute to flexural resistance.

The centreline moment due to dead load, figured as a simple span, amounts to 160 ft. kips, which quantity is reduced by 91 ft. kips, the dead load moment of the floor bracket, giving a net dead load moment of 69 ft. kips. Only one half the weight of utility cables on the floor bracket is considered when computing the cantilever dead load moment reduction. Four trucks abreast produce a moment of 450 ft. kips and an impact of 135 ft. kips. The total design moment is therefore 654 ft. kips, which at 20,000 p.s.i. requires a section modulus of 393 in.^{3}. A 30 in. by 11½ in. wide-flange beam at 130 lbs. per ft. having a section modulus of 404.8 in.^{3} is provided.

Fig. 12. Downstream side view—finished west crossing—looking east.



The end shear totals 100 kips, made up of 20 kips due to dead load and the balance due to truck and impact loads.

The floorbeams are held rigidly against overturning during erection by connecting the top corners of their webs to small 5 in. by ⅜ in. plates, which are welded to both the web and top flange of each main girder. These small web connecting plates are so located that on one main girder contact is made with the nearside of the floorbeam web and on the other main girder with the far side, thus permitting the floorbeam to swing horizontally into place.

In way of the river piers, the floorbeams are replaced by relatively stiff frames which have the threefold function of acting as a floorbeam, as a jacking girder for dead load of steel during erection, and of transferring the specified lateral force to the pier members. No permanent wind bracing is supplied, as the floor slab is designed to transmit the lateral load to the pier frames. At piers with adjacent 180 ft. spans, this lateral force totals 166 kips and is assumed to be resisted equally by the two pier members. The frame is proportioned at 25 per cent increased unit stresses for the moment of this lateral force about the neutral axis of the frame added to the moment of the floorbracket.

On the west crossing a pier frame consists of a 60 in. deep welded plate girder, with triangular webs inserted at each end between its bottom flange and the bottom flange of the main girder. These triangular webs extend to points 3 ft. 6 in. from the centreline of the main girders. Between these points, the web is stiffened with pairs of 4 in. by 5/16 in. plates spaced at 50 in. centres. Horizontal stiffeners placed opposite the bottom flange of the floorbrackets are provided to resist the thrust from the cantilever moment.

The frame web is connected to the main girder by butt welding it full length to the edge of the central 1½ in. thick bearing stiffener. This connection is accomplished by shop welding the edge of 3 in. by ¼ in. flat for the full depth of the bearing stiffener. This flat then serves the dual purpose of acting as a backing bar for the butt weld and providing holes at 9 in. centres for field assembly. To permit swinging the frame transversely into place these connecting flats on opposing main girder bearing stiffeners are positioned so as to contact opposite sides of the frame web surface. The east crossing pier frame design is similar to that of the west crossing with the exception that the welded girder is 40 in. deep instead of 60 in. deep.

Main Girder Geometry

Special importance is given to the determination of the geometry of the main girders. These calculations are used not only for their design computations, but also for their detailing and fabrication. The geometry may be defined as the establishment of the out to out dimensions of flanges throughout the length of the girder. The outside of the top flange is made parallel to and a fixed distance of 12 in. below the defined longitudinal crown of roadway.

To determine the underside of the bottom flange it is necessary to establish the economical depth of girder, out to out of flanges, at the piers and at the centreline between piers. The time element does not permit complete redesigns with various depths in order to attain absolute economy. Full use is made of past experience in the design of many bridges of this type and depths are chosen and maintained throughout the computations.

The 180-ft. spans of the west crossing are made 12 ft. deep at the piers and 8 ft. deep midway between piers. The corresponding depth for the 140-ft. span of the east crossing are 10 ft. and 6 ft. 6 in. The bottom flange is kept truly horizontal for a distance of 1 ft. 6 in. each side of the centreline of pier, to accommodate bearing stiffeners and pier members. Between the ends of these horizontal distances, the bottom flange is made approximately parabolic in shape with origin at the centreline of span.

The actual girder geometry of each span is determined by computing offsets to the flanges above and below an arbitrary working line, chosen as a straight line joining points 3 ft. below the top flange at the centreline of piers. Offsets, called working perpendiculars, are figured at each crossbeam position, and are made perpendicular to the working line. All floorbeams, floorbrackets and related details between piers are kept normal to the working line and on the working perpendicular.

Main Girder Proportioning

Like all indeterminate structures, it is necessary to know the material of the main girder before a correct stress analysis of it can be made. This implies determining the material by an approxi-

Fig. 13. Deck view—small traveller.

mate method and with this material making successive corrections using more exact methods. One of two approximate methods is generally adopted. The first is to assume a constant moment of inertia of the girder and to apply factors to the resulting moment at the supports and at midspan. For the 180 ft. span such factors would be about 1.25 at the pier and 0.75 at the centreline of span. The second approximate method is to assume a ratio of minimum I to maximum I of about 0.25, and to determine stiffness and carry-over factors from published tables of derived properties of haunched beams. Though these tables are intended for the use of concrete girders, the resulting moments obtained by distribution of fixed end moments are a reasonable first approximation.

The more exact successive steps consist of determining the moment of inertia of the girder at each floorbeam using depths defined by the geometry and material derived from the first approximation; determining the stiffness and carry-over factors due to variable moment of inertia; determining moments at the supports by distribution of fixed end moments; determining end shears; determining moments at each crossbeam position and at splice points; verifying the unit stress of the material at each point. If the material is found to be overstressed or understressed, it is corrected and the computations repeated.

In these calculations, the floor slab is not considered as contributing to the resistance of the vertical bending moment. For the 180-ft. span the resulting moments, shear and material due to a dead load of 4400 lb. per ft., a sidewalk uniform live load of 180 lb. per ft., a roadway uniform live load of 1,650 lb. per ft. or alternatively a concentrated load of 98,600 lb. followed by one of 24,600 lb., 14 ft. away due to four 20-ton trucks abreast with impact, are shown in the accompanying illustrations.

The maximum web shear of 585 kips requires a web area of 46.8 sq. in. A web plate 139 in. by ⅜ in. having an area of 52.1 sq. in. is provided, and is adequately stiffened by intermediate stiffeners at 5-ft. centres. The location of shop web splices is dictated by the size of plate available. These splices are full strength butt welds. Similarly the location of flange shop splices was dictated by lengths of plate obtainable in Canada. If it were possible, it would be more economical to avoid altogether the use of shop flange splices. Each position of flange shop weld must be analysed, to verify that the unit stress induced by the applied bending moment does not exceed 17,000 p.s.i., the allowable stress of weldments in tension. The field splice is located near a point of least bending moment, and is positioned midway between an intermediate web stiffener and a crossbeam. Thus the temporary bolted field connection does not interfere with the standard crossbeam arrangement and the bending moment is sufficiently low to permit taking out holes in the flanges for this connection without any increase in metal being required.

Main Girder Details

The girder web shears are resisted at the piers through the intermediary of welded plate stiffeners. These pier stiffeners are arranged in such a manner that the bearing stresses are transferred over a distributed area to the dished surface of the pier member. The group of bearing stiffeners is designed as a compression member at a maximum allowable unit stress of 15,500 p.s.i. For a reaction of 1,120,000 lb. an area of 72.3 sq. in. is required. Two central plates of 12 in. by 1½ in., plus four plates 7 in. by 1¼ in., spaced in pairs 8 in. either side of centre together with 20 in. of the ⅜ in. web plate provide 72.5 sq. in. of metal. Eighteen inches either side of the centreline of pier, where the bottom flanges change direction in forming the upward sweep of the parabolic curves, a small ½ in. plate fin is welded in to resist the outward component of the flange stress due to its direction change.

To improve the exterior appearance of the bridge, all intermediate main girder web stiffeners are placed on the interior face only. The sole stiffeners evidenced on the exterior web face are the main bearing stiffeners. Intermediate stiffeners are placed at each crossbeam position and also midway between crossbeams. At crossbeams, they are cut short and capped with a small plate to form a seat for the bottom flange of the floorbeam. The girder web for the depth of the floorbeam is stiffened by the direct welding of the web of the floorbeam and floorbracket. Stiffeners halfway between crossbeams run the full depth of the girder web between flanges. These intermediate stiffeners consist of single angles with toe welded to the girder web and outstanding leg parallel to the girder. Specifications do not cover the design of single angle stiffeners. However, the intent of the specification is considered as being complied with by designing the single angle stiffener with equivalent moment of inertia and section modulus to the corresponding conventional double angle stiffener that would be required. In computing the section modulus, a portion of the web (12 in.) is incorporated in the stiffener section.

Kneebraces are made of ⅜-in. plate fitted between the underside of floorbeams and the top face of the girder bottom flange. Their purpose is twofold. On the main girder pier section, they serve to stiffen the compression bottom flange, and they are located at each of the three crossbeams immediately on either side of the centreline of pier. On the main girder centre section, they are placed at every second crossbeam, and serve to transmit specified lateral loads to the resisting floor slab. Where used, the kneebraces replace the ordinary single angle intermediate stiffener.

For the full length of each continuous girder a ⅞-in.-dia. rod handgrip is located 3 ft. above the bottom flange. This grip is for the convenience and safety of department inspectors who may thus reach successive piers for inspection of pier members without climbing up and down at each pier.

Due to the fairly large downward grade of 1.5 per cent for most of the length of the west crossing, it is desirable to assure that no creeping of the floorslab might occur due to failure of bond with the top flange of the main girder. To this end, 1-in.-wide bars by ¾ in. deep and 12 in. long are welded to the top flange midway between each crossbeam. It is felt that these bars together with the floorbracket top flanges provide sufficient mechanical bond to prevent any possibility of relative slab movement.

The girders are cambered for

dead load only. The dead load deflection is computed and plotted graphically as a check and to determine the smoothness of the deflection curve. The camber is then added to that portion of the working perpendicular between the top flange and the working line, and subtracted from that portion of the working perpendicular between the working line and the bottom flange. Temporary erection bracing only is provided, and is removed after the floorslab has been poured. This bracing serves to square the structure during erection and to resist lateral forces during that period.

The effect of pier settlement on the continuous girders was investigated. Assuming a downward movement of 4 in. of a pier with 180-ft. spans on either side and no movement at adjacent pier, the reaction at the settled pier would reduce by 68 kips but the reaction at adjacent piers would increase by 52 kips. Thus at the settled pier the reaction is reduced by 6 per cent of maximum or 8.3 per cent of dead load only. Reactions at adjacent piers would increase by 4.6 per cent of maximum, or 6.3 per cent of dead load only. The effects on the bending moments would be to reduce the negative moment at the settled support by 3780 ft. kips, increase the positive moment midway in adjacent spans by 640 ft. kips and increase the negative moment at adjacent supports by 2430 ft. kips.

At midpoint of adjacent spans this means that the flange unit stress due to full dead load and live load would increase to 21,500 p.s.i. as compared with the design stress of 20,000 p.s.i. At the adjacent piers the flange unit stress due to dead load plus live load would increase to 22,100 p.s.i. For dead load only this stress would be 15,000 p.s.i. It would require a movement of 13 inches to attain a flange stress of 20,000 p.s.i. at adjacent piers, due to dead load only. Obviously, such a pier settlement would not endanger the structure, particularly as the live load could be controlled until corrective measures had been undertaken.

Pier Members

At each pier, the main girder reaction is transmitted to the concrete through a pier member, designed to distribute the load to the pier at a maximum pressure of 750 p.s.i. The main girder is considered fixed at the pier nearest the centre of each crossing. At this centre pier a non-moving or fixed pier member is used, and at all other bearings a roller nest or expansion pier member is employed.

A fixed pier member consists of a plate dished to a polished surface of 37 in. spherical radius which engages the polished surface of a disc plate of 36 in. spherical radius. The disc plate is welded to a thick bed plate designed to distribute the reaction over the required area. The dished plate is welded to the bottom flange of the main girder. Both the dished plate and disc plate have a threaded hole on dead centre. The hole in the dished plate is for a threaded dowel pin which engages the hole in the disc plate, thus assuring centering of the bearing. The hole in the discplate, prior to its use as just mentioned, serves to receive a temporary threaded eye-bolt, which permits ready handling of the pier member during its positioning. An expansion pier member is similar to a fixed pier member, with the exception that the bed plate is referred to as the upper bed plate, and rests on a series of rollers which in turn bear on a lower bed plate of nominal thickness.

All geometry calculations are based on a normal temperature of +60 deg. F. The maximum and minimum temperatures are assumed to be +120 deg. F and —40 deg. F, whence elongations are figured for a change of 60 deg. F and contractions for a change of 100 deg. F. In other words, the movement of the rollers from normal due to maximum increase of temperature is less than the movement due to maximum decrease of temperature. To equalize the movement of the rollers in both directions, the lower bed plates are offset from the centreline of pier by an amount equivalent to a temperature change of 20 deg. F. In this manner scribed lines on the centre of the upper and lower bed plates would be aligned at 40 deg. F; that is, the true average between assumed temperature extremes.

The west crossing expansion pier members at the abutments contain four 6⅛-in-dia. rollers 28⅛ in. long, and at all other piers they consist of seven rollers 42 in. long. On the east crossing they consist of three rollers 26¾ in. long at the abutments and five rollers 44¼ in. long at the remaining piers.

Floor Expansion Joint

At the abutments of both crossings, there is sufficient movement due to the defined temperature variations to necessitate the use of floor expansion joints. At the sidewalks, the conventional sliding checkered plate arrangement is used, but for the width of the roadway floor a finger type joint is adopted. The fingers are made of 2½ in. by ½ in. bars on edge, spaced at 1½-in. centres. They are chamfered at both ends and scalloped on the top edge to reduce skidding. Those on the abutment side alternate with those on the bridge side and have a normal overlap of 7½ in. and a clear space of ¼ in. between. They are supported by and welded to transverse vertical plates.

On the abutment side, these vertical plates are bolted to anchors preset in the concrete. On the bridge side, they are rivetted directly to short brackets provided on the pier frame. A series of longitudinal stringers are introduced in the first floor panel to resist the cantilever moment on the brackets. Nearby horizontal anchor rods with hooked ends are welded to the vertical plates just under the fingers.

Erection

The normal or preferred procedure for erecting a bridge of this type is to do all the assembly with a traveller on the deck of the structure. This method involves the use of temporary falsework bents placed at the outer end of the first girder section and at the outer end of each centre section. The reaction on the bent under this condition is very heavy, and for a successful operation it is necessary to be absolutely positive of its carrying capacity. Unfortunately, the decidedly soft river bed at the site precluded such assurance, thus eliminating any possibilty of using this falsework method of erection. Various other schemes were considered. The most promising was to erect the entire structure with floating derrick scows. This method was adopted and proved successful.

The site of the east bridge was not readily approachable by water from the St. Lawrence River, therefore all material was shipped by rail to a siding, where a locomotive crane transferred the steel to trucks and the material was transported to the job. A 20-ton guy derrick

Part IV

The Walther Rocket Works at Kiel

The Walther Werke had originally commenced work on propulsive ducts for aircraft as early as 1936 and later extended the scope of its efforts to power units for submarines and torpedoes, employing the same principles as for aircraft propulsion. In the propulsive duct, which operates on the "Ramjet" or "Athodyd" principle, the forward speed of the duct results in compression of the air by "ramming". Heat is then added to the compressed air by the burning of fuel. (Fig. 43.)

The functioning of this system depends upon the forward speed, of course, to supply the necessary "ram" effect and therefore such a system cannot develop a static thrust when at rest. In an effort to overcome this difficulty the Walther Company were led to the use of rocket units to induce a flow through the propulsive duct under static conditions (Fig. 44). Subsequently, the rocket development overshadowed the propulsive duct project, due to its ability to provide extremely high thrusts for short periods, which had immediate application to assisting the take-off of heavily-loaded conventional aircraft.

Walther developed two classes of rockets known as "hot" and "cold" types, both of which employed "T-stoff" (an 80 per cent solution of hydrogen peroxide in water) as the basic fuel. Large quantities of heat and free oxygen were obtained from the decomposition of "T-stoff", which was accomplished by bringing it into contact with a catalyst, "Z-stoff", (an aqueous solution of sodium permanganate). The key to the Walther rocket developments lay in the ability to produce large quantities of pure hydrogen peroxide and to prepare it as a stable solution of exceedingly high concentration in water.

In the "cold" units, the gaseous steam and oxygen resulting from the decomposition of "T-stoff" provided the necessary jet action. In the "hot" units, the "T-stoff" acted as an oxidizing agent, additional fuel being supplied which burned with the free oxygen to produce both heat and additional gases. The second fuel

EDITOR'S NOTE

Late in 1945 a group of Canadian scientists and engineers visited Germany to investigate scientific and technological achievements of our former enemies. The authors of this paper, at that time on the staff of the National Research Council, were assigned to the field of aeronautics.

The report submitted by these scientists was long and comprehensive, but, in spite of heavy demands on their time, they have prepared a condensation specially for the JOURNAL: Even in this condensed form the report is of necessity being published in four instalments. When all four parts have been published it is hoped a consolidated reprint will be available for those interested in preserving the report in its entirety.

This fourth and last instalment covers the Walther Rocket Works at Kiel; the Focke-Wulf Structures Laboratory at Detwold; Blohm and Voss Aircraft Works at Hamburg; Bayerische Motoren Werke at Munich; Deutsche Versuchanstalt Outstations; Aerodynamics Institute at Sonthofen, a summary and conclusions are added.

FIG. 46

employed was originally ordinary gasoline, but later "C-stoff", (a 30 per cent mixture of hydrazine hydrate in methyl alcohol) was preferred.

The "T-stoff" and "C-stoff" were injected into the combustion chamber by means of a special nozzle (Fig. 45), in which an internal diverging conical jet of "T-stoff" impinged upon an external cylindrical jet of "C-stoff". To prevent explosions it was necessary to pump the "C-stoff" first so that the "T-stoff" was decomposed immediately upon entry into the combustion chamber. A spring-loaded valve was provided in the "T-stoff" nozzle in case of back-fire.

In the smaller and simpler units the fuels were pumped by means of compressed air carried in bottles at 150 atmospheres pressure (2200 p.s.i.). In the larger, more advanced designs, electrically-driven centrifugal pumps were first used, but were later supplanted by turbine-driven pumps supplied with steam at 600 deg. C. resulting from the decomposition of "T-stoff" when passed over stone impregnated with "Z-stoff".

As corrosion protection is required with the above fuels, the tanks and piping had to be of either pure aluminum or stainless steel. Although jet temperatures were of the order of 1750 deg. C., the actual fuel nozzle temperatures were not high, so that stainless steel could be employed here also. In order to prevent the combustion chamber temperatures from becoming excessive, the "C-stoff" was led through a jacket surrounding the chamber walls before entering the combustion chamber, thus providing very effective cooling and permitting the use of low grade forged carbon steel for the combustion chamber.

Considerable difficulty was encountered at low temperatures since "Z-stoff" freezes at − 15 deg. C. while "T-stoff" itself freezes at − 25 deg. C. At high altitudes, above 40,000 ft., it was necessary to pressurize the fuel tanks and a small spiral pre-pump was used, in conjunction with the centrifugal impeller, to prevent cavitation.

On the simpler types of unit, metal rupture diaphragms were used as valves to initiate the flow. Usually, a powder squib was employed to actuate the piston and rupture a diaphragm in the air supply line, the line pressure then rupturing the diaphragms in the fuel lines. In the more advanced types, where control of the thrust was desired, a special injector valve in the combustion chamber, (Fig. 46), was developed which consisted of a rotating sleeve

Fig. 47. Walther 509 Rocket Power Plant for Messerschmitt Me 163 "Swallow" Fighter.

which progressively opens up additional fuel injection ports.

There were two main types of units used for assisting take-off. The first type had a " cold " drive and delivered 1100 lb. thrust for 30 seconds with a unit weight of 330 lb. and a fuel weight of 287 lb. giving a total of 617 lb. The second type employed a " hot " drive using gasoline as a second fuel and delivered 3300 lb. thrust for 30 seconds. The weight of this unit was 507 lb. plus 485 lb. of " T-stoff " and 24 litres of gasoline, giving a total of 1,030 lb. In order to prevent excessive temperatures in this unit, 30 per cent excess " T-stoff " was used to act as a coolant.

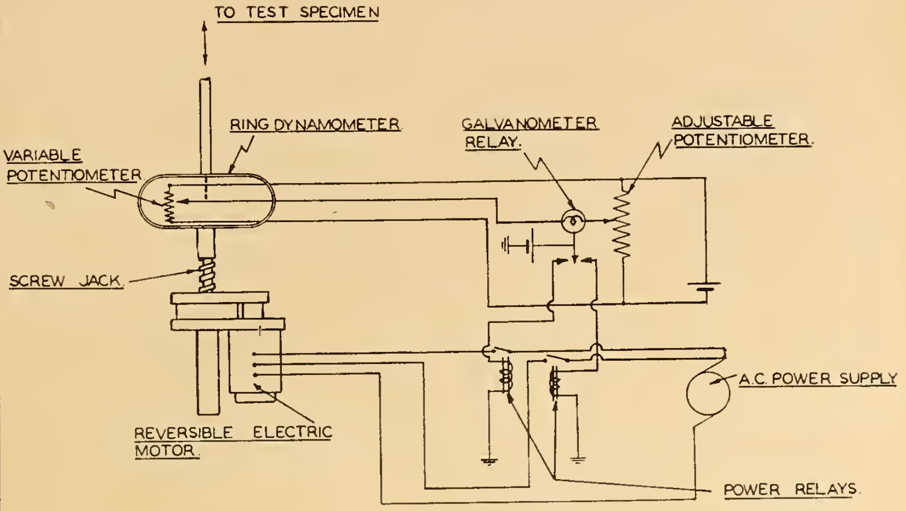
The large Walther 509 unit (Fig. 47), used "T-stoff" and "C-stoff" as fuels and was developed for continuous operation on the Messerschmitt 163 " Swallow " interceptor. The " Swallow " was a tailless rocket-propelled aircraft and with the Walther 509 unit delivering 3750 lb. thrust, the aircraft could attain a restricted maximum speed of 590 m.p.h. and required only three minutes to climb at an angle of 40 deg. to 33,000 feet. The gross weight of the aircraft was 9,000 lb., of which 4,400 lb. constituted fuel, but owing to the enormous fuel consumption of the rocket unit, the duration of flight was only 8 minutes, giving a range of approximately 66 miles when cruising at 495 m.p.h.

A modified 509 unit, delivering 4400 lb. thrust and weighing only 287 lb., was used for assisting take-off on the Messerschmitt 262 twin-jet fighter aircraft, the unit being mounted externally and jettisoned by parachute. Consideration had also been given to employing, in conjunction with the normal jet engine, a rocket unit burning " T-stoff " and kerosene for super-performance in an emergency. " T-stoff " had also been tried in piston type catapults used in V-1 launching, and a rocket-propelled catapult car had been developed for launching the Messerschmitt 163.

A further proposed development envisaged the use of a supplementary ceramic-lined combustion chamber, in conjuction with the normal rocket units, in order to develop high thrust for take-off and to give rapid acceleration through the trans-sonic region. The normal rocket unit was arranged to discharge into the large, jettisonable, auxiliary combustion chamber into which additional fuel was sprayed. In this way it was estimated that the thrust of the 509 unit used in the Me. 163 could be increased ten-fold which would permit the aircraft to be accelerated from rest to 1100 m.p.h. in only 6 seconds.

The Walther Company were developing a rocket power unit for the DFS 228 high altitude research aircraft. The DFS 228 was a single-seater tailless monoplane which was carried pick-a-back by a Do. 217 aircraft to an altitude of 40,000 ft. where it was launched. It then climbed to 98,000 ft. by stages, using the rocket unit intermittently, and by this procedure attained a maximum range of 750 miles from the launching point.

During the latter part of the war, Walthers also resumed their development of propulsive ducts and achieved fuel consumptions of the order of 7.2 lbs. of fuel per lb. of thrust per hour.



AUTOMATIC ELECTRIC SCREW JACK LOADING SYSTEM FOR STRUCTURE TESTING.

FIG 48

The Focke-Wulf Structures Laboratory at Detmold

The Structures Laboratory of the Focke-Wulf aircraft plant had been evacuated from Bremen in 1942 when the Allied bombing offensive threatened the factory. The Laboratory was well-equipped with testing machines of all types and sizes and included a large static testing frame. It was obvious that Focke-Wulf attached great import-

FIG 51

ance to dynamic testing of structures, as most of the test machines incorporated means for cyclic application of loads.

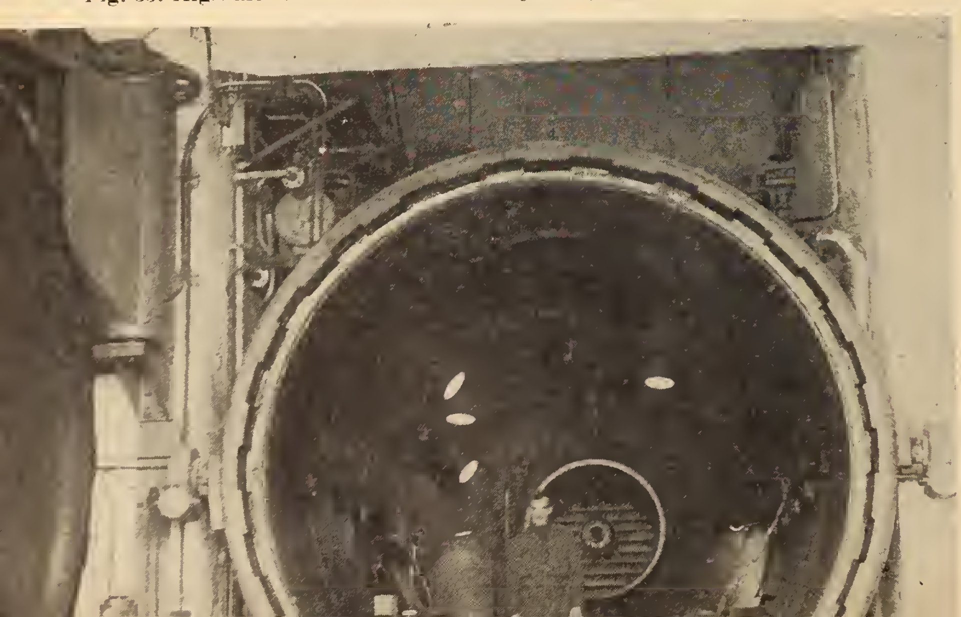
Focke-Wulf, due to the shortage of light metals, began in 1943 the development of aircraft structures employing wood and steel components. The steel construction was considered unsuitable and was dropped in the early stages, but the design of an all-wooden twin-engine fighter aircraft, the TA 154, (a copy of the British de Havilland "Mosquito"), was carried out. In consequence much of the work of this Laboratory was devoted to the development and testing of wooden structures.

The German wooden construction was much heavier than employed on the "Mosquito", probably due to the lack of light filler materials, such as balsa wood for stabilizing the plywood panels. A very comprehensive investigation of wood gluing was undertaken, in which all of the various factors affecting the strength of the bond, such as surface texture, grain direction, moisture content, glue composition and properties, drying time, temperature and duration of cure, glue line thickness, application technique, etc, were investigated.

In connection with the testing of wooden structures, an interesting technique was employed to determine which element of the structure failed first. This consisted in the use of an aluminum foil tape cemented to the various components so that upon fracture an electrical circuit was opened.

Another interesting technique for controlling the loading of the large static test frame was developed, using electrically actuated screw jacks. These screw jacks operated in conjunction with a "ring" type dynamometer which incorporated a variable rheostat actuated by the deflection of the dynamometer, as indicated in Fig. 48. The dynamometer rheostat formed two arms of a Wheatstone Bridge circuit. The other arms of the bridge were located in the control panel and their ratio was adjusted in advance to give a predetermined load. Until this load was reached and the bridge was balanced, there existed an electrical unbalance which, through relays, drove the electric motor in the screw jack in the appropriate direction to achieve balance. This system had the same advantage as hydraulic loading systems, in that distortion of the structure did not alter the load applied. In addition this arrangement also had the advantage of instantaneous irreversibility when failure occurred and permitted the reproduction of a given deflection pattern using manual control.

Fig. 53. High altitude test chamber for jet engines at B. M. W. Plant, Munich.



The Blohm & Voss Aircraft Works at Hamburg

This plant was a comparatively small establishment devoted principally to the experimental development of seaplanes and flying boats and did not engage in large-scale production. It was a branch of the very large shipbuilding interests of the same name and this may serve to explain the extensive use of boiler plate and structural steel in Blohm & Voss aircraft. The firm claimed to have obtained satisfactory results in the use of arc welded manganese and carbon steels for the primary structural elements of their aircraft. For example, a circular steel tube formed the main spar in the wing of their large flying boats, to which leading edge and trailing edge fairings were attached (Fig. 49). This spar was also used for fuel storage.

Blohm & Voss were developing two large flying boats, the BV 222 weighing 53 tons and the 6-engined BV 238 weighing 99 tons, both of which incorporated several novel features. The hull comprised a single shallow main step, together with an unusually large number of small auxiliary steps, about 1 in. deep, spaced at 3 ft. intervals, which were internally vented (Fig. 51). All controls passing through the wings were actuated by torque tubes to eliminate any adverse effects due to structural deflection. For manoeuvring on the water, an ingenious throttle arrangement was used, whereby sideways motion of the master throttle gave differential motion of the individual throttles.

To achieve adequate control without the necessity for power boosting, the larger part of the elevator of the BV 238 floated freely (Fig. 52), and its position was controlled by the movement of a servo tab on the trailing edge, which was actuated by the pilot's control. To provide aerodynamic " feel " of the control forces, a smaller inner portion of the elevator was connected directly to the pilot's stick. For longitudinal trim, the entire empennage was rotated about a hinge point below the tailplane (Fig. 52), to change its incidence. A fixed slot was incorporated in the stabilizer to maintain flow at high incidence.

Blohm & Voss also had under development a high altitude, single-engine fighter, the BV 155, designed to operate up to 55,000 ft. Here, in addition to the usual main wing spar of structural steel, the pressurized fuselage cockpit was also built up from welded steel plate. An unusual feature of this aircraft was the location of oversize radiators and supercharger intercoolers in the wings midway between the fuselage and wing tip. This aircraft was reputed to have a maximum speed of 430 m.p.h. at 50,000 ft.

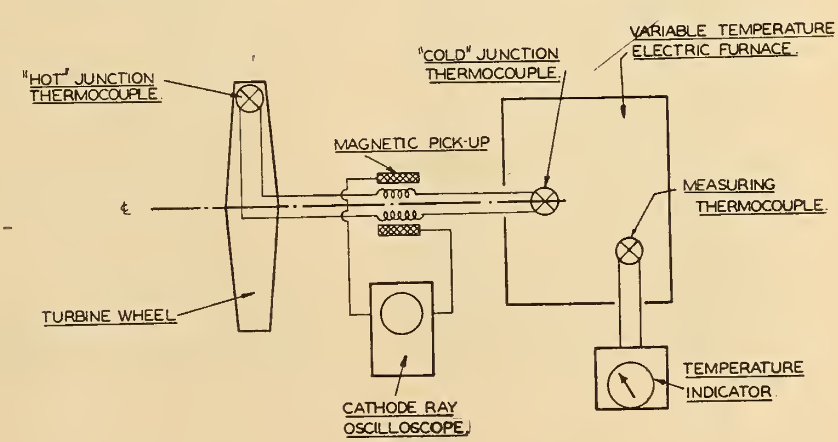
Another project in the preliminary stages was a jet-propelled fighter aircraft in which the pilot was seated astride the welded steel intake tube for the jet engine, which also served as a primary fuselage structural element. The layout included a high wing, with the tail being carried on a boom.

The assembly jigs being used for the construction of the BV 238 were of some interest, since they were capable of wide adjustment to permit their use in construction of aircraft or components of various sizes and types. The jig was fabricated from standard steel tubing connected by swivelling clamping rings at the joints, each ring being fitted with numerous lugs for the attachment of additional members. It was not attached to the concrete floor, but rested on pads and was equipped with screw jacks for vertical adjustment.

Blohm & Voss were also engaged in the production of guided missiles, and had employed a unique construction for the mass production of wings for the BV 246 glider bomb which incorporated radar target finding. These wings had the unusually high aspect ratio of 20, which presented a particularly serious structural problem. The wings were therefore fabricated from a spar, consisting of a stack of welded steel plates, onto which a concrete fairing was cast to give the required aerofoil shape.

Bayerische Motoren Werke at Munich-Oberwiesenfeld

The tremendous B.M.W. plant, which manufactured both reciprocating and jet engines for aircraft, had been severely bombed, with the result that a large part of the manufacturing facilities were dispersed to underground plants in more remote parts of Germany. However, the extensive research and testing facilities still remained. In particular, the elaborate high altitude test plant, capable of testing both reciprocating engines and jet engines, was unique. The facilities for testing of jet engines overshadowed anything existing in either the United States or the United Kingdom; consequently the plant was operated for some time after the cessation of hostilities in testing jet engines from the U.K. and U.S., prior to the dismantling



D.V.L. COMPARISON METHOD FOR MEASURING TEMPERATURE ON ROTATING TURBINE BLADES

FIG. 54

of the establishment in accordance with the terms of the Potsdam Agreement.

The engines under test were enclosed in a high altitude chamber (Fig. 53) having a diameter of 13 ft. and a length of 26 ft. The power from reciprocating engines was absorbed by a 5,000-hp. water brake and a 1500-hp. electric dynamometer which could be employed to give, when required, a total power absorption of 6500 hp. The thrust of the jet engines was measured by a simple mechanical balance.

The pressure in the chamber could be reduced to 0.08 atmospheres corresponding to an altitude of 55,000 ft., this being accomplished by the use of two multiple-stage centrifugal exhausters. These exhausters, which removed the products of combustion, could be connected in series or parallel to suit the requirements of the test. In order to reduce the temperature of the exhaust gases of the test engine and prevent damage to the exhausters, water was sprayed into the exhaust stream which in addition was passed through an air heat exchanger.

Charge air was supplied to the engine under test from a 3-stage centrifugal compressor, delivering a maximum of 55 lb. of air per second with a compression ratio of 2.4. This intake air was then passed through a water heat exchanger which could be used for heating the intake air, although normally the air was cooled. The air then passed through a brine spray cooler, the brine being refrigerated by a 7-stage, Freon system of 1000 hp. capacity. The minimum temperature of the air upon leaving the brine cooler was − 15 deg. C.

If further temperature reduction was required, the air was passed through an expansion turbine to produce useful work by circulating air through the exhaust heat exchanger, thus reducing the intake air temperature to a minimum value of − 70 deg. C. The air was then ducted directly to the engine in the altitude chamber, thereby giving the necessary ram pressure. With this arrangement air could be supplied to the test engine at any temperature from +50 deg. C. to − 70 deg. C. The intake air entered the chamber at one end and the exhaust from the engine was extracted from the other (Fig. 53). The entire operation of the plant was electrical and the controls and instruments were all located on a single central panel.

Advantage was taken of the elaborate compressor equipment provided in the test plant to operate a high speed wind tunnel, which was used principally for small scale tests of jet engines. The tunnel had an open jet 1.64 ft. in diameter and was enclosed in a chamber which could be evacuated to 0.1 atmospheres pressure. Using the exhausters for the test chamber, a total driving power of 8,000 hp. was available for this tunnel. Both "hot" jet tests (in which heat is added) and "cold" jet tests were carried out in this tunnel and wake survey equipment was employed for measuring the thrust produced.

Deutsche Versuchsanstalt für Luftfahrt—Outstations

Sonthofen

Owing to the severity of the bombing of the Headquarters of the D.V.L. at Berlin-Adlershof, the various laboratories were dispersed to remote sections of the country, the thermodynamics and materials groups being located at Sonthofen in southwestern Germany.

The thermodynamics group were concerned primarily with radiators and radiator ducting. A small wind tunnel 1.64 ft. in diameter, giving a speed of 164 feet per second, was enclosed in a refrigerated chamber, for testing oil radiators at temperatures down to − 60 deg. C. This installation had just been completed and was capable of handling oil radiators up to the size required for a 2,000 hp. engine. In addition, two smaller blower tunnels were available for special tests on heat exchangers and radiators. Considerable development of aluminum radiators had been undertaken owing to the shortage of copper in Germany, and a successful radiator had been produced having a weight only half that of the equivalent copper radiator. Considerable work had been done on inclined flow radiators (Fig. 50), which reduced the frontal area of the radiator and readily lent itself to simple lightweight armouring. Inclinations up to 60 deg. could be employed without excessive losses.

This group was also responsible for the development of the boundary layer removal system for wing radiators (Fig. 21), in connection with full-scale tests being carried out in the A.V.A. tunnels at Reyershausen. Much work was done on radiator intake design, in order to develop the best form of diffuser to achieve most efficient heat transfer. A satisfactory theory was derived to obtain any desired pressure distribution at the walls, and hence to design a diffuser giving a uniform pressure distribution and therefore no flow separation from the wall. Two small blower tunnels having glass walls were used for the diffuser tests, one of which was utilized in studying the effect of flow separation upon radiator efficiency. This laboratory was also equipped with a Mach type interferometer having a field of view 6 in. by 6 in. for studying high speed air flow, but it was considered that much development was needed on this type of instrument before the data could be correctly interpreted to give quantitative results.

The Materials Laboratory was well-equipped with special instruments for the fundamental investigation of material properties. Equipment for measuring the physical properties of the material, X-ray equipment, dilatometers, and a Leitz metal microscope, having a magnification of 2,000 times, were available. Problems under study included the investigation of residual stresses in spot welds, the diffusion of copper into steel in connection with bearing problems (where it was found that the diffusion could be prevented by the addition of a small amount of phosphorous to the steel) and a study of casting alloys of aluminum incorporating small percentages of copper and silicon.

Garmisch-Partenkirchen

This small laboratory was engaged entirely upon fundamental engine problems, and included some work on gas dynamics. Among the projects undertaken was the cooling of gas turbine blades, the liquid oxygen boosting of engines for emergency power, the control of jet engines, the calculation of entropy tables for products of combustion and a study of combustion processes, including fuel atomization and ignition lag in gaseous explosions.

An ingenious method for measuring the temperature of rotating bodies was developed (Fig. 54). This employed a "null" method of indication, the "hot" thermocouple being connected through the primary circuit of an electro-magnetic pick-up to a "cold" junction located in a controlled atmosphere but mounted on the rotating body. The temperature of the controlled atmosphere was adjusted until there was no current in the thermocouple circuit, as indicated by the magnetic pick-up which was connected to a cathode ray oscilloscope. In this way the errors usually introduced by slip rings in thermocouple circuits were overcome since even the best thermocouple slip ring arrangements, employing silver rings and silver graphite brushes containing 85 per cent silver, were unsatisfactory above a ring velocity of 33 feet per second.

Aerodynamics Institute of the Aachen Technische Hochschule

Sonthofen

With the increasing weight of the bombing offensive, the supersonic wind tunnels from the Technische Hochschule at Aachen were evacuated to Sonthofen, where they were housed in the same building as the D.V.L. Laboratory. The large tunnel had a 7.87 in. square open jet enclosed in a chamber, and was capable of achieving a Mach number of 2.7 for 5 seconds using a vacuum storage of 3530 cu. ft. capacity. The diffuser walls were flexible and could be adjusted to give various Mach numbers, while a pneumatically-operated plug valve was used to connect the tunnel to the vacuum.

The second intermediate tunnel had a 4 in. square working section and achieved a Mach number of 3.1 using the standard A.V.A. electrically-operated plug type valve. This tunnel had been used for drag and pressure distribution measurements on projectile models. The third tunnel was 3.15 in. square by 31.5 in. long and incorporated glass sides for use in studies of the formation of shock waves in diffusers and the recovery of energy in the flow. The speed of this tunnel was controlled by means of a throttle valve.

Conclusion

The picture of German Aeronautical Research and Development which we have attempted to paint here is composed from the more important information collected at the various targets visited. In covering so wide a field in the brief period of nine weeks, it is inevitable that all we could have hoped to achieve would have been a somewhat superficial appreciation of the broad aspects of the subject.

The material presented in this article, taken in conjuction with the more detailed information gleaned by other investigators concentrating on narrow specific subjects, together with the wealth of German technical reports now emanating from the hands of the translators, will perhaps be useful in allowing a critical appraisal of the achievements which the Germans had made in aeronautics.

The thought remains that a certain brilliance and daring was associated with their basic conceptions of the application of science to aeronautics and aeronautics to warfare. That they came so close to success but failed in the ultimate struggle may be due to many separate factors, but lack of close co-ordination and poor timing played a large part.

Notes on Management

(*See also page 31*)

The decision of the Institute's Publications Committee to devote some portion of the space in each issue of the Journal to the subject of Management is in my opinion, a significant step forward. More and more engineers are finding themselves in positions where technical ability is not the primary requirement. The trend of engineers towards managerial positions is already well established.

In the conduct of these notes on management, the objective will be to bring to the attention of engineers, significant events in the field of management and to provide leads which they may follow up for themselves. Comments and enquiries will be welcome. The more the readers participate, the more valuable will be these notes.

Because of the time interval between the writing of material and its arrival in the hands of the reader, it will not be possible always to inform readers of what is to happen—rather will these columns contain comment on what has happened. Indicative of this was the recent visit of Professor Schell of Massachusetts Institute of Technology to Montreal under the auspices of the Graduate Society of Ecole Polytechnique. Dr. Huet Massue and his associates are to be congratulated for their enterprise in arranging this forum. It is hoped that the Journal will cover the event more fully when the proceedings have been compiled.

C. E. GELINAS, M.E.I.C.,
Chairman, Publications Committee.

Training for Management and Administration

One of the noteworthy features in the management field is the spate of schools and training courses that are being offered.

The University of Western Ontario held a course in September that ran for about four weeks and was designed to meet the needs of men holding supervisory positions in industry and commerce. In addition the undergraduate and graduate courses in Business Administration have been revised.

Toronto University started a Graduate Course in Business Administration two or three years ago. The first class of graduates has now gone out into the active field, and it may soon be possible to obtain some evaluation of the effectiveness of the course.

The School of Commerce at McGill University is preparing to inaugurate Graduate Courses in Commerce and Administration next year, as well as Courses in the field of Industrial Relations.

About a year ago the School of Commerce at McGill University, in consultation with the Institute of Administration, launched an Extension Course in Management and Administration to extend over two years. This course is now in its second year and has proved so popular that some students have had to be refused as the maximum enrolment had been reached.

In addition there have been a number of short term schools run by Industrial Consultants which are reported to have had capacity attendances.

All this points to the fact that men with all sorts of backgrounds, when they get into executive positions, feel the need of wider training and education. That this is true of engineers has been stated many times to the writer of these notes.

The Society for the Advancement of Management has recently completed a survey of Management Education in which they circularized five thousand heads of business and five hundred deans and professors in schools of business administration. Usable reports were received from nine hundred and fifty executives and two hundred professors. The purpose of the survey was to: 1) ascertain the degree to which the training presently offered met the needs of employers of the graduates from the schools; and 2) obtain the opinions of the professors about the adequacy of the curricula. The results of the survey have been published in *Modern Management* for November, 1948.

The natural line of promotion for any engineer who is not wholly concerned with design, is to supervisory positions where a knowledge of management and administration is a necessity. The engineer who is looking forward to such a future will be wise to prepare himself by taking such courses as are available in his vicinity. If there are no such courses open to him the engineer can map out his own, and by systematic reading and participation in conferences dealing with subjects in this field, can go a long way towards the goal.

The beginner will probably be wise to start on one of the numerous books offered by publishers in this field. One of the newest is "Industrial Organization and Management" by Bethel, Atwater, Smith and Stackman, published by McGraw-Hill Company. There are many others of the same type, any one of which will serve to introduce him to the field. If he is interested in learning something about the historical figures in the field and the nature of their contributions he will find a very good compilation in "Industrial Management In Transition" by George Filipetti, published by Irwin. The Human Relations aspects are emphasized in "Human Factors In Management" by Schuyler Dean Hoslett and published by Harper Bros.

The *Journal Of Advanced Management* and its companion, *Modern Management* are published by the Society For Advancement of Management, 84 William Street, New York 7. Both these journals can generally be relied upon for useful and interesting material.

The Institute of Administration of Montreal has just issued its second volume of proceedings, being papers presented at their meetings in 1945-46. Copies are available from the secretary, 1420 Sherbrooke Street West, Montreal.

Canada is now a member of CIOS (Comité International d'Organization Scientifique), the International Committee of Scientific Management, through the Canadian Management Council, of which the E.I.C. is a member. Plans are under way to have a Regional Conference of CIOS in connection with the annual meeting of the Institute in May at Quebec. Further announcement of this will be forthcoming when plans are matured. The next International Management Congress is planned for 1951 in Belgium. The European nations are looking to Canada to take an increasing part in the International movement and the officers of the Canadian Management Council hope that they will get sufficient support to make that possible.

TWO BRIDGES AT THREE RIVERS

(*Continued from page 18*)

was mounted on the east abutment, and handled the steel off the trucks to a storage area or to a barge. The heaviest pieces to be handled were the pier sections of main girder weighing 20 tons each.

The west crossing was easily accessible by water, and as a consequence all material was loaded on barges at the fabricating plant and towed by tugs to the Three Rivers harbour. There, small motor boats brought the barges to the site. The heaviest pieces on this bridge are the 110-ft. end girder sections weighing 31 tons each. The pier sections weigh 28 tons each and the 105-ft. centre sections weigh 24 tons each. A 35-ton derrick mounted on a steel scow 40 ft.-by-130 ft. was used here.

The sequence of erection was similar for both bridges. Considering the east crossing, with derrick scow on the south side, the pier members were placed on the first pier away from the abutment. Then followed the first upstream girder pier section. It was placed on the pier member and blocked at the bottom flange to long transverse timbers on each side of the pier member. Wood struts from the ends of the long timbers to the top flange of the girder section stabilized the girder section temporarily. The pier members on the abutment were then positioned, followed by the first upstream end section of girder. This section rested on its pier member at its east end and connected to the pier section of girder by the temporary bolted splice at its west end.

Similar operations erected the downstream pier section and end section of the main girder. Then followed the assembly of pier frames, floorbeams, temporary bracing and floorbrackets on the south side. Erection progressed westward in the above manner by placing the next pier section, followed by the intervening centre section.

A feature of the erection of special interest is the main girder field splice. It must be adequate in strength to resist the shear and bending moment that occurs during steel erection, and also adaptable to the proper full strength welding of the flanges and web. The flange splices are attached to the flange by four Mayari steel bolts and one drift pin on each side of the splice centre and in each side of the girder web. The drift pins are usually placed in the second hole away from the centreline of splice. The upper bars on each flange engage three holes only on each side while the lower bars on each flange engage all five holes.

The web splice consists of a 6 in. by 5/16 in. flat 6 ft. 3 in. long, placed on the inside web face, and bolted to the girder webs by a single row of bolts at 6-in. centres on each side of the splice centre. A ⅛-in. backing bar is inserted on the underside of the weld groove before bolting up the flange splice. A similar backing bar is inserted between the web splice plate and web groove. Before welding, the upper splice bars of both flanges are removed, leaving a clear access for downhand welding of the flanges. Flanges of opposite girders are welded simultaneously by two different welders starting with the top flanges. When the flanges are about half welded the drift pins are removed, thus loosening the connection sufficiently to permit contraction without undue strain. The welding of the flanges is then completed. The web is then welded, working from top to bottom, using a stepped procedure. Welding of a span commences after two spans forward have been erected. While two men weld the four main girder splices of a span, four other welders complete the welding of the pier frames, floorbeam and floorbracket webs. Rivetters complete the job by rivetting the floorbracket flanges, kneebraces, shelf angles and fencepost sockets.

A special sequence for pouring the floor slab was established, to assure that there would not be any reversal of stress in the main girders. This sequence required that the portion of the slab over the pier section and approximately equal in length to it, be poured prior to the centre section immediately proceeding that pier section. Three spans were fully completed before slab pouring was allowed to commence. Two spans had to be completed ahead of any one span to be poured.

Erection started on the east crossing in April, 1947, and with a force all told of about 36 men the west crossing was completed in October of the same year.

Unification of Threads

Elsewhere in this issue is published the history of the project leading to the unification of screw threads, and considerable of the technical data. The recently signed agreement between the United States, and the United Kingdom and Canada, is of great significance, not only for the greater economies that will follow in industry but also for the encouragement it gives to international negotiations. In a world where nations around the table seem to differ so widely on so many subjects, it is indeed encouraging to discover that at least occasionally an acceptable agreement can be reached.

This was no simple matter. The discussions reached back almost forty years. Meetings took place in England, the United States and Canada. Between official meetings small groups and individuals, in spite of what seemed insurmountable difficulties and disheartening delays, kept hammering at it. It must be very gratifying to them to see some real attainment at last. To such persons is owed a great debt by industries and by nations.

In Canada the Canadian Standards Association has been working for many years with the agencies of other nations. The Hon. C. D. Howe, HON.M.E.I.C., in his capacity as Canada's representative on the Combined Production and Resources Board, has given strong support to the proposals. General A. G. L. McNaughton, M.E.I.C., has also done much to advance the cause. Perhaps the greatest credit for Canada's contribution should go to Neil Peterson, Chairman of the Canadian Standards Association Committee on Screw Threads. He has been in the thick of it all for many years and was one of those who would not give up in spite of all the discouragements.

The new thread system, to be known as "the Unified Screw Thread System", seems to provide for threads much closer to the present United States standards than to the British. The new form of thread is to have the same angle as the present U.S. standard, i.e., 60°. For the Americans the only change is that the root is now to be rounded instead of flat. In practice this may mean no change at all inasmuch as the taps and dies for flat roots become worn at the corners and actually produce a curved root. Although not technically meeting the American standard such form of root has been accepted very widely, particularly for loose threads.

On the other hand, the acceptance of the 60° angle means to the Britisher that none of his present tools can be used for the new standard. This is indeed a serious matter, but apparently British industry and government have concluded that it is better to have unification at any price than to risk going through the experience of the late world war. To observers here who have not been a part of these long negotiations it appears that the British have made agreement possible by unselfish compromise and sacrifice, in the interest of a great international cause.

The agreement on the unified thread does not mean instant change over. It will be the responsibility of each section of industry in each country to decide for itself when it will adopt the new standard or if it will adopt it at all. However it appears that the desire for a widening export trade by the Old Country will require a change to the new thread before long.

There are other matters still to be settled in the field of uniform standards. One of these not referred to in the news of the new agreement relates to draughting room practices. These differ widely between the countries. Fortunately the agencies working on international unification are to continue and before long this subject too may be agreed upon, to the advantage of all.

In the meantime it is a matter of great satisfaction that these three English-speaking nations have come to an agreement that may presage the ultimate solution of all similar problems.

Engineers for Engineering Work

The International Joint Commission is one of the most important international bodies on which Canada is represented. It is made up of six members—three appointed by the United States and three by Canada. The commission adjudicates on problems involving the interests of both countries, but principally is concerned with the division, use and control of all waters that lie on the international boundary or cross from one country to the other.

When one considers for a moment the responsibilities of this commission in connection with the proposed St. Lawrence Waterways —to take just one example—some idea can be gained of its importance. Add to this the problems involved in proper division of the waters of the several rivers which cross the border in the west and it becomes apparent immediately that this is indeed a "most important international body".

Upon the decisions of the board will depend a large part of the economic future of many parts of Canada. It is essential that Canada be ably represented. The record in this country shows all too clearly that on many matters affecting our international boundaries we have not done too well. In those instances the ignorance and lack of interest of one or more persons on the board representing the Canadian side of the argument cost Canada a terrific price. As far as the International Joint Commission is concerned the only way to be certain that the Canadian rights are appreciated and protected is to have forceful, intelligent persons on the Canadian section of the Commission who know something about the problems.

These problems are largely of an engineering nature, therefore, it seems logical that engineers should be on the commission. The Americans have recognized this principle and two of their representatives are engineers.

On November 9th the Institute wrote the Prime Minister urging him to appoint engineers to the two vacancies then open on the Canadian section. (This letter is published herewith.) Other appropriate steps were taken also in an endeavour to impress Ottawa authorities with the necessity of choosing strong well qualified men. Other organizations such as provincial professional associations took similar action. A pointed editorial appeared in the *Financial Post* of December 11th, which said among other things, "This is no time for turning the International Joint Commission into a resting place for party faithful." Editorials have appeared in several other leading newspapers such as the Ottawa Citizen, the Montreal Gazette, the Montreal Star and the Toronto Globe & Mail. Without exception they have advocated the appointment of technically qualified men.

Notwithstanding these efforts, an ex-cabinet minister, with no engineering training, aged seventy-one, and reportedly in poor health, has been appointed to fill one vacancy. It is still hoped that an engineer with the necessary knowledge and experience will be appointed to fill the other vacancy. To this end the Institute is still in communication with the Prime Minister's office.

It is expected that the balance of the story can be told in the February issue of the *Journal*.

Nov. 9, 1948

The Right Hon. Louis S.
St. Laurent,
Acting Prime Minister,
Ottawa, Canada.

Re-International Joint Commission

Dear Sir:

Following our telegram of today we would like to elaborate on the arguments in favour of the appointment of well qualified engineers to the two vacancies now to be filled on the Canadian Section of the Commission. This question was before the Council of the Institute last Saturday and I was instructed to communicate to you the result of those deliberations.

The problems before the Commission are almost wholly of a technical nature. Therefore, it seems appropriate that Canada should be represented by engineers. Actually, this is the policy followed by the United States in that they have appointed recently a second engineer to make up their section of the Commission.

We have some knowledge of the work of the Commission in terms of its economic value to Canada. The importance of securing the very best men cannot be overstated. Not only should the members be engineers, but they should be astute engineers well able to take care of Canada's interests in the company of astute engineers from the United States. Some measurement of the good work that can be done by an engineer in this position can be gathered from a study of the record of the many years that the Hon. C. A. Magrath, HON. M.E.I.C., was chairman of the Commission.

At the present time there are before the Commission several highly technical problems which will affect the economy of western Canada for all time. These are related not only to irrigation and agriculture but also to power development, flood and drought control. We have information that leads us to believe that the United States government would like to gain a larger share of some of these waters, and that in sessions to be held shortly they will endeavour to persuade our people that additional volumes of water should be diverted to them. Canadian engineers thoroughly familiar with the situation report that the water is vital to Canada and should not be allowed to go to the States.

There are many engineers in Canada who have lived with these problems all their lives and in that field are the best informed people in Canada. From this group we think the two vacancies should be filled. It is not sufficient that engineers be employed by the Commission in an advisory capacity but it is essential that they have the status and authority of a member of the Commission. If in the opinion of the United States government engineers are the best representatives, it seems logical to believe that engineers are the best representatives for Canada as well. Any decision to the contrary would seem difficult to justify.

If there is anything the Institute can do to assist the Cabinet in this matter, such as submitting a short list of qualified persons, we will be delighted to have the opportunity.

Yours sincerely,

(Sgd.) L. Austin Wright,
General Secretary

Starting Salaries

To the young engineer the starting salary is a most important consideration. To an older man it appears of lesser significance. What really matters is the remuneration offered later in life over the long period of employment and during the years of increasing domestic responsibility.

Unfortunately too often the tendency is to increase the starting wage without making adequate changes for the senior posts. Graduates right out of college are now getting at least twice as much as a few years ago, but senior engineers fall far below that. Recommended salary schedules published by many organizations show these same characteristics, and employers cannot be criticized if they accept such schedules as indicating what the profession wants. It is to be hoped that someday a proper balance of salaries will be adopted by all employers. After all in our economic system they are the ones who determine salaries, regardless of schedules.

The latest bulletin from the Bureau of Technical Personnel gives some figures for starting salaries, based on their recent experience. The figures are not much different from those established last year but it is interesting to see that the high level is being maintained. The Bureau's figures are very much the same as those developed in the Employment Service of The Engineering Institute. The table below shows what the Bureau reports.

This works out to show that only 7.7 per cent of the salaries are above $225.00 per month and only 3.9 per cent are below $175.00 per month. The figure of $200.00 has the greatest support although $205.00 is the average.

These figures are based on employment in almost every branch of engineering and of pure science. There is also a wide spread geographically, and in the type of employer. All these things add up to the indication that the basis for the statistics is pretty general and therefore sound.

STARTING SALARIES FOR MALE TECHNICAL PERSONS ON GRADUATION 1948 (Bachelor's Degree)

Monthly Starting Salary	Number of Cases	Monthly Starting Salary	Number of Cases
Below 175	39	205	30
175	155	210	82
180	11	215	101
185	20	220	19
190	42	225	160
195	47	Above 225	77
200	217	TOTAL 1000	

World Power Conference

Information has been released recently by the British National Committee about the next meeting of the Conference. The date is the week of July 10th, 1950, the location, London, England, and the theme is " World energy resources and the production of power ".

The technical programme, as announced by the British Committee, will consist of three divisions.

1. Reports of national committees dealing with (a), the energy resources of the country including solid, liquid and gaseous fuels; water power, raw materials for atomic power and (b) — an historical record of the development of the resources of the country and of prime movers for utilizing them.

II. Preparation of Fuels —

As all kinds of fuel — solid, liquid, and gaseous — can be used for the production of power, it is intended that papers contributed to this Division should deal with the various processes of preparation and refining of fuels to render them suitable as sources of power in different types of plant and appliance.

Under solid fuels, consideration should be given to the problems involved in the crushing, grinding, cleaning, and drying of fuels. The conditions to be met vary according to the nature of the raw material and the way in which it is to be used. It would be appropriate, for example, to discuss the physical characteristics of all kinds of solid fuel and the methods employed to meet the special requirements for, inter alia, carbonization, gas producers, steam raising, and furnaces generally. As an example, the consideration of the preparation and handling of pulverized fuel would come within this Division.

As the most important source of liquid fuels is petroleum, much attention should be given in the Section on liquid fuels to the preparation of petroleum and its fuel products. The fundamental principles of the processes of treatment of petroleum and its products are also largely applicable to all liquid fuels. Examples of the subjects that might well be dealt with are the principles and technology of such processes as:

(a) Separation by fractionation or solvent extraction.
(b) Degradation and synthesis by cracking, polymerization, alkylation.
(c) Refining by physical and chemical methods.

III. Production of Power —

The general interconnection of power networks has resulted in the production of power being concentrated in large electrical generating stations. Consideration should be given to the trends in the design of such stations and the determination of their most economical location. Any special features, as, for example, the use of cooling water obtained from the sewage effluent of large cities, would have particular interest.

Fuel supplies are becoming increasingly difficult to obtain, and their quality has tended generally to deteriorate. Methods of overcoming combustion and deposit difficulties, and means of compensating for the high cost of fuels are therefore of special importance. Increased pressures and temperatures of steam constitute the conventional method of improving economic results, so that thermal cycles employed and projected will be worthy of study. The capacity of the unit of plant, both of boilers and of turbo-alternators, is being increased, and information regarding the maximum power output which can be obtained per unit of weight would be of value.

Much work has been done in recent years on the development of the gas turbine, and the time is opportune to make a survey of the progress which has been achieved in its design and application.

The revival of the hot air engine constitutes one of the most interesting recent developments, and information regarding the degree of success attained with this prime mover will be welcome.

The Canadian committee has met twice to make preliminary plans for the programme and the conference. The chairman is Dr. Chas. Camsell and the honorary secretary is Mr. Norman Marr, Laurentian Building, 54 Albert Street, Ottawa, Ont. Other members of the committee are—Dr. J. B. Challies, Montreal; Mr. G. Gordon Gale, Ottawa; Mr. R. L. Hearn, Toronto; Dr. T. H. Hogg, Toronto; Dr. C. J. Mackenzie, Ottawa. Mr. Herbert Marshall, Ottawa. Mr. Victor Meek, Ottawa; Mr. John Murphy, Ottawa; Mr. L. A. Wright, Montreal; Mr. T. M. Patterson, assistant secretary, Ottawa.

Management

The *Journal* is proposing to publish monthly something on the subject of management. It may be just a news item or reference to a speech, a pamphlet or a book or it may be a technical contribution.

Professor J. A. Coote, M.E.I.C., has undertaken to prepare the material. He is well qualified in this field having studied the subject for many years. Recently he has established a two year extra mural course at McGill, which has been so successful that many more persons have applied for enrolment than could be accommodated.

Management is of vital interest to all engineers. It is the one subject that runs through all branches of the profession. Unlike many other subjects its importance increases with the passing years. At forty or fifty not many engineers have use for their calculus but almost all of them have need of a knowledge of management.

The Institute is one of many organizations that should be interested in the study of this subject. To this end a considerable portion of the next Annual Meeting will be devoted to it, and it is hoped the co-operation of other organizations will make these management sessions outstanding.

The *Journal* accepts its share of the responsibility for increasing the members' interest in the subject and their knowledge of it. The article appearing on page 26 is the first of a series.

The Engineer — A Social Innovator

The last of the functions, held this year to mark the seventy-fifth anniversary of the founding of Ecole Polytechnique, was a forum in the Ecole's auditorium, on December 1st. Held under the auspices of the Graduates' Society, the chairman was Huet Massue, M.E.I.C., and the principal speaker was Professor Erwin B. Schell, head of the Department of Business and Engineering Administration at the Massachusetts Institute of Technology, who discussed the engineer in relation to society.

Listing the tools of the engineer as the laws of nature, the lever of analysis, the unit of measure and the power of the plan, Professor Schell urged that the engineer be possessed with the strength of humility before truth, deceiving as it may be at times. The period of accelerated industrial change in which we live has introduced new stresses and strains in our social relationships, but, at the same time, the engineer has created new products, developed new methods of production and new devices which have shortened time and space, and have made severe physical toil obsolete. As an example of the social effect of the engineer's creative achievements, the speaker cited television which was causing a return to home life " at least for a time ".

As a builder of wealth, which in turn provides tax income, the engineer has a direct relationship with the government and the public. The present challenge to the engineer was for him to keep modern industry operating efficiently in all kinds of economic weather from which the public will become firmly convinced of the necessity of freedom of action for the maintenance of our standard of living. In closing, Professor Schell expressed the wish — " May the governments, in their wisdom, continue to provide that environment of freedom of thought and incentive to self development and growth that lie at the basis of our private enterprise system. It is in this climate that the engineer of to-morrow will continue most productively to grace our civilization ".

Professor Schell's address was followed by commentaries from a jury of leading Canadian engineers and one industrialist. They were: J. E. Armstrong, M.E.I.C., chief engineer of the Canadian Pacific Railway; Hugh Crombie, M.E.I.C., assistant vice-president of Dominion Engineering Co.; J. B. Stirling, M.E.I.C., vice-president of E. G. M. Cape & Co.; A. O. Dufresne, M.E.I.C., deputy minister of mines for Quebec; and H. H. Lank, vice-president of the Canadian Industries Limited.

Through the courtesy of the graduates' society, members of the Engineering Institute were invited to attend the meeting and were well represented in the audience of about 400, which included Past-Presidents J. B. Challies, L. F. Grant, and de Gaspe Beaubien, R. N. Coke, the Chairman of the Montreal Branch and most of the branch executive.

Prizes for Welded Bridge Designs

The trustees of the James F. Lincoln Arc Welding Foundation have announced a new award programme to advance the progress of welded bridge design.

The Foundation will award thirteen prizes for designs of " Welded Bridges of the Future ". The first award is $3,000.00, the second award $1,500.00 and the third $750.00. In addition to the awards for the three best designs there will also be ten honourable mention awards of $100.00 each.

The competition opens January 1, 1949, and closes June 30, 1949. Any engineer or designer who feels himself qualified to enter the programme is eligible for participation.

The bridge to be designed is a two-lane deck highway bridge supported on two end piers 120 feet apart. The bridge is to be designed for ASTM-A7-46 steel and for H20-44 loading. While the size, steel and loading for the bridge are specified, other than these specifications the designer is completely free to exercise his ingenuity. If he wishes, the designer may conceive and use new structural shapes not now available providing only that the new shape or shapes can be readily produced if and when a demand for them develops. Moreover, he may assume availability of fabricating facilities other than those now in existence.

Complete details of the rules and conditions of the programme are available in a printed brochure which can be secured upon application from The James F. Lincoln Arc Welding Foundation, Cleveland 1, Ohio.

The Editor,

It seems from statistical investigations in this office that some data can be treated more easily as convergent and hyperbolic than by usual statistical methods.

The data are such as those produced by inventories, budgets, etc., where the magnitudes are discrete, separated and of insufficient number to be tractable by any of the usual distribution methods. They are almost perfectly asymetrical, and the distributions discontinuous.

The procedure is to group the data in order of magnitude and cumulate. This gives a function that seems to be hyperbolic in every case treated, so far, from actual data.

If the position of a reading is X and if the cumulated total to that place is Y, the plot of X/Y vs. X is a straight line, which can be treated as a regression line by ordinary least squares procedure. This straight line may be used for interpolation and/or extrapolation.

For example, the first ten or fifteen terms of a series of sixty readings seem able to give the total of sixty terms by extrapolation within less than ten percent. This may have wide application.

Change in the magnitude of a given reading alters its position in the array and the total beyond it, but has little effect on the overall form of the curve, or on the rectified form.

Work is continuing and will be reported when the characteristics and abilities of the method have been examined and assessed.

Morley Lazier, M.E.I.C.,
Professional Engineer,
Toronto, Ont.

November 1, 1948

R. D. Hiscocks, Esq., M.E.I.C.,
c/o The Engineering Journal.

I would like to congratulate you on the Article appearing in the October issue of *The Engineering Journal*, of which you were one of the authors, relating to "Wartime Aeronautical Research & Development in Germany."

We are considerably interested in aviation development in relation to our patent practice and there is a scarcity of material on what was done in Germany in the period covered by your article. This is gradually being brought to the attention of the public and I believe your article adds substantially to the store of knowledge in this respect.

Yours very truly,

W. R. Meredith, M.E.I.C.,
Ewart, Scott, Kelley & Howard,
Ottawa.

Headquarters Records

Each time the *Journal* or other Institute mail is dispatched we are advised of undeliverable items due to incorrect addresses. Our records staff must follow up these changes and the regular service to members suffers thereby. *Please* advise headquarters when your address or occupation changes. The form below can be completed, clipped, and mailed to headquarters in a few moments.

News of Other Societies

The 1949 Convention of the Canadian Section of the **American Water Works Association** will take place April 25 to 27 at the Chateau Frontenac in Quebec City.

Secretary-treasurer of the Section is Albert E. Berry, of the Ontario Department of Health, Parliament Buildings, Toronto, Ont.

At the recent Annual Meeting of the **Society of Naval Architects and Marine Engineers,** New York, J. B. Woodward, Jr., was elected president of the Society for a two-year term beginning January 1, 1949. O. B. Whittaker was elected treasurer; Arlo Wilson and W. N. Landers were re-elected to the posts of assistant secretary and secretary, respectively.

The American Society of Mechanical Engineers announces that its 1949 Spring Meeting will be in New London, Conn., May 2 to 4. It is also announced that San Francisco, Calif., will be the locale of the 1949 Semi-Annual Meeting, of the Society, June 27 to 30, 1949.

The American Institute of Chemical Engineers has arranged a regional conference to be held in Montreal, September 19 to 22, 1949.

The Montreal Conference Committee of the Institute will make details of this meeting available at a later date.

The American Institute of Electrical Engineers' conference on the Industrial Application of Electron Tubes is scheduled for April 11 and 12, 1949, in the Statler Hotel, Buffalo, N.Y.

A.I.E.E. headquarters are at 33 West 39th Street, New York.

The Institute of Aeronautical Sciences' Seventeenth Annual Meeting is in progress in New York City at the Hotel Astor. The four-day Convention closes on January 27.

The 95th Annual Meeting of the **American Society of Civil Engineers** was held at the Hotel Commodore, New York City, January 21-24, 1949.

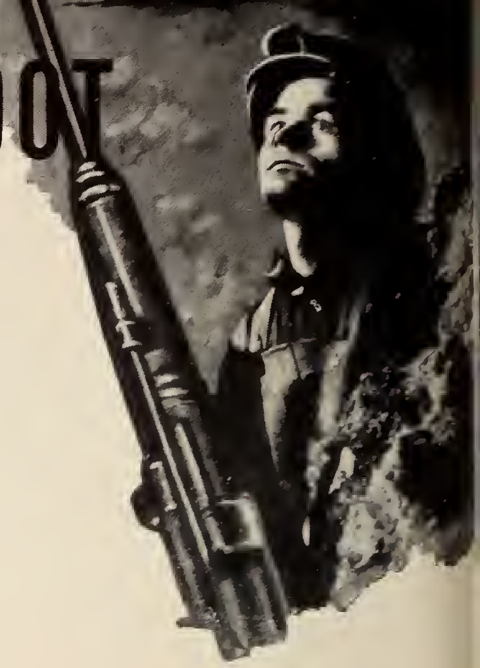
TYPE "L"

LIDDICOAT
Detachable Drill Bits

MANUFACTURED BY
hompson Products, Ltd.
ST. CATHARINES, ONTARIO

LOWEST COST PER FOOT DRILLED!



NOT A "CLAIM" BUT A FACT PROVED IN CANADIAN GOLD MINES

THE Liddicoat Type "L" Detachable Drill Bit is primarily a once-usage bit—in other words, a rock bit not intended to be resharpened after it becomes dull. In view of the low initial selling price, due to production on a mass production scale, resharpening in the mine steel shop would be neither practical nor economical. A handful of bits does a whole shift's drilling!

Scientifically designed to give fast cutting performance and long cutting life, Liddicoat Bits provide not only the advantage of low first cost but of lowest-cost-per-foot drilled . . . the acid test of any rock bit for economy, quality and efficiency. For drifting, stoping, raising, sinking, they are the fastest, farthest drilling and most economical bit sold today, as well as the lightest to use. Independent records obtained throughout the mining world, when Liddicoat Bits have been tested against competitive bits or steel, confirm these facts.

Developed and proved in Canadian gold mines, thousands are being used every day to speed up production and lower drilling costs. They are also being used extensively in the Construction field, where they are equally adaptable and offer the same decided advantages.

Liddicoat Detachable Bits are manufactured by Thompson Products, among the world's largest manufacturers of essential parts for the automotive and aircraft industry. There is hardly a car, truck, bus, tractor or aeroplane made on this continent that does not contain some Thompson manufactured products as original equipment.

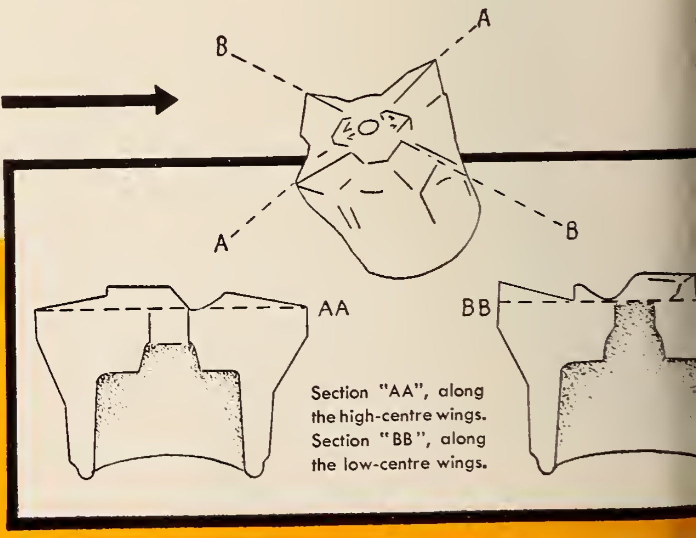
TWO-STAGE CUTTING ACTION

Since resharpening is not involved, it was possible to design the bit for maximum drilling efficiency. Liddicoat Bits actually chip out the rock, instead of battering the rock until it is pulverized, as is the case with conventional cross-bitted steel which becomes worn flat before the end of the run. This is accomplished by the two-stage cutting action and the special tooth design which retains sharp cutting portions for the full life of the bit. The cutting edges are shaped for fast drilling speed and the reaming edges for long gauge life, unhindered by considerations of regrinding and hot milling.

The advanced "pilot" portion, consisting of two raised, V-shaped "wings", chips away a centre hole and provides ease of "collaring": men using stopers or pluggers find they can "spot" holes easily without fighting the machine to keep it in correct alignment. Two cross "wings" that slope away from the centre of the bit make the first-stage cut. The other two cross "wings", with corners high and centre low, complete the cut. Ample clearance between "wings" permits cuttings to escape readily.

Two-stage cutting action described in section above is illustrated in diagram, *right.*

A HANDFUL OF DRILL BITS DOES A WHOLE SHIFT'S DRILLING !



Section "AA", along the high-centre wings. Section "BB", along the low-centre wings.

PREPARING DRILL ROD

Liddicoat Bits require no complicated attachment and are so designed to permit the attaching portion of the steel rod to be retained. Standard drill rod of any cross sectional shape and size can be prepared simply and cheaply, without the use of any special tools or machines, to fit the bit sockets.

If quarter octagon or hexagonal steel is used, operation consists of grinding the rod end, on standard machine, to print dimensions. Following this, the shank (attaching portion of steel rod) may be given heat treatment as recommended by the blueprint. The drill rod is then ready for use.

The shank may also be prepared by forging or machining. This is customary practice with most competitive bits, especially those of the screw type, the design of which makes shank preparation by such methods compulsory. However, the Liddicoat Bit is so designed that the rod end can be ground with resultant advantages. Grinding does away with all tool marks identified with machining; also the scale that is formed when steel is forged.

In case of quarter octagon steel being used (see diagram below), the four corners of the rod are ground to a cylindrical shape. Four "flats" are left remaining, corresponding to the four flat sides of the quarter octagon rod. The inner walls of the bit are shaped to correspond; the cross section of the inner walls being shaped in segments of a circle and "flats". The walls are also very slightly tapered. When driven on, the "flats" of the bit socket and shank keep the bit from turning on the rod.

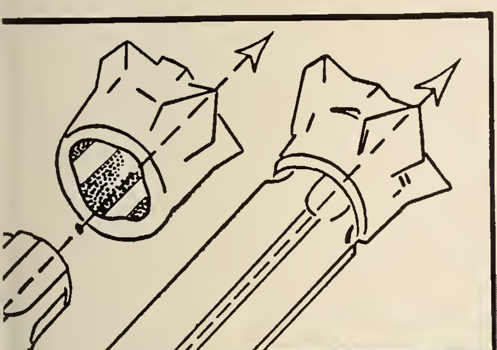
SIMPLICITY OF ATTACHMENT

The bit fastens onto the rod with a "drive" fit, as contrasted with the "screw-on" type of connection, the operation being done by the miner at the working face. After the "flats" inside the bit socket are placed in line with the "flats" of the shank, bit is partly driven on by hitting cutting teeth with a soft-faced hammer. As soon as drilling commences, machine blows drive the bit fully to the bottom of the socket, making an effective union.

Dull bits are just as readily detached from the shank, several methods being used, such as knocking off by hammer blow on bit socket or splitting socket with a special tool. A sliding weight knock-off block, which can be made in the average mine shop, provides another simple and effective method. Pneumatic detachers are also available.

SUITABLE FOR ANY GROUND

The Liddicoat Type "L" is available for use with 7/8" or 1" quarter octagon steel; and with 7/8" or 1" hexagonal steel. A special bit for 1 1/4" round steel is also available. Gauge sizes are sufficiently varied to ensure selection of bits suitable for any ground. "Wing" and gauge design allows full advantage to be taken of the modern cone automatic or hand-cranked drift machines by having longer steel changes.



METHOD OF ATTACHMENT

Diagram (left) shows the Liddicoat Type "L" Drill Bit, before and after attachment, where quarter octagon steel is used. In such case, the "wings" of the bit line up with the corners of the rod, the flat sides within the bit socket being located *between* the "wings". First machine blow completes bit seating. The harder the work, the tighter the lock.

FORGED FOR TOUGHNESS

Liddicoat Bits can be produced entirely by forging as they have no threads. By a patented and exclusive manufacturing process, the hot steel is subjected to tremendous pressure which extrudes the bits into the desired shapes. This method preserves the important grain of the steel, flow lines being compressed, rather than cut across as is usual in forgings of this type. The retention of the unbroken grain and the compression of the material give Liddicoat Bits an unusually strong material structure.

Because they are forged, Liddicoat Bits could be designed to do a much more efficient job than an ordinary cross bit. Forging also results in a stronger bit skirt and makes it possible to produce a bit much smaller and lighter than the old screw-thread type. The advantage gained in faster drilling speed through the use of a smaller bit is obvious.

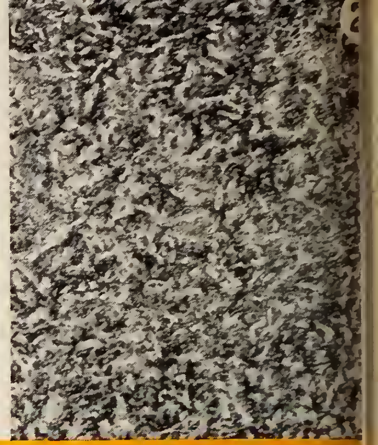
CONSISTENCY IN HARDNESS

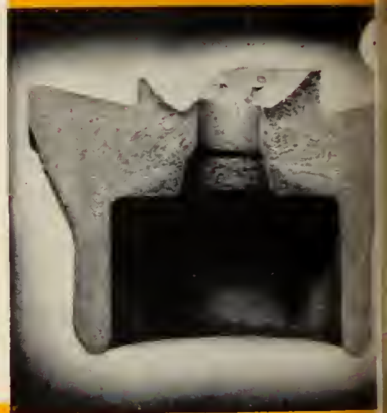
Heat treatment by the most modern methods assures consistency of hardness in all Liddicoat Bits. This means that, during its normal period of service, each Liddicoat Bit will operate at the same fast drilling speed and provide the same depth of penetration when used on rock faces of a similar nature.

A quality check is made of all materials before they are used. During actual manufacture, correct forging heats and cooling times are constantly maintained by means of accurately controlled temperatures for furnaces and quenching medium.

Every hour, during the hardening process, grab samples are tested in our metallurgical laboratory. Cutting and etching tests are made, not only for hardness and pattern of hardened bit portion, but to ensure that material flow line, grain size and uniformity of structure shall strictly conform throughout to the standards which our experience has proved to be essential for the production of rock cutting tools.

All bits are closely inspected before shipment; also painted in a distinguishing color to identify size called for by the user.





(1) Unretouched micrograph of bar stock showing structure of steel prior to heat treatment. This steel is manufactured to Thompson specifications and is regarded as the best analysis for this particular use.

(2) Unretouched microphraph showing structure of steel after heat treating. This photo shows structure of hardened portion of bit only.

(3) Sectioned drill bit, etched to show hardness pattern. Note: Photo number 2 shows the structure of this hardened portion. The remaining portion of the bit is unhardened, giving it toughness for long life.

(4) Sectioned drill bit etched to show material flow lines. This pattern is obtained by a modern forging process which also adds strength to the finished product.

(Below) Liddicoat Bits are produced for the mining and construction industries at the St. Catharines factory of Thompson Products Ltd., regarded as one of the most efficient straight line production units on the continent.

New Institute Branches

During 1948, the 62nd year of its existence, the Institute continued its growth and the expansion of its activities. The annual report which will appear in the February *Journal* will indicate that the branches were active and that the membership increased by more than 10 per cent.—a somewhat greater increase than the uniform rate established over several of the preceding years.

As an indication of the solidarity of the Institute, the significant accomplishment of the year was perhaps the increase in the number of branches. Negotiations were completed and a charter drawn up for the Central British Columbia branch which centers on the Kamloops and Okanagan Valley area of British Columbia. The charter is dated January 14, 1949, the date of the inaugural meeting. As this *Journal* goes to press arrangements are being made for President Finlayson to attend. Indications are that the branch will get away to a good start.

The provisional chairman and secretary of the new branch are M. L. Wade, M.E.I.C., consulting engineer, Kamloops, B.C. and Harry L. Cairns, M.E.I.C. of the Department of Public Works in Kamloops.

At the December 6th Council meeting in Montreal a charter was granted for the formation of a branch in Newfoundland. While it is expected the centre of the branch will be St. John's, it is planned that meetings will also be held at Grand Falls and at Cornerbrook in some system of rotation. The president is planning to visit Newfoundland early in May for the inaugural ceremony.

Negotiations were opened for a new Ontario branch in the Kitchener-Guelph-Galt area when, on December 16th, Vice-president Vance, W. A. T. Gilmour, Hamilton Branch chairman, and the General Secretary met with engineers of that area at a dinner in Kitchener.

Some 70 Institute members located in and around these industrial centres are presently classified non-resident members of the Hamilton branch. Enthusiasm for the new branch is very evident and it is expected that a petition for a charter will shortly be submitted to Council.

The formation of these three branches will bring the number in Canada—Newfoundland being included as the tenth province—to 32.

Personals

Notes of the Personal Activities of Members of the Institute

Brigadier J. M. Cape, M.E.I.C., was promoted from the rank of lieutenant colonel on December 16, and will command the artillery in the Third Canadian Division of the Canadian Army Reserve Force.

Brigadier Cape commanded an artillery regiment in Italy during the Second World War. In civilian life he is director and general superintendent of E.G.M. Cape & Company, Montreal engineering firm.

G. McK. Dick, M.E.I.C., formerly manager of engineering, has been appointed manager of engineering and purchasing by the Canadian Ingersoll-Rand Company Limited, with headquarters at the Company's works at Sherbrooke, Que. Mr. Dick joined the Company in 1915 as an apprentice pattern maker.

He left the Company temporarily in 1919 and studied at Bishop's College, Lennoxville, Que., and McGill University, Montreal, graduating as a bachelor of science in mechanical engineering in 1924. He then returned to the Company at Sherbrooke, and held various executive posts there and in the Sherbrooke Pneumatic Tool Company, the shell-making subsidiary of the Canadian Ingersoll Rand Company, leading up to his recent appointment.

William Storrie, M.E.I.C., Toronto consulting engineer, has been awarded the Dexter Brackett Award of the New England Water Works Association for a paper dealing with Toronto Water Works Extensions. Mr. Storrie is a past chairman of the Canadian Section of the American Water Works Association, and has been the recipient of the Fuller Award, and the Kenneth Allen Award of the Federation of Sewage Works Associations.

J. Clark Keith, M.E.I.C., general manager of the Windsor Utilities Commission, was guest of honour at a testimonial dinner given on the occasion of his retirement from the Metropolitan Hospital Board of Windsor after 20 years of service. Mr. Keith has been with the Windsor Utilities Commission since its formation in 1935, and had previously been chief engineer of the Essex Border Utilities Commission, whose functions were then assumed by the Windsor Commission.

Mr. Keith has been vice-president of the Institute for Ontario, and president of the Association of Professional Engineers of Ontario.

Gilbert H. Bancroft, M.E.I.C., has opened an office in the Canadian Bank of Commerce Building, Vancouver, B.C., and will act as a consultant in mechanical engineering, specializing in machine design. Previously he was chief engineer and a director in Engineering and Machinery Limited, Vancouver.

J. E. Armand Dugas, M.E.I.C., formerly with the industrial department of the Quebec Hydro Electric Commission, was recently appointed president of Power Survey and Equipment Limited, Montreal, Que. During the war, Mr. Dugas was with the electrical division of the Works and Buildings Branch of the R.C.A.F. No. 3 Training Command, in Montreal.

Roy W. Garrett, M.E.I.C., has been appointed city engineer of London, Ont. Mr. Garrett has been with the city engineer's department for 30 years, and has heretofore held the position of assistant city engineer. He served as city engineer in the absence of his chief during the recent war.

W. H. Paterson, M.E.I.C., was appointed in November to the post of executive assistant in the Toronto Transportation Commission. Mr. Paterson joined the Commission in 1943 after serving for several years for the Tropical Oil Company in Colombia, South America. He is a graduate of Queen's University, class of 1935.

F. C. Wightman, M.E.I.C., of Amherst, N.S., **Russell Carey** of Sackville, N.B., and **C. D. MacDonald,** M.E.I.C., of Amherst and Sackville, have established an engineering firm in Amherst, to serve the Maritime Provinces. Additional offices will be located at Sackville and at Halifax.

Mr. Wightman was town engineer in Amherst in prewar days, and also served as town engineer in recent years. Lately he has been acting as a consultant for various civic departments, in Amherst and in surrounding towns. He was at one time town manager for Kentville, N.S.

Mr. MacDonald has also been engaged in engineering work in the Maritimes. He was for some time on the staff of Mount Allison University as professor of engineering, plant superintendent and business manager. He had been in private practice in Amherst prior to the formation of the new firm.

R. G. Rowan, M.E.I.C., of the Bell Telephone Company of Canada has been appointed supervising engineer of the Laurentian District, Quebec Division of the Company. With headquarters in Montreal, he will have charge of the outside plant telephone engineering in the Laurentian Mountain Section north of Montreal.

Mr. Rowan has been with the Company since graduation in 1940 from Queen's University, and served with the R.C.A.F. in the recent war.

J. G. G. Belle-Isle, M.E.I.C., of the Bell Telephone Company of Canada, has been appointed supervising engineer of the Laurentian District, in charge of an engineering section located at Trois Rivieres, Que. He will have charge of outside plant telephone engineering in the Trois Rivieres-Shawinigan Falls Section of the Quebec Division. Mr. Belle-Isle has been with the Company since 1941. He had graduated from Ecole Polytechnique, Montreal, in 1939 and and had been connected with the Quebec Roads Department for three years. After service for some 4 years in the R.C.A.F., he returned to the Bell Telephone Company in 1946.

E. Dauphinais, M.E.I.C., is now in practice as a consulting engineer in Chicoutimi, Que. He was previously with the Saguenay Telephone Company of that city. Graduating from Ecole Polytechnique, Montreal, in 1941, Mr. Dauphinais was with the Foundation Company of Canada in Montreal until 1943, when he joined the Chicoutimi firm.

Stewart G. Harknett, M.E.I.C., became vice-president and managing director of Electrical Industries Limited, Edmonton, in Novemer last. He had been for fifteen years with Mumford, Medland Ltd., of Winnipeg, as manager of the electrical department.

J. T. Hugill, M.E.I.C., is in Paris, France, with the Department of Liquifaction of L'Aire Liquide. A graduate of University of Alberta, he received the degree of M.Sc. in chemical engineering in 1940. He worked for the Gas Commission of National Research Council at Edmonton, Alta., as a research assistant for a time that year, and later went to the Department of Chemistry of McGill University with a National Research scholarship. In 1941 he was in England at the Experimental Station at Porton, and was stationed later that year as a captain in the R.C.A., at the Experimental Station at Suffield, Alta. He was given the rank of major and served overseas, returning in 1945. He remained in Montreal, completing the requirements for the degree of Ph.D. in physical chemistry at McGill in 1946. He then joined Canadian Liquid Air Company in Montreal as a chemical engineer, remaining untl his recent appointment.

G. W. Allan, M.E.I.C., has been elected chairman of the Vancouver Branch of the Institute.

Mr. Allan is from Scotland, a graduate of the Royal Technical College of Glasgow. He served an apprenticeship of five years in that city with Mirlees-Watson Company. In Canada, in 1911, he was in the engineering office of B.C. Sugar Refining Company, Vancouver. The next year he joined the firm Allan & McKelrie, Vancouver, where he remained until 1918. He then joined Canadian Sumner Iron Works, Vancouver, in the capacity of vice-president. He was named president in 1926. He is also manager of the firm.

W. P. C. LeBoutilier, M.E.I.C., who is chairman this year of the Saguenay Branch, is with Price Bros. & Co. Ltd., Kenogami, Que.

Born at Quebec, he graduated from Royal Military College in 1926, and from McGill University in 1927. From the latter he received the degree of B.Sc. in civil engineering. He was a student engineer for Bell Telephone Company Ltd., Montreal, and was soon after named assistant district engineer in the same firm. In 1931 he went to Kenogami, Que., to the paper mills of Price Brothers as assistant to the engineer in charge of operating records. He was later placed in charge of this department. In 1937 he became assistant groundwood superintendent for the firm. He returned to the company after service for 5 years in the 2nd World War. He was attached to the Royal Rifles of Canada and was for a time a prisoner of war of the Japanese.

W. E. MacLennan, M.E.I.C.

W. E. MacLennan, M.E.I.C., has been elected chairman of the Lakehead Branch of the Institute. He is inspector of buildings and weights and measures for the city of Fort William.

Mr. MacLennan is from Scotland, where he studied, and served an apprenticeship of two years with an Edinburgh surveying firm. He spent further time with an engineering firm in London, England. In Canada he worked first in 1922 on highway construction in Saskatchewan. He did highway location work in Ontario the next year, and in 1924 he entered the field of paper mill construction and power development, with which he remained for 7 years. In 1931 he was in charge of highway location in the Province of Ontario, and was made resident engineer in 1934 on construction of the Trans-Canada Highway by the Department of Northern Development. He was named assistant engineer for the Ontario Department of Public Works at Fort William in 1936. In 1937 he went to Red Rock, Ont., as assistant resident engineer on construction of the pulp and paper mill of the Lake Sulphite Pulp Co. Ltd. there. He went to Fort William in 1939, to his present position.

W. L. Foss, M.E.I.C.

W. L. Foss, M.E.I.C., the newly elected chairman of the Lethbridge Branch of the Institute is supervising construction engineer, of P.F.R.A., Lethbridge.

Mr. Foss was born at Velva, North Dakota, but studied at University of Saskatchewan, receiving a B.Sc. in civil engineering in 1930. He worked as a field engineer for the city of Saskatoon, for four years after graduation in charge of general construction work, and in 1931-33 was resident engineer on the Broadway bridge over the Saskatchewan River.

In 1934 he worked for a time on railway location in California. In 1935 he was back in Canada and did some design and construction of water supply works for the Saskatchewan department of Public Works. He joined the staff of the Prairie Farm Rehabilitation Administration of the Dominion Department of Agriculture the same year as a junior engineer. He was named district engineer in 1936 in charge of design and construction in Southern Alberta of P.F.R.A. water development projects. For the department, he is now in charge of design and construction of the St. Mary-Milk River development.

A. Meade Wright, M.E.I.C., has been appointed assistant manager of the Atlantic Tug and Equipment Company, Inc., Syracuse, N.Y.

Mr. Wright had been with Construction Equipment Company Limited, Montreal, since 1947. He was a field engineer with Foundation Maritime Limited in Saint John, N.B., in 1946 after several years of service with the R.C.N.V.R., as a lieutenant. He graduated from McGill University, Montreal, in 1941, with the degree of bachelor of engineering, electrical.

A. C. G. Jarvis, M.E.I.C., is with the Ontario Paper Company, Thorold, Ont. He has previously been with the Quebec North Shore Paper Company at Baie Comeau, Que.

Paul E. Douville, JR.E.I.C., is assistant general manager of the Acton Rubber Company, Actonvale, Que. Mr. Douville joined the company soon after graduating in chemical engineering in 1943 from Ecole Polytechnique, Montreal.

R. F. Shapcotte, JR.E.I.C., is employed by the British Columbia Bridge and Dredging Co. Ltd., as assistant project manager on the construction of a mill for Nanaimo Sulphate Pulp Limited near Nanaimo on Vancouver Island. Mr. Shapcotte was previously with Bennett & White Construction Company Limited, Vancouver.

J. W. Fead, JR.E.I.C., is now on the staff of the University of Saskatchewan. Mr. Fead is a graduate of the University of Alberta, class of 1945, and was on the staff of that University in previous years.

R. J. Kennedy, JR.E.I.C., is at present doing graduate work in hydraulics at the State University of Iowa, while on leave from the staff of Queen's University. The American Society of Civil Engineers has awarded him the J. Waldo Smith Hydraulic Fellowship for the current year, the first award of the fellowship to a Canadian.

G. H. Green, JR.E.I.C., is employed at the University of Illinois as a special research assistant in mechanical engineering. Mr. Green received the degree of B.Sc. from University of Saskatchewan in 1944 and after service with the R.C.E.M.E. as a lieutenant he has served since 1946 as an instructor in mechanical engineering there.

W. C. Smith, JR.E.I.C., has left the wire and cable division of Northern Electric Company, Montreal, to join the sales staff of the Square D Company Canada Limited in their Montreal Office. Mr. Smith had been with the Northern Electric Company since his graduation in 1946 from Queen's University.

David Cramer, JR.E.I.C., is the newly appointed secretary of the Lethbridge Branch of the Institute. Mr. Cramer graduated from University of Saskatchewan in 1944, and joined the staff of the Prairie Farm Rehabilitation Administration as a junior engineer at Regina. He is now in the Lethbridge Section as assistant hydraulic engineer.

T. T. Anderson, JR.E.I.C., is secretary treasurer of the Saguenay Branch of the Institute.

He studied at University of British Columbia, receiving a B.A.Sc. degree in chemical engineering in 1942. He joined the Powell River Co. Ltd., but later in the year came to the Aluminum Company of Canada Limited where he was assistant supervisor of the hydrate department of the Bayer Ore Plant at Arvida, Que., up to 1945. He is now superintendent of plant development for the Company at Arvida.

A. G. Fletcher, S.E.I.C., is the secretary-treasurer of the Vancouver Branch this year. Mr. Fletcher graduated from University of British Columbia in 1948.

J. M. Carrol, S.E.I.C., graduated in engineering physics course of Queen's University in October, 1948, and joined the sales and service department of Applied Research Laboratories, Glendale, California. He is now located in Detroit, Mich., for the Company, and will work on sale, installation and servicing of the company's spectrochemical instruments in the eastern United States and Canada from a district sales office in Detroit.

Visitors to Headquarters

W. H. Paterson, M.E.I.C., executive assistant, Toronto Transportation Commission, November 25, 1948.

H. Bishop, Chief Engineer, British Broadcasting Corporation, London, England, November 30.

Lt.-Col. L. F. Grant, past-president of the Institute, Kingston, Ont., December 1.

J. Murray Fleming, M.E.I.C., President and General Manager, C. D. Howe & Co., Port Arthur, December 1.

H. W. McLeod, M.E.I.C., Canadian Pacific Railways, Winnipeg, Man., December 3.

Alan E. Cameron, M.E.I.C., President, Nova Scotia Technical College, Halifax, N.S., December 8.

P. E. Buss, M.E.I.C., President, Spun Rock Wools Ltd., Thorold, Ont., December 9.

E. D. Gray-Donald, M.E.I.C., Chief Engineer, Quebec Power Company and Quebec Railway Light and Power Co., December 9.

P. N. Bland, M.E.I.C., Vancouver, B.C., December 13.

J. M. Anderson, Vancouver, B.C., December 13.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

News reached the *Journal* only recently of the death on March 5, 1945, of **Colonel William Miles Miller,** M.E.I.C.

Colonel Miller who had been chief signals officer for Great Britain in East Africa, Madagascar and the Islands of the Indian Ocean, had retired from that position due to ill health in 1944 and lived on his farm near Nairobi, East Africa, until his death.

Colonel Miller was born in Montreal in 1891, and received his early education at Napanee Collegiate Institute. He entered Royal Military College, Kingston, Ont., in 1909 and obtained his diploma in 1912, receiving a commission in the R.C.E. the day after graduating. At the beginning of the First Great War he went to France with the "A" Corps Signal Company, Royal Engineers, and became a captain in 1915. In 1917 he transferred to the R.E. and became a major commanding the 32nd Divisional Signals Company, R.E., in the following year, and was for two years with the army of occupation in Germany. For the next fourteen years he saw service in India with the Royal Corps of Signals, and became chief signals officer, Southern Command, and was in Burma during the rebellion. In 1935 he was promoted to lieutenant colonel, and at the beginning of the recent war became colonel and chief signals officer for British troops in Egypt, and was later appointed C.S.O. of the East Africa Command extending from the Red Sea to Southern Rhodesia, and commanded the Signals at the taking of Madagascar. He was awarded the M.C. during the First Great War and the C.B.E. in 1941 for distinguished service in Libya. On his retirement he was appointed assistant director of produce disposal, East Africa Production and Supply Company at Nairobi, Kenya.

Colonel Miller joined the Institute in 1910, as a Student. He transferred to Associate Member in 1922 and to Member in 1940.

C. Camille Lessard, M.E.I.C., consulting engineer of Quebec City, died in Montreal on October 29.

Mr. Lessard, who was born in Quebec in 1889, graduated from Ecole Polytechnique, Montreal, in 1911. He was assistant to the district engineer for the Federal Public Works department at Quebec in 1915, when he became city engineer for the town of Levis. From 1917 to 1919 he was engineer for the town of Bienville, Que., and thereafter practised engineering privately in Quebec City. He supervised construction of water power developments, bridges and roads. He also designed and supervised many important waterworks and sewerage projects in the Province of Quebec. At the time of his death, Mr. Lessard was consulting engineer for a great number of municipalities in the vicinity of Quebec City.

Mr. Lessard joined the Institute in 1922 as an Associate Member. He transferred to Member in 1922.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

December 21st, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate *

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the January meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ALEXANDER—WILLIAM RONALD, of Ottawa, Ont. Born at Toronto, Ont., June 30, 1913. Educ.: B.A.Sc., (Civil), Toronto, 1935; R.P.E., Ontario; 1935, (8mos.), Dufferin Paving Co., Kenora, Ont.; 1936, (3 mos.), Toronto Iron Works; 1936, (3 mos.), Ventures Ltd., 1936-37, staff engr., Opemiska Copper Mines, development of mine which was closed in Aug. 1937 for lack of rail transportation; 1937-40, Ventures Ltd.; 1940-41, assisted in constrn. of mill buildings, underground develop't. prior to actual mining operations; 1941-42, with possibility of bauxite supply being cut off for Aluminum Co., Frobisher Exploration Co. (Ventures Limited, Toronto) was formed to search for deposits of nepheline syenite in south eastern Ontario—jointly with a mining engr. and geologist carried out investigations of all known bodies of nepheline syenite, dewatering old workings, surface and underground diamond drilling, etc.; 1942-47, Naval Service, Dept. National Defence, Ottawa; 1947 to date, township engr., County of Carleton, Nepean Township, Ottawa, Ont.

News of the Branches

Activities of the Twenty-nine Branches of the Institute and abstracts of papers presented at their meetings

Cornwall

G. G. M. Eastwood, M.E.I.C.
Secretary-Treasurer

T. B. Webster, M.E.I.C.
Branch News Editor

Members of Cornwall Branch and their wives learned **How Cotton Is Made** on November 22 at the Canada Mill of Canadian Cottons Limited. J. G. Sutherland, manager, gave a brief address of welcome and emphasized the importance of the industry to the community.

The mill superintendent, A. W. Tardiff, assisted by members of the staff then began a conducted tour of the plant, ably demonstrating the various operations in the processing of the cotton from the bale to the finished goods.

The tour ended at the cafeteria where refreshments were served. An expression of thanks for a most interesting and educational evening was tendered the hosts by Mr. Wallace, branch chairman.

The annual meeting of the Branch was held on December 13 at the King George Hotel. Chairman R. H. Wallace presided and reports of committees were submitted.

Mr. Ross-Ross, chairman of the Nominating Committee, announced the results of the election, in which Mr. Wallace was returned as chairman by acclamation. Those elected to serve two-year terms were H. Nickerson, F. R. Warner, and L. P. Stidwill.

Mr. Wallace reviewed the work of the Branch during the past year, thanking all members for their co-operation and interest. He also reported his trip to the annual meeting of the Institute at Banff. The civic affairs committee has been active, and two Institute members now serve on the City Planning Board where they can make a real contribution to city welfare.

After the conclusion of the business meeting two educational films were shown. These were entitled, "Exploring with X-Rays" and "More Goods for More People". They showed the parts that X-Rays and electrical control instruments play in the betterment of living conditions.

Kingston

D. L. Rigsby, M.E.I.C.
Secretary-Treasurer

J. T. Provan, Jr.E.I.C.
Branch News Editor

On Monday, 29th November 1948 the Kingston Branch of the Institute held a meeting at Gordon Hall, Queen's University. The guest speaker was L. C. Grimshaw, metallurgical engineer in charge of composite steels at the Jessop Steel Company Limited. P. Roy, chairman of the Kingston Branch, introduced the speaker.

The illustrated talk was a description of the manufacturing process for producing stainless clad steels, showing how a perfect bond is made between stainless and mild or other steels, to produce sheets and plates with one side only of stainless steel, for economy in subsequent manufacturing. Various applications of stainless clad steel in industry were pointed out, with useful information on fabrication techniques. Advantages of using stainless clad steel were mentioned such as economy, strength, heat conductivity, appearance, and aptness for deep drawn and cold press. Mr. Grimshaw concluded by mentioning standard procedures for welding, which was followed by a general discussion period.

The speaker was thanked by H. G. Conn, head of the mechanical department at Queen's University and the meeting adjourned.

❖ ❖ ❖

On Tuesday, 14th December, 1948, the Kingston Branch of the Engineering Institute of Canada held a meeting at the R.C.E.M.E. Officers Mess, Barriefield, Ont. The programme took the form of an estimating forum followed by a discussion and question and answer period. Members were welcomed to the Mess by Major G. T. Kirk and the meeting was presided over by Chairman P. Roy, who introduced the speakers.

Guest speakers were Mr. M. G. Saunders chief engineer of the Aluminum Company of Canada, Kingston Works, who spoke on **Cast Estimating by the Engineer** and Mr. G. Schuett of Schuett Construction Company who spoke on **Cost Estimating in Construction.**

Mr. Saunders began his talk by showing the value of an estimate and its justification. His suggested method of making an estimate was broken down into the following component parts.

All information pertaining to the job should be gathered and studied thoroughly, making sure no item is omitted. The information supplied is then broken down into its component parts. Experience on previous estimates should be utilized to good advantage. Information on accurate present day cost of materials should be obtained. The estimate should be based if possible on a cost per pound basis or other unit, depending on class and kind.

Also pointed out were the items which should be taken into account when making an estimate; such as overhead; preparatory work needed on the job before it actually begins; interference which may affect the work; facilities at hand, such as services; handling equipment necessary; clerical and maintenance work; such miscellaneous items as insurance, taxes, etc.; and contingencies.

Mr. Schuett said the accuracy of an estimate is based on the detail of the plans submitted. It was pointed out that often estimates are mistaken because the plans lack detail and the work has to be designed as it progresses.

Estimates may be calculated either of two ways. By phase building, in which each phase of the work is taken into account separately and a cost fixed for each. The second, and more common manner in this country, is the estimate based on the subdivision of the subtrades in which the job is broken down into the various subtrades with costs applied to each. In a case where the construction job is let out under subcontracts the total estimate is of course based on these sub-contractor estimates.

Mr. G. Schuett suggests the following system for making an estimate. The plans are submitted to a quantity surveyor who takes off accurate quantities of materials. These figures should be checked twice, and sent to a cost man who works on accurate information pertaining to present day prices. Finally the total estimate is submitted to the executive who makes final judgment on cost.

Both speakers mentioned labour cost in an estimate as a variable figure which greatly influences estimated cost in as much as the productivity of the class of labour obtainable at the job cannot be predetermined.

After a very interesting discussion period the speakers were thanked by Mr. D. Lee of Queen's University. D. L. Rigsby, secretary-treasurer, gave a report on forthcoming meetings.

The meeting was adjourned and refreshments were served.

Lethbridge

D. Cramer, Jr.E.I.C.,
Secretary-Treasurer

A. E. Lawrence
Branch News Editor

Forty-seven members and guests of the Lethbridge Branch of the Institute, attended a dinner meeting in the Marquis Hotel, Saturday evening, November 20th, to hear H. E. Salisbury, give an address on **Vegetable Canning and Marketing in Alberta.** Mr. Salisbury is general manager of the Alberta Canning Company.

The meeting was a Ladies' Night with the wives and friends of the members as guests. Chairman W. L. Foss presided. During the dinner, music was supplied by Browns' Instrumental Trio. Community singing ably led by R. S. Lawrence and vocal solos by Mrs. Dawn Benoit, accompanied by the Rev. V. E. Smith, were enjoyed by all. A. L. H. Somerville introduced the speaker.

In his talk to the meeting, Mr. Salisbury outlined the benefits which the canning industry brings to the farmer and the district as a whole. He stated that the green pea is an excellent plant to grow on land on which crop rotation is used, and that it has been found that sugar beets increase in yield when the green pea had been grown on the land before. They obviate the necessity of summerfallow and keep the land clean as well.

The cannery contracts all its acreage with farmers, and Mr. Salisbury stated that a farmer could net $115.00 per acre from the green pea crop and its by-products. The maximum acreage of green pea crop which one farmer could handle was about sixty acres.

The speaker outlined the method by which the various vegetables are treated and canned in the factory, and stated that there were three grades of canning done, namely "Fancy", "Choice" and "Standard". All runs are rigidly government inspected.

This year's crop of green peas was exceptionally good and the cannery was able to can 93 per cent of its run as "Fancy". There will be three million cases of peas in surplus in Canada. Mr. Salisbury also mentioned that the Canneries were perplexed by the whims of the consumer who insist on Sizes 1, 2, or 3 peas when the No. 4 is superior in quality and taste.

In conclusion the speaker stated that few areas are as good for canning crops as this of Southern Alberta and that he could safely predict that in the next seven years, canneries would virtually cover the country side.

Mr. Salisbury is an eloquent speaker and his highly informative and interesting talk was very much enjoyed by all present. A. J. Watson, on behalf of the Branch and guests, moved a hearty vote of thanks to Mr. Salisbury for his address. This was endorsed by all present.

Montreal

Arrangements have been completed for the annual Branch dance which will be held in the main Ballroom of the Mount Royal Hotel on the evening of February the 11th, 1949. Maurice Meerte's and Julio Reyes' orchestras have been engaged and will provide continuous music between 9.30 p.m. to 1.30 a.m.

A bar will be set up in the nearby Brittany Room, and refreshments will be served during the evening in the form of a buffet supper.

Dress will be optional.

Tickets will be placed on sale early in January and will be available at Headquarters and from members of the Entertainment Committee.

It is hoped that the dance will prove to be as successful as last year's at which some 600 members and their friends attended and enjoyed a very excellent party. The arrangements for this year's party have been carried out by Mr. R. Hobner and his committee with the able assistance of the Ladies Committee under the chairmanship of Mrs. I. R. Tait.

Junior Section

Leo Scharry, Jr.E.I.C.
Secretary-Treasurer

Throughout the year the Executive has noticed an increased interest on the part of the membership. Still, in general we must honestly admit that the attendance at the regular Monday meetings, though more numerous than the previous years, still will have to be stimulated so that more may reap the benefits of the efforts of your Executive. Social events such as Opening Night, Ladies' Film Nights, Oyster Party, and the Dance, are always overwhelming successes.

On November 29, the Section secretary, Léo Scharry, gave a talk on his recent trip to Mexico where he attended the 64th General Summer Convention of the American Institute of Electrical Engineers. The main contrasts and particularly native habits and customs, ranging from the cost of living to bull-fights, were explained both by Mr. Scharry and by a 45-minute English-speaking technicolor film loaned by the Mexican Government. A few exhibits were also on hand to demonstrate some of the native handicrafts such as blankets, tablecloths, serapes, etc.

The biggest dance ever arranged by the Junior Section was held on December 3 at the Ritz-Carlton Hotel. Over 650 persons were present and danced to the music of two orchestras. Plans are already being made for next year's dance which will be the fifth.

On December 13, Mr. L. J. Davignon, assistant general manager of the Banque Canadienne Nationale, in a highly educational talk, spoke on the **Services of a Bank.** Talks of this nature, though they seem non-technical, are for engineers a part of their training which is not usually dwelt upon in college curricula. This talk ended the 1948 activities.

Niagara Peninsula

J. J. Miller, M.E.I.C.
Secretary-Treasurer

C. A. O. Dell, M.E.I.C.
Branch News Editor

Sixty or more members and friends of the Niagara Peninsula Branch gathered for the November meeting at the recreation hall of the Horton Steel Company, at Fort Erie, Ontario.

An excellent turkey dinner was served

by a ladies' church group of Fort Erie.

Chairman W. A. Coombes called on W. R. Manock, president of the Horton Steel Co., who introduced Mr. H. C. Boardman, director of research for the Chicago Bridge and Iron Works. Mr. Boardman spoke on **Multispheres and Serrated Tanks.**

The subject was illustrated with slides and under the clear exposition of the speaker it became one of intense interest. A serrated tank is one of cylindrical, spheroidal or spherical shape with inner and outer skin plates, which are separated from each other by an annular space divided into segments by radial diaphragms connecting the vertical edges of the inner and outer skin plates. The plates of the inner skin are made flat and they form chords to the general circle of the tank. The outer plates are curved to a much smaller radius than the general radius of the tank as a whole, which gives the tank the serrated or pumpkin shell appearance. The important feature of this construction is that the size of a tank can be increased to an almost unlimited degree without unduly increasing the thickness of the skin plates. The inner plates are not welded along their horizontal edges, which results in a substantial reduction in welding cost.

Following the address and discussion period, past chairman M. F. Ker extended the thanks of the members to Mr. Boardman, and also to Mr. Manock and the Horton Steel Company for their kind hospitality. A number of members were conducted on a tour of the plant after the meeting.

At the executive meeting a new routine of operation was proposed by vice-chairman A. L. Asplin as to responsibility for programme arrangement. The suggestion was adopted and under the new arrangement the whole executive becomes the programme committee. It is divided into several groups each of which is responsible for one meeting of the year. In this way it is hoped to gain a wider interest and a better coverage of the interest fields of all the members. The committee will act under the chairmanship of the branch vice-chairman, whose duty it will be to integrate the activities of the sub-groups.

Ottawa

C. G. Biesenthal, m.e.i.c.
Secretary-Treasurer

R. C. Purser, m.e.i.c.
Branch News Editor

It is to the school children of today —the drivers of tomorrow—that the Ontario Department of Highways is paying most attention in its efforts to teach safe habits of driving, Deputy Minister J. D. Millar told members of the Ottawa branch of the Institute at their luncheon on October 28. Youngsters not only learn for the future but are able to teach their parents correct habits.

It is thanks to many safety organizations as well as the press that "a tremendous job is being done in backing the safety campaign". Mr. Millar said construction and maintenance of roads, education in safety and enforcement of laws were the four fields for promotion of safety on the highways.

In the Queen Elizabeth highway (Toronto to Hamilton), Ontario can boast of a road that "takes a back seat to no other on the continent". It is the busiest highway in Canada with a peak of 20,000 vehicles a day, yet has been the scene of only three fatal accidents in the nine years since it was opened.

Ontario also has more winter maintenance of roads than any other part of the world, was the first to use "symbol" road markings to replace worded signs, and is the only province or state on the continent using 12-inch red lamp signals, which can be seen as far as 12 miles ahead by car drivers.

The speaker was introduced by Walter Saunders, divisional engineer of the Department of Highways, and thanked by chairman J. L. Shearer. Head table guests were: Mr. Saunders; A. K. Hay, chief engineer of the Federal District Commission; and the following members of the Ottawa Suburban Roads Commission A. H. Fitzsimmons, A. E. Stephens, Harold Kidd, N. B. MacRostie.

❖ ❖ ❖

Britain's greatest and most plentiful resource is skill, with supplies of raw material and machinery down to a minimum, G. C. Monture, O.B.E., of Ottawa, told members of the Ottawa branches of the Engineering Institute and Canadian Institute of Mining and Metallurgy at luncheon November 18, at the Chateau Laurier.

Recently returned from Britain, Mr. Monture remarked manufacturers and scientists are working together in close co-operation in an attempt "to ensure that the product leaving the plant is the best that the craftsman and scientist can produce". He had been impressed with the type and thoroughness of research work being carried on in Britain and "the extent to which the manufacturing industries rely on the results of research work, and strict technical control employed".

The "grey market" in Britain and other European countries represents "a decline in moral and ethical values of the people". Mr. Monture described a visit to a British restaurant where items which did not appear on the menu could be obtained for an extra charge.

Food was the main topic of conversation replacing the popular subjects of, "sex and liquor", the speaker said. "No one actually is going hungry. The ration policy of the present government has resulted in a fine-looking group of young people from infancy to primary school age. In general, the good health of the people is attributed to their diet".

Mr. Monture was introduced by K. G. Chipman and thanked by the chairman J. L. Shearer. Head table guests included Dr. Charles Camsell, W. B. Timm, director of Mines, Forests and Scientific Services, John McLeish, past director of Mines and Geology branch; V. C. Wansborough, secretary, Canadian Metal and Mining Association and W. S. Lecky.

Saguenay

T. T. Anderson, Jr.E.I.C.
Secretary-Treasurer

Junior Section

T. H. Duffy, m.e.i.c.
Secretary-Treasurer

A meeting of the Junior Section of the Saguenay Branch was held at the Arvida Protestant School on December 6th.

This was the annual meeting for elections of officers, and Film Night.

The retiring chairman, C. J. Tanner, gave a review of the year's activities in the Junior Section, and reports of the secretary-treasurer were read and approved. Elections of officers for the 1948-1949 season were held, with the following results: T. T. Anderson is chairman; F. H. Duffy, vice-chairman; W. Dayton, secretary-treasurer; K. H. Cram and H. E. Marshall are committee members.

Following the elections, the following films were shown:

"Arc Welding at Work", "The Story of FM", and "Light". They proved very interesting.

Saskatchewan

D. W. Houston, m.e.i.c.
Secretary-Treasurer

R. Bing-Wo, m.e.i.c.
Branch News Editor

Regina Section

An informal meeting of the branch was held in the Canadian Room of the Hotel Saskatchewan on November 10, 1948. The speaker was Mr. G. K. Bell, Chairman of the Association of Consulting Engineers of Great Britain. Stewart Young, chairman of the Branch, presided, and the guest speaker was introduced by Mr. W. G. Coventry, British Trade Commissioner for the Prairie Provinces.

Mr. Bell is en route to Brazil and travelling through Canada to explore the possibility of the use of British engineering services, materials and equipment in Canada. He expressed a very optimistic opinion of the possibility of the use of British engineering in the Canadian West.

A discussion period followed and a large number of questions were answered by Mr. Bell, ranging from engineering standardization to labour problems.

M. J. Spratt tendered the vote of thanks to the guest speaker.

❖ ❖ ❖

A special meeting was called on November 19 at the Kitchener Hotel. The main purpose in calling the meeting was to discuss fully the new Dominion Labour Bill 195, and its effect on the engineering profession.

A great deal of discussion on collective bargaining and its ramifications was carried on. The final result was that the members present went on record as favouring exclusion from the operations of the new bill, of all registered members of the profession and all engineers-in-training. In order to gain the opinion of members throughout the Province a motion was passed directing that a letter ballot be taken on the matter before official action be taken.

Saskatoon Section

J. B. Mantle, m.e.i.c.
Secretary

On October 29, the Saskatoon Section held an informal meeting in the Engineering building of the University with P. C. Perry, m.e.i.c., district engineer of the Canadian National Railways presenting an intensely interesting paper **Precipitation — Evaporation Relationship**

for the Canadian Prairie. Mr. Perry has made a thorough study of the subject and by correlating Government data on average temperatures and precipitation has been able to define moisture-deficient areas of the West within fairly close limits. A moisture-deficient locality is one having a lower rate of precipitation than evaporation. Records indicate that 18 or 19 inches of moisture is the requirement for our warmest areas and this figure was used as a basis.

Mr. Perry had prepared several charts, one of the most striking of these being a plot of temperature against precipitation and evaporation. Knowing the average temperature of a locality, this curve foretells the annual precipitation requirement for a satisfactory precipitation balance. The importance of engineers, conservationists, and citizens recognizing and understanding the true moisture conditions of the prairies was stressed. The paper was followed by a spirited discussion session which was evidence of the interest of those present. The speaker was introduced by A. B. Olson and a well-deserved vote of thanks was moved by Clarence Forsberg.

Other events during the evening included a film on the electron microscope, "Unseen Worlds", from the National Film Board; and a film, made in Switzerland, dealing with the manufacture of Wild Surveying instruments, courtesy of the Western Drafting and Blueprinting Company.

The problem of Bill 195 and its effect on engineers was fully discussed, both students and practising engineers giving their views. The unanimous opinion of the group favoured exclusion of engineers from the provisions of the bill.

Do-nuts and coffee in the "common room" concluded a very satisfactory meeting.

❖ ❖ ❖

On November 17, the Saskatoon Section held a dinner meeting followed by a conducted tour of the Saskatchewan Government Telephone's local exchange. Ninety-two engineers took advantage of this opportunity to explore the "brain" of the telephone system. The telephone company's employees were on hand in full force to insure a well-conducted and thorough plant visit. Much credit is due to superintendent Medhurst, his supervisors and other staff members for the marvelous way in which the tour was organized. Everyone was able to see and to absorb a maximum of interesting information. Highlighted were such things as the free long distance telephone calls, the carrier equipment, the museum of old-time telephone equipment, the extensive test equipment and trouble warning systems, how the telephone pay station works, and last, but not least, the smart appearance of the "number please" lasses.

At the dinner, prior to the visit, a film "Telephone Courtesies" was viewed and was very much appreciated. The film, showing "what to do" and "what not to do" with your telephone, was presented in a colourful and humourous way. Mr. Wickware, methods engineer with the Saskatchewan Government Telephones at Regina, was present to introduce the film. Chairman Douglas extended a warm welcome to the many student members present and introduced head table guests Lovell, Wickware, Tubby, Friebel and Carroll.

St. Maurice Valley

G. W. Ince, s.e.i.c.
Secretary-Treasurer

J. G. MacLeod, m.e.i.c.
Branch News Editor

The third meeting of this Branch for the 1948-49 season featured a dinner meeting in Three Rivers, with Paul Brault of Dominion Bridge Company as guest speaker. The Mayors of Three Rivers and Cap de la Madeleine spoke briefly of the role of engineers and their contribution to the St. Maurice Valley.

Mr. Brault presented a very thorough and detailed description of the structural steel design and construction of the Duplessis Bridge in Three Rivers. His talk was illustrated throughout with lantern slides of interesting design features and photographs of the actual construction.

This bridge replaced the two old highway bridges across the St. Maurice River between Three Rivers and Cap de la Madeleine. It is of continuous girder construction over two crossings and cost some three million dollars. The East crossing is 635 ft. 4 in. long over 5 spans and the West crossing is 1375 ft. 4 in. over 8 spans. It is interesting to note that the 180-ft. span of this bridge is probably the longest on this continent for this type of bridge, and that all girder field splices were welded.

The speaker traced the design of the bridge in detail and indicated the amount of work required to obtain the final design, stress sheets, and templates. He also told of the particular construction problems encountered and the means used to overcome them.

A number of questions followed the talk and the speaker, who had been introduced by S. E. Williams of Three Rivers, was thanked by V. Jepsen of Grand' Mere.

Toronto

R. A. Muller, jr.e.i.c.
Secretary-Treasurer

M. W. Huggins, m.e.i.c.
Branch News Editor

Robert F. Legget, director of the Division of Building Research of the National Research Council addressed the November meeting of the Toronto Branch on Thursday, November 24th, 1948 in the Physics Bldg., University of Toronto. The audience of over 200 persons included many architects and students of the University as well as engineers.

NATIONAL RESEARCH COUNCIL

Speaking on the subject **Developments in Building Research,** Mr. Leggett traced the evolution of the N.R.C. as it functions today from the Honorary Advisory Council for Scientific and Industrial Research set up in 1916. The original council of twenty scientists and engineers functioned as a purely advisory body to the government on scientific and engineering matters. The present staff of the Council totals about 2500.

BUILDING RESEARCH DEVELOPMENT

Turning to the development of building research, Mr. Legget pointed out that with the exception of Great Britain, which has had a Building Research Station since 1921, the instigation of building research in other countries is of quite recent date, averaging about two years. In Canada the Division of Building Research and the Central Mortgage and Housing Corporation were both started on August 1st, 1947. Mr. Legget stressed that his division will not limit its investigations to housing but will study problems relating to any part of the building industry.

RESEARCH ON DOMINION-WIDE BASIS

Pointing out that Canadian climate comprises at least five distinct types, each of which entails its own building problems, the speaker stressed the Division's determination to carry out much of the necessary research right on the construction job. Mr. Legget hopes that the Division of Building Research will be advised of any unusual construction problems encountered during the progress of the work so that research officers may have an opportunity to study these problems for the benefit of the building industry as a whole.

PROGRAMME OF THE DIVISION

The first task will be the collating of the results of research already carried out and the organization of this material in a form readily available to the building industry.

In an effort to reach the individual builder, who spent such a large proportion of last year's one billion dollar expenditure on Canadian Construction, the Division plans to publish non-technical pamphlets.

HOUSING RESEARCH UNDER WAY

Housing research now under way includes a study to determine the where and why of heat losses. Knowledge thus gained of heat losses will be applied to a study of the desirability of building houses without basements. These would rest on a concrete slab laid on a foundation free from capillary moisture. Mr. Legget mentioned the numerous problems raised by the elimination of the basement and indicated that studies would be made in this connection to determine whether or not the overall picture indicates an economic advantage in this type of housing.

NATIONAL BUILDING CODE

The National Building Code of Canada is considered by some countries to be the finest yet produced anywhere. However, the Code is not a static document but is subject to constant revision and the next edition of the code will be issued in loose leaf form. A committee was appointed early in November to produce the revised Code.

The Soil Research laboratory has several studies under way including one on soil temperature variations. Work has also been started on materials of construction. The address was concluded with some slides illustrating work under way in other countries relating to building research.

Professor M. W. Huggins thanked the speaker on behalf of the Toronto Branch.

(Branch News is continued on page 60)

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment*.

Situations Vacant

CHEMICAL

JUNIOR CHEMICAL ENGINEER required by independent oil company located in Turner Valley. Duties will include design and supervision of maintenance and new construction work. Advancement will depend on initiative and readiness to assume responsibility. Salary open. Apply to File No. 1075-V.

CHEMICAL ENGINEER age 25 to 35 years, preferably with some experience in a rubber factory required by manufacturer in Province of Quebec to take charge of the laboratory and as soon as capable assume duties of plant engineer. Salary open. Apply to File No. 1077-V.

ELECTRICAL

ELECTRICAL DESIGNING DRAUGHTSMAN for work in Southern Ontario. Must be experienced. Salary up to $300. Apply to File No. 1059-V.

ELECTRICAL ENGINEER required as assistant to electrical superintendent by a textile manufacturing concern in Montreal. Applicant must have had good experience and be willing to accept responsibility. Salary open. Apply to File No. 1070-V.

RECENT GRADUATE, electrical background required as sales engineer by a manufacturer in Montreal. Salary open. Apply to File No. 1071-V.

ELECTRICAL ENGINEER with industrial background preferably pulp and paper required for senior position in electrical department of a paper mill in the Ottawa Valley. Salary open. Apply to File No. 1073-V.

ELECTRONICS ENGINEER and Technicians experienced on design and construction of radar, servomechanisms, computors or magnetometers required for development laboratory specializing in airborne devices for aerial survey and navigation. Advancement in rapidly expanding and progressive organization assured for capable personnel. Salary open. Apply to File No. 1074-V.

RECENT GRADUATE in Electrical Engineering required for Sales Engineering Work with old established Montreal firm. Must have had at least two years practical experience and be willing to travel occasionally. Apply to File No. 1094-V.

MECHANICAL

MECHANICAL ENGINEER with two or three years experience in chemical or allied industries required by chemical plant in Central Ontario. Salary open. Apply to File No. 1066-V.

MECHANICAL ENGINEER required as assistant to mechanical superintendent by a textile concern 35 miles south-west of Montreal. Must have had good experience and willing to accept responsibility. Salary open. Apply to File No. 1070-V.

MECHANICAL ENGINEER, experienced on design and construction of fine instruments wanted to take charge of small model shop in laboratory specializing on development of airborne radar and aerial survey and navigation aids, servomechanisms and computors. Advancement in rapidly expanding and progressive organization assured for capable engineer. Salary open. Apply to File No. 1074-V.

MECHANICAL ENGINEER required by an established manufacturing company in Toronto to layout and plan new building in the Toronto area. Opportunity for permanent employment. Reply stating age and experience. If possible attach a recent photograph. Salary open. Apply to File No. 1079-V.

MISCELLANEOUS

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experience in installations of production and cost control. Wage incentives ,etc. Free to travel. Preferably bilingual. Salary open. Apply to File No. 1058-V.

SALES ENGINEER 24 to 30 years of age, preferably single and free to travel required by Canadian manufacturer of industrial rubber products. Must have a minimum of 1 to 2 years post-graduate experience in mining or plant maintenance. Salary open. Apply to File No. 1060-V.

SENIOR ENGINEER required by Montreal contractor to supervise engineering and power development work in Ottawa area. Salary $425.00 up. Apply to File No. 1062-V.

INDUSTRIAL ENGINEER preferably with mechanical or chemical background and some experience in industrial engineering work, including plant layout and time study required by chemical company in Toronto. Apply to File No. 1065-V.

RECENT GRADUATE preferably mechanical or electrical background required by National Beverage Company. Training period in Montreal. Salary open. Apply to File No. 1069-V.

SALES ENGINEER required for sales staff of a manufacturer in Toronto. Preferably background in Mechanical, Chemical or Mining engineering. Salary open. Apply to File No. 1076-V.

SENIOR TIME STUDY MEN required by large National Organization in Ontario. Must be competent in methods improvement and have experience in developing standard data on machine tool and other operations. Salary open. Apply to File No. 1078-V.

JUNIOR ENGINEER OR ARCHITECTURAL DRAUGHTSMAN for city planning office in Western Canada. State education, experience, age and salary desired. Apply to File No. 1080-V.

GRADUATE CIVIL ENGINEER or ARCHITECT required for Saskatchewan community, about 6,000 population, to act as town planner under consultant, and as assistant to City Engineer. Interest in civic problems desirable. State education, experience and age. Apply to File No. 1080-V.

INDUSTRIAL ENGINEERS, must be fluently bilingual, two residents of Quebec City, one Bois Franc Region, one Grand'Mere, five Montreal, wanted by New York firm of Management Consultants, members of American Management Association contemplating to organize a branch in the Province of Quebec. Salary, commission and travelling expenses. Apply to File No. 1083-V.

JUNIOR SALES ENGINEER, preferably bilingual, to be trained for sales work with Montreal Industrial Company. Salary open. Apply to File No. 1086-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

JUNIOR RESEARCH CHEMIST required by a manufacturer in Central Ontario to be trained in Research work. Salary open. Apply to File No. 1017-V.

CHEMICAL ENGINEER, recent graduate, is needed for production work by chemical manufacturing firm situated in the Province of Quebec. Some experience in chemical production of synthetic resin manufacture would be advantageous. Salary open. Apply to File No. 1064-V.

CIVIL

CIVIL ENGINEER to act as assistant to Senior Officer of a well-established general contracting firm in Montreal. Applicant should have about five years experience and have some knowledge of all phases of building construction. Salary open. Apply to File No. 1038-V.

CIVIL ENGINEER required for Consulting Engineers office in Western Canada. Must have extensive experience water, sewer and pavement layouts capable of taking charge office staff and field parties. Partnership offered to right man. Salary open. Apply to File No. 1042-V.

CIVIL ENGINEERING GRADUATES with several years experience in building construction and estimating for permanent senior and junior positions in Winnipeg. Good prospects and pension benefits. Starting salary $250.00 and up per month with yearly increments. Apply to File No. 1061-V.

ELECTRICAL

ELECTRICAL ENGINEER with at least five years experience in Central Station and Substation installation and maintenance required by a Maritime Public Utility. Apply to File No. 1043-V.

MECHANICAL

MECHANICAL ENGINEER required by a large industrial concern in the Province of Quebec. Good chances for advancement. Salary open. Apply to File No. 1014-V.

MECHANICAL ENGINEER required by a large industrial plant in the East end of Montreal for product design work on major electrical appliances. We are prepared to offer definite advancement in a reasonably short period of time and salary will be based on potentiality rather than experience. Apply to File No. 1016-V.

RECENT GRADUATES in Mechanical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 1029-V.

MECHANICAL ENGINEER recent graduate, required for Engineering Department of a farm implement manufacturer in Ontario. Salary open. Apply to File No. 1030-V.

MECHANICAL DRAUGHTSMEN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for ordinary colliery plant, screening equipment, hoists, simple steel structures, etc. Salary $240 up depending upon ability. Apply to File No. 1032-V.

MECHANICAL ENGINEER preferably with a few years experience and some knowledge of pulp and paper required for design and layout by a company in New Brunswick. Salary open. Apply to File No. 1036-V.

SENIOR MECHANICAL DRAUGHTSMAN required by a machinery manufacturer in Central Ontario. Salary open. Apply to File No. 1044-V.

SENIOR MECHANICAL DRAUGHTSMAN for work in Ottawa. Ten years experience required in simple design layout and detail drawings for steam power plants, steam and hot water heating, ventilation and air conditioning. Four year contract if suitable. Reply in confidence, outlining experience and stating salary expected. Apply to File No. 1045-V.

MECHANICAL ENGINEER with industrial background required as sales engineer by consulting firm in Montreal. Salary $300 up according to experience. Apply to File No. 1049-V.

MECHANICAL ENGINEER thoroughly experienced in machine design with some background and experience in the printing trades required as methods engineer by manufacturer in Ontario. Must also have knowledge of production problems. Salary open. Apply to File No. 1050-V.

MECHANICAL ENGINEER with 5 or more years experience in industry, preferably pulp and paper required by manufacturer in Province of Quebec for duties involving organization of improvements, job schedules, machinery maintenance and some mechanical draughting. Salary $300-$350. Apply to File No. 1052-V.

METALLURGICAL

RECENT GRADUATES in Metallurgical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 1029-V.

MISCELLANEOUS

SALES ENGINEER required by Company manufacturing electrical switchgear, to represent them in Alberta and Sask. Salary and commission. A man with an aggressive personality and experience in this line of product can assure himself of a good income. Apply to File No 1018-V.

SALES ENGINEER, recent graduate, mechanical background, required by Canadian manufacturer. Must be free to travel. Location Ontario. Salary $235. to $250. Apply to File No. 1019-V.

GRADUATE ENGINEER, preferably mechanical or chemical, required for sales engineering in the Toronto area. Should have some experience in sales and maintenance engineering. Salary open. Apply to File No. 1020-V.

MECHANICAL OR ELECTRICAL ENGINEER age about 35 years with experience in building construction and machinery, maintenance and repair, capable of taking over the engineering and maintenance service in a large textile mill in Province of Quebec. Salary open. Apply to File No. 1021-V.

SENIOR INDUSTRIAL ENGINEER required by firm in Province of Quebec. Duties include: Wage incentives, method studies, cost reduction, etc. Should be graduate in mining or mechanical engineering. Salary open. Apply to File No. 1023-V.

GRADUATE ENGINEER mechanical or electrical background required to set up and organize a new department for a Canadian manufacturer. Must have plant and production experience. Preferably under 35 years. Salary open. Apply to File No. 1025-V.

FORESTRY ENGINEERS, recent graduates also class of 1949 required for extensive logging operations in Province of Quebec. Preferably but not necessarily bilingual. Current salaries paid. Apply to File No. 1026-V.

STRUCTURAL ENGINEER required by a firm of consulting engineers in Montreal for design work. Must have experience in structural steel and reinforced concrete. Salary open. Apply to File No. 1027-V.

GRADUATE ENGINEERS with mechanical and light structural experience, applicable to designing and detailing of conveyors, who are interested in establishing themselves with a well established growing concern to learn business in preparation for future advancement. Situated near Toronto. Salary open. Apply to File No. 1028-V.

JUNIOR ENGINEER preferably with civil background required for sales and service by a Montreal manufacturer of water-proofing compounds. Salary open. Apply to File No. 1033-V.

SALES ENGINEER under 35 years of age, preferably with engineering and sales experience required in Toronto, to become a specialist in capacitor sales. Salary according to qualifications and experience. Apply to File No. 1035-V.

GRADUATE ENGINEER with engineering and sales experience required as a Street lighting specialist in Toronto area. Position involves direct sales engineering with municipalities and utilities also engineering and production problems, directly concerned with the manufacture of street lighting equipment. Age under 35 years. Salary open. Apply to File No. 1035-V.

SALES ENGINEERS, one experienced man, also two juniors, willing to learn required by an electrical and power house equipment manufacturer in Montreal. Salary open. Apply to File No. 1035-V.

CONCRETE DESIGNERS with experience and preferably under 35 years of age required by construction company in Montreal. Salary open. Apply to File No. 1037-V.

MECHANICAL OR ELECTRICAL ENGINEER required as Montreal representative of a Canadian manufacturer with Headquarters in Ontario. Preferably some sales experience. Salary open. Apply to File No. 1039-V.

JUNIOR ENGINEER preferably with a few years experience required by Construction Company in Montreal. Salary open. Apply to File No. 1040-V.

GRADUATE ENGINEER for urban transportation system 25 to 40 years of age with at least five years experience. Hydro-Elect. plant operation experience essential. Steam or diesel electric generating plants desirable. A knowledge of time and motion study and evaluation would be a definite advantage. Salary open. Please send photograph and full particulars of education and experience. Apply to File No. 1041-V.

FOREIGN TRADE REPRESENTATIVE for Middle and Far East for one of Canada's largest chemical manufacturers. Must have extensive experience and knowledge in establishing important contacts in overseas markets. Canadian citizen. Knowledge of French. Salary $8,000 up. Apply to File No. 1046-V.

GRADUATE ENGINEER required by a consulting engineer in Montreal. Must have experience in boiler plant design and general knowledge of heating. Salary open. Apply to File No. 1048-V.

DRAUGHTSMAN required by industrial organization in Toronto. Must have plant and structural experience. Salary open. Apply to File No. 1051-V.

MECHANICAL OR CIVIL ENGINEER with 3 or more years experience in industry, preferably pulp and paper required by a manufacturer in Province of Quebec for duties involving study and preparation of improvement projects, such as, installation of machinery, piping, etc. Salary $250 to $300. Apply to File No. 1052-V.

MINING OR METALLURGICAL ENGINEER capable of taking charge of a plant control laboratory for plant and control work, required by a manufacturer in the St. Maurice Valley. Age should be between 30 to 40 years. Salary open. Apply to File No. 1054-V.

GRADUATE ENGINEERS required for sales staff of a manufacturer in Montreal. Preferably background in mechanical, chemical or mining engineering. Permanent position and good salary for right man. Apply to File No. 1057-V.

DESIGN ENGINEER for concrete machinery and mixers required by well established Ontario manufacturing company. Good opportunity. Good salary. Apply to File No. 1067-V.

ASSISTANT PLANT ENGINEER required for textile plant in Montreal. Age 27 to 35 and must have maintenance experience. Salary open. Apply to File No. 1068-V.

Situations Wanted

MECHANICAL ENGINEER, age 39, experienced in tool design and production methods, material selection, production records, control and co-ordination. Desires employment preferably in Montreal with either manufacturer or firm of Engineers who could utilize all or a part of above experience. Apply to File No. 551-W.

ELECTRICAL ENGINEER, Jr.E.I.C., Manitoba, '44, married, age 27. Presently situated in Maritimes desires active position in Central or Western region. Field service engineering, C.G.E. test course, Army radar experience. Interested in plant engineering, installation or development openings. Apply to File No. 846-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. (E.E.) Manitoba, 1943. Age, 27. Married. Electrical experience with R. C. Signals and 2½ years general electrical experience in industry. Sales training. Presently employed but desires position offering wider scope and opportunity. Preferably Montreal area. Apply to File No. 925-W.

GRADUATE MECHANICAL ENGINEER (McGill) M.E.I.C., P.Eng. Ont. 26 years experience including Oil refinery design, plant layout, structural design, pressure vessels, central station boilers and furnaces both design and specifications; surveys and reports on power plant and factory efficiency problems, inspection of installations, and supervision of maintenance on heating, ventilation and air conditioning of military and Air Port buildings, and fuel storage depots. War veteran, employed but desires renumerative responsible position on West Coast. Would consider partnership with Consulting firm. Apply to File No. 991-W.

STRUCTURAL ENGINEER, M.E.I.C., P. Eng., experienced in design work and preparation of drawings for wood, structural steel, and reinforced concrete structures. Interested in position or partnership with consulting engineering firm in Toronto, Hamilton, any other city in the interlake region, or Vancouver. Apply to File No. 1031-W.

ENGINEER, M.E.I.C. Graduate Civil and Electrical. Age 40, single. Experience covers engineering and building construction and maintenance, works maintenance, general and heavy construction machinery sales and service, shop management. Past seven years in executive and administrative capacity. Seek wider opportunities or position leading to same in business, engineering, or business engineering. Free to travel, any location including foreign, available one month notice. Apply to File No. 1266-W.

CIVIL ENGINEER, S.E.I.C., P.Eng. Que. B.Sc. doing post graduate study in Montreal requires part time employment preferably weekends at home. Experienced in various steel plate construction designs. Will also accept draughting and miscellaneous engineering work. Apply to File No. 1487-W.

SENIOR MECHANICAL ENGINEER, M.E.I.C., B.Eng., McGill '34, desires responsible position with a future. Presently employed with firm of chemical consulting engineers. Previous experience includes several years in charge of airplane design, planning, cost estimating and construction. Accustomed to directing technical staff and shop operations. Apply to File No. 1511-W.

GRADUATE ELECTRICAL ENGINEER, M.E.I.C., age 31, with seven years experience in electronics and radio, including radar and microwave techniques, and three years experience in industrial and utility engineering and management, desires permanent, responsible position Montreal, Ottawa, Toronto region preferred. Apply to File No. 1689-W.

SALES ENGINEER, B.E. (Electrical) N.S.T.C., M.E.I.C., Professional Engineer Nova Scotia, age 35, married. Presently employed in Halifax. Ten years experience successfully selling, and supervising the selling of, a variety of electrical equipment. Excellent contacts in Maritime Provinces and Newfoundland. Interested in position as branch manager, or district representative in Maritimes, on salary and commission. Would also consider being manufacturer's agent. Apply to File No. 1758-W.

CHEMICAL ENGINEER, M.E.I.C., Graduate of McGill. Age 33, married, bilingual, presently located in Montreal, experienced in production and process control of dairy equipment, aluminum plant pot-rooms, gas scrubbing plant. Last three years in charge of lubricant and fuel oil sales in marketing organization of major oil company. Desires responsible position with well established firm leading to management. Apply to File No. 1932-W.

CIVIL ENGINEER, M.E.I.C., P.Eng. Que., has structural, mechanical, chemical and mining experience. Qualifications merit consideration for responsible position, contract work on design, associate with consulting engineer. Location is Montreal but would locate elsewhere. Interests are structural design, mechanical trades for builidings, power development, steam plant, process plant design, machine and tool design, pulp and paper plant engineering and engineering research. Would consider position as resident engineer, or municipal engineer. Apply to File No. 1935-W.

CIVIL ENGINEER, M.E.I.C., P.Eng. Ontario, age 38, married. 14 years extensive structural experience in reinforced concrete and structural steel design and layout. Interested in association with well established progressive organization as Engineering Assistant or Chief Draughtsman. Present salary $5,000. Apply to File No. 2049-W.

EXECUTIVE ASSISTANT ENGINEER, M.E.I.C., Background of Engineering, production, Business Organization, Cost Control, and Management. Age 37, married, and preference for permanent association with enterprize in Montreal area. Apply to File No. 2228-W.

CIVIL ENGINEER, Jr.E.I.C., McGill, '45, married, with experience in surveying and construction. Presently employed with small construction concern in the preparation of estimates, records and cost analyses. Experienced in writing contracts and specifications. Bilingual. Seeking responsible position in Montreal or Ottawa areas. Apply to File No. 2405-W.

MECHANICAL ENGINEER, Jr.E.I.C., P. Eng., McGill '46, age 24, single. Presently employed as a machinist with a large concern. Employment in the past includes positions in tool design, air conditioning and methods engineering. Seeks responsible position with firm in production or shop management. Available on short notice. Apply to File No. 2707-W.

MECHANICAL ENGINEER, Jr.E.I.C., Sask. '46, P.Eng., Ont. Age 23. Married. Experience primarily in Pulp and Paper Industry in maintenance engineering, layouts and small construction jobs. Earnestly desires to enter Industrial Engineering field either with Consulting Engineer of Industrial Methods or Production Department. Location immaterial, available experience most important. Available on one month's notice. Apply to File No. 2795-W.

MECHANICAL AND INDUSTRIAL ENGINEER, Jr.E.I.C., McGill '44, 7 years industrial experience. Welding application and metallurgy, production supervision, production specifications, purchasing, wage incentives, time study, estimating, costing, design. Available 4 weeks notice. Apply to File No. 2920-W.

CHEMICAL ENGINEER. M.E.I.C., P.Eng., with considerable mechanical experience in plant construction, piping layouts and welding, 14 years industrial practice on positions of responsibility, desire a change of employment preferably in Montreal area. Bilingual. Apply to File No. 2940-W.

GRADUATE ENGINEER, S.E.I.C., Man. '47. Presently engaged in plant layout and field supervision. Experienced in mechanical and electrical construction and maintenance. Responsible position desired in business and production engineering in progressive firm. Apply to File No. 2975-W.

GRADUATE ELECTRICAL ENGINEER, M.E.I.C., P.Eng., Alberta, B.Sc. (Honors) Alberta, M.A.Sc. at Toronto. Married, age 25, 3 years experience in electric power utilization, some generation and distribution; 2 years as officer in electrical branch, R.C.N.V.R., supervision of electrical installations by civilian electricians. Particularly interested in permanent position in Western Canada. Available on one month notice. Apply to File No. 3050-W.

SALES ENGINEER, M.E.I.C., P.Eng.,N.S. and P.Q., B.Sc. Married, age 44, 7 years railway construction, 8 years sales manager large gas and electric utility, 5 years R.C.N.V.R., 5 years naval architect. Desirous of moving to South America, wishes position as sale representative preferably with manufacturer of marine equipment. Apply to File No. 3057-W.

MECHANICAL ENGINEER, M.E.I.C., P. Eng. Que. G.I.Mech.E.; A.M.I.Loco. E. (Great Britain). Aged 30. Married, 6 years Locomotive design and Construction, machine shop production and assembly. 5½ years Engineer officer, Royal Air Force, rank Squadron Leader, Chief Technical Officer. Employed 18 months in Province of Quebec. Desires change to position with more responsibility and opportunity for advancement. Preferably Southern Ontario or Western Canada. Apply to File No. 3059-W.

MECHANICAL ENGINEER, S.E.I.C., B.A.Sc., Toronto, age 26, single, experience in operation planning and detailing also sales. Presently employed with Importers as Correspondent and Interpreter. Languages: English and German perfect; French reading knowledge only. Desires employment as industrial engineer, preferably in Toronto area. Apply to File No. 3065-W.

SALES ENGINEER, S.E.I.C., recent graduate in Mech. Eng., N.S.T.C. At present very successful N.S. representative of Non-Engineering Organization, also desires to represent Engineering firm as well, part time or full time. Apply to File No. 3068-W.

MECHANICAL ENGINEER, A.M.I. Mech. E., P.Eng. Que. Graduate London 1935; age 37, married. 10 years experience in design, testing and installation supervision of all classes of I.C. engines, supercharging, steam machinery and plant layout in the U.K. 3 years technical executive and administrative experience in policy and production with responsibility of Government level Trilingual, English, German, Russian. Desires responsible position covering design, administrative or sales with progressive and reliable employers, anywhere in Canada. At present resident in Montreal. Apply to File No. 3069-W.

PART TIME WORK, Graduate Civil Engineer, B.A.Sc., Jr.E.I.C., now doing graduate work in Montreal. Desirous of obtaining part time work in concrete and steel design or cost estimating. Apply to File No. 3073-W.

GRADUATE MECHANICAL ENGINEER, 39, single, 14 years experience in research engineering, instrumentation, automatic controls, testing of materials and machinery. Knowledge of metallography, heat-treatment, and welding. Several languages. Acquainted with optical and electrical equipment, emergency maintenance of plant and motor transport. Desires suitable position requiring initiative. Apply to File No. 3074-W.

PART TIME WORK, 3rd Year Electrical Engineer, McGill S.E.I.C. Anxious to obtain part-time employment, preferably in electrical field. Have considerable free time available. Summer experience in textile plant also telegraph department of railroad company. Apply to File No. 3075-W.

MECHANICAL ENGINEERING STUDENT, S.E.I.C., 2nd year at McGill University, member, Society of Motion Picture Engineers, age 21, single. Interested in obtaining summer employment with prospects of permanent position in precision mechanical engineering field (instruments, meters, motion picture equipment). Machine shop experience, languages. Apply to File No. 3076-W.

GRADUATE ENGINEER, Toronto '42, M.E.I.C., P.Eng. (Civil Branch), age 30. Married. Overseas veteran with R.C.E.M.E. Experience in Mining and Metallurgy. Presently engaged in all phases of railroad construction and maintenance of way including estimating, general design and layout work. Desires change to position of professional responsibility in Municipal Engineering or Industrial work in smaller firm. Preferable location Toronto or neighborhood. Now completing two year course in Business Methods. Apply to File No. 3077-W.

CIVIL GRADUATE, S.E.I.C., B.Sc., Queen's. Age 25, married, veteran. Experience limited to survey work and varied shop experience. Desires a position with a consultant or with a town planner. Available on short notice. Apply to File No. 3078-W.

SALES ENGINEER, M.E.I.C. Electrical and Mechanical background, bilingual, 12 years service in Navy and 6 years with Wartime Shipbuilding and War Assets in technical and executive capacity. Interested in representing Firm in Montreal area. Available immediately. Apply to File No. 3081-W.

Attention, Members

Please telephone in advance and make an appointment if you propose using the Institute's Employment Department.

This will result in a better service to everyone concerned.

TELEPHONE PLATEAU 5078

Except in special cases all interviews will be arranged between the hours of 9 and 12.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Concise Oxford Dictionary of Current English, 3rd ed:
H. W. Fowler and F. G. Fowler. Oxford, Clarendon Press, 1946. 1520 p., cloth.

Consulting Engineer Year Book, 1948:
Princes Press, London, 1948. 228 p., illus., cloth.

Design of Industrial Exhaust Systems, 2nd ed:
John L. Alden. New York, Industrial Press, 1948. 252 p., illus., fabrikoid.

Elasticity and Anelasticity of Metals:
Clarence Zener. Chicago, University of Chicago Press, 1948. 170 p., illus., cloth.

Gas Tables: Thermodynamic Properties of Air, Products of Combustion, and Component Gases; Compressible Flow Functions, including those of Ascher H. Shapiro and Gilbert M. Edelman:
J. H. Keenan and Joseph Kaye. New York, Wiley, 1948. 238 p., illus., cloth.

Introduction to Engineering Problems:
R. Q. Brown. New York, Prentice-Hall, 1948. 191 p., illus., cloth.

Introduction to Gas-Turbine and Jet-Propulsion Design:
C. A. Norman and R. H. Zimmerman. New York, Harper Brothers, 1948. 286 p., illus., cloth.

Machine Design and Drawing Room Problems, 4th ed:
C. D. Albert. New York, Wiley; London, Chapman and Hall, 1948. 519 p., illus., cloth.

Microwaves and Radar Electronics:
E. C. Pollard and J. M. Sturtevant. New York, Wiley; London, Chapman and Hall, 1948. 426 p., illus., cloth.

Packaging Methods and Equipment:
O. W. Roskill & Co. (Reports) Ltd., London, 1948. 57 p., paper.

Principles of Electric and Magnetic Fields:
W. B. Boast. New York, Harper Brothers, 1948. 405 p., illus., cloth.

Tables of Physical and Chemical Constants, and some Mathematical Functions, 10th ed:
G. W. C. Kaye and T. H. Laby. London, New York, Toronto, Longmans Green, 1948. 194 p., illus., cloth.

Physics for Arts and Sciences:
L. G. Hector, H. S. Lein, and C. E. Scouten. Philadelphia, Toronto, Blakiston, 1948. 731 p., illus., cloth.

Radio Engineering, Volume One:

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

Vacuum Manipulation of Volatile Compounds; a Laboratory Manual Describing the Application of High Vacuum Technique in Experimental Chemistry:
R. T. Sanderson. New York, Wiley; London, Chapman and Hall, 1948. 162 p., illus., cloth.

PROCEEDINGS, TRANSACTIONS, ANNUALS, ETC.

Connecticut Society of Civil Engineers, Inc.:
Annual Report of Proceedings for the Sixty-fourth Year of the Society, ending March 17, 1948.

International Telecommunication and Radio Conferences, Atlantic City:

Engineers' Council for Professional Development, Chicago, 1948.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada.

BRITISH ENGINEERING SOCIETIES.

L. St.L. Pendred. Toronto, Longmans, Green, for the British Council, 1947. 38 p., illus., 8¾ x 6¼in., paper 1/6–.

This essay describes the three major engineering institutions of Great Britain—the Institution of Civil Engineers, the Institution of Mechanical Engineers, and the Institution of Electrical Engineers. Their history, their influence on the profession, and their important activities are outlined. An introduction gives a brief survey of the other engineering associations in Great Britain.

BRITISH STANDARDS INSTITUTION. STANDARDS.

London, the Institution, 1948.

BS 138:1948—Portable Fire Extinguishers of the Water Type (Soda Acid) *2/6–.*

Applies to the class of extinguisher in which the pressure required to expel the liquid contents is generated by the chemical action of an acid, in conjunction with a carbonate or bicarbonate solution.

BS 740, Pt. 1:1948—Portable Fire Extinguishers of the Foam Type. *2/6–.*

Applies to the class of extinguisher in which the pressure to expel the contents is generated by the chemical action of an acid salt solution stored in an inner container of an extinguisher, in conjunction with a carbonate or bicarbonate solution in combination with a stabilizer, stored in an outer container of the extinguisher, which when combined with the acid salt will produce foam.

BS 1382:1948—Portable Chemical Fire Extinguishers of the Water Type (Gas Pressure). *2/6–.*

Applies to the class of extinguisher in which the pressure required to expel the extinguishing medium (water) is produced by the compressed gas from a pressure container attached to or fitted into the extinguisher.

BOILER HOUSE AND POWER STATION CHEMISTRY, 2nd ed.

Wilfrid Francis. Toronto, Longmans Green, 1947. 274 p., illus., 8¾ x 5½ in., cloth, 21/–.

This book is intended to provide chemists, students of fuel technology and operators of boiler plant and power stations, with an introduction to the chemical considerations involved in the combustion of coal and in the generation of steam and electricity. The second edition has been written with a view to anticipating some of the changes in boiler house and power station practice that may be expected to materialize, so that the chemist, combustion engineer or fuel technologist associated with the generation of steam and electricity will be ready for developments of this character.

DOMINION OF CANADA INCOME TAX ACT, effective January 1, 1949, and EXCISE TAX ACT, 14th ed.

CCH Canadian Ltd., Toronto, 1948. 256 p., 9 x 6 in., paper, $2.00.

This edition contains the full text of the new Income Tax Act which is effective January 1, 1949. Each subsection of the Act is supplemented with a note giving the text of the analogous section or part of the Income War Tax Act as last amended. Also included are the Canada-United States Tax Convention Articles, the Canada-United Kingdom Tax Agreement and the Canada-New Zealand Income Tax Agreement.

HANDBOOK OF SCIENTIFIC AND TECHNICAL SOCIETIES AND INSTITUTIONS OF CANADA.

S. J. Cook and J. R. Kohr. Ottawa, National Research Council, 1948. 62 p., 9¾ x 6¾ in., paper, 25c.

This is a directory of 166 Canadian associations which contribute to the advancement of scientific and technical knowledge. It contains such data as address, officers, purpose, funds, publications, and changes of name of the organizations listed.

POLARIZED HEADLIGHT SYSTEM.

U.S. Highway Research Board, Washington, 1948. 36 p., illus., 9¾ x 7 in., paper. (U.S. Highway Research Board, Bulletin No. 11).

The chief objective of the polarized headlight system is to provide ample visibility for driving and to eliminate the glare from this light intensity. The principle is based on the optical law that if a beam of light is passed through certain crystals it will come out with waves in only one plane instead of vibrating in every direction. There are still some practical problems to be solved in connection with the optical system and installations.

RULES FOR WELDING PIPING IN MARINE CONSTRUCTION; CARBON STEEL ONLY.

American Welding Society, N.Y., 1948. 5 p., illus., 9 x 6 in., paper, 25c.

The purpose of this publication is to effect a uniformity in the classification and basic welding requirements for piping of the governing agencies in the shipbuilding industry. In this new edition materials and classification of piping have been revised and thereby clarified. Requirements have been made to conform more closely to requirements for stationary piping and have also been broken down into more specific groupings.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

ATOMIC ENERGY.

Karl K. Darrow. John Wiley & Sons, Inc., New York; Chapman & Hall, Ltd., London, 1948. 80 pp., illus., diagrs., tables, 8½ x 5½ in., cloth, $2.00.

This small book contains four lectures given in the Norman Wait Harris lecture series at Northwestern University in 1947. The lectures include as much of the science of atomic energy as possible to give in four hours to an audience consisting largely of people whose special fields of interest were other than physics.

GUIDE TO TECHNICAL WRITING.

W. G. Crouch and R. L. Zetler. Ronald Press Company, New York, 1948. 401 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $4.00.

This book covers both the techniques of various kinds of communications and the principles of writing. The business letter, technical article, report, abstract, and types of oral communication are considered in the first section. The chapter, "Language Essentials", reviews the fundamental principles. The "Index to English Usage" which follows has been arranged alphabetically and has been limited to essentials of English and grammar which technical men must employ. Throughout the style has been kept informal, even conversational.

PRINCIPLES AND METHODS OF TELEMETERING.

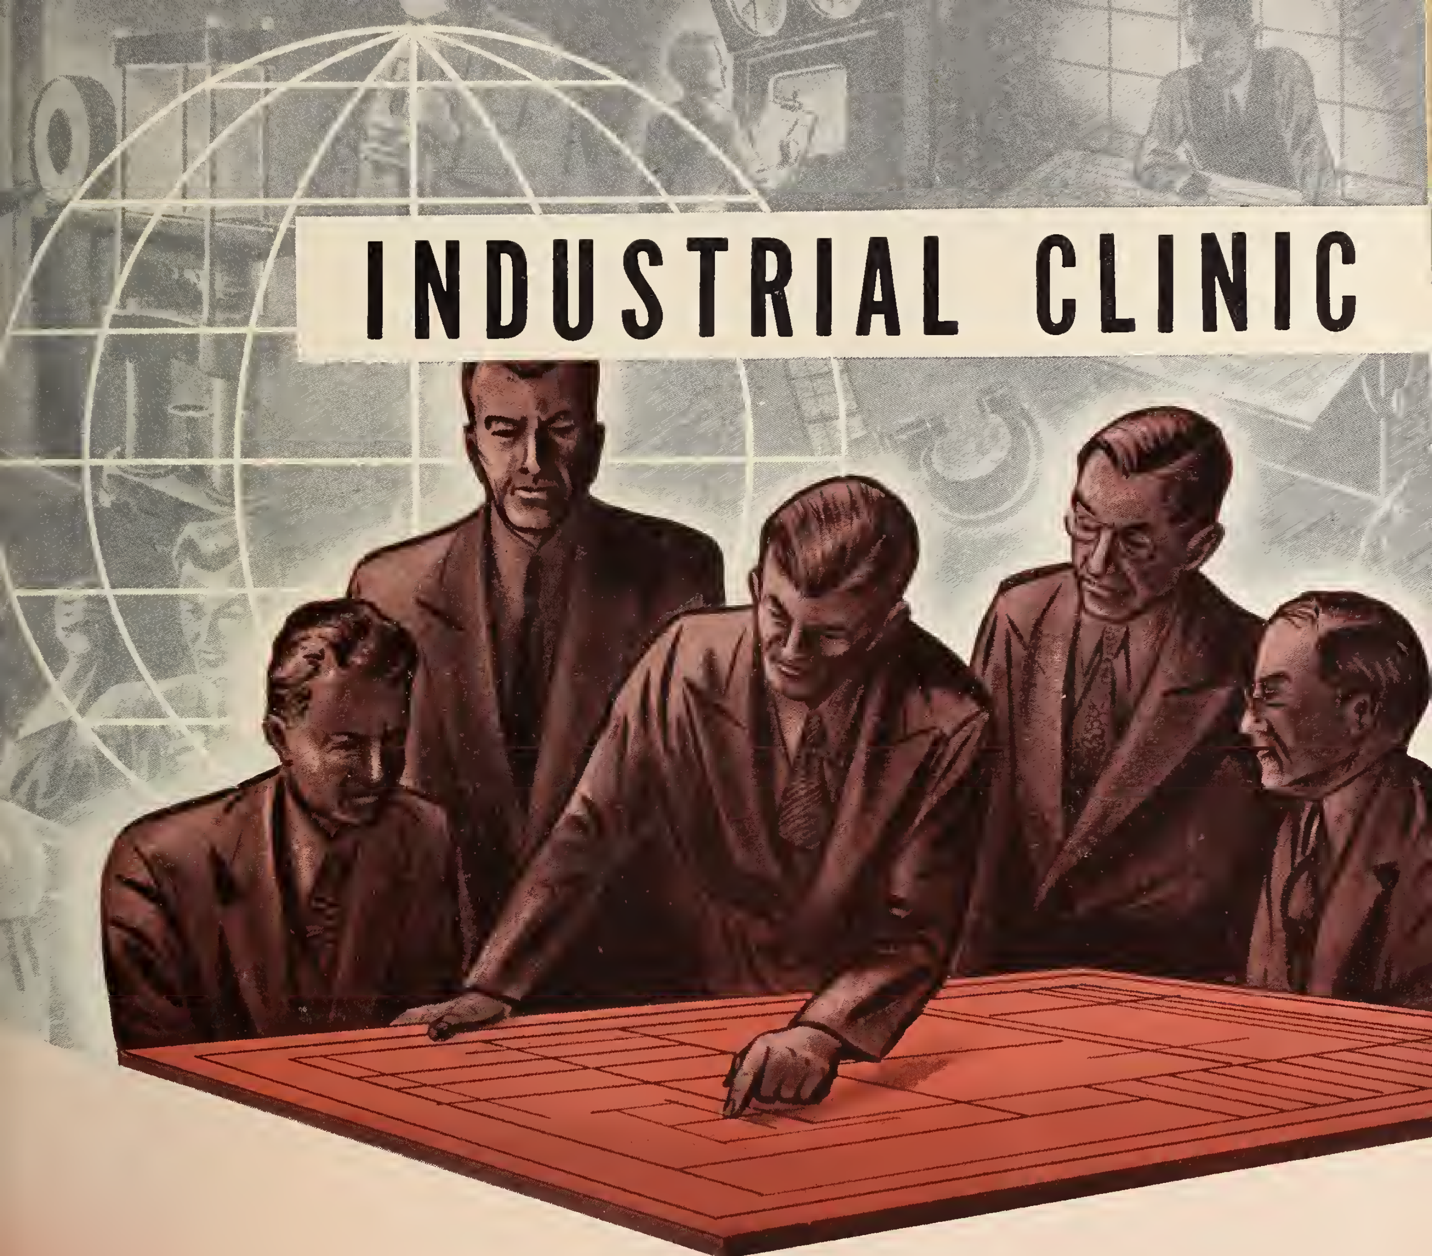
P. A. Borden and G. M. Thynell. Reinhold Publishing Corp., New York, 1948. 230 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.50.

Discussing the various types of telemetering systems, this book also considers the instruments used in America today. In addition to the principles and applications, it gives an analytical and descriptive treatment of the large variety of telemetering devices produced by seventeen companies. Installation methods, adjustments, and operating procedures are not included. Neither is there a repetition of detailed description of long known and well publicized systems, but rather abbreviated remarks. The bibliography covers both papers and patents.

ROTARY DRILLING HANDBOOK.

J. E. Brantly. 4th ed. rev. Palmer Publications, Los Angeles, New York, London, 1948. 568 pp., illus., diagrs., charts, tables, 7½ x 5 in., fabrikoid, $7.50. (U.S. funds)

This handbook was written for the use of floormen, drillers, toolpushers, superintendents, engineers and students of petroleum and drilling engineering. It contains all of the material and tables needed by the field engineer and practical rig operator. In this revised edition, several chapters have been rewritten and sections on newly developed practices have been added. The latest important advances affecting the mechanical operations of the rotary drilling industry have been included.



with world-wide resources...

Clinical methods applied to industrial needs... this is what Inglis offers you. Equipping a plant, extending a production line, providing new sources of power, are problems that call for the expert. Behind the Inglis engineering staff is an army of experts in every field, men who make the world's leading machinery and equipment. Because this industrial clinic is unique in Canada, you are most likely to get the soundest answers to your equipment problems from Inglis. Call in Inglis engineers at the earliest stage of your planning.

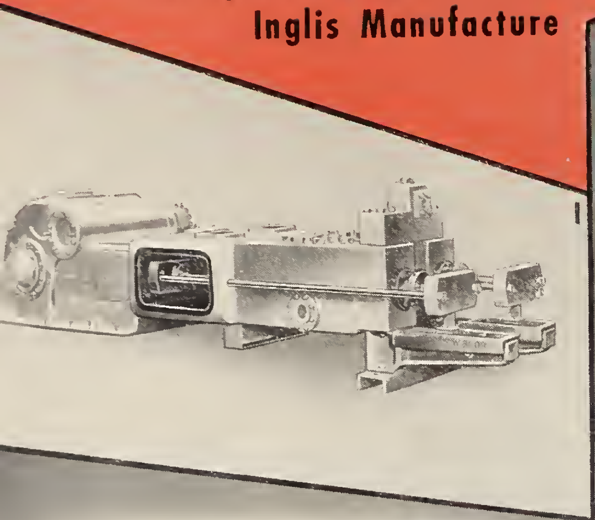
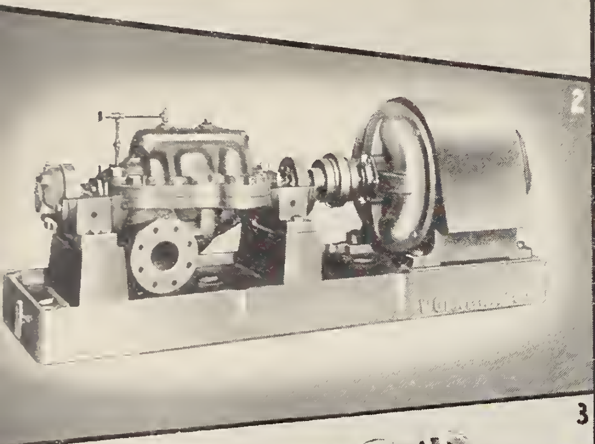
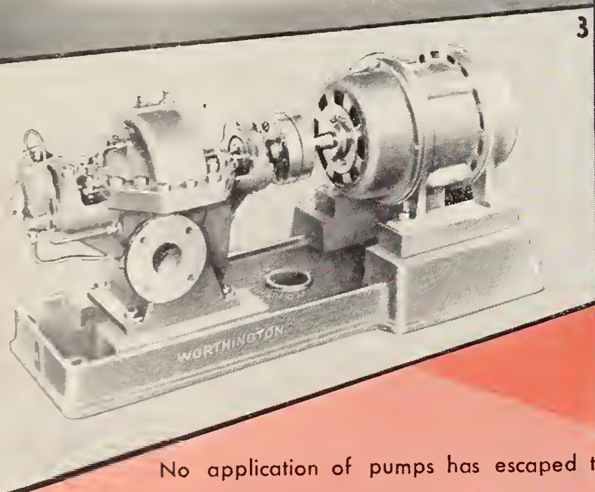
PUMPS

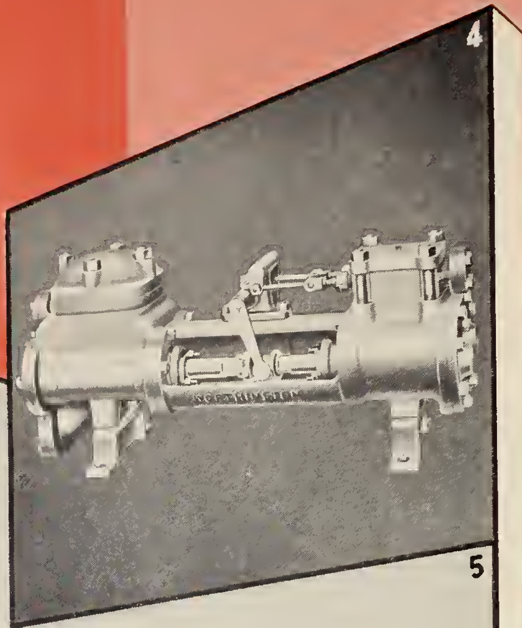
Worthington Design
Inglis Manufacture

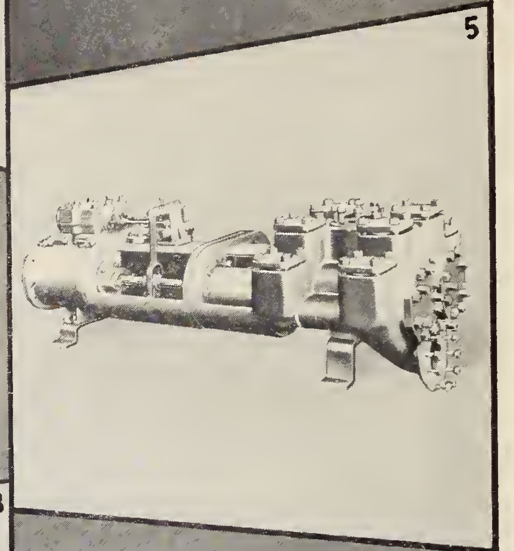
- CENTRIFUGAL PUMP
- STEAM PUMPS
- ROTARY GEAR PUM
- POWER PUMPS
- TURBINE WELL PUM

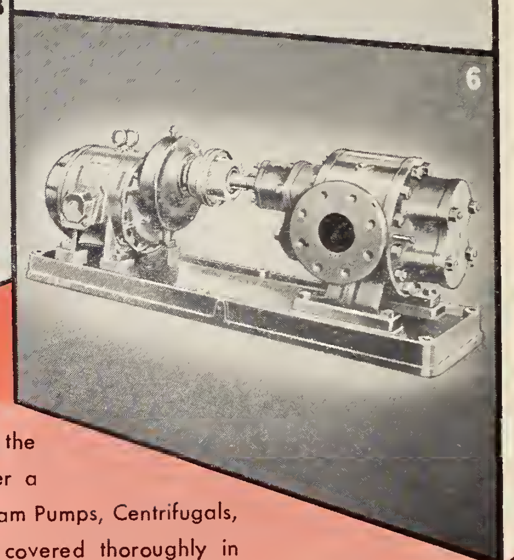












No application of pumps has escaped the study of Worthington designers in over a hundred years of producing pumps. Steam Pumps, Centrifugals, Power or Rotary Gear Pumps, all are covered thoroughly in the Worthington line. In Canada, Inglis applies the precision methods required for ordnance production to the manufacture of Worthington Pumps. Descriptive literature on pumps for any purpose is available at your request.

1. Duplex plunger power pump - Type KUF.
2. Multi-stage centrifugal pump.
3. Two-stage volute centrifugal pump - Type U.
4. Horizontal duplex piston steam pump - Type VA.
5. Duplex side-pot steam pump - Type PRL.
6. Rotary pump - Type GR.
7. Power pump - Type VTE.

SOCIETY FOR EXPERIMENTAL STRESS ANALYSIS, Proceedings, Volume V, No. 2.

Edited by C. Lipson and W. M. Murray, published and distributed by Addison-Wesley Press, Inc., Kendall Square, Cambridge 42, Mass., 1948. 153 pp., illus., diagrs., charts, tables, 11 x 8¼ in., cloth, $6.00.

The sixteen papers presented in this volume cover various aspects of stress and strain analysis chiefly by strain-gage and photoelastic methods. Special topics dealt with are: a pendulum analyzer for mechanical transients; photo-grid process for measuring strain in underwater explosions; the selection of allowable stresses for steel members; investigation of buckling shock mount.

SURVEYING.

W. Norman Thomas. 4th ed. Longmans, Green and Co., Toronto, New York; Edward Arnold & Co., London, 1948. 564 pp., illus., diagrs., charts, maps, tables, 8¾ x 5½ in., cloth, 30s., $9.00 (in Canada).

This standard British text describes in detail the instruments and procedures used for all kinds of surveying work: levelling, plane table surveying, curve ranging, earthwork calculations, triangulations, hydrographic, photographic and aerial surveying. Particular attention is paid to the adjustment of instruments, and a new chapter on the adjustment of errors has been added in this edition.

YEAR BOOK OF THE HEATING AND VENTILATING INDUSTRY, 1948.

Technitrade Journals, Ltd., 8 Southhampton Row, London, W.C.1, England. 206 pp., illus., diagrs., 8¾ x 5½ in., cloth, 5s.

Of interest to architects, consulting engineers, and those who deal with heating and ventilating contractors, this compact volume contains technical, contractual and trade information. In addition to articles on various phases of the field, there are a buyer's guide, a list of technical and trade associations, and a list of trade names. The officers and members of the Association of Heating, Ventilating and Domestic Engineering Employers are also included.

Although the following new books are not available in the Institute Library, inquiries concerning them will be welcome there or may be sent direct to the publishers.

CHEMICAL AND ELECTROPLATED FINISHES.

H. Silman, foreword by H. Moore. Chapman & Hall, Ltd., London, 1948. 414 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 30s.

This book presents a reasonably comprehensive account of modern industrial metal-finishing processes, together with the chemical and physical principles involved. It is of interest to engineers and designers and those concerned more directly with the scientific and technical aspects of metal finishing, both from the process and plant angles. All finishes which are applied to metals for both protective and decorative purposes from aqueous solutions with or without use the of electric current are included.

CURRENT-COLLECTING BRUSHES IN ELECTRICAL MACHINES.

By M· E. Hayes. Sir Isaac Pitman & Sons, Ltd., London, 1947. 191 pp., illus. diagrs., charts, tables, 8¾ x 5½ in., cloth, 21s.

Beginning with introductory chapters on carbon as a material and on the various types of carbon brushes, this comprehensive work proceeds with a detailed treatment of the design and use of such brushes. The principles and effective operation of current collecting devices are discussed with attention to wear and maintenance problems. A detailed table is given for the selection of brush quality.

ELEMENTARY MECHANICAL VIBRATIONS.

By A. H. Church. Pitman Publishing Corporation, New York and London, 1948. 200 pp., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.25.

Based upon courses given at New York University, this book covers the elementary principles and serves as an introduction to more extensive study of vibration problems. The author stresses the physical rather than the mathematical explanations of the phenomena. One chapter is devoted to balancing. A knowledge of mechanics and calculus is assumed· Extensive use of examples clarifies the text, and problems, with answers, are given at the end of each chapter.

ELEMENTS OF PHOTO-GRAMMETRY.

E. Church and A. O. Quinn. Syracuse University Press, Syracuse, New York, 1948. 120 pp., illus., diagrs., tables, 9¼ x 6 in., cloth, $3.00.

Prepared as a textbook for an introductory course in elementary photogrammetry, this edition presents the history and background together with basic principles and applications. Part I is devoted to fundamentals and includes chapters on field control and photographic interpretation. Part II consists of practical laboratory problems and contains sections on mapping methods.

EQUIPEMENT THERMIQUE DES USINES GENERATRICES D'ENERGIE ELECTRIQUE, 2d ed.

J. Ricard, preface by E. Mercier. Dunod, Paris, 1948. 659 pp., illus., diagrs., charts, tables, 9½ x 6¼ in., paper, 2900 frs.

This comprehensive text on the thermal equipment of electric generation plants covers in detailed form the following topics: steam cycles; heat transmission and heat exchangers; fuels and combustion; steam boilers and boiler furnaces; feedwater treatment; condensers and auxiliary equipment; steam turbines; plant construction, layout, and economics; selection of equipment and operative procedure; and the simultaneous production of steam and electrical energy.

FREE GOLD, the Story of Canadian Mining.

By A. Hoffman. Rinehart & Company, New York and Toronto, 1947. 420 pp., maps, woodcuts, tables, 8¾ x 5½ in., cloth, $5.00.

The development of the Canadian gold fields is told in narrative form by one of two brothers from Boston who struck out into the Canadian wilderness some twenty-five years ago. He describes the places and the men that were of importance in that development, the technical aspects of the mining industry, and the financial operations. The book is enlivened by anecdotes and first-hand accounts of the adventurous side of mining, but the emphasis throughout is on the tremendous account of toil and hardship behind what looks like an easy money proposition.

INDUSTRIAL ELECTRONICS REFERENCE BOOK.

Electronics Engineers of the Westinghouse Electric Corporation. John Wiley & Sons, Inc., New York; Chapman & Hall, Ltd., London, 1948. 680 pp., illus., diagrs., charts, tables, 12 x 8¾ in., cloth, $7.50.

The work of thirty-seven Westinghouse experts, this comprehensive book gives both the theoretical data and application information necessary to determine the possibilities and limitations of electronic devices. It covers fundamental theory; design, operation and construction of electronic tubes; electronic circuit components; circuits for different types of tubes; application to transmission lines and antennas; and many different types of industrial equipment. Care and maintenance of electronic tubes and apparatus are also considered.

INTRODUCTION A L'ETUDE DES RESEAUX ELECTRIQUES.

M. Parodi, preface by L. de Broglie, Société d'Edition d'Enseignement Supérieur, 99 Boulevard Saint-Michel, Paris 5e, 1948. 54 pp., diagrs., tables, 10 x 6½ in., paper, 200 frs.

The three chapters of this mathematical study of electrical networks cover respectively the characteristic matrices of connected networks, applications of the transformation theory to such networks, and an analysis of the energy-producing properties of passive networks.

METALLURGICAL MATERIALS AND PROCESSES.

By J. Elberfeld. Prentice-Hall, Inc., New York, 1948. 188 pp., illus., diagrs., charts, tables, 9¼ x 6 in., linen, $5.00; text ed., $3.75.

Intended as a text for students specializing in fields other than metallurgy, this book provides a general background in the science of metals. Emphasis is given to grain structure and constitution diagrams. Among the topics included are heat-treating furnaces and their controls, the forming of metals, welding and powder metallurgy, and laboratory procedure. Questions and summaries accompany each chapter, and an outline of the chemistry necessary for understanding the text is presented.

PRODUCTION COST TRENDS IN SELECTED INDUSTRIAL AREAS.

P. Neff, L. C. Baum and G. E. Heilman. University of California Press, Berkeley and Los Angeles, 1948. 249 pp., charts, tables, 9½ x 6 in., cloth, $4.00.

This statistical study compares manufacturing cost trends in the industrial areas of Los Angeles, San Francisco, Detroit, Cleveland, Chicago and Pittsburgh for the period 1929-1939. The trends in general manufacturing are first considered; then durable goods, such as food, textiles, paper, rubber products, etc.; and finally a number of selected industries are dealt with. The data utilized are taken mainly from the U.S. Census of Manufactures.

QUALITY CONTROL IN INDUSTRY, METHODS AND SYSTEMS.

By J. G. Rutherford. Pitman Publishing Corporation, New York and London, 1948. 201 pp diagrs., charts, tables, 9¼ x 6 in., cloth, $3.50.

Rec mmended as a text in industrial engineering courses, this book is also a reference manual for industrial engineers, executives and supervisors. It covers the organization, administration and functions of a department. Explaining and illustrating the actual methods of installation, it also gives complete data for the introduction, design and use of statistical sampling techniques. Part I contains generalized information outlining organizational practices and methods. Part II discusses statistical procedures.

RADAR, WHAT RADAR IS AND HOW IT WORKS, rev. ed.

O. E. Dunlap, Jr. Harper & Brothers, New York, 1948. 268 pp., illus., diagrs., 8¼ x 5¼ in., cloth, $3.00.

This popularly written book tells the story of radar without equations or technical language, so that the layman may appreciate the significance of radar. This new edition explores the postwar advances and provides information on how radar is being adapted to scores of peacetime uses.

RESIDENTIAL LIGHTING.

M. Fahsbender, D. Van Nostrand Company, New York, Toronto, London, 1947. 269 pp., illus., diagrs., charts, tables, 11¼ x 8½ in., cloth, $10.00.

This volume furnishes the facts, figures, and practical details of arrangement and design of home lighting. The various types of lighting equipment are described, the influence of period styling on lighting fixture design is explained, and portable lamps and lamp shades are treated in detail. Illumination requirements in various rooms, home wiring, light and vision, and light and color are treated. Emphasis is placed upon newly developed light sources such as fluorescent lighting, and special topics such as garden lighting and Christmas lighting are included. Five hundred and sixty-nine photographs and drawings illustrate the text.

SOME ASPECTS OF THE LUMINESCENCE OF SOLIDS.

F. A. Kröger. Elsevier Publishing Co., New York, Amsterdam, London, Brussels, 1948. 310 pp., diagrs., charts, tables, 8¼ x 6 in., cloth, $5.50.

Based on recent experimental work, this book contains some hitherto unpublished results together with theoretical considerations of certain aspects of this field. In the first chapter brief consideration is given to the energy levels in pure and disturbed crystals. A general picture is developed covering all possible luminescent effects, new experimental results are reported concerning some particular luminescent systems, and the final chapter is devoted to the influence of temperature on the efficiency of luminescence.

SURFACE CHEMISTRY FOR INDUSTRIAL RESEARCH.

J. J. Bikerman. Academic Press, Inc., New York, 1948. 464 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $8.00

This book presents the fundamental knowledge necessary for solving problems of physics and chemistry of surfaces and interfaces. The action of adhesives, friction and lubrication, ore dressing, emulsion stability and detergency are considered together with a variety of other phenomena. The book emphasizes such factors as the roughness of solid surfaces, the miscibility of "immiscible" liquids, and the sensitivity of physical quantities to common impurities.

SYNTHETIC PETROLEUM FROM THE SYNTHINE PROCESS.

B. H. Weil and J. C. Lane. Chemical Publishing Co., Inc., Remsen Press Division, Brooklyn, New York, 1948. 303 pp., illus., diagrs., maps, tables, 8¼ x 5¼ in., cloth, $6.75.

This survey of the current knowledge of the Fischer-Tropsch Process covers methods of production, the theoretical and engineering phases, purification of the synthesis gas, catalytic synthesis reactions, the products, by-products and derivatives. The basic economics is covered, and advances in German technology are discussed. There is an indexed list of government reports and systematic reference is made to over 2,000 articles and patents.

SYSTEMATIC MOTION AND TIME STUDY.

By M. E. Mundel. Prentice-Hall, New York, 1947. 232 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.00; text ed., $3.00.

This new book presents the basic elements of time and motion study, demonstrates actual jobs and cases with resultant benefits, and discusses what results may be expected from effective application of the advocated principles. The necessary charts graphs and records are described and illustrated, and considerable space is devoted to the separate steps in the taking of a stop-watch time study. Ratings, allowances and standards are covered, as are process analysis and layout.

(THE) CHEMISTRY AND TECHNOLOGY OF WAXES.

By A. H. Warth. Reinhold Publishing Corporation, New York, 1947. 519 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $10.00.

Of use to those engaged in a variety of industries, this volume covers the classification, description, origins, preparation and refining of more than 200 individual waxes, including significant facts on the chemistry of high-carbon constituents of waxes. The physical and chemical constants of waxes are presented in tabular form. Detailed procedures for their determination are given. A review of available patent material and a wealth of references are included, as well as a section on the application of waxes.

THEORETICAL AERODYNAMICS.

L. M. Milne-Thomson. D. Van Nostrand Co., Toronto, New York, and London, 1947. 363 pp., diagrs., charts, tables, 10 x 6½ in., cloth, 40s.

Based on lectures given at the Royal Naval College, this book discusses the assumptions used in studying the airflow around aircraft. It brings these assumptions to explicit statements and then examines what can be deduced from them. After preliminary discussion, the theory of two-dimensional airfoils is considered. Three-dimensional airfoils, the effect of compressibility of air in subsonic and supersonic flow, and the aircraft as a whole are subsequently considered. About 300 exercises, 260 diagrams, and appropriate references to the literature are also included.

WATER PURIFICATION CONTROL, 3d ed.

E. S. Hopkins. Williams & Wilkins Company, Baltimore, Md., 1948. 289 pp., illus., diagrs., charts, tables, 7¾ x 5½ in., cloth, $4.00.

This is a practical guide for operators of water purification plants. Revised to conform with modern practice, it is based on the author's own experiences at the Montebello Filters in Baltimore and elsewhere. A new section on the removal of iron and manganese has been added.

Business & Industrial Briefs

A Digest of Information received by The Editor

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

Link-Belt Ltd., Eastern Avenue at Leslie and Keating Sts., Toronto, 8, announces Book No. 2330 in which is described the Company's overhead trolly conveyors. It contains eighty illustrations which show the flexibility and adaptability of this type of conveyor.

•

Canadian General Electric Co. Ltd., 212 King St. W., Toronto, 1, has recently published an illustrated ten-page bulletin on its Pyranol distribution capacitors. The bulletin should be most useful to utility engineers. It shows in detail the construction of the individual pole-type units and their installation in a variety of applications. Apply to any CGE office and ask for bulletin CGEA-2561F.

•

C. O. Monat & Company, Limited, 6520 Park Ave., Montreal, offers No. 3 of the Sulzer Technical Review. This publication contains an article on Diesel-electrical emergency generating sets in which the main applications and the operation of this automatically controlled equipment is described. A second article covers some of the problems arising in the choice and installation of centrifugal pumps for steam power stations. Another feature of the publication is a contribution in which is described model equipment developed in the Sulzer thermal laboratory for research into regulating processes. Copies of the publication are available on request.

•

Ilg Electric Ventilating Co., Chicago, announces the release of a new Unit Heater Catalogue No. 348. The new catalogue pictures and describes the advantages of using unit heaters to heat the area from the floor line up to about six feet above that level. A complete description is given of the BTU method of estimating heat requirements with examples and necessary tables. Much other informative data is included.

•

Wright & Weaire Ltd., of 138 Sloane Street, London, S.W.1, England, offers a small two-colour brochure on the Wearite vice which is described by manufacturer as "The Vice with a thousand virtues". Some of the advantages of this equipment are that the jaws are automatically self-adjusted so that they can hold non-parallel surfaces such as wedges and mandrels. The normal gripping strength of the vice is 186 lbs., as this can be increased to 440 lbs. Copies of the brochure are available.

•

Garlock Packing Company of Canada Limited, 620 Cathcart St., Montreal, has available a supply of an excellent two-colour brochure on the Company's rubber expansion joints for pressure, vacuum, or pressure and vacuum. The publication is well illustrated and highly informative.

•

Readers of the Journal who wish to be placed on the mailing list for "Aluminium News" or the Alcan "Ingot" are invited to apply to the director of public relations, the Aluminum Co. of Canada, Ltd., 1700 Sun Life Bldg., Montreal. These publications are well edited and contain much interesting information.

•

Canadian General Electric Co., Bulletin CGEA-1265D, in which is described the company's thermostat for use with small heating units, is recommended. Copies may be obtained from any CGE office.

•

Readers who are interested in obtaining a list of the publications produced by the International Nickel Company of Canada, Ltd., 25 King St. West, Toronto, are invited to communicate with the Company asking for "List 'A'—Helpful Publications on Nickel Alloys." This guide to the Company's list of technical publications has been prepared in the form of a digest of contents and a check list. By means of this list it should be possible to complete in a very few minutes a request for the publication desired.

•

Copies of the December issue of the BEPCO Journal published by Bepco Canada Limited, 4018 St. Catherine St W., Montreal, 6, may be obtained on request. This issue contains a tribute to the inventive genius of A. F. Berry and an account of fifty years of transformer engineering.

•

Landis Thread Tips—produced by the Landis Machine Co., Waynesboro, Penn., is one of the publications which is published periodically by this well-known firm of machine tool manufacturers. It contains descriptions and specifications of the Company's products. Write to the Company if you wish to have your name placed on the mailing list.

•

Chain Belt Company, 1600 W. Bruce St., Milwaukee, 4, Wis., has published in full colour a 1949 calendar illustrating the Company's equipment on the job. Copies will be forwarded to readers of the Journal on request.

•

A complete presentation of the Rapistan line of floor trucks is contained in a new four-page bulletin issued by the Rapids-Standard Company, Inc., of Grand Rapids, Michigan. The two-colour bulletin includes photographs, descriptions and specifications of the various models of floor trucks manufactured by the company. Ask for bulletin TR-848.

•

An attractive two-colour eight-page brochure in which is described the operations and features of the new Barbar-Greene Model 522 Snow Loader is now available from the Company. Write to Barber-Greene Co., Aurora, Ill.

•

Convair Corporation, Pittsburgh, Pa., specialist in pneumatic conveying systems, has informed the editor that it will send readers of the Journal copies of its bulletin No. 102. Write to the Company for your copy.

•

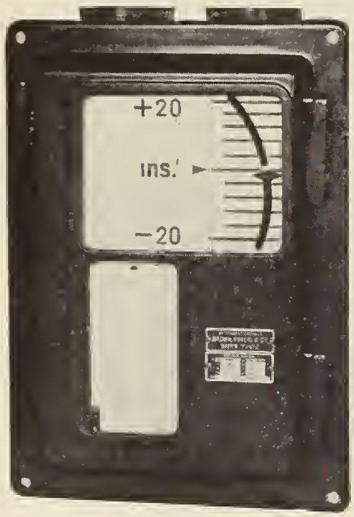
Tweco Products Company, P.O. Box 666, Wichita, 1, Kansas, will forward on request a new twelve page catalogue, No. 7, which illustrates the complete line of electrode holders, ground clamps, cable connectors, cable splicers, terminal connectors, cable lugs and carbon electrode holders manufactured by the Company. In the release which accompanied the catalogue sent to the editor it was stated "All requests from your readers will be promptly handled."

New Equipment and Developments

Canadian Vickers Limited and the Sandy Hill Iron and Brass Works of Hudson Falls, N.Y., announce that arrangements have been concluded between the two companies whereby Sandy Hill products will be made in Canada by Canadian Vickers Limited. The Sandy Hill Company specializes in the manufacture of pulp and paper machinery.

•

The Tremco Mfg. Co. (Canada) Ltd., 57 Bloor St. W., Toronto, Ontario, announces that it now has available a new alkali resistant floor enamel—Color-floor XX, for painting concrete floors. It is stated that this rubber base interior enamel may be used safely for painting basement floors and other concrete floors on or below grade, so long as no hydrostatic pressure exists. It is especially recommended for recreation rooms in basements and concrete floors built on the ground. It is claimed that it resists acids, alkalis, soaps, oil, grease, alcohol and offers good abrasion resistance. It is furnished in red, medium grey and dark green.



The "Nivometer"

Brown-Boveri (Canada) Limited, 1111 Beaver Hall Hill, Montreal, has announced a new type of liquid level indicator for boilers or any vessels containing liquid. Built without glass in the pressure space, it is available for pressures up to 1500 lbs./sq. inch, and special models are available for pressures up to 5000 lbs./sq. inch. Measuring ranges are from 12 inches up to 13 feet as required. The instrument is known as the "Nivometer". Full information and descriptive pamphlet are available from the Company.

•

The Muller Machinery Company, Metuchen, New Jersey, are manufacturing and marketing a new plaster mixer. The machine is of six cu. ft. capacity and has been designed to meet the rough working conditions so often found on plastering jobs. It is driven by a Briggs & Stratton engine through a heavy roller chain drive and is equipped with a bag shelf and bag splitter. It is fabricated of steel throughout and runs on disc type wheels fitted with roller bearings and pneumatic tires. Literature and full information are available from the manufacturer.

•

A variable pitch diameter clutch is now being manufactured by W.S.K. Inc. of Detroit. It is recommended for use with gasoline or electric power sources and it is claimed that it eliminates the need for expensive clutch assemblies. For complete details write to W.S.K. Inc., 405 Donovan Bldg., Detroit 1, Michigan.

•

A new cutting blowpipe, known as the Oxweld C-60 Machine Cutting Blowpipe—believed to be the world's largest—has been announced by Dominion Oxygen Co. Ltd. It has been designed for extra-heavy cutting operations, such as the scrap-cutting of skulls and buttons. Cutting of steel over six feet thick has been reported.

•

Canadian General Electric Co. Ltd., states that its instantaneous electronic mercury vapour detector has been designed to measure concentrations of mercury vapour in the air which may be injurious to the health of workers. This detector operates on the principle that ultra-violet light is scattered when it passes through atmosphere containing mercury vapour. A small blower draws air from the atmosphere into the instrument at a rate of ¼ cubic ft. per minute, and passes it between an ultra-violet light and a phototube. Variations in the output of the phototube cause the electronic circuit to indicate the concentration of mercury vapour in the air. The detector will measure mercury-vapour concentrations ranging from 0.03 to 3.0 milligrams per cubic meter, or from 0.004 to 0.37 parts per million by volume with an accuracy of approximately five per cent. It weighs only 29 lbs., and can be carried on an adjustable shoulder strap. Complete information may be obtained from this manufacturer.

•

Gutta Percha & Rubber, Limited paid tribute to the 391 members of its 25-year Club at a recent dinner held at the Royal York Hotel. At the dinner 30 new members were inducted into the club and each was presented with an engraved gold watch in recognition of long and valuable service to the Company.

•

A relatively small light weight, electric power industrial truck for fast manoeuvering and tiering loads has been developed by Elwell-Parker Elec. Co. of Cleveland, O. It has been designed for requirements in large merchandise warehouses and it is also suitable for use in manufacturing and shipping departments. Complete details are available from the manufacturer.

•

A power actuated tool for installing dropped ceilings has been developed by Mine Safety Appliances Co. of Pittsburgh, Pa. The operation can be accomplished in five seconds. This new tool may be used for a variety of purposes and the manufacturer will be pleased to supply specifications and details and make recommendations as to the correct use.

•

Sid Bersudsky and Associates, industrial designers have opened offices at 539 King St. West, Toronto. The new Toronto offices will have complete facilities for model making and construction of prototypes required in industrial design projects.

•

New equipment for testing ball bearing grease under conditions similar to those of field use is available from Canadian General Electric special products section. The new ball-bearing-grease tester accelerates those conditions which contribute to the destruction of a grease, thereby enabling motor users and grease manufacturers to compare the performance of one grease to another. Complete information about this new equipment may be obtained from the Canadian General Electric Company, 212 King St. W., Toronto.

•

According to information received from the Canadian Ingersoll-Rand Co., many heavy machine maintenance jobs in the industrial, electrical and construction fields can now easily be handled with a new model of the Company's electric rotary impact tool. With standard accessories, the new model is conservatively rated to run and remove nuts up to ⅝" thread size; drive and remove studs; extract broken cap screws and studs; apply and remove machine screws of all kinds; run wire brushes; drill brick, metal and masonry; tap; and ream. It may also be used for wood-boring. For further information write to the company at 800 New Birks Bldg., Montreal.

•

Work under the direction of The Consolidated Mining and Smelting Co. of Canada, Ltd., on the 500 square mile Pine Point Concession on the South shore of the Great Slave Lake, which was started early in July, is continuing under a proposed 3-year programme.

Appointments and Transfers

Herbert M. Treleaven has been appointed sales manager of the Trane Co. of Canada, Ltd.

•

J. H. Smith has been named manager of the CGE Toronto district office-apparatus division. F. A. Sutton has been appointed manager of the supply division in the same district.

•

E. M. M. Partridge has been appointed to the staff of the United Kingdom trade commissioner in Montreal. Mr. Partridge has had a number of years of

banking experience. He joined the armed forces in September, 1939, and rose to the rank of Lt. Colonel. He saw service in France before Dunkirk and later in New Guinea where he was attached to the Australian Army. He also served in India. On demobilization he entered the British Civil Service.

F. M. Williams

F. M. Williams has been appointed a service engineer by the English Electric Co. of Canada Limited. Mr. Williams' duties will include the investigation of all major complaints originating in the field. In addition he will be responsible for all field installation work. He has been in the employ of English Electric Co. in Great Britain and Canada for a number of years.

•

Steve A. Batorson has been named District Sales Representative for the northeastern United States and eastern Canada for the LeTourneau Company. His territory in Canada will include New Brunswick, Nova Scotia, Newfoundland, Labrador and Prince Edward Island. Mr. Batorson's Headquarters will be in Syracuse, N.Y.

•

R. P. Hiseler has been appointed manager of the a-c/d-c section of the Canadian General Electric Company's Apparatus Department.

•

Canadian Ingersoll-Rand Co. Ltd. announces the appointment of Donald MacLennan as assistant manager of purchasing. He will be located at the Company's plant in Sherbrooke, Que.

•

Gordon Francis McClay, formerly assistant to the manager of engineering has been appointed assistant manager of engineering by the Canadian Ingersoll-Rand Co. Ltd. He will be located at Sherbrooke, Que. His duties will include the supervision of the Company's engineering staff together with product development research. He is a native of Foster, Que., and has been with the Company since 1913.

NEWS of the BRANCHES

(Continued from page 45)

Vancouver

A. G. Fletcher, s.e.i.c.
Secretary-Treasurer

Stuart Lefeaux, jr.e.i.c.
Branch News Editor

The annual dinner meeting of the branch was held in the York Room of the Hotel Georgia on Saturday, November 20th. The minutes of the last annual meeting were read and adopted and the secretary-treasurer presented the financial statement for the year. John Buchan was again appointed auditor for the branch.

P. B. Stroyan, chairman, gave a brief report of the branch activities during the year. The total membership of the branch is now 786, the student membership being 402. Eight evening meetings and three plant visits were held during the year. The branch was honoured by the election of President J. N. Finlayson at the Banff convention. Mr. Stroyan thanked the members and officers for their co-operation and support during the year.

J. P. Fraser reported for the nominating committee and George Allan, chairman-elect, took over his new duties. R. E. Potter was elected vice-chairman and A. G. Fletcher, secretary-treasurer. J. E. Macdonald, G. H. Bancroft and A. M. Eyre, were elected to the executive committee for two year terms.

George Allan thanked the members for his election to the chair and asked Jack Macdonald to introduce Walter Owen, K.C., the guest speaker for the evening. Mr. Owen, a U.B.C. graduate, was appointed K.C. in 1944 and has had extensive experience in labour relations. The title of his address was **The Growth of the Labour Union.**

The basic rights of the individual have been assumed by the unions as union members are told where and for whom they may work. The unions have accomplished much for the working man but are now becoming too powerful and autocratic. Mr. Owen explained the phenomenal growth of the labour unions in Canada as brought about by the war, government legislation and communist activities. He deplored the facts that Canadian industrial unions pay funds to United States head offices and that autonomy is given up to the union's International policy. The difference between "closed shop" and "union shop" was outlined; the closed shop is not favoured by the union as it puts some responsibility on the union in the hiring of employees. The communist strength in unions was also deplored by Mr. Owen. He was most concerned about the tendency of unions to overlook the communist activities of their officers.

Dean J. N. Finlayson, Institute president thanked the speaker for his address and praised his work on industrial conciliation boards.

There being no further business, the meeting then adjourned.

Winnipeg

G. W. Moule, m.e.i.c.
Branch Secretary

R. H. Tivy, jr.e.i.c.
Branch News Editor

Electrical Section

J. C. Pratt, m.e.i.c.
News Editor

R. H. Andrews, high tension cable engineer of the Canada Wire and Cable Company, Toronto, addressed Electrical Section in Winnipeg, on the subject of **High Voltage Oil Filled Cable.**

R. H. Andrews, M.E.I.C.

The address was well illustrated throughout with lantern slides. The history, fundamentals of design and construction, and installation of high voltage oil filled cable were covered. A series of colour slides depicting the new sixty-nine-thousand-volt underground installation of the Winnipeg Hydro was of close interest to the audience.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOLUME 32 MONTREAL, FEBRUARY 1949 NUMBER 2

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

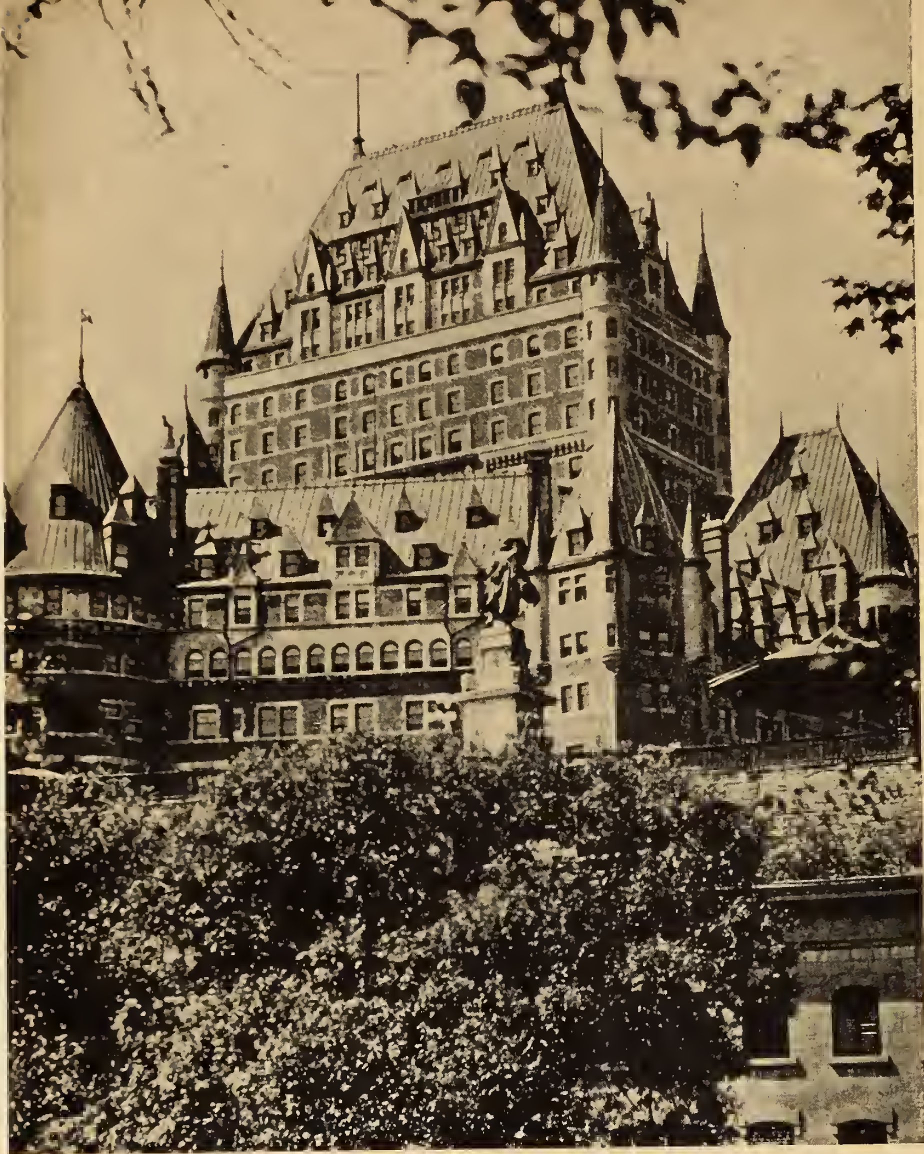
PUBLISHED MONTHLY BY

THE ENGINEERING INSTITUTE OF CANADA

2050 MANSFIELD STREET - MONTREAL

Indexed in The Engineering Index.

Price $4.00 a year in Canada, British Possessions, United States and Mexico. $5.50 a year in Foreign Countries. Current issues, 50 cents a copy, back issues 75 cents a copy. To members and affiliates, 25 cents a copy, $2.00 a year.—Authorized as second class mail, Post Office Department, Ottawa.



Chateau Frontenac, Quebec City

Historic Quebec City with its crooked, narrow streets, quaint and historic houses and churches is the "show-place" of North America.

Standing high above the City and overlooking the wide sweep of the St. Lawrence river is the Chateau Frontenac, one of the most famous hotels in the world. The Chateau will be the centre of all the activities of the Annual Meeting.

63rd ANNUAL GENERAL and PROFESSIONAL MEETING MAY 11th—13th 1949

- THE COMMITTEES have arranged an outstanding programme of professional and social events.
- The professional papers will cover many phases of engineering achievement and development and special emphasis will be placed on the "management" aspects of engineering.
- Tours of Quebec City and the surrounding district are being arranged and there will be many opportunities to enjoy with your friends the hospitality for which the Chateau Frontenac is renowned.
- Full details will be announced at an early date.

The Engineer's Part in Conserving Alberta's Resources

A paper presented at the Annual General and Professional Meeting of the Engineering Institute of Canada, at Banff, Alberta, June 2, 1948

by

John A. Allan, M.E.I.C.

Professor of Geology, University of Alberta

Calling attention to the fact that most of our resources are not inexhaustible, the author urges interest and cooperation in their development by engineers and scientists, as well as on the part of the Engineering Institute. Alberta's various resources of wild life, forest, soils, water, fuels and other minerals are discussed and the extent of utilization of each described.

Nature has endowed all parts of the surface of the earth with resources of some kind in varying degrees of abundance. Man is privileged to utilize those natural resources for his own, and for his neighbours' needs. But man is very irregularly distributed over the land surface, of which 40 per cent is desert or near desert and therefore unhabitable. According to a noted geographer (Prof. A. M. Carr Saunders, Geog. Jl., Dec., 1930), half the population of the world lives on 1/120th of the surface of the world. There is also a very uneven distribution of population in the habitable parts of the earth. Some areas are overpopulated, while other large areas are underpopulated. This uneven distribution applies to Canada, and even to Alberta, where population density is about four persons per square mile. The problem of overpopulation does not occur in Alberta.

It is suggested that the development and utilization of natural resources of any area depend only in part on the population. Local consumption and exportation to other near or far areas are factors of prime consideration in the marketing and utilization of resources. It would be national or provincial folly to develop, produce or manufacture raw materials if geography prevents the economic distribution of those products to areas where the population is less fortunate in respect to those natural products in the raw or manufactured form. The engineer can make a real contribution in the development and utilization of natural resources, by grasping the over-all picture in relation to production and conservation, not in respect to one resource only, but in the interrelation of all the natural resources of an area, which in this case is Alberta.

The pendulum of public opinion swings to and fro. In North America at least, we are entering upon an era of conservation. During a period of war, little thought is given to the future. Storehouses and stock piles of raw materials are drawn upon heavily through necessity. Following a war, stock taking of future reserves is given more serious thought. At no time in the history of civilization has the question of future requirements been thought about and studied more deeply and seriously by many. The engineer has an important part to play in this human drama of the future. He has not yet taken his rightful part in this all important problem of conservation.

It has been stated that conservation means "the greatest good to the greatest number — and that for the longest time". There is no cause for panic, but there are many good reasons why the engineer, in his orderly thinking and planning in projects under his supervision, should not remain in the vanguard. He should be out in front in his co-ordinated thinking, leading and directing conservation methods in all development undertaken in his field.

Resources Not Inexhaustible

Alberta is a young province including about 250,000 square miles. It is almost 200 years since the first white man saw Alberta, but it was not until some time after the Canadian Pacific Railway reached Medicine Hat in 1883, that any of the natural resources of Alberta were used, other than for meagre local domestic needs. Compared with some parts of Canada, the natural resources of Alberta are largely intact, since development is still in an early stage. Wastage in some resources has been serious but not too extensive, provided proper foresight is introduced into the necessary increased development.

Two of the most dangerous words used in referring to natural resources are *unlimited* and *inexhaustible*. The natural resources of the United States were considered by many to be inexhaustible. Some resources, like forests, were considered to be a detriment and even a menace to industrial development and must be burned or otherwise eradicated. In Canada, including Alberta, it was not until after the First World War that Canadians began to awake from a peaceful sleep of indifference. A few began then to think nationally, and to realize that natural resources were the most important asset to any country both today and tomorrow.

Even today too few in Canada fully appreciate the implication of development, utilization and conservation. It is hoped that the discussions taking place at this Convention will enable the engineer to see that to a greater extent than in the past, it is his duty to interest himself in, and implement in his actions, the same utilization and care of the resources for the benefit of individual and national income. The engineer can do much in striking a balance between the domestic and industrial needs of the people of today and those of the future.

There must be close co-operation between the engineer and the scientist in all problems related to the natural resources. General Dwight Eisenhower in an address in Ottawa, when he was honoured with the naming of a mountain west of Banff, emphasized that " the necessity for co-operation has not passed." Governments may and do regulate development and conservation of resources, but unless regulations are based on adequate scientific data, these protective measures are not effective. Here is where the engineer, the scientist and the technologist can obtain and analyse the scientific data, and pass on the results in order that governments can make more effective regulations. The engineer and the Engineering Institute should be in the best position to say what natural resources should or should not be developed within our National Parks.

Alberta's Resources

The natural resources of Alberta include fish, wild life, forest, soils, water and minerals. There are two groups of resources. The first three, namely, fish, wild life and forest, differ from the other three in that they are replaceable resources. By restocking the lakes and streams, the fish population can be maintained or increased. The wild life population is also replenishable and can be maintained by protective measures. But fish and wild life are increasingly important to Alberta. Both groups are protected fairly adequately by conservation regulations. The engineer can assist by his co-operation, chiefly by complying with regulations, and by realizing that these resources may be as vital to industrial development as the engineering project on hand.

The forest is one of the most vital factors in the long-range development of any part of the surface of the earth. The forest is a protective shield to all living matter, against the ravages of weather and climatic changes. The danger and devastation following the removal of forest mantle is only too well known. Proof of this change can be found in every continent. Large areas in India and China and in the Sahara desert, now waste lands, were well forested 2000 to 3000 years ago. The forest of today is a generation representing the development of only a few years. When a tree is removed, another tree may be planted to take its place, or nature may be allowed to regenerate a new forest. If this is not done the protective mantle has been removed from the soil and ground water, and dire results must be expected.

Alberta had a forest mantle estimated to cover 159,000 square miles, but fire and man have destroyed and therefore removed the protective mantle from many thousands of square miles. It is a fact that a part of this deforestation was justifiable in order to increase agricultural acreage. On the other hand, the removal of the forest has created a serious water supply problem, and in some parts, a soil erosion problem. Large areas on the plains are potential desert areas unless the forests are protected. The importance of forest protection in the watershed along the east slope of the Rocky Mountains has recently been realized. There has been set up the East Slope Conservation Board, a non-political body to undertake a reforestation programme. This important step in conservation requires the assistance and sympathetic support of all engineers. Since the underground water supply is dependent largely on the protective mantle, clearing and reforestation programmes should be based on scientific data.

Soils

All soils are young and are the product of the last few centuries. A new soil cannot be built up like a new tree, but the chemist and soil technologist can revive and build up an old soil. Since soil is related to and dependent upon other resources, the composition of the underlying rock, the forest, the rainfall, run-off, irrigation, etc., there must be full appreciation of cause and effect. Close co-operation of the geologist and other scientists, and the engineer are essential to the preservation of our soils.

Water

Water resources include the surface water in lakes and streams, and also the underground water derived only from the surface and therefore of meteoric origin. The deeper seated or juvenile waters are of minor consideration. Water resources are not inexhaustible as many seem to think, but are to a certain extent replaceable. Without rainfall water resources would become depleted and disappear. In developing water power and utilizing surface water, the engineer must fully realize the close, inseparable relationship between the forest, soil, and water resources. Without water there would be no soil, without water and soil there would be no vegetation, and without all three there would be no civilization. The surface of the earth would be like the surface of the moon. It has been pointed out that water and air are the only two essentials for the existence of life.

In the development of water resources, there are two different types of problems. Those associated with underground water supply are vastly different from those associated with surface water utilized for power and irrigation. Alberta abounds in surface water resources, with several major rivers that rise within the mountains in snowfields and icefields.

Power Development

To date power development by the Calgary Power Limited on the Bow River alone has an installed capacity of about 105,000 horse-power, and there are still several sites undeveloped on the Bow. There are also many undeveloped sites, both north and south from the Bow valley along or adjacent to the foothills belt. The suitability of a power site depends largely on the structure and composition of the underlying rock and on the character and thickness of the unconsolidated material. Geology is therefore a major factor in any power development within the mountains, foothills or on the plains, but the type of problem varies within these three different structural units.

Development of power to date within the foothills and mountains has been entirely along the Bow, not because the geological conditions are more favourable along this drainage, but because of several main factors. One of these is that more completely regulated flood control of the flow of a stream can be obtained from dams in tandem. A second factor is the stream load. The Bow is remarkably free from silt, partly because of the character of the terrain through which it flows, and partly because Bow Lake, Lake Minnewanka, and many other smaller settling basins have retained the silt. On the other hand, the North Saskatchewan, the Athabaska, and the Peace rivers all carry a heavy silt load, which might become quite a troublesome factor, but which should not prohibit the construction of dams along these rivers. Other papers on the programme by Messers T. D. Stanley, B. Russell, and G. L. MacKenzie (see *The Engineering Journal*, Sept. 1948) deal more adequately with water power development in Alberta.

Irrigation

The utilization of water for irrigation is just as important or more so, than the use of water in hydro-electric development, when one considers the long-range view. Dr. George Spence in a recent article on " Soil and Water Conservation on the Prairies " notes that water is liquid gold on the prairies. The productivity of the soil in large areas on the plains east of the mountains depends on moisture, which, if not obtained by rainfall, must be obtained by irrigation. Fortunately a body of thought has been built up in the form of the Prairie Farm Rehabilitation Administration, backed up by many engineers within The Engineering Institute of Canada. It is agreed that to maintain and increase food production across the prairies, water must be supplied. There is no more worthy and essential national development that calls for the attention and support of the engineers in Canada, than the utilization of the water resources in the form of irrigation.

History paints a grim picture of what has happened in many parts of the earth in the past 4000 years, largely due to neglect by man in not understanding and observing the laws of nature. Geology and geography indicate that deserts are young. Most deserts in the northern hemisphere are post-glacial and have formed within the last 10,000 or 15,000 years, when the Sahara was still covered with grass. There were no extensive desert regions in earlier geological time. Most desert areas have developed since the appearance of man. It has been pointed out that man can initiate desert conditions within a single generation. The invention of irrigation is placed in Babylon about 4000 B.C. The district around Irak with its fertile soil was at one time the granary of the ancient world, but is now a desert.

Great cities like Babylon and Ninevah flourished under a primitive but efficient system of irrigation canals between the Euphrates and Tigris, until wars and neglect destroyed the canal system and today the country is barren. Some in central Canada may say such examples are in Asia and Africa and Australia, but desert conditions cannot occur here. Without suggesting undue alarm, those desert conditions do occur in some parts of North America, and can develop in central Canada. Geographers have pointed out that the deserts on the high plateau of Tibet are comparable to those in Arabia or Libya, so that such waste conditions are not defined by latitude or by altitude.

An appeal is directed to engineers to be broadminded and far-sighted in the agricultural development of central Canada. Alberta is different today from what it was a few years ago when the mastodon, that hairy mammoth, travelled south just east of Banff, and nature can change the present surface conditions in the future. Co-operation is suggested between the engineer, the agriculturist and the scientist on some long-range irrigation programme, and more efficient use of our water resources.

Underground Water Supplies

The other phase of our water resources is the underground water supply. Altogether too little attention has been given to underground water resources under the plains east of the mountains, especially in Alberta. There are large areas in Alberta, where the future settlement and development will depend as much on the underground water supply, as on the fertility of the soil and the surface relief.

There is a lack of appreciation of the simple fact that surface water must be permitted to enter the underlying unconsolidated mantle or into the bedrock to produce an underground water supply. If surface water in sloughs and lakes is drained from the surface, or if the forest cover is removed, then the underground water supply will become depleted. The lack of underground water adjacent to the Peace River is largely because the valley of the Peace is over 700 feet deep and water cannot be stored up in the rock above the present level of the river.

There are problems on the development and production of underground water that are engineering in character and require the attention of the engineer. Even the E.I.C. can contribute by its support and by discussion on water problems through the *Journal*.

Minerals

Mineral resources are quite different from all other natural resources. The formation or occurrence of minerals is completely independent of the forest, soil and water resources. Mineral deposits have been formed slowly, in some cases requiring millions of years, and even geologic periods. Furthermore, mineral deposits are *exhaustible resources* because when developed by mining, they are gone forever and cannot be replaced. Mineral resources in any form are not unlimited, no matter how extensive the deposit may be, or how large the " mountain of ore " may appear to be. When a ton of coal is removed from the seam, or a thousand barrels of oil, or a million cubic feet of gas are produced from a well, those deposits have been depleted in that locality for all time by the amount removed.

Naturally, conservation has a somewhat different significance when applied to mineral resources. The situation is *use all you require, but waste none.* In any free country the slogan should be to develop and produce from the storehouse of mineral wealth, to the economic limit of local, national or international market, but reduce to a minimum the wastage on the surface or in the underground deposit. It is stated that the best opinion on mineral conservation "advocates foresight in the use of resources, employing the best techniques and the most efficient organization of production to reduce wastes" (Staley ②). The policy of *hoarding* of mineral resources is not favoured.

Coal Resources

Alberta is commonly referred to as a fuel province primarily, because coal, petroleum and natural gas comprise most of the mineral production to date. Other mineral resources in abundance are salt and gypsum. These five mineral products comprise the principal resources of Alberta.

Coal was discovered in Alberta in 1791, and mining has been carried on since 1872 when the first mine was opened at Lethbridge. The coal deposits are so widespread that by many, they are considered to be inexhaustible. Of course, this is not the case, as much coal is lost by mining operations. Dr. A. E. Cameron, former Deputy Minister of Mines for Nova Scotia, has stated that practically all of the coal mines in Nova Scotia, particularly in the upper levels, have left over 40 per cent, probably over 50 per cent of the coal underground to disintegrate and deteriorate. In Alberta the loss in coal mining has been of a similar order. Under the plains of Alberta where two or more seams occur close together, if the upper seam is not mined first, the coal in this seam may become unmineable by the removal of the coal from a lower seam. There is the natural tendency to mine the most profitable coal seam, although this may mean that it may be impossible to recover the higher coal later.

According to the Report of the Royal Commission on Coal, 1946, Alberta contains about 48 per cent of the coal reserves of Canada. The coal reserves in Alberta are given as, "mineable coal" about 48,000 million tons and "recoverable coal" about 24,000 million tons. To date approximately 100 million tons have been produced and possibly an equal amount rendered unmineable. The fact that there is a large coal reserve does not justify undue wastage. It is a fact that in some fields, the more accessible and more easily mined better rank coal is becoming depleted rapidly. Nevertheless the coal deposits of good quality are sufficiently large that it remains for the scientist and the engineer and the technologist to develop new uses for coal that cannot be mined profitably as fuel in the natural state.

Petroleum Resources

The petroleum resources will be discussed by others on this programme, so will be referred to briefly in this paper. Petroleum was discovered on Cameron creek near Waterton Lake about 1886. Production dates from May 1914 when Dingman No. 1 well was "brought in" in Turner Valley. The total production in Alberta to date amounts to about 100 million barrels, valued at about $170 million. Much of this has come from Turner Valley, but other fields include Taber, Conrad, Princess, Vermilion, Lloydminster, and Leduc where the discovery well was "brought in" on February 13, 1947 by the Imperial Oil Limited. There are now 60 producing wells in this new field.

The early history of Turner Valley, prior to the establishment of a Conservation Board, is not a pleasant one to relate. A small oil recovery was obtained from a tremendous flow of wet gas. As there was no market for the gas and no conservation control, Alberta lost by burning about 503 billion cubic feet of natural gas between 1929 and 1934. This represents an average daily wastage of about 344 million cubic feet.

The natural gas resources in Alberta are known to be large, but are not inexhaustible. It is estimated that in three fields only, namely, Turner Valley, Viking-Kinsella, and Medicine Hat-Redcliff, there is a proven reserve with estimated potentials of 1,500,000 million cubic feet. There are known to be undetermined gas reserves in several other parts of Alberta.

It has been suggested that natural gas from Alberta should be piped eastward at least as far as Winnipeg. However, the Honourable N. E. Tanner, Minister of Lands and Mines, has announced that the Alberta Government is not yet convinced that the reserves are sufficiently large to exceed what can be economically utilized within Alberta by industrial development in the near future. The Government of Alberta is fully cognizant of the importance of conservation of both natural gas and petroleum resources. The Alberta Petroleum and Natural Gas Conservation Board, constituted by "The Oil and Gas Resources Conservation Act" in 1938, is carrying out the policy of conservation fairly and efficiently.

The engineer who is familiar through the literature with the trend of scientific research on the processing of natural gas and the production of many by-products, must appreciate the importance of natural gas conservation, even in a country where the gas reserves might be considered by some to be *unlimited.*

The Tar Sands

It is just 160 years since Peter Pond first mentioned the extensive bituminous sand deposits of northern Alberta, which are exposed along the sides of the valley of Athabaska River for about 65 miles downstream and 40 miles upstream from McMurray. The proven area underlain by bituminous sands is over 10,000 square miles. Estimates on the content of the oil contained in these deposits range upward from 100,000 million barrels to over 250,000 million barrels of oil. The deposits are immense and represent one of the important potential undeveloped natural resources of Alberta.

Dr. K. A. Clark, professor of Mining Engineering, University of Alberta, who has carried on and directed extensive research on these bituminous sands since 1920 under the auspices of the Research Council of Alberta, sums up briefly the potentialities of these immense deposits in these words, "The conversion of heavy oils into high yields of gasoline is now a matter of every day commercial operations. There is no particular technical obstacle in the way of using the bitumen content of the bituminous sands as a crude oil. and this use must be placed along with that of road materials for present consideration. Which offers the best opportunity for commercial deelopment is a matter almost entirely of economics."③ The construction of a separation plant for test purposes by the Alberta Government at Bitumont, 41 miles down the Athabaska from McMurray, has just been completed and, according to Honourable N. E. Tanner, the plant is expected to be in operation in June or July, with an output of 35 barrels per day.

Salt Resources

The salt industry in Alberta has become one of the major industries. The production of common salt in Alberta began about twenty years ago, by Industrial Minerals Ltd., when, at a depth of 723 feet, a continuous bed of pure salt 211 feet thick was proven by drilling at Waterways on the Clearwater River, which is the north terminal of the Northern Alberta Railways Company, about 240 miles northeast from Edmonton.

In the search for oil in central Alberta, east of Edmonton, salt beds were encountered by drilling at Elk Point, Vermilion, Beaverhills Lake, Provost, at some of the deeper wells drilled in other localities, and also at Unity, Saskatchewan, close to the Alberta boundary. A tremendous deposit of salt has been proven to occur in east central Alberta.

The Alberta Salt Company has just completed the erection of a plant at Elk Point, close to the North Saskatchewan River, about 11 miles east of Edmonton. There are three beds of salt, totalling about 1000 feet in thickness, which occur between depths of 3000 and 4500 feet below the surface. At Unity, Saskatchewan, an important bed of potash occurs associated with the salt. According to L. H. Cole④, a low potash content was found in the salt at Provost and only a trace of potash occurs in the salt beds at Elk Point. With extensive deposits of salt, it will now be necessary to consider the development of the various chemical industries made possible by these deposits in Alberta, where there is an abundance of electric energy, gas and coal.

Miscellaneous Non-Metal Resources

The youngest industry in Alberta, only a few months old, is the manufacture of rock wool from shale. The plant of the Rock-Wool Products Company is situated on the Banff highway, about one mile west of Exshaw. It is reported that the rock wool produced is of good quality. There is no scarcity of suitable rock within the mountains and in other parts of Alberta, so this industry is likely to increase.

Alberta has an abundance of gypsum. Hundreds of millions of tons of gypsum rock are known to occur in two deposits. One deposit outcrops in the Peace River valley between Fort Vermilion and the mouth of Peace River. Another large deposit of pure gypsum occurs at the north boundary of Jasper Park, 35 miles north of the Canadian National Railways at Devona, 21 miles east of Jasper. Transportation is the major factor in the development of these gypsum deposits in the near future.

Other minerals known to occur in small quantities include talc, at the head of Redearth Creek, west of Banff; phosphatic beds around Banff, at Sundance canyon and in Spray valley adjacent to the golf course and used in the construction of the Banff Springs Hotel; phosphate rock also occurs in Crowsnest Pass near Coleman and at several other places within the mountains in Alberta; magnetic iron sandstones at Burmis and Pincher Creek; bentonite at Drumheller and elsewhere in Alberta, used for drilling muds in oil well development; fuller's earth in the north hill within the city of Calgary; pumacite at several localities; silica rock of pure quality near Pipestone Pass, north of Lake Louise; similar material in the North Saskatchewan valley, east of the Jasper-Banff highway; silica sand at many places throughout Alberta; brick and tile clays are widely distributed east of the mountains and throughout the length of Alberta; possibly some white pottery clays in the Cypress Hills area; pebbles for ball mills, etc. Some of these occurrences are worthy of investigation, before the economic importance of the small deposits are known.

There are no known deposits of metallic minerals of importance in Alberta, and the geology is not favourable for the formation of metallic minerals as ore bodies. In the northeast corner of Alberta, north of Lake Athabaska, there are Precambrian rocks, but no mineral deposits have yet been found in this area. Of course, there is some flour gold as placers along parts of the rivers, from the North Saskatchewan River northward, but the quantity is very small. Small pockets of sulphide ore have been found at a few places in the Rocky Mountains, but the quantity is insignificant. These occurrences include lead and copper at Silver City, now Castle, at the base of Mt. Eisenhower; copper at Simpson Pass; and zinc in Boom Mountain at Eldon. A mineral occurrence does not indicate a mineral concentration.

Conclusions

In this paper no attempt has been made to include all of the natural resources such as scenery and playgrounds in which Alberta abounds. The natural resources are varied, some are immense in known reserves, some are exhaustible and require adequate conservation consideration, others are replaceable or renewable, but the best use should be made in the development of any of the raw materials.

The main thesis presented in this short discussion is that the different natural resources are all directly or indirectly related one to the other, and the development of any one may have an immediate or a long range effect on other resources. The engineer by his training and application is best equipped to understand and appreciate the interrelation of the various natural resources. More consideration should be given by the engineer to the future effect, regionally and nationally, of the present methods and rate of development and use of any of the natural resources. His considered opinion can become a valuable guidance to industry and to governments in the most effective development and conservation of all natural resources.

SAMUEL FORTIER
PIONEER IN SOIL MECHANICS

by

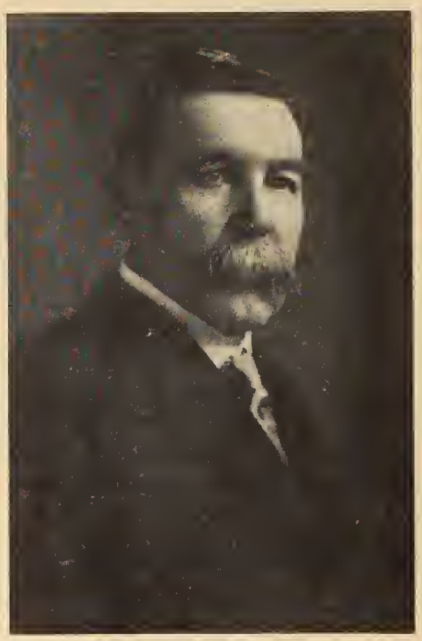
Robert F. Legget, M.E.I.C.

Director, Division of Building Research
National Research Council, Ottawa

"For . . . the construction of earth dams the physical and mechanical properties of soils are of much more importance than their mechanical ingredients. It is not essential that we know the amount of potash, etc. . . . but the size and weight of the grains, the amount of air space they enclose, the percentages of air and water contained in these open spaces, and the effects produced by moisture, heat and frost as well as the action of such forces as gravity, capillarity and evaporation are of great importance. . . . Success of works of this character rests mainly upon the fact that they were designed and built in accordance with an intimate knowledge gained from a close study. . . . of the physical properties of the materials."

This quotation might well be an extract from a recent paper dealing with rolled earth dams, so closely is it in accord with the modern viewpoint regarding the use of soils for this construction purpose. Strange as it may seem, it is from a paper written more than 50 years ago for the Canadian Society of Civil Engineers, (now the Engineering Institute of Canada), and published in the Transactions of that Society. It was reprinted in *The Canadian Engineer* in August 1896. The paper earned for its author the Gzowski Medal, the highest award of the Society. The author was one of the pioneer irrigation engineers of North America—Dr. Samuel Fortier.

Dr. Fortier was born at Leeds, Quebec, on April 24th, 1855. Graduating from McGill in 1885, he later received his Master's degree from the same university in 1907. Emigrating to the Western States, he was engaged three months on railroad survey work for the Denver-Rio Grande Railway; following this he spent three years as first assistant engineer for the Denver Water Company. In 1890



Samuel Fortier.

he became engineer and superintendent of the Ogden City Water Works.

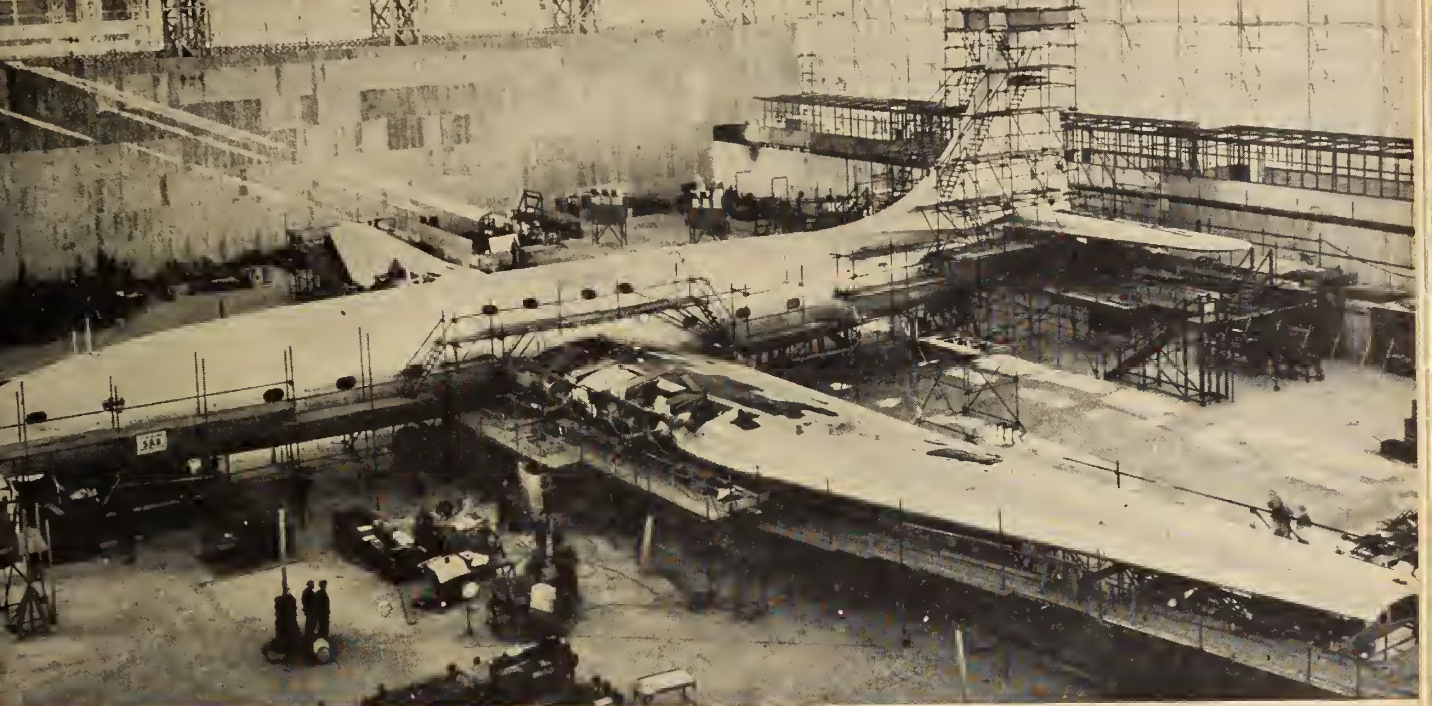
Dr. Fortier continued his work at Ogden for the next nine years, and during this period he carried out his experimental work on the properties of soils. He designed and constructed several earth dams and thus gained actual experience in the handling of soils on construction work. He also served from 1893 to 1898 as professor of civil and hydraulic engineering at the Agricultural College of Utah; he was also irrigation engineer in charge of the Experimental Station of this college. At the same time, he held corresponding positions in the Montana College of Agriculture and its Engineering Experiment Station. He also carried out hydrographic investigations for the U.S. Geological Survey in Northern Utah, Southern Idaho and Montana, and acted as consultant for a variety of other water works undertakings in the same region.

In July 1900 he began his long connection with the United States Department of Agriculture as agent for irrigation investigations in Montana. While assistant professor of irrigation at the University of California, he simultaneously directed the work in California of the Division of Irrigation of the Department of Agriculture. In 1907 he was made chief of this Division, and in 1921 became associate chief of the Division of Agricultural Engineering, now the United States Bureau of Agricultural Engineering.

After 1918 the Irrigation Division's headquarters were moved to Berkeley, California, where Dr. Fortier remained in charge until his retirement. His association with the University of California was resumed in 1924. From that year until he retired in 1931 he was consulting professor of irrigation investigations and practice. He died at his home in Berkeley on August 17, 1933.

Dr. Fortier was a pioneer in the establishment of irrigation projects in the West. Until relatively recently there was scarcely an irrigation project of any importance in that part of the continent which

(Continued on page 93)



The
Bristol Brabazon Airliner

From A Report Supplied By

A. E. Russell

Chief Designer, Bristol Aeroplane Co. Ltd., Bristol, England.

The Brabazon takes its name from England's first certified pilot Lord Brabazon of Tara. A piston-engined version, the Brabazon I, is expected to fly early in 1949 and a second gas-turbine-powered model, the Brabazon II, is under construction. The two aircraft are exceeded in size only by the American Hughes Hercules Flying Boat.

Power Plant

The Mark I is powered by 8 Bristol Centaurus engines—18 cylinder radial sleeve-valve piston engines, each delivering 2500 b.hp. for take-off, and installed in a novel paired arrangement. The two engines of each pair are angled inwards to drive a common reduction gear. The front and rear halves of each contra-rotating propeller are independently driven and controlled and if one engine of any pair is stopped its own propeller element can be feathered while the other engine continues to drive the remaining element. The Bristol Proteus propeller gas turbines of the Brabazon II are similarly arranged except that the reduction gearing is of a free-wheeling type, and stoppage of one turbine of a pair will disengage that engine, with the remaining Proteus driving the complete eight-bladed contra-rotating propeller.

Flying Controls

There were some very interesting conditions encountered in the design of the power operated flying controls. In aircraft as large as the Brabazon, the forces necessary to operate the controls are beyond the physical capacity of the pilot and the two common means of assistance are aerodynamic servo tabs or power relays. After an intensive programme of research the latter were selected for the Brabazon and particular attention was paid to duplication of components of the system to ensure absolute reliability at all engine speeds and conditions of engine failure. The added weight of the power units is fully offset by the elimination of

Fig. 1, above, shows the Brabazon, almost structurally complete, in one bay of the Assembly Hall having its many items of equipment installed.

Fig. 2, above left. October 1946. Frames in way of the inner wing are complete and the inner wing spars are located in the jig. Note the tubular bracing of the interspar ribs and front spar.

Fig. 3, above right. December 1946. This view gives a good idea of the amount of room available on the forward main deck. Note the method of blending the ends of the stringers as their numbers are reduced to match reduced bending stresses.

mass-balance weights in the control surfaces.

The effect of vertical gusts on an advancing wing is to change the angle of attack and the air forces on the wing. For every wing there are critical combinations of forward speed, rate of growth of gust velocity, and natural frequency of wing vibration which can produce local accelerations of as much as 16g. resulting in overbending and structural failure. In large aircraft such as the Brabazon the natural frequency of the wing may become as low as two or three cycles per second and, at this frequency, for the Brabazon, the critical forward speed is less than 300 miles per hour—or within the design cruising speed range. Dangerous vibrations could be avoided by altering course to avoid gusts, (often indicated by cloud formations) by reducing speed, or by designing a stiffer wing at the cost of increased weight. All these remedies have adverse affects on range and payload.

In the Brabazon the problem has been met by a principle of " gust alleviation " which involves changing the effective angle of incidence of the wing so as to meet the gust at a constant angle of attack. The ailerons are connected through the power operated control system to a pitch meter in the nose of the aircraft. Signals from the meter induced by up or down gusts then cause the ailerons to move in unison to reduce the lift of the wing for an up-gust or increase it for a down-gust. Although the pitch meter is about 80 feet ahead of the wing tip, the rate of response required in the ailerons is about 60 degrees per second and only a power operated system can provide such a high rate.

Air Conditioning

The demands of the human element on the Brabazon's designers were more exacting than those of the machine and this may be one of the reasons why the design of civil aircraft has lagged in Britain where concentration has been entirely on military aircraft during the war. It is one thing to accommodate a crew of super-men or even a large number of carefully selected, trained, and disciplined troops and to transport them long distances with only the bare necessities of life. It is a very different matter to convey a random selection of fare-paying passengers, unused to hardships, noise, and boredom at the standard of luxury they are entitled to expect for a trans-Atlantic fare of perhaps $400.00. They must be supplied with fresh air at the rate of one pound each per minute and this air must be maintained at the pressure temperature and humidity they are accustomed to find in their own homes. Pressurization to sea level atmosphere is perhaps not necessary but the apparent altitude of the cabin should never be allowed to exceed 8000 feet. For an aircraft cruising at 35,000 feet this means that a cabin differential pressure of 8 lb. per sq. in. must be maintained. This not only produces in the body structure of the Brabazon a hoop tension of about 1000 lb. per in. run, but also requires the total leakage area in the whole of the 6500 square feet of body surface to be not more than 1 square inch, otherwise excessively large blowers will be needed. This has to be achieved in the Brabazon by sealing 600,000 rivets 4,000 feet of plate joints and 400 feet of periphery of doors and windows.

To avoid stuffiness the total rate of circulation of air in the cabin must be about three times the rate of fresh air intake so the air is recirculated and must therefore be filtered and purified, and in particular, odours from the galley and dressing-rooms must not leak back to the passenger saloons. The relative humidity must not fall below a minimum of 25 per cent, or sleeping passengers will wake up with sore throats and cracked lips. Since at 35,000 feet all the moisture has been frozen out of the atmosphere, a very considerable quantity of water must be carried in the aircraft for humidification alone, apart from that needed for drinking, cooking and washing purposes. Complementary to the air-conditioning system is a fibre glass lagging which prevents excessive transference of heat and noise through the cabin walls. Although this material is the lightest ever made the amount needed to cover the inside of so large a body represents an appreciable weight penalty.

Accommodation

Passengers on first-class airliners need about four times the amount of space that they could tolerate in emergencies and the Brabazon I is designed to carry a maximum complement of 100 passengers plus a flight crew of seven and five stewards or air hostesses—112 persons in all. The wing passes through the body just below the centre line and the section within the body is pressurized to accommodate most of the switchgear and equipment associated with the extensive electrical supply systems. The main deck over the wing is extended fore and aft to provide space for a dining saloon seating 32 passengers at tables, together with the galley, pantry, cocktail bar, and lounge. At each end, stairways lead down to the main saloon and to the very ample dressing rooms and toilet accommodations located fore and aft of the wing under the dining saloon deck.

The saloon forward of the wing is devoted to first-class sleeping compartments for 36 passengers arranged on either side of the central gangway. The beds are quickly convertible for day use into seats. The saloon aft of the wing can be similarly arranged if required but present plans are to furnish it with 32 seats having a wide range of adjustment from an upright to a fully reclining position.

Electrical System

The considerations involved in the electrical design are interesting. In a medium sized aircraft the usual supply is 29 volts d-c which gives a favourable cable weight over the short distances involved. In large aircraft where circuit lengths increase to 100 feet and more, much higher voltages are necessary. The choice seems to lie between 115 volts d-c, and 208 volts, 3-phase, 400 cycle a-c. Higher d-c voltages are not advisable because of the difficulties of quenching a d-c arc. On the other hand, complications arise in the balancing of a-c loads and maintenance of constant frequencies. Alternating current generation has the great advantage that brush and commutator wear at high altitudes are not involved and this trouble is a major cause of unserviceability with d-c generators. There is also the possibility of using sturdy squirrel-cage motors, requiring no maintenance, at most points where rotary or linear actuation is required. Although cable size is reduced by the use of higher a-c voltages it should be remembered that 4 wires are required for a 3-phase supply instead of 2 or 1 for d-c depending on whether or not ground return is employed. There is little to choose on the score of cable weight but a-c switchgear however is generally rather heavier than that required for d-c.

In the Brabazon, a compromise has been reached whereby simple engine-driven alternators supply 3 phase current at 208 volts to frequency-insensitive loads such as propellor blade de-icing (a major load) and fluorescent lighting. This accounts for about 140 kilowatts and the remaining 15 kilowatts of the total electrical load is distributed as 29 volts d-c through step-down transformers and metal rectifiers which also charge storage batteries for engine starting and emergency services. In all, there are about 750 circuits with an aggregate installed cable length of more than 40 miles, about 700 of these circuits carrying the direct current. In view of the variation of ground supply at different air fields throughout the world, d-c starter motors are installed on the inboard engine which then drive the alternators through the accessory gear boxes at sufficient speed to start the remaining engines which are equipped with 3 phase a-c. Thus heavy duty d-c cables are reduced to a minimum length.

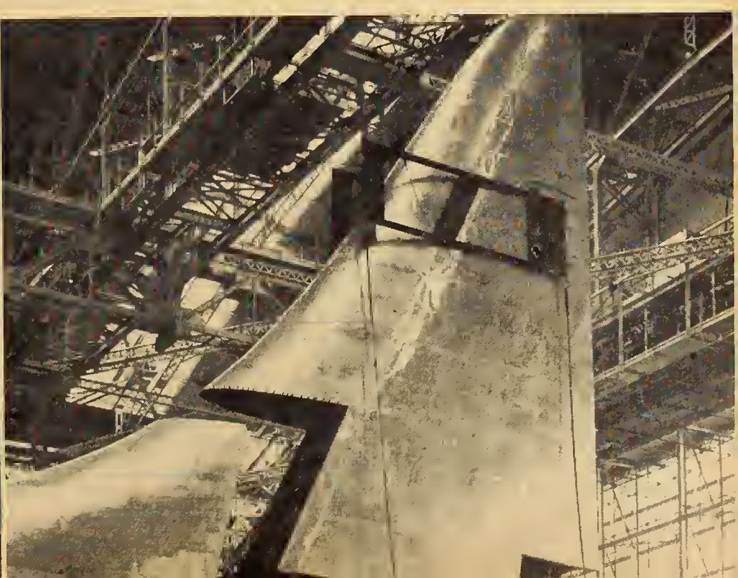
Leading Particulars

Following are some interesting statistics:

PERFORMANCE	Economical cruising speed	250 m.p.h. at 25,000 ft.	
	Operating ceiling	25,000 feet	
DIMENSIONS	Span	230 feet	
	Length	177 feet	
	Height	50 feet	
WEIGHTS	Structure	91,000 lb.	31.93%
	Power Plant	38,000 lb.	13.33%
	Removable equipment	26,000 lb.	9.12%
	Fuel & oil	95,000 lb.	33.34%
	Miscellaneous	11,000 lb.	3.86%
	Net payload	24,000 lb.	8.42%
		285,000 lb.	100%
	Max. landing weight	240,000 lb.	
	Wing loading	54 lb./sq. ft.	

Fig. 4, below left. October 1947. The Brabazon has been lowered on to its temporary undercarriage and wheeled backwards a few yards to bring the starboard main wheels on to a turntable set flush in the floor. The whole assembly is being pivoted through 90 deg. and at this point there is less than twelve inches clearance between the port tailplane tip and the end wall of the hangar.

Fig. 5, below right. November 1947. The giant vertical fin is lifted into position. Its apex is 50 feet above ground level, but the attachments were so perfectly matched that the operation took less than an hour to complete.



Notes on Management

"Transition in Corporate Controls". This is the title of an article in the September number of *Advanced Management* by Professor Joseph M. Juran of New York University.

Professor Juran took, as his text, an advertisement of the American Telephone and Telegraph Company, over the signature of its president, Walter S. Gifford. The message contained in the advertisement was that Management in the Bell System no longer represents the owners, but is entirely professional and therefore is in the position of Trustee, whose business it is to see that all the parties concerned — Capital, Labour, Management and the Public — receive consideration and equitable treatment.

Professor Juran paraphrases and condenses the advertisement in the following manner: "You owners may take a seat by the fire; we managers know what's best for you, for labour, and for the customers; we have taken over."

The change from ownership control to management control has been proceeding steadily for a number of years and has given rise to a good deal of discussion among economists and others interested in the control of business.

The situation in Canada was analyzed and placed on the record in the report of the Royal Commission on Price Spreads, 1935. This work was well done by one of our leading economists but the process has gone far beyond the conditions pictured there.

Seven years ago James Burnham (in his book, "The Managerial Revolution"), drew attention to the changes taking place. Like many other authors, Burnham ventured into the field of prophecy and some people did not like what he foretold. His book does contain, however, a very good exposition of the existing trends.

To revert to the subject of the relation and responsibility of Management, it has been pointed out many times that there is no inherent reason why Management should be appointed by the owners. There is no reason why Labour should not hire Management and Capital; or why Consumers should not unite and hire all three of the other factors. This is what has happened with some of the British Co-operatives.

The A. S. M. E., at their annual meeting in New York in the month of December, staged a panel discussion on the subject. According to people who heard it this was the highlight of their management sessions, which are always significant. We may expect to hear more of it.

❖ ❖ ❖

The writer of these notes recently participated in a meeting where the subject was Selection and Training of Executives. The first part of the subject was handled in what might be termed a normal manner, but when the speaker turned to the Training of Executives he soon launched into Semantics. Questioned about the sources of information in this field he mentioned "Science and Sanity" by Korzybski. Some of our readers who wish to try their teeth on something tough might tackle "Science and Sanity."

These remarks are not intended to be facetious as most of those present were greatly intrigued by the possibilities which the speaker envisaged. The core of his message was that people working together are influenced by the total situation — physical conditions, human relations, predispositions, group dynamics, and what have you. When we try to simplify things too much by saying: "He had his orders, why does he not obey them?" we ignore some of the most important factors in the situation. Training should enable executives to realize the existence and the importance of factors frequently overlooked. As was said above we shall probably hear more of it anon.

A news despatch from Ottawa says that an extensive programme of organization is being undertaken in various Government departments. It is also reported that they are looking for people experienced in this field. It is to be hoped that they find the right ones.

❖ ❖ ❖

The latest number of the *Journal of Advanced Management* reviews three books on Quality Control. This indicates the growing importance of, and attention being given to, this field. The mathematicians and statisticians have made their contribution and it is now up to the production men to work out the application of these methods to every-day situations. Where production quantities are large the problem has been largely solved but there is still a lot of necessary work to be done in the application of these methods where the production quantities are relatively small.

Incidentally in a lecture recently where Quality Control was the subject one member of the group said he had never heard of it outside the term inspection. The thesis developed by the lecturer was that to obtain Quality Control it was necessary to start at the very beginning, i.e., with design, and at every step on the way to production of the finished article, to ask the question, "Does this manner of doing this conduce to good quality in the product?" Many readers will appreciate how unfamiliar this conception is and how far-reaching would be the effects of its adoption.

❖ ❖ ❖

Professor Schell of Massachusetts Institute of Technology was in Montreal recently addressing the local chapter of N. O. M. A. Professor Schell is a member of the International Programme Committee of C. I. O. S. and while he was here Dr. Austin Wright and Messrs. Dion and Peachey had a lengthy conference with him regarding the programme for the Regional Conference in Quebec in May. These three gentlemen are also journeying to New York to confer with members of the Programme Committee of the National Management Council on the matter. Nothing but the best is good enough for this Conference.

J. A. C.

Report of Council For the Year 1948

Together with Committee and Branch Reports

It has become a custom to open this report with statements on the increased membership and the increased activities of the Institute. It is a pleasant privilege to be able to continue this custom for the account of the year 1948.

The year's end saw the membership record broken again, not only in the total figures but in the rate of increase. As shown by the Roll of the Institute given in detail later in this report, the total has now reached 10,878. New names added to the roster amounted to 2,075 which is 841 more than have been added in any previous year.

Once again there has been a great gain in Students and Juniors. The number of transfers to more senior grades has been most encouraging—a total of 741. It is interesting to know that the new by-law which transfers Students automatically to Junior has been wholeheartedly supported by Students. The year's record shows that 89 per cent of those so transferred have continued as Juniors. Great credit is due the Membership Committee of 1945 for devising these new methods.

New Branches

Further indication of expansion and increasing usefulness is shown by the development of new branches. Petitions for two new branches were received and granted during the year—one at Kamloops, B.C., to be known as the Central British Columbia Branch, and one in Newfoundland. The former was inaugurated in January 1949 with President Finlayson presenting the charter, and the latter will be inaugurated early in 1949. This brings the total to thirty.

At the time of writing another branch is in prospect in Ontario. Exploratory meetings were held there in December and there is every reason to expect that an application will be forthcoming shortly.

Annual Meeting

In the opinion of those who attended, the 1948 annual meeting at Banff was the most pleasant and successful of all meetings. The disastrous floods kept many members at home who had planned to be there, but even with that the attendance reached almost 650—a very gratifying figure. The professional programme was lengthened from the usual two days to three days. There were seventeen professional sessions. It was proven conclusively that the best background for such a meeting is a hotel with adequate accommodation restricted solely to those registered for the meeting.

Branch Officers Conference at Banff

For the second year the officers of branches were invited to conduct a conference on matters of prime importance to the branches. The conference was well attended and the deliberations occupied many hours. It was the wish of the branch officers that the conference be an annual affair and that more time be set aside for it.

Student Conference at Banff

For the third successive year undergraduate representatives of all Canadian universities at which engineering degrees are given, were invited to meet during the Institute's annual meeting. Like its predecessors this was a successful affair. Representatives were there from every institution from Vancouver, B.C., to Halifax, N.S.

Headquarters

The increase in Institute activities as described in the various parts of this report, has had noticeable repercussions at Headquarters. To meet the impact of increases in membership, transfers, branches, employment operations, library services, committee activities, etc., it has been necessary to increase the clerical staff somewhat. These increases added to already crowded premises have resulted in a state of congestion that is not conducive to the best results.

It is evident that if the Institute is to continue its policy of expansion in size and usefulness, additional office space must be found, either by appropriating some of the rooms now used for the membership in general or by securing space outside. Both possibilities are being examined by the House Committee.

Members who read in other sections of this report that over 2,000 new names were added to the membership list in 1948, that almost 750 transferred to more senior grades, that, in the library, books borrowed have increased by over 2,000, that in the employment service there were over 1,000 interviews, that the number of branches has increased by 10 per cent—these members will appreciate that Headquarters may well have growing pains.

Tribute must be paid to the work of the staff. It is doubtful if a more efficient, loyal group could be found in any office. They bring to their work a zeal that is unusual and which is reflected in the results obtained. In every department the work requires the acceptance of responsibility and the sacrifice of long hours of overtime. The Institute is most fortunate (and the General Secretary in particular) in having the services of these intelligent, industrious and pleasant people. Their work is reflected in the success of all phases of the Institute's activities.

Roll of the Institute

The membership of all classifications now totals 10,878, which again is a record. New names added for the year 1948 amounted to 2,075, but deaths, resignations and removals reduced the net figure to a gain of 1,719.

During the year 2,064 candidates were elected to various grades of membership. These were classified as follows: Members, 173; Juniors, 48; Students, 1,842; Affiliate, 1. The elections for the previous year totalled 1,085. Eleven reinstatements were effected. Life Membership was conferred on 44 members under the revised By-law 26.

Transfers from one grade to another were as follows: Junior to Member, 211; Student to Member, 1; Student to Junior, 527; Junior to Affiliate, 2, a total of 741.

Removals from the Roll

There have been removed from the roll during the year for non-payment of fees and by resignations, 110 Members; 122 Juniors; 43 Students, and 7 Affiliates, a total of 283.

Deceased Members

During the year 1948 the deaths of 73 members of the Institute, including one Honorary Member, have been reported as follows:

HONORARY MEMBER

Mead, Daniel Webster

MEMBERS

Allan, J. Lorn
Ambrose, John R. W.

STUDENTS

Evoy, Joseph Alfred Gilles
Marchionni, Dante Aldo
Rousseau, Gerard

Total Membership

The membership of the Institute as at December 31st, 1948, totals 10,878. The corresponding number in 1947 was 9,159.

	1947	1948
Honorary Members	20	19
Members	5,075	5,288
Juniors	1,924	2,166
Students	2,049	3,318
Affiliates	91	87
	9,159	10,878

Respectfully submitted on behalf of the Council.

J. N. Finlayson, M.E.I.C.,
President.

L. Austin Wright, M.E.I.C.,
General Secretary.

Legislation Committee

Your committee has studied all matters of legislation likely to affect the interests of the Institute and of its members, and again reports progress.

Thus ends another fruitful year with an ideal ever present:

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

Respectfully submitted,

J. A. Beauchemin, M.E.I.C.,
Chairman

Employment Department

In all phases of the work—interviews, placements and correspondence — the year just past was an exceptionally busy one for the department. The activity exceeded that of 1947, and vacancies still are in excess of the number of applicants available for employment.

This trend was noted in last year's report and it was pointed out then that no long-term forecast could be made on how long this condition would prevail. However, industrial activity remained high in 1948, and there is reasonable expectancy that the high volume of work handled will not abate in 1949. Volume alone, is not the gauge of success but rather satisfactory placement, both from the engineer applicant's viewpoint and that of the firm concerned. It is heartening to know that this has been obtained in a marked degree throughout the year.

The Employment Bulletin, introduced at the close of 1947, has proved its effectiveness as a means of informing all members on employment information well in advance of its publication in the *Journal.* This bulletin, which is mailed at the beginning of each month, has proved particularly helpful to firms seeking suitable applicants among those listed in the "Situations Wanted" column

There were 1,054 interviews recorded during the year 1948, and known placements totalled 158. As in previous years, it is certain that placements actually exceeded that recorded figure, but the department's reports are based on first-hand information, and can only be reported on that basis.

There were 525 new job files opened in 1948. At the end of the year applicants' files still open totalled 140.

In connection with the classified advertisements, it has been necessary in fairness to the many who wish to use this free service, to limit the number of insertions to three; for both situations vacant and situations wanted. Thus, when an advertisement does not appear for a fourth time, it does not mean necessarily that the situation has been filled or the applicant is no longer available. The file is kept open as long as needed, and the department will continue to answer all queries regarding it.

Still foremost in demand are the junior members of the profession. Large groups of engineering students continue to graduate from Canadian Universities. The service is planning to devote special attention to the matter of securing employer contacts for 1949 graduates, but the effects of this study will not be evident until late in 1949. The Institute and university authorities are maintaining close relations in all matters concerning employment opportunities for engineering students.

While the senior professional group is slightly more difficult to place satisfactorily, good progress was made in 1948.

Correspondence from overseas diminished slightly, but personal interviews, especially with British engineers recently arrived in this country under the accelerated immigration scheme, increased noticeably. Again, many satisfactory placements were effected among these new Canadians. The Institute, however, has kept its policy the same in this respect; it will help those who are resident here, but does not actively encourage engineers to leave other countries and come here on a speculative basis.

In general 1948 has been noteworthy not only for the proportion of successful placements, but in the further expansion of contacts. The membership increase in the Institute has reflected itself in the work of the department, and many new firms have used the service for assistance in filling vacancies. Certainly the burden of work has increased, and it has been most gratifying to receive letters from both employers and members alike expressing their appreciation of the department's efforts.

Respectfully submitted,

(Miss) J. Summers,
Employment Service

The Engineer in the Civil Service

The activities of this committee during 1948 have been along similar lines to those of previous years, namely, maintaining a watching brief over any action which might affect the engineer in the civil service, and constantly keeping before the Commission and those dealing with the activities of the engineer, the material previously presented in our various briefs before the committees and commissions dealing with matters affecting the engineer in the civil service.

Late in the year the committee sent a letter to The Hon. Louis St. Laurent, now Prime Minister, strongly supporting the action of the Professional Institute of the Civil Service in requesting the appointment to the Civil Service Commission of an engineer with "recognized scientific knowledge and administrative ability". This matter is at present before the Government. We have also recommended the appointment of an engineer to the International Joint Commission, which matter is still under advisement. These are a few of the activities of your committee during 1948, and it appears as if the results can only be judged by a long term view over the years.

N. B. MacRostie, M.E.I.C.,
Chairman.

Publication Committee

Members will have noted changes in the *Journal* during 1948 which the committee believes have been acceptable to the membership. Paper has been easier to obtain and although it has been necessary to pay particular attention to rising costs, the *Journal* has been printed on paper of sufficiently good and lasting quality to achieve a high standard of printing and reproduction of illustrations—an important factor in the presentation of technical papers.

A good deal of attention has been given to layout to present *Journal* material to the members in an attractive and readable form. This imposes a slight penalty in paper consumption which your committee believes can be readily justified.

In spite of substantial increases in advertising rates effective throughout the year, the *Journal* rates are again somewhat below the average for comparable business and technical journals in Canada and further increases in printing costs are imminent. In spite of printing costs being fifty per cent higher than in 1946 and 1947, the balance sheet for the *Journal* shows some improvement over the previous year and it is hoped that further improvement may be achieved in 1949. Intensive efforts have been made in Canada and the United States to bring to the attention of industrial advertisers the value of the *Journal* as an advertising medium.

The Branch Officers Conference at the annual meeting last year recommended to Council that the *Journal* should be thoroughly investigated to determine whether adequate coverage of the entire engineering field can be achieved by a single publication. The Publication Committee has been asked to carry out this investigation and the branch chairmen have been asked to act on a larger general survey committee. Acceptances have been received from the majority of the branch chairmen and at this writing the Publication Committee is compiling a brief which will present the complete picture for the consideration of branch executive and general meetings.

Because of the intense activity in all branches of engineering, the *Journal* has been well supplied with papers — the problem has been to obtain sufficient advertising revenue to meet the high cost of publishing the papers without too great a charge on the general funds of the Institute.

Respectfully submitted,

C. E. Gelinas, M.E.I.C.,
Chairman

Membership Committee

Early in 1948 in response to the instructions of Council, the committee prepared a proposal with regard to means by which the membership of the Institute could be increased in every branch. This was sent to Headquarters on January 22nd.

Throughout the year there were some conversations and exchange of correspondence with Headquarters and eventually it was agreed that the programme proposed originally be confined on an experimental basis to one branch.

It still remains for some small details to be worked out and for the basic list of prospects to be prepared by Headquarters.

It is hoped that by the end of 1949 the experiments will have been completed and if successful will have been applied to all of the branches across Canada.

H. R. Sills, M.E.I.C.
Chairman

Papers Committee

The members of this committee have largely taken care of any requests for papers in their respective provinces.

In Alberta there have fortunately been ample speakers throughout the year, and, generally speaking, all branches have had very good meetings and satisfactory papers. As far as papers and programmes go, practically all branches have had a better year than for several years in the past.

There is, therefore, nothing of a specific nature to report except progress and a successful year.

Respectfully submitted,

S. G. Coultis, M.E.I.C.,
Chairman.

Canadian Standards Association

The C.S.A. has completed another very active year in all its departments.

Under the main heading of Preparation of Standard Specifications, the Association has published twenty-eight new specifications during the year, reaffirmed nine, and has done a great amount of work on new projects and revisions of existing specifications necessitated by changes and developments in practice. Thirty entirely new projects have been started apart from those referred to above as completed and published, and fourteen of these latter are in civil engineering. The policy of review and revision has resulted in one hundred and four standard specifications being restudied by the respective committees in addition to those already readopted after such study. Much work has been done under the Canadian Electrical Code, Parts I, II, III, IV and V, and also under Non-ferrous Metallurgy.

At the Annual Meeting held in December a few revisions to the by-laws were adopted after study and recommendation by the appropriate subcommittee, these being designed to clarify procedure, to cope with the developments in organization and to expedite work.

A great deal of satisfactory progress has been made with the Welding Bureau which has grown in numbers and influence during the year. The Bureau now includes 112 Members, of which 75 represent fabricating firms and the other 37 sustaining Members, that is to say, firms interested in some aspect or other of the general welding procedure. A large proportion of the member firms have now been certificated as fully approved under the code and this work, which is the prime object of the Bureau, is being carried on as expeditiously as practicable. An important new development is the work of instruction both by correspondence course and by practical training, which the Bureau has undertaken. This course is partly designed to train supervisors, draughtsmen and engineers, but also permits of a certain amount of practical instruction to those who wish to secure it. Co-operation with educational societies has been established and lectures have been delivered under the auspices of the Bureau in Montreal, Toronto and Hamilton. In many cases these lectures have been recorded so that they may be repeated mechanically in other centres. A library on welding has been established, the nucleus of which was obtained from the Lincoln Foundation who presented some 200 books to the Bureau. The Administrative Board has been increased during the year and the financial situation has been definitely improved, so much so that the Bureau is now self-supporting.

The Electrical Approval subdivision of the Association has suffered financially from the restrictions placed upon imports during the year which resulted in the diminution of applications for examination of machinery and other electrical products. The laboratory staff had been enlarged during 1947 to cope with the increased volume of work and as much of this testing work was projected into 1948, the costs of operation could not be cut down to correspond with the reduction in new business. The Administrative Board reports that the rising costs have kept ahead of revenue and that even increases in fees have not made it possible to meet the situation raised by the falling off of applications. Apart from this circumstance which is beyond the control of the Board, the Approvals Division has been fully engaged in meeting its primary demands of rendering an inspection and approval service as efficiently as practicable.

The Association has maintained certain of its overseas connections such as its membership in the International Organization for Standardization and the International Electro-technical Commission, thus keeping in touch with developments in other parts of the world and is continually in close touch with standard organizations in the Commonwealth and in the United States.

Respectfully submitted,

P. L. Pratley, M.E.I.C.,

Representing E.I.C. on Main and Executive Committees.

Ontario Division

The activities of the Ontario Division during the year 1948 have been limited for a variety of reasons to organizational and planning work. The executive of the division have not consolidated the organization and membership and have made plans for more comprehensive activities in the year 1949.

Two meetings were held during 1948. The first coincided with the Regional Council Meeting in Toronto on October 2. The Statutory Meeting of the Executive was held in Hamilton, December 15.

During the year two items were considered by the executive of the division and further discussions during the coming year will be necessary before submission of final reports. These items were:

1. Toronto Branch Brief to Council
2. Toronto Branch Memorandum re Collective Bargaining.

Dr. A. E. Cameron's report on Soil Erosion has been presented to the division for action during 1949. An immediate survey of all Ontario Branches concerned with shoreline erosion will be made.

Officers for the forthcoming year were duly elected at the December meeting of the Division and are as follows:

Executive Committee:

Chairman......J. R. Dunbar, Hamilton
Vice-Chairman..W. L. Saunders, Ottawa
Secretary.....L. C. Sentance, Hamilton
Treasurer.........G. R. Turner, Ottawa

Board of Management: J. R. Dunbar, W. L. Saunders, L. C. Sentance, G. R. Turner, E. A. Cross, F. R. Pope, C. P. Warkentin.

Respectfully submitted,

L. C. Sentance, M.E.I.C.,
Secretary.

Library and House Committee

Two meetings of the committee were held during the year 1948. As for the last two years, the center of attention has been the need of additional space at headquarters. Plans for an extensive re-modeling of the present quarters, chiefly affecting the auditorium, and a new building to replace the older part of the building facing the street were prepared during 1947 and a continued study of this proposal carried on during the past year. Tentative discussions were held with the Finance Committee with the resulting opinion being that the cost of such a development was much too high, both as to capital cost and ensuing carrying charges.

The whole general scheme of providing additional space at headquarters was discussed at some length with Council in the latter part of the year. It was felt that a very thorough study should be made with the long range view chiefly in mind as to what building accommodation should be considered. Preliminary investigation of present conditions and how they will fit into, say, a 25-year programme of Institute activities, will be carried out by H.Q. staff. It is felt that the entire Institute membership should be made aware of the serious congestion now existing and how it is hampering and curtailing very worthwhile activities which would be of very definite value to every member. Efforts will be made to acquaint all members of the present situation since any expense involved in providing better, or completely new H.Q. facilities, will rest in the hands of the members generally. Since it may not be possible to delay some relief to present congestion for much longer, the committee will continue to study plans for a temporary expansion, the cost of which may be reasonable.

On the request of the Montreal branch, a study was made regarding the application of Public Address System in the auditorium at H.Q. This matter has been referred back to the local branch for further consideration.

During the past summer routine repairs and improvements were carried out. The repairs to headquarters steps were completed without altering the design or rendering them out of harmony with the existing architectural motif of the building.

LIBRARY

The Library now consists of approximately 13,410 volumes, including text books, reference books, periodicals, transactions, etc.; some 2,475 feet of shelving, and 51 vertical file drawers.

New material including text books, transactions, periodicals, etc., but excluding pamphlets, bulletins, and miscellaneous items, to the value of $2,421.00, has been added to the Library during 1948.

Accessions	1948	1947
New Books	202	228
Proceedings and Transactions	48	82
Reports and Bulletins	445	447
Standards and Tentative Standards	104	90
Pamphlets	169	152

We take this opportunity of thanking the publishers and reviewers for their very excellent co-operation during the past year. Reviews, book notes, and abstracts, numbering in all 418, have been published in *The Engineering Journal* during 1948, an increase of 170 over 1947. By publishing reviews and notes of new books in the *Journal,* we bring new publications to the attention of our readers, and also acquire considerable new material for the Library, thus serving a two-fold purpose.

Although no new films have been added to the film collection, some very comprehensive film catalogues have been acquired which will facilitate the compiling of subject bibliographies of films.

Use made of the Library has again shown a substantial increase over the previous year, especially insofar as the borrowing of material is concerned, as the following statistics indicate.

Days Open	272	270½
Evenings Open (5 to 8 p.m. Thursdays — winter months)	22	24
Inquiries Received:		
By Phone	2,791	2,531
In Person — Day	1,693	1,468
— Evenings	176	124
By Letter	1,399	1,229
Total	6,059	5,352
Increase 707 or 13.21 per cent		
Circulation:		
Books Borrowed	1,562	1,347
Periodicals, etc., Borrowed	2,375	1,821
Pamphlets Borrowed	1,054	811
Inter-Library Loans Borrowed	77	36
Indices Consulted	1,011	*
Films Borrowed	6	5
Total	6,085	4,020
Increase 2,065 or 51.36 per cent		

* Not recorded.

New Borrowers Added	226	180
No. of Borrowers as of Dec. 31st	265	113
Special Services:		
Bibliographies Prepared	101	95
Pages	211	236
Photostat Orders	29	26
Prints	182	177
Orders for Members	318	270

The work of reorganizing the Library is progressing, but very slowly. The new Library Regulations published each month in the Library Notes of *The Engineering Journal,* and the new system for handling library deposits have facilitated the work considerably.

Work has been begun on the new subject classification, using U.D.C. (Universal Decimal Classification) as published in abridged form in English by the British Standards Institution as BS 1000A:1948. The text books received since 1946 have been classified. This new file must be revised and corrected before the balance of the Library can be classified into it. Unfortunately, time and space are still very much at a premium.

In fact, lack of space is the great enemy of progress, necessitating, as it does, constant rearrangement of shelv-

Thurs (Oct-Mar)	9–8	9–5
Sat (closed Jy-Aug)	9–12	9–12

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

ing space, filing on the floor, discarding material worthy of being kept, loss of time (and tempers), and in general, making advancements and improvements all but impossible.

We wish to draw to the attention of members the Library Regulations printed herewith.

The Library is for the use of the members. Inquiries and suggestions are most welcome.

The committee expresses its appreciation of the work of the staff during the past year. It is hoped that practical steps may be developed in the near future to make that work easier.

Nominating Committee

Chairman: John R. Kaye

Admissions Committee

The committee held monthly meetings preceding each meeting of Council. Admissions or transfers were recommended for some 340 members not including 77 admitted under cooperative agreements, 1,842 student memberships and 516 automatic transfers from Student to Junior.

Mr. H. S. Van Scoyoc, M.E.I.C., undertook to prepare a manual for the guidance of the Admissions Committee and the branches. Considerable useful information was accumulated during the year and is being correlated with previous experience to establish a set of precedents for the appraisal of future admissions and transfers. It is expected that this manual will be available during the current year.

The by-laws concerning automatic transfer of Students to Junior member grade and mandatory transfer to full member grade are proving satisfactory in their application.

The committee would like to accord its appreciation of the work of the Headquarters staff which made possible the handling of such a large number of applications.

Respectfully submitted,

C. A. Peachey, M.E.I.C.,
Chairman

Committee on Professional Interests

Continued contact has been maintained with all branches of the Institute throughout the year. Again, as in 1947, nearly all branches and several provincial professional associations were visited by members of the committee, and advantage was taken of opportunities, during the trip West for the Annual Meeting at Banff, to establish new contacts in the Western Provinces. Several members of the committee attended the Maritime Professional Meeting at St. Andrews, N.B., in September.

The 75th anniversary of the founding of L'Ecole Polytechnique de Montreal—the oldest engineering school in Canada—was recognized suitably by the Institute, and a representative of the committee attended, as a guest of honour, the principal function marking that event.

Active contact was maintained with American Founder Societies. Under the aegis of our joint agreement with the ASME, a meeting of the Joint Committee took place in New York in December, every member being present. Matters discussed at length were:

(a) Service to student organizations;

(b) Participation of Institute members in research work of ASME committees;

(c) Reciprocal privileges of members in attendance at regional or annual meetings of each organization.

It is expected that some benefits to Institute members will result from conclusions reached during these discussions.

During the year the President and General Secretary of the Institute attended the meeting of the ASCE in Seattle. The committee believes that the Institute's decision to hold the 1950 Annual Meeting coincident with the ASCE meeting in Toronto will strengthen the relationship between these two organizations.

Reciprocal privileges between members of the Institute and of the British Institute of Radio Engineers were established during the year similar to those enjoyed by the British Institutions of Civil, Electrical and Mechanical Engineers. A similar arrangement is now being discussed by the General Secretary with the Institute of Aeronautical Sciences and the Royal Aeronautical Society.

No further action was taken concerning the recommendation of the Canadian Construction Association to the Federal Government in regard to preparation of a shelf of plans and specifications for public works, curtailing of public works at times of full employment, and improvement of salaries of engineers and architects in government service in order to attract and retain competent personnel. The committee believes that the matter is of considerable importance and it will be reviewed at an opportune time.

Representations to the Federal Government concerning the removal of duties on engineers' plans ended unsatisfactorily and your committee is of the opinion that further effort should be made to convince the appropriate authority that the engineers' complaint is justified.

The change in the annual fee of the Institute authorized by ballot in 1946 necessitated changes in the co-operative agreements with the provincial associations in Nova Scotia, New Brunswick, Saskatchewan and Alberta. The necessary amendments were approved by the respective governing bodies and the documents were signed late in the year.

The ever-growing membership of the Institute has brought about conditions in certain sections of the country permitting the formation of new branches through which members could be better served and more scope given to Institute activity. Several new branches are now being contemplated. It is a particular pleasure to record the application from members in Newfoundland to this end and it may be that by the time of the next annual meeting Newfoundland will have been admitted as a province and a branch established there. The first steps have been taken towards establishing a branch in the Kitchener, Ontario, area and a new branch has been authorized with headquarters in Kamloops, B.C.

Respectfully submitted,

J. B. Stirling, M.E.I.C.,
Chairman.

Committee on Employment Conditions

In its last year's report your committee pointed out the possibility of having Bill No. 338 passed in the House of Commons during 1948. At that time this Bill dealing with Industrial Disputes included engineers in its definition of an employee.

This legislation was again presented to the House in 1948 under Bill No. 195 with a revision however, excluding engineers from its scope. Council approved this revision at one of its general meetings and confirmed this attitude at a subsequent meeting when the dissenting opinions of some branch executives were submitted.

Your chairman visited the Peterborough branch executive to explain Council's policy and to present the problem involved in all its aspects.

He also attended a general meeting called by the Toronto branch where a general discussion took place after the Institute's and the Ontario Federation of Employee-Engineers' views were presented.

Legislation was passed approving the parliamentary committee's recommendations with few alterations, and it is to be reported that the engineering profession, while retaining the right to bargain voluntarily, has been excluded from the scope of the Industrial Disputes Act.

It should be kept in mind that when Council decided to support the proposal for the exclusion of engineers from collective bargaining legislation, they assumed a liability to do by other means everything possible to aid the young engineers in the improvement of their employment conditions.

It is recommended to Council that special attention be given to the economic status of the profession, especially to the young engineer's financial remuneration in governmental and industrial positions.

It is further recommended that special liaison be maintained with the provincial registration bodies' committees on collective bargaining in order to coordinate all efforts in this direction.

Respectfully submitted,

G. N. Martin, M.E.I.C.,
Chairman

Treasurer's Report

The audited statements of Assets and Liabilities and of Revenue and Expenditure for the year ended December 31st, 1948 are submitted herewith:

Income from membership fees shows an increase of $6,449.45 or approximately 9% as compared with the previous year.

Revenue from publications shows an increase of $37,718.37 or 66% over 1947 while expenditure is up $34,179.72 or 62%, due principally to higher printing costs. Profits from publications amounts to $10,407.78, an increase of more than 50% over the previous year, but it should be kept in mind that this favourable showing is due largely to the inclusion of the $2.00 subscription taken out of the fees of Members and Juniors.

The Building Fund was increased by $4,000 and now stands at $9,000. An amount of $1,500 has been placed in a new Technical Publications Fund. The total surplus for the year, before deductions for these two funds, amounts to $6,766.09. Total assets now stand at $113,563.25, an increase of approximately 8.5% over 1947.

The securities in the Institute's investment accounts amounting to $51,431.07, and having an approximate market value of $52,251.00, have been checked and found in order. During the year the Institute purchased $2,000 Hydro-Electric Power Commission of Ontario 3% bonds at $99.50 and sold $200 Dominion of Canada 4½% due 1958 (called in November 1948).

An effort should be made to increase the building fund at a rapid rate as Headquarters is overcrowded and something should be done to alleviate the situation.

The excellent showing during the year reflects great credit on the General Secretary and his staff.

Comparative Statement of Revenue and Expenditure

For the Year Ended December 31st, 1948

Revenue

Membership Fees:	1948	1947
Arrears	$ 3,860.86	$ 3,187.23

Transferred to Reserve for Past Services Pension Fund	......	8,000.00
Transferred to Building Reserve	4,000.00	......
Transferred to Technical Publications Fund	1,500.00	......
Surplus or *Deficit* for Year	1,266.09	1,809.73
	$176,181.99	$132,443.01

Respectfully submitted,
R. E. Heartz, M.E.I.C., *Treasurer.*

Finance Committee

During the year the revenues of the Institute have increased due both to a further increase in membership and to the increased advertising rates for the *Journal.* On the other hand, operating costs have continued to increase, as in all other lines of business.

Advertising revenue and *Journal* expenses, as shown in this year's statement, cannot be compared directly with those items in previous reports. This year's statement shows a gross revenue received for advertising including commissions, and commissions are included in the cost of publication. In previous years, the net revenue for advertising was shown and advertising commissions did not appear as an item of expense in our statement. Also in 1948, advertising commissions for thirteen months have been paid in order to make our advertising year conform to the financial year.

The overall financial position of the *Journal* has improved month by month, and it is expected that 1949 should show continued improvement.

During the year a further payment of approximately $1,500 was made from current revenue on account of our liability for past service benefits under the Pension Plan.

At the December meeting of Council, the Finance Committee was requested, if possible, to set aside out of this year's surplus a sum to assist in publishing more technical papers in 1949. Your committee, therefore, has set aside out of the year's surplus the sum of $1,500 for this purpose, and they also placed an additional $4,000 in the Building Fund.

The Finance Committee met regularly and reported to Council at each of its meetings during the year.

R. S. Eadie, M.E.I.C., *Chairman.*

Comparative Statement of Assets and Liabilities

As at December 31st, 1948

Assets

	1948	1947
Current:		
Cash on hand and in banks..........	$ 6,914.20	$ 3,021.84
Accounts receivable — less reserve..	8,739.77	6,082.43
Arrears of fees — estimated........	3,500.00	2,500.00
	$ 19,153.97	$ 11,604.27
Investments at Cost................ (Approximate market value as at 31st December 1948 — $52,251.00)	51,431.07	49,621.07
Sundry Advances....................	350.00	662.55
Deposit with Postmaster...........	175.00	175.00
Prepaid Insurance..................	260.00	428.10
Gold Medal.........................	45.00	45.00
Library—At cost less depreciation......	1,448.13	1,448.13
Furniture and Fixtures—At cost less Depreciation	4,700.08	4,523.62
Land and Buildings—Assessed Valuation	36,000.00	36,000.00
	$113,563.25	$104,507.74

Liabilities

		1948	1947
Current:			
Bank overdraft—current account.....		$	$ 453.33
Accounts payable.....................		6,665.41	5,618.68
Rebates to Branches.................		1,000.00	700.00
Unexpended balance of Rehabilitation Fund.........................		......	181.63
		$ 7,665.41	$ 6,953.64

Pension fund reserve................		8,000.00	8,000.00
Technical publications fund..........		1,500.00	......
Surplus Account:			
Balance as at 31st December, 1947..............	$ 60,419.80		
Add: Excess of revenue over expenditure for year as per statement attached	1,266.09		
Increase in estimated arrears	1,000.00		
		62,685.89	60,419.80
		$113,563.25	$104,507.74

Audit Certificate

We have audited the books and vouchers of The Engineering Institute of Canada for the year ended 31st December 1948 and have received all the information we required. We have verified the cash in banks and the investment securities and the revenue therefrom. In our opinion, the statement of assets and liabilities and statement of revenue and expenditure for 1948, as attached, are properly drawn up so as to exhibit a true and correct view of the Institute's affairs as at 31st December 1948 and of its operations for the year ended that date, according to the best of our information and the explanations given to us and as shown by the books.

Montreal, 20th January 1949.

Board of Examiners

Your Board of Examiners considers that the practice of referring applicants classed as Member with examination to the provincial associations or the Quebec Corporation has continued to prove satisfactory during the past year. However, there is under consideration a submission from one of the branches questioning the advisability of this delegation of examining powers to other organizations.

The Board of Examiners has held only one examination this year, in Newfoundland, where there is at the present time no professional engineering association.

R. DeL. French, m.e.i.c.,
Chairman.

Committee on the Training and Welfare of the Young Engineer

The Guidance and Welfare of the Young Engineer falls naturally into three levels: A—The High School; B—The University Graduate; C—The Young Graduate.

At the high school level, the chief E.I.C. activity has been indirect—i.e. through its representation on the Canadian Committee for Student Guidance in Science and Engineering. This committee succeeded in getting the Department of Labour at Ottawa to agree to publish a comprehensive guidance booklet patterned on the previous E.I.C. publication "The Profession of Engineering in Canada", but considerably more comprehensive. The C.I.C., C.I.M.M., C.C.P.E. & S., Bureau of Technical Personnel, and E.I.C. all contributed in the preparation of subject matter, and the booklet will be made available to all schools, and guidance groups throughout Canada at an early date.

It is the opinion of your chairman, that guidance work at the high school level can be most efficiently handled by pooling the Institute's efforts with those of other engineering societies, and all branches have been circularized twice with this recommendation and with suggestions for its practical implementation.

At the university level, the chief activity was the conference of Undergraduate Engineering Society delegates held during the June meeting at Banff. While the conference did not produce any new recommendations, it served an extremely valuable purpose in demonstrating the Institute's sincere interest in the young engineer, at the same time giving this representative group an insight into the activities of the Institute.

At the young graduate level, activity varies widely between branches. There is definite need for additional constructive action in this area.

Two actions that are needed to put the Institute's guidance work on a better footing, are obvious, but rather difficult to carry out.

1—Each branch should be visited by the chairman or someone equally interested in this work, and an endeavour made to convince each branch of the genuine necessity of organizing for guidance work at all three levels previously mentioned. Correspondence has proved definitely ineffective. A travelling field secretary could probably care for the greater part of this chore.

2—The committee should hold one or two meetings each year. These committee meetings would, I believe, become more feasible, if the main committee were divided into two sections—"Eastern" and "Western", or possibly a greater number of regional sections. I also feel that members for the committee should be drawn chiefly from the chairmen of branch committees.

It would be helpful if my successor as chairman is regularly invited to attend council meetings. This would facilitate the obtaining of the council's sympathetic support, without which it is difficult for the committee to do effective work.

G. R. Langley, M.E.I.C.,
Chairman.

National Construction Council

The following meetings of the National Construction Council of Canada were held during 1948:

Feb. 12—This meeting considered: import of Building Materials from U.S.A.; C.C.A. Resolutions re life of N.C.C.; housing; construction costs; and invitations to other National Associations to affiliate with N.C.C.

Apr. 22—This meeting dealt with letters from C.M.A. enclosing three submissions to Minister of Finance respecting Bill No. 454 re income taxes and from the South African High Commissioner's office at Ottawa re production of vermiculite. There was discussion re shortage of pig iron with an address by Major Anthes. The meeting also considered migration of technical personnel to the U.S.A. induced by high salaries and low taxes.

May 31—The Annual Meeting—A lengthy discussion on desirability of continuing the National Construction Council—its functions and history.

June 24—Adoption of Resolution considered at the Annual Meeting re future of Council and notice thereof to the Constituent Bodies.

Aug. 19—This meeting considered a letter received by the President from Allan C. Ross, Pres., of the C.C.A. concerning their resolution to the Prime Minister of Canada and the premiers of each province re Dominion Provincial accord in the fields of fiscal policy, taxation, resources development, low rental housing, labour, health and social welfare. It also drafted reasons to be sent to constituent bodies re continuation of N.C.C. on lines followed in past. Two other items on the agenda were the budget (no changes) and the migration of technicians to U.S.A.

Sept. 3—Letter from Secretary enclosing a copy of Resolution of C.C.A. and asking for comment.

Sept. 16—Letter to Secretary from E.I.C. signed by M. McLaren re assessment.

Sept. 21—Letter from Secretary to E.I.C. re continuing Council along similar lines as in the past.

Dec. 2—This meeting was for discussion of letter from Allan C. Ross re continuing N.C.C. Also considered was a letter from E.I.C. to W. E. Bonn enclosing copy of letter from A. C. Ross to President Finlayson of E.I.C.

Dec. 6—Discussion of W. E. Bonn's reply to the General Secretary of the E.I.C.

In conclusion it is suggested that during all these Meetings, it appeared that those representing the Constituent Bodies felt that the line of action taken by the C.C.A. represented a comparatively small group who had visions that the C.C.A. could more aptly express itself directly.

It seemed to be the feeling of these representatives that it would be much more politic for C.C.A. to express itself through the N.C.C. in such matters as, for instance, Dominion-Provincial relations.

Respectfully submitted,

W. E. Bonn, M.E.I.C.,
Representative of the E.I.C.

Canadian Chamber of Commerce

Note—The Institute is a member of the Canadian Chamber of Commerce. Several members of the Institute are active in its affairs, including Dr. Arthur Surveyer who at its request has prepared this report.

The chief activities of the Canadian Chamber of Commerce during the year 1947-48 can be summarized as follows:

Expansion of the Chamber movement;
Organization of National Affairs Committees;
Participation in radio discussions;
Campaign against Communism;
Defence of Private Enterprise;
Presentation of the Chamber's views to the Federal Government;
Study with a committee of the U.S. Chamber of Commerce of questions of mutual interest.

The work of the Chamber of Commerce shows how businessmen, who could probably never be elected to parliament, can, nevertheless, by studying national problems and by making apposite recommendations, take part in politics indirectly and give to the Government pertinent suggestions.

Expansion of Chamber Movement

The Canadian Chamber of Commerce is now a federation of 568 senior and 145 junior Boards of Trade and Chambers of Commerce, with a membership of over 100,000 people earning their living in big and in little business. The campaign has resulted in the affiliation of 152 new units during the past year. This campaign was carried out in the field by the members of the staff and was helped considerably by the former president himself, Mr. Bruce Hill, who spent 50% of his time away from home on Chamber business, thus giving the movement his personal leadership.

National Affairs Committees

Committees to study national affairs were formed in the various member organizations, under the direction of Col. R. D. Harkness, M.E.I.C. This resulted in an increase of from 100 to 165 National Affairs Committees in the various communities of the country. The objectives of National Affairs Committees include the following:

a) develop a better understanding and appreciation of national problems;
b) create a better informed public opinion concerning national problems; and
c) keep the Government fully informed on the opinions and desires of businessmen throughout the country.

With this end in view, National Affairs releases were issued by the Chamber during the year, on such subjects as import restrictions, proposed federal legislation, private enterprise, communism, Dominion-Provincial tax relations, Canadian citizenship, the alternative vote, the national budget, and where the sales dollar goes.

Private Enterprise

The Chamber also presented the views of business on Canada's system of private enterprise over the radio. First, 61 independent radio stations carried for the winter months a series of recorded dramatized capsule messages of one to two minutes duration; secondly, 53 stations carried the 15 minute recorded dramatized programmes, entitled "Pattern for Prosperity"; thirdly, seven Chamber directors participated in the CBC network during the winter and spring months.

The Chamber, convinced that the system of private enterprise is the only one which will give to Canadians an adequate standard of living, has continuously attempted to demonstrate the advantages of free enterprise. This was done chiefly by means of pamphlets distributed and sold to business firms, bringing the circulation of the series to over 750,000 pamphlets. In the same way, the pamphlet entitled "The Communist Threat to Canada" and another one entitled "How Communists Operate" were distributed and altogether 85,000 English copies and 15,000 copies in French have been delivered to all corners of the Dominion.

Federal Taxes

On taxation, the member organizations were polled on federal fiscal policy and on re-examination of the federal income tax law. Based on the findings of this poll, two relevant briefs were compiled by the Chamber Public Finance and Taxation Committee, under the joint chairmanship of Messrs. K. Dalglish and Courtland Elliott. On two occasions, during the year, Chamber officers discussed with the Minister of Finance matters relating to Dominion-Provincial tax relations and to the equitable taxation of all business enterprises, whether privately or publicly owned.

Labour Legislation

After consultation with the membership and a study of the proposed new labour code, in April last, the Chamber's Labour - Management Relations Committee communicated the Chamber's views to the Industrial Relations Committee of the House.

Dominion-Provincial Tax Relations

While continuing to press for a further Dominion - Provincial Conference directed towards the removal of the confusion and uncertainty of the tax situation which now exists for business, the Chamber's members were polled on their views concerning the methods for and rights to levying of succession duties and personal and corporate income taxes. The results of this poll were inconclusive. An overwhelming majority, however, reiterated approval of the calling of a new Dominion-Provincial Conference, the payment of subsidies by the Federal Government to provinces whose tax revenues were not adequate to provide public services up to a national average, the principle of equal taxation for all forms of business enterprise and the elimination of double taxation of corporate earnings.

Canada-United States Committee

The Canada-United States Committee jointly maintained by the two national Chambers of Commerce held its 25th and 26th Meetings at Hot Springs, Virginia, and at Murray Bay, Que., in May and September, respectively. This Committee is maintained to promote close and cordial relations between the businessmen of the two countries and to afford an opportunity for the study and discussion of business problems of mutual concern. Both meetings were under the Joint Chairmanship of Mr. C. A. Bullis, of Minneapolis and Mr. D. P. Cruikshank, o.b.e., of Ottawa. Conclusions reached at this year's meetings involved action to eliminate "invisible tariffs", greater economic co-operation and trading facilities, the operation of the European Recovery Program, joint agricultural aid to Western Europe, industrial co-ordination for defence and greater uniformity in the Customs Acts of the two countries.

Annual Meeting in Vancouver

The highlight of the Chamber's 1948 activities was the Annual Meeting which took place in Vancouver from the 26th to the 28th of October. Two special trains, one from Montreal and the other from Toronto, transported more than 500 businessmen and officials of Boards of Trade travelling from eastern points to attend this meeting. Stopovers of from six to twenty-four hours were made at Winnipeg, Saskatoon, Calgary, Moose Jaw, and Regina, in order to give the delegates the opportunity to meet with western members, to discuss with them problems of mutual interest, and more particularly to formulate the Chamber's policy declarations for 1948-49. These declarations of the Chamber should carry weight with the Government since its membership now totals 100,000 businessmen. Altogether it speaks for 1,650 large and small Canadian businesses with payrolls totalling 1,500,000 workers, a very substantial proportion of the total population gainfully employed in the country.

Mr. Henry Birks, of Montreal, President of Henry Birks & Sons Ltd., was chosen to head the Chamber during the next year. He has already mapped for himself a programme of travel across the country. Mr. Birks is an admirable choice to direct the extension of the Chamber's efforts, especially in stressing the pitfalls in the theories of radical groups who would supplant the present economic system by various forms of state control.

The Chamber reiterated its opposition to Socialism but its approval of social measures when kept within reason. Mr H. Greville Smith, former Chairman of the Executive Committee, declared: "We are not opposed to social progress, but we do recognize there may be limits to the rate of progress." The Chamber is in sympathy with desires for expanding social security programmes, but believes that such goals can be achieved only if Canadian national wealth continues to increase; there are limits to the demands which can be made on our national wealth at the present time, without jeopardizing Canadian hopes for the future. A careful distinction must be made between what is socially desirable as an ultimate aim and what can be achieved without damaging the system which makes our social welfare advances possible.

The Chamber is convinced that more people get more goods under free enterprise than under any other system, and that it can be made to produce a lot more for every one. It believes that it is the only system under which individual freedom can be maintained, and that anything that is wrong can be corrected by discussion. It opposes socialism as much as communism because it knows that in both systems the final product is a totalitarian state.

Respectfully submitted,

Arthur Surveyer, m.e.i.c.

Member of the Sub-committees on "Economic Development" and on "Public Finance and Taxation".

Applied Mechanics Reviews

Most engineers and scientists appreciate the importance of keeping abreast of developments in their own particular fields of interest. They realize also the value of knowing what is going on in other branches of science and engineering, which may possibly have application to their own work. Hitherto, the only way to remain well informed has been to read the available technical journals and reports devoted to the subjects of interest. For the engineer with wide interests this has become an appalling task, not only because of the accelerated pace of development during recent years but because of the tremendous growth in the number of published papers, a vast number of which appear in technical journals that the average engineer is never likely to see. The difficulty is not reduced by the fact that the majority of such reports have become highly mathematical in character and cannot, therefore, be dismissed with a brief perusal but must be studied carefully if the contents are to be fully understood.

The American Society of Mechanical Engineers has appreciated this need for the engineer to have easy access to the literature. Early in 1948 the Society began publishing a monthly journal designed to provide a comprehensive review of the important advances as they occur throughout the field of applied mechanics. This journal, known as "Applied Mechanics Reviews", has attempted to give only up-to-date material and has tried to select for review those papers which present new theories, ideas or methods—both theoretical and experimental and new data or calculations which have general application. Seven national professional associations in the United States, The Engineering Institute of Canada, and The Institution of Mechanical Engineers (Eng.) are assisting by representation on the Advisory Board. Dr. L. H. Donnell, Illinois Institute of Technology, is Editor and Dr. Stephen Timoshenko is chairman of the Editorial Board. It is a non-profit project.

Nine issues of "Applied Mechanics Reviews" have so far appeared this year (January to September issues) and it is now possible to appraise this publication in the light of the objectives the editors set for themselves and to tell engineers who are not familiar with it something of its characteristics. In the first nine issues, 1440 reviews have been presented, which, although somewhat less than the approximate goal of 1800, represents no mean achievement in the first nine months of publication. The papers reviewed in these first issues were published in 146 engineering and scientific journals. It is obvious, of course, that the editors must have examined a far greater number of journals than this. The journals from which papers have been reviewed to date originate in Argentina, Australia, Austria, Belgium, Canada, China, England, France, Germany, Greece, Italy, Japan, The Netherlands, Poland, Rumania, Russia, Sweden, Switzerland, the United States of America, and others.

Each review is written and signed by an internationally recognized authority and, in general, is about 250 words in length. The quality is very high and a real attempt has been made to give, in concise form, the essence from each paper. One cannot fail to be impressed by the evidence of so much "behind the scenes" labour which must go into the co-ordination and production of "Applied Mechanics Reviews".

Following is a list of the sections included and the total number of reviews which have been devoted so far to each section:

Section	Total No. of Reviews
I *Mechanics of Solids:*	
General Dynamics, Kinematics, Friction	27
Gyroscopes, Governors, Servomechanisms	11
Vibrations, Balancing	51
Wave Motion, Impact, Seismology	21
Elasticity Theory	51
Experimental Stress Analysis	32
Rods, Beams, Shafts, Springs, Cables, etc.	36
Plates, Disks, Shells, Membranes	46
Buckling Problems	83
Joints and Joining Methods	24
Structures	68
Plastic Flow, Failure, Mechanics of Solid State	106
Design Factors, Meaning of Material Tests	11
Material Test Techniques	31
Mechanical Properties of Specific Materials	52
Mechanics of Forming and Cutting Processes	11
II *Mechanics of Fluids:*	
Potential or Laminar Incompressible Flow	39
Turbulence and Boundary Layer	53
Compressible Flow, Gas Dynamics	113
Aerodynamics of Flight; Wind Resistance	140
Aeroelasticity (Flutter, Divergence, etc.)	25
Propellers, Fans, Turbines, Pumps, etc.	43
Experimental Flow Equipment and Technique	30
Hydraulics; Transport of Solids; Cavitation	40
Flow and Flight Test Techniques	4
III *Heat:*	
Thermodynamics	42
Heat Transfer; Diffusion	47
IV *Miscellaneous:*	
General Theoretical and Experimental Methods	30
Acoustics	44
Ballistics; Detonics (Explosions)	26
Soil Mechanics; Seepage	31
Geophysics, Meteorology, Oceanography	36
Lubrication; Bearings; Wear	19
Marine Engineering Problems	19

In the July issue of "Applied Mechanics Reviews" about 6½ pages were devoted to a list of the periodicals from which reviews are made. This gives the full name of each periodical, its abbreviation as used in the reviews, and the city and country in which the periodical originates.

It is quite evident that "Applied Mechanics Reviews" will become indispensable as a reference work, particularly to those engaged in basic research and development and also to teaching staffs of universities. Although a large percentage of the reviews are of papers dealing with fundamental work, there are also a fair proportion of papers of immediate interest and value to the practising engineer who may from time to time be faced with specific problems of some variety. The publication will undoubtedly be highly successful in keeping engineers in close touch with developments in the various fields of applied mechanics, for the expenditure of a comparatively small time on their part. The issues of "Applied Mechanics Reviews" are arriving about two months late, but the editors hope to catch up before long. Photostatic copies of any of the papers reviewed can be obtained from the editors at 25c per page, a service which enhances the value of the publication.

Respectfully submitted,

J. J. Green, M.E.I.C.,
E.I.C. Representative
Applied Mechanics Reviews.

Canadian Radio Technical Planning Board

The fourth annual meeting of the C.R.T.P.B. was held in Ottawa on Dec. 1st, 1948. Reports were submitted by the co-ordinators and panel chairmen which indicated that lack of information in regard to the International situation had greatly retarded the technical studies considered by the various panels. It was realized, however, that a tremendous volume of work lies ahead of the board and with the inauguration for a plan for closer liaison with the work of the Department of Transport, which was approved at the meeting, it was hoped that considerable progress would be made during the coming year.

Mr. G. C. W. Browne, controller of radio, Department of Transport, was a guest of the board and addressed the meeting. He complimented the board on its work and stated that the board was one of the salient examples of co-operation between administration and industry for the better utilization of the radio frequency spectrum for the benefit of Canada. He gave a very comprehensive report on the activities of his department on various International Committees to ensure that Canada is obtaining her fair share of the available frequency channels.

The tremendous expansion in the demand for radio frequency channels is placing an ever-increasing load on Mr. Browne's organization. He pointed out that the relatively new 152-162 m.c. band for mobile communication service, with taxicabs, private cars, trucks and so on, is already congested. He emphasized that the C.R.T.P.B. and the Canadian engineers could not be satisfied with present technical progress, but must strive to improve the performance of equipment being manufactured so as to make more efficient use of the existing channels.

To give some idea of the complexity of the international frequency allocation problems, Mr. Browne explained the purpose and function of the Inter-American Telecommunication Conference held in Rio de Janeiro, the International Telecommunication and Radio Conferences held at Atlantic City, the Commonwealth and Empire Radio Civil Aviation Conferences, the International Civil Aviation Conferences and the Provisional Frequency Board. In addition to this, Mr. Browne briefly touched on the activities of eleven other International Conferences which have been held since the war and six other conferences scheduled for the coming year. He stated that Canada had been well represented at most of these conferences, the majority of which lasted for many months.

It was with regret that the board accepted the resignation of Mr. R. M. Brophy as president who had headed the activities of the board since its inauguration. The officers elected for the ensuing year at the annual meeting were as follows:

Mr. R. A. Hackbusch.......... *President*
Mr. G. W. Olive......... *Vice-President*
Mr. S. D. Brownlee. *Secretary-Treasurer*

Respectfully submitted,

A. B. Hunt, M.E.I.C.,
Institute Representative on the Board.

Prairie Water Problems Committee

At the Annual Meeting of the Engineering Institute of Canada held in Banff in 1948, the following papers were presented:

"Water Resources of Alberta—Their Present and Ultimate Uses"—by Ben Russell, director of water resources, Province of Alberta.

"The Saskatchewan River and Manitoba's Water Problem"—by D. M Stephens, deputy minister of mines and resources, Province of Manitoba.

"The St. Mary-Milk River Irrigation Project," by G. L. MacKenzie, chief engineer, P.F.R.A., Regina.

"Irrigation in Western Canada—Its Possible Effect on Industry and Population"—by A. E. Palmer, superintendent, Dominion Experimental Station, Lethbridge, Alberta.

"The Work of the Institute's Committee on Conservation and Development of the Natural Resources of Alberta"—by Dr. John A. Allan, professor of geology, University of Alberta, Edmonton.

"Hydro Power Development on the Eastern Slopes of the Canadian Rockies"—by T. D. Stanley, production superintendent, Calgary Power Ltd., Calgary.

"Forest Management on the Eastern Slopes"—by Major General Howard Kennedy, chairman, Eastern Rockies Forest Conservation Board, Ottawa.

These papers dealt with irrigation and the various intricate problems in the control and use of the waters of interprovincial streams.

Your committee also drew the attention of the Council of the Engineering Institute of Canada to the fact that the two vacancies in the American Section of the International Joint Commission had been filled by engineers, the remaining member being a lawyer, there then being two vacancies on the Canadian Section, one of which has since been filled by the appointment of the Hon. J. Alison Glen.

The year 1948 marked the retirement of Victor Meek as comptroller of the Dominion Water and Power Bureau of the Department of Mines and Resources. Mr. Meek is one of the pioneers of Irrigation in Western Canada and the present development is in a large measure attributable to his work.

Respectfully submitted,

G. A. Gaherty,
Chairman.

Julian C. Smith Medal

Carrying out the instructions pertaining to the award of the Julian C. Smith Medal for 1948, the special committee consisting of Past-Presidents J. B. Hayes, L. F. Grant, and myself, has made a selection which has been submitted by letter ballot to all councillors.

As a result the Julian C. Smith Medal for 1948 is being awarded to R. W. Diamond, vice-president and general manager and director, The Consolidated Mining and Smelting Co. of Canada, Trail, B.C.

Respectfully submitted,

J. N. Finlayson, M.E.I.C.,
Chairman.

Sir John Kennedy Medal

The Sir John Kennedy Medal for 1948 has been awarded by the Council of the Institute to T. H. Hogg, M.E.I.C., consulting engineer, York Mills, Ont.

Respectfully submitted,

L. Austin Wright, M.E.I.C.,
General Secretary.

Juniors' and Students' Prizes

The reports of the examiners appointed in the various zones to judge the papers submitted for the prizes for Students and Juniors of the Institute were submitted to Council at its meeting on January 22nd, 1949, and accepted as follows.

H. N. Ruttan Prize (Western Provinces) to A. G. Fletcher, S.E.I.C., for his paper "Draughting a Logging Topographic Map".

John Galbraith Prize (Province of Ontario) to K. R. Stehling, S.E.I.C., for his paper "Rocket Propulsion".

Phelps Johnson Prize (Province of Quebec--English) to M. B. T. George, S.E.I.C., for his paper "Preliminary Design of a Light Racing Airplane".

Ernest Marceau Prize (Province of Quebec—French) to Gerard Gascon, for his paper "Exploitation des Gisements d'Ilménite du Lac Tio".

Martin Murphy Prize (Maritime Provinces)—No papers received.

Abstracts of Reports from Branches

Note—For Membership and Financial Statements see pages 90 and 91

Border Cities Branch

During the year the Border Cities Branch held nine executive and eight general meetings. These included the President's visit as well as a joint meeting with the Detroit section of the American Society of Mechanical Engineers.

The following is a list of the general meetings held during the year. The attendance is noted in brackets.

Jan. 8—**Research of the Hydro-Electric Power Commission Ontario** by W. P. Dobson, Director of Research of the Commission. (50)

Feb. 11—Combined Ladies' Night and International Joint Meeting when members of the Border Cities Branch were guests of the Detroit section of the American Society of Mechanical Engineers. (200)

Mar. 12—**Recent Developments in the Uses of Aluminum** by Gordon Black, Manager of the Sales Development Division of the Aluminum Co. of Canada. (55)

Apr. 9—**The Mining, Smelting and Refining of Nickel-Copper Ore,** a film supplied by the International Nickel Co. of Canada Ltd. (40)

May 14—**Materials Handling Equipment** by T. M. Harris, The Yale & Towne Mfg. Co. (39)

Oct. 6—President's Visit—Dean J. N. Finlayson, University of B.C. (90) (The ladies were present at this meeting)

Nov. 12—Student Night—Two papers were presented: **Chemical Treatment of Wood** by Alex McCaw, S.E.I.C., and **Cold Water Heating Systems** by Paul Valade, S.E.I.C. (53)

Dec. 10—**Conservation of our Natural Resources,** a series of films presented by The Carling Conservation Club. (34)

Calgary Branch

The following list gives the activities of the Calgary branch for the period December 1, 1947 to December 1, 1948. The attendance at meetings is indicated in brackets.

The Executive Committee met 11 times during this period, with an average attendance of eight.

The highlight of the past year was the Annual Meeting of the Institute held at Banff, June 1 to 5, when Calgary was the host branch.

Dec. 11—Symposium on **Oil and Gas Production and Processing** by G. A. Connell, JR.E.I.C., Chief Petroleum Engineer, Royalite Oil Co.; H. W. Newby, Br. Aff., Meterman, A. G. A. Piercey, Chief Chemical Engineer, J. W. Young, M.E.I.C., Asst. Field Superintendent, all of the Madison Natural Gas Co. Ltd. (82)

Jan. 8—**Manufacture and Applications of Lubricating Oils and Greases** by C. R. Shablitzke, Manager, Automotive and Industrial Lubrication, McColl-Frontenac Oil Co. Ltd. Also a colour film dealing with the Persian oil fields. (74)

Jan. 22—**Farm Electrification** by F. T. Gale, M.E.I.C., Superintendent of Rural Electrification, Calgary Power Ltd. (98)

Feb. 19—**The Joint Use of Poles by Electric Power and Communication Utilities** by D. G. Geiger, M.E.I.C., Transmission Engineer of the Bell Telephone Co. of Canada, Western Area, Toronto. This was a luncheon meeing. (49)

Feb. 21—Annual Ladies' Night was held at the Renfrew Club. Dancing, bridge, buffet supper, refreshments and entertainment. (134)

Mar. 1—Special luncheon meeting. **Why Manage the Resources** by Robson Black, President, Canadian Forestry Association. (59)

Mar. 4—**Trolley Coach Operation and Overhead Construction** by R. H. Wray, JR.E.I.C. (now M.E.I.C.), Electrical Engineer, Calgary Transit System. (63)

Mar. 13—Annual Meeting of the Branch. Installation of officers.

Mar. 19—Joint dinner meeting with the A.P.E.A. and the C.I.C. at the Palliser Hotel.

Oct. 7—Two films: **Colonel Crompton**—dramatizing the work of the famous British engineer, by courtesy of Bepco Canada Ltd.; and **Beyond the Pylons** showing the manufacturing of wire, cable, and meters. (68)

Oct. 21—**Bulk Handling of Grain and Other Materials** by J. M. Fleming, M.E.I.C., President and General Manager, C. D. Howe Co. Ltd., Port Arthur. (51)

Nov. 6—Afternoon plant visit: Choice of the refinery of the Imperial Oil Ltd., or the plant of the Alberta Nitrogen Department of the Consolidated Mining and Smelting Co. of Canada Ltd. (53)

Nov. 18—**Stabilization of the Sunnyside Hill Slides** by Dean R. M. Hardy, and a related paper on **Electro-Osmosis** by Professor J. A. Harle, Head of the Dept. of Electrical Engineering, both of the University of Alberta, Faculty of Engineering, Edmonton. (109)

Cape Breton Branch

The following Dinner Meetings were held during 1948:

May 12—Annual Meeting — Installation of Officers, followed by movies. (27)

Sept. 2—Presidential Visit of Dean J. N. Finlayson. (29)

Cornwall Branch

A very successful year was enjoyed by the Cornwall Branch. Our Civic Affairs Committee has been very active. and two of our Members were appointed to the City Planning Board. The ladies were invited to attend a tour of the Canada Mill of Canadian Cottons Limited.

The Cornwall Branch met seven times during the year with an average attendance of six. The following General Meetings were held during the year with attendance as shown in brackets:—

Jan. 20—**Pre-stressed Concrete Pipe**—an illustrated lecture by R. M. Doull, Manager of the Preload Company of Canada and Canada Gunite Company. (35)

Feb. 17—**Power Development on the Madawaska River**—an illustrated talk by J. R. Montague. Hydraulic Engineer of the Hydro Electric Power Commission of Ontario. (25)

Mar. 16—Presidential Visit of Lt.-Col. L. F. Grant. (50)

Apr. 20—**Fluid Drives in Industry**—by R. R. Noyes, Canadian Sirocco Company. (30)

Sept. 26—Tour of proposed St. Lawrence Seaway and Power Project with President J. N. Finlayson.

Sept. 27—Presidential Dinner. (84)

Oct. 19—**Modern Water Treatment**—by Prof. J. D. Lee, Associate Professor of Civil Engineering, Queen's University. (30)

Nov. 22—**How Cotton is Made**—a tour of the Canada Mill of the Canadian Cottons Limited showing Spinning and Weaving. (50)

Dec. 13—Annual Meeting. A Dinner Meeting with reports from Committee Chairmen and installation of Officers. (37)

Edmonton Branch

The following report of activities is submitted by the Edmonton Executive for the year 1948. Attendance figures are shown in brackets.

Jan. 13—**Wood Preservation** by J. H. Palmason, Gen. Mgr., Prairie Division, Dominion Tar and Chemical Co. Ltd. (65)

Feb. 10—**The Joint Use of Poles by Electric Power and Communication Utilities** by D. G. Geiger, Transmission Engineer, Bell Telephone Co. of Canada Ltd. (61)

Mar. 3—**Why Manage the Resources** by Robson Black, President of the Canadian Forestry Association. (41)

Apr. 6—**Problems Encountered on the Alcan Highway** by Lt.-Col. J. R. B. Jones, D.S.O., O.B.E., Senior Engineering Officer, Western Command. Joint dinner meeting with Edmonton Branch of Military Engineers' Association of Canada. (85)

Apr. 16—**Foundation Conditions in the Edmonton Area** by Prof. R. M. Hardy, Dean of the Faculty of Engineering, University of Alberta. Evening meeting sponsored by Junior Engineers' Committee held at University of Alberta.

Apr. 23—Branch Annual Meeting—Highlights of the year's activities, election of officers, concluding with a smoker. (60)

May 1—Western Visit of President Grant—An informal dinner meeting, to which the ladies were invited, was held in The Jasper Room of the Macdonald Hotel on the occasion of President Grant's Western Visit. The President spoke of international affairs and presented the Institute prize to Mr. Arnold Lesk. (75)

Oct. 8—The introduction of a formal ball to Edmonton Branch activities. Attendance of 370 indicates that this will be carried on in the following years. (370)

Oct. 14—Western Visit of President Finlayson—The President was entertained at luncheon at the Mayfair Golf and Country Club by the Executive, and at dinner in the Macdonald Hotel by the Executive and members of the Edmonton Branch. The ladies were present at the dinner meeting. (50)

Nov. 23—**Second International Conference of Soil Mechanics and Foundation Engineering** by Prof. R. M. Hardy, Dean of the Faculty of Engineering, University of Alberta. (75)

Dec. 15—Tour of North-West Industries Plant. Arranged and conducted by Mr. B. W. Pitfield, General Manager. Members inspected the new RCAF Navigation Trainers and other plant activities. (75)

Halifax Branch

During the year nine monthly dinners have been held as follows:

Jan. —Annual Combined Banquet.

Feb. —Professor Vilbert Douglas; **Geological and Mineral Possibilities of the Coast of Labrador.**

Mar. —Hon. Harold Connelly; **Nova Scotia Industry.**

Apr. —Students Meeting—**What the Profession and Industry Expects of the Young Engineer.** Messrs. McNab, Doane, Chisholm - Theakston, Johnson, McClymont.

May —D. O. Robinson, **Developments in Cement and Concrete.**

Sept. —Presidential Visit—Dean J. N. Finlayson.

Oct. —Inspection Trip — H.M.C.S. Magnificant.

Nov. —Students' Meeting — C. M. Anson.

Dec. —Annual Business Meeting.

Hamilton Branch

During the past year, the Hamilton Branch held the following meetings. Attendance figures are shown in brackets.

Jan. 23—Annual Meeting at McMaster Univ. Refectory. The guest speaker, O. H. Somers of the Standard Gage Co. Inc., chose as his subject **Tools for Dimensional Quality Control.** (115)

Feb. 19—**Backstage in Automotive Engineering** by H. E. Churchill of the Studebaker Corporation. (125)

Mar. 18—The Annual Students' and Juniors' Papers Night. The following papers were presented:
Vertical Transportation — A Key to Radial Expansion Applied to Hamilton by G. L. Schenider, S.E.I.C.
The Control of Motorized Bi-Parting Doors for Freight Elevators by E. M. Tuff, JR.E.I.C.
The Control of Electric Power Load in Paper Mills by R. W. Kennedy, JR.E.I.C. (45)

Apr. 22—**Ten Million K.V.A. Circuit Breaker Tests and Cooling** by A. W. Hill, Westinghouse Electric Corporation. (175)

Sept. 16—The President's Visit. Dean J. N. Finlayson spoke, and presented prizes won by Branch members in the past year. (62)

Sept. 23—**Stainless Clad Plate and Sheet** by L. C. Grimshaw of the Jessop Steel Company. (78)

Oct. 21—**Public Transportation in the City of Hamilton** by P. A. S. Todd, of the Hamilton Street Railway Company. (51)

Nov. 18—Annual Ladies Night and Dinner at McMaster University. R. B. Hassall, of Smith and Stone, Georgetown, spoke on **Ceramics** and two colour films were shown. (106)

Dec. 9—**Functions of a Research and Development Laboratory in an Industrial Plant,** an address by A. A. Moline, M.E.I.C., Canadian Westinghouse Co. Ltd., and an inspection tour of the Westinghouse Laboratories. (170)

Kingston Branch

During the calendar year 1948 the branch held eleven meetings as outlined below:—

Jan. 27—**Present Day Method of Designing & Constructing Bridges Are Obsolete and Should Be Replaced by New and Modern Methods** by C. P. Disney, Intrusion Prepakt Co., Toronto—an illustrated lecture.

Feb. 24—Student Papers Night — A combined meeting with the Engineering Society of Queen's University. The Society had Air Vice-Marshall E. W. Stedman give an illustrated lecture on the **Bikini Experiment.**

Mar. 15—President's visit—A mixed dinner meeting to welcome Colonel L. F. Grant.

Apr. 19—**Some Recent Developments in the Uses of Aluminum** — an illustrated talk by G. R. Black of the Aluminum Company of Canada.

May 18—**A Maintenance Forum** — A varied discussion on the problems of mechanical, electrical and buildings and grounds maintenance with the respective speakers being R. N. Boyd, Nylon Division, Canadian Industries Ltd.; A. MacDonald, Aluminum Company of Canada; and Major F. Mutter, Area Engineer Officer, Eastern Ontario Area.

June 24—Annual meeting of the Kingston Branch—A mixed dinner meeting featuring the installation of the new officers for the 1948-49 term. A coloured film **The Great Lakes** was shown and Bruce Fisher demonstrated mystic tricks.

Sept. 28—President's Annual Visit — A mixed dinner meeting to welcome President J. N. Finlayson.

Oct. 21—**The Engineering Profession in Ontario** by G. L. Macpherson, M.E.I.C., President of the Association of Professional Engineers of Ontario—This was a joint meeting with the Association members in the Kingston District.

Nov. 9—**The Alaska Highway** — by Brigadier Geoffrey Walsh, M.E.I.C., Area Commander, Eastern Ontario Area. **Men Against Rock**—a film in sound and colour featuring heavy rock excavation. Courtesy of Mr. C. D. Rees, Gardner Denver (Canada) Ltd.

Nov. 29—**Clad Steels**—An illustrated talk by L. C. Grimshaw, of the Jessop Steel Company.

Dec. 14—**An Estimating Forum**—A discussion on Estimating, featuring talks by M. G. Saunders, M.E.I.C., Aluminum Company of Canada, Kingston on **Cost Estimating by the Engineer,** and G. L. Schuett, M.E.I.C., Schuett Construction Company on **Cost Estimating in Construction — the Contractor's Technique Review.**

Kootenay Branch

The following report of activities is submitted by the Executive of the Kootenay Branch for the year 1948. Attendance is shown in brackets for each meeting.

The Executive held six meetings during 1948. General meetings were as follows:

Feb. 27—Annual meeting and election of officers was held and a film entitled **The Life of Colonel Crompton** shown. (24)

Mar. 10—Guest speaker at a luncheon meeting was E. W. Henderson, Motor Engineer, English Electric Co. who spoke on **Factors Affecting Motor Design.** (31)

Apr. 21—Clair White, Mines Dept., of the Consolidated Mining and

Smelting Co. gave a very interesting address on **Bulk Petrol Supply for the Allied Armies in Europe.** (36)

May 6—A banquet in honour of Lt.-Col. L. F. Grant, President of the Engineering Institute and his party was enjoyed by some 100 guests. Highlight of this meeting was the posthumous presentation of the Sir John Kennedy Medal awarded by Mr. L. A. Campbell, Sr., to Mr. L. A. Campbell, Jr.

May 7—A dinner meeting was held in honour of Lt.-Col. L. F. Grant and Dr. L. Austin Wright. (25)

Oct. 1—A general business meeting was held featuring reports of delegates to the Annual Meeting at Banff. (24)

Nov. 12—A general business meeting was held. Discussions centering on the local school building by-laws were featured. (24)

Dec. 10—Dr. Neil Campbell, Geologist, Consolidated Mining and Smelting Co. addressed a luncheon meeting on the topic **Yellowknife.** (34)

Lethbridge Branch

The following meetings were held by the Lethbridge Branch during the year 1948. Attendance figures are shown in brackets. The executive held seven meetings with an average attendance of six.

Jan. 23—Joint meeting — E.I.C. and A.P.E.A. A. J. Cullen — **The Conodion Citizenship Act.** (58)

Feb. 21—Musical programme, films — **Spot News, Sight Seeing at Home, Play Town.** (28)

Apr. 24—Frank Taylor—**The Production ond Monufocture of Beet Sugor in Southern Alberta.** (24)

May 3—Special meeting—Visit of President L. F. Grant, and General Secretary, Dr. L. Austin Wright. (40)

Oct. 23—Joint Meeting — E.I.C. and A.P.E.A. H. B. Corey—**Development of Petroleum Industry in Province of Alberta.** (65)

Nov. 20—Ladies Night. H. E. Salisbury, General Manager Alberta Canning Co. — **Vegetable Canning and Marketing in Alberta.** (47)

Dec. 18—Musical Programme — Films. (40)

Lakehead Branch

The following meetings were held by the Lakehead Branch during the year (attendance shown in brackets).

Jan. 21—A dinner meeting held at the Village Inn at Intercity. The programme consisted of a film on **Atomic Research,** and **Eskimo Summer,** a colour film on the Eastern Arctic. (23).

Feb. 18—The Annual Ladies Night was held at the Port Arthur Country Club. The programme began with refreshments and a buffet supper. Two films — **A Tour Through the Kentucky Coverns** and **Loke Superior** were shown. The films were followed by dancing. (57 couples)

Mar. 18—The members were guests at a welding school conducted by the International Nickel Company under the auspices of the Midwest Branch of the Canadian Pulp and Paper Association. After a buffet supper representatives of the International Nickel Company presented several lectures illustrated by films. (30)

Apr. 21—A dinner meeting was held at the Marriaggi Hotel, Port Arthur, on the occasion of President Grant's visit to the Lakehead. (48)

May 21—A joint meeting with the Thunder Bay Branch of the Canadian Institute of Mining and Metallurgy was held at the Lakehead Technical Institute, Port Arthur. The speaker was Mr. B. Sutherland who gave an illustrated lecture on **Soil Mechonics.** (40)

June 15—The Annual General Meeting was held at the Port Arthur Country Club with the Branch Chairman Mr. S. E. Flook in the chair. J. M. Fleming reported on the Annual General Meeting of the Institute at Banff and the meeting was concluded with two films **Visuol Aids** and **Land of Pioneers.** (42)

Oct. 10—The branch joined with members of the Canadian Pulp and Paper Association for a motor trip to Aguasabon and Terrace Bay to inspect the New Hydro-Electric Plant of the Ontario Hydro Commission, the townsite of Terrace Bay, and the Pulp Mill of the Long Lac Pulp and Paper Company. Those present were guests of the Long Lac Pulp and Paper Company at dinner. (75)

Nov. 16—A general dinner meeting was held at the Royal Edward Hotel, Fort William. Mr. S. E. Flook, Branch Chairman, presided. Mr. Brown of the Lakehead Technical Institute gave a talk on the activities of that institution. Three technical films **Instolling Armoured Coble, Hydroulics** and **The Allis Cholmers Hydroulic Log Barker** were shown. (35)

Dec. 6—A dinner was held in the Orpheum Grill dining room, Port Arthur. Members of the staff and students in Applied Science of the Lakehead Technical Institute were guests. A round table discussion on student guidance was held and two films, **The Tennessee Volley Authority** and **Life on the Western Marshes** were shown. (48)

London Branch

The Executive of the London Branch is pleased to report seven Regular and Special Meetings as follows:

Jan. 22—Annual Meeting. Reading of Reports and Installation of New Officers. Guest speaker, Dr. G. B. Langford, President of the Association of Professional Engineers of Ontario who spoke on **The Engineer in Modern Society.**

Feb. 24—E. V. Buchanan, M.E.I.C., General Manager, London Public Utilities Commission and J. A. Vance, M.E.I.C., Vance Construction Company, Woodstock spoke on **The Engineers' Council for Professional Development.**

Mar. 25—W. K. Clawson, M.E.I.C., on **Problems of o County Engineer** and W. R. Smith, M.E.I.C., on **Conservation ond Flood Control.**

Apr. 27—Eric W. Leaver of Electronic Associates Limited, Toronto, on **Machines Without Men.**

Sept. 17—President's Visit. Dinner meeting with Dr. and Mrs. J. N. Finlayson as Guests of Honour.

Oct. 26—Brigadier H. A. Sparling, C.B.E., D.S.O., Commander, Western Ontario Area, on **The Engineer ond the Defence of Conada** followed by films **Fido** and **Pluto.**

Nov. 12—**The Engineering Profession.** A public meeting sponsored by the London Council for Adult Education at which E. R. Jarmain, M.E.I.C., Branch Chairman, presided over a panel of experts who explained our profession in a most unusual, interesting and entertaining manner.

The Branch Executive met seven times during the year.

Moncton Branch

Four meetings of the Executive were held during the year. There were five branch meetings held at which technical subjects were discussed and business transacted as follows:

Apr. 7—A meeting was held in the City Hall. F. Kerr gave an illustrated address on **Bridge Testing on the British Roilwoys.**

June 22—A meeting was held for the purpose of nominating branch officers for the year 1948-49.

June 29—The annual meeting was held on this date.

Aug. 30—A dinner meeting was held at the Shediac Yacht Club. J. N. Finlayson, President of the Engineering Institute of Canada, was the guest speaker.

Nov. 22—A meeting was held in the Reid Photographic Centre. Addresses were given by R. L. Parsons, G. L. Dickson and J. A. Godfrey on **Vorious Aspects of Town Planning as Affecting the City of Moncton.**

Niagara Peninsula Branch

The Branch Executive held nine executive meetings and one electoral meeting during the year. The following general meetings were arranged and conducted by the Programme Committee.

Jan. 22—The annual Ladies' Night was held at the Red Casque Inn. S. T. Hadley, Control Chemist of the Robin Hood Milling, assisted by Mrs. L. Ballantyne of the same company, spoke on **The Processing of Flour ond Use of It in the Home.** A buffet luncheon was served after the meeting.

eb. 19—A dinner meeting was held at the Welland House, St. Catharines. D. P. Douglass, Electrical Inspector for the Province of Ontario, spoke on **The Use of Electricity in Mines.** In addition, arrangements were made for the showing of a coloured film on **Prospecting in the North.**

Iar. 19—A joint meeting with the Professional Engineers of Ontario was held at the Red Casque Inn. Col. T. M. Medland, Executive Director of Professional Engineers Association, was the speaker.

.pr. 22—A dinner meeting was held at the Welland House, St. Catharines. A. D. Smith of the Foster Wheeler Company gave an interesting discourse entitled **An Engineer's Visit to Turkey.**

Iay 27—At the Red Casque Inn a joint meeting was held with the American Society for Testing Materials. R. B. Gordon, Manager, Metallurgical Development Section of Westinghouse Electric, Pittsburgh, spoke on the subject of **High Temperature Steels, Super Alloys and Ceramics.**

une 3—Electoral Meeting at the Red Casque Inn.

une 11—Annual Meeting held at the Red Casque Inn. J. W. Corbett, Manager of Industrial Relations for Hayes Steel Co. spoke on the timely subject of **Labour Relations.**

Sept. 20—A dinner meeting was held at the Red Casque Inn, with President J. N. Finlayson, the General Secretary Dr. L. A. Wright, and Mr. Vance, Vice-President, in attendance.

Oct. 21—A plant visit was made to the Ontario Paper Co., Thorold, after which dinner was served on the premises and a speaker explained the difficulties of processing newsprint.

Nov. 18—A dinner meeting was held at the Horton Steel Works, Fort Erie, the speaker was Mr. H. C. Boardman, Director of Research for the Chicago Bridge & Iron Co., Chicago. His topic was **Multispheres and Serrated Tanks.**

Montreal Branch

The following papers were presented in 1948 (attendance in brackets:—

Jan. 8—**Economical Design of Rural Power Systems,** by R. F. Quinn (Joint Meeting with A.I.E.E.). (130)

Jan. 15—**Sperry Detector Cars and Testing Rail in Track,** by J. W. Dickerson. (100)

Jan. 22—**The Weather in War and Peace,** by G. H. T. Kimble. (80)

Jan. 29—**Wage Incentives,** by J. Keith Louden. (140)

Feb. 5—Annual Meeting. (80)

Feb. 13—Dance. (550)

Feb. 26—Students' Night. (125)

Mar. 4—**84" diam. Prestressed Concrete Pressure Pipe,** by R. M. Doull, M.E.I.C. (140)

Mar. 11—**Planning, Building and Operating Canada's International Shortwave Broadcasting Service,** by G. W. Olive, O.B.E., D. G. McKinstry, W. A. Nicols, R. D. Cahoon, J. E. Hayes (Joint meeting with I.R.E.) (160)

Mar. 18—**Design of Suspension Bridge With Respect to Dynamic Wind Action,** by Dr. O. H. Ammann. (155)

Apr. 1—**Automatic Control for Steam Boilers and Industrial Processes,** by P. S. Dickey. (150)

Apr. 8—**Steam Turbine Electric Locomotives for Main Line Service,** by Charles Kerr, Jr. (100)

May 1—Visit to new Boiler Plant, Dominion Bridge Company. (120)

May 11—Demonstration of Basic Control Principles, by R. N. Pond. (Joint Meeting with Cdn. Pulp & Paper Assc.) (240)

June 7—Exhibit of Chemical Institute of Canada.

June 15—I.R.E. Annual Meeting at St. Hubert — Aircraft and Radar Display. Address by Dr. O. M. Solandt.

Sept. 30—Opening Meeting. (165)

Oct. 7—Exhibition of the Work of the Swiss Engineer Robert Maillart. (160)

Oct. 14—**Laboratory Investigation of the Mechanism of Cavitation,** by Dr. R. T. Knapp. (120)

Oct. 16—Visit to Canadian Tube and Steel Company. (150)

Oct. 21—**AC-DC Conversion & Inversion,** by Lysle W. Morton (Joint Meeting with A.I.E.E.). (110)

Oct. 28—**The Industrial Engineer, his Function and Place in Industry,** by H. M. S. Ferguson. (155)

Nov. 4—**Architecture in a Period of Transition,** by Hugh Ferriss, M.Arch. (Joint Meeting with the P.Q.A.A.). (225)

Nov. 11—**Television,** by Dr. George H. Brown, Ph.D. (Joint meeting with the I.R.E.). (160)

Nov. 18—Moving Pictures. (65)

Nov. 25—**Planning Rapid Transit for Toronto,** by W. H. Paterson, M.E.I.C. (175)

Nov. 27—Visit to Imperial Oil Refinery. (225)

Dec. 2—**Thermoplastic Covering for Electric Wires and Cables,** by C. R. Ostrom and W. J. Pardy. (160)

Dec. 9—**Dust Precipitators — Types, Applications and Limitations,** by G. T. Doyle. (160)

Dec. 16—**The Achievement of Utopias,** by Lewis Mumford. (Courtesy of McGill University).

Junior Section

The Junior Section maintained the policy worked out two years ago to promote meetings of a high educational though non-technical nature. The results indicate that this policy seems to be the best so far adopted. The attendance varied throughout the meetings from 40 to 200.

Seven Executive meetings were held during the year.

Public Speaking Classes drew an average attendance of 30 members. Meetings are held once a week at Ecole Polytechnique with George Morrison in charge.

The 4th Annual Dance with an attendance of over 650 people was organized by John L. Bateman.

The following meetings were held during the year:

Jan. 12—**Engineering Forest Products**—F. A. Harrison.

Jan. 26—Annual Meeting — Elections — Films — Refreshments.

Feb. 9—**Selling Yourself and Your Product**—B. Hoffman.

Feb. 23—**The Rights of the Workers**—J. Perreault.

Mar. 3—Ladies' Film Night.

Mar. 22—**Labrador Mining Explorations**—Dr. J. A. Retty.

Oct. 4—**Effective Speaking**—K. Swinton.

Oct. 18—**Magic of Heating Controls**—W. J. Robinson.

Oct. 29—Oyster Party.

Nov. 1—Ladies' Film Night.

Nov. 15—Students' Night.

Nov. 29—**In Mexico, it's the Custom, Senor**—Leo Scharry.

Dec. 3—4th Annual Dance.

Dec. 13—**Services of a Bank** — J. L. Davignon.

Ottawa Branch

The report of the proceedings committee indicates that twelve meetings were held in 1948 with an average attendance of E.I.C. Members of 105; the highest attendance being 136, the lowest 62. The subjects covered territory from the Clyde River in Scotland to the Arctic and the Canadian Rockies, and ranged from the Humanities through to Housing.

The most successful Luncheon Meeting was that addressed by the President of the Institute, and our attendance was increased by the presence of many members of the Engineers Wives Association. It has since been suggested that a "Ladies Day" Luncheon, should be considered as an annual affair.

The attendance record indicates that Luncheon Meetings are more popular than evening meetings, and that subjects of general interest are more acceptable than those of a strictly technical nature.

The Institute Meetings seem to have a broad unifying influence, as compared to the limited appeal of the technical Societies.

Feb. 5—Luncheon meeting at the Chateau Laurier. **The Engineer and the Humanities** by Dr. R. C. Wallace, Principal, Queen's University. (133)

Feb. 19—Luncheon meeting at the Chateau Laurier. **Search Unending,** an address and film dealing with Oil Discovery, by John Ness, Imperial Oil Limited. (104)

Feb. 24—Joint meeting with A.I.E.E. at the National Research Council Auditorium. **Influence of Metals on Electrical Apparatus** by F. R. Benedict, Manager, Industrial Engineering Department, Westinghouse Electric Corporation.

Mar. 4—Luncheon meeting at the Chateau Laurier. **Practical Research** by C. S. Parsons, Chief, Bureau of Mines, Ottawa. (131)

Mar. 18—Luncheon meeting at the Chateau Laurier. **Scientific Development of the North American Arctic** by W/C K. C. Maclure, Director, Arctic Research, Defence Research Board. (136)

Apr. 1—Luncheon meeting at the Chateau Laurier. Sound film, **Beaverships.** (104)

Apr. 5—Joint meeting with A.I.E.E. at the National Research Council Auditorium. **The Development of Atomic Power** by Bruce E. Prentice, General Electrical Co., Schenectady, N.Y.

Apr. 15—Luncheon meeting at the Chateau Laurier. **What Hope Is There for Housing** by J. L. E. Price, J. L. E. Price & Co. Ltd. (112)

Apr. 28—Auditorium, National Museum. **Some Soil Mechanics Problems and Projects in the United States and Mexico** by F. Lionel Peckover, Division of Building Research, National Research Council.

May 6—Luncheon meeting at the Chateau Laurier. **The Engineer and Community Planning** by S. A. Gitterman, Architectural Branch, Central Mortgage & Housing. (85)

Sept. 23—Luncheon meeting at the Chateau Laurier. The president of the Institute J. N. Finlayson, University of British Columbia. (200 including ladies)

Oct. 14—Luncheon meeting at the Chateau Laurier. **P.F.R.A.** by G. L. MacKenzie, Chief Engineer, Prairie Farm Rehabilitation Branch, Dept. of Agriculture. (62)

Oct. 18—Joint meeting with the Division of bldg. research at the National Research Council, Main Building, Ottawa, Ont. **Doring Use of Reinforced Concrete by Robt. Maillart** by Robert Schreiver.

Oct. 28—Luncheon meeting at the Chateau Laurier. **Engineering for Safe Highways** by J. D. Millar, Deputy Minister, Dept. of Highways, Ontario. (75)

Nov. 18—Joint luncheon meeting with C.I.M. & M. at the Chateau Laurier. **A Glimpse of Britain** by G. C. Monture. (153)

Dec. 2—Luncheon meeting at the Chateau Laurier. **The Snare River Hydro Electric Development** by Norman Marr, Acting Controller, Dominion Water & Power Bureau. (96)

Peterborough Branch

Nine Executive meetings were held with an average attendance of eight. The following summarizes the eight Branch meetings during the year with attendance figures in brackets. Average attendance 42.

Feb. 19—**Micro Waves** by A. A. Blanchford, Bell Telephone Co. of Canada Ltd. (54)

Mar. 18—**Weather Forecasting** by W. G. Green, Department of Transport. (38)

Apr. 15—**Tools for Dimensional Control** by O. H. Somers, Standard Gauge Co. (71)

May 20—**Recent Developments in Aluminum** by W. S. Dunford, Aluminum Co. of Canada. (31)

Sept. 24—**Annual Dinner** addressed by E.I.C. President Dean J. N. Finlayson, University of B.C. (54)

Oct. 16—**Fall Outing**—Trip to Trenton Air Station as guests of W/C E. C. Luke. (16)

Oct. 28—**Soil Conservation Symposium** by D. R. McGregor, N. W. Finnie, and C. W. Holman, Peterborough Branch; and G. A. Hills, Ontario Dept. of Lands & Forests. (31)

Nov. 25—**China Today** by J. K. Sexton, Montreal Engineering Co. (38)

Québec Branch

The Executive Committee held six meetings with an average attendance of nine members for the transaction of branch business.

The activities of the Branch were varied and well attended, the programme of activities being as follows (attendance given in brackets):

Feb. 9—**Construction of an 84 inch diameter prestressed concrete pipe for the city of Montreal,** by R. M. Doull, General Manager, the Canada Gunite Co. Ltd., Montreal. (30)

Feb. 18—**Nouveaux usages pour l'aluminum et ses alliages,** by Claude P. Beaubien, Manager, Aluminum Co. of Canada, Quebec. (50)

Mar. 18—**Transite Pipe,** paper and and films, by W. D. Barron and S. M. Wilson, Canadian Johns Manville Co. Ltd. (32)

Mar. 30—Students' night. (42)

Apr. 12—**Conditionnement de l'air pendant l'hiver,** by Dr. P. A. Bricout, professor, Faculty of Science, Laval University. (45)

Apr. 26—**Etude de la Centrale actuelle de Beauharnois,** by Rene Dupuis, director-manager and chief engineer, Beauharnois Light Heat and Power Co. (48)

Apr. 30—Ritual of the calling of an engineer. (55)

May 31—**The Control of Atomic Energy,** by General A. G. L. MacNaughton, Canadian Delegate to the United Nations Organization. The branch was invited by the Quebec Military Institute to participate in this meeting. (75)

June 28—Annual General Meeting of the Branch. (22)

Sept. 13—The President's visit and the Annual Golf Tournament of the Branch. (104)

Oct. 18—**Fiberglass,** paper and films, by Kent Hutchison. (41)

Nov. 17—Visit to the new automatic Bell Telephone Exchange on St-Cyrille Street. (50)

Dec. 20—**D'ou viennent vos kilowatheures,** by Lionel Swift, Superintendent, Power Division, Quebec Power Company Ltd. (50).

Saguenay Branch

During the year the Branch held a total of six general meetings:—

Jan. 29—**Pulpwood Operation—from the Forest to the Mills** by J. L. Kelly, Manager, South Kenogami Division, Price Brothers Co., Chicoutimi, P.Q.

Feb. 19—**Recent Developments in the Uses of Aluminum** by G. K. Black, Sales Division, Aluminum Company of Canada, Montreal, P.Q.

Apr. 1—**Research and Industrial Progress** by G. E. Bourne, Manager, Special Products section, Apparatus Division, Canadian General Electric, Toronto.

May 27—**Scandinavia As Seen by a Canadian Hydro Electric Engineer** by F. L. Lawton, Aluminum Company of Canada, Montreal.

Aug. 27—Dinner Meeting and Visit of President, Dean Finlayson and Party.

Sept. 8—**Some World Problems** by Dr. R. C. Wallace, Principal, Queen's University, Kingston.

Junior Section

The Junior Section held a series of five meetings as follows:—

Feb. 4—**Fabricating Aluminum at Arvida** by F. E. Hogg, Aluminum Company of Canada.

Mar. 18—**Development and Processing of Aluminum Alloys** by K. M. MacQuarrie, Aluminum Company of Canada.

Apr. 21—**The Course of Copper and Gold** by W. A. Dayton, Aluminum Company of Canada.

June 5—**Informal Talk on a Recent Trip to Europe** by F. G. Barker, Aluminum Company of Canada.

Dec. 6—Annual meeting and film night.

Saint John Branch

On behalf of the Executive of the Saint John Branch we have the honour of presenting the annual report of the Branch for the year ending December 31st, 1948.

Four special meetings of the Branch were held during the year, all of them at the Admiral Beatty Hotel in Saint John (attendance shown in brackets):

Jan. 29—Annual Joint Dinner Meeting with the N.B. Association of Professional Engineers. Speaker: D. O. Robinson, **Concrete and Air Entrainment.** (70)

Mar. 24—Dinner Meeting with the presentation of Canadian General-Electric Company's films: (1) **Clean Waters,** (2) **Story of Frequency Modulation.** (48)

Apr. 22—Dinner Meeting: Mr. G. Lorne Wiggs presented a paper entitled **Radiant Heating and Cooling.** (58)

Oct. 21—Dinner Meeting: Approximately 80 students from University of New Brunswick accepted our invitation to hear Colonel Robert J. Cassidy deliver his paper entitled **Engineer Preparations for D-Day Landing in Normandy.** (125)

In addition to the Branch Meetings the Saint John Branch, in co-operation with the other Maritime Branches of the Institute, namely, Moncton, Halifax, and Sydney, and the Professional Associations of New Brunswick and Nova Scotia, arranged for and carried out the Maritime Professional Meeting at the Algonquin Hotel at St. Andrews-by-the-Sea on September 8th, 9th and 10th. There were over 200 members and their wives registered at the meeting. This provided the members of the Saint John Branch with an opportunity of meeting the President and his party, as no special Branch meeting was called for this purpose in Saint John. President Finlayson, accompanied by Mrs. Finlayson, attended the St. Andrews meeting, and many of our members became well acquainted with him while there.

The annual meeting of the Branch was held as a Dinner Meeting on December 16th and a new slate of officers for the year 1949 was duly elected. The annual report of the Executive was presented to the Branch as well as the annual membership and financial statements for the year. There were 33 members present.

There were five Executive Meetings during 1948, with an average attendance of eight members.

St. Maurice Valley Branch

The St. Maurice Valley Branch had a successful year during which there were seven branch meetings and five executive meetings. The branch by-laws were completely revised and Junior Sections were formed in Shawinigan Falls and Three Rivers.

The following is a list of the branch meetings:—

Feb. 3—Lecture meeting at Cascade Inn, Shawinigan Falls. **New Power Development at Shawinigan Falls** by E. V. Leipoldt, M.E.I.C., Vice President, Shawinigan Engineering Co. Illustrated with lantern slides.

Feb. 17—Theatre Night at Cascade Inn, Shawinigan Falls. Various industrial films.

Apr. 16—Annual dinner meeting at Cascade Inn, Shawinigan Falls. Dr. J. T. Rettaliata, Illinois, Technical Institute, presented an illustrated talk on **Gas Turbines and Jet Propulsion.**

Sept. 14—Visit of President J. N. Finlayson. Dinner meeting at Cascade Inn, Shawinigan Falls.

Sept. 26—Joint luncheon meeting with A.I.E.E. at Hotel Windsor, La Tuque. Guy Rinfret, M.E.I.C., Shawinigan Engineering Co., spoke on **Power Development in the St. Maurice Valley.** Plant visits to the Power House and Brown Corporation Paper Mill and refreshments at the Golf Club completed the day.

Oct. 21—Dinner meeting at St. Maurice Hotel, Three Rivers. Paul G. A. Brault, of Dominion Bridge Co., spoke on the **Design and Construction of the Duplessis Bridge,** illustrated with lantern slides.

Dec. 9—Film Night at Cascade Inn, Shawinigan Falls. Various illustrated films.

Shawinigan Falls Junior Section

Jan. 22—Lecture Meeting. **The Industrial Development of Shawinigan Falls** by J. S. Whyte, M.E.I.C., Shawinigan Chemicals Ltd.

Mar. 22—Short talks by young engineers.

Apr. 27—Lecture Meeting. **Labour Relations** by C. T. Cornelius, Aluminum Company of Canada.

June 10—Election Meeting.

June 29—Dinner Meeting. **Impressions of South Africa** by E. R. Williams, M.E.I.C., Shawinigan Chemicals Limited.

July 10—Plant visit to Shawinigan Water & Power Co. No. 3 Power House under construction.

July 24—Plant visit to Carbide Division of Shawinigan Chemicals Limited.

Aug. 7—Plant visit to Belgo Division of Consolidated Paper Corporation Ltd.

Aug. 19—Plant visit to Plant No. 1, Aluminum Co. of Canada.

Oct. 10—Lecture Meeting. **The Development of Carbide** by J. S. Whyte, M.E.I.C., Shawinigan Chemicals Ltd.

Nov. 30—Plant visit to Shawinigan Water & Power Co. No. 3 Power House under construction.

Dec. 1—Film Night, ladies invited.

Three Rivers Junior Section

Jan. 19—Plant Visit to Canada Iron Foundries Ltd.

Feb. 9—Discussion by R. Clark, of St. Maurice Valley Chronicle.

Feb. 23—Film Night.

Sarnia Branch

The Sarnia branch of The Engineering Institute of Canada during its third year held nine general meetings and twelve executive meetings. The following is a list of the general meetings:

Jan. 15—Dinner meeting held at the Polymer Cafeteria. Dr. Carl Whittemore of the Deloro Mining and Smelting Company, Madoc, Ontario, spoke on the subject of **Cobalt.**

Mar. 2—Combined dinner meeting held at the Lutheran Church at which the C.I.C. members were our guests. Mr. K. A. Henderson, Vice-President and Treasurer of the Imperial Oil Limited, spoke on the subject of **Canadian Finance in Relation to our National Position.**

Apr. 6—A smoker at the Vendome Hotel. W. R. Manock, President of the Ontario division of the E.I.C. spoke on the history and growth of the Ontario division. Two other topics **Town Planning** and **C.I.C. and E.I.C. Co-operation** were discussed at considerable length during the evening.

Apr. 30—A special meeting called to discuss bill No. 195 concerning the exclusion of engineers from collective bargaining.

May 26—Junior Night. This meeting took the form of a smoker held at the Golf Club. The early part of the evening was devoted to a tour through the Holmes Foundry and their new rock wool insulation plant. This was followed by refreshments and an informal discussion at the Golf Club.

Oct. 5—The President's visit and the annual Ladies Night. A dinner preceded by cocktails was held at the Golf Club. President Finlayson was accompanied by his wife and Mr. and Mrs. J. Vance. Mr. Vance is Vice-President of E.I.C. representing Ontario. President Finlayson and Mr. Vance addressed members and the ladies.

Oct. 28—E.I.C. were guests at the Ladies Night meeting at the Lutheran Church at which the Sarnia branch of the Chemical Institute were hosts. J. W. Bateman, of the Canadian General Electric Company gave a lecture on **The Magic of the Spectrum.**

Nov. 24—A dinner meeting held at the Fischer Hotel. R. F. Legget, Director of Building Research of the National Research Council spoke on **Building Research in Canada and Abroad.**

Dec. 9—Annual meeting.

Saskatchewan Branch

All meetings were held jointly with the Association of Professional Engineers. Average attendances at dinner and lecture meetings were 54 and 28 respectively. Programmes were as follows:

Jan. 16—Canadian Army re "Engineer in War" by Col. H. W. Love.

Feb. 20—Annual Meeting followed by dinner and Address by F. B. Bagshaw, K.C., entitled **Kipling and the India of Yesterday.**

Feb. 27—**Combined Use of Poles** by D. G. Geiger. (Lecture Meeting).

Mar. 19—**Expedition Muskox** by W. R. Young.

Apr. 27—Mixed Dinner addressed by Pres. L. F. Grant and Gen. Sec. L. Austin Wright. Summary of E.I.C. Affairs and Collective Bargaining were discussed.

Oct. 22—**Telephone Night** (followed by inspection of telephone equipment). Speaker, S. R. Muirhead.

Nov. 5—Lecture Meeting addressed by G. Bell, Chairman, British Consulting Engineers Association.

Nov. 19—Special Meeting to discuss **Collective Bargaining** in the light of recent Federal Legislation.

Dec. 17—**Sodium Sulphate Manufacture** (illustrated) by A. A. Holland.

Sault Ste. Marie Branch

The Sault Ste. Marie Branch of the Engineering Institute of Canada held five general meetings and three executive meetings during 1948. The general meetings were as follows:

Feb. 27—**The Development of the Paper Making Industry,** a paper presented by G. W. Holder of the Abitibi Power & Paper Co.

Sept. 24—A talk on **Meteorology** by Mr. Meyers of the U.S. Weather Bureau station at Soo, Michigan.

Oct. 29—**Cathodic Protection as Applied to Pipe Lines and Steel Structures,** a paper presented by Mr. T. R. B. Watson, corrosion engineer, Dominion Magnesium Ltd.

Nov. 26—**The Wealth of a Nation** a colour film presented through the courtesy of Abitibi Power and Paper Co. Ltd. Also a talk on the Geiger counter by Professor Kemp of the Houghton School of Mines.

Dec. 17—Annual Meeting.

Toronto Branch

The Executive held fourteen meetings with an average attendance of ten.

Regular meetings of the Branch are listed below, with attendance given in brackets.

Jan. 24—Ladies' Night. (114)

Jan. 28—Students' Night. (Joint with Junior Section). **Atomic Engineering** by A. S. Halpenny. **Characteristics of Kodachrome Film** by T. L. Faul. **The Heat Pump** by Richardson. **The Employees' Attitude to Management** by MacKenzie. **Solar Energy** by Hill. (62)

Feb. 26—**Load Testing Applied to Airport Runway Design,** by Dr. Norman W. MacLeod. (95)

Apr. 27—Annual Meeting—**Talk Tracks That Turn,** by Mr. Geo. L. Long. (67)

May 17—Collective Bargaining for Engineers — General Discussion. (67)

Oct. 1—President's Visit. (90)

Oct. 15—Exhibit of Work of Robert Maillart.

Oct. 28—**Growth of Hydro Related to Economic Development of Ontario,** by Mr. R. L. Hearn, (215)

Nov. 25—**Developments in Building Research,** by Mr. R. F. Legget. (200)

Junior Section

During the past year and a half the Junior Section has been handicapped by the loss of its executive members to the Senior Section. Suggestions were even made that the Junior Section should be disbanded until a group of recent graduates rallied to the cause and undertook to guide the section through a year's activities. In October 1948 another new executive was appointed comprising some members of the previous executive and some new members. It is their object to advance the work of the section and set up machinery for proper elections so that the general membership may participate more fully in governing its activities.

Seven executive meetings and the following general meetings were held in the past year. (Attendance in brackets.)

Jan. 28—Students' Night. (62)

Mar. 18—Annual Meeting. **Pre-Stressed Concrete** by E. A. Hesketh. (125)

Nov. 11—**Some Aspects of Atomic Energy** by D. H. W. Kirkwood; **Communication in Field and Industry** by G. F. C. Weedon; and **Application of Law to Engineering** by F. R. Duncan. (100)

Dec. 13—**Symposium on High Speed Flight** by Russell Bannock and Dr. Joslyn Rogers Jr.

Vancouver Branch

Jan. 21—Speaker: Dr. Lyle G. Trorey, M.E.I.C., **Air Surveys and Mapping.**

Feb. 18—Students' Night. Student Chairman—Alan Fletcher. Speakers: John McPhail. **Three Methods of Road Surfacing;** Don Jamieson, **The Erection of the Pine River Bridge;** Robin Fjarlie, **An Oceonographic Model of Alberni Harbour.**

Mar. 17—Speaker: J. A. Walker, **Town Planning in Vancouver.**

Apr. 21—Speaker, J. B. Alexander, Forest Products Laboratory, University of B.C.; **Wood as an Engineering Material.**

May 13—President's Visit. Lieutenant-Colonel L. F. Grant, President; L. Austin Wright, General Secretary.

June 16—Speaker: Huet Massue, **A Statistical Analysis of the Tennessee Valley Authority.**

July 28—Visit—B.C. Research Council.

Aug. 18—Visit — B.C. Sugar Refining Company.

Sept. 15—Ladies' Night. Technicolour Film—**The Land of Flowers and Missions — (California).** Photographed and shown by Oscar Olson. Address: **The Electric Home of the Future**—Bruce Donaldson, Canadian General Electric. Technicolour Film—**Travels Through Mexico** — Photographed and shown by Oscar Olson.

Oct. 20—Speaker: Frank Kerry, **Tonnage Oyxgen.**

Nov. 20—Annual Meeting.

Dec. 15—Dinner Meeting, Past Chairmen.

Victoria Branch

During the year there were five meetings of the Executive and eight general meetings including the Annual Meeting of December 19, 1947 and the Presidential Dinner May 17, of this year. President Grant and the General Secretary Dr. Wright were luncheon guests of the Executive on May 17, when an informal discussion was carried on relative to Institute affairs, while at the same time the ladies were entertained by the wives of the executive. A list of the meetings with speakers and subjects follows:—

Dec. 19—Annual Meeting and dinner. Election of officers for 1948 and other related business, followed by address of Chas. T. Hamilton, his subject being **The Victoria Memorial Arena.**

Jan. 16—Address by H. C. Anderson, Chief Engineer, Department of Public Works, Province of British Columbia on the subject **Our Highway System.**

Feb. 13—Address by D. G. Geiger, Engineer of the Western Area of the Bell Telephone Company of Canada. Subject, **The Joint Use of Poles by Electric Power and Communication Utilities.**

Mar. 19—Address by J. R. Johnston. Assistant Forester of the British Columbia Forest Service. Subject **Fire Weather and Forecasting in British Columbia.**

Apr. 16—Address by Lt.-Col. G. S. Andrews, M.B.E., Air Surveys Engineer, Government of British Columbia. Subject **Wartime Air Survey Developments Applied to the Mapping of British Columbia.**

May 17—Branch reception and dinner in honour of Lt.-Col. L. F. Grant, President of the Institute, and Dr. L. Austin Wright, General Secretary. Mrs. Grant and Mrs. Wright attended the dinner and members wives were also in attendance. Col. Grant's address dealt with problems of great importance to the Engineering Profession in Canada.

June 1—A number of Engineers from this Branch attended the Annual Meeting of the Institute at Banff. S. H. Frame was elected to Council.

Oct. 22—Address by Dr. F. W. Gray, late Assistant General Manager of Dominion Steel and Coal Corporation. Subject **Mining Coal Under Sea** with special reference to the mines in Cape Breton, Nova Scotia.

Nov. 19—Address by H. D. Dawson, Municipal Engineer, Municipality of Saanich, Vancouver Island, on **Problems and Experiences in Municipal Engineering, Including Preliminary Studies in the Gorge Canal Project.** At this meeting the officers of the Branch for 1949 were nominated.

Meetings were well attended and with the increase of twenty-seven members during the year, there should be added interest in Branch Affairs.

Winnipeg Branch

During the year 1948 the executive of the Branch held 10 meetings, the average attendance being 11.

The following general meetings of the Branch were held. with the attendance figures shown in brackets:—

Jan. 8—Annual meeting of the Branch —addressed by T. N. Miller, Superintendent of Pole Preservation, Manitoba Power Commission, on the subject of **Wood Preservation.** (54)

Feb. 19—**Design & Construction of a Hydro Electric Development** by R. E. Heartz, Vice-president and Chief Engineer. Shawinigan Engineering Co. (107)

Mar. 18—**Sanitary Engineering Developments in Canada** by Dr. A. E Berry, Director, Sanitary Engineering Division. Ontario Department of Health. (73)

Apr. 8—**Some Problems in the Development and Administration of**

Noturol Resources by D. M. Stephens, Deputy Minister of Mines & Natural Resources, Province of Manitoba. (53)

Apr. 26—Luncheon meeting with President L. F. Grant. (72)

Sept. 23—**A Stotistical Anolysis of the Tennessee Volley Authority** by Dr. Huet Massue, Statistical Engineer, Shawinigan Water & Power Co. (80)

Nov. 19—Joint meeting with I.R.E.—**Modern Electronic Educotion** by E. L. Palin, Director of Electronic Education, Ryerson Institute of Technology, Toronto. (79)

Dec. 10.—Joint meeting with the Engineers' Wives Association; Dr. A. H. S. Gillson, President of the University of Manitoba, addressed the gathering. (130)

Dec. 16—**New Applicotion of FM & Television** by W. H. Holroyd, Electronics Division, Canadian General Electric Co. A film **Jet Propulsion** was also shown. (85)

Student Section

Oct. 25—**Aims & Activities of the E.I.C.** by T. E. Storey, Chief Engineer, City of Winnipeg Hydro Electric System. (57)

Nov. 22—**Noturol Resources of the Proirie Provinces** by D. M. Stephens, Deputy Minister of Mines & Natural Resources, Manitoba. (54)

Electrical Section

During the year 1948 the Electrical Section held eight General Meetings as follows.

Jan. 16—Mr. Paul M. Ross, Superintendent of the High-Voltage Laboratory of the Ohio Brass Co. at Barberton, Ohio, gave a paper on **Burning of Wood Structures by Leokage Currents** (illustrated). (72)

Jan. 30—Mr. G. A. Muir, Special Service Engineer of the Manitoba Telephone System, spoke on **Mobile Telephone Service** (demonstration). (250)

Feb. 12—Annual Meeting of the Section. Following reports by Mr. D. A. McCuaig retiring chairman and Mr. L. A. Bateman, Secretary, Mr. M. D. Young the incoming chairman took the chair. Speaker for the evening was Mr. M. B. Mallett, chief engineer of the English Electric Co., who spoke on **Progress in Transformer Design.** (51)

Mar. 4—Mr. W. D. Garbutt, Technical Sales Manager of the Hackbridge and Hewittic Electric Co. of Canada, gave a paper on **Sixty Yeors of Rectifier Development** (illustrated). (73)

Mar. 12—Annual Dinner and Dance at the Marlborough Hotel, Winnipeg. Mr. H. Moody of Moody & Moore, architects, spoke on **Modern Moteriols in Construction.** (133)

Apr. 15—Mr. H. R. Sills, Senior Assistant Engineer of the Motor and Generator Division, Canadian General Electric Co., gave a paper on **Turbine Driven Generators.** (46)

Oct. 7—Mr. R. Noonan, General Manager of the Pioneer Electric Co., spoke on **Tronsformer Manufocture** (Plant Visit). (96)

Dec. 2—Mr. R. H. Andrews of the Canada Wire and Cable Co., gave a paper on **High Voltoge Coble-Development and Conodion Instollotions** (illustrated). (48)

Samuel Fortier—Pioneer in Soil Mechanics

(*Continued from page 68*)

does not bear the stamp of his counsel. He may well be said to be one of the group of engineers and scientists which enabled the West to take the place which it now occupies in relation to the agricultural economy of the United States.

Important as were his contributions to irrigation, Dr. Fortier's early studies in the field now called Soil Mechanics make him an important figure in the annals of North American engineering. His early paper to the Canadian Society of Civil Engineers contained the principal record of the clear and incisive thinking which he devoted to the engineering properties of soils, long before their importance had been generally recognized.

This paper, entitled " The Storage of Water in Earthen Reservoirs ", contains a useful discussion of soil sampling. The mechanical analysis of soils is naturally stressed, and though Dr. Fortier was limited to the practice of sieving, he suggests analysis of the finer particles might be done by means of mechanical soil separators like those invented by Drs. Hilgard and Osborne. He saw the importance of the void ratio in soils, and made ingenious attempts to determine this by dropping soil from a standard height into water.

Perhaps the most surprising feature of Dr. Fortier's work was his clear appreciation of the importance of compaction in the use of soils for the construction of earth dams. He uses the term " clay concrete " in discussing the construction of earth dams. The following statement shows clearly his logical approach to this important branch of soil work; " Since there are serious objections to each class of (soil) materials when used alone, the writer has made a few tests of compactness with various mixtures . . . which he has termed ' clay concrete ', the object always being to mix sufficient silt or clay with the sand to more than fill all the open spaces in the sand, and to mix with the gravel a sufficient volume of sand and silt or clay to more than fill all the open spaces in the gravel."

Dr. Fortier describes the construction of a hydraulic fill dam at Ogden, Utah, describing it as one of the first dams to be built with such careful control of the soil materials. He states that " earth deposited under water is free from the greater part of the air found in the open spaces." And he adds that " earth containing grains of different sizes packs better under water than in air."

With true scientific detachment Dr. Fortier states very clearly the limitations of the scientific studies which he made of soils. He suggests that at the time when he wrote, " knowledge of soil physics was too meagre to attempt of limiting the amounts of materials used to the same extent as one would in the construction, for example, of a railway bridge, or a roof truss." In view of his experiments, Dr. Fortier must have followed with unusual interest the study and recent growth of the new science of Soil Mechanics. He must have been encouraged that his early predictions were being at last confirmed, and he must frequently have smiled as he recalled the following words from his early paper—which even today are so meaningful: " For twenty years and over men have been testing the physical qualities of iron, steel, cements . . . Reservoir embankments on the other hand have been built in most instances without the requisite knowledge, upon mere guesswork, brawn and not brain predominating."

From Month To Month

News of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

Another Engineer Appointed to Cabinet Rank

Announcement of the appointment on November 15th of another engineer, the Honourable Robert H. Winters, to the Federal Cabinet, as Minister of Reconstruction and Supply, will be welcomed by all members of the engineering profession. Mr. Winters takes over one of the portfolios previously held by the Right Honourable C. D. Howe, namely the functions of the Department of Reconstruction and Supply dealing with Housing and with the Reserve of Public Construction Projects. He also becomes Chairman of the National Film Board and assumes direction of the Canadian Government Travel Bureau.

Mr. Winters, who at 38 is the youngest member of the Cabinet, was born in Lunenburg, Nova Scotia. After obtaining the degree of B.A. at Mount Allison University in 1931, he continued his studies in engineering at the Massachusetts Institute of Technology, receiving the degrees of B.Sc., and M.Sc. Specializing in communications, he was employed as engineer by the Bell Telephone Laboratories at New York, the New York Telephone Co. and later with the Northern Electric Co. in Montreal, in connection with development and manufacturing. He joined the reserve army in 1937 with "B" Corps Signals, R.C.C.S. in Montreal and in 1942 went active as Captain in the Royal Canadian Ordnance Corps. Later he was transferred to the Royal Canadian Electrical and Mechanical Engineers, where he was concerned with the operation of all the Corps' workshops in the Dominion. In 1944 he saw service in connection with the establishment of R.C.E.M.E. workshops in Britain,

The Hon. R. H. Winters

Belgium, and Holland. He still holds the rank of Lieut.-Colonel in the Reserve of Officers.

He was elected to the House of Commons in 1945, representing Queens-Lunenburg, N.S. During the 1948 session he served as Parliamentary Assistant for Revenue Minister, the Hon. Dr. J. J. McCann, later taking over similar duties with the Minister of Transport, the Hon. Lionel Chevrier. On the retirement of the Rt. Hon. J. L. Ilsley from the government last summer the need for Maritime representation in the Cabinet called for a member of Parliament from a Nova Scotia riding. As an already experienced member of the "Junior Cabinet", Mr. Winters was chosen to head the Ministry of Reconstruction and Supply at the time the Right Honourable Louis St. Laurent succeeded to the office of Prime Minister.

With the continuing emphasis on housing, and the increasing importance attached to the preparation of the Reserve of Public Projects in the event of the need arising to bolster employment, should a recession threaten, the appointment of an engineer to this important portfolio is a particularly fortunate choice. Through his connection with the Canadian Travel Bureau he will also be directly concerned with the forthcoming cooperation between the Dominion and the Provinces for the completion of the Trans-Canada Highway.

Prairie Provinces Water Board

In the papers which were delivered at the Prairie Water Problems session at last year's annual meeting and were published in the September issue of the *Journal* most of the authors indicated the urgent need for the formation of a Prairie Provinces Water Board.

It was during the Banff meeting that announcement was made from Ottawa that such a board was to be formed and a telegram was sent by the Institute's Committee on Prairie Water Problems indicating the committee's belief that the decision would meet with wide approval.

The Prairie Provinces Water Board met for the first time in

Regina on November 1, 1948, to begin its studies of the interprovincial streams of Manitoba, Saskatchewan and Alberta. The members are: L. B. Thomson (chairman), director of P.F.R.A., Regina; N. Marr, M.E.I.C., acting controller, Dominion Water and Power Bureau, Ottawa; D. M. Stephens M.E.I.C., deputy minister, Manitoba Department of Mines and Natural Resources, Winnipeg; G. N. Munro, M.E.I.C., chief engineer, Saskatchewan Water Rights Branch, Regina; B. Russell, M.E.I.C., director, Alberta Water Resources Branch, Edmonton. W. M. Berry, M.E.I.C., hydraulic engineer, P.F.R.A., Regina, has been appointed acting secretary to the Board.

Attention Again Called to Low Salaries

Attention was directed to the currently critical shortage of engineers in public service, and the reasons therefor, in an address by James L. Wickwire, M.E.I.C., Assistant Chief Engineer, Department of Highways and Public Works of Nova Scotia, delivered at the Canadian Good Roads Association Convention at Digby last September and published in the November 1948 issue of *Roads and Bridges.* Mr. Wickwire's remarks referred primarily to highway engineers, but were intended to include, and apply to, nearly all engineers in public service.

Lack of competent engineers in highway work, he said, was assumed to be a temporary condition due to the war, but it is only now becoming evident in its real proportions. Less than three per cent of the engineering graduates from 120 American engineering colleges polled last year, expressed " an interest " in highway work, not even an intention to engage in such employment.

The typical Resident Engineer, who directs the work of much more highly paid contractors' superintendents, received $2400. a year in 1939. Today, with the cost of living up some 60 per cent, and the income tax a serious matter he receives $3200., an increase of 33 per cent. He should be receiving $5000. The Division Engineer, who has under him a large organization consisting of engineers, superintendents, foremen and equipment, and directs the maintenance of from one to two thousand miles of highway costing up to $2 millions a year, received a salary of $3000. in 1939. Today he gets $3700. or an increase over 1939 of 23 per cent, where he should be receiving up to $6000., in order to attain the same modest standard of living he had in 1939. The cost of living index would have to be pushed back from its present peak of 160 to well below 100 before the engineer in public service would be bailed out of his present predicament.

Thus we expect to get a first quality product in a resident or division engineer, without paying for it and as Mr. Wickwire points out even a first quality product like a hunk of prime western beef gets more consideration. A few years ago it fetched about 30 cents a pound and is now reaching for $1.00. Furthermore the engineer has to eat the beef.

For far too long engineering services have not been properly appreciated or adequately rewarded. During the war there was a vast demand for technical and engineering services and this need has been growing ever since. The engineer is today being valued more highly than ever by all forms of business, except the highway business, which is one of the biggest businesses of all, but through failure to compete with rival engineering fields in salaries and other advantages, highway departments are not attracting the engineer.

Perhaps after all the engineer would have been wise to include his group in one of the giant labor organizations. He has not done so, because his code of conduct and the nature of his thinking and work creates an instinctive dislike of resorting to strikes, and to tactics employed or threatened by those organizations. He is beginning to wonder, though, if he may not after all be forced to adopt some form of concerted action to hasten the recognition of his value to the community. He observes the marked increase since 1939 in the pay of bricklayers, and carpenters etc., and even in the pay of common labour and he knows by what methods these increases were brought about.

The author's remarks refer to a question to which the Engineering Institute has directed attention on many occasions in the past. Because of failure to make the proper adjustments in salary scales, our highway systems will suffer, our road transportation will cost us more dearly, and our tourist business " take " will diminish. Similar results already are, or will be, observed in other categories of public service. The Engineering Institute heartily concurs in Mr. Wickwire's remarks and compliments him on his timely reference to the issue.

British Publications for Canada

For many years it has been a part of Institute policy, to secure for members, the publications of other societies at special prices. In *The Engineering Journal* of November 1948 was printed a list of publications for which such arrangements have been made already. It is now possible to include in the list the *Journal of the Institution of Civil Engineers.* This publication sells to non-members at 5s-0d per copy but is offered to members of the Engineering Institute, post free, for 3s-6d.

The *Journal* is published monthly from October to May—or eight times a year. Subscriptions in Canada should be sent to the Headquarters of the Institute at Montreal.

It is part of these agreements that the publications of the Engineering Institute be offered to members of the co-operating societies at the same price as is charged our own members. In this way *The Engineering Journal* has found its way into distant places. The inter-change of publications between societies with similar purposes in different parts of the world is good for the profession.

Canadian Soil Mechanics Conference

Canadian workers in the field of soil mechanics recently assembled in Ottawa under the auspices of the Associate Committee on Soil and Snow Mechanics of the National Research Council. This was the second conference of its kind and it brought together practically all those actively connected with this new branch of engineering activity. About sixty engineers and scientists from Nova Scotia to British Columbia met for two days to discuss their common problems.

The Second International Conference on Soil Mechanics and Foundation Engineering was held in Rotterdam, Holland, during the summer of 1948. At this great gathering were over five hundred delegates from all parts of the world and the record of the technical papers presented will fill seven large volumes. The Canadian delegates were Dean R. M. Hardy, M.E.I.C., of the Faculty of Applied Science, University of Alberta, Edmonton; Dr. N. W. McLeod of the Department of Asphalt Technology, Imperial Oil Ltd., Toronto; F. Lionel Peckover, M.E.I.C., Division of Building Research, National Research Council, Ottawa; Robert Peterson, M.E.I.C., soil mechanics engineer, P.F.R.A., Regina; and D. C. Watt of the Hydro Electric Power Commission of Ontario; and these men were in attendance at the recent Ottawa meeting to describe the impressions they had gained at Rotterdam. In this way it was possible for all Canadian workers in this field to benefit from the world-wide fund of information assembled at the Rotterdam meeting. Many special Canadian problems caused by the various types of soil which are found in different parts of the Dominion were discussed against the background of these international presentations.

At the Rotterdam meeting, an International Society of Soil Mechanics and Foundation Engineering was set up. At the recent Ottawa meeting, the first steps were taken towards the formation of a National Canadian Group which will be a constituent part of the new International Society. Mr. R. F. Legget, director of the Division of Building Research of the National Research Council was elected to continue as Chairman of the National Group.

Meeting of Building Officials

In response to numerous suggestions from building officials throughout Canada, and in order to provide a means for full discussion of building codes, with special reference to the start of further work on the National Building Code and related publications, a meeting of building officials is to be held in Ottawa on the 28th of February and the 1st of March, 1949, under the auspices of the Associate Committee on the National Building Code.

The purpose of the meeting is to bring together for discussion of mutual problems, those municipal officials who are directly concerned with the enforcement of local building regulations, and architects, engineers and contractors who are interested in their use.

The meeting, which will be held in the Sussex Street Building of the National Research Council, will convene at 10 a.m. on Monday the 28th of February, 1949, and admission will be by invitation only. There will be no fees to be paid in connection with the meeting or its published records, and luncheons served during the meeting will be complimentary.

Engineers, architects and others interested in building regulations are encouraged to ask for invitations. They can be obtained from the above-mentioned Committee, Division of Building Research, N.R.C., Ottawa.

News of Other Societies

The Fifty-Second Royal Netherlands Trade Fair at Utrecht will be held from March 29 through April 7, 1949. Canadian businessmen who wish to visit this fair may obtain all information from Mr. Jan Overweel, 86 Adelaide Street East, Toronto, Tel. Plaza 1010. Mr. Overweel is the Trade Fair representative in Canada.

The **American Chemical Society** has circulated advance programme notes on its 115th National Meeting in San Francisco, March 28 to April 1, 1949. The Fairmount Hotel will be general headquarters of the meeting.

The office of the American Chemical Society is at 60 East 42nd Street, New York 17, N.Y.

The 1949 Annual Meeting of the **Canadian Institute of Mining and Metallurgy** will be in Montreal. The Windsor Hotel will be headquarters, and the dates April 25 to 28.

The Montreal office of C.I.M.M. is at 811 Drummond Bldg.

The Chemical Institute of Canada announces the scheduling of the 1949 Annual Meeting for May 29 to June 1, at Halifax, N.S.

General manager and secretary of the Chemical Institute is Mr. Garnet T. Page, 18 Rideau St., Ottawa.

The 52nd Annual Meeting of the **American Society for Testing Materials** will take place June 27 to July 1, 1949, at Hotel Chalfonte-Haddon Hall, Atlantic City, N.J.

Information can be obtained from the Society, 1916 Race St., Philadelphia 3, Pa.

A schedule of 1949 meetings of the **American Institute of Electrical Engineers** includes: the South West District Meeting, Dallas, Texas, at the Baker Hotel, April 19 to 21; the Summer General Meeting, Swampscott, Mass., at the New Ocean House, June 20 to 24; the Pacific General Meeting, San Francisco, Cal., at the Fairmont Hotel, August 23 to 26; and the Midwest General Meeting, at the Netherland Plaza Hotel, Cincinnati, Ohio, October 17 to 21.

An A.I.E.E. Conference on Industrial Application of Electron Tubes is arranged for April 11 and 12, 1949, at the Hotel Statler, Buffalo, N.Y.

A.I.E.E. headquarters are at 33 West Thirty-ninth St., New York 18, N.Y.

The Spring Meeting of the **Society for Experimental Stress Analysis** will be held at Hotel Statler, Detroit, Mich., on May 19 to 21, 1949.

Inquiries should be addressed to the Society, P.O. Box 168, Cambridge 39, Mass.

The 1949 Convention of the **Canadian Section of American Water Works Association** will take place April 25 to 27 at the Chateau Frontenac in Quebec City.

Secretary-treasurer of the Section is Albert E. Berry, of the Ontario Department of Health, Parliament Bldg., Toronto, Ont.

The Seventeenth Annual Meeting of the **American Society of Tool Engineers** will be held March 10, 11 and 12, 1949, in Pittsburgh, Pa.

Further information can be obtained from Jno. M. Cannon Associates, Inc., 523 Penobscot Bldg., Detroit 26, Mich.

Correspondence

INSTITUTION OF NAVAL ARCHITECTS

10, Upper Belgrave St., London S.W. 1.

December 22, 1948.

The General Secretary,
The Engineering Institute.

It sometimes happens that important foreign members of this Institution come over here on business, or for a short visit. On such occasions, the Council would be glad to hear, if possible, beforehand, in case it may be possible for the President or other Members of Council to meet them and, if practicable, to offer hospitality.

I am, therefore, asked to write to you unofficially, in the hope that you may be able to let it be known that, whenever any prominent member of this Institution or other important person connected with shipbuilding is intending to pay a visit to this country, the Council would be glad to have the opportunity of knowing when he will be in London. Perhaps you would be able to send me a brief letter beforehand on these occasions?

Yours faithfully,

Captain (S) A.D. Duckworth, R.N.
Secretary.

Personals

Notes of the Personal Activities of Members of the Institute

F. C. Askwith, M.E.I.C., of the staff of the city of Ottawa, has retired as the city's commissioner of works, after seventeen years in that position. He had entered the service of the municipality in 1907, and worked as chief draughtsman, sidewalk engineer, roadway engineer and deputy city engineer before his appointment as Commissioner.

W. J. W. Reid, M.E.I.C., recently elected president of the Association of Professional Engineers of Ontario, is president of the Otis-Fensom Elevator Company Limited, Hamilton, Ont.

Mr. Reid is active in professional, academic, and business associations. He is vice-president elect of the Engineering Institute, and a member of the Executive Committee, Canadian Manufacturer's Association, Hamilton-Brantford Branch. As a member of the Canadian Standards Association, Mr. Reid took a leading part in the framing and promotion of a Standard Elevator Safety Code for Canada.

E. V. Buchanan, M.E.I.C., has been elected first vice-president of the Association of Professional Engineers of Ontario. He is general manager of the London Public Utilities, London, Ont.

W. H. M. Laughlin, M.E.I.C., of Proctor, Redfern and Laughlin, Toronto, Ont., has been named second vice-president of the Association of Professional Engineers of Ontario.

W. M. Scott, M.E.I.C., who since 1920 has been chairman of commissioners, Greater Winnipeg Water District, and since 1937 also chairman of commissioners, Greater Winnipeg Sanitary District, retired from that position on January 31, 1949.

At the request of the Administration Boards, however, he will continue as one of three Commissioners, all of whom will serve on a part-time basis.

W. J. W. Reid M.E.I.C.

P. B. Stroyan, M.E.I.C., has been elected president of the Association of Professional Engineers of British Columbia. He is superintendent of the Vancouver Parks Board, and an engineering graduate of University of British Columbia. Mr. Stroyan is the immediate past-chairman of the Vancouver Branch of the Engineering Institute.

D. D. Morris, M.E.I.C., of the Consolidated Mining and Smelting Company, Trail, B.C., was recently appointed general superintendent of the research and development division of the Company. Previously he was general superintendent of the Alberta Nitrogen Department, Cominco's chemical operations in Calgary.

Mr. Morris first joined the Company's staff in 1928 as an assayer. He transferred in 1936 to research in the chemical and fertilizer plants, and in 1940 became assistant general foreman of the ammonia group. In 1941 he was appointed superintendent of the ammonia plant at the Alberta Nitrogen Department at Calgary, and he held this position until his appointment to general superintendent there in July, 1943.

R. S. Woodford, M.E.I.C., recently was appointed general superintendent of the Alberta Nitrogen Department of Consolidated Mining and Smelting Company of Canada, Limited.

Mr. Woodford joined the Company as a prospector in 1927 soon after his graduation from the University of Alberta, where he received a B.Sc. degree

D. D. Morris, M.E.I.C.

in honors physics. He worked as assayer, shift boss, foreman and assistant superintendent of several plants at Trail previous to his appointment in 1946 as staff supervisor of the personnel division. In January, 1947 he was appointed assistant general superintendent of the Alberta Nitrogen Department, which position he leaves to take up his new duties.

C. D. Wight, M.E.I.C., was named Commissioner of Works for the City of Ottawa early in January. A Queen's University graduate, class of 1928, he joined Ottawa's engineering staff in 1932. He received appointments as assistant roadway engineer and city surveyor, and as assistant waterworks engineer, and was made assistant commissioner of works in 1942. He has been chairman of the Advisory Council of the Ottawa Area Planning Board.

James S. Cameron, M.E.I.C., vice-president of the Northern Electric Company, was elected mayor of Westmount, Que., in January, 1949.

Mr. Cameron was born in Stellarton, N.S., but studied mechanical engineering in Montreal, graduating from McGill University in 1908. He joined Northern Electric Company here in 1910 as a factory engineer. When the Northern Electric and Manufacturing Company and Imperial Wire and Cable Company, Limited, were amalgamated in 1914, under the name of Northern Electric Company Limited, Mr. Cameron became the company's first superintendent of plant. He was subsequently superintendent of the cable shop, assistant general superintendent, telephone division manager, supervisor of manufacturing, and assistant general manager of manufacture. His appointment as vice-president (manufacture) was announced in December last.

J. S. Cameron, M.E.I.C.

Rene Dupuis, M.E.I.C., chief engineer of the Beauharnois Light, Heat and Power Company, Beauharnois, Que., was recently appointed to the board of the Quebec Hydro Commission.

Mr. Dupuis, a past-chairman of the Quebec Branch of the Engineering Institute, has been with the Beauharnois Company since 1947. He had previously been on the faculty of Laval University.

A. B. Normondin, M.E.I.C., vice-president of the Provincial Electricity Board, Quebec, Que., was recently appointed technical adviser to the Provincial Government on hydraulic resources and hydro electric developments.

Colonel C. R. Boehm, M.E.I.C., is acting director of mechanical engineering, at Army Headquarters, Ottawa.

A graduate of University of Toronto in 1929, in civilian life until 1939 his work was in mining, lastly as mine manager for Denison Nickel Mines Ltd. He was appointed an ordnance mechanical engineer in the R.C.O.C. then, but transferred to the R.C.E.M.E., in 1944.

Matthew Balls, M.E.I.C., has been named assistant vice-president of the Shawinigan Water and Power Company, Montreal. He will continue to direct operations of the water resources department, of which he has been manager since 1941.

Mr. Balls began his career as an engineer on railway survey and construction in British Columbia, the western states and Alaska. In 1916 he became an hydraulic engineer in the Dominion Department of the Interior, and for 10 years was engaged in irrigation and water power surveys in B.C. and the Yukon. He joined the Shawinigan Company in 1926.

George A. Cowan, M.E.I.C., heads the new Edmonton Branch of the Railway and Power Engineering Corporation Limited.

Mr. Cowan has been with the Corporation since 1941 as a sales engineer located at the Winnipeg Office. He graduated from the University of Saskatchewan in mechanical engineering, and is a member of the Association of Professional Engineers of Alberta, and of the Canadian Institute of Mining and Metallurgy.

E. G. Cullwick, M.E.I.C., has been appointed professor of electrical engineering at University College, Dundee, Scotland.

Professor Cullwick was educated in England and was appointed assistant professor of electrical engineering at the University of British Columbia in 1928. He went to the University of Alberta in 1937 as professor and head of the department of electrical engineering.

He was on war service with the Navy in 1942 to 1946 with the rank of commander, and was awarded the O.B.E. for his work in organizing the electrical engineering branch of the service. He has been director of electrical research for the Defense Research Board in Ottawa since 1946.

Walter K. Dow, M.E.I.C., is now in private practice as a consulting electrical engineer in Montreal. He was formerly with the Canadian Comstock Co. Ltd., Montreal. Mr. Dow is a graduate of University of Toronto, class of 1937.

R. H. Garrett, M.E.I.C., has been appointed distribution designer in the electrical division of the B.C. Electric Company at Vancouver. He was formerly transit research assistant in the transportation division of the Company, which he joined in 1947. He had previously been in engineering work in Vancouver, after serving for several years in Canada and overseas with the R.C.A.F.

J. M. Hopkins, M.E.I.C., has recently been appointed to the application engineering division of Canadian General Electric Company.

Mr. Hopkins graduated in electrical engineering from Nova Scotia Technical College in 1942. He received C.G.E.'s "Test" training and was for a time with the Company's engineering service department. After service during the war in the R.C.N. as a lieutenant, he returned to Nova Scotia Technical College for two years as an assistant professor.

Donald L. MacKinnon, M.E.I.C., was appointed some months ago managing director of Bayside Company Ltd., Campbellton, N.B. He was previously superintendent of Foundation Maritime Ltd., at Summerside, P.E.I. He had been with the Foundation Company of Canada Ltd., Montreal, from the time of his graduation in 1939 from the University of New Brunswick, and he rejoined the Company in 1946 after service with the R.C.A.F. He then worked in Toronto as manager of the building department of Foundation Co. of Ontario Ltd. He went to Summerside in 1947.

John J. Rowan, M.E.I.C., of Imperial Oil Limited, has been transferred to the Sarnia section of the Company. He is in the engineering and development division there. He joined the company in 1936 and has been located in Montreal. He had graduated in 1935 with a B.A.Sc. degree in civil engineering from Ecole Polytechnique, Montreal, and in 1936 had received a B.Sc. degree in mechanical engineering from Massachusetts Institute of Technology.

Matthew Balls, M.E.I.C.

Lyle G. Trorey, M.E.I.C., is chief engineer and technical director of Photographic Surveys (Western) Ltd., of Vancouver, B.C. Mr. Trorey resigned some time ago as director of Aerographic Surveys Limited, of London, England, and as chief engineer of Aero Surveys Ltd., Vancouver.

G. A. Antenbring, M.E.I.C., has accepted a position as sales engineer with the E. Long Company of Orillia, Ont. He was previously an industrial engineer with Canadian Johns Manville Company, Asbestos, Que.

C. W. Bickers, M.E.I.C., has rejoined the Ford Motor Company of Canada in Windsor, Ont., as a member of the industrial engineering department, in charge of plant layout. He left the Company in 1946 and has since worked with the Kaiser-Frazer Corporation. Willow Run, as supervisor of the plant layout department; with Mechanical Handling Systems, Detroit, Mich., as a design engineer; and most recently with the Link-Belt Company in Chicago, Ill., as a design engineer on conveyors and material handling.

Jacques Leroux, M.E.I.C., has been named assistant to the Montreal district engineer of the Marine service of the Deırtment of Transport. A graduate of cole Polytechnique, Montreal, class of 939, he was for a time in the Depart-ent of Public Works of Canada be-re going to the Department of Trans-ort as an engineer on construction of ıe airport at Mont Joli, Que. He rved overseas with the R.C.E., was emobilized in 1945 and returned to the Department.

. J. Morrow, JR.E.I.C., has been awarded master's degree in chemical engineer-ıg by Princeton University. He re-eived a B.Sc. in 1947 from McGill Uni-ersity, Montreal.

Visitors to Headquarters

Marley Sparling, Toronto, Ont., director of the University of Toronto Alumni Federation, Toronto, January 7.

F. J. B. Humphrys, of Shawinigan Water and Power Ltd., Victoriaville, Que., January 7.

John Grieve, M.E.I.C., executive secretary, Canadian Institute of Steel Construction, Toronto, Ont., January 12.

James O'Halloran, M.E.I.C., chief engineer, Anglo Canadian Pulp and Paper Mills Ltd., Quebec, Que., January 27.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Colonel Alexander Macphail, M.E.I.C., former head of Queen's University engineering department died on January 13, 1949, in hospital in Kingston, Ont.

Born at Orwell, P.E.I., in 1870, Col. Macphail was educated at Prince of Wales College, P.E.I., and McGill University, Montreal, where he took honours in civil engineering. Following graduation from McGill, he took post-graduate studies at Heidelberg, Germany.

At the outbreak of the First World War, Col. Macphail became officer commanding the First Division Engineers. He had a distinguished military career, and was awarded the Distinguished Service Order in 1915 and the C.M.G. in 1919. He won the Belgian Croix de Guerre and was five times mentioned in dispatches.

He first went to Queen's University in 1904. He rejoined the staff in 1919 and was made head of the department of civil engineering. He held this post until 1939 when he retired. At that time he was awarded an honorary LL.D. degree. He held a similar degree from McGill University. He continued to edit the Queen's (Quarterly) Review until 1943. In 1939, Col. Macphail was awarded the Meritorious Medal for "meritorious contribution to the honour of the university."

Col. Macphail was also a poet and during his service overseas he met the late Rudyard Kipling. Of Colonel Macphail the famous poet said: "He built bridges with one hand and wrote poetry with the other." However the only poem Col. Macphail ever published was one entitled "An Unmarked Mound", which was included in "The Book of Sorrows" edited by his late brother, Andrew Macphail.

Col. Macphail was granted Life Membership in the Institute in 1939. He had joined as a Member in 1906.

J. M. Campbell, M.E.I.C., president of the Gananoque Electric Light Company, passed away in hospital in Kingston, Ont., on January 1, 1949.

Mr. Campbell, who was born at Perth, Ont., in 1862, was a pioneer in the electrical field in Canada. Before the turn of the century he was associated with the Royal Electrical Company, prior to the formation of the Canadian General Electric Company. He supervised installation of some of the first generating stations built in Canada. He also had charge of the installation of many of the earliest street railways in Ontario, Quebec and British Columbia. He was general manager of the Buffalo, Lockport and Rochester, N.Y. Railway Company from 1908 to 1911.

Mr. Campbell began his career operating a flour and feed mill in Verona, Ont. In 1884 he transferred the business and plant to Kingston, Ont., and later adopted the name of the Kingston Milling Company Limited. Becoming interested in electrical development, he organized the company which installed the first electric light plant in the city. The plant was enlarged twice and in 1893 was moved to the present site of the Public Utilities Commission. The city acquired the plant at that time, and the transfer of machinery was directed by Mr. Campbell, who acted as manager for a time. The Kingston Electric Street Railway was constructed about this time under his supervision.

For some time Mr. Campbell supervised the construction and operation of an electric railway in Vancouver, B.C. Returning to Kingston he acquired the Gananoque Light, Heat and Water Supply Company.

Mr. Campbell was actively interested in navigation and operated the steamers *St. Lawrence* and *Brockville* on the Bay of Quinte and the St. Lawrence River. In his youth he was an ardent yachtsman and was a past commodore and charter member of the Kingston Yacht Club. He was an ex-chairman of the board of governors of the Kingston General Hospital, and a member of the board of trustees of Queen's University for many years. He was at one time a member of the Board of Trade in Kingston and was president for one term.

Mr. Campbell joined the Institute in 1907 as a Member. He attained Life Membership in 1947.

Dr. Jardine McKerlie, AFFILIATE E.I.C., formerly of Toronto, Ont., who had been at Searcy, Arkansas, since early in 1948, passed away there on November 13, 1948.

Dr. McKerlie was for four years, during the recent war, production manager of the Ontario-Great Lakes division of Wartime Merchant Shipping Limited in Toronto, directing production of naval and cargo vessels. At the end of the war he became sales manager for John Inglis Company, a position he held until he left for Harding College, an industrial education centre at Searcy, Arkansas, to be director of an expansion programme.

Born at Glasgow, Scotland, in 1896, Mr. Kerlie studied at Royal Technical College there, and completed an apprenticeship in shipbuilding. After service with the Royal Artillery in World War I, he returned to W. C. Martin and Co., Glasgow, as superintendent of electrical contracts on naval ships. He was later an electrical contractor on his own account. He became manager of Milligan's Wireless Station, Glasgow, in 1921, but two years later he came to Canada and took a position as chief engineer of Webb's Bakery in Toronto. He was for a short time sales engineer and transportation analyst for Ward Motor Vehicle Co., Mount Vernon, N.Y. He then worked for eight years in the electrical refrigeration and air conditioning sales and engineering fields in Montreal and Toronto. In 1934 he became editor of "Refrigeration and Air Conditioning", a publication of National Business Publications Limited, Gardenvale, Que., and he remained at that post for 4 years. Meanwhile he remained active in construction work, and was executive vice-president of the Canadian Refrigeration and Air Conditioning Association from 1936 to 1938. In 1937 he was also chairman of the Canadian Engineering Standards Association Committee on the mechanical refrigeration code.

In 1938 he became director of training for Industrial Training Systems Limited, Toronto. However, a year later he joined the Department of National Defence and was appointed inspector of guns and carriages in the M.G.O. Branch. In 1940 he was made assistant chief ordnance mechanical engineer in the Branch, and at the end of that year went to the General Staff of the Canadian Army as director of technical instruction. In 1941 he transferred to Wartime Merchant Shipping Limited.

Dr. McKerlie joined the Institute as an Affiliate in 1942.

Major H. C. de Blois, M.E.I.C., who died at the Queen Mary Veterans Hospital, Montreal, on December 13, 1948, after a lengthy illness, was born at Tweed, Ontario, in 1913.

Major de Blois graduated from Royal Military College, Kingston, in 1934, and was commissioned in the Royal Engineers. He attended Cambridge University where he obtained B.A. and M.A. degrees with honors in mechanical sciences, and he followed engineering courses in 1936-37 at Chatham, England, as a Royal Engineer Army Officer.

Before and during the Second World War he served in Egypt and Malaya and was reported missing in the fall of Singapore, but was later reported safe in Ceylon. Retiring from the Royal Engineers on medical grounds resulting from his service, he returned to Canada in September, 1944, and served with the Chemical Control office of the Department of Munitions and Supply. He later held a position with the Canadian Industries Limited in Shawinigan Falls.

Major de Blois joined the Institute in 1946 as a Member.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

January 21st, 1948

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate *

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the February meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BAKER—JOHN JACQUES, of Montreal, Que. Born at Bristol, Eng. Feb. 11, 1916. Educ.: B.Sc., (Mech. Engrg.), Bristol Univ., England, 1936; special mech. engrg. apprentice, Metropolitan Vickers Electric Co., Ltd., Manchester, Eng.; 1938-39, planning asst., Fairchild Aircraft Co., Ltd., Longueuil, Que.; 1939-40, jr. designer, Harland & Wolff, Belfast, Ireland; 1940-46, F/Lt., Engr. Officer, R.A.F.; 1947-48, designer, Dominion Engineering Works, Lachine, Que.; 1946, (6 mos.), stress analyst, Canadair Limited, Montreal, Que.; designer of hydraulic and allied machines at Hydraulic Machinery Co., Ltd., Montreal, Que.

NEWS of the BRANCHES

Activities of the Twenty-nine Branches of the Institute and abstracts of papers presented at their meetings

Calgary

G. A. Hutton, jr.e.i.c.
Branch News Editor

T. M. Parry, m.e.i.c.
Secretary-Treasurer

A meeting of particular interest to members of the Calgary Branch of the Engineering Institute of Canada was held on November 18th, 1948, in the East Dining Room of the Hotel Palliser. The meeting was addressed by Dr. R. Hardy, dean of the faculty of applied science, University of Alberta, and Prof. Harle of the Electrical Engineering Department of the same University. The subject of the meeting was the application of electrosmosis to the mud slides which at present are occurring at a section of the North Calgary hillsides known locally as the Sunnyside Hill.

A section of hillside almost eight blocks long had shown signs of instability and evidence of slides occurring over a considerable period of years. Within the past three or four years a section about three blocks long has become increasingly active despite the fact that some drainage has been installed. Loose material from previous slides is behaving as a "mud flow" and has been encroaching steadily on the property and endangering the residences in this particular locality. Approximately forty thousand cubic yards of material is in an unstable condition in the mud flow. During the evening of May 8, 1948, the time of spring break, and following a heavy fall of rain and wet snow a new slide of catastrophic proportions occurred immediately west of the mud flow. About twenty thousand yards of material moved suddenly in this slide. Unless remedial measures are adopted it is to be expected that further slides will occur in the area.

Dr. Hardy enumerated the factors which have contributed to the condition, such as composition of the soil and climatic conditions, and he accounted for the increasing activity of the area. He told of the inquiry into the source of seepage water and consequent mud flow, and attributed responsibility to the general rise in ground water level which has occurred throughout the province in recent years.

Preliminary inspection and investigation indicated that extensive drainage works would be required to stabilize the bank and mud flows. The major problem in installing drainage works at this site is the difficulty of operating equipment on the soft wet material below the bank. Moreover the soil types involved tend to become water logged and are rather difficult to drain. For these reasons it was recommended that the process of "electrosmosis" be tried on the main mud flow. This involves forcing drainage by the passage of an electric current from the soil through anodes to well points acting as cathodes. This process also may be effective in controlling the direction of flow of seepage water, thus making it possible to prevent the sloughing of soft material into the excavation. It was realized that this adaptation to the particular circumstances at the Sunnyside Hill would be in the nature of a research project, but it had prospects of proving to be more economical than conventional drainage methods.

It is recommended that a graded sand and drainage blanket be installed over the whole area of the mud flow. The blanket must be placed below the frost line. In order to drain out the area to enable equipment to operate, it is recommended that the installation of a line of shallow well points be drilled along the upper side of the mud flow. This will provide sufficient drainage to permit equipment to operate on the slope. However, if necessary, additional stability may be provided by electrosmosis.

Prof. Harle followed Dr. Hardy with the explanation of electrosmosis, a natural phenomenon which was discovered in 1807. If a d-c voltage is applied along a capillary tube filled with liquid, displacement of the liquid along the tube occurs.

Prof. Harle's explanation of the theory and its application to the Sunnyside Hill was very well received by the members present. It was shown that there is a vast field of application for electrosmosis and other electrolytic phenomena in soil problems, but application or otherwise of these electrical methods will, as with all other engineering problems, be dictated by both the economic and scientific aspects of each problem.

Cornwall

G. G. M. Eastwood, M.E.I.C.
Secretary-Treasurer

T. B. Webster, M.E.I.C.
Branch News Editor

On January 11, the Cornwall Branch heard an illustrated lecture on **Processing Oils and Lubrication** given by Mr. G. E. S. Georges of the Canadian Oil Companies. About 50 were present including guests of the Cornwall Branch of the Chemical Institute of Canada who were welcomed by Chairman R. H. Wallace.

Mr. Georges has had 25 years experience in the petroleum industry. The first part of his lecture was covered by a technicolour film "Oil for Tomorrow" illustrating oil recovery operations from prospecting, discovery, and drilling, to the delivery of crude oil to the refinery. Scientific methods are used to guide in the location and estimation of crude oil pockets but Mr. Georges stated that still only one in seven wells are economically productive.

The speaker briefly described the refining processes in which the crude oil is distilled into its fractional components. Lubricating oils, constituting about 10 per cent of the crude oil, are treated to give desired properties by dewaxing, removal of impurities, and addition of compounds called additives. Additives are used to reduce pour point, increase resistance to oxidation, increase pressure resistance, and to give detergent properties to remove sludge. Mr. Georges spoke of greases which are dispersions of soap in oil. The properties of the grease depend on the element used in making the soap — the elements are aluminum, barium, sodium, calcium, iron, and lead. Barium and sodium give high resistance to heat, iron-based greases resist nitric acid, and lead greases withstand high bearing pressures.

In the discussion period after the lecture, Mr. Georges elaborated on oil well drilling operations. A short film, "Gasoline For Everybody", was also shown to illustrate refinery operations.

The speaker was introduced by H. W. Nickerson and thanked by G. M. Eastwood.

Edmonton

E. K. Cumming, M.E.I.C.
Secretary-Treasurer

A very successful dinner meeting of the Edmonton Branch of the Institute was held in Merrick's Embassy Room on Tuesday evening, November 23rd, with Vice-Chairman T. W. Dalkin presiding. Over eighty members attended to hear the guest speaker, R. M. Hardy, dean of the faculty of engineering at the University of Alberta, present a report on the Second International Conference on Soil Mechanics and Foundation Engineering. Dean Hardy was one of the five Canadian delegates to attend this Conference.

In his opening remarks Dean Hardy touched on his trip through Western Europe. He said that he had been privileged to visit the German cities of Hamburg, Hanover and Goettingen. In describing his trip through the Technical High School in Hanover the speaker remarked on the excellence of their soils and hydraulics laboratories and also upon the fact that the scientists at this school appeared to have lost touch with developments which had taken place in other countries during the war years. Another point of interest in the Dean's trip was the former Kaiser Willhelm Research Institute in Goettingen, which is now being re-organized as a centre for fundamental research in engineering, bio-chemistry, neurology and physics.

At the Conference itself, more than 400 papers were presented. The meetings were organized to provide discussion of the papers dealing with each of several major fields of interest in Soil Mechanics and Foundation Engineering. About 600 delegates attended from all parts of the world with the exception of Germany and Russia.

One of the most interesting points noted by Dean Hardy at the Conference and in his travels was that in European countries it is much more the general practice than in Canada to base the design foundations, roads and airport runways on the results of a complete soil survey.

Dean Hardy concluded his remarks by saying that in England and the Western European countries there were many more individuals and organizations specializing in the field of soil mechanics than in Canada, and that this work was being carried out not only by Government agencies, research stations and universities but also by specialized contracting firms. He stated that the Canadian delegates thoroughly enjoyed the time spent and that they were gratified with the enthusiasm with which the Canadian papers and ideas were received.

The speaker was introduced by Professor L. E. Gads of the University of Alberta and a vote of thanks which was enthusiastically endorsed by the meeting was moved by Bruce F. Willson.

❖ ❖ ❖

On the evening of December 15th, seventy-five members of the Edmonton Branch of the Institute and their guests were privileged to visit the plant of North-West Industries Limited.

Following a short business session, those in attendance were welcomed by B. W. Pitfield, M.E.I.C., general manager of he Company. Mr. Pitfield outlined briefly the operations carried out in the plant. He said that their main contract involved the fitting of ten Dakota aircraft with radar and communications equipment for the R.C.A.F. for training purposes. Mr. Pitfield introduced Mr. Robin Henry, who has been responsible for most of the design involved in this contract. Mr. Henry described briefly the equipment being installed in the Dakota aircraft, with many interesting remarks concerning the design problems involved.

The members were then shown through the plant where they had an opportunity to inspect the equipment as installed in a "mock-up" and in the aircraft. They were also able to examine other work being carried out in the plant which included the repair of many types of aircraft, the manufacture of Bellanca planes and the manufacture of truck and trailer bodies. The Bellanca planes, which are used in the North, were designed in this plant and many have given successful service in flying freight and passengers to the North country.

After seeing the plant the group returned to the company cafeteria and enjoyed an excellent lunch. A brief discussion ensued and a vote of thanks to Mr. Pitfield and his staff was moved by C. W. Carry.

Halifax

W. E. Jefferson, M.E.I.C.
Secretary-Treasurer

M. L. Baker, M.E.I.C.
Branch News Editor

In place of the regular dinner meeting in October, the members of the branch were invited to an inspection of the aircraft carrier, "*H.M.C.S. Magnificent*" at H.M.C. Dockyard. This inspection trip was made possible through the kind permission of the Commanding Officer, Commodore G. R. Miles, R.C.N. About 150 members availed themselves of the opportunity to see at first hand the many interesting features of this aircraft carrier.

Before the inspection proper began Commander (E) R. Balfour, R.C.N. outlined some of the functions of this type of naval craft. Following this talk the members gathered into small groups and under courteous and competent guides were conducted about the ship. A much appreciated social period was enjoyed after the tour.

❖ ❖ ❖

On November 8, the Halifax branch of the Institute and the Association of Professional Engineers of Nova Scotia were hosts to the graduating class of the Nova Scotia Technical College. This meeting was held at the Merchants Seamen's Club. W. C. Risley, Chairman of the branch presided.

C. M. Anson, general manager of the Dominion Steel and Coal Corporation, and past regional vice-president of the Institute, and J. D. Dunlop, president of the Students Council, Nova Scotia Technical College, were the guest speakers.

Mr. Dunlop, who was the student representative from the Nova Scotia Technical College to the student's conference at Banff, gave an excellent report on the proceedings of that conference.

The subject of Mr. Anson's address was **The Broad Approach to an Engineering Career.** Mr. Anson pointed out the necessity for a broad basis in engineering education, saying that while some emphasis has to be placed on the major fields of engineering, specialization to any considerable degree was not necessary. In setting out on his career, said the speaker, it is most important that the young engineer acquire an interest in human relationships.

Mr. Anson spoke of the engineering profession as one not always awarded according to merit. But there is immeasurable satisfaction in approaching a tough problem, and finally solving it. To drive home this thought he cited a recent problem that confronted him and his staff. A storm wrecked the pier at which the limestone for the blast furnaces was loaded for shipment to the steel plant. The story of the handling of the repair job was indeed an inspiration not only to the student but to the older engineer as well.

Lakehead

W. D. MacKinnon, M.E.I.C.
Branch News Editor

G. S. Halter, Jr.E.I.C.
Branch Secretary-Treasurer

A general dinner meeting of the Lakehead Branch was held on November 16 at the Royal Edward Hotel in Fort William at which the new executive was accepted and installed. The guest speaker was Mr. M. R. Brown, mining engineer on the staff of the Lakehead Technical Institute, Port Arthur, who told of the make-up of Lakehead Technical Institute, explaining its division into two main sections. One section is devoted to the training of capable technicians for industry and the other provides first year courses in arts and engineering equivalent to the first year in similar courses at other universities. The students who pass the arts and engineering courses will be accepted into second year at practically every university in Canada. Mr. Brown suggested that students at the Technical Institute be encouraged to join the Lakehead Branch of the Engineering Institute as student members. The school has a good reference library, especially on the subject of mining, and it is the aim of the staff to add to it, so that it will serve as a technical reference library for all industry at the Lakehead.

❖ ❖ ❖

A general dinner meeting of the Lakehead Branch was held on December 6, 1948, in the Orpheum Grill Dining Room in Port Arthur. Branch Chairman, W. E. Maclennan presided. Members of the staff and students in applied science at the Lakehead Technical Institute, Port Arthur, were present as guests.

Mr. MacLennan welcomed the guests and called on Dr. M. Bartley, principal of the Lakehead Technical Institute to introduce his staff and students.

The meeting took the form of a "round table" discussion of ways in which the Branch could aid the young engineer, and guide the student in the choice of his branch of engineering. C. L. Emery, co-chairman of the programme committee, began the discussion by introducing the branch executive. He stated that the Branch plans to make this a "Young Man's Year". For the first time there are students in engineering at the Lakehead, and the branch must give every help possible to the Technical Institute students in order to make the school a success. Several suggestions were received from members on the subject of aid to students, and on improvement of the Branch meetings generally. Mr. Cawley expressed the thanks of the Technical Institute.

The meeting concluded with the showing of two films "The Tennessee Valley Authority" and "Life in the Western Marshes".

Lethbridge

D. Cramer, Jr.E.I.C.
Secretary-Treasurer

A. E. Lawrence
Branch News Editor

Thirty-four members and guests of the Lethbridge Branch attended a dinner meeting in the Marquis Hotel, Saturday evening, December 18th, 1948.

The meeting was in the form of a musical and film programme. Vice-chairman R. D. Livingstone presided. Community singing led by R. S. Lawrence, recitations by A. J. Branch and vocal selections by Edgar Rannard were much enjoyed.

Three excellent films were screened by Mr. Ron Roberts. They included: "Instruments of Orchestras"—a film which explained the use of the different instruments in a large symphony orchestra; "Radiant Rockies"—a beautiful film showing the charms of the Rocky Mountain scenery; "Aluminum"—the story of the mining and manufacture of aluminum.

C. S. Clendening moved a vote of thanks to Mr. Roberts, which was heartily endorsed by all present.

Ottawa

C. G. Biesenthal, M.E.I.C.
Secretary-Treasurer

Capt. A. J. Bernard, M.E.I.C.
Branch News Editor

A regular luncheon meeting of the Ottawa Branch was held on December 2nd at the Chateau Laurier, Ottawa. Chairman J. L. Shearer presided.

Highlight of the meeting was a paper delivered by Norman Marr, acting controller, Dominion Water and Power Bureau, Department of Mines and Resources. Mr. Marr was very capably introduced by J. M. Wardle, director of Special Projects Branch, Department of Mines and Resources.

The paper **The Snare River, Hydro Electric Development,** was found very interesting by the large number of members present. In October, 1944, due to increasing power demands in the Yellowknife district, investigations were carried out on the Snare River by Mr. W. G. Stuart on behalf of Giant Yellowknife. Early in 1946 the Dominion Government took over the project for the purpose of assisting and expediting the economic development of the Territories. By Order-In-Council dated February 15, 1946, the Minister of Mines and Resources was authorized to proceed with the development and the task was delegated to the Dominion Water and Power Bureau under the direction of Mr. J. M. Wardle, then the Director of Surveys and Engineering Branch of the Department.

Giant Yellowknife agreed to continue, at cost, certain preliminary operations then underway and provide construction machinery for the site before the spring breakup. The Montreal Engineering Company were engaged to design the development and supervise construction. Construction was carried out by the Northern Construction - Mannix Companies on a cost-plus fixed-fee basis. The Transmission line was built by Giant Yellowknife to be taken over by the Government at cost. The development was first in operation October 4, 1948.

The site chosen for the main dam is a short distance from the outlet of Big Spruce Lake and about ten feet below lake level where the Snare River was divided into two narrow channels by a rock island rising about 40 feet above water level. An earth-fill clay-core, rock faced dam, 800 feet long, maximum height 73 feet and base width 420 feet, containing 170,000 cubic yards of material, was built. Materials for the dam were found in the vicinity. Sufficient rough lumber for the coffer dam and other construction was found on a point of Big Spruce Lake. This find was very fortunate as timber is very scarce in this area.

The main features of the development were given by the speaker, as follows: 8350 hp.; maximum head, 62 ft., average 56 ft.; storage area, 30 sq. mi.; main tunnel 16.5 ft. by 16.5 ft., length 136 ft.; penstock 13.5 ft. diameter, 40 ft. long; main turbine—S. Morgan Smith, Francis type, 8350 hp., 128.5 r.p.m. at 56 ft. head; main generator C.G.E., 7000 k.v.a., vertical 3-phase, 60-cycle, 6,900 volts, 128.5 r.p.m.; power house concrete substructure, steel frame superstructure with concrete block walls. Two supplementary dams were required on Big Spruce Lake to close depressions below the full reservoir level. One of these was designed as a spillway for surplus water.

The editor wishes to express the appreciation of all branch members to retiring branch news editor R. C. Purser, who due to health reasons could no longer carry on this activity. Best wishes are extended for a speedy recovery.

Peterborough

J. M. King, M.E.I.C.
Secretary-Treasurer

J. C. Allan, M.E.I.C.
Branch News Editor

An Engineer's Journey through China was the subject of an address delivered to the Peterborough Branch by J. K. Sexton of the Montreal Engineering Company on November 25, 1948.

Mr. Sexton made an extensive tour through China to study proposed sites for hydro electric development in 1946. Mr. Sexton reported that there were only 6,081 kw. of installed hydro electric capacity in all China exclusive of Manchuria and Formosa in 1946. In fact, that country's total installed capacity totalled only 690,400 kw. including both thermal and hydro power.

China's three-fold plan of post war power development projected: restoration of war-wrecked power plants and construction of small plants where most needed, and investigation of a number of medium sized projects and of several enormous projects for future construction. Of these the most famous is Yangtze Gorge hydro and navigation project. This would involve the installation of several million kilowatts of generating capacity. Although this project has captured the imagination of Chinese engineers it bears little relation to the present economy of the country.

For the investigation of the medium sized projects mentioned above, the Chinese government sought the assistance of Canadian engineers. The result was an agreement with the Montreal Engineering Company and the tour which Mr. Sexton described. Four typical sites at widely separated points were studied.

Mr. Sexton said that China, unlike Canada, is not a glaciated country and over its central area there are very few lakes indeed. Nor is there any snow storage such as serves to regulate the flow of our western rivers. In China the run-off is flashy, flood peaks are high, and the ratio of minimum to maximum flow is very low".

The floods in the upper Yangtze are phenomenal. In the gorge section they range from 47,000 to 2,100,000 c.f.s. and the river stage has varied over a range of 112 feet at Chungking. Mr. Sexton told of difficulties of shifting of gravels of the stream bed with consequent rapid filling of small reservoirs and large cost of large reservoirs.

In China all arable land, especially the irrigable land lying in valleys, is intensively cultivated and supports a dense population. Moreover there is no vacant land to which people may be moved. Hence the problem of water storage for power purposes by the flooding of land is of a social rather than an engineering nature. Some idea of the extent of the problem may be gained from the fact that on the Lung Chi Ho the creation of 350,000 acre feet of storage would involve moving 7,200 people. It is said that the Yangtze Gorge project would require the moving of 300,000 people.

Mr. Sexton said, "The most practical solution of the problem advanced so far, is the application of pumped irrigation to the arable lands lying at elevations beyond the reach of gravity, thereby making it possible to support a dense population and hence receive displaced people from reservoir sites."

Saint John

W. M. Brenan, M.E.I.C.
Secretary-Treasurer

A. R. Bonnell, M.E.I.C.
Branch News Editor

The annual dinner meeting of the Saint John Branch was held December 16 in the Admiral Beatty Hotel with the Chairman T. C. Macnabb presiding.

Following the annual report of the secretary-treasurer J. H. Maclure, discussion took place on the reports of the various committees.

It was decided after some discussion to hold two branch meetings a year in Fredericton to create a greater interest in the Branch by the Fredericton members. It was noted that the creation of a Fredericton Branch would create two weak branches instead of one strong one.

Mr. Macnabb in his retiring address stressed that engineers should become more active in fields of public life other than in their own profession. Speaking along professional lines Mr. Macnabb stated that engineers should be very careful in keeping records of their work, and in signing and dating plans.

The Branch officers were elected for the coming year and after a brief address by the new chairman, H. P. Lingley, the meeting adjourned.

Saskatchewan

D. W. Houston, M.E.I.C.
Secretary-Treasurer

R. Bingo-Wo, M.E.I.C.
Branch News Editor

The regular joint monthly meeting of the Saskatchewan Branch of the Institute and the Association of Professional Engineers of Saskatchewan was held on Friday, December 17, at the Kitchener Hotel in Regina. A. A. Holland, M.E.I.C. consulting engineer, Sodium Sulphate Division, Saskatchewan Minerals, presented a film and address on the Sodium Sulphate plant at Lake Chaplin.

The sodium sulphate plant is one of the Crown Corporations owned by the Government of Saskatchewan and is located on Lake Chaplin, about sixty miles west of Moose Jaw. This is a natural deposit of 18 square miles in extent, situated in a semi-arid country.

During the spring run-off from the surrounding hills, sufficient water is provided to dissolve the sulphate or Glauber's Salts, which is carried into the lake bed in solution. Evaporation concentrates the salts to 45 or 50 per cent and the lake is covered to a depth of six to twelve inches. The brine is then pumped into three reservoirs, each covering an area of one million square feet. In all they hold 200 million gallons. The brine cools and about the middle of November the surface temperature will be around 30 degrees Fahrenheit. When this temperature is reached, nearly all of the Glauber's Salts will be deposited at the bottom of the reservoir; the more soluble salts, such as sodium chloride and magnesium sulphate will remain in solution.

Harvesting of the deposit begins as soon as the reservoirs are drained, and the salt is stockpiled on both sides of a 1100 foot conveyor belt that carries it into a raw salt bin in the factory. A screw conveyor then conducts the raw salt into Holland Evaporators where melting and evaporation takes place. Finally, the remaining salt cake, containing less than ¼ of 1 per cent moisture is discharged into a hot salt conveyor and on to a vibrating screen where the oversize is removed and crushed in a rodmill.

The present plant is producing at the rate of 100,000 tons per year and when completed will produce 150,000 tons per year.

Professor A. H. Douglas, of the University of Saskatchewan moved a vote of thanks to Mr. Holland.

Victoria

S. H. Frame, M.E.I.C.
Secretary-Treasurer

T. A. J. Leach, M.E.I.C.
Branch News Editor

The annual meeting of the Victoria Branch was held in Lougheed's Banquet Hall on the 20th December with the retiring chairman, Major R. C. Farrow, presiding.

Mr. R. Bowering was elected chairman for the coming year and other officers included: D. A. MacLean, secretary-treasurer; T. Hogg, T. A. J. Leach, Lt. Col. B. Ripley, J. N. Anderson and E. Smith on the executive board; S. H. Frame, past secretary and Major Farrow will serve as counsellors.

Major Farrow, Provincial Comptroller of Water Rights gave an address on the 1948 floods in B.C. He dealt in particular with the Fraser River, illustrating his address with coloured slides.

A late spring accompanied by a high snow residual in the low areas and with increased water content in the higher snow courses, all pointed to a flood hazard and warnings were given at the beginning of May. With a peak discharge of 536,000 c.f.s., the 1948 Fraser River flood was ¾-foot below the 1894 flood level at Mission. However, due to the greater population area affected, last spring's flood caused the most extensive damage on record.

The speaker pointed out that many of the dykes date back to the eighties and that their maintenance was under the direct supervision of the local Dyking Boards. Haphazard selection of material used in their construction became apparent in times of flood. The location of borrow pits near the toe of the dykes resulted, in some cases, in the removal of impervious material opening the way for seepage.

Dyke construction in tidal areas is governed by high and low tide levels. In these areas Seward Dykes are employed. The design of River Dykes further upstream is dependent upon the maximum flood level.

It was pointed out that in no case did failure of a dyke occur by overtopping. However prolonged high water produced shear failure along the longitudinal axis of the dyke, as well as seepage. The heavy growth along the dykes added to the difficulties of the flood fighters in their efforts to place sandbags. Theirs was a job of constant vigilance and with the first signs of a boil, sandbags were rushed to the scene. Wherever possible such boils were walled around by sandbags. Water rising within this improvised reservoir equalized the hydrostatic pressure from the river.

In conclusion the speaker pointed out that at the present time reconstruction of the dykes is being carried out under the Fraser River Dyking Board. Added study is also being given to flood control by storage on the 850 square miles of lakes within the Fraser River watershed. For the present the reconstruction of dykes on a massive standard followed by good maintenance is necessary. More dredging of the Fraser River channel itself is also called for.

Winnipeg

G. W. Moule, M.E.I.C.
Branch Secretary

R. H. Tivy, Jr.E.I.C.
Branch News Editor

Electrical Section

J. C. Pratt, M.E.I.C.
News Editor

The Annual Dinner and Dance culminating the 1948-49 season's activities of the Electrical Section in Winnipeg will be held on the evening of March 4th in the Marlborough Hotel. D. A. McCuaig will be in charge of the arrangements, assisted by E. M. Scott.

Please!

If you have not completed and returned the yellow reply card which was sent to you in January —*DO IT NOW.* The postage is three cents.

Thank You!

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment.*

Situations Vacant

CHEMICAL

CHEMICAL SALES ENGINEERS, one required in Montreal, one for Winnipeg. Graduates preferred. Positions offer excellent opportunity to develop to management. Salary depends upon qualifications. Apply to File No. 1092-V.

CHEMICAL ENGINEER with about one year's experience to carry out plant research work on product improvement. Position in Toronto. Approximate starting salary $225. per month. Apply to File No. 1097-V.

CHEMICAL ENGINEERS required by chemical company in Toronto for sales engineering. One recent graduate for training in sales also one with about one year's experience. Approximate starting salaries $200 to $225 per month. Apply to File No. 1097-V.

CHEMICAL ENGINEER OR CHEMIST with some experience in the manufacture of pulp, paper and converted products required for Province of Quebec to take charge of the testing staff of a sub-section of the technical dept. under the general direction of the Technical Superintendent. Salary open. Apply to File No. 1098-V.

CHEMICAL ENGINEER required by large western industrial manufacturing concern. Applicant must be interested in boiler water treatment. Salary open. Apply to File No. 1103-V.

CHEMIST, recent graduate, required by chemical company in Western Ontario to take charge of control laboratory. Experience not essential but desirable. Salary open. Apply to File No. 1111-V.

CIVIL

CIVIL ENGINEER required for a Consulting Engineers Practice in the Maritimes. Preferably with three to six years experience. Duties both design and field supervision of construction for both municipal works and industrial buildings. Engineering survey experience required. Salary open. Apply to File No. 1087-V.

CIVIL ENGINEER, age 35 to 40 years, required by Public Institution for Montreal area. Must have construction experience and be able to supervise large building program. Salary $6,000 to $7,000. Apply to File No. 1091-V.

CIVIL ENGINEER to take charge of design and construction of service buildings, required by expanding chemical company in Western Ontario. Salary open. Apply to File No. 1111-V.

ELECTRICAL

JUNIOR ELECTRICAL ENGINEERS required as assistants to Works Engineers by a large chemical manufacturing company with Headquarters in Montreal. Applicants should have passed the C.G.E. Test course. Positions in Ontario. Salary open. Apply to File No. 1084 V.

ELECTRICAL ENGINEER, recent graduate, required for Canadian branch plant of a progressive, established American company. Duties to be production control working closely with sales. Permanent position for right man with excellent opportunity for advancement. Location Toronto. Salary open. Apply to File No. 1088-V.

ELECTRICAL DESIGNING ENGINEER required for plant engineering department. Preferably between the ages of 30-40 years, with 10 years of electrical design experience in industrial plant construction and maintenance. Position in Ontario. Salary open. Apply to File No. 1100-V.

ELECTRICAL ENGINEER, preferably with experience in electrical trouble shooting and maintenance work required by industrial firm in Toronto. Salary open. Apply to File No. 1101-V.

ELECTRICAL ENGINEER required in Latin America as assistant to Manager on Public Utility system. Must have broad experience in operation and maintenance of generating plants, sub-stations, transmission lines and distribution systems. Ability to speak Spanish desirable but not essential. Salary open. Apply to File No. 1112-V.

MECHANICAL

MECHANICAL ENGINEER with considerable experience in all kinds of Brass-Valves (including foundry work) required as Production Manager in Ontario. Must be alert and aggressive. Salary open. Apply to File No. 1009-V.

RECENT GRADUATE Mechanical Engineering, required by Canadian firm for work on test plant layout and design of special test equipment. Position offers interesting work in the new field of Gas Turbine Jet Engine development. Salary open. Apply to File No. 1089-V.

SENIOR MECHANICAL ENGINEER required by chemical company in Toronto to act as chief Engineer. Must be able to do process design work and prepare capital cost estimates. Approximate starting salary $400 per month. Apply to File No. 1097-V.

MECHANICAL ENGINEER, required as Plant Engineer by a pulp and paper mill in the Province of Quebec. Should have about ten years experience, the major part in the pulp and paper industry. Applicant will be required to take complete charge of maintenance department consisting of various trades crews with a total personnel of about 250 men. Salary open. Apply to File No. 1099-V.

MISCELLANEOUS

GRADUATE ENGINEER required by Montreal head office of a large Canadian Company for design, specification and layout of air conditioning, ventilating, fan and duct work for industrial processes, factories, offices, dust removal collecting systems, etc. Supervision of field installations, testing and making estimates. Must be familiar with all kinds of relative apparatus and equipment and with sheet metal air duct work. At least five years' experience with the above. Please give full details of experience, training, age, references, salary expected and date available. Apply to File No. 1015-V.

JUNIOR CIVIL AND MECHANICAL ENGINEERS required by large Canadian pulp and paper mill. Preferably some experience in pulp and paper mill engineering problems but experience not essential. Salaries open. Apply to File No. 1082-V.

GRADUATE ENGINEER required as sales promotion Manager by well established manufacturer of heating equipment used in all types of buildings. Age 30 to 40 years with experience in selling Mechanical equipment in the construction industry and preferably with Business Administration Course. Salary open. Apply to File No. 1085-V.

AIRCRAFT STRESS ENGINEERS AND DESIGN DRAUGHTSMAN required by Canadian company. Must have aircraft design experience or at least two years experience in stressing of aircraft structures. Salary open. Apply to File No. 1089-V.

GRADUATE ENGINEER, 30 to 40 years of age with 3 or 4 years experience in railroad engineering required in Montreal to take charge of railway division. Must be bilingual. Salary open. Apply to File No. 1090-V.

GRADUATE ENGINEER preferably electrical or mechanical required to fill the position of Assistant Superintendent of the Street Railway Department of a Saskatchewan city. Salary around $3,600 per year. Apply to File No. 1093-V.

SALES ENGINEER for contractors equipment and allied lines required by large manufacturer, Niagara Peninsula. Salary open. Apply to File No. 1095-V.

HEATING AND VENTILATING ENGINEER with some experience in mechanical equipment for buildings, is wanted for office work on heating, ventilating and air conditioning by firm of consulting engineers in Montreal. Salary open. Apply to File No. 1096-V.

GRADUATE ENGINEER with management ability, about forty-five years of age required by Industrial Corporation operating several branches. Experience should cover plant lay-out, production planning, job simplification, warehousing and supervision of personnel. Salary open. Apply to File No. 1102-V.

GENERAL OPERATING SUPERINTENDENT required by large electric utility company in the Far East for three large interconnected hydro-electric generating plants. Applicants must be thoroughly experienced in operation and maintenance of hydro-electric generating equipment. Salary open. Apply to File No. 1112-V.

DISTRIBUTION ENGINEERS required in Latin America must have at least five years experience on design and operation of overhead electric distribution systems. Salary open. Apply to File No. 1112-V.

*SALES ENGINEER required by large manufacturer of industrial products and building materials with offices in Montreal to reside in Sydney, N.S., and contact industrial accounts, building materials dealers and contractors in Cape Breton and Newfoundland. Experience in steel and/or chemical engineering an advantage but not essential. Salary open. Apply to File No. 1113-V.

* Filled since appearance in advance notice.

The following advertisements are reprinted from last month's Journal, not having yet been filled.

CHEMICAL

CHEMICAL ENGINEER, recent graduate, is needed for production work by chemical manufacturing firm situated in the Province of Quebec. Some experience in chemical production of synthetic resin manufacture would be advantageous. Salary open. Apply to File No. 1064-V.

JUNIOR CHEMICAL ENGINEER required by independent oil company located in Turner Valley. Duties will include design and supervision of maintenance and new construction work. Advancement will depend on initiative and readiness to assume responsibility. Salary open. Apply to File No. 1075-V.

CIVIL

CIVIL ENGINEER to act as assistant to Senior Officer of a well-established general contracting firm in Montreal. Applicant should have about five years experience and have some knowledge of all phases of building construction. Salary open. Apply to File No. 1038-V.

*CIVIL ENGINEER required for Consulting Engineers office in Western Canada. Must have extensive experience water, sewer and pavement layouts capable of taking charge office staff and field parties. Partnership offered to right man. Salary open. Apply to File No. 1042-V.

CIVIL ENGINEERING GRADUATES with several years experience in building construtcion and estimating for permanent senior and junior positions in Winnipeg. Good prospects and pension benefits. Starting salary $250.00 and up per month with yearly increments. Apply to File No. 1061-V.

ELECTRICAL

ELECTRICAL ENGINEER with at least five years experience in Central Station and Substation installation and maintenance required by a Maritime Public Utility. Apply to File No. 1043-V.

ELECTRICAL DESIGNING DRAUGHTSMAN for work in Southern Ontario. Must be experienced. Salary up to $300. Apply to File No. 1059-V.

ELECTRICAL ENGINEER required as assistant to electrical superintendent by a textile manufacturing concern in Montreal. Applicant must have had good experience and be willing to accept responsibility. Salary open. Apply to File No. 1070-V.

RECENT GRADUATE, electrical background, required as sales engineer by a manufacturer in Montreal. Salary open Apply to File No. 1071-V.

ELECTRICAL ENGINEER with industrial background preferably pulp and paper required for senior position in electrical department of a paper mill in the Ottawa valley. Salary open. Apply to File No. 1073-V.

RECENT GRADUATE in Electrical Engineering required for Sales Engineering Work with old established Montreal firm. Must have had at least two years practical experience and be willing to travel occasionally. Apply to File No 1094-V.

MECHANICAL

MECHANICAL ENGINEER required by a large industrial plant in the East end of Montreal for product design work on major electrical appliances. We are prepared to offer definite advancement in a reasonably short period of time and salary will be based on potentiality rather than experience. Apply to File No. 1016-V.

RECENT GRADUATES in Mechanical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 1029-V.

MECHANICAL ENGINEER, recent graduate, required for Engineering Department of a farm implement manufacturer in Ontario. Salary open. Apply to File No. 1030-V.

*MECHANICAL DRAUGHTSMEN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for ordinary colliery plant, screening equipment, hoists, simple steel structures, etc. Salary $240 up, depending upon ability. Apply to File No. 1032-V.

MECHANICAL ENGINEER preferably with a few years experience and some knowledge of pulp and paper required for design and layout by a company in New Brunswick. Salary open. Apply to File No. 1036-V.

SENIOR MECHANICAL DRAUGHTSMAN required by a machinery manufacturer in Central Ontario. Salary open. Apply to File No. 1044-V.

*MECHANICAL ENGINEER with industrial background required as sales engineer by a consulting firm in Montreal. Salary $300 up according to experience. Apply to File No. 1049-V.

*MECHANICAL ENGINEER with 5 or more years experience in industry, preferably pulp and paper required by manufacturer in Province of Quebec for duties involving organization of improvements, job schedules, machinery maintenance and some mechanical draughting. Salary $300-$350. Apply to File No. 1052-V.

MECHANICAL ENGINEER with two or three years experience in chemical or allied industries required by chemical plant in Central Ontario. Salary open. Apply to File No. 1066-V.

MECHANICAL ENGINEER required as assistant to mechanical superintendent by a textile concern 35 miles south-west of Montreal. Must have had good experience and willing to accept responsibility. Salary open. Apply to File No. 1070-V.

MECHANICAL ENGINEER, experienced on design and construction of fine instruments wanted to take charge of small model shop in laboratory specializing on development of air-borne radar and aerial survey and navigation aids, servomechanisms and computors. Advancement in rapidly expanding and progressive organization assured for capable engineer. Salary open. Apply to File No. 1074-V.

*MECHANICAL ENGINEER required by an established manufacturing company in Toronto to layout and plan new building in the Toronto area. Opportunity for permanent employment. Reply stating age and experience. If possible attach a recent photograph. Salary open. Apply to File No. 1079-V.

METALLURGICAL

RECENT GRADUATES in Metallurgical Engineering required by steel fabricating industry in Hamilton. Some knowledge of production operations would be helpful. Salary open. Apply to File No. 1029-V.

MISCELLANEOUS

JUNIOR ENGINEER preferably with civil background required for sales and service by a Montreal manufacturer of water-proofing compounds. Salary open. Apply to File No. 1033-V.

SALES ENGINEER under 35 years of age, preferably with engineering and sales experience required in Toronto, to become a specialist in capacitor sales. Salary according to qualifications and experience. Apply to File No. 1035-V.

GRADUATE ENGINEER with engineering and sales experience required as a Street lighting specialist in Toronto area. Position involves direct sales engineering with municipalities and utilities, also engineering and production problems, directly concerned with the manufacture of street lighting equipment. Age under 35 years. Salary open. Apply to File No. 1035-V.

MECHANICAL OR ELECTRICAL ENGINEER required as Montreal representative of a Canadian manufacturer with Headquarters in Ontario. Preferably some sales experience. Salary open. Apply to File No. 1039-V.

GRADUATE ENGINEER for urban transportation system 25 to 40 years of age with at least five years experience. Hydro-Elect. plant operation experience essential. Steam or diesel electric generating plants desirable. A knowledge of time and motion study and evaluation would be a definite advantage. Salary open. Please send photograph and full particulars of education and experience. Apply to File No. 1041-V.

GRADUATE ENGINEER required by a consulting engineer in Montreal. Must have experience in boiler plant design and general knowledge of heating. Salary open. Apply to File No. 1048-V.

DRAUGHTSMAN required by industrial organization in Toronto. Must have plant and structural experience. Salary open. Apply to File No. 1051-V.

MECHANICAL OR CIVIL ENGINEER with 3 or more years experience in industry, preferably pulp and paper required by a manufacturer in Province of Quebec for duties involving study and preparation of improvement projects, such as, installation of machinery, pip.ng, etc. Salary $250 to $300. Apply to File No. 1052-V.

MINING OR METALLURGICAL ENGINEER capable of taking charge of a plant control laboratory for plant and control work, required by a manufacturer in the St. Maurice Valley. Age should be between 30 to 40 years. Salary open. Apply to File No. 1054-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experience in installations of production and cost control. Wage incentives etc. Free to travel. Preferably bilingual. Salary open. Apply to File No. 1058-V.

SALES ENGINEER 24 to 30 years of age, preferably single and free to travel required by Canadian manufacturer of industrial rubber products. Must have a minimum of 1 to 2 years post-graduate experience in mining or plant maintenance. Salary open. Apply to File No. 1060-V.

*SENIOR ENGINEER required by Montreal contractor to supervise engineering and power development work in Ottawa area. Salary $425.00 up. Apply to File No. 1062-V.

*INDUSTRIAL ENGINEER preferably with mechanical or chemical background and some experience in industrial engineering work, including plant layout and time study required by chemical company in Toronto. Apply to File No. 1065-V.

DESIGN ENGINEER for concrete machinery and mixers required by well established Ontario manufacturing company. Good opportunity. Good salary. Apply to File No. 1067-V.

RECENT GRADUATE preferably mechanical or electrical background required by National Beverage Company. Training period in Montreal. Salary open. Apply to File No. 1069-V.

ELECTRONICS ENGINEER and Technicians experienced on design and construction of radar, servomechanisms, computors or magnetometers required for development laboratory specializing in airborne devices for aerial survey and navigation. Advancement in rapidly expanding and progressive organization assured for capable personnel. Salary open. Apply to File No. 1074-V.

*SALES ENGINEER required for sales staff of a manufacturer in Toronto. Preferably background in Mechanical, Chemical or Mining engineering. Salary open. Apply to File No. 1076-V.

SENIOR TIME STUDY MEN required by large National Organization in Ontario. Must be competent in methods improvement and have experience in developing standard data on machine tool and other operations. Salary open. Apply to File No. 1078-V.

JUNIOR ENGINEER OR ARCHITECTURAL DRAUGHTSMAN for city planning office in Western Canada. State education, experience, age and salary desired. Apply to File No. 1080-V.

GRADUATE CIVIL ENGINEER or ARCHITECT required for Saskatchewan community, about 6,000 population, to act as town planner under consultant, and as assistant to City Engineer. Interest in civic problems desirable. State education, experience and age. Apply to File No. 1080-V.

INDUSTRIAL ENGINEERS, must be fluently bilingual, two residents of Quebec City, one Bois Franc Region, one Grand'Mere, five Montreal, wanted by New York firm of Management Consultants, members of American Management Association contemplating to organize a branch in the Province of Quebec. Salary, Commission and travelling expenses. Apply to File No. 1083-V.

JUNIOR SALES ENGINEER, preferably bilingual, to be trained for sales work with Montreal Industrial Company. Salary open. Apply to File No. 1086-V.

* Filled since appearance in advance notice.

Situations Wanted

MECHANICAL ENGINEER, age 39, experienced in tool design and production methods, material selection, production records, control and co-ordination. Desires employment preferably in Montreal with either manufacturer or firm of Engineers who could utilize all or a part of above experience. Apply to File No. 551-W.

ELECTRICAL ENGINEER, Jr.E.I.C., Manitoba, '44, married, age 27, presently situated in Maritimes desires active position in Central or Western region. Field service engineering, C.G.E. test course, Army radar experience. Interested in plant engineering, installation or development openings. Apply to File No. 846-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. (E.E.), Manitoba, 1943. Age, 27. Married. Electrical experience with R.C. Signals and 2½ years general electrical experience in industry. Sales training. Presently employed but desires position offering wider scope and opportunity. Preferably Montreal area. Apply to File No. 925-W.

GRADUATE MECHANICAL ENGINEER (McGill), M.E.I.C., P.Eng., Ont. 26 years experience including Oil refinery design, plant layout, structural design, pressure vessels, central station boilers and furnaces both design and specifications; surveys and reports on power plant and factory efficiency problems, inspection of installations, and supervision of maintenance on heating, ventilation and air conditioning of military and Air Port buildings, and fuel storage depots. War veteran, employed but desires renumerative responsible position on West Coast. Would consider partnership with Consulting firm. Apply to File No. 991-W.

ENGINEER, M.E.I.C. Graduate Civil and Electrical. Age 40, single. Experience covers engineering and building construction and maintenance, works maintenance, general and heavy construction machinery sales and service, shop management. Past seven years in executive and administrative capacity. Seeks wider opportunities or position leading to same in business, engineering, or business engineering. Free to travel, any location including foreign, available one month notice. Apply to File No. 1266-W.

ELECTRICAL ENGINEER, M.E.I.C., P.E.Q., B.Eng., McGill '34, age 40, married, Bilingual. 15 years Sales and Service of industrial electrical and welding equipment. At present in charge of Sales and Administration for Canadian company. Desires position of responsibility with well established progressive company. Location preferably Quebec or Ontario. Home in Montreal. Available on short notice. Apply to File No. 1421-W.

CIVIL ENGINEER, S.E.I.C., P.Eng., B.Sc., doing post graduate study in Montreal requires part time employment preferably week-ends at home. Experienced in various steel plate construction designs. Will also accept draughting and miscellaneous engineering work. Apply to File No. 1487-W.

*SENIOR MECHANICAL ENGINEER, M.E.I.C., B.Eng., McGill '34, desires responsible position with a future. Presently employed with firm of chemical consulting engineers. Previous experience includes several years in charge of airplane design, planning, cost estimating and construction. Accustomed to directing technical staff and shop operations. Apply to File No. 1511-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.Eng., Que. Experience in the Engineering Department of large Corporations. Considerable experience in Hydraulic and design and building of Reinforced concrete structures. Several years as Construction & Field Engineer on various plants and Hydraulic Power Projects. Desires position with well established firm. Presently employed. Apply to File No. 1527-W.

SALES ENGINEER, B.E. (Electrical), N.S.T.C., M.E.I.C., Professional Engineer Nova Scotia, age 35, married. Presently employed in Halifax. Ten years experience successfully selling, and supervising the selling of a variety of electrical equipment. Excellent contacts in Maritime Provinces and Newfoundland. Interested in position as branch manager, or district representative in Maritimes, on salary and commission. Would also consider being manufacturer's agent. Apply to File No. 1758-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., Ontario, age 38, married. 14 years extensive structural experience in reinforced concrete and structural steel design and layout. Interested in association with well established progressive organization as Engineering Assistant or Chief Draughtsman. Present salary $5,000. Apply to File No. 2049-W.

CIVIL ENGINEER, M.E.I.C., P.Eng. (Alta.). Age 29, B.Sc. Married. Presently employed. Experience in light commercial construction and housing projects. Familiar with project planning and utility layouts. Have organized and supervised several large construction projects, have good background in lumber and building supply business relative to the construction industry. Some experience in highway location and construction, sewer and water distribution and natural gas installations. Interested in partnership with consultant engineer or architect, or position with progressive construction firm, would consider oil company. Home Edmonton, Alberta. Apply to File No. 2521-W.

MECHANICAL ENGINEER, Jr.E.I.C, Sask. '46, P.Eng., Ont. 23, married. Experience primarily in Pulp and Paper Industry in maintenance engineering, layouts and small construction jobs. Earnestly desires to enter Industrial Engineering field either with Consulting Engineer of Industrial Methods or Production Department. Location immaterial, available experience most important. Available on one month's notice. Apply to File No. 2795-W.

ENGINEERING PHYSICIST, Jr.E.I.C., Sask. '47, age 24, Prof. Eng., Ont. Single. Desires research work in progressive company. Preferably in Ontario or West. Experience includes six months outside plant of Bell Telephone, Montreal, 14 months ass't Engineer with Miniature Electric Motor Manufacturing Company. Duties are Research and test of design and materials plus plant control and maintenance. Presently employed, available one month's notice. Apply to File No. 2917-W.

MECHANICAL & INDUSTRIAL ENGINEER, Jr.E.I.C., McGill '44, 7 years industrial experience. Welding application and metallurgy, production supervision, production specifications, purchasing, wage incentives, time study,

* Employed since appearance in advance notice.

stimating, costing, design. Available 4 eeks notice. Apply to File No. 2920-W.

EMICAL ENGINEER, M.E.I.C., P.Eng., ith considerable mechanical experience in plant construction, piping layouts and welding, 14 years industrial ractice on positions of responsibility, esires a change of employment preferbly in Montreal area. Bilingual. Apply o File No. 2940-W.

CHANICAL ENGINEER, M.E.I.C., Prof. ng. (Quebec), 15 years of shop practice in maintenance and locomotive repair; 5 years machinery design, including welded vessels, process piping nd pulp mill layout. Seeking responsible position preferably in Montreal rea. Available on short notice. Apply o File No. 3045-W.

ECHANICAL ENGINEER, S.E.I.C., B.A.Sc., Toronto, age 26, single, experience in operation planning and detailing, also sales. Presently employed with Importers as Correspondent and nterpreter. Languages: English and German perfect; French reading knowledge only. Desires employment as industrial engineer, preferably in Toronto rea. Apply to File No. 3065-W.

LES ENGINEER, S.E.I.C., recent graduate in Mech. Eng., N.S.T.C. At present very successful N.S. representative of Non-Engineering Organization, also desires to represent Engineering firm as well, part time or full time. Apply o File No. 3068-W.

ECHANICAL ENGINEER, A.M.I. Mech.E., P.Eng., Que. Graduate London, 935; age 37, married, 10 years experience in design, testing and installation supervision of all classes of I.C. engines, supercharging, steam machinery and plant layout in the U.K. 3 years technical executive and administrative experience in policy and production with responsibility of Government level. Trilingual, English, German, Russian. Desires responsible position covering design, administrative or sales with progressive and reliable employers, anywhere in Canada. At present resident in Montreal. Apply to File No. 3069-W.

ART TIME WORK, Graduate Civil Engineer, B.A.Sc., Jr.E.I.C., now doing graduate work in Montreal. Desirous of obtaining part time work in concrete and steel design or cost estimating. Apply to File No. 3073-W.

RADUATE MECHANICAL ENGINEER, 39, single, 14 years experience in research engineering, instrumentation, automatic controls, testing of materials and machinery. Knowledge of metallography, heat-treatment, and welding. Several languages. Acquainted with optical and electrical equipment, emergency maintenance of plant and motor transport. Desires suitable position requiring initiative. Apply to File No. 3074-W.

ART TIME WORK, 3rd Year Electrical Engineer, McGill S.E.I.C. Anxious to obtain part-time employment, preferably in electrical field. Have considerable free time aavilable. Summer experience in textile plant also telegraph department of railroad company. Apply to File No. 3075-W.

ECHANICAL ENGINEERING STUDENT, S.E.I.C., 2nd year at McGill University, member, Society of Motion Picture Engineers, age 21, single. Interested in obtaining summer employment with prospects of permanent position in precision mechanical engineering field (instruments, meters, motion picture equipment). Machine shop experience, languages. Apply to File No. 3076-W.

RADUATE ENGINEER, Toronto '42, M.E.I.C., P.Eng. (Civil Branch), age 30. Married. Overseas veteran with R.C.E.M.E. Experience in Mining and Metallurgy. Presently engaged in all phases of railroad construction and maintenance of way including estimating, general design and layout work. Desires change to position of professional responsibility in Municipal Engineering or Industrial work in smaller firm. Preferably Toronto or neighborhood. Now completing two year course in Business Methods. Apply to File No. 3077-W.

IVIL GRADUATE, S.E.I.C., B.Sc., Queen's, age 25, married, veteran. Experience limited to survey work and varied shop experience. Desires a position with a consultant or with a town planner. Available on short notice. Apply to File No. 3078-W.

ALES ENGINEER, M.E.I.C. Electrical and Mechanical background, bilingual, 12 years service in Navy and 6 years with Wartime Shipbuilding and War Assets in technical and executive capacity. Interested in representing Firm in Montreal area. Available immediately. Apply to File No. 3081-W.

MECHANICAL ELECTRICAL ENGINEER, S.E.I.C., graduating in May from Ecole Polytechnique seeks position with progressive industrial firm. Age 26, single. Good Mechanical background. Employed during war with National Research Council. Ambitious, with good character and potentialities. Apply to File No. 3083-W.

CIVIL ENGINEER, M.E.I.C., B.A.Sc. Prof. Eng. Age 33. Married, no children, bilingual, seven years experience in the following fields: one year in hydro-electric power house operation, three years planning and supervision in shipbuilding, two years in design and supervision of irrigation works; one year as Construction Engineer in charge of the construction of a dam. Available in June, 1949. Presently employed in Ceylon. Apply to File No. 3085-W.

CHEMICAL ENGINEER, Jr.E.I.C., B.Sc., Queen's '46, Professional Engineer (New Brunswick), age 26, married. Reliable and conscientious. Experience includes product control, piping layout and general engineering in Pulp and Paper and Petroleum Industry. Also held responsible position in sanitary engineering field as district engineer-in-charge. Desires responsible position in industry or with consulting engineer. Available immediately. Apply to File No. 3092-W.

PROFESSIONAL ELECTRICAL ENGINEER seeks position where expert knowledge of motor control gear, motors, switchgear, cables, etc., is required. Wide experience in applications, field and makers tests, layout, specifications, purchase and installation of controls. Would consider engineer-representation of reputable firms. Apply to File No. 3095-W.

STUDENT in 4th year Civil Engineering U. of T., S.E.I.C., graduating this spring, desires a position with an engineering consulting firm doing design or research work in steel, reinforced concrete, or timber structures. 28 years of age, R.C.A.F. veteran, married, onc child. Apply to File No. 3096-W.

BOOK REVIEWS

CITIES OF LATIN AMERICA; HOUSING AND PLANNING TO THE SOUTH:

Francis Violich. New York, Reinhold, 1944. 241 p., illus., 9½ x 6¼ in., cloth, $3.75.

This book is a study of housing conditions, architectural development, and city planning in Latin America. It is based on material collected by the author during a survey of urban problems and plans in ten Latin American countries. The subject is an interesting and little-known one, and the author's treatment of it is highly readable and entertaining.

There is a great deal being done in Latin America towards city planning, but the movement as a whole is still in its infancy. Most planning offices operate as technical planning staffs under direct control of the government. Latin Americans excel in the planning of streets, parks, and public buildings. Their architecture is in the European tradition, but a beginning has been made in modern functional design.

General lack of education among the people is the chief cause of many social problems, and hinders the planning and housing programme. Two-thirds of the people are ill-housed, and many live in appalling slums. However, many technicians are interested and are working hard to improve conditions.

Much of the book is devoted to a contrast between Latin America and the United States, and the author finds that though Latin America is backward in comparison, the city planners are more versatile and less specialized, and work harder and more earnestly.

The book has been written with enthusiasm and vigour, and contains much information on the life and customs of Latin Americans as well as on city planning. It is well illustrated with photographs and attractively printed. L.S.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Aerial Photography in Urban Planning and Research:
Melville C. Branch, Jr. Cambridge, Harvard University Press; Toronto, S. J. Reginald Saunders. 1948. 150 p., illus., paper. (Harvard City Planning Studies No. 16).

Applied Mathematics for Engineers and Scientists:
S. A. Schelkunoff. New York, Toronto, London; Van Nostrand, 1948. 472 p., illus., cloth.

Civil Engineering for the Clerk of Works:
V. C. Whiting and K. Mills. London, New York, Toronto; Longmans Green, 1948. 152 p., illus., cloth.

Electromechanical Transducers and Wave Filters, 2d ed.:
Warren P. Mason. New York, Toronto, London; Van Nostrand, 1948. 419 p., illus., cloth.

Examination and Valuation of Mineral Property, 3d ed:
R. D. Parks, W. L. Whitehead and F. G. Pardee. Cambridge, Mass., Addison-Wesley, 1949. 504 p., illus., fabrikoid.

Field Engineering; a Handbook of the Theory and Practice of Railway Surveying, Location, and Construction, Volumes I and II, 22d ed:
W. H. Searles and H. C. Ives, edited by Philip Kissam. New York, Wiley; London, Chapman and Hall, 1949. 836 p., illus., fabrikoid.

Fuel and the Future; the Proceedings of a Conference held in London on October 8th, 9th and 10th, 1946, under the Auspices of the Fuel Efficiency Committee:
Ministry of Fuel and Power. London, HMSO, 1948. 3 vols., illus., paper.

Handbook of Culvert and Drainage Practice, for the Solution of Surface and Subsurface Drainage Problems, rev. ed:
Armco Drainage and Metal Products of Canada Ltd., Guelph, Ont., 1947. 510 p., illus., fabrikoid.

Handbook of Refrigerating Engineering, 3d ed:
W. R. Woolrich and L. H. Bartlett. New York, Toronto, London; Van Nostrand, 1948. 730 p., illus., cloth.

High-Polymer Physics; a Symposium:
Howard A. Robinson, editor. Brooklyn, N.Y., Chemical Publishing Co., 1948. 572 p., illus., cloth.

Installation and Servicing of Low Power Public Address Systems:
John F. Rider. New York, John F. Rider, Publisher, 1948. 204 p., illus., cloth.

Jet Propulsion in Commercial Air Transportation:
Robert E. Hage. Princeton, N.J., Princeton University Press, 1948. 91 p., illus., paper.

Logging; the Principles and Methods of Harvesting Timber in the United States and Canada:
N. C. Brown. New York, Wiley; London, Chapman and Hall, 1949. 418 p., illus., cloth.

Mathematics at Work:
Holbrook L. Horton. New York, Industrial Press; Brighton, England, Machinery Publishing Co., 1949. Illus., fabrikoid.

Metallic Corrosion Passivity and Protection:
U. R. Evans, with an appendix by A. B. Winterbottom. London, Arnold, 1948. 863 p., illus., cloth.

Motion and Time Study, 3d ed:
Ralph M. Barnes. New York, Wiley; London, Chapman and Hall, 1949. 559 p., illus., cloth.

Parking Lot Operation:
C. S. LeCraw, Jr. and W. S. Smith. Saugatuck, Conn., Eno Foundation for Highway Traffic Control, 1948. 114 p., illus., paper.

Practical Residential Wiring:
John F. Nowak. New York, Toronto, London; Van Nostrand, 1948. 495 p., illus., cloth.

Prestressed Concrete:
Gustave Magnel. London, Concrete Publications, 1948. 215 p., illus., cloth. (Concrete Series).

PROCEEDINGS, TRANSACTIONS, ANNUALS, ETC.

American Institute of Electrical Engineers:
Transactions, Volume 67, Part I, 1948.

LIBRARY REGULATIONS

Hours

	Oct.-May	June-Sept.

Thurs. (Oct.-Mar.)	9–8	9–5
Sat. (closed Jy.-Aug.)	9–12	9–12

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

American Society for Engineering Education:

Proceedings, Volume 55, 1947-48.

British Engineers' Association:

Classified Handbook of Members ond their Manufactures, 19th ed., 1948.

Canadian Automobile Chamber of Commerce:

Facts and Figures of the Automobile Industry, 1948.

International Recognition of Rights in Aircraft:

Convention, Geneva, June 19th, 1948.

Portland Cement Association:

Cement and Concrete Reference Book. 1948.

Smithsonian Institution:

Annual Report of the Board of Regents, 1947.

TECHNICAL BULLETINS, ETC.

Harvard University. Graduate School of Engineering. Publications:

No. 448—Shipways with Cellular Wolls on o Marl Foundation, M. M. Fitz-Hugh, J. S. Miller, and Karl Terzaghi.—No. 449—Functions of Extended Class in the Theory of Functions of Several Complex Variables, Stefon Bergman.—No. 450—Studies on Leptospiro Icterohaemorrhagioe, IV. Survival in Water and Sewage: Destruction in Water by Halogen Compounds, Synthetic Detergents, and Heot, S. L. Chang, M. Buckingham, and M. P. Taylor.—No. 451—Kernel Functions in the Theory of Partial Differential Equations of Elliptic Type, S. Bergman and M. Schiffer.—No. 452—Mechanism of the Hydrolysis of Chlorine, J. C. Morris. —No. 453—On Bergman's Integration Method in Two-Dimensional Compressible Fluid Flow, R.V. Mises and M. Schiffer.—No. 454—Behavior of Chlorine as a Water Disinfectant, G. M. Fair, J. C. Morris, S. L. Chong, and others.

Ingeniors Vetenskaps Akademien. Handlingar:

Nr 200—Sorption in Flow through a Granular Layer, C. H. Johansson, G. Persson, and Borje Svensson.

Institute of Metals. Reprints:

Damping Capacity of Metals in Transverse Vibration, K. M. Entwistle.—Effect of Grain-Size on the Damping Capacity of Alpha Brass, K. M. Entwistle.—Measurement of Grain-Size of Tungsten and Tungsten Carbide Powders used for the Manufacture of Hard-Metal, H. Burden and A. Barker.

Institution of Electrical Engineers. Proof Sheets:

Fixed Resistors for use in Communication Equipment with Special Reference to "High-Stability" Resistors, P. R. Coursey.—Magnetic Amplifiers, A. G. Milnes. —Oscillogroph for the Automatic Recording of Disturbances on Electric Supply Systems, W. T. J. Atkins.—Polyphase Commutator Machines, B. Adkins, W. J. Gibbs.—Recurrent-Surge Oscillograph and its Application to the Study of Surge Phenomena in Transformers, E. L. White and W. Nethercot.—Theoretical and Experimental Study of the Series-Connected Magnetic Amplifier, H. M. Gale and P. D. Atkinson.

Institution of Mechanical Engineers. Advance Copies:

Cinematography in Engineering, H. A.V. Bulleid.—Control of Production, S. W. Lister.—Further Researches in Fluid Flow through Beds of Granular Material, H. E. Rose and A. M. A. Rizk.—Lubrication of Engines in Public Service Vehicles, A. T. Wilford.

International Civil Aviation Organization. Publications:

Circular 7—AN/6—Engineering Study of Factors Affecting the Choice of Frequencies of DME.—Circular 8—AN/7—South Pacific Region; Status of Implementation of Recommendations of First South Pacific Regional Air Navigation Meeting.—Index of ICAO Documents, Volume 1, Volume 2, Parts 1, 2 and 3.

Kungl. Tekniska Hogskolans. Handlingar:

Nr 19—Thermal Ageing Properties of Cellulose Insulation Materials, G. Malmlow.—Nr 23—Impedance Measurements in Decimetre Wave Band, B. Josephson. Nr 24—Model Tests on Single-Step Planing Surfaces; Publication No. 1/1947 of the Ship Testing Laboratory, C. Falkemo and J. Adlercreutz.

North-East Coast Institution of Engineers and Shipbuilders. Advance Copies:

British Marine Gas Turbines, T. W. F. Brown.

Princeton University. Industrial Relations Section. Selected References:

No. 25—Recent Trends in Industrial Pension Plans.

Purdue University. Engineering Extension Dept. Extension Series:

No. 66—Proceedings of the Thirty-fourth Annual Road School, held at Purdue University, February 2-5, 1948.

Svenska Forskningsinstitutet for Cement och Betong. Meddelanden:

N:r 13—Investigation on Formation of Cracks in Reinforced Concrete Structure, G. Wastlund and P. O. Jonsson.—N:r 14 Differential Equation for Calculation of Vibrations Produced in Load-Bearing Structures by Moving Loads, S.T.A. Odman.—N:r 15—Effect of Dynamic Forces on Structures, Erik Forslind.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

CANADIAN STANDARDS ASSOCIATION. STANDARDS:

B97—1948—Limits and Fits for Engineering and Manufacturing. 50c. Ottawa, the Association, 1948.

This standard gives definitions of terms applying to fits between plain (non-threaded) parts, outlines the procedure for specifying such fits, including the choice of the basic size of the parts and their tolerances; the allowance of the fit; the use of the basic hole system or the basic shaft system and preferred fits for general engineering purposes. It applies particularly to fits between cylindrical parts, but may also be applied to fits between mating parts other than cylindrical.

ELECTRICITY; TEXT BOOK AND LABORATORY MANUAL:

M. M. Das. New York, Toronto, Van Nostrand, 1948. 483 p., illus., 8¾ x 5¾ in., cloth, $5.50 (in Canada.)

This book is based on a course of lectures and laboratory work given to students preparing for the Intermediate examinations in Science and Engineering of the University of London. Theory and experiment run parallel, and a large number of experiments have been included. Recent applications of electricity, such as Magnetic Prospecting, Discharge Tube Lighting, etc., are dealt with, as well as fundamentals. Questions and exercises follow each chapter.

HEAT CONVECTION FROM FINNED TUBES:

E. Horrison. Monchester, Emmott, 1948. 43 p., illus., 6½ x 4 in., paper, 2/6-. (Mechanicol World Monographs No. 46).

This Monograph is an attempt to correlate the literature of the film rate of heat transfer on the extended surface side of heaters. For simplicity it has been confined to the common case of air or other diatomic gas as the medium to or from which heat is transferred, though the extension to other fluids is not difficult.

LANCASHIRE BOILER AND ECONOMISER DEFECTS AND REPAIRS:

Sydney D. Scorer. London, John D.

Troup, 1948. 38 p., illus., 9 x 6 in., paper, 6 –.

This pamphlet discusses the various kinds of failures and defects in boilers, and approved methods for dealing with them. It includes a classified summary of defects recorded in vertical cross-tube, Lancashires and Cornish boilers, and furnace tables for rapid calculation of safe working pressure.

MANUAL OF REPORT PREPARATION, CORRESPONDENCE AND TECHNICAL WRITING:

Frank Kerekes and Robley Winfrey. Dubuque, Iowa, Wm. C. Brown Co., 1948. 397 p., illus., 11 x 9 in., paper, $6.00.

This manual on the preparation of reports is meant for the student as well as the man in business, industry, or science. It offers material and suggestions for the improvement of report preparation. Much of the usual academic treatment of English and composition is omitted. Stress is placed on the preparation of the typescript, handmade reports, and the original form of all reports. Emphasis is upon the complete process of "preparation", rather than only upon the "writing" of reports.

MODERN MECHANICAL SAW PRACTICE:

J. Raymond Foyster. London, Crosby Lockwood, 1947. 274 p., illus., 8½ x 5½ in., cloth.

The writing of this book is an endeavour to expound the latest knowledge of saws and sawing technique in a constructive and organized manner, so that it may contribute to the industry wherever saws are used. In propounding technique, controversial subjects have been extensively discussed. The book is intended for sawyers and saw-doctors, owners of machines, saw manufacturers, designers and machine manufacturers, and research workers.

POCKET-BOOK FOR MECHANICAL ENGINEERS, new ed:

D. A. Low, edited by B. B. Low. New York, London, Toronto; Longmans, Green, 1948. 778 p., illus., 6 x 4 in., fabrikoid, $4.50 (in Canada).

The author has compressed into one volume a great deal of detailed information needed for ready reference by the mechanical engineer. Tables and diagrams are included in abundance in all sections. There is a long introduction dealing with mathematics in all its branches. A section on mechanics leads to the discussion of materials, their properties, and their products. The greater part of the book is devoted to machinery and its parts.

RESEARCH IN INDUSTRY; ITS ORGANIZATION AND MANAGEMENT:

C. C. Furnas, editor; prepared by and published for Industrial Research Institute, Inc. New York, Toronto, London; Van Nostrand, 1948. 574 p., illus., 9¼ x 6¼ in., cloth, $8.00 (in Canada).

This book presents principles and experiences that have proved applicable and valuable in the organization and management of industrial research. Some of the subjects discussed are the research director's job; the research budget; qualifications of research personnel; professional growth of the research man; the location, design, and construction of a modern research laboratory; translating research results into new products and factory procedures. Extensive bibliographies are included.

TELEVISION; HOW IT WORKS:

John F. Rider Publishing Co., New York, 1948. 203 p., illus., 11 x 8½ in., paper, $2.70.

This is a text intended for the television technician and the service industry. It incorporates the theoretical principles upon which the various circuits of a television receiver are based and also explanations of the operation of television receivers such as are on today's market. Numerous illustrations and explanatory diagrams are included.

TRAFFIC ENGINEERING FUNCTIONS AND ADMINISTRATION:

Joint Committee of the American Association of State Highway Officials, American Public Works Association, and the Institute of Traffic Engineers. Chicago, Public Administration Service, 1948. 137 p., illus., 10½ x 7¾ in., paper, $2.50. (Public Administration Service Publication No. 100).

The three groups forming the committee to deal with the traffic problem in the United States published this report as a survey of the situation and a recommendation of the means to be applied and the organizational structure required in the most effective attack upon the problem. It includes a detailed discussion covering the various aspects of traffic engineering, as well as many charts, tables, and illustrations.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

DESIGN OF CRYSTAL VIBRATING SYSTEMS FOR PROJECTORS AND OTHER APPLICATIONS:

W. J. Fry, J. M. Taylor and B. W. Henvis. Dover Publications, New York, 1948. 182 p., diagrs., charts, tables, 9½ x 6 in., cloth $3.50.

A detailed study is presented of crystal vibrating systems and procedures for their design involving graphs based on fundamental piezoelectric relations. While the graphs are prepared primarily for the design of projectors, they are equally useful in the design of other piezoelectric devices. Part I contains the design curves and detailed explanations of their use. Part II deals with the mathematical analysis and the derivations of the expressions used in constructing the curves. Appendices A and B provide units, definitions, symbols, conventions, and tables and graphs of physical constants.

DIESEL ENGINE DESIGN, 5th ed:

E. F. P. Purday. Constable & Company, Ltd., London, 1948. 545 p., diagrs., charts, tables, 6¾ x 5½ in., cloth, 25s.

The fifth edition of this text has been generally revised, parts rewritten, and many figures replaced with new illustrations typical of later practice. A new chapter has been added, which reviews the main problems of design and shows that the performance of a typical modern Diesel engine can be closely accounted for by known physical principles. The place of the Diesel engine with respect to other internal combustion engines is also considered, with special reference to the recent development of the gas turbine.

ENGINEERING CONTRACTS AND SPECIFICATIONS, 2d ed:

R. W. Abbett. John Wiley & Sons, Inc., New York; Chapman & Hall, Ltd., London, 1948. 327 p., charts, 8½ x 5½ in., cloth, $3.75.

The purpose of this book is to present some of the legal and business aspects of the engineering profession. In contrast to the first edition, increased emphasis is placed upon contract procedure for private work, although the original material on government methods has been retained and brought up to date. An entirely new chapter on construction insurance has been added, and the sections on prequalification and arbitration have been rewritten and expanded. Much new material on specification writing has been added.

FAN ENGINEERING, AN ENGINEER'S HANDBOOK, 5th ed:

R. D. Madison, editor, Buffalo Forge Company, Buffalo, 1948. 808 p., illus., diagrs., charts, tables, 7 x 4½ in., cloth, $6.00.

The four major parts of this useful manual deal respectively with: the physics of air; fan characteristics, dynamics, testing, etc.; fan applications; fans and air conditioning equipment. Theoretical principles and descriptive material have been condensed in order to include as much engineering data as possible. The book has been revised throughout to conform to current practice, and a more complete ready reference index to charts and tables is provided.

INTRODUCTION TO APPLIED MATHEMATICS.

F. D. Murnaghan. John Wiley & Sons, New York; Chapman & Hall, London, 1948. 389 p., diagrs., tables, 9¼ x 5¾ in., $5.00.

Designed for graduate students and scientific workers with diversified interest, this book is a detailed and self-contained study of the mathematics used in modern physics and engineering. A methodical account is given of vector and matrix calculus, harmonic analysis, spherical harmonics, and Bessel functions. Also discussed are boundary value problems and integral equations, mechanical problems by means of the calculus of variations, and operational calculus.

INTRODUCTION TO HIGHWAY ENGINEERING, 5th ed:

J. H. Bateman. John Wiley & Sons, New York; Chapman & Hall, Limited, London, 1948. 538 p., illus., diagrs., charts, maps, tables, 9¼ x 5¾ in., cloth, $5.50.

In addition to fundamentals this comprehensive text includes practical examples and problems. In the revised edition material has been added on highway traffic surveys, soil-cement and bituminous-soil base courses, concrete mixtures, and the use of air-entraining cement or air-entraining admixtures. The material on highway subgrade soils has been reworked.

U.S. HIGHWAY RESEARCH BOARD, PROCEEDINGS OF THE TWENTY-SEVENTH ANNUAL MEETING, HELD AT WASHINGTON, D.C., Dec. 2-5, 1947.

R. W. Crum and others, editors. National Research Council, 2101 Constitution Ave., Washington, D.C., 1948. 523 p., illus., diagrs., charts, tables, 9¾ x 6½ in., cloth, $7.50.

Some forty-five papers and reports are contained in the present volume of this annual publication. They are grouped under six broad headings: economics, finance and administration; design; materials and construction; maintenance; traffic and operations; soils investigations. Information on the work of the various committees and on certain awards is also given.

PUBLIC HEALTH ENGINEERING, Vol. I.

E. B. Phelps and others. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948. 655 p., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $7.50.

Written primarily for municipal and civil engineers who want to know what to design and build and why, this book covers the entire field of environmental sanitation. Its approach is through chemistry and the biological sciences. Divided into two parts: a discussion of the air contact, broadly defined to include atmosphere pollution from smoke, odors and noise, ventilation, illumination and insect problems; and a discussion of water contact, including the uses and abuses of water resources, stream sanitation, sewage treatment and conservation of water supplies. Food will be dealt with in volume 2, to be published later.

Although the following new books are not available in the Institute Library, inquiries concerning them will be welcome there or may be sent direct to the publishers.

HEAT ENGINES, 3d ed:

S. H. Moorfield and H. H. Winstanley. Edward Arnold & Co., London; Longmans, Green and Co., New York, Toronto, 1947. 326 p., illus., diagrs., charts, tables, 7½ x 5 in., stiff cardboard, $2.25.

Containing fundamental principles, this book is intended for use as a text for a year course in heat engines. In this third edition, the Fahrenheit temperature system is used in all steam calculations and data. Other portions of the text have been rewritten and new examples included. A background of elementary physics is needed.

INDUSTRIAL ELECTRIC FURNACES AND APPLIANCES, Volume II.

V. Paschkis. Interscience Publishers, Inc., New York and London, 1948. 320 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $8.00.

This book covers resistance furnaces and appliances, induction and high-frequency capacitance heating, and the selection of furnaces. A fairly rigid classification of furnaces is made and applications for each general class are listed. The electrical fundamentals of induction and capacitance heating are discussed only briefly, and no attempt is made to cover specific technologies such as drying and quenching. Volume I presented an introductory survey and covered electrode melting furnaces.

MECHANICS, 2d ed:

J. W. Breneman. McGraw-Hill Book Company, New York, Toronto, London, 1948. 144 p., diagrs., tables, 9¼ x 6 in., cloth, $2.50.

A simplified presentation of the fundamentals of mechanics, this volume is intended for students with a limited mathematical background. Stress is laid on the application of principles to important practical problems common to industry. In addition to conventional topics, there is a complete study of levers, pulleys, gears and gear trains and mechanisms. In this new edition, the material has undergone considerable revision, and a large number of problems has been added.

PRODUCTION CONTROL, 2d ed:

L. L. Bethel, W. L. Tann, F. S. Atwater and E. E. Rung. McGraw-Hill Book Co., New York, Toronto, London, 1948. 289 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $3.50.

Originally developed for use by war production workers, this book has been rewritten in terms of current practice to meet the needs of a collegiate programme in management engineering. The general method of presentation is: statement of the basic principles; illustration of the principles through application to specific industrial situations; and case problems to which the student applies the principles involved. Elementary phases of industrial organization and management are omitted. A bibliography is included.

SOLID AND LAMINATED WOOD BENDING.

W. C. Stevens and N. Turner. Department of Scientific and Industrial Research; His Majesty's Stationery Office, York House, Kingsway, London, W.C.2, 1948. 71 p., illus., diagrs., charts, tables, 9¾ x 6 in., cloth, 5s.

The book describes the various necessary equipment and processes for effective wood bending. It is largely a handbook of practice, but contains sufficient theoretical background to explain the adopting of the various procedures. Glue setting methods are covered in the laminated bending section.

STANDARDS OF HYDRAULIC INSTITUTE, 8th ed., 1947.

Hydraulic Institute, 20 West Street, New York 6, paged separately, illus., diagrs., charts, tables, 11¼ x 8¾ in., paper, $3.00.

Of value to purchasers and users of pumps as well as to pump manufacturers, this volume contains pertinent technical and engineering pump data. There are sections on centrifugal, rotary and reciprocating pumps, on miscellaneous data, and over 80 pages on pipe friction.

TABLES FOR THE DESIGN OF MISSILES.

Harvard University Press, Cambridge, Mass., 1948. 226 p., diagrs., tables, 10¾ x 7¾ in., cloth, $9.00. (Annals of the Computation Laboratory of Harvard University, Vol. XVII.).

These tables were made to facilitate the design of missiles by permitting rapid calculation of the characteristics of the quantities affecting the behaviour of a missile in flight. In the introduction, definitions of the tabulated functions, the method of computation, interpolation instructions, the use of the tables, and nonstandard ogives are considered. The major portion of the book contains complete tables of important functions with sufficiently small increments for precise work.

TECHNICAL DRAWING PROBLEMS, Series 2.

H. C. Spencer and H. E. Grant. Macmillan Company, New York, 1948. no pagination, illus., diagrs., charts, tables, 11 x 9½ in., paper, $4.25.

Using for the most part completion-type problems, this workbook presents a wide variety selected from current industrial practice. A "work plan" section contains specific instructions for solving all the problems given, together with references to the companion text: "Technical drawing," by Giesecke, Mitchell and Spencer, the second edition, 1940. Technical lettering and freehand technical sketching are covered as well as the customary drawing-board work.

BUSINESS & INDUSTRIAL BRIEFS

A Digest of Information received by The Editor

Appointments and Transfers

Arthur H. Frampton has been appointed general manager of the English Electric Company of Canada, Limited. He will be located at the head office of the Company in St. Catharines, Ont. A graduate engineer, Mr. Frampton has been associated with the Canadian electrical industry for the past thirty years. Before joining English Electric, he was deputy assistant general manager—engineering, of the Hydro Electric Power Commission of Ontario.

As a Hydro executive, Mr. Frampton assumed major responsibilities in connection with the direction of the Commission's post-war expansion programme. He is president of the Engineering Alumni Association and is also actively identified with the Alumni Association of the University of Toronto.

G. Frank Simpson

G. Frank Simpson has succeeded his father, Guy H. Simpson as manager of the Quebec City branch of Crane Limited. Following graduation in Arts from McGill University in May 1928, he joined the Crane Company and has held positions in the Purchasing Department, Order Department, the Montreal Showroom, and as Advertising supervisor.

•

Roy H. Sjoberg is now assistant general manager, Automotive Division of the Canadian Car & Foundry Co. Ltd. He is located in the head office of the Company in Montreal.

A. K. Tate

A. K. Tate has been appointed general sales manager of the Car Division of the Canadian Car and Foundry Co. Ltd. Mr. Tate joined the Company in 1916 on his return from active service overseas. During World War II Mr. Tate was his Company's representative in Washington.

•

A. G. Robertson has succeeded the late F. C. Ransom as superintendent of the Refining Department of the Consolidated Mining and Smelting Co. of Canada Ltd. Mr. Robertson graduated in 1935 from the University of Alberta with a B.Sc. in mining engineering. He is vice-chairman of the West Kootenay branch of The Canadian Institute of Mining and Metallurgy.

•

The Northern Electric Co. Ltd., has made four senior appointments in the Wire and Cable Division. Effective January 1, R. G. Harries, formerly shop superintendent, was appointed works superintendent of the Division's Shearer Street plant in Montreal. A. M. Croll is now works superintendent of the Lachine plant.

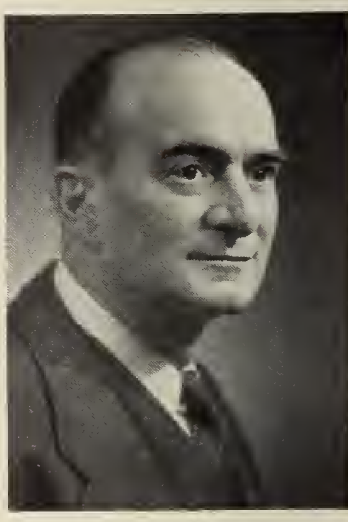
G. K. Reynolds, formerly acting Lachine plant superintendent, was appointed personnel superintendent of the Division and E. D. Bent has been named chief engineer.

•

It was announced in the New Year's R.C.N. promotion list that Commodore (E) John G. Knowlton, chief of Canadian Naval Technical Services, has been promoted to the rank of Engineer Rear Admiral.

•

C. L. Farquhar has been appointed manager of the Gananoque forging plant of the Steel Company of Canada Ltd. Mr. Farquhar has spent his entire professional career with the Company.



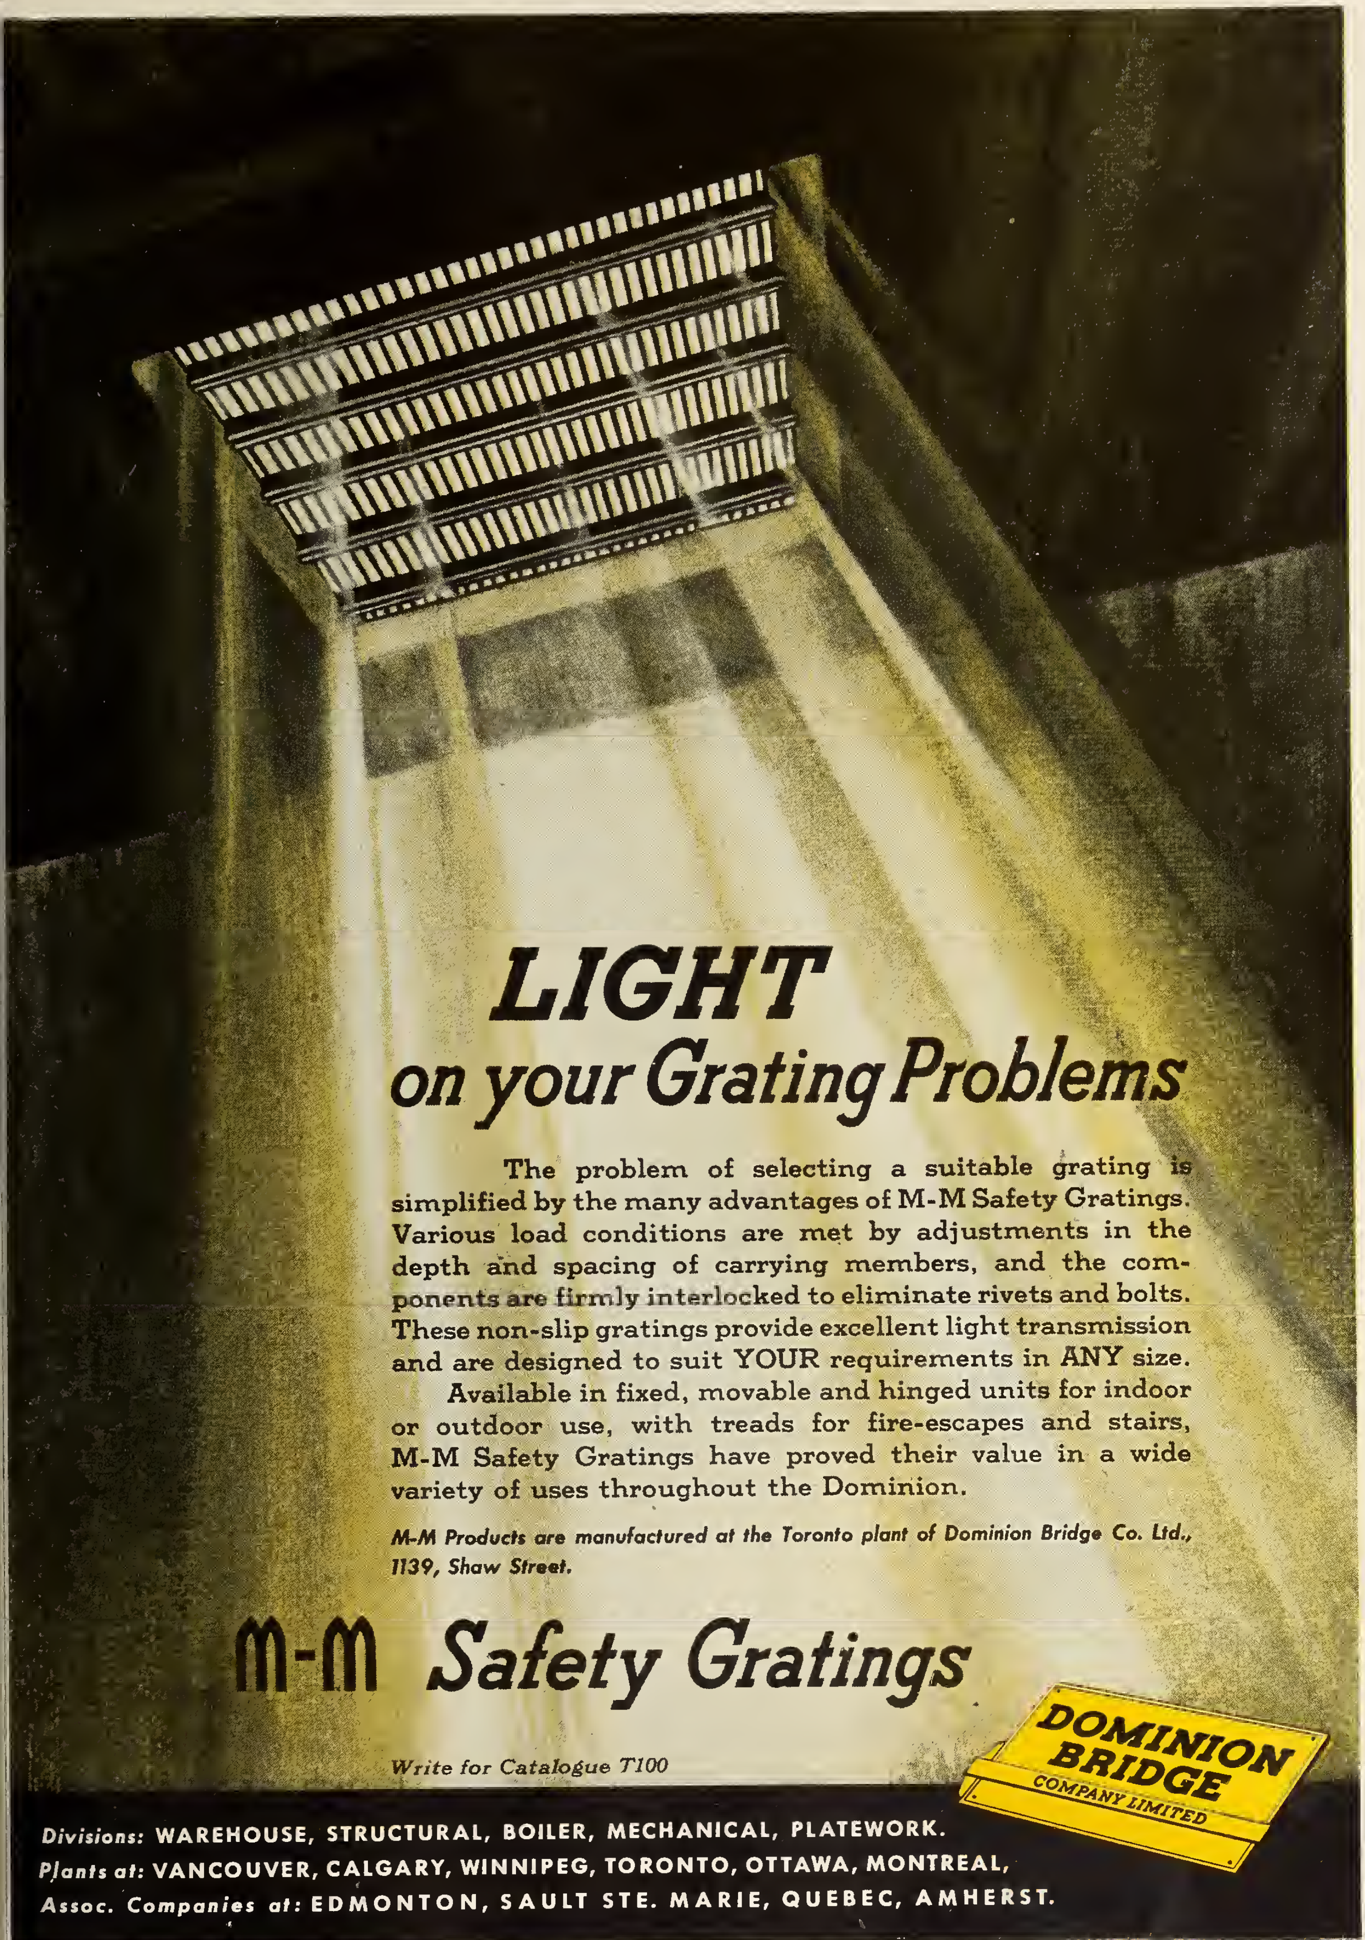
J. L. T. Martin

J. L. T. Martin has been appointed secretary of the Shawinigan Water and Power Company and Matthew Balls, M.E.I.C., has been appointed assistant vice-president of the Company.

Mr. Martin succeeds H. G. Budden who is retiring under the Company's pension plan. Mr. Balls will continue to direct operations of the water resources department of which he has been manager since 1941.

•

M. C. Lowe is now vice-president in charge of operations and R. K. Carty is



LIGHT
on your Grating Problems
The problem of selecting a suitable grating is simplified by the many advantages of M-M Safety Gratings. Various load conditions are met by adjustments in the depth and spacing of carrying members, and the components are firmly interlocked to eliminate rivets and bolts. These non-slip gratings provide excellent light transmission and are designed to suit YOUR requirements in ANY size.
Available in fixed, movable and hinged units for indoor or outdoor use, with treads for fire-escapes and stairs, M-M Safety Gratings have proved their value in a wide variety of uses throughout the Dominion.
M-M Products are manufactured at the Toronto plant of Dominion Bridge Co. Ltd., 1139, Shaw Street.
M-M Safety Gratings

secretary-treasurer of Canadian Allis-Chalmers Ltd. Mr. Lowe and Mr. Carty are directors of the Company.

•

J. C. Alexander has been appointed general sales manager, Mechanical Goods Division, Dominion Rubber Co. Ltd., Montreal. He joined the Company in 1936. After considerable experience as a sales engineer covering the mining, pulp and paper, and industrial accounts in the Company's Western Division, he was transferred in 1940 to the Toronto office as assistant sales manager of mechanical goods. In 1942 he was appointed executive assistant, War Products division at the Company's head office in Montreal and was later named as assistant general sales manager of the Mechanical Goods Division in which capacity he served up to the time of his present appointment.

H. T. Williams

H. T. Williams has been appointed general sales manager and O. E. Loberg assistant general sales manager of the Gurney Foundry Co. Ltd. In addition to his duties as general sales manager, Mr. Williams will continue to direct the sales of the Heating Division, while Mr. Loberg will supervise the sales of the Stove Division.

•

Dr. Gerard Herzberg was appointed, on January 1st, director of the Division of Physics of the National Research Council. Dr. Leslie E. Howlett has been appointed associate director of the Division of Physics of the Council.

•

D. D. C. McGeachy has been appointed president and general manager of the Canada Vulcanizer and Equipment Company Ltd., of London, Ontario. Mr. McGeachy has been affiliated with the Company as vice-president and general manager for the past year.

•

The Northern Electric Co. Ltd., has announced that Martin P. Murphy and James S. Cameron, M.E.I.C., have been appointed vice-presidents of the Company. Mr. Murphy was formerly assistant general manager (commercial) and he will now serve as general manager reporting to the president. Mr. Cameron was formerly assistant general manager (manufacturing).

J. H. Salter has been appointed assistant manager of the Personnel Division of The Consolidated Mining and Smelting Company of Canada Ltd. Mr. Salter graduated from the University of Toronto in 1934 with a B.Sc. degree in metallurgy and he started permanent employment with the Company in the same year.

•

A. E. Dyment has been named sales manager of the explosives division of Canadian Industries Ltd., Montreal. Mr. Dyment is a University of Toronto graduate in mining engineering. He has been with C.I.L. since 1930.

•

Sam L. Mackay, president of Engineering & Machinery Ltd., 736 Granville Street, Vancouver, B.C., has acquired Gilbert H. Bancroft's shares in the Company. Mr. Bancroft has opened his own engineering office. (See "Personals", January Issue.)

•

A. C. McGiverin is now director of government sales for all divisions of the Dominion Rubber Co. Ltd., Montreal.

•

N. Bruce Wilson, president of The Automatic Clutch Corporation of Canada, announces the removal of the head office of the Company to 165 Spadina Avenue, Toronto. The change in location was brought about by the Company's expansion in business.

N. Bruce Wilson

A. B. Russell has been appointed assistant works manager of the Canadian Allis-Chalmers' plant at Lachine, Quebec.

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

On advertising page 44 of this issue of the Journal is a half-page advertisement headed "Ex-Tuberculosis Patients Make First Class Employees" published under the authority of the Hon. Milton F. Gregg, V.C., minister of The Department of Veterans Affairs. The editor has received a copy of the booklet referred to in the advertisement and it is recommended as containing most informative material. Inquiries should be addressed to the Department of Veterans Affairs, Ottawa, Ontario, and the publication should be referred to by name "Employment of the Tuberculous".

•

South Bend Lathe Works, South Bend 22, Indiana, offers Catalogue No. 100-G. It is printed in four colours and contains illustrations and specifications of all major items manufactured by the Company. The street address of the manufacturer is 359 East Madison Street, South Bend 22, Indiana.

•

The Cleveland Worm and Gear Company, 3249 East Eightieth Street, Cleveland 4, Ohio, has available copies of an extremely interesting brochure entitled "More Horsepower per Dollar". Copies may be obtained from the manufacturer or through their Canadian agent, Peacock Brothers Limited, Ville Lasalle, Montreal, P.Q.

•

Armstrong Cork Canada Limited, P.O. Box 6092, Montreal, P.Q., has issued a twenty-four page two colour bulletin "Armstrong's Gasket and Sealing Materials". This publication is recommended to readers who wish to have available up-to-date information on the characteristics and uses of gaskets and sealing materials.

•

English Electric Company of Canada Limited of St. Catharines, Ontario, offers readers of the Journal a new booklet on type "AD" squirrel cage induction motors. The bulletin gives full specifications for this type of motor. The booklet measures 8½ x 11", contains 8 pages and is printed in two colours. Ask for bulletin No. 148-5.

•

The Gaertner Scientific Corporation, 1201 Wrightwood Avenue, Chicago 14, U.S.A., has authorized the distribution of a well-produced catalogue on Gaertner Microscopes for Laboratory and Shop. The publication is most informative and the material is presented in an excellent manner. Copies may be obtained from the manufacturer.

•

The Canadian Fairbanks-Morse Company offers bulletin G-182 covering American flexible metal hose for which the Company is the Canadian distributing agent.

•

The International Nickel Company of Canada Limited, 25 King St. West, Toronto, offers 4 interesting booklets.

These are "Controlling Corrosion on Petroleum Production Equipment"— which covers nickel alloy uses in the petroleum industry — "Corrosion by Concentration Cells" in which are suggested methods for minimizing or preventing concentration cell corrosion; a revised edition of "Helpful Publications of Nickel Alloys", in which are outlined the Company's materials which would be of interest to production men, design engineers, metallurgists, and other users of metal. The fourth booklet in the group is called "How to Cure Some Overhead Aches" and it is intended primarily for engineers in the brewing industry.

•

The Dominion Engineering Company Limited, P.O. Box 220, Montreal, will be pleased to add the name of readers of the Journal to the mailing list of the "Dominion Engineer," the Company's monthly publication which is now commencing its 16th volume. In the January, 1949 issue there is a description of manufacture of plywood and wallboard which provides most interesting reading.

•

The Miller Motor Company, 4027 N. Kedzie Avenue, Chicago 18, Illinois, offers an 8-page reprint of an article "Hydraulic Seals" which appeared in December "Machine Design." The article gives information on the advantages and disadvantages of the various types of hydraulic seals now in use and discusses recently developed methods of sealing.

•

The Nordberg Manufacturing Company, Milwaukee 7, Wisconsin, announces a new 10 horsepower Diesel engine. Known as the type 4FS-1 this new engine is a heavy duty, vertical type, four cycle, single cylinder, mechanical injection machine. It has 4½" bore and 5¼" stroke and is rated at 10 hp., 1200 r.p.m. and 15 hp. at 1800 r.p.m. For complete details ask the manufacturer for bulletin No. 165.

•

Information on the new D Roadster Tournapull, one-man operated, self-loading dirtmover, is contained in a new D Roadster literature Broadside, which may be obtained on application to the manufacturer, R. G. LeTourneau Inc., Peoria, Illinois.

New Equipment and Developments

Aiken & MacLachlan Limited of St. Catharines, Ontario, has been awarded the general contract for the construction of a dam and power house, Matthias Power Project, South Muskoka River, for the Orillia Water, Light and Power Commission. The dam will be 800 feet long and 30 feet high and the plant will develop 3000 hp.

•

According to information received from Hobbs Glass Limited, London, Ontario, "Herculite" plate glass is receiving wide acceptance. This product, which the manufacturer claims is much stronger than ordinary glass, will not break under normal usage. It will stand temperatures up to 500°F. It is also claimed that, should the glass be broken, the particles resemble rock salt and do not cut or lacerate.

The glass is recommended for use in revolving doors, inspection tables, oven door fronts and other places where there is exposure to heat or impact.

•

The 1949 Canadian International Trade Fair will be held at the Toronto Exhibition Grounds from May 30th to June 10th. One of the principal purposes of the Fair is to give business and professional men the opportunity to get together with their counterparts from every part of the world; to do business with them face to face, and to put the ingenuity and initiative of business and professional men to work in breaking down the barriers which impede present international trade.

The Trade Fair will be open to the public on two Wednesdays and one Saturday during the period of the Fair. On other days the attendance will be restricted to business and professional visitors. Twenty-one groupings of displays have been arranged and of particular interest to the professional engineer will be the Chemicals; Automotive; Marine and Aviation; Building Materials and Contracting Materials; Iron, Steel and Non-Ferrous Metals; Electrical Tools, Motors and Supplies; Engineering and Plant Equipment; Rail and Tramway Equipment and Supplies.

E. S. MacDonald Company, Montreal, is completing an order which calls for 25,000 five-gallon aluminum cans a week for a period of ten months. These cans are to be used for the transportation of acid from Montreal to a rubber plantation in the Malay States. The material being welded is type 57-SH aluminum, .032 in. thick. A welding speed of about 26 in. per minute is maintained, using 5 litres of argon gas per minute at approximately 60 amperes. Tungsten electrode, of 3/32" diameter, is used. Two CGE type WP Inert-Arc welders are being used for this job.

•

A new type of industrial truck to handle the largest packs of plate glass ever assembled has been designed and built by Elwell-Parker Electric Co., Cleveland, Ohio. The truck that has solved this problem is also recommended by the manufacturer for use in handling large sheets of other materials, such as steel, asbestos and building board. For details communicate with the manufacturer, 4205 St. Clair Ave., Cleveland 14, Ohio.

•

A two year research project aimed at checking and improving design procedures of shell roof structures has been assigned to the Fritz Engineering Laboratory of Lehigh University by the Roberts and Schaefer Engineering Co. of Chicago. Under the contract, experimental and analytical research will be conducted on the design of shell structures of reinforced concrete of the type used in large aeroplane hangars or in domes of monumental buildings. In such structures, spans of several hundred feet are bridged by shells only a few inches thick and stiffened by slender arch ribs.

•

A new portable pump unit has been announced by the Eco Engineering Company, 12 New York Avenue, Newark 1, New Jersey, manufacturers of Gearless Pumps. This new unit consists of an Eco Gearless Pump, Model PT-2, powered by a 1½ hp. single cylinder, four cycle air cooled gasoline engine. It is designed for use wherever a portable type emergency pump is required.

•

Etraco Manufacturing Co. Inc., Woods Church Road, Flemington, N.J., has announced a new portable safety transformer to safeguard workers in damp surroundings from the possibility of fatal electric shock while working with the conventional type of 110 volt extension lamp. It is particularly recommended for use in places where there is contact by hands, feet or body with grounded surfaces. The portable safety unit weighs only 4¼ pounds and reduces a 110 volt circuit to only 6 volts. Complete details may be obtained from the manuacturer.

•

The longest continuous lighting installation in the world, in which four ribbons of fluorescent light will extend almost two miles, has been designed for the Brooklyn-Battery tunnel by New York City engineers in collaboration with engineers of the General Electric Company. Each of the tunnel's two tubes will carry two lanes of traffic, and will be lighted by twin rows of white fluorescent lamps.

A total of 5,776 individual lamps will comprise the entire installation. The lamps will be housed in clear Pyrex "pipe" near the top of the sidewalls of the tubes.

Astronomical clocks will turn on a higher intensity of light in the portal sections of the tunnels during daylight hours.

•

R. G. LeTourneau Inc., of Peoria, Ill., has announced the addition of three new tools to its line of earthmoving and materials handling equipment—the E-35 Tournahopper, the E-40 Tournarocker and the E-25 Carryall Scraper. Complete details of the equipment may be obtained from the manufacturer.

•

The R.C.A. Victor Company Ltd., has completed what is believed to be the first installation in Canada of test equipment for use in the manufacture of television receivers.

•

Two 40-ton, four-axle, trolley-type, high-speed mine haulage locomotives have been delivered by General Electric's Locomotive and Car Equipment Divisions, Erie, Pennsylvania, to the Consolidated Mining and Smelting Co. of Canada Ltd. General Electric engineers said that these are the largest mine-type electrical locomotives ever built by the Company.

•

Canadian General Electric announces a compound recommended for lubricating rubber and lead covered cables as they are pulled through conduit. The compound contains no oils, greases, or other materials which may be injurious to wire and cable insulation. Complete details may be obtained from the Company.

•

Electric lighting costs will be reduced as a result of a fluorescent lamp improvement announced by General Electric Company. Consumers who have been employing 100 watt fluorescent lamps will use about 14% less electricity and still obtain the same amount of light, according to G.E. illuminating engineers.

The saving will be possible as a result of the development of an 85 watt fluorescent lamp which produces the same high light output, has the same long life and the same overall dimensions as a 100 watt lamp. This development is a result of the successful use of Krypton instead of Argon as the tube filling.

•

Vital Products Manufacturing Company announces new additions to its line of featherweight caulking guns and the redesign and improvement of standard models. These Caulking Guns are now supplied in seven sizes and types ranging from one pint to 2½ quarts capacity. For details apply to the manufacturer at 7500 Quincy Avenue, Cleveland 4, Ohio.

•

Installation of a chlorine cylinder-filling unit at the chemicals plant of Canadian Industries Limited in Cornwall is to be made at an approximate cost of $100,000, it was announced by the works manager, F. M. Robertson.

Work on the new unit, which was designed by C-I-L engineers, will start next spring and completion is expected by the fall. It will be housed in a new concrete brick and steel building.

•

Now in operation at the Northern Electric Company's Lachine Wire and Cable Plant are three new electric telephone cable dryers and two new Watson tripling machines. Several new impregnating tanks will be put into operation in a short time. A length of cable can be thoroughly dried within 80 to 90 minutes in one of the new driers. Before conversion to electricity this operation took from 6 to 8 hours in the case of loop cable and 24 to 30 hours when toll cable was being manufactured.

•

Industrial employment in Canada reached the highest known point during 1947. The general index for the eight major divisions were 8.5% higher than during the preceding year. Weekly payrolls rose 21.2%. The average wage and salary during the year was $36.15 per week as compared with $32.03 in 1946 — this represents a general increase of 11.6%.

•

According to the Canadian Metal Mining Association, mineral production in Canada during 1948 was over seven hundred and fifty million dollars in value. It is anticipated by the association that in the near future the value of mineral production will reach one billion dollars per year.

•

The Hydro-Electric Power Commission of Ontario is negotiating for the purchase of the Kaministiquia Power Company, according to a statement made by Robert H. Saunders. Commission chairman. The plant is located about twenty miles west of Fort William and has a rated capacity of 24,000 kilowatts. If the purchase is made the power developed

"Business & Industrial Briefs"

This section of the *Journal* is intended to keep readers informed on developments and changes in those business and industrial enterprises, and on new products, which affect the engineer.

If you write with respect to any of the items in this, or other sections, please mention

THE ENGINEERING JOURNAL

by the plant will be tied in with the Commission's Thunder Bay system or Northern Ontario property. The purchase would give the Commission control of the flow at the plant and also control over water storage facilities in the Kaministiquia River water shed.

•

The British Columbia Electric Railway is planning the construction of a 66-mile steel tar transmission line between Victoria and Nanaimo. The present arrangements call for completion by October 1950. The line will link up with the provincially owned British Columbia Power Commission Hart development at the Campbell River. Anticipated total cost of the project is about three million dollars.

•

H. B. Sherman, vice-president and general manager of the Calgary Power Limited has announced that plans have been completed to provide electricity for an additional 2,500 Alberta farms during 1949. About 2,000 miles of farm power lines will be built at an approximate cost of $1,800,000. Completion of the project will raise to over 6,500 the number of Alberta farms serviced by the company.

•

A scale model is being utilized by the Northern Electric Company for the rearrangement of the telephone division department on the ground floor of the Shearer Street plant in Montreal. The model, which measures approximately ten feet by five feet is marked off in squares, each square representing two square feet. Small scale models of all the equipment to be used in the plant have been made and miniature figures representing the personnel of the plant are included in the mock-up. The Company used a similar arrangement when planning the new wire and cable division plant at Lachine. It was found that the use of a model reduced planning costs and eliminated a great deal of preliminary drawing.

•

Canadians have been very prominent in the work being done by the International Civil Aviation organization. Brigadier C. S. Both, former secretary and legal advisor of Canadian Air Transport Board has succeeded Anson McKim as Canadian representative on the ICAO. Mr. McKim, is now vice-president of traffic for T.C.A. Pan Canada is taking steps to carry out its share of an ICAO sponsored agreement made with other North Atlantic countries. The work and duties to be performed by Canada under this agreement include the provision of thirteen weather observation stations, the correction and amplification of the aeronautical maps covering Canadian territory and their revision so that they will correspond with ICAO charts. As part of the same agreement a Canadian weather ship will be stationed on the Atlantic and a long range radar station will be operated.

•

According to Dr. Edward R. Weidlein, director of the Mellon Institute of Industrial Research, Pittsburgh, the vast coal resources of the United States should meet all requirements, for heat, light, power and transportation for more than one thousand years at the present rate of fuel consumption.

Counterweight Replacement on the Cherry Street Bascule Bridge

by

E. R. Graydon, M.E.I.C.

Engineer, Ontario Division, Dominion Bridge Company Limited, Toronto, Ont.

A paper prepared for publication in The Engineering Journal

Failures in the structural steel framework of counterweights for bascule bridges have been quite frequent. Theories as to the causes have been various and non-conclusive. The author presents a simple and plausible theory that serves a useful purpose. Describing the failure in detail and the method of repairs adopted, he analyses the design and gives his conclusions as to how such a failure may be avoided.

The North Cherry Street Bascule Bridge is a Strauss trunnion bascule structure over Keating's Channel on Cherry Street, in Toronto. It is a 130-foot span carrying a 42-foot roadway and sidewalks. Figure No. 1 shows a design diagram. It was erected in 1917, and hence, in the spring of 1947, had been in service for some thirty years. It had been erected in the open position, and the counterweights were believed to have been supported on piles during pouring.

The condition of the counterweights had been of concern to the owners of the bridge, The Toronto Harbour Commission, for some time. In an attempt to halt the severe weathering action occurring on the counterweights, a covering of light gauge metal plates had been placed on the surface of the counterweights in 1936.

In the spring of 1947, the Toronto Harbour Commission decided to remove the plate covers and investigate the condition of the counterweights. Removal of some of these plates revealed that deterioration had not been halted, but that large areas of the concrete surface were in poor condition. In general the entire surface was cracked, with many of these cracks extending over a foot below the surface, while the quality of the surface concrete had deteriorated to the extent that it could be flaked off or crumbled at ease. Upon discovery of this condition, the owners decided upon replacement of the concrete.

How Counterweights Were Repaired

The original counterweights had been composed of a concrete mix containing iron ore aggregate, and weighing 176 pounds per cubic foot. It was decided to replace the counterweight with a mix of the same weight per cubic foot, but using steel punchings to attain the required unit weight. As work was to be done in the navigation season, it was necessary to tie the bridge back in the open position. The leaf tie-backs were composed of two sets of 12 parts of ¾-inch wire rope. They were connected to the bridge trusses at the junction of the top chord and the sloping end posts, and were connected to anchorage pads located an average of 130 feet back from the trunnion pin. These anchorages were located in filled ground, and were composed of concrete pads, 5 ft. by 8 ft. by 12 ft. 6 in., poured around several vertical and batter piles. With the leaf up, the tie-back cables were installed and tightened up on wood blocking until the bumper springs reached the desired compression.

Removal of the counterweights was then commenced, working on both counterweights at about the same rate. The extent of the deterioration of the concrete was soon verified. Adjusting blocks in the pockets were found to have completely crumbled. Despite the condition of the exterior portion of the counterweights; a good deal of the interior concrete around the steelwork was in good condition, and was very difficult to remove. Examination of the concrete aggregate indicated that some gravel had been used for the coarse aggregate, and that the iron ore, used to attain the required weight per cubic foot, had varied in size from ¼ inch to 3 inch material. As removal of the concrete progressed, an additional source of trouble was revealed. A complete break was discovered in one of the counterweight truss members on the West side. Four additional breaks in the steel were discovered. With the counterweight trusses completely bare of concrete, a careful inspection was carried out, but no further cracks were discovered in the

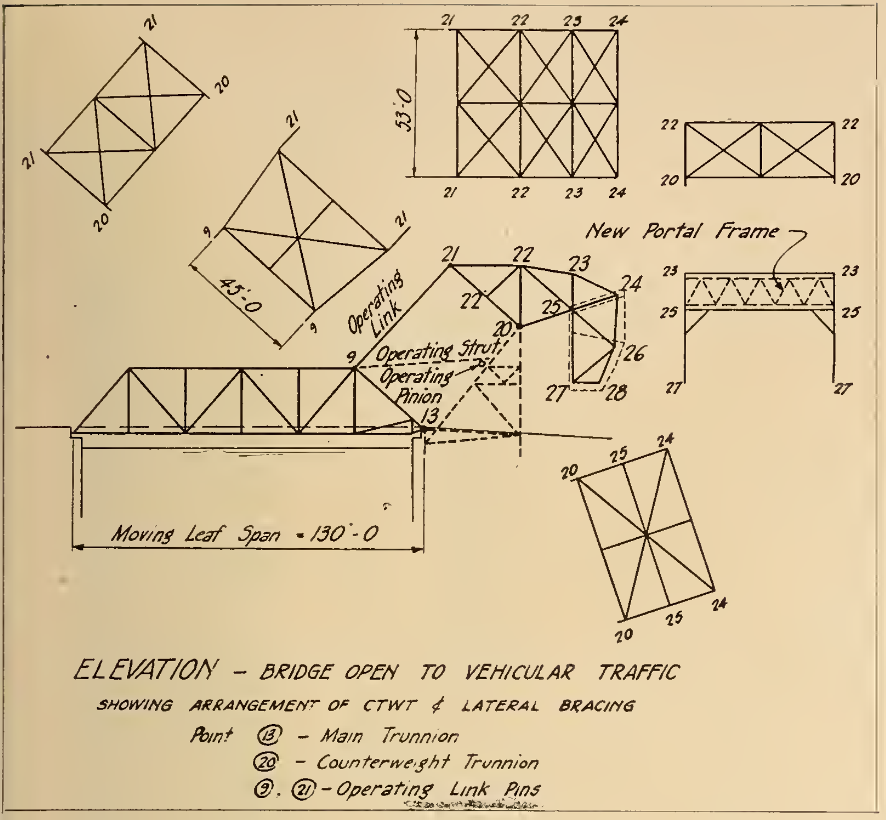

Fig. 1.

steelwork. Considerable corrosion had occurred, however, in the areas where the steel emerged from the concrete, and, in some cases, inside the counterweight where the steelwork had apparently not been in good contact with the concrete.

All of the breaks were spliced, and, after verification of the depth of corrosion by sand-blasting, the corroded areas were reinforced. The counterweights were then formed, and placed in one continuous pour, the forms being supported during the pouring, on piles driven before the bridge was tied back. Each counterweight required about 145 yards. The concrete mix had to be adjusted to allow for the steel added in splicing the fractured members, and the final unit weight of concrete was 172.7 pounds per cubic foot. This weight was attained by using a mix containing steel slugs. These slugs were steel punchings $\frac{3}{4}$ in. to $1\frac{1}{4}$ in. in diameter, and $\frac{1}{4}$ in. to 1 in. in thickness. The mix was designed to give 3,000 pound concrete, and the quantities for 1 cubic yard are shown below:—

Quantities per 1 Cubic Yard

Cement	570 lb.
Sand (dry)	1,280 "
Gravel (dry)	1,750 "
Steel Slugs	760 "
Water (total)	31 gal.

Tests were made of this mix before and during pouring, and the desired unit weight was closely adhered to. On removal of the forms, the bridge was balanced by the addition of adjusting blocks, poured to the same mix as the counterweights and, after testing, put back into service.

Where Failure Occurred

The whole operation may be of some interest, but the writer's main point in recording it was to call attention to the structural failure of the counterweight truss members, and to theorize on that failure. The failures discovered in the steel members of the counterweight trusses were as follows, and, in this description, the writer again refers the reader to Figure No. 1 for the location of the breaks:—

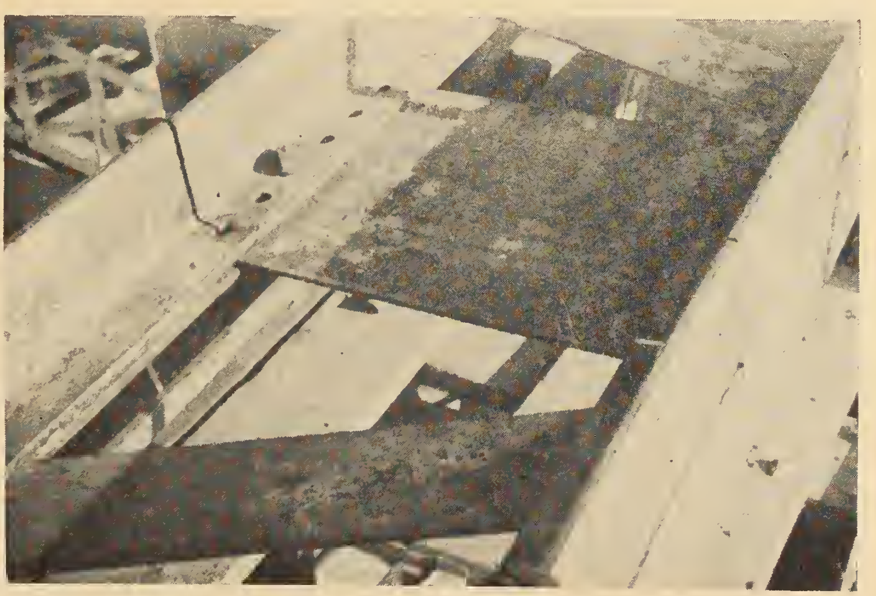
"(1). Member 25-27; West counterweight truss only; member completely fractured."

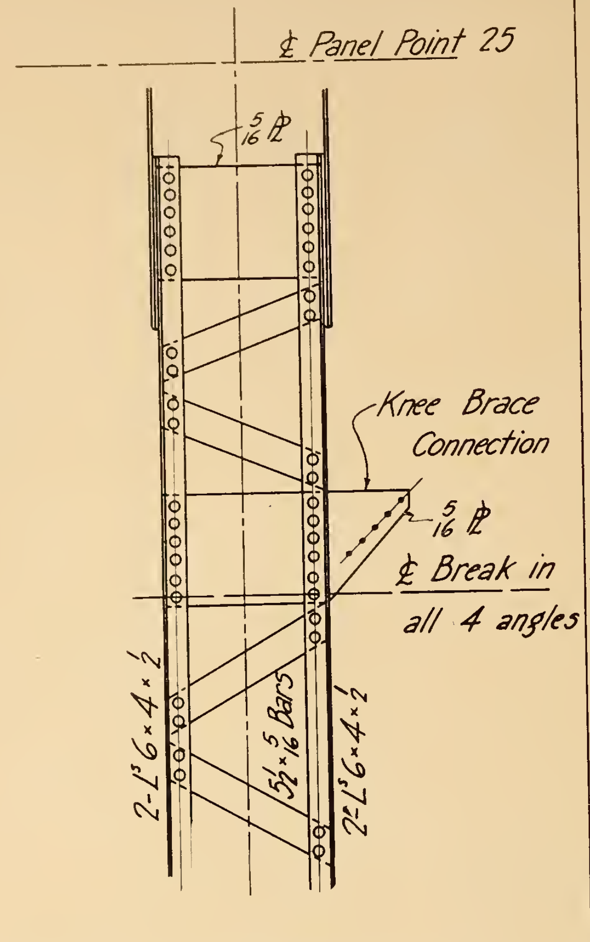
This member had been composed of four (4) angles, 6 in. by 4 in. by $\frac{1}{2}$ in., and all four angles were completely fractured, with the break occurring in the member immediately below the knee brace connection and through a section of minimum area. The break had evidently been in existence for some time, and, when first observed, the joint was open about 1 inch. There was no evidence of reduction of section, and the fracture was sharp and square with the member. Figure No. 2 is a picture of this break, and Figure No. 3 is a sketch of the member.

"(2). Member 24-26; East counterweight truss; two out of four angles fractured."

This member had been composed of four (4) angles, 6 in. by 4 in. by $\frac{1}{2}$ in., and two (2) flange plates, 15 in. by $\frac{1}{2}$ in. The flange plates did not extend for the full length of the member, but stopped about one foot from the edge of the gusset at Joint 26. Immediately adjacent to the end of the flange plate on one side of the member,

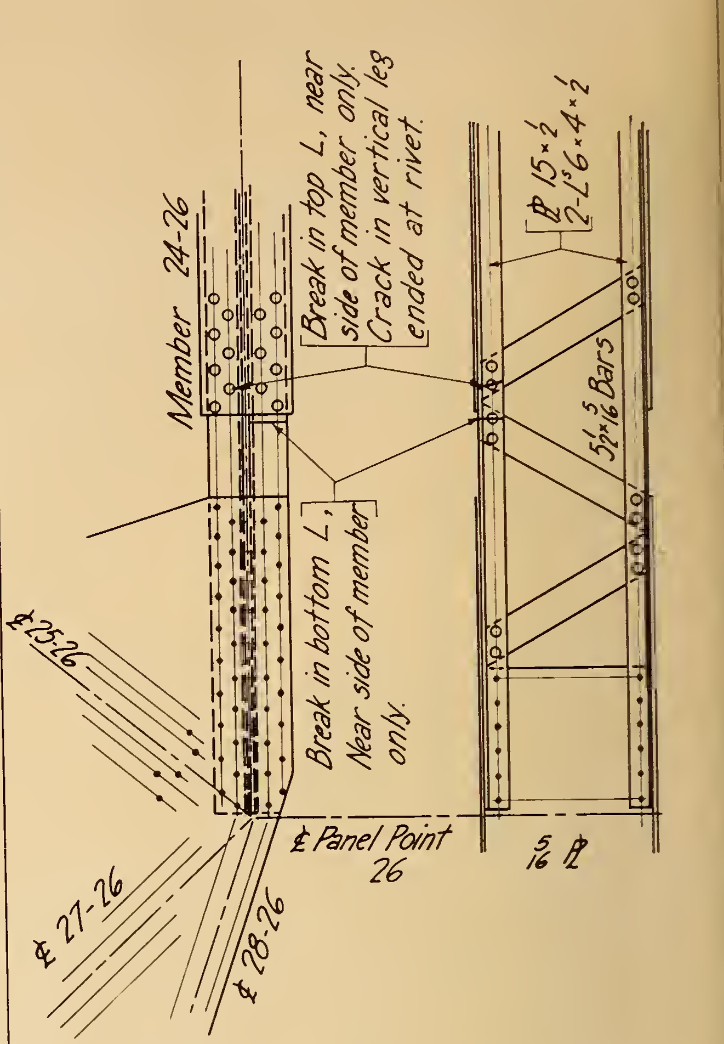
Fig. 2—Break in Member 25-27.





DETAIL OF MEMBER 25-27 SHOWING LOCATION OF BREAK

FIG. 3



DETAIL OF MEMBER 24-26 SHOWING LOCATION OF BREAK

FIG. 4

the bottom angle was completely fractured, and the lower half of the upper angle was also fractured. Figure No. 4 shows a sketch of this joint indicating the fractures.

"(3). Member 24-26; West counterweight truss; two out of four angles fractured."

This fracture was similar to that described under (2) above.

"(4). Member 20-24; East counterweight truss at Panel Point 25; one out of four angles fractured."

This member was composed of four (4) angles, 6 in. by 4 in. by 5/8 in., and four (4) web plates, 24 in. by 1/2 in. Two of the four web plates extend for the full length of the member, with the other two running from Points 20 to 25, ending slightly past Panel Point 25. The break in this member occurred in the bottom inside angle of the member. Figure No. 5 shows a sketch of this joint indicating the fracture.

"(5). Member 20-24; West counterweight truss at Panel Point 25; one out of four angles fractured."

This fracture was similar to the one described under (4) above.

Apparent Reasons for Failure

Consider Member 25-27. This member was composed of 4 angles, 6 in. by 4 in. by 1/2 in., with a gross area of 19 sq. in. and a net area of 15 sq. in. A check of the actual detail verified this net area. The design stress in the member was 200 kips plus 20 percent for impact, giving a total of 240 kips tension. At the basic unit stress of 16 kips per sq. in., an area of 15 sq. in. is required.

With the counterweight down, taking moments about a vertical line through Point 26 and neglecting, for the moment, the weight of the steel, we would have a stress of 136 kips tension. With the counterweight up, and taking moments about a vertical line through Point 26 of the whole volume of concrete in the counterweight, a stress of 316 kips tension is obtained.

The design figure of 200 kips was probably arrived at by the assumption that concrete above Line 25-26 would not contribute to the stress of Member 25-27. The assumption would seem entirely reasonable, as long as the whole mass of the concrete counterweight was an integral unit, securely bonded to all parts of the encased steel.

Disintegration of the concrete, with resulting deterioration in the bond between it and the steel.

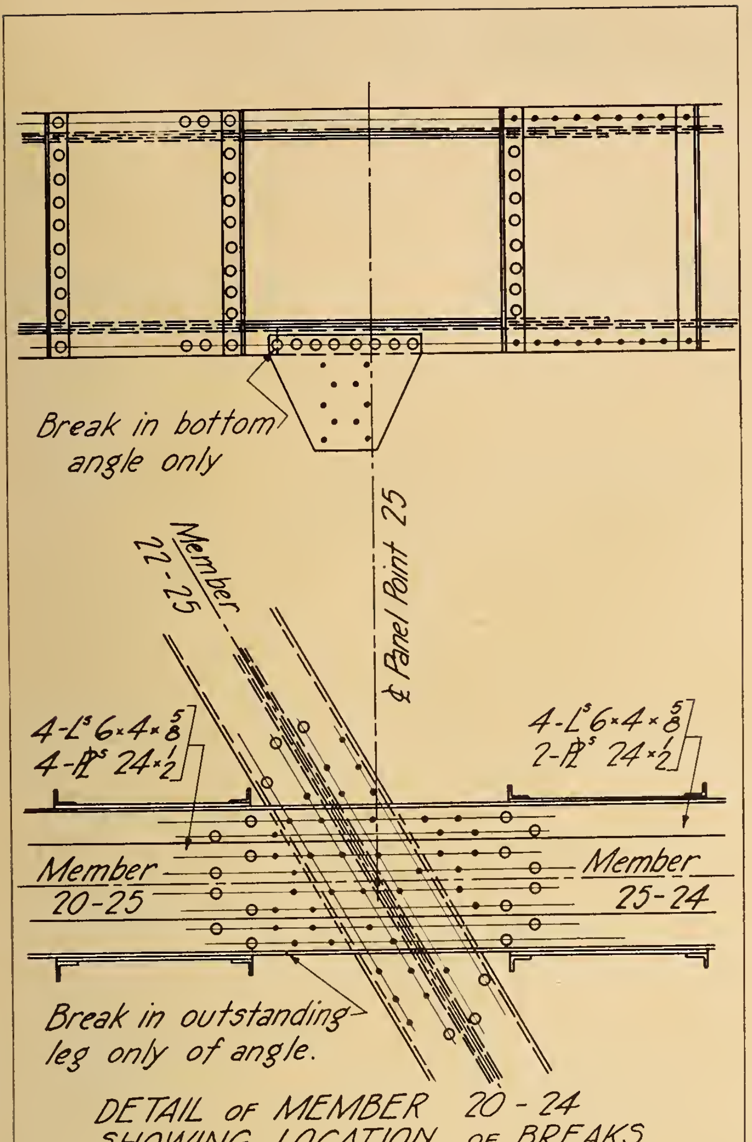


FIG. 5

would conceivably give a stress somewhere between the 200 kips used in design and the 316 kips mentioned above. Accompanying this increased direct stress, and also due to the deterioration of the concrete, severe bending stresses would be possible to such an extent that a 20 percent impact allowance would seem inadequate.

The failures in Member 24-26 were identical failures, and it was apparent that they had been induced by bending stresses. These bending stresses would be set up when cracking of the concrete had so progressed that large portions of the counterweight would be freed to create local bending in the member. The failures in Member 20-24 at Panel Point 25 were also identical failures, and in a symmetrical position. They occurred in one angle of the member only, starting at the extreme fibre of the member and extending in to the heel of the angle.

The fractured angle was located on the side of the member towards Point 27, and on the inside of the bridge. Due to the shape of the counterweights, the fractured pieces of angle would be the most highly-stressed material in Member 20-24, at Point 25, for ordinary operation with the concrete portion of the counterweight adequately bonded to the enclosed steel. In addition, the member is subject to reversal of stress in normal operation. The condition existing in this member when the counterweight concrete had become severely cracked, would be one in which bending and reversal of stress could become major factors eventually resulting in failure.

Other Measures Taken

The condition discovered in the counterweight trusses after removal of the concrete amply justified the decision to replace the counterweights. If no action had been taken, and the condition of the counterweights allowed to grow progressively worse, there seems little doubt that the counterweights would eventually have dropped off with results many times more costly than the repairs undertaken.

In addition to splicing and reinforcing the fractured members, various other steps were taken to strengthen the structure. All corroded material inside the counterweight trusses was either reinforced or replaced. Member 25-26, which could have given trouble similarly to Member 24-26, was reinforced in both trusses. U-shaped reinforcing rods were welded to all large gussets to bond the concrete to the steel in these areas more satisfactorily.

A 3-foot wide rib of concrete was added in the upper void in the counterweights near Point 25. It was felt that, in addition to giving better protection for the steel at this point, considerable shear strength would be added to the concrete in a very important area. A new steel brace frame was also added between the counterweight trusses in the plane of Member 25-23, thus greatly increasing the stiffness of the structure resisting the eccentric moment set up by the counterweights.

Conclusions

Certain conclusions may be drawn from a study of the facts in this instance, and it is possible that these may be of use to others who encounter a similar problem. It seems a reasonable assumption to say that, in bridges of this type, the counterweight trusses have not been designed for stresses other than those caused by the dead load of the concrete and steel, assuming that the bond between these is sufficient to carry the concrete load into adjacent panel points. Hence, when this bond between the concrete and steel is disturbed by extensive cracking and deterioration of the concrete, stresses will be set up in some of the truss members caused by bending. These stresses are quite likely to be subject to reversal, and they will not have been provided for. If the failure of the concrete is severe enough, and at a critical point, then damage to the steel counterweight trusses can be expected.

Forest Management in the Eastern Rockies

A paper presented at the Annual General and Professional Meeting of The Engineering Institute of Canada, at Banff, Alta., June 2, 1948.

by

Howard Kennedy, M.E.I.C.

Consulting Forestry Engineer, Ottawa.

The author, who is chairman of the Eastern Rockies Forest Conservation Board, explains why the Board was created, and gives an outline of its composition and its major problems, with its approach toward, and hopes for, the solution of these problems.

The Forest Reserves

In 1930 the Dominion Government turned over to the Prairie Provinces the natural resources lying within their boundaries. In the case of Alberta, the resources included a group of forest reserves, situated in the foothills of the Rockies and contained the headwaters of the major tributaries of the Saskatchewan and Athabasca Rivers. For many years previously, the Federal Government had paid particular attention to these reserves, and guarded them jealously on account of their importance to the control of stream flow in the rivers draining them.

The forests on these foothill reserves, although of considerable extent, are not Alberta's most valuable timber stands, which are located on the flat lands north and west of Edmonton. Lodgepole pine and spruce are the major conifer species on the slopes, while poplar is the only important deciduous species.

The area within the forest reserves which is treated in this paper is about 9,000 square miles in extent and lies just east of Jasper and Banff Parks, extending southward along the boundary of British Columbia as far as Waterton Lakes Park. It is somewhat wedgeshaped, varying in width from 15 miles at its southern extremity to over 50 miles in the north. There are corridors piercing it in the Cows Nest and Bow River districts.

The Saskatchewan River

Together with the National Parks mentioned, the area encloses the source of all the head waters of both branches of the Saskatchewan River. The major tributaries of the South Saskatchewan include the Oldman, the Bow and the Red Deer, while the North Saskatchewan which rises in Jasper Park is joined by the Brazeau and the Clearwater. These streams have in turn many tributaries, some of them of considerable size. The north and south branches of the Saskatchewan River join near Prince Albert and continue on to Lake Winnipeg, where their waters mingle with those of the other tributaries of the Nelson River.

The Saskatchewan River is by far the most important stream serving the Prairies, and is of vital importance to the continued development and prosperity of all three provinces. All the irrigation schemes already developed or projected, with one exception, that of the Milk River in Southern Alberta, are dependent on the waters of the Saskatchewan. The major hydro electric developments already installed in Alberta are all located on branches of the Saskatchewan. Future hydro developments west of Lake Winnipeg on the prairies will, no doubt, be dependent upon the controlled flow of this great river. With power or irrigation dams and an augmented summer flow it is not unreasonable to expect that inland water transport might again become an important element in that part of the prairies served by the Saskatchewan River.

Inter-Provincial Aspects

It will be appreciated that although the source of the Saskatchewan lies in the foothills of Alberta, its flow is of major importance to the other Prairie Provinces. Existing or projected irrigation schemes and power developments are of little avail unless there is an abundant supply of water in the streams feeding them. It could well happen that millions spent on such development could be rendered ineffective in dry seasons unless the future flow of the river is provided for. Even the fur farms on the marshes in Northern Manitoba are dependent upon water from the Saskatchewan River.

Formation Of The Board

The Federal Government, as well as the Provincial governments concerned, has been well acquainted with the inter-provincial aspects of the Saskatchewan River. It is recognized that forest cover has disappeared from parts of the forest reserves and that the glaciers which provide much of the summer flow of mountain streams on the east slopes are disintegrating at varying rates. In a few decades the influence of the glaciers will be considerably diminished, if indeed it has not disappeared.

Negotiations carried on for several years between the Federal Government and the government of the Province of Alberta resulted in an Agreement signed in 1947, later ratified by both governments, whereby "The Eastern Rockies Forest Conservation Board" was formed to administer that portion of the forest reserves on the eastern slopes, which includes the streams feeding the Saskatchewan River as outlined in an earlier paragraph.

Composition Of The Board

The Board consists of three members, a chairman and one member appointed by the Federal Government and one member appointed by the Government of Alberta. The salaries and travelling expenses of these members are paid by their respective governments. The other members of the Board are J. M. Wardle, M.E.I.C., of the Department of Mines and Resources representing the Federal Government and H. G. Jensen, former police magistrate of Calgary, representing the Alberta Government.

Financial Arrangements

The contract between the governments provides for an annual fund of $300,000 for 25 years for the operations of the Board. This is divided between the governments on the basis of $125,000 provided by the province, which receives returns for timber sales, grazing rights, etc., up to that amount, and $175,000 provided by the Federal Government. In addition to these continuing maintenance funds the Federal Government has provided $6,300,000 to be applied during the first six years of the contract for capital expenditures necessary to carry out remedial measures found necessary, by the Board.

Method Of Carrying Out Work

All work is done by and through the Government of Alberta. The Board acts more or less in the capacity of a firm of consultants. For instance: They decide what intensity of fire protection will be adequate, and what engineering projects are necessary. This is communicated to the Alberta Government which actually carries out the forest protection measures itself, and may arrange for work on construction projects to be carried out by contractors if it is not feasible to do it by day labour.

The Board provides the plans and specifications for all work, and carries out inspection as the work proceeds. It pays for, or arranges for the payment of, all accounts in connection therewith. This entails close liaison and cooperation with the engineering and forestry services of the Alberta Government and the accounting and auditing services of both governments.

Staff

The staff of the Board is organized under three divisions,—Administration, Engineering and Forestry. Office Administration, which includes public relations, has been allotted to the secretary of the Board; engineering which includes all surveys except those pertaining to forestry, preparation of plans and specifications for all construction work and supervision of this work constitute the main functions of the chief engineer. In addition to forest protection the chief forester is responsible for all forest inventory and the preparation of working plans for the operation of the forests. Forest research, nurseries (if any) and studies of the effects of grazing and similar studies are also within this field. Adequate technical and clerical assistance are provided for all branches.

The main office is in Calgary, and the chairman maintains an office in Ottawa where the Eastern Rockies Board shares an executive assistant and a stenographer with the Forest Insect Control Board.

Work To Be Carried Out

The Board recognizes that the main reason for its existence is the maintenance of forest cover on the territory allotted to it. All other activities are subsidiary. With this in mind it has realized that its first duty lies in protecting existing forests from further losses from any reason, whether the threat be from insects, disease, fire, fungi, animals or human beings.

In order to give adequate protection it is also realized that it is necessary to be able to reach every portion of the territory quickly. The first major construction projects are therefore concentrated in the development of a north-south road system, which will be tied in to the municipal and provincial road systems to the east and with the parks system of roads and trails on the west. The skeleton lay-out of this road system has been decided upon. Surveyors are already at work laying out the centre lines for the current season's work. Construction on the road system will be pushed with all possible speed.

Studies of other remedial measures necessary for the control of the streams on the reserve will be commenced this year, as well as studies on the effect of grazing by cattle, sheep and horses of which upwards of 30,000 head are pastured annually on the reserve.

Disastrous fires have denuded a large portion of the area from Red Deer River southwards. The area northwards, however, has not suffered badly in recent decades, and already carries a reasonably good stand of timber which has only to be protected. Experiments will be undertaken to ascertain the feasibility of utilizing faster growing species than lodge-pole pine on denuded areas. It may be necessary to develop nurseries. If so, such development will be fitted into the long term plans of the Dominion and Provincial Forest Service. The policy of the Board is definitely directed toward utilization and development of existing services, federal and provincial, rather than toward building parallel organizations of its own.

Slopes facing south and west

have not shown any worthwhile regeneration following fires and their reforestation poses a challenge which may be very difficult to solve. The quick run-off of melting snows and rains and the very high ground temperatures experienced under the direct rays of the summer sun both create conditions which may frustrate the establishment of seedlings under normal methods of developing forest cover.

Public interest requires that, as mentioned earlier, the Board shall maintain the closest possible liaison with both Federal and Provincial Forest Services and Departments of Agriculture, as well as with the Universities. All these groups have indicated their great interest in, and willingness to assist, the Board in solving its problems.

A working arrangement with the Fish and Game branch of the Province is also in effect. Mutual assistance in the matter of quickly extinguishing fires has been arranged with all neighbours. Fires will be attacked, as soon as detected, by the nearest personnel available with repayment by the agency controlling the area involved, whether it be the provinces of Alberta or British Columbia, the National Parks or the Municipalities bordering on the Reserve.

Federal-Provincial Aspect

The Board is conscious of the tremendous responsibility resting on its shoulders, due to the fact that this is the first example of joint Federal-Provincial attack on forest problems on any scale approaching that of the present undertaking. It is also aware that the summer flow of the Saskatchewan River in a few decades will depend largely on the measures it will carry out within the next few years. The future of co-operative schemes of similar nature elsewhere in Canada may depend on the success or failure of the present actions of the Eastern Rockies Forest Conservation Board. If it acts wisely, the Eastern Rockies project may well result in a more closely knit attack by Federal and Provincial governments on the problem of forest management than has been achieved in the past. In any event it provides for the most comprehensive project of forest management, with assured funds sufficient to do a useful job, that has yet been attempted in Canada, if not on the American continent.

The Future

If the work of the Board is carefully planned and wisely administered it could be the first step toward a more comprehensive Authority which will deal with the use of water in the watershed of the Saskatchewan River. The Board recognizes that provision of forest cover is only one step in the solution of a vast and complex problem.

The use of water for power creates problems of changing water-levels in lakes and streams which are claimed to be detrimental to fish life. It also creates aesthetic problems as well as problems of ice jams and their disposal. The use of water for irrigation on the upper stretches of the Saskatchewan may well reduce the lower stretches to a mere trickle in periods of drought or low summer flow. Irrigation projects already on draughting boards will, if constructed, require annually several millions of acre feet of water. Then there is the question of possible utilization of the river for inland navigation.

These are problems which are not possible of solution by any one province. It would therefore seem that a Saskatchewan River Authority will eventually be necessary to correlate the needs and rights of the various groups who may wish to make use of the waters of the Saskatchewan. The scope of an Authority of this nature is a matter for study and argument by those concerned. The necessity for some central Board is, to the author, beyond question.*

Conclusion

The main concern of the Board is that the public may expect quick results in the way of flood control in spring and increased stream flow in the summer. It is therefore taking pains to emphasize that no measures it can possibly undertake will result in quickly controlling the flow of the Saskatchewan River or its main tributaries. In dealing with forest management a calendar measuring time in quarter and half centuries is far more appropriate than one dealing in years. No miracles will be attempted.

The aim of the Board is centred on the long term project of controlling the run-off created by the relatively high precipitation on the eastern slopes, thereby providing for the maximum useful summer flow of water in the Saskatchewan River so that the disappearance of the glaciers will not be disastrous. In achieving this aim it is expected that a very considerable measure of stream control will become progressively effective. This will decrease the peak floods which now do so much damage, and will increase the minimum flow of the Saskatchewan and its tributaries.

The by-products of the Board's actions should be gradually improved fishing and hunting, easier to reach because of the road system provided. Also the development of Natural Resources including coal, lumber, ties, poles, mine timbers and pulpwood will be made easier as all parts of the area become more accessible.

In approaching their problems the policy of the Board is similar to that so well stated by David E. Lilienthal in his book "T.V.A.—Democracy on the March", when he said, "I believe men may learn to work in harmony with the forces of nature, neither despoiling what God has given nor helpless to put them to use".

---

* Shortly after the presentation of this paper at Banff last June, Ottawa announced the formation of the Prairie Provinces Water Board. See *The Engineering Journal,* February, 1949.

ECONOMIC IMPORTANCE of the ELECTRIC BOILER

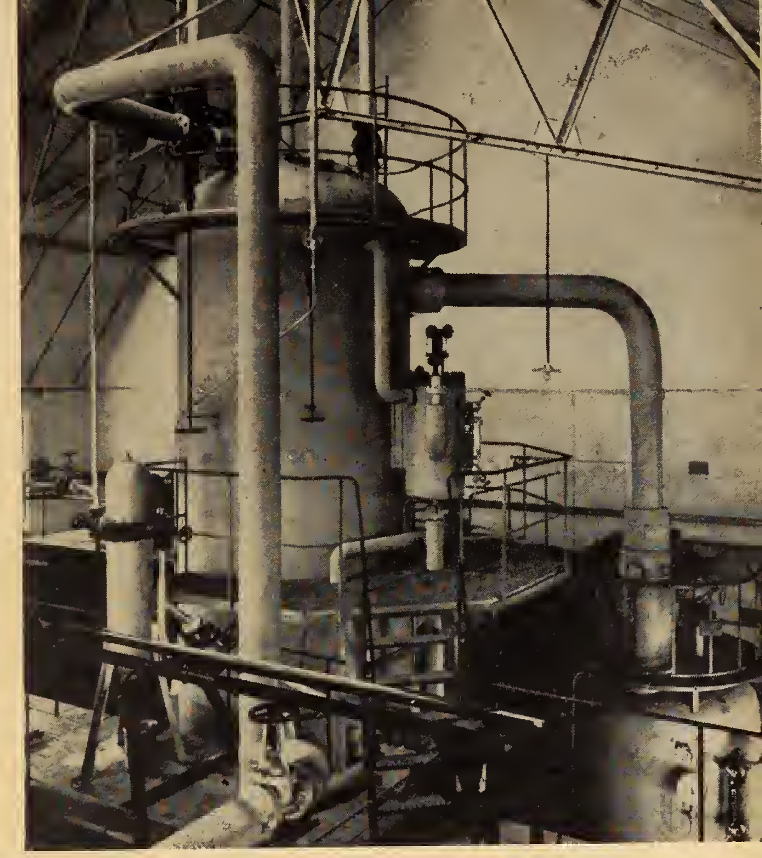

Fig. 4. Electric steam boiler for 6,000 kw., 10,000 volts and 250 lb. pressure, with closed primary circuit and steam transformer for the secondary circuit (consumption system) at 170 lb. pressure.

The following paper was prepared by engineers of Sulzer Brothers, well known Swiss Manufacturers of Electric Steam Boilers.

In response to a number of requests from the membership that the Journal should publish articles embodying the thinking and practice of foreign engineers, this paper, which contains a discussion of European practice relating to steam boilers, is reproduced. It has not appeared elsewhere in Canada.

The fullest possible utilization of waterpower is of the greatest importance in the national economy of many countries, and not least of Switzerland. While the hydro plants in such countries have difficulty in satisfying the growing demand for winter energy, in summer considerable water is wasted. Here the fundamental problems of an electricity supply based on water power will be briefly reviewed, and the importance of the electric boiler in the framework of the system explained.

Modern trade and industry depend to a large extent on the rational utilization of the available sources of power. The world's principal source of power was, and still is, coal. Its importance is enhanced by the fact that it not only stores up energy, but also yields valuable chemicals. The part played by water power in the world production of energy is modest by comparison. For countries such as Switzerland or Scandinavia, however, which possess neither coal nor any other heat-yielding raw material in any quantity, but have water power at their disposal in comparative abundance, the latter takes up a key position in the national economy.

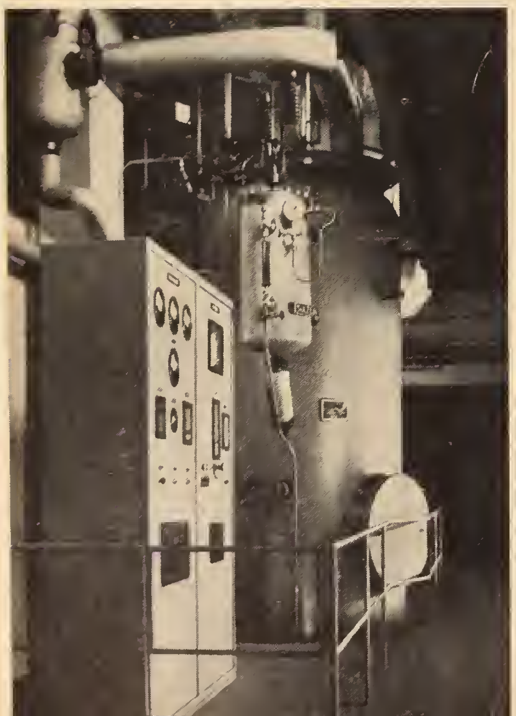
This fact has won wide recognition in the course of time, and has called forth numerous studies, plans and projects for the further utilization of water power. Careful calculations, however, have shown that in densely populated areas such as Switzerland, even after full development of all water-power schemes which are technically and economically feasible, the energy thus produced will not be sufficient to cover the steadily increasing requirements. There can therefore be no question of a surplus.

Fig. 1. Diagram of the daily energy consumption in a large urban electricity works on a winter's day (upper curve), and on a summer's day (lower curve). Abscissae are hours from midnight; ordinates are demand units.

Fig. 2. High-tension line of the Brusio power station, with a view of the Lake of Poschiavo. Electric boilers may be used to improve the economy not only of the power station itself, but also of the costly transmission lines.

The exploitation of hydro-electric energy is further complicated by the circumstance that just when the demand is greatest, the waters flow least abundantly: in winter, when light and heat are most needed, the rivers are at their lowest, while in summer, when demands

Fig. 3. Electric steam boiler of 4,500 kw., 3,000 volts and 170 lb. per sq. in., with control panel for the automatic supply of feed and pressure water in a co-operative agricultural establishment.



are less, a surplus of water is available.

Even during the day, however, electricity requirements are subject to large fluctuations, depending on our daily habits. The daily consumption curve of any district has marked peaks and valleys, the highest point—for example on a winter's day — probably lying somewhere between eleven and twelve o'clock in the morning, the lowest point between four and six in the morning (see fig. 1). The possible production of a hydro-electric plant remains practically constant during the course of the day. This means that at certain hours the output of a station is needed in full or may even be insufficient, while at other times, and specially in the night hours, a surplus of energy is available. Non-utilization of this surplus, from the viewpoint of national economy, not only represents a waste but also impairs the overall utility of the very costly plant.

This position illustrates graphically the difference between electric energy, which must be employed at the moment of its generation, and that contained in such fuels as coal or oil, which can be stored up as long as desired. The rational exploitation of water power therefore postulates the solution of two problems: 1. The creation of some balance between superfluous summer energy and increased winter demands. 2. The uniform distribution of consumption over the hours of the day.

A solution of the first problem consists in the erection, where possible, of power stations with compensation reservoirs, i.e. with artificial lakes in which the surplus summer water may be stored up, to be used for the generation of power to cover the extra demands in winter (fig. 2). Plans for new storage power stations have already been made, for instance, in Switzerland, but decades will be needed for their execution, so that any complete equalization of the seasonal discrepancy between supply and demand cannot be expected from this quarter for some time to come.

Other means of exploiting surplus summer energy must therefore be sought. At the same time an approach must be made to the second problem, that of the uniform distribution of power consumption over the twenty-four hours of the day.

Using Surplus Energy in Boilers and Heat Accumulators

There are today numbers of concerns which require considerable quantities of heat in the form of steam or hot water for their manufacturing processes, during both summer and winter alike. This energy was formerly supplied, as it is in part today, by coal, which prior to World War I could be imported at favourable rates. It was during World War I, however, that a coal shortage and rapid price increases for liquid and solid fuels made themselves felt. This prompted endeavours to discover the best method of transforming electric into thermal energy.

The electric boiler here offered the best solution (figs. 7, 3, 4, and 5). It can be connected up to work in combination with an existing fuel boiler plant, thus helping to solve the problem cited above by utilizing surplus summer energy. The coal saved in this manner can then be reserved for winter. For countries poor in coal this is an inestimable advantage, since coal imports are reduced and the hydraulic energy production turned to fuller account. For private concerns this solution makes it possible to maintain production despite lack of coal. Moreover, when the price of coal is high the savings on fuel enable the outlay for the electric boiler to be redeemed in a very short time. Finally the electric power station can in this way dispose of its surplus summer energy and thus make its plant more productive.

There now remains only the second problem, that of distributing this use of summer energy as rationally as possible over the twenty-four hours of the day, that is, of allocating it to the times of lowest demand. This end is largely served by providing heat accumulators which can be charged during the night hours and over the week-end (figs. 7 and 6). The stored-up heat is then put to use during the day, thus fulfilling the needs of the power station, and benefitting industrial undertakings which can use the cheap surplus energy. If the industrialist possesses his own waterpower plant, the accumulator enables him to store the surplus energy from his own turbines in the form of heat, and to make it available to his factory.

In electric boilers and accumulators we thus have a means of utilizing water power on a rational basis, which is equally interesting for national economy and for private enterprise. The electric boiler offers substantial technical advantages in service. It is characterized by high working reliability, immediate readiness for service, rapid adaptability to changing steam consumption and clean operation. Owing to its small space requirements, an electric boiler plant can be installed with a comparatively small outlay. Its low servicing costs, due to the elimination of supervision, combustion chamber attendance and ash removal, further help to make it a paying proposition.

balance in the consumption of energy and a definite economic advantage for the private industrialist.

Generally speaking, the choice of boiler type, working pressure, and transformer and accumulator arrangement depend not only on questions of heat economy but also on existing space conditions and on the position with regard to feed-water supply and condensate return. A comparison of the energy consumption of the different types of electric boiler reveals with what arrangement the best results can be attained.

According to individual requirements dictated by the type of heat needed and the contracts signed

Fig. 5. Electric steam boiler of 2,000 kw., 8,000 volts, and 210 lb. per sq. in., equipped with automatic regulation of output, pressure and feed water and installed in a paper mill.

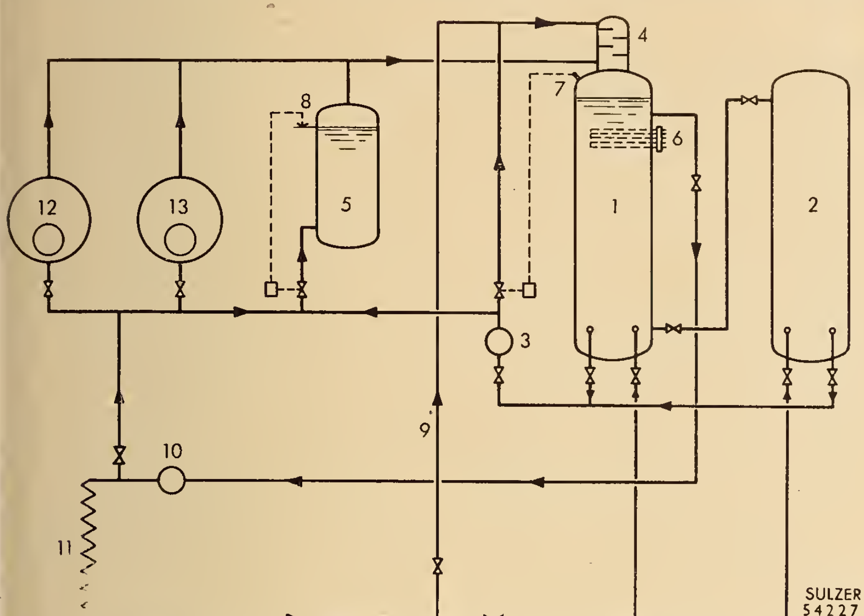


Fig. 6. Diagram of an electric hot-water accumulating plant in a textile factory.

Particularly favourable results are obtained when an electric boiler and accumulator plant are combined with an existing fuel boiler by connection in parallel; in this way a reserve of energy is created. Another measure that can be recommended is the adoption of disused coal boilers as steam or hot-water accumulators.

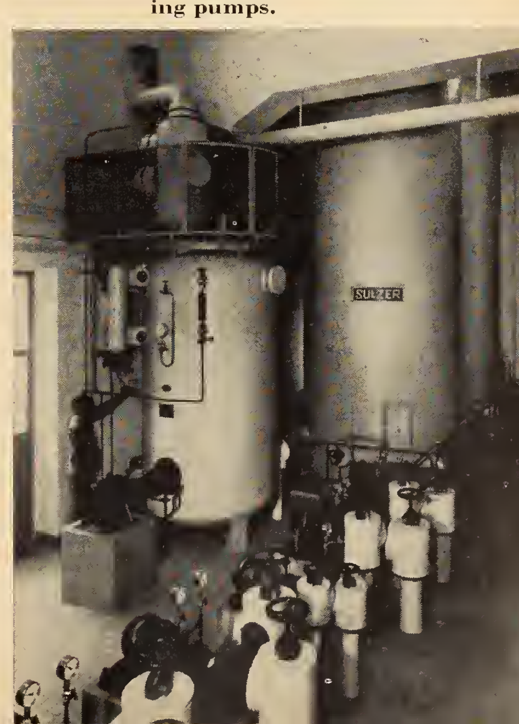
Electric Boilers in Trade and Industry

Curves depicting cumulative yearly installations of Sulzer electric boilers, which take a rising course not only during the crisis in the thirties but also during the more favourable economic periods, demonstrate that the electric boiler is not by any means a stop-gap. Experience goes to show instead that even in stable economic conditions, it brings with it a welcome

with the power supplying works, electric boiler plants may take any of the following forms:

1. Electric steam boilers and electric hot-water boilers with automatic regulation to a constant pressure or temperature, alone or combined with fuel boiler plants.
2. Electric steam accumulators (electrodes fitted in accumulator) with hand-operated remote electric control (output regulation) and with automatic time-regulated energy supply, in combination with fuel boiler standby.
3. Stratified superheated water accumulators, with automatic charging employing surplus power from outside mains or from private power plant, with resistance (indirect) heating or with electrodes.
4. Electric steam boilers with manual and automatic regulation to constant pressure and constant output, combined with heat transformers and possibly with fuel boiler plant.
5. Boilers with electric resistances for step-by-step regulation by hand or automatically by means of selector switchboard or programme switching.

Fig. 7. Electric hot-water accumulator plant in a textile factory. On the left a Sulzer electric boiler of 600 to 2,600 kw. capacity at 185 lb. per sq. in.; beside it two hot-water accumulators of 3,500 cu. ft. each with the circulating pumps.



6. Combined electric-oil and electric-coal steam accumulators and steam boiler plants.

The types of undertaking in which such plants are required include the following: Cellulose factories, dye-works, bleaching works, spinning and weaving mills, chemical works, boot factories, breweries, chocolate factories, agricultural concerns, cider factories, laundries, disinfecting institutions, public baths, district heating plants, hospitals, churches, etc.

An Electric Hot-Water Accumulator in a Textile Factory

A Swiss textile factory was confronted by a double problem: 1. To limit its consumption of outside power for heat requirements to times of lowest demand, and thus of lowest current price. 2. To utilize the surplus power from its own water-turbine plant for heat requirements.

This double aim was fulfilled by the installation of two electric hot-water accumulators, which were connected up to an existing mixed fuel and electric boiler plant. As can be seen from the diagram in fig. 6, the heat generating plant comprises two fuel-fired steam boilers (12 and 13), one electric boiler (5) and two hot-water accumulators (1 and 2).

An economizer of 64 sq. m. heating surface is connected up to the fuel boiler (12), which has a horizontal grate and a heating surface of 68 sq. m. The other fuel boiler, with a surface of 112 sq. m., is equipped with an underfeed stoker and an economizer of the same size. With the exception of the fuel boiler (12), which has a working pressure of 8 kg. per sq. cm., the heat generating plant works at a pressure of 13 kg. per sq. cm.

The electric boiler is designed for a maximum input of 2,600 kw. while the total capacity of the two accumulators (1 and 2) corresponds to 12,000 kwh. of energy. The first of the two hot-water accumulators is provided with a heat transformer for steam and hot water (4) with a capacity of 5,000,000 kcal. per hour. In the top of the accumulator (1) are fitted the electric resistances (6) which heat the water in the accumulator. The total connected load amounts to 700 kw. and is divided into two main components. 400 kw. are reserved for the firm's own surplus energy and 300 kw. for power from the mains.

The water contained in the accumulator can be heated up to 190 deg. C. Heating is done either with steam from the electric boiler, using energy from the mains, or by the resistances in the accumulator (1), in which case power can be taken either from the firm's own plant or from the mains, or finally both methods may be employed together. The expansion of the water in the circuit is taken by accumulator (1), the expansion space being so dimensioned that it can deal with a rise of the water temperature from 100 deg. up to the maximum of approx. 190 deg. C.

Accumulation by Switching on Electric Heating Resistances

a) Using Self-produced Energy:

Every surplus kilowatt-hour produced by the water turbine is diverted by a special automatic control to the accumulator, where it is used for heating the water. The control is brought into action by a wattmeter which, as soon as surplus is available, switches on the heating steps reserved for self-produced energy 8 kw. at a time (up to 400 kw.) through the controller and impulse transmitter. When the accumulator has reached the maximum service pressure, the energy supply is interrupted by a push-button switch. The electric connection of the control equipment is such that, even if the outside current responsible for the control impulses should fail, the step-by-step control of the self-produced energy can be maintained through hand-operated switches.

b) Using Mains Supply:

The starting of electric motors installed in the factory and run on self-produced energy has the effect that the maximum capacity of 400 kw. intended for the accumulator is no longer available. The interaction of the energy supplies from the factory plant and the mains is therefore so arranged that the regulator automatically switches on sufficient outside energy to compensate for shortages of self-produced energy. A further possibility is the exclusive use of outside energy, which can be switched on independently of the self-produced supply when desired.

Accumulation Through Electric Boiler With Outside Current

Charging of the two accumulators can be done with the electric steam boiler of 2,600 kw. connected load, in which case cheap night current is used. The capacity of the two accumulators in summer permits the full heat requirements of the following day to be met.

The charging of the accumulator proceeds as follows: the charging pump (3) delivers the cooled water from the accumulator (1 or 2, according to whether one or both are to be charged) into the 2.5-metre high cascade transformer (4), where it is heated to 190 deg. C by the steam from the electric boiler (5) or by the electric resistance(6) fitted in the accumulator, after which it settles in layers over the water level with the condensed steam. The delivery quantity of the charging pump is regulated in accordance with the accumulator pressure by means of a rheostatic pressure regulator (7), i.e. the quantity of water is adapted to the quantity of heat introduced in the form of steam, and the accumulator pressure is thus kept constant. The electric boiler is fed through the high-pressure pipes, the feed being automatically regulated by the rheostatic level regulator (8).

When the maximum accumulator pressure is reached (and charging thus completed) the electric boiler is first cut out, and afterwards the heating. If the pressure is reduced by the circulation of hot water in the heating system, the electric convector is automatically switched on again. If the heat produced just suffices for factory needs (so that there is no accumulation), the cooled water is conducted through the pipe (9) direct into the cascade transformer, while the feeding of the electric boiler is in this case effected from the industrial water supply. During the winter, when little or no surplus energy is available, the two fuel boilers take over the steam production, one of them serving as standby. The return water is again led direct into the transformer. There is no heat storage, but only temporary accumulation to cover peaks of heat demand.

The installation of accumulators in this plant enabled about 4 million kilowatt-hours of night and week-end energy to be put to use, which of course represents a substantial saving of fuel for the coal-fired boilers.

Discussion of German Aeronautical Research

Editor's Note —

In the first instalment of the paper "Wartime Aeronautical Research and Development in Germany", by Messrs. Green, Hiscocks and Orr (The Journal, *October 1948) the authors discussed German wind tunnels in which air speeds greater than that of sound were achieved.*

Mr. Floyd K. Beach, of the Petroleum and Natural Gas Conservation Board of Alberta inquired as to the certainty that such supersonic speeds have been achieved and the resulting correspondence should be of interest to engineers familiar with gas dynamics.

Lt.-Col. R. D. King, director, Waterways Experiment Station, Vicksburg, Mississippi, inquired about the use of powdered amber for observation of water flow in the A-12 water tunnel at L.F.A., Volkenrode. Mr. Orr replied to this inquiry and this correspondence is also reproduced herewith.

Floyd K. Beach, M.E.I.C.[1]

As discussion of "Wartime Aeronautical Research and Development in Germany", could the authors answer a question?

Has it been definitely established that air velocities have been artificially set up in wind tunnels in excess of the speed of sound? The authors refer to "Mach numbers" of the order of 3.9, and some tunnels are spoken of as "supersonic", but is there proof that air velocities, set up artificially, exceeded that of sound?

Not being conversant with aeronautics, I approach the problem from the literature of natural gas, which quite definitely shows that gas flow may be accelerated by pressure differentials, and the associated phenomena conform to the law of falling bodies until the velocity approaches the speed of sound in the medium and at the existing conditions of temperature and pressure. Beyond that point there is no increase in velocity, and efforts to put more gas past a given point result only in crowding more molecules into a given space.

Some of the wind tunnel research may furnish data from which natural gas engineers can revise their formulae, and it will be appreciated if any light can be thrown on the problem.

J. J. Green, M.E.I.C.[2]

There is no doubt that velocities exceeding the speed of sound have actually been obtained in specially designed high-speed wind tunnels in several countries. For example, at the National Physical Laboratory, England, small wind tunnels giving speeds as high as three times that of sound have been in use for at least ten years. Some details of one of these tunnels and the method used in designing the working section for a specific speed are given in the *Proceedings* of the Institution of Mechanical Engineers for April, 1937, and again in September, 1937.

The technique for producing supersonic velocities in a closed circuit tunnel is briefly as follows. A compressor in the circuit delivers the air at a relatively low velocity to the contraction section of the tunnel. In this section the air velocity increases until at the narrowest portion of the section (usually referred to as the nozzle) the velocity has reached the speed of sound. The channel is then expanded in section, with the result that the air accelerates to supersonic velocities, at the same time suffering a rapid decrease in density. The precise speed obtained is a function of the design of the divergent nozzle and the power applied through the compressor. This is, of course, the reverse of the effect which a divergent nozzle has on subsonic flow, wherein an expansion causes a decrease in velocity. The changed behaviour in the supersonic case is dependent on the attainment of the speed of sound in the nozzle. It is then impossible for the suction of the compressor to be transmitted upstream past the nozzle and into the contracting section, because the speed of such a transmission would be the speed of sound and in the nozzle this is identical with the velocity of the stream which is travelling in the opposing direction. The sonic flow in the nozzle, therefore, acts as a special type of valve which enables the creation of a very steep favourable pressure gradient in the divergent section of the nozzle. With an adequate pressure gradient any desired supersonic velocity can be attained.

In some types of discontinuous tunnels this favourable pressure gradient is provided by means of an evacuated chamber and a quick-acting valve, as described in our paper.

After the test section a convergent nozzle is provided in which the flow is decelerated to subsonic values, with a corresponding increase in pressure, density and temperature, before returning to the compressor. It is of course necessary to provide a cooling system to absorb the power dissipated in the circuit.

When moving at supersonic velocities, the air conforms to the laws which govern the flow of compressible fluids and these are substantially different from the laws of incompressible fluid flow which control the motion of the air at subsonic speeds.

A good reference for further study of this problem is "Introduction to Aerodynamics of a Compressible Fluid", by H. W. Liepmann and A. E. Puckett, published by John Wiley & Sons.

Floyd K. Beach, M.E.I.C.

I greatly appreciate the explanation of the devices used in setting up supersonic velocities in wind tunnels. In most matters my work is far removed from aeronautics and I have been unable to follow its development. My observation of the phenomena associated with flow of gas at sonic velocity never inspired me to attempt to launch an aircraft at speeds exceeding it, and I fear I have read of attempts to set up supersonic velocities in wind tunnels with unbelief, or at least with the feeling that I must be shown.

I shall consult the reference mentioned, but on analysing Dr. Green's reply I believe that our practice of assuming sonic velocity a maximum in gas streams is quite in order in the usual circumstances where there is no expanding nozzle preceding the measuring point.

The principal application in natural gas work has to do with evaluation of open flow from large gas wells. The well is never called upon to sustain maximum flow for

[1] Engineer, The Petroleum and Natural Gas Conservation Board, Province of Alberta, Calgary.

[2] Chief research aeronautical engineer, Air Transport Board, Ottawa.

long periods except by accident, and the figure for open flow is consequently not of great practical interest although it is one that may frequently be quoted. The claim that supersonic velocity has been attained in wind tunnels made me wonder if some of our past valuations of open flow had been excessive, but from Dr. Green's explanation I believe we have been reasonably correct.

A case in point arose very recently, and I quote it merely to illustrate our side of the problem.

A well was being drilled in a location and at a depth where no gas occurrence of any importance could be expected. While pulling the drill pipe to change bits, the mud was blown from the hole and a large gas flow followed. A valve on the surface casing was closed, and in very short time gas appeared from perhaps a dozen craters, some fully a quarter mile distant. A flow line was connected to the well head to lead the gas away from the rig and the valve was opened to relieve the cratering. The well owner and the drilling contractor wanted an evaluation of the rate of flow. The only measurement made was side static pressure taken four diameters from the open end of the flow line, and its determination hinges on the assumption that gas issues at sonic velocity. Shortly afterward, heavy mud was pumped into the well and gas flow was cut off. The reservoir from which the flow came may be a small one, easily exhausted, or it may cover an area of some size. If it is significant, other wells may penetrate it, and our valuation of the rate of flow gives a measure of depletion during the period of wild flow. If the reservoir is insignificant in capacity, the occurrence is still of importance as a warning, although the exact rate of flow is not so important.

J. J. Green, M.E.I.C.

We were very interested to hear something of the problems in the natural gas field and can now appreciate Mr. Beach's interest in this question.

He is quite correct in the assumption that supersonic velocities will not be obtained in the case of open flow from large gas wells, unless the outflow pipe has an expanding section at the exit.

In the case of efflux from a straight pipe in which there is no expanding cross-sectional area at the exit, however large the pressure drop between the gas in the pipe and the atmosphere, the pressure and velocity at the opening itself retain the values corresponding to sonic speed. The quantity of gas flowing out is then quite independent of the pressure differential. Even if the external pressure is reduced to a very small value it will have no effect on the outflow. Upon emergence from the pipe, however, the cross-sectional area of the jet of gas will increase due to its internal pressure and because of inertia effects the expansion of the jet will continue to such an extent that a region of reduced pressure is created in its interior. In the course of this expansion a supersonic velocity will be attained. As a result of the reduction of pressure within the jet, the flow will become convergent and the pressure will rise until it approximates to that at the pipe opening. From now on the process will be repeated. This explains briefly the succession of shock waves which have been observed in high velocity jets of air and gases. Here again, the attainment of supersonic velocity is dependent on the expansion of the gas stream after it has reached sonic velocity, which in this case occurs at the exit of the pipe.

An interesting analogy to such supersonic flow, which should not be pushed too far, is presented by the flow of automobile traffic through a bottleneck. As the road widens from the bottleneck, the velocity of the traffic increases, and if another bottleneck is reached the traffic velocity is reduced. In some respects, therefore, the flow of traffic resembles the motion of a compressible fluid.

It has been reported that the United States Navy has achieved a wind tunnel air speed of Mach 5.18 or approximately 3,960 miles an hour at sea level conditions, in a captured and modernized German supersonic tunnel with 16 in. square working section, at the Naval Ordnance Laboratory in Maryland. The record speed was obtained at a temperature of 377 deg. F. below zero. The highest speed previously obtained in the same tunnel was Mach 4.38.

Floyd K. Beach, M.E.I.C.

On reading Dr. Green's remarks in the foregoing, I turned up some notes made about fifteen years ago to find a sketch I made of a high velocity jet of natural gas flowing from a straight nipple (Fig. 1). At that time I could recognize that there were several zones in the jet having different characteristics and the differences were quite clear cut. The quick enlargement in cross-section on emergence is the most prominent feature, but within the stream and, as I recall, made visual as a fog, there is a cone rising from the end of the pipe and

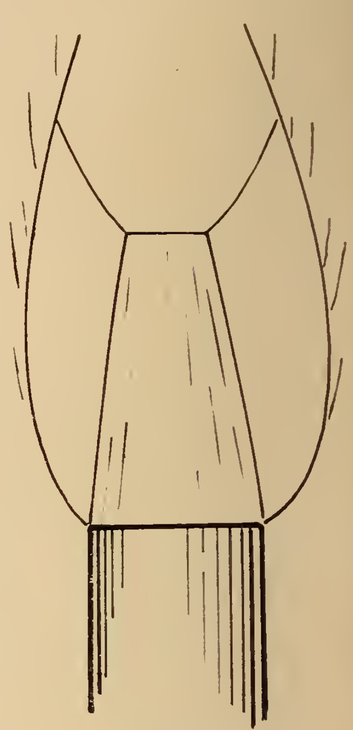


Fig. 1

truncated at the appearance of a second enlargement. This second enlargement does not extend outside the boundary of the main jet, and the jet loses its sharp outlines shortly beyond. What I did not sketch is a series of nodes extending upward at regular intervals, and sometimes numbering ten or a dozen.

Dr. Green's explanation makes clear that the truncation of the fog cone comes at a second shock wave, and the nodes of fog are a succession of shock waves. At the time I made the sketch I was at a loss to explain the phenomena, and the whole pattern of dynamics of gas movement was obscure. A bullet from a rifle can be projected at a velocity in the order of 3,000 feet per second, but any attempt to accelerate a gas by allowing it to issue through an orifice from a high pressure to a lower pressure is met by a limitation of the velocity of sound; or of the order of 1,000 feet per second. The bullet, in its trajectory meets no other projectile of a like order of mass, but a molecule of gas on being accelerated begins to collide with other projectiles of like mass and so long as collisions continue, the mean forward movement has as a limit the velocity of sound, which is a function of the square root of (specific heats ratio times pressure over density). The literature of natural gas goes into the matter of "linear" and "turbulent" flow. So long as there is a limitation of the speed of sound I can not now subscribe to gas moving in "linear" flow, but Dr. Green has made a clear case for linear flow as an explanation of supersonic flow.

Matter remains in a gaseous state only because each molecule has perceptible heat. When this perceptible heat is transformed into kinetic energy by lack of collisions with other molecules, acceleration should continue until the internal energy is exhausted. At the velocity quoted by Dr. Green, the energy has reached a very low point, and conditions are present for the formation of liquid air, although at such velocity coalescence into droplets could not be expected, and of course any checking of velocity is immediately reflected in a temperature rise.

At this point I search for criteria for measuring velocity. At subsonic velocities a Pitot tube can be used to measure impact and this can be converted to a measure of velocity, as a square root function of impact. When sonic velocity is reached impact no longer is a valid criterion, although it is useful in arriving at the quantity of gas passing in unit time. Under supersonic velocities, velocity should again be a square root function of impact, but under such unstable conditions as to cast doubt on the proper coefficient to use. I can now see the validity of the optical method quoted in the first instalment of the paper on German aeronautical research in the *Journal*.

For the natural gas engineer it becomes necessary only to recognize where and when sonic velocity is present. Work done about 1929 by the late Walter Reid suggests that when gas is emerging from the open end of a pipe, if pressure is measurable above atmospheric at a point four diameters from the end, sonic velocity has been reached. His formulas suggest that the absolute pressure at such a side static opening is 0.58 times the absolute pressure in a Pitot tube held facing the stream at a point in the centre of the end of the pipe. Under sonic velocity conditions it is often impossible to hold a Pitot tube in the stream, so the side static method has much value.

J. J. Green, M.E.I.C.

The subject of subsonic air flow is of course extensively concerned with the "laminar" and "turbulent" flow. In general, at high speeds (large Reynolds numbers) the unstable laminar regime is replaced by turbulent flow, but apparently little is known about the behaviour of fluids at supersonic speeds in this regard. In their book, "Aerodynamics of a Compressible Fluid", Messrs. Liepmann and Puckett conclude that turbulence, as recognized in incompressible flow, is scarcely possible in pure supersonic flow. Mr. Beach is quite correct in his statement that at very high supersonic velocities conditions exist for the formation of liquid air. This is in fact one of the problems to be overcome in high speed supersonic wind tunnels, where the expansion to high supersonic velocities causes a drop in temperature sufficient to reach that of condensation.

Regarding the measurement of high speed air flow velocities, the impact tube is still precise provided the correct formula is used relating the impact pressure to the free stream static pressure. The formula which holds for supersonic velocities is not the same as that which applies at subsonic velocities, except for the special case where the velocity is just equal to the speed of sound, when the two formulae are identical. The usual static hole in the conventional pitot head is no longer usable, however, because of interference from the shock wave ahead of the impact tube. It is therefore necessary to measure the free stream static pressure by means of a static orifice in the undisturbed flow remote from any shock waves.

I was interested to note the static pressure figure quoted by Mr. Beach, at a point four diameters from the open end of a pipe in which sonic velocity has been reached. References in the literature (for example, Eshbach "Handbook of Engineering Fundamentals") indicate that for the case of air or other diatomic gases, if sonic velocity is reached, the static pressure at the exit is 0.528 times the impact pressure.

R. D. King[3]

The recent article entitled "War-time Aeronautical Research and Development in Germany", in the October issue of *The Engineering Journal*, was read with considerable interest. The elaborateness and extent of equipment in contrast to the lack of co-operative effort between similar studies were of particular interest.

It was noted in the description of the water tunnel A.12 at L.F.A. that powdered amber was used to observe water flow around various shapes. We are interested in using this expedient in studying flow patterns in hydraulic structures.

It would be appreciated if additional information on the use of powdered amber could be made available to this office.

J. L. Orr[4]

The information on which this portion of our paper was based is contained in our original report to the British Intelligence Objectives Subcommittee BIOS No. 160. There will be further references to the use of water tunnels at A.V.A., Göttingen, in a subsequent article which is based upon BIOS Report No. 159.

In general the Germans employed four methods for rendering flow visible in water tunnels as follows:

1. Injection of a coloured liquid employing aniline dyes.
2. Injection of air bubbles.
3. The addition of aluminum filings in the form of plates approximately 0.5 mm. in length.
4. The addition of powdered amber 0.1 mm. in length.

It was stated that the powdered amber was preferred to aluminum filings due to its lower sinking speed. It should be noted here that the dimension quoted in our article for the size of the amber particles is incorrect and should read 0.0035" instead of 0.035".

I have been advised by our hydraulics laboratory that they have found aluminum particles of the abovementioned size to be too large and that they prefer to employ powdered aluminum similar to that employed in preparing aluminum paint.

[3] Lt.-Col. Corps of Engineers, director, Waterways Experiment Station, Vicksburg, Mississippi.

[4] Head, Low Temperature Research Laboratory, National Research Council, Ottawa.

A most interesting and novel feature of the A12 water tunnel was the incorporation of an electrical heating system to vary the kinematic viscosity of the water and thereby control the Reynolds number. Unfortunately our reference to this feature was deleted from the published article. With this system, it was found that by increasing the water temperature 45°C., the Reynolds number could be increased to 2.5 times. Excessive heating of water, however, gave rise to cavitation in the working section due to the low pressure of approximately ½ atmospheres. It was proposed to correct this by increasing the static water head on the tunnel but this had not been tried.

Notes on Management

Planned Execution

Extracted from an address given by Dr. Harlow S. Person to the Washington Chapter of Society for the Advancement of Management and published in Advanced Management, *December, 1945.*

. . . Scientific Management technique is a technique of approach; of approach to the solution of the management problem presented by each separate management situation. . . . It is a way of discovering what the particular management technique should be for each particular situation.

. . . The two major sectors of the technique (of Scientific Management) are: first, studies employing every resource of scientific method to discover the most suitable item, design, material, facilities for production and craftsmanship made available by the current state of technology—to discover, as Taylor put it, the laws of the managerial situation; and second, of arrangements, which are summed up in the word management, for bringing the laws of the situation discovered by the studies into dynamic creative relationship . . . Step by step research and arrangements must march along together.

. . . The major consequence, revolutionary in the field of management, of this coordination by Taylor of research and indicated arrangements is the creation for each enterprise of an institutional mind. This mind is independent of the personal minds of owners and managers, and of other individuals who may come and go, in whose collective activities the institutional mind expresses itself. This institutional mind has its powers of perception (investigation, research, experiment), of memory (records), of reasoning (analysis and comparison), and of design (planning and arrangement). Its life is coexistent with the life of the enterprise, and it can think and arrange affairs with that perspective made possible only by such characteristics. It has capacity to think in terms of experience larger than that which comes to any individual, to define distant goals, to arrange highly efficient ways and means of attaining them, and to pursue these distant ends consistently, yet with a flexibility which permits adjustment to changing conditions.

. . . It is the existence of an institutional mind that indicates whether an enterprise really has planning—that is, planning of a Scientific Management order. Planning in its generic sense—planning that is casual, expedient, personal, limited, unorganized—is not new. It began with the first human being and has continued ever since to be a natural practice of all individuals and groups. But planning that is identified with Scientific Management is highly organized and integrated, although in some enterprises it may be carried on in positions decentralized both vertically and horizontally. The institutional mind makes such planning possible, and planning is the major substance of that mind's activity.

The combination of centralization and decentralization of a highly organized and integrated planning function may be clarified by a schematic illustration. In an industrial enterprise characterized by Scientific Management on all its levels, there is an executive of high rank and competence responsible for the techniques and the coordination of activities of all planning units. Attached to the general administrative offices is a planning unit concerned with objectives, policies and over-all programmes. It discovers and organizes the data that constitute the basis of general administrative decisions; those, let us say, on the proprietary level. On the operating level, distinct from production planning and attached to the sales department, is a planning unit concerned with market analysis and sales programmes. In this unit originates the initial force governing operating activities in competitive enterprise; and it should be noted that there is necessarily a close integration of the studies and findings of the general administrative planning unit and this market programming unit. Attached to the sales department also is a supplementary planning unit concerned with direction of sales execution — quasi-planning and quasi-executive because it must plan execution of the sales programmes but also must manipulate and adjust selling activities by frequent changes of the plan to meet the variables of the market.

. . . It is because management is an art that planning is essential. Managerial situations are usually dynamic, day-to-day combinations of many variable elements. Human capacities and material facilities must be manipulated day by day to solve the problems presented by each day's peculiar combination of variables. What planning does is to bring science to the aid of the art in these day-to-day manipulations that effect control of variability. It is through the function of planning that research and arrangements are brought together and made to march along together.

With tools of scientific method, planning analyzes the cumulative experience of the enterprise and seeks to discover what elements in the experience are constant, what are variable and repetitive, and in so far as possible what are variable and fortuitous. For those that are constants it arranges routinized controls. For those that are variable and repetitive it arranges ways of detecting them, sometimes discovering their timing, and provides adaptable quasi-routinized controls for them. Those that are variable and fortuitous it handles as exceptions, focuses accumulated administrative and technological knowledge on each new such experience as it appears, and promptly makes to order a treatment to fit the circumstance.

Because it is a function of the management of dynamic situations, planning must be a continuous process. . . . Enterprises that are dynamic and changing cannot be planned once and for life. Planning is a part of the changing life, and, although relatively constant as to method, must in details of its arrangements and manipulations change to meet the changes presented by the stream of experience.

Planning must operate to the greatest possible extent in terms of standards. Among these are: precisely defined objective; precisely defined qualities and quantities; precisely defined technological ways and means of achievement, including human capacities as well as material facilities. These are the unit counters in planning's game with variability. These standards must be discovered by research and experiment. The behaviour of material things is governed by physical laws and the behaviour of human beings by psychological as well as physical laws, and it is discovery of these laws of behaviour that constitutes the research part of planning's responsibility. Once they are discovered, weighed, measured and evaluated, definitions and specifications must be formulated and maintained. The search is always under way for better standards, and from time to time a new standard is discovered and substituted for one that is obsolete; but until an established standard has been formally displaced, it must not carelessly or wilfully be disregarded.

Of outstanding importance among the standards required by planning is functional organization and distribution of responsibilities. Precisely who shall do what is critical, and who shall do what can be specified only in terms of functions. Analysis of objective leads to analysis of ways and means of achievement; analysis of ways and means leads to specifications of facilities and of the *what* and *how* and *when* and *where* of unit acts of execution. Definite responsibilities for definite acts of execution according to the flow of definite instructions must be assumed by the planning function. Otherwise there cannot be planned and coordinated execution, records at each unit point of execution to make certain that execution is as planned, and prompt action to correct imperfect execution where it may occur.

Planning for any enterprise of substantial scope must operate on various planes, each of which has its standards, which must interlock with—be multiples or divisors of—the standards of all other planes. . . . There is strategic planning on the highest plane, tactical planning on intermediate planes, blue-print planning at the level of detailed execution, and individual worker's planning at the individual workplace. It should never be out of mind that, except where a worker is victim of highly mechanized chain operations, he has large discretion within the frame of specifications of quality, quantity, tolerances, suggested methods, standard times, and so on, to plan how he as an individual will handle a particular job.

. . . Within this wide scope of its activity planning helps to plan policy at the one extreme, plans detailed execution at the other extreme, and has a finger on the pulse of actual execution. It is not a completely detached function which receives from top management advice as to objective and instructions to plan and has no concern with execution. But its concern with execution, subsequent to planning the execution, is strictly limited, and planning may do much harm if it reaches so far into the area of execution as to become meddlesome.

Finally, planning requires some basic, ultimate standard to serve as a guide for its own activities and as a criterion by which to judge their quality. This standard is something additional to achievement of the objective of the enterprise; it involves also the manner of achieving it. In industrial private enterprise this controlling standard is profit. Because in simple terms profit represents the difference between selling price and total cost, and the selling price ceiling is determined by the market and not by the enterprise, reduction of cost comes to be substituted for profit as the immediate standard by which the quality of planning is evaluated. In philosophic terms it is conservation of human and material energies.

Headquarters Records

Each time the *Journal* or other Institute mail is dispatched we are advised of undeliverable items due to incorrect addresses. Our records staff must follow up these changes and the regular service to members suffers thereby. *Please* advise headquarters when your address or occupation changes. Plan to Visit

An interesting corner in Quebec viewed from the Bishop's Palace with the Chateau in the background.

The St. Louis gate, not far from the Chateau

PRELIMINARY PROGRAMME

• WEDNESDAY, MAY 11th

Morning: The Quebec-Chicoutimi Highway.
The Arvida Aluminum Bridge.

The luncheon speaker will deal with the history of Quebec to give visitors an appreciation of the historic places which will be included in Thursday's tour of the city.

Afternoon: Mechanization of Woods Operations.
Paper-Making Machines.
High-Speed Photography.
Television.

The dinner address will be the report of the retiring president.

Evening: The Annual General Meeting.
Lecture—Guided Missiles.

• THURSDAY, MAY 12th

Morning: Forest, Mineral and Water Resources of Quebec.
The First Canadian Jet Airliner.

There will be no speakers at luncheon or dinner and the afternoon will be free for sightseeing, golf, and other diversions.

Evening: Non-technical lecture and demonstration of television. (R.C.A. Laboratories, Princeton, N.J. will provide equipment for a full practical demonstration of television in action.)

• FRIDAY, MAY 13th

A regional conference (Western Hemisphere) of the International Scientific Management Committee will be sponsored on Friday and Saturday by the Canadian Management Council. The Institute is one of eight member bodies of C.M.C. and has assisted the Council in arranging the conference.

Morning: Opening sessions of the Management Conference.
Papers on Hydro-Electric, Chemical Engineering and Community Planning subjects.

Historic Quebec this Spring

The luncheon address will be one of the highlights of the meeting. Dr. Lillian Gilbreth, the eminent American Industrial Engineer will deal with "The Place of Human Engineering in Management". Dr. Gilbreth is becoming widely known as "Mother" in the delightful story "Cheaper by the Dozen".

Afternoon: Panel discussion—"Management—A Trusteeship."

Evening: The Annual Banquet and Ball. The Hon. Maurice Duplessis, Premier of Quebec will be the dinner speaker.

• SATURDAY, MAY 14th

(Second day of the Management Conference).

Morning: Advantages to U.S. Industry of Branch Plants in Canada.
Decentralization of Industry in the Western Hemisphere.

Afternoon: Panel Discussion—"Changing Problems of Management in a Post-Boom Period."

A lookout in Battlefields Park.

MARK THE DATES!

MAY 11-14

● In view of the interesting programme and the limited accommodation, reservations should be made promptly after receipt of registration forms which will be mailed direct to every member.

● Single rooms will be scarce and unaccompanied delegates will be asked to share double rooms. The best way will be for delegates to make their arrangements in advance and indicate these on the reservation form.

● Convention rail fares will be available — round trip tickets from any point in Canada or Newfoundland for one and one-half times the one-way fare (plus twenty-five cents). Trans-Canada Airlines have special rates for groups of ten or more — 160% of the one-way fare.

● Ladies will be welcome at all functions. A ladies' Committee of the Quebec Branch is making additional arrangements of an unusually interesting character.

The well known Quebec Bridge which links the Northern and Southern parts of the Province of Quebec.

From Month to Month

News of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

Amendments to the By-Laws Proposed by Council

In accordance with Sections 19 and 80 of the by-laws, the Council presents for the consideration of corporate members the following proposal for the amendment of Section 12 and for the introduction of a new Section 30A.

These proposals will in due course be submitted for discussion at the annual general meeting on May 11th, 1949, in Quebec, and will subsequently go out to ballot.

The proposals now submitted were approved by the Council on February 19th, 1949.

Section 12—Fifth line—Eliminate the words:

"The number of Honorary Members shall not exceed twenty."

Proposed New Section 30A

Alternates

In the event of a councillor being unable to attend a specific meeting of Council the executive of the branch may appoint an alternate (other than a councillor) for that meeting only who shall be a member of the branch, such alternate to have all the rights and privileges of the councillor whom he is replacing.

Field Secretary

At the meeting of Council held in Montreal on February 19th it was agreed unanimously that a Field Secretary be appointed as quickly as possible, and that he operate with Toronto as his headquarters.

This is similar to a decision made by Council in 1946. The employment of such a person was one of the reasons for asking for an increase in annual fees at that time. Unfortunately the accelerating costs of doing business used up much of the increased revenue, but the principal reason for not proceeding then was that no suitable candidate applied for the position. Every Member and Junior was circularized in March, 1947, with details of the work but only three applications were received. These were not considered by the Finance Committee as meeting the requirements.

A Field Secretary with an office in Toronto should be able to increase greatly the services of Headquarters to the branches. In Ontario alone there are now twelve branches with prospects of more in the near future; also, such an office could be of special assistance to the Ontario Division.

As soon as he has acquired experience in and knowledge of the Institute he will be able to expand the service to branches in the west and the east. His contacts between Headquarters and branches and between branches should assist materially in the functioning of the branches and the general activities of the Institute.

The problem of finding a suitable man remains the prime consideration. Members who may be interested are invited to so inform Headquarters and further information will be supplied promptly.

Cooperation with A.S.M.E.

Recently the governing bodies of the American Society of Mechanical Engineers and The Engineering Institute of Canada have approved a proposal of the Joint Committee, that members of either society shall be permitted to attend annual meetings of the other on the same basis as if they were members.

In short this means that members of the Institute who are not members of the A.S.M.E. are privileged to register and participate in their meetings just as if they were members, and members of the A.S.M.E. may do likewise for E.I.C. meetings.

Immediately it is apparent that the registration fee for annual meetings which applies to non-members, is not applicable to members of these two organizations.

Probably this will result in more savings for E.I.C. members than for those of A.S.M.E., but it is hoped the arrangement will encourage more members of each organization to attend the meetings of the other.

The proposal was developed and presented by the Joint Committee that is maintained under the terms of the co-operative agreement between the two organizations. This committee meets twice a year — once at each of the annual meetings of the societies. The Institute members are John G. Hall and Dr. O. W. Ellis of Toronto and W. A. Newman and G. N. Martin of Montreal—all members of both societies. The American representatives are, A. E. White, A. G. Christie, J. B. Armitage, T. E. Purcell and C. E. Davies.

Employment of Tuberculous Veterans

The Department of Veterans Affairs has issued an appeal to prospective employes on behalf of cured tuberculous veterans. The *Journal* believes this to be a cause worthy of special attention.

These veterans acquired their infection in the service of their country but they have not had an equal break in the immediate post war rehabilitation. They must try to rehabilitate themselves now, three, four, five or more years later when jobs are not quite so plentiful and competition is keener.

Mass X-rays in recent years have shown that thousands have communicable tuberculosis without being aware of it. The cured tuberculous veteran is not released until he is non-infectious and he is subjected to regular check-ups to guard against relapse. The worker whose T.B. has healed is a better health risk in your plant than the man off the street.

There is no good reason why the veteran with healed tuberculosis should face any employment handicap if he is measured for his job with the same care that any good employer uses in his hiring techniques. Ability, not disability, is the yard stick. *Give him five minutes — he gave you five years.*

Another Engineer Appointed to Ottawa

Mr. Marc Boyer, M.E.I.C., former registrar of the Corporation of Professional Engineers of the province of Quebec has been appointed Deputy Minister of Reconstruction & Supply. Engineers will be particularly gratified by this appointment which follows so closely the appointment of the Minister, the Honourable R. H. Winters, another eminent engineer.

Marc Boyer, M.E.I.C.

The Institute has always contended that the engineer's training directed as it is toward the development of analytical thinking should be a notable asset in high government office. Of the all-too-few engineers who have aspired to, and reached such high office in Canada and elsewhere, most have served with distinction. Mr. Boyer's demonstrated abilities leave little doubt that he will acquit himself well.

Mr. Boyer graduated in civil engineering from Ecole Polytechnique of Montreal in 1928. After graduation he worked for the Quebec Streams Commission and was later engaged in research for Consolidated Mining & Smelting Company at Trail, B.C. In 1930 he joined the Department of Mines in the province of Quebec and in 1943 was appointed commissioner for the Civil Service Commission of the Province. Since 1945 he has been registrar and acting executive-secretary of the Corporation of Professional Engineers of Quebec.

The McCharles Prize for Invention or Research

The University of Toronto has announced that a prize of one thousand dollars has been made available by gift of the late Aeneas McCharles.

The prize will be awarded from time to time as recommendations are received.

(1) to any Canadian from one end of the country to the other, and whether student or not, who invents or discovers any new and improved process for the treatment of Canadian ores or minerals of any kind, after such process has been proved to be of special merit on a practical scale;

(2) or for any important discovery, invention or device by any Canadian that will lessen the dangers and loss of life in connection with the use of electricity in supplying power and light;

(3) or for any marked public distinction achieved by any Canadian in scientific research in any useful practical line.

Candidates must be proposed in writing by some qualified person other than the candidate and supported by a second such person familiar with the circumstances. Sufficient proof must be furnished to satisfy the committee as to the importance of the accomplishment on which the recommendation is based.

Forms for nomination may be obtained from Mr. C. E. Higginbottom, secretary, The McCharles Prize Committee, University of Toronto.

Ontario Association...Annual Meeting

The 1949 Annual Meeting of the Association of Professional Engineers of the Province of Ontario held in Toronto at the Royal York Hotel on Saturday, January 29th, was an outstanding success. The opening luncheon brought out an attendance of about six hundred, which was well rewarded by the address of Colonel F. J. Lyle, O.B.E., director of Trade and Industry Branch, Ontario Department of Planning and Development, on "Canada's Industrial growth and the Resulting Trade Problems."

W. L. Saunders of Ottawa, vice-president of the Engineering Institute, and L. Austin Wright, general secretary, were head table guests, along with others representing several more sister or kindred organizations.

The annual business meeting held in the Ball Room after lunch was also well attended. The reports of the retiring president George L. Macpherson of Sarnia and director T. M. Medland gave a general account of the year's activities and the membership and financing of the Association—all of which were of a very satisfactory nature. It was apparent to everyone that the Association is not only expanding its numbers, but its usefulness as well.

The new president, W. J. W. Reid of Hamilton, spoke briefly at the end of the agenda, expressing his appreciation of the honour done him and asking for the continued interest and support of the membership. The concluding item was the presentation by him of a certificate of life membership to Mr. Macpherson.

Perhaps the most interesting feature of the whole meeting was the question and comment period which followed the address. Many members took part in it—some to praise and of course some to criticize. The most frequently mentioned subject was collective bargaining. Mr. Macpherson explained that it wasn't possible to conclusively answer all the questions because a committee had been appointed to study the subject and the officers were not in a position to commit the Association before the report of the committee had been received and a policy evolved from it.

Other questions and suggestions related to better publicity for the profession, remuneration and employment conditions. All speakers from the floor stated their cases clearly and without rancour, and in fact gave living testimony to the inaccuracy of the too frequently heard comment that the engineers are an inarticulate lot. These discussions were a healthy indication that we enjoy a state of democracy in this Canada of ours, and that the Association is a vital organization making its contribution to that democracy.

The Ontario Association's annual business meeting:—G. L. McPherson, retiring president, makes his report. The incoming president, W. J. W. Reid of Hamilton, is on his right, with Col. T. M. Medland and J. M. Muir, executive director and registrar, respectively, of the Association, on his left.

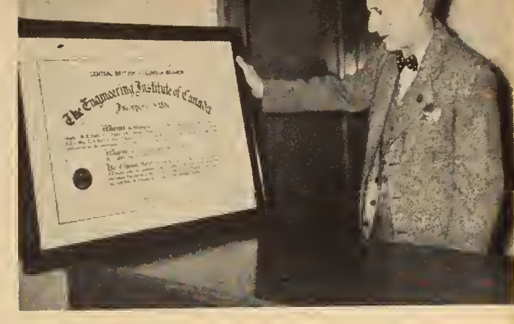
Another Institute Branch Begins Operations

The Central British Columbia Branch was inaugurated as the twenty-ninth branch of the Institute on January 14th at a dinner meeting in Kamloops, B.C. The branch will serve members resident in Osoyoos, Oliver, Penticton, Vernon, Revelstoke, Kamloops, Williams Lake, Quesnel, and Prince George.

The Institute's president Dean J. N. Finlayson of U.B.C. was on hand to present the charter of the new branch to M. L. Wade, provisional chairman. In his address the president outlined the history of engineering societies and associations from the birth of the Institution of Civil Engineers in England in 1818 and emphasized the overall scope of the Engineering Institute in the profession in Canada. In a letter to Headquarters Dean Finlayson said, "The executive of the new branch were exceedingly kind and the whole celebration bore evidence of careful planning. A goodly number of young engineers attended."

The following officers for 1949 were elected at the meeting: William Ramsay and H. L. Hayne of Kamloops, chairman and vice-chairman respectively; M. L. Wade and F. McCallum of Kamloops and A. R. Colby of Penticton, members of the executive committee; H. L. Cairns, Kamloops, secretary-treasurer.

The branch commences operations with 15 members, 8 juniors and 10 other grades on its membership roll and these members have wisely elected to their first executive a group of active and influential engineers whose records indicate enthusiastic support of the Institute in all its aims and activities. The *Journal* congratulates the new C.B.C. branch and expects that forthcoming issues will carry reports of its continuing growth and participation in the affairs of the Institute.



H. L. Cairns, first secretary-treasurer of the new branch, with the charter presented by President Finlayson.

Right (upper). W. E. Warburton on the left with A. F. Paget, G. W. Lake, B. C. Lewall, R. L. Bigg, H. M. Bigwood and C. H. Dunsmore.

(Lower). Left to right—the new chairman and vice-chairman, W. Ramsay and H. L. Hayne, with L. E. Willis, J. H. A. Steven and C. J. L. Sanderson.

Below (left). President Finlayson, M. L. Wade of the new branch executive, and W. Ramsay, the new chairman.

(Centre). From left—A. C. Dimock, D. C. McVicar, J. A. Leslie, J. Conrad, R. G. Harvey, R. S. B. Lillico, and F. W. Runnalls.

(Right). S. H. Blackey, C. W. Jones, T. Lee, E. H. Barclay, A. R. Colby.

First Pan American Engineering Congress

"Engineering in the Service of Peace"

Under this heading the engineers of Brazil are holding an international or North American conference of engineers at Rio de Janeiro on July 15th to 24th, 1949. Invitations to participate are issued to engineers in Canada and the United States and already considerable activity is evident in the United States.

Any members of the Institute who are interested are asked to communicate with Headquarters where there is additional information.

Herewith is the announcement and the invitation as issued by F. Saturnino de Brito, filho, President of Uniao Sulamericana de Associacoes de Engenheiros.

"Engineering in the Americas today needs a 'town meeting' for the expression of its common points of view, for the unification of its plans, for the joint study of the great problems which confront it — problems which relate to the general welfare and to peace among nations — and for the achievement of personal contact and direct links among the engineers of the American community, for which nothing can substitute.

"To achieve these objectives, the South American Union of Engineering Associations (USAI) decided to hold, in cooperation with engineering associations throughout the Americas, the First Pan American Engineering Congress, from July 15 to 24, 1949, in Rio de Janeiro, to be preceded by a meeting of engineers in Sao Paulo from July 9 to 13.

"The technical agenda of the Congress was prepared with the intention of including the principal sectors of engineering, having in view the great service which our profession can render to the Americas.

"The agenda has been made broad, to facilitate the presentation of papers and the objective examination of varied technical subjects. We felt this to be the best way to undertake the study of satisfactory uniformization in professional criteria.

"As the best manner to prepare to deal with the full agenda, we believe that, in addition to efforts to obtain individual papers, reports and recommendations, meetings should be held in each country for previous study of the subjects listed, with the participation of specialists in each of the main fields shown in the agenda. These groups, whose gatherings should be of considerable local and general interest, should prepare reports or recommendations accompanied by brief explanations, which will be submitted to the Congress.

"The period for presentation of papers ends April 30, 1949. This will make possible a sizeable contribution of ideas, papers, reports of achievements and proposals for new steps.

"Let us go forward, Engineers of all the American nations, to better collaboration in perfecting our techniques and in a common effort toward the progress, peace and liberty of the Americas.

"We await you here in Brazil, to greet you in brotherly fellowship."

Following is an abridgment of the agenda:

First Committee: Transportation and Communication — including railway, highway, maritime, river and lake, air tele-communication and postal.

Second Committee: Construction — including foundations, structures, construction.

Third Committee: Power — including hydraulic, fuel, electric.

Fourth Committee: Urban and Rural Engineering — including city planning, urban housing, public utility services, urban traffic, rural engineering.

Fifth Committee: Sanitary Engineering — including water supply, storm water, pollution and self purification of streams, lakes and bathing beaches, sewage, urban systems, disposal of wastes, hospitals and cemeteries, rural sanitation.

Sixth Committee: Industrial Engineering — including metallurgy, mechanical, extractive, processing and chemical industries.

Seventh Committee: Mining Engineering and Geology.

Eighth Committee: Teaching of Engineering.

Ninth Committee: Miscellaneous.

The James Watt International Medal

The Institution of Mechanical Engineers has announced the award of the James Watt International Medal to Dr. Frederik Ljungstrom of Sweden.

The conditions governing the award of the Medal were stated on its foundation to be as follows:

"James Watt was born on 19th January just over two centuries ago. To commemorate an event which was destined to bring about a revolution in the utilization of power the Institution of Mechanical Engineers of Great Britain decided to award every two years a Gold Medal to an engineer of any nationality who is deemed worthy of the highest award the Institution can bestow and that a mechanical engineer can receive. In making the award the Institution has secured the co-operation of the principal engineering institutions and societies in all parts of the world as nominating authorities."

The illustrious company which Mr. Ljungstrom joins includes Sir John Aspinall and Dr. F. W. Lanchester of Britain. Henry Ford and Professor S. Timoshenko of the United States, Dr. A. G. M. Mitchell of Australia and Professor A. Stodola of Switzerland.

Are You a Consulting Engineer?

Frequently Headquarters is asked to supply names or lists of names of consulting engineers to handle a great variety of work in Canada and in other parts of the world as well. Only recently two separate requests were received for names of engineers to design a group of works running into many millions of dollars.

In one way or another a good list has been built up, but it is more than likely that it is not complete. It should be complete.

It is the purpose of this article to invite all Canadian consulting engineers to send Headquarters a list of the kinds of work in which they are interested, so that we may have this information before us when further inquiries are received.

The Institute has been campaigning to have Canadian work designed and built by Canadians. It will be helpful in this campaign if we can have a complete and dependable catalogue of all consulting engineers and the work which they can do.

Canadian Construction Association

Convention Highlights

Attendance for the 31st annual C.C.A. convention at Toronto, January 23rd to 26th, 1949, established an all time record, with close to 900 registrations. This was attributed in large measure to the efforts of the Membership Committee which has brought the membership to a total of 700, double that of ten years ago.

Following registration, the meeting proceeded with presentation of various Committee reports. That apathy towards apprenticeship training posed the most pressing problem ever to face the industry, was stated by J. M. Pigott, C.B.E. of Hamilton, chairman of the Apprenticeship Committee. The industry was faced with the duty of setting aside methods that have proved inadequate to meet the shortage of tradesmen and of planning a new approach. "We must draw in five times as many boys as we have now, and train them more efficiently," he said.

General Manager R. G. Johnson briefly reported on the Association's activities during the past year, calling attention to the widely expanded information service now available to the membership. He announced that for the 1950 convention, to be held January 15th to 18th, 1950, the Mount Royal Hotel, Montreal, had been chosen.

At the first luncheon meeting Allan C. Ross, president of the Association, presented his annual report. He predicted that while it would be improper to forecast any substantial drop in costs for 1949, there was reason for hope that if inflationary factors are restrained, the cost rise may be halted by year's end. The anti-inflation programme mapped out at the last annual meeting, he said, could be credited for improvement in conditions during the past year, which showed a reduction in the rate of rise in costs from a 20 per cent increase in 1947 to a 10 per cent increase in 1948.

At the annual banquet, a welcome was extended to the Members by G. S. Welsh, Minister of Planning & Development, speaking on behalf of Premier T. L. Kennedy. The guest speaker was the Honourable R. H. Winters, newly appointed Minister of Reconstruction and Supply. Briefly reviewing gains over recent years in private investment in Canada, he predicted a pronounced swing in 1949 from industrial expansion to public utility construction, institutional buildings, and government projects. It is in the years beyond 1949, he pointed out, that public investment may have to play a more important part than in the past four years. Mr. Winters expressed the view that if all governments work together on a common goal, something could be done to help the industry avoid some of the excesses of booms and depressions, and contribute to greater stability of the Canadian economy. The federal "shelf" of public projects alone had reached a total of over $100 millions, he said, and he wanted to see it grow to $300 millions. He called on provinces and municipalities to build up their proportion to bring the combined total to over a billion dollars.

Second day addresses included H. J. Carmichael, chairman of the Industrial Defence Board, and D. B. Mansur, president of the Central Mortgage and Housing Corporation. Mr. Carmichael gave an outline of the skeleton organization being quietly set up now to deal with production for war should the necessity arise. Discussing the immediate need for housing, Mr. Mansur observed that we have just managed to look after current needs in Canada, without reducing the backlog of need accumulated during the war and since, yet no other country can show better per capita house production.

The Hon. Anthony Eden attended and addressed the meeting of the C.C.A. He is shown here with his aide, Commander Noble and Mr. Allan Ross, C.C.A. president, on his right. On his left are Albert Deschamps and Robert Drummond.

At the luncheon meeting, the second day, the guests were briefly addressed by the Honourable Anthony Eden, who was passing through Toronto. The luncheon guest speaker was Mr. A. C. Clark, chief of the Construction Division of the Public Roads Administration at Washington. In view of the growing importance of the Road Builders Section of the Association, and of their interest in the anticipated cooperation between Dominion and Provinces for completion of the Trans-Canada Highway, his outline of the excellent results obtained in building highways in the United States through cooperation between federal authorities and the various states was timely and constructive.

Speakers for the third day sessions included Past President Albert Deschamps, O.B.E.; R. F. Legget, director of building research, National Research Council; and F. K. Ashbaugh, Dominion steel controller.

On the lighter side, entertainment included attendance at the Royal Alexandra theatre, where a New York Cast showed a musical comedy production, " High Button Shoes ", and a Buffet Supper, under the auspices of the Toronto Builders Exchange, combined with a Robert Simpson Co. Fashion Show, and dancing. Entertainment of ladies included a trip to Niagara Falls.

Quebec Association Report on Minimum Salaries

The Corporation of Professional Engineers of Quebec has recently issued a report submitted by C. E. Gelinas, chairman of the Committee on Remuneration of Engineers. This report presents a proposed schedule of minimum salaries for engineers in the employee class, based on results of the survey carried out by the committee, as authorized by council in March, 1948.

The objectives of the survey were, to develop a schedule of minimum salaries suitable for adoption as part of the official code of the corporation; for employers as a practical method for determining minimum remuneration consistent with requirements and conditions of employment; for employees as an adequate standard of compensation commensurate with the obligations of any engineering classification; and for the entire profession as a logical basis for recognition of uniformly high standards of qualifications and remuneration.

Grade	Duties and Qualifications	Basis of Determination	EVALUATION						Salary in Dollars per Month		
			Education		Experience		Resp.†	Total			
			Degree	Points	Years	Points	Points	Points	Min.	Act.	Rec.

*Not observed — Obtained by extrapolation.

†As determined for Category A—Professional Work. Evaluation points for B—semi-professional and C—non-professional work in Grades III to VIII are 75 per cent of Values for A. Points shown in table for Resp. opposite average actual opposite grades V to VIII are for categories B and C.

Out of a total of 96 organizations approached, data from 71 were analysed, covering 480 classifications. Of 3200 questionnaires sent out to the Corporation's membership, 1670 replies were received, of which 1150 were analysed. The entire evaluation of results depends on a synthesis of three criteria; education, experience and responsibility.

The accompanying tabulation, developed from rationalization of data from both employers and members, shows the evaluation and comparison of average minimum, average actual, and recommended minimum salaries for eight grades of engineer employees. Valuation points for each of the three criteria mentioned are shown for the standard minimum requirements of each grade. Exhaustive statistical and graphic analyses led to the conclusion that each valuation point merited a rating of $1.37 in monthly salary.

The report comments that the exclusion of engineers who acquire qualification without attending University is not intended; nor is it implied that qualified engineers must be paid according to the schedule, since the employer must benefit from the employees' qualifications. Neither is it suggested that all engineers in any grade must be paid the minimum salary. The latter is merely the figure below which no salary is considered adequate. Recommendations are predicated on the assumption that there is a significant difference in value to an employer between a professional employee and one less qualified.

Only by maintenance of this difference can the higher salaries recommended be justified. The Committee, in submitting their report added a recommendation that steps be taken to lay out a plan for implementation of the report on its acceptance.

A comparison of the minimum salaries as recommended in this report, with minimum current, actual current averages, as well as with C.P.E.Q. recommended minima of 1944 and with A.P.E.O. minima recommended in 1947 are as follows: Present recommendations range 20 percent higher for lower grades, ten percent higher for higher grades, than current minima, they range 20 percent higher and 14 percent higher than current averages for grades I and II, are the same in medium grades, and are higher for grades VI, VII and VII by 17, 21 and 26 percent respectively.

Compared with Quebec 1944 recommendations, they are higher by some 17 percent than lowest three and highest two grades, and slightly lower than three medium grades. Compared with 1947 Ontario recommendations, they correspond closely, except for grade 1 where they exceed Ontario's by 5 percent.

Adoption of the recommended schedule would have the effect of raising 85 to 95 percent of current minimum salaries for grades I and II, of raising roughly half of current salaries for grades III, IV and V, and of raising three quarters of the current minimum salaries in the three highest grades.

News of Other Societies

The **Canadian Electrical Association** plans its 59th annual convention to take place on June 28, 29 and 30, 1949, at Banff Springs Hotel, Banff, Alberta.

The **Chemical Institute of Canada** reminds engineers of the annual chemical conference, in Halifax, May 30 to June 1, 1949.

Advance registration forms are available from C.I.C. head office, 18 Rideau St., Ottawa.

The 1949 Canadian regional conference of the **Illuminating Engineering Society** will be in Toronto, April 28-29.

F. P. Labey of Northern Electric Co. Ltd., 1620 Notre Dame St. West, Montreal, is secretary of the Montreal Section of the Society.

A. B. Dove, M.E.I.C., of Montreal, a director of the **Wire Association,** advises that this worldwide organization will hold its first Canadian regional meeting in Montreal, April 28-29, at the Mount Royal Hotel. Information may be obtained from Mr. Dove, at the Steel Company of Canada Limited, P.O. Box 460, Montreal.

The eastern district branch of the **Association of Professional Engineers of B.C.** held its annual meeting at Kootenay on January 31, 1949. J. H. D. Hargrave was elected chairman of the branch Other members of the council are: vice chairman, A. C. Ridgers, M.E.I.C., of Rossland; J. Atwell and A. Lambert, M.E.I.C., South Slocan; A. Telfer, Rossland; A. G. Dickinson, past chairman; and a new secretary, J. M. Heaps, M.E.I.C.

The Montreal regional conference of the **American Institute of Chemical Engineers,** September 7, 8 and 9, 1949, will devote two days to technical papers. Plant visits to several industries at Shawinigan Falls, Que., have also been arranged.

Members of the Engineering Institute are invited to attend, and the local committee on arrangements includes several E.I.C. members. Its chairman is Dr. H. R. L. Streight, P.O. Box 10, Montreal.

The A.I.Ch.E. schedule of 1949 meetings also includes regional meetings at Los Angeles, Calif., March 6-9, 1949, and at Tulsa, Oklahoma, May 8-12, 1949. The A.I.Ch.E. annual meeting for 1949 will be in Pittsburgh, Pa., at William Penn Hotel, December 4-7.

The 1949 annual meeting of the **Canadian Institute of Mining and Metallurgy** will be in Montreal, April 25-28 at the Windsor Hotel.

The Montreal office of C.I.M.M. is at 811 Drummond Bldg.

Arrangements are now complete for the **American Institute of Electrical Engineers'** Conference on Industrial Application of Electric Tubes. It will take place in Buffalo, April 11-12, 1949, at the Statler Hotel.

A.I.E.E. headquarters are at 33 West 39th St., New York 18, N.Y.

The **American Society of Civil Engineers'** calendar of meetings includes the spring meeting, Oklahoma City, April 20-23, 1949; the summer convention in Mexico City, July 13-15, 1949; the fall meeting at Washington, D.C., November 2-4, 1949; and the annual meeting at New York, January 18-20, 1950.

For the annual spring meeting of the **Society of Naval Architects and Marine Engineers** in San Francisco, Calif., May 12-13, 1949, headquarters will be the Palace Hotel.

For further information write H. M. Wick, American Bureau of Shipping, 45 Broad St., New York 4, N.Y.

The 115th national meeting of the **American Chemical Society** will be held March 28 to April 1, 1949, in San Francisco, at the Fairmount Hotel.

The office of the Society is at 60 East 42nd Street, New York 17, N.Y.

The **American Society of Mechanical Engineers'** schedule of 1949 meetings includes the spring meeting at New London, Conn., May 2-4; the semi-annual meeting, San Francisco, Calif., June 27-30; the fall meeting, Erie, Pa., September 28-30; and the annual meeting, at New York, November 27 to December 2.

The **American Institute of Mining and Metallurgical Engineers** includes in its calendar of 1949 meetings a regional meeting at Neil House, Columbus, Ohio, on September 25-28; and the fall meeting, under the auspices of the Institute of Metals Division of A.I.M.E., in Cleveland, October 17-19. The next annual meeting of A.I.M.E. will be in February, 1950, in New York.

The **Society of Automotive Engineers** has scheduled 1949 national meetings as follows: an aeronautic and air transport meeting and aircraft engineering display, at the Hotel New Yorker, April 11-13; the summer meeting June 5-10, at the French Lick Springs Hotel, French Lick, Ind.; the west coast meeting, August 15-17, at Multnomah Hotel, Portland, Ore.; a tractor meeting at Hotel Schroeder, Milwaukee, Wis., September 13-15; an aeronautical meeting and aircraft engineering display October 5-8, in Los Angeles at the Hotel Biltmore; and a diesel engine meeting on November 1-2 at the Chase Hotel, St. Louis, Mo.

Inquiries will be welcomed by the Society at 29 West 39th St., New York 18, N.Y.

The First International Congress of Civil Engineering will be held in Mexico from April 30 to May 7, 1949. It is convened by the **College of Civil Engineers of Mexico.**

The office of the organizing committee is at Plaza de la Republica 55-606, Mexico, D.F., Mexico.

Correspondence

January 9, 1948.

Dear Mr. Wright:-

Thank you very much for your kind letter of December 28th enclosing Life Membership card.

A lot of water has gone under the bridge since I joined the Institute in 1911 and I have been glad to see the gradual progress made by the Institute and its members. I believe our engineers have done themselves proud through the years and should be encouraged to greater efforts and not discouraged by such appointments of outside engineers as is proposed in the planning of Mount Royal and environs and has occurred in the beautification of Ottawa and the recent appointment of Mr. Glen, rather than an experienced engineer, to the very important post on the International Joint Commission. Maybe such appointments have a great bearing on the flight of our trained men to the United States. They note that when any worth while engineering opportunities occur they are parceled out to outsiders or to persons that are not engineers. That is not as it should be.

Again thanking you and wishing you the Compliments of the Season.

J. W. MacMahon, M.E.I.C.

February 10th, 1949

To the Editor,
The Engineering Journal.

Dear Sir:

In the September, 1948, issue of *The Shipping Register and Shipbuilder,* the writer made the following statements, viz:

> The present plans for the improvement of the St. Lawrence Waterway are based upon the knowledge of twenty-five years ago and they should not be proceeded with until the following oversights have been adequately weighed and, if thought wise, provided for. These oversights are:
>
> (1) The designers made no study of the winter temperatures of Lake Ontario and made no effort to use the heat always present in those waters to keep the Waterway free from ice in the winter. Present day evidence indicates that an open channel can be maintained every winter from Lake Ontario to a point well east of Quebec where connection can be established with the Gulf waters, which do not freeze over.
>
> (2) The designers were limited by their instructions to a channel depth of 30 feet. Naturally the St. Lawrence River is adapted to the construction of a much deeper channel and a 50 ft. waterway is easily obtainable from the broad and deep Gulf waters up to Lake Ontario.
>
> (3) The designers purposely neglected the study of the use of Lake Ontario as a storage basin to aid in the development of hydro-electric power, considering such studies to be premature. That position cannot be maintained today. The demand for hydro-electric power is not constant throughout the year, particularly in Canada and the deliberate use of the great lake as a storage basin would make desirable the construction of much larger installations both at Barnhart's Island and at the lower power developments on the waterway, say, in the case of Barnhart's Island an installation of about 3,000,000 hp instead of 2,200,000 hp. as now contemplated.
>
> (4) The designers made no study of the possibility of establishing a joint control over the flow of the St. Lawrence and Ottawa Rivers. The results of such a control would be to increase the hydro-electric power available on the waterway by, say, 500,000 hp. and to render possible an almost perfect control of the flow of the St. Lawrence River between Montreal and Quebec.

In support of the foregoing paragraphs it may be pointed out:

(1) Observations taken in Lake Michigan continuously from November, 1941, to February, 1944, by Prof. Church establish the fact, that, in the deep Great Lakes, the mass of the water is of one temperature from top to bottom during the winter months—that temperature slowly falling to a minimum in the month of March but never falling down to freezing point. From the same observations.

the rates at which the water mass parts with its heat can be determined with an approach to accuracy. If Professor Church's results are compared with those from simultaneous observations made on Lake Ontario by the Dominion Meteorological Bureau it may be concluded that Prof. Church's data may be safely used in water temperature studies in and around Lake Ontario at least until the temperature cycle of Lake Ontario has been studied with as much care as was that of Lake Michigan. Accepting this conclusion, a limit can be set to the time within which the waters of Lake Ontario must flow to reach the salt water of the St. Lawrence Estuary without cooling down sufficiently to permit the formation of ice. Knowing the time limit and the discharge of the river it is a routine matter of hydraulics to design a suitable channel for the river. In midwinter a channel velocity of about 3 m.p.h. will probably be desirable but there must be no still water. Considering how radical a change in the regimen of the river is involved in the above suggestion it might be wise to first develop the upper reach of the river from the Duck Islands to Barnhart Island on the principle of heat conservation and so obtain reliable data for use in the improvement of the lower reaches. The resulting improvement in the power possibilities for Ontario would alone justify the cost of regimenting the upper reaches to provide for an ice-free channel.

(2) Assuming that certain dams that have been recommended for construction have been built, a study of the published plans and charts of the river will disclose the fact that, in the distance of 200 miles between the Duck Islands and Montreal, 146 miles of the channel will require no further deepening to secure a depth of 50 ft. Of the remainder, 35 miles call only for dredging in easy material and only 19 miles will involve the handling of rock and boulders. The engineering profession is not responsible for selecting a 30 ft. depth for a channel which is naturally suitable for 50 ft. navigation.

The water levels and tide records between Montreal and Ile aux Coudres were carefully investigated for the Department of Public Works by R. Steckel, M.E.I.C., about 1890. If these are studied it will be seen that during high water stages a channel approaching 50 ft. in depth already exists between Montreal and Three Rivers. To perpetuate that condition it is only necessary to maintain spring water levels and this can be done partly by improving the regulation of the flow of the river as later discussed and partly by building a dam in the neighbourhood of Ile aux Coudres. The slopes as shown in Mr. Steckel's records will be found to be suitable for a regulated river flowing in a designed channel. In other words the St. Lawrence River between Three Rivers and Ile aux Coudres can be converted into a fresh water stream flowing always full with water levels corresponding closely to present high water marks. The channel depth below Three Rivers will generally be greater than 50 ft.

(3) & (4) These two paragraphs may well be discussed together. The Ottawa River is a turbulent stream with few natural storage basins. Nature however has been very generous in providing storages on the St. Lawrence and these can be used to aid in more fully utilizing economically the flood waters of the Ottawa River. From a study of the discharge records of the latter it will be seen that it lends itself rather well to regulation in two time periods, a high water period of four months and a low water period of eight months. If the power plants on the Ottawa are designed to utilize the regulated high water flow then during those four months the flow of the St. Lawrence can be sharply cut back at Barnhart Island and the surplus waters can be stored in Lake Ontario to increase the flow of the river during the other eight months. On this basis it would be proper to design the power plant at Barnhart Island for a flow of 300,000 c.f.s. of which 200,000 c.f.s. would be held under Ontario title. The power plants at Beauharnois and Montreal would benefit in like amount. But one precaution is necessary in the carrying out of the plan. The water level of Lake Ontario must be drawn down to an established minimum — say about 243 — at the end of every water year which comes about March 31st. With this precaution the choked off flow of the river can be safely held without a fluctuation of water levels in Lake Ontario of more than four feet and without danger of high water flooding.

At present the flow of the St. Lawrence River above Sorel varies from about 180,000 c.f.s. to 510,000 c.f.s. (monthly mean flow) but with the regulation suggested above the limits of flow should be 275,000 c.f.s. and 350,000 c.f.s. a reduction in the amplitude of the variation in flow of about 75 per cent.

The above comments are of course all too brief to develop the problems under discussion but they appear to justify certain pertinent questions:

(i) Why is it proposed to build a 27½ ft. waterway in a location where a 50 ft. waterway can be secured at relatively little added expense.

This is but to repeat the mistake made by the Canadian Government in the 1870's when it decided to build the St. Lawrence Canals, without provision for future growth.

(ii) Why has the possibility of keeping the waterway channel free from ice for twelve months in the year not been fully explored.

(iii) Why should the storage capacity of Lake Ontario not be used to give Ontario an additional power supply approaching 1,000,000 hp. and Quebec an addition of 1,250,000 hp.

Lastly it may be asked why the St. Lawrence waterway should be considered as necessarily an international project. 85 per cent of the power to be developed on it will be for Canadian use. It is estimated that 85 per cent of the freight traffic on it will come from Canadian sources and 85 per cent of the shore line that will be affected by the proposed improvements is held under Canadian title. Surely there is a strong case for an all-Canadian construction — the federal government being backed up by the wealthy Provinces of Quebec and Ontario because of the great stores of hydro-electric power which will become available to them. Full privilege of use can be granted to our American friends in partial return for the privileges extended to Canadian vessels in the Panama Canal, a courtesy which should never be overlooked.

The writer would welcome opportunity to defend his opinions at greater length than the columns of the *Journal* permit but it is not suggested he has fully explored the problems that are dealt with herein. He has only intended to invite others to do so.

J. G. G. Kerry, M.E.I.C.

Personals

Notes of the Personal Activities of Members of the Institute

J. C. Davis, M.E.I.C., of St. Boniface, Man., was appointed senator in January when it was announced the former president of the Manitoba Liberal Association would represent Manitoba in the Upper House when parliament opened.

Senator Davis is president and general manager of J. C. Davis Ltd., Winnipeg engineering firm, and is on the directorates of several other companies. During the war years, he served on the advisory board of the Department of War Services. He is a Graduate of McGill University, Montreal.

W. J. Tindale, M.E.I.C., retired at the end of 1948 as chief engineer of the West Kootenay Power and Light Company, Limited, Trail, B.C.

Mr. Tindale, who contributed to the Institute's Annual Meeting in 1948 the paper on the Power Development on the Kootenay River, has completed 24 years of service with the Company.

As designing engineer he was intimately associated with all developments of the power company between 1926 and 1938. From 1938 to 1940 came the extension of the Upper Bonnington plant, followed in 1942 by construction of the Brilliant plant. Prior to commencement of the Bonnington plant, Mr. Tindale was given the appointment as the power company's chief engineer.

G. L. Macpherson, M.E.I.C., has been appointed general manager of refineries for Imperial Oil Ltd. A graduate of the University of Toronto, he joined the Company in 1922 as a draughtsman. In 1937 he was appointed assistant chief engineer and in 1943 chief engineer. He was later named manager of the engineering and development division, the post he held until his recent appointment.

I. R. Tait, M.E.I.C.

He is the immediate past-president of the Association of Professional Engineers of Ontario, and is E.I.C. Councillor representing the Sarnia Branch.

Louis Trudel, M.E.I.C.

K. R. Swinton, M.E.I.C.

Louis Trudel, M.E.I.C., was appointed in February to the position of assistant manager of the public relations and advertising department of the Shawinigan Water and Power Company, Montreal. He will continue to act as manager and editor of *The Shawinigan Journal,* which position he accepted in 1947, leaving E.I.C. Headquarters after eight years of service as assistant general secretary.

Before coming to the Institute in 1939 Mr. Trudel, a graduate of Ecole Polytechnique, Montreal, had been associated consecutively with the Provincial Electricity Board, the Southern Canada Power Company and Marine Industries Ltd.

Lt. Col. K. R. Swinton, M.E.I.C., former assistant director of electrical and communications design with the Department of National Defence and manager of the electronics division of the R.C.A Victor Company Limited, Montreal, has been appointed vice-president and executive assistant to the president of Imperial Typewriters of Canada, Rotaprint Company of Canada, Limited, and Ritchie Office Equipment Limited, Montreal.

R. Bowering, M.E.I.C.

Col. Swinton, who holds an M.Sc. degree in radio and television engineering, will be in charge of the new electronics division of the Organization, and will also act as general manager and director of an American subsidiary company which is presently being formed in the United States. His work will include the development and sales of new apparatus, and the direction of all export activities.

R. H. Wallace, M.E.I.C., was re-elected chairman of the Cornwall Branch of the Institute at its recent annual meeting. Mr. Wallace, a graduate of Royal Military College and of McGill University, Montreal, is plant superintendent of Canada Starch Company Ltd., Cardinal, Ont.

Prof. M. L. Baker, M.E.I.C., was elected recently chairman of the Halifax Branch of the Institute. Prof. Baker, who is associate professor of mechanical engineering at Nova Scotia Technical College, Halifax, is also a graduate of that college. Before entering N.S.T.C., he was a machinist. He received a B.Sc degree in mechanical engineering in 1932 and he joined Hillis & Sons Ltd., Halifax, as a sales engineer. A year later he joined the staff of N.S.T.C. as an instructor. He was appointed assistant professor of mechanical engineering in 1938.

A. A. Swinnerton, M.E.I.C., was recently elected chairman of the Ottawa Branch of the Institute.

Mr. Swinnerton studied at University of Toronto, where he graduated in chemical engineering in 1919. He served overseas during World War I, and on his return to Canada in 1917 he worked as a chemist with British Acetones, Toronto, and in 1919 he was appointed assistant chemist in the Department of Mines at Ottawa. In 1921 he was promoted to be chemist in charge of oil shale investigations. He was later transferred to the fuel research laboratories of the Department. He worked on the Dominion Fuel Board, and he is now a chemical engineer in the fuel research laboratories of the Bureau of Mines of the Department of Mines and Resources.

Neil Metcalf, M.E.I.C., has been elected chairman of the Hamilton Branch of the Institute.

Mr. Metcalf, metallurgical engineer of

A. L. Furanna, M.E.I.C.

Burlington Steel Company Hamilton, is a graduate of University of Wales with the degree of B.Sc. He worked at Cardiff, Wales, for a time, and in 1926 was appointed assistant metallurgist for Ford Motor Company at Manchester, England. He went to the United States to the Detroit shops of the Ford Company in 1927, but in 1928 he joined the Treadwell Engineering Company at Easton, Pa., as chief metallurgist. It was in 1936 that he joined Burlington Steel Company Limited.

G. W. Lusby, M.E.I.C., chairman of the Border Cities Branch of the Institute, is an engineer with Ford Motor Company of Canada Ltd., Windsor, Ont. He joined the company in 1927, having been employed previously by the Fraser Brace Company at Gatineau, Que., and by the Canadian International Paper Company at Trois Rivieres, Que. He is a graduate of Nova Scotia Technical College, Halifax, having received a B.Sc. degree in mechanical engineering in 1925.

I. R. Tait, M.E.I.C., recently elected chairman of the Montreal Branch of the Institute, is chief engineer of Canadian Industries Limited, Montreal.

F. F. Walsh, M.E.I.C.

Mr. Tait, a graduate of McGill University, joined C.I.L. in 1915 as an elec-

Max L. Baker, M.E.I.C.

trical engineer. He received his appointment as chief engineer in 1939.

H. P. Lingley, M.E.I.C., is chairman of the Saint John Branch of the Institute.

Mr. Lingley graduated from University of New Brunswick in 1930. He worked for Canadian National Railways for a time, and on the reconstruction of the West Saint John Harbour. He was an engineer inspector on several projects for the Federal Department of Public Works in New Brunswick, and he was appointed a junior engineer in the Department in 1937. He was made an assistant engineer in 1943. He is now an assistant engineer with G. G. Murdoch, Saint John.

A. L. Furanna, M.E.I.C., was recently elected chairman of the London Branch of the Institute.

Mr. Furanna graduated from Queen's University in 1939, and he remained at the University for a year as a demonstrator in electrical engineering. He joined the London Public Utilities Commission then, as assistant to the engineer. In 1943 he went to Sparton of Canada Ltd., London, as an engineer in the instrument division. Mr. Furanna has since returned to the London Public Utilities Commission as an engineer.

Photo by Carey Studio

Neil Metcalf, M.E.I.C.

F. F. Walsh, M.E.I.C., has been elected chairman of the Sarnia Branch of the Institute. Mr. Walsh graduated from University of Toronto in 1940 with the degree of B.A.Sc. in mechanical engineering. He was employed by the Steel Company of Canada, at Hamilton, Ont., until 1943, spending one year on a graduate training course, and two as foreman in the mechanical department. He then went to the Imperial Oil Company, Sarnia, Ont., on a training course in preparation for operations at the Polymer Corporation. At the Polymer Corporation he was for two years technical supervisor of steam and power plant, and he was then appointed utilities engineer. He is now assistant technical controller for the Corporation.

D. C. Holgate, M.E.I.C., of the Sault Structural Steel Co. Ltd., is chairman of the Sault Ste. Marie branch of the Institute.

Mr. Holgate has been with his firm since 1941, and has been engineer in charge of all design and drawing office work for the company. In 1943 and 1944 he was in training with the R.C.A.F. Mr. Holgate transferred to Sault Structural Steel Co. from Dominion Bridge Company, Toronto, where he was for two years a structural steel draughtsman. He had previously worked for a time with the MacKinnon Steel Corporation Ltd., Sherbrooke, Que., after his graduation from McGill University in 1938.

R. Bowering, M.E.I.C., was recently elected chairman of the Victoria Branch of the Institute.

Mr. Bowering received a B.Sc. degree in civil engineering from University of Manitoba in 1938. He received the degree of M.A.Sc. in public health engineering at Toronto University a year later and he went to the Board of Health of British Columbia in 1940 to be public health engineer and chief sanitary inspector. He is now director of the division of public health engineering of the Department of Health of the province.

A. W. McMaster, M.E.I.C., was recently elected library trustee for the city of Westmount, Que. The election by acclamation followed his nomination by the Westmount Municipal Association early in January.

R. A. C. Henry, M.E.I.C., of Montreal, has been elected to the board of directors of Marine Industries Limited, and appointed executive vice-president. Mr. Henry will also be associated with Sorel Industries Limited and other companies of the Marine Industries group.

Paul A. Beique, M.E.I.C., of Montreal, has been elected a member of the board of directors of the Mutual Life Assurance Co. of Canada.

E. T. W. Bailley, M.E.I.C., combustion engineer, Steel Company of Canada, Ltd., at Hamilton, has been elected a director of the Association of Iron and Steel Engineers, Pittsburgh, Pa.

John N. Flood, M.E.I.C., has again been nominated by the Canadian Construction Association to attend the second meeting of the Building, Civil Engineering, and Public Works Committee of the International Labour Organization. The meeting is to be held in Rome, Italy, starting on March 15. Sailing early in March, he plans to return home from Liverpool on the Empress of France on April 12.

Mr. Flood is president of John Flood and Sons Limited, engineers and contractors, Saint John, N.B.

R. A. C. Henry, M.E.I.C.

D. K. Penfold, M.E.I.C., chief engineer in the Water Rights Branch of the Department of Lands of British Columbia, has been named a member of the Public Utilities Commission and the Coal and Petroleum Board of the Province, in Victoria. He was appointed to the staff of the Water Rights Branch in 1928, and was made district engineer at Kelowna in 1931. He continued in that position until 1941 when he was made chief engineer.

Russell E. Potter, M.E.I.C., is terminating his position as city engineer of New Westminster, B.C., to accept the newly created position of executive assistant to the Fraser River Basin Commission. The personnel of the Commission will consist of officials of the Federal and Provincial Governments interested in various phases of the River development. Mr. Potter's job will be to co-ordinate the work of these varying interests.

Graduating in civil engineering from the University of Saskatchewan in 1925, he took a student course with the Allis-Chalmers Manufacturing Company in Milwaukee, Wis. He went to British Columbia in 1929 and spent four years in the consulting engineering office of A. C. R. Yuill. Mr. Potter was then appointed city engineer for Nelson, B.C. In 1939 he moved to New Westminster as city engineer. For two years during the recent war he was on leave of absence to the Air Force doing engineering work on the Northwest Staging Route and Alaska Highway.

C. J. Jeffreys, M.E.I.C., recently resigned his position as chief engineer for Stadler Hurter Co. and has established a private practice in Montreal, as consulting engineer covering industrial and general pulp and paper mill design, renovation and process work.

Mr. Jeffreys attended Willesden and London Polytechnic through scholarships and served five years apprenticeship with the British Thompson Houston Co. before coming to Canada in 1924. He has been connected with the pulp and paper industry on design and development with C. Walmsley Company, Canadian International Paper

Paul Beique, M.E.I.C.

Company, Abitibi Power & Paper Company, Fraser Paper Company, Dominion Engineering, and Ontario Paper Company, previous to taking a position with the late John Stadler, during which period he also served as development engineer with the Powell River Paper Co., B.C.

His services were requested during the war with Allied War Supplies as mechanical engineer in connection with design of chemical and explosive plants. In 1944 he rejoined the late John Stadler and had an interest in the Company now known as Stadler Hurter & Co.

During his association in the pulp and paper industry, he has been engaged as engineer and later chief engineer on a number of new pulp and paper mill projects, renovations, and valuations covering kraft, bleached and unbleached sulphite, dissolving pulp, semi-chemical pulp, newsprint, and wallboard.

A. L. Cole, M.E.I.C., who has been superintendent of power for the Saskatchewan Power Commission, will be acting general manager "pending a permanent appointment" in the new crown company, Saskatchewan Power, which will replace the Commission. The general manager will direct the new company, and will be responsible to the board of directors.

At various times Mr. Cole has been an instrument draughtsman, associate editor of a New York power magazine, and chief engineer with the Regina Light and Power Company. He was also employed in the construction of Ontario power plants. He first came to the Commission in 1937 when he accepted the position of superintendent of the Saskatoon plant. In 1946 he was appointed superintendent of power.

Dr. A. F. Baird, M.E.I.C., of Fredericton, N.B., was elected president of the Association of Professional Engineers of New Brunswick at the annual meeting in Saint John in January. Dr. Baird is professor and dean of applied science, University of New Brunswick.

John P. Mooney, M.E.I.C., was elected vice-president of the Association. Mr. Mooney, who is manager of Mooney Construction Co., Saint John, is a past-councillor of the Engineering Institute. **R. C. Eddy,** M.E.I.C., of Bathurst, N.B., is councillor for the Chatham district; **V. S. Chestnut,** M.E.I.C., is councillor for the Saint John District; and **W. C. MacDonald,** M.E.I.C., of Moncton, councillor for that district.

I. P. Macnab, M.E.I.C., of Halifax, has been elected president of the Association of Professional Engineers of Nova Scotia for 1949. Mr. Macnab, the general manager of the Public Service Commission of Halifax, is also vice-president of the Engineering Institute of Canada **L. D. Hopkins,** M.E.I.C., of Bridgewater, N.S., is vice-president of the Association of Professional Engineers of Nova Scotia. He is with the Acadia Construction Co. Ltd., Bridgewater. Councillors are **G. D. Stanfield,** M.E.I.C., and **J. P. Messervey,** M.E.I.C., for Halifax; and **E. D. Brown,** M.E.I.C., Dingwall, and **F. C. Morrison,** M.E.I.C., New Glasgow.

H. W. Lea, M.E.I.C., who for various periods during the past 25 years has been associated with R. S. and W. S. Lea, consulting engineers, has taken over the practice, which, following the retirement of the late R. S. Lea, M.E.I.C., in 1930, had been carried on by W. S. Lea, M.E.I.C., until his death in 1947.

Mr. Lea has also been associated with the Montreal Sewers Commission and Phillips Electrical Works Limited, and was resident engineer on construction of the Chicoutimi Ocean Terminal. In 1941 he went to Ottawa as chief executive officer of the Wartime Bureau of Technical Personnel. Early in 1942 he succeeded E. M. Little as director of the Bureau and in 1945 was appointed co-ordinator of the Department of Reconstruction and Supply. Eventually Mr. Lea found it necessary to resign from government service to devote sufficient time to his practice as a consulting engineer in Montreal and Ottawa.

John Grieve, M.E.I.C., has been appointed executive secretary of the Canadian Institute of Steel Construction, Toronto.

Coming from Scotland, Mr. Grieve, worked in Canada for the Dominion Bridge Company, Montreal, and went to the United States for the Detroit Graphite Company as vice-president in charge of the New York office. Returning to Canada, he became general industrial manager of Brandram Henderson, but later went to Imperial Varnish and Color Company as sales promotion manager.

Donald C. Beam, M.E.I.C., formerly chief engineer of the Carter Construction Co. Ltd., has been appointed chief engineer of the Canadian Institute of Steel Construction, Toronto.

Mr. Beam joined the Carter Construction Company in 1945. He had previously been associated with construction in the Toronto Department of Buildings, which he joined as structural engineer and plan examiner. For three years he was technical secretary to the Joint Committee on Revision to Toronto Building By-Law. In 1941 his services were loaned to Wartime Housing Ltd., as general superintendent of construction. He was later named manager of the maintenance and construction department and he served in that capacity until 1945.

Y. R. Tasse, M.E.I.C., is no longer with the Canadian General Electric Co. Ltd., for whom he was an apparatus engineer at Quebec City. He has become a partner in the consulting engineering firm of Tasse, Sarault et Associés, Quebec.

Mr. Tasse studied at Ecole Polytechnique, graduating in 1935. He joined Canadian General Electric and followed the "test course." He spent some time at the various plants and at the Toronto and Montreal offices, and was transferred to Quebec in 1938. There he opened the apparatus department, of which he was in charge until the formation of the new firm.

G. E. Soroult, M.E.I.C., a partner in the newly established firm, Tasse, Sarault et Associés, of Quebec, has been in consulting practice in that city for the past few years. He is also director of the electrical engineering department at Laval University. The new firm specializes in the electrical, heating and ventilating fields.

Mr. Sarault is a graduate of McGill University, class of 1934. He has been on the staff of Laval University for a number of years. He had worked previously as chief engineer of the C.B.C. radio station C.B.F. in Montreal.

A. Sondilonds, M.E.I.C., has been appointed Winnipeg manager for Automatic Electric (Canada) Limited. He has been associated with the Company since 1940 and has served in the Edmonton and Regina Branches. Since 1945, Mr. Sandilands has been wire and cable sales engineer in the Winnipeg district.

L. M. Hunter, M.E.I.C., engineer for the city of Ottawa, was named assistant commissioner of works by the Board of Control in February. He has been an employee of the engineering department since 1911.

Brigodier Mourice G. Archer, M.E.I.C., of Quebec City, was promoted to that rank in December last and was appointed to command the artillery of the Fourth Canadian Infantry Division of the Canadian Army Reserve Force.

Brig. Archer served in Northwest Europe during the recent war, took command in 1944 of the 4th Medium Regiment, R.C.A., and in 1946 was given command of the 6th Field Regiment, with the rank of lieutenant-colonel. Brig. Archer, in civilian life, is in the consulting engineering firm, Archer & Dufresne, Quebec.

F. J. Hoar, M.E.I.C., of Watertown, N.Y., has been elected to the offices of president and treasurer of the G. D. Jenssen Company, Inc., of that city. Mr. Hoar has been vice-president and general manager since he joined the Company in 1944. He had been associated previously with Stebbins Engineering and Manufacturing Company, Watertown, as middle west representative, and as manager of Canadian Stebbins Engineering and Manufacturing Co. Ltd., Montreal

F. S. MacDonald, M.E.I.C., of Montreal, has been appointed vice-president of the G. D. Jenssen Company Inc., of Watertown, N.Y. Mr. MacDonald has been associated with Homad Services Ltd., Montreal, since 1948, and will continue his association with that Company. He was previously with Sherbrooke Machineries Limited, Sherbrooke, Que.

L. M. Nodeou, M.E.I.C., has been appointed registrar of the Corporation of Professional Engineers of Quebec. Mr. Nadeau has been assistant registrar of the Corporation since 1946. Previously he had been an engineer inspector for Canadian Underwriters Association, Montreal, from the time of his graduation from Ecole Polytechnique, Montreal, in 1936.

F/L. Ion Gillean, M.E.I.C., is in Ottawa, Ont., a signals officer in the R.C.A.F. Maintenance Command. He is an engineering graduate of McGill University, class of 1940. He served with the R.C.A.F. from 1941, taking his discharge in 1945 with the rank of flight lieutenant. He then worked with the Marconi Company in Montreal for several years before rejoining the permanent force recently.

C. E. Cleveland, M.E.I.C., is on the geological staff of the Barnsdale Oil Company, Calgary, Alta., which company he joins after spending a number of years as geologist and exploration engineer with the Bralorne Mines Ltd., of Vancouver, B.C. He received the degree of B.A.Sc. in geology from University of British Columbia in 1934. He received M.Sc. and Ph.D. degrees from McGill University in 1938 and 1940.

J. C. Critchley, M.E.I.C., has accepted employment with Dominion Textiles Co. Ltd., Magog, Que. Mr. Critchley is the former superintendent of Canadian Durex Abrasives, Brantford, Ont.

John Y. Stanfield, M.E.I.C., has accepted a position with the Phoenix Insurance Company of Hartford, Conn. He had been general manager of Londonderry of Canada Limited, at Montreal. A graduate of Nova Scotia Technical College, class of 1933, Mr. Stanfield was overseas with the R.C.A. from 1940-1945, serving with the rank of major.

Thomos A. G. Beeching, M.E.I.C., has accepted a position with the Dominion Water and Power Bureau in Victoria, B.C. He was formerly sales engineer for Brown, Boveri Ltd., Montreal.

Arthur W. Dimond, M.E.I.C., has accepted a position with the Canadian Carborundum Company, Niagara Falls, Ont. He was formerly an engineer with Burgess Battery Company in that city.

A. F. M. M. S. Huda, M.E.I.C., has returned to Pakistan. A graduate of Calcutta University, he received the degree of M.A.Sc. in civil engineering in 1947 from University of Toronto. He was an India Government overseas scholar at Toronto.

D. M. Venton, JR.E.I.C., who was assistant city engineer at Owen Sound, Ont., resigned in January to accept the position of engineer and road superintendent of the Township of East Whitby, Ont. Mr. Venton graduated from University of Toronto in 1945.

D. A. Buhr, JR.E.I.C., is on temporary leave of absence from the P.F.R.A., Regina, Sask., to attend the Utah State Agricultural College where he is working toward a master's degree in civil engineering. Recently he and Howard M. Olson of Sheldon, N. Dak., were jointly awarded the Aluminum Co. of America fellowship to conduct research on aluminum sprinkler irrigation tubing and couplings. Mr. Buhr graduated from University of Saskatchewan in 1947.

Theodore Wildi, JR.E.I.C., has joined the teaching staff of Laval University, Quebec City. He is a graduate of McGill University, where he obtained a B.Eng. degree. He served for a number of years with the Canadian Comstock Company, and for the past five years he has been with the technical group of the Electrical Tamper and Equipment Company of Montreal. At Laval, Mr. Wildi will be in charge of electrical machines and will operate experimental work among the students in the machine laboratories.

Lionel Boulet, JR.E.I.C., has joined the teaching staff of the electrical engineering department of Laval University, where he obtained the degree of B.Sc. in 1944. Mr. Boulet worked with R.C.A. Victor Co., Montreal, for two years, and after studying at the University of Illinois and receiving an M.Sc. degree in 1947, he returned to R.C.A. Victor to work in the electronics laboratories, remaining until his recent appointment.

Williom Hobson, JR.E.I.C., has been appointed manager and district engineer of the Montreal branch office of D. M. Fraser, Ltd., of Toronto, distributors of electrical and mechanical power equipment. Mr. Hobson was formerly employed by the Northern Electric Co Ltd., in the telephone division.

G. L. Porker, JR.E.I.C., has left the employ of Toronto Iron Works Ltd., where he was design engineer since his graduation from the University of Saskatchewan in 1946. He is now a sales engineer with Sarco Canada Ltd., in the White-Rogers electrical controls division, in Toronto.

M. D. Arnaud, S.E.I.C., is with H. G. Acres in Niagara Falls, Ont. He graduated from University of Toronto in 1948 with a B.A.Sc. degree in civil engineering.

Visitors to Headquarters

G. D. Stanfield, M.E.I.C., Starr Manufacturing Works Ltd., Halifax, January 31

G. A. Day, Brown Company, Berlin, New Hampshire, January 31.

Arnold H. Hoffer, JR.E.I.C., General Electric Company, Schenectady, N.Y., February 4.

W. O. Mocloren, M.E.I.C., Brian Colquhoun & Partners, Johannesburg, South Africa, February 9.

W. R. Monock, M.E.I.C., Horton Steel Works Ltd., Fort Erie, Ont., February 10.

W. G. Stuort, M.E.I.C., Yellowknife, N.W.T., February 11.

George S. Sonders, JR.E.I.C., Port Arthur, Ont., February 14.

S/L C. V. Trites, M.E.I.C., Ottawa, Ont., February 17.

S/L J. D. Shonnon, R.C.A.F., Rivers, Man., February 17.

F. Lionel Peckover, JR.E.I.C., National Research Council, Ottawa, Ont., February 22.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Jacques Rabut, HON.M.E.I.C., consulting engineer, of Paris, France, who died on December 1, 1948, was internationally known as an authority on reinforced concrete structure.

M. Rabut, who was head of the firm, Société Ch. Rabut et Cie., in Paris, was made an Honorary Member of the Institute in 1937, at the age of fifty-two. He was also a prominent member of the Société des Ingenieurs Civils de France. M. Rabut studied at the Ecole Nationale des Ponts et Chaussées, Paris, graduating in 1909.

After distinguished service at the front as an engineer officer during World War I, he was sent to the United States with the French High Commission, and later served with a French mission in the United States for the purchase of equipment for the rehabilitation of the devastated regions in France. He then went to China with an international commission assembled by the Chinese Government to deal with the reconstruction of the bridge over the Yellow River. On several other occasions he has been retained by the French Government, notably in connection with a large cold storage plant erected in 1919 at Saint Pierre-Miquelon.

M. Rabut paid a visit to the United States and Canada, in 1934, during which he delivered a series of lectures at the Ecole Polytechnique, Montreal, on French engineering construction, dealing largely with the works with which his firm had been associated as consultants. M. Rabut was one of the French engineers whose remarkable designs in reinforced concrete seemed so daring to engineers accustomed to North American practice in that material. Among such structures may be mentioned two reinforced concrete arch-rib bridges of 330 ft. span over the Meuse, and a number of reinforced concrete airplane hangars of 170 ft. span at Cherbourg and Querqueville.

The death of M. Rabut occurred in Washington, D.C., U.S.A., where he was serving on a French Government mission.

John Brooke, M.E.I.C., of Hervey Junction, Que., died on December 9, 1948.

Very scant information appears in the Institute files relating to Mr. Brooke's career. He was placed on its rolls as an Associate Member in 1899, transferred to Member in 1940, and was granted life membership in 1931.

William Ernest Jenkins, M.E.I.C., of Vancouver, B.C., passed away on February 2nd, 1949. He was president and general manager of Columbia Bitulithic Ltd., Granville Island, Vancouver. He was born at Orwell, P.E.I., in 1884.

On graduating from Queen's University in 1907, Mr. Jenkins joined Bitulithic and Contracting Limited, Winnipeg, and remained until 1915. He was, at first, superintendent in charge of the firm's various contracts in Edmonton. From 1911 he had been general superintendent of work in Calgary and Edmonton. From 1912 he was also a director and the manager of Edmonton Gravel Company Limited.

In 1915 he joined the department of Public Works of Alberta, Highways Branch, with whom he did some work on sand clay mixtures and on tar sands near McMurray. In 1921, he went to Vancouver, B.C., and he has been well known in road and airport construction work in that province also, and as president and general manager of Columbia Bitulithic Ltd.

He joined the Institute in 1907 as a Student, transferring in 1917 to Associate Member, and in 1940 to Member. He was a vice-president of the Canadian Construction Association.

George R. Heckle, M.E.I.C., of Yonkers, N.Y., a consulting engineer with offices in New York City, died in hospital on January 18, 1949.

Mr. Heckle, who was born at Wellesley, Mass., in 1876, graduated from Massachusetts Institute of Technology in 1897. For the next ten years Mr. Heckle worked successively for the Rutland Canadian Railroad, the Baltimore & Ohio Railroad and for T. A. Gillespie Company, contractors, in New York and Pittsburgh. He was construction engineer for the Corrugated Bar Company, of St. Louis, Mo., in 1906-08, working in Missouri, Kansas and Oklahoma. In 1909 he became associated with the engineering firm of Stone & Webster, for whom he laid out electric railway lines in Florida. Later, as vice-president and engineer of the Amberson Hydraulic Construction Company of Canada, he directed several power projects in Canada.

In the first World War Mr. Heckle prepared a number of concrete shipways for the Government at Hog Island, Penn. After the Armistice he opened an office as a consulting engineer in New York. In 1922 he was in Canada again, carrying out hydro-electric developments for the Frederick Loomis Company, and he later established a consulting practice in hydraulic engineering in Montreal, with which he was occupied from 1922-26. He moved his practice to New York City then and did work in U.S.A., Canada, Alaska, and Cuba.

He was a member of the American Society of Civil Engineers, and of the Corporation of Professional Engineers of Quebec. He joined the Engineering Institute as a Member in 1914. He attained life membership in 1947.

James Robertson, M.E.I.C., who died in Vancouver, B.C., on January 22, 1949, was a past-councillor of the Institute Mr. Robertson was born at Kilmarnock, Ayrshire, Scotland, in 1890, and there he served an articled pupilage in engineering.

He was for the past 17 years an engineer in the Dominion Bridge Company's Pacific Division. He was transferred there in 1929 from the Montreal section where he had been an erection engineer. Joining the staff of the Company in 1907, he worked as a draughtsman and checker for a time, and then enrolled to study engineering at McGill University, Montreal, where he graduated with a B.Sc. degree in civil engineering in 1914. Meanwhile his service with the Bridge Company continued during summer vacations.

Mr. Robertson was active in the Institute, serving in 1936 as the Vancouver Branch chairman and in 1939-40 as councillor representing that branch. He had joined the Institute in 1913 as a Student, transferring to Associate Member in 1916 and to Member in 1935. He was also active in fund raising campaigns of the McGill Graudate Society in British Columbia.

John Fraser MacKenzie, M.E.I.C., who was division engineer of the Canadian National Railways at Edmundston, New Brunswick, passed away suddenly at his home on October 18, 1948.

Mr. MacKenzie was born at Fort George, Invernesshire, Scotland, in 1891, He was educated in the old country and coming to Canada as a young man was first employed as rodman and later instrumentman with the Dominion Iron and Steel Company in Sydney, N.S. For the past thirty-four years he had been employed with the Canadian National Railways, entering their service in 1914 at Campbellton, N.B. After enlisting and serving overseas as an officer in the Royal Canadian Artillery during the first World War, he resumed his service with the Railway in Campbellton, as instrumentman, in 1919. He was transferred to Edmundston in 1923 holding the position of senior instrumentman until 1937, when he was appointed roadmaster at Fredericton, N.B., covering the Centreville subdivision of the Edmundston Division. In 1941 he was appointed relieving division engineer serving at Charlottetown, P.E.I., and Edmundston, N.B. In 1942 he was appointed division engineer of the Edmundston Division.

Mr. MacKenzie joined the Institute as a Student in 1914, becoming an Associate Member in 1921 and a Member in 1940. He also held membership in the Association of Professional Engineers of New Brunswick.

A. C. Eddy, M.E.I.C., a life member of the Institute from 1946, died on March 8th, 1948. The *Journal* has received notice of this only recently. Mr. Eddy was chief engineer, of the railway department of the British Columbia Electric Railway, Vancouver, having retired in December 1946 after many years of service with the Company. He had joined the Institute in 1914 as a Member.

James Robert Wood, M.E.I.C., who was Calgary city engineer died on December 31, 1948, at Carstairs, Alta., where he was spending the Christmas season. Mr. Wood had planned to retire shortly.

Born in Scotland in 1888, he attended the Royal Technical College of Glasgow, graduating as an associate in civil engineering in 1911. He worked for a time in the United States, and later for Pacific Mills Ltd., at Ocean Falls, B.C. He was with Imperial Oil Ltd. in the 1920's in Regina. Later he joined the city engineering staff of Vancouver and was designing engineer in the sewer construction branch in 1929, when he received the appointment of assistant city engineer in Calgary. He became city engineer in 1940.

Mr. Wood joined the Institute as an Associate Member in 1919, transferring to Member in 1935.

John Foss Plow, M.E.I.C., former assistant general secretary of the Institute, died on February 3, 1949, after several weeks illness. He was born at St. Albans, Vermont, in 1900.

Mr. Plow's service with the Institute was from 1930 to 1938. He was a graduate of Royal Military College, Kingston, Ont., in 1921, and he studied civil engineering at McGill University. He was vice-president of B. Plow and Co. Ltd., Montreal, until 1925, and he was then with Price Brothers and Co. Ltd., at Riverbend, Que., until 1930. From 1927 he had been assistant to the mechanical superintendent in charge of steam plants and mechanical draughting and design.

Mr. Plow's valuable service to the Institute for eight years was commented on by J. B. Challies, then president of the Institute, who made a presentation to him when he resigned in 1938 from the office of assistant general secretary. He had accepted a position with Charles Warnock and Company, Limited, Montreal, inspection and testing engineers, and after service in the recent war, on demobilization in 1945 he returned to the Company. He was its treasurer and manager at the time of his death.

He had joined the 7th Field Battery on graduation from R.M.C., and also served in the 66th Field before being promoted captain in 1931. He was promoted major and appointed in 1934 to command the 1st Medium Battery, 2nd Montreal Regiment, R.C.A., and shortly after the outbreak of war he was appointed to command the 1st-57th Battery. In 1940 he was posted to second-in-command of the 2nd Medium Regiment. He went overseas, was promoted lieutenant-colonel, and on his return commanded the 51st Heavy Anti-Aircraft Regiment, R.C.A. He subsequently joined the Reserve Force, and returned to civilian work.

Mr. Plow had joined the Institute as a Student in 1921, transferring to Junior in 1928, to Associate Member in 1930, to Member in 1940.

James Addison McCoubrey, M.E.I.C., whose death occurred suddenly at Shaunavon, Sask., on January 31, 1949, was with the Saskatchewan Department of Highways.

Mr. McCoubrey was born in Spain of Scottish parents in 1882 but lived in Scotland until he came to Canada in 1900.

He was first engaged in engineering work on the old "Transcontinental" railroad at Superior Junction. In 1909 he joined the construction department of the Canadian Pacific Railway, with whom he was connected as an engineer on construction projects in Saskatchewan and Alberta until 1932, first as resident engineer and later as an assistant to the chief engineer.

From 1934-36 he was division engineer at Kenora, Ontario, on the Kenora-Fort Frances Highway, and later supervised several construction projects in Northern Ontario and Quebec. In 1945 he returned to Saskatchewan taking up residence in Shaunavon, a town which he helped found in 1913 and which for many years had been his home. During the last several years he was employed as a bridge engineer for the Saskatchewan Department of Highways.

Mr. McCoubrey joined the Institute as an Associate Member in 1924 and became a Member in 1940.

Frank Carl Christie, M.E.I.C., of Regina, Sask., died at his home on February 1, 1949. He was born in Yorkton, Sask., in 1895, and he attended University of Toronto, graduating in 1917 in civil engineering, receiving a B.A.Sc. degree.

Following his graduation, Mr. Christie accepted a position as an engineer with a steel rolling mill in Buffalo, N.Y. After a few months service he went to Fort William, Ont., where he was engaged in the design and construction of terminal grain elevators. He served in the first World War with the Canadian Army, and he returned to Yorkton in 1919. There he wrote his examinations to qualify as a Saskatchewan land surveyor, and formed a surveying partnership. He did surveying work in all parts of the province.

In 1928 Mr. Christie went to Regina and bought the surveying practice of C. S. Cameron. He remained at this work until 1934 when he became business manager of the Concrete Products Company in Regina. In 1938 he was employed by the city of Regina to supervise construction at the municipal airport.

A year later Mr. Christie joined the staff of the provincial department of highways as a resident engineer. He was loaned to the federal department of transport and was in charge of the construction of extensions to the Regina airfield and the construction of the flying training school at Swift Current, Sask.

In 1941, Mr. Christie joined the city of Regina engineering department as an assistant. He was named building inspector for the city in 1946. He was engaged in planning new buildings for the Regina Street Railway at the time of his death. Recently Mr. Christie worked with Dr. E. G. Faludi on a programme of town planning for the city of Regina, and on the revision of the Town Planning by-law. He was to have attended the Ottawa Conference in March on the National Housing Code.

Mr. Christie joined the Institute in 1938 as an Associate Member, transferring to Member in 1940. He was a past president of the Saskatchewan Land Surveyors Association.

Ray Binn Delvin, M.E.I.C., of Montreal, whose death in July 1948 has now come to the attention of the *Journal*, was an electrical engineer with Fraser Brace Limited, Montreal. He had been a Member of the Institute from 1945.

William H. C. Mussen, AFFIL. E.I.C., of Westmount, Que., died on December 15, 1948. He was born in Montreal in 1870.

Mr. Mussen was in business as a supplier of railway, mining and contractors' equipment when he joined the Institute in 1903 as an Affiliate. He later established Mussens Ltd., suppliers of construction equipment, and he was president of the firm until his death.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

March 21st, 1949

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate *

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the April meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BALDOCK—DONALD WILLMOTT, of Winnipeg, Man. Born at Brandon, Man., July 11, 1923. Educ.: B.Sc., (Civil), 1945; 1942, rodman, civil aero. divn., Department of Transport; 1943, instru'man., Ducks Unlimited (Canda); 1944-45, Officer, R.C.E.; Northwest Highway System; 1946-47, res. engr., bridge constrn., and at present, design engr. and chief of bridge dept., Winnipeg, Man.

References: W. B. Akerley, G. H. Herriot, G. R. Fanset, E. P. Fetherstonhaugh, N. M. Hall, W. F. Riddell, A. E. Macdonald.

BARCLAY—ERIC HANBURY, of Kamloops, B.C. Born at Kelowna, B.C., Sept. 16, 1901. Educ.: Graduate, R.M.C., 1923; R.P.E., B.C.; Montizambert & Ralston, as follows: 1923-28, transitman, 1928-31, chief of party; with Department of Public Works, British Columbia, as follows: 1944-45, transitman; 1945-46, instru'man. on constrn.; 1946 to date, resident engr., i/c all new road constrn. on Cariboo Highway.

References: H. L. Hayne, J. H. A. Steven, H. L. Cairns, H. C. Anderson, L. F. Grant.

BARTLEY—MELVILLE W., of Port Arthur, Ont. Born at Winnipeg, Man., April 24, 1910. Educ.: B.Sc., Manitoba, 1934; M.A., Ph.D., Toronto, 1936, 1940, respectively; R.P.E., Ontario; Member, C.I.M.M.; with Ontario Dept. of Mines, as follows: 1933-36, (summers); 1936-39, survey party chief, Steep Rock Iron Mines; 1940-41, exploration engr.; 1940-43, chief geologist; 1943-44, chief geologist & production mgr.; 1947 to date, principal, Lakehead Technical Institute, Port Arthur, Ont.

NEWS of the BRANCHES

Activities of the Twenty-nine Branches of the Institute and abstracts of papers presented at their meetings

Edmonton

E. K. Cumming, M.E.I.C.
Secretary-Treasurer

Urban Transportation was the subject of an address by Norman D. Wilson, consulting engineer of Toronto, at a dinner meeting of the Edmonton branch held on January 19, 1949. Branch chairman H. W. Tye presided. The speaker who was in Edmonton making a study of the city's transportation problems, was introduced by City Commissioner D. B. Menzies, who spoke of Mr. Wilson's wide experience in the transportation field as consultant to many cities and as director of the Brazilian Traction Company.

Mr. Wilson began by reviewing urban transportation from the days of the horse-drawn street car up to the present time. He described the first period of the electric street railways which began in 1890 and it's effect on the design of city thoroughfares and on traffic legislation. This period was followed by the development of the motor bus shortly after the first world war. Motor buses were first operated in cities where the street railway system was unable to expand quickly enough to keep up with the rapid expansion in many cities due to war time prosperity. Mr. Wilson also spoke of the collapse of all private street railway companies and transfer of transportation responsibilities from private to public organizations.

The speaker discussed transportation systems in various cities in South and North America and illustrated his remarks with a number of excellent slides. He showed the effect of the rush hour peak on the number of vehicles required and fare cost. He stated that the main problem, where transit systems are concerned, is the provision of a thoroughfare for buses and street cars as well as automobiles, and that the cost of such thoroughfares should be borne by the automobile users and transit system jointly. In concluding his remarks Mr. Wilson stated that the problem of handling automobile traffic is a serious one, and illustrated this statement by saying that if all members of office staffs in a down-town area drove automobiles, one-half of all office floor space would be required for their parking, with no allowance for customers and patrons.

A vote of thanks to Mr. Wilson was moved by Tom Main and was heartily approved by the 150 members and guests present.

❖ ❖ ❖

A dinner meeting of the Edmonton branch was held Wednesday evening, February 2, at which a paper on **The Underground Electrical Distribution Network for the City of Edmonton,** was presented by Stan Hampton and C. Z. Monaghan, electrical engineers with the City of Edmonton Electric Light and Power Distribution Department.

In his remarks Mr. Monaghan reviewed briefly the preliminary studies which were made before transfer of overhead electrical distribution lines to underground. He stated that a ring main network had been selected for a number of reasons, the most important being the excellent reliability of service obtained with such a system. Mr. Monaghan said that seven 500-k.v.a. transformers had been installed in the most heavily loaded down-town area. The plans for this year call for the installation of nine more 500-k.v.a. transformers with an ultimate aim of having the whole down-town area eventually served by the underground system. The speaker showed a number of drawings indicating the placing of the transformer vaults at the lane and street intersections with service manholes at various points between the transformer vaults. He also exhibited a sample of the secondary cable being used. This Neoprene-covered cable was selected because it was felt it would give better service than lead covered cable.

Mr. Hampton described the installation of the system, using a number of very fine photographs to illustrate the various steps carried out. He showed the problems encountered in installing the transformers and in pulling the cables. Mr. Hampton said that the only real difficulty encountered was in balancing the load, in changing from the old three-wire to the new-four wire secondary distribution system. He said that they found it necessary to shift some of the loads, but with a certain amount of experimentation, it was found possible to balance all loads. Since the installation of the system in September there have been two transformer faults without any interruption in the service to consumers.

The speakers were introduced by W. Cowley and a vote of thanks was moved by T. E. Bate. This vote of thanks was heartily approved by the 80 members present who thoroughly enjoyed the address on a topic of local interest.

Lethbridge

D. Cramer, Jr.E.I.C.
Secretary-Treasurer
A. E. Lawrence
Branch News Editor

Mr. A. D. Palmer, vice-president of Sturdie Propane Limited, Lethbridge, addressed a meeting of the Lethbridge Branch, at the Marquis Hotel, on January 15, on the subject **The Manufacture and Distribution of Liquified Petroleum Gas in Alberta.**

Vice-Chairman R. D. Livingstone, presided, with about 30 members present, and Institute affairs were reviewed by Secretary D. Cramer. E. A. Lawrence introduced the speaker.

Mr. Palmer said the manufacture and distribution of Liquified Petroleum Gas (Propane) in the Province of Alberta is a new industry introduced from the United States, where it has been in successful operation for some years. Last year there were 2,600,000,000 gallons of this gas used by some 4,000,000 consumers in the United States.

The late Dr. Boomer was largely responsible for the early development of this liquified petroleum gas in Alberta, and later Mr. Blackstock of the Industrial Development Board gave his support to the further development and study of its potentialities. Finally Mr. Barber of Calgary installed a Propane Plant at Turner Valley.

The waste gases of Turner Valley which used to be burnt at the flares are now collected and mixed with a small percentage of crude. This mixture is put through an absorption plant where the undesirable ingredients are eliminated and the impurities removed. The remaining gas propane is then liquified at a pressure of about 400 p.s.i. and stored in tanks at Turner Valley.

Mr. Palmer discussed methods by which Propane proceeds from Turner Valley to Alberta distributors and consumers, and went on to remark that up to November of 1948. Propane was imported from the United States, but the Alberta consumer now uses Turner Valley Propane, and the number of consumers are increasing rapidly. Propane is used for cooking, hot water heating and also as a motor fuel. It is also used for the enrichment of manufactured gas produced in cities where natural gas is not available. It is more expensive than natural gas, but as a compensation, has about $2\frac{1}{2}$ times the heating potential.

An interesting discussion followed Mr. Palmer's address and a very hearty vote of thanks was expressed on behalf of the branch by P. E. Kirkpatrick.

❖ ❖ ❖

Sixty-three members and guests of the Lethbridge Branch gathered at the Marquis Hotel for a Ladies Night dinner meeting on February 19, 1949, and to hear Mr. Harold Long, general manager of the Lethbridge Herald, speak on **The Early History and Economics of Southern Alberta Irrigation.**

Chairman W. L. Foss presided. Dinner music provided by Mr. and Mrs. Geo. Brown and community singing led by R. S. Lawrence were much enjoyed. Excellent entertainment was featured by Miss Jackie Boyle, vocalist, Mrs. R. L. Francis, violinist accompanied by Mrs. F. C. Russell; and Mr. C. Daniel, vocalist, accompanied by Mrs. Daniel.

Mr. Long was introduced by C. S. Clendenning. He commenced by tracing the early history of Southern Alberta, closely correlated with the history of irrigation, from the establishment of Fort Macleod in 1874. He told how cattle were brought in to provide food as the buffalo was rapidly disappearing. He described the early development of coal at Lethbridge by British capital in the North West Coal and Navigation Company, which later became the Alberta Railroad and Irrigation Company and was given a land grant by the Government in subsidy to building the railroad.

Charles Alexander Magrath, a young engineer employed by the A.R. & I. to find ways to put the land to use, suggested irrigation. Water from the St. Mary River first reached Magrath in 1899 and Lethbridge in 1900. The first sugar factory was started by Mr. Jesse Knight at Raymond in 1905. However, irrigation was not popular at this time as rainfall was plentiful and tremendous crops could be raised on dry land. But droughts eventually came and the years of 1910, 1914, 1917, 1918 and 1919 were particularly bad. The demand for irrigation came back.

The Lethbridge Northern Irrigation Project was started in 1919 under heavy debt and the Alberta government backed the bond issue.

Poor prices for crops made payment by the farmers impossible, and the debt was cut down by the Government. However, the average yearly gross return in the last five years from this project has been equal to the original five million dollar capital cost of the project. Today, the Dominion government is building and financing the main structures and canals for the St. Mary-Milk Rivers Development, which will add 390,000 acres of irrigated land to the former A.R. & I. Project.

In concluding, Mr. Long stated that the most pressing problem today is to set up industries and find markets for the products of irrigated land, and the greatest possible use must be made of the available water resources, particularly the waters of international streams, since they are rapidly being made use of by the United States.

E. A. Olafson, of Regina moved a hearty vote of thanks to Mr. Long for the very interesting and excellent talk.

London

G. E. Humphries, M.E.I.C.
Secretary-Treasurer

R. G. Code, M.E.I.C.
Branch News Editor

The Annual Dinner Meeting of the London Branch of the Institute was held on January 31 in the Wolseley Barracks Reserve Force Officers Mess. Members of the Military Engineers Association were guests at this meeting.

A very interesting and enlightening address was given by Gordon R. Henderson of Sarnia, chief engineer for the Polymer Corporation of Canada. It was entitled **Polymer, the Growth of an Industrial Area.**

Mr. Henderson introduced his subject by giving a description of the general organization of the Polymer Corporation and cited various reasons for the strategic location of the plant. Freedom from submarine warfare menace necessitated an inland location, and Sarnia was chosen on account of the unlimited quantities of fresh water from Lake Huron, the immediate locality of chemical salts, piped oil, railway and transport centre, and a flat terrain which could be used in future expansion of the industry and development of the suburban areas of the present City of Sarnia.

The manufacture of such by-products as styrene and ethylene were outlined, along with that of glycol at the Dow Chemical plant, which was installed in 1947. "Cold rubber" from a highly reactive catalyst system and its contribution to the economic system was discussed.

Aside from technical processes described, the speaker pointed out many economic features relating to the rubber industry as a whole, and illustrated how Polymer has a far greater economic value to Canada than a mere industrial development.

Mr. Henderson was introduced by E. V. Buchanan, London, and thanked for his excellent address by James A. Vance of Woodstock.

The new officers of the London Branch were introduced at this meeting.

Guests at the head table were Major Geo. E. Humphries, M.B.E.; James A. Vance; E. V. Buchanan, vice-president, Association of Professional Engineers of Ontario; Gordon R. Henderson; A. L. Furanna, chairman of the Branch; W. C. Miller, city engineer of St. Thomas, Ontario; George N. Scroggie, vice-chairman of the Branch; and Colonel Norman W. J. Smith, D.S.O., chairman of the Military Engineers Association, London Branch.

The London Branch meeting of January 31.

Moncton

V. C. Blackett, M.E.I.C.
Secretary-Treasurer

Various aspects of town planning as ffecting the City of Moncton were ealt with by three speakers at a branch ıeeting held on November 22nd. S. R. 'rost was the presiding chairman. The ırst paper was presented by R. L. Parsons, who confined his remarks to the raffic problem. Street widening, where easible, was advocated by Mr. Parsons ut improvement in conditions would e mainly dependent on the re-routing f traffic, one way streets, and the openıg up of service lanes for the unloadıg of trucks behind stores on the main usiness streets.

The second paper, read by G. L. Dickson, dealt with the feasibility of reducıg the smoke nuisance. He suggested central heating plant for the railway uildings and the use of more oil electic power in the shunting yards. The iversion of all freights around Moncton ould, he said, relieve the city of much f the smoke. J. A. Godfrey, the third peaker, enlarged on this topic and read art of a paper on smoke, which he has repared for the Town Planning Comıission.

After light refreshments, two moving ictures were shown. The first was a ocumentary film showing how the Parsons Construction Company built Moncton's wartime housing units in record me, using on-the-spot factory prefabcation methods. The second film was March of Time production on atomic nergy.

Niagara Peninsula

J. J. Miller, M.E.I.C.
Secretary-Treasurer

C. A. O. Dell, M.E.I.C.
Branch News Editor

The regular meeting of the Branch as held in the Birch Room of the Welınd House in St. Catharines on Thursay, February 3.

Following refreshments and dinner, Chairman R. A. Coombes called on rthur Bennet, who introduced the uest speaker, E. N. Davis, personnel ıanager, Campbell Soup Co., Ltd., and ıember of the Ontario Labour Relaions Board.

In the development of the subject, **ndustrial Economics and Engineering** the peaker brought to his audience a picure of a multitude of perplexing huıan problems that have risen and are ising every day, in industry, as a result f the steady advance of technological cience. As an illustration he pointed ut that due to engineering progress he following changes have taken place ı industry in the forty years from 1899 o 1939: worker productivity has douled, working hours have been reduced rom 54½ hours to 40 hours per week, nd at the same time the weekly wage as jumped 37 per cent, averaging $450 ıore per year per man. These changes ave had prodigious effects, and the huıan problems involved in the fair diision of the increased wealth have been ompounded at an amazing rate. Mr. Davis gave a number of specific exmples and explained how many of hem had been solved.

The address was followed by a lively eriod of questions. P. E. Buss tenderd a warmly seconded vote of appreciation to the speaker who had opened a viewpoint not completely familiar to all engineers but well worth their most sincere consideration.

Saguenay

T. T. Anderson, Jr.E.I.C.
Secretary-Treasurer

On January 28, 1949, Dr. Huet Massue, M.E.I.C., addressed the Saguenay Branch on the subject of **The Tennessee Valley Authority.** The meeting took place in the Arvida High School Auditorium. Dr. Massue is an engineer economist with the Shawinigan Water and Power Company, Limited, Montreal.

Before introducing his main topic, the speaker showed a very interesting series of slides covering the growth of Institude Membership by year and by Province.

On the subject of T.V.A. Dr. Massue presented a very complete statistical picture by means of slides. Of some eighty million potential horsepower in the U.S.A., some nineteen millions are developed. The T.V.A. project constitutes about one and one half million horsepower to-date.

Dr. Massue showed charts to illustrate that in most industries the cost of electricity alone is not sufficient to decide the location of the industry. Exceptions to these are perhaps aluminum and pulp and paper industries which consume some 60 per cent of power developed in Quebec Province.

Dr. Massue showed that in the case of the T.V.A. project only about 40 per cent of the investment was charged against power production, the balance going against flood control and navigation. Dr. Massue intimated that the benefits derived from flood control and navigation did not justify the expense written off against them.

The speaker was concerned with the wrong impression received by the public on the cost of public hydro-electric installations compared to private utilities. If taxes lost and interest charges are taken into account, the cost of public installations is generally greater than comparable private enterprises.

The speaker answered a number of questions after the talk. Mr. R. A. Lemieux, M.E.I.C. provided a vote of thanks.

❖ ❖ ❖

At a meeting of the Saguenay Branch on February 15, 1949, three speakers outlined the **Development of the Saguenay System.**

F. H. Duffy, system protection engineer and acting electrical engineer of Aluminum Company of Canada, Limited, Shipshaw, outlined the growth of the Saguenay System especially as it affected oil-circuit-breaker interrupting capacities. His talk covered development of the system from its inception in 1926 until the present day.

A paper by Mr. E. W. McKernan, superintendent of Saguenay Power Company, Limited, Isle Maligne, described recent changes in the 13.2 k.v. bus arrangement in the power station at Isle Maligne which were necessitated by growth of the system. Mr. Kernan was unable to attend the meeting and his paper was read by G. R. LaBossiere of Isle Maligne station.

F. A. Brown, assistant chief operator of the Power Department of Arvida Works, outlined methods that were used to make changes at the Arvida 154-k.v., substation to provide more flexible and efficient operation.

The speakers were introduced by the chairman, W. P. C. LeBoutillier, and thanked by A. B. Sinclair.

Junior Section

W. A. Dayton, M.E.I.C.
Secretary-Treasurer

A meeting of the Junior Section of the Saguenay Branch was held at the Saguenay Inn on February 7, 1949.

R. V. Smith of the Aluminum Company of Canada, Limited, addressed the meeting on **Ships and Their Engines.** Mr. Smith was in the Merchant Navy throughout the war, taking part in the Dunkirk and Singapore evacuations.

He described the different types of ships in the Merchant Fleet and discussed the factors which govern the choice of engines for each class. He traced the development of steam and Diesel engines and gave a brief description of the steps which led to their present high level of efficiency. The training of an engineer from his apprenticeship through to the rank of chief engineer in the British Merchant Navy was briefly summarized, thereby illustrating the thorough training in the practical and theoretical aspects of this profession. The talk was illustrated by some interesting slides showing various installations of marine steam and Diesel engines.

A period of discussion followed, during which the audience showed great interest in the subject.

The meeting was the second Annual Smoker held by the Junior Branch and was very well attended.

Chairman T. T. Anderson introduced Mr. Smith, who was thanked on behalf of the section by S. H. Rochester.

Saint John

W. M. Brenan, M.E.I.C.
Secretary-Treasurer

A. R. Bonnell, M.E.I.C.
Branch News Editor

The annual joint dinner of the Saint John Branch and the New Brunswick Association of Professional Engineers was held January 27 at the Admiral Beatty Hotel.

After refreshments and dinner, a toast to the Association of Professional Engineers was proposed by R. M. Richardson, and responded to by John Mooney. A toast to the Institute was proposed by L. O. Cass and responded to by Don Fonger, president of the Engineering Society at the University of New Brunswick.

The speaker for the evening was T. C. Macnabb, retired superintendent of the Canadian Pacific Railway.

Mr. Macnabb had chosen as his topic **Building a Railroad.** He spoke of the difficulties that would be encountered in building the "E.I.C. Railroad" from Saint John to Quebec.

Mr. Macnabb began with the difficulties that would be encountered in getting a charter from the Legislature, in making surveys and buying right-of-way, telling of methods which would be used by the "Company's" agents in buying land cheaply. He told of all the staff that would be required to carry on the business and comply with government regulations, and of the freight rates which would be required to carry this staff, meet other operating costs, and pay the stock holders and of the difficulty of getting the government to grant these rates. Mr. Macnabb concluded by accepting the government's offer to buy his railroad at half its cost.

Following Mr. Macnabb's talks, Mrs. Dora Breau and her troupe staged a floor show which included dancing chorus, acrobatics, singing, tap dancing and comedy skits.

Mr. Macnabb's humorous talk, followed by a floor show, was greatly appreciated by engineers present, as a departure from the usual form of meeting.

St. Maurice Valley

G. W. Ince, Jr.E.I.C.
Secretary-Treasurer

J. G. MacLeod, M.E.I.C.
Branch News Editor

On December 9, 1948 a Film Night was held at the Cascade Inn, Shawinigan Falls. The following films were shown: "Beaverships", "The World's Largest Electrical Shop", and "Men Against Rock". J. T. Thwaites, Canadian Westinghouse Company, and Charles Marsh, Canadian General Electric Company, spoke briefly between films.

❖ ❖ ❖

The first meeting of the new year was held on January 20 at the Cascade Inn, Shawinigan Falls, and took the form of a lecture meeting. At the start of the meeting two members were elected to the Branch Nominating Committee. R. E. Kirkpatrick, immediate past secretary-treasurer ,then spoke briefly on the recent revision of the Branch by-laws which was before the membership for approval.

The first talk was given in French on **Administration Municipale** by R. Dorion, M.E.I.C., city manager of Shawinigan Falls. Mr. Dorion pointed out that the classification of villages, towns and cities is based on the population, and that a city is managed much like a corporation. The mayor and aldermen of a city correspond to the president and board of directors of a corporation, and the city manager and city engineer to the general manager and chief engineer. He noted that nearly all the city managers in Quebec are engineers.

The second paper was given by E. A. Delisle, M.E.I.C., city engineer of Shawinigan Falls. Discussing **City Planning in Shawinigan Falls,** he began with the historical background of Community Planning and outlined the subject. The engineer is well suited to make a technical approach to the problem and synthesize the results of geographical and topographical surveys, transportation facilities, and industrial sites into the master plan. One of the most important factors in town planning is zoning, which divides the land into various areas according to population density, height and density of buildings, commercial and residential districts. Mr. Delisle dealt with Shawinigan Falls in particular, and told of the difficulties that are being encountered because the city grew up on project planning rather than community planning.

After a question period the speakers were thanked by C. G. de Tonnancour of Shawinigan Falls.

Junior Section

W. R. Ford, Jr.E.I.C.
Chairman

The short lull in activities after a heavy summer programme was broken by a very well attended meeting in September at which E. R. Williams, M.E.I.C., spoke on his trip to South Africa. J. S. Whyte spoke to the Section the following month on the **Development of Carbide in Shawinigan Falls.** In November a tour was conducted through the new power development of the Shawinigan Water & Power Co. at Shawinigan Falls. At that time one of the new units was in operation and the other two were in various stages of construction. Ladies were invited to the December meeting which featured a "Movie Night" with industrial and skiing films. A lecture meeting was held in January when W. D. Mosher spoke on **Engineering and Natural Resources.** At this meeting the by-laws of the Section were finally approved and a nominating committee was named.

Saskatchewan

D. W. Houston, M.E.I.C.
Secretary-Treasurer

R. Bing-Wo, M.E.I.C.
Branch News Editor

At the regular monthly meeting of the Saskatchewan Branch held on January 21 at the Kitchener Hotel in Regina, C. N. Munro, M.E.I.C., chief engineer, Water Rights Branch, Department of Natural Resources discussed **Some Aspects of Water Supply as it Affects the Prairie Provinces.**

Mr. Munro pointed out that water is a scarce resource in the province of Saskatchewan. The average precipitation ranges from 9 in. to 17 in., making the run-off per acre very small. The water supply situation very often determines the practicability of industries locating in certain areas.

The most dependable source of water supply for Saskatchewan lies in the international and interprovincial streams and rivers. These are the North and South Saskatchewan, Churchill, Souris and Qu'Appelle rivers. For Saskatchewan's needs, the Saskatchewan River is apparently the most reliable. Since this river flows through Alberta and Manitoba also, these provinces have a vital interest in the proposed use of it's waters. Mr. Munro went on to describe the irrigation works proposed and already developed on the Saskatchewan and it's tributaries in Alberta and drew attention to large proposed irrigation tracts in Saskatchewan now under study by the P.F.R.A. Other industries such as fur farming in the Cumberland area of Saskatchewan and fishing in Manitoba were described. In order that interprovincial rivers be used to the best advantage of all, a newly organized body, the Prairie Provinces Water Board has been set-up. The function of this body will be study of the potential uses of interprovincial streams, the allocation of water and the recommendation to the governments of the best plan of overall development.

Manitoba's interest in the plans of Saswatchewan lies in the fact that it's main source of hydro power in the Winnipeg River is rapidly being overtaxed. In that province's search for a new source of hydro power, there is a scheme whereby the North Saskatchewan is diverted into Lake Manitoba and finally dropped 90 ft. into Lake Winnipeg. In this way it is claimed that the whole of the flow in the Saskatchewan River could be utilized.

A lively discussion period followed Mr. Munro's address. J. W. Farrell moved a vote of thanks to the speaker.

Toronto

R. A. Muller, Jr.E.I.C.
Secretary-Treasurer

On Saturday, February 12th, the Branch held its Annual Ladies' Night at the Albany Club. The speaker was Mr. John Ness, a geologist of long standing with Imperial Oil Company. Mr. Ness was awarded the Institute's Leonard medal some time ago and has also been on Council. The subject of his address was **Western Oil Discoveries** and was followed by a movie entitled "A Mile Under the Wheat". It was an excellent talk, concise, and interesting because it not only revealed the extent of exploratory work but also Canada's economic position in respect to oil.

Of particular interest and highly gratifying to the branch was the presence of W. J. W. Reid, president of the Association of Professional Engineers of Ontario, and Mrs. Reid, who did us the honour of motoring over from Hamilton to be present. Mr. Reid is also vice-president-elect for the Ontario Region. Also, we were glad to have Mr. and Mrs. R. L. Dunsmore (International Petroleum Company). Mr. Dunsmore is a past vice-president of the Institute. These two couples along with the branch vice-chairman Ross Graydon and Mrs. Graydon, Mr. and Mrs. Whitson. the speaker, Branch Chairman J. F. MacLaren and Mrs. MacLaren made up the head table.

In addition to the address by Mr. Ness the programme included a "Lucky-Numbers Draw" for the ladies, and a performance by a magician-comedian.

Because of limited capacity the sale of tickets was not pushed, but nevertheless about 126 were present and all seemed to go away happy about the affair.

Dunc. Whitson, the able chairman of the entertainment committee, aided by his good wife, did a splendid job in arranging for the evening and in carrying out the details.

Junior Section

On January 18 the Junior Section of the Toronto Branch held its annual Ajax Meeting, in the Recreation Hall of the Ajax Division of the University of Toronto. This meeting was conducted in the form of a panel with three guest speakers addressing the student body on **Professional Employment.**

The first speaker was L. D. McKenna, placement officer of the Technical Service Council, who explained how the Council was founded over twenty years ago by a group of public spirited citizens. Its function is to aid in placing engineers who are seeking employment and also to encourage industry to make more use of the professional engineer.

The Council is an independent, non-profit organization and is maintained by voluntary subscriptions from industry. No fees are requested, but it requires approximately fifty ($50.00) dollars to place an applicant in a job.

Mr. McKenna said employment opportunities at the present time are numerous and favourable, and starting salaries depend upon a man's character, his past experience, and the location of the job.

Colonel Kenneth Bradford, director of the University of Toronto Placement Service, was introduced by Mr. McKenna. The University Placement Service, it was explained, maintains a list of positions which are open, as well as information regarding the various industries operating in Canada. Starting salaries offered this year are better than those of last year, and there is still a wide variety of opportunities for the young graduate engineer.

The Placement Service also maintains a list of positions open in South America, Trinidad, the Netherlands and the United States.

Many firms in this country need engineers but as yet they have not obtained any. Colonel Bradford asserted also, that engineers are becoming increasingly active in a wide variety of non-engineering work.

Colonel T. M. Medland, executive director of the Association of Professional Engineers, was then introduced by Colonel Bradford.

The requirements of any profession, as expressed by Colonel Medland, are organization, education, experience and exclusion. The organization is achieved by such bodies as the Association of Professional Engineers of Ontario. Education must be pursued by the engineer throughout his entire life, and his experience depends upon himself. The exclusion of the unfit is accomplished by the licensing bodies of the provinces.

The Association attempts to broaden the field of opportunities by making Industry aware of the uses of the professional engineer. Contact is also made with service clubs and the general public to acquaint them with the service of engineers.

The speakers were thanked by Mr. T. J. Hogg of the Junior Section.

❖ ❖ ❖

On Saturday morning, January 22, the Toronto Branch—Junior Section visited the Hamilton Works of the Steel Company of Canada Limited. The group, consisting of sixty-six (66) members and guests, was divided into five groups, each led by a most competent guide, made available by Stelco.

The visit included inspection of the entire process from coke ovens and blast furnaces where pig iron is drawn off to open hearth furnaces where steel is born, to soaking pits, blooming mills, billet mills and finishing mills where steel is shaped into plate, strips, sheet and bars—the finished products of the Steel Company.

Transportation between Toronto and Hamilton was supplied by members of the Section who kindly made their cars available for the trip.

The Junior Section has planned a Stag Party and a field trip to the Hydro development at Des Joachims in March. The Annual Meeting will be held in April. Further particulars of these events will be sent to all members.

Vancouver

A. G. Fletcher, s.e.i.c.
Secretary-Treasurer

Stuart Lefeaux, jr.e.i.c.
Branch News Editor

On January 19 about seventy members of the Vancouver Branch gathered in the Medical-Dental auditorium to hear Harry Minshall, erection engineer for the Dominion Bridge Company, Pacific Division, speak on **Emergency Bridging.** The address dealt with three particular projects in lower central British Columbia in which railroad bridges had been washed out by flood conditions prevailing generally in British Columbia during May and June of 1948. It was explained that these floods were the worst on record since 1849 and that the amount of water flowing in the various rivers was approximately three times as great as that during a normal freshet season.

The speaker showed slides of the three bridges, the first one being over the Elk River at mile 52.6 on the Canadian Pacific Railway branch line, in which one abutment suffered so severely from scouring that the bridge span had to be supported on a temporary structure of steel H piles driven at the first panel point pending reconstruction of the abutment. The second emergency bridging was over the Nicola River at mile 18 on the Canadian Pacific Railway branch line, where one of the piers suffered so badly from scouring that the span was dropped into the water and wrecked so completely as to preclude replacement. A platoon from the Royal Canadian Engineer's Training School at Chilliwack was brought to the job and received valuable training experience in demolishing the span and the abutments. At the same time work proceeded on construction of an alternate crossing, making use of two 80-ft. plate girder spans brought in from Ontario and placed on pile supports. The third emergency job was accomplished on the bridge over the North Thompson River on the Canadian National Railway line at mile 28.8, three miles west of Savona in which two of the six spans in the crossing were in danger of being dropped into the water by the tilting of one of the piers. These two spans were successfully pulled back into the adjacent remaining spans, the defective pier demolished and the two spans rolled back into place.

The excellent talk by Mr. Minshall was supplemented by slides of photographs taken on the job, giving a complete review of these very exceptional undertakings.

❖ ❖ ❖

On Wednesday, February 2, twenty members of the Vancouver Branch attended a luncheon and field trip at the No. 214 Base Work Shops, R.C.E.M.E., Jericho, Vancouver.

After the luncheon at the officers mess, Major Bradbury outlined the tour of the shops where radar, telephone communications, electrical equipment, internal combustion engines and other military equipment are serviced and repaired. The members attending received excellent descriptions and explanations of the work, and all agreed the army again came through in unexcelled fashion. Colonel Sherman thanked the hosts for the hospitality and arrangements.

Victoria

D. A. MacLean, jr.e.i.c.
Secretary-Treasurer

T. A. J. Leach, m.e.i.c.
Branch News Editor

The increasing demand for more and better maps was stressed by Lt.-Col. G. S. Andrews in his address on **Aspects of the Mapping Problem in B.C.,** presented to the Victoria Branch of the Institute on January 21.

Economic development included hydroelectric power, watershed and flood control, and forest management, calls for various types of map refinement.

Colonel Andrews, who is chief engineer of the Air Surveys Division of the Provincial Government, stated that large areas of B.C. have not yet been mapped. Production of the standard topographical map, also, has not kept pace with available air photo coverage.

To meet the immediate demands a programme of interim mapping has been introduced which makes use of whatever control is available. With a speed-up in the standard map programme the interim maps will be gradually superseded.

To speed up field work, Colonel Andrews pointed out, a large increase in staff would be required. This would mean a greater standardization of methods with experienced personnel acting in a supervisory capacity. In this way men with limited technical training would be able to do much of the routine work.

The recent addition of air transport for men and supplies has cut down the travelling time in the field. The most recent development has been the helicopter but experience has shown that the performance of the helicopter at higher altitudes around 6000 ft. is not dependable due to the rapid decrease of air density with altitude.

The use of the optical micrometer reading transit has increased the accuracy of field surveys. Recent developments within the Survey Branch on ground cameras have reduced their weight from 30 or 40 pounds to 7 pounds. This, together with the replacement of glass negatives by roll film, has increased the mobility of field parties.

Recent modification of its methods of photography allow the Division to produce interim maps showing planimetric detail, cultural features, and rough form lines. In plotting, the slotted templet method of control has replaced the radial line plot.

During the recent war tri-camera photography was developed and this rapid method of air photo cover is being used in B.C. It is hoped that in a short time, using tri-camera photos, a yearly coverage of 20,000 square miles will be obtained and that more accurate information will follow with the completion of the vertical photo programme.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment*.

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST with some experience in the manufacture of pulp, paper and converted products required for Province of Quebec to take charge of the testing staff of a sub-section of the technical dept. under the general direction of the Technical Superintendent. Salary open Apply to File No. 1098-V.

CHEMICAL ENGINEER OR CHEMIST, with some experience in inks or colour mixing required to set up a colour mixing department and a small chemical laboratory. Must be bilingual. Position in Province of Quebec. Salary open. Apply to File No. 1116-V.

CHEMICAL ENGINEER OR CHEMIST, recent Ph.D., or equivalent with good background in organic chemistry preferably along the lines of wood and cellulose chemistry and fuels technology. Applicant needs capacity for contacting plant personnel and appreciation of engineering phases of problems. Position in British Columbia. Salary open. Apply to File No. 1118-V.

CHEMICAL ENGINEER, recent graduate, required for junior position by industrial plant in the Province of Quebec. Salary open. Apply to File No. 1119-V.

JUNIOR CHEMICAL ENGINEER required by chemical company in Toronto for process control work at their salt plant in Nova Scotia. Salary open. Apply to File No. 1121-V.

CHEMICAL ENGINEER, recent graduate, required for position in technical department of a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 1122-V.

CHEMICAL ENGINEER required as plant chemist by large newsprint mill. Preferably four to six years in the pulp and paper industry in chemical and control departments. Salary open. Apply to File No. 1131-V.

CHEMICAL ENGINEER required in Ontario. Duties will involve the compounding for and quality control of industrial rubber goods. Previous experience in the rubber industry would be an advantage. Salary open. Apply to File No. 1133-V.

CHEMICAL ENGINEERS required by chemical plant in Province of Quebec. Duties include responsibility of the production and the operation of chemical equipment such as filter presses, evaporators, vacum jets, solvent recovery, etc. Salaries open. Apply to File No. 1134-V.

CIVIL

CIVIL ENGINEER, required in Ottawa, must have at least ten years experience in the design of frame houses and wood structures. Salary open. Apply to File No. 1108-V.

CIVIL ENGINEERS, required by public utility in Toronto. Must have at least five years experience in design of steel structures on Power developments. Salary open. Apply to File No. 1109-V.

CIVIL ENGINEER, recent graduate, required by Montreal firm of contractors and engineers. Applicant must have an understanding of the following subjects or be prepared to acquire same: general construction, engineering, estimating, elementary surveying, construction practices, etc. Salary entirely dependent upon ability. Apply to File No. 1114-V.

ELECTRICAL

ELECTRICAL ENGINEERS, experienced in the maintenance of power meters and relay protection schemes also men exeprienced in installation of large rotating electrical machines, high voltage and low voltage switch gear. Manufactures test experience preferred. Positions with public utility in Toronto. Salaries open. Apply to File No. 1109-V.

ELECTRICAL ENGINEERS required by public utility in Toronto. Must have the following experience: Design, layout and estimates for medium and large, low voltage and high voltage substations or design and construction of transmisison and distribution lines. Salary open. Apply to File No. 1109-V.

ELECTRICAL ENGINEERS required by public utility in Toronto. Must be experienced in communications preferably a specialist in radio and frequency modulation also knowledge of power and telephone line carriers required. Salary open. Apply to File No. 1109-V.

ELECTRICAL ENGINEER for sale of electrical and allied machinery in Southern Alberta to open branch office in Calgary. Must have trade contacts and interest in firm can be purchased by a proven suitable man. Apply to File No. 1123-V.

ELECTRICAL ENGINEER between 35 and 40 years of age with a minimum of five years experience with a public Utility or related industry required as Manager's Assistant for electrical distribution system in fast growing town of 25,000 population. Salary open. Apply to File No. 1124-V.

JUNIOR ELECTRICAL ENGINEER required in Toronto for designing Selenium Rectifiers and some Carrier Current Control equipment. Salary open. Apply to File No. 1136-V.

SENIOR ELECTRICAL DRAUGHTSMAN required in Toronto. Must have considerable experience on generating and substation layouts. Salary open. Apply to File No. 1137-V.

MECHANICAL

MECHANICAL ENGINEER, required as Service Promotion Man for Export Division of large National Organization Must have good technical background and service experience in the automotive industry. Responsibilities include writing and editing promotion material, policies, bulletins and elective letters. Salary open. Apply to File No. 1110-V.

MECHANICAL ENGINEER, recent graduate, required as sales engineer by a firm of Power House and Building Specialties. Job located in Ontario and training period in Montreal. Salary $250. Apply to File No. 1126-V.

*MECHANICAL ENGINEER, required as assistant to senior engineer. Previous experience, three to five years in heavy industry and plant layout required. Excellent prospects for advancement. Salary range $300 to $350 per month to start. Apply to File No. 1129-V.

*MECHANICAL ENGINEER with four to five years experience in design, layout and detail work. For preference, but not necessary, with experience in the paper industry. Must be capable of taking charge of a drawing office under the Plant Engineer in large newsprint mill. Salary open. Apply to File No. 1131-V.

*MECHANICAL ENGINEER with background of production processing and tool design experience. Required as sales engineer by manufacturer of special purpose machine tools, jigs, fixtures, gauges, ets. Located in Windsor, Ont. Salary open. Apply to File No. 1138-V.

METALLURGICAL

METALLURGICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in research, development and production. Salary open. Apply to File No. 1106-V.

MISCELLANEOUS

GENERAL MANAGER, to supervise all operations including steam and diesel generating stations, transmission and distribution systems required by large Canadian electrical utility. Administrative ability and experience chief qualifications. Up to date knowledge of power industry also desirable. Salary open. Apply to File No. 1104-V.

COMBUSTION ENGINEER wanted by large indsutry near Montreal. Must be capable of taking charge of high pressure boilers, turbo generators and boiler house personnel. Permanent position and good salary. Apply to File No. 1105-V.

GRADUATE ENGINEERS interested in applied research in inorganic physical chemistry required for research laboratory of Montreal firm. Applicants should have from two to five years experience. Salary open. Apply to File No. 1107-V.

ELECTRICAL OR MECHANICAL ENGINEERS with experience in electrical, industrial and commercial equipment and domestic appliances for frequency Conversion Program. Position with public utility in Toronto. Salary open. Apply to File No. 1109-V.

GRADUATE ENGINEERS, preferably with six to ten years' post graduate experience to act as field representatives of Technical Information Service, N.R.C. in Montreal and Toronto. As the work involves personal visits to industrial firms, a personnally owned car is essential. The Montreal representative must be fluently bilingual. Apply to File No. 1115-V.

GENERAL MANAGER required for Saskatchewan Power Commission. Position requires full responsibility and authority for all operations. Principal requirements, administrative, engineering or other technical experience in power operations very desirable. Salary open. Apply to File No. 1117-V.

* Closed since appearance in March Bulletin.

SALES AND SERVICE ENGINEERS required for selling and servicing of water treatment chemicals and water treatment equipment of all types throughout Canadian industry. Considerable travelling involved. Applicants preferably not over 27 years of age. Positions located in Southern Ontario and Maritimes. Salary open. Apply to File No. 1120-V.

A GRADUATE ENGINEER required by chemical company in Toronto to carry out research work on product improvement. Salary open. Apply to File No. 1121-V.

ASSISTANT CITY ENGINEER required by City of Calgary, Alberta. Applicant must have executive ability and preferably experience in Municipal work covering sewers, sewage disposal, streets, paving, sidewalks, bridges, building construction and Town Planning. Salary range $3,500 to $4,500. Apply to File No. 1125-V.

*STRUCTURAL DESIGN ENGINEER required in Montreal. Preferably some experience in Building design and architectural work. Salary open. Apply to File No. 1127-V.

CIVIL OR MECHANICAL ENGINEERS required for openings in connection with construction of new refinery being built at Montreal East. Preferably some experience in heavy chemical industry also junior vacancies. Salary open. Apply to File No. 1128-V.

JUNIOR SALES ENGINEER required in Montreal by large industrial firm. Preferably with a couple of years experience and the desire to get into sales work. Salary $250. Apply to File No. 1130-V.

JUNIOR ENGINEER required by American Company for their three factories located in Canada. Duties include supervision of office routine, order supplies, etc. Knowledge of French and English would be an advantage. Salary open. Apply to File No. 1132-V.

MAINTENANCE ENGINEER, mechanical or electrical background with about ten years experience including plant maintenance. Duties include responsibility for mechanical and electrical maintenance, general supervision of power plant and mechanical stores. Salary open. Apply to File No. 1135-V.

JUNIOR ENGINEER with three to five years experience, preferably mechanical, required in Montreal to develop equipment specifications, sources of supply for equipment and generally look after the routine of an engineering office. Salary open. Apply to File No. 1135-V.

DRAUGHTSMAN with five to ten years experience in plant layout, material handling equipment and some structural required by an electro-metallurgical plant located in Northern Ont. city. Salary open. Apply to File No. 1139-V.

The following advertisements are reprinted from last month's Journal having not as yet been filled.

CHEMICAL

JUNIOR CHEMICAL ENGINEER required by independent oil company located in Turner Valley. Duties will include design and supervision of maintenance and new construction work. Advancement will depend on initiative and readiness to assume responsibility. Salary open. Apply to File No. 1075-V.

CHEMICAL SALES ENGINEERS, one required in Montreal, one for Winnipeg. Graduates preferred. Positions offer excellent opportunity to develop to management. Salary depends upon qualifications. Apply to File No. 1092-V.

CHEMICAL ENGINEERS required by chemical company in Toronto for sales engineering. One recent graduate for training in sales also one with about one year's experience. Approximate starting salaries $200 to $225 per month. Apply to File No. 1097-V.

CHEMICAL ENGINEER with about one year's experience to carry out plant research work on product improvement. Position in Toronto. Approximate starting salary $225. per month. Apply to File No. 1097-V.

CHEMICAL ENGINEER required by large western industrial manufacturing concern. Applicant must be interested in boiler water treatment. Salary open. Apply to File No. 1103-V.

CIVIL

CIVIL ENGINEER required for a Consulting Engineers Practice in the Maritimes. Preferably with three to six years experience. Duties both design and field supervision of construction for both municipal works and industrial buildings. Engineering survey experience required. Salary open. Apply to File No. 1087-V.

CIVIL ENGINEER, age 35 to 40 years, required by Public Institution for Montreal area. Must have construction experience and be able to supervise large building program. Salary $6,000 to $7,000. Apply to File No. 1091-V.

*CIVIL ENGINEER to take charge of design and construction of service buildings, required by expanding chemical company in Western Ontario. Salary open. Apply to File No. 1111-V.

ELECTRICAL

ELECTRICAL DESIGNING DRAUGHTSMAN for work in Southern Ontario. Must be experienced. Salary up to $300. Apply to File No. 1059-V.

ELECTRICAL ENGINEER required as assistant to electrical superintendent by a textile manufacturing concern in Montreal. Applicant must have had good experience and be willing to accept responsibility. Salary open. Apply to File No. 1070-V.

ELECTRICAL ENGINEER with industrial background preferably pulp and paper required for senior position in electrical department of a paper mill in the Ottawa valley. Salary open. Apply to File No. 1073-V.

JUNIOR ELECTRICAL ENGINEERS required as assistants to Works Engineers by a large chemical manufacturing company with Headquarters in Montreal. Applicants should have passed the C.G.E. Test course. Positions in Ontario. Salary open. Apply to File No. 1084-V.

ELECTRICAL ENGINEER, recent graduate, required for Canadian branch plant of a progressive, established American company. Duties to be production control working closely with sales. Permanent position for right man with excellent opportunity for advancement. Location Toronto. Salary open. Apply to File No. 1088-V.

RECENT GRADUATE in Electrical Engineering required for Sales Engineering Work with old established Montreal firm. Must have had at least two years practical experience and be willing to travel occasionally. Apply to File No. 1094-V.

ELECTRICAL DESIGNING ENGINEER required for plant engineering department. Preferably between the ages of 30-40 years, with 10 years of electrical design experience in industrial plant construction and maintenance. Position in Ontario. Salary open. Apply to File No. 1100-V.

ELECTRICAL ENGINEER, preferably with experience in electrical trouble shooting and maintenance work required by industrial firm in Toronto. Salary open. Apply to File No. 1101-V.

ELECTRICAL ENGINEER required in Latin America as assistant to Manager on Public Utility system. Must have broad experience in operation and maintenance of generating plants, substations, transmission lines and distribution systems. Ability to speak Spanish desirable but not essential. Salary open. Apply to File No. 1112-V.

MECHANICAL

MECHANICAL ENGINEER required by a large industrial plant in the East end of Montreal for product design work on mapor electrical appliances. We are prepared to offer definite advancement in a reasonably short period of time and salary will be based on potentiality rather than experience. Apply to File No. 1016-V.

MECHANICAL ENGINEER required as assistant to mechanical superintendent by a textile concern 35 miles southwest of Montreal. Must have had good experience and willing to accept responsibility. Salary open. Apply to File No. 1070-V.

MECHANICAL ENGINEER, experienced on design and construction of fine instruments wanted to take charge of small model shop in laboratory specializing on development of airborne radar and aerial survey and navigation aids, servomechanisms and computors. Advancement in rapidly expanding and progressive organization assured for capable engineer. Salary open. Apply to File No. 1074-V.

SENIOR MECHANICAL ENGINEER required by chemical company in Toronto to act as chief Engineer. Must be able to do process design work and prepare capital cost estimates. Approximate starting salary $400 per month. Apply to File No. 1097-V.

MECHANICAL ENGINEER required as Plant Engineer by a pulp and paper mill in the Province of Quebec. Should have about ten years experience the major part in the pulp and paper industry. Applicant will be required to take complete charge of maintenance department consisting of various trades crews with a total personnel of about 250 men. Salary open. Apply to File No. 1099-V.

MISCELLANEOUS

GRADUATE ENGINEER required by Montreal head office of a large Canadian Company for design, specification and layout of air conditioning, ventilating, fan and duct work for industrial processes, factories, offices, dust removal collecting systems, etc. Supervision of field installations, testing and making estimates. Must be familiar with all kinds of relative apparatus and equipment and with sheet metal air duct work. At least five years' experience with the above. Please give full details of experience, training, age, references, salary expected and date available. Apply to File No. 1015-V.

SENIOR INDUSTRIAL ENGINEER required by Management Consultants in Montreal. Experience in installations of production and cost control. Wage incentives etc. Free to travel. Preferably bilingual. Salary open. Apply to File No. 1058-V.

SALES ENGINEER 24 to 30 years of age, preferably single and free to travel required by Canadian manufacturer of industrial rubber products. Must have a minimum of 1 to 2 years post-graduate experience in mining or plant maintenance. Salary open. Apply to File No. 1060-V.

RECENT GRADUATE preferably mechanical or electrical background required by National Beverage Company. Training period in Montreal. Salary open. Apply to File No. 1069-V.

ELECTRONICS ENGINEER and Technicians experienced on design and construction of radar, servomechanisms, computors or magnetometers required for development laboratory specializing in airborne devices for aerial survey and navigation. Advancement in rapidly expanding and progressive organization assured for capable personnel. Salary open. Apply to File No. 1074-V.

SENIOR TIME STUDY MEN required by large National Organization in Ontario. Must be competent in methods improvement and have experience in developing standard data on machine tool and other operations. Salary open. Apply to File No. 1078-V.

*JUNIOR ENGINEER OR ARCHITECTURAL DRAUGHTSMAN for city planning office in Western Canada. State education, experience, age and salary desired. Apply to File No. 1080-V.

*GRADUATE CIVIL ENGINEER or ARCHITECT required for Saskatchewan community, about 6,000 population, to act as town planner under consultant, and as assistant to City Engineer. Interest in civic problems desirable. State education, experience and age. Apply to File No. 1080-V.

INDUSTRIAL ENGINEERS, must be fluently bilingual, two residents of Quebec City, one Bois Franc Region, one Grand'Mere, five Montreal, wanted by New York firm of Management Consultants, members of American Management Association contemplating to organize a branch in the Province of Quebec. Salary, Commission and travelling expenses. Apply to File No. 1083-V.

GRADUATE ENGINEER required as sales promotion Manager by well established manufacturer of heating equipment used in all types of buildings. Age 30 to 40 years with experience in selling Mechanical equipment in the construction industry and preferably with Business Administration Course. Salary open. Apply to File No. 1085-V.

* Closed since appearance in March Bulletin.

JUNIOR SALES ENGINEER, preferably bilingual, to be trained for sales work with Montreal Industrial Company. Salary open. Apply to File No. 1086-V.

AIRCRAFT STRESS ENGINEERS AND DESIGN DRAUGHTSMAN required by Canadian company. Must have aircraft design experience or at least two years experience in stressing of aircraft structures. Salary open. Apply to File No. 1089-V.

GRADUATE ENGINEER, 30 to 40 years of age with 3 or 4 years experience in railroad engineering required in Montreal to take charge of railway division. Must be bilingual. Salary open. Apply to File No. 1090-V.

GRADUATE ENGINEER preferably electrical or mechanical required to fill the position of Assitant Superintendent of the Street Railway Department of a Saskatchewan city. Salary around $3,600 per year. Apply to File No. 1093-V.

SALES ENGINEER for contractors equipment and allied lines required by large manufacturer, Niagara Peninsula. Salary open. Apply to File No. 1095-V.

HEATING AND VENTILATING ENGINEER with some experience in mechanical equipment for buildings, is wanted for office work on heating, ventilating and air conditioning by firm of consulting engineers in Montreal. Salary open. Apply to file No. 1096-V.

CHEMICAL ENGINEER OR CHEMIST with some experience in the manufacture of pulp, paper and converted products required for Province of Quebec to take charge of the testing staff of a sub-section of the technical dept. under the general direction of the Technical Superintendent. Salary open. Apply to File No. 1098-V.

*GRADUATE ENGINEER with management ability, about forty-five years of age required by Industrial Corporation operating several branches. Experience should cover plant lay-out, production planning, job simplification, warehousing and supervision of personnel. Salary open. Apply to File No. 1102-V.

GENERAL OPERATING SUPERINTENDENT required by large electric utility company in the Far East for three large interconnected hydro - electric generating plants. Applicants must be thoroughly experienced in operation and maintenance of hydro-electric generating equipment. Salary open. Apply to File No. 1112-V.

DISTRIBUTION ENGINEERS required in Latin America must have at least five years experience on design and operation of overhead electric distribution systems. Salary open. Apply to File No. 1112-V.

SALES ENGINEER, required by large manufacturer of industrial products and building materials with offices in Montreal to reside in Sydney, N.S., and contact industrial accounts, building materials dealers and contractors in Cape Breton and Nfld. Experience in steel and/or chemical engineering an advantage but not essential. Salary open. Apply to File No. 1113-V.

Situations Wanted

MECHANICAL ENGINEER, M.E.I.C., University of Toronto, Canadian Citizen, experience in Canada and abroad, knowledge of several languages. Desires contacts in view of changing the actual line of work with better salary. 37 years of age, married with small family. Great practical and theoretical knowledge in Thermodynamics, hydraulics, aircraft and furniture making and finishing, also all systems of production control. Minimum salary accepted $7,000 per year. Apply to File No. 140-W.

MECHANICAL AND CIVIL ENGINEER, M.E.I.C., Queen's, age 49. Five years hydro-electric power development construction, one year industrial building construction, two years sales engineer and estimator architectural ironworks concern, fourteen years oil refinery on initial construction, on operations and maintenance, last six years refinery engineer in charge of maintenance safety, equipment inspection, design and construction of plant changes and extensions, industrial buildings. Resigned to undertake private venture. Desires to re-enter industry. Apply to File No. 166-W.

MECHANICAL ENGINEER, age 39, experienced in tool design and production methods, material selection, production records, control and co-ordination. Desires employment preferably in Montreal with either manufacturer or firm of Engineers who could utilize all or a part of above experience. Apply to File No. 551-W.

ELECTRICAL ENGINEER, Jr. E.I.C., Manitoba, '44, married, age 27. Presently situated in Maritimes desires active position in Central or Western region. Field service engineering, C.G.E. test course, Army radar experience. Interested in plan engineering, installation or development openings. Apply to File No. 846-W.

GRADUATE MECHANICAL ENGINEER (McGILL), M.E.I.C., P.Eng.Ont. 26 years experience including oil refinery design, plant layout, structural design, pressure vessels; central station boilers and furnaces both design and specifications; surveys and reports on power plant and factory efficiency problems, inspection of installations, and supervision of maintenance on heating, ventilation and air conditioning of military and airport buildings, and fuel storage depots. War veteran, employed but desires remunerative responsible position on West Coast. Would consider partnership with consulting firm. Apply to File No. 991-W.

ELECTRICAL ENGINEER, M.E.I.C., P.E.Q., B.Eng., McGill '34, age 40, married, Bilingual. 15 years Sales and Service of industrial electrical and welding equipment. At present in charge of Sales and Administration for Canadian company. Desires position of responsibility with well established progressive company. Location preferably Quebec or Ontario. Home in Montreal. Available on short notice. Apply to File No. 1421-W.

CIVIL ENGINEER, S.E.I.C., P.Eng. Que., B.Sc., doing post graduate study in Montreal requires part time employment preferably weekends at home. Experienced in various steel plate construction designs. Will also accept draughting and miscellaneous engineering work. Apply to File No. 1487-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.Eng., Que. Experience in the Engineering Department of large Corporations. Considerable experience in Hydraulic and design and building of Reinforced concrete structures. Several years as Construction and Field Engineer on various plants and Hydraulic Power Projects. Desire position with well established firm. Presently employed. Apply to File No. 1527-W.

MECHANICAL ENGINEER, M.E.I.C., McGill 1940. Age 33, Married. Experienced in plant and canal construction, shop work and shop management, cost estimating and control, aircraft maintenance and design. Previous positions include company chief inspector and assistant superintendent. Seeking responsible position in Montreal area. Available three weeks notice. Apply to File No. 1586-W.

SALES ENGINEER, B.E. (Electrical). N.S.T.C., M.E.I.C., Professional Engineer Nova Scotia, age 35, married. Presently employed in Halifax. Ten years experience successfully selling, and supervising the selling of, a variety of electrical equipment. Excellent contacts in Maritime Provinces and Newfoundland. Interested in position as branch manager, or district representative in Maritimes, on salary and commission. Would also consider being manufacturer's agent. Apply to File No. 1758-W.

CIVIL ENGINEER, M.E.I.C., P.Eng. Ontario, age 38, married. 14 years extensive structural experience in reinforced concrete and structural steel design and layout. Interested in association with well established progressive organization as Engineering Assistant or Chief Draughtsman. Present salary $5,000. Apply to File No. 2049-W.

EXECUTIVE ASSISTANT ENGINEER, M.E.I.C.. Background of Engineering, production, Business Organization, Cost Control, and Management. Age 37, married, and preference for permanent association with enterprise in Montreal area. Apply to File No. 2228-W.

CIVIL ENGINEER, M.E.I.C., P.Eng. (Alta.). Age 29, B.Sc. Married. Presently employed. Experience in light commercial construction and housing projects. Familiar with project planning and utility layouts. Have organized and supervised several large construction projects, have good background in lumber and building supply business relative to the construction industry. Some experience in highway location and construction, sewer and water distribution and natural gas installations. Interested in partnership with consultant engineer or architect, or position with progressive construction firm, would consider oil company. Home Edmonton, Alberta. Apply to File No. 2521-W.

PARTNER wanted by engineer, M.E.I.C., with 25 years experience, contemplating private practice. Must have necessary qualifications; previous experience with consulting engineer desirable. Apply to File No. 2642-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., with seven years intensive work with large pulp and paper mill, construction, maintenance, estimate, layouts, process development, time study, etc., also experience in public work-management: water, sewer, electric system generation, transmission and distribution with full responsibilities of design and work, etc. Services available at short notice. Age 32, married and bilingual. Apply to File No. 2823-W.

ENGINEERING PHYSICIST, Jr.E.I.C., Sask. '47, age 24, Prof. Eng. Ont. Single. Desires research work in progressive company. Preferably in Ontario or West. Experience includes six months outside plant of Bell Telephone, Montreal. 14 months ass't Engineer with Miniature Electric Motor Manufacturing Company. Duties are Research and test of design and materials plus plant control and maintenance. Presently employed, available one month's notice. Apply to File No. 2917-W.

MECHANICAL ENGINEER, M.E.I.C., B.Sc. Queen's. Age 32. Married. Veteran. Navy Engineer Officer. Experience primarily includes heating and power plant design, estimating construction and maintenance. At present employed but desires change to responsible position in Ontario, British Columbia or Alberta. Apply to File No. 3020-W.

MECHANICAL ENGINEER, M.E.I.C., Prof. Eng. (Quebec), 15 years of shop practice in maintenance and locomotive repair; 5 years machinery design, including welded vessels, process piping and pulp mill layout. Seeking responsible position preferably in Montreal area. Available on short notice. Apply to File No. 3045-W.

PART TIME WORK, Graduate Civil Engineer, B.A., Sc., Jr.E.I.C., now doing graduate work in Montreal. Desirous of obtaining part time work in concrete and steel design or cost estimating. Apply to File No. 3073-W.

GRADUATE MECHANICAL ENGINEER, 39, single, 14 years experience in research engineering, instrumentation, automatic controls, testing of materials and machinery. Knowledge of metallography, heat-treatment, and welding. Several languages. Acquainted with optical and electrical equipment, emergency maintenance of plant and motor transport. Desires suitable position requiring initiative. Apply to File No. 3074-W.

MECHANICAL ENGINEERING STUDENT, S.E.I.C., 2nd year at McGill University, member, Society of Motion Picture Engineers, age 21, single. Interested in obtaining summer employment with prospects of permanent position in precision mechanical engineering field (instruments, meters, motion picture equipment). Machine shop experience, languages. Apply to File No. 3076-W.

GRADUATE ENGINEER, Toronto '42, M.E.I.C., P.Eng. (Civil Branch), age 30. Married. Overseas veteran with R.C.E. M.E. Experience in Mining and Metallurgy. Presently engaged in all phases of railroad construction and maintenance of way including estimating, general design and layout work. Desires change to position of professional responsibility in Municipal Engineering or Industrial work in smaller firm. Preferable location Toronto or neighborhood. Now completing two year course in Business Methods. Apply to File No. 3077-W.

CIVIL GRADUATE, S.E.I.C., B.Sc. Queen's. Age 25, married, a veteran. Experience limited to survey work and varied shop experience. Desires a position with a consultant or with a town planner. Available on short notice. Apply to File No. 3078-W.

* Closed since appearance in March Bulletin.

Building Research

Engineers and Architects interested in the application of research to building and associated engineering problems are invited to enquire about employment possibilities with the newly formed Division of Building Research of the National Research Council. An enquiring mind is an essential; experience in building work in Canada is really necessary; bilingualism would be helpful. Salaries depend upon training and experience; opportunities for useful work are unlimited. Enquiries should be addressed to the Director, Division of Building Research, National Research Council, Ottawa.

SALES ENGINEER, M.E.I.C. Electrical and Mechanical background, bilingual, 12 years service in Navy and 6 years with Wartime Shipbuilding and War Assets in technical and executive capacity. Interested in representing Firm in Montreal area. Available immediately. Apply to File No. 3081-W.

MECHANICAL ELECTRICAL ENGINEER, S.E.I.C., graduating in May from Ecole Polytechnique seeks position with progressive industrial firm. Age 26, single. Good Mechanical background. Employed during war with National Research Council. Ambitious, with good character and potentialities. Apply to File No. 3083-W.

CIVIL ENGINEER, M.E.I.C., B.A.Sc., Prof. Eng. Age 33. Married no children, bilingual, seven years experience in the following fields: one year in hydro-electric power house operation, three years planning and supervision in shipbuilding, two years in design and supervision of irrigation works; one year as Construction Engineer in charge of the Construction of a dam. Available in June 1949. Presently employed in Ceylon. Apply to File No. 3085-W.

WANTED

MANAGER'S ASSISTANT FOR ELECTRICAL DISTRIBUTION SYSTEM IN FAST-GROWING TOWN OF 25,000 POPULATION

Applicant must be a Professional Electrical Engineer, be between 35-40 years old, have had a minimum of five years experience with a Public Utility or related industry. Please supply resume of experience, photo and expected salary in initial reply.

Apply: File No. 1124-V.

CHEMICAL ENGINEER, Jr.E.I.C., B.Sc. Queen's '46, Professional Engineer (New Brunswick), age 26, married, reliable and conscientious. Experience includes product control, piping layout and general engineering in Pulp and Paper and Petroleum Industry. Also held responsible position in sanitary engineering field as district engineer-in-charge. Desires responsible position in industry or with consulting engineer. Available immediately. Apply to File No. 3092-W.

PROFESSIONAL ELECTRICAL ENGINEER, A.M.I.E.E., seeks position where expert knowledge of motor control gear, motors, switchgear, cables, etc. is required. Wide experience in applications, field and makers tests, layout, specifications, purchase and installation of controls. Would consider engineer-representation of reputable firms. Apply to File No. 3095-W.

STUDENT in 4th year Civil Engineering U. of T., S.E.I.C., graduating this spring, desires a position with an engineering consulting firm doing design or research work in steel, reinforced concrete, or timber structures. 28 years of age, R.C.A.F. veteran, married, one child. Apply to File No. 3096-W.

CIVIL ENGINEER, S.E.I.C., B.Sc. Sask. '48. Age 25, single, veteran. Desires foreign employment. Experience in municipal engineering construction, surveying and geophysical work. Available one month. Apply to File No. 3104-W.

CIVIL ENGINEER, S.E.I.C., E.I.T. (B.Sc. Alta.), age 29. Married. Presently employed in construction supervision, design and estimating. Experienced in highway and municipal works, surveys and layout. Four and one half years overseas artillery survey experience. Desires a permanent position with a consultant or other engineering firm in Western Canada. No objection to travel in connection with field work. Available on reasonable notice to present employer. Apply to File No. 3106-W.

MECHANICAL ENGINEER, M.E.I.C., age 35, married, excellent health. Four years practical mining experience, three years woods operations. Presently employed in woods mechanization program. Three years army experience, automotive repair and maintenance. Desires work in maintenance, or sales and supervision of field installations, testing and making estimates. Apply to File No. 3115-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng. (McGill) 1944. Married. 26 years of age, one child. Army service in R.C. Signals. Post-graduate training in Radio Physics at the University of Western Ontario. At present employed as Assistant Professor of Physics at a Maritime university. Interested in research or development in radio, electronics or allied fields. Preferably Montreal or Ottawa area. Apply to File No. 3127-W.

CIVIL ENGINEERING STUDENT, S.E.I.C., Toronto, Veteran, age 27, Married, graduating this spring, desires employment commencing about May 1st. Will consider anything, but primarily interested in reinforced concrete and structural steel design work in Southern Ontario. Apply to File No. 3128-W.

CIVIL ENGINEERING STUDENT, S.E.I.C., Graduating in May 1949, from University of British Columbia. Age 23, married, veteran. Experience limited to survey work. Desires experience with a consultant or with large design and construction company. Available after May 15th, 1949. Apply to File No. 3129-W.

GRADUATE ENGINEER, Jr.E.I.C., age 32, married, desires position leading to increased responsibility in railway or its equivalent field. B.Sc. Eng. (Electrical) University of Manitoba ('44), two years Engineer Officer Royal Canadian Navy operating and repair of Steam turbines and diesel electric generators, nine years railway machine shop, one year detail and design of welded pressure vessels, steam generators. One winter a lecturer in mechanical engineering. One year in railway signal engineering on signal layout, installation, circuit design. Apply to File No. 3130-W.

MANAGER OF MANUFACTURING

required by Canadian mill producing 500 tons per day of Specialty Papers, Tissues, Paperboard and Newsprint. Position requires proven managerial ability and technical qualifications for the production of paper. The location is most desirable and salary attractive. Applications giving all essential information will be kept confidential if desired — and should be addressed to

File No. 1140-V.

MECHANICAL ENGINEER, Saskatchewan, 1946, Jr.E.I.C., married, age 25. Presently located in Winnipeg area, desires permanent position in industrial or plant engineering. Experience includes teaching, construction, sales, equipment design and installation. Available May 1st, 1949. Apply to File No. 3131-W.

EXECUTIVE, B.A.Sc., P. ENG., M.E.I.C. Wide managerial experience in all phases, Development, Production, Sales, Organization, Cost Control. Age 39. Married, family. Willing to consider position with established concern requiring senior executive. Apply to File No. 3138-W.

ELECTRICAL ENGINEERS

with 7 to 15 years' experience on design, estimating and layout of medium large and large high voltage sub-stations.

ELECTRICAL ENGINEERS

as resident engineers with 5 to 10 years' experience in construction of high voltage sub-stations and hydro-electric generating stations.

ELECTRICAL ENGINEERS

with 5 to 10 years' experience in design and construction of wood and steel tower power lines.

ELECTRICAL ENGINEERS

with 5 to 10 years' experience in design and construction of distribution systems. Location Toronto and elsewhere in Ontario, Canada.

Apply, stating professional qualifications and experience to File No. 1109-V.

ATTENTION EMPLOYERS!

News of the Branches

(Continued from page 167)

In closing, the speaker stated that increased expenditures, much greater than present costs of 21 cents per capita, are needed to hasten the survey programme. At present the Provincial Air Survey Library has a copy of every photo ever taken either by the Government or the R.C.A.F. and these are available for public use.

Mr. D. Roy thanked the speaker on behalf of the Institute.

Winnipeg

G. W. Moule, M.E.I.C.
Branch Secretary

Electrical Section

J. C. Pratt, M.E.I.C.
News Editor

George E. Creed, chief motor design engineer of the Canadian Westinghouse Co., Hamilton, was the guest speaker at the annual meeting of the Electrical Section, February 3, in Winnipeg. Mr. Creed's subject was **Picking the Right Induction Motor for the Job.**

The address covered the electrical modifications, types of protection, and mechanical modifications of polyphase motors from ½ to 5000 horsepower. It was pointed out that Canadian manufacture follows N.E.N.A. Standard dimensions for polyphase induction motors in order to effect interchangeability of American and Canadian motors. Slides were used to illustrate the various motor types. An informal discussion followed, after which W. A. Trott of Greenlaw and Trott moved a vote of thanks to Mr. Creed which was heartily approved by the gathering. The meeting then adjourned to the "Snack Shop" for refreshments.

Pulling Back the Curtain on an Engineer's Family Life

CHEAPER BY THE DOZEN

Frank B. Gilbreth, Jr., and Ernestine Gilbreth Carey. New York, T. Y. Crowell Co., 1949. Illus., 8 x 6 in., cloth, $3.75.

Although this book will be of wide general interest it has a special call to engineers. It tells the inside-the-home story of two outstanding members of the profession — and tells it well. There are many amusing pictures of the efficiency engineer's ideas applied to the family, but in general the great professional success of one of the world's earliest and most successful "time and motion study" engineers, is not part of the story. The home life account is one of the best family sagas that has been offered to the public. Every engineer should read it — particularly if he has children.

The book is funny, not just amusing — really downright hilariously funny. The Gilbreths have twelve children six boys and six girls — all as agreed upon in advance by these efficiency experts. Mr. Gilbreth must have been a remarkable character — big, dynamic, impulsive, kind, afraid of nothing and of nobody, full of the love of life, the love of his work and most of all the love of his family.

Although the book is full of riotous nonsense there are two threads which run through it pointing up two all important principles — the value of a happy home life and the recognition that education can be taught as a game. Mr. Gilbreth never neglected a meal or other family assembly as an opportunity for fun and games — but helpful games. Almost without knowing how it came about all the children down to six years of age learned among other things how to write on a typewriter quickly and accurately by the touch system in two weeks time, how to do mental arithmetic as fast and as accurately as an adding machine and how to receive and transmit messages in Morse. They could all square any and every number from one to fifty, in their heads. It was a trick method that brought consternation to many people but great fun and amusement to the family, particularly "father".

Another reviewer is quoted herewith in his reference to the terrible Pierce Arrow ("the tin you love to touch") which was a colourful part of the Gilbreth life. "Only a motion-study expert could have coped with their temperamental Pierce Arrow. But Dad found no difficulty in blowing all three horns (one electric, two of the bulb variety) as he stepped on the gas, steered madly through traffic, puffed on his cigar, cuffed a noisy youngster in the back seat, and bellowed, "Road hog, road hog", at the unwary.

"The annual trip to their summer home in Nantucket, Massachusetts, was always fraught with drama. They inevitably caused a sensation when they passed through a small town, and were once taken for an entire orphanage on an outing. Stops were of course, frequent and once when one of the twelve got left behind, the loss was not discovered for several hours.

"Democracy was religiously practised in the Gilbreth family through the medium of the family council. There was the matter of the dog, for instance. Dad firmly believed that 'any pet which didn't lay eggs was an extravagance that a man with twelve children could ill afford'. But the vote was twelve to one, with Mother abstaining, and the dog was added to the general bedlam.

"The Gilbreths astounded the Nantucket natives (who considered the Gilbreth homestead — a pair of lighthouses with a cottage squeezed between — a must stopping place for visiting tourists), paralyzed the Montclair schools, and routed the visiting psychiatrists. Their high jinks are faithfully reported by two of the famous dozen in this uproarious book."

The story is of particular interest to members of the Institute as Mrs. Gilbreth (Dr. Lillian Gilbreth, B.Litt., M.Litt., Ph.D., M.Eng., D.Eng., Sc.D.(2), LL.D.(2), in chronological order) is to be a luncheon speaker at the Annual Meeting in Quebec. After Mr. Gilbreth's sudden death she carried on the consulting practice with great success and put everyone of the twelve children through university. In the book, she is played down in favour of "father" but there is a significant note in the preface. It reads "she (Mother) is still active today after rearing twelve children—but that's another story". And so it should be—and what a delightful one it will be.

If the reader of this review wants to be good to himself he should read "Cheaper by the Dozen" and then come to Quebec and hear "mother" speak on "Human Engineering in Management". Each will be a memorable event in his life.

L. A. W.

ABSTRACTS

INSTITUTION OF ELECTRICAL ENGINEERS. PAPERS:

Some Projects Favourable to Direct Current Transmission and the Role of the British Electrical Industry in Relation thereto:

F. J. Errol and The Lord Forrester.

Transmission by direct current can be of service in the development of new energy resources. Possible research projects are discussed, and an outline of a major transmission project in each of four continents is given.

Substations, with Particular Reference to Yorkshire Practice:

L. H. Fuller and C. R. Clarke.

Describes substation practice in a large area of Yorkshire where considerable progress has been made in supplying the sparsely populated sections as well as the larger industrial installations. Details are given of designs at 66 kV. and 11 kV., and slides and models are shown, with special reference to 11 kV. cubicles and 11 kV. kiosk substations.

Theory and Design of Magnetic Amplifiers:

H. M. Gale and P. D. Atkinson.

Basic circuits and characteristics of magnetic amplifiers are reviewed. Mathematical analysis can produce a solution showing that the steady state and transient operation of an amplifier depend on only three dimensionless coefficients. This solution leads to methods of determining the steady state current and flux waveforms and the response to sudden changes in input.

Polyphase Commutator Machines:

B. Adkins and W. J. Gibbs.

There are three types—the shunt and series motors, the commutator frequency changer, and the Scherbius machine. The paper describes the practical arrangement of each type of machine and the associated regulating apparatus, and explains the general effect on performance. The theory of all these machines can be derived from that of a slipring induction motor which has a slip frequency voltage injected into the secondary winding.

Selection of Transformers for Use in Distribution Networks, with Particular Reference to the New Standard 240 Volts:

E. Tobin.

Discusses voltage, ratio, tappings, and economic size of standard transformers, with a few notes giving the permissible duration of overloads starting with a known oil temperature and air temperature.

Insulators to Withstand Air-Borne Deposits:

J. J. Taylor. (American Institute of Electrical Engineers. Preprint.)

Representative types of fog insulators are classified according to design principles. The general conclusion is that each type has inherent limitations and that a completely satisfactory solution of the problem is still to be found. The mechanism of leakage surge flashover is examined. Continued research into methods of establishing a voltage gradient by resistance means is recommended. In such research, leakage surge counters promise to be a useful tool. A description is given of surge measuring equipment and of results obtained on one group of outdoor tests.

New Type of Cast Iron—Nodular Graphite Iron:

J. G. Pearce. (V. 1349. British Cast Iron Research Association.)

Nodulite is a new engineering material evolved by the British Cast Iron Research Association. It is a grey cast iron, as-cast, and without heat-treatment, having the graphite content in the nodular or spherulitic form. The process yielding this product consists essentially in adding a small amount of cerium (available commercially in the form of mischmetal) to a particular type of base iron, best met by a low phosphorus pig iron. The form of the process favoured by the Association consists in the addition to the molten metal in the ladle of a predetermined amount of mischmetal, followed by a ladle graphitiser, when the phosphorus content of the metal does not exceed 0.5%. In the ordinary unalloyed state the material is extremely soft and machinable. It can be produced with virtually any metallurgical structures in the metal, and the use of alloying elements or heat treatment to improve the strength of the metal structure by the usual procedures can be followed. Figures are quoted to give some idea of the properties of these cerium-treated irons.

Use of a Technical Library:

R. H. Whitford and J. B. O'Farrell. (In Mechanical Engineering, volume 70, number 12, December 1948. p. 987-993.)

Scientific publications of wide variety are being issued so prolifically that even the most zealous reader can keep abreast of progress within but a narrow field. It is highly essential, therefore, to acquire familiarity with efficient search techniques, for the specialist today must not only know, but know how to find. Accordingly, this article outlines suitable procedures for locating data in the various forms of technical literature, such as books, serials, journals, government publications, and trade catalogues, each type being described from the standpoint of subject material and its availability through skilful use of bibliographical tools.

SELECTED ADDITIONS TO LIBRARY

TECHNICAL BOOKS, ETC.

Aeronautical Conference, London, 3rd-5th September, 1947:

Convened by The Royal Aeronautical Society and The Institute of the Aeronautical Sciences, edited by J. L. Pritchard and Joan Bradbrooke. London, Royal Aeronautical Society, 1948. 704 p., illus., cloth.

"Get it from Crane"

. . piping equipment for every need

From coast to coast, Canada's mining industry knows the value of "Getting it from Crane". It means quick, sure selection of quality piping equipment — in brass, iron, steel and alloy materials.

Leading Canadian mines depend on Crane valves, fittings and fabricated piping — to convey and control compressed air for rock drills, hoists and loaders — for dewatering operations — and in mill, smelter and refinery processes.

Specialized equipment has been developed for particular service conditions, and has been constantly improved as operating requirements and Crane research have shown the need.

For every Canadian industry requiring equipment to control the flow of oil, air, gas, steam or water, the unsurpassed extent and variety of the complete Crane line provide:

ONE
SOURCE OF SUPPLY
RESPONSIBILITY
STANDARD OF QUALITY

For complete information on particular requirements, ask your Crane Branch.

L. E. Cheyney. Columbus, Ohio, Battelle Memorial Institute, 1948.

Remarks on the Engineer in Public Service:

J. L. Wickwire. Halifax, Nova Scotia Dept. of Highways and Public Works, 1948.

Society's Challenge to Technical Education; a Report of the Inauguration of T. Keith Glennan as President of Case Institute of Technology:

Case Institute of Technology, Cleveland, Ohio, 1948.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

AMERICAN STANDARDS ASSOCIATION. STANDARDS.

New York, the Institution, 1948.

Z38.4.19-1948 — Nomenclature for Parts of a Photographic Objective Lens. *25c.*

Z38.4.20-1948 — Methods of Designating and Measuring Apertures and Related Quantities Pertaining to Photographic Lenses. *25c.*

Z38.4.21-1948 — Methods of Designating and Measuring Focal Lengths and Focal Distances of Photographic Lenses. *35c.*

These standards define the focal length of the lens of a camera in more exact terms than has been the case up to the present time and provide methods of designating and measuring apertures of photographic lenses. The terms used in describing the parts of a lens are defined. The standards are part of a series sponsored by the Optical Society of America.

ASBESTOS; ITS PREPARATION AND APPLICATION:

A. E. Williams. Manchester, Emmott, 1948. 44 p., illus., 6½ x 4 in., paper, 2/6-.

In this Monograph the writer has endeavoured to review briefly the present-day methods of producing asbestos and its various products. Some of the better known of these products, such as roofing tiles, pipes, coatings for metal, gaskets, washers, packing, etc., are described.

BIBLIOGRAPHY ON PRESTRESSED REINFORCED CONCRETE:

Engineering Societies Library, New York, 1948. 25 p., 11 x 8½ p., paper, $4.00. (ESL Bibliography No. 2.)

Covering all aspects of the subject, including theory, design, construction practice and applications, this comprehensive bibliography supplies 190 annotated references to the literature from all over the world for the past sixty years. The patent literature has not been covered, except for the inclusion of a few of the earliest patents. Each entry gives source, date, number of pages, price where possible, and a brief, concise annotation.

BRITISH STANDARDS INSTITUTION. STANDARDS.

British Standards Institution, London.

Moulded Insulating Materials for General Electric Purposes. BS 488: 1948. *2/6.*

This standard covers moulded materials for use as insulating materials for general electric purposes on currents up to 250 volts, and at working temperatures not exceeding 100° C. It provides for four grades of moulded materials based on resistance to heat and specifying qualifying limits for electrical properties, resistance to heat, strength, and general properties for each grade.

Treatment of Water for Marine Boilers (with a Section on Engineering Factors). BS 1170:1947. *10/6.*

This is a revision of the wartime standard. It describes that method of boiler water treatment by which the scale and corrosion-forming salts are destroyed by alkaline reagents, with or without the use of an organic coagulant, as may be considered necessary. Three methods of water treatment are prescribed. Abbreviated instructions for these three methods are given in the form of data sheets in an appendix.

LIMITS AND FITS FOR USE IN LOCOMOTIVE WORK, January, 1948:

Locomotive Manufacturers Association of Great Britain, London, 1948. 15 p., 7¾ x 5 in., leather.

This is one of the standards to be used in locomotive manufacture, since all locomotives built in Great Britain for export will henceforth be constructed to standard tolerances to provide interchangeability and standardization to such a degree as to simplify considerably running-shed maintenance replacements, shop overhauls, and the ordering and assembly of spare parts.

MEASUREMENT OF FLUID PRESSURE; PRESSURE GAUGE EQUIPMENT, ITS APPLICATION, INSTALLATION AND MAINTENANCE:

J. R. Fawcett. Manchester, Emmott, 1948. 42 p., illus., 7¼ x 5 in., paper, 2/-. (Mechanical World Monographs No. 42.)

This Monograph describes the construction and use of instruments for measuring pressure, from the lowest vacua to the highest pressures found in practice. Many of the commoner problems met with in pressure measurement are considered and some description is given of the points to be watched when dealing with various fluids and the different methods of producing pressure.

SPEED CONTROL OF ELECTRIC MOTORS:

Emmott, Manchester, 1948. 51 p., illus., 7¼ x 5 in., paper, 2/6-. (Mechanical World Monographs No. 45.)

This Monograph reviews the subject of variable speed operation of electric motors in general, dealing with characteristics of various types of motors, their possibilities and limitations from a speed control point of view.

U.S. HIGHWAY RESEARCH BOARD. BULLETINS:

Washington, Highway Research Board, 1948.

No. 12—Highway Finance.

Included in this bulletin are papers on the Federal-aid highway program; highway finance and the consumer; information needed for fiscal and allied phases of long-range highway program planning; highway revenue and expenditure trends; and current long-range studies of highway modernization programs.

No. 14—Soils Committee Reports and Special Papers.

This bulletin contains reports of the committee on frost heave and frost action in soils, the committee on soil cement roads, and the committee on soil calcium chloride roads. The special papers are as follows: Field studies to determine the value of calcium chloride for compaction of soils; and jacked-in-place pipe drainage.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

COBALT. (A.C.S. Monograph No. 108).

R. S. Young. Reinhold Publishing Corp., New York, 1948. 181 p., illus., charts, maps, tables, 9¼ x 6 in., cloth, $5.00.

Written for the scientific worker who wants either complete or specific information, this monograph assembles and reviews critically existing data on the chemistry and metallurgy of cobalt. Certain unpublished features and developments which have come within the author's experience are included. Promising lines of further investigation in various fields are indicated.

COMBUSTION ENGINEERING, a Reference Book on Fuel Burning and Steam Generation.

Edited by O. de Lorenzi. Combustion Engineering Co., New York, Montreal, 1947. Paged in sections, illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50.

This book deals with the various methods and equipment used for fuel burning, steam generation, and heat recovery, and was prepared by a number of fuel technologists, combustion engineers, and specialists. Brief outlines of early developments, as contrasted with modern designs, are included in many chapters. Selection of equipment and performance calculations are considered as well as the operation and maintenance of equipment. Numerous tables and diagrams complement the text.

COMPANY WAGE POLICIES.

R. A. Lester. Princeton University, Princeton, New Jersey, 1948. 45 p., 9¼ x 6 in., paper, $1.50. (Industrial Relations Section Research Report Series: No. 77.)

This brief study is the result of a survey of the processes by which wage policy is determined by some 100 representative manufacturing companies in the United States, small and large. Topics dealt with include the basis for plant level of rates, factors in wage-level charges, and the consequences of intercompany uniformity.

CYBERNETICS, OR CONTROL AND COMMUNICATION IN THE ANIMAL AND THE MACHINE.

N. Wiener. John Wiley & Sons, New York; Herman et Cie, Paris, 1948. 194 p., diagrs., charts, 9¼ x 6 in., cloth, $3.00.

This book describes the application of statistical mechanics methods to communications engineering. Its subject matter ranges from such control mechanisms as servomechanisms, mathematical calculators, and automatic pilots, to the nerves and brain of the human body. Representing the meeting point of control and communications engineering, neurophysiology, and psychology, the discussion considers human control functions and the mechanico-electrical systems designed to replace them.

LITERATURE SEARCH ON DRY CELL TECHNOLOGY. (Special Report No. 27.)

M. Dolan and B. H. Weil. Georgia Institute of Technology, State Engineering Experiment Station, Atlanta, Ga., 1948. 700 p., 8¾ x 5½ in., leather, $5.00; foreign, $5.50.

This compilation, placing special emphasis on synthetic manganese dioxide depolarizers, was prepared in connection with a research program at the State Engineering Experiment Station of the Georgia Institute of Technology. It constitutes an indexed, annotated bibliography of the pertinent literature dealing with (1) dry cell technology, (2) manganese ore deposits throughout the world, and (3) methods of treating such ores for the preparation of depolarizing compounds. Over 1500 abstracts from journals and more than 2300 digests of pertinent foreign and domestic patents are given.

NATIONAL CONFERENCE ON INDUSTRIAL HYDRAULICS, Proceedings, 3rd Annual Meeting, October 16-17, 1947.

Armour Research Foundation, Technology Center, Chicago 16, Illinois, 1948. 129 p., illus., diagrs., charts, tables, 9 x 6 in., paper, $3.00.

The Conference attempts to fulfill a need for an interchange of ideas on problems confronted in the large field of industrial hydraulics. The papers from the third meeting deal with hydraulic governor operation, hydraulic circuits of industrial process controls, various phases of cavitation, practical hydraulic coupling design modifications, hydraulic transmissions, and the design of hydraulic seals.

NON-FERROUS METALS AND ALLOYS.

E. Gregory and E. N. Simons. Paul Elek, 38 Hatton Garden, London, E.C.1, 1948. 196 p., illus., charts, tables, 7½ x 5 in., cloth, 12s. 6d.

Of value to students and engineers, this simply written book is an exposition of the character, properties and treatment of the important non-ferrous metals and alloys. The opening chapter deals with the general principles of heat treatment. Each group of alloys is then considered in turn, concluding with solders, bearing alloys, and the precious metals.

RADIO AT ULTRA-HIGH FREQUENCIES, Volume II (1940-1947).

Edited by A. N. Goldsmith and others. Published by RCA Review, Radio Corporation of America, R.C.A. Laboratories Division, Princeton, N.J., July 1948. 485 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $2.50 plus $0.20 postage to foreign countries.

This compilation of original and reprinted papers is presented in seven sections: antennas and transmission lines, propagation, reception, radio relays, microwaves, measurements and components, and navigational aids. As additional sources of reference, the appendices include a bibliography and summaries of all papers appearing in volume I of the set.

RUBBER TO METAL BONDING.

S. Buchan. Crosby Lockwood & Son, Ltd., London; Technical Book Association of Canada, Vancouver, 1948. 239 p., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 21s.

This work on the use of rubber as a constructional unit deals particularly with the process which utilizes brass plating as a bonding agent, although other bonding agents are discussed. Both natural and synthetic rubbers are considered, molding methods are described, and the mechanism of the rubber-to-brass bond is gone into in detail. The bibliography consists of data sources referred to in the text.

SIMPLIFIED DESIGN OF STRUCTURAL TIMBER.

H. Parker. John Wiley & Sons, New York; Chapman & Hall, London, 1948. 218 p., diagrs., charts, tables, 8 x 5 in., leather, $3.25.

Of value to builders and architects, this book can also be used by those with no previous training or study. Dealing primarily with wood members that support loads in buildings, the book includes a full explanation of the principles of mechanics involved in the design of these members which is based on the recommendations of leading authorities of timber construction. There are 45 useful tables as well as practical examples and problems.

SPECIFICATIONS AND LAW ON ENGINEERING WORKS.

W. C. Sadler. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948. 493 p., tables, 8½ x 5½ in., cloth, $5.00.

Designed for the engineer with little or no legal training, this book provides a foundation in engineering law for the writing of specifications. A summary of the historical significance of various legal systems is included. Among the topics specifically discussed with examples taken from actual experience are the legal instruments of contractual documents, illegal matters of concern to engineers, the law on agency partnerships and corporations, patents, and workmen's compensation. A complete set of detailed contracts and specifications, covering the construction of a transmitter building for the University of Michigan, is presented in the appendix.

Although the following new books are not available in the Institute Library, inquiries concerning them will be welcome there or may be sent direct to the publishers.

COLLEGE PHYSICS.

H. A. Perkins. 3 ed. Prentice-Hall, Inc., New York, 1948. 786 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.65; text ed., $5.00.

The purpose of this book is to give the student a substantial grasp of physical principles rather than to describe phenomena. Covering all the usual phases of physics included in an elementary text, this volume uses very simple algebra and trigonometry. Some historical background is given, and modern ideas are used throughout. Mention is made of such new developments as radar, and there is a considerable discussion of atomic energy. Problems with and without answers follow each chapter, and a section of the appendix deals with the solution of problems.

ENGINEER'S SKETCH-BOOK OF MECHANICAL MOVEMENTS, DEVICES, APPLIANCES, CONTRIVANCES AND DETAILS.

T. W. Barber. 7th ed. E. & F. N. Spon, Ltd., 57 Haymarket, London, S.W.1, 1948. 355 p., diagrs., tables, 8½ x 5¼ in., cloth, 15s.

This book provides, side by side, brief descriptions and sketches of the various devices in use for accomplishing many specific mechanical movements or works. Such devices as accumulators, bearings, cams, doors, gears, handles, jets, levers, pivots, rotary engines, swivels and tappets are included. In this fifth edition, the text and many of the sketches were revised, and many additions have been made.

EXPLORING ELECTRICITY, Man's Unfinished Quest.

H. H. Skilling. Ronald Press Company, New York, 1948. 277 p., illus., diagrs., 8½ x 5½ in., cloth, $3.50.

Considering electricity through the years as the scientists knew it, this volume is devoted to stories of these scientists and their friends, including the outstanding personalities from Thales to Fermi. A knowledge of electrical principles is developed through the historical approach.

GENIUS OF INDUSTRIAL RESEARCH.

D. H. Killeffer. Reinhold Publishing Corporation, New York, 1948. 263 p., charts, 9¼ x 6 in., cloth, $4.50.

This treatment of modern industrial research and its methods is intended primarily to guide the ambitious young researcher to a better understanding and a surer mastery of his craft. The material is mostly from the field of industrial chemistry. The accounts of how many important modern developments were achieved are quoted directly from the original presentations.

HIGH-SPEED AERODYNAMICS.

H. W. Sibert. Prentice-Hall, Inc., New York, 1948. 289 p., diagrs., charts, tables, 8½ x 5½ in., cloth, $6.00.

Dealing with both the subsonic and supersonic ranges, this book analyzes the various aspects of the flow of a compressible fluid past a solid body. The effects of certain wing types and of high airplane Mach numbers on airplane performance are discussed. A knowledge of the calculus and elementary aerodynamics is the minimum prerequisite.

KINEMATICS MACHINES.

L. M. Sahag. Ronald Press Company New York, 1948. 249 p., illus., diagrs., 9½ x 6 in., cloth, $4.00.

Following introductory chapters on fundamental conceptions and motion in machines, the text is divided into separate detailed discussions of the particular actions and mechanisms dealt with, such as: instant centers, linear and angular velocities, cams, gears, flexible links, etc. In the solution of problems in velocities and accelerations the graphic method has been applied in preference to the analytic method.

PETROLEUM PRODUCTION, Vol. IV, Condensate Production and Cycling.

P. J. Jones. Reinhold Publishing Corp., New York, 1948. 238 p., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.00.

Continuing the author's "Petroleum Production" series, the present volume discusses the production of the liquid commercially extractable from the gases found in reservoirs at pressures greater than the minimum condensation pressure for heavy ends. A thorough mathematical analysis is made of the varied situations in which it is economically worthwhile to carry on this production by cycling or other means of pressure maintenance. Section II on applications deals with specific cases of radial, elongated, and linear reservoirs, and discusses the maximum efficient rate of production.

PRECISION MEASUREMENT METHODS AND FORMULAS.

J. Johnson. Pitman Publishing Corp., New York and London, 1948. 181 p., diagrs., tables, 9½ x 6 in., linen, $3.00; 16s.

Bridging the gap between "school" mathematics and practical application of theory, this book on tool inspection presents actual problems and their solutions. The overall theory behind the solution is clearly shown. Solutions are for the greater part based on setups requiring the simplest of instruments. No special ability other than knowing how to use trigonometric tables is necessary.

UNDERWATER EXPLOSIONS.

R. H. Cole. Princeton University Press, Princeton, N.J., 1948. 437 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50.

Emphasis is placed on fundamental physical properties and useful theoretical methods of shock wave development and propagation. Following a qualitative description of an underwater explosion, there is a general discussion of basic hydrodynamical relations. The detonation process and theory of shock waves are considered next. Various pressure gauges, photography of underwater explosions, shock wave measurements, motion of a gas sphere, and secondary pressure waves are also considered.

VANDERBILT RUBBER HANDBOOK.

Edited by S. S. Rogers, published by R. T. Vanderbilt Co., 230 Park Ave., New York. 9th ed., 1948. 719 p., illus., diagrs., charts, tables, 8½ x 5½ in., fabrikoid, $7.50.

The purpose of this reference manual is to instruct new men entering the rubber industry in the fundamentals of compounding, and to provide experienced technologists with needed information and data. To accomplish these aims, the discussion deals first with basic substances, properties and processes; next with fundamental compounding procedures; and finally with the application of the foregoing principles to the compounding of specific types of rubber goods.

WELDING FUNDAMENTALS.

H. P. Rigsby. Pitman Publishing Corp., New York and London, 1948. 178 p., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $2.75.

In this compilation of the fundamentals and principles of welding for the engineering student the actual technique of welding is treated as secondary material. Following a historical development of the various welding methods are chapters on the equipment needed for each method. Welding gases, rods, fluxes, and types of joints are considered as well as the testing of welds. Standard welding symbols and a glossary of welding terms are included.

Business & Industrial Briefs

A Digest of Information received by The Editor

New Equipment and Developments

This year the B. J. Coghlin Company Limited of Montreal is celebrating its 80th anniversary as a manufacturer of springs, track tools, and railway supplies.

The Company was formed by Bernard James Coghlin in 1869. Mr. Coghlin, who was trained in one of the steel works in Sheffield, England, came to Canada to take over a small spring plant operating under the name of the Montreal Spring Company. The Company was incorporated under a Dominion Charter in 1910 when Bernard W. Coghlin was elected president and managing director, which position he still holds.

•

The New Holland Manufacturing Company of Mountville, Pa., commenced quantity production in January of what is claimed to be world's largest impact stone crusher. This new crusher known as Model 5050 Double Impeller Breaker has been under test for many months. The manufacturers claim that it can take stone up to 50 inches and reduce it to aggregate in one operation. For complete details communicate with the manufacturer.

•

The British Columbia Coast Lumbermen have sponsored a new Trade Bureau to be known as the " B.C. Coast Woods Trade Extension Bureau ". H. J. Mackin has been elected president and R. M. Shaw the vice-president.

The new bureau, which is sponsored by the B.C. Lumber Manufacturers Association, Western Lumber Manufacturers Association, and Alaska Pine Sales Ltd., has been formed to promote the use and marketing of lumber and allied products through advertising, trade extension, and research. The trade extension campaign for the initial part of the current year is chiefly concerned with promoting the use of correct grades of wood in home construction.

The Bureau has prepared two pamphlets which are available on request. " Use the Right Grades of Lumber in Your Home ", which is intended primarily for architects, engineers, and contractors and " A Quality Home Can Cost Less " which is directed at lumber dealers. These publications may be obtained from the Bureau. All communications should be addressed to: The Secretary, B.C. Coast Woods Trade Extension Bureau, 837 West Hastings St., Vancouver, B.C.

Research and development of safety equipment for all industries, including the construction industry, will be undertaken in a new laboratory, to be built in Pittsburgh by Mine Safety Appliances Company.

•

A new design of heavy duty hose has been announced by the Dominion Rubber Co. Ltd., Mtl. Designated Poled Lead Press Hose, it combines the desirable features of both molded lead press and pole made hose.

The new hose is designed for heavy duty service in mining, construction and general contracting. The hose was first produced in 1939-40 and trial lengths were tested in a number of Canadian mines. Service life was exceptional under the extremely rugged conditions obtaining in the mining field. Owing to the war full production of this new type hose was delayed.

The manufacturer claims that the new hose is up to 30% lighter than conventional hose designed for equivalent service. It is also claimed that it has superior wearing qualities, other favourable features are smooth cover, close outside diameter tolerances, homogeneous bonding of cover, carcass and tube, close inside diameter tolerances, smooth, dense tube structure. It is available in 50 ft. lengths and is now being made in air drill and water types. Other types are being added.

•

Canada's largest transformer was placed in service by B.C. Electric Railway Company in January when a unit rated at 66,667 kva. came into operation at the Horne Payne sub-station at Burnaby, B.C. — six miles from Vancouver. First of the step-down units to supply power for Vancouver from B.C.E.R.'s Bridge River development at Shalalth, the transformer completes the first stage of the development—the first step-up unit (50,000 kva.) having gone into operation at Bridge River on October 23rd. Transmission voltage is 230,000 volts. The transformer was engineered and built at the Davenport (Toronto) Works of Canadian General Electric.

•

Addressing the Gauge and Toolmakers Association in London on February 15th, Sir E. H. Gilpin, chairman of the British Food Machinery Manufacturers Association, strongly urged United Kingdom industry to fight for the Canadian market. He said, " We industrialists must accept and co-operate with the Government policy of Canadian priority even to the extent of sacrificing some of the contents of our depleted pockets." Sir Harry stressed the importance of using Canadian publications as advertising media and the necessity for brochures and pamphlets prepared primarily for the Canadian market.

•

A new engineering material described as ductile cast iron which combines the process advantages of gray cast iron, such as fluidity, castability and machinability has been developed in the research laboratories of the development and research division of the International Nickel Company. Closing the gap between cast iron and cast steel, this material is characterized by a graphite structure in the form of spheroids, free from graphite in the flake form. It is claimed to have excellent physical properties, particularly high elastic modulus, high yield strength and ductility. Complete information on this new product may be obtained from the International Nickel Company of Canada Limited, 25 King Street West, Toronto 1.

•

Canadian General Electric Company Limited have opened a new plant at Cobourg, Ontario. This will be used for the manufacture of compression, injection, molded, and extruded plastics for a wide variety of industrial and domestic uses such as radio cabinets, telephones, tubing, spinning buckets for textile mills, electrical insulating parts, cosmetic containers, and household applications.

The plant is equipped with 70 hydraulic compression molding presses including a 924-ton 28-inch ram, which is claimed to be the largest in Canada. The plant occupies 76,000 square feet and production area is all on one floor. Up to 350 persons will be employed. Many interesting features were incorporated into the plans for this building and the Company will be pleased to supply additional data.

•

Weathertight steel shipping containers have been developed by the Dravo Corporation of Pittsburgh for use as portable field offices and as tool cribs on construction projects. The address of the Company is Dravo Corporation, Neville Island, Pittsburgh 25, Pa.

Russel-Hipwell Engines Limited of Owen Sound, Ontario, have developed a new powerful Diesel unit providing "low weight per horsepower" power for a variety of applications. For details communicate with the manufacturer.

•

An architectural exhibition, of a kind never before seen, is to be held in London as a part of the Festival of Britain in 1951. It will be sited in the centre of London, on the banks of the Thames, in the vicinity of Westminster Bridge. It will take the form of a cross-section of a typical residential neighbourhood. This will be shown as in the course of construction and will comprise not only houses and flats but other features which go to make up a properly balanced development. Some of the dwellings to be exhibited will be completed while others will be only partially finished to indicate the various types of building technique.

•

During 1948 Great Britain was the largest exporter of automobiles. Her overseas sales of cars, commercial vehicles and agricultural tractors totalled $584,000,000 or $240,000,000 more than in 1947. The number of motor vehicles exported in December was the highest in the year.

•

Canadian Car & Foundry Company Limited has commenced its delivery of 55 Canadian Car-Brill C-36 Inter-urban buses to Provincial Transport Co. These buses are of very modern design with special suburban type seats, foam rubber cushions and arm rests, interior parcel racks, individual reading lights for each pair of seats. They are powered by Hall-Scott underfloor engines.

•

A new large volume Whiteprinter has been announced by the Charles Bruning Co. Inc., Chicago, Illinois. The machine is intended primarily for use in engineering and business offices where there is a large volume of duplicating work. The manufacturer claims it will reproduce anything drawn, typed, written, or printed upon translucent mediums, at speeds up to 105 square feet per minute. Prints from post card size up to 42" in width and in any length are made on the machine with equal ease. This new Bruning Whiteprinter is known as the "Volumatic Model 93." The manufacturer will supply descriptive material.

•

Dutch Industries will be represented at the Trade Fair in Toronto May 30th to June 10th.

•

Northern Electric Company Limited have now incorporated into their medical programme a series of vision tests. The principal equipment to be used during these tests will be an "Ortho-Rater", manufactured by the Bausch & Lomb Optical Company. The purpose of the tests is to make sure that employees' vision is adequate for the jobs in which they are engaged and advice will be given on how defective vision may be improved.

•

A fourteen day aircraft show will be held at the Canadian National Exhibition, Toronto, from August 26th to September 10th. The aircraft show is to take place in the Exhibition Grounds and on the mezzanine of the spacious Automotive Building, where 30,000 square feet of space is being made available. The show will feature products of some of the leading Canadian, U.S. and British aircraft manufacturers.

•

Petrochemicals Ltd., with head office in London, England, have announced the installation and operation of the first cracking furnace in their plant at Partington near Manchester. The "Catarole Process" is employed. According to information received from the Company, from the beginning of operation the quality of the products, both liquids and gases, has been up to specification and the yield of olefinic gases, which constitute a valuable part of the gaseous product, is higher than expected. Delivery of gases to the Manchester Corporation Gas Works has commenced.

The Catarole process converts an essentially non-aromatic charging stock derived from petroleum into the full range of aromatic hydrocarbons, formerly obtainable only from coal tar. The process is new and is an entirely British invention.

•

The American Standards Association has just given its final opproval to a new American Standard which puts into effect the Unified Screw Thread system agreed upon by Great Britain, Canada, and the United States by the Declaration of Accord signed in Washington last November.

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

South Bend Lathe Works, South Bend 22, Indiana, offers readers of the Journal a large size Works Wall Chart, entitled "Tap Drill Sizes".

•

Leeds and Northrup Co., 4911 Stenton Ave., Philadelphia 44, Pa., have prepared a most interesting catalogue covering their complete line of Speedomax indicators, recorders and controllers.

The publication contains 44 pages. It is well illustrated, and presentation is excellent. Copies may be obtained on request.

•

A 36-page booklet, just released by Hardinge Co., Inc., 240 Arch Street, York, Pa., contains a general discussion of dry grinding, five pages of operational tips for improving mill performance, a number of typical dry-grinding layout drawings, and operational data from several dozen specific installations in the mining, metallurgical, chemical, ceramics, stone, iron and steel industries. Ask for bulletin 17-B.

•

Watson Jack & Company Limited, 1410 Stanley Street, Montreal, have just published a 32-page booklet, 8½ in. x 11 in., entitled, "WAJAX Forest Fire-Fighting Equipment". Copies are available.

•

Nordberg Manufacturing Co., Milwaukee 7, Wis., announces publication of bulletin 163, on Nordberg Diesel Engines, type DB-24, for stationary and marine service for Duafuel or oil burning operation, supercharged and non-supercharged.

The brochure consists of eight pages printed in two colours and it describes and illustrates a vertical, four-cycle, single acting, trunk piston type engine of 16½ in. bore and 24½ in. stroke. Ratings range from 815 to 1900 horsepower at speeds of 277 and 300 r.p.m. Sizes range from five to eight cylinders. Ask for bulletin 163.

•

Patent restrictions on the sale of preformed wire rope in Canada expired on February 10th. R. G. LeTourneau are now offering their product "Tournarope" to earthmoving and materials handling contractors throughout the Dominion. The Wire Rope Division of the Company will market this product through authorized Canadian LeTourneau Distributors. Folders and bulletins describing Tournarope may be obtained from R. G. LeTourneau, Inc., Peoria, Illinois.

•

A very attractive 8-page folder has been prepared by Surface Combustion Corporation, Toledo, Ohio, to describe its line of Standard-Rated Industrial Furnaces. The booklet is printed in two colours and is profusely illustrated. The equipment covered in the folder includes that required for hardening, tempering, forging, metal melting, air heating etc. Ask for Bulletin SC-141.

•

Canadian Ingersoll-Rand Co. Ltd., New Birks Building, Phillips Square, Montreal, have issued three publications. Two of these "How to Make Your Air Power Equipment Do More Work at Less Cost," and "The Little Book With Big Money Saving Ideas" are of pocket size. The third publication "The Rotary Electric Impactool" measures 8½ by 11 in. Copies of these publications may be obtained from the Company.

Aveling-Barford Ltd. of Grantham, England, who now have representation in Canada from coast to coast have published a series of most interesting booklets and brochures. These are "What We Make". It covers their complete line of Road Rollers, Dumpers, and the Calfdozer trench cutting machine and vibratory concrete finishers. Separate publications are also available covering the Company's One Yard Dumper, The Dumptruck, 12 Ton Dumper, Trench Cutting Machine, Diesel Shuttle Dumper, Vibratory Concrete Finishers, and Road Rollers. Copies of these publications may be obtained on application to Charles Cusson Ltd., 284 Ontario St. W., Montreal; M. L. Baxter Ltd., 1900 St. Clair Ave. W., Toronto; Vancouver Engineering Works Ltd., 519 W. 6th Ave., Vancouver; Vulcan Iron & Engineering Works, Winnipeg, Man.; Industrial Road & Equipment Ltd., Calgary and Edmonton, Alberta.

•

South Bend Lathe Works, South Bend 22, Indiana, offers catalogue No. 77-U covering machine tool attachments and accessories. The catalogue has 28 pages and contains illustrations and specifications on items which will make possible the performance of a wider range of work on lathes and drill presses.

•

The February 1949 issue of the Bepco Journal contains an interesting article on Oil Circuit Breakers by Brian M. Burt. To have your name placed on the mailing list for this interesting publication write to Bepco Canada Ltd., 4018 St. Catherine St. West, Montreal 6, Que.

•

The Gerin Corporation of Red Bank, N.J., P.O. Drawer 653, is distributing a new circular No. 300 "Required Equipment for Lubrication Control". It illustrates the Portable Oil Inspection Kit recently announced by the Company whereby any mechanic can quickly measure the contaminants occurring in lubricating oil during use. There is no charge for the publication.

•

The Sulzer Technical Review No. 4, 1948, contains an article on air conditioning in the textile industry, a paper on the demand which the gas turbine designer must make on highly heat-resisting steels; and the practical means available for determining strength properties after long working periods. This issue also contains short notes on a number of reports on Diesel engines for French ships, the transport of a large marine engine on a Rhine barge and the recommissioning of the motor vessel "Aorangi". Copies of the publication may be obtained from C. O. Monat & Co. Ltd., 6520 Park Avenue, Montreal, Que.

•

The eighteenth volume of the C.I.L. "Oval" began with the February issue, copies of which are now available. The "Oval" is published every two months in separate English and French editions by the Public Relations Bureau of Canadian Industries Ltd. It is a semi-technical publication and is of wide-spread interest. For copies apply to the Editor, the C.I.L. Oval Box 10, Montreal, Que.

•

The February 1949 issue of the "Dominion Engineer" is devoted to the publication of an article "How to Sell Quality" by J. C. Aspley. The article is based on the creative selling methods of the top salesmen in forty-three nationally known companies. For copies of the publication apply to the Dominion Engineering Co. Ltd., P.O. Box 220, Montreal, Que.

•

Performance of wrought iron in more than 100 different applications in the marine industry, including ships, structures and shore installations is described in a new 64 page book just published by A. M. Byers Co., Pittsburgh.

Illustrated descriptions of the service record of wrought iron plate for the hulls of all types of vessels, some of them a century old, are contained in one chapter of the book. Use of wrought iron plate and pipe for many other services aboard ships are also depicted.

The publication shows also how piers are being equipped with fire steps of wrought iron plate to retard the spread of flames, at the same time resisting the corrosive action of salt water. This interesting book describes, also, dam design and construction, and numerous applications for wrought iron such as by-pass and air inlet piping for penstocks, drainage lines, stop-log guides, bars for locking pre-cast concrete riprap in place, and skin plating. Members of the Institute may obtain a copy of the publication without charge.

•

The Aluminum Co. of Canada Ltd., Sun Life Bldg., Montreal, Que., publish regularly the "Alcan Ingot" and "Aluminum News". To ensure regular receipt of these publications please communicate with the Company asking that your name be placed on the mailing list.

•

Spielman Agencies Ltd., 420 Lagauchetiere St. West, offer the revised issue of the Kerner-Greenwood Waterproofing Specifications Booklet. This booklet covers those types of Portland cement concrete, stucco and plaster waterproofing work that occur in everyday practice. The booklet contains 20 pages and there are twenty diagrams. A copy will be forwarded on receipt of request.

Appointments and Transfers

Canadian Westinghouse Co. Ltd. announces the retirement of George F. Foot who held the position of manager of sales. Mr. Foot entered the electrical industry in 1900 with the Westinghouse Electric and Manufacturing Co. at Pittsburgh. After service in the Tracing Dept., he entered the engineering department where he was assigned the responsibilities of correspondence with engine and water-wheel builders for the mounting of generators with their prime movers. During this period Mr. Foot organized night classes in mechanical drawing under Dr. Charles F. Scott, then chief electrical engineer of the Company. These classes were the origin of the Westinghouse Employees Educational System. He came to Canadian Westinghouse in 1905 and has travelled extensively throughout the Dominion on behalf of his employer. He was appointed assistant manager of sales in 1929.

Born in Stratford, Ont., Mr. Foot was educated in London, Ont., and later studied engineering under Westinghouse engineering experts in Pittsburgh.

G. E. Bourne

G. E. Bourne has been given general responsibility for the nucleonics activities of Canadian General Electric's Apparatus Department.

Mr. Bourne joined the Test Department of C.G.E. in 1920 and has had long experience in the field of electrical apparatus. In his present capacity he will maintain liaison with the programmes of research and development in Canada and the United States and, in particular, will study the programme being conducted by the General Electric Company for the U.S. Atomic Energy Commission.

William Barnacal has been appointed assistant works manager of the Canadian General Electric's plant in Montreal. Until his present appointment, Mr. Barnacal was general superintendent of the Company's plant in Peterborough. He has had very broad experience over the last half century in mechanical and production engineering. He served his apprenticeship with an engineering and ship-building firm in Great Britain and graduated from Liverpool University in mechanical engineering. During the war, he was responsible in the Department of Munitions and Supply for much of the building and equipping programme of Sorel Industries Ltd. and other munition plants.

•

J. W. Cote has been appointed general sales manager of the Laurentide Equipment Co. Ltd., Montreal.

•

T. J. Carey has been appointed manager of the plastics and porcelain section in the Chemical Division of Canadian General Electric. In his appointment Mr. Carey will be responsible for the commercial policy and administration of the wide range of industrial molded plastics produced in the Company's new Cobourg Works. His activities will also include electrical porcelain products of the Peterborough works.

•

Alex M. Thomson has been appointed managing director of Dresser Manufacturing Co. Ltd., Toronto. D. B. McWilliams, the former managing director, submitted his resignation to the Company effective January 1, 1949, so that he could devote his entire time to the operation of the McWilliams-Beardmore Mines Ltd. Mr. Thomson has been employed for the past 2½ years as sales engineer for the Dresser Manufacturing Co. He will continue to give his personal attention to all field problems in sales and engineering.

High above the St. Lawrence River, on the slopes of Cape Diamond stands historic old Quebec City—dominated by the Chateau Frontenac.

In this baronial Norman castle, commencing May 11th, engineers from every province, from the United States, Brazil and several countries of Europe will gather for the 63rd Annual Meeting of the Institute and the first Western Hemisphere Regional Conference of the International Committee of Scientific Management. *Canadian Pacific Railway Photo*

The Arvida Bridge

Design of The Aluminum Superstructure

by

C. J. Pimenoff, M.E.I.C.

Structural Designer

Dominion Bridge Company, Limited, Lachine, Que.

Canada is soon to build at Arvida, Quebec, the first all-aluminum highway bridge on the American continent. This paper tells of the preliminary planning, gives a general description of the structure and outlines its design, including specifications, loads, stresses, etc. Problems peculiar to aluminum construction are discussed with indications of methods by which they were overcome. Measures for the protection of aluminum are outlined.

The paper will be presented in summary at the Annual Meeting in Quebec with additional details of fabrication and proposed erection procedures.

THE bridge will be situated in the municipality of Arvida and will span the Saguenay River in the immediate vicinity of Shipshaw Power House No. 2, a 1,000,000 h.p. hydro-electric plant supplying power to the Arvida aluminum works of the Aluminum Company of Canada, Limited. See Fig. 1. The present facilities for crossing the river consist of two bridges, railway and highway, both situated about a mile upstream from the power house. Formerly the existing highway bridge was quite adequate, but with completion of the Shipshaw plant and the extension of the Arvida city limits to include Shipshaw townsite, the need for a second crossing soon became evident.

In 1943, at the request of the City of Arvida, the General Engineering Department of the Aluminum Company of Canada began to make preliminary studies of the proposed bridge.

On account of the natural beauty of the site and the intention to develop the south shore opposite the Power House into a landscaped park area, considerable thought was given to the appearance of the structure. The arch type was chosen as the one most appropriate to the topography of the site, its use being fully justified technically by the excellent rock formations on the shores capable of taking the thrust.

With regard to the general conception of the project, valuable suggestions were received from Messrs. F. G. Todd, landscape architect, and H. L. Fetherstonhaugh, architect, both of whom had been consultants on the Shipshaw townsite work. Much-appreciated advice was also obtained from Mr. Olivier Desjardins, chief engineer, Department of Public Works, Province of Quebec. The late Mr. Paul Cret, consulting architect of Philadelphia, Pa., was consulted on the aesthetics of the bridge. In addition, he made some suggestions with regard to handrailing and the lighting scheme.

The locale being the heart of the aluminum industry in Canada, it was decided to study the feasibility of using structural aluminum instead of steel. An all-aluminum bridge, it was felt, would indeed be a fitting expression of the pioneering spirit and of the great development of that industry in the last decade or two. It was, of course, expected that the first cost of an aluminum bridge would be greater than that of a steel one, but that over the years, it would be more or less offset by lower maintenance charges.

The Aluminum Company of Canada prepared preliminary designs, in aluminum and in steel, and fixed the proposed location of the bridge and its alignment.

In April 1946, the City of Arvida invited the Dominion Bridge Company Limited to study the project further and to submit two alternative designs, based on the general arrangement as developed by the Aluminum Company. After many months of study and design, including frequent consultations with the Aluminum Company of Canada and Aluminium Laboratories Limited regarding the properties of aluminum alloys, Dominion Bridge Company submitted the two designs with approximate estimates of the cost of the metallic superstructure. The estimate for the aluminum alternative was perforce only an indication of the cost,

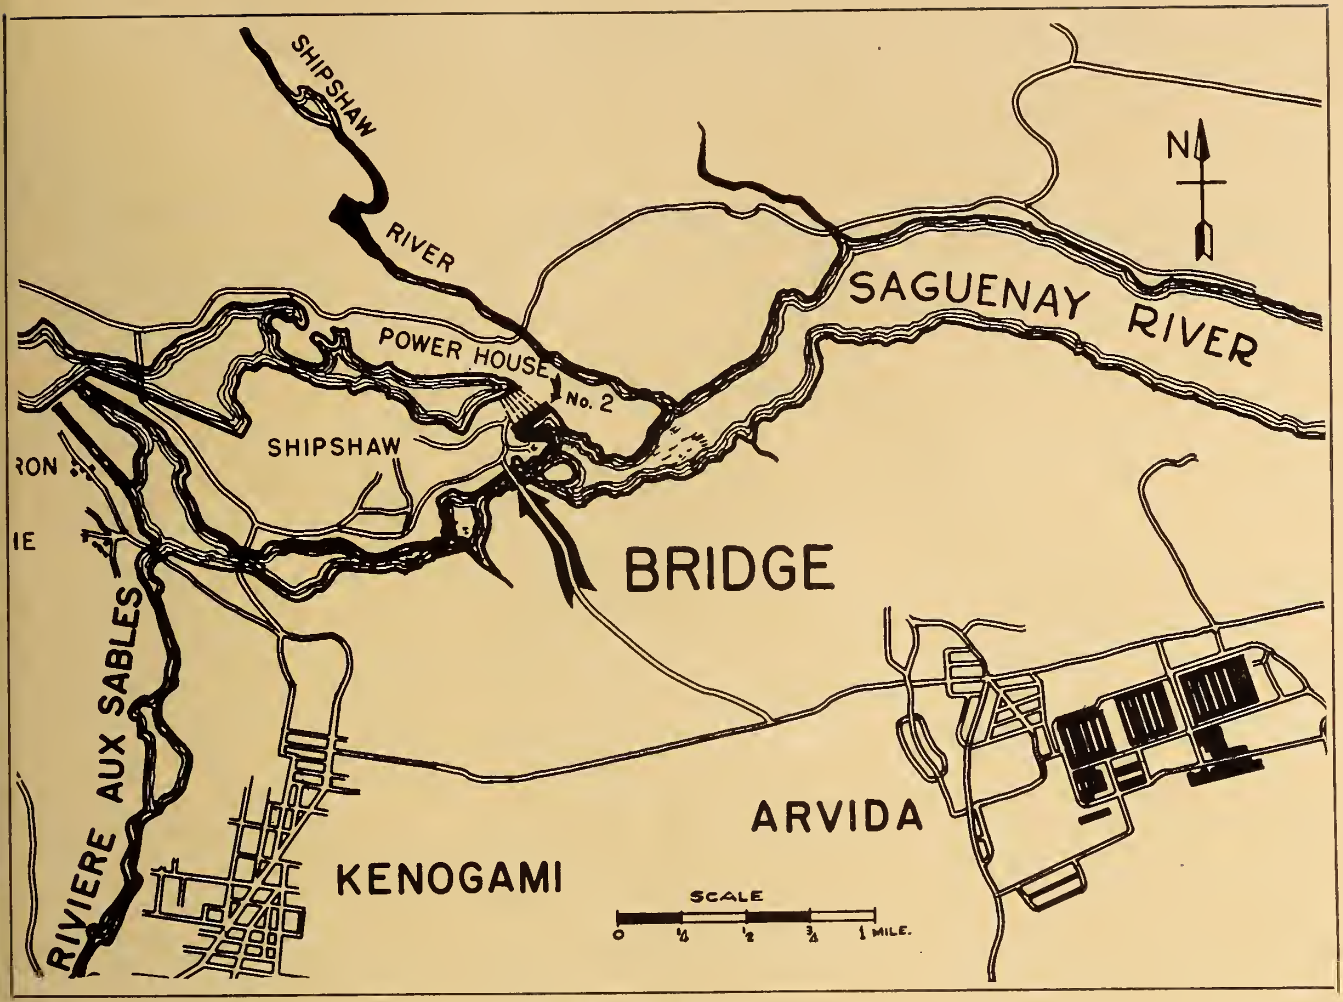

Fig. 1. Location map.

as it involved the fabrication of material with which the Company had had but limited previous experience and no experience at all in its application to bridgework. The City of Arvida adopted the aluminum design and instructed the Dominion Bridge Company to proceed with the job on the basis of cost plus a fixed fee. The firm of Surveyer, Nenniger and Chenevert, consulting engineers, was retained by the City to design and supervise the construction of the concrete deck slab, handrail, lighting arrangements and substructure.

To the best of the writer's knowledge, only two all-aluminum spans have been built to date; an experimental 100 ft. deck girder railway span in an otherwise steel girder crossing, built for the Massena Terminal Railroad, at Massena, N.Y., and a double leaf bascule bridge recently completed in England. Also, a number of existing bridge floors have been rebuilt in aluminum to reduce dead weight, as in the Smithfield Street suspension bridge in Pittsburgh, Pa.

General Description

The bridge consists of the main span which is a fixed arch 290 ft. centre to centre of skewbacks and 47½ ft. rise, and of five 20 ft. continuous girder approach spans at each end. (Figs. 2 and 3.) Total length between back walls of abutments is 504 ft. The box girder arch ribs are 23 ft. centres, and are braced with latticed girders, forming a K-system of bracing. All posts, over the arch as well as in the approaches, are on the same centres as the arch ribs and are spaced 20 ft. longitudinally. Of box construction, they are not braced in either direction, except for the posts at the skewbacks. The latter are braced together with horizontal struts, thus forming rigid frame bents, and are considerably heavier than the typical post, having been designed to take the lateral wind reaction from the deck.

The floor system consists of two lines of longitudinal girders, continuous from end to end and supported by the posts, and of floorbeams of the same depth as the girders and framing into them at panel points and at midspan. The floorbeams are thus spaced 10 ft., and carry a sidewalk bracket at each end. Longitudinal stringers on the centre line of the bridge span between floorbeams. Two lines of sidewalk stringers rest on sidewalk brackets.

The roadway is 24 ft. between curbs and is of 8-in. poured-in-place continuous concrete slab, reinforced in two directions. There is no crown in the roadway and the bituminous wearing surface is 2½ in. thick throughout. There are two 4 ft. sidewalks, of precast concrete construction. The units are 5 ft. long, the slab thickness varying from 6½ in. at the outer edge and 5½ in. near the curb. The curb was made only 6 in. high to allow the opening of car doors, but in the interest of safety, the aluminum handrailing, was designed for greater lateral forces than is usual. It consists of vertical square bars between two longitudinal 4 in.

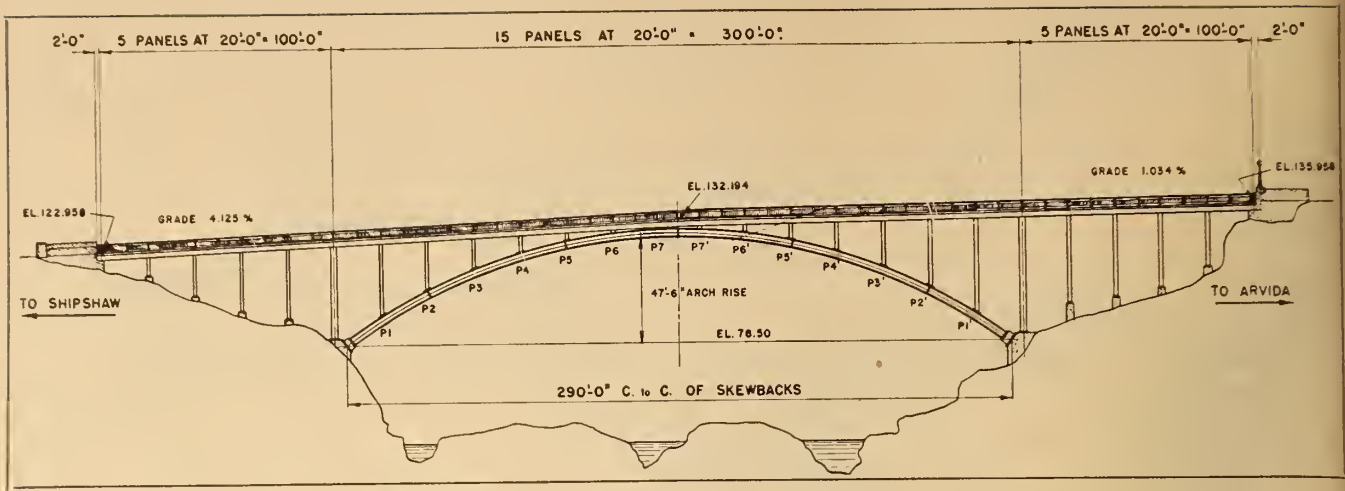

Fig. 2. Elevation of Aluminum Highway Bridge at Arvida.

channels, and of an extruded semi-elliptical section for the top rail, with posts at every floorbeam. A grooved, channel-shaped extruded fascia will conceal the edges of the sidewalks and will add to the clean cut appearance of the structure.

The bridge deck is sloping down from the south end, the grade being 1.034 per cent over the south approach, and 4.125 per cent over the north approach, with a joining vertical curve over the arch span. Finger-plate type expansion joints are provided in the roadway at both ends of the bridge, with drainage troughs underneath. There are no intermediate drainage scuppers. The bridge is lighted with fixtures located under the top handrail in pairs on either side of every fourth handrail post, on both sidewalks. Two ornamental pylons, made of fluted shafts supporting globes of the world in cast aluminum, are provided at the south end of the bridge, thus forming an entrance, as it were, to the bridge and the Power House beyond. Concealed lights in the pedestals of the pylons will illuminate the globes at night.

The sidewalks over the south abutment are widened to 8½ ft. to act as observation platforms.

Design

Specification—A special specification was drawn up, jointly, by the Aluminum Company of Canada, Aluminium Laboratories and Dominion Bridge Company, covering material, loads, unit stresses and allowable increases in them due to combined loads, painting and protection of metal, and other general considerations. In the proportioning of material and in the items not covered by this specification, the designers were guided by L. S. Moisseiff's "Design Specifications for Bridges and Structures of Aluminum Alloy 27 S-T", 1940 Edition.

Material—There is a great variety of aluminum alloys on the market, ranging from low strength commercially pure aluminum to high strength alloys for structural use. They are divided into two main groups, casting alloys and wrought alloys, the latter being subdivided into the "non-heat-treatable" and the "heat-treatable" alloys. The structural alloys used in this bridge are in the heat-treatable group.

The structural shapes are almost always formed by extrusion. In this process the ingot, 99.5 per cent Aluminum, is remelted, the alloying metals added, and the alloy is cast into ingots of suitable size. The ingot is placed in a press and is extruded under great pressure through an orifice having the shape of the desired section. The extruded piece is then subjected to a solution heat treatment, accomplished by heating it to the required temperature (about 500° C), in order to dissolve the soluble alloying constituents. This is followed by a rapid quenching in cold water to retain this state.

The metal being in a comparatively soft state and readily formed, the pieces are at this stage straightened by stretching. The metal begins to harden almost immediately after quenching, and in the naturally ageing alloys the maximum strength is reached in a few days. In other alloys, however, a second heat-treatment or artificial ageing is necessary. This consists of raising the temperature of the metal to about 170° C, holding it there for several hours, and then allowing it to cool at room temperature.

Plate and sheet undergo similar heat-treatment, but are rolled instead of extruded. To provide maximum resistance to corrosion, the alloy plate, prior to rolling, is placed between two sheets of pure aluminum and the three are rolled together, thus producing a plate consisting of an alloy core, coated on both sides with pure aluminum. Such plates are termed "Alclad".

All alloy designations in this paper are those of the Aluminum Company of Canada (Alcan). In collaboration with the metallurgists of the Aluminum Company, the following alloys were chosen for the various elements of the structure: *Alcan 26 S-T* for extruded shapes and Alclad plates, chosen chiefly for its high strength; *Alcan 16 S-T* for rivets, because of its adequate strength and good formability; *Alcan 65 S-T* for handrail, because of its excellent weathering qualities, and *Alcan 2S* for the thin sheets separating concrete deck from structural aluminum, to provide protection for the latter.

The chemical composition and pertinent mechanical properties of the above alloys appear in Appendix I, but the outstanding characteristics common to them all are: low Modulus of Elasticity (10,300,000 p.s.i., viz. about one-third that of steel); high coefficient of thermal expansion, about twice that of steel or average concrete; light weight, about one-third that of steel; susceptibility to galvanic corrosion and to chemical attack by alkaline solutions.

Loads

The bridge was designed for the following loads:

Dead Load—Actual dead load concentrations were calculated for each post, increasing slightly from the crown towards the skewbacks. The average dead loads are 4840 lb. per lin. ft. of bridge over the arch span and 4420 lb. per lin. ft. on the approaches.

Live Load—On Roadway: Two 20-ton trucks abreast or 80 lb. per sq. ft.

On Sidewalk: To stringers and brackets—Rear wheel of a 20-ton truck. To arch ribs—40 lb. per sq. ft.

The structure was also checked for an alternative live load of a 50-ton transformer on a 12-ton float, pulled by an 18-ton tractor. It was assumed that this load would travel on the centre line of the bridge at a slow speed, producing no impact.

Impact

30 per cent on all truck loads.

Wind

A lateral force of 30 lb. per sq. ft. on 1½ times the projected area of structure, plus 200 lb. per lin. ft. of bridge applied seven feet above roadway, or 50 lb. per sq. ft. on 1½ times the projected area of the unloaded structure.

Temperature—The structure was also designed to withstand stresses resulting from a temperature variation of 140° F, from −40° to +100°.

Lateral Loads on Handrailing—
To top rail: 700 lb. per lin. ft.

To complete panel between posts: 1140 lb. per lin. ft.

To posts: 4500 lb. at the top.

Unit Stresses—The normal allowable unit stresses in pounds per sq. inch for the various alloys are tabulated below:

Alcan 26S-T
Axial Tension, Net Section 21,000
Axial Compression, Gross Section
.40 (65,500-642 KL/r) for KL/r $\leqq$ 68
with maximum of 21,000

or $.40\left(\dfrac{102{,}000{,}000}{(KL/r)^2}\right)$ for KL/r > 68

Alcan 65S-T
Axial Tension, Net Section 15,000
Axial Compression, Gross Section
.40 (41,100-319 KL/r) for KL/r $\leqq$ 86
with maximum of 15,000

or $.40\left(\dfrac{102{,}000{,}000}{(KL/r)^2}\right)$ for KL/r > 86

Where K is a factor depending on the end conditions and is .50 for both ends fixed and 1.00 for both ends free. For average conditions K is taken between .75 and 1.00.

In the Compression formulae the expression in brackets is the ultimate compressive unit stress and the coefficient .40 indicates the factor of safety of 2½.

	Alcan 26S-T	Alcan 65S-T
Shear	12,500	10,000
Bearing	30,000	20,000
For Rivet Alloy 16S-T	Basic Shear 10,000	

No "allowable bearing" for rivets was specified, but in the case of their bearing on "thin" plates, the basic shear values were reduced.

Allowable Stresses for Combined Loads—The probability of maximum stresses resulting from live load, wind, and the extremes of temperature, all occurring at the same time, is exceedingly remote. Consequently, it was decided, for the various combinations of loads, to multiply the normal allowable unit stresses by the following factors:

For Arch Ribs:

D.L. & L.L....................	.90
D.L., L.L. & Wind or Temp....	1.15
D.L., L.L., Wind & Temp.......	1.40
D.L. & Alt. L.L.................	.90
D.L., Alt. L.L. & Temp.........	1.40

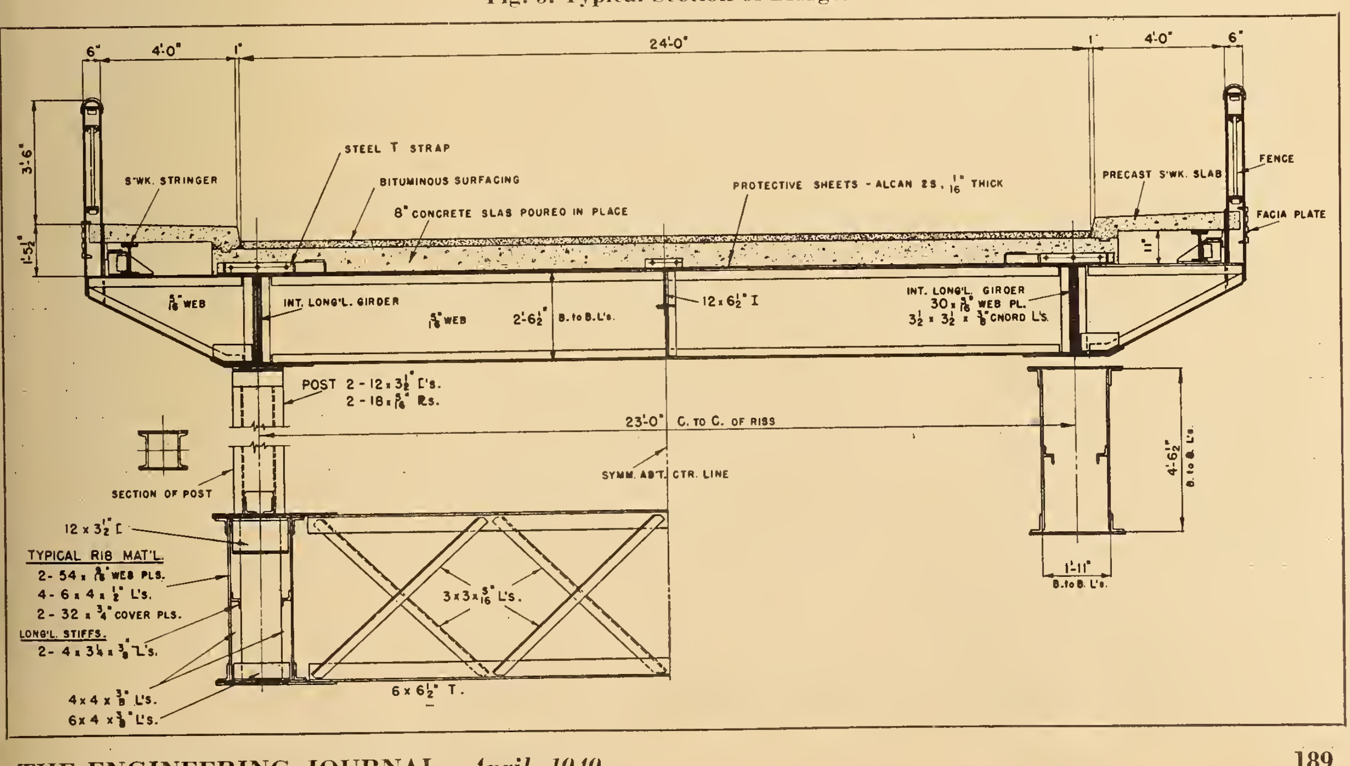
The above factors include an allowance for the "secondary stresses" due to rib deformation. This point is discussed under the part of the paper dealing with the design of the ribs.

For Floor Members and Posts:

D.L. & 1 Truck................	1.00
D.L. & 2 Trucks	1.25
D.L., 2 Trucks & Temp.........	1.50
D.L. & Alt. L.L................	1.25
D.L., Alt. L.L. & Temp.........	1.50

Allowable unit stresses for other elements of the structure were similarly increased.

Fig. 3. Typical Section of Bridge.



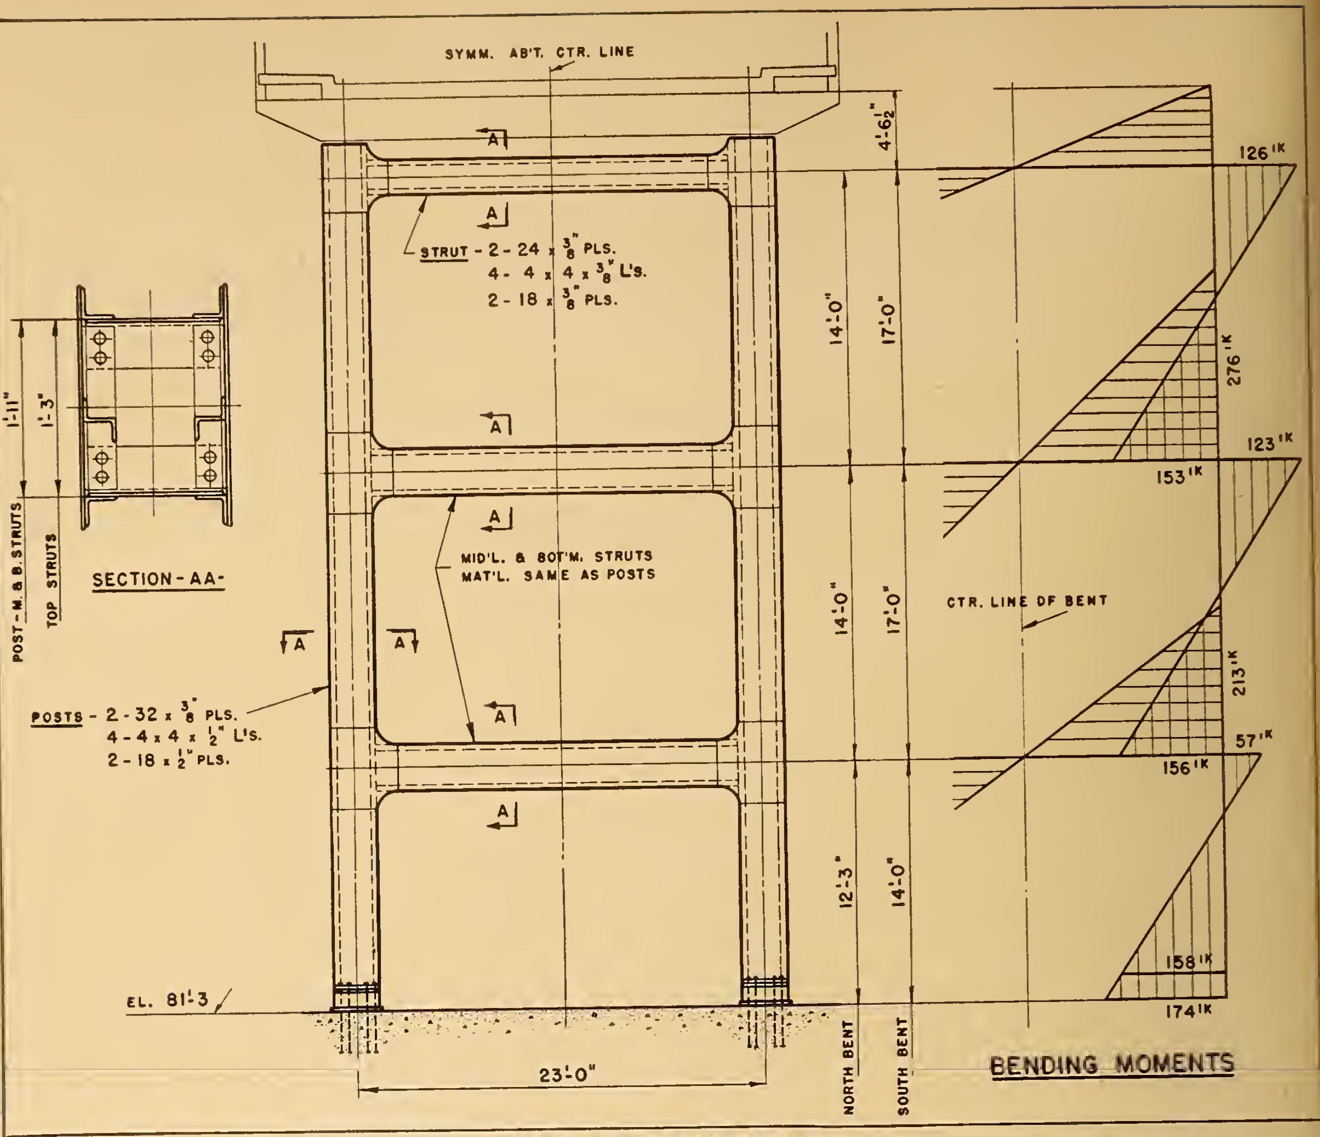


Fig. 4. Bents at Skewbacks.

Floor Slab — To eliminate the possibility of aluminum being brought into contact with wet concrete the design was developed on the basis of precast concrete slabs. Supported on all four sides and measuring 10 ft. x 12¾ ft. x 8 in. thick, the panels were designed with two-way reinforcing. Two schemes of joining the slabs were investigated. One was to leave them in no way connected, merely filling the joints with a mastic compound. The other scheme was to make a continuous deck by welding the projecting ends of reinforcing bars and grouting in the joints. In the former the wind was assumed to be entirely resisted by the aluminum floor members and bracing; while in the latter, the concrete deck was designed to take the whole load, being about ten times as stiff as the aluminum system. The latter scheme was chosen on the merits of its lateral stiffness and because it would add to the general rigidity of the structure.

The slab was designed for the wind on the deck and on the live load totalling 450 lb. per lin. ft., and was analyzed as a four-span continuous girder supported at the abutments, at the main bents and at the crown of the arch. Rigid supports were assumed at first, and as the design developed the lateral deflections of the arch crown and of the tops of main bents were calculated. These deflections being appreciable, the whole system was refigured, on the basis of elastic supports at the crown and at the main bents. The wind reactions at the supports and their lateral deflections were as follows:

	Unyielding Supports Reactions	Elastic Supports Reactions	Elastic Supports Deflections
At Abutments	15^k	49^k	0
At Main Bents	63^k	33^k	1.4 in.
At Crown of Arch	69^k	61^k	2.3 in.

The maximum moment in the deck due to lateral wind is 4200 ft.-kips, causing a maximum compressive stress in the concrete of about 460 lb. per sq. in. and requiring 10 sq. in. of longitudinal reinforcing at the outer edges of the roadway slabs. To protect the aluminum from the effects of grout or of the moisture that might seep through the concrete slab, sheets of commercially pure aluminum 1/16 in. thick, were called for between the slab and the top flanges of all aluminum floor members. These sheets form shallow troughs, ⅜ in. deep, which were to have been filled with bedding mortar just before the placing of slabs.

The coefficient of linear expansion of aluminum being twice that of concrete, the designers were faced with the problem of differential expansion and contraction of the two materials due to temperature changes. The differential contraction in the length of the bridge for a temperature drop of 100°F was computed to be about 3 inches. If the slab were anchored to the floor members at the crown, the relative slip between them at the ends of the bridge would be 1½ inches, which would result in very serious consequences.

It was decided, therefore, to prevent all relative movement between floor and supporting members by anchoring them to each other; if securely held together at the ends, no tendency to relative movement would exist at intermediate points. A substantial anchorage, combined with the expansion joint in the floor, was developed at each end of the two lines of longitudinal girders. For the maximum drop in temperature the resulting longitudinal force was computed to be 112 kips for each line of girders, and was easily taken by the slab in compression. For the maximum rise in temperature the developed force was about 50 kips, and was resisted by a few additional bars placed in the slab directly over the girders. Perpendicular to the axis of the bridge, the slabs were to be held on the centre line of the bridge, but were to be free at the edges; only a small slip would have been required to relieve temperature stresses.

Due to market conditions, mild steel reinforcing bars were not procurable, and therefore high carbon steel bars were ordered. The latter were not considered suitable for field welding, and the precast slab design was changed to poured-in-place slab. Great care, however, will be taken to protect the aluminum from wet concrete. In addition to the protecting sheets of pure aluminum, the top flanges of all floor members will be painted with bituminous paint, and forms will be made watertight. The change did not affect the floor design except that, no slip being possible, the floor slab, besides being anchored to the aluminum longitudinally was also anchored transversely at the ends of each floorbeam. The sidewalk slab remains of precast construction.

Floor System

Owing to high working stresses and low modulus of elasticity of the material the deflections of members were of some consequence. Every effort was made to keep them to a minimum. For the same reason, where no give at the supports could be expected, it was deemed advisable to use seat connections in preference to ordinary connection angles. It was feared that after many repeated loadings, because of comparatively low ductility of the material cracks might develop in the angles. The floor system being completely integrated with the concrete deck, the temperature effects were of vital importance.

Longitudinal Girders—The principal function of the longitudinal girders is the support of the floor slab and of the mid-panel floorbeams. In addition they have to act as chords of a horizontal truss, resisting lateral wind prior to the completion of he slab. Because at the ends of the bridge the longitudinal girders are rigidly anchored to the slab, considerable temperature stresses are induced in them. In view of this, and also to reduce vertical deflections, longitudinal girders were made continuous over the whole length of the bridge. An added advantage was a contribution to the general stiffness of the structure, the girders over the arch spans acting to some extent similarly to the stiffening trusses in suspension bridges. The ribs being twenty-three times as stiff as the girders, however, this effect was neglected in the proportioning of the latter.

The girders are 2 ft. 6½ in. back to back of angles, built up of 30x5/16 in. web plate and 4-3½x3½x⅜ in. flange angles, except in the end panels where the angles are ½ in. thick. The temperature forces were assumed to act at mid-depth of the floor slab, and were developed into the girders with rigid brackets. The girders pass over the posts, the bearing stiffeners also acting as end connection angles for the floorbeam and sidewalk brackets. There are no intermediate stiffeners. The splices are located in the region of minimum moments, 2½ ft. off the supports.

Floorbeams—The floorbeams are of the same depth as the longitudinal girders. The web is also 30x5/16 in. plate, but the flanges are made of 3½x3½x½ in. angles. The sidewalk brackets are cantilevered at both ends of each floorbeam and are of the full floorbeam depth at their inner ends. The top flange straps are made of steel tees and are connected to the aluminum with galvanized steel bolts.

The floorbeams were originally designed in conventional manner, as simply supported at the ends, except for some relieving moment from the sidewalk brackets. It was felt that the shortening of the top flanges due to either flexure, or a drop in a temperature, or both would be permitted by a slight slip between the member and the floor slab. When, however, the precast slab design was changed to poured-in-place, it became evident that no slip would be possible on account of thorough bonding of the embedded steel straps.

The floorbeam was therefore redesigned on the basis of the top flange being held rigidly at its ends. To develop the resulting thrust, the number of bolts connecting the strap to the floorbeam was doubled and some lugs were added to the tee to give sufficient bearing area on concrete. The salutary effects of the change were a 33 per cent reduction in the maximum positive moment in the floorbeam and a 47 per cent reduction in the maximum live load deflection. The floorbeam material had already been ordered and was not changed.

To minimize the deflection of the bridge floor at the expansion joints, the end floorbeams are supported at mid-span as well as at the ends.

Stringers—The roadway stringers, spanning only 10 ft., are standard 12x6½ in. I-beams. At one end each stringer frames into a panel-point floorbeam which is more or less free to turn slightly and thus relieve the strain on the connection angles. At the other end each stringer is supported on a mid-panel floorbeam, held at the middle of the bottom flange by the intersecting lateral braces. This floorbeam is thus rigidly held against rotation, and the seat type of connection was adopted for this end of the stringer. The beam is free to move slightly on the seat, thus preventing the development of temperature stresses. The stringers in the end panels were made of the full floorbeam depth.

The sidewalk stringers support the outer edges of the sidewalk slabs and are standard 10x5 in. I-beams. Resting on the sidewalk brackets, and being free to expand and contract, they were designed as ordinary simple beams.

Handrail Posts—The handrail

was designed for considerable lateral forces, and special care was taken to develop fully the resulting moments at the bottom of the handrail posts, which are 6x6 in. H-beams. The adopted detail is indicated on the Typical Cross-section, Fig. 3. To prevent temperature stresses and possible distortion, the longitudinal members of the handrail and the fascia are connected to the handrail posts by means of bolts in slotted holes.

Floor Bracing — The floor is braced with single angle diagonal bracing in the plane of the bottom flanges of longitudinal girders and floorbeams.

End Bearings—The floor system is carried on three sliding-plate bearings at each abutment: two under the ends of the longitudinal girders and one in the middle of the end floorbeam. The sliding surfaces are rolled bronze on steel, the bronze plate being connected to the aluminum member above with galvanized steel bolts and separated from it with a sheet of insulating material. The wind shear being 16 kips per bearing, the sliding surfaces are tongue-and-grooved, and the steel bed plate is securely anchored to the concrete.

Expansion Joints—Being held at the crown of the arch, the floor is provided with expansion joints at the abutments. The steel of the expansion joint ties slab and girders to each other; otherwise the floor joints are of conventional design.

To prevent water from splashing on the end floorbeam, a gutter is provided directly under each joint.

Posts—The posts are built up of 2—12 x 3½ in. channels, 10 in. back to back with flanges turned out and of 2—18 x 5/16 in. plates, and are placed with channel webs running parallel to the bridge. For inspection, 6 in. diameter holes spaced 3½ ft., are provided in the web of the inside channel. The actual unit stress is only about half the allowable, as the proportioning was governed by stiffness considerations, the slenderness ratio for the longest post being 86, with the maximum allowable of 90. For appearance and repetition of detail, the same material was used for all posts.

Much thought was given to the design of post connections, both top and bottom. Three different schemes were sketched and studied. One scheme was a post, pin-connected at both ends, the pin at the top running perpendicular to the floorbeam, thus minimizing secondary stresses due to its deflection. The pin at the bottom was turned perpendicular to the direction of the ribs, in order to alleviate bending stresses in the post due to the expansion and contraction of the deck and the breathing of the arch ribs. This scheme was not adopted, because of lack of experience with aluminum pins, fear of their wear, and in the interests of general rigidity of the structure.

Another scheme was to connect the posts rigidly to the floorbeams. It was also dismissed, on account of the cumbersome detail required to develop the end moment, particularly in the case of shorter posts.

The arrangement which was finally adopted was a compromise between the first two: The floorbeam was seated on the posts, but the connections were made "semi-rigid" to provide adequate stiffness under ordinary service load on the bridge. The connections at the bottom of the posts resting on the ribs and the posts themselves, were found to be sufficiently flexible not to produce serious temperature stresses. The posts supporting the approaches rest on steel bed plates. Longitudinal movement of the deck will be made possible by the bending of the posts. Only the end posts, on account of their shortness, were provided with rocker bases.

Main Bents

The Main Bents (Fig. 4), two in number, are located at the ends of the arch span, and in addition to supporting the deck vertically, they also support it laterally. The wind shear carried by each bent, taking into account its own elasticity, is 33 kips, giving rise to bending moments, as shown in Fig. 4. The bents, resting as they do on massive skewbacks, were figured fully fixed at the bases. Each bent is a three-tier rigid frame, adopted in preference to a braced bent because of its pleasing appearance. The posts and the struts are of box girder construction, consisting of 2—32 x ⅜ in. web plates, 4—4 x 4 x ½ in. angles and 2—18 x ½ in. flange plates, except the top struts which are made of 2—24 x ⅜ in. plates, 4 — 4 x 4 x ⅜ in. angles and 2—18 x ⅜ in. plates.

The long dimension is in the plane of the bent, to resist bending moments. The 32 in. plates are stiffened in the middle with longitudinal Z-bars; the posts and the ends of the struts are squared up with transverse stiffener frames. 6 in. diameter hand-holes are provided on the inside of the posts and in the top and bottom plates of struts. The rigid connections at the joints are effected by means of 2—½ in. plates with radiused corners. The bases rest on steel bed plates and are anchored with 8—1½ in. galvanized steel bolts. The base detail is concealed by a thin sheet casing, of alloy Alcan 65S-T.

The unit stresses in the bents run fairly low, since the proportioning of the material was largely influenced by the demands of lateral stiffness. Some of the available stress margin is, however, used up by temperature stresses, caused by the longitudinal movement of the bridge deck. For this condition, the bents were figured as cantilevered from the base, the top moving freely with the deck.

Arch Ribs

Material—The main span of the bridge (Fig. 2.) is a parabolic arch of 290 ft. span and 47½ ft. rise. consisting of two fixed ribs of box girder construction. The ribs are spaced 23 ft. centre to centre. and are braced to each other. Except for the end panels, they are of the same material throughout, and are built up of 2—54x9/16 in. web plates 1 ft. 9⅞ in. inside to inside, 4—6x4x½ in. angles 4 ft. 6½ in. back to back, turned out, and 2—32x¾ in. cover plates. Gross area is 127.95 sq. in. and moment of inertia is 63,740 in.⁴ In the end panels the cover plates are 32x1 in.

The web plates are stiffened at mid-height with longitudinal 4x3¼ in. Z-bars running between transverse stiffener frames which are spaced about 5½ ft. apart and consist of 4x4x⅜ in. angles on the web plates and of 6x4x⅜ in. angles on the cover plates, riveted at the corners to form a rigid frame. There are two such frames under each post, one foot apart, and, the posts being located centrally on the rib, the top horizontal stiffeners are replaced with 12 in. channels, which deliver the load to the rib web plates.

The ribs are spliced at each post, except P7, with shop splices at points P1, P3, P4 and P6 and with field splices at P2, P5 and the crown, the ribs being symmetrical about the crown. The rib sections are faced for bearing. The splices were designed for 50 per cent of compression capacity of the rib and checked for maximum possible tension increased by 50 per cent. The bracing between the ribs consists of struts at the panel points and of diagonals, forming a K-system. Both are of almost full rib depth and are of latticed girder construction, the chords of struts being made of T's, cut from 12x6½ in. I-beams, and those of the diagonals of 10 in. channels. The web system consists of double intersection diagonals, without " verticals ", all diagonals being of 1—3x3x5/16 in. angle.

The bracing is connected to the ribs with lateral plates, and bevelled fills are provided to take care of a sudden change of inclination of the plane of bracing, as compared with the smooth curve of the ribs. To make the interior of the ribs accessible to inspection, manholes with removable covers are provided in the top cover plate of the ribs, near the points P1 and P5.

The bases of the ribs rest on a steel bed plate, 6 ft. 8 in. x 4 ft., and are anchored for maximum moment with 22—2 in. dia. steel bolts, 7 bolts off each flange and 4 off each webb. The bolts at their lower ends are welded to a steel frame, to insure their accurate spacing and setting prior to pouring of concrete. The base detail is concealed with an alloy sheet casing. The abutments deliver the arch thrust to solid rock and are sufficiently massive to resist the skewback moments.

Hinged vs. Fixed Arch—Considerable thought was given to the choice of arch type. Preliminary design called for a two-hinged arch, but after the rib had been proportioned and its deflections evaluated, it was feared it might prove too flexible for satisfactory performance. For comparison, a fixed rib was designed and its deflections calculated. The deflections of both ribs caused by a 20-ton load were as follows:

	At Quarter-Point	*At Crown*
Two-hinged rib .	3.50 in.	1.20 in.
Fixed rib .	1.64 in.	.78 in.

Because of its considerable greater rigidity, the fixed type of rib was chosen. It was estimated that there would be no appreciable difference in cost between the two types, since the small economy in the fixed ribs themselves would be largely offset by their costlier bases.

Geometry of Rib—In determining the geometry of an arch ring it is usually endeavoured to make its centre line follow the dead load funicular as closely as possible. In the case of a continuously loaded arch this can be realized with accuracy, but in the case of a curved arch loaded only at certain points, the best that can be done is to make the arch curve a mean of the circumscribed and the inscribed curves of the dead load funicular polygon, thus approximately equalizing the positive and negative moments and minimizing them both.

In the case of the Arvida arch, the variation in the dead load concentrations at the posts was small, and it was found that a truly parabolic curve passing through the skewbacks and the crown produced dead load moments that were low compared to other moments. The parabolic curve was therefore adopted.

Analysis—The arch ring was analyzed by the well-known method of cutting it at the crown and replacing the internal stresses at that point with a horizontal thrust, a vertical shear and a moment. By equating the horizontal and vertical movements and rotations of the end of one half of the arch to those of the other, and solving the resulting simultaneous equations, the expressions for the unknown thrust, shear and moment were obtained. These expressions contained summations of terms for the segments of the arch ring, the summations involving the coordinates of the segment centres, segment lengths, moments of inertia and the free moments in the residual cantilever arms due to applied loads.

The rib between the skewbacks and the crown was divided into fifteen segments, and was first analyzed on the basis of constant moment of inertia. The final design was based on the actual moment of inertia.

Dead and Live Loads—Dead and live load stresses were determined by means of influence lines. There were only seven cases of loading, as the unit load was in turn applied at the seven panel points. The resulting horizontal thrusts and moments at all panel points and mid-panel points were tabulated. Maximum positive and negative moments with corresponding thrusts were obtained for all the above points in the rib, both for uniform live load and truck concentrations. In general, the governing moments at the panel points were positive and caused by trucks, whereas at mid-panel points they were negative and caused by uniform live load.

Wind—It was deemed safe enough to assume the lateral wind load as acting on the whole span, thus substantially simplifying calculations. The ribs and their bracing were designed for the wind on themselves plus the lateral shear at the crown from the wind on the deck. This shear was computed taking into account the relative elasticities of the deck and of its lateral supports. The thrusts and moments were arrived at in the conventional manner: the stresses in the bracing diagonals were first obtained from wind shears, and then the vertical and horizontal components of the above stresses were applied to the rib.

Temperature—The arch was designed for a temperature range of 140°F (−40° to +100°). With the average fabricating temperature of +60°F, the usual practice would have been to design the ribs for a drop of 100° or a rise of 40°. In order, however, to minimize the effects of temperature, the " mean " was assumed to be +30°F, thus giving the maximum variation from the mean, either way, of only 70°. This reduced the temperature effects by 30 per cent. As it is, of course, impossible to fabricate the material at +30°F, the fabricating temperature was still assumed to be +60°, but the ribs will be cambered for the difference. The resulting increase in size was calculated, and the ribs will be fabricated that much " large ". After the bridge is completed, however, the ribs will be free from temperature stresses, at 30°F, since at that temperature they will assume their normal geometry.

Summary of Stresses

A table of thrusts and moments was compiled for all panel points, mid-panel points, the springing and the crown. Unit stresses in the rib were calculated for three combinations of loads: D.L. and L.L.; D.L., L.L. and temperature; and D.L., L.L., temperature and wind. An extract of the table covering the calculations for the springing, the crown and Point P4, appears in Table 1.

Table I. Arch Rib Stresses.

THRUST & MOMENT COMBINATIONS WHICH GOVERN ARE UNDERLINED
ALL UNIT STRESSES IN LBS. PER SQ. INCH.

The resulting unit stresses were alculated at two points in the rib ross-section: at the extreme fibre, vhere the allowable stress is govrned by the width-thickness ratio f the cover plate, and in the web late, some distance off the toe of he flange angle, where the allowble stress is governed by the simlar ratio of the web plate. The hears were found to be of no conequence.

Stresses, due to rib shortening re also not listed. Such stresses ue to dead load thrust will be ullified by cambering the ribs. In ddition to the already discussed emperature camber, the ribs will e fabricated "long" by an mount necessary to counteract heir eventual shortening due to ull dead load. The live load thrust lue to partial loading of the span or maximum live load moments, is elatively small, and the stresses rising from the rib shortening due o it are of no importance.

Deformation Stresses—In the nethod of arch analysis referred o previously, the deflections of the rch rib are neglected. Actually he rib does deflect, thus changing lightly its own geometry and causng a change in internal moments. n arches of average span this ffect is small and can be safely eglected. In the case of the Arvida rch, however, despite the fact that he span is comparatively short he effect of rib deflections was inestigated because of the low Modulus of Elasticity of the materal. The process (by the method of uccessive approximations) being uite laborious, the calculations vere made for only two points, the rown and panel point P4.

The bending moments in the rib lue to any one loading were first obtained by means of influence lines, and from these moments the leflection curve for the rib was plotted. The effect of these deflections on the rib was obtained by multiplying the thrust at any point by the radial component of deflection at that point, and then applying these moments to the rib as external forces. The induced "secondary" moments in the rib and the resulting "secondary" deflections were then computed. The latter were so small that the process was not carried any further, but the figures indicated that in the worst case the total "secondary" moment would not exceed 14 per cent of the original moment.

It was deemed reasonable to make an overall allowance for the effect of rib deflection by means of a 10 per cent reduction in the permissible unit stresses in the rib figured in the usual manner. The advantage of the fixed arch over the hinged one became even more apparent at this stage, when it was estimated that these "secondary" stresses in the latter might run as high as 30 per cent of the figured stresses.

Riveting—The structure will be riveted with cold-driven rivets, 51/64 in. dia., of Alcan Alloy 16 S-T. Shop rivets where possible will be pressure driven, while all field rivets, as well as the shop rivets, inaccessible to the riveting machine will be driven with a heavy pneumatic riveting gun. Originally the field connections were to have been field bolted, as it was considered impractical to drive cold aluminum rivets of this size with a gun. A programme of rivet testing was, however, carried out, jointly by the Aluminium Laboratories Limited and the Dominion Bridge Company, the result of which was the development of a satisfactory technique of driving cold rivets with a gun. A new type of driven rivet head was also developed and was named "annular". The manufactured head is a modification of the usual button type.

Protection of Aluminum — Although aluminum alloys have excellent weather resisting qualities, where surfaces are in contact with other metals, or even with each other, in presence of moisture, there is some danger of galvanic corrosion, unless proper precautions are taken. Even a thin layer of some neutral material such as bituminous paint, is considered adequate to prevent it. Consequently all aluminum surfaces in contact will be covered with a coat of Alumilastic of brushing consistency, containing 5 per cent of zinc chromate. In the case of the connection to the bronze sliding plates at the ends of the bridge, this precaution was thought insufficient owing to possible accumulation of dirt, and a sheet of fibrous insulating material ⅛ in. thick was called for between the aluminum and the bronze.

When completed, the bridge will be thoroughly cleaned but will not be painted. Nevertheless, accessibility has been provided to all parts of the structure, so that if desired it could be painted at some future date.

Acknowledgments

The author made the design computations and developed the principal details of the structure, with suggestions and advice from other engineers in his company. He also received valuable advice from other sources and would like to express his appreciation to Mr. W. L. Pugh, chief engineer, Aluminum Company of Canada, and his staff; The Aluminium Laboratories, Limited; Mr. R. A. Lemieux, city manager of Arvida, and to Mr. E. Nenninger, consulting engineer, of the firm Surveyer, Nenninger and Chenevert.

Appendix I

The following data was taken from the "Handbook of Aluminum Alloys" published by the Aluminum Co. of Canada, Ltd.

Physical properties common to all structural aluminum alloys

Specific Gravity	2.70
Coefficient of Linear Expansion	.000012 to .000013 per 1°F.
Modulus of Elasticity	10,300,000 lbs./sq. in.
Modulus of Rigidity	3,800,000 lbs./sq. in.

Chemical Composition, showing the percentage of principal alloying constituents

	Alcan 26 S	*Alcan 65 S*	*Alcan 16 S*
Cu	3.9 — 5.0	0.15 — 0.4	2.0 — 3.0
Fe	1.0	0.7	0.7
Mg	0.2 — 0.8	0.8 — 1.2	0.2 — 0.5
Mn	0.4 — 1.2	0.15	0.20
Si	1.2	0.4 — 0.8	0.70

Mechanical Properties (Minimum) in lbs./sq. in.

A paper prepared
for publication in
The Engineering Journal

The runway project now under construction at Rivers, Manitoba, is believed to have the strongest pavement built to date in Canada. It is also the first to be designed and constructed by the R.C.A.F. This paper describes the method used by R.C.A.F. engineers to make high quality concrete aggregates from low quality local gravels obtainable near the airport.

Postwar defence planning included the siting of an air school for joint training at Rivers, Manitoba. The requirements stipulated surfaces capable of supporting 180,000 lb. aircraft, 6,000 ft. long and capable of extension to 10,000 feet; width to be 200 feet, with 50 ft. shoulders to support 40,000 lb. aircraft. The site had been a navigation school during the war, and had three asphalt runways of low bearing value, taxi strips and aprons. These existing pavements were to be removed if necessary, or retained for continued use by light aircraft.

The plan of the new runways is shown in Fig. I. Specifications were prepared and tenders requested for the construction of only one runway, the Northwest. This contract was later extended at re-negotiated prices to cover the whole of the programme.

Alternative Sources For Aggregates

The concrete runway system, now partly completed, requires a total of 120,000 cubic yards of concrete. The closest commercial source of suitable natural aggregate was Birds Hill near Winnipeg, a rail distance of 165 miles. The present freight rate on gravel is $2.51 per yard, with prospect of a further increase. Transportation has therefore been, a major item in the cost estimates. To keep costs down, engineering curiosity was directed to the treatment of local gravels with the hope that a method could be devised to make this material suitable for concrete.

In general, the agricultural part of Manitoba west of Winnipeg, and extending into Saskatchewan, has scattered sand areas containing small and medium deposits of gravel. These are not water sorted gravels and the deposits contain a variable amount of harmful shale. Deposits in the vicinity of Rivers contain approximately 2 per cent of shale in the plus 1 inch range, 5 per cent in the 1 inch to 10 mesh range and 20 per cent in minus 10 mesh. These deposits also contain a small amount of rotten granite and a minor amount of drip coating in the upper portions.

In many parts of Canada, construction engineers are frequently faced with unsatisfactory sources of aggregate supply. This paper describes an entirely new approach to the problem of assuring excellent concrete, by providing suitable aggregates through separation by the flotation method, as used in the mining industry for cleaning coal and treating coarse ores. To R.C.A.F. engineers goes the credit for first adapting this process to material of low initial value such as gravel.

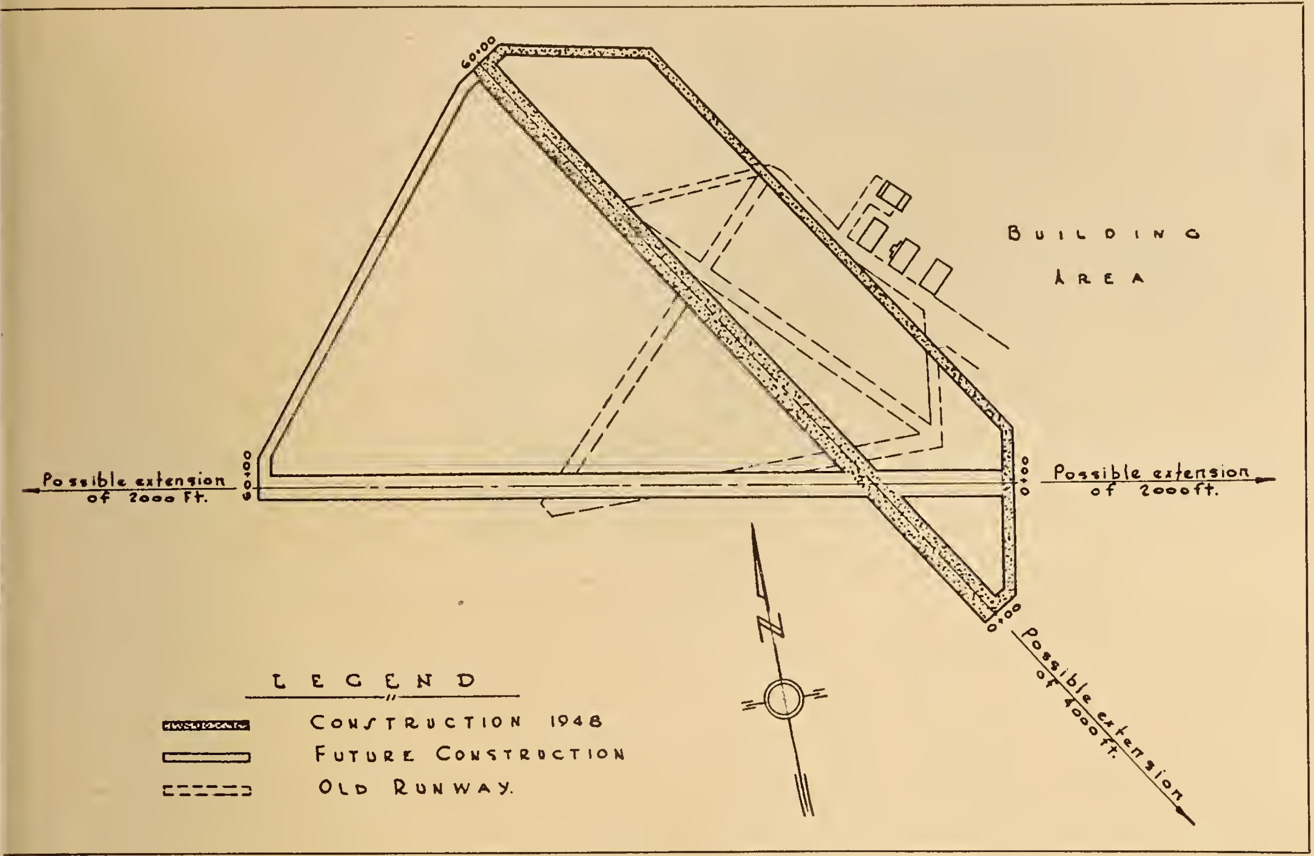

Fig. 1. Plan for improved runways at Rivers, Manitoba.

caused by evaporation from the underside of the pebbles. The remaining constituents are hard granite, quartz and silicified limestone.

Preliminary testing indicated that the crushing and screening operation necessary with any process of separation would reduce the rotten granite to competent sand particles, because the weakness was on the grain boundaries. At least it would reduce it to a fine sand fraction that could be wasted if necessary. It also appeared probable that the weaker coatings would be removed in this manner, and that the stronger coatings would have no ill effect. The main problem was therefore the removal of the shale.

The Birds Hill aggregate is principally a medium limestone. Preliminary tests indicated that 4500 lb. concrete could be made from this material, and it was used for most of the 1948 season. However, the flexural strength on test did not maintain the normal ratio to the high compressive strength, reaching only 630 lb. per sq. inch at 28 days. It was noted that the normal break was across the coarse aggregate, indicating that the low flexural strength reflected weakness in the aggregate. Birds Hill could supply only 1½ inch maximum size, whereas the size required is 2¼ inch.

The search for a method of eliminating shale was therefore encouraged by the probability that the harder constituents of the local gravel would make a stronger concrete, and by the evidence that 2¼ inch maximum aggregate could be obtained.

Flotation Method Chosen

The obvious basis for elimination of shale was specific gravity. The shale has a specific gravity of 2.0, while the usable minerals have a specific gravity greater than 2.6. Attention was directed, therefore, to a separation based on this characteristic, specifically to the sink float or heavy media type of separation.

The process of separating coarse minerals by difference in specific gravities, using a finely ground heavy mineral suspension in water, to simulate a heavy liquid in which one mineral will float while another sinks, has become fairly well known to the mining industry during the last fifteen years. It is still, however, a new process, perfected during the last few years, and now being adopted on a large scale for cleaning coal and raising the grade of iron ores. Lately, it has proved its value to small mining enterprises treating coarse ores. This project is the second to use the process in Canada; it is the first anywhere to use the process on material of such low initial value as gravel. It was estimated that gravel would have two advantages over coarse ores in the process, in that the rounded shapes would allow easier flow and that there could be no accumulation of midlings in the cone.

The heavy liquid processes use either magnetite and ferrosilicon, or galena, as heavy mineral, since these are easily recovered by magnetic separation or by flotation. It was decided to use the magnetite process because of the present high cost of galena, the relative indestructibility of magnetite, and because of the possibility that even tiny amounts of lead sulphide may have an ill effect in concrete.

A deposit of suitable gravel was

Fig. 2. The Mobil Mill in operation.

discovered in the fall of 1947 about 4 miles from the airport. After completion of exploration and preliminary tests, Maintenance Command, which controls construction for the R.C.A.F. authorized the forwarding of a 1,000 lb. average sample to the laboratory of the American Cyanamid Company at Stamford, Conn. The result of tests was received in April of 1948. For these tests, the minus 10 mesh fraction, which cannot be treated by the standard heavy media process, was eliminated. An evidently complete elimination of shale was easily obtained in the plus 10 mesh portion, using only magnetite and a specific gravity of 2.43. The screening operation to eliminate the minus 10 mesh also effectually disposed of the rotten granite and weak coatings. Approximately 80 per cent of concrete aggregate is plus 10 mesh. The major part of the problem was consequently believed to be solved.

The processed gravel returned from the laboratory was forwarded to Milton Hersey Co. Ltd. at Montreal for a concrete test. As it was considered probable that minus 10 mesh sand could be obtained only from the Birds Hill deposits, sand of this type was used with the process gravel to make concrete test batches. The results showed a density of 156 lb. per cubic foot, using a cement content of 6.7 bags per yard and a water cement ratio of 0.47. Compressive strength was 4170 to 4300 lb. at 7 days, and 5600 to 6300 lb. at 28 days. Flexural strength was 585 to 660 lb. at 7 days, and 780 to 855 lb. at 28 days. An abrasion test on the gravel showed about the same as for the Birds Hill material, but the soundness test was considerably better, the weighted average loss after 10 cycles of soundness test being approximately 3.0 per cent.

Equipment and Plant Needed

On the basis of the above results and the obvious large saving in expense evident from estimates, a recommendation was made to Maintenance Command that the necessary equipment be acquired immediately. It was obvious that construction could not be delayed until the equipment was assembled and in smooth operation, but it was considered that this process could supply a part of the aggregate for 1948 and all of the plus 10 mesh portion for 1949. With this plan in mind, Maintenance Command arranged promptly with A.F.H.Q. and National Defence for the immediate expenditure of $50,000 in U.S. funds.

The equipment ordered was an HMS (heavy media separation) Mobil Mill size 2M manufactured by the Western Knapp Engineering Company of San Francisco. (Fig. II and III) It consists of a structural steel framework with the necessary equipment mounted, the whole being semi - portable. About six days are required to complete the bolted assembly, with a crew of six men. In this case, assembly was delayed because of the slowness in delivery of magnetite, which had to be ground to a close specification, and was obtainable only in the United States with some difficulty. Assembly was completed and test runs were started on August 27th, under the supervision of Mr. Graham Eby, engineer for the North American Cyanamid Company of Toronto.

The plant is erected at the gravel pit. The gravel is mined by shovel or carryall and dumped in a shallow hopper, whence it is delivered by a feeder mechanism onto an elevating belt discharging on a Cedar Rapids vibrating screen in combination with a 36 inch jaw crusher. This is all standard contractor's equipment. The oversize is reduced to 2 inches and the undersize, below 10 mesh, is eliminated by wet screening. The prepared feed from this preliminary plant is delivered by belt to a 7 ft. inverted cone at the Mobil Mill, where it is immersed by height of fall in a medium consisting of ground magnetite, kept in partial suspension in water by slowly revolving arms. The shale portion floats on the medium and is moved by slow centrifugal force to a tangential overflow launder, which conveys it to a 36 inch Allis Chalmers vibrating screen. The heavy portion of the feed sinks through and with the medium to the inverted apex, thence down a 5 inch square pipe to an air lift, which elevates it to the Allis Chalmers screen. It requires about five seconds for material to pass through the cone to the screen. Both sink and float products are fed to either side of a longitudinal divider on the same screen. Ten mesh ton cap screen is used.

The plant was erected 7 weeks before the end of the season. Of this time, only 4 weeks was available because the crushing and screening plant was otherwise in use. Operation on a 3 shift basis was confined to the last ten days of the season. A total of 5500 cu. yards of aggregates was produced.

Plant Operation

The bulk of the medium is drained from the products at the top end of the screen, and returned to the cone through a circulating pump. The remaining magnetite is drained and washed from the products by water sprays and passed to a magnetic separator, which eliminates sand and clay that have entered the circuit. The cleaned magnetite is then pumped ɔ a densifier, which is a screw-ype classifier in which the helix an be raised or lowered as desired. ʾhis item of equipment serves to ĺewater the magnetite and to store t or feed it back to the circuit as ĺesired. In passing back to the one, the magnetite falls through , demagnetizing coil, consequently he particles of magnetite do not locculate in the cone. A small notor generator for the coil, and compressor for the air lift, are he remaining items of equipment. \ flow-sheet is shown in Fig. III.

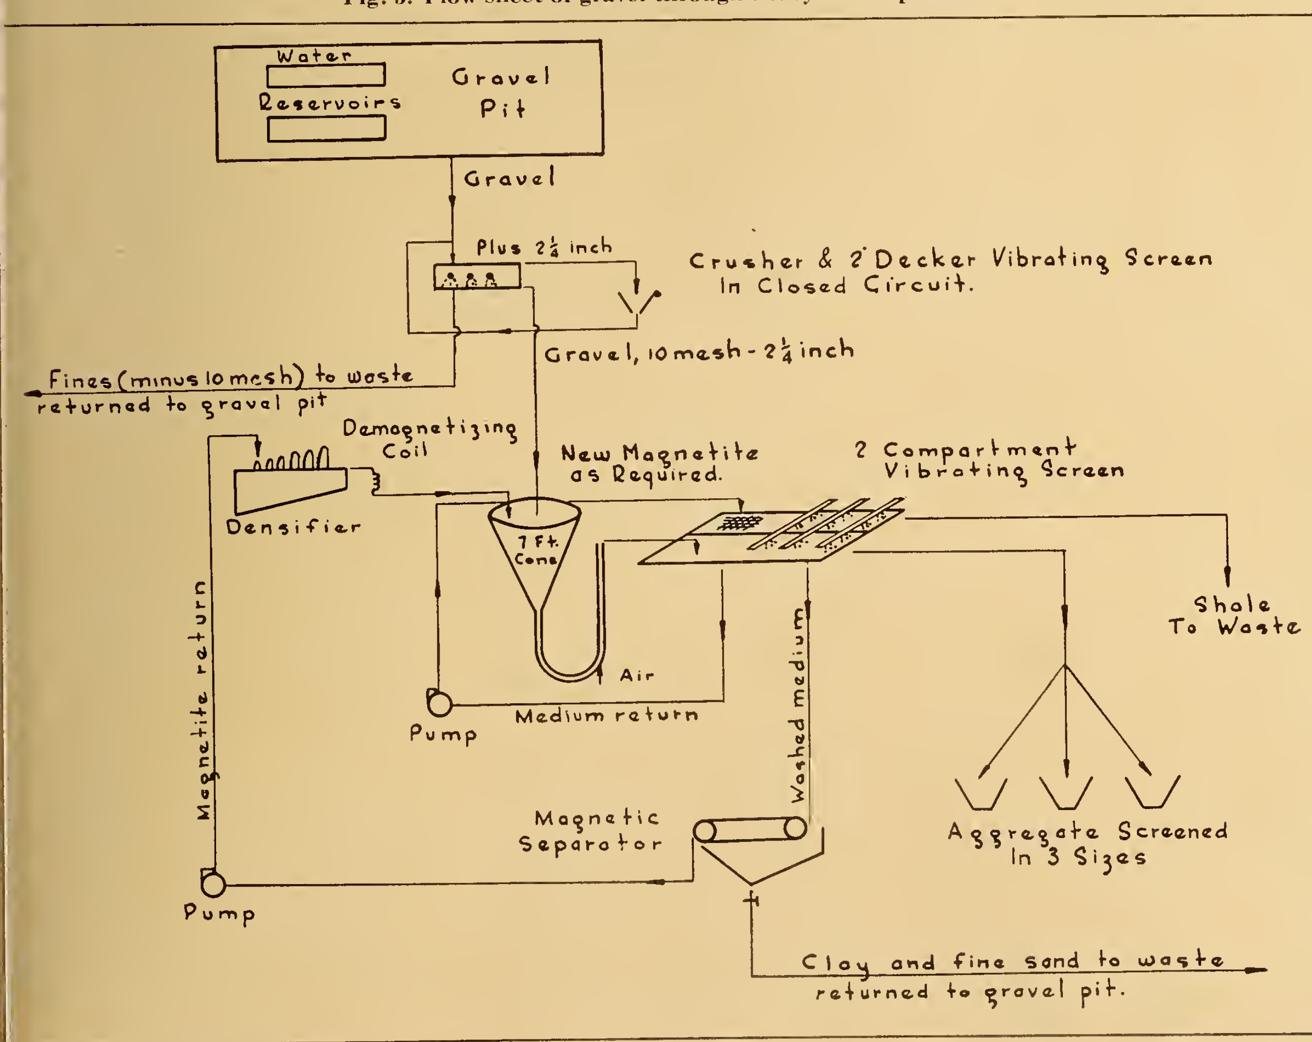
The aggregate side of the screen ıas been double decked, and an ıpron screen added, so that the ɪroduct is divided into 3 sizes as equired for proper proportioning ıt the concrete mixer. The shale ɪroduct is wasted, but may be of ıse as a binder in gravel surfaces. ʀotten granite and weak coatings ıre eliminated by the crushing and ;creening process. Water and power are required to operate the equipment. Electric power was obtained from the Manitoba Power Commission at a distance of one half mile. The Mobil Mill requires 65 hp.

The gravel deposit rests on clay at a depth of 13 feet. As the pit enlarged, reservoirs were excavated in the clay and the seepage, which is small in this semi-arid climate, is yet enough over the large area of the excavations to make up all lost water. All wasted water with its sand and clay content is returned to the pit and loses most of its burden before entering the pools. The water supply pump is placed at the clear end of the reservoirs. The Mobil Mill can operate satisfactorily at less than 200 gal. per yard of product, but approximately four times this amount is required in wet screening to eliminate the minus 10 mesh and launder it back to the pit. The actual loss of water is simply the difference in the water content of the products as mined and as delivered to the bins. An arrangement had been made with the C.N.R. to supply the project with water if necessary from their system, at the town of Rivers a mile distant.

Experimenting Brought Improvements

Initial operation of the plant was not smooth. In addition to shortage of water, due to underestimating the pump capacity required for elimination of the minus 10 mesh, and due to the small size of excavation when the pit was started, there was serious delay in delivery of the fine screens. There was also a difficulty in finding suitable minus 10 mesh sand at Birds Hill. For these reasons, it was decided to eliminate minus ⅜ material until these difficulties were

Fig. 3. Flow sheet of gravel through heavy media plant.



overcome. This required only dry screening and the screens were available. The plant operated successfully on this basis for three weeks. During the last week of the season in October a source of minus 10 mesh sand was found and water, pump and screens were available. The plant was therefore changed to treat plus 10 mesh again and operated with complete success.

The plus 3/8 inch aggregate was used in concrete with sand from Birds Hill for two weeks at the end of the season. It was noted that the concrete finished much better than formerly, though the maximum size was now 2½ inches instead of 1½. There was a small increase in compressive strength, the average of 12 cylinders of the mixed aggregate being 4813 lbs. per sq. inch at 28 days, as compared to 4623 for the same number of cylinders of Birds Hill aggregate under nearly identical conditions.

Operation of the Mobil Mill showed that it does not require an even rate of feed. Sudden changes from no load to full load did not affect the clean separation of the shale. For prolonged shutdown, the magnetite is stored partly in the densifier and partly in the hopper beneath the screen. For a shutdown of several hours, it is most convenient to leave the cone circuit in operation at a slow rate. In case of power failure, perhaps 20 minutes may be required to get the magnetite into suspension again. Plugging of the cone or airlift from any cause is relieved by opening the gate at the airlift and dumping, or partly dumping, the contents of the cone into a sump. The process is essentially simple and nearly foolproof, so trouble is rare.

Subsequent to the initial tests at the Stamford Laboratory, a test was made on the discarded minus 10 mesh sand, to see if the shale portion could be eliminated. The "Dutch State Mines Cyclone" was used for this purpose. For the test, the sand was mixed into the same magnetite medium as used in the heavy media test. It was then pumped under pressure, entering tangentially into a small inverted covered cone. There is no mechanism in this cone, the separation being based on centrifugal force and specific gravity. The heavy sand is drawn off continuously from the bottom apex and the shale is forced out at the top through a pipe at the center.

A good separation was obtained without difficulty and the cleaned sand was tested for concrete by Milton Hersey Co. Ltd. They reported it as very satisfactory. However, considerable capacity in magnetic separators is required, in order to recover the magnetite from the sand products and these separators were not available. Fortunately, in September, a deposit of water sorted sand nearly free of shale and of the right grading was found on a small hill in the middle of the Assiniboine valley 12 miles from the Airport. At the end of the season, 17,000 yards of this sand was mined, transported and stockpiled at the airport for 1949 operations. This sand will be 20 per cent of total aggregates and has averaged in tests 0.15 per cent of shale and 4 per cent silt and clay. Because the coarser aggregates are washed in processing the average of the whole aggregate will be 0.03 per cent shale and 0.4 per cent silt and clay.

The Mobil Mill occupies a space of 28 feet long, 16 feet in height and 14 feet wide. This comparatively small plant produced without difficulty in normal operation 30 yards per hour of aggregate. Capacity of the cone and screen was not reached at any time. At one time the capacity of the magnetic separator to remove slimes and fine sand from the circuit was reached, but examination of the pit at this time showed that the clay over-burden was not properly stripped.

Cheaper Than Nearest Commercial Supply

The normal operating costs of the Mobil Mill are easily estimated. Only one operator is required and a week of training is sufficient. The only tests required are for the specific gravity of the medium at the top and bottom of the cone. With such a considerable difference in specific gravity between the shale and aggregate, supervision is easy. The plant requires 65 hp. in electric motors. The magnetite loss is less than ½ lb. per cu. yard of aggregate produced. Disregarding lost time, these costs total about 7 cents per cu. yard on this project. It is estimated that screen life will range from 5,000 to 10,000 cu. yards. Pump liners will probably be required every 20,000 cu. yards.

It is expected that total operating cost during the coming season will average close to 10 cents per cu. yard. Write off of the plant cost is estimated at 5 cents per cu. yard. Patent costs are in the form of a royalty on production payable to the American Cyanamid Company, which acts as agent for the patentees. The major costs in the project are mining of the gravel, the initial crushing and screening operation and the trucking cost to the airport. The proportion of lost time caused by the Mobil Mill has been negligible to date. Pending detailed costs from a full season of operation, it is estimated that the mining and crushing-screening operations will cost 65 cents per cu. yard for each and 10 cents per mile for trucking, a distance of 4 miles, making a total of $1.70 per yard. These estimates are believed to be ample.

The cost of aggregates loaded into the cars at Birds Hill was 80 cents for sand and $1.40 for coarse aggregate. It is expected that these prices may be increased as much as 20 per cent for 1949. With a present freight rate of $2.51 per yard, the delivered cost for the 1949 season will total $3.90 per yard; in addition there is the cost of unloading the cars at 40 cents per yard, unless they can be unloaded direct to the batcher.

Before removing the plant, a stockpile will be processed for future construction. An investigation will be made to ascertain whether it is worth while to process aggregates for concrete block construction so that materials will be cheaply available for a future building programme.

The heavy media process can be used to great advantage for the beneficiation of poor gravels, if the harmful material can be removed by specific gravity methods. It may be especially valuable in this age of high freight rates. The cost of the process, including royalty, is about equivalent in Manitoba to a truck haul of two miles.

Where Process Is Suitable

In order to decide whether the process can be used successfully on any project, the following should serve as a guide: The deleterious material must be lighter or heavier than the desired constituents of the gravel, but a large difference is not essential. A higher specific gravity of medium can be obtained by substituting ferro-

UTILIZATION OF WOOD IN THE GATINEAU INDUSTRIES

by

G. D. Davidson, M.E.I.C.
Plant Engineer,
Canadian International Paper Company,
Gatineau, Quebec.

A paper presented before the Montreal Branch of The Engineering Institute of Canada in November, 1947.

This is a portion only of the original paper presented by the author. The parts here omitted in the interest of conserving space covered woods operations and newsprint production.

Opening with a general description of Canadian International Paper Company's huge mill at Gatineau Point, where some 2,000 persons are employed, the author describes in detail the processes used in the manufacture of fibreboard, masonite, hardboard, and plywood.

The Town of Gatineau is located on the north bank of the Ottawa River, just below the mouth of the Gatineau and about six miles from Ottawa. The first of the industries to be established here by Canadian International Paper Company was their newsprint mill, which was completed late in 1927. Originally designed for a total capacity of six hundred tons of newsprint per day, it is expected that the production rate will soon reach eight hundred tons per day.

The second plant to be built at Gatineau went into operation in June of 1928. This is the mill of International Fibre Board Limited. Its production has also been increased over the period in question, until it now produces about one hundred million square feet of insulating board per year.

In 1940 the plant of the Masonite Company of Canada Limited became the third of the Gatineau group of industries. It has a daily capacity of one hundred thirty-five thousand square feet of hard-board ⅛-in. thickness basis, or enough board to cover an area of over three acres per day. This plant is also being expanded, and its production is expected to be about doubled.

The fourth plant came into production in April, 1946. It produces one hundred and sixty tons per day of bleached sulphite dissolving wood cellulose. As an alternative product it makes one hundred and eighty tons per day of bleached sulphite pulp for shipment to fine grade paper mills.

The fifth plant to be added to the group was the plywood mill of International Plywoods Limited, which came into production in September, 1946. Its capacity is three million square feet, ¼-in. thickness equivalent, of plywood per month. Its product is made from hardwood, whereas, with minor exceptions, the previous four plants mentioned use coniferous or soft wood. This has proved to be desirable in that it means that the lumbering or logging on the company limits is no longer confined to softwood species, and thus full advantage with resulting economies are realized in the woods operations.

Construction is currently starting on a sixth distinct industry, an alcohol plant. As its raw material will be waste sulphite liquor from the sulphite mill, it will not increase the over-all consumption of wood, but will mean more complete utilization of the wood substance now entering the paper mill.

International Fibre Board

The fibre board mill was constructed as a means of utilizing waste screenings from the news mill in the days when screen rejects were normally high, and the demand for insulating board relatively low. As these conditions tended to reverse, it became necessary to augment the stock from the news mill by installing grinders for fibre board, and later by the utilization of sawdust from the news mill chip screens.

With the original installation of the grinders, spruce was available for board stock. Later it became advisable to conserve spruce for the new mill and substitute jack pine. Now the mill grinds poplar and basswood, which have proved very satisfactory, plus about 6 percent pine sawmill slabs.

For stock, a freeness of 650 to 700 is required at the forming machine for easy water removal, and the ultimate product should have the following major characteristics:

1. Strength and proper flexibility for handling on the job.
2. Low density for insulation.

3. Uniformly smooth surface.
4. Texture adaptable to special finishes on a tenoner.

For groundwood stock, a 20 grit open pore alundum stone is used, sharpened with a 2 in. by 2½ in. spiral burr, and operated at a pressure of 45 lb. per sq. in. of stone grinding area. This gives a long fibre with a freeness of 500 to 550, with power consumption of 35 hp. days per ton.

The groundwood stock is screened and, mixed with news mill rejects plus refined sawdust stock, it goes to the fine screens. Rejects from these screens pass through refiners, thence back to the bull screen chest. Rejects from the bull screen itself are passed through a shredder, thence to the bull screen chest. About 7 percent of the furnish is chipper sawdust from the sulphite mill, steamed in a 1000-lb. digester for 30 minutes at 70 lb. pressure, then blown through a hydraulic valve. The steamed sawdust is passed through a disc refiner, thence to the screen chest.

In addition to the above stock, waste wrapper and core ends from the news mill are used to the extent of about 2½ percent of the furnish. This stock is worked up in a continuous beater and pumped to the screen chest. With this mixture of stock, the desired freeness of 650 to 700 is obtained.

The stock is diluted and flows through a conventional flexible sluice into the vat of a unit that forms the board. The drum of the forming unit is 14 feet in diameter, with a 10½-foot face, and operates at 15 in. of vacuum. From the forming unit the sheet passes through the press section, consisting of four spring loaded baby presses and three pneumatically loaded main presses. The press section is equipped with a 40 mesh top wire and a 24 mesh bottom wire.

Leaving the press the sheet is 30 percent dry and calipers 9/16 in. It is then cut to the desired length by a slitter travelling both with the board and transversely. Board length may be varied from 12 to 20 feet. An automatic tipple loads the boards into a ten-level rack, which in turn empties into transfer racks automatically. These are necessary since there are two parallel kilns, one 8-level kiln 348 feet long, and a 10-level kiln of half that length.

The board is carried through the kilns on chain-driven rolls between steam coils at the rate of 32 seconds per foot in the long kiln. Kiln temperatures are maintained at 300 degrees F., at the wet end to 320 degrees at the dry end. Air is circulated through the kilns by a series of high capacity blowers, equipped with pre-heaters.

The board leaves the kiln containing 1½ to 2 percent moisture and calipering ½ in. It is thence conveyed through longitudinal and transverse slitters and cut to finished sizes.

The major portion of the output of the plant is sold for insulating and wall boards, but some of it is converted in the finishing department of the fibre board mill into mouldings for wall and ceiling treatment, and acoustical tile is produced as well. This tile is used for ceilings in offices and other rooms where its sound-deadening effect is desirable and consists of rectangular blocks of fibre board in which holes are drilled.

Hardboard Plant

In the Masonite process of producing hardwood, wood chips are exploded by shooting from guns by high pressure steam. They are then reassembled and welded into dense, smooth, strong and grainless boards, all without the use of binders or adhesives other than the natural lignin in the wood itself. The raw material used at Gatineau is jack pine.

The process takes the name of its inventor, William H. Mason. The story of its discovery as related by the Masonite Corporation is briefly as follows: Mr. Mason, a chemist, had perfected a process for the recovery of naval stores from pine lumber in the dry kilns in the sawmill district in the southern states. He set out to find a means to convert the tremendous waste of slabs and edgings he saw daily going to the trash burners.

Starting from the fact that wood is basically cellulose fibre and lignin binder, he set out to find a means to separate the fibres from each other without breaking or damaging them, first by softening the lignin by heating with steam, then subjecting them to steam under high pressure and separating the fibres by an explosion of that steam. In his initial experiment he drilled a hole into the end of a piece of steel shaft, and filled the chamber with a handful of wood chips and a few ounces of water. He then forced a steel plug into the muzzle of this "gun" and heated it on the outside with blow torches. After he calculated that the temperature within the gun was 800 degrees Fahrenheit, he tapped the plug loose with a long iron bar. The plug was never retrieved, but on the ground were the long fibres that proved wood could be reduced to fibres by an explosion.

It was found that the fibres were too tough and strong to make paper, but these characteristics made them ideally suitable for forming into structural insulating boards. The first experimental boards were made one half inch thick, and dried in a hot platen press used for the determination of moisture content in lumber. Good insulation boards were produced. Then, by accident or fortune, startling results were accomplished. A sample was placed in the press just before lunch time, the gauges were set, the steam turned off, and Mr. Mason went to lunch. The valve which had been turned off developed a sudden leak and when Mr. Mason returned for his sample he had not a half inch board, but, a board one eighth inch thick, smooth, dense and amazingly strong. Thus did Masonite Presdwood come into being.

The wood for the plant at Gatineau is handled and prepared by the wood room of the paper mill, and delivered in the form of screened chips to storage bins or "magazines", and becomes ammunition for the Masonite gun. This 26-in. calibre gun is a forged steel cylinder about 6 ft. long with walls over two inches thick, mounted vertically, with the muzzle pointing downwards.

The gunner charges the gun through an eight inch diameter "breech" in the cover, with a charge of about one tenth of a cord of chips. The breech, or loading port, is sealed by a valve disc placed against its seat on the underside of the cover, and forced tight against the seat by the internal pressure in the gun. The muzzle end of the gun is tapered to six inches in diameter, and is fitted with a series of slots ⅜-in. wide, with total area of about six square inches. The muzzle is sealed by a valve with externally applied hydraulic pressure.

After filling and sealing, steam is introduced into the gun until the pressure reaches about 600 lb. per sq. in., which takes about 40 seconds. The pressure is then brought up rapidly to over 1000 lb. per sq. in., held for a few seconds, and then the discharge valve is opened. The gun blows into a stainless steel cyclone, where the steam and stock are separated. The fibre is dropped out of the bottom of the cyclone into a stock chest, equipped with agitators, and mixed with water to a concentration of one part fibre to 40 parts water.

This mixture is pumped through a battery of refiners, screened to remove the undesirable knots and woody slivers, and is now ready to be reformed into board. The first step is to form a wet lap containing the proper proportions of fibre and lignin binder for the thickness and weight of finished board to be produced. The forming unit is essentially a fourdrinier paper machine. The fourdrinier wire, however, in this machine carries the sheet right through the press section of three sets of top and bottom press rolls.

As the mixture runs over the machine, the fibres are interlaced and felted by the removal of water, by drainage through the travelling wire, and by the use of vacuum boxes, and the presses. The thickness of the wet lap varies when leaving the forming unit from three quarters to two inches, the three-quarter inch lap producing a finished board one-eighth inch thick.

The edges of this wet fibre lap are trimmed, and it is cut into 16-ft. lengths by means of an automatic traversing cutter, travelling along at the same speed as the board. The laps are discharged from a tipple into a stationary rack which holds twenty boards. When the twentieth board is fully in the stationary rack, the twenty are discharged simultaneously into a moveable rack, which is then used to convey the load to the press.

The press has twenty daylights between twenty-one steam heated platens, each heated through telescoping pipes with steam at 180 psi. Each opening has a highly polished chromium plated upper face plate, which imparts a smooth finish to the boards.

The laps are run into the press from the moveable rack by travelling wire screens, which provide for the removal of steam and water during the pressing and drying cycle. A pressure of two thousand tons is applied by hydraulic cylinders, and accurately controlled during the cycle to obtain a close tolerance to specification.

When the drying is completed the press is opened, and the boards are discharged into a moveable rack by withdrawing the wire screen. From this rack they are unloaded and carefully inspected for surface defects. They are then sent to the finishing department for final trimming and cutting to size.

Part of the Presdwood is put through a further tempering process, consisting of subjecting it to treatment with various oils, and later baking at high temperature and humidifying the treated board. This treatment increases the strength, density, toughness and resistance to moisture absorption.

Following are the principal physical characteristics of ⅛ in. Masonite Presdwood and tempered Presdwood.

	Presdwood	*Tempered Presdwood*
Weight per sq. ft. lbs.	.730	.760
Specific gravity.	1.00	1.06
Modulus of rupture p.s.i......	6,000	11,000
Tensile strength p.s.i.	3,500	6,000
Water absorption, per cent. 2 hours submersion	6.0	3.5

Plywood Mill

This mill has been designed to convert one million ft. b.m. of hardwood logs per month into plywood. The average 14 ft. long, 13 in. diameter log scales 101 ft. b.m. In other words, the daily intake of logs will amount to approximately 400 logs or seven carloads per day. The largest portion of the logs is birch, but basswood, elm, maple, ash and other hardwoods are also utilized. Most of the logs come from the Canadian International Paper Company limits, some from local farmers.

The logs are stored in an artificial pond just north of the mill. They are moved in or out of the log pond by a western type skyline, which is really a bridge crane covering a 800 ft. by 200 ft. area, the bridge structure replaced by wire cables. The logs have to be kept under water during the hot seasons to prevent spoilage. Logs can be kept indefinitely under water without deteriorating.

The length of the plywood sheet is determined by the length of the bolt fed to the lathe, whereas the width (measurement across the grain of the face) can be varied in the manufacturing process. The plant turns out plywood sheets in lengths varying from five to eight feet and in three and four foot widths. Consequently logs are cut to these lengths plus oversize for trimming. Most of the product is three-ply, but heavier panels are also made involving more plies (½ in.-five-ply; ¾ in.-seven-ply, etc.).

The logs which come in lengths from 8 ft. to 16 ft., are cut to one of the standard panel sizes (5 ft. to 8 ft.) on a band saw. Since efficient operation is only possible if the lathe cuts a fair number of logs of the same length during a shift, logs are sorted according to length after the saw inside the plant. When a sufficient number of logs in any standard length has accumulated, the logs are carried by a conveyor into one of eight concrete vats, where they are steamed for from 8 to 24 hours, depending on the size of the log and the prevailing outside temperature.

After this treatment, the logs are ready to be cut on one of the two lathes. The lathe converts the logs into veneers. These veneers may be of different thickness from 0.030 in. to 0.250 in. thick. These thin sheets of wood are called veneers until they reach the press and are glued into three-or-more ply panels. The glued product (after the press) is termed "plywood". As the veneer comes out of the lathe, it is clipped to the desired width which is mostly 4 ft. If defects in the logs are too large, the clipper clips the clear part between the defects. The part with the defect becomes fuel, whereas the clear parts will be glued together to make 48 in. width in a subsequent operation called jointing and edge-gluing.

All sheets, either full-width or narrower (called components) are passed through the dryer, and are dried to between 3 per cent and 10 per cent moisture content. The dried standard size sheets are now ready to be pressed into plywood. The components go to the jointer, where their edges are cut straight by two cutter heads, after which resin glue is applied to the joints. After the glue has dried, the components are passed through the edge-gluing machine, from where they emerge in standard width. These sheets meet the originally standard width sheets at the press.

In front of the press the plywood is assembled. The centre lay-

MANAGEMENT—

TODAY AND TOMORROW

by

Paul Kellogg, M.E.I.C.

President,

Stevenson & Kellogg, Ltd.,

Montreal.

PART ONE

During last year, when the "Notes on Management" section of the *Journal* was first considered, the author was asked to set down, for the benefit of the *Journal's* readers, something of what he believed to be the fundamentals of the whole subject of Management.

With the cooperation of members of his organization he has prepared three concise papers, of which the first is published herewith. It forms a simple and understandable summary of the problem of management as it is today, and is tending, in the opinion of the author, to become in the future.

The other two papers will be published in later issues of the *Journal* and will expand two of the fundamentals considered in this first paper, viz., formal and informal management methods, and management tools and people.

Formalization of Management Practices

In the main, there are three important changes which have taken place in the form of business management over the past century. The first is the formalization of management practices and methods to facilitate control of business. Many can recall the business man who carried all his records in a little black book, personally knew every employee, and whose sole measure of profit was the yearly increases in his bank balance. Contrast this with today's trained professional managers who use modern and sometimes elaborate systems for keeping records, whose employees are scientifically selected by personnel specialists, and whose modern budgetary and cost control systems can tell them at any moment whether profit expectations are being reached and, if not, why not.

There are several reasons for this evolution in management practices. The first of these is growth in size. The larger a business becomes, the more difficult becomes the task of coordinating, directing, and regulating its members and its affairs. Routine and standard policies and practices are therefore developed to relieve management from time-consuming decisions on minor and routine matters. A second reason is competition, under which the alert and progressive survive and profit, and the less able go bankrupt. Because of competition, the cost of production must be reduced, and this calls for better methods of production and cost controls.

A third factor is increasing government regulation, which greatly increases the required number and accuracy of records, and has brought about the development of better record-keeping procedures and office machines. A fourth is the growth of unionization and bargaining powers of the unions, calling for systematic methods for determining wage rates and administering them. Mass bargaining procedures have forced management to develop better production methods, incentives, and training schemes, and to devote more attention to the cares and woes of its working force. A fifth is mass production. As better machines, and mass production techniques produce more and more goods at lower and lower costs, sales production and distribution must be systematically planned and scheduled.

Formalization of management entails more controls, leaving less to the judgment of the individual. Printed policy manuals outline company policies, and company attitudes towards employees, suppliers, and customers. Organization charts define the responsibilities of the various company officers. Standard costs and flexible budgets facilitate the planning of profits. Scientific personnel selection, job evaluation, systematic wage administration, production controls, wage incentives, machine accounting, perpetual inventory controls, and a host of other systems and methods have become part of the business man's language. But formalized procedures should be assigned their proper place—that of a servant and not of a master. They are tools of management. They are the means by which management performs formally a function which it would otherwise have to do informally. Every one of the purposes served by these formal procedures is performed by every manager of every business—no matter how small that business.

When should management substitute formal procedures for informal? This will depend upon the degree to which factors leading to formalization exist in the particular business under consideration. The decision of how far to go is an important one for management. Certain departments may require more formalization than others, depending upon whether the fixed costs there are relatively high or low. A careful analysis of sales revenue in its relation to the fixed costs and variable costs of operation should be made before deciding where to install improvements. In cases where increment profit margin, that is, the difference between sales revenue and variable costs, is large and fixed costs relatively high, the detailed formal aids to the sales manager would probably be justified. On the other hand, if the increment profit margin is low and variable costs relatively high, emphasis must be placed upon cost reduction in the plant, as small decreases in the cost of production will have considerable effect on the profit picture. An expense analysis that will provide such information is important and necessary to each business if management is going to select formal systems intelligently.

Management—A Profession

What of the future? Competition is becoming increasingly more severe. Because businesses tend to grow, we can expect a more widespread use of these techniques, as well as continued improvements and refinements in management controls. A trend is now appearing, particularly in large organizations, towards the establishment of central control staffs attached to top management, whose function will be to keep abreast of developments in management procedures, supervise changes in company practices and coordinate all planning, standardizing and controls.

A second significant change that has taken place in the character of management is the evolution of the professional career manager, as contrasted with the owner-manager of the past. These professional managers are paid a salary for their services and they may or may not own a financial interest in the business. In the old days, the owner of a business was its logical manager—not so today. One of the reasons for this change is that many large corporations today have long since lost their identity with their original owners, and most of them have wide-spread public ownership with no one person or family owning or controlling their policies. Further, the management of larger corporations is highly complex, and only trained and experienced executives can cope with the complicated problems with which they are faced.

Some of the results of this change are interesting. Everyone is now an employee, which implies that all have the same community of interest, namely their mutual protection and welfare, achieved only if all contribute their best. Nevertheless, because the management group represents the owners, there is a distinct division among the company employees. Management now substitutes for capital in the capital-labour combination. It is now management to whom labour turns to settle its grievances or raise its wages. Labour's contacts with the owners or stockholders are now rare. It is organized to promote the interests and welfare of its own group. On the other hand the management employees still largely depend upon individual negotiation with owners or their representatives. Compensations are usually determined by others in the same group at a higher level. Finally the top few men make financial arrangements directly with the Board of Directors. This idea of self-determination of salaries within an integrated group within a company has not been applied to labour-employees. The nearest approach today is the negotiated labour scale where usually an outsider comes to terms with management.

Management as a profession has been recognized, and programmes are being developed to train men specifically for management responsibilities. Such schools as Harvard, M.I.T., Stanford, University of Western Ontario, and many others have installed courses with this end in view. Many corporations have also recognized this trend and have training programmes within their organizations to prepare their future administrators and executives for management.

Human Relations

The third significant trend in management's tasks is the development of a new relationship with labour. This is today the great frontier. Our highly industrialized society apparently often fails to provide adequate motivation and satisfaction to the individual worker, particularly at the lower levels. Recent studies, such as those of Elton Mayo and his associates at Harvard, show the great complexity of the factors involved in motivating our working people.

Underlying these difficult problems connected with labour, there can be discerned some definite developments which are producing problems today compared with yesterday, and which will increase tomorrow's problems compared with today's. One such trend is the increasing education of the labour force. This condition will continue, because illiteracy is still decreasing and today's children are carrying their education much farther than did yesterday's.

Along with this increasing education of the working force is the trend towards mechanization. This means that the working force is now divided into a more skilled minority group which must understand the machinery used, and a much larger majority group in which the individual worker is becoming more and more mechanized, repetitive, and more imitative of the machine itself. Some members of this majority group are naturally adjusted to repetition, but certainly not all of them are. What are we going to substitute for the interest, initiative, and necessity for judgment which was present in the old type of craft work?

Indeed, perhaps a cause for some labour agitation can be found in this condition. A healthy man's mind must be occupied. If it is given a task which does not challenge it, then the mind will fill itself up with extraneous things not relating directly to the work in hand.

In order to give the workman full opportunity to use his talents, he must be brought more and more into the cooperative operation of that part of the business in which he is directly concerned. We are seeing this in some joint labour-management control of such projects as job evaluation and time study, and in union activity through grievance committees, negotiations, and other relations with management. The task for business as a whole is to harness these talents of labour along with management as a team, to promote the general welfare of the business, which in the end will be advantageous to both parties.

This goal is difficult to achieve. It demands, above all, an honest approach by management, and this in many cases has been its greatest weakness. We advocate joint participation in those divisions of management which directly concern conditions of work and pay. We advocate the use of every means possible to awaken the interest of the labour-employee in the company which employs him. We advocate solicitation of these ideas and adequate reward for those which are accepted. We cannot advocate, however, a participation in management by a labour organization.

The adjustment of the human being to the work situation in our increasingly industrialized and systematized society, the diagnosis and correction of situations causing emotional strain and frustration, the adjustment of machines to fit the individual rather than vice versa, and the underlying human reactions are being given considerable study, and will become of increasing importance in the period ahead of us.

Our industrial machine is becoming very complex. There is so much to learn, so much to know, within each facet of business, that no one man can be expected to be an expert in all fields. We can picture in the future development of organization, the provision of staffs of specialists within each of the fields that have to do with the control of material, machines, practices, costs, and last but far from least, human relations. We can expect to see an increasing use of formal management practices and control, and more attention directed to the training of men for professional management careers. We can expect to see management taking part with its workers in more and more cooperative efforts concerning activities with which they may be directly concerned.

MINING PROCESS APPLIED TO RUNWAY CONSTRUCTION

(*Continued from page 200*)

silicon for part of the magnetite, and a difference of 0.1 in specific gravity is sufficient for separation. The materials in the deposit should be naturally proportioned in the correct sizes, or be capable of being made so by crushing and screening without too much cost. A source of minus 10 mesh sand, if required, must be assured either by natural deposits or by one of the treatments described.

Power can be obtained by substituting self contained power units where necessary. Water may be a major problem. As explained, the process does not require much new water, and 30 g.p.m. would probably be ample. It does, however, require a large amount of circulating water for screening out the minus 10 mesh. A settlement area, where the water can drop its burden of clay and sand is therefore essential. If the water table is close to the surface, there will be no difficulty; but if the water table is low, reservoirs may be made in clay, as in this project, or settlement tanks may be necessary. Circular tanks with a raking mechanism would be excellent, but rectangular tanks of fairly small area can be used if cleaned out periodically. The addition of lime or some other settling agent would get rid of colloidal clay quickly.

It is now recognized that materials in aggregate that are harmful to concrete may be also injurious to asphalt. This process should therefore have a considerable future in the gravel industry, particularly for concrete and asphalt road work since it is semi-portable, but also whenever cheaper or higher strength aggregates can be obtained by its use.

UTILIZATION OF WOOD IN THE GATINEAU INDUSTRIES

(*Continued from page 203*)

er of the three-ply is passed through a glue spreader, which applies the adhesives on both sides of this "core". The press has twenty openings, and, depending on the thickness of the panels, one heavier or two thinner panels are pressed simultaneously in each opening. Thus twenty to forty sheets are pressed in one press cycle.

The pressing temperature and press time varies according to the thickness of the panel and adhesives used. With the standard urea resin, two ¼ in. panels are pressed at 245 deg. F. for 6½ minutes. Half the press load is laid up on each glue spreader, ten openings of the press being loaded from one side and ten from the other side of the press. Loading all twenty openings from one side would be too slow, and cause precuring of the glue before the press is closed. After pressing, the plywood is ripped and trimmed to size, then the panels are sanded on three drum sanders and are ready for shipment.

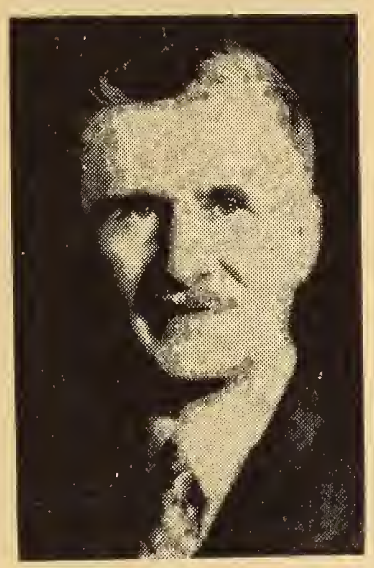
The daily 40,000 ft. b.m. of logs are converted into approximately 100,000 sq. ft. of ¼-in. plywood. The actual yield depends on such factors as sizes and grades required. The thinner plywood is largely used for panelling of walls while the thicker panels are used as cupboard doors, table tops, boxes, spools, etc. and for a great variety of other furniture and general uses.

At present the bark, and the veneers not suitable for plywood manufacture, as well as saw trimmings, are chipped up and burned in the boilers to supply steam to the plant. There are various developments under way to utilize this material in other forms. It may be chipped and used for the core of heavier panels with a suitable binder; part of it may be used for the production of paper or rayon. The birch "cores" which are left over in the lathe after the veneer has been cut off are sold to another company for turning plugs, to be used in newsprint, while the softer cores (poplar and basswood) are used in the fibre board plant as part of their raw material. The defective cores and butts are at present used for fuel wood only.

THE CITY OF QUEBEC IS HAPPY AND PROUD TO GREET THE MEMBERS OF THE ENGINEERING INSTITUTE OF CANADA!

To all the Canadian Engineers who are coming here for the Annual Meeting of the Institute, I extend the warmest welcome! The importance of this gathering which brings together the most prominent scientists of our Country and those more intimately identified with its development, is fully appreciated by every one. It seems to me that it is also well appropriate that it should take place in our City. Quebec is proud of her glorious past, but does not live only on souvenir and history; she is equally interested in the present and the future and is determined to play a prominent part in the industrial and commercial development of our Country. The engineers will certainly be interested in seeing for themselves what is actually being done here in this respect.

I hope that all our distinguished guests will enjoy their stay in our City and bring home a memory that will contribute to make this congress one of the most successful in the history of their association.



Son Honneur le maire de Québec
Lucien Borne

C'EST UN GRAND HONNEUR POUR LA VILLE DE QUÉBEC DE RECEVOIR L'INSTITUT DES INGÉNIEURS DU CANADA!

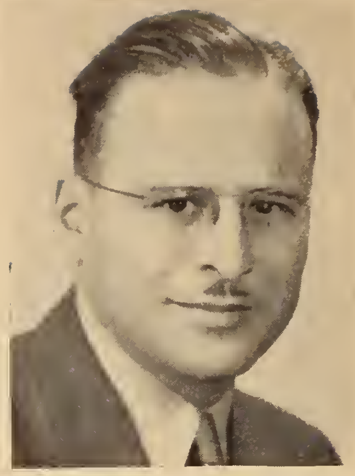
A tous les ingénieurs canadiens qui nous visiteront à l'occasion de son congrès annuel, je souhaite la plus chaleureuse bienvenue! L'importance de cette réunion, à laquelle prennent part les hommes de science les plus en vue du pays et le plus intimement liés à son développement, n'échappe à personne. Il me semble qu'il sied bien qu'elle ait lieu en notre ville. Québec s'enorgueillit d'un passé glorieux, mais ne vit pas uniquement de souvenir et d'histoire; le présent et l'avenir l'intéressent également et il entend jouer un rôle prépondérant dans le développement industriel et commercial de notre pays. Les ingénieurs seront sûrement intéressés à voir ce qui est en voie de s'accomplir chez nous dans ce domaine.

Je souhaite que tous nos distingués visiteurs emportent de leur séjour un souvenir qui contribuera à faire de leur congrès à Québec l'un des plus heureux dans l'histoire de leur association professionnelle.

Lucien Borne

Mayor of Quebec *Maire de Québec*

Alex Lariviere
Vice-President, Zone C
Vice-président, Zone C



Paul Vincent
Chairman, Quebec Branch
Président, Branche de Québec

E. D. Gray-Donald
Councillor, Quebec Branch
Conseiller, Branche de Québec

The executive officers of the Quebec Branch of the Engineering Institute of Canada are pleased to extend a most cordial invitation to their fellow members all through Canada to visit historic Quebec City for the Sixty-third Annual Meeting.

After the opening of the first branch in Toronto, the Council of the Canadian Society of Civil Engineers authorized the formation of the second branch in Quebec in 1907. Started with some forty members, the roll of the Quebec Branch of the Engineering Institute of Canada now numbers well over 300.

In 1927, the Engineering Institute held its Annual General Meeting in Quebec for the first time with very great success when Dr. A. R. Decary was president. The Institute chose the historic capital again for its Annual Meeting in 1944, with Mr. René Dupuis as General Chairman. The appreciation of all those who participated has been so freely given that Quebec has again been selected for the Annual Meeting this year.

The programme will stress the engineering utilization of the natural resources of the oldest and of one of the richest provinces in Canada. Other important engineering fields will be treated extensively, and a special attraction will be the Regional Conference of the International Committee of Scientific Management.

The members of the Quebec Branch sincerely hope that you will be able to attend the meeting and enjoy the noted French-Canadian hospitality from May 11th to 14th next.

Paul Vincent,
Chairman of the Branch and the Annual Meeting Committee.

Les officiers de la section de Québec de l'Institut Canadien des Ingénieurs sont heureux d'être les hôtes de leurs confrères de toutes les régions du Canada.

Le 20 avril 1907, vingt ans après sa fondation, le Conseil Général de la Société Canadienne des Ingénieurs Civils autorisait officiellement la création d'une section à Québec. C'était la deuxième section de la Société, après celle de Toronto. D'une quarantaine de membres à ses débuts, la section québecoise de l'Institut Canadien des Ingénieurs compte maintenant plus de 300 membres.

Le premier Congrès annuel tenu dans la vieille cité de Champlain, en 1927, eut un succès retentissant sous la présidence générale du Dr A. R. Décary. En février 1944, l'Institut choisissait de nouveau la capitale historique de la Province de Québec pour sa réunion générale annuelle, sous l'habile direction du président local, monsieur René Dupuis. Le résultat en fut si éclatant que Québec est encore choisi pour le Congrès général de 1949.

Les sujets qui y seront traités feront ressortir le rôle important de l'ingénieur dans l'exploitation des ressources naturelles à peine utilisées de la plus ancienne et d'une des plus riches provinces du Canada. Des travaux importants de génie et des problèmes d'administration seront aussi l'objet d'abondantes discussions.

Vous êtes donc tous cordialement invités à venir profiter de l'hospitalité traditionnelle des membres de la section de Québec les 11, 12 et 13 mai prochains.

Le président du Congrès et de la section de Québec.

Paul Vincent.

ELECTRICITY from the ATOM

by

Arthur Surveyer, M.E.I.C.
Consulting Engineer, Montreal, Que.

Contrary to common belief, scientists were not solely responsible for the development of atomic energy for military uses. Engineers and industry also contributed to a major degree. The situation was stated very succinctly by Colonel K. D. Nichols, shortly after V-day, who said:

"The public is prone to hail the inventor and the final product and to overlook the engineering and construction that is essential if the idea of the former is to be translated into the latter. The engineering problems . . . were numerous, unique and staggeringly difficult, the time schedule only slightly short of impossible."

The late A. C. Klein, who was in charge of the construction of the Manhattan project for Stone & Webster, declared that:

"If we take the percentage of the whole combined engineering, construction, and research, about 90 per cent of the money was spent for construction and engineering and 10 per cent for research. In addition to construction and engineering, the operating organization are largely staffed by engineers. Probably the percentage there is of the order of 90 to 10."[1]

There is no doubt that if electricity is to be produced from the atom, engineers will play an important part in the designing, building and operation of these plants. The writer hopes that the readers of *Journal* will find in this paper an easy lead to the study of nuclear engineering.

In closing this introduction, it must be pointed out that although the writer was a member of the National Research Council during the war, he was not on the Chalk River staff of researchers. In addition, none of the work undertaken at the Chalk River plant was ever discussed at Council meetings, so that he could not commit any indiscretions.

This paper is subdivided under the following headings:

Discoveries which revealed the existence of atomic energy.
The structure of the atom.
The splitting of uranium.
The wartime atomic pile.
Electricity from the atom.
Estimated cost of atomic electricity.
Latest developments in nuclear power studies.
General conclusions.

AUTHOR'S COMMENT

This paper was originally given in the form of an address to the Spoke Club of The Shawinigan Water & Power Co., on March 3rd, 1948. It was prepared for the purpose of familiarizing the writer with the basic technical features of atomic pile construction and operation, since this knowledge is necessary to appraise the possible repercussions of new discoveries in the field of nuclear energy. It is reproduced here because the generation of electricity from the atom is primarily an engineering task. In preparing this paper, the writer was compelled to study the latest articles and books on nucleonics and he hopes that the difficulties experienced in ploughing new paths through his hardening brain, has enabled him to outline the problem in a manner easily understandable. Needless to add that in preparing this paper, the writer has borrowed right and left, thus working as a compiler rather than as an author.

Discoveries that Revealed the Existence of Atomic Energy

The discovery that there is in the atom frozen energy which might possibly be released goes back to the end of the last century when, in 1896, Antoine Henri Becquerel, Professor at The Ecole Polytechnique de Paris, observed that photographic plates wrapped in a sheet of black paper and placed in a drawer had been affected in the dark, by invisible rays from uranium salts. This was the first demonstration of natural radioactivity, and started the hunt for the explanation of this new puzzle. In the following decade,

[1] "Engineering in An Atomic Era" by A. C. Klein, Engineering Manager, Stone & Webster Engineering Corporation. Presented at the Fall Meeting of A.S.M.E. October 3rd, 1946. Reproduced in *Mechanical Engineering*, December 1946.

Rutherford and others showed that the Becquerel rays were of three kinds which they called alpha, beta, and gamma. At the same time Pierre and Marie Curie, pupils of Becquerel, went on to discover radium, the most strongly radioactive element which they found always present in uranium. The question at the time was how to account for radio-activity, this giving off of faintly charged particles. Rutherford deduced that this energy could be nothing else than the breaking down of the element, a conception which conflicted with all previous ideas and which, as stated at the time, stood the science of physics on its head.

As radium dissipates its energy, it eventually turns into lead, but this natural decay is very, very slow. Dangerous to human flesh and bone as is exposure to radium, a gram of it would release in 100 years only enough heat to boil a small cup of water. So no one did more than dream of trying to utilize such a feeble force.

It was Albert Einstein who, by his prophetic calculation in 1905, made the scientific world realize that there was an unbelievable power which could be converted into energy by the breaking down of the atoms of any matter. His opinion was that mass and energy are different forms of the same thing; that all matter in the universe is locked-up energy, and that all energy (which includes light and heat) is unlocked or dissipated matter. He announced that the energy liberated by a given loss of mass was equal to the mass of the disintegrated material multiplied by the square of the speed of light. Einstein knew no way of unlocking this energy. His prophetic announcement, made more than 40 years ago, that the complete conversion of one pound of anything would yield 11.4 billion k.w.h. of energy, started the scientists on the search which culminated in the explosion of the first atomic bomb, at the Alamogordo test in New Mexico, on July 16th, 1945.

The Structure of the Atom

In order to understand how the atom can be made to release energy, it is necessary to examine the nature of the atoms themselves. All engineers doubtless remember the teachings of their school days, that the atom was indivisible, and that it was the smallest particle in nature. Modern physicists have now shown that it is composed of three different elements, the electron, the proton, and the neutron.

Figure No. 1 shows that the atom consists of a number of negatively-charged electrons flying around a central positively charged body, the nucleus or core. This tiny core is only 1/5000th part of the size of the atom, but it is so dense that it contains nearly all the atom's weight. The rest is empty space enclosed by a cloud of electrons moving around the nucleus much as the earth and the other planets move around the sun. The positively-charged protons and the negative electrons attract each other, but the "electron clouds" are held out in their orbits by the centrifugal force of their great speed, somewhat as the earth is held away from the strong pull of the sun.

For each proton in the core, there is one electron in the cloud flying around the nucleus since plus and minus must balance in the atom. As shown in Figure 2, uranium 238, until recently the heaviest element, has 92 protons, and 92 planet electrons flying around its core, and 146 neutrons.

All engineers remember the atomic weight scale in chemistry, where all elements were given an atomic weight by comparing them with the weight of an atom of hydrogen. The nuclear physicists have added to this notion the *atomic number* or *charge* which indicates the number of protons in the nucleus of an atom, and also the number of electrons flying around its core. The sum of the neutrons and the protons in the nucleus gives the atomic weight.

The chemical behaviour of atoms depends on the number of protons in their cores. Chemically, all atoms which have the same number of protons behave in exactly the same way. It is the number of protons which make one element differ from the other. Gold and mercury, for instance, are as unalike as night and day, yet the difference between them is one proton only. If you could chip off one of the 80 protons in the mercury core, you would have an atom of the gold. This is the transmutation of elements formerly sought after by the old alchemists. In order to change the number of protons in the core of an element it is necessary to break up its atom and modern alchemy has succeeded in splitting the atoms of all the known elements.

There are, however, elements which have the same chemical composition and properties, the same number of protons, but a different number of neutrons, thus giving them slightly different atomic weights. These elements are called *isotopes* and the four principal uranium isotopes found in nature are as shown in Fig. 3; U-238; U-235 and U-234. There is also U-233 which is a man made product and is not found in nature.

The Splitting of Uranium

The natural radioactivity of such elements as uranium is so slow that it is useless. True, artificial energy leaks can be produced by bombarding usually stable elements, but these leaks of atomic energy are also very slow, and furthermore the energy required to break up an atom in this way is much greater than the energy obtained.

It seemed therefore, that although the method of atomic bombardment could produce some atomic transformation to satisfy our scientific curiosity, it was absolutely inapplicable for the purpose of practical utilization of the energy frozen in the atom. The problem thus appeared insoluble until two German scientists, in January 1939, realized what they called "fission" of uranium by breaking down this element under neutron bombardment into two lighter atoms plus some extra neutrons. (See Figure 4 and Figure 5.) Since the sum of the masses of the two light nuclei resulting from this fission was less than the mass of the parent uranium atom, it was evident, according to Einstein's relationship between mass and energy, that this loss of mass would release energy which would appear in the form of the tremendous speeds with which the fragments shot away from the scene of fission.

The Wartime Atomic Pile

The phenomenon of nuclear fission was a discovery. The nuclear chain-reaction pile was one of the major inventions in history. The wartime pile used at Hanford, Wash., to produce plutonium for bombs from uranium, is already mechanically obsolete, yet it reveals the basic principles on which future piles for power will operate. The heat generated in vast quantities by the fission will be utiliz-

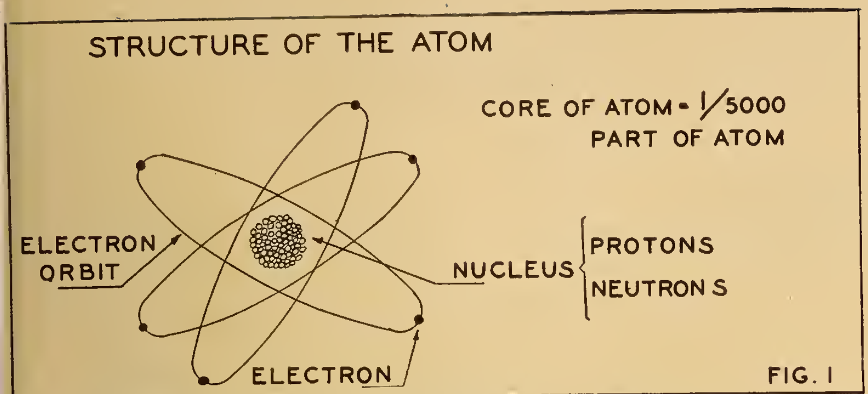


FIG. 1

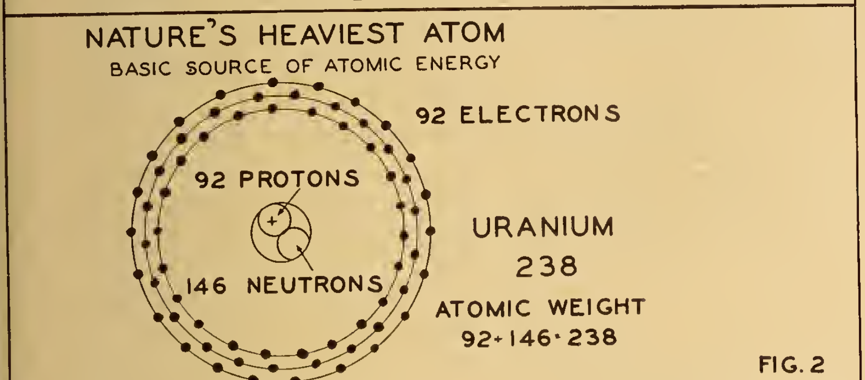

FIG. 2

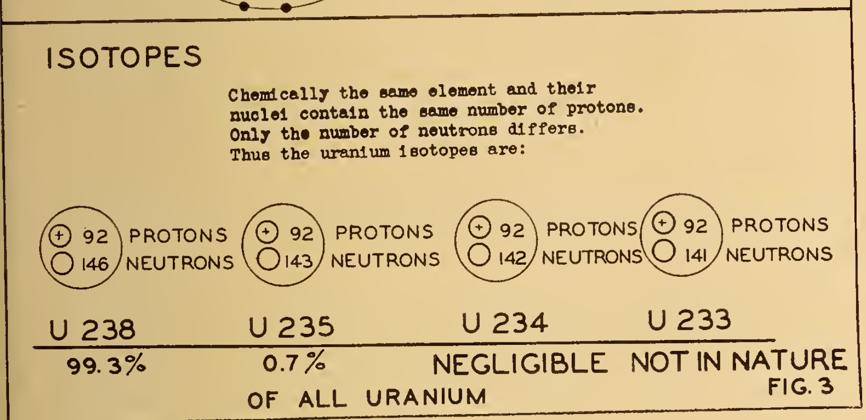

FIG. 3

ed. The plutonium used for bomb manufacture, will be returned to the pile as supplementary fuel. Such a pile is shown in Fig. 6. It is made of graphite which acts as moderator, slowing down the speed of the neutrons from 6000 miles per second to one mile per second, thus making them more effective. Slugs of purified uranium sealed in aluminum cans are placed in correctly spaced cylindrical holes passing through the graphite. To prevent the pile from blowing up, cadmium or boron steel rods are inserted into other holes to act as controls. These rods absorb the neutrons so that when pushed into place they cause the chain reaction to die out from lack of neutrons. When the rods are pulled out to a certain point, the absorption effect is decreased. Without this control the uranium would melt and therefore cooling of the pile is very important. Aside from the cooling and control elements, the pile simply runs by itself once enough material has been put together. It does not even need a "pilot light" to start operation as there are always enough stray neutrons to start a chain reaction.

Thus as long as you put the ingredients together in the right proportions, the mixture will start cooking with its own energy. Over a period of time the contents of the batch in the atomic oven are gradually changed and if a slug is removed after a certain interval, it is found to consist no longer of pure uranium. A small part of U-235 has been transformed into atoms of lower atomic weight, while a little of the U-238 has been transformed through a succession of stages into U-239, neptunium NU-239, and fissionable plutonium PU-239. Plutonium is what we want. (See Figure No. 6.)

The slugs of uranium which have to be removed from time to time, contaminated as they are with radio-active fission products and rich in poisonous plutonium, must be handled with the greatest care. One of the important phases of the Manhattan Project was the development of remote control techniques for the chemical separation of plutonium and the fission products from the uranium metal.

The manufacture of plutonium is a milestone in human history. It is the product of alchemy, the transmutation of elements on a scale large enough to be industrially important and militarily decisive.

Electricity from the Atom [2]

To bring the energy released by the fission of the atom into a readily manipulated and transportable form, it is necessary to convert it into electrical energy. The most specific description of a practical atomic power plant officially released comes from the Clinton Laboratories at Oak Ridge, Tenn. It is reproduced as Figure No. 7. It shows an atomic furnace placed in a thoroughly shielded structure. In it may be seen blocks of uranium embedded in a moderator, just as in the piles used for the production of plutonium.

The nuclear power unit consists of a pile for producing heat, a recirculating cooling medium, either a liquid or a gas, and an electrical generating plant. The recirculating cooling medium will carry heat from the pile to the generating area, where the heat will be picked up by a heat exchanger and converted into electrical power by the conventional equipment. Alternatively, the cooling medium might be a gas and might drive a gas turbine in the generating area.

One of the first problems with which the engineer must cope in the design of a nuclear power unit is the selection of the coolant or heat transfer medium. First of all, the medium must resist the great neutron bombardment in the pile without having an appreciable fraction of its mass converted into some other element altogether. Strange things happen in a pile. Nitrogen, a gas, comes out as carbon; silicon comes out as phos-

[2] See "Atomic-power Engineering—Some Nuclear Problems" by Alfred O. C. Nier, and "Atomic-power Engineering—Some Design Problems," by Bruce R. Prentice, *Mechanical Engineering*, September, 1947.

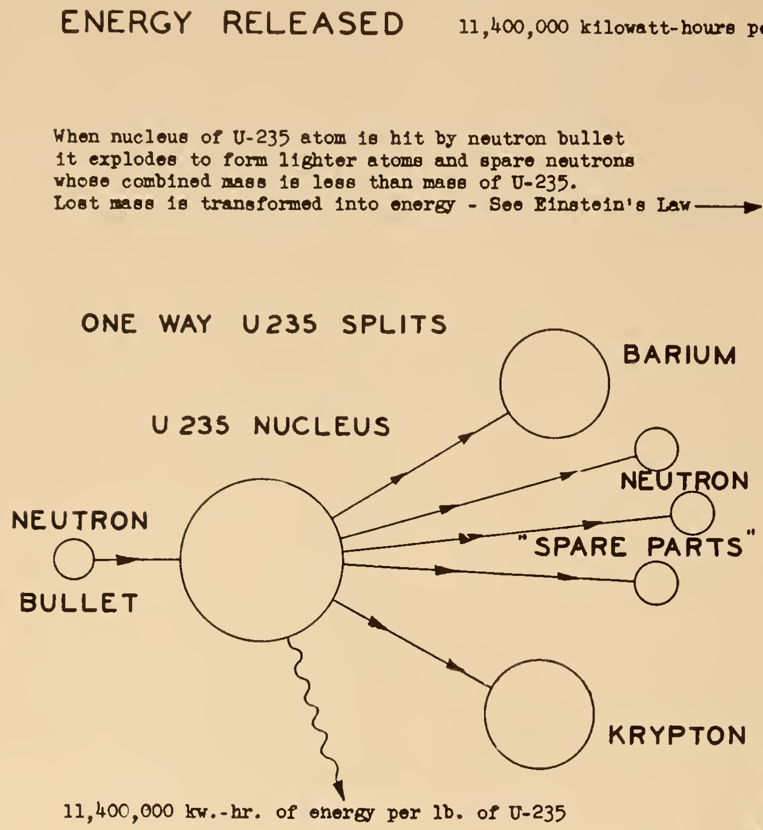

FIG. 4

EINSTEIN'S LAW:

One pound of anything = 11,400,000,000 kwh.

when $\left.\begin{matrix}\text{mass}\\ \text{or}\\ \text{energy}\end{matrix}\right\}$ converts to $\left\{\begin{matrix}\text{energy}\\ \text{or}\\ \text{mass}\end{matrix}\right.$

Applying this law to U-235 split:

Explosion products of one pound of U-235 weigh 0.9990 lb., so 0.001 lb. of the mass is converted into

0.001 x 11,400,000,000 = 11,400,000

kilowatt-hours of energy.

FIG. 5

phorous; gold comes out as mercury. The second requirement in the choice of the heat transfer medium is that it should not be unduly corrosive and should remain liquid at high temperature and under relatively low pressures.

Third, the medium must not poison the reaction by absorbing an excessive amount of neutrons, since neutrons are the life-blood of the pile operation. Therefore, only a small amount of coolant can be allowed in the pile. Obviously then, heat loads will be very high, and the design of the cooling passages and arrangement of heating elements in the pile itself involve some advanced heat transfer engineering. Equipment for handling the coolant outside the pile also presents problems. While the temperature of the fluid might cause it to be a fire or health hazard, most of the major design problems are caused by its radioactive nature.

Naturally there must be a pump in the system to circulate the coolant. Since the pump is handling the radioactive fluid it too will become radioactive, and it will not be possible to approach it, except after a prolonged shut down. This means that there will be no normal maintenance allowed, no packing of the glands for example. The problem of finding a gland that does not require repacking, yet is able to hold a thermally hot liquid, several hundred degrees perhaps, is a difficult one, especially when we realize that this radioactivity of the cooling medium may damage and eventually disintegrate the packings. The pump must be absolutely reliable. If the pump failed and the heat transfer medium were to stop circulating in the unit, the heat would build up so rapidly that excessive temperatures might be reached in the pile and necessitate a shutdown. A multiple pump unit will probably be used, with a spare in parallel, standing idle but ready to pick up the load. Although a pile cannot explode like an atomic bomb, adequate controls are necessary to keep the pile from running away and getting hot enough to melt.

Shielding of nuclear power will be a most complex problem on account of the intensity of radiation. Shields are not just a mass of concrete as so many people think, but are very carefully engineered structures which incorporate a great deal of ingenuity and plain horse sense. In addition to the high level of radiation, the high temperature in the new units will cause thermal expansions of the various parts, and all this must be compensated for in the shielding design. The shields too will undergo thermal expansion, for they operate by stopping the radiation and turning it into heat. Many holes will pierce the shields for process tubes, controls, and so on, and each hole itself must be properly shielded to prevent escape of radiation.

Instruments will be required for the pile itself, to show power level, neutron intensity, and other major operating variables, and to give indications of trouble if any develops. This instrumentation will be a major electrical engineering job, for this equipment must be rugged and reliable. The safety instrumentation will be particularly important. In case of trouble, control rods shut down the unit automatically, and other necessary safety equipment must be actuated. This instrumentation must be fool-proof and it must operate on currents as feeble as micro-micro amperes.

If the fuel of the atomic furnace is natural uranium, it will do two things: in addition to generating power from the fission of U-235, it will be producing plutonium through the conversion of U-238. But plutonium itself is a nuclear fuel. Thus, while generating power, the atomic furnace will be at the same time manufacturing a new fuel, and thereby will continue to regenerate itself. This process of conversion called "breeding", means that ultimately not only U-235, but also U-238 is used as a fuel. The plutonium PU-239 produced may be used in the same furnace or be shipped out to another one.

There is on Figure No. 7 a schematic arrangement of the principal parts in a chain reaction pile:

1. Uranium fuel, containing U-235 (fissionable material) and U-238 (fertile material for the production of PU-239) in arbitrary proportions.
2. Moderator for slowing down neutrons.
3. Reflector for conserving neutrons.
4. Shield for protecting power plant personnel.
5. Heat transfer fluid or gas for transporting the heat energy out of the nuclear reactor.
6. Control rod for varying the reactivity of the reactor and the power level.

This is a very sketchy description of an atomic power plant and does not feature the many design and operating problems which have to be overcome, many of which are new to the engineering profession. As Professor Alfred O. Nier points out: "There are always formidable engineering problems to be solved before any great scientific discovery is put to everyday use, and in the same way, many bridges must be crossed before atomic energy can be used for practical power production."

Estimated Cost of Atomic Electricity

While no such plant has ever been built, it is felt that a large stationary nuclear plant is possible. It has been estimated that, based on early 1946 costs, a plant designed along the lines indicated and producing 75,000 kilowatts could be built in a normal locality in the eastern United States for approximately $25,000,000. On the assumption that the plant would operate at 100 per cent of load factor, and that interest charges on the investment would be 3 per cent, this plant could produce power at approximately 8 mills per kilowatt hour. This study and the following estimates were made by members of Monsanto Clinton Laboratories staff and the Monsanto Chemical Co. engineering department under the direction of Dr. C. A. Thomas, vice-president of Monsanto Chemical Corporation. The following table I shows in detail the comparison made by Dr. Thomas between the capital and operating costs of a nuclear power and a coal fired electric plant estimated to cost $10,000,000. The operating costs of this plant depend on the price of coal. The price of bituminous coal of

FIG. 7

Table I

Nuclear Energy for Power Production

Table taken from paper by Ward F. Davidson, Research Engineer, Consolidated Edison Co. of New York Inc., presented at the Fuel Economy Conference of the World Power Conference, The Hague, 1947.

The following data marked * in the Table below has been taken from the reports submitted to the United Nations Atomic Energy Commission as " Scientific Information Transmitted to UNAEC " by Mr. Bernard M. Baruch, United States Representative. The estimates given are based on studies made by members of the Monsanto Clinton Laboratories staff, and the Monsanto Chemical Co. engineering department under the direction of Dr. C. A. Thomas, vice-president of Monsanto Chemical Co.

COMPARISON OF CAPITAL AND OPERATING COSTS OF ELECTRICITY FROM NUCLEAR POWER AND FROM COAL

Item	*Unit*	*Nuclear Power*	*Coal*
Installed plant capacity*	kw.	75,000	75,000
Construction cost, Total*	$	25,000,000	10,000,000
Cost per unit capacity	$/kw.	333	133
Annual load factor		100%	100%
Annual output	kwh.	657,000,000	657,000,000
Price of coal*	$/ton		7.00
Heat value of coal*	B.T.U./lbs.		13.500
Plant thermal efficiency			0.25
Annual charges			
Interest*	$	750,000	300,000
Fuel	$	} 4,506,000	2,301,000
Other operation	$		1,699,000
Total	$	5,256,000	4,270,000
Cost per unit of output	mills/kwh.	8.00	6.50

* Data given in report; other values are derived.
N.B. difference in cost 1.5 mills per kwh. x 657,000,000 kwh. = $990,000.
coal cost $2,301,000 ÷ 7 = 330,000 tons.
$990,000 ÷ 330,000 tons = $3.00 per ton + $7.00 = $10.00 per ton.

13,500 BTU was taken at about $3.50 per ton at the mine and about $7 per ton delivered to the furnace of a power plant in the eastern United States. The cost of producing power in this plant would be approximately 6.5 mills per kilowatt hour. Dr. Thomas concludes that equality of operating costs between coal power plants and nuclear power plants would be reached if the coal were $10.00 per ton.

Mr. Ward F. Davidson, research engineer of Consolidated Edison Co. of New York Inc., made the following comments in a paper presented at the Fuel Economy Conference, at the World Power Conference, at the Hague in 1947. After discussing the general engineering and technical problems involved in the design of a power plant using atomic energy, Mr. Davidson concluded that:

" There are so many uncertainties that it is clearly impossible at this time to make any predictions as to construction or operating costs for such power plants."

He considers it disappointing

that the report does not show separately estimated charges for depreciation, for maintenance, for labour and supervision. He also points out that the thermal efficiency for the coal plant is too low, and that in sum:

"Several of the assumptions made by Dr. Thomas are such as to make the comparison of power from nuclear energy and power from coal unduly favor the former, and that consequently in terms of the probable economic justification for nuclear energy, it means that the point of equal cost would not come with cost at $10.00 per ton ($0.37 per million BTU) but at a considerable higher cost for coal."

Mr. Walter Isard of the American University and Mr. John B. Lansing of the Massachusetts Institute of Technology, in a recent paper entitled "Comparison of power cost for atomic and conventional steam stations", took up again Dr. Thomas' estimate of the cost of nuclear energy. By assuming load factors of 80 per cent and 50 per cent respectively, instead of 100 per cent as used by Dr. Thomas, they concluded that cost of atomic power under these assumptions would be 9.4 mills per kwh. for an atomic plant operating at 80 per cent load factor and 14.5 mills for a plant operating at 50 per cent load factor. At the beginning of their paper, however, these authors warned their readers of the difficulty in making dependable estimates of the cost of atomic power:

"All existing nuclear piles have been constructed for non-power purposes. And there is great uncertainty about both capital and operating costs of the pile, chemical and metallurgical plants, and heat exchanger of the future atomic plant. Little, if any significance, therefore, should be attached to the numerical estimates of costs of atomic power used in this paper."[3]

Another point which should be noted is that Messrs. Isard and Lansing used in their calculations of the capital costs of an atomic power plant the figure of $25,000,000 adopted by Dr. Thomas. Since Dr. Thomas made this estimate, the construction cost index has

[3] Furthermore Mr. Isard stated that this paper would be revised in some important respects and that the finished paper would be published in a forthcoming issue of *Review of Economics and Statistics*.

Table II

Estimates of Atomic Power Costs

By Messrs. Isard & Lansing

Installed plant capacity	75,000 kw.	75,000 kw.
Plant factor	80%	50%
Annual output	25,600,000 kwh.	328,600,000 kwh.
Capital Costs:		
a. Pile	$12,000,000	$12,000,000
b. Chemical and Metallurgical plants	5,000,000	5,000,000
c. Steam plant	2,000,000	2,000,000
d. Power plant	6,000,000	6,000,000
Total	$25,000,000	$25,000,000
Capital costs per kw.	$333	$333
Costs of Production		
1. *Direct Costs:*		
a. Fuel	$ 50,000	$ 35,000
b. Labour and supervision	500,000	500,000
c. Maintenance	750,000	600,000
d. Supplies, chemicals and other expenses	175,000	175,000
	$1,475,000	$1,310,000
2. *Fixed Costs:*		
a. Interest 3% on the average	$ 750,000	$ 750,000
b. Depreciation and obsolescence (1) on pile 10%	1,200,000	1,200,000
(2) on chemical and metallurgical plants 6%	300,000	300,000
(3) on conventional power equipment 4%	320,000	320,000
c. Insurance, taxes and miscellaneous charges at 3.5%	875,000	875,000
Total	$3,445,000	$3,445,000
Total Costs of Production	$4,920,000	$4,755,000
Total Costs per kwh.	9.4 mills	14.5 mills

gone up over 40 per cent in the United States and the cost of skilled labour about 35 per cent. Making this correction would bring the costs of the atomic power plant to at least $35,000,000 and the cost of producing power would also be raised proportionately. Referring to the question of capital cost, Mr. David Lilienthal, chairman of the United States Atomic Energy Commission, speaking in Boston, on November 19th, 1948, explained why the development of atomic energy remains a public responsibility, and said in part:

"No private concern has yet come forward with a proposal to build a reactor at the expense of the Company. There is good reason for this. These reactors are very expensive experiments. . . . Altogether the cost of a reactor runs to something like $50,000,000. The prospect of a return is remote, and the money risk is great."

The following Table II has been taken from the paper by Messrs. Isard and Lansing.

It must be pointed out here that Dr. Thomas' estimate of 8 mills per kwh. and Messrs. Isard and Lansing of 9.4 mills to 14.5 mills per kwh. are for nuclear energy at the plant and at generator voltage. The average return of hydro-electric energy sold in the Province of Quebec is somewhat less than 4 mills per kwh. delivered to the various customers so that the cost of nuclear energy would have to come down considerably before it could compete with power from hydro-electric plants.

Another feature which is not always mentioned is the fact that if an atomic pile goes wrong, the whole mass within the concrete shield is so radio-active, that it cannot be approached for months. One of the foremost British authorities, Sir Wallace Akers, Director of Atomic Research in Great Britain, last year made the following very realistic comment on this problem:

"How many times must the initial capital equipment be multiplied to provide the continuous source of power upon which people can rely as they now rely on power stations."

Latest News in the Field of Nuclear Power Research

The United States Atomic Energy Commission has frequently been criticized for devoting most of its energy to the military aspects of atomic energy rather than towards the industrial utilization of nuclear energy. Apparently this criticism has had its effect because, at the beginning of February of this year, Commissioner Robert Bacher, a member of the AEC announced that the Commission now has a programme for tackling the three crucial questions that must be answered before any one can tell what atomic energy's real role is going to be.

The first question is that of "breeding", that is to say can a reactor be built that will produce more fissionable material than it consumes. There is only one known substance found in the earth, on which nuclear energy relies, namely the isotope 235 of uranium (U-235). It is present in uranium to the extent of one part in 140 or 0.7 per cent. There are, however, artificial fissile substances, which can be made as products of nuclear reaction induced by the release of nuclear energy. Two in particular are of interest as they have a bearing on the problem of the large scale exploitation of atomic energy. These are isotopes 239 of the new element plutonium (PU-239) and the man-made isotope 233 of uranium (U-233). Both have nuclear properties similar to U-235, and can in principle be used as active agents of a nuclear reactor.

Plutonium is automatically produced in any nuclear reactor using natural uranium (as distinct from uranium in which the 235 isotopes have been concentrated by isotope separation). U-233 is produced from thorium (TH-232) when it is introduced into a nuclear reactor.

It is not yet known whether "breeding" is feasible, that is to say whether a reactor can be built that will produce more fissionable material than it consumes. If the answer is yes, then atomic energy is a major power resource comparable to coal, good for thousands of years. If the answer is no, then uranium 235 is probably a special freak that must be rigidly conserved for military uses. A number of leading industrial firms in the United States have been retained by the A.E.C. to tackle this problem: they are E. I. Dupont de Nemours, General Electric Co., Standard Oil Development Co., Carbide & Carbon Chemicals Corp., Kellez Corp., BlawKnox Co., Monsanto Chemical Co., and Dow Chemical Co. The U.S. Atomic Energy Commission expects to have an answer by 1951 or 1952.

The second problem to be studied is to find out if atomic reactors can produce electric power on a large scale at a cost comparable to that of existing coal and hydro plants. The Atomic Commission has initiated an extensive programme in Commission owned facilities, chiefly at the Argonne Laboratory near Chicago, where a reactor known as the Zinn pile will be built to run at an extremely high temperature, 2,000 degrees F., and will be fueled by highly enriched U-235 operating with fast neutrons. This pile is expected to generate considerable power.

Another reactor will be built by General Electric at its Knolls Atomic Power Laboratory near Schenectady. This reactor will run somewhat cooler than the Zinn pile but will also take off a substantial amount of power by circulation of a liquid metal, (possibly a sodium potassium alloy), through the pile, and then through a heat exchanger. The Commission expects to know by 1957 at what cost nuclear energy can be produced.

Thirdly the Westinghouse Electric Corporation is undertaking the construction of test models of reactors for driving submarines and other naval vessels, which means that considerable power must be generated in a small space. It will use enriched U-235 for fuel and will have no chemical heating plant. The engine will be so designed that, when fission products begin to poison the reactor, the whole fuel unit can be removed and sent to a treatment plant, while a new fuel unit is inserted in the engine. Construction by Westinghouse is scheduled to start early in 1950, and by 1952 or 1953 A.E.C. may have an atomic engine for warships that will give them a range of tens of thousands of miles without refueling. This investigation has been initiated in the hope of finding out if, regardless of costs, the atomic power plants can do things which cannot be done in any other way.

Conclusions

Summing up, there is no doubt that electricity from the atom will eventually be used commercially, but it is very doubtful if atomic electricity will ever compete in cost with hydro-electricity. It must also be pointed out that the development of a practical and economical power plant would not change the present methods of transmitting and distributing electricity. It is simply a case of the nuclear power plant versus the hydraulic or fuel power plant, and the writer does not think that the hydro-electric plant will be displaced by the atomic power plant, certainly not for a number of years to come.

In concluding, it seems advisable to quote the authoritative opinion of Mr. David E. Lilienthal, chairman of the United States Atomic Energy Commission, who stated the case as follows:

"When can we expect a substantial part of this country's energy requirements — say 10 to 20 per cent—to come from atomic energy plants. Are such things right around the corner? Should the power industry slow up plans for expansion of steam generated power? Should Congress drop the St. Lawrence power project? Should investors in the power industry begin to worry about the effect of atomic energy on their holdings?

"The facts compel the conclusion of the Atomic Energy Commission that power from atomic energy is definitely not just around the corner. It will almost certainly follow the course of supplementing rather than supplanting existing, economical sources of energy supply. Our judgment is clearly that no one should delay sound and economical additions to power supply, whether by fuel generated electricity or water power."

The most recent expression of opinion concerning atomic power, appeared in the fourth semi-annual report by the United States Atomic Energy Commission, addressed to Congress:

"Even on the assumption of a most favorable and rapid technical development along these lines, a word of caution is needed as to the time scale. We do not see how it would be possible under the most favorable circumstances to have any considerable portion of the present power supply of the world replaced by nuclear fuel before the expiration of 20 years."

THE members of the Engineering Institute of Canada are proud to join their fellow Canadians in welcoming the people of Newfoundland into the Dominion. May the new status of the Ancient Colony lead to the greatest era of development and prosperity in its long history.

FROM MONTH TO MONTH

News of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

The Field Secretary

At the March meeting of Council held in Hamilton Vice-President R. S. Eadie announced that the long search for a Field Secretary had ended in an appointment which he was certain would meet with unanimous approval throughout the membership. The name he wished to announce was Mr. Charles E. Sisson of Toronto.

Mr. Sisson's duties begin on April 1st. Due to personal arrangements made previously he is not able to devote full time to the position until August or September, but he assumes office on a part time basis immediately.

Mr. Sisson is suited admirably to the task as he has occupied several branch and Institute offices. He is well and favourably known in Ontario and as well has numerous friends in other parts of Canada. He is familiar with Institute affairs and Institute policy having devoted much time to his duties as committee and branch chairman, councillor, and vice-president.

He was born in Dunham County, Ontario, and attended high school in Peterborough, after which he taught school for two and a half years. He left this to join the Canadian General Electric Co. in 1901 but in 1902 enrolled in engineering at the "little red school house", now the Faculty of Applied Science and Engineering at Toronto. He was graduated in 1905 with honours and the class prize. Also he was elected president of his class, a position he has maintained ever since.

He returned to the Canadian General Electric taking a particular interest in transformer and induction motor design. He was prominent in the establishment and development of the company's

C. E. Sisson, M.E.I.C.

student training courses, an interest which he maintained throughout his career with the company. In 1921 when the transformer work was transferred to Toronto, he transferred also, later becoming managing engineer of the Davenport Works. He retired from the company at the end of 1947.

Outside of his work Mr. Sisson has had several interests. For two years he was a member of the Peterborough Utilities Commission. He was chairman of the Toronto section of the American Institute of Electrical Engineers, and later vice-president for Canada. For two years he was a councillor for the electrical division of the Association of Professional Engineers of Ontario.

Outside of the activities related to his profession, he has given generously of his time to educational, Red Cross, Church and fraternal work.

During the summer Mr. Sisson plans to visit branch offices in Quebec, New Brunswick and Nova Scotia, in addition to which he will be in attendance at the Annual Meeting at Quebec from May 10th to the 14th.

The Institute is indeed fortunate to secure a member whose qualifications are so ideally suited to the duties and opportunities of this important office.

Chemistry in Canada

It is a pleasure to welcome into the Canadian field of technical periodicals, the new publication of the Chemical Institute of Canada. Starting with the April issue the Chemists will be speaking with their own voice instead of through the medium of a commercial publication. Up until the beginning of this year the publication *Canadian Chemistry and Process Industries* has been the organ of the society, and it has served the purpose well — as well as could be expected of a publication that was not fashioned solely to their needs.

It was a normal evolution that the society which was re-organized in 1945 should now require its own monthly periodical. It is perhaps unfortunate that the project had to be launched under the unfavourable publishing conditions of today, but the society's decision to go ahead is but a demonstration of the courage and farsightedness of its officers.

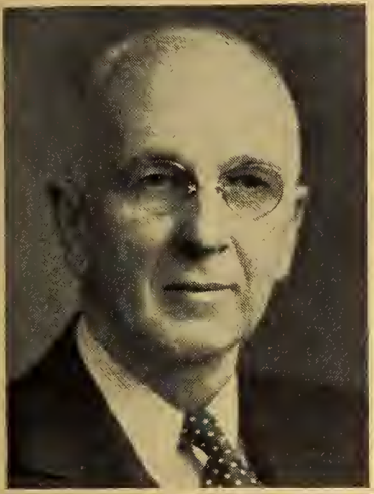
The Engineering Journal wishes its new confrere success in all its endeavours. If in any way the Engineering Institute can be of assistance in the naturally difficult days that follow the inauguration of a venture such as this, it will be a pleasure to have the opportunity to serve.

To *Chemistry in Canada* we extend our sincere good wishes and our hopes for an early realization of its programme and its purposes.

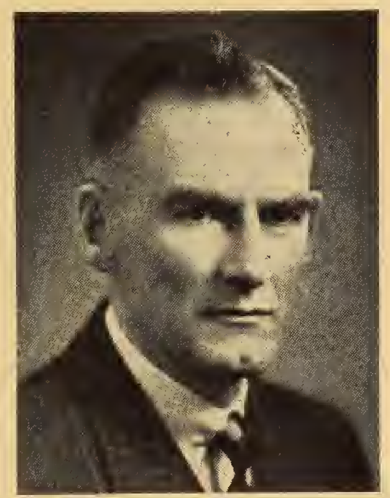
A New Dean of Engineering at Toronto

Some time ago the retirement of Dr. C. R. Young, Dean of the Faculty of Applied Science and Engineering, University of Toronto was announced by Dr. Sydney Smith, president of the university.

Dr. Young's successor has now been named. He is Kenneth F. Tupper formerly director of the engineering division of the atomic energy project at Chalk River. Mr. Tupper joined the University staff on April 1st and will succeed Dr. Young on July 1st.



C. R. Young, M.E.I.C.



Copyright by Milne Studios Ltd.
Kenneth F. Tupper, M.E.I.C.

C. R. Young was appointed Dean in 1941 after serving on the University of Toronto engineering staff for more than thirty years. He has had a distinguished career (see *The Engineering Journal March, 1942*, page 173) and has been the recipient of numerous honours and awards in recognition of his services. One of his greatest interests has been the development in engineers of " those things that represent the significant difference between a professional engineer and a technologist " to quote from his message to the members of the Institute upon his election to the presidency in 1942.

The *Journal* has published several of his addresses and writings in support of this purpose and they have invariably been noteworthy. If Dr. Young is able to turn some of his newly acquired leisure time to further writings on this subject the profession will be greatly enriched thereby.

Kenneth F. Tupper is one of Canada's leading authorities on atomic energy and jet propulsion. He received his early education in Saskatoon and Calgary and graduated with the degree of B.A.Sc. in mechanical engineering from the University of Toronto in 1929. He also holds a masters degree in aeronautical engineering from the University of Michigan.

During the war he was one of three members of a mission of the National Research Council sent to England to study the jet propulsion work of Air Commodore (now Sir Frank) Whittle. When a Canadian Crown Company, Turbo Research Limited was formed to work in the field of jet propulsion, Mr. Tupper became its chief engineer.

Turbo Research Limited was absorbed by the Avro (Canada) organization and Mr. Tupper went to the Chalk River Project where in February, 1947, he became director of the engineering division.

At 43 Mr. Tupper has accepted the responsibility for the operation of Canada's largest engineering school, which responsibility is made greater because of the high standard set by his predecessor. Mr. Tupper's record indicates that the University has made a wise choice and his age should ensure that the benefits will be available for many years. In the leisure afforded by his retirement, Dean Young may be able to exert an even wider influence in the acquirement and manifestation by engineers of " those attributes of a well-rounded professional man that lie beyond and above a mere knowledge of the techniques and procedures necessary to the attainment of the physical objectives of his work."

It appears that the benefit to the profession will be twofold.

Personality Requirements for Engineers

Three years ago the Engineers' Council for Professional Development of which the Engineering Institute is a member sponsored a study, the purpose of which was to sensitize college students as to the definite requirements of personality and character which the world wants and needs, in its leaders and its workers.

A subcommittee, chaired by Dr. Allan R. Cullimore undertook to explore the possibilities of inventorying the personality factors involved in requirements for various engineering classifications, by sending questionnaires to a pilot group of widely dispersed executives, representing a good cross section of American engineering activity.

An interim report by this subcommittee published in June 1948, reported that for general engineering, " intelligence " was ranked first as a requirement by 80 per cent of replies; and a further 18 per cent ranked intelligence in third or fourth place. Similarly " physically acceptable " was ranked by 93 per cent of replies in fifth or sixth place. " Dependability " was ranked in the first three places by 82 per cent of replies, while " organizationally acceptable " ranked in the first three places by 84 per cent of replies.

In the field of Research and Design the general pattern was largely the same. In Management and Production " intelligent " holds first place by a small margin, while other qualities increase in value. In Sales and Distribution, " intelligence " is ranked in fourth place, while " dynamic " and " physically acceptable " moved up to first and second place respectively.

The next step was to broaden the survey by tapping the opinions of two other groups: college administrators, and engineering faculties. The comparison of replies from these groups with those from the pilot group indicates that for General Engineering there are few deviations. The administrators were inclined to give equal weight to " Intelligent " and " Dependable ", in contrast to the other two groups. On the whole the picture is very much the same for all, as regards concentration of choice.

The result of a similar sampling of a cross-section of merchants, distributors, manufacturers and personnel officers, compared to the rankings in the " General " classification made by the three groups sampled at the engineering level, indicated a substantial agreement, except in the qualities of " Dynamic " and " Emotionally Acceptable ". The personnel officers distinctly reversed the relative positions previously established for these characteristics, placing the former in next to last place, just above " Physically Acceptable ", and advancing " Emotionally Acceptable " to fourth place.

Copies of the complete report may be secured through Headquarters of the Institute for 25 cents.

Correspondence

The Editor,

The November issue of the *Journal* published the ECPD " Canon of Ethics for Engineers " and solicited an expression of opinion from the membership. Engineering ethics has been the subject for study of a group of graduate students at Purdue University under the direction of Prof. R. E. Fadum. During classroom discussions, the following questions were raised which, I feel, should be clarified before the Canon of Ethics is adopted by the Institute.

(a) Engineers are frequently called upon to write letters of recommendation for former employees or students. Occasionally, the person writing the recommendation may feel that an unfavorable reply would be in the best interests of all concerned. Section 23 of the Code states, in part, " He (the Engineer) will not directly or indirectly injure the professional reputation, *prospects* or practice of another engineer." An unfavorable reply would certainly injure the prospects of the Engineer; however, I would consider it unethical not to submit a poor or negative recommendation when it is felt that the Engineer in question is absolutely unqualified or unsuited for the position for which he is applying. Because of the situation described above, a rewording of Section 23 appears to be in order.

(b) Section 15 of the Code states, " He (the Engineer) will not accept compensation, financial or otherwise, from more than one interested party *for the same service*, or for services pertaining to the same work, without the consent of all interested parties." It is common practice for consulting engineers to duplicate plans as much as possible provided, of course, that these plans are considered to be the most economical solution for their clients. Could not the words " for the same service " be interpreted as condemning this practice?

I would be interested in your views regarding the questions raised in this letter.

G. A. Leonards, M.E.I.C.,

Instructor, Soil Mechanics and Foundation Engineering, Purdue University, Lafayette, Indiana.

Second Wallberg Lecture

The Scientist and The Engineer

" The scientist and the engineer have much to contribute to progress, not only through their professional accomplishments, but also through the influence their example can exert on the attitudes of the general public. Current emphasis on research and development indicates increased public appreciation of the value and power of science, and adds up to greatly increased opportunities for scientists and engineers. But with the opportunities come new responsibilities. Has the rapid increase of public faith in science caught us unprepared to make good? If so, the pendulum may later swing the other way ".

This was the keynote of an address recently given by Dr. Karl Taylor Compton. The occasion was the presentation before the Faculty of Applied Science and Engineering of the University of Toronto, on January 11th, 1949, of the Second Wallberg Lecture, one of a series of continuing lectures for the advancement of engineering educational work, as provided for in bequests of the late Emil Wallberg, prominent Canadian engineer of Swedish birth, and bearing his name.

Following a brilliant service of fifteen years as Professor of Physics in Princeton University, culminating in the Chairmanship of the Department, Dr. Compton was appointed to the Presidency of the Massachusetts Institute of Technology in 1930. For eighteen years he filled that office with great distinction, retiring from it only a few months ago to become Chairman of the Research and Development Board of the United States Military Establishment. As member or directing head of over fifty Boards, Councils, Foundations, Commissions, Bureaux, or Committees he has made an incalculable contribution to his own country and to the whole civilized world in the furtherance of the arts of peace and the promotion of security against aggression.

What are the things, Dr. Compton asks, that people most crave and need? What can the scientist and engineer contribute toward the satisfaction of these desires? They crave peace and security; protection against the perils of nature; steady employment, more compatible working conditions, better housing, better health. The greatest ultimate challenge to mankind is the problem of maintaining our growing population in the face of rapidly depleting resources. Science and Engineering have positive contributions to make to every one of these requirements. Technological progress is the only common denominator to them all.

The author points out that "Salomon's House", the research organization visualized by Francis Bacon back in the sixteenth century in his *New Atlantis*, epitomizes the whole duty of the scientist and the engineer. For Bacon wrote that its objective was to arrive at "the knowledge of causes, the secret motions of things, and the enlarging of the bounds of human empire, to the effecting of all things possible." In conclusion he recalls the warning words of Francis Bacon: "that which man altereth not for the better, Time, the Great Innovator, altereth for the worse." The scientist and the Engineer must be creative and progressive.

Dean C. R. Young, of the University of Toronto, realizing the outstanding value and importance to the profession of the messages contained in these Wallberg lectures, has again made it possible for members of the Engineering Institute of Canada to obtain copies of another of them. Single copies will be supplied free on application to the Secretary of the Faculty of Applied Science and Engineering, Toronto University. Multiple copies will be furnished at cost.

A. B. Dove, M.E.I.C., of Montreal, a director of the **Wire Association,** advises that this world wide organization will hold its first Canadian regional meeting in Montreal, April 28-29, at the Mount Royal Hotel. Information may be obtained from Mr. Dove, at the Steel Company of Canada Limited, P.O. Box 460, Montreal.

The **Canadian Welding Bureau** announces that Harry Thomasson, M.E.I.C., of the Canadian Westinghouse Company will make a western lecture tour in the interests of the Bureau. He will spend two days in each of the cities of Winnipeg, Calgary, Edmonton and Vancouver, delivering a series of lectures to participants in the Bureau's welding course.

In addition a public lecture on the first evening of Mr. Thomasson's visit to each city will be open to all interested in arc welding in any of its branches or applications.

Mr. Thomasson's itinerary is planned as follows: Winnipeg May 2 and 3; Calgary, May 5 and 6; Edmonton, May 9 and 10; Vancouver, May 12 and 13.

The office of the Bureau is at 22 College Street, Toronto, Ont.

News of Other Societies

The **Canadian Electrical Association's** 59th Annual Convention will be held at the Banff Springs Hotel, Alberta, on June 28, 29 and 30, 1948.

B. C. Fairchild, managing director of C.E.A., is in charge of arrangements. His office is at Room 704 Tramways Building, Montreal 1, Que.

The Society of Automotive Engineers has scheduled for June 5-10 the summer meeting at French Lick Springs Hotel, French Lick, Indiana.

Inquiries should be addressed to the S.A.E., at 29 West 39 St., New York 18, N.Y.

A cordial invitation from the **American Society for Engineering Education** is extended to all those interested in Engineering Education to attend the 57th Annual Meeting (June 20 to June 24) to be held at Rensselaer Polytechnic Institute located at Troy, New York.

The programme at this meeting will consist of four general sessions to hear and to discuss papers of general interest together with some sixty functional conferences to discuss a variety of educational problems in such fields as, research mathematics, mechanics, architectural engineering, drawing, mineral engineering, industrial engineering, chemical engineering, electrical engineering, aeronautical engineering, physics, etc.

Reservations for registration, quarters and meals may be made by writing to Professor A. Allan K. Booth, Department of Mechanics, Rensselaer Polytechnic Institute, Troy, New York.

The **Canadian International Trade Fair** will take place from May 30 to June 10, 1949, at the Exhibition Grounds in Toronto, Ont.

The 1949 annual meeting of the **Canadian Institute of Mining and Metallurgy** will be held in Montreal, April 25 to 28 at the Windsor Hotel.

The Montreal office of C.I.M.M. is at 811 Drummond Bldg.

The **Chemical Institute of Canada** reminds engineers of the annual chemical conference in Halifax, May 30 to June 1, 1949.

Registration forms are available from C.I.C. head office, 18 Rideau St., Ottawa.

The Canadian regional conference of the **Illuminating Engineering Society** will take place April 28-29, in Toronto.

F. P. Labey of Northern Electric Co. Ltd., 1620 Notre Dame St. West, Montreal, is secretary of the Montreal Section of the Society.

The Montreal regional conference of the **American Institute of Chemical Engineers,** September 7, 8 and 9, 1949, will devote two days to technical papers. Plant visits to several industries at Shawinigan Falls Que., have also been arranged.

The local committee on arrangements is headed by Dr. H. R. L. Streight, P.O. Box 10, Montreal.

Engineers are reminded that details of the 1949 spring meeting of the **American Society of Mechanical Engineers,** at New London, Conn., May 2-4, are available from the Society, 29 West 39th St., New York, 18, N.Y.

The **American Water Works Association,** 500 Fifth Avenue, New York, 18, N.Y., has mailed advance programmes for the 69th Annual Conference which is to be held May 30 to June 3, at the Stevens Hotel in Chicago, Ill.

The 1949 convention of the Canadian Section of **American Water Works Association** is taking place April 25-27 at the Chateau Frontenac in Quebec City.

Personals

Notes of the Personal Activities of Members of the Institute

Dr. Arthur Surveyer, M.E.I.C., of Montreal, general consulting engineer, has been named a director of Credit Foncier Franco-Canadien Ltee. Dr. Surveyer is also a director of The Shawinigan Water and Power Company and of the Holland-Canada Mortgage Company.

He is a past-president of the Institute, a member of the National Research Council, and is active in various Canadian and American professional and business organizations.

Dr. J. B. Chollies, M.E.I.C., has been elected a director of The Shawinigan Water and Power Co., Montreal.

Dr. Challies, vice-president and executive engineer of the company, is also vice-president, director and secretary of St. Maurice Power Corp., and a director of Brown Co. and of Brown Corp., The Shawinigan Engineering Co. Ltd., Quebec Power Co., Canadian Light and Power Co., and Saguenay Power Co. Ltd.

W. K. Dow, M.E.I.C., and **A. B. Rogers,** M.E.I.C., announce their association as consulting electrical engineers, providing a complete consulting service covering industrial and municipal electric power and lighting systems.

Mr. Rogers, upon leaving McGill University in 1915, joined the Engineering Department of Shawinigan Water and Power Company. For the past more than 25 years he has been in charge of the department of the Shawinigan Engineering Company responsible for the design and construction of primary and terminal substations on the Shawinigan system. He was also responsible for the design and installation of a large number of electric boiler plants.

Mr. Rogers has been intimately associated with the rapid expansion of the Shawinigan Company, recently retiring as senior electrical engineer. He is a member of the Corporation of Professional Engineers of Quebec, The Canadian Standards Association and the Canadian Electrical Association. He is also a life member of the Montreal Amateur Athletic Association.

Mr. Dow graduated in electrical engineering from the University of Toronto in 1937, when he began his engineering career with the Aluminum Company of Canada at Arvida.

From then until 1943 he was engaged in many phases of the company's power expansion programme involving facilities for aluminum ore and reduction plants at Arvida, Shawinigan Falls, La-tuque, and Beauharnois, Quebec, as well as fabrication plants at Toronto and Kingston, Ontario. During this time he obtained leave-of-absence from the Aluminum Company to pursue post-graduate studies at the University of London, England.

In 1943, Mr. Dow transferred to Canadian Comstock Company where he was responsible for the design and supervision of power installation for a number of large industries, particularly those of aluminum and pulp and paper. He is now engaged in projects for the pulp and paper and mining industries. He is a member of the Corporation of Professional Engineers of Quebec, The Association of Professional Engineers of Ontario, and the American Institute of Electrical Engineers.

W. L. Bird, M.E.I.C., retired on March 31 after 43 years with the Kaministiquia Power Company, Fort William, Ont. He has been vice-president and general manager of the Power Company, which was recently purchased by the Ontario Hydro Electric Commission to be absorbed into the Hydro's Thunder Bay system.

The Company, with headquarters in Fort William and plant at Kakabeca Falls has operated successfully since 1906. On its first local industrial contract for electrical power, with the Fort William Times-Journal, dated June, 1906, one of the signators was Mr. Bird, who has been manager since its inauguration.

J. B. Challies, M.E.I.C.

Lt.-Col. K. R. Swinton, M.E.I.C., former honorary secretary, was elected president of the Montreal branch, United Nations Association.

C. V. Antenbring, M.E.I.C., chairman of the Winnipeg Branch of the Institute this year, is president and manager of Cowin & Co. Ltd., Winnipeg.

Mr. Antenbring graduated from the University of Manitoba in 1926. He joined Cowin & Co. in 1927 as designer of reinforced concrete, after spending some months with Kelker & DeLeew, municipal engineers, Chicago, Ill.

W. Romsoy, M.E.I.C., has been elected chairman of the newly formed Central British Columbia Branch of the Institute. He is a former district engineer of the Department of Public Works of British Columbia, having been stationed in various parts of the Province before his retirement recently.

Prof. A. H. Douglos, M.E.I.C., the new chairman of the Saskatchewan Branch of the Institute, is associate professor in the engineering department of the University of Saskatchewan, Saskatoon.

Prof. Douglas is a graduate of that University, and was with the department of Highways of Saskatchewan as assistant bridge engineer until he entered the R.C.A.F. in 1941. He served until 1945, attaining the rank of wing commander. He returned to the Department of Highways and Transportation as inspection engineer, but joined the faculty of the University in 1947.

A. M. Thompson, M.E.I.C., was recently elected 1949 chairman of the Electrical Section of the Winnipeg Branch of the Institute. Mr. Thompson is apparatus sales engineer with the Canadian General Electric Company in Winnipeg.

J. W. Kerr, M.E.I.C., has been named manager of the newly formed Central Station and Transportation Sales Division of Canadian Westinghouse Company Limited, Hamilton, Ont.

Mr. Kerr was formerly manager of central station sales and his responsibilities will continue to cover all central station apparatus, and in addition will include steam and traction apparatus.

J. F. Lester, M.E.I.C., is now with the Highways Branch of the Department of Public Works of the Province of Alberta, at Edmonton.

Mr. Lester has recently returned from England, where he was engineer agent with Sir Alfred McAlpine Ltd., civil engineering contractor at Wolverhampton.

W. F. McMullen, M.E.I.C., has been named manager of the Technical Personnel Division of Canadian General Electric Company.

In addition to assisting the director of personnel administration in all matters relating to the technical personnel of the Company, Mr. McMullen is responsible for recruiting engineering graduates for C.G.E.'s well-known "Test" Course, and assisting in their final placement within C.G.E. or industry generally.

J. D. Duncon, M.E.I.C., has been named manager of the Induction Motor Section of Canadian General Electric Co. Ltd., with responsibility for the company's wide range of induction motors over 1/3-h.p. in rating.

Per Hall, M.E.I.C.

A graduate of the University of British Columbia, on completion of C.G.E.'s "Test" Training he held a number of appointments in the company's apparatus organization. During the war, he rose to the rank of major in overseas service with the Royal Canadian Corps of Signals, and received the M.B.E.

Lieut.-Col. R. J. Carson, M.E.I.C., has been posted to National Defence Headquarters in Ottawa, where he is G.S.O. I to the chief engineer, Canadian Army. He was formerly command engineer officer, Eastern Command, Halifax.

Colonel Carson is a graduate of Royal Military College, 1936, and of Queen's University, Kingston, 1937.

J. M. Taylor, M.E.I.C., has announced that he will retire as city electrical engineer for Saskatoon, Sask., at the end of the year 1949.

Mr. Taylor has been with the City's engineering staff for 37 years. He was educated in Scotland, and he worked in Dundee, from 1909 to 1912 with Maxwell's Ltd., as outside foreman in charge of construction and maintenance of electric light and power installations. In Canada he was employed by the city of Saskatoon power plant, receiving successively appointments as chief electrician, assistant city electrical engineer, and acting city electrical engineer. He received his appointment as city electrical engineer in 1933.

W. A. Friebel, M.E.I.C., presently assistant electrical engineer for the city of Saskatoon, Sask., will become city electrical engineer at the end of the year 1949, on the retirement of J. M. Taylor, M.E.I.C.

Mr. Friebel is an electrical engineering graduate of University of Manitoba, class of 1933. He joined the Saskatchewan Power Commission in 1936, and was successively a relieving operator, a district operator and a district superintendent. He worked also during this time as a laboratory instructor in electrical engineering at University of Saskatchewan.

P. G. W. Walker, M.E.I.C., is with the Spruce Falls Power and Paper Co. Ltd., at Kapuskasing, Ont.

He had been municipal engineer for the City of St. Thomas, Ont., since 1947. He was with the R.A.F. as a pilot and instructor from 1941 to 1946, after which he returned to Sir Alexander Gibb & Partners in England, with whom he was associated before going into the R.A.F. Mr. Walker graduated from Cambridge University, England, in 1941.

Per Holl, M.E.I.C., has been appointed assistant chief engineer of the Foundation Company of Canada Limited, at Montreal.

Mr. Hall joined the Company in 1946 as a designing engineer. He had previously been with Aluminum Company of Canada Limited from 1940, working in Montreal, Newfoundland, the Virgin Islands, and in British Guiana.

Mr. Hall graduated in 1929 from the Royal Technical College in Copenhagen, Denmark, receiving the degree of B.Sc. in civil engineering. He worked in Europe until 1939.

G. G. Leroux, M.E.I.C., has been named supervisor, engineering design, for Foundation Company of Canada Limited, at Montreal.

Mr. Leroux is a graduate of McGill University, receiving the degree of bachelor of engineering in 1940. He was with the R.C.A.F. from 1940 to 1945, and he joined Foundation Company in 1945.

J. M. Thomas, M.E.I.C., has been named mechanical engineer for Foundation Company of Canada Limited, at Montreal. Mr. Thomas is a graduate of University of New Brunswick, with degrees in civil and electrical engineering received in 1932 and 1933. He joined Foundation Company in Montreal in 1940, coming from the Highway Department of New Brunswick. He was with Foundation Maritime Ltd., in 1942 to 1945, with the position of planning engineer and later production engineer. He returned to Foundation Company of Canada in Montreal as designing engineer in 1945.

J. D. McPherson, M.E.I.C., is the 1949 chairman of the Junior Section of the Montreal Branch of the Institute. He is assistant chief engineer of Highway Paving Co. Ltd., Montreal. He graduated from University of Alberta in 1943 with the degree of B.Sc. in civil engineering.

Thomas A. Monti, M.E.I.C., has been appointed district engineer in Montreal for the Canadian Institute of Steel Construction.

He graduated in 1941 from Ecole Polytechnique, Montreal, and he joined the staff of Dominion Bridge Company. In 1943 he became assistant manager of Colonial Industries Ltd., in Montreal. From 1944 to 1947, Mr. Monti worked as a consulting engineer to small machinery manufacturers, and upon receiving from the University of Montreal in 1947 the degree of Doctor of Science in physics of metals, he joined the National Research Council as Montreal regional representative. During the last six years, he has also been attached to the Ecole Polytechnique as part-time assistant professor in strength of materials.

F. R. Thompson, Jr.E.I.C., has accepted employment as a design engineer with Cockshutt Plow Co. Ltd., Brantford, Ont. He was previously a detail engineer with Mathews Conveyer Co. Ltd., Port Hope, Ont. He graduated from University of Saskatchewan in 1946, with the degree of B.Sc. in mechanical engineering.

W. E. Boyle, Jr.E.I.C., is joining the refrigeration engineering staff of Arnett Company Limited, Winnipeg, Man. He is a graduate mechanical engineer from the University of Saskatchewan, and has been on the instruction and research staff of that university prior to joining the Arnett organization.

A. R. Hailey, Jr.E.I.C., has been elected chairman of the Peterborough Branch of the Institute.

Mr. Hailey is assistant D.C. design engineer, Canadian General Electric Co. Ltd., Peterborough. He has been with the C.G.E. since his graduation in 1941 from the University of British Columbia with the degree of B.A.Sc.

A. R. Hailey, Jr.E.I.C.

Leo Schorry, Jr.E.I.C., has returned recently from Philadelphia where he attended a course in telemetering equipment and power recorders at the plant of Leeds & Northrup Ltd. Mr. Scharry is a sales engineer with Sangamo-Wagner Company, in Montreal.

James F. McKay, Jr.E.I.C., is employed by the Dow Chemical Company of Canada in Sarnia, Ont., as a process engineer. Mr. McKay recently returned from Massachusetts Institute of Technology where he followed a post graduate course in chemical engineering. A chemical engineering graduate of University of Saskatchewan class of 1944, he was for a time in the R.C.N.V.R. and was in 1946 in the production department of Naugaturck Chemicals, Elmira, Ont.

J. B. Goodfellow, Jr.E.I.C., has rejoined the Canadian Johns-Manville Company Limited, in Toronto, Ontario, as technical assistant to the Transite Pipe Section. He was previously a section leader with Stadler, Hurter and Company, consulting engineers in Montreal.

George Wood, S.E.I.C., has been elected president of the Engineering Society of the University of Saskatchewan for the 1949-50 academic year. Mr. Wood is a third year student in civil engineering and has had several executive positions in the society in the past. The retiring president is **Ston Rokosh,** S.E.I.C.

John Edwin Armstrong

C.E., M.E.I.C., C.P.E.Q.

President

OF

The Engineering Institute of Canada

Chief Engineer,
CANADIAN PACIFIC RAILWAY

In these days when there is so much talk about Canadian engineers going to the United States it is a pleasure to dwell on a case where an American has come to Canada and taken an important part in building this country.

The president-elect of the Institute, John E. Armstrong, was born in Peoria, Ill. He graduated from Bradley Polytechnic Institute in 1905 and from Cornell University in 1908 with the degree of civil engineer.

From the beginning he has been associated with railways, starting at an early age in 1901. His earliest experience was with the Toledo, Peoria and Western Railway but subsequently (1908-12) he moved to the Pennsylvania Lines West of Pittsburgh. In 1912 he came to Canada with the Canadian Pacific Railway at Montreal as assistant engineer (1912-28) becoming a Canadian citizen in 1921. In 1928 he was appointed assistant chief engineer and in 1939 became chief engineer, the position he still occupies.

In spite of the heavy duties of his professional position he has found time to assist in the activities of various societies. There are three organizations to which he has made special contributions; the American Railway Engineering Association (A.R.E.A.) the Canadian Standards Association (C.S.A.) and the Engineering Institute of Canada. In the A.R.E.A., he has been a director, chairman of standing and special committees, a vice-president, and president in 1934-35. In the C.S.A. he was appointed to the main committee in 1941, and to the executive committee in 1945. He still occupies both offices. In 1940 he was president of the Canadian Railway Club. In the Engineering Institute he has been a member since 1917. He was on the finance committee from 1939 to 1947 and was vice-president of the Institute for 1945-46. He has been an active member of the Kiwanis Club of Montreal for many years.

Perhaps his most noteworthy work for the Institute was his chairmanship of the special committee on the Engineering Features of Civil Defense in 1942. Working closely with Prof. Fred Webster, (subsequently HON. M.E.I.C.) who, as Great Britain's expert on the effects of bombing, visited Canada for several months in 1942, his committee organized groups across Canada, and assembled a great volume of information which would have been vital had this country been bombed. Under his guidance the Institute arranged for a three day "secret" convention at Toronto at which Prof. Webster provided information to 150 engineers from all parts of Canada. The proceedings were published subsequently and constituted Canada's text book on that subject. Mr. Armstrong's leadership in that urgent project indicates his splendid qualifications for the high office of President of the Engineering Institute of Canada.

Newly Elected Officers of the Institute

W. J. W. Reid, M.E.I.C., the newly-elected vice-president of the Institute, for the Province of Ontario, is president of Otis-Fensom Elevator Company Limited, Hamilton, Ontario.

Mr. Reid was born in Oak River, Manitoba. After primary education in the West, he enlisted in the Royal Canadian Engineers and served overseas in World War I. On his return to Canada he studied for matriculation at the University of Manitoba, and subsequently enrolled at University of Toronto, in electrical engineering and graduated in 1924.

In 1921 he joined the Otis-Fensom Elevator Company Ltd. as a student engineer during vacations. In 1924 he completed a specialized training course with the parent Company in U.S.A. and returned to Canada in charge of electrical manufacturing and control. Subsequently, he acted as field engineer on elevator construction and service until 1926, when he became assistant construction manager. In 1927 he was appointed construction manager and in 1930 his duties were enlarged to embrace supervision of all engineering activities of the Company. In 1933 he became works manager and occupied this position at the outbreak of War in 1939.

W. J. W. Reid, M.E.I.C.

In 1941 Mr. Reid was appointed manager of munitions in charge of all Otis-Fensom war production with particular reference to the Ordnance Division, a large-scale high-priority Bofors gun project erected and operated for the Canadian Government. This undertaking, which produced thousands of complete Bofors equipments in addition to a large volume of other war materials, was built up in the course of two years from a small nucleus of technical personnel to a peak employment of approximately 5,000 persons. Mr. Reid was also responsible for the no less exacting duties of disbanding and terminating this project when its wartime purpose had been served. In the post-war re-establishment and expansion of the Company's peacetime activities, Mr. Reid's responsibilities were extended to cover all phases of Company activity throughout the Dominion, in recognition of which he was named vice-president in 1946. In July 1948 he was elected to the presidency of the Company.

Mr. Reid is active in professional, academic, and business associations. His offices and membership in such organizations include: president, Association of Professional Engineers of the Province of Ontario; and member of the Executive Committee, Canadian Manufacturers' Association, Hamilton-Brantford Branch. As a member of the Canadian Standards Association, Mr. Reid took a leading part in the framing and promotion of a Standard Elevator Safety Code for Canada. He has been active, also, in affairs of the E.I.C., which he joined in 1920 as a Student. He transferred to Associate Member in 1929 and to Member in 1940.

Richard E. Heartz, M.E.I.C., has been elected vice president of the Institute for the Province of Quebec.

Mr. Heartz, who is vice president and chief engineer of The Shawinigan Engineering Company, Limited, is a native of Prince Edward Island. Following graduation from McGill University in 1917 he enlisted with the Royal Flying Corps and received his commission with the Royal Air Force the following year.

In 1920 he began his long association with The Shawinigan Engineering Company. As resident engineer on power development at Shawinigan Falls, La Gabelle, St. Narcisse and Paugan Falls, he gained engineering and construction experience, subsequently being transferred to the Head Office in Montreal. In 1935 he was appointed assistant chief engineer and since then has been intimately associated with all phases of the numerous diversified projects of the company. Many innovations in methods and equipment, which have led to increased economies, have been initiated by him.

In 1941, during the recent war, he was loaned by the Shawinigan Company to Wartime Merchant Shipping Limited where he acted in the capacity of general manager until 1942. This Dominion-wide organization directed and co-ordinated the efforts of fourteen shipyards and their associated suppliers in carrying out the Canadian cargo vessel programme which employed at the peak 75,000 men and produced over 4,-000 000 tons of shipping.

Portrait by Nakash

R. E. Heartz, M.E.I.C.

In January, 1947, Mr. Heartz was appointed vice-president and chief engineer and was made a director of the Shawinigan Engineering Company.

Active in the affairs of the Engineering Institute for some years, Mr. Heartz was chairman of the Montreal Branch in 1941; member of council 1942-43-44; treasurer in 1948. He joined the Institute in 1917 as a Student, transferring to Associate Member in 1926, to Member in 1933. Other professional affiliations include The Corporation of Professional Engineers of Quebec, the Canadian Electrical Association, and the American Society of Civil Engineers.

H. N. Macpherson, M.E.I.C.

H. Nalan Macphersan, M.E.I.C., has been elected vice president of the Institute to represent the Western Provinces.

Mr. Macpherson, who was born at Carleton Place, Ont., is a graduate in civil engineering of University of Toronto, class of 1914, with a degree of B.A.Sc. He worked on shell inspection for the Imperial Ministry of Munitions during World War I, at Moose Jaw, Edmonton and Montreal. He later joined O'Connor Bros. Ltd., as engineer, on the Company's road building contracts in Montreal and Richmond, Que., and from 1921 to 1923 he conducted a contracting business, building bridges in Saskatchewan.

He established Regina Creosoted Products Ltd., in 1926, and since that time has been identified with the timber preservation industry. He was for several years with the Alberta Wood Preserving Co. Ltd., and the Canada Creosoting Company Ltd., at Calgary, as assistant to the vice-president, western region. In 1932 he established the Permanent Timber Products Limited at Vancouver, and continues as president of this company. His specialized field in engineering is the design and standardization of preserved timber units for construction of drainage structures.

In Regina, Calgary and Vancouver he has served on executives and committees in service club, community organization, and Board of Trade. During the last war he was a director of the Greater Vancouver Welfare Federation and Community Chest and on the executive of the Co-ordinating Council. For the Department of Labour he filled the position of regional director of the Wartime Bureau of Technical Personnel. Advisory to the construction controller, he was one of a committee of three on British Columbia licenses and priorities throughout the war.

He has been prominently identified with many engineering organizations, particularly in the Canadian West. He joined the Institute in 1917 as an Associate Member, transferring to member in 1936. He has been active on the executives of the Saskatchewan, Calgary, and Vancouver Branches, and was councillor for the Vancouver Branch in 1941.

E. C. O'Leary, M.E.I.C.

E. C. O'Leary, M.E.I.C., has been elected to represent the Halifax Branch on the Council of the Institute.

Mr. O'Leary was born in Nova Scotia and was educated at St. Mary's College, Halifax, and Nova Scotia Technical College. He obtained his degree in civil engineering from the latter in 1936.

After early experience on building construction he turned to highway-work and general construction. In his present positions as vice-president and general manager of the McDonald Construction Company, Limited (Halifax) and holding corresponding positions in the Nova Scotia Construction Company, Limited, he is now engaged in all types of construction.

Shortly after graduation he was construction superintendent with the Standard Paving Maritime Limited. As such he was in charge of various highway projects throughout the Maritimes; the construction of the Sydney-Reserve Airport; and various water, sewer and street developments. Notable amongst these was the Big Indian Lake Development, designed and executed to supply the war-swollen population and the Military and Naval installations of Halifax with water. The ground work—streets, sewer and water—for practically all Maritime Housing projects throughout Nova Scotia was carried out under his supervision.

On the formation of the Halifax Public Service Commission in 1944 he joined that organization as operations engineer. As such he was responsible for the construction, maintenance and repairs of the public water system in and serving the City of Halifax. In 1946 Mr. O'Leary took an active part in the reorganization and affiliation of the firms with which he is now associated; and has occupied his present positions since that date.

L. O. Cass, M.E.I.C.

Mr. O'Leary is the vice-president of the Halifax Construction Association. He has been active in his support of the Halifax Branch of the Institute, being elected its chairman in 1947. He joined the Institute in 1941 as a member.

L. O. Cass, M.E.I.C., has been elected Councillor of the Institute representing the Saint John Branch.

Born in Springhill, N.B., he received a B.Sc. degree in civil engineering from the University of New Brunswick in 1939 and entered the Department of Highways of New Brunswick as office engineer and instrumentman.

The same year he transferred to the New Brunswick Hydro Commission as chief of party on transmission line location. He went to Montreal, where he was employed by T. Pringle & Son, consulting engineers, as draughtsman and field engineer, and later to the Foundation Company of Canada as assistant to the group superintendent of construction at St. Paul l'Ermite, Que. Transferred to Shipshaw, Que., by the company, he was area engineer there in 1941 and 1942, when he joined E. G. M. Cape & Co. of Montreal as field engineer on the construction of the naval ordnance depot at Dartmouth, N.S.

Mr. Cass has been with the National Harbours Board at Saint John, N.B., since 1944 when he became assistant engineer.

Mr. Cass was chairman of the Saint John Branch in 1946. He joined the Institute in 1939 as a Student, transferring to Member in 1944.

G. T. Malby, M.E.I.C., has been elected Councillor of the Institute representing the Saguenay Branch.

G. T. Malby, M.E.I.C.

Mr. Malby was born at Winnipeg, Man., and educated at St. John's Technical High School, Man. He graduated with the degree of B.Sc. in civil engineering from the University of Manitoba in 1935. Upon graduation he was employed by the Manitoba Government Highway Department as field engineer. In 1936 he was engaged on aerial mapping for the topographical and Aerial Surveys Branch, Dominion Department of the Interior, Ottawa. Joining the engineering staff of Saguenay Power Company, Arvida, Que., he worked on design, construction and survey work in 1937. He transferred to the Aluminum Company of Canada, Ltd., in 1939 as assistant resident engineer on construction. In 1942 he became resident engineer for the same Company in charge of construction of plants at Shawinigan Falls and La Tuque, Que. A year later he joined the operating staff of the La Tuque Works as mechanical superintendent and in 1944 was transferred to Alcan's Arvida Works as assistant mechanical superintendent in charge of construction and plant maintenance. In 1949 he became construction engineer and inspector of buildings and structures for the Aluminum Company of Canada, Limited, there.

Mr. Malby is a member of the Cor-

Notman photo

F. W. Bradshaw, M.E.I.C.

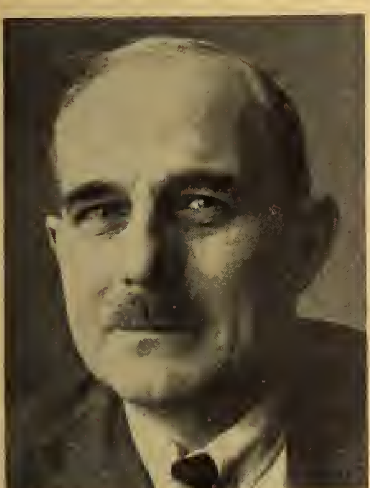
poration of Professional Engineers of Quebec. He joined the Institute as a Junior in 1938, transferring to member in 1947.

F. W. Bradshaw, M.E.I.C., has been elected Councillor of the Institute representing the Saint Maurice Valley Branch.

Mr. Bradshaw is chief engineer of the Consolidated Paper Corporation Limited, Grand'Mère, Que. He is from Surrey, England, a graduate of Wellington College, Berks, England, class of 1918. He attended McGill University in Montreal, graduating in 1925 with the degree of B.Sc. with honours in Chemical Engineering.

He had worked on vacations for Price Brothers, at Kenogami, Que., and on graduation he went to the Riverbend mill of the Company in Quebec. He was transferred later that year by the Company to Quebec City, where he was engineering assistant to the research engineer. He spent two years as assistant to the mechanical superintendent of Price Bros. Riverbend mill, and he went in 1930 to the company's specialty mill at Jonquiere, Que., where he was engineer in charge of control and engineering design.

From 1932 to 1934 he held various temporary positions including that of engineer for Carlton Mills Ltd., woollen manufacturers; and during this time he was with G. D. Peters & Co., welding engineers; and with Beardmore Leathers Limited, tannery.



R. N. Coke, M.E.I.C.

It was in 1934 that Mr. Bradshaw joined Consolidated Paper Corp. Ltd., serving first at Three Rivers, Que., as development engineer in the research department. He was named assistant to the chief engineer in 1937, and was transferred to Grand'Mère, Que. He became assistant chief engineer in 1941, chief engineer in 1943.

Mr. Bradshaw joined the Institute in 1920 as a Student, transferring to Junior in 1925, to Associate Member in 1929, to Member in 1940. He is a member of the Technical Section of the Canadian Pulp & Paper Association; and of the Technical Section of the American Pulp & Paper Industry.

E. B. Jubien, M.E.I.C., has been elected as one of the new Councillors of the Institute representing the Montreal Branch.

He was born in Sydney, N.S., educated at Mount Allison University and McGill University, graduating from the latter in 1926 in electrical engineering. He joined General Electric Company at Lynn, Mass., where he took the student test course. On returning to Canada in 1927 he was associated with Ryan & Coombe in Montreal for a period of 6 months. Subsequently in 1928 he was employed by Canadian Industries Limited, engineering department. During the period 1928-1940 he carried out engineering work at the various C.I.L. plants throughout Canada. In 1940 he was transferred to General Chemical Division of C.I.L. as assistant production manager, and in 1942 was made acting production manager. He joined Dominion Textile Co. Ltd., engineering department in 1946.

He is a member or the American Institute of Chemical Engineers and of the Corporation of Professional Engineers of Quebec. He is also a member of the Canadian Management Council and a member of the Municipal Council in the Town of Mount Royal.

He joined the Institute as a Student in 1922, became an Associate Member in 1935 and a Member in 1940. He has been a member of the Montreal Branch entertainment committee, and chairman of the papers and meetings committee in 1945, and a member of the executive committee in 1946-1947.

R. N. Coke, M.E.I.C., has been elected Councillor of the Institute representing the Montreal Branch.

He is a chief engineer, Operation Division, Quebec Hydro Electric Commission, Montreal. He was born in Jamaica, B.W.I., and graduated from McGill University with a degree of B.Sc. in electrical engineering in 1914. He joined the staff of the Northern Ontario Light and Power Company on graduation, but enlisted with the Canadian Army in 1914 and served overseas until 1919. On return to Canada, he joined the engineering staff of the Saskatchewan Provincial Telephone Company in Regina. In 1920 he joined the Bell Telephone Company in Toronto as assistant traffic engineer. In 1921 he worked with the Canadian Westinghouse Company in Hamilton, Ont., as erecting engineer. He became associated the next year with the Winnipeg Electric Company as assistant electrical engineer and later transferred to the Northern Western Power Co., as electrical engineer. In 1929 he joined the staff of the Montreal Light, Heat & Power Cons. as assistant general superintendent M.L.H. & P. Cons. and later of Hydro-Quebec.

E. B. Jubien, M.E.I.C.

Mr. Coke who has been active in Montreal Branch affairs, is a past chairman and a member of various committees. He joined the Institute in 1917 as a Junior, transferring to Associate Member in 1923, and to Member in 1939.

R. D. Bennett, M.E.I.C., has been elected to represent the Kingston Branch on the Council of the Institute.

He is a native of Montreal and attended McGill University, where he obtained B.Eng. and M.Sc. degrees in 1932 and 1933 respectively, and having served as demonstrator in the department of chemical engineering for three years, received his Ph.D. in 1935.

From 1935-1937 he was associated with the Canadian Industrial Alcohol Co. Ltd. and with J. T. MacDonald and Co. Ltd., joining Canadian Industries Limited in 1938. With that firm he served in various research and production capacities at Beloeil and Shawinigan Falls, Quebec, and in 1941 was transferred to C-I-L's Nylon Division in Montreal. In 1942, coinciding with the opening of the Kingston nylon plant, he was moved to Kingston, Ontario, where, having held Nylon Division technical and production posts, he is now in charge of nylon technical service.

Mr. Bennett is a past chairman of the Branch. He joined the Institute as a Student in 1930, transferring to Associate Member in 1938, and to Member in 1940.

J. L. Shearer, M.E.I.C., has been elected Councillor of the Institute representing the Ottawa Branch.

He is engineer to the commission, Ottawa Suburban Roads Commission. He is a native of Ottawa and a graduate of Queen's University, Kingston, Ont. From 1928 until 1933 he held various positions in Western Canada and on the Pacific coast in connection with municipal engineering construction work. In 1933 he returned to Ottawa and was for two years in charge of construction of large relief sewers being built by the City of Ottawa engineering department. Following this he was em-

R. D. Bennett, M.E.I.C.

J. L. Shearer, M.E.I.C.

V. A. McKillop, M.E.I.C.

W. H. Small, M.E.I.C. (Fryer)

ployed by N. B. MacRostie, M.E.I.C., civil engineer of Ottawa, in drawing up reports on flood conditions in southern Ontario. After short intervals with Donald-Hunt Limited, Montreal, and the Aluminum Company of Canada Limited, Arvida, Que., he was for two years on the staff of the Ottawa Division of the Ontario Department of Highways. He then was employed by the assessment department of the City of Ottawa, until his appointment to his present position in 1945.

Mr. Shearer is immediate past chairman of the Ottawa Branch. He became a Student member of the Institute in 1928, an Associate Member in 1936, a Member in 1940.

V. A. McKillop, M.E.I.C., has been re-elected Councillor of the Institute representing the London Branch. Born at West Lorne, Ont., he graduated from the University of Toronto with a B.A.Sc. degree in 1924. On graduation Mr. McKillop joined the staff of the Public Utilities Commission at London, Ont., as assistant engineer and two years later was promoted to engineer. He is at present assistant manager of the Commission.

Mr. McKillop joined the Institute as a Junior in 1926, transferring to Associate Member in 1927. He became a Member in 1940.

D. G. Geiger, M.E.I.C., has been elected Councillor of the Institute to represent the Toronto Branch.

Mr. Geiger is from Ottawa, a graduate of Queen's University with B.Sc. degrees in electrical and mechanical engineering, received in 1922 and 1923. He remained at the University after graduating as a demonstrator in electrical engineering for two years, and in 1924 joined the transmission engineering department of the Bell Telephone Company of Canada at Toronto. He returned to Queen's as a lecturer in 1926. There he was in charge of broadcasting and operating station CFRC and redesigned and rebuilt the broadcasting equipment. He rejoined the Bell Telephone Company two years later, going to the transmission department at Montreal, and transferred in 1930 to his present position as transmission engineer at Toronto.

Mr. Geiger is a member of the Council of Queen's University, and has been a member of the national committee of communication of the American Institute of Electrical Engineers. He is vice-president of the A.I.E.E. Mr. Geiger has been active on the Toronto Branch of the Engineering Institute, and was its chairman in 1947. He joined the Institute in 1922 as a Student, transferring to Associate Member in 1928 and to Member in 1938.

F. J. Ryder, M.E.I.C., has been elected Member of Council of the Institute for the Border Cities Branch.

Born at Holyoke, Mass., he graduated from McGill University in civil engineering in 1929. After graduation he was employed in the draughting department of the Canadian Bridge Company in Walkerville, Ont. In 1938, he accepted the position of sales engineer with the same company in their Toronto Office and served in that capacity until 1943, when he was transferred back to head office in Walkerville to assist in planning and production of war materials. In 1945 he was appointed to the position of assistant shop superintendent in Walkerville, and still serves in that capacity.

Mr. Ryder joined the Institute as a Student in 1928, transferring to Junior in 1935 and to Member in 1942. He served as secretary-treasurer of the Border Cities Branch in 1945, and as chairman of the Branch in 1946.

W. H. Small, M.E.I.C., has been elected Councillor of the Institute representing the Lakehead Branch.

Mr. Small is from Benzonia, Michigan. He attended Michigan State College, graduating in 1908 with a B.Sc. degree in civil engineering. He was first employed as a manual training instructor by the school board at Port Huron, Mich., and in 1909 accepted a similar position in Louisville, Ky. He came to Canada in 1912 as draughtsman for Barnett-McQueen Construction Company, Fort William, Ont., and in 1914 worked with C. D. Howe, as designing engineer. Back in the United States in 1916 he was draughtsman for the Webster Manufacturing Company at Tiffin, Ohio, until his return to Canada and to the Barnett McQueen Company as chief draughtsman in 1917. He was promoted in 1934 to chief engineer and is now vice-president and chief engineer of the firm.

Mr. Small was chairman of the Lakehead Branch in 1946. He joined the Institute in 1939 as a Member.

F. E. Estlin, M.E.I.C., has been elected Councillor of the Institute to represent the Saskatchewan Branch.

Born at Melita, Man., he graduated

D. G. Geiger, M.E.I.C.

F. J. Ryder, M.E.I.C.

from the University of Manitoba with a B.Sc. degree in electrical engineering in 1925. On graduation he joined the Canadian General Electric Company at Peterborough, Ont., being transferred the following year to Winnipeg, as industrial control specialist. In 1932 he moved to Regina, Sask., as sales engineer with the company.

In 1946, Mr. Estlin was chairman of the Saskatchewan Branch, and president of the Association of Professional Engineers of Saskatchewan. He joined the Institute in 1938 as an Associate Member, transferring to Member in 1940.

J. V. Rogers, M.E.I.C., has been elected Councillor of the Institute to represent the Kootenay Branch.

Mr. Rogers, the assistant chief engineer of Consolidated Mining & Smelting Company at Trail, B.C., is from Victoria, B.C. He received the degree of B.A.Sc., in electrical engineering from University of British Columbia in 1933. He did airport and highway work for a time for the Department of National Defense M.D. 11, in Victoria, and he worked in 1934-35 as operator in the Island Falls plant of Churchill River Power Company, Sask., and he later became assistant engineer on construction of the 4th unit extension of the Island Falls power plant.

In 1937 he worked on preliminary plans for a hydro plant for Berens River Mines, Favorable Falls, Sask. He worked then, on the 5th unit extension at Island Falls as construction engineer.

Mr. Rogers was, from 1938 to 1940, mechanical superintendent of the Privateer Mine at Zeballos, B.C., after which he joined Consolidated Mining & Smelting Company as a draughtsman. He was on loan to the Federal government from the Company from 1940-42, as chief draughtsman on construction of chemical plants in Calgary, Alta. Then, on loan to the Alberta Nitrogen Products chemical plant at Calgary, he was plant engineer for about two years. He did work in 1944 on natural gas in Turner Valley, as inspection engineer on loan to the Alberta government. Returning to Consolidated Mining & Smelting Co., he did special work for the chief engineer at Trail, B.C. He was named superintendent of construction and maintenance in 1945, and in 1948 was appointed assistant chief engineer.

Mr. Rogers is a member of the Association of Professional Engineers of British Columbia, and the Trail Board of Trade. He joined the Engineering Institute in 1936 as a Junior, transferring to Associate Member in 1939, and to Member in 1940.

J. E. Cranswick, M.E.I.C., has been elected to represent the Edmonton Branch on the Council of the Institute.

He is from Moore Park, Man., and a graduate in electrical engineering of the University of Manitoba, class of 1929. He spent two years after graduation with Canadian Westinghouse Company at Hamilton, Ont., on a student apprenticeship course. He went to the Edmonton branch office of the Company in 1931 and, apart from one year in Calgary, he has been on sales work in that area since that time. He is at present, branch manager for Canadian Westinghouse in Edmonton.

Mr. Cranswick was chairman of the Edmonton Branch of E.I.C. in 1947. He joined the Institute in 1942 as a Member.

W. N. Kelly, M.E.I.C., has been elected councillor of the Institute representing the Vancouver Branch.

Mr. Kelly was born at Douglas, Isle of Man, and he was educated at Belfast Technical College and at Liverpool University. He served an apprenticeship as engineer with Combe, Barbour and Combe Ltd., Belfast. From 1903 to 1908 he was employed with various firms of engineers at Liverpool. He came to Canada in 1909 and was engaged in various engineering projects in British Columbia. Later, he was appointed superintending engineer with Consolidated Whaling Corporation and North Pacific Sea Products Co. In 1925, he joined the staff of Yarrows Limited in Vancouver. In 1926, he entered private practice as a consulting engineer at Vancouver and has since been carrying on successfully as mechanical engineer and marine surveyor. Mr. Kelly is surveyor to the British Corporation for the Register of Shipping and Aircraft.

The Vancouver Branch elected Mr. Kelly as its chairman in 1943. He had joined the Institute as Member in 1936.

J. V. Rogers, M.E.I.C.

J. E. Cranswick, M.E.I.C.

F. E. Estlin, M.E.I.C.

William N. Kelly, M.E.I.C.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

David Rhys Thomas, M.E.I.C., who was prominent in mining engineering, died on March 4th, 1949, at his home in Toronto.

Mr. Thomas was born near Cardiff, Wales, in 1876, and received his education and technical training in Great Britain. He came to Canada in 1899 and was first employed as an assistant engineer in the engineering department of the Canadian Pacific Railway, in Manitoba and Saskatchewan.

In 1901 he went to British Columbia, where he worked on railway construction. He was later mine surveyor for the Le Roi No. 2 Mine, at Rossland, and in 1903 became surveyor and assayer for Rossland Kootenay Mining Co., Ltd.

In 1905 he went to Mexico where he remained about ten years, during which time he was successively mine superintendent of the Sirena (silver) Mine at Guanajuato, and manager of the Topia Mine (silver lead) and the Predilecta Mine (silver) both in the state of Durango. In 1916 he came back to Canada and was assistant manager of the Moose Mountain Iron Mine at Sellwood, Ontario, and also laid out the original operational scheme for the limestone quarry near Ingersoll, Ont., now operated by the American Cyanimide Company. He returned to Mexico in 1919 to become engineer in charge of exploration for the Mexican Corporation and was afterwards manager of the Teziutlan copper smelter at that time owned or controlled by the above company. While with the Mexican Corporation he was largely instrumental in planning the operational layout at the Fresnillo mine at Zacatceas, a large tonnage low grade silver operation. With the fall in price of silver and base metals in 1921, Mr. Thomas came to New York where he was for a time connected with the formerly well known consulting mining firm of Spurr & Cox Inc.

In 1925 he returned to Canada to take the management of the Argonaut gold mine near Larder Lake, a position which he held until the mine finally closed down in 1928. He then settled in Toronto and devoted himself to consulting work for a few years, finally retiring from active practice in the early "thirties".

Mr. Thomas was a life member of the Institute from 1947. He had become an Associate Member in 1904, and a member in 1913. He also held membership in the Canadian Institute of Mining & Metallurgy, the American Institute of Mining and Metallurgical Engineers, and the Association of Professional Engineers of Ontario.

Frank Herbert Latimer, M.E.I.C., whose death on February 10th, 1948, has only recently come to the attention of the *Journal*, was a life member of the Institute from March, 1946. He was born at Kincardine, Ont., in 1860.

Mr. Latimer had retired from his private practice in Engineering for some time and was in fruit growing business, though retaining his interest in current engineering work.

Mr. Latimer was a graduate of Royal Military College, class of 1882. He did railway work until 1890 in Canada and the United States. He then went into general practice in Vancouver, B.C. He made his headquarters at Vernon, B.C., for a time, and he designed irrigation works for that municipality and for others in the province. He went to Penticton, B.C., as engineer for the Southern Okanagan Land Company about 1911. There he designed municipal water works and electric light for the municipality and others. He was in private practice chiefly on irrigation and surveys. He was a British Columbia land surveyor and a Dominion Land Surveyor.

Probably the most notable achievement of his engineering career was the Southern Okanagan Irrigation Project undertaking on behalf of the British Columbia government from 1918 to 1924, which transformed the area, once only sagebrush and cactus, into one of the richest and most thriving fruit growing sections of the country. Mr. Latimer was actively interested, also, in pharmacy and assaying, philately and golf.

He had joined the Institute in 1916 as a Member.

V. Boshuck, S.E.I.C., who was a student in engineering at University of Toronto, died in December, 1948, at the age of 27.

He was born at Saskatoon, Sask., and was educated at Bedford Road College there. He served as a machinist in the R.C.E.M.E. from 1942 to 1945, and he entered University of Toronto in 1946.

E. I. Armstrong, S.E.I.C., of City View, Ontario, who was a student at Carlton College, Ottawa, died recently. He was born at Kirk's Ferry, Quebec, in 1922.

He was educated at Glebe Collegiate Institute, Ottawa, and entered Carlton in 1947.

C.I.O.S.

Regional Conference

The first Western Hemisphere Regional Conference of the CIOS (Comité International d'Organisation Scientifique) will be held on May 13-14 in conjunction with the 1949 Annual Meeting of the Institute. The Institute is a member of the Canadian Management Council and is co-operating with CMC and with the National Management Council (U.S.A.) and the Instituto de Organizacao Racional do Trabalho (Brazil) in the preparations for this important meeting.

Details of the Management sessions were included in the preliminary programme mailed to members early in April.

Sec.-Treas., G. W. MOULE, P.O. Box 541, Winnipeg, Man.

NEWS of the BRANCHES

Activities of the Twenty-nine Branches of the Institute and abstracts of papers presented at their meetings

Edmonton

E. K. Cumming, M.E.I.C.
Secretary-Treasurer

Dr. M. R. de Quervain of Davos, Switzerland, addressed a dinner meeting of the Edmonton Branch the evening of February the 22, 1949. This meeting was held in the banquet room of the "Seven Seas" restaurant, with approximately 95 members and their guests in attendance. Dr. de Quervain and Mr. D. C. Pearce just completed a tour of the Canadian Rockies, during which they carried out snow research on behalf of the National Research Council of Canada.

In commencing his address Dr. de Quervain quoted excerpts from a report, "Snow and Ice Research in Canada" by R. F. Leggett of the National Research Council, to the effect that Canadian research was being carried out with a view to improving snow handling equipment, over-snow travel, prevention of ice jams, and the effect of winter conditions on food, clothing and shelter. The speaker said that Canada is making extensive surveys to obtain information on snow storage and its effect on irrigation, erosion, soil conservation, and frost protection. He went on to describe the snow research laboratory in Davos, Switzerland and the methods used in that country. He described penetrometer tests taken in the field, the method of obtaining samples, compressive and tensile tests carried out on these samples, and microscopic examination of snow formations. Dr. de Quervain illustrated his talk with a number of coloured slides and a silent film showing the tests actually being carried out. Following his address Dr. de Quervain presented a film showing Swiss skiiers in action.

All present found the address extremely interesting and educational and were surprised to learn of the progress that has been made in the scientific investigation of snow conditions. The speaker was introduced by H. J. Williamson, and a vote of thanks was moved by L. A. Thorssen.

❖ ❖ ❖

On March 10th the Edmonton Branch heard an address on **Synthetic Resins and Some of Their Applications** given by G. R. MacLean of Edmonton. Approximately forty members and their guests were present at the meeting at which Chairman H. W. Tye presided.

Mr. MacLean, who has had considerable experience in industrial chemistry since graduating from the University of Alberta as a chemical engineer, discussed the formation of the various types of resins used in industry; their application to the manufacture of industrial and decorative laminates, plywoods, insulation bats, surface finishes, and their use in oil well plugging and the utilization of wood wastes. The speaker described the manufacture of a typical industrial laminate using a cloth base and a B-stage phenolic resin binder. He also described the process used in manufacturing laminates with a paper base. He stated that the Howard Smith Paper Mills were utilizing lignin in making a decorative laminate with a phenolic resin binder.

In discussing the local picture the speaker stated that he did not think that the present market would support the production of synthetic resins in the Edmonton area despite the fact that all the raw materials are readily available. He discussed the possible use of resins in the local plywood industry and in making insulating board using straw or wood chips as a base. He said that the resins would also find their applications in the oil well drilling and in the manufacture of rockwool insulation. To illustrate his remarks the speaker showed samples of various resins, insulation boards using wood and straw bases, and industrial and decorative laminates.

A lively discussion followed concerning the possible development of such an industry in northern Alberta. The speaker was thanked by P. L. Debney and the meeting adjourned.

Hamilton

I. M. Macdonald, Jr.E.I.C.
Secretary-Treasurer

L. C. Galloway, Jr.E.I.C.
Branch News Editor

Public Transportation in the City of Hamilton was the subject of an address by P. A. S. Todd, general manager of the Hamilton Street Railway Company, at the meeting of the Hamilton branch on October 21, 1948. Fifty-one members and guests came to the meeting at McMaster University and all felt richly rewarded for their attendance. Vice-Chairman N. Metcalfe, occupied the chair, and called upon A. E. Tuck to introduce Mr. Todd to the audience.

Mr. Todd outlined some of the achievements of the Hamilton Street Railway Company since it undertook to operate the street railway system in September 1946, and proceeded to elaborate on some of the problems, such as the handling of peak loads, the distribution and collection of tickets, and the operation and scheduling of equipment and personnel.

Mr. Todd went on to say that at present the system is in a period of reconstruction. Much old and obsolete equipment must be scrapped shortly and plans are being made to revise the transportation system to further the aim of providing good service economically. Such plans, in the face of present shortages of manpower and equipment are fraught with many difficulties and can only be implemented after much hard work and much farsighted constructive thinking.

The interest of the audience in Mr. Todd's address was made evident by the many questions which followed. In conclusion, J. Elliot, expressed the appreciation of those present and Vice-Chairman Metcalfe adjourned the meeting.

❖ ❖ ❖

Local pottery manufacturers held the spotlight at the annual Ladies Night of the Hamilton Branch on November 18, 1948. Seventy-five members and guests attended and after dinner, heard an address by Mr. R. B. Hassal of the Smith and Stone Co., Georgetown, Ont. Chairman W. Brown presided, and Neil Metcalfe introduced the speaker.

Mr. Hassal recounted the history of pottery, remarking that its discovery probably came about when early man lined baskets with mud and by accident these baskets were baked. Pottery was made in Egypt and China as long ago as 2500 B.C. The Greeks learned to manufacture pottery, as eventually did the Romans, whose red samian ware supplanted the sun-dried mud ware made by the Britons in England.

Pottery, as an English industry, first appeared in the sixteenth century. Since that time, many improvements in manufacturing processes have brought the English pottery to the position of esteem which it holds today. Mr. Hassal pointed out that the American industry also produces pottery of a very fine quality and is now challenging the long standing superiority of English product.

J. M. Elliot, M.E.I.C., thanked Mr. Hassal for his interesting address and for the remainder of the evening two films were shown. The first, "A Beautiful Necessity", supplied by Sovereign Potters Ltd., dealt with the manufacture of plates, saucers, cups and other pottery.

As a diversion, the second film "Clean Water" dealt with an entirely different subject — that of sewage treatment.

❖ ❖ ❖

Once again members of the Hamilton Branch had the great pleasure of hearing an address by John Ness of the Imperial Oil Co., on the subject, **Oil.** The occasion was the Annual Meeting of the Hamilton Branch of the Institute held on January 13, 1949, in the Scottish Rite Club. Sixty-two members and guests attended.

After dinner Chairman W. Brown commenced the business of the evening. The announcement was made that four members of the branch J. P. Gordon, N. L. Crosby, W. G. Milne, M. Pequegnat, had been granted the status of life membership, and congratulations were extended to them. It was also announced that a member of the Hamilton Branch, W. J. W. Ried, M.E.I.C., had been elected to the office of president of the Association of Professional Engineers of the Province of Ontario; and that another member, J. R. Dunbar, had been elected to the office of chairman of the Ontario Division.

The announcement of proposed plans for the founding of a new branch of the Institute at Kitchener, Ontario, caused considerable interest since Kitchener has been in the area served by the Hamilton Branch. The Hamilton Branch joined with Vice-President J. A. Vance who expressed his approval of the plans and his encouragement for the new branch.

The main item of business was the election of officers for the branch for the year 1949. The retiring chairman W. E. Brown expressed his appreciation for the efforts of the other members of the executive during 1948 and his confidence in the executive which was being installed. The newly-elected chairman, Neil Metcalfe, then took the chair, and Mr. W. B. Nicol introduced Mr. John Ness.

Mr. Ness traced the development of the oil industry in Canada from its beginnings in Ontario prior to 1895 to the present developments in Alberta. He illustrated that Canada has been supplying only a small fraction of its own oil consumption. The remainder has been imported from many parts of the world.

Canada's main source of oil has been the famous Turner Valley Field and ever since its discovery, untiring efforts in the search of oil have been exerted in the hope that somewhere in Canada another "Turner Valley" may be hidden. These searches have been in vain until recently when oil was discovered at Leduc, Alberta. The size of the deposit there is of course not known but the prospects of a large deposit are very good and Canada may be on the point of vastly improving her oil situation.

The many questions which followed illustrated the interest of the audience in the speaker's subject. Following them, M. A. Montgomery, thanked the speaker and Neil Metcalfe adjourned the meeting.

Kingston

D. L. Rigsby, M.E.I.C.
Secretary-Treasurer

J. T. Provan, Jr.E.I.C.
Branch News Editor

On Tuesday, February 22, the Kingston Branch of the Institute held a joint meeting with the Engineering Society of Queen's University.

The Engineering Institute portion of the programme consisted of the annual presentation of student papers for which the branch presents prizes. H. L. Armstrong, S.E.I.C., won first prize with his presentation of a paper on **Pulse Code Modulation.** This paper described in detail the theoretical aspects of long distance communication by wire using the pulse code modulation system. The second prize was won by A. D. Kaill who spoke on **Rolling Bearings.** Mr. Kaill's paper covered the importance of choosing the proper bearing for the job, applying it in a proper manner and a systematic maintenance procedure in order to minimize maintenance costs. R. H. Rehder spoke on the **Ward-Leonard System** of electrical control, and was awarded third prize. This paper generally covered the description of the system and its application on rolling mills, mine hoists, elevators, etc.

The guest speaker for the Engineering Society of Queen's University was Dr. J. J. Green, chief research aeronautical engineer, Air Transport Board, Ottawa. Dr. Green spoke on the subject of **Jet Engines,** discussing the advantages and disadvantages of using jet engines in aircraft. He described, with illustrations, the axial flow and radial types of compressors used on these engines, and he spoke in detail of the theoretical aspects of the design of engines of this type, and compared jet engines with the standard piston-type internal combustion engine which has been in use on aircraft since the early days of flying. Dr. Green stated that cooling and structural progress limits piston engine power and that the development of the jet engine has been aided materially by these limitations.

Chairman of the Engineering Society portion of the programme was G. Devlin, while P. Roy presided over the presentation of the student papers. Judges for the papers were Mr. M. G. Saunders, M.E.I.C., Col. L. F. Grant, M.E.I.C., and Professor H. J. Styles, P.Eng.

Dr. Green was introduced by Professor S. D. Lash who was a former classmate of Dr. Green's at the University of London.

❖ ❖ ❖

A meeting of the Kingston Branch was held on March 16, 1949 at Gordon Hall, Queen's University. Lt.-Col. W. S. Hunt introduced the guest speaker, Mr. D. H. Parker, assistant designer, A. V. Roe Canada Limited, who spoke on the subject of **Gas Turbine Engines with Special Reference to the Avro Canada Chinook.** Phil Roy, chairman of the meeting, thanked the speaker.

Mr. Parker's talk was illustrated by a sound film showing the general principles of jet propulsion, slides showing in detail the working parts of gas turbine engines, photographs showing assembly methods and machining of parts; and also various actual parts of the engine itself were on hand for visual inspection. The general history of gas turbine engines, fundamentals of jet propulsion, the centrifugal gas turbine engine, the axial gas turbine engine, were discussed, and Mr. Parker concluded with an analysis of the Avro Canada Chinook.

London

G. E. Humphries, M.E.I.C.
Secretary-Treasurer

Robert G. Code, M.E.I.C.
Branch News Editor

A meeting of the London Branch was held on February 22, at Wolseley Barracks Officers' Mess. The Military Engineers Association also attended.

The guest speaker of the evening was Wilfrid Jury, curator of the Museum of the University of Western Ontario. Mr Jury is a well-known authority on Indian life in Canada and has spent a lifetime of research on the early American inhabitants. His address entitled **Digging Into the Past** was found to be extremely interesting, especially to the engineers whose work takes them over the areas Mr. Jury spoke about.

The speaker was introduced by George N. Scroggie and thanked by S. G. Chipman.

Niagara Peninsula

J. J. Miller, M.E.I.C.
Secretary-Treasurer

C. A. O. Dell, M.E.I.C.
Branch News Editor

The Niagara Peninsula Branch held a joint meeting with members of The Association of Professional Engineers of Ontario on Thursday, March 3, at The Red Casque Inn.

We were honoured to have as our guests, W. J. W. Reid and Col. T. M. Medland, president and secretary, respectively, of the Association. President Reid spoke briefly to the members on matters of joint interest to the Association and to the Institute, and mentioned his hope for an early consummation of a joint agreement between the Institute and the Association. He expressed sincere appreciation to the branch for the invitation extended to him to address the engineers of this district.

The speaker of the evening was Professor G. B. Langford, professor of mining geology, University of Toronto. His subject was **Shore Erosion of Lake Ontario.**

Over one hundred engineers and landowners and their friends, resident in this district had assembled for this meeting and they were well rewarded by Dr. Langford's exposition of the subject.

He pointed out that the problem of shore erosion of Lake Ontario is one that should receive immediate national attention because of the alarming rat at which valuable land is being lost. This land is of a type that is so scarce in Canda that it should be regarded as a highly important national asset. Dr Langford also pointed out that the problem should receive the attention of the very best engineering talent because the studies necessary and the works to be prescribed, designed and built are of a size and nature that can be brought to a successful conclusion by trained engineers only.

Results of Dr. Langford's investigation, which has been going on over the past several months under government sponsorship, were extensively described and cannot be touched upon in this report, but his story held the fixed interest of the audience and developed a lively period of questions and answers.

A buffet lunch was served after the meeting during which members had the opportunity of meeting the speakers and guests.

Ottawa

J. C. Elliott, M.E.I.C.
Secretary-Treasurer

Capt. A. Bernard, M.E.I.C.
Branch News Editor

The first luncheon meeting in 1949 of the Ottawa Branch was held in the Que-

…bec Suite of the Chateau Laurier on February 10.

The new chairman, A. A. Swinnerton, occupied the chair. The success of this luncheon augurs well for the ability of the new management committee led by Lt.-Col. M. C. S. Brown to keep up the standards set by the 1948 Committee led by S. Hardcastle.

Guest speaker for the occasion was Allan C. Ross, president of the Canadian Construction Association, who gave a very informative talk on **Construction in Canada**. Mr. Ross stressed that as construction men and engineers we have an important stake in and vital responsibility for Canada's future. Membership in the Canadian Construction Association has risen from 200 before the war to 700 today. The Association is now recognized by the Government as the voice of the construction industry.

It is estimated that Canada's Construction Industry in 1949, together with industries indirectly working for construction, will be a $2 billion business. It can well be called a "Barometer of Business". The C.C.A. is urging the Government, and with some success, that public projects unless vitally necessary should be postponed in favour of such things as housing etc. This planning of construction, for better use of our material and labour resources, would greatly help construction costs.

The problem of housing in Canada was an important item in the paper given by Mr. Ross. Climatic conditions, together with a dislike by Canadians of prefabs, make mass production of houses difficult. It was suggested that "packaged housing", whereby all necessary materials, cut to length, and erection drawings are supplied to the builder, might be the answer. Another solution suggested was the "Modular System" where all house components are designed in multiples of certain dimensions such as 4", 8", 12" etc. This latter would require certain changes in the manufacture of basic components such as bricks, etc.

The C.C.A. is strongly in favour of better Dominion-Provincial relations. This would help particularly in setting up a Dominion Provincial Highway Commission which would plan our roads to better open up our resources.

In conclusion Mr. Ross said the C.C.A. had pronounced in no uncertain terms strong belief in free enterprise, founded on liberty of the individual will to operate to the best interests of our country.

Dr. J. J. Green announced the revival of the "Ottawa Aeronautical Section" of the E.I.C. and asked all interested to attend a meeting on February 14.

The Chairman announced the acceptance as a life member Mr. E. Viens, who has been a member of the institute for 35 years. Mr. Viens is a retired member of the Department of Public Works.

❖ ❖ ❖

The Ottawa Engineers Wives Association are to be complimented on the huge success of a dance held at Lansdowne Park on February 12. This association founded in 1947 had as its first president Mrs. K. Cameron, wife of Dr. K. Cameron, a past president of the E.I.C.

Officers responsible for the success of the dance were: Mrs. L. M. Christmas, President; Mrs. A. K. Laing, Treasurer; Mrs. T. Foulkes, Secretary; Mrs. S. Parsons, Social Convenor.

Congratulations, ladies, and may we have many such parties in the future.

❖ ❖ ❖

A luncheon meeting of the Ottawa Branch was held at the Chateau Laurier on March 10, 1949.

Featured at the meeting were films shown through the courtesy of the Bell Telephone Company in Ottawa, these films were as follows:

"Trouble in Spots"—which gave a very instructive review of trouble encountered in telephone construction and service trouble caused by magnetic storms due to sun spots; preservation of telephone poles; and new methods of cable line construction.

"Telephone Screen Review (No. 3)"—This film describes radio telephone communications, and deals with micro waves beam transmission radio; telephone on trains, and the production of unspoken speech.

"Western Crossing"—This film describes the building of 1600 miles of underground cable from east of the Mississippi to the Pacific Coast. Problems encountered where construction of cable lines cross desert and mountain areas. It also provided interesting information on modern cable laying equipment.

Guests at the head table were: Mr. R. H. Keefler, assistant to the president of the Bell Telephone Company; Mr. J. E. Hutchison, district manager of the Bell Telephone Company; Brig. J. L. Melville; Mr. J. H. Irvine, and Mr. H. R. Welch.

❖ ❖ ❖

A luncheon meeting of the Ottawa Branch E.I.C. was held at the Chateau Laurier on February 24, 1949.

The guest speaker Dr. O. M. Solandt, chairman of the Defence Research Board, was introduced by A/M G. O. Johnson.

The subject of Dr. Solandt's talk was **The Defence Research Board.** He mentioned the research organizations existing under the National Research Council and throughout the Services during the recent war, and the recognition in 1944 and 1945 of the necessity of planning a post war research organization.

The Defence Research Board was legally constituted on April 1, 1947. Organization was modelled administratively, to some extent, upon the National Research Council.

Dr. Solandt described the Headquarters Staff of the Board, its relations, with the Armed Forces and with the "research community" throughout the country. Advisory Committees form a link between Defence Research and the Armed Forces and the scientific community of the country.

Research establishments exist from Halifax to Esquimalt. Prominent among them are: the Experimental Station at Suffield, Alberta; the Canadian Armament Research and Development Establishment at Valcartier, Que.; the Defence Research Chemical Laboratory at Ottawa; the Radio Propagation Laboratory at Ottawa; the Defence Research Northern Laboratory at Churchill, Man.; and two naval Research Laboratories, at Halifax and Esquimalt.

The programme of the Board is based on Canadian facilities and resources, said Dr. Solandt, citing Arctic research, chemistry and anti-submarine research as some logical participants.

Engineers, he said, are important to every stage of the work, and the tendency to do more research and development in engineering schools should make Canadian industry more independent of help from other countries in the future, providing management will take full advantage of the opportunity.

While matters of defence have been uppermost in the programme of the Board, those of civil defence, and both offence and defence in the war of ideas will also be studied. This last field is one of the most complex fields of psychology, but there is no doubt that it is a legitimate activity of the Board.

Dr. Solandt closed by remarking that the best hope of preventing another war is to show that we are strong and that the operation of the Defence Research Board constitutes one of the means by which that strength can be developed.

Guests at the head table were: Air Vice-Marshal C. R. Dunlop; Major-Geenral F. F. Worthington, and Mr. W. D. Laird, assistant general secretary of the E.I.C.

Saint John

W. M. Brenan, M.E.I.C.
Secretary-Treasurer

A. R. Bonnell, M.E.I.C.
Branch News Editor

Ladies night at the Saint John Branch was held as a dinner meeting in the Admiral Beatty Hotel, Thursday evening, February 17.

After refreshments and dinner, a toast to the ladies was proposed by Malcolm Redding and responded to by Mrs. Victor Chestnut.

Ira P. Macnab, regional vice-president, of Halifax, was the speaker for the evening, this being his official visit to the Saint John Branch.

Mr. Macnab spoke briefly on Institute affairs, and then, for the benefit of the ladies present, enlarged on his experiences while working in Venezuela. The audience was impressed with Mr. Macnab's description of his encounters with snakes, with strange Venezuelian food and customs. He told of being personally acquainted with the late Signor Gomez, former dictator of Venezuela, and told of the good that the dictator did for his country in promoting industry. Most of the audience had only known of the late dictator's weak points.

Rod Richardson thanked Mr. Macnab for his talk, on behalf of the Branch.

Following Mr. Macnab's talk, colour motion pictures of Nova Scotia were shown. The pictures were of particular interest to vacationists.

H. P. Lingley, Chairman of the Branch, presided over the meeting.

Sarnia

C. P. Sturdee, M.E.I.C.
Secretary-Treasurer

J. M. Garton, Jr.E.I.C.
Branch News Editor

Ninety-three members and guests of the Sarnia Branch attended the first meeting of the year—a dinner meeting held at the Polymer Cafeteria on January 20. The guest speaker K. H. Braithwaite, vice-president of Fiberglas Canada Ltd., outlined the history of glass making and described the highly specialized methods of producing glass in fibre form. Mr. Braithwaite described the uses of the various types of glass fibres and some of the control testing required to obtain maximum insulating value. Following Mr. Braithwaite's interesting talk, a trip was made through the recently constructed plant of Fiberglas Canada Ltd.

❖ ❖ ❖

The second meeting in 1949 was held on February 23 at the Lutheran Hall. At this meeting, the Sarnia Branch was host to the Sarnia Section of the Chemical Institute of Canada. Following the dinner, the guest speaker, John Ness, retired geological expert of Imperial Oil Ltd., spoke on **Western Oil Developments.** Mr. Ness outlined the history of oil production and, in particular, Canada's role. The speaker described the development of the Southern Ontario fields, Turner Valley, Norman Wells, and the Leduc and Redwater areas. While Canada is still a major importer of oil, her position as a producer is rapidly strengthening.

In answering questions from the floor, Mr. Ness described the admirable way in which the Province of Alberta is handling the conservation aspects of its oil resources.

Following Mr. Ness' address, a new film, "A Mile Below the Wheat", was shown. This film, produced by Imperial Oil Ltd., gives a pictorial story of the discovery and development of the Leduc field.

Saskatchewan

D. W. Houston, M.E.I.C.
Secretary-Treasurer

R. Bing-Wo, M.E.I.C.
Branch News Editor

The Annual Meeting of the Saskatchewan Branch of the Institute and the Association of Professional Engineers of Saskatchewan was held in the Canadian Room of the Hotel Saskatchewan in Regina on February 18. The Annual Reports of both bodies were read. Reports of committees were presented as well as a report on the Saskatoon Section by J. B. Mantle, the local secretary. The election of officers for both Institute and Association offices was held.

The annual dinner took place in the private dining room of the Hotel Saskatchewan. Guest speaker was the Hon. W. S. Lloyd, Minister of Education for Saskatchewan, speaking on the subject **Technical Education.**

Mr. Lloyd traced the development of the growth of technical schools in Saskatchewan. He pointed out the need for institutions to train the young people of the province in practical skilled trades as differentiated from those who wanted the purely academic type of training. Large technical schools are now operating in the cities of Regina, Moose Jaw, Saskatoon and Swift Current with smaller schools being set up in many other districts. In sparsely settled districts where it has been impractical to form a school, the government provides itinerant teachers who travel about a route taking the education facilities to the students.

Past-president E. K. Phillips moved a vote of thanks to the Hon. Mr. Lloyd.

Saskatoon Section

J. B. Mantle, M.E.I.C.
Secretary

At a dinner meeting on January 26, 1949, with a record attendance of 110, the Saskatoon Section heard S. A. Kerr, resident geologist for Imperial Oil Limited at Leduc Oil Field, speak on the subject of the **Leduc Oil Field.** Mr. Kerr showed, with the aid of slides, the extent of the field and many details of the geological formations underlying it. Production figures were interesting; five million barrels of oil have been taken from the field to date with estimates on the amount remaining running as high as 170 million barrels. The present controlled production rate is 24,000 barrels per day.

Details as to the causes of the eruption last year of the Atlantic No. 3 well were given. Efforts to arrest the oil flow included stuffing the crater with 1,000 tons of roughage ranging from chicken feathers to cotton seed hulls. In view of the ever present fire hazard two inclined relief wells were drilled, one of these being completed the day before a fire resulted due to the derrick falling into the crater. The fire was snuffed out two days later by pumping tons of water down the relief well.

After the meeting Mr. Kerr answered a multitude of questions about Leduc.

❖ ❖ ❖

On February 24, the Saskatoon Section held a dinner meeting with the noted Swiss snow scientist, Dr. M. de Quervain as guest speaker. Dr. de Quervain, presently attached to the National Research Council's Division of Building Research, indicated with the aid of slides and a film the measures that had been taken by Switzerland to increase the knowledge of **Snow Mechanics** and to apply this knowledge in the overcoming of snow problems. Most of the research had been carried on at the Swiss Institute of Snow and Avalanche Research, established in 1943. Very careful and ingenious procedures were giving information on little known properties of ice and snow. Some properties studied were: evaporation rate; friction; grain size (observation under polerized light); heat conductivity; hardness; air permeability; tensile, compressive and shear strengths; plasticity and creep. Avalanches and snow slides were being prevented by tree planting, by agitation to prevent snow accumulation and by strategic placement of wooden retaining walls. A set of snow measuring instruments, the property of the National Research Council, was displayed and aroused much interest.

The well attended meeting, 97 being present including five guests from the University Physics Department, was given an opportunity of comparing the beauty of Switzerland and our own Rocky Mountain area. Dr. de Quervain showed several coloured slides of his own land while Dr. N. B. Hutcheon presented some of his coloured slides of Banff, Alberta.

Toronto

R. A. Muller, Jr.E.I.C.
Secretary-Treasurer

M. W. Huggins, M.E.I.C.
Branch News Editor

Monday night, January 31 was the annual Student's night of the Toronto Branch. Five excellent papers were presented by students of the engineering faculty of the University of Toronto.

The first prize of $50.00, donated by the T. Eaton Co. Ltd., was won by Paul LaPrairie of third year mining engineering, who spoke on **The Rock Burst Problem.** In his excellent paper he explained the causes of the two main types of rock burst which were of the surface and deep or seismic variety. He outlined the history of rock bursts insofar as it is known and went on to explain that Canada, as a result of an intensive research programme instituted in 1934 through the Ontario Mining Association and the National Research Council, is far ahead in this field.

The second and third prizes, of thirty and twenty dollars respectively, were donated by the Dickie Construction Co. Ltd. Second prize was won by G. C. McHaffie of fourth year mechanical engineering for his very interesting paper, **Some Thoughts on Vibration.** He discussed all types of vibration, from earthquakes to leaf flutter. He explained the causes of automobile wheel shimmy, motorcycle road wobble, suspension bridge oscillation, penstock vibration, turbine blade failure and numerous other types of vibrations. He closed by saying that vibration is a willing servant but an impossible master.

A. T. Patterson of fourth year engineering physics won third prize for his excellent paper **Electrostatic Precipitation of Dust.** A considerable part of the paper was based on his own experience with a precipitator built by himself and used in a hot air heated home. He brought the need for such equipment very close to home by showing a bacteria culture from a sample of University of Toronto air. There was a great contrast between this and another culture inocculated with electrostatically precipitated dust.

The remaining two speakers were: V. L. Richards of fourth year engineering and business, a prize winner last year, who presented a most interesting paper on the development of **The High Compression Automobile Engine;** and W. B. Duncan of third year mechanical engineering who spoke on **Magnetometers and Geophysical Surveys.**

The judges had great difficulty in selecting the three prize winners as all papers were excellent.

❖ ❖ ❖

A symposium on welding was held by the *Toronto Branch* on Thursday evening, February 24. The speakers were R. M. Gooderham, manager of the Canadian Welding Bureau; Ramsay Moon, welding consultant to the supporting organizations of the Canadian Welding Bureau; and Gordon Cape, welding engineer from the Dominion Bridge Company's Lachine office.

The meeting, held in the Physics Building of the University of Toronto, was attended by about 200. Members of the Canadian Welding Society were the guests of the Branch.

Mr. Gooderham presented an excellent paper on the work and aims of the Canadian Welding Bureau. He explained that despite its prime function as an approvals division of the Canadian Standards Association, because of the existing conditions it has been necessary for it to sponsor the development of educational programmes for engineers, welding technicians and welders. He pointed out, however, that it was hoped to expand the existing educational facilities of our universities and the new technical institutes in Ontario so that adequate welding training will be provided and the Bureau may then return to its most important field of operation; namely the preparation of codes and the certification of personnel and firms performing welding. By so doing it is confidently expected that Canadian welded products prepared to the Canadian Welding Bureau standards will receive world-wide acceptance

Mr. Moon confined his paper to a discussion of the welding research developments which have occurred in the past and those which may occur in the future. Mr. Moon stated that welding research has been so intensive that knowledge of fatigue stresses in welded structures is now ahead of our knowledge of the same stresses in riveted structures. He stated that in the future engineers are going to be much more concerned with ultimate capacities of structures and will be using the principles of limit design. He described developments in size of weld, type of electrodes, temperature control, fatigue stress reduction, and metallurgy of welding. He also described some very interesting experiments which were carried out on the welded liberty ships to determine loads and stresses in operation. He explained that Hitler favoured welding and as a result the German welding research has been very extensive. He stated that expenditures in welding research on this continent are still rather small.

Mr. Cape presented a very interesting paper, with illustrations, showing the many fabrication problems which must be solved and how some of them are solved. He cited a number of lessons which had been learned from experience and explained how these lessons had led to the development of fabrication rules. The explanations of how the various difficulties were overcome was most clear and it is certain that a very lengthy discussion would have developed had there been time available.

The vote of thanks was moved by D. D. Whitson.

Junior Section

R. C. Harris, s.e.i.c.
Secretary

On February 21, 1949, a meeting was held in the new mechanical engineering building of University of Toronto, when two speakers gave different aspects of the topic **The Professions and their Relation to Everyday Life.** Dr. R. W. I. Urquhart, medical director, of the Hydro Electric Power Commission of Ontario, outlined the training of a doctor, and his subsequent work as a general practitioner. The dangers of complete concentration were illustrated by contrasting the work of a specialist and of a general practitioner and it was said to be beneficial to stand back from time to time to study the general picture.

The growth of industrial medicine was outlined; with this the relation between doctor and patient became clear. The doctor's only thought is the good of his patient, status and financial benefit being disregarded. His attitude should be common to all professions. One should only consider and serve the best interests of the client.

Dr. Urquhart concluded with a few sentences on the importance of one's relationships with others. Human relations are continuous through one's life, and it were wise to cultivate interest and facility in these affairs.

Professor E. A. Allcut of the mechanical engineering department of University of Toronto, began by defining a profession and a trade. By numerous similes and parables he illustrated the close connections between the fundamentals of medicine, engineering and law.

Each profession has its training and apprenticeship period, leading to membership in a guild or professional association. In each profession, clarity of expression is a fundamental necessity, allowing the desirable interchange of ideas. A branch of a profession should not be practised to the exclusion of all others, nor must the humanities be neglected.

If there be any difference in status between engineers on one hand and lawyers and doctors on the other, it may be due to the fact that recognition of engineering as a profession has occurred so recently in comparison. Engineering must maintain and even improve its standards in the coming years.

The Junior Section plans include among its activities a stag party, and a field trip to the Des Joaquins and Stewartville developments of the H.E.P.C. of Ontario.

Vancouver

A. G. Fletcher, s.e.i.c.
Secretary-Treasurer

Stuart Lefeaux, jr.e.i.c.
Branch News Editor

The Vancouver Branch of the Engineering Institute held the annual Students' Night on Wednesday, February 16, 1949. There was a good attendance to hear the three papers chosen from twelve given by U.B.C. Engineering students in a preliminary contest.

Martin Dayton spoke on **Sewage Disposal for Kamloops, B.C.** Mr. Dayton, a fourth year civil engineering student briefly outlined the existing sewage disposal system and went on to explain how it could be improved.

Ivan Sorensen, a third year civil engineering student, spoke on **Henriette Lake Dam B.C.,** giving a clear account of the problems and methods of construction from the foundation to the spillway. After he had taken the audience through the entire construction with blackboard illustrations and verbal descriptions he showed, on the screen, a series of photographs of the project from beginning to completion.

Cyril White, a third year mechanical engineering student spoke on **Construction and Manufacture of Wire Rope.** Mr. White explained the manufacture of steel for wire ropes and described several patterns to which wire ropes are constructed. He explained what preformed strands are and demonstrated their advantages with various samples.

All three papers were well treated and delivered. After the judges announced the decision as to the first, second, and third prizes Mr. T. Berry, branch councillor, made the awards of three book prizes presented by Sumner Iron Works Ltd., Dominion Bridge Co. Ltd., and Canadian Liquid Air Ltd.

Victoria Branch

D. A. MacLean, jr.e.i.c.
Secretary-Treasurer

T. A. J. Leach, m.e.i.c.
News Editor

An interesting address was given by A. L. Carruthers on **Okanagan Flood Control** to members of the Victoria Branch on Friday, February 18, at the Prince Robert House.

The Okanagan Basin cuts across the 49th parallel and lies in the westerly half of the Monashee Mountain plateau in southern B.C. The valley extends southerly into Washington for 73 miles and northerly through British Columbia to Vernon.

Within this trough is found Okanagan Lake, which drains south from Penticton through Okanagan River, Skaha Lake, Okanagan Falls, the Town of Oliver, Osoyoos Lake, and finally joins the Columbia River at Brewster in Washington.

Mr. Carruthers discussed the topography of the basin; the economic and climatic conditions, and the history of water control activities in the area.

Following the flood of 1942, matters were brought to a head and a Dominion-Provincial Board was appointed to study all matters related to lake and river control and to recommend remedies. A survey of the Okanagan was carried out under the Provincial Department of Public Works, covering the valley floor from Penticton to the boundary, covering an area approximately 35 miles in length by 2½ miles in width. In addition a geological survey was made by the Department of Mines and Resources. For hydrological studies of the Okanagan River 30 gauging stations were added to the four existing ones. Studies followed to obtain the most beneficial control with the idea of assuring 1½ feet storage to satisfy irrigation demands.

As the present control range of 3 feet had proved inadequate this was increased to 4 feet with a range from 98.5 to elevation 102.5. This is to be accomplished by the construction of a new control dam at Penticton. In case of emergency the level can be drawn down an additional foot. This is to provide irrigation demands of Oliver during a possible drought period.

Further recommendations made by the Board included the construction of a 22 mile outlet channel down as far as Osoyoos Lake on the International Border. This channel would have a capacity of 2100 c.f.s. at the dam and this would increase down-stream to 3800 c.f.s., to allow for tributary inflow. With berms of 10 ft. on each side of the channel and the banks built up 4 ft above high water level a factor of safety would be provided in case the water overtopped the channel section.

As the new channel is considerably

(*Continued on page 242*)

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment*.

Situations Vacant

CIVIL

CIVIL ENGINEER with at least 2 years practical experience required by a large inter-municipal Corporation in Western Canada. Under supervision and direction applicant must be able to assist and perform technical engineering work, prepare plans, perform field duties in connection with the construction and maintenance of simple structures, to install equipment, supervise and direct small groups of men. Salary $235 up. Apply to File No. 1144-V.

RESIDENT CIVIL ENGINEER required to take charge of municipal improvements by firm of consulting engineers in Prairie Provinces. Give full details of age, qualifications and experience. Salary open. Apply to File No. 1148-V.

CIVIL ENGINEER, 25 to 30 years of age, preferably veteran with some experience in construction field. Duties and future would lie in supervision and later some administration. Position offers long term security, pension, etc., and reasonable advancement with merit. Salary open. Apply to File No. 1149-V.

JUNIOR CIVIL ENGINEER preferably with some experience in construction work required in Alberta by company starting the construction of a new hospital. Salary open. Apply to File No. 1152-V.

ELECTRICAL

ELECTRICAL ENGINEER required by city in Western Canada. Duties will primarily be concerned with designing of all new electrical work for any city department also inspecting and checking existing installations. Work will be under the supervision of the Superintendent and the Assistant Superintendent. Salary $250 to $300 per month. Apply to File No. 1143-V.

GRADUATE COMMUNICATION ENGINEERS, Canadian citizens, interested in audio, radio and video frequency systems engineering. Salaries up to $350 per month depending on qualifications, location Montreal. Apply to File No. 1147-V.

ELECTRICAL ENGINEER, who could be responsible for operation and maintenance of electrical, air conditioning and instrument systems for large, modern industrial plant in Eastern Ontario. Electrical trades experience is essential but training would be provided on air conditioning and instrument work. Apply to File No. 1155-V.

MISCELLANEOUS

MANAGER OF MANUFACTURING required by Canadian mill producing 500 tons per day of specialty papers, tissues, paperboard and newsprint. Position requires proven managerial ability and technical qualifications for the production of paper. Location most desirable and salary attractive. Apply to File No. 1140-V.

DESIGNING AND STRUCTURAL ENGINEERS required by Provincial Government West Coast. Duties include designing and preparation of plans of bridges, ferries, wharf structures, etc., in timber, steel or concrete. Preferably with experience in bridge design and construction. Salary $3,504. rising to $4,104. per annum. Apply to File No. 1142-V.

CIVIL OR SANITARY ENGINEER, with a number of years experience required by a large intermunicipal Corporation in Western Canada. Must be able to assume responsibility in design, detailing, estimating, preparing specifications, to layout and supervise the construction repairs and maintenance of a sewerage collection system and treatment plant. Salary $325 per month up. Apply to File No. 1144-V.

SUPERINTENDING ENGINEER for Eastern University to take charge of physical plant maintenance and help plan the building program. Salary from $350. Apply to File No. 1145-V.

SALES ENGINEERS required by control equipment manufacturer, one man needed for industrial sales and one with background in heating and ventilating. Headquarters in Montreal. Salaries open. Apply to File No. 1146-V.

TOWN ENGINEER required by town in Ontario. Duties include supervision of Board of Works as well as complete charge of municipal, electrical water and telephone department projects. Salary open. Apply to File No. 1150-V.

CHIEF ENGINEER required by large public utility system in Eastern Ontario. Applicants must have had experience in the operation and design of electric or waterworks systems. Salary open. Apply to File No. 1151-V.

MECHANICAL AND CHEMICAL ENGINEERS required for junior positions in Montreal. Salaries open. Apply to File No. 1154-V.

ASSOCIATE PROFESSOR in organic Chemistry and fuels Technology. Duties will be to teach a first course in Organic Chemistry to junior students, a course in Organic Unit Processes in the senior year, and such other work as may be assigned. Special emphasis will be given to Chemical Utilizations of Solid and Liquid Fuels, including gasification, hydrogenation, etc. Apply to File No. 1156-V.

ASSISTANT PROFESSOR of Mineral Engineering. Duties will be to instruct in Mineralogy and Mineral Dressing with special reference to coal and the industrial minerals, and they will include operation of the mineral dressing laboratories for commercial testing of ores and processes. Apply to File No. 1156-V

DRAUGHTSMEN, required by G. E. C. Switchgear Department, Engineering Works, Witton, Birmingham, 6, England. Must have good experience in any class of switchgear design or layout. Permanency and good opportunities for capable men. Apply, stating age, experience and technical qualifications to File No. 1157-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER required by large Western Industrial manufacturing Concern. Applicant must be interested in boiler water treatment. Salary open. Apply to File No. 1103-V.

CHEMICAL ENGINEER OR CHEMIST recent Ph.D. or equivalent with good background in organic chemistry preferable along the lines of wood and cellulose chemistry and fuels technology. Applicant needs capacity for contacting plant personnel and appreciation of engineering phases of problems. Position in British Columbia. Salary open. Apply to File No. 1118-V.

CHEMICAL ENGINEER recent graduate, required for position in technical department of a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 1122-V.

CHEMICAL ENGINEER required as plant chemist by large newsprint mill. Preferably four to six years in the pulp and paper industry in chemical and control departments. Salary open. Apply to File No. 1131-V.

CHEMICAL ENGINEER required in Ontario. Duties will involve the compounding for and quality control of industrial rubber goods. Previous experience in the rubber industry would be an advantage. Salary open. Apply to File No. 1133-V.

CHEMICAL ENGINEERS required by chemical plant in Province of Quebec. Duties include responsibility of the production and the operation of chemical equipment, such as filter presses, evaporators, vacuum jets, solvent recovery, etc. Salaries open. Apply to File No. 1134-V.

CIVIL

CIVIL ENGINEER required for a consulting engineers practice in the Maritimes. Preferably with three to six years experience. Duties both design and field supervision of construction for both municipal works and industrial buildings. Engineering survey experience required. Salary open. Apply to File No. 1087-V.

CIVIL ENGINEER, age 35 to 40 years, required by Public Institution for Montreal area. Must have construction experience and be able to supervise large building program. Salary $6,000 to $7,000. Apply to File No. 1091-V.

CIVIL ENGINEER, required in Ottawa, Ontario, must have at least ten years experience in the design of frame houses and wood structures. Salary open. Apply to File No. 1108-V.

CIVIL ENGINEERS, required by public utility in Toronto. Must have at least five years experience in design of steel structure on power developments. Salary open. Apply to File No. 1109-V.

CIVIL ENGINEER, recent graduate, required by Montreal firm of contractors and engineers. Applicants must have an understanding of the following subjects or be prepared to acquire same: general construction, engineering, estimating, elementary surveying, construction practices, etc. Salary entirely dependent upon ability. Apply to File No. 1114-V.

ASSISTANT CITY ENGINEER required for city of Calgary, Alberta. Applicant must have executive ability and preferably experience in Municipal work covering sewers, sewage disposal, streets, paving, sidewalks, bridges, building construction and town planning. Salary range $3,500 to $4,500. Apply to File No. 1125-V.

ELECTRICAL

JUNIOR ELECTRICAL ENGINEERS required as assistants to works engineers by a large chemical manufacturing company with headquarters in Montreal. Applicants should have passed the C.G.E. Test course. Position in Ontario. Salary open. Apply to File No. 1084-V.

ELECTRICAL ENGINEER recent graduate, required for Canadian branch plant of a progressive, established American company. Duties to be production control working closely with sales. Permanent position for right man with excellent opportunity for advancement. Location Toronto. Salary open. Apply to File No. 1088-V.

ELECTRICAL DESIGNING ENGINEER required for plant engineering department. Preferably between the ages of 30-40 years, with 10 years of electrical design experience in industrial plant construction and maintenance. Position in Ontario. Salary open. Apply to File No. 1100-V.

ELECTRICAL ENGINEER, preferably with experience in electrical trouble shooting and maintenance work required by industrial firm in Toronto. Salary open. Apply to File No. 1101-V.

ELECTRICAL ENGINEERS, experienced in the maintenance of power meters and relay protection schemes also men experienced in installation of large rotating electrical machines, high voltage and low voltage switch gear. Manufactures test, experience preferred. Positions with public utility in Toronto. Salaries open. Apply to File No. 1109-V.

ELECTRICAL ENGINEERS required by public utility in Toronto. Must have the folowing experience: Design layout and estimates for medium and large, low voltage and high voltage substations or design and construction of transmission and distribution lines. Salary open. Apply to File No. 1109-V.

ELECTRICAL ENGINEERS required by public utility in Toronto. Must be experienced in communications preferably a specialist in radio and frequency modulation, also knowledge of power and telephone line carriers required. Salary open. Apply to File No. 1109-V.

ELECTRICAL ENGINEERS required in Latin America as assistant to Manager on Public Utility system. Must have broad experience in operation and maintenance of generating plants, substations, transmisison lines and distribution systems. Ability to speak Spanish desirable but not essential. Salary open. Apply to File No. 1112-V.

ELECTRICAL ENGINEER for sale of electrical and allied machinery in Southern Alberta to open branch office in Calgary. Must have trade contacts and interest in firm can be purchased by a proven suitable man. Apply to File No. 1123-V

ELECTRICAL ENGINEER between 35 and 40 years of age with a minimum of five years experience with a public utility or related industry required as Manager's Assistant for electrical distribution system in fast growing town of 25,000 population. Salary open. Apply to File No. 1124-V.

JUNIOR ELECTRICAL ENGINEER required in Toronto for designing Selenium Rectifiers and some Carrier Current Control equipment. Salary open. Apply to File No. 1136-V.

SENIOR ELECTRICAL DRAUGHTSMAN required in Toronto. Must have considerable experience on generating and substation layouts. Salary open. Apply to File No. 1137-V.

MECHANICAL

MECHANICAL ENGINEER required as Plant Engineer by a pulp and paper mill in the province of Quebec. Should have about ten years experience, the major part in the pulp and paper industry. Applicant will be requested to take complete charge of maintenance department consisting of various trades crews with a total personnel of about 250 men. Salary open. Apply to File No. 1099-V.

MECHANICAL ENGINEER, required as Service Promotion Man for Export Division of large National Organization. Must have good technical background and service experience in the automotive industry. Responsiiblities include writing and editing promotion material, policies, bulletins and effective letters. Salary open. Apply to File No. 1110-V.

MECHANICAL ENGINEER recent graduate required as sales Engineer by a firm of Power House and Dust Collection Specialties. Job located in Ontario and training period in Montreal. Salary $250.00. Apply to File No. 1126-V.

METALLURGICAL

METALLURGICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in research, development and production. Salary open. Apply to File No. 1106-V.

MISCELLANEOUS

GRADUATE ENGINEER required as Sales Promotion Manager by well established manufacturer of heating equipment used in all types of buildings. Age 30 to 40 years with experience in selling mechanical equipment in the construction industry and preferably with Business Administration Course. Salary open. Apply to File No. 1085-V.

AIRCRAFT STRESS ENGINEERS AND DESIGN DRAUGHTSMAN required by Canadian company. Must have aircraft design experience or at least two years experience in stressing of aircraft structures. Salary open. Apply to File No. 1089-V.

GRADUATE ENGINEER 30 to 40 years of age with 3 or 4 years experience in railroad engineering required in Montreal to take charge of railway division. Must be bilingual. Salary open. Apply to File No. 1090-V.

SALES ENGINEER for contractors equipment and allied lines required by large manufacturer, Niagara Peninsula. Salary open. Apply to File No. 1095-V.

HEATING AND VENTILATING ENGINEER with some experience in mechanical equipment for buildings is wanted for office work on heating, ventilating and air-conditioning by a firm of consulting engineers in Montreal. Salary open. Apply to File No. 1096-V.

COMBUSTION ENGINEER, wanted by large industry near Montreal. Must be capable of taking charge of high pressure boilers, turbo generators and boiler house personnel. Permanent position and good salary. Apply to File No. 1105-V.

GRADUATE ENGINEERS interested in applied research in inorganic physical chemistry required for research laboratory of Montreal firm. Applicants should have from two to five years experience. Salary open. Apply to File No. 1107-V.

ELECTRICAL OR MECHANICAL ENGINEERS, with experience in electrical, industrial and commercial equipment and domestic appliances for frequency conversion program. Position with public utility in Toronto. Salary open. Apply to File No. 1109-V.

DISTRIBUTION ENGINEERS required in Latin America must have at least five years experience design and operation of overhead electric distribution systems. Salary open. Apply to File No. 1112-V.

GENERAL OPERATING SUPERINTENDENT, required by large electric utility company in the far east for three large interconnected hydro electric generating plants. Applicants must be thoroughly experienced in operation and maintenance of hydro electric generating equipment. Salary open. Apply to File No. 1112-V.

GRADUATE ENGINEERS, preferably with 6 to 10 years postgraduate experience to act as field representatives of Technical Information Service, N.R.C. in Montreal and Toronto. As the work involves personal visits to industrial firms personally owned car is essential. The Montreal representative must be fluently bilingual. Apply to File No. 1115-V.

GENERAL MANAGER required for Saskatchewan Power Commission. Position requires full responsibility and authority for all operations. Principal requirements, administrative, engineering or other technical experience in power operation very desirable. Salary open. Apply to File No. 1117-V.

SALES AND SERVICE ENGINEERS required for selling and servicing of water treatment chemicals and water treatment equipment of all types throughout Canadian industry. Considerable travelling involved. Applicants preferably not over 27 years of age. Positions located in Southern Ontario and Maritimes. Salary open. Apply to File No. 1120-V.

CIVIL OR MECHANICAL ENGINEERS required for openings in connection with construction of new refinery being built at Montreal East preferably some experience in heavy chemical industry also junior vacancies. Salaries open. Apply to File No. 1128-V.

JUNIOR SALES ENGINEER, preferably mechanical background, required in Montreal by large industrial firm. Preferably with a couple of years experience and the desire get into sales work. Salary $250. Apply to File No. 1130-V.

JUNIOR ENGINEER required by American Company for their three factories located in Canada. Duties include supervision of office routine order supplies, etc. Knowledge of French and English would be an advantage. Salary open. Apply to File No. 1132-V.

MAINTENANCE ENGINEER mechanical or electrical background with about ten years experience including plant maintenance. Duties include responsibility for mechanical and electrical maintenance, general supervision of power plant and mechanical stores. Salary open. Apply to File No. 1135-V.

JUNIOR ENGINEER with three to five years experience, preferably mechanical required in Montreal to develop equipment specifications, sources of supply for equipment and generally look after the routine of an engineering office. Apply to File No. 1135-V.

DRAUGHTSMAN with five to ten years' experience in plant layout material handling equipment and some structural required by an electro-metallurgical plant located in Northern Ontario city. Salary open. Apply to File No. 1139-V.

AERODYNAMICIST capable of carrying out performance and stability calculations for initial design. Permanent position with good prospects, in Montreal area. Salary open. Apply to File No. 1159-V.

Situations Wanted

MECHANICAL ENGINEER, M.E.I.C., University of Toronto, Canadian Citizen, experience in Canada and abroad, knowledge of several languages. Desires contacts in view of changing the actual line of work with better salary. 37 years of age, married with small family. Great practical and theoretical knowledge in Thermodynamics, hydraulics, aircraft and furniture making and finishing also all systems of production control. Minimum salary accepted $7,000 per year. Apply to File No. 140-W.

MECHANICAL AND CIVIL ENGINEER, M.E.I.C., Queen's, age 49. Five years hydro-electric power development construction, one year industrial building construction, two years sales engineer and estimator architectural ironworks concern, fourteen years oil refinery on initial construction, on operations and maintenance, last six years refinery engineer in charge of maintenance safety, equipment, inspection, design and construction of plant changes and extensions, industrial buildings. Resigned to undertake private venture. Desires to re-enter industry. Apply to File No. 166-W.

MECHANICAL AND ELECTRICAL, M.E.I.C., P.Eng. (Ont.). Age 41. Single. Overseas 1940 with R.C.E., followed by 7 years as Technical Staff Officer, British Army, on Research and Development, including period as Head of Technical Intelligence Mission to Austria. Vickers Plant Course followed by 13 years Canadian experience including Telephone Plant; Automobile; Electrical Power Apparatus and Wire and Cable; Design and Manufacture Electric Cranes, Foundry Equipment Diesel Engines and other Heavy Engineering Products. Intimate knowledge British Ministry of Supply and Engineering Industry. Pre- and Post-War knowledge of all Europe, particularly Belgium, Switzerland, Austria and Czecho-Slovakia. Interested in European position for Canadian or U.S. firm or Administrative Engineering Post in Canada. Apply to File No. 415-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc.(E.E.) Manitoba 1943. Age 27. Married. Electrical experience with R.C. Signals and 2½ years general electrical

Field Technical Representative

Required, immediately, graduate Engineer — required by large well known firm — preferably with mechanical background and sales experience — to travel, extensively, in Eastern Canada as representative for a distributor of pneumatic material-handling equipment. Principal contacts will be in cement, heavy chemical, food, pulp and paper, brewing and aluminum industries.

Must be able to write concise and accurate letters and reports.

Good salary and opportunities for advancement.

Write:—Give complete professional biographical data, enclose recent photograph, state salary required.

File No. 1158-V.

experience in industry. Sales training. Presently employed but desires position offering wider scope and opportunity. Preferably Montreal area. Apply to File No. 925-W.

PRODUCTION ENGINEER, M.E.I.C., P.ENG., McGill '33 (Electrical). Married. Extensive knowledge business organization and management. Accustomed to conferring with top Executives. Broad experience includes sales, plant organization and management, interpretation and use financial reports and plant operating statements, budgetary control, production plannings, cost development and control, method improvements, plant layout and general engineering. Desires permanent association, offering good future possibilities, with well established manufacturing or sales organization. Available on reasonable notice. Apply to File No. 1186-W.

MINING GRADUATE, M.E.I.C., with twenty years experience in mine operation and development, and associated construction, etc., desires permanent connection with senior responsibility; Ontario location preferred. Apply to File No. 1252-W.

ELECTRICAL ENGINEER, M.E.I.C., P.E.Q., B.Eng., McGill '34, age 40, married, bilingual. 15 years sales and service of industrial electrical and welding equipment. At present in charge of sales and administration for Canadian company. Desires position of responsibility with well established progressive company. Location preferably Quebec or Ontario. Home in Montreal. Available on short notice. Apply to File No. 1421-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.Eng., Que. Experience in the Engineering Department of large Corporations. Considerable experience in hydraulic and design and building of reinforced concrete structures. Several years as construction and field engineer on various plants and hydraulic power projects. Desire position with well established firm. Presently employed. Apply to File No. 1527-W.

MECHANICAL ENGINEER, M.E.I.C., McGill 1940. Age 33. Married. Experienced in plant and canal construction, shop work and shop management, cost estimating and control, aircraft maintenance and design. Previous positions include company chief inspector and assistant superintendent. Seeking responsible position in Montreal area. Available three weeks notice. Apply to File No. 1586-W.

CIVIL ENGINEER, M.E.I.C., age 41, interested in position as Project Manager or Chief Engineer. Sixteen years of experience in field and office covering design and construction of large building projects, surveys, bridges, roads, dams, and particularly Hydro Electric power projects. Capable of taking complete charge of design and construction. Apply to File No. 1751-W.

Wanted Immediately SENIOR TOOL DESIGNERS

We now have several openings for tool designers of senior quality. The men required should have not less than 10 years' experience in general tool designing in addition to a basic training of 3-5 years at tool and jig-making. Experience in tooling for the automotive or aero-engine production industry a decided asset.

These positions call for top flight men with initiative and creative ability, and who are capable of directing others for the tooling of a large project — "Location Toronto Area". In response, please provide full particulars on age and academic record: also names and addresses of previous employers, together with the length of service and nature of work performed: also salary expected. Replies will be treated in confidence. Apply to File Number 1160-V.

ACTIVE PARTNERSHIP desired with a firm of General Building Contractors located in Montreal or would be interested in forming new company with one or more construction engineers. Advertiser has capital and 20 years of construction experience. For additional information, apply in confidence to File No. 2138-W.

INDUSTRIAL AND CIVIL ENGINEER, M.E.I.C., P.Eng., Que. B.A.Sc. Age 40. Married. Fluently bilingual. Seeks position as Industrial Engineer, Executive Sales Engineer, Town Engineer, experience in motion and time study, methods, process, development, production control, costing, plant maintenance, highway engineering, municipal engineering, sales. Available on short notice. Apply to File No. 2157-W.

GRADUATE ENGINEER, M.E.I.C., McGill Chemical Engineering 1935. Six years experience in plant operation, four

Building Research

Engineers and Architects interested in the application of research to building and associated engineering problems are invited to enquire about employment possibilities with the newly formed Division of Building Research of the National Research Council. An enquiring mind is an essential; experience in building work in Canada is really necessary; bilingualism would be helpful. Salaries depend upon training and experience; opportunities for useful work are unlimited. Enquiries should be addressed to the Director, Division of Building Research, National Research Council, Ottawa.

MANAGER OF MANUFACTURING

required by Canadian mill producing 500 tons per day of Specialty Papers, Tissues, Paperboard and Newsprint. Position requires proven managerial ability and technical qualifications for the production of paper. The location is most desirable and salary attractive. Applications giving all essential information will be kept confidential if desired — and should be addressed to

File No. 1140-V.

Professor of Electrical Engineering

Applications are invited by the University of Manitoba for the post of Professor and Chairman of the Department of Electrical Engineering which becomes vacant on Sept. 1, 1949, on the retirement of Dr. E. P. Fetherstonhaugh. Commencing salary will depend on candidate's qualifications.

Full information regarding candidate's age, academic and professional record and other qualifications with names of three references and a recent photograph should be submitted with the application not later than May 23rd, 1949 to THE REGISTRAR OF THE UNIVERSITY OF MANITOBA, WINNIPEG, MAN., from whom further particulars may be obtained.

years in the R.C.A.F., aeronautical engineering and four years in business and industrial consulting. Desire responsible position in Quebec or Ontario. Apply to File No. 2228-W.

CIVIL ENGINEER, M.E.I.C., P.Eng. (Alta.). Age 29. B.Sc. Married. Presently employed. Experience in light commercial construction and housing projects. Familiar with project planning and utility layouts. Have organized and supervised several large construction projects, have good background in lumber and building supply business relative to the construction industry. Some experience in highway location and construction, sewer and water distribution and natural gas installation. Interested in partnership with consultant engineer or architect, or position with progressive construction firm, would consider oil company. Home Edmonton, Alberta. Apply to File No. 2521-W.

PARTNER wanted by engineer, M.E.I.C., with 25 years experience, contemplating private practice. Must have necessary qualifications; previous experience with consulting engineer desirable. Apply to File No. 2642-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., with seven years intensive work with large pulp and paper mill, construction, maintenance, estimate, layouts, process development, time study, etc., also experience in public work-management; water, sewer, electric system generation, transmission and distribution with full responsibilities of design and work, etc. Services available at short notice. Age 32. Married and bilingual. Apply to File No. 2823-W.

ENGINEERING PHYSICIST, Jr.E.I.C., Sask. '47, age 24, Prof. Eng. Ont. Single. Desires research work in progressive company. Preferably in Ontario or West. Experience includes six months outside plant of Bell Telephone, Montreal. 14 months ass't Engineer with Miniature Electric Motor Manufacturing Company. Duties are research and test of design and materials plus plant control and maintenance. Presently employed, available one months notice. Apply to File No. 2917-W.

MECHANICAL ENGINEER, M.E.I.C., B.Sc. Queen's. Age 32. Married. Veteran. Navy Engineer Officer. Experience primarily includes heating and power plant design, estimating construction and maintenance. At present employed but desires change to responsible position in Ontario, British Columbia or Alberta. Apply to File No. 3020-W.

GRADUATE MECHANICAL ENGINEER, A.M.I.M.E., fully qualified, age 34, educated on the continent and in England with extensive experience in layout, design and manufacture of handling machinery requires post with expanding organization. Available shortly. Apply to File No. 3021-W.

MECHANICAL ENGINEER, M.E.I.C., Prof. Eng. (Quebec) 15 years of shop practice in maintenance and locomotive repair; 5 years machinery design, including welded vessels, process piping and pulp mill layout. Seeking responsible position preferably in Montreal area. Available on short notice. Apply to File No. 3045-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng.,Q.,G.I., Mechanical E., A.M.I. Loco., E., (Great Britain). Aged 30. Married. 6 years locomotive design and construction, machine shop production and assembly. 5½ years Engineer Officer, Royal Air Force—rank Squadron Leader, Chief Technical Officer. Employed 2 years in Province of Quebec. Desires change to position with more responsibility and opportunity for advancement. Preferably Southern Ontario and Western Canada. Apply to File No. 3059-W.

SALES ENGINEER, M.E.I.C., retired Naval Officer, mechanical and electrical background. Experienced in sales and running branch office. Four years with wartime shipbuilding, 2 years with War Assets Corporation in technical and executive capacity. At present in marine and engineering supply sales. Interested in permanent position in Montreal area. Apply to File No. 3081-W.

MECHANICAL ELECTRICAL ENGINEER, S.E.I.C., graduating in May from Ecole Polytechnique seeks position with progressive industrial firm. Age 26, single. Good mechanical background. Employed during war with National Research Council. Ambitious, with good character and potentialities. Apply to File No. 3083-W.

CIVIL ENGINEER, M.E.I.C., B.A.Sc. Prof. Eng. Age 33. Married no children, bilingual, seven years experience in the following fields: one year in hydro-electric power house operation, three years planning and supervision in shipbuilding, two years in design and supervision of irrigation works; one year as Construction Engineer in charge of the construction of a dam. Available in June 1949. Presently employed in Ceylon. Apply to File No. 3085-W.

CHEMICAL ENGINEER, Jr.E.I.C., B.Sc. Queen's '46, Professional Engineer (New Brunswick) age 26, married. Reliable and conscientious. Experience includes product control, piping layout and general engineering in Pulp and Paper and Petroleum Industry. Also held responsible position in sanitary engineering field as district engineer-in-charge. Desires responsible position in industry or with consulting engineer. Available immediately. Apply to File No. 3092-W.

PROFESSIONAL ELECTRICAL ENGINEER, A.M.I.E.E., seeks position where expert knowledge of motor control gear, motors, switchgear, cables etc. is required. Wide experience in applications, field and makers tests, layout, specifications, purchase and installation of controls. Would consider engineer-representation of reputable firms. Apply to File No. 3095-W.

CIVIL ENGINEER, S.E.I.C., E.I.T. (B.Sc. Alta.), age 29. Married. Presently employed in construction supervision design and estimating. Experienced in highway and municipal works, surveys and layout. Four and one-half years overseas artillery survey experience. Desires a permanent position with a consultant or other engineering firm in Western Canada. No objection to travel in connection with field work. Available on reasonable notice to present employer. Apply to File No. 3106-W.

MECHANICAL ENGINEER, M.E.I.C., age 35, married, excellent health. Four years practical mining experience, three years woods operations. Presently employed in woods mechanization program. Three years army experience, automotive repair and maintenance. Desires work in maintenance, or sales and supervision of field installations, testing and making estimates. Apply to File No. 3115-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng. (McGill) 1944. Married, 26 years of age, one child. Army service in R.C. Signals. Post-graduate training in Radio Physics at the University of Western Ontario. At present employed as Assistant Professor of Physics at a Maritime University. Interested in research or development in radio, electronics or allied fields. Preferably Montreal or Ottawa area. Apply to File No. 3127-W.

CIVIL ENGINEERING STUDENT, S.E.I.C., Toronto. Veteran, age 27. Married, graduating this spring, desires employment commencing about May 1st. Will consider anything, but primarily interested in reinforced concrete and structural steel design work in Southern Ontario. Apply to File No. 3128-W.

CIVIL ENGINEERING STUDENT, S.E.I.C. Graduating in May, 1949, from University of British Columbia. Age 23, married, veteran. Experience limited to survey work. Desires experience with a consultant or with large design and construction company. Available after May 15th, 1949. Apply to File No. 3129-W.

GRADUATE ENGINEER, Jr.E.I.C., age 32, married, desires position leading to increased responsibility in railway or its equivalent field. B.Sc. Eng. (Electrical) University of Manitoba ('44), two years Engineer Officer Royal Canadian Navy operating and repair of steam turbines and diesel electric generators, nine years railway machine shop, one year detail and design of welded pressure vessels, steam generators. One winter a lecturer in mechanical engineering. One year in railway signal engineering on signal layout, installation, circuit design. Apply to File No. 3130-W.

MECHANICAL ENGINEER, Saskatchewan, 1946, Jr.E.I.C., married, age 25. Presently located in Winnipeg area, desires permanent position in industrial or plant engineering. Experience includes teaching, construction, sales, equipment design and installation. Available May 1st, 1949. Apply to File No. 3131-W.

EXECUTIVE, M.E.I.C., B.A.Sc., P.Eng. Wide managerial experience in all phases of development, production, sales, organization, cost control. Age 39. Married, family. Willing to consider position with established concern requiring senior executive. Apply to File No. 3138-W.

MECHANICAL ENGINEER, Jr.E.I.C., (B.Eng., McGill, '47) one year experience in design and draughting and some construction work. Presently completing professional course in Industrial Relations. Interested in becoming established with industrial firm to do time study work, job evaluation, wage incentive plans, personnel supervision etc., where background of engineering could be useful. Some knowledge of French. Area of Ontario, Quebec or B.C. Available on month's notice. Apply to File No. 3149-W.

ELECTRICAL ENGINEER, S.E.I.C., B.A.Sc.(E.E.), U.B.C. 49, married, age 33. Electrical experience with R.C. Signals (overseas 6 yrs.) Desire employment in power or electronics. Available 1 May, 1949. Apply to File No. 3154-W.

ELECTRICAL ENGINEER, M.E.I.C., I.E.G., Prof. Eng. Quebec. Age 35. Several languages spoken fluently. Married, no children. Extensive practical experience in plant maintenance and trouble shooting, seeks resident position with industrial firm, available at short notice. No objection to go to country. Apply to File No. 3155-W.

ELECTRICAL ENGINEER, S.E.I.C., recent graduate of Nova Scotia Technical College, married, five summers' pre-graduation experience plant electrical maintenance, desires employment in Montreal area, preferably in design, testing, or small-scale production of electronic or communications equipment. Apply to File No. 3156-W.

GRADUATE MECHANICAL ENGINEER, Jr.E.I.C., Canadian, 29 years of age, married, one child. Seven years varied experience mostly with one employer, in general machine-shop, foundry, drafting, process and mining industries. At present assistant mechanical superintendent of mining concern in South America. Returning to Canada in June. Desire position, preferably in Canada or the U.S.A. Apply to File No. 3157-W.

ELECTRICAL ENGINEER, S.E.I.C., S.A.I.E.E., age 23, married, B.Sc. '48 from University of New Brunswick, at present taking one year post graduate work at the University of London on Beaverbrook Overseas Scholarship. Summer vacations spent in the Power & Paper Industry. Returning to Canada early in September. Apply to File No. 3161-W.

GRADUATE ENGINEER, M.E.I.C., with broad administrative experience in manufacturing. Responsibilities have included development of national sales organization, planning of national advertising campaign, purchasing for light metal manufacturing plant, product promotion and development, patents and cost accounting. Youthful, aggressive, dependable and loyal. Widely traveled. Complete personal file available. Apply to File No. 3162-W.

GRADUATE MECHANICAL ENGINEER (McGill), M.E.I.C. P.Eng. Que., married, bilingual, five years sales experience in heavy plant and contracting equipment in Province of Quebec. Responsibilities include sales promotion, sales engineering in regards to steam and electrical equipment and pumps, supervision of installations and recommended maintenance schedules. Some experience in electrical installations, welding and surveying. Desires position of responsibility with progressive firm, not necessarily in sales. No locality preference. Presently employed. Apply to File No. 3163-W.

MECHANICAL ENGINEER, M.E.I.C., McGill 1942, age 28, presently engaged as design, sales and construction engineer with small company manufacturing and installing heavy industrial machinery, demand for which is falling off due to heavy oil production. Has had experience, RCEME Overseas, steel designing and detailing. Would consider any employment offering interesting problems, responsibility and future promotion. Apply to File No. 3164-W.

EMPLOYMENT

FOR

STUDENTS

The Institute is anxious to help Student Members who are seeking summer employment.

Employers are requested to advise the Employment Service of the Institute as to any vacancies they may have.

Address all information to:

THE EMPLOYMENT SERVICE

THE ENGINEERING INSTITUTE OF CANADA

2050 MANSFIELD ST.

MONTREAL 2, QUE.

NEWS OF THE BRANCHES

(*Continued from page 237*)

shorter than the existing one, provisions have been made for twelve drop sections. These will be of boulder and quarry rock construction.

On the embankments, service roads will be constructed to serve bordering properties and to provide facilities for channel maintenance. One new railway bridge and several highway bridges will be required.

In conclusion Mr. Carruthers stated that the Provincial and Dominion Governments had given their approval, provided funds and instructed that the work proceed. It is estimated that the total cost will be $2,400,000.

Winnipeg

G. W. Moule, M.E.I.C.
Branch Secretary

Electrical Section

J. C. Pratt, M.E.I.C.
News Editor

At the monthly meeting of the Engineering Institute's Electrical Section held March 3, Clayton H. Glenn, spoke on the subject of **The Electrical System of the North Star Airliner.** Mr. Glenn is special assignments engineer with Trans-Canada Air Lines, with whom he has been employed for the past six years.

The electrical system in the aircraft was traced from the four 24 volt d-c generator sources to the myriad of instruments and mechanisms used throughout the craft. Mr. Glenn mentioned the continual weight reductions being made in generating equipment and cited the postwar figure of seven pounds per kilowatt. The various items of electrically operated or controlled equipment were explained, and the descriptions proved to be of considerable interest to all present. Some idea of the extent and complexity of electrical equipment can be given by mention of the fifteen miles of wire which is necessary to interconnect the many units. The cost of this equipment is in the neighborhood of $150,000 per plane.

A lively discussion kept Mr. Glenn busy for some time following his address, after which the meeting adjourned for refreshments.

BOOK REVIEWS

METALLIC CORROSION PASSIVITY AND PROTECTION, 2nd ed:

U. R. Evans, with Appendix by A. R. Winterbottom. London, Arnold; Toronto, Longmans Green, 1948. 863 pp., illus., 9¼ x 6 in., cloth, $14.00 (in Canada).

This new edition has been largely rewritten. An introduction dealing with the principles of electrochemistry has been inserted in place of the long footnotes in the previous edition. Each chapter is divided into three parts, one devoted to the scientific basis of the subject, one dealing with practical problems, and a third presenting a quantitative treatment.

The book includes simple examples of corrosion and passivity; study of thin films; oxidation at high temperatures; corrosion in moist or polluted atmospheres; corrosion not involving the absorption of oxygen; corrosion of ferrous materials involving the absorption of oxygen; corrosion of non-ferrous materials involving the absorption of oxygen; influence of stress, strain and structure; influence of contacts and crevices; protection by inhibitive treatment of water; protection by chemical and electrochemical treatment; protection by paints and enamels; protection by metallic coatings; and testing. An appendix deals with optical methods for the determination of films on metals based on polarization and interference phenomena.

The book has been provided with extensive indices and bibliographic references. J.D.

ABSTRACTS

INSTITUTION OF ELECTRICAL ENGINEERS. PAPERS:

Magnetic Amplifiers, *A. G. Milnes.*

Discussion of transductor behaviour on short-circuit; the effect of permeability on the performance with self-excitation; the arrangements of transductors to give duo-directional magnetic amplifiers; fundamental design principles relating power output, amplification and time lag with supply frequency, core area and self-excitation.

Oscillograph for Automatic Recording of Disturbances on Electric Supply Systems, *W. J. T. Atkins.*

Describes a fully automatic oscillograph in which 15 CRO tubes, housed in a common camera, may be photographed side-by-side on a common 70 mm film. Any abrupt supply voltage change influences a detector initiating the CRO beams and starting a film driving motor. Recording equipment is capable of giving detailed service records of modern high speed switchgear and protection.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Basic Electrical Engineering for Students of Electrical Engineering:
G. F. Corcoran. New York, Wiley; London, Chapman and Hall, 1949. 449 pp., illus., cloth.

Computation Curves for Compressible Fluid Problems:
C. L. Dailey and F. C. Wood. New York, Wiley; London, Chapman and Hall, 1949. illus., paper.

Design of Steel Buildings, 3rd ed:
H. D. Hauf and H. A. Pfisterer. New York, Wiley; London, Chapman and Hall, 1949. 280 pp., illus., cloth.

Earth Conduction Effects in Transmission Systems:
E. D. Sunde. New York, London, Toronto; Van Nostrand, 1949. 373 pp., illus., cloth. (Bell Telephone Laboratories Series).

Elements of Mechanical Vibration, 2nd ed:
C. R. Freberg and E. N. Kemler. New York, Wiley; London, Chapman and Hall, 1949. 227 pp., illus., cloth.

How to Maintain Electric Equipment in Industry:
General Electric Co., Schenectady, N.Y., 1944. 372 pp., illus., cloth.

Industrial Electricity, Volume Two— Alternating-Current Practice:
W. H. Timbie and F. G. Willson. New York, Wiley; London, Chapman and Hall, 1949. 781 pp., illus., cloth.

Radio Amateur's Handbook, 26th ed:
American Radio Relay League, West Hartford, Conn., 1949. 617 pp., illus., paper.

Sewerage Design and Specification:
L. B. Escritt. London, Contractors Record and Municipal Engineering, 1947. 293 pp., illus., cloth.

Soil Mechanics for Civil Engineers:
B. H. Knight. London, Arnold, 1948. 255 pp., illus., fabrikoid.

Twenty-Five Years; a Record of the Origin, Progress and Achievements of the Electricity Supply Commission, Union of South Africa, 1923-1948:
Electricity Supply Commission, Johannesburg, 1949. 63 pp., illus., cardboard.

PROCEEDINGS, TRANSACTIONS, ANNUALS, ETC.

Bank of Canada:
Annual Report to Minister of Finance and Statement of Accounts for the Year 1948.

Canadian Almanac and Directory, 102nd ed:
Copp Clark, Toronto, 1949.

Corporation of Professional Engineers of Quebec:
Report of the President and Council for the Year 1948 together with Auditor's Report and Financial Statement.

Engineering and Industrial Catalogue, 14th ed, 1948-49:
Canadian Engineering Publications, Montreal, 1949.

Metropolitan Water District of Southern California:
Report for the Fiscal Year, July 1, 1947 to June 30, 1948.

Toronto Harbour Commissioners:
Annual Report, 1948.

TECHNICAL BULLETINS, ETC.

American Institute of Mining and Metallurgical Engineers. Technical Publications:
No. 2454—Effect of Hydrogen on the Ductility of Cast Steels, C. E. Sims, G. A. Moore, and D. W. Williams.

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

Canada. Bureau of Mines. Memorandum Series:

No. 102—Gasoline Survey for Summer, 1948, P. B. Seely and F. E. Goodspeed.

...Bureau of Statistics. Mining, Metallurgical and Chemical Section. Publications:

Iron and Steel and their Products in Canada, 1943-45.

Edison Electric Institute. Publications:

No. Q-10—Cable Operation, 1946.

Institution of Electrical Engineers. Proofs:

Direction-Finding Site Errors at very high Frequencies, H. G. Hopkins and F. Horner.—Measurement of Light and Colour, G. T. Winch.—Railway Traction Control.—Equipment on Suburban London Transport, E. Webster.—Scattering of Radio Waves by Metal Wires and Sheets, F. Horner.—Selection of Transformers for Use in Distribution Networks, with Special Reference to the New Low-Voltage Standard of 240 Volts, E. Tobin.—Testing, Reconditioning and Servicing of Domestic Appliances, H. Hobbins.—Tidal Power and the Severn Barrage, H. Headland.

Institution of Mechanical Engineers. Advance Copies:

Application of Free Jets to the Mixing of Fluids in Bulk, H. Fossett and L. E. Prosser.—Influence of Valve Port Design on the Volumetric Efficiency of the Compression—Ignition Engine, C. B. Dicksee—Investigations into Cyclone Dust Collectors, A. J. ter Linden.—Marine Boiler Deterioration, I. G. Slater and N. L. Parr.—Marine Engineering in the Royal Navy: a Review of Progress during the last Twenty-five Years, Vice-Admiral Sir John Kingcome.—Reciprocating Seals, F. H. Towler.—Rotary and Oscillating Seals, T. E. Beacham.

International Civil Aviation Organization. Publications:

Abbreviations of Place Names, January 1949 (Doc 6314-COM/509).—ICAO Regional Manual—North Atlantic (Doc 4500) Amendment No. 30, February 23, 1949.

North-East Coast Institution of Engineers and Shipbuilders. Advance Copies:

Production of Forgings for Marine Purposes, R. C. Benson.—Propeller Blade Vibrations, W. L. Hughes.—Underwater Propeller Vibration Tests, L. C. Burrill.

Ohio State University. Engineering Experiment Station. Bulletin:

No. 135—Experiments on Belt-Drive Fundamentals, C. A. Norman.

Society of the Plastics Industry. Publications:

Basic Chemistry of the Polyester Laminating Resins, E. M. Beavers.—Decorative Surfacing of Reinforced Laminates, T. W. Noble.—Manufacture and Properties of Plastic Surfaced Plywoods, B. G. Bull.—Molded Finishes, C. E. Bacon.—Organic Peroxides as Catalysts for Polyester Type Resins, C. H. Ryholt and T. C. Swigert.—Silicones, New Engineering Moterials, R. W. Kolderman.—Surface Coatings for Reinforced Plastics, P. O. Blackmore.

STANDARDS, SPECIFICATIONS, ETC.

British Standards Institution. Standards:

BS 387:1948—Attachment and Drive of Circular Metal Cutting Saws for Cold Working. — BS 590:1949 — Electrically Welded Mild Steel Chain; Short Link and Pitched or Calibrated for Lifting Purposes.—BS 1449:1948—Steel Plate Sheet and Strip—Addendum No. 1: Dec. 1948.—BS 1488:1948—Test-Films for 16mm Cinematograph Projectors.—BS 1498:1948—Gear Hobbing Machines for Turbine and Similar Drives.—BS 3006:1949—Dimensions of Ship's Stud Link Anchor Cables.

Canadian Standards Association. Specifications:

CSA Z91-1949—Code of Practice for Window Cleaning.

Edison Electric Institute. Specifications:

TD-7, 1948—Specifications for Spool Type Secondary Racks.

American Standards Association, New York, 1949.

BOOK NOTES

The Institute does not assume responsibility for any statements made; these are taken from the preface or thet ext of the book.

Prepared by the Library of The Engineering Institute of Canada.

BRITISH STANDARDS INSTITUTION. STANDARDS:

British Standards Institution, London.

Steel Plate, Sheet and Strip. BS 1449:1948. 2/6-.

This British standard is an extension of, and should be regarded as a companion to BS 970, to provide more fully for the steels that are commonly supplied in the form of plate, sheet and strip.

Structural Steel. BS 15:1948. 2/-.

The standard specifies process of manufacture, test methods and requirements, permissible margins on weights and dimensions, marking, provision of test certificates and inspection procedures. Tests on manufactured rivets are also described.

Use of Structural Steel in Building. BS 449:1948. 6 -.

This British standard relates primarily to the use of structural steel in building. The requirements of the standard shall be deemed not to apply to structures fabricated from steel tubes, which will be covered by an addition to this standard (in course of preparation), nor to structures fabricated from light gauge sheet and strip steel.

CANADIAN STANDARDS ASSOCIATION. SPECIFICATIONS:

Z7.1 Series-1948—Specifications for Motion Picture Photography. $2.50. Ottawa, the Association. 1948.

The purpose of these specifications is to cover the performance characteristics of equipment and materials and certain other matters such as methods of designating relative apertures, shutter speeds

and emulsion speeds, physical definitions, and preferred processes or practices. Dimensional standards are also important since certain materials such as films and plates are intended for use with similar equipment produced by different manufacturers.

INDUSTRIAL HEALTH REVIEW:

Dept. of National Health and Welfare, Industrial Health Division, Ottawa, January 1949. Semi-annual. Free.

This new bulletin will deal with such topics as: current industrial health activities in Canada and abroad; research projects in industrial health; new toxic materials used in industry; unusual uses of old materials; information on morbidity, mortality and health services in industry; notification of refresher and advanced courses in industrial medicine and hygiene; abstracts of articles which have had a limited circulation, and other metarial of interest and value to the readers.

NATURE OF A PATENTABLE INVENTION; ITS ATTRIBUTES AND DEFINITION, 2d ed:

J. E. R. Hayes. Cambridge, Mass., Addison Wesley, 1948. 187 pp., illus., 9¼ x 6 in., cloth, $5.00.

The author attempts to arrive at a means of deciding whether an invention is patentable or not. The subjective analysis of an invention has the following advantages: the mind is directed to the essential invention as being the principal factor, and an entity in itself; an approach to the patent law is provided that will admit of more general principles and broader generalizations.

REPORT ON THE WORK CARRIED OUT IN THE "PANEL" OR "RADIANT" HEATED TEST BUILDINGS AT THE NATIONAL RESEARCH COUNCIL LABORATORIES, OTTAWA, DURING THE WINTER, 1947-1948:

C. D. Niven. National Research Council, Ottawa, 1948. 20 pp., illus., 10¾ x 8¼ in., paper, 25c. (N.R.C. Publication No. 1791).

Conditions were investigated in a test building heated alternatively by radiators and by floor or wall panel heating. More heat can be obtained from a heated floor than is usually assumed, provided the floor be heated right up to the edge. Great improvement in comfort can be effected by use of ceiling ventilation when the room is overheated due to solar radiation. Insulation on the walls and also around the perimeter of a concrete floor slab lying right on the ground is important in maintaining comfortable conditions.

STUDY OF ENGINEERING REGISTRATION LAWS:

A. M. Sargent. Detroit, the author, 1948. 60 pp., illus., 8½ x 5½ in., paper, 75c.

This discussion of engineering licensing laws was written to present to the engineering profession, and to all of those whom it affects, a clear picture of the licensing situation. It is the purpose of the booklet to objectively examine the public necessity for registration laws, to call attention to the effects strict enforcement would have upon the industry and society in general, to discuss the general requirements of the laws and to point out some of the potentially dangerous practices open to administrative officials who are granted broad and vaguely-defined powers.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

AERIAL PHOTOGRAPHY IN URBAN PLANNING AND RESEARCH:

M. C. Branch, Jr. Harvard University Press, Cambridge, Mass., S. J. Reginald Saunders, Toronto, 1948. 150 pp., illus., diagrs., charts, maps, tables, 11 x 8½ in., paper, $3.75 in Canada. (Harvard City Planning Studies, XIV.)

Part I, on the use of spiral photographs, discusses the effective types, the methods of photographic mapping, and the cost of aerial surveys. Part II deals with the special knowledge prerequisite to the effective use of air photos, including information on photoruns and plotting mosaics, flight planning, equipment, and photographic interpretation.

CIVIL ENGINEERING.

V. C. Whiting and K. Mills. Longmans, Green and Co., New York, London, Toronto, 1948. 152 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $3.50 in Canada.

This book is designed to give the man who already has the practical experience, the necessary technical knowledge for a supervisory position in civil engineering works. It will give him an understanding of plans, detail drawings, quantities, and specifications, and will teach him to keep records. Materials and plant are dealt with, and a special chapter is devoted to concrete.

DESIGN OF INDUSTRIAL EXHAUST SYSTEMS, 2d ed:

J. L. Alden. Industrial Press, New York, 1948. 252 pp., diagrs., charts, tables, 8¾ x 5½ in., cloth, $3.50.

This book describes how to design, build or buy an exhaust system that will meet the requirements of law or of industrial hygiene. It includes exhaust ventilation, low pressure pneumatic conveying, design of hoods and piping, and structural details, as well as the selection of dust separators, centrifugal and axial flow fans. Two new chapters on hoods for fumes and on axial flow fans, as well as lesser additions, are included in this new edition.

ELASTICITY AND ANELASTICITY OF METALS.

C. Zener. University of Chicago Press, Chicago, Illinois, 1948. 170 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $4.00.

Of interest to physicists, metallurgists and engineers, this book presents the science of the nonelastic behavior of metals at low stress levels. It considers the various types of anelasticity and develops their interrelations. A review is given of the various types of relaxations which have been found to give rise to anelasticity, and also of the dependence of the elastic properties of a metal upon its microstructure. Over 200 references are cited. The author points out the role which studies of this behavior will play in the future development of metallurgical science.

FUEL AND THE FUTURE.

Great Britain, Ministry of Fuel and Power. His Majesty's Stationery Office, 429 Oxford Street, London, W.1, England, 1948. 3 vols., diagrs., charts tables, 9½ x 6 in., paper. 3s.6d.

Vol. I of this report of an officially convened conference deals with the generation of steam, steam utilization, and heat for drying. Vol. II covers high temperature processes, the carbonization and chemical industries, and several special industrial sessions. Vol. III presents modern heating in relation to the architect and fuel services in the home. Two simultaneous joint sessions on district heating and the sizing and grading of coal are also included.

HANDBOOK OF REFRIGERATING ENGINEERING, 3d ed:

W. R. Woolrich and L. H. Bartlett. D. Van Nostrand Co., New York, London, Toronto, 1948. 730 pp., diagrs., charts, tables, 7½ x 5 in., cloth, $10.50 in Canada.

Beginning with fundamental units, primary refrigerants, and charts and tables of thermodynamic characteristics, this handbook continues with detailed descriptions of refrigerating equipment and processes. Special adaptations to ice making, quick freezing, freezer storage, air cooling, and marine refrigeration, are dealt with separately. Lubrication, instruments and controls, piping details, and safety measures are also discussed. The extent of revision in the present edition is indicated by the more than 300 additional pages.

HIGH-POLYMER PHYSICS. A SYMPOSIUM,

Edited by H. A. Robinson. Chemical Publishing Co., Remsen Press Division, Brooklyn, New York, 1948. 572 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $12.00.

Thirty-nine physicists and chemists, all prominent experts in their special fields, contributed to this symposium.

The individual articles are devoted to the molecular structure, physical and physico-chemical properties of natural and synthetic high polymers. The last part deals with scientific instruments used for making determinations and carrying out tests. There is a bibliography at the end of each chapter.

INSTALLATION AND SERVICING OF LOW POWER PUBLIC ADDRESS SYSTEMS.

J. F. Rider, Publisher, 480 Canal St., New York, 1948. 208 pp., illus., diagrs., charts, tables, 7¾ x 5½ in., cloth, $1.89.

Stressing practical facts and ideas, this book deals with the installation and servicing of low power public address systems. It opens with a discussion of the fundamentals of sound and pertinent acoustical problems. This is followed by an explanation of devices used as inputs to an amplifier. Various types of audio amplifiers are considered as well as the important subject of impedance matching. Problems of installation and trouble-shooting are presented with typical examples.

INTRODUCTION TO GAS-TURBINE AND JET-PROPULSION DESIGN.

C. A. Norman and R. H. Zimmerman., Harper & Brothers, New York, 1948. 286 pp., illus., diagrs., charts, tables 9½ x 6 in., cloth, $5.00.

Designed for the beginner in the field, this volume deals with gas turbines for stationery, aircraft, marine, and locomotive plants, and also with rockets. It goes thoroughly into both the performance and design of gas turbine and jet propulsion apparatus. Well illustrated, it includes nearly 200 figures, performance graphs, and photographs.

MICROWAVES AND RADAR ELECTRONICS.

E. C. Pollard and J. M. Sturtevant. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948. 426 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., linen, $5.00.

In this book, a physicist and chemist have presented the postwar development and the peacetime applications of radar. After surveying the field, the special knowledge of electricity and magnetism necessary to an understanding of microwaves is outlined. Discussed in detail are the significance of microwaves and radar electronic techniques in physical and chemical research. Much attention is devoted to the applications considered in scientific literature since the end of the war.

PACKAGING METHODS AND EQUIPMENT.

O. W. Roskill & Co. (Reports) Ltd., 14 Great College Street, London, S.W.1, March, 1948. 57 pp. plus Appendices, 14 pp., 14 in. x 9¾ in., stiff paper, 30 s.

Following an historical sketch, this mimeographed report describes the various types and methods developed for shipping containers, liquid packages, solid packages, finishing and handling equipment, and special forms of packaging. A list of British manufacturers of packaging materials and equipment is appended.

PRESTRESSED CONCRETE.

G. Magnel. Concrete Publications, Ltd. 14 Dartmouth St., Westminster, London, S.W.1, 1948. 215 pp., illus., diagrs., charts, tables, 9¾ x 6½ in., linen, 15s.

This book describes the principles and practice of building with prestressed concrete. A notable feature is the simplicity of the design methods which allow for the various losses of prestress. Different methods of inducing a compressive stress are discussed. Statically-indeterminate structures, continuous beams with equal spans, numerous tests, and practical applications are all considered. The notation is similar to that used in Britain for ordinary reinforced concrete with such additional symbols as required.

PRINCIPLES OF ELECTRIC AND MAGNETIC FIELDS.

W. B. Boast. Harper & Brothers, New York, 1948. 405 pp., illus., diagrs., charts, tables, 9½ x 6 in., cloth, $4.75.

This textbook is designed for study by undergraduate students desiring a fundamental comprehension of electric and magnetic fields. Parts I and II provide an introduction to basic concepts, and Part III treats important supplementary aspects of the subject. No knowledge of electric circuits is presumed in Parts I and II, such concepts are developed as they are needed. The book is written in the MES system of units, and a knowledge of calculus is necessary. Examples are used freely as a means of applying theory to practical engineering problems.

RADIO ENGINEERING, Volume I.

E. K. Sandeman. John Wiley & Sons, New York, 1948. 775 pp., diagrs., charts, tables, 9 x 5½ in., cloth, $6.50.

Originally planned as instructions for maintenance engineers at B.B.C transmitting stations, this book is designed to give beginners in radio the working principles they need. It is also a reference volume for experienced engineers and designers of radio circuits and equipment. A working knowledge of elementary algebra and logarithms is needed. Practical ends are stressed, either in the form of technical facts, designs or methods or else in the form of essential formulas.

SYMPOSIUM ON INTERAL STRESSES IN METALS AND ALLOYS.

Institute of Metals, 4 Grosvenor Gardens, London, S.W.1, England, 1948. 485 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, 42s. (Monographs and Report Series No. 5).

Of interest to mechanical and metallurgical engineers, this symposium contains thirty-six papers grouped under three main headings: the measurement of internal stresses; the origin, control and removal of internal stresses; effects associated with internal stresses, both on the microscopic and the microscopic scale. A wide variety of metals and conditioning is covered in the separate papers. Over one hundred pages of technical discussion of the papers presented have been appended.

TECHNICAL WRITING.

K. Hendricks and L. A. Stoddard. Utah State Agricultural College, Logan, Utah, 1948. 117 pp., diagrs., charts, maps, tables, 9¼ x 6 in., cloth, $1.50.

This book is designed as a text for the student in technical writing and as a quick reference manual for the experienced research worker. Every phase of research writing with the exception of sentence and paragraph construction is included. Emphasis is placed upon the gathering of material, the collecting of data and the handling of illustrations, foot notes, and cross references. Methods of exploring a field and recording the findings are considered.

TOOL STEEL SIMPLIFIED, rev. ed.

F. R. Palmer and G. V. Luerson. Carpenter Steel Company, Reading, Pa.; Williams & Wilson, Montreal, 1948. 564 pp., illus., diagrs., charts, tables, 9 x 6 in., cloth, $12.00, U.S.A.; $2.50 elsewhere.

Intended for the man who makes tools, this handbook of modern practice, presents in simple and accessible form the technical and metallurgical knowledge possessed by the steel expert. Outstanding features are sections on the selection of tool steel for each kind of tool, the properties, heat treatment and testing of tool steel, and other practical information. In this revised edition, new methods, new terms, and new principles are included. Tool-steel types are based on the "matched-set" classification developed by the Company.

VACUUM MANIPULATION OF VOLATILE COMPOUNDS.

R. T. Sanderson. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948. 162 pp., diagrs., tables, 8½ x 5½ in., cloth, $3.00.

Of interest particularly to the investigator without special training in the field, this book provides a firm foundation for working with high vacuum apparatus. It supplies all the data necessary for the construction and operation of such apparatus. The appendix includes reference material on instruments used in this type of research and on almost 400 compounds conveniently studied by the described procedures.

Although the following new books are not available in the Institute Library, inquiries concerning them will be welcome there or may be sent direct to the publishers.

ASM REVIEW OF METAL LITERATURE, Volume 4, 1947.

M. R. Hyslop, ed. American Society for Metals, Cleveland 3, Ohio, 1948. 720 pp., 9¼ x 6 in., fabrikoid, $15.00.

This comprehensive survey of the metallurgical literature published during 1947 continues the useful series started in 1944. The brief abstracts indicate the scope and content. In addition to the main classified arrangement of the items, a detailed subject index and an author index are provided. The addresses of the journals and periodicals abstracted are given. Both American and foreign literature are covered in the more than 5000 items included in the current volume.

HANDBOOK OF CHEMISTRY AND PHYSICS.

C. D. Hodgman, ed. Chemical Rubber Publishing Co., 2310 Superior Ave., Cleveland 14, Ohio, 1948. 2686 pp., tables, cloth, $6.00.

The present issue of this standard reference work retains the original purpose —to provide accurate data constantly wanted by physicists and chemists in convenient form for quick reference. The present edition has been revised throughout and new matter added where called for. In addition to the material relating strictly to chemistry and physics, there is considerable information in the fields of metallurgy, magnetism, electricity, radio and electronics, photography, statistics, geology, mineralogy, etc.

BUSINESS & INDUSTRIAL BRIEFS

A Digest of Information received by The Editor

New Equipment and Developments

Bepco Canada Limited, 4018 St. Catherine Street, West, Westmount, Montreal 6, has expanded its repair department which is now in a position to service all types of electrical instruments. The repair staff includes six skilled instrument repairers.

•

Through manufacturing arrangements between Eaton Manufacturing Company and The McKinnon Industries, Ltd., Eaton two-speed axle units are now being made in St. Catharines, Ontario, of Canadian materials. General Motors, International Harvester, and Ford will offer these axles on various truck models.

•

To minimize heating requirements and keep viscous oils in a fluid state, two tanks in a Montreal oil refinery were insulated with a three inch thickness of loose mineral wool. Aluminum sheets were fastened to the tank surfaces by means of " Z " lugs. Loose mineral wool was installed between the sheets and the tank at each rise of sheets. The aluminum sheets not only serve the purpose of supporting the insulation, but also act as a vapour seal and weather protector.

•

According to information received from the Canadian General Electric Company it is estimated that 12,000 television receivers will be made in Canada during 1949. Although the Dominion Government has not yet granted TV transmitter licenses, roughly ten per cent of all Canadians are within range of United States television stations.

C.G.E. is now producing a second TV model.

•

A special committee has been set up to advise on the use of magnesium. The purpose of the committee is to give direct assistance to Canadian industry on points regarding the properties, fabrication, surface treatment, and design of magnesium alloy products. Enquiries on these points should be directed to the committee chairman, L. G. White, Suite 1505, 320 Bay Street, Toronto, Canada. The committee is made up of representatives of government agencies, universities and industry.

Chatham Products Company, 15 East Runyon Street, Newark 5, N.J., is marketing a new safety device that provides instant automatic light when the regular source of current is interrupted. When current is restored the emergency light goes off automatically. The fluorescent tube in the emergency light will provide approximately ten hours of emergency service. It is operated with standard dry cell batteries and uses standard Mazda fluorescent lamps. For details communicate with the Company.

•

Sir George Godfrey & Partners (Canada) Ltd., 751 Victoria Square, Montreal, announce that they now represent Tenaplas Ltd., of Berkshire, England, manufacturers of " Polythene " pipe, tubing, fittings, etc.

Polythene pipe and tubing is extruded from polymerized ethylene and it is one of the latest achievements of the British plastics industry. The Canadian agency will be pleased to furnish further details.

•

On March 4th the Right Honourable C. D. Howe, Minister of Trade and Commerce, stated that during 1949 public and private investment outlay for new construction and for new machinery and equipment in Canada is expected to be increased by 8%. In a second report, tabled at the same time, the Minister predicted continued improvement in the supply of building materials even though a few items will continue to be in short supply.

Mr. Howe's report indicates that public and private investment intentions call for capital expenditures in 1949 of \$3.3 billion as against \$3 billion spent in 1948. The programme will comprise \$2 billion for new construction and \$1.3 billion for new machinery and new equipment. Allowing for price rises during 1948, averaging 7 per cent, the 1949 programme in terms of volume will involve a slight increase over 1948. In these terms, volume of construction will be higher by about 6 per cent, and equipment lower by about 6 per cent.

•

Montreal Locomotive Works Limited has a backlog of orders amounting to approximately \$27,000,000. This amount is \$8,000,000 greater than the value of the unfilled orders a year ago.

The backlog includes about \$5,000,000 of orders on Diesel-electric locomotives for Canadian railways and \$18,000,000. for steam locomotives for delivery to India, Newfoundland and Nigeria. All export orders will be paid for in United States dollars.

The first Diesel-electric locomotive — a switcher — manufactured by the Company was exhibited at the International Trade Fair last May. It was well received by Canadian railway officials and their growing interest is evidenced by steadily mounting inquiries and orders. Electrical equipment for Diesel units will be supplied by Canadian General Electric Company and Dominion Engineering Works Limited will supply the engines.

•

Veterans established under the Veterans' Land Act have obtained, through that branch of the Department of Veterans' Affairs, 8,078 tractors, 2,903 one-way tillers, 1,816 binders and 8,608 combines. These figures are compiled up to the end of March, 1948.

•

The Wade Tool Company of Waltham, Mass., has announced a new development in connection with the manufacture of collets. All collets made by the Company now have their threads ground from the solid after hardening. By this new process it is claimed that possible distortion in thread pitch or shape is eliminated. Details may be obtained from the manufacturer.

•

According to Earle C. Brockett, vice-president of Canadian Johns-Manville Co. Limited, Canada's business boom is expected to continue this year and may equal the all time peak of 1948.

Mr. Brockett also stated that his Company has spent 12 2/3 million dollars in Canadian expansion since the war and work now in progress will bring the total to, approximately, \$14 million before new production facilities are completed.

•

Canadian General Electric Company has opened a new office and warehouse in Sherbrooke, Quebec. The building is located at 33 Belvidere Street. It has office and showroom facilities and a three-storey warehouse of approximately

For want of a Nail
The shoe was lost...
IN THE DAILY EFFORT to secure continuous production the dependable movement of materials within the plant is of paramount importance. While an overworked crane is busy elsewhere, the empty lathe and idle machinist are costing money. If repeated many times, this can result in a crippling overhead.
The Mechanical Division of Dominion Bridge Company specializes in the design and fabrication of many types of cranes and other handling equipment. The lengthy experience and complete facilities of this department are at your disposal.
For want of a Crane
The day was lost
MECHANICAL DIVISION*
DOMINION BRIDGE
COMPANY LIMITED

Assoc. Companies at: Edmonton, Sault Ste. Marie, Quebec, Amherst.

3,000 square feet. Construction is of reinforced concrete with a stone and brick exterior. A staff of thirteen, under the direction of A. H. Duchene, is employed. A branch of the Company has been located in Sherbrooke since 1919.

•

The footwear plant of Dominion Rubber Company Limited, located at St. Jerome, Quebec, has been awarded the National Safety Council's Distinguished Service to Safety Award. Announcement of the award was made by N. H. Dearborn, president of the National Safety Council of Chicago. The plant has operated for 6,411,303 man hours without a disabling injury since December, 1946. During 1948 this plant was awarded the "Excellence Shield" donated by the Quebec Association for the Prevention of Industrial Accidents — the highest honour given by the Association. It was also awarded the Department of Labour Trophy, competed for by firms which operated over 1,000,000 man hours without accident during a twelve-month period.

•

Output of refined petroleum products in Canada in 1948 was almost 11 per cent higher than in the preceding year. Major increases were in motor gasoline, kerosene, and fuel oil. According to the Dominion Bureau of Statistics, the year's aggregate output amounted to 80,969,000 barrels as compared with 73,-77,000 in 1947.

•

In the annual report of the International Nickel Company of Canada Limited, Robert C. Stanley, chairman of the Board of Directors, stated "Underground development totaled 84,152 ft., compared with 54,790 in 1947. This brings the total underground development to over 250 miles."

Technical research and development on improving mining and processing methods have proved to be of major importance in efforts to recover and produce greater quantities of metals and to counteract the sharp upward trend in costs which have been experienced since the beginning of the war. This work was expanded during the year and will be continued in 1949.

Capital expenditures made by the Company amounted to over $14 million as compared with $9½ million in 1947. The items of larger importance were $4½ million on the mines and $5 million on the new process plant at Copper Cliff for the production of nickel in the form of nickel oxide sinter for the market and for intermediate refinery products. Capital expenditures for 1949 are estimated at approximately $18 million.

•

Commenting on the production record now being achieved by C.G.E.'s Cobourg plant, which is devoted to the output of plastics, H. M. Turner, president of the Company said "The success of plastics in many phases of Canadian life is being assured by sound engineering and production practice. Plastics combine many of the best characteristics of other materials such as metals, wood, glass and even rubber and they have many special qualities all their own. To apply these qualities most efficiently to each of the hundreds of applications in the home, in industry and commerce, requires engineering and production knowledge of a special sort, backed up by progressive research."

The new Cobourg plant represents the first phase of C.G.E.'s plan to establish the Company's plastic effort in one highly specialized plant with its own engineering and production facilities.

•

J. R. White, vice-president of Imperial Oil Limited, speaking in Toronto on March 16th said "If current production progress is maintained then it is safe to predict that Canada will be self-sufficient in oil by 1958". To reach the day when Canada will no longer have to import petroleum from the United States, it will be necessary to construct a network of pipe lines across the country. The first of these pipe lines will be one stretching 450 miles from Edmonton to Regina. It will be constructed by 1950 at an initial cost of $35,000,000. Seventy thousand tons of steel will be required.

•

"Channel Flushing", a new development in induction melting furnaces has been announced by the Fisher Furnace Division of Lindberg Engineering Company, Chicago. According to the manufacturer "Channel Flushing" always keeps the channels between the two-chamber induction melting furnaces clean and free of slag or oxide accumulations. The primary coil of the furnace transformer is located in a manner to cause a greater volume of molten metal to be impelled into one chamber than the other. This raises the molten metal in one chamber, and lowers the level in the other. Every 60 seconds, when the power is cut off, the higher level subsides, and the molten metal flows to the other chamber until the same level exists in both chambers. When the current is restored, the molten metal is forced in the opposite direction, again causing a higher level in the one chamber than the other. For further information, communicate with the Lindberg Engineering Company, 2444 West Hubbard Street, Chicago 12, Illinois.

•

The Decca Navigator Company has secured a contract from the Bahrein Petroleum Company for a chain of Decca transmitting stations as a survey aid in connection with the search for oil beneath the bed of the Persian Gulf.

•

The Rubatex Division of Great American Industries Inc., 230 Park Avenue, New York 17, N.Y., announces the full development and present availability of Rubatex gas-expanded closed-cellular rubber, for general use in industry and transportation, and in products for the public. For details communicate with the manufacturer.

•

Canadian Standards have been determined for fire-hose, window cleaning, radio interference, railway gates and several other items since January 1st, it is announced by the Canadian Standards Association. Details may be obtained from the Association, National Research Building, Ottawa, Ontario.

•

Canada's gross national production in 1948 was $15,414 millions, about three times higher than in 1939.

•

Quebec newsprint mills provide paper for three out of every 10 newspapers in the world said K. H. J. Clarke, assistant manager of sales for the International Nickel Company of Canada Limited at a meeting held, recently, in Three Rivers, P.Q.

"St. Maurice Valley is the largest newsprint production area in the world and the pulp and paper industry is one of Canada's most important", said Mr. Clarke. Discussing what the pulp and paper industry means to Quebec's economy, Mr. Clarke pointed out that, apart from income tax payments by the corporations involved, the industry spends close to $400,000,000 in Quebec each year for wages, services, materials, and supplies.

•

Dominion Oxygen Company Limited, has announced the opening of their new oxygen and acetylene plant at Arvida, P.Q. This plant will serve the requirements of all industry in the Lake St John area. The Company's other plants are at Montreal, Shawinigan Falls, Quebec, Toronto, Merritton, Welland, Sault Ste. Marie, Winnipeg, Saskatoon and Vancouver.

•

Appointments and Transfers

Robert H. Macdonald has been appointed assistant sales manager, reinforcing steel division, The Steel Company of Canada Limited. He will be located at the Company's general sales office in Hamilton. Mr. Macdonald started his business career with the Company, in the chemical laboratories, in 1937 and later represented the welding rod sales division. He served overseas during World War II.

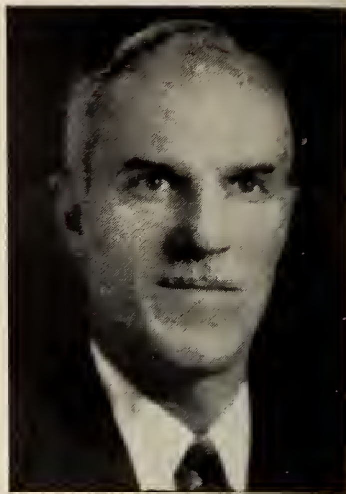
•

J. M. Paterson, manager of Canadian sales, Aveling-Barford Limited, Grantham, England, has announced the appointment of the following agents: Maritimes and Newfoundland: J. Clark & Sons Limited, 123 York Street, Fredericton, N.B. (This company has branches throughout the Maritimes); Quebec: Chas. Cusson Limited, 284 Ontario Street West, Montreal. (branches at Val d'Or and Quebec City); Ontario; M. L. Baxter Limited, 1900 St Clair Avenue West, Toronto; Saskatchewan and Manitoba: Vulcan Iron and Engineering Limited, Winnipeg, Manitoba; Alberta: Industrial and Road Equipment Limited, Calgary and Edmonton; British Columbia: Vancouver Engineering Works Limited, West Sixth Avenue, Vancouver. Mr. Paterson will maintain offices at 9 Bruel Gardens, Toronto.

•

The Foundation Company of Ontario Limited has announced that W. E.

Hickey has been appointed district engineer. He will be located at the Company's Toronto Office.



L. I. Playfair

L. I. Playfair has been appointed manager of the Montreal district of Canadian General Electric. He is responsible for the sales and service of all the Company's products in the province of Quebec through its offices and warehouses in Montreal, Sherbrooke, Three Rivers, Quebec City, and Chicoutimi.

•

Kenneth J. Libby

A. C. Wickman (Canada) Limited have opened a new office in Windsor, Ontario, and Kenneth J. Libby has been appointed district representative in that area. Mr. Libby takes over the duties relinquished by Earle Harding.

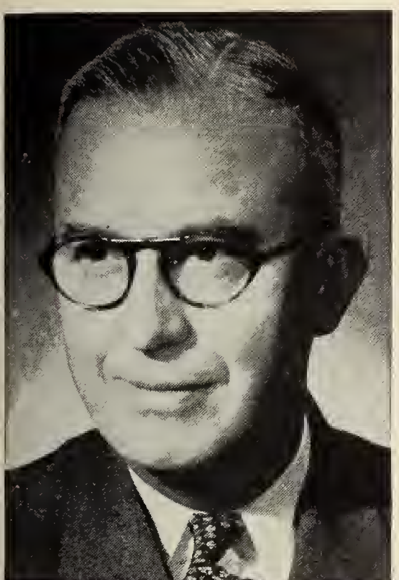
•

Alchem Limited, Burlington, Ontario, announces the appointment of G. Garnett Simms as district engineer for Ontario. He will make his Headquarters in Toronto. Mr. Simms graduated in metallurgical engineering from the University of Toronto in 1938 and before joining Alchem in 1946 was employed by International Nickel Co. of Canada Limited and the Aluminum Company of Canada Limited.

Donald H. Isbister has been appointed service engineer in the Ontario district for Alchem Limited. Mr. Isbister graduated in mechanical engineering from the University of Toronto and served with the Royal Canadian Electrical and Mechanical Engineers in Canada and overseas during the war. Before joining Alchem in the spring of 1948 he was on the staff of the University of Toronto.

•

D. M. Waterous, formerly vice-president and general sales manager, has been appointed vice-president and general manager of Waterous Limited, Brantford, Ontario. B. M. Kennedy, formerly assistant general sales manager, succeeds Mr. Waterous as general sales manager, and N. L. Elliott is his assistant.



F. G. Willmot

Fred G. Willmot has been appointed assistant general sales manager of the Goodyear Tire & Rubber Company of Canada Limited. Mr. Willmot has had over twenty years of experience with the Company and he is well known in the rubber industry. He has been manager of several departments in the sales division and previous to his present appointment was manager of tire sales.

•

Gordon H. Rochester has been appointed timber controller of the Department of Trade and Commerce. He succeeds W. E. Uren who continues his other duties as chairman of the Dominion Coal Board. As timber controller, Mr. Rochester will be responsible for the regulation of lumber exports which are still under control.

•

C. T. Ball formerly wire and cable sales manager of the Northern Electric Company Limited, general sales division, has been appointed eastern district sales manager. He succeeds D. C. McKellar who has been transferred to Toronto as central district sales manager.

Clayton W. Morgan has been appointed sales manager of Henry Disston and Sons, Toronto. He was previously manager of the Company's Moncton, N.B., branch.

•

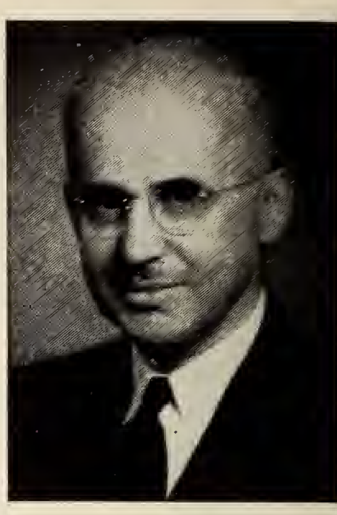
R. W. Ryan has been appointed executive assistant to G. W. G. McConachie, president of Canadian Pacific Air Lines. W. G. Townley has been appointed general manager of operations in Winnipeg. He will move his headquarters to Vancouver when the Company's trans-Pacific operations begin. He will also be responsible for control of domestic operations. The Company is now planning a trans-Pacific schedule which will call for nearly 16,000 miles of air routes to Australia, New Zealand, and the Orient. The existing domestic services of the Company embrace nearly 10,000 route miles.

•

At the fifth Annual Meeting of the Canadian Fan Manufacturers' Association the following officers were elected for the year: president, A. H. Blake, manager of the B. F. Sturtevant Company of Canada Ltd.; vice-president, J. H. Gregory, sales manager of the Canadian Blower & Forge Company Ltd.; secretary-treasurer, L. O. Monroe.

•

F. W. MacLaren has been appointed manager of the newly opened C.G.E. office and warehouse which is located at 465 George Street, Sydney, N.S.



V. E. North

Victor E. North has been appointed to the staff of the apparatus division of C.G.E. A native of Nova Scotia Mr. North graduated from the N.S. Technical College with the degree of B.Sc (elect.). Following the C.G.E.'s "Test" training he held a number of appointments in the apparatus organization in the Toronto and Montreal offices of C.G.E.

E. B. MacRobie

E. B. MacRobie has been appointed manager of the industrial heating section of C.G.E.'s supply department.

W. I. Turner

William I. Turner, formerly assistant general manager of Railway & Power Engineering Corporation Limited, has been appointed vice-president and general manager of Canadian Controllers Limited. Mr. Turner graduated in electrical engineering from the University of Toronto in 1925 and has been closely associated with the industrial control industry in Canada for the past 19 years.

•

J. G. MacDermot, manager of the Western Division of Monsanto (Canada) Limited has been elected a vice president of the Company. A native of Vancouver Mr. MacDermot joined I. F. Laucks Ltd., in 1939 and that Company became a subsidiary of Monsanto in 1944.

H. Neville Potter has been appointed executive vice-president and general manager of the Dearborn Chemical Company Limited, 2454 Dundas Street West, Toronto. Mr. Potter graduated from the University of Toronto in 1937 with a degree in chemical engineering. He enlisted in the Royal Canadian Air Force, serving for three years until discharge in 1945, at which time he was appointed technical director of the Company. He was elected to the board of directors in 1947. Dearborn Chemical Company Limited is a manufacturer of boiler feed water treatment, rust preventives and wrappers. Main offices and laboratories of the Company are in Toronto and sales offices are maintained in Montreal, Saint John and Vancouver.

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

The Bristol Company of Canada Limited, 71-79 Duchess Street, Toronto, has available a new bulletin "A New, More Accurate Method of recording Smoke Violations".

•

Webster & Sons Limited, 724 Canada Cement Building, Montreal, P.Q., offer a booklet entitled "Materials for Better Floors". The publication is well produced and most informative.

•

The foreign trade service of the Department of Trade and Commerce issue an interesting weekly booklet, "Foreign Trade". It is published by the authority of the Right Honourable C. D. Howe, Minister of Trade and Commerce. It should be of particular interest to firms and individuals seeking export markets. The publication is also available in French. A nominal charge of $1.00 for fifty-two copies is made. To be placed on the mailing list, forward the sum of $1.00 to The Editor, "Foreign Trade", Foreign Trade Service, Department of Trade and Commerce, Ottawa, Ont.

•

Hanley Company Inc., 101 Park Avenue, New York 17, N.Y., have produced an excellent two-colour brochure on "Impervo" Floor Brick. This publication is very well produced and it is illustrated by photographs and line drawings giving dimensions.

•

"Greater Quantities at Lower Costs" is the title and theme of a new twelve-page, two-colour pulverizer bulletin just released by Lippmann Engineering Works, 4603 West Mitchell St., Milwaukee. To assist in the promotion of ag-lime, one section of this bulletin is devoted to showing how much an adequate liming programme can do for both crop and pasture land. Included also are capacity tables, dimensions and specifications for the 15 sizes of pulverizers Lippman builds. Ask for the publication by number, 1160.

Lincoln Electric Company of Canada Ltd., 179 Wicksteed Avenue, Leaside Toronto 12, Ontario, offers a reprint from "Machine Design" of an article "Channel-Grid Stiffener System". The article was written by Charles Bailey, chief engineer, and David Boyd, works manager of the general engineering division of John Inglis Co. Ltd., Toronto, Ont.

•

A new bulletin on Bristol Diesel engine pyrometers has just been published by the Bristol Company of Canada Limited, 71-79 Duchess Street, Toronto. Approved commercial type diesel engine pyrometers and thermocouples suitable for use on all types of diesel engines are described and illustrated by photographs and dimensioned drawings. Ask for bulletin P-1239.

•

The March 1949 issue of the "Dominion Engineer" is devoted to an article on the stability of crawler cranes and shovels. The author is E. A. Nix, engineer of the Dominion Hoist and Shovel Company Limited. Copies may be obtained on application to the Dominion Engineering Company Limited, P.O. Box 220, Montreal, P.Q.

•

Nickel Information Service, a department of the International Nickel Company of Canada Limited, 25 King Street, West, Toronto 1, Ontario, offers the following publications to *Journal* readers.

The "Corrosion Reporter" the latest issue of which features notes on cellulose and viscose rayon. It contains a twelve page report dealing with corrosion problems encountered during the processing of rayon. "Corrosion Tests in Organic Sulfations and Sulfonations", an eight page booklet of interest to process industries. It contains technical information and tables on the results of research conducted by the corrosion engineering section of the Company's development and research division.

Crane Limited, 1170 Beaver Hall Square, Montreal 2, Quebec, offers a forty-eight page booklet on "Pipe Coils".

•

The "Northern Circuit", a quarterly publication issued by the Northern Electric Company Limited, 1620 Notre Dame Street, West, Montreal, Quebec, is available to readers of the *Journal*. The content of the publication is of a general nature and presentation is in magazine style.

•

A new twenty-eight page booklet has just been released by Dominion Wheel & Foundries Ltd., exclusive manufacturers of "Domite" alloy irons. It represents the technical story of Domite alloy irons. The various types of Domite irons are dealt with under separate headings showing the physical properties and applications for metal products manufacturing. Well illustrated by charts and photographs, the booklet will prove a useful reference for all interested in alloy irons and their uses. Copies may be obtained on request from Dominion Wheel and Foundries Ltd., 171 Eastern Avenue, Toronto.

•

The Coventry Gauge & Tool Co. Ltd., Coventry, England, offers a four-page brochure catalogue on their "Matrix" Micro-Maag Internal Micrometer. This catalogue is very well produced. Copies may be obtained, without charge, on request.

•

Forano Limited with head office and works at Plessisville, Quebec, and sales and service office at 335 Canada Cement Building, Montreal 2, Quebec, has issued a twenty-page publication "Simplified Selection Tables for Light and Heavy Duty Forano V-Belt Drives". This brochure is very well produced and the tables it contains should prove to be of great assistance to the user. Ask for Catalogue No. VB-48.

•

Frederick C. Baker & Co., 229 Yonge Street, Toronto 1, Canada, has released a new condensed instrument catalogue. It lists many instruments required for general industrial use as well as special types for power plants, laboratories, pulp and paper companies, air conditioning, mining, agriculture, factory, educational institutions, research, etc. Ask for "Condensed Instrument Catalogue."

•

Information on the new electric-control C Tournapull is given in a new broadside, TP-167, just released by R. G. LeTourneau, Inc., Peoria, Ill.

•

A new industrial gas burner catalogue describing high and low pressure equipment for all common gaseous fuels has just been released by Surface Combustion Corporation, Toledo, Ohio. Divided into 10 sections and containing over 130 pages, this attractive maroon-bound catalogue is designed as a ready reference source for all engineers concerned with specifications and design of gas combustion equipment. A copy may be obtained by writing to Surface Combustion Corporation, Toledo 1, Ohio.

MORE and more key men in Canadian industry are turning to Canadian Vickers for their needs... whether it's for specially designed machinery, new equipment to replace worn out parts or for assistance in making repairs and adjustments that will speed production and reduce operating costs.
Regardless of the nature of your requirements... ships or mining equipment, copper or other metal work, engines or boilers . . . Canadian Vickers Limited has the experience and the facilities to fill your needs accurately and economically.

A Message from The President

It is the privilege of your President, during his term of office, to accept official blame for all unfavourable developments, and official credit for all favourable developments concerning The Engineering Institute of Canada. My purpose will be to see to it that causes for official blame are restricted to a minimum, and that true credit is passed on to the members and staff, without whose loyal support the Institute would be meaningless and its presidency a mere sinecure.

Since the founding of The Canadian Society of Civil Engineers in 1887, marked changes have taken place in engineering. At that time there were essentially only two kinds of engineering—one handled by Civil (or civilian) Engineers, and the other handled by Military Engineers. The Society was founded to serve the former.

Subsequent expansion of engineering knowledge far beyond the ability of any one person to grasp, has resulted in the division of the civil engineering field into many parts, each handled by engineers specializing in that particular part, only one of which is now called civil engineering. At the same time, warfare has expanded from embattled armies to total war in which all engineers participate more or less directly. The title Military Engineer, therefore, has lost much of its former significance. About thirty years ago, when these trends had become evident, the name of The Canadian Society of Civil Engineers was changed to The Engineering Institute of Canada.

While these changes were occurring in engineering, engineers also were changing. In 1887 engineers generally lacked professional consciousness and were, to a substantial extent, high grade technicians. That there were many individual exceptions to this is evidenced by the founding of The Canadian Society of Civil Engineers, the charter of which made it quite clear that this was to be a professional society. Professional consciousness in a large group, however, develops slowly.

An engineering education, if accepted by the individual as a personal attribute to be used solely for personal gain, could well lead to regrettable egotism or to equally regrettable class consciousness. If leavened, however, with a full understanding of all that is stated and implied in the Code of Ethics of The Engineering Institute of Canada, it should lead to a professional consciousness based directly upon the Golden Rule and a willingness to serve the profession and the general public without thought of personal gain. With the support and co-operation of all members, I hope to see a substantial advance in such professional consciousness among engineers during the coming year.

In selecting me for your President, you, the members of The Engineering Institute of Canada, have conferred upon me the highest honour you have to bestow. There is no higher position in the engineering profession. It will be my endeavour so to fulfil your expectations of me, that at the end of my term of office I may face you with the knowledge that I have done my best, and it has been acceptable to you.

John E. Armstrong

President.

ELECTRONICS IN AIR POWER

by

Wing Commander C. B. Limbrick

Director of Air Plans (Scientific), R.C.A.F. Headquarters, Ottawa

This paper, specially prepared for publication in the *Journal*, discusses the uses to which electronic devices are being put today for the operation of high speed aircraft, for purposes where the requirements for instantaneous and accurate reactions to be transmitted are too fast for accomplishment by the human senses.

It is necessary to understand what is meant by "Air Power" and "Electronics" before attempting to discuss the role of electronics in air power. With the advent of guided missiles there has been, inevitably, considerable controversy and discussion as to the present exact meaning of "Air Power". The writer's personal definition is: "An armed force, and its ancillaries, that normally utilizes air as the supporting element for the manoeuvres of its principal military equipment."

It seems that the descriptive word or term "Electronics" is now often used to classify most, if not all, devices using electricity, for operating power; for instance, advertising signs, toasters, toy trains, etc. For the purpose of this paper "electronics" may be defined as the application of thermionic tubes or valves to devices used in air power. Other electric apparatus employing tubes, such as diathermy machines, movie sound machines, etc., could be classified as electronic devices and as components of air power. This, because human beings are necessary for some part of the operation, and maintenance of all military functional equipment, and such electrical devices not generally included under the classification of "military electronics", are necessary in the general maintenance of health and morale of air force personnel.

The air power of today, employing aircraft flying at velocities close to the speed of sound, and guided missiles travelling at supersonic speeds, require precision senses for their efficient and safe operation. So we may well define electronics when applied to air power as the "central nervous system" (fig. 1) tying together, and stimulating, as required, all the varied equipment that requires activation with great rapidity and accuracy of timing, to ensure efficient operation of the whole system or force.

Human Senses Too Slow

The time is rapidly approaching when even the relatively concise and speedy co-ordination of brain and muscle by a healthy young man is not good enough to ensure the necessary operation of aircraft controls. Brain and muscle may not provide the rapid complicated aerial movements of transonic or supersonic aircraft in combat operations. Precision is limited and affected by re-action time and fatigue, errors of muscle co-ordination, detection and correction of minute variations without appreciable time lapse, and errors of judgment.

Sensory requirements of functional equipment employed in air power are almost fantastic, certainly far beyond the limits of present human accomplishment. They are even greater than certain amazing powers possessed by many birds, and also beyond the possibilities of training human senses. We humans cannot see or hear far enough or well enough; we cannot speak with sufficient volume to reach any great distance nor with any degree of security against eavesdroppers, we cannot say sufficient words per minute to convey the required amount of information fast enough for high speed operations. Practically all the main sensory powers of man must be improved beyond the limits of human acuteness or training, if air power is to make full use of modern high speed aircraft and contemporary equipment.

Air power, due to the speed and complexity of modern aircraft and weapons, and to operations in an element unnatural to the normal activities of humans, requires extraordinary powers of mental and physical skill or effort. Systems for ground control of air operations also require special qualifications to fully exploit the operational potential of modern aircraft. The brain functions of normal men are not sufficiently fast or proficient to fulfil all the stringent demands. Physical effort is required beyond normal human capacity and endurance. In addition to the necessity of providing devices to assist the human powers, means must be available to deny to opposing forces the use of similar devices. Air power employs many ingenious electronic countermeasure equipment designed to annoy the enemy and to offset enemy counters to our electronic material.

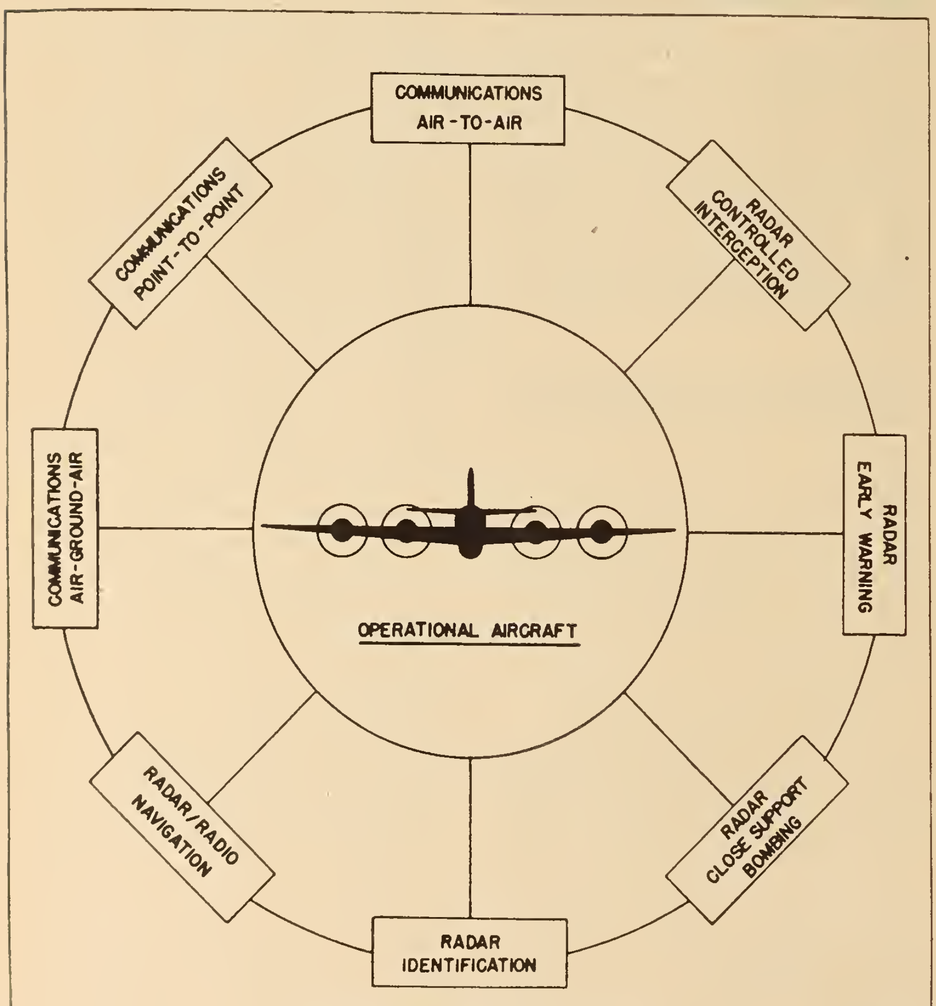
Aircraft may be divided into three categories: those manned and operated by aircrew which normally rely on the human senses unaided by any extra devices; aircraft operated by instrument assisted aircrew; and flying machines which normally are flown and navigated entirely by automatic devices. The first type is rarely encountered in military formations; the second is the normal situation in modern air forces; and the last is partially in being and will perhaps be in general use by say 1955 or 1960. In addition to aircraft and guided missiles, air power utilizes many devices and weapons which require automatic or semi-automatic operation and control. This automatic operation is nearly always provided by electronic equipment.

In Military Operations

It is, then, quite evident that man has dreamt of, designed and produced military aircraft, flying machines, and weapons, so complex and fast that his normal senses, though highly trained, are not suited to adjust themselves to this new conception of air power. Here electronics in many forms has taken over the task, permitting man to produce, and operate efficiently, modern air machines, and to cope with the exotic air power of the future. Without electronics, air power would be almost useless, and any country or nation that does not maintain progress in the development and use of electronics can not compete with those nations whose air power utilizes to the full the assistance provided by electronic devices.

As a result of new concepts of " Blitz Kreig " and " Superblitz ", movements and operations must be timed with extreme precision. Those responsible for planning and operation of air power must now consider space in terms of time rather than of miles, with aircraft flying at six to seven hundred m.p.h. and guided missiles with velocities of over 3000 m.p.h., all operational movements and communications must be both rapid and accurately timed. Electronics have demonstrated what super-velocities can do to shrink our world. It matters little to people at each end of a radio telephone terminating at Ottawa and London that the space between terminals is 3500 miles. To the conversing parties there is no perceptible time lag, and therefore no space between the parties. However, the tremendous speed of electromagnetic waves is barely high enough to cope with modern air power requirements. Automatic equipment, more efficient operating techniques, and new terminal equipment must be employed to overcome delays which would cancel the advantages of radio velocities. Considerable effort is being expended to find a solution to limitations in the use of micro-wave devices, due to relative short ranges of line of sight transmission.

There exist no mechanical timing devices which can provide the accuracy necessary to ensure rapid activation and operation of defence and attack forces, and to collect and integrate all the information that must be available to ensure the optimum use of air power at the disposal of a commander. Electronic methods of timing use the highest speed available to man, that of light. This speed, together with an accuracy of better than one quarter of a millionth of a second, provides a timing device unequalled by any mechanical device. Electronic equipment will accept and reject matter from many sources of information. It will integrate, compute and display the final complete answer. If necessary, it will automatically encypher the information, despatch it to many centres and there automatically decypher and display it. Such



ELECTRONIC NERVOUS SYSTEM FIG. 1

necessary operations may be carried out without help from humans except to start, stop and maintain the electronic equipment.

In Research and Development

Many are familiar with the more spectacular aspects of electronics used by air forces; such devices as early warning radar, controlled interception, automatic pilots, navigational aids, etc., are well known. Essential devices to ensure precision timing and rapid computation are often overlooked. Electronics not only fill requirements for accurate timing and rapid calculation for operational uses. It also provides similar methods to assist in accelerating research and development of new aircraft and weapons. Electronic computers can do in one hour the same amount of work that could be done by an experienced mathematician in six months. The nation which can produce "the best the fastest" usually has the better chance of success. Electronic calculators, telemetering devices, industrial controls, simulators and many other instruments assist in the speedy production of new airborne and associated ground equipment for military use.

Perhaps the best way to illustrate the size and complexity of the electronic role in air power is by the use of a chart showing the various functions of electronics in the different departments of a modern air force. The chart, at Fig. 2, shows the breakdown without much detail, for example, "Navigational Aids" could be further broken down into its many functional aspects such as: Long Range Navigation, Ground Controlled Approach, Distance Measuring Equipment, Homing Beacons, Airfield Surveillance Radar, etc.

Electronics have become so indispensable to air power that the old practice of stowing the electronic gear in spare spaces has disappeared. Modern procedure is to include in the original aircraft layout properly sized spaces in correct relation to the function of each piece of electronic equipment. Space requirements for electronic devices are given a high priority and serious consideration is necessary before electronic gear is discarded to make room for something else. In this atomic age the atomic bomb is, and must be, associated with air power. Research on atomic power and actual construction of atomic bombs is not possible without electronic control and measuring equipment. The basic research into atomic fission was carried out with the aid of complex electronic equipment. Precise and delicate measurements must be made with remote control, and this is only possible through electronics.

It is certain that electronics will steadily progress in value to air power. As the speed and versatility of aircraft and missiles increase, automatic control will ensure defence and offense with a minimum of human loss to the air power with superiority in electronic development.

In Civil Aviation

In our ever decreasing time-sized world, rapid and accurate communications are essential both for military and civilian purposes. This will be accomplished by the development of micro-wave relay, airborne and ground based. It can be accomplished by the increasing use of co-axial cable which, in an emergency, might well be laid by aircraft. Telephone cable has already been placed in position from aircraft flying at over 100 m.p.h.

The use of electronic devices by civil aviation is equally important. Peacetime development of military equipment is of course slower than under the stimulus of war, but fortunately electronics is one of the arts serving both military and civilian functions. Therefore, development may be coordinated and carried out with economy. For example, development of unattended radar beacons or micro-wave relay stations would be of great value to commercial airways or for military use.

In conclusion we can recapitulate by stating briefly that the role of electronics in air power is to extend limits of the human sensory system; to assist and augment human physical effort; to increase the capacity of the human mind in time/quantity terms; to reduce loss of life and equipment; to provide rapid and secure communications over any distance; and to furnish a versatile tool for the use of scientists and engineers.

Handling and Storing Grain

and

Other Bulk Materials

by

J. M. Fleming, M.E.I.C.

President, C. D. Howe and Company, Limited, Consulting Engineers.
Port Arthur, Ont.

Reprinted from the Journal of the Institution of Mechanical Engineers, England

In dealing with a subject of such broad nature in a short time it will be necessary to confine the remarks to brief descriptions and discussions of the main features in grain handling and other plants.

It is apparent that the volume to be handled annually, hourly, or daily, has an important bearing on the choice of equipment to produce an economic operation. The availability and cost of labour is another factor influencing the choice.

This paper, therefore, is confined to a brief description and discussion of equipment and of methods presently considered the best practice where high volumes are handled. My experience has been mainly on the Great Lakes and at the Atlantic and Pacific seaboards of Canada — all high grain volume areas. A chart of shipments for the past fifteen years is shown in Fig. 1. The methods used, however, would have an application in any area.

Terminal Grain Elevators. Terminal grain elevators may be subdivided into four general types; (1) an interior or storage elevator used for the concentration of grain at a central shipping point, received directly from the farm or smaller country elevator — such an elevator usually cleans grain and ships by rail or vessel and Fig. 2 illustrates a Canadian upper lake terminal of this type; (2) a mill elevator for the handling and storage of grain for processing and manufacturing in an adjacent plant — it may receive grain by rail or vessel or both; (3) a transfer elevator for the transfer of grain from one vessel to another, or to railway cars located on an interior waterway; (4) a seaboard elevator for the transfer of grain from inland waterway vessels or railway cars to ocean vessels.

All these types are similar in general design and construction, but use somewhat different devices and arrangements. The use of reinforced concrete for the buildings is now almost universal — concrete

Fig. 2 (above) shows a Canadian upper lake terminal grain elevator of the storage type.

being a satisfactory material for bin walls. The enclosing walls of various floors, where large glass areas are present, have proved satisfactory for ventilation and for the release of dust explosion pressures, without undue building damage. A typical flow diagram for a terminal elevator is shown in Fig. 3. This illustrates a Canadian upper lake terminal, but could apply equally well to a seaboard terminal.

Grain Unloading From Railway Cars. The unloading of grain into an elevator from a railway car is commonly done by power shovel devices manually controlled by two operators within the car. These devices have long been in use and little improvement has been made since their origination, nor is any real improvement possible. This method economizes in power but uses considerable labour and is unpleasant dusty work for grain shovellers.

Air suction unloaders use considerably more power than shovel devices, and about the same amount of labour, since two men are required on the suction nozzles within the car to get the proper rate of unloading. As the weight of the suction hose is not supported inside the car, it is comparatively hard, but not very dusty, work for the operators.

In Canadian practice to-day, two 50-ton cars per hour is a good average unloading rate by shovel or suction. Real improvement is possible in the air suction method in the near future, though there is little chance of reducing power requirements.

Automatic car dumpers have also been in use for thirty years, and are to-day the best unloading device where a moderate or high volume is handled. The modern car dumper will unload a car in 4½ minutes, and is being currently designed to handle cars of 105 tons gross weight. It unloads six to eight cars per hour.

The railway car is placed on the "cradle" and locked in a central position, the side door is removed automatically and the car and cradle are tilted sideways through about 15 deg., the grain discharging to the pit below. Cradle and car are then tilted up to 45 deg. in each direction. A third tilt endways is usually necessary with a small baffle plate on the floor of the car to remove the last of the grain. The cradle is then levelled and the car removed.

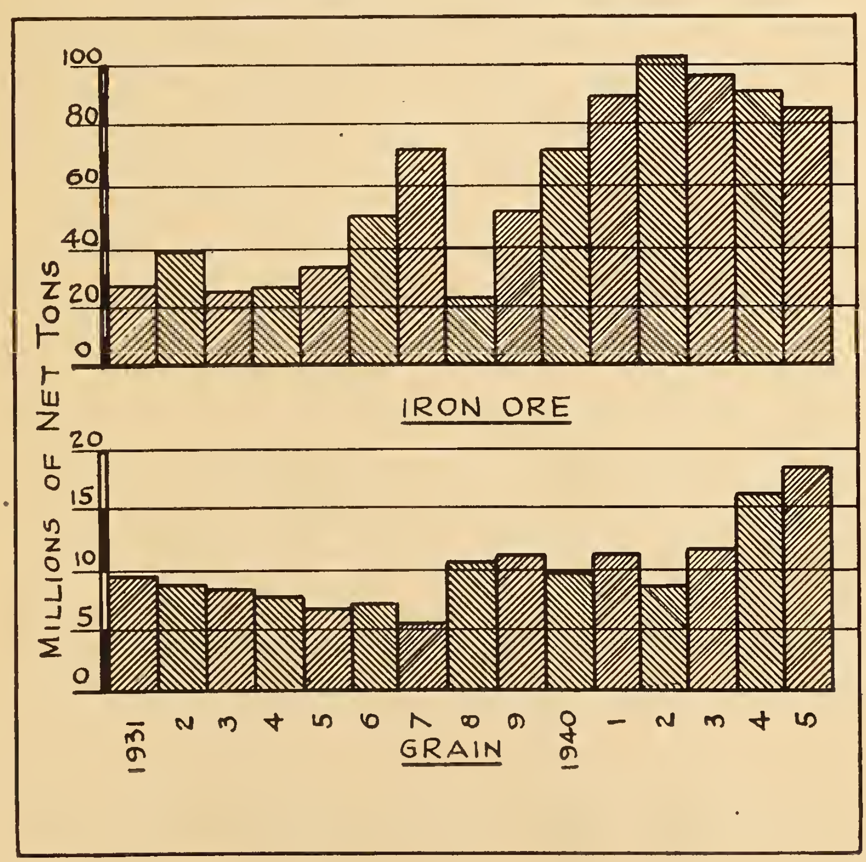
Special cars for grain carrying with hopper bottoms, and covers with hatches have been proposed. The suggestion has so far been ignored by Canadian railways, though recently Australian railroads have placed in service a practical 20-ton hoppered grain car. But cars that carry grain in one direction may have to load other commodities on the return trip. So it appears more economic to provide such special devices as car dumpers to unload ordinary general service railway cars at terminals rather than to provide special hopper cars. No change in this viewpoint is likely in the future.

Grain Unloading From Vessels. The unloading of grain from vessels presents a variety of problems. Many types of vessels are used for grain and it is difficult to select a device that will handle all classes of vessels. Air suction is probably the best method where flexibility is important. The suction hose can be used to unload almost any type of vessel or barge, and can use its own or the vessel's hoisting gear for handling and moving the hose in the hold. Air suction units with capacities of 6,000 bushels per hour are in use. Multiple units can operate through different hatches.

Where the variety of vessels to be unloaded is not too great, a marine leg of the bucket type, mounted on a boom and crosshead, is the best application. The marine leg is swung out over the vessel with the boom. The crosshead supports the inner end of the boom within the marine tower on the wharf. A hinged telescopic spout discharges grain to the wharf tower. The tower contains machinery for hoisting, weighing, and re-elevating the grain. Four to six power shovelling machines are required for cleaning up within the vessel. Such marine legs are built in capacities up to 25,000 bushels per hour on the dip.

On the Great Lakes, where considerable uniformity of lake vessels is obtained, crosshead type marine legs are undoubtedly the best high-capacity device in use. Legs are housed in moveable towers and up to four units can be placed in one vessel. They are 110 feet in length supported on a cross-

Fig. 1. Net tons of iron ore and grain carried in bulk freight vessels on the Great Lakes in seasons 1931-45.



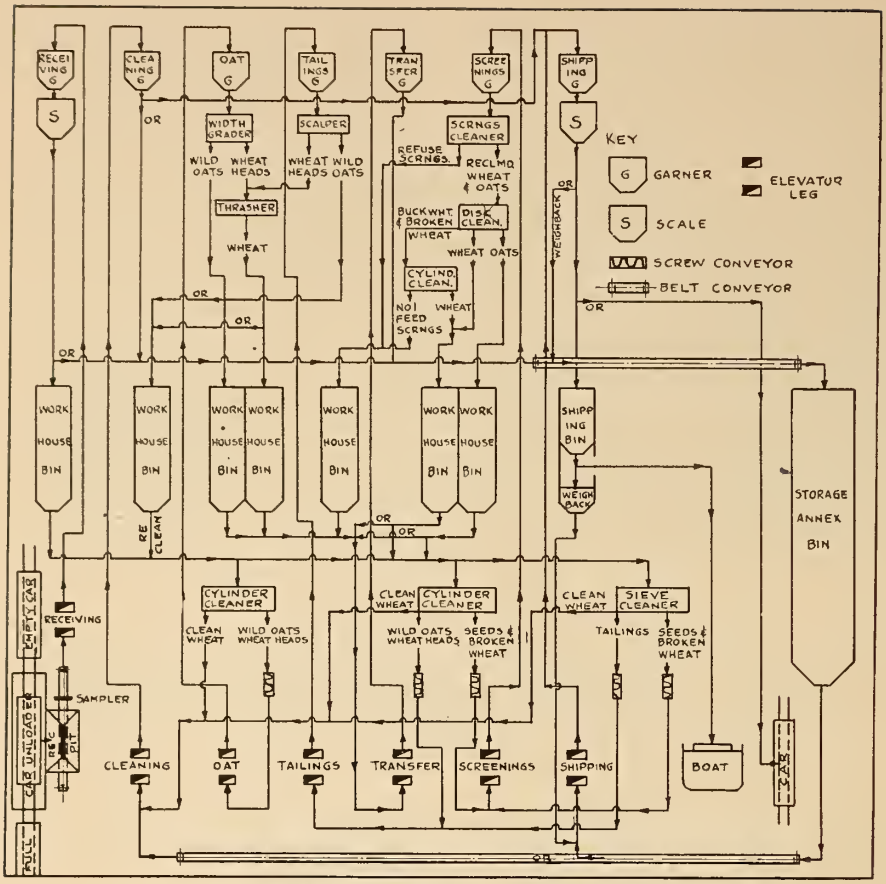


Fig. 3. Typical flow diagram of a terminal grain elevator.

head in the tower with vertical travel. The lower end of the leg is pushed out from the tower over the vessel by a pusher mechanism rolling on the back of the leg. The tower also contains all hoisting, weighing, elevating, and shovel equipment.

Four sets of heavy power shovels with two operating speeds are used for cleaning up the holds. The capacity of the large crosshead type legs is 36,000 bushels per hour on the dip. On large Great Lake bulk grain carriers of 400,000 to 500,000 bushel capacity, the average unloading rate is 24,000 bushels per hour per marine leg unit.

In general the bucket elevator type of unloading is much more economical on power consumption than air suction unloading although somewhat more labour is used. These unloading devices are well established in grain handling and nothing new is in prospect beyond continued small improvements.

Grain Handling Machinery. Elevator legs of the bucket type, mounted on rubber belting with cotton plies, are in general use for terminal elevators. The tendency to-day is to provide better driving mechanism and safety devices. Interlocks should be provided to cut off power in the event of a slow down in leg speed from a tendency to choke at the boot of the elevator leg or from any block in the flow of grain from the head spout.

For distribution of grain throughout terminal elevators, belt conveyors are used exclusively. They are equipped with troughing rolls throughout. Belt speeds are about 850 ft. per min.., though speeds up to 1,100 ft. per min. have been used. Such speed is not satisfactory, however, for some of the lighter grains. Capacities range up to 36,000 bushels per hour.

Grain Cleaning. Cleaning machinery is of three types. The screen type with air aspirations both at the feed and discharge ends is the oldest type and is still used. Disk machines with air aspirations on the feed ends are also used. The most popular cleaner to-day is the cylinder type, with indents to suit the various grains to be cleaned. This type is built in capacities up to 2,000 bushels per hour. Cleaning machinery is being improved continually. All-steel frames and anti-friction shaft bearings will soon be standard for such machines. Recleaning machines for reclaiming grain and separating screenings and railings are combinations of the three types already mentioned.

Grain Storage. Terminal grain storage bins should be designed for active storage and should not hold over 40,000 bushels per bin, and a variety of bin sizes is desirable in a storage unit. Reinforced concrete is generally used for the walls. Sliding forms are used, raised by screw jacks, and the concrete is poured continuously from the bin bottom to the top of the bin. On rock foundation bin heights up to 160 feet have been used.

The regular circular bin is best. These are often spaced a few feet apart and connected with contact walls, the interspaces being subdivided with other walls to provide a variety of bin capacities. In a terminal elevator the ratio of capacity between the working section and the storage section should be between 1/6 and 1/10.

Belt conveyors in the cupola with moveable trippers to distribute grain to the various bins, and similar belt conveyors in the basement to draw off the grain, provide for the distribution and handling of the grain. All bins should be fully hoppered and the tops enclosed.

Temperature recording apparatus is very useful in storage units, particularly in warmer climates. This is accomplished by suspended conduits containing electrical cable with thermocouples at intervals. All such thermometers are connected to a central control board and any temperature rise can be detected immediately and the grain cooled by drawing off the bin, re-elevating and filling again.

Temporary Storage. In 1940 when Canada was faced with carry-overs in excess of 500,000,000 bushels of grain, it was evident temporary storage of some sort would be necessary. Wooden cribs and plank bins were constructed adjacent to country elevators, and much was done on the farms to hold grain until elevator space was available. In all, about 75,000,000 bushels of storage space of this type was provided in Western Canada.

However, it was also necessary

to provide terminal storage. This was done during the summer of 1941, providing a total further space for 55,000,000 bushels at Port Arthur and Fort William adjacent to terminals, in addition to the permanent 95,000,000 bushels capacity there.

The temporary storages were built with concrete floors and a central concrete tunnel along the middle of this floor contained a belt conveyor for drawing off the grain. The side walls were of timber crib construction. The roof was supported on wood post towers, sloped at the angle of repose of the grain. At the roof peak a small cupola was built to contain a belt conveyor for filling the storages.

These sheds were 144 feet wide, and varied in length from 600 to 1,200 feet. The depth of the grain was 48 feet at the centre and 18 feet at the side walls. Each building held from 2,000,000 to 4,000,000 bushels. The total length of sheds built was about three miles. 60 per cent of the grain would flow out to the conveyor and the balance had to be moved by power shovels. The use of these temporary storage sheds lasted five years until stocks decreased. The sheds then were demolished and the material salvaged for housing projects. Such storage cost about 9 cents per bushel to build, including equipment and connections to the terminals. They were not expected to be cheap to operate, and cannot be recommended for permanent storage. The programme, however, provided safe storage in an emergency.

Some difficulty was experienced from infestation in the grain but the loss from such damage was less than 1/6 per cent. The grain had to be turned over about once every eight months to maintain it in good condition. Grain in temporary storage in the cold winter weather gave no trouble.

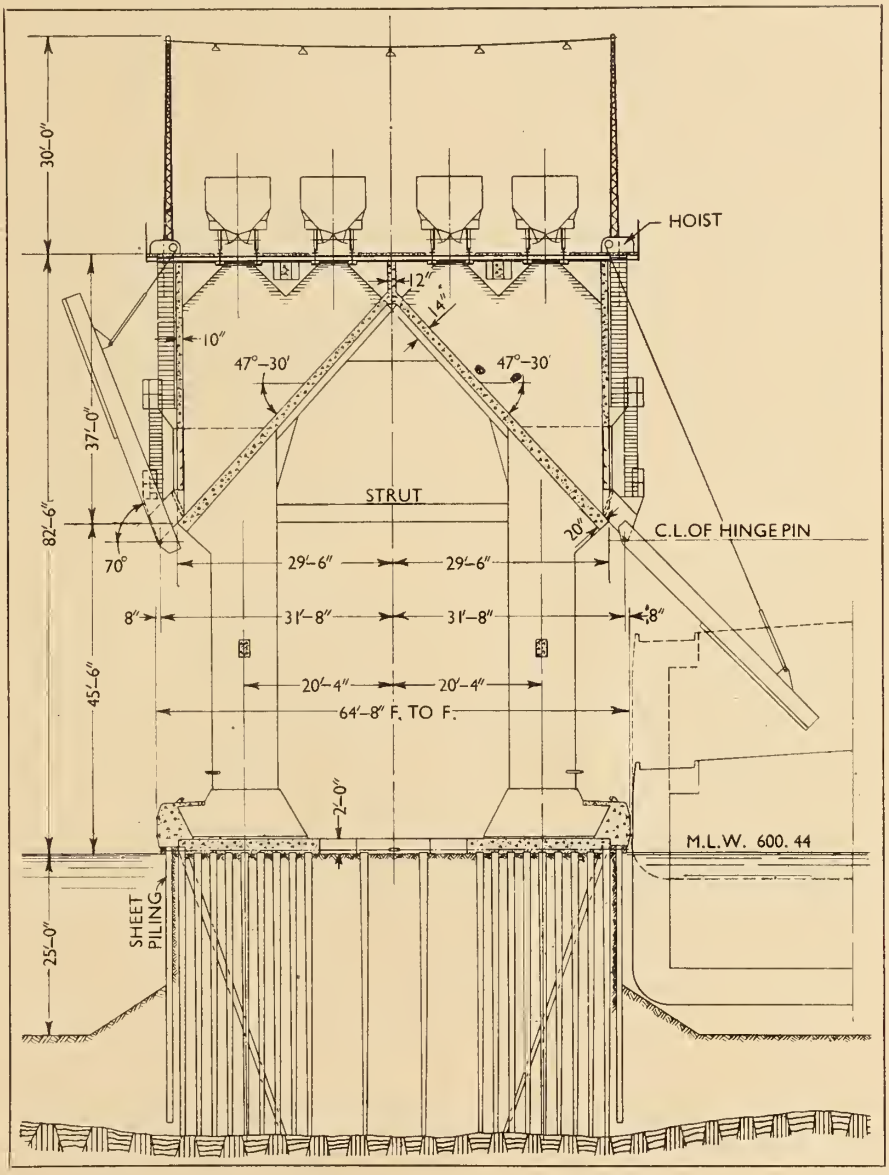
Grain Shipping. Shipping from the terminal is accomplished by direct spouts from shipping bins to vessels, or, if the wharf is remote from the terminal, by a belt conveyor system. Railway car shipments are directly spouted from the scales to the railway cars, the spouts having bifurcated ends to load without trimming the car. Sacked grain shipments are made at the wharf in sacking towers built into the shipping galleries. Bulk grain is discharged from the conveyor system to a bin below. This bin discharges to sacking machines, which in turn discharge to the wharf level for loading into the vessels with slings.

There are many elaborate systems of grain shipping galleries for delivery of bulk grain at ocean ports to vessel berths at transit sheds, making it unnecessary to move the vessel to load grain when other cargo is being handled. Travelling ship loaders have been devised to discharge bulk grain from overhead conveyor systems at any point throughout the length of the wharf, but their expense has never been fully justified.

Auxiliary Equipment. The dust explosion hazard in terminal elevators has always caused concern to operators. Of first importance is good housekeeping to remove daily the static dust on floor, ledges, and walls. The handling of grain produces dust and it is impossible to confine such dust at all points where discharging grain from spouts is loaded on to belt conveyors or placed in bins.

Dust control systems are now in common use and should become universal in all grain handling plants. These systems mean the application of air suctions at all points in the terminal where dust may be liberated into the atmosphere, and the collection of all this dust by means of air piping, with traps to remove any grain or heavier material, and fans and dust collectors to remove the lighter material from the air volume. With the dust control system in

Fig. 4. Cross-section of a typical pocket ore dock.



operation the housekeeping problem is simplified and the reduction of suspended dust reduces the explosion hazard.

The custom of removal of tramp iron from grain as received in terminals will probably become general. Iron can be very troublesome, damaging equipment and also increasing the explosion hazard through sparks from such metal striking concrete walls, or metal spouts and hoppers. Suspended electro-magnets over receiving conveyors can be devised to pick up all metal from the grain stream. If the magnet is covered with a moving belt, it can be made self-cleaning. These devices are not commonly in use, since the cost of installation is somewhat high.

Individual electric drives are now the rule in modern elevator design. All electrical apparatus should be dust tight and electrical interlocks used in the various drives to prevent human error in operation and to safeguard equipment from overloading or choking. Electric signal and telephone communication throughout the plant is becoming more complete and is a great aid to efficient operation.

Iron Ore Handling. The handling of iron ore on the Great Lakes is an example of the high efficiency and low handling cost that can be achieved over a long period of years where a high continuous volume is present. This handling method is developed from a combination of special bulk freight vessels, railway cars, gravity loading systems, and large mechanical unloading units.

The bulk freight vessels are standard, with hatches at 24-foot centres and no partitions in the hold, making a continuous cargo space fore and aft. Cargoes up to 18,000 tons are carried.

The railway car is of special design, hoppered to a central gate at the bottom and 24 feet in length. Capacities of ore cars range up to 75 tons, though 50 to 65 tons is the usual range.

The high level pocket ore dock, for transfer of the ore from cars to vessels, is a special development from the early days of the iron mining industry in Minnesota. The cross-section of a typical pocket ore dock is shown in Fig. 4. The top of the dock is about 8 feet above water, with four tracks which connect with the railway yards by tracks on trestles. The ore cars are shunted to the top of the dock from the classification yards. The dock pockets or bins are spaced at 12-foot centres and hold from 300 to 400 tons of ore. The cars are emptied directly into the pockets, each car registering on every ore pocket.

At the bottom of each pocket a gate and chute is located, operated by an individual two-drum hoisting winch on the top. The ore chute can be lowered into the hatches of the vessel and the whole pocket discharged in a matter of seconds.

A new development in the unloading of ore cars is a 5-ton shakeout. This is a weight placed on top of the car, having a motor and eccentric to produce rapid vibrations of the weight. This is proving effective for removing caked ore from the cars, and is a great labour saver. It is useful also on any sticky bulk material in hoppered cars.

Coal Handling. There are many well-established varieties of coal handling devices. One war-time development may be of interest. It was necessary to stockpile large quantities of coal at central steam electric stations and manufacturing plants to insure continued operation in case there was an interruption in coal deliveries. Danger of fire in coal stockpiles of any size has been a common trouble and various means of ventilating and limiting the depth have been set.

Recently coal has been stockpiled, after crushing, by ordinary road building machinery — the surface of the pile being sealed by packing fine coal with the heavy treads of the machines, or coating with a sealing compound. Stockpiles 100 feet high were built up in such a manner.

The self-unloading type of bulk freight carrier is used to a large extent on the Great Lakes for coal, limestone, and other bulk materials. The holds of the vessels are hoppered to two tunnels. Here the material is drawn off to conveyor belts, or dragged by scrapers which discharge at one end to an elevating device. The main advantage in this type of vessel is the handling of bulk freight to points where no unloading facilities are available.

The use of belt conveyors for all sorts of handling of bulk materials is now quite common, and should be developed to a much greater extent in the future. The loading of ore, limestone, coal, and any coarse bulk material can be done economically and rapidly entirely with belt conveyors. Lump material up to 12 inches in size can be handled without undue wear and tear on equipment. The belts used for handling large lump or abrasive material are generally of cord construction with a heavy rubber cover, having an overall thickness of ⅞ inch and widths up to 60 inches.

Conclusion. The whole subject of material handling is so closely connected with unit cost of material handled that in any particular problem the choice of equipment is decided by economic rather than by technical considerations. It is not a matter of what is the best and fastest type of equipment to do the work, but what it will cost per ton or bushel, including both the capital and operating costs.

There are three main principles to be studied in an approach to any material handling problem for selecting the method and equipment to be used. In the first place, capital plus operation cost per unit handled should be at a minimum. Secondly, the rate of handling per hour or per day should not exceed five times the average rate on a seasonal or annual basis. If it does, then the cost of the higher speed equipment will be out of proportion. Finally, the flexibility of the method and equipment to be used should be determined from the expected number of different types of carriers using the facilities.

While the above principles should be broadly considered, I believe they can be applied to any particular problem.

MECHANIZATION OF THE FRANKLIN MINE

by

David G. Burchell

General Manager, Bras d'Or Coal Co., Limited, Bras d'Or, N.S.

A paper presented before the Maritime Meeting of the Engineering Institute of Canada, at Digby, N.S., September, 1948

The Franklin was the first coal mine in Canada to adopt mechanical loading at the face, using shakers and duckbills. This paper tells how the equipment is set up and how it works. The continuous system of coal extraction used in this mine is explained, and its advantages over the older, more commonly known method, known as the parallel room system, are assessed. The cycle of operations is explained and reasons given for the choice of certain types of equipment. The electrical layout is described, as well as how time studies and labour cost records are kept. The losses and gains from using mechanical loading are weighed. In conclusion the author shows how, by increasing production, mechanization tends to increase wages.

The Franklin Mine of the Bras d'Or Coal Company, Ltd. is situated at Bras d'Or in Cape Breton county, Nova Scotia, and is located near the western edge of the Sydney coal basin. The mine is on the main line of the Canadian National Railways three miles west of Sydney Mines. The operation is carried on in a 42 in. seam, locally known as the Sullivan or Edwards, and lies 350 ft. beneath the Sydney Main or Harbour seam. Entrance to the mine is by means of a pair of slopes, bearing North 25° 30′ East, and dipping ten percent seaward. At the present time the slopes are some 6,000 feet in length. The coal is a high volatile bituminous, Class A to B; it is one of the lower seams in the basin, and contains a considerable quantity of impurities. The mine plant is designed for an output of 700 tons per day. At the present time we are producing 500 tons per day.

There are a great number of washouts in the seam, as well as quantities of iron pyrites in certain sections of the mine. These washouts vary in thickness from a few inches to 18 feet and possibly more, and usually replace the coal to the full height of the seam. These washouts are of great interest to geologists. From an operating point of view they present one of our most difficult problems and a great hindrance to the mechanization of the loading operation.

Introduction of Mechanical Loading

Some eight years ago when this mine was projected it was decided to experiment with some type of mechanical loading, because of the increasing cost of production. After due consideration of the various types of equipment available, it was decided to use shakers and duckbills. Thus, this was the first mine in Eastern Canada to adopt a system of mechanical loading at the face. You will note that the term mechanical loading is used rather than mechanization. The term "mechanization" is rather a loose one when used in connection with the mechanical operation of the various units in a coal mine. Strictly speaking the terms "mechanical loading" and mechanization are not synonymous, though they are sometimes used in that sense. Practically all the various operations carried out underground in the getting of coal have been mechanized for some years in the Nova Scotia mines with one exception, that of the loading coal at the face.

There are various methods of loading coal mechanically in underground mines. Probably the simplest method and certainly the most satisfactory under certain conditions is known as "duckbill mining". All means of mechanically loading coal are merely methods for reducing the amount of physical labour required. Shaker conveyors have been used for years for transporting the coal from the working face to the transportation system. In most cases coal is hand-loaded from the floor onto the shaker conveyor, and duckbill mining is merely this older method of transporting coal brought up to date. This is done by the addition of a self-loading head, or "duckbill". The duckbill was originally developed in Germany in the early "twenties", but did not prove successful until the idea was transmitted to this side of the Atlantic, where it was developed by the Union Pacific Coal Company in the United States. This company developed the apparatus to a point where the manufacturers of mining equipment felt it was a sound and practical idea. The patent rights were obtained by the Goodman Manufacturing Company of Chicago, and they are today still the only manufacturer of this type of equipment. (Fig. 3)

Any mechanical device used to load coal is a means of supplanting the human muscles for getting the coal off the floor into the transportation equipment. A man can lift so much and no more. He can load more tons of coal on a low conveyor, because the lift is less, than he can in a mine car two, three, or even four feet high. If the lifting operation is eliminated, the man can produce more coal with less effort.

The Duckbill

Duckbills are particularly adaptable for thin seams and for mines having heavy, tender top conditions which require close timbering. A duckbill is a self-loading head, attached to a shaker conveyor. A shaker conveyor consists of troughs or pans of steel, supported a few inches off the mine floor by cradles and to which backward and forward motions are supplied by a reciprocating engine or drive. The engine can be driven by any suitable means, such as compressed air or electricity. If an electric motor is used, it must be fitted with a fly-wheel. A differential motion is usually necessary on shaker conveyors, particularly if the conveyor is to move the coal on the level or against a slight grade. In most cases the drive is provided with means for adjusting the number of strikes per minute. Experience determines what length of stroke is best suited to the particular conditions of the individual mine. Our engines run at approximately 74 strokes per minute.

The differential motion provides a quick backward stroke and a slower return or forward motion, thus the quick backward stroke overcomes friction between the coal and the conveyor trough, and permits the trough to slide under the coal. The coal then remains where it was relative to the mine floor, but the slower forward stroke of the conveyor carries the coal with it, because it is not fast enough to overcome the frictional grip of the coal on the conveyor. Thus with each stroke the coal moves forward about six inches or roughly thirty feet per minute. This combination of slippage on the backward stroke and movement on the forward stroke causes the coal to advance along the panline, where it is received into the mine car or other transportation medium.

The duckbill itself (Fig. 2) is merely an addition to a specially designed shaker trough in the shape of a shovel like projection. This duckbill or loading head is made of cast steel, so designed that it can be pushed under the coal which has been shot down, and haul it back into the panline. The special trough connected to the duckbill is 15 feet long, and contains a companion trough of slightly larger size, which fits underneath the duckbill trough. This combination, known as the telescopic trough (Fig. 1), is used so that the duckbill can be moved ahead or back without disconnecting it from the panline proper.

Just behind the rear end of the telescopic trough and fastened to

Fig. 1. Rear view of Duckbill showing telescopic trough.

Fig. 2. Duckbill loading at face.

it, is a swivel joint (Fig. 3), by which means it is possible to swing the duckbill through an arc of some 40 degrees, to right or left of centre. When the face has been cut and the duckbill is set up ready for operating, the telescopic trough is in the short or closed position. As the duckbill works towards the face and cleans up the coal which has been shot down, the telescopic trough is gradually extended. When a point is reached where the trough is fully extended the panline is disconnected behind the swivel, the duckbill and swivel move forward the length of a pan, and an additional length is inserted. The panline is then bolted and the apparatus is again ready for an additional advance of ten feet. If the grip blocks are released on the backward stroke and tightened when on the forward stroke, the duckbill will move toward the face at a rate equal to the length of the stroke of the engine. On the other hand, by reversing this operation, the duckbill is retracted or moved back from the face. This operation is automatic, it being only necessary for the operator to move the operating lever either forward or backward, depending on which way he wishes to move the duckbill.

Method of Extraction At Franklin Mine

At the present time we are following a method of extraction known as the continuous room system. From our main slope driven on the pitch of the seam we develop triple entries, which are three parallel levels, driven at right angles to the main slopes. Our present equipment allows us to drive these entries approximately one-half mile in length, and with additional conveyors it would be possible to drive them much further. These three entries or levels are fourteen feet wide and separated by a pillar of thirty feet. The centre or main entry is known as the Belt Level, and here the 30 inch conveyor is installed. (Fig. 4) The right hand or low level is used to conduct the fresh air into the working faces, and to carry the power cables, while the upper or high level is developed to provide sufficient space to set up the shaker drives, so that the coal can be discharged onto the conveyor belt in the centre level. It also provides a return airway.

These levels are driven in solid coal, so that there is a block at least 900 ft. in width to the left or high side of the levels. This is a block of coal that will be worked out by the continuous room system. Such a block contains roughly 125,000 tons, and provides about one year's operation for the mine. When the levels have been developed a suitable distance and the conveyor belt set up, four or five shaker conveyors are then installed in the roomnecks provided by the development of the high level. It requires 50 feet to set up the drive and duckbill. These shaker conveyors with duckbills then proceed to extract the coal uphill and advance for a distance of about 325 feet, as shown on Fig. 10. The rooms are 21 ft. wide and there is 21 ft. of solid coal left between each pair of rooms. When the shaker units have reached a distance of 270 feet, as shown on the plan, they are turned both right and left and crosscuts are driven.

After making the crosscuts, the shakers continue until a distance of 325 feet is reached. This provides room to set up again after the lateral belt is installed. At this point two more belt conveyors are set up. The headway belt, shown in the right hand room on the plan, is approximately 300 feet long. The lateral conveyor is then installed in the series of crosscuts made at the top of the room. At this time the shaker units are moved uphill to the beginning of the next room. The coal is then loaded directly from the shakers onto the lateral belt, which in turn delivers it to the headway belt and it is then transported down the grade and finally discharged on the main conveyor in the level. (Fig. 8) When the second lift has been worked out the operation described above is repeated, the headway belt being extended an additional 300 feet.

There are considerable advantages to be derived from this continuous room system of mining, over and above that of the older and perhaps more commonly used method, which is known as the parallel room system. In the parallel room system, rooms are driven a distance of 300 feet, after which the shaker conveyor and all the other equipment is withdrawn from the room, moved in the level and set up again to drive another series of rooms parallel to the first ones. It is necessary to make new setups every eight or ten days. In making this type of setup the duckbill must be dragged 300 feet from the room face down to the level, turned at right angles, moved 40 feet along the level, turned at right angles again and set up to make it ready for the next operation. In close timbering this is an extremely difficult operation, because of the length of the duckbill and the space required to negotiate two close right angle turns. In the continuous room system, after the first set of rooms has been worked out, it is only necessary to pull the shaker drive 300 feet up the hill, set it up and all the other equipment is already there ready for operation again. Considerable time and a great deal of expense is thereby saved.

Another important point, and one which probably caused us to change to the continuous room system about a year ago, is the problem presented by stowing stone from the stone troubles. In parallel rooms, if a stone trouble is encountered a short distance from the level, and if there is not sufficient stowage room in the room itself, this stone must be loaded and hoisted to the surface. In the continuous room system, after the first set of rooms has started away, should stone be encountered in any place along the 900 ft. length, it can be stowed in the old rooms, without the necessity of loading and hoisting it to the surface.

A series of three belt conveyors is used to transfer the coal from the delivery end of the shaker conveyors to the mine car on the main slope. These conveyors are all 30 inch and run at a speed of 200 feet per minute. The belts are carried on ball bearing type idlers, some of which are equipped with "sealed for life" ball bearings.

The main level belt, sometimes called the "mother conveyor", is 2,400 ft. in length, and extends in from the main slope. Running at right angles to this belt and up the pitch is a second conveyor 600 ft. in length, known as the headway belt, which is moved in the level as the extraction of the rooms is completed. Reference to the plan will show the layout of these conveyors. The third, or as we call it, lateral belt, is of a lighter construction and is set up at the top of a series of break throughs at the room ends, as shown on the plan. This belt has to be moved every ten days or so, and for that reason is purposely constructed of a portable nature.

The three conveyors and all the shakers in the section are interlocked from an electrical standpoint. The control of all these electric motors is vested in the operator at the loading head or discharge end of the level belt and by means of a push button, he can stop or start all the equipment in the section. Starting at the face, the shaker conveyor is controlled through a rotary or centrifugal switch, which is installed on the underside of the lateral conveyor belt. If the conveyor belt is stopped, the shaker cannot be operated. You can see the reason for this, because the men at the face, being as far as 300 feet from the lateral or level belt, are unable to know whether the belt is running or not; thus if the control of the shaker were in the hands of the facemen there would be a great deal of spillage on the level.

The lateral belt is, in turn, controlled by a similar switch installed in the headway belt, and headway belt is also controlled by the same arrangement on the level belt. Thus the operator can stop or start all the units at will. Theoretically these belts should not stop, however, there are occasional delays such as a shortage of cars or some mishap, which makes it necessary for the loading head operator to stop everything in the section. Normally, however, these belts run continuously for the eight hour shift. By means of a remote control push button, the facemen are able to stop or start their shaker conveyors at will, provided however, they are only able to start their shaker if the belts are running. These rotary switches are so adjusted that they operate immediately the belt's speed drops about 10 per cent.

Cycle of Operations

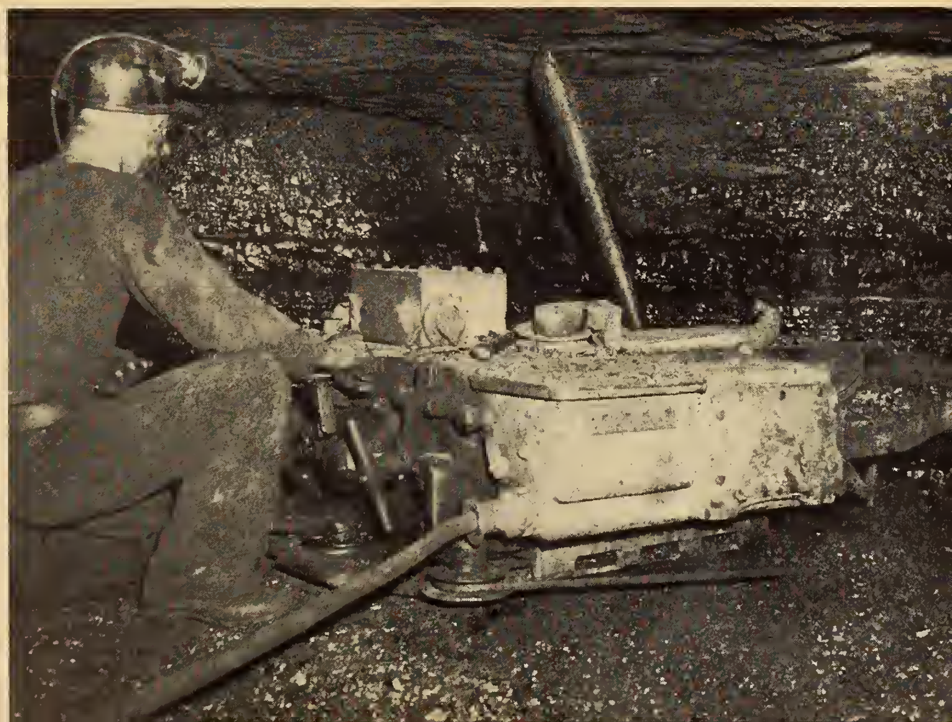
All the equipment is operated two shifts. On the third or eleven o'clock shift the conveyor belts are reversed and material, such as timber, pan line accessories etc. are brought in and distributed to the working faces, so that in the morning when the mine starts operating, a complete supply of materials is on hand to carry them through two successive shifts. One of the greatest difficulties in conveyor operation is training the conveyor belts so that they will track properly in reverse as well as forward direction. It is absolutely essential that the conveyors be properly installed, and to assure a perfectly straight line they are lined with the transit by the engineering staff.

Any number of room shakers, up to the capacity of the belt, could be worked in a section of this design. We are presently using five shakers in the room section. Each crew consists of three men, who perform all the necessary mining operations. These consist of cutting, drilling, shooting, loading, timbering and extending the conveyors. Each room is equipped with a shortwall coal cutter, post mounted electric drill, electric fan or blower for ventilation, duckbill and shaker and the necessary hand tools. The auxiliary fan is located at the room neck and provides a suitable current of air to properly ventilate the place for safety.

The cycle of operation at the face (Fig. 6) begins with the undercutting. The shortwall, which is equipped with an eight foot cutter bar, starts cutting on the right hand side of the 25 ft. wide place. This machine is operated by one man. When he has cut a few feet, the second begins drilling, while the third helps the other two or prepares the powder and stemming for the shooting. By the time the face is undercut the drilling is also completed, and the third man has prepared the break-in or snub shot for firing. This is fired, providing coal for the duckbill to start work. As soon as one side of the room is cleaned up, the shortwall begins cutting again and, when space is provided, the drilling operation goes forward as before. At this point, all three operations are being carried on simultaneously.

Shortwall mining machines (Fig. 5) are used for undercutting the coal. We have tried various types of undercutters and have found the Goodman "512" the most satisfactory. Our later machines have 8 ft. cutter arms and the earlier ones are 6 and 7 feet. We have now standardized on 8 ft. This gives an increase in the rate of advance and consequent output. The latest addition to our mining machines is the installation of "bugdusters", which device cleans the slack coal made by the cutter bar from underneath the kerf, and piles it in a neat row behind the machine. Blasting is done with

Fig. 5. Shortwall coal cutter.



Monobel No. 14, a permitted explosive, and electric detonators.

We have tried almost every type of cutter bit that has been developed. To date we have not been able to find any type of bit as satisfactory as the old standard 1 in. x ½ in. forged steel bit, which is resharpened until it is used up. We carried on extensive experiments with tungsten carbide tipped bits, but did not obtain a satisfactory cost due to the preponderance of sulphur balls or "dogs" in the coal, which had a tendency to chip the tungsten carbide from the shank. These tungsten carbide tipped bits cost in the vicinity of $5.00 apiece, so it would not be economical if too many of these had to be discarded. This cost per bit compares with about six cents for the standard type. At the time the initial cost of tungsten carbide bits was $5.00 each, and the cutting cost ran in the vicinity of 13 cents per ton. This compares with the standard cutter bit, which costs about 6 cents each, and gives a cutting cost per ton of slightly over 3 cents. We have also tried tipping the standard coal cutting bits with Borod and other hard-surfacing materials, but the results obtained did not justify the original expense. Some years ago we also tried several types of throw away bits, with results that were not encouraging.

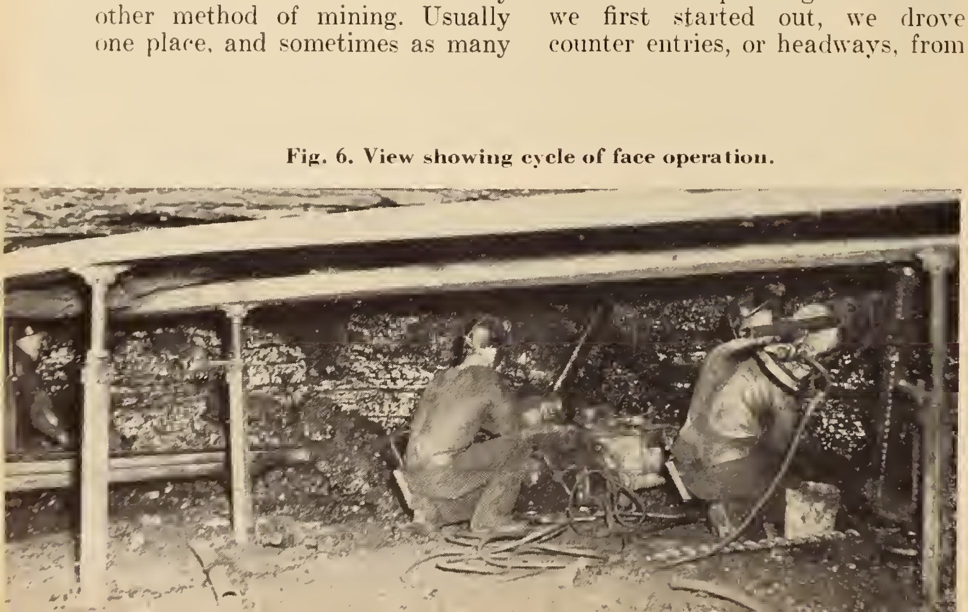
Under favourable conditions it is possible to make three complete cleanups in an eight hour shift. However, three cuts are not usually attained because of exceptionally heavy roof, hard cutting, or the stone troubles which were mentioned earlier. The average tonnage produced per shift is 37 tons per place, or slightly over 12 tons per man at the face. This is not a high tonnage for mechanical loading. However it is considerably better than could be obtained under any other method of mining. Usually one place, and sometimes as many as three, produce no coal for one, two or three successive shifts, because of the prevalence of stone troubles. When these washouts are encountered in the rooms, the place is narrowed to about ten feet, and the stone so produced is stowed along the ribs of the room. Thirty seven tons per shift is an overall figure, and includes all the shifts that were spent in non-productive stone work. If the time spent in stone work were cast out, the tons per shift of actual coal produced would be increased to 48.

The roof is tender. Great care is necessary to hold this tender top, and 3 in. x 10 in. white oak cross beams are used to support this, set on three or more steel jacks. Adjustable jacks are used rather than timber, because they have to be moved from time to time to allow the duckbill to be shifted across the face as loading progresses. After the face has been cleared up, or at some convenient time, two or three men replace the temporary oak cross beams and jacks with twelve ft. black spruce booms and permanent timber. A closely supervised plan of timbering is followed This system of timbering has caused a large reduction in the number of accidents caused by roof falls.

When the coal comes out the level on the conveyor it is discharged into 2½ ton steel drop bottom mine cars, (Fig. 7) and hauled to the surface by an electric hoist. At the present time this hoist is a 150 hp. single drum, and contains 6,000 ft. of 1 in. plow steel rope. The hoisting speed is 600 ft. per minute. Four cars make a trip. A larger hoist is ready for operation as soon as output warrants its use.

There is little doubt in our mind that the continuous room system is the most satisfactory method of working shaker conveyors and duckbills in a pitching seam. When we first started out, we drove counter entries, or headways, from our main entries or levels, and from both sides of those worked the rooms on the strike of the seam. We soon found that due to the 10 per cent pitch, it was almost impossible to keep the duckbill from sliding towards the low side of the room. In order to overcome this it was necessary to use the tail rope of the mining machine to hold the duckbill in position at the face for loading. This worked very well, but, we soon realized that when the mining machine was being used to retain the duckbill in the proper loading position, it could not be used for cutting the face and we were, therefore, unable to carry out a satisfactory face cycle, viz., cutting, drilling and loading simultaneously with a certain percentage of overlap on each operation. We eventually revamped our entire operation to a plan known as the continuous room system. This system is used to some extent in the United States, but is not common, as it is seldom necessary to overcome such difficulties as we have in the Nova Scotia coal field.

Fig. 6. View showing cycle of face operation.



Electrical Equipment

The Franklin Mine is completely electrified. Current is transmitted from the switchboard of the Eastern Light and Power Co., Ltd. in Sydney, a distance of about 20 miles, at 23,000 volts. The utility steps down this voltage to 2,300 and delivers it on our property, where we carry it underground by means of a borehole and submarine type armoured cable. The current is then transmitted underground at 2,300 volts to the various working sections of the mine, where it is further stepped down to 550 volts. Approved type oil circuit breakers and pyranol filled transformers are used in the operating section of the mine. The 550 volt current is transmitted by means of wire armoured cable through Mavor and Coulson junction boxes to the working face. The various machines at the face, such as coal cutters, drills, etc., are then plugged in these junction boxes by means of an approved type plug and the current is carried to the machine through flexible cab type three conductor trailing cable.

The flameproof oil break switchgear carries the Buxton certificate, and is used on all secondary circuits. These circuit breakers are fitted with all necessary protective devices for the circuits, such as over-current protection, which is provided on all three phases, and is in the form of series wound solonoids. Under-voltage protection is also given by means of a release, which has an under-voltage action and operates within fine limits. The flameproof junction boxes, or cable couplers, are of heavy cast iron construction capable of carrying 200 amps. at 550 volts. These are used for joining the submarine type cable and are also fitted with plugs for mining machines or drills. The plugs are of an approved type and cannot be removed from the socket, without first breaking the circuit.

Electrical control of the various units can easily become too complicated for efficient maintenance. It is important to keep it as simple as possible. The three conveyors and all the shakers in the section are interlocked, and the control of all these units is vested in the operator at the loading head. The headway and lateral belts are further controlled by means of a roller switch, actuated by the forward motion of the belts themselves. The shakers are also controlled by similar rotary switches installed in the lateral or headway belt as required. Thus, when the level belt is started by means of the push button and magnetic switch and it reaches a pre-determined speed, the roller switch closes the circuit and starts the headway belt.

Similarly, when the headway belt gains speed it closes the circuit on a roller switch which starts the lateral belt. When the lateral belt gets up to speed, the roller switches close the circuits and it is then possible to run any number of the shakers which are discharging onto this belt. In stopping, the reverse operation takes place so that the shakers stop first then the lateral belt, followed by the headway belt and finally the level belt. This sequence is purposely arranged to prevent spillage. If, for any reason, such as car shortage, it becomes necessary to stop the level belt, the operator at the loading head has definite control of all the loading units. Each room shaker is fitted with a push button at the face, by which the individual shaker can be stopped. It can only be started again provided the belts are all running.

This control system worked very well but had one weakness; it was not possible to stop either the lateral or headway belt in an emergency, except from the loading head. We developed and built in our shop a rather ingenious stop, start and reverse push button station, that can be operated at any point along the headway by means of a pull wire. This serves as an emergency stop and is also used to control the belt when taking in materials on the 11 o'clock shift. This control consists of a permissible push button station, fitted with a shaft arrangement containing two four-position cams. These are rotated by means of a ratchet wheel and lever which in turn, are operated by the pull cord at any position along the headway or level.

Fig. 7. Loading mine car at end of conveyor belt.

Operating Practice

The mine is ventilated with a Jeffrey Aerovane two stage fan which delivers 26,000 cu. ft. of air per minute against a pressure of 1.3 inches of water. This fan is installed in a concrete fanhouse on the surface and is driven by a 25 hp. electric motor. Emergency power is provided by means of a Ford V-8 motor, used in case of power failure. Permanent stoppings in the main intake air course are of brick or concrete. Temporary stoppings in the levels are made of double boards with brattice cloth between the two layers.

The drainage system is simple. A lodgment capable of holding about 10 days' water is provided 3,000 ft. from the mouth of the slope. Just below this is installed a 250 Imp. gallon per minute centrifugal pump made of Krupp stainless steel and is not harmed by the mine water which, in many cases, is extremely hard on bronze. The pump discharges the water through a vertical borehole, 365 feet in length and is operated normally eight hours out of the twenty four. Thus sufficient reserve capacity is available in the event of extraordinary water conditions. Much mine water is due to surface seepage. This is particularly true in mines where the coal was worked close to the outcrop. Because this was guarded against in developing the Franklin mine, the water is not unusually heavy, being about one ton of water pumped for each ton of coal hoisted.

When coal reaches the surface it is dumped in a hopper underneath the bankhead, from where it is fed to a 42 inch steel apron conveyor by means of a reciprocating feeder. This apron conveyor travels at a rate of 50 ft. per minute and is used as a picking belt. A number of men are employed on each side of this belt to pick out bits of rock and stone. After the coal has had the larger pieces of rock and impurities removed, it is elevated to a point where it is discharged on a vibrating screen, which separates it into various sizes. The run of mine coal is first separated into two sizes: lump and 1 in. slack. The lump coal is then further divided into 2 in. x 1 in. nut and plus 2 in. lump. The 1 in. slack is then further sub-divided into stoker and fine slack. These four sizes are presently being produced, and the stoker and nut sizes are treated with oil to make them dustless. The

Fig. 8. View looking along main level showing belt conveyor.

slack and stoker coals are carried on a rubber belt underneath a high-powered electric magnet, which effectively extracts all bits of tramp iron such as spikes, nuts, etc. This is a necessary precaution in the preparation of a satisfactory stoker fuel, because tramp iron, if not eliminated, will cause a great deal of trouble in shearing stoker pins.

Time and Cost Studies

After taking a considerable number of time studies and compiling the information obtained, we discovered that most of the delays were caused by faulty managerial methods and poorly planned work, rather than by deliberate and unintentional delays by the workers themselves. The Time Study Engineer must be a man of exceptional tact. As a rule, workers resent the fact that management employs a man to observe their every move. Under these conditions some men tend to show off, as it were, and work exceptionally hard when the company time study engineer is making a study of his work. On the other hand, some other individuals take the opposite view and work as slowly as possible, hoping perhaps by so doing, that they will be able to establish a lower standard of work requirement. The engineer soon is able to evaluate these different types of workers and is thus able to throw out or discard data which would tend to create a wrong conclusion. We did find, however, that as soon as the workers realized that the purpose of time studies was not to try to get them to work harder in order to produce more coal, they did co-operate.

Daily labour cost sheets are kept, so the management can see the daily labour cost as well as the total labour cost to date on any one day. So far we have not attempted to keep daily material costs, as this is somewhat complicated in order to get accurate results. Labour cost is by far the greatest proportion of the operating cost, and is the one item which requires closest scrutiny. Costs, other than labour, are kept on a monthly basis.

One of the most important factors in an operation of this type is the efficient organization of the supervisory and maintenance forces. Regular routine inspections are made of all mechanical and electrical equipment and the results are reported daily on inspection forms — the idea being to detect and if necessary replace worn or faulty components before they can cause a breakdown, with consequent interruption on the working shifts. Repairmen are employed for this work on the eleven o'clock shift as it is difficult, while the equipment is in use, to make repairs without causing delays.

Losses and Gains Through Mechanical Loading

Mechanical loading, if it is to be successful, requires careful design and consideration for many auxiliary operations in addition to that one operation of mechanical loading. Perhaps the most important is transportation. Without adequate and continuous facilities to keep the coal moving from face to surface, any mining plan is doomed to failure. The efficiency of any loading machine is predicated on its ability to operate with the least possible number of delays. It is necessary to have a supply of empty cars at all times. All the shakers and belts in the section are connected by means of an electrical interlock, under the control of the man at the loading head. That one push button stops

or starts three conveyor belts and five shakers in sequence. The absolute necessity for eliminating every possible excuse for stopping the conveyor belt at the loading head is thus obvious. Mechanization also requires more mine cars, as it is not possible to load cars as fully from a conveyor as by hand. Thus more mine cars must be available and the mine transportation system geared to handle more mine cars for a given output.

There are many other factors which must be given detailed study before installing a system of mechanical loading. The introduction of additional mechanical equipment will increase the per ton maintenance cost and, by the same token, power consumption will also be increased. Consideration must be given the quality of the coal produced, because the introduction of mechanical loading will increase the percentage of small coal, which will result in an overall reduction in the sales realization. This is of prime importance for coal that is sold in the domestic market, as large coal usually brings a premium from the householder with hand fired furnaces. Furthermore, we must remember that a mechanical loader is not able to differentiate between coal and impurities, such as stone, and therefore mechanically loaded coal will contain more impurities, which must be removed in the cleaning process on the surface.

On the other hand, there are advantages to be gained with the introduction of mechanical loading. It is possible to concentrate all the mine workings in one or two sections of the mine, and thereby effect considerable savings in the labour force required in such auxiliary operations as transportation, maintenance and so on. Concentration of workings is possible, because the advance per shift is greater, and therefore fewer places are necessary to obtain a required output. We must not lose sight of the fact, however, that if concentration is carried too far and we expect to get all our production from one or two sections, a delay or breakdown will affect the daily output, perhaps to a point where we would not get any coal at all. This could occur from failure in a main line belt conveyor.

Such delays must be guarded against by more stringent inspection and maintenance of equipment. The more fully a mine is mechanized, the greater the amount of capital required for investment in the property. It is almost a foregone conclusion that mechanization of the face loading cycle means double and possibly triple shifting. Workmen have to be trained to become machine-minded. Considerable training is required, because it is necessary to change the workmen's habits so that they will get away from the old idea of hand loading, in which only one complete cleanup is made in a shift. The introduction of machinery makes it imperative that the equipment be used for the full eight hour shift.

What then are some of the major economic implications of mechanization? The ultimate aim of mechanization is the reduction of cost. Labour costs, which represent about sixty percent of the cost of production, have been steadily rising; these along with increased cost of materials, make it more than ever necessary to find some further methods of cost reduction. The next step must be mass production, and until mass production of coal is achieved the ultimate aim cannot be fully attained. Mechanization, as it is today, has not reached the status of mass production—it is merely a patch work arrangement, an intermediate stop as it were, on the road towards that end. Actually, all mechanization has accomplished so-far is the substitution of machinery for manpower.

Mass Production Means Higher Wages

To make true progress, mechanization must produce or cause mass production of coal. Successful mass production means continuous production in vast quantity, with a very minimum of operating motion. The answer is perhaps some form of continuous mining, whereby the machinery employed would permit continuous cutting, extracting and loading. There can be no true mass production as long as all these operations are not integrated and performed as one. Coal is a basic product. It is the indispensable fuel. The coal industry is progressive and already considerable work has been done in the development of an experimental continuous miner. These machines, when fully developed and adapted to various mining conditions, will make possible the cutting, dislodging and loading of coal in one operation.

Coal, like any mineral, is a wasting asset, and cost increases as we advance from the original point of entry of the seam. As an example, haulageways daily increase in length, thus the cost of landing the coal or ore on the surface also increases and eventually a point is reached where, unless new techniques are developed, it is no longer economical to mine the mineral. The same applies to ventilation and the upkeep of airways, and all the other auxiliary operations practised in getting coal. So, in order to prolong the fateful day, when we must, as we say in the coal mining industry, "put the bush in her", various schemes and improvements must be continually practised by management. Mechanization and mass production of coal will reduce cost. It will not cause unemployment, as many seem to think. It will, however, enable the Canadian mines to produce more coal and thereby supply a greater percentage of Canada's coal requirements. Many of our labour leaders seem to ignore the fact that wages come from production; if production is increased, then mechanization will tend to increase wages.

MANAGEMENT—

TODAY AND TOMORROW

by

Paul Kellogg, M.E.I.C.

President,

Stevenson & Kellogg, Ltd.,

Montreal.

PART TWO

Methods—Formal and Informal

The second in a series of three papers on Management prepared for The Engineering Journal

In Part 1 of this series, we noted several factors that contributed to the degree of formality in management procedure. One was the growth in the company's size. Another was the more acute competitive position of individual companies and, in general, the increased competitive pressure on all business. We noted, also, that the type of company cost structure often indicated that formalization was proper in some departments but not so necessary in others. In this instalment these topics are expanded, and some of the reasons given for the conclusions arrived at.

Growth as a Factor in Formality of Management

Formalization is needed when the processes of business management become sufficiently complicated so as to be beyond the comprehension of a single brain. Formalization provides what is in effect a mechanical brain into which certain facts are inserted and out of which certain results can be obtained at will, and in which there is a memory of what has been put in so that nothing need be omitted when the proper time comes to use such information. This need for formalization with growth can be simply illustrated. Take, for instance, scheduling. As long as there is a simple operation within a business a single man can schedule the operations of his department. He can keep the orders all on his desk; he can, by passing along among the machines, determine how much is done, and who is ready for more work, and the degree of completion of the orders; he can put the proper order ahead of others. In other words, he can do a fairly satisfactory job of scheduling without any paper work outside of a few memoranda.

The department manager must also requisition the proper materials and assure they are delivered on time. He must watch his stock piles and bins. At the end of a week, by a rough inventory, he can assess his needs for the following week. He can keep account of all these varied things within his own mind because of their simplicity.

As his business grows, however, more formal systems have to be introduced. The greater the volume of business, the more complicated and detailed must be this scheduling system. It is now necessary to have an entire department occupied with scheduling, co-ordinating purchases and inventories and following up of supplies closely, to avoid delays in the manufacturing process. The machine loading programme must be adroitly administered so that there be no delays, for it is unlikely that employees will be so flexible that to satisfy an immediate need, they can be shifted from one machine to the other. It is far more likely that each man has a particular place and, if there is no work, he will be idle.

Similar conditions relate to formalized employment procedure. In the small plant the boss himself interviews the people who may come to work for him. He knows what they are doing and he knows their personality. It would be more simple, in his case, to take on a few that he might have to get rid of later on because he misjudged them, than to set up a complicated and formal procedure of application, testing and induction. But, as with production, when the number of new employees increases, the complexity of jobs they are to fill becomes greater. The problem then is to have all the information possible so that there will be the least wastage of employees, the same as there would be the least wastage of material. It seems obvious, therefore, that the volume or size of operation is one factor that contributes logically to the degree of formalization necessary in management procedure.

Competition as a Factor in Formalization

There are, however, other factors that enter into the ability of a plant to survive profitably on a simple informal basis. Informal procedure invariably breeds lack of continuous operation. Time studies in such a plant would reveal a considerable waste of time because of idle machines waiting for work, waiting for tools or waiting for supplies and other delays. In some instances these inefficiencies might not be fatal if the company were making an article that was not strongly competitive and on which, therefore, the profit was sufficiently high to stand that sort of thing.

Several decades ago there was not the need for formalized procedure in many of the smaller plants. Today, however, competition in all fields is increasing, and probably will continue to increase in severity. When competition hits these plants that have been operating with a minimum of formalized control, their selling prices cannot be set as loosely as they were before. To sell at all they must reduce their prices. This means that profits go down and the first thing they know they are operating in the red. Now they must look to saving time, and to getting increased production out of equipment. Thus do formal procedures originate. Of course competitive pressure does not always stem from cost reduction. There may be the necessity of formalizing the procedure in the sales department so that it can bring in more business.

Basically, the increase in either case arises because problems get beyond the ability of one man to handle. Yet, in one respect, the reasons for it are different. In the case of increase in size, the task becomes too great for any one man, regardless of whether methods are improved. In the case of increased formalization from competition, the task becomes greater than one man can handle without formalization because of the necessity of doing a better job even within the small plant or department concerned.

Localized or Selective Formalization

By localized or selective formalization we mean formal processes of control in certain departments, for reasons peculiar to the cost structure of the business. This is a basis of formalization that perhaps is not so well recognized as it should be. It is really a refinement of the establishment of formalization to meet competitive pressure. To understand the need it is necessary to understand the basic structure of costs. In every business costs can be roughly divided into two general patterns: those which are fixed through ordinary ranges of business volume, such as taxes, depreciation, executive salaries; and those which vary directly with output, such as materials and direct labour, where direct labour is paid altogether on the basis of output.

There are other costs which combine elements of fixed and variable costs, and which may be separated into those two kinds. Then there is a fourth kind which is irregular, and which can be roughly classified into a fixed or a variable portion. The result is that costs can usually be segregated into just two classes—totally fixed and totally variable costs. In businesses of different types the proportion of costs which are fixed and variable will differ greatly. In industries with large expensive machines, where the amount of labour is not large, you will find a high fixed cost because of this expensive equipment. In other industries with a large amount of assembly work and hand labour on material, where the equipment is relatively minor in value in relation to output, you have the reverse condition, with high variable costs and low fixed costs.

Businesses with high fixed costs have certain problems and opportunities that do not exist in businesses of high variable costs. When these are recognized, they will indicate why some departments must be more closely and formally controlled in high fixed cost businesses, than they need to be in low fixed cost businesses. To explain the matter clearly, let us illustrate with two hypothetical companies. First, we have Company "A", a high fixed cost company. The operating statement for that company is as follows:

Let us explain these terms. Increment margin is the difference between the selling price and the sum of all the variable costs required to produce. This margin pays all fixed costs, and if there is any balance remaining it becomes profit. If the margin exceeds fixed costs, operations are profitable. If it is less than fixed costs, losses result. Profit-volume ratio is the ratio between the increment margin and selling price. This becomes the percentage of the selling price and therefore, the percentage of any increase or decrease in sales which is added to or subtracted from increment margin when sales change. This is an important figure to know because it thus computes the gain or loss in profits arising from changes in dollar sales. Labour-volume ratio is the ratio of direct labour costs to selling price. This ratio applied to changes in sales value indicates how much more or less should be expended for direct labour. Conversely it indicates how much new sales value of production would arise from increases in volume of labour.

Let us assume a successful effort is made to reduce direct labour cost per unit by as much as 10 per cent. This would be accomplished with labour's full co-operation, and would be the resultant of better management, leading to the elimination of idle and waiting time, and the reward to the workers for better than standard basic performance. Now the operating statement will show direct labour as $9,000 and profits as $11,000. This changes the ratios at the bottom of the statement. The increment margin is now $61,000, profit-volume ratio is 61 per cent and the labour-volume ratio 9 per cent.

Company "A"—High Fixed Costs

Operating Statement

Sales			$100,000
Variable Costs:			
Labour, Direct	$10,000		
Material	25,000		
Other	5,000		
Total		$40,000	
Fixed Costs:			
Maintenance & Depreciation	$15,000		
Factory Salaries	15,000		
Insurance & Taxes	2,000		
Sales & Admin.	13,000		
Other	5,000	50,000	90,000
Profits			$ 10,000
Increment Margin ($100,000—$40,000)			60,000
Profit-Volume Ratio (P/V) 60,000 ÷ 100,000			60%
Labour-Volume Ratio (L/V) 10,000 ÷ 100,000			10%

After this campaign, if business does not increase, the only saving is the $1,000 saving in labour cost (but not labour *rates* as explained above), which results in $1,000 or 10 per cent more profit. It may be possible to sell the increase in the volume of production, made possible by reason of the increase in labour efficiency of at least 10 per cent, for if labour costs had been reduced 10 per cent the only way that this can be realized on the present manufacturing volume is to reduce the labour force. If bonuses are paid to those remaining on the payroll this reduction would have to exceed 10 per cent. Instead of making this reduction through normal turnover or through transfer of employees to other departments an attempt is made to increase the business, so these workers can be retained for higher production. This is possible and very profitable for the company because by reason of this more efficient labour programme the actual capacity of the department has been increased. Labour is producing more per man per day.

There will be at least $1,000 worth of labour available, and if the remaining force is earning a normal minimum of 20 per cent bonus under the revised incentive programme, there would be $3,000 worth of labour available. The labour ratio under the revised conditions is 9 per cent. Therefore, if $1,000 to $3,000 worth of labour is to be used to produce more goods, the amount produced by that labour in sales value is $11,100 to $33,300. Because this business has a high profit-volume ratio, the increased increment margin on this additional sales is 61 per cent of this amount, or $6,771 to $20,313. As fixed costs have already been absorbed, this increased increment margin also represents that much additional profit.

Thus, if more business can be secured, instead of making only $1,000, which is saved in labour cost, the profits will grow to a minimum of $6,771 or possibly $20,000 by reason of the increased production now possible. This is 67 per cent to 200 per cent of the profit that existed before incentives went into effect, and nearly 7 to 20 times as much as from labour savings alone on the old volume of business. This illustrates clearly how important sales effort is in this high fixed cost company. If there is to be any formalization, it is most important that it be done in the sales department, where good results will be so apparent in increased profits.

The same type of reasoning is now applied to Company "B" which is a low fixed cost company. The operating statement for that company is as follows:

Company "B"—Low Fixed Costs

Operating Statement

Sales			$100,000
Variable Costs:			
Labour	$40,000		
Material	25,000		
Other	5,000		
Total		$70,000	
Fixed Costs:			
Maintenance & Depreciation	2,000		
Factory Salaries	8,000		
Insurance & Taxes	1,000		
Sales & Admin.	8,000		
Other	1,000		
Total		$20,000	$ 90,000
Profits			$ 10,000
Increment Margin ($100,000-$70,000)			30,000
Profit-Volume Ratio (P/V) (30,000 ÷ 100,000)			30%
Labour-Volume Ratio (L/V) (40,000 ÷ 100,000)			40%

There is a project in this company also to increase labour efficiency, resulting in a reduction of labour cost (but not of labour rates) of 10 per cent. The overall reduction of 10 per cent is possible even though individual workers earn as much as or more than before. This means $4,000 in this plant as against $1,000 in the high fixed cost company. This $4,000 saving or profit is 40 per cent of the present profit of the company, whereas the 10 per cent saving in labour cost in the Company "A" was only 10 per cent of the profits. So this company has effected an increase in percentage profits four times greater than the percentage reduction in labour cost.

The revised operating statement will now show a labour cost of $36,000 and an increase in profits to $14,000. This will change the profit-volume ratio to 34 per cent, and will reduce the labour-volume ratio to 36 per cent. Let us now assume that this company also was able to fill up the production possibilities created by the increase in labour efficiency, by the amount of business that $4,000 to $12,000 worth of labour could bring in. The new labour-volume ratio of this company is 36 per cent, therefore, $4,000 worth of labour can bring in $11,100, and $12,000 worth of labour can bring in $33,300, the same amounts, which it was found, could be brought in by the saving in labour cost in Company "A". The difference comes, however, in the amount of profit that can be earned. The profit-volume ratio even on the new basis is only 34 per cent or $3,774, and 34 per cent of $33,300 is $11,322, the profit from the business which these otherwise unneeded employees could account for. This is only approximately half the additional profits found in the case of Company "A".

It is now seen that in Company "B", the savings from the reduction in labour cost are the most important item. Very close and detailed formalization must be applied to their labour payment plan, to scheduling all items that affect direct cost, because this is such a large factor in the total cost. In Company "A" the chief reason for improved labour efficiency is the necessity for increasing the capacity of the plant to take care of new highly profitable business. The two above illustrations show clearly the need for selective formalization when the reason for it is clearly understood.

Scope of Formal Procedures

There have been many books written on plans of formal procedures. The following partial list indicates the choice that lies before management. It starts at the basic organization and goes through the various processes of manufacture and the control of material, labour and office, and ends up with some financial considerations. The list though not a complete one, does cover the main subjects usually included in formal procedures.

List of Formal Techniques and Procedures

(1) *Organization Charts*

Formal pictures of lines of authority throughout the organization.

(2) *Standard Practice Information*

A formalizing of all routine in the entire organization, or in selected departments or procedures.

(3) *Job and Salary Descriptions*

(4) *Job and Salary Evaluations*

Descriptions and evaluations are valuable to the employment department in filling each job. They are good for mutual understanding of the requirements and scope of the job by the employer and employee.

(5) *Employee Selection*

More or less formal techniques of interview, testing, physical examination and other procedures.

(6) *Employee Training*

This is training of employees in the technical requirements and the best method of doing their work. It is applied particularly to new employees but also used for older employees in work simplification programmes.

(7) *Employee Evaluation*

Also known sometimes as merit rating, wherein employees are evaluated on the work they do, giving due credit to those who are doing a better job than the average and finding means by which those below the average may be brought up to a higher rating.

(8) *Plant Layout*

A formal layout of machines and equipment showing the flow of work in the plant to the best advantage of the manufacturing programme.

(9) *Motion Study*

The working out of the best possible manner of doing any selected task. The more complicated the tasks, the larger the plant, the more it pays to adopt this formal procedure.

(10) *Scheduling*

Several comments have already been made on scheduling, which may be done by means of very complicated procedures down to very simple ones.

(11) *Inventory Control*

(12) *Preventative Maintenance*

This includes many features such as regular inspection to prevent breakdown, and the concentrating of most of the maintenance work in the preventative category.

(13) *Time Study and Output Standards*

Ultimate time study practice demands people who have spent months in learning it, so that a correct job can be done.

(14) *Market Research*

(15) *Sales Management*

Including quotas, incentives, training and a general drive of all salesmen to bring in business.

(16) *Sales Incentives*

(17) *Standard Costs*

A system of accounting by which actual costs are measured against pre-determined standards.

(18) *Flexible Budgets*

A plan by which each department which controls expenditure of money for men or materials is treated as if it were in business for itself. It is given standards against which to operate, which change with the volume going through the department, and is judged against the operations in terms of these flexible standards.

(19) *Financial Budgets*

(20) *Statistical Quality Control*

(21) *Keymen Incentives*

Often tied in with flexible budgets.

(22) *Executive Incentives*

Sometimes tied in with profit sharing.

(23) *Executive Training*

Attention to the training of minor and major executives in their own field.

(24) *Personnel Administration*

This again covers a multitude of practices from the organization of the Personnel Department to the more or less formalized procedure in induction, development and separation of employees.

(25) *Formalized Grievance Procedure*

(26) *Health and Safety Programmes*

(27) *Labour - Management Committees*

Often of great value in increasing production.

(28) *Suggestion Systems*

(29) *Physical Fitness Programmes*

(30) *Recreational Programmes*

(31) *Insurance and Pension Programmes and Plans*

(32) *Machine Accounting*

(33) *Office Methods and Incentives*

(34) *Other Special Reports and Investigations*

With all these things to consider, it is no wonder that there has sprung up in the last quarter century a profession variously called industrial engineering, management engineering or management consultants. This profession contains within it people attached to industry and those operating outside as consultants. These professionals spend their time in studying these various formalized procedures. Management will be well advised, when confronted with the necessity of reviewing the formalization of their procedure, to have such men on their staff, or to consult those outside, who can give counsel when considering the extension of the formalization of procedure, because otherwise mistakes can be made. Mistakes in formalization can be costly.

From Month To Month

News of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

Technical Papers

Catering as it must to all kinds of engineers, the *Journal* cannot publish some of the more technical papers offered to it without drawing upon itself the wrath of those whose interests lie along other lines. As it is, we find our readers hard enough to please, a condition not to be wondered at in view of the catholic composition of Institute membership.

What we should do is to reserve technical material, especially that of lasting value, for a regular series of "transactions", thus leaving the *Journal* free to publish articles of general or transient interest only. Unfortunately, it seems unlikely that we shall be financially able to adopt this very desirable policy for a long time to come. Therefore, as a compromise between what we would like to do and what we feel we can do, it has been decided to issue Technical Papers as occasion demands.

These will include papers which we feel will be of real interest and value to members, mostly the kind of material to which those interested will refer frequently. In form, the papers will be letter size, both stapled and punched, so that they may be preserved in pamphlet form or filed in a ring binder.

Technical Papers will not be distributed automatically to all members — you will have to order them — but each will be briefly reviewed in the *Journal* when ready. Sales will be on a cash basis to avoid the nuisance of bookkeeping and to keep prices as low as practicable. Prices, by the way, will be set at a figure just high enough to cover costs of production and mailing and so will vary.

Technical Paper No. 1, now ready, is entitled "Flow in Conduits and Canals", by Professors R. DeL. French, M.E.I.C., of McGill University, and F. M. Wood, M.E.I.C., of Queen's University, and is reviewed briefly on page 292. This is the manner in which it is proposed to advise members of the publication of all future Technical Papers.

Two other Technical Papers are in preparation, one dealing with the hydraulics of air-water mixtures and the other with the design of resistors in radio engineering.

The Publication Committee solicits other papers for inclusion in this series. They may be of any length and on any subject; the essentials are that they be concise, that they contribute something to the literature of the subject and that they be of reasonably wide appeal.

M.I.T. Awards New Degree

The following announcement of the award of a new engineering degree by Massachusetts Institute of Technology has been supplied to the Journal by M.I.T.'s News Service. Ed.

A new terminal for practicing engineers, to be called the "Engineer" degree, has been approved at the Massachusetts Institute of Technology and is expected to be awarded for the first time at the Institute's commencement this June, Dr. John W. M. Bunker, dean of the Institute's Graduate School, announced recently.

The degree "Engineer", with the field of specialization designated, will require about two years' study following a bachelor's degree in any one of the Institute's various engineering departments.

"The new degree," said Dean Bunker in making the announcement, "fills an educational need for the development of professional engineering competence at a higher level than is ordinarily represented by the Master of Science degree."

"The expansion of scientific knowledge which can be applied in several areas of engineering practice has been so extensive," Dean Bunker pointed out, "that a specialist in any one field needs to achieve more than casual acquaintance with related fields if he is to render the most effective service in engineering."

"With the establishment of the Engineer degree as a terminal degree for those who will practice engineering," Dean Bunker concluded, "the Ph.D. and Sc.D. degrees will continue to be the objective for those who have interest in and aptitude for original, creative research."

The new degree will be recommended for students who complete an individually-planned, two-year programme of study and research at the Institute beyond their undergraduate degrees. Emphasis will be placed upon engineering practice rather than on the research which is characteristic of a programme of study leading to a Ph.D. degree.

Most Master's Degree candidates at the Institute require slightly more than one year of study to complete their work; candidates for the new degree, Engineer, will require at least two years at the Institute. This added time will result in more thorough training in a wider variety of relevant subjects, and also will enable students to delve more extensively into such fields as industrial economics, business administration, labour relations and international affairs, thus improving their understanding of the social implications of the work in which they will be engaged.

When the field of specialization is to be indicated, the Engineer degree will be referred to as follows: Civil Engineer, Mechanical Engineer, Metallurgical Engineer, Electrical Engineer, Chemical Engineer, Sanitary Engineer, Marine Mechanical Engineer, Naval Architect, Naval Engineer, Aeronautical Engineer, Building Engineer, and Meteorologist.

LOYALTY TEST

By Harvey N. Davis

President, Stevens Institute of Technology

> *"Unless you can find some sort of loyalty, you cannot find unity and peace in your active living."*
>
> —JOSIAH ROYCE

NOWADAYS, when an FBI man asks me about the loyalty of so-and-so, I reply that, as far as I know, he is not, and has never been, and, in my opinion, is not likely to become, either a traitor, a spy, or a Communist of the Russian brand trying to bore from within. That seems to cover the question.

But surely, this adds up to a very narrow definition of the fine old word "loyalty"; and maybe this is a good time for us to re-discover the broader meaning which Professor Royce had in mind, 40 years ago, when he wrote the lines quoted above.

True loyalty, according to Royce's definition, is never a negative thing. It is a positive, wholehearted and outflowing devotion to something beyond your private self, bigger than you are.

In the long run, he believed, no one can be secure or successful or happy if he lives only for himself. We grow only by giving the best of ourselves to something that we believe in heart and soul. This is the essence of loyalty.

In terms of this definition, how loyal are you? Here is a simple way to find out. Below are some things in which nearly everyone believes:

1. **Your family**
2. **The organization for which you work**
3. **Your community**
4. **Your church**
5. **Your country**

Now put this list aside. Then take it out again a few days or weeks or months from now. When you do, ask yourself this question: "Since first reading this page, have I so lived that these five things are stronger, better, finer because of me?"

If you can answer a truthful yes, then you will know that you understand the meaning of loyalty—and, along with it, the secret of true happiness.

Reviews of Technical Papers

No. 1. "FLOW IN CONDUITS AND CANALS", R. DeL. French, McGill University, and F. M. Wood, Queen's University.

This paper provides working tables and diagrams for the solution of many hydraulic problems concerning flow in open or closed channels not under pressure. The text is given over almost entirely to illustrative problems. The tables give values of logarithms of 1.318 C, $r^{0.63}$ and $s^{0.54}$ in the Hazen and Williams' formula, and of recommended values of C.

There are nomograms for the solution of this formula for circular sections, for correlating C in this formula with n in the Kutter formula, for solving Markmann's formula for loss of head on curves and for reducing canal sections to equivalent circular sections. Other graphs give the values of the hydraulic elements, Q and V, of a variety of sections which it is believed will cover all ordinary cases Another chart gives the diameters of circular sections equivalent to the sections just referred to.

Many of these tables and diagrams were developed by the authors for use in their private practice, the others were specially computed to complete the treatment of the subject. They will be useful in shortening and facilitating computations required in hydraulic designs of many kinds.

The price of this paper is $1.50 cash with order, which may be sent to Institute headquarters, 2050 Mansfield St., Montreal 2.

Correspondence

Toronto, April 13, 1949.

To the Editor,

While specific provisions for dealing with situations such as those mentioned in the letter of G. A. Leonards, M.E.I.C., (*Eng. Journal*, Nov. 1948), may be lacking in the ECPD Canons of Ethics for Engineers, these and similar difficulties may often be resolved by application of the general principles set out in the two introductory paragraphs.

When an engineer is requested to write a recommendation for a former employee or student whose qualifications are inadequate for a desired position, he has no alternative to telling the truth. He is under an overriding duty of service to the public and to those who employ engineers. The second paragraph of the preamble of the ECPD Canons of Ethics requires him to discharge his duties "with fidelity to the public, his employers and clients, and with fairness and impartiality to all." Solicitude for the future of another engineer should not lead him into the position of justifying incompetency at any time. Failure to disclose the inability of an applicant to discharge the duties of a post satisfactorily might react very unfavourably on the profession as a whole.

In justification of a consulting engineer charging the full fee for plans that are very similar to those used for another work it may be said that what the client pays for is expert knowledge and skill. The furnishing of that knowledge and skill through the use in large measure of plans that have been previously used by him would seem to be not different from the charging by a surgeon of a standard fee for performing a common and highly conventionalized operation which he has performed scores or maybe hundreds of times before. Moreover, the reduction of the fee below the standard that must be charged by a less-experienced competitor might be held by the Association of Professional Engineers of the Province as constituting unfair competition.

C. R. Young, M.E.I.C.

Dean,
Faculty of Applied Science,
University of Toronto.

April 14, 1949

Mr. L. A. Wright,

General Secretary,
The Engineering Institute of Canada.

Today, after a long hard struggle, the Ottawa headquarters of "March of Books" are officially being transferred to the Canadian Book Centre in Halifax. However, it is most gratifying to know that when the campaign is completely over we will have collected a little over 200,000 books and periodicals.

May I take this opportunity of expressing the deep appreciation of the officers of "March of Books" for the magnificent support given to us by the Engineering Institute of Canada. Miss Royal-Gagnon joins me in extending our personal thanks for your warm words of counsel and encouragement when we were in difficulties.

W. A. Magill,
Director, March of Books

Monopoly and Wages

The Editor,

Further to Mr. J. L. Wickwire's and the Engineering Institute's comments on low salaries in the engineering profession (Feb. issue of the *Journal*) — with which I heartily agree, I would like to point out that the engineer has not yet a monopoly of his profession, which all successful professions have, in varying degrees. Without creating a monopoly, price of labour or other commodities, cannot be controlled. The engineer has long been too busy protecting his reputation so that the employer can be sure he gets competent advice, and not sufficiently busy at seeing that the employer pays for it. Try and get technical advice from a physician, chartered accountant, or lawyer free, that you could easily extract from an engineer.

Monopolies, whether of capital or labour are natural phenomena of the free enterprise system. The word "monopoly" is used in its full economic sense and, till engineering becomes a monopoly it will remain a poorer profession. Premier Duplessis of Quebec recently contended that engineering as the

Advise Headquarters Promptly of Changes engineers would have defined is " no monopoly ", and he is perfectly right. Too small a group is trying to control too large a field of technical jurisdiction. Primarily, the field and jurisdiction of engineering has yet to be defined in a practical way, when this is done all employed in doing engineering work within the field — whether they be specialists in diverse fields such as physicists, chemists and even practical designers, etc. — must be induced to join an organization that is willing to, and can talk price. This organization could have sufficient grades within it to appease those that have superior backgrounds. A poor and unfair way to create a monopoly is to exclude those that are doing the actual technical work with the arbitrary statement "they are not qualified " I am sure that all competent men, whether they be university trained or of a lower order, would be willing to join together to arbitrate adequate wages for all, not just the few.

United effect, such as raising wages, can only be had by united effort. Insofar as the word " union " seems to be odious to our profession, let us call it an association as the physicians have done. Let it not be a closed union as well as a closed shop concept, this, as I believe most students of economics will agree, can only have poor results to both the profession and employer.

H. Verdier, s.e.i.c.

News of Other Societies

The **Canadian Electrical Association's** 59th Annual Convention will be held at the Banff Springs Hotel, Alberta, on June 28, 29, and 30, 1949.

B. C. Fairchild, managing director of C.E.A., is in charge of arrangements. His office is at Room 704 Tramways Building, Montreal 1, Que.

The Montreal regional conference of the **American Institute of Chemical Engineers,** September 7, 8 and 9, 1949, will devote two days to technical papers. Plant visits to several industries at Shawinigan Falls, Que., have also been arranged.

Members of the Engineering Institute are invited to attend, and the local committee on arrangements includes several E.I.C. members. Its chairman is Dr. H. R. L. Streight, P.O. Box 10, Montreal.

The **Chemical Institute of Canada** reminds engineers of the annual chemical conference in Halifax, May 30 to June 1, 1949 at the Nova Scotian Hotel. C.I.C. head office is at 18 Rideau St., Ottawa.

A cordial invitation from the **American Society for Engineering Education** is extended to all those interested in Engineering Education to attend the 57th Annual Meeting (June 20 to June 24) to be held at Rensselaer Polytechnique Institute located at Troy, New York.

The programme at this meeting will consist of four general sessions to hear and to discuss papers of general interest together with some sixty functional conferences to discuss a variety of educational problems in such fields as, research mathematics, mechanics, architectural engineering, drawing, mineral engineering, industrial engineering, chemical engineering, electrical engineering, aeronautical engineering, physics, etc.

Reservations for registration, quarters and meals may be made by writing to Professor A. Allan K. Booth, Department of Mechanics, Rensselaer Polytechnique Institute, Troy, New York.

The Society of the Plastics Industry, 295 Madison Avenue, New York 17, N.Y., announces its 1949 annual meeting for May 26 and 27 at Edgewater Beach Hotel, Chicago, Ill.

Further programme notes are now available from the Society.

The **American Water Works Association,** 500 Fifth Avenue, New York, 18, N.Y., will welcome enquiries about its 69th Annual Conference, May 30 to June 3, 1949, at the Stevens Hotel in Chicago, Ill.

The summer national meeting for 1949, **Society of Automotive Engineers,** will convene June 5 to 10, at French Lick Springs Hotel, French Lick, Indiana.

Inquiries should be addressed to S.A.E., at 29 West 39th St., New York 18, N.Y.

The schedule of 1949 meetings of the **American Institute of Electrical Engineers** includes: the summer general meeting at the New Ocean House, Swampscott, Mass., June 20-34; the Pacific general meeting at the Fairmount Hotel, San Francisco, Cal., August 23-26; the midwest general meeting, at Netherland Plaza Hotel, Cincinnati, Ohio, October 17-21.

A.I.E.E. headquarters are at 33 West Twenty-ninth St., New York, N.Y.

The summer convention of the **American Society of Civil Engineers** is taking place this year in Mexico City, July 13-15.

Information can be obtained from the Society, 33 West Thirty-ninth Street, New York 18, N.Y.

The 52nd Annual Meeting of the **American Society for Testing Materials** will take place June 27 to July 1, 1949, at Hotel Chalfonte-Haddon Hall, Atlantic City, N.J.

Information can be obtained from the Society, 1916 Race St., Philadelphia, 3, Pa.

The **American Society of Mechanical Engineers,** 29 West 39th St., New York 18, N.Y., will hold its 1949 Semi-Annual Meeting at San Francisco, Calif., June 27-30.

The Engineering and Marine Exhibition, at Olympia, London, England, planned for August 25 to September 10, 1949, is to incorporate a Welding Exhibition.

The exhibition is supported by the British Engineers Association (Incorporated); the Society of Motor Manufacturers and Traders Ltd., The British Electrical and Allied Manufacturers' Association (Incorporated); The Institute of Welding; and The British Acetylene Association. The organizers are F. W. Bridges & Sons, Ltd., Grant Building, Trafalgar Square, London, W.C. 2.

The National Congress of French Engineers will take place on June 4, 5, and 6, 1949 at Toulouse.

The congress is organized, under the aegis of the Federation of French Engineering Societies and Associations, by the **Union of Engineers of the Toulouse Region.** The office of the latter is at 8, rue du Poids-de-l'Huile, Toulouse, France.

Personals

Notes of the Personal Activities of Members of the Institute

Fred Seibert, M.E.I.C., of Winnipeg, Man., was installed as president of the Canadian Institute of Mining and Metallurgy at the recent annual meeting of that Institute in Montreal.

Mr. Seibert is industrial commissioner for Canadian National Railways in Winnipeg, Man.

P. L. Pratley, M.E.I.C., Montreal consulting engineer, was recently placed in charge of building the $13,500,000 bridge to gap the Strait of Canso, between Cape Breton Island and the Nova Scotia mainland. Mr. Pratley, whose appointment was announced recently by the Dominion Transport minister, was a member of the joint Dominion-Nova Scotia board of engineers which has been surveying the bridging project for more than a year. The bridge is expected to be completed by about 1953.

T. G. Tyrer, M.E.I.C., chief surveyor of the surveys branch of the land titles office, has retired after thirty years of service with the Saskatchewan provincial government.

Mr. Tyrer came from England to Saskatoon in 1911, and was articled to W. M. Stewart of Phillips, Stewart and Lee, civil engineers and land surveyors. He went overseas in World War I with the Canadian Army, mustering out in 1919 with the rank of lieutenant-colonel. On his return he rejoined Phillips, Stewart and Lee.

In 1921 he joined the staff of the surveys branch in Regina, and qualified as a Saskatchewan land surveyor in 1923. He became deputy chief surveyor in 1931, and in 1944 he was appointed chief surveyor.

On going to Regina, Mr. Tyrer joined the 14th Field Company Engineers, commanding the unit until 1933, when he took over command of the 12th district engineers. He was posted to the corps reserve in 1938 and went overseas in 1940 in command of the Engineer Company No. 1 General Holding Unit. He returned from overseas and was posted to the corps reserve in 1941.

He is a past president of the Saskatchewan Land Surveyors Association, and at present is secretary of the organization.

Sir G. D. Rhodes, M.E.I.C., who is in Nairobi, Kenya Colony, British East Africa, has terminated his services with Sir Alexander Gibb & Partners, on completion of the work for which he was sent to Kenya. He has taken an appointment under the Government of Kenya, as special commissioner for works and chief engineer.

F. L. Leduc, M.E.I.C., Montreal consulting engineer, has been appointed vice-chairman of the Tariff Board of Canada.

Mr. Leduc graduated from Ecole Polytechnique, Montreal, and later received a degree of Master of Arts in social sciences and political economy from University of Montreal. A former Montreal alderman, he was a member of the Quebec Legislative Assembly from 1935 to 1946 and was provincial minister of highways from 1936 to 1938.

A. G. Graham, M.E.I.C., director of the Regional Planning Division, Department of Municipal Affairs, British Columbia Government, resigned recently and took up duties on April 1st as division engineer on the construction of the Pacific Great Eastern Railway between Quesnel and Prince George, B.C.

J. A. Lalonde, M.E.I.C.

J. A. Lalonde, M.E.I.C., Montreal consulting engineer, has been elected president of the Corporation of Professional Engineers of Quebec for the year 1949. Mr. Lalonde is a past-councillor and past-treasurer of the Institute, and a past-chairman of the Montreal Branch.

J. A. H. Henderson, M.E.I.C., of Montreal, is vice-president of the Corporation; and **F. S. Howes,** of Montreal, is the secretary-treasurer. Councillors of the Corporation are: **L. W. Bladon,** Montreal; **Leo Dufresne,** Quebec; **G. Letendre,** Quebec; **L. O'Sullivan,** Montreal; and **A. Pouliot,** Quebec.

Professors Raymond Boucher, M.E.I.C., **Léonard Cartier,** M.E.I.C., and **André Leclerc,** M.E.I.C., of the department of hydraulic engineering at Ecole Polytechnique, entered recently into partnership for private practice under the name, Boucher, Cartier, Leclerc, consulting hydraulic engineers. Their firm specializes in the field of hydraulic engineering, such as the design and supervision of projects related to water supply and water distribution, sewage, hydro-electric developments, river regulation, canals, hydraulic models studies, testing of hydraulic machinery, studies in hydrology and related subjects.

Professor Boucher is a graduate of Ecole Polytechnique, class of 1933, and a master of science in civil engineering (M.I.T. 1934). He has been connected, since graduation, with Ecole Polytechnique and has many times served as consultant for various power companies. He is presently professor and head of the department of hydraulic engineering at Ecole Polytechnique.

Messrs. Cartier and Leclerc are, respectively, associate and assistant professor in the same department and have been, since their graduation, connected in various ways with projects in the field of hydraulic engineering.

R. M. Hardy, M.E.I.C.

R. M. Hardy, M.E.I.C., dean of the Faculty of Engineering of University of Alberta, Edmonton, has been elected president of the Association of Professional Engineers of Alberta for the year 1949.

F. A. Brownie, M.E.I.C., of Calgary, has been elected vice-president of the Association.

Councillors of the Association are: **J. G. Dale,** M.E.I.C., Edmonton; **John Haddin,** M.E.I.C., **H. B. LeBourveau,** M.E.I.C., and **J. G. Spratt,** M.E.I.C., of Calgary; and **D. B. Menzies,** M.E.I.C., **John G.**

Dale, M.E.I.C., and **L. A. Thorssen,** M.E.I.C., of Edmonton; and **W. L. Foss,** M.E.I.C., of Lethbridge. **Julian Garrett,** M.E.I.C., is Dominion Councillor; and **P. M. Sauder,** M.E.I.C., is councillor representing the Engineering Institute. University faculty representative is **R. S. Trowsdale,** M.E.I.C.

Mark M. Winred, M.E.I.C., has established a consulting engineering practice in Montreal, for the planning and preparation of estimates in connection with new enterprises, and reorganization and adaptation of existing ones.

He has been in manufacturing industries since his graduation in 1921 from the University of Warsaw, Poland, with the degree of master of science. He was with Warsaw Locomotive Works until 1934. In 1925 he had been made superintendent of the diesel engine department.

M. M. Winred, M.E.I.C.

Mr. Winred came to the United States in 1936 as a delegate to the Third World Power Conference in Washington; and after further work in Europe, came to Canada in 1941 under an agreement between British, Canadian, and Polish Governments. He has been associated since that time, with Canadian firms, advising on the manufacture of such materials as diesel and gasoline engines; ships, shells and guns; valves; prefabricated dwellings and plywood aeroplane parts; and pulp and paper making equipment.

C. D. Schultz, M.E.I.C., of C. D. Schultz & Company Limited, foresters and forest engineers, Vancouver, returned in March from a three-week trip to British Guiana, where he had gone in order to advise on a timber development and management problem for a British Crown Corporation.

Mr. Schultz had made trips in a similar capacity to Australia and New Guinea last Spring.

Karel R. Rybka, M.E.I.C., Toronto consulting engineer, has been elected a director of the Eric Dent Company Ltd., Toronto. This recently formed company has started pilot operations on dehydration of legume crops, and Mr. Rybka has been entrusted with their engineering problems.

Donald Mordell, M.E.I.C., associate professor of mechanical engineering at McGill University has received a graut for research in gas dynamics. His laboratory is at Macdonald College, in Ste. Anne de Bellevue, Que., and houses a new turbo-jet engine a gift of Rolls-Royce Limited.

Mr. Mordell will study fuel combustion, on which he has worked since coming to McGill in 1947 following work on jet engine development at the Rolls Royce plant in Derby, England.

His research is supported by the National Research Council and the Defense Research Board. The first contributions were received by McGill from Imperial Oil Limited and Ford Motor Company of Canada, for the opening of Canada's first gas dynamics laboratory.

W. T. Holgate, M.E.I.C., has been appointed, recently, to the application engineering division of the Canadian General Electric Company's Apparatus Department. He will be responsible for commercial engineering studies involving medium industry and modernization projects.

Mr. Holgate graduated from the University of Alberta in 1930 and since that time has been associated with the Company's test department, with general engineering, the instrument laboratory, the production department, and with the Toronto district office as sales engineer. Recently he was manager of the general sales section, at the Toronto district office.

Geddes M. Webster, M.E.I.C., was recently appointed assistant inspector of mines for Northwest Territories by the Dominion Department of Mines and Resources. He is stationed at Yellowknife.

Mr. Webster has been a consulting engineer in the Yellowknife district for the last three years, and previously he was with the engineering and production departments of Defence Industries Limited, at Verdun, Que., and Canadian Industries Limited, Nylon Division, at Kingston, Ont.

D. L. MacKinnon, M.E.I.C., is managing director of the Bayside Construction Company Limited, Campbellton, N.B., a newly formed company which has taken over the construction operations of the J. & D. A. Harquail Company Limited, and which will carry on a general contracting business.

D. L. MacKinnon, M.E.I.C.

Mr. MacKinnon graduated from the University of New Brunswick in 1939 with a B.Sc. degree in civil engineering and in 1944 received his M.Sc. degree from the same university. After graduating, he joined the Foundation Company of Canada as an engineer. During the years 1940 to 1943 he was associated with the Arvida construction and the Shipshaw Hydro project, and for a period was chief engineer with Foundation Company's subsidiary, Gunite and Waterproofing Company. In 1943 he enlisted with the R.C.A.F. and received his pilot's wings. In 1945 he returned to the Company and worked on various projects. He has been in Campbellton for some time.

Fred Hunt, M.E.I.C., has been appointed assistant division engineer for Canadian National Railways at Belleville, Ont. He was previously at St. Catharines, Ont., assistant engineer on the Niagara, St. Catherines and Toronto Railway.

J. S. K. Gosiewski, M.E.I.C., has been employed by H. W. Lea, M.E.I.C., consulting engineer, as head of the Ottawa Office. He was previously with the Aluminum Company of Canada Limited in Montreal, and was a partner in the firm Korward Wood Products Company, Montreal.

P. M. de Chazal, M.E.I.C., has been appointed assistant manager of the Stanley Tool Company of Canada Ltd., of Roxton Pond, Que. He is assuming this post in addition to his former duties as methods engineer. He joined the company in 1948 after a three year period in South America as chief engineer in a cement plant located near Sao Paulo, Brazil.

R. W. Franklin, M.E.I.C., is now in Kansas City, Mo., where he is a structural plan examiner for the Department of Public Works of the City. He had previously been, from 1946, with J. Gordon Turnbull, Inc., consulting engineers, of Cleveland, Ohio.

L. A. Petrie, M.E.I.C., has joined H. G. Acres and Company, Niagara Falls, Ont. He was previously with Montreal Cottons Limited, Valleyfield, Que.

S. F. Sznajder, M.E.I.C., who was with C. D. Howe Company Ltd., Hamilton, Ont., is now with Canadian-Brazilian Services Ltd., in the hydraulic division, in Toronto.

R. H. Smith, Jr.E.I.C., has joined Burndy Canada Limited, in Toronto, Ont. He was with Canada Cement Company in Montreal since his graduation in 1947 from University of Manitoba.

Charles H. Clay, Jr.E.I.C., has been appointed division engineer, Dominion Department of Fisheries, with headquarters at Vancouver, B.C. He worked for the International Pacific Salmon Fisheries Commission for five years as design engineer and resident engineer. He has had extensive experience in the development of Hells Gate fishways and other projects on the Fraser River and its tributaries.

Mr. Clay will be in charge of a stream improvement programme on the West Coast.

William H. Hamer, S.E.I.C., is now a design engineer with the Sangamo Company in Toronto, Ont. He graduated in 1948 from the University of Toronto, with a B.Sc. degree in electrical engineering.

A. M. Thomson, S.E.I.C., is with Canadian-Brazilian Services, Toronto. He graduated from the University of Saskatchewan in 1948.

I. Attas, S.E.I.C., on graduating from McGill University this month will join the Electric Tamper Company of Canada Limited, Montreal.

G. R. Daemen, S.E.I.C., will work for the Thomson Electrical Works Limited in Montreal, after graduating this month from McGill University, Montreal.

John O. McCutcheon, S.E.I.C., who graduates from McGill University, Montreal, this month will work for the Defence Research Board, at Ottawa, Ont., in the Scientific and Intelligence Branch.

M. E. Halladay, S.E.I.C., is with the British American Oil Co. Ltd., at Montreal East, Que. He graduated in 1948 from Queen's University, Kingston, Ont., in mechanical engineering, and has since taken a training course with International Harvester Company in Hamilton, Ont.

W. H. Carr, S.E.I.C., has joined the staff of the University of Toronto. A veteran student at that University, Mr. Carr will graduate early in 1949.

W. T. Clarke, S.E.I.C., joins Westeel Products, in Montreal, on graduating in May, 1949, from McGill University. Mr. Clarke was in the R.C.A.F. from 1943 to 1945.

A. G. Morris, S.E.I.C., joins the staff of E. F. Drew and Company, Montreal, on graduation in May, 1949, from McGill University, Montreal.

Vernon D. Shute, S.E.I.C., is now a junior engineer with the Hydro-Electric Power Commission of Ontario, with headquarters at Niagara Falls, Ont. Mr. Shute graduated in 1948 from Nova Scotia Technical College, Halifax.

Visitors To Headquarters

Everett S. Lee, of Schenectady, N.Y., March 16.

Col. H. W. Love, M.E.I.C., Ottawa, and **Lt. Col. R. J. Carson,** M.E.I.C., Ottawa, on March 17.

C. M. Smyth, M.E.I.C., of Sydney, N.S., March 28.

J. D. McLeod, M.E.I.C., Vancouver, B.C.; **J. W. S. Bondy,** of Winnipeg, Man.; and **J. L. McDougall,** M.E.I.C., Riverbend, Que., on April 9.

W. R. Bonnycastle, M.E.I.C., of Vancouver, B.C., April 20.

S. Logan Kerr, M.E.I.C., Philadelphia, Pa., April 21.

Caetano Alvares, Jr., Sao Paulo, Brazil, April 23.

Edward H. Robie, New York, April 27.

E. C. Adams, M.E.I.C., Toronto, April 28.

Eugene Vinet, M.E.I.C., Caracas, Venezuela, April 30.

Institute Prize Winners

R. W. Diamond, M.E.I.C., vice-president and general manager, Consolidated Mining and Smelting Co. of Canada Ltd., Trail, B.C., has been awarded the Julian C. Smith Medal of the Institute for the year 1948. The citation which accompanies the award is as follows:

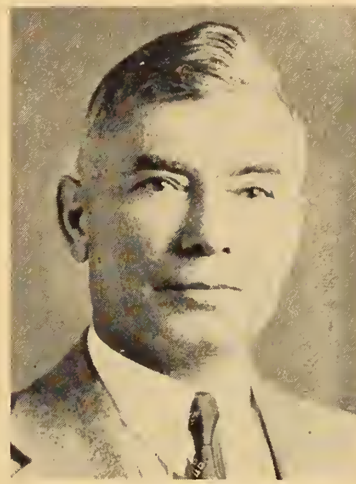
"The Julian C. Smith Medal is awarded annually, by the Institute for 'Achievement in the Development of Canada'. This year it is awarded to Randolphe William Diamond, Vice-President and General Manager, The Consolidated Mining & Smelting Co. of Canada, Ltd.

"Mr. Diamond was born in Campbellford, Ont., and graduated from the University of Toronto in 1913. He then joined the research class of the Anaconda Copper Mining Co. at Anaconda. He is one of the pioneers in the concentration of ores by the flotation process. Because of his success in this field, he was employed by the Consolidated Mining & Smelting Co. in 1917, and successfully developed a process for the concentration of the ores of the great Sullivan Lead, Zinc, Silver Mine in British Columbia, thus providing the basis for the growth of one of Canada's most important industrial units.

R. W. Diamond, M.E.I.C.

"After serving the company for a number of years as head of the concentration department, he was placed in charge of the fertilizer production programme in 1939, and has been largely responsible for the development of this important phase of industry and agriculture. The plant now produces over 500,000 tons per year. Mr. Diamond became the operating head of his company in 1935, and in 1947 he was appointed president of the West Kootenay Power & Light Co.

"Despite the pressure of company



T. H. Hogg, M.E.I.C.

duties, Mr. Diamond has found time to give freely of his services to the Institute and to the Canadian Institute of Mining & Metallurgy of which he is the immediate past president. In 1933 he was awarded the McCharles award and gold medal by the University of Toronto and in 1936 he was the winner of the Leonard Medal which is awarded by this Institute. Last year Mr. Diamond won the Blaylock Medal of the Canadian Institute of Mining & Metallurgy and he was honoured by Queen's University by the conferring of the degree of Doctor of Laws."

T. H. Hogg, M.E.I.C., Toronto consulting engineer, has been awarded the Sir John Kennedy Medal of the Institute for the year 1948. The citation which accompanies the award is as follows:

"Thomas Henry Hogg was born close to the site where he was to build for himself a record as a great engineer and a great citizen. Chippawa and the Niagara Falls area were the locale for many important events of his life from his birth to his greatest engineering achievement.

"From 1913 until 1947 Dr. Hogg served with the Hydro Electric Power Commission of Ontario, starting as a modest assistant engineer and finishing as Chairman and Chief Engineer. In addition he has rendered consulting services to public and private bodies in almost every province of Canada.

"He has served his fellow graduates and undergraduates too, as a member of the Senate of the University of Toronto for over twenty-five years. He further served the profession as president of the Engineering Institute in 1940.

"Dr. Hogg is one of those men who in spite of great professional attainments, lives close to his friends and associates. Although for years he has held great administrative responsibilities, he has not lost his deep knowledge of the technical side of his profession. He will always be an outstanding hydraulic engineer.

"The Sir John Kennedy Medal is awarded for outstanding merit in the profession — for noteworthy contribution to the science of engineering and to the Institute. Surely there is no more worthy one among us than Thomas Henry Hogg."

A. H. Wilson Busby, M.E.I.C., has been awarded the Gzowski Medal of the Institute for his paper "Localized Overheating in the Wall of a High Pressure Vessel and Its Effect on Rupture Strength", which appeared in the July 1948 issue of *The Engineering Journal.*

Mr. Busby is superintendent of engi-

A. H. W. Busby, M.E.I.C.

neering research and development for Consolidated Mining & Smelting Company of Canada Limited at Trail, B.C.

He graduated in mining engineering from University of Birmingham, England, in 1923. He had completed an apprenticeship with General Electric Company at Birmingham, in 1918, and had served in 1918 and 1919 with the Royal Air Force before entering University.

He was an electrical research engineer with the Mines Department in England for a time before coming to Canada in 1924 and joining the electrical department of Consolidated Mining & Smelting. He was assistant superintendent of the electrolytic department of the company's zinc plant from 1927 to 1930. He was made senior research assistant in the Research Department in 1930; and senior research engineer and supervisor of the instrument and physical testing division in 1945. He was named superintendent of physical research in 1945 and in 1946 he was appointed to his present position.

Mr. Busby is a member of the Association of Professional Engineers of British Columbia; of the National Association of Corrosion Engineers, the Instrument Society of America, and the Society of Experimental Stress Analysis. He is chairman of the Kootenay Branch of the Engineering Institute this year.

Others of Mr. Busby's papers have been published. A paper on "Single Core Armoured Cables for Alternating Current" written with Mr. G. M. Harvey, M.Sc., appeared in the *Proceedings of the Institution of Electrical Engineers,* in 1925. Mr. Busby collaborated with Mr. F. E. Lee on the paper "The Rapid Determination of Current Efficiency in the Electrolysis of Zinc Sulphate Electrolyte" which appeared in the *Transactions of the Electrochemical Society,* Vol. LX, 1931.

P. T. Bloomer, M.C.I.M., of Kimberley, B.C., was presented with the Leonard Medal at the annual banquet on April 26 of the Canadian Institute of Mining and Metallurgy. Mr. Bloomer's qualifying paper which was published in the *Canadian Mining and Metallurgical Bulletin.* January 1948, dealt with "Pillar Extraction at the Sullivan Mine".

Mr. Bloomer is assistant mine superintendent for Consolidated Mining & Smelting Company of Canada Limited, at the Sullivan Mine, Kimberley, B.C. A native of Kamloops, B.C., Mr. Bloomer was educated in that province before going overseas with the Western Universities Batt. in 1916. He studied engineering at the Canadian Army Military College near Godalming, England, and then went to Siberia with the Canadian Army, returning in 1919.

After one more year of study, Mr. Bloomer joined the Consolidated Mining & Smelting Company in 1920, at Rossland, B.C. He went to the engineering staff after two years underground experience. In 1925 he was promoted

P. T. Bloomer, M.C.I.M.

to the position of chief surveyor, Rossland and Outside Properties, and, two years later, to that of assistant superintendent of the Coast Copper Company, Vancouver Island.

Mr. Bloomer was assistant superintendent and engineer for the Slate and Manson Creek placers in northern B.C. from 1932 to 1934, when he transferred to the engineering staff of the Sullivan Mine. He was appointed superintendent of the Box Mine at Goldfields, Sask., in 1935, and he transferred to the Pinchi Lake Mercury Property in 1942 as superintendent. He went to his present position at Sullivan Mine in 1944.

C. O. P. Klotz, M.E.I.C., of Aluminum Company of Canada Limited, Montreal,

C. O. P. Klotz, M.E.I.C.

has been awarded the Plummer Medal of the Institute for his paper "Laurentien Aluminum," which appeared in the February 1948 issue of *The Engineering Journal.*

Mr. Klotz is from Lanark, Ontario, a civil engineering graduate of Queen's University, class of 1933. He did general contracting work until 1935, when he joined the Geological Survey of Canada to do office and field work. From 1936 to 1938 he was on the engineering staff at Kingston Penitentiary employed by the Department of Justice.

He was then for a year a lecturer in civil engineering at Queen's University. In 1939 he did soil surveys for the Ontario Department of Highways, and

J. D. A. Mollard, M.E.I.C.

that year he joined the Codes and Specifications Section of National Research Council, working on the National Building Code.

In 1941 Mr. Klotz accepted a bursary for post graduate study at Cornell University, in highway engineering, municipal and regional planning. The next year he joined Aluminum Company of

B. G. Ballard, M.E.I.C.

Canada, Limited, and until 1946 was connected with the property department in the development of the City of Arvida, except for a period of eighteen months as resident engineer in charge of construction at the Kingston Works. In 1946 he transferred to Montreal to the sales development division.

Mr. Klotz is a member of the Corporation of Professional Engineers of Quebec; of the Canadian Construction Association and the Montreal Builders Exchange. He is chairman of the Arvida Planning Committee.

J. D. A. Mollard, M.E.I.C., of Regina, Sask., has been awarded the Keefer Medal for his paper "The Engineering Significance and Photo-interpretation of Some Transported Soil Materials".

Born at Watrous, Saskatchewan, Mr. Mollard received his early education there, winning the Governor-General's Medal on matriculation. He later attended the University of Saskatchewan, graduating in 1945 with a B.Sc. degree in civil engineering. Following graduation he was employed for a season as resident engineer with the Saskatchewan Department of Highways. Mr. Mollard then moved to Indiana where he obtained his master of science degree in 1947 from Purdue University, specializing in the field of highway engineering. Subsequently for some time he was with the Indiana State Department of Highways doing research work on airphoto mapping and engineering evaluation of soil and bedrock materials. He is presently engaged as air surveys engineer with the Irrigation and Water Development Branch of the P.F.R.A., located in Regina, Saskatchewan.

A. G. Fletcher, S.E.I.C.

Mr. Mollard is the author of a number of technical papers, published in the United States and Canada, dealing with the use of aerial photography in engineering and its allied sciences. The most recent of these is entitled "Aerial Photographs Reveal Friends on the Earth's Surface," published in a recent edition of *The Saskatchewan Engineer*. In 1947 he became a member of the Institute and the Association of Professional Engineers of Saskatchewan.

B. G. Ballard, M.E.I.C., of Ottawa, is the recipient of the Institute's Ross Medal for the year 1948, for his paper "Recent Canadian Radar," which appeared in the July 1948 issue of *The Engineering Journal*.

Mr. Ballard graduated in electrical engineering from Queen's University following which he took the graduate engineering course in the Westinghouse Electric and Manufacturing Company at East Pittsburgh, Pa. On completion of this he entered the engineering department of that company and remained there until 1930. He then joined the staff of the National Research Council, assuming charge of the Electrical Engi-

K. R. Stehling, S.E.I.C.

neering Laboratory. In 1948 he became director of the Division of Radio and Electrical Engineering.

A. G. Fletcher, S.E.I.C., has been awarded the H. N. Ruttan Prize for 1948, for his paper "Draughting a Logging Topographic Map".

Mr. Fletcher was born in 1925 at Gibsons Landing, B.C. He attended various country, public and high schools on the B.C. Lower Mainland, and graduated from Lord Byng High School, Vancouver, B.C. He attended University of British Columbia graduating in civil engineering in 1948. He worked on logging topographical maps and logging engineering surveys during the summers from 1942 until 1945. During the summer of 1946, he was on topographic field parties on large mapping projects carried out by C. D. Schultz and Co. Ltd., forest engineers. During the summer of 1947, he was chief of a topographic survey party for C. D. Schultz & Co. Ltd. on a mapping project at Vancouver Bay, Jervis Inlet, B.C. Presently he is employed as engineer in training in civil engineering with the British Columbia Electric Railway Co. Ltd.

K. R. Stehling, S.E.I.C., has been awarded the John Galbraith Prize of the Institute for 1948 for his paper on "Rocket Propulsion," which was published in *The Engineering Journal* in March 1948.

Mr. Stehling attended University of Toronto from 1941 to 1943. He served from 1943 to 1945 in the Armoured Corps of the Canadian Army, and he returned then to the University. He received a B.A. degree in 1948. He is now employed by Allied Chemical and Dye Corporation, Buffalo, N.Y., in the plant engineering department; and he is also

M. B. T. George, S.E.I.C.

studying for a M.A. degree in industrial physics at University of Buffalo.

Mr. Stehling became a student member of the Institute as a result of the choice of his paper "Underground Gassification of Coal" to win a student contest. He is president of the Canadian Rocket Society which was founded in 1948; and a fellow of the British Interplanetary Society.

M. B. T. George, S.E.I.C., has been awarded the Phelps Johnson Prize of the Institute for 1948. Mr. George's paper is entitled "Preliminary Design of a Light Racing Airplane."

Mr. George was born at Pope, Manitoba, but was educated in Saskatchewan where he graduated with senior matriculation from Regina Central Collegiate in 1939. Interested in aeronautics, he studied for a year at Aero Industries Technical Institute, Los Angeles, California.

He returned to Canada in 1940 and came to Noorduyn Aviation Ltd., Montreal. He held a position there as group-leader in the engineering department until October 1945 and during this period his work included draughting supervision and production engineering on the Noorduyn Norseman cargo airplane and the Harvard trainer.

In the fall of 1945 he commenced his studies at McGill University in the applied mechanics option, civil engineering department. In 1948 he was awarded a University scholarship; and he is a member of the Phi Epsilon Alpha Engineering Society. In May of this year he graduated with the degree of bachelor of engineering.

During the summers Mr. George has been engaged in liaison engineering and detail design at local aircraft companies. Next fall he hopes to begin postgraduate studies in aeronautical engineering at an American University.

Gerard Gascon, S.E.I.C.

Gerard Gascon, S.E.I.C., has been awarded the Ernest Marceau Prize of the Institute for 1948, for his paper "Exploitation des Gisements d'Ilmenite du Lac Tio".

Mr. Gascon was born in Montreal in 1922 and attended school in Montreal and Terrebonne, Que. He went to Bourget College, Rigaud, Que., where he obtained a B.A. degree, "magna cum laude". He graduated from Ecole Polytechnique, Montreal, in 1948, receiving the degree of bachelor of applied science, with distinction.

He had acquired practical experience in mining during the summer holidays, in 1944 at the Frood Mine, Sudbury, with International Nickel Co.; in 1946 at the Ross Mine, Rammie, Ont., with Hollinger Gold Mine; and in 1947 at Allard Lake and Tio Lake, North Shore, for Kinnco Explorations Company. Since graduation, he has been at the Marquette Iron Range, working as a junior mining engineer with Inland Steel Company.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Hugh Miles Lewis, M.E.I.C., who was prominent in British Columbia shipbuilding, lumbering, papermaking and railway circles since 1910, died suddenly on December 28, 1948, at his home in Vancouver. He was born at Port Arthur, Ont., in 1887.

He had been vice-president and general manager of Sorg Pulp Co. Ltd., Port Mellon, for four years.

Mr. Lewis went to British Columbia 38 years ago while associated with Canadian Northern Railway as an engineer. He served five years with the Canadian Army in the First World War. After his return from overseas he became assistant manager of the Port Arthur Pulp and Paper Company, and he was later given the position of engineer for the Company. In 1929 he joined Provincial Paper Company, but came back to British Columbia and was with Pacific Mills Ltd., at Ocean Falls. He became manager of the south (Vancouver) yard of Burrard Dry Dock Co. Ltd., in 1941. Besides supervising construction of 10,000-ton freighters outfitting of aircraft carriers came under his wing.

In 1942 he was a shipyard operators' representative on the Richard Commission appointed by Ottawa in a West Coast shipbuilding controversy.

Mr. Lewis joined the Sorg firm when wartime shipbuilding contracts ended.

Mr. Lewis became an Associate Member of the Institute in 1920, transferring to Member in 1940.

Frank F. Sefton, M.E.I.C., of Toronto, who passed away on April 5, 1949, had been chief engineer in the Toronto Transportation Commission's rapid transit project.

Mr. Sefton was born in Toronto in 1890, and was educated there. He worked in the western coal fields for several years, before returning to Toronto and joining a firm of surveyors. He entered the Department of Railways and Bridges of the City of Toronto in 1911, and he remained in this work until 1915, when he went overseas with the Canadian Infantry. On his return he did some construction work in Quebec, at Ste. Agathe des Monts, before entering the firm, Smith, Kerry and Chace Ltd., Toronto. He joined the Toronto Transportation Commission soon afterwards, and was made chief draughtsman of the Way Department. He stayed with the Commission until the time of his death.

F. F. Sefton, M.E.I.C.

Mr. Sefton served overseas in the recent war, with the rank of flight lieutenant with the R.C.A.F. He returned to the Commission on his discharge, and was in charge of public utilities subway design for the rapid transit department.

He has been active in the Toronto Branch of the Institute, which he joined in 1921 as an Associate Member. He transferred to Member in 1940.

G. W. Jarvis, M.E.I.C.

G. W. Jarvis, M.E.I.C., of Montreal, died on March 17, 1949, in Montreal after a brief illness. He was chief engineer of McColl-Frontenac Oil Company Limited.

He was born at Hamilton, Ont., in 1907, and studied at Hamilton Technical School and Queens University, graduating in 1930 with the degree of B.Sc. in mechanical engineering. He remained at the University as a lecturer and demonstrator for two years. He joined McColl-Frontenac in .1934 and held various positions on construction and operations until 1943 when he was appointed chief engineer. Under his guidance a most extensive construction programme was carried out, culminating in the erection of the new fluid catalytic cracking facilities in 1948.

Mr. Jarvis joined the Institute in 1931 as a Student, transferring to Junior in 1938, and to Member in 1943.

Herschel Eugene Denton, managing director of General Petroleums Ltd., drilling contractors, Calgary, Alberta, died in the Holy Cross Hospital at Calgary, March 30th, 1949.

Mr. Denton was also president of Denton - Spencer Co. Ltd., consulting petroleum engineers, and president of Superior Oils Ltd., a producing company. He was born at Mineral Wells, Texas, in 1907, and graduated from New Mexico Agricultural & Mechanical Arts in 1934 with a B.Sc. in mechanical engineering. He had started working in the oilfields of California in 1926 and continued to do so while completing his university work. After graduation he rejoined the Ohio Oil Company with whom he was first employed in 1930. He rose to field superintendent with that Company in the Wyoming and Montana fields.

Early in 1938 he came to Alberta to take the post of production superintendent with the Anglo Canadian Oil Co. Ltd. in Turner Valley. He is credited with the introduction of many new procedures in drilling and production practice in Turner Valley.

In March, 1941, with Cody R. Spencer, he formed the partnership of Denton & Spencer which carried on a petroleum engineering and drilling consulting practice. Also at this time General Petroleums Ltd. was formed to carry on drilling contracting and Mr. Denton became managing director of this firm. Denton & Spencer was incorporated in 1945 as Denton-Spencer Co. Ltd. to carry on petroleum engineering, and General Petroleums Ltd. under Mr. Denton's management became one of the leading drilling contractors in Canada. In 1946 Mr. Denton was active in organizing Superior Oils Ltd. a producing company which attained an enviable position under his guidance. A few days before Mr. Denton died Superior placed their well at Joseph Lake on production and production figures were sent to the hospital at Mr. Denton's request.

Mr. Denton was always active in fraternal and technical organizations. He was licenced to practise professional engineering by the Association of Professional Engineers of Alberta in 1938 and was registered as a member in 1946. He was also licensed to practise in Saskatchewan. Mr. Denton joined the Engineering Institute of Canada in 1945 and the American Institute of Mining & Metallurgy in 1946. He was a member of the American Petroleum Institute since 1938. He was a member of the Western Canada Petroleum Association and was on the Advisory Committee of the Association to the Petroleum and Natural Gas Conservation Board of Alberta. In 1948 he became a member of the American Association of Drilling Contractors.

News of the Branches

Activities of the Twenty-nine Branches of the Institute and abstracts of papers presented at their meetings

Border Cities Branch

H. D. Keil, M.E.I.C.
Branch News Editor

W. R. Mitchell, M.E.I.C.
Secretary-Treasurer

On March 11th Mr. John Ness of the Imperial Oil Ltd., addressed the Border Cities Branch of the Institute in the auditorium of the Ford Motor Co. of Canada. His topic was **Canada in the Oil World.**

The oil industry in Canada is about 90 years old and has produced about 60 billion barrels of oil. Of the present Canadian oil reserves 90 per cent are located in Alberta and the North West Territories, the remaining 10 per cent are in Ontario.

Mr. Ness dealt particularly with the discoveries and developments of the Alberta fields and described the Turner Valley and Leduc projects. He mentioned also the future possibilities of the Athabaska tar sands and the use made during the last war of the Norman field located in the North West Territories.

Canada uses more oil per capita than any other country in the world and even with her large oil reserves will continue to import extensive supplies particularly for consumption in the eastern part of the country.

Mr. Ness saw no reason for alarm over the dwindling world oil supplies since only one third the area of the world has yet been penetrated. Furthermore, from the present proven oil reserves we can expect a supply of oil at least equal to the total quantity produced by the oil industry throughout its past 90 years of existence. To augment this supply we can still manufacture synthetic crude oil.

To supplement his talk Mr. Ness showed a film entitled "Search Unending".

Cornwall

G. G. M. Eastwood, M.E.I.C.
Secretary-Treasurer

T. B. Webster, M.E.I.C.
Branch News Editor

Boiler Control was the topic under discussion on February 15 at the regular meeting of the Cornwall Branch. K. D. Sheldrick of the Bailey Meter Company delivered the illustrated lecture which was attended by over 50 people. Branch Chairman R. H. Wallace welcomed the local members of the Institute of Power Plant Engineers who had been invited to hear an address of special interest to operating engineers.

Harold Nickerson introduced Mr. Sheldrick who is the manager of the Montreal branch of his company. Mr. Sheldrick outlined the wide scope of automatic control in industry where its application has improved the quality of product and has reduced costs. In boiler plant operation, automatic control contributes to savings in operating costs, betterment of working conditions, improvement in safety and lessening of smoke nuisances. Mr .Sheldrick illustrated his lecture with lantern slides which showed boilers controlled primarily by steam-flow, air-flow responses to control fuel supply rate and draft with auxiliary corrective actions caused by steam pressure measurement. Details of pilot valves, relays, selector switches, control valves and control panels were clearly illustrated.

Mr. Sheldrick reviewed the rapid advance of process control engineering in the past 30 years and claimed that even greater advances are possible in the next 30 years.

The speaker was thanked by Mr. Nasmyth.

❖ ❖ ❖

On March 8 at the Hotel Cornwallis, there was a dinner meeting of the local branches of the Engineering Institute and the Chemical Institute of Canada. The meeting, presided over by D. Leushner of the C.I.C. and R. H. Wallace of the E.I.C. was addressed by E. L. Davies, vice-director-general of the Defense Research Board. Guests at the dinner were the officers of the Stormont, Dundas and Glengarry Highlanders.

Mr. Davies contended that the destructive powers of atomic weapons have been greatly over-publicized by the press. He claimed that the atom bomb's greatest effectiveness in war arose from the psychological fear that it created—comparable to the fear of chemical warfare in the First World War. Mr. Davies also stated that "push-button" warfare is largely a creation in the minds of the press, and warfare is yet far from being completely mechanized.

Radar and DDT are two examples of

scientific discoveries that have been greatly over-rated. Radar is a logical outgrowth of television but its effectiveness is still unpredictable as shown in its failure before the collision of HMCS "Micmac" and the freighter "Yarmouth County."

Mr. Davies told of the great advances made in medical research during the war—advances made possible by the increased money made available for research; the greater need for the care of war casualties; and, most importantly, the greater opportunity for carrying out experiments on large bodies of men under discipline.

The speaker said that experience has shown that directed research is more effective than independent research in attaining success in any one project but that freedom of research is more conducive to new discoveries. He claimed that Russia's directed research programme might well lead to the perfection of a better atomic bomb but that if a weapon better than an atomic bomb were discovered, the chances are that its discovery would be made in a country where freedom of research is practised.

Mr. Davies was introduced by R. H. Wallace and thanked by Captain John Cook.

Lakehead

G. S. Halter, jr.e.i.c.
Secretary-Treasurer

A general meeting of the Lakehead Branch of the Engineering Institute of Canada was held at the Mary L. Black Public Library, Westfort, on Wednesday evening, January 12, 1949. There were 27 members and guests present. W. E. MacLennan, branch chairman, presided, and expressed his pleasure in seeing students of the Lakehead Technical Institute present.

A business meeting dealt with financial and membership reports, and with the announcement of the January regional meeting of Council. D. R. Beckett and J. M. Fleming were named to be, respectively, Eastern district representative of the Branch, and Branch representative on the Institute nominating committee.

Discussion followed, on the subject of the form in which meetings would be organized, and it was remarked that this was an experimental non-dinner meeting. Discussion took place, also, of details of the forthcoming dinner and dance. Mr. A. Paoli of the John Inglis Company, Winnipeg, was an unexpected visitor at the meeting and he kindly consented to give a short talk on **Refrigeration as Applied to Skating Rinks.** The talk was illustrated by isometric drawings and proved to be very interesting. Both sand and concrete surfaces were described and the complete cooling cycle was outlined. Considerable discussion took place after the talk.

W. C. Byers moved a vote of thanks to the speaker. Mr. MacLennan also thanked the speaker, and adjourned the meeting.

❖ ❖ ❖

The annual dinner and dance of the Lakehead Branch was held Wednesday evening, February 16, in the Norman Room of the Royal Edward Hotel, with 65 couples present.

Mr. W. E. MacLennan, branch chairman, presided at the dinner and proposed a toast to the King. A. D. Norton was in charge of all the arrangements for the evening and was assisted by the secretary-treasurer, Syd Halter. S. Flook said grace before the meal. Gib Heath designed the original blueprinted menus which were quite appropriate for this engineering affair.

A beautiful rose corsage was given to each lady as she entered the dance floor. There was a large punch bowl at one end of the Norman room and Bill Adamson was in charge there. An illuminated Engineering Institute of Canada shield with beaver insignia was in proud display in a prominent place on the wall of the Norman room.

The dress for the evening was optional. The entire evening had an air of friendly informality and there were no after-dinner speeches.

❖ ❖ ❖

A dinner meeting of the Lakehead Branch of the Institute was held in the banquet room of the Orpheum Grill, Thursday, March 17.

H. Bruce MacConnell, m.e.i.c., superintendent of the Barnett-McQueen Company Limited, spoke on **General Estimating in the Building Trade,** as applied to warehouses, factories, schools as well as small dwellings. Mr. MacConnell gave the detailed step-by-step procedure involved in estimating the cost of a building from drawings and specifications. He said that not only must the estimator decide the cost, but he must also decide how long it will take to complete a project.

Considerable discussion took place, and Mr. McConnell informed between 50 and 60 present that the well-known escalator clause in many present contracts was due to the possibility of strikes on the job as well as the increase in the cost of materials between the time of tendering and delivery of the materials to the job.

A. D. Norton, programme committee chairman, gave a financial report on last month's dinner and dance.

Employment of non-Canadian engineers by Canadian companies in certain jobs where Canadian engineers were as well or even better qualified, was discussed in some detail.

Syd Halter, branch secretary-treasurer, advised that negotiations would soon be underway for a co-operative agreement between the Association of Professional Engineers of Ontario and the Ontario Division of the Engineering Institute of Canada. Mr. Halter explained the details involved and advised the group that there were already agreements between five provincial professional associations and five provincial branches of the Institute. Mr. D. Laidlaw moved that such an agreement in Ontario be endorsed. The motion was seconded by M. G. Burbidge and carried unanimously.

W. E. MacLennan, branch chairman, presided and said that it was gratifying to see such a good turnout. Some engineering students from the Lakehead Technical Institute, student members of the Institute, were also present.

Lethbridge

D. Cramer, jr.e.i.c.
Secretary-Treasurer

E. A. Lawrence
Branch News Editor

The regular meeting of the Lethbridge Branch of the Institute Saturday evening, March 19, was addressed by Mr. A. Cullen, on the subject of the Professional Engineering Act of Alberta.

W. Foss presided over the meeting with a large attendance of members and affiliates present. Brown's Instrumental Trio played during dinner, and vocal solos by Mrs. D. Benoit and community songs led by R. S. Lawrence were enjoyed.

E. A. Lawrence introduced Mr. Cullen, who explained the organization of the Association of Professional Engineers of Alberta.

The use of the title, "Engineer", presupposes membership in the Association and Mr. Cullen enumerated conditions under which one may be a "member" or "licentiate" of the Association. He told of the manner in which officers and executive are elected, and of the General Faculty Council, which handles admission. Mr. Cullen discussed, also, various other sections of the Act.

Following an interesting discussion, Councillor for the Association, Mr. J. M. Campbell, thanked the speaker for his excellent address.

Montreal

Junior Section

J. D. McPherson, m.e.i.c.
Chairman

A noteworthy event in the 1949 spring programme of the Junior Section, was a forum on **The Personal Aspects Of Engineering,** March 14. Also of wide interest, was an address by Mr. L. G. Beaubien, on **The Functions of a Stock Exchange,** March 28. Mr. P. H. LaPointe, architect, gave a lecture on **Advances in Building Materials for the Modern Home** on February 28; and Mr. Yvon DeGuise, m.e.i.c., presented an illustrated lecture and film, on **The Beauharnois Project,** on April 11.

Because of its novelty and impressive results; the purpose, organization, and results, of the Forum were reported for the *Journal*.

The forum was organized by Past Chairman Paul Salvas, who acted as discussion leader. Chairman of the evening, J. D. McPherson, introduced the principal speaker, J. B. Sterling, m.e.i.c., vice-president of E. G. M. Cape Co. Ltd., and president of the Corporation of Professional Engineers of Quebec. The chairman noted that amongst students and junior engineers there existed a desire for the knowledge which would enable them to orient themselves in their profession, and relate the professional career to business, industry, and labour. Underlying this is the idea that the economy of human effort attained in working toward well defined goals will enable the young man to achieve a better way of life, and fuller self realization, at an age when lack of this breeds frustration and disillusionment. He noted that the forum was designed to explore some of the personal aspects of engineering; and to this end, the knowledge and experience of a panel of successful engineers was made available to those students and juniors participating.

Mr. Sterling emphasized the importance to the young engineer of personality and character in the building of a successful career, and indicated that a weighted percentage would give these personal qualities 75% as against 25% for knowledge of engineering science

The speakers at recent Montreal Junior Section forum. Left to right, J. B. Stirling, H. C. Nourse, Discussion Leader Paul Salvas, J. A. Lalonde, Dean Ignace Bouillet, and Chairman J. D. McPherson.

and technique of business. He stated that individual success is measured not only by how much we know, but in a far greater measure by how much of it we can put to use, and the manner in which we do it. He pointed out that many graduates had failed to apply the same approach to their personal problems which they as engineers had used with reasonable success in their engineering work.

Mr. Serling suggested that much good would result were student guidance and selection more seriously developed. As a means of building personality, he noted the benefits to be gained by active participation of engineers in professional or business organizations and groups.

Dean Ignace Brouillet, M.E.I.C., dean of the Ecole Politechnique, the second participant in the discussion, outlined how the practising engineer can assist the faculties of the universities in formulating courses or curricula; and made the plea that practising engineers offer more of their time to the universities in the training of students.

Mr. H. C. Nourse, M.E.I.C., described the work being done by student guidance committees of the Institute and told of the opportunities for student guidance offered by the Montreal Branch. Dr. J. A. Lalonde, M.E.I.C., emphasized the importance of younger engineers becoming active in public organizations and community activities. He remarked that the regard in which engineers are held by their fellow citizens can be directly associated with their participation and usefulness in community life.

Following a brief intermission, the panel discussed questions submitted by members of the gathering: this later discussion proved immensely interesting and profitable.

Niagara Peninsula

J. J. Miller, M.E.I.C.
Secretary-Treasurer

C. A. O. Dell, M.E.I.C.
Branch News Editor

On Thursday, March 24, members of the branch visited the nickel refining plant of The International Nickel Company in Port Colborne, where they were conducted on a tour through the plant. The trip was arranged with the co-operation of R. C. McQuire, general superintendent of the plant. Guides were provided for small groups, and the manufacturing process was followed from the receipt of the raw material through to the finished product.

The rendezvous following the plant visit was the Barclay Hotel in Welland where about fifty engineers assembled for dinner.

Following the dinner chairman R. A. Coombes officiated at the presentation of the Institute Insignia in the form of a watch fob to past chairman M. F. Ker.

Mr. McQuire gave a short history of the refining of nickel and a brief account of the widespread occurrence of nickel ores on the earth's surface, but pointed out that only a few of the known ore bodies are of the type that are amenable to the presently known refining processes. The speaker then followed with a very complete explanation of the process which is used at the Port Colborne refinery. Many interesting questions arose during the discussion which followed, all of which were satisfactorily answered by Mr. McQuire.

A short session of the executive was held after the meeting, at which the report of the nominating committee was received.

Saguenay

T. T. Anderson, Jr.E.I.C.
Secretary-Treasurer

A meeting of the Saguenay Branch was held at the Arvida High School, on Tuesday evening, March 22, 1949.

The speaker was M. E. Wight, director, Technical Service Division, McColl-Frontenac Oil Company, Limited, Montreal, and his subject was **Lubricating Oils, their Manufacture and Uses.**

Mr. Wight divided his subject into three main phases:

(a) Separation of the crude oil fractions: this section dealt with the refinery methods used to separate the various oil fractions. The functions and construction of the bubble cap tower were clearly explained and slide diagrams shown. The speaker then covered clay filtration and solvent dewaxing.

(b) Means of differentiating between oils: this section dealt with the various tests employed to differentiate and maintain the various types of oil. The speaker spent some time discussing the properties of napthenic and paraffinic base mineral lubricating oils, covering the use of viscosity tests and viscosity index.

(c) Additives — their purpose and functions: this section of the talk dealt with the various chemicals which are added to give desired properties to lubricating oils so that they may meet conditions of service and temperature. Various comparison slides were shown.

Mr. Wight answered many questions following the talk. A capacity audience attended.

On Tuesday, March 29, 1949, at the Arvida High School a series of three films were shown. The films were entitled: "Deep Horizons" — The biography of an oil well; "Masters of Molecules" — The story of a refinery; "Tankers" — The story of wartime oil transport.

These films were a follow up on Mr Wight's talk of March 22, 1949. At that meeting a general power failure had caused postponement of film showings.

The speaker was introduced by Chairman W. P. C. LeBoutillier, and was thanked by F. A. Dagg.

Junior Section

W. A. Dayton, M.E.I.C.
Secretary-Treasurer

A meeting of the Saguenay Branch Junior Section, was held at the Saguenay Inn on March 15, 1949.

The speaker was C. B. Shipton of the Aluminum Company of Canada, who spoke on the **Manufacture of Phosgene** at the Windsor Works of Canadian Industries Limited.

Mr. Shipton discussed the properties of phosgene chemically and physically in order to provide a background for the description of the actual plant process and the inherent dangers when dealing with such a toxic product. He stressed the fact that the plant described was not built to produce phosgene for chemical warfare, but as an intermediate step in the production of a chemical to be used in the manufacture of cordite.

The interest of the audience was demonstrated by the questions asked during the later discussion period.

Mr. Shipton was introduced by the Chairman, T. T. Anderson, and thanked, on behalf of the members, by R. Lewis.

❖ ❖ ❖

At a meeting of the Saguenay Branch Junior Section at the Saguenay Inn, on Wednesday, April 6, 1949, the speaker was R. A. Lemieux, M.E.I.C. His subject was **Town Planning, its Nature and Origin.**

Mr. Lemieux began by discussing Arvida, a planned town. In the early days Aluminum Company engineers had looked after planning and administration. However in 1942 authority was turned over to the city council and city administration, which latter Mr. Lemieux heads. In 1943 the administration recommended formation of a Town Planning Commission and the first meeting of the new body was held on October 27, 1943. Throughout the wartime expansion of Arvida the efforts of the Town planners have been invaluable in maintaining order and beauty in the face of greatly accelerated growth.

Mr. Lemieux also spoke of the history of town planning, which goes back as far as early Greek and Egyptian civilizations, and he traced its growth to modern times.

Mr. Lemieux showed that zoning is necessary to provide sanitation, to lessen traffic hazards and fire risk, to prevent overcrowding, to maintain health, security, and improve morale. He showed that a building code was necessary for the safety of occupants and of neighbours and for the safety of buildings. He described the work of the building inspector as being delicate, one in which firmness and courtesy must go hand in hand. He stressed the need for expanded public education along town planning lines.

Following the talk two very interesting films were shown. They were entitled "When we build again", and "This is Tomorrow".

The speaker was introduced by the Chairman and thanked by Laurent Tessier, Jr.E.I.C..

Sarnia

C. P. Sturdee, M.E.I.C.
Secretary-Treasurer

J. M. Garton, Jr.E.I.C.
Branch News Editor

A Television Revolution was the theme of an address delivered by Mr. J. G. Smart of The Canadian General Electric Company to a dinner meeting of the Sarnia Branch of the Institute on March 29, 1949.

The speaker outlined the many ways in which mankind will benefit as television develops. Television receivers are bringing excellent entertainment right into the home, and thus are making a contribution to the present much neglected home life. Selected television programmes will help develop hobbies and talents of such diversity as cooking or improving one's golf. Sports will be enjoyed by much larger audiences than ever before. The speaker mentioned the medical profession's use of television for instructional purposes, where operations can be watched by a large number of students. Top notch instructors in all fields are able to demonstrate and teach to audiences of almost unlimited size through the use of television. In industry, television is being used to observe dangerous scientific experiments such as rocket development and experiments with super-sonic aircraft. In the field of advertising, television is already making great strides. The impact of clever televised advertising is quite impressive, and advertisers are now considering this medium worthy of consideration when spending advertising dollars.

Mr. Smart then outlined the growth of television during the past years. In the United States it is anticipated that by the end of 1949 there will be 2,000,000 receiving sets in operation, compared with 900,000 at the end of 1948. At the present time there are no commercial television transmitters in operation in Canada, but it is estimated that about 10 per cent of Canada's population are close enough to American stations for good reception. As a result, the demand for Canadian manufactured television sets in the Windsor and Niagara Peninsula areas is greater than the Canadian manufacturers can supply. Television receivers now retail in Canada for about $600.

Television in Canada has every indication of becoming a healthy industry. Present plans call for the erection of transmitting stations in Montreal and Toronto in the near future.

Mr. Smart's address was illustrated by slides and a film "Sightseeing at Home". The speaker was introduced by Mr. C. S. Phelps and thanked by Mr. F. F. Dyer.

Saskatchewan

Regina Section

D. W. Houston, M.E.I.C.
Secretary-Treasurer

R. Bing-Wo, M.E.I.C.
Branch News Editor

At the regular monthly meeting of the Regina Section at the Kitchener Hotel on Thursday, April 21, three speakers discussed **The Power Situation in Saskatchewan.**

The first speaker, H. I. Nichol, superintendent, of the Light and Power Department, City of Regina, dealt with power generation in Saskatchewan.

The major steam plants in the province are located in Regina with a capacity of 36,000 kw., Saskatoon with a capacity of 25,000 kw., and Moose Jaw with a capacity of 20,000 kw. The minor steam plants are located at Prince Albert—11,000 kw.; Estevan—7,700 kw.; North Battleford—3,000 kw., and Weyburn—2,200 kw. The Estevan plant will become one of the bigger steam generating plants in the future because of its proximity to the coal fields.

Mr. Nicholl also dealt with diesel plants, of which there are 26 in the province, the major ones at Yorkton—2,250 kw.; Swift Current—2,975 kw.; and Unity—1,930 kw. The speaker also discussed the costs of power generation, pointing out that the two major factors affecting such costs were the cost of fuel and the load factor on the system. He went on with a description of the power network covering the province of Saskatchewan and how the independent networks of the past have been amalgamated into the network of the present.

A. G. Teskey, manager of Canadian Westinghouse in Regina, next dealt with the consumption of power. He said that Saskatchewan occupies a unique place in that it is one of the few places on this continent where all the power is generated by the use of steam and diesels. He quoted comparative costs of power and consumption in the provinces of Alberta and Manitoba as compared with Saskatchewan. The lower cost of power in Alberta due in part to the fact that the plants there are very close to the coal and oil fields and also due to the influence of cheaper hydro-electric power. The Manitoba rates were lower because of the use of hydro and the fact that the farm area is concentrated in an area only about one third as large as that in Saskatchewan.

W. B. Clipsham, engineer, Saskatchewan Power Corporation, dealt with future developments in the province.

The main source of power in Saskatchewan comes from coal. The building of an oil pipeline into Saskatchewan from Alberta fields would displace the use of coal with the exception of the Estevan area, which lies right in a coal field. The use of natural gas in the Unity district was also described. Mr. Clipsham then spoke on possible hydro development in the province. Two sites were possible; the Fort a la Corne site on the Saskatchewan River could develop 42,000 continuous horse power and a peak of 125,000 horse power. The South Saskatchewan River Dam would develop a large amount of power but the bulk of this would be ultimately required to pump irrigation water, although some power would be available for sale during the early development of the project.

Mr. Clipsham illustrated by means of a graph, the growing power demand based on present rates of growth. There were 395 villages in the province with 46% still to be served by the Power Corporation and of the 138,000 farms only 1,776 were served up to last year. With the new loads which might be expected, the power demand in 1960 would be about two times the demand in 1948.

❖ ❖ ❖

The regular monthly meeting of the Saskatchewan Branch was held in the Kitchener Hotel, Regina on March 18, 1949.

Mr. A. William, Director of Industrial Development and Mr. J. Bichan, Director of Mineral Resources, Department of Natural Resources, presented papers on the work being carried out by their branches. Mr. S. Lucas, manager of the Saskatchewan Timber Board also presented a talk on the timber industry in Saskatchewan.

Mr. Williams presented a picture of the natural mineral deposits of the province and explained how these were being developed commercially. Of all the natural deposits of commercial minerals in Saskatchewan, those connected with the ceramic industry were most important commercially. The location of these ceramic clays and shale were shown on a map. The method of mining and selling this product was explained by Mr. Williams. A large tonnage of Saskatchewan clays are shipped to the plant at Medicine Hat where it is made into pottery ware and sewer pipe.

Various other minerals were mentioned, sodium sulphate, magnesium sulphate, sodium chloride, bentonites, volcanic ash, marl and ochre, being among these. Mr. Williams discussed each of these and their possible commercial value.

Mr. Bichan spoke on mining and prospecting being carried on in the province. Saskatchewan was later in the development boom due in large part to the natural barrier formed by a forest belt which covers the north central part of the province. It was only within the last three years that a suitable road had been constructed into this area.

Mr. Bichan spoke of the important uranium discoveries made in Saskatchewan. Three definite fields have been located at Goldfields, Lac la Ronge and Black Lake. The geological formation in the area is favourable to the deposition of pitchblende and there appears every likelihood of further discoveries being made during the coming year. Saskatchewan holds first place among the provinces in uranium exploration and development.

The petroleum industry was also mentioned. The large number of drilling and exploration permits being issued would put Saskatchewan second only to Alberta in the search for oil.

Mr. Lucas spoke on the timber industry in Saskatchewan. He mentioned the conservation practice that is necessary in order that a sustained yield of our forest be possible. It was pointed out that a period of 80 to 140 years is required for a tree to reach maturity and unless a planned programme of cutting was used, the forests would rapidly become depleted.

Spruce trees are the most plentiful in Saskatchewan as a commercial tree along with good stands of jackpine and birch. The aspen and poplar trees are considered as a weed tree although poplar is being used in the manufacture of plywood at the Hudson Bay plant.

Mr. J. Mantle, secretary of the Saskatoon Section moved a unanimous vote of thanks to the three speakers for their interesting and informative addresses.

Saskatoon Section

J. B. Mantle, M.E.I.C.
Secretary

On Thursday, March 17, 1949 the Saskatoon Section held an informal smoker with four local engineers talking on various topics of engineering interest. Some 65 members were present to hear these informative papers.

Herb Bear of Richardson Road Machinery Company elaborated upon the **Design and Development of a Rotary Snow Shovel.** This piece of equipment could be readily attached to farm tractors for use in clearing country roads. The final shovel design was of the rotating blade type driven from the tractor power take off. It was capable of clearing 5,000 cubic yards of freshly fallen snow per hour.

Walter Ball of the Housing Research Center discussed the features of **Prestressed Concrete Design.** Mr. Ball had visited the experimental laboratories at the University of Ghent and he described what he had seen there. He employed a hypothetical slab bridge design to illustrate the large savings in weight that could be obtained with prestressed concrete.

Stan Hartridge of Hi-Way Refineries, under the topic **What's New in Refining?**, traced the history of oil refining, and went on to discuss the plans for a projected new refinery to be erected in Saskatoon. This plant was to include a 1500 barrel per day straight-run unit and a 500 barrel per day cracking unit for refining crude from the new Alberta fields. The refinery was being designed and built by a firm of engineering contractors in the U.S.A.

A. B. Olsen of the Saskatchewan Power Corporation discussed his experience with **Oil Firing of Boilers** in the Saskatoon Plant. While being expensive to operate he felt that the use of oil in stand-by equipment was highly desirable.

❖ ❖ ❖

On March 31, 1949, the Saskatoon Section combined its Annual Meeting with a Smoker and drew an attendance of 35 members. Dr. D. L. Gibson of the University Dairying Department was the guest speaker on this occasion and he elaborated on the plans and projects for The New Soils and Dairy Laboratory at the University. A considerable amount of refrigeration was required for their work and they planned on using either Freon 12 or 22 as the refrigerant. Two five horsepower and two fifteen horsepower compressors were being installed. Some of their research work was to be in the fields of powdered milk, ice cream manufacture, domestication of foreign cheeses and preservation of dairy products in ration packs. Vern Friebel ably expressed the appreciation of the assembled engineers for a most informative and interesting talk.

The secretary, J. B. Mantle, then reported on the activities of the Section during the past year. This report showed that $117.00 had been expended during the past year in presenting seven meetings (average attendance 75) and other undertakings to increase the interest of students in the affairs of the Association and Institute. During the year 65 technical films were shown to engineering students during noon hours with an average attendance of 160. A special vote of thanks was given to student Bob Haid for his work in connection with these film showings. The number of undergraduates who were either student members of the Institute or the Association approached 250 at the time of the report. Elections of officers for the 1949-50 term resulted in W. R. Staples being returned as Secretary, and Walter Ball and A. B. Olsen assuming membership on the Programme Committee. Provision was made for the election of a student member to the programme committee at the first meeting in the Fall.

Sault Ste. Marie

N. Bachynski, Jr.E.I.C.
Secretary-Treasurer

The first meeting of the Sault Ste. Marie Branch for the 1949 season featured a dinner meeting at the Windsor Hotel on Friday, March 4th. The guest speaker, Mr. Ralph W. Stickney, welding engineer with the Canadian Welding Bureau presented an interesting paper on **The Purposes and Activities of The Canadian Welding Bureau.** Included in the audience were members of the Algoma Welding Society who attended the meeting as guests. The speaker was introduced by the chairman, D. C. Holgate.

Mr. Stickney said the prime purpose of the Canadian Welding Bureau is to set up welding standards in this country. The progress of welding depends on sound, safe welding and this can be obtained by applying accepted welding codes.

The speaker gave briefly the history of welding which led to the vital part it played in World War II. Large projects such as Mulberry Harbour, the construction of aircraft, tanks and ships, were cited as evidence of the increasing prominence being obtained by welding in the fabricating world.

In peace time, Mr. Stickney stated, with the growing industrial demands on welding, it is dangerous to have many trained in welding but few in the limits of welding. To overcome this undesirable condition fabricating firms should have: proper engineering; proper supervision; qualified operators; correct welding material and equipment; and suitable welding standards and procedures. Mr. Stickney concluded by emphasizing that the purpose of the Canadian Welding Bureau is to approve fabricating firms and to serve industry and welding in every possible manner.

The talk was followed by a discussion period and the speaker was thanked by Mr. C. Stenbol of the Algoma Steel Corporation.

Vancouver

Alan Fletcher Jr.E.I.C.
Secretary-Treasurer

Stuart A. Lefeaux, Jr.E.I.C.
Branch News Editor

On Tuesday, March 22nd members and friends of the Vancouver Branch were favoured with a talk on **The Principles and Practice of Materials Handling Equipment** given by Mr. A. F. Anjeskey at the Theatre Under the Stars Building auditorium. George Allan introduced Mr. Anjeskey, an electrical engineer, and general sales manager of the Cleveland Crane and Engineering Company, Tramrail Division.

The speaker assured his audience that he was not giving a sales talk on his product but wished to consider the subject from an engineer's point of view. Materials handling equipment is not essentially for labour saving but for "labour aiding"; heavy lifting by mechanical means and elimination of waste handling and waste space. The increase in production resulting from extensive use of handling equipment is a large factor in the keeping down of unit costs. Mr. Anjeskey gave many examples of the use of overhead installations in the paper and automotive industries; he criticized the railroads for not providing top-loading box cars for efficiency in loading and unloading.

Modern industrial and storage building plans should provide for overhead crane installations; warehouses should have floors capable of withstanding the heavy loads resulting from overhead handling and high stacking of materials.

Colonel Sherman, M.E.I.C., thanked the speaker for his most interesting treatment of the subject and all agreed the meeting was valuable to engineers interested in manufacturing or handling of materials.

❖ ❖ ❖

Members of the Vancouver Branch welcomed the opportunity of making a field trip to the MacMillan Industries Plywood Plant and the Canadian White Pine Sawmill on Wednesday, April 6th. Approximately forty members turned out for the complimentary luncheon at the plant cafeteria and afterwards divided into groups to inspect the plywood plant and sawmill.

The plywood plant, situated on the North Arm of the Fraser River, has 187,000 square feet of factory floor area and has a production rating of 120,000,000 square feet of ⅜-in. plywood annually and 35,000 plywood-faced Mono-dors monthly. The plant contains three lathe units or "peelers" capable of handling logs up to 8 ft. 6 in. diameter and 10 ft. 6 in. length with a speed of 400 lineal feet of veneer per minute. Transfer tables transport the veneer from lathes to clippers where the sheet is cut to selected size. The veneer passes through the dryers, patching, jointing and sorting to the presses where various thicknesses are assembled; panels are then trimmed and inspected before final sanding and packaging.

The sawmill is made up of three individual sawmill plants; "A" mill with band saw and Swedish gang saw unit for long-cutting and specialties, "B" mill with band saw for large diameter logs and "C" mill with Swedish and sash gang saws for small diameter logs. Steam for lumber dry kilns, plywood driers, and turbines is produced from "hogged" waste from the mills; average steam production is 100,000,000 pounds per month. Approximately one half of the total single-shift capacity of 10,000,000 board feet per month is planed for domestic and export production.

All members present expressed their appreciation for the hospitality of MacMillan Industries Limited, and professed a much better knowledge and understanding of lumber and plywood production. The hard-working chairman, George Allan, proved capable once again of providing a topic of great interest to members.

Victoria

D. A. MacLean, jr.e.i.c.
Secretary-Treasurer

T. A. J. Leach, m.e.i.c.
Branch News Editor

E. G. Oldham, Forester in charge of the recently created Parks Division, British Columbia Forest Service, gave an interesting talk on **Recreation in British Columbia** to the Victoria Branch at Prince Robert House on Friday, March 18.

The speaker reviewed the history of recreation.

Today the necessity for leisure has grown more important because more free time is available and the strain of modern life is great. In 1840 the majority of young men worked 72 hours a week while today the average working week is only 40 hours. The nature of work today is much more scientific and is concentrated into special lines with the result that work, generally, is more tiring mentally.

The setting aside of park areas for recreation in British Columbia dates back to the beginning of the century but it was not until 1934 that any vigorous effort was made to improve these park areas. At that time the Provincial Government started employing young men in a forestry training programme. This was continued until the outbreak of the war in 1939 when development came to a standstill.

Today, Mr. Oldham said, there are 10,808,120 acres in British Columbia devoted to recreational purposes and that most of these facilities were for people in the lower income brackets.

To encourage recreation within these parks, permits are granted for the building of homes and hunting lodges. To maintain the high standard, all building concessions are constructed and owned by the Government. They are, in turn, leased to individuals who operate them.

The long term planning of parks must take into consideration the population trend. For this purpose, reconnaissance surveys are made around the populated areas, and a master plan is evolved. Mr. Oldham pointed out that the State of New York park plan has been taken as a model, with certain modifications, for British Columbia.

Plans for 1949 programme include the building of jeep trails through the parks and the spending of $205,000 on the Mt. Seymour area.

Following his talk Mr. Oldham showed colored films of recreational spots in British Columbia.

The annual dinner dance of the Winnipeg Electrical Section. Above, the head table, left to right, C. V. Antenbring, branch chairman; Mrs. A. M. Thompson; Mrs. E. P. Fetherstonhaugh; Prof. J. A. Russell, the guest speaker; A. M. Thompson, Electrical Section chairman; Mrs. J. A. Russell; Dr. E. P. Fetherstonhaugh; Mrs. C. V. Antenbring.

Below: A general view of the meeting.

R. Bowering, Chairman, presided and a vote of thanks was moved by G. Irwin, which was heartily endorsed.

Winnipeg

G. W. Moule, m.e.i.c.
Secretary-Treasurer

Electrical Section

J. C. Pratt, m.e.i.c.
News Editor

The Annual Dinner and Dance of the Electrical Section was held on March 4. The guest speaker, Professor J. A. Russell, director of the School of Architecture and Fine Arts at the University of Manitoba spoke on the subject **Your Home Designed for Living.** Professor Russell was introduced by R. Noonan, Vice-Chairman of the Section, and following the talk which was very well received by both the ladies and gentlemen present, E. M. Scott moved a hearty vote of thanks to the speaker.

A. M. Thompson, Section Chairman presided. D. A. McCuaig and E. M. Scott were in capable charge of the arrangements.

❖ ❖ ❖

A. M. Thompson, recently elected chairman of the Electrical Section, has been transferred to the Montreal Office of the Canadian General Electric. R. Noonan, who was the Section's vice-chairman, has agreed to fill the vacancy.

At the April 7 meeting, the Electric Section had the pleasure of hearing W. A. Trott give a very stimulating talk on **Light as Radiant Energy.** The address covered the psychological and physiological effects of radiation on human and other forms of life. It pointed out that the effects caused by the action of "seeing" form only a small part of the total effects of radiant energy on the body.

Mr. Trott is vice-president of Lighting Materials Ltd., president of Geetee Ltd., and a partner in the firm of Greenlaw and Trott, consulting engineers.

PRELIMINARY NOTICE

of Applications for Admission and for Transfer

April 26th, 1949

The By-Laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate *

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described at the June meeting.

L. Austin Wright, General Secretary.

*The professional requirements are as follows:—

A **Member** shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the council. In every case a candidate for election shall have held a position of professional responsibility for at least two years. The occupancy of a chair as professor, assistant professor, associate professor or lecturer in a faculty of applied science or engineering, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the council shall be required to pass an examination as prescribed by council, on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged.

A **Junior** shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year, if the candidate for election has graduated from a school of engineering recognized by the council, in which case he shall not remain in the class of Junior beyond the end of the eighth year after graduation.

Every candidate who has not passed the examinations of the third year in a school of engineering recognized by council shall be required to pass an examination in engineering science as prescribed by council. He shall not remain in the class of Junior beyond age thirty.

A Junior may be transferred to Member without payment of transfer fee providing he makes application before the end of the seventh year after graduation or, if a non-graduate, before attaining age twenty-nine, and his application is approved by council.

Council may extend the above limits if in its opinion special circumstances warrant such extension.

A **Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the council or shall be required to write examinations as prescribed by the council.

He shall be:

a. pursuing a course of instruction in a school of engineering recognized by the council, in which case he shall be transferred to Junior automatically without payment of transfer fee in the second January after graduation, or

b. receiving a practical training in the profession in which case he shall be transferred to Junior without payment of transfer fee providing he makes application before attaining age twenty-five and his application is approved by council.

He shall not remain in the class of Student after he has attained the age of twenty-five, unless in the opinion of council special circumstances warrant the extension of this age limit.

An **Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ALEXANDER—ARTHUR FRANK, of Port Hope, Ont. Born at Saskatoon, Sask., Dec. 8, 1910. Educ. Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment.*

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER required by Pulp and Paper Mill in Quebec. Previous experience in the industry preferable but not essential. Salary open. Apply to File No. 1170-V.

CIVIL

GRADUATE CIVIL ENGINEER with some experience in structural steel required by firm engaged in the manufacture and sale of prefabricated steel structures. One man needed for liaison and co-ordinating the work between fabricators and design engineers and one for visiting clients in Quebec, with headquarters in Toronto. Salary depends on ability and experience with a minimum of $350.00. Apply to File No. 1168-V.

CIVIL ENGINEER, preferably bilingual required by well established firm of Engineers and Contractors located in Montreal. Applicant should have about five to ten years experience in engineering construction and estimation. Salary open. Apply to File No. 1174-V.

MECHANICAL

MECHANICAL ENGINEERS with 3-5 years experience in mechanical design and general plant engineering, as well as field work required by firm in Quebec. Salary open. Apply to File No. 1001-V.

GRADUATE ENGINEER, preferably with mechanical background and sales experience required by large well known firm as Representative for a Distributor of pneumatic material-handling equipment. Principal contacts will be in cement, heavy chemical, food, pulp and paper, brewing and aluminum industries. Salary open. Apply to File No. 1158-V.

MECHANICAL ENGINEER required to take over complete operations of machine shop, foundry and pattern shop in Province of Quebec. Must be bilingual. Salary open. Apply to File No. 1169-V.

SENIOR MECHANICAL DRAUGHTSMAN, thoroughly experienced in machine design with some background and knowledge of material handling equipment. Salary open. Apply to File No. 1171-V.

MINING

MINING ENGINEERS for design and layout work also some field work required by firm in Province of Quebec. Salary open. Apply to File No. 1001-V.

MISCELLANEOUS

MECHANICAL OR ELECTRICAL ENGINEER required as assistant to mechanical superintendent in large eastern Canadian brewery. Duties will include assisting supervision of maintenance and installation of pumps, motors, steam boilers and refrigeration system, etc. This is a junior position, so no experience is required. Salary open. Apply to File No. 1154-V.

SENIOR TOOL DESIGNERS required in Toronto. Should have not less than ten years experience in general tool designing in addition to a basic training of three to five years at tool and jig making. Experience in tooling for the automotive or aero-engine production industry an asset. Salary open. Apply to File No. 1160-V.

PROFESSOR AND CHAIRMAN of the Dept. of Electrical Engineering required by University of Manitoba. Position becomes vacant September 1st, 1949. Salary will depend on candidates qualifications. Apply to File No. 1162-V.

GRADUATE ENGINEER required for a new plant being built in the Maritimes. Duties include installation of machinery also operation of plant. Applicant should have general engineering experience knowledge of steam, electricity and a certain amount of chemistry training, although the latter is not essential. He could be trained in this part after the plant operates. Salary open. Apply to File No. 1163-V.

CHIEF DESIGN ENGINEER, capable of taking care of and being responsible for all drawing office work in a modern West Coast pulp and paper mill. Applicant must have a minimum of five years responsible design practice in pulp and paper work. Salary open. Apply to File No. 1164-V.

SALES ENGINEER, mechanical background required in Montreal. Must have knowledge of heating, ventilating and pumps. Salary open. Apply to File No. 1165-V.

RECENT GRADUATE required, familiar with or interested in design and testing of centrifugal reciprocating power and direct acting steam pump of all types. Position located in Ontario. Salary open. Apply to File No. 1166-V.

GRADUATE ENGINEER preferably electrical or mechanical background required by large industrial plant as maintenance engineer. Duties include responsibilties of all maintenance work also setting up and maintaining lubrication and inspection schedules. Salary open. Apply to File No. 1167-V.

SALES ENGINEER required for the Montreal district to represent a reputable conveyor company manufacturing in the Province of Ontario. Conveyor experience is desirable but not strictly necessary but engineering background essential. Remuneration would be on a commission basis with excellent possibilities. Apply to File No. 1172-V.

TWO experienced bilingual men required for approximately 18 months work in French Morocco under excellent conditions. One with structural design, field and instrument experience and one with adequate practical experience and capacity for Construction foreman opening. Salaries $350 to $550 per month. Apply to File No. 1175-V.

MECHANICAL SALES ENGINEER, age 30 to 40 years with executive ability required by old-established firm in Montreal. Good opportunity for an aggressive salesman to expand the present contacts and to create new fields. Knowledge of French an asset. Salary open. Apply to File No. 1176-V.

The following advertisements are reprinted from last month's Journal, having not yet been filled.

CHEMICAL

CHEMICAL ENGINEER OR CHEMIST recent Ph.D. or equivalent with good background in organic chemistry preferable along the lines of wood and cellulose chemistry and fuels technology. Applicant needs capacity for contacting plant personnel and appreciation of engineering phases of problems. Position in British Columbia. Salary open. Apply to File No. 1118-V.

CHEMICAL ENGINEER recent graduate, required for position in technical department of a paper manufacturer in Eastern Ontario. Salary open. Apply to File No. 1122-V.

CHEMICAL ENGINEER required as plant chemist by large newsprint mill. Preferably four to six years in the pulp and paper industry in chemical and control departments. Salary open. Apply to File No. 1131-V.

CIVIL

CIVIL ENGINEERS, required by public utility in Toronto. Must have at least five years experience in design of steel structure on power developments. Salary open. Apply to File No. 1109-V.

CIVIL ENGINEER with a least 2 years practical experience required by a large inter-municipal Corporation in Western Canada. Under supervision and direction applicant must be able to assist and perform technical engineering work, prepare plans, perform field duties in connection with the construction and maintenance of simple structures, to install equipment, supervise and direct small groups of men. Salary $235 up. Apply to File No. 1144-V.

CIVIL ENGINEER, 25 to 30 years of age, preferably veteran with some experience in construction field. Duties and future would lie in supervision and later some administration. Position offers long term security, pension, etc., and reasonable advancement with merit. Salary open. Apply to File No. 1149-V.

JUNIOR CIVIL ENGINEER preferably with some experience in construction work required in Alberta by company starting the construction of a new hospital. Salary open. Apply to File No. 1152-V.

ELECTRICAL

ELECTRICAL ENGINEERS required by public utility in Toronto. Must be experienced in communications preferably a specialist in radio and frequency modulation, also knowledge of power and telephone line carriers required. Salary open. Apply to File 1109-V.

ELECTRICAL ENGINEERS, experienced in the maintenance of power meters and relay protection schemes, also men experienced in installation of large rotating electrical machines, high voltage and low voltage switch gear. Manufactures test, experience preferred. Positions with public utility in Toronto. Salaries open. Apply to File No. 1109-V.

ELECTRICAL ENGINEERS required by public utility in Toronto. Must have the following experience: Design layout and estimates for medium and large, low voltage and high voltage substations or design and construction of transmission and distribution lines. Salary open. Apply to File No. 1109-V.

ELECTRICAL ENGINEER for sale of electrical and allied machinery in Southern Alberta to open branch office in Calgary. Must have trade contacts and interests in firm can be purchased by a proven suitable man. Apply to File No. 1123-V.

SENIOR ELECTRICAL DRAUGHTSMAN required in Toronto. Must have considerable experience on generating and substation layouts. Salary open. Apply to File No. 1137-V.

ELECTRICAL ENGINEER required by city in Western Canada. Duties will primarily be concerned with designing of all new electrical work for any city department also inspecting and checking existing installations. Work will be under the supervision of the Superintendent and the Assistant Superintendent. Salary $250 to $300 per month. Apply to File No. 1143-V.

GRADUATE COMMUNICATION ENGINEERS, Canadian citizens, interested in audio, radio and video frequency systems engineering. Salaries up to $350 per month depending on qualifications, location Montreal. Apply to File No. 1147-V.

ELECTRICAL ENGINEER, who could be responsible for operation and maintenance of electricity, air conditioning and instrument systems for large, modern industrial plant in Eastern Ontario. Electrical trades experience is essential but training would be provided on air conditioning and instrument work. Apply to File No. 1155-V.

MECHANICAL

MECHANICAL ENGINEER, required as Service Promotion Man for Export Division of large National Organization. Must have good technical background and service experience in the automotive industry. Responsibilities include writing and editing promotion material, policies, bulletins and effective letters. Salary open. Apply to File No. 1110-V.

MECHANICAL ENGINEER recent graduate required as sale Engineer by a firm of Power House and Dust Collection Specialties. Job located in Ontario and training period in Montreal. Salary $250. Apply to File No. 1126-V.

METALLURGICAL

METALLURGICAL ENGINEER required by large metallurgical firm in the Maritimes. Good opportunity for advancement in research, development and production. Salary open. Apply to File No. 1106-V.

MISCELLANEOUS

COMBUSTION ENGINEER, wanted by large industry near Montreal. Must be capable of taking charge of high pressure boilers, turbo generators and boiler house personnel. Permanent position and good salary. Apply to File No. 1105-V.

GRADUATE ENGINEERS interested in applied research in inorganic physical chemistry required for research laboratory of Montreal firm. Applicants should have from two to five years experience. Salary open. Apply to File No. 1107-V.

ELECTRICAL OR MECHANICAL ENGINEERS, with experience in electrical, industrial and commercial equipment and domestic appliances for frequency conversion program. Position with public utility in Toronto. Salary open. Apply to File No. 1109-V.

GRADUATE ENGINEER, preferably with 6 to 10 years postgraduate experience to act as field representative of Technical Information Service, N.R.C. in Toronto. As the work involves personal visits to industrial firms personally-owned car is essential. Apply to File No. 1115-V.

GENERAL MANAGER required for Saskatchewan Power Commission. Position requires full responsibility and authority for all operations. Principal requirements, administrative, engineering or other technical experience in power operation very desirable. Salary open. Apply to File No. 1117-V.

ASSISTANT CITY ENGINEER required for city of Calgary, Alberta. Applicant must have executive ability and preferably experience in Municipal work covering sewers, sewage disposal, streets, paving, sidewalks, bridges, building construction and town planning. Salary range $3,500 to $4,500. Apply to File No. 1125-V.

CIVIL OR MECHANICAL ENGINEERS required for openings in connection with construction of new refinery being built at Montreal East, preferably some experience in heavy chemical industry, also junior vacancies. Salaries open. Apply to File No. 1128-V.

JUNIOR SALES ENGINEER, preferably mechanical background, required in Montreal by large industrial firm. Preferably with a couple of years experience and the desire to get into sales work. Salary $250. Apply to File No. 1130-V.

JUNIOR ENGINEER required by American Company for their three factories located in Canada. Duties include supervision of office routine order supplies, etc. Knowledge of French and English would be an advantage. Salary open. Apply to File No. 1132-V.

DRAUGHTSMAN with five to ten years' experience in plant layout material handling equipment and some structural required by an electro-metallurgical plant located in Northern Ontario city. Salary open. Apply to File No. 1139-V.

MANAGER OF MANUFACTURING required by Canadian mill producing 600 tons per day of specialty papers, tissues, paperboard and newsprint. Position requires proven managerial ability and technical qualifications for the production of paper. Location most desirable and salary attractive. Apply to File No. 1140-V.

DESIGNING AND STRUCTURAL ENGINEERS required by Provincial Government West Coast. Duties include designing and preparation of plans of bridges, ferries, wharf structures, etc., in timber, steel or concrete. Preferably with experience in bridge design and construction. Salary $3,504 rising to $4,104 per annum. Apply to File No. 1142-V.

CIVIL OR SANITARY ENGINEER, with a number of years experience required by a large inter-municipal Corporation in Western Canada. Must be able to assume responsibility in design, detailing, estimating, preparing specifications, to layout and supervise the construction repairs and maintenance of a sewerage collection system and treatment plant. Salary $325 per month up. Apply to File No. 1144-V.

SUPERINTENDING ENGINEER for Eastern University to take charge of physical plant maintenance and help plan the building program. Salary from $350. Apply to File No. 1145-V.

SALES ENGINEERS required by control equipment manufacturer, one man needed for industrial sales and one with background in heating and ventilating. Headquarters in Montreal. Salaries open. Apply to File No. 1146-V.

TOWN ENGINEER required by town in Ontario. Duties include supervision of Board of Works as well as complete charge of municipal, electrical water and telephone department projects. Salary open. Apply to File No. 1150-V.

CHIEF ENGINEER required by large public utility system in Eastern Ontario. Applicants must have had experience in the operation and design of electric or waterworks systems. Salary open. Apply to File No. 1151-V.

ASSOCIATE PROFESSOR in organic Chemistry and fuels Technology. Duties will be to teach a first course in Organic Chemistry to junior students, a course in Organic Unit Processes in the senior year, and such other work as may be assigned. Special emphasis will be given to Chemical Utilizations of Solid and Liquid Fuels, including gasification, hydrogenation, etc. Apply to File No. 1156-V.

ASSISTANT PROFESSOR of Mineral Engineering. Duties will be to instruct in Mineralogy and Mineral Dressing with special reference to coal and the industrial minerals, and they will include operation of the mineral dressing laboratories for commercial testing of ores and processes. Apply to File No. 1156-V.

DRAUGHTSMEN, required by G.E.G. Switchgear Department, Engineering Works, Witton, Birmingham, 6, England. Must have good experience in any class of switchgear design or layout. Permanency and good opportunities for capable men. Apply, stating age, experience and technical qualifications to File No. 1157-V.

AERODYNAMICIST capable of carrying out performance and stability calculations for initial design. Permanent position with good prospects, in Montreal area. Salary open. Apply to File No. 1159-V.

Partner Wanted

ACTIVE PARTNERSHIP desired with a firm of General Building Contractors located in Montreal or would be interested in forming new company with one or more construction engineers. Advertiser has capital and 20 years of construction experience. For additional information. Apply in confidence to File No. 2138-W.

PARTNER, wanted by engineer with 25 years experience, contemplating private practice. Must have necessary qualifications; previous experience with consulting engineer desirable. Apply to File No. 2642-W.

GRADUATE CIVIL ENGINEER, Jr.E.I.C., age 33, 11 years engineering experience in mining, all types surveying, airport and highway construction, building construction, sewage and water works office administration and mechanical experience in pulp and paper industry for past 3 years. Would like to contact parties or company interested in consulting engineering or construction with view to partnership, junior or otherwise. Wanted location in west, preferably Edmonton. Apply to File No. 2792-W.

Situations Wanted

MECHANICAL GRADUATE, M.E.I.C., University of Toronto, Canadian citizen, experience in Canada and abroad, knowledge of several languages. Desires contacts in view of changing the actual line of work with better salary. 37 years old, married with small family. Great practical and theoretical knowledge in Thermodynamics, Hydraulics, Aircraft and Furniture making and Finishing also all systems of Production Control. Minimum salary accepted $7,000 a year Apply to File No. 140-W.

MECHANICAL AND CIVIL ENGINEER, M.E.I.C., Queen's, age 49. 5 years hydro-electric power development construction, 1 year industrial building construction, 2 years sales engineer and estimator architectural iron works concern, 14 years oil refinery on initial construction, on operations and maintenance, last 6 years refinery engineer in charge of maintenance, safety, equipment inspection, design and construction of plant changes and extensions.

Engineering Publicity

Wanted for large Mantreol engineering cancern, assistant to Sales Development Manager far wark an baoklets, advertisements, editarial articles, etc. Some engineering background is essential. Experience in writing or publicity is desirable. This is a positian offering interesting work, good prospects and gaad salary far the right man. File No. 1178-V.

industrial buildings. Resigned to undertake private venture. Desires to re-enter industry. Apply to File No. 166-W.

MECHANICAL AND ELECTRICAL, M.E.I.C., P.ENG. (Ont.). Age 41. Single. Overseas 1940 with R.C.E., followed by 7 years as Technical Staff Officer, British Army, on Research and Development, including period as Head of Technical Intelligence Mission to Austria. Vickers Plant Course followed by 13 years Canadian experience including Telephone Plant; Automobile; Electrical Power Apparatus and Wire and Cable; Design and Manufacture Electric Cranes, Foundry Equipment Diesel Engines and other Heavy Engineering Products. Intimate knowledge British Ministry of Supply and Engineering Industry, Pre- and Post-War knowledge of all Europe, particularly Belgium, Switzerland, Austria and Czech-Slovakia. Interested in European position for Canadian or U.S. firm or Administrative Engineering Post in Canada. Apply to File No. 415-W.

MECHANICAL ENGINEER, age 39, experienced in tool design and production methods, material selection, production records, control and co-ordination. Desires employment preferably in Montreal with either manufacturer or firm of Engineers who could utilize all or a part of above experience. Apply to File No. 551-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. (E.E.) Manitoba 1943. Age 27. Married. Electrical experience with R.C. Signals and 2½ years general electrical experience in industry. Sales training. Presently employed but desires position offering wider scope and opportunity. Preferably Montreal area. Apply to File No. 925-W.

PRODUCTION ENGINEER, M.E.I.C., P. ENG., McGill '33 (Electrical). Married. Extensive knowledge business organization and management. Accustomed to conferring with top Executives. Broad experience includes sales, plant organization and management, interpretation and use financial reports and plant operating statements, budgetary control, production plannings, cost development and control, method improvements, plant layout and general engineering. Desires permanent association, offering good future possibilities, with well established manufacturing or sales organization. Available on reasonable notice. Apply to File No. 1186-W.

MINING GRADATE, M.E.I.C., with 20 years experience in mine operation and development, and associated construction etc., desires permanent connection with senior responsibility; Ontario location preferred. Apply to File No. 1252-W.

MECHANICAL ENGINEER, M.E.I.C., McGill 1940. Age 33. Married. Experienced in plant and canal construction; shop work and shop management, cost estimating and control, aircraft maintenance and design. Previous positions include company chief inspector and assistant superintendent. Seeking responsible position in Montreal area. Available three weeks' notice. Apply to File No. 1586-W.

MECHANICAL ENGINEER, Jr.E.I.C., McGill, 1943, age 28, married with small family. Practical experience in machine shop, draughting, assembly and tool room work. 2½ years Engineer Officer Royal Canadian Navy, operation and maintenance of marine engines and auxiliaries. 3½ years production engineering, plant layout, manufacturing methods, etc. Knowledge of cost accounting and industrial management. Desires position in production, sales or maintenance. Available on short notice. Apply to File No. 1592-W.

CIVIL ENGINEER, M.E.I.C., age 41, interested in position as Project Manager or Chief Engineer. Sixteen years of experience in field and office covering design and construction of large building projects, surveys, bridges, roads, dams, and particularly Hydro Electric power projects. Capable of taking complete charge of design and construction. Apply to File No. 1751-W.

INDUSTRIAL AND CIVIL ENGINEER, M.E.I.C., P.Eng., Que. B.A.Sc. Age 40. Married. Fluently bilingual. Seeks position as Industrial Engineer, Executive Sales Engineer, Town Engineer, experience in motion and time study, methods, process, development, production control, costing, plant maintenance, highway engineering, municipal engineering, sales. Available on short notice. Apply to File No. 2157-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., University of Sask. 1940, age 32, married. Continuous employment in engineering field since graduation. Experience includes design office and field work on construction, structural and mechanical plant engineering, maintenance and project engineering, production control, cost estimating and control. Seeking responsible position with future, preferably in Montreal area (Home). Available shortly. Apply to File 2219-W.

GRADUATE ENGINEER, M.E.I.C., McGill Chemical engineering 1935. Six years experience in plant operation, four years in the R.C.A.F., aeronautical engineering and four years in business and industrial consulting. Desire responsible position in Quebec or Ontario. Apply to File No. 2228-W.

MECHANICAL INDUSTRIAL ENGINEER, Jr.E.I.C., leaving for Europe in near future. Will undertake missions of technical or other nature. Research, executive, service or sales works. Bilingual, age 27, good appearance, broad experience. Apply to File No. 2338-W.

CIVIL ENGINEER, M.E.I.C., '33, D.L.S., railway, mining, government and construction experience. Not averse to some travelling. Opportunity to advance lacking in present position. Married. Age 37. Available one month's notice. Full details of qualifications on application. Apply to File No. 2460-W.

INDUSTRIAL-MECHANICAL ENGINEER, Jr.E.I.C., P.Eng. Ont., B.A.Sc. Married. Age 29. Desires position requiring more responsibility and initiative in paper, lumber or allied industry or consulting industrial firm preferably on west coast or southern Ontario. Officer veteran. Experience in production control, cost analyses, plant and production layouts, work simplification, material handling, motion and time study, incentive systems. Now completing Business methods course. Apply to File No. 2794-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.E.Q., with seven years intensive work with large pulp and paper mill, construction, maintenance, estimate, layouts, process development, time study, etc., also experience in public work-management; water, sewer, electric system generation, transmission and distribution with full responsibilities of design and work, etc. Services available at short notice. Age 32. Married and bilingual. Apply to File No. 2823-W.

CHEMICAL - METALLURGICAL ENGINEER, M.E.I.C., McGill. Age 43. Eighteen years experience in process development and operation, covering ore beneficiation (metallic and non-metallic), ferrous metallurgy, inorganic chemical processing. Positions held largely management. Familiar with determining suitable plant location and layout, equipment design and specification, process simplification, control and operation. Desires connection with progressive firm as manager of promising venture. Presently engaged. Minimum salary $6,000. Apply to File No. 2831-W.

MECHANICAL AND INDUSTRIAL ENGINEER, Jr.E.I.C., McGill '44. 7 years industrial experience. Welding application and metallurgy, production supervision, production specifications, purchasing, wage incentives, time study, estimating, costing, design. Available 4 weeks notice. Apply to File No. 2920-W.

GRADUATE MECHANICAL ENGINEER, A.M.I.M.E., fully qualified, age 34, educated on the continent and in England with extensive experience in layout, design and manufacture of handling machinery requires post with expanding organization. Available shortly. Apply to File No. 3021-W.

RESEARCH PROBLEM WANTED: Three students working for degree of Master of Chemical Engineering who will be working in Montreal this summer on experimental portions of their thesis desire an additional problem in Applied Unit Operations to be completed on a co-operative basis to help finance studies. Apply to File No. 3049-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng.Q., G.I., Mechanical E., A.M.I. Loco., E., (Great Britain). Aged 30. Married. 6 years locomotive design and construction, machine shop production and assembly. 5½ years Engineer Officer, Royal Air Force—rank Squadron Leader, Chief Technical Officer. Employed 2 years in Province of Quebec. Desires change to position with more responsibility and opportunity for advancement. Preferably Southern Ontario and Western Canada. Apply to File No. 3059-W.

SALES ENGINEER, M.E.I.C., retired Naval Officer. Mechanical and electrical background. Experienced in sales and running branch office. Four years with wartime shipbuilding, 2 years with War Assets Corporation in technical and executive capacity. At present in marine and engineering supply sales. Interested in permanent position in Montreal area. Apply to File No. 3081-W.

CIVIL ENGINEER, S.E.I.C., E.I.T. (B.Sc. Alta.), age 29. Married. Presently employed in construction supervision design and estimating. Experienced in highway and municipal works, surveys and layout. Four and one-half years overseas artillery survey experience. Desires a permanent position with a consultant or other engineering firm in Western Canada. No objection to travel in connection with field work. Available on reasonable notice to present employer. Apply to File No. 3106-W.

MECHANICAL ENGINEER, M.E.I.C., age 35, married, excellent health. Four years practical mining experience, three years woods operations. Presently employed in woods mechanization program. Three years army experience, automotive repair and maintenance. Desires work in maintenance, or sales and supervision of field installations, testing and making estimates. Apply to File No. 3115-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng., (McGill) 1944. Married, 26 years of age, one child. Army service in R.C. Signals. Post-graduate training in Radio Physics at the University of Western Ontario. At present employed as Assistant Professor of Physics at a Maritime University. Interested in research or development in radio, electronics or allied fields. Preferably Montreal or Ottawa area. Apply to File No. 3127-W.

CIVIL ENGINEERING STUDENT, S.E.I.C., Toronto, veteran, age 27, married, graduating this spring, desires employment commencing about May 1st. Will consider anything, but primarily interested in reinforced concrete and structural steel design work in Southern Ontario. Apply to File No. 3128-W.

CIVIL ENGINEERING STUDENT, S.E.I.C., graduating in May, 1949, from University of British Columbia. Age 23, married, veteran. Experience limited to survey work. Desires experience with a consultant or with large design and construction company. Available after May 15, 1949. Apply to File No. 3129-W.

GRADUATE ENGINEER, age 32 married, desires position leading to increased responsibility in railway or its equipment field. B.Sc. Eng. (Electrical) University of Manitoba (44), two years engineer officer Royal Canadian Navy operating and repair of steam turbines and diesel electric generators, nine years railway machine shop, one year detail and design of welded pressure vessels, steam generators, desuporheaters, one winter a lecturer in Mechanical Engineering, one year in railway signal engineering on signal layout, installation, circuit design. Apply to File No. 3130-W.

MECHANICAL ENGINEER, Saskatchewan, 1946, Jr.E.I.C., married, age 25. Presently located in Winnipeg area, desires permanent position in industrial plant engineering. Experience includes teaching, construction, sales, equipment design and installation. Available May 1. Apply to File No. 3131-W.

EXECUTIVE. M.E.I.C., B.A.Sc., P.Eng. Wide managerial exeperience in all phases of development, production, sales, organization, cost control. Age 39. Married, family. Willing to consider position with established concern requiring senior executive. Apply to File No. 3138-W.

MECHANICAL ENGINEER, Jr.E.I.C., (B.Eng., McGill, '47), one year experience in design and draughting and some construction work. Presently completing professional course in Industrial Relations. Interested in becoming established with industrial firm to do study work, job evaluation, wage incentive plans, personnel supervision, etc., where background of engineering could be useful. Some knowledge of French. Area of Ontario, Quebec or B.C. Available on month's notice. Apply to File No. 3149-W.

ELECTRICAL ENGINEER, S.E.I.C., B.A.Sc., (E.E.), U.B.C. 49. Married, age 33, Electrical experience with R.C. Signals (overseas 6 yrs.). Desire employment in power or electronics. Available May 1, 1949. Apply to File No. 3154-W.

ELECTRICAL ENGINEER, M.E.I.C., I.E.G., Prof. Eng. Quebec. Age 35. Several languages spoken fluenty. Married, no children. Extensive practical experience in plant maintenance and trouble shooting, seeks resident position with industrial firm; available at short notice. No objection to go to country. Apply to File No. 3155-W.

ELECTRICAL ENGINEER, S.E.I.C., recent graduate of Nova Scotia Technical College, married, five summers' pre-graduation experience plant electrical maintenance, desires employment in Montreal area, preferably in design, testing, or small-scale production of electronic or communications equipment. Apply to File No. 3156-W.

GRADUATE MECHANICAL ENGINEER, Jr.E.I.C., Canadian, 29 years of age, married, one child. Seven years varied experience mostly with one employer, in general machine-shop, foundry, drafting, process and mining industries. At present assistant mechanical superintendent of mining concern in South America. Returning to Canada in June. Desire position, preferably in Canada or the U.S.A. Apply to File No. 3157-W.

ELECTRICAL ENGINEER, S.E.I.C., S.A.I.E.E., age 23, married, B.Sc. '48 from University of New Brunswick, at present taking one year post graduate work at the University of London on Beaverbrook Overseas Scholarship. Summer vacations spent in the Power & Paper Industry. Returning to Canada early in September. Apply to File No. 3161-W.

GRADUATE ENGINEER, M.E.I.C., with broad administrative experience in manufacturing. Responsibilities have included development of national sales organization, planning of national advertising campaign, purchasing for light metal manufacturing plant, product promotion and development, patents and cost accounting. Youthful, aggressive, dependable and loyal. Widely travelled. Complete personal file available. Apply to File No. 3162-W.

GRADUATE MECHANICAL ENGINEER (McGill), M.E.I.C., P.Eng. Que., married, bilingual, five years sales experience in heavy plant and contracting equipment in Province of Quebec. Responsibilities include sales promotion, sales engineering in regards to steam and electrical equipment and pumps, supervision of installations and recommended maintenance schedules. Some experience in electrical installations, welding and surveying. Desires position of responsibility with progressive firm, not necessarily in sales. No locality preference. Presently employed. Apply to File No. 3163-W.

Attention, Members

Please telephone in advance and make an appointment if you propose using the Institute's Employment Department. This will result in a better service to everyone concerned.

TELEPHONE PLATEAU 5078

Except in special cases all interviews will be arranged between the hours of 9 and 12.

MECHANICAL ENGINEER, M.E.I.C., McGill 1942, age 28 presently engaged a design, sales and construction enginee with small company manufacturing an installing heavy industrial machinery demand for which is falling off due t heavy oil production. Has had experience, R.C.E.M.E. Overseas, steel de signing and detailing. Would conside any employment offering interestin problems, responsibility and future pro motion. Apply to File No. 3164-W.

MECHANICAL ENGINEER, S.E.I.C. P.Eng. Ont., Toronto 48, married, family, age 35. 7 years drafting, shop experience. 1 year design engineer, in pulp and paper line and heavy industrial equipment. Interested in plant en gineering or design, desires permanen position with responsibility. Apply t File No. 3180-W.

CIVIL ENGINEERING STUDENT, S.E.I.C wants permanent position. Graduating May, 1949 from the University of New Brunswick, Veteran R.C.A.F., navigator married, 3 children. Position preference are with a consulting engineer or some company doing inspecting and supervising work on construction. Apply t File No. 3182-W.

CHEMICAL ENGINEER, S.E.I.C., (Laval '49), B.A.Sc., P.Eng. Age 23. Single Experienced in woodcutting operations galvanizing mill, coal carbonization, re covery and refining of coal by-products Desirous of obtaining a position with an engineering consulting firm dealing with chemical engineering problems (e.g. chemical plants, installation o heating systems, air conditioning, etc.) Would also consider engineering work with a well established company, preferably in the province of Quebec Available June 1st, 1949. Apply to File No. 3183-W.

RECENT GRADUATE, S.E.I.C., single age 24, veteran. Now completing post-graduate study in Mechanical Engineering at Princeton University. Objective of this post-graduate work has been to develop as thorough a background as possible for manufacturing and industrial administration. At present working on the thesis in quality control. Interested in any type of opening that will be available in June. Apply to File No 3186-W.

STUDENT, S.E.I.C., in 4th year Mechanical Engineering, U. of S., graduating this spring, desires a position with the Petroleum Industry. Experience includes survey work, petroleum sales drilling and testing oil wells, and radar technician with the R.C.A.F. In excellent health, 26 years of age, married Apply to File No. 3187-W.

MECHANICAL AND ELECTRICAL ENGINEER, M.Sc., A.M.I.E.E., married, age 30. Also holds honours degree in physic and has good knowledge of mathematics. Desires position where these qualifications would be of value, probably in development, design or research and preferably in the field of mechanical engineering. Experience includes five years in the technical branch of the R.A.F. and eighteen months as mechanical engineer in large industrial concern. Apply to File No. 3188-W.

ELECTRICAL ENGINEERING STUDENT S.E.I.C., graduating this spring from U.N.B. Veteran, age 27, married. 2 children. 4 years with R.C.A.F. signals radar, summer 1948 with National Research Council in microwave laboratory. Entering McGill September 1948 for post graduate work in communications. Desires position in or near Montreal for summer — Good references available. Apply to File No. 3190-W.

BOOK REVIEW

CORROSION HANDBOOK:

H. H. Uhlig, editor; sponsored by The Electrochemical Society, Inc., New York, Wiley; London, Chapman and Hall, 1948. 1188 pp., illus., 9¼ x 6 in., cloth $12.00.

Reviewed by C. M. Carmichael*.

The Corrosion Handbook as edited by Dr. Uhlig is the most comprehensive book of its kind published. There has long been a need for an authentic book on corrosion and methods of overcoming it. In producing this book, Dr. Uhlig has had the co-operation of 102 scientists and engineers, each one an acknowledged authority in his particular field.

Some of the data has never been published before, while a great deal of the other material has been published in various articles and publications, but this volume presents the subject matter in concise form, readily found for practical use.

The prestige of the contributors inspires the reader to accept as accurate the data to the extent of its development. The development of the subject, however, is still in its infancy, and further research will doubtless be one of the fruits of this excellent book.

It is impossible to review all the many subjects treated in this volume of over 1100 pages, but the arrangement of the data is so well indexed that any particular subject will be readily found even by those making their first acquaintance with this subject.

Engineers whose activities include specifying of materials subject to corrosion should have and use this work.

Vice-President, Stainless Steel Division, Shawinigan Chemicals Ltd., Montreal, P.Q.

ABSTRACTS

INSTITUTION OF ELECTRICAL ENGINEERS. PAPERS:

Small Power Transformers for Aircraft Electrical Equipments, *A. Langley Morris.*

Transformer design and constructional features are presented with a view of obtaining the smallest possible transformer for a given rating. A design for a 500 V.A. 1600 cycle transformer is given in the appendix.

Some notes on the Design of H.V. Transmission Lines with Special Reference to Indian Conditions, *A. F. Coventry.*

Deals with design conditions for overhead lines in India. Discusses choice of conductor size and voltage for long primary lines. The performances o. three examples of long H.V. transmission lines, as calculated by rigorous methods, are tabulated in order to show that the assumptions which have been made in arriving at the simple formulae which are used to calculate natural power and the distance it can be transmitted for given power loss, are sufficiently close for all practical purposes.

ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Canadian Master Tax Guide for 1948 Returns and 1949 Policy Based upon the Income Tax Act, Income War Tax Act, 4th ed:

CCH Canadian Limited, Toronto, Montreal, 1949. 222 p., illus.

Centennial History of the Pennsylvania Railroad Company, 1846-1946:

G. H. Burgess and M. C. Kennedy. Philadelphia, Pennsylvania Railroad Company, 1949. 835 p., illus., cloth.

Civil Engineer in War; a Symposium of Papers on War-time Engineering Problems:

Institution of Civil Engineers, London, 1948. 3 vols., illus., paper.

Engineer in Industry:

E. H. Schell. Montreal, Association des Diplômés de Polytechnique, 1948. 48 p., illus., paper.

Engineering Laminates:

A. G. H. Dietz, editor. New York, Wiley; London, Chapman and Hall, 1949. 797 p., illus., cloth.

Engineering with Rubber:

W. E. Burton and the B. F. Goodrich Company. New York, Toronto, London; McGraw-Hill, 1949. 486 p., illus., cloth.

Fluid Mechanics, 2nd ed:

R. C. Binder. New York, Prentice-Hall, 1949. 361 p., illus., cloth.

Introduction to Chemical Science, 2nd ed:

W. H. Hatcher. New York, Wiley; London, Chapman and Hall, 1949., 449 p., illus., cloth.

Lampes à Eclairs Lumière Blanche et leurs Applications:

Marcel Laporte. Paris, Gauthier-Villars, 1949. 90 p., illus., paper.

Long Sault Rapids, St. Lawrence River; an Enquiry into the Constitutional and other Aspects of the Project to develop Power therefrom:

A. V. White. Ottawa, Commission of Conservation, Committee on Waters and Water-Powers, 1913. 384 p., illus., cloth.

Metal Working and Heat-Treatment Manual, Volume 3—Surface Hardening Processes:

F. Johnson. London, Elek, 1949. 185 p., illus., cloth.

Molybdenum; Steels, Irons, Alloys:

R. S. Archer, J. Z. Briggs, C. M. Loeb, Jr. New York, Climax Molybdenum Company, 1948. 391 p., illus., cloth.

Notes on Soldering:

W. R. Lewis. Greenford, Middlesex; Tin Research Institute, 1948. 88 p., illus., paper.

Patent Law for Lawyers, Students, Chemists, and Engineers, 2nd ed:

C. H. Biesterfeld. New York, Wiley; London, Chapman and Hall, 1949. 261 p., cloth.

Railway and other Steamers:

C. L. D. Duckworth and G. E. Langmuir. Glasgow, Shipping Histories Ltd., 1948. 340 p., illus., cloth.

LIBRARY REGULATIONS

Hours

	Oct.-May	June-Sept.
Mon.-Fri.	9–6	9–5
Thurs. (Oct.-Mar.)	9–8	9–5
Sat. (closed Jy.-Aug.)	9–12	9–12

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

Rayonnement, Photométrie et Eclairage:

Merry Cohu. Paris, Gauthier-Villars, 1949. 398 p., illus., paper.

Science and Engineering of Nuclear Power, Volume 2:

Clark Goodman, editor. Cambridge, Mass., Addison-Wesley, 1949. 317 p., illus., cloth.

Telephony: a Detailed Exposition of the Telephone Exchange Systems of the British Post Office, Volume 1:

J. Atkinson. London, Pitman, 1948. 513 p., illus., cloth.

Trade-Marks:

H. Bennett. Brooklyn, Chemical Publishing Co., 1949. 479 p., illus., cloth.

PROCEEDINGS, TRANSACTIONS, ANNUALS, ETC.

American Society for Engineering Education. Engineering College Research Council:

Proceedings of the Annual Meeting, 1948.

Canada 1949: Official Handbook of Present Conditions and Recent Progress:

Dominion Bureau of Statistics, Ottawa, 1949.

Canada. Dominion Water and Power Bureau:

Water-Power Resources of Canada, 1948.

Consulting Engineer Year Book 1949:

Princes Press Ltd., London, 1949.

Engineering Foundation:

Annual Report, October 1, 1947 to September 30, 1948.

Kelvin Medal, 1947:

Report of the Proceedings at the Presentation on the 7th October, 1948.

TECHNICAL BULLETINS, ETC.

American Chemical Society:

Abstracts of Papers presented at the 115th National Meeting, March 29th, 1949.

Harvard University. Graduate School of Engineering. Publications:

No. 459—Polarographic Determination of Dissolved Oxygen in Water and Sewage, E. W. Moore, J. C. Morris, D. A. Okun.

Institute of Metals. Reprints:

Consideration of the Nature of Brittleness at Temperatures above the Solidus in Castings and Welds in Aluminum Alloys, W. I. Pumphrey and P. H. Jennings.—Consideration of the Nature of Brittleness at Temperatures below the Solidus in Castings and Welds in Aluminium Alloys, W. I. Pumphrey and D. C. Moore.—Flow of Metal in Tube Extrusion, C. Blazey and others.—High-Temperature Tensile Properties of Cast Aluminium-Silicon Alloys and their Constitutional Significance, W. I. Pumphrey and P. H. Jennings.—Recovery and Recrystallization of Rolled Aluminium of Commercial Purity, P. C. Varley.—Some Metallurgical Problems of Importance to Aircraft, H. Sutton.

Institution of Electrical Engineers. Proofs:

Analogies between the Vibrations of Elastic Membranes and the Electromagnetic Fields in Guides and Cavities, E. C. Cherry.—Automatic Control of Lead-Acid-Battery Charging Equipment, R. A. Harvey.—Development of Q-Meter Methods of Impedance Measurement, A. J. Biggs and J. E. Houldin.—Electric and Diesel-Electric Traction on the Netherlands Railways, H. J. Van Lessen.—Overhead Line Regulations, H. W. Grimmitt.—Some Notes on the Design of H. V. Transmission Lines, with Special Reference to Conditions in India and Pakistan, A. F. Coventry.

Institution of Mechanical Engineers. Advance Copies:

Causes of Flue Gas Deposits and Corrosion in Modern Boiler Plants, W. F. Harlow.—Crankshaft Damping, P. Draminsky.—Sulphur in Diesel Fuels, Ir. J. J. Broeze and A. Wilson.—Some Current Types of Marine Diesel Engine, C. C. Pounder.—Thermal Analysis of the Contra-Flow Regenerative Heat Exchanger, C. E. Iliffe.

International Civil Aviation Organization. First South East Asia Regional Air Navigation Meeting, New Delhi, November-December 1948. Publications:

Final Report, Aerodromes, Air Routes and Ground Aids Committee (Doc SE/301, AGA-SE/100).—Final Report of the Air Traffic Control Committee (Doc SE/302, ATC-SE/100).—Final Report of the Communications Committee (Doc SE/303, COM-SE/100).—Final Report of the Frequency Planning Sub-committee (Doc SE/303A, COM-SE/100).—Final Report of the Meteorological Committee (Doc SE/304, MET-SE/100).—Final Report of the Search and Rescue Committee (Doc SE/305, SAR-SE/100).

Manitoba. Department of Mines and Natural Resources. Mines Branch. Publications:

Bibliography of Geology, Coal, Oil, Natural Gas, and Industrial Minerals in the Post-Cambrian Region of Southern Manitoba to 1945, L. B. Kerr.

National Association of Corrosion Engineers:

Abstracts of Papers to be Presented at the April 11-14, 1949 Conference at Cincinnati, Ohio.

North-East Coast Institution of Engineers and Shipbuilders. Advance Copies:

Dept. of the Army, Washington, D.C., 1948.

Studies of Continuous Bridge Trusses with Models:

W. J. Eney. Bethlehem, Pa., Lehigh University, 1949.

Turbo-Supercharging of Internal Combustion Engines:

C. V. J. Mackenzie-Kennedy. London, Draughtsman Publishing Company for the Association of Engineering and Shipbuilding Draughtsman, 1947.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

AERONAUTICAL CONFERENCE, LONDON, 3rd-5th SEPTEMBER, 1947:

Convened by The Royal Aeronautical Society and The Institute of the Aeronautical Sciences, edited by J. L. Pritchard and Joan Bradbrooke. London, Royal Aeronautical Society, 1948. 704 pp., illus., 10 x 7 in., cloth, £2.12.6 for members of the Conference, £3.12.6 for non-members.

The papers and discussions presented at this conference cover theoretical considerations on stability and control at high speeds; control in low speed flight; modern operational factors affecting airworthiness; icing problems; high speed testing in the Southern California Cooperative Wind Tunnel; high speed performance; the economics of personal aircraft; electronic control and instrumentation of aircraft; structural problems of large aircraft; thin walled monocoques; résumé and analysis of NACA wing-flow tests; practical design problems arising from sweepback; some novel structural properties of stressed skin wings; some aspects of transport aeroplane development; helicopter power plant installation; turbine engine icing problems; factors affecting future development of reciprocating engines; personal aircraft, an American appraisal; rotor systems and control problems in the helicopter; and the propeller turbine aero-engine.

BRITISH STANDARDS INSTITUTION. STANDARDS:

London, the Institution, 1948.

B.S. 15:1948—Structural Steel for Bridges, etc., and General Building Construction. *2/–.*

This revision includes a requirement for a minimum yield stress for steel manufactured to this standard. Steel complying with this standard is, in general, suitable for welding of all sizes.

B.S. 460 and B.S. 1205:1948—Cast Iron Rainwater Goods. *5/–.*

These standards deal with quality of materials, freedom from defects, facilities for inspection, marking and rejection. The specific clauses deal with dimensions, weight, thickness, sockets, ears, hammer test and finishes relating to gutters. There are 33 tables of dimensions and over 60 illustrations.

HALF-HOURS WITH GREAT SCIENTISTS; THE STORY OF PHYSICS:

Charles G. Fraser. Toronto, University of Toronto Press; New York, Reinhold; London, Oxford University Press, 1948. 527 pp., illus., 9½ x 6¼ in., cloth. $6.00.

This book has been written in the hope of bringing some of the most important passages of the literature of science within the reach of every one. It introduces great scientists so that the reader may learn from them the parts they played in the advancement of science and of the human race. The author describes, in terms not too technical for the average reader, the story of mechanics, acoustics, optics, thermics, and electricity and magnetism, from their earliest beginnings to the scientific achievements of the present day. There is an abundance of quotations and illustrations which make the story vivid and interesting reading.

SOURCES OF ENGINEERING INFORMATION:

Blanche H. Dalton. Berkeley and Los Angeles, University of California Press, 1948. 109 pp., 9½ x 6¼ in., cloth, $4.00.

This is a list of American source material in engineering subjects, designed as a guide to locating information quickly and accurately from among the mass of material published on engineering subjects. It includes indexes to periodical and serial literature; abstracts; means of locating and identifying periodicals; bibliographies; reference books (general, biographies, encyclopedias, dictionaries, handbooks and manuals, mathematical tables, manufacturers' directories); trade catalogues; and standards and specifications. A short note is appended to many of the entries, and each section is prefaced by an explanation of the use to which that type of reference material can be put. Each section is subdivided by subject, so that it is easily possible to locate the source material for one particular type of engineering. Entries are clear and complete.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

APPLIED MATHEMATICS FOR ENGINEERS AND SCIENTISTS.

S. A. Schelkunoff. D. Van Nostrand Company, New York, Toronto, London, 1948. 472 pp., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50 in Canada.

This book is devoted to those branches of mathematics which are needed in mathematical physics and engineering. It is divided into two parts, one considering general mathematical methods, and the other, special transcendental functions. Such topics are included as power series, vector analysis, differential equations, linear analysis, Bessel functions, and Legendre functions.

CIVIL ENGINEER IN WAR, A SYMPOSIUM OF PAPERS ON WAR-TIME ENGINEERING PROBLEMS.

Institution of Civil Engineers, Great George Street, London, S.W.1, England, 1948. Illus., diagrs., charts, maps, tables, 8½ x 5½ in., stiff paper, $9.75 in Canada per set of 3 volumes. (Engineering Institute of Canada, Montreal, in charge of sale and distribution in Canada).

A total of sixty-eight papers on war-time engineering problems is included in those three volumes. Vols. 1 and 2 deal with specific operations with respect to airfields, roads, railways, bridges, docks, harbors, and storage systems. Vol. 3 contains more general treatment of problems in the fields of hydraulics, structures, surveying, tunnelling and the properties of materials. Hundreds of photographs and diagrams illustrate the important aspects of each paper.

FIELD ENGINEERING, 22d. ed.

W. H. Searles and H. C. Ives. 22nd ed. by P. Kissam. John Wiley & Sons, New York; Chapman & Hall, London, 1949. 422 pp., diagrs., charts, tables, 7 x 4 in., cloth. Vol. I (Text) $3.75; Vol. II (tables) $3.75; combined Vols. I & II, $6.50.

This standard handbook for railroad surveyors and builders has again been revised and modernized to conform with developments of the past few years. New material added includes methods of air mapping, theory and application of the vertical curve, basic economic aspects of highway and railway location, the two-base method for precise altimetry, and the latest surveying techniques. The 400 pages of tables may be had separately or in the combined volume.

GAS TABLES, THERMODYNAMIC PROPERTIES OF AIR, PRODUCTS OF COMBUSTION AND COMPONENT GASES AND COMPRESSIBLE FLOW FUNCTIONS.

J. H. Keenan and J. Kaye. John Wiley & Sons, New York; Chapman & Hall, London, 1948. 238 pp., diagrs., tables, 10¼ x 7¼ in., cloth, $5.00.

Invaluable in the calculation of engineering problems involving air, this volume supersedes "Thermodynamic Properties of Air" by the same authors. The properties of air have been re-examined and re-calculated. Additions include the properties of combustion products of hydrocarbons and their constituent gases. The tables for the analysis of flow of compressible fluids have been greatly extended. For engineering application to the design of power apparatus, the precision is of the same order as that of modern steam tables.

INDUSTRIAL ELECTRONICS AND CONTROL.

R. G. Kloeffler. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1949. 478 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $5.50.

This book is designed for the student whose major interest is in the electric power, mechanical or chemical engineering field, rather than for the communications major. Beginning with Bohr's early theory of the atom, the author proceeds to the basic theory of electron tubes, associated circuits, and control component devices. The latter part of the book covers the major applications in the industrial and commercial fields.

LOGGING.

N. C. Brown. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1949. 418 pp., illus., diagrs., charts, maps, tables, 9¼ x 6 in., cloth, $5.00.

A combination and revision of two earlier works by the author, this book covers the methods and procedures of logging used in all parts of North America. Recent developments in mechanical logging are fully covered, as are the important changing aspects of logging methods. Both land and water log transportation is considered.

MACHINE DESIGN DRAWING ROOM PROBLEMS, 4th ed.

C. D. Albert. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1948. 519 pp., illus., diagrs. charts, tables, 9¼ x 5¾ in., cloth, $5.00.

This book is designed to include in a single volume all the information necessary for drawing room or laboratory courses in machine design. This new edition has sixteen comprehensive problems on machine design and ten chapters of reference information. Fifteen of the old chapters have been revised, and the chapters on worm gearing and allowable stresses completely rewritten. Three new problems have been added.

MATHEMATICS AT WORK.

H. L. Horton. Industrial Press, New York 13, 1949. No pagination, diagrs., tables, 9¼ x 6 in., fabrikoid, $6.00.

This book is a working manual for machine designers, tool engineers, gage designers, mechanical draftsmen, and technical or trade students. It reviews the fundamentals of arithmetic, algebra, geometry and trigonometry. There is a comprehensive discussion of problems and their solution and an explanation of special aids in computation. 145 pages of standard mathematical tables, including logarithmic and trigonometric tables, are included.

MOTION AND TIME STUDY, 3d. ed:

R. M. Barnes. John Wiley & Sons, New York; Chapman & Hall, London, 1949, 559 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $6.00 in Canada.

This standard text presents the basic principles that underlie the successful use of motion and time study, supplementing each with illustrations and practical examples. In this third edition most of the chapters have been revised and new material added. Five new chapters deal with process analysis, gang process charts, activity charts, and man and machine charts. Action photographs have been included. There is new material on rating operator performance and motion and time study training programs.

OIL SHALES AND SHALE OILS.

H. S. Bell. D. Van Nostrand Company, New York, Toronto, London, 1948. 157 pp., illus., diagrs., charts, tables, 9¼ x 6 in., $5.00 in Canada.

Beginning with geographical distribution and the history of exploitation, this book presents the existing information on the methods and economics of producing oil from shale. The oil shales of the world are discussed. Mining methods, retorting, and refining of oil from the shale are explained. The relative costs of this oil source are tabulated References from a wide variety of sources are given.

ROCKET PROPULSION ELEMENTS.

G. P. Sutton. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1949. 294 pp., illus., diagrs., charts, tables, 8½ x 5½ in., cloth, $5.40 in Canada.

Designed as a reference manual as well as a college text, this book presents both the basic elements and the technical problems of rocket propulsion systems. Emphasis is placed more on liquid propellant rockets rather than on solid propellant units, but the material on thermodynamic, thermochemical and ballistic principles applies to both types. Examples, problems, illustrations and references are included.

SCIENTIFIC FOUNDATIONS OF VACUUM TECHNIQUE.

S. Dushman. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1949. 882 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $15.00.

This book is a comprehensive study of all phases of achieving, maintaining and measuring very low gas pressures. It presents a survey of fundamental ideas in physics, chemistry and metallurgy, which will be found useful in dealing with problems in this field. References to the literature appear as footnotes. Both scientific research and practical engineering applications are considered.

SEMI-FIREPROOF CONSTRUCTION.

H. R. Staley. D. Van Nostrand Company, Toronto, New York, London, 1948. 327 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50 in Canada.

This book deals with the details of construction and the sequence and methods of erection of buildings within the scope of semi-fireproof construction. A discussion of soils and piling foundations is presented. The assembly of forms for walls and the mixing, handling and placing of concrete for both walls and floors are discussed in detail. Exterior masonry wall construction is dealt with both from the point of structural integrity and water-tightness. Tools and equipment are discussed as each operation is considered.

STEAM BOILER YEARBOOK AND MANUAL (IV).

S. D. Scorer, editor. Paul Elek Publishers, Ltd., London, E.C.1, 1948. 589 pp., illus., diagrs., charts, tables, 5½ x 5½ in., cloth, 30s.

This book contains an accumulation of useful data on the steam-generating field. Part I presents illustrated descriptions of almost every kind of steam boiler and associated plant and is a guide to modern British steam boiler practice. Part II deals mainly with operating problems and incorporates material on modern boiler practice and development taken from English and foreign sources.

TRENDS IN ENGINEERING EDUCATION, THE COLUMBIA EXPERIENCE.

J. K. Finch. Columbia University Press, New York, 1948. 140 pp., charts, tables, 8 x 5½ in., cloth, $2.00.

Although presenting the philosophy of education of one particular school, the Columbia School of Engineering, this small volume should be of interest to all engineering educators. Two of the most important problems discussed are the broadening of engineering curricula to include basic subjects of general education and the development of graduate instruction and research in engineering science. Teaching methods and the problem of faculty appointments have not been considered.

Although the following new books are not available in the Institute Library, inquiries concerning them will be welcome there or may be sent direct to the publishers.

ELECTRIC RESISTANCE STRAIN GAUGES.

W. B. Dobie and P. C. G. Isaac. English Universities Press, Limited, London, 1948. 114 pp., illus., diagrs., charts tables, 8¾ x 5½ in., linen, 15s.

This book is of value to the experimenter or development engineer who is required to evaluate strains in load bearing machines or structures. It deals with the various difficulties encountered in using electric resistance strain gauges and suggests methods for overcoming them. The basic mathematical and electronic theory needed in the use of this tool is included. The authors have reviewed and edited the technical literature which appeared in English and American journals.

MEASUREMENT OF STRESS AND STRAIN IN SOLIDS.

Institute of Physics, 47 Belgrave Square, London, S.W.1, England, 1948. 114 pp., illus., diagrs., charts, tables, 9½ x 6 in., linen, 17s.6d. plus 10d. postage; U.S.A. $4.00. (Physics in Industry).

This book is based on the Proceedings of a Conference arranged by the Institute of Physics and held during July 1946. Three papers survey the fields of electrical resistance strain gages, recent developments in photoelasticity, and methods for measurement of strain, such as extensometers and the use of brittle lacquer coatings. The other papers are concerned with the details of the applications of various techniques to specific problems.

SUPERSONIC FLOW AND SHOCK WAVES.

R. Courant and K. O. Friedrichs. Interscience Publishers, Inc., New York, 1948. 464 pp., diagrs., tables, 9¼ x 6 in., linen, $8.00.

Helpful to engineers, physicists, and mathematicians, this book treats basic aspects of the dynamics of compressible fluids in mathematical form. It presents a systematic theory of nonlinear wave propagation, particularly in relation to gas dynamics. Classical as well as recent developments are included. No attempt has been made to cover the entire field nor to provide summaries of results which could be used as recipes for attacking specific engineering problems.

SECOND INTERNATIONAL CONFERENCE ON SOIL MECHANICS AND FOUNDATION ENGINEERING, ROTTERDAM

June 21-30, 1948

The seventh volume of the *Proceedings* will be published when sufficient orders are received. It will contain 41 papers from all parts of the world, plus 23 papers prepared by French engineers, and published in "Travaux" for June, 1948.

Applications for this supplementary volume should be sent to the Secretary of the Conference, Oostplantsoen 25, Delft, Netherlands, accompanied by a draft for 15 Dutch guilders (approx. $6.40).

Business & Industrial Briefs

A Digest of Information received by The Editor

New Equipment and Developments

A new truck tire, developed by the Goodyear Tire & Rubber Co. of Canada, Ltd., New Toronto, Ont., is claimed to have " built in shock absorbers ".

The Company claims that by a unique process, shock, stress and strain are cushioned in the carcass of the tire by layers of soft rubber between the plies. Company tests indicate reduced wear and tear on the tire, less damage to the carcass and reduced costs to users because of the longer running life.

•

To create interest in wood the Osmose Wood Preserving Company of Canada Limited conducted a guessing contest at the Sportsmen's Show, held recently in Montreal. A four-foot section of an elm tree was displayed at their booth and visitors were invited to guess the age of the tree. Nearly six thousand five hundred people competed. The age of the tree, which was grown in Montreal, was ninety-five years. Forty-nine people had the correct answer. The highest guess was twenty thousand four hundred and thirty-one years and the lowest, eleven years.

•

Victor M. Drury, president of the Canadian Car & Foundry Co. Ltd., stated that the year 1948 was the greatest in history for the railway rolling stock industry. Production would have reached even greater heights had more steel been available.

For the Company the feature of the year was large orders from Canada's own railways for rolling stock replacement. Mr. Drury is of the belief that by 1950 Canadian railways will have largely overcome rolling stock deficiencies.

•

In a survey of the water power resources of Canada, compiled by the Dominion water & power service bureau, it is stated " Progress in hydro-electric development in Canada during 1948, as measured by plants coming into operation, was at a fairly high rate and a huge programme of construction is at present underway or planned which will rapidly increase capacity during the next few years ".

The survey lists, by provinces, the total water power resources of Canada and the total recently computed from the records of the bureau. 25,722,900 hp. at ordinary minimum flow and 40,124,100 hp. at ordinary six month flow. The figures are based on eighty per cent efficiency.

Since the beginning of the present century water power development in Canada has grown from 143,156 hp. to 10,870,718 hp. installed by the end of 1948. The growth in the total of hydraulic installation has been continuous and fairly consistent, particularly since 1920. The average increase per year has been, roughly, 300,000 hp.

Quebec is richest in water power resources, containing over 32 per cent of the total recorded for the Dominion. It also ranks highest in developed power. The present installation in the province of nearly 6,000,000 hp. is 55 per cent of the total for all provinces. Ontario also has large power resources and is exceeded only by Quebec and British Columbia in this respect.

•

The volume of sales of the Northern Electric Company Ltd., in 1948 set a new record in the Company's 35 year history. Sales for the year topped by 22 per cent the previous high set in 1947. Sales to the Bell Telephone Company of Canada represented 40c out of every dollar of sales. During the year there was a reduction in inventories by more than \$3,600,000. Wages and salaries at \$29,509,000 were higher than ever before in the history of the Company and surpassed the 1947 figure by nearly \$6,000,000. The total number of employees at the end of the year stood at 12,385 and of these people more than 10 per cent have over twenty-one years of service. Further expansion, during 1949, is anticipated and whole scale operation in the new plant is anticipated.

•

The 37th National Safety Congress and Exposition will be held October 24 to 28 in Chicago, Ill. For further information write to R. L. Forney, general secretary, National Safety Council, 20 North Wacker Drive, Chicago 6, Ill.

•

At the recent International Nickel annual meeting, held in Toronto, Robert C. Stanley, chairman of the board of directors, said " Our world sales of nickel in all forms in 1948 were 240,098,274 pounds, compared with 205,278,868 pounds in the year 1947. Over 90 per cent of this total was consumed in the United States, Great Britain and Canada. Consumption outside of these three countries was only a small fraction of pre-war volume."

Mr. Stanley also stated that during the past decade the Company has been forced to mine ores of lower grade. To illustrate this point he stated that 43 pounds of nickel were obtained from each ton of ore mined in 1938 while in 1948 this figure had dropped to 27 pounds.

The Company's sale of copper for Canadian consumption in 1948 was 90 per cent greater than in the years immediately preceding the war. Mr. Stanley referred to progress made in the flash smelting process. He said " Results obtained in our pilot unit have justified the planned construction of an oxygen plant and of an initial flash smelting furnace on a commercial scale. The new process will permit a considerable saving in coal requirements, and at the same time will serve both to increase the production of sulphuric acid and to enable the production of liquid sulphur dioxide from furnace exhaust gases by Canadian Industries Limited. This represents another step forward in the maximum utilization of our ores, an objective to which we are devoting continuing and fruitful research."

•

A programme of graduate work in engineering, physics, and chemistry leading to the master's degree, is to be inaugurated by Drexel Institute of Technology, Philadelphia. The programme will go into operation commencing with the fall term of this year.

•

On April 26th the Canadian Standards Association announced that two new codes have been issued with respect to radio interference. These codes deal with interference from industrial, scientific, and medical apparatus and interference caused by railway and other signal and communication systems. For copies of these codes apply to the Canadian Standards Association, National Research Building, Ottawa, Ont.

•

Great Britain is establishing air corridors ten miles wide. They will form a system of aviation highways at heights of between 5,000 and 11,000 feet. These highways have been established to insure safer flying and to prevent collisions between aircraft in poor visibility. Both civil and military planes will be expected to conform to this new form of traffic control.

•

The world's first pressurized blast furnace is being built in Scotland. Working on the principle of the domestic pressure cooker, the new furnace will speed up steel output from 15 per cent to 20 per cent.

•

What is claimed to be the world's most powerful electric transformer has been shipped from the Westinghouse Electric Corporation's transformer plant at Sharon, Pa., to help increase the supply of power in the Detroit area.

Rated at 145,000 kilowatt-amperes and capable of handling 195,000 horsepower of electrical energy, the machine is big enough to supply all the electric power needed for a city the size of Winnipeg. The 125-ton unit will be installed in the giant Trenton Channel Station of the Detroit Edison Company. It will be used to boost the station's generating voltage from 15,000 volts to 135,000 volts. The unit contains 56 tons of "Hipersil"— silicon steel—core material, 63 miles of copper wire and 6,000 gallons of insulating and cooling oil.

This new three-phase transformer is rated 30 per cent higher yet it is smaller and 17 tons lighter than the most powerful transformer previously built. This combination of high power and light weight is the result of the use of "shell-form" construction coupled with "form fit" design of tank which houses the transformer core and windings. Size and weight were also further reduced by using "Hipersil", a special silicon steel used by Westinghouse which, it is claimed, can carry one-third more magnetic flux than steels previously used.

•

A new line of a-c Arc Welders, featuring increased welding range and stepless precision current control, is available from Canadian General Electric Company. The new welders are available in 200, 300, 400, and 500 ampere models for indoor manual welding; 750 and 1000 ampere models for machine and submerged melt welding; and a special 200 ampere model for light-duty, job-shop welding. The 300, 400, and 500 ampere models are offered also in weather-resistant enclosures with "Idlematic" control for both indoor and outdoor operation.

The new welders have an open-circuit voltage of 75 volts, providing good welding performance through added arc stability. "Idlematic" controls on the weather-resistant models automatically reduce the open circuit voltage on the electrode to about 30 volts, but when the arc is struck the advantage of 75 volt open-circuit voltage is retained. Increased strength and protection for the welders are provided by newly designed steel housings. For complete details communicate with the company at any of its branch offices.

•

In Imperial Oil's report for the year 1948 it is stated that the company found more crude, produced, transported, refined, distributed and marketed more oil and products than ever before.

Capital expenditures for plant and equipment totalled $46,591,937. Sales in Canada and Newfoundland were $1,819,-000,000 gallons. The Company's eight refineries processed an average of 136,027 barrels a day, an increase of 14.5 per cent over 1947. Major developments in manufacturing during the year were the completion of new refining units at Montreal East at a cost of about $22,-000,000 and of the first phase of a new oil refinery at Edmonton. An eight-inch pipe line was laid from Nisku to the Company's Edmonton refinery and considerable progress was made in planning for a 16-inch line which will be laid from Edmonton to Regina. Exploratory footage drilled in Alberta totalled 153,403 feet. One hundred and nineteen wells, of which three were dry holes, were drilled in the development of known fields.

•

The number of firms to be represented at the 1949 Trade Fair in the machinery, engineering and plant equipment trade group has been given a sharp boost with the reservation of space by Engineering Industries Association representing 1,200 firms from the London region of England.

The firms are manufacturers of light and medium engineering products, tools and instruments. In addition to offering their products for sale at the Trade Fair, the association will investigate Canadian market requirements, price competition, saleability of their goods and report the findings to member firms.

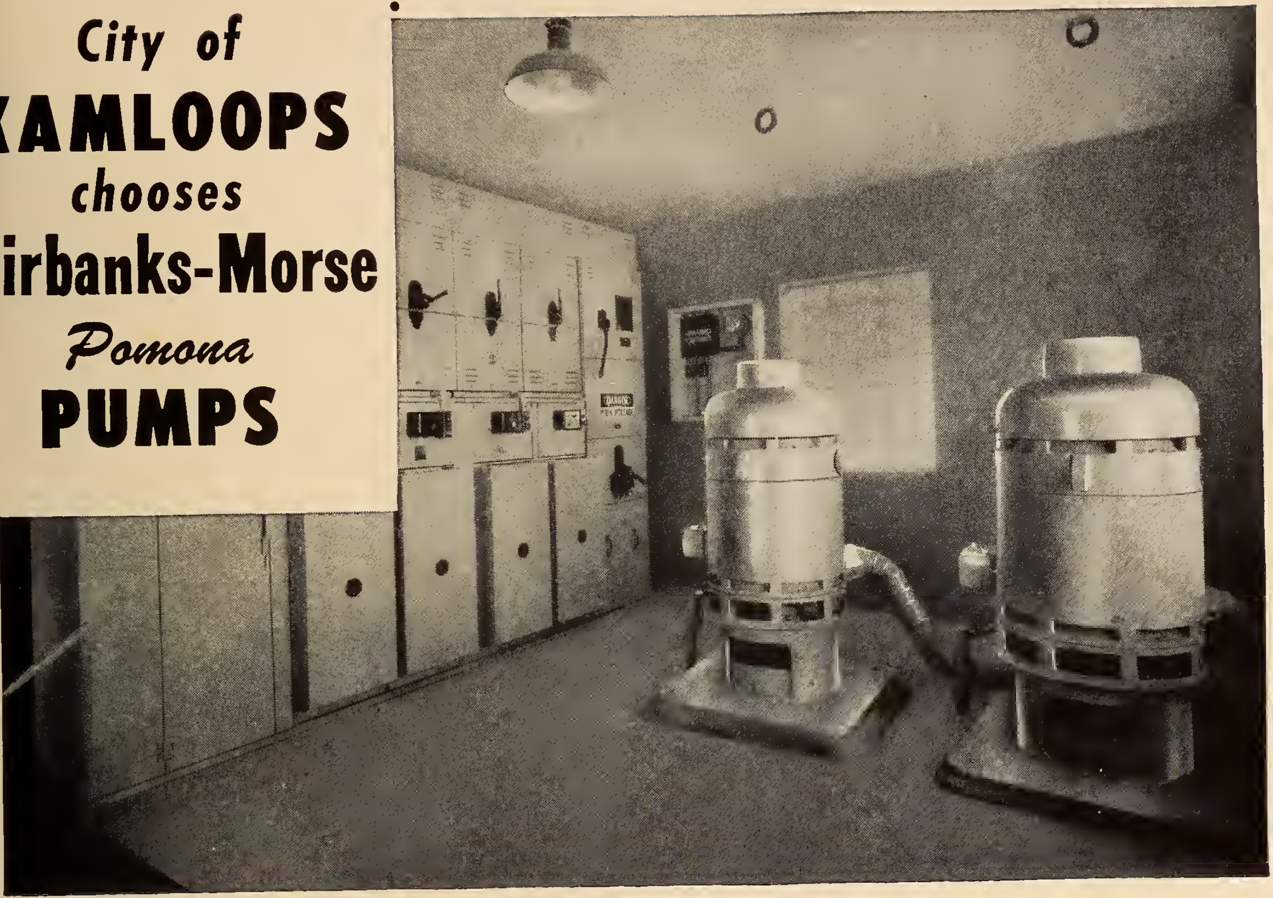
Machinery and plant equipment firms from nine countries have reserved space at this time with this latest British entry placing that country at the top in number of firms represented.

•

U.S. Secretary of Commerce, Charles Sawyer, requested the Advertising Council to discontinue its heavy steel scrap campaign, effective May 15, because of the improvement in the steel scrap supply situation.

•

Intended for fast demolition work for use wherever footing is treacherous, a



Motor floor, showing 150 HP motors and control panels for deep-well installation of two Pomona Turbine Pumps operated by the City of Kamloops, B.C.

new paving breaker, weighing only 38 pounds, has been added to the Gardner-Denver line. For details communicate with the Company at Chicago or with its Canadian representatives.

•

It is claimed that a Canadian Westinghouse development will assist in saving the Ontario public upwards of $1,000,000 in connection with the Hydro frequency changeover programme. This development, a dual-frequency fluorescent lamp ballast, which can be economically produced, provides a simple means of switching and eliminates the necessity of altering and reconnecting the original wiring within a fluorescent lighting fixture. G. F. Mudgett and E. I. Morwick of the Westinghouse Lighting Division at Hamilton developed the new ballast which has been approved by the Canadian Standards Association.

•

The first low-cost oxygen plant of commercially substantial tonnage output, to be built for the petro-chemical industries, has successfully passed all initial test runs, it was announced by E. A. Flaschar, general manager of the Stacey-Dresser Engineering Division of Dresser Industries, Inc. Installed in Winshire, Texas, as an integral part of a petro-chemical plant, recently completed by the McCarthy Chemical Company, the new oxygen unit is now producing more than the design quantity of 175 tons per day of 90-95 per cent pure oxygen which is delivered at 800 psig. For complete details communicate with the Director of Public Relations, Stacey-Dresser Engineering Division, 1900 Superior Aven., Cleveland, Ohio.

•

An industrial X-Ray service is available, at Canadian General Electric Company, which will provide inspection and report on the structure of metallic or non-metallic materials. The equipment will handle materials up to one inch in thickness and up to a maximum of 20″ by 30″ in outside dimensions. Standard size pictures are 8″ by 10″ or 14″ by 17″ with delivery of prints within two or three days of the time the parts for inspection are received. The cost of the service is four dollars for each satisfactory film; transportation charges are additional. Pieces to be X-rayed should be sent to the Works Laboratory, Davenport Works, Canadian General Electric Company, 940 Lansdowne Ave., Toronto. The covering order should be sent to the Company's Head Office, 212 King Street West, Toronto, marked for the attention of E. Rudge.

•

Lippmann Engineering Works of Milwaukee,—4603 W. Mitchell Street—Wisconsin, has expanded its production of equipment for pits, mines and quarries, and is ready to consolidate distribution in the Great Lakes region. Manufacturers' representatives interested in securing further details, with a view to acting as Lippmann representatives in Ontario, should communicate with the Company at the address given in this item.

•

Arrangements have been made for Harold Wilson, president of the Board of Trade of Great Britain, to tour the Dominion. Mr. Wilson arrived in Canada on May 12th and after a tour of three weeks will be present at the opening of the Canadian International Trade Fair, Toronto.

•

The world's lightest solid, a "plastic foam" that swells up when baked to 100 times its original volume, has been developed by the Westinghouse Electric Corporation. It is lighter than some gases. The chemist responsible for this new development is Robert F. Sterling. It is believed that the new plastic foam will be used to insulate such things as soft-drink coolers, pre-fabricated metal houses and aeroplanes.

•

A two million pound-inch torsion testing machine, which can accommodate a specimen four feet four inches in diameter and up to sixteen feet in length, has been proof tested at the Fritz engineering laboratory of the civil engineering department at Lehigh University. Designed to study the torsional behaviour of structural members such as plate and box girders, the testing machine is capable of handling full-sized bridge sections, twisting them through any desired angle. The machine itself is, approximately, nine feet high and 25 feet long with a gross weight of 15 tons and a centre line 46 inches above floor-level.

•

A curtain wall of cellular glass and concrete has been developed by the Pittsburgh Corning Corporation of Pittsburgh, Pa. "In erecting single or multi-storey buildings, this new concept lowers costs, reduces construction time, makes possible more usable floor space, and provides permanent insulation", according to a statement issued by the Company. The panels used consist of cellular glass insulation cores and concrete veneers made up into thin, flat sandwich walls. They have been fabricated in several practical sizes and thicknesses. The insulated wall panels are made in-the-flat in any practical size. The largest panels made, to date, measure 256 sq. ft. each. The popular thickness is six inches; 2-inch cellular glass core with 2-inch exterior and 2-inch interior veneers. This is less than half the thickness of the conventional masonry wall. Construction on which these new insulated panel walls have been used includes—the Service Center at Toronto the Hydro-Electric Power Commission of Ontario, the Plastic Factory of Canadian Industries Ltd., Shawinigan Falls, Que., and the Retail and Wholesale Office of Hobbs Glass Co., Ltd., Trois Rivieres, Que. Complete details may be obtained from the Company—Pittsburgh Corning Corporation, 307 Fourth Avenue, Pittsburgh, Pa.

•

A new improved vacuum-tube voltmeter for measuring voltage in electronic and other low-energy circuits where minimum current drain is desirable, is available from Canadian General Electric's meter and instrument section. Designated as Type AA-1, the instrument has a calibrated range of 0.001 volt to 300 volts at all frequencies from 10 cycles to 1.5 megacycles. It is also graduated in decibels covering a range of minus 52 to plus 52 from a reference level of 1 milliwatt at 600 ohms. Complete details may be obtained from any C.G.E. branch office.

•

Monsanto (Canada) Limited are now occupying their new offices located at the plant, 425 St. Patrick Street, Ville LaSalle, Montreal. The new two-storey and basement offices are in a modern building specially constructed to accommodate the expanding executive and office personnel. The new Montreal telephone number for the Company is Wellington (WE) 8421.

•

Authorization for the expansion of the Kingston-Ont., Nylon Plant of Canadian Industries Limited which will approximately double its production of nylon yarn and staple fibre has been given by the directors of Company. Plans are being made to proceed immediately with the necessary construction. Some 300 additional employees will be required when the plant is in full operation.

•

A rain repellent for aircraft windscreens has been invented. It is now being manufactured and marketed by a Canadian company. This windscreen treatment is the result of seven years research by Dr. D. F. Stedman of the Division of Chemistry, National Research Council.

•

Development of a special Tower Loader attachment for discharging concrete batches to forms above ground level or into trucks has been announced by the Kwik-Mix Company of Port Washington, Wisconsin. The tower device can be fitted to either the model 11-S or 16-S mixers. Information and specifications on the Tower Loader may be obtained, from Construction Equipment Co. Ltd., Montreal.

•

Cast Iron Machine Bases, weighing 100-tons each, were powder-cut with ease to five smaller size pieces by the Illinois Equipment Co. of Chicago. The equipment used was Oxweld C-60 Oxy-Acetylene Cutting Blowpipe. This equipment is sold in Canada by Dominion Oxygen Company Ltd., 159 Bay Street, Toronto 1, Ont.

•

The governments of British Uganda and Egypt have launched a huge irrigation and electricity generation scheme. The project will make possible an increase in the cultivable area of Egypt from 5.9 million acres to about 7 million acres. In the Sudan the irrigable area will be increased from 862,000 acres to 2.5 million acres. The scheme will also reclaim thousands of swampy acres in southern Sudan, and provide electricity for the industrialization of the British protectorate of Uganda. The project compares in size with the Tennessee Valley Authority. The cost of the first stage, which is the construction of an enormous dam at the Owen Falls, to regulate the level and discharge of Lake Victoria into the White Nile, is estimated at the equivalent of $48 million. The Egyptian Government will contribute $16 million and the British Protectorate of Uganda $32 million. Six turbines, each with an output of 15,000 kilowatts, or 90,000 kilowatts in all, will be installed.

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

Copies of the following publications may be obtained from the International Nickel Co. of Canada Ltd., 25 King Street West, Toronto, Ont. The March issue of the "Corrosion Reporter". In an article in this issue is traced the history of phosphorus discovery and development and present day methods of manufacture and application. Also offered is a publication entitled "Mechanical Tubing as an Engineering Material". It is a summary of information on nickel and nickel alloy tubing as well as other tubing in materials such as steel, stainless steel, copper and aluminum.

•

Spielman Agencies, Ltd., 420 Lagauchetiere Street West, Montreal 1, Quebec, offer a new four-page folder which contains, in handy reference form, Portland cement concrete, stucco, plaster and mortar waterproofing specifications. These abridged specifications have been reduced from the twenty-page Kerner-Greenwood Waterproofing booklet. There is no charge for the publication.

•

Copies of "J.I.C. Hydraulic Standards for Industrial Equipment" are offered by Miller Motor Company of Chicago. The entire "Standards"—as compiled and approved by the six cooperating groups of the Joint Industry Conference under direct sponsorship of leading automotive and industrial manufacturers, are reproduced word-for-word in this sixteen-page eight and a half by eleven booklet. The address of the Miller Motor Company is 4027 N. Kedzie Ave., Chicago 18, Ill.

•

The Bristol Company of Canada Ltd., 71-79 Duchess St., Toronto, 2, Ont., offers Bulletin No. P-1239 which covers Bristol Diesel Engine Pyrometers. This 12-page, two-colour, bulletin is attractively designed and most informative.

•

"Surveys from the Air" is the title of a 28-page, four-colour brochure which may be obtained from the Photographic Survey Company Ltd., 1450 O'Connor Drive, Toronto, Ont. The brochure describes many types of photographic survey work with emphasis on the methods used and the results obtained.

•

Surface Combustion Corporation, Toledo 1, Ohio, has just released a two-colour bulletin showing the application of "Surface" burners to typical immersion heating installations. Both suction and atmospheric type burners are described and details are given for the use of the equipment in such jobs as interrupted quenching, rust-proofing processes, cleaning diesel motor blocks, and the removal of scale from cast metal parts. Ask for bulletin SC-142.

•

Brown, Boveri (Canada) Limited, 1111 Beaver Hall Hill, Montreal 1, have available copies of an interesting publication describing the Company's Isotherm Turbo-Compressor. The pamphlet is well written and illustrated. Ask for Publication 1629-E.

•

The Canadian Fairbanks Morse Company Ltd., 990 St. Antoine Street, Montreal, has produced a twenty-four page publication entitled "A Half Century of Progress". This interesting history deals with the progress of the Company since its founding in Montreal in 1898. Illustrations of the Company's plans and offices are shown and descriptions are given. For copies communicate with the Company, attention Mr. John O. Pitt.

•

"The Bepco Journal" published by Bepco Canada Limited, 4018 St. Catherine St. W., Montreal 6, Que., is available to readers of the "Journal". The April, 1949, issue contains an article on a-c generators as manufactured at the Bruce Peebles Works. There is no charge for this monthly publication.

•

The April issue of the "C.I.L. Oval" contains an interesting article entitled "Soil—and Survival". For copies of the publication communicate with the Department of Public Relations, Canadian Industries Limited, New Birks Bldg., Phillips Square, Montreal.

"Dominion Oxygen Tips" is the title of a monthly publication produced by the Dominion Oxygen Co. Ltd. This Company magazine should be most interesting and helpful to the engineer who is interested in welding. It is well written and illustrated. To be placed on the mailing list communicate with the Company at 159 Bay Street, Toronto 1, Ont.

Appointments and Transfers

The Department of Trade & Commerce has announced the appointment of Douglas Arthur Jones of Hamilton, Ont., as Federal steel controller. He suceeds F. K. Ashbaugh.

Mr. Jones was formerly with the Steel Company of Canada at Hamilton. He joined the Department about three years ago.

•

G. Sahovaler has been appointed Canadian representative of the Ateliers Ferret-Goglio, French manufacturers of cemented carbide which is branded by the name of "Diametal". Mr. Sahovaler, formerly a resident of Paris, France, is a graduate of McGill University. His office is located in suites 412-13, Castle Bldg., St. Catherine St. W., Montreal.

•

R. J. Ker has been appointed manager of the air conditioning division, Montreal district office, Canadian General Electric Co. Ltd.

Mr. Ker has had wide experience in connection with the air conditioning industry. He is a native of Windsor, Ont. He was educated at Kennedy Collegiate and at the University of Detroit. He joined C.G.E. in 1935 and has been in the Montreal sales and engineering departments since 1941. He is a member of the American Society of Heating and Ventilating Engineers and the Refrigeration Service Engineers Society.

•

H. Clark Minns has been appointed supervising engineer in charge of the mechanical section and general industrial and installation work of Blenkhorn & Sawle Ltd. of Niagara Falls and St. Catharines, Ont.

COVER PICTURE

This month's cover shows a unique gathering of international delegates to the 1949 Annual Meeting and the first Hemisphere Conference of the International Committee of Scientific Management (CIOS).

From left to right, they are:—E.I.C. President J. N. Finlayson, Vancouver; Jacques Greber, Paris, France, consultant to the National Capital Planning Committee; Dr. Lillian Gilbreth, Montclair, N.J., president, Gilbreth Inc., consulting management engineers; Dr. Hugo de Haan, Geneva, Switzerland, secretary general of CIOS; Miss Elsie MacGill, Toronto, consulting aeronautical engineer; J. Edgar Dion, Montreal, chairman of the Conference programme committee; C. A. Peachey, Montreal, chairman of the Canadian Management Council; Dr. M. E. Alvaro, Rio de Janeiro, president, Brazilian Institute of Scientific Management (IDORT); and S. John Wright, London, England, member of the British Agricultural Engineering Mission to Canada.

Mr. Greber is pointing out to the group some of the features of the plan for Canada's national capital at Ottawa.

PHOTO-INTERPRETATION of TRANSPORTED SOIL MATERIALS

This paper was presented to the Regina and Saskatoon Sections of the Saskatchewan Branch of the Engineering Institute of Canada in November 1947 and January 1948 and merited for the author the Keefer Medal of the Institute for 1948.

by

J. D. Mollard, M.E.I.C.

Air Surveys Engineer,
Prairie Farm Rehabilitation Branch,
Department of Agriculture, Canada.

The identification of wind, water, and ice transported deposits by means of airphoto interpretation techniques is introduced in this paper to supplement existing methods of mapping and evaluating soil materials. The interpretation and analyses of certain elements which form airphoto soil patterns are described in some detail. Geological deposits discussed and illustrated are kames and eskers, sand dunes, alluvium, moraines, glacial lakebeds and loess (wind-blown silt). The application of photo-interpretation to engineering problems is also given.

Before the civil engineer is able properly to design certain types of outdoor projects he has first to select a favourable site. This selection can be made quickly and economically with the help of aerial photographs, once the interpreter has acquired a technique for identifying surface geological materials, since he has the advantage of viewing landscape patterns of large areas at one time, far beyond the horizon of the observer on the ground. The trained observer soon develops a capacity for recognizing the manifold landform patterns, such as sand dunes, eskers (gravel ridges) or glacial lakebeds.

Photo-interpretation finds application in many branches of engineering and science. Foremost among these are natural resources surveys, soil mapping, right-of-way selection, drainage mapping, forest mapping and contract planning. In order to realize the most good from the material set forth in this paper, there must necessarily be a blending of the knowledge and perspective of the engineer, the geologist and the soil scientist.

Application of Photo-Interpretation

Natural Resources Surveys

Inasmuch as certain ore deposits are related to geomorphic processes[1] and history; folds, faults, dykes, veins, and other similar structures are identifiable. ⑰ [2] When these structures are localized, a trained geologist can quickly determine the prospecting possibilities of such a "find." Occasionally vestiges of tilted strata from dome remnants appear in the photos, usually in areas where the bedrock has no appreciable soil cover. This type of information will often narrow the amount of field exploration in potential oil localities.

Lately much interest has been evinced from those quarters of geology concerned with the mapping of contacts between fundamental rock types. Wherever this procedure is used it should be followed by field checks. Also, all pertinent geological maps should be kept close at hand. They will testify to the skill of the interpreter and method of map production.

One organization in Western Canada has used the photographs to locate swamp and bog areas for the propagation of muskrats. The observer is able to limit field work by studying present and past drainage courses in areas virtually inaccessible by land transportation. Maps can be drawn to show the kind, character, and distribution of natural forests so that preliminary quantity estimates can be made. In northern latitudes a system of forest classification such as this provides a liaison between sound management of timbered regions and other contingent resources — notably, water, range, recreation, and wild life.

Soil Mapping

In Western Canada soil materials are mapped primarily for two

[1] Geomorphology: The study of landforms—surface features on the earth's crust ②.

[2] Numerals circled, thus: ⑰, refer to corresponding items in the Bibliography at the end of the paper.

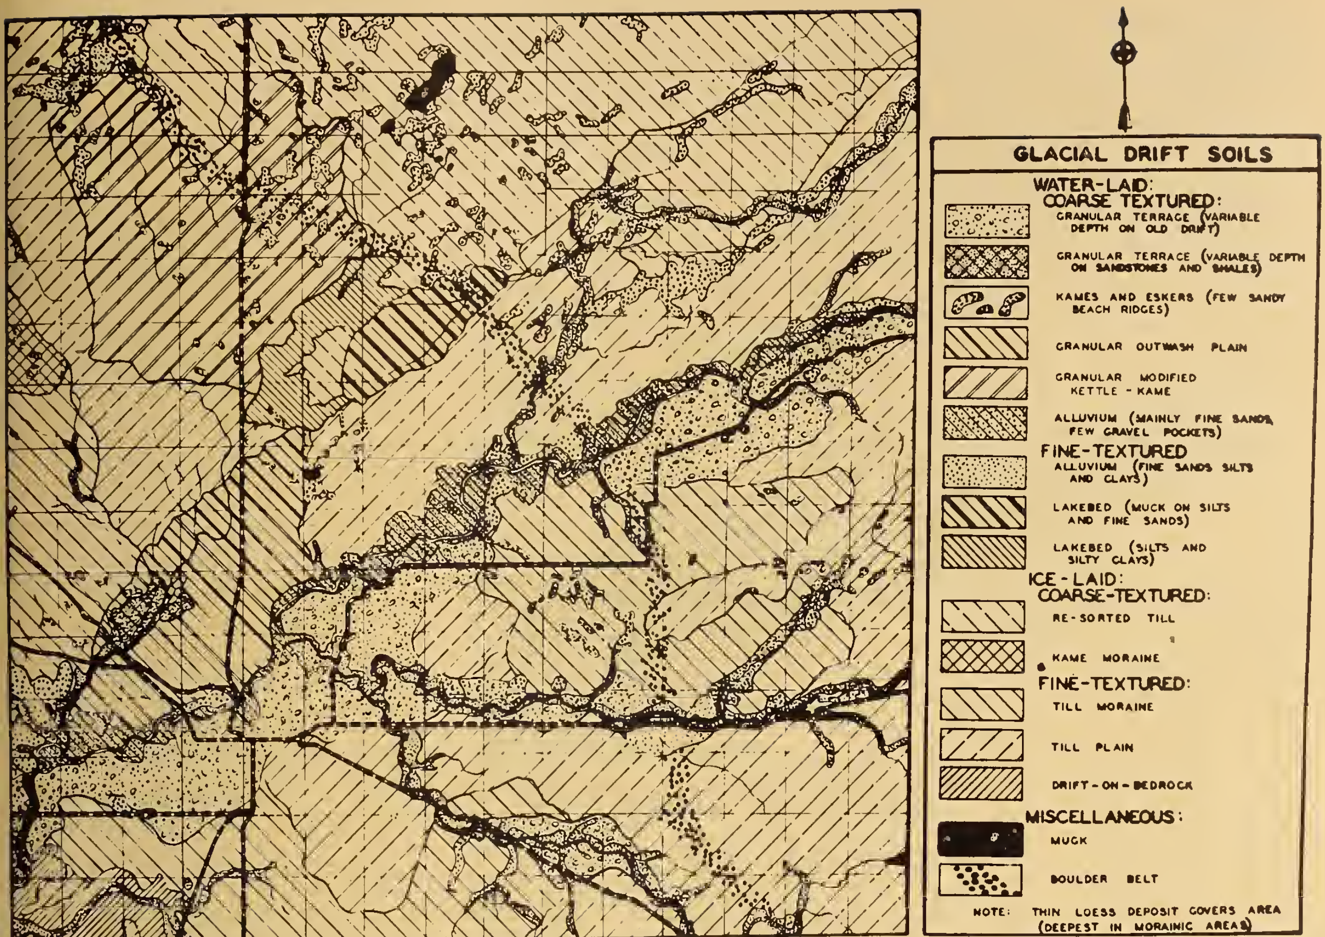

Fig. 1. Soil map. A reproduction of part of a regional soil parent material map. Such a map usually will require some translation before it can be used to the best advantage.

purposes: a) to determine their relative ability to produce plant life; and b) to determine their relative suitability as construction materials. Fundamentally, both of these adopt a system of soil classification which is related to the fields of applied geomorphology and applied pedology.[3] The product of these landform and soil forming processes results in a characteristic soil pattern on the photograph.

In sum, the following indicate where phototechniques can be profitably applied to soil investigations; soil classification (engineering, geological, agricultural); highway and airport site selection; dam site and canal location; and location of granular borrow materials. A soil map prepared from airphotos for engineering purposes is reproduced in Figure 1.

Drainage Mapping

A significant application of airphotos concerns the mapping of drainage systems and basins. These maps will serve as a source of useful data for reconnaissance surveys in highway and airport location, water development projects, and flood control. Information regarding watershed areas and conditions affecting runoff can be included on these maps. (See Figure 2.)

Contract Planning

It has been found that aerial photographs lend themselves well to certain types of contract planning. Interpretation of aerial photographs in the earliest reconnaissance stages may save weeks of tedious and expensive field investigation. In regions where dam sites are proposed, it is a good idea to construct a mosaic[4] of the surrounding area, including several miles of reach of the river. In this way the shortest cross-section of the river can be selected readily, as well as surface features that may be desirable to spillway and tunnel location. The area should also be carefully investigated for the presence of faults, landslides, and even lesser movements. In the photos, landslides are revealed by long, curved arcs accompanied by vertical displacements, or by a series of slump blocks along the side of a steep slope. The location of bedrock outcrops in glaciated regions can also be detected by close examination of the aerial photographs.

Use of Stereovision[5]

Stereoscopic coverage permits the interpreter to determine relative slope and relative relief. For stereoscopic examination one photograph is laid on top of, and partly overlapping, the adjacent print, with the distance of separation of the same point on adjoining photos approximately 2¼ inches. When the photos have been adjusted,

[3] The science that treats of soils in their natural state (8).

[4] A composite picture made by matching together contact prints, so that a large area can be seen at one time.

[5] The application of binocular vision which enables the observer to view two different perspectives of an object and to obtain from them a mental impression of the third dimension.

Fig. 2. Drainage map. Use of the drainage map for computing watershed areas in rough terrain. This map has been prepared from aerial photographs.

centre a stereoscope over them to obtain an optical reception of the third, or vertical, dimension. Frequently, when photographs are viewed stereoptically for the first time the observer will have some difficulty in "getting" the relief. With practice, however, it is possible to view matched pairs stereoptically with the naked eye.

Good quality prints are a prerequisite. Several factors influence the clarity of soil patterns on the airphoto, namely: a) the season of the year in which the photos were taken; b) the time of the day at which the exposure was made; and c) the weather conditions prior to taking the photos.

Elements of Airphoto Identification of Soil Areas

The technique of identification of engineering soil areas from aerial photographs is acquired by a careful study of all elements which compose what is termed "the soil pattern." It is pertinent to mention briefly what is meant by "soil pattern". To the untrained observer an examination of the photograph reveals little, yet to the trained observer a soil pattern is apparent.

This pattern is the result of natural and human forces acting on the original material from which the soil was derived. The elements that make up the soil pattern are visible features which are largely the result of relief and chemical and physical properties of the soil profile.[6] To translate these elements, or tools of interpretation, intelligently the observer should have an understanding of the basic principles underlying climatology, geology, pedology, and ecology.[7]

[6] The series of layers in any given soil is designated as its profile and its characteristics are made up of the sum total of the layers of its profile (8).

[7] The study of plants with reference to their environment and factors that control their distribution.

The elements which contribute most toward the formation of soil patterns are the landform, soil position, soil colour, erosion, surface drainage, vegetation, land-use, and man-made features. See Charts I and II, Figure 3.

Landform (Parent Material)

The local physical structure of the surface of the earth is called the "landform." It is, in fact, to most people the landscape. In bedrock areas the origin and composition of the parent rock will largely determine weathering characteristics and, therefore, the landform. Similarly, sand dunes and loess possess a physical appearance that has been shaped by the wind, and is distinguishable by a directional trend.

Soil Position

When identifying landforms in the photograph, cross - sectional sketches of the terrain should be drawn with the view of estimating relative slope and relative relief. In general, a good deal of information can be read from the position of the soil relative to neighbouring local relief. That is to say, the soils on the top of a hill may be vastly different from those in a nearby slough, which may be injuriously high in alkali content or in organic matter because of slightly different vegetative and moisture conditions.

Soil Colour

Soil colours are important; although the observer must be careful not to confuse soil colour and colour caused by plant growth (Fig. 4, upper). The relative amounts of light and dark areas are important—especially in glaciated regions. Muck (decomposed plant matter) will photograph black; shifting sand dunes, pure white; and moraines, mottled light and dark grey. The latter is due to the thin, dark surface layer on the hills, which, as a result of cultivation, permits the subjacent white limy soils to be ploughed to the surface. In the depressions the top soil is usually too thick for this condition to occur. The hills are usually dry, whereas moisture tends to accumulate and darken the soil colour in the depressions.

Erosion

The erosion shapes of gully systems reveal certain properties of the soil profile (Fig. 4, lower). Under normal conditions gravel gullies will assume a V-shape; pure

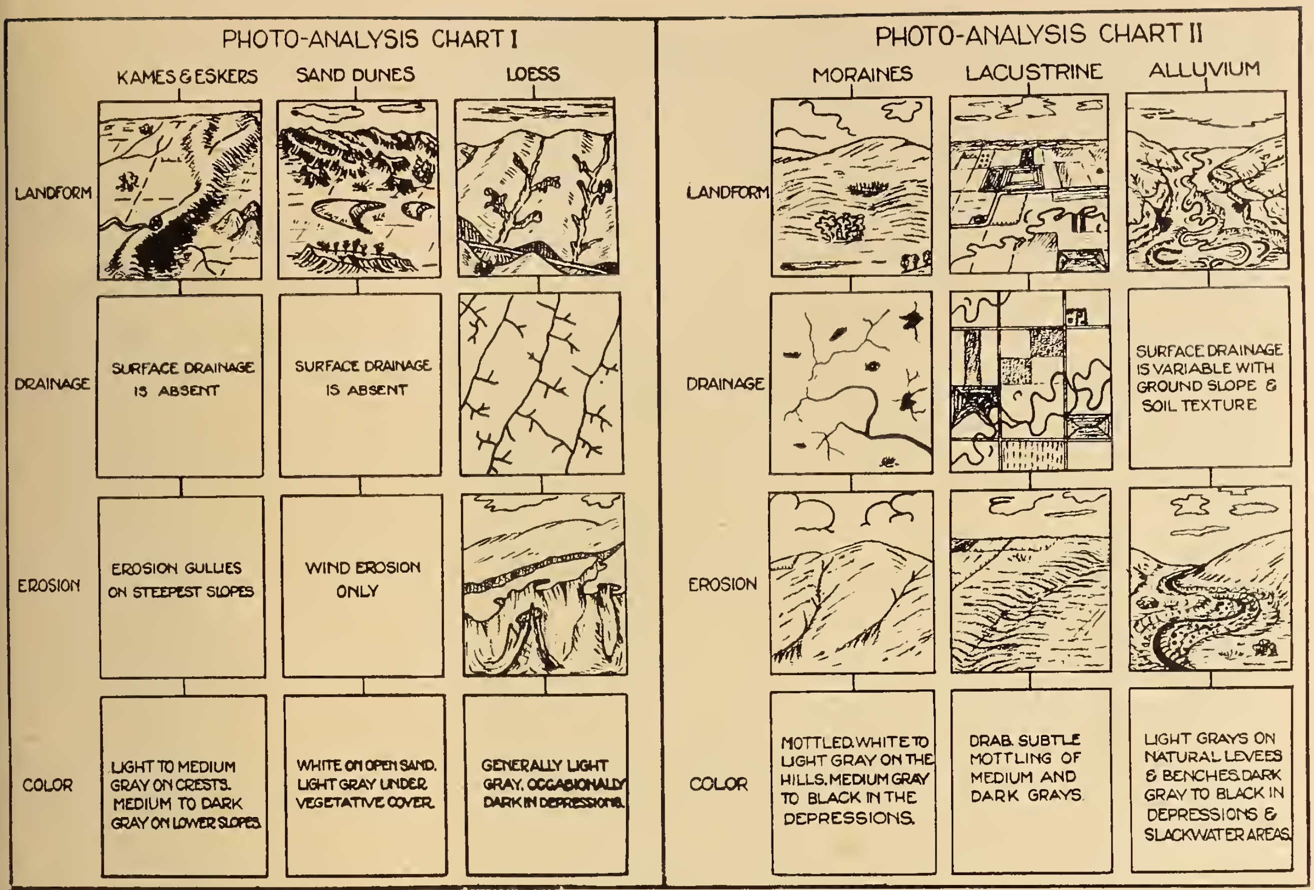

Fig. 3.

silt, a U-shape; and clays, a smooth, softly rounded form. Gully cross-sections should be drawn wherever possible to ascertain textural (grain-size), and plasticity characteristics. At the same time the interpreter should analyze the cause of gully formation and so determine its importance, since gully cross-section is a function of the climate, soil porosity, and ground slope.

Surface Drainage

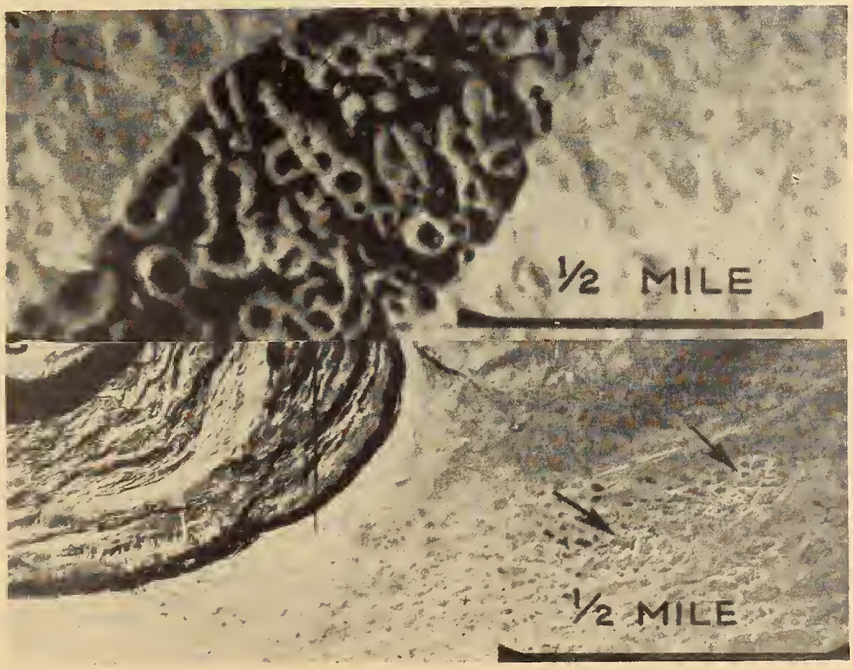
Obviously the more developed and intricate the surface drainage pattern, the more likely it is that the subsoil is impervious. Depending upon topographic position, sandy and gravelly soils show a lack of surface drainage. On the other hand, on gentle slopes, silts, clays, and silty clays tend to erode rapidly. In bedrock areas a trellis drainage pattern is a reliable indicator of tilted or folded rock, while a radial drainage pattern accompanies igneous intrusions and volcanic cinder cones.

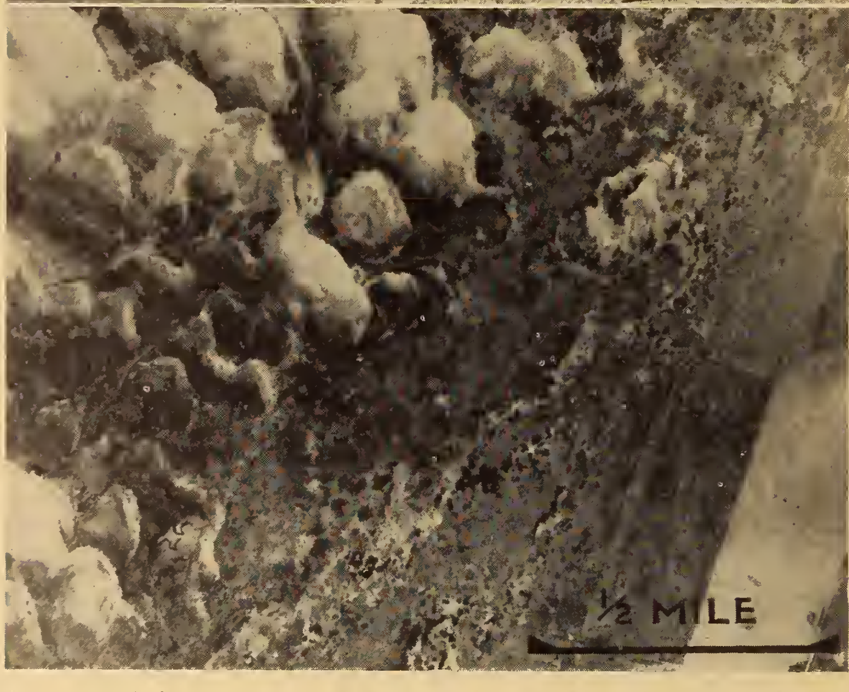
Vegetative Cover

Very often vegetable cover is the chief airphoto element in soil areas covered by dense forest. One commonly used procedure to identify soils under these conditions is local correlation between soils and vegetative types, and then between these types of vegetation and colour tones in the airphoto. In addition, the observer should

Fig. 4 (upper) Soil colour. The relation between relief and soil colour tone is shown in this illustration. A prairie fire (left) accentuates white circular rings, which follow along the crests of these sharp knolls. The dark centres of these rings represent slight depressions in the top of the knolls.

(Lower). Erosion. Intense weathering has deeply dissected these thinly stratified beds of sandstone and shale. Wind has shifted sand from the flood plains to the upland area (arrows).





(Upper) Fig. 5, Esker. In this excellent illustration, the proximity of the esker, *A*, to the drainage channel, *B*, suggests that the deposit was probably formed by a subglacial stream flowing along the valley bottom.

(Lower) Fig. 6. Sand Dunes. An air view of shifting sand dunes along the Alberta-Saskatchewan boundary. These dunes have been formed by wind rolling fine sands along the bottom of an old lakebed.

be familiar with the influence that photographic processes have upon colour tones recorded by the many types of forest foliage. Usually a good deal of experience is necessary to distinguish soil types from vegetative cover.

Land-use

Coupled with the part which nature has played in forming soil patterns is the important role of man in his agricultural and industrial development of the land. An excellent example is the so-called "dead" furrow, which the farmer uses to drain his land. Here the interpreter deduces that the land is poorly drained, and accordingly impervious. Strip farming is another example where the farmer is required to till his land in long, narrow strips to prevent soil drifting. This procedure has been adopted in many light soil areas in southern Alberta and Saskatchewan. Along several rivers in British Columbia the regular dotted pattern of orchard fields suggests good subdrainage. These soils are mainly sands and sandy loams which have been transported there by water.

Engineering Pedology

Some elements of the soil pattern may be altered by changes in climate, but others will remain the same for a given soil profile regardless of geographical location (12). The chief reason that subtle variations often exist is due to climate, which affects the type and amount of vegetative cover and the intensity of soil colour. Fortunately, in instances where some of the elements are unreliable, a proper evaluation of the remaining elements will usually give some clue to the soil type shown on the airphotos.

Just as like soil profiles give similar airphoto patterns, the converse is also true: that wherever soil patterns are duplicated, similar geological and pedological conditions have prevailed. This is understandable since the physical properties of the soil are related to geological and pedological processes of soil formation. An excellent illustration is the large Regina glacial lakebed in Southern Saskatchewan.

This basic premise is summarized in Technical Development Report No. 52, Civil Aeronautics Administration, Washington, D.C., (9), from which is quoted, in part:

> Soils are products of nature upon which they are almost wholly dependent for their formation, distribution, and physical and chemical characteristics. Therefore, in their natural states, soils are subject to analyses and interpretation based on natural processes. Thus, if the knowledge is available of the original material from which a soil was formed and of the conditions to which it was exposed, general information concerning the resulting soil is immediately derivable.
>
> In addition, available detailed data for one soil may be applied in general to a second soil that originated and developed under the same conditions as the first. This is the fundamental hypothesis. . . . It holds true for all geological forma-

tions, whether they be of bedrock or of transported material moved by wind, water, or ice.

It further states: " Although the process of soil formation follows this basic principle, the soil mantle is more complex than these statements might indicate." This last statement is significant since the soil mantle in many instances has been complicated by many different geologic processes. Therefore, it is essential that the interpreter be constantly aware of the limitations and accuracy of his work.

Soils of Glacial Drift Areas

With the exception of the high mountainous regions in Canada, there are only a few isolated areas which have not been profoundly affected by the Pleistocene continental glaciers. Although this material is usually heterogeneous in composition and variable in depth, it may, depending on its mode of deposition, be remarkably uniform in composition and depth — for example, sand dunes and lacustrine (glacial lakebed) silts and clays.

Since the recession of the last ice sheet the processes of soil formation have altered the original surface materials to form layers, or horizons, varying considerably in chemical and physical properties. These different soil horizons result from the effect of such environmental factors as climate, vegetation, micro-organisms, drainage, relief, and time (soil maturity), acting upon the original surface geological deposits. By correlating glacial landforms and their associated soil profiles with airphoto patterns it is possible to identify soils for engineering and agricultural purposes.

Eskers and Kames

The exact method of formation of eskers and kames has not been definitely determined except that they were formed by glacial streams either on, within, or under the ice sheet. In the airphotos, eskers appear like abandoned railway grades, except that they are less symmetrical and not so straight (see Fig. 5). Other identifying elements of kames and eskers are their incongruity with the surrounding landscape; light colour tones along their crests; and frequent dark tones around their bases.

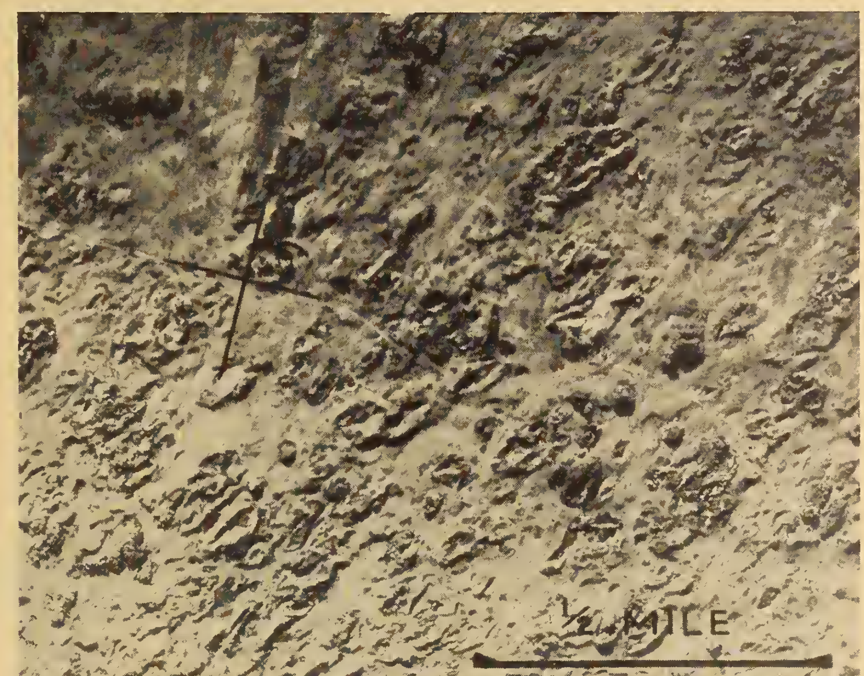
The granular material found in these forms is important wherever aggregates are needed for construction purposes. When investigating these deposits as borrow material, it is best to begin excavation near the crest of the ridge, since at this point the top soil will be at a minimum. It is also advisable to work against an open face, thereby mixing the fine sands and gravels as they cleave from the walls of the gravel pits.

Sand Dunes

The crescent-shaped sand dune is one of the most easily recognized of all landforms. This particular type of dune is gradually built up by small supplies of sand and moderate winds (3). The usefulness of dune sand for engineering purposes has been established. In highway

(Upper) Fig. 7. Sand Dunes. The double crested dunes shown here are typical of many areas in Southern Saskatchewan. The steep side of these dunes (away from the prevailing wind) has a slope of about 35 degrees with the horizontal, which is the angle of repose for material of this size.

(Lower) Fig. 8. Alluvium. A photograph of the alluvial flood plain along the Assiniboine River. Current markings are plainly visible along the inside bends of this river. Wind action has moved fine sand from the plains of the upland to form small dunes (arrows).



and airport construction they are excellent sources of borrow for base courses, and as a subgrade material they are among the best (9). Small amounts are also being used to obtain desired aggregate gradation in concrete work. Groundwater supplies frequently occur at depths less than 20 feet in duned areas of Saskatchewan. Inasmuch as these deposits exhibit a marked lack of drought resistance, have a tendency to erode easily, and have a high silica content, they are low in plant nutrient elements and have little value from an agricultural standpoint.

Alluvium

Deposits which have been transported by running water are called "alluvial." In Western Canada these soils are usually found along present-day drainage courses, although deltaic deposits are to be found in many upland areas.

The large volume of water that flowed down these stream channels has left its tell-tale current markings. These marks (see Fig. 8) are easily recognized in the airphoto. Intense current action has carved wide, parallel, circular markings, variously termed "sweeps," "scars," or "scrolls," which follow the downstream trend of the river channel. When viewed stereoptically, the relief of alluvial plains may appear level or benched, depending on the amount of water at the time of deposition. When these soils are well-drained and light in texture, they are reflected in the photo by light grey soil colours (Fig. 8).

These deposits are a convenient borrow material for the outer portion of impervious core type, earth-fill dams. Coarse alluvial soils serve as an excellent subgrade for highways and airports, provided that their relative topographic position renders them free of inundation by spring floods. Seepage will often be a limiting factor in areas where canals or similar construction is proposed. Their flat topography and pervious nature make them among the most suitable soils for irrigation.

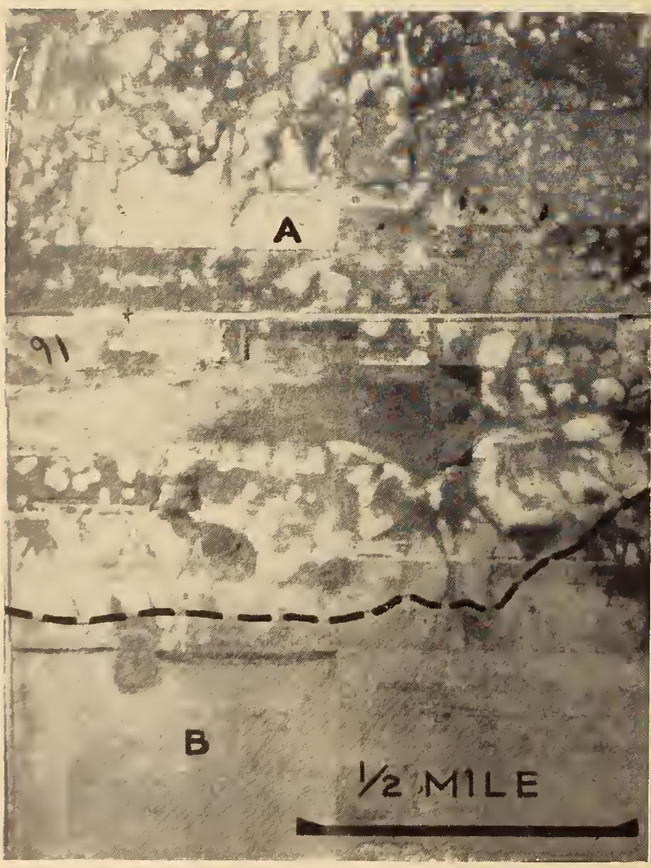
Moraines

It is believed that moraines were formed during the time when the ice front was at a temporary halt, either when the ice was at its maximum advance, forming a terminal moraine — or during its recession, giving rise to the so-called recessional moraine. The textural composition found in this accumulation of drift is a function of the condition which existed when the debris was being deposited. A plausible explanation for stratified drift common in some moraines, is that the stagnant ice possessed a system of intersecting cracks and crevasses, the material in these fillings being left as roughly sorted knobs of silt, sand, and gravel when the ice completely melted. When these knobs are numerous, steep-sided and coarse in texture the landform is called "kettle-kame moraine."

The engineering problems in a kettle-kame landform are several. For instance, if a dam were constructed in such an area, little or

(Left) Fig. 9. Moraine and Glacial Lakebed. The two soil patterns shown here can be distinguished without the aid of stereovision. Differences in parent material and topography are largely responsible for the change in airphoto pattern. *A* is mapped as undifferentiated glacial till; *B* as lakebed heavy clay.

(Right) Fig. 10. Lakebed Soils. The absence of soil colour mottling is due to flat topography, uniform soil textures and uniform profile development. By sample and test, the soil properties of this lakebed are uniform. Soils on this particular lakebed exhibit abnormally high volume change and liquid and plastic limits.



no runoff would be expected to reach the river. Ground-water supplies are favourable, since water will be found entrapped in sand and gravel lenses. Although borrow materials are available, the hilly terrain is not suitable to highway or airport construction. Farm lands will be correspondingly poor in these vicinities because of the rough topography, high losses of moisture by rapid runoff, and high proportion of wasteland caused by wet depressions ⑩.

Glacial Lakebed Soils

Lakebed soils are created where the land in front of the glacier slopes toward the ice, thereby damming the water derived from the melting ice. The high density of the still water in marginal glacial lakes, produced by cold climates, retarded the settling of silts and clays, thus causing them to become diffused and to filter slowly to the bottom.

The landscape associated with lacustrine soils is one of the most level of all geomorphic forms. Because of this, and since the soils are uniform in texture, the lakebed pattern is easily discerned in the photos. Uniform soil colour tones, flat terrain, and rectangular field and highway patterns are the principal airphoto elements (Fig. 10). Gully banks, because they are related to the origin of the soil, assume softly rounded shapes; gully systems have low gradients and are characterized by aimless meanders.

Glacial lakebed deposits cover several thousand square miles in Western Canada, ①, and are highly important both from an agricultural and engineering standpoint. They present some of the best wheat growing soils in the country as well as some of the most adverse soils upon which to build. The heavy soil hinders road and airport construction during wet weather, because of its ability to retain moisture by capillary action.

Loessial Soils

The origin of loessial deposits is attributed to the violent wind storms which transported silt particles in suspension from the dried-up flood plains of large rivers — the Mississippi and the Missouri, for example—to the upland, and from desert areas such as those found in northern Africa and central Asia.

Fig. 11. Loess. The erosion pattern of windblown silt in humid continental climates is shown by this photo. The "fishbone" drainage system, seen in this picture, is more fully developed than in other loess deposits in North America.

Loessial soils can be detected in the airphotos by their uniformity of gully pattern regardless of climate or geographic location. Their gully systems have the semblance of a "fishbone," with long, straight channels representing a backbone, and short, right-angle tributaries resembling ribs (Fig. 11). Vegetation is the main variable of this pattern. The other chief identifying elements are the strong parallelism of elongated hills and drainage systems, the mohair-like surface appearance and excessive erosion in areas of moderate to heavy rainfall.

Conclusions

In a paper of this kind definite limitations must properly be imposed. As a result, only a few wind, water, and ice transported soils were chosen to demonstrate the adaptability of photo-techniques to engineering and agricultural problems. To accomplish this end one and sometimes two pictures were used to illustrate each landform. To describe each landform, its variation and airphoto elements, adequately, would require numerous airphoto illustrations and supporting ground views, and is therefore beyond the scope of this paper.

The general method of approach and airphoto interpretation techniques set forth apply equally well to bedrock areas, regardless of whether they are volcanic, igneous, metamorphic or sedimentary in origin. The same holds true for both residual and non-soil localities.

By way of conclusion it should be emphasized that the interpretation of other standard patterns requires constant field checking. If this is done, the observer will quickly learn the potentialities and limitations of his work. As the degree of refinement increases, the whole process becomes more and more dependent upon the experience of the interpreter.

Acknowledgments

The writer wishes to express his appreciation to G. L. MacKenzie, chief engineer, G. W. Parkinson, design engineer, and R. O. Peterson, soil mechanics engineer, all of the P.F.R.A.; and to H. G. Dion, associate professor of soils, University of Saskatchewan; and H. C. Moss, soil specialist, Dominion Department of Agriculture, Saskatoon, Saskatchewan, who read the manuscript and offered helpful suggestions.

Discussion

F. C. Brownridge[1]

The section dealing with "Use of Stereovision" might be amplified. The purpose for which the prints are intended will enter into the choice of print required. Where contrast is an important feature a double weight glossy paper will give better results. If topographic features or boundaries are to be outlined, double weight semi-matt print may be preferable, due to the ease with which they may be marked. Some experiments have also been tried with "transparencies"; that is, the positive photograph reproduced on film. When these are viewed with the aid of a lighted background, detail in shadows, not visible in regular prints, may be seen fairly clearly.

The section on "Engineering Pedology" is possibly the most important part of the paper, and should be thoroughly understood to appreciate the methods used in airphoto analysis. The principles, upon which the whole system of interpretation is built, are fully explained. The origin, description, interpretation and engineering significance of the selected land forms are given in some detail. From experience in checking a large number of eskers and kames on the ground, and examining many airphotos of Ontario, there are additional features which are felt to be important.

In the case of eskers, which are more or less continuous, there is usually associated with them a depression which might be termed an "esker trough". This depression which is adjacent to and parallel with the esker, may take the form of either a watercourse, a series of elongated lakes or ponds, or may simply be low, swampy land. This is because eskers have a directional trend the same as that of the glacial movement, and not always the same as the slope of the land surface. Thus in many cases the esker forms a barrier and changes the direction of stream flow to one parallel with it. The kettle lakes or ponds seen in many photos, forming a chain parallel with the esker, may be due to blocks of ice separated and left at about the same stage of melting as that in which the esker was formed. Both eskers and kames are used extensively as sources of granular materials. The grading of the material in the case of eskers is more consistent and of a coarser nature, usually ideal for crushing for road work. Kames show more variation in bedding, with layers of fine sand, silty loam or clay loam, usually much finer in grading throughout.

As a verification of the principle that "the land form is the indicator for the parent material" it may be interesting to refer to an investigation now under way in connection with drumlins, which are not mentioned in the paper. These symmetrical cigar-shaped hills associated with many till plains are much more readily recognized and identified from airphotos than on the ground. Samples of the parent material taken from over one hundred drumlins in south-western Ontario show a close textural relationship usually classified as a compact and stony sandy loam, loam or clay loam. The percentage of sand, silt and clay varies within narrow limits. The profile development is comparatively shallow, with the material of the "B" horizon, usually a medium dark brown colour, classified as light clay or clay loam. The drumlin material is definitely related to the source from which the soils were transported and exhibits a corresponding chemical variation.

Applications

It may be pertinent to mention the use which is being made of airphotos by the Province of Ontario. The Department of Lands and Forests is engaged in a five-year programme of photographing, mapping and timber typing an area of 180,000 square miles of northern Ontario and the forested part of southern Ontario. The purpose is to determine the forest resources of the Province. The negatives and prints are an average scale of 1,320 feet to one inch, and are used in conjunction with geodetic and intermediate ground control to produce planimetric maps by the slotted template method. From glossy double-weight prints of the photos timber typing of the forested areas is being carried out and substantiated by repeated ground checks. From the survey an estimate of available timber may be obtained.

ATTITUDE and EDUCATION

by

W. B. Wiegand

Director of Research, Columbian Carbon Company, New York

Reprinted from the Journal of the American Society for Engineering Education, December issue, 1948

Introduction

My subject is Attitude and Education. My thesis, a simple one, is first that the prime purpose of education is to inculcate healthy attitudes; second that choice of subjects or curriculum has little to do with this; third that the teacher has everything to do with it; and fourth I am making a plea for the increased recognition of teachers who inspire in their pupils an attitude of warmth and good will.

Social Utility vs. Traditionalism

The choice of educational subjects has evoked much controversy. A mid-western professor of education has in a recent article flayed what he calls the Traditionalist School of education. By this he means "those who believe that the way to strengthen a pupil's memory, judgment or reasoning is to give him stiff doses of the traditional subjects, Classics, Mathematics, Science." Opposed to this is what he calls the "Social-Utility School," the members of which emphasize the teaching of such knowledge as is likely to function directly in the life of the individual. The professor is not mealy-mouthed about the defects of the traditionalist school, which, he admits "includes the great majority of university professors, a very large proportion of professional men, doctors, lawyers, etc., etc." and he adds, "a goodly number of top business executives!" This is how he disposes of the claims of the traditionalists. "They think," he says, "that judgment is a unity and that people have good, medium, or poor judgments. The exercise of judgment in one area like mathematics will, therefore, automatically improve one's judgment in purchasing a car, choosing a wife or voting in an election!" Then he goes on to expound the credo of his Social-Utility School. "They," he explains "believe that training in memorizing poetry may be of little or no help, or even a downright hindrance, in remembering the stock quotations, or in recalling the names of acquaintances!" How true but perhaps how unimportant! Education has, of course, to do with mental discipline and also with vocational instruction, but who will not agree with Livingstone when he says "our fundamental and chief task of education today is to form the right attitude to life"? There are others who approach the problem more plausibly.

The Humanities

When receiving a degree in Toronto, Mr. Anthony Eden recently expressed the hope that there might, in education, be a greater emphasis upon the humanities. We observe the trend towards prolonged college lecture courses on the history of Western Culture and the like. I am not convinced that we shall so simply purge the rising generation of the humors which have bedeviled us. Here is what A. E. Housman, a great scholar, poet and humanist, has to say, "I do not much believe in these supposed effects of classical studies. I do not believe that the proportion of the human race whose inner nature the study of the classics will transform and beautify is large," and again, "I never yet heard it maintained by the wildest enthusiast for Classics that the standard of morality or even of amiability is higher among classical scholars than among men of Science!" His final remark on the subject is refreshing. "The special effect," he says, "of a classical education on the majority of those who receive it is not to transform and beautify their inner nature, but rather to confer a certain amount of polish on their surface!!!"

There are teachers of language, literature, and history as insignificant as an iota, so dry they rattle. The human soul can congeal in etymology as readily as in our test tubes. Science holds no monopoly of heartless intellectualism. There are teachers who know their subjects cold. I was first taught Geology by a world-famous professor who could not conceal his scorn for freshmen. That finished the subject for me. My first introduction to Shakespeare was a minute hypercritical analysis of "Julius Caesar." I cannot, even now, manage to read this play without wincing. I know a professor of romance languages who had so spent himself on his books that he had nothing left over for his students. It was not until his own son had entered the class and then reported how the students disliked it that the realization came to him. It would seem evident that a curriculum based on literature, languages and history cannot, of itself, "transform and beautify our inner nature."

Then there are those who pin their hopes for better attitudes upon a more up-to-date religion.

Neo-Psycho-Analytical Religion?

Conspicuous among these is Liebman whose persistent best seller "Peace of Mind" aims to co-polymerize psychiatry and religion. There were things in this book which I found obscure. I have time for only a few excerpts. On page 38 I read, "Thou shalt love thyself properly and then thou wilt love thy neighbor." This seemed pleasant enough advice, but on reaching page 72 I read, "Experiments now indicate that the love of neighbor is a *pre-requisite* for love of self!" Can you blame me for deciding to love nobody until Research Director Liebman had made up his mind?

But to me the most astounding proposal in this book was a suggestion that what this age requires is not so much a transformation of man as a revised edition of the Deity. Here are his words "A religion that will emphasize man's nothingness and God's omnipotence may have fitted the needs of many Europeans but it will not satisfy the growing self-confident character of America. There is a chance for a new idea of God—a religion based not upon surrender or submission." Liebman may be a teacher with a large following in a neurotic world but surely what is needed is not so much a new religion embellished with phychiatric trappings as an inspired re-statement of the truths expounded by the Founder of Christianity. And now what about Science, our own subject?

Science and Miracles

The Founder of Christendom worked miracles which brought many people to see and hear Him. But when they were assembled He spoke not about miracles but about the meaning and the ends of life. Upon the "miracles" of Science is now focussed the attention of the world. What have we got to say? What is *our* message? Must it be that we are scientists, not priests, so that our sole duty is to keep building ever higher the huge pyramid of scientific knowledge?

Rather, has the time not come when everyone who practices our profession should remind those around him that while insisting on the green light to the truth in intellectual matters we are also beings who in our personal philosophy agree with Plato when he says, "It is not the life of knowledge, not even if it included all the sciences, that creates happiness and well-being, but a single branch of knowledge—the science of good and evil"?

Surely, then, our message to all, including Jacques Barzun the distinguished educator who has called upon Science to humanize itself, may well be that science, as such, needs no more, or less, humanizing than does archaeology or etymology, but that first and foremost must come a right attitude to life, for this is an end, whereas science like all other aspects of knowledge is, in itself, but a means. But how can such attitudes be fostered in a day when the simple faith of our forefathers has largely vanished, when the fission of the nucleus overshadows the Sermon on the Mount? My answer is, "Mainly through our teachers."

Teachers

Right attitudes are not fostered by this or that subject of study. They *are* fostered by the inspiration and the example of great teachers. Here is how Richard Livingstone expresses it, "The moving force of life is a vision. Men devise means when they are mastered by the passion for an end. Education is impossible without the habitual vision of greatness. A teacher cannot give an adequate training in anything unless he knows, and can make pupils see, what is great in it." May I give an example or two?

A Vedic Hymn

At high school our classics teacher had decided to cajole me into Classics at the University. At his home in the evenings, he would grill me in Latin and then try to interest me in Greek. This he would interlard with references to older Sanskrit roots. One evening my attention must have wandered for he suddenly stopped and finished out something. It was a poem from the Rig-Veda. He began by drawing me a picture of a Hindu shepherd high up in the Himalayas watching the sunrise, four or five thousand years ago, his soul bursting with the beauty of it. Then he read to me his own translation. As he read, his voice thickened and his eyes filled. He handed me the sheet of paper. It is entitled "Hymn to Dawn—Rig Veda X." I will read only the first line: "Go Forth, go forth, upon the ancient pathway . . . ."

I have kept it through the intervening forty years. At the time it was water off a duck's back. At the University I studied, not classics, but chemistry and physics. But now, after all these years, that water has returned to refresh a sometimes disgruntled soul! By an impulse not to be denied I began a year ago the study of Greek, and now in Homer I have at last found the hobby which will sustain me for the rest of my lifetime. Like chickens, early influences come home to roost. And this priceless boon, I owe to my old teacher who lived humbly but *whose memory is beyond price in the hearts of his pupils. He did more than impart knowledge—he inspired an attitude.*

Algebra

Our freshman class in Algebra at the University was huge and raucous. Like everyone else I had always loathed Algebra. We groaned as we sat awaiting the first lecture. To our surprise, it was the head of the department who entered. Beaming upon us he said he was going to devote his first lecture to one of the most fascinating parlour tricks he knew. Would we please pay close attention and see how bright we were. Then he began expanding on the blackboard an infinite geometric series — something simple like $1+1/3+1/9+1/27$, etc. On and on he went across the huge blackboard, chatting pleasantly and getting us to help him with the mental arithmetic. After quite a number of terms had been unhurriedly expanded, he turned to us: "Gentlemen, do you understand that I could go on like this for all Eternity? That this series never ends? Think of it and never again look upon mathematics as a dry subject. The terms I have just set down can be expanded till they stretch from this room to the outermost reaches of interstellar space — and yet even there they will not even terminate." "Now, gentlemen," he went on, "what would you do if I asked you to add together all of these terms? Impossible? Not at all. Be here promptly at 9 on Thursday and I'll tell you the secret."

Our cynicism had vanished. Next Thursday we turned up alive with curiosity — and to many of us, from that moment, *Algebra had lost its terrors. The reason was that our professor had infused Algebra with warmth. Our attitude had changed. To him, and therefore to us, Algebra was no longer an affair of the head. It had become an affair of the heart!*

Obstetrics

The next incident occurred in my Junior year. My roommate, a medical student, burst in one day, replete with wrath. "The queerest lecture I've *ever* had." He explained. The lecture was the opening one on childbirth. It was the senior professor, an eminent authority. He had bowed formally to the huge class, as used to be the custom in those days, then without a word turned to the blackboard with his crayon and began to draw a straight line. His hand moved with agonizing slowness. After ten minutes the stupefied students could see naught but a huge letter, four feet high. The letter was "W". Another ten minutes passed and by now an "A" had appeared. The students were getting noisy and shuffling their feet. All they saw was the silent professor's back and that crayon creeping along at a snail's pace. By and by a huge "I" had taken its place next to the "A". Another ten minutes and the gong had rung. The lecture was over. But at that moment the professor had finished his fourth and last letter. It was a "T". "W-A-I-T" stared out at the throng of medical students—a monumental lesson (meaning "never be in a hurry to use instruments") which would stick in their minds throughout their lives. The professor bowed, still without uttering a word, and left the room. . . . My friend is now a distinguished obstetrician —*But he has never ceased extolling the wisdom of this great teacher who knew when to make details subservient to principle and who had contrived to invest his students with an attitude of humility and awe towards their profession.*

Art

Last autumn I attended a course of lectures on the history of Greek art. The rather austere professor had led us through the Minoan and Mycenaean periods. Now he projected on the screen that exquisite vase by Exekias showing Dionysus in a Boat. He looked at it silently for a minute. Then he turned to us and said, "Ladies and gentlemen, we now approach an era in describing which I may depart from my customary attitude. I may occasionally break down into superlatives. Can you forgive me? *Of course we forgave him! We sat forward in our seats. The glow of warmth was there and had enveloped us.*

Entropy

I am now going to say a word about Entropy. Do I hear someone ask, "Is he going to romanticize on That?" Why not? Who can brood over this magnificent concept with other than a feeling of humility, awe, even of reverence? A century ago, Carnot, Clausius, and Kelvin fought their way through to its announcement and not without opposition. I have never met Karl K. Darrow but his recent paper on the Concept of Entropy in the *Journal of Physics* (1944) treats the subject with so much elegance and warmth as to make one feel that entropy ought to be included as one of the Humanities. What matter whether we look upon entropy as a quantity which can flow, or as Darrow prefers, an attribute which never flows but rises or falls in situ, or whether we understand it best in terms of disorder or randomness? *What does matter, for the purpose of this discussion, is that entropy can be presented in a manner which promotes an attitude, and a student who can be led to feel in this way about entropy, as well as think about it, is on the road towards being a humanitarian: he is the more likely to use entropy for good, rather than for evil ends. He is developing an attitude of warmth rather than one of heat—and if there is anything needed in this day, it would seem to be less heat and more warmth!*

Music

There are many ways to a healthy attitude. Take music. There is a member of this institute whom I frankly envy: After a gruelling day in town he will arrive at his country house late in the evening, sit down at his Hammond organ and play great music for hours on end. What a royal road to inner peace. His attitude towards music had been fixed in early childhood. This friend is present this evening but I must not mention him by name. He might never forgive me.

I talked to a brilliant young mathematician, head of his department in a large Eastern college, about scholarship versus inspirational teaching. His explanation was stark. "When promotions come up, the college authorities," he explained, "feel that they must rely upon some concrete evidence of merit. If a man does not publish, how can his abilities be evaluated?

Here I reach the core of my thought this evening. *We are as never before in history surrounded by concrete progress, by the things which are seen. It is in the realm of things not seen that our failures occur. So my plea is for the greater recognition of teachers whose output is measured not alone in papers but in pupils—not alone in books but in boys. When we find such let us honor them, reward them and promote them. Let us make clear the high regard in which we hold them.*

For they will be teachers whose attitudes towards their subject—be it literature, art or science—will be one of warmth as well as of light. They not only will think but feel, and impart these attitudes to others. And upon such may depend our survival in this atomic age.

Tragedy in the North

Years ago I went hunting for moose, to a club in Quebec. It was November and cold. The members were talking of a tragedy that had just occurred. A New Yorker had come up on his first hunt. He had gone to Abercrombie & Fitch and bought everything in sight; compasses, flashlights, pocket-axe, a huge hunting knife and 100 rounds of heavy ammunition. At night when it came time to return, he suddenly realized that he had lost his bearings. Then he began tearing about in endless circles. The tracks next morning told the tale of his night of desperate struggle. Exhausted, he had finally collapsed. Next morning the search party discovered his body, still laden with gadgets and 100 rounds of ammunition. All he needed to do the moment he was lost, was to stop, light a fire and warm himself through the night. By morning help would have come to him.

I wonder if we today are not in a similar case. The pace of our life may mean that *we* have lost our bearings, and are trying to make up in activity what we lack in direction. Perhaps *we* are weighed down by too many gadgets and too many rounds of ammunition, so that through concentration upon the means, we have lost sight of the ends. Perhaps we, too, need to pause and light a fire, the fire of human understanding, and having warmed ourselves and our attitudes by its side throughout the night, it may be that by morning help will come to *us*. . . .

MANAGEMENT—
TODAY AND TOMORROW

by

Paul Kellogg, M.E.I.C.

President,

Stevenson & Kellogg, Ltd.,

Montreal.

PART THREE

Management Tools and People

The third in a series of three papers on Management prepared for The Engineering Journal

In Part II of this series we discussed the policies and tangible methods and tools which could be used to aid good management of a company. We have assumed the proper people to use the tools, so there would be sufficient interest in the work that the tools would be used to best advantage. This, unfortunately, is not always the case. It has been demonstrated time and again that tools can work to the personal satisfaction of the workers, for the good of the company, for the improvement of product and for the improvement of production. They may be a source of inspiration to the workers. On the other hand, by using unsound tools or by using unsound methods their use has sometimes been distorted, bringing dissatisfaction, deterioration of relations between the workers and management and, finally, to an impasse between the two.

In the early days, when management tools were used with less care and less fairness than today, these conditions of distortion and dissatisfaction often resulted. We have had many strikes and bitter recriminations against the so-called stretch-out, which is the misuse of a tool which, in its proper form and application, has been a source of real satisfaction to both management and labour. Recollections of these misuses of the past are still reflected in some of the policies of unions and, in fact, of management as well, which are only slowly being broken down as barriers to a more perfect understanding between management and labour.

Although much may still be done in advancing industry by the improving of methods and techniques, the new gains are now relatively small and may grow less, save for the possible introduction of some major revolution, such as occurred when steam power was discovered. Yet there are obviously great gains still possible from better utilization of human resources. This is best illustrated in the negative aspects, a strike or merely a lack of harmony among the working force. This can modify the technological gains, can even bring about the failure of an industrial organization or, in the long run, even of an industrial society.

This task of proper use of tools by their acceptance on the part of their users is not a simple one. The science of psychology is making inroads on the border of this field. Pending the time when it can produce accurate results on the basis of cause and effect in the mental processes of people, we must do the best we can to study the problem and come to conclusions by trial and error. The picture of the old watchmaker making a complete watch is a familiar one. He was skilled. He manufactured each part of the watch and put it together. He sold it as a complete product of his own effort. The art of making the watch was passed down from father to son. Thus in the old days, the craft idea of individual production and individual output, bearing a name to be proud of, was the chief motivation in the excellent products which came from such a system.

Obviously such a system was expensive, and today in mass production it is not possible to put the worker's name individually on a piece of merchandise. It bears instead the name of the organization to which the worker gives his time. In this process, the worker has changed from doing the whole job to doing a very small part. Perhaps now he just screws up one nut on one piece of the assembly. More and more complicated machines are being developed, there is a growing need of highly skilled workers who will understand the construction, operation and maintenance of these machines. This group, however, is a small one compared with the large number of workers who merely feed or tend machines. The workers are mass performers, doing repetitive operations.

During the war there was another development which hastened this trend, namely the necessity to de-skill operations because of the great demand and the intense shortage of skilled labour. During this process of change in manufacturing methods, which is still not complete, all workers have become more and more educated; more able to tackle complex jobs; more able to think through operations which have become less and less frequent in need.

There will always be a group of workers who are satisfied with today's machine feeding. On the other hand, there still remains a large body of workers which is dissatisfied with routine and restless under its demands. What can be done to bring back to these workers some substitute for the old craftsman's sense of a job well done because it bore his name? The complete answer has not been found. So today, we have to apply what remedies we can see are needed, to take care of the more obvious disadvantages of the present system. Regardless of what is done, there must be in these matters a genuinely honest approach by management to their solution.

Suitable Jobs and Working Conditions

Some jobs must be tedious and repetitive, and there are people who fit naturally into jobs of that type. The selection of someone who finds the work gets on his nerves is immediately laying the foundations for the eventual failure of that employee on that particular job. In this field, the methods used by the psychologist have gone a long way in making it possible to select the right people for the right job. A full job description can be interpreted by the psychologist in terms of aptitudes and personal characteristics which will lead to contentment with the work presented.

This ability, however, must be applied in a general way. There is no such thing as distinctive division of all jobs into those which are repetitive and those which require a considerable amount of intelligence, training or personal ability. Where jobs have some repetitive features in them and occasionally require distinct individual ability, then we must select for that ability and we may still have dissatisfaction over the repetitive portion of the job. We find today that more and more attention is being paid to having pleasant surroundings for the worker, such as colour schemes, light supply, and in acceptance and recognition of certain personal habits of relaxations that will lead on the whole to more contented workers.

Motion study, if properly applied, is one of the essential things to bring about acceptable and interesting conditions of work by the employee. He should be seated correctly; he should have the proper light; he should be taught to eliminate all useless and tiring motions; mechanical helps should be available wherever possible.

Proper Rewards for Best Effort

In spite of the official frowning upon incentive payments on the part of the international unions, basically the individual worker likes to be paid for any extra effort that he puts into his job. He is afraid of it only when he fears that the administration of an incentive plan will be unfair. This fear, of course, he inherits from the former use of the stretch-out and the unfair application of piece work without sound time study work. The rewards must, of course, be paid promptly. They must be adequate, and easily understood so that they can be computed by the employee so he can make a check of his own pay.

In some plants, profit sharing for all has been most effective — at least over short periods of time. Generally, it has not yet stood the test of time through periods of contraction in business activities, so that it can be put down conclusively as an effective method of rewarding employees and assuring their co-operative interest. As the complexity of the employee's job increases, so does the difficulty of establishing a correct incentive to the employee. To sum up the whole matter of financial rewards, the employee, whether he be worker or foreman, or even farther up the ladder, must have a conviction within himself that his extra effort will be rewarded, and that he will be paid according to the work he does. He may then be fully contented with the plan of award.

Opportunity for Advancement

When surveys of workers have been made to indicate what they consider most desirable in a job, it is seldom that "opportunity for advancement" appears high on the list. It seems obvious, then, that the opportunity for advancement is not so important as is generally supposed. With some, however, who have within them the aptitude and the desire to manage, the opportunity for advancement is an important requirement for contentment. To management, therefore, falls the obligation to find out which employees are not only qualified to advance but also have the desire and, when opportunity for advancement comes, to see that the proper qualified men are given the advanced positions. This can be accomplished through the industrial psychologist, through the testing of employees and through the study of their aptitude for management, their general intelligence and their ability to control and manage others.

Training and Education

This refers to the training in skill and method on a particular job to which an employee has been assigned.

Adequate training in the proper methods of doing jobs, and practice of the method, are essential to making interested new workers. No newcomer likes to find out for himself how the job should be done, or through begrudging instructions given by fellow workers, who perhaps dislike to take the time to do that sort of thing.

One of the best means of education are the conferences held with the higher supervisory group, often called training conferences. In these meetings men are taught to think, they are given prescribed studies to pursue and, through discussion, they are educated in the business problems, in management techniques, in the proper way to handle workers and many other phases of management.

The foreman certainly cannot be neglected. He determines, or helps to determine, whether the employees are going to be happy in their work. The foreman must apply these mechanical helps in such a way that they will be converted to interest on the part of the worker. For that reason, it is impossible to place too much emphasis upon the proper education of the foreman in performing his duties as management's representative, in these days when those duties are so much more complicated.

Giving Employees Facts

Another form of education needed by all employees is education respecting the company's activities and problems and profits. In more and more factories, there are times when all the employees and their families are guests of the company so that they can see what the complete process in the factory is. All this contributes to the interest of the employee in the product in the making of which he may perform only a very small part. Some facts and figures must also be given to the employees.

Again the honesty of the management and the sincerity of management's purpose must be clearly evident, because any employee receiving figures from the company is apt to look at them with a sceptic's eye, unless he has full confidence in the management.

The ideas of the workers today on the profits which industry is making are sometimes fantastic. Surveys have shown that the average worker believes that the company is earning from four to ten times what it actually is in profit, on the investments of the stock holders, or on sales, or on whatever basis they may be measured. In this connection, it is worth while quoting from an address before the Society for Advancement of Management by Mr. Walter Cenerazzo, president of the Watchmakers' Union.

> "I want to see Harvard, Yale, the University of Chicago, and every other institution in America, develop economists and send them into the plants and, on company time if you please, if necessary, bring in the foreman and the stewards, bring in the group leaders, the committee representatives of the Union, and teach them what their corporation is, what the industrial and sales problems are, how the company arrives at the price for which they sell the product —teach them everything there is to know about the company, and make those courses six weeks, two or three days a week, a couple of hours a day. Then, at the end of that period, you can rest assured that when Mr. Nathan, the economist, and such people, start to preach about those great big profits that industry is going to make, some little guy is going to get up and say: 'Look Joe, here is the rate, here are the profits, here are the unit costs. Now, go sell that class struggle stuff elsewhere.'"

The information given out in these classes could be printed in a simplified form and mailed to the employee at his home. The employee could then discuss in his leisure time the aims and problems of his company with his wife and family. In this way a family interest in the job and in the employer is built up. It is necessary that working men and women realize that the policy of producing less and getting more jeopardizes the security of their company, and thus their jobs.

Security and Participation in Management

High on the list of desirable qualities in a job the employee will write "security". This is being supplied in many benefits to employees, most of which increase in value with length of service. Planned production to minimize seasonal peaks and valleys, an annual guaranteed wage, service pensions and various forms of life, health and accident insurance are examples of plans adopted to increase job and social security. Whereas these material benefits do not in themselves satisfy the craft urge, they do contribute materially to the toleration of modern conditions without active complaint.

We have left to the last the most interesting of all modern movements to re-create interest in the part of the worker, that is, his participation in management. Here is the field where the educated worker, of whom there are many, will find his place; where the ambitious man can direct his ambition towards a profitable and constructive end. Here is the field from which management itself may select skilled future supervisors, foremen, superintendents and officers. Highly educated employees are going to participate in the management of the company whether the managers like it or not. It is being done in certain cases now. How could we look otherwise upon union activities in plants where they have a great deal to say about working conditions, the amount of output and matters of that kind, except as the participation of employees in the management of the company?

However, such participation has been used by labour itself as an "opposition party" to management, because management itself has not recognized these workers with exceptional abilities and made them a part of the management group. How then can that be done? The union, as an organization — an enterprise — with its own management group (setting their own salaries as in a company) makes an appeal to those workers in a company who find no outlet for their restless desire for advancement. Here they have a chance to advance, and they will grasp it unless the company searches them out and offers them equal or better opportunities as a part of the management group. If the employee accepts, he then changes his "political party".

Obviously management hasn't always tried very hard to find these skilled men, else we would not find so many times that union representatives show up better than management representatives in joint enterprises. These opportunities will provide outlets for some members of the restless group of to-day's routine workers.

Indirect Participation

There are other projects in which the workers can participate even as members of the union and operate through it. Two such projects are job evaluation and time study. Job evaluation involves a description of his job, giving in detail what he should do and to whom he should report, what his duties and responsibilities are and relating his job to others in the plant on some kind of an orderly system. Certainly, the employee has a right to give approval to his job description and to participate, at least, to the point of discussion of the evaluation of his job compared with others in the plant.

Similarly, time study is a matter with which the employee is directly concerned personally. It is used to determine what should be the fair output in a given standard time for the work on which the employee is engaged. Improper and unskilled time study has been the basis of great union complaint against the stretch-out and against the misuse of this tool in earlier times. Today employees elect their own stewards or representatives to go along with representatives of management, and to become capable themselves of making proper and skilled time studies. Then between the employee and the company there can be agreement as to what constitutes a standard amount of work which the employee should be expected to produce for a standard hour's pay. When the project is worked on and approved jointly, then there can be no question of complaint on account of stretch-out, and negotiations between employees and company become much simpler.

There are other methods of formal participation in management. One of these is the suggestion system, in which the employees have a chance of expressing their ideas through the suggestion box, receiving suitable reward for accepted suggestions. Properly administered, this creates a great deal of interest and takes advantage of many sound ideas from the employees, often leading to the discovery of employees with ideas who can be considered for subsequent promotion. A fair and conscientious administrative system obviously goes along as one of its essentials. Then there is participation of employees in various committees. There is the grievance committee, there is the safety committee and there may be other committees relative to different phases of the work on which the employees have a representative.

These are new interests, they are interests of a high type which can well occupy the minds and challenge the abilities of those employees who have not found enough to occupy their minds in the ordinary work which they do. All these are expressions of the trend towards the participation of employees in management. It seems certain that this trend will continue to accelerate both in number of companies adopting plans of this sort and, perhaps, in the extent of participation of employees in management.

Need for Measurement

When we were considering management tools and practices which were installed to make better production and to help ensure profits, one of the chief considerations given was to an adequate system of measuring the results. That same thing is needed in these relations between management and workers. Perhaps the degree of success of the effort can generally be seen in the general satisfaction of workers, in the lack of complaints, in the cutting down of grievances and in the ease with which management and workers can discuss company affairs. In the long run, that is probably the best way. There are, however, other ways of taking measurement occasionally, usually called attitude studies. In them, some neutral party circulates carefully worded questionnaires among all the employees asking very pertinent questions about the company, their position in the company, their griefs, their likes and dislikes — even getting down to persons. Questionnaires are unsigned and from them an analysis is made of the actual situation within the company. These produce surprisingly interesting results, and are most useful.

We have discussed above some of the things that are being done today towards substituting a new interest with the employees who, in the old days, would have had the craft interest and the personal interest in the work which was done. They are inadequate, they have not yet met the problem, which is extremely complex. Yet these measures are undoubtedly steps in the right direction, and will lead to other — and even better — understanding of the solution of the problem in days to come than is possible today with our present knowledge.

PHOTO-INTERPRETATION OF TRANSPORTED SOIL MATERIALS

(*Continued from page 340*)

using aerial photos since 1935. Practically all preliminary planning for new highway locations is now done from airphotos to a scale of approximately 1,000 feet to one inch. In conjunction with an accurate ground control survey, maps or study plans to a scale of 400 feet to one inch are prepared by the method referred to. All physical features are shown. The multiplex projector is used for drawing contours. With the stereocomparagraph form lines may be plotted, from which a general conception of the topography of the area may be secured. The chosen line is drawn on the prints and from these the location field party stakes the route without any reconnaissance.

The Soils Branch of the same department has found airphotos valuable for indicating sources of granular materials. These may be located on the photos in the form of eskers, kames, abandoned beaches, glacial spillway terraces or as outwash deposits. The photos may also be used in a detailed pedological survey of a highway location. The time required for the field work may thus be reduced to less than half that otherwise required, and in addition airphotos will indicate the areas where intensive field study is required.

Conclusion

These applications of airphoto interpretation are only a few of the many uses to which this technique may be adapted, whether it be in the field of geology, pedology, or any branch of civil engineering. The extent of the information contained in the modern airphoto is almost unbelievable to the layman. At present there are too few skilled in interpreting this information and in adapting it to various purposes. Much work is still required, with repeated checking between photos and ground, before a rapid translation may be made. This is necessarily limited to areas with which the interpreter is familiar or about which he has reliable knowledge. Airphotos give the interpreter a perspective which is not obtainable by any other method. Those familiar with their use would be reluctant to relinquish this modern aid.

Canada in the Berlin Airlift

Although the R.C.A.F. did not operate any aircraft in the Berlin airlift, Canadian-built aircraft were represented in the corridors leading to Berlin's Gatow airport.

The photograph shows an AVRO Lancastrian, the civil conversion of the famous Lancaster bomber, discharging fuel oil into ground tanks at Gatow. This aircraft was built by Canadians at Victory Aircraft Ltd., Malton, Ont., and was used on T.C.A.'s trans-Atlantic services before she joined the fleet of one of the civil air carriers who operated in the airlift under charter to the occupation authorities.

Sixty-Third Annual General Meeting

Convened at Headquarters, Montreal, on January 27th, 1949, and adjourned to the Chateau Frontenac, Quebec City, May 11th, 1949

THE BUSINESS MEETING

The Sixty-Third Annual General Meeting of The Engineering Institute of Canada was convened at Headquarters on Thursday, January 27th, 1949, at eight fifteen p.m., with Vice-President R. S. Eadie in the chair.

The general secretary having read the notice convening the meeting, the minutes of the Sixty-Second Annual General Meeting were submitted, and on the motion of Louis Trudel, seconded by Leon A. Duchastel, were taken as read and confirmed.

Appointment of Scrutineers

On the motion of F. L. Lawton, seconded by H. F. Finnemore, Messrs. C. E. Gelinas, Leo Scharry and J. D. Sylvester, were appointed scrutineers to canvass the officers' ballot and report the results.

There being no other formal business, on the motion of J. B. Stirling, seconded by J. A. Lalonde, it was resolved that the meeting do adjourn to reconvene at the Chateau Frontenac, Quebec City, at eight fifteen p.m. on the eleventh day of May, nineteen hundred and forty-nine.

The adjourned meeting convened at nine o'clock p.m. on Wednesday, May 11th, 1949, with President J. N. Finlayson in the chair.

Nominating Committee—1949

The general secretary announced the membership of the Nominating Committee of the Institute for the year 1949 as follows:

Chairman: John R. Kaye, Halifax, N.S

Branch	*Representative*
Border Cities	C. G. R. Armstrong
Calgary	H. B. LeBourveau
Cape Breton	W. S. Wilson
Central B.C.	H. L. Cairns
Cornwall	C. I. Bacon
Edmonton	F. R. Burfield
Halifax	G. J. Currie
Hamilton	I. M. Macdonald
Kingston	M. N. Hay
Kootenay	A. C. Ridgers
Lakehead	J. M. Fleming
Lethbridge	A. J. Branch
London	E. R. Jarmain
Moncton	R. L. Parsons
Montreal	W. Sharples
Niagara Peninsula	C. G. Cline
Ottawa	Norman Marr
Peterborough	A. L. Killaly
Quebec	C. H. Boisvert
Saguenay	B. E. Bauman
Sarnia	G. R. Henderson
Saskatchewan	E. K. Phillips
Sault Ste. Marie	R. A. Campbell
Saint John	F. P. Vaughan
St. Maurice Valley	J. H. Douglas
Toronto	A. E. Berry
Vancouver	P. B. Stroyan
Victoria	A. L. Carruthers
Winnipeg	T. E. Storey

Award of Medals and Prizes

The general secretary announced the various awards of the Institute for the year as follows, stating that the formal presentation of these distinctions would be made at the annual dinner of the Institute on the evening of May 11th.

Honorary Membership—to Dr. Malcolm Pirnie, consulting engineer, New York, N.Y.

Sir John Kennedy Medal — "A recognition of outstanding merit in the profession or of noteworthy contribution to the science of engineering or to the benefit of the Institute" — to Thomas H. Hogg, M.E.I.C., York Mills, Ontario.

Julian C. Smith Medal — "For achievement in the development of Canada" — to R. W. Diamond, M.E.I.C., Trail, B.C.

Gzowski Medal — to A. H. Wilson Busby, M.E.I.C., Trail, B.C., for his paper "Localized Overheating in the Wall of a High Pressure Vessel and its Effect on Rupture Strength".

Leonard Medal — to P. T. Bloomer, M.C.I.M., Kimberley, B.C., for his paper "Pillar Extraction at the Sullivan Mine."

Plummer Medal — to C. O. P. Klotz, M.E.I.C., Montreal, for his paper "Laurentien Aluminum".

Keefer Medal — to J. D. Mollard, M.E.I.C., Regina, Sask., for his paper "Engineering Significance and Photo-Interpretation of Some Transported Soil-Materials."

Ross Medal — to B. G. Ballard, M.E.I.C., Ottawa, Ont., for his paper "Recent Canadian Radar".

Students and Juniors Prizes

H. N. Ruttan Prize — (Western Provinces) — to A. G. Fletcher, S.E.I.C., Vancouver, B.C., for his paper "Draughting a Logging Topographic Map".

John Galbraith Prize — (Province of Ontario) — to K. R. Stehling, S.E.I.C., Buffalo, N.Y., for his paper "Rocket Propulsion".

Phelps Johnson Prize — (Province of Quebec, English) — to M. B. T. George, S.E.I.C., Regina, Sask., for his paper "Preliminary Design of a Light Racing Airplane."

Ernest Marceau Prize — (Province of Quebec, French) — to Gerard Gascon, S.E.I.C., Ishpeming, Michigan, for his paper "Exploitation des Gisements d'Ilmenite du Lac Tio."

Report of Council, Report of Finance Committee, Financial Statement and Treasurer's Report

On the motion of C. E. Gelinas, seconded by R. C. Flitton, it was resolved that the report of Council, the report of the Finance Committee, the financial statement and the Treasurer's report be accepted and approved.

Reports of Committees

On the motion of G. J. Currie, seconded by R. N. Coke, it was resolved that the reports of the following committees be taken as read and accepted: Legislation, Engineer in the Civil Service, Publication, Membership, Papers, Library and House, Admissions, Professional Interests, Employment Conditions, Board of Examiners, The Young Engineer, Prairie Water Problems, Employment Department, Canadian Standards Association, National Construction Council, Canadian Chamber of Commerce, Canadian Radio Technical Planning Board, Applied Mechanics Reviews.

Branch Reports and Ontario Division Report

On the motion of I. S. Patterson, seconded by J. J. Green, it was resolved that the reports of the various branches and of the Ontario Division be taken as read and approved.

Amendments to the By-Laws

Two proposals were presented for the amendment of the by-laws. One of these proposed that the limit of twenty placed on the number of honorary members be removed. The other proposed that under certain circumstances an alternate be authorized for a councillor who is unable to attend any specific meeting of Council. The first was approved unanimously without any discussion and the second was approved unanimously, as submitted, although there was some discussion as to the possibility of rewording one phrase.

The proposed amendments are as follows and will be submitted to letter ballot of the corporate membership in accordance with Section 80 of the by-laws:

SECTION 12

Fifth line — Eliminate the words: "The number of Honorary Members shall not exceed twenty."

PROPOSED NEW SECTION 30A

Alternates

In the event of a councillor being unable to attend a specific meeting of Council the executive of the branch may appoint an alternate (other than a councillor) for that meeting only who shall be a member of the branch, such alternate to have all the rights and privileges of the councillor whom he is replacing.

Canons of Ethics

The general secretary presented a report of a special committee of the Institute on the Canons of Ethics as proposed by the Engineers' Council for Professional Development (ECPD) which had been accepted at the annual meeting of Council held in Banff, in June, 1948. Among other things the report recommended that the Canons be submitted for approval to a general business meeting of the Institute, to be considered as complementary to and in amplification of the present Code of Ethics as adopted on January 27, 1925.

Past-President Challies pointed out that the Canons have been approved by the Founder Societies of the United States and several other organizations as well. Therefore he moved their approval and adoption by The Engineering Institute of Canada.

Colonel Grant, as the Institute's representative on the executive of ECPD spoke in favour of the proposal and expressed his pleasure in seconding the motion. On being put to the meeting, the motion was carried unanimously.

Election of Officers

The general secretary read the report of the scrutineers appointed to canvass the officers' ballot for the year 1949 as follows:

President:
J. E. Armstrong, Montreal, Que.

Vice-Presidents:
Western Provinces—H. N. Macpherson, Vancouver, B.C.
Province of Ontario—W. J. W. Reid, Hamilton, Ont.
Province of Quebec—R. E. Heartz, Montreal, Que.

Councillors:
Vancouver Branch—W. N. Kelly.
Kootenay Branch—J. V. Rogers
Edmonton Branch—J. E Cranswick
Saskatchewan Branch—F. E. Estlin
Lakehead Branch—W. H. Small
Border Cities Branch—F. J. Ryder
London Branch—V. A. McKillop
Toronto Branch—D. G. Geiger
Ottawa Branch—J. L. Shearer
Kingston Branch—R. D. Bennett
Montreal Branch—R. N. Coke, E. B. Jubien
St. Maurice Valley Branch—F. W. Bradshaw
Saguenay Branch—G. T. Malby
Saint John Branch—L. O. Cass
Halifax Branch—E. C. O'Leary

On the motion of M. Eaton, seconded by Viggo Jepsen, it was resolved that the report of the scrutineers be adopted, that the scrutineers be thanked for their services in preparing the report, and that the ballot papers be destroyed.

Retiring President's Address

The text of the retiring president's address appears on page 358 of this number of the *Journal.*

Vote of Thanks to Quebec Branch

On the motion of E. B. Jubien, seconded by F. W. Bradshaw, it was unanimously resolved that a hearty vote of thanks be extended to the Quebec Branch in recognition of their hospitality and activity in connection with the holding of the Sixty-Third Annual General Meeting.

Vote of Thanks to Retiring Officers

In presenting a motion of thanks to the retiring president, vice-presidents, and councillors, Past-President Cleveland stated that with the growth of the Institute these positions have become more and more important, requiring a considerable amount of work and thought. It was with this in mind that he was so pleased to present a motion of thanks and appreciation to this year's retiring officers. The motion was seconded by Mr. Buss and carried unanimously.

The meeting adjourned at nine forty-five p.m.

The Professional Meeting

There are some who have said that this year's annual meeting was the best ever attempted. That may be an overstatement, springing from some personal experience, nevertheless it is generally admitted that it was a good meeting. Quite readily it could have been the best but there are no absolute standards by which comparisons can be made.

The registered attendance was

992 which was close to the best that has been recorded for any Institute meeting. When the Quebec City branch is compared in numbers with Toronto and Montreal branches this showing will be appreciated as a remarkable achievement. The Quebec committee may well feel satisfied with the results of their efforts.

Both the technical and the social programmes were ambitious beyond previous endeavour. The former comprised twenty sessions, with six additional sessions on the management programme. The social programme included sightseeing tours of great variety, boat trips, plant trips, shiplaunching, golf tournament, with Muriel's Room turning up at the most unexpected places. The attendance at the technical sessions was most gratifying. In most cases the capacity of the room was tested to the full, and in some instances people had to be turned away for lack of space. Larger rooms could have been used to advantage, if they had been available. Testimony to the excellence of these sessions was abundant — the management papers being especially well received. It is planned that all papers and addresses will appear in the *Journal* with a full issue devoted to the management material.

Tuesday's Council meeting saw 17 of the 29 branches represented, with councillors in attendance from as far away as Halifax and Vancouver. At the meeting of the 1949-50 Council on Thursday, May 12th, there were representatives from 19 branches. Further details of these meetings will be covered in subsequent issues of the *Journal*.

The historic Garrison Club provided a delightful setting for the annual president's dinner which followed the Council meeting on Tuesday, the day preceding the official commencement of the meeting. Seven of the seventeen living past presidents were in attendance, including Dr. A. R. Decary of Quebec (1927) and A. J. Grant of Ottawa (1930) and, in accordance with custom, each of these seven elder statesmen of the Institute addressed a few remarks to the guests. A magnificent engraved silver tray was presented by the Quebec branch to Dr. Decary to commemorate his 50th year of Institute membership.

It was a wise course which resulted in the address at Wednesdays' opening luncheon on the History of Quebec by Abbé Arthur Maheux, archivist of the Seminary of Quebec. The Abbé's delightful discourse about the various "tourists", from Jacques Cartier to those of the present day, helped delegates and their ladies to gain a better appreciation of the old city and the points of interest which were visited on the sightseeing tours.

It is difficult and of course unnecessary to pick out any one event as the most outstanding. The packed ball room, gallery and foyer for the television talk and demonstration would indicate that it ranked high, but the 572 persons who heard Dr. Lillian Gilbreth at luncheon on Friday would find it difficult to place anything ahead of that thrilling experience augmented as it was by the brilliant introduction of Dr. Gilbreth made by Elizabeth (Elsie) MacGill, M.E.I.C. These two women, each an outstanding engineer in her own country, gave a performance as a team, which is not likely to be surpassed or even equalled in future Institute meetings.

An unusual international flavour was achieved by the management sessions, which enjoyed the support and participation of a number of eminent American delegates. In addition, the Brazilian Management Council (IDORT) was represented by Dr. M. E. Alvaro accompanied by Senora Alvaro, and Dr. Hugo deHaan of Switzerland, secretary-general of the International Management Committee (CIOS), attended at the request of the president of that body, Assar Gabrielson of Stockholm. Dr. de Haan was accompanied by his daughter and her husband, Mr. N. B. Carey of New York.

Jacques Greber, M.E.I.C., consultant to the Federal District Commission, delivered a paper on the plan for the national capital at Ottawa. A model and a number of maps and photographs were set up in the library of the Chateau in connection with this paper.

For complete adequacy to the occasion, the banquet speaker on Friday evening was pre-eminent. On limited notice Mr. S. John Wright of London, England, flew from Regina and his duties with the U.K. Agricultural Engineering Mission to address the banquet in place of the Premier of Quebec who was prevented by illness from attending. Mr. Wright measured accurately his audience, the occasion, and the demands of the extensive annual banquet programme, and his address was a real contribution to better understanding between Canada and the United Kingdom. In a rare combination of wit and dignity he told of Britain's efforts toward economic recovery and pleaded with Canadians not for pity, but for understanding and the maximum of co-operation. Truly the cause of the old country was well served at this meeting.

The story of this outstanding meeting would not be complete without a tribute to the Radio Corporation of America and the Canadian Broadcasting Corporation, which two organizations combined to sponsor the television technical paper and popular demonstration. Dr. R. D. Kell, director of television research at R.C.A.'s laboratories in Princeton, New Jersey arranged for the supply of several television cameras with at least twelve receivers and all the necessary auxiliary equipment and he delivered the technical paper and participated in the popular demonstration. Alphonse Ouimet, M.E.I.C., assistant chief engineer of the C.B.C., with K. R. Patrick of R.C.A.'s Montreal office, supervised arrangements on the Canadian side and directed the audio operations of the programme.

The Students' Conference and Branch Officers' Conference were directed this year in a greater measure by the participants themselves. The students were especially keen and a great deal of credit is due to Dr. G. R. Langley for the time he has devoted, in Quebec and for several years previously, to the work of the Institute's student guidance committee in whose province the conference lies. The Branch Officers' Conference suffered somewhat because the most satisfactory times at which it might be held conflicted with council or general meetings and these meetings command the attendance of most of the branch officers. On this occasion, however, the officers appointed their own chairman and secretary and met at times agreeable to most of the delegates. The minutes when transcribed should yield much of value to council and to the branches. Representatives from 14 branches were in attendance.

This 1949 annual meeting emphasized, more than has any previous Institute meeting, the value of publicity to the profession and the paramount position of the In-

Nineteen of the 29 branches were represented at the Annual Meeting of Council on Tuesday preceding the Annual Professional Meeting.

SIXTY-THIRD ANNUAL MEETING PHOTOGRAPHS

ON THE FACING PAGE:

Some of the Institute's senior officers (l. to r., back row): R. S. Eadie, Quebec vice-president; W. J. W. Reid, vice-president-elect for Ontario; L. Austin Wright, general secretary; R. E. Heartz, vice-president-elect for Quebec; J. A. Vance and W. L. Saunders, Ontario vice-presidents; (front row) I. P. Macnab, Maritime vice-president; J. E. Armstrong, president-elect; J. N. Finlayson, president; Alex Lariviere, Quebec vice-president.

At the head table for Wednesday's dinner, student delegates shared honours with past-presidents and other officers of the Institute. In the centre photo are shown (l. to r.) A. G. Norem, student delegate from the University of Alberta; President Finlayson; Vice-President Eadie, who presided; John Fisher, "The C.B.C.'s wandering reporter and observer of the Canadian Scene"; Dr. A. R. Decary, the senior past-president in attendance at the meeting.

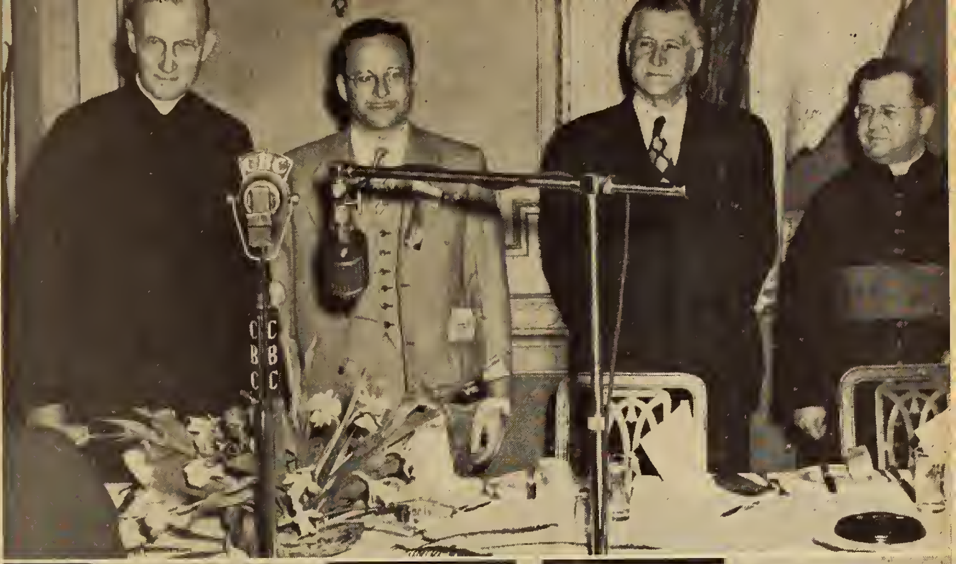
Executives of CIOS with the organizational chart of the Committee: (l. to r.) Dr. M. E. Alvaro, president of IDORT; H. B. Maynard, president of the National Management Council; C. A. Peachey, chairman of the Canadian Management Council; and Dr. Hugo de Haan, secretary-general of CIOS.

ON THIS PAGE:

At Wednesday's opening luncheon the principals were (l. to r.): Abbé Arthur Maheux, of the Seminary of Quebec, who spoke on "The History of Quebec City"; Paul Vincent, chairman of the Quebec Branch and official host to the meeting; His Honour Lucien Bourne, mayor of Quebec, who extended his City's welcome; and Mgr Alphonse Marie Parent, secretary general of Laval University.

The two centre photographs include the past-presidents who were guests of President Finlayson at the Garrison Club on Tuesday evening. They are (above l. to r.): DeGaspé Beaubien, L. F. Grant, Thomas Hogg, F. P. Shearwood, A. R. Decary, President Finlayson; (Below l. to r.): A. J. Grant, E. A. Cleveland, K. M. Cameron, and the president-elect, J. E. Armstrong. On the extreme right is K. R. Mitchell, councillor for the Halifax Branch, whose opposite number (not shown at the left of the upper photo) was councillor W. N. Kelly from Vancouver Branch.

Among those at the head table at the Annual Banquet were (l. to r.) Mrs. Malcolm Pirnie; the speaker, S. John Wright; President Finlayson; and Dr. Lillian Gilbreth.



PRESENTATIONS

The Institute's medals and prizes for 1948-49 were presented at the Annual Banquet on Friday, May 13. At top (l. to r.) President Finlayson congratulates Dr. Thomas Hogg, R. W. Diamond and A. H. W. Busby who were awarded, respectively, the Sir John Kennedy Medal, the Julian C. Smith Medal and the Gzowski Medal. These are the three highest awards of the Institute, the Sir John Kennedy Medal being awarded only once every two years. Below (l. to r.) C. O. P. Klotz, B. G. Ballard, and M. B. T. George receive from the president the Plummer Medal, the Ross Medal, and the Phelps Johnson Prize.

Other prize winners who were unable to be present were J. D. A. Mollard (Keefer Medal); A. G. Fletcher (Ruttan Prize); K. R. Stehling (John Galbraith Prize); and Gerard Gascon (Ernest Marceau Prize). The Leonard Medal had been awarded on a prior occasion to P. T. Bloomer. Details of these awards were published in the May issue of the *Journal*.

Left:—The President confers honorary membership in the Institute on Dr. Malcolm Pirnie, distinguished consulting civil engineer, and past-president of the American Society of Civil Engineers. (Citation appears on page 366).

elegates, their ladies and guests were received at the Annual Ball on Friday night by, (l. to r.), ast-President J. N. Finlayson, Mrs. Pirnie, Dr. Malcolm Pirnie, Mrs. Armstrong, President E. Armstrong, Mrs. Vincent and the chairman of the Quebec Branch, Paul Vincent.

he speaker at Friday's Luncheon was Dr. Lillian Gilbreth the distinguished American manage-ent engineer, shown here with Vice-President I. P. Macnab of Halifax, who presided at this nction.

t the President's Dinner, Dr. A. R. Decary of Quebec received from the Quebec branch the graved silver tray shown in the picture below. In the group with Dr. Decary and President inlayson are A. B. Normandin, E. D. Gray-Donald, President-elect J. E. Armstrong, Roger esjardins, Alex Lariviere, Paul Vincent and Hector Cimon, who made the presentation.

The Boat Trips

The Boat Trips

On Thursday afternoon many of the delegates enjoyed boat trips on the St. Lawrence and visited the Quebec Bridge and other points of interest. The Vessels were the government ice-breakers, Ernest Lapointe and N. B. McLean.

Left, top:—This group includes J. A. Beauchemin, Montreal, (at the wheel), and C. E. Gelinas, Montreal, at his right.

Centre:—Mr. Walter Manning, Quebec (Superintendent, Department of Transport, who arranged the boat trips); Mr. and Mrs. E. R. Brannen, Fitzroy Harbour; Mr. and Mrs. L. C. Sentence, Hamilton.

Bottom:—Mr. and Mrs. J. T. Lang, Montreal; and Mrs. J. R. Mills, Montreal; Max L. Baker, Halifax.

Right, top:—Mrs. Roger Desjardins, Mrs. Maurice Ostiguy, Mrs. L. J. Barron, Mr. Phil French, Mrs. L. Trudel, Mrs. A. P. Benoit, Messrs. Jacques and A. P. Benoit.

Right Bottom:—Mr. E. E. Orlando, Montreal; Miss Dorothy White, Quebec; Mrs. I. S. Patterson, St. Catharines; Mrs. Orlando; Mr. and Mrs. H. W. Lea, Montreal.

The photo at right centre shows the three youngest delegates studying the television camera. Tony (age 3), Alec (4), and Steve (5) are sons of Dean R. M. Hardy of the faculty of engineering, University of Alberta. Mrs. Hardy is shown at the left of the photograph.

---

stitute as the central publicity agency for the profession. John Fisher "the C.B.C.'s wandering reporter and observer of the Canadian scene" based his broadcast on Sunday, May 15th on his attendance and observations of the meeting. Citing, as an example, the distinguished career of Miss Elsie MacGill and her comparative anonymity in Canada, Mr. Fisher chastized the engineers for their excessive modesty and failure to acquaint other Canadians with their achievements. Mr. Fisher told the delegates in a short address at dinner on Wednesday evening, May 11th, that Canada's future depends on the development of her vast natural resources and, because such development is the responsibility of engineers, they are the most important group in Canada today. The press services and the C.B.C. in cooperation with the C.P.R. Public Relations Officer at the Chateau Frontenac covered the meeting very thoroughly with resulting widespread publicity throughout the country.

A special feature arranged by John Fisher and the Canadian Broadcasting Corporation was a fifteen minute discussion on Wednesday afternoon by President J. N. Finlayson, President Elect J. E. Armstrong, Past President, L. F. Grant and the Maritime vice-president, Ira P. Macnab, which was recorded for broadcast over the national network and was also played for the delegates at Wednesday's night dinner after Mr. Fisher's brief introductory remarks.

The meeting was also given further radio coverage in a third fifteen minute broadcast on the French network on Sunday May 15th, and two announcements broadcast with the C.B.C.'s regular news service.

There can be no doubt that the Institute's friends in industry contributed much to the success of the meeting by their generous contribution to "Muriel's Room" (perhaps the quotation marks are superfluous in view of the firm place this institution has achieved at annual meetings). It is in this delightful rendezvous that old friendships are renewed and new friendships made. The custom does much to weld the parts of an annual meeting into a solid entity productive of maximum values in business and pleasure.

The 1949 annual meeting has established a standard which will not be easily equalled or surpassed. However, with each passing year the Institute grows in stature and influence and the sights are imperceptibly raised for the programme and attendance at the Annual Meeting. Already the formation of committees is under consideration and it will not be long before the assembly will begin of all the thoughts and suggestions out of which will emerge in Toronto in July next year the combined annual summer meeting of the American Society of Civil Engineers and the annual meeting of The Engineering Institute of Canada. If the comments heard in Quebec can be believed most of this year's delegates will be in attendance and the Toronto committees will be striving mightily to meet their great expectations.

Headquarters Records

Each time the *Journal* or other Institute mail is dispatched we are advised of undeliverable items due to incorrect addresses. Our records staff must follow up these changes and the regular service to members suffers thereby. *Please* advise headquarters when your address or occupation changes. The form below can be completed, clipped, and mailed to headquarters in a few moments.

Address of the Retiring President

J. N. Finlayson, D.Sc., M.E.I.C.

Delivered before the Sixty-third Annual General and Professional Meeting of The Engineering Institute of Canada, Quebec, Que., May 11, 1949

During my term of office it was my privilege to visit twenty-eight of the twenty-nine branches from Sydney to Victoria and observe at close range the contributions that engineers are making to the peacetime economy of the Commonwealth. The time was auspicious for such a series of visitations. In every locality and in every centre there were marked manifestations of progress, installations of new plants, expansion of industry and abundant prosperity. On this occasion I feel that I cannot do better than attempt to present in outline some of the outstanding developments under way which will help to raise still higher our standard of living and contribute to the improved welfare of our citizens.

The annual meeting of the Institute at Banff in June, 1948, coincided with the occurrence of most disastrous floods in the Fraser River and Columbia River valleys. Approximately 51,000 acres of land were covered with water for one whole month, May 26 to June 26. I am glad to report that due mainly to the splendid efforts of our engineers — many, members of the Institute — the work of restoration and rehabilitation is progressing favourably. The estimated cost is more than ten million dollars. Improved types of dykes and improved methods of construction have been developed.

On the Campus of the University of British Columbia, under grants from the National Research Council, a scale model of the Fraser River delta is being built, where hydraulic problems pertaining to floods and irregularities of flow can be investigated. In the new Applied Science building a hydraulic laboratory complete with flumes and measuring tanks for experimental purposes has been installed, together with a modern materials testing laboratory and a well-equipped soils testing laboratory. Substantial additional units of hydro-electric power were installed in British Columbia during the year under review; new pulp and paper and celanese mills are in the course of construction; proposals have been announced for the establishment of aluminum and steel refineries.

In the Province of Alberta there is renewed activity in oil production. The announcement that Alberta has proven to the world that it is one of the best hopes for new major oil reserves is endorsed by leading oil authorities. The United States is no longer able to meet even its own peacetime needs; it has become a net importer of oil. This is of major importance to Canada, long an importer. It is stated to be within the bounds of possibility that Canada's annual total consumption of oil (approximately 100 million barrels) may eventually be forthcoming from this rich prairie province. Leduc, Woodbend, Redwater, Lloydminister, have become almost household names. 355 wells were drilled in Alberta and Saskatchewan in 1948. The major oil companies in the U.S.A., together with many independents, are associated with our own Canadian companies in the annual outlay of 50 million dollars on oil exploration and development. There is a report that the Government of Alberta will probably pass legislation to permit the export of natural gas to other parts of Canada. This would add many millions of dollars of revenue to the Province, the oil companies, and their shareholders.

The proposed Spray River hydro-electric development and the construction of the St. Mary dam and irrigation system in Southern Alberta are examples of a steadily expanding industrial and agricultural life. Travelling across the prairies, one is impressed with the work done and projected by the P.F.R.A. The proposed dam across the South Saskatchewan at Elbow is most interesting. Recent discoveries of uranium metals in the Lake La Ronge area give promise that Saskatchewan may become one of the main sources of atomic energy in North America.

In Manitoba additional units have been added to hydro-electric plants on the Winnipeg River and definite plans have been made for a large new development at Pine Falls. Mineral production is steadily increasing and present indications are that expansion will be still greater in the near future. The Sherritt-Gordon Mines Limited has continued an aggressive programme of exploration and development of the copper-nickel occurrences in the Lynn Lake area; the Nor-Acme gold property of the Howe Sound Exploration Company Limited is about ready for full-scale operation. Also noteworthy is the production in increasing quantities of activated non-swelling bentonite in the Thornhill area.

Passing along to Ontario, it is announced that completion of the mill construction by Kerr-Addison Gold Mines (4,000 tons daily) places that mine in the enviable position of being Canada's largest gold producer and the second largest in the western hemisphere, exceeded only by Homestake. Discovery of pitchblende at Theano Point on the north shore of Lake Superior gives promise of important mining developments in that area. Plans are proceeding for the commencement of the rapid transit project in Toronto and the city planning scheme in Ottawa.

Perhaps the outstanding engineering event that occurred in the Province of Quebec during the past year is the commencement of the development of the iron and titanium deposits in the northeastern areas of the province. New hydro-electric units on the St. Maurice, the new highway to the Saguenay district, the aluminum arch bridge at Arvida and the proposed titanium refineries at Sorel are items of major interest and importance.

It was a very great pleasure for me to find thriving business and manufacturing conditions in the Maritime Provinces. The marketing of fruit, coal, etc., met with many problems apparently incapable of immediate solution, but the hope is expressed that improved conditions will prevail before the close of the calendar year. It is exhilarating for a native of the Maritimes to note the progress made in the construction of hard-surfaced highways. Intense interest is exhibited in the prospect for improved transportation facilities at the Strait of Canso, and the recent announcement that a bridge is to be built is enthusiastically applauded in all the provinces.

I had hoped to be able to visit Newfoundland but, after due consideration, it was decided expedient to postpone the inauguration ceremonies of Branch No. 30 until the late summer or early autumn.

Although I saw only a relatively small part of the three billion dollar construction programme authorized in Canada for the current fiscal year, I do appreciate the privilege accorded me, as president of the Institute, of conveying to you information on some of the activities in which many of our members are engaged. I may mention parenthetically that three-quarters of the volume of investment mentioned above is due to expenditures of private business and individuals and less than one-quarter to government expenditures on construction machinery and equipment. It is interesting to hear from reliable sources that in the last four years more than 8 billion dollars have been spent on construction machinery and equipment — more than half as much as the government spent directly on Canada's war effort. More than 275,000 housing units have been built, at about twice the rate of the thirties or fifty percent better than in the prosperous twenties.

It is predicted that in the years beyond 1949, private investment activity will begin to slide to a lower level than that which prevailed in the immediate post-war period. If so, public investment may have to provide a larger proportion of our expansion budget.

It is reassuring to be told that to this end, preparatory plans are being made.

While, as indicated in these remarks, there is evidence of an abundant prosperity in every part of Canada; while we are expanding our capital structure at unprecedentedly rapid rates, with the consequent increase in production of goods and services; while we are dazzled by government and corporation surpluses, there is grave concern expressed concerning the shrinkage of our old overseas markets and the collapse of the North Atlantic trade triangle which solved many of our marketing problems in the pre-war years. More than half of our overseas exports on which our prosperity depends are paid for through the Marshall Plan. That Plan may possibly be abandoned in about three years. Today even the Marshall Plan is proving insufficient to buy all our surpluses as the apple growers, fishermen, and lumbermen well know. Avoidance of a depression within the next decade will require a measure of good luck and good management. I trust that it may not be considered irrelevant to suggest that the engineer, by virtue of his training in the fields of production, transportation, and distribution may be able to make a contribution towards the solution of economic and political problems. Perhaps it is not mere coincidence that an engineer, a member of this Institute, has been appointed Minister of Trade in the Federal Cabinet or that his former portfolio, that of Reconstruction and Supply, has been filled by the appointment of another engineer. Our guests from sister societies in the United States will be pleased to recall that both these gentlemen studied the science of engineering at the Massachusetts Institute of Technology.

One of the most interesting of the visits was that to the youngest member of the Institute family at Kamloops when I had the honour and pleasure of presenting the Charter to an enthusiastic group of members.

The Maritime Professional Meeting held at The Algonquin, St. Andrews-by-the-Sea, New Brunswick, September 8-10, was an unqualified success. The committees are to be congratulated for the excellent programme of papers and entertainment that they provided. It was interesting and instructive to observe the degree of harmony and co-operation that exists between Institute Branches and Professional Associations in the Maritimes.

The realization of a need for co-operation among the various institutes, associations, and societies in dealing with national problems led to an interesting round table discussion at Vancouver last month, concurrent with the annual meeting of the Dominion Council of Professional Engineers. Representatives of the Engineering Institute of Canada, the Canadian Institute of Mining and Metallurgy, the Chemical Institute of Canada and the Canadian Society of Forest Engineers met with the officers and members of the Dominion Council on Tuesday, April 5, 1949. Although no agreement was reached, there was an almost unanimous expression of opinion as to the necessity for the formation of a body that will be empowered to speak for all Canadian engineers in matters of general interest and national import. It is to be hoped that subsequent meetings of a similar nature will be able to find a common satisfactory answer to this all important question.

Much concern is expressed in every branch about the employment outlook for graduate engineers in view of the large classes attending the universities. The Bureau of Technical Personnel has compiled some very useful information which it issues periodically in bulletins and reports. In a recent publication it is stated that there are in Canada about 25,000 engineers who are either graduates of recognized universities or technically qualified members of appropriate professional organizations or both. The new supply in prospect includes 3300 graduates in 1949, 3500 in 1950, and 2300 in 1951, about 9000 in all for the three years mentioned. Some of the prospective graduates may be lost to Canada through emigration, some lost to engineering by diversion to other fields. On the other hand, there will be some additions to the ranks by the entry into Canada of a number of engineers from other countries.

The Bureau conducted a survey in an attempt to arrive at an estimate of future demand for trained engineers. Information was sought from about 1500 employers including practically all of the largest users of engineering skills. As a result there was an indicated demand for about 2000 new graduates each year during the five-year period 1947-1952. It was revealed that approximately three-quarters of all the engineering personnel in the country were on the payrolls of less than 200 employers. More than one-third of the country's engineers find their livelihood in the various phases of manufacturing operations. Dean Young reports that less than one-half of the engineering graduates of the University of Toronto devote their lives to purely technical pursuits. Graduates in great numbers are to be found in responsible administrative positions, in industry, in the public service, in finance, insurance, law, the diplomatic service, and on the bench. I might add graduates from my classes are occupying pastorates in important metropolitan churches.

At this point the question naturally arises: what kind of education must we provide if our young engineers are to succeed in meeting the requirements of the broader field that is opening for them? This question has been studied seriously by the Institute, especially by its Committee on the Young Engineer. The late Lord Tweedsmuir who spoke on several occasions to engineers had something to say about education. Put broadly he said the question is how to combine humanism with technique. By humanism in education we mean the study of man in all his relations as thinker, as artist, as a social and moral being; by technique, the acquisition of that special knowledge which directly concerns the making of a livelihood. We must face this question with common sense and a proper perception of realities. It is no good giving a boy a smattering of culture if he is going to starve, and, in this day and generation, it is not much more good to provide him with some equipment for earning his daily bread and to leave his mind narrow and inelastic. One side of a solution is that there should be an honest endeavour to introduce into our engineering curricula some elements of what we call the humanities. The other may be found in the way in which technical training itself is conducted. If it is regarded not merely as the acquisition of a certain number of rules of thumb, but as a piece of serious mental training, then we are introducing the spirit of the humanities into the vocational side. We are producing not only technicians, but men and women with minds. We are producing potential citizens.

There remains the pleasant duty of returning thanks for the great honour done me. I have enjoyed every one of the presidential duties very much indeed. Some of you know that when this office was first proposed to me I was not very eager to accept it. I was aware that there were certain important duties which I would be expected to perform and I was conscious of limitations, geographical and otherwise, that would prevent complete fulfilment. I could only promise that when any such duty did present itself, I would do my best to meet it in a right and proper manner according to the best of my judgment. I retire from office now more appreciative than ever of the high place that the Institute has in the community. I regret that it was impossible for me to attend more than two or three meetings of Council during the year, and my warmest thanks are now tendered to the vice-presidents, councillors, chairmen, and members of committees who carried the ball so effectively. I am especially grateful to all kind friends who provided transportation and good company throughout their respective districts and to the General Secretary and his efficient staff for making plans for all my journeys with such diligence and dispatch. I convey to my successor in office my best wishes for a very happy and fruitful year.

Special Convocation at Laval University

On Wednesday, May 11, during the Annual Meeting, a special convocation was held by Laval University to confer the honorary degree of doctor of science on President Finlayson; A. R. Decary, Quebec superintendent of public works; and A. B. Normandin, technical adviser to the Quebec department of hydraulic resources.

In the photograph taken after the ceremony at the University are (l. to r.) Hon. Senator Paul Henri Bouffard, K.C.; Dr. Decary; Dr. Finlayson; Canon Maurice Laliberté, vice-rector of Laval; Dr. Normandin; and Mgr. Alphonse Parent, secretary general of Laval.

News of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

World Government

The undersigned were appointed by the council of the Institute as delegates to the 53rd Annual Meeting of the American Academy of Political and Social Science held in Philadelphia, Pa., on April 8 and 9, 1949, the general topic of discussion being World Government, Why? When? How?

Most of the speakers were, as with virtue, for World Government of some sort but differed about the degree of surrender of national sovereignty and the method of arriving at a World State. The World Federalist would make it in one jump, others through the processes of revision of the United Nations charter and others would have none of it. Nearly all agree that scientific advancements in mass slaughter make necessary some controlling body with power to settle international difficulties, some believing in immediate action, others thinking there was sufficient time for evolution instead of revolution.

The discussion of the International Trade Organization (I.T.O.) was productive of the most spirited knockdown and dragout fight Dr. Clair Wilcox was in favour of the I.T.O. pacts even although they have many complicated escape clauses which are so involved no one can understand them and they make escape difficult. He pointed out that twenty or more nations were already functioning under the pacts and that over double that number would adhere to them, and that Canada would have to make the least changes in its tariff policies. Dr. Elvin H. Killheffer opposed the pacts as not being sufficiently favourable to the United States. He maintained that tariffs were the least objectionable form of barriers in the way of world trade. He also took exception to many of the clauses of the I.T.O. pacts as being unrealistic.

Of the more than twelve speakers, about one-half had been connected, in one way or another, with the United Nations or its affiliated organizations. Others included the diplomatic representatives to the United States, economists and members of organizations such as the American Tariff League, the American Civil Liberties Union and others.

The aspects of Communism, Socialism, Fascism, and Capitalism were referred to many times and the general impression was that the majority of the speakers held views which were somewhat to the left of center, tending toward a socialistic attitude as distinguished from the Communist philosophy.

The problems faced by small nations under present day world conditions were discussed by some of the speakers. The complete text of all of the addresses made during the meeting will be published in the July issue of "The Annals" of the Academy and your delegates have arranged to have two copies of this publication presented to the library of the Institute for the use of the membership.

Your delegates were entertained by the Academy at luncheon on April 8 and had, at all times, a most pleasant and profitable two days. They thank the Institute for the opportunity to represent it and remain,

Yours truly,

S. Logan Kerr, M.E.I.C.,
Consulting Hydraulic Engineer,
Philadelphia, Pa.

W. S. Pardoe, M.E.I.C.,
Professor of Hydraulic Engineering, University of Pennsylvania,
Philadelphia, Pa.

The Presidential Visits

For many years it has been the custom for presidents of the Institute to visit the branches whenever possible during their terms of office. Since they are leaders in the profession and are invariably busy men, the sacrifices of personal and business affairs which they must make to devote three full months to the annual branch visits can be readily appreciated.

There is no doubt that the visits are valuable and are favoured by the branches. Attendance at the meetings at which the President speaks is often the record for the year and there is fruitful discussion of Institute affairs. It is customary for the president and general secretary to have less formal meetings with the executive of each branch, and these meetings have clearly contributed to the present robust condition of the Institute.

The itinerary for President Finlayson's trip from his home in Vancouver to the Annual Meeting in Quebec included all those branches which he had not visited previously: Victoria, Vancouver, Kootenay, Lethbridge, Calgary, Regina, Winnipeg, Lakehead and Sault Ste. Marie. The perversity of the weather marred a perfect score when fog prevented his plane from landing at Sault Ste. Marie and the meeting there had to be cancelled. It may be possible, however, for Dean Finlayson to complete his 29 visits by calling at Sault Ste. Marie on his way back to Vancouver during the summer.

The president was accompanied by the assistant general secretary. Mr. Laird had proceeded to Vancouver via Saskatoon and Edmonton where he had met with branch executives and visited the Universities of Saskatchewan and Alberta.

In Victoria the ladies were included at a dinner meeting in the Empress Hotel with Reg. Bowering, the branch chairman presiding.

An enthusiastic welcome was tendered by a large attendance of Vancouver Branch members in the York room of the Georgia Hotel. On the day following Mrs. George W. Allen, wife of the branch chairman received the visitors and branch executives at her attractive home which commands a superb view of the sea from the slopes of West Vancouver.

At the Kootenay Branch, membership is composed mainly of engineers and executives of the Consolidated Mining & Smelting Company of Canada Limited. The president and assistant general secretary were guests of the company at South Slocan and Trail and in the latter centre there were two luncheon meetings with branch members and the executive, and a large dinner meeting with the ladies present and with civic executives and members of other technical societies as guests.

The party were met at Lethbridge by Chairman W. L. Foss, Secretary-Treasurer Dave Cramer, R. D. Livingstone, J. M. Davidson, R. S. Lawrence, C. S. Clendening, and other members of the branch. They spent the afternoon inspecting the tremendous P.F.R.A. earth dam which is rising from the bed of the St. Mary River to augment the already extensive irrigated areas of Southern Alberta — and thereby add to the prosperity of this already well-endowed province. A large dinner meeting was held at the Marquis Hotel.

At Calgary, in addition to the general meeting, at the Renfrew Club, the visitors enjoyed an illuminating discussion of Institute matters at a luncheon with the executive. Officials of Calgary Power Limited, under the direction of Mr. G. A. Gaherty, M.E.I.C., president of the company, arranged for a visit to the company's new power development at Spray Lakes near Banff, where, with appropriate ceremony, Dean Finlayson closed the cofferdam to direct the water through the diversion tunnel and unwater the site of the new earth dam on which the project is based.

In Regina the president and assistant secretary were privileged to attend a joint meeting of the Saskatchewan Branch executive and the Council of the Association of Professional Engineers of Saskatchewan. Cooperation under the agreement in Saskatchewan is very close and the Institute and Association act largely as one body — an ideal arrangement.

The Winnipeg Branch executive set an outstanding example of interest in Institute affairs. They had prepared an agenda for the executive luncheon, and the discussion carried on through the whole afternoon with almost all members remaining to participate. It was obvious that those present carried the opinions of the branch members in all matters and the visitors were given the impression that Winnipeg Branch is in an extremely healthy condition.

The next and as it proved later, the last stop was at the Lakehead where the travellers were joined by Mr. J. A. Vance, one of the two vice-presidents in Ontario. The party lunched with the branch executive and a record attendance turned out to welcome the president and his party at dinner at the Country Club. After dinner, the group adjourned to a comfortable lounge where a most stimulating informal discussion continued until close to midnight.

After four attempts to land at the fog-shrouded airport which serves Sault Ste. Marie, T.C.A. was forced to carry the party on to Toronto and after a telephone conversation with branch officials the meeting was cancelled, to the president's extreme disappointment.

The general meetings which each branch held on the occasion of the president's visit are not treated in detail in the foregoing as they have been and will be treated fully by the branch news editors in the appropriate section in this and other issues of the *Journal.*

There is no doubt of the great value of the visits of the president to the branches. Their usefulness can be increased proportionately as the executive will endeavour to sample membership opinion on all issues and arrange informal meetings with the president with agenda of all controversial issues and full unrestricted discussion. The meeting with the executive at Winnipeg was particularly noteworthy in this respect and might well be regarded by other branches as a model of procedure by which the maximum benefit may be secured from the presidential visits.

News of Other Societies

The **Canadian Electrical Association's** 59th Annual Convention is being held at the Banff Springs Hotel, Alberta, on June 28, 29 and 30, 1949.

B. C. Fairchild, managing director of C.E.A., is in charge of arrangements. His office is at Room 704 Tramways Building, Montreal 1, Que.

The **Institute of Power Engineers,** 496 Church Street, Toronto. Ont., announce that Canada's Power Show will be staged at the Royal York Hotel, Toronto, on November 28, 29 and 30, and December 1.

The show will contain exhibits of the products of leading power equipment manufacturers. Designed primarily for the Canadian supplier, many other countries will also be represented. Attendance is estimated at double that of the last power show in 1947, which attracted 6,000 persons connected with power plant engineering.

The **Community Planning Association of Canada,** has announced that the National Citizens' Conference on Community Planning will take place at the Fort Garry Hotel, Winnipeg, Man., October 6-8, 1949.

The Conference will discuss "Building Lessons of the 1940's; Planning Opportunities for the 1950's".

Further information will be supplied by the Association, 56 Lyon Street, Ottawa, Ont.

The Montreal regional conference of the **American Institute of Chemical Engineers,** September 7, 8 and 9, 1949, will devote two days to technical papers. Plant visits to several industries at Shawinigan Falls, Que., have also been arranged.

Members of the Engineering Institute are invited to attend, and the local committee on arrangements includes several E.I.C. members. Its chairman is Dr. H. R. L. Streight, P.O. Box 10, Montreal.

The Annual meeting of A.I.Ch.E. for 1949 will be at Pittsburgh, Pa., at the William Penn Hotel, December 4-7.

The first Plant Maintenance Show, an exposition devoted exclusively to cost reduction through improved installation, operation and maintenance of equipment and services in factories, warehouses and other plants, will be held in the Auditorium, Cleveland, Ohio, January 16 to 19, 1950. Clapp & Poliak, Inc., of New York will manage the exposition.

Concurrently, a 4-day conference on plant maintenance methods will be held, with L. C. Morrow, editor, *Factory Management and Maintenance*, as general chairman.

The **American Institute of Mining and Metallurgical Engineers** includes in its calendar of 1949 meetings a regional meeting at Neil House, Columbus, Ohio, on September 25-28; and the fall meeting, under the auspices of the Institute of Metals Division of A.I.M.E., in Cleveland, October 17-19. The next annual meeting of A.I.M.E. will be in February, 1950, in New York, at the Statler (Pennsylvania) Hotel.

Headquarters of A.I.M.E., are at 29 West 39th St., New York.

The **Federation of Sewage Works Associations,** 325 Illinois Building, Champaign, Illinois, has chosen Hotel Statler, Boston, Mass., as headquarters of its 22nd annual meeting on October 17-20, 1949.

Host to the Federation will be the **New England Sewage Works Association,** which will combine its twenty-first annual meeting with the national convention.

The 1949 semi-annual meeting of the **American Society of Mechanical Engineers,** is being held June 27-30, at San Francisco, Cal.

The Society's fall meeting is scheduled for September 28-30 at Erie, Pa.; and the annual meeting will be in New York on November 27 to December 2, 1949.

Offices of the A.S.M.E. are at 29 West 39th St., New York 18, N.Y.

The 52nd annual meeting of the **American Society for Testing Materials** will be in session June 27 to July 1 at Atlantic City, N.J., at Hotel Chalfonte Haddon Hall.

The Society' first Pacific area national meeting will be at the Fairmount Hotel, San Francisco, Cal., October 10-14, where some 70 technical papers will be presented.

Information can be obtained from A.S.T.M., 1916 Race Street, Philadelphia 3, Pa.

The 1949 summer convention of the **American Society of Civil Engineers** will be in Mexico City, July 13-15. The fall meeting is scheduled for Washington, D.C., November 2-4; and the Society's next annual meeting will take place January 18-20, in New York City.

A.S.C.E. headquarters are at 33 West 39th St., New York 18, N.Y.

The schedule of 1949 meetings of the **American Institute of Electrical Engineers** includes: the summer general meeting at the New Ocean House, Swampscott, Mass., June 20-24; the Pacific general meeting at the Fairmount Hotel, San Francisco, Cal., August 23-26; the midwest general meeting, at Netherland Plaza Hotel, Cincinnati, Ohio, October 17-21.

A.I.E.E. headquarters are at 33 West Thirty-ninth St., New York, N.Y.

The west coast meeting of the **Society of Automotive Engineers** will be held August 15-17, at the Multnomah Hotel, Portland, Ore.

Inquiries should be addressed to S.A.E. at 29 West 39th St., New York 18, N.Y.

The programme of the 57th annual meeting of the **American Society for Engineering Education,** in session June 20-24 at Rensselaer Polytechnique Institute, Troy, New York, consists of four general sessions to hear and to discuss papers of general interest together with some sixty functional conferences to discuss a variety of educational problems.

Professor A. Allan K. Booth, Department of Mechanics, Rensselaer Polytechnique Institute, Troy, is in charge of registration.

At the 1949 Engineering and Marine Exhibition, at Olympia, London, England, August 25 to September 10, 1949, the seventeenth exhibition in the series instituted in 1906, over 600 exhibitors will be represented.

The honorary president of the Exhibition is Rt. Hon. Sir John Anderson, P.C., G.C.B., G.C.S.I., G.C.I.E., F.R.S., Chairman of the Port of London Authority. The organizers are F. W. Bridges & Sons, Ltd., Grand Buildings, Trafalgar Square, London WC2.

For the Second International Mechanical Engineering Congress, September 1949, Paris, France, has been chosen as the locale.

Theme of the Congress will be "Production Efficiency."

The Congress Secretariat is at 11, Avenue Hoche, Paris (VIIIe).

Second General Meeting of the Ontario Provincial Division

The second general meeting of the Institute's Ontario Provincial Division was called to order at 9 A.M. March 19th, 1949, with Mr. J. R. Dunbar in the chair.

The meeting considered the "Toronto Brief" which was submitted to Council by the Toronto branch in 1946 and decided that the reply to the Brief by the committee on professional interests constituted the full action necessary and that the question required no further consideration. The general feeling of the meeting was that many of the recommendations of the Brief have been implemented in whole or in part and that further benefits could result if the contents of the brief were kept before Institute bodies for future reference.

The subject of shore line erosion on the Great Lakes was considered. Mr. W. R. Rice stated that the Honourable George H. Doucett, Minister of Highways and Public Works, through the Deputy Minister of Public Works, Mr. George N. Williams, is anxious to give all assistance possible in the matter of shore line erosion within the scope of the various provincial Acts of Parliament and to cooperate with the Federal Government in schemes for relief within the provincial boundaries. Mr. Rice stated that he is already planning immediate meetings with some municipal bodies which have requested investigation by the provincial government and other governing bodies into shore line erosion and protection problems.

After some discussion the meeting moved that "a committee be formed to include one member from each branch whose geographical location be such that they would be interested, with the object of communicating with, and assisting other groups now specifically concerned with the problem of shore line erosion, and placing the whole problem before the community involved."

The subject of collective bargaining was raised and Mr. D. D. Whitson stated that the objective of the Toronto group in submitting a memorandum to Institute Headquarters was to explore ways and means of getting the Ontario Government to allow certification of units of the Association of Employee Professional Engineers & Assistants and to maintain the certification of those already certified at the time of the change in legislation which restricted engineers from legal provisions relating to collective bargaining. There was considerable discussion as to the effectiveness of the bargaining units without the legal backing which they had formerly enjoyed and the point was once again raised as to whether the various engineering bodies had been right in advocating the exclusion of engineers from the provisions of the collective bargaining legislation. The general feeling of the meeting was in favour of this action but there were opinions expressed that a minority group did exist which favoured collective bargaining and the engineering bodies had some responsibility toward this group.

It was moved that, in view of the fact that the problem is receiving adequate attention from both the Federation and the Ontario Association, the Institute would be wise to withhold further action until these other groups have completed their studies.

In the matter of new business it was suggested that the views of Mr. J. G. G. Kerry regarding a St. Lawrence Deep Waterway should be placed before the executive of the Ontario Division for discussion.

There was also a definite feeling that the Institute should be taking more positive steps to ensure that young engineers receive instruction, information and consideration with the object of inducing a real desire for Institute membership.

The meeting adjourned at 11 A.M.

Personals

Notes of the Personal Activities of Members of the Institute

Dr. J. J. O'Neill, M.E.I.C., vice-principal of McGill University, Montreal, and dean of the Faculty of Engineering of McGill, was elected in February last as chairman of the Arctic Institute of North America.

Dr. O'Neill is a charter member of the Arctic Institute, and is active in several geological and engineering societies. He is Dawson Professor of Geology at McGill.

V. R. Currie, M.E.I.C., has been appointed commissioner of works and city engineer of the City of Kingston, Ont.

Mr. Currie, a graduate of Queen's University, class of 1923, has been since 1928 with the Department of Transport of Canada, and was stationed most recently at the Welland Ship Canal at St. Catharines, Ont.

He is a veteran of both World Wars serving in the latter with the R.C.E. with the rank of captain.

E. G. Cullwick, M.E.I.C., left in June for Scotland, having been appointed the first Watson-Watt Professor of electrical engineering in the University of St. Andrew's, at University College, Dundee, Scotland.

Mr. Cullwick graduated from Cambridge University in 1925, and was for some time connected with Canadian General Electric Company, Limited, at Peterborough, Ont. He held University appointments subsequently; in 1928-1935 as assistant professor of electrical engineering at University of British Columbia; in 1935 as lecturer in engineering at the Military College of Science, Woolwich, England; in 1936, again at U.B.C., as associate professor electrical engineering; and from 1937 at the University of Alberta, as professor and head of the Department of electrical engineering.

During the recent war, on leave from the University of Alberta, he served in the R.C.N.(R), as director of electrical engineering at Naval Service Headquarters, Ottawa, receiving the rank of captain (E), and being awarded the O.B.E in 1946. He resigned from his university post in 1946, and was appointed director of the Electrical Research Division of the Defence Research Board, at Ottawa, which position he has relinquished, to take the appointment in Scotland.

Alphonse Ouimet, M.E.I.C.

Alphonse Ouimet, M.E.I.C., assistant chief engineer of the Canadian Broadcasting Corporation, has been appointed by the Corporation, as coordinator of television.

He has been engaged in television work and research since his graduation from McGill University in 1932 when he was employed as a research engineer with Canadian Television Ltd., Montreal. In 1935 he joined the Canadian Radio Broadcasting Commission and later became operations engineer for the C.B.C.

In 1939 he was made general supervising engineer and in 1941 received his appointment as assistant chief engineer Two years ago he made a study tour of television in Britain, France, Holland and the United States.

K. W. Fraser, M.E.I.C., has been appointed manager of sales by the Canadian Westinghouse Company Limited, Hamilton, Ontario.

Mr. Fraser was at Hamilton, as assistant to the vice-president in charge of sales, since 1948. He had previously been district manager of the Quebec District, with headquarters in Montreal. A graduate of the University of Toronto, in the 1927 class in electrical engineering he spent several years with the Westinghouse Electric and Manufacturing Company at Pittsburgh, Pa., and returned to Canada in 1930 when he entered the Montreal district office on sales work.

H. L. Cairns, M.E.I.C., has been transferred to headquarters of the Public Works Department of British Columbia at Victoria, with the position of office engineer. He has been at Kamloops, B.C., a locating engineer for the Department.

Mr. Cairns relinquishes with regret his connection with the new Central British Columbia branch of the Institute, which he has served as secretary-treasurer since its inauguration January last.

George Bromley, M.E.I.C., has advised of the opening of a new professional engineering office of Kearns & Bromley, associate consulting engineers, at Wolfville, N.S. The office will be under the supervision of Mr. Bromley, and will offer services in connection with power plants, heating systems, water supply, sewerage, ventilation, air conditioning, refrigeration and electric systems.

Mr. Bromley has been in the firm since 1946 working from the Montreal office. He had done other consulting work in Montreal in 1945, after his discharge from the R.C.N.V.R. in which he served with the rank of Lieutenant. He is a graduate of University of Manitoba class of 1936, with the degree of B.Sc. in electrical engineering.

J. G. MacGregor, M.E.I.C., has recently been named general manager of the Canadian Utilities Limited, Edmonton, Alta.

Mr. MacGregor, a past councillor of

J. G. MacGregor, M.E.I.C.

the Institute has been with Canadian Utilities since his graduation in 1929 from the University of Alberta. He worked at Calgary until 1931, when he was transferred to Vegreville in charge of the Company's diesel plants and transmission and distribution systems in that area. In 1939 he was transferred back to Calgary as assistant manager, but went to the Edmonton office in 1948.

H. A. Cooch, M.E.I.C.

Harold A. Cooch, M.E.I.C., formerly vice-president in charge of sales, has been elected president of the Canadian Westinghouse Co. Ltd. Mr. Cooch has been associated with the Company since 1910. Following graduation in electrical engineering, from the University of Toronto, Mr. Cooch entered the Company's apprentice engineering course at Pittsburgh. He has been in the Westinghouse sales force since 1912 and was transferred to the head office of the Company in 1923. The following year he was appointed assistant to the vice-president. In 1938 he was appointed vice-president, and was placed in charge of sales in 1944. He has been a director of the Company since 1946. Mr. Cooch saw service Overseas in World War I when he held the rank of Captain with the engineers of the 3rd Canadian Division. Mr. Cooch joined the Institute as a member in 1939 and has served the Hamilton branch in various executive positions.

Robert F. Shaw, M.E.I.C., was appointed in April last to the position of manager of engineering for The Foundation Company of Canada, Limited, and is located at the Company's head office in Montreal.

Mr. Shaw is a civil engineering graduate of McGill University, class of 1933. He joined Foundation Maritime Limited in 1937 as assistant to the vice president, building construction; was named assistant to the president in charge of shipbuilding; and later shipyard manager at Pictou, N.S. He returned to Montreal in 1945 to Foundation Company of Canada Limited. He was assistant to the president from 1946 until his recent appointment.

T. C. Main, M.E.I.C., and **E. M. Rensaa,** M.E.I.C., announce that their consulting firm, Main and Rensaa, will in future be known as Main, Rensaa & Minsos, as a result of the association with the firm of **A. O. Minsos,** M.R.A.I.C.

Mr. Minsos has been with the firm for some time as architectural consultant, and he now becomes a partner. He is a member of the Royal Architectural Institute of Canada and is a registered architect in Alberta. A Canadian by birth, Mr. Minsos received his architectural degrees in Switzerland and Germany, and after graduation did further study in town planning. He practiced architecture in Oslo, Norway, until his return to Canada in 1947.

In advising the *Journal* of this new association, Mr. Main said, "Mr. Rensaa and I feel that this country would benefit from a closer association between architects and engineers. The present arrangement in our firm, in our opinion gives us the opportunity of providing better service to the public."

Bernard Beaupre, M.E.I.C., was appointed early in 1949 as chief of the secretariat of the Engineering Division of the City of Montreal.

Mr. Beaupre graduated from Ecole Polytechnique, Montreal, in 1941, and after a year's service with Dominion Bridge Company in Montreal, he attended University of Toronto, doing postgraduate work in health engineering, and receiving an M.Sc. degree in 1943. He then joined the Division of Industrial Hygiene of the Ministry of Health of Quebec.

F. A. Hanington, M.E.I.C., is now an engineer with the Elgin Construction Company at St. Thomas, Ontario.

Mr. Hanington, an electrical engineering graduate of the University of New Brunswick, class of 1931, was previously supervisor of construction for the Veterans Land Act, at London, Ont.

K. R. Meyer, M.E.I.C., has joined the E. B. Eddy Company at Hull, Que., as development engineer, where he is to be responsible for work on coordinating and extending existing production and service facilities, and preparation of long range expansion programmes.

Mr. Meyer was previously with Stadler, Hurter & Co., Montreal, where for the last three years he was in charge of several design sections and of the requisitioning and estimating department.

Ralph C. A. Pittis, M.E.I.C., is with the Toronto Transportation Commission as assistant engineer, maintenance of way, at the Hillcrest Works, Toronto. Mr. Pittis, a 1937 graduate in civil engineering from the University of Toronto, was a maintenance engineer on the staff of that University prior to his recent appointment.

K. A. Lawrence, Jr.E.I.C., has been employed as an engineer with the City of Montreal. Mr. Lawrence is a 1946 graduate of McGill University, Montreal.

V. J. Pimenoff, Jr.E.I.C., has joined the staff of Canadian Broadcasting Corporation in Montreal. He is a 1949 graduate in electrical engineering from McGill University, Montreal.

Stuart Clark, Jr.E.I.C., who was formerly with the Thunderbay Paper Company, Port Arthur, Ont., is now a mechanical engineer in the Plant Engineering Department of Ford Motor Company of Canada, Windsor, Ont.

Arthur Martynse, S.E.I.C., has joined the staff of Canadian Industries Limited as a mechanical development engineer at Shawinigan Falls. He graduated in mechanical engineering this year from the University of Saskatchewan.

James Harris, S.E.I.C., has obtained a position with Canada Packers Limited in their Edmonton plant. Mr. Harris is a 1949 graduate in mechanical engineering from the University of Saskatchewan.

W. H. Kasperski, S.E.I.C., a 1949 graduate in mechanical engineering from the University of Saskatchewan, is with Hudson's Bay Mining and Smelting Co. Ltd., in Flin Flon, Man.

David Friesen, S.E.I.C., is employed by the Dominion Foundry & Steel Company in Hamilton. Mr. Friesen graduated in mechanical engineering this year from the University of Saskatchewan.

H. N. Young, S.E.I.C., has obtained a position with Canadian Pacific Railways. His duties commenced after graduating recently from McGill University.

G. L. MacLean, S.E.I.C., has been employed by Coca Cola Company Limited, Montreal, his duties commencing after graduating from McGill University in May.

J. F. Harris, S.E.I.C., has obtained a position with Stevenson & Kellogg Co. Ltd., Montreal, Que. He is a 1949 graduate from McGill University.

J. K. Picken, S.E.I.C., on graduating from University of Manitoba this year, joined the staff of the Hydro Electric Power Commission of Ontario.

Visitors to Headquarters

D. Roland Webb, M.E.I.C., Saint John, N.B., May 3.

S. John Wright, London, England, May 3.

A. H. Wilson Busby, M.E.I.C., Trail, B.C., May 7.

William N. Kelly, M.E.I.C., Vancouver, B.C., May 13.

Lillian M. Gilbreth, Montclair, N.J., May 16.

R. W. Boyle, M.E.I.C., Ottawa, May 19.

J. F. D. Withrow, M.E.I.C., Vista, Cal., May 25.

Donald R. Beckett, M.E.I.C., Fort William, Ont., May 26.

New Honorary Member of the Institute

Malcolm Pirnie

The following is the citation read at the presentation of honorary membership to Dr. Pirnie, at the recent Annual Meeting of the Institute:

Dr. Malcolm Pirnie, Hon.M.E.I.C.

The presentation of Honorary Membership is the highest honour any society may bestow. Tonight the Institute so honours one of its own members, one of its good friends, one of the most distinguished engineers of that country to the south of us which, of itself, is distinguished for its great engineers.

Malcolm Pirnie richly deserves the commendation of his friends and fellow engineers. At their hands he has been honoured many times. Outstanding among these honours is his honorary degree of Doctor of Engineering received from Rensselaer Polytechnic Institute, and the Hoover Medal presented to him only a few months ago.

The Institute is proud to join that distinguished and discerning group, in further acclaiming his outstanding character and achievements.

Doctor Pirnie is a consulting civil engineer who lives in Scarsdale and works in New York — not an unusual combination. He has been associated with many great enterprises in the field of water and sanitation. He has been consultant to private corporations, states, municipalities and the American Government both in war and in peace. His professional record is far too extensive to attempt even an outline here.

He has been a strong supporter of those societies which have won his favour. He is a past president of the American Society of Civil Engineers, The Engineers Joint Council, the American Waterworks Association and the American Institute of Consulting Engineers.

He is one of those engineers who accepts readily his civic responsibility. In Scarsdale he has served as Trustee and Mayor. He is an honorary trustee of the White Plains Hospital. For seven years he was a trustee of Vassar College. He has served on the New York University Engineering Advisory Committee, and is right now chairman of Princeton Advisory Committee to the Department of Civil Engineering, a member of a Board at Harvard and a trustee of Robert College, Istanbul, Turkey.

Dr. Pirnie's own belief is that "professional stature is one of acknowledged leadership accorded special privileges, that requires nearly equal division between professional undertakings, contributions to the advancement of the profession and service as a citizen to subdivisions of government as advisor or official".

Dr. Pirnie's record is a splendid example of the full life as it may be lived by the engineer, and is an inspiration to all, both old and young, who are privileged to know him. Truly, he has walked "The Second Mile" which the late Dr. Wickenden described as "the mile of voluntary effort", where men strive for excellence, and seek to invest their work with a wide and enduring significance.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Lt.-Col. Henry John Lamb, M.E.I.C., former Ontario supervising engineer for the Federal Department of Public Works, died on May 19, 1949, in Toronto.

Col. Lamb was a past president of Royal Military College, Kingston, Ont., a former vice-president of the Royal Canadian Institute, and a past-president of the Association of Professional Engineers of Ontario.

Born at St. Georges, Bermuda, in 1871, he attended Royal Military College, Kingston, graduating in 1893. He was subsequently engaged on geological surveys and railway surveys as assistant engineer. His early engineering work included the construction of the street railway of the city of Quebec and the erection of steel bridges and masonry substructures for Canadian Pacific Railway. In 1897 he was appointed section engineer on construction of the Crow's Nest Pass Railway for the C.P.R., and was made assistant engineer, maintenance-of-way, on the western division of the C.P.R. the following year. He joined the staff of the Department of Public Works of Canada in 1901 as assistant engineer on construction and maintenance of harbours and rivers. He was promoted to district engineer in charge of harbours and rivers in the west of Canada in 1905. From 1909-12 he was engineer in charge, representing the Dominion Government on the construction of the Detroit River Tunnel.

He served throughout the first Great War as general staff officer at headquarters, 1st and 3rd divisions, and also as assistant director on the Air Ministry in London. Col. Lamb was twice mentioned in despatches and was awarded the D.S.O. for conspicuous gallantry during operations in the field. On returning to Canada in 1919 Col. Lamb was appointed supervising district engineer for the Department of Public Works of Canada, for the Province of Ontario.

Retiring from that office, Colonel Lamb later served with the Department of Munitions & Supply as resident technical officer at the mill of Anaconda American Brass Limited, New Toronto, Ont.

Colonel Lamb has been a Life Member of the Institute since 1939. He had joined the Institute as an Associate Member in 1899, transferring to Member in 1905.

Russell Grey Swan, M.E.I.C., of Montreal, who died at his home on April 20, 1949, was prominent as a specialist in the study of water resources and the regulation of rivers.

Mr. Swan retiring in 1942 as manager of the water resources department of The Shawinigan Water Power Company, was credited with much of the responsibility for the basic hydraulic studies which resulted in the successful development of hydro-electric power on many of Quebec's rivers. His work contributed greatly to the programme by which the Shawinigan Company expects to develop, eventually, more than two million horsepower on the St. Maurice River alone.

Born at Kincardine, Ont., in 1887, Mr. Swan graduated from the University of Toronto in 1909 as a bachelor of applied science. He went west immediately in the service of the Water Resources Branch of the federal Department of the Interior, conducting hydrometric studies in Manitoba and irrigation plans in Alberta.

After taking part in the construction of the Coquitlam-Buntzen hydro-electric development near Vancouver, he rejoined the Dominion Department as chief engineer for the British Columbia and Yukon district in 1913, and for the next 12 years directed the studies which have since been used in various power developments, irrigation and flood control projects along the west coast. He joined the Shawinigan Company in 1925.

Mr. Swan was a member of the Corporation of Professional Engineers of Quebec. He became a Life Member of the Institute in 1942. He had joined as a Student in 1907 and had transferred to Associate Member in 1913, and to Member in 1940.

W. Raywood Smith, M.E.I.C., of Goderich, Ont., who had retired as Middlesex County engineer in 1946, died in hospital in Goderich on April 28 after a brief illness.

A well known conservationist, he was a consultant of the Ontario Planning Department and hydraulic engineer for the Aux Sable Conservation Authority.

Mr. Smith was born in Toronto, Ont., in 1888, was educated there, and qualified in engineering as an articled apprentice to the late F. W. Farncombe, O.L.S. He joined the Grand Trunk Pacific Railway at Fort William as a draughtsman for the division engineer, and he later served as instrumentman on construction. He was sent to the West by the Railway, and served in the Prairie Division as instrumentman on a track party, and in the Mountain Division as resident engineer. He was with the Canadian Northern Railway in 1911-12, as resident engineer on the Athabasca and Brazeau Mountain Branches. In 1913 he became resident engineer for the Edmonton, Dunvegan and British Columbia Railway.

Mr. Smith served in World War 1, with the rank of lieutenant in the R.C.E., and on his return to civilian life received the appointment as assistant county engineer of Middlesex County, Ontario. In 1940 he was named county engineer.

Mr. Smith carried on his private practice after his retirement in 1946 from Middlesex County, and he was appointed in 1947 as special consultant to the Ontario Department of Planning and Development, to act in an advisory capacity between the Department and municipal bodies in the Thames River Valley, which was being surveyed for flood control and conservation development.

Mr. Smith joined the Institute in 1918 as an Associate Member, transferring to Member in 1940.

F. B. Kilbourn, M.E.I.C., president of Canada Cement Company, died in Montreal on May 20th as a result of a heart attack. Mr. Kilbourn was at the time planning to attend the spring meeting of the Portland Cement Association at Warm Springs, Va.

Mr. Kilbourn, a prominent Canadian industrialist, was wartime steel controller of Canada, and in addition to his association with Canada Cement, was president of Canadian Refractories Ltd., and Dolmite Refractories Ltd.

He was born at Owen Sound, Ontario, in 1883. After attending public and high schools in Ontario, he came to Montreal and studied at McGill University for a year. He worked for a period with the Royal Electric Company and with the Montreal Light, Heat and Power Company.

He began his career in the cement industry with his discovery about 1904 of the adaptability of the rock formation of Montreal to the manufacture of cement and he built and operated the plant of the Lakefield Portland Cement Company. He continued to operate the plant after it was acquired by the Canada Cement Company.

He was superintendent of No. 1 Plant, Canada Cement Company, from 1909 to 1919 and acted as general superintendent from 1919 to 1939. Elected a director of the company in 1931, he was appointed vice-president in 1937, assistant general manager in 1939, general manager in 1942 and president in 1948.

For his work as Canada's steel controller during the recent war Mr. Kilbourn was invested with the O.B.E. in 1946.

Mr. Kilbourn joined the Institute as a Member in 1924, transferring to Member in 1927.

Claude Knox McDonald, M.E.I.C., of Shawinigan Water and Power Company, Montreal, passed away on March 15, 1949.

Mr. McDonald was born in Glasgow, Scotland in 1885, and received his education in that city. He served his apprenticeship in the shipbuilding industry and prior to the first World War was employed as a hull design draughtsman with Scotts' Shipbuilding and Engineering Co., Greenock. In 1919 he came to Canada and was employed in the same capacity with the Davie Shipbuilding and Repairing Company, Levis, Que.

Moving to Toronto in 1921, Mr. McDonald became associated with Walter J. Francis & Co., consulting engineers, and was engaged in research work for the Ontario Hydro-Electric Inquiry Commission. In 1923 and 1924 he worked for a time on general mechanical design for Canadian Line Materials Ltd., Toronto. Taking up residence in Montreal in 1924, he worked on electric power plant design with the same firm. He joined the Shawinigan Water and Power Co., in 1926, and was engaged in power development work until the outbreak of the second World War.

In 1941, while on loan to the Dominion Government, Mr. McDonald returned to the shipbuilding industry, joining Wartime Merchant Shipping Ltd., as hull design engineer. In 1942 he became associated with the Geo. T. Davie Shipbuilding Company, Levis, Que., and subsequently became naval architect for that firm, engaged in the construction of naval and merchant vessels. Mr. McDonald returned to the Shawinigan Water and Power Company in 1945, where he was employed at the time of his death. He had been in ill health for the last three years.

During the First World War, Mr. McDonald was commissioned as a lieutenant in the Royal Field Artillery. He saw service in various sections of Europe throughout the war years. He was wounded in action and later mentioned in despatches.

Mr. McDonald joined the Institute in 1924 as an Associate Member, transferring to Member in 1940.

J. L. E. Price, M.E.I.C., Montreal contractor and builder, passed away in Montreal on May 20, 1949, after an illness of several months. Mr. Price was president and general manager of J. L. E. Price and Company Limited, Montreal.

Born at Aberbeeg, Monmouthshire, Wales, in 1889, he was educated in public and technical schools in England and Wales, and served an articled pupilage in engineering and architecture. Before coming to Canada in 1911 he served as engineer with several British contracting firms.

His first position in Canada was with the Department of Natural Resources, Canadian Pacific Railways, and after four years there he left in 1915 to serve as a lieutenant with the Canadian Expeditionary Forces. Returning from overseas, he became assistant to the chief engineer and manager for construction of International Paper Company's mill and hydro-electric development at Temiskaming, Que.

From 1921 to 1931 he served as vice-president and director of George A. Fuller Company of Canada Limited, in which capacity he was responsible for construction of such important Montreal structures as the Royal Bank of Canada, Bell Telephone, and Dominion Square buildings.

In 1931 Mr. Price formed his own company — J. L. E. Price & Company Limited — which since that time has taken in hand many large scale peace-time and wartime contracts for such clients as the Department of Munitions and Supply; the Aluminum Company of Canada, Ltd.; Canadian Industries Limited; Defense Industries Limited; Canadian Pacific Railway Company; R.C.A. Victor Company Limited; Dominion Textiles Limited; Dominion Oilcloth and Linoleum Company Limited; Shawinigan Water and Power Company; and The Bank of Nova Scotia.

One of Mr. Price's outstanding contributions to the construction industry during late years has been the development of apprenticeship training in Quebec, through his invaluable work as chairman of the Apprenticeship Commission of the Building and Engineering Construction Trades of Montreal. He also found time to serve as chairman of the Montreal Rehabilitation Veterans' Housing Committee and as president of the National House Builders' Association. In 1947 the Canadian Legion awarded to Mr. Price the medal of Merit in tribute to his work on veteran housing.

Mr. Price joined the Institute as a Member in 1932.

John Wesley Pierce, M.E.I.C., of Peterborough, Ont., a past president of the Dominion and Ontario Land Surveyors Associations, died on March 8, 1949, after a short illness.

Mr. Pierce was born at Cookshire, Que., in 1885, and he studied engineering at University of Toronto. He qualified as an Ontario Land Surveyor and a Dominion Land Surveyor in 1909, and qualified in Manitoba in 1930. His engineering practice took him across Canada, from New Brunswick to the Great Slave Lake area of the Northwest Territories.

Mr. Pierce, from 1904 to 1912 was employed in surveying work in Ontario, and then he became a member of the firm Beatty and Pierce, engineers and surveyors, Pembroke, Ont. Mr. Pierce became employed by the Surveyor General of Dominion Lands in 1919. It was in 1920 that he received the appointment as surveyor representing Dominion and Ontario governments on the survey of the Manitoba — Ontario boundary. This work, which Mr. Pierce regarded as his most important achievement, was in 1947 retraced and extended by his son, John A. Pierce.

In 1923 Mr. Pierce was sent to New Brunswick as acting provincial supervisor for the Topographic Survey of Canada, and the next year he was appointed supervisor for Ontario, which position he occupied until his retirement from the Civil Service of Canada in 1932. Mr. Pierce at that time commenced a practice in Peterborough, Ont., in which he was active until his death.

Mr. Pierce joined the Institute in 1933 as a Member.

J. A. Laughton, M.E.I.C., who was senior consulting engineer for Stevenson & Kellogg Ltd., at Montreal, died in hospital on April 19, 1949, after a brief illness.

Mr. Laughton was born at Brandon, Man., in 1909, and studied at University of Manitoba, graduating in 1935 with the degree of B.Sc. in civil engineering.

He worked for Canadian Brown Steel Tank Co., Toronto, Ont., as an engineer from 1935 to 1938; and was a sales engineer for Lincoln Electric Co. of Canada Ltd., Toronto, Ont., in 1938-40. He then joined Hamilton Bridge Co. Ltd., as a welding engineer and shop superintendent. Two years later he came to Montreal and was with the Dominion Rubber Company for several years.

In 1946 he became an engineer for Wilson Contracting Company, and among other projects was staff engineer on the erection of the Laurentien Hotel in Montreal in 1946 and 1947. He joined the staff of Stevenson & Kellogg in 1948.

Mr. Laughton joined the Institute in 1940 as a Member. He was also a member of the Association of Professional Engineers of Quebec and of the American Institute of Tool Engineers.

News of the Branches

Activities of the Twenty-nine Branches of the Institute and abstracts of papers presented at their meetings

Calgary

T. M. Parry, M.E.I.C.
Secretary-Treasurer

D. C. Fleming, M.E.I.C.
Branch News Editor

The Calgary Branch of the Institute met for dinner at the Renfrew Club on April 29, 1949.

The meeting was honoured by the presence of Dean J. N. Finlayson, president of the E.I.C. and Assistant General Secretary Doug Laird.

The president and assistant general secretary are on a trans-Canada tour, meanwhile visiting the various Branches and inspecting noteworthy engineering projects in the various provinces.

The president addressed the gathering of about 100 and made some observations about the industrial scene.

The industrial expansion of Canada from coast to coast indicated a continued need for engineers; thus assuring graduating engineers of ample employment opportunities. The west might not be able to absorb all the graduates, but the industrialized east could offer plenty of employment. Opportunities for geological and chemical engineers were particularly good in Alberta's oil fields. The president said he was particularly impressed with the St. Mary Dam near Lethbridge. "It should give Southern Alberta a complete new lease on life. It will ensure stability of the agricultural industry in that area." He urged members to form a strong organization which would act in the interests of the engineering profession as the Canadian Bar Association does for the legal profession.

Doug Laird addressed the meeting briefly and told of the problems associated with the publishing of the *Journal*. He mentioned that a directory of membership, as well as an engineering products directory was in preparation. The membership is increasing at the rate of about 10 percent per year and now stands at about 12,000.

News that a prominent and popular engineer, Sam G. Coultis, would leave for Edmonton shortly, occasioned a presentation by Homer LeBourveau. Mr. Coultis has been prominent in Southern Alberta's oil industry for the past 32 years. He will assume his duties as vice-president and general manager of the Imperial Pipe Line Company, a subsidiary of Imperial Oil, Ltd. The heartfelt best wishes of his numerous friends and associates go with him.

Edmonton

E. K. Cumming, M.E.I.C.
Secretary-Treasurer

O. G. Kelly, M.E.I.C.
Branch News Editor

At an evening meeting held jointly by the Edmonton Branch of the E.I.C. and the local branch of the M.E.A.C. in the Garrison Officers' Mess of the Prince of Wales Armouries on Thursday, April 14th, Major-General Howard Kennedy, Ottawa, consulting engineer, presented a paper dealing with **Forest Management on the Eastern Slopes.** Branch Chairman H. W. Tye presided. General Kennedy was introduced by Lt.-Col. J. S. Beeman, who traced the speaker's career in forestry engineering up to his present appointment as chairman of the Eastern Rockies Forest Conservation Board.

The speaker commenced by explaining that forestry is a very broad field, and affects our daily life in many ways. He stated that the main function of forests is to equalize stream flow. They also act as a habitat for wild life, and they prevent erosion. These are the long-term benefits which we derive from them. The short-term benefits consist of forest products.

General Kennedy quoted statistics to show the place of forestry in the world. He stated that the total forested area of the world is 25 per cent of the land area, and that world use at present amounts to 600 million cords annually. There are enough forests in the world, he said, to last indefinitely if managed wisely.

Dealing with erosion, the speaker said that in his estimation, steady erosion of agricultural land throughout the world constitutes a threat to world peace more serious than Communism or the Atomic Bomb.

Turning to his work with the Eastern Rockies Forest Conservation Board, General Kennedy stated that it had as its chief object the regulation of the spring run-off in order to offset the shrinkage of the glaciers, from which approximately 50 per cent of the summer flow of our larger prairie rivers is now derived. The first stage is to protect the forests already there and to this end a start has been made on a trunk road running the entire length of the Conservation Board area. The Board is also studying the effects of grazing in certain areas and is experimenting with the growing of trees. In closing the speaker warned against expecting quick results and stressed the importance of public interest and co-operation in making forest conservation effective.

After an interesting discussion, F. R. Burfield moved a vote of thanks to the speaker, which was heartily endorsed by the 62 members and guests present. Refreshments, served by the Mess staff, ended a very enjoyable evening.

❖ ❖ ❖

Sixty-three members were in attendance at the Annual Meeting of the Edmonton Branch held on Monday, April 25, 1949, in the MacDonald Hotel. The meeting took the form of a dinner, followed by a business session and smoker. H. W. Tye acted as chairman. During the dinner period the chairman presented engraved silver steins to the following local members who had presented papers to the branch during the year: Dean R. M. Hardy, for his address entitled "A Report on the Second International Conference on Soil Mechanics and Foundation Engineering" — Messrs. C. Z. Monaghan and S. J. Hampton, for their paper entitled "The Underground Electrical Distribution Network for the City of Edmonton" — and Mr. G. R. MacLean, for his paper entitled "Synthetic Resins and Some of Their Applications".

Reports covering branch activities during the past year were presented. An increase in membership was reported, from 266 at April 30th, 1948, to 367. In addition to these members it was reported that 45 students had made application but had not as yet had their applications approved by Council.

After discussion of matters on the agenda, elections took place which resulted in the following list of Branch officers: Chairman, T. W. Dalkin; Vice-Chairman, E. H. Wright; Secretary-Treasurer, E. K. Cummings; Executive, O. G. Kelly, W. I. McFarland, E. L. Smith, H. A. Carswell, T. C. Main, R. E. Phillips; Auditors, D. K. Campbell and H. Hole, Jr.

The retiring Chairman then turned over the meeting to Mr. Dalkin and the business session was adjourned.

❖ ❖ ❖

On May 14th one hundred and ten members of the Edmonton Branch and their guests were conducted on a tour of the newly constructed Imperial Oil Refinery at Edmonton.

Members met in the Administration Building at the refinery and H. H. Moore outlined the history of the plant and described some of the highlights of its transportation from Whitehorse to its present location.

J. A. Sidervan, production controller, and A. L. Scott, chief clerk production control, gave brief lectures on the processing and the general description of some of the equipment and their functions.

Members were then divided into four groups and conducted on a tour of the entire refinery. The tour was considered by all members very successful and enlightening and it was felt special mention should be made of the following members of the staff of the refinery: H. H. Moore, superintendent; E. S. Davis, assistant superintendent; A. Mira, process superintendent; B. H. Sherwood, plant maintenance engineer; D. E. Pittard, chief chemist; J. A. Siderван, production controller; H. J. Rae, technical superintendent; W. Anderson, production control engineer; A. L. Scott, chief clerk production control.

Mr. Scott is a lecturer at the University of Alberta and is employed with the Imperial Oil Company during his vacation periods.

Halifax

M. L. Baker, M.E.I.C.
Secretary-Treasurer

A. R. Harrington, M.E.I.C.
Branch News Editor

A very interesting paper on **Radiant Heating** was presented to the February meeting of the Halifax Branch of the Institute by G. Lorne Wiggs of Montreal.

Mr. Wiggs explained how radiant heating crept up on us in Canada without very much notice being taken of it. He explained that coils installed in the ceiling of a building must emit heat by radiation; this heating being similar to electro magnetic and sound waves, warms anything in the path of the wave similar to the sun's action on the earth.

Some radiant heating systems are installed in the floors, but this method also sets up convection currents to heat the room. Radiant heating installed in the ceiling has advantages over that installed in the floor in that the ceiling changes temperature more quickly, due to the small plaster covering over the coils compared to the large concrete covering that would be over coils installed in the floor.

Some of the advantages of radiant heating are that we may operate with lower room air temperatures, lower temperature gradients between the floor and ceiling, better humidity control and lower fuel consumption. Temperature control is a difficulty with thermostats in the building and some installations use a thermostat outside for 80 or 90 percent control with trimmer thermostat control inside for 10 percent.

Mr. Wiggs stated that on buildings costing between $25,000 and $50,000 radiant heating will about break even in cost compared to the more common types in use. In larger buildings however, hospitals, apartment houses, etc. Radiant Heating installations will cost about 15 per cent less.

C. D. Martin extended a vote of thanks to the speaker on behalf of the members present.

❖ ❖ ❖

The development of electronics is "the greatest aid to navigation since the discovery of the compass," James H. Rowlett, vice-president and general manager of the firm of Cossor (Canada) Limited, told a meeting of the Halifax Branch of the Engineering Institute of Canada on March 22, 1949, at the Lord Nelson Hotel. Speaking on the subject **Electronic Aids to Navigation,** Mr. Rowlett described in vivid detail several systems of the application of electronics to navigation and predicted that it would be of tremendous value to navigation both at sea and air in the future.

Mr. Rowlett outlined the problems of navigation both for marine craft and aircraft and stated that during the recent war, many aids to navigation had been developed. By the stimulus of the war, he added, the application of electronics to navigation had been developed considerably.

Although radar is not being used to a great extent in Canada as yet, since it had only been brought into use during the war, he termed it "the coming thing" and said that the combination of Radar and LF Loran might very possibly be the answer to the long range anti-collision device.

During his address, Mr. Rowlett described in great detail the operations of various systems of electronics in navigation, including Radar, Loran, Consol and Decca, and outlined the many advantages and problems that were involved. One by one, he broke down their various steps in transmitting messages to either sea or air craft and the various methods employed in sending out signals by either continuous waves or pulse transmissions.

❖ ❖ ❖

The April meeting of the Halifax Branch was held at the Lord Nelson Hotel, April 28th. Dr. R. O. Jones, professor of psychiatry, Dalhousie University, lecturer in industrial psychiatry at Nova Scotia Technical College, and psychiatrist at the Victoria General Hospital, Halifax, presented a paper on the **Importance of Human Relationship in Industry.**

The speaker stated that just as doctors must consider people rather than a collection of pieces and parts of an anatomy, engineers must realize that all machinery and equipment is run by people. Thus their behaviour is important to industry. The chief problem of a psychiatrist is to prevent bad behaviour in a general way, rather than cure individuals of the results of bad behaviour. Behaviour depends upon an individual personality facing a particular situation. If situation and the personality are known, behaviour can be predicted. Usually the situations are known, so the job is to study the personality, which must be considered under three general aspects: physical characteristics, intelligence, and emotional growth.

In placing a person in a job, care should be taken to see that the job fits his personality needs for prestige, sense of accomplishment, security, and hope of advancement. This requires considerable study by management, as in modern industry there is little opportunity for satisfaction to the employee, as he seldom sees the completed article on which he has done partial work and it is hard for him to realize his importance to the completed project.

Dr. Jones described the very interesting experiment undertaken by the Western Electric Company several years ago, called "The Hawthorne Experiment".

Not all the work to be done in this field is to be expended on the employee, but management itself can often cause trouble, so that management itself should look to its job personality. The first signs of poor behaviour, due to insufficient attention being paid to the personalities of the workers show up in absenteeism, employee unrest and low productivity.

Dr. Jones concluded by saying that tests are very effective in showing persons not suited for a particular job, but they don't necessarily show the person best suited.

Considerable discussion occurred after the presentation of the paper and Chairman M. L. Baker conveyed a vote of thanks to the speaker on the motion of Mr. L. J. Archibald.

Hamilton

I. M. Macdonald, Jr.E.I.C.
Secretary-Treasurer

J. H. Mitchell, Jr.E.I.C.
Branch News Editor

The regular monthly meeting of the Hamilton Branch was held on February 17, 1949, in the Science Lecture Theatre, McMaster University, Chairman Neil Metcalf presided, and 40 members and guests were in attendance.

The speaker, J. J. Kelly, was introduced by H. Thomasson as the Hamilton district manager of the Lincoln Electric Company of Canada, and a well known authority on welding and welding problems. Mr. Kelly's talk was entitled **Arc Welding and Related Construction Design.**

The speaker began by pointing out that fabrication by welding had been proven and is now accepted as a standard method of construction. He cited as examples the floating harbour Mulberry, Bailey Bridges, and the oil supply line Pluto, used by the armed forces in invading Europe, which were speedily fabricated by welding. These were, he said, completely satisfactory from a structural point of view, and were built with a minimum of labour and expense.

Welded construction has many advantages, such as lightness, cheapness, improved appearance, and speed of fabrication, continued Mr. Kelly. He pointed out the many improvements that had been made in welding techniques to keep pace with new designs, and outlined some of these with the help of a very interesting sound film.

After a question period, the speaker was thanked by W. B. Nicol, and the meeting adjourned for the customary refreshments.

❖ ❖ ❖

About 130 people were present at the annual joint meeting of the Hamilton Branch of the E.I.C. and the Toronto section and Hamilton sub-section of the American Institute of Electrical Engineers at the Westinghouse West Plant in March.

Neil Metcalf, chairman of the Hamilton Branch of the E.I.C., who presided, said that he felt that nothing but good could come from those joint meetings, as they enabled engineers of various branches to get together and understand each other's point of view.

E. M. Coles, vice-president and director of engineering of Canadian Westinghouse Company Limited, welcomed the gathering on behalf of the company.

J. F. Moore, chairman of the Toronto

section of the American Institute of Electrical Engineers, also spoke.

A. A. Moline, chief engineer of Canadian Westinghouse Company Limited, introduced the speaker J. E. Barkle, of Westinghouse Central Station Department, Pittsburgh, who described the various electrical power distribution systems.

A vote of thanks was proposed by A. W. Murdoch.

❖ ❖ ❖

The Hamilton Branch of the Institute held its April meeting on Thursday, April 21, 1949, at McMaster University Lecture Theatre.

The members assembled to hear a talk by W. J. W. Reid, president of Otis-Fensom Elevator Company and vice president of Engineering Institute of Canada. His subject was **Organizing a New Plant.**

Special guests of the evening were Hamilton and District members of the Association of Professional Engineers of Ontario, of which Mr. Reid is president.

Chairman Neil Metcalf, opened the meeting by stating the reason for the assembly and extending a welcome to the members of the Professional Engineers of Ontario.

He asked Colonel T. M. Medland, executive director of the Association of Professional Engineers of Ontario, to say a few words to the audience. Mr. Medland was followed by C. E. Sisson, who was recently appointed field secretary of the E.I.C.

John Elliott introduced the speaker of the evening.

Mr. Reid opened his address by stating that for the sake of clarity he would follow a pattern of presentation in which the audience should assume that it was an individual called into the office of the director of a large industry where he is informed that he has been selected as manager of a new plant.

The lecture followed as direction and advice from the director to the nominee.

Under the heading "Locality and Size" the director said, "The old theory, that the larger the plant the greater the economics, has fallen into disfavour, and has been replaced by the theory that a plant under the direction of one manager who has a grasp of all operations showed greater economics." He went on to indicate ways in which the new theory should be applied to a new plant.

A lively discussion followed, hinging on building types, incentives and rates.

The "director" advised his new manager on the matter of profit.

Free enterprise only works under the profit system and those operators who do not make a profit will soon find that they are replaced by other people in the competitive system.

Today, when many people's minds are being filled with community and co-operative effort, state communism and socialism, they are beginning to feel it is wrong to make money. Therefore, start at the beginning to get the employees under your direction profit conscious.

Great labour leaders like Green and Murray who rarely miss an opportunity to bait big business, have on many occasions expressed themselves in favour of the profit system and opposition to socialistic system.

L. C. Sentance thanked the speaker on behalf of the assembled group for the very thought provoking lecture and extended a very hearty vote of thanks.

Neil Metcalf extended an invitation to the audience to share in sandwiches and coffee, and adjourned the meeting.

Kingston

D. L. Rigsby, M.E.I.C.
Secretary-Treasurer

J. T. Provan, Jr.E.I.C.
Branch News Editor

On Tuesday, May 3, 1949, the Kingston Branch held a meeting in the Biology Lecture Room, Old Arts Building Queens University.

The guest speaker was Lt.-Col. P. G. F. Young, O.B.E., British Army Directing Staff, Army Staff College, Kingston, and was introduced by Lt.-Col. W. S. Hunt, Officer Commanding R.C.E.M.E. School, Barriefield.

The subject chosen was **Palestine During the Latter Days of the British Mandate.** Lt.-Col. P. G. F. Young has spent some time in the East and gave a first hand account of the events leading up to the dissolving of the British Mandate. In the course of the speech the speaker discussed the topography of the land, the history of the people, the living conditions of the people, the military aspect, and the final partition of Palestine by the U.N.O.

After a discussion period, M. G. Saunders, plant engineer at Kingston Works of the Aluminum Company of Canada, Ltd., thanked the speaker and the meeting adjourned.

Lethbridge

D. Cramer, Jr.E.I.C.
Secretary-Treasurer

The visit of President J. N. Finlayson and Assistant General Secretary W. D. Laird to the Lethbridge Branch of the Institute was marked by a very successful field tour and dinner on April 28, 1949.

The field tour left Lethbridge at 11 a.m. and visited the Pothole Dam which is part of the St. Mary-Milk River Development, and then went on to the St. Mary Dam site which is now under construction by the P.F.R.A. The party was conducted by W. L. Foss, branch chairman and supervising construction engineer for the project.

Lunch was held at the W. C. Wells Construction Company Camp Dining Room with the members and visitors as guests of the Company.

The party returned to Lethbridge and the dinner meeting was held in the Marquis Hotel, with W. L. Foss in the chair.

The branch was also host to a large group of American and Canadian Engineers who were attending a meeting of the International Joint Commission.

Dinner music by Brown's musical trio, community singing led by R. S. Lawrence, and vocal selections by Miss Ella Finlay, Miss Laverne Cummings, and Mr. Art Hunt were very much enjoyed.

K. F. Vernon, regional director of the U.S. Bureau of Reclamation at Billings, Montana, spoke briefly on the work of the International Joint Commission.

W. D. Laird, assistant general secretary of the E.I.C., spoke on affairs of the Institute and informed members of proposed changes in the Journal. He spoke of the services of the Library and employment Bureau, and of the appointment of Field Secretary C. E. Sisson.

Dr. Finlayson was introduced by C. S. Clendening and outlined the highlights of his term of office. He spoke of the important work that the Institute is doing, and emphasized the need for an engineer on the International Joint Commission.

R. S. Lawrence moved a note of thanks to Dr. Finlayson for his address.

The meeting was one of the most successful ever held by the Branch.

Niagara Peninsula

H. L. Weaver, M.E.I.C.
Secretary-Treasurer

C. A. O. Dell, M.E.I.C.
Branch News Editor

A regular meeting was held on April 21st, in the Merritt Room of the Barclay Hotel, at Welland, Ont.

Following dinner, Chairman R. A. Coombes called on E. R. Zacharias, who introduced J. A. Whittaker, sales engineer of the Joseph Stokes Rubber Co., Welland.

Mr. Whittaker spoke on the subject of **Plastics and Hard Rubber Products As Applied in Industry To-day.** He explained the chemical composition and named the ingredients which are used in the manufacture of various hard rubber products, many of which are manufactured in Canada by Joseph Stokes Rubber Company only. Several of the engineering problems involved in the manufacturing process were explained and a number of the uses of the products were illustrated. The speaker also elaborated on plastic products as produced by his firm and a number of samples of the latter were on display. The range of products discussed included bowling balls, buttons, garden hose and ladies' hose (rayon), radio cabinets and others.

Following the usual discussion period a vote of thanks was tendered to the speaker by P. E. Buss.

Samples of the products discussed were left on the table for inspection by the members at the close of the meeting and these added considerably to the interest and to the discussion of the subject.

Ottawa

J. C. Elliott, M.E.I.C.
Secretary-Treasurer

Capt. A. Bernard, M.E.I.C.
Branch News Editor

The regular luncheon meeting of the Ottawa Branch was held at the Chateau Laurier on the 21st of April, 1949.

Members of the Canadian Institute of Mining and Metallurgy also attended this meeting.

The speaker for the occasion was Robert H. Saunders, C.B.E., K.C., chairman of the Hydro Electric Power Commission of Ontario. Mr. Saunders gave a very interesting talk on the conservation and use of natural resources in Ontario.

The speaker was introduced by Frank Plant, commissioner with the Hydro Electric Power Commission of Ottawa. G. C. Monture, chairman of the Canadian Institute of Mining and Metallurgy, ably thanked the speaker for a very instructive and interesting talk.

Others at the Head Table were: A. A. Swinnerton, chairman of Ottawa Branch of E.I.C.; A. A. Richardson, project manager at Des Joachims; F. G. Rutley, vice-president, Foundation Company of Canada; C. S. Parsons, chief, Bureau of Mines; Marc Boyer, Deputy Minister of Reconstruction and Supply; W. M. Goodwin. Secretary of C.I.M.M.; G. C. McRostie, of the Management Committee, Ottawa Branch E.I.C.

Peterborough

M. M. Uloth, M.E.I.C.
Secretary-Treasurer

J. C. Allan, M.E.I.C.
Branch News Editor

J. T. Purvis, engineer in charge of Turbine Design Section of the Gas Turbine Engineering Division, A. V. Roe Canada Ltd., delivered a lecture on **Jet Aircraft Engines** on April 21, 1949. A capacity audience was present at the Public Library Auditorium to hear this lecture.

The several types of jet engines were described to show the place of the gas turbine type of jet engine, and the following discussion was centred on it, with particular reference to the Avro Canada "Chinook".

Following a short history of gas turbine work in Canada, Mr. Purvis showed a sound film to explain and illustrate the general principles of jet propulsion, a general study of centrifugal engines, a study of axial engines, and a description of the Avro Canada "Chinook".

One of the first considerations of an aircraft power plant is weight, and in this regard the gas turbine jet engine is superior, being about half the weight of its reciprocating engine counterpart. Another advantage is that it does not have large numbers of moving parts, consisting as it does of one main rotor assembly with two or three auxiliary gear boxes. This greatly decreases the number of things that can go wrong.

Jet engines, being balanced to close limits, give very smooth vibrationless operation. They have a very low oil consumption. In Jet propulsion, also, very high powers can be built into limited volume with small frontal area.

It is however in the realm of high speed flight that gas turbine jet engines come into their own. The propulsion efficiency of the conventional propellor decreases very rapidly at speeds in excess of 400 m.p.h. This is not surprising if it is realized that the blade tips are slicing the air at speeds approaching the speed of sound.

The efficiency of a jet engine is a function of its forward speed, so that its efficiency curve continues to rise steeply past 400 m.p.h. Its high fuel consumption therefore can be tolerated.

In addition the gas turbine engine does not require the use of expensive high octane fuels. Kerosene is the ordinary fuel but they have also been run on fuel oil.

Mr. Purvis showed a series of slides to illustrate the functioning and the parts of the gas turbine engine. His very complete description of the "Chinook" engine brought home the nature of the jet engine to the audience and difficulties in its construction.

Following a question period, Mr. Purvis displayed a collection of engine parts.

On May 5th, A. L. Malcolm, until recently resident engineer at the H.E.P.C. Des Joachims development, delivered a paper to the Peterborough Branch on the subject of the **Design and Construction Features of the Des Joachims Development.** Sixty-five members and guests were present.

Mr. Malcolm commenced by explaining that present conditions have made it necessary for the Ontario Hydro-Electric Power Commission to turn its attention to the development of those power sites which are within easy reach of the Commission's transmission network so that they may provide reasonably large blocks of power within the next two or three years.

A study of the power surveys since 1942 showed the place of Des Joachims in the general scheme. Delays with respect to the St. Lawrence made it imperative that further development of the Ottawa river be completed at an early date. An early survey by the Dominion Government, Department of Railways and Canals, relative to the proposed Georgian Bay canal was the starting point of the Des Joachims studies and if the Georgian Bay canal ever becomes a reality, the headwater and tailwater levels to be established at Des Joachims will conform to the regulated levels which would be required for that proposed waterway.

The Rapides des Joachims development, when complete, will comprise the installation of a station of 480,000 horsepower, consisting of 8 units of 60,000 horsepower each.

A series of slides were shown to illustrate the various construction stages and methods employed. The use of surplus war assets, Bailey bridging for temporary structures was illustrated and explained. This material is salvageable and may be used on other work in the future.

Disposal of flood water, supplementary contracts for highway construction, railway relocation, etc., were described as well as the installation of very extensive rock crushing, screening, and aggregate storage facilities.

The meeting concluded with a coloured motion picture to illustrate the recent construction projects undertaken by the H.E.P.C. all over the province.

Following a lively question period, a vote of thanks was moved by H. R. Sills.

St. Maurice Valley

G. W. Ince, Jr.E.I.C.
Secretary-Treasurer

J. G. MacLeod, M.E.I.C.
Branch News Editor

Science and Living was the title of an address by J. T. Thwaites, electronics engineer of Canadian Westinghouse Company at the annual meeting of St. Maurice Valley Branch on April 29th, at Three Rivers.

The meeting was attended by A. Lariviere, vice-president of the Institute, and P. Vincent, chairman of the Quebec Branch, who described the Annual General Meeting of the Institute at which the Quebec Branch would be host. Prizes were presented to E. A. Love and W. G. Seline for the best papers prepared by Juniors and read at a recent meeting. H. K. Wyman of the nominating committee announced the results of the election of officers for the forthcoming season: chairman, S. E. Williams; vice chairman, R. E. Kirkpatrick; secretary-treasurer, J. B. Edwards; committee men. C. H. Neil, A. H. Watier, G. R. Goring.

A. Davison introduced the guest speaker as one of Canada's leaders in electronics. After discussing the law of averages as applied to the origin of life Mr. Thwaites sketched the time span of evolution to emphasize the vast improvement of creature comfort which science has obtained for man in recent decades, and predicted that a 20-hour week for labour was probable in view of the increasing efficiency of output in industry. The sources of both hydro and thermal power are unequally distributed with respect to population but the industrial application of atomic energy will give all countries an equal chance for industrial development by atomic power plants and may be an important link in forging a lasting peace although its effect may not be felt for many generations. Since men's consumption of power in industrial countries is increasing by 5 to 10 per cent per year, and since conventional power sources are limited, the discovery of atomic energy has come at a propitious time, a further proof of the hand of a Master Planner.

The address was followed by a Walt Disney cartoon, issued by Westinghouse, illustrating the improvement in living standard over the past 300 years.

After a brief discussion period Professor H. O. Keay thanked the speaker.

❖ ❖ ❖

Patents was the subject of a very interesting talk presented to the St. Maurice Valley Branch by Dr. A. H. Heatley, director of patents of Shawinigan Chemicals Limited, on February 22 in Shawinigan Falls. Dr. Heatley gave a general outline of the subject and indicated what inventors had to go through in order to obtain patents on their inventions. He also pointed out, with the aid of some very humorous slides, the difficulties which beset patent agents in their daily tasks. To conclude his lecture he showed slides of interesting patents including some on plants and fruit.

❖ ❖ ❖

One of the best attended meetings of the year was held in Three Rivers on March 23rd, when W. H. Durrell of Labrador Mining and Exploration Company spoke on **The New Quebec-Labrador Iron Ore Development.** The meeting started with a 30 minute film showing the locale and scope of operations undertaken so far. Twenty-four holes have been drilled to date which have proved some 320 million tons of ore located within 300 ft. of the surface with little overburden, so that it can be reached by open-pit mining. All equipment used in the exploratory work was flown to a central point and distributed by roads to the various drilling sites. Mr. Durrell went on to say that an expenditure of approximately $200 million will be required to get operations started. This includes loading facilities at Seven Islands, 320 miles of railroad, and a 25,000 h.p. power development at Eaton Canyon. He estimated that the mine could be in operation within four years of the start of the railroad.

❖ ❖ ❖

On April 6th a "Junior Night" was held in co-operation with the Junior Section in Shawinigan Falls. Six junior members contested for prizes presented by the Branch Executive for the two best papers. The following is a list of speakers and their subjects: **Drying of Solids** by D. G. Demianiw, Shawinigan Chemicals Limited; **Radiant Heating by Hot Water** by A. E. A. Love, Consolidated Paper Corporation Limited; **Distribution System Voltage Conversion with Particular Reference to Shawinigan Falls** by W. R. Mackay, Shawinigan Water and Power Co.; **Power Developments on the Winnipeg River** by R. J. MacLean, Aluminum Company of Canada; **Some Features of Modern Transformer Design** by W. G. Seline, Shawinigan Water and Power Co.; and **Statistics — a Tool for the Engineer** by W. H. T. Wilson, Canadian Industries Limited. After some minutes of consultation the judges selected Messrs. Love and Seline as the winners of a close contest.

Saskatchewan

D. W. Houston, M.E.I.C.
Secretary-Treasurer

R. Bing-Wo, M.E.I.C.
Branch News Editor

A meeting of special interest was held on Monday, May 2, 1949, at the Hotel Saskatchewan on the occasion of the visit of President J. N. Finlayson and Assistant General Secretary W. D. Laird. This meeting coincided with "Ladies Night", and proved to be one of the outstanding meetings of the year.

Mr. Laird dealt briefly with Institute affairs. Regarding *The Engineering Journal*, he pointed out that the *Journal* in trying to serve the entire field of engineering is trying to do a job which in the United States requires a considerable number of specialized publications. The whole matter of the *Journal* is now under study by the publications committee who will draw up a brief in a short time. The advertising appearing in the *Journal* is necessary to help defray the cost of publication which runs to nearly $5,000.00 per month. Some branches had expressed the desirability of having Transactions published but up to the present time Council has not seen that it was possible.

Mr. Laird also mentioned that the publishing of a Membership Directory was to be made separate from the *Journal*. Announcement was made as to the formation of branches of the Institute in the central B.C. area, the Kitchener-Guelph-Galt area and Newfoundland. The appointment of C. E. Sisson of Toronto as field secretary was also announced.

Dean Finlayson spoke of the observations he had made in his presidential tour. It was noted in all places that a spirit of optimism for the future prevails. Among the indications of an expanding industrial and agricultural development, Dean Finlayson noted the increasing demand for aluminum produced at the Arvida plant in Quebec; the search for hydro power sites in British Columbia; the St. Mary Irrigation scheme in Southern Alberta, along with a huge hydro development for the Calgary Power Co., on the Spray River; the large scale irrigation scheme being planned in Saskatchewan. Other signs of expansion in other provinces of Canada were mentioned by Dean Finlayson. He also paid tribute to the engineers of the country who are playing such an important and essential role in this growth.

Toronto

R. A. Muller, Jr.E.I.C.
Secretary-Treasurer

Junior Section

R. C. Harris, S.E.I.C.
Secretary

The weekend of April 23 was the occasion of a coach field trip to the Des Joachims Development, on the Ottawa River. The trip was made possible by the courtesy of the Hydro-Electric Power Commission of Ontario, and was made a success by the energetic leadership of their field staff, particularly that of Mr. W. M. Hogg, the resident engineer.

The party of 29 members was fortunate in seeing every piece of equipment on this large project in operation on Saturday.

Other interesting points studied were the cableway and its unique hoisting arrangement on the block, the bridge for the closure gantry, the pipeline for pumping dry cement to the Quebec mixer, the cofferdams and the powerhouse section, rock excavation, and the main dam. A visit to the gravel pit, and the aggregate crushing, scalping, screening, and storage plant gave an indication of the quantities involved (860,000 cu. yds.).

The control dam at McConnell Lake was inspected also. The concrete monoliths here are poured in form cages of Bailey Bridge material, in lifts of about 50 ft.

❖ ❖ ❖

At the April 27 meeting of the Junior Section, the results of the preferential ballot for the 1949-50 executive were announced.

The chairman elect, T. H. Ivory, had all members present give their suggestions on the type of meetings to be held in the coming year. There was a slight preference for more field trips. The past year's activities were reviewed by the retiring officers.

The guest speaker was M. J. C. Lazier, professional engineer and consultant, who delivered a most intriguing talk on **Mathematical Analogies Useful in Business.** This was a subject of general interest.

Starting from a discussion of rates of change and flow in electricity, hydraulics, and thermodynamics, Mr. Lazier showed how these concepts could be applied to the movement of money.

The mortality of capital goods has a typical time curve, with periodic damped oscillations of replacement. Intelligent study of the morphology of business economics could lead to great savings by avoiding the replacement maxima.

A great deal of other interesting matter on this new area of thought was discussed.

The meeting closed with a barrage of questions, during which the speaker gave a short bibliography.

Mr. Lazier was introduced by D. MacDonald, and thanked by R. C. Harris.

❖ ❖ ❖

The stag party (Salami Soiree) was enjoyed by 50 members on the evening of March 29, 1949, at the Oddfellows Hall. It proved to be a very successful party, and gave to the proponents of social gatherings just what they had been demanding.

While the refreshments were liquidated, there were singsongs, music on piano and guitar, and magic by Reg. Carson.

Vancouver

Alan Fletcher, Jr.E.I.C.
Secretary-Treasurer

Stuart S. Lefeaux, Jr.E.I.C.
Branch News Editor

The Annual Presidents' Banquet of the Vancouver Branch was held at

Toronto Branch Junior Section at Des Joachims. In the background is part of the main dam, and the interprovincial span of the concrete conveyor bridge.

Hotel Georgia on Friday, April 22nd. Approximately eighty members attended to honour President J. N. Finlayson and Assistant General Secretary W. D. Laird who were paying the annual "official visit".

Chairman George Allan opened the after-dinner meeting with a few remarks concerning the branch charter.

Two excellent films were shown; the first, "Bridge River", a B.C. Electric Railway Company film of interesting scenes during construction; the second film was "Operation Overflow", which showed highlights of the Fraser River Valley flood of 1948.

Mr. Allan introduced W. D. ("Doug") Laird to branch members. Mr. Laird was making his first visit to Vancouver as the assistant to Mr. L. Austin Wright. Mr. Laird gave a report on the *Journal* publication; the problems of advertising, space utilization, circulation, housing and finance were discussed. Mr. Laird also reminded members of the literature research service and the 14,000 volume library at Headquarters, facilities of which are available to members. He also commented on the work of the publications committee, which was endeavouring to establish a fund for the publication of technical papers in pamphlet form.

President Finlayson formally thanked his fellow branch members for his election and gave a resume of his recent visit to the branches. He referred to the strong feeling of national pride found in all the provinces visited and of the many large industrial developments that are meaning greater wealth for all Canadians. The President also stressed the main problem of the need for unity of the profession throughout the Dominion. The Institute membership should be expanded to represent all practising engineers in Canada so that it may speak with a truly national voice for the profession in all matters affecting the welfare of engineers. Unification of registration standards throughout the Dominion is necessary to strengthen the profession in its work for the engineers.

Bill Kelly, branch councillor, thanked the president and Mr. Laird for their inspiring talks and wished them good luck on their trek eastward to the annual meeting at Quebec.

Chairman George Allan and Mrs. Allan entertained the President and Mr. Laird at their West Vancouver home on Saturday, April 23rd, when members of the branch executive and wives had an opportunity to meet President Finlayson and Mr. Laird informally and chat about Institute affairs.

Victoria

D. A. MacLean, Jr.E.I.C.
Secretary-Treasurer

T. A. J. Leach, M.E.I.C.
Branch News Editor

The Victoria Branch held its annual banquet at the Empress Hotel on Wednesday, April 20th, when they were host to Dean J. N. Finlayson and Mr. W. D. Laird. This was the first point of the presidential tour which took the president eastward across Canada and terminated at the Annual General and Professional Meeting in Quebec in May.

R. Bowering, the Victoria branch chairman, presided at the meeting and introduced Mr. Laird, assistant editor of *The Engineering Journal*.

Mr. Laird in discussing Institute growth pointed out that of a total eligible list of 25,000 engineers in Canada, about 12,000 are members of the Institute. Strength for expansion and increase of membership must come from within. For this, the members themselves must be convinced of the benefits and advantages of belonging to the Institute. This includes tangible values such as reduced rates on various foreign Engineering Society Publications, access to the technical library at Montreal including bibliographies and literary searches, *The Engineering Journal* with its employment service, and the various professional meetings on technical subjects. Probably one of the most important advantages, and one whose value cannot be assessed, is membership in a national organization which is in contact with nearly every phase of public life.

Following Mr. Laird, Dean Finlayson was introduced by Dr. Gray who gave a brief summary of President's education and professional accomplishments.

The distinguished engineer, who has held important company and government engineering posts across Canada and in the United States, sketched a glowing picture of the Dominion's future as new mining and engineering developments across the country come into being.

The speaker pointed out the important role the engineer is playing in these developments, and with it the need of one national professional organization to represent the Canadian engineer. In concluding, Dean Finlayson said "The people have a right to expect some unified opinion. We should forget regional differences and concentrate on the formation of such a council."

Kenneth Reid thanked the President for his entertaining and lively address and asked that he convey the best wishes of the Victoria Branch to the members at the annual meeting in Quebec.

❖ ❖ ❖

On Sunday, April 10th, members of the Victoria Branch, with their wives, left the city by car enroute for the John Hart Power Development on Campbell River.

At noon, the trip was pleasantly interrupted by a luncheon at the Malaspina Hotel, Nanaimo, where the travellers were guests of the B.C. Power Commission. Mr. Garth Griffith, the regional superintendent for the Commission at Nanaimo presided over the luncheon programme.

Dean J. N. Finlayson, president of the E.I.C., accompanied the party and expressed delight in the expansion he had noted in Nanaimo. Other visitors to the luncheon included Mayor George Muir of Nanaimo, S. R. Weston, chairman of the Power Commission, Reeve Chapman of North Cowichan, and J. C. Spur of the Nanaimo Board of Trade.

In the afternoon the party continued north to Painters Lodge at Campbell River, with a few stopping off at Courtenay.

On Monday morning under the guidance of G. A. Vandervoort, chief operating engineer of the B.C. Power Commission, a tour was made of the John Hart Hydroelectric Development.

This project, located on Campbell River, was described in detail by Kenneth Reid, M.E.I.C., in the December, 1948 issue of the *Journal*.

Construction of the storage dam at Ladore Falls to raise the water 58 ft. in Lower Campbell Lake is well under way and two rectangular sluice gates are already in place. During its construction the river has been diverted by a tunnel through the south bank.

The main dam further downstream has been completed. It diverts water through the adjacent intake structure which in turn connects with a 12 ft. diameter woodstave penstock. A second penstock of the same size is under construction and eventually a third one will be built.

No. 1 penstock changes to a 12 ft diameter steel pipe just before dropping abruptly to the power house. Here it terminates in a steel wye, the branches of which feed No. 1 and 2 turbines. These two units of 28,000 hp. each have been in operation over a year.

It is expected that the second penstock, its surge tank, and the corresponding 3 and 4 units will be in operation early this summer.

Following the morning tour the party was the guest of the General Construction Company at a luncheon held at the camp. H. V. Serson, project manager for the Company, presided.

In his closing remarks, R. Bowering, Victoria Branch chairman, gave thanks both to the B.C. Power Commission and the General Construction Company for their hospitality and for the well planned tour.

It seemed to be the opinion of members that the Campbell River trip had been one of the outstanding events of the year.

Winnipeg

G. W. Moule, M.E.I.C.
Secretary-Treasurer

Electrical Section

J. C. Pratt, M.E.I.C.
News Editor

The last meeting of the season was held May 5, with R. Noonan presiding over the gathering. The speaker was Mr. Paul Shane, operating engineer with the Manitoba Power Commission. The subject on which he spoke was, **Fuse Co-ordination in Rural Lines.**

Mr. Shane outlined the problems associated with providing optimum service to a proposed 50,000 farms spread over an area of 30,000 sq. miles and the steps the Power Commission were taking to solve these problems. A major endeavour is to prevent the burning of fuses on transient faults by the judicious use of circuit reclosers. Experience to date indicates that reclosers on the system pay for themselves in an average period of six years by reduced replacement of fuses alone, and at the same time provide a more continuous service.

The operating characteristics of circuit reclosers, fuses, sectionalizers and equalizing breakers were outlined, and an active discussion followed.

The speaker was introduced by R. Tivy, electrical engineer, Manitoba Power Commission, and an expression of thanks to Mr. Shane was moved by L. A. Bateman, operating engineer, Winnipeg City Hydro, at the close of the address

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment*.

Situations Vacant

CIVIL

CIVIL ENGINEER with a minimum of ten years construction experience particularly hydro-electric power projects required in Toronto. Salary open. Apply to File No. 1173-V.

CIVIL ENGINEERS required by large organization with headquarters in Toronto. To take charge of design and construction of small timber and concrete dams and maintenance and operation of locks and dams, etc. throughout the Province of Ontario. Applicant must have at least several years experience on construction of timber and concrete dams with sluiceways, etc. Salary can be arranged to meet qualifications. Apply to File No. 1187-V.

ELECTRICAL

ELECTRICAL ENGINEERS with at least five years practical experience in layout and erection high tension and low tension overhead lines on wood poles. Experience in transformer maintenance and repair, sub station switchgear maintenance and erection, would be an advantage. Required by Bahamas Government Electric Department, Nassau. Salary open. Apply to File No. 1180-V.

ELECTRONIC ENGINEERS, 23 to 35 years of age, required for design and development of radar type electronic equipment and mechanical design. Previous experience on similar type of work desirable. Location Nova Scotia. Salary $3,000 to $5,000 depending on qualifications. Apply to File No. 1189-V.

ELECTRICAL ENGINEER experienced in power systems distribution, electrical and lighting layouts for small industrial plants using up to 300 K.W. of power. Location Montreal, salary up to $350.00 per month depending upon qualifications and experience. Apply to File No. 1191-V.

MECHANICAL

MECHANICAL ENGINEERS with at least five years practical experience in the operation and maintenance of four cycle diesel alternators in sizes up to 2,500 H.P. Required by Bahamas Government, Electrical Department, Nassau, Salary open. Apply to File No. 1180-V.

MECHANICAL ENGINEER required for design, estimating and sales of various mechanical equipment, such as, internal combustion engine-driven generator sets, water purification and pumping plants industrial and contractor equipment. Position located in Ontario. Salary open. Apply to File No. 1192-V.

MECHANICAL ENGINEER, experienced in product design and production methods, must be familiar with all engineering problems relative to manufacturing of metal products. Age 35-45 for manufacturing plant located near Montreal. Salary open. Apply to File No. 1198-V.

MISCELLANEOUS

ASSISTANT TO SALES DEVELOPMENT MANAGER required for large Montreal Engineering concern for work on booklets, advertisements, editorial articles, etc., engineering background essential. Experience in writing or publicity is desirable. Salary open. Apply to File No. 1178-V.

MUNICIPAL ENGINEER required by Town of Fort Erie, Ontario. Reply giving full particulars as to age, education, qualifications, experience and remuneration. Apply to File No. 1179-V.

ASSISTANT ENGINEER for Provincial Government—West Coast. Duties include taking charge of maintenance and construction work on forest or park road projects, designing simple bridges and other structures, making reports and recommendation on allied engineering problems in connection with Forest Service projects. Must have several years practical experience. Salary $3,504 rising to $4,104 per annum. Apply to File No. 1181-V.

GRADUATE ENGINEER with technical and practical experience in concrete field required by large transit mixed concrete business in Montreal. Work would be under supervision of consulting engineer and applicant would be required to work as a liason officer between company to its consumers. Salary open. Apply to File No. 1182-V.

SENIOR DESIGNER with from five to ten years experience and a general knowledge of structural design in relation to buildings and bridges, required by a steel company in Southern Ontario. Salary open. Apply to File No. 1184-V.

TOWN ENGINEER required for town in the Maritimes. Duties include all work connected with streets, water supply and distribution, building inspecting, etc. Salary open. Apply to File No. 1193-V.

CIVIL OR AGRICULTURAL ENGINEER required in Farm Structures Division of an agricultural college in Ontario. Applicant would be in charge of teaching to the degree students in the fourth year course also two year Associate Farm course as well as research and demonstrations related to this field of work. Salary open. Apply to File No. 1195-V.

SALES ENGINEER with knowledge of chemistry desirable wanted by Canadian branch of American firm for industrial sales to power plants, pulp and paper mills, municipalities, institutions, etc. Must be graduate engineer and Canadian citizen. Location Ont. Age between 30 and 40. Salary open. Apply to File No. 1196-V.

JUNIOR SALES ENGINEER wanted by Canadian branch of American firm for industrial sales to power plants, pulp and paper mills, municipalities, institutions, etc. Must be graduate engineer and Canadian citizen. Salary open. Location Ontario. Apply to File No. 1197-V.

CONSTRUCTION SUPERINTENDENT, capable of supervising housing project. Must be familiar with all phases of prefabrication. State previous experience. Salary open. Apply to File No. 1199-V.

CONSTRUCTION ENGINEER, for Housing Development. Must be experienced at layout and have knowledge of prefabrication. Salary open. Apply to File No. 1199-V.

The following advertisements are reprinted from last month's Journal, not having yet been filled.

CIVIL

CIVIL ENGINEER with at least 2 years practical experience required by a large inter-municipal Corporation in Western Canada. Under supervision and direction applicant must be able to assist and perform technical engineering work, prepare plans, perform field duties in connection with the construction and maintenance of simple structures to install equipment, supervise and direct small groups of men. Salary $235 up. Apply to File 1144-V.

GRADUATE CIVIL ENGINEER with some experience in structural steel required by firm engaged in the manufacture and sale of prefabricated steel structures. One man needed for liason and co-ordinating the work between fabricators and design engineers and one for visiting clients in Quebec, with headquarters in Toronto. Salary depends on ability and experience with a minimum of $350.00. Apply to File 1168-V.

ELECTRICAL

GRADUATE COMMUNICATION ENGINEERS, Canadian citizens, interested in audio, radio and video frequency systems engineering. Salaries up to $350 per month depending on qualifications, location Montreal. Apply to File No. 1147-V.

MECHANICAL

MECHANICAL ENGINEERS with 3 - 5 years experience in mechanical design and general plant engineering, as well as field work required by firm in Quebec. Salary open. Apply to File No. 1001-V.

GRADUATE ENGINEER, preferably with mechanical background and sales experience required by large well known firm as Representative for a Distributor of pneumatic material-handling equipment. Principal contacts will be in cement, heavy chemical, food, pulp and paper, brewing and aluminum industries. Salary open. Apply to File No. 1158-V.

MECHANICAL ENGINEER required to take over complete operation of machine shop, foundry and pattern shop in Province of Quebec. Must be bilingual. Salary open. Apply to File No. 1169-V.

SENIOR MECHANICAL DRAUGHTSMAN, thoroughly experienced in machine design with some background and knowledge of material handling equipment. Salary open. Apply to File No. 1171-V.

MECHANICAL SALES ENGINEER, age 30 to 40 years with executive ability required by old-established firm in Montreal. Good opportunity for an aggressive salesman to expand the present contacts and to create new fields. Knowledge of French an asset. Salary open. Apply to File No. 1176-V.

MINING

MINING ENGINEERS for design and layout work also some field work required by firm in Province of Quebec. Salary open. Apply to File No. 1001-V.

MISCELLANEOUS

MANAGER OF MANUFACTURING required by Canadian mill producing 500 tons per day of specialty papers, tissues, paperboard and newsprint. Position requires proven managerial ability and technical qualifications for the production of paper. Location most desirable and salary attractive. Apply to File No. 1140-V.

DESIGNING AND STRUCTURAL ENGINEERS required by Provincial Government, West Coast. Duties include designing and preparation of plans of bridges, ferries, wharf structures, etc.. in timber, steel or concrete. Preferably with experience in bridge design and construction. Salary $3,504 rising to $4,104 per annum. Apply to File No. 1142-V.

CIVIL OR SANITARY ENGINEER, with a number of years experience required by a large inter-municipal Corporation in Western Canada. Must be able to assume responsibility in design, detailing, estimating, preparing specifications, to layout and supervise the construction repairs and maintenance of a sewerage collection system and treatment plant. Salary $325 per month up. Apply to File No. 1144-V.

SUPERINTENDING ENGINEER for Eastern University to take charge of physical plant maintenance and help plan the building program. Salary from $350. Apply to File No. 1145-V.

TOWN ENGINEER required by town in Ontario. Duties include supervision of Board of Works as well as complete charge of municipal, electrical, water and telephone department projects. Salary open. Apply to File No. 1150-V.

CHIEF ENGINEER required by large public utility system in Eastern Ontario. Applicants must have had experience in the operation and design of eletcric or waterworks systems. Salary open. Apply to File No. 1151-V.

DRAUGHTSMEN, required by G.E.C. Switchgear Department, Engineering Works, Witton, Birmingham, 6, England. Must have good experience in any class of switchgear design or layout. Permanancy and good opportunities for capable men. Apply stating age, experience, and technical qualifications to File No. 1157-V.

AERODYNAMICIST capable of carrying out performance and stability calculations for initial design. Permanent position with good prospects, in Montreal area. Salary open. Apply to File No. 1159-V.

PROFESSOR AND CHAIRMAN of the Dept. of Electrical Engineering required by University of Manitoba. Position becomes vacant September 1st, 1949. Salary depends on candidate's qualifications. Apply to File No. 1162-V.

CHIEF DESIGN ENGINEER, capable of taking care of and being responsible for all drawing office work in a modern West Coast pulp and paper mill. Applicant must have a minimum of five years responsible design practice in pulp and paper work. Salary open. Apply to File No. 1164-V.

SALES ENGINEER, mechanical background required in Montreal. Must have knowledge of heating, ventilating and pumps. Salary open. Apply to File No. 1165-V.

GRADUATE ENGINEER preferably electrical or mechanical background required by large industrial plant as maintenance engineer. Duties include responsibilities of all maintenance work, also setting up and maintaining lubrication and inspection schedules. Salary open. Apply to File No. 1167-V.

SALES ENGINEER required for the Montreal district to represent a reputable conveyor company manufacturing in the Province of Ontario. Conveyor experience is desirable but not strictly necessary but engineering background essential. Remuneration would be on a commission basis with excellent possibilities. Apply to File No. 1172-V.

TWO experienced bilingual men required for approximately 18 months work in French Morocco under excellent conditions. One with structural design, field and instrument experience and one with adequate practical experience and capacity for Construction foreman opening. Salaries $350 to $550 per month. Apply to File No. 1175-V.

Situations Wanted

CIVIL ENGINEER, M.E.I.C., P.Eng., age 43, desires spare time work. Twenty-one years experience in construction, both field and office, also plant maintenance covering design, supervision and surveying. Would like design on draughting work in evenings with surveying on week-ends. Apply to File No. 225-W.

MECHANICAL AND ELECTRICAL, M.E.I.C., P.Eng. (Ont.). Age 41. Single. Overseas 1940 with R.C.E., followed by 7 years as Technical Staff Officer, British Army, on Research and Development, including period as Head of Technical Intelligence Mission to Austria. Vickers Plant Course followed by 13 years Canadian experience including Telephone Plant; Automobile; Electrical Power Apparatus and Wire and Cable; Design and Manufacture Electric Cranes, Foundry Equipment, Diesel Engines and other Heavy Engineering Products. Intimate knowledge British Ministry of Supply and Engineering Industry. Pre- and Post-War knowledge of all Europe, particularly Belgium, Switzerland, Austria and Czecho-Slovakia. Interested in European position for Canadian or U.S. firm or Administrative Engineering Post in Canada. Apply to File No. 415-W.

MECHANICAL ENGINEER, age 39, experienced in tool design and production methods, material selection, production records, control and co-ordination. Desires employment preferably in Montreal with either manufacturer or firm of Engineers who could utilize all or a part of above experience. Apply to File No. 551-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. (E.E.) Manitoba, 1943. Age 27. Married. Electrical experience with R.C. Signals and 2½ years general electrical experience in industry. Sales training. Presently employed but desires position offering wider scope and opportunity. Preferably Montreal area. Apply to File No. 925-W.

PRODUCTION ENGINEER, M.E.I.C., P.Eng., McGill '33 (Electrical). Married. Extensive knowledge business organization and management. Accustomed to conferring with top Executives. Broad experience includes sales, plant organization and management, interpretation and use financial reports and plant operating statements, budgetary control, production plannings, cost development and control, method improvements, plant layout and general engineering. Desires permanent association, offering good future possibilites, with well established manufacturing or sales organization. Available on reasonable notice. Apply to File No. 1186-W.

MINING GRADUATE, M.E.I.C., with 20 years experience in mine operation and development, and associated construction etc., desires permanent connection with senior responsibility; Ontario location preferred. Apply to File No. 1252-W.

CIVIL ENGINEER, M.E.I.C., age 41, interested in position as Project Manager or Chief Engineer. Sixteen years of experience in field and office covering design and construction of large building projects, surveys, bridges, roads, dams, and particularly Hydro Electric power projects. Capable of taking complete charge of design and construction. Apply to File No. 1751-W.

CHEMICAL ENGINEERING GRADUATE M.E.I.C., McGill, 1938, age 35. My experience has included Laboratory work, production, chemical plant operation and costing, industrial development surveys, raw material supply planning, purchasing materials for plant construction and operating. Apply to File No. 1947-W.

INDUSTRIAL AND CIVIL ENGINEER, M.E.I.C., P.Eng., Que. B.A.Sc. Age 40, married. Fluently bilingual. Seeks position as Industrial Engineer, Executive Sales Engineer, Town Engineer, experience in motion and time study, methods, process, development, production control, costing, plant maintenance, highway engineering, municipal engineering, sales. Available on short notice. Apply to File No. 2157-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., University of Sask., 1940, age 32, married. Continuous employment in engineering field since graduation. Experience includes design office and field work on construction, structural and mechanical plant engineering, maintenance and project engineering, production control, cost estimating and control. Seeking responsible position with future, preferably in Montreal area (home). Available shortly. Apply to File No. 2219-W.

GRADUATE ENGINEER, M.E.I.C., McGill Chemical engineering 1935. Six years experience in plant operation, four years in the R.C.A.F., aeronautical engineering and four years in business and industrial consulting. Desire responsible position in Quebec or Ontario. Apply to File No. 2228-W.

MECHANICAL INDUSTRIAL ENGINEER, Jr.E.I.C., leaving for Europe in near future. Will undertake missions of technical or other nature. Research, executive, service or sales works. Bilingual, age 27, good appearance, broad experience. Apply to File No. 2338-W.

CIVIL ENGINEER, M.E.I.C., "33" D.L.S., railway, mining, government and construction experience. Not adverse to some travelling. Opportunity to advance lacking in present position. Married. Age 37. Available one month's notice Full details of qualifications on application. Apply to File No. 2460-W.

CIVIL ENGINEER, M.E.I.C., Prof. Eng. (Ont.) Queen's B.Sc. Mechanical background. 3 years general plant and machine shop experience. 6 months railway maintenance. 8 months railway and general construction. 8 months R.C.E. 17 months design engineer of pulp and paper mill also in charge of construction and plant layout. Presently employed as assistant chief engineer in Woodlands Division of eastern pulp and paper mill with full responsibility of all roads, bridge and building construc-

TRANSPORTATION CONSULTANT

Professional engineer for large corporation to advise on rail and water freight transportation problems.

Five to ten years responsible experience in this field and knowledge of economics required.

Apply to File No. 3882-V.

tion. Available 1 month's notice. Location immaterial. Apply to File No 2553-W.

INDUSTRIAL-MECHANICAL ENGINEER, Jr.E.I.C., P.Eng. Ont., B.A.Sc. Married. Age 29. Desires position requiring more responsibility and initiative in paper, lumber or allied industry or consulting industrial firm preferably on west coast or southern Ontario. Officer veteran. Experience in production control, cost analyses, plant and production layouts work simplification, materials handling, motion and time study, incentive systems. Now completing Business Methods course. Apply to File No. 2794-W.

CHEMICAL - METALLURGICAL ENGINEER, M.E.I.C., McGill. Age 43. Eighteen years experience in process development and operation, covering ore beneficiation (metallic and non-metallic), ferrous metallurgy, inorganic chemical processing. Positions held largely management. Familiar with determining suitable plant location and layout, equipment design and specification, process simplification, control and operation. Desires connection with progressive firm as manager of promising venture. Presently engaged. Minimum salary $6,000. Apply to File No. 2831-W.

MECHANICAL AND INDUSTRIAL ENGINEER, Jr.E.I.C., McGill, '44. 7 years industrial experience. Welding application and metallurgy, production supervision, production specifications, purchasing, wage incentives, time study, estimating, costing, design. Available 4 weeks notice. Apply to File No. 2920-W.

RESEARCH PROBLEM WANTED: Three students working for degree of Master of Chemical Engineering who will be working in Montreal this summer on experimental portions of their thesis desire an additional problem in Applied Unit Operations to be completed on a co-operative basis to help finance studies. Apply to File No. 3049-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng., Q., G.I., Mechanical E., A.M.I. Loco., E., (Great Britain). Aged 30. married. 6 years locomotive design and construction, machine shop production and assembly. 5½ years Engineer Officer, Royal Air Force, rank Squadron Leader, Chief Technical Officer. Employed 2 years in Province of Quebec. Desires change to position with more responsibility and opportunity for advancement. Preferably Southern Ontario and Western Canada. Apply to File No. 3059-W.

GRADUATE ENGINEER, M.E.I.C., P.Eng., B.A.Sc., Toronto, married, age 31. Desires employment as assistant to construction or municipal engineer or would consider position on engineering staff of manufacturing company. 4 years army engineer officer, 4½ years experience in construction, surveying, layout and mining. Presently located in Toronto. Apply to File No. 3077-W.

SALES ENGINEER, M.E.I.C., retired Naval Officer, mechanical and electrical background. Experienced in sales and running branch office. Four years with wartime shipbuilding, 2 years with War Assets Corporation in technical and executive capacity. At present in marine and engineering supply sales. Interested in permanent position in Montreal area. Apply to File No. 3081-W.

MECHANICAL ENGINEER, Jr.E.I.C., Jr. A.S.M.E., P.Eng. (Ont.), B.Sc., Queens, '47, married. At present completing work at Yale University towards master of engineering degree. Broad basic experience. Desires appropriate position, preferably in design. Available in June. Apply to File No. 3111-W.

MECHANICAL ENGINEER, Jr.E.I.C. (B.Eng., McGill, '47), one year experience in design and draughting and some construction work. Presently completing professional course in Industrial Relations. Interested in becoming established with industrial firm to do time study work, job evaluation, wage incentive plans, personnel supervision, etc., where background of engineering could be useful. Some knowledge of French. Area of Ontario, Quebec or B.C. Available on month's notice. Apply to File No. 3149-W.

ELECTRICAL ENGINEER, S.E.I.C., B.A.Sc (E.E.), U.B.C., 49, married. age 33 Electrical experience with R.C. Signals (overseas 6 yrs.). Desires employment in power or electronics. Available 1 May. 1949. Apply to File No. 3154-W.

ELECTRICAL ENGINEER, M.E.I.C., I.E.G. Prof. Eng., Quebec. Age 35. Several languages spoken fluently. Married. No children. Extensive practical experience in plant maintenance and trouble shooting, seeks resident position with industrial firm, available at short notice. No objection to go to country. Apply to File No. 3155-W.

ELECTRICAL ENGINEER, S.E.I.C., recent graduate of Nova Scotia Technical College, married, five summers' pre-graduation experience plant electrical maintenance, desires employment in Montreal area, preferably in design, testing or small-scale production of electronic or communications equipment. Apply to File No. 3156-W.

GRADUATE MECHANICAL ENGINEER, Jr.E.I.C., Canadian, 29 years of age, married, one child. Seven years varied experience mostly with one employer, in general machine-shop, foundry, drafting, process and mining industries. At present assistant mechanical superintendent of mining concern in South America. Returning to Canada in June Desire position, preferably in Canada or the U.S.A. Apply to File No. 3157-W.

ELECTRICAL ENGINEER, S.E.I.C. S.A.I.E.E., age 23, married, B.Sc. '48 from University of New Brunswick, at present taking one year post graduate work at the University of London on Beaverbrook Overseas Scholarship Summer vacations spent in the Power and Paper Industry. Returning to Canada early in September. Apply to File No. 3161-W.

GRADUATE ENGINEER, M.E.I.C., with broad administrative experience in manufacturing. Responsibilities have included development of national sales organization, planning of national advertising campaign, purchasing for light metal manufacturing plant, product promotion and development, patents and cost accounting. Youthful, aggressive, dependable and loyal. Widely travelled. Complete personal file available. Apply to File No. 3162-W.

GRADUATE MECHANICAL ENGINEER (McGill), M.E.I.C., P.Eng., Que., married, bilingual, five years sales experience in heavy plant and contracting equipment in Province of Quebec. Responsibilities include sales promotion, sales engineering in regards to steam and electrical equipment and pumps, supervision of installations and recommended maintenance schedules. Some experience in electrical installations, welding and surveying. Desires position of responsibility with progressive firm not necessarily in sales. No locality preference. Presently employed. Apply to File No. 3163-W.

MECHANICAL ENGINEER, M.E.I.C., McGill, 1942, age 28, presently engaged as design, sales and construction engineer with small company manufacturing and installing heavy industrial machinery, demand for which is falling off due to heavy oil production. Has had experience, R.C.E.M.E. Overseas, steel designing and detailing. Would consider any employment offering interesting problems, responsibility and future promotion. Apply to File No. 3164-W.

MECHANICAL ENGINEER, S.E.I.C., P.Eng., Ont., Toronto 48, married, family, age 35. 7 years drafting, shop experience. 1 year design engineer, in pulp and paper line and heavy industrial equipment. Interested in plant engineering or design, desires permanent position with responsibility. Apply to File No. 3180-W.

CIVIL ENGINEER STUDENT, S.E.I.C wants permanent position. Graduating May, 1949, from the University of New Brunswick. Veteran R.C.A.F., navigator, married, 3 children. Position preferences are with a consulting engineer or some company doing inspecting and supervising work on construction. Apply to File No. 3182-W.

CHEMICAL ENGINEER, S.E.I.C. (Laval '49), B.A.Sc., P.Eng. Age 23, single. Experienced in woodcutting operations, galvanizing mill, coal carbonization, recovery and refining of coal by-products. Desirous of obtaining a position with an engineering consulting firm dealing with chemical engineering problems (e.g. chemical plants, installation of heating systems, air conditioning, etc.) Would also consider engineering work with a well established company, preferably in the province of Quebec. Available June the 1st, 1949. Apply to File No. 3183-W.

RECENT GRADUATE, S.E.I.C., single, age 24, veteran. Now completing post-graduate study in Mechanical Engineering at Princeton University. Objective of this post-graduate work has been to develop as thorough a background as possible for manufacturing and industrial administration. At present working on thesis in quality control. Interested in any type of opening that will be available in June. Apply to File No. 3186-W.

STUDENT, S.E.I.C., in 4th year Mechanical Engineering, U. of S., graduating this spring, desires a position with the Petroleum Industry. Experience includes survey work, petroleum sales, drilling and testing oil wells, and radar technician with the R.C.A.F. In excellent health, 26 years of age, married. Apply to File No. 3187-W.

MECHANICAL AND ELECTRICAL ENGINEER, M.Sc., A.M.I.E.E., married, age 30. Also holds honours degree in physics and has good knowledge of mathematics. Desires position where these qualifications would be of value, probably in development, design or research and preferably in the field of mechanical engineering. Experience includes five years in the technical branch of the R.A.F. and eighteen months as mechanical engineer in large industrial concern. Apply to File No. 3188-W.

ELECTRICAL ENGINEERING STUDENT, S.E.I.C., graduating this spring from U.N.B. Veteran, age 27, married, 2 children. 4 years with R.C.A.F. signals radar, summer, 1948, with National Research Council in microwave laboratory. Entering McGill, September, 1949, for post graduate work in communications. Desires position in or near Montreal for summer. Good references available. Apply to File No. 3190-W.

GRADUATE U.N.B., 1949, in Electrical Engineering, anxious to secure a position in Ontario or Eastern Canada. Three years experience as a wireless electrical mechanic in the R.C.A.F. and one summer as an installer of dial phone equipment, also one summer with a power and paper company. Have also a complete commercial diploma. Position desired preferably with a power company or an auxiliary of such. Apply to File No. 3196-W.

CHEMICAL ENGINEER, S.E.I.C., B.Sc., '44, M.Sc., '45, Queen's, Ph.D. from Cornell University, Ithaca, N.Y., expected this summer, desires position in research or development in the chemical industry. Age 27, married. Good background in physical and inorganic chemistry, 1½ years experience in research and development department of abrasive company working on process and product improvement. Available September 1st. Apply to File No. 3197-W.

CIVIL ENGINEER, M.E.I.C., P.Eng. Ontario, University of Manitoba '41. 32 years of age, single. Experience in construction airport buildings and sewer and water, 1½ years in aircraft inspection and instructor of inspectors, surveying for water sites, 2 years in design of reinforced concrete and steel structures. Desire position with consulting engineer, in industry, or in municipal field. Available on short notice. Apply to File No. 3198-W.

PROFESSIONAL ENGINEER, Jr.E.I.C. B.Sc. Eng. Age 34 years with 10 years engineering experience in plant operation, maintenance, design, construction and buying in the mining, rubber and petroleum refinery fields. 5 years previous diversified experience. Wishes to join the Purchasing Department of a reliable firm which is considering the employment of engineers in that department. Apply to File No. 3199-W.

MECHANICAL GRADUATE, age 24. Jr.E.I.C., P.Eng. Q., Queen's 1947. Two years experience as a Maintenance Engineer with Large Montreal industrial firm. Engaged in general plant and machinery maintenance work, including co-ordination of the work of draftsmen, machinists and other trades. Evening student in Commerce Courses. Navy veteran. Desires same type of work with another large or small Montreal industrial firm. Apply to File No. 3208-W.

GRADUATE ELECTRICAL ENGINEER, S.E.I.C., U.N.B. '49, age 22. Single. Experience limited to three summers in both peliminary and construction surveys for Highways, and one with Canal

Service. Interested in Power Installation and development. Would consider employment abroad. Apply to File No. 3209-W.

MECHANICAL GRADUATE, Grad. I.M.E., Cambridge University, single, age 26. 3 years shop apprentice in English plants, 3 years Engineer Office Royal Navy, running and maintenance of steam turbine and reciprocating machinery. Now special apprentice machinist in U.S. Desires junior production position in Ontario. Apply to File No. 3210-W.

CIVIL ENGINEERING STUDENT, S.E.I.C., Toronto. Veteran, age 27. Primarily interested in structural steel or reinforced concrete design but will consider anything. Available immediately. Apply to File No. 3211-W.

Partner Wanted

ACTIVE PARTNERSHIP desired with a firm of General Building Contractors located in Montreal or would be interested in forming new company with one or more construction engineers. Advertiser has capital and 20 years of construction experience. For additional information, apply in confidence to File No. 2138-W.

PARTNER, wanted by engineer with 25 years experience, contemplating private practice. Must have necessary qualifications; previous experience with consulting engineer desirable. Apply to File No. 2642-W.

GRADUATE CIVIL ENGINEER, Jr.E.I.C., age 33, 11 years engineering experience in mining, all types surveying, airport and highway construction, building construction, sewage and water works office administration and mechanical experience in pulp and paper industry for past 3 years. Would like to contact parties or company interested in consulting engineering or construction with view to partnership, junior or otherwise. Wanted location in west, preferably Edmonton. Apply to File No. 2792-W.

Attention, Members

Please telephone in advance and make an appointment if you propose using the Institute's Employment Department.

This will result in a better service to everyone concerned.

TELEPHONE
PLATEAU 5078

Except in special cases all interviews will be arranged between the hours of 9 and 12.

Important Notice

In the past, Council has availed itself of its authority under the by-laws to extend the time for payment of fees and for application of the penalties for arrears of fees. In recent years, however, the costs of supplying the Institute's services have increased, as every member will appreciate, to an extent that Council cannot now justify the provision of these services to members who have not paid their annual fees within the period prescribed by the by-laws. Therefore:—

Effective July 1st, 1949, in accordance with the provisions of Section 25 of the by-laws, the names of members in arrears will be removed from the mailing list to be replaced when such arrears have been paid in full.

Copies of the *Journal* for July and succeeding months cannot be ordered from the printer for members in arrears. Extra copies are sometimes available and will be sent to members who pay arrears of fees as long as the supply lasts.

BOOK REVIEW

THEORY OF LIMIT DESIGN

J. A. Van Den Broek, M.E.I.C.

N.Y., John Wiley & Sons; London, Chapman & Hall, 1948. 144 pp., illus., diagrs., charts, tables, 8½ in., cloth, $3.50.

Reviewed by P. L. Pratley, M.E.I.C.*

Theory of Limit Design covers numerous articles on the same subject published previously, much laboratory investigation on slender columns, and certain material new to the present reviewer in the way of column formulae.

The built-in and continuous beams are treated much as usual, but rather more discussion is accorded to the problem of the transmission towers.

While the subject is theoretically interesting, its practical application is definitely limited and in some respects can be questioned, particularly as to wisdom. The actual effect of using this theory on beam design is simply to increase the permissible loading by allowing higher unit stresses, all of which will occur in practice within the elastic zone before plastic yield begins. By proportioning a uniformly loaded single span built-in beam for a moment of

$$\frac{wL^2}{16} \text{ instead of } \frac{wL^2}{12}$$

the apparent capacity load is raised by one-third, while the ultimate fibre stress remains at the specified elastic limit, say 35,000 lbs. for medium steel. Due, however, to the adoption of a factor of safety of say two, the permitted working load never induces plastic yield and the system remains elastic: the governing moment is $\frac{1}{2}$ of $\frac{wL^2}{12}$ and the working fibre stress reaches $\frac{2}{3}$ of 35,000 lbs. or 23,333 lbs. instead of the 20,000 lbs. normally specified. In other words, cutting the capacity load by two does not cut the ultimate fibre stress by two, from 35,000 to 17,500, because the distribution of moment assumed in arriving at a fibre stress of 35,000 under capacity load does not occur, so that the factor of two is illusory if applied to fibre stresses.

The author states quite frankly on Page 122 and makes a clear reference to the same fact on Page 89, that the crux of his method when applied to redundant frameworks such as transmission towers, is the assumption that once "the buckling strength of the compression diagonal is reached, its carrying power remains constant until some other member, say the tension diagonal or the cross strut CD, is also loaded to its capacity strength." This is difficult to accept as a fact in spite of the succeeding paragraph, for it must again be realized that when the safety factor of approximately two is applied to the external load, making this figure half the capacity load, a situation is created which ensures that this crux is not proven because plastic yield is not experienced.

The theory is interesting as a theory, but dangerous to offer as a design method, because only the experienced and thoughtful designer will remember that the stress distribution assumed in computing capacity loads is rendered impossible when a factor of safety of two is applied.

The reading of the book suggests, as did the reading of all previous articles by the same author on the same subject, that this tool, useful though it might be in certain circumstances, should not be placed unreservedly in the hands of the inexperienced designer. It should be reserved for the occasional use of the competent and experienced engineer possessed of a full appreciation of the assumptions adopted and of the departure from the elastic theory and also possessed of considerable independent practical judgment.

The present reviewer continues to protest against the claim made on Page 82 that eccentricity, end moments, and a length ratio are identical. They are interrelated unquestionably, but being respectively of dimensions —, length —, mass x length —, and 0, they cannot, by any stretch of the facile imagination, be regarded as identical. To persist in such a claim only adds confusion to confusion and indeed, while the author knows very well what he is talking about, he seems to take extraordinary steps to give the impression that he doesn't.

Minor confusion is introduced by the different form of equation w on pages 101 and 111 and equation x on pages 106 and 111, while on page 97 the word in the middle of line 14 is "almost" not "most".

*Consulting Engineer, Montreal, Canada.

SELECTED ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC

Airplane Structural Analysis and Design:
E. E. Sechler and L. G. Dunn. New York, Wiley; London, Chapman and Hall, 1942. 420 pp., illus., cloth. (Galcit Aeronautical Series.)

Bibliographic Survey of Corrosion, 1945; a Compilation of Corrosion Abstracts:
Illinois Institute of Technology, Corrosion Research Laboratory. Houston, Texas; National Association of Corrosion Engineers, 1948. 129 pp., cloth.

Bibliography of Cement and Concrete, 2d ed.:
Cement and Concrete Association, London, 1949. 46 pp., paper.

Cheaper by the Dozen:
F. B. Gilbreth, Jr., and E. G. Carey. New York, Crowell, 1948. 237 pp., illus., cloth.

Cosmic Ray Physics:
D. J. X. Montgomery. Princeton, N.J.; Princeton University Press, 1949. 370 pp., illus., cloth.

Cylinder Wear in Diesel Engines with, a Special View to Large Marine Units:
Carl Hoegh. Brooklyn, N.Y.; Chemical Publishing Co., 1949. 238 pp., illus., cloth.

Elements of Applied Hydrology:
Don Johnstone and W. P. Cross. New York, Ronald Press, 1949. 276 pp., illus., cloth.

Engineering the New Age:
J. J. O'Neill. New York, Ives Washburn, 1949. 320 pp., cloth.

Foundations of Nuclear Physics; Facsimiles of Thirteen Fundamental Studies as they were originally reported in the Scientific Journals, with a Bibliography:
Dover Publications, New York, 1949. 273 pp., illus., cloth.

Bibliographies and Extensive Literary Searches

Short subject bibliographies will be compiled on request.

Extensive searches will be made at a charge per hour of $1.50 to members, and $2.50 to non-members.

Indicate which required
Be specific

Borrowing and Purchasing

Books, periodicals, photostats, translations, etc., may be borrowed for 2 weeks, or purchased by any member of the Institute, resident in Canada.

A library deposit of $5.00, at par in Montreal, is required before items may be borrowed.

All carrying charges are payable by the individual. Except in the case of library deposits, payment should not be made in advance.

Non-members may consult the library, but may not borrow material.

Heating, Ventilating, Air Conditioning Guide, Volume 27, 1949:

American Society of Heating and Ventilating Engineers, 1949. 1,384 pp., illus., fabrikoid.

Instrument Manual, 1949:

United Trade Press, London, 1949. 660 pp., illus., cloth.

Invention and Innovation in the Radio Industry:

W. R. Maclaurin and R. J. Harman, with a Foreword by K. T. Compton. New York, Toronto; Macmillan, 1949. 304 pp., illus., cloth. (Massachusetts Institute of Technology Studies of Innovation.)

Metallurgical Study of German Aircraft Engine and Airframe Parts, Part 2:

Special and Alloy Steel Committee. London, Manchester; Kennedy Press, 1948. 110 pp., illus., cloth.

National Conference on Industrial Hydraulics, Fourth Meeting, October 20-21, 1948, Proceedings, Volume 2:

Armour Research Foundation of Illinois Institute of Technology, Chicago, 1949. 154 pp., illus., paper.

Numerical Calculus; Approximations, Interpolation, Finite Differences, Numerical Integration, and Curve Fitting:

W. E. Milne. Princeton, N.J.; Princeton University Press, 1949. 393 pp., illus., cloth.

On the Theory of Stochastic Processes and their Application to the Theory of Cosmic Radiation:

Niels Arley. New York, Wiley, 1948. 240 pp., illus., cloth.

Personnel Selection; Test and Measurement Techniques:

R. L. Thorndike. New York, Wiley; London, Chapman and Hall, 1949. 358 pp., illus., cloth.

Photoelectricity and its Application:

V. K. Zworykin and E. G. Ramberg. New York, Wiley; London, Chapman and Hall, 1949. 494 pp., illus., cloth.

Radioactive Measurements with Nuclear Emulsions:

Herman Yagoda. New York, Wiley; London, Chapman and Hall, 1949. 356 pp., illus., cloth.

Royal Society Empire Scientific Conference, June-July, 1946, Report:

Royal Society, London, 1948. 2 vols., illus., cloth.

Theory of Modern Steel Structures, Volume 2—Statically Indeterminate Structures and Space Frames, rev. ed.:

L. E. Grinter. New York, Macmillan, 1949. 312 pp., illus., cloth.

Three Decades; the Story of the State Electricity Commission of Victoria from its Inception to December 1948:

Hutchinson & Co. (Publishers) Ltd., Melbourne, Australia, 1949. 192 pp., illus., cloth.

War History of the Radio Branch:

National Research Council of Canada, Radio Branch, Ottawa, 1948. 131 pp., illus., paper. (N.R.C. Report No. ERA-141.)

TECHNICAL BULLETINS, ETC.

Institute of Metals. Reprints:

Application of Flux Degassing to Commercially Cast Phosphor Bronze, N.I. Bond-Williams.—Melting and Casting Aluminium Bronze Ingots for Subsequent Working, A. J. Murphy and G. T. Callis.—Melting and Casting of Brass, Maurice Cook and N. F. Fletcher.—Melting and Casting of Nickel Silver at the Works of Messrs. Henry Wiggin and Co., Ltd., E. J. Bradbury and P. G. Turner.—Melting and Casting of Non-Ferrous Metals, G. L. Bailey and W. A. Baker.—Production of Refined-Copper Shapes, R. H. Waddington.

Institute of the Aeronautical Sciences:

Aeronautical Engineering Catalog, 1949.

Institution of Electrical Engineers. Proofs:

Detection by Oscillographic Methods of Winding Failures during Impulse Tests on Transformers, E. C. Rippon and G. H. Hickling. — Hot-Cathode Thyratrons: Practical Studies of Characteristics, H. deB. Knight.—Motor Uniselector and the Technique of its Application in Telecommunication, W. H. Grinsted.—Parasitic Forces Existing in Induction Watt-Hour Meters, G. F. Shotter.

Film in Industrial Safety Training:

P. R. Ignatius. Boston, Mass., Harvard University, 1949.

Function of Fares:

L. K. Sillcox. New York, New York Air Brake Co., 1949.

Preliminary Report upon Administration of the Plan, Vancouver, British Columbia:

Vancouver Town Planning Commission. St. Louis, Missouri; Harland Bartholomew and Associates, 1948.

Signaling Significance:

L. K. Sillcox. New York, New York Air Brake Co., 1949.

Theoretical Study of Ram-Jet Propulsion:

Boleslaw Szczeniowski. (Reprinted from Canadian Journal of Research Section A, volume 26, number 6, November 1948.)

Transport in Time of Change:

L. K. Sillcox. New York, New York Air Brake Co., 1949.

BOOK NOTES

The Institute does not assume responsibility for any statements made; they are taken from the preface or the text of the books.

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARDS FOR THE AUTOMOBILE INDUSTRY:

British Standards Institution, London, 1948. (B.S. Handbook No. 8.) 335 pp., illus., 8¾ x 5¾ in., cloth, 15/-.

This Handbook brings together in readily accessible form the standards of direct interest to the automobile industry and all concerned with it. It contains automobile standards of the Society of Motor Manufacturers and Traders; British Standards in full, or those parts which are of direct interest to the automobile industry; horse power correction charts; S.A.E. standards for splines and serrations; steels

for the motor industry in the form of bars and forgings, sheet and strip, and wire for springs; and references to British Standards for aluminium and aluminium alloys, bronzes and brasses.

BRITISH STANDARDS INSTITUTION. STANDARDS:

British Standards Institution, London.

Compressed Natural Rock Asphalt. BS 348:1948; Mastic Asphalt (Limestone Aggregate) for Roads and Footways. BS 1447:1948; Mastic Asphalt (Natural Rock Asphalt Aggregate) for Roads and Footways. BS 1446:1948.

These three standards on asphalt are revised editions of BS 348 and BS 596. The most important change relates to chippings.

Media for Biological Percolating Filters. BS 1438:1948. 2/6.

This standard prescribes for durability, uniformity of size, shape of the pieces of medium, cleanness, nature of surface, chemical inertness, and mechanical properties of filters for treatment of sewage, water, and certain trade waste waters.

CONCISE HISTORY OF MATHEMATICS:

Dirk J. Struik. New York, Dover, 1948. 2 vols., illus., 6¾ x 4½ in., cloth, $1.50 per vol., $3.00 per set.

This is a short description of the main trends in the development of mathematics from its earliest beginnings up to 1900, and of the social and cultural setting in which it took place. Emphasis is placed on the continuity and affinity of thought in the Oriental civilizations; on the distinction between established fact, hypothesis, and tradition; on the relation of trends in Renaissance mathematics to the commerce and engineering of the time; on the persons and schools rather than subjects in nineteenth century mathematics. There are many illustrations and bibliographies are given for each section.

EDUCATION FOR PROFESSIONAL RESPONSIBILITY:

Inter-Professions Conference on Education for Professional Responsibility. Pittsburgh, Carnegie Press, 1948. 207 pp., illus., 8½ x 5½ in., fabrikoid.

The purpose of the conference was to promote the interchange of experience among teachers of medicine, law, divinity, engineering, and business. The sessions were concerned with the objectives of professional education; content and method in professional education; and the social and humanistic aspects of professional education. The papers of particular interest to engineers deal with the achievement of objectives in the education of the engineer; objectives and objectivity in science; and the use of problems and instances to make engineering education profitable.

ELECTRIC WINDERS; a Manual on the Design, Construction, Application, and Operation of Winding Engines and Mine Hoists, 2d ed.:

H. H. Broughton. London, Spon, 1948. 450 pp., illus., 9¾ x 7½ in., fabrikoid, 63/– plus 1/6– postage.

This text is based on the analysis of approximately 2,000 winders and mine hoists. A large number of tables is featured in order to make data immediately serviceable. In this new edition, there is much additional and new material, as, for instance, Koepe-pulley winders, deep-level winding, intensive hoisting, and skip-hoisting of coal. Accounts are given of a number of failures in the hope of improving design and construction. There are extensive bibliographies on every aspect of the subject treated in the book.

PARKING LOT OPERATION:

C. S. LeCraw, Jr., and W. S. Smith. Saugatuck, Conn., Eno Foundation for Highway Traffic Control, 1948. 114 pp., illus., 9 x 6 in., paper.

Includes general information on parking lots, and discussions on layout and arrangement of lots, practices and policies in lot operation, efficiency of lot use, policies on head-in and back-in parking, practices in vehicle delivery, relationships of lot capacity to waiting times, the allocation of area, and financial matters.

RADIO HANDBOOK (Manuel Radio), édition française:

Editions Techniques, anct. P. H. Brans, Antwerp, Belgium, 1948. 351 pp., illus., 11¾ x 8 in., paper.

This manual is a translation of the 10th edition of "Radio Handbook", published by Editors and Engineers, Santa Barbara, California. It deals with short wave or high-frequency radio, especially for the licensed amateur. Some of the subjects included are vacuum tubes, radio receivers, radio sets, frequency modulation, antennas, cathode ray oscillographs. There are numerous illustrations, diagrams, and tables.

THEORY AND CALCULATION OF ALTERNATING CURRENTS:

B. C. Lee. London, Spon, 1948. 150 pp., illus., 8¾ x 5½ in., cloth, 16s. plus 4d. postage.

In this book, a knowledge of direct-current circuit theory and of elementary calculus is assumed. The contents include alternating current fundamentals, series and parallel circuits, power and power factor, resonance, three-phase circuits, vector algebra, complex waveforms, equivalent circuits, network theorems, short-circuit calculations, and symmetrical components. Special emphasis is laid on circuit conventions. The author is of the opinion that a firmly based system of conventions is essential to the logical development of polyphase circuit theory. A large number of worked examples is included.

TRAFFIC DESIGN OF PARKING GARAGES:

Edmund R. Ricker. Saugatuck, Conn., Eno Foundation for Highway Traffic Control, 1948. 182 pp., illus., 9 x 6 in., paper.

This study evaluates the design features of off-street parking facilities from the viewpoint of traffic engineering, and presents factual data for those interested in building new facilities, either as owners or designers. Methods and techniques that the traffic engineer applies to traffic on the highway and street system apply directly to location, design, and operation of terminal facilities.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

BASIC ELECTRICAL ENGINEERING FOR STUDENTS OF ELECTRICAL ENGINEERING.

G. F. Corcoran. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1949. 449 pp., illus., diagrs., charts, tables, 9¼ x 5¾ in., cloth, $4.50.

This textbook was designed especially for use in an introductory course in electrical engineering. The most outstanding feature is the simple and direct method by which magnetic field concepts are handled. First D-C theory is considered, with D-C circuit analyses by the mesh and model methods. This is followed by electric field theory, magnetic field theory, inductance, capacitance, and non-linear circuit elements. There is a wide range of problems with each chapter. The rationalized m k s system of units is employed.

COMPUTATION CURVES FOR COMPRESSIBLE FLUID PROBLEMS.

C. L. Dailey and F. C. Wood. John Wiley & Sons, New York; Chapman & Hall, London, 1949. 33 pp., text, charts, 11¼ x 9¼ in., paper, $2.00.

Serving as supplementary material to the text, "Aerodynamics of a Compressible Fluid", by Liepmann and Puckett, this volume presents a series of charts in three sections: energy relations and heat addition functions; plane shock and expansion relations; and conical flow relations—Taylor-Maccoll theory. A brief discussion is given of each function and its corresponding plot to explain its use.

DESIGN OF STEEL BUILDINGS, 3d ed.

H. D. Hauf and H. A. Pfisterer. John Wiley & Sons, New York; Chapman & Hall, Limited, London, 1949. 280 pp., illus., diagrs., charts, tables, 8¾ x 5½ in., cloth, $5.00.

This book presents the general principles of structural design as applied to the framing of commercial, institutional and residential type buildings. In this edition the material on welded construction has been expanded. In addition to a general discussion of welded framing connections, the application of welding to the design of plate girders and roof trusses is treated in detail. The chapter on the design of beams has been rewritten, and a more detailed treatment of the use of safe loading tables included. All the problems have been revised and new ones added.

EARTH CONDUCTION EFFECTS IN TRANSMISSION SYSTEMS.

E. D. Sunde. D. Van Nostrand Co., New York, Toronto, London, 1949. 373 pp., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50 in Canada.

Primarily concerned with fundamental methods, this book deals with the analysis of earth conduction effects and the principles underlying protective measures against resultant circuit disturbances. Theory is presented from first principles, together with formulas, curves, and methods used in engineering applications. The MKS system of units is used. Each aspect of earth conduction is presented with a coverage of present knowledge and new material gained from studies made at the Bell Telephone Laboratories. There is a bibliography.

ELECTROMECHANICAL TRANSDUCERS AND WAVE FILTERS. 2d ed.

W. P. Mason. D. Van Nostrand Co., Toronto, New York and London, 1948. 419 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, $7.50 in Canada.

This book presents the fundamental analogies and interconnections between electrical and mechanical theory. The present edition incorporates a number of new topics, some of them growing out of work on transducers and filters during the war. The subjects selected have been those which round out and apply the methods already described in the book which cover electrical network theory, acoustic equations, vibration of membranes and plates, and various electromechanical systems.

ELEMENTS OF MECHANICAL VIBRATION, 2d ed.
