Organization and Responsibilities of the International Joint Commission

by

General The Honourable A. G. L. McNaughton, M.E.I.C.

Chairman, Canadian Section
International Joint Commission

An address presented at the inaugural meeting of the Belleville Branch of The Engineering Institute of Canada on December 8, 1950.

Set up by treaty in 1909, and patterned after the International Waterways Commission it replaced, the International Joint Commission reviews water problems along the common frontier of the United States and Canada under authority above that of national law. Its objective is the adjustment and settlement of disputes before they reach the controversy stage.

Various categories of boundary waters are here described and methods of dealing with each are discussed, with reference to typical cases dealt with in the past. Procedure to be followed in reaching decisions is outlined. The author draws attention to the primarily engineering character of the Commission's work, as a reason why it should be of continuing interest to engineers.

I have been asked to say a few words to you about the International Joint Commission, the body set up by the Treaty of 1909, and designed to provide a continuing mechanism, with authority transcending that of national law. Through this commission problems between the United States and Canada, arising along the 5,655 miles of boundary between them, can be brought under review at their inception. They can thus be dealt with before they might magnify and enlarge through controversy, thus alarming and embittering public opinion in either country, making their eventual solution increasingly difficult.

Certainly this wise conception of dispelling trouble in advance was uppermost in the minds of James Bryce and Elihu Root, the plenipotentiaries who negotiated the Treaty. This is shown by the opening paragraph of the preamble, which refers to the High Contracting Parties as "being equally desirous to *prevent* disputes regarding the use of boundary waters and to settle all questions which are now pending . . .; along their common frontier, and to make provision for the adjustment and settlement of all such questions as may hereafter arise. . . ."

I venture to speak to you on this subject, because the problems which have arisen along the boundary, and which have been referred to the Commission for solution during the 38 years of its existence, have mostly been concerned with the use of water. Use of water is primarily a matter for engineers.

Certainly all the questions which have come to the Commission, whether they dealt with water or with other subjects, have involved important engineering considerations. It has invariably been through engineering methods of analysis and deduction that the way has been found to the solutions which have evolved and have been adopted.

Boundary Waters

"The waters from main shore to main shore of the lakes and rivers and connecting waterways . . . along which the International boundary . . . passes" for more than half its long course from the Atlantic to the Pacific are defined as "boundary waters". The duties and authority vested in the Commission by the Treaty of 1909 distinguishes sharply between these waters and those waters which "in their natural channels would flow into" or "from" the boundary waters, or "the waters of rivers flowing" from one country to the other "across the boundary".

The text of the Treaty shows that those who drafted it had a clear conception of the varied character of the questions likely to arise in each of these several categories of waters. Certainly they have provided the Commission with authority which has proved apt in each one of the particular sets of circumstances which have had to be met.

The use to be made of "boundary waters" is a matter of deep concern to the inhabitants of the region, regardless of which side of the boundary they may happen to live. It is important that, whatever individuals or communities may do with these waters for their own advantage, they should not prejudice the welfare of others or put anyone at an unfair disadvantage.

Furthermore, these lakes and

rivers along the boundary are not minor features of the landscape. They are vast assets of far-reaching and enduring importance, on the proper use of which depends the future economic development and prosperity of the whole region in both countries.

Navigation to Remain Free

The Treaty recognizes these intimate joint interests of the two countries in these boundary waters. It provides that their navigation "shall forever continue free and open for the purposes of commerce" to the inhabitants and to the ships, vessels, and boats of both countries". It will be "subject, however, to any laws and regulations of either country within its own territory, not inconsistent . . . and applying equally and without discrimination".

These rights of free navigation, so long as the Treaty remains in force, extend also to "the waters of Lake Michigan", which is not a boundary water, "and to all canals connecting boundary waters, now existing or which hereafter may be constructed . . ." "Free", means free in the sense of free to use, and not in the financial sense, because tolls may be charged provided they "shall apply alike", and both "High Contracting Parties shall be placed on terms of equality. . . ."

The Treaty also implicitly recognizes the difficulties which would be presented to the inhabitants on the two sides of boundary waters in coming together and making adequate arrangements for the development of their joint interests. In such cases they would have to proceed separately through the ordinary national economic and legal systems of their respective countries. For the better and more convenient regulation and development of these interests the Commission is given "jurisdiction", and is required to "pass upon all cases involving the use or obstruction or diversion of the waters" in question.

Priority for Use

It is provided that, in the exercise of this jurisdiction by the Commission, "the High Contracting Parties shall have, each on its own side of the boundary, equal and similar rights in the use of . . . boundary waters". In order that past arrangements should not be called in question, it is prescribed that "existing uses of boundary waters on either side" are not to be disturbed. The Treaty seeks to avoid controversy as far as possible by far-sighted legislation based on convenience. It specifies that, wherever conflict occurs, the use of water for "domestic and sanitary purposes" shall have priority over "navigation". It provides that use for navigation shall take precedence over "uses for power and for irrigation". It also provides that . . . "boundary waters and waters flowing across the boundary are not to be polluted on either side to the injury of health or property on the other".

By the Treaty, and except as may be "provided for by special

General McNaughton

agreement . . ., no further or other uses or obstructions or diversions, whether temporary or permanent, of boundary waters on either side of the line, affecting the natural level or flow of boundary waters on the other side of the line, shall be made except by authority of the United States and the Dominion of Canada within their respective jurisdictions, and with the approval of the International Joint Commission".

By these provisions the power to initiate plans for "the deepening of channels, the construction of breakwaters, the improvement of harbours" and the like is left to the respective Governments on their own side of the line, provided . . . that the results "do not materially affect the level or flow . . ."

Patterned After Waterways Commission

These far-reaching and quite novel provisions, vesting wide jurisdiction and authority in the International Joint Commission, are based on the experience of its predecessor, the International Waterways Commission. That Commission was set up by the concurrent legislation of the United States (1902) and of Canada (1905), for the purpose of investigating and reporting upon the condition and use of waters adjacent to the boundary. It had no executive responsibility, however.

The fundamental new conceptions underlying the Treaty of 1909 are largely due to the inspiration of a great Canadian, Sir George Gibbons, who had been chairman of the Canadian Section of the International Waterways Commission. His insight into the causes likely to lead to controversy and his views as to proper methods for the resolution of such difficulties as might arise, were closely followed by the plenipotentiaries in the drafting of the Treaty.

Two Categories of "Waters"

I have referred to the authority of the Commission over "boundary waters", where evidently jurisdiction in the joint interest of those concerned in both countries — individuals, communities and governments — has been given in wide measure, without precedent in international affairs.

I will now refer to those waters which "in their natural channels would flow across the boundary, or into boundary waters", or which flow "from boundary waters". In these cases the waters in question originate from a region which is essentially national in character, and go to another which has the same character. While they are in the boundary zone they are only of passing and limited international concern, except should any action by one government result in damage on the other side.

When these streams have or resume their purely national character, the competence of the riparian governments to legislate is supreme. It provides full authority on which to base effective administration to reflect the desires and the interests of all those who are primarily concerned.

There was some suggestion that streams crossing the boundary should be dealt with as boundary waters. Fortunately, I think, these practical considerations were recognized, and the Treaty leaves the national authority in these waters entirely undiminished. It does, however, require that this national authority shall itself provide the means whereby, if any one on the other side is aggrieved, he may obtain redress.

Typical Cases Dealt With

Cases may occur of "interference with or diversion of waters on the other side of the boundary, the effect of which would be productive of material injury to navigation interests on its own side". In the Treaty each nation reserves "any right which it may have, to object . . .". Close technical co-operation exists between the Departments of the two Governments charged with the development and maintenance of navigation facilities on the lakes and streams along the boundary. In such an atmosphere this reservation has proved merely an extra precaution which in practice there has never been any occasion to use.

In the case of waters "flowing from boundary waters or . . . flowing across the boundary", the principal cause for dispute which was feared was the possible construction of some work downstream from the boundary, "the effect of which is to raise the natural level of waters on the other side". Works of this character and effect are not permitted unless "the construction or maintenance thereof is approved by the . . . International Joint Commission".

The Treaty of 1909 defined the agreement reached in cases of the diversion of waters at Niagara for the generation of power, and the division of the flow of the St. Mary and the Milk River in Montana and Alberta for irrigation. In both cases a formula was sought which would give equal benefits to each country.

The Niagara provisions have now been superseded by the Niagara Diversion Treaty of 1950, which has been ratified by both countries. Under this Treaty substantial increases of flow are made available to each country for the power, now so urgently required for our defence preparations. All the rights acquired by Canada have been made available (Agreement dated 27 March 1950) to Ontario. This is in accordance with the established policy that the Canadian Provinces should have rights to power in their rivers, even if these rivers are in part international in character.

In the Niagara Diversion Treaty, in order to ensure the preservation of the scenic beauty of the Falls by the construction of works to redistribute the flow, the Commission is invited "to make recommendations as to the nature and design of such remedial works and the allocation of the task of construction as between Canada and the United States". Ontario has agreed to construct such works in Canada as may be decided upon.

The St. Mary-Milk River agreement, after interpretation by the Commission, has stood the test of time. Large sums of money have been and continue to be invested in putting the divided water from these rivers on the land in the respective countries. Vast areas are now under crop where formerly there was little but sage brush.

Neither side was entirely satisfied by the original arrangement. It now seems proved, however, that the important thing was a firm decision which would allow the work of irrigation to proceed. That was the view of our authorities, who are averse to re-opening this matter because of the resulting uncertainty which would trouble the minds of those who farm the lands in question.

Limitations to Decisions

In addition to the provisions giving the Commission jurisdiction in regard to "boundary waters . . . waters which flow therefrom, and . . . waters which cross the boundary", the Treaty of 1909 provides that . . . "any other question or matters of difference involving the rights, obligations, or interests . . . along the common frontier . . . *shall* be referred . . . to the . . . Commission for examination and report, whenever either . . . Government shall request. . . ."

In these cases the Commission is required to proceed to investigate and report in accordance with the terms of the particular reference made to it by the Governments. It is specified that "such reports . . . shall not be regarded as decisions of the questions or matters so submitted either on the facts or the law, and shall in no way have the character of an arbitral award".

At first sight these limitations may seem formidable. In practice they have in no way compromised the useful results which have been secured. In fact the opposite is the case, because these carefully drawn conditions have given the Commission a useful frame of reference for its work. The Commission relies on a thorough study of the facts which are counter-checked and amplified in open hearings, held to provide a "convenient opportunity" in the localities concerned, "for all parties interested" to be heard.

At these hearings any individual with a bona fide interest can appear, either in person or by counsel, to have his say with complete freedom. Repeated experience has shown that where a complex situation is thus reduced to a statement of verified technical facts, there is little difficulty for the Commission to arrive at an agreed recommendation. And, with an agreed recommendation the subsequent agreement of the Governments is greatly facilitated.

Procedure

As a result, in its long history there is only one case of a division in the Commission, and this was on a point of procedure and not of substance. Also in the completed References there is only one case in which the Governments have not acted on the Commission's recommendations.

The Treaty of 1909 contains a provision which further broadens the authority and functions of the Commission. With a view to meeting a possible requirement, foreseen but never used so far, the Treaty provides that "any questions or matters of difference . . . may be referred for decision . . . by the consent of the two Parties, it being understood that on the part of the United States any such action will be by and with the advice and consent of the Senate and on the part of His Majesty's Government with the consent of the Governor-General in Council".

If this provision is invoked the Treaty further provides that "a majority of the Commission shall have power to render a decision . . ." and if ". . . the . . . Commission is equally divided" then the Commission's report "shall thereupon be referred for decision . . . to an umpire chosen in accordance with the procedure . . . of the Hague Convention . . . dated October 18, 1907. Such umpire shall have power to render a final decision . . ." That is, if such a course is embarked upon to deal with a difference or dispute it must proceed to finality and the governments have agreed in advance that the decision will be accepted.

Such are the powers and duties assigned to the International Joint Commission, a body comprised of

(*Continued on page 12*)

Gas Turbines In Industry

by

W. B. Wilson

Industrial Engineering Division,
General Electric Company,
Schenectady, N.Y.

A paper presented before the Peterborough Branch of the Engineering Institute of Canada, on October 23, 1950

The engineering profession has shown great interest in development of the gas turbine. The fact that the gas turbine is ready for application now should be of special interest to management in industry because of the large quantities of oil and natural gas now available in Canada.

The combustion gas turbine is a self-contained prime mover suitable for driving electric generators, pumps, compressors, chippers, grinders, and other machinery. It requires little auxiliary apparatus, can be built to operate without water and, based on experience to date, it is expected that the gas turbine will compare very favourably with other prime movers from the standpoint of maintenance.

It is a very simple prime mover consisting of the compressor, combustion chambers, and turbine. Atmospheric air is compressed in the compressor and then passes into the combustion chambers. In the combusion chambers fuel is burned with the air required for combustion and the resulting gases are mixed with excess air to reduce their temperature before they pass through the turbine.

The combustion gases are expanded through the turbine and exhausted to atmosphere. In such a gas turbine, using a turbine inlet temperature of 1300 to 1500 deg. F., and with compressor and turbine efficiencies higher than 85 per cent, approximately two-thirds of the turbine output is required to drive the compressor and one-third for useful work.

History of the Gas Turbine

Gas turbines power the turbo-superchargers and jet engines so extensively used in aircraft today. Because of the publicity given these during World War II, we are sometimes inclined to consider the gas turbine as a new idea. It is not. In 1680, it was discussed by Bishop Wilkins in a book called "Mathematical Magick". The claims for his gas turbine were that it was suitable for "turning a spit, reeling of yarn, the chiming of bells, the rocking of a cradle, and diverse other 'domestick' functions."

In the years that followed, various other ideas were proposed, and attempts were made to find a satisfactory gas turbine or, for that matter, any prime mover that would operate successfully on combustion gases. In 1895, Mr. Charles G. Curtis secured patents in the United States on his idea of a gas turbine. In 1902, the late Dr. Sanford A. Moss operated the first gas turbine wheels in the United States at Cornell University. In 1904, combustion gas turbines were built by the General Electric Company and tested in both their Schenectady, N.Y., and Lynn, Mass., plants.

Research continued in America and abroad and, at the time of World War I, gas turbine-driven superchargers were developed for internal-combustion aircraft engines. Efforts to perfect the gas turbine continued, with the result that knowledge and experience were gained in the design and manufacture of efficient compressors and turbines, and in the production of materials which would withstand normal design stresses at the high operating temperature needed for the gas turbine to serve as an efficient and reliable prime mover.

Efficiencies of the component parts, and allowable temperatures of the turbines were so low in many of the earlier gas turbine units, that the entire output was required by the compressor and nothing was left for useful work. In many instances the turbine could not even drive its own compressor.

High-strength materials suitable for operation at high temperatures, and high-efficiency turbines and compressors for this application were not commercially available until the 1930's, 250 years after Bishop Wilkins first discussed the gas turbine.

Early Non-Military Applications

Some European manufacturers have been very active in the gas turbine field. A gas turbine for power generation, driving a 4000-kw. generator, was installed in Switzerland about 1939. A locomotive gas turbine of approximately half this rating was placed in service about 1941.

Outlining the early developments of gas turbines for non-military uses, the author describes open-cycle, regenerative-cycle and compound-cycle types in turn, and explains the concept of overall efficiency.

The many uses to which gas turbines may be applied in industry are discussed, and performance compared with steam turbines and steam engine plants.

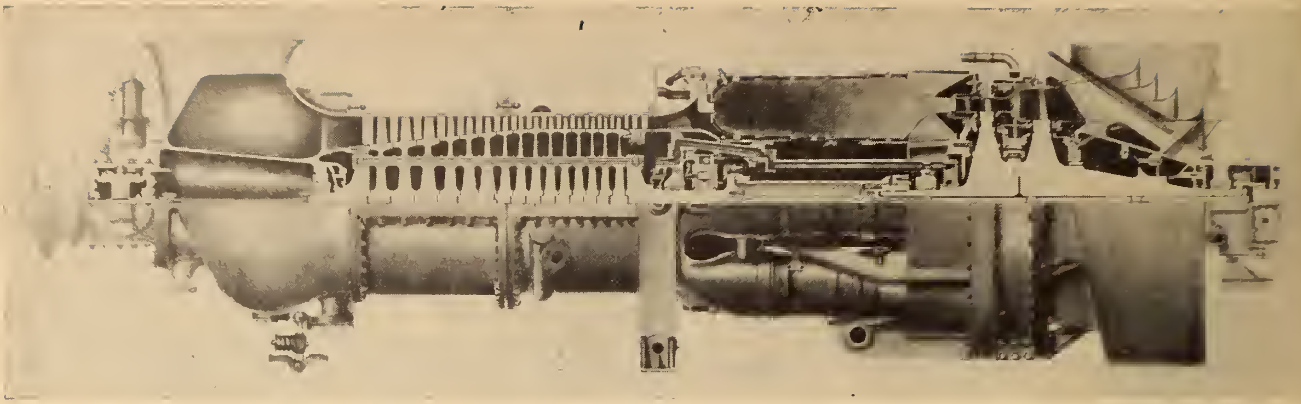

Fig. 1. 3,500-kw., simple, open-cycle gas turbine.

The first non-military applications of "combustion" gas turbines in the United States were in 1949. These applications included a gas turbine-powered electric locomotive used on the lines of the Union Pacific Railroad, and a gas turbine used for power generation in a station of the Oklahoma Gas and Electric Company. A third unit, installed for power generation in 1950, is now in service in a station of the Central Maine Power Company. The performance of these units has been very satisfactory. A fourth unit is now being installed in a plant of the Bangor Hydro Electric Company in Maine.

The Simple Open-Cycle Gas Turbine

Many different cycle arrangements have been considered for the gas turbine. There is the open-cycle, in which atmospheric air is used once in its passage through the compressor and turbine; the closed-cycle where the same atmospheric air is used over and over, and is heated from an external source; and combinations of the two in varying degree. The efficiency of any of these cycles will depend upon the extent to which intercooling, regeneration, and other refinements are employed.

When all things are considered, the open-cycle arrangement has many very desirable features, and this is the cycle selected for the first units developed by the General Electric Company. Three types of combustion gas turbine power plants have been developed by that company for industrial, locomotive, pipe line pumping, and utility applications. In describing these types, kilowatts will be used as a measure of the net turbine output even though the gas turbine units available are equally well suited for driving pumps, compressors, and other such equipment.

One type—a 3500-kw. unit, operates on the simple open-cycle described earlier. Three such units are now in commercial service and their performance has been most satisfactory. A cross section of this unit is shown in Fig. 1. Atmospheric air is compressed to approximately 80 p.s.i.a. in the compressor, fuel is mixed with the air and burned in the combustion chambers and then expanded through the gas turbine. Note the rugged compact construction of this unit. The turbine drives the compressor at approximately 6700 r.p.m. through a coupling at the high-pressure end, and the load through a coupling at the exhaust or low-pressure end. Gas turbine units may be used to drive mechanical loads direct or through suitable reduction gears, such as are used when driving generators.

Advantages of Compactness and Heat Energy Recovery

This type of gas turbine powers the electric locomotive in service on the lines of the Union Pacific Railroad. A gas turbine power

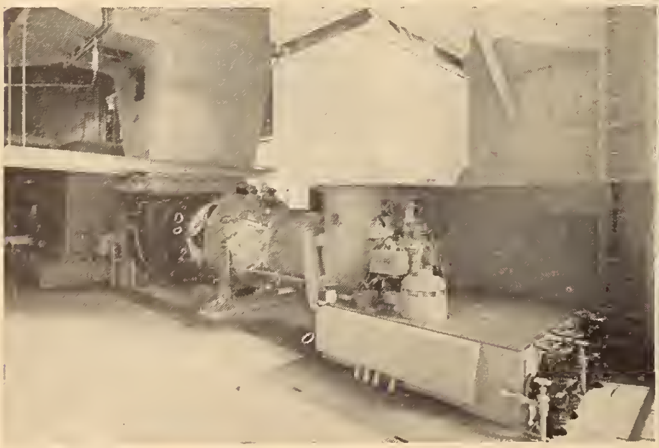

Fig. 2 (left). 3,500-kw. gas turbine generator set at Arthur S. Huey power station of Oklahoma Gas and Electric Co.

Fig. 3 (right). Building housing 3,500-kw. gas turbine set at the Arthur S. Huey power station of the Oklahoma Gas and Electric Co. Heat recovery equipment and exhaust stack are in the left foreground.

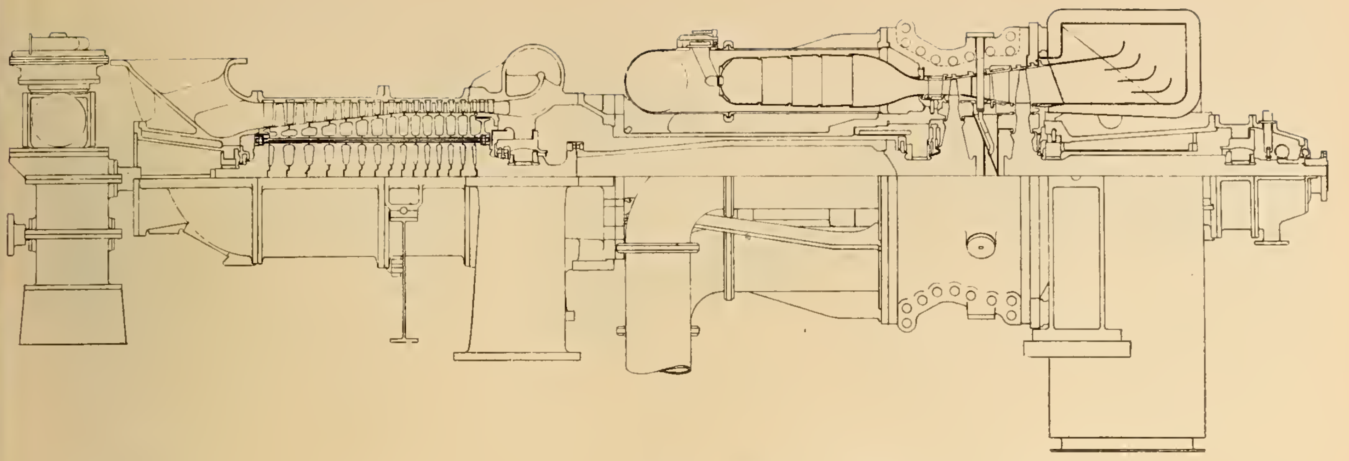

Fig. 4. 3,500-kw. regenerative-cycle gas turbine.

plant of this type, as installed for electric power generation in a plant of the Oklahoma Gas and Electric Company, is shown in Fig. 2. This is a 3500-kw. gas turbine-generator unit complete with all required auxiliaries, compactly arranged and requiring a floor area of only 8 ft. 9 in. by 47 ft. No basement is necessary, and the required foundation is very simple.

Greatest fields for application of the simple open-cycle unit are where space and weight are of prime importance, such as in a locomotive; where a unit is required for standby service, such as to supplement a hydro system or to take peak loads; or where there is a use for heat energy which can be recovered from the exhaust gases. Efficiency of this unit is approximately 15 per cent without heat recovery from the exhaust gases. By recovering heat from the exhaust gases, plant efficiencies higher than 70 per cent can be realized. All efficiencies discussed will be based on the higher heating value of the fuel. Depending upon the fuel used, efficiencies based on the lower heating value will range 4 to 10 per cent higher than efficiencies based on the higher heating value.

Gas turbine cycle efficiency for the Oklahoma installation was approximately 65 per cent, because heat recovered from the exhaust gases was utilized to heat feedwater for an existing steam plant. A view of this heat recovery equipment is shown in Fig. 3 located just outside the turbine room, with gas turbine exhaust gases passing through the feedwater heater and exhausting to atmosphere through the stack in the background.

This simple open-cycle gas turbine unit has applications in paper, rug, textile, chemical, petroleum, and other industrial plants which require heat energy, such as process steam, in addition to electric energy. The application here would be similar to that of an extraction type or non-condensing steam turbine. In such plants, application of equipment should of course be selected to provide all plant requirements with a minimum total expenditure for fuel, purchased power, fixed charges, and other operating expenses.

Concept of Overall Efficiency

To consider the cost of electric energy or heat energy separately is not sufficient—the overall fuel and operating dollars are most important. For plants using the same type of fuel and generating all heat and electric energy requirements within the plant, fuel dollars are directly proportional to overall plant thermal efficiency. This efficiency is very useful for evaluating various plant cycles, and is defined as the

$$\frac{\textit{Total available and useful output}}{\textit{Total actual input}}$$

This concept of plant thermal efficiency clearly recognizes both heat energy and electric energy; the useful electric energy can be converted into an equivalent heat basis. High thermal efficiency is an important factor in overall operating costs.

In one industrial plant recently, a gas turbine was considered for the generation of power, using heat from the exhaust gases for drying large fibre boards. Overall gas turbine cycle efficiency for this application was approximately 66 per cent, and even though fuel costs were only 15 cents per million b.t.u., an annual return of 40 per cent on the initial investment was indicated.

In another industrial plant, waste heat boilers were to be used, recovering heat from the gas tur-

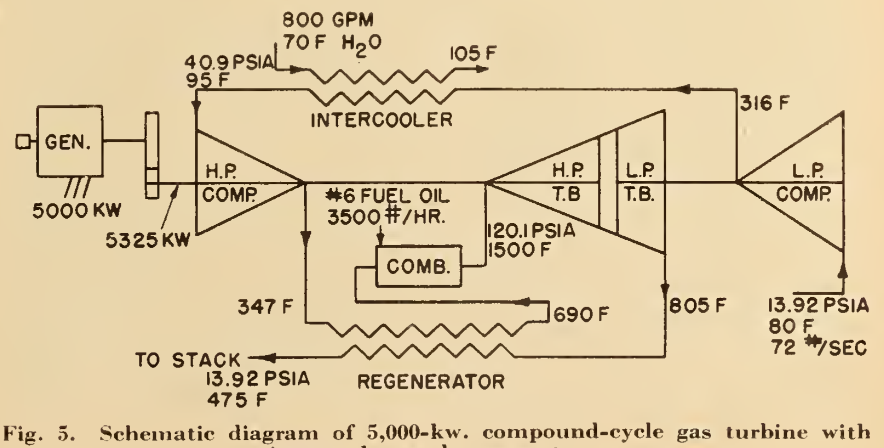

Fig. 5. Schematic diagram of 5,000-kw. compound-cycle gas turbine with intercoolers and regenerators.

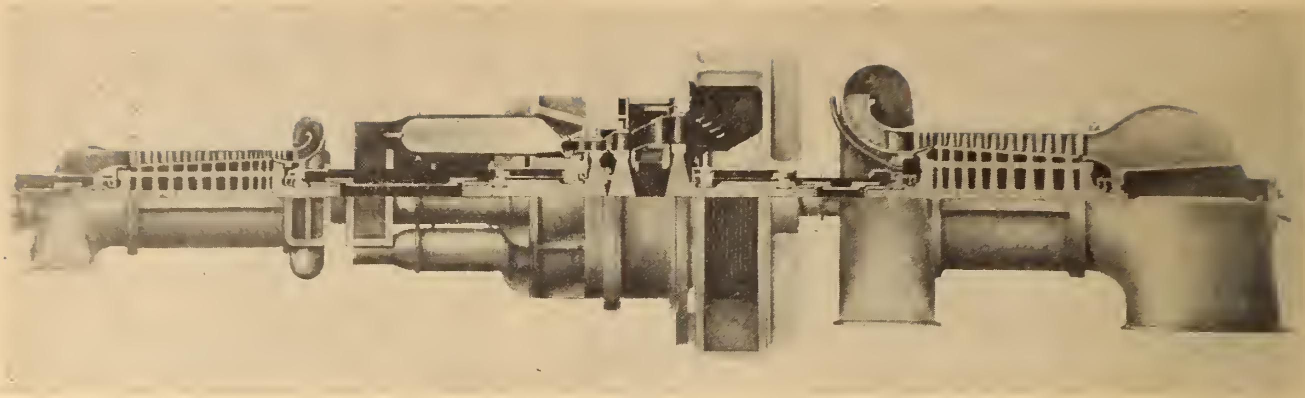

Fig. 6. Gas turbine for 5,000-kw. turbine-generator set.

bine exhaust gases to generate steam. Heat in the turbine exhaust gases was to be recovered for the generation of steam in two boilers at two different pressures —175 p.s.i.g. and 40 p.s.i.g. From the last boiler, the exhaust gases pass through an economizer to heat feedwater for the boilers before exhausting to the stack. This arrangement would provide a total of 39,000 lb. of steam per hour and 3500 kw. of electric energy. Overall gas turbine cycle efficiency for this steam and power generation is approximately 70 per cent.

The Regenerative-Cycle Gas Turbine

The second type developed was a self-contained 3500-kw. (5000 hp.) regenerative-cycle unit. This unit is very similar to the simple-cycle unit just described, except that a regenerator is used to heat the air after compression by recovering heat in the exhaust gases. The regenerator reduces the fuel required and improves the cycle efficiency without the use of waste heat boilers or other heat recovery equipment, as described earlier for the simple-cycle unit. Efficiency of this unit without additional heat recovery equipment is 22.4 per cent.

A cross section of this unit is shown in Fig. 4. This gas turbine power plant actually consists of two turbines — the high-pressure turbine driving the compressor and the low-pressure turbine driving the load. Both turbines are located in the same casing thus eliminating high-temperature external gas piping.

The regenerative-cycle gas turbine is applicable in Central Electric Stations for power generation, and for driving compressors on gas pipe lines. By using waste heat boilers instead of the regenerator, it may be used to supply both process steam and electric power in an industrial plant.

The Compound-Cycle Gas Turbine

The third type developed was a self-contained 5000-kw. compound-cycle gas turbine power plant complete with intercoolers and regenerators. These units are particularly adapted for applications requiring the generation of electric power only.

The cycle of this unit is shown diagrammatically in Fig. 5. In this unit we also have two turbines—the high-pressure turbine driving the high-pressure compressor and the load, and the low-pressure turbine driving the low-pressure compressor. Intercoolers are located between the low-pressure and high-pressure compressors, to reduce the work of compression. Regenerators heat the air after the final stage of compression before it enters the combustion chambers, and further reduces the fuel required by recovering heat from the exhaust gases.

Having a picture of the cycle and heat exchange equipment, an actual cross section of the turbines and compressors is shown in Fig. 6. Compressors and turbines have the same rugged construction as the 3500-kw. units. The combustion chambers are similar and, even though we have both a high-pressure and a low-pressure turbine, high temperature external gas piping is eliminated by placing both turbines in the same casing. The efficiency of this gas turbine plant, without additional heat recovery equipment, is 26.3 per cent, comparable to the best condensing-steam turbine plants of equal rating. A fourth type, now in the design stages, is a compound cycle unit rated 15,000-kw.

Controls

Controls for the gas turbine and its auxiliaries are conveniently arranged on a single panel. The simplicity of these units makes automatic control of the gas turbine plant practical, and either manual or automatic controls can be provided.

Fuels

With apparatus available today, the most practical fuel for these turbines is bunker "C" oil or gas. The unit cost of these fuels is comparable to and even lower than solid fuels in parts of Canada. In such areas the gas turbine plant should compare very favourably with other fuel fired plants. Because of the efficiency, simplicity, lower installed cost, and expected low maintenance of gas turbine plants, they also have applications in many areas where oil and gas fuels are more expensive than fuels suitable for other plants.

The cost of Diesel oil, as used in most internal combustion engine plants, is 1½ to 2 times the cost of "Bunker C" oil suitable for the gas turbine—this in itself is a sizeable factor in favour of the gas turbine plant.

Many Uses in Industry

So much for the gas turbine designs available—where can these be used to advantage in industry?

First

The gas turbine unit is particularly well suited for application in the pulp and paper, the textile, meat packing, refinery, and other industries requiring heat energy— usually in the form of process steam — in addition to electric energy. Power costs in such industries are minimized, because overall plant thermal efficiencies higher than 70 per cent are realized when heat energy recovered from the turbine exhaust gases is used in process.

Where continuous process operations are a "must", the gas turbine with its quick starting characteristics can be used for standby, emergency, or peak load service even in plants where it is not used to supply the normal daily plant load.

Second

In many areas where hydro power is not available at low cost, because of the distance from areas of generation, and electric power generation from fuel is considered, gas turbine generators may be applicable. The simplicity and efficiency of the gas turbine plant may indicate an increase in the number of thermal generating stations, to limit the use of long transmission lines from hydro systems.

Third

Gas turbine units have been applied in the States as standby for hydro systems in case of low water supply, or for peak load demands. Low standby operating and supervisory expense is possible because gas turbines may be shut down without the maintenance of hot boilers for instantaneous or daily load peaks. The combustion gas turbine can be started, put on the line, and operated at full load in less than 10 minutes. Such an installation is shown in Fig. 7.

Fourth

Because of its operating speeds, the gas turbine is particularly well suited as a mechanical drive unit for blowers, compressors, pumps, and other such equipment. Industries such as steel, gas pipe line pumping stations, and refineries should have wide use for the gas turbine. When desired, use of automatic or semi-automatic controls for the gas turbine makes it practical to install the unit in remote locations with a minimum of operating and supervisory expense.

Fifth

The gas turbine as a power plant for locomotives has many very desirable features. A 4500-hp. locomotive is built in a single cab when powered by the gas turbine. This is two to three times the power of other single cab locomotives extensively used today. This higher horsepower per ton is an advantage on many lines, particularly those which do not operate on steep mountainous grades. Simplicity and expected low maintenance also favours the gas turbine as a locomotive power plant.

Comparison with Steam Plants

Many of the gas turbine applications mentioned above are applications where steam turbines, internal combustion engines or steam engines are used at the present time. From the standpoint of space required, weight, initial cost, simplicity, and cooling water requirements, the gas turbine plant would now be favoured for many of these applications.

As for fuels, the steam turbine or the steam engine plant may be favoured in certain areas where the cost of coal or other solid fuels is lower than oil or gas. The burning of coal in gas turbines presents some problems at the present time. Research is now being conducted to perfect methods for the successful use of coal as the fuel for gas turbines. No doubt, at some future date, satisfactory equipment will be developed so coal can be used commercially as the fuel for gas turbines, as it is now used in other thermal plants.

In thermal plants supplying electric power only, gas turbine plant efficiencies compare favourably with other plants of comparable size. In plants requiring both electric energy and heat energy, selection of prime mover to give the highest plant thermal efficiency will depend on the ratio of electric power requirements to heat energy or process steam requirements. Gas turbines, steam turbines and internal combustion engines can be operated at high cycle efficiency when heat recovered from the exhaust can be used in process.

In many such industries, the use of electric energy has increased more rapidly than process steam or other forms of heat energy. The gas turbine is favoured in these industries because the ratio of electric power to process steam is high. In the intermediate range of process steam requirements, the condensing extraction turbine, the gas turbine utilizing waste heat boilers with supplementary firing, or a combination of the two may be selected.

Britain's Royal Festival Hall

An abstract of a paper which appeared in "The Consulting Engineer", October, 1950.

The Abercrombie plan for the development of the County of London stressed the need for dealing with the dreary south bank of the Thames as a whole, suggesting in a general way what form this development might well take. It was natural then, that when it was decided to celebrate the centenary of the Great Exhibition of 1851 by holding another exhibition to show Britain's progress during the hundred years, this area should be chosen as the site, especially since many of the exhibition buildings will be permanent.

One of the principal structures of the exhibition group will be a concert hall, the Royal Festival Hall, which is now under construction, and which is described in some detail in an article by Messrs. Scott and Wilson, M.M.I.C.E., the consulting civil engineers for the building, in the October, 1950, issue of *The Consulting Engineer*. While in general its design follows conventional lines, some of its features seem to us unique and it is of these that we shall write.

The upper floor is entirely occupied by the main hall which will seat 2,900 people; with all standing space occupied its capacity is 3,450. A smaller hall under the main hall will accommodate 750. There are also the usual foyers, a bar and restaurants. The slope of the site is such that entrances are provided at separate levels for the main hall and for the other rooms.

It was originally intended that the frame should be of structural steel, but delivery difficulties made a change to reinforced concrete desirable, except that the roof is carried on steel trusses. To save steel, joints in reinforcement are welded instead of lapped. A concrete mat foundation covers the whole area of the building; its bottom is about 13 feet below normal ground water level and therefore the walls and floors of the basements are water proofed. Dewatering the site by means of well points proved eminently successful.

The outstanding feature of the structural design of the Royal Festival Hall is the extraordinary care which has been taken to reduce nuisance from unwanted sound. This may come from the exterior of the building—there is a busy railway bridge close by and Waterloo Bridge is not far away — noises might be transmitted from one hall to the other, noises originating in the building might be heard in either hall, noise from ventilating fans and other service apparatus would be objectionable.

The main hall is a box within a box. Interior roof, walls and floor are entirely separated from the exterior elements, either by adequate air spaces or by fibre glass where they would normally come in contact. The inner floor has a ventilating chamber under much of its area; over the small hall where it is only of single thickness it is supported by columns which are insulated from the rest of the structure, resting on footings which are also insulated. The loads from the small hall are carried by tubular columns, surrounding those just referred to, and resting on footings on top of the main footings. These features are well shown in the accompanying illustration. (Author's longitudinal section.)

The walls of the main hall are double, separated by insulation wherever they come into direct or indirect contact. The roof is of precast concrete slabs and is double with an air space and fibre glass between the layers. There is also a suspended ceiling over the main hall at the level of the lower chords of the trusses. The space between the upper and lower chords of these trusses is used for ventilating ducts, lighting circuits and for access to the ceiling, in case it becomes necessary to "doctor" it to improve the acoustic properties of the hall itself.

Special precautions were taken to muffle the ventilating system by lining ducts with acoustic materials, by jacketing them with similar materials in some locations and by silencing fans and motors as far as practicable.

This double construction naturally introduced some interesting problems into the structural design, notably in providing for the support of the cantilevered main balcony and in assuring the stability of the tall and relatively thin walls of the main hall, all of which were successfully solved, though in some cases they required methods of calculation which were unusual, to say the least. It is a tribute to the ability and co-operation of the architects and the various consultants that design had advanced far enough in about six months after the inception of the scheme to start on the construction of the foundations.

When finished, the Royal Festival Hall will cost about $4,800,000 and will involve 63,000 cubic yards of excavation; 31,800 cubic yards of concrete, plain and reinforced; 2,600 tons of reinforcing steel and 2,900 tons of structural steel. √

Fig. 3. Construction of the Royal Festival Hall showing erection of roof girders nearing completion.

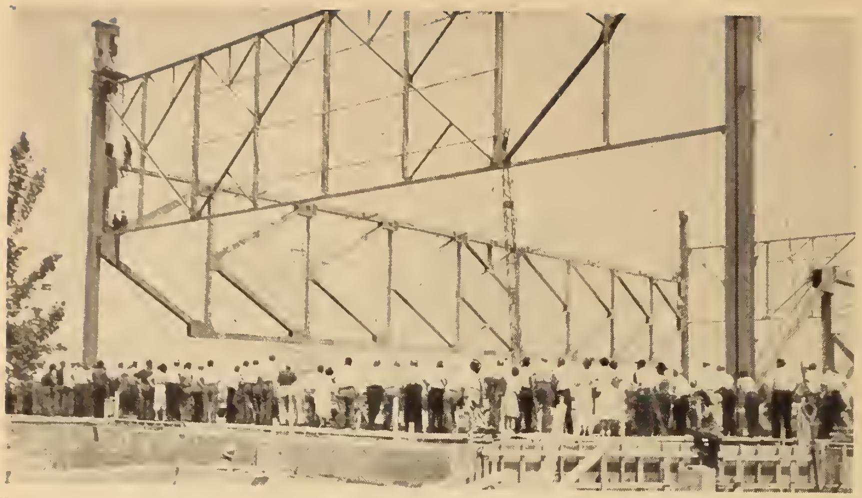

Fig. 1. On the way up: note the top column extension and guys, and the 115-foot trusses in place.

Erection of Long-span Trusses

The photos on this page show two interesting stages in the erection of 8,600 tons of structural steel required for the new Kitchener (Ont.) Auditorium. The central part of this building is 115 x 220 feet, with a single column at each corner only. Thus the main roof is outlined by two 220-foot trusses and two of 115 feet span each. The long trusses are 28 feet deep, are fabricated from wide-flange shapes and weigh about 80 tons each.

The erection of these heavy trusses posed a problem which was simply and neatly solved by using the permanent corner columns, temporarily heightened by 11-foot extensions at their tops, as gin poles, after the 115-foot trusses had been set by moto-cranes. These short trusses, of course, partly braced two columns in one plane; additional stability was secured by four guys from the top of each column to previously set deadmen in the building foundations.

The long trusses were assembled in vertical planes on timber blocking on the ground between two columns. Temporary outriggers and cables provided for lateral stiffness while these trusses were hoisted into place with heavy blocks and tackle at each end. It took about ten minutes to hoist each truss the 40 feet from the ground to its final position, where it was first bolted, then rivetted in place.

Jenkins & Wright, of Kitchener, are the architects for this building, C. C. Parker, M.E.I.C., of Hamilton, consulting engineer, and the Dunker Construction Co., Limited, of Kitchener, general contractors. Steel was supplied by the Hamilton Bridge Co., Ltd. √

Organization and Responsibilities of the International Joint Commission

(*Continued from page 4*)

three Commissioners appointed by each of the two countries. The Commission largely determines its own procedure to fit the needs of particular references. It may call upon the technical services of either government for assistance. Evidence may be taken on oath and the attendance of witnesses may be compelled, but these extreme powers have never, so far as I am aware, had to be used.

Membership Drawn from Professions

Today the membership of the Commission comprises one lawyer formerly a state governor and member of the United States Senate; there are four professional engineers; the sixth member is a gentleman who in his former capacity as Director of the Prairie Farm Rehabilitation Administration has had extensive practical experience in engineering of a character which is particularly relevant to an important part of the Commission's work, that is the use of water for irrigation. He is an Associate Member of this Institute. Thus down the years, the Commission seems to have acquired a professional character in keeping with the work it has been called upon to perform.

Time does not permit a recital of the many references received by the Commission from the two governments. The work of the Commission has been primarily engineering in character. On one reference or another it has involved considerations relevant to every branch of engineering—civil, electrical, mechanical, hydraulic, sanitary, meteorological—to mention a few. May I suggest that this Commission and its work is of prime and continuing interest to this Institute. Its sole object is to find out and to do what ought to be done in accord with the principles of justice and equity, and thus to fulfil its mission to promote peace and concord on the border. √

Flood Control in California

W. R. Slater **Howard Curtiss** **Paul A. Oliver**

Bureau of Reclamation, U.S.A.

From a paper presented at the Sixty-fourth Annual General and Professional Meeting of The Engineering Institute of Canada and the Annual Summer Meeting of the American Society of Civil Engineers, at Toronto, Ont., July, 1950.

Construction of three big features authorized in the Boulder Canyon Project Act, approved December 21, 1928, were Hoover Dam, Imperial Dam, and the All-American Canal. Imperial Dam and the All-American Canal system were built during the period 1935-1947 at a cost of approximately $40,000,000. The over-all length of the All-American Canal is 204 miles, of which the Coachella Canal comprises a 123-mile branch. The alignment of the canal system is shown in Fig. 1. At its intake the All-American Canal has a capacity of 15,155 c.f.s.; its branch, Coachella Canal, starts with a capacity of 2,400 c.f.s. and extends northwesterly along the east slopes of Imperial Valley and the Salton Sea, enters Coachella Valley with a capacity of 1,300 c.f.s. and crossing the valley floor and turning southward to end at mile 123.5 above Indio, serves 17,000 acres of presently developed land and 58,000 acres of new land to be brought under cultivation on completion of the project. An underground concrete pipe distribution system to serve the land is under construction.

In the 45-mile reach of the canal, immediately upstream of its entrance to the valley, 32 wash siphons serve to pass flood waters from the adjacent mountain washes across the canal. The last 37 miles of the Coachella Canal is concrete lined.

High-intensity storms, centred over the steep mountain areas above the canal, occur during the summer and fall, and because of lack of vegetation result in large flash floods which carry heavy debris loads out of the steep mountain canyons to be deposited in great debris cones which form a portion of the irrigable land. Initial plans for the development of Coachella Valley contemplated the construction of overchutes and siphons for the passage of storm water across the canal. Although such a plan would protect the canal, it would provide no protection for the agricultural land and its irrigation lateral system lying on the lower side of the canal. For this reason protection dikes Nos. 1 and 2 to impound floods have been built for 26 miles along the upper, or easterly, side of the lined portion of the canal.

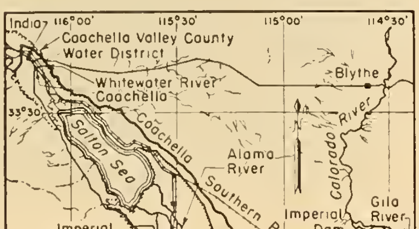

Fig. 1. Coachella Canal carries Colorado River water 123 miles from All-American Canal to irrigate 75,000 acres of valuable date and citrus crops in Coachella Valley County Water District. Canal capacity is 1,300 c.f.s. as it enters Valley.

The design and construction of these flood control works are the subject of this article.

The maximum probable flood for washes crossing the Coachella Canal in the valley was determined by assuming the occurrence of a storm of maximum probable magnitude at a time when ground conditions are conducive to maximum runoff. The protective works were designed on the basis of these floods. The size of the drainage areas, shown in Fig. 4, indicated that the maximum probable flood would be produced by a cloudburst type of storm. Since records of rainfall in Coachella Valley were inadequate to determine the size of such a storm, a study was made of the record of cloudburst storms in the Southwest. One at Avalon, Calif., on October 21, 1941, of 5.53 in. in $3\frac{1}{4}$ hours, was considered large enough to be a probable maximum, and hydrographs of floods from the drainage areas shown in Fig. 4 for such a storm were derived and used to design the works.

The methods used for deriving and applying unit graphs and distribution graphs were substantially

Fig 2 (above). Wasteway No. 1 Outlet.

the same as that described in the U.S.G.S. Water-Supply Paper 772. The unit hydrograph for an area is an expression of the time distribution of runoff resulting from unit effective rainfall. Unit quantity usually represents an average depth of one inch over the area. Unit duration is usually expressed in hours or minutes.

As used here, the distribution graph shows, in per cent of unit runoff, the average rates of runoff by successive unit-time intervals. The basic runoff and rainfall data for the drainage areas tributary to the Coachella Canal are inadequate for the derivation of any distribution graphs. Distribution graphs were derived for nine other drainages in the general region by a trial and error reproduction of recorded major floods.

The general method of determining the synthetic unit hydrograph described in the report is in most respects similar to that developed in transactions of the American Geophysical Union, Part I, 1938, pages 447-454, and Part II, 1940, page 626. The method is used in determining the time distribution of runoff (represented by distribution graphs) in drainage areas for which no concentration point hydrographs are available for a direct determination of this kind. It provides for transposition to those areas of the characteristic time distribution of runoff in regional drainage areas for which such distribution can be determined. In application, the characteristic time distribution to be transposed usually represents an average of those for several streams. Use of the method is practicable when the assumption may logically be made that drainage areas within a given region are physiographically and hydrologically similar.

Since no two drainage areas are alike in physical characteristics such as area, dimensions, stream-channel pattern, channel length, and stream slopes, the respective runoffs from these areas never concentrate in an exactly similar manner and only by chance are

Fig. 3 (below). Concreting Wasteway No. 1 Channel.

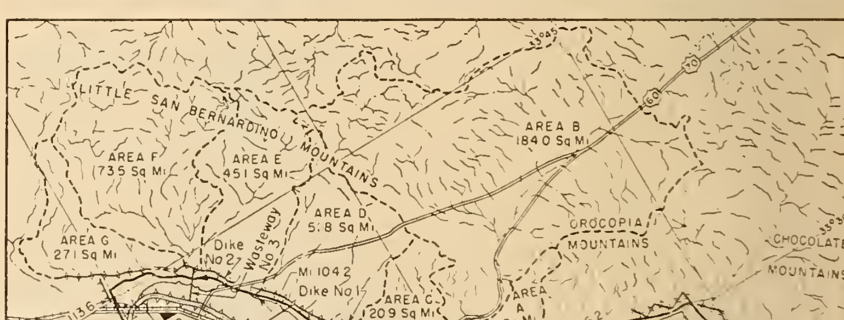

Fig. 4. In Coachella Valley. Coachella Canal and irrigated lands below it get protection from flash cloudburst floods by 26 miles of dikes about 25 ft. high, forming detention basins above canal.

ıeir respective distribution graphs xactly alike. Therefore, direct :ansposition of distribution graphs rom one area to another is usually voided. However, most distribuıon graphs are similar to a coniderable degree, and the introuction of a factor (parameter) alled "lag" will bring arrangeıent of ordinates along the basis ıf distribution graphs into a genrally consistent relationship.

Lag as used herein constitutes ın empirical expression of the ›hysical characteristics of the lrainage area in terms of time. In he method used in this report, the irst step required in evaluating ag for an area in which the charıcteristic time distribution of runıff is known, consists of constructng a curve called the "summation ıydrograph". The definition of lag tself involves the discharge time elationship expressed by such urves. The relationship of lag to lischarge plots in the form of a urve called the "S-graph". The ıverage S-graph for a number of lrainages is the principal tool used n the transposition process.

Summation hydrograph — The ummation hydrograph for an area s a hydrograph of the runoff that vould result from the continuous generation of unit excess rainfall ›ver the area. It is derived by ılgebraically adding a series of ınit hydrographs consecutively paced one unit period. Thus the ime required for the summation ıydrograph to reach ultimate maximum) discharge is equal to he length of the base of the unit hydrograph less one unit period. For convenience in application, discharge is plotted in per cent of ultimate discharge.

Fig. 6. Riprapping Dike No. 1.

Lag—Lag for an area defined herein is the elapsed time (in hours) from the beginning of unit excess rainfall to the point where the summation hydrograph for that area reaches 50 per cent of the ultimate discharge. When the lags determined from observed hydrologic data for several natural drainages are correlated to the physical characteristics of those drainages, an empirical relationship is usually apparent. This relationship can then be used to determine the lags for other natural drainage areas for which the physical characteristics can be determined, but for which the distribution graphs for concentration points cannot be determined because of inadequate hydrological data.

Measurement of lags for drainage areas in southern California demonstrate that the lags for these areas could readily be expressed by the empirical formula:

$$\text{Lag (in hours)} = \left[\frac{C_t \quad L \times L_{ca}}{S^{\frac{1}{2}}}\right]^m$$

Where C_t and m = constants.

L = length of longest watercourse, in miles.

L_{ca} = length along longest watercourse, measured upstream to a point opposite centre of area, in miles.

S = Overall slope of drainage between the headwaters and the collection point in feet per mile.

With the benefit of extensive studies made in 1943 by the Los Angeles office of the Corps of Engineers, the Bureau plan provided for the concentration of two dikes forming storage basins and three concrete-lined wasteway channels for the evacuation of the impounded water, as shown in Fig. 4. The first basin is formed by Dike No. 1 extending for 16.4 miles along the 45-ft. contour immediately uphill from the canal. Dike No. 2 extends for 10 miles along the 60-ft. contour to form Basin No. 2, with its floor 27 ft.

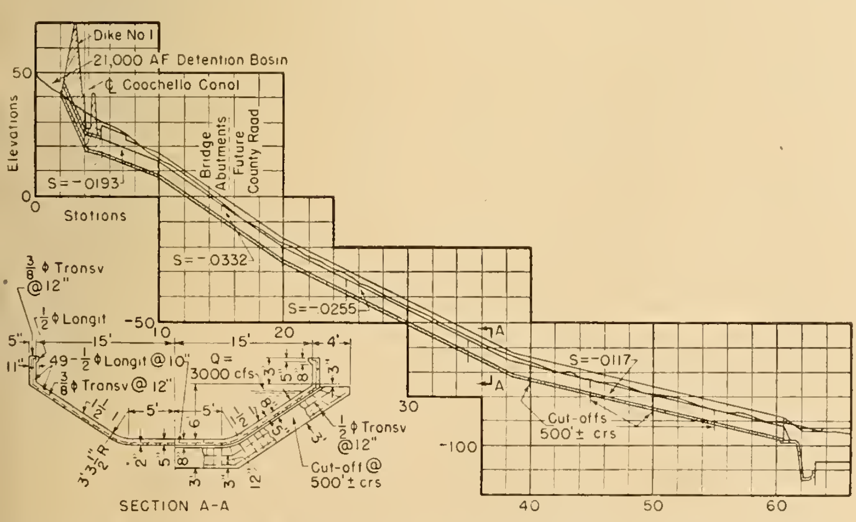

Fig. 5. Wasteway No. 2, shown in section and profile, carries flash-flood waters under Coachella Canal and into Whitewater River storm channel leading to Salton Sea. Wasteways Nos. 1 and 3 are of similar construction.

higher than the canal water surface.

When a storm is centred over one of the drainage areas shown in Fig. 4, the rainfall and runoff from adjacent areas are reduced. The storage basin above Dike No. 1 was estimated to be subject to a runoff of 19,000 acre-ft. from drainage areas A, B, C and D; and that for Dike No. 2 was estimated at 16,000 acre-ft. from areas E, F and G. Ten per cent was added to this pondage to take care of silting. Basin No. 1 is provided with two wasteway channels and Basin No. 2 with one. Wasteway No. 1, which is 15,300 ft. long, discharges on the beach of Salton Sea. Wasteway No. 2, which is 6,150 ft. long, and Wasteway No. 3, which is 9,150 ft. long, discharge into the Whitewater River Storm Channel.

The area between the dike alignment and the successive contour intervals upward from the contour on which the dikes rested were planimetered on a topographic map and the volumes added until the storage volume behind the dikes equalled the design pondage. For Dike No. 1, resting on contour 45, the required water surface for 21,000 acre-ft. stood at El. 64. Allowance for settlement and for freeboard set the elevation of the top of Dike No. 1 at about El. 70, making this dike 25 ft. high. Similarly the crest of Dike No. 2, resting on the 60-ft. contour, was determined at El. 89.5 for detention of 18,000 acre-ft. The typical dike-section adopted has a crest width of 20 ft. and slopes of 2:1 on the lower face and 3:1 on the upper face. The embankments were built with excavating and hauling equipment and placed in layers not over 8 in. thick. Borrow was taken from within the basins.

The storage basin behind Dike No. 1 is in reality formed of four sub-basins connected by channels constructed between the dike and spurs from adjacent hills. To provide rapid dispersion of floods within a basin without undue velocity, these channels are constructed with a minimum base width of 200 ft. Where velocities in excess of 5 f.p.s. are anticipated, the 3:1 upper slope of the dikes is protected with a layer of asphalt 6 in. thick. A concrete cutoff wall 4 ft. deep was constructed at each end of the asphalt mat, and a riprap blanket extends a minimum of 50 ft. beyond each cutoff. The toe of the dike is also protected by extending the asphalt mat from 4 to 6 ft. below the dispersion channel floor and covering this extension with riprap.

Wasteways Nos. 1, 2 and 3 consist of a culvert under the dike and canal, an automatic wasteway from the canal discharging into the culvert box, a concrete-lined wasteway channel, wasteway outlet structures and suitable outfall channels in earth. The wasteway channels are concrete lined and utilize a section designed to obtain the economy of a trapezoidal section, in which concrete lining can be placed by modern slip-form methods, plus the splash resistance of a rectangular flume section. The section adopted is shown in Fig. 5, which also shows the profile of Wasteway No. 2. Inside and at the top of the vertical walls splash copings are provided. The water at maximum discharge varies in velocities between 25 and 35 f.p.s. as it passes down the slopes in the wasteways, and in all cases the maximum water depth is below the top of the trapezoidal part of the section.

Construction of the flood works by contract was initiated in February, 1945 with the start of earthwork operations on the initial section of Dike No. 1 and its dispersion channels. This construction together with that for Wasteway No. 1, which was started in November, 1945, provided protection to 9 miles of canal. The sequence of flood-work construction was such that where practicable the dikes and wasteways would be built concurrently with and immediately adjacent to the canal. Pending the resolution of questions relative to the repayment obligation of the Coachella Valley County Water District, construction was limited to the completion of a section of Dike No. 1 and to Wasteway No. 1, until January, 1948, when construction was started on the final portion of Dike No. 1 simultaneously with that on Dike No. 2. Contract work on Wasteways Nos. 2 and 3 was started in May, 1948. As the two dikes were completed somewhat in advance of Wasteways Nos. 2 and 3, the work on the wasteways was jeopardized by rain storms in the winter of 1948-1949. However, the wasteway contractor was able to complete all work on the channels and structures by January, 1949 and was only slightly inconvenienced by a few minor rain storms.

Operations connected with the construction of the dike proceeded quite uniformly. At peak operation and when material was most accessible, the contractor was able to place an average maximum of 350,000 cu. yd. per month.

Beginning in January, 1948, the second and final section of Dike No. 1 was built with tractor and scraper units with pusher tractors assisting in the loading at the borrow pit. In heavy cuts, where such equipment could be advantageously used, the contractor employed a 2½-cu. yd. dragline and three 12-cu. yd. bottom-dump trucks. As on the Shea Co. section of Dike No. 1, this latter equipment was used primarily for topping out operations.

As the source of supply for rock was too remote to make riprap economical for slope protection, an asphalt mat was substituted. The contractor set up an 80-ton-per-hour hot-mix plant and, using screened native material from the alluvial fan on the nearby Thermal Wash, was able to lay down a very acceptable product. The mat material was hauled from the plant in trucks and transferred by bucket to a canal paver modified to lay down a flat strip of mat 10 ft. in width. The lay-down on the slope was made in strips parallel to the dike centre-line.

By proper weighting of the paver, the mat density obtained before any supplemental rolling, was at or above that obtained in the laboratory determinations of the maximum probable density for the material. A supplemental rolling up and down the slope, or at right angles to the lay-down direction, was effective in smoothing and binding the mat at the joints between lay-down passes, but this rolling was found to have little effect in increasing the overall mat density. When the mat was inspected after it had been in place a year and a half, effects of weathering were not discernible.

Construction of Dike No. 2 was started in January, 1948. The contractors elected to throw the maximum of equipment into the work in an attempt to complete it all as quickly as economically possible. Fine material and borrow pits exposed to the wind caused delaying sandstorms. The contractor was forced to wet down the borrow area to reduce lost time. At times his monthly rate of bank placement totalled 800,000 cu. yd. and his monthly average was 600,000 cu. yd.

Wasteway No. 1 included 3.3 miles of channel, of which 2.9 miles were lined with concrete and 0.4 mile was in open cut. Also included was a concrete and structural steel railroad bridge, a reinforced concrete highway bridge and the channel-outlet and stilling-pool structure. All excavation of channel and structures was accomplished with little delay by tractor and scrapers and by dragline. The channel subgrade was trimmed to neat line by an endless-bucket type of subgrade trimmer, and the concrete lining was placed with a slip-form paver machine. Concrete was batched at a centrally located plant. The paving mix was dry batched for mixing at the paver, while the structural concrete mix was batched into transit-mix trucks and placed at the structures by dragline or buggy.

Because of wartime depletions the supply of construction materials was critical and considerable difficulty was experienced by the Government in securing adequate quantities for the work. An extension of time commensurate with the delay caused by failure of the Government to furnish materials on time made it necessary for the contractor to carry on the operation of paving the channel during an extremely warm period. In order that the temperature of the concrete at time of placement would not exceed the specification limit of 90 deg. F., it was necessary for the contractor to start his work day in the early morning hours and also to cool the mixing water with ice.

As the rate of placement was approximately 225 cu. yd. per day, and air temperatures on many days exceeded 100 deg., the quantity of ice used was considerable. In the placement of concrete in the channel lining, the mix was batched to the slip-form machine from a 34-cu. ft. paver equipped with boom and dump bucket. A trailer-mounted water tank was pulled behind the mixer, and ice was added to the water which passed through this tank from the supply line to the mixer.

Even with air temperatures up to 110 deg. and aggregate temperatures considerably in excess of 100 deg., it was possible at all times to maintain the temperature of the mix at the time of placement under a maximum of 88 deg. by the use of this cooling method. The contractor was able to complete all channel lining and parapet wall construction on this contract by September 14, 1946. As the period starting about July 15 and extending through September is considered to be one when cloudburst storms are probable, it can be understood that considerable concern was felt by the contractor and by the Bureau during this time.

Wasteways Nos. 2 and 3 were started in May, 1948. As the contractor rented the machines for trimming and lining the channels, the Wasteway No. 1 contractor, construction methods and equipment were very similar to those for that wasteway, and hence no list of equipment is given for construction of Wasteways Nos. 2 and 3. The method of supplying concrete to the slip form differed in that transit-mix material was used instead of dry batching to a paver at the slip form.

By making alterations in the slip form such as the use of an endless conveyor from the mixer to a distribution hopper, the rate of placement was increased to a maximum of 300 cu. yd. per shift. This contractor's average for several weekly periods equalled the Fisher contract's daily maximum. Concrete material for structures was obtained from the same source as for the lining.

On completion of Wasteway No. 3, the contractor was directed to remove the shoo-fly dike built on Dike No. 2 for protection to this wasteway. Construction was completed without major incident in May, 1949. √

France's Oldest Engineering School

L'Ecole Centrale des Arts et Manufactures (The Central School for Constructive and Manufactured Works) called more simply "l'Ecole Centrale" and "Piston" by students is the principal French school for the training of engineers in all branches. It was instituted when French industry was beginning to develop. At the School's centenary in 1929, it had produced 16,000 engineers and out of the 24 courses provided for at the beginning 22 were still in existence, though necessarily adapted to the development of industry and the progress of science.

A private school originally, it taught pure applied science, but its students were soon to be an essential part of modern society. In 1857 the School was passed over to the State.

Bousquet. a former student, was the inventor of the bogies used under railway carriages. Sautter built more than 2,000 lighthouses. Darblay substituted wood pulp for rag in the manufacture of paper.

Eiffel built bridges and that famous tower for the 1889 Exhibition. Berges and Fredet harnessed the first waterfalls and water-power. Boivin discovered sugar-refining with hydrocarbonate of lime. All these were "centralites".

The School system is a hard one; the course of study is three years and the final diploma carries with it the title of "Ingénieur des Arts et Manufactures." Every year 230 new students enter school after a very stiff competitive entrance examination and go to lectures in the morning, and in the afternoon do practical work. The students have to be present regularly at 8.15 a.m. every day and "clock in" as in factories; what is more they must never "skip" lectures or the amphitheatre!

Laboratories of industrial chemistry and mineralogy; thermic and electrotechnic machines; machine tools and hydraulic workshops; metal and material resistance; radioactivity and reinforced concrete; waves and television; such are the forms of specialization open to the future engineer at the "Central." Thus there is nothing to prevent the student who has graduated as an erecting engineer or metallurgist from becoming a chemist, but the tendency is for increasingly greater specialization for engineers. √

SARNIA
Where The Twain Will Meet

by

J. R. Nicholson, O.B.E.

Executive Vice-President, Polymer Corporation, Sarnia, Ont.

A paper presented to the Montreal Branch of The Engineering Institute of Canada, November 2, 1950.

The discovery of oil in the Canadian West, the plans for the movement of vast quantities of that oil to the Sarnia area, and for the erection there of new and greatly increased refinery units, will make available to the growing petro-chemical industry, new and vital raw materials from a Canadian source.

You will recall the oftly quoted language of Rudyard Kipling: "East is East and West is West, and ne'er the twain shall meet". The poet Kipling was referring to differences in the mental outlook of the peoples of the Orient and the Western Hemisphere and not to the exchanges of products between two great hemispheres, or to the movement of commodities between eastern and western Canada.

These oil discoveries, however, mean the opening of a new chapter in the economic life of our country. The existing refineries in Southwestern Ontario, and the petro-chemical industry, so firmly established in Sarnia, need and welcome this new supply of oil. This development means more to the Sarnia area than to any other centre in Eastern Canada. Sarnia is the place where the twain, Western oil, and Eastern equipment to process it, are to be brought together; for it is at Sarnia that the first oil from the West will be refined, and from which products made therefrom will be distributed.

Imperial Oil's Role

The story of what has taken place in the Sarnia area since the turn of the century, more particularly in the last 10 years, is one of real accomplishment; it holds great promise for the future. Such a story of industrial development is usually a story of certain companies. Three companies have to date played the most important roles in the developments at Sarnia, viz. Imperial Oil, Polymer Corporation and Dow Chemical of Canada.

It would be helpful to briefly outline here the nature of Imperial Oil's refinery operation at Sarnia, with special reference to its part in the production of petro-chemicals. The primary refining units separate the crude oil into the following principal fractions—gaseous hydrocarbons, natural gasoline, kerosene, gas oils, etc. The gas oil and some of the heavy gasoline are used as feed for the cracking units. The gases from these cracking units, and the light pressure distillate which is separated from the crude gasoline, are combined to provide feedstock for the giant Polymer Corporation plant. This feed stream consists of a mixture of light hydrocarbon chemicals, including methane, ethane and ethylene, propane and propylene, butanes and butylenes. I would like to direct your attention particularly to these, since the basis of the petro-chemical operations presently centered in Sarnia is found in these interesting materials.

Polymer Conceived After Pearl Harbour

Within a few weeks of Pearl Harbour in December, 1941, approximately 90 per cent of the rubber producing areas of the world passed into enemy hands. The lack of this critical and strategic material presented the greatest threat to the success of the Allied cause. Unless within a few months an answer could be found to this critical problem, the Allied war effort and the domestic economies of the U.S.A., Great Britain and Canada would collapse. In December, 1941, the Canadian Government, acting on the recommendation of the Rt. Hon. C. D. Howe, then Minister of Munitions and Supply, made a courageous and far reaching decision. It decided to build a synthetic rubber plant in Canada of sufficient capacity to take care of the nation's wartime rubber requirements. Out of that decision came the Polymer Corporation.

The advent of Alberta oil will be of great importance to Sarnia. Here Canadian oil and Canadian chemical plants will together build up an all-Canadian petro-chemical industry.

Here the author tells how Imperial Oil, Polymer, Dow Chemical, Sun Oil and other corporations are working together to this end, and the role each one plays. He shows the importance of styrene and the peacetime products made from it. He tells how Polymer's output of styrene finds an added outlet through polystyreue plants built by Dow and Monsanto, while sales of by-products and surplus power are helping to reduce operating costs.

Showing how integration and informal co-operation have produced a uniquely efficient and economic petro-chemical industry, the author looks to the future for further developments that may make Canada ultimately independent of chemical imports.

The Polymer plant consists of seven main units, or rather groups of units. It involved an original expenditure of approximately $50 millions in the amazingly short period of less than two years. During the past five years a further $8 millions has been spent in extensions and additions designed to improve quality, diversify production and make the best economic use of its by-products. Extensions involving the expenditure of a further $7½ millions have recently been announced. They will be completed within the next twelve months.

Polymer Corporation was incorporated in February, 1942. It was charged by the Government with the responsibility for the construction and operation of an integrated synthetic rubber plant capable of taking care of Canada's wartime requirements. The new corporation had no technical knowledge which would enable it to produce either synthetic rubbers or the basic chemicals necessary for their manufacture. It, therefore, proceeded to enter into agreements with three operating companies having, or readily able to acquire, the necessary technical "know how". The capital investment in the plant was made by Polymer and the operating companies were each paid annually by Polymer a "management fee" for their technical knowledge and plant management. The three companies were:

1. St. Clair Processing Corporation Limited, a subsidiary of Imperial Oil, which had the task of recovering and purifying the ethylene, isobutylene and butadiene needed for the manufacture of the two principal types of rubber, Buna S and Butyl, and of making Butyl rubber. St. Clair Processing also operated the steam, power and water facilities and the central machine shop.

2. Dow Chemical of Canada Limited, a subsidiary of Dow Chemical Company of Midland, Michigan, which prior to Pearl Harbour was the only company in America, and one of the two or three companies in the world, that had ever produced styrene monomer on a commercial scale.

3. Canadian Synthetic Rubber Limited, a subsidiary of the four largest Canadian rubber companies, namely, Dominion, Firestone, Goodrich and Goodyear. This company was to train Canadian personnel and to operate the large Copolymer Plant, in which butadiene and styrene were to be made into rubber.

Polymer Today

Today the operating set-up of the Polymer plant is similiar to what it was when operations began nearly seven years ago, except that St. Clair Processing Corporation no longer operates any of the Polymer units. By agreement with and entered into at the request of Imperial Oil, Polymer itself on May 1st, 1946, took over the operations formerly handled by St. Clair.

Sarnia was chosen as the site for the Polymer plant for a number of reasons; it is the location of the largest refinery in Canada and the only refinery of any size in Canada that was fed by pipeline at that time; benzene, one of the two principal ingredients of styrene, was readily available from the coke ovens of the steel companies at Algoma and Hamilton; coal for the generation of steam and power was also readily available from the Northern Ohio lake ports; salt brine needed for the production of rubber was available from salt wells already in operation at Sarnia; and the St. Clair River had a ready supply of the tremendous quantities of cooling and process water required for the operation.

The principal product of the Polymer plant is the general purpose rubber, Buna S, sold in Canada and abroad under the trade name of Polysar S. As previously mentioned, it is made from butadiene and styrene. The manufacture of butadiene from petroleum involves the separation and purification of a series of light hydrocarbons of the C_4 group. You first recover reasonably pure butylene from the mixed C_4 cut. This step necessitates, first, the extraction of the isobutylene from the stream and then the removal of the normal butylenes, leaving only the butanes and certain other chemicals. To produce styrene you must, in addition to benzene, have large quantities of ethylene. This can be recovered from the mixed gas stream itself, or made through cracking ethane, propane or other components of that stream.

Large and expensive installations of equipment and highly trained technical operators are needed to carry out these intricate and expensive operations. To keep the operations on an economic level involves tremendous throughput. Consequently everything possible must be done to make the best economic use of the by-products and waste products of the plant, and to use any incremental production capacity in the several units to the best possible advantage.

What Research Division is Doing

Before the war came to a close, it had been decided that Polymer should continue into the post-war period. It was evident that the company would have to face the competition of natural rubber. The Canadian industry would be unable to absorb the entire output of the Canadian plant when natural rubber was again available in substantial quantities. It was decided in 1944 to organize a research and development division at Polymer which would be responsible for the improvement of existing products and the development of new ones. It was also decided that immediately after the termination of hostilities an energetic export programme must be initiated. New outlets must be found for the hydrocarbon by-products and for the steam, power and other utilities which were available in excess of Polymer's own requirements.

Polymer's research organization now consists of approximately 100 people, and is headed by one of Canada's most brilliant young research chemists. It has done an outstanding job in developing a series of new and interesting rubbers of different types, each intended for some specific purpose. This staff operates two well equipped pilot plants and other facilities, installed at a cost of over $1 million. In addition to the two basic types of rubber produced during the war, namely, Polysar S and Butyl, Polymer now produces oil resisting rubbers of the Buna N family and high styrene rubbers of high quality. It also produces latices of various kinds, as well as the new so-called cold rubber, which has attracted so much attention in the newspapers and technical periodicals. Approximately 60 per cent of Polymer's $25 millions worth of rubber is exported from Canada annually. Last year this rubber was exported to 32 different countries, and new markets are opening almost every month.

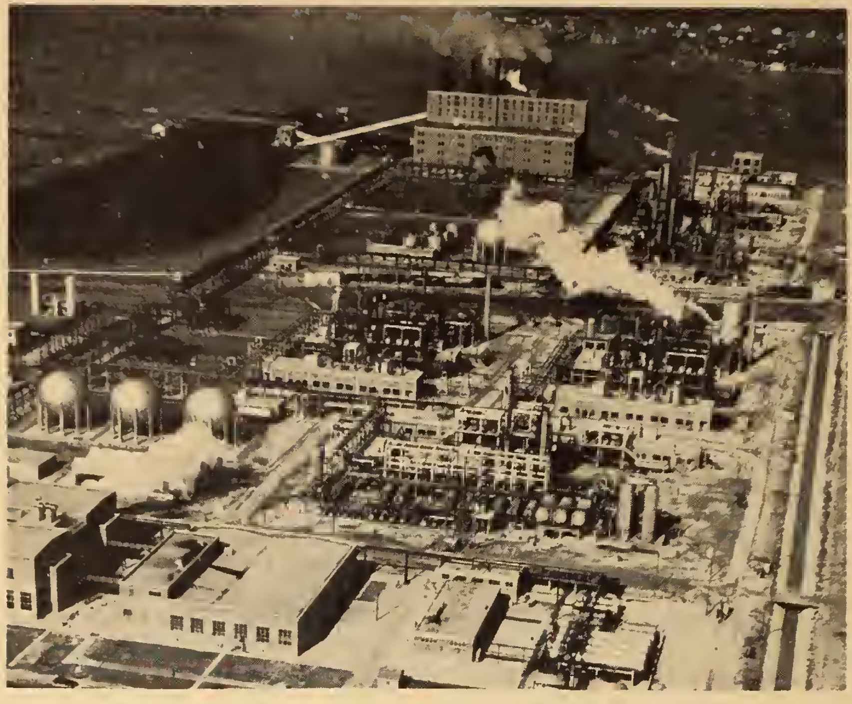

Fig. 1. An aerial view showing part of the eight-acre layout of the Polymer plant at Sarnia.

another oil refinery now operating in the Sarnia area, the Canadian Oil Refinery at Petrolia. Some materials from it have been used by Polymer and its associated companies during recent years, but the part it has played so far in the developments in Sarnia are small compared to what lies ahead. Canadian Oil has oil rights and interests in the new Western oil discoveries. A month ago the President of Canadian Oil Companies announced that a contract had been let for the erection of an $18 million-oil refinery on the St. Clair River, 3 miles south of where the Dow-Polymer plants are located. This new refinery will use Canadian oil. It will be linked by pipeline with Polymer and Dow. It will inevitably play an important part in the expansion and development of a better balanced and more diversified petroleum chemical industry.

Styrene—Peacetime Material

Of equal importance to what has been done in the so-called synthetic rubber field is what has been done since the war in other petro-chemical and plasti-chemicals fields. Styrene is made from benzene and ethylene. To keep the larger of the two copolymer (the strictly rubber) units at Sarnia operating at capacity, less than 12,000 tons of monomeric styrene is required per annum. Consequently, during the war it was never found necessary to recover more than 25 per cent of the ethylene in the feedstock from the Imperial Oil Refinery to provide the styrene needed for maximum rubber production.

Due to improved operating techniques, and to a combination of other factors, it became apparent during the war period that over 20,000 tons of monomeric styrene could easily be produced in the styrene unit, provided the necessary ethylene was available. It later became apparent that by removing bottlenecks and making a relatively small expenditure in the styrene plant itself, production of monomeric styrene could be increased to approximately 30,000 tons per annum. Still later the plant's actual capacity looked more like 36.000 tons.

When the second Great War broke out in 1939, the large scale use of styrene in the production of plastics, costume jewellry, insulation and refrigeration equipment

Dow Chemical and Sun Oil

Dow Chemical of Canada is the third essential member of the Sarnia family. It makes styrene moulding powders with a wide variety of colours in its new, modern factory. It uses large quantities of ethylene (supplied by Polymer) in the manufacture of ethylene glycol and other products. It supplies Polymer by pipeline with the tremendous quantities of salt brine, which Polymer requires for its operations. It supplies caustic soda to Polymer. Sun Oil, the fourth member, provides light hydrocarbon feedstocks.

More should be said of the contribution that this corporation, Sun Oil Company, has made to the Sarnia development. For the past five years one-third of the feedstocks consumed by Polymer have come from the Sun Oil Refinery at Toledo, Ohio. These feedstocks have been coming in by tank car but there is now under construction a pipeline at a cost of over $4 millions which will carry feedstocks from Toledo to Sarnia. It is believed that that pipeline is the forerunner of another large refinery, which will form part of the integrated chemical industry.

Integration of Six Corporations

Thus there are four large companies working closely together at Sarnia in Canada's only large scale integrated petro-chemical operation. Imperial serves as the keystone of the integrated workings. It refines more than 50,000 barrels of petroleum a day. As a result, large quantities of valuable light hydrocarbons formerly burned as fuel only, are now available and being used in the manufacture of valuable chemicals. Polymer plays the highly important part of processing these light hydrocarbons. It also uses ethylene, isobutylene and normal butylenes for the manufacture of its principal product, rubber. Additional quantities of ethylene, butane, isobutylene and styrene are sold by Polymer to other companies. It also supplies chemicals, steam and water to Dow and Fiberglas and steam to Imperial Oil.

Mention might be made here of the other new chemical industry in Sarnia, namely, Fiberglas of Canada. Because substantial quantities of steam, fuel gas and oil are required in the manufacture of fiberglas, that company built at Sarnia during the years 1947 and 1948 a $2½-million plant. Thus, production of another chemical product, fiberglas, was begun for the first time in Canada in the Sarnia area in December, 1948. The plant is now working at capacity, and has unfilled orders on hand that will keep it going at capacity for the foreseeable future. An expansion is being considered.

Mention must also be made of

and other materials was just getting underway on this continent. Because of the exigencies of war, it was impossible to develop the market potentialities of this interesting and inexpensive material. It was realized, however, long before the war came to an end, that there would be a tremendous demand for styrene monomer and other plasti-chemicals in Canada and elsewhere as soon as hostilities ended. Polymer realized the importance of making maximum use of the incremental production capacity that existed in its styrene plant and in certain of its other equipment. The Company also realized the necessity of recovering maximum quantities of ethylene and other chemicals in order to reduce the cost of production.

Dow and Monsanto for Polystyrene

Negotiations were therefore opened with Dow Chemical of Canada, with a view to having the latter build a modern polystyrene plant and other chemical plants at Sarnia. Within a few weeks of the end of the war in Europe, agreement in principle had been reached between Dow and Polymer on a programme which involved not only increased production of styrene monomer by Polymer, and the erection of a modern polystyrene plant by Dow; it also involved the expansion of Polymer's ethylene recovery and purification facilities and the erection of chlorine, ethylene glycol and caustic soda plants by Dow. Shortly thereafter, Monsanto of Canada entered into a joint programme with Polymer. This programme involved the erection of a second polystyrene plant by Monsanto in Montreal, with Polymer supplying the monomeric styrene needed for that operation.

Dow and Monsanto originally estimated they would need monomeric styrene to keep their plants operating at economic levels. To produce even the modest quantities of this material necessitated expenditures of substantial sums by Polymer for compressors, refrigeration and other equipment necessary to recover the additional ethylene needed to operate the styrene monomer plant at the higher level capacity, and Dow's glycol plant at design capacity. Subsequently, Dow's and Monsanto's estimates of what they would require for their Canadian customers, and to take care of their rapidly expanding demands for polystyrene for export, were revised upwards.

It is no secret that today both companies could use more than twice the quantities of monomeric styrene that were provided for in their original contracts negotiated with Polymer less than five years ago. To meet these expanding demands Polymer has put in additional equipment to recover all the ethylene that could be recovered economically from the mixed gas stream coming to Polymer from the Imperial Refinery. It has also spent more than $1 million in new facilities to crack ethane and propane, and make ethylene therefrom to meet the increased demands. Further substantial expenditures to remove bottlenecks and build up production from the 30,000- to the 36,000-ton level in the styrene plant proper, are included in the $7½-million expansion programme referred to earlier.

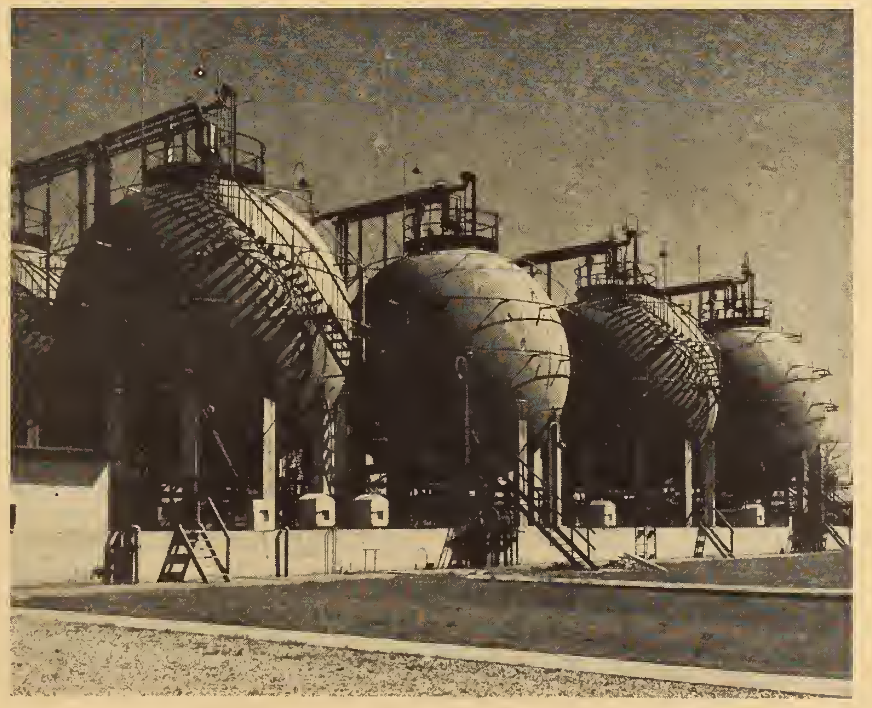
By-products and Surplus Power Cut Costs

The cracking of ethane and propane to satisfy its own ethylene requirements and those of its principal styrene customers, Dow and Monsanto, as well as Dow's private requirements of ethylene for the manufacture of glycol, involves the production of propylene as a by-product. The production of styrene from ethylene and benzene involves the production of hydrogen as a by-product. The production of styrene of the high degree of purity necessary for the plastics industry, and also for synthetic rubber, involves the production of toluene as a by-product. The use of large quantities of high pressure steam to crack and separate the several hydrocarbons involved in the intricate operation requires the production of tremendous quantities of high pressure steam.

A great deal of electrical energy is also required in the operations. By installing turbo-generators, and by passing the high pressure steam through these generators, Polymer has been able to produce sufficient electric power to take care of its own requirements and those of other industries nearby. It is also now supplying under a long term contract a substantial block of electrical power to the Hydro-Electric Power Commission of Ontario. This arrangement is a reasonably profitable and beneficial one for Polymer, since it enables it to make maximum use of the steam and power facilities which were installed as an essential part of Polymer's own operations.

It has been of great assistance also to Hydro and to the people of Ontario during the periods of the year when the power shortages have been most troublesome. Increased earnings from the sale of surplus butadiene, surplus ethylene, incremental styrene and utilities, by-product toluene and by-

Fig. 2. Pressure tanks for storage of Butadiene at the plant of Polymer Corporation, Sarnia.



product butane have tended to reduce Polymer's operating costs. This reduction has gone a long way towards enabling Polymer to successfully sell its principal product, rubber, in competition with natural rubber.

Team Work Has Brought Success

The type of integration that exists between Imperial Oil, Dow Chemical, Fiberglas, Sun Oil and Polymer today is unique, in that it involves five entirely separate corporations, not one of which has any financial or stock interest in any of the others. Yet, without that inter-relationship there could be no efficient and economic petro-chemical industry in the Sarnia area, and Canada today would not be the proud possessor of such a prosperous and rapidly expanding petrochemical industry. What has been done in the short space of a few years is but an indication of what may still be done at Sarnia. Time does not permit considering the full potentialities of methane, ethylene, propylene, butylenes, butadiene and the other chemicals that will be made available in increasing quantities in the area in question. Each and every one of these materials offers a great challenge to the chemist and the chemical engineer. Consequently, one hesitates to predict what the future has in store for Sarnia.

Based on what has taken place in the petroleum industry over the past 12 years, on the discovery of oil in increasing quantities in Western Canada, and on the completion of the pipeline to the head of the Great Lakes, it is inevitable that the years ahead will see great progress in every branch of the petroleum field in this country. With Imperial's great interest in these new oil fields, it is not unreasonable to expect great changes in and additions to Imperial's Sarnia refinery and in the not far distant future.

Since the production of synthetic rubber is still in its infancy, it is to be expected that still greater changes will take place in Polymer's own operations. Further diversification of rubber production is likely to lead to the construction of new and different types of units, to enable the production of new rubbers, latices and masterbatches. Expansion of Polymer's activities as a supplier of base chemicals to the chemical industry, including the synthetic detergent and the synthetic fibre industries, may also be expected. Dow's huge, modern chlorine plant, its caustic soda plant, its ethylene glycol plant, its polystyrene plant, its solvents plant are now all in successful operation. In line with what has happened in the other large scale petro-chemical industries elsewhere in the world, further expansion on the part of Dow of Canada is a certainty.

Independence from Chemical Imports Possible

The combined investments of Imperial Oil, Dow Chemical and Polymer at Sarnia total between \$130 and \$160 millions. The new refining and other facilities to be built within the next two years will cost \$50 millions more. These companies, together with Monsanto in Montreal, working together, have made Canada independent of the rest of the world for its requirements of the cheapest and most interesting plastic yet to be discovered, namely, polystyrene. That product is undoubtedly being used to a greater or lesser extent by nearly every firm in the plastics business in Canada. What has been done in the polystyrene plastic field is and will continue to be done with other plasti-chemicals.

There are a number of chemicals being currently imported into Canada which could be manufactured from materials available in the Sarnia area. The erection of a carbon black plant to supply black for incorporation in black masterbatch is also indicated. The erection of facilities at Sarnia to oxidize waste lignin from the Canadian pulp and paper industry, and thus provide a Canadian filler for another interesting plasti-chemical, lignin masterbatch, is another probability. A plant for the production of another interesting plasti-chemical, polyethylene, is indicated when the demand for that material warrants such an undertaking. The erection of one or more plants in the Sarnia area to produce superior types of rubber and plastics products that can best be made from man-made rubber and allied materials, are also just around the corner.

The West can now supply the principal basic raw material, oil. Since growing domestic and export markets exist and the design for a successfully integrated petrochemical industry already exists, the future of the industrial area of Sarnia is assured. That design has, in fact, been put into successful operation. I bespeak the wholehearted co-operation and support of the engineers and other technically trained men assembled here tonight, in our efforts to round out and improve the design for that industry. Our common objective is to enable an intelligent and industrious Canadian people to reap the benefits to which they are entitled, from their rich and precious heritage of raw materials. √

Gas Turbines in Industry

(*Continued from page 9*)

This ratio of process steam per kilowatt hour varies widely in different plants, ranging from plants having no requirement for heat energy, to plants requiring an equivalent of 40 lb. or more of steam per kilowatt hour. Today, the average in industrial plants is perhaps no more than 20 lb. of steam per kilowatt hour and, with the rapid increase in the use of electricity, the ratio is likely to decrease still more in the future. In many new plants, and particularly in the expansion of existing plants, the ratio of process steam to electric power requirements may be quite low. A low ratio favours the gas turbine.

From the gas turbines described and the applications enumerated, it can therefore be seen that the gas turbine is a very useful additional tool for the power engineer in selecting prime movers, for new plants or for plant expansions, which will provide electric energy or both electric energy and heat energy at the highest overall plant efficiency. The gas turbine is a versatile prime mover, and its advantages should not be overlooked when a thermal generating station is being considered. √

FROM MONTH TO MONTH

Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

A New Approach to Graduate Study

For the past year Nova Scotia Technical College has been conducting an interesting experiment in post graduate engineering study. By arrangement with Canadian Westinghouse Limited, graduate engineers enrolled in the Westinghouse Training Course in Hamilton meet one night per week, two hours per night for twenty-five weeks, for courses of lectures, recitations, and discussion. Instructors approved by the Committee on Graduate Studies at Nova Scotia Tech. are drawn from those in responsible charge of the problems and projects in the plant that are involved in the topics covered in the courses.

Attendance is taken, problems and test papers are set, and a final examination is given. Satisfactory completion of each course constitutes a credit toward a Master's Degree from Nova Scotia Tech.

With a satisfactory undergraduate record, completion of the full prescribed Graduate Engineers' Training Course at the Westinghouse plant, and satisfactory completion of not less than two of the graduate courses described above engineers may be admitted to candidacy for a Master's degree. The degree may then be granted upon satisfactory completion of a third graduate course and submission of a thesis satisfactory to the College. The third course may be one of those offered at the Westinghouse plant or an acceptable course taken at a university of recognized standing.

The courses presently offered or contemplated at the plant are:

Circuit Theory and Analysis, Symmetrical Components, Electrical Machine Design, Industrial Electronics, Welding Metallurgy, and Dynamics and Vibrations.

A total of twenty-five students successfully completed courses in the second term of the 1949-50 academic year and forty-five are presently enrolled in the first term of the 1950-51 year.

In a letter to the *Journal* Dr. A. E. Cameron, President of Nova Scotia Technical College, said in part:

"You will understand that these large registrations will only include a few of our own graduates. Practically every Canadian university giving electrical engineering is represented in the registration. This we take to be a clear indication that graduate work of this nature has a definite appeal. Obviously we have not yet had enough experience to prove the value of this scheme of education. The average quality of the candidates is high. They have been well screened, first by Westinghouse in its Selection Committee and then by our Committee on Graduate Studies."

Perhaps it is too soon to pass judgment on this somewhat revolutionary idea in Canadian engineering education. However, it would seem to approach the British system of apprenticeship training which many engineers favour, and the possibility of achieving a Master's Degree should add to the attraction of the Westinghouse Training Course. Perhaps also, higher degrees earned in the practical atmosphere of industry may free their holders from the "ivory tower" stigma which sometimes attaches to those who have spent five, six or even seven years in the seclusion of a university.

It will be interesting to follow the progress of the young engineers who have benefited from this scheme.

Cover Picture

In view of the prominence of the Sarnia area in the Canadian economy and the timely address by J. R. Nicholson (see page 18), this month's cover photo would seem to be particularly appropriate. It shows a piping and valve installation at the Dawn compressor and storage station of Union Gas Company of Canada Limited near Sarnia.—*Photo courtesy Peacock Brothers Limited.*

"A Wise and Gracious Custom"

On December 11, 1950 the Hydro-Electric Power Commission of Ontario, with appropriate ceremonies, renamed its transformer and frequency changer station at Pond Mills, near London, Ontario, the "E. V. Buchanan Station". Mr. Buchanan, general manager of the London Public Utilities Commission is a past councillor and past vice-president of the Institute and is currently president of the Ontario Association of Professional Engineers.

The ceremonies included an inspection of the station during which Mr. Buchanan threw the switch which brought in power from the Des Joachims plant on the Ottawa River over a new 375-mile transmission line. A luncheon followed at the Hotel London at which a number of distinguished speakers paid tribute to Mr. Buchanan and to the profession of engineering of which he is such a worthy representative.

The Institute agrees heartily with A. J. Rush, mayor of London, who said that the custom of naming Ontario Hydro's new developments after leading engineers is "a wise and gracious one".

Principals in the ceremonies at the new E. V. Buchanan transformer and frequency changer station. From left to right:—R. H. Saunders, chairman, Hydro-Electric Power Commission of Ontario; E. W. Curtis, chairman, London Public Utilities Commission; Mayor Allan Rush, of London; E. V. Buchanan; Councillor V. A. McKillop; J. B. Hay and R. W. D. Lewis, K.C., commissioners, London Public Utilities Commission.

British Aero Gas Turbines Favoured

The Wright Aeronautical Corporation, one of the major U.S. aircraft engine manufacturers has concluded an agreement with the Bristol Aeroplane Company of England, for the manufacture of Bristol aircraft gas turbine engines under licence in the United States.

This agreement follows a previous agreement by which the Wright Corporation is also licensed to build the Armstrong-Siddeley, Sapphire, Python, and Mamba engines. The Sapphire is claimed to be the world's most powerful aircraft gas turbine.

American firms have also taken out licences to build the Rolls Royce Nene and Tay engines.

News of Other Societies

Chemical engineers will meet in Toronto on February 19 and 20, 1951, for the Toronto regional conference of the chemical engineering division of **The Chemical Institute of Canada** (18 Rideau St., Ottawa, Ont.).

The 34th annual conference of The Chemical Institute of Canada is planned to take place in Winnipeg, June 18 to 20, 1951.

The Maritime branch of the Canadian Section of the **American Water Works Association** was formed recently, replacing the Maritime Water Works Association. W. R. Godfrey, director of works for Saint John, was elected president of the new body.

The spring meeting of the **American Society for Testing Materials** (1916 Race St., Philadelphia) will take place in Cincinnati, Ohio, March 5 to 9, 1951.

The Institute of the Aeronautical Sciences (2 East 64th Street, New York 21), announces the sixth annual flight propulsion meeting, March 16, 1951, at the Hotel Carter, Cleveland, Ohio.

Lawrence B. Richardson, rear admiral, U.S.N. (Ret.) director of research and development, Fairchild Engine and Airplane Corp., has been elected president of the Institute of the Aeronautical Sciences for the year 1951. S. Paul Johnston and Robert D. Dexter have been re-appointed director and secretary respectively.

The semi-annual meeting of the **American Society of Mechanical Engineers** (29 West 39th Street, New York 18, N.Y.) will be held in Toronto, Canada, at the Royal York Hotel, June 11 to 15, 1951.

General A. G. L. McNaughton, M.E.I.C., will speak at the annual banquet of the **Association of Professional Engineers of Ontario,** at the Royal York Hotel in Toronto, on January 27, 1951.

The banquet will conclude the two-day annual meeting of the Association, and will be presided over by E. V. Buchanan, M.E.I.C., president of the Association.

The Institution of Engineers, Australia, (Science House, Gloucester & Essex Streets, Sydney) will hold its annual conference in 1951 in Brisbane, from April 2 to 7, 1951. Members of The Engineering Institute of Canada, residing in Australia or visiting Australia during this period are invited to attend the Conference under the same conditions as members of the Institution, and both the Council of The Institution and the Committee of the Brisbane Division assure them of a warm welcome.

Elections and Transfers

At the meeting of Council held in Montreal, November 18, 1950, a number of applications were presented for consideration and on the recommendation of the Admissions Committee, the following elections and transfers were effected:

Members:

C. W. Adams, *Arvida, Que.*
F. C. Adsett, *Belleville, Ont.*
W. C. Benger, *Belleville, Ont.*
F. J. Bleackley, *Montreal, Que.*
J. E. Buchan, *Belleville, Ont.*
F. W. Collyer, *Belleville, Ont.*
J. W. Dolphin, *Winnipeg, Man.*
H. A. Erith, *Montreal, Que.*
T. E. Flinn, *Belleville, Ont.*
J. A. Grant, *Belleville, Ont.*
E. G. Gurnett, *Belleville, Ont.*
A. Hinds, *Montreal, Que.*
A. D. Janitsch, *Belleville, Ont.*
A. A. G. Johns, *Ottawa, Ont.*
J. P. Kirby, *Montreal, Que.*
J. H. Legate, *Belleville, Ont.*
W. A. Lowe, *Winnipeg, Man.*
J. G. Lucas, *Peterborough, Ont.*
B. H. McGregor, *Belleville, Ont.*
J. A. McLaren, *Sudbury, Ont.*
A. E. May, *Belleville, Ont.*
C. E. Meyers, *Belleville, Ont.*
F. E. Moore, *Belleville, Ont.*
D. Panar, *Edmonton, Alta.*
C. R. Phillips, *Belleville, Ont.*
J. C .R. Punchard, *Belleville, Ont.*
C. E. Rickards, *Belleville, Ont.*
O. H. Scott, *Belleville, Ont.*

Applications through Associations

By virtue of the co-operative agreements between the Institute and the Associations of Professional Engineers, the following elections and transfers have become effective:

ALBERTA

Student to Junior:

F. F. Newton, *Edmonton, Alta.*

SASKATCHEWAN

Students:

W. B. Anderson	P. M. Hunchak
J. I. Beggs	R. C. Hovdebo
H. G. Bird	L. A. Kaskowich
V. E. Campbell	P. B. O. McNally
R. C. Carlson	J. B. Motta
J. O. S. Clarke	O. Sawula
J. A. Cook	W. Shakotko
J. M. Crook	D. H. Simpson
R. J. Genereux	A. Soroka
W. H. George	A. J. Stuart
M. Grimsen	G. A. Swanson
A. A. Grindlay	E. Veidelek
S. J. Harper	W. L. Weber
G. W. Hart	F. J. Williams
T. G. Heron	Z. R. Zackaropoulos
W. M. Hughes	

Student to Junior:

M. W. Thompson, *Regina, Sask.*

NOVA SCOTIA

Junior to Member:

H. McClymont, *Halifax, N.S.*

QUEBEC

Member:

J. N. Bodtker, *Baie Comeau, Que.*

Meeting of Council

Secretary's Notes

A meeting of the Council of the Institute held at Headquarters on Saturday, November 18th, 1950, convening at nine-thirty a.m.

Employment of Engineers from Outside of Canada and Tariff Item 180e

The general secretary reported that on a recent visit to Ottawa he had again called on the Tariff Board to discuss the form of the formal presentation which the Institute was to make in January. He reported that he had been received very cordially and had gained considerable information that would be helpful.

Civil Defence

The general secretary reported that at the Digby meeting there had been a discussion with regard to uniform standards of screw threads for fire hose couplings and fire pumpers. He had been in touch with the Canadian Standards Association and the Coordinator of Civil Defence and had discovered that progress towards the acceptance of uniform standards both in Canada and the United States had not gone very far. Apparently Canadian standards and the United States standards were different and it may be some time before these differences can be ironed out.

Resolutions from the Branch Officers Conference

Mr. Wright reported that the minutes of the conference had been received recently but that the resolutions had not been specifically defined therein. However, he had gone through the minutes and picked out the five points which he believed represented the conclusions reached at that conference. They are as follows:

Resolution No. 1

This followed a long discussion on the quality and the cost of the recent membership directory. It states that: "Unqualified approval of the directory is given" and recommends that a similar one be published in about 5-year periods.

Resolution No. 2

This proposes that a nominal charge be made for the directory and that members be canvassed in advance as to whether or not they want a copy sent to them. On the voting there were five dissenting delegates who stated that they were in favour of the directory being issued at regular intervals but they were opposing a charge being made. In the subsequent discussion it was agreed that the motion would be interpreted to mean that consideration would be given to a charge being made.

Resolution No. 3

This followed a discussion of the proposal made by the Winnipeg branch executive that a new grade of "fellow" be established. The resolution records the opinion of the meeting that such action should not be taken.

Resolution No. 4

This followed a discussion as to whether or not junior members should be given the privileges of corporate membership. The resolution states that juniors should remain as non-corporate members but that they should be given the same voting privileges as accorded corporate members.

Resolution No. 5

This followed a discussion as to whether or not a better employment service could be rendered on a national basis if the Institute co-operated with the Canadian Institute of Chemistry and the Canadian Institute of Mining & Metallurgy, and any other organizations who were prepared to participate. The resolution gives approval to the suggestion.

Queen's University Board of Trustees

In view of the fact that the Institute each year presented a cash prize to Queen's University the Institute had been classified as a benefactor and thereby was entitled to make nominations to the Board of Trustees.

Accordingly, it was moved, seconded and agreed unanimously that the Institute should nominate D. K. MacTavish of Ottawa and R. D. Harkness of Montreal.

Report of Finance Committee

Mr. Heartz reported on the financial statement to the end of October, pointing out that income was substantially greater than for last year but that the expenses, too, were higher. He pointed out that the printing of the membership directory and the full year's operation of the Toronto office would produce an adverse effect on the year's surplus as compared to 1949. However, he was of the opinion that at the end of the year there would still be a small surplus. On Mr. Heartz's motion, the report was approved.

New Branch at Belleville, Ontario

Following negotiations which had been carried on by members of the Peterborough Branch and by engineers in the Belleville district, it had been decided to make application for a new branch with headquarters at Belleville. Accordingly, a petition signed by twelve corporate members of the Institute resident at Belleville was now submitted to Council as follows:

> "We, the undersigned corporate members of The Engineering Institute of Canada, do hereby make application for the establishment of a branch with headquarters at Belleville, Ontario.
>
> We feel that we could maintain and conduct a very successful branch to the mutual advantage of engineers in this district and to the Institute as a whole.
>
> Respectfully submitted.
>
> G. A. BRADFORD
> G. D. DIES
> A. O. DRYSDALE
> J. N. MCCAREY
> SYDNEY SILLITOE
> T. T. BOUTILLIER
> F. F. FULTON
> DOUGLAS W. BEWS
> W. L. LANGLOIS
> H. L. EASTON
> W. L. DICKSON
> C. R. WHITTEMORE"

On the motion of Mr. Finnemore, seconded by Mr. Eaton, it was unanimously resolved that the application be accepted, that the branch be authorized and that an expression of Council's appreciation of their efforts be extended to the officers of the Peterborough Branch.

It was noted that in addition to the members signing the petition, applications were being submitted to this meeting from twenty-eight engineers in the district who wished to become charter members of the new branch.

The provisional officers of the new branch were noted and approved as follows:

Chairman, F. F. Fulton; Secretary, S. Sillitoe; Treasurer, W. L. Langlois; Executive: E. G. Gurnett, G. A. Bradford, J. E. Buchan; Meetings and Papers, A. O. Drysdale.

On the recommendation of the provisional committee it was unanimously resolved that Mr. Douglas W. Bews be appointed councillor to represent the Belleville Branch.

Report of the Field Secretary

Colonel Grant reported that at every centre appreciation had been expressed of the Institute's recognition of these non-resident members. He felt that the Institute should continue with these efforts to reach non-resident members both in the maritimes and in other parts of Canada as well. In some instances it appeared as if a new branch would be justified and in others it was proposed that the branch to which the group belonged should hold meetings at those centres from time to time.

Speaking of other parts of Canada, Mr. Stirling inquired as to what branches members belonged who were in the Northwest Territories. He pointed out that the presence of Institute members in remote areas such as this and also in Prince Edward Island and Newfoundland indicated the widespread interests and influence of the Institute and emphasized its national character. He expressed great satisfaction with Colonel Grant's report.

Legislation Committee

The membership of the Legislation Committee, as submitted by the chairman, was approved unanimously as follows:

L. A. Duchastel, *Chairman*
Maurice Bourget
Paul Vinet.

Annual Meeting 1951

It was noted that the annual general meeting of the Institute would be convened at Headquarters on Thursday, January 25th, 1951, and would be adjourned to reconvene at the Mount Royal Hotel, Montreal, on Wednesday, May 9th, 1951.

Co-Operative Agreement with American Society of Mechanical Engineers

The general secretary reported that for some time the joint ASME-EIC committee had been discussing means by which the privileges of both societies could be made available to student members. Certain recommendations had been agreed upon at the meeting of the committee held in Toronto last July and he presented a communication from the secretary of the ASME which reported that that organization had approved of the recommendations as follows:

(1) That student members of the EIC attend ASME meetings in Canada or the United States under the privileges enjoyed by ordinary members for such meetings;

(2) That the list of Canadian schools where EIC had student members (in addition to Toronto, Queen's and British Columbia) be adopted as part of the ASME list of approved schools;

(3) That the same consideration for Junior membership according to the standard procedures of ASME be accorded EIC students graduating from Canadian universities where mechanical engineering is taught.

(4) That the subscription rate for Mechanical Engineering be $3.50 (plus bulk postage) to EIC students in Canadian engineering schools where there are no ASME student branches.

Following some discussion on the motion of Mr. Hamilton, seconded by Mr. Swinnerton, it was unanimously resolved that Council approve the granting of similar privileges to ASME students enrolled at Canadian universities and that the subscription for the Engineering Journal be $2.00 per year.

ASME Representation on Institute Council

It was noted that under the terms of the co-operative agreement, Mr. Chester B. Hamilton, M.E.I.C., of Toronto, had been reappointed as the ASME representative on the Institute Council for a further period of one year terminating on December 31st, 1951. This was approved unanimously.

CSA Committee on Structural Timber

On the motion of Mr. Jubien, seconded by Mr. Buss, it was unanimously resolved that Mr. Alan K. Hay, of Ottawa, be appointed the Institute's representative on the Canadian Standards Association Specification Committee on Structural Timber. Mr. Hay has agreed to accept the appointment.

International Conference of Naval Architects and Marine Engineers

The general secretary reported that the Institute had been invited to name two delegates to the International Conference of Naval Architects and Marine Engineers being held in Britain in June and July, 1951. W. H. Milne, M.E.I.C. and H. H. German, M.E.I.C. were planning to attend this conference, and on the motion of Mr. Geiger, seconded by Mr. Crawford, it was unanimously resolved that they be appointed as the official delegates of the Institute.

Corporation of Professional Engineers Of Quebec

The general secretary reported that the joint committee established under the co-operative agreement with the Corporation of Professional Engineers of Quebec had met recently and discussed several subjects of interest but without bringing in any recommendations to Council. Methods of further co-operation which were considered were:

(a) Invitation of all Corporation members to EIC branch meetings.

(b) The admission of members of the Corporation to the annual meeting of the Institute on the same basis as EIC members.

(c) Joint premises.

(d) Joint fees.

(e) Future meetings of the committee.

Council agreed that branches should be encouraged to invite non-EIC members of the Corporation to their meetings and approved also of inviting all such members to the forthcoming annual meeting in Montreal. The report was received as a progress report.

Manitoba Agreement

The general secretary read a letter from the secretary of the Winnipeg Branch from which it was noted that the ballot for the co-operative agreement between the Institute and the Association of Professional Engineers in Manitoba would be sent out to the membership of both bodies on December 4th. It was hoped that the agreement would become effective as of January 1st, 1951.

Provincial Institute of Technology and Art (Calgary)

The general secretary reported that a request had been received from A. A. Peebles, M.E.I.C., chief instructor, Department of Aeronautics, at the Provincial Institute of Technology and Art in Calgary, asking Council to accept as Juniors the graduates of a course in aeronautical engineering offered by that Institute.

Following a lengthy discussion, and acting on the recommendation of the Board of Examiners it was agreed that the Council would accept such graduates as Juniors of the Institute. It was emphasized, however, that each person becoming a Junior under this agreement should be impressed with the necessity of preparing to write an examination so that he could in due course be transferred to corporate membership, such examination to include English and economics as well as additional technical material.

Personals

Notes of the Personal Activities of Members of the Institute

W. M. Scott, M.E.I.C., chief commissioner of the Greater Winnipeg Water District and of the Greater Winnipeg Sanitary District, retired at the end of 1950.

Chairman of the board of commissioners for the water district from 1920 until 1949 and of the sanitary district from its inception in 1937 until 1949, Mr. Scott continued as a commissioner of both boards after his retirement as chief commissioner early in 1949.

Mr. Scott first went to Winnipeg, from Montreal in 1906, and he worked there on hydro development and in consulting engineering before joining the water district board.

He had worked in municipal engineering in the United States and in other parts of Canada after graduation from McGill University.

Major-General N. E. Rodger, M.E.I.C., quartermaster-general of the Canadian Army for the past five years will attend a senior officers' course in England. Maj.-Gen. Rodger was promoted to his present rank in 1946.

He is a graduate of Royal Military College (with honours), and a bachelor of science, McGill University, Montreal. Appointed to a commission in the Royal Canadian Engineers (Permanent Force) in 1928, at the outbreak of war in 1939 he held the rank of major. He then went from Kingston, Ont., to Canadian Military Headquarters in London, England. He received staff appointments with the First Canadian Infantry Division and the 1st Canadian Corps. From December, 1941 until September, 1942, with the rank of lieutenant colonel, he was personal assistant to General A. G. L. McNaughton. He was promoted then to rank of brigadier and appointed Brigadier General Staff, C.M.H.Q., London. From November, 1943 until February, 1944 he commanded the 10th Canadian Infantry Brigade, and then became Brigadier General Staff, 2nd Canadian Corps, in which capacity he served until the end of hostilities. An appointment to the Canadian Army Staff at Washington followed.

T. R. Loudon, M.E.I.C., head of the departments of civil engineering and aeronautical engineering at the University of Toronto completed forty years of teaching at Toronto recently.

A group of engineers who had studied with him forty years ago, met in his honour, to present him with a portrait in oils of himself.

Professor Loudon graduated from University of Toronto in 1905, in civil engineering. He joined the staff of the University in 1907 as a lecturer in the faculty of applied science and engineering. He has continued his association with the University and has also become widely known as a consultant. During World War I, Professor Loudon served with the Royal Canadian Engineers. In the recent war, with the rank of wing commander, he organized the R.C.A.F. School of Aeronautical Engineering in 1940, and was with the R.C.A.F. Test and Development Establishment until 1943. Then he returned to his academic work, and to the appointment as commanding officer of the R.C.A.F. University Air Training Corps, at University of Toronto.

He succeeded Dean C. R. Young as head of the department of civil engineering of the University in 1943 with the title of professor of civil engineering and aeronautics.

R. McIsaac, M.E.I.C., the division engineer at New Glasgow, N.S., for Canadian National Railways, has retired from C.N.R.

Mr. McIsaac has been associated with C.N.R. for many years, and was with the National Transcontinental Railway, and the Saint John and Quebec Railways, previously. He went to C.N.R. in 1919 as an assistant engineer on location.

A. V. Gale, M.E.I.C., has retired from the Gatineau Power Company, Hull, Que.

Mr. Gale was vice-president and general manager of the Hull Electric Company for many years, and in 1946 became manager of the Hull division of Gatineau Power Company.

F. H. Midgley, M.E.I.C., has retired from Canadian Pacific Electric Lines, Preston, Ont., and recently returned from a visit to Scotland.

Mr. Midgley is a councillor of the Institute representing the Kitchener Branch.

Since 1915 he has been associated with Lake Erie and Northern and Grand River Railway Company at Preston, Ont. (Canadian Pacific Electric Lines) where he has been in charge of construction and maintenance of way.

N. J. Good, M.E.I.C., who was attending University in Baltimore, Maryland, has returned to the Department of Health, in Victoria, B.C., to work in the division of environmental sanitation. He was assistant public health engineer for the Department of Health in Victoria before going to Baltimore.

E. M. Van Koughnet, M.E.I.C., is now associated with the Power Corporation of Canada Ltd., in Montreal.

He was previously with the Quebec Provincial Electricity Board at Montreal. He served as secretary-treasurer of the Montreal Branch of the Institute from 1946 to 1948.

Colonel L. G. C. Lilley, M.E.I.C., has been appointed director of Works and Accommodation, Department of National Defence (Army) Ottawa, Ont.

Colonel Lilley goes to Ottawa from Edmonton, where he was posted in the Western Command. He was the commandant of the R.C.E.M.E. School at Chilliwack in 1947 and 1948.

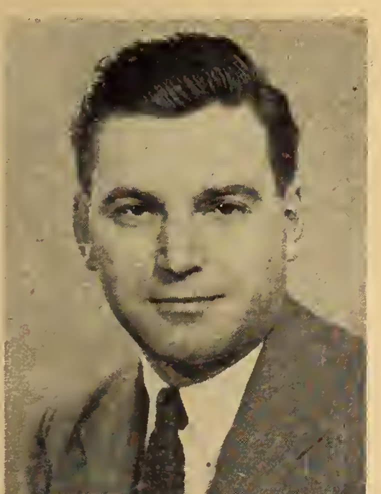
Garth Griffiths, M.E.I.C., of the B.C. Power Commission, has been appointed assistant chief engineer for the Commission at Victoria. He was previously the superintendent of the coastal region at Nanaimo, B.C.

C. E. Morrison, M.E.I.C., is general manager for G. L. Griffith and Sons Ltd., Stratford, Ont. Previously he was employed as engineer by Asbestonos Corporation, Ltd., at Montreal, Que.

J. J. Baker, M.E.I.C., who was with the National Harbours Board, working at the Montreal Harbour, is now employed by Montreal Locomotive Works.

Ernest R. Hammond, M.E.I.C., is on the staff of the National Research Council in Chalk River, Ont.

He has been with the Electric Tamper and Equipment Company of Canada Limited in Montreal since 1946, when



E. R. Hammond, M.E.I.C

he retired from active service with Royal Canadian Navy. He had received a master's degree in civil engineering in 1939, from Massachusetts Institute of Technology.

G. H. Hoganson, M.E.I.C., of Canadian National Railways, has been appointed assistant division engineer of the Moncton Division.

He joined the C.N.R. as a junior assistant engineer, research and development department, Montreal in 1947, after his graduation from Nova Scotia Technical College in civil engineering.

Brian M. Kenny, M.E.I.C.

Two years later he was promoted to instrumentman at Campbellton, N.B., and later in the same year was appointed assistant engineer in the regional engineering office at Moncton, the position he has held until his recent appointment.

Brian M. Kenny, M.E.I.C., has announced the formation of a new engineering company, Kenny Consolidated Engineering Industries Limited, Toronto, of which Mr. Kenny is president. The firm will handle sales and distribution of electrical and mechanical industrial equipment, particularly serving the process industries.

Mr. Kenny has been in the Canadian engineering industry for twenty years, the major part of his experience being with Canadian General Electric Company, Genelco Limited, and Waterous Limited, Brantford, Ont.

W. Gordon McLaughlin, M.E.I.C., is now working with the Ford Motor Company of Canada Limited, Windsor, Ont. He was previously with the contracting firm of Aiken & MacLachlan, Ltd., St. Catharines, Ont.

Julien Ricard, M.E.I.C., is with the Canadian Standards Association, Montreal, Que. Mr. Ricard was previously at Quebec City, an electrical engineer on the staff of the Rural Electrification Bureau of the Province of Quebec.

Paul M. Smith, M.E.I.C., is now employed by Surveyer, Nenniger & Chenevert, consulting engineers, Montreal, as a resident engineer at Parent, Que.

He returned to Canada early in 1949 from India, where he worked on several irrigation projects, and has since been in charge of repair of dams at Lake Kenogami, Que., for Concrete Repairs and Waterproofing Co. Ltd.

William J. Pearce, M.E.I.C., field engineer for Stone and Webster Engineering Corporation has been transferred from the Niagara Mohawk's Power Corporation's steam station at Dunkirk, N.Y., to a similar steam station under construction at Albany, N.Y., for the same power corporation.

George Ward, M.E.I.C., sales engineer with J. J. Marshall Limited in Vancouver, B.C., will specialize in lighting, heating and electronic equipment. He was previously a telephone power equipment engineer for Northern Electric Co., Montreal, Que.

Mr. Ward graduated from the University of British Columbia in 1947.

D. J. S. Irvine, M.E.I.C., who was a research engineer for Consolidated Mining and Smelting Co., Trail, B.C., is now employed by Dominion Tar & Chemical Company in Toronto, Ont.

D. J. S. Irvine, M.E.I.C.

Lionel Desert, Jr.E.I.C., is with the firm of Surveyer, Nenniger & Chenevert, consulting engineers, of Montreal, working at Senneterre, Que.

He was previously a resident engineer for the Department of Roads at Montreal, Que.

Bruce F. Keays, Jr.E.I.C., of Canadian National Railways, has been appointed division engineer for the New Glasgow Division at New Glasgow, N.S.

Mr. Keays graduated from University of New Brunswick in 1942 as a civil engineer. He had worked with the Canadian National Railways as timekeeper at Newcastle, N.B., from 1939. In 1943 he became a draughtsman in the engineering department at Campbellton, N.B., and the next year an instrumentman at Edmundston, N.B. Mr. Keays was appointed assistant division engineer of the Moncton division in 1948, which position he held up to the time of his present appointment.

Marcel L. Bussiere, Jr.E.I.C., is now employed with Merck and Company in Valleyfield, Que. He was previously with National Breweries Limited, Montreal.

J. S. Ellis, Jr.E.I.C., has recently commenced work with H. G. Acres & Co., consulting engineers, Niagara Falls, Ont. He received a B.Sc. (with honours) from Queen's University in 1948 and a master of engineering from McGill University in 1949. Mr. Ellis has been connected with the Shawinigan Engineering Company since 1947.

Joseph Anthony D'Angelo, Jr.E.I.C., is working with the Ford Motor Company of Canada in the time standards and methods department, of the industrial engineering department at Windsor, Ont.

He was previously with the production planning department of National Heating Products Sales Ltd., Montreal.

He graduated in 1946 in electrical engineering from University of Manitoba.

A. B. Jarvis, Jr.E.I.C., of McColl Frontenac Oil Co. Ltd., is on a temporary transfer from Montreal to Edmonton, Alta.

He graduated from Queen's University in the fall of 1948, receiving a B.Sc. in civil engineering.

G. L. Metcalfe, Jr.E.I.C., formerly assistant engineer with the Pacific Coast Pipe Co. of Vancouver, B.C., is now working in Calgary, Alta., for the Buchan Construction Co.

Mr. Metcalfe graduated with a B.Sc. degree in civil engineering from the University of Alberta in 1949.

E. G. DeWolf, Jr.E.I.C., previously employed as assistant plant superintendent of Maritime Industries Limited, Amherst, N.S., is now manager of salt production for Prairie Salt Co., division of Dominion Tar and Chemical Co., at Unity, Sask.

George Gardner Wellington, Jr.E.I.C., is now working with the Aluminum Company of Canada. He was previously employed by the Defence Research Board, at Victoria, B.C.

C. D. Worby, Jr.E.I.C., of the Canadian National Railways, has been transferred from Winnipeg, Man., to Prince George, B.C., as assistant division engineer.

He graduated from the University of Manitoba in 1947 receiving a degree of B.Sc. in civil engineering. He joined the C.N.R. in 1947.

W. B. Rice, Jr.E.I.C., has been appointed associate professor in the department of mechanical engineering of Queen's University.

Professor Rice obtained his bachelor of engineering degree from McGill University in 1944. He has been assistant professor of mechanical engineering at McGill since 1946. He served during the war as a lieutenant in the Canadian navy. He has also been on the staff of the Northern Electric Company, Montreal, and of Canadian Industries Limited.

Alfred J. Prell, Jr.E.I.C., has accepted a position with Dow Chemical of Canada, Limited in Sarnia, Ont., as a project engineer.

He graduated from the University of Toronto in 1948.

M. A. Waghorne, Jr.E.I.C., of Sarnia, is now manager of the plywood division of Mac Craft Industries Ltd., Sarnia, Ont.

Previously he was assistant manager for Dominion Plywoods Limited, in Southampton, Ont.

J. N. Booth, Jr.E.I.C., of Toronto, Ont., has gone to Windsor, Ont., to work for the Ford Motor Co. of Canada Limited, in the maintenance engineering department. While in Toronto he was an engineer for Canadian Brazilian Services Ltd., and prior to that he was a junior engineer for The British American Oil Co. Ltd., in Toronto.

W. K. Henshaw, S.E.I.C., is district representative for Reliance Petroleum Limited, in Hamilton, Ont.

He was previously employed as superintendent by A. Cope & Sons, Ltd., general contractors, Hamilton, Ont.

F/O K. E. McKenzie, S.E.I.C., a construction engineer (special projects) in the R.C.A.F. is stationed at Ottawa, Ont.

He graduated from the University of Manitoba in 1950 receiving the degree of B.Sc. in mechanical engineering.

J. J. Marlow, S.E.I.C., of Hamilton, Ont., has obtained a position as instrumentman for J. L. E. Price Construction Company in Toronto, Ont., and is working on the new Bank of Nova Scotia building in Toronto.

Mr. Marlow graduated from the University of Toronto, in 1950, with a degree of B.A.Sc. in civil engineering.

R. M. Taylor, S.E.I.C., of Montreal, is on a test course with the English Electric Co. Ltd., at St. Catharines, Ont.

Z. J. Czaplinski, S.E.I.C., is now working for St. Raymond Paper Co. Ltd., Desbiens, Que.

Mr. Czaplinski graduated from McGill University, last spring, with the degree of B.Eng. in chemical engineering.

J. F. Preston, S.E.I.C., has returned to Montreal to work for the C.I.L.

Upon graduation from McGill last spring he went to Ford Motor Co., at Windsor, Ont., as a design engineer.

E. J. Slotwinski, S.E.I.C., who graduated from the University of Toronto in electrical engineering in 1950, has joined Dow Chemical of Canada, in Sarnia, Ont., as a junior electrical engineer.

Giles Bissonette, S.E.I.C., is with the engineering department of Bepco Canada Ltd., Montreal, Que.

He has been with the Steel Co. of Canada at Hamilton, Ont., since his graduation in electrical engineering in 1950 from McGill University.

J. G. Hamel, S.E.I.C., who graduated from McGill University in civil engineering in 1950 has joined the staff of the Foundation Company of Canada and is located at Ottawa, Ont.

S. S. Archer, S.E.I.C., is working with the Ford Motor Company of Canada Limited, Windsor, Ont. Mr. Archer graduated in 1950 from the University of Manitoba in electrical engineering.

A. Lemelin, S.E.I.C., who graduated in 1950 from Laval University in electrical engineering, is now employed with the Department of the Inspection of Mines as an electrical engineer.

Jan J. Munk, S.E.I.C., has been appointed sales engineer in Eastern Ontario and Quebec for the Powertronic Equipment Limited.

Jan J. Munk, S.E.I.C.

Mr. Munk was educated in Vienna and London, England. He came to Canada in 1937. During World War II he served with the R.A.F. and the R.C.A.F. and graduated from McGill University in electrical engineering in 1950.

M. C. Jerrard, S.E.I.C., is working for the Ford Motor Company of Canada Limited, Windsor, Ontario.

Mr. Jerrard had been with the Bowden Machinery Company, Toronto, since graduating from the University of Manitoba in mechanical engineering in 1950.

Thomas Robert Marien, S.E.I.C., who graduated in civil engineering from McGill University in 1950, is working for the Pentagon Construction Company at St. Joseph D'Alma, Que.

A. W. Rowe, S.E.I.C., is now working as a sales engineer for Peacock Brothers, Montreal, Que. He graduated from McGill University with a degree in mechanical engineering in 1950.

D. G. Thompson, S.E.I.C., of Vancouver, B.C., is on the staff of the B.C. Power Commission at Vernon, B.C.

He graduated from the University of British Columbia in 1950 in electrical engineering.

W. E. Turner, S.E.I.C., of Medicine Hat, Alta., is now employed by the City of Calgary as a surveyor.

Mr. Turner graduated from the University of Alberta last spring in civil engineering.

Marc Vermette, S.E.I.C., who graduated from Laval University last year is now an engineer in training with the Canadian Genêral Electric Co. Ltd., at Toronto, Ont.

R. J. Ward, S.E.I.C., is with Canadian Westinghouse Co., presently at Beauharnois, Que. He will be located in Hamilton, Ont., early in 1951. He graduated in 1950 from University of B.C. in electrical engineering.

Louis Gaston Boucher, S.E.I.C., who was an engineering draughtsman with the Electric Tamper and Equipment Co. of Canada Ltd., in Montreal, is now with the Commonwealth Electric Company Limited, Montreal, Que.

Walter E. Webb, S.E.I.C., who is with the Canadian National Railways has been transferred from Montreal to Ottawa.

Mr. Webb graduated from McGill University in 1950 in civil engineering.

Visitors to Headquarters

E. V. Buchanan, M.E.I.C., London, Ont., November 21, 1950.

W. Ball, St. Paul l'Ermite, Que., November 21.

A. Antoine, Paris, France, November 29.

G. A. Blackburn, M.E.I.C., Ottawa, Ont., December 7.

J. V. Deane, M.E.I.C., Halifax, N.S., December 13.

W. E. White, M.E.I.C., Ottawa, Ont., December 13.

I. W. Martin, Toronto, Ont., December 13.

J. M. Fleming, M.E.I.C., Port Arthur, Ont., December 13.

B. A. Culpeper, Hamilton, Ont., December 13.

C. M. Cock, London, England, December 14.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

H. M. Dibblee, M.E.I.C., of Montreal, a life member of the Institute since 1940, died in Montreal on November 1, 1950. Mr. Dibblee had retired from active engineering work about ten years ago.

He was born at Woodstock, N.B., in 1871.

He went into railway work in 1886, working in the Maritimes and northeastern United States, and in 1898 he joined the Canadian Pacific Railway to work in Western Canada.

He remained with C.P.R. for many years, serving at posts in Manitoba, Ontario and Quebec, on engineering and construction. He was assistant engineer at Montreal in 1929, resident engineer for Quebec-Grand Mere section in 1930, and later an inspector in the Montreal Terminals.

Retiring from C.P.R., he did some engineering work for Dominion Construction, Digby, N.S., in 1942.

Mr. Dibblee joined the Institute as a Student in 1895, transferring to Associate Member in 1906, and to Member in 1940.

G. N. Houston, M.E.I.C., prominent Southern Alberta irrigation engineer died on November 12, 1950, at Olds, Alberta.

Mr. Houston was born in Windham, Conn., in 1870. A graduate of Princeton University in civil engineering in 1893, he went to Denver to engage in irrigation work, and later became assistant professor of civil engineering at Colorado College of Agriculture, Fort Collins. He was later appointed professor of civil engineering at the University of Arizona, at Tucson.

He was appointed superintendent of the Denver Sugar, Land and Irrigation Company, Colorado, and later became deputy state engineer of that state. He was in private practice in Denver, Colorado, before coming to Canada in 1913 as a consultant in irrigation engineering.

He returned to the United States during the first World War as a supervising engineer for the War Department.

After the war he returned to Canada — in 1918 — and became assistant commissioner and later acting commissioner of irrigation in the reclamation service of the federal department of the interior. It was during this time that he had much to do with extensive irrigation surveys in Southern Alberta and Saskatchewan. He helped the Lethbridge Southeastern project, now becoming part of the S.M.R.D.

Then in 1921, when the contract for the Lethbridge Northern Irrigation District project was awarded, Mr. Houston, along with L. C. Charlesworth, became the irrigation counsel for the Alberta government and for three years supervised construction.

In 1925 Mr. Houston accepted the post of superintendent of the Lethbridge irrigation project of the C.P.R.'s natural resources department, the original A.R. and I. project. He held this post until his retirement in 1936.

Since his retirement he maintained residence at Olds, doing some consulting work, lecturing at Olds School of Agriculture, and acting as secretary for the Olds Hospital.

For several years he was less active, but attended meetings of the Calgary Branch of the Institute.

He joined the Institute in 1914 as a Member and attained Life Membership in 1942.

R. M. Smith, M.E.I.C., who was president of the Canada Culvert Company Limited, Toronto, Ont., and a former Deputy

R. M. Smith, M.E.I.C.

Minister of Highways for Ontario, died at his home in Toronto, on November 16, 1950.

Mr. Smith was born in Kingston, Ont., in 1887. He attended the Kingston Collegiate Institute and Queen's University where he received his degree in civil engineering. He joined the staff of the Department of Mines in 1911 and spent three years on geological survey work in Northern Ontario. He was transferred to the Department of Public Works in 1914 and in 1916 when the Highways Branch was separated from that Department, he was made a member of the newly formed Department of Highways. In 1925 he became chief engineer of this Department, and in 1927 he was named deputy minister. When the Department of Northern Development was amalgamated with the Department of Highways in 1935, Mr. Smith became deputy minister of the combined departments.

Under Mr. Smith's direction, the Province constructed and maintained a network of trunk highways and secondary roads. Outstanding among these has been the Queen Elizabeth Way from Toronto to Fort Erie, Ont. He also contributed to the adoption of the Highway Improvement Act and the Highway Traffic Act. Mr. Smith played an important part in the development of northern Ontario, opening up an extensive agricultural and mining area through a network of modern highways. This work culminated in 1942 in the last link of an all-Canadian highway from coast-to-coast — of which 1,400 miles lies within Ontario.

When the Alaska Highway project was started, the United States requested that Mr. Smith assist by supplying help on the aerial survey of the route of the highway and later in the direction of the construction of 350 miles of the main highway within Canadian territory. After leaving the Department, and after temporary retirement for reasons of health, he joined Canada Culvert Company in 1945.

In 1943 he was honoured by Queens University in the granting of an LL.D. In 1942 he was awarded the Julian C. Smith Medal of the Institute "for achievement in the development of this Dominion". He was also presented with honorary life membership in the Ontario Good Roads Association at its annual meeting in 1947.

Mr. Smith joined the Institute in 1921 as an Associate Member, transferring to Member in 1940. He was a member of the Executive of the Ontario Good Roads Association and was the Canadian member of the American Highway Research Board for some years. He also served on the Ontario Civilian Defence Committee, and on the Toronto City Planning Board. He was a member of the Association of Professional Engineers of Ontario.

Robert E. Lembcke, M.E.I.C., assistant engineer for the Texas & Pacific Railway Co., Fort Worth, Texas, died on October 17, 1950, at Fort Worth.

He was born at Philadelphia, Pa., in 1888. He graduated from North Dakota Agricultural College, receiving a B.Sc. degree in civil engineering in 1910. Upon graduation he worked with Morgan Engineering Co., Memphis, Tenn., in

Mississippi and Arkansas. In Canada he worked on municipal projects in St. Boniface, Man., in 1911-12; and he was superintendent of construction for the Guilbault Co. Limited in works at various locations in Manitoba.

He joined the Engineering Institute in 1914 as an Associate Member, transferring to Member in 1940, and attaining Life Membership in 1950.

Joseph W. Simard, M.E.I.C., former Montrealer, died in Paris on October 16, 1950.

He was born in Montreal in 1885, studied at St. Mary's College, McGill University, and Ecole Polytechnique, Montreal.

After graduation from l'Ecole Polytechnique in 1908 with a degree in civil engineering, Mr. Simard was associated with Messrs. P. A. Masson and Wilfrid Hamilton in bridge and road construction and other public works. From 1918 to 1927, he devoted his time to investment banking dealing mostly in municipal and industrial financing. He went abroad in 1927 as representative of financial interests.

In 1930, he joined La Société de Forage LAYNE-France as engineer in

Joseph W. Simard, M.E.I.C.

charge of sales with residence in Paris, France. He continued in that position until the German invasion of 1940.

In that period he took part in a huge ground water supply development for the City of Paris and also for the suburbs of that city, the latter work being done by Layne-France for two private water supply companies, namely, La Société Lyonnaise des Eaux and La Compagnie Générale des Eaux. He was also instrumental in the carrying on of many other important water well drilling contracts, both municipal and industrial, throughout France, particularly at Bordeaux and Rochelle. Wells often reached a depth of over 1000 meters and were of the well-known gravel wall type drilled by the rotary method, the main difficulty consisting in the setting of a screen surrounded with filter gravel in the water bearing formation at deep levels. He did similar work in Germany, England, Tunisia, Algeria, Morocco and Senegal. Two other companies were formed for the development of ground water in Africa and Asia. Two hundred installations were completed in France alone.

During the Second World War, Mr. Simard was with International Water Supply, Ltd., the Canadian affiliates of the Layne organization. He was for a while their Eastern Canadian district manager and in that capacity was connected with various defence installations and municipal projects. During the same period, he was also stationed at Washington, D.C., intermittently, where he looked after the interests of Layne-France and other subsidiaries in the French colonies.

In 1946, he returned to France as president and managing director of Layne-France, which position he occupied until his death.

Besides being a member of various professional organizations, Mr. Simard has been president of Le Cercle Universitaire and a member of the Montreal Rotary Club, the Canadian Club, and other community and social clubs both in Montreal and Paris, France. He was chairman of the Paris Branch of the British Chamber of Commerce from 1937. During the last war, he was sent as a representative of the Canadian Government on an inspection tour of the social services of the Canadian Army Overseas. On frequent occasions, he served as the representative of the Engineering Institute of Canada at European professional meetings. He wrote several papers and gave many lectures on the subject of ground water development. In his extensive travels he had made many friends in the public administration, municipal and industrial fields.

Mr. Simard became a Member of the Engineering Institute in 1940.

Charles E. Legris, M.E.I.C., consulting engineer of St. Jean de Brebeuf, Que., died recently.

Mr. Legris was born at Arctic, West Warwick, Rhode Island in 1886. He studied at McGill University, Montreal, receiving a bachelor of science degree in civil engineering in 1914. Upon graduation he worked with Stone & Webster, Boston, Mass., as a structural and concrete draughtsman. He was in private practice in civil engineering in West Warwick, R.I., for a time, and from 1915 to 1916 he was town engineer of West Warwick.

With the Duke-Power Company from 1917-1923 he was engaged on hydro-electric projects in the United States and in Canada, as resident engineer and field engineer. Among those projects was construction work for the Aluminum Company of Canada at Arvida, Que. He returned to his civil engineering practice at West Warwick in 1928.

He was with the War Department in Kansas City and St. Louis, Mo., in 1929-30, engaged on flood control investigations and channel rectification work on the Missouri and Kansas Rivers and in 1930 to 1931 he worked with the Interstate Commerce Commission, Washington, D.C., on railway inventories. For a period of nine years, up to 1942 Mr. Legris was construction engineer, Public Buildings Administration, Federal Works Agency, in Washington, D.C., engaged on the supervision and construction of Federal Buildings, and repair and maintenance of buildings. He was then engaged by Reconstruction Finance, Defence Plant Corporation, and the Office of Defence Plants, as a supervising engineer on construction of war industrial projects. Under his supervision has come the construction of such plants as that of the United Engineering & Foundry Company, New Castle, Penna., and that of the Aluminum Company of America at Cleveland, Ohio.

In 1947 he returned to private practice as a consulting civil engineer, in Providence, R.I. He has resided in the Province of Quebec since 1949.

Mr. Legris joined the Institute as an Associate Member in 1923, transferring to Member in 1940.

NRC's Aircraft Ski Research

Development of improved types of aircraft skis is a problem of considerable importance in Canada, and work in this direction undertaken at the National Research Council has resulted in a theory of ski friction which gives a satisfactory explanation of the behaviour of aircraft skis under varying conditions.

The theory is based on the idea that the contact between ski and snow takes place at a large number of very small areas and that the heat generated by friction causes sufficient melting to provide water lubrication at the points of contact. It is further considered that each contact area is enclosed in a water drop which does not move appreciably with respect to the snow, and that the remainder of the ski bottom is in contact with air. Thus, in the case of dry snow, the friction component of ski resistance is made up of (a) solid friction, most of which occurs near the toe of the ski, (b) viscous drag due to shearing in the very thin film of water between the ski and the areas of contact and (c) drag due to surface tension forces acting at the perimeters of the water drops in contact with the ski bottom.

Early in the tests, it was found that sliding resistance and adhesion were far more dependent upon snow conditions than on the design of the ski. Further, the skiing quality of snow varies continually and it is not unusual to observe marked changes taking place in less than an hour. More than 2,000 sliding resistance tests have been made using a towing dynamometer, drawn by a half-track.

Trials are continuing during the current winter.

News of the Branches

Activities of the Thirty-three Branches of the Institute and abstracts of papers presented at their meetings

Belleville

S. Sillitoe, M.E.I.C.
Secretary-Treasurer

The inaugural meeting of the Belleville Branch of the Institute was held at the Quinte Hotel in Belleville, December 8th, 1950 with 170 ladies and gentlemen present at dinner. The principal speaker of the evening was General the Honourable A. G. L. McNaughton who was introduced by the Chairman, Brigadier F. F. Fulton.

Dinner began with Grace said by Mr. Frank S. Follwell, M.P., who was one of the head table guests. Others at the head table included Mr. J. M. King, chairman of Peterborough Branch; Mr. and Mrs. James A. Vance; Mrs. F. F. Fulton; Mrs. A. G. L. McNaughton; Colonel L. F. Grant, field secretary; Mr. J. S. Cameron; Miss M. McLaren; Mr. W. D. Laird and the members of the Belleville executive and their wives; Mr. and Mrs. S. Sillitoe; Mr. and Mrs. W. L. Langlois; Mr. and Mrs. J. E. Buchan; Mr. and Mrs. E. G. Gurnett; Mr. and Mrs. G. A. Bradford; Mr. and Mrs. A. O. Drysdale; and Mr. D. W. Bews, councillor.

The Chairman acknowledged the best wishes of Colonel R. D. Harkness and Mr. A. B. Hunt of Montreal and expressed the regrets of Dr. O. Holden, Mr. E. V. Buchanan, and Dr. L. Austin Wright who were unable to attend. Mr. Fulton welcomed many guests from out-of-town, including Mr. Ross-Ross of Cornwall, Mr. W. E. Brown of Hamilton, Mr. F. H. Midgley of Kitchener. A large group had come from Toronto including Mr. Cross, Mr. Geiger, Mr. MacLaren and others; and a large group from Peterborough who had fostered the formation of the Belleville Branch, including Mr. J. M. King, chairman, Mr. Herzog, Mr. Killaly, Mr. Pope, Mr. Fanjoy, Mr. Dobbin, and many others; Mr. E. Russell Eaton of Sudbury, Mr. Paul Buss of Niagara Branch, Mr. G. T. L. Andrew of Kingston, Mr. R. E. Heartz of Montreal and a large number of others including Mr. and Mrs. I. R. Tait, Mr. and Mrs. R. N. Coke, Mr. and Mrs. R. C. Flitton, Mr. C. A. Peachey, Mr. E. B. Jubien and others. Mr. and Mrs. John Stirling represented Saint John and Montreal.

The meeting was addressed by Mr. W. D. Laird, assistant general secretary who discussed the events leading up to the formation of the Belleville Branch. This was followed by a short address from Mr. J. A. Vance, president of the Institute, who made the presentation of the Charter.

Mr. Edgar Cross of Toronto presented a donation of $25.00 as a token of good-will from the Toronto Branch. Mr. E. Russell Eaton presented a head table ash tray as a gift from the Sudbury Branch. The next speaker was Mr. J. S. Cameron, vice-president of the Northern Electric Company and Mayor of Westmount, who expressed the thought that the formation of a Belleville Branch would result in a great contribution to the life and activity of the whole Belleville community. Mr. J. M. King, chairman of the Peterborough Branch dwelt upon the formation of the Belleville Branch from the time it was planned in Peterborough and called upon those members of the Peterborough Branch, Mr. Dobbin, Mr. Killaly, and Mr. Pope, who had been active from its inception. He made the presentation of a Lectern on behalf of the Peterborough Branch. Colonel L. F. Grant addressed the gathering for a short time and pleased everyone with his dry humour.

General McNaughton addressed the gathering on the subject of the International Joint Commission and dealt with the early history of the original boundary commission and the problems connected with this important subject. He showed how engineering considerations were of extreme importance in arriving at any decision in connection with the International Boundary, and traced the progress made in the last 38 years. He showed how powers and responsibilities of the Commission had a profound effect upon the navigation, irrigation, and sanitation problems in the waters of United States and Canada.

His address was fully reported in the press and was rebroadcast over Radio Station C.J.B.Q., Belleville on Sunday, December 10th, at 3:30 p.m.

The gratitude of the meeting was expressed by Brigadier J. E. Genet, C.B.E., M.C.

During the dinner the musical background was provided by Mr. Dean Whalen at the Hammond Organ. A thoroughly successful social evening, together with an extremely informative paper by General McNaughton was enjoyed by all those present.

Cape Breton

G. W. Ross, M.E.I.C.,
Secretary-Treasurer

S. G. Naish, M.E.I.C.,
Branch News Editor

On December 12th Mr. L. Love of Railway Power & Engineering Company showed moving pictures in color of various types of centrifugal pumps. In particular the films featured a new design of submersible pump with the motor below the pump, at the bottom of the borehole.

At the end a film was shown covering earth moving equipment. The speaker was introduced by C. N. Murray, and W. S. Wilson proposed a vote of thanks. R. Bradley was chairman of the meeting.

Cornwall

John A. Sargeant, Jr.E.I.C.,
Secretary-Treasurer

A. A. B. McMath, M.E.I.C.,
Branch News Editor

The annual dinner meeting of the Cornwall Branch was held at the Cornwallis Hotel on December 7th. Twenty-three members attended and heard reports from the various committees. W. P. Nesbitt of the nominating committee reported that G. G. M. Eastwood had been elected chairman again for another year. He also announced that the following members had been elected to the Executive for two years: A. S. Holder, F. R. Warner, H. W. Nickerson. Executive members who still have one year in office are D. Ross-Ross, R. H. Wallace, P. H. Nasmyth, F. E. Trewartha and A. A. B. McMath.

In his report for the Membership Committee, L. P. Stidwill mentioned that the branch now has 58 members and 9 affiliates. Chairman G. G. M. Eastwood related some of the proceedings at the Annual General Meeting held in Toronto last July. Councillor D. Ross-Ross reviewed some of the Institute's history.

Three excellent films were shown to complete the programme. "Wealth of the Andes" described mining activities in Peru, and illustrated the spectacular nature of the railway which runs from Peru back into the mountainous mining country. "Ducks Unlimited" showed how the organization of that name is working to preserve ducks and other wild fowl in Western Canada. "Bamboo" covered scenes in Java. The extensive use of this material for buildings and bridges was depicted. Various structures shown brought out the ingenuity of the native craftsmen, who are forced to lash bamboo members together, since they cannot be nailed.

Charter Night at Belleville

Top—Some of the guests at head table were, l. to r., F. S. Follwell, J. M. King, Mrs. Vance, President Vance, Mrs. Fulton, General McNaughton, Brig. F. F. Fulton, Mrs. McNaughton, Lt.-Col. L. F. Grant, J. S. Cameron, Miss May McLaren, W. D. Laird, Mrs. Buchan, J. E. Buchan, Mrs. Drysdale, A. O. Drysdale, Mrs. Langlois, W. L. Langlois, D. W. Bews.

•

Left—Principals in the inauguration ceremonies, General McNaughton, President Vance and F. F. Fulton.

Bottom, opposite page—Others at the head table were, l. to r., G. A. Bradford, S. Sillitoe, Mrs. Sillitoe, Mr. Follwell.

At top and bottom on this page are shown some of the 170 guests who attended the inaugural dinner.

Right—President Vance and branch chairman F. F. Fulton, after the presentation of the Branch charter.

Hamilton

G. L. Schneider, jr.e.i.c.,
Secretary-Treasurer

John H. Mitchell, m.e.i.c.,
Branch News Editor

A symposium on **Iron Ore Resources in Labrador, Ontario and Mesabi** was conducted by three eminent authorities, Dr. R. D. MacDonald, Queens University, Dr. E. G. Pleva, University of Western Ontario; Dean H. S. Armstrong, McMaster University, to the enjoyment and interest of over one hundred members of the Hamilton Branch and their guests members of the Association of Professional Engineers of Ontario. Chairman Sentance introduced the panel and then called on Dr. Pleva to start the symposium.

Dr. Pleva traced the history of Mesabi back to the time that the Merrit Brothers, timber prospectors, sunk a mine at Iron Mountain and discovered that great Lake Superior ore body known as Mesabi.

Eighty per cent of American iron ore comes from the Lake Superior area and about four-fifths of that originates at Mesabi. Mesabi's ore runs about 51.5 per cent, but as a supplier of high grade ore its days are numbered.

Second on the panel, Dean Armstrong said that three well-defined bodies of ore are evident in Ontario . . . Steep Rock, Mishipicotan and Goulais River.

The three workings at Steep Rock, Hogarth, Errington and Inland Steel run about 58 per cent and expect to boost production to 6 or 7 million tons per year in five years.

Dr. MacDonald stated that Labrador was first tried in 1936-1939 by Hollinger Explorations who were gold prospecting at that time. The ore body is similar to Mesabi, close to Hamilton River with a potential hp. of 5,000,000, but 360 railroad miles from the St. Lawrence. The markets include Eastern United States, British Isles, and Central United States if the St. Lawrence Seaway is approved.

Stripping costs are low and taxes on profits only 5 per cent. Potential is 100,000,000 tons per year in about 10 to 20 years. The years 1954 and 1955 may see ore out of Labrador.

Mr. Sentance asked the audience to direct their many and varied questions to the respective authority. Mr. W. J. Dawson expressed the interest and delight with which the members and guests received the three speakers.

Mr. Sentance invited the group to light refreshments and declared the meeting adjourned.

Kingston

J. T. Provan, jr.e.i.c.,
Secretary-Treasurer

S. H. Rochester
Assistant Secretary

The Kingston Branch, E.I.C. held its regular monthly meeting on Tuesday, 21st November in the old Arts Building of Queen's University with Mr. G. T. Andrews in the chair.

The speaker for the evening, Lieut.-Colonel P. C. King, m.e.i.c., r.c.e.m.e., was introduced by Professor A. Jackson. Lieut.-Colonel P. C King, who has recently assumed the post of professor of mechanical engineering at the Royal Military College, was formerly officer in charge of the Track Section of the Vehicle Development Establishment in Ottawa, and has studied the problems of vehicle propulsion and advanced tank design for many years.

Lieut.-Colonel King's subject was entitled **Some Problems in the Design of Northland Vehicles** and commenced with an explanation of the type of terrain encountered north of the line in Canada's Tundra Belt. This was supplemented by a film illustrating Arctic conditions, particularly the muskeg with its varying depths to the permafrost.

The speaker went on to explain the difficulties in crossing muskeg with heavy vehicles both tracked and with standard tired wheels and illustrated the limitations in size and weight imposed upon armoured fighting vehicles operating over this type of terrain, with particular references to the advantages of light alloys in vehicle design.

Colonel King continued with an explanation of the type of suspension used on tracked vehicles and how effective steering can be achieved with a well designed power train. In discussing the relative advantages of the Diesel and Gasoline Engine in vehicle propulsion, Colonel King said that the additional weight of the Diesel engine was compensated by fuel savings, but in many cases the gasoline engine was found to be more satisfactory.

In conclusion the speaker surveyed the operation and maintenance of auxiliary equipment and mentioned the use of oil dilution as a means of improving cold weather starting of vehicles.

Following a lively question period, the speaker was thanked by Dr. R. D. Bennett, and the meeting was then adjourned.

Lethbridge

D. Cramer, m.e.i.c.
Secretary-Treasurer

J. T. Dokken, jr.e.i.c.
Branch News Editor

Members and guests of the Lethbridge Branch E.I.C. gathered at the Marquis Hotel on Saturday, November 18, 1950, to hear Mr. R. A. Reagh, chief engineer of Radio Station C.J.O.C., talk on the subject of television.

Mr. Reagh traced the development of television from its beginning in about 1873 in a very crude form. Television took a big step when the Cathode ray tube was designed, and has taken great strides since 1936 with the development of the Orthicon tube.

The type of broadcasting most popular today is a combination of films and studio entertainment. Films used are similar to those put through a standard projector used in theatres. It is possible to take a film of an event and have it ready for broadcasting in twenty minutes.

The distance over which television can be broadcast depends on the line of sight between the sending antenna and the receiving aerial. A two hundred foot tower would have a range of fifty to sixty miles. There are two alternatives for carrying television over distances. One is the use of land lines in which the co-axial cable is used and the other is the use of F.M. repeater stations.

The speaker thought that the main reason that television has not developed in Canada is because the C.B.C. has refused to license private stations for television broadcasting; however, he thought that the large areas of sparsely settled country in Canada would hold up development. Mr. Reagh thought that it would be feasible to operate a television station in Lethbridge. Such a station would involve an initial outlay of $100,000 to $200,000.

Following his address, Mr. Reagh showed a film called "Sight Seeing at Home" which illustrated some of the technicalities involved in television broadcasting.

Mr. Reagh was introduced by Mr. A. R. Niven and a hearty vote of thanks to the speaker was moved by Mr. A. J. Branch.

Prior to Mr. Reagh's talk the members were entertained with piano selections by Mr. Norm Thomas, and vocal selections by Miss Jackie Boyle and Mr. Thomas. Community singing led by R. S. Lawrence was enjoyed by all present.

Mr. P. E. Kirkpatrick was in the chair.

Peterborough

G. W. Herzog, jr.e.i.c.,
Secretary-Treasurer

M. V. Powell, m.e.i.c.,
Branch News Editor

The November meeting of the Peterborough Branch on Thursday, November 23rd was addressed by Mr. A. E. Davidson, engineering consultant, Hydro Electric Power Commission of Ontario. This illustrated lecture was entitled **Hydro-Electric Development in Sweden** but the speaker included many interesting comments on Sweden and its people. Swedish State Power Board Representatives have visited Canada and the United States several times in the last few years and at the invitation of the Board, a return visit of some fifteen engineers from Canada and the United States was made last June.

The speaker was impressed with the interest of workmen in the various projects and the provisions made for their welfare by their employers. There is a considerable trend toward public ownership of utilities although there are many private power producers selling power throughout Sweden. The forests are very carefully supervised and harvested and fires are almost unknown. It was surprising to the audience to hear that one of the great new developments, Harspranget was north of the Arctic Circle.

Most of the engineers in Sweden are young and progressive and the many novel and advanced features encountered are partly due to this. In northern Sweden, most modern dams are built of earth with a concrete core and some clay backfill to control seepage. One dam had a concrete curtain between piers and is now undergoing extensive repairs to the exposed down-stream side. At one time ice was a serious problem and in some cases 25 per cent of the power from a plant was used in warming the racks. A novel feature of most Swedish power developments is that almost all equipment excepting of course, the dam, is underground and usually in the solid granite. This practice is defended economically and certainly would have a great advantage in case of air raids.

Long transmission lines are common in Sweden and even an undersea power cable 60 miles long is to be laid to the Island of Gottland in the Gulf of Bothnia. The 380,000 volt, 600 mile transission line from Harspanget was of pecial interest. As well as having a igher voltage than has been used in merica, dual cables spaced about 18 nches apart are used to control corona. Two spacers are placed in each 1,000 ft. pan after the cables are in place by men ravelling along on the cables in trolley arriages.

Mr. D. T. Bath moved a vote of hanks. The Chairman, Mr. J. M. King hen called for nominations of candidates for next year's executive.

Saguenay

F. E. Hogg, M.E.I.C.
Secretary-Treasurer

On Tuesday, November 21, Mr. J. V. Leach, of the technical service department of Imperial Oil Limited, Sarnia, addressed the Saguenay Branch of the Engineering Institute of Canada. Mr. Leach is in charge of the Engine Testing Laboratory at Sarnia, which is concerned with both laboratory testing and road testing. Mr. Leach spoke on the **Lubrication of Gasoline and Diesel Engines.**

Mr. Leach explained that gasoline and Diesel engines differ in their requirements for lubricating oils. He described the duties that lubricating oils must perform in different parts of an engine. He explained how the qualities of a fuel will affect the specifications for the lubricating oil and he described methods of developing lubricating oils for various purposes, such as Diesel electric locomotive lubrication, etc.

Mr. Leach showed some slides. The talk was followed by a question period, covering a broad field, which demonstrated the general interest in lubricating problems.

❖ ❖ ❖

Junior Section

R. H. Singleton, M.E.I.C.
Secretary

A successful smoker was held by the Junior Section in the Saguenay Inn Tuesday evening, November 28. Mr. S. F. White, of the Aluminum Company of Canada, presented a very interesting and entertaining talk on **The Development of a Public Speaker or a Conference Leader.** Mr. White proved to be an extremely able speaker himself. It was stressed that a speaker must know exactly the purpose of his speech, whether to convince, to humour, or provide illustration for his audience. Methods of speech preparation and delivery were discussed in a general way. The development of a public speaker follows only after much study and, particularly, practice. The audience was asured that "stage fright" was common to nearly all beginners and could be overcome by concentrating more on the contents of the talk than on its method of delivery. One of the main secrets of good delivery is naturalness. The subject was particularly timely since a large number of junior members have been asked to speak during the coming season. A very lively discussion period followed. The refreshments were enjoyed after the usual fashion.

The speaker was introduced by the chairman, Mr. H. V. Page, and ably thanked by Mr. J. E. Pickering.

It was announced by the chairman that the following Junior Section officers had been elected at the annual business meeting held in the Laboratories auditorium on October 24, 1950: chairman, H. V. Page; vice-chairman, M. Fredericks; secretary-treasurer, R. H. Singleton; committee members, C. Loutit and D. M. Archer.

St. Maurice Valley

C. M. Williams, S.E.I.C.,
Secretary-Treasurer

C. De Tonnancour, M.E.I.C.,
Branch News Editor

Saturday afternoon, November 18th, a group of 40 members and friends of the St. Maurice Valley Branch of the Engineering Institute of Canada caravanned up to Montauban where the lead and zinc mines and concentration plant of the Anacon Lead Mines were inspected in detail.

Greeted at their arrival by Mr. Douglas Parent, works manager, and his technical assistants, the group was briefed on the historical and technical details of the operations, and then, clad in the latest miner's styles, including helmet, light, rubber suit, etc., were lowered to the 500 foot level, which now stretches half a mile in various radial directions from the main shaft and hoist. The main gallery was explored to the point where a new shaft is in progress, both from underground and surface, to an underground level of 700 ft. The mine is very dry due to the absence of faults in the rocky formation, which lies close to the edge of the Laurentian shield and is a paradise for the initiated due to the rich variety of rocks and minerals found, some of which are unique to Montauban.

The ore, consisting of zinc and lead sulfide, with trace of pyrites, native and alloyed gold and silver, is separated from the rock in a flotation process, at the rate of 45-50 tons a day of concentrates, coming from approximately 600 tons of rock. Further separation sends the zinc to England and the lead to Trail, B.C.

Developments done on recovery of mica were also disclosed. This deposit was known since 1910 and exploited by various interests until two years ago when the present owners started expanding to the present scope of operations.

Members of the party reached home for the most part enriched with a new experience and after further exploration, on the surface this time, with road map in hand, through the back roads of the counties of Portneuf and Champlain.

Vancouver

A. G. Fletcher, Jr.E.I.C.
Secretary-Treasurer

Stuart S. Lefeaux, M.E.I.C.
Branch News Editor

The annual dinner meeting of the Vancouver Branch was held in the Hotel Georgia on Saturday, November 25th with approximately ninety members present. Chairman Sidney Hogg introduced the head table guests and carried on the business meeting. The chairman's annual report of the Branch activities disclosed that the total Branch membership is now 984; over 50 per cent are students. The annual general meeting of the Engineering Institute of Canada will be held in Vancouver in May, 1952. Mr. Hogg asked for the continued support of the steady members and a drive to have more members take an active part in Branch affairs.

Mr. George Allan, Branch councillor, reported for the Nominating Committee that the following slate of Branch officers had been elected: chairman, J. E. Macdonald; vice-chairman, S. H. deJong; secretary-treasurer, Stuart S. Lefeaux; executive committee, E. L. Hartley, H. Libbey and C. Scrymgeour (2-year terms). Mr. F. R. Adams and Mr. R. Walkem are members of the 1951 executive by virtue of their election for a two year term at the last annual meeting. Mr. J. A. Webster, M.E.I.C., was elected to serve a further one-year term to replace Mr. deJong.

Mr. Percy Buchan, M.E.I.C., gave the auditor's report for the Branch and was once again elected as auditor for 1951. Mr. Alan Fletcher, the secretary-treasurer gave the financial statement for the branch which showed expenditures of $1,139.00 and receipt of $1,328.00 for the year ending November 15th. Mr. W. N. Kelley introduced Mr. A. P. Fenton, the 1950 winner of the W. N. Kelley shopwork Prize at University of British Columbia. Mr. Sid Hogg then turned the meeting over to Mr. Jack Macdonald the chairman elect.

Mr. Macdonald introduced the Reverend William Hills of St. George's Parish, Cadboro Bay, Vancouver Island, the guest speaker for the evening. Mr. Hills received his theological training at the University of Toronto and was ordained in eastern Canada. During the war he served as a padre with the Royal Canadian Navy. Mr. Hills has earned an international reputation as an outstanding public speaker and advocate of democracy.

Mr. Hills told of his recent speaking tour through Illinois and Wisconsin and emphasized the superiority of Canadian democratic institutions. He believes that the one thing to guard against in Canada is too much government with the subjection of the individual and individual initiative.

Mr. Hills was thanked for his inspiring address and all agreed the topic to be most timely and important to engineers.

Victoria

W. A. Bowman, Jr.E.I.C.,
Secretary-Treasurer

T. A. J. Leach, M.E.I.C.,
Branch News Editor

The use of the Multiplex in topographical mapping was described to members of the Victoria Branch on Friday, November 17, 1950, by Col. W. K. MacDonald, D.L.S.

Col. MacDonald who is engineer in charge of multiplex operations for the Provincial Department of Lands illustrated his address by slides.

The Multiplex was originally developed by the Zeiss Company and first appeared on the market in 1933. About 1938 Bausch and Lomb obtained a license from Zeiss to manufacture and sell the equipment on this continent. Various improvements have been made over the intervening years and the Multiplex is today generally accepted as a precision mapping accessory.

The operation of the Multiplex utilizes the principles of direct optical projection of two or more overlapping aerial photographs. In effect the light rays that formed the photographs are projected in the reversal of their direction at time of photography.

The pictures are projected on a table.

each pair in complementary colour and observed through spectacles having correspondingly coloured lenses. The optical model which appears on the board can then be examined by means of a floating mark and measurements made in three directions.

In order that the photographic negative (5" x 5") may be used in the Multiplex it must be reduced to one quarter of this size by a special reduction printer. The tiny pictures are known as diapositives and one is inserted in each of the Multiplex projectors. Finally by tipping, tilting, lengthening or shortening the model the projected images of the control points are brought into coincidence with their map positions.

The measurements of the space model are made on a small circular plate which can be adjusted vertically. Directly beneath the floating mark on the plate is a pencil which draws lines on a plotting surface as the dote is made to follow some contour.

In multiplex work the desirable minimum control for five overlaps is a horizontal and vertical control at the start and finish photos and in addition two other points fixed vertically on the same photos.

Col. MacDonald in concluding his address pointed out that the cost of obtaining control against Multiplex operating time presents a problem in economics that must be considered when planning each Multiplex mapping project.

A long and lively discussion period followed his address after which the speaker was thanked by Mr. D. MacLean.

Reminder

The 1951 Annual Meeting of the Engineering Institute will be held at the Mount Royal Hotel, Montreal, May 9, 10, and 11.

First Meeting of Engineers in P.E.I.

On October 30, during a tour of Maritime branches and branch non-resident areas, the field secretary, Lt.-Col. L. F. Grant met with a group of engineers at the Charlottetown Hotel in Charlottetown, Prince Edward Island.

As far as can be determined, this was the first organized meeting of engineers in that province and much credit is due to V. A. Ainsworth, general manager, Maritime Electric Co., for his part in the arrangements.

The accompanying photograph was taken during the meeting and includes:—

Back row, left to right: C. A. MacVey, M.E.I.C.; J. C. McIntosh; W. S. Veale, S.E.I.C.; D. I. D. Rozman, M.E.I.C.; T. B. McLennan, Jr.E.I.C.; K. C. Martin, S.E.I.C.; H. A. Messervey; Wm. MacDougall; J. H. Hearn, S.E.I.C.; R. H. Nicholson; E. J. MacLeod, M.E.I.C.; J. Van Maarion.

Middle row, left to right: R. B. Smith, S.E.I.C.; C. H. Stewart, Jr.E.I.C.; H. E. Miller, M.E.I.C.; R. G. White; R. S. MacBeath; L. F. Grant, M.E.I.C., field secretary of the E.I.C.; V. A. Ainsworth, M.E.I.C.; J. A. Reardon; E. S. Chandler; B. D. Elderkin; G. L. Smith, Jr.E.I.C.

Front row, left to right; W. R. Brennan; J. A. Spinney, Jr.E.I.C.; C. F. Buckingham, S.E.I.C.; D. E. MacLean, Jr.E.I.C.; H. R. Miller, Jr.E.I.C.; L. W. Hacker; A. H. Gillis, Jr.E.I.C.; G. J. Hayer; C. W. Currie.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment*.

Situations Vacant

CHEMICAL

YOUNG CHEMICAL ENGINEER required by firm located in Montreal, engaged in the manufacture of sponge rubber and brake linings. Excellent opportunity offered in growing concern. Salary open. Apply to File No. 1699-V.

CIVIL

CIVIL DRAUGHTSMAN required by large well established Canadian company. Minimum of 10 years experience in concrete. Location Toronto. Apply to File No. 1687-V.

CIVIL ENGINEER, English speaking, preferably some surveying experience on road or transmission line location or other topographic work. For training in photogrammetry and subsequent employment as ground surveyor and control engineer for aerial mapping. Apply in writing stating experience to File No. 1691-V.

CIVIL ENGINEER, French speaking for training as operator of photogrammetric plotting machines and subsequent employment as operator in Montreal office. Good long term prospects for right man with executive ability. Initial salary during probationary and training period $200.00 per month. Apply to File No. 1692-V.

ELECTRICAL

ELECTRICAL ENGINEER required by large well established Canadian company minimum 2-3 years experience. Calculations stability studies and relaying applications including operation calculating board. Prefers masters degree. Location overseas. Apply to File No. 1687-V.

FOUR ELECTRICAL ENGINEERS required by a large well established Canadian company. C or D class. Minimum 1-3 years experience, preferably in powerhouse electrical layout. Location Toronto. File No. 13651. Apply to File No. 1687-V.

ELECTRICAL ENGINEER required in Montreal with experience in communications and/or electronics. Recent graduate or one with several years experience. Salary according to qualifications. Apply to File No. 1693-V.

FOUR ELECTRICAL ENGINEERS with five years or more experience in design, specifications, estimates, layout, inspection and testing, etc., for distribution work. Location Toronto. Reply stating age, education and details of work actually carried out in previous positions to File No. 1696-V.

MECHANICAL

MECHANICAL ENGINEER required by large organization in Montreal. Applicant should be between 30 to 35 years. Duties include general machine shop work and planning. Apply to File No. 1673-V.

MECHANICAL ENGINEER required for northern Ontario sulphate mill. Recent graduates would be considered. Excellent opportunities to gain experience and good prospect for promotion. Apply to File No. 1677-V.

MECHANICAL ENGINEER required for small manufacturing plant in Niagara Peninsula. Duties will consist of general draughting and machine design, particularly valves. Some previous experience would be advantageous. Apply to File No. 1681-V.

TWO MECHANICAL ENGINEERS for mechanical inspection in the field. Experience necessary in Hydro-Electric projects. Location overseas. Apply to File No. 1687-V.

MECHANICAL ENGINEER to act as sales engineer for large organization in Montreal. Salary range $5,000.00. Apply to File No. 1690-V.

MECHANICAL ENGINEER required by firm located in the Maritimes with some experience in steel design and construction. Apply to File No. 1695-V.

YOUNG MECHANICAL ENGINEER required as assistant superintendent by firm located in Montreal manufacturing spun nylon yarn and nylon wool. Apply to File No. 1700-V.

MECHANICAL ENGINEER to act as project engineer required by large organization in Montreal. Salary open. Apply to File No. 1701-V.

MECHANICAL (practical) Production Engineer, with thorough knowlwedge of metal working machinery, plant lay-out, processing, tooling and die making, production control for Western Canada manufacturer selling all across Canada to other manufacturers and to wholesalers. Prefer man of 40 or older. Permanent and good future for a good practical factory manager and producer. Apply to File No. 1704-V.

MISCELLANEOUS

TWO SALES ENGINEERS required to act as representatives in Montreal and Toronto by young progressive industry, interested in the sale of British made products and having some experience in pulp and paper industry. Apply to File No. 1674-V.

SENIOR PETROLEUM ENGINEER required by independent Canadian Oil Company with headquarters in Calgary. Applicant should be particularly experienced in reservoir engineering and production practices. No one with less than 7 years experience in the industry need apply. Give synopsis of education, training and experience and supply recent photo. Apply to File No. 1675-V.

YOUNG MECHANICAL OR CHEMICAL ENGINEER required in Montreal to take charge of production and sales for a small company engaged in the cleaning and glazing of bakers bread and bun pans. Salary open. Apply to File No. 1676-V.

MECHANICAL OR ELECTRICAL ENGINEER for supply inspection department of a large organization in Toronto. Applicant should have at least 12 to 15 years extensive practical shop and office experience in the manufacture of heavy mechanical and electrical machinery and equipment. Reply stating age, education and details of experience to File No. 1678-V.

SENIOR BUYER with 7 to 10 years diversified purchasing experience. Electrical engineering or engineering training desirable; also administrative or supervisory ability. Location Toronto. Apply to File No. 1679-V.

MECHANICAL OR CIVIL ENGINEER, 30-40 years of age with practical experience in the field on erection and installation of pulp and paper machinery and equipment. Will be responsible for supervising in the field either directly over the working personnel or to the contractor and will include meetings and discussions with the customers necessitating a good personality and diplomacy. Installations may be anywhere in Canada. Applicant will spend sometime in head office in Toronto. Apply to File No. 1680-V.

INSTRUMENT ENGINEER (electrical or mechanical preferred) required for large oil refinery in Montreal east. Applicant should have not less than three years experience as instrument engineer or not less than 5 years general electrical engineering experience. Would be expected to take charge of instrument department under general supervision of power engineer. Salary open. Applications will be treated confidentially and should include full particulars as to qualifications, together with recent photograph. Apply to File No. 1684-V.

RESIDENT ENGINEER wanted, for construction of proposed Granville bridge in Vancouver, B.C. Duration of work approximately two years, starting about March 1, 1951. Applications should be made by letter giving full details of experience, professional qualifications, age, etc., and salary expected. Apply to File No. 1685-V.

SALES ENGINEER or contact man required by a firm of inspection engineers in Montreal. Must have considerable experience and be between 30 and 40 years of age. Apply to File No. 1686-V.

RESIDENT ENGINEER required by large well established Canadian company, minimum 10 years experience in Hydro Electric construction, competent in design, construction experience in field. Age approximately 40 years. Location overseas. Apply to File No. 1687-V.

BRITISH ADVERTISER seeks Canadian engineering firm with reputation, willing to join with long established English counterpart. Enquirer to provide capital, select tools and supervise projects directed to both government equipment and rearmament programs. Also industrial manufacturer of small engines, motorcycles, etc. Apply to File No. 1688-V.

MECHANICAL OR CIVIL ENGINEER required by large engineering firm for their Toronto sales office. Age about 26 or 27 years. Applicant must have definite sales ability and would be away 50% of time. He should also have some practical experience with heavy equipment for paper mills, mines or quarries. Territory Northern Ontario district. Apply to File No. 1689-V.

DESIGN ENGINEER preferably mechanical required by large organization in Montreal. Applicant must have administrative ability. Salary range $5,000.00. Age 30 to 40 years. Apply to File No. 1690-V.

GRADUATE ENGINEER for design work on buses, required by large organization in Montreal. Apply to File No. 1690-V.

SALES ENGINEER required by a company engaged in the selling and servicing of fire protection and water conditioning equipment. Applicant should be preferably mechanical or civil engineer. Territory in and around Montreal. Apply to File No. 1694-V.

RECENT GRADUATE required by manufacturer in Winnipeg. Applicant must be interested in production planning, time and motion study, etc. Work will be in connection with the setting up of a modern production program. Training period. Salary open. Apply to File No. 1698-V.

YOUNG MECHANICAL OR MINING ENGINEER required in Ontario. Duties would consist of engineering and time studies of open-pit mining and milling operations with the purpose of improving methods and installing wage incentives. Firm would train the engineer in time studies. Excellent opportunity for advancement into supervisory production positions. Apply to File No. 1702-V.

AIRCRAFT HYDRAULIC DESIGNER required by large Montreal aircraft manufacturing firm. Must have 4-5 years experience and sound overall knowledge of system layout, flow calculations and detail component design. Apply to File No. 1703-V.

YOUNG ENGINEER to act as expeditor in the purchasing department of organization in Montreal. Applicant should be between 30 to 35 years and be free to travel 50% of the time. Material handled would be all types of heavy equipment in connection with smelting plant. Apply to File No. 1705-V.

WANTED

20 GRADUATE ENGINEERS AND DRAUGHTSMEN MECHANICAL — CIVIL ELECTRICAL

by

C. D. Howe Company Limited,

1421 Atwater Avenue, Montreal, Quebec.

For Projects in Ontario and Quebec. Apply to File No. 1697-V

or

by letter direct to Firm (Preference to those with 3 years practical experience)

The following advertisements are reprinted from last month's Journal, not having yet been filled.

CHEMICAL

CHEMICAL ENGINEER required in British Columbia. Applicant should be of research calibre, with broad interest, who is capable of planning and carrying out research connected with the construction and operation of a variety of processes. He should also be able to make engineering cost studies in connection with the industrial applications of such research projects. Apply to File No. 1596-V.

CHEMICAL ENGINEERS required by chemical division of large firm located in the United States. Senior and recent graduates required. Excellent opportunities offered. Salaries open. Apply to File No. 1613-V.

JUNIOR CHEMICAL ENGINEER required in Montreal, by organization importing industrial chemicals from abroad. Applicant would act as sales engineer. Apply to File No. 1637-V.

TWO JUNIOR OR INTERMEDIATE CHEMICAL ENGINEERS for the control department of pulp and paper industry in the Maritimes. Duties would be in connection with control and process work. Apply to File No. 1650-V.

CIVIL

CIVIL ENGINEER required by firm in Western Canada, fabricators of structural steel. Duties include designing and estimating and contacting various customers. Salary $250.00 to $300.00. Apply to File No. 1517-V.

CIVIL ENGINEER required in Montreal for specialized work travelling in the Province of Quebec. Applicant should have some municipal experience or experience in waterworks and have a working knowledge of French. Duties include survey in the field and the writing of analytical reports. Age not over 30 years. Apply to File No. 1604-V.

CIVIL ENGINEER, recent graduate with some construction experience required for municipal duties in Ontario. Apply to File No. 1607-V.

CIVIL ENGINEER with experience in design and construction of heavy reinforced concrete structures for hydroelectric development in Eastern Canada. Prefer three years' experience. Apply to File No. 1630-V.

CIVIL ENGINEER, experienced, well qualified, required immediately, for town in the Maritimes, to survey and superintend the installation of a water supply system. Reply in writing giving full particulars as to experience, qualifications, references and salary expected to File No. 1632-V.

CIVIL ENGINEERS wanted with experience in design and construction of municipal works. Salary $235.00 per month and up, based on experience and qualifications. Apply to File No. 1641-V.

CIVIL ENGINEER required by large firm in Ontario, with about 10 years structural experience. Applicant must be experienced and able to assume responsibility. Apply to File No. 1644-V.

CIVIL ENGINEER with some experience on structural design, preferably on transmission towers and switching yards. Duties include engineering calculations, design and investigations of structures and surveys. File No. 13466. Apply to File No. 1651-V.

YOUNG CIVIL ENGINEER required by conveying industry in Montreal. Applicant should have some experience in design and detail work on structural steel. Good opportunity for advancement offered. Apply to File No. 1663-V.

ELECTRICAL

ELECTRICAL ENGINEER required. Good opportunity for one who has had two or more years experience on sales and contract work in an electrical manufacturing company. This position offers excellent opportunity for advancement with a growing concern. Apply to File No. 1558-V.

ELECTRICAL ENGINEER required in Montreal. Applicant should have some experience in radio work and draughting. Apply to File No. 1595-V.

ELECTRICAL ENGINEERING GRADUATES to be trained as field engineers in applied illumination by a firm located in Ontario. Excellent opportunity offered for mature-minded graduates who are seeking a lifetime career.

Technical Representative Required

in Montreal by

CANADIAN BRANCH OF BRITISH TEXTILE firm, manufacturing textile and cable machinery. Applicant must have executive ability as position offers exceptional opportunity. Apply to File No. 1706-V.

Several openings for young men as trainees or more mature former graduates who would be accorded an opportunity commensurate with their experience. Apply to File No. 1601-V.

ELECTRICAL ENGINEER required by paper company in Province of Quebec. Applicant should have some experience in heavy electrical equipment. Salary range $300.00 to $350.00. Apply to File No. 1605-V.

JUNIOR ELECTRICAL ENGINEER to act as design engineer and to do general electrical engineer duties, required by large organization in Montreal. Apply to File No. 1612-V.

ELECTRICAL ENGINEER required in Province of Quebec with a minimum of 4 or 5 years experience in supervising an electricians crew in an industrial plant. Applicant must have a proven record of success in industrial electrical maintenance. Salary open. Preference will be given to a man with pulp and paper experience. Apply to File No. 1615-V.

ELECTRICAL ENGINEER required in Ontario with some experience in distribution system planning and construction. Applicant must have personality and ability. Excellent opportunity offered. Apply to File No. 1625-V.

ELECTRICAL ENGINEER, well qualified graduate for position of assistant chief engineer of hydro-electric construction department with foreign branch of Canadian company. To be responsible for equipment layout, control circuit designs, specifications and procurement of all electrical features of power houses, pumping stations, switching stations and auxiliaries. A similar background and field experience would be desirable. Prefer familiarity with factory tests, N.E.M.A., and A.S.A. and A.C.I.E.E. standards. Apply to File No. 1630-V.

ELECTRICAL ENGINEERS with experience to assist the engineer of voltage-rated equipment. Duties include equipment layout, design, specification writing, procurement involving circuit breakers, disconnect switches, motors and related equipment, conduit and cables. Location overseas. Prefer experience with public utilities or electrical manufacturers. Apply to File No. 1630-V.

ELECTRICAL ENGINEERS with several years' experience for testing and field inspection of all types of electrical equipment. Should be familiar with N.E.M.A., A.I.E.E. and A.S.A. standards. Single men preferred. Location overseas. Good living conditions, housing supplied. Apply to File No. 1630-V.

.ECTRICAL ENGINEER with industrial experience, preferably with an electrical manufacturing firm, for inspection work in Toronto. Duties include engineering calculations, inspection of equipment during purchasing, and supervision of tests. Apply to File No. 1630-V.

.ECTRICAL ENGINEER with several years' experience, preferably with public utility or electrical manufacturing firm required by a large, well established company. Duties would include solution of engineering problems connected with design, testing, analysis or specifications; to assist in the development of new methods, designs and procedures; analysis of fie'd investigations and tests; report writing, and other engineering work. Prefer at least five years' experience. Location: Southern Ontario. Apply to File No. 1630-V.

RADUATE IN ELECTRICAL or radio engineering from a recognized university with a number of years experience with airborne radio and radar equipment. Previous experience with R.C.A.F. airborne equipment desirable. Apply to Fi'e No. 1642-V.

RADUATE IN ELECTRICAL or radio engineering required in Ottawa, with a number of years experience in radio and radar, or allied fields. Ability to write good technical English essential. Previous experience in the writing of technical manuals and reports is desirable. Apply to File No. 1642-V.

LECTRICAL ENGINEER for position as relay engineer with foreign branch of Canadian company. Prefer several years' experience with an operating company. Appointment would be initially for three years. File No. 13510. Apply to File No. 1651-V.

OUNG ELECTRICAL ENGINEER required in Montreal for inside sales work on transformers. Apply to File No. 1654-V.

OUR ELECTRICAL ENGINEERS, recent graduates with some experience in power required by large firm in Montreal. Apply to File No. 1658-V.

LECTRICAL ENGINEER required by company in Montreal, with a minimum of 2 years experience in design and layout work. Applicant should also have some knowledge of construction. Duties include design and repair of work in the field and office. Salary range $350.00. Apply to File No. 1664-V.

MECHANICAL

IECHANICAL DESIGN ENGINEER required by large organization in Montreal. Applicant should have 10-15 years experience. Apply to File No. 1593-V.

SCIENTIFIC OFFICERS WANTED

OTTAWA - ONTARIO

Applicants should be Canadian citizens who are graduates in science, preferably with post graduate training. Research or general experience in some particular scientific field is desirable in certain positions. War service will be considered an additional qualification in some positions and a requirement in others.

DUTIES: The main duties will pertain to the co-ordination, control and dissemination of scientific information in most of the major fields of science and technology.

SALARY: $2,700 - $3,800, depending upon qualifications and experience.

APPLY TO: Box 1274, Station B., Ottawa, Ontario.

MECHANICAL ENGINEER required by large firm in Montreal to act as railroad car engineer. Applicant should have 2 or 3 years (or more) of experience in the design of tank cars, as defined by the Association of American Railroads. Familiarity with the requirements of the A.A.R., the I.C.C., the Bureau of explosives and the Board of Transport Commissioners is essential. Salary open. Apply to File No. 1600-V.

MECHANICAL ENGINEER required by large firm in Montreal. Applicants should have experience in the pulp and paper industry, particularly in the design and/or operation of paper making machinery. One or two years experience desired. Salaries open. Apply to File No. 1600-V.

MECHANICAL ENGINEERS with design experience and ingenuity required for an aggressive Canadian firm manufacturing electronic and mechanical controls and instruments. Project engineers and junior engineers required. Salaries open. Apply to File No. 1609-V.

MECHANICAL ENGINEER required immediately for sales department. Large company requires the immediate services of mechanical engineer, for its sales department, preferably bilingual. This is a permanent salaried position, with well established company. State age, education and outline all experience. All replies treated in confidence. Apply to File No. 1620-V.

MECHANICAL ENGINEERS required by large manufacturing firm located one hundred miles from Montreal. Excellent opportunities for experience and promotion in time study standards department eventually leading to shop management. Apply to File No. 1621-V.

MECHANICAL ENGINEER for inspection of hydraulic turbines and associated plant equipment. Prefer at least five years shop experience. Location Southern Ontario. Apply to File No. 1630-V.

MECHANICAL ENGINEER with considerable experience for design and layout of large air-conditioning systems. Duties include supervision of engineers and draughtsmen, solution of engineering problems, development of new designs and methods, analysis of field investigations; investigations, designing and report writing. Apply to File No. 1630-V.

MECHANICAL ENGINEER required to introduce French equipment in Canada; various machine tools and instruments. Applicant should be English speaking with a working knowledge of French. Excellent opportunity offered. Products manufactured to Canadian and American standards. Apply to File No. 1631-V.

MECHANICAL, heating and ventilating engineer required by internationally known manufacturer of heating equipment to take over Eastern Ontario territory, out of Ottawa. The same territory for other prominent manufacturers' lines is open to the right man. Apply to File No. 1646-V.

MECHANICAL ENGINEER required in Province of Quebec with some plant experience. Duties include design and plant layout work. Apply to File No. 1648-V.

MECHANICAL ENGINEER required in Ontario. Applicant should be young and aggressive with B.Sc. Canadian university for position as service manager. Must be capable of dealing with public and of instructing men in overhaul and maintenance of diesel equipment. Apply by letter only, stating age, height, weight, marital status, military service, university, religion, business experience and enclose photograph. Apply to File No. 1652-V.

MECHANICAL ENGINEER with knowledge of industrial steam power plant design, heating system design and application of steam, air and hydraulics as applied to processes, required by large established company. 5 years or more experience desirable, location Montreal. Salary open. Apply to File No. 1655-V.

MECHANICAL ENGINEER, required by new Electric Smelting Metallurgical p'ant at Sorel, Quebec. Applicant should have considerable experience in design, construction and operation of heavy industrial plants, preferably steel. Apply to File No. 1668-V.

MISCELLANEOUS

ENGINEER required by a firm of consulting engineers in Montreal with experience in mechanical equipment for building, for work on heating and plumbing. Apply to File No. 1549-V.

ASSISTANT PRODUCTION SUPERINTENDENT, press operations required in Ontario. Applicant should be familiar with die equipment and be able to assume responsibility of a production shift consisting of two foremen and approximately eighty men. He must have a thorough knowledge of standards, production control, cost control, labour relations, etc. Apply to File No. 1559-V.

ASSISTANT PRODUCTION SUPERINTENDENT, finishing operations, required by firm with the following finishing operations on various types of steel: polishing, chromium, and buffing and be in a position to assume responsibility of a production shift consisting of four foremen and approximately one hundred men. He therefore must have a thorough knowledge of standards, production control, cost control, labour relations, etc. Apply to File No. 1559-V.

PETROLEUM ENGINEER required by large firm in Montreal. Applicant should be graduated in mechanical, or petroleum engineering and should be familiar with the design and use of well head equipment especially Xmas trees and well head pumping equipment. Salary open. Apply to File No. 1600-V.

DEVELOPMENT ENGINEER by nuclear engineering branch to do experimental and development work in the field of mechanical engineering related to the design of atomic energy reactors and associated equipment. Applicants should have an engineering degree with high academic standing and five or more years engineering development experience. Apply to File No. 1602-V.

PLANT ENGINEER, with about 2 or 3 years experience required by an industrial firm manufacturing roofing materials, etc., in Montreal. Two production engineers also required with experience in time studies, job evaluation. Salaries open. Apply to File No. 1610-V.

EQUIPMENT ENGINEER to supervise small draughting office and take responsibility for communication equipment layouts and drawings. Preferably graduate with five to ten years experience in wire communication equipment layouts and drawings. Apply to File No. 1614-V.

JUNIOR ENGINEER PHYSICIST required for varied and interesting research and design program, recent graduate, preferably with excellent academic standing. Location Montreal. Apply to File No. 1614-V.

PUMPS ENGINEER with established contacts, under 35 years, required as assistant to factory representative by leading British manufacturers of centrifugal and process pumps to prepare tenders, visit clients. Toronto area. Apply to File No. 1618-V.

FACTORY REPRESENTATIVE, experienced, under 45 years, required by leading British manufacturers of centrifugal and process pumps to develop and supervise sales in Canada. Apply to File No. 1618-V.

STRUCTURAL STEEL DETAILER required for a Maritime steel fabrication company with at least 5 years experience. State full particulars in first letter and when available. Salary open. Apply to File No. 1619-V.

GRADUATE ENGINEER OR ARCHITECT required by Montreal publishing house, with 5 to 10 years practical experience in building field for position as editor of monthly national building paper. Writing experience essential. Top flight opportunity for right man. Write giving details of background, experience and salary required to File No. 1623-V.

HYDRAULICS ENGINEER (civil or mechanical) with post-graduate study or experience for water utilization studies with foreign branch of Canadian company. Practical or teaching experience of interest. Apply to File No. 1630-V.

ENGINEER required in Ontario with about 5 years experience as estimator in general contractors office and with a knowledge of general office routine. Apply to File No. 1634-V.

SMALL WELL ESTABLISHED ELECTRICAL MAINTENANCE BUSINESS in Montreal for sale at moderate price. Excellent opportunities for expansion under progressive management. Thorough investigation invited. Apply to File No. 1635-V.

JUNIOR MECHANICAL OR ELECTRICAL ENGINEER, preferably mechanical, for engineering department of manufacturer in Montreal of temperature controls, as applied to heating and ventilating systems. Apply to File No. 1636-V.

SALES MANAGER required by firm located in Montreal. Applicant should have sales experience and a thorough knowledge of the operation of steel plants. Apply to File No. 1637-V.

ELECTRICAL AND CIVIL ENGINEERS with about 1 year experience, required by large organization in Montreal. Apply to File No. 1639-V.

MECHANICAL OR CIVIL ENGINEER required for the position of plant engineer for Montreal. Age 25 to 30 years, English speaking Canadian. Position offers better than average opportunity for applicant who is more interested in management than the practice of engineering. First few years applicant would be plant engineer with full responsibility of maintenance, product design, tooling, etc. Apply to File No. 1640-V.

PUMP DESIGNER wanted by large pump manufacturing firm in Montreal district. Excellent opportunity with wide scope for someone with initiative. Apply to File No. 1643-V.

FIRM, PRESENTLY LOCATED IN GERMANY, founded in 1908 and specializing in the design and manufacture of water treatment plants for boilers as well as for industrial purposes, wishes to contact firm or individual in Canada interested in forming a company here to use their designs for the benefit of Canadian industry. Willing to train an engineer, expenses paid in Germany. Apply to File No. 1645-V.

RATE SPECIALIST for foreign branch of Canadian company. Prefer man experienced in rate setting and retired from a hydro public utility. Duties during 2 or 3 years appointment, would be to serve as a consultant during organization of a rate department. File No. 13513. Apply to File No. 1651-V.

SCIENTIST WANTED in Ottawa, with engineering degree or science, preferably with post-graduate training in aeronautical engineering. A wide knowledge and at least 5 years experience in aeronautics is essential. The applicant must have served in the R.C.A.F., preferably in a position of responsibility in aeronautical engineering in armament work. Experience in research and development work will be considered an additional qualification. Must have ability to work well with others. Canadian citizen. Apply to File No. 1656-V.

SALES ENGINEER, for a permanent position in Toronto office. Preferably one who has had some experience in fan application work such as heating and ventilating, mechanical draughting, etc. Salary open. Apply to File No. 1657-V.

FULLY QUALIFIED structural design engineer required by firm located in Toronto. Apply to File No. 1659-V.

HYDRAULIC AND STRUCTURAL DESIGN ENGINEERS required in Ottawa. Work assignments may have to do with the development of major waterworks. Salary up to $7,500.00 depending on qualifications. For further details, write to The Civil Service Commission, Ottawa, and request information circular, 50-616. Apply to File No. 1660-V.

ENGINEER REQUIRED in Montreal full experience in the design and construction of filter plants and water reservoirs. Apply to File No. 1661-V.

MECHANICAL AND CHEMICAL ENGINEER required in paper mill located in Newfoundland. Experience is not absolutely essential, but one or two years in industry, not necessarily the paper industry, would be preferred. The applicants must be single and starting salary would be $300.00 to $325.00 a month depending on qualifications. Apply to File No. 1667-V.

ENGINEERS REQUIRED by chemical firm in Ontario; mechanicals with one to three years experience in the chemical or petroleum plant design and civil or mechanical engineer with 2 or 3 years experience in general plant construction. Apply to File No. 1669-V.

GRADUATE ENGINEER required in Ontario, with experience in design, construction, service and application of internal combustion engines, particularly diesel engines. Apply to File No. 1670-V.

PURCHASING AGENT required by internationally known manufacturer of power equipment, presently establishing a new factory near Montreal. Applicant must be capable of organizing own purchasing department to handle the purchasing of factory equipment, raw materials and prefabricated parts for the production of large and small electric power equipment, and must be familiar with Canadian market. Attractive salary offered with security and opportunity. Apply to File No. 1671-V.

ASSISTANT FACTORY MANAGER required by internationally known manufacturer of power equipment, presently establishing a new factory near Montreal. Applicant must have good technical background and extensive experience (including several years management) in the mechanical or preferably the electrical engineering field, and be familiar with labour relations, employee training, cost estimating and accounting, factory organization and maintenance, modern production methods and equipment and be preferably bilingual. Please include photograph. Apply to File No. 1671-V.

Situations Wanted

PROFESSIONAL GRADUATE ENGINEER, M.E.I.C., will work part time on production difficulties, organize production systems; improve product design; advise on heat treatment, materials; factory lay-outs; design of hydraulical and ventilation systems; finishing problems for furniture industry. Apply to File No. 140-W.

CHEMICAL ENGINEER, B.Sc. 1942, M.E.I.C. Equal knowledge of English and German, fuel technologist (petroleum and gas) 9 years experience in research and process development work, including design and operation of pilot plants; in charge of most work. Desire position with research organization, or process engineer with oil company or gas manufacturing company. Available in one month notice. Apply to File No. 1314-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., of executive calibre, is interested in becoming associated with progressive company, manuacturers of mechanical equipment or fabricators of metal products, in technical sales, production or engineering capacity. Background of over thirteen years experience includes seven years in designing, detailing, estimating and sales of metal building products plus business and general engineering. For complete details apply to File No. 1840-W.

YOUNG REGISTERED CIVIL ENGINEER with ten years army, administrative and municipal experience desires spare time employment to help him gain additional technical experience. Available Lower B.C. Mainland approximately 20 hours per week, including limited time during weekdays. Draughting and surveying assistance can be arranged. Apply to File No. 2377-W.

MECHANICAL ENGINEER, Jr.E.I.C. (McGill 1947). Age 25, married and family of two. Experience consists of four years of summer work as instrumentman on highway construction; several months as sales engineer in pumps and allied electrical equipment; one year including specialized training in fire inspection work for United States fire insurance company. For the past two years have been a full partner in a road building outfit in Western Canada. Desires permanent position where responsibility, organization and sales ability are important qualifications. Starting salary and location are secondary factors. Available immediately. Apply to File No. 2858-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng. Age 31, married. Electrical Engineering, Toronto; business administration, Western. Profit minded and capable. Ten productive years experience in electrical industry; broad background in manufacturing, sales and market research, on both industrial and consumer durables. Apply to File No. 2946-W.

MECHANICAL ENGINEER, M.E.I.C., Queens 1936, age 38, married. Currently engaged in research work, 2 years, desire to return to industrial or commercial field. Have had the following experience since graduation: about 10 years diversified work in plant engineering embracing — dust control, 2½ years, application of control to metallurgical processes (primary metal producers), 3 years, industrial ventilation and air-conditioning, 1 year, general plant maintenance, 3½ years; about 2 years steel forging experience in small plant covering purchase, installation, and operation of equipment. Would be available at one month's notice to present employer. Apply to File No. 2966-W.

GRADUATE DRAUGHTSMAN, designer, Jr.E.I.C., B.Eng. Desires a position in the structural design field, preferably reinforced concrete and design. Age 24, McGill (Civil) graduate 1948. Two years experience in structural steel and reinforced concrete detailing and design. Prefer employment in Montreal area, will consider good position elsewhere. Presently employed. Available on short notice. Apply to File No. 3026-W.

MECHANICAL ENGINEER, B.Sc. 1941, single, veteran of R.C.A.F. Experience in laboratory work, aircraft maintenance, design of heavy machinery with emphasis on welding and applied stress analysis. Willing to work outside Canada. Apply to File No. 3058-W.

MECHANICAL ENGINEER, 1947, Jr.E.I.C., age 26, two years of experience in maintenance and one and one-half years of experience in design and installation in industrial plants. Desires quality control or industrial engineering work in Montreal. Apply to File No. 3208-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng. Six years experience in design, manufacturing, sales and application engineering, including electronic test equipment design, manufacture of public address equipment, preparation of sales information and technical writing, application of motors, controls, transformers, switchgear, etc. Desires permanent position in power field, in design, operating or application engineering, not sales. Aims to advance into management or advisory engineering. Location preferred, Southern Ontario or British Columbia. Apply to File No. 3326 W.

MECHANICAL ENGINEER, S.E.I.C., graduate N.S.T.C. 1950. Veteran, married, age 24. One summer's experience in petroleum industry. Available immediately. Willing to work anywhere. Apply to File No. 3356-W.

MECHANICAL ENGINEER, Toronto 1946, Jr.E.I.C., A.S.M.E., A.S.H., P.Eng. Age 28 years, married. Desire a position in production engineering where initiative is required to overcome production difficulties and cut down production costs. Presently employed as engineer in charge of production and development but wish to change for better position where all out effort is appreciated. Past experience includes 4½ years of 2 cycle gasoline engine design and subsequent supervision of production tooling, gauging routing, etc. Familiar with production processes involving ferrous and non-ferrous alloys, and production machines. Would prefer location in Ontario. Apply to File No. 3361-W.

ADMINISTRATIVE SUPERVISOR, B.A.Sc. in metallurgy (hon.) M.E.I.C. Presently employed in chemical production. Ten years experience in production and fabrication of chemical and metallurgical products. Seeks position as managerial assistant in a smaller center. Apply to File No. 3362-W.

MECHANICAL ENGINEER, S.E.I.C. 1950, Nova Scotia Technical College. Age 27, single, in good health. R.C.N.V.R. veteran. Experience: Six months office clerk, 18 months machinist apprentice, also three smummers in large steel plant. Will work anywhere in Canada or U.S.A. Available immediately. Apply to File No. 3363-W.

MECHANICAL ENGINEER, M.E.I.C. now fully employed in Montreal, desires part time work at home, evenings and weekends. Ten years varied experience at draughting, designing and estimating of plate and machine work. Apply to File No. 3367-W.

PRESTRESSED CONCRETE SPECIALIST, B.Sc., A.M.I.C.E., M.Soc., C.E. (France), British ex R.E.M.E. Captain, bilingual. Experience Britain, France, Switzerland, Spain, Egypt. Arriving Canada New Year, invites offers now. Apply to File No. 3368-W.

VIL ENGINEER, M.E.I.C. 17 years experience in the design of industrial buildings, oil refinery plants, reinforce concrete: bridges, jetties, heavy foundations, shell roofs and domes, etc., desires part time work. Apply to File No. 3369-W.

OCESS ENGINEER, M.E.I.C. chemical and metallurgical. Extensive experience in metal-working industry in both production and development. Desires senior position in technical or administrative field. Apply to File No. 3374-W.

ECTRICAL AND MECHANICAL ENGINEER, B.Sc., M.I. Mech E., M.I.E.E., A.M.I.C.E., seeks employment in Canada as from May next. Aged 47, married, three children. Experience include oil-field electrification, consulting engineering, govt. inspection, operation and management of hydro-electric undertakings, valuation. Recently in India visiting all hydro-electric schemes on behalf of major oil company. Present annual salary equivalent to $9,000.20 basic $12,000.00 with allowances. Available near Halifax early May. Apply to File No. 3378-W.

ETALLURGICAL ENGINEER, M.E.I.C., P.Eng. (Ontario). Age 35, married, located in Toronto, desires sales post leading to administrative position in metallurgical or allied field. Ten years experience in industry includes technical control, process and methods application in light manufacturing, production supervision and administration. Currently employed in consulting capacity contacting industry throughout Ontario. Available after reasonable notice to present employer. Apply to File No. 3381-W.

IVIL ENGINEER (B.E.N.Z.) 32, married, ex-service pilot. Experience in railroad, hydro-electric, highway, and airdrome construction, water supply, sewage disposal work. Also some experience in structural design and mechanical workshops. Seeks employment with consulting or structural engineers construction company, or Federal or Provincial organization. Presently in charge of airport project, available in mid-January. West Coast location preferred, but go anywhere. 2½ years experience of Canadian conditions. Expect to obtain Canadian registration at early date. Apply to File No. 3382-W.

CIVIL ENGINEER (Toronto 1949) P.Eng. Age 30. Married. R.C.A.F. veteran. Experience in hydraulic, hydrologic and hydroelectric fields including soil and foundation exploration, power and economic studies, flood control, and specification writing. Desires position in similar field. One month notice required to present employer. Apply to File No. 3383-W.

CIVIL ENGINEER, S.E.I.C., B.A.Sc., Toronto University, 1949, married, age 25, at present employed in London, Ontario. Desire permanent employment with opportunity for advancement. Experience in surveying, light construction work, draughting and general engineering duties. Willing to work anywhere in Canada but continuous travelling not desirable. Apply to File No. 3384-W.

METALLURGCAL ENGINEER, S.E.I.C. Graduate of 1950, McGill. Age 26, veteran, single. One year of practical experience in steelmaking with electric furnaces. Desire position leading to responsibility. Quite willing to work outside of country if so desired. Available on short notice. Apply to File No. 3385-W.

CIVIL ENGINEER, P.Eng. of Ontario, U.N.B. 1949. Age 30, married, with car, desires a position with an engineering and general contracting firm in southern Ontario. Have had 4 years experience in construction work as labourer, timekeeper, foreman, field engineer, estimator, and owner's representative. Presently situated in southern Ontario. Available on reasonable notice to present employer. Apply to File No. 3386-W.

GRADUATE ENGINEER, M.E.I.C. Married. Approximately 14 years industrial plant and construction experience including positions as resident construction engineer and plant engineer. At present employed and would consider changing only if offered a similar or better position with suitable opportunity for advancement. Apply to File No. 3387-W.

SENIOR PRODUCTION ENGINEER, M.E.I.C., of internationally famous engineering concern would like to assist small or medium size engineering firm in Montreal area in quickly clearing up design, production, or estimating difficulties Available Saturdays or evenings. Temporary assignments considered. 10 years wide experience, fully qualified. Apply to File No. 3392-W.

MECHANICAL ENGINEER, S.E.I.C. Graduated with honours from U.B.C. in May, 1950. Age 24, single and in good health. At present employed in non technical work in Ontario receiving supervisory training. Would like design development on research work anywhere in Canada. Available on short notice. Apply to File No. 3395-W.

ELECTRICAL ENGINEER, honours degree, A.M.I.E.E., M.A.I.E.E. 10 years experience world famous electrical manufacturing company wishes permanent position anywhere in Canada. Very adaptable having broad range of interests. At present in Great Britain. Available early 1951. Apply to File No. 3396-W.

ELECTRICAL ENGINEER, S.E.I.C. Graduated University of Alberta, 1950. Veteran, age 29; married, no children, desires permanent position anywhere in Canada. Have Naval electrical experience and training (E.A. 3rd Class) also experienced in electrical servicing. Have good technical background and excellent personality records. Available immediately. Apply to File No. 3403-W.

CIVIL ENGINEER, Jr.E.I.C. 31 years, B.A.Sc. Toronto, 43. 7 years experience in industrial and housing construction both in field engineering and job supervision. Desire position in Southern Ontario in construction or related industry. Apply to File No. 3404-W.

GRADUATE CIVIL ENGNEER, M.E.I.C., P.Eng. (Ont.) Age 38, married, family 2. Experience includes 10 years mining and 6 years pulp and paper covering—construction, plant engineering and design. Presently employed as assistant resident engineer. Ontario or Quebec province preferred. Available on reasonable notice. Apply to File No. 3409-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., age 25, five years experience in highway and bridge construction. Presently employed but desires position with more varied experience. Am interested in any type of engineering and will work anywhere. Available in three weeks. Apply to File No. 3411-W.

Attention, Members

Please telephone in advance and make an appointment if you propose using the Institute's Employment Department.

This will result in a better service to everyone concerned.

TELEPHONE PLATEAU 5078

Except in special cases all interviews will be arranged between the hours of 9 and 12.

BOOK REVIEW

CONTEMPORARY STRUCTURE IN ARCHITECTURE:

Leonard Michaels. New York, Reinhold, 1950. 240 pp., illus., $10.00. Reviewed by J. Morrow Oxley, M.E.I.C., F.R.A.I.C.

This book is a plea and a stimulant to both architect and engineer for a closer co-ordination, in the conception of a building or project to fulfill a given need, and co-operation in its execution.

To quote in part from the "Foreword" by Eric Mendelsohn, "Recent developments in the knowledge of steel and reinforced concrete have confirmed the visions of the structural and architectural pioneers of contemporary building. Both POST and BEAM (the ancient static principal) and BUTTRESS and VAULT (the medieval dynamic principal) are being superseded by the elastic principal of continuity of our time . . . This is the structural meaning of "organic" architecture.

To take his rightful place in this creative art, the Engineer, beyond his scientific computations, must be as sensitive to form as the Architect to structure — the only way for structure and form to challenge each other."

The development of the author's theme in Section I — CONTEMPORARY STRUCTURE — starts with the one dimensional elements of the post and beam (the skeleton frame), and leads through the two dimensional structural slab (horizontal or vertical) to the three dimensional shell (space-frame or dome).

The invention of a durable material strong in tension was the first step in freeing the builder from the limitations imposed by lack of continuity. Steel, developed as an economically practical material near the end of the last century, for use in structural shapes and as reinforcement for concrete, enabled that step to be taken. Simpler, more direct methods of stress analysis, applicable to steel, concrete, timber or aluminum, and the use of welding for steel, and split ring connectors and glueing for timber, have all increased the scope of design for continuity, until it is accepted as a matter of course for any important structure to-day.

The first sixty-nine pages deal chiefly with single storey structures composed of linear elements (beam and column, rigid frame, vierendeel truss, cantilever, arch) but include a few examples of multistorey frames, space frames and rotational structures.

Each of the principal structural materials — steel, concrete, and timber, is illustrated by numerous examples in a variety of forms, and is followed by a discussion of applicability and, in some cases, of economic factors.

All of the standard types are shown as well as some of rather special design such as that applied on an all welded frame for a factory at Waltham Cross, England.

THE HORIZONTAL INFILLING — floor and roof slabs, is discussed and illustrated in nine pages dealing with one-way and two-way systems of poured in place, pre-cast and combination methods of using reinforced concrete, and of diagonal grids of light steel sections.

Section I — Part 2 — BEYOND THE SKELETON FRAME to quote "the realization of continuity and mutual support in framing members lends itself to an ultimate fusion in which the frame is transformed into an elastic diaphram or slab . . . This development is of the greatest significance in the spanning of space . . .

Examples of arches, flat slabs, and slab-bands are shown followed by FOLDED SLABS and the STRUCTURAL SHELL.

Section II — STRUCTURE IN ARCHITECTURAL DESIGN — opens with the statement that "The divorce of engineer and architect in the nineteenth century displaced structure from its traditional place in architectural evolution, and it is only in recent years that pioneer work has shown the way in which contemporary structural development can form the basis of a new and vigorous architecture."

This theme is discussed under the headings of Plan, Section, Massing, Structural Form and Expression, and many examples of its application are illustrated.

The APPENDIX in twenty-seven pages describes Contemporary Structural Materials in a brief survey of Steel, Reinforced Concrete, Timber and Aluminum Alloys. It covers, for each material, an historical note, structural characteristics, jointing and assembly, development in application, and trends for the future.

As the author says, the architect to-day, being remote from the manufacture of the materials from which his buildings are made, must come to terms with the situation by a close understanding of that factor which governs the realization of structural creation — the nature of available materials.

Throughout the book the illustration by photograph and explanatory diagram is comprehensive, giving examples of practically all types of modern building structure, and a few that are yet only ideas but nevertheless tend to stimulate thought.

This volume will be valuable to all engineers who are concerned with structural design for buildings, and to all students who look forward to an intelligent interest in the subject.

SELECTED ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Architects' and Builders Size Book:
H. M. Tansley. London, Newnes, 1950. 206 pp., illus. 17/6.

Australia, 1950:
Melbourne, United Press, 1950. 800 pp., illus., $3.25.

Basic Electrical Measurements:
M. B. Stout. New York, Prentice-Hall, 1950. 504 pp., illus., $7.75.

Chemical Thermodynamics:
I. M. Klotz. New York, Prentice-Hall, 1950. 369 pp., illus., $6.00.

De re Metallica:
Georgius Agricola. New York, Dover, 1950. 638 pp., illus., $10.00.

Design of Electrical Apparatus: 3rd ed.:
G. H. Kuhlmann. New York, Wiley, 1950. 512 pp., illus., $8.45.

Electric Circuit Theory:
H. Tropper. Toronto, Longmans, Green, 1949. 164 pp., illus., $3.00.

Electromagnetic Waves and Radiating Systems:
E. C. Jordan. New York, Prentice-Hall 1950. 710 pp., illus., $10.00.

Encyclopedia on Cathode-ray Oscilloscopes and Their Uses:
John F. Rider and Seymour D. Uslan. New York, Rider, 1950. 982 pp., illus., $9.00.

Engineering Hydraulics:
Hunter Rouse. New York, Wiley. 1950. 1039 pp., illus., $15.00.

ONE
SOURCE OF SUPPLY
RESPONSIBILITY FOR ALL MATERIALS
HIGH STANDARD OF QUALITY
Whatever the piping components required—it's sound policy and good business to make sure your specifications read "CRANE". Wherever a fluid has to be conducted or controlled—whether in home, industry, commercial buildings, institutions, public service, transportation systems—you can count on Crane to supply the right component for the purpose.
Valves and Fittings, for example, are readily available from Crane standard lines in brass, cast iron, malleable iron, steel, lined or unlined, in a wide variety of pressure ranges—or in special alloys to meet particular operating conditions in your plant—or to your particular specifications in size, design or material.
Bends, coils, headers, heat exchangers and other forms of fabricated piping assemblies are all manufactured by Crane to suit the needs of industrial users.
Materials and equipment for maintenance, installation and fabrication of your plant piping can be all obtained from Crane, too. Available are special tools for handling, cutting, threading; gaskets, thread lubricant, sheet and other packing, bolt studs, companion flanges, insulation of various types, pipe hangers and supports, and a variety of other similar products.
For complete information on the components, assemblies or materials you require, consult your Crane Catalogue literature, or see your nearest Crane Branch.

LIBRARY REGULATIONS

Hours

Mon., Tues., Wed., Fri. . 9 a.m. - 6 p.m.
Thursdays . . . . 9 a.m. - 8 p.m.
(For Montreal branch meetings)
Saturdays . . . . . . 9 a.m. to 12 noon

Summer Hours

9 a.m. - 5 p.m. Closed all day Saturdays.

Bibliographies and Literary Searches

Short subject bibliographies are compiled on request.

Extensive searches will be made at a charge of $3.00 per hour to members, and $5.00 per hour to non-members.

Please give as much detail as possible when requesting information of either type.

Borrowing and Purchasing

Books, periodicals, photostats, translation, etc. may be borrowed for two weeks at a time. **A fine of 25c. per day will be charged for each day borrowed items are retained beyond this period.**

A library deposit of $5.00 at par in Montreal is required before items may be borrowed. Books, periodicals, etc. may be ordered by members through the library. All carrying charges are payable by the individual concerned. Except in the case of library deposits, please make **no payments in advance.**

Non-members may consult the library, but may not borrow material.

Fundamentals of Acoustics:

L. E. Kinsler. New York, Wiley, 1950. 516 pp., illus., $6.00.

Illustrating for Tomorrow's Production:

J. H. Farmer. Toronto, Macmillan, 1950. 203 pp., illus., $5.75.

Industrial and Safety Problems of Nuclear Technology:

M. H. Shamos. New York, Harper, 1950. 368 pp., illus., $4.00.

Interplanetary Flight:

A. C. Clarke. London, Temple Press, 1950. 164 pp., illus. 8/6.

Life of an American Workman:

Walter P. Chrysler. New York, Dodd. Mead, c1950. 219 pp., $3.00.

Low-temperature Properties of Ferrous Materials:

New York, Society of Automotive Engineers, 1950. 97 pp., illus., $2.00 to SAE members, $4.00 to non-members.

Neue Theorie des Stahlbetons: 3rd ed.:

Rudolf Saliger. Vienna, Verlagsbuchhandlung Franz Deuticke, 1950. 135 pp., illus., $2.80.

Pattern Making:

J. G. Horner. Toronto, Ambassador Books, 1950. 390 pp., illus., $4.50.

Phenolic Resins — Their Chemistry and Technology:

P. Robitschek and A. Lewin. London, Iliffe, 1950. 261 pp., illus., $6.75.

Problems in Engineering Drawing:

J. M. Arnold. New York, Prentice-Hall, 1950. $4.35.

Problems in the Theory of Viscous Compressible Fluids:

Lagerstrom. Pasadena, Durand reprinting committee, 1950. $2.00.

Process Heat Transfer:

D. Kern. Toronto, McGraw-Hill, 1950. 871 pp., illus., $9.50.

Reviews of Petroleum Technology, v. 9, 1947:

London, Institute of Petroleum, 1950. 340 pp., 27s 6d.

Secretary's Handbook, 7th ed.:

Sarah Augusta Taintor and Kate M. Monro. Toronto, Macmillan, 1950. 573 pp., $4.00.

Snow Melting:

T. N. Adlam. New York, Industrial Press, 1950. 224 pp., illus., $4.50.

Television:

Princeton, Radio Corporation of America, v. 5: 1947-1948, 461 pp., illus., $2.50; v. 6: 1949-1950, 422 pp., illus., $2.50.

Television Servicing:

W. H. Buchsbaum. New York, Prentice-Hall, 1950. 340 pp., illus., $5.35.

Tool Engineering:

L. E. Doyle. New York, Prentice-Hall, 1950. 499 pp., illus., $6.35.

Transit Modernization and Street Traffic Control:

John Bauer. Chicago, Public administration service, 1950. 271 pp., $5.00.

Transmission Lines and Filter Networks:

J. J. Karakash. Toronto, Macmillan, 1950. 413 pp., $6.00.

Ultra High Frequency Engineering:

T. L. Martin. New York, Prentice-Hall, 1950. 456 pp., illus., $8.00.

Walls and Wall Facings:

Denzil Nield. London, Spon, 1949. 276 pp., illus., 18s.

TECHNICAL BULLETINS, PAMPHLETS, ETC.

Aluminum Company of Canada. Publications:

Use of aluminum bus conductor. Bus conductors and fittings. Price list No. 5.

American Society for Engineering Education. Publications:

Research is learning.

Association of Professional Engineers of Saskatchewan. Membership Lists:

Membership list 1950.

Bituminous Coal Research, Inc. Reprints:

Coal, by H. J. Rose. (From Encyclopedia of Chemical Technology, v. 4).

British Society for Research in Agricultural Engineering. Publications:

Crop drier engineering development abstract 1. Reprints of tests No. 1-3, 5-27.

British Welding Research Association. Recommendations:

No. T. 23—Recommendations for the metal arc welding of butt welds in steel pipelines for power plants. No. T. 26—Recommendations for the design and fabrication of arc welded structural steelwork, built-up girders and compression members.

Canadian Chamber of Commerce. Publications:

Policy declarations and resolutions of the Canadian Chamber of Commerce.

Canadian Potteries Ltd. Publications:

Consolidated pocket book of roughing-in dimensions.

Engineering Societies Library. Bibliographies:

No. 6—Bibliography on non-metallic bearings. No. 7—Bibliography on domestic and industrial applications of solar heating.

Institute of Metals. Reprints from the Journal of the Institute of Metals:

No. 1253—Corrosion and related problems in sea-water cooling and pipe systems in H.M. ships.

North East Coast Institution of Engineers and Shipbuilders. Papers:

A preliminary investigation of the discrepancies between the calculated and measured wavemaking of hull forms, by John R. Shearer.

U.S. Department of the Interior. Engineering Monographs:

No. 5—Soap lake siphon, by Robert Sailer.

...Structural Research Laboratory Reports:

No. SP-26—An analysis of the stress distributions in and near stress gages embedded in elastic solids.

...Hydraulic Laboratory Reports:

No. Hyd.-245—Hydraulic model studies of the cedar bluff dam outlet works regulating gate and stilling basin — Cedar bluff unit — Missouri river basin project. No. Hyd.-282—Field tests to study the pressure variation induced by wave action on the Miter gate leaves of the bucket caisson drydock at Grand Coulee dam — Columbia basin project.

...Materials Laboratories Reports:

No. C-517—Effect of iron concretions selected from Bixby dam aggregate on the durability of concrete. No. c-524—Laboratory tests of the effect of hot water and air-entrainment agent requirements of concrete mixes.

U.S. Highway Research Board. Current Road Problems:

No. 13-R—Use of air-entrained concrete in pavements and bridges.

...Bulletins:

No. 24—Requirements for off-street automobile parking facilities in zoning or other local ordinances. No. 25—Controlled access expressways in urban areas.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

.S.T.M. PUBLICATIONS:

.merican Society for Testing Mateials, 1916 Race Street, Philadelphia, ennsylvania:

Bibliography and abstracts on electrical contacts, sixth supplement to. 28 pp., 75c.

This supplement lists written material n recent work done in various parts of ie world. Of particular note is some work n the fundamental physics of contact pplication.

Electron microstructure of steel. 50 pp., $1.35.

Among other features, this report inludes 47 specially prepared figures contituting electron micrographs of various teel constituents. It is printed on special aper to bring out the details of the microraphs.

Standards on plastics. 624 pp., $4.85.

This fifth edition presents in convenient p-to-date form some 120 A.S.T.M. specications and test methods covering a wide ange of plastics and related materials. he compilation includes 11 recommended ractices. In addition there are definitions f terms relating to plastics; descriptive omenclature of objects made from plasics; and code for designating form of maerial. The methods of test cover the ollowing properties of plastics: strength, ardness, thermal and optical properties, nd permanence.

Symposium on turbine oils. 56 pp., $1.50.

This is a review of past progress and uture problems in the field of turbine ubrication. Inhibited turbine oils are iscussed, together with their selection and ests to determine the remaining useful ife of such oils when they have already een used.

BRITISH STANDARDS:

British Standards Institution, 24-28 Victoria St., London, S.W.1.

B.S. 240; Part 2, 1950—Steel balls for Brinell hardness testing, 2/-.

Specifies the hardness of balls used in carrying out the tests, and having diameters of 10, 5, 2 and 1 mm. Also gives pecifications concerning the two methods of testing, namely: the diamond pyramid ardness test, and the reciprocal pressure est.

B.S. 1675: 1950—Weft pirns (paper fit) for direct spinning of cotton.

Gives basic dimensions for weft pirns manufactured from wood, light alloys or plastic materials for spinning, on the ring frame, cotton yards onto pirns for direct use in the shuttle of non-automatic of shuttle changing automatic looms.

DECAY OF TIMBER AND ITS PREVENTION:

K. St. A. Cartwright. Brooklyn Chemical Pub. Co., 1950. 294 pp., illus., $7.50.

Originally prepared by the British Government Forest Products research laboratory, this book appeared in three separate parts: Decays affecting oak, 1936; softwoods, 1938; British hardwoods, 1942. This material has since been revised, with additions, and published by permission of H.M.S.O. by Chemical Publishing Co.

The inestimable value of this book lies in the fact that its information comes from Scientific research in almost every part of the globe. Different types of decay are treated, the resistance to decay of various composite wood materials discussed and factors responsible for the natural durability of timber is described.

Wood preservatives and methods for their application, as well as staining of timber by fungi and methods for its prevention are considered.

Anyone either doing research work on timber preservation, or actually involved in the storage of wood material will find this a valuable addition to their book shelf.

DESCRIPTIVE GEOMETRY ESSENTIAL PRINCIPLES AND APPLICATIONS FOR STUDENTS OF ENGINEERING AND ARCHITECTURE. 3rd ed.:

Floyd A. Smutz and Randolph F. Gingrich. New York, Van Nostrand, 1950. 142 pp., illus., cloth, $3.90.

In this text, an attempt has been made to include the methods and theories that are required of a draftsman and to exclude much of the material that is purely mental gymnastics. At the risk of being monotonous through repetition, all the problems of the text are stated, analysed, and solved. A sufficient number of exercises for class assignment have been included to make it possible to carry several similar courses without duplication of assignments.

DIESEL ENGINE FUELS AND LUBRICANTS:

Edward Wright and H. F. Purday. London, Constable, 1950. 153 pp., illus., cloth, $3.00.

Whilst improvements to Diesel engine fuels and lubricants have been achieved with the help of all the resources of modern science, this book does not intend to be a scientific treatise. Its aim is practical — namely, to serve as a handy reference for the use of engineers and managers in charge of Diesel engines. The authors have tried to include enough information on the chemistry and physics of fuels and lubricants to facilitate mutual understanding between Diesel-engine users and oil suppliers.

ELECTRIC RESISTANCE WELDING. A PRACTICAL GUIDE TO SPOT; SEAM, PROJECTION, AND BUTT WELDING METHODS:

H. Butler. London, Newnes, 1950. 182 pp., illus., cloth, 17/6.

This book surveys the various electric resistance welding processes and their applications to engineering manufacture. A chapter has been devoted to each of the main processes mentioned in the title. Chapters 2 and 3, in addition, are devoted to the various types of control gear, while Chapter 5 deals with the specially important subject of light alloy welding.

EXAMINATION OF WATER AND WATER SUPPLIES (Thresh, Beale and Suckling), 6th ed.:

E. W. Taylor, rev. London, Churchill, 1949. 819 pp., illus., 70/-.

Assuming the public to be entitled to "a water supply which, besides being safe, is also of high 'aesthetic' quality, being reasonably soft, clear and bright in appearance and free from taste and odour", Mr. E. W. Taylor now presents his findings in this sixth revision of the original volume by Messrs. Thresh, Beale and Suckling.

Special attention has been paid to sources of water supply, gathering grounds and underground supply, and the increasing importance of biological considerations.

Chapters rewritten from former editions to keep pace with recent additions to our knowledge include those on water-borne disease, bacteriology of water samples, and disinfection of water supplies.

Format and presentation of information has been kept as uniform as possible with former volumes, which will be familiar to many of our readers.

PHYSICAL MECHANICS. AN INTERMEDIATE TEXT FOR STUDENTS OF THE PHYSICAL SCIENCES:

Robert Bruce Lindsay. New York, Van Nostrand, c1933. 436 pp., illus., cloth, $6.50.

The present work is intended to serve as an intermediate text suitable for students who have had a year of general physics and the two-year course in general college mathematics now customary for students intending to concentrate in the physical sciences. The material presented includes not only particle dynamics and statics with an introduction to rigid bodies, but also enough of kinetic theory, elasticity, wave motion and the behavior of fluids to justify the title.

THEORY AND DESIGN OF GAS TURBINES AND JET ENGINES:

E. T. Vincent. New York, McGraw-Hill, 1950. 606 pp., illus., cloth, $9.75.

This book has been written to provide a text in the field of gas turbines in which the theory and practical application of that theory to specific design problems are included. The presentation is in such a manner that a senior undergraduate or graduate student should be capable of solving an average design problem in a reasonably workable manner. In this text an effort has been made to bring the aerodynamic and "gas dynamic" problems down to a point where the general engineering student without aeronautical background can understand the main problem involved.

WORKS MANAGEMENT AND ORGANIZATION:

P. S. Houghton. London, Spon, 1950. 269 pp., ilus., 25/-.

There arises in every establishment the need for careful planning of the whole organization, so that instead of "just growing" it will develop according to plan, function smoothly with the minimum of expenditure and energy. Thus waste, in its many forms, is subjected to a strict control. The purpose of this book is to help the chief personnel in making a careful study of the basic principles underlying successful management. The methods or procedure described are typical of the modern well conceived practice.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

CAPACITORS FOR INDUSTRY:

By W. C. Bloomquist, C. R. Craig, R. M. Partington and R. C. Wilson. John Wiley & Sons, New York, 1950. 246 pp., illus., linen, $4.50.

Of interest to industrial plant engineers and electricians, utility power salesmen, consulting engineers, and industrial power application engineers, this book provides practical capacitor application data in tabular and curve form. In most cases, the answer can be obtained directly without the solution of the right triangle or the use of complex algebra. Numerous examples are included illustrating the use of data and, where necessary, the step-by-step procedure for the solution of practical problems.

ELECTRICAL ENGINEERS' HANDBOOK, Electric Communication and Electronics. (Wiley Engineering Handbook Series.)

Edited by H. Pender and K. McIlwain. 4th ed. John Wiley & Sons, New York, 1950. Sections separately paged, illus., $11.05.

The new edition of this standard handbook, prepared by seventy-eight specialists, is entirely rewritten to reflect the rapid widening of the electronics field. In particular, frequency modulation and all the pulse techniques in both the communication and radar fields are now covered for the first time as are radio aids to navigation. The range of topics covered is demonstrated in the section headings which include mathematics and symbols, properties of materials, electron tubes and circuit elements, electrical instruments and measurements, acoustics and acoustical devices, optics and optical devices, telephony, telegraphy, television, and medical applications of electricity.

ELEMENTARY THEORY AND DESIGN OF FLEXURAL MEMBERS:

By J. Vawter and J. G. Clark. John Wiley & Sons, New York; Chapman & Hall, London, 1950. 215 pp., illus., cloth, $4.00.

Appropriate for an elementary design course, this text presents the basic theory of flexure as applied to the design of members in bending. Although separate chapters treat the use of different materials, emphasis is placed on the fact that the same basic laws govern any of the common structural materials. Certain peculiarities of the various materials are also taken into consideration. Illustrative examples and problems are incorporated in each chapter.

ENGINEERING ECONOMY:

By H. G. Thuesen. Prentice-Hall, New York, 1950. 501 pp., illus., cloth, $6.65.

The importance of considering thoroughly the economic as well as the technical aspects in the solution of engineering problems is stressed throughout the book. To this end the several chapters deal with the basic mathematical factors, the treatment of estimates, various kinds of costs and accounting methods, bases for comparison or alternatives, evaluation of replacements, economy of operations, utilization of personnel, and the application of engineering economy studies to public activities. Illustrative numerical examples are extensively used.

FOUNDATIONS AND AERODYNAMICS:

By A. M. Kuethe and J. D. Schetzer. John Wiley & Sons, New York, 1950. 374 pp., illus., linen, $7.48.

Stressing an understanding of basic concepts, this book treats perfect, viscous, and compressible fluid flow theory with applications to problems in aeronautics and other fields of engineering. Among the topics discussed are thin airfoil and finite wing theory, one dimensional flow, flow around wings, shock waves, laminar and turbulent boundary layers, turbulence and transition. No previous knowledge of aerodynamics is assumed, but undergraduate physics and mathematics through advanced calculus are required. Problems are grouped in sections at the end of the text.

FOUNDATIONS OF STRUCTURES:

By C. W. Dunham. McGraw-Hill Book Co., Toronto, 1950. 679 pp., illus., linen, $9.10.

Written for civil engineering students, this book discusses in considerable detail the planning and dimensioning of foundations encountered in ordinary engineering practice. It shows how to obtain and interpret data regarding soils, how to plan the support of a structure upon them, and how to devise means for the construction of the foundation. A wide variety of foundation problems is illustrated, and there is an extensive treatment of bridge piers and abutments.

HIGHWAY ENGINEERS' POCKET BOOK:

By F. G. Royal-Dawson. E. & F. N. Spon, Ltd., London, W.C.2, 1950. 113 pp., illus., cloth, 12s. 6d.

Technical data are provided for the design and lay-out of all types of roads which will be used by fast traffic. The book contains all the essentials of the theory of transition curves based on the lemniscate curve, and includes tables from which direct results can be obtained for both horizontal and vertical curves.

INDUSTRIAL ACCIDENT PREVENTION:

By H. W. Heinrich. 3rd ed. McGraw-Hill Book Co., Toronto, 1950. 470 pp., illus., cloth, $6.05.

Placing special emphasis on the human factor in safety work, this book provides full coverage from fundamentals through specific methods and devices to the setting up and carrying out of full-scale safety programs. New chapters on motor-vehicle fleets, supervision, personal protective devices, and a short-form safety course are included in this edition. New material is also added to the sections on accident hazards and production faults, supervisory control of employee performance, and cause analysis of boiler and machinery accidents.

INSTALLATIONS ELECTRIQUES A HAUTE ET BASSE TENSION, Volume II. (Electrotechnique Appliquée):

By A. Mauduit. 2nd ed. Dunod, Paris, 1950. 1302 pp., illus., fabrikoid, 4,850 frs.

This second volume of a two-volume set provides a full treatment of both theory and practice in connection with switches, interrupters, circuit-breakers, and relays of various types. The problem of line protection is discussed with detailed consideration of overcurrents and overvoltages. The practical operation of distribution systems is described, dealing with the central station, sub-stations, and overhead lines. The final chapter is devoted to system stability, interconnection, costs and rate-setting. The two volumes together provide coverage of both low- and high-tension installations.

LINEAR INTEGRAL EQUATIONS:

By W. V. Lovitt. Dover Publications, New York, 1950. 253 pp., diagrs., tables, 8¼ x 5½ in., linen, $3.50.

The general theory of linear integral equations is presented in a systematic manner together with applications to differential equations, calculus of variations, and some problems in mathematical physics. The discussion is purposely confined to those equations which are linear and in which a single integration occurs. This edition is a reprint of a 1924 book which has been out of print for some time.

REFRIGERATION ENGINEERING:

By H. J. Macintire and F. W. Hutchinson. 2nd ed. John Wiley & Sons, New York, 1950. 610 pp., illus., linen, $6.50.

This revised, modernized and expanded edition provides basic data on the essential principles of refrigeration, and includes recent advances in commercial machinery. Eight new chapters, over 70 illustrative figures, more than 30 full-page graphical solutions, and 160 new problems are provided. The new material covers the topics of reversed cycle theory, analysis of transient phenomena, the heat pump, and radiation effects in determination of equilibrium cold-storage temperature.

STRUCTURAL THEORY:

By H. Sutherland and H. L. Bowman. 4th ed. John Wiley & Sons, New York, 1950. 394 pp., illus., linen, $5.00.

Emphasizing structural stress analysis, this book serves as an introduction to the basic concepts of structural theory which relate to trusses, rigid frames, and space frames. Major revisions in this fourth edition occur in the chapters dealing with slope and deflection, and with rigid frames. New material is included on the solution of compound trusses by means of the Williot-Mohr diagram, fixed points in continuous beams, and on members of varying moment of inertia. The treatment of the Norris Method is expanded.

SURVEY OF MODERN ELECTRONICS:

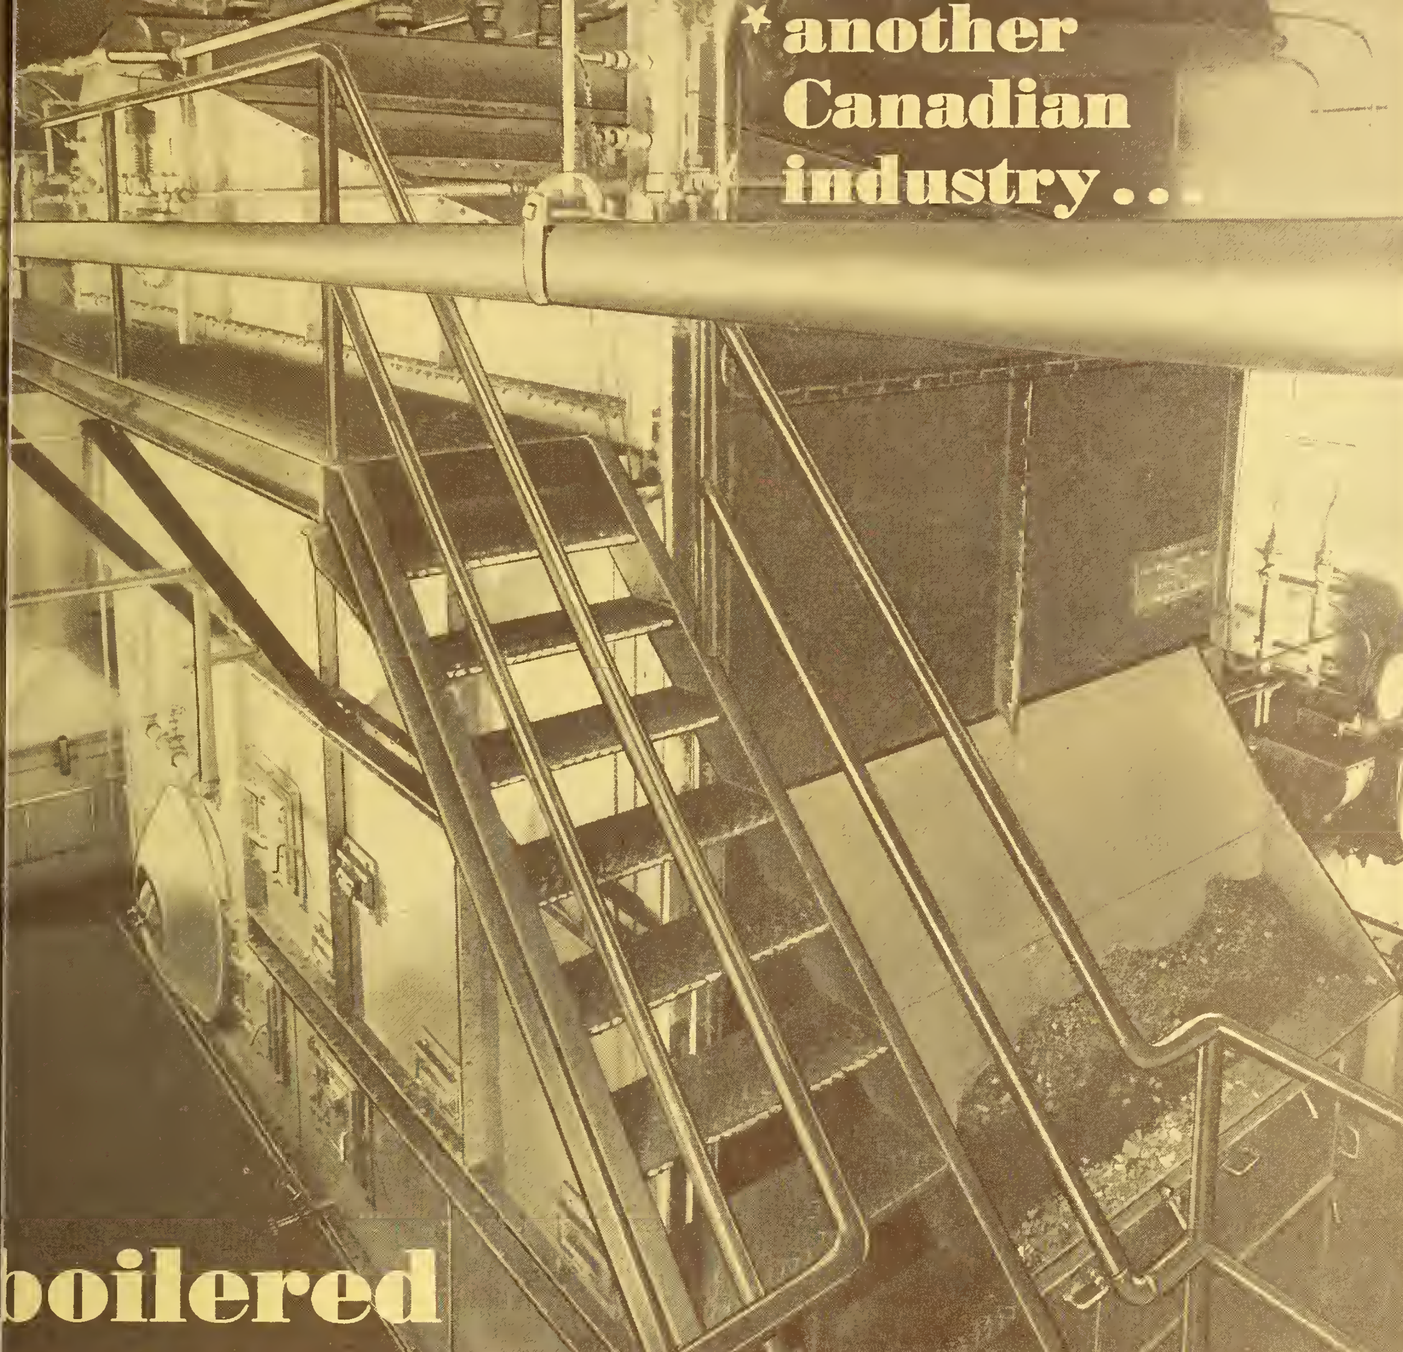
By P. G. Andres. John Wiley & Sons, New York, 1950. 522 pp., illus., cloth, $5.75.

Providing a descriptive rather than mathematical treatment, this book explains the fundamentals of electronics and provides a summary of applications. It is intended as a text for a short course in electronics for non-electrical engineering students. The basic principles of construction, operation, and application of electron tubes are stressed. A knowledge of elementary physics, d-c fundamentals, and some a-c fundamentals is assumed. General references are included in the appendix, and specific references and problems are placed at the end of the chapters.

THEORY OF FLOW AND FRACTURE OF SOLIDS, Volume I:

By A. Nadai. 2nd ed. McGraw-Hill Book Co., Toronto, 1950. 572 pp., illus., cloth, $13.00.

Emphasizing mathematical principles and mechanical laws governing flow and fracture, this book is the first of a two-volume revision of the author's earlier work, "Plasticity". The scope of this edition is broadened by a survey of the general conditions causing fracture in materials and by a discussion of some of the details and results of research on the yielding and fracture of ductile metals under combined stress. The second volume is to deal with applications of the principles set forth in Volume I.



by BABCOCK

★ **"O. K. for O'Keefe's"** said the engineers at O'Keefe's Ale Brewery Ltd., Simcoe Street, Toronto, when they saw the efficiency and the reliability they could achieve with a Babcock Type "G" Boiler. At full capacity it produces 20,000 lbs. of steam per hour. It meets the necessary load fluctuations and maintains a constant 125 lbs. per sq. inch pressure, fired by Babcock Type "J" Chain Grate Stoker.

Turn costs into profits with efficient Babcock Boilers. Write us today.

Business & Industrial Briefs

A Digest of Information

received by

The Editor

Appointments and Transfers

I. A. Leishman.—M. A. Leishman has een appointed chief engineer, of the lamilton Works of the Steel Company f Canada Ltd. Mr. Leishman was ormerly the Company's electrical en-ineer.

●

. D. Elmhirst.—A. D. Elmhirst is now ıanager of the Canadian Westinghouse

A. D. Elmhirst

office at Swastika, Ontario. Mr. Elmhirst joined the company in 1929 and has served in Swastika since 1936.

●

Hackbridge New Address.—The Hackbridge and Hewittic Electric Company of Canada Ltd. now has plant and offices at Ville LaSalle, Montreal. The address is 103 Elmslie Street, Ville LaSalle, Montreal 32, Quebec.

●

Wilkinson & McClean. — Wilkinson and McClean Limited of Calgary and Edmonton have just completed arrangements whereby they will work in close collaboration with the Vancouver engineering group comprising Vancouver Machinery Depot Ltd., Vancouver Engineering Works Ltd., and Vancouver Iron Works Ltd.

E. M. Wilkinson, will be managing director of Wilkinson and McClean Ltd., Lucey Export (Canada) Ltd., and Cummins Diesel Service Co. Ltd. Allan McClean will serve as managing director of Northern Asbestos and Building Supplies Ltd. and R. F. Butler is a director and sales manager of Wilkinson and McClean Ltd.

George W. Sweny has accepted the office of president of Wilkinson and McClean Ltd. and Northern Asbestos and Building Supplies Ltd. He is also president of Vancouver Machinery Depot Limited and its subsidiaries, Vancouver Iron Works Limited and Vancouver Engineering Works Ltd. Hugh Harper has been named a director of Wilkinson and McClean Ltd. and he will specialize in the development of business with the oil and chemical industries. Donald B. Grant, who is secretary-treasurer of the Vancouver companies, will serve in the same capacity in the Alberta company.

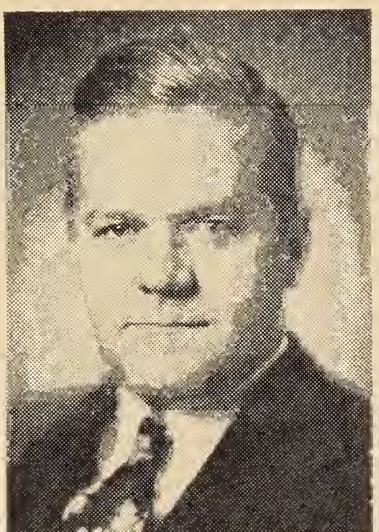
●

Stelco Appointments.—Lee T. Craig has been appointed vice-president of the Steel Co. of Canada Ltd. Mr. Craig has been associated with the Company for the past thirty years most recently in the position of general sales manager. Harry E. Stipe has been made general sales manager, Western Division. Mr. Stipe has been with Stelco for the past thirty-eight years. Before his new appointment he was assistant general sales manager.

●

K. S. Harris.—Kenneth S. Harris has been named director of the steel division of the Department of Trade and Commerce.

●



KEITH W. SHAW J. HOWARD POPE

Following a meeting of the Directors of Imperial Oxygen Ltd., December 21st, Mr. R. C. Holbrook, Company President, announced the following appointments:

Mr. Keith W. Shaw, formerly of the firm's Toronto branch, has been elected Vice-President and a Director of the Company. He will take up his new duties in Montreal.

Mr. J. Howard Pope, formerly of the Montreal Office succeeds Mr Shaw as Manager of the Company's Toronto operations.

Public Works — New Brunswick. — G. W. Cassidy has been appointed deputy minister of public works for the Province of New Brunswick. He succeeds A. W. Barbour who is now executive assistant to the minister, the Hon. W. S. Anderson.

•

Reliance Electric Appointments.—Following the establishment of Reliance Electric and Engineering (Canada) Ltd., of Welland, as successor to the Commonwealth Electric Corporation Ltd., the following appointments have been made: president, J. W. Corey; vice-presidents, J. N. Stanley and G. E. Bevis; and secretary-treasurer, C. G. Kilty. Mr. Corey is also president of the Reliance Electric and Engineering Co. of Cleveland, Ohio. Mr. Stanley and Mr. Kilty have been officers of the Canadian company since 1934. Mr. Bevis was formerly district sales manager for Reliance in Syracuse, N.Y.

•

W. M. McKie.—W. M. McKie has been appointed to the transformer division of Canadian General Electric Company's apparatus department. He will serve at the head office, Toronto.

•

Commercial Corporation Appointments.—C. A. R. Snell, of Winnipeg and Montreal, has been appointed general manager of the Canadian Commercial Corporation. He is on loan from Canadian National Railways.

W. R. Harris has been named assistant general purchasing agent. He will be succeeded as director of the emergency production allocation division by Group Captain Victor S. J. Millar, on loan from the R.C.A.F. J. M. Priddle has been appointed assistant to the managing director and C. A. Drouin is assistant to the general purchasing agent.

•

Monsanto Changes.—J. G. MacDermot of Vancouver, B.C., has been appointed assistant director of Monsanto Chemical Company's Foreign Department. He will serve in St. Louis, Mo. For a number of years he has been manager of western operations for Monsanto (Canada) Ltd., with headquarters in B.C. He will remain a member of the board of directors of the Canadian Company.

D.D. Stokes of Montreal, has been appointed manager of adhesive and resin sales in eastern Canada for Monsanto (Canada) Limited.

"Business & Industrial Briefs"

This section of the *Journal* is intended to keep readers informed on developments and changes in those business and industrial enterprises, and on new products, which affect the engineer.

If you write with respect to any of the items in this, or other sections, please mention

THE ENGINEERING JOURNAL

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

Blast Cleaning.—A new bulletin "Continuous Blast Cleaning Can Reduce Your Cleaning Costs" is now available from American Wheelabrator and Equipment Corp., Mishawaka, Indiana.

The eight-page booklet explains the advantages offered by the continuous airless abrasive blast cleaning and cites actual production figures for the five sizes of Wheelabrator Continuous Tumblasts. Ask for bulletin No. 454.

●

Pump Bulletin.—Canada Pumps Limited, Kitchener, Ont., have recently released bulletin No. 976-D which covers their new line of Close-Coupled Pump units.

The pump end of these units is the new CC, CM, and CL line and can be fabricated in the standard cast iron bronze fitted construction or in special metals, as desired. The pump is close-coupled to the motor by means of a cast iron bracket designed for strength, accessibility to stuffing box, and compactness. The pump casing is bolted to the bracket in such a manner as to allow for changing the discharge in the field. The bulletin is well produced and contains valuable technical information. Ask for bulletin No. 945C.

●

Calcium Chloride and Concrete.—The Calcium Chloride Association of Washington, D.C. recently produced a bulletin "Calcium Chloride in Concreting". The publication is divided into sections—Calcium Chloride in Portland-Cement Concrete—How to use Calcium Chloride in Concrete—Practical Experiences with Calcium Chloride, Technical Abstracts and References, Specifications. Copies may be obtained through the courtesy of Brunner Mond Sales Co., Birks Building, 620 Cathcart St., Montreal, Que.

●

Tractor Tires.—Brunner Mond Canada Sales, Ltd., Birks Bldg., Montreal, have available copies of a small but highly interesting publication describing the use of Calcium Chloride for weighting tractor tires. It is claimed that the use of a calcium chloride solution in tractor tires provides better traction, less bounce, longer tire-life, non-freezing in temperatures as low as 40 deg. below zero. This little booklet will be very useful to those who are required to operate tractors under winter conditions.

●

Safety Appliance.—The complete line of Mine Safety Appliances Company's Safety Belts is described in a new 4-page bulletin. The bulletin is divided into sections describing: body-type belts, harness-type belts, bridge and structural steel workers' belts, linemen's belts, petroleum workers' belts and miscellaneous safety belts, which include

Scotchlite reflector belts and a forestry workers' belt. Copies of this new bulletin No. CF-26 may be obtained by writing to Mine Safety Appliances. Co. Ltd., 500 MacPherson Ave., Postal Station "E". Toronto, Ont.

•

Fiberglas Ducting.—Arrowhead Rubber Company, Division of National Motor Bearing Co., Inc. announces that a catalogue on Airtron, the company's line of flexible and rigid Fiberglas ducting hose, sleeves and couplings is now available.

The sixteen page manual gives the complete story on the ducting material which has enjoyed wide acceptance in industry in the few years since its development. Of particular interest to design engineers and others interested in the characteristics and performance specifications of Fiberglas ducting are the seven pages of engineering data which list, among other factors, weight, working temperature ranges, design working pressures, leakage factors, etc. For copies apply to the Arrowhead Rubber Co., Downey, California. Ask for catalogue No. 503.

•

Spray Valve.—The Farval Corporation, 3249 East 80th Street, Cleveland 4, Ohio, has just published a 4-page bulletin in which is described a new spray valve. It is claimed that by means of this valve, either grease or oil can be sprayed onto open gearing, slide surfaces, or any other area where it is desirable to apply a measured amount of lubricant at regular intervals. The valve can be operated wherever compressed air is available. Ask for bulletin No. 60, and apply to the Canadian agent: Peacock Brothers Ltd., Ville LaSalle, Que.

•

Locknuts.—The Locknuts section of Industrial Fasteners Institute, Cleveland, Ohio, has just released an 18-page two-colour bulletin describing various types of locknuts and their principles of operation. The publication is highly descriptive and well produced. For copies apply to the Institute at 3648 Euclid Ave., Cleveland, Ohio.

•

Dominion Oxygen Booklet.—A new eight-page illustrated booklet, "Powder Cutting and Scarfing Processes", is available from Dominion Oxygen Company, Ltd., 159 Bay Street, Toronto 1, Ont. The booklet describes application of these processes in the fabrication of stainless steel. Other uses discussed are the powder-cutting of heavy steel scrap and non-ferrous applications. The booklet may be obtained without charge.

•

Circuit Breakers.—The English Electric Company of Canada Ltd., St. Catharines, Ont., have just released a new leaflet describing the IAS and IBS Oil Circuit Breakers. The leaflet, No. 31.3, replaces and makes obsolete leaflet 3520 on the same subject. Copies will be forwarded on request.

•

Pickling & Washing Machine.—The B. F. Goodrich Rubber Company, of Canada Ltd., Kitchener, Ontario, offer copies of a well-produced leaflet in which is described the "B. F. Goodrich Pickling and Washing Machine", which "prepares your formed-metal products with fully-enclosed, high-pressure spray action".

It is claimed that the machine reduces man-hour costs from 30 per cent to 75 per cent and cuts pickling time up to 66 per cent. It eliminates odours, corrosive fumes, splashings, and drippings. It is rubber lined by a special B. F. Goodrich process. The machine was designed and constructed in Kitchener, Ontario, by the B. F. Goodrich Rubber Company of Canada Ltd. In association with Edward Curran, Engineering Limited, of Wales. The machines are now in operation in four Canadian industrial plants and are doing much to revolutionize the methods of treating domestic appliance parts preparatory to enamelling. Copies of a descriptive bulletin will be forwarded on receipt of written request to B. F. Goodrich Rubber Co. of Canada.

•

Building and Insulation. — Canadian Johns-Manville Co. Ltd., 199 Bay Street, Toronto 1, offer a folder "Build and Insulate with One Material". It deals with "Marinite", a sheet material composed of asbestos fibres, diatomaceous silica and an inorganic binder. The four-page illustrated folder specifically directs attention to the use of Marinite for breechings, for the construction of ovens and driers, and for the fireproofing of structural steel. Copies of the publication are available.

•

Gasoline-Burning Heaters.—Brief descriptions and specifications of the complete line of Hunter gasoline-burning cab and cargo heaters and dry-ice cargo refrigeration systems are given in a compact, 4-page, 8½-in. by 11-in., folder just published by the Hunter Manufacturing Co. It is well illustrated with photographs and drawings of various models and it also contains recommendations as to installation. Copies may be obtained from Monahan Supply Corporation, 191 Queen St. E., Toronto, Ont.

•

Fire-Fighting Equipment. — Ansul Chemical Company, Marinette, Wisconsin, offer a 4-page 2-colour folder describing their Dry Chemical Piped System, designed for total flooding and for local application. Ask for bulletin describing Dry Chemical Piped System. The dry chemical piped systems are specially recommended for the following types of hazards: paint dip tanks and spray booths, ovens, driers, oil quench tanks, flammable liquid pumping stations, transformers, diesel and gasoline engines, printing presses, loose textile stocks, oil storage tanks, flammable liquid storage rooms, marine hazards, asphalt saturators.

•

Heat-Treating Periodical.—A new publication, designed to present current technical and operating information on heat treating metallurgy and practice, has been instituted by Surface Combustion Corporation, Toledo, Ohio. This bulletin entitled "Heat Treat Review" will be published periodically by Surface Combustion and distributed to persons concerned with heat treating operations. It is intended to provide up-to-date information on heat treating processes as applied to all phases of the metal work-

ing field. To be placed on the mailing list apply on your official letterhead to the Editor, Heat Treat Review, Surface Combustion Corporation, Toledo 1, Ohio.

●

Fan Brochure.—Keith Blackman Ltd., have produced an excellent catalogue entitled "Fan Engineering Equipment". It has been designed to present, in concise but comprehensive form, the main fan engineering products of the Keith Blackman organization. These products are marketed in Canada under the brand name of "Tornado". The purpose of the catalogue is to supplement the more complete publications dealing with the individual types of fan equipment manufactured by the Company. For copies of this new publication, and of the more detailed publications communicate with Vokes (Canada) Ltd., 3801 Dundas Street West, Toronto, who are the Canadian distributing agents. Engineers residing in the vicinity of Toronto may obtain copies by telephoning Murray 7569.

●

Flame Hardening.—A new flame hardening apparatus catalogue has been announced by Air Reduction Canada Limited. Descriptions and illustrations of the latest Airco flame hardening equipment are contained in this 20 page catalogue. For copies write to Air Reduction Canada Ltd., 218 Front Street East, Toronto.

New Equipment and Developments

Canadian Expansion. — Private and public investment in Canada is estimated at $3.0 billion for 1950, an increase of $500 million over the total for 1949 and the highest level on record. The increase is in part due to a rise in construction and machinery and equipment costs, which for 1950 as a whole are estimated to be 7 per cent higher than in 1949. The remaining 7 per cent increase represents a rise in the volume of private and public investment.

Outlays on construction in 1950 are expected to reach $2.4 billion, as compared with $2.1 billion in 1949, reflecting a price increase of 8 per cent and a volume increase of 9 per cent. It is estimated that the value of machinery and equipment purchases will increase from $1.3 billion to $1.5 billion, a 10 per cent rise, consisting of a 6 per cent increase in price and a 4 per cent increase in volume.

●

New Canadian Companies.—Nearly two hundred manufacturing firms of foreign origin have been established in Canada during the last five years. 147 of these originated in the United States, 34 in the United Kingdom, and 16 in other European countries. The United States companies now in Canada employ over 10,000 persons those from Great Britain provide work for nearly 6,000, and those from other countries for between 300 and 400.

The new postwar firms are manufacturing many items which were not in production in Canada before 1946. Outstanding examples are jet aircraft, diesel locomotives, gas turbine engines, roller bearings, a variety of automobile parts, rock drill bits, and new types of electronic equipment.

●

Solvents Service.—Dow Chemical of Canada Ltd., 204 Richmond Street West, Toronto 1, have announced the establishment of a technical service in synthetic solvents. The service is designed to assist factory management in obtaining more efficient and more economical use of chlorinated solvents in metal degreasing or dry cleaning. The service includes cost analysis of cleaning methods, planning production flow charts, suggestions on equipment maintenance and operating procedures, as well as assistance on particular cleaning problems.

J. M. LeRoy has been appointed technical consultant. His services will be available to industries using synthetic solvents such as trichloroethylene, perchloroethylene and carbon tetrachloride for metal degreasing and dry cleaning. Mr. LeRoy speaks both English and French fluently. He will operate from the Company's Toronto and Montreal offices but his services will be available to industries across the country.

●

Space Heater.—A small, gasoline-burning, space and transport heater, developed for the U.S. armed forces, is now being used to overcome many military and semi-military heating problems. Measuring only 11 in. by 21 in. by 24 in. yet capable of producing 60,000 B.t.u.

and circulating heated air—fresh or recirculated—at 500 cubic feet per minute, enough to heat an average 5-room house, it is being manufactured by the Hunter Manufacturing Co., 1550 E. 17th Street, Cleveland 14, Ohio. Complete details may be obtained by writing to the Monahan Supply Corporation, 191 Queen Street E., Toronto.

The heater is equipped for radio interference suppression and it is, therefore, being used extensively in radar and radio vehicles and shelters. It is thermostatically controlled and its fuel consumption averages little more than one half gallon per hour.

●

Abitibi Expansion.—Early in December the Abitibi Power and Paper Company, Ltd., announced that it had acquired all the common shares of British Columbia Pulp and Paper Co.

●

Canadian Aluminum to U.K.—Arrangements have been made by the Ministry of Supply of Great Britain with the Aluminium Company of Canada Ltd. for the supply to the United Kingdom of 50,000 metric tons of virgin aluminium in addition to 150,000 metric tons already contracted for during the year 1951. In 1952 and 1953 the Company will deliver 220,000 metric tons each year. The U.K. Government has agreed to make a loan to the Company of 25 million dollars towards the financing of further expansion.

●

New Fire Extinguisher. — What is claimed to be the first pressurized extinguisher designed for hazardous metal fires has been developed by Ansul Chemical Co. It is known as the Ansul MET-L-X Dry Powder Extinguisher and it is claimed to be extremely effective on fires in magnesium, sodium, potassium, zinc, and powdered aluminum plants.

The extinguishing agent fuses and forms an air-excluding crust over the burning metal. The small particle size of the dry powder makes possible its use in a gas-pressure type extinguisher. The new extinguishing agent is moisture-repellent, free-flowing, non-toxic, non-corrosive, and non-abrasive. It does not conduct electricity and will not deteriorate under normal conditions.

The new Ansul MET-L-X Extinguishers are manufactured in 30 lb., 150 lb., and 390 lb. sizes. Larger units, including an automatic piped system are also available to meet special requirements. This new fire fighting equipment has been placed on defense order allocation by the United States Government.

●

Power Show Report.—Better economy in power production and far wider use than has ever yet been seen were forecast by the 19th Exposition of Power and Mechanical Engineering, presented under the auspices of the American Society of Mechanical Engineers in Grand Central Palace, New York. November 27 to December 2. Held in conjunction with the Society's annual meeting, the display was topical, packed with examples of advanced practice in every department, tuned to progress in industrial mechanization.

As in previous expositions, the exhibits included materials of engineering construction, component and auxiliary apparatus and distribution facilities, and controls associated with the generation of power. Supplementing such displays was a second group composed of tools and production equipment, most of which was associated with the production and maintenance of power plants.

Attendance throughout the exposition totalled 32,000.

●

Welding Torch.—A new, lightweight, air cooled Heliarc torch for inert gas-shielded arc welding is announced by Dominion Oxygen Company, Ltd. The torch, which has a two-position welding head and needs no water cooling, has a maximum current capacity for continuous duty of 75 amperes. It is designed for welding thin-gauge materials.

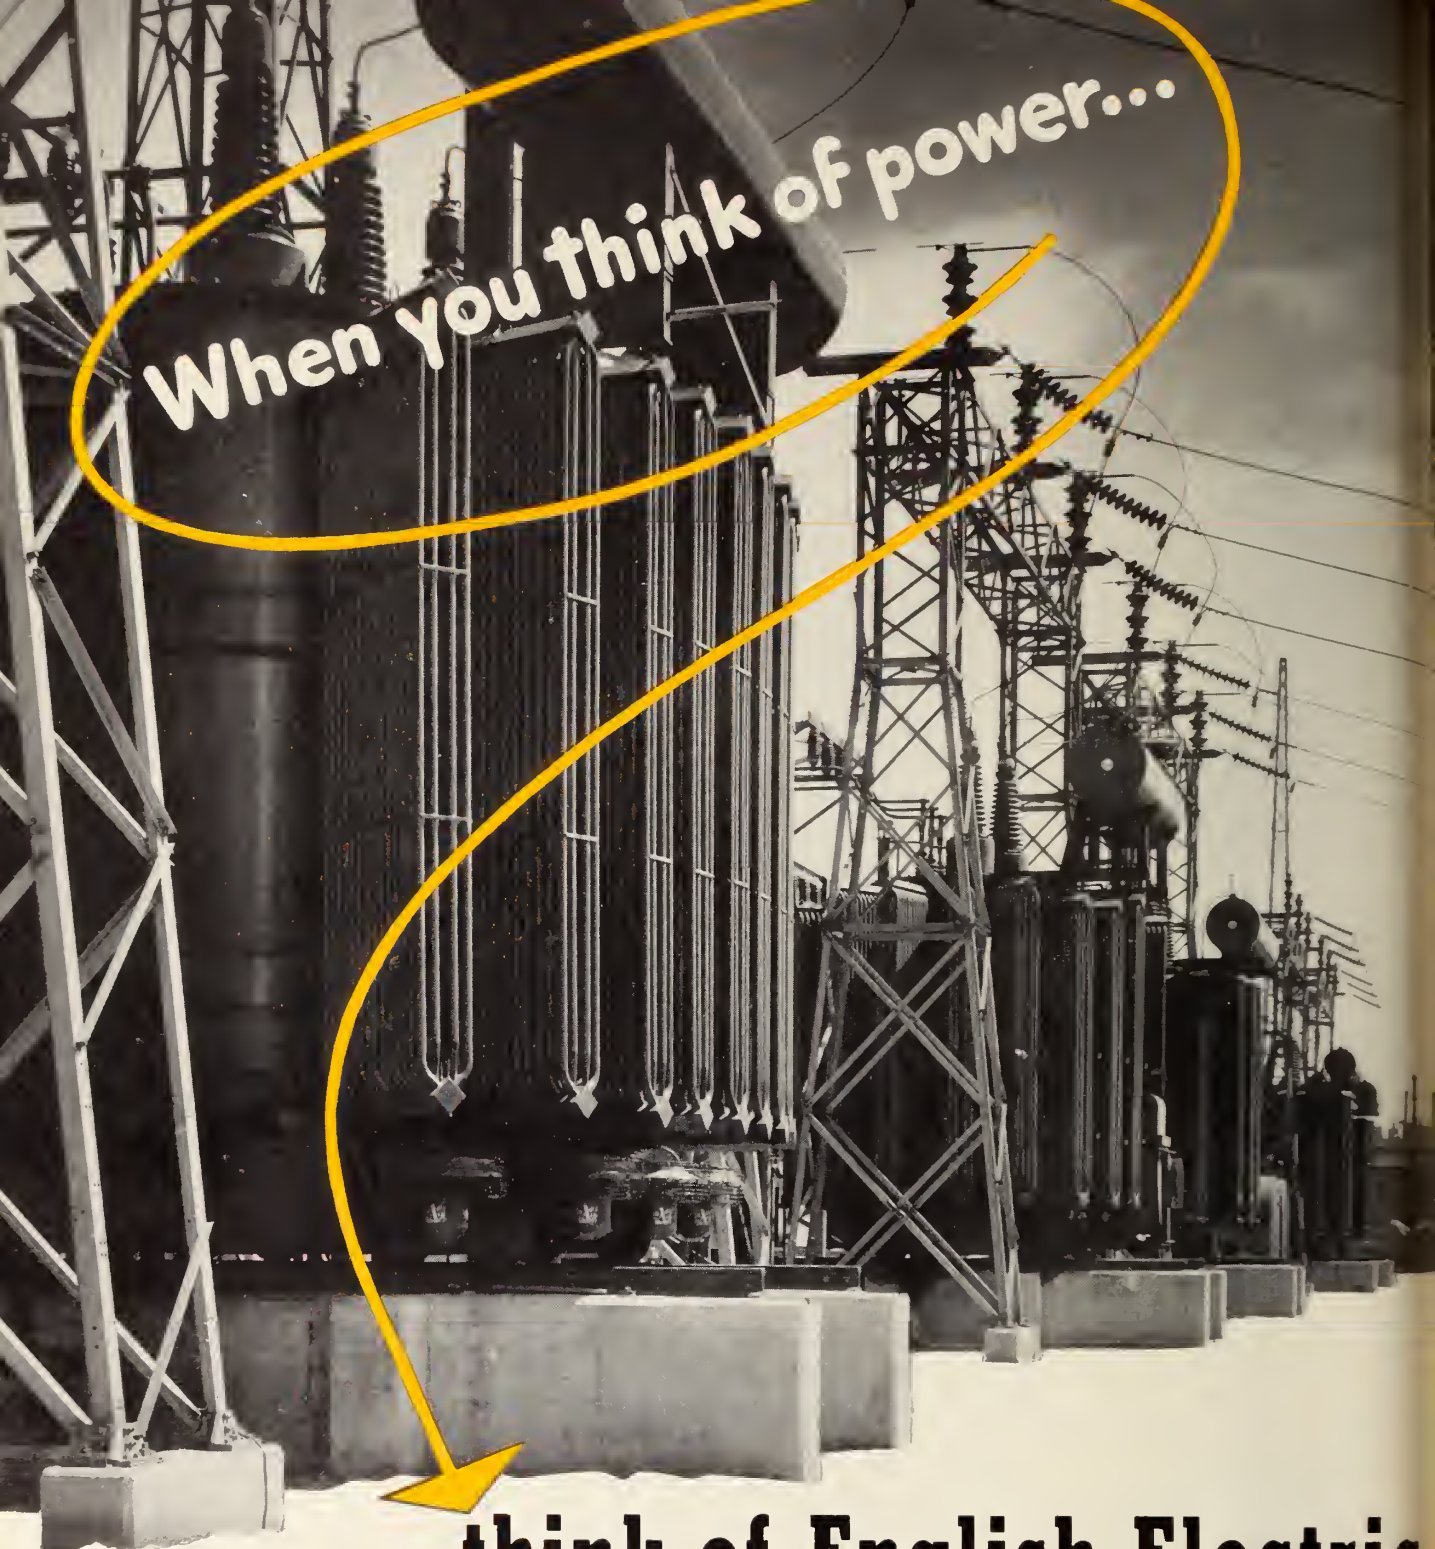
●

U.K. Electrical Equipment.—A Newcastle, England, firm has received orders totalling $8-million for the Ontario Hydro-Electric Commission's $30-million Toronto plant. The first contract, placed early this year with the firm was for two turbo-alternators, each 100,000 kw. A further contract for two similar units, has just been announced by Sir Claude Gibbs, the firm's chairman and managing director.

The first two generators are now in an advanced stage of construction, and should be working towards the end of 1951. The third unit will be supplying electricity in Toronto in November 1952 and the fourth in January 1953.

●

C.G.E. Equipment.—The first post-war blooming mill drive in Canada is to be installed at the Algoma Steel plant at Sault Ste. Marie. A 7,000-hp. 50-r.p.m. General Electric motor will replace a



When you think of power...

team engine on the main drive. Other lectrical equipment involved in this nportant installation includes a flywheel notor generator set and G.E. magne-last air circuit breakers.

A feature of the new installation is a ystem of "amplidyne control" which ermits accurate control of the reversing nain drive from one simple master witch with a choice of six speeds in ither direction. The drive, control and elated electrical equipment, will be en-ineered and built at the Peterborough Vorks of Canadian General Electric Co. The installation is planned for September 951. The rating of the main drive d-c notor is 7,000 hp.; 50 deg.; 50/120 r.p.m.; 50 volt; 430,000 lb. net weight. The m-g et is a 4-unit flywheel type, consisting of three 2,000-kw d-c generators, one ,000-hp. wound-rotor induction motor nd one flywheel of 170,000 hp. seconds tored energy.

An order for 16, 20,000 k.v.a. trans-ormers has been received by Canadian General Electric Co. for the new Alcan levelopment at "Chute de Diable" on he Peribonka River. The installation vill step up power from the new devel-opment, from 13,200 to 172,000 volts, for ransmission to the Arvida smelter. The ransformers are oil-cooled units employ-ng the exclusive G.E. shielded layer vinding. One bank of transformers has vindings of aluminum wire rather than he conventional copper. Installation is scheduled to begin in September 1951.

●

New Synthetic Fibre.—A British chemi-cal company is investing a very large sum of money on a new Wilton, north England, plant for the production of a new synthetic fibre known as "Terylene". It is claimed that this new product feels like silk and is twice as strong as cotton. The new plant will produce the material at the rate of a 11 million lbs. per year.

Terylene is chemically different from any other synthetic fibre. Its raw materials are the by-products of crude oil. It has excellent textile properties, drapes beautifully, and is pleasant and soft to the touch. Terylene fabrics can be easily laundered and quickly dried. Knitted goods made from it are warm to the touch as well as attractive.

●

Silicone Rubber Compound.—A new silicone rubber compound is available from the Chemical Division of Canadian General Electric Company. This compound permits rubber fabricators to mould silicone rubber parts more easily and with highly improved mechanical and thermal properties.

Designated as No. 81223 rubber compound, this new G-E silicone rubber is outstanding for its ease in processing. Many parts can be fabricated from it without prolonged oven-cure and it has excellent moulding and extrusion properties after only a five-minute warm-up. Because of the outstanding hot tear strength of G-E 81223 silicone rubber, parts with undercuts can easily be removed from moulds; and being neutral in colour, stock can be coloured for product identification purposes for individual fabricators.

Further information may be obtained by writing to the chemical division of Canadian General Electric Co. Ltd.

●

New Valves.—A line of valves for actuating air or hydraulic cylinders has just been introduced by Ledeen Manufacturing Co., Los Angeles, California. These valves embody rotating disc construction and are made in three types: for hand - operation, foot - operation, and finger or solenoid operation. This group of valves is available in 14 different models for 5 different cycles in 6 sizes and may be used for controlling the flow of air, oil or water. The hand-operated valves turn 45° each way from neutral, a total of 90°. The foot-operated valves turn 15° each way from neutral or 30° total. The finger or solenoid-operated valves are actuated by two simple poppets, which are depressed about ⅛" by light finger touch. Complete details may be obtained from the Company. The address is 1602 So. San Pedro St., Los Angeles 15, California.

●

Nordberg Diesels.—Nordberg Manufacturing Company, Milwaukee, Wisconsin, announces the addition of a two cylinder engine to supplement the Type 4FS1 single cylinder, 10 to 15 horsepower Diesel engine which is already on the market. This new engine, conservatively rated at from 20 to 30 horsepower within an operating speed range of 1200 to 1800 r.p.m., has a 4½-in. bore and 5¼-in. stroke. It is known as the 4FS2. Complete information may be obtained from the manufacturer.

●

New Thermometer.—What is claimed to be a new and different type of industrial thermometer is now being distributed in Canada by the Palmer Thermometer Company, Limited, of Toronto. The thermometer has an adjustable dial that can be rotated to any position for easy reading. The thermometer stem can be mounted at any angle and the dial rotated to any position. The instrument has an 11-inch scale, marked in bold, readable numbers.

●

Canadian Trade Fair.—Despite current unsettled world conditions, it is anticipated that the 1951 Canadian International Trade Fair will surpass all others both in numbers of participants and visitors. England is again a major exhibitor, with more space booked so far than any other country. The United States, Czechoslovakia, Italy, and Switzerland are also well represented and space has been taken by firms located in Australia, Scotland, Austria, France and South Africa. The new Industry Building, which, when completed will be one of the most modern exhibition buildings on this continent, will absorb the anticipated increase in exhibitors. Its additional 50,000 square feet of floor space will provide a total of 220,000 square feet for display purposes. The actual size of the Fair, including restaurants, lounges, the reception area, and other necessary services, is more than 500,000 square feet. Machine tools, plant equipment, textiles, and material handling exhibits promise, at the time of writing, to be the leaders in space taken and variety of products to be shown.

●

Foster-Wheeler Contracts. — Foster-Wheeler Ltd. of St. Catharines, Ont., has been awarded a contract for the extension of Imperial Oil's Edmonton refinery. The additions will be a fluid catalytic cracking unit with auxiliary gas recovery plant and a vacuum distillation unit.

Each of the two units will have a capacity of 10,000 barrels a day, and are part of a programme estimated to cost $5 millions. The new equipment will increase production of high octane gasolines, but will not add materially to the refinery's capacity nor number of employees.

The "cat cracker" will be the first of its kind in the world. Design is by Standard Oil Development Co. and has been subjected to exhaustive tests. The result is a catalytic cracker which is simpler to operate and more efficient.

Construction will begin as soon as possible in the spring and is expected to be completed in the summer of 1952.

●

Helicopter Helps Steeple Jack.—How to repaint a 150-foot stack with a minimum interruption in plant operation was demonstrated recently with the aid of a helicopter at the Monsanto Chemical plant in Everett, Mass.

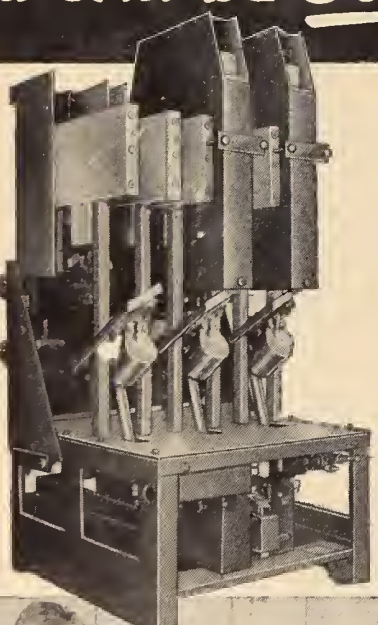
The steeple jacks went to the top of the stack in the helicopter, taking with them staging hooks, blocks and falls, and other equipment. A steeple jack leaned out the door of the machine and dropped his staging hook to the top of the stack. The necessary ropes were lowered to the ground and the steeple jack then went to the base of the stack, and hoisted himself into the bos'n's chair. Total time, including take-off and landing, was one half hour.

●

Industrial Management.—A gift of $5,250,000 from the Alfred P. Sloan Foundation Inc., for the establishment of a School of Industrial Management at the Massachusetts Institute of Technology was announced by Dr. Karl T. Compton, Chairman of the Corporation of the Institute.

Dr. Compton said "The concept of the school will be to correlate the complex problems of management in modern technical industry with science, engineering, and research. The objective will be to prepare young men of today better to meet the exacting demands of indus-

(*Continued on page 73*)



LONGER LIFE: Silver inlaid primary contacts; arc-resistant alloy arcing contacts; vertical arc deionizers using Zircon porcelain plates.

BETTER PROTECTION: Consistent fault-clearing time and ability to withstand repetitive operation. More protection for your equipment!

STRONGER ELECTRICALLY: Westinghouse condenser type bushings; high dialectric micarta base supports and insulation. Send for booklet B-4016.

trial management as they become the industrial executives of tomorrow."

Wood-Treating Course.—The Ottawa Laboratory of the Forest Products Division, a unit of the Forestry Branch of the Department of Resources and Development, will conduct a five-day course in kiln-drying, commencing February 19th. Applications for attendance must be received by February 3rd as only a limited number of applicants can be accommodated. Only one person from any single firm will be accepted and vacancies will be allotted in the order that applications are received. If the demand is sufficient, a second course may be held in March. Applications should contain the following information: (1) Name and status of applicant; (2) Whether of not a hotel reservation is desired; (3) If hotel reservation is desired, state applicant's expected time of arrival in Ottawa.

Address applications to: The Superintendent, Forest Products Laboratory, Department of Resources and Development, Ottawa, Ontario.

Subjects to be dealt with during the course are: The significance of wood-using industries in the Canadian economy; commercial species of woods used in Eastern Canada and their identification; cellular structure of wood and its effect on seasoning; mechanical properties, moisture strength relations, and other factors; wood seasoning; air seasoning; kiln-drying; control instruments and other kiln equipment; drying schedules; seasoning defects and how to overcome them; storing and shipping of seasoned lumber; other methods of seasoning; decay and stain in lumber. There will also be visits to woodworking industries.

Iron Ore Reserves.—M. S. Fotheringham, president, Steep Rock Iron Mines Ltd., said recently, "The Steep Rock reserves of high quality iron ore are now known to exceed those of any other range old or new, on the continent".

Stainless Steel.—Stainless steels up to three times harder than those ordinarily available have been produced by a unique low temperature treatment at the Westinghouse Research Laboratories. By immersing the steel in liquid nitrogen baths at 300 degrees below zero Fahrenheit and then rolling or forging it at sub-zero temperatures, Westinghouse metallurgists have succeeded in superhardening the metal. It has been disclosed that even greater hardness has been achieved by following up the supercold treatment — called Zerolling — with heating at controlled temperatures.

Because the treated steel can withstand much higher "pull" and pressure loads than conventional stainless steels, the scientists predicted that it will find many new uses as a wear-resistant material in bearings, valve seats, springs, and other machine parts where high strength and corrosion resistance are required. Further information may be obtained by writing the Canadian Westinghouse Co., Hamilton, Ont.

Long Power Line Suspension.—The Consolidated Mining and Smelting Company of Canada, Ltd., recently announced a proposed extension of its power transmission lines to carry power from its Kootenay River plants near Nelson, to Kimberley, B.C. The project, which is estimated to cost nearly $3,000,000, will be started early in the new year and is expected to be completed in about two years. A 170,000-volt 75,000-k.v.a. transmission line will carry the power from Cominco's Corra Lynn plant on the Kootenay River up the West Arm of Kootenay Lake to a point between Ainsworth and Coffee Creek on the Main Kootenay Lake. The power will cross the lake to a point south of Riondel. The crossing, a distance of two miles, will be by overhead cables. This is believed to be the longest overhead span in the world.

Huge Clearing Press.—A 750 ton British Clearing Press recently installed at Armstrong Whitworth's plant in Coventry, England, is one of the latest examples of U.S.-U.K. co-operation in military production. The largest press of its type in an aircraft company in England, the press is of United States design and was built under licence in England by Vickers-Armstrongs at Newcastle.

Stewartville Spillway Performance Model and Prototype

by

J. B. Bryce, M.E.I.C.

Assistant Hydraulic Engineer,
Generation Department,
Hydro Electric Power Commission of Ontario

A paper presented to the Sixty-fourth Annual General and Professional Meeting of The Engineering Institute of Canada, and the Annual Summer Meeting of the American Society of Civil Engineers, Toronto, July 1950

This paper emphasizes the value of a model for pre-determining designs of hydraulic structures. Tests on a laboratory model of a dam and spillway disclosed best position for sluices and best location for training walls. It pointed the way to saving concrete by using lower walls with curved rolled-back lips. Best position, shape and size of baffles to dissipate energy were also determined.

For two main reasons, Stewartville spillway has been selected as the subject of this paper. The first reason is that the hydraulic design of the spillway was based entirely on model tests. As the spillway has now been in operation for some two years, sufficient time has elapsed to enable a comparison to be made between model and prototype performance.

The second reason is that two features of the spillway design are considered to be of general interest. These are: (1) rather unusual training walls, developed during the model test to guide satisfactorily flow at supercritical velocity, and (2) a somewhat unconventional application of baffle piers to obtain the necessary energy dissipation.

General Description of Spillway

The Stewartville development of The Hydro-Electric Power Commission of Ontario is located on the Madawaska river, about ten miles upstream from its confluence with the Ottawa river. Stewartville has an installed capacity of 81,000 horsepower, and operates under a head of 150 feet.

A general view of the development is shown in Figure 1, with the spillway on the left. Two sluices, 35 feet wide and with a normal head on the sill of 25 feet, are controlled by sluice gates, and two sluices 16 feet wide and with a normal head on the sill of 20 feet, are controlled by stop logs.

The discharge from these sluices issues onto an obliquely sloping rock hillside, and training walls contain and direct this stream into an open rock cut and thence to the river downstream. The rock cut is the open downstream portion of the tunnel used to dewater the site while the development was being constructed. In this cut, baffle piers are used to dissipate some of the energy in the stream before it is released into the erodible tailrace.

Scope and Description of Model Tests

The model tests of the spillway were carried out in the hydraulic laboratory of the University of Toronto in the summer of 1946. The location of the sluices, the location and design of the training walls and energy dissipating baffle piers, and the downstream river protection were all the responsibility of the model tests. All the spillway was reproduced, and also the downstream river for a distance of about 700 feet below the juncture with the spillway flow. The model was constructed to a 1:60 scale, and was undistorted.

In the first series of tests, a fixed bed was used in the channel downstream. The effort was concentrated in determining the optimum location of the sluices relative to the hillside and the most effective training wall locations. After considerable testing, the locations shown in Figure 1 were adopted. The rather unique training wall design developed in the tests is discussed in detail in the next section.

In a second series of tests, the fixed river bed was replaced by a moveable bed, and scour studies were carried out. While guiding the discharge from the sluices into the head end of the tunnel cut resulted in considerable energy dissipation in the resulting fall, the scour studies indicated that further energy dissipation was necessary. A great variety of energy dissipating devices was tried, but baffle piers in the tunnel cut were found to be the most effective. Destructive scour from the remaining energy released into the river could be prevented by heavy riprap on the far shore.

In Figure 2 is shown a view of the model with the sluices in their final position, and the training walls and baffle piers in place. The moveable bed tailrace is shown excavated to final grade. In Figure 3, the model is shown in action.

Training Wall Design

As mentioned before, the dis-ıarge from the sluices issued onto hillside which sloped both down-ream and to the left. The down-ream slope was sufficient to pro-ıce supercritical velocities at all nes, the velocities reaching about) feet per second at the end of e walls. The cross slope was suffi-ent, also, to cause a pile-up on e left wall, particularly if more an one sluice was open. It was und to be beneficial, also, that is stream be directed to the head ıd of the cut. This meant, there-re, that the training walls must ıntain this high velocity stream ıd also change its direction, rather ɔruptly in some cases.

Very high walls at first appear-l necessary for this purpose, as a ream of water rose to consider-ɔle heights along the wall when ıe direction of the flow was alter-l, due to the high energy content the water. It was noted, how-ver, that this stream was rela-vely thin. This suggested that if curved rollback lip were added) the top of the wall, then much ıwer walls might be possible. Such roved to be the case in the model, ıd prototype walls, dimensioned s shown on Figure 4, were con-ructed. In Figure 5 is shown the rototype in action with the right ate fully open and the rollback on ıe right wall in full operation.

The use of these rollbacks per-ıitted the wall heights originally ·quired to be reduced by half. As ır as it is known, this is the first me walls of this type have been esigned and built, and they ap-ear to offer real advantages if flow at supercritical velocity is to be changed in direction by the wall.

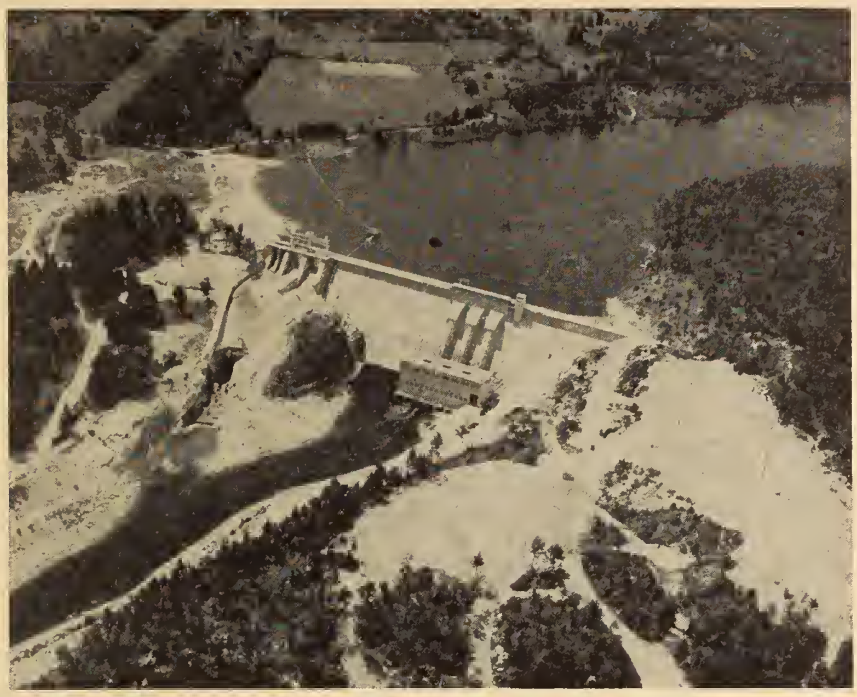

Fig. 1. General view of Stewartville Development showing spillway on the left.

Baffle Pier Design

Analysis of Energy Dissipation

By means of Pitot tubes, the energy line down the spillway and through the channel cut was measured, both with and without baffle piers in place. These energy lines are shown plotted in Figure 6, and permit an analysis of the energy dissipation. It may be observed from Figure 6 that even with no baffle piers in place, a large energy loss occurs from the stream falling into the rock cut. Scour studies indicated, however, that further energy dissipation was necessary if excessive scour was to be avoided in the erodible tailrace.

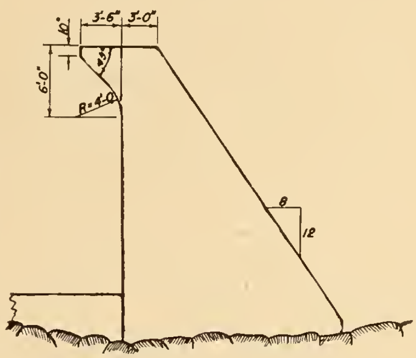

Fig. 4. Typical section of training walls showing rollback developed during model tests.

With the piers in place, it may be noted that the energy present in the stream issuing into the tailrace is near the theoretical minimum, and is considered to be the practical minimum considering the probably great non-uniformity in velocity distribution. This was confirmed by the fact that, regardless of the number of additional energy dissipating devices placed en route, the issuing energy remained the same. Under full flood flow, it may be computed from the diagram that the piers are absorbing some 85,000 horsepower which would otherwise be released into the tailrace.

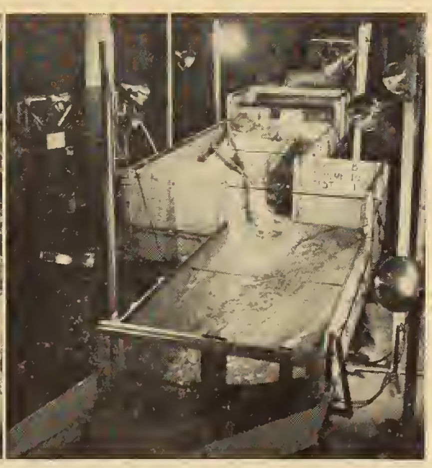

Fig. 2 (left). View of model with sluices in final position, and with training walls and baffle piers in place. Moveable bed tailrace shown excavated to final grade.

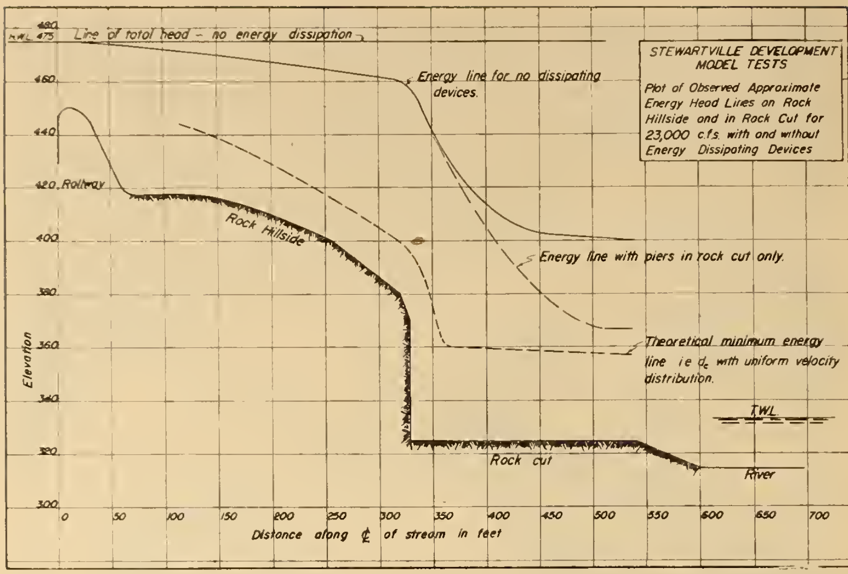
Fig. 3. View of model in action.



Baffle Pier Shapes Tested

A great many tests were made on the number, arrangement, and shape of the piers to give optimum results. It was established that eight piers gave the best results but a surprising feature was the great effect that the pier shape had on their efficacy. First sharp-cornered piers were tested, Figure 7 (g), then the various modifications shown in Figure 7 were tried in an effort to reduce possible cavitation. In every case, however, a departure from the sharp-cornered piers resulted in a markedly poorer performance. Hence the sharp-cornered design, Figure 7 (g), was adopted, and the corners framed with steel angles to discourage spalling

Fig. 5 (right). Training walls in action with 16,000 cubic feet per second discharge from right sluice gate. Note rollback on right wall in full operation.

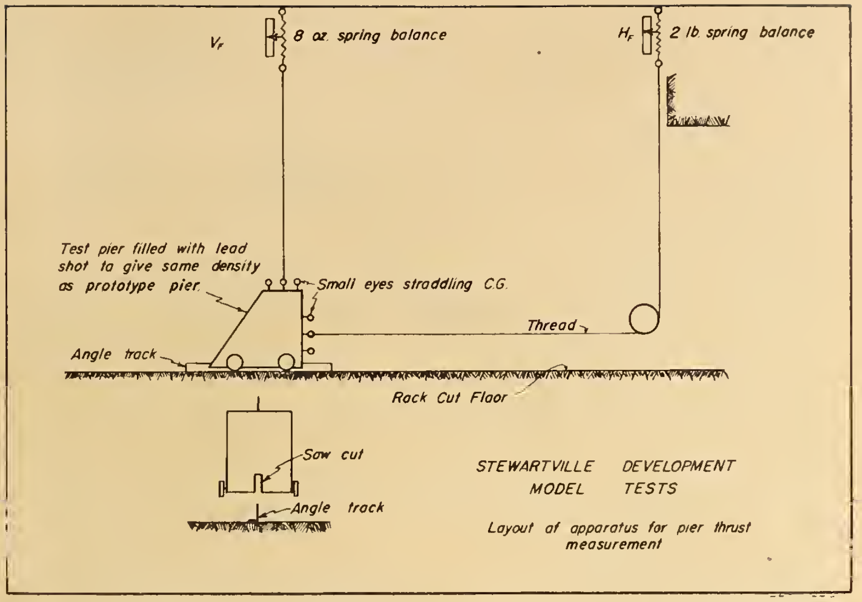

Fig. 9. Diagrammatic sketch of apparatus used to measure loading on baffle piers.

'igure 8 is a photograph of the iers as constructed.

leasurement of Forces Acting on Piers

To assist in the structural de-ign of the piers, an effort was nade to measure the forces acting pon them. While special equip-ient was not available for an ac-urate determination of the forces nvolved, an approximation was onsidered to be of value. The nethod used was to replace each ier in turn by a pier specially veighted to give the correct specific ravity, and free to move in a rack parallel with the channel's ongitudinal axis. In Figure 9 is hown a diagrammatic sketch of he apparatus, and spring balances s shown then measured the force arallel to this axis and also the vertical force on the pier. From these measurements it is believed that a reasonably accurate estimate of the forces involved became possible. Incidentally, the measured force acting downstream corresponded to that computed if a drag coefficient of 1.6 were used in the drag formula.

Prototype Performance

In May 1949, a test operation of the spillway was made, with each large gate being fully opened in succession. In Figure 5 is shown the right wall in full operation when the right gate was opened, and in Figure 10 is shown the left wall in action when the left gate was opened. In Figure 11 is shown the energy dissipation in progress with the right gate fully open, which corresponded to a spillway flow of 16,000 cubic feet per second.

Model-Prototype Conformity

As far as could be determined by visual observation, the action of the prototype appeared to agree in every respect with that predicted by the model. The height of water on the training walls and the action of the walls appeared identical with the model performance. While it was impossible to determine the actual energy dissipation, the flow pattern appeared to be the same, and the riprap protection on the far shore appeared adequate to resist the energy released into the tailrace.

It appears reasonable to conclude that model tests may be used with confidence in the solution of problems of this type. √

Strategic and Economic Factors Affecting Canada's Far Northwest

by

M. W. Maxwell, M.E.I.C.

Chief of Development,
Canadian National Railways, Montreal

A paper presented before the London Branch of The Engineering Institute of Canada, on November 21, 1950

This paper traces the development of the North Pacific Planning Project, outlining its original scope and its expansion to cover peacetime economic aspects and more territory.

Pointing out that Alaska is the key to the defence of the west coast of this continent, the author warns that in a general war Oriental or European enemies would not neglect these Arctic approaches. He interprets the physical geography of the North Pacific Region in terms of defence, and shows the importance of Prince Rupert as a major supply base.

A plea is made for giving the Pacific Northwest the greater attention it deserves as well as for heeding the Pacific Planning Project's recommendations today, when they are doubly pertinent due to the threat of war.

Through the middle and late war years a group of Canadian men, selected from academic, scientific and public service sources, with whom I had the honour to be associated, carried out an extensive survey of what is, perhaps, with the exception of the Arctic regions, the least understood and most incompletely appreciated area of the continent. This is the northwestern corner of the Commonwealth described in their final notes as follows:

> "This great expanse of mountain, valley, lake, and plain, designated herein as the North Pacific Region of Canada, comprising northern British Columbia, most of northern Alberta, and the District of Mackenzie with the entire Yukon Territory."

Despite the problem of dealing comprehensively with the economic geography of such an immense and little known region, the original conception of the project was much broader. It proposed a joint study by Canada and the United States of what we have referred to as the North Pacific Region, which would have incorporated in it the territory of Alaska.

It came about in this way: Following the landing by Japanese forces on the islands of Kiska and Attu, the cold realization dawned on both Canada and the United States of the significance of this violation of North American ground. Feverish defence preparations were made, first individually and then jointly, by the forces of the two nations. Canada's chain of interior landing fields was developed into the Northwest Staging Route, the Alaska Military Highway was built, measures were taken to secure a source of oil from the Canadian interior, and a rail line connecting the rail system of the continent with the Alaska Railway was surveyed. Canadian forces joined with United States forces in the routing of the Jap from the Aleutian Islands of Alaska.

Project Extended to Include Economic Aspects

In these joint undertakings it became apparent that there was a significance far beyond individual national defence interests. Suggestions were made, and developed at high national levels, that the two countries should undertake intensive studies of problems of mutual interest or concern in the economic development of this vast northwestern corner of the Continent.

These suggestions were passed through the Joint Economic Committees of Canada and the United States, whose self-effacing and little publicized work and influence was so vital in our common struggle. In 1943 they decided to sponsor a joint series of studies, to be known as the North Pacific Planning Project. The objective of this internationally conducted investigation was to study the possibilities for the economic development of the region; i.e., the Canadian North Pacific and Alaska, for the benefit of the two countries. The question would be viewed particularly from the defence standpoint—and directed to the welfare of the inhabitants of the area, with special attention to the problem of the post-war utilization of the facilities established n the area for military purposes.

The territory that originally came under this study comprised, including Alaska, 1,360,000 square miles, of which about 700,000 square miles was in Canada. The final Canadian area studied was expanded to take in about one million square miles. Dr. Charles Camsell, C.M.G., M.E.I.C., well known to all of you, was made Canadian director of the Project, and the United States director was Mr. James C. Rettie.

Study Mainly a Canadian Effort

To augment the limited information pertaining to the region, technical departments of both Federal and Provincial governments organized field surveys, to make special studies of the geology and mineral resources, forests, wild life, recreational resources, water power potentials, and to extend the topographical knowledge. Departments of Agriculture put in hand special soil surveys, completed and filed data on horticultural studies; the Fisheries services cooperated by furnishing the results of work done in the far hinterland; the Dominion Bureau of Statistics made some special studies, and a particularly painstaking and valuable piece of work was turned in by the Meteorological Division of the Department of Transport. In addition the Government of British Columbia carried out special work on the mineral resources and the forests of the northern section of that province. Corresponding departmental work was done in the United States.

It was unfortunate that, following certain departmental reorganizations at Washington and the wartime transfer of some of the key men, (a much larger and more ambitiously organized group than the Canadian) the United States panel was broken up and their work on Alaska, of which some 12 volumes had been filed, was suspended.

It was decided, however, that the Canadian group should not only continue the study of the Canadian territory, but that the territory should be expanded somewhat. As finally defined, it lies within the area bounded on the

Fig. 1. Aerial view of Prince Rupert, B.C.

Fig. 2. Prince Rupert Communications. Highway bridge over Bulkley at Hazelton.

Fig. 3. Prince Rupert's contribution to the Second World War included construction of naval vessels such as the one pictured here.

west by the Pacific ocean, on the south by a straight line drawn from the head of Bella Coola Inlet to headwaters of the Athabaska River near Jasper; eastward by the Athabaska River to the vicinity of Waterways, and thence by the 110th Meridian to Coronation Gulf in the Arctic; northward by Amundsen Gulf and the Beaufort Sea, and northwestward by the Territory of Alaska.

Project's Recommendations Should be Heeded Today

While the results of the work, due to disbanding of the United States panel, fell somewhat short of the early objective, the working plan was carried to completion and the results published in the form of a monograph entitled "Canada's New Northwest".

This work has had a limited edition and distribution and is comparatively little known. Yet its findings and recommendations seem especially pertinent in the situation in which the peoples of the United Nations generally, and the North American countries especially, find themselves today. Because of this I have thought some of the discussions, comments, conclusions, and occasional recommendations which it sets out are so timely as to be worthy of some mention at this time; and, from a viewpoint of five years after, with soldiers of our country engaged in another Pacific war with Orientals, that some of the observations may be worth noting.

It is not, however, my purpose to dwell in any detail on the findings of this work; it is rather my thought to develop a little further discussion of some of the aspects of political geography that it opened up in the light of developments that have followed the last World War. Until the second or Pacific phase of that war commenced, world political influence and military might had its geographical centre somewhere in Western Europe; Canada remained largely outside the zone of geopolitics. Today, Canada faces Soviet Russia northward across the partially navigable Arctic Ocean. Westward she faces across the main sea paths to the Orient. She forms, with Alaska, the great American land bridge and air path to the Asiatic continent. Thus the Canadian continental fringe becomes physically vital in any continental defence plans in which, doubtless, the United States will remain the dominant economic and political power.

Alaska the Key to Defence of West Half of Continent

In this geopolitical picture of the future, Alaska will stand out like the sore thumb that it resembles on the map of the world. Alaska, with the adjacent coastal fringe of Canada is the key to the defence of the Pacific shore of the continent. Alaska contains a great interior basin, in which an invader by land, sea, or air might well lose himself. With its vast chain of weather-cursed islands, the invasion of which represented so costly and so empty a victory for the late enemy, it forms a natural barrier. Furthermore, Alaska is an economic island. While its natural channels of land communications pass through Canada, it depends almost entirely for transportation on its sea connection with the northwestern ports of the United States.

The defence measures undertaken jointly and rather feverishly by the two countries following Pearl Harbor provided in the field of transportation:

a) The completion and expansion of a Canadian-built airway from Edmonton to Whitehorse and its extension to Fairbanks, Alaska, to form the Northwest Staging Route for the transfer of aircraft and equipment to Alaska and to our late Allies in Soviet Russia. This route connects the continental air centres with the extensive military air establishment of Alaska.

b) The Alaska Highway, built largely for the support of this Staging Route and so located that it can most conveniently serve it.

c) The establishment of an oil pipe line from Norman Wells in the MacKenzie valley across the MacKenzie Mountains through Yukon to a refinery established at Whitehorse, all now removed or abandoned.

d) Provision throughout the Canada-Alaska defence area of a system of communications.

e) The establishment of a forwarding depot for ordnance and supplies at the Port of Prince Rupert.

It should be mentioned here that while the Alaska Highway was under construction, the building of a military railroad to connect the Canadian rail system with the rail system in Alaska was considered by the United States Army Command, and with Canadian concurrence a route survey was made. This survey took advantage of a remarkable natural feature, the Rocky Mountain Trench. This valley lies just west of the main chain of the Rockies, and provides easy gradients and a straight alignment with few natural obstructions, from a junction with the Canadian rail system near Prince George, B.C., for nearly 500 miles to the Yukon border. Thence the proposed route crossed Yukon territory to Alaska making connections with the Alaska railway south of Fairbanks. Because of the improvement in the strategic and tactical situation in the North Pacific following the naval action at Midway, the railway project was abandoned. In any event, the original concept of such a work, to be completed in a year, would have been impossible of accomplishment.

Only Two Passable Gaps in Mountain Bastion

With the exception of the abortive attempts in the Aleutians, the opportunity offered either to possible Oriental or European enemies of attacking North America across our northwestern or northeastern Arctic approaches respectively, is not likely to be neglected in any future aggression against this continent. Such attacks would come either through Iceland-Greenland-Baffin Land, or through our North Pacific continental region of Alaska - Yukon - Northern British Columbia. It is, moreover, the opinion of some analysts of the late action in the Pacific that the failure of the Japanese was in their geographical concept of the military problem of North American invasion. Whatever might have been the final outcome of a major attack by the enemy on Alaska or the northern British Columbia coast, certain it is that little in the way of mechanics of defence or services of supply would have confronted them.

As a background, let us consider very broadly the physical geography of the North Pacific Region. It may be thought of as occupying part of two great physiographic provinces; first, the *Cordilleran*, represented in the Coastal Mountain System, the Interior Plateau, represented northward by the Yukon Plateau, and the Rocky Mountain System; and second, the *Great Central Plain*, including here the great Alberta Plain, which I have always thought of as the high prairie, the Peel River Plateau, and the MacKenzie Lowlands. To this might be added the great central basin of Alaska and the low-lying tundra-like northwest slope to the Beaufort Sea—corresponding to the Mackenzie Lowlands, but separated from them by the height of land between the Porcupine and Mackenzie Rivers.

It is a fact, obvious from the topography, that in all this far-flung coast from south of the United States border to the Alaska Islands, there are only two breaks in the Coast Range that, in the present development of land transportation economy, admit of the practical passage of a rail line. These are the passes cut through the coast mountains by the Fraser and Skeena rivers. Other passes have been surveyed; the Chilco, the Bella Coola, the Upper Nass-Portland Canal route—blocked by a glacier—and the Stikene route. All lack either

Fig. 4. Railway trestle on the Prince Rupert line near Smithers, B.C.

Fig. 5. Newly constructed naval vessel in Prince Rupert drydock during the Second World War.

physical or present economical feasibility.

Thus, from Puget Sound to the Aleutian Islands the grand old Coast Range raises its turrets challenging penetration except at two points, (1) the canyon of the Fraser River, the gateway to which is the Port of Vancouver, with the Port of New Westminster, with which should be associated the Squamish gateway to the Fraser Valley, (2) the canyon of the Skeena River, the gateway to which is the Harbour of Prince Rupert.

Prince Rupert Harbour Sheltered and Well Equipped

At this point let us note the situation of Prince Rupert with respect to ocean and coastal transportation. Nature has furnished along the Pacific Coast a sheltered waterway extending nearly 1,000 miles from Puget Sound, in the State of Washington, past Victoria and Vancouver, along the full length of the British Columbia coast and far up the inside of the panhandle of Alaska to Juneau, Haines (terminal of a branch of the Alaska Highway) and Skagway. Prince Rupert stands at the entrance to these Alaska waters, the most northerly Canadian deep-water harbour on the Pacific, and the only North American harbour north of Vancouver with rail access to the continental heartland.

Moreover, owing to the fact that the shortest routes from point to point over the earth's surface are the "great circle" lines connecting these points, the sailing distance from Puget Sound ports to Oriental ports is 465 miles or one and a half days' sailing time greater than from Prince Rupert. (Probably nearer three days in the case of convoys.) A saving of three days or more on the turn-around of a naval or supply ship or convoy in the wartime condition of shortage of bottoms is something to be reckoned with.

The advantage of Prince Rupert as a major supply base in support of military action in the Pacific was well demonstrated during the late war, when the United States Army made substantial extensions to the large existing deep-water dock and ocean sheds there, and established extensive cold storage, housing, administrative and other facilities including a large ordnance warehouse. This forwarding point served as a supply station for the entire Aleutian campaign. Not the least of the advantages to the Allied effort in the Pacific was the existence here of the Prince Rupert dry dock, and the ship construction and repair facilities of the Canadian National Railways. These include a heavy-duty floating pontoon dock. There is an associated shipbuilding plant in which eleven 10,000-ton Liberty type ships and a number of other craft were built during the war. There are also fully equipped marine repair shops and a foundry, where extensive repairs were made to war-damaged craft throughout the war.

This sheltered deep-water harbour, with its approach channel of 21 fathoms, would accommodate all the navies of the world. Good anchorage is obtainable in from 12 to 23 fathoms and the harbour is entirely landlocked and free from ice throughout the year. The main body of the harbour is about 10 miles long and a mile and a half wide. For the whole length of the city which has a peacetime population of about 9,500 it is about a mile wide. Mean tidal range is 20½ ft. There are 12 wharves, of which the 9 having 35 ft. low water depth alongside have a total berthing length of over 4,500 feet.

Advantageous Rail Rates

The existing equalization of rail rates from eastern and midwestern United States points to Seattle, Vancouver and Prince Rupert has some significance in the future of Alaska, the economic island, and, indeed, of Northwestern Canada. Prince Rupert is 640 miles nearer to Alaska than is Seattle, and about 530 miles nearer than is Vancouver. This shorter distance is reflected in steamship rates from Prince Rupert to points in southeast Alaska, which are very considerably below the rates to these points from Seattle. The differential in rates to Ketchikan and Skagway on a representative list of 88 common consumers commodities from points in midwestern and eastern United States shows a transportation cost differential on carload shipments favouring the Prince Rupert routing—i.e. rail to Prince Rupert and steamship to Alaska destination ranging from 4 to 15 per cent, with one maximum of 28 per cent. Of the 88 commodities studied only two; viz, bacon and shortening, did not favour the Prince Rupert routing.

A few samples, just as they come off the sheet, are representative:

Lard from Chicago to Ketchikan favours Prince Rupert by 7.2% to Skagway by 9.0%.

Cheese from Milwaukee to Ketchikan favours Prince Rupert by 8.9% to Skagway by 10.1%.

Power Transmission Belting. from Chicago to Ketchikan favours Prince Rupert by 6.2% to Skagway by 7.8%.

Men's shoes, from St. Louis to Ketchikan favours Prince Rupert by 4.0% to Skagway by 5.1%.

It will be seen that the spread in rates is great enough to merit careul study by shippers, especially shippers of defence goods who are delivering eastern-made goods to Alaskan destinations.

The reason why this advantageous rate situation has existed for years without notable increase in traffic, via the Canadian route, is not far to seek. The peacetime Alaskan market has been too limited to absorb carload shipments, which move into United States northwestern ports under carload rates. On the other hand, less-than-carload shippers would have to pay less-car rates via Prince Rupert, losing on the rail haul, all or possibly more than could be gained through the shorter water movement. There are various means by which this could be overcome, assuming adequate volume and frequency of connecting steamship service with Alaska. It will be sufficient for this discussion to point to the cost and time advantage of this routing, particularly as it may have a bearing on defence commodity movements.

Low Gradients — Moderate Curves — Heavy Standard Bridges

In various past discussions with defence and other governmental authorities of both Canada and the United States, there was obvious misconception of the quality and physical characteristics of the rail line to Prince Rupert, which joins the main transcontinental line at Red Pass Jct., 279.5 miles west of Edmonton. Because traffic, except for the war years, has always been light on this line, there seemed to be a vague general impression that it is a second grade line. The fact is that the line from Red Pass Jct. to Prince Rupert was built by the Grand Trunk Pacific Railway Company (completed in 1914) to the standards of a high-class main trunk line.

Since the G.T.P. and Canadian Northern Railway systems were consolidated for operation in the Canadian National system, the main terminus of that system has been at Vancouver, where much more rail traffic originates, terminates or is forwarded. Consequently, the so-styled "Rupert line" has had to assume branch line status. The traffic density is very low, population in the towns and villages directly on the route not exceeding 40,000, of which Prince Rupert accounts for 9,000 to 10,000.

However, the high standards of construction held the ruling grade to 4/10ths of one per cent, except for one relatively short eastward pusher grade of 1 per cent immediately west of Red Pass Jct. Compare this with the mountain gradients of some of the widely advertised North American roads. It might be recalled too, that the main line crossing of the Great Divide just east of Red Pass (Yellowhead Pass) is the lowest rail passage of the Rockies in North America. Steel bridges are of heavy standard construction—Coopers E 51 loading. The curvature of a standard maximum of 6 degrees is extremely moderate, having regard to the fact that this is mountain terrain almost throughout.

Oil-burning locomotives are used, and due to the light nature of the traffic these have been of 25,000-lb. tractive effort which, in practical terms, means handling trains of about 35 cars or 2,000 gross tons. Yard track capacity at terminals, while adequate for present day demands, is limited, but can be extended at all points without additional land commitments, as adequate provision was made in original construction. During the late spring, summer and autumn months there is a heavy express fish movement from Prince Rupert to eastern Canadian and United States points. In summer there is a fairly heavy tourist traffic over the line, which passes through some of the finest scenery in America.

Advantages Summarized

I think we may safely draw a number of conclusions:

1. The port of Prince Rupert is the only immediately practical land gateway to the Pacific from the interior production centres of Canada and the United States between Vancouver and the Aleutian Islands of Alaska.
2. The Prince Rupert land route provides an excellent channel of transportation for commercial as well as military purposes for the United States and Canada to Alaska and the countries of the Orient.
3. The Port of Prince Rupert —one of the world's greatest harbours — has highly developed port and marine facilities, capable of ready and swift expansion.
4. The rail line serving this port from the interior has been built to high railway standards, its present capacity can be readily amplified.
5. Under peacetime, no less than wartime conditions, the route through Prince Rupert offers large advantages in the movement of traffic between the United States and Alaska.

Moreover, not only is the over-all distance from points in the central and eastern United States and Canada to Oriental points shortened, as compared with other Pacific Coast ports, but of even greater significance is the saving

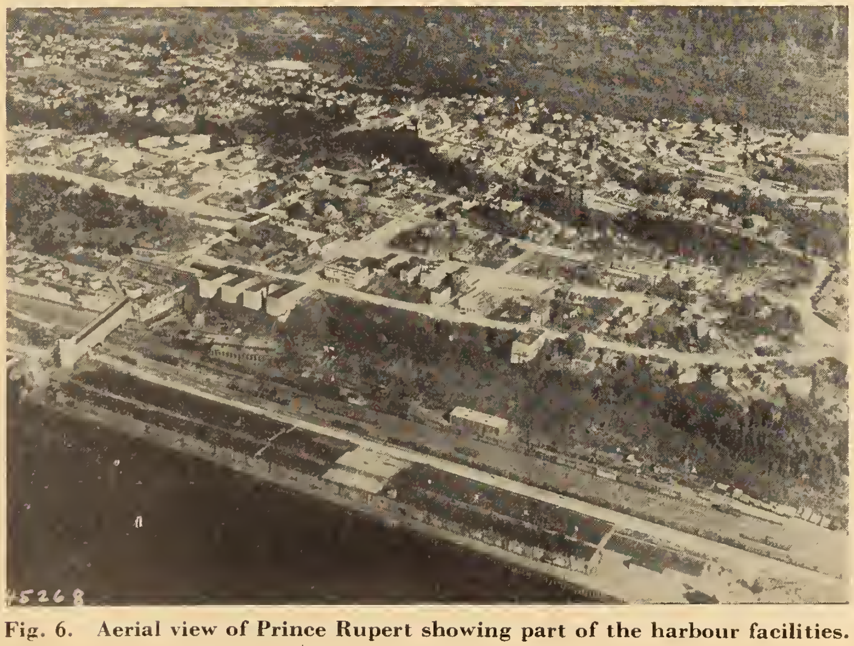

Fig. 6. Aerial view of Prince Rupert showing part of the harbour facilities.

in ocean-going ship tonnage required to move a given volume, and hence the hazard and resultant loss incidental to the movement of that volume. The saving in ocean sailing time to Oriental ports from Prince Rupert as compared with, say San Francisco, is 2½ days. The saving in ton days and, finally, in ship lifetimes especially in war conditions can readily be visualized. These points were well exemplified, though little publicized, in the late world war, when the United States forces used Prince Rupert as a forwarding base for ordnance and supplies of the Aleutian Campaign.

Northwest Deserves More Attention

It was not my purpose in preparing this paper to put forward any proposals or suggestions for action in the field of either defence or international collaboration. My excuse for choosing the northwestern corner of the continent as a subject is only that I have spent considerable time in parts of that country, and consequently have thought more about it than I have about some other things. I think it deserves a great deal more attention by North Americans of both nations, and especially in North American schools, than it has been receiving. Speaking in character, as a railway man mainly concerned with matters bearing on the development of our territory I can, however, with knowledge and confidence set out the following conclusion:

The northern Pacific coast of Canada, with its great harbour and port at the gateway to southeastern Alaska and facing to the Orient, has potentialities of national and continental significance which have been obscured, partly by events and partly by lack of popular understanding. Late developments in industry, in world affairs and in international relations, point to the increasing advantages that have come from the establishment of Prince Rupert as a Pacific Ocean terminal on the only harbour north of the Vancouver locality reached by the continental rail systems: advantages from a viewpoint of continental defence, as a factor in international relations in its situation at the gateway to Alaska and as a prime centre of industry on the north Pacific coast of British Columbia.

Cold Weather Construction

The crusher and mill buildings of Johns-Manville's new Munroe asbestos mine in northern Ontario were built during the winter months last year when temperatures were as low as —56°F on an exposed thermometer. The two five-storey steel frame buildings comprising 83,500 sq. ft. of floor space were erected in 190 working days using mainly unskilled labour, recruited locally and working under extreme winter weather conditions.

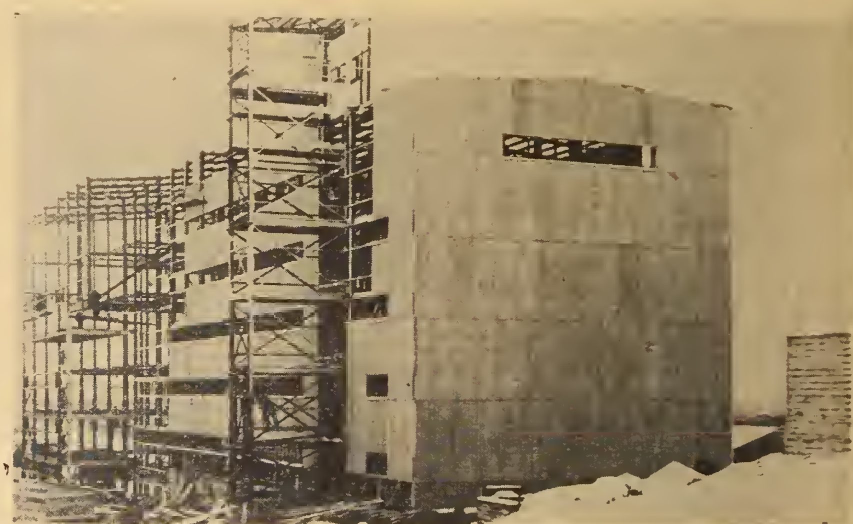

Fig. 1. First group of bays with exterior walls of corrugated Transite applied.

This performance was due mainly to the extreme simplicity of the wall construction used for the buildings. The steel structure was completed in units of 8 to 12 bays, the steel for each bay being carried to the full height before starting the next bay. After a group of bays was framed, the girts that support the wall were placed and the walls were built working from the outside in.

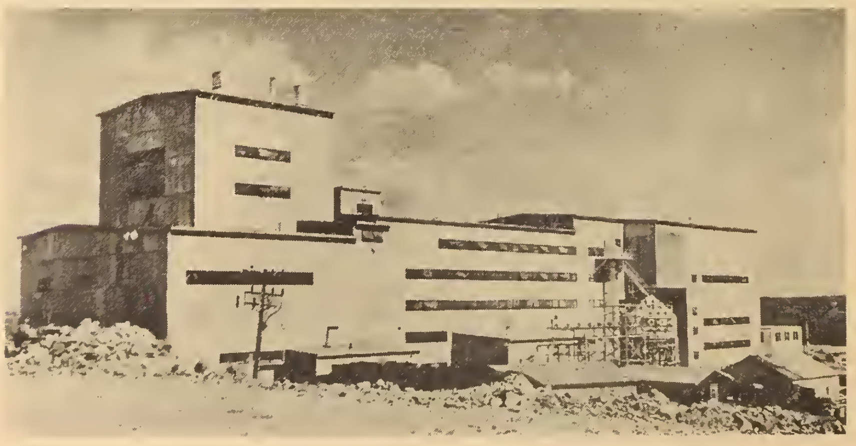

Fig. 2. Exterior of completed crusher and mill buildings.

Sheets of corrugated asbestoboard lapped horizontally and vertically, were stud welded to the steel transite. As soon as one group of bays were enclosed by these exterior sheets, a tarpaulin was dropped over the open end to permit heating and pouring of the five floors of concrete. Rock wool batts were then stacked against the inside surfaces of the corrugated Transite and covered with a vapour barrier paper. The wall was completed by stud welding an interior wall of corrugated Transite.

The finished wall is only 5½ in. thick and weighs only 15 lb. per sq. in. but it has an insulating value equal to a 10 ft. thickness of brick masonry.

Secretary, S. SILLITOE, 250 Sydney Street, Belleville, Ont.

BORDER CITIES

Chairman, H. D. KEIL
Vice-Chair., W. R. MITCHELL
Executive, W. A. McDOUGALL, P. S. DEWAR, D. A. SINCLAIR
(Ex-Officio), J. G. HOBA, J. K RONSON, F. J. RYDER
Sec.-Treas., J. C. AITKENS, c/o Ford Motor Company of Canada Ltd., Windsor, Ont.

CALGARY

Chairman, W. A. SMITH
Vice-Chair., D. C. JONES
Executive, H. R. HAYES, G. WEBSTER, R. S. WOODFORD, F. E. BALSHAW
(Ex-Officio), R. T. HOLLIES, P. M. SAUDER, J. J. HANNA, T. M. PARRY
Sec.-Treas., D. C. JONES, c/o Canadian Western Natural Gas Co. Ltd., 215 - 6th Avenue, West. Calgary, Alta.

CAPE BRETON
Chairman, C. N. MURRAY
Vice-Chair., W. DODSON
Executive, E. J. PRINCE, J. R. WALLACE, H. S. MARSHALL, W. L. DODSON, D. McKERRON, A. B. ROSSETTI, N. A. D. PARLEE, S. G. NAISH, K. E. GUSTAFSON
(Ex-Officio), C. M. SMYTH
Sec.-Treas., G. W. ROSS, Canadian General Electric Co. Ltd. Sydney, N.S.
Asst.-Sec., J. PRINCE

CENTRAL BRITISH COLUMBIA
Chairman, F. McCALLUM
Vice-Chair., A. F. PAGET
Executive, H. R. HATFIELD, R. L. BIGG, F. E. DEMBISKE
(Ex-Officio), W. RAMSAY, M. L. WADE
Sec.-Treas., M. L. ZIRUL, c/o Water Rights Branch, 515 Columbia Street, Kamloops, B.C.

CORNWALL
Chairman, H. W. NICKERSON
Executive, A. S. HOLDER, F. E. TREWARTHA, P. H. NASMYTH, A. A. B. McMATH, F. R. WARNER
(Ex-Officio), D. GILES, D. ROSS-ROSS, R. H. WALLACE
Secretary, JOHN A. SARJEANT, c/o Howard Smith Paper Mills Ltd., Cornwall, Ont.

EDMONTON
Chairman, E. H. WRIGHT
Vice-Chair., E. L. SMITH
Executive, H. A. CARSWELL, T. C. MAIN, R. E. PHILLIPS, N. J. ALLISON, L. G. GRIMBLE, E. SKARIN
(Ex-Officio), T. W. DALKIN, J. E. CRANSWICK
Sec.-Treas., T. E. BATE, Box 369, Edmonton, Alta.

HALIFAX
Chairman, A. R. HARRINGTON
Executive, P. M. LANE, G. F. C. BENNETT, J. W. MacDONALD, M. F. DEAN, J. P. VAUGHAN, L. J. ARCHIBALD, E. G. DeWOLF, J. E. CLARKE, W. J. FISHER, Wm. G. MUIR
(Ex-Officio), L. D. HOPKINS, E. C. O'LEARY, W. C. RISLEY, W. H. CHISHOLM
Sec.-Treas., W. E. JEFFERSON, 302 South St., Halifax, N.S.

HAMILTON
Chairman, E. T. W. BAILEY
Vice-Chair., W. L. HUTCHISON
Executive, F. J. McMULKIN, J. H. MITCHELL, W. R. McCOLL, H. H. WALKER
(Ex-Officio), W. E. BROWN, L. C. SENTANCE, W. J. W. REID
Sec.-Treas., G. L. SCHNEIDER, Bavaront, Halton Place, Burlington, Ont.

KINGSTON
Chairman, G. T. L. ANDREWS
Vice-Chair., A. L. MacLEAN
Executive, J. S. CAMPBELL, C. R. DUNLOP, D. L. RIGSBY, L. F. GRANT
(Ex-Officio), J. W. BROOKS, R. D. BENNETT, M. G. SAUNDERS
Sec.-Treas., J. T. PROVAN, 132 Wellington St., Kingston, Ont.

KITCHENER
Chairman, M. A. MONTGOMERY
Vice-Chair., M. D. STEWART
Executive, J. F. RUNGE, A. J. GIRDWOOD, S. DEMBICKI, A. C. MACNAB
(Ex-Officio), F. H. MIDGLEY
Sec.-Treas., W. R. ROBERTS, 356 Guelph St., Kitchener, Ont.

KOOTENAY
Chairman, J. L. BALLENY
Vice-Chair., H. P. HAMILTON
Executive, J. P. SVARICH, P. S. BARRATT, S. L. BAIRD, E. B. BROADHURST, W. V. NICHOLSON
(Ex-Officio), A. H. W. BUSBY, J. V. ROGERS
Sec.-Treas., T. W. LAZENBY, 1974 Topping Street, Trail, B.C.

LAKEHEAD
Chairman, O. J. KOREEN
Vice-Chair., A. J. MICKELSON
Executive, F. E. AYRES, A. D. NORTON, E. T. CHARNOCK, H. A. OAKS, J. H HARGRAVE, D. HUNTER, K. A. McCAFFREY, M. S FOTHERINGHAM
(Ex-Officio), W. H. SMALL, H. M. OLSSON
Sec.-Treas., G. S. HALTER, 22 Murray Block, Fort William, Ont.

LETHBRIDGE
Chairman, M. S. MITCHELL
Vice-Chair., P. E. KIRKPATRICK
Executive, A. L. H. SOMERVILLE, W. L. FOSS, W. B. THOMSON
(Ex-Officio), R. D. LIVINGSTONE, R. S. LAWRENCE, A. G. DONALDSON
Sec.-Treas. D. CRAMER, c/o P. F. R. A. Airport, Lethbridge, Alta.

LONDON
Chairman, G. E. HUMPHRIES
Vice-Chair., D. D. C. McGEACHY
Executive, R. G. CODE, D. N. COOKE, R. G. NEWELL, S. G. CHIPMAN, J. D. CAMPBELL
(Ex-Officio), G. N. SCROGGIE, V. A. McKILLOP, J. A. VANCE
Sec.-Treas., I. D. PATTERSON, R.R. No. 7, London, Ont.

MONCTON
Chairman, N. B. EAGLES
Vice-Chair., E. M. NASON
Executive, F. A. DIBBLEE, T. H. DICKSON, R. T. SANSOM, R. H. STEVENSON, W. D. G. STRATTON, C. L. TRENHOLM
(Ex-Officio), R. L PARSONS
Sec.-Treas., V. C. BLACKETT, 229 Highfield St., Moncton, N.B.

MONTREAL
Chairman, E. R. SMALLHORN
Vice-Chair., F. L. LAWTON
Executive, P. G. A. BRAULT, A. B. DOVE, G. E. SHAW, J. A. OUIMET, W. E. PATTERSON, R. F. SHAW
(Ex-Officio), H. GAUDEFROY, R. N. COKE, J. E. ARMSTRONG, H. F. FINNEMORE, R. E. HEARTZ, J. M. CRAWFORD, E. B. JUBIEN, J. P. CARRIERE, I. R. TAIT, L. L. O'SULLIVAN, L. A. DUCHASTEL
Sec.-Treas., R. B. WOTHERSPOON, Dominion Textile Co. Ltd., 710 Victoria Sq., Montreal.

NEWFOUNDLAND
Chairman, E. L. BAILLIE
Vice-Chair., G. H. DESBARATS
Executive, GRANT R. JACK, H. K. WALTER, E. H. BARTLETT, ERIC HINTON, G. W. CUMMINGS, W. L. STUEWE, J. B. ANGEL, H. S. WINDELER, E. L. BALL
Sec.-Treas., JAMES M. HOPKINS, 107 Bonaventure Avenue, St. John's, Nfld.

NIAGARA PENINSULA
Chairman, C. CLIMO
Vice-Chair., I. S. PATTERSON
Executive, J. E. KENNEDY, E. GRUMMITT, C. A. O. DELL, P. A. PASQUET, G. A. BENNETT, W. NEALE, H. L. WEAVER
(Ex-Officio), A. G. ASPLIN, P. E. BUSS
Sec.-Treas., J. J. MILLER, Niagara, St. Catharines & Toronto Railway, St. Catharines, Ont.

OTTAWA
Chairman, A. C. ROSS
Executive, G. R. DAVIS, T. FOULKES, M. C. S. BROWN, H. R. WELCH, J. J. GREEN
(Ex-Officio), J. L. SHEARER, A. A. SWINNERTON, J. C. ELLIOTT
Sec.-Treas., W. R. MEREDITH, 56 Sparks St., Ottawa.

PETERBOROUGH
Chairman, J. M. KING
Executive, C. B. MUIR, J. L. McKEEVER, J. C. ALLAN, B. OTTEWELL, A. J. BONNEY, G. T. DAVIS, C. W. HOLMAN
(Ex-Officio), A. R. HAILEY, F. R. POPE, M. M. ULOTH
Sec.-Treas., G. W. HERZOG, 601 Homewood Ave., Peterborough. Ont.

QUEBEC
Life Hon. Chair. A. R. DECARY
Chairman, LUDGER GAGNON
Vice-Chair., JEAN ST-JACQUES
Executive, M. ARCHER, C. B. BATE, G. DEMERS, J. P. DROLET, L. R. TALBOT, G. E. SARAULT
(Ex-Officio), J. O. MARTINEAU, P. A. DUPUIS, PAUL VINCENT, C. H. BOISVERT
Sec.-Treas., ROGER DESJARDINS, Prov. Transport and Communication Board, Court House, Quebec.

SAGUENAY
Chairman J. F. BRAUN
Vice-Chair., F. G. BARKER
Executive, G. K. CLEMENT, B. L. DAVIS, L. W. GEAKE, E. W. McKERNAN, J. MERCIER, D. F. NASMITH
(Ex-Officio), W. F. CAMPBELL, G. T. MALBY, H. V. PAGE
Sec.-Treas. F. E. HOGG, 846, C-I, 7th Street, Arvida, Que.

SAINT JOHN
Chairman, W. R. GODFREY
Vice-Chair., JOHN REED
Executive, A. R. BONNELL, D. R. WEBB, A. G. WATT, C. G. CLARK
(Ex-Officio), E. O. TURNER, L. O. CASS, D. O. TURNBULL, A. F. BAIRD
Sec.-Treas., W. M. BRENAN, 42 Princess St., Saint John, N.B.

ST. MAURICE VALLEY
Chairman, R. E. KIRKPATRICK
Vice-Chair., C. G. de TONNANCOUR
Executive, W. R. MacKAY, E. T. BUCHANAN, J. M. JOPP, C. H. NEIL, A. H. WATIER, G. R. GORING
(Ex-Officio), F. W. BRADSHAW, J. F. WICKENDEN, S. E. WILLIAMS
Sec.-Treas., C. M. WILLIAMS, Riverside, Grand'Mere, Que.

SARNIA
Chairman, C. P. STURDEE
Executive, S. V. ANTENBRING, A. W. SKENE, R. A. McGEACHY, J. GUTHRIE, C. M. STEWART, B. B. HILLARY, J. W. GRAEB
(Ex-Officio), F. F. DYER
Sec.-Treas., G. R. McMILLIN, Imperial Oil Ltd., Sarnia, Ont.

SASKATCHEWAN
Chairman, G. W. PARKINSON
Vice-Chair., A. B. OLSON
Executive, ALLAN TUBBY, P. G. McARA, C. C. HAY, R. BING-WO, J. B. MANTLE
(Ex-Officio), F. E. ESTLIN, A. H. DOUGLAS, M. J. SPRATT
Sec.-Treas., D. W. HOUSTON, P.O. Box 101, Regina, Sask.

SAULT STE. MARIE
Chairman, F. H. MacKAY
Vice-Chair., F. D. GREENWOOD
Executive, W. D. ADAMS, G. M. LYON, T. F. RAHILLY, C. W. BOAST
(Ex-Officio), L. R. BROWN, W. R. DALTON
Sec.-Treas., K. H. SNELL, 33 Riverview Ave., Sault Ste. Marie, Ont.

SUDBURY
Chairman, C. O. MADDOCK
Vice-Chair., R. H. MOORE
Executive, P. G. BENJAFIELD, F. A. ORANGE, W. F. MILLER, J. S. COOPER, J. E. FREEMAN, J. F. McCALLUM
(Ex-Officio), E. R. EATON
Sec.-Treas., D. W. McKINTY, The International Nickel Co., Copper Cliff, Ont.

TORONTO
Chairman, C. D. CARRUTHERS
Vice-Chair., W. H. PATERSON
Executive, D. C. BEAM, R. W. TEAGLE, I. S. WIDDIFIELD, H. P. CADARIO, M. McMURRAY, K. F. TUPPER
(Ex-Officio), E. R. GRAYDON, E. A. CROSS, D. G. GEIGER, J. F. MacLAREN, C. B. HAMILTON
Sec.-Treas., F. E. WELLWOOD, 236 Avenue Road, Toronto, Ont.

VANCOUVER
Chairman, J. E. MacDONALD
Vice-Chair., S. H. deJONG
Executive, E. L. HARTLEY, H. LIBBEY, C. SCRYMGEOUR, F. R. ADAMS, R. WALKEM, J. A. WEBSTER
(Ex-Officio), W. N. KELLY, J. N. FINLAYSON, H. N. MACPHERSON, S. HOGG
Sec.-Treas., STUART S. LEFEAUX, 975 Lagoon Drive, Vancouver, B.C.

VICTORIA
Chairman, T. A. J. LEACH
Vice-Chair., A. S. G. MUSGRAVE
Executive, D. A. MacLEAN, J. A. W. IZARD, G. W. C. LAKE, A. W. LASH, W. G. McINTOSH
(Ex-Officio), W. F. GRAY, H. F. BOURNE
Sec.-Treas., W. A. BOWMAN, 1280 Kings Road, Victoria, B.C.

WINNIPEG
Chairman, J. C. TRUEMAN
Vice-Chair., J. L. CHARLES
Executive, E. D. GAUER, J. W. GREENLAW, R. N. SHARPE, G. H. HERRIOT, R. T. HARLAND, W. L. WARDROP, J. R. RETTIE, R. A. MARVIN, W. C. HEANEY, L. G. SCOTT
(Ex-Officio), C. V. ANTENBRING, T. H. KIRBY
Sec.-Treas., G. W. MOULE, P.O. Box 541, Winnipeg, Man.

ONTARIO DIVISION
Chairman, W. L. SAUNDERS
Vice-Chair., W. A. T. GILMOUR
Treasurer G. R. TURNER
Board of Management, E. A. CROSS, F. R. POPE, C. P. WARKENTIN
Secretary, L. C. SENTANCE, c/o Canadian Westinghouse Co. Ltd., Hamilton, Ont.

Report of Council

For the Year

1950

Together with Committee and Branch Reports

During the past year, the Institute has continued the expansion of membership and activity that has characterized the years since the beginning of the Second World War. This expansion is general in national engineering bodies throughout the world.

The years of preparation for, and waging of, the Second World War were times of emphasis on pure and applied science, and incalculable scientific and engineering progress was made. The engineer population has increased tremendously and the Engineering Institute of Canada has become an organization to be considered and consulted in the conduct of the country's affairs, and such consideration and consultation has, in fact, come to comprise a good deal of the work of the Council and the directing and executive officers. Agenda of Council meetings commonly include correspondence with the senior ministers and department heads in Ottawa.

New Branches

During 1950 the Sudbury branch was officially inaugurated and has been most active on behalf of the profession in northern Ontario. In December, a long-standing need was met by the inauguration of the branch in Belleville, Ontario.

Annual Meeting

The 1950 Annual Meeting was a new departure from established procedure in that it was held in conjunction with the Annual Summer Convention of the American Society of Civil Engineers. About a thousand American and Canadian engineers attended and all agreed that the experiment resulted in an excellent exchange of views and technical information.

The branch officers' and students' conferences and other events identified with the Annual Meetings of the Institute were held as in the past but technical sessions, entertainment, plant visits, and most luncheon and dinner functions were held jointly with A.S.C.E. The combined efforts of both societies resulted in a particularly comprehensive technical programme comprising 57 technical papers.

Council and Committees

Council met 11 times during the year with 6 of these meetings being held at points outside Montreal. Standing and special committees have been active and it seems unnecessary to report again details which have been reported throughout the year in the pages of the *Journal*.

Engineers Council for Professional Development

The Institute, has, during 1950, continued its active support of this influential international group. The appointment of Lt.-Col. L. F. Grant, past-president and field secretary of the Institute to be vice-chairman of E.C.P.D. was in some measure a tribute to the contribution of the Institute, but it was also a further recognition of the personal support Col. Grant has himself extended in the various posts he has occupied on behalf of the Institute.

The activities of E.C.P.D. were considered in some detail in the report of the annual meeting of that organization which appeared in the November *Journal* (P. 988).

Premises

The expansion of the Institute activity has aggravated the congestion of the Headquarters building. The House Committee has continued to study the situation and certain minor changes have been made. After the installation of oil heating, the basement space was cleaned and painted and has now been put to use largely to provide additional accommodation for the library. During the past year, certain necessary repairs were made to the front mansard roof but there are indications that further extensive repairs will be necessary during the coming year.

Presidential Visits

During 1950, Presidents J. E. Armstrong and J. A. Vance continued the custom of visiting all, or as many as possible of the branches. With the complete co-operation of the Canadian Pacific Railway Mr. Armstrong was able to visit every branch and Mr. Vance has, at the time of writing, covered the maritime and western branches.

Commonwealth Conference

In accord with the desire of Council to maintain close relations with the World's major engineering bodies, Mr. Vance and the general secretary attended the second meeting of the Conference of Commonwealth Engineering Institutions in Johannesburg, S.A., in April and May of last year. The proceedings and resolutions of the conference have been published in the *Journal* (July p. 616) and are further covered in this issue (p. 107).

Field Secretary

In October the Toronto office of the Institute was moved from 350 Bay St., to the new building of the Ontario Association of Professional Engineers at 236 Avenue Road. This arrangement is expected to facilitate full co-operation between the Institute and the Association. In his capacity as field secretary, Col. L. F. Grant has already visited many of the branches and has particularly concentrated on the problem of keeping the Institute in touch with members not resident in branch centres.

Membership

The membership in all classifications now totals 14,317. New names added for the year amounted to 2,019, but deaths, resignations, and removals reduced the net increase to 1,751. Most of Canada's senior engineers in responsible executive positions are members and many lend their active support to the extent of real sacrifice in time and personal resources. The Council and the membership of the Institute are deeply indebted for these contributions which are in large measure responsible for the place the Institute occupies on the national scene. These engineers must be constantly succeeded, however, and it is fortunate that the Institute has always commanded the support of the most outstanding and aggressive younger engineers whose procession through branch and Council responsibility in the Institute so often parallels their rise to executive rank in industry.

The following figures indicate great promise for future years, however. Student members in the 1950 elections comprised 1,629 which would indicate that the rising generation is recognizing these obligations early. There were in addition 232 Members, 124 Juniors, and 4 affiliates elected during the year. There were 30 reinstatements and 46 members were honoured with the classification of life member.

141 Juniors and Students transferred to Member and 1,266 Students transferred to Junior. Seventy-six Members, 77 Juniors, 35 Students and 7 affiliates resigned or were removed from the list for non-payment of fees.

Deceased Members

During the year 1950 the deaths of 73 members, including one Honorary Member, have been reported as follows:

Honorary Member

Doherty, Robert Ernest

Members

Amos, Arthur
Astels, Fletcher
Atkinson, Marshall Brodie
Barnes, Howard T.
Bates, Harry Eli
Birkett, Leonard Harris
Buckle, Charles Wilfrid
Cann, William N.
Carpenter, Henry Stanley
Chalmers, John
Chisholm, Donald Alex.
Chisholm, William Ronald
Connor, Arthur William
Creasor, John Alfred
Cropper, William Charles McDonald
Dibblee, Harry Miles
Dixon, Leon Snell
Duffy, David Auriel
Dunn, Guy Campbell
Elwood, Michael M.
Ericson, Charles Gotthhard
Evans, D. Arthur
Farrow, Richard Charles
Fawkes, Arthur Walter Ellson
Fowler, Charles Allison DeWitt
Goldman, Hyman A.
Grandmont, Bruno
Gregory, Alex Watson
Hill, E. S.
Hill, Stanley Clayton
Holden, John Chiene
Houston, Gavin N.
James, Harold H.
Keith, Homer Pasha
Legris, Charles Ernest
Lembcke, Robert E.
Lumb, William Ewart
Lyman, Stephen M.
Marshall, Joseph Atholstan Pembroke
Middleton, John
Mitchell, William Gordon
Morrison, Hugh Archibald
Munson, Arthur Hale
Macdonald, Archibald J.
MacDonald, Charles Donald
Macdonald, John Butler
McGrail, Thomas Ernest
Macnab, John J.
MacRostie, Norman Barry
O'Leary, H. Gordon
Porcheron, Alphonse D.
Roland, John Wilson
Russell, Allan Hugh
Sears, John Joseph
Sherrin, Philip William
Sherwood, Luman
Simard, Joseph W.
Smith, Robert Melville
Snyder, Horace H.
Thorne, Edward Lefferts
Treloar, George Edward
Walker, Alfred Paverley
Wellwood, Henry
Woollcombe, Edward Mickle
Worsfold Cuthbert Coleman
Wright, Archibald E.

Juniors

Chalmers, Hugh McL.
Dohan, John Timmins
Stark, James Currie

Students

Collis, Bruce John
Derome, Paul Louis
Kaiser, Joseph John

Total Membership

The membership of the Institute as at December 31, 1950 totalled 14,317, divided in the following classes (1949 figures are included for comparison):

	1949	1950
Honorary Members	21	20
Members	5,410	5,663
Juniors	2,558	3,740
Students	4,498	4,818
Affiliates	79	76
	12,566	14,317

Respectively submitted on behalf of the Council.

James A. Vance, M.E.I.C.,
President.

L. Austin Wright, M.E.I.C.,
General Secretary.

Legislation Committee

The Committee was organized during the late autumn and according to the terms of reference, no legislation affecting engineers has been passed. Therefore, the Committee has nothing particular to report.

L. A. Duchastel, M.E.I.C.,
Chairman

Committee on Employment Conditions

As chairman of the above mentioned committee for the Institute, I wish to report no specific activities for the past year. It appears that the present employment situation in Canada and abroad does not warrant the intervention of the Institute in any individual case that may develop.

As for the last few years, this Committee has not been called for any active work.

G. N. Martin, M.E.I.C.,
Chairman

Employment Service

Demand for engineers exceeds the supply. That is the general trend noted by the employment service during 1950 and with the high industrial activity this trend is expected to continue throughout the current year.

For the first half of last year the demand was average, but in the later part the number of openings and requests for candidates from various firms has risen sharply. The increased pace of industry, caused apparently by the unsettled international situation, has not only opened many new doors for members of the engineering profession but has greatly expanded the contacts of the service.

Known placements of engineers through this office in 1950 were 121; 595 persons were interviewed and a large volume of correspondence was handled. While it is valuable for the record to know when the efforts of this service are successful through acknowledgement of employers and candidates, the routine matter of formal acknowledgment is frequently overlooked or forgotten. It is safe to assume that many more placements are obtained as a result of our contact work. Many placements were also made during the summer months with students seeking employment. They proved to be highly successful not only from the view point of students registered but also with many employers.

Junior engineers are very much in demand and the large graduating class of 1950 has been well absorbed into industry. Actually, vacancies for recent graduates are becoming difficult to fill, since almost all seem to be satisfactorily employed. Despite the normally lower demand for seniors, the service is able to report many highly successful placements. The heavy flow of immigration from the United Kingdom and Europe has supplied many skilled candidates and many of these too have been placed. Several firms seem to have filled their quotas for other than native Canadian engineers but there are still professional men arriving in Canada who are available.

A total of 360 vacancies were registered with the department in 1950 and the details showed great variety of needs. Several firms, not previously associated with the engineering field, sought our assistance in obtaining personnel. Sales work, requiring technical background, was prominently offered and found many applicants. A large publishing house employed juniors for magazine production work, a comparatively new outlet for engineering knowledge and skill. With the broader scope, it is not difficult to place engineers with general technical ability.

It is interesting to note in correspondence that long established businesses in the United Kingdom also seek Canadian representatives to handle its large export business to Canada. The volume of letters from all parts of our own country from coast to coast indicates the high prestige enjoyed by The Institute and its services.

The department is appreciative of the many gracious acknowledgments and thanks for services rendered. They provide encouragement and, perhaps more practically, keep our records more exact and valuable. For this reason alone, we would ask, as in previous years, that members co-operate in letting us know the results of interviews or contacts arranged by the employment service. A successful placement when recorded, enables us to clear our files and move on to spend the time on those still to be served.

At the end of the year, there were 94 applications on the available list. In some instances, these may represent men seeking specific types of jobs or certain locations of employment and again other special circumstances may prevail.

In its fourth year of publication, now well established, The Employment Bulletin, of which 1,000 copies are distributed each month, has been most helpful to members as a ready and quick summary of the employment picture.

The Employment Service wishes to assure applicants and employers alike that, during 1951, it will continue to serve them with all its energy, seeking out prospects to fill vacancies and exploring the widening employment field.

(Miss) A. Summers,
Employment Service

Publication Committee

During 1950, 171,910 copies of *The Engineering Journal* — an average of 14,325 per month — were printed. The cost of production was 53c per copy, or $6.36 per subscriber for the year. 811 pages of technical and news material were published. The committee extends the thanks of the Institute to the contributors of papers and branch secretaries and others who supplied news items and reports.

In 1947, the last year in which the advertising interests of *The Engineering Journal* were handled by an outside agency, the loss to the Institute in publishing the *Journal* amounted to some $8,000. In January, 1948, a new contract was signed which placed the advertising operations in the hands of the present publication manager whose office is in the Headquarters building and who, in addition to acting as the *Journal's* advertising agent, lends his extensive experience to the make-up of the editorial section of the publication.

Under this arrangement the *Journal* has shown a steadily improving financial position up to the report for 1950 which indicates that the *Journal* has been able to contribute a modest sum to the other publishing activities of the Institute—and particularly the publication of separate technical papers.

As reported a year ago, the *Journal* has come to serve as the general news vehicle of the profession in Canada and your committee believes it meets a real need in this respect. Certainly the committee encounters evidence that the membership generally favours the present form of the *Journal*. Council has made available, funds for the separate publication of highly specialized technical papers and it is entirely reasonable that modest surpluses which the *Journal* may be able to achieve should contribute also to this important publishing activity.

Your committee desires to emphasize again that this fund is available and it is prepared to receive, in fact it earnestly solicits, manuscripts covering original work of Canadian engineers. It is an obligation of the Institute to provide these publishing facilities for its membership and it is likewise an obligation of Canadian engineers to set down their technical accomplishments for the reference of future engineers.

Because of increased costs of all services and the constantly increasing circulation of the *Journal*, the publication manager found it necessary to recommend that the *Journal's* advertising rates should be increased effective January 1, 1951. Although the increase is approximately 25 per cent, the *Journal's* rates are still considerably less than the national average for contemporary technical publications.

I. R. Tait, M.E.I.C.,
Chairman.

Library and House Committee

One meeting of the committee was held in 1950. The need of additional room at headquarters has of course been discussed, but the question of additional office space is not now so pressing due to the fact that the reading room on the second floor has been taken over for administrative purposes. However, headquarters' activities are still expanding and the need for additional space, undoubtedly, will arise before long. It should be pointed out that the main difficulty in supplying additional space at headquarters is in obtaining sufficient money to do a job that will be satisfactory for many years to come. The amount required for this work is substantial and exactly how this money can be obtained is not readily apparent. It is understood that a grant is being made to a building fund every year, so that in time sufficient capital will be available.

In the meantime, this committee feels that present facilities have been expanded practically to the limit, but under present conditions where materials, etc., are difficult to obtain, this is not the time, perhaps, for proceeding with a complete new building.

During the early part of the summer, repairs were effected to the front part of the roof at headquarters' building, but further work in this direction will be required next summer.

Also during this last summer, the basement has been cleaned and painted throughout and is now used for the storage of books from the library. This move has been made possible because of the change last year from coal heating to an automatic oil system.

H. F. Finnemore, M.E.I.C.,
Chairman

Library Report

During 1950, the only change in the library, outside of staff, has been the addition of about 500 feet of shelving space in the stack room which should provide for about four more years of expansion. Provision is also now almost completed for extra reading and study space in this stack room.

Under the instructions of the general secretary, the librarian spent a week at the Engineering Societies Library in New York last October, working on the Universal Decimal System of Classification. This week proved most interesting and instructive. Work has already started at the Institute on the completion of the classifying of all the books in the library. All members of the staff are keen on this work. As it progresses, the increased knowledge of the books and their contents enables the librarians to render better service to the members, and, of still more importance, the members are better able to serve themselves in finding detailed information on any subject in which they may be interested.

Enquiries for information by telephone, letter and in person, show an increase of 21 per cent over any previous year, and circulation and reading room use of books, pamphlets and reference books has increased 15 per cent.

The attention of members is drawn to the library film service. At the present time, the library has in its collection eleven films, but Institute membership in the Canadian Film Institute gives the members access to all film information obtainable from Ottawa. Enquiries are invited.

The following statistics will be of interest to members:

Additions to the Library—	1950	1949
Books	364	259
Reports, Standards, etc.	771	766
Total	1135	1025
Increase — 8 per cent.		
Circulation—		
Books	2156	2089
Journals	2640	2036
Pamphlets	813	677
Films	6	8
Total	5615	4810
Increase — 15 per cent		
Enquiries Received—		
By telephone	4194	2978
In person—day	2129	2013
In person—evening	191	202
By letter	2060	1578
Total	8574	6771
Increase — 21 per cent		

The value of material received for review purposes and on exchange, totalled $2,886, an increase of 5 per cent over 1949.

Appreciation is expressed to all publishers who have co-operated in providing these books and reviews. It is hoped that the publicity has proved of advantage to all concerned.

Emily Keeley,
Chief Librarian

Membership Committee

The programme recommended by this Committee, of soliciting desirable prospects to become members of the Institute, is being initiated through the efforts of the Field Secretary's office. The results are not yet available.

The great increase in membership in the Institute has been through recruitment in the Universities and the subsequent transference of these student members to juniors and in turn the graduation of a large number of juniors to full membership. At the moment approximately half the membership of the Institute is junior and student.

The inauguration of several new Branches has provided facilities that have resulted in a number of desirable prospects joining as corporate members in these Branches.

In all the Branches there are numbers of desirable prospects who should be invited to join the Institute. It is hoped that some programme can be devised that will assure that these prospects are invited to become members.

H. R. Sills, M.E.I.C.,
Chairman

Board of Examiners

In September of last year Prof. R. DeL. French who had served as chairman of the Board of Examiners since February, 1945 relinquished these responsibilities and the writer desires to record the Board's appreciation of his outstanding contributions to its activities during this considerable period. The movement to Canada in the post-war period of large numbers of British and foreign engineers and the necessary appraisals of their engineering education and experience have resulted in a good deal of work for the Board. It is considered that the Institute is greatly indebted to Prof. French for his extensive contribution to this work.

To avoid duplicating the legally prescribed functions of the licensing bodies, it has been the policy of Council whenever possible to recommend to applicants that they should seek registration if their engineering education is not obviously equivalent to that offered by the Canadian universities. Because of particular circumstances in some of the provinces however, this policy cannot always be applied and the Board is then required to prescribe such examinations as it considers necessary.

Throughout the past year the Board has considered a number of such cases and has in each case recommended such examination as seemed called for. The Board has also co-operated with headquarters in the conduct of examinations.

Toward the close of the year the Board completed inquiries which indicated that the national universities of the Baltic States of Esthonia, Latvia and Lithuania were of equivalent status. Previously only the University of Latvia at Riga had been approved but, on the recommendation of the Board, the three universities are now considered equally acceptable.

C. A. Robb, M.E.I.C.,
Chairman

Treasurer's Report

The audited statements appearing below indicate that the Institute continued to operate on a sound financial basis during the year 1950.

Income from membership fees totalled $109,720.05, an increase of $7,215.02 or approximately 7.0 per cent over 1949.

Revenue from publications totalled $127,659.81, an increase of $23,409.93 or 22.4 per cent over the previous year. Expenses of publications totalled $126,877.17, an increase of $25,881.28 or 25.6 per cent over 1949.

After transferring $3,000 to the Building Fund, surplus for the year amounted to $458.60.

Securities in the Institute's investment accounts amounted to $56,728.75, representing a slight increase realized through conversion of certain holdings. The approximate market value as of 31st December, 1950, of all our securities stands at $56,716.00.

ALBERT DESCHAMPS, M.E.I.C.,
Treasurer.

•

Finance Committee

During the year 1950 the revenue eached an all-time high of $240,173, due o continued expansion in membership, o transfers of students and juniors to igher grades and to increased volume f advertising in the *Journal.*

There was likewise a large increase in xpenditure due to higher building exense, to the larger number of Journals rinted and distributed, to necessary staff and salary adjustments including the operation of a field secretary's office in Toronto throughout the year for the first time, to the publication of a directory which proved more expensive than originally estimated, to changes and expansion in Library staff, including transfer to enlarged quarters and to the general increase in the cost of doing business experienced by all.

While the Institute has come through a year of intense activity with the *Journal,* due to excellent management, carrying itself with a small margin to spare, it is to be especially noted that the excess of revenue over expenditure of $3,458.60 amounts to less than 1½% of the gross income and to only $0.24 per member including students and juniors. An amount of $3,000 has been transferred to the building fund which now stands at $20,000 and $458.60 credited to surplus account.

Special reference is made to the "Voluntary Contribution" project which Council agreed to in 1950. The need for additional funds was so apparent to the committee and to Council that some method had to be devised quickly to meet the situation. Consideration was given to increasing the fees but this is a slow process closely restricted by the by-laws. Had such a method been followed a whole year would have been lost. It is hoped and believed that the voluntary method will produce substantial results.

The Finance Committee recommends strongly that in future the reserves account should be increased on the basis of not less than $1.00 per member per year, including students and juniors to

AUDITORS' CERTIFICATE

We have audited the books and vouchers of The Engineering Institute of Canada for the year ended 31st December 1950 and have received all the information we required. We have verified the cash in banks and the investment securities and the revenue therefrom. In our opinion, the statement of assets and liabilities and statement of revenue and expenditure for 1950, as attached, are properly drawn up so as to exhibit a true and correct view of the Institute's affairs as at 31st December 1950 and of its operations for the year ended that date, according to the best of our information and the explanations given to us and as shown by the books of the Institute.

RITCHIE, BROWN & CO.
Chartered Accountants.

MONTREAL, 12TH JANUARY 1951.

provide for necessary expansion and the uncertainties of the future.

The Finance Committee met twelve times during the year and reported to Council at each Council meeting.

The Finance Committee is in an excellent position to appreciate the work done by the Headquarters' organization. Under these circumstances it is a pleasure to record the Committee's appreciation of the excellent service rendered by the general secretary and his entire staff.

R. E. Heartz, m.e.i.c.,
Chairman

Committee on Professional Interests

To assist the reader of this report to secure a clear understanding of this Committee's objectives, it would appear useful to have these objectives restated.

Originally organized to assist in the advancement of co-operative agreements between the Provincial Associations and the Institute which promoted their incorporation in the first instance, this Committee, while still carrying on its original work, has acquired, usually by direction of Council, the duty of assisting in the promotion of new branches, the encouragement of co-operative agreements with sister engineering societies and certain other special work not specifically coming within the scope of other standing or special committees.

With the foregoing in mind, we believe that the past year, from this Committee's standpoint, has been one of unusual progress. There have been many indications of substantial growth and of consolidation of the many gains made by the Institute in the five post-war years.

Chiefly to be recorded are:

(1) The eminently successful work being done by Colonel L. F. Grant as field secretary, whose activities will undoubtedly be recorded elsewhere but whose influence on the work of this Committee is of such a nature that this report would be incomplete were this assistance not gratefully acknowledged. This Committee regards the field secretary's work to date, and the potential accomplishments of that position, as being, as was expected, of the greatest importance.

(2) The overwhelming vote in favour of an agreement between the Manitoba Association and the Winnipeg Branch of the Institute is another step towards complete co-operation.

(3) Discussions are being held which are confidently expected to lead to the formation of a Branch in Prince Edward Island.

(4) The visit of the president and general secretary to Britain and South Africa, reported elsewhere, forges another link in Commonwealth co-operation.

(5) The Joint Annual Meeting with the American Society of Civil Engineers and the Engineering Institute in July, 1950 did much to cement the friendly relations between the two societies and in many ways offered the membership of both opportunities for interchange of ideas that occurs only too rarely.

(6) The inauguration of the branch at Belleville, Ontario, brought our

Auditors' Certificate

We have audited the books of the Harry F. Bennett Educational Fund of The Engineering Institute of Canada for the year ended 31st December 1950 and have obtained all the information and explanations we have required. The accounts record interest received on fully repaid loans only, no charge having been made for accrued interest on outstanding loans. In our opinion, the above statement of receipts and disbursements is properly drawn up so as to exhibit a true and correct view of the affairs of the Fund as at 31st December 1950 and for the year ended that date according to the best of our information and the explanations given to us and as shown by the books of the Fund.

Ritchie, Brown & Co.

Montreal, 12th January 1951.

total number of branches to thirty-three (33).

Implementing a decision by Council, ie vice-presidents of the various zones, sually in company with some senior embers, visited the branches of their one. Reports by both branch members nd the vice-presidents concerned indiated that this decision was a sound one lready the practice has resulted in iscussions bringing benefits to both ranches and headquarters.

This committee views with satisfacon the conferring by universities and ster societies, of honours and awards pon some of our distinguished members -events which were previously record-l in *The Engineering Journal*.

The increasing frequency of visits by minent engineers from Britain and the nited States and the visits of our members to the headquarters and ranches of our sister societies are nanifestations of growing unity in the rofession and such reciprocal visits hould receive the encouragement of ll members.

Admissions Committee

The work of this committee followed he usual pattern with recommendations resented at each meeting of Council on applications pending at the time. However, the recent revision of the by-aws has placed additional responsibility on this committee since opinions are not now received from the Councillors, and the sponsors are contacted only on specific request from the Admissions Committee.

Admissions or transfers were recommended for 376 members in addition to 138 automatic admissions and transfers under co-operative agreements, and 1,234 automatic transfers from Student to Junior. 1,629 students were admitted.

As noted in last year's report, work on the manual was suspended pending revision of the by-laws. The resulting simplified procedure in processing applications at Headquarters has now been established and the first draft of the Manual should be issued in the early part of 1951.

J. M. Crawford, M.E.I.C.,
Chairman

Ontario Division

The activities of the Ontario Division for the year 1950 have been limited in extent, and related entirely to projects initiated previously.

1. Shoreline Erosion

The committee on Shoreline Erosion, under the chairmanship of Mr. P. Buss, M.E.I.C., has studied in detail the report of Dr. G. B. Langford on this subject. Prompted by recent severe losses incurred at the western end of Lake Ontario, the Committee has taken steps to bring the problem before Federal authorities, through National engineering organizations.

2. Co-operation with the Ontario Association of Professional Engineers

The officers of the Division have continued discussions with officers of the Association, and a very satisfactory relationship, indicative of the fullest desire to further co-operation, has been maintained. Through the initiative of several Ontario Branches, and with the active co-operation of the Association, members of the Association have been encouraged, successfully, to participate in Branch and Institute activities.

3. St. Lawrence Waterway

The committee dealing with this subject has, under the chairmanship of Mr. E. A. Cross, M.E.I.C., completed an extensive study of Mr. J. G. G. Kerry's paper, and of related literature. Further investigation has been considered to be undesirable in the light of present advanced state of International discussions on this subject.

Officers for the forthcoming year are as follows:

Executive Committee: chairman, W. L. Saunders, Owen Sound; vice-chairman, W. A. T. Gilmour, Hamilton; secretary, L. C. Sentance, Hamilton; treasurer, G. R. Turner, Ottawa.

Board of Management: W. L. Saunders, Owen Sound; W. A. T. Gilmour, Hamilton; L. C. Sentance, Hamilton; G. R. Turner, Ottawa; E. A. Cross, Toronto; F. R. Pope, Peterborough; C. P. Warkentin, Sarnia.

A copy of the duly audited financial statement follows, prepared by the Treasurer, Major-General G. R. Turner.

Canadian Standards Association

As your representative on the Main Committee of the Canadian Standards Association, it is my privilege to furnish another annual report on the activities of this important and rapidly growing body.

The year 1950 has been a very busy one in all branches of the Association's activity, but the outstanding feature has been the transfer of the Approvals Division to new quarters at 71-77 Florence St., Toronto, and its consolidation as an operating unit in the C.S.A., severed entirely from the Hydro-Electric Power Commission of Ontario. This change is of outstanding importance and has involved a great deal of careful study and concentrated effort, but during a visit to the new quarters in November, the writer was impressed with the value of the new development and the splendid facilities now available to the large staff which has been transferred from various separated offices and plants to these new laboratories.

The Canadian Welding Bureau, another important division of the C.S.A., has also been very active in the promotion of good welding practice, including the education and control of operators. Since the establishment of this Bureau a few years ago, the confidence of engineers, architects, building officials and fabricators has increased to the point where welding is accepted for bridge and building structures by many municipalities and government departments throughout Canada. Further developments are in prospect in order to smooth out some of the difficulties and misunderstandings that still exist and a very active and important future is visualized for this division.

During the year, 47 new C.S.A. publications were issued comprising 34 new standards and 13 revised editions of existing standards. Twenty existing standards were reaffirmed as representing current practice, while minor revisions to 15 other standards were accomplished by the issue and insertion of revision slips. Many other projects are under investigation, some in an advanced stage and some in a preliminary stage, and to the construction industry, some of the more important accomplishments are the preparation of 19 specifications dealing with gypsum and lime products and also the consolidation of the specifications dealing with timber products under the newly organized Sectional Committee. Furthermore, the Sectional Committee on Civil Engineering has been divided to make possible the formation of Sectional Committees on such matters as concrete and building materials, etc.

Among the 47 standards published or republished during 1950, are a series under G-40 for structural steel, the new S-1 covering steel railway bridges, this being the 4th edition, a 3rd edition of B-12 covering galvanized steel wire strand, a 2nd edition of B-33.1 governing cap screws, set screws, studs and nuts and new additions of 015.1 and 015.2 governing cedar poles.

In conclusion, it may be noted that membership in the C.S.A. is increasing both in numbers and in representation and that industry in general is appreciating the fact that this Association provides a real service to both producer and consumer. There are still many problems to which standardization might be applied and the Association is willing and anxious to offer its services in every case where there is evidence of a potential usage for standard specifications.

P. L. Pratley, M.E.I.C.,
Representative of the Institute.

Prairie Water Problems Committee

Your Committee on Prairie Water Problems was not particularly active during the past year. The individual members were, however, very interested in the hearings of the International Joint Commission which held sessions in connection with the application of the Reclamation Service of the United States for a share of the water of the Belly and Waterton rivers. Some members of the committee gave evidence before the Commission, and participated in the discussion.

Your Committee wishes to go on record as being pleased with the appointment of General A. G. L. McNaughton, M.E.I.C., as Chairman of the Canadian Section of the International Joint Commission, and Jean A. L. Dansereau, M.E.I.C., as a Member of the Canadian Section.

While no problems have arisen, your Committee is very pleased to note the progress in the building of additional irrigation and power works that will make good use of considerable additional water, and increase both agricultural and industrial production. The Federal Government spent over four million dollars, and the Alberta Government over two million in the development of the St. Mary and Milk Rivers project in 1950. This year's construction brought about 6,000 acres additional land under irrigation, but eventually a total of about 340,000 acres will be reclaimed. This will, it is estimated, increase the population of Southern Alberta by about 30,000 persons, and increase the agricultural production by millions.

Calgary Power Ltd. made good progress in the construction of the Spray project, which will soon be put into operation, adding 210,000 acre feet of storage in the Bow River basin, and 90,000 H.P. to the company's power production.

The Prairie Water Board, set up by the Federal Government, and the governments of the provinces of Alberta, Saskatchewan and Manitoba, is functioning and making a thorough check up on the use and waste of water in the prairie Provinces. Its work should result in more economical use of the streams that originate in the East slope of the Rocky Mountains.

G. A. Gaherty, M.E.I.C.,
Chairman.

Committee on Atmospheric Pollution in Canada

This Committee was appointed early in 1949 to study the general question of atmospheric pollution in the various parts of Canada and to recommend a standard by-law or ordinance that could be adopted, with such local modifications as might be necessary, for use in any of the provinces.

The Committee was a joint one representing a number of different public and professional bodies, and since October 12th, 1949, eight formal meetings of the Committees have been held. At each meeting appropriate sub-committees were formed to study various individual aspects of the problem, and the reports of these sub-committees were dealt with at the main Committee meetings.

The full report, including the form of ordinance suggested, is now ready in draft form and will be considered at the next meeting of the Committee on January 17th, 1951. If it is then approved, after the necessary amendments have been made, it will be referred back to the parent organizations for approval or criticism. Thereafter, if the report is approved as it stands, it will be printed and published, but if further amendments of a serious nature are required, the Committee will reconsider the matter and will then, presumably, issue a new report.

E. A. Allcut, M.E.I.C.,
Chairman

Canadian Chamber of Commerce

The Canadian Chamber of Commerce celebrated its 25th Anniversary in 1950. During that period of phenomenal industrial expansion it has given leadership in the solution of many problems affecting the social and economic health of the country. This has been done not only in the national field but also, through the constituent local Boards of Trade and Chambers of Commerce, at the community level. "In fact, it is here that the most effective Chamber of Commerce work is done. It is through these community organizations, devoted to the promotion of the civic, commercial, agricultural and industrial progress of the community, that building for the future is taking place."

The basic soundness of the Canadian economy was shown by its ability to meet the unprecedented demands of the last war and by the facility with which it changed from war-time to peace-time conditions. However, in the words of the Annual Report of the Chamber "we are again faced with the need for greater defence expenditures. There is the prospect that continuing and heavier requirements for our actual survival will defer any further transition to a more normal peace-time basis for business generally.

"It would be difficult to superimpose even a moderate preparedness programme on our present industrial structure without limiting to some degree the freedom of producers to produce and of consumers to consume. Moreover, the burden on the national budget of substantially larger defence expenditures and larger social and public works expenditures could become dangerously onerous. All of our foreshadowed security legislation and spending, therefore, should be reexamined in the light of our defence situation.

"Nevertheless, both government and business are confronted with the problem of building sufficient bulwarks against communist aggression without undermining the very foundation on which our progressive democracy rests. Some sacrifices are inevitable, but a practical compromise must be effected between satisfactory defences and improving standards of living for our people. At the same time, any business boom brought on by the threat of war does not add to the country's basic economic health and strength. A democracy cannot turn its armaments into a profit.

"It is against this background that business leadership will be called upon to face a challenging year ahead. The Canadian Chamber is effectively organized to play its part in meeting that challenge."

This is a problem in which engineers, individually and as members of the Engineering Institute of Canada, should be vitally interested and in which they should take an active part.

J. A. McCrory, M.E.I.C.,
Representative of the Institute.

National Construction Council

Four meetings of the Council were held during the past year to consider certain proposals and requests from Organizations affiliated with the Council.

Perhaps the most important matter was the growing tendency of private and public bodies to engage engineers and contractors from the United States to plan and design their plants and buildings. This practice has created considerable dissatisfaction among Canadian engineers inasmuch as it reflects on their ability and professional qualifications. The situation was also aggravated by the change made a few years ago in the customs' regulations, whereby engineers' plans, drawings, and blueprints were admitted into Canada duty free.

In order to draw public attention to this situation, the Council felt it necessary to emphasize:

1. The cost of educating architects and engineers.
2. The loss of many of our talented youth who emigrate to the United States where they usually find little difficulty in obtaining lucrative positions.
3. The unfairness of tariff item No. 180e which permits engineers' plans to be brought into Canada duty free.
4. The conservation of American dollars.

With the assistance of the Engineering Institute of Canada and the Royal Architectural Institute of Canada, a survey was undertaken of the Canadian universities to ascertain the number of students taking courses in engineering and architecture, the number of graduates in these professions, the average cost of their education and the absorptive capacities of the engineering and architectural fields to take up the respective graduates.

The results of the survey indicated that there were 10,715 engineering students and 783 architectural students at Canadian universities in 1949-1950, of which, it was estimated, 3,591 would graduate in engineering and 99 in architecture during the year 1950. It was further learned, as a result of the survey, that the approximate average cost of an engineer's education, including tuition fees, text books, equipment, and living expenses, based on a four-year course, was approximately \$4,500.00 and that of an architect, \$4,240.00. To these amounts should be added the pro-rata cost of providing the necessary facilities and staff at the universities which is estimated at \$3,000.00. It was also learned that the absorptive capacities of the engineering and architectural fields were approximately 100 per cent for the engineers and 87 per cent for the architects.

While the free entry into Canada of engineering plans has been the subject of much discussion at meetings of the Engineering Institute of Canada, the Canadian Construction Association, and other bodies, the National Construction Council, because of the strong feeling that engineering services were being purchased in the United States when equal or better services were available in Canada, wrote to the Minister of Finance, drawing his attention to the fact that customs tariff item No. 180e, originally intended to apply only to engineering services not available in Canada, was, as at present worded, open to abuse. The Council believes that certain advantages have been taken which were never intended and this was causing a great deal of dissatisfaction among engineers and architects. The Council therefore urged the Minister of Finance to either amend or repeal the item in question and it was gratified to learn that he had agreed to refer the matter to the Tariff Board for investigation and report.

Another matter to come before the Council was the request of the Canadian Lumberman's Association to lend support to their resolution urging government action in the protection of Canada's forest resources. In view of the importance to the construction industry of the preservation of our timber resources, the Council wrote to the Prime Minister expressing wholehearted approval of this resolution. The Council was gratified to learn from the Prime Minister that the Government was also very much concerned with the tremendous loss of our forest resources through fire and disease and that legislation had been submitted to Parliament providing "for entering into agreement with the provinces for the protection, development, and utilization of Canada's forest resources, including protection from fire, insects, and diseases". This legislation, known as Bill No. 62, was subsequently passed, following which the Council sent its congratulations to the Prime Minister who expressed his appreciation for its kind words of commendation.

Among other matters to come before the Council during the past year, was the licensing of United States engineers to practise in the Province of Ontario. This enabled them to carry out a number of building projects which could not be carried out by American architects because they were not allowed to practise in Ontario under the existing Architects' Act. This matter is now under joint consideration by the Ontario Association of Architects and the Professional Engineers of Ontario and it is hoped that some satisfactory solution can be found to the problem.

Other matters considered included the Canadian International Trade Fair, on one of the Committees of which representation was requested from the Council; a draft code for dwelling construction in connection with which the National Research Council requested comments and suggestions; and the Combines Investigation Act, which the Council felt did not come within its jurisdiction, but was rather a matter for the individual consideration of its affiliated organizations.

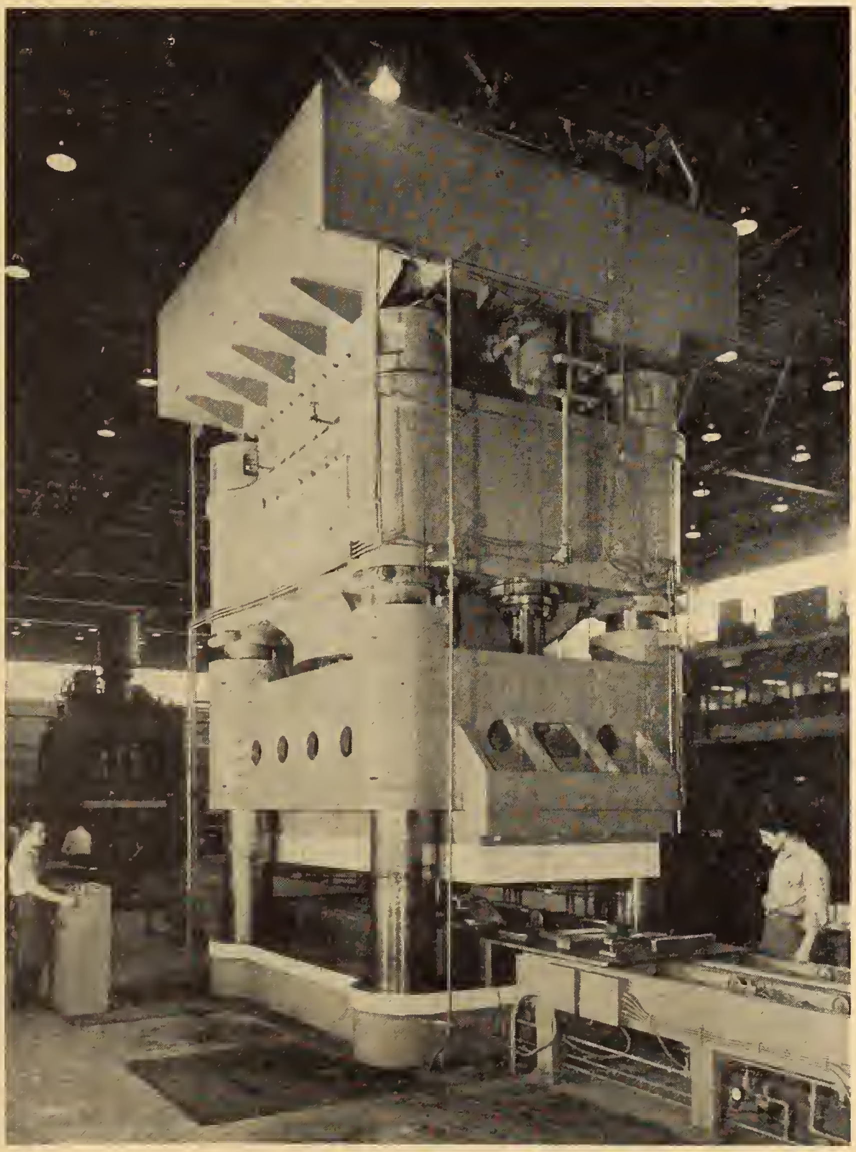
W. E. Bonn, M.E.I.C.,
Representative of the E.I.C.

Giant Forming Press for Aircraft Parts

This 5,000-ton hydraulic forming press, one of the largest ever manufactured in Canada, has just been built by Canadian Vickers, Limited, for Canadair, Limited, for the manufacture of aircraft parts.

A forming press of this type is economical because only a male die is needed. A block of special rubber in the lower part of the moving platen flows under pressure and bends the metal around the die. The rubber block in this press is the largest piece of rubber yet made in Canada. It is 12 inches thick, four feet wide and 12 feet long and weighs 3,702 pounds; it was made by the Dominion Rubber Co. Limited.

Built to Watson-Stillman designs, this press is not only one of the largest in the country but embodies the latest design features. It was completely manufactured in Canada, with the exception, of some of the hydraulic pump equipment which was unobtainable here. The top platen weighs 40 tons, the bottom weighs 35 tons, while the moving platen in the centre weighs 70 tons. The bottom platen is of welded construction. The rubber pad holder, made of seven-inch steel plate, has complete penetration welds. Holes for the four corner guide posts, each 18 inches in diameter, were bored simultaneously in the three platens. The press operates with a single ram, 62 inches in diameter; fluid pressure is 3,000 p.s.i.



FROM MONTH TO MONTH

Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

Hydro Electric Progress in Canada 1950

The annual review of Canadian Water Power Development, recently issued by the Water Resources Division, Department of Resources and Development, Ottawa, reports a new record for 1951 of 1,037,275 hp. of new hydro-electric capacity installed during the year. This brings total installed capacity to 12,654,835 hp., or 23 per cent of total resources. New plants and extensions under active construction will add a further million hp., while those definitely planned amount to another $1\frac{1}{2}$ million hp. Increased demand for energy was reflected in an 8-per cent increase over 1949 in the consumption of primary power.

In British Columbia, the B.C. Power Commission is undertaking two projects in the interior, totalling 37,000 hp. A 140-mile power line to Vernon was completed and another from Campbell River to Duncan is under construction. The B.C. Electric Railway Co. has installed a third 47,000-hp. unit at Ruskin, and will modernize the Lake Buntzen plant, increasing its capacity by 42,000 hp. Storage capacity has been increased on the Bridge River plant. Several substations have been built, as well as a power line from Nanaimo to Victoria. Northern B.C. Power Co. is installing 2,700 hp. in 3 diesel units. The Aluminum Co. of Canada will give further study in 1951 to their proposed 1,600,000-hp., development at Kitimat. In the Yukon, construction started on a 3,000-hp. plant at Mayo by the N.W. territories Power Commission.

In Alberta, Calgary Power Co. has developed 62,000 hp. at Spray Lakes, and 39,000 further hp. will be completed at three others of its plants in 1951. The transmission system is being extended. 2,500 additional farms were supplied with power service. Northern municipalities are installing two small plants and investigating a third. Edmonton has converted two more boilers to gas firing.

The Saskatchewan Power Commission is adding 15,800 hp. at Kindersley and Estevan, and built 350 miles of transmission lines during the year. Consolidated Smelters has reopened its 3,300-hp. hydro-electric plant at Wellington Lake, closed since 1942.

In Manitoba, Winnipeg Electric has added one more unit at Seven Sisters, and has built a double circuit power line to its new substation at Transcona. 38,000 hp. of the ultimate 114,000 hp. now being developed by the Winnipeg Hydro at Pine Falls, will be completed in 1951, as well as a first of two steam power units for the City of Winnipeg. Sherritt Gordon Mines is developing 7,000 hp. on the Laurie River for their Lynn Lake Mine. The Manitoba Power Commission has added 278 miles of transmission lines and 3,363 miles of farm lines during 1950, and increased substation capacity by 16,300 kva.

In Ontario, the H.E.P.C. accelerated their development programme on the Ottawa River due to rapid increase in demand for power. Seven 60,000-hp. units were placed in service at Des Joachims, leaving one for completion in 1951. At Chenaux, two 20,000-hp. units went into service late in 1950, leaving 6 more for completion in 1951. At La Cave, construction of a plant with ultimate capacity of 192,000 hp. is actively proceeding and 72,000 hp. will be ready during 1951. A 56,000-hp. plant was placed in service at Thessalon in July, while at Pine Portage two 40,000-hp. units are now in service.

Two steam-generating stations

Cover Picture

In his paper on page 76, J. B. Bryce, M.E.I.C., describes the extensive model tests from which was evolved the design of the spillway at the Stewartville Power Development of the Hydro-Electric Power Commission of Ontario.

This month's cover photo is a general view of the development in which the spillway shows very clearly at the left of the dam.

are under construction at Windsor and Toronto; the former with initial capacity of 132,000 kw.; the latter with initial capacity of 188,000 kw., both to be completed in 1951. Ultimate combined capacity will be 600,000 hp. Five temporary steam plants with combined capacity of 61,000 hp. were placed in service in 1950. Planning is proceeding on the Niagara River development authorized last year by treaty, with its proposed six 100,000-hp. units, scheduled for completion in 1954.

The Commission during the year built 1,870 miles of transmission lines and 2,100 miles of rural lines. 33,000 new rural customers were added. Good progress was made in converting from 25 to 60 cycles, and the programme is scheduled for completion by 1958 or 1959. Besides the H.E.P.C. programmes, 21,000 hp. have been added by two paper companies and one municipality during the year.

In Quebec, units totalling 241,800 hp. were brought into operation, and more than half a million hp. is scheduled for 1951 completion. Quebec Hydro installed another 110,000 hp. at Beauharnois, and 220,000 more hp. will be completed in 1951. Shawinigan has placed two 65,000-hp. units in service at their Trenche plant on the St. Maurice and will install a further 3 units in 1951. Northern Quebec Power Co. are adding a fifth 34,500-hp. unit on the Quinze River, to be completed in March 1951. The Aluminum Co. of Canada has commenced work on a 200,000-hp. development on the Peribonka River, for completion in 1952, and is planning a second development of similar size on the same river. A total of 81,000 hp. at five sites is actively under construction by various companies and municipalities for early completion, while other smaller developments totalling some 21,000 hp. are planned for commencement at early dates. Four hundred miles of transmission line and 615 miles of rural lines were completed during 1950 by Quebec Hydro, Shawinigan, and other companies.

In the Atlantic provinces, the Nova Scotia Power Commission installed 12,800 hp. on the Mersey River in 1950; 28,000 additional steam and hydro capacity is under construction. The N.S. Light & Power Co. completed a 5,000-hp. plant in 1951. The Company will add 3,000 hp. of hydro power in 1951 and will add two 20,000-kw. steam units in Halifax during 1951 and 1953. The New Brunswick Power Commission is building a 27,000-hp. plant on the Tobique River, and is enlarging its Grand Lake steam plant by 12,500 kw. in 1951 and by 15,000 kw. in 1952. The Newfoundland Light & Power Co. added 13,000 hp. in 1950, and is adding 3,300 hp. at Tors Cove in 1951. Other plants nearing completion are: Seaboard Power Co., Sydney, 15,000 kw.; and Maritime Electric, P.E.I., 7,500 kw. In the four Atlantic provinces, 200 miles of new transmission lines were completed in 1950, with a further 60 miles to come in 1951, while in Nova Scotia alone 350 miles of rural lines were built in 1950.

Ontario Association Annual Meeting

The Ontario Association of Professional Engineers' Annual Meeting was held on January 26 and 27 at the Royal York Hotel, Toronto.

A highlight of the meeting was the banquet on Saturday evening at which the speaker was General A. G. L. McNaughton, chairman of the Canadian Section of the International Joint Commission.

The banquet also marked the introduction of the new executive of the Association for 1951, headed by president W. H. M. Laughlin, M.E.I.C., of the consulting firm of Proctor, Redfern, and Laughlin of Toronto. Mr. Laughlin succeeded E. V. Buchanan, M.E.I.C, general manager of the London Public Utilities Commission.

A graduate with honours from the University of Toronto the new president first joined the Dominion Bridge Company in Toronto. In 1946 he left the position of chief engineer of the Company's Ontario Division to become a partner in the firm of Proctor & Redfern at which time the partnership assumed its present name.

Other members of the 1951 Association executive are: vice-presidents, O. D. Johnston, M.E.I.C., and J. H. Smith of Toronto; R. C. McMordie, M.E.I.C., W. L. Sagar, M.E.I.C., R. M. P. Hamilton, A. M. Doyle, A. W. Murdock, G. Ross Lord, M.E.I.C., and J. R. Montague, M.E.I.C., all of Toronto; J. L. Lang, M.E.I.C., Sault Ste. Marie; C. K. Fraser, Peterborough; D. S. Simmons, M.E.I.C., Sarnia; O. W. Titus, M.E.I.C., Leaside; L. C. Sentance, M.E.I.C., Hamilton; J. W. Baker, Virginiatown; A. E. Cave, Geraldton; M. W. Hotchkin, Kirkland Lake.

W. H. M. Laughlin, M.E.I.C.

C.C.A. Meets in Quebec City

The 33rd annual meeting of the Canadian Construction Association was held at Quebec City from January 21 to 24, 1951. More than 700 delegates attended. At the first general session, reports of standing and special committees and of representatives were read. Lorne Bain, chairman of the membership committee, announced that current membership stands at 810, a net increase over last year of 59.

Chairman W. J. Mackay of the publicity committee, reported that press and radio representatives are turning more and more to the C.C.A. for authoritative information on construction matters, and that releases enjoy wide acceptance. Chairman Drummond of the committee on materials called attention to a reversal in 1950 of conditions experienced in 1949, when a general balance between material supply and demand had been a main factor in stabilizing construction costs. Steel shortages, he believed, would continue for some time to come, in spite of the current expansion and modernization of Canadian mills. 1949 steel imports had dropped to an annual rate of 750,000 tons. There would be no production increase until late 1952. A further rise in production of brick is expected, while supplies of lumber are more favourable, and would exceed deliveries in 1950, particularly in the lower grades. He urged material manufacturers to expand production facilities, to keep pace with the appreciably larger construction volume that steel industry expansion will make possible.

Chairman F. G. Rutley of the equipment rentals committee asked approval for publication of a schedule of equipment rentals for use of governments, owners, and contractors, at a cost of $5,000, which would be largely refunded by sales of the schedules. Chairman G. E. Crain of the civil defence liaison committee, pointed out that his committee was an advisory group in connection with various engineering services required in the event of a major disaster. Groups had been formed in practically all areas, composed of competent men in their respective fields, many with former army experience, ready to assist authorities at all government levels. He felt that stress should be laid on organization and financial aspects, as well as on equipment available and type of work required.

E. S. Sargent, chairman of the legislation committee, called attention to the Essential Materials Act, of last September, which gave the Minister of Trade and Commerce standby powers to regulate production, distribution, and prices of essential materials. The two items most likely to be affected were steel and electrical energy. Enumerating several additions to, and changes in, federal and provincial legislation during 1950, he noted progress toward legislation to eliminate double assessment of employees for workmen's compensation when temporarily employed outside of their home province. Chairman Albert Deschamps of the taxation committee, pointed to the leadership given to industries by the C.C.A., in submitting its excellent brief last year to the Minister of Finance, as a result of which relief was afforded for the first time in the 1950 budget, to shareholders of closely held corporations in the event of the death of the head of the firm. H. P. Frid, chairman of the labour relations committee, stated that many labour leaders and employers have agreed that the time has arrived for the National Joint Conference Board to meet again, to agree on a labour formula that will make for the co-operation and peace so essential for defence construction.

More Apprentices Needed

J. M. Pigott reported as chairman of the apprenticeship committee, that present registration of active apprentices stood at 9,816 for Quebec, and 5,499 for all other provinces excepting P.E.I. and Newfoundland. Though this was an all time high, the latter figure should be doubled, due to the present acute shortage of mechanics. Furthermore, if the Quebec system is shown to produce satisfactory mechanics and if the apprentices stay in the industry, without too high a turnover, serious thought must be given, he warned, to adopting the Quebec system throughout Canada, abrogating the old apprenticeship agreement in effect in other provinces.

There was, he charged, serious lack of co-operation in the training of employees. He again begged the association to try and get a uniform response from employers. The scarcity of skilled mechanics, he pointed out created too-powerful unions, which could obtain advantages over other trades. It drove work from field to factory, and reacted unfavourably on design and craftsmanship. Not only were more mechanics needed, but better and more intelligent mechanics as well. The industry was also suffering from a lack of properly trained superintendents and foremen. Institutes for advanced technical training are being advocated, and some are coming into existence. Mr. Pigott asked that priority be given by the management committee to full consideration to the teaching of skilled construction trades to Canadian youth, to deal with the existing manpower shortage.

Defence Construction

R. G. Johnson, general manager of the Association, presently on loan to the Department of Trade and Commerce as president, Defence Construction Ltd., for the duration of the present emergency, thanked the membership for their many offers of co-operation. The best assistance they can give, he said, is to get their contracts completed quickly and economically. Defence Construction Ltd. is a Crown Company, set up to administer the construction programme for the national defence effort. Staffed by Central Mortgage and Housing personnel whose inspectors are located close to almost all D.C.L. job sites, it not only awards contracts, but carries out inspection, and is the paying agent as well. Five regional offices will call for and analyse tenders, awarding them in a matter of days. Only delays anticipated are when voted funds are inadequate. Some inspection will be done by National Defence, and some by engineering firms. As time goes on, engagement of the latter's services will increase.

The trend in defence construction will be towards permanent types of construction, requiring less maintenance. The target for speedy settlement with builders is three weeks after completion. All bidders will receive lists of all bids after award has been made. Contractors must first make an effort to get their own materials but if this fails, help will be given in procurement by the crown company, which also will have a material expediting division. A statement is forthcoming shortly regarding designations for priorities.

Bidders tendering firm prices, said Mr. Johnson, were at an advantage over those inserting escalator clauses. Each supplier and sub-contractor was in the best position to forecast trends and estimate firm prices.

President's Address

At the first day's luncheon, "Bob" Drummond of Toronto, the Association's president, presided. Following a welcome to the City by Armand Viau, Quebec's industrial commissioner, speaking on behalf of mayor Lucien Bourne, Mr. Drummond gave the president's annual address, in which he called attention to the record volume attained by the industry during 1950, the final D.B.S. figure for which would exceed $2½ billions. While government estimates of total work completed, including companies and individuals working on their own account, amount to $3.1 billions, 15 per cent greater than for 1949; half of this increase in dollar volume probably represents increase in physical volume. Reappearance of shortages and delays and wage increases were reflected in a 10 to 15 per cent increase in construction costs over a year ago. Yet costs are not out of line with the general trend.

The projected $1¼ billion defence programme, he said, plus shipbuilding, freight car building, and allied requirements, superimposed on record breaking civilian demand, foreshadows serious shortages and the imposition of certain controls. Controls and cutbacks are a negative approach. Emphasis should be placed on more effective use of our supplies, and expanded production and imports and the development of a larger labour force. He welcomed announcements by major steel producers of increases in capacity. Repetition of the postwar voluntary deferment of less essential projects was, he believed, just as possible today. Warning of the economic consequences of strikes, he recommended secret ballots on strike action and enforcement of penalties for illegal strikes.

Continuing, the president expressed the view that there is undue fear today of another depression. With a new spirit of courage, vision, and enterprise, he said, we have abandoned the lack of confidence which has so long frustrated our rate of progress. The course ahead is clear and gives no cause for fear. Self control can avoid a broad measure of government controls. Should world events grow more serious, general controls affecting production, prices, and pay envelopes may become unavoidable. One cannot be operated effectively without the other.

The guest speaker at the annual dinner was the Hon. Maurice Duplessis, Prime Minister of the Province of Quebec. Mr. Duplessis sounded a warning that we are today suffering from infirmity of will power. We see references to rationing and restrictions, when logic tells us the only reasonable and fair control is self control. This apathy and complacency, and not communism and subversive ideas, is the danger of the day. People forget that the money to support social security measures is their own money that they pay in taxes.

Resolutions

Resolutions under consideration by general contractors, sub-contracts, roadbuilders, and supply sections of the Association include recommendations for reciprocal agreements between provinces to avoid double assessment of workmen's compensation, a repeal of Customs Tariff 180 (e) which permits free importation of engineers' plans. Discontinuance of security deposits with tenders for privately owned projects, repeal of the existing Mechanics Lien Act; and a new act to protect only workmen; better inspection procedures for housing; changes in labour relations legislation to require secret ballots when trade unions vote on strike action; deferment of non-essential construction; resistence to escalator clauses and quotation of firm prices by the membership; encouragement and assistance to the Quebec-Ontario Joint Committee on apprenticeship.

Other resolutions up for discussion and approval call for training of immigrants in local methods, language, and customs, and attainment of citizenship; early completion of the Trans-Canada Highway; practical leadership by the Federal Government to provinces, cities, and municipalities in the matter of civil defence, and advice and direction in regard to costs; elimination of level grade crossings; and standardization of highway traffic signs.

Other Speakers

Other speakers on the Convention programme include Col. Willard Chevalier executive vice-president, McGraw Hill Publishing Co. Inc., New York; Max W. Mackenzie, C.M.G., Deputy Minister of Trade and Commerce, Ottawa; and J. M. Wardle, C.B.E., M.E.I.C., director of engineering, Water Resources Branch, Department of Resources and Development, Ottawa. The meeting closed with a dinner dance on Wednesday evening, January 24.

An Engineer Looks at Emigration

Sir Frank Whittle, HON. M.E.I.C., is better known as the inventor of the turbo-jet engine, than as an inventor or improver of emigration methods but today he is again coming into the public gaze because of some revolutionary ideas on emigration which he is advocating.

Not long ago Sir Frank was in Canada to sound out the officials at Ottawa on his proposals. They have not received much publicity, but he has sent the Institute a copy of a short article which gives a rather general outline of what is contemplated. Even a casual reading will disclose the immensity of the scheme, and only a few moments' contemplation will reveal it to be bold beyond anything ever conceived before. However, it is a positive proposal and deserves the serious consideration of everyone. Don't say it can't be done until you have given thought to the great advantages it offers. No proposal that holds such almost boundless possibilities for good, should be dismissed casually. It is indeed big business and big thinking.

Just recently Sir Frank has been elected chairman of the group, that is promoting the proposal; "the New Era of Emigration".

Here is the article:

"Operation Commonwealth"

Air Commodore Sir Frank Whittle, Hon.M.E.I.C.

A great deal is said about the numerical strength and technical quality of our fighting services, but far too little is said about aspects of the security of Great Britain and the Commonwealth which are even more vital to survival. However strong the fighting services may be, we shall remain dangerously vulnerable as long as we are 50,000,000 people living in a land which, even with its present highly developed internal communications, is not capable of feeding more than 30,000,000 from its own soil.

Even if the population were evenly distributed, the situation would be dangerous enough, but it is not. The great bulk of it is concentrated in a few small areas. The fact that one-sixth of the total population is concentrated in the 680 square miles or so of Greater London at least doubles our vulnerability due to over-population in itself. Added to this, all our main arteries radiate from London; dangerous bottlenecks in our overseas supply routes occur at such ports as London, Liverpool, Southampton, and Glasgow.

How many people stop to think what our situation would be if the railways, arterial roads, and major docks were put out of action overnight? They are the lungs and arteries of a highly organized community; without them it is probable that no more than 10,000,000 people could hope to survive. In other words, about four-fifths of the total population would be faced with death from starvation, because even though there might be food for three--fifths of the population, its distribution would become virtually impossible.

While a dislocation on this scale seems unlikely, it is not impossible. In these days of atom bombs, something approaching it is easily possible.

A highly organized community has many analogies with the human body. The individuals which compose it—like the cells of the body—are for the most part specialized to do certain limited functions. Apart from their own particular form of specialization, they are entirely dependent on other sections of the community for the means of life. The central government, telephone system, etc., are analagous to the brain and nervous system; the roads and railways fulfil similar functions to the veins and arteries, and so on, but like many complex mechanisms, while it may be very efficient while it is working, it is also very vulnerable — that is one of the great dangers of over-centralization. The better it works while it is working, the more liable it is to complete dislocation.

No country in the world is so vulnerable to the atom bomb as Great Britain. Five or six atom bombs at an equal number of vital points would cause complete chaos. They would not necessarily come from the air—what is to stop some innocent-looking tramp steamer from depositing atom bombs at critical points in the Thames and other major harbours, to be exploded at the will of the enemy? For all we know, they may be in position now. It would pay an enemy to use them in such a way that the maximum material damage is done while the loss of life is kept as low as possible. Collapse by starvation would then come all the sooner.

What are we going to do about it? Piecemeal emigration is useless. Nothing short of a very carefully planned large-scale migration will do. Whole communities must be moved to other parts of the Commonwealth in such a way that they can rapidly become virtually self-contained in their new home — with them must go their tools and, so far as possible, their living accommodation. The whole thing would have to be run like a large-scale military operation. The order in which people go would be most important. It is clear, for example, that the emphasis should be on the building trades in the initial phase. We could afford this because after about two million people had gone, the need for building further houses in this country would virtually disappear.

The movement of such enormous numbers of people and the vast quantities of equipment which would have to go with them is an immense task. It would, for example, require 100 voyages of a grossly over-crowded Queen Elizabeth to move one million people by sea. Nevertheless, colossal though the task is, it is vitally urgent that we face it.

Not only would we benefit from such a policy, but the seriously under-populated sections of the Commonwealth would benefit also. Ultimately the whole Commonwealth would benefit in standard of living because the man-power now absorbed in carrying food from where it is grown to where it is eaten would be released for more productive activity.

Large-scale migration is the most urgent need—after that, or associated with it, a number of other measures are necessary. Redistribution of the remaining population; decentralization of communications and distribution; an increase in the number of usable harbours and so on. Not until these things have been done shall we be safe from liability to a very swift knock-out, followed by mass starvation.

It must be remembered that if a situation developed in which the whole surviving population was engaged in a desperate struggle to escape starvation, civilization as we know it would disappear. In such a seething cauldron the scum would rise to the top; the average decent citizen would stand little chance against the desperate and unscrupulous criminal elements in the wild scramble for the means of life. Many of them would not shrink from cannibalism to keep their beastly selves in existence. These people are already a menace — they would become a very serious menace indeed in the circumstances visualized here.

Any potential aggressor must be fully aware of our dangerous situation. Twice in one generation we have been brought to the brink of disaster by submarine blockade and twice we have had just sufficient time and means to scrape through. Time is essential to deal with aggression successfully. The aggressor always has the initiative. He is able to choose when he will strike, where he will strike and how he will strike. In this atomic age, we may not be allowed the time that saved us last time.

I believe that a policy of large scale planned migration beginning at the earliest possible moment is a vital necessity if the British nation is to survive a third world war, but I also believe that the tremendous effort would not be wasted if we are fortunate enough to escape war. Planned migration is a policy which is equally necessary for security in war and for prosperity in peace.

These things must be self-evident to any intelligent and well-informed individual — a blinding glimpse of the obvious almost—yet it is a deplorable fact that neither the Conservative nor Labour party leaders have had the courage to say what it is their duty to say. Why? They should know by now that the British people give of their best when faced with a mighty task in which they believe.

Let 'Operation Commonwealth' begin.

Interesting Papers at Chemical Engineers Meeting

A number of interesting papers were delivered at the meeting of the American Institute of Chemical Engineers in early December at Columbus, Ohio.

New Rubber Production Process

It was reported that a continuous cold rubber process has been developed by the B. F. Goodrich Chemical Company, Cleveland, Ohio. Cold rubber, familiar to most motorists as a source of tire rubber superior to the synthetic rubber produced during the war, was until recently produced by a batch method involving a 16-hour mixing period. A Goodrich-operated R.F.C. plant at Port Neches, Texas, has been converted from batch operation to continuous process. The conversion has increased capacity by about 20 per cent, lowered costs, improved quality, and resulted in better process and plant control. Over 65 million pounds of cold rubber have been thus produced.

Radioactive Wastes

Another speaker dealt with decontamination techniques which are claimed to have successfully eliminated the possibility of atmospheric pollution by radioactive airborne wastes.

Two methods are used to eliminate radioactive wastes — filtration and absorption. The great majority of these wastes are present as fine dust, so filtration techniques have been developed which reduce radioactivity to the level normally occurring in the atmosphere. For those few radioisotopes which are true gases, more complex absorption procedures are required.

Radioactivity that is removed from the air, must be permanently stored as it will be years, in most cases, before the radioisotopes have decayed to their stable products. In some cases, however, where work with short-lived radioisotopes is carried out, storage for about one hundred days is all that is required.

Fuel Oil From Coal

The U.S. Bureau of Mines in a progress report on the liquid-phase hydrogenation of coal announced at the meeting that improvements in the process made it possible to produce a usable fuel oil at only 1500 pounds pressure, representing a three- to six-fold reduction from previous high-pressure processes. This lower pressure permits the use of welded equipment and more easily available piping materials rather than the heavy forgings, special piping and valves required for the present high-pressure process. Such simplification in equipment may make it feasible to produce fuel oil in regions where petroleum is scarce, but where coal is plentiful, relieving the stress on U.S. and Allied merchant shipping in time of emergency, in addition to providing a supply of oil during normal times for those localities.

Glass Developments

The development of glass that conducts electricity was reported at the meeting. The use of this conducting glass in windows of aeroplanes, locomotives and ships helps to keep the windows free of fog and ice. Very lightweight glass, full of tiny bubbles, is another unusual product, which is proving itself as a heat insulating material and as a buoyant core for life rafts. Glass blocks have invaded every type of construction, from residences to chemical plants. Glass is astoundingly versatile and practical as a construction material for chemical process equipment when suitable precautions are taken.

Solar Heating

Black glass can be used to heat houses by capturing radiation from the sun, which supplies the United States with energy equivalent to over 150 million tons of coal every day. It was contended by one of the speakers that most of this energy is now wasted, but could be captured for residential heating. The proposed heat collector consists of a group of partially blackened, overlapping glass plates, mounted on a house roof. The arrangement is similar to that of shingles, separated by small air spaces. A glass cover over the staggered plates is employed to keep out dirt. Because of the high transmissivity of glass for solar radiation and its low transmissivity for long-wave heat radiation, the glass surfaces in the unit become heated when exposed to sunlight, and the reradiated heat has no avenue of escape. Air passing between the plates is heated from the trapped heat of the sun and forced into the house. A roof-top solar heat installation can be designed to supply 60 per cent of the energy required for heating a home.

Trucks and Roads

The Highway Research Board and the U.S. Bureau of Public Roads are co-operating in an attempt to determine quantitatively the effects of heavy truck traffic on a concrete pavement, on behalf of the highway departments of 11 states and the District of Columbia. Seven makers are furnishing trucks, and gasoline, oil, and grease is being contributed by 14 companies.

The test road is a 1.1-mile section of U.S. Route 301 in Maryland. It consists of two 12-foot lanes of 9-7-9 inch cross section, reinforced with wire mesh. Expansion joints are 120 feet apart, with two construction joints equally spaced between them. All cross joints have ¾-inch dia. dowels 15 inches apart, and lanes are tied together by dowels four feet apart. Subgrade soil is reasonably uniform throughout the test section.

Four axle loadings are being used:

- 18,000 lb. on one axle
- 22,400 lb. on one axle
- 32,000 lb. on tandem axles
- 44,800 lb. on tandem axles

Although the tests have not progressed far enough yet to warrant final conclusions, they have already definitely shown the destructive effect of heavy axle loads, whether measured by the cracking of the slab or by the vertical displacement of joints. For example, the 44,800-lb. load produced about 11 times as much cracking and eight times as much joint displacement as the 32,000-lb. load, though the ratio of the load is only 1: 1.4; while the 22,400-lb. load produced six times as much cracking and 11 times as much joint depression as the 18,000-lb. load, although the load ratio is only 1:1.24.

These tentative results suggest that road damage increases much faster than the load causing it, perhaps about as the sixth to eleventh power. Definite conclusions must, of course, await the completion of the tests and the careful analysis of the results, but they have already shown how destructive to road surfaces heavy traffic can be, and add strength to the contentions of those who would limit the permissible weight of vehicles using the public highways.

News of Other Societies

The **Royal Architectural Institute of Canada** (1323 Bay St., Toronto, 5) announces that the annual meeting in 1951 will be held at the Chateau Frontenac, Quebec City, March 1, 2, and 3.

The 1951 convention of the **Canadian Section of the American Water Works Association** is planned to take place from May 21 to 23, at the Royal Alexandra Hotel, Winnipeg.

The annual dinner meeting of the **Engineers' Alumni Association** (Central Ontario Branch) of the University of Manitoba will be held in the Royal York Hotel in Toronto, on February 24, 1951, commencing at 5.30 p.m.

The Wire Association will hold its Canadian regional meeting on April 19 and 20, 1951, at the Royal Connaught Hotel, Hamilton, Ontario. Chairman of the main committee for this meeting is Mr. James W. Galloway, of B. Greening Wire Co. Ltd., Hamilton.

Concurrently with the National Materials Handling Exposition at the International Amphitheatre, Chicago, April 30 to May 4, there will take place the Materials Handling Conference sponsored by the American Material Handling Society. Information may be obtained from Clapp & Poliak, Inc., 341 Madison Avenue, New York 17, N.Y.

Toronto, Canada, will be host to the 1951 summer general meeting of the **American Institute of Electrical Engineers,** which is scheduled for June 24 to 29, at the Royal York Hotel.

O. W. Titus, M.E.I.C., of Canada Wire and Cable Company, Toronto, is chairman of the general committee.

The Institution of Engineers, Australia, (Science House, Gloucester and Essex Streets, Sydney, N.I.W.) will hold its annual conference for 1951 in Brisbane from April 2 to 7, 1951. Members of The Engineering Institute of Canada residing in Australia or visiting Australia during this period are invited to attend the Conference under the same conditions as members of the Institution, and both the Council of The Institution and the Committee of the Brisbane Division assure them of a warm welcome.

A regional meeting of the **American Institute of Chemical Engineers,** (120 East 41st Street, New York 17, N.Y.) will take place March 11 to 14, 1951, at the Greenbrier Hotel, White Sulphur Springs, Va.

A comprehensive **Building Research Congress** planned for September 11 to 20, 1951, in London, England, will be the first of its kind ever to be held. The Congress will review the progress made in research in relation to architecture, building, and the associated branches in civil engineering, and it has been arranged because of a widespread interest in the subjects in many countries.

Dates of the Congress are September 11 to 20, 1951. It will be centred in the Institution of Civil Engineers, London.

Plans are proceeding for the **Third World Petroleum Congress** at The Hague, Holland, May 28 to June 6, 1951.

National Committees have been formed in many countries. Enquiries regarding the Canadian Committee and Canadian participation in the Congress should be addressed to Dr. R. K. Stratford, Imperial Oil Ltd., Sarnia, Ont.

New Role for Canadian Good Roads Association

The recent reorganization of the Canadian Good Roads Association, with wider objectives, an executive committee, and a headquarters at Ottawa under the direction of managing director C. W. Gilchrist, promises to focus the public's attention on Canada's need for more and better highways.

Canada is far behind the United States in the education of public opinion as to the need for better roads. There, national and state associations have long been active in directing all highway-user interest toward that end. When these associations speak, it is with authority, and politicians do listen. As a result the federal Public Roads Administration matches all state highway expenditures dollar for dollar.

In Canada the first step in this direction was taken a year ago by the signing of an agreement between the Federal Government and most of the provinces for sharing the cost of completing the Trans-Canada Highway. Not only is federal help in building other highways conspicuously lacking, but federal sales and excise taxes collected on gasoline and motor vehicles are never directly applied to

R. M. Hardy, M.E.I.C.

helping with highway improvement, while provincial gasoline taxes and license fees are often applied to many other purposes.

At the Association's Winnipeg convention last September, Past-President Willis warned that Canadians were facing a national traffic jam. During the past two decades, he pointed out, motor vehicle production has increased 90 per cent, while highway expenditures have only increased by 45 per cent. We have only some 22,300 miles of paved roads for our 2,500,000 registered motor vehicles. Adding the normal summer tourist vehicles to our own total would give about 360 vehicles for every mile of Canada's paved highways.

The Association is a national, non political, non profit organization, whose interest is the development of economical, efficient, and safe highway transportation in the public interest. It represents both road builders and road users. Its objectives are to ensure sound highway planning, financing, construction and management; reduction of the highway death and accident toll; application of taxes derived from highway users solely to road construction; more federal aid; safeguard of provincial rights; uniform and tighter licensing laws; standardization of traffic signs; sound regulations for vehicle sizes, weights and loads; and more uniformity in motor vehicle laws, including those relating to insurance.

The Association has also announced plans for establishing a national highway research institute, to contribute to improvement in the fields of highway engineering, construction, traffic control and highway safety. Robert M. Hardy, M.E.I.C., dean of engineering of the University of Alberta, one of Canada's leading research engineers in the field of soil mechanics, will head the institute, assisted by a committee of experts; engineers, traffic authorities, economists, and others. Even the medical aspects will receive attention, such as psychiatry as it relates to driver behaviour and accident prevention.

This Committee's terms of reference include problems relating to road location and design for safe and efficient flow of traffic and lower operating costs for vehicles. They also include determination of means for reducing construction and maintenance costs through the use of suitable materials and methods; community planning as it affects parking problems; vehicle design; accident proneness and driver behaviour; the effect of weather on winter driving conditions; and promotion of driver training and instruction in high schools.

This institute will be in full operation within a year, and generous support is assured for the continuance of its work. Services will be available to all levels of government as well as to other groups and individuals who may require information and guidance.

Conference of Engineering Institutions of the British Commonwealth

Johannesburg: April, 1950

REPORT OF THE CONFERENCE

At the invitation of the South African Engineering Institutions, extended at the first meeting held in London in September, 1946, the second meeting of the Conference of Engineering Institutions of the British Commonwealth was held in Johannesburg from the 11th to the 20th April, 1950. The following Institutions were represented:

AUSTRALIA

The Institution of Engineers, Australia

Delegates: W. D. Chapman, M.C.E., D. Eng., M.I.C.E., M.I.E.Aust., Past-President; C. H. D. Harper, M.C., A.M.I.E.Aust., M.A.S.M.E., Secretary.

CANADA

The Engineering Institute of Canada

Delegates: James A. Vance, M.E.I.C., President-Elect; Dr. L. Austin Wright, B.A.Sc., A.M.I.C.E., M.E.I.C., Secretary.

NEW ZEALAND

The New Zealand Institution of Engineers

Delegate: S. G. Scoular, M.N.Z.I.E., President.

SOUTH AFRICA

The South African Institute of Civil Engineers

Delegates: A. F. Bruyns-Haylett, B.Sc. M.I.C.E., M.Inst.T., President; J. P. Leslie, B.Sc., M.I.C.E., Vice-President.

The South African Institute of Electrical Engineers

Delegates: J. A. F. Michell, O.B.E., B.Sc.(Eng.), M.I.E.E., President; A. W. Lineker, B.Sc., M.I.E.E., Mem.A.I.E.E., A.M.I.C.E., A.M.I.Mech.E., Vice-President.

The South African Institution of Engineers

Delegates: S. F. Ginkey, M.Sc. (Eng.), M.I.Mech.E., President; G. Bradford, M.Eng., M.I.Mech.E., M.I.E.E., Vice-President.

[At each session one delegate from each of the South African Institutions was present, with Mr. A. J. Adams (Secretary, Associated Scientific and Technical Societies of South Africa).]

UNITED KINGDOM

The Institution of Civil Engineers

Delegates: V. A. M. Robertson, C.B.E., M.C., M.I.C.E., M.I.E.E., President; E. Graham Clark, C.B.E., M.C., B.Sc., M.I.C.E., Secretary.

The Institution of Mechanical Engineers

Delegates: Dr. S. F. Dorey, C.B.E., M.I.Mech.E., F.R.S., President; Sir Henry Guy, C.B.E., D.Sc., M.I.Mech.E., F.R.S., Secretary.

The Institution of Electrical Engineers

Delegates: Professor E. B. Moullin, M.A., Sc.D., M.I.E.E., President; W. K. Brasher, M.A., M.I.E.E., Secretary.

The Conference held nine sessions, and the results of its labours, expressed in the form of Recommendations and Resolutions, have since been adopted and endorsed by the Councils of each of the foregoing Institutions, the New Zealand Institution of Engineers preferring neither to confirm nor to reject one Recommendation, as noted below.

Though the Institution of Engineers (India) was not represented, the Council of that body have adopted and endorsed, with two exceptions noted later, all the Recommendations and Resolutions of the Conference.

It was proposed at the outset, and agreed, that the chair at the sessions of the Conference should be taken in rotation by the Presidents of the three Engineering Institutions of the United Kingdom; this procedure was accordingly followed throughout the Conference.

The deliberations began with a review of the operation of the Recommendations of the first meeting of the Conference, which had been convened in September, 1946, on the invitation of The Institution of Civil Engineers. The Institution of Mechanical Engineers and The Institution of Electrical Engineers in London. From reports given by the representatives of each Constituent Institution, it was clear that considerable progress had been made, through increasingly intimate collaboration and through the interchange of facilities and the exchange of information, in more effectively accomplishing the purposes for which the individual Institutions were founded.

As a result of this review a number of Recommendations to the Councils of the Constituent Institutions were drawn up, as follows:

1. That the Councils of the Constituent Institutions shall, when requested, send to each other as soon as they become available lists of papers which are to be published, giving the dates of publication or reading, so that any Institution can inform the initiating body that it is interested in a particular paper.

Note. This represents an emendation of Resolution II of the 1946 Conference.

2. That mutual arrangements be made between the Constituent Institutions whereby all members accredited by a letter of introduction signed by the Secretary be granted facilities as "visiting members" for a period not exceeding six months.

Note. This represents an emendation of Resolution VI of the 1946 Conference.

3. That the principles laid down in Resolutions IX, X and XI be reaffirmed and that they be pursued in the further development of the education policies of the Constituent Institutions.

Note. Resolutions IX, X and XI of the 1946 Conference read as follows:

Resolution IX.

That a common standard of general education for those entering the profession should be required by all the Constituent Institutions, ensuring that engineers have received a liberal education of a character providing a general foundation of culture and that for this the Councils of the Constituent Institutions should adopt a standard not less than that of the Common Preliminary Examination adopted by the Home Institutions for admission to their Student membership.

Resolution X.

That it being considered desirable to work towards a uniform standard of examination each Constituent Institution be recommended to model any examinations it holds, accepts, or influences, on the general pattern worked out by the three Home Institutions as a test of knowledge of:

(i) the basic principles of applied science,
(ii) the application of engineering science to one or other of its main branches, and
(iii) the practice of a particular branch of engineering.

Reciprocal recognition must lie always between the Institutions concerned and must depend upon the degree to which a common standard is reached.

Resolution XI.

That the Conference affirms the opinion that a professional engineer should include in his training a reasonable period of ordered practical training in or on engineering works. Having regard to the different conditions and practices within the Commonwealth, the Conference does not find itself in a position to make a definite proposal for the period and character of such training. But, in spite of the differences which now exist, it is recognized as desirable to work towards a uniform standard.

4. That, except in very special circumstances, the Constituent Institutions should aim at requiring a test by examination for Associate Membership.

Note. This resolution represents an emendation of Resolution XIII of the 1946 Conference.

5. The Conference having reconsidered Resolution XVI and reviewed the present position in each of the countries represented, together with the experience of registration of engineers where it is in force or has been experienced, recommends to the Councils of Constituent Institutions in those countries where the registration of engineers is not in force that the public and the profession are best protected from the practice of unqualified persons by maintaining a high standard of admission to the National Institutions and not by such registration.

Notes.

(i) Resolution XVI of the 1946 Conference reads as follows:
That, having regard to the different practices in different parts of the Commonwealth, some of which have registration whilst others have not, it would be impracticable to define any common line of action, but the Conference expresses the hope that each Constituent Institution will be alert to take such action as is open to it to protect the public and the engineering profession from practice by unqualified persons.

(ii) Having only limited knowledge of conditions in countries where the registration of engineers is not in force the Council of the New Zealand Institution of Engineers does not feel competent to confirm or to reject this Recommendation.

After this review the Conference discussed a number of matters which had been brought forward by the various Constituent Institutions, considering, among other things, the form of constitution that should be recommended for adoption by the Councils of the Constituent Institutions.

The Conference also considered methods by which liaison might be established with the Conference of the Engineering Societies of Western Europe and the United States of America, and recommended that the principles which they feel should underlie such liaison should be brought to the attention of the Engineering Societies participating in the latter Conference.*

Close attention was paid to the attitude which should be adopted by the Conference and its Constituent Institutions in their relations with UNESCO, and a recommendation in the following terms was adopted:*

(i) The Conference recommends that the Constituent Institutions inform their respective Governments and National Committees of UNESCO of the services which the present Conference performs in the field of engineering collaboration within the Commonwealth.

(ii) Furthermore, the Conference has taken note of the interest of UNESCO in fostering international collaboration among engineers, and recommends that when a Constituent Institution has occasion to advise UNESCO on matters relating to engineering, it should inform the Secretariat, it being understood that the Conference itself does not seek a defined relationship such as that known by UNESCO as "consultative status."

(iii) The Conference has been informed that UNESCO is proposing to undertake the formation of an organization to act in an advisory capacity in connection with International Special Congresses, to assist in preventing clashing of dates and overlapping of programmes and to advise UNESCO in respect of any grants of money for this purpose.
In view, however, of the constitution of this Conference and of a similar Conference of the Engineering Societies of Western Europe and the United States of America, and of the possible formation of a Conference of Engineering Societies of the Western Hemisphere, it is the opinion of this Conference that it is not necessary for UNESCO to concern itself with the affairs of the National Engineering Societies and their relations with each other, and indeed it would strongly deprecate any action which UNESCO might take to do so.

(iv) The Conference further recommends that the Councils of the Constituent Institutions take steps to ensure that appropriate representation of engineering opinion is secured by themselves on the National Consultative Committees of UNESCO in each of the countries of the Constituent Institutions.

In considering the better dissemination of scientific information among their members and otherwise, the Conference took note of the proceedings at the Scientific Information Conference, convened by the Royal Society in London in 1948, and gave particular attention to the Fair Copying Declaration of the Royal Society, making the following recommendation:

The Conference being informed that the Constituent Institutions have either subscribed to, or will favourably consider subscribing to, the Fair Copying Declaration of the Royal Society, recommends to the Councils of the Constituent Institutions that they publish a note in an appropriate part of their Proceedings stating that their Institution has subscribed to this declaration. The Conference also recommends that the Royal Society be advised of the desirability of this practice being adopted by all parties to the declaration.

Among other decisions, it was agreed that each Constituent Institution should be recommended to make available to the Secretariat full details of its activities, nature, organization and scope, so that this information could be conveniently grouped and published as a booklet. Arrangements were made by which the cost of this enterprise could be equitably shared, and it was further agreed that the information should be made available in this way to the Participating Societies of the Western European Conference and of any Conference of a like nature that might be formed in the Western hemisphere.

The Conference also agreed to interchange information on the titles and scope of the activities of the large number of specialist engineering societies and professional engineering protective associations which exist in the countries of the Constituent Institutions.

Much attention was given in the course of the deliberations to the important question of defining for the purposes of the Conference the meanings of the terms "professional engineer" and "technician," and, having learned of the setting up by the Western European Conference of a Working Party to study this matter, the Conference expressed the hope that while the Working Party were pursuing their deliberations they should inform the member Institutions of the Commonwealth Conference of their views before they were finalized. The representatives of the three British Engineering Institutions undertook to take the necessary steps in this regard.

Reverting to the important question of engineering documentation, the Conference discussed a report on the action taken by the Conference of Representatives of the Engineering Societies of Western Europe and the United States of America in setting up a Working Party to inquire into the needs of users of engineering abstracting services, and resolved to ask the members of the Western European Conference, through the Secretariat, that the proceedings of this Working Party be also made available to the Constituent Institutions, who would themselves inform the Working Party, through the Secretariat, of

* These Recommendations have not been accepted by the Council of the Institution of Engineers (India), which was not represented at the Johannesburg meetings of the Conference.

any needs peculiar to their own countries.

During intervals between the formal sessions the visiting delegates, in the course of tours in the vicinity of Johannesburg, were able to visit many places of engineering and scenic interest. They received much kind entertainment of a more personal character, and arrangements were also made for them to visit Eastern Transvaal and the Kruger National Park.

At the conclusion of the Conference, appreciation was expressed on behalf of the visiting delegates for the hospitality extended to them by the South African Institutions, and it was requested that the South African delegates should convey these expressions to their respective Councils. The Conference expressed its appreciation of the secretarial work which had been carried out by the permanent staff of the Associated Scientific and Technical Societies of South Africa.

Elections and Transfers

At the meeting of Council held at the Quinte Hotel, Belleville, Ontario, on Saturday, December 9th, 1950, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

Members:

I. J. Adair, *Arvida, Que.*
R. A. Adams, *Hamilton, Ont.*
W. Boyd, *Toronto, Ont.*
R. J. Green, *Montreal, Que.*
W. K. Gwyer, Jr., *Trail, B.C.*
H. Hendry, *Toronto, Ont.*
J. T. Kelton, *Riverside, Ont.*
H. W. Luckett, *Toronto, Ont.*
S. M. MacIver, *Ottawa, Ont.*
T. A. McLaren, *Vancouver, B.C.*
A. Meletopoulos, *Montreal, Que.*
G. D. Morgan, *Campbellford, Ont.*
W. D. Proctor, *Hamilton, Ont.*
R. Rodaru, *Montreal, Que.*
E. W. Rudge, *Bradford-on-Avon, Eng.*
L. Schenker, *Lansing, Ont.*
A. F. D. Short, *Calgary, Alta.*
H. S. Stavang, *Copper Cliff, Ont.*
H. Stubley, *Montreal, Que.*
R. G. Walford, *Calgary, Alta.*

Juniors:

D. T. Austin, *Arvida, Que.*
D. E. Burnham, *Cornwall, Ont.*
R. M. Cuddy, *Ottawa, Ont.*
S. Jaugelis, *Montreal, Que.*
J. A. McRae, *Montreal, Que.*
A. A. Moncel, *Montreal, Que.*
S. Nowski, *Toronto, Ont.*
H. C. Palmer, *London, Ont.*
A. T. Ross, *Toronto, Ont.*
A. L. Whitehead, *Calgary, Alta.*
P. Wright, *Beachville, Ont.*

Transferred from the class of Junior to that of Member:

L. E. N. Carr, *Calgary, Alta.*
W. A. Ker, *Kelowna, B.C.*
D. G. Maclean, *Toronto, Ont.*
R. A. Muller, *Toronto, Ont.*
I. F. Ronalds, *Leaside, Ont.*
L. C. Turner, *Montreal, Que.*

Transferred from the class of Student to that of Member:

A. R. Edis
C. E. Howard

The following Students were admitted:

C. Allard
M. Asselin
E. A. Bastien
G. Beaulieu
P. G. Beaulieu
R. Begin
J. Belleau
P. Belleau
J. J. J. G. Blouin
H. Bonneau
R. Borduas
R. Bouchard
U. Bouchard
P. Bourassa
G. Brazeau
H. Brodeur
P. Brosseau
P. Labrecque
P. Laforest
R. Lafrance
M. Lafreniere
D. Lahaie
G. Lahaise
J. R. Lalancette
B. Lamarre
A. La Roche
W. J. Laskaris
J. M. Lawn
H. J. Lazarski
P. Leforte
R. G. Legare
R. Lepine
M. Leroux
M. Levesque
E. R. Bruce
G. E. Buteau
W. L. Canniff
L. Cesvet

W. S. Zaruby

Applications through Associations

By virtue of the co-operative agreements between the Institute and the Associations of Professional Engineers, the following elections and transfers have become effective:

ALBERTA

Junior:

J. L. Pulford, *Edmonton, Alta.*

Junior to Member:

D. H. Pugsley, *Calgary, Alta.*

NOVA SCOTIA

Member:

A. L. Spackman, *Halifax, N.S.*

Junior to Member:

L. J. Payzant, *Halifax, N.S.*
T. A. Somerville, *Halifax, N.S.*

Coming Events:

Annual General and Professional Meeting

Montreal

May 9, 10, 11 - 1951

Personals

News of the Personal Activities of Members of the Institute

T. A. J. Leach, M.E.I.C., chief hydraulic engineer of the Water Rights Branch of the Department of Lands and Forests of British Columbia, has been elected chairman of the Victoria Branch of the Institute.

Mr. Leach is from Kamsack, Saskatchewan, a graduate of the University of Saskatchewan in civil engineering in 1938. He joined the Department of Lands and Forests in 1947, after service with the P.F.R.A., the Federal Department of Transport, the R.C.E., and the Saskatchewan Department of Highways and Transportation.

W. R. Godfrey, M.E.I.C., director of Public Works for the City of Saint John, N.B., has been elected chairman of the Saint John Branch of the Institute.

Mr. Godfrey is from Chatham, N.B., a graduate of University of New Brunswick, having received a B.Sc. degree in electrical engineering in 1935. For four years he was a cost accountant and assistant to the provincial district highway engineer in district No. 2 of New Brunswick. From 1940 to 1942 he was an instrumentman on airport construction with the Department of Transport, and from 1942 he was a water supply engineer for that Department on development of water supply for airports in Eastern Canada and Newfoundland. He went to his position in Saint John in 1946.

T. A. J. Leach, M.E.I.C.

A. R. Harrington, M.E.I.C., electrical engineer for the Nova Scotia Light and Power Co. Ltd., Halifax, N.S., has been elected chairman of the Halifax Branch of the Institute.

Mr. Harrington, who was born in Sydney, N.S., graduated from Nova Scotia Technical College in 1936 receiving a bachelor of engineering degree in electrical engineering. He joined the Nova Scotia Light & Power Co. Ltd. after graduation, as an engineer on design and supervision of canals, dams and hydraulic works.

H. D. Keil, M.E.I.C., is the new chairman of the Border Cities Branch of the Institute. Mr. Keil is with Canadian Industries Limited at Windsor, Ont.

He is from Brooks, Sask., and is a graduate of University of British Columbia, class of 1937. He was associated with Canadian Westinghouse Company at Hamilton, Ont., until 1940, after which he joined Canadian Industries Limited at the Windsor Plant as an electrical engineer. He was later appointed assistant maintenance supervisor and is now a planning and scheduling engineer for the Company.

F. H. MacKay, M.E.I.C., distribution superintendent, Great Lakes Power Co., Ltd., Sault Ste. Marie, Ont., is the new chairman of the Sault Ste. Marie Branch of the Institute.

A graduate in electrical engineering of University of Manitoba, he was born at Virden, Man. After graduation in 1936 he worked on hydro-electric maintenance and construction for the Great Lakes Power Company, being appointed in 1941 an assistant engineer on operation and construction. He received the appointment as distribution superintendent in 1947.

C. P. Sturdee, M.E.I.C., who was recently elected chairman of the Sarnia Branch of the Institute, is a mechanical design engineer with Imperial Oil Limited in Sarnia.

Mr. Sturdee received a bachelor of engineering degree from McGill University in 1934. That year he went to Imperial Oil Limited in Montreal as draughtsman and designer. From 1937 to 1941 he was sales manager for Gilbert & Barker Mfg. Co. Limited, in Toronto, Ont., after which he went to Sarnia, Ont., as a mechanical designer for Imperial Oil Limited in the general engineering department.

John E. Macdonald, M.E.I.C., superintendent of construction, in the engineering division of the B.C. Electric Railway Company, has been elected chairman of the Vancouver Branch of the Institute.

Mr. Macdonald was born in Vancouver and is a graduate in mechanical engineering from the University of British Columbia. He was associated with the West Kootenay Power and Light Company for eight and a half years before going to the B.C. Electric in 1939.

In 1940 he joined the R.C.A.F., on leave of absence. Overseas twice, he was engaged in aeronautical engineering and specialized in construction and

John Macdonald, M.E.I.C.

acceptance of Canadian-built Mosquito bombers. A squadron leader on discharge, he returned to the Company as a construction engineer and a year later was appointed superintendent of construction.

Geo. C. Davis, M.E.I.C., has recently been appointed president of the Winnipeg Central Heating Co. Ltd.

Mr. Davis graduated from the University of Manitoba in civil engineering in 1932 and started work with the Northern Public Service Corporation Limited and Winnipeg Heating Company Limited, the jointly managed residential entral heating companies that serve Winnipeg. Starting as an underground mechanic's assistant, he worked up through the service department, and then a substation operator to the sales and customers' relations department in 1935. In 1937 he was made vice-president and appointed to the board of directors of the two companies and was in charge

George C. Davis, M.E.I.C.

of customer relations, sales and utilization engineering.

In 1947 he was made vice-president and general manager of the companies, which just recently have merged. He is now president of the new company.

Mr. Davis is a member of the American Society of Heating and Ventilating Engineers, a past-president of the Manitoba Chapter. He is also a member of the Association of Professional Engineers of Manitoba.

G. C. McRostie, M.E.I.C., is continuing the consulting civil engineering practice formerly carried on at Ottawa under the name of MacRostie and McRostie.

F. T. Peacock, M.E.I.C., founder, chairman of the board, and former president of Peacock Brothers Limited, Montreal, has announced executive changes in the company.

W. P. Ferguson, M.E.I.C.

F. R. McDonald, M.E.I.C., has become vice-president and general manager of the company, succeeding as vice-president John Bryson, who has been appointed president and secretary-treasurer. **W. P. Ferguson,** M.E.I.C., was named general sales manager of Peacock Brothers, and F. A. Lucas is assistant general sales manager. All are directors of the company.

F. R. McDonald, M.E.I.C.

Mr. McDonald, a member of the publication committee of the *Engineering Journal*, is a mechanical engineering graduate of the University of Toronto, class of 1921. He has been a director of Peacock Brothers for several years. He joined the company in 1923.

Mr. Ferguson, who received the degree of B.Sc. from McGill University in 1924, has been with Peacock Brothers since that time. He was in charge of the Toronto and Sydney offices, and he was a director and western manager of the company in Vancouver, before coming to Montreal in 1947.

William J. Johnston, M.E.I.C., has been promoted to the position of superintending engineer at headquarters of the Department of Public Works of Canada.

After graduating from the University of New Brunswick in 1913, with the degree of B.Sc. in civil engineering, Mr. Johnston joined the Department as an assistant engineer in the Saint John District.

He enlisted in the Canadian Expeditionary Force (Siege Artillery) in 1917, and was on active service until 1919, when he returned to the St. John district staff. In 1936 he was promoted to the position of senior assistant engineer at Winnipeg, Man.

Mr. Johnston came to Ottawa in 1943, and in 1947 he was appointed district engineer in the Edmonton District, which had just been created. Due to the rapid post-war expansion of mining and other business activities in the Northwest Territories, and the resultant increase in the scope of public works in this area, the Department decided to establish a new district office at Edmonton, Alberta. Mr. Johnston organized the new district and carried out the huge construction programme, which extended into the Arctic Circle.

S. Stephenson, M.E.I.C., of Toronto, Ont., is the Canadian representative of Decca Navigator Company Limited and Decca Radar Limited.

Mr. Stephenson was demobilized from the British Army early in 1949, with the rank of lieutenant-colonel, returning to Canada, and has since represented the two Decca companies across Canada, including the supervision of service in Canada and the United States.

Educated in England, he worked in Canadian organizations from 1929 to 1939.

R. A. McLachlan, M.E.I.C., has been elected president of the Association of Professional Engineers of B.C.

Mr. McLachlan was born in Vancouver, and attended public and high schools there. He studied engineering at University of British Columbia, and at Massachusetts Institute of Technology, receiving the degree of bachelor of science from M.I.T. in 1926.

He joined Federal Drydock & Shipbuilding Company at Kearny, N.J., but returned in 1927 to Vancouver where he was with the Vulcan Iron Works, prior to joining the Dominion Bridge Company's Vancouver offices in 1929. He became chief draughtsman in 1937, and in 1947 structural mechanical engineer, and in 1950 chief engineer of the Pacific division.

R. A. McLachlan, M.E.I.C.

F. Krug, M.E.I.C., general manager of Montreal Engineering Company, Limited, consulting and operating engineers, Montreal, left at the end of January for Middle and South America. He will be away until mid-April and will visit Monterray and Mexico City, Mexico; San Salvador, El Salvador; Panama City, Rep. of Panama; Maracaibo and Caracas, Venezuela; and San Juan, Puerto Rico.

B. Wensley King, M.E.I.C., of Montreal has been named managing director of the Sperry Gyroscope Company of Canada, Ltd., newly formed subsidiary of The Sperry Corporation, U.S. manufacturer of precision aeronautical, marine and ordnance instruments.

A graduate of Royal Military College and Queen's University, Mr. King served from 1940 to 1945 as an engineering officer with the R.C.A.F. Thereafter he joined Canadair Limited where he has been purchasing agent.

The Canadian subsidiary will represent, in addition to the Sperry Gyroscope Company of Great Neck, New York, the Sperry Gyroscope Company Limited of Brentford, England.

B. Wensley King, M.E.I.C.

Herbert F. Schmelz, M.E.I.C., and **Wm. C. Viner,** M.E.I.C., have formed the engineering firm of Engineering Associates, Montreal, to work in design of production tooling, jigs and fixtures, single purpose machines, and moulds for rubber and plastics and associated rubber processing equipment.

Mr. Schmelz was formerly associated with Dominion Rubber Co. Ltd., Montreal, Que., as an engineer in charge of the equipment design and development division. He was educated at the Polytechnical Institute of Vienna, Austria, graduating in 1936.

Mr. Viner graduated from McGill

W. C. Viner, M.E.I.C.

University in 1941 with a bachelor of engineering degree in mechanical engineering. He served in the R.A.F. and the R.C.E.M.E. until 1946. He was associated with E. A. Robinson Oil Burners Ltd., M. Bernard & Son (Can.) Ltd. and Webster Industries Inc. of Montreal.

I. Kursbatt, M.E.I.C., consulting engineer, announces that he has set up in private practice in Montreal. He was employed by Dr. P. L. Pratley, M.E.I.C., during the past year on the design of the Canso Strait Bridge. Previously, he worked on the foundations and structures of the Columbia Cellulose Company's plant at Watson Island, B.C., for the Stadler Hurter Company. Formerly, he was bridge engineer to the Oxfordshire County Council in Britain where he was responsible for several long span rigid frame type bridges both in structural steel and reinforced concrete.

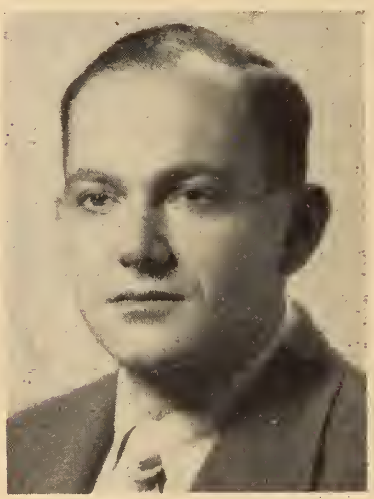
I. Kursbatt, M.E.I.C.

W. B. Boggs, M.E.I.C., is now employed with Canadair Limited, Montreal, Que.

Mr. Boggs graduated from McGill University in mechanical engineering in 1940. After several years with the R.C.A.F., he joined Trans-Canada Air Lines at Dorval, Que., where he was supervisor of maintenance until his recent appointment.

D. R. Fonger, Jr.E.I.C., is working for Benjamin Brothers Limited, Winnipeg, Man.

Mr. Fonger graduated from the University of New Brunswick in civil engi-



H. F. Schmelz, M.E.I.C.

neering in 1949. He was formerly structural detailer for Dominion Bridge Ltd., Winnipeg, Man.

H. B. Hall, Jr.E.I.C., is now working for Canadian Laboratory Supplies Ltd., Toronto, as an executive trainee.

Mr. Hall graduated from the University of Toronto in 1948 with a degree of B.A.Sc. in chemical engineering.

A. G. Eyles, S.E.I.C., has gone to Boston, Mass., to work for the firm of Jackson and Moreland, consulting engineers.

Mr. Eyles received a B.Eng. degree in civil engineering from McGill University in 1950.

W. D Munro, S.E.I.C., is now employed by the Shawinigan Engineering Company. He graduated from Nova Scotia Technical College in electrical engineering in 1950, receiving a degree of B.Eng. in electrical engineering.

S. J. Babin, S.E.I.C., who was a construction engineer with Central Mortgage and Housing Corporation Montreal, has accepted a position with Defence Construction Limited, Ottawa.

Mr. Babin graduated from the University of New Brunswick in 1949 in civil engineering.

E. D. Mackie, S.E.I.C., graduated from the University of Saskatchewan in the spring of 1950, and joined the Ferranti organization. Having completed a training course in the plant, he has now been assigned to the Ontario district sales division of Ferranti Electric Limited, serving both the meter and transformer divisions.

E. D. Mackie, M.E.I.C.

I. J. Vogwill, S.E.I.C., who graduated from the University of British Columbia in 1950 receiving a B.A.Sc. degree in mechanical engineering, is working for A. V. Roe. (Canada) at Malton, Ontario, as a junior design engineer.

Visitors to Headquarters

C. J. Mackenzie, Hon. M.E.I.C., Ottawa, Ont., December 28, 1950.

G. R. Turner, M.E.I.C., Ottawa, Ont., January 3, 1951.

E E. Goldsmith, Johannesburg, S.A., January 4.

E. D. Crawley, Middleton, N.S., January 5.

D. L. Rigsby, M.E.I.C., Kingston, Ont., January 8.

G. L. Dickson, M.E.I.C., Moncton, N.B., January 9.

Alexander Penman, Edinburg, Scotland, January 9.

J. N. Morens, St. Johns, Nfld., January 12.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

John J. Macnab, M.E.I.C., active for many years in Trenton, Ontario, as a civic administrator, died at his home in Trenton, Ont., on September 9, 1950.

Mr. Macnab was born at Bruce County, Ontario, in 1876. He was educated in Canadian public schools, graduating from Port Elgin High School and from McGill University in 1906 with the degree of bachelor of science. From 1906 to 1913 he was employed as engineer and superintendent of heavy construction, including railway shops, breakwater construction and hydro electric power plants, living in Moncton, N.B. and Cape Bauld, N.S., and Porcupine, Cobalt and Sudbury in Ontario. It was in 1913 that he moved to Trenton and was engaged in civil engineering and general contracting.

He joined the Institute in 1904 as a Student, transferring to Associate Member in 1907, and becoming a Member in 1940. He was a member of the Association of Professional Engineers of Ontario.

He was associated with community service throughout his life. He was a member of the Trenton Town Council for six years, and served on the Separate School Board and the Trenton Memorial Hospital Board. He was chairman of the Old Age Pension Board of Ontario.

D. A. Evans, M.E.I.C., who retired from the Powell River Paper Company at Powell River, B.C., in November, 1950, died on December 16th, at Powell River. Mr. Evans was a director of the Company and the vice-president in charge of industrial and personnel relations.

Mr. Evans was born in Wales in 1885. He received his diploma in mechanical engineering from the University of Wales in 1908. His first engineering work in Canada was in the shops of the Grand Trunk Railway at Montreal in 1908. He later became connected with the National Transcontinental Railway in the designing department and worked on draughting, installation of equipment and mechanical engineering with the Company until 1914. He served successively with the Canadian Pacific Railway, Canadian Explosives Limited, and the Canada Carbide Company at Shawinigan Falls, Que. In February, 1917 he was appointed manager of the St. Maurice River Boom and Driving Company, which position he held until 1924, when he became associated with the Newfoundland Power and Paper Utilities Corporation. He set up logging operations for the Cornerbrook Mill in Newfoundland, and also for the Dolbeau Mill north of Lake St. John in Quebec. He was managing the mill at Dolbeau before going to the Powell River Company as resident manager in 1936. He was elected a vice-president in 1947. On his retirement, he was retained in a consulting capacity on policy matters of the Company.

He joined the Institute in 1909 as a Student, transferring to Associate Member in 1914 and becoming a Member in 1920, and attaining life membership in 1949. He was an honorary life member of the technical section of the Pulp and Paper Association of Canada.

D. A. Evans, M.E.I.C.

News of the Branches

Activities of the Thirty-three Branches of the Institute and abstracts of papers presented at their meetings

Belleville

S. Sillitoe, M.E.I.C.,
Secretary-Treasurer

The second meeting of the Belleville Branch was held in the Rotary Room at the Quinte Hotel with sixty-five members in attendance. Mr. F. F. Fulton was in the chair and after a brief report by the secretary, the chairman called upon Mr. E. G. Gurnett to introduce the speaker of the evening, Dr. Huet Massue, engineer-economist, Shawinigan Water and Power Company, Montreal.

The subject of Dr. Massue's address was **Water Power in Canada.** He commenced with an interesting introduction of the subject by touching upon the developments in Europe and the economics of the situation in such developments as Loch Slay in Scotland where enormous engineering works involving miles of tunnels and aqueducts result in an increase in the catch basin area from six square miles to thirty-two square miles and a plant producing only 134,000 kw. He compared this to a project in Canada at Lake St. John costing only two and one-half million dollars for a dam which resulted in a storage basin of 600 square miles and the production of several million kw. of power. At the same time, the Scottish development, owing to intermittent, although heavy rain fall, has only a 10 per cent load factor as compared to a nearly 80 per cent load factor in Canadian developments.

Dr. Massue's presentation of a very extensive collection of data which had been thoroughly analyzed and organized for vivid presentation was delivered in conjunction with a large number of coloured slides. These slides included graphs and charts comparing many different factors related to the growth of power developments throughout the world and particularly in Canada in the

Provinces of Ontario and Quebec. Among the slides were such subjects as "Potential horsepower by continents of the world, compared to the actual power development; Potential and developed horsepower in Canada; Horsepower per capita for countries of the world; and Horsepower per capita for Canada and the Provinces". This chart shows the Province of Quebec far ahead of any other Province or state on the continent. Dr. Massue proceeded to explain that the reason for this lay in the character in the load of this province, where there are three heavy industries; pulp and paper, chemical, and aluminum, which account for large blocks of power. By comparison Ontario has a curve showing steady growth in many diversified industries, which would appear to be less subject to major changes in load.

Interesting comparisons between the revenue per dollar investment in power companies as compared with other industries were drawn. It was evident that power companies have a very heavy investment for the amount of revenue they derive.

Dr. Massue was able also to draw interesting pictures of the growth of population in relation to power development as well as numerous other interesting sidelights too numerous to be recorded here. The graphic presentation of the vast amount of statistics in such an interesting manner is indeed a worthy achievement for which Dr. Massue and the Shawinigan Power Company are to be greatly commended.

Mr. D. W. Bews expressed the thanks of the meeting for this most interesting address.

Border Cities

J. C. Aitkens, M.E.I.C.,
Secretary-Treasurer

C. J. Radford, Jr.E.I.C.,
Branch News Editor

On October 5, the members of the Border Cities Branch were privileged to hear an address by Mr. S. L. Fear, liaison engineer of the Ontario Hydro-Electric Power Commission. Approximately 80 members and friends were in attendance.

Mr. Fears' subject **Steam Power Plants** was very appropriate for this locality as the J. Clark Keith steam power station is being constructed on the outskirts of Windsor.

The two steam plants specifically referred to in the talk were the aforementioned, and the Richard L. Hearn Station in Toronto. In the absence of Chairman J. Hoba, the speaker was introduced by the Vice-Chairman, Doug Keil.

It was pointed out that the idea of using steam plants to produce electric power is not new; that in fact, Sir Adam Beck, founder of Hydro, had visualized this very thing many years previously. At the present time it is anticipated that these power plants will take care of extra power demands that occur at certain well defined periods but which are not a year round problem. Using especially prepared large scale graphs and charts, Mr. Fear demonstrated that steam plants when properly operated on a scientific basis are an economical means of augmenting our supply of "white coal" power. Line losses and line maintenance costs from Niagara to any large, distant power consuming community such as Windsor are heavy items of expense and point the way to production of power close to the location of power demand.

Slides were shown of the sites of the two plants as they were before construction started, following step by step the various stages of construction, to recent pictures of the projects as they are at the present time. Mr. Fear pointed out that both plants are scheduled to produce power in September, 1951, and are well on schedule. Pile foundations are being used in both cases, with a steel superstructure at Toronto, and reinforced concrete at the Windsor site, each being faced with brick. Toronto will produce 160,000 kw. as opposed to 120,000 kw. at Windsor.

Some of the engineering problems encountered and overcome in the various construction phases were recalled by the speaker. At the Richard L. Hearn site, railways were relocated to allow material and equipment to flow smoothly as required. An interesting point was the conveying of material excavated from the Toronto Rapid Transit System tunnel to the site, and its use as fill. The main problem at Windsor was the never ending battle with a very tricky clay soil condition necessitating much careful planning and study at all times when excavating in this material. At present a cofferdam has been completed for the intake and pouring of concrete for the open-cut channel is in operation.

The meeting was thrown open for questions and at the conclusion Mr. J. W. Southin, project manager for H. G. Acres & Company, consulting engineers at the J. Clark Keith Steam Plant, expressed to Mr. Fear the gratitude of the audience. Many members lingered to inspect more closely the variety of charts and curves on steam plant operation displayed by Mr. Fear.

❖ ❖ ❖

On November 10, a joint meeting of the E.I.C. Border Cities Branch and the local branch of the Association of Professional Engineers of Ontario was held at the Prince Edward Hotel, Windsor. The highlight of this meeting was the presence of Mr. E. V. Buchanan, president of the A.P.E.O. and the always-popular Colonel "Tom" Medland, executive director.

Mr. Jim Ronson commenced the meeting by announcing the results of the nominating committee ballot for the executive for 1951. Mr. Fred Ryder then introduced the first speaker, President Buchanan whose subject was **Security and the Professional Engineer.** The essence of the President's address was a challenge to the engineering profession to broaden the scope of their work, to dare and achieve new ideas with the same pioneering spirit so evident in our forbears in this new land, and to let security take care of itself. There are always those who would seek security he said. A few find it. Many do not. None add one iota to the sum total of knowledge, or increase our standard of living, the avowed aims of our professional societies.

The speaker expressed a high regard for trade unions, but expressed the belief that such an organization could not fit in, or should not fit in to Professional Associations. This, he said, is apparent in the very nature of our creed. The President then threw out another challenge and rebuttal—to those who would criticize engineers and claim we have merely applied old country techniques and changed them very slightly to meet the needs of a young and growing country and have done little towards pioneering new and distinct ideas. He cited James Watt as the first practical mechanical engineer who came to basic truths by experiment and would accept nothing that he could not prove. On a parallel to this he listed such contemporaries as Whittle—jet engines; Turnbull from New Brunswick — variable pitch propeller; engineers at Chalk River, who have made amazing progress in new atomic achievements; H.E.P.C. engineers who perfected the technique of pouring good concrete in sub-zero weather; engineers in our pulp and paper industry who built the first plant in the world capable of turning out newsprint at the rate of 2,000 ft. per minute, and others. This, he urged, is proof that no group of men has done more to invent and develop unique industrial methods and processes, or contributed more to a higher standard of life for all, in this and other countries, than have the professional engineers of Canada.

In conclusion he appealed to all young engineers to "dare to be foolish" to reject mass thinking and hackneyed "standard practices" and to try and better such practices in their own fields of work. To shed our "Ivory Tower" complex and learn not to shun publicity, to make the public conscious of the role of the professional engineer in our national life, he said is the duty and privilege of each member.

Mr. Joe Hoba, in the chair, introduced Colonel Medland and welcomed him to the meeting. His talk was entitled **A Beaver and an Ostrich.** He proceeded to bring the members of the Association up to date on current Association affairs, giving some interesting details on the manner in which applications for membership were handled, and the exhaustive research and office routine required. The "meat" of his talk was on account of what is being done to educate the public about the engineering profession. It was urged upon all present, as members, to take a keen and active interest in promoting the public relations programme now being conducted by the A.P.E.O. and to do all in their power to bring the professional achievements of Canadian engineers before the public.

Joe Hoba thanked the Colonel who then, with able assistance from President Buchanan, did a noble job of answering a barrage of questions relating to the evening's discussion. Refreshments followed.

Cape Breton

G. W. Ross, M.E.I.C.,
Secretary-Treasury

S. G. Naish, M.E.I.C.,
Branch New Editor

On January 16th Mr. J. C. Nicholson, retired general superintendent of Mines for the Dominion Coal Company gave a very interesting address on **The History of Coal Mining in Nova Scotia.**

Starting with the Duke of Kent, and the General Mining Association, Mr. Nicholson traced the various stages of the industry up to the present time. Having lived and worked all his life in Nova Scotia coalfields, Mr. Nicholson made the various pioneers and leaders of the industry live, as human beings, by instructive and amusing anecdotes.

He reminded his listeners of the early coal miners who got up at four in the morning to walk many miles to work, go underground at six, and not get back to the surface until after dark. He claimed that, even with modern mining machines, the output of these early miners had not been equalled. In concluding his talk, Mr. Nicholson paid tribute to these mining pioneers, who had created an industry for us under primitive conditions by hard work.

The meeting was under the chairmanship of Carl Gustafson, and the speaker was introduced by Louis Frost. A vote of thanks to the speaker was moved by Sydney Mifflen, who traced the early formation of the Cape Breton Branch. Anecdotes of early days were also told by W. S. McDonald and James Morrison.

A vote of sympathy was sent to Yorke Barrington, town engineer of Sydney Mines, on account of his illness. It was proposed by H. J. McCann, Jr., and seconded by S. G. Naish. A number of members testified to Mr. Barrington having been a most faithful attender of the Institute meetings. He was one of the very first members and has scarcely missed a meeting. All the members wished him a speedy recovery.

An invitation from the Halifax Branch to the Annual Banquet with the Professional Engineers on January 30th was read by Branch Chairman Cliff Murray.

Kingston

J. T. Provan, Jr.E.I.C.,
Secretary-Treasurer

S. H. Rochester, M.E.I.C.,
Assistant-Secretary

The regular monthly meeting of the Kingston Branch of the Institute, was held on Tuesday evening, December 12, 1950, in the Mackenzie Building, R.M.C. Mr. G. T. Andrews was in the chair. The business portion of the meeting introduced committee reports by Major A. L. MacLean (Papers Committee), Mr. D. L. Rigsby (Membership), Professor J. S. Campbell (Student Guidance), Professor A. Jackson (Public Relations). In addition, Mr. M. G. Saunders reported on the activities of the E.I.C. council meetings and the inauguration of a new Branch at Belleville. Mr. J. Provan gave the secretary-treasurer's report on the financial statement of the Branch.

The principal speakers for the evening, Mr. D. L. Rigsby, Aluminum Company of Canada, Ltd. and Mr. M. J. Waite, Aluminium Laboratories, were introduced by Professor Hugh Conn.

Mr. D. L. Rigsby gave a most interesting illustrated talk about his recent visit to Australia, and a brief survey of the industrial situation in the Dominion. He explained the equipment in use at the aluminum fabricating plant of the Australian Aluminium Company at Sydney. He pointed out the advantage to Canada in living next door to the huge industrial warehouse of the U.S.A. as against the comparative isolation of Australia which largely is dependent on its own resources and engineering "know-how".

Mr. Rigsby illustrated his air trip with an excellent set of pictures taken during his journey, commencing from Vancouver and proceeding to Australia via San Francisco, Honolulu, Fiji Islands, Sydney and Melbourne. The return journey was made via Singapore, Bombay, Cairo and Rome with a two week stop-over in England for a tour of aluminum fabricating plants there. Mr. Rigsby arrived in Montreal some eight weeks after departure.

Mr. M. J. Waite gave a most informative talk on the subject of welding. The speaker emphasized the importance of proper design of welded joints and particularly stressed the necessity of including full information on welding requirements in all working drawings. A poor welding design results in improper welding, bad appearance and high cost. However with careful attention of properly trained welding personnel to the preparation of parts, and careful selection of materials, a high strength joint with pleasing appearance can be made with remarkable economy.

Mr. Waite put forward his opinion that welding has now reached such a high level of importance in industry that universities and industries should take steps to ensure that detailed technical training in welding is given to young engineers and to the practical welder on the job. He felt that a higher standard of welding practice and very worthwhile economies could be achieved by making one man responsible for welding design and application in individual concerns. This would avoid indecision and lack of technique, and would provide a stimulated interest in the trade.

Mr. Waite displayed slides illustrating welded joints and structural welding work, and showing how failures may occur as result of incorrect procedures.

The meeting was adjourned for refreshments at the invitation of the R.M.C. Faculty Club.

Lethbridge

David Cramer, M.E.I.C.,
Secretary-Treasurer

J. T. Dokken, Jr.E.I.C.,
Branch News Editor

The Lethbridge Branch of the Institute held its monthly meeting at the Marquis Hotel on December 16, 1950. M. S. Mitchell, branch chairman, presided over the meeting.

J. Haimes, retiring city engineer, introduced Mr. J. Neufeld who will be Lethbridge's new city engineer. He welcomed Mr. Newfeld both to our branch of the Institute and to the city and joined with all those present in wishing him the best in his new position.

The Brown Musical Trio supplied the dinner music and R. S. Lawrence led in community singing. Vocal selections by Mrs. Janet McLeod and Mr. A. Branch, accompanied by Mrs. Katherine Brown, were thoroughly enjoyed.

Mr. Mitchell, the branch chairman, introduced Mr. P. M. Sauder, colonization manager for the St. Mary River Development, who showed three very enjoyable films depicting the scenery, people and industry of Alberta.

The first film, "Alberta Irrigation," dealt with the route of our water supply from its source in the mountains to its ultimate use in the irrigated fields. The various crops grown "under the ditch" and the numerous industries such as canning and sugar refining which have grown up in Southern Alberta due to irrigation were very interestingly portrayed as well as interesting views of the irrigation structures which can be seen in this part of the country.

The second film, "Alberta Vacation" was an interesting and refreshing travelogue of the scenic playgrounds and places of historic and geographic interest in Alberta.

"Songs of the West", a short film of western music, amid a mountain ranch setting, melodiously rounded out the evening's entertainment.

Mr. Mitchell, on behalf of the members present, gave Mr. Sauder a hearty vote of thanks for showing these films of interest and entertainment.

Peterborough

G. W. Herzog, Jr.E.I.C.,
Secretary-Treasurer

M. V. Powell, M.E.I.C.,
Branch News Editor

A well attended meeting of the Peterborough Branch on December 13th was addressed by Mr. R. M. McGee, sales representative of the Jones and Laughlin Steel Company, on the subject of **The Manufacture of Steel.** Mr. McGee was introduced by C. W. Holman and his address was entertaining and instructive, illustrated by a very fine film.

The production of steel was illustrated from the mining of the three main elements, through all the various steps in their handling and smelting to its making and final shaping. The speaker mentioned a fourth, and very important element, the human element. The workers' safety and health are now well guarded in modern steel plants.

The bulk of the Jones and Laughlin Company's iron ore comes from the Mesabi Range where it is dug out of open pits by power shovel and loaded directly into ore cars for transportation to Duluth. It is crushed, separated from impurities and loaded into the ore carriers by gravity in a most efficient and quick manner. Loading a ship with 14,000 tons of ore can be accomplished in about one hour, the trip down the lakes to Cleveland takes three and one half days, and unloading by a number of special cranes less than four hours. At the steel plant, the ore cars are lifted bodily from the rails, and dumped.

The mining and transportation of the other two elements, coal and limestone is accompanied in just as efficient a manner. The production of the necessary coke from the coal was illustrated, and the operation of the blast furnaces. In the Bessemer process of making steel an electric eye is used to control the operation and this is covered by a Jones and Laughlin patent. The operation of an open hearth furnace was clearly demonstrated. In the final rolling of steel shapes, the temperature is controlled largely with use of electric eyes.

Mr. M. V. Powell moved a vote of thanks to Mr. McGee. Mr. G. W. Herzog was Chairman of the meeting, and Mr. F. Pope gave a short account of the inaugural meeting of the new Belleville Branch which had its beginning with a meeting held June 1st by the Peterborough Branch at Belleville.

Saguenay

F. E. Hogg, M.E.I.C.,
Secretary-Treasurer

W. A. Armstrong, Jr.E.I.C.,
Branch News Editor

On December 11, 1950, Mr. D. Ross of the Pentagon Construction Company addressed a group of thirty members, describing the Ottawa River Power Development, with particular reference to the recently built Chenaux Development, on which he was assistant superintendent of construction.

Mr. Ross described the Chenaux as the fourth largest development on the main Ottawa River, on which the total developed power is approximately equal to that of the two Shipshaw plants. The developments are mainly low head, the maximum being one hundred and thirty feet, at Des Joachims. The power developed on the Ottawa is transmitted as far as five hundred miles, from the Quebec—Ontario border to Windsor, Ont., serving the industrial areas in southern and western Ontario.

Mr. Ross illustrated his description of the Chenaux construction with coloured slides. A particularly interesting feature was the use of a "pumpcrete" machine for pumping concrete to all parts of the structure, in both summer and winter conditions. The interesting discussion period which followed the showing of the slides indicated the keen interest which this type of construction holds in the Saguenay district.

The speaker was introduced by Mr. J. F. Braun, and Mr. F. E. Hogg voiced the appreciation of the audience.

Toronto

F. E. Wellwood, m.e.i.c.,
Secretary-Treasurer

I. S. Widdifield, m.e.i.c.,
Branch News Editor

The Toronto Branch of the Institute and the Ontario Section of the American Society of Mechanical Engineers held a joint meeting on November 9, 1950. Approximately 75 were present, in the McLennan Laboratory at the University of Toronto.

Mr. D. H. Thorburn, president of Gas Machinery Company (Canada) Limited, addressed the meeting on the effect of introducing natural gas into an industrial area presently served with manufactured gas.

Mr. Thorburn outlined in some detail the history and development of the natural gas industry, and stated that the conversion in Toronto would be more similar to conversions that had taken place in the United States rather than elsewhere in Canada.

The records show that the Chinese used natural gas before the Christian era. The first natural gas was discovered in North America near Charlestown, West Virginia, and was first used for house heating in 1821 near Verdonia, N.Y. In 1889, natural gas was first discovered in Canada in Essex County near Windsor.

The advance in use of natural gas in the last few years has been rapid, and there is presently installed 280,000 miles of gas pipe lines not including the multitude of city distribution systems. The present yearly use is six trillion cubic feet and the known gas reserves amount to one hundred and eighty trillion cubic feet.

Equipment which is normally used for burning manufactured gas will not be satisfactory without alteration when a change is made to natural gas. It is necessary that a survey be made and all equipment listed. This equipment is then engineered for natural gas consumption and the necessary parts ordered and installed. The main reason why equipment must be altered was due to the fact that B.T.U. Content of natural gas is practically double that of manufactured gas and also the combustion ratio between gas and air is different for efficient operation.

❖ ❖ ❖

Mr. S. L. Fear, liason engineer, steam stations, of the Hydro-Electric Power Commission of Ontario, addressed a regular meeting of the Toronto Branch on November 30th, in the Mining Building of the University of Toronto. Mr. Fear's subject was **Steam Stations for Hydro 1949-1953.**

Mr. Fear, who has been with the Hydro for many years on the study and design of steam stations, covered the development of the Richard L. Hearn Station at Toronto, and the J. Clark Keith Station at Windsor, as well as many smaller stations which the Commission has built and which are presently in operation throughout the Province.

The talk was well illustrated with drawings, graphs and lantern slides, and the various stages of development in the two major stations explained in detail.

Mr. Fear explained that at the present time the Commission was planning to use the stations only under peak load conditions and compared the cost of steam generated power to that developed hydraulically.

Approximately 125 members were present and all listened enthusiastically to Mr. Fear's remarks, as was evident by the number of questions which were asked at the conclusion of the address.

Victoria

W. A. Bowman, jr.e.i.c.,
Secretary-Treasurer

T. A. J. Leach, m.e.i.c.,
Branch News Editor

The regular monthly meeting of the Victoria Branch was held at Prince Robert House on December 15. During the business session the following officers were elected for the coming year: chairman, T. A. J. Leach; vice-chairman, A. F. G. Musgrave; secretary-treasurer, W. A. Bowman. Members of the executive are D. A. MacLean, G. W. C. Lake, J. A. W. Izard, A. W. Lash and W. G. MacIntosh. News-Editor will be G. Kidd.

Following the business meeting, A. B. Sanderson, chief designing engineer of the B.C. Department of Public Works gave an interesting address on **Highway Bridges in B.C.**

He pointed out that bridge building in B.C. dates back many years to the time when the Indian tribes in northwestern B.C. built spans of considerable length. One of the most famous of these is the Hagwellget Bridge which spans the Bulkley River north of Hazelton. This bridge with an overall length of between 150 and 170 feet and having a clear span of about 90 feet was made from local timber and abandoned telegraph wire. An old canard commonly told about this bridge is that, on its completion, the builders tested it by assembling a group of the fattest squaws in the village and sending them across. When they had crossed safely, the bridge is said to have been approved for public use.

While timber bridges are still used on secondary roads, steel and concrete bridges are being constructed on the main highways.

However, little reinforced concrete is being used as it requires special equipment and labour which in outlying districts is not easily available.

Of particular concern in B.C. is to find stable crossings in the wild rivers which flow through it. The most erratic rivers are those that are contained in glacial valleys such as the Capilano, Elk, and Similkameen, where continuous shifting of the water bed is taking place. Often by examining the cross section of the river bed its general stability can be determined for unequal cutting will be evident by a steeper slope on one side than on the other.

Generally foundation problems are not difficult in British Columbia except on the lower Fraser below Hope where deep deposits of silt require long piles to distribute the load. On the Stave River Bridge just recently constructed steel piles penetrate the mud to a depth of 70 feet. To avoid the dewatering of such a site prepakt concrete piers were built.

Methods of erection vary from place to place with the rocky canyon sites proving the most difficult. Under such conditions usually the cantelever or skyline method of erection must be used. In one particular case two triple-triple Bailey bridges were first placed across a gorge to act as falsework for the two bridge trusses.

The speaker pointed out that increasing road widths of today require wider bridges and at present the 12-foot lane is considered standard although in some places in the States they have gone up to 13 feet. Since bridges the same width as the road have the effect of slowing down traffic the tendency is to build bridges as wide as 30 feet to fit a 24-foot roadway. In B.C. where traffic is not a problem this is not so important and bridge widths run between 24 and 26 feet.

Loading for bridges was formerly based on so much a square foot. But now with bridges classified according to the number of lanes, generally the type of loading used on each lane, for calculation purposes, is an idealized truck with a trailer classified as an H-15-S-12 or an H-20-S-16 load. Trucks of 30 tons or more are permitted with the allowable axle load varying between 18,000 and 32,000 lb. depending upon its length.

In conclusion Mr. Sanderson pointed out that bridge design had advanced considerably in the last few years and such recent practices as pre-stressed concrete, welding and the use of aluminum in bridging by the Aluminum Company of Canada was producing economy both in weight and material.

After a very interesting question period the speaker was thanked by Mr. A. L. Carruthers on behalf of the Branch.

Winnipeg

G. W. Moule, m.e.i.c.,
Secretary-Treasurer

Electrical Section

K. Hallson, jr.e.i.c.,
Secretary-Treasurer

J. C. Pratt, m.e.i.c.,
Branch News Editor

Mr. J. Armstrong of the English Electric Co., Motor Division, St. Catharines, Ontario, recently addressed the Electrical Section of the Engineering Institute in Winnipeg. His subject was **Some Aspects of Synchronous Motor Characteristics and Appliances.**

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment.*

Situations Vacant

CHEMICAL

TWO CHEMICAL ENGINEERS 1948 or 1949 graduates to act as process engineers in the production units. Location Ontario. Salary open. Apply to File No. 2004-V.

CHEMICAL ENGINEER 1940 to 1945 graduate capable of geological evaluation of petroleum and gas producing areas and preferably with experience in refinery or chemical production. Location Ontario. Salary open. Apply to File No. 2004-V.

CHEMICAL ENGINEER 1949 or 1950 graduate required by chemical firm in Ontario. Applicant to act as administrative assistant to the works manager. Excellent opportunity for a junior engineer with clerical or administrative experience. Apply to File No. 2004-V.

CHEMICAL ENGINEER required by firm located in Montreal to act as sales engineer in Province of Quebec. Applicant should have sales experience and be between 28 to 31 years of age. Car provided. Apply to File No. 2010-V.

CIVIL

YOUNG CIVIL ENGINEER about 35 years of age with construction and administration ability. Applicant should be bilingual. Location Montreal. Excellent opportunity offered. Salary open. Apply to File No. 2009-V.

CIVIL ENGINEER required by large Canadian company with experience in structural steel design, preferably on hydro-electric structures such as gates and outdoor switching yards. Apply to File No. 2017-V.

CIVIL ENGINEER for design work on hydro-electric structures. Prefer at least four years' experience in this field. A knowledge of power house and dam foundations is desirable. Good opportunity with large Canadian company. File No. 137. Apply to File No. 2017-V.

ELECTRICAL

ELECTRICAL ENGINEER with a minimum of two years industrial experience on control devices and wiring, prefer test course training. Location Southern Ontario. Please quote File No. 13710. Apply to File No. 2005-V.

ELECTRICAL ENGINEER with two years industrial experience on circuit breakers, disconnect switches and metalclad switchgear, prefer test course background. Location Toronto. Quote File No. 13711. Apply to File No. 2005-V.

ELECTRICAL ENGINEER with a minimum of two years industrial experience on rotating electrical equipment, prefer test course background, duties include specification writing and general engineering work with large Canadian firm. Location Toronto. Refer to File No. 13712. Apply to File No. 2005-V.

ELECTRICAL ENGINEER required by large Canadian organization for its overseas operations to act as chief of system planning. Duties will include long range overall system planning of generating, transmission and receiver-station facilities in co-operation with operating companies; the direction of the activities of overhead and underground distribution, relay-protection, carrier-current, radio, special studies and standards and research departments, long range forecast of capital expenditures for the necessary transmission and distribution facilities and general engineering problems. Quote File No. 137. Apply to File No. 2005-V.

WELL QUALIFIED ELECTRICAL ENGINEER required by a large Canadian organization for its overseas operations to act as supervisor of relay protection. Duties will include preparation of plans for relay protection of transmission circuits, reservoirs and substations; review of relay maintenance procedures. Quote File No. 137. Apply to File No. 2005-V.

WELL QUALIFIED ELECTRICAL ENGINEER required by a large Canadian organization to act as supervisor of overhead distribution for its overseas operations. Duties will include long range planning of overhead distribution systems and allied substations; review of present overhead distribution practices with a view of improving and standardizing such practice and reducing operating costs. Quote File No. 137. Apply to File No. 2005-V.

YOUNG ELECTRICAL ENGINEER, 1949 or 1950 graduate required by consulting engineering firm in Montreal. Salary open. Apply to File No. 2008-V.

ELECTRONIC ENGINEERS required by large Montreal firm for development work on radio communication equipment and radar. Applicants should have three or more years of practical design experience in this field. Apply to File No. 2011-V.

THE PUBLIC SERVICE OF CANADA requires Electrical Engineers (electronics and communications). Appointments at Ottawa, Toronto and Montreal. Salaries up to $4,740.00 per annum. Details and application forms may be obtained by writing Civil Service Commission, Ottawa. Competition No. 50-158-B. Apply to File No. 2016-V.

ELECTRICAL ENGINEER required by large Canadian Company, with hydro electric operations in Brazil with several years experience with industry on public utility. Duties will include: specification writing, analyzing bids, checking manufacturer's drawings, inspection of heavy electrical equipment, supervision of freight tests and technical correspondence. Prefer a minimum of three years experience. Location Toronto. File No. 13741. Apply to File No. 2017-V.

ELECTRICAL ENGINEER required by university in Montreal. Duties include design and construction of electronic equipment and finally extensive research. Apply to File No. 2022-V.

ELECTRONIC ENGINEER required in Montreal with some experience with radar. Apply to File No. 2026-V.

MECHANICAL

MECHANICAL ENGINEER required by a large manufacturer in Montreal of heavy mechanical equipment. Applicant should have several years industrial experience which should include a background of welding knowledge. Apply to File No. 2001-V.

MECHANICAL ENGINEER required for the maintenance department of chemical manufacturer located in Province of Quebec. Applicant should have three to five years maintenance experience in chemical, refinery, brewing or some similar industry. Apply to File No. 2002-V.

TWO MECHANICAL ENGINEERS 1947, 1948 or 1949 graduates with design experience in the chemical or allied industries. Location Ontario. Apply to File No. 2004-V.

MECHANICAL ENGINEER 1947, 1948 or 1949 graduate to assist in plant construction inspection and supervisory work. This is a permanent position. Location Ontario. Salary open. Apply to File No. 2004-V.

MECHANICAL ENGINEER with several years experience on design and layout of mechanical equipment for hydro-electric construction, location Southern Ontario. When replying please quote File No. 137-8. Apply to File No. 2005-V.

MECHANICAL ENGINEERING GRADUATE or equivalent with three or more years experience in design and manufacture of light alloy structures required by large Montreal firm manufacturing radio communication equipment and radar. Apply to File No 2011-V.

MECHANICAL ENGINEER recent graduate up to three years employment interested in obtaining drawing office experience in plant production of heavy armament work. Forty minutes by tramways from Phillips Square, Montreal. Apply to File No. 2014-V.

MINING

TWO MINING ENGINEERS required by large firm in Province of Quebec to take charge of surveying work underground. Reply giving full details of experience and salary required. Apply to File No. 2015-V.

MISCELLANEOUS

TECHNICAL REPRESENTATIVE required in Montreal by Canadian Branch of British textile firm, manufacturing textile and cable machinery. Applicant must have executive ability as position offers exceptional opportunity. Apply to File No. 1706-V.

SCIENTIFIC OFFICERS wanted. Applicants should be Canadian citizens who are graduates in science, preferably with post graduate training. Research or general experience in some particular scientific field is desirable in certain positions. War service will be considered an additional qualification in some positions and a requirement in others. The main duties will pertain to the co-ordination, control and dissemination of scientific information in most of the major fields of science and technology. Salary $2,700.00-$3,800.00 depending upon qualifications and experience. Apply to Box 1274, Station B, Ottawa, Ontario. Apply to File No. 1707-V.

DESIGN ENGINEER approximately ten years experience in structural material handling and mechanical design. Boiler design experience an asset but not essential. Location Western Canada. Apply to File No. 2000-V.

CITY ENGINEER required in Western Canada. Applicants should state age, qualifications, salary required and details of previous experience. Preference will be given to applicants possessing municipal engineering experience. Apply to File No. 2003-V.

HYDRAULIC ENGINEER with several years' experience on reinforced concrete design and hydraulic structures, location Southern Ontario. Please quote File No. 13709. Apply to File No. 2005-V.

GRADUATE ENGINEER required by firm located in Western Canada, to handle all packaging equipment and installations throughout Canada, as well as all machines and equipment in plant. Headquarters in Winnipeg. Recent graduate required. Apply to File No. 2006-V.

RADIO TECHNICIANS required by small manufacturer located in the Maritimes, for aircraft electronic equipment maintenance. Applicants should have some experience. Apply to File No. 2007-V.

PRODUCTION MANAGER for small light engineering unit located in the Maritimes, employing approximately 60 people. Duties include production methods and layouts, produce own cost estimates on jobbing basis and be wholly responsible for operation of plant production facilities and personnel. Apply to File No. 2007-V.

CHIEF DRAUGHTSMAN required to establish small drawing office in electronics plant, located in the Maritimes. Mechanical design experience of electronic equipment, small mechanisms and structures. To be responsible for mechanical design, drawing system and draughting personnel. Mechanical draughtsmen also required. Apply to File No. 2007-V.

SENIOR ENGINEERS required by small manufacturer located in the Maritimes. Age 25 or over. University degree in engineering or physics. Three or more years experience in electronics in a senior capacity. Preferably with experience in radar problems. Salary $4000.00 to $6000.00. Junior Engineers also required with same type of background. Apply to File No. 2007-V.

FULLY QUALIFIED TEXTILE TECHNOLOGIST, graduate of textile institute, required in Montreal by industrial consultant. Applicant should have industrial engineering experience. Give full details as to experience and education to File No. 2012-V.

SALES ENGINEER, excellent opportunity for right man. Ontario sales and service for power house chemicals with established and growing firm. Degree in chemical engineering and knowledge of power plants and water treatment desirable but not essential. Prefer ages 25 to 35. Apply to File No. 2013-V.

MECHANICAL DRAUGHTSMEN, detailers, checkers, all grades from 2 years experience and up for plant in production of heavy armament work. Forty minutes by tramways from Phillips Square, Montreal. Apply to File No. 2014-V.

TWO INDUSTRIAL ENGINEERS graduates in mining required by large organization in Province of Quebec. Applicants should have some experience underground to do time study work, eventually leading to senior positions in methods and layout work. Reply giving full details of previous experience and salary desired. Apply to File No. 2015-V.

CIVIL OR MECHANICAL ENGINEER required by large mining organization in Province of Quebec for design and layout of buildings and equipment for asbestos milling operations. Reply giving full details of previous experience and salary desired. Apply to File No. 2015-V.

SUPERVISOR OF UNDERGROUND DISTRIBUTION. Large Canadian organization requires well qualified electrical engineer for its Brazilian operations, duties will include long range planning of all underground distribution systems and of allied substations, review of the present underground distribution practices and reducing operating cost, making such studies as required by the chief of system planning or the chief electrical engineer. Apply to File No. 2017-V.

ASSISTANT PRODUCTION SUPERINTENDENT required by large firm of long standing manufacturing men's shirts, pajamas etc. for plant near Three Rivers, Quebec. Experience in manufacturing these lines or similar necessary. Applicant would be required to plan for high production, improve methods, lower costs etc. Good position to right party. Apply to File No. 2018-V.

RESEARCH CHEMIST required by chemical firm in Ontario for laboratory research under supervision. Minimum age 23 years, bachelor's or master's degree in chemistry or chemical engineering. Two or three years technical experience or Ph.D. in lieu of experience. Apply to File No. 2019-V.

CHEMIST required by chemical firm in Ontario for the development of textile chemicals. Minimum age 27 years. Degree in chemistry or chemical engineering with 5-10 years technical (laboratory or production) and sales experience. Position requires both research and sales abilities combined with practical knowledge of textile industry. Apply to File No. 2019-V.

ASSISTANT WORKS MANAGER required by chemical firm in Ontario. Age 30 to 35 years. Degree in chemical, mechanical or civil engineering, minimum of 5 years experience in industry. Responsible for overall supervision of plant operations, capable of maintaining discipline and assuming responsibility. Apply to File No. 2019-V.

SALES ENGINEER, recent graduate, preferably mechanical or electrical required by well established supply house with nation wide representation. Experience in equipment sales, of value but not essential. Training period to be spent in Montreal. Good opportunity for advancement to party interested in making career of this work. Apply to File No. 2020-V.

ARCHITECTURAL DRAUGHTSMAN required by large pulp and paper manufacturer in Eastern Canada for general architectural designs covering building changes on existing buildings and new buildings, etc. Apply to File No. 2021-V.

ENGINEERING DRAUGHTSMAN required by paper industry located in Montreal. Must be fully qualified. Apply to File No. 2023-V.

THREE FULLY QUALIFIED ENGINEERS required by a firm of management consultants located in Montreal. Salary open. Apply to File No. 2024-V.

MECHANICAL OR CIVIL ENGINEER required by national beverage company to act as plant superintendent in plant situated outside of Montreal. Applicant should be between 25 to 35 years of age. Salary open. Apply to File No. 2025-V.

APPLICATIONS will be received by the City Engineer until 12 noon, February 15th, for the position of traffic engineer for the city of Calgary, Alberta. Applicant should be a graduate engineer and shall have not less than three years experience in the field of traffic engineering. Applicant shall state age, qualifications, experience and salary expected. References as to experience and character shall be submitted with application. Apply to File No. 2027-V.

The following advertisements are reprinted from last month's Journal, not having yet been filled.

CHEMICAL

JUNIOR CHEMICAL ENGINEER required in Montreal, by organization importing industrial chemicals from abroad. Applicant would act as sales engineer. Apply to File No. 1637-V.

TWO JUNIOR OR INTERMEDIATE CHEMICAL ENGINEERS for the control department of pulp and paper industry in the Maritimes. Duties would be in connection with control and process work. Apply to File No. 1650-V.

CIVIL

CIVIL ENGINEERS wanted with experience in design and construction of municipal works. Salary $235.00 per month and up, based on experience and qualifications. Apply to File No. 1641-V.

CIVIL ENGINEER required by large firm in Ontario, with about 10 years structural experience. Applicant must be experienced and able to assume responsibility. Apply to File No. 1644-V.

CIVIL ENGINEER with some experience on structural design, preferably on transmission towers and switching yards. Duties include engineering calculations, design and investigations of structures and surveys. File No. 13466. Apply to File No. 1651-V.

YOUNG CIVIL ENGINEER required by conveying industry in Montreal. Applicant should have some experience in design and detail work on structural steel. Good opportunity for advancement offered. Apply to File No. 1663-V.

CIVIL DRAUGHTSMAN required by large well established Canadian Company. Minimum of 10 years experience in concrete. Location Toronto. Apply to File No. 1687-V.

CIVIL ENGINEER, English speaking, preferably some surveying experience on road or transmission line location or other topographic work. For training in photogrammetry and subsequent employment as ground surveyor and control engineer for aerial mapping. Apply in writing stating experience to File No. 1691-V.

CIVIL ENGINEER, French speaking for training as operator of photogrammetric plotting machines and subsequent employment as operator in Montreal office. Good long term prospects for right man with executive ability. Initial salary during probationary and training period $200.00 per month. Apply to File No. 1692-V.

ELECTRICAL

ENGINEER required by a firm of consulting engineers in Montreal with experience in mechanical equipment for building, for work on heating and plumbing. Apply to File No. 1549-V.

ELECTRICAL ENGINEER required. Good opportunity for one who has had two or more years experience on sales and contract work in an electrical manufacturing company. This position offers excellent opportunity for advancement with a growing concern. Apply to File No. 1558-V.

GRADUATE IN ELECTRICAL or radio engineering from a recognized university with a number of years experience with airborne radio and radar equipment. Previous experience with R.C.A.F. airborne equipment desirable. Apply to File No. 1642-V.

ELECTRICAL ENGINEER for position as relay engineer with foreign branch of Canadian company. Prefer several year's experience with an operating company. Appointment would be initially for three years. File No. 13510. Apply to File No. 1651-V.

YOUNG ELECTRICAL ENGINEER required in Montreal for inside sales work on transformers. Apply to File No. 1654-V.

FOUR ELECTRICAL ENGINEERS, recent graduates with some experience in power required by large firm in Montreal. Apply to File No. 1658-V.

ELECTRICAL ENGINEER required by company in Montreal, with a minimum of 2 years experience in design and layout work. Applicant should also have some knowledge of construction. Duties include design and repair of work in the field and office. Salary range $350.00. Apply to File No. 1664-V.

FOUR ELECTRICAL ENGINEERS with five years or more experience in design, specifications, estimates, layout, inspection and testing, etc., for distribution work. Location Toronto. Reply stating age, education and details of work actually carried out in previous positions to File No. 1696-V.

MECHANICAL

MECHANICAL, heating and ventilating engineer required by internationally known manufacturer of heating equipment to take over Eastern Ontario territory, out of Ottawa. The same territory for other prominent manufacturers' lines is open to the right man. Apply to File No. 1646-V.

MECHANICAL ENGINEER required in Province of Quebec with some plant experience. Duties include design and plant layout work. Apply to File No. 1648-V.

MECHANICAL ENGINEER required in Ontario. Applicant should be young and aggressive with B.Sc. Canadian university for position as service manager. Must be capable of dealing with public and of instructing men in overhaul and maintenance of diesel equipment. Apply by letter only, stating age, height, weight, marital status, military service, university, religion, business experience and enclose photograph. Apply to File No. 1652-V.

MECHANICAL ENGINEER with knowledge of industrial steam power plant design, heating system design and application of steam, air and hydraulics as applied to processes, required by large established company. 5 years or more experience desirable, location Montreal. Salary open. Apply to File No. 1655-V.

MECHANICAL ENGINEER required by large organization in Montreal. Applicant should be between 30 to 35 years. Duties include general machine shop work and planning. Apply to File No. 1673-V.

MECHANICAL ENGINEER required for small manufacturing plant in Niagara Peninsula. Duties will consists of general draughting and machine design, particularly valves. Some previous experience would be advantageous. Apply to File No. 1681-V.

TWO MECHANICAL ENGINEERS for mechanical inspection in the field. Experience necessary in Hydro-Electric projects. Location overseas. Apply to File No. 1687-V.

MECANICAL ENGINEER to act as sales engineer for large organization in Montreal. Salary range $5,000.00. Apply to File No. 1690-V.

MECHANICAL ENGINEER required by firm located in the Maritimes with some experience in steel design and construction. Apply to File No. 1695-V.

YOUNG MECHANICAL ENGINEER required as assistant superintendent by firm located in Montreal manufacturing spun nylon yarn and nylon wool. Apply to File No. 1700-V.

MECHANICAL ENGINEER to act as project engineer required by large organization in Montreal. Salary open. Apply to File No. 1701-V.

MISCELLANEOUS

SMALL WELL ESTABLISHED ELECTRICAL MAINTENANCE BUSINESS in Montreal for sale at moderate price. Excellent opportunities for expansion under progressive management. Thorough investigation invited. Apply to File No. 1635-V.

SALES MANAGER required by firm located in Montreal. Applicant should have sales experience and a thorough knowledge of the operation of steel plants. Apply to File No. 1637-V.

ELECTRICAL AND CIVIL ENGINEERS with about 1 year experience, required by large organization in Montreal. Apply to File No. 1639-V.

PUMP DESIGNER wanted by large pump manufacturing firm in Montreal district. Excellent opportunity with wide scope for someone with initiative. Apply to File No. 1643-V.

FIRM, PRESENTLY LOCATED IN GERMANY, founded in 1908 and specializing in the design and manufacture of water treatment plants for boiler as well as for industrial purposes, wishes to contact firm or individual in Canada interested in forming a company here to use their designs for the benefit of Canadian industry. Willing to train an engineer, expenses paid in Germany. Apply to File No. 1645-V.

RATE SPECIALIST for foreign branch of Canadian company. Prefer man experienced in rate setting and retired from a hydro public utility. Duties during 2 or 3 years appointment, would be to serve as a consultant during organization of a rate department. File No. 13513. Apply to File No. 1651-V.

SCIENTIST WANTED in Ottawa, with engineering degree or science, preferably with post-graduate training in aeronautical engineering. A wide knowledge and at least 5 years experience in aeronautics is essential. The applicant must have served in the R.C.A.F., preferably in a position of responsibility in aeronautical engineering in armament work. Experience in research and development work will be considered an additional qualification. Must have ability to work well with others. Canadian citizen. Apply to File No. 1656-V.

SALES ENGINEER, for a permanent position in Toronto office. Preferably one who has had some experience in fan application work such as heating and ventilating, mechanical draughting, etc. Salary open. Apply to File No. 1657-V.

FULLY QUALIFIED structural design engineer required by firm located in Toronto. Apply to File No. 1659-V.

HYDRAULIC AND STRUCTURAL DESIGN ENGINEERS required in Ottawa. Work assignments may have to do with the development of major waterworks. Salary up to $7,500.00 depending on qualifications. For further details, write to The Civil Service Commission, Ottawa and request information circular, 50-616. Apply to File No. 1660-V.

ENGINEER REQUIRED in Montreal full experience in the design and construction of filter plants and water reservoirs. Apply to File No. 1661-V.

MECHANICAL AND CHEMICAL ENGINEER required in paper mill located in Newfoundland Experience is not absolutely essential, but one or two years in industry, not necessarily the paper industry, would be preferred. The applicants must be single and starting salary would be $300.00 to $325.00 a month depending on qualifications. Apply to File No. 1667-V.

GRADUATE ENGINEER required in Ontario with experience in design, construction, service and application of internal combustion engines, particularly diesel engines. Apply to File No. 1670-V.

PURCHASING AGENT required by internationally known manufacturer of power equipment, presently establishing a new factory near Montreal. Applicant must be capable of organizing own purchasing department to handle the purchasing of factory equipment, raw materials and prefabricated parts for the production of large and small electric power equipment, and must be familiar with Canadian market. Attractive salary offered with security and opportunity. Apply to File No. 1671-V.

ASSISTANT FACTORY MANAGER required by internationally known manufacturer of power equipment, presently establishing a new factory near Montreal. Applicant must have good technical background and extensive experience (including several years management) in the mechanical or preferably the electrical engineering field, and be familiar with labour relations, employee training, cost estimating and accounting, factory organization and maintenance, modern production methods and equipment and be preferably bilingual. Please include photograph. Apply to File No. 1671-V.

RESIDENT ENGINEER

to act as owners representative for hydro electric project in Northern Quebec. Excellent salary for experienced man. Apply to File No. 2028-V.

TWO SALES ENGINEERS required to act as representatives in Montreal and Toronto by young progressive industry, interested in the sale of British made products. Knowledge of pulp and paper industry desired. Apply to File No. 1674-V.

SENIOR PETROLEUM ENGINEER required by independent Canadian Oil Company with headquarters in Calgary. Applicant should be particularly experienced in reservoir engineering and production practices. No one with less than 7 years experience in the industry need apply. Give synopsis of education, training and experience and supply recent photo. Apply to File No. 1675-V.

MECHANICAL OR ELECTRICAL ENGINEER for supply inspection department of a large organization in Toronto. Applicant should have at least 12 to 15 years extensive practical shop and office experience in the manufacture of heavy mechanical and electrical machinery and equipment. Reply stating age, education and details of experience to File No. 1678-V.

SENIOR BUYER with 7 to 10 years diversified purchasing experience. Electrical engineering or engineering training desirable; also administrative or supervisory ability. Location Toronto. Apply to File No. 1679-V.

TWO MECHANICAL OR ELECTRICAL ENGINEERS for the design and development of meters and clocks, required for large electrical organization in Quebec City. Apply to File No. 1682-V.

INSTRUMENT ENGINEER (electrical or mechanical preferred) required for large oil refinery in Montreal east. Applicant should have not less than three years experience as instrument engineer or not less than 5 years general electrical engineering experience. Would be expected to take charge of instrument department under general supervision of power engineer. Salary open. Applications will be treated confidentially and should include full particulars as to qualifications, together with recent photograph. Apply to File No. 1684-V.

RESIDENT ENGINEER wanted, for construction of proposed Granville bridge in Vancouver, B.C. Duration of work approximately two years, starting about March 1, 1951. Applications should be made by letter giving full details of experience, professional qualifications, age, etc., and salary expected. Apply to File No. 1685-V.

SALES ENGINEER or contact man required by a firm of inspection engineers in Montreal. Must have considerable experience and be between 30 and 40 years of age. Apply to File No. 1686-V.

RESIDENT ENGINEER required by large well established Canadian company minimum 10 years experience in Hydro Electric construction, competent in design, construction experience in field. Age approximately 40 years. Location overseas. Apply to File No. 1687-V.

BRITISH ADVERTISER seeks Canadian engineering firm with reputation, willing to join with long established English counterpart. Enquirer to provide capital, select tools and supervise projects directed to both government equipment and rearmament programs. Also industrial manufacturer of small engines, motrocycles, etc. Apply to File No. 1688-V.

MECHANICAL OR CIVIL ENGINEER required by large engineering firm for their Toronto sales office. Age about 26 or 27 years. Applicant must have definite sales ability and would be away 50% of time. He should also have some practical experience with heavy equipment for paper mills, mines or quarries. Territory Northern Ontario district. Apply to File No. 1689-V.

DESIGN ENGINEER preferably mechanical required by large organization in Montreal. Applicant must have administrative ability. Salary range $5,000.00. Age 30 to 40 years. Apply to File No. 1690-V.

GRADUATE ENGINEER for design work on buses, required by large organization in Montreal. Apply to File No. 1690-V.

GRADUATE ENGINEERS and draughtsmen, mechanical, civil, electrical required for projects in Ontario and Quebec. Preference to those with 3 years practical experience. Apply to File No. 1697-V.

RECENT GRADUATE required by manufacturer in Winnipeg. Applicant must be interested in production planning, time and motion study, etc. Work will be in connection with the setting up of a modern production program. Training period. Salary open. Apply to File No. 1698-V.

AIRCRAFT HYDRAULIC DESIGNER required by large Montreal aircraft manufacturing firm. Must have 4-5 years experience and sound overall knowledge of system layout, flow calculations and detail component design. Apply to File No. 1703-V.

MECHANICAL (practical) Production Engineer, with thorough knowledge of metal working machinery, plant lay-out, processing, tooling and die making, production control for Western Canada Manufacturer selling all across Canada to other manufacturers and to wholesalers. Prefer man of 40 or older. Permanent and good future for a good practical factory manager and producer. Apply to File No. 1704-V.

Situations Wanted

MECHANICAL ENGINEER S.E.I.C. 1950 graduate, University of Toronto. Age 24, single. Experience in machine shop and repair and maintenance work. Presently employed in structural steel, foundry and machine tool industry as plant layout and maintenance engineer. Interested in permanent position leading to responsibility. Willing to work and learn. Available on short notice. Apply to File No. 1505-W.

YOUNG REGISTERED CIVIL ENGINEER with ten years army, administrative and municipal experience desires spare time employment to help him gain additional technical experience. Available Lower B.C. Mainland approximately 20 hours per week, including limited time during weekdays. Draughting and surveying assistance can be arranged. Apply to File No. 2377-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., P. Eng., (Ontario), age 31, married. Presently employed in Toronto. Desires responsible position with manufacturing firm. Nine years experience in mechanical and structural design, inspection, shop liaison, and sales and service. Apply to File No. 2586-W.

MECHANICAL ENGINEER, Jr. E.I.C. (McGill 1947). Age 25, married and family of two. Experience consists of four years of summer work as instrumentman on highway construction; several months as sales engineer in pumps and allied electrical equipment; one year including specialized training in fire inspection work for United States fire insurance company. For the past two years have been a full partner in a road building outfit in Western Canada. Desires permanent position where responsibility, organization and sales ability are important qualifications. Starting salary and location are secondary factors. Available immediately. Apply to File No. 2858-W.

MECHANICAL ENGINEER, M.E.I.C., Queens 1936, age 38, married. Currently engaged in research work, 2 years, desire to return to industrial or commercial field. Have had the following experience since graduation: about 10 years diversified work in plant engineering embracing — dust control, 2½ years, application of control to metallurgical processes (primary metal producers), 3 years, industrial ventilation and air-conditioning, 1 year, general plant maintenance, 3½ years; about 2 years steel forging experience in small plant covering purchase, installation, and operation of equipment. Would be available at one month's notice to present employer. Apply to File No. 2966-W.

GRADUATE DRAUGHTSMAN, designer, Jr. E.I.C., B.Eng. Desires a position in the structural design field, preferably reinforced concrete and design. Age 24, McGill (Civil) graduate 1948. Two years experience in structural steel and reinforced concrete detailing and design. Prefer employment in Montreal area, will consider good position elsewhere. Presently employed. Available on short notice. Apply to File No. 3026-W.

MECHANICAL ENGINEER, B.Sc. 1941, single, veteran of R.C.A.F. Experience in laboratory work, aircraft maintenance, design of heavy machinery with emphasis on welding and applied stress analysis. Desires work of research nature. Willing to work outside Canada. Apply to File No. 3058-W.

MECHANICAL ENGINEER, 1947, Jr.E.I.C., age 26, two years of experience in maintenance and one and one-half years of experience in design and installation in industrial plants. Desires quality control or industrial engineering work in Montreal. Apply to File No. 3208-W.

CIVIL ENGINEER, B.Sc. 1947, Jr. E.I.C., P.Eng. (Quebec), age 26, married, with car, 3½ years varied structural experience with architects, fabricators and contractors, covering design, detailing and estimating of structural steel and concrete as well as liaison work, desires position with responsibility. Must include outside work in design and supervision, and/or liaison work, or sales promotion. Available on one months' notice to present employer. Ontario or Alberta preferred. Apply to File No. 3340-W.

PROCESS ENGINEER, M.E.I.C., chemical and metallurgical. Extensive experience in metal-working industry in both production and development. Desires senior position in technical or administrative field. Apply to File No. 3374-W.

ELECTRICAL AND MECHANICAL ENGINEER, B.Sc., M.I. Mech. E., M.I.E.E., A.M.I.C.E., seeks employment in Canada as from May next. Aged 47, married, three children. Experience includes oilfield electrification, consulting engineering, Government inspection, operation and management of hydro-electric undertakings, valuation. Recently in India visiting all hydro-electric schemes on behalf of major oil company. Present annual salary equivalent to $9000.00 basic $12000.00 with allowances. Available near Halifax early May. Apply to File No. 3378-W.

METALLURGICAL ENGINEER, M.E.I.C., P.Eng. (Ontario) Age 35, married, located in Toronto, desires sales post leading to administrative position in metallurgical or allied field. Ten years experience in industry includes technical control, process and methods application in light manufacturing, production supervision and administration. Currently employed in consulting capacity contacting industry throughout Ontario. Available after reasonable notice to present employer. Apply to File No. 3381-W.

CIVIL ENGINEER (B.E.N.Z.), 32, married, ex-service pilot. Experience in railroad, hydro-electric, highway, and airdrome construction, water supply, sewage disposal work. Also some experience in structural design and mechanical workshops. Seeks employment with consulting or structural engineers construction company, or Federal or Provincial organization. Presently in charge of airport project, available in mid-January. West Coast location preferred, but go anywhere. 2½ years experience of Canadian conditions. Expect to obtain Canadian registration at early date. Apply to File No. 3382-W.

CIVIL ENGINEER (Toronto 1949), P.Eng. Age 30. Married. R.C.A.F. veteran. Experience in hydraulic, hydrologic and hydroelectric fields including soil and foundation exploration, power and economic studies, flood control, and specification writing. Desires position in similar field. One month notice required to present employer. Apply to File No. 3383-W.

CIVIL ENGINEER, S.E.I.C., B.A.Sc., Toronto University, 1949, married, age 25, at present employed in London, Ontario. Desire permanent employment with opportunity for advancement. Experience in surveying, light construction work, draughting and general engineering duties. Willing to work anywhere in Canada but continuous travelling not desirable. Apply to File No. 3384-W.

METALLURGICAL ENGINEER, S.E.I.C. Graduate of 1950, McGill. Age 26, veteran, single. One year of practical experience in steelmaking with electric furnaces. Desire position leading to responsibility. Quite willing to work outside of country if so desired. Available on short notice. Apply to File No. 3385-W.

GRADUATE ENGINEER, M.E.I.C., married. Approximately 14 years industrial plant and construction experience including positions as resident construction engineer and plant engineer. At present employed and would consider changing only if offered a similar or better position with suitable opportunity for advancement. Apply to File No. 3387-W.

SENIOR PRODUCTION ENGINEER, M.E.I.C., of internationally famous engineering concern would like to assist small or medium size engineering firm in Montreal area in quickly clearing up design, production, or estimating difficulties. Available Saturdays or evenings. Temporary assignments considered. 10 years wide experience, fully qualified. Apply to File No. 3392-W.

MECHANICAL ENGINEER, S.E.I.C. Graduated with honours from U.B.C. in May, 1950. Age 24, single and in good health. At present employed in non-technical work in Ontario receiving supervisory training. Would like design development on research work anywhere in Canada. Available on short notice. Apply to File No. 3395-W.

ELECTRICAL ENGINEER, honours degree, A.M.I.E.E., M.A.I.E.E. 10 years experience world famous electrical manufacturing company, wishes permanent position anywhere in Canada. Very adaptable having broad range of interests. At present in Great Britain. Available early 1951. Apply to File No. 3396-W.

ELECTRICAL ENGINEER, S.E.I.C. Graduated University of Alberta 1950. Veteran, age 29; married, no children, desires permanent position anywhere in Canada. Have Naval electrical experience and training (E.A. 3rd Class), also experienced in electrical servicing. Have good technical background and excellent personality records. Available immediately. Apply to File No. 3403-W.

CIVIL ENGINEER, Jr.E.I.C., 31 years, B.A.Sc. Toronto 43, 7 years experience in industrial and housing construction both in field engineering and job supervision. Desire position in Southern Ontario in construction or related industry. Apply to File No. 3404-W.

MECHANICAL ENGINEER, M.E.I.C., graduate McGill 1943, veteran, age 30, seeks position as project or plant engineer. Broad experience in plant layout, design, construction, alteration and maintenance work. Employed during past 3 years on design and construction of large mill now nearing completion. Would consider alternative position as executive assistant or sales engineer. Apply to File No. 3405-W.

CONSTRUCTION COST ENGINEER, Queen's 1948, R.C.A.F. Veteran, with experience in all phases of estimating, scheduling, cost control, material requisitioning and expediting, for both large and small industrial projects, desires an executive or supervisory position where hard work and initiative will lead to advancement. Other assets include wife, two children and own car. Location unimportant. Apply to File No. 3406-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., P.Eng. (Ont.) Age 38, married, family 2. Experience includes 10 years mining and 6 years pulp and paper covering-construction plant engineering and design. Presently employed as assistant resident engineer. Ontario or Quebec province preferred. Available on reasonable notice. Apply to File No. 3409-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., age 25, five years experience in highway and bridge construction. Presently employed but desires position with more varied experience. Am interested in any type of engineering and will work anywhere. Available in three weeks. Apply to File No. 3411-W.

1950 GRADUATE University of Saskatchewan, distinction in Engineering Physics. 26 years, family of 2, currently mastering in physics. Have background as resident engineer on municipal engineering project; ex-navigation instructor in R.C.A.F. Desire work in applied reasearch or in general engineering. Available May, 1951. Apply to File No. 3414-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.Eng., B.Eng. McGill 1949. Age 28. Single. Good health. Experience: two summers as junior draughtsman in pulp and paper mill, two summers as helper in foundry and boiler shop of firm manufacturing heavy machinery, spring 1949 to date as engineer with major oil company. Desires to obtain plant engineering experience with a firm located in the Toronto area. Apply to File No. 3415-W.

TWO PROFESSIONAL ELECTRICAL ENGINEERS, Jr.E.I.C. Honours graduates of Canadian Universities, having completed two years training with a leading Canadian Electrical Manufacturer, seek to better their positions. Professional employment with any progressive Canadian company will be considered. Apply to File No. 3416-W.

ELECTRICAL ENGINEER, S.E.I.C., B.A.Sc. U.B.C. 1950. Age 27, single. Experience: Radar mechanic R.C.A.F. One summer each as coal mine car repairer, tipple machinery operator, and electricians' helper in coal mine. Will work anywhere. Available immediately. Apply to File No. 3417-W.

MECHANICAL ENGINEER, S.E.I.C. graduate, University of Saskatchewan 1950. Age 31, married. 4 years overseas with R.C.A.F. as wireless mechanic. Some boiler shop and pipe fitting experience. Would like to specialize in heating and air conditioning or in power house work. Willing to undertake any required training. Apply to File No. 3422-W.

ELECTRICAL ENGINEER, Jr.E.I.C., Assoc. A.I.E.E., B.Sc. University of New Brunswick 1949. Age 25, single. One year experience in the manufacture and design of polyphase and single phase motors. Seeks position in design or production engineering in power field preferably in Montreal area. Available immediately. Apply to File No. 3423-W.

CHEMICAL ENGINEER, Laval 1949, single, bilingual, with summer experience in shipbuilding, galvanizing of steel and making of aluminum. Nearly two years experience in food industry in Montreal. Desires a position in industrial, sales or plant engineering with opportunity for advancement. Available on short notice. Apply to File No. 3428-W.

MECHANICAL ENGINEER

(25-30 years of age)

required for manufacturer of spun synthetic textile yarns at Granby, Quebec. The Plant Superintendent is a Graduate Mechanical Engineer and the position now open is that of Assistant Superintendent. Duties will include Planning Production, the Maintenance of the Machines, Planning and Installation of new machinery and daily contact with all levels of the plant personnel. Salary will be dependent on the experience of the Successful Applicant but a minimum of $300.00 per month has been established. Please reply in detail to file No. 1700-V.

Mechanical Engineer Required

As assistant to chief inspector of large oil company in Montreal. Applicant should have at least three years' experience in plant maintenance, involving shop fabricating methods, and inspection. Knowledge of metallurgy and familiarity with corrosion problems an asset. Salary open. Apply to File No. 2052-V.

ATTENTION EMPLOYERS!

The Employment Service of the Institute has available a number of student members who anticipate graduation this spring.

Interested employers are invited to advise the Institute as to the type of engineering graduate they wish to interview. Complete details will be furnished on receipt of your request.

Address Enquiries To:

EMPLOYMENT SERVICE

The Engineering Institute of Canada

2050 Mansfield St., Montreal 2, Que.

Mechanical Engineer Required

For engineering office of large oil company. Applicant should have minimum of two years' experience in design and layout of mechanical equipment. Working knowledge of pressure vessel design an asset. Location Montreal. Salary open. Apply to File No. 2052-V.

BOOK REVIEW

SCIENTISTS AT WAR:

Wilfrid Eggleston. London, Oxford University Press, 1950. 291 pp., illus., cloth, $3.50.

Reviewed by Dr. E. P. Fetherstonhaugh, M.E.I.C.

Throughout the tragic years of World War II engineers and scientists were aware that a great deal of important war research was in progress at and under the direction of the National Research Council of Canada. But until the publication recently of Mr. Wilfrid Eggleston's book, "Scientists at War" no comprehensive report was available to the public on the nature and extent of the war researches that had been undertaken in this country.

In this most interesting and informative volume there may now be found the answers to many of the questions that puzzled Canadians during the progress of the war. Some of the researches must still be shrouded in secrecy, but many interesting developments are now removed from the secret list and described in language devoid of all unnecessary technicalities.

The book contains eleven chapters, two appendices and an index. It is well illustrated with numerous photographs. The first chapter gives a review of research in Canada and briefly introduces in general terms some of the aspects of war research. It is followed by four chapters dealing respectively with "Radar", "The Proximity Fuse", "New Explosives" and "Atomic Energy". The use of scientific equipment in war is covered in three intensely interesting chapters dealing with the war on land and sea and in the air. Separate chapters are devoted to "Materials and Food" and "The Medical Front". The story concludes with a discussion of "Science and the Future", in which the great importance of maintaining an adequate and active research organization for peace and war is strongly emphasized. Reference is also made to the creation in 1947 of the Defence Research Board and its important functions.

To the general public and especially to those who have an interest in scientific developments, this book is as readable as a fascinating novel. Having read it one is conscious of certain outstanding impressions. There is a feeling of confidence in the ability of Canada's young scientists to match their wits against those of any country, and there is a realization that at certain stages of the war and in some of its aspects the results might have been vastly different had the scientists and engineers not been ready with counter measures to block the effect of the enemy's ingenious inventions.

Everyone will agree with Mr. Eggleston's statement on the first page of his book that "no scientist would seek to claim any of the glory due to the front line forces". But on the other hand it is right that due acknowledgment should be made of the arduous and devoted labours of the scientists and engineers who, working always against time solved in a practical way so many of the intricate and urgent problems of the armed forces.

In concluding this brief review, reference must be made to the splendid leadership given to the National Research Council by two members of the Engineering Institute of Canada: General A. G. L. McNaughton, who was President in the years immediately preceding the war and whose military experience, scientific knowledge and foresight led him to lay the foundations well in advance for certain contingencies that were bound to arise if war were to come; and Dr. C. J. Mackenzie who assumed the duties of President when General McNaughton left to take the First Canadian Division overseas. Under Dr. Mackenzie's inspiring and competent leadership through the six war years a vast amount of valuable research was undertaken and brought to a successful conclusion so that in many instances the finished equipment was available to the armed serviced in an almost unbelieveably short space of time after their need had been foreseen.

SELECTED ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Airplane Design Manual, 3d ed.:
F. K. Teichmann. New York, Pitman, 1950. 382 pp., illus., $7.50.

Chemical Formulary, Volume IX:
Chemical Pub. Co., Brooklyn, 1951. 649 pp. $7.00.

Circuit Analysis of A.C. Power Systems, Volume II:
Edith Clarke. New York, Wiley, 1950 396 pp., illus. $8.50.

Elementary Theory of Structures:
J. C. Grassie. Toronto, Longmans, Green, 1950. 392 pp., illus. $5.00.

Fundamentals of Quantum Mechanics:
Enrico Persico. New York, Prentice-Hall, 1950. 484 pp., $8.00.

Horizontal Diesel Engines:
R. A. Collacott. London, Temple Press, 1950. 122 pp., illus. 8/6.

Kinematics of Machines, 5th ed.:
G. L. Guillet and A. H. Church. New York, Wiley, 1950. 299 pp., illus. $4.00.

Laplace Transformation:
W. T. Thomson. New York, Prentice-Hall, 1950. 230 pp. $5.00.

Plumbers' Pocket Book of Roughing-in Dimensions for Plumbing Fixtures:
A consolidated service by Canadian Potteries Ltd., and other companies. 134 pp., illus., paper.

Power System Stability, Volume II:
H. W. Kimbark. New York, Wiley, 1950. 288 pp., illus. $8.00.

Public Health Engineering, Volume II:
E. B. Phelps. New York, Wiley, 1950. 213 pp., illus. $4.00.

Receiving Tube Substitution Guide-Book:
H. A. Middleton. New York, Rider, 1950. 215 pp., illus. $2.40.

Rudiments of Mathematical Physics:
James Bain, Montevideo, 1950. 92 pp., illus.

Small Plant Management:
American Society of Mechanical Engineers. Toronto, McGraw-Hill, 1950. 548 pp., illus. $7.80.

TV and Other Receiving Antennas (Theory and Practice):
Arnold B. Bailey. New York, Rider, 1950. 595 pp., illus. $3.00.

TECHNICAL BULLETINS, ETC.

American Society of Civil Engineers. Memoranda:
No. 321F, 1950—How to approach the business of getting a job, (for) senior civil engineering students and new graduates.

American Standards Association. Price Lists:
Price List, August 1950.

British Electrical and Allied Industries Research Association. Lists of Publications of The Electrical Research Association:
List, August 30th, 1950.

...Technical Reports:
No. L/T227: The crystallography and thermodynamics of order-disorder transitions in certain mixed ketones, by V. Daniel. No. L/T228: Tracking in solid insulating materials; consideration of replies to questionnaire, ed. by V. E. Yarsley. No. N/T57: Magnetization curves for polycrystalline ferromagnetics, by H. Lawton and K. H. Stewart. No. S/T58: Propagation of electromagnetic disturbances along a thin wire in a horizontally stratified medium, by B. L. Coleman. No. U/T115: A new oscillograph for the recording of very fast electrical transients, by R. E. Bauer and W. Nethercot.

LIBRARY REGULATIONS

Hours

Mon., Tues., Wed., Fri. . 9 a.m. - 6 p.m.
Thursdays . . . . 9 a.m. - 8 p.m.
(For Montreal branch meetings)
Saturdays . . . . . . 9 a.m. to 12 noon

Summer Hours

9 a.m. - 5 p.m. Closed all day Saturdays.

Bibliographies and Literary Searches

Short subject bibliographies are compiled on request.

Extensive searches will be made at a charge of $3.00 per hour to members, and $5.00 per hour to non-members.

Please give as much detail as possible when requesting information of either type.

Borrowing and Purchasing

Books, periodicals, photostats, translation, etc. may be borrowed for two weeks at a time. **A fine of 25c. per day will be charged for each day borrowed items are retained beyond this period.**

A library deposit of $5.00 at par in Montreal is required before items may be borrowed. Books, periodicals, etc. may be ordered by members through the library. All carrying charges are payable by the individual concerned. Except in the case of library deposits, please make **no payments in advance.**

Non-members may consult the library, but may not borrow material.

Canada. National Research Council. Additions to the Publications of National Research Council:

July-August 1950.

...Building Notes:

No. 7: Instruments for measurement of dynamic stresses (or strains) in temporary steel structures, by W. R. Schriever.

...Aeronautical Laboratories. Reports:

No. ME 1950 (3), being quarterly bulletin July 1 to September 30, 1950.

...Translations:

No. TT-64: The Swiss Federal Institute for snow and avalanche research on Weissfluhjoch near Davos at 8700 feet above sea level.

Canadian Manufacturers' Association Inc. Annual General Meeting Reports:

79th Annual general meeting, report of the general manager, J. T. Stirrett.

Engineering Societies Library. Bibliographies:

No. 5 — Bibliography on machinery foundations, design, construction, vibration elimination.

Georgia Institute of Technology, State Engineering Experiment Station. Circulars:

No. 28—The solvent extraction of oilseed, by E. P. Cofield.

Institute of Metals. Reprints from Journal of the Institute of Metals:

No. 1254—The jet-impingement apparatus for the assessment of corrosion by moving sea-water, by R. May and R. W. De Vere Stacpoole. No. 1255—Pitting corrosion in copper water pipes caused by films of carbonaceous material produced during manufacture, by Hector S. Campbell. No. 1256—The new continuous brass mill of the Scovill manufacturing company, Waterbury, Conn., U.S.A., by J. J. Hoben and J. F. Mulvey. No. 1257—The flow of zinc under constant stress, by A. H. Cottrell and V. Aytekin. No. 1258—Mechanism of primary creep in metals, by W. A. Wood and R. F. Scrutton. No. 1259—The mechanism of creep as revealed by X-Ray methods, by G. B. Greenough and Edna M. Smith. No. 1260—Some X-Ray observations on the nature of creep deformation in polychrystalline aluminium, E. A. Calnan and B. D. Burns. No. 1261—The Thermodynamics and Kinetics of precipitation in solid solutions, H. K. Hardy.

Institution of Structural Engineers. Reports:

Report on the structural use of aluminium alloys in buildings.

Society of Naval Architects and Marine Engineers. General Information Book:

General information book, edition of 1939.

...Advanced Copies of Papers to be Presented at Annual Meetings:

No. 1—An approximate theory of heavily loaded, free-running propellers in the optimum condition, by Hermann W. Lerbs. No. 3—Cooling effect of tube holes in thick shells of marine boilers, by J. F. Harvey. No. 4—The backing power of geared-turbine driven vessels, by E. F. Hewins and others. No. 5—Design-stage calculations of torsional, axial, and lateral vibrations of marine shafting, by Eugene Panagopulos. No. 6—Bearings and lubrication for marine turbines and reduction gears, by Frank C. Linn and John T. Burwell. No. 7—Standards for stability of ships in damaged condition, by Vito L. Russo and James B. Robertson. No. 8—Stateroom fire test, by Archibald H. McComb and Edwin E. Benzenberg. No. 9—Some aspects of ship bottom corrosion, by Paul Ffield.

U.S. Bureau of Mines. Information Circulars:

No. 7568—Methods of excavation and roof support used in some recently constructed tunnels, by S. P. Polack.

U.S. Geological Survey. Water Resources Review:

July 1950.

PAMPHLETS

Airport Design and the All-Weather Navigation Program:

Walter Prokosh. Presented at the annual meeting of The Airport Operators Council, Cleveland, 1950.

Anglo-Newfoundland Development Co., A Survey of:

Collier, Norris & Quinlan, Montreal, 1950.

Business Administration. Lecture Course:

L. Urwick. Institute of Industrial Administration.

Canadian City Growth, Problems of:

Albert Rose. Ottawa, Community Planning Association of Canada, 1950.

Canadian Government Specifications Board, An Outline of its Character and Function:

Ottawa, National Research Council, 1949.

Coal in Canada, Current Statistics on:

C. L. O'Brian. Presented at annual general meeting of The Canadian Institute of Mining and Metallurgy, Toronto, 1950.

Coals. The Briquetting of Alberta Coals:

W. A. Lang. Presented at the annual general meeting of The Canadian Institute of Mining and Metallurgy, Toronto, 1950.

Compaction of Soil:

F. H. P. Williams and D. J. Maclean. London, H.M.S.O., 1950.

Concrete Kerbs; Causes and Prevention of Failures:

J. A. Loe. London, H.M.S.O., 1950.

Condensation in the Home:

National Research Council, Division of Building Research. (Better Building Bulletin, June 1949.)

Corporation of Professional Engineers of Quebec. Proposed New Tariff of Fees and General Conditions:

The Corporation, 1949.

Dredging at DeCew Falls:

S. C. Cooper. Reprint from Engineering and Contract Record, Feb. 1947.

Education for Management. Management Subjects in Technical and Commercial Colleges:

Report of a special committee appointed by the Minister of Education. London, H.M.S.O., 1947.

Flood Control Works All-American Canal, Coachella Branch Boulder Canyon Project:

Willard R. Slater and others. Paper presented at Joint Summer Convention on the American Society of Civil Engineers and the Engineering Institute of Canada, Toronto, 1950.

Low Temperature Properties of Ferrous Materials:

New York, Society of Automotive Engineers.

Management's Debt to Engineering:

L. Urwick, Paper presented to the Birmingham Association of Mechanical Engineers, 1948.

Mines and Quarries in the Province of Quebec, List of the Principal Operators and Owners:

Quebec, Quebec Department of Mines, 1949.

North American Security:

A. G. L. McNaughton. Address delivered at the 79th annual general meeting of the Canadian Manufacturers' Association, 1950.

Point Four Program:

U.S. Dept. of State, Washington, 1949, 1950.

Psychology of Safety in Supervision:

J. L. Rosenstein. National Safety Council of U.S., 1950. Consists of 6 pamphlets: No. 1—You can't change human nature; No. 2—What is your U.Q.?; No. 3—Teaching safety on the job; No. 4—People act alike; No. 5—Safety takes teamwork; No. 6—You are human too.

Research in Learning:

Engineering College Research Council.

St. John's Newfoundland, Report on:

John Bland. St. John's Commission of Town Planning, 1946.

Sands for Plasters, Mortars and External Renderings:

A. D. Cowper. London, H.M.S.O., 1950.

Scotland, Manufacturing and Export Centre:

Edinburgh, Scottish Council, 1950.

Service for Management:

London, British Institute of Management, 1949.

Undeveloped Water-Powers in the Province of Quebec:

A. B. Normandin. Engineering Institute of Canada, 1949.

ANNUALS, YEARBOOKS, ETC.

American Concrete Institute:

20-year index (1929-1949) to the Journal of the American Concrete Institute.

British Welding Research Association:

Annual report, 1949/1950.

Connecticut. Board of Registration for Professional Engineers and Land Surveyors:

Roster of registered professional engineers and land surveyors, January 31, 1950.

Crown Assets Disposal Corporation (Formerly War Assets Corporation):

Sixth annual report to the Minister of Trade and Commerce, April 1, 1949—March 31, 1950.

Ecole Polytechnique:

Liste des diplomés, May 1950.

Nova Scotia. Board of Commissioners of Public Utilities:

Report for the year ended December 31st, 1949.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

A.S.T.M. PUBLICATIONS:

American Society for Testing Materials, 1916 Race Street, Philadelphia, Pennsylvania:

Special technical publications:

No. 96—Papers on radiography. 95 pp., illus., $1.75.

In the present volume, three papers deal with the progress of electrostatic and betatron-type X-ray generators operating at potentials above the familiar one million volt range. Other papers deal with industrial and engineering applications of X-Ray machines.

No. 99—Symposium on use of pozzolanic materials in mortars and concretes. 203 pp., illus.

This symposium is the result of renewed interest in the subject of pozzolanic or blended cements. The paper starts with a definition and historical review of the early use of pozzolans, and continues with discussions on their use in mass concrete. Other aspects of the subject are also dealt with in detail.

No. 102—Symposium on high additive content oils. 63 pp., illus., $1.75.

The lubricating oils considered in this symposium are of an entirely new type and differ from the previous heavy-duty oils in that they contain from five to ten times as much additive. This is a well-rounded presentation from the standpoints of both the equipment and lubricants manufacturers.

No. 103—Symposium on application of statistics. 36 pp., $1.00.

This paper deals with the application of statistics to quality control in modern testing. Papers presented deal with: "The economic relationship between design and acceptance specifications", "Precision and accuracy of test methods", "Use of statistics to determine precision of test methods", "Modern quality control".

Standards:

Glass and Glass Products. Illus.

Products considered are divided in three groups: Glass and glass containers, glass insulators, glass textiles. In each case are given the methods of testing and the definitions of terms relating thereto. This is essentially a reprint of page 323-384 of 1949 Book of A.S.T.M. Standards, Part 3.

Procedures for testing soils. 418 pp., illus., $3.75.

These procedures are divided in five parts: soil explorations and sampling of soils; physical characteristics and identification of soils; physical and structural properties of soils; special and construction control tests for subgrades and base courses of highways and airports, and also for stabilization of soil with admixtures of soil, cement, bituminous and chemical materials for earth dams and embankments; bearing capacity tests of soil in place and dynamic properties of soils.

AMERICAN SOCIETY FOR ENGINEERING EDUCATION. ENGINEERING COLLEGE RESEARCH COUNCIL. PROCEEDINGS OF 1949 ANNUAL MEETING:

American Society for Engineering Education, Iowa City, 1950. 140 pp., paper, $2.00.

A symposium of 12 papers on instrumentation for engineering research highlights the proceedings of this 1949 annual meeting. Other papers in the publication describe federal military and non-military engineering research interests, as reported to the research council. The symposium on instrumentation contains descriptions of a number of new mechanical and electrical instrumentation devices developed in industrial and college laboratories.

CCH'S CONSOLIDATION CANADIAN INCOME TAX ACT, 16th ed., June, 1950:

CCH Canadian Ltd., Montreal, 1950. 328 pp., paper, $3.00.

This Consolidation reproduces the current law. Following each section in smaller two-column type is the full text of the section as it was prior to amendment, plus the full text of the analogous provision of the Income War Tax Act. A two-way cross reference table to the old and the new Act is an added feature. A 34-page index brings all points of reference to instant use.

CANADIAN SALES AND EXCISE TAX GUIDE:

CCH Canadian Ltd., Montreal, 1950. 194 pp., paper, $2.00.

This is the first authoritative statement on sales and excise taxes for popular use. It contains an alphabetical list of items exempted from tax. It also gives full information on the computation of the tax on goods produced in Canada, imported or for export, on samples, repairs, contracts, returned goods, ships' stores, custom work, containers and coverings, goods lost or damaged in transit, freight, etc.

CLASSIFIED HANDBOOK OF MEMBERS AND THEIR MANUFACTURES; 21st ed.:

British Engineers' Association, London, The Association, 1950. 655 pp., cloth.

This volume consists of reading matter and advertisements. A comprehensive classified list of manufacturers, which is distinctively printed on a different coloured paper, will be of great assistance to purchasers of engineering equipment. The foreword deals with progress in the engineering industry and pays tribute to the work of the research organizations which serve the industry.

HELICAL SPRINGS:

J. R. Finniecome. Manchester, Emmott, 1949. 60 pp., illus., paper, 2/6. (Mechanical World Monograph No. 56).

In this Monograph, particular attention is directed to a number of authoritative investigations on the closely coiled spring of circular cross section. The results of the analysis are presented by formulae, graphs, and charts. It is hoped that these may prove useful to those who are anxious to ascertain rapidly and accurately the desired design information.

INTERPLANETARY FLIGHT; AN INTRODUCTION TO ASTRONAUTICS:

Arthur C. Clarke. London, Temple Press, 1950. 164 pp., illus., cloth, 8/6.

This book is intended as a survey of the possibilities and problems of interplanetary flight, as far as they can be foreseen at the present day. The attempt has been made throughout this book to keep the treatment quantitative, and to give exact values and magnitudes rather than vague generalities. A great deal of the mathematics has been relegated to the appendix, and it is believed that the argument can be followed without undue difficulty by readers with only a general mathematical or scientific training. The approach is from the astronomical rather than the engineering point of view.

MACHINING AND MANIPULATION OF STAINLESS STEELS:

Walker, W. F. Manchester, Emmott, 1950. 78 pp., illus., paper, 3/6. (Mechanical World Monograph No. 57.)

The machining and other operations on stainless steels need not be regarded as troublesome, for with correctly designed tools and the early appreciation of the problems involved, first class and economic results can be obtained. It is the object of these pages to provide this information, the substance of which has been drawn from the author's experience as a production engineer.

A MANUAL OF PLASTICS AND RESINS IN ENCYCLOPEDIA FORM:

William Schack, ed. Brooklyn, Chemical Pub. Co., 1950. 547 pp., illus. $10.00.

Containing some 1500 subjects, arranged in alphabetical order for speedy reference, this volume is a compact but comprehen-

sive survey of the materials, processes, products and equipment of the plastics industry.

Both full length and short articles, on products, definitions and chemical terms are included, and also appendices, A, Trade names with their composition and manufacturer; B, Fabrication charts; C, Comparative prices of plastics.

PATTERN MAKING FOR ENGINEERS, 8th ed.:

J. G. Horner and Philip Gates. London, Technical Press, 1950. 390 pp., illus., cloth, 8/-.

The class of work dealt with in this book is believed to be sufficiently varied to prove instructive in the various branches of pattern-making. While the apprentice will certainly study it with advantage, it is hoped that the practical pattern-maker, the foundry man, the draughtsman, the designer, and those comprising the works executive will not peruse it in vain. To keep abreast of new developments, this eighth edition has been enriched by new illustrations.

RADIOACTIVITY AND NUCLEAR PHYSICS, 2nd ed.:

James M. Cork. New York, Van Nostrand, 1950. 415 pp., illus., cloth, $6.00.

This book is intended as a text for an introductory course in nuclear physics at the upper graduate or beginning graduate level. It is also hoped that it will be useful to research workers in this field. To this end, a revised Table of Isotopes with energies and significant references is included, as well as many other tables relating range, energy and momentum for various particles. For the student, there are problems at the end of each chapter, whose solution should aid to an understanding of the various topics.

STATE-CITY RELATIONSHIP IN HIGHWAY AFFAIRS:

Norman Hebden and W. S. Smith. New Haven, Yale University Press, 1950. 230 pp., $4.00.

Although the locale of this publication is limited to the U.S., the increasing importance of municipal, city and state or province division of responsibility for highway activities and financing has now become a major problem in most countries.

State laws, authority for rights of way, allocation of highway construction in cities state authority in city traffic control, traffic control devices and sources of highway revenue—those and a host of other pertinent questions are considered in this new book just published by Yale University Press. It should be of vital interest to all readers concerned either with road and highway construction, or in these forms of Engineering and Construction contracts with public organizations.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

BASIC ELECTRICAL MEASUREMENTS.

By M. B. Stout. Prentice-Hall, Inc., New York, 1950. 504 pp., illus., linen, $7.75.

This book is devoted to selected methods and instruments used most frequently to measure electrical phenomena. The principles, construction and use of galvanometers, potentiometers, a-c bridges and other measuring circuits and ancillary equipment are discussed. Two chapters deal with magnetic measurements and electrical indicating instruments. Introductory material covers such topics as electrical units, experimental procedures, and aids to computation. Selected references and problems are included at the end of most of the chapters.

CHEMICAL THERMODYNAMICS, Basic Theory and Methods.

By I. M. Klotz. Prentice-Hall, New York, 1950. 369 pp., illus., cloth, $6.00.

Designed primarily for chemists, this text presents the logical foundations and interrelationships of the theory of thermodynamics and expounds the methods by which theoretical principles may be applied to practical problems. The classical or phenomenological approach is used to the exclusion of the statistical viewpoint. Much attention is given to the mathematical tools needed in the application of theory. Exercises for student solution follow each chapter.

DESIGN OF ELECTRICAL APPARATUS.

By J. H. Kuhlmann. 3rd ed. John Wiley & Sons, New York, 1950. 512 pp., illus., cloth, $8.45 (Can.).

Practical methods are presented for the design of electrical apparatus, with explanations of the theory, procedure, and limits of design. Changes in this third edition include a revision of design constants and limits, the plotting of the characteristic curves of electrical sheet steels on semi-logarithmic paper, the enlargement of the copper tables to include new wire insulating materials, new values of insulation thickness, a review of multiplex windings, and many new methods for determining electrical and mechanical characteristics.

ELECTROMAGNETIC WAVES AND RADIATING SYSTEMS.

By E. C. Jordan, Prentice-Hall, New York, 1950. 710 pp., illus., linen, $10.50.

Intended for use by senior and graduate electrical engineers and physicists, this textbook considers the theory and applications of electromagnetic radiation and propagation. A review of fundamental theory is followed by the presentation of more advanced material on electromagnetic waves. Transmission lines, wave guides, and antennas are discussed as well as ground-wave and sky-wave propagation. A bibliography and problems follow most of the chapters.

ENGINEERING HYDRAULICS, Proceedings of the Fourth Hydraulics Conference, Iowa Institute of Hydrolic Research, June 12-15, 1949.

Edited by H. Rouse. John Wiley & Sons, New York, 1950. 1039 pp., linen, $15.00.

This comprehensive reference work, written by selected authorities, constitutes the official proceedings of the Fourth Hydraulics Conference, held in 1949. Fundamental principles are emphasized throughout the thirteen chapters that deal with the principles of flow, hydraulic similitude, flow measurement, hydrology, flow of underground water, steady and unsteady flow in closed and open systems, flood routing, wave motion, sediment transportation, and hydraulic machinery. The Appendix contains a list of symbols, dimensional considerations, and the properties of common fluids.

ILLUSTRATING FOR TOMORROW'S PRODUCTION:

By J. H. Farmer, A. J. Hoecker and F. F. Vavrin. Macmillan Company, Toronto, 1950. 203 pp., illus., linen, $5.75.

In a simple step-by-step treatment this text shows how to make a perspective drawing from an orthographic drawing, how to make true-scale exploded drawings, and how to make freehand drawings using mechanical construction principles. Isometric and oblique drawings are explained, the preparation of drawings for reproduction is described, and aircraft illustrating is briefly dealt with in a separate section.

IRRIGATION PRINCIPLES AND PRACTICES.

By O. W. Israelsen. 2nd ed. John Wiley & Sons, New York, 1950. 405 pp., illus., linen, $6.00.

Stressing irrigation principles, this book also describes modern methods and practices. Features of this second edition are a simplified treatment of the flow of water in soil, new material on drainage, a consideration of the consumptive use of water, a discussion of the social and administrative aspects of irrigation, and the addition of more than 300 selected references to recent publications on irrigation and drainage.

PROCESS HEAT TRANSFER.

By D. Q. Kern. McGraw-Hill Book Co., Toronto. 1950. 871 pp., illus., cloth, $9.70.

Combining both theory and modern practice, this text provides systematic instruction in the calculations, derivation and empirics of heat transfer, using the language and methods of industry. Each principle is developed within the actual equipment and flow patterns in which it occurs in the majority of industrial operations. All calculations are treated as interrelated occurrences between hot and cold agents through a single surface. Worked and unworked problems are included.

SNOW MELTING.

By T. N. Adlam. Industrial Press, New York, 1950. 224 pp., illus., linen, $4.50.

A comprehensive manual on all phases of the use of embedded hot water coils for melting snow on roads, driveways and sidewalks. It considers the different types of systems, the calculation of pipe sizes and spacing, and data on snowfall in the United States, Alaska and Canada. Design details, anti-freeze solutions, installation techniques, and installing and operating costs are also included.

TELEVISION, Volume V, 1947-1948, 461 pp.

TELEVISION, Volume VI, 1949-1950, 426 pp.

Edited by A. N. Goldsmith and Associates. RCA Review, Radio Corporation of America, RCA Laboratories Division, Princeton, New Jersey, August 1950. Illus., linen, $2.50 per vol., plus $.20 postage outside U.S.A.

The fifth and sixth volumes of this series cover the years 1947-1948 and 1949-June 1950. Like the previous volumes, they contain papers written by RCA authors which were published in various technical journals and magazines. Each volume is presented in six sections: pickup, transmission, reception, colour, UHF, and general. Some papers, because of space requirements, are presented in summary form only, whereas other papers are presented as previously published. In volume 6, as an appendix, some 506 technical papers on television and related subjects, written by RCA authors and published from 1929 to June 1950, are listed chronologically.

TELEVISION SERVICING, Theory and Practice.

By W. H. Buchsbaum. Prentice-Hall, New York, 1950. 340 pp., illus., linen, $5.35.

Part I of this practical manual covers the theory of television receivers, starting with the picture tube and progressing to the antenna. The installation practices outlined in Part II conform with the methods employed by a number of well-established service organizations. Part III is a trouble-shooting guide, arranged by symptoms.

TOOL ENGINEERING, Analysis and Procedure.

By L. E. Doyle. Prentice-Hall, New York, 1950. 499 pp., illus., linen, $6.35.

Beginning with a discussion of the nature and scope of tool engineering, this book covers the diverse aspects of the current duties, responsibilities, and procedures of the tool engineer. Economic principles, estimating, planning, manufacturing and dimensioning principles, process operations, layout, tool design and handling are covered in detail as major factors in the solution of problems that arise in tooling for efficient production. Practical examples and review questions are provided.

TRANSMISSION LINES AND FILTER NETWORKS.

By J. J. Karakash. Macmillan Co., New York, 1950. 413 pp., illus., cloth, $6.00.

In this exposition of elementary theory, consideration is given to pertinent conditions encountered in circuits dealing with frequencies extending from the voice range to the microwave range. The three main sections deal respectively with conventional steady-state transmission-line theory with emphasis on high-frequency applications, an introductory approach to network theory, and electric wave filters of various types. The application of Maxwell's electromagnetic field equations to wave guide transmission is discussed in an appendix.

ULTRA-HIGH FREQUENCY ENGINEERING.

By T. L. Martin, Jr. Prentice-Hall, New York, 1950. 456 pp., illus., linen, $8.00.

Intended for senior students majoring in electrical engineering or physics, this book contains a general study of the techniques associated with ultra-high frequency systems. It deals with the theory and technique of the component parts that make up complete systems, but not with the functioning of such systems as a whole. Six general areas covered are the generation and synchronization of special wave forms, the amplification of UHF systems, UHF transmission systems, circuit elements, oscillators, and the propagation of signals. Mathematics through calculus is assumed as well as introductory courses in electron tubes and circuits.

WAVE MECHANICS, Elementary Theory. 2nd ed., 312 pp., $3.50.

WAVE MECHANICS, Advanced General Theory. 524 pp., $5.00.

By J. Frenkel. Dover Publications, New York, 1950. Illus., linen.

This is the first American printing of a two-volume set published in England in 1934 and 1936. The first volume gives a general survey of wave mechanics and quantum statistics using only elementary mathematics. The second volume is devoted to the mathematical development of the general ideas underlying the subject and connects it with classical mechanics. Only the most essential elements of the theory are considered. References for each chapter are given at the end of the book.

Service
Beyond
The Sale

NOT ALL OUR STEEL GOES INTO BRIDGES!
FOR EXAMPLE: Our warehouse division supplies plain steel which is distributed daily from nine centres by rail and road for a great variety of uses.
One of our five main divisions* the Dominion Bridge warehouse service has been supplying the needs of industry for over 40 years.
It embodies the most modern storage, cutting and handling facilities for the prompt shipment of steel orders to any part of the country.
It will pay you to investigate this unique service.

- **BELOW:** A 4000 cubic yard clean-up blast in sluiceway. (Hydro-electric development project, Beauharnois, Quebec.)
- **LEFT:** Untrimmed walls of sluice are evidence of overbreak control possible with split-second blasting.

SPLIT SECOND BLASTING

New Technique employing
-I-L SHORT-PERIOD CAPS

hether your blasting is carried out underground mining operations, quarries or on construction work, u will be interested in *split-second* asting. This is an entirely new techque making use of extremely short tervals between the firing of charges . . . carried out with C-I-L Short-Period Caps. In actual practice it has shown outstanding advantages over instantaneous or rotation firing by conventional methods. *Split-second* blasting is actually proving itself to be "the most fundamental advance in the art of blasting since the substitution of dynamites for black powder."

- Reduced Vibration and Concussion
- Improved Fragmentation
- Less Backbreak in Quarries and on Surface Excavation
- Improved Condition of Stope Backs and Walls Underground

E-51-3

r further information regarding split-second blasting, contact your C-I-L Explosives Reesentative or write us for copy of Explosives Bulletin No. 86. Canadian Industries Limited, plosives Division, P.O. Box 10, Montreal.

BUSINESS & INDUSTRIAL BRIEFS

A Digest of Information

received by

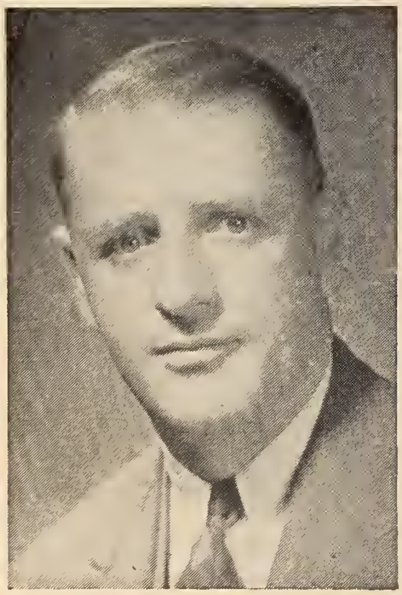
The Editor

Appointments and Transfers

E. J. Smith.—E. J. Smith has been named industrial locomotive specialist in Canadian General Electric's Transportation Division.

●

M. C. Lowe.—M. C. Lowe, formerly vice-president of Canadian Allis-Chalmers Ltd. has been appointed president of Canadian Allis-Chalmers (1951) Limited, a new wholly-owned subsidiary of the Allis-Chalmers Manufacturing Co., Milwaukee, Wisconsin.



M. C. Lowe

●

H. Dixon.—Harry Dixon of Montreal has been appointed assistant manager of western operations for Monsanto (Canada) Limited with headquarters at Vancouver, B.C.

●

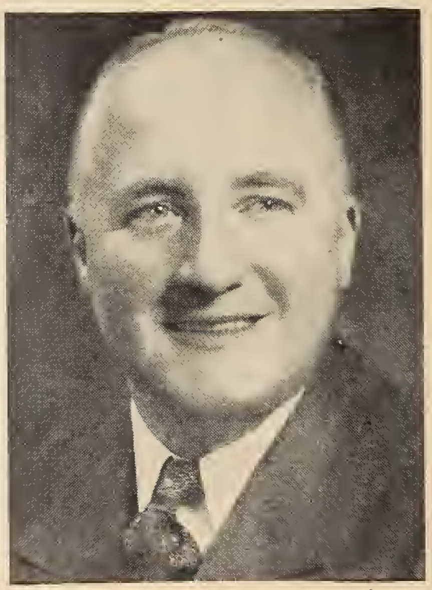
Canadian Standards Changes.—J. G. Morrow, chairman, Canadian Standards Association, has announced the following changes in the organization of the approvals division. These laboratories are located on Florence Street, Toronto.

Formerly the Division was operated by an administrative board which also had the responsibility of recommending approvals to the inter-provincial approvals council.

A new procedure gives Gerry Moes, recently appointed director, prescribed responsibilities There has also been created a technical advisory committee, one for each distinct branch of approvals work. The services of this technical committee will be available to the submittor and they include the adjudication of an appeal against the withholding of approval of any device.

It is believed that these changes will result in better and faster service.

●



C. A. Harrison

Charles A. Harrison.—Charles A. Harrison has been appointed district sales executive in charge of the Vancouver Sales Office and British Columbia territory of Jenkins Bros. Ltd. The appointment was announced by Herbert H. Gee, vice-president in charge of sales.

Mr. Harrison has occupied various positions with the Company. For the past eleven years he has been connected with the Jenkins Brothers sales office in Toronto.

●

Northern Electric Changes. — M. M Cockburn has been appointed Toronto manager of special sales for Northern Electric Company. R. R. Farrell, formerly of Timmins has been appointed to succeed Mr. Cockburn at Hamilton. R. A. Lee, formerly of the Kingston branch, has been named to the position of manager at Timmins.

●

C.G.E. Calgary District.—A. E. Ormsby has been appointed manager of Canadian General Electric Company's Calgary district. Mr. Ormsby is well known in the electrical industry throughout the west. For a number of years he has been manager of C.G.E. office in Edmonton.

●

Peacock Brothers Appointments. — John Bryson has been elected president and secretary treasurer of Peacock Brothers Limited. Previous to his appointment he was vice-president and secretary treasurer of the Company. Francis T. Peacock, founder of the Company, has been appointed chairman of the board. F. R. McDonald has succeeded Mr. Bryson as vice-president and

John Bryson

; also appointed general manager. W. P. 'erguson has been named general sales ıanager, and F. A. Lucas assistant genral sales manager *(See "Personals" in his issue.)*

●

Iinneapolis-Honeywell Appointments. —The Minneapolis-Honeywell Regulaor Co. Ltd. have announced the followıg appointments. John H. Fox is now ales manager, central region. He will ıake his headquarters in Toronto and is responsibilities include the superision of all sales offices and sales activties in Toronto, Hamilton and London. George E. Downie has been named naional sales manager for the heating ontrols division of the Company; W. '. E. Duncan is now national sales manger, commercial division; R. P. Hoover as been appointed sales supervisor of he industrial division, central region; 'lifford J. Paisley, is sales supervisor of he heating controls division, central egion, and John H. Cornwell is the ales supervisor of the commercial diviion, central region.

●

V. B. Thompson.—The Dominion Tar nd Chemical Co. Ltd., announce the ppointment of W. B. Thompson as ıanager of the development departıent. Mr. Thompson was formerly manging director and vice-president of the Nichols Chemical Company, Ltd.

●

'. C Clarke.—T. C. Clarke, formerly Alberta and British Columbia district ıanager of Northern Electric Co. has een appointed sales manager of the Company. C. E. Woolgar has succeeded Mr. Clarke in the western territory.

Mr. Clarke has served in all of Canda's western provinces during his long ssociation with the electrical industry. He joined Northern Electric at Vanouver as sales manager in 1920 and in 929 was named district sales manager t Winnipeg. Three years later he was ransferred back to Vancouver as district ales manager for Alberta and British Columbia. He was appointed district ıanager for the two provinces in 1933.

●

George Kent Agents. — George Kent Ltd., Luton, Bedfordshire, England, have leveloped a special domestic water neter for the Canadian market. It is nown as the Norlantic Major. It conains a straight-reading register, a frostrotection device, and meets the Amerian Waterworks Association specification or capacity, body length, and performnce. The basic design of the well known Kent M2 Rotary Piston meter has been etained. A long term plan provides for he assembly of the meter in Canada.

The following sales and service agents ave been appointed.

British Columbia:

Sealand Products, Ltd.,
2746 West Broadway,
Vancouver, B.C.

Alberta and Saskatchewan:

Gorman's Ltd.,
10238 — 104th Street,
Edmonton, Alta.

Manitoba and Northwest Ontario to line 90° with the addition of Fort William and Port Arthur:

D. G. Sutherland,
307 Niagara Street,
Winnipeg, Man.

Quebec and Ontario (West to line 90 excluding Fort William and Port Arthur):

J. W. Ellis Industries,
42 Lombard Street,
Toronto, Ont.

All these agents will carry stocks of spare parts to meet the needs of Norlantic Major users.

George Kent Ltd. have appointed a Canadian manager to co-ordinate all their activities in Canada. A further announcement on this appointment will be made.

●

Gutta Percha Offices.—Gutta Percha and Rubber Ltd., have announced the transfer of their general offices to their new building at 114 O'Hara Avenue, Toronto.

The offices had been located at 160 West Lodge Avenue for the past 19 years. In the new building very modern facilities for the comfort and convenience of the staff are provided.

Construction of the new building was under the supervision and direction of the Gutta Percha Engineering Service. The floor area is approximately 10,000 sq. feet.

●

Ingersoll-Rand Building. — Canadian Ingersoll-Rand Ltd. have announced the completion of their new building in Calgary and that the branch will be under the management of J. (Jack) E. Kolb who is well-known in oil circles. The building is at 611 11th Ave., W., in

> ## "Business & Industrial Briefs"

downtown Calgary. The telephone number remains unchanged.

The building was designed and supervised by Norton A. Fellowes of Montreal and Rex A. Millar of Calgary. It was built by the Hurst Construction Company and is of contemporary styling and functional in every respect. Canadian Ingersoll-Rand Co. Ltd., have been manufacturers of gas and air compressors, pumps, mining, and industrial equipment and machinery for over 70 years.

●

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

Protective Equipment.—A selection of approved protective equipment of interest to industries directly concerned with the atomic energy field, as well as the increasing number of industrial plants using radio-active isotopes, is presented in a new 8 page booklet published by Mine Safety Appliances Company. Described in the booklet are respiratory protective equipment, air sampling equipment, ventilation accessories, protective clothing, materials for contamination control, automatic artificial respiration instruments, and oxygen therapy equipment. Ask for booklet No. G-10. Address inquiries to Mine Safety Appliances Company of Canada Ltd., 500 MacPherson Ave., Toronto, Ont.

•

Underfloor Wiring.—A 19-page booklet on "G.E. Fibreduct Underfloor Wiring" is now available from any branch of Canadian General Electric Company. Of special interest to engineers and electrical contractors, the well-illustrated booklet shows the application of this nonmetallic underfloor raceway for commercial, industrial and institutional buildings. The contents of the booklet include layout design, installation methods and design and dimension diagrams for the smaller systems of Fibreduct raceways. The publication number is 4417-A.

•

Research Instrument Book.—"Instruments Accelerate Research" is the title of a new 84 page book recently published by the Minneapolis-Honeywell Regulator Company Ltd., Vanderhoof Ave., Leaside, Toronto 17, Ont.

This publication describes, for what is believed to be the first time, many types of equipment which, alone or in combination with other apparatus, are being used in research and analytical studies.

In addition to the importance of the publication as a reference and application guide for researchers and analysts, the book illustrates the great strides made in the instruments field since World War II. It also emphasizes how extensively industrial instruments are being used alone or in combination with others for technical, engineering and laboratory work.

The Company has given extensive mention to devices, made by many organizations, which are used in combination with its own instruments. A complimentary copy of this well produced publication will be sent to any *Journal* reader who is engaged in research work. When applying for a copy please do so on your official letterhead. Ask for bulletin No. 15-14.

•

New Film Available.—Canadian Westinghouse Company, Hamilton, Ont., offer for showing a film "Electrical Proving Ground". The film depicts the story of high-power laboratory testing.

It tells its story through narration, nusic, and approximately 200 scenes aken at manufacturing, testing and intallation locations. The picture was nade at the Westinghouse laboratories n East Pittsburgh. However, the quarer million tests carried out in the laoratory over the past 25 years are all vailable to the Canadian Westinghouse Company. The film takes 26 minutes o show—it is in full colour.

●

Liquids Control. — Precision Thermometer and Instrument Company, 1400 Brandywine Street, Philadelphia, offer a publication in which is described "Denitrol" equipment, designed for use in he control or the recording of blending, nixing, separation, dilution, and conentration of industrial process liquids. Ask for bulletin No. W.-2.

●

Precision Casting.—Microcast Division of Austenal Laboratories, Inc., 715 East 59th Place, Chicago 37, Illinois, offer a unique folder in which are described many precision casting applications. The folder is entitled "File on Microcasting Case Histories". Information is given on eight case histories of Microcast applications. The brochure is directed, primarily, at design engineers.

●

Scotch Boiler.—Dominion Bridge Co. Ltd., P.O. Box 280, Montreal, have recently released a folder in which is described their new low pressure Scotch Dry Back boiler. The copy in the publication points out that the new boiler s compact, inexpensive to install and requires a minimum of skilled labour for maintenance. Its unique construction, which assures a large steam output from a small unit occupying minimum space, s described. This new boiler has been designed particularly for oil firing but it can be used efficiently for gas firing and for some types of coal firing. It is built n ten sizes ranging from 30 to 200 hp. The folder is No. B-110.

●

Safety Gratings. — The Dominion Bridge Co., P.O. Box 280, Montreal, Que., announces that a new edition of its Catalogue is now available covering M-M. Safety Gratings, Fire Escapes, and Steel Trough Stairs. This 16-page publication is well illustrated and contains, amongst other data, manufacturing process details of grating treads, specifications and tables of safe distributed loads. The manufacturers state that M-M Safety Gratings are rigidly constructed and contain no rivets. They shed water and oil and have good nonslip properties. Ask for publication No. T-100.

●

Arc Welding. — A new booklet "Procedures and Equipment for Argon Metal Arc Welding, described the apparatus for this new welding method. The booklet can be obtained without charge from Dominion Oxygen Company Ltd., 159 Bay Street, Toronto 1, Ont.

●

Armco Publications.—Armco Drainage and Metal Products Inc. Guelph, Ontario, offer the following publications "An Economical Answer to Limited Headroom—Fast Runoff". It describes Armco Pipe-Arch and Multi-Plate Pipe-Arch and shows why they carry more water than round pipe. Test data and case histories also show the advantages of this type of piping. In addition the folder discusses erosion and corrosion problems. Tables are included which give recommended sizes and gauges.

"Armco Corrugated Metal Pipe—A type for Every Need". It lists the types of full-round pipe and pipe-arch available to meet specific requirements for various types of sewers, culverts, conduits, or irrigation systems. The booklet also contains reference data for assistance in selecting the most suitable structure. Photographs and case-histories show where plain galvanized, asphalt coated, Asbestos-Bonded and Paved-Invert Pipe and Pipe-Arch have given long service life under all types of conditions. Also included are details on fittings and instructions on the installation of Armco drainage structures.

The third publication offered is a small book entitled "Installation Manual-Armco Drainage Products". This is of pocket size and should be extremely valuable to those who are in charge of installation work.

●

Economiser Publications. — E. Green & Son Ltd., are represented in Canada by Peacock Brothers Ltd., P.O. Box 6070, Montreal. Green's are one of the world's oldest and best known manufacturers of Economisers and their Canadian representatives have available a complete range of descriptive literature. This literature is beautifully-produced and highly informative. When applying for copies please state whether you require details of the complete range of Green economisers or data on equipment designed for a specific need.

●

The Dominion Engineer.—No. 1 of volume 18 of the "Dominion Engineer," published by the Dominion Engineering Co. Ltd., Lachine, Que. contains a review of the Company's engineering manufacturing achievements during 1950. For copies of this and subsequent issues apply to the Company at Box 220 Montreal, Que.

●

Timber Booklet. — The B.C. Coast Woods Trade Extension Bureau, 837 West Hastings Street, Vancouver, B.C. offers a 4 page reprint of an article "Douglas Fir or Pacific Coast Hemlock" by W. Thornber, Timber Engineer.

●

Clarifiers.—A four-page bulletin No. 30-B has just been published by the Hardinge Company, Inc., 240 Arch Street, York, Pa. It covers the line of sand filter clarifiers made by the Company.

The equipment described is intended primarily for use in processes where a crystal-clear filtrate is desired. Numerous installations have been made for filtering gold solutions in cyanide mills, sodium chloride solutions in chlorine producing plants and other solutions in chemical plants. Copies are available.

●

Bepco Journal. — The January 1951 issue of the Bepco Journal contains an article on the Crompton Magnicon, a self-regulating alternator, by G. W. Jones. Another article featured in the issue is "Adjustable Speed D.C. Motor Drives" by E. A. Chandler, assistant chief engineer of the Company. To be placed on the mailing list for the Bepco Journal apply to Bepco Canada Ltd., 4018 St. Catherine St. West, Montreal, Que.

Gray Iron Coating.—Gray Iron Founder's Society Inc., 210 National City E. 6th Bldg., Cleveland 14 Ohio. offer a prospectus of their new manual "Metallic and Non-Metallic Coatings for Gray Iron". This manual, besides outlining process economies, indicates how industry can conserve essential alloys and still maintain normal production. The society, when forwarding the prospectus will be pleased to quote the purchase price of the manual.

Bristol Bulletin. — The Bristol Company of Canada Ltd., has just published a new edition of its thermocouple and pyrometer accessories bulletin. It lists many additional items and contains new data on the proper application and use of thermocouples. This 56-page publication contains a well illustrated catalogue of hundreds of pyrometer supply items, including assembled thermocouples, thermocouple wires, extension wires, protection tubes, insulators, and accessories for the full range of industrial pyrometer applications.

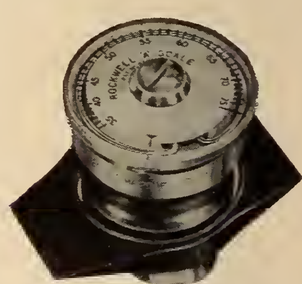
New technical information and installation sketches have been added to the "Users' Manual" section, which contains engineering data on modern practices in pyrometry. Also included are tables of calibration data for the commonly used base metal and rare metal thermocouples. The new edition is offered to *Journal* readers. Ask for No. P1238. The address of the Company is 71-79 Duchess Street, Toronto, Ont.

Gear Data. — Hamilton Gear and Machine Co. Ltd., 950-990 Dupont Street, Toronto 4, Ont. offer a technical data sheet "Flame-hardened Gear Teeth". This is one of a series of technical bulletins which are offered to *Journal* readers.

Aluminum Data. — The Aluminum Company of Canada Ltd., 1700 Sun Life Building, Montreal, have compiled a 60-page series of data sheets which are offered under the title of "Conductors". This release will be of particular value to engineers who are concerned with electricity. Recently the Company released a series of data sheets "Conductor Accessories". These too will be sent to interested readers. There is no charge for this service.

Fan Book.—The Canadian Fan Manufacturers' Association, P.O. Box 275. Windsor, Ont. has just published bulletin No. 102-C entitled "Standards, Definitions, Terms and Test Codes for Centrifugal, Axial, and Propeller Fans". The bulletin includes under one cover all information previously published in three separate bulletins. It also includes new tables on size standards for various types of fans and illustrations of revised fan arrangements. This publication will be of great interest to all users of fans. Copies are available without charge. Ask for bulletin No. 102-C.

Portable Hardness Tester. — Newage (Canada) Limited, 1178 Bay Street. Toronto, are Canadian distributors of a new type of hardness tester. It is a direct reading instrument designed for rapid inspection of production work. It weighs three pounds.



The tester has a spring-loaded, hardened-steel conical indicator and a two-inch diameter scale, which is normally marked for 100 to 440 Brinnell. Corresponding Rockwell, or diamond pyramid scale are fitted if required.

Complete details on this unique instrument are available. Write to the Company, at the address above asking for descriptive literature on the Ernst Hardness Tester.

Welding Review.—No. 2 of volume 25 of the "Welding Review" contains a series of articles which will be of extreme interest to those in charge of welding operations. At the end of the publication there is a tear out section in which is described A. W. S. Electrode Classifications—(All position types and E6103 and flat position electrodes.) For copies of

HONEYWELL CONTROL VALVES

are

Inexpensive • Dependable • Trouble-Free!

You'll find the right control valve for your product in the Honeywell Line—whether it must be pneumatically or electrically operated. There's a wide variety of types and sizes—for pressures as low as a few inches of water up to 1200 psi. Their extreme ruggedness and dependability have met the test of service in thousands of systems throughout industry. Low in cost, easy to install and requiring little or no maintenancc . . . they return big dividends in years of uninterrupted, trouble-free operation.

COMMERCIAL • RESIDENTIAL • INDUSTRIAL • WORLD'S LARGEST ORGANIZATION FOR ADVANCED INSTRUMENTATION AND CONTROL

Investigate the complete Honeywell Line now! Convince yourself of the many advantages of these valves for built-in equipment in systems or parts of systems. For specific information on any type call in your Honeywell Engineer or write for Catalogs 8202 and 8303. MINNEAPOLIS-HONEYWELL REGULATOR CO., LTD., Leaside, Toronto 17.

What new industry will use this yard?

New sets of rails branching from the trunk line—a sign that someone's plans for a new industry will soon become reality. This may be to mine ore found in the hills; but just as likely it will turn out some household article, previously imported—and make it cheaper and better if the plant design is right.

Can Britain help? The answer lies in another question: what is the source of Britain's industrial wealth? It is long experience, skilled craftsmanship, and the ability to make the finest machinery in the world. All these are available to Canadian industry, through great British firms such as Vickers-Armstrongs Ltd.

With its immense production capacity, this firm, best known perhaps for its ships and aircraft, has for many years been equipping all kinds of industries—such as soap, paint, printing, cement—in countries all over the world: a service of interest to all those who look beyond frontiers for the best the world can produce.

If *you* are concerned with industrial development, why not get in touch with Vickers-Armstrongs.

BUSINESS AND INDUSTRIAL BRIEFS

(*Continued from page 152*)

this and other numbers of the Welding Review apply to the Canadian Liquid Air Co. Ltd., 1111 Beaver Hall Hill, Montreal, Que.

●

Shaft Seals. — The Garlock Packing Company of Canada Limited, 620 Cathcart Street, Montreal, offer an interesting publication "Garlock Mechanical Seals for Rotary Shafts".

These seals are intended to provide leakless operation on a rotary shaft. It is claimed that there is no wear on the shaft when a Garlock seal is used. Sealing is effected by leakless and positive contact between carefully lapped metal-to-carbon or metal-to-metal mating surfaces. One of these elements rotates with the shaft and the other is stationary. The stationary element does not contact the shaft.

These precision-built seals are made in several standard designs and in a wide range of highest grade materials. Copies of this publication are available.

●

Asbestos Board.—Three new catalogues on asbestos cement building board have just come off the press. They deal with three outstanding products. Trafford Tile; Corrugated Board (4 in. Pitch); and Flat Board. Each material is thoroughly dealt with as to specifications and detailed construction data. All are well-illustrated with photographs of actual buildings with type lines explaining the reasons why the particular material was used. *Journal* readers will find these publications most informative. They may be obtained by writing to Atlas Asbestos Company, 5600 Hochelaga Street, Montreal.

●

Another Armco Publication.—How to use lightweight corrugated steel sheeting to effectively control movement of soil or water is described in a new illustrated 10 page booklet published by Armco Drainage and Metal Products Inc. Entitled "Armco Steel Sheeting for Trenches, Cofferdams, Cutoff Walls, Shore Protection", it points out where Armco interlocking and flange type sheeting can be used to advantage. For copies apply to the Company at Guelph, Ontario.

●

Nordberg Bulletin.—Nordberg Manufacturing Co., Milwaukee 7, Wis. offer a new 28-page 2-colour bulletin, in which are described the various types of machinery they manufacture. Fully illustrated with installation and product photographs, this bulletin gives design data on Nordberg two and four-cycle stationary and marine Diesel engines, gasoline marine engines, Symons Cone Crushers and Screens, mine hoists, machinery for the basic processing of ores and minerals, air and gas compressors and railway track maintenance equipment. Ask for bulletin No. 187.

●

Highway Construction Papers.—Highway construction problems were discussed during several sessions of the American Concrete Institute's 47th Annual Convention in San Francisco, Calif., Feb. 20-22, 1951.

A copy of the programme and copies of some of the papers presented may be obtained by applying to R. E. Wilde, American Concrete Institute, 18263 W. McNichols Road, Detroit 19, Michigan.

●

Acoustical Adhesive.—Tremstik Acoustical Adhesive, manufactured by the Tremco Manufacturing Company (Canada) Ltd. of Toronto, is now available to lumber yards and building supply dealers. Until very recently, the adhesive was distributed only through national distributors of acoustical tile and through large contractors.

For further details of this adhesive apply to the Tremco Manufacturing Co. (Canada) Ltd., 57 Bloor Street, Toronto, Ont.

New Equipment and Developments

Canadian Allis-Chalmers Purchased.—The purchase of all the physical assets of Canadian Allis-Chalmers Ltd., by a new wholly owned subsidiary of Canadian Allis-Chalmers Ltd. of Milwaukee, Wisconsin, was announced on February 1st.

The new subsidiary is known as Canadian Allis-Chalmers (1951) Ltd. The Canadian firm, which employs approximately 525 people, will continue the production of heavy machinery for the Canadian market. The main plant is located at Lachine, Quebec, and the principal products are hydraulic turbines, centrifugal pumps, texrope drives, mining machinery and equipment for the paper industry.

This is the second purchase of a Canadian plant by the Allis-Chalmers Manufacturing Co. in the past six months. In September, 1950, Allis-Chalmers Rumley Ltd., another Canadian subsidiary of the Company, purchased a plant at St. Thomas, Ontario.

In connection with the latest purchase, M. C. Lowe, president said "The wholly owned subsdiiary is now an integral part of the 103 year old Allis-Chalmers Manufacturing Co. which has a splendid history of production, research, engineering, and sales. With these resources at our command, we look forward to a steady growth of business in our Canadian market and the continuation of our cordial relations with both customers and suppliers."

•

Dominion Mobile Crane. — A mobile crane, with outriggers, with maximum capacity of 20 tons at 10 feet radius — is one of the latest machines to be produced by Dominion Hoist and Shovel Co. Ltd. It is known as the Dominion TM-20 Truck Crane.

The machine is built within highway width limitations and is particularly suited where frequent moves must be made between jobs. It is furnished with a butt splice quick connection boom to enable rapid changes in boom length to be made, and the basic short boom can be folded under for transport along the highway. The machine is fitted with worm driven precision boom hoist independently controlled. Tipping loads are carried from the revolving deck to the truck chassis by hook rollers engaging a double flanged roller path; the centre pivot thereby being relieved of all tipping strains. The chassis is specially built for crane service and includes front and rear outrigger boxes with sliding outrigger beams. The heavy tandem rear-drive axles are mounted on walking beams to allow operation on rough ground while maintaining full traction on all drive wheels. Air brakes are fitted on all wheels and an emergency transmission brake is manually operated to hold the machine while parked. Air brakes can be left on by latching the brake pedal during crane operation.

The cab is all-steel and weatherproof with ample ventilation and adequate safety glass windows allow operation in all weathers. The chassis is all-steel and is of the half width type to allow space for stowage of the boom while travelling. For reduced highway loads, the rear crane counterweight can be removed and transported separately. For shovel and pullshovel operation, the crane can be mounted in a rear position to ensure proper dipper operation over the back of the chassis frame. Clamshell and dragline attachments are also available.

•

Imperial Oil Refinery.—A major expansion and modernization programme for Imperial Oil's Sarnia refinery was announced on January 8th. When the programme is completed, probably by the end of 1952, Sarnia will have a plant of 71,000-barrel-a-day capacity. It is designed to process Alberta crude oil in equipment of the most up-to-date type.

Present capacity of the refinery is 55,500 barrels a day.

Preparation of the site for the new refinery units will start soon.

•

New Pavement Cutter.—Joy Manufacturing Co. (Canada) Ltd., Galt, Ontario, has announced the development of a new pavement cutter. This cutter has been designed to reduce to a minimum the inconvenience caused by necessary street openings for the repair of water mains or underground utility lines. Two large wheels, carrying Sulmet tungsten carbide tipped bits, saw parallel 2-inch slots in the pavement, 18 in. to 54 in. apart. The strip of paving between the slots can then be removed in chunks with a backhoe or similar equipment. Preliminary testing is said to have indicated that the pavement cutter will triple the speed and halve the cost of pavement removal. The machine is very silent in operation.

The cutter is mounted on four solid rubber tires and it is powered by a 75 hp. gasoline engine. It weighs 15 tons and travels from job to job at a speed of about 12 miles per hour.

•

Multiple Punching.—A new patented multiple hole punching system for unlimited hole punching patterns has been announced by Wales-Strippit of Canada Ltd., Hamilton, Ont. The new system provides "a simpler, faster, more convenient and economical method of punching holes in sheet metal parts by permitting the entire set-up to be made outside the stamping press or press brake." In addition, the Wales punch and die units are interchangeable permitting the same units to be used and reused in an infinite number of set-ups. This feature makes possible a minimum inventory of parts.

For complete details communicate with Wales-Strippit of Canada Ltd., 344 Sherman Ave. N., Hamilton, Ont.

●

Air Velocity Control.—A new, proportional action velocity controller, for controlling air velocities ranging from 50 to 250 feet per minute, has been developed by Johnson Temperature Regulating Co. of Canada, Ltd. While many applications of the new controller are possible, it is designed primarily to control the velocity of air through the doors of fume hoods, employed in working with radioactive materials, where a fixed velocity is required with variable door openings. It already is being used in atomic energy and cancer research projects.

Operation of the instrument is based on the fact that the velocity of air moving between two points, is proportional to the difference in pressure between those points. This extremely sensitive regulator responds to pressure variations of .0001 in. water gauge, and controls velocities within plus or minus 10 feet per minute. Control pressure increases in direct proportion to the increase in velocity. An increase of 10 feet per minute increases the control pressure 1 p.s.i.

The instrument consists of a very light, flexible diaphragm operating a pneumatic control mechanism. One side of the diaphragm is exposed to the pressure within the laboratory, and the other side is connected to an averaging pressure tip located within the fume hood. Thus, the diaphragm responds to the difference in pressure which causes flow through the hood door and automatically takes into account which of the two pressures is higher. For further information apply to the company at 3615 Danforth Avenue, Toronto 13, Ont.

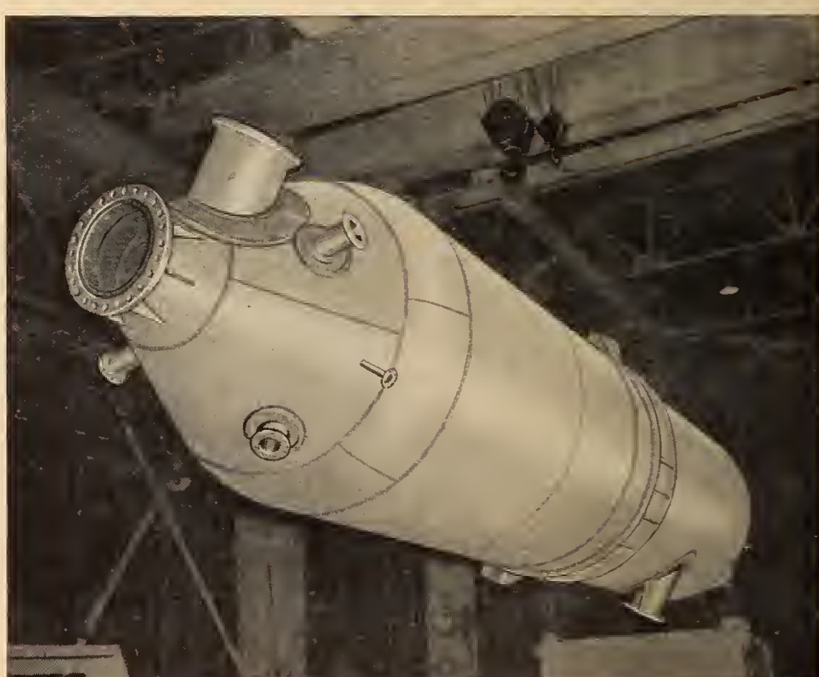
●

U.K. Steel Output.—United Kingdom steel production in 1950 reached a new record of 16,292,700 tons, nearly 300,000 tons above the target set at the beginning of the year and 740,000 tons above 1949.

●

New Control Instrument. — Taylor Instrument Companies of Canada Ltd., have announced the development of a force-balance, non-indicating controller, known as the TRANSET TRI-ACT Controller. It is designed for pneumatic transmission systems. It is claimed that this new controller incorporates all the basic process control responses of conventional controllers but it utilizes them in a different manner thereby giving improved performance. The new circuit contains two closed loops in series — the first containing fixed proportional response and adjustable rate action; the second, has adjustable proportional response and adjustable automatic reset. Such an arrangement gives the controller the ability to apply corrective action to the valve soon enough to prevent process conditions from overshooting or undershooting the set point.

It is also claimed that the new instrument will permit a faster reset rate and rate action than heretofore obtained. The composite effect of the three responses allows start-up and pneumatic setting with no overspeeding. The faster response settings allow the use of rate and reset response with stability on pro-



Steel Vessels — Inconel Lined.—To minimize risk of iron contamination in certain process industries, steel vessels lined with Inconel have been made in Canada. The lining is applied by an automatic spot welding machine developed by the manufacturers, John Inglis Co. Ltd., of Toronto. By this means the advantages of Inconel vessels are obtained at only a fraction of the cost of the solid vessels previously in use. In a recent order for these vessels 4 were constructed. Each weighed 29 tons empty and measured 9 ft. 2 in. diameter by 42 ft. 9 in. long. There were over 90,000 spot welds in each unit.

cesses where these effects were needed but could not be used.

A number of additional features are claimed. Complete details may be obtained from Taylor Instrument Companies of Canada Ltd., 10 Church Street, Toronto 1.

New Yukon Road.—A new 247-mile highway, connecting Whitehorse with Mayo, Y.T., was completed in 1950. The all-weather road was built by the Federal government to aid mining development in one of the largest lode-mining areas in Yukon Territory.

Electrical Power.—The total installed capacity of water power plants in Canada is currently listed at 12,654,835 hp. This represents a development of about 23 per cent of total resources.

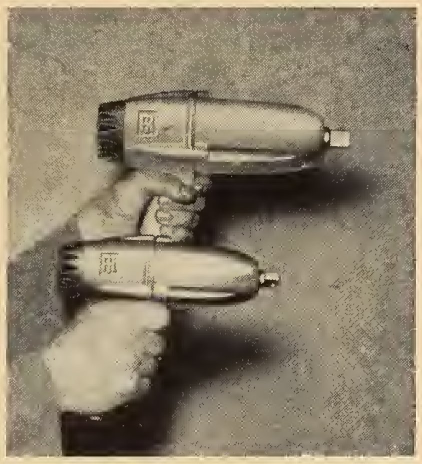
Wood Products Value.—The new value of Canadian wood products has been estimated at 1¼ billion dollars; approximately $92.00 for every Canadian citizen. Out of each $100.00 of the national income, about $20.00 is derived from trees.

Engineering Award. — The Rover Motor Company of Britain has been awarded the Dewar Challenge Trophy for "the year's most outstanding technical achievement" — the world's first gas turbine car which took 10 years to perfect.

Marine Meeting.—There will be an international conference of Naval Architects and Marine Engineers in London, England. The conference will open on June 26th and will remain in session for two weeks.

B.C. Flag Mast—Erection of a 108-ft. flag mast, given to the London County Council by British Columbia, has been completed at the Festival of Britain, South Bank, London, England.

New Ingersoll-Rand Tool.—Canadian Ingersoll-Rand Company Ltd., Birks



Building, Phillips Square, Montreal, announces two new air impactools, the size 504 for nut runing up to ⅜ in. bolt size, and the size 510 for nut running up to ¾ in. bolt size.

Similar to the Ingersoll-Rand Size 4U and 8U Electric Impactools in general appearance, both tools are streamlined and well balanced for ease of operation. The large, easy-to-grip reverse caps are deeply grooved so that tools may quickly be reversed even with greasy hands. Palm fitting pistol grip handles make these tools easy and comfortable to operate over long periods of time.

Special attention has been paid to the application of scientific muffling to lower operator fatigue and increase morale and safety. Ask Canadian Ingersoll-Rand Company Ltd. for their descriptive material on the complete range of impactools.

X-Ray Tanks.—A new line of stainless steel developing tanks for X-Ray department darkrooms is available from General Electric X-Ray Corporation Limited.

The steel used in the tanks is a special alloy designed to resist the corrosive action of photochemicals. The tanks are made in three standard sizes which can be arranged in multiples to suit the needs of darkrooms of various sizes and work loads. Address inquiries to General Electric X-Ray Corporation Ltd., 212 King St. West, Toronto 1.

British Industries Fair.—The British Industries Fair, which is held at Earls Court and Olympia, London, and East Bromwich, Birmingham, England, from April 30 to May 11, is designed expressly for the overseas industrialist and buyer. Every attempt is made to anticipate and satisfy their needs.

The service extended to the potential B.I.F. visitor begins in his home country. He is encouraged to call at his nearest British embassy, consulate, or other British government office, and to state his requirements so that they may receive individual attention. He will also be given advice on transportation and accommodation and given introductions to trade associations or government representatives in Britain.

●

Scottish Gold Miners. — Early this month 136 Scotsmen left Scotland for Timmins, Ontario, where they will be trained as gold miners. They were selected out of 900 applicants by a personnel officer of a Canadian gold-mining company during a visit to Scotland. The men have passed rigid medical and trade tests.

●

C.M. & S. Expansion.—The Consolidated Mining and Smelting Company of Canada, Limited, announced recently that, at a cost of over $3,000,000, it will add another 70 tons to the present 425-ton daily output of zinc from its plants at Trail, B.C. The new project is expected to provide permanent employment for about 50 men and will be completed in about two years. The expansion is being made to handle the increasing tonnage of zinc concentrates from British Columbia customs shippers and also the concentrates which will be coming from the Bluebell and other Cominco properties being prepared for production.

Work involved in the new project includes minor additions to the roasting and leaching plants, the installation of over 200 electrolytic cells, the provision of three 10,000-amp Mercury arc rectifiers and the installation of a new electric melting furnace.

●

Stelco Production. — The Steel Company of Canada Ltd. has almost tripled its yearly production of steel since 1939. During the past several years it has invested nearly $40,000,000 in the expansion of its mills for the production of plates, hot and cold rolled sheets and tin plate. This has made it possible to produce flat rolled forms (at a rate of over half a million tons a year). Other expenditures for the improvement of Stelco's plant and manufacturing facilities bring the Company's total investment during the past 10 years to a total of over $65,000,000.

●

Penetrometer Price Reduction. — A sharp reduction in price and great increase in accuracy are two main features of a new penetrometer available from General Electric X-Ray Corportion Ltd.

These penetrometers are designed to assist in the checking of the radiographic calibration of x-ray machines, to insure that they are operating properly, and also to test the performance of the machine under varying techniques. Complete information may be obtained from any C.G.E. office.

●

Plant Expansion.—Sir George Godfrey & Partners (Canada) Ltd., Lachine, Que., have announced the extension of their present plant.

The original plant, completed in October 1949, was primarily established for

the manufacture of cabin superchargers, essential to aircraft pressurization, and aircraft cooling units for air conditioning jet fighter cockpits and cabins of modern jet transport planes. In the industrial field, Godfrey produces several sizes of rotary positive displacement blowers and other equipment being manufactured includes several types of aircraft ground servicing equipment.

●

Sand-blasting.—The W. W. Sly Manufacturing Co. 4700 Train Avenue, Cleveland 2, Ohio, have just introduced a new sandblast cabinet designed for cleaning dies, tools, piston rings, valves, and other small parts. Its primary use is for cleaning small metal parts by the use of soft abrasives, such as ground corn cobs or ground nut shells. These will thoroughly remove all surface impurities without scoring the metal. It can also be used with sand or metal abrasives.

●

Atomic Power. — Monsanto Chemical Company has announced that it has informed the Atomic Energy Commission (U.S.) that it is ready to go ahead with a study of the feasibility of developing and operating nuclear reactors for the production of plutonium and with the ultimate goal of producing electric power.

●

Carborundum Coated Abrasives. — Canadian Carborundum Company Ltd will now service the Canadian market with a complete line of Carborundum Branch coated abrasives, it was announced by Leon A. Patt, general manager of the Company.

Mr. Patt said that the Company's distributors throughout Canada, many of whom have handled Carborundum products for over a quarter of a century, are being offered the opportunity to add the Company's coated abrasives to their present lines of Carborundum products, such as grinding wheels, sharpening stones, and abrasive grains.

●

Cluster Lights. — New, weatherproof cluster lights for outdoor protective lighting, factory yard lighting, boundary fence lighting, and other industrial area floodlighting applications are provided with the new Stonco Cluster Box No. 25 recently announced by Stone Manufacturing Company, Elizabeth 4, New Jersey.

Designed to conserve aluminum, the new unit combines tough aluminum alloys that are precision die-cast under tremendous pressure. A removable aluminum cover plate, sealed with a heavy cork gasket, provides quick, easy access to inside wiring. Each box has six holes tapped ½-in IPS to take from one to five standard lampholders for 150-watt, 200-watt or 300-watt outdoor weatherproof reflector bulbs which are available, as standard stock, from all major lamp bulb manufacturers. In recommending cluster lights for plant protective and anti-sabotage lighting, the manufacturer points out that burnout of a single floodlight normally results in total darkness whereas every light in a cluster would have to burn out before total darkness would result. Complete details may be obtained from the manufacturer.

Water and Sewerage Systems for Yellowknife

by

N. M. Hall, M.E.I.C.

Consulting Engineer and Chairman,
Department of Mechanical Engineering,
University of Manitoba, Winnipeg.

An address to be delivered to the Winnipeg Branch of The Engineering Institute of Canada.

As our settled area creeps steadily northward, there will be more and more communities to be supplied with municipal amenities, first probably water supply and sewerage systems. Conventional designs and methods must be modified to suit sub-arctic conditions. Mr. Hall's paper relates how the application of common sense problems, a solution which two years of operation have shown to be both successful and efficient.

The unusual features of this undertaking are due to its location on the west shore of Yellowknife Bay, a broadening of the Yellowknife River as it flows into Great Slave Lake from the north. The town is about 650 air miles north of Edmonton, 185 miles south of the Arctic Circle. It is within the area where permafrost exists a few inches deep under moss or muskeg 10 feet or more deep, in very sandy soils. There are many lakes, ponds and muskegs, with rocky knolls and ridges rarely more than 175 feet above Great Slave Lake. Vegetation is sparse and trees have little value except as firewood, though there is lumber available from sawmills on the south shore of the lake. Total annual precipitation rarely exceeds ten inches. Temperatures of —50° F. during the long winter, the prevailing northerly winds and the sparse snowfall introduce unusual problems into the operation of a water and sewerage system.

Transportation from Edmonton, the nearest distributing centre, is by air, rail and water, and recently, by the all-weather Mackenzie Highway from Peace River to the south shore of the Lake. Though some express and emergency shipments go by air, bulk freight is carried by the combination of rail and water routes from Edmonton. Freight rates are naturally high.

The existence of gold in the district has been known for many years. The Con Mine of the Consolidated Mining and Smelting Co., Ltd., about two and one-half miles from the old townsite, poured its first gold brick in 1938. The Negus Mine, half a mile beyond, came into production soon after. Following the war and with the increase in communication and transportation facilities, there was more active prospecting and development; in 1948 the Giant Yellowknife Mine, about four miles away, came into production and others are following.

Hydro-electric power from a single 4,500-hp. unit on the Yellowknife River about 35 miles distant from the town is distributed by the Yellowknife Power Co. Ltd. and this supply has recently been supplemented from an 8,350-hp. unit on the Snare River* about 95 miles away, installed by the Federal Government. The plants were synchronized in 1949.

Except for a limited amount of local firewood, the only fuel available is oil from Norman Wells on the lower Mackenzie River. This oil in three grades, light and medium diesel and Bunker C, is brought up the river by barge to the tank farm on Joliffe Island, or direct to the wharves of large consumers who have their own storage.

Old Townsite

The old town is located on a promontory joined to the north shore by an isthmus about one-quarter mile long. This site culminates in a rocky peak 100 feet high and is skirted by a one-way road with shipping facilities along the water front, and buildings back from the shore. A bridge connects it with Latham Island, where there are a few dwellings and an Indian settlement. Joliffe Island with its tank farm is further offshore. The population was difficult to estimate because of its floating element engaged in seasonal activities. Normally, the summer peak was about 2.500, and the town had already extended well beyond the rocky promontory. It had already been established as an administrative centre by various Government departments.

A summer water supply system, installed in 1939, served a number of street water points, and there was a small pumper for fire protection. The system consisted of exposed steel piping, a woodstave storage tank on the summit of the rock, a gasoline-driven pump

* See *The Engineering Journal,* Vol. 33, No. 3, March 1950.

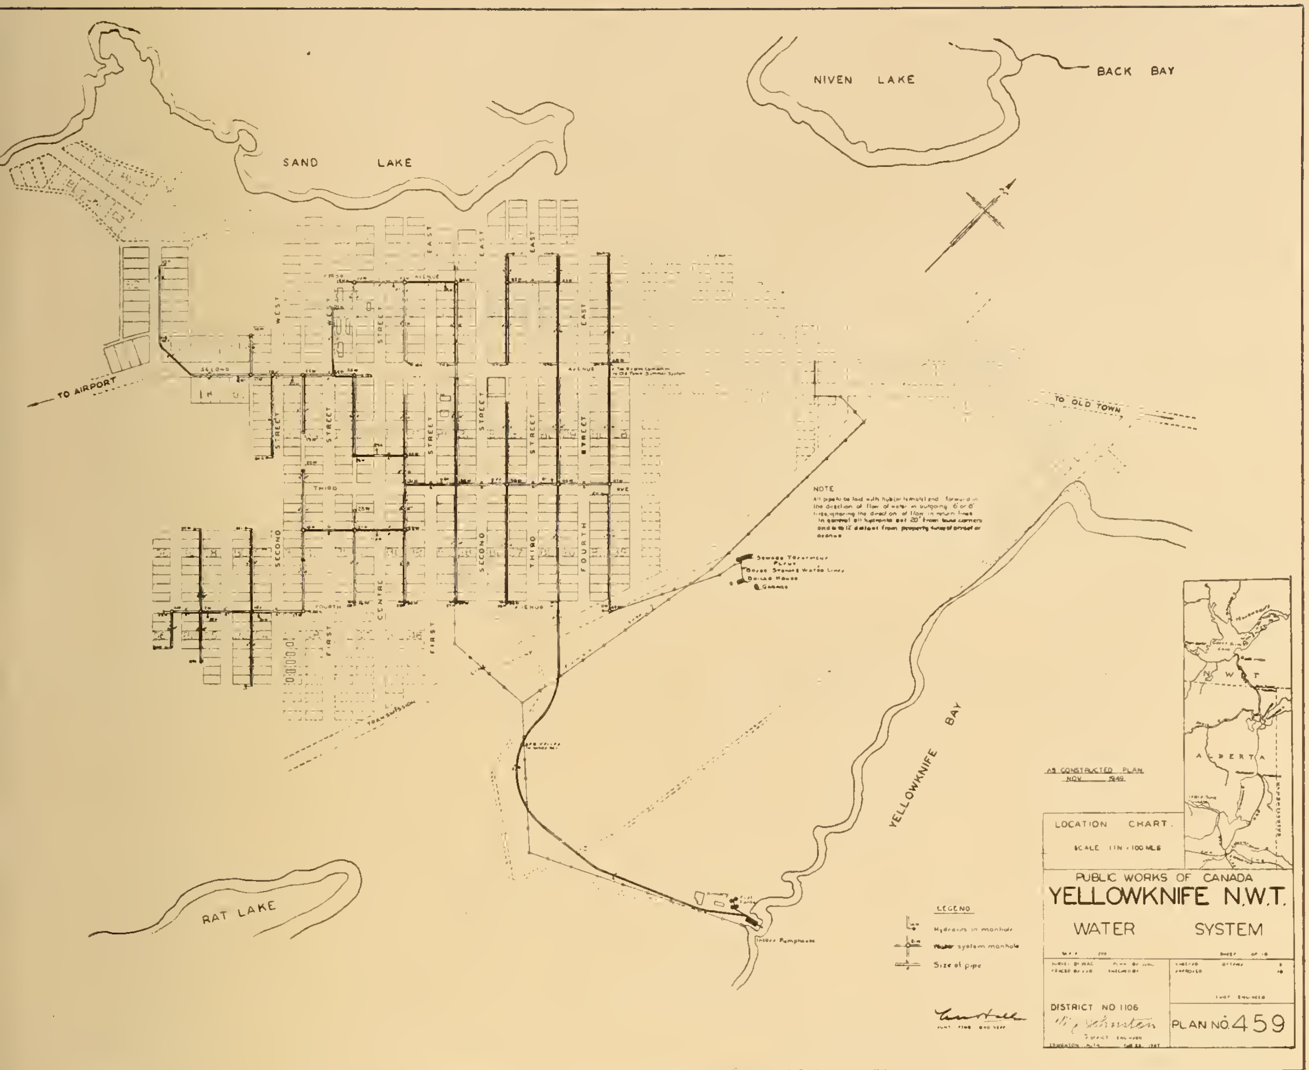

Fig. 1. Water system.

lrawing from the harbour, and an ITH chlorinator. It operated from arly June to freeze-up. A limited ire service and tank delivery was naintained in winter from supply ioles in the lake ice. Sanitary ser- rice was by motor truck and refuse ind garbage were burned. No ap- reciable extension or improve- nent to the existing system was egarded as practicable.

New Townsite

In 1945 the then Department of Mines and Resources selected a iew townsite to provide for an xpected increase in population, atisfactory location about a mile nland was subdivided into lots 50 y 100 ft. in blocks of 24, with 20-foot lanes. Rock outcrops, mus- keg pockets and reserved sites, educed the number of serviceable ots to about 450. The Depart- nent arranged with the Department of Public Works to investigate the feasibility of a water and sewer system for the new town.

Following an examination of the site and the results of a number of test borings, the writer recommended a conventional gravity sewer system and a circulating water system, with provision for heating as necessary, taking water from an intake in the Lake about a mile from the old town and about 3,000 feet from the south boundary of the new town. All pipe lines would be buried and insulated, using moss of excellent quality available in almost unlimited quantity in the neighbourhood. Supplying the summer service in the old town with a safe water instead of that from the questionable harbour intake was considered in the proposal. These recommendations were accepted and the design undertaken early in 1946. In 1947 a further nominal 175 lots were added to the original site; of this area, two low-lying portions, which would require sewage lifts, were left for future development.

The accompanying Figures 1 and 2 show the original site as extended. Second Avenue, later renamed Franklin Road, is the main thoroughfare leading from the old town to the airport. All other avenues and streets have lately been renamed to honour persons associated with the early history and development of the Northwest Territories. The site slopes gently northward from Second Avenue towards First Avenue and Sand (Frame) Lake, and gently southward towards Fourth Avenue. There are a few rock outcrops, and the average elevation is about 100 feet above the Lake. The northern half is sandy, with permafrost at various depths up to 10 feet or more, and the southern half is mostly overlaid with muskeg, with permafrost originally occurring at depths as little as a few inches. In order to avoid disturbing the permafrost under streets and to keep these clear for traffic, it was early decided to locate the water and sewer lines as far as possible in the lanes. Over two hundred test holes were put down to locate rock and permafrost levels. Clearing of trees and stripping to rock or permafrost was commenced early in 1946. A temporary summer water system of surface piping to street corner outlets in the new townsite was fed from the old town system by a small motor driven booster pump. The truck system of garbage and sewage disposal was extended to serve the new townsite.

Water System

As shown in Figure 1, the water system consists of an 8-in. header along Third Avenue fed from the pumphouse by about 3,500 feet of 8-in. pipe. From this header, 6-in. valved laterals run up and down the lanes. They are dead-ended. Paralleling these and in the same trenches is a return system consisting of a 6-in. header and a 6-in. intake return line, and valved 4-in. lines along the laterals. These, too, are not cross-connected. All piping is Universal cast iron with cast iron coupling bolts, laid with a minimum cover of 5 ft. 6-in.

A consumer's connection (Fig. 3) consists of a loop from a corporation cock on the 6 in. lateral into the basement, returning to a corporation cock in the 4 in. return. Inside the basement are cut-off valves, a tee leading to the meter, and on the return leg, a flat-faced union containing a copper disc with one or more small orifices to permit continuous circulation. All external piping is half-inch soft copper, with standard galvanized valves and fittings in the basement. For large consumers, the pressure leg only of the loop is larger.

Where there is neither a consumer connection nor a hydrant at the dead end of the lateral, an orificed half-inch copper "jumper" is installed in a four-foot manhole to ensure safe continuous circulation in the lateral. There are 38 six-inch hydrants, located at street intersections and at the dead ends of laterals. They have 6-in. valved runouts with half-inch copper orificed returns to the 4-in. lateral. In general, the runouts are 20 feet long, with hydrants six feet from property lines, set in rectangular concrete manholes, that may be drained by hand pump. Each hydrant has two $2\frac{1}{2}$-in. hose and one $4\frac{1}{2}$-in. pumper outlets. They are located so that no consumer is more than 300 feet from a hydrant.

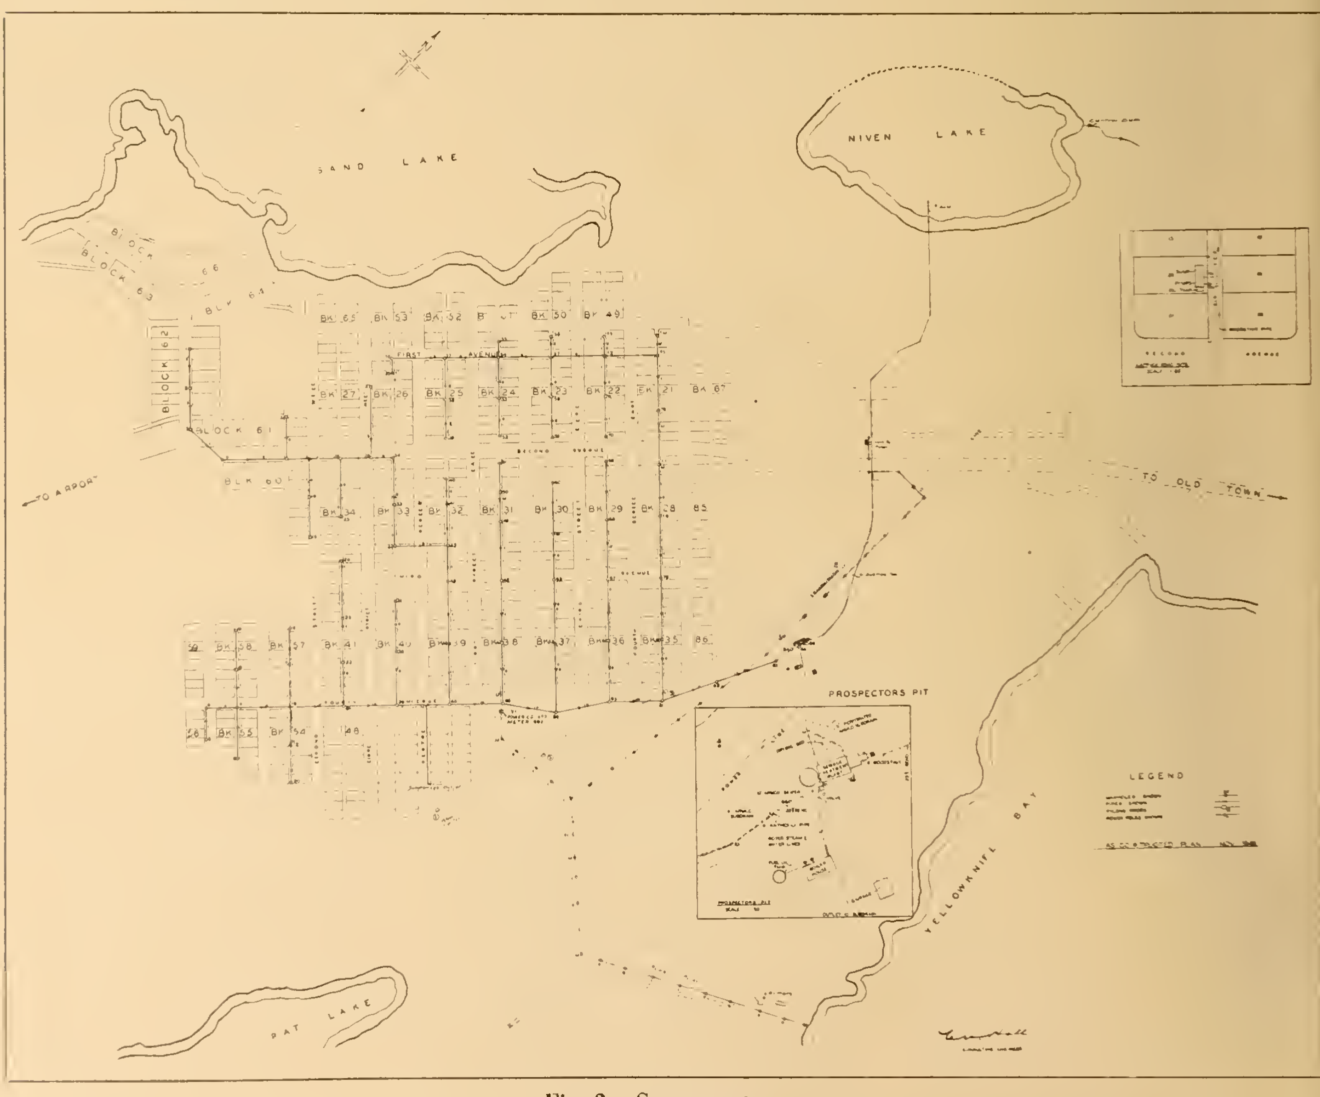

Fig. 2. Sewer system.

It will be noted that hydrants are fed from one direction only. This differs from conventional practice, but is unavoidable where a positive flow is essential.

The return flow from the orifice discs goes to a 500-U.S.-g.p.m. motor-driven circulation or secondary pump, in duplicate, which delivers it to the 8-in. pressure main. The difference between the delivery and return, representing consumption, is made up through a connection to a 6,000-gallon woodstave makeup tank in the pump house. In this connection there is an automatic chlorine feed which ensures the treatment of all makeup. The secondary pump has a delivery head of 215 feet, which provides for pipe friction, 100 feet of static head, and 85 feet pressure at street level. The pressure in the return line is throttled down to the makeup tank pressure by a hand-operated valve. The makeup tank is fed by a float-controlled 250-U.S.-g.p.m. motor-driven primary pump, also in duplicate, drawing from the intake well in the Lake. This pump has a foot valve and submerged delivery without a check valve to ensure being continually primed.

In the 6-in. return line is a shunt on the suction side of the secondary pumps containing a standard injector through which steam at 20 lb. gauge can be injected for heating. A two-pen graphic recording thermometer records the outgoing and return temperatures. Sufficient steam is injected to ensure that the return from the system is safely above 32 deg. F.

For fire protection, a 1,200-U.S.-g.p.m. gasoline driven pump draws from the intake well and discharges directly into the outgoing 8-in. line. At its rated head of 350 feet, it delivers at normal street pressure to the hydrants. Additional fire pressure is obtained from the pumper. A separate semi-automatic chlorinator feeds liquid chlorine to the suction to ensure that none but treated water can ever enter the system of the fire pump.

In the pump house are two 60-hp. and one 70-hp. return tubular boilers, with safety valves set at 30 lb. gauge, and fired by semi-automatic burners using Bunker C oil. On a nearby rock ledge at about 25 feet elevation are four 35,000-U.S.-gallon fuel oil tanks (Fig. 4) with heating coils surrounding the oil outlets. The connecting oil, steam and condensate lines are in a moss insulated box. The tanks are replenished directly from oil barges during the summer delivery season.

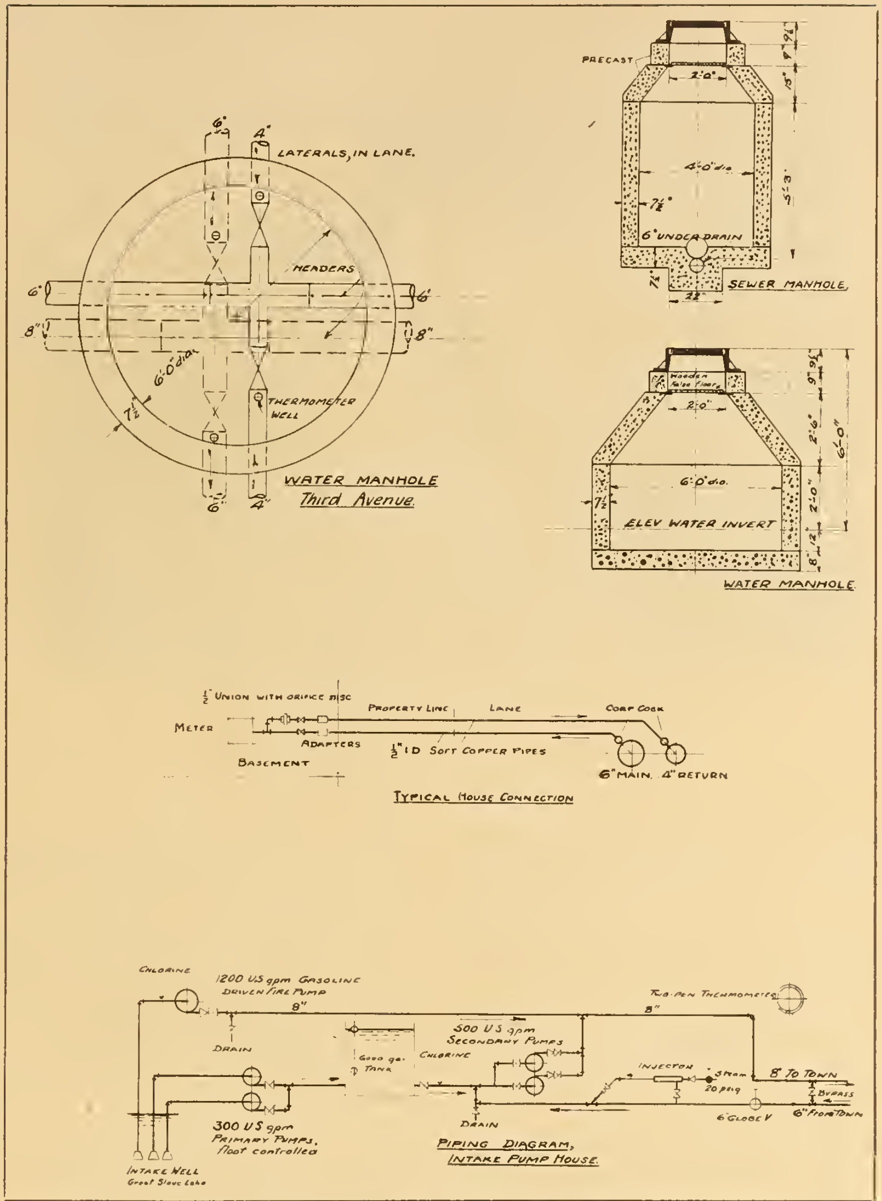

Fig. 3. Piping details for water system.

Electric power at 60 cycles and 2,300 volts is taken from the Yellowknife Power Company at a switching structure at Fourth Avenue. A three-phase circuit on wood pole-line leads to a two-throw switch in the pumphouse, thence to a bank of three 25 k.v.a. transformers just outside the building. From the transformers, 220 volt power re-enters the building for general use. The pole line also carries a 2,300-volt circuit for the sewage units.

To ensure uninterrupted service, a 125-k.v.a. 2,300-volt diesel-electric unit is installed in the pumphouse. By means of the two-throw knife switch, power is immediately available from this standby unit in the event of failure of hydro service.

Manholes

All laterals, both 6-in. outgoing and 4-in. return, at the Third Avenue headers and at other similar distributing points, are valved and provided with thermometer wells for checking temperatures. These are in four-foot and six-foot circular manholes as required. The cylindrical section of each manhole on a concrete base, was cast in place using collapsible plywood forms. Above this section is a precast frustum of a cone with a 45-deg. slope reducing to 24-in. diameter, which carries a conventional cast iron manhole ring and solid

Fig. 4. Fuel oil tanks at the intake pump house.

cover. Precast concrete rings were used where required to suit adjustments in lane and street grades. No reinforcement was used. The sewer manholes are all four feet diameter and of the same design.

Provision was made for supporting 24-in. diameter wooden false floors in the necks of the manholes to carry a moss insulating pad. This was found to be an unnecessary precaution. No ladder rungs are provided. Access is by a light wooden ladder carried in the maintenance truck. There are approximately 44 water manholes and 77 sewer manholes.

Pump House

This is 70 feet by 30 feet, of wood construction with rock wool insulation including the ceiling, and fire resistant sheathing on both walls and ceiling. It rests on a waste mine-rock fill extending outwards from the shore lines (Fig. 5). The intake well is 30 feet further into the lake, connected to the building by a covered insulated bridge carrying the suction pipelines. The well is four feet square inside and 10 by 10 feet outside, of hollow wall construction with walls of laminated 6 by 6-in. lumber. It rests on a mine-rock extension of the building base and is surmounted by a fully insulated and heated superstructure. Through each corner of the hollow wall is a wood pile and the hollow wall is rock filled. Extending further into the lake is a 10-in. corrugated steel pipe with bronze fish screen, well below ice cover which may be up to four feet thickness. The bronze screen is approximately 120 feet from the original shore line. The solid rock lake bottom carries 18 feet or more of very fine silt. The mine rock fill was sunk by assembling heavy surcharges and setting them by light dynamite charges which dislodged the silt. The fill was allowed to rest over the winter of 1947-48 before completing machine foundations in the following summer. No settlement has occurred.

The pump house proper is heated by steam unit heaters and the intake well and bridge by radiators. All condensate is returned to the boilers by a motor-driven pump. Steam injected into the town water must be replaced by makeup. The water is quite satisfactory for both boiler and town use, except for continuous slight bacteria count. Chlorination is continuous.

Sewerage System

This is of the conventional gravity type. It comprises a 10-in. interceptor along Fourth Avenue, extended to the disposal plant about 800 feet beyond the south-east corner of the townsite. The minimum cover is 7 ft. 6 in. and the minimum grade of 0.40 per cent was exceeded in a few cases only.

The sewer mains are two feet below, and six feet horizontally from the water mains. All pipe is corrugated steel, factory-dipped, with an extra float to smooth the invert. All service connections to the mains are 8 x 8 x 6 x 6-in. double 45° wyes, located approximately at the downstream boundary of every serviceable lot. The 6-in inlet branches are inclined upwards at 20°, with their inverts tangential to that of the main. Included with each is a 6-in. 45° ell, providing a compound bend for the convenience of the user and permitting the use of cast iron, tile or other piping. No house connections enter the 10-in. interceptor. At every intersection of sewer mains and at all changes of grade and alignment, is a four-foot concrete manhole. No provision was made for handling storm water; a by-law forbids the connection of eavetrough downspouts. This precaution was taken on account of the amount of dust deposited on roof. surfaces by summer winds.

Sewage Treatment Plant

This consists of a twin-cell primary sedimentation tank, an adjoining effluent sump, pumps in a dry well, sludge pumps in a similar dry well, a circular heated digestion tank and an oil fired steam heating plant, all located at what is locally referred to as the "Prospector's Pit".

The effluent is pumped through 1,200 feet of 6-in. woodstave force main in a shallow trench, over a rocky ridge to a second effluent tank with pumps in a dry pit. This site is alongside Franklin Road and is locally referred to as the "Garbage Road" site. From here it is pumped through 1,800 feet of 6-in. woodstave pipe over another rocky ridge and discharged through an insulated box on a trestle extending well beyond the shore line into an isolated shallow pond called "Niven Lake", with an area of about 13 acres (Fig. 6). All effluent pumps are in duplicate and with a capacity of 200 U.S. g.p.m. each, float operated at 220 volts, 3 phase from transformer banks tapped from the 2,300 volt line from the water intake plant and hence protected by the diesel-electric set. To avoid the possibility of the freezing of standing effluent between pumpings, there is at each plant a motor-operated spill valve that drains its force-main back to the sump when pumping ceases. Each sump has a nominal capacity of 10,000 gallons. Niven Lake normally loses its water by evaporation only, but has an old overflow into Back Bay, an arm of Yellowknife Bay. A low timber dam, with 8-in. tide gate, was thrown across the overflow. The effluent to date has caused very little discharge here. The incoming warm sewage maintains a clear opening through the ice at all temperatures. Should there ever be excessive overflow into Back Bay, it may be justifiable to add further treatment at the outfall.

The twin primary sedimentation tanks are 10 ft. by 26 ft. 6 in. and 8 feet deep from water level, with screen, grit-chamber, effluent-trough and suspended weir of conventional design. Motor-operated endless chain scrapers move the sludge into the suction pit of the sludge pumps, whence it is pumped into the 21-foot-diameter by 20-foot deep hopper bottom concrete digestion chamber. The digestor is heated by hot water in submerged copper coils. The same sludge pumps deliver digested sludge to open driving beds nearby.

At a distance of about 100 feet from the tanks is the 20 by 40 ft. boiler room with two 15 hp. boilers operating at 15 lb. gauge, oil fired with medium diesel fuel oil. Hot water is pumped from a heat exchanger to the digestor and steam radiators heat the building. All piping is in buried insulated boxes. A 4-in. line carrying town water in the same trench as the raw influent supplies clean water for boiler and wash-down purposes. No attempt is made to utilize sewage gas. The treatment plant meets the standards of the Federal Department of Health and Welfare.

Construction

During the 1946 season, the lanes were cleared and a considerable amount of stripping was done by light bulldozer to expose permafrost. Orders were placed for all water, sewer and woodstave pipe and fittings, and boilers, pumps, diesel generator, fuel tanks and other large pumphouse equipment, including the sewage effluent pumps. Each length of water pipe and each fitting was shop tested by hydraulic pressure before shipment and all sewer pipe was crated in sizes for handling by water transport.

During the winter of 1946-47, the contract for the installation was placed with the Northern Construction Company and J. W. Stewart, Ltd., of Vancouver, assuming a two-season period for completion. All tools and construction equipment were purchased or supplied by the Department of Public Works, and on the completion of the work, stored in Yellowknife for future work in the Territories. Active construction commenced late in April, 1947. Pipe trenches were opened by dragline, shovel and back-hoe. Due to the sandy nature of the soil, excavation by trenching machine was impracticable. The summers of 1947 and 1948 were both cold and wet and thawing of the permafrost was very slow, due, partly, to the heavy accumulation of ground water and to the extremely fine sand encountered.

The problem of dealing with the accumulated water became so acute that it was decided to lay a system of under drains under more than half of the townsite. This consisted of 13,000 feet of 6-in. corrugated and dipped steel pipe perforated along the invert and laid in a bed of moss to filter out the fine sand. It was laid so as to form an immediate support for the sewer lines, and cut off trenches drained the system at two points towards the main lake.

Although the ground water elevation was approximately that of the adjoining Sand (Frame) Lake, there was no evidence that seepage took place through the bank of the lake. Measurements showed a steady flow from the drainage system, except in winter, when all flow ceased. It is anticipated that the flow will gradually diminish in seasons to come.

With the removal of this ground water, trenching proceeded steadily. A considerable amount of rock, mainly as hummocks, undetected by the test bores, was encountered, but, fortunately, there were few buildings to interfere with blasting. No piping was laid in 1947. The entire season was devoted to stock piling moss, to drainage, to preparation of the trenches, and to intake pump house foundations. This building was completed sufficiently to serve as a storehouse for machinery.

Construction work ceased in October and was not resumed until June, 1948. This season was again cold and wet, but pipe laying was largely completed, except in outlying areas where heavy

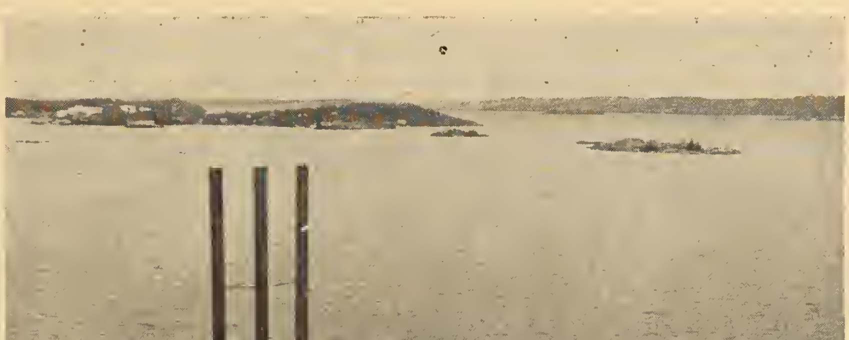

Fig. 5. Intake pump house for the water system on Great Slave Lake. The old townsite is in the far background.

rock work was required. Sections of water main were tested with compressed air before backfilling; and all mains were covered on the sides and top with enough moss so that there remained a thickness of about 10 in. after backfilling.

The arrival of cold weather prevented the erection of the sewage disposal plant, but the effluent pumps and sufficient sewerage system were completed to be put into operation. This gave service to the hotel, the hospital, the school and to centrally located buildings, a total of about 40 connections. Raw sewage was pumped into Niven Lake.

Preliminary operation was commenced late in November, with regular operation late in December, 1948. As a precautionary measure, outgoing water was held at 70 deg. F. for a month, and then gradually reduced to 40 deg. or 45 deg. F, depending on outdoor temperature and as required to ensure a return temperature safely above freezing.

A few breaks occurred in water lines, due mainly to difficult ground and back filling during severe weather. The operation of consumers' loops was entirely satisfactory. The sewage disposal plant and the remainder of the street system were completed in 1949 and their operation continued under the Department of Public Works until April 1, 1950, when the systems were formally handed over to the Department of Resources and Development.

Except for a few line leaks, the water system has been in normal and satisfactory operation over a period which includes two severe winters. The line failures were mainly in locations where the initial installation could be done only in freezing weather with frozen backfill. This demonstrates that a system can be designed to operate under sub-arctic temperatures and the restrictions and limitations of such a geographical location. This includes laying water and sewer mains and house connections at moderate depths that may be either above or below the boundary between seasonal and permafrost. Available records show that, within reasonable depths, the temperatures in permafrost are only a few degrees below 32 deg. F, with small annual fluctuations.

Because of the time lag between atmospheric and ground temperatures at pipe depths, water returned to the plant at higher than lake temperatures well into the winter and the period of water heating was from late December until June. The cost of fuel consumption has been lower than estimated, due, no doubt, to the effectiveness of the moss insulation and to the small number of consumers so far connected.

The sewerage system has operated without incident in spite of the small number of connections.

All water services are metered, and all the connections are entirely at the expense of the consumer, but to a standard set out by the Department.

The ultimate addition of a water tower was kept in mind, but it was decided to defer it until the system had been in operation for a time. A water tower would be a hazard to a circulating system in severe weather, but by restricting it to summer use, the system could be operated as a conventional system with a saving in labour and power that probably would carry the fixed charges added by the tower.

Personnel

This project was sponsored by and carried through to completion under the general approval of the Federal Department of Mines and Resources, now the Department of Resources and Development.

Initially, it was under the immediate supervision of Mr. P. E. Doncaster, M.E.I.C., district engineer of the Winnipeg office of the Department of Public Works. Later it was transferred to the newly organized Edmonton office, Mr. W. J. Johnston, M.E.I.C., district engineer. The resident engineer was Mr J. E. Kellett, M.E.I.C., assisted by Mr. E. Lundman, Jr.E.I.C., who has remained as operating manager following the transfer to the Department of Resources and Development in 1950. The contractor's superintendent was Mr. John McNeil of Vancouver. The writer was consulting engineer. √

Engineers in Civil Defence

by

W. J. Scott, K.C.
Ontario Fire Marshal.

An address delivered before the Toronto Branch of The Engineering Institute of Canada, on February 1, 1951.

In this address I have been requested to discuss with you how engineers can fit into the civil defence picture. The necessity for civil defence is the ugly fact that faces Canadians today. When World War II ended, none of us then anticipated that in less than six years we would be girding ourselves for defence against the stupendous horrors of the atomic bomb. The film you have just seen, "The Tale of Two Cities", which was produced by the United States Army and recently declassified for public showing, gives you a much better idea of atomic warfare than any words can describe. My problem is to indicate to you some thoughts as to what you and I can do to safeguard our own lives and those of our families and fellow citizens, and to preserve our democratic way of life.

Civil defence is national life insurance in these perilous times. We, in our efforts and expenditures for civil defence, are just paying the premium on this life insurance. Our hopes are that civil defence will not be needed against war in our times. Here we are in the same position as the young husband who hopes that an early death will not cut him off from the support of his family. Just as, if he is a prudent man, he carries life insurance to provide against a possible disaster, so we in these days have to participate in civil defence. Or to take an example from the fire insurance field, it is probable that every man in this audience carries fire insurance on his home or property, even though the statistics for the Province show that only about one building in 25,000 suffers loss by fire in any year. In these days of communist aggression it would be a rare individual who would say that the possibility of war is not one out of 25,000. If we take the Canadian Prime Minister's figure as to the possibility of war being not more than one chance in 50, then civil defence today is 50 times as necessary as fire insurance.

In view of the wide interest in the subject of civil defence today, the *Journal* considers this paper important and timely. Engineers in all parts of Canada have an important part to play in civil defence. The references to other publications on the subject will be of help to those seeking wider information.

Atom Bomb Obliterates Area Five Square Miles

Those members of this audience who saw France in World War I, will vividly remember how a single shell would demolish a house or possibly even several houses. World War II brought its greater destructions through incendiary bombs and through its block-busters and then the V-1 and the V-2's. The characteristics of the V-2 are particularly appropriate for our study as to our possible future in atomic warfare. This missile travelled faster than sound, so that the public had no knowledge of its approach. The common expression was "If you hear a V-2, you are safe".

Similarly with an atomic bomb, if anyone takes evasive measures, or in other words "ducks" immediately, there is a good chance of survival even if he is out in the open when he sees and hears an atomic explosion. If he has advance warning of a few minutes to seek shelter, his chances are proportionately better. The V-2 demolished almost a whole city block. The single "nominal atomic bomb", as it is called in the U.S. textbook, virtually obliterates an area of five square miles and causes damage and secondary fires some two miles from ground zero for a total area of important damage of twelve to fifteen square miles.

This tremendous destruction from an atomic explosion is due to the great release of energy from the fission of uranium-235 or plutonium. On page 13 of the U.S. textbook "The Effects of Atomic Weapons" the energy equivalent of fission of one kilogram of U-235 is given as $2X10^{13}$ calories, $2.3X10^{7}$ kilowatt hours, or $8.4X10^{20}$ ergs. As engineers you will know that this energy release comes from the conversion of matter into energy when the mass equivalents of the resulting fission products are somewhat less than the mass equivalents of the original U-235. This is the energy from fission which is still in itself very much less than the energy that would be released

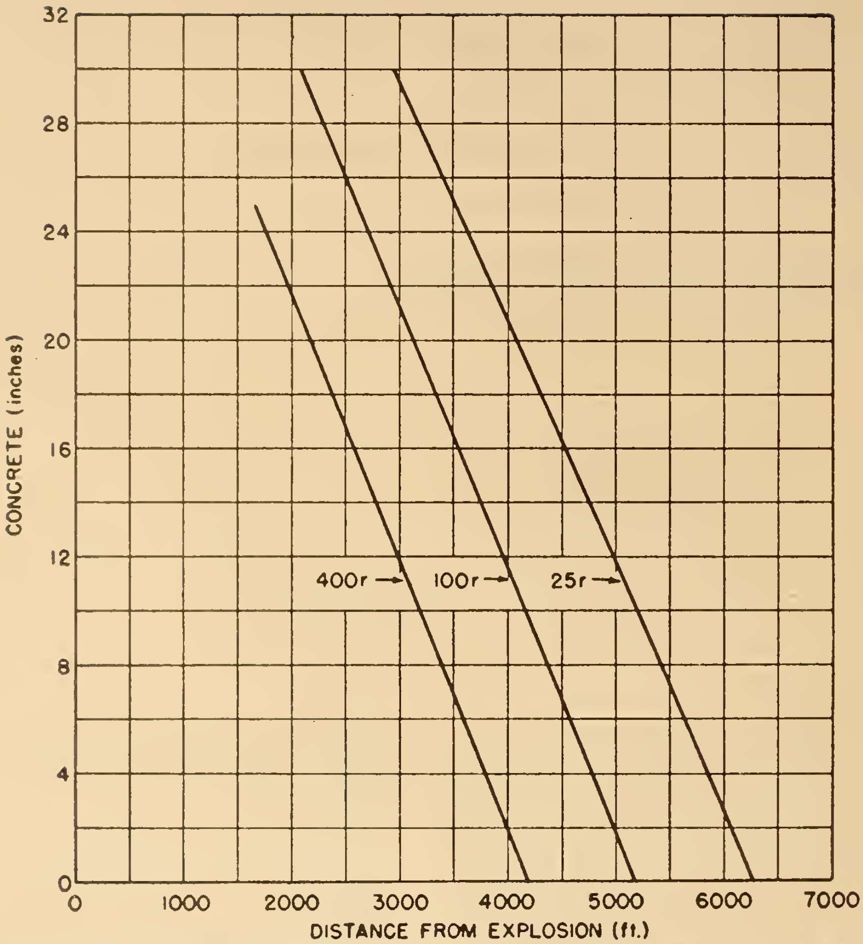

Fig. 1. Thicknesses of concrete required as function of distance from explosion to reduce initial gamma radiation to various amounts.

if the whole kilogram were converted into energy. That would be more than 1,000 times greater, for using the famous Einstein formula of $E=mc^2$ the release energy from the total destruction of one kilogram would be:

$$E = mc^2$$

$$\text{(in ergs)} = \text{(mass in grams)} \times \text{(speed of light in centimeters per second)}^2$$
$$= (1000) \times (3 \times 10^{10})^2$$
$$= 9 \times 10^{23} \text{ ergs.}$$

Where Engineers Can Help

In the past history of the world, whenever science has discovered a new weapon to use against mankind, defensive measures have always been developed. The Canadian textbook "Organization for Civil Defence" devotes Part V to "Methods of Civil Defence". Next I want to discuss with you briefly some of the lines of endeavour where it appears engineers can best give their most effective help to the people of Canada. In these comments I am not announcing policies for the Ontario Government, but speaking solely as an individual. Here I am drawing on my personal experience as a member of the Ontario Civilian Defence Committee during World War II, and of the new Ontario Civil Defence Committee. I speak from the background of the intensive study I have made of civil defence activities in both the United Kingdom and the United States during World War II and since.

In this Canadian Government publication the sub-headings and a few brief comments on them are:

Warning

This section provides for civil defence warning control centres in target areas. A recent press announcement from Ottawa gives the development of a new siren which can be heard over a radius of two miles. Engineers are certainly going to be needed where the differing power supplies available, even in individual locations in a single city, will provide the first complexity. I well remember the troubles we had in fitting the sirens delivered to single and three phase motors and 110 and 220 volt circuits. All phases of the warning system will require engineering skills for their maintenance and operation. Similar problems arise with general communications, which in the immediate area of an atomic explosion will probably be exclusively by radio. While civil defence services will have their own short wave radio systems, undoubtedly public broadcasting stations will be used for messages to the general populace. Indeed each householder is advised to have a battery-operated radio in his home, so that he and his family can continue to receive directions even though there be a general power failure.

Dispersion

This is largely a field for town planners and those who choose the locations for individual industries, which are followed inevitably by the communities of their workmen and those who provide service for them. Dispersion is the best counter-method against atomic attack, for an atom bomb is an expensive device in man hours and needs a substantial target to justify its expenditure, although the size of the target decreases as the Russians' stockpile of atom bombs grows. This is very much a long-term proposition, for obviously it is impossible to completely disperse our populations today without a complete disruption of production. But each factory which is built in some small town or on the outskirts of a metropolitan centre, instead of in the midst of a city, is another aid towards dispersion.

Construction

The paragraph in the Canadian manual says so much in a few lines that it is worth quoting in full:

"The inclusion in building codes and building practices of shock resisting features, fire prevention requirements and basements suitable for shelters, would greatly increase our defences at relatively little additional cost and reduce fire risk in peacetime."

Much research work is being done in this regard, and shortly formal recommendations will be issued from Ottawa. In the meantime we do have considerable information from the United States. I particularly draw your attention to the fifteen pages starting at age 372 of "The Effects of Atomic Veapons". Here the very reasonable principle is laid down, "It eems that a distance of about half mile from ground zero (the point lirectly under the bomb burst) vould be a reasonable compromise or the planning of general protecive measures". No one can foreast just where an atom bomb will go off, and it is just not economially feasible to try to build proective structures that will withtand a direct hit. There are facors entering into the Japanese experience which form the basis for his advice. The table on page 376 hows that the percentage mortalty did not drop to 90 per cent unil 2,000 feet from ground zero, vith the downward curve becoming harp only after 3,000 feet where he percentage mortality is 80 per ent.

The major reason for this loss of ife and the property destruction is he violence of the shock wave. The nost destructive point from which n atomic bomb can be used is an ir burst about 2,000 feet above he ground. The major destruction s within a radius of about 2,000 eet from ground zero, and thereafter decreases with the cube of the listance. To non-technical people his use of the figure 2,000 feet rom ground zero seems as if the scientists were being too definite about atomic explosions. But if you read the thirty-five pages devoted to the mach effects, starting on page 57 of "The Effects of Atomic Weapons", it will be seen that t is a simple matter of physics. The bouncing of shock waves from the earth and their reflection by the descending waves following, taking into account the intensity of these waves and their possible angle of incidence, gives the greatest mach effect at about 2,000 feet. There the combined intensities are about eight times as great as a single shock wave. Beyond that distance the angle of incidence is too great, and the intensity of the explosion decreases with the cube of the distance.

Another factor in determining this half mile is that in any atomic explosion there is a great release of neutrons which have a maximum range in air of about 2,100 feet. If the explosion is a low air burst so the ball of fire touches the ground, an hour after the explosion the radioactivity at ground zero is still 8,000 roentgens. The significance of this is that the laboratory

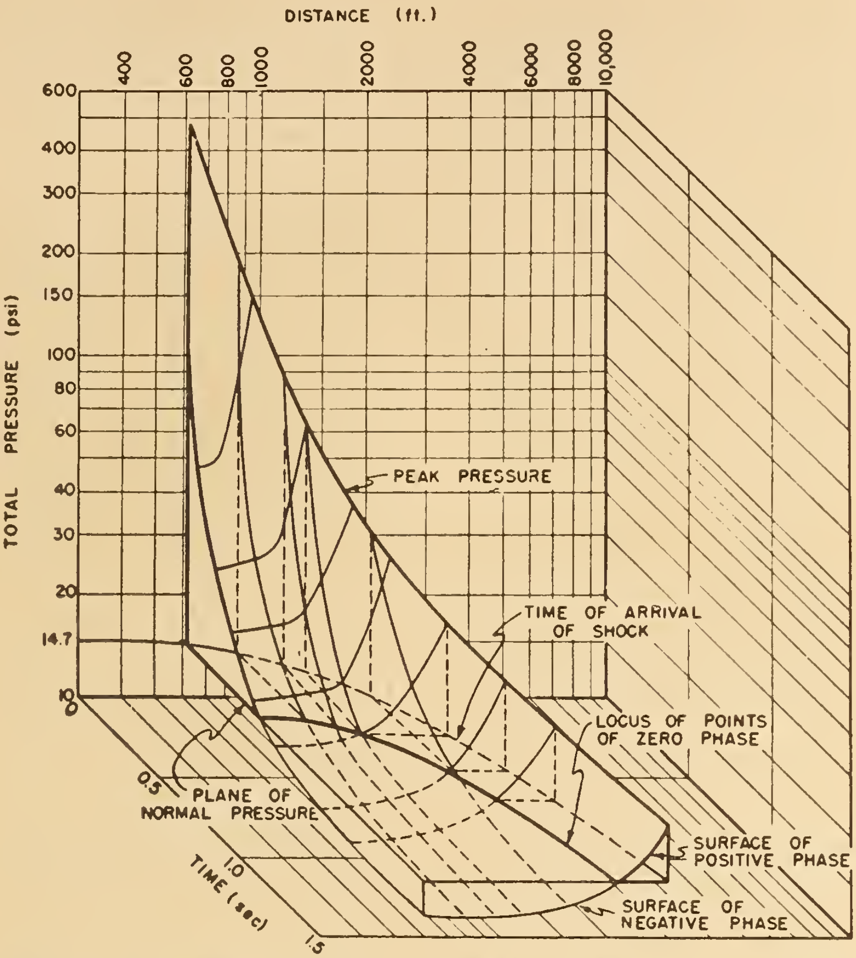

Fig. 2. Total pressure-time-distance diagram for shock wave in infinite homogeneous atmosphere.

tolerance for exposures is 0.3 roentgens per week and the text "The Effects of Atomic Weapons" at page 236 gives a dose of 400 roentgens received over the whole body in the course of a few minutes as the median lethal dose which would be fatal to about 50 per cent of human beings.

All radioactivity from an atomic burst decreases with the square of the distance, so that at just over 6,000 feet from ground zero there is no prompt gamma radiation of any kind, even for a person in the open without any protection. Those of this audience who are construction engineers will be interested in the graph* showing the thicknesses of concrete required as a function of distance from an atomic explosion, to reduce the initial gamma radiation to various amounts. This is on page 237 of the "The Effects". For example at 2,000 feet it requires 22 inches of concrete to reduce gamma radiation to an intensity of 400 roentgens, which is the 50 L.D. dosage, while 12 inches of concrete will do the same at 3,000 feet. The usual measure for civil protection is 100 roentgens to which radiation is reduced at 3,000 feet by 22 inches of concrete and at 5,000 feet by just two inches of concrete. The Jap experience was that only 15 per cent of the personal injuries were attributed to nuclear radiation.

The Japanese experience in the heat wave that accompanies an atomic explosion was that this was responsible for a high proportion of the physical damage, with total fire destruction being about 80 per cent of the building damage. It is hard to differentiate between the fires which were caused by thermal radiation and those which were secondary fires, arising from ordinary causes of buildings damaged by the blast. Burns, from these same two causes, accounted for about a third of the Jap casualties. The thermal radiation is caused by the high temperature of the atomic

* Reproduced as Fig. 1 of this paper on page 172.

explosion and the resulting "ball of fire", which reaches about 900 feet in diameter. The intensity of the thermal radiation is given at page 180 of "The Effects" as 6.7×10^{12} calories. At page 201 there is a table showing that this will give moderate burns on the unprotected human skin at a distance of 10,000 feet from an atomic explosion, will char white paper at 12,000 feet and char maple at 7,000 feet. It is possibly of some technical interest that while close up there is some ultra violet radiation, the most damaging effects at a distance are from radiation in the infrared range.

Fortunately the thermal radiation travels in straight lines, so that only direct exposure leads to harmful consequences. Shelter behind almost any object is effective except quite close to ground zero, and the ordinary building construction principles for better fire safety apply completely.

The U.S. textbook "The Effects of Atomic Weapons" states that for blast, thermal radiation and gamma radiation there is time for the individual to take evasive measures which can reduce the casualties by 50 per cent. On p. 125 it is pointed out the duration of the blast is in the order of one second and at p. 29 that its shock wave travels 12,000 ft. in 10 seconds. On p. 207 it is stated that only one-third of the thermal radiation is received in the first second after the explosion. Even for gamma radiation, the semi-log graph on p. 238 shows 18 per cent of the total dosage in the first one-tenth of a second, just under 50 per cent in the first second, and about 80 per cent in the first two minutes. These "ducking" times form the basis for the detailed advice to the public given in the U.S. pamphlet "Survival under Atomic Attack".

Blackout Precautions

The Canadian policy on blackout precautions is not decided as yet, and any instructions will come from the Department of National Defence. However, in view of the physical limitations against frequent air attacks on Canada, it would seem ridiculous to institute any system of blackouts such as were generally observed in the United Kingdom during World War II. It is also a question as to how effective any blackout is against the use of radar. There might have to be some type of black-out however in coastal cities, to avoid becoming too plain targets for guided missiles from submarines.

Shelters

The Canadian policy on shelters as given in the manual is: "The construction of heavy surface or special underground shelters would not be justified at present. Incidental shelters can be made at little cost in money or materials in many types of structures, particularly in basements. . . . Enforcement of suitable building codes incorporating shock and fire resisting features, and other safety requirements above and below ground would help provide protection from A-bomb effects."

In the U.S. textbook "The Effects of Atomic Weapons" there are fifteen pages starting at page 372 that give principles of proper construction in much more detail than is possible here. For example, the recommendation for multi-storey, reinforced-concrete or steel-frame buildings suggests the design should allow for a horizontal wind component of 90 pounds per square foot, with a vertical component of 70 pounds per square foot, to provide against structural collapse at a distance of half a mile from an atomic burst. For underground structures, the design for earthquake resistance is suggested.

There are just two points in building construction that should be mentioned further. One is that all load-bearing brick or concrete block walls have poor resistance to an atomic blast. Not only do they collapse, but the bricks and blocks become highly-dangerous missiles. Further, if we are to live in an age of possible atomic warfare, our engineers and architects will have to reverse the present trend towards the extensive use of glass. The Jap experience was that the casualties to personnel in reinforced concrete buildings were higher than in buildings of ordinary construction, due to injuries from glass splinters. This hazard from glass splinters from an atomic explosion is exceedingly severe, and extends over a much greater area than the danger zone for structural damage, heat radiation or gamma radiation.

For those who want to design structures to resist an atomic blast, there is a most instructive three-dimensional graph* on page 51 of "The Effects of Atomic Weapons". From this pressure-time-distance diagram of the shock wave, it will be seen that there is a peak over-pressure of about ten pounds per square inch at 2,000 feet which has a duration of 0.5 seconds. A lawyer like myself should probably hesitate to translate this to engineers. But for those who might be thinking of the family garage as a shelter, it may be mentioned that my slide rule shows this means on a garage wall 8 feet high and 15 feet long a total pressure of 86.4 tons for a duration of half a second.

Restoration of Public Utilities

The British and Japanese experience with bombings are not comparable to Canadian conditions, since our public utilities' services are usually buried much deeper in the ground in order to be below the frost line. Nevertheless these public utilities would present major problems after an atomic attack. The expectation is that except for an area close to ground zero, the mains for water, gas, sewers and any underground electric lines would not be damaged, although above-ground connections might be fractured. The very obvious pre-planning is for grid systems with frequent cut-offs. The making of complete and accurate maps of all public utilities is an obvious necessity, and it should be remembered that these should not be stored in the city halls which are usually in the centre of the target, but copies should be at various points in the perimeter of target areas.

What should the industrialists, business man and private householder do with respect to his public utilities in the event of a few minutes advance warning of an atomic attack? This is a debatable problem, on which the authorities so far have failed to agree. Just a week ago today I sat in on a civil defence meeting in New York City where many eminent engineers failed to reach unanimity in a three-hour discussion on such a question as to whether or not the householder should try to shut off his water, gas and electricity. The consensus of the U.S. experts seems to be that for both electricity and gas, only the appliances should be shut off. It was

* Reproduced as Fig. 2 of this paper on page 173.

elt that the hazards of pilot lights when the service is being turned on again would be greater than the danger of leaving the main valve open on gas mains.

For electricity it is deemed highly desirable to pull the switch on oil furnaces, but to leave the main switch for lighting services on for lighting, and also for the use of radios for directions from the civil defence authorities. For water mains it is felt these should be left untouched to provide an immediate water supply for firefighting, as well as to maintain sprinkler systems in operation. For those who might worry about sprinkler leakages, it is believed that at distances of about 3,000 feet or more a sprinkler-head would not open under even direct thermal radiation, although this is something on which there may be further information available shortly.

Civil Defence Engineering Section

On page 32 of the Canadian manual, further opportunities for engineers are given in the organization of Civil Defence Engineering Section to handle decontamination, salvage, building repair and pioneer groups to supply labour for general use in clearing debris, etc. These are all specialized trades in normal peacetime fields, where their very names denote the purposes.

What Ontario is Doing

All the above advice is not to be deemed as entirely comprehensive, but just designed to give to you members of the Engineering Institute of Canada some lines of thought to develop and expand. But all this advice raises questions as to what the Ontario Government may be doing about civil defence. Therefore I shall refer briefly to the progress we have made in this Province.

Our direct interest in civil defence for the present emergency goes away back to 1948. It was in that year that, as an unofficial Canadian observer, I sat in on the Washington meetings which drafted the famous U.S. publication known as the "Hopley Report". This textbook established basic principles for a very elaborate civil defence organization. That publication has now been replaced by the recent one referred to earlier, "United States Civil Defence" which contains the following chapters of real interest to engineers; 9. Air Raid Warning Service; 10. Shelter Protection; 18. Engineering Service; 19. Rescue Service; 20. Communications; 21. Transportation; 22. Plant Protection; and 23. Supply Service.

Later, since a Canadian Civil Defence Co-ordinator has been appointed at Ottawa, we in this Province have worked in very close co-operation with him and his staff. To obtain the most authoritative information possible on the new hazards of atomic warfare, the Ontario Government, through co-operation from Ottawa, sent me to take the U.S. Army's course in radiological defence, which I completed last May. Dr. R. G. Struthers of the Ontario Department of Health has also just returned from taking the medical radiological course at Washington, D.C.

Since last September, the Canadian Army have been running a series of three-week courses in atomic - bacteriological - chemical warfare at Camp Borden, where Ontario has filled every vacancy offered to us. For instance, the seventh member from my own staff goes up to the ABCW course opening next week. The first Civil Defence Forum to discuss national planning for training and operations opened at Hull, Quebec, on Monday of this week, and there are seven representatives from Ontario at this, including one from the Fire Marshal's Office. We will have another large delegation at the second national forum opening February 15.

Last year the Ontario Civil Defence Committee was formally organized, with Col. the Honourable G. Arthur Welsh, Provincial Secretary, as its Chairman. It is impossible to establish a full-scale civil defence system until the basic problem is settled of finances as between the federal-provincial-municipal governments. Nevertheless much progress has been made. The pattern for organization in this Province is that there are five semi-autonomous divisions of police, fire, health, welfare and civil defence divisions, all closely co-ordinated and working together.

The health and welfare organizations are already established on a county basis, and it is decided as a matter of provincial policy that fire departments for target areas should also be co-ordinated on a county basis. It is probable that the police will follow the same pattern. With the example of Toronto and York County in the action they took last week to establish a county basis, it may well be that the general civil defence activities throughout the Province will be co-ordinated on the county level like the four other services just mentioned.

Organizing Well Underway

Ottawa has designated certain areas in this Province as potential targets, where detailed surveys have been made or are underway as to existing hazards and protective facilities. In all instances, the municipalities concerned have been notified as to Ottawa's directions, but for obvious reasons these names cannot be made public. However, in all of them initial steps for organization have been taken. Dealing with my own sphere of the fire services, I can say that the organization which has been initiated is for the fire chief for the largest city in each county to be responsible for co-ordination and standardized training of all fire departments in his county.

These fire chiefs are now working on mutual aid running-cards which would provide immediate help to any target centre from all fire departments in an area of 50 to 100 miles away. All these fire departments are listed in detail in our own F.M.O. publication mentioned earlier, where in the latter pages these are all tabulated by counties throughout the Province. In the 43 aeroplanes owned by the Ontario Department of Lands and Forests we have a highly-mobile fire department, with small fire pumps in the hundreds and fire hose by the millions of feet, available for immediate dispatch to any point in central Canada or for mutual aid to the United States. For obvious reasons I cannot give details, but I can assure you that you would be surprised at the extent to which existing resources have been organized.

Similarly on the provincial level for other services, the Province through its short-wave radio networks of the Department of Lands and Forests and the Ontario Provincial Police can now blanket the entire Province, for the purpose of getting aid for any stricken area or calling for aid from any district able to help. Before starting any recruiting or training programme, it is obvious that instructors on both the provincial and local level must be provided first. This is one of the reasons mentioned for the attendance of people at the various Canadian and U.S. courses. In order to supplement this training of instructors, we have had very extensive distribution of educational literature. For instance, all the publications mentioned in the Bibliography have been sent to municipal fire departments throughout Ontario and to other municipal authorities and officials. There have been quite a number of others sent out too, including all available British manuals.

Further, Col. Welsh has specially authorized me to make two announcements which will be of special interest to this gathering. The first is that the importance of the engineering profession is recognized in the fact that he has arranged to include an official representative from the professional engineers of Ontario, among the Ontario delegation to the current national civil defence forums at Ottawa. Secondly, the first general distribution of educational literature is in the hands of the printers from whom deliveries will start in a few days of 280,000 copies of the U.S. pamphlet "Survival Under Atomic Attack", which will be distributed first throughout the high schools of this Province.

Incendiary Bombs Less Likely

In all these discussions you may have noted that my references have all been to "atomic attack". Under present world conditions, our only possible enemy is Russia and her satellites. Fortunately for us in Canada, these are all far removed from the settled portions of our country and particularly from the Province of Ontario. Unless or until the unlikely event happens of Russia capturing land bases on this continent or in Newfoundland, it is a physical impossibility to have saturation raids against us like the raids in Europe during World War II, and which Great Britain would undoubtedly suffer in any future war.

As to the type of attack we would most likely receive here, just look at the fact that it would take 2,000 Russian bombers with 10,000 aircrew reaching Toronto to drop high explosive and incendiary bombs, to give an equal effect to one "nominal atomic bomb." Consideration of the engineering tests of "efforts and results" readily show the type of attack for which we need to prepare. In any event, preparations against atomic attack would automatically take care of any lesser attacks by high explosives and incendiaries. But I need hardly reassure you, in conclusion, that all of us hope none of our civil defence efforts will ever be called upon for actual experience in war during our lifetimes. We are simply paying our life insurance premiums in this troubled world.

PLAN NOW TO ATTEND

Airborne Magnetometer

by

T. O'Malley

President

Canadian Aero Service Corporation, Ottawa.

An address presented to the Ottawa Branch of The Engineering Institute of Canada.

Magnetic measurements have been used in prospecting since the 17th century. Ground magnetometers are still used extensively to measure variations in the field of the earth, in search of oil and minerals, but the newest and most economical geophysical prospecting tool is the airborne magnetometer. This instrument brings a significant improvement to the quality of magnetic measurements, because it provides high sensitivity and stability, continuity of record, and escape from serious error due to daily magnetic variation. It avoids measuring near-surface accidentals which often obscure ground measurements, and finally the instrumentation and survey technique produce highly dependable records. The sum of these improvements is a new and economical exploratory tool for oil and minerals, particularly useful in large areas in those of difficult access. In the past four years the total miles of traverse covered with the airborne magnetometer alone exceed the traverses covered by all other methods of geophysical prospecting combined.

The high-sensitivity airborne magnetometer has an interesting history. It was developed and first flown by the Gulf Research & Development Co. in February, 1941. Then, since the instrument had possibilities as a submarine detector, it was further developed and modified for this use, during the recent war, then development reverted to its use as a geophysical prospecting tool. Its commercial history began in January, 1947, when the first commercial airborne magnetometer survey ever made in search of minerals was made in Canada.

Modern magnetometer aircraft are equipped with the continuously recording Gulf magnetometer, with the detector either towed below the aircraft on a cable or mounted in the tail of the aircraft, depending on the design of the plane and the accuracy of measurement required. The next piece of equipment is a stabilized continuous strip camera, the Sonne camera, to take continuous pictures 35 mm. wide, and incorporating a stabilized mirror to minimize side tilt and thus reduce movement, increasing photograph quality and position orientation. The third instrument used is a recording radio altimeter to give a continuous picture of ground clearance. Since the magnetic signals weaken as the airborne magnetometer is moved from the magnetic source, this altitude recorded is important. An optional piece of equipment is Shoran, used for flight guidance, depending on the circumstances of the survey.

Now that the instrumentation has been explained, an outline of the survey routine will show the importance of the mapping phase of airborne magnetometer surveys.

If suitable aerial maps exist they may be used, otherwise new ones must be made at 1 mile to the inch, with the photographic flight-lines running parallel to the magnetometer traverses. These traverses are now plotted on the aerial photographs as parallel lines a quarter-mile apart, or perhaps less, since this is a mineral survey. The pilot then flies along each of these quarter mile separated lines at an altitude of about 500 feet. Seven or eight days of this tedious flying makes a pilot wish he were on a "milk run" for T.C.A.

During the flight the magnetometer records variations in the earth's field as a profile on a ten-inch tape. The magnetometer operator also monitors the radar altimeter. At the same time the camera photographs the path the aircraft is flying. These three records — the magnetometer profile, the altimeter record and the photographic record—are marked and numbered simultaneously, so that all three are co-ordinated in time.

To control the effects of daily magnetic variation, which in Southern Canada is severe and can invalidate a survey, the following procedure is used. A series of overlapping closed loops, each taking less than 20 minutes, is flown around 30 by 50 mile sections of the area. In addition, tie lines are flown every six miles across the traverse lines. The traverse lines are anchored to these control loops and tie lines with the result that no magnetic reading is more than a minute and a half from a control point. This control pattern is used in oil surveys; mineral surveys require less control because the gradient is usually steep. One more precaution is observed: a magnetometer identical with the airborne unit operates on the ground to observe variations in the magnetic field directly. This information is

Fig. 1. The flight survey personnel check over the flight strip before take-off. The pilot follows the flight lines indicated on the strip of aerial photos. The survey plane is seen at the left.

radioed to the survey plane periodically. If the variations are not linear within a period of a few minutes the flight is stopped.

When the flight is completed, some five hours and 500 miles of recorded traverse later, the film is developed. The co-ordinating marks — "fiducials" — are spotted from the Sonne film back to the flight strip used by the pilot. Then these points are transferred from the flight strip to the base map used to compile the data for the survey. Following this, the magnetic profile is read in units called "gammas". These readings are plotted on the base map between the fiducials, which also appear on the magnetometer profile. This plotting procedure is repeated for each profile. Then the base map is contoured by drawing smooth lines between corresponding values. The result is a map, which reflects accurately all the subtle changes in gradient which are important to proper interpretation.

What information does this map provide to aid mineral prospecting? What are the general geologic problems to which the airborne magnetometer may be economically applied? Here are some; more may appear as the full use of its qualities begins to be made.

Fig. 2. The magnetometer with aircraft and crew.

Survey target magnetic

The fields of survey in which the magnetometer has been used so far are primarily those where the ore being sought is itself magnetic. Two obvious examples are magnetite and ilmenite. Successful surveys for both of these minerals have been made with the airborne magnetometer. Aside from areas still under investigation, commercial magnetite bodies have been found by the airborne magnetometer in Ontario. The world's largest known ilmenite bodies were delineated in Quebec with the airborne magnetometer.

Target non-magnetic, but in intimate association with magnetic material

Some mineralization processes produce or segregate magnetite along with the mineral being sought. Many placer deposits segregate magnetite with the economic minerals being sought. Hence, rutile, uranium, gold, and tin offer possible exploration targets in the placer category, and surveys for asbestos are possible because of the magnetite associated with the asbestos mineralization.

Target non-magnetic, but magnetic horizon associated

Some of the earliest surveys with the airborne magnetometer were made in northern Michigan, where the host rock is highly magnetic, but the mineralized areas are oxidized to hematite and hence are non-magnetic. At first glance it would appear that the heavy magnetic signals of the host rock and the small magnetic indications of the ore would make the magnetometer useless as an exploratory tool. However, convolutions of the beds are extremely well indicated on magnetic maps and can be traced by reference to related magnetic horizons, even though overlain by hundreds of feet of glacial drift.

Structural geologic indications

The ability to make maps of great precision opens up the possibility of using the airborne magnetometer in general structural problems which have heretofore not been explored by magnetic methods. It is obvious that a one-gamma map will show up dykes and intrusions however small. It is also obvious that if there are magnetic beds in the near-surface structures, they can be mapped with considerable confidence. Faults and folding will become obvious in the magnetic record.

Conclusive examination of a geologically favourable area

A good example of a survey used to find all possible ore bodies within a given domain is given by Dr. Weston Bourret in the *Journal of Economic Geology*, referring to the survey at Mingan, Quebec. Here the boundaries of the anorthosite were first established by widely spaced magnetic flights; then within the established boundaries, a precise and closely spaced survey was made, to locate all ilmenite deposits within the area. No other exploratory method would have given conclusive answers of this nature within a reasonable length of time.

So far this paper applies to a survey in which the pilot flew "contact". Over undifferentiated country or over water the use of the Sonne camera to record the flight path is impracticable. In such circumstances Shoran has been used to guide the aircraft. Recording Shoran co-ordinates continuously during the survey flights makes plotting the position of the aircraft a simple routine and provides the horizontal reference for the magnetic data.

In all magnetometer surveys it is necessary to evaluate the type of base map on which to plot the path that will serve most adequately and economically. In areas of low relief a carefully constructed photographic index will suffice for most mineral surveys, where only relative and not geographic orientations are needed. On the other hand, in oil prospecting surveys the areas covered are large and the anomalies broad, so the mapping must be of a higher order of accuracy.

This can be illustrated by describing the routine of producing an oil survey. A 16,000,000-acre area near Peace River, Alberta, will serve as an example. In this survey small inflections on the magnetometer profile are important. Inconsistent and erroneous horizontal positions can create spurious anomalies of the order of these small inflections.

In this survey the area was photographed at one mile to the inch from 34,000 feet altitude. A slotted template radial control plot of this photography was then prepared. On this plot the positions for each fiducial recorded by the Sonne Camera were plotted, and then the profiles were fitted into their approximate positions. Thereafter, the same routine as described for mineral surveys was followed.

The utility of such maps in oil prospecting can be described by quoting from L. L. Nettleton, who is a recognized authority in magnetic interpretation: "As a first look at broad areas, its most useful result may be in showing the general configuration of the basement, the location of synclinal axes and broad swells of the basement surface and the corresponding variations in the thickness of the sedimentary section. This, in turn, can indicate the probable drilling depth required to reach particular horizons in the section and possibly point to zones where pinch-outs, reefs or other irregularities may be more probable." Other useful information is also obtained.

Magnetometer surveys often promote the use of aerial photographs as an aid to prospecting and development. A by-product of these surveys may be a topographic map or a precise, controlled mosaic. Each serves the need for base maps for other work. Since the aerial magnetometer survey is not an end in itself, but rather a rapid reconnaissance tool, further ground exploration is always necessary, and by-product maps speed up such programmes.

Fig. 3. Airborne magnetometer in flight during a mining survey over the muskeg of eastern Canada. These surveys, which have helped to uncover important finds, are flown at an altitude of a few hundred feet. First such commercial survey ever made was flown in January, 1947, in the Province of Ontario, in spite of temperatures of 20 and 30 below.

An example of how the fields dovetail is the Allard Lake titanium survey, an ideal application of the airborne magnetometer. Since the results of the magnetic survey were positive, the aerial photographs taken incidental to the survey were also used to make a topographic map for a preliminary railway location. In another survey, the photographs for the magnetometer survey were compiled in precise, controlled mosaics on which were plotted the traverses and the stations for the subsequent gravity and seismic surveys. Thus the necessity of plane table work was eliminated. In addition, the photographs were used for photo-geologic interpretation.

Aerial mapping and this new geophysical exploration tool work hand in hand to speed the search for oil and mineral resources in the Dominion. More than 100,000 miles of traverse have been flown already, and the method is still growing in usefulness. √

Chemical Control of Vegetation

by

A. Brodie

A paper reprinted from the February 15, 1950, issue of "New Zealand Engineering".

Vegetation growth is a problem of major or minor concern to almost every engineer, and labour conditions have brought the problem into definition just when very effective and revolutionary means of chemical control have been discovered. This paper describes the latest developments and trends, in New Zealand. Costs given are, of course, for New Zealand; they would probably be lower in Canada.

Vegetable growth is to the local authority engineer an annoyance, to the railway engineer a problem, to the power authority engineer a hazard, and to the drainage engineer a nightmare. Soil conservation and forestry associations may be greatly embarrassed by the wrong kind of growth in the wrong place, and not even the harbour board engineer is altogether free of this worry, as endowed lands and undeveloped foreshores can and do breed noxious weeds.

The hoe, the axe, the sickle and the scythe now have limited value. High labour rates result in *rising* costs of $90 or so an acre for grubbing thick gorse, and the problem is then only partly solved, because regrowth is rapid and extensive. But 80 per cent to 100 per cent effective control of these pests can be obtained with a vast saving of manpower and at a *falling* overall cost of $25 to $35 an acre by chemical means.

Intermediate between hand and chemical treatment comes mechanical operation. Irrigation ditches are cleaned by a trenching machine, a drag-line or a grab, or by hauling a loop of heavy chain along the channel. In Australia two 120-hp. caterpillar tractors, joined by a 400 ft. steel cable, have been tearing swaths 250 ft. wide out of scrub. In the South Island, the New Zealand Railways use drags to work the ballast on the track and so smother the growth of vegetation. In Tanganyika a fleet of bulldozers, rooters and tractors is clearing the jungle itself.

An older method than these is that of fire, which is often efficacious but also hazardous. Science has developed a good system in the flamethrower whereby controlled burning can clean off the weeds between row crops for the farmer—or for the engineer, the growth on the railway permanent way and the vegetation on the banks of irrigation and drainage channels. In the main, however, the flame is a retardant only, and, if growth is rank, has to be used twice—the first time to dry off the vegetation, the second to burn off.

The danger from lush growth surrounding oil installations and the like is most effectively removed by yet another method, that of establishing lawns, or else pasture cropped by tethered sheep.

The chemical control of vegetation is by no means new. The Romans gave the final seal to the fate of Carthage by a simple and effective sterilization of the soil through sprinkling a liberal dose of common salt over the site. This would call for 4 to 8 tons of salt to the acre. The genesis of chemical control, however, really belongs to the year 1899, when Jones and Orton studied the application of sodium chloride, copper sulphate, several of the arsenicals, and other salts. Soon sodium arsenite was the standard weed-killer in Europe and America, particularly for railway work. The succeeding years showed unspectacular progress until the efficacy of sodium chlorate, borax and carbon bisulphide as plant-killers was discovered. Continued desultory development revealed a limited use for petroleum oils, coal-tar distillates and other products.

In the 1930's some research was under way in England and America on plant hormones. These are organic chemicals generated in very minute quantities in the plants themselves, and were first noted in 1905 by an English scientist, Starling. Their present name is derived from a Greek word meaning "that which stimulates". Before the last war some of the hormones were isolated, analysed and then synthesized. Later Britain and America pooled their knowledge, and the U.S.A. carried out intense research on hormones as another possible war weapon. It was known that the metabolism of plants could be disrupted by unbalanced dosages of these hormones in a way not dissimilar to the effects of erratic glandular secretions in the animal world, though scientists do not yet know precisely how these important chemicals operate in either flora or fauna. But the effects can be truly astonishing. The merest trace of one type of hormone will give an impetus to the growth of seeds, seedlings and cuttings. Another hormone will set fruit and give seedless tomatoes. Others prevent potatoes from shrivelling or sprouting, stop pre-harvest drop of tree fruits, or regulate the growth and ripening of pineapples at will so that the canning season can extend over six months instead of three. Hence the name "growth regulators" sometimes used. From chemical curiosities in 1944 these hormones had risen by 1948 to astounding fame and have given an impetus to biochemical research that will without doubt show spectacular results within the next few years.

The two plant hormones of interest to engineers are 2, 4-D (2, 4-dichlorophenoxyacetic acid) and 2, 4, 5-T (2, 4, 5-trichlorophenoxyacetic acid). These are less benevolent than those hormones mentioned above except when used with care and exactitude. For instance, one part in a million will kill a tomato plant in active growth. Herein lay their war potential. A sufficient dose at the right time is capable of dealing destruction to almost any crop, be it grain or vegetable, let alone most fruit and ornamental trees and flowers. Their common virtue lies in the fact that different species of plant life show varying degrees of susceptibility to these two hormones, and in the fact that extremely small quantities of liquid are needed for their application.

Most weeds, briars, scrub, bushes and many trees can be killed without detriment to the grasses, as the latter, owing to their thin, upright, waxy-surfaced leaves, are tolerant to these hormones to a fairly considerable degree. In this characteristic lies the supreme virtue to the highways engineers and the soil conservation engineer, but it is a drawback in the eyes of the railway maintenance staff, who specify a clean sweep of all vegetation on the permanent way.

Before discussing the many facets of these growth regulators, it is proposed to summarize briefly the whole useful range of chemical herbicides that have a place in the engineers' references. It should be noted that a combination of two or more of the following chemicals can be used, often with enhanced effect. The pattern of action suggests division into the following groups:

Soil sterilants.
Soil fumigants.
Contact herbicides.
Translocated herbicides: (a) Non-hormone-like; (b) hormone-like.

Soil Sterilants

Chlorates

The commonly-used sodium chlorate and certain proprietary products are similar in action, though the latter, owing to various additions, are slightly less inflammable. Both have been used extensively for the control of noxious perennial weeds, and they are good for small patches where quick and complete eradication is desired and where soil sterility for one to three years is not objectionable.

Chlorates are usually applied in spray mixtures containing 1 to 2 lb. per gallon of water at the rate of 500 to 800 gal./acre, depending upon the density of the vegetation. The cost of material from \$55 to \$110 per acre.

Enough should always be applied to wet the plant thoroughly at or after full bloom for perennials, or when annuals are 2 in. to 3 in. high. A fan jet, not a cone type, should be used. In some cases material may also be used in the dry form with a mechanical spreader, in the spring. Approximately 675 to 1,000 lb. per acre are used. Usually more than one, sometimes as many as three, applications are required before complete control of deep-rooted perennials is obtained.

Chlorate materials are corrosive to spraying equipment, and should be applied in large gallonages of water, at pressures ranging from 50 to 150 lb./sq. in. Chlorates form highly inflammable combinations with organic matter and are toxic to livestock. They are mainly a by-product from surplus electrical energy, so the world supply tends to fluctuate independent of market demand. Several tragedies of recent years have raised rather considerable transport difficulties.

Ammate

Ammate (ammonium sulphamate) is used to control small patches of some resistant weeds, and for quick elimination of woody shrubs. It is especially adapted to areas where toxic materials such as sodium chlorate are likely to endanger roots of nearby plants. Applied as a spray or dry at 3 to 8 cwt. per acre, the material costs \$70 to \$160 per acre.

Ammate, dissolved in water at the rate of 1 lb./gal., should be applied at pressures of 50 to 100 lb./sq. in. if possible, the undesirable growth being thoroughly wetted. Usually two applications are necessary before complete control is accomplished. As a foliage spray, it is recommended for control of woody plants that are not affected, by 2, 4-D or 2, 4, 5-T, or that are adjacent to sensitive crops.

The material has also proved successful for killing tree stumps and in the elimination of sprouts. It is sprayed or applied dry on freshly-cut stumps at the rate of approximately 1 oz. per inch of tree diameter. Used in this way, it inhibits the growth of sprouts and aids to some extent in rotting out the stumps.

It is showing some promise as a control for perennial grasses.

Ammate is corrosive, and, after using it, sprayers should be thoroughly washed. It is non-toxic and non-inflammable.

Borax

Borax is well adapted for the control of herbaceous weeds and grasses on areas round grain elevators, timberyards, oil installations, arsenals, warehouses, tele-

Fig. 1. A patho fc Californian thistle after spraying with hormone weedkiller. *D.S.I.R. Photo*

phone poles and in parking areas, tennis courts and driveways. The material is used mostly in the dry form, but can be sprayed. It is applied by a fertilizer spreader at the rate of 2,300 to 3,400 lb. per acre, costing $80 to $110 per acre for material.

Borax is recommended for the elimination of difficult perennials, but its use on crop land will be limited because the ground usually becomes sterile for some years after such heavy applications. On non-crop land, soil sterility may be desirable. It is not considered poisonous, is non-inflammable and is non-corrosive to ferrous metal.

Arsenicals

Those in most common use, sodium arsenite, arsenic trioxide and arsenic pentoxide, are water-soluble and are usually sprayed at the rate of 1,100 to 2,200 lb. of the chemical per acre, costing $90 to $180 per acre for material. The spray mixture is applied at 100 to 200 gal./acre. Leaching by rain removes soluble arsenic from the soil rather rapidly, so for maximum effect these chemicals should be applied during dry periods. Soil texture naturally affects the degree of leaching, so must also be considered in determining the dosage required. From one year to five years' sterility of the soil results, but, as they are highly toxic to man and beast, the use of arsenicals is very limited by safety considerations.

Coal-gas Tar Distillates

Coal-gas distillates and cut-back residues at 60 to 100 gal./acre can be very effective, but are costly, dirty, and constitute a fire risk on street walks and roadsides. A lighted match dropped on sprayed vegetation has been known to set off a blaze.

Soil Fumigants

The three main soil fumigants are (a) carbon bisulphide, (b) chloropicrin, (c) prochlor, which are used by placing 2 fluid oz. in holes 18 in. apart and 6 in. to 8 in. deep. At 1,100 lb. per acre, materials cost $90 to $225 per acre. They have been used for the control of deep-rooted weeds on land of high value and are mentioned in this paper merely as being indicative of an unusual direction of attack upon vegetable growth.

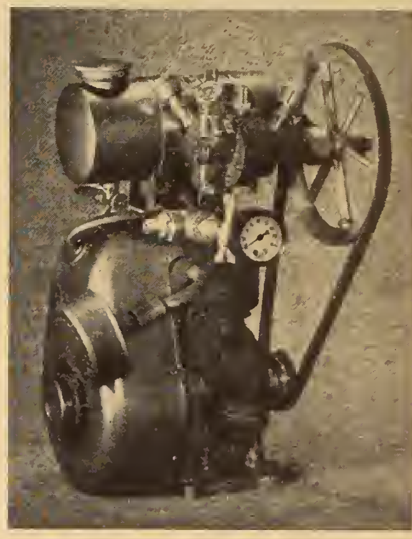

Fig. 2. Compact engine and pulp assembly. The pump has a built-in pressure relief valve.

Contact Herbicides

Dinitro Compounds

The most effective of these to date is ammonium dinitro-ortho-secondary-butylphenol when applied in oil or oil-and-water emulsion, using one or two gallons of the active ingredient per acre. The cost of materials ranges from $10 to $25 per acre. It is useful for the reduction of vegetation or "chemical mowing", so finds a place in giving quick temporary elimination of grassy and broad-leafed weed growth along highway ditches, railroads and fence rows where mechanical mowing is impractical. The chemicals can be poisonous to stock and to humans, and stain clothing and skin seriously, but are not corrosive to the usual metals.

Chlorinated Phenols

Pentachlorophenol and other chlorinated phenols are sprayed with an oil carrier at 20 to 40 lb. of the active ingredient per acre for destruction of above-ground growth. The total volume of spray liquid will usually be 50 to 150 gal./acre according to density of vegetation. As with all contact herbicides, any unwanted foliage must be covered completely, leaving no above-ground growing point to develop again. Cost of materials is $10 to $35 per acre. The phenols can be poisonous taken internally in quantity, can irritate eyes and skin, but are not corrosive.

Translocated Herbicides

(A) Non-Hormone-like

Trichloroacetic Acid (T.C.A.) — This is sprayed to control certain grasses and prickly pear cactus at a rate of 10 to 100 lb./acre, and costs about $25 up to $180 per acre for materials. The lesser dosage will retard or stop grass growth without killing, and is therefore used instead of mechanical or hand mowing to maintain vision of signs and guard rails on highways. Moist conditions are required to transmit it to the roots, and results vary according to the types of grasses. Soil sterility lasts 60 days or so, depending on rainfall. Cost of materials may be expected to fall on entering large-scale production. It is non-toxic and non-corrosive.

IPC.—This material, known chemically as isopropyl-n-phenyl carbamate, is one of the newer weed-killing chemicals which are promising but which are still in the experimental stages. It has given results in tests conducted for the control of perennial grasses, and at present should be used only for experimental treatments. It is sprayed at 4 to 10 lb. with 50 to 100 gal.

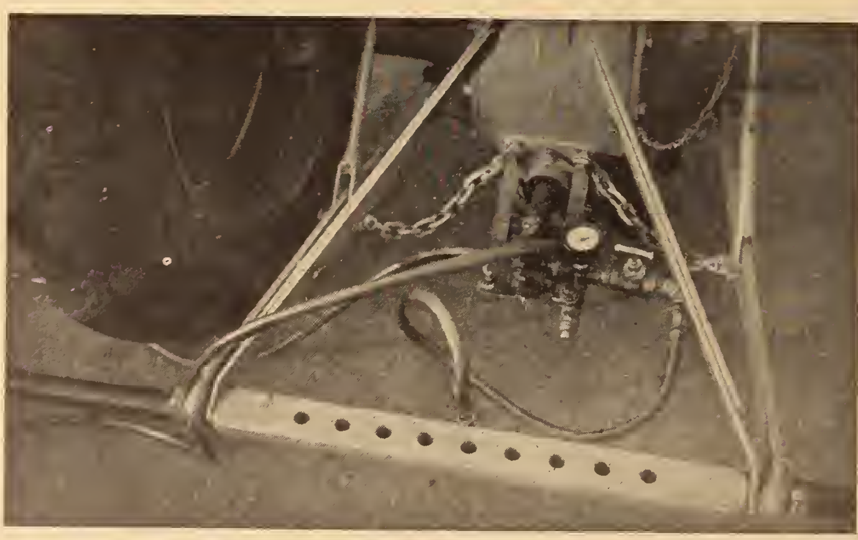

Fig. 3. Tractor power take-off unit.

of diesel oil to the acre. Cost of material is $35 to $70 per acre.

(B) *Hormones or Growth Regulators*

These products are now obtainable almost entirely from sterling sources and are neither poisonous, inflammable nor corrosive.

2-Methyl-4-Chlorophenoxyacetic Acid (M.C.P.A.).—This hormone is comparable with the sodium salt form of 2,4-D in its effect, and has its place in crop and pasture treatment. However, the engineer will be primarily interested in the esters of 2,4-D and 2,4,5-T discussed next. It has not yet proved possible to produce a workable formulation of an M.C.P.A. ester.

2,4-Dichlorophenoxyacetic Acid (2,4-D).—Spraying or dusting 2,4-D at 3 oz. to 4 lb. of acid per acre costs $1 to $4 per acre for materials.

If properly applied, the 2,4-D or its stimulus is translocated through the entire system of susceptible plants, thereby ensuring death of the complete specimens. There are three main groups commonly used.

(a) *Sodium Salts* (Powder forms).—The salt forms include the sodium salt of 2,4-D. This powder is easily transported and stored. Concentrations of 2,4-D acid up to 97 per cent are on the market. The mono-hydrate salt forms are completely water-soluble, mix with all types of water, but are not yet readily available in this country. These salts are excellent forms of 2,4-D for easy-to-kill weeds, especially for lawns, parks and cemeteries because of their stability. Consequently, they are the safest to use where desirable vegetation such as flowers and ornamentals are likely to be injured by spray fumes.

The main disadvantage of the 2,4-D sodium salts is that they are completely water-soluble, so that rain which falls within a short time following application tends to make them less effective. Judicious spraying with increased dosages and the addition of wetting agents make the salt forms more effective.

(b) *Amine Salts* (Liquids).—There are several forms of amine salts of 2,4-D. The basic acid is in this case dissolved in an organic alkali and makes a liquid concentrate. The amine salts of 2,4-D are water-soluble, making a clear solution. They are quite stable and are best for easy-to-kill weeds. Since these forms also are non-volatile, they are well adopted for spraying in lawns, parks, cemeteries, etc.

Occasionally when used in extremely hard water, especially in concentrated forms, some clogging of the nozzles can occur, owing to calcium and iron precipitates. The compounds are being improved by the addition of sequestring agents, so that this condition will not be troublesome in the future.

There are some disadvantages in the amine forms. They are not quite as effective on old or semi-resistant weeds as are the esters. On the other hand, they are not quite as harmful to the plants among which many weeds grow. Being water-soluble, they should be applied when spraying conditions are favourable, so that the material is not washed off by rain. In this respect they are less affected than are the sodium salts.

(c) *Esters* (Liquids).—The esters of 2,4-D, sometimes referred to as the oil-based forms of 2,4-D, will usually prove the most effective of these weapons for the engineer. The esters are made by combining 2,4-D acid with methyl, ethyl, isopropyl, butyl and amyl alcohol.

They are recommended specially for the control of weeds along roadsides, ditch banks, fence rows, railroad embankments and pastures where the primary under-cover is grass.

The esters have given better control than the other forms on deep-rooted perennial weeds, on harder-to-kill weeds, and on woody growth. Experimental work has not progressed far enough to show outstanding difference between the various esters.

Fig. 4. Spray machine and 17-ft. 10-in. articulated boom.

As a group, the ester forms are much more effective than are either the salt or amine forms in midsummer and midwinter. They make emulsions in combinations with water, or mix with oils and penetrate the leaves quickly, and so are not washed off to any great extent by rain. Since they are the most potent of the 2,4-D compounds, much smaller quantities are needed. This very often makes them one of the cheapest forms of 2, 4-D to use.

The chief disadvantage of the ester forms is that more damage will result from over-dosage than when either the amines or salts are used. Sometimes, when extensive or careless spraying is carried out, drifting fumes will injure desirable plants such as tomatoes and legumes of various kinds at some distance from the spraying site.

2,4,5-Trichlorophenoxyacetic Acid (2,4,5-T).—This acid is a very valuable adjunct to 2,4-D. It also is not harmful to grasses at moderate dosages, but will control some growth that is resistant to 2,4-D. It appears from recent tests that brambles, including blackberry, are susceptible and that 80 per cent to 100 per cent control can be obtained. In this case it is most important that the stems be treated rather than the leaves. Older bushes lend themselves best to attack either by high-pressure high-volume spray application to drive past the leaves on to the stems from above, or low-volume medium-pressure internal application by special appliances—*e.g.*, the blackberry spear. Up to 1 gallon of the concentrate per acre, at a cost of about $17, is needed. The 2,4,5-T should be mixed with water for high-volume and with dieselene for medium-volume treatment. The cost of the material may be expected to fall as the scale of production rises.

Another effective treatment method is to mow the brambles, leaving stumps about 9 in. above ground level, and then to spray the freshly-cut surfaces and the stems right to the ground.

The time to treat uncut bushes is summer and autumn; stump treatment, according to overseas experience, is effective at any time.

When to Spray with 2,4-D and 2,4,5-T.

Generally speaking, vegetation is most susceptible to 2,4-D when the plants are young and about 3 in. to 6 in. high. Late frost or a warm dry spring may harden off many young plants prematurely so that they are more difficult to kill with ordinary concentrations of 2,4-D.

If weeds in pasture, fence rows, ditchbanks and roadsides are sprayed when they are relatively young, considerable material can be conserved.

Perennial weeds should be sprayed not earlier than at the bud stage, and regrowth appearing from perennial roots should be sprayed again when rosettes are from 3 to 8 in. high. On annual weeds, one spraying is usually enough to kill all existing plants; on perennial weeds, several sprayings are usually required before complete control is accomplished. It has been proved that the most tenacious perennial can be exterminated by six-monthly spraying over a period of three years.

Brushwood should be allowed to leaf out completely before it is sprayed. If sprayed too soon, it is often merely defoliated and not killed.

Weeds and Their Reaction to 2,4-D and 2,4,5-T

The stage of growth at which weeds are sprayed is very important. Many weeds which are sensitive to 2,4-D in the seedling or early-growth stages become only moderately sensitive and some even semi-resistant as they become older. Older weeds, which have been hit by a late frost, weeds which have been growing under dry conditions, or weeds with a lot of dust on the leaves are usually harder to kill with 2,4-D than when they are growing fast and have plenty of moisture and nutrients available. Results may not be apparent even up to three months after treatment; the reaction can be very slow (particularly in winter), but none the less sure.

Application of 2,4-D and 2,4,5-T

For chlorates, arsenicals, ammate and others, high-gallonage application is still necessary—*i.e.*, 200 to 500 gal./acre. For 2,4-D as little as 2½ gal./acre can be used under most favourable conditions, though 8 gal./acre is a general recommended rate. In spraying, it is the 2,4-D which does the killing; the water is only the carrier. The same amount of 2,4-D in 100 gal. of water per acre or in 5 gal. will give equal results, but the concentrated spray saves water hauling, size of equipment and time. The acid equivalent or pounds of 2,4-D acid per gallon of mix is the measure of concentration both by manufacturers and users, whether of salts, amines or esters. It should be noted, however, that the relative effectiveness of these three forms of 2,4-D is roughly 100, 120, 160.

Application of 2,4-D can be made in two ways—as dust or as spray. There are many dust-spreading machines and hand appliances, but this form of treatment is not recommended except in back country because there is too much danger of material drifting to susceptible plants. Sprays will settle much more quickly, particularly the oil-based types.

Knapsack Sprayers

Knapsack sprayers are inexpensive, are easily handled and carried, and can be taken to inaccessible areas. They are excellent for small patches, and with concentrated sprays and low-volume nozzles, extensive areas can be covered with one fill of solution. With the low-volume nozzles, one disadvantage of an 8-gal. pressure-type sprayer, that of frequent re-pumping, is largely eliminated. There are sprayers on the market which can be carried and pumped at the same time, eliminating the need for putting down the sprayer to pump it up, but they are tiresome for continued use. The knapsack sprayer is inadequate for extensive areas, but it is useful for spot spraying, and for spraying in lawns, parks, cemeteries, along fence rows and round buildings.

Small Power Plants

Small power units, consisting of an engine and a pump, are easily made and transported. They can be carried in a pickup, sledge, trailer, tractor or truck along with the spray solution and booms or hand guns. Such units are relatively inexpensive and they save much time and labour in pumping.

The main disadvantage of the small portable unit is that a vehicle must be used for transportation while spraying. However, portable units are often more convenient than tractor-mounted units because they can very quickly be removed from the conveyance. These units can feed a number of hand appliances.

Tractor Attachment Units

The main advantage of a tractor attachment unit is that the tractor furnishes both power and transportation. Booms and hand guns are easily carried. With concentrated weed sprays such units—carrying from 50 to 100 gal. of solution on the tractor—are able to spray from 5 to 10 acres without refilling. For ease in moving, 15 to 20 ft. booms are usually best, although in level areas additional extensions to cover wider reaches may be advisable. Several hose lines with hand booms, wands or guns can be served from the pumps.

Turbine Blowers

Spray mix injected into the air stream from a turbo-blower gives a cloud of fine spray that can be directed into dense growth on public utility rights-of-way, on roadsides, on fire-breaks, or in forestry plantations. This is a quick and efficient method of application in locations clear of sensitive crops, shrubs and trees, but has the same drawback as dust applicators—*i.e.*, danger from wind drift.

Aircraft Units

Application by aircraft is a professional job to be done by experts, and has found favour in many areas because it saves so much time (60 to 100 acres treated per hour) and permits spraying when the ground cannot support heavy spray machines or the country is not readily accessible. Concentrated sprays are always used, preferably unified with oil.

Spraying must be done when air currents are relatively still. There is a great hazard to nearby crops, gardens, shrubs and trees because of drift and occasional failure of valves to cut off the spray mixture as the plane leaves the area. Application by aircraft should properly be restricted to locations where there is a minimum of sensitive crops in the vicinity, with ample allowance made for spray fumes and drift. Flag-men or smoke markers must be used to guide the plane when flying to and fro, and suitable landing places must be within handy reach of the working area. A helicopter is ideal for treating brushwood and willows, as the down draught from the propeller drives the spray in past the leaves.

Woody Growth

Second only to the control of annual and perennial weeds is the use of 2, 4-D and allied chemicals on woody growth. Extensive trials and fairly wide testing of the use of chemicals promise considerably lower costs as well as more permanent eradication than where scrub or tree growth is slashed or handled mechanically.

As with other plants, woody growth varies considerably in susceptibility to 2, 4-D. Most species of willows are very susceptible at all stages of growth. Poplar shows more resistance, especially as the tree increases in size; poplar saplings to a height of 4 ft., or thereabouts, are more susceptible than trees 12 to 20 ft. high. Most of the hardwoods—oak and ash especially — are classed as resistant; likewise some of the shrubs such as wild rose and brambles. These latter, however, succumb to 2, 4, 5-T.

While many excellent "kills" of willows, to a height of 20 to 40 ft., have been obtained with cover sprays, treatment at a much younger stage of growth is recommended. This holds especially for all less susceptible woody growth. Best results will follow treating woody growth up to three or four years of age. "Cut-over" land is best sprayed a year or two after cutting and while regrowth is still growing actively, and is sensitive to the action of the chemical. A solution of 2, 4-D ester (5 per cent or stronger) applied to the surfaces of stumps and canes will kill some trees and shrubs that are tolerant to foliage sprays.

Owing to the dense and large amount of leaf and stem surface to be covered when treating trees, considerably more water per acre is desirable than for ordinary weed spraying, and higher pressure facilitates penetration of dense foliage.

Three methods of applying sprays to woody growth are available. The boom sprayer, as used for flat lands, has not proved very satisfactory for woody growth, owing to limited coverage, varying heights of growth, the problem of obstructions met with along roads, etc. An adaptation of the boom rig, employing an extended flexible boom reaching well over the ditch or roadside, is in quite general use in Eastern Canada.

A power sprayer, employing two hose lines and equipped with four-nozzled hand booms, has given fairly satisfactory results on limited-sized jobs. For any considerable mileage this method will be found too slow and costly, as well as giving "patchy" results.

The turbine-type machine, using an air blast into which is fed the chemical solution, is particularly well adapted to treating roadways, ditches, power and telephone rights-of-way. A blast of spray can be directed upward, downward or parallel to the machine as desired, for a distance of 50 to 60 ft. The air blast will work away from or sideways to, but not directly into the wind.

When considering the turbine type of sprayer, two factors should not be overlooked — the rapidity with which the work can be covered and the cost of operation. Ten or more miles of roadway can be treated daily. Not including chemicals, the cost of application will be about $25 per day. It would seem advisable for two or more municipalities to co-operate in the purchase and operation of this type of machine. It is possible that contract sprayers may be ready to take on work of this kind, whereby a large overhead outlay could be avoided.

Approximately 1½ to 4 lb. of acid of 2, 4-D per acre are recommended for mixed woody growth. In the case of willows, satisfactory results have followed the use of lesser amounts. The addition of 5 per cent to 10 per cent diesel fuel oil to the spraying speeds the kill, and may result in more effective eradiction. The ester form of 2, 4-D is recommended. Preliminary trials indicate that the addition of equal parts of 2, 4-D and 2, 4, 5-T may be advisable where woody growth resistant to 2, 4-D is encountered. Gorse is a case in point. Trials show that, where leaves and foliage are completely covered with this spray, very good control may be expected. The problem of "old man" gorse is best handled by first burning off in the autumn, or, better still, felling and burning. The burning cracks the hard seed, which can remain fertile 50 years in the ground before germinating. The dense resultant regrowth in the following late summer is then readily treated. The cost of materials should not exceed $15 an acre. Adult standing gorse would require much greater quantities of liquid and it would be very difficult to ensure complete coverage of all stem and leaf surfaces. The dead stand of trunks would still have to be dealt with. If it were fired, the subsequent seedling growth would be intense.

Information on how late in the season woody growth can be treated is rather limited. In general, treatment may start any time after the trees and shrubs have leaved and while growth is rapid. Where it is desired to destroy weeds along with woody growth, it may be necessary to delay spraying until the weeds have started to grow.

Except under ideal conditions for treatment, complete coverage followed by 100 per cent "kills" can hardly be expected. Retreatment a year or two after initial application, whereby misses and re-growth are picked up, should assure nearly complete eradication of all growth susceptible to the chemical. Surface sowing of grass seed over treated areas will help to establish competition which will go far to prevent weed and tree re-establishment.

Not much information is available on cost of treating woody growth. The Manitoba Drainage Maintenance Board reported to the Second Western Canadian Weed Control Conference as follows:

"Woody plant growth in drainage channels and roadsides can be effectively and economically controlled by treatment with 2, 4-D formulations. Comparative costs of chemical and mechanical control are as follows: Chemical control, two applications, approximately $14 per acre — this includes cost of chemical. Mechanical control (men with brush hooks and axes) approximately $50 per acre. Chemical control, in addition to the saving in cost, is also more permanent, as it kills the roots of the plants."

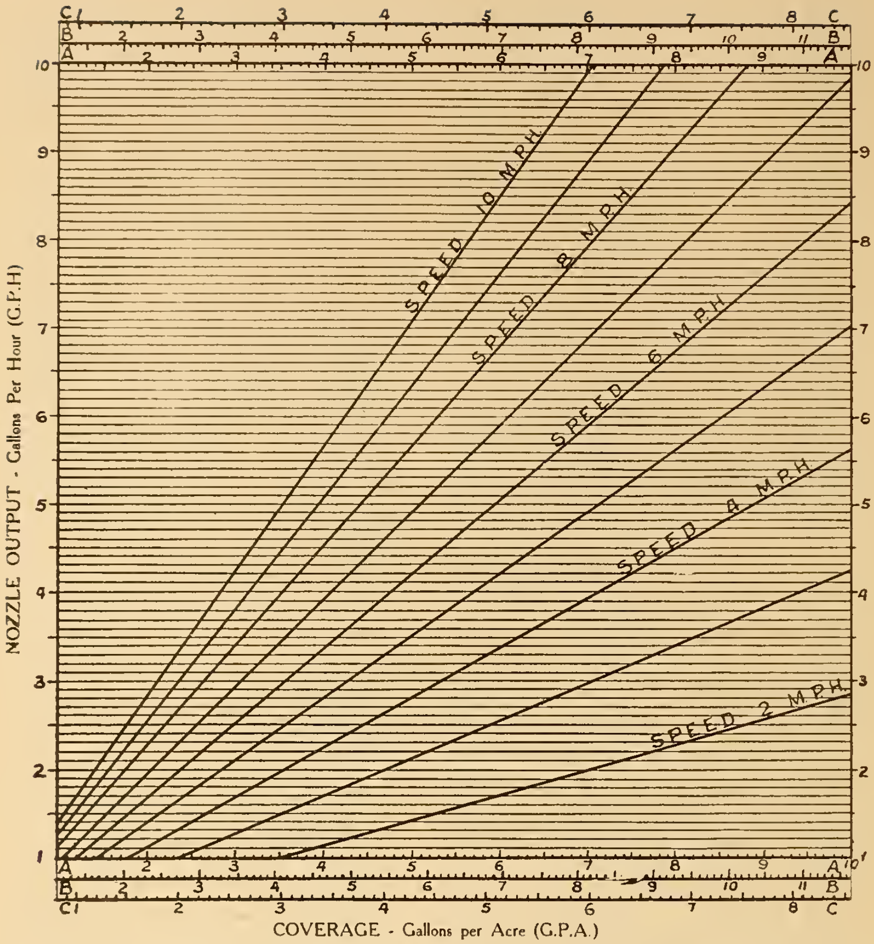

Fig. 5. Chart relating coverage and speed to nozzle output. Use scale A-A for 14-in. nozzle spacing, scale B-B for 12-in., and scale C-C for 16-in.

Engineering Applications

Engineers will find their own personal problem within one of the main categories given below. It should be remembered always that chemical weed control, particularly with the hormone-type products, is no slapdash simple operation. For best economy, careful experiments, research and records are vital and will pay handsome dividends. Concentrations, times of application and quantities of liquid should be varied, and the weather, temperature, humidity, soil type, rainfall before and after, and even time of day, should be noted. Not only the quantitative infestation of the dominant weed species and the results thereon, but also the same facts relating to incidental weeds, should be recorded. If such records are kept, in a year or two the engineer will have determined the minimum dosages and the best times and circumstances for optimum results under the particular conditions of soil and species in his own locality.

The Municipal Engineer

The chipping of grass and weeds along gutters, roadsides, kerbs and footpaths will soon be a thing of the past. The consequent loading and disposal of the spoil will no longer be needed and the dust nuisance will abate. T.C.A. and I.P.C. both hold promise of safe, economical control of grasses and weeds in the near future. At present, owing to the fire hazard allied to chlorates, the danger of arsenicals, and the staining of walls and apparel by tar products, the best solution is a mixture of 2, 4-D and pentachlorophenol in an aromatic oil base. This costs about $17 per acre for materials and will eliminate almost all low growth except some perennial grasses which are killed to the ground surface only. A spring and autumn application, however, will keep all growth well under control if applied at the rate of about 20 gal./acre. It should be applied to damp the whole surfaces of the growth, using a knapsack sprayer, a roller sprayer, or a power-operated hand wand.

A knapsack sprayer with low-volume nozzle wand will control fennel and hemlock, using 2, 4-D, gorse using a brushkiller of 2, 4, 5-T plus 2, 4-D, blackberry using 2, 4, 5-T alone.

Roadside embankments and cuttings should be trimmed of bushy growth in the autumn then sprayed with brushkiller in the following summer. Parks, cemeteries, golf courses and sports grounds can be cleaned of most weeds by spraying with the roller sprayer or a power rig in the spring. Hospital, school and institution grounds can be similarly treated.

County and Highway Engineers

Noxious weeds, such as ragwort, should be spot-sprayed with 2, 4-D through a knapsack sprayer. Weed and brush can be controlled with a tanker truck mounting an articulated boom on one side together with two long hose leads for reaching inaccessible places. A turbo blower may be used when clear of crop lands; a bushkiller mixture (2, 4-D plus 2, 4, 5-T) is used. Tests so far show it advisable to spray blackberry with 2, 4, 5-T alone for economy. Grasses are not affected by normal dosages of these hormones. Treated areas should be sown and fertilized if necessary to establish a strong turf which will inhibit seedling growth of weeds.

Railways

Right-of-way treatment is similar to that for highways. Track treatment, however, seeks elimination of all weeds, and has in the past been done with chlorates or arsenicals. North American practice now favours 2, 4-D fortified with pentachlorophenol in dieselene at the rate of 16 gal./acre. This cuts down all vegetation on the permanent way, but will not eliminate certain grasses, on which T.C.A. is used where necessary. For economic use of the chemicals, the hoe should be used on erratic "old man" growth.

Plant investment, maintenance and operating costs of chemical treatment as against hand or mechanical control on the permanent ways of the New Zealand Railways are approximately in the ratio of two to three. The figures refer to the use of chlorates in high gallonage spraying. The application plant consists of an A.B. engine, crew accommodation carriage, materials wagon, mixing wagon, 6,000 gal. tank wagon, and finally the pump and spray wagon. Using chlorates, the 6,000 gal. of spray mix covers about 20 miles at a speed of 25 m.p.h. The chlorate at 1 lb./gal. costs $28 per mile at the new dollar exchange rate.

Experiments using the 2, 4-D mix with this spray train have proved that the 6,000-gal. tank will serve for 200 miles of track at the same speed of 25 m.p.h. with equal control at a cost for materials of under $17 per mile. It is possible that this low-volume treatment will permit the use of small district equipment giving more flexibility of application in keeping with local requirements.

Public Utility Rights-of-way

Noxious weed treatment is similar to the county and highways remedy. The bigger problem is to keep ground growth from threatening overhead lines or smothering above-ground pipe-lines, and to keep the routes clear for inspection, maintenance and repair patrols. The 2, 4-D plus 2, 4, 5-T brushkiller is now widely used for this abroad at about 100 gal. of spray per acre. Truck or tractor-mounted units operate in easy country using turbo blowers, spray guns or hand wands. Rough country calls for knapsack or helicopter application.

Catchment Boards

Willow control is the prime concern in this case. The action of 2, 4-D in killing right to the roots is nowhere more important than in the elimination of resprouting of treated willows. Various species show differing degrees of susceptibility. Foliage spray is economic for growth up to 8 to 10 ft. high. Old growth may be dealt with by painting freshly-cut stumps or by frilling (*i.e.*, cutting and opening back the bark to expose the cambium layer all round) and pouring in 2, 4-D concentrate. Intermediate growth is often handled by spray painting 2, 4-D concentrate in a 2-ft. band around the trunk just above ground level. Drilling a hole in the trunk or stump and pouring in concentrate is variable in its results. Spraying from aircraft has of late given very satisfactory results abroad.

Influences peculiar to each district require that each catchment board conduct a wide range of experiments itself if best economy and effects are to result.

Drainage Boards

Irrigation channels and waterways are now threatened in parts of this country with the deadly water hyacinth, for which 2,4-D is possibly the only answer, and a very ready one. It is reported non-toxic to fish in concentrations far greater than likely to be encountered in water-wheel control. Chlorinated benzenes and special emulsions of solvent naphthas have been very successfully used for the control of submerged aquatic weeds, so allowing for freer flow in the channel. These materials, however, are slightly toxic to fish.

Forestry

Firebreaks must be kept clear of rank vegetation, scrubland cleared for planting, competitive growth eradicated from amongst standing timber. In some cases even grasses must be eliminated from firebreaks. 2,4-D and 2,4,5-T in oil provide the best answer to date.

Soil Conservation

2,4-D and 2,4,5-T enable the eradication of undesirable growth without detriment to the establishment of a protective grass cover. An abandoned field in Norfolk, U.S.A., with an eight-year-old brush cover of elder, birch, willow, aspen, blueberry, maple and spirea was cut over in the autumn and the largest stumps painted immediately with esters of 2,4-D and 2,4,5-T. Subsequent sprouting foliage was sprayed in the spring and the field converted to semi-natural grassland in twelve months. The quantity and duration of re-spraying will relate directly to the amount of hard-to-kill species that may have been present in the original cover.

Low-volume Nozzles

Were it not for the development of delicately precise low-volume nozzles, hormone-type weedkillers would have doubtful virtue over older chemical treatment methods.

The primary function of a nozzle is to deliver a uniform coverage with minimum fogging on a plane area when working at a constant pressure and travelling at a constant speed. To this end, where multiple nozzles are used, each nozzle of a specified size or output must rate exactly as the others over the whole range of working pressures. This is where some years of painstaking research and the evolution of expensive machinery have at last attained a measure of perfection.

The first efforts were directed at the solid and the hollow cone. It is obvious that in translatory motion neither of these jet shapes can give uniform coverage. The solid cone in travelling concentrates too much spray mix in the central area; the hollow cone too much towards the outer edges. This led naturally to the more difficult manufacturing proposition, the fan-shaped jet.

Three methods are adopted in the production of the fan-type jet:

(1) Two impinging circular jets as in the fishtail gas burners.
(2) A circular jet deflected from a dead smooth inclined surface.
(3) Partial penetration into the sharp angle of a V-cut by a conical hole from the rear. This gives a lemniscate orifice.

No. 1 is the principle of the Bray gas jet. The fine orifices are too easily blocked and difficult to clean. The "spread" is too uneven. No. 2 is adopted by the Kromer Co. in U.S.A. and is not unsatisfactory. No. 3 is the most favoured method by the bigger nozzle manufacturers in the U.S.A.—*e.g.*, Spray Systems Co., Spray Engineering Co., and the Monarch Engineering Co. Earlier efforts were partially frustrated by a thick outer edge to the spray jet from the lemniscate orifice, but the above firms have now overcome this problem to a greater or lesser extent. The disadvantages of the products of the two first companies are:

(a) The feather edge of the orifice; this results in wear and alteration of capacity after a period of use.
(b) A multiplicity of parts to the nozzle, leading to possible losses in the field when clearing blockages, etc.

The Monarch Engineering Co. claim that their orifice is a thickened edge product 12 times that of the edges of other brands. There is one invaluable feature, namely, the one nozzle housing (body and cap) will accommodate any one of a whole range of interchangeable tips (low-volume fan, hollow cone, solid cone, and high-volume fan). It is this nozzle that finds widespread use in New Zealand, as tips alone may be imported and the housings manufactured locally, thereby eking out dollars.

The range of these Monarch interchangeable tips runs from as low as 0.84 gal./hr. output up to as high as 300 gal./hr.

To relate nozzle size, speed of travel and coverage in gallons per acre there is a simple handy graph illustrated in Fig. 5, page 186.

There are three methods of mounting nozzles on the spray boom so as to reduce loss of spray mixture after shutting off. (N.B.—It is not wise to attempt to screw a nozzle directly into a boom. The wall thickness of tubing is not sufficient to give enough threads to prevent leakage.)

(1) Insert and weld the nozzle holder well up into the boom tube.

(2) Use an inverted U to draw off from the top of the boom.

These two methods trap any loose scale or grit in the boom but limit drip only partially. They are of little effect in the latter respect on sloping ground.

(3) The best safeguard is to use a ball check valve in combination with (1). It is inserted above the nozzle and comprises a spring-loaded valve that automatically closes when the fluid pressure drops to 10 lb./sq. in. Its use is essential for aircraft spraying to prevent spray falling on sensitive crops, etc., when the plane is manoeuvring between working runs.

The Low-volume Fan Tip is generally to be preferred for weed control spray booms. It gives better penetration and less fogging than the cone type.

The Low-volume Hollow Cone Tip is preferred on hand wands by many users. It gives better atomization than the others.

The Solid Cone Tip is useful for spot spraying and for applying oil sprays. It is best for drenching work with hand appliances.

The High-gallonage Tip is useful for all purposes requiring the application of larger volumes of liquid.

Always check nozzle output with the pressure gauge readings on the machine and do not rely on makers' rated capacities. Rated capacities are based on water spraying, and the output with oils, for instance, will be different. Again, all pressure gauges are not always accurate. Re-check output occasionally according to severity of use. In time, wear on nozzle tips will increase output.

The orifice of these tips has a delicate edge so *do not use a needle* to free blockages. A toothpick or toothbrush is suggested.

Before operating a new machine in the field with hormone sprays, run the liquid through the system for, say, half an hour, collecting the spray in containers under each nozzle. This will free any dirt, grit, filings, etc., that may be in the system and so will eliminate stoppages in the field itself.

Clean tips after each day's use by boiling for half an hour in "Basol 88" obtainable from most dairy supply companies. Dust and oil can build up round the orifice and deform the shape of the jet.

Never lay the boom on the ground; store it in a clean place.

For users having a "Holland" or "Dragon" knapsack sprayer there are available special nozzle housings designed with all the interchangeable tip features and for direct fitment to the wands of these sprayers.

It has been found that humidity and plant and ground moisture as well as plant physiology play a part in determining the effectiveness of hormone sprays. This accounts for a large proportion of the failures on some occasions when applying spray mix at 2½ to 5 gal./acre. The other prime factor is time of day. Operations before noon will generally be good; in the afternoon, less so, particularly towards evening. Hence the recommendation for the general user is now to spray at not less than 8 gal./acre.

Some recommended tip sizes for various purposes are given above. Expert operators know under what conditions the following liquid rates can safely be reduced.

	Rate (gal./acre)	Monarch Fan Tip No.
Crop and Pasture Weeds...	8	32
Ragwort, not less than....	20	46
Dinitro Products, not less than	30	59
Gorse (with water)	80	67
Gorse (with dieselene)	30	59
Blackberry (with dieselene)	30	59
Blackberry (with water)...	80	67

For blackberry work it is most important to spray the stems rather than the leaves. To facilitate this a special blackberry spear has been developed. A triple nozzle head sprays a 180° fan, highly atomized and of 3 ft. radius. It is hoped that working at 40 lb./sq. in. pressure or more, less liquid and less concentrate will give control equal to that obtained by the higher rates listed above.

Finally, mention should be made of z.i.p., comprising a zinc organic complex in polyethylene polysulphide (p.e.p.s.), a new chemical which, applied to ground growth, or to trees, makes them repellant to destructive animals. Rabbits, opossums, deer or livestock will not touch grass, crops or trees so sprayed. The chemical is non-poisonous and the effect lasts up to three months, according to the rate of growth of the vegetation.

In conclusion, it must be remembered that these growth regulator compounds are not magic chemicals. There are still some shortcomings, disappointments and pleasant surprises in their behaviour. They are still very new and we really know very little about them. But they are in the process of revolutionizing the control of misplaced growth. Thanks to the chemist, the prophecy that man would ultimately succumb to the overpowering progress of weeds and insect pests is now confounded in the first as well as the second respect.

Contemporary Trends in Building Design in Europe

The headquarters library has recently received a number of illustrated brochures from the International Information Centre for the Building Industry (Bouwcentrum) at Rotterdam, Holland. A few representative examples have been reproduced on the facing page in response to suggestions that Canadian engineers are interested in what their contemporaries in other countries are doing.

The file which presently includes data sheets on 24 outstanding examples in European building practice may be obtained from the library under the usual loan conditions. For further information readers should write directly to Bouwcentrum, Diergaardesingel, Rotterdam, Holland.

FROM MONTH TO MONTH

Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

Manpower Controls

The creation by the Federal Government of the National Advisory Council on Manpower will be of interest to all Canadians. The terms of reference as reported in the press are very general, but it may be that the Council itself or the officials of the Department of Labour have more specific ideas as to what has to be done and how it is to be done. According to press and radio the Council is "to advise the government on how to make the best use of Canada's available labour resources in the face of the developing shortage of manpower, created by defence production and military requirements".

The Council is made up of four representatives of labour and four of employers, two each from agriculture, women and the veterans. The balance of fourteen comes from the government services. The joint chairmen are Arthur McNamara, Deputy Minister of Labour and Norman Robertson, clerk of the Privy Council.

It is reasonable to expect that the word manpower includes the professions, but the specific representatives of the group, other than for agriculture, are all officers of trade unions. There is no reference to the professions or the universities but agriculture is singled out to have two representatives. Likewise the veterans have two representatives although they cannot possibly represent any specific division of labour as far as occupation is concerned.

It is to be hoped that the professions are not to be neglected or that their interests are not to be delegated to the trade unions. In the professional groups the engineers and the scientists are going to be important and early consideration as to their disposal or control is essential if in an emergency the waste that was experienced in the last world war is to be avoided.

One of the four members representing employers is Albert Deschamps of Montreal, an engineer of distinction who many times has served his government in their need. Members of the profession will be well pleased with his selection, and perhaps his presence on the Council can be taken as some representation for them. Incidentally Mr. Deschamps is the Treasurer of the Institute.

There are three more engineers on the Council representing government services. These are Marc Boyer, M.E.I.C., Deputy Minister of Mines and Technical Surveys, Hugh Young, Deputy Minister of Resources and Development, and E. L. M. Burns, Deputy Minister of Veterans Affairs. Although the selection of these four gentlemen has been made without regard to their professional status, it is of some comfort to know they are there.

In the writer's opinion it would have been a better arrangement if the advisory group had been selected entirely from persons outside of government service. With over 50% of the Council membership chosen from and at the deputy minister's level, it seems a bit inconsistent that the terms of reference should say the Council "is to advise the government". In other words, this is to say that the government is to advise itself. If it is advice that is wanted it should be sought outside of government circles. Civil servants, even at the deputy minister level, are not ordinarily thought of as advisers to the government. They are the administrators who should be seeking outside advice to add to the knowledge that is theirs by virtue of their ministerial duties.

Including the joint chairmen the

Cover Picture

This month's cover photo shows a crew pouring steel ingots at Sorel Industries Limited, Sorel, Quebec.

At left is a laboratory observer carrying an optical pyrometer. Such men are all graduate metallurgists and their job is to check and record accurately every step in the operation of making steel so that at no time can there be any departure from specific procedures.

ouncil consists of 30 members, 16 f whom are in the government ervice. It does seem like an unsual arrangement.

The Institute has expressed its nterest and concern in this matter y means of a letter addressed to he Hon. Milton F. Gregg, Minister f Labour. Mr. Gregg replied romptly by telephone and exressed appreciation of the Instiute's interest but did not indicate hat any change in the make-up of he Council was contemplated.

At the regional meeting of the ouncil of the Institute held on ebruary 17th at Shawinigan alls, it was agreed that further onsideration of this matter would e assigned to the Committee on Professional Interest with power o act.

Herewith is the letter to the Minister:

Montreal, Feb. 6, 1951

The Hon. M. F. Gregg, v.c.,
Minister of Labour,
House of Commons,
Ottawa, Ont.

Dear Mr. Gregg:

The newspaper announcement of the creation of a National Advisory Board on Manpower is of more than usual interest to the officers of the Institute. It seems like a move in the right direction.

However there appears to be one serious omission in the representation. We can find nothing relating to technical manpower. It may be that this is included in the Civil Service representation but we feel that like labour, employers, agriculture, women and veterans this form of representation should come from outside of the Civil Service or the departmental representation.

We are confident that no one appreciates more than you do the vitally important part which must be played in the ominous future by engineers and scientists. Perhaps it is the most essential group in the whole combination of helpful forces. It seems to us that the Advisory Council should have a clear representation for this group.

Personally I feel that an Advisory Council would be most effective if it were made up entirely of representatives outside of government, with representatives of certain governmental departments designated as assistants or aids to the Council.

It may not be possible at this late date to rearrange the Council even though favourable consideration were given to this proposal and therefore we urge that immediate attention be given to having adequate representation on the Council for engineers and scientists.

Yours sincerely,

(Signed) L. Austin Wright,
General Secretary

The Tariff on Engineers' Plans

Back in June, 1946, the Federal Government by means of Tariff Item 180e removed the tariff on several classifications of engineers' plans. In response to the urgent request of several members, the Institute protested this action both promptly and emphatically. There was a long exchange of telegrams and letters with the Minister of Finance but no real action took place until January 30th, 1951. On this date the Tariff Board held a public hearing at Ottawa to consider the method of valuing plans for customs purposes, and to hear argument for or against the 1946 changes.

The Institute's Committee on Professional Interests prepared a brief, and presented it at the hearing. It is impossible to know what the Board's recommendation will be, at least not for some weeks, and perhaps not then. However, the hearing was an interesting affair, and presented a good picture of democracy at work. It is too bad that it had not taken place before the tariff was removed in 1946.

On frequent occasions the *Journal* has reported on this matter. All the arguments in favour of at least a partial restoration have been given. It has been discussed with the executives of all the branches and talked over at great length with officers and members who had a particular interest in it. Therefore it is hardly necessary to review it in detail again, but it is believed by the committee that the brief itself should be presented to the membership—and so it appears herewith.

At the hearing certain points were raised, upon which the Institue was asked for an expression of opinion. These points were covered verbally before the Board and were confirmed later in writing. The letter covering these points also is presented herewith.

It is interesting to observe at this late date that the block of industry (at least 30 companies) which opposed the Institute's stand before the Board, seemed not to have a clear picture of what the Institute was asking for. Even after the brief had been presented, some company representatives failed to recognize that the Institute's plea was indeed reasonable, and not harmful to them.

It is the opinion of many who are familiar with it, that if the proposal had been discussed back in 1946 as it was in 1951 there would have been no difference of opinion at all. Industry has a good case and the Institute admits it, but 180e went too far—even beyond what certain industries had requested. All this would have come to light at that time and much misunderstanding been avoided, if the government had consulted the engineers as well as the industries concerned, back in 1946.

It is the Institute's hope, now that everything had been brought out in the open, that the interested industries will no longer think that the engineers were unreasonable or thoughtless of the welfare of Canada.

Another pleasing feature of the whole experience was that it afforded several engineering organizations an opportunity to demonstrate their ability to get together on a matter of common concern. The Institute was pleased to be so closely associated with the Corporation of Professional Engineers of Quebec and the Canadian Construction Association, and with other provincial associations which had taken an interest in the subject.

Herewith are the documents presented by the Institute to the Board:-

January 29, 1951.

The Tariff Board—Canada,
Connaught Building,
Ottawa, Ontario.

Reference No. 111

Gentlemen:-

The Engineering Institute of Canada appreciates this opportunity to present to the Tariff Board its views on tariff items 180 and

180e, by which last mentioned item the tariff on certain types of plans or designs produced by engineers, was removed in 1946.

In order to better understand the Institute's wide interest in this question, may we present the following information. The Institute was established in 1887. It operates through thirty-three branches spreading from St. John's, N'fld. to Victoria, B.C. Its membership of over 14,500 is made up of professional engineers and students of all branches of the profession such as mechanical, electrical, civil, chemical, mining and so on. It has a broad interest in the affairs of the profession and of Canada.

In asking for the restoration of this tariff in certain cases and a change in the basis of evaluation, the Institute is acting in the interests of the profession, but believes that the best interests of other groups as well, will be provided for, if the recommended changes are made. These groups include general contractors, manufacturers and architects. In studying the problem the Institute has been in close collaboration with the Canadian Construction Association and the provincial associations of professional engineers; particularly the Corporation of Professional Engineers of Quebec.

In the four and a half years during which the matter has been before the Council of the Institute, it has been discussed with every branch from coast to coast. There has been an unanimous support for the proposals which the Institute now proposes to make.

In order to have a further and final consultation with members, the Committee on Professional Interests to which Council has referred this matter called a meeting on Thursday, January 25th at the Headquarters of the Institute in Montreal to which were invited representatives from a wide variety of interests including consulting engineers, general contractors, industry, professional organizations and the Canadian Manufacturers Association. Tariff Item 180e was discussed in considerable detail and from many aspects. Eventually a completely unanimous conclusion was reached which conclusion forms the basis of the Institute's proposal with regard to this Item.

There are several strong arguments to support the proposal, but it is believed they can be better appreciated by the Board if the proposal itself is presented at this point. In this way there can be no confusion or ambiguity as to the purposes of the proposal or the logic of the arguments.

The Institute proposes—

> That Tariff Item 180e be revised by deleting the word "Plant" which is the 9th word in the first sentence, and substituting therefor the word "production", so that the sentence will read "Engineers' plans, drawings or blue-prints of machines and production equipment"; all words after "equipment" to be deleted.

The specific arguments to support this proposal are—

As presently written 180e includes on the free list many types of engineering work which are now a commonplace to Canadian engineers, such as "plant layouts, foundations, structural supports, dams, spillways and other hydro construction". The Institute feels there should be a tariff on drawings for such work, in order to suggest to Canadian organizations that Canadians are competent to do it, and to discourage the habit of going outside of Canada for such services.

The present wording is not clear. "Wiring piping, platforms, ladders, stairs, etc." seem too trival to be included separately in a tariff item. The Institute contends that normally such things may be associated with or attached to machines. In such cases they are actually a part of the machine or equipment and thus would be exempt from duty, as is the machine.

It is recognized that a tariff encourages foreign industry to erect plants in Canada for the Canadian market. Isn't it reasonable therefore to expect that similarly foreign engineering firms can be encouraged to establish their "plants" in Canada? The Institute argues not only that the tariff should be restored in many instances where it has been removed but that the rate should be high enough to make it worth while for a foreign engineering firm to open a designing office here. Therefore—

> The Institute proposes that the valuation of plans under Tariff Item 180 should be based on 3% of the cost instead of the present 1% as described in the Appraisers' Bulletin of June 20, 1939. This adjustment would make the tariff more effective and at the same time would eliminate the inconsistency of the present practice, whereby architects' plans are valued on the 3% basis and have been so valued for many years.

The Institute's interest in the tariff comes from the conviction that as far as possible Canadian work should be done by Canadian engineers. It is admitted that in some instances of a highly specialized nature it may be advantageous to consult firms outside of Canada, but in most cases Canadian firms are as competent or more competent than firms anywhere else in the world to do Canadian work. The Institute's study indicates that many orders are placed elsewhere, simply because some Canadians who employ such services are ignorant of Canadian engineers' competence and accomplishments. It seems unfair and unwise to encourage this unnecessary employment of foreign firms by making tariff concessions.

It is natural that American engineering firms should specify American made equipment (as they do) because they are familiar with it. For the same reason they are likely to use in their designs of structures to be built in Canada, materials, parts and standards not used, not suitable or not obtainable in Canada. This creates delays and unnecessary expense for the Canadian customer. Also there are noteworthy examples of American engineers designing types of equipment, plant layouts and foundations that are not suitable to Canadian weather, temperatures and other conditions.

In those instances where Canadian firms or government agencies feel that the specialized knowledge of some one foreign firm is essential to them, it is contended that such specialists should work through a Canadian associate. In this way a Canadian staff of engineers will be employed on the designing instead of Americans.

As an alternative it is contended that the American specialist should establish his own office in Canada to do Canadian work. Thus Canadians will become familiar with the highly specialized fields, without the necessity of moving across the border to do so. It seems only fair and reasonable that the money arned in Canada should in large ieasure be spent in Canada. The ffices referred to in this paragraph re much different from the sales ffices now being operated here by everal American firms.

Another evil that follows the invasion of the Canadian engineerng field by Americans is that freuently American contracting firms re given the contracts for the vork because—

a—They are subsidiaries or associated companies.

b—The engineering firm has established the "habit" of using a certain contracting firm or firms.

Canada is fortunate in having nany large and highly competent ontracting companies who can do practically all the work required in Canada. They should not be exluded from their own natural field by the employment of American ngineering firms to do the work of design.

There are many actual cases on ile with the Institute that prove he accuracy and the common sense of the agreements advanced in this presentation. Most of them have been submitted previously to the Minister of Finance but if the Board desires copies for its records he Institute will be pleased to upply them. They prove that in nost instances there was no need of employing foreign engineers, and hat in several instances better reults could have been obtained if Canadians had been engaged. Under these circumstances it is obvious there will be no hardship for Canadian users of engineering services, if a modest tariff is applied —or restored—to discourage the iabit of engaging the engineering irms of other countries.

The Institute urges that the proposed changes be instituted as quickly as possible, in order to bring to an end the injurious effects on the engineers of the present procedure.

All of which is submitted.

R. E. Heartz, M.E.I.C,,
Vice-President.

J. B. Stirling, M.E.I.C.,
Chairman of
Committee on Professional
Interests.

L. Austin Wright, M.E.I.C.,
General Secretary.

2050 Mansfield Street,
Montreal, January 29th, 1951.

The Tariff Board of Canada,
Ottawa, Ont.

Re: Item 180 and 180e

Gentlemen:-

May we have the privilege of placing before the Board in writing certain items which were discussed during the recent hearing, but which are not covered by our brief?

In the first place we would like to refer to the method of valuation for engineers' plans. You will recall that this was discussed in some detail before the Board last week. Our position is that we are satisfied with the present *system* as long as the *rate* is set at 3% instead of the present 1%.

Judging from the terms of reference, it appears that the Minister is interested in investigating the present method in order to determine if a better method can be devised. With this in mind we have proposed that the valuation of engineers' plans for customs purposes be based on the actual fair market value of the plans themselves rather than on the estimated cost of the finished structure, as is done at present.

To us this seems like a much simpler method inasmuch as it takes care of all the variables that enter into the present method. Also it would render unnecessary any checking of the finished structure which is necessary now, to compare the estimated cost with the actual cost.

From the observations of the Board members, made at the recent hearing, it appears that if Section 35 (1) of the Act is administered as it is written, the basis of valuation will be precisely that which we have proposed. In those cases (if there are any) in which the fair market value cannot be determined and section 35 (2 or 3) are resorted to, we request that the basis of valuation as described in the Appraisers Bulletin (Miscellaneous No. 6—Revised) be changed from 1% to 3%. This latter figure approximates the actual cost (the engineers' charges) much more closely than does the former.

Secondly, you will recall that representatives of Canadian Industries Limited asked that process layouts be added to the list of duty-free plans which we had described in our brief. To this we agree fully. Thus the final proposal of wording for duty-free plans would be:

"Engineers' plans, drawings or blue-prints of machines, production equipment and process layouts".

We are grateful to you for this opportunity to expand our previous presentation.

Yours sincerely,

L. Austin Wright, M.E.I.C.,
General Secretary.

Thanks, Dr. Cleveland

Members of the Institute who know or have heard of Past-President Dr. E. A. Cleveland of Vancouver will agree heartily with the sentiment of the following editorial which appeared in the Vancouver Province on February 2, 1951:-

"For years, whenever local municipalities have talked about amalgamating any of their activities, they have remarked on the outstanding success of one such merger—Greater Vancouver Water Board and Vancouver and District Sewerage and Drainage Board.

"Those boards are held up as models of what can be accomplished by municipal co-operation. And by common consent the credit is given to Dr. E. A. Cleveland, LL.D., M.E.I.C., chief commissioner of the Water Board and chairman of the Sewerage Board.

"This week Dr. Cleveland marks his 25th anniversary as chief commissioner of the Water Board. For 25 years his tact, diplomacy, integrity, force of character and engineering skill have served the cities and municipalities that belong to the board.

"It is no accident that during Dr. Cleveland's quarter-century the water services of those cities and municipalities have been administered with the minimum of friction and a maximum of efficiency. They have been directed by a firm hand.

"Dr. Cleveland has kept above politics and petty squabbles and has adroitly discouraged both on his boards. As an engineer, as an administrator and as a public servant he has set a great example of service.

"A self-sacrificing man, Dr. Cleveland has always preferred to remain in the background. After 25 years we Vancouverites want to record our appreciation and our thanks."

Engineers and Automobiles

It is interesting to note that an automobile insurance company doing business both in the United States and Canada recently released particulars of an extensive survey of its experience with all forms of automobile insurance.

The figures indicated that engineers stood seventh in order of excellence as automobile insurance risks.

In the list of sixty-four different categories of automobile users commissioned military personnel stood twenty-sixth, doctors thirty-second, and the legal profession fifty-first.

Pre-stressed Concrete Committee

The Institute is advised that the Institution of Civil Engineers has recently established a pre-stressed concrete development committee to co-ordinate research work leading to a basis of assessing the ultimate strength of pre-stressed concrete.

A rational approach to the assessment of ultimate strength has been put forward by Prof. A. L. L. Baker in the Institution of Civil Engineers Structural and Building Engineering paper No. 26 entitled "Recent Research in Reinforced Concrete and its Application to Design". The method is basically dependent on the knowledge of the stress-strain characteristics of the concrete and steel used and the limiting strains at failure of a beam. It is desirable that, in any future tests, measurements of strain should be made, so that the validity of Professor Baker's method may be checked.

The committee hopes to co-ordinate test work on beams and obtain the data required to verify Prof. Baker's method.

N.S. Association and Halifax Branch Hold Joint Annual Meeting

Some 300 engineers from Halifax and various centres in Nova Scotia attended the joint annual meeting of the Halifax Branch of the E.I.C. and Association of Professional Engineers of Nova Scotia on January 30th last. The meeting took the form of a banquet in the main ballroom of the Lord Nelson Hotel.

Joint chairmen were A. R. Harrington, chairman of the Halifax Branch and J. D. Fraser, president of the Association. The principal speaker was Air Vice-Marshal C. R. Slemon, Air Officer Commanding R.C.A.F. Training Command, Trenton, Ont.

Among the guests at head table were:- Mr. Harrington, Mr. Fraser, I. P. Macnab, president-elect of the Institute; Angus Macdonald, Premier, and Hon. J. A. D. McCurdy, Lieut.-Governor of Nova Scotia; Mayor G. S. Kinley of Halifax, Air Vice-Marshal Slemon; AV/M R. C. Gordon, A.O.C. Maritime Group R.C.A.F.; Dr. A. E. Cameron, president, Nova Scotia Technical College; Brigadier E. C. Plow, General Officer Commanding, Eastern Command.

The following new members of the Association executive were elected at the meeting: president, J. Douglas Fraser, M.E.I.C., Halifax; vice-president, Dr. D. J. MacNeil, M.E.I.C., Antigonish; councillors, Wm. A. Devereaux, M.E.I.C., Halifax; Dr. M. Roy Foran, M.E.I.C., Halifax; Clyde Cameron, M.E.I.C., New Glasgow; and R. P. Nicholson, M.E.I.C., Stellarton.

Ontario Association Honours General McNaughton

Highlights of the annual meeting of the Ontario Association of Professional Engineers were the address by General A. G. L. McNaughton on the work of the International Joint Commission, and the presentation of the Association's gold medal to the General by Lt. Col. L. F. Grant, past-president of The Engineering Institute.

The medal, for "outstanding accomplishment to the nation", has been awarded only twice before — to the Honourable C. D. Howe, Minister of Trade and Commerce and Dr. C. R. Young, dean emeritus of applied science at the University of Toronto.

The photograph above was taken after the presentation ceremony. It includes (l. to r.) E. V. Buchanan, retiring president of the Association, Gen. McNaughton, Col. Grant, and W. H. M. Laughlin, incoming president of the Association.

Further Honours to E. V. Buchanan

Last month the *Journal* reported on the recognition by Ontario Hydro of the outstanding contribution of E. V. Buchanan as general manager of the Public Utilities Commission of London, Ontario. It was a complete surprise to Mr. Buchanan to be invited to participate in the inauguration of Hydro's great new transformer and frequency changer station at Pond Mills and to find that the station was to be named the E. V. Buchanan Station.

The most recent honour was entirely premeditated and Mr. Buchanan was given warning that he was to be the honour guest at a banquet in Port Stanley which would commemorate his 40 years of service as general manager of the London and Port Stanley Railway. Highlight of the festivities was the conferring on Mr. Buchanan of an honorary citizenship of the Town of Port Stanley. The accompanying photo was taken at the Stork Club at Port Stanley.

At the testimonial dinner for E. V. Buchanan, left to right, Ven. Archdeacon W. A. Townshend; Mayor Allan J. Rush; J. Bevan Hay, vice-chairman of the P.U.C.; Dr. J. J. Tallman, chief librarian, U.W.O.; R. W. D. Lewis, K.C., chairman of P.U.C.; Mr. Buchanan; George D. Y. Leacock, president, Maloney Electric Co., Toronto, guest speaker; Elmo W. Curtis, past chairman of the P.U.C.; Alex G. Calder, commissioner, P.U.C.; Vern McKillop, secretary, P.U.C

Engineering — Profession or Trade

From *Engineering News Record*, September, 1950.

"New light is cast on the old question as to whether engineering is a profession or trade by the U.S. Supreme Court's decision in a case relating to fees schedules set up by real estate boards.

Because real estate operators—like engineers—sell services rather than commodities, the first question before the court was whether supplying such services constituted a trade, as that term is used in the prohibitions against restraints on trade in the Sherman Act.

The Supreme Court concluded that it did constitute a trade. And in stating why it did, the court made observations that may be applicable to engineering services.

This decision of the Supreme Court also is of importance to engineers because it related to schedules of minimum fees that are set up by local real estate boards and which members are required to observe. The court found that the system under which the Washington Real Estate Board issued its schedule constituted a violation of the Sherman Act.

Since the high court handed down its decision (May 8) the U.S. Department of Justice has announced that the decision will be used as the basis for action against organizations of architects and engineers that set up schedules of fees. The charge will be that the use of these schedules is also a violation of the Sherman Act (E.N.R., May 18, P. 23).

From a review of this decision and of preceding legal dictum, it appeared logical to conclude that, from the purely legal point of view, only a small part of what engineers do falls into the professional classification. When a consulting engineer is called in for the sole purpose of rendering an opinion based on his knowledge of engineering, the courts could be expected to hold that his work on that engagement is professional. But as soon as he undertakes to render a service, to prepare designs and specifications, his work would be considered a trade—in the eyes of the law.

The Supreme Court had before it an appeal from a decision of the United States District Court for the District of Columbia in THE UNITED STATES OF AMERICA V THE NATIONAL ASSOCIATION OF REAL ESTATE BOARDS ET AL. In the district court, the Department of Justice had charged the National Association of Real Estate Boards, its executive vice-president, the Washington Real Estate Board and 15 of its members with violation of the Sherman Act by conspiring to fix commission rates for the members. (The national association had in its code of ethics a provision that schedules of fees set by local boards should be observed, and the Washington board had a provision in its code stating that "brokers should maintain the standard rates of commissions adopted by the board, and no business should be solicited at lower rates.")

The national and local boards as well as the officers and members covered by the indictment were acquitted by the district court in both the criminal and civil action. Subsequently, the Department of Justice appealed the district court's decision in the civil suit to the Supreme Court. The high court concluded that there was not sufficient evidence against the national board and its executive officer to warrant conviction, so it let their acquittal stand; it concluded, however, that the case against the Washington board was sufficient to warrant conviction.

A basic question in this case was whether the business of a real estate agent is a "trade" within the meaning of the Sherman Act, or whether it is a type of service that is outside the provisions of that act.

On that point Justice Douglas, who delivered the opinion for the Supreme Court, said:

"Members of the Washington

board are entrepreneurs. Some are individual proprietors; others are banks or corporations. Some have no employees; others have large staffs. But each is in a business of his own. The fact that the business involves the sale of personal services rather than commodities does not take it out of the category of "trade" within the meaning of Sect. 3 of the act. The act was aimed at combinations organized and directed to control the market by suppression of competition "in the marketing of goods and services."

The Supreme Court's statement that members of the Washington real estate board are entrepreneurs, each with a business of his own, and its observation that "the fact that this business involves the sale of personal services rather than commodities does not take it out of the category of "trade" within the meaning of the act "would seem to indicate that the court would reach a similar conclusion concerning the practice of consulting engineers and architects, if and when the question is placed before it."

Athlone Fellowships

A recent visitor to Montreal was Dr. William Abbott of the British Ministry of Education who is visiting Canada to assist committees in examining candidates for the recently established Athlone Fellowships for engineering training in the United Kingdom.

On February 7th last Council, through Vice-President Heartz, arranged a luncheon for Dr. Abbott, at which the latter was able to outline the purposes and conditions for the award of the fellowships. Dr. Abbott stated that there are twenty-eight fellowships to be offered in group A—for undergraduates; and ten in group B for engineers in industry. At the time of the luncheon meeting committees had on hand some seventy applications.

The fellowships will provide for travelling costs to and from the United Kingdom and weekly allowance of £6-10 shillings, which is roughly equivalent to the wage of a skilled mechanic. Dr. Abbott admitted that while this income might seem low to Canadians, the Ministry of Education felt rather strongly that the Canadian candidates should not be treated any better than Britain's own apprentices or apprentices from other parts of the Commonwealth—there are said to be approximately a thousand of these visiting students every year from other countries of the Commonwealth.

Dr. Abbott accompanied by Mr. F. East of the United Kingdom High Commissioner's office in Ottawa, is to visit the universities in Canada.

Correspondence

Overseas Members

Maracaibo, Venezuela,
January 24, 1951.

Dear Mr. Editor:-

I have for acknowledgement your letter of the 31st October, 1950, and I would deem it a favour if you would convey to the Council my sincere appreciation of their confidence in having approved my transfer from Junior Member to Member of the Institute.

It is regrettable that distance prevents me from actively joining into activities of the Institute. You can rest assured, however, that those of us who are living down here are still very much interested in the affairs of the Institute and the strides in Canadian Engineering as evidenced by the *Journal*.

I hope that on my next trip to the States and Canada I may have the opportunity of personally visiting your Headquarters.

F. S. Idenden, M.E.I.C.

Bordeaux, France,
January 31, 1951.

Dear Mr. Editor:-

I very recently received the December Copy of the Engineering Journal and wish to take this opportunity to thank you for forwarding them to me in France. I find that the people here, particularly the Engineers, are interested in Canada, and the opportunities that it has to offer. I find the *Journal* most interesting, particularly from a technical point of view, and its contents enable me to more accurately discuss the present methods of construction employed at home and to confirm my statements that Canada is the ideal country to live in and the land of opportunity for all its citizens.

As mentioned in my previous letter, I expect to be back in Canada in July, 1951, and will then no doubt be in need of employment. The Institute Employment Service succeeded in finding suitable employment for me last year, and I would like to make use of its facilities again this year.

P. C. Barlow, S.E.I.C.

Civil Defence

Montreal, Que.,
January 29, 1951.

Circular Letter to Branch Secretaries of *The Engineering Institute* of Canada.

Gentlemen:-

For some time consideration has been given by the Council of the Institute to the subject of civil defence. Also there have been discussions between officers of the branches and officers of the Institute. I have been instructed to send a circular letter to the branches informing them of Council's policy.

More than a year ago the president of the Institute was invited to see General F. F. Worthington, Coordinator of Civil Defence, to discuss these matters. To the meeting was also invited Mr. Allan Ross who at that time was chairman of the Ottawa Branch of the Institute and president of the Canadian Construction Association. The general secretary and Major-General Guy Turner also were present.

The situation was discussed in considerable detail and the outcome was that in the opinion of all it appeared there was nothing that the Institute could or should do at the moment. General Worthington agreed to keep in touch with us and to advise us just as soon as the situation changed.

Recently some of the branches have been asking for information and the matter has been discussed further by Council. Acting under instructions from a recent meeting spoke again with General Worthington and in this conversation he explained that the situation as far as we were concerned was precisely as it had been at the time of the interview in Ottawa.

General Worthington believed that there was still nothing which we could do at the national level but he did point out that members of the Institute could be of great assistance in working with other groups at the local level. He recommended that they be urged to interest themselves in the matter from that point of view. He stated also that he would get in touch with us just as soon as there appeared to be anything that we could do as a national organization.

Under these circumstances Council has agreed that no action will be taken until instructions or requests are received from the government. However, Council desires to call attention to General Worthington's statement that members of the Institute could help at the local level. It is suggested that where local affiliations have not taken place already members of the branches get in touch with others who are interested in this subject and lend their assistance to any movement which may develop. In this way it is believed that the maximum assistance can be rendered.

If any branch has observations to make on this subject or suggestions which they think would be helpful please write Headquarters so the matter may be considered by Council.

Council would be interested in knowing of any activities in this field whether carried out by the branch or by individuals. Such information might well be reported through the columns of *The Engineering Journal.*

L. Austin Wright, M.E.I.C.,
General Secretary.

Colombo Plan

Ottawa, January 27, 1951
Room A133, No. 1 Building

Mr. L. Austin Wright, M.E.I.C.,
General Secretary

Canadian newspapers recently have given a generous amount of publicity to the "Colombo Plan", which is the Commonwealth's counterpart of the United States Point-Four Program, and the United Nations Technical Assistance Program. The Colombo Plan involves South and South-East Asia; the recipient countries at present being Ceylon, India and Pakistan, while the United Kingdom, Canada, Australia and New Zealand are the sources from which technical assistance will be sought.

The Technical Assistance Service, of the Department of Trade and Commerce, has been organized to administer Canada's part in the Plan. The main functions of this unit will be to secure Canadian technicians for long or short term periods of service abroad, and to place foreign trainees in Canadian industry. In view of the similarity of purpose and functions of the United Nations Technical Assistance Program and the Colombo Plan, this Division has been assigned the task of handling the Canadian end of the United Nations program.

The success of these programs in Canada will depend on the support and co-operation given by Canadians, particularly by Canadian industry and the associations and societies directly related to industry. In view of the present world situation, it is unnecessary to emphasize the importance of these technical assistance programs. It is realized that the provision of technicians for service abroad and the placement of trainees in our industry will entail certain sacrifices and expenditures, both by the Federal Government and by industry. This, however, should be regarded as part of Canada's effort to assist the Asiatic countries in their struggle to raise the standard of living of their respective peoples, and to eliminate outside influences that might destroy their freedoms.

Your Institute, through its wide membership, can be of very great value in promoting these programs. May we enlist your co-operation in drawing to the attention of your membership requests for technical assistance received by us, and in contacting certain industries we feel may hesitate to accept trainees from Ceylon, India and Pakistan.

There is a tremendous selling job to be done, and we believe you can help us to put the idea across to your members. This indirectly contributes to the national defence of Canada. The cost of such programs will be very small in comparison with that of an all-out war. Furthermore, the long term results to be achieved will be of mutual benefit.

Your comments on this subject will be much appreciated.

T. J. BROOK,
Director,
Technical Assistance Service,
Department of Trade and
Commerce, Canada.

Montreal,
February 8, 1951
(dict. Feb. 6)

Department of Trade
and Commerce,
Ottawa, Ont.

Attention: T. J. Brook, Esq.,

In your letter of January 27th you call our attention to the Technical Assistance Service of the department which has been organized to render assistance of a technical nature to the Asiatic countries. This matter has been brought to our attention before through the department and also through other officers of the government. However we're glad to have your further communication and in particular your suggestion that we can be of assistance.

I can assure you that the officers and members of The Engineering Institute of Canada have a deep interest in these problems which may well have an important bearing on the world situation. It is impossible to commit ourselves to any specific undertakings at the moment because the authority for such things lies with our Council. However until you have a specific proposal to put to us I can tell you that we are most interested and sympathetic.

Would it be helpful to you if we printed in *The Engineering Journal* the letter which you have just sent to us? The *Journal* goes to almost 16,000 people and many of them are just the type that you have in mind—both for services in the Asiatic countries and as prospective employers of the citizens coming from both countries for training in Canada.

If you could let me have word on this promptly we could have the letter in the March issue. I'm sure that it would interest many hundreds of our members. If you would like to make any change in the communication in the light of the fact that we might publish we'd be very glad to have you revise the communication.

If you have any specific ideas in mind please do not hesitate to send them to us. Our organization caters to engineers in all branches of the profession and it's made up of the most senior men in the profession and in industry as well as about 6,000 of the younger men—both students and junior engineers. Surely within this large company there would be some few that would be of particular value to you in the enterprises which you will be promoting.

L. AUSTIN WRIGHT, M.E.I.C.,
General Secretary.

Elections and Transfers

At the meeting of Council held at Headquarters in Montreal, Saturday, January 20th, 1951, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

Members:

J. B. M. Armstrong, *Vancouver, B.C.*
F. A. Bain, *Montreal, Que.*
R. R. Buckley, *Ottawa, Ont.*
C. H. Conroy, *St. John's, Nfld.*
S. V. Donvito, *Arvida, Que.*
G. Perris, *Cornwall, Ont.*
I. Ingenohl, *Montreal, Que.*
W. S. Korwin-Lopuszanski, *Montreal, Que.*
P. R. McAdam, *Sudbury, Ont.*
A. Packevicius, *Ottawa, Ont.*
F. R. Ross, *Sudbury, Ont.*
R. Saarits, *Lethbridge, Alta.*
P. E. Semler, *Copper Cliff, Ont.*
J. W. Smith, *Sudbury, Ont.*
L. E. Tarandi, *Montreal, Que.*
L. C. A. Walford, *Montreal West, Que.*

Juniors:

S. Gaunt
R. S. Trussler

Transferred from the class of Junior to that of Member:

R. A. Begg, *Montreal, Que.*
N. W. Blakely, *Hamilton, Ont.*
J. T. Brennan, *Ste. Rose de Laval, Que.*
W. H. Craig, *Beauharnois, Que.*
C. Damecour, *Montreal, Que.*
D. L. Dickson, *Montreal, Que.*
P. E. Douville, *Acton Vale, Que.*
B. H. C. Downman, *Belleville, Ont.*
W. Hobson, *Lachine, Que.*
H. A. N. Holland, *Mount Royal, Que.*
G. B. MacCoy, *Sarnia, Ont.*
D. K. Macdougall, *Chatham, N.B.*
S. D. MacKinnon, *Calgary, Alta.*
G. R. McLean, *Edmonton, Alta.*
G. E. Ransom, *Beauharnois, Que.*
A. G. Rochon, *Sorel, Que.*
F. F. Woods, *Montreal, Que.*
J. M. Woods, *Campbellton, N.B.*

Transferred from the class of Student to that of Junior:

H. A. Templeton, *Guelph, Ont.*

The following Students were admitted:

B. W. Allen
E. E. Anderson
J. C. Apps
J. R. Arnold
N. Baker

Applications through Associations

By virtue of the co-operative agreements between the Institute and the Associations of Professional Engineers, the following elections and transfers have become effective:

ALBERTA

Juniors:

R. W. Edgecombe, *Edmonton, Alta.*
M. A. Jackson, *Edmonton, Alta.*

Junior to Member:

D. A. Bennett, *Medicine Hat, Alta.*

Student to Junior:

J. G. Hutcheon, *Calgary, Alta.*

SASKATCHEWAN

Member:

W. F. Gibbs, *Maple Creek, Sask.*

Juniors:

A. L. Court, *Regina, Sask.*
T. J. Manning, *Regina, Sask.*

Students:

J. F. Acton, *Saskatoon, Sask.*
D. A. Drew, *Saskatoon, Sask.*
T. A. Kajewski, *Saskatoon, Sask.*
E. W. Minogue, *Saskatoon, Sask.*

Junior to Member:

I. W. Twaddell, *Saskatoon, Sask.*

NOVA SCOTIA

Junior to Member:

C. W. Johnston, *Halifax, N.S.*
W. P. Kerr, *Rockingham, N.S.*

Student to Member:

J. H. Reeder, *Kentville, N.S.*

QUEBEC

Member:

J. A. Hayman, *Montreal, Que.*

At the meeting of Council held in Shawinigan Falls, Que., Saturday, February 17th, 1951, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

Members:

R. P. Allsop, *Toronto, Ont.*
E. C. Brisco, *Chatham, Ont.*
J. E. Campbell, *Gatineau, Que.*
T. M. Carscadden, *Lethbridge, Alta.*
J. V. Daniliauskas, *Montreal, Que.*
G. B. Erlebach, *Vancouver, B.C.*
S. T. Reynolds, *Sarnia, Ont.*
A. R. Stanford, *Corner Brook, N'fld.*
A. S. Wright, *Corner Brook, N'fld.*

Juniors:

R. W. Brown, *Shawinigan Falls, Que.*
C. G. Fritz, *Winnipeg, Man.*
P. A. Gobeil, *Cap de la Madeleine, Que.*
D. L. Marr, *Sudbury, Ont.*
W. D. McDonald, *Toronto, Ont.*
U. Raabe, *Winnipeg, Man.*
A. D. Rae, *Sarnia, Ont.*
J. W. Waldron, *Kingston, Ont.*

Transferred from the class of Junior to that of Member:

J. M. Casault, *Edmonton, Alta.*
G. W. Clarke, *Edmonton, Alta.*
J. D. Cram, *Wallaceburg, Ont.*
H. L. Dahl, *Winnipeg, Man.*
P. S. Dewar, *Windsor, Ont.*
T. C. Elliott, *Calgary, Alta.*
G. G. Fisch, *Montreal, Que.*

News of Other Societies

The **Society for Advancement of Management,** Montreal chapter (P.O. Box 164, Station B, Montreal) announces the second one-day Industrial Engineering Conference, March 30, 1951, at the Mount Royal Hotel.

W. B. Hewus of Dominion Rubber Company Ltd., Montreal, is secretary and co-ordinator of the conference, the general theme of which is "Engineering—a Profit Path".

The **Chemical Institute of Canada** (18 Rideau St., Ottawa, Ont.) will hold its 34th annual conference in Winnipeg, Man., June 18 to 20, 1951.

The **American Institute of Electrical Engineers** (33 West 39th Street, New York), schedules district meetings as follows—the southern district meeting April 11 to 13 at Miami Beach, Florida; north eastern district meeting, May 2 to 4, at Syracuse, N.Y.; the Great Lakes district meeting, May 17 to 19, at Madison, Wisconsin.

The three district meetings precede the Summer General Meeting of A.I.E.E., which will take place in Toronto, Canada, June 24 to 29, at the Royal York Hotel.

June 11 to 15, 1951, are the dates of the Toronto semi-annual meeting of the **American Society of Mechanical Engineers** (29 West 39th Street, New York 18). The Royal York Hotel will be headquarters.

The **American Society for Testing Materials** (1916 Race Street, Philadelphia 3, Pa.) announces that the annual meeting in 1951 will be at Atlantic City, N.J., Chalfonte-Haddon Hall, June 18 to 22.

The **British Standards Institution** (24/28 Victoria Street, Westminster, London, S.W.1.) announces the appointment of Mr. H. A. R. Binney, C.B., as the new director and secretary of the Institution.

He succeeds the late Mr. Percy Good, C.B.E.

The **Institution of Naval Architects** and the **Institute of Marine Engineers,** in Association with the **Institution of Engineers and Shipbuilders in Scotland** and the **North East Coast Institution of Engineers and Shipbuilders,** will hold the International Conference of Naval Architects and Marine Engineers during the Festival of Britain this year.

The dates for the international conference are:- London, June 25 to 30, 1951; Glasgow, July 2 to 4, 1951; Newcastle, July 4 to 6, 1951.

The secretary of the Conference is at 10 Upper Belgrave Street, London, S.W.I.

The 1951 annual conference of the **Institution of Engineers Australia** (Science House, Gloucester & Essex Streets, Sydney, N.S.W.) will be in session in Brisbane, April 2 to 7.

The International Welding Conference will meet in London and Oxford, England, from July 14 to 21, 1951. The congress will include the annual meeting of the **International Institute of Welding,** and its various commissions, and is being sponsored by the five

British member societies, namely, the Institute of Welding (2, Buckingham Palace Gardens, Buckingham Palace Road, London, S.W.I.), the British Welding Research Association, the British Acetylene Association, the Welding Sections of the British Electrical and Allied Manufacturers' Association and the Sheet and Strip Metal Users' Technical Association. The president of the Reception Committee is Sir William Larke, K.B.E.

The Measurements Section of the **Institution of Electrical Engineers** will hold a conference on electrical instrument design in London, England, from the 28th to the 30th of May this year. Members of the Engineering Institute of Canada are invited to attend.

Full details of the conference may be obtained from the secretary of the Institution, Savoy Place, London, W.C. 2.

At the annual meeting in January of the **Association of Professional Engineers of New Brunswick** at the Admiral Beattie Hotel in Saint John, N.B., Prof. J. Harry Moore, M.E.I.C., was elected president. He succeeds J. P. Mooney, M.E.I.C., of Saint John, who retains a seat on the council as past-president.

Other items on the agenda of the meeting were a presentation to R. A. Hughes of the first $200 scholarship of the Association; a report from Dr. A. F. Baird, the Association's representative on the E.I.C. Council; the setting up of a public relations committee; and a change in the Association's by-laws to permit the use of the designation of P. Eng., rather than R.P.E.N.B.

The principal speaker was J. M. H. Fraser, superintendent of the Saint John Dry Dock Co. Ltd.

On the occasion of the Festival of Britain, a **Joint Engineering Conference** will be held by the Institutions of Civil, Electrical, and Mechanical Engineers in London from June 4 to 15. The purpose is to record the contributions of Britain's engineers and scientists to the advance of civilization.

Members of the Institute are cordially invited to attend and participate in the discussions. Further details may be obtained from headquarters.

Personals

News of the Personal Activities of Members of the Institute

J. A. McCrory, M.E.I.C., former president of The Shawinigan Engineering Co. Ltd., has been elected chairman of the board. He is succeeded as president by **R. E. Heartz,** M.E.I.C., the former vice-president and chief engineer of the company; and **A. L. Patterson,** M.E.I.C., has been appointed chief engineer.

J. A. McCrory, M.E.I.C.

Mr. McCrory joined the Company in 1916. Subsequent appointments in the Company were as follows: office engineer, 1918; vice-president and chief engineer in 1935; and president in 1949.

In 1950 he was awarded The Julian C. Smith medal of the Engineering Institute for achievement in the development of Canada. The degree of D.Sc. was conferred upon him by McGill University, Montreal, in 1950.

Mr. McCrory was chairman of the Montreal Branch of the Institute in 1929; and represented that branch on the council in 1930-1936; and he was vice-president in 1937-38.

Mr. Heartz began his association with the Company in 1920. He was resident engineer on power developments at Shawinigan Falls, La Gabelle, St. Narcisse, and Paugan Falls, subsequently being transferred to the head office in Montreal. In 1935 he was appointed assistant chief engineer and since then has been associated with all phases of the numerous Shawinigan Engineering projects. Many innovations in methods and equipment, which have led to increased economies have been initiated by him.

R. E. Heartz, M.E.I.C.

In 1941 he was loaned by the Shawinigan Company to Wartime Merchant Shipping Limited where he acted in the capacity of general manager until 1942. This organization directed and coordinated the efforts of fourteen shipyards and their associated suppliers in carrying out the Canadian cargo vessel programme.

A. L. Patterson, M.E.I.C.

In January, 1947, Mr. Heartz was appointed vice-president and chief engineer and was made a director of The Shawinigan Engineering Company.

Mr. Heartz has been chairman of the Montreal Branch of the Institute; a councillor and a vice-president. He is chairman of the Finance Committee of the Institute.

Mr. Patterson, the new chief engineer, joined the Company as a junior engineer, subsequently becoming office engineer, and assistant chief engineer.

He graduated from McGill University in mechanical engineering in 1914. He was overseas from 1914 to 1919 with the R.C.A., and joined the Shawinigan organization on his return.

F. McCallum, M.E.I.C., regional engineer for P.F.R.A. Kamloops, B.C., has been elected chairman of Central B.C. Branch.

Mr. McCallum is from Saskatoon and is a graduate of the University of Saskatchewan, where he received a B.Sc. degree in civil engineering in 1938. He joined the Prairie Farm Rehabilitation Administration in Regina that year. He was appointed assistant engineer in Calgary in 1941 and went to Regina as assistant engineer a year later. He received the appointment as district engineer of P.F.R.A. at Regina in 1944. He was later district engineer at Saskatoon, and in 1948 went to his present position as regional engineer at Kamloops.

E. R. Smallhorn, M.E.I.C., general manager of Aerocrete Construction Co. Ltd., Montreal, has been elected chairman of the Montreal Branch of the Institute.

A Montrealer, he graduated from McGill University receiving a B.Sc. in civil engineering in 1923. On graduation he worked for the late H. G. Hunter, consulting engineer in Montreal, on water works and sewage work.

He left Mr. Hunter to accept a position as assistant to Mr. Willis Chipman, consulting engineer, Toronto, in connection with the design and construction of

E. R. Smallhorn, M.E.I.C.

a filter plant, reservoir and other additions to the water system of the City of Welland, Ont. On the completion of this job, he came back to Montreal to accept a position with the firm of R. S. and W. S. Lea for whom he acted as assistant engineer in connection with extensions to the water works systems at Windsor, Ont., and Brantford, Ont., and the power development on the Coaticook River for the Town of Coaticook, Que.

In 1931, he left Mr. Lea's employ to become associated with Aerocrete Montreal Limited. This firm later was absorbed or developed into the present Aerocrete Construction Company Limited of which he is now general manager.

F. McCallum, M.E.I.C.

George E. Humphies, M.E.I.C., has been elected chairman of the London Branch of the Institute.

Born at Wolverhampton, England, he was educated at Wolverhampton and Staffordshire Technical College, receiving a national certificate in mechanical engineering from the Institution of mechanical engineers in 1927. He had been associated with Foster Bros. Ltd., in England as a draughtsman. In Canada in 1928 he was with Hamilton Bridge Company, and in 1929 he did structural design for the Hydro-Electric Power Commission of Ontario, after which he worked for a time with McClintic Marshall Construction in Pittsburgh, Pa. He worked for the Department of Lands and Forests in 1932, and for several years after he was in the mining industry. From 1935 to 1940, for Canadian Comstock Co. Ltd., Toronto, he worked on design and construction of metallurgical and power plants in mines in Ontario.

He was overseas with the R.C.E. in the recent war. Since his return he has been in private practice, in partnership with M. M. Dillon & Company, consulting mechanical engineers in London, Ont.

H. W. Nickerson, M.E.I.C., chief engineer of Canadian Cottons Ltd., Cornwall, Ont., has been elected chairman of the Cornwall Branch of the Engineering Institute.

A graduate of the University of New Brunswick. Mr. Nickerson received a B.Sc. degree in electrical engineering in 1929 and in civil engineering in 1933. During 1929 and 1930 he was with the telephone engineering department of Northern Electric Company Ltd., in Montreal, and with the wire and cable sales department. He joined Canadian Cottons Ltd., at Milltown, N.B., in 1934, during the construction of a reinforced concrete dam. He was made assistant plant engineer of the Gibson Mill of Canadian Cottons in Marysville, N.B., in 1939. He was appointed plant engineer of the Canada Mill and the Dundas Mill of the Company in Cornwall, Ont., in 1943. He received his appointment as chief engineer of the Company in 1947.

F. F. Fulton, M.E.I.C., manager of the Belleville Plant of the Northern Electric Company, has been elected chairman of the Belleville Branch of the Institute.

Mr. Fulton has been with Northern Electric since his graduation from McGill University in 1928, and most of his service with the company has been in the field of electronics. He entered the active forces in 1939, as a lieutenant,

F. F. Fulton, M.E.I.C.

and attained the rank of brigadier early in 1945. He served overseas, and was awarded the O.B.E. in 1943 for his contribution to the technical services.

With Northern Electric he started as a sales engineer and after occupying a number of positions, became sales manager of special products in 1937. Following his return from active service in 1946, Mr. Fulton was made chief engineer of the electronics division and in 1949 was appointed manager of government contracts. He went to his present position in 1950.

C. D. Carruthers, M.E.I.C., of Wallace, Carruthers & Associates Ltd., Toronto, has been elected chairman of the Toronto Branch of the Institute.

Born at Millbrook, Ont., Mr. Carruthers studied at the University of Toronto receiving the degree of B.A.Sc. in 1927. After graduation he joined Gordon L. Wallace, M.E.I.C., consulting engineer, as designer and draughtsman.

He remained with Gordon L. Wallace, and received in 1931 an appointment as chief designer. He was consulting structural engineer for the firm prior to his appointment as associate and chief designer in 1947. The firm became known as Wallace, Carruthers & Associates Ltd., in 1951, and Mr. Carruthers is general manager and designing engineer.

E. T. W. Bailey, M.E.I.C., chief combustion engineer for the Steel Company of Canada, Ltd., at Hamilton, has been elected chairman of the Hamilton Branch of the Institute.

Mr. Bailey graduated from the University of Toronto with a B.A.Sc. degree in chemical engineering in 1926. In 1932 he received the professional degree of chemical engineer from the same institution. He worked with Aluminum Company of Canada Limited, Arvida, Quebec, for two years as assistant chief chemist, before joining the Steel Company of Canada at Hamilton, in 1928. He was later appointed head of the combustion engineering department.

Mr. Bailey was the winner of the Plummer Medal of the Engineering Institute in 1948. He is a director of the Association of Iron and Steel Engineers.

Julian Garrett, M.E.I.C., will discontinue temporarily his practice as a natural gas consultant in Edmonton, Alta., to accept a two year appointment by the Government of Barbados as public utilities commissioner and director of petroleum and natural gas. Before going into private practice in 1948 he was vice-president of Northwestern Utilities Limited, Edmonton.

T. R. McLagan, M.E.I.C., president and general manager of Canadian Vickers Ltd., Montreal, was elected to membership of the American Bureau of Shipping in New York, at the recent annual meeting.

The Bureau which sets and maintains shipbuilding standards, required extension of the foreign surveying staff, with exclusive surveyors being stationed in eight foreign ports including Halifax and Vancouver.

Richard A. Low, M.E.I.C., who was associate professor of civil engineering, resigned some months ago from the staff of Queen's University, Kingston, Ont., to become chief executive engineer for Trans-Canada Highway Division, Federal Department of Resources and Development.

Professor Low graduated from Queen's University in 1928 with a B.Sc. in civil engineering and joined the teaching staff of that institution in 1930, where he later became, successively, assistant professor of civil engineering and associate professor. He holds the degree of master of civil engineering from Cornell University.

Professor Low has worked on geodetic, railway and highway surveys, and on construction jobs. He made the final location of the Quebec Chibougamou Railway, and located the south section of the Isle Maligne-Quebec transmission line for the Shawinigan Water and Power Company. Shortly after the outbreak of the recent war he joined the gauge division, Department of Munitions and Supply, in Ottawa, and served during its period of organization, returning to Queen's in the autumn of 1942. He has long been interested in community planning, doing graduate work in this field and making several traffic surveys. He has been active in developing the work of the Kingston Town Planning Commission. He has served as chairman and secretary of the Kingston Branch and represented the branch on the Council of the Engineering Institute in 1945.

John T. Watson, M.E.I.C., has retired from the post of city manager of Lethbridge, Alta.

Mr. Watson came from Scotland to Canada in 1900. He was appointed, in 1906, assistant to the chief engineer of the City of Calgary power and light plant. From 1906 to 1916 he was superintendent of the Western Electric Company's plant at Red Deer, Alberta, and in the latter year was appointed chief engineer of the City of Lethbridge power and light and water plant. In 1929 he received the appointment as city manager of Lethbridge.

Commenting on his retirement, Lethbridge newspapers recalled J. T. Watson's able administration of the civic financial situation as well as his work in municipal utilities during his long service.

A. L. Mieville, M.E.I.C., has been appointed managing director of the associated companies throughout Asia of John Blackwood Hodge Limited. He will reside in Calcutta, India. Previously he was managing director of Bailimo Limited, London, England.

H. G. Michell, M.E.I.C., who was general manager of the Bolivian Power Co., Ltd., at La Paz, is now with the Montreal Engineering Co. Ltd., Montreal.

Mr. Michell went to the Bolivian Power Company in 1939 as manager of Oruro division. He was manager of the La Paz division in 1946 and 1947. He was then appointed general manager of the Company.

M. D. Stewart, M.E.I.C., who was formerly city engineer of Sudbury, Ont., is affiliated with the Kilborn Engineering Co. Limited, consulting engineers in Toronto. He is concerned with the design and supervision of various municipal engineering works.

R. J. Askin, M.E.I.C., has been appointed vice-president (manufacturing) of the Abitibi Power and Paper Company Limited, Toronto, Ont.

Mr. Askin started in the pulp and paper business with the Fort William Paper Company Limited in 1921. He was appointed manager of this mill in 1930 shortly after its merger with Abitibi operations and he was later appointed manager of the Thunder Bay Division. In 1942 he moved to Toronto as assistant manager of mills, becoming manager in 1943. He is a graduate in mechanical engineering of Queen's University. He is a past-councillor of the Engineering Institute of Canada, and a past-chairman of the technical section of the Canadian Pulp and Paper Association.

Fred H. Ballou, M.E.I.C., of Vancouver, has retired from the position of chief engineer of the British Columbia Sugar Refining Company, Limited. Mr. Ballou was eligible for retirement two years ago but postponed his departure from the sugar company's services until after the completion of the new beet sugar factory at Taber, Alta. He was in command of the engineering and construction of this large factory, and he also was in charge of establishing the company's factory at Picture Butte, Alta.

W. R. Craig, M.E.I.C., is the new chief engineer of the British Columbia Sugar Refining Company, Limited, Vancouver, B.C. and its subsidiary operations, including the Canadian Sugar Factories, Ltd., in Southern Alberta.

Mr. Craig graduated in 1933 as an electrical engineer from University of Alberta. He worked at various positions including a short period with the Lethbridge Northern Irrigation District, until he joined the engineering staff of Canadian Sugar Factories in 1935 as assistant construction engineer on the company's factory at Picture Butte. On completion of this project, Mr. Craig held various posts with the sugar Company there and at Raymond, Alta. For a short time he was master mechanic of the Picture Butte plant.

In 1940 he was transferred to Vancouver and has been at the sugar company's head offices ever since, except for two years' service with the R.C.E.M.E. On his discharge from the army with the rank of lieutenant he returned to the sugar company's engineering staff at Vancouver.

Henrik Mugaas, M.E.I.C., is associated with the firm Hill-Clark-Francis Ltd., New Liskeard, Ont.

Mr. Mugaas was with Lamaque Gold Mines Limited, Bourlamaque, Que. for many years, returning to his work there after service in the R.C.A.F. in the recent war. He was chief surveyor of the Company.

E. K. Lewis, M.E.I.C., of Imperial Oil Limited, has been transferred from Montreal to Winnipeg, where he is superintendent of the manufacturing department. Mr. Lewis has been with the Imperial Oil since 1934. He was at Dartmouth, N.S., for several years, and in the engineering and development section of the Company at Sarnia, Ont. He was production manager of the Polymer Corporation in 1946. He came to Montreal as superintendent of the Imperial Oil Refinery in 1948.

He graduated from N.S. Technical College in 1930.

W. J. McAdam, M.E.I.C., the former chief engineer of J. L. E. Price, Montreal, Que., is now with Wood and Langston, Montreal.

Mr. McAdam had joined J. L. E. Price in 1947 as assistant to the chief engineer with reference to the mechanical and electrical trades. He was chief engineer for Wartime Housing Ltd., Toronto, in 1946 and 1947.

Dr. K. R. Rybka, M.E.I.C., and **John H. Ross,** M.E.I.C., both of Toronto, have been appointed by the City of Toronto to a Committee to study the application for the increase in the price of gas made by the Consumers Gas Co. of Canada.

Ewart M. Haacke, M.E.I.C., Toronto, Ont., is now associated with J. A. Wilson Lighting & Display Ltd., in Montreal, Que.

Mr. Haacke was editor, for the past 6 years, of the Hugh C. MacLean publication "Electrical News and Engineering". He joined the publication as associate and technical editor in 1945 after service with the R.C.A.F. He graduated from Queen's University in electrical engineering in 1942.

A. O. Drysdale, M.E.I.C., has been appointed assistant superintendent of Plant No. 5 of Canada Cement Co. Ltd., Belleville, Ont. He has been assistant superintendent of the Company's plant in Montreal for several years.

E. L. Miners, M.E.I.C., is working in Ottawa, Ont., as estimator for the Defence Construction Co. Ltd.

Mr. Miners graduated from the University of Saskatchewan in civil engineering in 1936. He was for several years the assistant general manager of he C. M. Miners Construction Co. Ltd. n Saskatoon.

D. L. McGillivray, M.E.I.C., of Imperial Oil Ltd., has been transferred from Sarnia, Ont., to Toronto, Ont. During the recent war he was a technical advisor on petroleum products to the Royal Canadian Navy, with the rank of lieutenant commander in the R.C.N.V.R. He returned to his work with Imperial Oil in 1946.

James M. Courtright, M.E.I.C., of Shell Oil Co. of Canada Ltd., has been transferred from Vancouver, B.C., to Toronto, Ont., where he will be general manager of the purchasing and stores department.
Mr. Courtright, has been associated with the Company since his graduation from Queen's University in civil engineering in 1941.

E. H. Sinclair, M.E.I.C., who was branch manager of the Quebec Division of Canadian Ice Machine Company Limited, Montreal, is now associated with John Inglis Co. Ltd., refrigeration and air conditioning division and has been transferred to the British Columbia Branch.

Maj. I. M. McLaughlin, M.E.I.C., of the Department of National Defence, has returned to Ottawa following a course at the Military College of Science, Shrivenham, England.
Maj. McLaughlin went to England in 1948.

Gordon H. Mikkelborg, M.E.I.C., of the Ontario Paper Co. Ltd., has moved to Thorold, Ont., as materials handling and transportation engineer. He was, earlier, mechanical superintendent at Heron Bay South, Ont.

J. E. Thom, M.E.I.C., who has been assistant superintendent of construction, at the University of Toronto, is now associated with the firm of architects, Page & Steel, of Toronto.

G. P. Dewar, M.E.I.C., of Imperial Oil Ltd., has been transferred from Montreal to the manufacturing department of the Company in Winnipeg, Man.

B. D. McDermott, M.E.I.C., is a project engineer with Foundation Co. of Canada, Montreal. He was associated with J. L. E. Price Company in 1947-1950, and, earlier, with the Fraser-Brace Engineering Co. Ltd., at Montreal and in Shawinigan Falls.

John R. Michie, M.E.I.C., of Canadian Ice Machinery Co. Ltd., has been transferred from Ottawa to Vancouver, B.C.
Mr. Michie graduated from University of Toronto in mechanical engineering in 1940. He has since been associated with Canadian Ice Machinery Company as designer of refrigeration systems, sales engineer, assistant to the president on plant expansion, or contract engineer, and he was Ottawa Branch Manager before going to Vancouver. He served with the R.C.N.V.R. in the recent war.

J. L. Dery, M.E.I.C., is associated with Labrador Construction Co. Montreal. Previously he was vice-president of The Key Construction, Ltd., in Montreal, Que.
Mr. Dery graduated from the Royal Military College in 1934.
He worked in Montreal for the Federal Department of Public Works, before going overseas in the recent war with the R.C.A. He was a partner in the consulting engineering firm of Lapointe and Dery, in Montreal prior to joining the Key Construction Company in 1949.

B. E. U. Gagnon, M.E.I.C., is with Bathhurst Power & Paper Co. Ltd., Bathurst, N.B., as a senior designer. He was formerly with Stadler, Hurter & Co., Montreal.

Thomas J. Kew, M.E.I.C., is a design engineer with Ford Motor Co. of Canada, Windsor, Ont.
He graduated from Queen's University in 1948 receiving a B.Sc. degree in civil engineering, and was thereafter engineer in charge of testing materials at the Department of Public Works testing laboratory in Ottawa.

F. A. Hunt, M.E.I.C., who was assistant division engineer for the Canadian National Railways at Belleville, Ont., has been transferred to Capreol, Ont., as division engineer.
Mr. Hunt joined C.N.R. at Brantford, Ont., after graduating from Queen's University in 1940. He served overseas in the recent war as a lieutenant in the R.C.E. He has, since returning to C.N.R., been located at Toronto, at St. Catharines, and at Belleville.

Stuart S. Gilmour, M.E.I.C., has been appointed by the British Columbia Electric Company to the position of resident engineer on the reconstruction of the number one Hydro-Electric plant situated at Lake Buntzen near Vancouver, B.C.
Mr. Gilmour had been, for several years previously, chief field engineer for the Columbia Cellulose Co. Ltd., at Prince Rupert, B.C.

Kenneth R. Shipley, M.E.I.C., who is with Imperial Oil Limited, has been transferred from the Montreal East Refinery, to Winnipeg, Man.
Mr. Shipley was the supervisor of

Chairmen of E.I.C. Branches whose elections were announced in the February issue

W. R. Godfrey, M.E.I.C.
Saint John Branch

F. H. MacKay, M.E.I.C.
Sault Ste. Marie Branch

H. D. Keil, M.E.I.C.
Border Cities Branch

G. P. Sturdee, M.E.I.C.
Sarnia Branch

Plant No. 2, of Imperial Oil in Sarnia in 1944, and he was with the Tropical Oil Company in Columbia, S.A., as assistant refinery superintendent for several years, before returning to Imperial Oil in Montreal.

D. A. Welsh, JR.E.I.C., is district engineer at Prince George, B.C., for the British Columbia Department of Public Works.

Mr. Welsh graduated from University of British Columbia in civil engineering in 1949.

E. Ross Welsh, JR.E.I.C., has been appointed Quebec district engineer of Alchem Limited with headquarters in Montreal. His new territory will include all of Quebec except the northern mining regions.

Mr. Welsh graduated from the University of Saskatchewan with a B.Sc. degree in mechanical engineering. During World War II he served for three years with the Canadian Dental Corps and one year as an air gunner with the R.C.A.F. He joined Alchem Limited in 1948 and was in charge of the company's Calgary office for the past two years.

He is a member of the Canadian Institute of Mining and Metallurgy and of the Association of Professional Engineers of Alberta.

R. K. Nicholson, JR.E.I.C., formerly of Montreal is a sales engineer in the apparatus department with Canadian General Electric Co. Ltd., in Toronto, Ont.

Mr. Nicholson received a degree of B.Eng. in electrical engineering from McGill University in 1949.

Louis A. Zalkind, JR.E.I.C., is a design engineer for the Libby Air Conditioning Ltd., in Montreal Previously he was sales engineer for Sheldons Ltd., Galt., Ont.

W. V. Tobias, JR.E.I.C., is with Canadian Industries Limited. in the construction engineering department at Kingston, Ont. Formerly he was with Canadian Hydrographic Service at Ottawa, Ont.

J. M. Thomas, JR.E.I.C., is now employed by the Electrical Manufacturing Co. Ltd., at Montmagny, Que. He was previously with the Department of Colonization in Quebec City.

H. H. L. Pratley, JR.E.I.C., has gone to New Glasgow, N.S., to work for the Maritime Steel & Foundry. Previously he was designer with P. L. Pratley, M.E.I.C., consulting engineer, Montreal.

H. J. T. Patterson, JR.E.I.C., is working with the Dominion Structural Steel Limited, Montreal. He graduated from McGill University in civil engineering in 1948.

Previously he was employed by Shawinigan Engineering Co. Ltd., working on hydro-electric construction.

Guy Petit, JR.E.I.C., is with Fraser-Brace Engineering Co. Ltd., working at St. Joseph d'Alma, Que., as field engineer on dam construction.

Previously he was with The Shawinigan Engineering Co. Ltd., at Trenche, Que.

Mr. Petit graduated from Ecole Polytechnique in civil engineering in 1949.

Stan Nowski, JR.E.I.C., of Trenton, Ont., is an assistant construction engineer for Donald Inspection Ltd., Toronto, Ont.

He graduated from the University of Toronto in 1949 in civil engineering.

D. P. Howell, JR.E.I.C., who was previously with the Civil Service Commission, Department of Resources & Development at Banff, Alta., is now working at the Royal Canadian Mint, in Ottawa, Ont., as an assayer.

Mr. Howell graduated from the University of Alberta in 1949, receiving a B.Sc. in chemical engineering.

Andre Moncel, JR.E.I.C., who had been district development engineer with Canadian Liquid Air Co. Ltd. at Dorval, Que., is sales engineer with Watson Jack & Company Ltd., Montreal.

G. L. Lackman, JR.E.I.C., is a mechanical engineer with Canadair Ltd. He was previously employed as industrial design engineer, with Design Services Reg'd., Montreal.

Mr. Lackman graduated from Queen's University in mechanical engineering in 1948.

C. R. Eaton, JR.E.I.C., is employed in the design department for A. V. Roe (Canada) Ltd., at Malton, Ont. He graduated from University of Saskatchewan in mechanical engineering in 1949.

T. W. Dobson, JR.E.I.C., is assistant chemist at Donnacona Paper Co., Ltd., at Donnacona, Que. He was previously the assistant chemist for Price Bros & Company Ltd. at Kenogami, Que.

Mr. Dobson received a B.Sc. degree from Queen's University in 1948.

V. R. Cox, JR.E.I.C., is an instrumentman with Canadian National Railways, Edmonton, Alberta. He graduated from the University of Alberta obtaining a B.Sc. degree in 1949.

R. H. Carroll, JR.E.I.C., is now employed with Rotor Electric Company Limited, Toronto, Ont. He was previously working on design for Dominion Electrohome Industries Ltd., at Kitchener, Ont.

Mr. Carroll graduated from Queen's University in electrical engineering in 1946.

Paul Brissette, JR.E.I.C., is a plant engineer for Sorel Industries Ltd., at Sorel, Que.

After graduating in 1948 from Ecole Polytechnique, Montreal, he worked with Canadian Fairbanks Morse Company in Montreal.

J. G. Belzile, JR.E.I.C., is a mechanical assistant with Canada Packers Ltd., Montreal, Que. Previously he was chief draughtsman for E. J. Wright Utilities Ltd. at Strathroy, Ont.

R. G. Barbour, JR.E.I.C., of Fredericton, N.B., is in Montreal, working for Southern Canada Power Company. He is a 1949 graduate of the University of New Brunswick with a degree of B.Sc. in electrical engineering.

Lt. Albert J. Arcand, JR.E.I.C., who was at Chilliwack, B.C., with the R.C.S.M.E. is now stationed at the No. 4 Works Coy., R.C.E., in Montreal.

He graduated from University of Saskatchewan in agricultural engineering in 1949.

Bernard Abugov, JR.E.I.C., is an inspector of electricity and gas in Montreal for the Dominion Civil Service.

He graduated from McGill University in electrical engineering in 1949.

D. R. Abbey, JR.E.I.C., is field office manager, in the resident engineer's office at Senneterre, Que., for Surveyer, Nenniger and Chenevert, Montreal.

Mr. Abbey graduated from University of Saskatchewan in 1945, and did postgraduate work at McGill University.

D. I. Ourom, JR.E.I.C., of Ottawa, has left Canada for a period of two years during which time he will be associated with the Demerara Bauxite Co., MacKenzie, British Guiana.

W. A. Doherty, JR.E.I.C., is company engineer with the K. J. Beamish Construction Co. Ltd., Toronto. During 1950 he obtained the degree of M.A.Sc. from the University of Toronto.

F. S. Yano, S.E.I.C., (University of Manitoba, 1950, B.Sc., mechanical engineering) is on a training course with Massey Harris Co. Ltd. in Toronto, Ont.

R. C. Wannop, S.E.I.C., (U.B.C., 1950, B.A.Sc., civil engineering) is on the staff of Swan, Rhodes & Wooster, consulting engineers, Vancouver, B.C.

Harley Stewart, S.E.I.C., (University of Manitoba, 1950, B.Sc., mechanical engineering) is now in Windsor, Ont., working for the Ford Motor Co. of Canada Previously he was assistant supervisor in the forming department of Fiberglass Canada Ltd., Sarnia, Ont.

Joseph Norman Stevens, S.E.I.C., (University of Manitoba, 1950, B.Sc., civil engineering) is with the Department of Public Works of Canada in Winnipeg, Man.

C. W. Pidgeon, S.E.I.C., (Queen's University, 1948, B.Sc., mechanical engineering) who was doing post-graduate work at Queen's is now with the Capital Wire Cloth & Manufacturing Company, Ottawa, Ontario.

Michael C. Nadas, S.E.I.C., (University of Toronto, 1950, B.A.Sc., chemical engineering) is a paint chemist for Scarfe & Co. Ltd., Brantford, Ont.

M. W. McDermid, S.E.I.C., (McGill University, 1950, B.Eng., mechanical engineering) is in Quebec City with Anglo-Canadian Pulp & Paper Mills.

James S. MacDonald, S.E.I.C., (Nova Scotia Technical College, 1950, B.E., mechanical engineering) is with Canadian Vickers Ltd., Montreal, working as an industrial engineer.

C. A. Marteinson, S.E.I.C., (University of Manitoba, 1950, B.Sc., mechanical engineering) is now employed by Combustion Engineering Corporation in Montreal.

P. A. Lanigan, S.E.I.C., (McGill University, 1950, B.Eng., civil engineering) is with Southern Canada Power, in Montreal.

C. J. Kielland, S.E.I.C., (McGill University, 1950, B.Eng., civil engineering) has joined the staff of C. J. Jeffreys, consulting engineers, Montreal, as a structural engineer. He was previously in Lake St. John, Que., working for A. F. Byers Construction Co. Ltd.

A. Robert Jackson, S.E.I.C., (University of Manitoba, 1950, B.Sc., electrical engineer) is now an engineer-in-training with the Toronto Hydro-Electric System.

Charles H. Hood, S.E.I.C., (Nova Scotia Technical College, 1950, B.E., mechanical engineering) is a sales engineer with Austen Bros. Ltd., in Halifax, N.S. Previously he was a student engineer with the Nova Scotia Light and Power Co. Ltd., Halifax.

H. S. Hicklin, S.E.I.C., (University of Toronto, 1950, B.A.Sc., engineering physics) is working with Polymer Corporation, Sarnia, Ontario.

John W. Grainge, S.E.I.C., (University of Alberta, 1950, B.Sc., civil engineering) is a sanitary engineer for the Department of National Health and Welfare at Edmonton, Alta.

H. F. Gladish, S.E.I.C., (University of Toronto, 1950, B.A.Sc., mechanical engineering) is working as a junior engineer for E. B. Eddy, Company Ltd., Hull, Que.

C. Cameron Johnson, S.E.I.C., (University of New Brunswick, 1950, B.Sc., civil engineering) is with the Federal Department of Resources and Development as a park engineer in the national Parks Branch. He is stationed at the Fundy National Park at Alma, N.B.

Gerald J. Foley, S.E.I.C., (University of Saskatchewan, 1950, B.Eng., civil engineering) is employed by Central Housing & Mortgage at Ottawa, Ont., in the Defence Construction Branch working as a building estimator.

John S. Edwards, S.E.I.C., (University of British Columbia, B.A.Sc., mechanical engineering 1949, metallurgical engineering, 1950) is in the sales office of Dominion Oxygen Co. Ltd., in Winnipeg, Canada.

W. A. Corbett, S.E.I.C., (University of Manitoba, 1950, B.Sc., civil engineering) is working for Underwood & McLellan, consulting municipal engineers.

Edward Chow, S.E.I.C., (University of British Columbia, 1950, B.A.Sc. civil engineering) is with Swan, Rhodes & Wooster, consulting engineers, Vancouver, B.C., as a designing engineer.

Bruce Brown, S.E.I.C., (University of Manitoba, 1950, B.Sc., mechanical engineering) is with A. V. Roe Canada Ltd., at Malton, Ont.

L. M. Bluteau, S.E.I.C., (McGill University, 1950, B. Eng., mechanical engineering) is on a training course as a mechanical assistant with the Canadian Pacific Railway. Before starting the course he spent three months with the Royal Canadian Navy (Reserve).

J. Baumholz, S.E.I.C., is executive director of the Canadian Palestine Trading Co. Ltd. Previously he was secretary-treasurer and manager for Victory Equipment & Supply Co. Ltd., Montreal.

T. J. Anderson, S.E.I.C., (University of Saskatchewan, 1950, B.Eng., mechanical engineering) is engineering drawing instructor at the University of Toronto.

J. A. Aitken, S.E.I.C., (University of Manitoba, 1950, B.Sc., mechanical engineering) is a sales and service engineer with Combustion Engineering Corporation, Montreal, Que.

C. W. Dumka, S.E.I.C., of Edmonton, is working for Northern Electric Co. Ltd., in Montreal, as a design engineer.

J. F. Butterworth, S.E.I.C., (McGill University, 1950, B.Eng., metallurgical engineering) is employed with Light Alloys Limited, at Renfrew, Ontario.

H. F. Burns, S.E.I.C., (University of Manitoba, 1950, B.Sc., civil engineering) is in the engineering department of the City of Winnipeg.

Visitors to Headquarters

E. V. Buchanan, M.E.I.C., London, Ont., January 19, 1951.

J. G. G. Kerry, M.E.I.C., Port Hope, Ont., Jan. 23.

Drummond Giles, M.E.I.C., Cornwall, Ont., Jan. 25.

R. E. Kirkpatrick, M.E.I.C., Grand'Mere, Que., Jan. 25.

E. R. Eaton, M.E.I.C., Sudbury, Ont., Jan. 25.

V. C. Blackett, M.E.I.C., Moncton, N.B., Feb. 2.

Mrs. Blackett, Moncton, N.B., Feb. 2.

Viggo Jepsen, M.E.I.C., Grand'Mere, Que., Feb. 2.

Alan E. Cameron, M.E.I.C., Halifax, N.S., Feb. 6.

Allan Tubby, M.E.I.C., Saskatoon, Sask., Feb. 8.

G. R. McMeekin, M.E.I.C., Trail, B.C., Feb. 12.

T. C. Main, M.E.I.C., Edmonton, Alta., Feb. 12.

G. F. Bennett, M.E.I.C., Halifax, N.S., Feb. 12.

V. G. Kosnar, M.E.I.C., Ottawa, Ont., Feb. 23.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

Guy C. Dunn, M.E.I.C., who was assistant to chief engineer for the Canadian National Railway lines, and a resident of Perth, Ont., died on December 31, 1950.

Mr. Dunn was born in Quebec City in 1862, and was educated in Lennoxville, Que. In 1881 he went to work for the Atlantic and Northwest Railway (now C.P.R.). He was chief engineer of the Ottawa, Northern and Western System of railways for eight years, and manager of construction. During this time he built the Royal Alexandra Bridge at Hull, Que., which went into use in 1901. In 1904 Mr. Dunn was appointed district engineer for the New Brunswick section of the National Transcontinental Railway. He resigned from that position in 1908 and was appointed a district engineer of Grand Trunk Pacific Railway in New Brunswick. From there he was transferred to Winnipeg as division engineer in charge of engineering work on main line and branches, and from there to Fort William, and to Edmonton.

In 1921 he was appointed assistant to chief engineer of Canadian National Railways, a position which he held until his retirement in 1928.

He joined the Institute as an Associate Member in 1887, transferring to Member 1897. He was associated also with the Professional Engineering Associations in Manitoba and Ontario.

Frederick R. Wilford, M.E.I.C., railway and government engineer and contractor, Lindsay, Ont., died on January 15, 1951.

A native of Cookshire, Que., Mr. Wilford was born in 1866. From 1886 to 1890 he was engaged on the survey and construction of the Cape Breton Railway under the Dominion Government, after which he worked on maintenance of way for the International Coal and Railway Company. He was with the Canadian Pacific Railways from 1892 to 1895 on survey and construction. From 1895 to 1897 he was engineer for the Royal Pulp and Paper Mills Co. of East Angus, Que., in charge of river improvement, sidings and yards, a system of waterworks. In 1897 he was appointed assistant engineer on the St. Lawrence Canals by the old department of railways and canals of the Dominion Government. In this work he was in charge of various works in connection with the enlargement and deepening of the Iroquois Section of the Galops Canal.

A resident of Lindsay, Ont., for the past 40 years, he formed the firm of F. R. Wilford and Company with his two sons.

He built power dams at Bobcaygeon, Lakefield and Young's Point, a power station at Lindsay, and part of the C.P.R. lines from Lindsay to Bethany, as well as schools and hospitals in Belleville and Lindsay.

The company ceased to operate two years ago.

Mr. Wilford joined the Institute as an Associate Member in 1894, becoming a Member in 1903.

John Chalmers, M.E.I.C., of Vancouver, pioneer engineer, who surveyed western territory in building one of Canada's main rail lines, died at Vancouver, B.C., on December 20, 1950. Mr. Chalmers had gone to Vancouver from Montreal on his retirement in 1937.

He was born in Scotland in 1867, but he was educated in Canada and graduated from University of Toronto in 1894. He did railway work in Ontario first, and municipal engineering at Guelph, Ontario. In 1896 he was resident engineer for the Toronto, Hamilton and Buffalo Railway. From 1899 to 1906 he did right of way surveys for track laying and bridging for Canadian Northern Railway in Western Canada. From 1906 to 1912 he was structural engineer for the Department of Public Works of the Province of Alberta, in charge of construction of buildings and bridges, during which time the Parliament Buildings in Edmonton were built. He then worked for the City of Edmonton for several years, and he was with the Imperial Munitions Board during the first World War, at Ottawa and Winnipeg. He then joined John Quinlan Company, contractors, in Montreal and he was engineer and manager of the firm until his retirement in 1937. He resided in Vancouver after his retirement, devoting his time to gardening and the making of fine furniture.

He joined the Institute in 1899 as an Associate Member, transferring to Member in 1910.

L. N. Jenssen, M.E.I.C., died on May 21, 1950, in Norway.

Mr. Jenssen was born in Hommelvick, Norway, in 1871. He graduated from the School of Technology, of Trondhjem, Norway in 1891, and took a postgraduate course in hydraulics and structural engineering at the Polytechnicum, Munich, Germany. He was employed for 10 years in Norway on survey and construction work principally dambuilding and mill-erections, and in 1902 he came to Canada to work for Price Bros. at Quebec City. He was occupied on railway construction for several years in Quebec, Ontario and British Columbia His later engineering work took him to Norway, to Brazil, and to the United States where he was associated with G. D. Jenssen and Company in New York City around 1920. He was resident engineer in 1922 for Alexander Potter of New York in connection with work in Warren, Idaho, for the Unity Goldmining Company. He was later a construction engineer with the Cherry River Paper Company at Richmond, West Virginia.

In 1925 he joined the staff of the Duke-Price Power Company at Isle Maligne, Que., as a designing engineer. He joined Fraser Brace Ltd., in Montreal in 1926.

Mr. Jenssen retired from engineering work in 1939 and returned to Norway, where he resided at the time of his death.

He joined the Institute as an Associate Member in 1904, becoming a Member in 1911, and a Life Member in 1947.

John B. Parham, M.E.I.C., who was inspecting engineer for B.C. Electric Railway Co., in Vancouver, B.C., died on January 4, 1951, at his home in Vancouver.

Mr. Parham was born at Valleyfield, Que., in 1882, and was a graduate of McGill University from which he received the degree of B.Sc. in 1908.

He had served with the 5th Royal Scots of Canada in 1900, and had gone to South Africa with the 4th Canadian Mounted Rifles.

After graduation he worked with the Interprovincial Pacific Railway at Moncton, N.B., and with the North Pacific Lumber Company. He was employed for twenty years by the Canadian Fairbanks-Morse Co. Ltd., in charge of the electric and hydraulic department. His work included pump installations at Copper Mountain and Coldstream, B.C.; installations at the Dominion Experimental Farm at Summerland, B.C.; at the Esquimalt dry dock. He also worked for Canadian Fairbanks-Morse, after leaving their regular employ on an installation at Premier Gold Mining Company. He was later associated with the Greater Vancouver Water Board; and with the Public Utilties Commission of Vancouver. He joined the Seaforth Highlanders of Canada in 1927, being appointed general staff officer with the rank of captain in 1940. Retiring from active service in 1944 he rejoined the Greater Vancouver Water Board. He later assisted the B.C. Electric Company in the installation of the high-head penstocks of the Bridge River Development, acting as representative for the Shawinigan Engineering Co. Ltd. He was an inspecting engineer for B.C. Electric Company during recent years.

On the reserve of the Seaforth Highlanders, he acted as staff officer in Vancouver and Victoria during the Second World War.

He joined the Institute as a Student in 1907, becoming an Associate Member in 1913, and transferring to Member in 1936. He was also a member of the Association of Professional Engineers of British Columbia.

D. M. Fraser, M.E.I.C., president and general manager of D. M. Fraser Limited, Toronto, died on January 20, 1951.

Mr. Fraser was born at Edinburgh, Scotland, in 1879. He studied electrical engineering at the Heriot Watt College, Edinburgh. From 1906 to May 1910 he worked in Scotland on electrification of steel and cotton mills.

In 1912 he came to Canadian General Electric Co., as an estimating engineer. For C.G.E. he was responsible for the design, layout and complete installation of the electrical plant at the shipyard of the Canadian Allis-Chalmers Company. He inspected electrical work at Halifax Shipyards. He also prepared complete electrical proposition for the Prince Rupert floating dry dock and was responsible for the complete electrical distribution system for Lauzon Dry Dock, Levis, Que.

He formed the Dominion Engineering Agency Limited, in 1922, and was president and managing director of the firm. In 1927 he founded the firm D. M. Fraser Limited, and was president and general manager of this firm of agents for industrial electrical equipment, until his death.

Mr. Fraser joined the Institute in 1920 as a Member, receiving Life Membership in 1951. He was a fellow of the American Institute of Electrical Engineers, and a member of the Association of Professional Engineers of Ontario and the Toronto Electrical Club.

John H. Dyer, M.E.I.C., electrical draughtsman for R. A. Hanright, consulting engineer in St. Catharines, Ont., died on January 8, 1951.

Mr. Dyer, was born in Halifax, Nova Scotia, in 1906. He graduated from Nova Scotia Technical College in 1928 receiving a B.Sc. degree in electrical engineering.

In 1928 and 1929 he followed the student apprentice course at Canadian Westinghouse Company at Hamilton, Ont., after which he was appointed a junior switchboard engineer. In 1933 he was in the testing laboratory of Imperial Oil Company at Dartmouth, N.S. He joined the staff of St. Mary's College, Halifax, N.S. in 1935 and was assistant professor of engineering for two years, working during vacations for the Milton Hersey Company, Sydney N.S. In 1937 he joined the English Electric Company of Canada Ltd., St. Catharines, Ont., working with the Company on switchgear design until 1945. That year he went to Sutcliffe Company, Limited, in New Liskeard, Ont. In 1949 he became associated with R. A. Hanright, consulting engineer in St. Catharines, Ont., as an electrical draughtsman.

He joined the Institute as a Student in 1928, becoming a Junior in 1937, and a member in 1942. He was also a member of the Association of Professional Engineers of Ontario.

Leon S. Dixon, M.E.I.C., of Bangor Maine, passed away in December, 1950.

Mr. Dixon was born in Medford Center, Maine, in 1886. He graduated from Higgins Classical Institute and from the University of Maine with bachelor of science and master of science degrees in mechanical engineering. For the past twenty-five years, Mr Dixon held executive engineering, production and construction assignments with firms in Canada and the United States.

His early engineering work in the New England States, consisted of construction work for Industrial General Contractors; engineering for Cape Cod Construction Company; survey engineering for G.N. Paper Company Bangor, Maine; design engineering for General Electric Company, Lynn, Mass.; and mechanical engineering for Eastern Mfg. Co., Bangor, Maine. He did work for the U.S. Army, in 1918, returning to Eastern Mfg. Co. as a mechanical engineer until 1920.

He worked in Canada in 1920-21 with the Riordon Company, Montreal, after which he was manager of engineering for the Eddy Paper Corporation, Three Rivers, Que., in 1923-24. As consulting engineer he was again associated with the Riordon Corporation for a time. He was general superintendent of operation, production and process revisions in 1924-25, for the Bogalusa Paper Co., in Louisiana, after which he returned to Canada as chief engineer and construction manager for Canadian International Paper Co., Montreal. He served as consulting engineer and construction manager for the Eddy Company, Ottawa, in 1931-32, and was associated with pulp and paper and allied industries and utilities and water supply as a consulting engineer from 1933 to 1945. He was the pulp and paper consultant for Stone and Webster Engineering Corp., Boston, Mass., from 1945 to 1948; and for two years after was a consultant with Newport News Shipbuilding and Drydock Company. In 1950 he was a consultant working with Madigan-Hyland, engineers, of New York City, on a proposed new pulp and paper mill in Labrador. His headquarters were in Toronto during that time.

He joined the Institute in 1921 as an Associate Member, transferring to Member in 1923. He held membership also in the American Society of Civil Engineers, American Society of Mechanical Engineers, the Royal Engineering Society, the American Military Engineers, and the Technical Association of the Pulp and Paper Industry.

Allan Kenneth Hayes, S.E.I.C., of Harvey Station, N.B., died in a motor accident in Chatham, N.B., January 4, 1951

Mr. Hayes was employed by Diamond Construction Company as a junior engineer after graduating from the University of New Brunswick as a civil engineer in 1950. He had worked with the company previously as an undergraduate. He had also done summer work during his first three years at the university, with the Department of Highways of N.B., as a chainman and instrumentman.

He was born in 1926 in Woodstock, N.B., where he received his high school education.

NEWS of the BRANCHES

Activities of the Thirty-three Branches of the Institute and abstracts of papers presented at their meetings

Belleville

S. Sillitoe, M.E.I.C.,
Secretary-Treasurer

The 3rd Meeting of the Engineering Institute of Canada, Belleville Branch, was held February 8th at the Kiwanis Center with 40 members in attendance. Mr. F. F. Fulton was in the chair. The Secretary read the minutes of the previous meeting and gave a short report of the membership status, showing that it had reached a total of 84, and explained that this was due in part to an increase in territory which is still subject to change. He reported that Mr. Fulton had attended the Toronto annual meeting and that Mr. F. C. Adsett had attended the Peterborough annual meeting, representing Belleville.

Mr. J. H. Legate introduced the speaker of the evening, Mr. I. I. Sylvester, who took as his subject **Diesel Electric Locomotives take their place in Canadian Railroading.**

Mr. Sylvester began his address with a brief outline of the development of the Diesel electric locomotive over a period of the last 25 years and touched upon early experiences with experimental cars produced by the C.N.R. for service on its newly acquired branch lines. He gave an interesting description of the operation of the Diesel engine and explained the principles with the aid of slides, showing the difference between 2 cycle and 4 cycle engines. He pointed out that an experimental Diesel electric car, which was run from coast to coast over the C.N.R. lines in 1927, still holds the speed record for the trip, and was instrumental in establishing the possibilities for the Diesel locomotive. The first practical applications were made in smaller units used as shunters and switchers. With improvement in the power plant and the development of higher powers, these engines have gradually become applicable to freight hauling.

With the aid of films he showed the improvements in construction of the Diesel electric locomotive from the early developments to the modern stream-liner in which the frame work has been changed from a platform type of construction to a truss structure in which the major strength of the unit is built into the side walls of the locomotive. This structure is then covered with a streamlined skin. The major improvements in the Diesel locomotive, as compared to its steam predecessor, stem from the fact that the controls are electrical and therefore smooth acting. The tractive effort is therefore smooth rather than pulsating, which results in very much less tendency towards driver slippage and makes it possible for a locomotive of the same weight to start and pull a very much heavier load than the equivalent steam locomotive. In addition the smoother power makes it possible to operate at higher speeds over the same track. The efficiency of the Diesel locomotive is double the efficiency of equivalent engines using gasoline or high petroleum derivatives as fuel and in comparison with steam the advantage is graphically represented by the fact that one tank car of fuel oil is equivalent to 12 car-loads of coal. It is thus possible for the Diesel locomotive to run much greater distances without servicing and provided the human element and scheduling of runs can be managed, a modern locomotive may be run as much as 900 miles a day. At the present time Diesel locomotives have not been applied extensively to passenger service because the greater financial return on investment can be derived by applying the efficient Diesel to freight and shunting operations. One problem remains in connection with passenger application, namely the development of boilers for heating with sufficient capacity to cope with the extremely cold winter weather encountered in the Prairies and in the mountains. Continual development is proceeding on this important phase of the work and at the present time locomotives with a power of 4,500 horse-power are equipped with a boiler for heating with a capacity of 4,000 lb. per hour and are used on some of the shorter passenger runs. Mr. Sylvester closed his talk with an interesting colour film entitled "Railroading on the Maybrook".

After an interesting discussion period the speaker was thanked by Mr. J. Buchan.

Cape Breton

G. W. Ross, M.E.I.C.,
Secretary-Treasurer

S. G. Naish, M.E.I.C.,
Branch News Editor

On February 20, the Cape Breton Branch heard an interesting address by Mr. Peter J. Power, superintendent of industrial relations for Dosco, on **Human Engineering.** The speaker pointed out that modern statistics showed that most prominent men owed their success to their knowledge of how to get on with other people, rather than to their technical skill. In particular, the need is great for those in executive positions to be able to secure co-operation from those around them.

The address was preceded by a colour film "No Man is an Island" showing the operations of the Consolidated Mining and Smelting Company, which the members considered outstanding. This film was obtained by courtesy of Prof. D. J. McNeil, Department of Geology, St. Francis Xavier University, to whom a vote of thanks was proposed by Bill McDonald, seconded by J. H. Fraser.

The speaker was introduced by Branch Chairman Cliff Murray, and congratulated by Mark W. Booth. A vote of thanks to the speaker was moved by Alec Miller and seconded by M. R. Chappell.

Central British Columbia

M. L. Zirul, M.E.I.C.,
Secretary-Treasurer

The regular general dinner and meeting was held at the Allison Hotel, at Vernon, on January 26. Notices had been sent to all members and to all others connected with engineering in the district. Twenty-seven were in attendance. The guest speaker was H. N. Macpherson, regional vice president of the Institute.

Mr. M. L. Zirul, secretary treasurer, took the chair temporarily, in place of Mr. M. L. Wade, who was to install the newly elected executive. The new officers were presented and A. F. Paget, vice-chairman, assumed the chair in place of Mr. F. McCallum, chairman, who was unable to attend.

President Vance

Counterclockwise around this page are photos of the president's western trip.

At top left. Enjoying the scenery near Kamloops are W. M. Ramsay, past chairman, and F. McCallum, chairman of the C.B.C. Branch; with Mrs. Vance and H. N. Macpherson of Vancouver, who accompanied the presidential party through most of the trip.

In the next two photos the president is shown as he presented certificates of student prizes to R. H. Assaly and A. Mohammed at the Universities of Saskatchewan and Manitoba.

A group of student engineers at Saskatoon were J. B. Motta. R. R. Carley, O. Sawula, L. E. Timlin, W. G. Kostyshn and M. E. Stadnyk.

Buffet luncheon at Prince Albert with R. R. Keith, Mrs. Vance and Mrs. W. Christie.

The Prince Albert section executive in session with the president. W. F. Hayes, R. R. Keith, J. Jonsson, R. T. Hollies (Calgary), W. Waters, E. R. Smith, Mr. Macpherson (Vancouver), W. D. Smith, Mr. Vance.

Others of the group who met the president in Prince Albert were Mrs. J. Jonsson, W. S. Paine, Maurice Pardoe and Mrs. W. D. Smith.

The C.B.C. Branch executive at Kamloops — back row, L. E. Willis, M. L. Wade, R. A. Barton, A. F. Paget, M. L. Zirul. Front row, W. M. Ramsay, Mr. Vance, Mr. Macpherson and F. McCallum.

The president was greatly impressed by the great St. Mary dam near Lethbridge. Pictured here are two of the senior engineers on the project — Ben Russell, M.E.I.C., Alberta, director of water resources, and W. L. Foss, resident engineer.

Wm. Jamieson (centre) was host to the presidential party at Powell River, B.C. With him are G. W. Allen. W. N. Kelly, H. N. Macpherson, all of Vancouver, and the president.

Visits the Branches

Clockwise on this page are further scenes from presidential visits throughout Canada.

At top left are Dean McLeod of the Faculty of Applied Science, University of British Columbia; J. P. Fraser, assistant chief engineer, B. C. Electric Company; with Mr. Vance at the Vancouver Branch meeting.

Mr. and Mrs. Vance, with Mrs. H. N. Macpherson in Stanley Park, Vancouver.

Past-president E. P. Fetherstonhaugh, the president, J. C. Trueman and H. N. Macpherson at Winnipeg.

Another group at the Saskatoon meeting included I. M. Fraser, V. Dallin, J. B. Mantle, A. Tubby and E. K. Phillips.

The next picture was taken during the luncheon meeting with the executive of the Winnipeg Branch. It includes (l. to r.) A. E. MacDonald, Mr. Vance, J. C. Trueman, G. W. Moule, S. H. Eggertson, L. A. Bateman, R. T. Harland. In the foreground is J. W. Greenlaw.

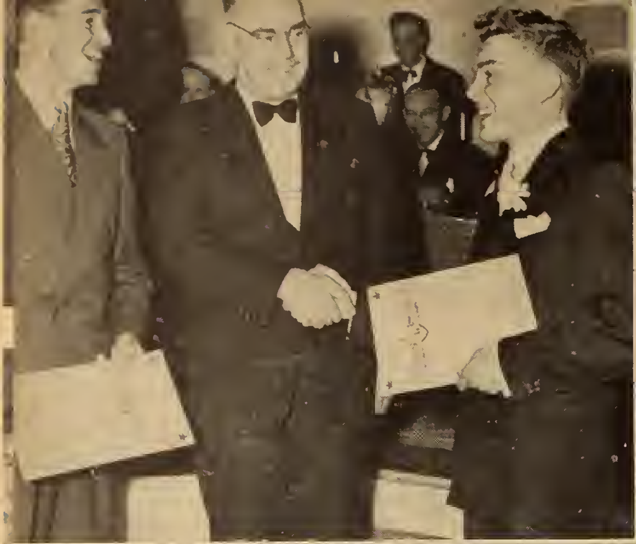
The head table at the Ottawa Branch luncheon meeting included, Mrs. D. B. Rees; R. S. Eadie (Montreal); Mrs. L. M. Christmas, past president, Ottawa Engineers' Wives Association; Dr. P. E. Gishler, chairman, Ottawa Branch, C.I.C.; Mrs. K. M. Cameron, Mr. Vance, and Branch Chairman Allan Ross.

Left to right. Norman Marr, D. M. Stephens (Winnipeg), B. B. Hogarth (Winnipeg), T. M. Patterson, at the Ottawa Branch luncheon.

Professors D. S. Nicol and M. L. Baker (foreground) and G. C. Reid and W. E. Jefferson (behind the table) listen intently to the president's message at Halifax. (The gentleman in the far background was not identified.)

The president and Mrs. Vance with Mr. and Mrs. Eric Hinton at Corner Brook, Nfld.

Presidents at Halifax. Left to right are president-elect I. P. Macnab, past-president J. B. Hayes, and president Vance.



Top left. A feature of the Hamilton Ball was the presentation of certificates for the best papers presented to the Branch by Students and Juniors. The winners R. B. Kerr and B. A. Warren are shown here receiving the president's congratulations.

Top right. The receiving line at the Engineers' Ball of the Hamilton Branch: Branch chairman L. C. Sentance, Mrs. Buchanan, Mr. Vance, Mrs. Vance, E. V. Buchanan, president at that time of the Ontario Association, and Mrs. Sentance.

Upper left. Back to the west again for this photo of Mr. Vance with the Lethbridge branch executive. They are (back row) W. L. Foss, R. D. Livingstone, R. S. Lawrence, P. E. Kirkpatrick, D. Cramer and (front row) A. L. H. Somerville, the president, M. S. Mitchell, A. G. Donaldson.

Lower left. When he visited the University of Alberta, Mr. Vance presented the certificate of the 1950 Student Prize to G. W. Jull.

Bottom left. During his visit to Ottawa Branch the president spoke to the students at Carlton College. He is shown here at the College with branch secretary W. R. Meredith, Air Vice-Marshal E. W. Stedman, assistant professor of engineering, and Branch Chairman A. C. Ross.

Bottom right. At the head table in Edmonton were: (l. to r.) R. E. Heartz (Montreal), T. W. Dalkin, Mr. Vance, Branch Chairman E. H. Wright, H. N. Macpherson (Vancouver) and Dean R. M. Hardy.

Top left. A reception was tendered the president in New York during the annual meeting of A.S.C.E. Some of those who attended were: R. J. G. Schofield, Mr. Vance, (unidentified), H. B. Oatley, R. E. Heartz, C. Davis, A. G. Christie, E. Vinet and C. E. Davies.

Top right. En route from Saskatoon to Prince Albert the president was a guest of J. L. Charles, M.E.I.C., chief engineer, Western Region, C.N.R. He is shown here with P. C. Perry, M.E.I.C., district engineer (left) and Mr. Charles, right, in the business car.

Upper right. During the annual meeting of the Military Engineers' Association, the president placed a wreath on the cenotaph at Chilliwack.

Lower right. Principals at the Military Engineers' meeting in Chilliwack: Maj.-Gen. McKenzie, Mr. Vance, Mr. T. Ingledow, Maj.-Gen. G. R. Turner, who was elected president of the Association.

Bottom left. The president was the principal speaker at the banquet of the Military Engineers' Association at Chilliwack. Here he is flanked by Lt.-Col. H. H. Minshall, Vancouver, and Maj.-Gen. Hertzburg.

Bottom right. This photo taken at the Hamilton Engineers Ball includes Branch secretary-treasurer G. L. Schneider, Mrs. Schneider, Mrs. J. B. Carruthers and Mr. Carruthers.

Mr. Macpherson, M.E.I.C., president and manager of Permanent Timber Products Ltd., Vancouver, was introduced by M. L. Zirul. In his **Comments on the Preservation of Timber Products,** he dealt with the history and development of wood preservation, the various types of rot and the treatments developed to combat them in the uses to which the timber is put. He described in detail the creosote treatments and the uses for which the treatments are suited.

Mr. Ramsay expressed the thanks of his audience to Mr. Macpherson.

A very interesting note was added to the meeting, by the presentation to Mr. A. G. Hatton, by members of the Water Rights Branch and by personal friends outside the Branch, some of whom were present, of a Hardy fly-fishing outfit to commemorate his retirement as district engineer from the Water Rights Branch.

Mr. Macpherson was called upon to lead a discussion on the possibility of forming a Central Branch of the British Columbia Engineering Association and of holding joint meetings of the E.I.C., and that body. A resolution was moved and seconded, and recorded and passed, that if such a branch of the Association is formed, its meetings would be held jointly with those of the C.B.C. Branch of the Institute. A committee consisting of Messrs. H. R. Hatfield, D. McMynn, and L. E. Willis, would give the matter further study.

Cornwall

John S. Sarjeant, Jr.E.I.C.
Secretary-Treasurer

A. A. B. McMath, M.E.I.C.
Branch News Editor

On January 26, the Cornwall branch met in Courtaulds' assembly room. This meeting was open to ladies and a total of 35 people attended.

The guest speaker on this occasion was Mr. Drummond Giles, president of Courtaulds (Canada) Limited. In his opening remarks, chairman G. G. M. Eastwood pointed out that besides being a local branch member, Mr. Giles was also a vice president of the Engineering Institute. Mr. Giles prefaced his address with a reference to Mr. Eastwood's impending departure to Kapuskasing. He expressed regret that the branch was losing a valued member who had rendered considerable service since the branch's inaugural in 1946 and wished him success in his new venture. Mr. Eastwood then handed over the branch charter to Mr. Giles, who passed it on to the new chairman, H. W. Nickerson.

Mr. Giles then described to his audience, some of the highlights of his recent visit to the Ottawa branch. After that, a 25 minute film was shown through the courtesy of Courtaulds. This film, "Threads of Science", told the story of rayon, in technicolour, from the time Robert Hooke first hoped in 1664 that such an artificial composition might some day be made. Georges Audemars' research in Switzerland in the 1850's and Count de Chardonnet's first rayon plant in France (1891) were mentioned. Courtaulds started operations in England in 1904. Their Cornwall plant opened in 1925 and produced the first rayon in Canada. After adding to this plant through the years, Courtaulds can now fabricate some 30,000,000 pounds of rayon annually.

The speaker was thanked by H. W. Nickerson. Then the latter called on Donald Ross-Ross to make a presentation to G. G. M. Eastwood on behalf of the members, in appreciation of his services to the branch.

Hamilton

G. L. Schneider, Jr.E.I.C.
Secretary-Treasurer

John H. Mitchell, M.E.I.C.
Branch News Editor

At the Annual Meeting of the Hamilton Branch of the Institute of Canada, Mr. L. C. Sentance presided at the head table of a luncheon at the Scottish Rite Club.

Mr. Sentance introduced the head table as follows:—E. R. Graydon, chairman, Toronto Branch, E.I.C.; Wm Stewart, chairman, Hamilton Branch, The Chemical Institute of Canada; E. T. W. Bailey, vice-chairman, Hamilton Branch E.I.C.; J. A. Vance, president, of the Engineering Institute; H. A. Cooch, chairman of the Board, Canadian Westinghouse; Dr. G. P. Gilmore, president, McMaster University; W. E. Brown, M.E.I.C. Councillar of the Institute; R. A. McLean, president, Hamilton Construction Assoc.; G. L. Schneider, secretary treasurer of the Hamilton Branch.

At the conclusion of the dinner, Chairman L. C. Sentance called the meeting to order and asked the secretary-treasurer to read the minutes of the last annual meeting. In his annual report, the secretary-treasurer stated that membership stood at 272 plus 64 non-resident members. Mr. Schneider read the nominating committee's proposed executive committee for 1951. This slate was put to the members and approved. The executives are as follows: chairman, E. T. W. Bailey; vice-chairman, W. L. Hutchison; secretary treasurer, G. L. Schneider; executive committee, F. J. McMulkin, J. H. Mitchell, M.E.I.C.; W. R. McColl, M.E.I.C.; H. H. Walker, Jr.E.I.C. The nominating committee for 1952 was nominated from the floor and included:—L. C. Sentance, H. A. Lumsden, A. Love, A. E. Tuck, G. L. T. Vollmer.

Mr. Neil Metcalf offered thanks to McMaster University through Dr. Gilmore for the thoughtful cooperation with Hamilton Branch in arranging the schedule of their lecture theatres for the monthly meetings.

Mr. H. A. Cooch introduced Mr. J. M. Breen, president of Canada Cement Ltd. Mr. Breen said "Engineering as a profession tries to help humanity and interests itself in all phases of civilization except those of art, literature and medicine". In solving many of life's problems an engineering background is a great help. Engineering is a man's job and does not attract "namby-pambies".

Today there is a great demand for engineers and those taking up the profession should obtain a broad education first and not specialize too early. Sometimes an engineer finds himself a specilist in a field for which there is no demand.

A four year course is not enough to make an engineer; graduation is not the end of the study but the beginning. Mr. Breen said "In the engineering curriculum greater attention should be given to two subjects, economics and public speaking." Of the first, sufficient is needed to give encouragement for study in later years. The second is important, as engineers generally are often unable to express their ideas in words.

The speaker was thanked by Mr. J. A. Brown.

The chairman introduced President J. A. Vance who said a few words of commendation for the work of the Branch over the past year.

The chairman reviewed the year's progress of the Branch, thanked the executive for their support, and handed the gavel to E. T. W. Bailey, chairman elect for the year 1951.

Mr. A. R. Hannaford thanked last year's executive for their fine service to the Branch.

Mr. Bailey stated that the next meeting would be at McMaster University Science Theater February 15 when Dean K. F. Tupper, University of Toronto, would speak on **"Heat Energy and Man;** then on March 22nd at Convocation Hall, McMaster University, the Hamilton Branch would invite all members of the Association of Professional Engineers, Chemical Institute, and outlying branches of the E.I.C. to hear Gen A. G. L. McNaughton, M.E.I.C.

The chairman adjourned the meeting.

Lethbridge

D. Cramer, M.E.I.C.
Secretary-Treasurer

J. T. Dokken, Jr.E.I.C.
Branch News Editor

The monthly dinner of the Lethbridge Branch was held on Saturday, January 20, in the Marquis Hotel with 75 members, guests and their wives attending. Chairman H. S. Mitchell presided.

Dinner music was supplied by the Browns' Musical Trio. Community singing led by R. S. Lawrence, a guitar duet by Jerry and Nick Devoss and a vocal selection by Miss Jackie Boyle accompanied by Mrs. Katherine Brown were enjoyed by all.

Mr. R. Hadlington of the Lethbridge Chamber of Commerce showed three fine films of varied geographic interest. "The Pearlers," a film showing a pearling ship off the coast of Northern Australia, depicted the method of obtaining mother-of-pearl, with emphasis on the work of the diver. The film stressed the high note of co-operation required between the diver and his "tender" on deck who is responsible for the diver's safety while under water.

The second film, "Across Ungava Peninsula", followed the journey of four scientists and four Indian guides across Northern Quebec's hitherto unexplored Ungava Peninsula. The party started by canoe on July 15th from the east coast of Hudson's Bay, moving upstream over a series of lakes with shallow rapids between each. This first part of the journey was barren of animal and bird life but 1500 new varieties of arctic flora were found and taken back. Twenty-seven water falls were encountered on this upstream trek indicating a great power potential. A new type of sextant was used on this trip for mapping.

After a four-day portage of over twenty miles through numerous lakes and rivers, the headwaters of the Payne River were reached on August 20th. Thick clouds of mosquitoes were encountered in this area against which high inds were the only defence. Permafrost was found to be 20 to 24 inches below ground surface. Bird, animal and fish life was very extensive over this part of the journey.

After a difficult journey of 325 miles the party arrived at Ungava Bay having collected a great deal of valuable data pertaining to this unexplored part of Canada.

The third film, "A Winter Carnival", showed the highlights of winter sports in Canada's various centres.

George Brown extended a hearty vote of thanks on behalf of the members and guests to Mr. Hadlington of the Chamber of Commerce for showing these interesting and educational films.

London

I. D. Patterson, M.E.I.C.,
Secretary-Treasurer

Robert G. Code, M.E.I.C.,
Branch News Editor

At the annual meeting of the London Branch of the Institute, Branch officers were elected as follows: G. E. Humphries, chairman; D. C. McGeachy, vice-chairman; I. D. Patterson, secretary-treasurer; Robert G. Code, D. N. Cooke, R. G. Newell, S. G. Chipman, and Donald Campbell. G. N. Scroggie is the past-chairman.

The guest speaker at the dinner was Mr. W. J. W. Reid of Hamilton, president of the Otis Elevator Company, Limited. Mr. Reid defined an engineer as one "who has been trained in engineering thinking".

Those so trained are becoming the main directing influences of modern life.

This shift of influence, said Mr. Reid, is not new and not novel. It has been occurring for some time. More and more engineers are receiving key positions in industry, business and finance. This trend will continue and increase, he predicted.

The shift in influence began when the world changed from an agricultural economy to an industrial economy . . . more and more pleople gravitated to industry for their livelihood. In turn the control of industry came more into the hands of the engineers who planned and built it.

Who then are influencing the majority of the people? If the majority are in industry, then one of the great influences in their lives is from industry—controlled by engineers.

For some time now, said Mr. Reid, we have been living in a 'materialistic world.' Not a world of materialistic ideology, but a world of actual materials. We want more cars, more highways, more plants, more power stations, he said, and these had been obtained by the 'engineering thinker'.

That the solution of the world's economic and social problems should become the work of engineers is natural, Mr. Reid said. As engineers are moving into all levels of finance and industry the social and economic problems are of necessity coming into their hands.

Their solution, he thinks, will be found as solution to production problems has been found. The 'engineering mind' is trained in logic and precision thinking. Once the problem has been analyzed the solution will not be long in coming.

However, he said, some engineers have adjustments to make in their new positions. Their precision-trained minds need some adjustment. Social problems aren't precise, he said, often they are intangibles. To this extent engineers must adjust themselves. Some have done so, others have yet to do so.

Members of the Military Engineers Association and the Association of Professional Engineers (Ontario) were invited to the meeting.

Montreal

R. B. Wotherspoon,
Secretary-Treasurer

There were over 100 present at the dance on February 2nd, at the Windsor Hotel, which was a great success and enjoyed by everyone. We were very

At the Montreal Branch Dance

Upper (clockwise around the table from left foreground) Tom Stafford, Mrs. Phaneuf, Leo Phaneuf, Mrs. Henne, Larry Henne, Mrs. Cholette, Pierre Cholette, Mrs. Mullins, George Ferrier, Harry Mullins, John Hillen, Mrs. Ferrier, Mrs. Perley, Allan Perley and Mrs. Stafford.

Centre (clockwise around the table from left) Unidentified, Mrs. Pragnell, Herb Pragnell, H. C. Link, Mrs. Link, K. R. Mills, Mrs. Mills, Mrs. Eldridge, T. Eldridge, Mrs. Hall, Per Hall and Miss J. Milne. Standing at right are Mr. and Mrs. E. G. Patterson.

Lower (left to right) Mrs. Croft, Archie Benjamin, Mrs. Fraser, Phil Croft, Mrs. Benjamin and E. G. Fraser.

sorry that the President and Mrs. Vance were unable to attend. Members and guests were received by Mr. and Mrs. R. E. Heartz, under whose patronage the dance was held, the Branch Chairman and Mrs. Smallhorn and the Vice-Chairman and Mrs. Lawton.

It can now be said that the Montreal Branch has five active Technical Sections with a sixth being organized. Meetings have been arranged by the Section Committees as follows: Civil Section, 6 meetings on Tuesday nights; Chemical Section, 3 meetings on Tuesday nights; Electrical Section, 5 meetings on Wednesday nights; Mechanical Section, 6 meetings on Monday nights; Transportation Section, 7 meetings on Tuesday nights.

The Mechanical Section is holding its meetings in the Ecole Polytechnique Auditorium and the Transportation Section meetings will take place in the Windsor Station.

We are pleased to report that Council has approved the use of the auditorium by the Branch on Monday to Thursday of every week, commencing 1st October, 1951. At this time it is expected that the Industrial Management Section will commence its activities.

Members not already registered with the Section or Sections of their choice, may do so in writing to the Secretary-Treasurer.

Members will have noticed that a high proportion of the expenses of the Branch has gone to printing of notices. In order to sustain the additional cost being incurred by the sections, your executive has decided to change the method of notifying members of meetings. In future two cards will be sent out each fortnight. One card will go to Members only and will give full details of 2 General (Thursday night) meetings with a list of section meetings, giving date, subject, speaker and place only. The other card will be sent to Juniors and Students with full details of a Junior Section meeting and listing with date, subject, speaker and place, the General and Section meetings of the Branch. Registered members of sections will receive notices of their section's activities.

Niagara Peninsula

J. J. Miller, M.E.I.C.,
Secretary-Treasurer

J. E. Kennedy, Jr.E.I.C.,
Branch News Editor

On Tuesday, January 16, the Niagara Peninsula Branch held a dinner meeting at the Esquire Hotel in St. Catharines. The speaker was Mr. W. J. W. Reid, M.E.I.C., President of Otis Elevator Co., and vice-president of the Engineering Institute of Canada. His subject **Modern High Speed Passenger Elevators,** illustrated with slides and motion pictures, was well received.

Mr. Reid traced the evolution of the elevator from the early models driven by steam engines and line shafts, through the age of hydraulic elevators to the modern traction drive units with the compact machinery in the penthouse and very complicated control systems. The complications increase roughly with the cube of the speed, and so does the cost of the installation. However, high speed elevators can handle more traffic and therefore fewer elevators are required, and Mr. Reid pointed out that in an office building of 8 stories, the rental income from the space saved by one less elevator shaft could amount to a half a million dollars over a period of forty years.

The modern "Autotronic" control systems, which in effect means automatic electronic, have gone a long way towards making the modern high speed elevators practical and foolproof. This "brain" of the elevator co-ordinates the movements of elevators in banks to give the most efficient service and can be set by the supervisor to handle the varying peaks that occur during a working day.

The next meeting was announced for February 15, 1951, at the Esquire Hotel in St. Catharines and will be a joint meeting with the Niagara International Section of the American Institute of Electrical Engineers, and the Engineering Department of the Canadian Comstock Company, Frequency Conversion Division. The speaker, arranged by the Engineering Department of Canadian Comstock Company, it was announced, would be Dr. Otto Holden, assistant general manager engineering of the Hydro-Electric Power Commission of Ontario, and his subject would be **The New Hydro Developments at Queenston and the Ottawa Valley Project.**

Peterborough

J. P. Watts, M.E.I.C.
Secretary-Treasurer

M. V. Powell, M.E.I.C.
Branch News Editor

The annual meeting of the Peterborough Branch was held at the Kawartha Golf and Country Club on January 30, 1951. A reception was held at 6:30 p.m. and the dinner with its traditional hams carved at the table then followed. The chairman, J. M. King presided at the business meeting and welcomed the visitors after expressing regret that our President, Mr. J. A. Vance, could not be present. The guests included Mr. Douglas Laird, assistant general secretary of the Institute, Mr. Jack Morris of Courtauld's Limited of Cornwall, and Mr. Fred C. Adsett of the Belleville Branch.

The business meeting was carried out in a lighter vein to relieve the tension under which many of the engineers have recently been working. All reports except that of the Secretary-Treasurer were verbal and decidedly humorous, the actual written reports, being filed for record. One item of the secretary-treasurer's report, the entertainment account came in for serious criticism by W. M. Cruthers who demanded an itemized accounting of the various expenditures. J. L. McKeever, the chairman of the Social and Entertainment Committee then stated in no uncertain terms that he would give no accounting. The guests and most of the members did not realize that this was part of the programme until about 2 ounces of liquid in a tiny bottle was passed over to Mr. Cruthers as his share of the entertainment. He then, was fully pacified after smelling, sipping and pouring it into his glass.

Mr. Adsett the representative of the infant Belleville Branch was wheeled in, dressed in baby clothes including bonnet, by Mr. Ross Dobbin, and conveyed greetings from his Branch. Mr. Douglas Laird gave a brief address on Institute affairs. Frank Pope introduced Mr. Jack Morris who outlined the "Trades Training Scheme" introduced in 1948 at Courtauld's Limited. The scheme is open to any employee from 20 to 40 years of age who is able to qualify.

The training period is two-and-a-half years and is broken up into six-month periods. In each period, the trainee learns a different phase of his chosen trade under a qualified workman who instructs eight trainees and receives extra remuneration. The trainees are also required to take night classes at the Cornwall Vocational School. Both speakers entertained the meeting with several superbly told stories.

The results of the election of Branch officers were as follows:—Chairman, A. J. Bonney, Quaker Oats Company; secretary-treasurer, J. P. Watts, C.G.E. Company; Members of executive, R. T. Bogle, G. S. Wade, J. L. McKeever, C. B. Muir, D. A. Drynan.

Saguenay

F. E. Hogg, M.E.I.C.
Secretary-Treasurer

W. A. Armstrong, Jr.E.I.C.
Branch News Editor

On Monday, January 22nd, 1951, a dinner meeting of the Saguenay Branch was addressed by Mr. J. F. Wickenden, vice-president of the Institute. Mr. F. G. Barker, presided, and the speaker was introduced by G. T. Malby, M.E.I.C.

Mr. Wickenden reviewed the affairs of the Institute and outlined a plan for a convention of the branches in his region. The lengthy question period which followed covered such topics as higher membership fees and procedure for obtaining membership for new Canadians.

Mr. E. Pare brought greetings from the Quebec Branch to the seventy-five guests present. Mr. Wickenden was welcomed to the district by Mr. L. C. Wellington of the Aluminum Company of Canada, and by Mr. N. F. McCaghey of Price Brothers.

Junior Section

R. H. Singleton, M.E.I.C.
Secretary

A technical meeting was held by the Junior Section of the Saguenay Branch, in the new Laboratories auditorium Tuesday evening February 6. Mr. E. H. Gavlas, of the Aluminum Company of Canada's Shipshaw Power House, presented a very interesting and instructive talk on **Principles of Design and Testing of Electrical Insulation.** The basic fundamentals of the behaviour of insulating materials when subjected to alternating voltages was first presented. This was followed by descriptions of the design of low and high tension power cables, of transformers, and of bushings (insulators at points where power cables enter transformers), particular stress being placed on insulating characteristics and subsequent power factor values. Finally, methods of testing insulation in the above equipment were described. This is done by applying an alternating voltage across the insulation and measuring the current and also the power that escapes across it. The contact positions for testing must be ingeniously chosen, particularly when checking the transformers.

The address was presented in an efficient and straightforward manner and so as to be understood by those less acquainted with electrical principles. The peaker was introduced by the chairman, Ir. H. V. Page and thanked by Mr. G. . Kinnear.

Sarnia

G. R. McMillin, M.E.I.C.
Secretary-Treasurer

R. Neil Payton, Jr.E.I.C.
Branch News Editor

On Tuesday, January 16, sixty members of the Sarnia Branch attended a inner meeting to hear an address by Ir. Brad Hooper of the Refractories Division, Babcock-Wilcox Company, New York. The speaker was introduced y P. C. Cochrane, and spoke on the opic **Refractories and Their Applications,** illustrating his address with oloured slides showing the manufacture f refractories in the company plant at Augusta, Ga.

Mr. Hooper described refractories under 4 major headings; scope of refractories made, general types, properties, and methods of control of properties. Refractories are defined as heat esisting materials and are made in standard brick shape, special shapes under 1,000 pounds, and refractory nortars. Refractories are necessary as a art of the "tooling-up" programme for many industries including the power, glass, iron and steel industries, the speaker explained. Before metals can be roduced there must be blast furnaces capable of resisting the particular temperature and atmosphere present in the rocess. Of the refractories made in the United States, silica and aluminous silica comprised 58 per cent, with lesser percentages of more costly magnesites, chromites and fused alumina. The later types may be used where resistance to basic or acidic slags are required, also for maximum resistance to abrasion. High thermal conductivity is a property common to these types. Much greater quantities of the intermediate grades of fireclay brick are used in steam boilers, open hearth and blast furnaces, which may require a million brick or more per furnace.

Other firebrick having special qualities include a heavy firebrick used for "backing-up" furnace walls and a lightweight insulating firebrick developed for the U.S. Navy. Weight of the latter brick is as low as one pound, containing 90 per cent air space and can withstand furnace temperatures up to 2400 deg. F. without serious loss of strength, shape or spalling. Thermal conductivity is approximately one-fifth that of average firebrick, making this type of firebrick of great promise in jet engine and atomic energy fields. Mr. G. Foucar on behalf of the local section thanked the speaker for his informative address.

Following the dinner, chairman of the new committees were introduced by President-elect C. P. Sturdee.

It was also announced that the President of the Institute would be guest of honour at the February and March meetings.

Sudbury

D. McKinty, M.E.I.C.,
Secretary-Treasurer

The Sudbury Branch of the Institute held a general dinner meeting on Friday, January 12, 1951. Fifty-eight attended, most of whom were members, with some from Sturgeon Falls and Espanola.

Mr. Rowatt, general sales manager of the S.K.F. Company, presented two films: "A Travelogue of Sweden's Industry" and "The Making of Bearings". The films were followed by a lively discussion period which showed the keen interest of the members in anti-friction bearings.

The application of the branch for membership in the Sudbury Chamber of Commerce has been approved and a branch member, P. R. McAdam, has been elected to the board of directors. The members have shown considerable interest in Branch membership in the Chamber and support of its functions should be quite active.

The next general meeting was announced as a dinner held jointly with the Professional Engineers, on February 9, 1951. Guest speakers would be E. V. Buchanan and Tom Medland.

Toronto

F. E. Wellwood, M.E.I.C.,
Secretary-Treasurer

I. S. Widdifield, M.E.I.C.,
Branch News Editor

Mr. C. D. Carruthers was installed as chairman of the Toronto Branch at the annual meeting held in the Albany Club on Tuesday, January 16, 1951. More than 100 members sat down to dinner and greeted President Vance on his presidential visit. President Vance discussed the engineering profession in Canada and expressed concern at the falling off of the enrolment of students in the engineering faculties of the Canadian Universities. He also felt that there was a definite need for greater cooperation between civilian and army engineers and suggested that army engineers in this military district be invited to take part in our Branch meetings. He thought it might be possible to have the army engineers address one of the meetings and tell the Branch members of their needs and problems. He outlined in some detail his trip across the Country and his visits to the various branches and closed by drawing attention to some of the problems facing the Institute in the near future.

The Leonard Medal was presented to Mr. Cavanaugh, of the Ontario Research Foundation, by President Vance.

The following societies were represented at the head table:

Class of 1951, University of Toronto.

Engineering Society of the Faculty of Applied Science.

Ontario Chapter A.S.M.E.

Toronto Branch A.I.E.E.

Toronto Builders Exchange.

Association of Professional Engineers of the Province of Ontario.

Toronto Chapter of the Ontario Architects.

Hamilton Branch E.I.C.

Belleville Branch E.I.C.

Past Presidents Dr. C. R. Young and Colonel Grant were also at the head table.

In addition to Chairman C. D. Carruthers, the following executive members were elected: W. H. Patterson, vice-chairman; F. E. Wellwood, secretary-treasurer; committee members, H. Cadario, McKenzie McMurray, Dean K. Tupper. The following committee members will carry on to complete their two year terms: R. Teagle, D. Beam, I. Widdifield.

Vancouver

Stuart S. Lefeaux, M.E.I.C.,
Secretary-Treasurer

H. T. Libby, M.E.I.C.,
Branch News Editor

The February meeting of the Vancouver Branch of the Institute was held in the Medical Dental Building Auditorium on February 16, with J. E. MacDonald in the chair and approximately 45 students and members present. The featured speakers were Dave Wood, Al Cronk and Emil Dubnie, whose papers had been selected as the three best in the competition recently conducted among the engineering students of the University of British Columbia. Don Jamieson, chairman of the student branch, was called upon to introduce the speakers.

The first paper, **Colour in Industry,** by Dave Wood dealt at some length with the benefits that can be derived by the careful study and application of colour in the factory and office. He showed how sound colour engineering tends to reduce fatigue and increase employee morale.

Al Cronk's paper on **Blanking Dies,** explained how the aircraft industry made cheap and effective blanking dies, suited more particularly for use on light guage and soft metals, at considerably less cost than conventional dies. He illustrated his paper with clear blackboard illustrations.

The final paper, **Copper Mountain Mine,** by Emil Dubnie, explained the geology of the area surrounding the Copper Mountain Mine near Princeton, B.C., and told of the high degree of mechanization and careful engineering planning required to make the removal of ore from this area economically feasible. Mr. Dubnie's paper was illustrated with a prepared map and much use was made of the blackboard during his talk.

The board of judges, comprised of W. Tindale, D. Denham and E. B. Webster, awarded the prizes to Emil Dubnie, Al Cronk and Dave Wood in that order. Dr. H. J. McLeod, dean of the Faculty of Applied Science of the University of British Columbia, in presenting the prizes, remarked that he was sure that the judges must have had great difficulty in selecting the best paper and thanked the Institute for the interest that it takes in the engineering students.

Mr. S. H. de Jong, chairman of the Programme Committee, outlined the tentative programme for the summer and fall season and stated that members would be formally notified as soon as the dates were established.

Mr. H. N. "Dutch" Macpherson reported on his recent visit to a Kamloops meeting and conveyed the best wishes of that group to the Vancouver Branch.

The regular monthly meeting of the Vancouver Branch of the Engineering Institute of Canada was held in the Auditorium of the Medical Dental Building at 8:00 p.m. on the evening of January 17th with members of the Vancouver Branch of the B.C. Engineering Society as guests. A record attendance of approximately 190 were present to hear a very fine talk by Mr. J. C. Oliver, Vancouver city engineer, on some of the problems of a city engineering department.

Mr. Oliver opened his address with a brief review of the services that were required in order that large cities could exist, such as sewers, water supplies, railway, interurban and urban transportation, airports, electric and gas services and communications such as telephones and telegraphs. He pointed out that, even though most of these services were carried on by private companies, the City plays an important part in the over-all planning.

In reviewing briefly the history of the City for the last 10 years he showed how during the war years a tremendous backlog of maintenance work was built up owing to the shortage of men and materials. By briefly reviewing, also, the tremendous growth in the population during the last decade he showed how a great expansion of existing facilities became necessary.

Mr. Oliver reviewed briefly the progress made todate. He explained that instead of the population remaining approximately static or even possibly declining after 1945, as had been anticipated, it has actually increased approximately 23 per cent. The City has also been affected by the rising costs of wages and materials so that the approved 50 million dollar 10-year programme has not been able to achieve what was expected of it. To-date 72 miles of streets have been paved or resurfaced, 55½ miles of sewers have been installed and 60 miles of water main laid. Besides this, 100 miles of gravel roads have been treated. All this, on top of the normal maintenance work that is required to the 1,000 miles of streets in Vancouver. The extent to which these repairs can go was emphasized by the fact that the cold spell of last winter cost the City $310,000 for snow clearing, sanding and extra maintenance on the light type of roads.

Mr. Oliver stated that traffic planning and traffic control was by no means the least important of the City's services. He mentioned the fact that the taxes paid by the ordinary domestic esablishment by no means pay for its share of the City's services. The difference is made up largely by the higher taxes paid by the down-town shopping area and by businesses and industries. He pointed out that in order to protect property values in the down-town area, and thereby maintain that source of revenue, it was necessary to provide for free flowing traffic in and out of the City and to encourage short-time parkers. He further explained that it would be virtually impossible to provide sufficient street capacity to permit everybody to use their private cars and drive into the heart of the City in the rush hours without some congestion, but as long as the transit system can operate freely by far the greatest majority of the people would be served.

Mr. Oliver touched briefly on traffic problems peculiar to Vancouver brought about by False Creek and mentioned the plans under consideration to overcome this difficulty. The first is, of course, the erection of the new Granville Street Span. In answer to a question Mr. Oliver replied that to the best of his present knowledge the bridge was going ahead as planned.

When questioned regarding the possibility of early completion of the Vancouver-New Westminster expressway, Mr. Oliver explained that it will be a very expensive project, costing at least $10 million per mile, and more in the cities. He said that at present the time lost and the volume of traffic does not merit such an expenditure although the time will undoubtedly come when it will. He explained that the stand that the City is taking is that the route should be established, building lines planned, the necessary properties purchased while they are comparatively cheap, rather than be faced at a later date with the problem of purchasing a route through fully built-up districts.

On behalf of the meeting Mr. R. A. McLachlan thanked the spreaker for an extremely informative and interesting talk, and mentioned that he was sure that many other civic-minded bodies would welcome such a talk.

Victoria

W. A. Bowman, jr.e.i.c.
Secretary-Treasurer

Gordon J. A. Kidd, s.e.i.c.
Branch News Editor

The annual meeting of the Victoria Branch was held in the Prince Rupert House on Friday evening, January 19, 1951. Chairman H. F. Bourne carried on the business meeting.

Mr. G. W. C. Lake, councillor, reported for the nominating committee and the following slate of branch officials were elected: chairman, T. A. J. Leach; vice-chairman, A. S. G. Musgrave; secretary-treasurer, W. A. Bowman; branch news editors, G. J. A. Kidd; executive committee, A. W. Lash and W. G. McIntosh; and D. A. MacLean, G. W. C. Lake and J. A. W. Izard, by virtue of their election for a two-year term at the last annual election.

D. A. MacLean, J. A. W. Izard, and G. Simmons, were nominated and elected to the programme committee. Colonel Sherwood was elected as auditor for the Branch.

Mr. Leach introduced Mr. G. F. Greene, light and power superintendent of the B.C. Electric Railway Company, who gave a most interesting address entitled, **Electronics Enter the Power Field.**

Mr. Green pointed out how the power engineer is accustomed to dealing with large things; huge dams, generators, thousands of amperes of current. His electronic brother engineer, as he juggles with vacuum tubes and tiny fractions of an ampere, which seem so puny by comparison, for years has been overlooked. However, it has gradually dawned upon the power engineer that the electronic engineer held the answer to problems that had gone unanswered for years. The electronic engineer has done much to keep the cost of electricity from rising when everything that goes into its operation and production has nearly doubled in the past few years. This has been done by reducing operation costs and much of this reduction has been brought about by use of electronic devices.

Mr. Greene then went on to explain some of these devices and how they are used. They are as follows: supervisory control by which the operation of numerous devices can be effected from a remote point over a single control channel; telemetering, where meter readings of temperature, water level, or any measurement that can be translated into electrical impulses can be transmitted over great distances; fault location for transmission lines which locates a fault in the line within a few hundred feet and eliminates costly patroling; space radio which is mostly useful for communication with mobile units; carrier current radio by means of which the same wire that carries the power can be used to carry intelligence; load control system, which is a combination of some of the above; automatic synchroscope which relieves the operator of the responsibility for bringing systems together at precisely the correct moment; microwave radio with its promise for increased transmission channels at less capital cost than telephone lines; the mercury arc rectifier which is important in the metallurgical fields; and the precise control of timing functions with the electronic timer.

As a result, during the short time that electronics have been in the power field, it has accomplished remarkable results with large savings in operating costs. Mr. Greene concluded his address by expressing the belief that electronics have been accepted as a very necessary part of an increasingly complex operation.

British Gas Turbine Developments

Most important news in this field during 1950 was the release of figures giving the power output of the Armstrong Siddeley "Sapphire" said to be the most powerful aircraft engine in the world. Static thrust is 7,200 -lb. which, at a speed of 600 miles an hour, is equivalent to over 10,000 horsepower—more than the whole power output of all four engines of a normal present-day airliner.

Another development witnessed during 1950 was the propulsion of a small passenger car by a gas turbine of 120 horsepower developed by the Rover Company in Britain. Two of these turbines were used to power a motor launch which was demonstrated on the River Thames.

Key to successful turbine practice is the metal of which turbine blades are made. This has been a major problem for designers throughout the world. In August, 1950, some details were released of the alloy known as "Nimonic 90", which has been in use on aircraft turbine engines for some time. It is claimed for it that, at 750 Degrees Centigrade, it is ten per cent better than the alloy used formerly (Nimonic 80 A) and that even at 870 degrees Centigrade it shows a high load-carrying capacity for long periods.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment.*

Situations Vacant

CHEMICAL

CHEMICAL ENGINEER to act as economic analyst. Applicant should have post graduate training in finance and commerce or business administration with 2 years experience in chemical industry. Duties include market analysis and research. Location Ontario. Apply to File No. 2036-V.

TWO CHEMICAL ENGINEERS required in Central Ontario with about 2 to 5 years experience in the chemical industry, for processing work in rubber plant. Apply to File No. 2036-V.

YOUNG CHEMICAL ENGINEER required in plant located in Province of Quebec. Applicant would be obliged after completing training period to take charge of analytical laboratory and to co-ordinate production with control both in alcohol distillery and in magnesia insulation plants. Preferably under 30 years of age with 1 or more years industrial experience. Apply to File No. 2054-V.

CHEMICAL ENGINEERS with production ability, to operate chemical equipment such as filter presses, evaporators, vacuum jets, solvent recovery, etc. Location Valleyfield, Quebec. Excellent opportunity offered. Salary open. Apply to File No. 2053-V.

CHEMICAL ENGINEER 1949 or 1950 graduate required by large pulp and paper industry located in Province of Quebec. Apply to File No. 2059-V.

CIVIL

CIVIL ENGINEER required by large construction company in Montreal. Applicant should have 3 or 4 years experience in the design of reinforced concrete. Apply to File No. 2033-V.

CIVIL ENGINEERS required by large construction company in Montreal. Applicants should have 2 or 3 years experience in field and general construction. Apply to File No. 2034-V.

CIVIL, ELECTRICAL AND MECHANICAL ENGINEERS

Required by Vancouver, B.C., firm for office design on large hydro-electric development. Desire only working engineers with three or more years hydro or related experience.

Applications should include complete record of experience, salaries received, salary expected, and time required to make a transfer to Vancouver. Salaries commensurate with qualifications. Apply to File No. 2065-V.

YOUNG CIVIL ENGINEER with knowledge of reinforced concrete structures. Duties include supervision of concrete construction in Quebec, measurements on the work, drawings, reports and process estimates. Applicant must be bilingual. Reply in writing, giving full particulars as to experience, qualifications and salary expected to File No. 2060-V.

CIVIL ENGINEER required by engineering department of construction company. Duties include estimating, laying out construction work and engineering supervision. Salary dependent upon ability. Reply giving complete details of background and experience. Apply to File No. 2064-V.

ELECTRICAL

ELECTRICAL ENGINEER required by large power company in Eastern Canada. Some experience preferable but not essential. Good opportunity for advancement. Excellent working conditions. Apply to File No. 2031-V.

ELECTRICAL ENGINEER 1947 or 1948 graduate with broad experience in selection installation and maintenance of electrical equipment in either industrial plant or public utility. Location Ontario. Apply to File No. 2044-V.

ELECTRICAL ENGINEERS required by large public utility in Montreal. Applicants with or without experience desired. Apply to File No. 2046-V.

MECHANICAL

MECHANICAL ENGINEER wanted, with designing experience and mechanical ability, plus a desire to become sales engineer, by manufacturer of road building machinery located in the Province of Quebec. Good speaking knowledge of French is necessary. Apply to File No. 2037-V.

MECHANICAL ENGINEER with 3 to 5 years experience in maintenance engineering. An asset if bilingual but not necessary. Location: Valleyfield, Quebec. Excellent opportunity offered. Salary open. Apply to File No. 2053-V.

MECHANICAL ENGINEER, recent graduate, to act as plant superintendent in large bakery in Montreal. Apply to File No. 2055-V.

MECHANICAL ENGINEER of about 35 to 40 years of age to assist mechanical superintendent of plant located in Eastern Canada. Work will involve assisting supervision of construction, installation and maintenance of plant equipment including pumps, boilers, refrigeration air-conditioning equipment, etc. Salary about $5,000.00. Apply to File No. 2056-V.

MECHANICAL ENGINEER required for large construction quarry and concrete company. Must have some experience in layout and design of plants. Salary commensurate with ability. Reply giving complete details of background and experience. Apply to File No. 2064-V.

METALLURGICAL

METALLURGIST, recent graduate required for cast iron foundry located in Province of Quebec. Apply to File No. 2050-V.

MISCELLANEOUS

TOP FLIGHT MAN for methods and time study work on all operations incidental to manufacturing of light and heavy sheet metal products. Excellent opportunity for man of proven ability and experience to establish himself with a sound company employing 200 people. Salary open. Applicants to apply in writing giving complete facts on education, experience and personal history. Enclose recent photograph. Apply to File No. 2029-V.

HYDRAULICS ENGINEER for the water rights branch, department of lands, B.C. Provincial Government. Salaries; hydraulic engineer Victoria and assistant district engineer, Kamloops $3,696.00 to $4,296.00 assistant hydraulic engineer, Victoria $3,336.00 to $3,576.00. Positions permanent; superannuation plan. Candidates must be British subjects, preferably under 45 years of age; graduates in civil engineering or equivalent; eligible for full registration in Association of Professional Engineers of B.C. (in case of the last position, eligible for registration as engineer in training), knowledge of survey methods, photogrammetry hydraulics and hydrology of river discharge, dam design, soil mechanics and samplings; field and office experience on engineering work in hydro electricity, or irrigation and water supply or hydrology. Apply to File No. 2032-V.

ENGINEERING PHYSICIST required in Ontario for laboratory control work on routine analysis, calibration and development of testing and measuring equipment. Applicant should have about 1 year experience. Apply to File No. 2036-V.

HYDRAULIC ENGINEER fully qualified required by large industrial organization in Montreal. Applicant should be familiar with the design of hydro-electric power stations and water storage. Apply to File No. 2038-V.

PROFESSIONAL ENGINEERS of 2 to 15 years experience required for a large manufacturing firm in Southern Ontario. Reply giving education, experience, etc., to File No. 2040-V.

TWO SALES ENGINEERS required by firm in Montreal manufacturing welding and cutting apparatus. Applicants should be 1949 or 1950 graduates in engineering with definite sales ability. Apply to File No. 2041-V.

GRADUATE ENGINEER required in the development and engineering department of firm located in Montreal. Applicant must have a minimum of 4 years experience in a steel manufacturing plant. Position involves technical assistance to the steel industry in use of our products and work on problems related to this field. The territory will be mainly in Quebec and Ontario with headquarters in Montreal. This is an excellent opportunity along technico administrative lines for the suitable person. Apply to File No. 2042-V.

SALES ENGINEER, preferably mechanical, required by organization in Montreal. Applicants should be around 33 to 37 years. Duties would include designing and selling under supervision of specialty machinery used in pulp and paper mills for handling pulp wood and newsprint. Starting salary $4,000.00. Apply to File No. 2043-V.

CHEMICAL OR PETROLEUM ENGINEER 1940 to 1945 graduate capable of geological evaluation of petroleum and gas producing areas and preferably with experience in refinery or chemical production. Location Ontario. Apply to File No. 2044-V.

REPRESENTATIVE required by firm in Toronto manufacturing tarred felt and pitch used in roof construction, tar distillers, etc. Applicant would be obliged to call on architects, consulting engineers and general contractors. Apply to File No. 2047-V.

MECHANICAL AND STRUCTURAL ENGINEERS to act as project engineers to undertake the study and necessary design and drawing work in connection with a combination bar and strip mill located in Ontario. Salaries open. Apply to File No. 2048-V.

PROJECT ENGINEER graduate with at least ten years experience in design, construction and operation of petroleum chemical plants on petroleum refineries, required to supervise project division of company engaged in engineering and construction of gas processing plants located in Montreal, Canada. Salary commensurate with ability and experience. Apply to File No. 2051-V.

ENGINEER, age 35 to 45 years as maintenance superintendent and chief engineer for large Montreal property, approximately 750 rooms. Must be certified for large boiler plant, and be experienced in controlling cost of maintenance trades, including plumbers, carpenters, painters, etc. Bilingual preferred. Attractive opportunity to become established in permanent congenial situation. Apply to File No. 2057-V.

DESIGN AND DETAIL ENGINEERS required by a package handling conveyer concern located in Ontario. Promotion to responsible positions is offered to applicants having the necessary ability and qualifications .Apply to File No. 2058-V.

MECHANICAL OR CHEMICAL ENGINEER with two to three years' design experience in the chemical or petroleum industry located in Ontario. Excellent opportunity offered for advancement in a fast growing young company. Apply to File No. 2061-V.

DRAUGHTSMAN, Senior layout man, required for the engineering department of new plant in Western Ontario. Must be capable of making complicated layouts from specifications, drawings, sketches or notes furnished by engineers and have considerable knowledge of manufacturing processes and their limitations. Should be capable of doing some designing. Experience in structural work and piping. University degree would be helpful but not necessarily required. Apply to File No. 2062-V.

TWO RECENT GRADUATES required immediately for new Canadian plant of well known American Company. Prefer men with interest in industrial piping for chemical and other industries. Excellent opportunities for advancement. Salary commensurate with ability and experience. Company located in Hamilton. Apply to File No. 2063-V.

WE REQUIRE QUALIFIED ENGINEERS experienced in construction work on reinforced concrete, structural steel and frame buildings, as well as incidental services. Administrative ability and technical knowledge are essential. Employee benefits include three weeks annual vaction, sick leave allowance and a liberal plan for life insurance. hospitalization, and surgical benefits for the employee and his family. Replies are to contain details concerning education, experience, salary requirements, age, marital status and date available. Apply to File No. 2066-V.

The following advertisements are reprinted from last month's Journal, not having yet been filled.

Situations Vacant

CIVIL

CIVIL DRAUGHTSMAN required by large well established Canadian company. Minimum of 10 years experience in concrete. Location Toronto. Apply to File No. 1687-V.

CIVIL ENGINEER, English speaking, preferably some surveying experience on road or transmission line location or other topographic work. For training in photogrammetry and subsequent emplyment as ground surveyor and control engineer for aerial mapping. Apply in writing stating experience to File No. 1691-V.

CIVIL ENGINEER, French speaking for training as operator of photogrammetric plotting machines and subsequent employment as operator in Montreal office. Good long term prospects for right man with executive ability. Initial salary during probationary and training period $200.00 per month. Apply to File No. 1692-V.

YOUNG CIVIL ENGINEER about 35 years of age with construction and administration ability. Applicant should be bilingual. Location Montreal. Excellent opportunity offered. Salary open. Apply to File No. 2009-V.

CIVIL ENGINEER required by large Canadian company with experience in structural steel design, preferably on hydro-electric structures such as gates and outdoor switching yards. Apply to File No. 2017-V.

CIVIL ENGINEER for design work on hydro-electric structures. Prefer at least four years' experience in this field. A knowledge of power house and dam foundations is desirable. Good opportunity with large Canadian company. File No. 137. Apply to File No. 2017-V.

ELECTRICAL

THE PUBLIC SERVICE OF CANADA requires Electrical Engineers (electronics and communications). Appointments at Ottawa. Toronto and Montreal. Salaries up to $4,740,000 per annum. Details and application forms may be obtained by writing Civil Service Commission, Ottawa. Competition No. 50-158-B. Apply to File No. 2016-V.

FULLY EXPERIENCED ELECTRICAL ENGINEER required by textile industry located outside Montreal. Applicant must have some real practical experience, about 15 years in a manufacturing plant, preferably textile mill. Excellent opportunity offered. Apply to File No. 1418-V.

FOUR ELECTRICAL ENGINEERS required by a large well established Canadian company. C or D class. Minimum 1-3 years experience, preferably in powerhouse electrical layout. Location Toronto. File No. 13651. Apply to File No. 1687-V.

FOUR ELECTRICAL ENGINEERS with five years or more experience in design, specifications, estimates, layout, inspection and testing, etc., for distribution work. Location Toronto. Reply stating age, education and details of work actually carried out in previous positions to File No. 1696-V.

ELETRICAL ENGINEER with a minimum of two years industrial experience on control devices and wiring, prefer test course training. Location Southern Ontario. Please quote File No. 13710. Apply to File No. 2005-V.

WELL QUALIFIED ELECTRICAL ENGINEER required by a large Canadian organization to act as supervisor of overhead distribution for its overseas operations. Duties will include long range planning of overhead distribution systems and allied substations; review of present overhead distribution practices with a view of improving and standardizing such practice and reducing operating costs. Quote File No. 137. Apply to File No. 2005-V.

ELECTRICAL ENGINEER required by large Canadian organization for its overseas operations to act as chief of system planning. Duties will include long range overall system planning of generating, transmission and receiver-station facilities in co-operation with operating companies; the direction of the activities of overhead and underground distribution, relay-protection, carrier-current, radio, special studies and standards and research departments. long range forecast of capital expenditures for the necessary transmission and distribution facilities and general engineering problems. Quote File No. 137. Apply to File No. 2005-V.

ELECTRICAL ENGINEER with two years industrial experience on circuit breakers, disconnect switches and metalclad switchgear, prefer test course background. Location Toronto. Quote File No. 13711. Apply to File No. 2005-V.

ELECTRICAL ENGINEER with a minimum of two years industrial experience on rotating electrical equipment, prefer test course background, duties include specification writing and general engineering work with large Canadian firm Location Toronto. Refer to File No. 13712. Apply to File No. 2005-V.

YOUNG ELECTRICAL ENGINEER, 1949 or 1950 gradaute required by consulting engineering firm in Montreal. Salary open. Apply to File No. 2008-V.

ELECTRONIC ENGINEERS required by large Montreal firm for development work on radio communication equipment and radar. Applicants should have three or more years of practical design experience in this field. Apply to File No. 2011-V.

ELECTRICAL ENGINEER required by university in Montreal. Duties include design and construction of electronic equipment and finally extensive research. Apply to File No. 2022-V.

ELECTRONIC ENGINEER required in Montreal with some experience with radar. Apply to File No. 2026-V.

MECHANICAL

MECHANICAL ENGINEER required by large organization in Montreal. Applicant should be between 30 to 35 years. Duties include general machine shop work and planning. Apply to File No. 1673-V.

MECHANICAL ENGINEER required for small manufacturing plant in Niagara Peninsula. Duties will consist of general draughting and machine design, particularly valves. Some previous experience would be advantageous. Apply to File No. 1681-V.

TWO MECHANICAL ENGINEERS for mechanical inspection in the field. Experience necessary in Hydro-Electric projects. Location overseas. Apply to File No. 1687-V.

MECHANICAL ENGINEER to act as sales engineer for large organization in Montreal. Salary range $5,000.00. Apply to File No. 1690-V.

MECHANICAL ENGINEER required by firm located in the Maritimes with some experience in steel design and construction. Apply to File No. 1695-V.

MECHANICAL ENGINEER required by a large manufacturer in Montreal of heavy mechanical equipment. Applicant should have several years industrial experience which should include a background of welding knowledge Apply to File No. 2001-V.

MECHANICAL ENGINEER with several years experience on design and layout of mechanical equipment for hydro-electric construction, location Southern Ontario. When replying please quote File No. 137-8. Apply to File No. 2005-V.

Managing Engineer

For Canadian owned company manufacturing electrical equipment in Toronto. Professional engineer with electrical-mechanical background required, preferably with experience in switch gear cubicle and street lighting design. This position requires both administrative and engineering ability. Age range—30 to 40. Excellent future, good salary, plus bonus and pension. Give full details of education and experience. Our employees know of this advertisement. All replies will be held in strictest confidence. Apply to File No. 2067-V.

ENGINEERS

for

Defence Construction Work

We require qualified engineers experienced in construction work on reinforced concrete, structurol steel and frames buildings, os well os incidental services. Administrotive ability ond technical knowledge are essentiol. Employee benefits include three weeks annuol vacation, sick leave allowance ond liberol plan for life insuronce, hospitalization, o n d surgicol benefits for the employee and his family. Replies ore to contoin detoils concerning education, experience, solory requirements, age, moritol stotus and dote ovoilable. Apply to File No. 2066-V.

MECHANICAL ENGINEERING GRADUATE or equivalent with three or more years experience in design and manufacture of light alloy structures required by large Montreal firm manufacturing radio communication equipment and radar. Apply to File No. 2011-V.

MECHANICAL ENGINEER recent graduate up to three years employment interested in obtaining drawing office experience in plant production of heavy armament work. Forty minutes by tramways from Phillips Square, Montreal. Apply to File No. 2014-V.

MINING

TWO MINING ENGINEERS required by large firm in Province of Quebec to take charge of surveying work underground. Reply giving full details of experience and salary required. Apply to File No. 2015-V.

MISCELLANEOUS

TWO SALES ENGINEERS required to act as representatives in Montreal and Toronto by young progressive industry, interested in the sale of British made products and having some experience in pulp and paper industry. Apply to File No. 1674-V.

SENIOR PETROLEUM ENGINEER required by independent Canadian Oil Company with headqaurters in Calgary. Applicant should be particularly experienced in reservoir engineering and production practices. No one with less than 7 years experience in the industry need apply. Give synopsis of education, training and experience and supply recent photo. Apply to File No. 1675-V.

MECHANICAL OR ELECTRICAL ENGINEER for supply inspection department of a large organization in Toronto. Applicant should have at least 12 to 15 years extensive practical shop and office experience in the manufacture of heavy mechanical and electrical machinery and equipment. Reply stating age, education and details of experience to File No. 1678-V.

SENIOR BUYER with 7 to 10 years diversified purchasing experience. Electrical engineering or engineering training desirable; also administrative or supervisory ability. Location Toronto. Apply to File No. 1679-V.

TWO MECHANICAL OR ELECTRICAL ENGINEERS for the design and development of meters and clocks, required for large electrical organization in Quebec City. Apply to File No. 1682-V.

INSTRUMENT ENGINEER (electrical or mechanical preferred) required for large oil refinery in Montreal east. Applicant should have not less than three years experience as instrument engineer or not less than 5 years general electrical engineering experience. Would be expected to take charge of instrument department under general supervision of power engineer. Salary open. Applications will be treated confidentally and should include full particulars as to qualifications, together with recent photograph. Apply to File No. 1684-V.

RESIDENT ENGINEER wanted, for construction of proposed Granville bridge in a Vancouver, B.C. Duration of work approximately two years, starting about March 1, 1951. Applications should be made by letter giving full details of experience, professional qualifications, age, etc., and salary expected. Apply to File No. 1685-V.

SALES ENGINEER or contact man required by a firm of inspection engineers in Montreal. Must have considerable experience and be between 30 and 40 years of age. Apply to File No. 1686-V.

RESIDENT ENGINEER required by large well established Canadian company, minimum 10 years experience in Hydro Electric construction, competent in design, construction experience in field. Age approximately 40 years. Location overseas. Apply to File No. 1687-V.

BRITISH ADVERTISER seeks Canadian engineering firm with reputation, willing to join with long established English counterpart. Enquirer to provide capital, select tools and supervise projects directed to both government equipment and rearmament programs. Also industrial manufacturer of small engines, motorcycles, etc. Apply to File No. 1688-V.

DESIGN ENGINEER preferably mechanical required by large organization in Montreal. Applicant must have admisistrative ability. Salary range $5,000.00. Age 30 to 40 years. Apply to File No. 1690-V.

GRADUATE ENGINEER for design work on buses, required by large organization in Montreal. Apply to File No. 1690-V.

GRADUATE ENGINEERS AND DRAUGHTSMEN, mechanical, civil, electrical required for projects in Ontario and Quebec. Preference to those with 3 years practical experience. Apply to File No. 1697-V.

MECHANICAL (practical) Production Engineer, with thorough knowledge of metal working machinery, plant layout, processing, tooling and die making, production control for Western Canada Manufacturer selling all across Canada to other manufacturers and to wholesalers. Prefer man of 40 or older. Permanent and good future for a good practical factory manager and producer. Apply to File No. 1704-V.

AIRCRAFT HYDRAULIC DESIGNER required by large Montreal aircraft manufacturing firm. Must have 4-5 years experience and sound overall knowledge of system layout, flow calculations and detail component design. Apply to File No. 1703-V.

TECHNICAL REPRESENTATIVE required in Montreal by Canadian Branch of British textile firm, manufacturing textile and cable machinery. Applicant must have executive ability as position offers exceptional opportunity. Apply to File No. 1706-V.

SCIENTIFIC OFFICERS wanted. Applicants should be Canadian citizens who are graudates in science, preferably with post graduate training. Research or general experience in some particular scientific field is desirable in certain positions. War service will be considered an additional qualification in some positions and a requirement in others. The main duties will pertain to the co-ordination, control and dessemination of scientific information in most of the major fields of science and technology. Salary $2,700.00 - $3,800.00 depending upon qualifications and experience. Apply to Box 1274, Station B, Ottawa, Ontario. Apply to File No. 1707-V.

DESIGN ENGINEER approximately ten years experience in structural material handling and mechanical design. Boiler design experience an asset but not essential. Location Western Canada. Apply to File No. 2000-V.

CITY ENGINEER required in Western Canada. Applicants should state age, qualifications, salary required and details of previous experience. Preference will be given to applicants possessing municipal engineering experience. Apply to File No. 2003-V.

HYDRAULIC ENGINEER with several years' experience on reinforced concrete design nad hydraulic structures, location Southern Ontario. Please quote File No. 13709. Apply to File No. 2005-V.

GRADUATE ENGINEER required by firm located in Western Canada, to handle all packaging equipment and installations throughout Canada, as well as all machines and equipment in plant. Headquarters in Winnipeg. Recent graduate required. Apply to File No. 2006-V.

RADIO TECHNICIANS required by small manufacturer located in the Maritimes, for aircraft electronic equipment maintenance. Applicants should have some experience. Apply to File No. 2007-V.

PRODUCTION MANAGER for small light engineering unit located in the Maritimes, employing approximately 60 people. Duties include production methods and layouts, produce own cost estimates on jobbing basis and be wholly responsible for operation of plant production facilities and personnel. Apply to File No. 2007-V.

CHIEF DRAUGHTSMAN required to establish small drawing office in electronics plant, located in the Maritimes. Mechanical design experience of electronic equipment, small mechanisms and structures. To be responsible for mechanical design, drawing system and draughting personnel. Mechanical draughtsmen also required. Apply to File No. 2007-V.

SENIOR ENGINEERS required by small manufacturer located in the Maritimes. Age 25 or over. University degree in engineering or physics. Three or more years experience in electronics in a senior capacity. Preferably with experience in radar problems. Salary $4,000.00 to $6,000.00. Junior Engineers also required with same type of background. Apply to File No. 2007-V.

FULLY QUALIFIED TEXTILE TECHNOLOGIST, graduate of textile institute, required in Montreal by industrial consultant. Applicant should have industrial engineering experience. Give full details as to experience and education to File No. 2012-V.

SALES ENGINEER, excellent opportunity for right man. Ontario sales and service for power house chemicals with established and growing firm. Degree in chemical engineering and knowledge of power plants and water treatment desirable but not essential. Prefer ages 25 to 35. Apply to File No. 2013-V.

MECHANICAL DRAUGHTSMEN, detailers, checkers, all grades from 2 years experience and up for plant in production of heavy armament work. Forty minutes by tramways from Phillips Square, Montreal. Apply to File No. 2014-V.

TWO INDUSTRIAL ENGINEERS, graduates in mining, required by large organization in Province of Quebec. Applicants should have some experience underground to do time study work, eventually leading to senior positions in methods and layout work. Reply giving full details of previous experience and salary desired. Apply to File No. 2015-V.

CIVIL OR MECHANICAL ENGINEER required by large mining organization in Province of Quebec for design and layout of buildings and equipment for asbestos milling operations. Reply giving full details of previous experience and salary desired. Apply to File No. 2015-V.

SUPERVISOR OF UNDERGROUND DISTRIBUTION. Large Canadian organization requires well qualified electrical engineer for its Brazilian operations, duties will include long range planning of all underground distribution systems and of allied substations, review of the present underground distribution practices and reducing operating cost, making such studies as required by the chief of system planning or the chief electrical engineer. Apply to File No. 2017-V.

ASSISTANT PRODUCTION SUPERINTENDENT required by large firm of long standing manufacturing men's shirts, pajamas, etc., for plant near Three Rivers, Quebec. Experience in manufacturing these lines or similar necessary. Applicant would be required to plan for high production, improve methods, lower costs, etc. Good position to right party. Apply to File No 2018-V.

RESEARCH CHEMIST required by chemical firm in Ontario for laboratory research under supervision. Minimum age

23 years, bachelor's or master's degree in chemistry or chemical engineering. Two or three years technical experience or Ph.D. in lieu of experience. Apply to File No. 2019-V.

CHEMIST required by chemical firm in Ontario for the development of textile chemicals. Minimum age 27 years. Degree in chemistry or chemical engineering with 5-10 years technical (laboratory or production) and sales experience. Position reqiures both research and sales abilities combined with practical knowledge of textile industry. Apply to File No. 2019-V.

ASSISTANT WORKS MANAGER required by chemical firm in Ontario. Age 30 to 35 years. Degree in chemical, mechanical or civil engineering, minimum of 5 years experience in industry. Responsible for overall supervision of plant operations, capable of maintaining discipline and assuming responsibility. Apply to File No. 2019-V.

SALES ENGINEER, recent graduate, preferably mechanical or electrical required by well established supply house with nation wide representation. Experience in equipment sales, of value but not essential. Training period to be spent in Montreal. Good opportunity for advancement to party interested in making career of this work. Apply to File No. 2020-V.

ARCHITECTURAL DRAUGHTSMAN required by large pulp and paper manufacturer in Eastern Canada for general architectural designs covering building changes on existing buildings and new buildings, etc. Apply to File No. 2021-V.

ENGINEERING DRAUGHTSMAN required by paper industry located in Montreal. Must be fully qualified. Apply to File No. 2023-V.

THREE FULLY QUALIFIED ENGINEERS required by a firm of management consultants located in Montreal. Salary open. Apply to File No. 2024-V.

MECHANICAL OR CIVIL ENGINEER required by national beverage company to act as plant superintendent in plant situated outside of Montreal. Applicant should be between 25 to 35 years of age. Salary open. Apply to File No. 2025-V.

Situations Wanted

GRADUATE CIVIL ENGINEER AND LAND SURVEYOR with proven ability to carry out responsibilities. Available on short notice. Over 23 years of wide experience on four continents. Experience includes design layout and field supervision of: roads, dams, buildings, drainage, irrigation works. Veteran C.R.E. and E.A.E., married, bilingual. Situations held in Canada: Chief of survey parties, resident engineer. Abroad: as district and assistant chief engineer for over 19 years in the British, Turkish, Iraqi, Government Services. Apply to File No. 489-W.

MECHANICAL ENGINEER, S.E.I.C. 1950 graduate, University of Toronto. Age 24, single. Experience in machine shop and repair and maintenance work. Presently employed in structural steel, foundry and machine tool industry as plant layout and maintenance engineer. Interested in permanent position leading to responsibility. Willing to work and learn. Available on short notice. Apply to File No. 505-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., P.Eng., (Ontario), age 31, married. Presently employed in Toronto. Desires responsible position with manufacturing firm. Nine years experience in mechanical and structural design, inspection, shop liaison, and sales and service. Apply to File No. 2586-W.

MECHANICAL ENGINEER, Jr.E.I.C. (McGill, 1947). Age 25, married and family of two. Experience consists of four years of summer work as instrumentman on highway construction; several months as sales engineer in pumps and allied electrical equipment; one year including specialized training in fire inspection work for United States fire insurance company. For the past two years have been a full partner in a road building outfit in Western Canada. Desires permanent position where responsibility, organization and sales ability are important qualifications. Starting salary and location are secondary factors. Available immediately. Apply to File No. 2858-W.

GRADUATE DRAUGHTSMAN, designer, Jr.E.I.C., B.Eng. Desires a position in the structural design field, preferably reinforced concrete and design. Age 24, McGill (Civil) graduate 1948. Two years experience in structural steel and reinforced concrete detailing and design. Prefer employment in Montreal area, will consider good position elsewhere. Presently employed. Available on short notice. Apply to File No. 3026-W.

MECHANICAL ENGINEER, B.Sc. 1941, single, veteran of R.C.A.F. Experience in laboratory work, aircraft maintenance, design of heavy machinery with emphasis on welding and applied stress analysis. Desires work of research nature. Willing to work outside Canada Apply to File No. 3058-W.

MECHANICAL ENGINEER, 1947, Jr.E.I.C., age 26, two years of experience in maintenance and one and one-half years of experience in design and installation in industrial plants. Desires quality control or industrial engineering work in Montreal. Apply to File No. 3208-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng. Six years experience in design, manufacturing, sales and application engineering, including electronic test equipment design, manufacture of public address equipment, preparation of sales information and technical writing, application of motors, controls, transformers, switchgear, etc. Desires permanent position in power field, in design, operating or application engineering, not sales. Aims to advance into management or advisory engineering. Location preferred, Southern Ontario or British Columbia. Apply to File No. 3326-W.

CIVIL ENGINEER, B.Sc. 1947, Jr.E.I.C., P.Eng. (Quebec), age 26, married, with car, 3½ years varied structural experience with architects, fabricators and contractors, covering design, detailing and estimating of structural steel and concrete as well as liaison work, desires position with responsibility. Must include outside work in design and supervision, and/or liaison work, or sales promotion. Available on one months' notice to present employer. Ontario or Alberta preferred. Apply to File No. 3340-W.

GRADUATE ENGINEER, M.E.I.C., married. Approximately 14 years industrial plant and construction experience including positions as resident construction engineer and plant engineer. At present employed and would consider changing only if offered a similar or better position with suitable opportunity for advancement. Apply to File No. 3387-W.

SENIOR PRODUCTION ENGINEER, M.E.I.C., of internationally famous engineering concern would like to assist small or medium size engineering firm in Montreal area in quickly clearing up design, production, or estimating difficulties. Available Saturdays or evenings. Temporary assignments considered. 10 years wide experience, fully qualified. Apply to File No. 3392-W.

MECHANICAL ENGINEER, S.E.I.C. Graduated with honours from U.B.C. in May, 1950. Age 24, single and in good health. At present employed in non technical work in Ontario receiving supervisory training. Would like design development on research work anywhere in Canada. Available on short notice. Apply to File No. 3395-W.

ELECTRICAL ENGINEER, honours degree, A.M.I.E.E., M.A.I.E.E. 10 years experience world famous electrical manufacturing company wishes permanent position anywhere in Canada. Very adaptable having broad range of interests. At present in Great Britain. Available early 1951. Apply to File No. 3396-W.

ELECTRICAL ENGINEER, S.E.I.C. Graduated University of Alberta, 1950. Veteran, age 29; married, no children, desires permanent position anywhere in Canada. Have Naval electrical experience and training (E.A. 3rd Class), also experienced in electrical servicing. Have good technical background and excellent personality records Available immediately. Apply to File No. 3403-W.

CIVIL ENGINEER, Jr.E.I.C., 31 years, B.A.Sc. Toronto '43. 7 years experience in industrial and housing construction both in field engineering and job supervision. Desires position in Southern Ontario in construction or related industry. Apply to File No. 3404-W.

WELDING ENGINEER, M.E.I.C., P.Eng. B.A., B.Sc. Queen's 1941. Age 34, married. 7 years production and development experience in the fabrication of heavy industrial equipment with particular reference to welded pressure vessels. Desires continued experience in this or related fields. Available on short notice. Apply to File No. 3407-W.

MECHANICAL ENGINEER, M.E.I.C., graduate McGill 1943, veteran, age 30, seeks position as project or plant engineer. Broad experience in plant layout, design, construction, alteration and maintenance work. Employed during past 3 years on design and construction of large mill now nearing completion. Would consider alternative position as executive assistant or sales engineer Apply to File No. 3405-W.

CONSTRUCTION COST ENGINEER, Queen's 1948, R.C.A.F. Veteran, with experience in all phases of estimating, scheduling, cost control, material requisitioning and expediting, for both large and small industrial projects, desires an executive or supervisory position where hard work and initiative will lead to advancement. Other assets include wife, two children and own car. Location unimportant. Apply to File No. 3406-W.

GRADUATE CIVIL ENGINEER, M.E.I.C P.Eng. (Ont.). Age 38, married, family 2. Experience includes 10 years mining and 6 years pulp and paper covering—construction, plant engineering and design. Presently employed as assistant resident engineer. Ontario or Quebec province preferred. Available on reasonable notice. Apply to File No. 3409-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., age 25, five years experience in highway and bridge construction. Presently employed but desires position with more varied experience. Am interested in any type of engineering and will work anywhere. Available in three weeks. Apply to File No. 3411-W.

1950 GRADUATE University of Saskatchewan, distinction in Engineering Physics, 26 years, family of 2. Currently mastering in physics. Have background as resident engineer on municipal engineering project; ex-navigation instructor in R.C.A.F. Desire work in applied research or in general engineering Available May 1951. Apply to File No 3414-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.Eng., McGill 1949. Age 28. Single. Good health. Experience: two summers as junior draughtsman in pulp and paper mill, two summers as helper in foundry and boiler shop of firm manufacturing heavy machinery, spring 1949 to date as engineer with major oil company. Desires to obtain plant engineering experience with a firm located in the Toronto area. Apply to File No. 3415-W.

TWO PROFESSIONAL ELECTRICAL ENGINEERS, Jr.E.I.C., Honours graduates of Canadian Universities, having completed two years training with a leading Canadian Electrical Manufacturer, seek to better their positions. Professional employment with any progressive Canadian company will be considered. Apply to File No. 3416-W.

ELECTRICAL ENGINEER, S.E.I.C., B.A.Sc., U.B.C. 1950. Age 27, single. Experience: Radar mechanic R.C.A.F. One summer each as coal mine car repairer, tipple machinery operator, and electricians' helper in coal mine. Will work anywhere. Available immediately. Apply to File No. 3417-W.

MECHANICAL ENGINEER, S.E.I.C., graduate University of Saskatchewan 1950 Age 31, married. 4 years overseas with R.C.A.F. as wireless mechanic. Some boiler shop and pipe fitting experience. Would like to specialize in heating and air conditioning or in power house work. Willing to undertake any required training. Apply to File No. 3422-W.

ELECTRICAL ENGINEER, Jr.E.I.C. Assoc. A.I.E.E., B.Sc. University of New Brunswick 1949. Age 25 ,single. One year's experience in the manufacture and design of polyphase and single phase motors. Seeks position in design or production engineering in power field preferably in Montreal area. Available immediately. Apply to File No. 3423-W.

CHEMICAL ENGINEER, Laval 1949 single, bilingual, with summer experience in shipbuilding, galvanizing of steel and making of aluminium. Nearly two years experience in food industry in Montreal. Desires a position in industrial, sales or plant engineering with opportunity for advancement. Available on short notice. Apply to File No. 3432-W.

CIVIL ENGINEER, S.E.I.C. Will graduate from N.S.T.C. May 1951. Age 31. Married. Experience on the following projects. 1 summer, rodman on municipal street layout. 1 summer, instrument man on topographic survey. 1 summer, instrument man with Department of Highways. 1 summer, resident engineer on marshland reclaimation project. Desires position preferably in municipal engineering or in Maritimes with construction company. Apply to File No. 3438-W.

GRADUATE MECHANICAL ENGINEER, Jr.E.I.C., Sask., 1950. At present taking masters degree at University of Toronto. R.C.A.F. veteran, 5 years practical engineering experience. Willing to work hard and accept responsibility. References and detailed experience on request. Available May 1951. Apply to File No. 3439-W.

MECHANICAL ENGINEER, Sask. 1949 (with distinction), Jr.E.I.C., P.Eng., age 32, married, veteran, desires position in Hamilton area. Since graduation experience includes employment with contractor in refrigeration, air conditioning and ventilation, including design of systems and installation. Desires a change with a firm which will give more chances of using my engineering qualifications as present position does not allow a large enough scope for engineering work. Available on one month's notice to present employer. Apply to File No. 3442-W.

ELECTRICAL ENGINEER, Higher National Diploma 1949 (Power Course), Dundee Technical College, Scotland. P.Eng., Ont. One year experience as field engineer on design and reconstruction transmission and distribution lines in Scotland. Six years as technical officer in R.E.M.E. Four years as apprentice technician with power company in Pôland. Experience in diesel-electric and hydro-electric plants in planning office and line surveying. Wishes to find employment in power field or design, would like to learn from the start the Canadian way of work. Apply to File No. 3443-W.

CHEMICAL ENGINEER, Jr.E.I.C. (B.Sc., Queen's 1948). Age 29, married, one child Two years experience production supervision and development engineering in chlorine-alkali industry. Some experience in coal tar refining. At present employed. Desires position in Ontario or Quebec. Apply to File No. 3452-W.

SALES AND TECHNICAL SERVICE engineering employment desired by young engineer (24 years, single) expecting to graduate in Metallurgical Engineering (McGill) in May, 1951, S.E.I.C. Many summer months experience in the making, shaping and inspection of steel. Location is practically immaterial and applicant is willing to travel. Willing to start on training program if necessary. Available June 1st, 1951. Apply to File No. 3453-W.

CHEMICAL ENGINEER, S.E.I.C. Alberta. 1946. Age 29, married, one child. Background of successful experience in production control, cost reduction studies and process design in petroleum refining and synthetic rubber manufacturing fields. Capable of assuming responsibility. Available after graduation in business administration (U.W.O.) in May. Apply to File No. 3456-W.

METALLURGICAL ENGINEER, Jr.E.I.C., Toronto, 1948. Business Administration. University of Western Ontario, 1951. Desires position in production engineering or as technical salesman for a manufacturer of durable producers' and consumers' goods. Age 28, married. Naval Veteran. Over two years' experience with a large Canadian manufacturing firm chiefly as a production supervisor. Conversant with French. Available in May. Apply to File No. 3457-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Ont.) B.Sc., University of Alberta, 1945, age 27, married. 1 year in highway location, design, estimates and construction; 5 years field and office experience in surveys, design, layout and construction supervision in transmission lines, tower footings, reinf. conc. and pile foundations, also some knowledge of municipal engineering. Presently employed in Ontario. Desire position in Alberta with consulting engineers, construction company, or other company with own engineering staff. Available after September, 1951. Apply to File No. 3458-W.

DOCK AND HARBOUR AUTHORITY

Winter Navigation on the St. Lawrence:

J. G. G. Kerry. London, Dock and Harbour Authority, issues of November and December, 1950.

In this paper the author draws the conclusion that the Great Lakes and particularly Lake Ontario are large scale natural accumulators of heat energy, with temperatures in the mass of their waters never as low as the freezing point. This warm water, he believes, should be utilized to keep the river free of ice as far downstream as Ile aux Coudres opposite Baie St. Paul. Ice conditions in the Gulf of St. Lawrence are also discussed, and suggestions made for reducing the flow of heavy ice and low temperature water into this basin, thus making possible winter navigation on the St. Lawrence River.

A deep narrow channel is proposed at the lower end of Lake Ontario between Main Duck Island and Cape St. Vincent, 1500 feet wide and perhaps 50 to 100 feet in depth. The flow through this channel would be regulated at four points on the Seaway, namely Barnhart Island, Beauharnois, Montreal, and by a proposed barrage at Ile aux Coudres below Quebec. The channel would be so designed that velocities would be nearly constant in winter. Parallel levees would be built for cutting off the back waters from the channel and for holding the ice in the backwater areas until it melts in the spring. Joint control of the St. Lawrence and Ottawa Rivers would minimize variations in the flow below Montreal.

Turning to the problem of keeping the Gulf of St. Lawrence open for winter navigation, the author points out that ice from the Bay of Chaleur and the Bight of Prince Edward Island does not usually move out along lines such that it would block the ship track. On the other hand, ice from the Strait of Belle Isle, though limited in quantity, may include heavy and dangerous blocks of ice from the Labrador coast. The closing of the Strait of Belle Isle by a dam would be very costly, but if done, not only would this heavy ice be kept out of the Gulf, but waters along the north shore of the Gulf would also be warmer and the formation of ice there would be checked.

Pointing out that waters are generally clear of ice all winter along the north shore from Murray Bay and the mouth of the Saguenay to Sept Iles opposite Anticosti, belief is expressed that a barrage at Ile aux Coudres would cut off up-river ice and permit navigation without danger between all up river ports and Sept Iles. Between Anticosti and Port aux Basques in Newfoundland an ice pack may always be expected to form in February and March but it will become much more open if the preventive measures suggested in the paper are taken. From Port aux Basques to the ocean there is always an open ship track.

Mr. Kerry reminds his readers that more than two decades ago a paper published by the Department of Marine and Fisheries predicted that closure of the Strait of Belle Isle would free the ship channel from ice obstruction in winter. He feels that further official study and action are long overdue.

SELECTED ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Alternating Current Circuits, 3rd ed.:
R. M. Kerchner and G. F. Corcoran. New York, Wiley, 1951. 598 pp., illus., $5.50.

Applied Nuclear Physics, 2nd ed.:
E. Pollard and W. L. Davidson. New York, Wiley, 1951. 352 pp., illus., $5.00.

Basic Refractories: Their Chemistry and Their Performance:
J. R. Rait. London, Ilife, 1950. 410 pp., illus., 60s.

Canadian Official Railway Guide with Airlines, January, 1951:
Montreal, International Railway Publishing Co., 1951. Monthly. Specimen copy: $4.00. Year subscription: $10.00.

Chimie Organique. Tome 3: Fonctions Complexes:
Albert Kirrmann. Paris, Armand Colin, 1950. 184 pp., 180 fr.

Effects of Atomic Weapons:
U.S. Dept. of Defense and U.S. Atomic Energy Commission. New York, McGraw-Hill, 1950. 456 pp., illus., $3.00.

Explanatory Handbook on the British Standard Code of Practice for Reinforced Concrete:
W. L. Scott and others. London, Concrete publications, 1950. 119 pp., illus., 9s.

Finishing Handbook and Directory, 1951:
London, Sawell productions, 1950. 246 pp., illus., 15/-.

Heaviside Centenary Volume:
London, Institution of Electrical Engineers, 1950. 98 pp., illus., $1.10.

Indium:
Maria Thompson Ludwick. New York, Indium Corporation of America, 1950. 276 pp., illus., $7.50.

Industrial Solvents, 2nd ed.:
Ibert Mellan. New York, Reinhold, 1950. 758 pp., illus., $12.00.

Oil Field Exploration and Development:
A. Beeby Thompson. London, Technical Press, 1950. v.1. 577 pp., v. 2. 630 pp., illus., $10.50 per volume.

Properties of Lubricating Oils and Engine Deposits:
C. A. Bouman. Toronto, Macmillan, 1950. 170 pp., illus., $2.85.

Tables for Conversion of X-Ray Diffraction Angles to Interplanar Spacing:
Washington, U.S. Dept. of Commerce, 1950. 159 pp., $1.75 (National Bureau of Standards, Applied Mathematics series, No. 10).

Theorie, fonctionnement et calcul des machines electriques. Tome I: Circuit magnetique. Machines a courant continu:
A. Guilbert. Paris, Dunod, 1951. 608 pp., illus., 2760 fr.

United Nations Scientific Conference on the Conservation and Utilization of Resources. Volume I. Plenary Meetings:
Lake Success, United Nations, 1950. 431 pp., $4.50.

Urban Mapping:
Ottawa, Central Mortgage and Housing Corp., 1950. 15 sheets.

Welded Deck Highway Bridges:
James G. Clark ed. Cleveland, James F. Lincoln Arc welding foundation, 1951. 247 pp., illus., $2.50.

In water and sewage systems

CRANE VALVES

do MORE than safeguard public health...

(*Above*) New Supply Line from reservoir of large city, showing installation of Crane 48-inch Gate Valves, bevel gear operated.

(*Right*) Raw Water Inlet to high service pumps in suburban water plant, equipped with Crane low pressure gate valves

They <u>also</u> reduce maintenance, repair and replacement costs!

In the waterworks and sewage disposal plants of Canadian municipalities, Crane valves are serving as dependable public servants. They provide the sure flow control that is essential to safeguard public health.

They do more... because of their sturdy construction and unusually long life, they reduce maintenance, repair and replacement costs to a minimum.

Officials and engineers responsible for public water supply and sewage disposal systems demand the highest standards of performance from their equipment. Crane Quality valves and fittings meet them.

• • •

(*Right*) No $465\frac{1}{2}$, Outside Screw and Yoke, Flanged —Brass Seats, Brass Stem—one of the sturdy well-proportioned Iron Body Wedge Gate Valves from the Crane line which are providing long and dependable service to Canadian industry. See Crane 41 Catalogue literature.

LIBRARY REGULATIONS

Hours

Mon., Tues., Wed., Fri. . 9 a.m. - 6 p.m.
Thursdays . . . . 9 a.m. - 8 p.m.
(For Montreal branch meetings)
Saturdays . . . . . . 9 a.m. to 12 noon

Summer Hours

9 a.m. - 5 p.m. Closed all day Saturdays.

Bibliographies and Literary Searches

Short subject bibliographies are compiled on request.

Extensive searches will be made at a charge of $3.00 per hour to members, and $5.00 per hour to non-members.

Please give as much detail as possible when requesting information of either type.

Borrowing and Purchasing

Books, periodicals, photostats, translation, etc. may be borrowed for two weeks at a time. **A fine of 25c. per day will be charged for each day borrowed items are retained beyond this period.**

A library deposit of $5.00 at par in Montreal is required before items may be borrowed. Books, periodicals, etc. may be ordered by members through the library. All carrying charges are payable by the individual concerned. Except in the case of library deposits, please make **no payments in advance.**

Non-members may consult the library, but may not borrow material.

TECHNICAL BULLETINS, ETC.

American Society for Testing Materials. Progress Reports:

Electron microstructure of steel; first progress report subcommittee XI on electron microstructure of steel. A.S.T.M. Committee E-4 on metallography.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARDS:

British Standards Institution, 24/28 Victoria St., London, S.W.1. British Standards are available from the Canadian Standards Association, National Research Building, Ottawa, Canada.

B.S. 1589: 1950—Thermal Insulating Materials. Plastic Composition Flexible and Loose-fill. 2/-

This standard relates to plastic composition, flexible, and loose-fill insulating materials for central heating and hot and cold water supply installations inside a building, which may be extended to short out-door runs of piping.

B.S. 1655: 1950—Flanged Automatic Control Valves for the Petroleum Industry (Face-to-face Dimensions). 2/6

The primary purpose of this standard is to ensure that valves of the conventional pneumatic diaphragm operated single or double beat type, of given sizes and standard flange ratings, will be interchangeble in a pipe line system irrespective of the design of the valve and by whom it is manufactured.

B.S. 1657: 1950—Buttress Threads, 3/-.

The present work provides for a standard form of thread and gives formulae for calculating suitable allowances and tolerances. A recommended system of gauging is also included. Preferred series for the diameters and numbers of threads per inch-of buttress are given. No attempt has been made to introduce a rigid pitch/diameter relationship.

B.S. 1669: 1950—Industrial Perforated Plates, 2/-.

This standard has been designed to cover industrial perforated plates having round and square apertures in the sizes and arrangements which are most commonly used, and tolerances on aperture sizes and pitch of apertures have been introduced. No attempt has been made to standardize other shapes of aperture such as slots.

BRITISH STANDARDS CODES OF PRACTICE FOR BUILDING:

British Standards Institution, 24/28 Victoria St., London, S.W.1.

Draft Code No. 305—Sanitary Appliances and their Installation, 3/-.

The present work deals with materials, appliances, design considerations, work off site, work on site, inspection and testing, maintenance. It is part of group of codes 300-309: "Building drainage, sanitary services and refuse disposal".

Draft Sub-Code No. 231.302—The Painting of Non-ferrous Metals, 3/-.

This code deals with the painting of non-ferrous metals in the forms in which they are more frequently used in buildings, e.g. metal claddings, linings, pipes, cast or extruded sections and fittings. The code also includes recommendations for the painting of these metals when they are deposited as coatings on iron or steel, e.g. galvanized iron.

CANADIAN STANDARDS:

Canadian Standards Association, Room 3010, National Research Bldg., Ottawa, Ontario.

No. B79, 1950—List of Standard Sizes for Cast-iron Radiators, 50c.

This list of standard sizes is intended to further large scale production of radiators of a few standardized sizes.

No. C22.2. No. 0, 1941—Revision of Appendix C Flexible Cords and Fixture Wires, 50c.

The following Tables give details on the various types of flexible cord and fixture wire and specify the minimum grades of flexible cords that may be used on portable electrical appliances of many kinds.

No. C22.2. No. 25, 1950—Construction and Test of Enclosures for Use in Class II, Groups F and G Hazardous Locations, 50c.

This specification is primarily intended to be used only as a basis for the preparation of approval reports on equipment of a type and capacity for which there are no testing facilities.

No. C22.2. No. 41, 1950—Construction and Test of Grounding and Bonding Equipment, 50c.

This specification applies to ground clamps, bonding devices, grounding and bonding bushings, water-meter shunts, armoured grounding wire, ground rods, and the like.

No. G 40.1, 1950 General Requirements for Delivery of Rolled Steel Plates, Shapes and Bars for Structural Use, 50c.

This specification covers a group of common requirements which, unless otherwise specified in the purchase order or in an individual specification, shall apply to rolled steel plates, shapes and bars under specifications G40.2,3, 4, 5, 6.

No. G40.2, 1950—Structural Rivet Steel, 20c.

This specification covers carbon steel for rivets for structural purposes. The steel shall be made by either or both of the following processes: open hearth, electric furnace.

No. G.40.3, 1950—Mild Structural Steel, 20c.

This specification applies to rolled steel shapes, plates and bars of structural quality. It does not apply to stay bolts of rivet steel. Steel made by either or both open hearth, electric furnace processes.

No. G40.4, 1950—Medium Structural Steel, 20c.

This specification applies to rolled carbon steel plates, shapes and bars of structural quality. It does not include rivet steel. Steel making processes, as per Specification G40.3.

No. G40.5, 1950—Carbon Steel Plates of Structural Quality; Plates 2 inches and under in thickness, 20c.

This specification applies to four grades of carbon steel plates of structural quality in thicknesses up to 2 inches incl. Chemical composition and physical properties of these steel plates are given in detail.

No. G40.6, 1950—Structural Silicon Steel, 20c.

This specification applies to special high strength structural steel plates, shapes and bars. It does not apply to eyebars or rivet steel.

No. O15.1, 1950—Physical Properties and Preservative Treatment of Eastern White Cedar Poles, 50c.

The general purpose of this work, has been the adoption of dimensions permitting different species of poles to be considered on an equivalent basis for engineering or purchasing requirements.

No. O15.2, 1950—Physical Properties and Preservative Treatment of Western Red Cedar Poles, 50c.

Same purpose and set-up as Specification No. 015.1.

No. S1, 1950—Steel Railway Bridges, $1.25.

This specification applies primarily to fixed railway bridge spans of 400 ft. or less in length and to viaducts. It is also applicable to simple spans of greater length and to cantilever bridges, continuous bridges, arch bridges, etc.

No. W55.1, 1950—Resistance Welding Equipment, $1.00.

This specification is intended to cover the primary electrical and mechanical features pertaining to certain recommended standard sizes of the various types of resistance welders.

No. Z76.1, 1950—Methods of Determining Weight of Coating (Stripping Test) of Galvanized Iron and Steel Articles.

These methods cover the procedure for determining the weight of coating of galvanized iron and steel sheets of wire, and describe a stripping procedure suitable for other galvanized articles.

No. Z76.2, 1950—Method of Determining Uniformity of Coating (Preece Test) of Galvanized Iron and Steel Articles. Prices. Price of Standards Z.76.1 and Z76.2 under same cover, is 50c.

The Preece test covers the procedure for determining the uniformity of coating by the use of a solution of copper sulphate on galvanized iron and steel articles such as wire, electrical metallic tubing and rigid conduit pipe, castings, forgings, structural steel, special hardware, bolts, screws, etc.

No. Z93.1, 1950—Fire Hazards Specification for the Construction and Test of Domestic Oil Burning Equipment, Vapourizing Sleeve Type, 2nd ed., 75c.

This specification states the minimum requirements for domestic oil burning appliances of the vapourizing sleeve type, with a burning rate not greater than one Imperial gallon per hour. Such appliances are considered as using a topped or distilled fuel oil, having a flash point of not less than 100°F. closed cup, and having a specific gravity of 28 to 40 degrees Baumé.

No. Z93.2, 1950—Fire Hazards Specification for the Construction and Test of Domestic Oil Burning Equipment, Vapourizing Pot Type, 2nd ed., 75c.

The purpose and scope of this specification are similar to those of specification Z93.1.

No. Z102.1, 1950—Moisture Vapour Barriers, 50c.

This specification covers the limits for moisture vapour transmission rate of flexible moisture vapour barriers. Moisture vapour barriers are flexible packaging materials which have the ability to resist the transmission of water vapour.

ARCHITECTS' AND BUILDERS' SIZE BOOK:

H. M. Tansley. London, Newnes, 1950. 206 pp., illus., 17/6.

The architect and his assistants on the drawing-board, the builder and his men, and all who are concerned with building, constantly need to know the sizes of components and fittings. The purpose of this book is to answer concisely and factually questions as to the size of a building element, other sizes available, types that will fit, etc. A number of firms are named and some trade names given.

AUSTRALIA 1950; THE HERALD YEARBOOK:

J. A. Alexander ed. Melbourne, Herald and Weekly Times, 1950. 800 pp., illus., $3.25.

A cursory glance through "Special Articles" in this volume reveals such titles as "Soil Erosion Problem in Australia"; "Aircraft Production in Australia"; "Nuclear Physics, Atomic Number and Isotopes"; "Development of the Leigh Creek Coalfield," and a host of others, comprising a total of 75 pages. All of these are signed articles.

The other 725 pages consist of regular yearbook information, but of a particularly broad scope, in some cases, world statistics being given. An informative article on the U.N. is included, and the book carries both a table of contents and an index. End paper bearing flags of the U.N. in colour add to the physical attractiveness of AUSTRALIA 1950.

CHEMISTRY OF INDUSTRIAL TOXICOLOGY:

Hervey B. Elkins. New York, Wiley, 1950. 406 pp., illus., $5.50.

In this book an attempt is made to treat industrial poisons primarily from the point of view of the chemist and engineer. This means that the harmful substances themselves will be emphasized, and the industrial processes in which they are used, rather than the symptomology and pathology of their effects on the human body. Emphasis is placed on the probable seriousness of injuries, rather than their complete physiological characterization.

ELECTRON MICROSCOPY. PROCEEDINGS OF THE CONFERENCE ON ELECTRON MICROSCOPY, DELFT, July 4-8, 1949:

The Hague, Martinus Nijhoff, 1950. 188 pp., illus., $2.25.

These proceedings are printed as an answer to a general demand for a book containing all the papers read at the Conference. About fifty papers are presented, on the origins of microscopy and of the electron microscope, constructional details, image formation and contrast, resolving power and apparatus, specimen techniques, and medical, biological, chemical and industrial applications. The book is well illustrated with drawings, photographs of equipment and reproductions of micrographic prints.

ELEMENTARY THEORY OF STRUCTURES:

J. C. Grassie. Toronto, Longmans, Green, 1950. 392 pp., illus., $5.00.

This book covers the fundamental principles of mechanics, as applied to the theory of structures. Its scope is confined entirely to determinate structures, and, in consequence, the book is suitable for all engineering students who require an elementary knowledge of structures. Enough typical examples have been worked out, to form an important feature of this book. Problems with answers are given at the end of each chapter.

HORIZONTAL DIESEL ENGINES:

R. A. Collacott. London, Temple Press, 1950. 122 pp., illus., 8/6.

This book has been written primarily for students and for users who have little technical knowledge or experience of Diesel engines. Operations, fuels, maintenance and selection are covered thoroughly, while specifications are given for all types up to 300 b.h.p. Chapters cover principles, engine details, fuel injection, cooling, lubrication, installation, operation, running and maintenance

INDUSTRIAL AND SAFETY PROBLEMS OF NUCLEAR TECHNOLOGY:

M. H. Shamos. New York, Harper, 1950. 368 pp., illus., $4.00.

This work contains the most important contributions prepared for 1950's Conference on industrial and safety problems of nuclear technology. Gordon Dean, chairman of the U.S. Atomic Energy Commission, leads with an article on the technological problems and dangers peculiar to the industrial development of atomic power. Eighteen other contributors, leaders in the fields of industrial development, nuclear research, radiation medicine, and casualty insurance, combine to make this the first practical discussion of problems linked with industrial uses of fissionable material.

KINEMATICS OF MACHINES, 5th ed.:

G. L. Guillet and A. H. Church, New York, Wiley, 1950. 299 pp., illus., paper.

Professor Church has retained and extended the Guillet approach that made earlier editions of this book so popular. This approach was characterized by an emphasis on practical applications and by frequent illustrations of these applications. The mechanisms with which this work deals at length are slider-crank mechanisms, cams, rolling contacts, gears, gear trains, flexible connectors, etc.

LIFE OF AN AMERICAN WORKMAN:

Walter P. Chrysler. New York, Dodd, Mead, c1950. 219 pp., $3.00.

This informal biography is the story of the head of one of America's greatest industries. It tells how Chrysler was already making his own tools when he became an apprentice in a railroad machine shop. The automobile industry was young and raw when he went into it, and he studied and improved every detail of its operation. He tells of his half-a-million-a-year job as head of the Buick division of General Motors, of the building and exhibition of the first Chrysler car in 1923-24, of the deal that gave him Dodge, and of his gradual building up of Chrysler Corporation to what it is today.

MOTOR SHIP REFERENCE BOOK, 19th ed.:

Compiled by the staff of "The Motor Ship." London, Temple Press, 1950. 187 pp., illus., 15s.

This book treats the new designs of Diesel propelling and auxiliary engines for ships. It contains chapters on the history of shipbuilding, engines (four-stroke, two-stroke, or double-acting), engine rooms, centrifugal separators, gas turbines, etc. This publication is very well illustrated with photographs and diagrams of equipment. It includes Lloyd's rules for the construction of heavy oil engines, as well as a list of builders of marine Diesel engines.

PHENOLIC RESINS—THEIR CHEMISTRY AND TECHNOLOGY:

P. Robitschek and A. Lewin. London, Ilife, 1950. 261 pp., illus., $6.75.

The authors' purpose in writing this book, has been to integrate theoretical knowledge and industrial practice, thus providing a link between the science and technics of phenolic resins. Included and discussed are the more fundamental modern trends and developments: particularly physics and kinetics on the theoretical side and pulp resin preformas on the technological side. There are 121 diagrams, 16 photographs, 49 tables and a meticulously complete index.

PLUMBERS' POCKET BOOK OF ROUGHING-IN DIMENSIONS FOR PLUMBING FIXTURES:

A consolidated service by Canadian Potteries Ltd., and other companies. 134 pp. illus., paper.

This new pocket-book contains roughing-in measurements on all fixtures manufactured in the four combined Canadian factories of the following companies: Canadian Potteries, Crane Steelware, Port Hope Sanitary, Alliance Ware. Drawings were produced from accurate physical measurements taken of every fixture. This is a useful "on-the-job" reference work for fixtures made of vitreous china, porcelain, enameled cast iron, or porcelain on steel.

PROBLEMS IN ENGINEERING DRAWING, 3rd ed.:

J. M. Arnold and others. New York, Prentice-Hall, 1950. $4.35.

This is an unbound volume of worksheets. Most of these sheets are partial layouts, making possible the presentation of a maximum amount of subject matter within a limited time: with such layouts, the student need not copy those portions with which he is already familiar. In conformity with modern industrial practice, many of these layouts are printed on tracing vellum; the others are printed on light and heavy drawing papers. The problems are grouped under several commonly used headings: lettering, multiview drawing and sketching, dimensioning, etc.

RECEIVING TUBE SUBSTITUTION GUIDE BOOK:

H. A. Middleton. New York, Rider, 1950. 215 pp., illus., $2.40.

This is a greatly enlarged and revised edition of the book WARTIME RADIO SERVICE published in 1944. This new book lists about 750 receiving tube types and their bases, including all of the following series: 4, 5, 6, 7, and 7L old-style base series, octal base series, loctal base series, 7-pin miniature series, 9-pin noval series, subminiature series. All substitutions listed here describe in detail the necessary data for changing or rewiring the sockets.

SECRETARY'S HANDBOOK. A MANUAL OF CORRECT USAGE, 7th ed.:

Sarah Augusta Taintor and Kate M. Monro. Toronto, Macmillan, 1950. 573 pp., $4.00.

Our chief observation on this book would be to remark on its misleading title or sub-title. We would suggest that a future edition be sub-titled "A MANUAL OF AMERICAN USAGE".

Misspelled and confusing words, rules of grammar, forms of address and sample letters, all are considered. But prospective buyers would be well advised to consider the purchase of this volume only if the individual involved has access to an English or Canadian volume of similar content.

SMALL PLANT MANAGEMENT; A GUIDE TO PRACTICAL, KNOW-HOW MANAGEMENT:

Ed. by Edward H. Hempel, Chairman Small Plant Committee of ASME. New York, McGraw-Hill, 1950. 548 pp., illus., $7.80.

This study provides a wealth of information on small plant management. It progresses in logical order through four sections: small plants as economic factors, management tasks, how to solve the important problems of small plant management, and small plant future. Among the pertinent topics discussed in these sections are financing and banking. The chapters are each written by an expert on the subject being studied.

WALLS AND WALL FACINGS:

Denzil Nield. London, Spon, 1949. 276 pp., illus., 18s.

This book is an attempt to bridge the gap between the educational textbooks for this subject and recent research information. It describes and discusses, against the background of a detailed analysis of requirements, traditional techniques modified to suit present conditions, and recent developments which to some extent have been proved. Part one is theory, and deals with strength, stability, durability, insulation, etc., while part two is practice, and deals with types of materials and walls.

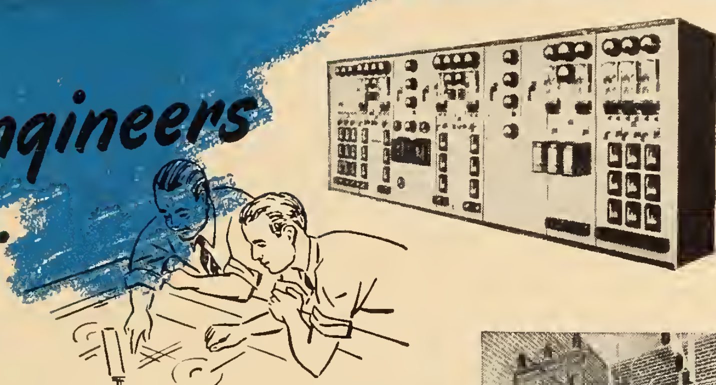
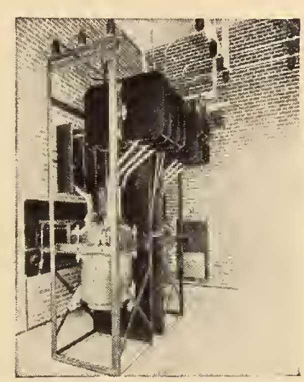
SWITCHGEAR PROBLEMS?

Let BEPCO Engineers Solve them...



No matter whether your supply is 138 K.V. or 600 V., whether your system requires a rupturing capacity of 2,500,000 K.V.A. or 25,000 K.V.A., or your load is 3000 amps. or 30 amps., there are BEPCO "Tested" circuit breakers to suit. Many breakers are carried in stock, and can be quickly incorporated into any type of switchboard assembly, such as open frameworks, vault assemblies, flat-backs, fixed cubicles, withdrawable trucks, outdoor switch-houses, or unit sub-stations. All BEPCO assemblies are ruggedly built to C.S.A. standards with safety precautions and interlocks to meet local requirements.



Bepco engineers will be glad to help you in your switchgear problems — contact our nearest office or representative.

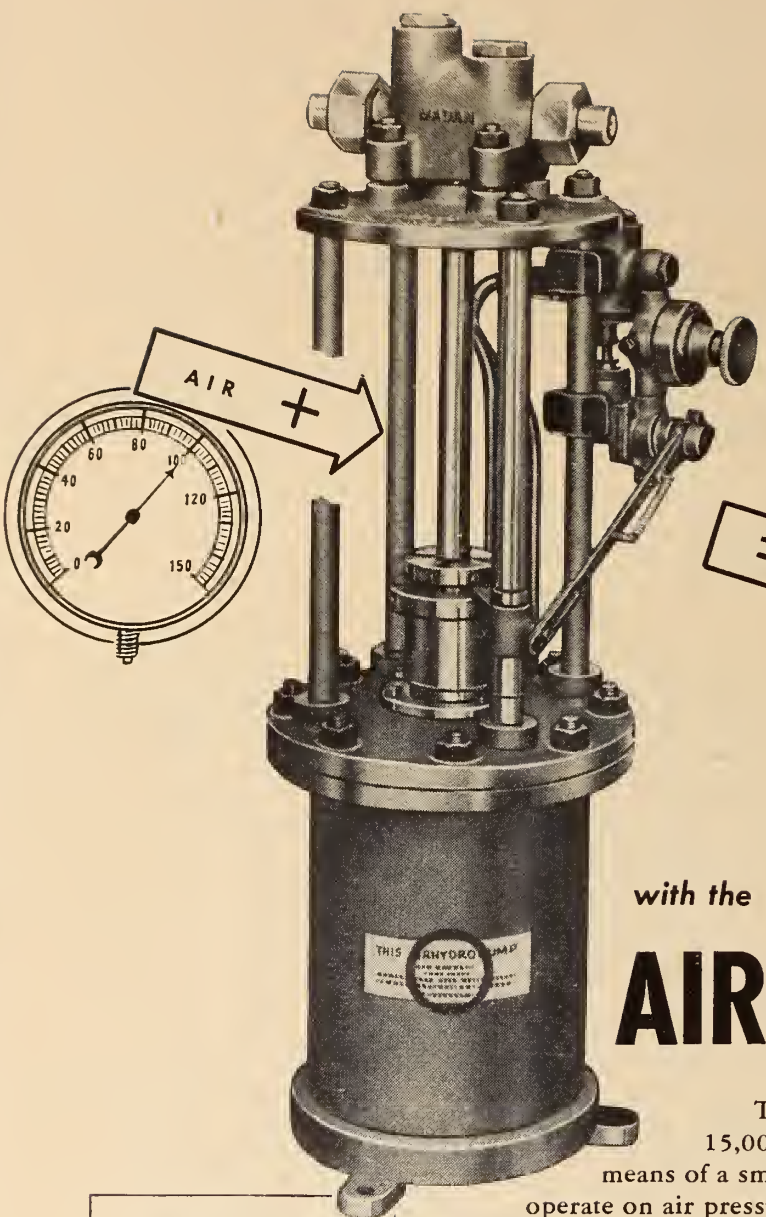
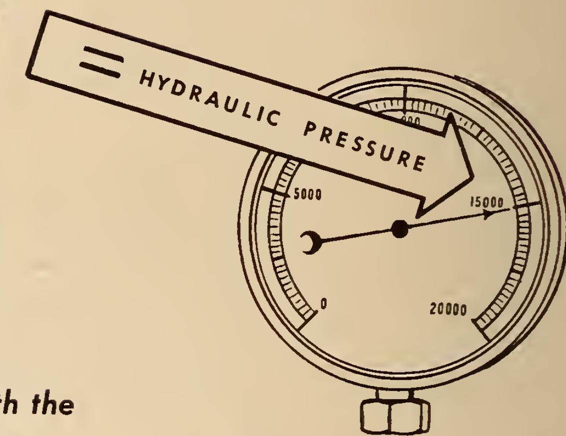
Hydraulic Pressure
From Your Air Line . . .





with the

AIRHYDROPUMP

The Airhydropump can produce up to 15,000 p.s.i. hydraulic pressure by means of a small volume of compressed air. It will operate on air pressures as low as 10 p.s.i. and as high as 100 p.s.i.

The Airhydropump is the economical answer to practically all testing applications requiring static hydraulic pressure. It is also widely used to operate hydraulic jacks, rams, presses, etc.

Portable, compact and fully automatic in operation, the Airhydropump has the advantages of easy adjustment to the required pressure and the certainty of maintaining that pressure indefinitely.

Both single-acting and double-acting models are manufactured in a wide range of air-to-hydraulic pressure ratios. One of these is bound to meet your requirements. Satisfied Airhydropump users are numbered in the hundreds the world over.

FOR HYDRAULIC PRESSURE TESTING:

CASTINGS
VALVES
PIPING
TANKS

Also to operate Hydraulic Jacks, Roms and Presses.

A grommet is not a cable

New B.F. Goodrich grommet V belts cut costs 20 to 50%

A GROMMET is made by winding heavy cord upon itself to form an *endless* loop. Don't confuse it with an ordinary cable, which is merely a twisted cord, the ends of which must overlap to make a loop. The B.F. Goodrich grommet V belt combines all of the load-carrying cord into twin endless grommets, saves belt costs by working better, lasting longer.

Grommet belts are more flexible — They have no splice, no stiff section where cords overlap (85% of failures of ordinary belts occur in overlapped sections). B.F.G. belts have twin grommets, no fabric or plies in the middle of the belt that stiffen it and generate heat. They have more *elasticity*, less permanent stretch than any other belt.

Stand shocks better — Actual running tests in field and laboratory show that B.F.G. grommet V belts have a higher safety factor, much greater ability to withstand shock load than do ordinary V belts — actually lasted 20 to 50% longer!

No "lost" cords — In an ordinary V belt much of the cord strength is lost — wasted in the centre of the belt where the cords don't pull their share of the load. In a grommet belt *all* the cords work *all the time.* There are no centre cords.

Only B.F.G. has the grommet belt — Twin grommet construction is an exclusive, patented B.F. Goodrich development. To make sure you get genuine grommet V belts see your local distributor or B.F.G. branch. *The B.F. Goodrich Rubber Co. of Canada, Ltd., Kitchener, Ont. Branches and Distributors across Canada.*

INDUSTRIAL PRODUCTS

MANUFACTURE OF SPUN IRON PIPES No. 6

CARRIAGE. — We have followed the pro-cesses involved in the manufacture of Stanton Spun Iron Pipes through their various stages, and we now approach the conclusion of our narrative.

Prior to the preparation for despatch, each pipe is stencilled with the name STANTON, together with any other markings that may be required.

Those destined for shipment overseas are pro-tected at their ends by Hessian caps or bags filled with wood wool.

Pipes are finally transported from the Com-pany's own loading bays by road, rail and sea. A large fleet of lorries, together with railway wagons having direct access to the main lines, is continually employed in carrying Stanton Pipes for use all over the world.

CONCLUSION. — The end of the story of manufacture of Stanton Spun Iron Pipes has now been reached; for the pipes themselves, despatch from the Works and delivery to site is only the beginning of a lifetime's unfailing service.

Stanton Pipes are as dependable in Nicaragua as they are in Norway, as long-lasting in Iraq as in Iceland, for the process of their manufac-ture ensures that adequate allowance is made for conditions prevailing at their destination.

The lower of the two photographs on the left shows Stanton Pipes being laid in a street in the City of Victoria, capital of British Col-umbia, and Canada's second port.

Business & Industrial Briefs

A Digest of Information received by The Editor

Appointments and Transfers

Powell River Appointments. — The Powell River Co. announce the following appointments. Dr. Ralph Patterson has been named technical director. Dr. John Keays is now superintendent of research and development, and Don Blake has been named projects engineer. C. R. Hogan has succeeded Mr. Blake as assistant mechanical superintendent.

●

J. M. Courtright.—The Shell Oil Company of Canada Ltd. has appointed J. M. Courtright as manager of the purchasing-stores department. He will make his headquarters in the Toronto office of the Company.

In his new position Mr. Courtright will be in charge of Shell's extensive buying organization throughout Canada. Before his present appointment he was sales manager of the Company's British Columbia operations.

●

Alchem Limited.—J. G. Hutcheon has been appointed service engineer for the Western Canadian district of Alchem Limited. A native of Calgary, Mr. Hutcheon graduated last year from the University of Alberta. His territory will extend from Swift Current, Saskatchewan to the Pacific coast. He will make his headquarters in Calgary. Mr. Hutcheon replaces E. Ross Welsh who has been placed in charge of the company's Montreal office.

●

A. E. Cooper.—Arthur E. Cooper has been appointed chief engineer of the heating controls and commercial divisions of the Minneapolis-Honeywell Regulator Co. Ltd., Leaside, Ont. Mr. Cooper is a graduate of Queen's University in Mechanical Engineering. Before joining Minneapolis-Honeywell he was production manager of the appliance and metal products division of Dominion Electrohome Industries at Kitchener.

●

Northern Electric Division.—Northern Electric Co. Ltd. has established a seventh sales district which includes the Company's branches at Edmonton, Calgary and Lethbridge. J. E. Milburn, manager at Edmonton since 1947, has been placed in charge of the new district, which was formed out of the eastern side of the former Alberta-B.C. district, while Edmonton has been raised to the status of a district headquarters.

In announcing the split of the former Alberta-B.C. district, A. L. Brown, manager of the general sales division, explained that the Company distributing houses and sales offices in British Columbia will now be known as "Pacific District." The headquarters of the district will be at Vancouver.

●

H. G. DeYoung.—H. George DeYoung has been appointed works manager of Atlas Steels Limited according to an announcement made by Edward P. Geary, executive vice-president of the Company. Mr. DeYoung comes to Atlas Steels from Treadwell Engineering Company, Easton, Pa., where he was assistant to the president.

●

Hall's Barton Ropes.—Antony Gibbs & Co. (Canada) Limited, 230 Bay Street, Toronto, have been appointed Ontario and Quebec Agents for the Hall's Barton Ropery Co. Limited, of Hull, England.

Hall's Barton, who have been in business for over 150 years manufacture all types of wire and manila rope.

●

General Electric Sarnia District.—S. E. Tripp has been appointed to take charge of Canadian General Electric "Supply" sales in the Sarnia district. He will serve the expanding industrial life of the area, specializing in construction equipment, industrial heating, chemical materials, and related products.

●

H. K. Impey.—Herbert H. Gee, vice-president in charge of sales of Jenkins Bros. Ltd. has announced the appointment of Harry K. Impey as Alberta sales representative. Mr. Impey will make his headquarters at 107 Clarke Building, 10160-102nd Street, Edmonton.

H. K. Impey

Thompson Electrical Works.—Philip A. Wait has been named president and Henry J. Waldorf has been named vice-president and chief engineer of Thomson Electrical Works, Montreal. Formerly known as Fred Thomson Company, the firm was founded in 1893. It is still under the same independent ownership and is the largest plant devoted to the repair of electrical equipment in Canada.

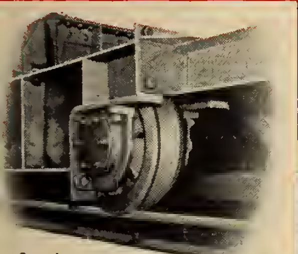
(*Continued on page 254*)

Note these dates...

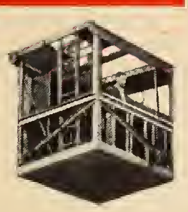
ANNUAL MEETING

May 9-10-11

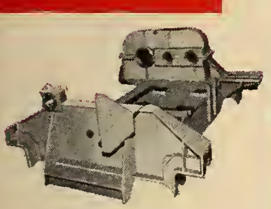
No Compromise
ON DESIGN!



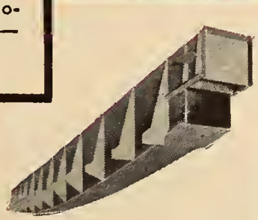
Sturdy, unit-built wheel and axle assembly—quickly removable.



Special attention to engineering of electrical equipment and comfort of operator.



Welded trolley frame, pioneered by Dominion Bridge. Design provides positive location of bearing housings—permanent alignment.



Welded girder of latest design. Other types: riveted, lattice, and I-beam.

IN more than fifty years of crane building, Dominion Bridge has maintained a pre-eminent position by adhering rigidly to these basic principles:

1. Every crane receives special engineering study and is designed and built to suit the application *exactly.*

2. Every component is built to the well-known Dominion Bridge standards of quality.

1000 cranes operating satisfactorily in Canada and many other parts of the world bear witness to the soundness of these principles.

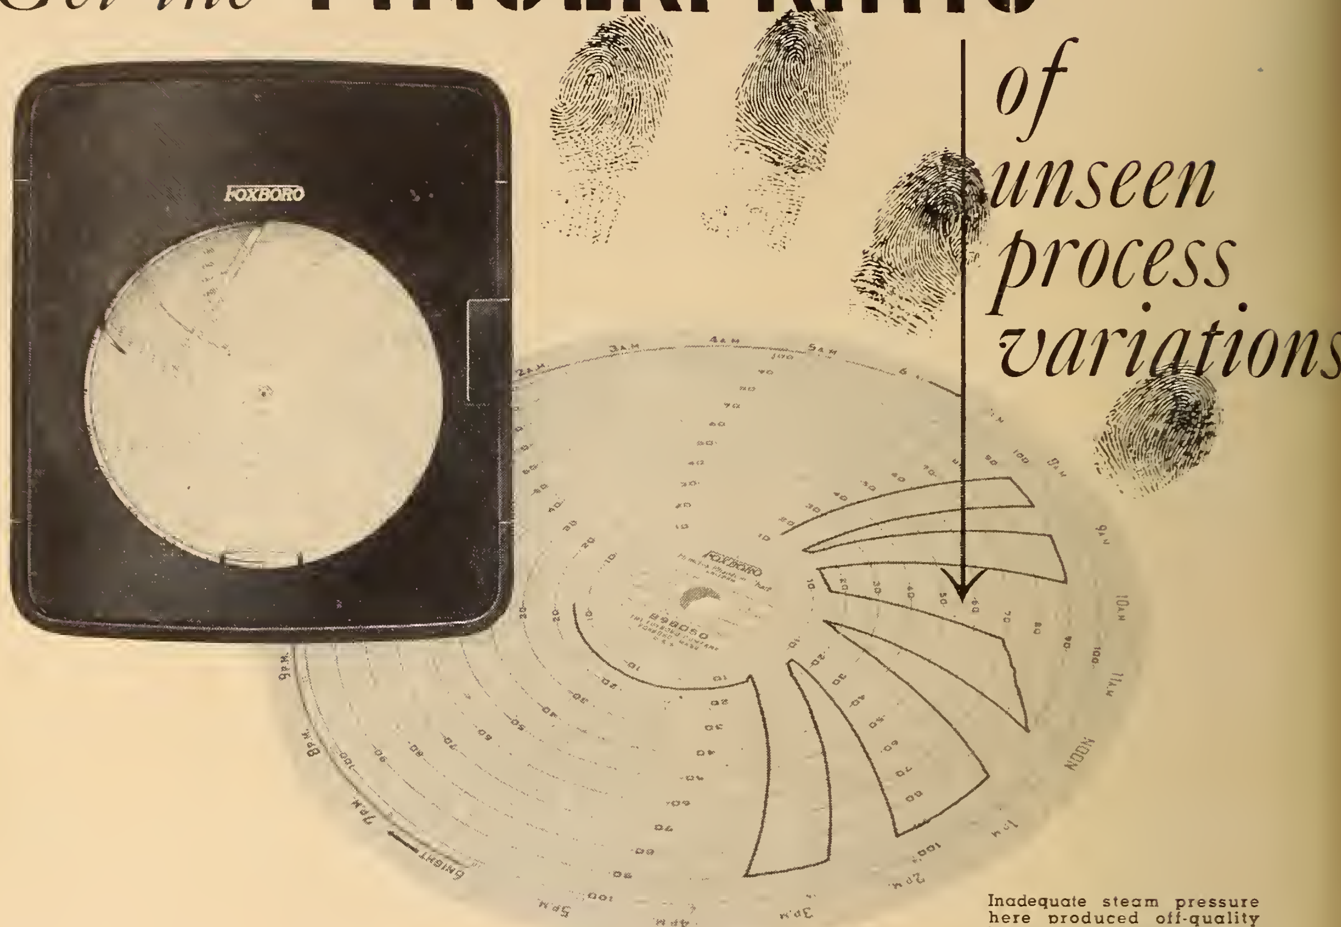
MECHANICAL DIVISION*
DOMINION BRIDGE
COMPANY LIMITED

*OTHER DIVISIONS: Platework, Boiler, Warehouse, Structural.

Plants at: Vancouver, Calgary, Winnipeg, Toronto Ottawa, Montreal

Assoc. Companies at: Edmonton, Sault Ste. Marie, Quebec, Amherst

Get the "FINGERPRINTS" *of unseen process variations*



Inadequate steam pressure here produced off-quality batch that could have gone undetected. "Fingerprints" on the Foxboro record gave timely warning for quick correction.

. . . with Foxboro Recorders for temperature, pressure, flow

Off-standard processing leaves its telltale fingerprints, clearly and unfailingly, when Foxboro Recorders are on the job. Only at neglected points can it go undetected. To reduce the chances of off-quality batches in your operation, cover *all* the critical process variables, *now* . . . by installing additional recorders.

For the highest accuracy and dependability under day-in, day-out service, be sure to specify Foxboro Recorders — for temperature, pressure, and flow. Precision engineering, plus skillful manufacture result in instruments of the highest quality. Their ultra-sensitive mechanism responds instantly to the slightest variations — writes them down, continuously, and without attention except routine changing of charts.

Now is the time to bring your process instrumentation up to date. A small investment in instruments today can repay you every day for years to come. Write for Bulletin 198-2. PEACOCK BROTHERS LIMITED, 412 St. Patrick Street, Montreal, P.Q. Also Calgary, Noranda, Sudbury, Sydney, Toronto, Vancouver and Winnipeg.

BUSINESS AND INDUSTRIAL BRIEFS

(*Continued from page 250*)

International Nickel.—Dr. John F. Thompson, President of the International Nickel Company of Canada Limited, was elected to the additional office of Chairman of the Board of Directors, according to a recent announcement by the Company. Dr. Paul D. Merica, executive vice-president and a director, was elected a member of both the executive committee and the advisory committee of the Company.

Dr. Thompson has been with the Company since 1906. He was elected assistant to the president in 1928 and was made a director and member of the executive committee in 1931. He was appointed vice-president in 1932, executive vice-president in 1936, and a member of the advisory committee in 1937. He succeeded the late Robert C. Stanley as president in February, 1949.

Dr. Merica has been executive vice-president of the Company since February, 1949. He first became associated with International Nickel in 1919, becoming a director of research and subsequently associate manager of the development and research department. He was elected assistant to the president in 1931, a director in 1934 and a vice-president in 1936.

•

Festival of Britain.—Resident engineer in charge of the whole of the South Bank site of the Festival of Britain is a Torontonian, Colonel Leonard Adlard.

•

New Equipment and Developments

Magnifying Device.—A device — half microscope, half television receiver — that magnifies living tissues up to 25,000 times life size, has been invented by a British scientist. An ordinary microscope magnifies only up to 5,000 times, and the electron microscope works only on dead tissues.

•

Ontario Hydro Operations.—In the current annual report of the Hydro Electric Power Commission of Ontario, the following information is given.

Expenditures for capital construction in 1950 for the total system were $142,000,000. For 1950, the Ontario Hydro supplied 309 individual municipalities with power. The report states that the Commission supplied power to the municipalities at cost.

$593,000,000 is given as the cost of the post war construction and development programme of the Commission. This includes nine hydro electric projects, two steam electric stations and one steam electric source of purchased power. The total of some one million four hundred housand horsepower of new capacity is o be in service by 1952.

The Commission states that it will press for the development of power on the St. Lawrence River, which, it is claimed, is indispensable to Ontario's future expansion in every field.

The total investment of the Commission and the municipalities distributing system in power undertakings, at October 31st, 1950, amounted to $869,955,377. Revenue for the year amounted to $62,007,799.

•

Marine Gas Turbine.—According to information released by the British government the first gas turbine ever made for driving ocean-going ships has been built by British engineers and has successfully completed rigorous tests.

•

Concrete Testing.—Redesigned to separate the loading and weighing units, a new concrete testing machine of 100,000 lb. capacity is announced by Baldwin-Lima-Hamilton Corporation of Pittsburgh, Pa. A two-unit design prevents transmission of load shocks to the indicator and keeps the operator out of range of flying or falling particles from breaking specimens. Welded construction of the loading unit and simple structural lines of both units give a good appearance to the machine.

The new machine is similar in operation to the 90,000-lb. machine which it replaces. It is designed primarily for testing 2-in. cubes and 3-in. by 6-in. cylinders but the stroke and dimensions of the working space are large enough to permit many other uses. Complete information may be obtained from the manufacturer.

•

British Industries Fair.—For details regarding the British Industries Fair communicate with: United Kingdom Trade Commissioners in the following cities: Ottawa, 56 Sparks Street (Telephone 3-4085); Montreal, 1111 Beaver Hall Hill (Telephone UNiversity 3381); Toronto, 67 Yonge Street (Telephone ADelaide 2174); Winnipeg, 403 Royal Bank Building (Telephone 92-3153); Edmonton, 10053 Jasper Avenue (Telephone 4-2417); Vancouver, 850 West Hastings Street (Telephone PAcific 8381).

•

Mine Diesel-Locomotive.—Ruston & Hornsby, Ltd., of Lincoln, England have developed a new series of flameproof locomotives for underground use. The new locomotive is powered by a 75 horse power Diesel engine. It is a 10-ton machine and it incorporates several unique features.

Close attention has been paid to those points which are of great importance to the mining industry—maximum visibility for the driver, compactness combined with accessibility, simplicity of control, reasonable first cost, and reliability.

It is claimed that the locomotive can be used in either gassy or naked flame mines. It is the first machine of British design to have a driving position at each end and adequate protection has been afforded for the driver.

To effect simplicity of control, only two levers are used, one for gear changing and the other for applying the air brakes. When wishing to change driving stations both these levers are detached and carried by the driver to the other end of the machine. From either control point the driver is enabled to engage each of the four forward gears and, in addition, has one reverse position to enable him to back up to trains without the necessity of changing ends.

The locomotive is of unit construction throughout each unit—engine, radiator, gearbox, etc., being easily detachable without affecting adjacent units. All parts of the locomotive, other than the

"Business & Industrial Briefs"

This section of the *Journal* is intended to keep readers informed on developments and changes in those business and industrial enterprises, and on new products, which affect the engineer.

If you write with respect to any of the items in this, or other sections, please mention

THE ENGINEERING JOURNAL

main frame, axles and jackshafts, are completely interchangeable from one machine to another of the same type irrespective of the gauge of the locomotive.

Complete information on this new equipment may be obtained from Ruston & Hornsby Ltd., 36 Lombard St., Toronto 1, Ont.

•

Pressurized Buildings. — "Tomorrow's buildings may be pressurized as well as being scientifically heated and cooled, if progress in indoor climate control continues at its present pace." This was a statement made recently by W. H. Evans, vice-president of Minneapolis-Honeywell Regulator Co. Ltd.

Mr. Evans made his statement when describing an electronic control system which, he said "is one hundred times more sensitive than ordinary heat regulating setups". The system being described by Mr. Evans is believed to be the first practical means of controlling radiant floor panel heating. Basically, this sensitive control is attached to a three-way thermostatic system, including an anticipating outdoor thermostat, a room thermostat and a sensing element in the water line. The system was developed during three years of research and experimentation at the Honeywell laboratories, where the personnel worked in cooperation with the universities of Minnesota and Purdue. Complete details may be obtained from Minneapolis-Honeywell Regulator Co. Ltd., Leaside, Ont.

•

Tungsten Reserves.—On February 22 the Right Hon. C. D. Howe announced in the House of Commons that the Canadian government has taken steps to purchase for $328,000.00 the known tungsten ore reserves of the Emerald property in British Columbia. The purchase was made from Canadian Exploration Ltd.

Equipment has been ordered to build a mill of 250 tons daily capacity and the mine, which has been closed down for some years, is being rehabilitated. It is expected that initial production of tungsten concentrates will be obtained by next fall.

•

Oxygen Equipment.—Dominion Oxygen Co. Ltd., 159 Bay St., Toronto 1, announce the new "Linde" L-26 Oxygen Therapy Liter-Flow Adaptor which makes it possible to administer oxygen from an industrial type oxygen regulator and a cylinder of oxygen. The new adaptor converts pounds per square inch pressure to "liters-per-minute" flow.

In emergencies, the L-26 Adaptor can be especially useful to disaster and rescue crews in industrial plants, and to civilian defence organizations in augmenting available hospital-type therapy regulators.

The Adaptor is approximately 4 inches long. It contains no moving or fragile parts. It can be carried in the glove compartment of an automobile or in a small satchel.

•

Rubber-Metal Bonding.—According to "Trade Topics", Messrs. Aero Research Ltd., Duxford, Cambridge, England, have developed a new simple and cheap method of bonding rubber to metals so

Stainless steel tableware . . . handsome and durable . . . will never tarnish, chip or break, adds grace and beauty to any table setting.

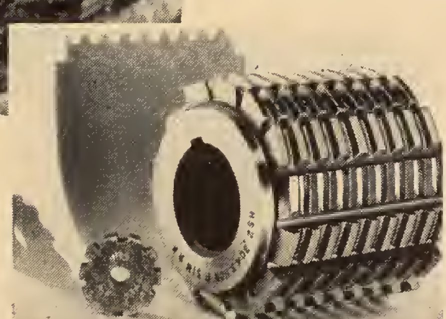
Stainless steel jewelry retains its gleaming lustre without polishing . . . cannot stain even the most delicate skin.

PRODUCTS TO CAPTURE THE FEMININE FANCY... TOOLS TO SERVE CANADIAN INDUSTRY...

made from Atlas Special Alloy Steels

Creative imagination and the practical advantages of indestructible, permanently beautiful stainless steel combine to produce things women can't resist. More and more Canadian fabricators are using Atlas stainless steel to increase product appeal . . . to add strength without excess weight, polished appearance without polishing, complete resistance to tarnishing, weathering and corrosion.

In every major Canadian industry, too, other Atlas specialty steels are used in the really *tough* spots . . . in mining drills, in key components of countless machines, in tools of close to diamond hardness which cut, saw, punch and shape other metals to a million uses.



Hundreds of industrial operations depend upon the efficiency of cutting tools made from specially compounded heat-resistant Atlas High Speed Steels.

e steels used in mining drills which bite into ielding rock must have special qualities of dness, shock resistance and ability to meet eptional stresses. Atlas Mining Steels have en specially developed for all types of ling applications.

8-51

The fine tool and alloy steels produced by Atlas for Canadian industry include—

ATLAS HIGH SPEED STEELS

Designed for cutting and machine tools which must have high resistance to deformation and wear even when cutting edges become heated to a visible red in operation.

ATLAS NIPIGON - ATLAS SPARTAN-7 - ATLAS POWHATAN - ATLAS A.C.X.
ATLAS TROJAN - ATLAS SIXIX

Write for Atlas Technical Bulletin No. 8, which gives complete metallurgical data and handling instructions for Atlas High Speed Steels. Address your request to:

ATLAS STEELS

lastingly and firmly that the two materials can be considered a part of each other. As a result the use of rubber as an engineering material in reducing vibrations and absorbing impacts may be greatly increased.

The new method is known as the "Redux" process. The secret is to treat the rubber surface with sulphuric acid, thus hardening it a little and covering it with fine cracks which gives it better adhesive properties. After simple treatment with Redux Liquid resin and powder, the rubber and metal are clamped together under pressure. To effect a permanent bond the metal and rubber can be baked in an oven or pressed in a steam-heated hydraulic press. The use of these adhesives is not restricted to metals only, but with them rubber can be satisfactorily bonded to bakelite, tufnol, delaron, etc. For further details communicate with the Company.

•

Feeding Coiled Strip.—George F. Clash & Sons Ltd., Cobham Mill Road, West Drayton, Middlesex, England have recently designed a new type of stock reel for feeding coiled strip metal to presses. Unlike other reels it is turned by the natural spring of the coiled strip material and snatching is thereby eliminated. The reel is recommended for use with presses having automatic feeds as the supply of strip adjusts itself automatically to the pull of the feeding device.

The reel lies in a horizontal plane—its axis is vertical and it is free to revolve on a stand. The coil of strip material lies in the reel and is drawn from the centre of the coil, instead of from the outside as with other reels.

The strip is taken over a simple support to the feeding mechanism of the press and, as the inner layer of the coil reduces in diameter when the strip is withdrawn, its natural spring is induced to turn the reel. Standard reels will accommodate coils up to 24 in. in diameter and 6 in. in width, while a smaller size of reel 12 in. in diameter is made for small coils. The manufacturer will be pleased to supply further details.

•

Swiss Industrial Fair.—The Swiss Industries Fair, Basle, to be held from April 7 to 17, 1951 will again this year give an imposing survey of the latest achievements of Swiss textile machinery industry covering a wide range of machines of the highest efficiency.

Among the textile machines on display will be the latest spinning mill machines, ring-spinning frames, with high-draft arrangements—which simplify and shorten the working cycle—and ring-spinning frames with moving spindle rails which are available for worsted spinning processes and with which cops of substantially increased lengths can be built up.

Other automatic high-efficiency preparatory machines will also be shown. These include wrap-tying, reeding and reaching-in machines and a unique dropper-pinning machine. The exhibits will also include various automatic weft winders for silk, rayon, crepe, cotton, staple fibre, etc.

In addition to the extensive textile exhibit, special sections will be devoted to the display of electric clocks for industrial and public buildings, tools, equipment for the chemical, pharmaceutical, and cosmetic industries, electrical appliances and special machinery for the graphic arts, food trade, leather, and metal working plants, paper mills, and woodworking industries. Engine and plants and machinery for a great variety of industrial processes will be exhibited in a special section.

For more detailed information apply to the Swiss Legation, 5 Marlborough Ave., Ottawa, or to the Swiss Consulates at: 1572 McGregor St., Montreal; 159 Bay St., Toronto; 402 West Pender St., Vancouver; 416 Main St. (McIntyre Block), Winnipeg.

●

Hoist Over-loading.—W. C. Dillon & Co. Inc., 1421 South Circle Ave., Forest Park, Chicago, Ill. have announced an overload warning signal designed to protect hoists and cranes as well as the life of the operator.

The original version of this device served only as a cut-off for the hoist motor. Now the new unit combines this feature with a self-contained warning klaxon, light, and batteries.

The unit can be set to operate at any one point between 500 and 10,000 pounds and it is claimed that accuracy is within ½ of 1 per cent. To change the switch cut-out, point in the field, it is necessary only to lift a weight of desired capacity and turn adjustment screw until the switch operates. If load exceeds the safe limit, the motor automatically cuts out. The operator must then press a reverse switch to return the load to the floor. Surplus weight *must* be removed before a pickup can be completed.

●

Wax As Lubricant.—S. C. Johnson & Son, Limited, Brantford, Ontario, have developed new uses for certain types of wax as a metal working lubricant.

Recent tests, conducted in a variety of metal working manufacturing plants, show that special blends of waxes used in place of conventional lubricants permit the drawing of stainless steel far beyond its theoretical capacity. This also serves as a replacement for the copper flashing on stainless steel wire used for cold heading. Wax blends, it is claimed, are also proving useful in the drawing of aluminum. Metal fabricators, too, find that the use of wax as a lubricant extends the life of tools and dies and in some cases completely eliminates degreasing.

For additional details of these new developments communicate with the Johnson Company at Brantford, Ont.

●

D.C. Power Supplies.—Canadian General Electric Co., Limited, 212 King St. West, Toronto, have announced a new line of metal-enclosed d-c power supplies. These new products utilize selenium rectifier stacks, and are applicable wherever d-c power is required.

The new conversion equipment may be used for excitation of synchronous motors; operation of d-c elevators, cranes, and machine tools; and for conversion of a-c feeders to d-c.

Designed for indoor installation, the rectifier units are mounted in a metal casing consisting of one to four separate sections, mounted vertically, one on top of the other, and bolted together. A removable front panel permits easy access to all component parts.

The new units can be furnished to supply either 125 or 250 volts d-c from a 208-, 230- or 460-volt, three phase, 60 cycle a-c supply. Convection cooled units are available in ratings of 0.75, 1.5, 3 and 5 kw. Fan-cooled units are rated at 7.5, 10, 12.5, 15, 18.5, 20 and 25 kw. When larger ratings are required, two or more rectifier units may be connected in series and/or parallel to increase the current or voltage rating of the installation.

Built without moving parts, except for the fan in the higher-rated units, the power supplies need little maintenance. The fan requires greasing approximately twice a year.

●

British Oil Refineries.—Britain's output of refined oil products last year totalled 9.4 million tons compared with 2.5 million tons in 1938. New refineries under construction will bring the output to 25 million tons by 1953—more than eight times the 1938 rate of production.

●

Water Hampering Manitoba Oil Well.—An official of the California Standard Company said that an abundance of water is making Manitoba's first producing oil well difficult to control.

The well is 8½ miles west of Virden in southwestern Manitoba. Originally tested at about 72 barrels daily, the excess of water has cut oil production to a net of 15 barrels daily.

John Orr, resident geologist for California Standard, said: "While we have never thought it was a really terrific well, it has shown that there is oil in Manitoba and we intend to produce it."

The well now is throwing up about 60-per-cent water.

The company is drilling a second well a quarter-mile south of No. 1.

●

Canadian Trade Fair.—The British machine-tool group has booked about 30,000 sq. ft., 5000 more than last year at the 1951 Canadian International Trade Fair. Seven separate British trade associations and a number of private firms have also taken blocks of space to exhibit a wide range of machine tools, mechanical handling equipment, printing machinery, scientific instruments, and related products. In the eight capital goods classifications, 40,000 sq. feet has already been booked.

●

Lincoln Electric Expansion.—The Lincoln Electric Co. of Canada Limited, has announced plans for an addition to its factory. The new wing, covering 45,000 square feet of floor space, will more than double existing manufacturing facilities.

The new building will have an all-welded steel frame and will include many other modern developments for efficient and low cost production. Two 70-foot spans over the entire length of the building will give unobstructed floor and overhead space, thus allowing complete freedom in planning the most economical assembly lines and use of modern and economical handling equipment.

An electrical grid system in the floor will permit connection of machines anywhere in the plant, thus eliminating overhead wiring. The paved courtyard will be radiant heated to keep it free of snow. The flat roof will carry a four-inch water bath for summer insulation.

●

Cobalt Production.—It was announced recently, by the Rt. Hon. C. D. Howe, Minister of Trade and Commerce, that to stimulate further production of cobalt to meet future defence and essential requirements for the metal, the Canadian Government will purchase Northern Ontario concentrates for a period of three years on the following basis:

"For ores and concentrates containing 10-11.99% cobalt—$1.35 per lb. of cobalt

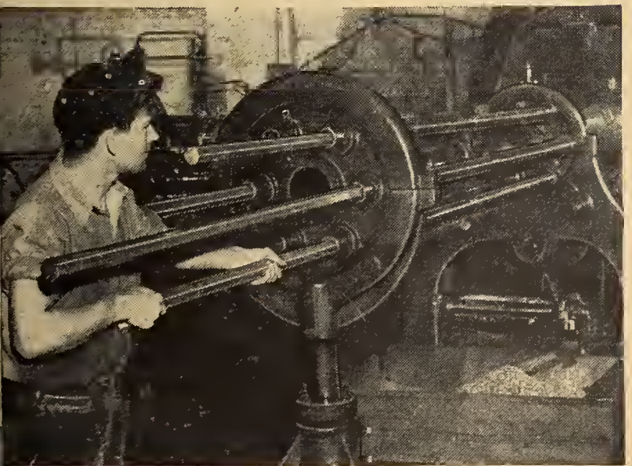
Anaconda CO-OPERATES WITH INDUSTRY

Anaconda copper is extensively used in the manufacture of sink faucets shown being assembled.

In this tank coupling nuts are immersed for copper, nickel and finally chromium plating.



Brass rods are fed to an automatic screw machine which transforms them into parts for home appliance manufacturers or plumbing supplies.

Photographs courtesy Wallaceburg Brass Limited.

Copper Answers Industry's Needs

FORTY-SIX years ago—in 1905—a young Canadian started a business which was destined to become one of the largest of its kind in the country. His name, H. W. Burgess, the company, Wallaceburg Brass Limited.

Today, Wallaceburg Brass Limited, still guided by its original founder, is nationally known for the manufacture of plumbing fixtures, automobile parts and home appliance units. One of the basic ingredients of these products is brass supplied in increasing quantity by Anaconda.

Here, then, is another of the many industries which depend on the unique combination of characteristics found in copper and its alloys—malleability, tensile strength, and resistance to corrosion. Such properties have proved the answer to hundreds of production problems. Perhaps they can solve your needs, too. Write Anaconda American Brass Limited, Main Office and Plant: New Toronto, Ontario. Montreal Office: 939 Dominion Square Building. Anaconda—since 1922 Headquarters in Canada for Copper and Brass.

ANACONDA

or copper and its alloys...consult ANACONDA

contained; 12-13.99% cobalt—$1.40 per lb. of cobalt contained; 14% or over cobalt—$1.45 per lb. of cobalt contained.

The Deloro Smelting and Refining Company, will act as buying agents for the Government, and that Company's smelter facilities will be used to convert such ores and concentrates into metal to establish a Canadian emergency stockpile.

The new price schedule represents an increase of approximately 50c per lb. of metal. The ores and concentrates will be purchased by the Deloro Company on the basis of assay determinations by the Temiskaming Testing Laboratory at Cobalt, Ontario. Minimum shipments acceptable will be 5-ton lots. The silver content of such shipments will be paid for on the basis of Deloro's customary tariff. (There has been some criticism of these prices—Editor.)

Trade Fair Opening.—Sir Robert Sinclair, K.C.B., K.B.E., immediate past president of the Federation of British Industries, and chairman of the Imperial Tobacco Company, Bristol, England, will open the Fourth Canadian International Trade Fair, to be held in Toronto May 28 to June 8.

Tree Height Calculator.—Forest engineers of the federal Resources and Development Department have designed a shadow-height calculator to determine tree heights observed on aerial photographs. This technique replaces the lengthy calculations required by older methods.

Gift to British Children. — Bepco Canada Limited, Canadian representatives of a number of well-known British concerns, recently provided nearly 600 packages of candies for distribution at the annual party for children of Lancashire Dynamo & Crypto Company employees. The party was held at the Company's social and athletic club at the Trafford Park works.

British Tractors.—Ferguson tractors have already earned $20 million for Britain. Seventy machines were recently delivered to Nova Scotia and New Brunswick.

Clay Product Testing.—Until quite recently there has been some doubt among engineers that vitrified clay products are truly elastic like other common structural materials. A relatively new method of strain measurements for these materials has now proved that ceramic materials are elastic. Stress-strain diagrams have been plotted and accurate moduli of elasticity ranging from 6,000,000 to 9,000,000 pounds per square inch have been obtained from them at Ohio State University's Engineering Experimental Station.

Prof. J. O. Everhart has applied the results of his studies to the practical problem of sewer pipe behavior under load. He believes that the data he has obtained can be used as a basis for revision of national and local specifications for sewer pipes to remove present inconsistencies. Details of the equipment used for the tests and experiments conducted by Prof. Everhart may be obtained from the Baldwin Locomotive Works of Pittsburgh, Pa.

New Brunswick Power.—A total of 257,267,035 kwh. were produced by plants of the New Brunswick Electric Power Commission and purchased from private producers during the fiscal year ended October 31, 1950, according to information issued in the Commission's 31st Annual Report.

›f this total, the Commission's own
lities produced 242,302,755 kwh., the
k of which was borne by the three
ım plants at Grand Lake, Saint John,
l Chatham. The remaining 14,964,280
n. were purchased from private pro-
ers and redistributed.
ι new 27,000 hp. hydro-electric de-
opment on the Tobique River is now
construction and an expansion at the
ınd Lake steam plant is also under
y. Mileage of high voltage transmis-
ı line increased from 566 in 1949 to
in 1950. Most of this mileage is
)00-volt line.

›ut 1,150 of whom 104 are employed
the headquarters in Fredericton.

●

ltage Regulators.—A complete new
e of three-phase, dry-type, induction
tage regulators to meet the ever-in-
asing industrial demand for regulated
ee-phase power at low voltages, is
ilable from Canadian General Elec-
:'s transformer division.
This new line includes both self-cooled
l forced-air-cooled regulators in stand-
l 10 per cent and 20 per cent (raise
l lower) ranges of regulation.
The new standard line is being offered
ratings from 120 to 600 volts and from
to 85 kva. Three-phase, dry-type rat-
s have been available in these sizes
the "Triplex" assembly, which con-
s essentially of three single-phase reg-
tors on a single base. However, the
v arrangements of the three-phase
ıding on a single core makes possible
onsiderable saving for users of three-
phase voltage regulators in the ratings being offered.

The manufacturer emphasizes that the new design is not intended to entirely replace the "Triplex" assemblies. Apply to any CGE office for complete details of this new equipment.

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

Industrial Shower Mixer.—Recommended especially for hotels, hospitals, clubs, schools and industrial plants, Crane Limited offer descriptive literature on a "Rada" Thermostatic Shower Valve. It is claimed that this new valve holds the temperature of the shower steady and prevents sudden changes in temperature. To obtain the temperature desired the user merely turns on the "hot" and "cold" valve and sets the regulator at the temperature required. A special stop prevents too high a temperature being inadvertently used. Complete information may be obtained from

Crane Limited, 1170 Beaver Hall Square, Montreal or at any Crane branch.

●

Conveyor Chain.—S-815 Flat-Top Conveyor Chain is the subject of a new 4-page illustrated folder (No. 2344), published by Link-Belt Limited, Eastern Avenue at Leslie and Keating Street, Toronto 8. The folder gives dimensions and pertinent data on this light, durable, efficient type of conveyor chain and its cut tooth sprocket wheels—for the transportation of small containers, bottles, packages or parts through such operations as washing, bottling, packing, capping and labeling. Copies are available.

●

Multiple Punching.—Wales-Strippit of Canada Limited, 344 Sherman Avenue North, Hamilton, Ontario, have produced a new brochure which introduces, illustrates, and describes the Wales Multiple Hole Punching System.

As stated in an earlier issue of the *Journal* this system provides a simple, fast, convenient and economical method of punching holes in sheet metal parts by permitting the entire set-up to be made outside the stamping press or press brake. In addition, the punch and die units are interchangeable, permitting the same units to be used and re-used in an infinite number of set-ups.

Copies of the brochures are available. Ask for "Brochure M" and apply to the manufacturer at Hamilton.

●

Plant Housekeeping.—In the February 1951 issue of the C.I.L. Oval there is an interesting article on "Good Housekeeping in Factories" entitled "Dirt and Disorder". The author is Miss Winnie Rowles, women's personnel supervisor at the C.I.L. Nylon Plant, Kingston, Ont. For copies of this number of the "Oval" apply to the editor, the C.I.L. Oval, Box 10, Montreal, Que.

●

Fluorescent Lighting.—Standard types of fluorescent lighting are explained from all angles in the new 32 page brochure issued by J. A. Wilson Lighting & Display Limited, 280 Lakeshore Road, Toronto 14, Ontario.

This publication carries a complete description of fluorescent fixtures carried by the manufacturer, and describes, in detail, the installation, usage and other technical data which is valuable to the selection of correct lighting.

Five full pages in the publication carry general information and illumination data which will be most useful to lighting engineers.

The publication is called "Standard Fluorescent Lighting Equipment". Copies may be obtained from the Company.

●

Embankment Stabilization.—An economical solution to embankment stabilization is offered in a new manual published by Armco Drainage & Metal Products, Inc.

The 16-page illustrated booklet "Armco Bin-Type Retaining Walls" not only describes how the walls are used but shows how strength plus flexibility is incorporated in their design.

Photographs illustrate how the walls are simply and economically installed with a minimum of excavation.

Illustrated case histories also show where Armco bins have been used for embankments along highways, railr… lakes, streams and city streets. Techn… data on selection of design, and the … required for various types of sect… as well as sketches showing typical … plications are included. For copies … this publication apply to Armco Dra… age & Metal Products of Canada Li… ited, Guelph, Ontario.

●

Semi-Instantaneous Heaters.—A new … page bulletin on Whitlock-Darling ty… "R" Semi-instantaneous Heaters is n… available to *Journal* readers. The B… tin, No. 25, contains illustrations … diagrams showing typical installatio… plus other valuable information on d… mestic, industrial, and commercial hea… ing and commercial heating boosters.

For copies of the publication apply … Darling Brothers Limited, 140 Prince … Montreal, Que.

●

Heat Treating Furnaces.—Surface Combustion Corporation, Toledo, Ohio, has just published an eight page bulletin on heating and heat treating furnaces intended primarily for defence production. The bulletin covers heating for forging as well as heat treatments to develo… the required properties for the production of all kinds of ordnance material. Among the items covered in the bulletin are ammunition, guns, tanks, aircraft, and ships. The production of engines, power transmission equipment, as well as tools and special parts, is als… covered.

Copies of the Bulletin may be obtained by writing to Surface Combustio… Corporation, Toledo, Ohio. Ask for Bulletin SC-150.

●

"Dominion Engineer".—No. 2 of Volume 18 of the Dominion Engineer is devoted to an article entitled "Economic Implications of Korean Crisis". The author is Professor Sumner H. Slichter of Harvard University. After giving reasons why it is vitally important to in-

crease productive capacity, Dr. Slichter estimates that 33 billion of output a year will be needed for replacing and expanding this production. For copies of the "Dominion Engineer" apply to the Dominion Engineering Co. Limited, P.O. Box 220, Montreal, Que.

●

Taylor Instrument Quarterly.—Taylor Instrument Company of Canada Limited, 110 Church Street, Toronto, is Canadian publisher and distributor of a quarterly publication called "Taylor Technology". This magazine will be of particular interest to engineers who wish to obtain up to date information on the application and uses of the control, registering, and metering equipment sold in Canada by the Taylor Company. Copies of the publication may be obtained from the Company.

●

Johns-Manville "Power Specialist".—Canadian Johns-Manville Company, Limited, 199 Bay St., Toronto, publish periodically a publication called "The Power Specialist". In the issue under review the following are the titles of feature articles: "70 Years of Public Service — Cleveland Electric Illuminating Company helps to build a bigger and better community"; "Old pipe lines made new"; "Report from Italy"; "Weather-to-be"; "They drink the Pacific" — this article describes new techniques and materials for evaporating salt water; "Cat cracker by Esso"; "New Asbestos Find". To be placed on the mailing list for this publication, please communicate with the Company.

●

Nickel News.—The International Nickel Co. of Canada Limited, 25 King St., West, Toronto, publish a magazine known as "Nickel News and Topics". The publication contains articles on the use and applications of nickel, and is now in its 22nd volume.

The publishers will be pleased to place the names of Journal readers on their mailing list for regular receipt.

●

Chemical Digest.—The Chemical Digest is the name of an interesting publication of Foster D. Snell Incorporated, chemists and engineers, 29 West Fifteenth St., New York 11, N.Y.

No. 1 of Volume 17 contains articles on the planning and direction of research, the use of atomic energy, iron ore supplies, and an extract from the Journal of Commerce headed "Lignin — Problem or Profit?"

●

Industrial Preparedness.—The Canadian Industrial Preparedness Association is an organization which encourages active participation in industrial preparedness for the common defence of Canada. The Association publishes from time to time a leaflet known as "The Bulletin". In a recent issue, the following articles are presented:—"North Atlantic Treaty Organization and Defence Production Requirements", "Current Defence Contracts", "Concern Over Material Shortages". For copies of this Bulletin please apply to the Canadian Industrial Preparedness Association, 1410 Stanley Street, Montreal.

●

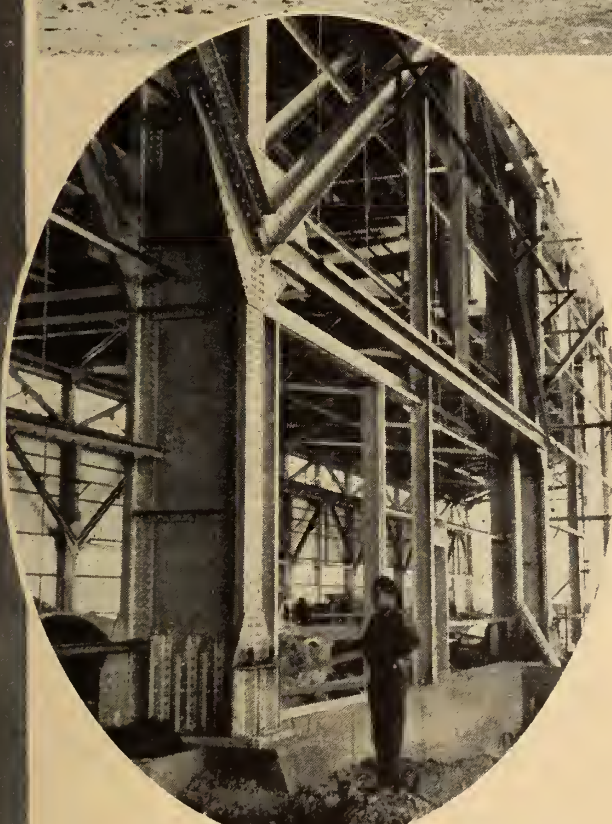
Ontario Hydro Research.—Each quarter the Hydro Electric Power Commission of Ontario publishes "Hydro Research News" which should be of interest to a number of Journal readers. To obtain sample copies communicate with — The Editor, Hydro Research News, Hydro Electric Power Commission of Ontario, University Avenue, Toronto.

●

Imperial Oil Review.—One of the most widely distributed of Canadian Publications used in the interest of shareholders and employees is the Imperial Oil Review. The publication is of a semi-technical nature and it describes the operations of the Company, the economic aspects of oil production and distribution, and carries numerous news items and feature articles on current activities in the oil production field. The publication is recommended not only for the nature of its contents but for the pleasing manner in which the articles are presented. For copies apply to The Editor, Imperial Oil Review, 56 Church Street, Toronto, Ontario.

●

Power Notes.—The Diamond Power Specialty Corporation, Windsor, Ontario, are Canadian distributors of an interesting publication known as "Power Notes". Intended primarily for steam, mechanical, and consulting engineers, it is issued on a bi-monthly basis. In the most recent issue there are papers on "The Penetron" by Andries C. deWilde, of the Research Department of Detroit



Edison Company, and "Water Column Piping Gives Trouble" by H. D. Fisher. This article describes an incident which occurred during the starting up of a new boiler installation, and the methods used to correct the trouble. For copies apply to the Company at Windsor, Ontario.

•

Building Research Congress.—Early in September of this year there will be a building research congress in Great Britain. The organizers of the Congress, most of whom are members of the various British Professional Societies, have recently issued a complete programme of the meeting. Copies may be obtained by applying to the organizing secretary, Building Research Congress 1951, Building Research Station, Watford, Herts, England.

•

Soil-Cement News.—The Portland Cement Association, Chicago 10, Illinois, issue at regular intervals a bulletin known as "Soil-Cement News" which covers developments and progress in construction and research in the field of soil-cement. To obtain copies of this publication communicate with any Canadian manufacturer of cement.

•

Centennial Brochure.—One of the best-produced and most interesting publications to come under review in this section during recent months is a brochure issued by Fisher & Ludlow Limited of Great Britain, to illustrate the activities of the Company during the past 100 years. The publication is produced on a high grade of paper and it is filled with interesting text material and four colour illustrations made from paintings by eminent British artists. The publication describes the plant of the Company, the products and expansion throughout 100 years of operations. In addition to the paintings there are numerous beautifully produced photographs. For copies of the publication write to Toon and Heath, Winfield House, Poplar Road, Solihull, Birmingham, England.

•

Worm Gear Speed Reducers.—The Cleveland Worm and Gear Company, 3249-59 East 80th Street, Cleveland 4, Ohio, advise that current catalogues and bulletins covering the full line of Cleveland Worm Gear Drives will be supplied to Journal readers on request.

•

Humidity Control.—The Surface Combustion Corporation, Toledo 1, Ohio, have recently inaugurated a new bulletin "The Humidity Engineer", which deals with interesting installations of the Company's Kathabar Humidity Control Systems.

•

Diesel Electric Sets.—Caterpillar Tractor Company has just issued a new 16 page booklet dealing with "Caterpillar Diesel Electric Sets". The booklet covers leading particulars, specifications, and performance data for units ranging from the 314-kilowatt D397 to the 165-kilowatt D364. Copies may be obtained from any Caterpillar dealer.

•

Steam Traps. — Velan Engineering Company, 1216 Drummond Street, Montreal, will supply on request, a data sheet which gives the outstanding features of the Company's universal steam trap which was originally developed in Europe and put into production in North America last year.

Steam Generating Stations of The Hydro-Electric Power Commission of Ontario

by

Richard L. Hearn, M.E.I.C.

General Manager and Chief Engineer,
Hydro-Electric Power Commission of Ontario,
Toronto, Ont.

A paper to be presented to the Sixty-fifth Annual General and Professional Meeting of The Engineering Institute of Canada, Montreal, May 11, 1951.

Recalling plans made in 1944 for meeting anticipated power demand for twenty years ahead, the author shows how sights had repeatedly to be raised as loads grew beyond expectation. Delay in ratifying the Seaway treaty made steam plants necessary to increase the Hydro's proportion of dependable high-load-factor power.

The main features of each of the two steam plants now building are given, as well as a description of their fuel supply. Looking ahead, the paper outlines how demand will be met after plants now under construction are fully loaded, and discusses future plans for integration of the various systems and interconnections with systems in neighbouring provinces and states.

The purpose of this paper is to give a general review of the reasons why the Ontario Hydro is constructing two large steam generating stations, one at Toronto and one at Windsor. The main features of each plant will be described, and a brief outline given of the events which led up to the Ontario Hydro's decision to build steam stations along with new hydraulic generating stations.

During 1944 and 1945, the Ontario Hydro's engineering staff made a detailed analysis of their existing power supply, together with a study of possible future demands up to 1965. Our huge post-war expansion programme has been largely based on those studies. In December, 1945, power for the supply of the Southern Ontario system load was obtained entirely from hydro-electric plants situated on the Niagara and St. Lawrence rivers, the Ottawa river and its tributaries, the Trent Valley system and rivers in the Georgian Bay area. The dependable peak capacity totalled about 1,562,000 kilowatts.

The plants supplied by the Niagara and St. Lawrence rivers have a much more dependable supply of water than any other river system in the province. The dependable run-off and storage from the Ottawa and its tributaries, the Trent Valley and its tributaries, and the rivers of the Georgian Bay area, are subject to a much greater extent to the effects of high and low run-off as controlled by precipitation and the watersheds feeding these rivers, than either the Niagara or St. Lawrence.

During the winter of 1946-1947 the Ontario Hydro had prepared for its consideration a report on the new developments which would be needed to meet the expected Southern Ontario system load requirements in the succeeding years. Since that time the programme recommended in the report has been periodically reviewed in the light of information becoming available after each year's operation, and the programme has been modified accordingly.

Loads Increased Faster than Expected

Based on the studies made in 1947 of previous load conditions and probable future trends, it was decided that plans for future power supply should be based on an estimated peak demand in December, 1952 of 2,300,000 kilowatts. The estimate was based on a long-term growth of about 60,000 kilowatts per year for the fifteen years starting in 1946. On this basis, additional generating capacity apart from the hydro-electric plants already being built, would be required by 1952.

Various plans were developed for the accomplishment of our objective. After careful consideration, it was decided to proceed with the plan which not only furthered the development of the natural resources of the Province, but was also the most economical. The plan we chose also had the advantage of being capable of expansion or contraction as required. It envisaged the construction of hydro-electric plants on the Ottawa river at La Cave, Chenaux and Des Joachims and a steam plant in the western end of the Southern Ontario system.

As you know, we proceeded with development of the hydro-electric sites, while for the steam plant we recommended the construction of a generating station having a capacity of 120,000 to 180,000 kw., on the basis of minimum annual cost and its flexibility in meeting the expected future load growth. Thus approval was given to proceed with the construction of the J. Clark Keith generating station at Windsor. This station would have an initial capacity of two 60/66,000-kw. units, with provision for future extension to permit the installation of additional units.

During 1947 and 1948 the new generating station at Stewartville, on the Madawaska river, came into operation and a second unit was installed at DeCew Falls. These installations provided an additional capacity of 120,000 kw., but the growth in load in 1948 in the Southern Ontario system turned out to be nearly double our long-term estimate of 60,000 kw. Consequently in January, 1949 the estimate of load for 1952 was increased from 2,300,000 kw. to 2,500,000 kw. We made plans for further generating capacity, including the second steam generating station to be located at Toronto.

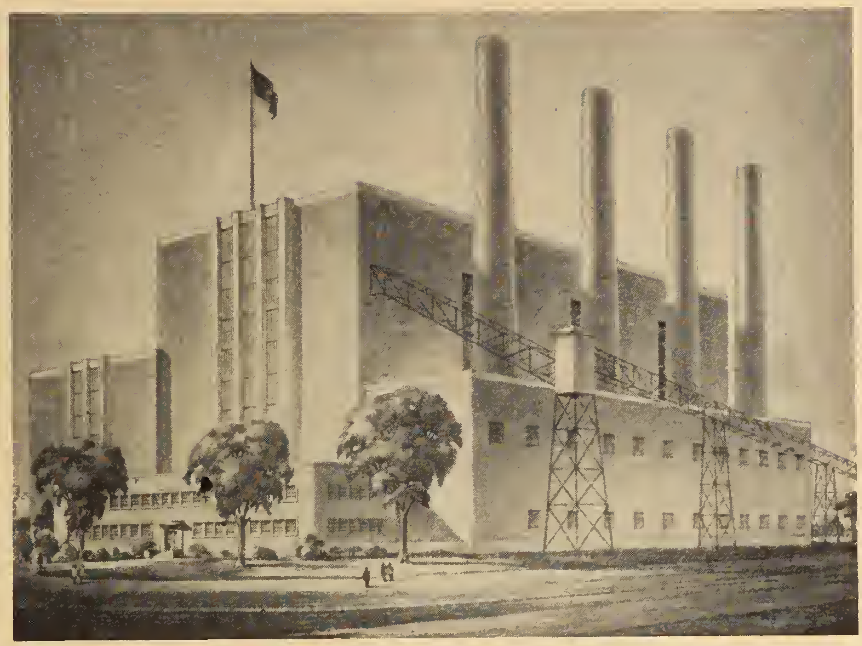

Fig. 1. Architect's drawing of the Richard L. Hearn Generating Station, Toronto.

Delay on Seaway Called for More Steam Power

With our then authorized programme of hydro-electric expansion, the total system resources by 1952 would be about 2,330,000 kw. (exclusive of fuel-electric resources, which will amount to approximately 350,000 kw.). Of this total about 915,000 kw. would be supplied by plants on the Niagara and St. Lawrence rivers, where the flow is dependable and of a high-load factor. The remaining 1,415,000 kw. would be obtained from hydro - electric plants on other rivers, where the flow is dependent on run-off and storage conditions which can vary greatly.

From a comparison of these figures, one will clearly see that the percentage of dependable-flow plants with high load-factor will be only 40 per cent. In 1945, previous to the construction of plants at La Cave, Des Joachims and Chenaux, the percentage was 60 per cent. Another factor influencing the decision was that in 1949 there were no hydraulic sites of sufficient capacity, or of a high-load-factor nature, which could be economically developed in the time required.

Even had the St. Lawrence development been approved in 1949, power from it would not have become available until some time in 1954 or 1955. The new steam plant would still have been necessary to provide for the deficiencies prior to 1954, and after that time would have provided a balance between hydraulic and steam resources of the Southern Ontario system. As no agreement was reached on the development of the St. Lawrence site, it was considered prudent to

Fig. 2. Architect's drawing of the J. Clark Keith Generating Station, Windsor.

proceed with a second steam-electric station to go into service late in 1951 or early in 1952.

One of the important items that influenced the location of the second steam plant in the Toronto area was the favourable site conditions, and the fact that it was close to a very heavy concentration of load. The present load in the Toronto area is approximately 651,000 kw., or some 30 per cent of the total system load for Southern Ontario.

The Toronto Steam Plant

The Toronto plant is to be known as the Richard L. Hearn Generating Station, and will have two units in service by the end of 1951. The first unit will be a 25-cycle, 88,000 kw. unit. It has been so designed by the manufacturers, at our request, that it can be changed to 60-cycle operation by changing the generator rotor. The second unit will be a 60-cycle, non-convertible unit having a capacity of 100,000 kw. The first unit was made a 25/60 cycle convertible unit, in order to provide initial supply at 25 cycles, because of the very high rate of load growth which is being experienced at that frequency. We found that the overall cost for a station with a convertible unit was much less than that for a station with a 60-cycle unit needing frequency-changers and associated equipment to convert the output for use at 25 cycles.

In the Richard L. Hearn generating station at Toronto, each steam generator will produce 850,000 lb. steam per hour at 875 p.s.i.g., at 900 deg. F. at the superheater outlet, with feed water at 365 deg. F. and one per cent blow down. Each unit is equipped with 16 pulverized-coal burners, which are fed from four coal pulverizers. At full load the quantity of coal burned will be about 40 tons per hour per unit.

The turbines are directly connected to the generators, and of the four units to be installed at Toronto, the first and third will supply electrical energy at 25 cycles and the second and fourth at 60 cycles. Later the first and third units will be converted to 60 cycles, and their design is such that this conversion can be readily done by taking out the rotor of each unit and substituting one designed for 60-cycle operation.

The speed of the turbines, when they are operating at 25 cycles, will be 1,500 revolutions per minute, which will be increased to 1,800 revolutions per minute for 60-cycle operation. The capacity of each unit on 25-cycle operation will be about 88,000 kilwoatts, and on 60-cycle operation, 100,000 kilowatts. The turbines are equipped

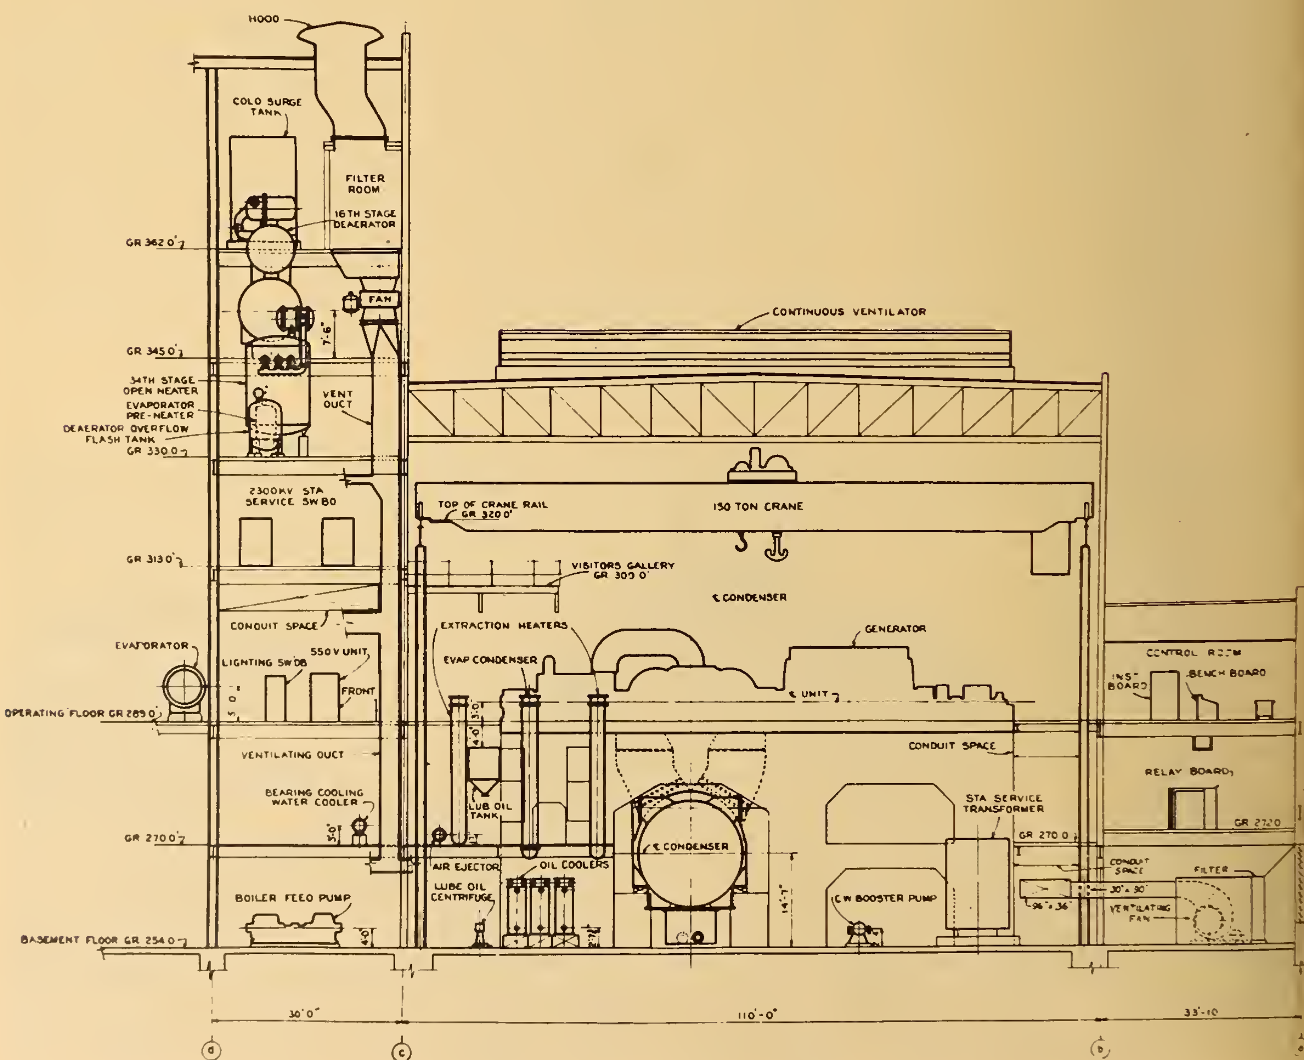

Fig. 3. Cross section of turbine room of the Hearn Station, showing machine locations.

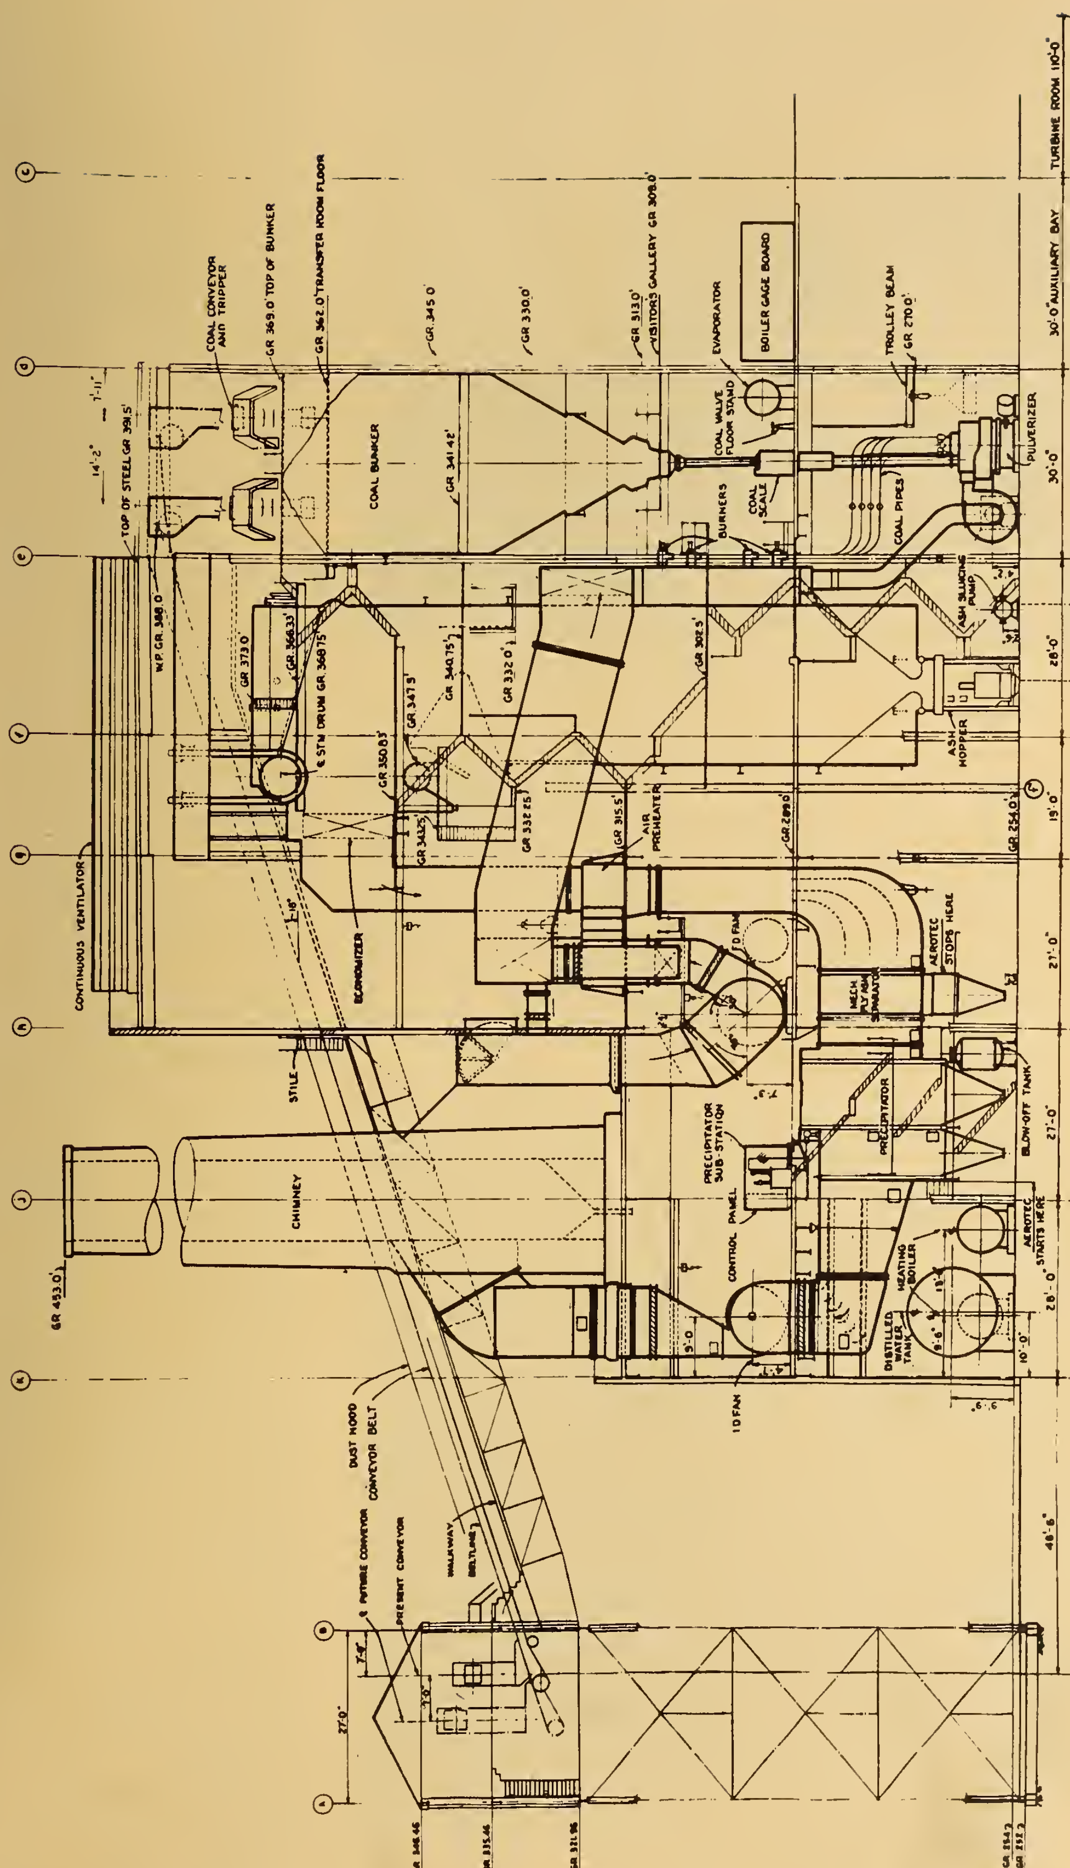

Fig. 4. Cross section of boiler room of the Hearn Generating Station, showing machine locations.

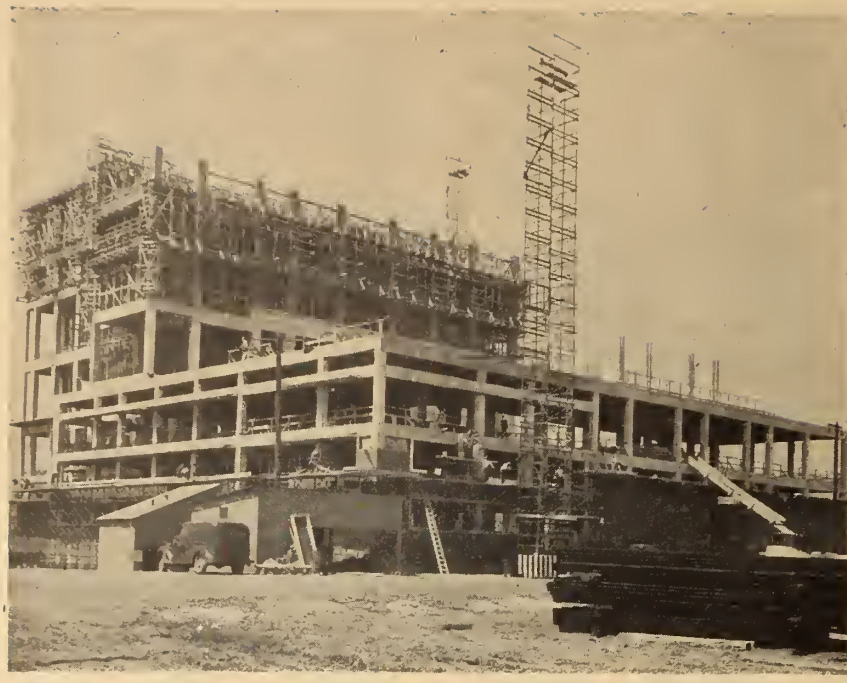

Fig. 5. Concrete structure of the J. Clark Keith Generating Station.

with turning devices to turn the rotors over slowly during the warm-up period.

The generators, in accordance with modern practice, will be hydrogen-cooled, and will be operated normally at a hydrogen pressure of ½ pound per square inch, which may later be increased to 5 pounds per square inch if necessary, when operating under conditions of overload. The exciter and pilot exciter will be directly driven from each generator. These generators will produce electrical energy at 11,000 volts on 25-cycle operation, and at 13,800 volts on 60-cycle operation.

The condensers at Toronto will be of the two-pass type. Each turbine exhausts into a surface condenser, which has two steam nozzles connected to the turbine exhausts by flexible rubber expansion joints. Each condenser has a maximum continuous capacity to condense 620,000 pounds of steam per hour. Cooling water for the condensers will be pumped from the turning basin in the harbour at the rate of 52,000 United States gallons a minute.

The water will be drawn through trash racks and travelling screens, and handled by means of three vertical axial-flow pumps, which will serve two units. Each pump is of sufficient capacity to serve one unit, but the third has been installed to act as a standby for either of the units. The cooling water will be chlorinated sufficiently to prevent the formation of slime in the condenser tubes. The tube surface totals 60,000 square feet and is made up of ⅞ inch outside diameter Admiralty metal tubes, each 26 feet long between tube sheets. The axis of the condensers will be set at 90 degrees to the axis of the turbines.

In addition to firming up with Hydro plants in times of low flow and low run-off, the steam station at Toronto will protect the Toronto area against serious interruptions on transmission systems, just as the station at Windsor will protect that area from similar interruptions. Thus the reliable power supply to both Toronto and Windsor will be materially improved.

Decision to Add Further Units

During the fall of 1950 Ontario Hydro decided, in view of the tremendous load growth in the Southern Ontario system caused by the greatly increased demands of all types of consumer and the defence programme, that the preliminary estimate of primary demand in December, 1953 would be about 2,825,000 kilowatts and 50,500,000 kilowatt-hours a day. This was based on the assumption that the continued growth beyond 1950 would be of the same order as that which had taken place in the previous two years. In the fall of 1950 the estimated dependable capacity of existing resources and those under construction was 2,693,000 kw. and 50,075,000 kilowatt-hours per day. It was again evident that additional generation would be required to supply the estimated loads in December, 1953.

After considering the possibility of sub-normal water conditions, possible plant outages, and possible increased purchases of power, it was decided that in the time available the only economical and reliable way to augment system resources was the installation of third and fourth units at the steam station at Toronto and a third unit at Windsor. The two additional units at Toronto will be similar to the first two; one a 25/60-cycle and the other a 60-cycle. The third unit at Windsor will be a 60-cycle, 66,000-kw. unit. These additional units will be available for service in 1952 and 1953.

Windsor Steam Plant

The general design of our new steam stations is along modern lines including steam generation, power generation, power transformation and transmission with auxiliary equipment.

The principal features of the Toronto plant are found in the Windsor plant, but differences exist and these are as follows: Each steam generator at Windsor, with superheater and economiser, will produce 650,000 lb. steam per hour at 875 p.s.i.g., 900 deg. F. at the superheater outlet, with feed water at 418 deg. F. and 1 per cent blow down. Each is equipped with 12 pulverized coal burners, which are fed from 4 coal pulverizers. At full load the quantity of coal burned will be about 30 tons per hour per unit.

At the Windsor plant there will be 3 generators, each of 66,000 kilowatts capacity, running at 3,600 revolutions per minute and delivering electrical energy at 13,800 volts. The main and pilot exciters are driven through a gear reducer connected to the generator. The steam turbine at Windsor will have five stages of feed-water heating, but in other respects will be similar to the Toronto plant. The condensers will be of the single-pass twin-shell type.

At Windsor, coal handling is different, by reason that the self-unloading ships will discharge into a hopper at Hydro's docks. From there a boom-type conveyor will stack the coal into a crescent-shaped pile, from which it will be transferred by mobile equipment to permanent storage. From this stage it will be handled as at Toronto.

Fuel Supply

Both at Toronto and Windsor the fuel supply for the steam generators can be coal, oil or gas, but coal will be used initially. It will be delivered during the navigation season by self-unloading ships, and transferred to the stock pile by means of mobile equipment consisting of standard tractors and carry-all scrapers. The coal will be reclaimed from the stock pile by the same equipment and delivered to a hopper, from where it will be conveyed by belt through rotary crushers and thence by conveyor to the coal bunkers. From here the coal will pass through controlled weighing scales and will be discharged into pulverizers, to emerge with a fineness such that 72 per cent of it will pass through a 200-mesh screen.

From the pulverizers the coal is picked up by the air from high-pressure fans and discharged through the burners into the combustion chamber. The secondary air needed for these burners is supplied from forced draught fans, which pass it through Lungstrom preheaters, raising its temperature to about 500 deg. F., having extracted the heat from the flue gases.

The flue gases leave the Lungstrom air-heater at a temperature of about 330 deg. F. and pass through a centrifugal type of dust collector to an electric precipitator, where almost all of the fly-ash is removed. Induced draught fans draw the gases through the precipitator, and from its outlet they are discharged through 200-foot chimney stacks to the atmosphere. An interesting refinement in the equipment is a photo-cell device which will record the amount of fly-ash in the discharged gases. Smoke elimination will be 97 per cent efficient, and well in excess of the requirements of the city of Toronto's anti-smoke by-law.

Steam will Take the Peak Loads

In addition to providing the needed capacity, and providing a minimum reserve, these two steam generating stations will also have a second function to perform, namely to take care of peak-load demands on the system. Engineering studies indicate the economies of the combination of steam with hydro, when analyzed on the basis of variable flow on the rivers and peak demands on the system.

With this planned generating capacity becoming available, as shown below, we estimate that by

Summary of Hydro's Post-War Development Programme 1945-1954

Construction of Generating Plants as at December 31, 1950

System and Development	*In service*	*Dependable Peak Capacity Kw.*
In Operation:		
Southern Ontario System		
DeCew Falls (Extension) — Niagara region	Sept. 1947	57,000
Stewartville—Madawaska river	Sept. 1948	63,000
Emergency fuel-electric units	Nov. 1949-April 1950	61,000
Des Joachims—Ottawa river	7 units July-Dec. 1950	350,000
Chenaux—Ottawa river	2 units, Dec. 1950	30,000
Thunder Bay System		
Aguasabon—Aguasabon river	Oct. 1948	40,000
Pine Portage—Nipigon river	July 1950	60,000*
Northern Ontario Properties		
Ear Falls (Extension)—English river	June 1948	6,000
George W. Rayner—Mississagi river	July 1950	42,000
Authorized and Under Construction:		
Southern Ontario System		
Des Joachims—Ottawa river	1 unit, Feb. 1951	50,000
Chenaux—Ottawa river	6 units, June 1951	90,000

1952 we shall be able to permit full supply of our primary demands.

Capital Cost

The total estimated capital cost of the 1945-1954 programme is likely to be $925,000,000.

Future Expansion

Studies made in 1950 of the growth in load showed that additional power will be required for the Southern Ontario system after the completion of our present programme in 1953. Even if the St. Lawrence development were to be approved this year, the Commission would not be able to get a supply of power from this source until, say, 1956.

We have, therefore, as the result of successful negotiations between Canada and the United States last year, gone ahead with the redevelopment of Niagara Falls. We have done much preliminary work on a new station to be built close to the Sir Adam Beck—Niagara No. 1 generating station at Queenston. The new development will be known as the Sir Adam Beck-Niagara generating station No. 2, and will use water under a 300-foot head instead of 135 feet to 180 feet, as at present at the Toronto Power and Ontario Power plants at Niagara Falls. This station will have a capacity of 450,000 kilowatts and is expected to be in operation in 1954. Until it is in operation we expect that the Toronto-Windsor steam stations, together with the three new plants on the Ottawa river, will be capable of providing the capacity to meet all demands.

Integration of System

The generating capacities of the other systems operated by the Ontario Hydro, namely the Thunder Bay system and the Northern Ontario Properties, are at present adequate, as a result of our postwar expansion programme in each system, both of which we completed last year. We have, however, made many studies with the ultimate aim of integrating the Southern Ontario, Northern Ontario and Thunder Bay systems. This integration would have operating advantages both from the point of view of reliability of water supply and power supply.

Last year we built a tie-line from the Southern Ontario system to the Northeastern region of Northern Ontario Properties. We have at present under construction a tie-line from the Thunder Bay system to the Northwestern region of Northern Ontario Properties, and we hope in the not-too-distant future to interconnect the Northeastern region with the Thunder Bay system. When this occurs we shall have a huge provincial network extending from Patricia district in northwestern Ontario to Abitibi in the northeast, and linked to the Southern Ontario system, which runs from Beauharnois in the east to Windsor in the southwest.

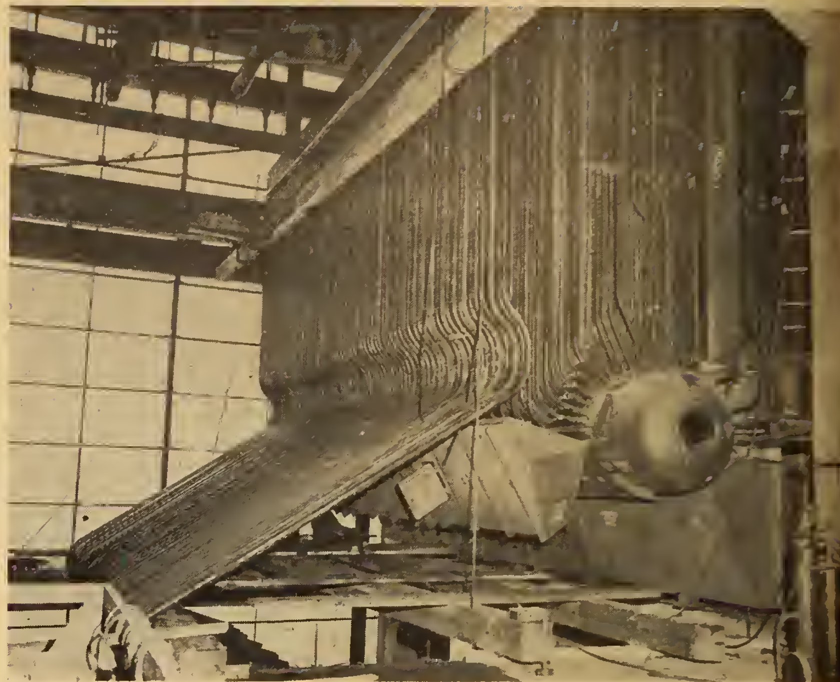

Fig. 7. Steam generator tubing at the J. Clark Keith Generating Station, Windsor.

The authorities in this province, in conjunction with those in the Province of Manitoba, are continuing studies with a view to an interconnection which would benefit both provinces in the future. Studies are also being made in connection with further interconnections with the United States which would be beneficial in time of emergencies.

At present, Ontario, Quebec and New York State are already interconnected, so that in the future we can look forward to a vast network of power lines stretching from Manitoba on the west to Quebec on the east and from James Bay in the north to New York State and Michigan in the south.

Details of Construction

Following is a synopsis of the engineering firms responsible for the design, and the supplies of generating units, for each plant:

Richard L. Hearn Generating Station, Toronto

Supervised by: The Hydro-Electric Power Commission.

Consulting Engineers and Designers: Stone & Webster Engineering Corporation.

Turbine Generator: C. A. Parsons & Co. Ltd., England.

Steam Generating Units: Babcock-Wilcox & Goldie-McCulloch of Galt.

Estimated Cost: $67,000,000. Expended to Dec. 31, 1950, $10,000,000.

J. Clark Keith Generating Station, Windsor

Supervised by: The Hydro-Electric Power Commission.

Consulting Engineers: H. G. Acres & Co., Niagara Falls.

Turbine Generator: English Electric Company, England.

Steam Generating Units: Babcock-Wilcox & Goldie-McCulloch, Galt.

Estimated Cost: $35,000,000. Expended to Dec. 31, 1950, $10,500,000.

It is impossible in a paper of this length to give the names of all manufacturers who have supplied, or are supplying, equipment for these plants, but a comprehensive list will be available in the near future.

PROGRAMME*

of the

Sixty-fifth Annual General And Professional Meeting

of

THE ENGINEERING INSTITUTE OF CANADA

at

THE MOUNT ROYAL HOTEL, MONTREAL

MAY NINTH TO ELEVENTH

1951

*Subject to slight change.

REGISTRATION

$4.00 Members, Juniors • Non-Members **$5.00**

(no fee for ladies and students)

Opens 3.00 P.M., Tuesday, May 8

9.00 A.M. to 6.00 P.M., May 9 - 11

• WEDNESDAY, MAY 9TH

10.00 A.M. *THE FIRST FIVE YEARS OF PROFESSIONAL DEVELOPMENT — A CHALLENGE TO MANAGEMENT*

A symposium of the Training Committee of the Engineers' Council for Professional Development
A. C. Monteith, Vice-President in charge of Engineering and Research, Westinghouse Electric Corp., Pittsburgh, Pa.; H. K. Breckenridge, Vice-President, West Penn Power Co., Pittsburgh; K. B. McEachron, Jr., Manager, Technical Education Division, General Electric Co. Schenectady, N.Y.; J. C. McKeon, Manager, University Relations, Westinghouse Electric Corp., Pittsburgh, Pa.

11.00 A.M. *QUEBEC'S TITANIUM DEVELOPMENT*

M. J. O'Shaughnessy, M.C.I.M., Plant Superintendent, Sorel Operations, Quebec Iron and Titanium Corp.

LUNCHEON
WEDNESDAY, MAY 9th
Champlain Room

Speaker: Prof. A. L. Phelps, McGill University

"The Engineer and his English".

12.30 P.M. **$2.75 per person**

2.15 P.M. *CANADIAN MILITARY AIRCRAFT—1946-51*

Group Captain E. C. Luke, O.B E., M.E.I.C., Chief, Logistics Planning Section, Royal Canadian Air Force, Ottawa.

SPECIAL FEATURES OF BRITISH POWER TRANSMISSION

C. W. Marshall, M.I.E.E., Deputy Chief Engineer, British Electricity Authority, London, England.

3.15 P.M. *MAINTENANCE OF VITAL SERVICES UNDER ENEMY ACTION*

N. M. Brydon, M.E.I.C., Managing Director, Brydon Construction Co. Ltd., Glasgow, Scotland.

RESEARCH IN GAS DYNAMICS AT McGILL

D. L. Mordell, M.E.I.C., Assoc. Prof. of Mechanical Engineering and Director of the Gas Dynamics Laboratory, McGill University, Montreal.

4.15 P.M. *CANADIAN INDUSTRIAL PREPAREDNESS*

Maj. Gen. G. B. Howard, General Manager, Canadian Industrial Preparedness Association, Montreal.

WESTERN GAS RESOURCES IN THE ECONOMY OF CANADA

Dr. G. S. Hume, O.B.E., Dept. of Mines and Technical Surveys.

8.30 P.M. *ANNUAL GENERAL MEETING*

Reports and election of officers.

• THURSDAY, MAY 10TH

9.30 A.M. *PANEL DISCUSSION — MANAGEMENT AND PUBLIC RELATIONS*

A panel of leaders from business and industry.
Moderator—Paul Kellogg, M.E.I.C.

ELECTRO-THERMAL DE-ICING OF AIRCRAFT

J. L. Orr, M.E.I.C. Senior Research Officer, Low Temperature Laboratory, National Research Council, Ottawa.

LUNCHEON
THURSDAY, MAY 10th

Muriel's Room will be open at the usual luncheon hour but there will be no formal arrangements for the meal. The hotel dining rooms are the Hunt Café and Normandie Room on the main lobby floor and the Coffee Shop and Cafeteria in the lower lobby. The information desk will supply details of other restaurants for which Montreal is noted.

12.30 P.M. *INSPECTION TRIP TO BEAUHARNOIS PLANT OF THE QUEBEC HYDROELECTRIC COMMISSION.*

Luncheon on arrival at 1.30 p.m. as guests of the Commission.

Bus tickets $1.00 per person.

or

2.30 P.M. *INSPECTION TRIP TO PLANT OF CANADAIR LIMITED*

Builders of the Sabre jet fighter and the North Star transport aircraft.

Bus tickets .75c per person.

• FRIDAY, MAY 11TH

9.30 A.M. *STEAM GENERATING STATIONS OF THE ONTARIO HYDRO*

R. L. Hearn, M.E.I.C., General Manager and Chief Engineer, Hydro Electric Power Commission of Ontario, Toronto.

THE NEW PRINCE RUPERT PLANT OF COLUMBIA CELLULOSE CORPORATION

S. B. Roberts, M.A.S.M.E., Chief Engineer, Celanese Corp. of America, New York City.

10.30 A.M. *THE ST. LAWRENCE WATERWAY — NATIONAL OR INTERNATIONAL*

J. G. G. Kerry, M.E.I.C., Port Hope, Ont.

FIELD WELDED DIGESTERS FOR THE COLUMBIA CELLULOSE PLANT

P. E. Savage, M.E.I.C., erection engineer, Dominion Bridge Co., Montreal.

LUNCHEON
FRIDAY, MAY 11th
Champlain Room

Speaker: Dr. O. M. Solandt, Aff. E.I.C., Chairman, Defence Research Board, Ottawa, Ont.

12.30 P.M. **$2.75 per person**

DINNER - WEDNESDAY, MAY 9th
Champlain Room

The address of the retiring president, James A. Vance, M.E.I.C.

7.00 P.M. Dress Informal **$4.00 per person**

2.15 P.M. *LIME KILN OPERATION AT SHAWINIGAN CHEMICALS*

R. H. Hall, Plant Research Dept., Shawinigan Chemicals Ltd., Shawinigan Falls, P.Q.

AIR SANITATION

E. A. Allcut, M.E.I.C., Prof. and Head, Dept. of Mechanical Engineering, University of Toronto, Toronto, Ont.

3.15 P.M. *ELECTRONIC CONTROLS*

E. W. Hutton, M.A.I.E.E., Electronics and Regulator Control Engineering Division, General Electric Co., Schenectady, N.Y.

SOME MODERN ASPECTS OF TUNNELLING

Brian H. Colquhoun, M.I.C.E., M.E.I.C., Brian Colquhoun & Partners, Consulting Engineers, London, England.

4.15 P.M. *INSTRUMENTATION FOR CHEMICAL PROCESSES*

J. V. Quinn, Process Engineer, Chemical Development Division, Canadian Industries Ltd., Montreal; and J. A. Rice, Field Engineer, Fischer & Porter (Canada) Ltd., Toronto.

"MURIEL'S ROOM"

Once again the Institute's friends in industry are making this traditional rendezvous possible, and will welcome members, their ladies and guests.

PLEASE WEAR YOUR REGISTRATION BADGE

PLEASE NOTE

Prices for meals include gratuities and provincial tax. Tickets must be obtained in advance and refunds cannot be made less than three hours in advance of any function.

ANNUAL BANQUET AND DANCE

Ballroom **7.30 P.M.**

Speaker: Sir William Stanier, F.R.S., Hon. M. I. Mech. E.
Consultant to the British Railways.

Chairman: James A. Vance, President of the Institute.
Presentation of medals and prizes, induction of the incoming president and introduction of new council.

RECEPTION AND DANCE — 9.30 P.M.

The retiring president James A. Vance and Mrs. Vance, the incoming president Ira P. Macnab and Mrs. Macnab, and the chairman of the Montreal Branch, E. R. Smallhorn and Mrs. Smallhorn, will receive the members, their ladies and their guests.

$5.00 PER PERSON

$2.00 PER PERSON (DANCE ONLY) **DRESS OPTIONAL**

IMPORTANT

THE COMMITTEES WILL DO EVERYTHING POSSIBLE TO ASSURE YOUR SATISFACTION IN MONTREAL. IT WILL HELP IF YOU INDICATE YOUR WISHES AS EARLY AS POSSIBLE. ENTERTAINMENT AND RECEPTION COMMITTEE MEMBERS WILL WEAR RED BADGE RIBBONS.

HOTEL ACCOMMODATIONS AND TRANSPORTATION

The Mount Royal is the headquarters hotel and all activities, unless otherwise noted, will be held there. All those planning to attend are urged to make requests for room reservations as early as possible. Late requests, and those who so specify, will be assigned space in nearby hotels or tourist accommodation.

All requests for convention reservations should be addressed to:—

The General Secretary,
The Engineering Institute of Canada,
2050 Mansfield St.,
Montreal 2, Que.

If desired accommodation is unavailable, delegates will be assigned to the next best that can be obtained. Unaccompanied delegates should indicate whether they will be prepared to share twin-bedded double rooms. It is most satisfactory of course if such sharing arrangements can be worked out in advance and indicated on the application for reservations.

Special reduced convention fares have been authorized for rail travel in Canada. If you plan to travel by rail, please ask for the rail certificate which entitles the delegate and members of his family to round-trip tickets for one and one-half times the one-way fare plus twenty-five cents.

Trans-Canada Air Lines have special convention rates for parties of ten or more. Your local T.C.A. agent will gladly supply details.

Fig. 1. View of the new Trenche Development from downstream.

TRENCHE

Shawinigan's Latest and Greatest Development

A paper based on information supplied by the Engineering Department of The Shawinigan Water and Power Company

On December 14, 1950, at inauguration ceremonies in which Quebec's Premier Maurice Duplessis took part, the first unit of the Shawinigan Water and Power Company's hydro-electric power development at Trenche on the Upper St. Maurice was officially placed in service, seven months ahead of schedule. This, the sixth site to be developed to date, is the largest of this Company's power plants on the St. Maurice river, and was designed and constructed by the Shawinigan Engineering Company, a subsidiary of the parent company. Its full capacity will be 390,000 hp. in six units, five of which are expected to be in service by early summer of 1951.

A large part of the power it produces will be used at the new titanium plant at Sorel, Quebec. The Trenche development, on which some $40 millions has been spent, is situated 130 miles upstream from Trois-Rivières. One existing plant lies further upstream, while four more are built between Trenche and Trois-Rivières. Four additional sites on the upper St. Maurice remain to be developed. Completion of Trenche will bring Shawinigan's total installed capacity close to 1¾ million horsepower. The total potential of the St. Maurice may be placed at about 2½ million horsepower.

The site selected is at a narrowing in the river between high rock hills. The power house and intake structure are at the west end; the latter is connected to the west bank by a concrete bulkhead wall. Adjacent to the intake structure on the east are a log chute and four small regulating sluices and east from these, extending across the river, is the main dam, a massive gravity type structure 460 feet in length with a maximum height of 230 feet. Between this main dam and the east bank of the river are four 50-foot main sluices. Water is conveyed from the intake to the powerhouse through six 20-foot diameter concrete covered steel penstocks, 350 feet long.

The maximum river discharge at the development is 170,000 cubic feet per second, through five turbines, four regulating gates and four sluices. The total head on the plant is 160 feet. The head pond or forebay extends for six miles upstream. In it, at its deepest point, the Shawinigan Company's new head office building on Dorchester Street in Montreal could be entirely submerged.

The St. Maurice River

The St. Maurice, the second largest tributary of the St. Lawrence, has its watershed wholly within the Province of Quebec. It rises in a series of lakes near the Hudson Bay height of land, and flows 240 miles in a southeasterly direction through the Laurentian

Mountains to Trois-Rivières, where it joins the St. Lawrence. Its drainage basin is approximately 16,000 square miles. While a small portion of its drainage area near the outlet is a part of the St. Lawrence plain, suitable for agricultural purposes, by far the greater portion is rugged and generally important for its timber, fur, and game as well as its developed and undeveloped waterpower.

Meteorological records of several stations within the St. Maurice watershed show that the minimum annual precipitation is 26 inches, the maximum 46 inches and the average 36 inches. Records of river surface elevations have been maintained at Shawinigan Falls since 1901. A rating curve of river flow in cubic feet per second has been made by metering over a wide range of discharge. From these records it has been determined that, under natural flow conditions — that is, before any storage was provided, the minimum flow at Shawinigan Falls was 5,800 cubic feet per second and the mean average annual run off 25,600 cubic feet per second, equivalent to 61 per cent of the average precipitation.

In order to develop fully the power possibilities of the river it was quite evident that storage reservoirs would have to be created. Since 1908, and particularly since 1918, the regulation of the St. Maurice has been improved considerably by the addition of storage on the Manouan river, aggregating 20 billion cubic feet, and by the construction of Gouin dam near the headwaters of the St. Maurice which, creating one of the world's largest artificial reservoirs, impounds 220 billion cubic feet, or 280 billion cubic feet with flashboards. In 1930, further storage was provided when the Mattawin dam on the Mattawin river, an important tributary of the St. Maurice, forming a reservoir with a capacity of 33 billion cubic feet, came into operation. These dams are owned by the Province of Quebec and are operated by the Quebec Streams Commission.

Through the operation of these and other reservoirs the minimum flow of 5,800 cubic feet per second has been increased to more than 20,000 cubic feet per second at Shawinigan Falls, and proportionately at all other developments on

the river. As a result of these storages the prime power capacity of the St. Maurice has been more than trebled. The lower section of the St. Maurice with developments at La Gabelle, Shawinigan Falls, and Grand'Mere, utilizing 285 feet of head on 16 miles of river, has an installed capacity of 862,900 horsepower, of which 489,900 horsepower is concentrated at Shawinigan Falls.

Fig. 5. View from the east bank showing, in the foreground, the sluice section, centre, the main dam and, background, the regulating gates and intake section. The length from shore to shore is 1,500 ft.

With the lower St. Maurice approxmately 75 per cent developed by 1928, and with the demand for power showing a steady rate of increase, it was quite apparent that the potential power on the lower reaches of the river would soon be completely developed, and that serious consideration should be given to the potential power resources of the upper reaches of the river.

Early in 1928 application was made to the Quebec Government for the power rights on the upper St. Maurice above La Tuque. In 1928, the Shawinigan Company secured a lease to develop the potential power on that section of the river, from the division line between the townships of Vallières and Dumoulin at river mileage 110, to the junction of the Manouan and the St. Maurice at river mileage 188, constituting a section 78 miles in length.

A comprehensive investigation of the power possibilities of the Upper St. Maurice was carried out from July, 1928, to December, 1929. During this period surveys were made for possible hydroelectric developments at 19 locations, and data was obtained relative to railways, timber limits and depots, Indian reservations, and fish and game clubs, which would eventually come within the flooded areas.

On completion of these developments, 622 feet out of a gross head of 630 feet on this 78-mile section of the Upper St. Maurice will be utilized. In addition to these projects La Tuque has been developed as a part of the Upper St. Maurice system, with a probable ultimate capacity of 267,000 horsepower, thus bringing the proposed ultimate installation on the upper half of the river to about 1,500,000 horsepower.

The first development to be constructed on the Upper St. Maurice (1930-1934) was at Rapide Blanc, about 35 miles above La Tuque. The next development was built at La Tuque, where 178,000 horsepower was brought into service in 1940. This project, owned by the St. Maurice Power Corporation, is controlled jointly by Shawinigan and The Brown Corporation and operated by the Shawinigan Company. The plant has been designed for an ultimate installation of 267,000 horsepower. In 1943 a fifth 44,500-horsepower unit was added, bringing the installed capacity to 222,500 horsepower.

With regard to the remaining four undeveloped sites on the upper St. Maurice aggregating 520,000 horsepower, Rapide Sans Nom with an ultimate installation of 252,000 horsepower is presently under investigation, while the other three—Rapide Allard, Rapide du Lievre and Rapide des Coeurs, require but little further study for the preparation of general plans.

Construction

Work was commenced on the Trenche project in April, 1948, by building a 26-foot wide gravel highway eight miles in length, connecting with the 10-mile construction highway built to serve the Rapide Blanc plant further upstream, making an access road some thirteen miles long from the Rapide Blanc siding on the C.N.R. to the site of the new development. Concurrently work was started on enlarging the railhead facilities for unloading freight, and on building a townsite for 2,500 workmen and their families, including bunkhouses and dining rooms for accommodating 2,000 workers, on the west bank of the river. Recreational facilities, schools, a church, theatre, hospital, bank, dancehall, laundry, as well as service establishments such as stores, barber shops and cobbler, were provided in the townsite.

Excavation of the rock bypass channel in midstream was begun in January, 1949, as well as on the cofferdams necessary to divert the flow of the entire river through the diversion channel.

Construction of the project reached the final stage last November 12th, when water was first admitted to No. 5 unit, setting it in motion for its test run. One week later, power was being fed out over the line.

Thereby was culminated a year and ten months of intense construction activity. Placing of concrete reached a peak last summer during the building of the main dam and sluiceways. Later, in the fall, the openings left in the dam to permit passage of the river flow were concreted up, sealing the dam and causing the water to rise against it, providing a head for the production of power.

This latter operation, known as the "closure" of the dam, was really two operations, and was accomplished in three stages. The main flow of the river had been passing through one large 50-ft. wide channel (permitting easy passage for logs and providing for flood conditions) and two 21-ft. wide lesser channels. These widths were chosen because stop logs and gates in these sizes were already designed (from previous projects) and could be used to make the closure. This enabled placing of orders for materials without the delay which new designs would have engendered. However, these gates could not sustain the high lift of water against them should one closure only be made. Thus, a further two 21-ft. openings were left higher up in the dam to pass the water and thus limit the depth until such time as the filling of the openings below with concrete had been effected.

The three stages of closure were as follows: First the large 50-ft. channel was closed off upstream and downstream with stop logs, the area unwatered and the whole filled with concrete. The water, of course, continued to flow through the two adjacent 21-ft. openings. In the second stage, gates were lowered to close these off, and water rose to the level of the upper set of openings as the pouring of concrete proceeded below. This operation completed, the gates were retrieved from below and used a second time to close off the upper 21-ft. openings. This third stage brought the water to the level of the sluiceway crests and provided a head for starting up the first machine.

Rock handling and concrete transportation equipment for the

Fig. 6. Sluiceway and flood channel under construction. The maximum discharge will be 170,000 cubic feet a second, including the projected five turbines, four regulating gates and the four sluice gates, each of which is 50 feet by 31 ft. 6 in. The sluice section is 260 feet long, and the flood channel extends 450 feet downstream from the sluice.

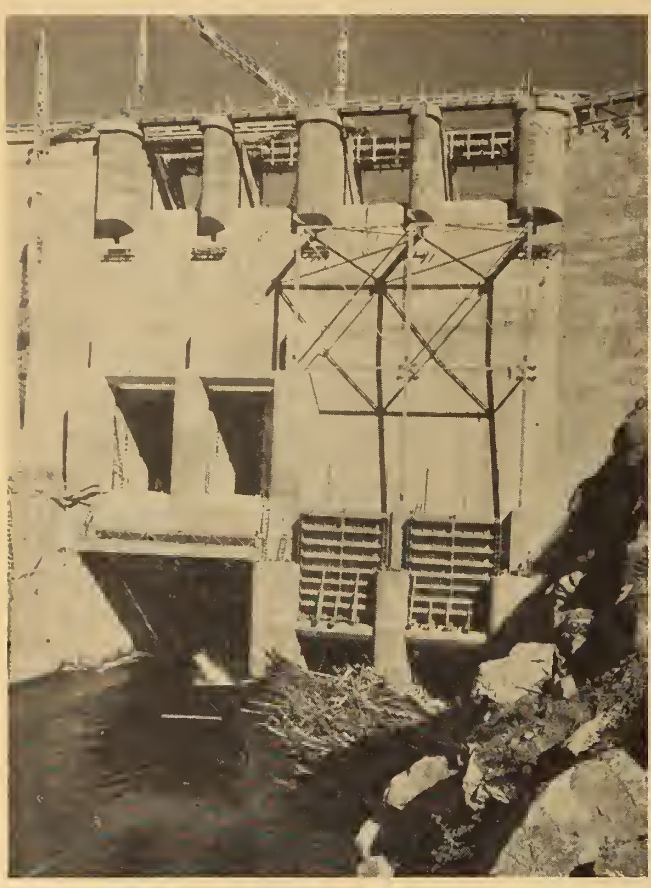

Fig. 7. Upstream face of the dam showing by-pass openings. Water is passing through 50-ft. channel (lower left) and two 21-ft. channels, closure gates for which are seen mounted above the openings. Above the 50-ft. opening can be seen the two additional 21-ft. channels for limiting the head on the lower gates.

job was all motorized. Placing of the concrete was effected by means of electrically operated stiffleg and guy derricks. Each of two concrete mixing plants consisted of two 2-yard Smith mixers with full batching equipment, using bulk cement. Coarse aggregate was mainly obtained by crushing rock obtained from the excavation, while fine aggregate was hauled from a gravel pit some three miles upstream.

The total rock excavated for the job amounted to half a million cubic yards. The total of concrete placed in all component parts of the structure was 550,000 yards. Peak progress on placing of concrete reached a rate of 75,000 yards per month. During the life of the job some 3,000 railway carloads of cement, 1,000 carloads of lumber, 700 carloads of equipment and 250 carloads of steel were hauled by truck over the 13 miles of access highway from railhead to site. Employment rose to a total of some 700 late in 1948, and peaked during the fall of 1949 at some 2,000, 300 of which was carpenter labour.

Power House and Equipment

The power house superstructure, 383 feet long by 58 ft. wide, is built of structural steel and brick walls, with reinforced concrete roof slab. The interior is sand-lime brick, and the generator room floor is paved with red quarry tile. The power transformers are banked in rear of the generators on the upstream side. Air-blast circuit breakers are located on an upper floor. The generator room crane is of 215-ton lifting capacity, with span of 53 feet.

The turbines are Francis type, built by Dominion Engineering Works, rated at 65,000 hp., turning at 128.6 r.p.m. They are fitted with plate steel scroll cases. Generators are rated at 53,000 k.v.a. each, 90 per cent power factor.

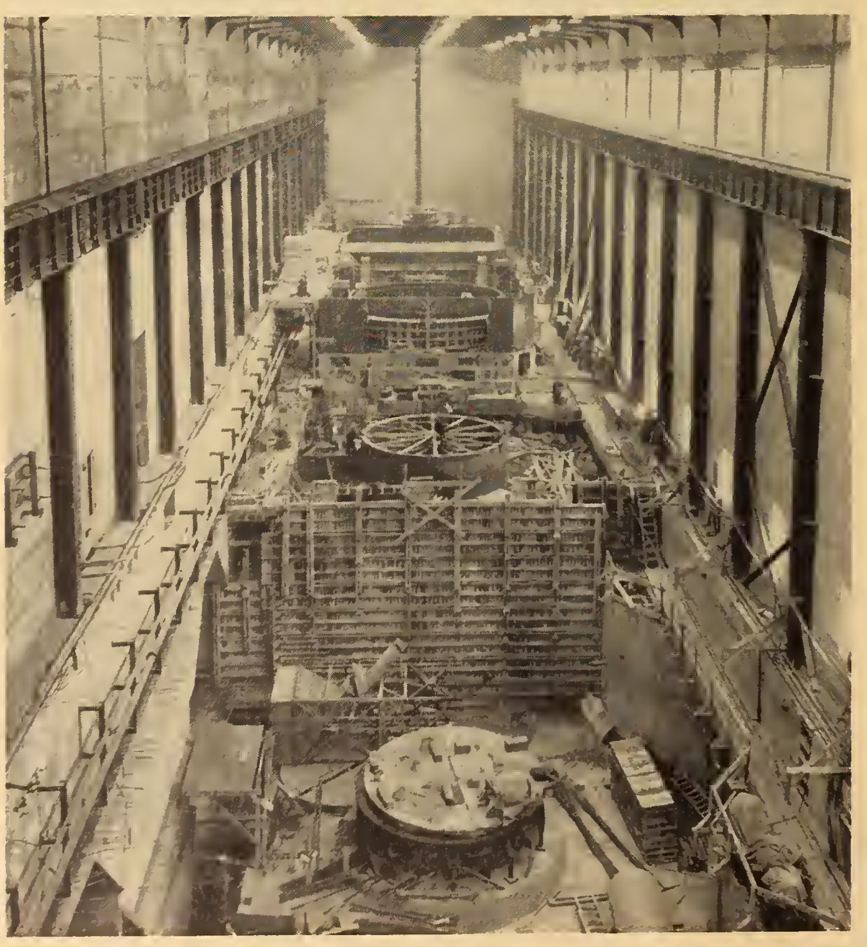

Fig. 8. Interior of the power house showing, in various stages of construction, four of the five units. The turbines are rated at 65,000 horsepower, turning at 128.6 r.p.m., and the generators are 53,000 kva., 90 per cent P.F., 13,800 volts, 2,200 amps, 3-phase, 60-cycle, 97 per cent efficiency at full load. The transformers, located in bays on the upstream side of the power house, are 53,000 kva., 230,000 h.v. star, 127 amps., 13,800 l.v. delta, 2,200 amps.

3,800 volts, 2,200 amps, 3-phase, 0-cycle, 97 per cent efficiency at ıll load, built by Canadian General Electric Company. The main ransformers are 53,000 k.v.a., 30,000 h.v. star, 127 amps, 13,-00 l.v. delta, 2,200 amps, built by Canadian Westinghouse. The air-blast circuit breakers are 220 k.v. Brown Boveri type and 13.8 k.v. Westinghouse type CA.

Six pairs of intake gates 18 ft. vide by 26 ft. high were supplied by the Dominion Bridge Co. Ltd., which company also supplied the our main sluice gates, 50 ft. wide by 31½ ft. high, as well as the our smaller regulating gates. All hese gates are of the fixed roller ype with electrically operated ıoists and are electrically heated or winter operation where necessary.

Power from the generators at 13,800 volts is fed to giant power transformers, mounted on a deck along the upstream face of the power house, which step it up to 230,000 h.v. star, 127 amps, 13,-individual generators and transformers operate as units paralleled only on the high voltage bus, in this respect following the general pattern of the nearby plant at Rapide Blanc. In the operating of the station, emphasis will be placed on automatic features of control, so as to minimize the amount of direct control by an operating staff.

The switching station is located between the power house and the intake section. The power will travel directly over a transmission line to the terminal station at Trois-Rivières. Protection of this line will be effected simply through the high voltage breakers at Trenche and at the terminal station.

The transmission line is a considerable undertaking in itself. It is 110 miles long, with conductors of aluminum reinforced with steel, carried on galvanized steel towers, and will cost about $4½ millions. It will follow the route of the present line between Rapide Blanc to Trois-Rivières.

When fully developed the St. Maurice River will have an ultimate installation of about 2,400,-000 horsepower, of which more than 1,600,000 horsepower is developed or under construction. Water from Gouin storage dam will generate power by flowing through ten hydro-electric plants operating under a total head of 1,021 feet, of which 511 feet have been utilized and 160 feet is presently under construction. √

Field-Welded Digesters for the Columbia Cellulose Company

A paper to be presented before the Sixty-fifth Annual General and Professional Meeting of The Engineering Institute of Canada, at Montreal, May 11, 1951.

by

P. E. Savage, M.E.I.C.

Erection Engineer,
Dominion Bridge Company Limited, Lachine, Que.

For over 30 years the Dominion Bridge Company has been producing digesters for the pulp and paper industry, both in Canada and abroad. During the past 15 years a large number of shop welded sulphate digesters have been built. These conform to paragraph U 68 of the A.S.M.E. Code for Unfired Pressure Vessels,—that is, all welds are examined by X-ray and the final assembly is stress relieved. The largest units of this type produced by the Company to date run about 11 ft. 6 in. I.D. by 48 ft. face to face of nozzles, and weigh about 60 tons. Such a vessel is easily handled in the Lachine plant stress relieving furnace, is within most railway shipping clearances, and in most cases has not proven too difficult to place in the field as a unit.

Sulphite digesters, on the other hand, usually run considerably larger than this, 16 ft. dia. by 48 ft. face to face of nozzles being a rather small unit. Such a unit would not enter any stress relieving furnace now installed in Canada at least, and the large diameter would preclude rail shipment. Furthermore assuming it could be shipped, for example by a water route, handling and placing costs as a unit in the field would in most cases be prohibitive. Consequently it has been the Company's general practice in the past to ship sulphite digesters in sections, and to assemble, rivet and caulk them in the field.

History of the Contract

Early in 1947, the Company was asked to bid on the supply of sulphite digesters for a proposed new pulp mill near Prince Rupert, B.C. They were to be used in the production of high grade sulphite pulp by the Columbia Cellulose Company, a subsidiary of the Celanese Corporation of America. Each unit was to be about 18 ft. dia. by 56 ft. face to face of nozzles. Approximate comparative prices were requested on the conventional mild steel shell, to be tile lined for protection from the cooking acids, and alternatively on a stainless clad plate which could be used without additional lining.

Following the Company's standard practice, the mild steel alternative was estimated as field rivetted. The nature of the clad plate, of course, required that it be designed for field welding. After some months of negotiations and discussion, the purchaser finally settled on 5 digesters of conventional rivetted construction, 19 ft. 4 in. dia. by 60 ft. 9 in. face to face of nozzles. Design and construction was to be in accordance with British Columbia regulations. Working pressure at the top nozzle was specified as 125 p.s.i. The design was made based on using A.S.T.M. A 212 Grade B flange quality plate.[1] Using a safety factor of 5, heads, shell and cones worked out to 1⅜ in. thick, with longitudinal butt straps 1 in. thick and circumferential butt straps 15/16 in. thick. Each digester was supported on 8 columns of rolled H sections. The total estimated weight of each unit was over 150 tons.

Shortly after quoting on this proposition, an alternative price based on all welded digesters 19 ft. dia. by 59 ft. face to face of nozzles was requested. The working pressure at the top nozzle was raised to 135 p.s.i. The design and construction was to be in accordance with British Columbia regulations for unfired pressure vessels, Class I. (This is basically similar to the A.S.M.E. paragraph U 68 in that it calls for

(1) Carbon max. .. 0.33%
Manganese max. 0.90%
Phosphorus max. 0.04%
Sulphur max. . 0.05%
Silicon .... 0.15% to 0.30%
Tensile strength 70,000 — 82,000 p.s.i.

The paper describes the construction of five sulphite digesters 19 ft. diameter by 65 ft. high. They are an innovation to the pulp and paper industry in Canada at least, in that they were largely welded, radiographed and stress relieved in the field. The successful completion of the project opens new fields to industry, as it proves the practicability of producing high quality welded pressure vessels of large size without restrictions of shipping and handling.

An account is given of the background of digester construction by the author's Company, followed by a brief history of the contract and an outline of the preliminary planning of the work. The actual building of the units in sequence from shop fabrication to hydrostatic test is described.

welding operators to be government qualified, all seams radiographed, and the final assembly stress relieved.) Using a safety factor of $1\frac{1}{2}$, and the same material as for the rivetted design, plate thicknesses worked out to practically $1\frac{1}{4}$ in. throughout. The estimated weight of each unit was under 100 tons, less than 2/3 the weight of the rivetted design. This proposal was finally accepted by the purchaser.

Preliminary Planning

Some consideration was given to the building of a stress relieving furnace at the Vancouver plant, large enough to accommodate a complete digester. The units could then have been completely shop fabricated, shipped by water route and erected in one piece. It was decided, however, that it would be more economical to ship in sections, and to weld, radiograph and stress relieve in the field.

The original construction schedule called for the digester building and the adjoining buildings on either side to be erected before digester assembly was begun. It was, therefore, planned to set up a temporary shop in one of the buildings adjacent to the digester building. The equipment was to consist of handling facilities, welding machines, welding positioners, X-ray equipment and a small stress relieving furnace. It was proposed to weld all longitudinal seams in this shop, positioning the sections so that all welding would be done in the downhand position. These sub-assemblies would then be X-rayed, stress relieved, erected in their final position, and the circumferential joints welded and radiographed in place. It was not planned to stress relieve the circumferential joints. The stress in these seams is only half of that in the longitudinals, and the B.C. code does not require them to be stress relieved if, in the opinion of the Chief Inspector, "he is satisfied that, due to size, the digester could not be stress relieved as a unit." (Section 292.)

After giving careful consideration to the magnitude and importance of the work, the Chief Inspector requested an investigation of the possibility of stress relieving the complete units. It was known that large oil refinery vessels had been stress relieved in the field in both Canada and the United States. After looking into the matter carefully, it was decided that it was quite practical to carry out such an operation in this case. In general, the method adopted was to insulate the digesters on the outside and to circulate hot gases through them until they attained stress relieving temperatures.

This decision caused a reconsideration of the whole plan of field operations. It now appeared logical to assemble the digesters completely, and to weld, radiograph and stress relieve them all in their final location. It was felt that the additional expense and difficulty of making the welds in position would be more than offset by the saving of the cost of the temporary shop, and the provision of special handling equipment to erect digester sections only. Steps were therefore taken to schedule the digesters and the building steel so that everything could be erected at the same time, using the same erection crews and derricks.

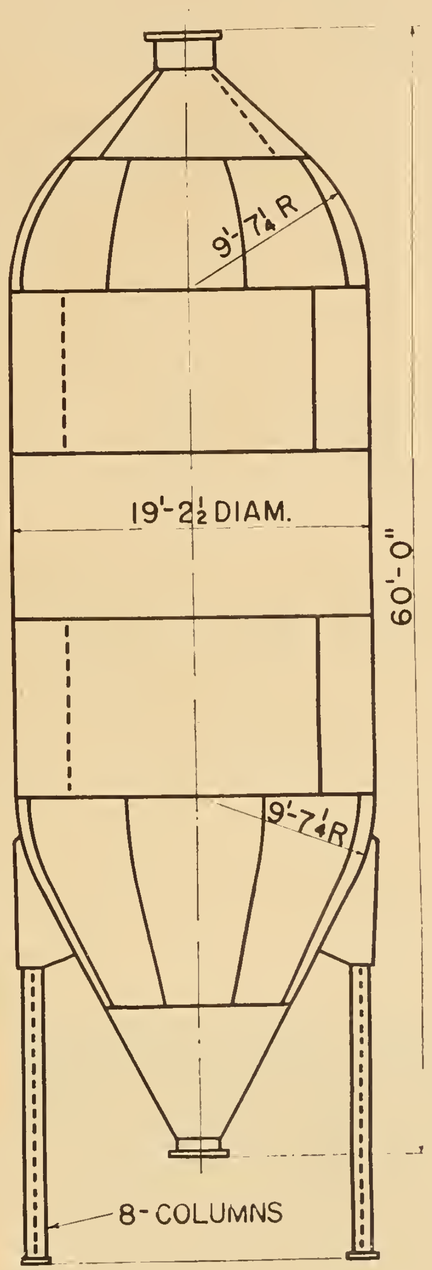

Fig. 1.

The general outline of the digesters was finally established as shown in Fig. 1. Note that the profiles of the top and bottom curved sections are the same. As a result, only one set of dies was required for the forming. The supporting rolled H columns are so turned that their weak axes are tangential to the cone. Consequently they deflect outward and inward at their tops relatively easily as the digesters expand and contract under temperature changes. This feature helps to minimize local bending stresses in the bottom cone, which is particularly advantageous during stress relief. This point will be discussed in detail in the description of that operation.

The connections of the legs to the shell gusset plates, and the leg bracing are all field rivetted. Since there were rivetters on the building project, this did not involve the organizing of additional field crews. Later on, two sulphite digesters were field welded for the Canadian International Paper Company at Gatineau, Que. There were no rivetting crews on this job, so the leg details were designed with a few bolt holes for assembly purposes, and the main strength of the connections was developed by field welding. Both types proved satisfactory. Incidentally, the 2 C.I.P. digesters were built to A.S.M.E. paragraph U 69, which required all welding to be done by qualified welders, welding spot checked only, and no stress relief.

Assembly clips were provided on all seams as shown in Fig. 2. These were located at approximately 3 ft. centres along all joints, and were designed to allow the digesters to be completely erected without doing any welding.

Choice of Electrodes and Joints

Selection of the most suitable type of welding electrode and the design of grooves for best field welding conditions were carefully studied. Due to the high strength of the main material, a high strength electrode was required. Various rods conforming to A.W.S. Classifications E 7010 and E 7011 were tried out. Satisfactory physical results were obtained with these

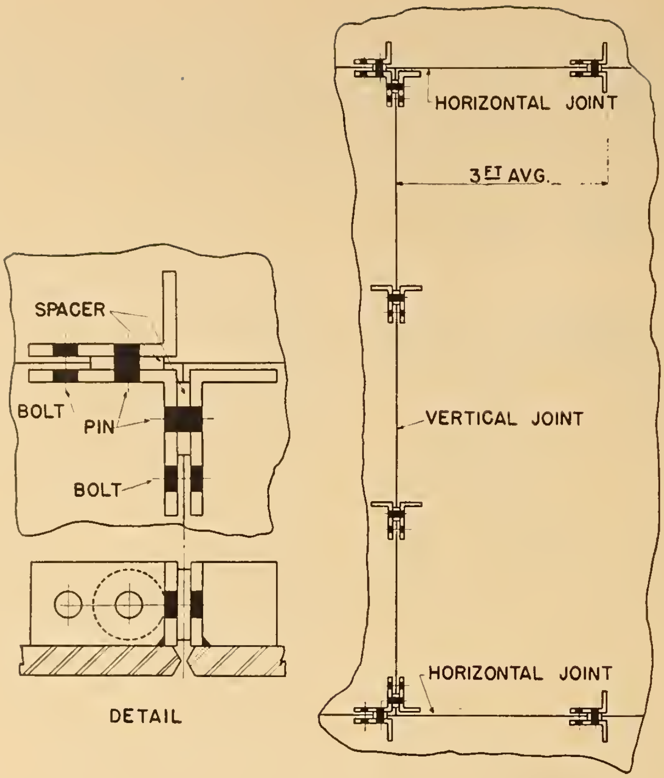

Fig. 2.

rods (an E 7010 electrode was actually qualified for the job) and competent welders could readily be taught to handle them. It was necessary, however, to preheat the plate to at least 200 deg. F. to prevent cracking of the welds. Such preheating in the field would prove costly, not only due to the labour and fuel involved, but also to less flexibility in the distribution of welders about the digesters. A lower production rate would also be expected due to hotter working conditions.

During the early discussions in the fall of 1948, the Industrial Engineering Department was in favour of using an electrode conforming to A.W.S. Classification E 7016. However, this rod was comparatively new, and it was not possible to obtain enough support from welding experts in either Canada or the United States to warrant trying it out on such a large project. By the fall of 1949, however, it had been sufficiently proven that several authorities favoured its use. A number of experimental welds were made, and it was found to produce excellent results without pre-heating. Although the technique of welding with this rod was new, it was found that with proper instruction good welders could easily adapt themselves to its use.

After various tests, grooves as shown in Figs. 3a, 3b, 3c and 3d were established as being most workable. For comparison, Figs. 3e and 3f show typical details of rivetted horizontal and vertical butt joints. The double Vee butt joint shown in Fig. 3a was used on all vertical joints on the straight sections. It is a fairly standard detail for such joints. After a few passes have been put in from one side, the root or first pass is chipped out to sound metal, and the joint completed.

The single Vee butt joint shown in Fig. 3b was used on top and bottom curved sections. This joint is covered by the A.S.M.E. Code, but is not normally acceptable under British Columbia regulations. However, after consultation with the Chief Inspector on its design, it was decided that the single Vee would be more satisfactory than the double Vee in that it minimized overhead welding. The only overhead work reqiured with the single Vee was the placing of a small back run after chipping out the root pass slightly.

The horizontal double Vee joint shown in Fig. 3c was designed to simplify chipping out of the root pass. This accounts for the slight eccentricity of the top half, and the 15 degree bevel on the outside of the lower half. The welding was started from the inside, and the root pass chipped from the outside so that the chipping tool was always running away from the curvature of the plate. The 15 degree bevel gave greater clearance for the chipping tool.

The horizontal single Vee joints shown in Fig. 3d are in the same category as the vertical single Vee. Note that a goodly portion of these butts can be considered as a downhand groove—that is, until the weld deposit is flush with the upper edge of the lower plate.

These grooves were all qualified using an E 7016 electrode under the supervision of the Province of Quebec Department of Labour. They all worked out satisfactorily in the field, but welding would have been a bit easier if all the grooves had been prepared with a

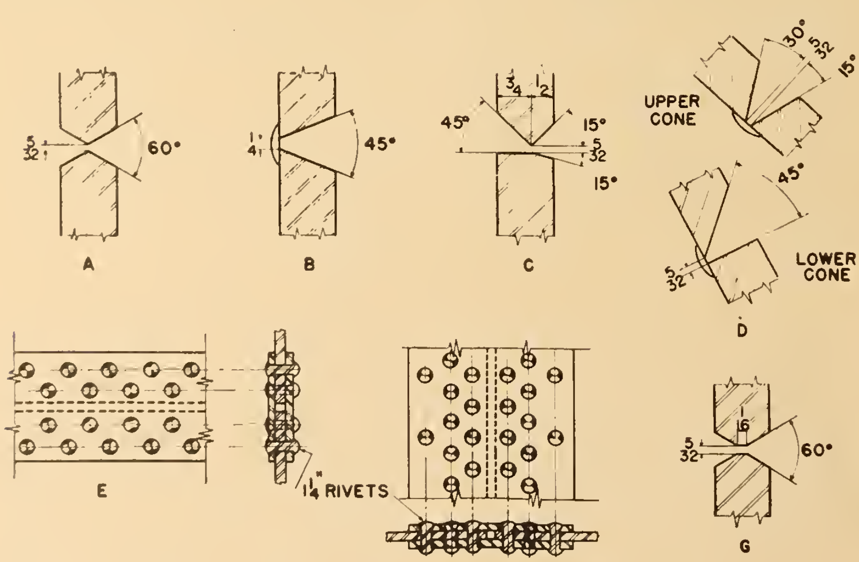

Fig. 3.

ight flat nose as indicated in Fig. g. The E 7016 rods take an appre-iably higher welding current than he ordinary mild steel rods, and he knife edges tended to burn off oo readily, giving in effect a wider pen joint with a flat nose. On both his contract, and that mentioned arlier for C.I.P. at Gatineau, vhenever a joint fitted up too losely in the field, it was opened p by chipping off the knife edge, iving the condition shown in Fig. ig.

Isotopes for Radiography

When it was planned to sub-assemble the digester sections in a emporary shop, it was intended to adiograph the longitudinal seams, ising a 250,000 volt X-ray machine rom the Vancouver shop. Radium

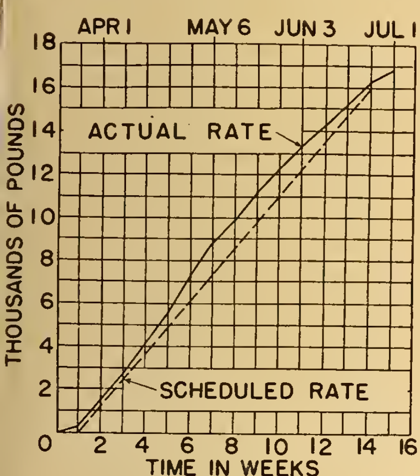

Fig. 5. Welding progress.

as a source of gamma rays was considered for doing the circumferential seams. After the decision was made to do all the welding in place, the use of the X-ray machine for all radiographing was studied. It was found to be workable, but he handling of the equipment appeared to be an awkward and expensive procedure.

About this time it was learned hat Chalk River could produce a adioactive isotope of cobalt known as Cobalt 60, which could be used as a source of gamma rays suitable or this type of work. After several discussions with the Industrial Radiology Department of the National Research Council, it was decided that it would be suitable or all field radiography of the digesters. Consequently, Chalk River was requested to prepare two sources approximately equivalent o 2 grams of radium, and one

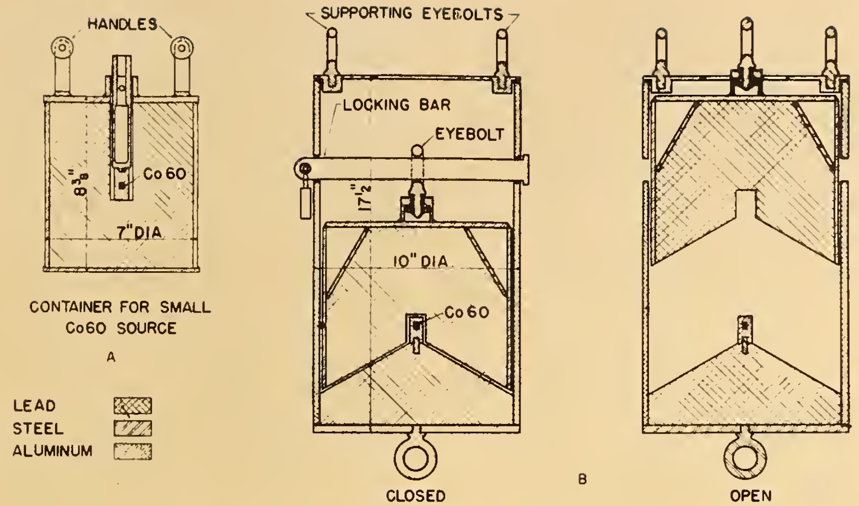

Fig. 4. Containers for large Co60 sources.

source approximately equivalent to 1 gram of radium.

While the sources were being prepared in the atomic pile, the Company developed containers to protect the operators and workmen from radiation. The container for the small source is shown in Fig. 4a. This is simply a storage box, as the source is small enough that it can be removed from the container and placed in position reasonably often without exposing the operator to excessive radiation. The larger

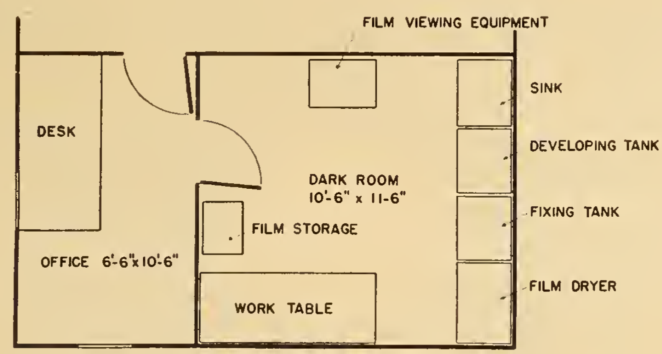

Fig. 6.

Fig. 7.

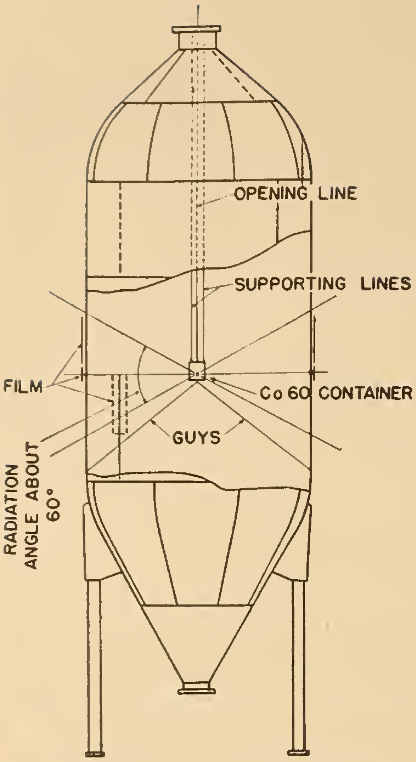

Fig. 8a.

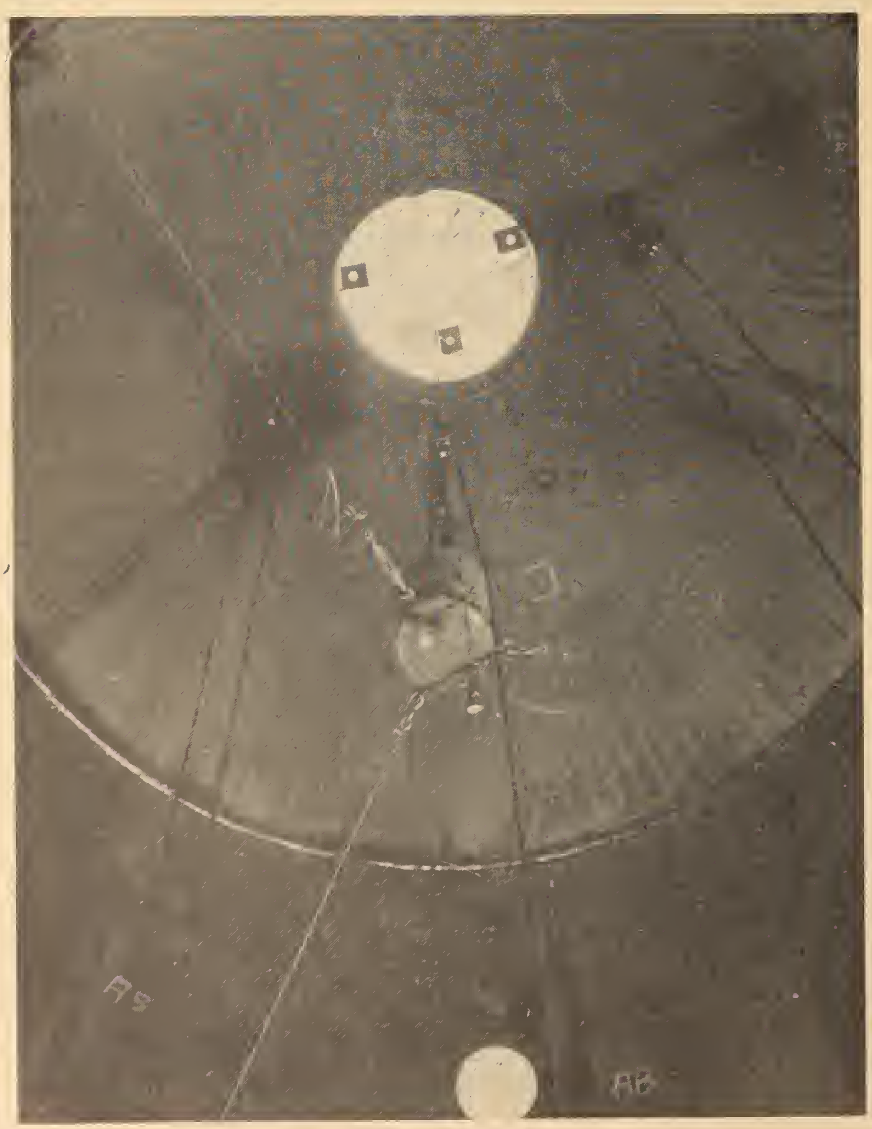

Fig. 8b.

sources, however, were much too powerful for this type of handling. The general features of their containers are shown in Fig. 4b. This arrangement has two important advantages. The first is that the source can be set in position while completely enclosed in its protective lead shield. When everything is set up ready for the exposure, all personnel can move to a safe distance, and the container be opened from a remote point. The second advantage is that all radiation except that in useful directions is thoroughly shielded.

The sources were shipped from Chalk River to the National Research Council at Ottawa during the fall of 1949. Late in October of that year, a member of the Lachine shop inspection staff, experienced in X-ray and gamma ray work, spent about two weeks in Ottawa working with N.R.C. experts on accurate measurement of the sources, selection of suitable films, and general development of techniques. These sources were by far the largest that Chalk River had produced up to that date, so it was the first opportunity to try out the isotope on what might be considered a full scale operation. (Actual strengths of the sources as checked at Ottawa were 1750, 1725, and 861 milligrams radium equivalent.)

Shop Fabrication

All digester components were fabricated in the Company's Lachine shops during the latter part of 1949. Straight shell plates were machine burned on the edges and rolled cold to shape. Dome sections were formed hot, using a full size die in a 2500 ton hydraulic press. They were then machined burned to dimension in a specially designed jig. Another jig was used to locate the assembly clips and leg gussets. Top and bottom cone sections were completely shop fabricated and X-rayed. All nozzles were welded in place, the welds being checked by the Magnaflux method. The top and bottom cone sections and the bottom dome sections were all stress relieved in the Lachine furnace. Everything except the straight shell sections was shop assembled and match marked, minor adjustments being made to insure the best possible fit in the field.

Field Assembly and Welding

The digesters were assembled in the field along with the building steel, all the work being handled by the same equipment and erection crews. This assembly was completed early in 1950. Weather conditions were not suitable for welding operations, and since the general schedule did not warrant any undue rush, nothing further was done until March 20th. By that time, the building was fairly well closed in, and weather records indicated that the temperature was not likely to fall below 40 degrees. About a month before, one of the Lachine field welding supervisors, who had done much of the actual welding on the experimental work on groove design and electrode selection, went to Vancouver. He acted in an advisory capacity to give the benefit of the experience gained in this experimental work to the Vancouver Erection Department, which was responsible for all the actual field work on the project.

Six training booths were set up

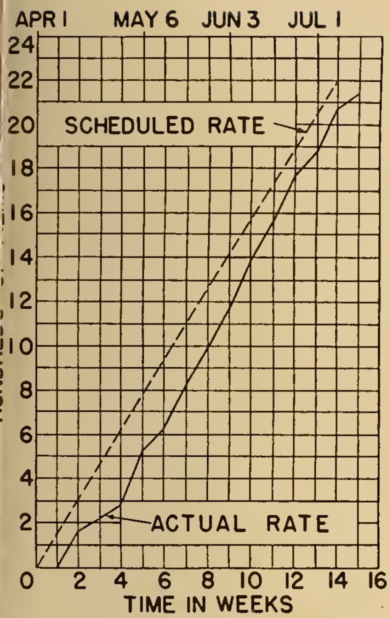

Fig. 9. Gamma ray progress.

n the Company's Vancouver shop, nd a group of 23 welders were elected for training and qualifying nder the B.C. Code. Vancouver ad already selected the foreman who was to be in charge of the work, and he and the Lachine upervisor co-operated closely hroughout the training period. All velders were given 2 to 3 days raining with the electrodes and rooves to be used on the job. All ractice plates were X-rayed, and he films gone over very carefully vith the men, to show them where hey were producing good work and vhere they were having trouble.

Each man then made his qualifi-ation plates, and a new group was rought in for training. In all, 23 nen were put through the school, nd all 23 qualified. It was felt that he careful planning and the use of he X-ray in training were the reatest factors in the unusual suc-ess in qualifying 100 per cent of he men tested. However, it was ound during the actual work that here was a wide variation in the uality of the work that the men vere able to turn out consistently. Towards the end of the job it be-ame necessary to weed out a few f the men who became too unreli-ble for economical production.

On March 20th, the welding fore-nan and some 10 welders arrived n the job and started final fitting p of the joints for welding. This vork involved checking the open-ng of the joints and correcting vhere necessary, the fairing up of he plates between the erection lips, the placing of backing strips, and the fitting of suitable strong-backs to help minimize welding distortion. Within 3 days production welding was begun with 2 men working on the single Vee butts of the bottom cone. The remainder of the men continued on fitting up, a couple of operators at a time being started on production work under close supervision, until the full production force which averaged about 15 men was built up.

In the meantime, the radiograph technician from Lachine had gone to Prince Rupert, and had the darkroom and equipment all set up ready to start control checking. Check radiographs were taken from the very start of production welding, using the small Co 60 source to take overnight spot checks, sometimes with grooves only partially filled. An average of 2½ pounds of electrode per man hour was deposited over the whole job, the records showing 6582 production man hours of welding to deposit 16,582 pounds of electrode. A weekly progress graph of actual production compared with the scheduled average rate was kept as shown in Fig. 5.

Just over 4 per cent of the weld footage had to be chipped and repaired. This was slightly more than had been expected, in view of the precautions taken. Welding rods were carefully stored in a dry place, and were placed in an electrically heated box for some time before use. All grooves were thoroughly wire-brushed with power driven tools just before welding to remove scale and rust, and each morning all grooves were dried out with heating torches. Also, the aforementioned radiograph spot checks were used as often as practicable. In spite of all this, defects persisted in cropping up. They

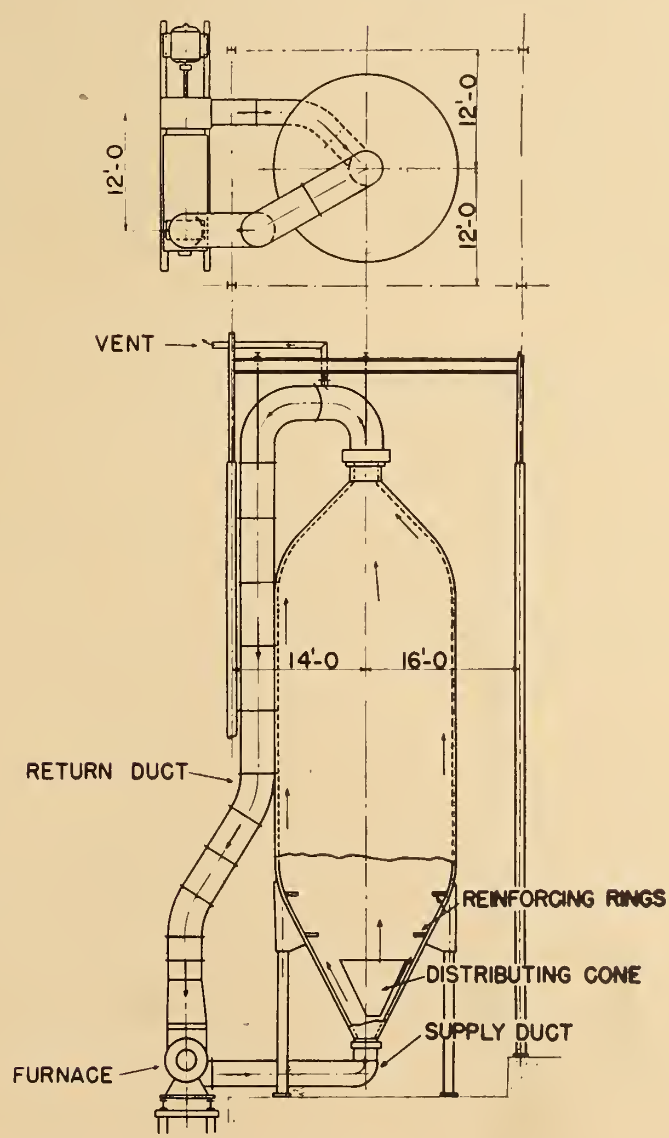

Fig. 10.

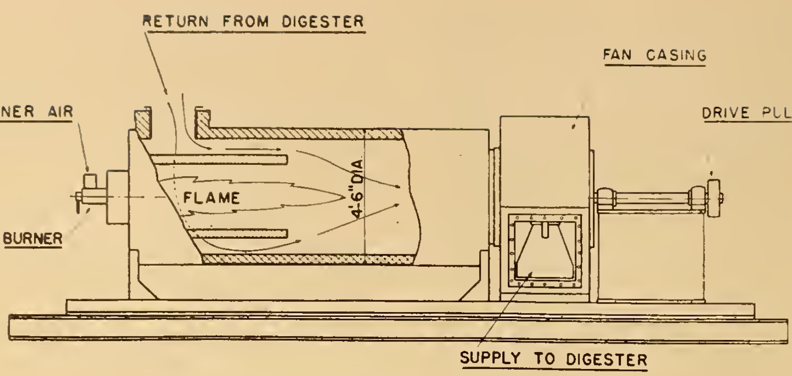

Fig. 11.

seldom occurred in isolated spots. When they were found, it frequently meant chipping out a large percentage of a seam. Practically all defects were slag inclusions; lack of fusion, porosity and cracks being almost negligible.

Since there was not sufficient electric power available to drive motor generator welding sets, all welding was done by gasoline driven units of 300 and 400 ampere capacity. These proved completely satisfactory, but of course, were considerably more expensive to operate than electric motor driven sets, due to gasoline and oil costs, and greater starting up and servicing labour requirements. Capital and maintenance costs are also appreciably higher than for electric driven machines.

Radiography

Due to the large number of films to be processed (an estimated 3,000 films 4½ in. x 17 in.), and the importance of observing results quickly for welding quality control, it was felt that a well equipped darkroom was a necessity. A large room was available in the Company's field office, so no crowding was necessary. Modern equipment of ample capacity was purchased and laid out as shown in Fig. 6.

Standard flexible cardboard film holders were used. It was at first thought that they could be secured to the digesters by means of heavy cord and industrial adhesive tape as is commonly done in shop work. It was found, however, that the tape was practically useless on the cold damp steel in the field. The technicians on the job developed a canvas strip with pockets for the vertical seams, and a system of wooden clips with light cable fastenings for the circumferential seams. Fig. 7 shows both arrangements clearly.

Lead screens were placed in the film holders both in front of and behind the film. Their function is to filter out scattered radiation and long wave radiation, which does not materially assist in the production of an image, thereby improving the quality of the radiographs. Thicknesses of 0.015 in. in front of the film, and 0.020 in. behind the film gave satisfactory results.

Standard radiograph procedure in this type of work requires that a defect 2 per cent of the thickness of the plate be visible. In order to prove that defects of this magnitude are being shown up, penetrameters are placed on the plate beside the joint and radiographed with the weld. These are steel plates, ½ in. x 1½ in., their thickness being 2 per cent of the thickness of the plate being radiographed. Three holes, 2, 3 and 4 times the penetrameter thickness (but not less than 1/16 in. dia.) are drilled through each penetrameter. All edges are square and free of burrs. It is specified that the outline of the penetrameter and the 3 holes be visible on the exposed film.

In order to make conditions most difficult, it is required that the penetrameter be placed on the side of the plate next to the radiation. This makes it more difficult to get a sharp outline of the penetrameter on the film, as there is a certain scattering of the rays as they pass through the plate, which causes a fuzziness around the edges of the image on the film. Figure 8a shows the setup used with the large Co 60 sources. Figure 8b is a photograph of the same assembly taken from below the source. It will be seen from Fig. 8a that, in the case of a circumferential seam exposure, 3 penetrameters at 120 deg. would prove that all films on that seam were exposed under identical conditions. Actually, 4 at 90 deg. were used on these seams. The same principle was used throughout—that is, at least sufficient penetrameters were applied to insure that all films in any one setup were being exposed under the same conditions.

The usual system for identifying radiographs is to apply small lead numerals and/or letters to the plate with adhesive tape, recording them on the film in the same manner as the penetrameters. This is quite satisfactory for normal X-ray work, but it was thought that, with the large number of films to be exposed at once, the time and labour to place the lead numbers and letters would be excessive. Consequently, a system was developed using a perforated serial number on each film. Using a code system, the serial number gives the digester number, the seam, and the exact position on the seam of each film exposed. The films for any given setup were all perforated and loaded into the cardboard exposure holders in the darkroom beforehand, the holders being marked correspondingly with crayon. The system proved readily workable, and was an effective timesaver in the setting up of an exposure.

Protection

In order to protect the technicians and workmen from excessive radiation, three methods were used. The first was the generous use of warning signs and barriers to keep all unauthorized persons at a safe distance. The second was the use of dental X-ray films supplied by the Health Radiation Branch of the National Research Council. These films were worn by the technicians and a few of the men working nearest the sources. Each week these were air mailed to Chalk River where they were developed and their density checked. Naturally, the density of the film is a measure of the radiation to which it, and therefore its wearer, has been exposed.

The third method was the use of pocket ionization chambers. This device is about the size of a fountain pen, and is basically a condenser. It is fully charged in a special charging unit at the start of each day's work. Exposure to radiation reduces the charge on the condenser, so that a measure of the charge at any time is a measure of the radiation to which it and the wearer have been exposed. There are different types of these instruments on the market. Those used on this job could be read directly at any time, the charge scale being calibrated directly in milliroentgens. The National Research Council's standard of a maximum exposure of 50 milliroentgens per day was used. There was no difficulty in carrying out the work and staying within this limit, although to do so required careful planning by the technicians. As far as is known, there were no psychological problems amongst the men caused by the use of the isotope.

The exposure time for a circumferential joint on the full diameter of the digester was some 35 hours. As a result, much of the radiography had to be done at odd times in order to prevent over-exposing the workmen to radiation. Many of the long exposures were made over week ends and holidays, so that the radiography staff had to work all sorts of odd hours. Fortunately, the film used had considerable latitude, so that an appreciable over-run of the optimum exposure time was permissible without adversely affecting the results.

It is of interest to note that the half life of Cobalt 60 is some 5.7 years, so that by the time the work was well started, sufficient decay had taken place that an allowance for it had to be made in exposure time calculations. Information and graphs developed by the National Research Council proved most useful in the calculations of exposure times.

Fig. 9 shows the record of actual radiograph progress compared with the scheduled average rate. Progress lagged behind the schedule throughout, but never enough to cause any great concern. In any case, it could not be speeded up without taking the chance of exposing men to excessive radiation.

Stress Relief

The general arrangement of equipment for stress relief was as shown in Fig. 10. The heating unit, shown diagramatically in Fig. 11, is essentially an oil fired furnace, followed by a circulating fan. The fan is of stainless steel capable of handling 20,000 c.f.m. of cold air when driven by a 40 hp. motor. It is good for a maximum temperature of 1400 deg. F. The furnace is fired by a proportioning oil burner, and has a capacity of 3,000,000 B.t.u. per hour. Once the oil-air ratio for any one fuel rate is established on the burner, a single lever controls both the oil and air supply over the range of the burner.

The fan is driven through a Vee belt drive, and the fuel pump and primary air blower are driven by other Vee belts off the fan shaft. An indicating ammeter is provided in the motor circuit to check on possible fan or motor over-loading. Steel duct sections for the hot gas supply were 30 in. square, and return ducts were 42 in. diameter. Both were lined with 3 in. of insulating concrete. Expansion joints giving ample clearance in both vertical and horizontal directions were provided at the top and bottom of the digesters and at the return inlet to the fan. A 12 in. vent pipe with a control damper was provided at the top of the return duct system. This bled off gas to compensate for the air added at the furnace to support combustion.

Five chromel-alumel thermocouples were attached to the shell at strategic points and connected to a multiple point recording instrument. Supplementary thermocouples were placed at several additional points over the vessels, and check readings recorded at intervals over the whole stress relief period. A sixth thermocouple was placed in the supply duct just at the fan outlet, and connected to a single point recorder. This instrument was also equipped as a controller, to operate a motor regulat-

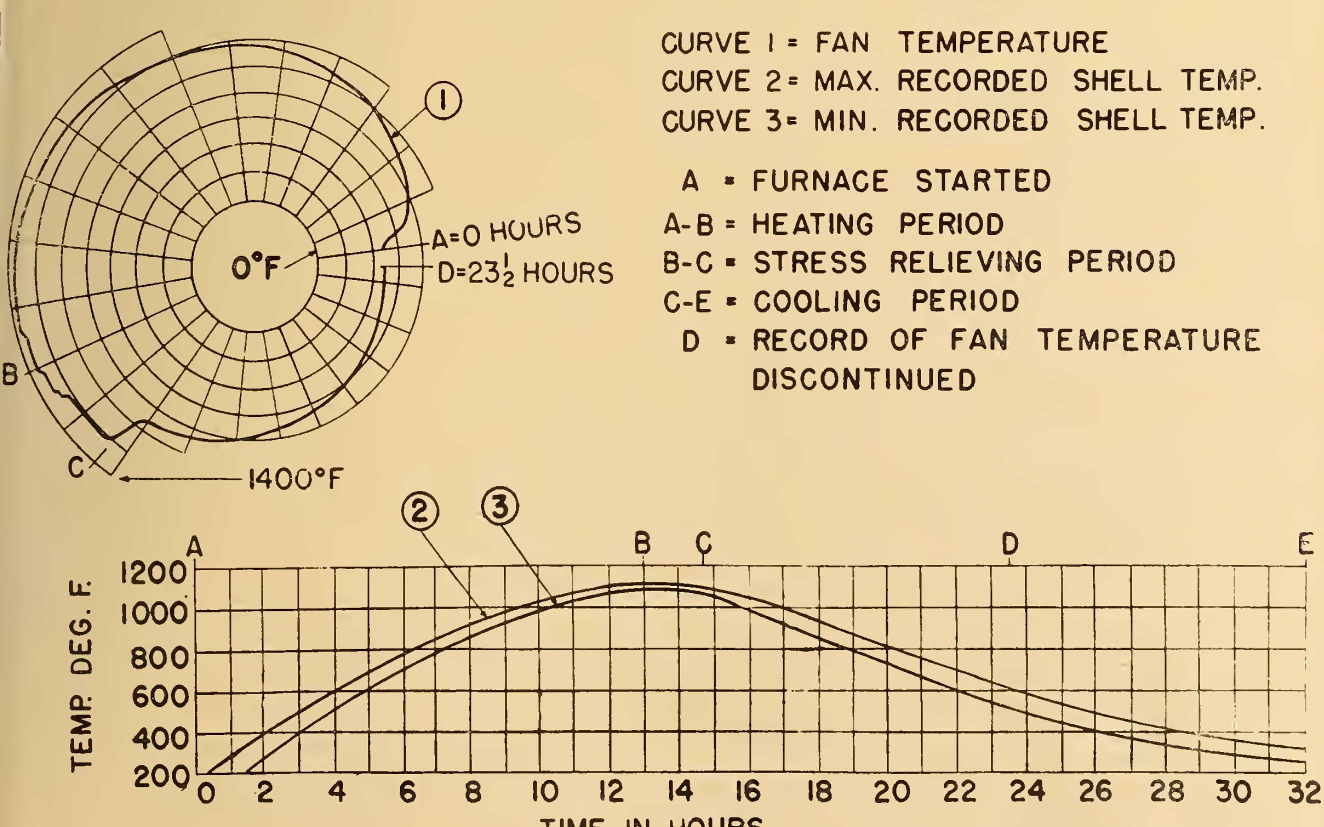

Fig. 12.

ing the oil-air flow to the burner with relation to temperature. The control motor had not been delivered when the rest of the equipment was ready to run, so it was necessary to operate manually. Due to the large amount of steel to absorb heat, and the large radiating surfaces, temperature changes of the system were slow, and manual control proved quite adequate.

To ensure good distribution of the hot gases against the sides of the vessel, a steel distributing cone as indicated in Fig. 10 was used. It was offset from the digester centreline to compensate for the tendency of the hot gases to channel up the side of the unit opposite the inlet duct. Blank steel covers were provided for all openings, those in the large nozzles having a 1 in. pipe nipple in their centre. The object of these was to provide improved circulation of gases through the nozzles, and therefore more uniform heating. In practice they were found unnecessary, and actually undesirable, as the blast of hot gases from some of them set fire to parts of the scaffolding during the first operation. Consequently the nipples were all capped off for the treatment of the last 4 units. Fortunately the possibility of fire had been foreseen and two firemen were on hand with ample equipment throughout all stress relieving.

The digesters were lagged with two 2 in. layers of rockwool blankets, the joints being staggered. Each blanket was 4 ft. by 8 ft., encased in 1 in. chicken wire for ease in handling. This material was not guaranteed for the temperatures to be reached during stress relief, but tests conducted in the Company's furnace at Lachine indicated that it would stand up for the duration of the job. Actually, mechanical damage sustained during the repeated handlings proved much greater than that due to temperature. Enough material was purchased to cover one and one half digesters, which was just enough to complete the job.

The approximate expansion on the maximum diameter at stress relieving temperature is about 1½ in. This meant that the legs had to be deflected outwards ¾ in. as a cantilever beam fixed at the base. To cause this deflection on the weak axis of the column section used, a horizontal force of nearly 1000 lb. is required. This would naturally result in an equivalent force being applied inward to the bottom of the digester through the gusset plates.

Since the yield point of steel at stress relieving temperatures is very low, it was felt that failure might occur if this force were allowed to act on the unsupported plate. Consequently, temporary reinforcing rings as indicated in Fig. 10 were welded into the 8 bottom sections of each digester. These plates were welded in place in the shop before the leg gussets were applied to help keep distortion due to that operation to a minimum. After the lower joints were welded up, these plates were made into continuous rings by welding in splice straps at the joints.

In addition to providing stiffening to the plate, it was felt desirable to reduce the horizontal thrust somewhat. To accomplish this, it was planned to jack the bases of the columns outward about one-half the calculated ¾ in. deflection, which would reduce the thrust at the top by some 50 per cent. It was felt that the remaining force of about 500 lb. per column would not be excessive. In practice, it was found that the contraction due to the welding of the 8 vertical joints drew the tops of the columns in almost exactly the desired amount, so it was not necessary to jack out the bases.

The large increase in the diameter at the top of the columns results in an increase of about ½ in. in the chord length between the columns. Consequently small bolts were placed in the leg bracing connections to allow them to slip the amount of this increase. Also, the bolts in the connections between columns and gusset plates were not really tightened, but just snugged up, to minimize the fixing effect of this large joint.

Figure 12, copied from the recorder and control charts for number 3 digester clearly show the stress relief cycle. A complete observation sheet recording temperatures, draft conditions at various points, damper and burner settings, etc., was also kept for each digester. Note that the soaking period for stress relief is based on paragraph W 462 of the A.P.I.—A.S.M.E. Code, which allows temperatures down to 900 deg. F. with corresponding longer soaking times.[2]

The first operation went pretty much according to plan and time schedule, and although minor changes and adjustments were tried on subsequent units, no significant improvement was accomplished. In general there was nothing critical in the whole operation in the way of damper positions, drafts, etc. The only thing that had to be watched closely was the temperature at the fan, to avoid carrying over its safe limit of 1400 deg. F.

Following stress relief, each digester was cleaned down and the bottom cone reinforcing plates removed. They were then subjected to hydrostatic test—a hammer test at one and one half times the design pressure, and straight pressure test at twice the design pressure.

Organization

The co-operation between everyone concerned was largely responsible for the successful completion of the whole project. This includes the co-operation between all interested departments of the Dominion Bridge Company, as well as that between the Columbia Cellulose personnel and the Company. The assistance given by the Industrial Radiology Department of the National Research Council was invaluable. Special mention must be made of the progressive attitude taken by the British Columbia Boilers and Machinery Inspection Department. Their appreciation of the special conditions and problems to be met in pioneering of this type proved most helpful.

In the early planning stages of the contract, at least six departments of the Company were at work on various phases of the project. It soon became obvious that the contract could not be carried out in the ordinary routine manner due to the large number of departments involved and the geographical conditions. Consequently the author was made co-ordinator, with a view to preventing omissions or duplication of work, to schedule and co-ordinate shipments, and to act in a consulting and advising capacity to all departments concerned as to the influence of field conditions and requirements on their work.

As the writer is mainly concerned with field problems, this paper has naturally leaned rather heavily towards field engineering, organization and construction.

Standards for Citizenship

The Roy V. Wright Memorial Lecture

by

Arthur T. Vanderbilt

Chief Justice, Supreme Court of New Jersey, Newark, N.J.

Reprinted from the November 1950 issue of "Mechanical Engineering".

I come here tonight in the name of friendship. Roy V. Wright had a great capacity for friendship, active, helpful friendship with many different kinds of men. One reason for that was that he was a man—one of the relatively few men—who did his duty in every field of life and not merely in one narrow specialty.

In his own special work as an editor, none stood higher. He recognized his duty to his profession and gave it an extraordinary year of activity as the president of this Society, but he didn't stop with that high honour; he continued to serve it in various capacities, not the least important of which was as the promoter and the chairman of the A.S.M.E. Engineers' Civic Responsibility Committee. He was equally active in his community, in his church, in the Y.M.C.A., in the work of the local hospital of which he was president, and in a dozen other ways. In addition to all this he was active for many years in politics, first, as a member of the governing body of Essex County, New Jersey, one of the dozen largest counties in the nation; then, as a member of the Republican State Committee; and, finally, as a member of the State Senate.

For busy professional men, pressed with heavy responsibilities, many of which cannot be delegated, the inevitable tasks of political activity in a democratic society with free competition in politics as well as in enterprise are bound not only to be time-consuming, but to be thoroughly irksome. Nobody but a thoroughly good citizen such as Roy Wright was would ever take the pains or spend the time that is required in politics the way he did for years.

Delivered at the inauguration of the Roy V. Wright Lectureship, under the auspices of the Engineers' Civic Responsibility Committee, at the Annual Meeting, November 27 to December 2, 1949, of The American Society of Mechanical Engineers.

The Roy V. Wright Lecture was established as a tribute to Dr. Wright's participation as a citizen in the affairs of his community and in recognition of the stimulus his speeches and leadership gave to participation by all engineers in civic affairs.

Dr. Wright was a past-president and Honorary Member of A.S.M.E. and until his death the active leader of the A.S.M.E. Engineers' Civic Responsibility Committee. Editor.

But he did not stop here; he loved to work with young engineers, and so for many years he held the instructorship in civics and government at the Newark College of Engineering. The work culminated in the preparation, along with Mrs. Wright, and the publication of "How to Be a Responsible Citizen." After reading a score of books in that field, I still think theirs is by all odds the best.

It is peculiar pleasure for an erstwhile lawyer now removed to the seclusion of the bench to come to address a body of engineers, because I know, contrary to the general opinion among the profession, that the engineers have been among the first to awake to a growing sense of their responsibility as citizens. I consider the report published in 1944 by the Society for the Promotion of Engineering Education to be one of the greatest educational documents in American history. At a conference, held at Buck Hill Falls two years ago and sponsored by the Carnegie Corporation, of leading educators from the five professions of business, divinity, engineering, law, and medicine — a strange group some of you will think — it was the engineers and the divines who showed, at least in my opinion formulated after a quarter of a century of participation in politics, any real conception of what is expected of us today as citizens. I don't know whether it would be true of lawyers as a whole, but the professors of law who attended the conference were as unwilling to face not only the realities but the ideals of political life quite as much as the educators in business and medicine. For this neglect, can there be any doubt that business—and through business the whole country—has been paying the penalty for the last quarter to a half century? And is it not equally obvious that the default of the medical profession to see and do its duty as citizens is at least responsible for the specter of socialized medicine which is sending the shivers up and down the medical spine?

We often speak of this as an

age of science. Half a century ago many good people were very much troubled over the apparent conflict between science and religion. All too many people have resolved that conflict by forgetting religion. Then we began to speak of the times as the age of technology, the age of mass production. The emphasis was on the satisfaction of material wants. As Emerson put it a century ago:

> Things are in the saddle
> And ride mankind.

But such designations of our age are grossly superficial. This is not the age of science; this is not the age of technology; this is not the age of mass production; this is not even the age of atomic energy or the atomic bomb.

Like it or not, we must each of us sooner or later face up to the fact that this is an age of politics, and in many parts of the world the age of power politics. In every continent except ours you will find dictators struggling to suppress democracy. Even here government has taken over large areas of activity undreamed of a quarter of a century ago. You get four very definite reminders of this a year from the Collector of Internal Revenue and I know not how many times from state and local authorities. This is an age of power politics, because people no longer think of government as an institution to live under, an institution that will protect them from force and violence at home or abroad and give them the opportunity to live, to work, to play, and to prosper. On the contrary, many people now look on government as an institution to live on. The growth of government employment in America is something that should claim your attention. According to a study by Fabricant, published by the Falk Foundation, in 1900, there was one person out of 28 on the public payroll (I am not taking into consideration the millions of people who are being paid either to raise or not to raise something); in 1920 there was one out of every 15 on the public payroll; in 1940 there was one out of every 11; and in 1948 there was one out of every 8. Every engineer, I am sure, has the statistical ability to plot the curve and tell us the exact year in which everybody will be on the public payroll. The only question that will remain to be solved in that millennium is who will make the money to meet the public payroll that we shall all be on, for it is notorious that governments do not make money, they merely spend it, and the most we can hope is that they spend it wisely.

This perennial reaching out of government is almost as grave a danger as the international threat that faces us on almost every continent. But with all of these involvements at home and abroad we face what seems to me to be an even more sinister phenomenon in our own domestic life. I personally do not like to have statistics thrown at me, and I shall not indulge excessively, but three figures tell the story of what is happening to us by our own volition. In 1940 only 59.5 per cent of our eligible voters took the trouble to go to the polls to vote for the next president. In 1944 the percentage had dropped to 56.4 per cent. In 1948 it had again dropped to 51.2 per cent. If this curve continues, it is plain that in 1952 we shall elect our president, a ruler with greater powers than any other in the world, by a majority of a minority of the eligible voters. This default not even to take the trouble to vote was dramatically illustrated in the Congressional elections. In 1938, thirty-eight million people voted for members of Congress, but in 1942, when we were well in World War II, eleven months after Pearl Harbor, the number of citizens who voted for members of the Congress that was to wage the war and perhaps dictate the peace dropped from 38 million to 28 million. Compare, if you will, these shameful figures with the recent election in Italy where 93 per cent of the people voted, or the still more recent election in Austria where 95 per cent of the people voted. I hope it is not true that we need to be deprived of our liberty as the citizens of these other countries were to make us recognize the practical worth to us of the great privilege of voting. Our failure to vote is, just a symptom of the disease which has many other unhappy manifestations. A nationwide poll made not so long ago revealed that 67 per cent of the people answering a questionnaire said they would not like to have their sons go into politics, and 50 per cent of all the people said that a man could not go into politics and remain honest. Think of that! Of course, there are dishonest politicians just as there are dishonest businessmen, but no one suggests that we should not go into business because some businessmen are faithless. After a quarter of a century or more of political activity, I have the firm conviction that the percentage of dishonest politicians is no greater than the percentage of dishonest businessmen, or dishonest labour leaders, dishonest anything else. How are we to run a democratic representative system of government if good people are too good for public affairs?

I cannot deny that politics may be a mean game. I have known what it is to be subjected to public attacks which everyone knew were absolutely untrue. It is very disagreeable; it makes a man of integrity very angry. But as I see it, we have the alternative of either doing our share year to year, month to month, and week to week in this disagreeable game of politics or every quarter of a century or less sending our sons—and it may well be next time our daughters—into the frightful ordeal of total war, not to mention imposing on our children and our grandchildren and their children in turn a staggering national debt which it seems almost impossible ever to meet. For any sane man or woman there can be no question as to what the choice will be.

And yet the fact is that most men shrink from running for public office. Very often their employers discourage them. Still more often the women of the household dread the inevitable rough and tumble to which the head of the house will be exposed. I know something about this at firsthand, for my chief political job over many years was to persuade men to run for office. They never ran any risk of being defeated. If they ran on our ticket, they were sure to be elected. They weren't called upon to put up big campaign contributions. All they had to do was to run; but all too often the little woman back home would say no, and that would be the end of the participation in politics of an otherwise desirable citizen.

Now that I am completely out of politics I am going to tell you something that I have never reealed before. I am going to tell ou how I learned as a matter of ıd experience to overcome the pposition of the ladies. When we anted a man to run, we would ave the right committee wait on im, not at his office, not at the lub, but at his home with his wife resent. When the good lady beins to hesitate, you just ask her, Won't you pray over it?" No oman can ever turn you down on hat. Then the next step is to ask, Why shouldn't we pray right ow?" If you can get them to pray ight on the spot and make your ppeal a very personal one, you ill find that there are very few omen who have the courage to urn God down. It is a very good ystem and I commend it to you ll.

Another great difficulty, of ourse, emanates from the dislike f many corporations to having heir employees and junior executives in politics. In fact, there are great many corporations which ike to have their lawyers, their ngineers, and their accountants n firms which have both Republicans and Democrats so that they vill always have a friend in the uling camp. Either the total pposition of corporations to their nen getting into politics or their fforts to play a bipartisan game end to destroy sound government, ınd sooner or later they will come o realize it.

You may think the situation hat I am describing is something of recent growth. Not so at all. *Fortune* ran a survey some years ago of the 67,000 graduates of the twelve leading preparatory schools n the United States. Some of these schools had histories running back for a century or two. Out of that tremendous number of picked men there was but one president, one justice of the United States Supreme Court, and 27 senators. For all too long our best brains have been going into business, into science, and into the law, and neglecting politics. When the article I refer to appeared, it so aroused the president of one of the New England colleges, who was speaking at one of the very preparatory schools involved, that he asserted that one could not go into politics and be a gentleman, as if that were the end of it all. Now really, I suppose if we are called upon to choose between being a good citizen and what he called being a gentleman, all of us would prefer to be good citizens. It is much more essential to the welfare of the country and to the continued existence of our children and grandchildren. Well, there you have the problem—a world in turmoil, the men who should be our public leaders uninterested in government and politics, and our citizens when they do vote not always voting intelligently.

When I moved out 25 years ago to the little town in Essex County where I now live, a town which prides itself on its intelligence, one of my friends, a Princeton graduate and a Harvard Law School man at that, called me up and said, "We are having an election for the school board next week and I hope you are going to vote." "Yes," I said, "I expect to." "Everybody up here is voting for Nos. 1, 3, and 5 on the ballot." "Tell me," I said, "who are 1, 3, and 5, and who are 2, 4, and 6, and also No. 7, if there is a No. 7?" I could feel the temperature dropping to the freezing point. "Do you have to be as legalistic at home," my neighbour said, "as you are down at the office?" And when I tell you that one of the men running in the election in which I was being asked to vote blindly was Dr. Frank B. Jewett of the Bell Telephone Laboratories, one of the greatest engineers of our times, you will see how important it was that I should know whether he was 1, 3, or 5, or 2, 4, or 6 before I voted, and I insist that I was not being legalistic merely because I wanted to know who the candidates were.

Many years ago I went to a political meeting in Montclair, where I was asked to pinch-hit for a speaker while we were awaiting the arrival of Dwight W. Morrow, who was campaigning for United States Senator. Not being a trained political speaker, I suggested that we would play a game. If you want to become the most unpopular man in your town, I suggest that you play this same game and I will guarantee you results. There was my audience of 300 or 400 Republican county committeemen and women, the Republican members of the election boards, the presidents and other officers of innumerable Republican Clubs of Montclair, the Montclair that likes to call itself "the Athens of America." "Raise your right hand," I said, "and then drop it when you can't answer a question. At the end I will test to see that you know the answers that you claim to know when you keep your hand up." All raised their hands. "Who is the President of the United States? the Vice-President? the two United States Senators?— remember, there are two." Hands began to fall. "And who is your Congressman, not any Congressman but your own Congressman? and your Governor? and your State Senator? and your twelve Assemblymen?" By this time there were just a few hands left. "And your nine Freeholders? and the County Clerk? etc." Finally I said, "And who are the five Commissioners who govern Montclair?" At the end there were only two hands up in the entire audience! All the rest did not know even the names of the people for whom they had voted, not to say anything about their character and capacity for the things they were supposed to do. It was really quite shocking. Imagine how the ordinary citizenry of Montclair would make out if these active politicians in my audience did not know the answers; and if Montclair, what about all the rest of the United States? It is no easy job, is it, to be an intelligent voter?

And how difficult it is to vote honestly! In the diary of John Burroughs, the naturalist, who was probably as honest a man as ever lived, you will find this note on the day after the presidential election in 1912: "Woodrow Wilson won. It might have been worse; it might have been Taft. Voted for T.R. out of friendship—something he would never have done for anyone." Now, here you have an honest man admitting that he cast his vote for the presidency, not on the basis of who was the best man for the office, but on the basis of personal friendship. How can we ever hope for sound government if we vote for a man simply because he has the best profile, or wears the best clothes, or has the best voice, or the best Harvard accent, or the best anything else other than the capacity to be the best officer?

Now, when you think of all of the parasites who vote, not for friendship, but because of a job given to the family or the promise of some post that they may never get or because they think it best suits their individual pocketbooks, you will realize how far we have got to go before we will have achieved the first fundamentals of good citizenship. Indeed, not until men and women go into the voting booth and exercise their franchise with the honesty and intelligence that they would exercise as jurymen or women charged with the passing upon some defendant's life, can we hope for good government.

I have mentioned jury duty. I should hesitate to repeat my performance in Montclair by asking all who have ever asked to be excused from jury service to raise their hands. I really don't care to lose friends everywhere, but jury service is one of the few things that the state asks of us in peacetime beyond voting, and its proper exercise is essential to an honest administration of justice. Here is a field which requires almost as much improvement as that which I have indicated is needed in the selection of our public officials. There is almost no limit to the devices and the stratagems to which the ordinary citizen will resort to evade his duty to act as a juror. And yet we must all realize that the honest administration of justice, the very issue of liberty and life on the one hand and the safety of society on the other depend on the performance by the average citizen of his duty as a juror.

Our country really asks very little of us in voting and in jury service and yet if we do not attend to these fundamental responsibilities, we may be very sure that we are helping to bring on the day when the state will ask of us the ultimate duty of military service, which no one may refuse. Not only will the command come to us, but to the younger generation, a command that might have been escaped if each and every one of us had done his full duty in peacetime as a citizen. A man may be just as patriotic in peacetime as in war, though strangely enough we have a tendency always to think of patriotism as exclusively a wartime virtue.

I have dwelt on some of the fundamental responsibilities of citizenship: honest, intelligent voting; jury duty, an absolute essential to the administration of justice in this country; and military service in time of crisis. In addition to all of these official duties, however, each of us has an equally important unofficial duty as a citizen.

Ours is a country that is run in the last analysis by public opinion. If we are to really do our full duty as citizens, we must be ready year in and year out to play our part in the molding of public opinion. Let me give you an example or two of what I have in mind. I happened to be in London in February, 1938, the day after Anthony Eden resigned from the Cabinet in protest against Neville Chamberlain's policies of appeasement. I happened to have lunch with five judges of the House of Lords, the highest court in England. They quite frankly explained to me the meaning of Mr. Eden's resignation, and I equally frankly asked them why they had not listened to Charles Lindbergh, who earlier that month had said in the English press on his return from Germany that he had seen 30,000 warplanes there. Now, whatever may be Mr. Lindbergh's shortcomings as a politician and a statesman—and I think they are serious—he at least is a good aviator and he surely could recognize warplanes when he saw them. And yet the English practically threw him out of the country because, as the judges said, "Our people want peace and they don't want to have anybody telling them about warplanes in Germany. Our people just don't want to know how many planes the Germans have." And so for a year and a half, instead of preparing themselves to meet the 30,000 warplanes, the English did nothing.

We do not have to go abroad to find similar examples of failure of public opinion to meet its responsibilities. Back in October, 1937, President Roosevelt made a very courageous speech in Chicago, popularly known as the Japanese Quarantine Speech. That was nearly two years before World War II started and well over four years before we went into the war. The chances are that if we had heeded that speech, World War II might have been avoided or at least confined to the European area, but the fact is that practically every newspaper in the United States, Democratic and Republican alike, accused the President of being a warmonger. We had no intelligent public opinion in the United States in the realm of international affairs to back him up at that time. Consequently his ideas on this subject died aborning and the road for Pearl Harbor was prepared. The attitude of those carefree but unfortunate days was reflected in a bit of verse I saw in a college newspaper:

The cow is in the cornfield.
The cat is in the lake,
The baby is in the ashcan,
What difference does it make?

Well, as you can see as engineers it makes a lot of difference. The cow, if it ate enough corn, would die. The cat in the lake would spell pollution to the waters. Somebody would certainly feel very badly if anything happened to the baby in the ashcan. And yet we were all saying in those days, "What difference does it make?" That was the spirit of the times and it brought us to a very sad pass. Accordingly, I have no hesitancy in saying that our great unofficial duty as citizens as the molders of public opinion is fully as important as our duty to vote, to act on juries, and to render military service if called on.

Everywhere we turn abroad we are faced with problems that seem to be almost beyond solution. Difficult as these problems are, I am more concerned with what is going on in our midst. The Director of the Federal Bureau of Investigation, Mr. J. Edgar Hoover, tells us that there is a serious act of violence committed in the United States every twenty minutes, but he adds that this is insignificant when compared with what communism is doing to us, especially in our labour unions. These are matters wherein we should bring the force of our influence to bear on public opinion. Equally deplorable is the steady drift year after year of government away from the states and toward Washington, away from the localities where citizens live to the state capital. The constant tendency in government seems to be toward centralization, and centralization inevitably spells bureaucracy. We are becoming so accustomed to the high cost of government that we regard it as normal. Last July the President in his annual message on the economic state of the Union said, "One of the things we must do is to increase inheritance taxes." I can't help but think of an estate of thirty-six million dollars, where represented one of the parties in iterest. The will provided for pecific legacies of four and a half nillion. Then the testator gave all f the rest, residue, and remainder f the estate to his wife. The question that I want to put up to you s how much did she get out of the hirty-six million dollars after ineritance taxes and specific legacies vere paid? The answer is less than ne-half million dollars, and yet the 'resident suggests that inheritance axes are not enough!

I will not say anything about income taxes, but I am wondering onstantly why someone doesn't ise up and say, "The war is over, et's get back to peacetime taxes," ut no—all of us are taking warime taxes as the customary thing or peacetime. That is the great anger of war, that its dictatorial owers will be perpetuated in time f peace.

I have indicated some of the nain problems which confront the verage citizen. I can hear many eople say, "We haven't got the ime! We haven't got the time! Ve are all so busy getting started. Ve are all so busy running some orporation that we are the head of or getting ready to be the head of that we just haven't got time to hink of our duties as citizens." Vell, if we were but willing to give ip our many secular holidays to he work of citizenship, we would nave more time for that purpose han we would know what to do vith. It would be interesting for each and every one of us to jot lown in the course of a year just now many days, or hours, or ninutes each of us gives to his luties as a citizen. I warrant for he average man it would be less han an hour in the course of a year, and for many much less than hat. We have neglected our birthright. Indeed, many of us seem to nave failed to recognize what it really is—freedom, greater than nas been known anywhere else in the civilized world or anywhere else in the pages of recorded history.

Of what avail the plow or sail,
Or land or life,
If freedom fail?

The only thing that is going to stop freedom from failing in this country is the attention of every man and woman, especially those who have the intelligence and character to be leaders, to performing his or her duties as a citizen. √

Efficiency?

The legend of the efficiency of North American industry has become almost a tradition. We are prone to look down our noses at the outmoded ways of the rest of the world and to feel that we alone possess the secret of how to do anything with the least expenditure of time, labour and materials. Without denying that, on the whole, our industry is probably more efficient than others, there is still room for improvement.

In its June, 1950, issue *Construction Methods and Equipment* analyses the results of observations on highway construction made by a joint committee of the Highway Research Board and the U.S. Public Roads Administration. Seven classes of equipment and 33 projects were studied.

After allowing for bad weather and other periods when work was manifestly impossible, the following table shows how little of the available time was really used. Calling the time during which equipment could and should have been working 100 per cent, it actually worked only as the figures show.

	Per cent
Asphalt plants	63
Bituminous pavers	26
Dual-drum paving outfits	52
Euclid loaders	48
Power shovels	51
Tractor-scraper units	79
Wheel-scraper units	60

The average for all equipment is only 39 per cent.

Lost time was due to many causes, among them lack of operators, breakdowns, interference with other equipment, waiting for help, moving from one part of the job to another, starting up and closing down and shortage of materials. Some of these are inevitable, some would seem to be the resuts of inadequate planning.

Construction is admittedly less efficient than manufacturing and because of its nature probably always will be, but the figures quoted make one wonder if perhaps a rigid analysis of many manufacturing operations might not show comparable conditions. √

The *New Grand Haven*

When completed, the recently launched *New Grand Haven* will be the largest railway freight car ferry in the world, being 60 feet longer and having 12 feet more beam than the present largest. The principal dimensions of the vessel are: length overall, 466 ft.; breadth extreme, 71 ft.; depth to upper deck, 42 ft. 3 in.

Power is supplied by twin screw Vickers-Skinner steam unaflow machinery, capable of developing a total brake horsepower of 10,000 and giving the vessel a designed maximum service speed of about 18 knots.

The unusual proportions of the vessel, coupled with the high speed created special propulsion problems and the form of the ship and of the propellers was the result of exhaustive model tests which were commenced before the order was placed. For safety and strength the vessel has double bottom construction throughout and eight main watertight bulkheads.

A minimum of forty maximum size fully loaded freight cars can be taken each trip on five tracks and special attention has been given to attaining ample clearances. Freight cars will be loaded and unloaded over special stern bridges and the structure of the aft end of the vessel is designed to take particularly heavy loads and units too large for normal rail transportation.

The contract for this vessel was signed in April, 1950, and, bearing in mind the great difficulties in obtaining steel, etc., it is believed that the launching of this ship complete with engines and boilers in so short a time sets something of a building record for a vessel of this size.

The vessel was designed by Mr. R. Lowery, naval architect, Canadian Vickers, Limited, and all working and detail drawings were made by Vickers own staff. It is expected that the *Journal* may be able to present more complete design and construction details in the form of a paper in a future issue. √

Pulp and Paper Research

by

J. S. Hart

Chief, Chemical Pulping Group,
Pulp and Paper Research Institute of Canada.

An address delivered to the Engineering Institute of Canada, at Montreal, on Thursday, November 30, 1950

Drawing attention to the importance of pulp and paper production as Canada's leading industry, Mr. Hart explains the origin and operation of the Pulp and Paper Research Institute of Canada, under joint control of the Industry, the Government of Canada, and McGill University.

Describing the various processes employed in the production of pulp and paper, he gives examples of how research, both fundamental and applied, is aiding the industry, in directions such as making stronger paper; increasing the pulp content of rayon; finding new uses for lignin; and in developing uses for by-products. In conclusion he points out that the tree is self-perpetuating and, with the help of research can become the basis of a well balanced chemical industry with a great future ahead of it.

Research in the pulp and paper industry has been extensive, and can be described only briefly in the space at our disposal. However, it is proposed to give some of the outstanding achievements arising from research and to indicate what may be expected in the future.

The application of the fruits of research to commercial operations is of importance. The pulp and paper industry in Canada is our largest manufacturing industry, and the future usefulness of its enormous capital investments must be assured. One of the principal means to this end is the organization and operation of scientific research, together with the development of its findings into practical form.

This has been realized by the industry in Canada. After the first war, through the leadership of some of its prominent men, the Pulp and Paper Research Corporation was formed. The object was to provide a centre in which the necessary research could be conducted. It was provided that the Department of Cellulose and Industrial Chemistry at McGill University, as instituted by the E. B. Eddy Endowment, should be combined with the new organization, and the whole known as the Pulp and Paper Research Institute. An integral part of this new organization was the Pulp and Paper Division of the Forest Products Laboratories of Canada, which had been continuously carrying out pulp and paper research since before 1914.

This organization was under the control of the three parties involved viz. the Canadian Pulp and Paper Association, representing the Industry, McGill University and the Canadian Government. This year, again under the leadership of several prominent men in the industry, the Institute was reorganized as a single legal entity with a federal charter, a board of directors, a full-time president and its own business office.

Under this new set-up the Institute is undergoing a period of expansion in which its facilities and scope will be greatly increased. It is planned that attention will be given to more diversified training of personnel for the industry. Graduate education has always been considered a major purpose of the Institute along with both fundamental and applied research and the attendant testing, calibration and library services.

Pulp Contains Cellulose and Lignin

Before proceeding, it would be well to briefly explain what is meant when we talk about pulp and paper. The pulp we are talking about is an agglomeration or mass of fibres obtained principally from trees, but in some cases from other plant materials. These fibres are composed of a substance called cellulose, so named because it is the main constituent of wood cells. These cells constitute about fifty per cent of the solid material of the tree.

The remaining solid material is composed for the most part of a substance called lignin, which surrounds and holds in place the cellulose fibres. There are other components, related to cellulose, which are grouped under the general name of hemi-cellulose. Paper, on the other hand, is a deposition of these cellulose fibres from a suspension in water, in the form of a sheet which is subsequently dried.

A full account of the development of the pulp and paper industry, past, present and future, would commence with the raw materials, continue through the two basic processes for converting them to pulp and paper, with all the ramifications of those processes, and would end with by-products and off-shoots of the industry. It will be impossible here to give such a complete account, and it is intended to mention raw materials only briefly, then to continue with methods of isolating the fibres and forming a sheet of paper.

Quality and Proportion of Fibres

It has been mentioned that the tree is the main source of cellulose fibre, and that only about 50 per ent of the tree is in this fibrous form. For this reason, anything that can increase the number of trees, or ensure a continuous supply of trees, will be a step in the right direction. Forest management, as a means of providing the continuous supply, is one of such measures.

The number of species of trees that can be made available for pulp making and the quality of the fibres in such trees, are vast fields for research. It must be remembered that a relatively small proportion of the trees drained from our natural resources goes into pulp making. Approximately 2 per cent becomes pulp and

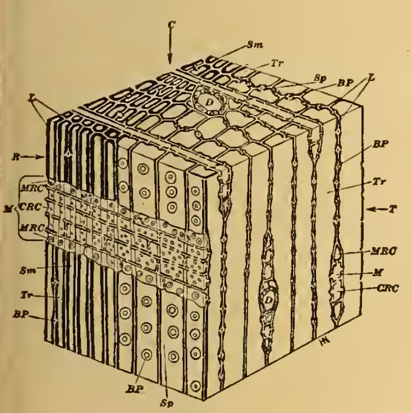

Fig. 1. Diagram of a small block of spruce wood, greatly enlarged, showing a part of one annual ring.

about the same percentage is lost owing to insects, disease, fire and wind.

Insects and disease are the subjects of intensive research, and here much progress has been made. However, much remains to be done, as exemplified in the fight against the spruce budworm. This insect is responsible for enormous losses, and while research has shown a means for combating it on a small scale, methods have still to be perfected in order to overcome its ravages in our forests as a whole.

The quality of cellulose fibres is another vast field of research. Into this subject enter many fundamental problems of physical chemistry. But concerning the subject of raw material, it is only necessary to consider what has been accomplished by selective development of the various cereals and other foods, to realize what may lie ahead in the field of silviculture. We must first ascertain the desirable characteristics required, and then it may be possible to produce them.

Next we come to the isolation of these cellulose fibres from the raw material, by processes which may be either mechanical or chemical in their action, or a combination of both. The fibres themselves are cylindrical in form with elongated ends, and are situated with their longer axis parallel to the perpendicular axis of the tree. In mechanical pulping the fibres are separated by mechanical disintegration of the wood, the most common method of which is the groundwood process.

In this a log of wood is subjected to pressure grinding on a wetted revolving stone. The resulting fibres contain most of the non-cellulosic materials in the original tree. In chemical pulping wood chips are placed in a digester and cooked with various solutions. The lignin is dissolved by solvents under conditions which do not attack the cellulose to any appreciable extent, and the result is a pulp of almost pure cellulose fibre.

Groundwood Process

The groundwood process was the first commercial method for isolating fibres from wood. It is still a most important process to our Canadian economy in view of the fact that it furnishes approximately 85 per cent of our yearly output of 4½ million tons of newsprint. Spruce and balsam at first were almost exclusively used, but research has developed the use of jackpine in Canada, southern pine in the United States, and poplar to a limited extent in both countries. Similar applications of research will no doubt increase in the future.

Briefly, mechanical or groundwood pulp is produced by pressure grinding of a log of wood against a wetted stone. There are many variables involved in this operation such as the speed of the stone, quality of the stone, grinding pressure, grinding temperature, amount of water introduced, etc., which affect the quality of the pulp and economy of the process. A great deal of research into these factors has been carried on in all pulp-producing countries, and a considerable portion of this has been done at our Research Institute here in Montreal. Early research on groundwood quality at the Forest Products Laboratory, the fore-runner of the present Institute, led to the development of the Canadian Standard Freeness Tester, used the world over for controlling groundwood quality.

Of great advantage in groundwood research has been the development of a practical miniature grinder at the Institute, which simulates commercial grinding operations and allows the results to be applied to full-scale operations. A further important feature is that the fundamentals of grinding can be studied in a manner not practical with commercial grinders. Studies are adding continually to our knowledge of the grinding process which, up to the present, is incomplete.

Chemical Pulping

In chemical pulping cellulose can be destroyed during the cook, so it will be readily appreciated that the technique of dissolving the lignin, leaving the cellulose unharmed, should be well understood. Unfortunately such is not the case. The composition of lignin is still by no means established, and comparatively little is certain of the reactions by which lignin goes into solution. A major difficulty in establishing the structural formula for lignin in its original state lies in the fact that its structure changes during its solution, and until the original structure can be more definitely

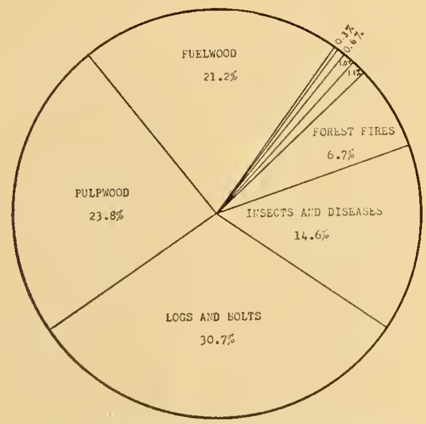

Fig. 2. Diagram showing how Canada's forest resources are used (period 1939-1948). (Hewn railway ties, 0.3% — Pit props, 0.6% — Poles, posts, rails 1.0% — Miscellaneous, 1.1%.)

Fig. 3. Canadian Standard Freeness Tester in use.

established we are compelled to follow empirical methods rather than verified laws of natural science.

The art of chemical pulping was developed over a number of years, largely through the experiences of operators. Research by various investigators first led to the discovery of the first principles of chemical pulping, but for many years the chemist had little to do with pulp making. Engineering research entered into the designing of better materials and methods of manufacture, but it is only quite recently that we are again delving into the physics and chemistry attendant on the isolation of cellulose fibres by chemical means. In all parts of the pulp-producing world the two main processes for making chemical pulp, i.e. the sulphite (or acid) and the alkali methods, are receiving attention, and progress is slowly but surely being made. These two main methods both arrive at cellulose fibres through dissolving the lignin with different solvents.

Sulphite or Acid Process

The sulphite, or acid, process dissolves the materials cementing the fibres together by means of a solution containing free sulphurous acid and a bisulphite of an alkali, in most cases calcium bisulphite. This process was discovered in 1867 and the first sulphite pulp mill in Canada was built at Merritton, Ontario, in 1885. Since that time, much progress has been made both in the technique of sulphite pulp manufacture and in the fundamental knowledge of the process.

The original inventor, and those who later developed sulphite manufacture, were faced with the problem of finding suitable materials to withstand the action of the hot sulphurous acid. Lead-lined vessels were used at first; but these were not suitable for large digesters. Next the practice of lining them with acid-proof brick was developed. This, however, did not protect the pumps, valves and piping, and so-called acid-resisting bronze became the metal used for these purposes. This bronze was not entirely resistant to acid. It was somewhat better than iron or steel but annual replacement was still a major item. Research in the steel industry developed acid-resisting or stainless steel, and this has replaced, almost entirely, the use of bronze. A well-equipped sulphite mill today has installed about 650 lb. of finished stainless steel per ton of daily capacity, in the acid and digester departments alone.

Effect of Hot Liquor on Equipment

Though research on stainless steels has been done by the steel industry, certain special alloys have been developed in conjunction with the sulphite mills. Use of these steels by the mills has spurred research in pulp manufacture along new lines. Two major developments, made possible by stainless steel, have been indirect cooking with forced circulation and the hot acid system.

In the former the cooking solution is withdrawn from the digester continuously during cooking and, after passing through a heater, is returned to the digester. The heater can be dispensed with and the liquor circulated only. With hot acid systems the digester relief, both liquid and gas, is collected and stored under pressure, thus retaining the heat. Both these developments require pumps and pipes to withstand the hot acid under pressure. This was not practical with bronze, but is a simple matter with stainless steel.

Sulphite manufacture uses enormous quantities of sulphur dioxide. This is produced in the acid plant by burning elemental sulphur. In the development of the sulphite process it was soon apparent that large amounts of scale formed in the digesters and fittings. This scale was for the most part calcium sulphate and must have come from sulphuric, rather than sulphurous, acid. Research into its formation has been extensive, and has led to great improvements in the combustion of the sulphur, such as new types of burners with spray coolers for rapidly cooling the gas.

Sources of Sulphur

The elemental sulphur of this continent comes principally from Texas. Before the war research had developed an additional source at the Trail Smelter, where large quantities of sulphur dioxide escaped in the flue gas and killed vegetation over a large area. The company was forced to find ways for removing this sulphur from waste gases and, as a result, a new source became available through research. Many mills, particularly in the West, used this sulphur prior to the war. It is believed a more profitable use has now been developed, and Texas is again the main source for pulp mills.

Mention should also be made of a Canadian development for producing sulphur dioxide through burning iron pyrites. This is not extensively used, principally because Texas sulphur is more economical. However, at least one mill is using this method successfully, due to extensive research.

Calcium and Other Bases

Calcium in the form of limestone is prevalent in all sulphite-producing countries, and is relatively cheap. Therefore, calcium is used almost to the exclusion of all other suitable substances. It has however certain disadvantages, such as the slow rate of diffusion of the calcium ion. Because of this, a generous time allowance is necessary to ensure complete penetration of the wood chips, before elevating the temperatures to a point where solution of the lignin takes place. Calcium also forms insoluble compounds with the resins in the wood and this substance, called pitch, is a frequent source of trouble to the paper maker.

Originally, other bases were expensive and generally their cost was prohibitive. But as supply has become more plentiful research in their use is keeping pace. The three most common bases are magnesium, ammonia and sodium, developed in that order. A new mill has been built at Longview, Washington, by the Weyerhaeuser Company, applying methods and procedures developed by themselves and the Howard Smith Paper Mills Limited of Cornwall, for using magnesium instead of calcium. One of the principal features is that the waste liquor can be burned and the process chemicals recovered.

Also on the West Coast, the Crown Zellerbach Company and the Soundview Pulp Company have combined their research and development facilities to endeavour to perfect the use of ammonium bisulphite. The penetration of this liquor into the chip is very rapid; thus the cooking time can be shortened, resulting in a greater digester turn-over. The problem of recovery of chemicals has not yet been solved, but research has made great strides in that direction and no doubt it will be before long. By the use of both these bases the quality of the pulp is said to be improved.

Fundamental Research

Much of the story of sulphite, so far, has been concerned with the development of the process from the results of research. Fundamental research has been extensive, and is continuing all over the world. Great advances have been made in Sweden in elucidating the theory of the steps by which lignin goes into solution in the sulphite process. Work on this phase, as well as other aspects, notably the rate of penetration into the chip, are continually in progress at the Research Institute, as well as other centres in Canada and the United States. With respect to penetration studies, the Institute has long been a pioneer.

The realization of the importance of this work governed the choice of programme of many investigators at the Institute, working under the direction of Dr. Otto Maass prior to the last war. Their work was directed towards a critical study of how to achieve penetration rapidly, how to condition chips with liquor in a manner that will aid and accelerate subsequent cooking, and how to eliminate the detrimental influence of entrapped air. In other words, an attempt was made to find out as much as possible about the chemical, physical and mechanical factors governing the penetration of cooking liquors into chips. This work was interrupted by the war, but is now being resumed with good results.

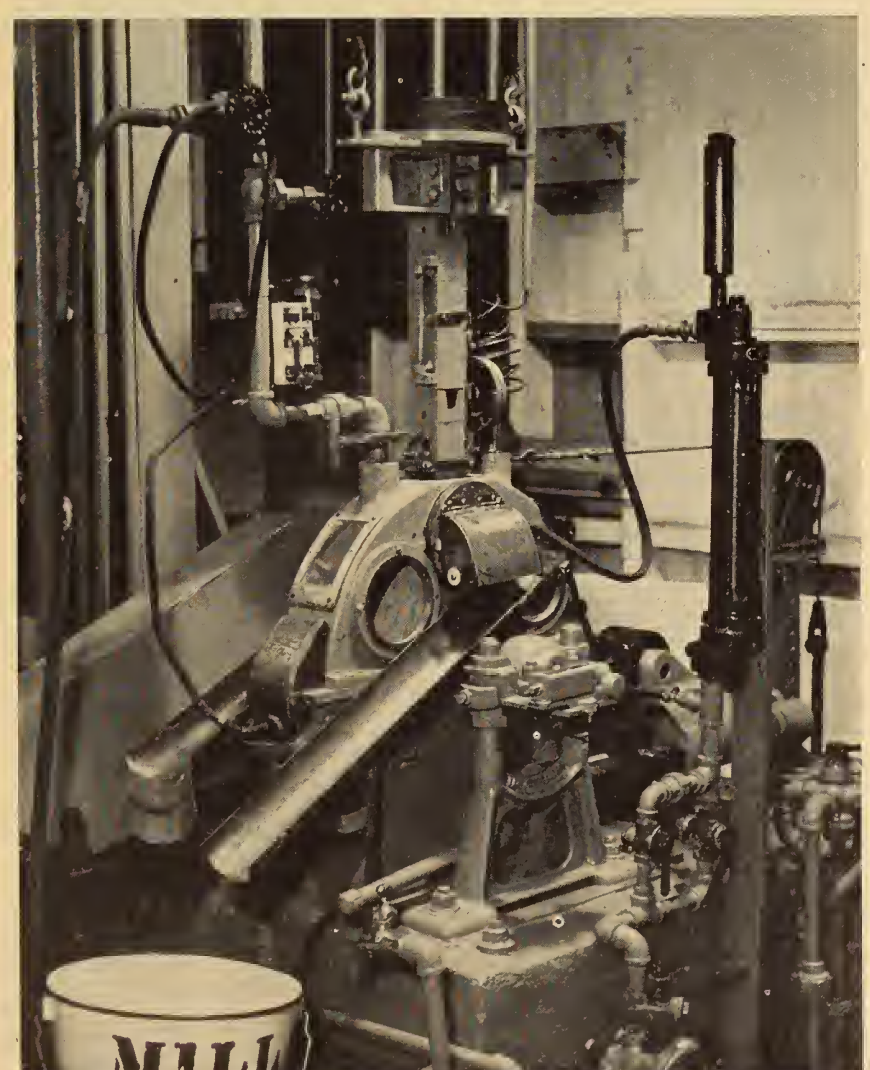

Fig. 4. Miniature grinder at the Pulp and Paper Research Institute of Canada.

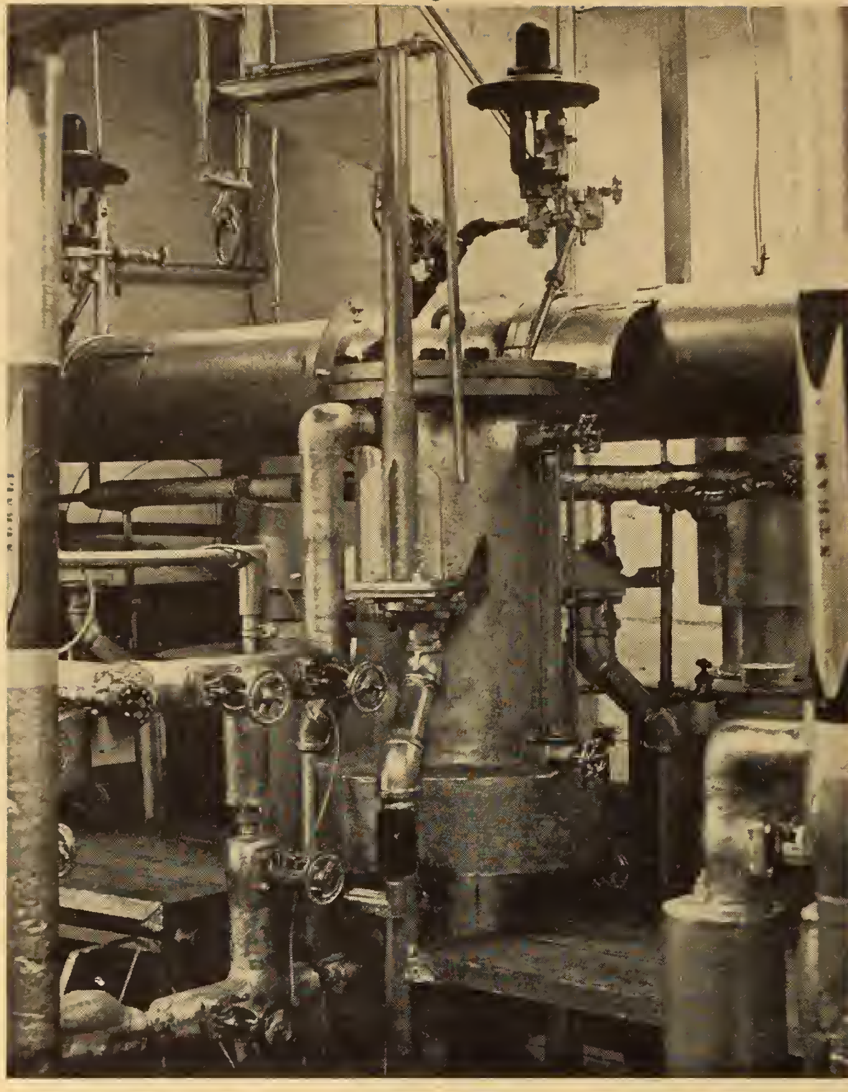

Fig. 5. Digester at the Pulp and Paper Research Institute of Canada.

Alkaline Process

The other main branch of chemical pulping is the alkaline process, in which the lignin is dissolved by an alkali, usually caustic soda. This outdates the sulphite process, and was for many years the means by which straw, rags, bamboo, etc., were reduced to a pulp. Its use with the new-found raw material, wood, was a natural development. The first soda-pulp mill in Canada, the second on this continent, was started at Windsor Mills, Que., in 1864. In 1879, research conducted in Danzig led to the use of sodium sulphate or salt cake as a source of caustic soda. The resultant pulp was considerably stronger when sodium sulphate was added, than that produced by caustic soda alone. It became known as kraft pulp, and is today the principal alkaline pulp produced. In Canada its production is not as great as that of sulphite, yet amounts to over a million tons annually.

The recovery of the process chemicals in alkaline pulping was of great economic importance, and much research has been done on this subject. Originally the liquor was burnt with no attempt at recovering the heat, though much thought was given to such a process. One of the pioneers in this field was Mr. G. H. Tomlinson of the Howard Smith Paper Mills, whose efforts led to the production of the B and W, Tomlinson Furnace, now widely used in all parts of the world.

Other companies have also developed furnaces for a similar purpose. All employ the principle of spraying the concentrated liquor into the furnace, where it is ignited and the heat from the combustion is used for making steam. This steam is returned to the pulp and paper mill, and the process thereby becomes almost self-sup-

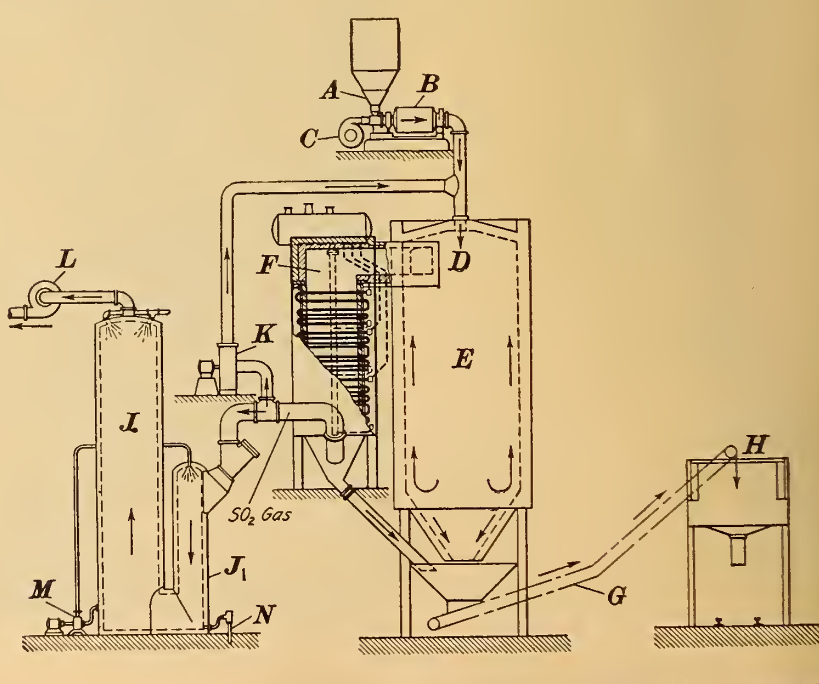

Fig. 6. Diagram of the Nichols-Freeman Pyrites Flash Roaster. (From: Pulp and Paper Manufacture. Vol. 1).

Legend

porting in steam. The slag from the furnace is returned to the alkali plant, where it is recovered in its original form and is used for making up fresh cooking liquor.

Such a system recovers some of the sulphur in the slag as sodium sulphide. However, some is lost in the flue gases, and much research has been done on this feature. It is of particular importance, because the obnoxious odours coming from a kraft mill are caused by various sulphur compounds. If these can be changed to a non-volatile form, the obnoxious smell may be reduced. Again the Howard Smith Paper Mills has been a leader in this field, and has developed the oxidation tower where the black liquor is oxidized with air before burning. In this way more sulphur is retained in the system and some of the smell can be reduced.

Alkaline Liquor Does Not Attack Metal

Unlike the sulphite industry, metals used in the alkaline process presented no problem. At least that was the case until recently. Since iron is relatively stable in the presence of caustic soda, all digesters, pumps, fittings, etc., were made of this material, and records of early digesters show the digester life as around twenty-five to thirty years. However, digesters installed in the "thirties" have averaged only about 15 years and, at the present rate of corrosion, those installed since 1947 have an expectancy of only four to six years. This is a serious problem which confronts the industry and is being actively investigated in all alkaline pulp-producing countries. From the mass of evidence so far available, it is difficult to isolate any common factor, and much detailed research is necessary. The Pulp and Paper Research Institute has been asked to take the lead in this matter for the alkaline mills in Canada, and an extensive investigation is planned.

Bleaching Widens Use of Woods

In chemical pulping, either acid or alkaline, it is not practical to remove the last traces of lignin adhering to the fibres. Cellulose, itself, is a colourless substance, and the residual lignin with the fibre gives a definite colour to the product. With sulphite, this lignin is readily removed with chlorine, but with alkaline pulps it is not so simple. For a long time kraft, with its brown colour, was used for coarse grades of paper only. It was not until research developed the multi-stage bleaching technique that white pulp from the kraft process became commercially feasible.

This in turn opened up a tremendous source of raw material. Certain woods, notably the pines and Douglas fir, have a component which inhibits acid pulping. In addition they usually contain a large quantity of pitch, which is not soluble in acid but which can be removed by the alkaline process. In the early "thirties", very little pulp was made from southern pine or Douglas fir. Since then an enormous industry has grown up, fostered by the benefits research has given to producing excellent pulps from these woods.

Semi-Chemical Pulp

In describing chemical pulping procedures, our story has been concerned with the isolation of the cellulose fibres in as pure a state as possible. It has also been brought out that these fibres comprise about half of the tree, the remainder being non-fibrous materials, principally lignin. The cost of raw materials has increased at an astounding rate in the last few years. This is caused by many factors, but certainly one prime reason is the increasing scarcity of pulpwood. Thus anything that

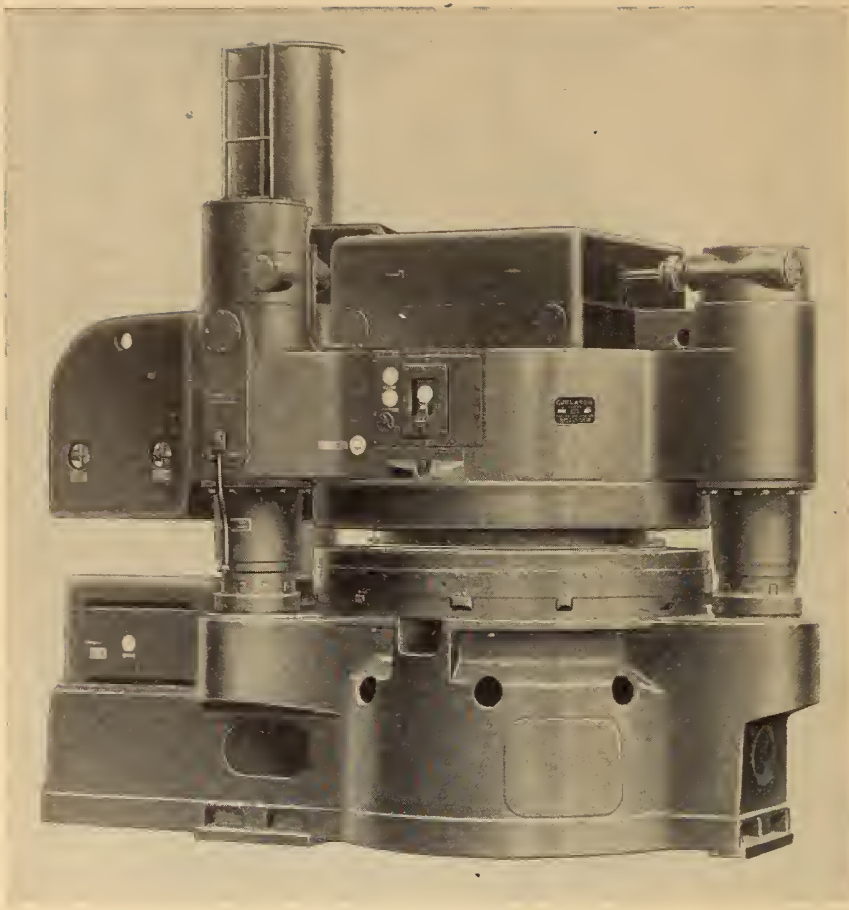

Fig. 8. The Curlator.
(Courtesy: Price Brothers & Company, Limited.)

can result in an increase in the usable half of the tree will be profitable, and will also provide better utilization of our forest resources.

Much effort is being expended on research with that end in view. The ideal is a fibre, with as much non-fibrous material adhering to it as is possible and with the necessary pliability and felting properties. Such a product is given the general name of semi-chemical pulp. As might be supposed, sufficient chemical action is given in various ways to soften but not entirely dissolve the lignin bond, so that the fibres can be separated by subsequent mechanical action.

The yield of semi-chemical pulp may vary over wide ranges, and with higher yields the quality would be expected to fall off. Such is the case, but as the results of research become utilized, both in the technique of cooking and in perfecting the mechanical means for defibring, higher percentages of better quality pulp are being produced.

One of the developments for cooking, whereby the lignin is softened but not appreciably dissolved, is the so-called neutral sulphite process, developed by the United States' Forest Products Laboratory at Madison, Wisconsin. This process changes the form of the lignin in a similar manner to the initial steps in the regular acid sulphite method. The changed lignin does not go into solution to any great extent, because of the neutral character of the solvent. The amount dissolved can be regulated to a certain degree by controlling the pH.

The Curlator

Semi-chemical pulp can also be made by the alkaline process where a partial cook is achieved by less drastic conditions in the digesters. Yields of 60 to 65 per cent of good fibre are obtained after mechanical treatment of the softened chips. This is a recent development and is the outcome of extensive research.

In the development of design many improvements have been made in conventional-type refiners. The result is that the fibres in the partially cooked or softened chips are separated, without much cutting of the fibres taking place. This allows the high yields of good quality pulp in semi-chemical pulping. In addition to this progress on conventional types, a refiner has been built making use of an entirely novel principle. This is known as the Curlator, and was developed by members of the technical staff of Price Brothers at Kenogami and Riverbend. By means of this refining machine, which uses a circular rubbing action, yields of acceptable sulphite pulp for newsprint in the order of 65 per cent have been obtained. This is a remarkable advance over the customary 46 to 50 per cent yields, and the possibilities of the Curlator have not yet been fully developed.

Continuous Pulping

All chemical pulping, with the exception of some semi-chemical installations, is done by batch processing. Continuous pulping on the face of it would seem to offer many advantages, and much research along these lines is being conducted throughout all pulp-producing countries today. One development is nearing completion in Sweden, but has yet to be tried over an extended period.

One problem connected with continuous pulping is the question of complete and uniform penetration of a cooking solution into the chips. In the batch processes a generous allowance of time assured penetration, which may not necessarily be uniform. This problem has received attention at the Institute and considerable progress has been made. Our techniques are not ready for publication yet, but they should prove to be of great assistance in overcoming the problem of penetration in continuous or batch cooking. There is no doubt, however, that continuous cooking is nearing our doorstep and we must be ready to receive it when it arrives.

Stronger Paper Through Research

It is only from a water suspension that the bonding of fibres occurs to any appreciable extent. By the action of mechanical work on the fibres in the presence of

Legend

1. LOGS — of spruce and balsam, cut on timber limits, are delivered to the mills by river drive, ship, rail and truck.
2. BARKERS — remove bark by rubbing the logs against one another.
3. STORAGE PILES — supply wood in winter.
4. GRINDERS — produce mechanical (groundwood) pulp by pressing the wood against revolving grindstones.
5. SLIVER SCREENS — remove large pieces of wood.
6. COARSE SCREENS — remove larger particles of wood.
7. FINE SCREENS — remove smaller undesirable particles of wood.
8. THICKENERS — remove excess of water not needed in pumping pulp.
9. WET MACHINES — remove water and form thick wet sheets (laps) of pulp.
10. FILLER — clay or pigments for printing quality.
11. RESIN SIZE — prevents ink penetration into paper.
12. COLOUR — dyes produce the required shade.
13. SULPHUR BURNER — burns sulphur to make SO_2.
14. GAS COOLER — cools gas in water-cooled coils.
15. LIMESTONE TOWERS — produce cooking acid from gas, limestone and water.
16. ACID STORAGE — of cooking acid from towers.
17. CHIPPERS — cut logs into chips by revolving knives.
18. CHIP SCREENS — remove oversize chips and wood dust.
19. DIGESTERS — acid-proof-lined steel vessels in which part of the wood is dissolved by acid and steam under pressure leaving only cellulose.
20. BLOWPITS — into which the pulp is discharged and washed.
21. SCREENS — remove dirt and large particles of pulp.
22. THICKENERS — same as No. 8.
23. BLEACHER — whitens pulp for fine papers.
24. WET MACHINES — same as No. 9.
25. BEATERS — brush out the fibres and mix them with filler, size and colour.
26. STOCK CHESTS — store beaten pulp.
27. JORDAN — cuts and brushes fibres further.
28. FLOWBOX — spreads the diluted pulp through the slice onto the machine.
29. WIRE — forms the wet mat of interwoven fibres deposited from the dilute pulp by drainage and suction.
30. PRESSES — remove water and compact the sheet.
31. DRYERS — remove water by passing the sheet over steam-heated cylinders.
32. SIZE PRESS — applies size to the sheet's surface.
33. DRYERS — dry the sheet.
34. CALENDER STACK — of polished rolls smooths the sheet.
35. WINDER — rewinds and slits the complete roll into smaller rolls as ordered.

water, the cohesive force is greatly increased. The increase in tensile strength of a sheet of paper through mechanical work on the pulp, or "beating", was supposed to be the result of an addition of water to the fibre structure, and the pulp was said to have become hydrated. This term is still in use but research has shown that it is not the whole story, if indeed, it is the story at all.

Little evidence has been found for hydration in the chemical sense. There is some additional retention of water, it is true, but there is also a great increase of fibre surface through fibrillation and swelling of the fibres. Various theories have been put forward to account for the results obtained. Dr. Boyd Campbell, of the Institute staff, has long been a leader in this field, and no doubt we are close to the truth. This great advance in fundamental knowledge has accounted for much of our progress in papermaking techniques, and has contributed to more than doubling the speeds of paper machines.

A recent development in paper manufacture is the production of paper having good strength when wet. This has long been a dream of papermakers, and is now effected, for the most part, by the addition to the slush pulp of melamine and urea resins. This particular product has developed enormously since 1942. During the war it was used extensively for paper for the printing of maps for the armed services. Among peace-time uses, the most common is for paper towels.

Use of Isotopes and Electron Microscope

Those of you who have seen a paper machine in operation will realize the necessity for removing the water rapidly once the sheet has been formed on the wire. But the forming of this sheet, or the uniform deposition of the fibres, is of equal importance. This has developed, for the most part, through trial and error. It is only recently that a concentrated scientific attack has been made to understand the factors involved. It is too early to announce results but, undoubtedly, a big advance in our fundamental knowledge will be made possible from trials just completed at the Baie Comeau mill of the Ontario Paper Company.

These trials were conducted by members of the staff of the Institute and made use of radioiodine as an atomic tracer. Radioactive iodine from Chalk River was introduced at various points in the headbox of the paper machine, and its path through to the finished sheet could be traced effectively. This is the first time that radioactive tracers have been applied to a paper machine in this manner. We believe that much valuable information will result. Use of isotopes is not restricted to paper machines. They could also be used, for example, in tracing the path of activated sulphur during chemical pulping.

In the field of fundamental cellulose chemistry, the usefulness of this tracer technique has been compared with that of the microscope, the spectroscope, or X-ray analysis. It is possible to label elements, or atoms or groups, which can then be introduced into cellulose, and the steps in the mechanisms under investigation can be observed. A practical development may well result from use of this tool to study the synthesis of cellulose in the living plant by the assimilation of carbon dioxide. It may be used as well in the so-called bacterial cellulose, which certain microorganisms synthesize from simple sugars in the laboratory. Undoubtedly much will be heard of this tracer technique in forthcoming months, both from the standpoints of fundamental cellulose chemistry and of plotting the paths of larger particles such as the fibres themselves in the pulp stream.

In the last few years research into the submicroscopic structure of the cellulose fibre has added much to our knowledge, and is giving us a clearer understanding of its behaviour under different conditions. We are getting closer to that happy state when we will be able to specify correctly our requirements for a pulp to meet some particular need. The development of tools to assist in this research has been of importance. One of the most important is the electron microscope.

Many different means are used today to measure the quality of pulp. Most of these measure the properties of a mass of fibres, but do not give much indication of what has happened to the individual fibres. This information is of vital importance if we are to understand what causes the difference between acid and alkaline pulps, so as to eventually improve them. This is another field of endeavour at the Institute.

More Pulp in Rayon

We have, so far, considered cellulose as a fibre for subsequent use in papermaking. However, a large amount of wood pulp produced today is made specially for use in the rayon industry. This wood pulp has always been made by the sulphite process. In the manufacture of rayon an appreciable quantity of cotton linters has always been mixed with the pulp, but through extensive research in improving the quality of the latter, it has largely replaced the cotton. As an example, within the last ten years or so, wood pulp has been increasingly used in the production of cellulose acetate or celanese, whereas formerly cotton linters were used exclusively. Much of the research on improving pulp quality for rayon was carried out at the laboratories of the Canadian International Paper Company at Hawkesbury.

We have been considering sulphite as the wood pulp used for dissolving pulp, but recent advances in the alkaline cooking process have produced pulps that are suitable for the rayon industry. During the war, much of our explosives in Canada were made from kraft pulp, which was nitrated to produce nitro-cellulose.

By-Products

It has been mentioned that only about half of the tree is in fibrous form and that, in cooking, these non-fibrous substances are dissolved as much as possible. That statement is true in the main although, since one method of cooking employs an acid and the other an alkali, the so-called waste liquors will have a slightly different composition with respect to the amounts of hemi-cellulose dissolved and the form of the lignin constituent. Thus each type may be considered separately.

For many years research has been carried out on the utilization of sulphite waste liquor. The first thought was to use it as a fuel, as is done with the black liquor in the alkaline process. However, the fly ash presents a problem and burning is not used extensively, unless fuel costs are a major factor, such as is the case in Sweden. The new magnesium base development, mentioned previously, includes the recovery of the process chemicals and the burning of the liquor as a fuel is part of the process. For some years the waste liquor has been concentrated and used as a road binder. The concentrated liquor is also used as a binder in the linoleum industry.

The sugars in the original tree are present, for the most part, in the sulphite waste liquor and the liquor is treated to produce yeast of alcohol from them. These processes have been developed extensively in the last few years. One mill in Canada, The Mersey Paper Company at Liverpool, Nova Scotia, has been producing yeast for some years. Alcohol is made at Thorold and at Gatineau. From sulphite waste liquor certain fine chemicals such as vanillin are also produced. Research will, no doubt, increase the number of these in the future.

In dealing with components other than lignin in the waste liquors, we must consider the original tree. In it are many organic chemicals, some of which may be recovered after pulping. There are, for instance, certain fats and sugars which will vary in amount according to species and locality. In the alkaline process the fats can be recovered and a product known as tall oil results. This has a wide use in commerce, and the original supply came from a species of nuts grown in Japan.

During the war the natural supply was curtailed and a great amount of research was undertaken in order to recover tall oil from alkaline black liquor. This occurred for the most part in the Southern United States, since Northern woods did not yield large amounts. Associated with tall oil recovery there are certain other very valuable chemicals that can be used in the drug industry, though they are difficult to isolate. Research is continuing in this field.

Uses for Lignin

We now come to lignin, which forms between 25 and 30 per cent of the original tree and, with the exception of water, is by far the largest component in the effluent from a pulp mill. The structural formula of lignin is not definitely known, although the substance itself has been isolated in certain forms for over a century. Chemists, as well as physicists, are searching out all the factors of this problem and are endeavouring to find lignin's composition as well as its uses. Much progress has been made, and one of the leaders in this field is the Pulp and Paper Research Institute, where the late Dr. Hibbert, and now Dr. Purves, have contributed much to our present knowledge.

Lignin is a thermoplastic and so should find a use in the plastic field. This has been developed at Howard Smith into the product which you all know as Arborite. This is not a moulded plastic but the lignin is used as a laminating agent with a paper base. Widespread use of lignin in this way gives promise of becoming an economic industry.

There are other possible uses for lignin, most of which are in the research stage in many laboratories all over the world. Some of these recently reported, are:

a) A tanning agent for leather.
b) An additive to oil-well drilling muds; it controls the viscosity of the mud and plugs holes through which water comes.
c) As a soil builder; as a mulch or fertilizer. If an acid soil is needed, the material is good.
d) As a dispersing agent in the rubber industry to disperse carbon black.
e) As a dispersing agent for use in making concrete, it saves one bag of cement in six when mixed at one quarter pound in 100 pounds of cement. The cement mixes better, less water is used and tougher concrete results.
f) A treatment for boiler feed water. It prevents scaling.

Tree Can Support Chemical Industry

It is apparent that research in the field of lignin chemistry has much to offer. In conclusion, this should be emphasized and a general comment added on the application of research to the whole industry. Our principal raw material, the tree, is self-perpetuating under proper forest management. It contains all the ingredients of a well-balanced chemical industry. Within the next quarter century we can surely expect great advances in our knowledge of the uses for this valuable raw material. We may visualize the paper industry as ever increasing its service to the community.

In the universities and paper laboratories of the United States, a recent publication listed 319 different research projects that are in progress. These are, for the most part, related to fundamental problems. In Canada such a list is not readily available but, in the various universities and mill laboratories, we know much work is being carried out. At the Pulp and Paper Research Institute of Canada, we have one of the most complete chemical pulping laboratories on the continent. Here research is continually in progress, both for our general knowledge and, at times, for the requirements of some particular mill. We are not alone in the feeling that important advances are in the making all over the pulp and paper manufacturing world, wherever intelligent research is being carried out. Canada will not lag in this effort. √

Soil Mechanics Conference

The programme of the 4th Annual Canadian Soil Mechanics Conference in Ottawa last December included three papers of general interest. Two of these dealt with problems encountered in construction in northern Canada but little known generally. J. A. Pihlainen told of difficulties in building house foundations on permafrost, and N. W. Radforth described recent studies of muskeg. A paper was also given by the chairman on special foundation problems in Canada, covering difficulties caused particularly by the geology and weather of the Dominion. Reports heard by the delegates included some results of investigations of house foundations following the recent Winnipeg flood. The engineering design of the emergency dikes at Winnipeg was described, along with difficulties in their construction.

Another interesting problem discussed was the "salvage" of a gymnasium in a western city from complete destruction due to drying out of the underlying soil. One wall had sunk over one foot and the structure was about to be condemned. When the cause was discovered, tie rods were installed to hold the wall in place, and means were devised to keep the soil moist in order to prevent further shrinkage.

Among the ingenious methods reported was one which makes use of radioactivity to find the moisture content of soil in situ. A source of neutron radiation, shielded so that the radiation can only pass through the surrounding soil to reach a nearby element sensitive to the rays, is lowered into a bore hole. After exposure, this element is brought to the surface and the amount of radiation to which it was subjected is read with a Geiger counter. From this, the moisture content of the soil at the level of the source can be found. √

A Note on Stress Distribution in Crane Girders

by

S. D. Lash, M.E.I.C.

Professor of Civil Engineering,
Queen's University,
Kingston, Ont.

The usual crane girder is composed of a channel and an I-beam, fastened together so as to form a structural member having the cross-section of Fig. 1. Either riveting or welding may be used to unite the two members. This note reports the results of experiments carried out on such a beam in order to determine the distribution of stress across the section. The conclusions should apply to other beams in which the flanges are extended in the direction of the neutral axis.

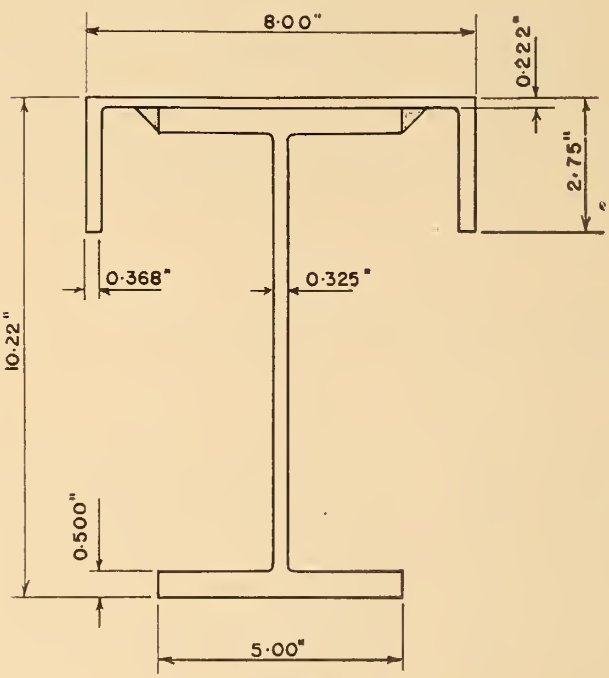

Fig. 1. Cross-section of beam.

The beam and channel were of aluminum alloy (Alcan 26ST) as shown in Fig. 1 and of approximately the following properties:

Ultimate strength	70,000 p.s.i.
*Yield strength	62,000 p.s.i.
Elongation	11 per cent
Shearing strength	45,000 p.s.i.
Modulus of elasticity (Tension E_t)	10,500,000 p.s.i.
Modulus of elasticity (Compression E_c)	10,700,000 p.s.i.

*0.2% offset.

Two continuous ½-inch fillet welds were used to fasten the beam and channel together. The general arrangement of loading is shown in Fig. 2. In order to obtain a fairly complete picture of the distribution of strain across the section, eighteen electrical resistance

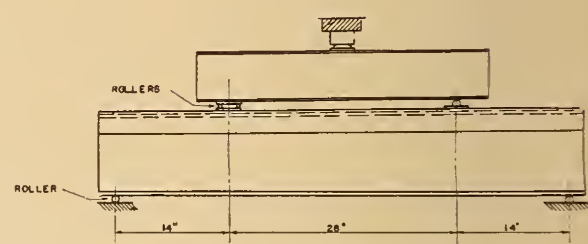

Fig. 2. General arrangement of test.

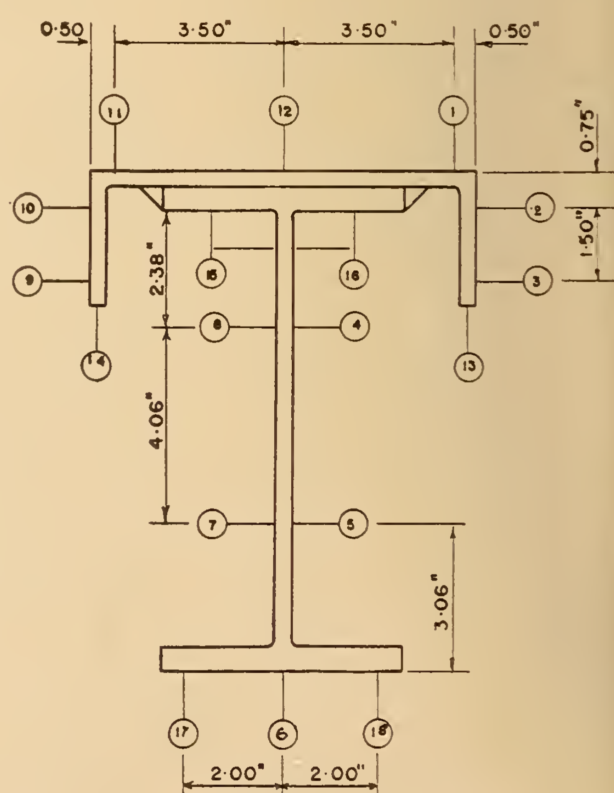

Fig. 3. Location of strain gauges.

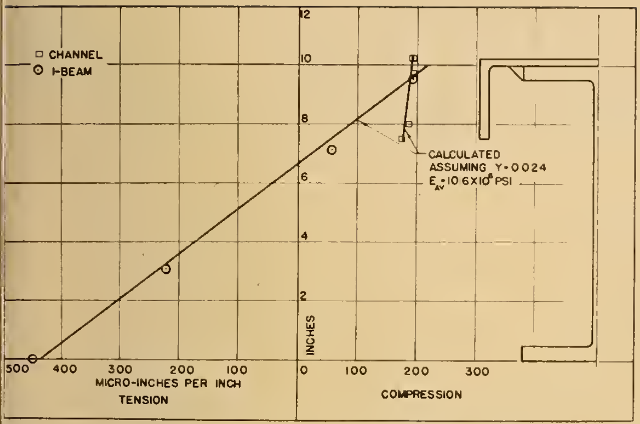

Fig. 4. Typical experimental results.

strain gauges were secured to the beam at mid-span in the locations shown in Fig. 3.

Typical results are shown graphically in Fig. 4. Each point on the graph represents the average reading of all the gauges at a particular distance from the neutral axis. For example, the three gauge readings on the upper surface of the compression flange are averaged to give a single reading. The maximum difference between an average and an individual reading was 14 per cent. These differences indicate that the load has some tendency to twist the channel.

The results show clearly that, if the whole beam is considered, plane sections do not remain plane. Considering the I-beam only, sections appear to remain plane, but the strains in the channel are different from those in the I-beam at the same distance from the neutral axis. The strains in the channel are approximately constant across its whole area.

Although plane sections do not remain plane, the observed values of the maximum strains, both on the tension and compression sides of the beam, agree fairly closely with values indicated by the theory of simple bending. This is indicated in the following table:

	Calculated Value	*Observed Value*
Depth to neutral axis	3.79 in.	3.90 in.
Maximum tensile stress for a moment of 140,000 in. lb	4605 p.s.i.	4720 p.s.i.
Maximum compressive stress for a moment of 140,000 in. lb	2730 p.s.i.	2680 p.s.i.

A check on the accuracy of the experimental work is obtained by comparing the total tensile and compressive forces at the cross-section under consideration. This leads to the following result, based upon the strain readings shown in Fig. 4.

Moment 140,000 in. lb.

Tension in flange of I-beam,	$1068\ E \times 10^{-6}$
Tension in web of I-beam,	$386\ E \times 10^{-6}$
Total tension,	$1454\ E \times 10^{-6}$ lb.

Assuming $E_t = 10.5 \times 10^6$ p.s.i., total tension = 15,250 lb.

Compression in flange of I-beam,	$580\ E \times 10^{-6}$
Compression in web of I-beam,	$109\ E \times 10^{-6}$
Compression in channel,	$692\ E \times 10^{-6}$
Compression in weld,	$48\ E \times 10^{-6}$
Total compression,	$1429\ E \times 10^{-6}$ lb.

Assuming $E_c = 10.7 \times 10^6$ p.s.i., total compression = 15,270 lb.

Interpretation of Results

The reasons for the experimental results become apparent if a free-body diagram of the channel is considered (Fig. 5). External loads are applied through bearing plates to the upper surface of the web of the channel. These are balanced by reactive forces supplied by the I-beam on which the channel rests. The exact distribution of these reactive forces is unknown, but it is such that the bending moments induced in the channel by the vertical forces are very small and probably negligible. At the same time, the web of the channel is compelled to take the same strain as the top flange of the I-beam. This is accomplished by means of forces transmitted through the weld. These forces build up gradually in the portions of the beam subjected to shearing force. Their line of action is uncertain, but it is near the controidal axis of the channel; it is not surprising, therefore, that the distribution of stress across the channel tends to be uniform.

It is possible to calculate the stresses produced by any given moment, on the basis of the following assumptions:

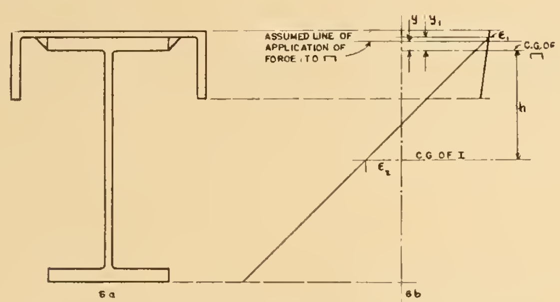

Fig. 6. Distribution of strain across the section.

(a) That plane sections of the I-beam and channel remain plane, though the two are not in the *same* plane.

(b) That the moduli of elasticity in tension and compression are equal.

(c) That the strains in beam and in channel at some given distance from the neutral axis are equal.

Consider the composite section shown in Fig. 6a, and let it be assumed that the distribution of strain for a given moment M is as shown in Fig. 6b. Let ϵ_1 be the common strain of beam and channel, assumed to occur at the upper surface of the beam, and ϵ_2 be the axial strain on the beam. Then the axial force on the beam $= \epsilon_2\, EA_I$. This must be equal to the axial force on the channel, since the resultant forces in tension and compression due to the bending in the beam and the

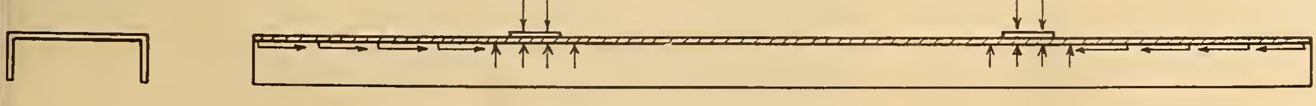

Fig. 5. Longitudinal section of channel.

channel must balance. The load on the channel therefore consists of a force $\epsilon_2 EA_I$ applied at an assumed distance y from its centroidal axis. This is equivalent to an axial force $\epsilon_2 EA_I$ and a moment $\epsilon_2 EA_I y$.

The strain produced by this force and moment at a distance y from the centroidal axis of the channel is,

$$\epsilon_1 = \frac{\epsilon_2 A_I}{A_C} + \frac{\epsilon_2 A_I y y_1}{I_C}$$

$$= \epsilon_2 \left[\frac{A_I}{A_C} + \frac{A_I y y_1}{I_C}\right] \quad (1)$$

where the subscripts $_I$ and $_C$ distinguish the properties of the I-beam and of the channel, respectively.

The total moment of resistance of the section $M_T = M_I + M_C +$ moment due to axial forces in beam and channel, where M_I and M_C are the bending moments in the I-beam and the channel, considered separately.

$$M_T = (\epsilon_1 + \epsilon_2) EZ_I + \epsilon_2 EA_I y + \epsilon_2 EA_I h$$

where h is the distance between the center of gravity of the I-beam and that of the channel.

Substituting for ϵ_1 from (1)

$$M_T = \epsilon_2 EZ_I \left[\frac{A_I}{A_C} + \frac{A_I y y_1}{I_C} + 1\right] + \epsilon_2 EA_I y + \epsilon_2 EA_I h$$

Letting $\epsilon_2 E = s_2$

$$M_T = s_2 \left[Z_I \left(\frac{A_I}{A_C} + \frac{A_I y y_1}{I_C} + 1\right) + A_I (y + h)\right]$$

Hence, if M_T is known, s_2 may be determined, and using equation (1) s_1 may also be found. The only quantity in the above equation that is uncertain is y which depends upon the assumed line of application of the horizontal forces applied to the channel. This may be estimated, or it may be determined experimentally. For the results shown in Fig. 4 the stresses in the channel are 1960 p.s.i. at the top and 1780 p.s.i. at the bottom. If P be the axial force in the channel,

$$s = \frac{P}{A_C} + \frac{Pyc}{I_C}$$

$$1960 = \frac{P}{3.96} + \frac{Py\,(0.78)}{2.83}$$

$$1780 = \frac{P}{3.96} - \frac{Py\,(1.97)}{2.83}$$

from which $y = 0.024$ in.

For this value of y and for a moment of 140,000 in. lb., the preceding expressions give $s_2 = 1095$ p.s.i. and $s_1 = 2362$ p.s.i. These lead to the following values for the depth to the neutral axis and for maximum tensile and compressive stresses:

Depth to neutral axis	3.64 in.
Maximum tensile stress for a moment of 140,000 ins.	4520 p.s.i
Maximum compressive stress for a moment of 140,000 in.	2540 p.s.i.

These values agree reasonably closely with the observed values given previously, but even closer agreement can be obtained if the properties of the channel are modified to allow for the weld metal. If this is done, and an average value of E of 10.6×10^6 p.s.i. is assumed, the calculated line shown on Fig. 4 is obtained.

These experiments were carried out in the materials laboratory of Queen's University, with the assistance of Mr. K. Haraldsen and with the financial support of the National Research Council. The Aluminum Company of Canada co-operated by providing the aluminum alloy sections.

New Large Milling Machine

In accordance with its policy of modernizing plant and equipment at its Lachine shops, the Dominion Bridge Company has recently installed a huge plano-milling machine manufactured by Messrs. Kendall and Gent of Manchester, England. The machine has already demonstrated its ability to reduce operating times and costs particularly in the accurate machining of large crane components.

The machine was built to Dominion Bridge specifications, and its main features are as follows: Number of milling heads—2. Rate of feed for table—1 in. to 12 in. per min. Rate of feed for vertical head—1 in. to 8 in. per min. Max. longitudinal table travel — 22 ft. Max. distance table to vertical spindle cutter—5 ft. 6 in. Adjustment of vertical spindle—10 in. Total weight of machine—70 tons. Max. distance upright to a vertical spindle—8 ft. 6 in. Travel of side head on upright—4 ft. 3 in. Adjustment of horizontal spindle —14 in.

In the photograph the new machine is shown planing the trolley frame for a 60-ton capacity crane.

The Engineer's Stake in Public Relations

Contributed by the Management Division and presented at the Fall meeting, Worcester, Mass., September 19-21, 1950, of The American Society of Mechanical Engineers.

by

John D. Waugh, Jr. A.S.M.E.

Prendray & Leibert, New York, N.Y.

Reprinted from "Mechanical Engineering", December, 1950.

Compared to the struggles of other professions for favourable public recognition, engineering is twice blessed. Both its origin and its recent past have bequeathed it a favourable, though not prominent, public standing. In the minds of people who understand the creed, philosophy, and contributions of engineering, the collective image of the profession is a positive one of objective research, constructive effort, and service to mankind.

Some other professions are haunted by dark symbols created in the past. Doctors shudder at the word "quack." "Shyster" gives the legal profession a chill. "Bloated" capitalist and "cheap" politician are familiar expressions. Leading businessmen and statesmen are not immune to them. The study of word meanings is full of such labels which, through usage, association, and deliberate twisting have become derogatory symbols. Among the leading professions, engineering alone has not been successfully labelled with a negative symbol.

Theory of Conditioned Reflexes

The significance of "symbols," i.e., words, sounds, and marks which stand for something else, was first determined by the noted Russian physiologist and Nobel prize winner, Ivan Petrovich Pavlov. Pavlov's discoveries emerged from his experiments which formulated the theory of conditioned reflexes. His experiments, initially conducted on dogs, followed a systematic pattern. A bell was rung and immediately afterward powdered meat was placed in the dog's mouth. The meat evoked a natural reflex in the dog; its mouth watered. When this procedure had been repeated three or four times a day for about ten days, it was found that striking the bell without giving any powdered meat would cause the dog's mouth to water. Thus a conditioned reflex was established in that a specific response followed promptly upon a sensory stimulus which had previously produced no such result.

Applied to humans and simply stated, this means that people are responsive to repeated physiological stimuli, and—more importantly—mental stimuli. The effects of repeated mental stimuli are familiar to all of us. We often hear clangorous radio advertising, having no educational value but accompanied by such insistently repetitive theme songs, catchwords, or just noise, that we learn about the advertised product in spite of making no conscious effort to learn, or even while making a deliberate effort to ignore it.

In essence, what we repeatedly see, hear, read, or experience about specific subjects establishes symbols in our minds for those subjects. Our feelings and expressions on these subjects are automatically released when the symbol is presented.

Symbols—such as names or insignia—may be either good or bad. They will vary with the audience and may change character from generation to generation. For example, the Ku Klux Klan was once a tolerated organization identified by an outlandish, but respected, costume. Now, due to a changing sense of values on the part of the public, the hooded figure is a sinister, unwelcome symbol. "Uncle Joe" Stalin once beamed down from posters put up by our Government, here in New York. Now his name and caricature are used to accent alarming situations. Today the U.N. is a symbol of co-operation and hope, while the Air Force symbolizes protection and power.

Commercial Symbols

Of less importance in world affairs but of no less significance to their possessors are the kinds of symbols associated with commercial enterprises.

If, for instance, an automobile company today possesses a good symbol, it is due to the practice of sound engineering, good manufacturing, and positive public relations. If the mention of a certain automobile evokes generally favourable comment, it is because the commentator has experienced quality performance and service from his car, or knows of people who have. Additionally, he probably has been well treated by his serviceman, has known employees of the company who were responsible citizens, has read of the accomplishments of the company, seen its advertising, learned of the leadership of its executives, and has come to possess many other opinion-forming facts of a positive nature.

Good symbols do not come into being by happenstance. They evolve from a definite philosophy of doing business. If a product is well designed and efficiently manufactured and can be sold competitively, its favourable acceptance and endorsement of the company behind it are largely accomplished by the practice of good public relations. Likewise, acceptance of an institution or a profession depends not only upon its philosophy and practice but also on repeated positive presentation of its story to the public. In short, if mention of a firm, a product, an institution, or a profession evokes favourable comment from a large number of people, then the symbol of the subject has become respected through repeated friendly associations.

Obscurity of the Engineer

In spite of the generally favourable standing of engineering, there is evidence that the profession is not fully understood and appreciated by the general public. If you were to take a poll of passersby on the street, asking each of them to name a great engineer, chances are they would scarcely be able to name one. Yet, most of these people could unhesitatingly name a great general, or a great statesman, or a poet, or actor, or even a great scientist.

Chances are that those who could name a great engineer would name one who achieved wide public recognition through some activity other than the practice of his profession. Better-informed members of the public might reply with the names of George Goethals, Julius Krug, Herbert Hoover, or George Washington. An engineer can become famous—if he also happens to be President of the United States.

The relative obscurity of one of the most brilliant and original engineers was commented upon lately in the editorial columns of the *New York Herald-Tribune*, in connection with a tribute to William J. Wilgus.

These are excerpts from the editorial:

"In a predominantly engineering civilization—a civilization surrounded and sustained by the works of the engineer, and incapable of living for an hour except as these almost miraculous constructions function as they were intended to do—it is remarkable how few engineers ever reach public prominence.

"We duly honour our poets and statesmen, our philosophers and soldiers and great salesmen and scientists, but we seldom know who our engineers are. William J. Wilgus was well known in New York; yet hardly one in every million who has gone through the Grand Central Terminal or frequented the present Park Avenue can have connected his name with those major improvements, in which his was the inspiring and guiding mind.

"He was an outstanding engineer in an engineering civilization; but civilizations rarely recognize their greatest architects."

This indifference on the part of the public to the significant achievements of engineers is sometimes attributed to the technical nature of the profession. It is said to be too complicated and too remote ever to appeal to public imagination. But in view of the performance of other professions, this argument is not valid.

Scientists Widely Recognized

Scientists, working in the purely abstract realm, have done a superb job of dramatizing their profession. Harold Urey, Robert Oppenheimer, Vannevar Bush, Harlow Shapely, Roy Chapman Andrews, and at least a dozen more bright lights of science are recognized by large segments of the public. Their stories are told and retold, their counsel is sought, and their advice is very frequently accepted. The very fact of their recognition should dispel the idea that the public is not interested in technical subjects. What the scientists have done is to strip abstract and mathematical subjects of their technical embroidery and explain them in terms of human interest and public benefit. They have recognized their responsibility to the public to interpret their work in terms of what it means to the advance of human knowledge. The attendant benefits of this advance imply progress in national defence, public health, advancing living standards, and many other subjects of general concern and interest. Engineers could do the same thing quite as capably and establish a greatly improved symbol.

Engineers, individually and collectively, have an important stake in improving their public relations so that the profession will achieve wider understanding, with its corollary benefits. Also, greater appreciation will better enable the profession to meet and handle forces which threaten it. The present public understanding of the engineering profession is one of the first factors to consider in planning to improve public understanding.

Public's Concept of the Engineer

Look at the national picture of the engineer fostered by Hollywood. The movies usually show an engineering hero in riding boots, peering through a transit and waving for a building or a bridge to be moved over a little.

Aeronautical engineers depicted in the movies fly their own creations into the wild blue yonder and on the ground are invariably humped over a drawing board, sweating out an over-glamorized artist's conception of an improbable aircraft.

Chemical, mining, and electrical engineers are generally left out in the cold, but now and then they have been portrayed as eccentric individuals possessing some pocket-size gadget that an unscrupulous mob is trying to steal to use against mankind. Automotive engineers have been shown as begoggled auto-race drivers grinding up a dirt track to prove a sensational new unpatented carburettor while a furtive gang is trying to steal the invention.

Advertising portrayals of the engineer have, in general, been more factual and complimentary. However, there have been some awful bobbles due to inadequate research or failure to check on technical details.

At the community level there is widespread misunderstanding of an engineer's function, whatever his field. It has been said that an untold number of wives, when they state that their husbands are engineers, are asked, "With what railroad?" When exact titles are given, such as "stress analyst at the Concrete Airplane Corporation," members of the lay public still do not know what the engineer does. They are not interested in, and will not remember, unusual technical titles. They understand that doctors heal the sick, lawyers guide people's legal relationships, mechanics fix things, and so on. They will have to be told what engineers do to appreciate their place in the scheme of things.

Also in the community there appears to be an insufficient proportion of engineers who take the lead in civic projects, organize worth-while activities, or speak before important civic groups. Programme committees often consider technical people a bit dull and pedantic. If an engineer is suggested as a speaker, someone will tell about an engineer he knows, Harry Hemisphere. It is recounted that Harry won't say a ball is round, but will say: "It appears to be round at the prevailing temperature and under existing light conditions, but, without having proper instrumentation and criteria for round balls, I cannot risk my professional integrity by stating that the ball is round."

Though this characterization may be overdrawn, there are many engineers whose analytical talents render them virtually inarticulate and hardly candidates for speaking appearances.

Companies, schools, and local and national engineering societies frequently find it difficult to get eminently qualified engineers to write interesting papers and present them effectively. Lay groups experience the same reticence. One result of this reluctance to lead is that the professional standing of engineering slips relative to the standing of other more active groups. Doctors and lawyers are social, civic, and political-minded because their living depends directly upon the symbol they and their professions maintain.

Practices which may damage the prestige of the engineering profession constitute a leading problem. People who seek to trade on the term "engineer" are blurring the outline of the profession. There are "cosmetic," "display," "promotion," "personnel" and many other so-called engineers. Unless the limits of professional engineering are publicly defined, and this practice discouraged, someday we may find supermarkets with "vegetable engineers."

Students at engineering schools periodically follow "fads" for certain branches of engineering which threaten the college with overstaffing in one field and shortages in others. At the seat of this difficulty is the failure of the profession, collectively, to present accurately the opportunities existing throughout engineering. Every engineer has a vested interest in the appropriate distribution of his fellow members throughout the profession. If there is disillusionment or displacement of engineers, or the profession loses its allure for capable young men, its future growth and standing are imperilled.

Time for Public Relations Programme

To meet the problems facing their profession, engineers can undertake a programme within the scope of their present activities by applying well-known public-relations principles. The profession is fortunate in having the organization and machinery to conduct a successful programme for greater public recognition and appreciation. The national societies, with their experienced headquarters staffs and their network of chapters, form the ready-made organization. The machinery is provided by the general-circulation engineering publications, national, regional, and local meetings programmes and flow of paper presentations. What is needed additionally is a representative expression by members that they recognize their stake in public relations and want to do something about it.

An engineering public-relations programme should include these objectives:

1. To gain wider public recognition of the role of the engineer in modern society. This would help maintain the prestige of the profession and assure its attraction for the best-qualified young men.

2. To take definite steps in meeting threats to the profession. By making clear the requirements and defining the limits of the profession, shadowland "engineers" can be discouraged from using unqualified titles.

3. To inform engineers how their stake in public relations has a direct bearing on their income and the security and prestige of their positions. The values of participating in social, economic, and political affairs at all levels would be emphasized.

To gain wider public recognition, individual engineers and their societies should draw public attention to the profession itself through a major, annual, newsmaking event which would represent all of the branches of the profession. Such an event, properly staged, would give the profession an opportunity to reiterate its creed and cite the accomplishments of engineering in terms of public interest. This annual event would serve to draw national attention.

But national attention is not enough. A continuing programme should be planned to draw more attention at the community level throughout the year. Steps should be taken to assure engineers that speaking and writing, appearing on radio and television programmes, and engaging in civic affairs and other public enterprises are not unfashionable for members of the country's third largest profession. Rather, it should be emphasized that the future standing of the profession may depend upon such activities.

The nationwide public-relations programme of the medical profession, in defending itself against socialization, has been hugely successful partly because of the high public standing of many of its members. When these respected and well-known members of the community speak for or against some issue, the standing they have acquired through prior civic activities at the local level lends immeasurable weight to their argument.

To meet threats to the profession, the engineering societies could get together to publicize the extent of the engineer's training and the stringent requirements he must meet. It could be made unpopular for unqualified people to trade on the designation "engineer." Doctors have popularized the intern and his long and intensive training. The legal profession makes a big to-do about how terrifying and tough the bar exams are and how many fail to pass each bar. The Air Force has for years widely broadcast the numbers of student pilots who couldn't pass the supremely difficult air-cadet course. The object of this dwelling upon failures and rough courses is to spotlight the qualifications of the accomplished individual to serve the public.

Unrecognized Qualities of the Engineer

The public would probably be astonished to learn of the weeding-out process that takes place in the engineering schools. Also, they might be surprised to know of the unpublicized, but difficult, requirements of the State Board professional - engineering examinations. Such requirements as five years' practice of engineering under specified conditions before qualifying for the State Board, among others, should be known more widely. People can be guided to take interest in a professional field that assures such high-caliber men and levels of knowledge.

The individual engineer's stake in public relations can be spelled out in terms of how he will benefit by participation in public affairs. Qualification for management posts is often based on the many facets of a man's personality, seldom on his deep concentration and immersion in one subject. Engineers experienced in dealing with people are often selected to represent their company on important matters. Engineers who become successful in dealing with people, in addition to their understanding of cold materials, are better able to put across engineering ideas and changes, develop personal prestige, and advance to greater engineering responsibility.

Engineering groups all over the country are surrounded by untapped gold mines of information on how their profession can participate in public affairs. Dealers in ideas, editors, writers, commentators, politicians, advertising men, public-relations people, and many others, are generally pleased to appear on engineering programmes and explain the nature of their work and its relation to engineering. From these people, engineers can learn how their activities can be related to the public interest.

Within companies, engineers can extend greater co-operation to their advertising, sales, and public-relations departments. Occasionally, engineers suspect that their work will be given a razzle-dazzle treatment by the interpretive departments, so they withhold co-operation. This problem could be resolved, wherever it exists, by articulate engineers taking interest in the interpretation of their work and trying to instruct the other departments. Public-relations departments are perennially looking for technical articles, engineering accomplishments, and publicity items. These people can do much to help in the preparation of interesting articles and frequently can take the curse of stuffiness off technical papers. In companies where this co-operation is requested, engineers receive excellent representation in many company and public activities. Engineers need only seek out this potentially valuable assistance in helping them tell their story.

Public Role of Engineering

Former President Herbert Hoover recently emphasized engineering's public role and need to tell its story when he said, "The engineer's works are out in the open where all men can see them. He cannot deny he did it. The doctor's mistakes are buried in the grave. The voters forget when the politician changes the alphabetical names of his falling projects. Trees and ivy cover the architect's failures. The lawyers can blame the judge or the jury. Unlike the clergyman, the engineer cannot blame his failures on the devil."

If the engineering profession ever decides to follow a plotted course of improving its public relations, it will again be twice blessed: Because it has done tremendous good and promises to do very much more, and because it is not a pressure group, and the only axe it has to grind is that it wants to be known for the good work it has done and is doing.

Shipbuilding Activity in Canada

This photo represents the climax of many weeks of planning and preparation for the launching of the largest vessel ever built at the yards of the Port Arthur Shipbuilding Co. Ltd.—and the largest tanker ever built for service on the Great Lakes.

S.S. Imperial Redwater is the second and slightly larger of two tankers built for Pipe Line Tankers Ltd., for service between the pipe line terminal at Superior, Wisconsin and the refineries at Sarnia. She is 620 feet long with a beam of 68 feet and will handle some 175 million gallons of Alberta crude oil each shipping season. Her sister ship, *Imperial Leduc,* was built and recently launched at Collingwood, Ont.

FROM MONTH TO MONTH

Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

Registration of Technical Manpower

The following letter from the Minister of Labour is printed herewith under instruction of Council. It is Council's wish that each and every member of the Institute shall complete his questionnaire and return it as quickly as possible.

Many members will realize that a similar record was made several years ago for the Wartime Bureau of Technical Personnel.' The Institute understands that these records are still intact, but agrees they must be brought up to date. Therefore members are urged to file the information even though it may be largely a duplicate of that supplied previously.

The Department of Labour is to be commended for its prompt action on this important matter.

MINISTER OF LABOUR—CANADA

Ottawa, March 10, 1951

Mr. James A. Vance, President, and Members of Council.

Gentlemen:

As you will no doubt have learned from recent public announcements, the Department of Labour is embarking on a project to review the records of technical and scientific personnel in Canada with the object of bringing them up to date. Each such person will shortly be given the opportunity to co-operate in this task by listing his particulars as of 1951 on an appropriate questionnaire form.

In view of the whole-hearted co-operation received from your Institute and its members when the roster of technical personnel was first built up during World War II, I do not hesitate to request your assistance in this 1951 programme. Speaking for both my Department and for the Government, I can assure you it is realized that the sympathetic support of all professional societies involved is of the greatest importance to the effectiveness of this plan. With this in mind, it would be appreciated if you could find occasion to refer to the matter in an early issue of your official publication requesting each member to do his part by completing and returning the questionnaire when it is received.

As the new records are compiled, we shall be in a position to arrive at an up-to-date assessment of existing resources of skill as possessed by this important segment of Canadian manpower.

Yours very truly,

(Signed) MILTON F. GREGG

Bridge Failure

The news of the collapse of the Duplessis Bridge at Three Rivers, Quebec, came as a shock to everyone, and in particular to engineers. At this late writing there is no indication as to the cause, and doubtless any clear and final statement will be long delayed because of the necessity of a careful analysis of all the elements that might have entered into it. In the meantime however there is much interesting conjecture and idle rumour.

The bridge, which consists of two crossings separated by an island in the St. Maurice River, broke into the news in 1950 because of the discovery of fractures in two of the steel girders, one on each crossing. These failures were followed by a careful investigation, which is reported to have indicated that the trouble was due to faults in the material, not to design or fabrication. The question arises naturally as to whether or not the same trouble accounted

for the more recent and disastrous failure. It is at this point that the facts are hidden from the outside observer and possibly also from the insider. However, reports from persons who saw the restoration work underway indicate that the failures are from different causes because, during the repairs of the fractured girders last year, all girders were reinforced with riveted splices at all points similar to those where failure occurred. The girder which fractured last year in the west crossing was not one of those that went down.

The story of the design and construction of the bridge appeared in *The Engineering Journal* of January, 1949. It is interesting to read that account now. From it we find that each crossing was an all-welded structure designed as a continuous girder for its full length, free at both ends and fixed at the centre pier. The spans which collapsed were the four to the west of the centre pier on the west crossing. The four to the east of this pier remain standing.

At the time of writing it has not been possible to examine the piers or the steelwork of the collapsed section, because of the condition of the ice. The fast water has kept certain portions of the river open, and at other spots the ice is too thin for safety. This is borne out by the fact that a tractor and driver were lost through the ice, when trying to raise one of the motor cars involved in the tragedy.

It has been stated authoritatively that the cause of the disaster cannot be determined until the fallen structure can be examined. Doubtless this will mean examination in the field and in the laboratory. Hence it is not likely that the great puzzle will be solved for some time to come. However in the meantime it is likely the arguments will continue, and various periodicals will come forth with a variety of answers. *The Engineering Journal* will not be one of them. It appears as if every engineer associated with the design of the structure is a member of the Institute. The Institute thus is so close to this unfortunate affair that the *Journal* does not propose reaching any conclusions on its own, but will await the official word that will come in time from those who really know.

Another Milestone in Unification

On February 22 an agreement was signed between the Institute and the Association of Professional Engineers of Manitoba which marks a further step toward unification of the engineering profession in Canada.

The agreement follows the pattern of those that have operated so successfully in Saskatchewan, Alberta, New Brunswick and Nova Scotia. It combines fees, provides for reciprocal E.I.C. membership and registration, and does much to eliminate duplication of activities and administrative procedures. Ultimately it should make registration and E.I.C. membership synonymous in Manitoba and give all professional engineers in that province the advantage of the Institute's branch activity.

The historic signing ceremony is pictured on the opposite page. At the table are W. D. Hurst, president of the Manitoba Association, and President J. A. Vance of the Institute. Standing behind are (l. to r.) C. S. Landon, registrar of the Association; C. L. Fisher, vice-president of the Association; J. B. Stirling, vice-president elect and

E.I.C. — Manitoba Association banquet in Winnipeg.

Signing ceremonies in Winnipeg.

chairman of the Institute's Committee on Professional Interests; T. E. Storey, chairman of the Winnipeg Branch of the Institute; E. P. Fetherstonhaugh, past-president of the Institute; and L. Austin Wright, general secretary of the Institute.

On the facing page, the head table at the dinner includes: (l. to r.) Vice-President Fisher; Mr. Patton, associate editor of *The Winnipeg Tribune;* L. A. Wright; Alderman McLeod, representing the city of Winnipeg; Frank Evans, K.C., the principal speaker; President Vance; President Hurst; C. Rhodes-Smith, attorney-general of Manitoba; Mr. Stirling; T. H. Kirby, Institute Councillor for the Winnipeg Branch; and C. S. Landon.

Secretary of I.M.E. Retires

Some months ago the Institution of Mechanical Engineers, announced that its secretary Sir Henry Guy had found it necessary to tender his resignation because of ill-health. Recently the Institution appointed as his successor, Mr. Brian G. Robbins.

Sir Henry Guy is a good friend of the Engineering Institute of Canada and is known personally to more than a few members. The general secretary, past-president J. B. Hayes, and President Vance, in particular have come to know him well through the Conferences of Commonwealth Engineering Institutions held in London in 1946 and in Johannesburg, South Africa, last year.

The following are highlights only of Sir Henry's impressive career. From 1907 to 1910 he attended University College, South Wales, where he gained diplomas in mechanical and electrical engineering and won the Bayliss Prize of the Institution of Civil Engineers, a Royal Research Scholarship, and a Whitworth Exhibition Prize. He joined the British Westinghouse Company in 1910 and became chief engineer of the mechanical department of its successor, the Metropolitan - Vickers Electrical Company in 1918. In 1936 he was elected to the board of Metropolitan Vickers Electrical Export Company. He resigned in 1941 to become secretary of the Institution of Mechanical Engineers.

Sir Henry Guy

Sir Henry has served the profession in many capacities. He is a Fellow of the Royal Society and has served on its council and that of the British Standards Institution. He has been on the Executive Committee, of the National Physical Laboratory and chairman of its Engineering Research Committee. Other committees of which he has been a member, or chairman include The Committee on properties of steam and the Power Plant Section of the British Electrical and Allied Industries Research Association; the Advisory Council on Scientific Research and Development of the Ministry of Supply, and the Gun Design and Static Detonation (bombs) committee of that Council; the committee on Armament Development of the Ministry of Supply; the committee of The Royal Aircraft Establishment; the committee on Technical Organization of the Army; the Board of Chemical Warfare; The Ordnance Board; the Mechanical Engineering Advisory Committee of the Ministry of Labour; the Advisory Council to

Brian G. Robbins

the Scientific and Industrial Research Committee of the Privy Council; the Mechanical Engineering Research Board, the Fuel Research Board, and many others. In 1946 he was appointed a trustee of the Imperial War Museum.

He has contributed many papers to the literature of the profession and has been the recipient of the Thomas Hawksley Gold Medal, the Parsons Memorial Medal, the Honorary Associateship of Manchester College of Technology, and the honorary degree of D.Sc. of the University of Wales. He was created a Knight Bachelor in the New Year's Honours list of 1949.

It is particularly interesting to note that during Sir Henry's tenure of the secretaryship, the membership of the Institution of Mechanical Engineers increased from 14,000 to 35,000.

Sir Henry's successor, Mr. Brian G. Robbins, obtained his mechanical engineering degree at the City and Guilds (Engineering) College, South Kensington after a period of service with the Royal Engineers at the end of the First World War. For research work which followed the degree course and led to the Diploma of the Imperial College, he was awarded an Unwin Scholarship. He went to Vauxhall Motors Ltd., Luton, for 4 years after which he returned to college for a period of research and teaching. Later he joined the Institution of Automobile Engineers as assistant secretary and was appointed Secretary in 1934.

At the outbreak of World War II Mr. Robbins entered the War Office where he was with the Directorate of Military Training. He was released from R.E.M.E. in 1945 with the rank of Lieut. Colonel.

In 1947 the Institution of Automobile Engineers Amalgamated with the Institution of Mechanical Engineers and Mr. Robbins became an assistant secretary of the latter organization. He succeeded Sir Henry Guy as secretary in January of this year.

The Engineering Institute of Canada sincerely wishes Sir Henry Guy improved health, and long years of enjoyable leisure, in which he will find many more opportunities to contribute to the advancement of the profession. To Mr. Brian Robbins the Institute extends its congratulations and best wishes for a long and fruitful period as senior permanent officer of one of the world's most distinguished professional engineering bodies.

Engineering Training for Canadians in Britain

In recent months, the *Journal* has published details relating to the Athlone fellowships for postgraduate engineering study and training in the United Kingdom.

The United Kingdom High Commissioner's Office has announced the names of the first young Canadian engineers who are to receive two years of the best engineering training Britain can offer. They are as follows:

McGill, Montreal—Ross Edwin Chamberlain, S.E.I.C.; Constantine Bachovzeff; Ralph Gilmour Wilson, S.E.I.C.; J. Montague Squire; Noel Bernhard Montagnon.

Ecole Polytechnique, Montreal—Florian Boivin, S.E.I.C; Pierre Bourassa, S.E.I.C.

Laval University, Quebec — Renaud Hinse, S.E.I.C.; J. Joseph Alfred Brisson, S.E.I.C.; Henri Pierre Tardif, JR.E.I.C.

Queens University, Kingston — Alan James Williams, S.E.I.C.; Francis Walter Slingerland, JR.E.I.C.; George Rennie Sinclair, S.E.I.C.; Wallace Graham Breck.

University of Toronto—John Michael Armour; Gordon Thomas Leist; Donald Charles Leigh; James Nelles Matthews, S.E.I.C.; Thomas Lang Moffat; Barry Warren Prior; William Ashall Firstbrook; John Thomas Koski; Donald Hugh MacDonald, JR.E.I.C.; Donald George Stephenson.

University of Manitoba, Winnipeg—Peter J. Waugh, S.E.I.C.; Dalton Horace Minty; Andrew John Moffat, S.E.I.C.; Vernon Leroy Dutton, M.E.I.C.; Kenneth Henry Williamson, JR.E.I.C.

University of Saskatchewan, Saskatoon — Robert Emanuel Collin; William Trevor Link.

University of Alberta, Edmonton — George Walter Jull, S.E.I.C.; William James De Coursey, S.E.I.C.

University of British Columbia, Vancouver—John Alfred Heath Lund, S.E.I.C.; Henry Frederick Naylor; John Blakely Nuttall, S.E.I.C.

University of New Brunswick, Fredericton—Gerald Reade McCully, S.E.I.C.; Eugene Lancelot Fytche.

Of this group, 12 will be placed in British Universities, another 12 in industry, and the remainder will take one year's training in both industry and universities.

Closely related to these fellowships are the apprentice and postgraduate training schemes regularly in effect in many important British Industries, which schemes have been made available in recent years, to selected young Canadian engineers—in fact to engineers from all parts of the world. The Brush-Associated British Oil Engines group of companies, Austin Motors Ltd., British Thomson-Houston, Coventry Gauge and Tool Company and The National Gas Turbine Establishment are companies which have been drawn specifically to the *Journal's* attention but it is implied that there are many others.

One of the many proofs available that these Engineering training schemes meet present-day requirements, none is more immediately convincing than the fact that students from all parts of the world are taking advantage of them. Austin Motors have students from twenty-seven countries, B.T.H. from eighteen, including two men from the United States. As applied to graduate engineers, the schemes generally include a two- to three-year's course of practical training and many of the companies also award research scholarships leading to Ph.D. degrees.

An Important Award

The Council of the Institution of Mechanical Engineers has awarded the 1951 James Watt International Medal to Dr. H. H. Blache, of Denmark, for his contributions to the advancement of mechanical engineering, and particularly for his pioneer work in the development of the large Marine Diesel Engine.

Dr. Blache was nominated by the Danish Society of Engineers.

The James Watt International Medal was founded to commemorate the bi-centenary of the birth of James Watt, on 19th January, 1736, an event which was destined to bring about a revolution in the utilization of power. It takes the form of an award every two years of a gold medal to an engineer of any nationality who is deemed worthy of the highest honour the Institution can bestow and that a mechanical engineer can receive. In making the award, the Institution has secured the co-operation of the principal engineering Institutions and Societies in all parts of the world as nominating authorities. The Engineering Institute of Canada has participated on behalf of this country.

Previous recipients of the medal have been:

Sir John A. F. Aspinall (Britain), 1937; Henry Ford (U.S.A.), 1939; Professor Aurel Stodola (Switzerland), 1941; A. G. M. Michell (Australia), 1943; Dr. F. W. Lanchester (Britain), 1945; Professor Stepan Timoshenko (U.S.A.), 1947; Dr. Fredrik Ljungstrom (Sweden), 1949.

Pictured above and below are groups at the Shawinigan Falls meetings.

The President Visits St. Maurice Valley Branch

The March meeting of Council was held at the Cascade Inn at Shawinigan Falls on Saturday, March 10th, in conjunction with the presidential visit to the St. Maurice Valley Branch.

During the trip the presidential party took the opportunity to visit the site of the Duplessis Bridge failure. The lower photograph, taken against one of the entrance pylons of the bridge as a backdrop includes (l. to r.) general secretary Austin Wright; J. O. Martineau, councillor, Quebec Branch; Harold Young, Dominion Bridge Company; President Vance; Vice-President J. F. Wickenden; R. E. Kirkpatrick, chairman, St. Maurice Valley Branch; Frederic Poliquin, Alderman, Three Rivers; S. E. Williams, past chairman, St. Maurice Valley Branch.

The upper picture was taken at the Chateau de Blois in Three Rivers. In the front row are: (l. to r.) Mrs. W. R. Mackay and Mrs. C. H. Neil, of Three Rivers; Alderman Poliquin; Mr. Vance; Mr. Kirkpatrick; Mr. Wickenden; Mrs. Vance; Mrs. Wickenden; Miss M. McLaren, E.I.C. Headquarters. In the back row are (l. to r.) E. A. Cross, Toronto Branch councillor; R. C. Flitton, past-councillor, Montreal; Mr. Williams; L. A. Duchastel, councillor, Montreal Branch; Mr. Wright; Mr. Martineau; W. R. MacKay, a member of the St. Maurice Valley Branch executive; R. N. Coke, councillor, Montreal Branch; C. H. Neil, St. Maurice Valley Branch executive; C. Williams, branch secretary; I. R. Tait, councillor, Montreal Branch; C. G. de Tonnancourt, vice-chairman, St. Maurice Valley Branch.

Meeting of Council

Secretary's Notes

At a meeting of Council, at Headquarters, January 20, 1951, Vice-President R. E. Heartz was in the chair.

Tariff Item 180-e

There was a general discussion of the subject, the outcome of which was that the Institute's Committee on Professional Interests under the chairmanship of J. B. Stirling was asked to take on the responsibility of making the necessary representation to the Tariff Board at the end of the month.

It was announced that the Institute had arranged for a meeting of engineers representing a great variety of interests to take place in the Institute auditorium on the afternoon of Thursday, January 25th in order to discuss the problem with them. On the basis of the outcome of this discussion the brief would be prepared. It was the general opinion that the Institute would be agreeable to the continued exemptions from customs duties of plans for machinery and production equipment.

Civil Defence

Mr. Allan C. Ross of Ottawa was appointed as the Institute's representative of the National Research Council Committee which had been set up to study the subject of shelters in relation to building structures.

It was agreed that the Council of the Institute should advise the branches of its policy with regard to the Institute's participation in civil defence. Council did not believe that this was a matter which at the moment should be handled on the national level but did agree that members of the branches should be encouraged to participate in the activities at the branch level. It was agreed that a letter along these lines would go out immediately to the branches.

Lecture Course

It was reported by the field secretary that a series of lectures of a non-technical nature had been arranged for young engineers in the Toronto area. The course is to consist of twenty lectures and the persons attending the lectures were to pay a fee to cover at least a portion of the cost. Twenty-two young men had reported for the course.

Manitoba Agreement

The scrutineers appointed by the chairman opened the councillors' ballot on the proposal for a co-operative agreement with the Association of Professional Engineers of Alberta. They reported that of 148 ballots returned all but 5 were in favour of the proposal. It was reported also that the ballot taken by the Association in Manitoba was approximately 11 to 1 in favour of the agreement. It was announced that the ceremony of signing the agreement would take place in Winnipeg on Thursday, February 22nd. at which it is expected the president, the Chairman of the Institute's Committee on Professional Interests and the general secretary would attend.

Toronto Office

The Finance Committee reported the receipt of a substantial sum of money from the Toronto branch for the assistance which the Toronto office of the Institute had been able to render the branch.

Technical Sections—Montreal Branch

The general secretary presented a request from the Montreal branch that the auditorium at Headquarters be made available to them on Mondays, Tuesdays, Wednesdays and Thursdays throughout the season. Previously the space had been made available to them on Tuesdays and Thursdays, and every other Monday. This further request was for the balance of the Monday evenings and for all of the Wednesday evenings.

The Montreal branch in their communication indicated that they had established six separate technical sections and were prepared to have meetings four nights a week if the auditorium were made available to them. It ws agreed that their request be granted to be effective at the beginning of the Fall programme in 1951.

Legal Action by Former Advertising Agent

The general secretary reminded Council that some time ago action had been taken by the former advertising agent for *The Engineering Journal*, claiming payment of a substantial amount for commissions on advertising that had been sold previous to the cancellation of his contract. The general secretary explained that the lawyers and the officers of the Institute had not been able to see any justice in the claim and accordingly had refused to make payment. The case had now come to trial although it was not expected that any decision would be handed down for at least one month's time.

The annual report of Council which included reports of committees and branches, was presented and approved.

Regional Meeting of Council

A letter was presented from the Lakehead branch in which the request was made that a regional meeting of Council be held there in the month of June. Council looked with favour on the proposal and the general secretary was instructed to notify the branch.

News of Other Societies

The triennial reunion of the **Engineers' Alumni Association** of the University of Toronto is planned for Friday and Saturday, October 26 and 27, 1951, at the Royal York Hotel.

The 1951 convention of **The Canadian Section of the American Water Works Association** is scheduled for May 21 to 23, 1951, at the Royal Alexandra Hotel, Winnipeg, Man.

The summer general meeting of the **American Institute of Electrical Engineers** will take place in Toronto, Ont., June 25 to 29, 1951, at the Royal York Hotel.

O. W. Titus, M.E.I.C., of Canada Wire & Cable Co., Toronto, Ont., is chairman of the general committee.

The spring meeting of the **Society for Experimental Stress Analysis** will be held at The National Bureau of Standards and The Wardman Park Hotel, Washington, D.C., May 16, 17, 18, 1951. All inquiries should be addressed to Dr. Edward Wenk, Jr., c/o The David Taylor Model Basin, Washington 7, D.C.

The fourth annual meeting of the **Heat Transfer and Fluid Mechanics Institute** will be held at Stanford University, Stanford, California, on June 20, 21, 22, 1951. The Institute will consider advances in the fields of heat transfer, fluid mechanics, and related fields.

Sponsors for the Institute are: California Institute of Technology; Stanford University; University of California; University of Santa Clara; University of Southern California; and the following divisions of The American Society of Mechanical Engineers. Applied Mechanics, Gas Turbine Power, Heat Transfer, Hydraulics.

The complete programme will be issued in May, and will be published in the May issue of *Mechanical Engineering*. Further information may be obtained from A. L. London. Dept. of Mechanical Engineering, Stanford University, Stanford, California.

An **Applied Mechanics Conference** will also take place at Stanford University, June 22, 23, 1951, arranged by the Applied Mechanics Division of the American Society of Mechanical Engineers, (29 West 39th Street, N.Y.). Subjects of discussion will be dynamics, elasticity, experimental stress analysis, strength properties of material and plasticity.

The National Society of Professional Engineers announces the election of new officers who will assume office on July 1, 1951. L. L. Dresser of Tulsa, Oklahoma, has been named president of the Society.

The semi-annual meeting of the **American Society of Mechanical Engineers,** (29 West 39th Street, New York 18, N.Y.) will be held at the Royal York Hotel in Toronto, Ont., from June 11 to 15, 1951.

Sessions of the **International Conference of Naval Architects and Marine Engineers** are scheduled as follows: London, England, June 25 to 30, 1951; Glasgow, Scotland, July 2 to 4, 1951; Newcastle, England, July 4 to 6, 1951. The secretary of the conference is at 10 Upper Belgrave Street, London, S.W. 1.

The **Measurements Section** of the **Institution of Electrical Engineers,** (Savoy Place, London, W.C. 2) announces a conference on electrical instrument design in London, England, May 28 to 30, 1951.

Plans are proceeding for the **Third World Petroleum Congress** at The Hague, Holland, May 28 to June 6, 1951.

National Committees have been formed in many countries. Enquiries regarding the Canadian Committee and Canadian participation in the Congress should be addressed to Dr. R. K. Stratford, Imperial Oil Ltd., Sarnia, Ont.

The programme of the 9th **International Management Congress,** Brussels, Belgium, July 5 to 11, 1951, has been released. The International Committee of Scientific Management (C.I.O.S.) and the Belgian national committee have announced subject matter, travel arrangements, etc.

Canada is collaborating in the presentation of several subjects. For further information, Canadians should contact the Canadian Management Council, 549 Burnside Place, Montreal 25, Quebec.

Elections and Transfers

At the meeting of Council held in Niagara Falls, Ont., Saturday, March 17th, 1951, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

Members:

W. F. Ball, *Kitchener, Ont.*
B. Baranowski, *Burlington, Ont.*
D. Beaulieu, *Montreal, Que.*
K. Bulins, *Corner Brook, Nfld.*
J. S. Bury, *Trinidad, B.W.I.*
H. Chaput, *Ottawa, Ont.*
J. N. Dickie, *Hamilton, Ont.*
D. N. Fraser, *Montreal, Que.*
W. H. Gauvin, *Montreal, Que.*
J. Gilmore, *Montreal, Que.*
B. A. Hesketh, *Montreal, Que.*
N. M. Hobbs, *Montreal, Que.*
D. C. Hutchinson, *Calgary, Alta.*
F. W. Iveson, *Perth, Ont.*
W. J. Kedzierski, *Montreal, Que.*
V. B. King, *Woodstock, Ont.*
A. D. Lindsay, *Montreal, Que.*
W. B. McMullen, *Sudbury, Ont.*
P. T. Mikluchin, *Toronto, Ont.*
R. C. Mitchell, *Hamilton, Ont.*
L. F. Pepino, *London, Ont.*
W. G. Siebrasse, *Montreal, Que.*
M. I. Speigel, *Sudbury, Ont.*
J. A. Stewart, *Montreal, Que.*
C. H. Templeton, *Winnipeg, Man.*
D. R. Tennent, *London, Ont.*
I. A. Usher, *Toronto, Ont.*
F. H. Vercoe, *Hamilton, Ont.*
C. M. Wells, *Montreal, Que.*
G. E. Willan, *Burlington, Ont.*
D. F. Wood, *Montreal, Que.*

Juniors:

J. Allen, *Sarnia, Ont.*
C. M. Armstrong, *Windsor, Ont.*
F. G. Burchell, *Copper Cliff, Ont.*
J. Deptuck, *Arvida, Que.*
R. H. Hales, *Macdonald College, Que.*
W. J. Keough, *Sarnia, Ont.*
T. B. J. Kruzelnicki, *Winnipeg, Man.*
B. D. Mathers, *Toronto, Ont.*
A. McGregor, *Moose Jaw, Sask.*
D. L. S. Pearce, *Montreal, Que.*
D. R. Rowe, *Yorkton, Sask.*
A. H. Todd, *Hespeler, Ont.*

Transferred from the class of Junior to that of Member:

A. D. Allin, *Rolphton, Ont.*
D. B. Baker, *Montreal, Que.*
W. D. Barron, *Montreal, Que.*
R. A. Bowie, *Montreal, Que.*
R. A. Bowman, *Victoria, B.C.*
A. M. Cameron, *Kirkland Lake, Ont.*
E. M. desRivieres, *Quebec, Que.*
J. N. Galli, *Montreal, Que.*
L. A. Glen, *Montreal, Que.*
P. G. Gregory, *Sorel, Que.*
L. G. Grimble, *Edmonton, Alta.*
A. D. Harkness, *Lachine, Que.*
M. N. Joubert, *Quebec, Que.*
L. S. Heinze, *Ottawa, Ont.*
E. H. Martin, *St. Vital, Man.*
J. D. MacMillan, *Beaupre, Que.*
R. W. McNally, *Hamilton, Ont.*
D. P. MacVannel, *Ottawa, Ont.*
J. R. Menard, *Rimouski, Que.*
C. E. Mercier, *Joliette, Que.*
E. W. Montgomery, *Ft. Garry, Man.*
F. H. Nowman, *St. Catharines, Ont.*
G. A. Potts, *Brantford, Ont.*
D. A. Sinclair, *Windsor, Ont.*
R. F. Stapells, *Montreal, Que.*
C. H. Townsend, *Hamilton, Ont.*
E. R. Welsh, *Montreal, Que.*

Transferred from the class of Student to that of Junior:

J. H. Schuster, *Brooklyn, N.Y*

The following Students were admitted:

R. F. Allen	C. H. McAdam
V. W. G. Arnold	R. K. MacDonald
N. W. Bethune	K. A. McCaskill
W. E. Bonnell	J. R. McGovern
D. F. Brandon	M. E. McPherson
G. A. M. Burton	W. B. Maxwell
H. D. Connor	M. W. T. Matthews
V. C. Dohaney	R. W. Myers
J. Dunlop	G. W. Newman
D. T. Durrant	K. O. Oliver
E. A. Godfrey	D. W. Patterson
J. P. Hartt	R. S. Pollock
C. R. Hansen	D. W. Prendergast
E. J. Hebert	F. C. Reddy
A. M. Heise	L. D. Rose
J. M. Henry	J. A. Ryan
J. Hodder	Y. Saar
W. F. Iwanson	W. J. Smith
G. L. Johnson	J. H. Washburn
M. R. Levesque	J. P. Walsh

Applications through Associations

By virtue of the co-operative agreements between the Institute and the Associations of Professional Engineers, the following elections and transfers have become effective:

Alberta

Member:

J. L. Phelps, *Whitehorse, Y.T.*

Junior to Member:

J. E. Flavin, *Edmonton, Alta.*
D. I. Hougan, *Edmonton, Alta.*
T. H. Newton, *Edmonton, Alta.*
M. E. Stewart, *Edmonton, Alta.*

Saskatchewan

Member:

S. J. Hartridge, *Saskatoon, Sask.*

Junior:

H. Fleming, *Regina, Sask.*

Students:

J. M. Childs, *Saskatoon, Sask.*
J. A. Heal, *Saskatoon, Sask.*
B. Kahane, *Saskatoon, Sas.*
D. A. Lane, *Saskatoon, Sask.*
I. C. Rorquist, *Saskatoon, Sask.*
D. L. Stewart, *Saskatoon, Sask.*
L. W. Vigrass, *Saskatoon, Sask.*

Junior to Member:

B. Boyson, *Regina, Sask.*
N. L. Iverson, *Saskatoon, Sask.*
R. H. Persson, *Prince Albert, Sask.*
W. L. Saunders, *Regina, Sask.*

Student to Junior:

L. T. Johnson, *Regina, Sask.*
W. A. Willison, *Moose Jaw, Sask.*

Manitoba

Member:

D. F. Kenney, *Winnipeg, Man.*

Nova Scotia

Junior to Member:

A. F. Chisholm, *Halifax, N.S.*

New Brunswick

Members:

W. H. Crandall, *Moncton, N.B.*
A. J. Cyr, *Fredericton, N.B.*

Junior to Member:

R. D. C. Clark, *Rothesay, N.B.*
W. D. Fanjoy, *Saint John, N.B.*
J. A. Flood, *Renforth, N.B.*
D. R. Holyoke, *Saint John, N.B.*
R. S. Myles, *Fredericton, N.B.*
H. S. McCleave, *Saint John, N.B.*
R. R. McIntyre, *Moncton, N.B.*
G. D. Reeleder, *Woodstock, N.B.*
R. G. Scott, *Fredericton, N.B.*

Student to Member:

R. A. Park, *Moncton, N.B.*
D. R. Robson, *Sackville, N.B.*

Correspondence

Having been advised that a group of engineers in Ottawa had tried a somewhat novel approach to the housing problem, the Editor inquired, and the result was the following interesting description of their project.—Ed.

Ottawa, Ont.,
January 8, 1951

Dear Mr. Editor:

I have your letter of December 27, 1950, and am happy to reply to your enquiry about the Fairhaven housing project near Ottawa.

The purpose of Fairhaven Co-operative Community is to provide high quality housing in a desirable community employing co-operative organization to achieve reasonable costs. The Fairhaven idea arose as a result of the serious shortage of adequate housing which developed in the Ottawa district during the war years. A number of engineers from the National Research Council formed a study group on housing in 1946. The result of their studies was the formation of Fairhaven Co-operative Community Incorporated, a company chartered in November, 1947, under the Companies Act of Ontario to provide housing for its members. The membership was not and is not restricted to any particular group of people and although several of the members are National Research Council engineers there are some members from other government departments and others in private businesses. Included in the group are three architects.

Photos above and below are views of the Fairhaven project.

Soon after incorporation the Co-operative acquired a very desirable site just off the Montreal Road near the Rockcliffe Airport at Ottawa. The first job to be tackled was a topographical survey of the site. From the information obtained, a large scale relief map of the property was prepared and the work of subdivision began. This was a rather long and arduous task since it was realized that the ultimate success of the venture depended on very careful attention to this matter. The land is rolling and somewhat rocky in spots. Many fine trees were in existence and were prizes we were most anxious to keep. The general aims adhered to during the subdivision were

(1) to provide lots of about 150' x 200'

(2) To adjust lot boundaries so that each lot contained a particular geographic feature which would enhance its house building possibilities. For example split level houses were envisaged for some of the lots so that the lot boundaries were adjusted to make full use of the rock ledges and slopes which make split level houses feasible.

(3) to provide a road which would service the houses with minimum interference with the natural beauty of the site

(4) to spare as many of the fine trees as possible

(5) to provide community parks

(6) to provide a suitable septic area on each lot.

With information from the Community Planning Association and the keen effort of several members of the group, a plan was finally adopted which met most of our equirements and satisfied the members. Some small modifications were incorporated at a later date in order to satisfy the requirements of the Ottawa Area Planning Board.

The members then set about building the roads, removing trees, clearing ground, etc. A monthly quota of hours to be donated by each member was established. If a member fails to meet his quota he pays a fine of 75 cents for each hour of default. Money raised in this way is used to reimburse the more enthusiastic members who work over the quota, or to hire outside labour.

In order to ensure an overall blending of the architecture, the Board of Directors of the Co-operative must approve all house plans. Careful attention is given to the location of each house to avoid interference with neighbouring houses and activities. While there is no set policy with regard to the style of house, it is a general principle that each house must be a commonsense design suited to the lot in question. It has been recommended to all members that they seek the services of an architect.

The plan of operation for the co-operative is that the group as a whole should develop the property and community facilities. The individual member looks after the building of his own house and becomes the owner of both house and lot. The deeds to the individual lots incorporate restrictions which are designed to protect the group interests.

Because the members have undertaken this development as a group, coupled with the sound guidance that the company has received from its engineer members, a most attractive community is taking shape. The total cost to each member which covers his own lot, the community facilities, and other group assets such as a considerable quantity of lumber cut from the surplus timber contained on the property amounts to several hundred dollars less than the price asked for unimproved lots in neighbouring subdivisions. Purchases in quantity for the group have also provided significant savings.

Included in the 20 members are 11 engineers and 2 architects. All members have much the same educational and social background. The forty or so children of the members will attend the new Maplewood school which has been built on property adjoining the Fairhaven site.

President of the Fairhaven company is C. Kenneth Rush, JR.E.I.C. Others of the Board of Directors are G. Y. Slader, JR.E.I.C., W. F. Campbell, L. Churchward, and C C. J. Bond.

I wish to thank you for your interest. Any further information we can supply will be forwarded at your request.

Yours very truly,

C. Kenneth Rush, JR.E.I.C.

Quebec Bridge Undergoing "Face Lifting"

Tourists, residents and engineers at large will be equally interested in the work now proceeding on the Quebec Bridge and its approaches. The bridge was completed in 1917 for railway traffic only and although it still ranks as the largest cantilever bridge in the world, the roadway added in 1929, which was then built as wide as the available space between the two railway tracks would permit, has for some years been considered to be of inadequate width for vehicular traffic.

As part of a large general scheme for improving the approach to Quebec from across the St. Lawrence River, the present roadway is being doubled in width, whilst a new 780-ft. bridge, including a 480-ft. arch span, has just been completed across the Chaudière River on the same alignment as the Quebec Bridge The Chaudière bridge provides space for a three-lane highway of equivalent width to the new highway on the Quebec Bridge, and is part of an efficient feeder system to the main crossing.

The work is being carried out under the authority of the Quebec Government (Hon. Romeo Lorrain, Minister of Public Works, and Ivan E. Vallée, Deputy Minister), Dufresne Engineering Co. Ltd. being the official agents of the department for the work. The steel work for the new Chaudière Bridge and for the changes on the Quebec Bridge is being fabricated and erected by Dominion Bridge Company Limited.

The work is being done in two stages, and the photograph shows the first stage nearing completion. i.e. the construction of the new half section of roadway over the disused railway track. This part of the work will be finished during the present year, and the traffic will be diverted to the new section. Then the old roadway will be removed and the new roadway extended to its full width. Thus, by mid-summer of 1951, a continuous 30-ft. roadway providing for three lanes of traffic will be in operation.

The illustration also brings out clearly the 3-in. I-beam Lok grid flooring, manufactured by Dominion Bridge Co. Ltd. under licence from U.S. Steel Corporation. More than 100,000 sq. ft. of this flooring will be used for the bridge.

Quebec Bridge.

CABINET DU MAIRE

OFFICE OF THE MAYOR

MONTRÉAL

AU NOM DE LA POPULATION DE MONTRÉAL et en mon propre nom, je souhaite la plus cordiale bienvenue aux délégués qui prendront part au congrès annuel de l'Institut des Ingénieurs du Canada.

C'est un grand honneur pour la Ville de Montréal que d'avoir été choisie cette année comme le siège de ces importantes assises qui grouperont une élite d'ingénieurs qui jouent dans l'économie moderne un rôle de plus en plus considérable.

Je puis assurer les congressistes de l'Institut des Ingénieurs du Canada qu'ils recevront chez nous l'accueil le plus chaleureux et qu'ils conserveront de leur séjour au milieu de nous un durable souvenir.

ADOLPHE, MONTREAL

I EXTEND A MOST CORDIAL WELCOME to the delegates who will participate in the annual convention of The Engineering Institute of Canada, on behalf of the people of Montreal and in my own name.

Montreal is highly honoured in having been selected to be the site of these important deliberations which will unite top-ranking engineers who are contributing greatly to our modern economy.

I can assure the delegates of The Engineering Institute that they will be greeted in Montreal with a really warm welcome and that they will not soon forget their stay among us.

LE MAIRE DE MONTRÉAL

(CAMILLIEN HOUDE)

MAYOR OF MONTREAL

IRA P. MACNAB, M.E.I.C.

PRESIDENT

OF

The Engineering Institute of Canada

1951

The presidency of The Engineering Institute of Canada, one of the greatest opportunities for service to the profession, comes to Ira P. Macnab of Halifax as the culmination of a series of tributes that have testified emphatically to the high regard in which he is held.

Mr. Macnab was born at Malagash, Nova Scotia, and received his early education in local public schools. He spent seven years as an apprentice and journeyman machinist and then studied engineering at Mount Allison University and Nova Scotia Technical College, receiving the degree of Bachelor of Science in mechanical engineering in 1913. After two years as manager of a machine shop, he joined the Nova Scotia Light and Power Company and, by 1923, was superintendent of the tramway department.

In that year, he accepted an executive position with the Riverside Iron Works in Calgary. In March, 1924 he was asked by the Royal Securities Corporation of Montreal to inspect the properties of the Venezuela Power Company which the Corporation had acquired, and in May, 1925 was appointed general manager of that utility. He was transferred to the Monterey Railway Light and Power Company in 1930, and in 1931, returned to Halifax to join the Nova Scotia Board of Commissioners of Public Utilities.

In 1947 Mr. Macnab was appointed to his present position, general manager of the Halifax Public Service Commission.

Mr. Macnab realized very early that voluntary service to the representative organizations of his profession was essential to his own development. He was active in the organization of the Halifax branch of the Institute and was its vice-chairman when he left for Calgary in 1923. He was also on the council of the Association of Professional Engineers of Nova Scotia. His active contributions were interrupted during the period in South America and Mexico but he maintained his Institute membership and again lent his active support when he returned to Halifax.

He was chairman of the Halifax Branch in 1938 and again a member of the Council of the Nova Scotia Association. He was councillor for Halifax branch in 1939-40, vice-president of the Association during the same period, and in 1949 was simultaneously president of the Association and vice-president of the Institute for the Maritime zone. In 1950 he was elected president of the Dominion Council. He was active in the promotion of the Institute's joint agreement with the Nova Scotia Association which combines fees and membership and in effect allows the two organizations to function as one in that province.

Mr. Macnab's signal contributions to the American Water Works Association and its Canadian section, have been recognized recently through his nomination to receive one of the association's highest honours, the George Warren Fuller Memorial Award for distinguished service in the field of water supply.

Mr. Macnab has always taken an active interest in community work. After returning from Mexico he served three years as an elected representative of the Cumberland County Municipal Council. During the last war he was provincial chairman for Nova Scotia of the Disaster relief committee of the Red Cross. In 1942 he was appointed chairman of the committee to prepare a new Master Plan for the future development of the City of Halifax. This committee after three year's work proposed a plan which has formed the basis for the development of the city since that time. In 1949 he was chairman of the Community Chest drive in the City of Halifax and is now serving on the executive of the Halifax Civil Defence committee. For several years he has been a member of the Council of the Halifax Board of Trade.

He has served on the Board of Regents of Mount Allison University and is now a member of the Board of Governors of Nova Scotia Technical College. In 1950 Mount Allison further recognized his great worth by conferring on him the degree LL.D. (Honoris causa).

Mr. Macnab is the third president of the Institute from the Maritimes and he assumes the office at a time when the profession of engineering looms large on the national and international scene. His record of past services ensures that he will add further distinction to this high office.

and Ontario Land Surveyor, and has a large private practice.

Mr. Armstrong is an active member of the Border Cities Branch, is a past-chairman, and served two years as a councillor. He joined the Institute as a Junior in 1921, transferring to Associate Member in 1925, and to Member in 1940. He is president of the Ontario Land Surveyors Association, and is a Trustee of the Canadian Section of the American Waterworks Association. He has taken a keen interest in the welfare of the engineering profession.

J. B. Stirling, M.E.I.C., of Montreal, has been elected vice-president of the Institute to represent the Province of Quebec.

Mr. Stirling has been president of E. G. M. Cape & Co., Montreal, since May 1950. He joined E. G. M. Cape Company in 1915, and was a field engineer and a supervising engineer on many contracts of the Company. He became a partner in the firm in 1928 and vice-president in 1940.

J. B. Stirling, M.E.I.C.

He was born at Dundas, Ontario, and received his early education there. Graduating from Queen's University, class of 1911, he worked first on municipal construction projects in Ontario, Manitoba, Saskatchewan. He served in Canada, England and France with the R.C.E. in 1917 to 1919.

In 1948 Mr. Stirling was president of The Corporation of Professional Engineers. He is president of the Montreal Board of Trade, and a past-president of the Canadian Construction Association. A past-councillor of the Engineering Institute, and a past-chairman of the Montreal Branch, he has served the Institute's Committee on Professional Interests as chairman since 1944. He joined the Institute in 1913 as an Associate Member, transferring to Member in 1934.

Newly Elected Officers of the Institute

J. W. Sanger, M.E.I.C., general manager of the City of Winnipeg Hydro Electric System has been elected vice-president of the Institute to represent the Western Provinces.

Born in Bristol, England, Mr. Sanger received his technical training at Faraday House, London. From 1906 to 1911 he was district superintendent of the Midland Electric Power Company at Staffordshire, England. In 1912 he came to Canada and worked as distribution superintendent for the City of Winnipeg Hydro Electric System. During 1913 and 1914 he was assistant branch manager for the Siemens Company of Canada Limited. He returned to the City of Winnipeg Hydro Electric System in 1915 as power house superintendent. In 1922 he was appointed chief engineer of the system, and he received the appointment as general manager in 1944.

Additional professional contributions of Mr. Sanger have included service as vice-chairman, Manitoba Power Commission (1931-34); and as a member of the Manitoba Rural Electrification Enquiry Commission (1942).

J. W. Sanger, M.E.I.C.

Mr. Sanger joined the Institute as an Associate Member in 1921, transferring to Member in 1936. He was chairman in 1939 of the Winnipeg Branch of the Institute, and Councillor for the branch in 1942. In 1933 Mr. Sanger was president of the Association of Professional Engineers of Manitoba. He is also a member of the American Institute of Electrical Engineers.

C. G. R. Armstrong, M.E.I.C., consulting engineer, Windsor, Ont., will represent the Province of Ontario as vice-president of the Institute.

Mr. Armstrong was born at Merlin, Ontario, and attended highschool there and at Leamington, Ont. He graduated from the University of Toronto in 1920 with a degree of B.A.Sc. In 1924 he received his certificate as an Ontario Land Surveyor.

C. G. R. Armstrong, M.E.I.C.

He gained his early engineering experience with the International Nickel Company, on topographical and underground surveys at Creighton Mines. In 1920, he was assistant construction superintendent with Brunner Mond Canada Limited, at Amherstburg, Ont. In 1921 and 1922, he was on the staff of University of Toronto as a demonstrator in engineering drawing. The following year he entered the employ of the late J. J. Newman, consulting engineer and Ontario Land Surveyor at Windsor, and in 1925 entered the partnership of Newman and Armstrong in that city. Since 1944 Mr. Armstrong has operated his own business under the name of C. G. Russell Armstrong, consulting engineer.

J. W. Morris, M.E.I.C., has been elected councillor of the Institute to represent the Newfoundland Branch.

Mr. Morris who was born at Wallace, N.S., studied at McGill University where he received a B.A.Sc. degree in 1894.

He worked first on operation and construction for the Montreal Street Railway. He was later associated with the Royal Electric Company's hydro electric nstallations at DeCew Falls, Ont., and t Chambly, Que., and worked on general servicing for the Company in Quebec and Ontario. He was later in Kingston, Jamaica, and in Georgetown, British Guiana, as superintendent of construction for street railways. For

J. W. Morris, M.E.I.C.

many years Mr. Morris was associated with Reid Newfoundland Company, St. Johns, as superintendent of the electrical department. He was made general manager of the Newfoundland Light and Power Co. Ltd., on transfer of the company to the Royal Securities Corporation. Mr. Morris is now retired.

Mr. Morris became a Member of the Institute in 1920.

M. L. Baker, M.E.I.C., associate professor of mechanical engineering at Nova Scotia Technical College, Halifax, has been elected to the Council to represent the Halifax Branch.

Mr. Baker was born at Pinehurst, N.S. He was a machinist for the Acadia Gas Engines Ltd., Bridgewater, N.S., before

M. L. Baker, M.E.I.C.

attending Nova Scotia Technical College, from which he graduated in mechanical engineering in 1932. He worked for Hillis & Sons Ltd., Halifax as a sales engineer for a year before joining the staff of the N.S.T.C., as an instructor. He was appointed assistant professor of mechanical engineering in 1938.

He joined the Institute as a Member in 1945 and was chairman of the Halifax Branch in 1949. Active also in the Association of Professional Engineers of Nova Scotia, he was a member of council of the Association for the term 1948-50.

D. O. Turnbull, M.E.I.C.

D. O. Turnbull, M.E.I.C., who was chairman of the St. John Branch in 1950, has been elected to the Council of the Institute.

Mr. Turnbull has been in private practice as a consulting engineer in Saint John, N.B. since 1945. He had been in the Navigation Branch of the R.C.A.F. from 1939 to 1944.

Born at Rothesay, N.B., he studied at Rothesay Collegiate School and Ridley College, St. Catharines, Ont. He went to Royal Military College, Kingston, Ont., graduating in the class of 1929. He worked for a time for Canadian Industries Limited and in 1930 he joined the Foundation Company of Canada Ltd. He was a job engineer and later a job superintendent with the Foundation Company until 1939.

Joining the Institute as a Junior in 1932, he transferred to Associate Member in 1939 and to Member in 1940. He has been active in the Saint John

W. P. C. LeBoutillier, M.E.I.C.

Branch, and is a councillor of the Association of Professional Engineers of New Brunswick.

W. P. C. LeBoutillier, M.E.I.C., assistant general superintendent of the Kenogami Mill of Price Brothers & Company, Limited, has been elected to council to represent the Saguenay Branch.

Born at Quebec City, he attended Royal Military College, Kingston, graduating in 1925. He received a bachelor of science degree in civil engineering from McGill University the following year. He joined the Bell Telephone Company of Canada upon graduation and was posted to the Montreal division outside plant engineer's office, where he remained until 1929. At that time he left Montreal for the north country to work in pulp and paper industry, joining Price Brothers & Company Limited, at the Kenogami Mill. During World War II he served with the Canadian Army, returning in 1945 to Kenogami.

He has been a member of the Saguenay Branch since 1929 and during this period served as branch secretary, vice-chairman and chairman. He joined the Institute as a Junior, transferring to Associate Member in 1938, and to Member in 1940.

Milton Eaton, M.E.I.C., has been elected to the Council of the Institute to represent the St. Maurice Valley Branch.

M. Eaton, M.E.I.C.

Mr. Eaton is an electrical engineer for Shawinigan Chemicals Limited, Shawinigan Falls, Que. He was awarded the Gzowski Medal of the Engineering Institute in 1933 for his paper "Automatic Operation of Electric Boilers". He is responsible for later improvements in electric boiler controls described in a paper presented at the A.I.E.E. summer general meeting of 1947 and published in the October, 1947, issue of "Electrical Engineering."

Born at Whitewater, Man., he studied at McGill University and graduated with the degree of B.Sc. in electrical engineering in 1921. During 1921-22 he was on the engineering staff of the Shawinigan Water and Power Company at Shawinigan Falls, Que.

From October 1922, he was in charge of the electrical department of the Canadian Electro Products Co. Ltd., the company which in 1927 was incorporated as Shawinigan Chemicals Limited.

He joined the Institute as a Student in 1920, becoming an Associate Member in 1925 and a Member in 1940. He was chairman of the St. Maurice Valley subsection of A.I.E.E., in 1947-48; chairman of the St. Maurice Valley Branch of the E.I.C. in 1948-49.

H. Gaudefroy, M.E.I.C., who has been elected a councillor of the Institute to

H. Gaudefroy, M.E.I.C.

represent the Montreal Branch, is a professor at Ecole Polytechnique, Montreal.

Mr. Gaudefroy was born in Montreal and studied at Mont Saint Louis College and at Ecole Polytechnique where he graduated in civil engineering in 1933. He did post-graduate work at the Massachusetts Institute of Technology, obtaining a degree in electrical engineering in 1934. For the next four years he was an engineer with the Bell Telephone Company in Montreal, working on automatic central office equipment.

He joined the staff of Ecole Polytechnique in 1939 as assistant professor of mathematics. He was named associate professor in 1943, and assistant to the dean, and registrar. In 1947 he became a full professor.

A reserve officer of the R.C.A.F., with the rank of squadron leader, he is commanding officer of the University of Montreal Reserve University Flight. He has been secretary-treasurer of the Graduate Society of Ecole Polytechnique since 1940.

He has worked on committees of professional societies in which he holds membership — the Corporation of Professional Engineers of Quebec, the American Society for Engineering Education, and the Engineering Institute. He was chairman of the Montreal Branch of the Institute in 1950. He had joined the Institute as a Junior in 1934, transferring to Member in 1942.

A. S. Rutherford, M.E.I.C., vice-president of J. L. E. Price & Company Limited, Montreal, has been elected a councillor of the Institute to represent the Montreal Branch.

Mr. Rutherford, a Montrealer, entered the Royal Military College of Canada in 1917 and graduated in 1920. He went to McGill University where he received a degree of bachelor of science, in civil engineering in 1922. That year he joined

A. S. Rutherford, M.E.I.C.

Church Ross Company Ltd., engineers and contractors, for whom he worked as office engineer, field engineer and construction superintendent for six years. From 1928 to 1932 he was with George A. Fuller Company of Canada Ltd., Montreal as superintendent of construction of the Dominion Square Building, C.I.L. House, and the Canadian General Electric Building, in Montreal. In 1932 be became associated with J. L. E. Price, M.E.I.C., and A. Turner Bone, M.E.I.C., in the formation of J. L. E. Price & Company Limited, builders and contractors, and he was appointed the vice-president of the company.

From 1940 to 1945 he served in the Canadian Army, and held the following posts: with the Royal Canadian Engineers as company commander; Assistant Director of labour, Canadian Army; and C.R.E., Second Canadian Army Troops, R.C.E.

He joined the Institute in 1920 as a Student, transferring to Associate Member in 1928, becoming a Member in 1940.

A. C. Ross, M.E.I.C.

A. C. Ross, M.E.I.C., president of Ross-Meagher Limited, Ottawa, will represent the Ottawa Branch on the Council of the Institute.

A native of Ottawa, he studied at Ottawa public and normal schools and Ottawa Collegiate. He went to McGill University and graduated with a degree of bachelor of science in electrical engineering in 1911. He worked as an inspector and assistant electrical engineer for National Transcontinental Railway form 1911 to 1914. He took the 1st Reinforcing Company from the 38th Battalion overseas in the spring in 1915. He served in England, France and Belgium with the 12th Reserve Battalion, the 38th Battalion, and the 4th Canadian Entrenching Battalion, as captain, and was promoted to major. He was invalided home in 1918, and after his discharge, became a partner in Ross and Meagher. The firm later became Ross-Meagher Limited, general contractors and engineers.

Mr. Ross was president of the Canadian Construction Association in 1949, and during 1950 was chairman of the Ottawa Branch of the Engineering Institute. He joined the Institute in 1933. He is a member of the Association of Professional Engineers of Ontario, and a past-president of the Ottawa Board of Trade.

M. G. Saunders, M.E.I.C., plant engineer for the Aluminum Company of Canada, Limited, Kingston Works, will represent the Kingston Branch on the Council of the Institute.

Born at Elgin, N.B., Mr. Saunders attended Acadia University. He served overseas from 1915 to 1919 with the C.E. and the R.A.F. He received the degree of B.A. from Acadia in 1916, in absentia. He entered Nova Scotia Technical College on his return and received the degree of B.Sc. in mechanical engineering 1923. He served as assistant professor

M. G. Saunders, M.E.I.C.

of engineering at Acadia University for 4 years and in 1927 received a master of arts degree from that university. He joined the staff of the Aluminum Company of Canada Limited at Arvida that year as a mechanical engineer, becoming mechanical superintendent in 1932. He transferred as plant engineer, in 1945, to the Kingston Works of the Aluminum Company of Canada Limited.

While at Arvida Mr. Saunders was active in the Saguenay Branch of the Institute; he was chairman in 1939-40, and a member of council for that branch in 1941-43. He has represented the Kingston Branch on the Ontario Provincial Division of the Institute since the

E. R. Graydon, M.E.I.C.

formation of the Division. He joined the Institute in 1933 as an Associate Member, transferring to Member in 1940.

E. R. Graydon, M.E.I.C., chief engineer for the Ontario division of the Dominion Bridge Company, Limited, has been elected a councillor to represent the Toronto Branch of the Institute.

Mr. Graydon was born in Toronto, and received his engineering education at the University of Toronto, graduating in 1935 in civil engineering. He was employed by the Toronto Iron Works Ltd., before joining the Dominion Bridge Company Limited, in 1937. He received the appointment as chief engineer in 1947.

Mr. Graydon joined the Institute as a Member in 1942, and has served the Toronto Branch as chairman of the Junior Section and chairman of the Branch. He is a member of the Association of Professional Engineers of the Province of Ontario, and an associate member of the American Society of Civil engineers.

V. A. McKillop, M.E.I.C.

V. A. McKillop, M.E.I.C., has been re-elected councillor of the Institute representing the London Branch.

He was born at West Lorne, and graduated from the University of Toronto with a B.A.Sc. degree in 1924. On graduation Mr. McKillop joined the staff of the Public Utilities Commission, London, Ontario, as assistant engineer, and two years later was promoted to engineer. He later became assistant manager and in 1949 became assistant general manager and secretary of both the Public Utilities Commission and the London Railway Commission.

Mr. McKillop joined the Institute as a Junior in 1926, transferring to Associate Member in 1927, to Member in 1940. He is a past-chairman of the London Branch, and has completed two previous terms as councillor for the London Branch.

G. W. Lusby, M.E.I.C.

G. W. Lusby, M.E.I.C., will represent the Border Cities Branch of the Institute on the Council.

Mr. Lusby was born at Ahmerst, N.S., in 1903. He attended Acadia University, and Nova Scotia Technical College, Halifax, receiving a B.Sc. degree in mechanical engineering in 1925.

He worked for Canadian International Paper Company at Three Rivers, Que., on the resident engineers staff in 1925. With Fraser Brace Engineering Company, Gatineau, Que., the next year, he worked on paper mill construction. He joined Ford Motor Company of Canada Ltd., at Windsor, Ont., in 1927 to work on layout and design of plant equipment. He has remained with the Company, and is engineer to the general superintendent of plant 4, body and final assembly division.

Mr. Lusby joined the Institute as a Student in 1925, transferring to Junior in 1931, to Associate Member in 1937, and to Member in 1940. He has been active in the Border Cities Branch, serving as its secretary-treasurer in 1947, and as its chairman in 1949.

E. R. Eaton, M.E.I.C., of Canadian Johns-Manville Co. Ltd., Sudbury, has been elected Councillor representing the Sudbury Branch for the term 1951-52.

A charter member of the new Sudbury Branch formed last year, Mr. Eaton was its first councillor. He has been a member of the Institute since 1943. He is also a member of the Association of Professional Engineers of Ontario.

Born and educated at Orillia, Ontario, he attended the University of Toronto, graduating with the degree of B.A.Sc. in mechanical engineering in 1936.

E. R. Eaton, M.E.I.C.

Following graduation he joined the Steel Company of Canada Ltd., at Canada Works, in Hamilton, working on the improved performance of cold heading tools. In 1939 Mr. Eaton was appointed plant superintendent of the East Mill, and in 1945 project engineer for Canada Works.

Early in 1947 he joined Canadian Johns-Manville, and since that time has been located in Sudbury as district sales engineer.

S. E. Flook, M.E.I.C., city engineer of Port Arthur, Ont., has been elected councillor to represent the Lakehead Branch of the Institute.

Mr. Flook was born at Willowdale, Ont., and attended Toronto University where he obtained a B.A.Sc. degree in 1912. He received the degree of O.L.S. in 1913.

In 1913 he moved to Port Arthur and practiced surveying and engineering until 1934, at which time he received the appointment as city engineer of Port Arthur.

Mr. Flook was chairman of the Lakehead Branch of the Institute in 1947. He has been a Member since 1936.

E. J. Durnin, M.E.I.C., construction engineer for the Saskatchewan Power Corporation, has been elected to the Council

S. E. Flook, M.E.I.C.

E. J. Durnin, M.E.I.C.

of the Institute to represent the Saskatchewan Branch.

Mr. Durnin was born at Dauphin, Man. He was educated at Melfort, Sask., and at the University of Saskatchewan, graduating as a bachelor of arts in 1924. He was for two years in Royal Canadian Air Force, after which he attended University of Manitoba and graduated with a degree of B.A.Sc. in electrical engineering in 1928. The following year he went to Canadian Westinghouse Company, Hamilton, Ontario, for an apprentice course. He became associated with the Saskatchewan Power Commission in 1930. He was successively assistant engineer and district operating superintendent for the Saskatoon power plant, and commercial superintendent at Regina. From 1940 to 1945 he served in Canada, England and N.W. Europe, with the Royal Canadian Engineers, returning to Saskatchewan Power Corporation in 1946.

He joined the Institute as a Junior in 1930, becoming an Associate Member in 1939 and Member in 1940.

H. W. Tye, M.E.I.C., will represent the Edmonton Branch on the Council of the Institute.

During the past year Mr. Tye has been executive secretary for Alberta Division, Prairie Roadbuilders Section, Canadian Construction Association at Edmonton.

H. W. Tye, M.E.I.C.

Mr. Tye was born at Haysville, Ont., and attended Galt Collegiate Institute. He graduated from the University of Toronto in 1908. He was employed by the construction department of Canadian Pacific Railway until 1922 on various engineering projects in Western Canada. He transferred to the Lacombe North-Western Railway Co. in 1922, and was in charge of engineering and operation until 1928. He joined the Northern Alberta Railway Company then, and was engineer in charge of maintenance and construction until his retirement in 1949.

Mr. Tye served overseas as a battalion works officer attached to the Winnipeg Grenadiers in World War I. He was awarded the Military Cross at Passchendale.

He joined the Institute as a Member in 1944.

A. H. W. Busby, M.E.I.C., has been elected to represent the Kootenay Branch on the Council of the Institute. Mr. Busby is with Consolidated Mining and Smelting Company of Canada Limited at Trail, B.C.

Mr. Busby was born in Birmingham, England. He graduated in mining engineering from University of Birmingham, in 1923. He had completed an apprenticeship with General Electric Company at Birmingham, in 1918, and had served in 1918 and 1919 with the Royal Air Force before entering University.

A. H. W. Busby, M.E.I.C.

He was an electrical research engineer with the Mines Department in England for a time before coming to Canada in 1924 and joining the electrical department of Consolidated Mining and Smelting. He was assistant superintendent of the electrolytic department of the company's zinc plant from 1927 to 1930. Subsequent appointments in the Company were as follows: senior research assistant in the Research Department, 1930; senior research engineer and supervisor of the instrument and physical testing division, 1942; superintendent of physical research, 1945; superintendent of engineering research and development, 1946. Mr. Busby was awarded the Gzowski Medal of the Institute in 1949.

He is a member of the Association of Professional Engineers of British Columbia; of the National Association of Corrosion Engineers, the Instrument Society of America, and the Society of Experimental Stress Analysis. He was chairman of the Kootenay Branch of the Engineering Institute in 1949.

G. W. Allan, M.E.I.C., president of Canadian Sumner Iron Works Limited, has been elected councillor of the Vancouver Branch of the Institute.

Mr. Allan was born in Scotland, and received public and high school education in Vancouver, Canada. He returned to Scotland, where he graduated from the Royal Technical College of Glasgow in mechanical engineering, and served an apprenticeship as an engineer with Mirrlees-Watson Glasgow Co.

Returning to Canada in 1911, he joined the engineering staff of the B.C. Sugar Refining Co., before forming the engineering firm of Allan & McKelvie, later incorporated as the Canadian Sumner Iron Works Limited. In 1918 he was appointed vice-president and he became president in 1928.

G. W. Allan, M.E.I.C.

Mr. Allan was chairman of the Vancouver Branch in 1949. He had joined the Institute as a Member in 1942.

P. B. Stroyan, M.E.I.C., superintendent of the Board of Park Commissioners, Van-

P. B. Stroyan, M.E.I.C.

couver, will be a councillor of the Institute representing the Vancouver Branch.

Mr. Stroyan was born in Derby, England. He studied civil engineering in Canada at the University of British Columbia, graduating in 1924 with a B.A.Sc. degree. In the next 10 years he was employed on design and construction of concrete and structural steel works at the S. E. Junkins & Major Co.; Major J. R. Grant, consulting engineer; John S. Metcalfe Co., Vancouver; and Major W. G. Swan, consulting engineer; and with the Vancouver School Board. In 1935 he worked for Consolidated Mining and Smelting Company on design and details of industrial buildings. In 1936 he was clerk of works on school construction for the Vancouver School Board. He joined the Vancouver Parks Board as assistant superintendent and engineer in 1937.

In 1948 Mr. Stroyan was chairman of the Vancouver Branch of the Institute, and in 1949 he was president of the Association of Professional Engineers of British Columbia. He joined the Institute as an Associate Member in 1938 transferring to Member in 1940.

Personals

News of the Personal Activities of Members of the Institute

Reginald Bowering, M.E.I.C., has been elected councillor for the Victoria Branch of the Institute. Mr. Bowering is in Korea at present on leave of absence from the Department of Health and Welfare of British Columbia.

Mr. Bowering, a sanitary engineer in the Health Department was the only Canadian engineer selected to join the six teams of doctors and engineers sent to Korea.

Mr. Bowering received the degree of B.Sc. from the University of Manitoba in 1938 and graduated with a M.A.Sc. degree in public health training at the University of Toronto in 1939. He joined the British Columbia Health Department in 1940, as public health engineer and chief sanitary inspector. He was later appointed director of the division of public health engineering of the Department of Health & Welfare.

R. Bowering, M.E.I.C.

He has taken active interest in stream pollution control and is a member of the Pacific Northwest Pollution Control Council.

He joined the Institute as a Member in 1942. He was chairman of the Victoria Branch in 1949.

R. W. Diamond, M.E.I.C., vice-president and general manager of The Consolidated Mining and Smelting Company of Canada, Limited, has been awarded the medal of the Institute of Metals of London, England. This medal is the highest award made by the Institute of Metals and is presented for outstanding services to the non-ferrous metal industries. As a recipient of this honour from one of the world's most prominent technical societies, Mr. Diamond joins a company of other very distinguished metallurgists.

R. W. Diamond, M.E.I.C.

Mr. Diamond is a past-president of the Canadian Institute of Mining and Metallurgy. He was the recipient of the Julian C. Smith Medal of the Engineering Institute in 1949.

Major-General C. R. S. Stein, M.E.I.C., has been appointed civil defence co-ordinator for the Province of British Columbia.

The Engineer Sub-committee of the Greater Victoria Civil Defence Board includes **A. S. G. Musgrave,** M.E.I.C., chairman; **H. D. Dawson,** M.E.I.C., and **H. F. Bourne,** M.E.I.C.

The work of the co-ordinator is already under way in its organization, and the education of the public for the civil defence programme is to begin soon.

H. F. Finnemore, M.E.I.C., chief electrical engineer of Canadian National Railways, Montreal, was guest speaker at the regular monthly meeting of the Central Electric Railfans Association at Chicago, in January. Mr. Finnemore described the electrification system of the Canadian National in connection with the Montreal terminal and Montreal suburban lines for which the company recently received three new locomotives, and now has on order 18 multiple-unit suburban motor and trailer coaches.

P. M. Sauder, M.E.I.C., has resigned as general manager of the Western Irrigation District. He was appointed, during 1950, colonization manager of the De-

P. M. Sauder, M.E.I.C.

partment of Water Resources of the Alberta Government, in connection with the St. Mary River Development.

One of the major responsibilities of the government will be colonization of the adjacent lands when that project is completed. Mr. Sauder is manager of the St. Mary River Development. He will transfer to S.M.R.D. the colonization staff of the Lethbridge Northern Irrigation District, whose colonization work is practically completed.

Mr. Sauder directed the Lethbridge Northern Irrigation District, launched in 1919, from 1924-1940. He was then appointed director of water resources for the Province, and since 1944 he has been general manager of the Western Irrigation District at Strathmore, Alta. He will continue to act as a consultant to the Western District.

George W. Rayner, M.E.I.C., president of Rayner Construction Co. Ltd., Toronto, is among those engineers whose names have been given to new projects of the Ontario Hydro-Electric Power Commission. He was recently presented with an illuminated scroll in appreciation of his work in the construction of Ontario Hydro's tunnel development on the Mississagi River, near Thessalon. The development has since been renamed the George W. Rayner Generating Station.

The presentation was made at the annual dinner of the Ontario Road Builder's Association on February 21. Mr. Rayner is a past-president of the Association.

Dr. A. E. Berry, M.E.I.C., director of the sanitary engineering division of the Ontario Health Department, has been elected president of the American Water Works Association.

Dr. Berry is a graduate of Toronto University, where he received a degree in civil engineering with honours in 1917, and in 1921 a degree of M.A.Sc. He has been with the Ontario Department of Health since 1917, returning from service overseas in the First World War to the engineering staff. He was appointed director of the sanitary engineering division in 1926, being made responsible for supervisory control over

Dr. E. A. Berry, M.E.I.C.

all of the public waterworks and sewerage systems in Ontario.

Among his many contributions to professional associations has been service as councillor of the Engineering Institute, representing the Toronto Branch (1941); president of the Federation of Sewage Works Associations (1944); chairman of the Canadian Section of American Water Works Association; and secretary of the Canadian Institute of Sewage and Sanitation.

Bell Telephone Appointments

A. J. Groleau, M.E.I.C., **A. G. Anderson,** M.E.I.C., and **C. L. Dewar,** M.E.I.C., were involved in organization changes an-

A. G. Groleau, M.E.I.C.

nounced recently by The Bell Telephone Company of Canada.

Mr. Groleau, formerly staff assistant, assistant vice-president (engineering),

C. L. Dewar, M.E.I.C.

has been appointed chief engineer, eastern area. A graduate of McGill University, he joined the Bell Company in 1928 as a student engineer. He has held various engineering posts with the company, being successively a traffic assistant, dial equipment engineer, a maintenance and dial equipment engineer and general facilities superintendent. He has been a member of the Engineering Institute since 1928.

Mr. Dewar, formerly assistant vice-president (engineering), has been appointed general manager, eastern area. Following his graduation from McGill University, he joined the Bell Company as a student engineer in 1923. Prior to the Second World War, he held appointments as assistant field engineer,

A. G. Anderson, M.E.I.C.

superintendent of construction and plant, and as a dial equipment engineer and chief engineer, eastern area. During the Second World War he was president of Wartime Shipbuilding Limited at Montreal. He returned to the Bell Telephone in 1945. He has been a member of the Engineering Institute since 1937.

Mr. Anderson, formerly assistant vice-president (operations), has been appointed assistant vice-president (engineering). Also a graduate of McGill, he entered the service of the Bell Telephone in 1921 as a student engineer. He has held various engineering posts with the company as equipment engineer, machine switching equipment engineer, general traffic engineer, plant extension engineer and operating results supervisor. In 1941 he was appointed chief engineer, eastern area. He has been a member of the Engineering Institute since 1944.

Alfred M. Beale, M.E.I.C., has retired from Water & Power Bureau, Department of Mines and Resources, Ottawa, Ont.

Mr. Beale graduated in 1905 from London University, England, with the degree of B.Sc. in engineering. After graduation he worked for Tangyes Ltd., Birmingham, England. Coming to Canada in 1906 he worked in the drawing office of the Dominion Bridge Co. Lachine, Que., and with the American Bridge Co., in Detroit, before going, in 1908, to the Railway Lands Branch of the Department of Interior, Ottawa. He did exploration work in Northern Saskatchewan and Alberta, and worked on the Winnipeg River water power survey, in his early years with the Department. He became a senior assistant engineer in the Water Power Branch in 1920. He has remained associated with the Federal Water and Power Bureau, which later came under the Department of Mines and Resources. He was an engineer Grade 5 before his retirement.

Thomas O. Whillans, M.E.I.C., of Ottawa, has been promoted to the post of assistant commissioner of patents with the Patent and Copyright Office of the Secretary of State Department.

Mr. Whillans joined the patent office in 1921 as an assistant patent examiner and has held progressively higher posts since that time.

A native of Ottawa, Mr. Whillans received his education in that city and at Queen's University, where he graduated with a B.Sc. degree in mechanical engineering in 1917.

B. G. Ballard, M.E.I.C.

B. G. Ballard, M.E.I.C., director of the Radio and Electrical Engineering Division, National Research Council, has been elected chairman of the Ottawa Branch of the Institute.

Mr. Ballard graduated in electrical engineering from Queen's University following which he took the graduate engineering course in the Westinghouse Electric and Manufacturing Company at East Pittsburgh, Pa. He then entered the engineering department of that company, remaining there until 1930. He joined the staff of the National Research Council assuming charge of the Electrical Engineering Laboratory. In 1948 he assumed his present position. He was a recipient of the Institute's Ross Medal for the year 1948.

John M. Hansen, M.E.I.C., is with Defence Construction Limited, at Edmonton, Alta.

Mr. Hansen graduated in civil engineering in 1933 from Royal Technical College, Copenhagen, with a degree of B.Sc. In Europe he did designing and construction engineering and road engineering. He was a superintendent for the firm of civil engineers, Rasmussen and Scholtz, in Copenhagen, before coming to Canada in 1947. He was employed as designer and draughtsman by W. M. Barnes, general contractor, in Edmonton. During 1949 he worked for Sparling & Davis, general contractors, Edmonton, after which he worked for City of Edmonton engineering department, on design and construction.

Arthur H. Hull, M.E.I.C., is retiring from the Hydro-Electric Power Commission of Ontario, after many years of service with the Commission.

Mr. Hull graduated from Toronto University with a degree of B.A.Sc. in 1906, he followed the engineering apprenticeship course of Canadian Westinghouse Co., Hamilton. In 1909 he went to Smith Kerry & Chase, Toronto, as an electrical draughtsman, working with the company until 1913. He then joined the Ontario Hydro as an engineer assistant on field inspection. He was made engineer-in-charge of the station section, Electrical Engineering Department in 1920, and acting chief electrical engineer in 1938. He was appointed head of the electrical engineering department in 1946. Since 1949 he was a consulting electrical engineer in the generating division of the Commission.

H. H. Tripp, M.E.I.C., division engineer, for the Canadian Pacific Railway Company at Fort William, Ont., has retired from the Company.

Mr. Tripp graduated from Cornell University in 1903, and joined the Canadian Pacific Railway in 1909. His work with the Railway has included appointments as transitman at Cranbrook, B.C., and in Northern Alberta; resident engineer at Edmonton; chief clerk at Calgary; resident engineer at Winnipeg terminals; resident engineer at Kenora. He was transferred from Edmonton to Fort William, Ont., as division engineer in 1939.

W. R. Alder, M.E.I.C., London division engineer of the Department of Highways of Ontario for the past 16 years has retired from the Department.

Mr. Alder has been with the department since shortly after the Highways Improvement Act was passed, has seen and supervised much of the tremendous expansion and improvement of Ontario highways.

He graduated from Queen's University, Kingston in 1907. He was assistant engineer of the Highways Department in the Prescott area from 1919 to 1924, when he was moved to Durham to take charge of the Owen Sound division. He was appointed London division chief in 1935.

John A. Murray, M.E.I.C., has announced the formation of his own manufacturers' sales agency with headquarters at Winnipeg, specializing in automotive products and covering Western Canada.

Mr. Murray has been associated as sales manager for the past three years with James B. Carter Limited and Electric Heating and Manufacturing Company Limited, Winnipeg.

Prior to joining the Carter organization he was engaged in manufacturing and engineering work with the Aluminum Co. of Canada Limited and Northern Electric Co. Limited. He is an engineering graduate of the University of Toronto, class of 1940.

C. D. Carruthers, M.E.I.C.

Mr. Carruthers' election as chairman of the Toronto Branch was announced in the March issue.

S. Barkwell, M.E.I.C., has joined the apparatus division of Canadian General Electric Company's Winnipeg district office, from the company's Head Office, after a number of years' experience specializing in the design of power transformers.

He graduated in 1940 from the University of Manitoba with the degree of B.Sc. in electrical engineering.

Peter W. Gow, M.E.I.C., has been appointed manager of manufacturing for Canadian Allis-Chalmers Limited at their plant in Lachine.

Mr. Gow joined the Company as draughtsman in 1920 at their Davenport Works, Toronto. In 1934 he was transferred to the Lachine plant and a year later was appointed chief draughtsman. It was while he was head of the engineering department, the Company was able to secure such contracts as the Aluminum Company's Shipshaw project and the Welland Canal Gate Lifter, among others.

He was appointed works engineer in 1946. When Canadian Allis-Chalmers became a subsidiary of Allis-Chalmers, Milwaukee, Wisc., in February 1951, Mr. Gow was appointed to his new position.

Born in London, England, and educated at Woolwich Polytechnic and Woolwich Arsenal, Mr. Gow graduated there in 1920. The same year he came to Canada.

M. L. Zirul, M.E.I.C.

M. L. Zirul, M.E.I.C., secretary-treasurer of the Central B.C. Branch, of the Institute, has been appointed district engineer at Kamloops, B.C., for the Water Rights Branch of the Department of Lands and Forests, B.C.

A graduate of the University of British Columbia he obtained a B.A.Sc. degree in civil engineering in 1941, after which he worked for the Dominion Water and Power Bureau, Department of Mines and Resources, in the Kootenay District. In 1944 and 1945 he was employed by Powell River Paper Company, Powell River, B.C., on construction of various projects of the Company. He was draughtsman on reinforced concrete and steel design of the new hydraulic barker and chipping plant in 1945-46. He went to the Water Rights Branch in 1946.

Walter E. Burke, M.E.I.C., is assistant design engineer with the New Zealand State Hydro-Electric Department in Wellington, New Zealand.

Mr. Burke graduated from London University, receiving a B.Sc. degree in engineering in 1938, after which he worked with Westinghouse Brake and Signal Co. Ltd., in London, England. From 1941 to 1944 he was an officer in a railway mobile workshop unit, Royal Engineers, in charge of repairs of rolling stock, operating in England and French North Africa. Later he was a workshops officer with a transportation stores unit in Italy. In 1946 he was appointed a staff officer (with rank of major) at Railway Headquarters in British Occupation Zone of Austria.

In Canada in 1949 he joined Canadian Car and Foundry Company as a sales engineer.

A. F. Paget, M.E.I.C., has been appointed chief engineer of the Water Rights Branch of the B.C. Department of Lands and Forests, Victoria, B.C.

Mr. Paget is originally from Saskatchewan, and received his education in Edmonton. From 1923 to 1931 he was with Canadian Pacific Railway. In 1935 he was appointed superintendent and manager for Keremeos Irrigation District where he remained until 1941. For four years he served in the Canadian Army (Active), R.C.E. as a works officer and district engineer officer. During 1946-1947 he was assistant city engineer and building inspector of the City of Vernon. He joined the Water Rights Branch as assistant engineer in 1947, and he was district engineer at Kelowna, B.C., before his recent appointment.

He is vice-chairman of the Central B.C. Branch of the Institute.

W. A. Kerr, M.E.I.C., who was assistant district engineer at Kelowna, for the Water Rights Branch of the B.C. Department of Lands and Forests at Kelowna, B.C., is now district engineer.

Mr. Kerr is a graduate of the University of British Columbia, receiving a B.A.Sc. degree in 1945. Previous to joining the Water Rights Branch in 1946 he was with the Northern Construction Co. & J. W. Stewart Ltd.

G. H. Dunphy, Jr.E.I.C., has recently been appointed by Canadian General Electric Company as its specialist in distribution equipment for utilities, throughout the Maritimes and Newfoundland. He joins the supply division staff in the company's Halifax district office.

Mr. Dunphy graduated in mechanical engineering in 1947 from Nova Scotia Technical College. Since that time he has served with C.G.E. in the east and at its head office in Toronto, specializing in utility and lighting equipment.

L. M. Poitevin, Jr.E.I.C., of the Canadian National Railways staff in Cochrane, Ont., has been appointed a Laurentian division engineer in Quebec City.

A graduate of McGill University he joined the railway as a draughtsman in the research and development department in 1944. In 1948 he was made an instrumentman in the division at Cochrane, Ontario. He served as assistant engineer on the Laurentian division prior to his present appointment.

E. G. F. Sweet, Jr.E.I.C., is with the engineering department of the Brantford Coach and Body Co., Ltd.

Previously he was mechanical engineer with Babcock Wilcox and Goldie McCulloch, Galt, Ont.

R. P. Proctor, Jr.E.I.C., who graduated from Nova Scotia Technical College in mechanical engineering in 1947 is now employed by the Dow Chemical of Canada. He was a steam plant engineer with Canadian Celanese Ltd., in Drummondville, Que., before going to his present position.

H. J. T. Patterson, Jr.E.I.C., is junior design engineer for Dominion Structural Steel Co., Montreal. He was in Trenche, Que., working for the Shawinigan Engineering Co., after graduating from McGill University in 1948 in civil engineering.

Harley K. Larsen, Jr.E.I.C., is now employed by E. G. M. Cape & Co. on the construction of the extension to the Dominion Public Building in Moncton, N.B. Previously he was employed by T. Pringle & Son, working in Montreal and Three Rivers and also by the Fluor Corporation of Los Angeles, and the Dominion Bridge Co., Ltd., of Montreal.

He graduated from University of New Brunswick in civil engineering in 1949.

W. I. Honeyman, Jr.E.I.C., who was previously in Toronto, Ont., working in the technical department of E. F. Drew Co., is now in Montreal employed as a sales engineer for Canada Colors & Chemicals (Dominion) Ltd.

He graduated in chemical engineering from McGill University in 1949.

Murray E. Blanchard, Jr.E.I.C., is a construction enginer on the Peribonka No. 1 Development of the Aluminum Company of Canada, Limited, at Isle Maligne, Que. Previously he was a design engineer for the Saint John Sulphite Co., Fairville, N.B.

J. B. Goodfellow, Jr.E.I.C.

J. B. Goodfellow, Jr.E.I.C., has been transferred to Montreal in the capacity of district TRANSITE pipe manager for the Canadian Johns-Manville Co. Ltd.

Mr. Goodfellow is a graduate of McGill University in mechanical engineering. From 1941 to 1947, he was with the Grinnell Company of Canada, Ltd., as a fire protection engineer. Following this, he was employed by the Canadian Johns-Manville Co. Ltd., as construction superintendent of the applied insulation department and by Stadler-Hurter, consulting engineers, in the capacity of section leader for water, sewerage and fire protection design. In 1949, he rejoined Canadian Johns-Manville in Toronto as technical assistant in the TRANSITE pipe department.

He joined the Engineering Institute of Canada in 1942 and, while in Toronto, assisted on the Paper's Committee for the 64th Annual Meeting.

W. O. Bratina, Jr.E.I.C., will work for the Ontario Research Foundation in Toronto as a metallurgist. Previously he was with Canadian Sugar Factories Ltd., at Taber, Alberta.

J. G. Townsend, S.E.I.C., of Hamilton. Ont., is with Spartan Air Services Ltd., Ottawa, Ont. He operates a helicopter fleet for this company on topographical and geophysical surveys. He graduated in civil engineering from Queen's University in 1950.

W. N. Plumb, S.E.I.C., of Vancouver, B.C., who graduated from the University of British Columbia in 1950, is now employed as a junior mining engineer for Torbrit Silver Mines, Ltd., in Alice Arm, B.C.

F/O A. G. Hoyt, S.E.I.C., is at the R.C.A.F. Station at Edmonton, Alta. He graduated from the University of British Columbia in 1950.

H. D. Adam, S.E.I.C., of Flin Flon, Man., who graduated from the University of Saskatchewan with a degree of B.Sc. in electrical engineering in 1950, is now in Ottawa working in the Department of National Defence, as an electrical engineer.

Visitors to Headquarters

P. A. Voss, Denmark, February 26, 1951.

Leo G. McLaren, M.E.I.C., Rimouski, Que., Feb. 27.

D. W. Hawes, S.E.I.C., Peterborough, Ont., March 6.

A. E. Cameron, M.E.I.C., Halifax, N.S., March 13.

John P. Stirling, M.E.I.C., Pine Portage, Ont., March 27.

F. R. Burfield, M.E.I.C., Edmonton, Alta., March 27.

C. R. Evans, M.E.I.C., Ottawa, Ont., March 27.

G. P. F. Boese, M.E.I.C., Calgary, Alta., March 27.

A. G. S. Musgrave, M.E.I.C., Victoria, B.C., March 29.

W. Thornber, M.E.I.C., Vancouver, B.C., March 29.

OFFICERS OF THE BRANCHES

BELLEVILLE

Chairman, F. F. FULTON
Executive, W. L. LANGLOIS, G. A. BRADFORD, J. E. BUCHAN, E. G. GURNETT, A. O. DRYSDALE
(Ex-Officio), D. W. BEWS,
Secretary, S. SILLITOE, 250 Sydney Street, Belleville, Ont.

BORDER CITIES

Chairman, H. D. KEIL
Vice-Chair., W. R. MITCHELL
Executive, W. A. McDOUGALL, P. S. DEWAR, D. A. SINCLAIR
(Ex-Officio), J. G. HOBA, J. K RONSON, G. W. LUSBY, C. G. R. ARMSTRONG
Sec.-Treas., J. C. AITKINS, c/o Ford Motor Company of Canada Ltd., Windsor, Ont.

CALGARY

Chairman, H. R. HAYES
Executive, C. W. COOTE, T. M. SCHULTE, R. C. HIND, A. G. BRAY
(Ex-Officio), R. T. HOLLIES, K. W. MITCHELL, W. A. SMITH
Sec.-Treas., D. C. JONES, c/o Canadian Western Natural Gas Co. Ltd., 215 - 6th Avenue, West, Calgary, Alta.

OFFICERS OF BRANCHES (*Continued*)

CAPE BRETON

Chairman, C. N. MURRAY
Vice-Chair., W. DODSON
Executive, E. J. PRINCE, J. R. WALLACE, H. S. MARSHALL, W. L. DODSON, D. McKERRON, A. B. ROSSETTI, N. A. D. PARLEE, S. G. NAISH, K. E. GUSTAFSON
(Ex-Officio), C. M. SMYTH
Sec.-Treas., G. W. ROSS, Canadian General Electric Co. Ltd., Sydney, N.S.
Asst.-Sec., J. PRINCE

CENTRAL BRITISH COLUMBIA

Chairman, F. McCALLUM
Vice-Chair., A. F. PAGET
Executive, H. R. HATFIELD, R. L. BIGG, F. E. DEMBISKE
(Ex-Officio), W. RAMSAY, M. L. WADE
Sec.-Treas., M. L. ZIRUL, c/o Water Rights Branch, 515 Columbia Street, Kamloops, B.C.

CORNWALL

Chairman, H. W. NICKERSON
Executive, A. S. HOLDER, F. E. TREWARTHA, P. H. NASMYTH, A. A. B. McMATH, F. R. WARNER
(Ex-Officio), D. GILES, D. ROSS-ROSS, R. H. WALLACE
Secretary, JOHN A. SARJEANT, c/o Howard Smith Paper Mills Ltd., Cornwall, Ont.

EDMONTON

Chairman, E. H. WRIGHT
Vice-Chair., E. L. SMITH
Executive, H. A. CARSWELL, T. C. MAIN, R. E. PHILLIPS, N. J. ALLISON, L. G. GRIMBLE, E. SKARIN
(Ex-Officio), T. W. DALKIN, H. W. TYE
Sec.-Treas., T. E. BATE, Box 369, Edmonton, Alta.

HALIFAX

Chairman, A. R. HARRINGTON
Executive, P. M. LANE, G. F. C. BENNETT, J. W. MacDONALD, M. F. DEAN, J. P. VAUGHAN, L. J. ARCHIBALD, E. G. DeWOLF, J. E. CLARKE, W. J. FISHER, Wm. G. MUIR
(Ex-Officio) L. D. HOPKINS, M. L. BAKER, W. C. RISLEY, W. H. CHISHOLM, I. P. MACNAB
Sec.-Treas., W. E. JEFFERSON, 302 South St., Halifax, N.S.

HAMILTON

Chairman, E. T. W. BAILEY
Vice-Chair., W. L. HUTCHISON
Executive, F. J. McMULKIN, J. H. MITCHELL, W. R. McCOLL, H. H. WALKER
(Ex-Officio), W. E. BROWN, L. C. SENTANCE
Sec.-Treas., G. L. SCHNEIDER, Bavaront, Halton Place, Burlington, Ont.

KINGSTON

Chairman, G. T. L. ANDREWS
Vice-Chair., A. L. MacLEAN
Executive, J. S. CAMPBELL, C. R. DUNLOP, D. L. BIGSBY, L. F. GRANT
(Ex-Officio), J. W. BROOKS, M. G. SAUNDERS
Sec.-Treas., J. T. PROVAN, Aluminum Co. of Canada Ltd., Kingston, Ont. Confidential.

KITCHENER

Chairman, A. C. MACNAB
Vice-Chair., W. R. ROBERTS
Executive, A. J. GIRDWOOD, M. P. STEWART, J. A. TOD, W. L. BRADLEY
(Ex-Officio), F. H. MIDGLEY, M. A. MONTGOMERY
Sec.-Treas., J. F. RUNGE, c/o Armco Drainage & Metal Products, Guelph, Ont.

KOOTENAY

Chairman, H. P. HAMILTON
Vice-Chair., S. L. BAIRD
Executive, E. B. BROADHURST, R. POLLARD, C. E. MacKINNON, G. R. McMEEKIN, W. V. NICHOLSON
(Ex-Officio), J. L. BALLENY, A. H. W. BUSBY
Sec.-Treas., T. W. LAZENBY, 1974 Topping St., Trail, B.C.

LAKEHEAD

Chairman, O. J. KOREEN
Vice-Chair. A. J. MICKELSON
Executive, F. E. AYRES, A. D. NORTON, E. T. CHARNOCK, H. A. OAKS, J. H. HARGRAVE, D. HUNTER, K. A. McCAFFREY, M. S. FOTHERINGHAM
(Ex-Officio), S. E. FLOOK, H. M. OLSSON
Sec.-Treas., G. S. HALTER, 22 Murray Block, Fort William, Ont.

LETHBRIDGE

Chairman, M. S. MITCHELL
Vice-Chair., P. E. KIRKPATRICK
Executive, A. L. H. SOMERVILLE, W. L. FOSS, W. B. THOMSON
(Ex-Officio), R. D. LIVINGSTONE, R. S. LAWRENCE, A. G. DONALDSON
Sec.-Treas. D. CRAMER, c/o P. F. R. A. Airport, Lethbridge, Alta.

LONDON

Chairman, G. E. HUMPHRIES
Vice-Chair., D. D. C. McGEACHY
Executive, R. G. CODE, D. N. COOKE, R. G. NEWELL, S. G. CHIPMAN, J. D. CAMPBELL
(Ex-Officio), G. N. SCROGGIE, V. A. McKILLOP, J. A. VANCE
Sec.-Treas., I. D. PATTERSON, R.R. No. 7, London, Ont.

MONCTON

Chairman, N. B. EAGLES
Vice-Chair., E. M. NASON
Executive, F. A. DIBBLEE, T. H. DICKSON, R. T. SANSOM, R. H. STEVENSON, W. D. G. STRATTON, C. L. TRENHOLM
(Ex-Officio), R. L. PARSONS
Sec.-Treas., V. C. BLACKETT, 229 Highfield St., Moncton, N.B.

MONTREAL

Chairman, E. R. SMALLHORN
Vice-Chair., F. L. LAWTON
Executive, P. G. A. BRAULT, A. B. DOVE, G. E. SHAW, J. A. OUIMET, W. E. PATTERSON, R. F. SHAW
(Ex-Officio), H. GAUDEFROY, R. N. COKE, J. E. ARMSTRONG, H. GAUDEFROY, E. B. JUBIEN, A. S. RUTHERFORD, I. R. TAIT, J. P. CARRIERE, J. B. STIRLING, L. L. O'SULLIVAN, L. A. DUCHASTEL
Sec.-Treas., R. B. WOTHERSPOON, Dominion Textile Co. Ltd., 710 Victoria Sq., Montreal.

NEWFOUNDLAND

Chairman, E. L. BAILLIE
Vice-Chair., G. H. DESBARATS
Executive, GRANT R. JACK, H. K. WALTER, E. H. BARTLETT, ERIC HINTON, G. W. CUMMINGS, W. L. STUEWE, J. B. ANGEL, H. S. WINDELER, E. L. BALL
(Ex-Officio), J. W. MORRIS
Sec.-Treas., JAMES M. HOPKINS, 107 Bonaventure Avenue, St. John's, Nfld.

NIAGARA PENINSULA

Chairman, C. CLIMO
Vice-Chair., I. S. PATTERSON
Executive, J. E. KENNEDY, E. GRUMMITT, C. A. O. DELL, P. A. PASQUET, G. A. BENNETT, W. NEALE, H. L. WEAVER
(Ex-Officio), A. G. ASPLIN, P. E. BUSS
Sec.-Treas., J. J. MILLER, Niagara, St. Catharines & Toronto Railway, St. Catharines, Ont.

OTTAWA

Chairman, B. G. BALLARD
Executive, G. R. DAVIS, J. J. GREEN, J. D. WHITTAKER, R. E. HAYES, J. S. WATT
(Ex-Officio), A. C. ROSS, A. A. SWINNERTON, K. GORDON, G. R. TURNER
Sec.-Treas., W. R. MEREDITH, 56 Sparks Street, Ottawa, Ont.

PETERBOROUGH

Chairman, A. J. BONNEY
Executive, C. B. MUIR, R. T. BOGLE, J. L. McKEEVER, D. A. DRYNAN, G. S. WADE
(Ex-Officio), J. M. KING, G. W. HERZOG, F. R. POPE
Sec.-Treas., J. P. WATTS, 1287 Hazeldean Ave., Peterborough, Ont.

QUEBEC

Life Hon. Chair. A. R. DECARY
Chairman, LUDGER GAGNON
Vice-Chair., JEAN ST-JACQUES
Executive, M. ARCHER, C. B. BATE, G. DEMERS, J. P. DROLET, L. R. TALBOT, G. E. SARAULT
(Ex-Officio), J. O. MARTINEAU, P. A. DUPUIS, PAUL VINCENT, C. H. BOISVERT
Sec.-Treas., ROGER DESJARDINS, Prov. Transport and Communication Board, Court House, Quebec.

SAGUENAY

Chairman J. F. BRAUN
Vice-Chair., F. G. BARKER
Executive, G. K. CLEMENT, B. L. DAVIS, L. W. GEAKE, E. W. McKERNAN, J. MERCIER, D. F. NASMITH
(Ex-Officio), W. F. CAMPBELL, H. V. PAGE, W. P. C. LeBOUTILLIER
Sec.-Treas. F. E. HOGG, 846, C-I, 7th Street, Arvida, Que.

SAINT JOHN

Chairman, W. R. GODFREY
Vice-Chair., JOHN REED
Executive, A. R. BONNELL, D. R. WEBB, A. G. WATT, C. G. CLARK
(Ex-Officio), E. O. TURNER, A. F. BAIRD, D. O. TURNBULL
Sec.-Treas., W. M. BRENAN, 42 Princess St., Saint John, N.B.

Secretary, L. C. SENTANCE, c/o Canadian Westinghouse Co. Ltd., Hamilton, Ont.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

E. S. Mattice, M.E.I.C., of Montreal, died on February 1, 1951.

Born in Cornwall, Ont., in 1870, he was educated at Upper Canada College and McGill University, from which he graduated as a bachelor of applied science in civil engineering in 1890. He went to the Dominion Bridge Company as a draughtsman, and held several positions with the company until 1921. He then went to the Phoenix Bridge & Iron Works, Ltd., Montreal, Que., as managing director. This company was purchased by Canadian Vickers Ltd. in 1923, and Mr. Mattice received the appointment as chief engineer of Canadian Vickers. From 1925 to 1929 he was manager and chief engineer of Steel Gates Company Limited, St. Catharines, Ont., being in charge of construction and erection of the steel gates of the Welland Ship Canal. In 1929 he was appointed vice-president and manager of the National Bridge Company of Canada in Montreal and in 1934 he went to the firm Farand and Delorme. Montreal, as vice-president and general manager.

Mr. Mattice was president of Structural Engineering Co. Ltd.; director of Raymond Construction Co. Ltd., and a director of the Eastern Canada Steel and Iron Works, Ltd.

He was later associated again with Dominion Bridge Company on sales and design work and with the Canadian Institute of Steel Construction. He retired in 1944 from active engineering work.

Mr. Mattice joined the Institute in 1887 as a Student, becoming an Associate Member in 1895, transferring to Member in 1902, and attaining Life Membership in 1932.

W. R. Chisholm, M.E.I.C., retired engineer, and life member of the Institute died June 18, 1950.

Mr. Chisholm was born at Antigonish, Nova Scotia in 1876. He graduated in arts from St. Francis Xavier University in 1896; and in science in 1902. He was for a time professor of mathematics at the University and was later professor of draughting. For a year afterwards he did mechanical work for the Dominion Coal Co., Glace Bay, Nova Scotia. He was then employed for some time by the Halifax and South Western Railway, then under construction. In 1906 he went to the National Transcontinental Railway as resident engineer at Hervey Junction, Que., later becoming division engineer over a section of the railroad. His work included the building of the Batiscon Bridge on that line. Mr. Chisholm's work for the railway was terminated because of failing eyesight.

Returning to South Side Harbour, Antigonish County, Nova Scotia, he purchased a farm and lived there until his death, taking part in movements calculated to advance the social and economic conditions of the district and county.

He joined the Institute as an Associate Member in 1907, transferring to Member in 1940.

Seth W. Crowell, M.E.I.C., civil engineer and land surveyor in private practice died suddenly in January, 1951.

Mr. Crowell was born in Yarmouth, N.S., in 1885. He graduated in arts from Dalhousie University in 1909, and in 1915 he qualified as a Nova Scotia Land Surveyor. Meanwhile he had worked with the Transcontinental Railway, as instrumentman, resident engineer and assistant engineer, transferring in 1912 to the Ottawa headquarters staff. In 1915 he was appointed town engineer for Yarmouth, N.S. He went into private practice in 1923 in Wolfville, N.S. In 1930 he was assistant engineer for the Canadian National Railways at Cape Tormentine, N.B. Later that year he was made assistant engineer of the Nova Scotia Highways Board at Sydney, N.S. He served the Department of Highways for many years at Amherst as resident engineer. He was field engineer for the Department of Transport at Port Mulgrave, Nova Scotia for a time. Mr. Crowell was in private practice in Amherst for several years before his death. He was the chief consultant there in regard to boundary matters.

He joined the Institute as a Junior in 1912 becoming Associate Member in 1918 and transferring to Member in 1940.

C. C. Whittier, M.E.I.C., who retired from Whittier Laboratories, Chicago, Ill., U.S.A., died in December, 1950.

Mr. Whittier was born at Cornville, Maine, in 1876. He graduated from the University of Maine in 1899 with a degree in civil engineering. After graduation he was associated with railway work in Maine and in Mexico. He then joined the Robert W. Hunt engineering organization, working in Chicago and New York. He was general manager of Robert W. Hunt & Co. Limited, in Montreal in 1913. Mr. Whittier became president of Standard Chemical and Mineral Corporation in Chicago, Illinois. He was later associated with Nutrition Research Laboratories, in that city, and with Whittier Laboratories there. He had retired from Whittier Laboratories about 1946.

Mr. Whittier joined the Institute in 1915 as a Member, attaining life membership in 1947.

David B. Carswell, M.E.I.C., of Montreal, a consultant for the shipbuilding industry across Canada for many years died on February 28, 1951.

Prior to his illness last December, Mr. Carswell had been supervising the construction of the large ore-carrier programme at Welland, Ont.

Born in Scotland in 1884, he attended the Paisley & Glasgow Technical Colleges and the Manchester Technical College, graduating in 1912. While in Scotland he served an apprenticeship as mechanical engineer and draughtsman and a marine engineer. He was works manager in Manchester, England for the firm of Sir Henry Simons in 1909 to 1913.

During the first World War he was assistant general superintendent for the Detroit Shipbuilding Co.; and in 1919-1921 he was assistant general manager of McDougall Duluth Shipbuilding Co., Duluth. He came to Canada to work for the Canadian National Steamships, as superintendent. In 1927 he was appointed general manager of the Montreal Dry Docks. He was managing director for Canadian Vickers from 1929 to 1933. That year he associated himself with the Dominion government as marine superintendent. At the outbreak of World War II he was made director general of shipbuilding. He was appointed controller on ship repairs and salvage in 1941 to 1945, serving also in his capacity of director general of shipbuilding in 1944 and 1945. He was made president of the Wartime Shipbuilding Company in 1945. He went into private practice as marine consultant in 1946. In recognition of his work, Mr. Carswell was decorated in 1943 as an Officer of the Order of the British Empire, and at the end of the war was made a Fellow of the Society of Consulting Marine Engineers and Ship Surveyors of London, England.

He joined the Institute as a Member in 1946.

C. A. G. Snelling, JR.E.I.C., of Windsor, Ontario, died accidentally December 30, 1950.

Mr. Snelling was born in Quetta, India, in 1922. He studied at Wellington College, Essex, England, and at The Hill School at Pottstown, Pa. He received B.A.Sc. degree in civil engineering from University of Toronto in 1949. He served with the R.C.A.F. for four years and received the British Empire Medal for bravery.

Joining the Institute in 1949 as a Student he transferred to Junior this year.

News of the Branches

Activities of the Thirty-three Branches of the Institute and abstracts of papers presented at their meetings

Belleville

S. Sillitoe, m.e.i.c.
Secretary-Treasurer

The fourth meeting of the Belleville Branch of the Engineering Institute of Canada was held March 12th at the Kiwanis Centre with fifty members present. Mr. F. F. Fulton, in the chair, called upon Mr. F. Adsett to describe the proceedings at the annual meeting of the Peterborough Branch at which he represented Belleville. Following Mr. Adsett's interesting description of the Peterborough treatment of the birth of the Belleville Chapter, Mr. Fulton called upon Mr. A. L. Killaly to introduce the speaker of the evening, Mr. J. G. G. Kerry, m.e.i.c.

The subject of Mr. Kerry's talk was **Ice on the St. Lawrence Seaway** and was illustrated by lantern slides.

Mr. Kerry took his audience on a trip up the St. Lawrence, beginning at the Gulf and ending at Lake Ontario, describing in some detail the important physical features of the St. Lawrence system, with particular reference to ice formation, water temperature, and salinity. The importance of the St. Lawrence seaway to Canadian economy was emphasized throughout the talk by reference to the development of the Labrador Iron Mines and the general principle that those places which make most rapid and permanent development are those which are served the cheapest form of transportation — by steamer. An interesting aspect of the problem to an engineering society is the fact that once the Government of the country is in a position to decide that the economics of the situation justify enormous expenditures necessary for its development, the establishment of a year round ship channel is in Mr. Kerry's judgment only an engineering problem capable of satisfactory solution. In order to determine the methods by which a solution can be achieved, Mr. Kerry described the process whereby ice was formed on the river and in the gulf and dwelt upon the sources of the currents which carry the ice into the ship channel during the winter months of the year.

Mr. Kerry explained that the St. Lawrence Gulf and Estuary have an extremely deep channel extending from the Cabot Straits up to the mouth of the Saguenay River and thence up that river. In this channel and in the whole Gulf of St. Lawrence, there are most interesting currents which carry the ice into the shipping lanes. The general sources of ice in the ship channel are icebergs which are carried into the straits from the Grand Banks region by the Laurentian current, as well as smaller bergs which come through the Straits of Belle Isle brought down by the Labrador current and vast amounts of river ice in the spring of the year brought down by the Gaspe current from the upper reaches of the river.

The engineering solution to the ice conditions in the Gulf involve the erection of a barrage or rock fill across the Straits of Belle Isle which are relatively shallow. The river ice which is troublesome, particularly below the Island of Orleans just below Quebec, would be taken care of by a diversion dam between the Island of Orleans and the southern shore at the eastern end and a number of diversion dams located at the lower end of the Island and at the Ile aux Coudres which would result in the provision of a ship channel down which the main river current would flow. The resulting dead water except in the main channel would develop a solid ice pack during the winter months which would not get into the ship lane. The ice which is brought into the gulf and estuary by the Laurentian current is mainly in the form of icebergs which are easily located by the Government Navigation Services who give adequate protection to all ships that follow their instructions.

The remainder of the problem is an interesting study of the relationship of water temperature and salinity at various parts of the year. More information is required on this phase of the problem, particularly in the winter time. The formation of a thin sheet of ice which is often broken by the tides is no serious problem but an interesting factor in the improvement of navigation in the St. Lawrence seaway on a year round basis is that by correct design of the channel in the upper reaches of the river, the current might be increased to a rate of an average three miles per hour which would result in the temperature of the water brought down from Lake Ontario being maintained high enough throughout the full course of the river in the ship channel so that the formation of ice would not be a serious problem even in the winter months. Navigation would then be possible throughout the year and very low cost transportation would inevitably result.

It was agreed that the possibilities of such a plan really stimulate the imagination of all who are interested in the building of Canada and it was pointed out that the provision of a seaway would enable ships to ply their way into Lake Ontario which remains free of ice throughout the year. The sheet ice which forms in harbours at Kingston and Toronto would in reality present no problem which could not be surmounted by the use of ice breakers.

Mr. O. H. Scott in moving a vote of thanks to the speaker recounted the association of Mr. Kerry with the early power developments in the area surrounding Belleville and reminisced on his association with Mr. Kerry when he was a professor at McGill University and later as a member of the firm of consulting engineers — Kerry and Chase of Port Hope, which had been responsible for the development of many engineering works along the Trent and St. Lawrence system. Those in attendance confirmed the appreciation of Mr. Kerry's talk with a hearty applause.

Cornwall

John A. Sarjeant, jr.e.i.c.
Secretary-Treasurer

A. A. B. McMath, m.e.i.c.
Branch News Editor

February 26 was "local night" for the Cornwall Branch. Twenty-one members met in the King George Hotel and heard three branch members give papers on the work with which they are connected.

G. B. Stidwill, assistant to the division manager of Howard Smith Paper

Mills Limited, described his company's \$7,500,000 expansion programme which started in 1947. It should be completed in 1952. To illustrate the magnitude of this mill's operations, Mr. Stidwill pointed out that it now uses 35 million gallons of water per day, or seven times as much as the whole city uses in hot weather. When a new boiler plant is completed, the mill's total coal consumption will be the equivalent of the fuel required to heat all the homes in Cornwall.

E. G. Myers, shift operator at the City pumphouse, outlined some of the problems encountered there. Normally the canal provides a 30-foot head for two water wheels which are the main source of power for driving the pumps. However, ice can block the intake to these wheels, so that steam driven pumps have to be pressed into service. City water consumption rises to 5½ million gallons per day in midsummer. A new filtration plant has been proposed, to which water would flow by gravity if the seaway project goes through. In the meantime, the water would be pumped.

A. S. Holder, works engineer at the Cornwall C.I.L. plant, gave a report on his visit to the second annual Plant Maintenance Conference and Show, held at Cleveland, in January. Mr. Holder described how proper lubrication can cut costs. He also told how colour can be used to reduce eye strain, and to indicate danger or safety areas. A brief description of various gadgets that have been invented to meet different problems, completed this paper.

The speakers were introduced by P. H. Nasmyth, and were thanked by Chairman, H. W. Nickerson.

❖ ❖ ❖

Misfortune appears to have blocked attempts to plan for the annual visit of the President this year. In January his illness, and his heavy schedule for February set back the event, until March 15th appeared to be all clear. Then on that day, word came that he was held up by a train wreck. However the branch had to proceed with their dinner and dance at the Cornwallis Hotel. Welcome guests were J. B. Stirling, vice-president elect of the Quebec zone, and W. D. Laird, assistant general secretary. These gentlemen and their wives helped to swell the attendance to 77, including wives and friends of the branch members. This was the Branch's fourth annual presidential dinner meeting.

Mr. Stirling and Mr. Laird, with very little advance notice, proved to be most entertaining speakers, and were much appreciated by their audience. Mr. Stirling referred to the decreasing number of engineers now graduating, and pointed out that an effort should be made to interest more high school pupils in the profession. Unless this is done, the increasing number of job openings will lead to a serious shortage of engineers within three or four years. He also referred to the Institute's efforts to have Tariff Item 180E imposed again. This tariff would protect Canadian engineers from a flood of American plans and specifications which can now come in.

Mr. Laird carried the discussion on this latter project farther and described a register of Canadian consulting engineers, which has been compiled by the Institute. This register is now available.

At the Cornwall Branch Dance

Left to right, Mrs. J. B. Stirling; R. H. Wallace, past chairman of the branch; Mrs. W. D. Laird; J. B. Stirling, vice-president elect of Quebec Zone; H. W. Nickerson; Mrs. Nickerson; Mrs. Donald Ross-Ross.

Clockwise around the table from left, Mrs. Vernon MacDonald, Mr. MacDonald, Tom Webster, Miss E. O'Neil, Mrs. Allan Toole, Mr. Toole, Miss B. Palmer, Roy Zurbrigg.

Left to right, Fred Winterburn, Mrs. Winterburn, D. Ross-Ross, Mrs. F. R. Warner, Mrs. Ross-Ross, Mrs. G. B. Stidwill, F. R. Warner, Mrs. C. I. Bacon, G. B. Stidwill (standing) and C. I. Bacon.

He also referred to the size of *The Engineering Journal,* which is now a bigger business than the Institute itself.

R. H. Wallace, past-chairman of the branch, thanked the speakers. Chairman H. W. Nickerson presided. During the dinner, young Edward Fagan sang two solos. His father, William Fagan, led community singing. During the after-dinner intermission, this reporter learned that Mr. Stirling is an accomplished musician on different instruments, on top of his busy engineering career with the E. G. M. Cape Co.

Most of the guests remained to enjoy the dance which followed, with Bob Eadie's group providing the music. W. D. Laird made several passes with his camera, leaving his victims wondering how they looked. Dancing continued until midnight.

Halifax

W. E. Jefferson, M.E.I.C.
Secretary-Treasurer

M. F. Dean, M.E.I.C.
Branch News, Editor

On January 30, the joint annual dinner of the Halifax Branch of the Institute and the Association of Professional Engineers of Nova Scotia was held at the Lord Nelson Hotel, and was attended by 300 members and guests of both organizations. Air Vice-Marshal C. R. Slemon spoke to the meeting on **Your R.C.A.F.** after the dinner. The annual dinner is a function looked forward to by many engineers of the area, and the committee this year produced an evening as enjoyable as any of the past. W. A. Devereaux was the committee chairman.

❖ ❖ ❖

On February 21 the Branch members were privileged to hear Mr. Marvin W. Maxwell, chief of development, Department of Research and Development, Canadian National Railways. Mr. Maxwell's talk suggested a need for more emphasis in schools on the natural facilities and resources of Canada, which if applied should result in less movement of Canada's young people to "greener fields." Engineers and their associations could do invaluable work in pointing out Canada's assets to youths, and in promoting their interests at home.

This February Meeting took a new form as an experiment. A light lunch was served at 5.30 p.m., before the lecture. The meeting was adjourned at 7.45, allowing Members to attend without conflict with later engagements. It is hoped that the result will be wider attendance at the monthly meetings.

Of general interest is the fact that three Branch members have been selected to serve on the Halifax Civil Defence Control Committee: Dr. Ira P. MacNab, W. W. Downie, and H. W. L. Doane. N. T. Smith is a member of the Planning Committee of the same organization.

Dr. Ira P. MacNab will receive another recognition for his untiring efforts. The American Water Works Association announced recently that Dr. MacNab will receive the George Warren Fuller Memorial Award for distinguished service in the water supply field. Dr. MacNab, manager of the Public Service Commission of Halifax, is also the president-elect of the Engineering Institute.

Hamilton

Geo. L. Schneider, M.E.I.C.
Secretary-Treasurer

Bernard A. Warren, S.E.I.C.
Branch News Editor

"Man is a heat engine requiring fuel, but he defies all the laws of efficiency," Dean K. F. Tupper, O.B.E., told the Hamilton Branch of the E.I.C. at the regular monthly meeting Feb. 15.

Dean Tupper, of the faculty of applied science and engineering at the University of Toronto was introduced by a former classmate from S.P.S., C. C. Parker, prominent local structural consultant.

Dean Tupper prefaced his remarks by describing the typical breakfast of a surveyor working in the mountains—fruit course, hot cereal, 6 strips of bacon, 2 eggs, fried potatoes, pancakes, coffee, toast and marmalade, and apple or blueberry pie.

Man in converting this fuel into energy, is said to attain efficiencies of 35 per cent—close to that of the ideal thermal cycle—and an unusual characteristic is that he will work when the atmospheric temperature is greater than his own. Man's standby loss, using Joule's Equivalent, is 400 B.t.u.'s per hour. Walking, he uses 800 B.t.u.s per hour, sawing wood (not sleeping) 1900 B.t.u.'s per hour and walking upstairs, 4400 B.t.u.'s per hour.

By means of these and comparable figures, the extent of the proposed morning's activities should determine the breakfast menu.

A man can generate one fifth hp for one hour. A man can walk thirty miles a day and be able to repeat the performance the following day. On a bicycle, he might do 90 miles per day.

Man can easily get rid of waste heat in cold weather in the process of converting fuel into work. In temperatures of 98 degrees he can dissipate heat by perspiring; but with humidity hovering near 100 per cent, if he continues to work, he will pass out.

Man has developed Thermal Power over some 200 years. He has increased efficiencies from ½ per cent in the Newcomen Engine to 35-40 per cent in the engines of today. Man's body temperature of 37 deg. C. or 98.6 deg. F. is retained by the most efficient thermostat—much more efficient than that in a large house whose northern rooms are cold while the room containing the thermostat is just right. We help the body to retain its temperature by desiring comfort.

Man's desire to be comfortable has over-ridden his concern about the cost. Over one half of the fuel burned to-day is used to heat our buildings. When we consider that the U.S. steel production is one hundred million tons per year, requiring an average of one ton of coal per ton (and this is coming close to one ton per capita), the fuel used to heat buildings must also be in astronomical figures. The nation's economic graph is tied very closely to the fuel consumption graph.

Where can we get our fuel when coal supplies run out? or when oil supplies become depleted?

Dean Tupper then turned to nuclear physics a field in which he is well qualified.

From the formula $E = MC^2$, where E is in ergs, M is the mass of matter destroyed, and C a constant in the order of the speed of light; one pound weight of matter destroyed to produce energy could raise a half mile cube of rock three miles vertically.

"All very well," said the Dean. "But how do we destroy this matter?"

The first eight elements constitute 98 per cent of the earth's crust. No energy can be gained from these stable elements as far as we now know. Uranium constitutes about .008 per cent of the earth's crust, but the necessarily unstable Uranium 235 is available only as one part in 139 of regular Uranium. To equal the power output of Queenston's 9×10^{15} foot pounds per yard, ¾ of a pound of Uranium must be totally destroyed. Actually, only 1 per cent can be annihilated.

Thus we must supply now 300 pounds and at an expected efficiency of 10 per cent for power output, 3000 pounds of Uranium 235 will be required. Since there exists only one part Uranium 235 in 139 parts of common uranium, 210 tons of common Uranium must be supplied. At the present rate of refining this ore, power production by this method is impractical.

Where do we then turn?

Casting aside the 2×10^{29} foot pounds of work done daily by the tides as being impractical to harness, Dean Tupper suggested the sun's radiation as the last currently known real hope.

Physicists tell us that by fusion of hydrogen into helium, the temperature of the centre of the sun is in the order of 31,000,000 degrees F. and, at its present rate of radiation, in 10^9 years it will have dissipated only 1 per cent of its mass. The daily heat flow from the sun intercepted by one square mile of earth's surface is equivalent to 5,000,000 hp., with each square foot getting 500 B.t.u.'s per hour. For example, with 50,000,000 people in Java whose area is only 50,000 square miles, one tenth of 1 per cent of the solar energy per square mile is presented to each resident, or 5,000 hp. per native per day.

Man can do little by himself; with fuel he can do miracles. Because we must dig coal, we shall probably run out of oil reserves faster, but with the present rapid exploitation of fuel, reserves are being rapidly depleted. This age will probably be termed the 'Hydrocarbon age'; and next we shall look to the physicist to save us from extinction.

Offering hope to all present, Dean Tupper concluded with the consoling thought that when earthly days are done we may find perfection where no one need worry about weather conditions—or elsewhere—a plenteous supply of heat is assured.

After a round of questions, Mr. W. L. Hutchison thanked the speaker and led the large group in attendance to donuts and coffee.

Kingston

J. T. Provan, Jr.E.I.C.
Secretary-Treasurer

S. H. Rochester, M.E.I.C.
Assistant Secretary

The Kingston Branch E.I.C. and the Engineering Society of Queen's University attended a joint meeting on February 27th, 1951, in the old Arts Building, Queen's University. This was the occasion for the annual presentation of "Student Papers Night" conducted by Queen's Engineering students. Awards for the prize-winning papers were divided into two groups, Class I competing for three prizes donated by the Engineering Institute of Canada valued at $25, $15, and $10, and Class II competing for two prizes donated by the Ontario General Contractors Association valued at $30 and $20. Class II competition is open only to civil engineering students.

Mr. Arthur Lee of Queen's Engineering Society presided over the meeting, at which local industry, R.M.C., and Queen's University were well represented. Mr. Lee announced the nomination of Judges Dr. R. D. Bennett, Professor Hugh Conn and Major A. L. MacLean.

Competing in Class I were the following speakers in order of merit as ruled by the judges: *First prize*—$25 went to E. Candy for his paper on **Mechanical Octanes**; *second prize*—$15, to D. K. Venus, who spoke on **Hard Chrome Plating**; and *third prize*—$10, to A. H. Ruddell for a paper on **Some Problems in Ventilating a Passenger Vessel.**

In Class II the prizes were awarded as follows: *First prize*—$30, to N. W. Martola speaking on the **Maggot River Culvert**; *second prize*—$20, to J. H. Bleany for his paper on **Pile-driving in Permafrost.**

These papers were all well presented, dealing with a wide range of technical subjects and much interest was shown by members present. The meeting adjourned to the Players Lounge for luncheon, where prizes were presented by Major A. L. MacLean on behalf of the Engineering Institute of Canada, and by Mr. Charles Smith on behalf of the Ontario General Contractors Association, who expressed the belief that next year's Class II awards would be increased to a total of $75.

Kitchener

J. F. Runge, Jr.E.I.C.
Secretary-Treasurer

A. H. Todd
Branch News Editor

The February meeting of the Kitchener Branch was honoured by a visit from President James A. Vance. The meeting was held at the Officers' Mess of the Royal Canadian Engineers and was presided over by the new chairman, A. C. Macnab of Hespeler. Mr. Vance was introduced by Councillor Frank Midgley of Galt. Mr. Vance made some observations about his recent trip across Canada in the interests of Canadian engineers. From Newfoundland to British Columbia he has found the demand for engineers still very great, and he regrets to see enrolment in Universities falling off.

Industries such as pulp and paper, mining and petroleum industry, which are fundamental to the Canadian economy, are employing engineers at an ever increasing rate. Consolidated Mining & Smelting at Trail, B.C., in the middle of the Rockies is employing 300 engineers in every phase of the business.

Oil developments in Alberta have been a boom to Canada. So greatly has production increased, the present 1000-mile pipe line cannot handle the output of the wells and a second line is under consideration. Pumping at all wells has been curtailed until this transportation problem is solved. Canada's oil production is soon expected to equal the country's consumption.

There is a surplus of natural gas from the oil fields which could be piped to the United States and sold there. However, it is felt that expanding industry and population in the west may soon need all oil available.

Mr. Vance also mentioned water conservation programmes and power developments and the important part they will play in Canada's future development.

Niagara Peninsula

J. J. Miller, M.E.I.C.
Secretary-Treasurer

Geoffrey W. Ince, Jr.E.I.C.
Branch News Editor

At a very well attended dinner meeting at St. Catharines, February 15, the branch was joined by members of the Canadian Comstock Engineers' Association and the Niagara International Section of the A.I.E.E. The large audience heard one of the best papers presented before the branch for some time. The speaker was Dr. Otto Holden, assistant general manager of engineering, of the H.E.P.C. of Ontario, and his subject was **Ottawa and Niagara River Power Developments.**

Dr. Holden started with a brief review of treaties between Canada and the U.S. over the Niagara River. The old treaty of 1910, states the amount of water that may be diverted for power generation, while the one ratified last October stipulates the minimum quantity that must go over Niagara Falls. This is to be 100,000 c.f.s. by day, 50,000 c.f.s. at night from April to November, and 50,000 during the winter months. The daily flow of 100,000 c.f.s. is considered sufficient water to produce the green appearance that contributes to the beauty of the Falls.

Remedial works will be carried out by the International Joint Commission to preserve the natural beauty of the Falls. Work will have to be carried out on the Canadian or Horseshoe Falls to prevent the rapid erosion of the centre, about 5 ft. per year, and to spread the flow evenly over the whole horseshoe.

The H.E.P.C. is considering directly utilizing the extra flow of water available at night during the summer, rather than ponding it for use during the day. To do this, it plans to pond water on the Ottawa River at night, as ponding facilities are presently available there, and transfer Niagara power to take the load dropped by the Ottawa River generating stations.

By using slides, Dr. Holden pointed out the route and construction of the new waterway to feed the new plant at Queenston. It will have a capacity of 20,000 c.f.s., and will consist of a 5½-mile tunnel and a 3-mile canal, entering the existing headwaters of the Queenston plants. The tunnel will be concrete lined, 45 ft. in diameter, and will require about a 50 ft. diameter excavation of some 2 million cubic yards of rock. Its roof will be supported with a steel framework using about 15,000-18,000 tons of steel. It will be the largest diameter tunnel in the world.

The new generating station will have an initial installation of 6 generators of 105,000 hp. each, and provision for a further 6 units. Utmost consideration was given to the generator design to ensure maximum efficiency, as the water driving them is a rather valuable commodity, since it has travelled some 8½ miles in a costly waterway since leaving the river. The first unit is scheduled to go into operation in June 1954.

Ottawa

W. R. Meredith, M.E.I.C.
Secretary-Treasurer

A. J. Bernard, M.E.I.C.
Branch News Editor

Shipbuilding in Canada was the subject of a talk to Ottawa members at a luncheon meeting on October 26, 1950. Mr. Richard Lowery, naval architect with Canadian Vickers Limited, was the speaker.

Mr. Lowery briefly outlined the history of shipbuilding in Canada. Wooden-ship days found Canada one of the leaders. Ships can still be produced in Canada in fewer man-hours, but labour costs make it difficult to compete with nations having lower wage-rates. We depend largely on the export trade for our work. Recent devaluations of the pound and the heavy demand for U.S. dollars have hit the shipbuilding industry.

Defence requirements are now helping the industry somewhat, but Mr. Lowery expressed the opinion that only the formation of a large overseas merchant marine would permanently benefit the industry. The lack of facilities for manufacture of ship's equipment in Canada has been a handicap sometimes.

Mr. Keith Gordon, vice-chairman of the Junior Section, thanked Mr. Lowery.

❖ ❖ ❖

Robert F. Legget, director of the division of building research, National Research Council, addressed Ottawa members on November 7, 1950.

Mr. Legget explained the functions and aims of Building Research in Canada, where considerable effort is being given to the co-ordination of such research. Various government departments have carried out studies on materials and construction methods, which studies will be co-ordinated. Liaison with research in other countries will be kept. No study will be made on problems which do not effect building in Canada and on which research can better be carried out in other countries.

Two major factors govern building in Canada, geology and climate. In view of this the lines of research in Canada should be concerned with: Building in the North of Canada, fire research, snow and ice research, soil mechanics and foundation research, and the whole question of the enclosure of buildings to guard against the Canadian climate.

In addition to building research, necessary service work for the National Building Code of Canada and for the Canadian Government Specification Board is carried out by the Division.

The speaker gave brief details of the various studies being made across Canada on existing structures and on experimental building.

Mr. J. H. Irvine thanked the speaker.

❖ ❖ ❖

"A bright future for young Engineers in Canada" was the keynote of a talk given to Ottawa Engineers and their wives by James A. Vance, president of the Engineering Institute of Canada, at a luncheon meeting on November 23, 1950.

The development of a broad engineering knowledge, while not ruling out certain specialization, seems to be a requirement of the modern engineer. Mr. Vance heartily agreed with this trend.

The president indicated that particularly in these critical times the Engineering Institute should show greater interest in the Military Engineers. He personally complimented Maj.-Gen. G. R. Turner, a member of the Ottawa Branch, on his recent election as president of the Military Engineering Association of Canada.

Provincialism has no place in Canadian engineering. The speaker advocated closer relationship between various Canadian engineering groups.

Mr. Vance stated that very cordial relations exist with British and United States engineering groups and that the groundwork was complete for closer ties with other Western Hemisphere groups.

The Ottawa Chairman, Mr. Allan C. Ross, introduced Mr. Vance and Mrs. Vance to the meeting. Lt.-Col. M. C. S. Brown, chairman of the proceedings committee, thanked the speaker.

❖ ❖ ❖

Ottawa members were fortunate to hear, at the luncheon meeting of December 7, 1950, an address by the Minister of Resources and Development, Hon. R. H. Winters.

Whether the "Cow Herd" or not the members did hear from Mr. Winters of the bountiful resources of our country and the opportunity it offers to engineers.

Various phases of Canada's development, hydro, mining, highways and research were touched on by the speaker. The National Research Council were particularly complimented on their work during World War II.

The speaker was introduced by Brigadier J. W. Bishop, Vice Adjutant General, Canadian Army. Mr. Harold McLeod, chairman of the Ottawa Branch of the Canadian Institute of Mining and Metallurgy, thanked Mr. Winters.

❖ ❖ ❖

The annual meeting and election of officers of the Ottawa Branch was held at the Chateau Laurier on the evening of January 11, 1951. Officers elected were as follows: chairman, B. G. Ballard; secretary-treasurer, W. R. Meredith; management committee, R. E. Hayes, John S. Watt and J. D. Whittaker.

Reports on finances by the treasurer and various reports by heads of committees were presented. The financial report indicated a very active year for the Branch.

The retiring chairman, Mr. A. C. Ross, personally and on behalf of the Branch, thanked Lt.-Col. M. C. S. Brown (in absentia) for his very energetic work during the past year as chairman of the proceedings committee. (Lt.-Col. Brown has left the Branch for a period of staff studies in England.)

Votes of thanks were tendered to various groups and to the local newspapers for their splendid coverage of Branch activities.

Mr. Drummond Giles, zone vice-president, addressed the members. His remarks gave approval of Branch activities and of the splendid attendance record of members.

Mr. Giles further directed his remarks to the young engineer. He quoted as follows from a message by Sir W. A. Stanier, prominent British engineer, "In my opinion there is an ever increasing need for well trained engineers. We regard the training as incomplete if it does not include at least two years as

The executive of the Ottawa Branch. Seated, A. C. Ross, past chairman; B. G. Ballard, chairman; W. R. Meredith, secretary. Standing, Major J. D. Whittaker, chairman of proceedings committee; J. S. Watt; A. A. Swinnerton; R. E. Hayes, and G. R. Davis, chairman of the membership committee.

an apprentice in the workshop. As in any other profession there are times when one passes through a period of drudgery, but I have found that where there is real interest there is no drudgery and I commend that thought to your engineers".

Two interesting films, one on municipal traffic problems, the other on the conservation of natural streams, lakes, etc. were shown.

The new chairman, Mr. Ballard, voiced his appreciation to members for his appointment and expressed a desire to keep up the good work done by the retiring Branch officers.

The meeting was climaxed by an excellent buffet luncheon and suitable refreshments.

❖ ❖ ❖

On February 8, 1951, Mr. Kenneth S. Harris, director of the Steel Division, Department of Trade and Commerce, addressed a luncheon meeting.

Mr. Harris outlined briefly plans to control steel allocation and production to best meet requirements during the present emergency. This problem not only includes Canadian requirements but also Canada's contribution to the Atlantic Pact and other agreements.

Defence needs are of course to receive first priority but other projects already under way would receive fair consideration.

Mr. Allan C. Ross, acting chairman, in the absence of Mr. Ballard, introduced the speaker. Mr. R. E. Hayes thanked Mr. Harris.

❖ ❖ ❖

Mrs. C. S. Parsons and other energetic members of the engineers' wives organization really went all out in staging the engineers' wives dance at Lansdowne Park, Ottawa. The occasion was made successful by the graciousness and hospitality of all wives and in particular by the committee in charge. Such a "do" required work by all the ladies but particular mention might be made of: president, Mrs. C. S. Parsons; vice-president, Mrs. Alec Ignatief; social convener, Mrs. D. B. Rees; ticket convener, Mrs. J. F. Lyons. Other officers of the ladies' group are Mrs. T. L. Hughson, Mrs. R. R. Rogers, Mrs. G. H. Desbarats, Mrs. L. J. Lichty, Mrs. G. E. Smith, Mrs. P. Bresset-des-Nos, and Mrs. L. M. Christmas, past president.

There is complete agreement with appreciation to Mrs. K. M. Cameron who founded this up and coming organization.

Saguenay

F. E. Hogg, M.E.I.C.
Secretary-Treasurer

A meeting of the Saguenay Branch was held on February 21st at the Aluminium Laboratories' auditorium. Mr. L. E. Marion gave a talk on a-c/d-c conversion. The speaker was introduced by Mr. F. G. Barker, M.E.I.C., vice-chairman and an audience of 30 enjoyed the address.

Mr. Marion related that he had that afternoon watched a meter which showed over 1,200,000 horsepower entering a consumer's plant. He mentioned that Arvida Works was probably the only place in the world where this could be seen, and remarked on the fact that most of the alternating current was being converted to direct current for aluminum production. About 20 per cent of all power produced in Canada is converted to d-c. Other uses, besides aluminum production, are refining of copper and lead, production of zinc, operation of trolleys and cranes and continuous rolling mill drives, electroplating and anodizing. The mercury arc rectifier is the most important method of changing from a-c to d-c although motor generator sets, synchronous converters and copper oxide and selenium rectifiers were also described.

Three members were elected by the meeting to the Nominating Committee and will arrange the election of Branch officers for the next year. They are: B. E. Bauman, M.E.I.C., J. Mercier, M.E.I.C., W. Fraser, M.E.I.C.

Junior Section

R. H. Singleton, M.E.I.C.
Secretary-Treasurer

A very successful smoker was held by the Junior Section of the Saguenay Branch in the Saguenay Inn, Tuesday evening, February 27. Messrs. T. A. Wootton and C.R. Fox presented individual talks describing their experiences while held captive by the Germans during the recent World War. Mr. Wootton was captured while serving as an Army officer in Sicily in 1944 and described his capture and the slow and intermittent trip to Germany as a captive. Mr. Fox was shot and captured in a flight over occupied Europe in 1942 while serving as an Air Force officer. His talk dealt in more detail with P.O.W. camp life.

The excellent style of both speakers combined with the seemingly unlimited volume of subject material, assured the success of the meeting and the keen interest of the members was reflected in the lengthy question period. The refreshments were enjoyed in the usual fashion.

The speakers were introduced by the chairman, Mr. H. V. Page and Mr. W. F. Patterson, expressed the thanks of the audience.

Saint John

W. M. Brenan, M.E.I.C.
Secretary-Treasurer

J. Arthur Flood, M.E.I.C.
Branch News Editor

Members and guests of the Saint John Branch gathered at a dinner meeting at the N.B. Scottish Officers Mess on February 22, to hear Dr. P. L. Pratley, M.E.I.C., consulting engineer, give an illustrated lecture on the theories and ideas embodied in his design of the piers for the proposed Canso Bridge to span from Cape Breton county to the mainland of Nova Scotia.

Dr. Pratley was introduced by the branch chairman, W. R. Godfrey, who gave a brief history of the speaker's career as a designing engineer and cited a few of the many now famous structures of Dr. Pratley's design.

Dr. Pratley, presently making a tour of Maritime Branches, cited several instances where his design of piers for the Canso project has been publicly questioned by the press and quoted remarks made by absolutely unqualified and biased sources generally called "reliable" but "undisclosed". In his remarks the speaker illustrated how ridiculous some of these statements were, but in their influence on public opinion created a "psychology of fear" among responsible parties who were ignorant of the facts. This same fear, difficult to dispell could involve a design far in excess of that demanded by the elements.

"A design such as this," Dr. Pratley stated, "is an assembling of experience." Every part of the construction, has been done before in some part of the world. It remains for the designer to gather the knowledge and experience of others and assemble it to his own advantage".

The main problems encountered in designing the Canso project were: navigation, ice, scour, and deep water.

In designing for navigation the ideas of shipping companies and Royal Canadian Naval authorities were incorporated in locating the best position for the lift span.

Ice, although sometimes a most important consideration is not in this case too serious a condition. Icebergs, as such, Dr. Pratley stated, do not appear in the Strait of Canso, despite reports to the contrary. The piers presently designed will withstand a force of some 365,000 tons of ice — a field 3,000 feet square, 12 feet thick moving at a rate of 12 feet per second.

In addition to the moment that the piers are capable of resisting, their design is such that they will cut any ordinary ice field encountered.

The element of scour does not enter the picture to any extent in this location. Test borings of the Strait bottom indicate a conglomerate rock beneath a gravel surface, the rate of water flow is small and the water carries very little, if any, sand or silt, a combination far from conducive to scouring. In any case, the danger of scour is overcome by limiting the relationship between width and spacing of piers.

The deep water problem is the most important factor of design and involved the greatest amount of engineering skill in the design of the piers. With the aid of slides, Dr. Pratley illustrated his proposed design of the cage structure and his methods of pouring concrete in the deep water. He said that the use of intrusion pre-packed concrete was the greatest single factor in solving the problem of concrete placement.

After a short question period, Mr. John Reid tendered his sincere thanks to the speaker on behalf of the branch for a very informative and most enjoyable evening.

Sudbury

D. W. McKinty, Jr.E.I.C.
Secretary-Treasurer

The Sudbury branch joined with the Association of Professional Engineers at the dinner meeting February 9th. There were 102 in attendance.

A short sing-song was held after dinner with Russ Eaton leading a most spirited effort by the members.

The guest speaker for the evening, Col. Tom Medland, was introduced by the Chairman C. O. Maddock.

Col. Medland gave a most enlightening talk on the functions of the Association of Professional Engineers. He discussed the highlights of the past year, dwelling to some lengths on the public relations programme which is now in full swing.

In speaking of the new headquarters building in Toronto, Col. Medland mentioned how it was the hope of the association that all engineering groups would keep their records there. He pointed out that the field secretary of the Institute already has an office in the building.

In conclusion, Col. Medland spoke most optimistically of the demand for engineers in Canada during the next few years. Col. Medland was thanked by Mr. Gill on behalf of the group.

A discussion period followed the talk and the questions asked indicated the interest of the group in the various laws governing the engineering profession.

Victoria

W. A. Bowman, Jr.E.I.C.
Secretary-Treasurer

G. J. A. Kidd, S.E.I.C.
Branch News Editor

The proposed power project and aluminum smelting plant being planned by the Aluminum Co. of Canada in British Columbia will cost about $550,000,000 and will see the birth of a city of 50,000 at the Kitimat Bay site.

This was predicted February 16 by John S. Kendrick, resident engineer for the company, in an address to Victoria Branch.

Mr. Kendrick's talk, entitled **Search for Power,** outlined the preliminary survey work already done in the Kitimat Valley area and along the proposed route of an 85-mile transmission line from the power plant to the smelter.

Analysis of costs showed that the power project would cost $200,000,000 and the smelter plant at Kitimat, $350,000,000.

It is not definite, Mr. Kendrick told the engineers, "but we know now what we want and how much it will cost."

The company's plant at Arvida, Ont., is now the world's largest and the proposed plant will be very much larger, he said.

If the project gets under way, it will take three years to begin production. The power source will provide 800,000 horsepower, and within five years this will be stepped up to 1,600,000 horsepower.

The smelter will turn out about 500,000 metric tons of aluminum ingots per year, as compared with the present Arvida output of 230,000 metric tons.

Mr. Kendrick outlined the discovery and development of aluminum.

Although the metal is the most plentiful ore on the earth crust and the third most plentiful element, it is very difficult to isolate. In 1880, 30 years after its discovery, Louis Napoleon served dinner on aluminum dishes. Only the head table got the aluminum, said Mr. Kendrick. "The ordinary guests had to be content with solid gold."

Reason for the development of tremendous quantities of electric power for processing the raw ore, he said, was that ten kilowatt hours of electric energy was needed to produce one pound of metal.

The raw material is bauxite, which is obtained from British Guiana and which usually is broken down to aluminum oxide at the source. The latter compound is shipped to the smelters for the electrolytic refining process.

Mr. Kendrick said that, although there was a temporary recession in world markets for aluminum after the war, the increased cost of other metals has boosted the demand for aluminum more than ever.

"Peace or war, good times or bad, come what might, the aluminum output has doubled every ten years for the past 60 years," he said.

He said that if the company decides to go ahead with the project, it will be very soon so it can take advantage of the 1951 building season.

The company has spent several millions on preparatory work, said Mr. Kendrick, but this has been only for surveys and tests.

He showed coloured slides taken on a trip to the area last summer. One of the subjects was a test length of power line strung between two aluminum towers for testing icing conditions throughout last winter.

The test ground was more than 5,000 feet up on a wind-swept plateau that could be reached only by helicopter.

J. T. Thwaites, M.E.I.C. (left), guest speaker at the meeting of February 28, and L. A. Bateman (right) chairman of the Electrical Section of the Winnipeg Branch.

Winnipeg

G. W. Moule, M.E.I.C.
Secretary-Treasurer

Electrical Section

J. C. Pratt, M.E.I.C.
News Editor

The History and Development of the Circuit Breaker formed the subject of Mr. J. T. Thwaites' address to the Electrical Section of the E.I.C. in Winnipeg, February 28th. Mr. Thwaites is section engineer, Electronic Section, Canadian Westinghouse Co., Ltd.

❖ ❖ ❖

L. A. Bateman, operating engineer, Winnipeg Hydro, has been elected recently to the chairmanship of the Engineering Institute's Electrical Section, in Winnipeg. R. A. Marvin, Northern Electric Company, is past chairman; E. A. Scott, Winnipeg Electric Company, vice-chairman; S. H. Eggertson, Winnipeg Electric Company, executive member; and K. Hallson, Winnipeg Hydro, secretary.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment*.

Situations Vacant

CHEMICAL

GRADUATE CHEMICAL ENGINEER required for district sales office of large organization in Montreal. Promotional sales work in Province of Quebec of product line of water conditioning and steam treating apparatus. Age 24 up with preferably some sales experience. Not necessarily bilingual. Apply to File No. 2087-V.

CHEMICAL ENGINEER required to head department of chemical technology in the Indian Institute of Science, Bangalore. Candidate should possess high academic qualifications in chemicial technology, together with considerable research and teaching experience. Should have knowledge of design and operation of chemical pilot plants. No age limit is prescribed. Duties will involve instruction of personnel. This is the foremost research institute in India and has well established post-graduate departments of aeronautical engineering, electrical communication engineering, metallurgical engineering, internal combustion engineering, power engineering and electrical technology and chemical engineering and chemical technology. Post of head of chemical technology has been vacant for sometime. Apply to File No. 2077-V.

CHEMICAL ENGINEER, 1950 graduate with an interest in process development and design work. Location Ontario. Apply to File No. 2093-V.

PRODUCTION ENGINEER

As an assistant to the Production Manager of a company manufacturing electrical switchgear and allied products in British Columbia. Graduate Engineer preferred with some experience in production work. Reply in writing with particulars of qualifications to File No. 3000-V.

CIVIL

CIVIL ENGINEERS required by large hydro-electric utility company located in Montreal. Two required with approximately 3 years experience in concrete and others with field experience. Apply to File No. 2078-V.

CIVIL ENGINEER with at least ten years experience in design and detail of steel and reinforced concrete structures for Montreal office of consulting engineering firm. Salary open and possibility of association to right man. Apply to File No. 2091-V.

ELECTRICAL

LARGE POWER COMPANY in Eastern Canada has an opening for a young electrical engineer. Some experience preferable but not essential. To work on power systems engineering. Excellent working conditions. Apply to File No. 2031-V.

ELECTRICAL ENGINEER with at least five years professional experience, a substantial part of which should have been in hydro-electric central station and substation design. Salary $325.00 to $400.00 per month depending on qualifications and experience. Location Victoria, B.C. Apply to File No. 2073-V.

ELECTRICAL ENGINEER required by large organization in Montreal with about five years experience in general electrical engineering, preferably in the transportation field. Salary range $350.00 to $400.00 per month. Apply to File No. 2074-V.

YOUNG ELECTRICAL ENGINEER with about three years experience required by manufacturer located in Montreal. Applicant would be obliged to do some mechanical work in general plant engineering. Apply to File No. 2075-V.

TWO ELECTRICAL ENGINEERS required by firm located in Toronto. Applicants should have one to four years experience preferably in communications or power. Apply to File No. 2076-V.

ELECTRICAL ENGINEER required to head the departments of power engineering and electrical technology in the Indian Institute of Science, Bangalore. Candidate should have a doctorate or master's degree in electrical engineering from a recognized university, 15 years' experience in a responsible position in large power project, experience in guiding research and in the execution of large power projects. No age limit is prescribed. Duties will involve instruction of personnel. This is the foremost research institution in India, and has well established post graduate departments of aeronautical engineering, electrical communication engineering, metallurgical engineering, internal combustion engineering, power engineering, and electrical technology and chemical engineering and chemical technology. Post of head of the power engineering and electrical technology departments has been vacant for some time. Apply to File No. 2077-V.

TWO ELECTRICAL ENGINEERS required by large hydro-electric utility company located in Montreal. Applicants should have two to three years experience. Apply to File No. 2078-V.

ELECTRICAL ENGINEER, who is familiar with and particularly interested in the application of control equipment and the producing of wiring diagrams, required by manufacturer of conveying machinery located in Ontario. Apply to File No. 2082-V.

EXPERIENCED ELECTRICAL ENGINEER, preferably between 28 and 35 years of age required by paper industry located in Ontario. Not absolutely necessary, but preferably with design and practical experience in pulp and paper mill. Apply to File No. 2083-V.

ELECTRICAL ENGINEER with two to four years' broad experience in the selection, installation and maintenance of electrical equipment in either industrial plant or public utility. Location Ontario. Apply to File No. 2093-V.

ELECTRICAL ENGINEER, with at least 4 years experience in electrical field, preferably on substation layout and installation, required by P.U.C. with a total load of about 250,000 H.P. and operate their own generating stations. Location about 100 miles north of Toronto. State wages expected, age etc. Apply to File No. 2096-V.

MECHANICAL

CHIEF MECHANICAL ENGINEER or assistant chief mechanical engineer required by large firm of consultants in Toronto. Salary open. Apply to File No. 2033-V.

MECHANICAL ENGINEERS with experience in process layout, design of steam plants, water supply systems and sewage and industrial waste treatment facilities. Salaries commensurate with experience. Apply to File No. 2068-V.

MECHANICAL ENGINEER with at least two to three years' experience in the design and job fabrication of A.S.M.C. pressure vessels and heat exchangers required for design, estimate and inspection work by engineering company located in Montreal. Salary commensurate with ability. Apply to File No. 2070-V.

MASTER MECHANIC required for central waterpower, irrigation and navigation commission, New Delhi, India. Candidate should have considerable experience as a mechanic and have held responsible positions in the field of mechanical engineering. Age, about 45 years. Duties will involve supervision of the operation and maintenance of machines employed on river valley projects, such as the construction of large concrete, earth and other types of dams, large power houses and transmission systems and the excavation of canals. He will also be required to train Indian personnel working under him. Apply to File No. 2077-V.

MECHANICAL ENGINEER required by engineering college, Guindy, India, to organize new department of production engineering and to train students for their master's degree in production en-engineering. Candidate should have a basic degree in mechanical engineering, a doctor's degree in production and industrial engineering, five years experience in a production workshop, five years experience in an engineering institution, preparing students for a standard degree and five years experience in directing research, leading to a master's degree in a recognized university. No age limit. Apply to File No. 2077-V.

MECHANICAL ENGINEER for field job required by large hydro electric utility company located in Montreal. Applicant should have approximately two years experience on mechanical equipment. Apply to File No. 2078-V.

SEVERAL 1951 mechanical engineering graduates required by pulp and paper industry located in the Province of Quebec. Apply to File No. 2081-V.

MECHANICAL ENGINEER required by firm in Ontario to act as furnace supervisor. Applicant should have preferably some experience and also in combustion of both oil and gas, high and low pressure and who has a knowledge of refractories. Also willing to train young interested mechanical engineer. Apply to File No. 2088-V.

YOUNG MECHANICAL ENGINEER required by manufacturer of various types of machinery located in Montreal, for extensive design. Good opportunity to right man interested in this type of work. Apply to File No. 2092-V.

MISCELLANEOUS

GRADUATE ENGINEER with three to four years welding experience in metal fabricating plant is required by a firm manufacturing gases and welding equipment. Position involves technical assistances to firms in the correct application of various welding processes. Salary commensurates with experience and qualifications. Apply to File No. 2071-V.

GEOLOGISTS: Two required by the engineering, geology and ground water division of the geological survey of India. One should be a specialist in ground water and the other in the investigation of dam sites. Duties will involve geological studies and investigations, assisting the director in coping with the large amount of work this division is called upon to perform. Ages, between 35 and 50. Apply to File No. 2077-V.

TWO LECTURERS IN MARINE ENGINEERING required for proposed residential marine engineering college for period of three years from August, 1952, to train engineer officers for Indian Mercantile Marine. Should possess certificate of extra first class engineer, of the United Kingdom Board of Trade or equivalent and have at least five years' experience as teacher in marine engineering. Age between 35 and 45 years. Duties will involve instruction of students with workshop experience, for examination for certificates of competency as engineers. Salary and allowances will be fixed to bear relation to what candidate can normally expect in his own country and will be paid by lending country. Place of residence Calcutta or Bombay. Wife and dependent children will be provided with free first class transportation to and from India once during contract period, provided they remain for not less than one year. Apply to File No. 2077-V.

CAPTAIN SUPERINTENDENT required by the director-general of shipping to teach and train personnel for service in the Indian Mercantile Marine. Should possess a Master's foreign-going certificate and five years' experience in training seamen ratings for the mercantile marine, three of which must have been spent in charge of such a training establishment. Age between 35 and 50 years. It is proposed to establish two training ships at Visakhapatnam with other training ships and/or ship training establishments on the west coast of India. Period 3 years. Apply to File No. 2077-V.

POWERHOUSE FOREMAN required for central waterpower, irrigation and navigation commission, New Delhi, India. Candidate should have considerable experience in the erection and maintenance of large hydro electric power plants. Age, about 45 years. Duties will involve erection and maintenance of diesel power houses for the supply of power on river valley projects, together with the erection and maintenance of large power houses, in connection with hydro electric projects. He will also be required to train Indian personnel working with him. Apply to File No. 2077-V.

WORKSHOP FOREMAN required for central waterpower, irrigation and navigation commission, New Delhi, India. Candidate should have considerable experience in the management of large workshops, in the manufacture of gates for dams, spillways, canals, sluices, and in the manufacture of electrical transmission towers. Age, about 45 years. Duties will involve supervision of large workshops required during construction of river valley projects and the instruction of Indian personnel working under him. Apply to File No. 2077-V.

MASTER ELECTRICIAN required for central waterpower, irrigation and navigation commission, New Delhi, India. Candidate should have considerable experience as an electrician and have held responsible positions in the field of electrical engineering. Age about 45 years. Duties will involve supervision of the operation and maintenance of electrical machinery employed on river valley projects, such as construction of large concrete, earth and other types of dams, large power houses and transmission systems. He will also be required to train Indian personnel working under him. Apply to File No. 2077-V.

CHIEF TECHNICAL ADVISER to Director General of Civil Aviation required for research and development of existing organization. Candidate should possess high academic qualifications and several years' experience in aeronautical design, particularly relating to airworthiness of prototype aircraft. Age between 40 and 50. Duties will involve the provision of advice and direction of aeronautical development. Appointment for three years, subject to period of probation of six months. Apply to File No. 2077-V.

MECHANICAL ENGINEER AND FUEL TECHNOLOGIST required by central electricity commission, Simla, India. Candidate should have 15 years' experience in design, construction and operation of steam power stations, with steam pressure of 600 lbs. per square inch and above and with units ranging from 30,000 K.W. Age above 45 years. Although there are several large power systems, both thermal and hydro-electric, in operation in India, there are no facilities for training Indian personnel in the design of power plants and ancillary equipment. Duties will involve instruction of personnel to meet demands of large power development program. Apply to File No. 2077-V.

DESIGNING ENGINEER required for central waterpower, irrigation and navigation commission, New Delhi, India. Candidates should have considerable experience in the design of high tension transmission lines and tower structures. Age 45 to 50 years. Duties will involve design of high tension transmission lines and tower structures, in connection with large hydro-electric projects. He will also be required to act in an advisory capacity on the design of transmission lines, and to train Indian engineers working with him. Apply to File No. 2077-V.

INDUSTRIAL ENGINEER required by firm of management consultants. Should be experienced in plant layout, production control, time studies, wage incentives, cost and budget controls. Age 35 to 60. Free to travel. Apply to File No. 2079-V.

ENGINEERS required in the manufacturing department of large electrical organization located in Ontario. Duties include the line up of operations and tooling, to initiate cost reduction programs, to lay-out departments, etc., on various products. Limited number of openings in production control, foundry work and in test work. Apply to File No. 2080-V.

PLANT ENGINEERS are required to do engineering work in connection with plant expansion and with plant maintenance, particularly along electrical lines. Location Ontario. Apply to File No. 2080-V.

DESIGN ENGINEERS required by large electrical organization in Ontario. Engineers are required to do both mechanical and electrical design but principally the latter on all types of electrical equipment. Specific experience is desired but not absolutely necessary. Apply to File No. 2080-V.

CIVIL OR MECHANICAL ENGINEER required by paper industry located in Ontario. Applicant should have design and practical experience, preferably five or six years in pulp and paper mill. Apply to File No. 2083-V.

GRADUATE ENGINEER required by firm located in Toronto. The work involved will be supervision of installation of marine radar, servicing marine radars installed on ships and some sales and/or office work. Considerable travelling involved. Interviews can be arranged in Ottawa, Toronto or Montreal. Apply to File No. 2034-V.

MECHANICAL AND CHEMICAL ENGINEERS required in the control department of paper mill located in Newfoundland. Applicants must be interested in control and process work. Salaries open. Apply to File No. 2085-V.

RESIDENT ENGINEERS AND INSTRUMENTMEN required for work on the construction of the Quebec North Shore and Labrador Railway. Applicants should have some experience on highway work. Good working conditions. Salaries open. Apply to File No. 2086-V.

MECHANICAL EQUIPMENT SUPERINTENDENT required by woods department of pulp and paper company. Should have degree in mechanical engineering or equivalent. Capable of initiating and supervising preventive maintenance programme and repair work to all mechanical and power equipment. This is a senior position for an active man with a proven record of success in this type of work. Candidate for opening must be bilingual. The salary will be commensurate to experience and qualifications. Apply to File No. 2089-V.

MECHANICAL DRAUGHTSMAN with at least three to five years experience in equipment tool and jig work for Montreal office. Supply full details in first letter. Apply to File No. 2091-V.

STRUCTURAL STEEL AND REINFORCED CONCRETE DETAILERS for Montreal office with a minimum of five years experience in either field. State full particulars in first letter. Salary open. Apply to File No. 2091-V.

CHEMICAL OR MECHANICAL ENGINEER to act as design engineer, with two or more years' experience in the chemical or allied industry. Location Ontario. Apply to File No. 2093-V.

TOOL ENGINEERS and patent lawyer required by large automotive industry in Ontario. Apply to File No. 2094-V.

ELECTRICAL DRAUGHTSMAN, with at least 6 years experience required by P.U.C. of about 25,000 H.P. State wages expected, age, etc. Apply to File No. 2096-V.

The following advertisements are reprinted from last month's Journal, not having yet been filled.

CHEMICAL

CHEMICAL ENGINEER required to take charge of process development group. Applicant should have at least five years development and production experience in chemical industry. Position in Ontario. Salary open. Apply to File No. 1335-V.

TWO JUNIOR OR INTERMEDIATE CHEMICAL ENGINEERS for the control department of pulp and paper industry in the Maritimes. Duties would be in connection with control and process work. Apply to File No. 1650-V.

CHEMICAL ENGINEERS with production ability, to operate chemical equipment such as filter presses, evaporators, vacuum jets, solvent recovery etc. Location Valleyfield, Quebec. Excellent opportunity offered. Salary open. Apply to File No. 2053-V.

YOUNG CHEMICAL ENGINEER required in plant located in Province of Quebec. Applicant would be obliged after completing training period to take charge of analytical laboratory and to coordinate production with control both in alcohol distillery and in magnesia insulation plants. Preferably under 30 years of age with 1 or more years industrial experience. Apply to File No. 2054-V.

CHEMICAL ENGINEER 1949 or 1950 graduate required by large pulp and paper industry located in Province of Quebec. Apply to File No. 2059-V.

CIVIL

CIVIL ENGINEER required by large firm in Ontario, with about 10 years structural experience. Applicant must be experienced and able to assume responsibility. Apply to File No. 1644-V.

CIVIL ENGINEER for design work on hydro-electric structures. Prefer at least four years' experience in this field. A knowledge of power house and dam foundations is desirable. Good opportunity with large Canadian company. File No. 137. Apply to File No. 2017-V.

CIVIL ENGINEER required by large Canadian company with experience in structural steel design, preferably on hydro-electric structures such as gates and outdoor switching yards. Apply to File No. 2017-V.

CIVIL ENGINEERS required by large construction company in Montreal. Applicants should have 2 or 3 years experience in field and general construction. Apply to File No. 2034-V.

YOUNG CIVIL ENGINEER with knowledge of reinforced concrete structures. Duties include supervision of concrete construction in Quebec, measurements on the work, drawings, reports and process estimates. Applicant must be bilingual. Reply in writing, giving full particulars as to experience, qualifications and salary expected to File No. 2060-V.

CIVIL ENGINEER required by engineering department of construction company. Duties include estimating, laying out construction work and engineering supervision. Salary dependent upon ability. Reply giving complete details of background and experience. Apply to File No. 2064-V.

ELECTRICAL

FULLY EXPERIENCED ELECTRICAL ENGINEER required by textile industry located outside Montreal. Applicant must have some real practical experience, about 15 years in a manufacturing plant, preferably textile mill. Excellent opportunity offered. Apply to File No. 1418-V.

GRADUATE ELECTRICAL ENGINEER required in the Province of Quebec as sales engineer for established wire and cable company. Experience in power field desirable. Salary open. Apply to File No. 1570-V.

ELECTRICAL ENGINEERS with experience in electronics and radar for positions in Ottawa. Salaries open. Apply to File No. 1588-V.

THE PUBLIC SERVICE OF CANADA requires Electrical Engineers (electronics and communications). Appointments at Ottawa, Toronto and Montreal. Salaries up to $4,740.00 per annum. Details and application forms may be obtained by writing Civil Service Commission, Ottawa. Competition No. 50-158-B. Apply to File No. 2016-V.

ELECTRICAL ENGINEER required by large Canadian company, with hydro electric operations in Brazil with several years experience with industry on public utility. Duties will include: specification writing, analyzing bids, checking manufacturer's drawings, inspection of heavy electrical equipment, supervision of freight tests and technical correspondence. Prefer a minimum of three years experience. Location Toronto File No. 13741. Apply to File No. 2017-V.

ELECTRICAL ENGINEER required by university in Montreal. Duties include design and construction of electronic equipment and finally extensive research. Apply to File No. 2022-V.

ELECTRICAL ENGINEERS required by large public utility in Montreal. Applicants with or without experience desired. Apply to File No. 2046-V.

MECHANICAL

MECHANICAL DRAUGHTSMEN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for ordinary colliery plants screening equipment. Hoists, simple steel structures, etc. Salary open. Apply to File No. 1332-V.

MECHANICAL DESIGN ENGINEERS required by west coast pulp and paper mill. Previous pulp and paper experience desirable but not necessary and consideration will be given to all applicants with industrial experience. Salaries from $3,600.00 upwards commensurate with experience. These are permanent appointments in a well established mill. Apply to File No. 1582-V.

MECHANICAL ENGINEER required by large firm in Montreal to act as railroad car engineer. Applicant should have 2 or 3 years (or more) of experience in the design of tank cars, as defined by the Association of American Railroads. Familiarity with the requirements of the A.A.R., the I.C.C., the Bureau of explosives and the Board of Transport Commissioners is essential. Salary open. Apply to File No. 1600-V.

MECHANICAL ENGINEER required by large firm in Montreal. Applicants should have experience in the pulp and paper industry, particularly in the design and for operation of paper making machinery. One or two years experience desired. Salaries open. Apply to File No. 1600-V.

MECHANICAL ENGINEERS with design experience and ingenuity required for an aggressive Canadian firm manufacturing electronic and mechanical controls and instruments. Project engineers and junior engineers required. Salaries open. Apply to File No. 1609-V.

MECHANICAL ENGINEER required immediately for sales department. Large company requires the immediate services of a mechanical engineer, for its sales department, preferably bilingual. This is a permanent salaried position, with well established company. State age, education and outline all experience. All replies treated in confidence. Apply to File No. 1620-V.

MECHANICAL ENGINEERS required by large manufacturing firm located one hundred miles from Montreal. Excellent opportunities for experience and promotion in time study standards department eventually leading to shop management. Apply to File No. 1621-V.

MECHANICAL ENGINEER required in Province of Quebec with some plant experience. Duties include design and plant layout work. Apply to File No. 1648-V.

MECHANICAL ENGINEER with knowledge of industrial steam power plant design, heating system and application of steam, air and hydraulics as applied to processes, required by large established company, 5 years or more experience, desirable location Montreal. Salary open. Apply to File No. 1655-V.

MECHANICAL ENGINEER 25 to 30 years of age required for manufacture of spun synthetic textile yarns at Granby, Quebec. The plant superintendent is a graduate mechanical engineer and the position is that of assistant superintendent. Duties will include planning production, the maintenance of the machines, planning and installation of a new machinery and daily contact with all levels of personnel. Salary will be dependent on the experience of successful applicant. Minimum $300.00 per month. Apply to File No. 1700-V.

MECHANICAL ENGINEER required by a large manufacturer in Montreal of heavy mechanical equipment. Applicant should have several years industrial experience which should include a background of welding knowledge. Apply to File No. 2001-V.

MECHANICAL ENGINEER with several years experience on design and layout of mechanical equipment for hydro-electric construction, location Southern Ontario. When replying please quote File No. 137-8. Apply to File No. 2005-V.

MECHANICAL ENGINEERING GRADUATE or equivalent with three or more years experience in design and manufacture of light alloy structures required by large Montreal firm manufacturing radio communication equipment and radar. Apply to File No. 2011-V.

MECHANICAL ENGINEER recent graduate up to three years employment interested in obtaining drawing office experience in plant production of heavy armament work. Forty minutes by tramways from Phillips Square, Montreal. Apply to File No. 2014-V.

MECHANICAL ENGINEER wanted, with designing experience and mechanical ability, plus a desire to become sales engineer, by manufacturer of road building machinery located in the Province of Quebec. Good speaking knowledge of French is necessary. Apply to File No. 2037-V.

MECHANICAL ENGINEER required as assistant to chief inspection of large oil company in Montreal. Applicant should have at least three years experience in plant maintenance, involving shop fabricating methods and inspection. Knowledge of metallurgy and familiarity with corrosion problems an asset. Salary open. Apply to File No. 2052-V.

MECHANICAL ENGINEER REQUIRED for engineering office of large oil company. Applicant should have minimum of two years' experience in design and layout of mechanical equipment. Working knowledge of pressure vessel design an asset. Location Montreal. Salary open. Apply to File No. 2052-V.

MECHANICAL ENGINEER with 3 to 5 years experience in maintenance engineering. An asset if bilingual but not necessary. Location: Valleyfield, Quebec. Excellent opportunity offered. Salary open. Apply to File No. 2053-V.

MECHANICAL ENGINEER, recent graduate, to act as plant superintendent in large bakery in Montreal. Apply to File No. 2055-V.

MECHANICAL ENGINEER of about 35 to 40 years of age to assist mechanical superintendent of plant located in Eastern Canada. Work will involve assisting supervision of construction, installation and maintenance of plant equipment including pumps, boilers, refrigeration, air-conditioning equipment, etc. Salary about $5,000.00. Apply to File No. 2056-V.

MECHANICAL ENGINEER required for large construction quarry and concrete company. Must have some experience in layout and design of plants. Salary commensurate with ability. Reply giving complete details of background and experience. Apply to File No. 2064-V.

METALLURGICAL

FOUNDRY METALLURGIST required in British Columbia. Applicant should have broad experience in research work. Apply to File No. 1118-V.

METALLURGIST, recent graduate required for cast iron foundry located in Province of Quebec. Apply to File No. 2050-V.

MISCELLANEOUS

EXPERIENCED DESIGN ENGINEER required by a large Western Canadian steel fabricating shop. Must be experienced in design of boiler and pressure vessels. Material handling equipment, structural steel. Apply to File No. 1502-V.

SENIOR DESIGN ENGINEER required in Ottawa, with a degree in mechanical or chemical engineering. Applicant should have a minimum of 5 years experience in mechanical design particularly with reference to chemical plant equipment and process. Apply to File No. 1507-V.

ASSISTANT PRODUCTION SUPERINTENDENT. Press operations required in Ontario. Applicant should be familiar with die equipment and be able to assume responsibility of a production shift consisting of two foremen and approximately eighty men. He must have a thorough knowledge of standards, production control, cost control, labour relations, etc. Apply to File No. 1559-V.

ASSISTANT PRODUCTION SUPERINTENDENT finishing operations, required by firm in Ontario. Applicant must be familiar with the following finishing operations on various types of steel; polishing, electro plating (copper, nickel and chromium) and buffing and be in a position to assume responsibility of a production shift consisting of four foremen and approximately one hundred men. He therefore must have a thorough knowledge of standards, production control, cost control, labour relations, etc. Apply to File No. 1559-V.

TECHNICAL DIRECTOR wanted for paper company producing from 100% rag to 100% sulfite papers. Applicant should be a graduate chemist or chemical engineer and must be bilingual. Surroundings are ideal and living conditions very good. Mills located near Montreal in the Laurentian Mountains. Apply to File No. 1586-V.

DEVELOPMENT ENGINEER by nuclear engineering branch to do experimental and development work in the field of mechanical engineering related to the design of atomic energy reactors and associated equipment. Applicants should have an engineering degree with high academic standing and five or more years engineering development experience. Apply to File No. 1602-V.

SENIOR PETROLEUM ENGINEER required by independent Canadian Oil Company with headquarters in Calgary. Applicant should be particularly experienced in reservoir engineering and production practices. No one with less than 7 years experience in the industry need apply. Give synopsis of education, training and experience and supply recent photo. Apply to File No. 1675-V.

GRADUATE ENGINEERS AND DRAUGHTSMEN, mechanical, civil, electrical required for projects in Ontario and Quebec. Preference to those with 3 years practical experience. Apply to File No. 1697-V.

SCIENTIFIC OFFICERS wanted. Applicants should be Canadian citizens who are graduates in science, preferably with post graduate training. Research or general experience in some particular scientific field is desirable in certain positions. War service will be considered an additional qualification in some positions and a requirement in others. The main duties will pertain to the co-ordination, control and dissemination of scientific information in most of the major fields of science and technology. Salary $2,700.00-$3,800.00 depending upon qualifications and experience. Apply to Box 1274, Station B, Ottawa, Ontario. Apply to File No. 1707-V.

DESIGN ENGINEER approximately ten years experience in structural material handling and mechanical design. Boiler design experience an asset but not essential. Location Western Canada. Apply to File No. 2000-V.

HYDRAULIC ENGINEER with several years' experience on reinforced concrete design and hydraulic structures, location Southern Ontario. Please quote File No. 13709. Apply to File No. 2005-V.

ELECTRONIC ENGINEERS required by large Montreal firm for development work on radio communication equipment and radar. Applicants should have three or more years of practical design experience in this field. Apply to File No. 2011-V.

FULLY QUALIFIED TEXTILE TECHNOLOGIST, graduate of textile institute, required in Montreal by industrial consultant. Applicant should have industrial engineering experience. Give full details as to experience and education to File No. 2012-V.

MECHANICAL DRAUGHTSMEN, detailers, checkers, all grades from 2 years experience and up for plant in production of heavy armament work. Forty minutes by tramways from Phillips Square, Montreal. Apply to File No. 2014-V.

SUPERVISOR OF UNDERGROUND DISTRIBUTION. Large Canadian organization requires well qualified electrical engineer for its Brazilian operations, duties will include long range planning of all underground distribution systems and of allied substations, review of the present underground distribution practices and reducing operating cost, making such studies as required by the chief of system planning or the chief electrical engineer. Apply to File No. 2017-V.

ASSISTANT PRODUCTION SUPERINTENDENT required by large firm of long standing manufacturing men's shirts, pajamas, etc., for plant near Three Rivers, Quebec. Experience in manufacturing these lines or similar necessary. Applicant would be required to plan for high production, improve methods, lower costs, etc. Good position to right party. Apply to File No. 2018-V.

RESEARCH CHEMIST required by chemical firm in Ontario for laboratory research under supervision. Minimum age 23 years, bachelor's or master's degree in chemistry or chemical engineering. Two or three years technical experience or Ph.D. in lieu of experience. Apply to File No. 2019-V.

CHEMIST required by chemical firm in Ontario for the development of textile chemicals. Minimum age 27 years, degree in chemistry or chemical engineering with 5-10 years technical (laboratory or production) and sales experience. Position requires both research and sales abilities combined with practical knowledge of textile industry. Apply to File No. 2019-V.

SALES ENGINEER, recent graduate, preferably mechanical or electrical required by well established supply house with nation wide representation. Experience in equipment sales, of value but not essential. Training period to be spent in Montreal. Good opportunity for advancement to party interested in making career of this work. Apply to File No. 2020-V.

ARCHITECTURAL DRAUGHTSMAN required by large pulp and paper manufacturer in Eastern Canada for general architectural designs covering building changes on existing buildings and new buildings etc. Apply to File No. 2021-V.

ENGINEERING DRAUGHTSMAN required by paper industry located in Montreal. Must be fully qualified. Apply to File No. 2023-V.

THREE FULLY QUALIFIED ENGINEERS required by a firm of management consultants located in Montreal. Salary open. Apply to File No. 2024-V.

MECHANICAL OR CIVIL ENGINEER required by national beverage company to act as plant superintendent in plant situated outside of Montreal. Applicant should be between 25 to 35 years of age. Salary open. Apply to File No. 2025-V.

ELECTRONIC ENGINEER required in Montreal with some experience with radar. Apply to File No. 2026-V.

TOP FLIGHT MAN for methods and time study work on all operations incidental to manufacturing of light and heavy sheet metal products. Excellent opportunity for man of proven ability and experience to establish himself with a sound company employing 200 people. Salary open. Applicants to apply in writing giving complete facts on education, experience and personal history. Enclose recent photograph. Apply to File No. 2029-V.

HYDRAULICS ENGINEER for the water rights branch, department of lands, B.C. Provincial Government. Salaries: hydraulic engineer Victoria and assistant district engineer, Kamloops, $3696.00 to $4295.00, assistant hydraulic engineer, Victoria $3336.00 to $3576.00. Positions permanent; superannuation plan. Candidates must be British subjects, preferably under 45 years of age; graduates in civil engineering or equivalent; eligible for full registration in Association of Professional Engineers of B.C. (in case of the last position, eligible for registration as engineer in training) knowledge of survey methods, photogrammetry hydraulics and hydrology of river discharge, dam design, soil mechanics and samplings; field and office experience on engineering work in hydro electricity, or irrigation and water supply or hydrology. Apply to File No. 2032-V.

HYDRAULIC ENGINEER fully qualified required by large industrial organization in Montreal. Applicant should be familiar with the design of hydroelectric power stations and water storage. Apply to File No. 2038-V.

TWO SALES ENGINEERS required by firm in Montreal manufacturing welding and cutting apparatus. Applicants should be 1949 or 1950 graduates in engineering with definite sales ability. Apply to File No. 2041-V.

GRADUATE ENGINEER required in the development and engineering department of firm located in Montreal. Applicant must have a minimum of 4 years experience in a steel manufacturing plant. Position involves technical assistance to the steel industry in use of our products and work on problems related to this field. The territory will be mainly in Quebec and Ontario with headquarters in Montreal. This is an excellent opportunity along technico administrative lines for the suitable person. Apply to File No. 2042-V.

SALES ENGINEER, preferably mechanical, required by organization in Montreal. Applicants should be around 33 to 37 years. Duties would include designing and selling under supervision of specialty machinery used in pulp and paper mills for handling pulp wood and newsprint. Starting salary $4,000.00. Apply to File No. 2043-V.

REPRESENTATIVE required by firm in Toronto manufacturing tarred felt and pitch used in roof construction, tar distillers, etc. Applicant would be obliged to call on architects, consulting engineers and general contractors. Apply to File No. 2047-V.

MECHANICAL AND STRUCTURAL ENGINEERS to act as project engineers to undertake the study and necessary design and drawing work in connection with a combination bar and strip mill located in Ontario. Salaries open. Apply to File No. 2048-V.

PROJECT ENGINEER graduate with at least ten years experience in design, construction and operation of petroleum chemical plants on petroleum refineries, required to supervise project division of company engaged in engineering and construction of gas processing plants located in Montreal, Canada. Salary commensurate with ability and experience. Apply to File No. 2051-V.

ENGINEER, age 35 to 45 years as maintenance superintendent and chief engineer for large Montreal property, approximately 750 rooms. Must be certified for large boiler plant, and be experienced in controlling cost of maintenance trades, including plumbers, carpenters, painters, etc. Bilingual preferred. Attractive opportunity to become established in permanent congenial situation. Apply to File No. 2057-V.

DESIGN AND DETAIL ENGINEERS required by a package handling conveyer concern located in Ontario. Promotion to responsible positions is offered to applicants having the necessary ability and qualifications. Apply to File No. 2058-V.

DRAUGHTSMAN, Senior layout man, required for the engineering department of new plant in Western Ontario. Must be capable of making complicated layouts from specifications, drawings, sketches or notes furnished by engineers and have considerable knowledge of manufacturing processes and their limitations. Should be capable of doing some designing. Experience in structural work and piping. University degree would be helpful not necessarily required. Apply to File No. 2062-V.

TWO RECENT GRADUATES required immediately for new Canadian plant of well known American company. Prefer men with interest in industrial piping for chemical and other industries. Excellent opportunities for advancement. Salary commensurate with ability and experience. Company located in Hamilton. Apply to File No. 2063-V.

CIVIL, ELECTRICAL AND MECHANICAL ENGINEERS, required by Vancouver, B.C., firm for office design on large hydro-electric development. Desire only working engineers with three or more years hydro or related experience. Applications should include complete record of experience, salaries received, salary expected and time required to make a transfer to Vancouver. Salaries commensurate with qualifications. Apply to File No. 2065-V.

WE REQUIRE QUALIFIED ENGINEERS experienced in construction work on reinforced concrete, structural steel and frame buildings, as well as incidental services. Administrative ability and technical knowledge are essential. Employee benefits include three weeks annual vacation, sick leave allowance and a liberal plan for life insurance, hospitalization, and surgical benefits for the employee and his family. Replies are to contain details concerning education, experience, salary requirements, age, marital status and date available. Apply to File No. 2066-V.

MANAGING ENGINEER for Canadian owned company manufacturing electrical equipment in Toronto. Professional engineer with electrical mechanical background required, preferably with experience in switch gear cubicle and street lighting design. This position requires both administrative and engineering ability. Age range 30 to 40 years. Excellent future, good salary, plus bonus and pension. Give full details of education and experience. Our employees know of this advertisement. All replies will be held in strictest confidence. Apply to File No. 2067-V.

Situations Wanted

GRADUATE CIVIL ENGINEER AND LAND SURVEYOR with proven ability to carry out responsibilities. Available on short notice. Over 23 years of wide experience on four continents. Experience includes design layout and field supervision of: roads, dams, buildings, drainage, irrigation works. Veteran C.R.E. and E.A.E., married, bilingual. Situations held in Canada: Chief of survey parties, resident engineer. Abroad: as district and assistant chief engineer for over 19 years in the British, Turkish, Iraqui, Government Services. Apply to File No. 489-W.

ELECTRICAL ENGINEER, S.E.I.C. graduate Nova Scotia Technical College 1950, married, veteran, 34, presently employed by large cable manufacturing company in Montreal as a junior development engineer in their electrical laboratory, desires position in Nova Scotia preferably Halifax area. Previous experience in surveying, communications, d.c. machinery. Willing to accept position in any branch of electrical engineering including sales. Available for interview in Montreal anytime and in Nova Scotia in July, 1951. Apply to File No. 1325-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Ontario), B.Sc. (Hons.) Birmingham, England, 1948. Age 28. Single. Ex-Sapper, Field Engineers of Union Defence Force (South Africa). Presently employed in temporary position in Toronto. Seeks permanent employment where hard work and initiative will lead to advancement. Fifteen months experience in municipal roads and drainage work in South Africa, including surveying, design and supervision. Also eleven months with waterworks in Canada on design of steel and reinforced concrete structures and writing of specifications. Willing to work anywhere. Apply to File No. 1463-W.

MECHANICAL ENGINEER S.E.I.C., 1950 graduate, University of Toronto. Age 24, single. Experience in machine shop and repair and maintenance work. Presently employed in structural steel, foundry and machine tool industry as plant layout and maintenance engineer. Interested in permanent position leading to responsibility. Willing to work and learn. Available on short notice. Apply to File No. 1505-W.

MECHANICAL ENGINEER, M.E.I.C., U.B.C. 1936. Age 37, married. 3 years experience as designer in paper machinery department of large manufacturer. 5 years as senior officer in the A.I.D. of the R.C.A.F. engaged on technical and administrative duties. 6 years as engineer in the paper and saw milling industry on the west coast, engaged on the layout, design and installation of wood-handling plant and equipment, including considerable experience in the design and erection of timber, steel and concrete structures. Desires position as resident engineer or senior engineering position covering industrial planning and development. Apply to File No. 1965-W.

WORKS MANAGER and administrator with experience in mechanical, electrical and civil engineering work open for appointment. Apply to File No. 2429-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., P.Eng. (Ontario), age 31, married. Presently employed in Toronto. Desires responsible position with manufacturing firm. Nine years experience in mechanical and structural design, inspection, shop liaison, and sales and service. Apply to File No. 2586-W.

CIVIL ENGINEER, B.Sc. 1947, Jr.E.I.C., P.Eng. (Quebec). Age 26, married, with car, 3½ years varied structural experience with architects, fabricators and contractors, covering design, detailing and estimating of structural steel and concrete as well as liaison work, desires position with responsibility. Must include outside work in design and supervision, and/or liaison work, or sales promotion. Available on one months' notice to present employer. Ontario or Alberta preferred. Apply to File No. 3340-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., with extensive experience at draughting, designing and estimating of all types of plate, structural and machine work, now fully employed, desires part time work for evenings and week-ends. Apply to File No. 3367-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng. Six years experience in design, manufacturing, sales and application engineering, including electronic test equipment design, manufacture of public address equipment; preparation of sales information and technical writing, application of motors, controls, transformers, switchgear, etc. Desires permanent position in power field, in design, operating or application engineering, not sales. Aims to advance into management or advisory engineering. Location preferred, Southern Ontario or British Columbia. Apply to File No. 3326-W.

CIVIL ENGINEER, M.Sc., M.E.I.C., P.Eng., age 39. Practical experience since 1934 in design of reinforced concrete and steel structures (warehouses, factory buildings, power station, boiler houses, heavy foundations, hydraulic structures, oil refinery plants, gas plants, jetties) estimate and surveying. Seeks position in Ontario or Quebec. Apply to File No. 3369-W.

MECHANICAL ENGINEER, M.E.I.C., graduate McGill, 1943, veteran, age 30, seeks position as project or plant engineer. Broad experience in plant layout, design, construction, alteration and maintenance work. Employed during past 3 years on design and construction of large mill now nearing completion. Would consider alternative position as executive assistant or sales engineer. Apply to File No. 3405-W.

CONSTRUCTION COST ENGINEER, Queen's 1948, R.C.A.F. Veteran, with experience in all phases of estimating, scheduling, cost control, material requisitioning and expediting, for both large and small industrial projects, desires an executive or supervisory position where hard work and initiative will lead to advancement. Other assets include wife, two children and own car. Location unimportant. Apply to File No. 3406-W.

WELDING ENGINEER, M.E.I.C., P.Eng., B.A., B.Sc., Queen's 1941. Age 34, married. 7 years production and development experience in the fabrication of heavy industrial equipment with particular reference to welded pressure vessels. Desires continued experience in this or related fields. Available on short notice. Apply to File No. 3407-W.

1950 GRADUATE, University of Saskatchewan, distinction in Engineering Physics. 26 years, family of 2, currently mastering in physics. Have background as resident engineer on municipal engineering project; ex-navigation instructor in R.C.A.F. Desire work in applied research or in general engineering. Available May, 1951. Apply to File No. 3414-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.Eng., B.Eng., McGill 1949. Age 28. Single. Good health. Experience: two summers as junior draughtsman in pulp and paper mill, two summers as helper in foundry and boiler shop of firm manufacturing heavy machinery, spring 1949 to date as engineer with major oil company. Desires to obtain plant engineering experience with a firm located in the Toronto area. Apply to File No. 3415-W.

TWO PROFESSIONAL ELECTRICAL ENGINEERS, Jr.E.I.C. Honors graduates of Canadian Universities, having completed two years training with a leading Canadian Electrical Manufacturer, seek to better their positions. Professional employment with any progressive Canadian company will be considered. Apply to File No. 3416-W.

ELECTRICAL ENGINEER, S.E.I.C., B.A.Sc., U.B.C. 1950. Age 27, single. Experience: Radar mechanic R.C.A.F. One summer each as coal mine car repairer, tipple machinery operator, and electricians' helper in coal mine. Will work anywhere. Available immediately. Apply to File No. 3417-W.

MECHANICAL ENGINEER, S.E.I.C. graduate, University of Saskatchewan, 1950. Age 31, married. 4 years overseas with R.C.A.F. as wireless mechanic. Some boiler shop and pipe fitting experience. Would like to specialize in heating and air conditioning or in power house work. Willing to undertake any required training. Apply to File No. 3422-W.

ELECTRICAL ENGINEER, Jr.E.I.C., Assoc. A.I.E.E., B.Sc., University of New Brunswick, 1949. Age 25, single. One year experience in the manufacture and design of polyphase and single pnase motors. Seeks position in design or production engineering in power field preferably in Montreal area. Available immediately. Apply to File No. 3423-W.

CHEMICAL ENGINEER, Laval 1949. Single, bilingual, with summer experience in shipbuilding, galvanizing of steel and making of aluminum. Nearly two years experience in food industry in Montreal. Desires a position in industrial, sales or plant engineering with opportunity for advancement. Available on short notice. Apply to File No. 3432-W.

CIVIL ENGINEER, S.E.I.C. Will graduate from N.S.T.C., May, 1951. Age 31. Married. Experience on the following projects. 1 summer: rodman on municipal street layout. 1 summer: instrument man on topographic survey. 1 summer: instrument man with Department of Highways. 1 summer: resident engineer on marshland reclaimation project. Desires position preferably in municipal engineering or in Maritimes with construction company. Apply to File No. 3438-W.

GRADUATE MECHANICAL ENGINEER, Jr.E.I.C., Sask., 1950. At present taking masters degree at University of Toronto. R.C.A.F. veteran, 5 years practical engineering experience. Willing to work hard and accept responsibility. References and detailed experience on request. Available May, 1951. Apply to File No. 3439-W.

MECHANICAL ENGINEER, Sask., 1949 (with distinction), Jr.E.I.C., P.Eng. Age 32, married, vetrean, desires position in Hamilton area. Since graduation experience includes employment with contractor in refrigeration, air conditioning and ventilation, including design of systems and installation. Desires a change with a firm which will give more chances of using my engineering qualificaitons as present position does not allow a large enough scope for engineering work. Available on one month's notice to present employer. Apply to File No. 3442-W.

ELECTRICAL ENGINEER, Higher National Diploma, 1949 (Power Course), Dundee Technical College, Scotland. P.Eng., Ont. One year experience as field engineer on design and reconstruction transmission and distribution lines in Scotland. Six years as technical officer in R.E.M.E. Four years as apprentice technician with power company in Poland. Experience in diesel-electric and hydro-electric plants in planning office and line surveying. Wishes to find employment in power field or design, would like to learn from the start the Canadian way of work. Apply to File No. 3443-W.

CHEMICAL ENGINEER, Jr.E.I.C. (B.Sc., Queens 1948). Age 29, married, one child. Two years experience production supervision and development engineering in chlorine-alkali industry. Some experience in coal tar refining. At present employed. Desires position in Ontario or Quebec. Apply to File No. 3452-W.

SALES AND TECHNICAL SERVICE engineering employment desired by young engineer (24 years, single), expecting to graduate in Metallurgical Engineering (McGill) in May, 1951, S.E.I.C. Many summer months experience in the making, shaping and inspection of steel. Location is practically immaterial and applicant is willing to travel. Willing to start on training programme if necessary. Available June 1st, 1951. Apply to File No. 3453-W.

CHEMICAL ENGINEER, S.E.I.C., Alberta, 1946. Age 29, married, one child. Background of successful experience in production control, cost reduction studies and process design in petroleum refining and synthetic rubber manufacturing fields. Capable of assuming responsibility. Available after graduation in business administration (U.W.O.) in May. Apply to File No. 3456-W.

METALLURGICAL ENGINEERING, Jr. E.I.C., Toronto, 1948. Business Administration, University of Western Ontario, 1951. Desires position in production engineering or as technical salesman for a manufacturer of durable producers' and consumers' goods. Age 28, married. Naval veteran. Over two years' experience with a large Canadian manufacturing firm chiefly as a production supervisor. Conversant with French. Available in May. Apply to File No. 3457-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Ont.), B.Sc., University of Alberta, 1945. Age 27, married. 1 year in highway location, design, estimates and construction; 5 years field and office experience in surveys, designs, layout and construction supervision in transmission lines, tower footings, reinf. conc. and pile foundations, also some knowledge of municipal engineering. Presently employed in Ontario. Desire position in Alberta with consulting engineers, construction company, or other company with own engineering staff. Available after September, 1951. Apply to File No. 3458-W.

BRITISH SUBJECT, chartered electrical engineer, apprenticeship trained, presently holding technical and commercial managerial appointment in branch works of one of the premier manufacturing electrical companies in England, wishes to contact Canadian principals with view to ultimate emigration to Canada or with Canadian subsidiaries overseas. Three years wartime experience of Canada. Canadian references. Six years commissioned Naval service. Age 37. Married. Apply to File No. 3463-W.

ELECTRICAL ENGINEER, Sask., 1950, S.E. I.C., P.Eng. Age 30, married, veteran. Desires permanent employment anywhere in Canada. Experience includes 4 years radar mechanic, one summer sales, several months practical experience on wiring and installation of transformer banks switch gear, motors, etc. Apply to File No. 3464-W.

AERONAUTICAL ENGINEER, Jr.E.I.C., graduate Mass. Institute of Tech. Age 28, married, good health. Seven years experience with major airline on aircraft specifications and negotiations, mock-up, stress analysis, performance calculation, aircraft evaluation, detailed design, testing, report writing, correspondence, administration. Hard worker, willing to take responsibilities. Apply to File No. 3470-W.

GRADUATE ENGINEER, Jr.E.I.C., University of Saskatchewan, 1948. Age 25, single and in good health. Three years experience in farm implement design. Seeks employment in design or production engineering. Willing to undertake any required training. Presently employed but desires position leading to responsibility. Available on short notice. Apply to File No. 3472-W.

PLANT ENGINEER of medium sized company, Mechanical, McGill, 1948, Jr.E.I.C. Veteran, single, 27 years, desires affiliation with medium or large concern. Undertook and completed movement of two plants. Designed, costed and implemented major changes and installations of boiler house, air compressor house, air exhausting systems, electrical mains, instruments, heating and steam process mains. Staff of approx. 100, 20% licensed tradesmen. Collection of basic production machine data for time loading, scheduling, etc. Other studies and training courses. Excellent references. One month's notice. Apply to File No. 3476-W.

CIVIL ENGINEER, S.E.I.C., B.Sc., U.N.B., 1950, navy veteran. Age 26, married with one child. Have considerable experience in highway construction in N.B. References on request. Apply to File No. 3477-W.

AGRICULTURAL ENGINEER, S.E.I.C., graduated from U.B.C. in May, 1950. Age 24, single and in good health. Farm background and experience in the operation, repair and maintenance of most types of farm equipment. Would like design, development, or research work in farm power and machinery, rural electrification, or irrigation and drainage anywhere in Canada. Willing to work for a moderate salary to gain experience. Available on short notice. Apply to File No. 3478-W.

CIVIL ENGINEER, Jr.E.I.C., B.Eng., McGill, 1949. Age 26, married, presently employed by construction firm in Montreal, would offer services for part-time employment in designing, estimating, etc., related to varied fields of building construction, especially reinforced concrete, steel or timber structures and foundations. Apply to File No. 3480-W.

ELECTRICAL ENGINEER, Jr.E.I.C., 1949, graduate of the University of Manitoba, about to complete two year apprenticeship in England, seeks employment in Canada, as from August, 1951. Experience includes testing of instrument transformers, testing of A.C. and D.C. motors and generators, 6 months in D.C. machine design engineers office, 3 months in electronic development laboratory, 6 months erection of steel mill rolling equipment. Undergraduate experience includes summer employment as student engineer in steel plant. Apply to File No. 3481-W.

GRADUATE ENGINEER, Jr.E.I.C., honors graduate, McGill, 1949, married, overseas R.C.A.F. veteran. Varied experience in the field of production control and planning, methods analysis, time study quality control and allied engineering subjects. Desirous of obtaining a position in the management sphere. Location Toronto area. Available immediately. Apply to File No. 3482-W.

CIVIL ENGINEER, B.Eng., McGill, 1944, M.E.I.C., P.Eng. Married with two children, veteran R.C.E. Have had about ten years experience in construction, maintenance and industry including long-range planning, design and economic studies; also supervision and inspection as resident engineer. Familiar with general office routine and accounting procedures. Proven ability to handle labour, direct staff work and meet the public. Now enrolled in course on Modern Business with Alexander Hamilton Institute. Present employment highly responsible but wish to locate in Montreal area. Ambitious toward executive position requiring engineering and business training. Apply to File No. 3486-W.

BOOK REVIEW

OIL FIELD EXPLORATION AND DEVELOPMENT, 2 Volumes. Volume 1: OIL FIELD PRINCIPLES; Volume 2: OIL FIELD PRACTICE.

A. Beeby Thompson. London, Technical press, 1950. 546 pp., 630 pp., illus., $10.50.

This 1950 revision of an already widely accepted source book on oil field exploration and development serves a two-fold purpose.

In addition to all the basic information contained in the 1925 edition, appendices, with original chapter references, describe and outline new developments and discoveries in information and technique over the past 25 years.

A brief survey of appendices contents shows these discoveries and developments geographically subdivided; U.S.A. petroleum productions since 1859; and world petroleum production since 1880.

Closer study, however, reveals discussion and reports on the work of skilled geophysicists with magnetometers, gravimeters, seismographs and electrical contrivances, and developments in the location of concealed oil structures through soil analysis.

Correlation of strata by their heavy mineral content, or the assemblage of micro fauna remains have proved invaluable when breaks or macro fossils are confused or unidentifiable: and knowledge of regional geology has been immeasurably improved due to the high degree of perfection developed in flying techniques and aerial photography apparatus.

Numerous illustrations, both plate and black and white, and an excellent index to both volumes, in each volume add further to the usefulness of this 2-volume work.

E.K.

SELECTED ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

Airplane aerodynamics:
D. O. Dommash. New York, Pitman, 1951. 520 pp., illus., cloth, $6.50.

Aménagements Hydro-électriques:
I. Leviant, Paris, Dunod, 1951. 148 pp., illus., 640 fr.

Automatic control of industrial plant and processes:
J. W. Ashley. London, Emmott, 1950. 65 pp., illus., 3s. (Mechanical World Monograph No. 60).

Bibliography of statistical quality control; supplement:
Grant I. Butterbaugh. Seattle, Univ. of Washington Press, 1951. 141 pp., $2.00.

Cams and springs for poppet valves:
W. H. Lee. London, Emmott, 1950. 42 pp., illus., 2/6. (Mechanical World Monograph No. 61).

Die design and diemaking practice; 3rd ed.:
Franklin D. Jones ed. New York, Industrial Press, 1951. 1,083 pp., illus., $7.00.

Electric illumination; 2nd ed.:
J. O. Kraehenbuehl. New York, Wiley, 1951. 446 pp., illus., $8.00.

Electrical code:
London, Institute of petroleum, 1950. 99 pp., 26s. (Being part 1 of the Institute of petroleum Model code of safety practice in the petroleum industry).

Electrical year book 1951:
London, Emmott, 1951. 360 pp., illus. 3/–.

Elements of ore dressing:
A. F. Taggart. New York, Wiley, 1951 595 pp., illus., $10.00.

Exposés d'économique; introduction générale. L'apport des ingénieurs français aux sciences économiques:
F. Divisia. Paris, Dunod, 1951. 158 pp. illus., 650 fr.

Handbook of correctional institution design and construction:
United States Bureau of prisons, Washington, 1949. 317 pp., illus., $6.00.

Ingenious mechanisms for designers and inventors, Volume 3:
Holbrook, L. Horton ed. New York, Industrial Press, 1951. 536 pp., illus., $6.00.

Methods of operations research:
P. M. Morse, and G. E. Kimball. New York, Wiley, 1951. 158 pp., $4.00.

Natural gas economics:
Joseph A. Kornfeld. Dallas, Texas, Transportation Press, 1951. 260 pp., illus., $5.00.

Physics in chemical industry:
R. C. L. Bosworth. Toronto, Macmillan, 1951. 928 pp., illus., $13.35.

Pressure vessels:
William Buchan Ritchie. London, Emmott, 1950. 71 pp., illus., 3s.

Prestressed concrete:
Gustave Magnel. London, Concrete Pub. Ltd., 1951. 300 pp., illus., $3.50.

Process engineering:
W. H. Schutt. New York, McGraw-Hill, 1948. 309 pp., illus., $5.85.

Report preparation:
Frank Kerekes. Ames, Iowa State College Press, 1951 .449 pp., illus., $6.90.

Soil mechanics for civil engineers:
Knight, B. H. Toronto, Longmans, Green, 1951. 255 pp., illus., $4.20.

LIBRARY REGULATIONS

Hours

Mon., through Fri. . . . 9 a.m. - 5 p.m.

Saturdays . . . . . . 9 a.m. to 12 noon

Summer Hours

9 a.m. - 5 p.m. Closed all day Saturdays.

Bibliographies and Literary Searches

Short subject bibliographies are compiled on request.

Extensive searches will be made at a charge of $3.00 per hour to members, and $5.00 per hour to non-members.

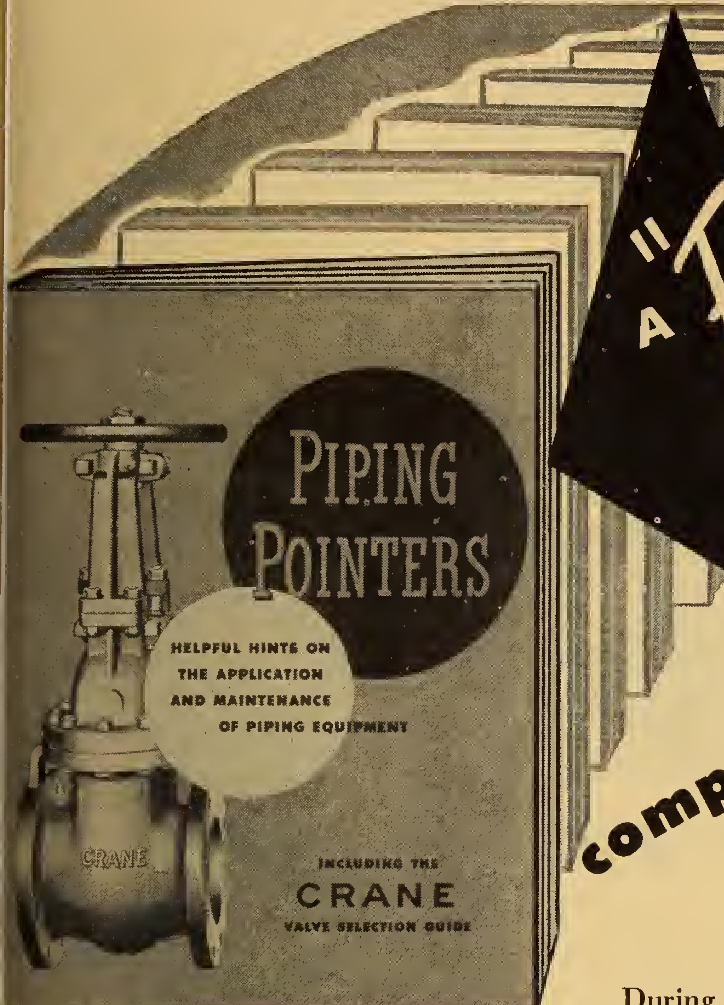
Please give as much detail as possible when requesting information of either type.

Borrowing and Purchasing

Books, periodicals, photostats, translation, etc. may be borrowed for two weeks at a time. **A fine of 25c. per day will be charged for each day borrowed items are retained beyond this period.**

A library deposit of $5.00 at par in Montreal is required before items may be borrowed. Books, periodicals, etc. may be ordered by members through the library. All carrying charges are payable by the individual concerned. Except in the case of library deposits, please make **no payments in advance.**

Non-members may consult the library, but may not borrow material.



A "Best Teller" IN THE PIPING WORLD

completely NEW edition

full of practical, helpful information

During World War II, when shortages of essential materials necessitated increased watchfulness by all those concerned with plant piping—particularly maintenance men—the informative Crane "Piping Pointers" Manual was warmly welcomed and appreciated.

Today industry, gearing itself to preparedness production, faces comparable conditions. Today, therefore, is the appropriate time for the re-issuance of similar helpful information. The 1951 edition of "Piping Pointers", now available, is completely new from cover to cover. With its 316 illustrations it comprises 36 pages of piping selection, installation and maintenance "know how".

A definite *must* for the trainee . . . an appreciated refresher course for the old-timer . . . it's a valuable, convenient and virtually indispensable reference guide for all plant men.

Ask for your copies, now... You're welcome to two or two dozen—as many as you require for your staff—and for your shop training programme.

Ask, too, about the Crane film, "Piping Pointers", a 28-minute, 16 mm. sound picture which we will gladly loan for your training schedule. It shows novices how to do things right in hooking up piping components. Write or phone your Crane Branch—or write "Piping Pete", c/o Crane Limited, 1170 Beaver Hall Square, Montreal.

Fascicule en français

Le fascicule "Notions de tuyauterie", imprimé en français, comprend un dictionnaire de 16 pages, anglais-français et français-anglais, où se trouvent tous les termes employés en tuyauterie. Ce fascicule est donc d'une utilité considérable pour les plombiers, les acheteurs et, en général, toutes les personnes intéressées à l'installation et à l'entretien des tuyauteries.

TECHNICAL BULLETINS, PAMPHLETS, ETC.

British electrical and allied industries research association. Technical Reports:
No. L/T210—The sequence and location of internal discharges in dielectrics, by J. H. Mason. No. L/T212—Rheological study of the creep of dielectrics over short times and its relation to dynamic properties, W. Lethersich. No. L/T233—Compressibility and absorption frequency of ionic crystals, B. Szigeti. No. L/T235—The sequence and location of internal discharges in dielectrics (second report), by J. H. Mason. No. L/T236—A note on the mean free path of slow electrons in ionic crystals, by S. Zienau. No. L/T241—The deterioration and breakdown of dielectrics resulting from internal discharges—1, by J. H. Mason.

Canada. National Research Council. Laboratory notes:
No. ST-1-50—A note on vibration isolation from a non-rigid base, by J. P. Uffen.

Canadian standards association. Lists of publications:
List of publications, 1951.

Council for codes of practice for buildings construction and engineering services (London). Reports:
Fourth report, 1st January to 31st December 1949.

Engineering societies library. Bibliographies:
No. 8—Bibliography on management of construction jobs.

Institute of metals. Reprints:
No. 1273—Shearing of metal bars, by T. M. Chang and H. W. Swift. No. 1277—Stress-ageing treatment and its effects on the physical properties of copper-, iron-, and aluminium-base alloys, by R. F. Gill and others. No. 1278—The influence of alloy constitution on the mode of solidification and sand castings, by R. W. Ruddle and A. L. Mincher. No. 1279—Some observations on the alpha-beta transformation in titanium, by A. D. McQuillan. No. 1280—Review of published information on the oxydation and scaling of copper and copper-base alloys, by R. F. Tylecote.

Institution of civil engineers. Civil engineering codes of practice:
No. 4 (1950)—Foundations. Draft for comment.

International civil aviation organisation (ICAO). Indexes of ICAO documents:
Cumulated edition April 1947 to December 1948. Cumulated edition January to December 1949. Cumulated edition January to July 1950. Special issue PICAO and ICAO assembly documentation 1946 to 1950.

...Serials received in ICAO library:
December 1950.

Princeton university. Industrial relations section. Research reports:
No. 83—Maximum utilization of employed manpower. A check list of company practice.

RCAF experimental and proving establishments. Development reports:
No. D1-1—Propeller blade angle meter.

U.S. Highway research board. Bulletins:
No. 32—One-way streets.

...Research reports:
No. 11-B—Surface drainage.

BOOK NOTES

Prepared by the Library of The Engineering Institute of Canada

BRITISH STANDARDS:

British Standard Institution, 24/28 Victoria St., London, S.W.1.

B.S. 231: 1950—Pressboard for electrical purposes, 3/–.

This reedition of the 1936 standard includes tests for ageing in oil and resistance to compression and de-formation. Amendments have been made to the definitions.

B.S. 781: 1950—Wrought iron chain slings, 6/–.

This standard deals with iron chain slings and rings, links alternative to rings, egg links and intermediate links. It provides a specification for materials, form and dimensions of components, and tests for wrought iron chain slings from 3/8 in. to 1½ in. nominal size.

B.S. 1134: 1950—The assessment of surface texture (centre-line-average height method), 6/–.

The present work refers to the measurement of the irregularities of metal surfaces machine-finished by various methods. It covers terminology, instruments and methods to be employed in assessing B. S index numbers for surface textures, preferred limits for the grading of textures, and symbols to be employed on drawings.

B.S. 1507/1508: 1950—Steel (ferrous) pipes and tubes for pressure vessels for use in the chemical and allied industries, 10/6.

This document contains a comprehensive range of specifications for pipes and tubes manufactured from twelve types of steel, including mild steel, alloy steel and austenitic steel. Full details are given of chemical compositions, mechanical properties, methods of test and tolerances in finished pipes and tubes.

B.S. 1646: 1950—Graphical symbols for instrumentation, 2/6.

The system of instrument symbols described is suitable for use in engineering and industrial reports and in plant arrangement and layout drawings. It enables any combination of instruments to be shown in relation to the units of the plant with which they are associated.

B.S. 1663: 1950—Higher tensile steel chain (electrically welded), 2/6.

In addition to short link chain, the standard provides for pitched or calibrated load chain for use with pocketed sheaves, and the range of sizes covered (in terms of the diameter of bar which the chain is made) is from ¼ in. to 2 in. Also given are specifications of quality of material, heat treatment, dimensions and tolerances of bar and links, workmanship, breaking strength and safe working loads.

B.S. 1692: 1950—Gin blocks, 2/–.

Specifications are given in this standard for fibre rope gin blocks used in building or similar work for hoisting materials, by direct hand manipulation or by means of small portable hand winches. Four sizes of blocks are specified: 4, 8, 12 and 16 inches.

B.S. 1693: 1950—X-Ray diffraction powder cameras, 2/–.

This standard deals with standardization in the design of 1) Cameras having a nominal diameter of 9 cm., which are intended for use at room temperatures where the film is mounted by the Van Arkel or by the Bradley-Jay method. 2) Cameras having a nominal diameter of 19cm., with fixed or removable film holder, in which the type is mounted on a fibre of small diameter with provisions for rotation or oscillation.

B.S. 1698: 1950—Mercury-arc rectifier equipments, 5/–.

Application of this standard can be made to mercury arc rectifier equipments comprising half-wave rectifiers of any type having mercury pool cathodes, rated at 50 kw and above, having not less than 6 phases, for D.C. voltages not exceeding 4,000 and for service in non-explosive atmospheres.

B.S. 1700: 1950—Typical ship's derrick rigs, 7/6.

This British Standard is intended to serve as a useful informatory guide for those directly concerned with the working of cargo, and provides information on the various components of ship's cargo lifting tackle. Four typical derrick rigs are shown by drawings which also give methods of estimating graphically resultant loads on the gear.

B.S. 814: 1950—Mild steel drums, light duty-fixed ends. (Packaging standard), 2/–.

B.S. 1702: 1950—Mild steel drums, heavy duty-fixed ends. (Packaging standard), 2/–.

These two standards include specifications for the 44 Imperial gallon petrol drum. They specify the quality and gauge of metal and give details of construction, dimensions, closures, testing and marking.

B.S. 1133 Section 8: 1950—Wooden containers. (Packaging standard), 10/6.

This lengthy standard (137 pages) covers all types of sawn wood and plywood cases and boxes, casks, barrels and crates; it also includes a section on closures for returnable cases. An exceptionally useful feature is the inclusion of a chart to assist in calculating various details of skids for large frames cases; a chart for sizes of nails to be used is also included

B.S. 1133 Section 14: 1950—Adhesive and sealing tapes. (Packaging standard), 3/–.

This publication includes sub-sections describing gummed paper tapes and gummed cambric tapes, as well as the various types of self-adhesive tapes. For the latter, detailed specifications are given as well as the usual descriptive matter and a number of tests related to these specifications are included in the appendices.

BASIC REFRACTORIES. THEIR CHEMISTRY AND THEIR PERFORMANCE:

J. R. Rait. London, Iliffe, 1950. 408 pp., illus., 60s.

The present work contains a review of our fundamental knowledge relating to basic refractories, including dolomite, magnesite, chrome-magnesite and forsterite. The establishment of the complex phase diagram CaO-MgO-SiO_2-Al_2O_3-Fe_3O_2 and the derivation of the constitution of numerous commercial basic refractories from various countries are described. Chrome ores have also received detailed attention. Basic refractories under various service conditions have been subjected to detailed examination.

CHIMIE ORGANIQUE. Tome 3, FONCTIONS COMPLEXES:

A. Kirrmann. Paris, Armand Colin, 1950. 183 pp., 180 fr.

This book on complex organic compounds is the third of a series on organic chemistry, by this author. Throughout the book, emphasis is put on the mutual influence of two functions in the same molecule, and on the new resulting properties. The nomenclature of this small manual follows the best French traditions, and would not be readily understood by readers with an English speaking background.

ELECTRICITY IN THE HOME AND ON THE FARM, 3rd ed.:

F. B. Wright. New York, Wiley 1950. 380 pp., illus., $3.96.

This book is written for those who wish to gain a practical knowledge of electricity and its applications in the home and on the farm. It is the aim of the author to present here such fundamentals and practical jobs as will aid the reader to think for himself in terms of electricity and to acquire some of the more common skills in its use. The book is divided in two parts, the first dealing with fundamentals and their application to home and farm, the second being a series of practical jobs ranging from the simple to the more difficult.

FINISHING HANDBOOK AND DIRECTORY, 1951:

London, Sawell Pub. Co., 1951. 246 pp., illus., 15/–.

A study of this first edition of FINISHING HANDBOOK AND DIRECTORY, leads one to hope that it will become a regular publication.

The first 5 sections of the book are devoted to preparation treatments, each one the work of a specialist in the particular finish concerned.

Notes, tables and data of interest to the finishing shop follow this, and directions of Brand and trade names, equipment, supplies and services, names and addresses, and trade associations and organisations connected with finishing, complete this handy reference volume.

HEAVYSIDE CENTENARY VOLUME:

London, Institution of Electrical Engineers, 1950. 98 pp., illus., 5/–.

Celebrating the centenary of the birth of Oliver Heaviside, this volume published by the Institution of Electrical Engineers, is both a technical and a personal appreciation of Oliver Heaviside, the scientific genius and the man.

Papers on his unpublished notes, contributions to electromagnetic theory, operational calculus, telegraph transmissions, and pure mathematics are included. The volume opens with a description of Oliver Heaviside — the man, by Sir George Lee O.B.E., M.C., based on his personal correspondence, and accounts by his friends.

Oliver Heaviside: A personal sketch, by G. F. C. Searle, Sc.D., F.R.S., complete with personal anecdotes, brings the volume to a close — A fitting tribute to a great scientist.

INDUSTRIAL HIGH FREQUENCY ELECTRIC POWER:

E. May. New York, Wiley, 1950. 355 pp., illus., $5.00.

This book has been written around the notes prepared for a course of lectures on "industrial high-frequency technology", given in 1944 at the Birmingham Central Technical College. The book includes chapters on arc and spark oscillators, high frequency alternators, the triode valve, class B and class C operation of power amplifiers with tuned loads, induction and dielectric heating. There are preliminary and complementary chapters on the basic circuit theory, auxiliary equipment and H. F. measurements, industrial applications and operating problems.

MECHANICAL WORLD YEAR BOOK 1951:

Manchester, Emmott, 1951. 268 pp., illus., 3/6.

The 1951 issue of this yearbook contains, as usual, mathematical and mechanical tables, a clssified buyers directory, much advertising, a list of these advertisers, and the useful section on gas turbines. The publishers have chosen the subject "Engineering aspects of productivity", for authoritative treatment. Treatment of this subject includes chapters on the continuous flow gas turbine, belt conveyors and elevators, fuel and lubricating oils, machine tools, steam boilers, gearing, etc.

NUCLEAR PHYSICS:

Francis Bitter. Cambridge, Mass., Addison-Wesley, 1950. 216 pp., illus., $5.50.

This book is intended for students who have had a course in atomic theory in addition to the usual introductory physics courses. Since it is often impossible to give separate instruction to students intending to continue the study of nuclear science and to those intending to specialize in some other field, the author has attempted to write a book suitable for both groups. Some of the problems and exercises at the ends of the chapters have been chosen with the intention of interesting students who may wish to think somewhat more deeply about matters discussed in the text.

PRIVATE COMPANIES SPECIAL TAX ON UNDISTRIBUTED INCOME:

CCH Canadian Ltd. Toronto and Montreal, 1950. $2.00.

In this publication, tax-saving features permitted under recent amendments and regulations covering private and controlling companies are discussed at length by CCH consulting legal and accounting editors. Every "private company"—seventy-five shareholders or less—and certain conolling companies may take advantage of ie savings permitted and indicated, de- ending upon the facts of their particular ıse. The procedure is set out in detail ith examples.

ROCEEDING OF THE UNITED NA- IONS SCIENTIFIC CONFERENCE N THE CONSERVATION AND UTI- IZATION OF RESOURCES, 17 AU- UST - 6 SEPTEMBER, LAKE SUC- ESS, NEW YORK. Volume 1, PLE- IARY MEETINGS:

New York, United Nations, 1950. 431 pp., $4.50.

With the need for a reasoned and scien- fic conservation of world resources be- oming more and more evident these Pro- eedings are a means to a mobilization and rganization of that knowledge.

In addition to that however, they con- titute a definite milestone in the history f the U.N., in that they mark the first ccasion on which the U.N. invited the cientists of the world to meet together for he presentation and exchange of views.

The papers are grouped under broad ubject headings, and contributors are isted at the back with page references. Most papers include bibliographies.

PROPERTIES OF LUBRICATING OILS AND ENGINE DEPOSITS:

C. A. Bouman. Toronto, Macmillan, 1950. 170 pp., illus., $2.85.

The purpose of this book is to deal with he most important principles and prob- ems underlying the lubrication and foul- ng of internal combustion engines. The eader is assumed to be acquainted with he principles and the construction of in- ernal combustion engines as well as with ome fundamental physical and chemical acts. The author discusses the classifica- ion and manufacture of lubricating oils, ests for fresh oils, forms of contamination, ractical tests for lubricating oils, etc. The ook contains much tabulated material, ncluding conversion tables for kinematic viscosity to Redwood No. 1 viscosity, Saybolt universal viscosity and Engler viscosity.

STRUCTURAL PLASTICS:

H. C. Engels and others. Toronto, McGraw-Hill, 1950. 301 pp., illus., $5.85.

"Structural plastics" presents a factual, realistic and analytical coverage of the structural characteristics of plastics, and may be useful to the chemist, the struc- tural engineer, the architect, the aircraft designer, etc. The scope of the book is re- stricted to structural considerations and is not intended as a treatment of the en- tire plastics field. The reader will find here a sound treatment of low-pressure lami- nates and laminating techniques, porous plastics, honeycomb constructions, sand- wich materials, and structural adhesives, as well as a separate chapter on radome design and fabrication.

TABLES FOR CONVERSION OF X-RAY DIFFRACTION ANGLES TO INTERPLANAR SPACING:

Washington, U.S. Dept. of Commerce, 1950. 159 pp., $1.75. (National Bureau of Standards, Applied mathematics series No. 10).

The following tables give spacing values δ in angstrom units corresponding to the angles θ which are usually measured when diffraction patterns are used for chemical identification and crystal structure deter- mination. The first six tables give the spacing values for the angles θ from 0° to 90° at intervals of 0.01°. These tables were calculated by using the $K\alpha_1$ wavelengths for X-Ray targets of molybdenum, copper, nickel, cobalt, iron and chromium, re- spectively. The last two tables contain a rearrangement of the data for copper and iron.

THEORIE, FONCTIONNEMENT ET CALCUL DES MACHINES ELECTRI- QUES. Tome 1, CIRCUIT MAGNE- TIQUE. MACHINES A COURANT CONTINU:

A. Guilbert. Paris, Dunod, 1951. 608 pp., illus., 2,760 fr.

The present work is intended both as a manual for students of scientific schools and as a vade mecum for engineers build- ing or using electrical machines. This first volume studies machines either generating or using direct current. Throughout the book, graphics are used, whenever they can successfully take the place of alge- braic calculations and demonstrations. It is claimed that less formulae are employed than in most publications of similar coverage.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

AIRPLANE DESIGN MANUAL:

By F. K. Teichmann, 3rd ed. New York, Pitman, 1950. 382 pp., illus., $7.50.

Written for the student, young engineer, and draughtsman, this book outlines an orderly procedure for the design of air- planes. It considers airfoil selection, preliminary weight estimation, the balance diagram, the various parts of the plane, instruments and equipment, preliminary performance calculations, elementary long- itudinal stability calculations, and ma- terials of construction. The appendix contains much valuable data. The edition has been revised and the bibliography omitted.

CHEMICAL FORMULARY, Vol. IX:

Edited by H. Bennett. Chemical Publishing Co., Brooklyn, 1951. 648 pp., illus., $7.00.

This volume of the Chemical Formulary contains a collection of new, up-to-date formulae for a wide variety of products. Only the introductory material which is repeated in all volumes is retained. The list of chemicals and their suppliers has been enlarged with new trade-mark chemicals.

CIRCUIT ANALYSIS OF A-C POWER SYSTEMS, Volume II:

E. Clarke. New York, Wiley, 1950. 396 pp., illus., $8.50.

Continuing the treatment started in Volume I, this book presents methods for determining the performance of a-c power systems under normal and abnormal operating conditions. The electrical characteristics of insulated cables, various types of transformers and autotransformers, synchronous machines and induction motors are determined, with special attention to the development of equivalent circuits for use in the component networks. As in Volume I, circuits are analyzed by means of components.

DE RE METALLICA:

By Georgius Agricola, translated from the First Latin Edition of 1556 by H. C. Hoover and L. H. Hoover. New York, Dover, 1950. 638 pp., illus., $10.00.

This early classic on mining and metallurgical practice, originally published in Latin, was translated into English by Herbert Hoover and his wife, Lou Henry Hoover, and published in 1912. Long out of print, the Hoover translation has now been reprinted in complete form: text, footnotes, original illustrations, and three documentary appendices provided by the translator.

ELECTRIC CIRCUIT THEORY:

By H. Tropper. Toronto, Longmans, Green 1949. 164 pp., illus., $3.00.

Intended as a text for senior electrical engineering students, this book provides a unified account of some of the fundamental aspects of circuit theory. It shows how the solution of many network problems may often be simplified by the application of a few specific theorems. The treatments of steady-state and transient theory are based on the "superposition principle". A knowledge of elementary A.C. theory is assumed.

ENCYCLOPEDIA ON CATHODE-RAY OSCILLOSCOPES AND THEIR USES:

J. F. Rider and S. D. Uslan. New York, Rider, 1950. 982 pp., illus., $9.00.

This book covers the theory and uses of all types of cathode-ray oscilloscopes and synchroscopes manufactured from 1940 to 1950. It is divided roughly into four categories: the first dealing with theory and operation; the second, with applications; the third, with commercial oscilloscopes and related equipment; and the last is a compilation of 1600 complex waveform patterns. Three appendices on the characteristics of cathode-ray tubes, RMA cathode-ray bases, and photography, and a bibliography complete the book.

FUNDAMENTALS OF ACOUSTICS:

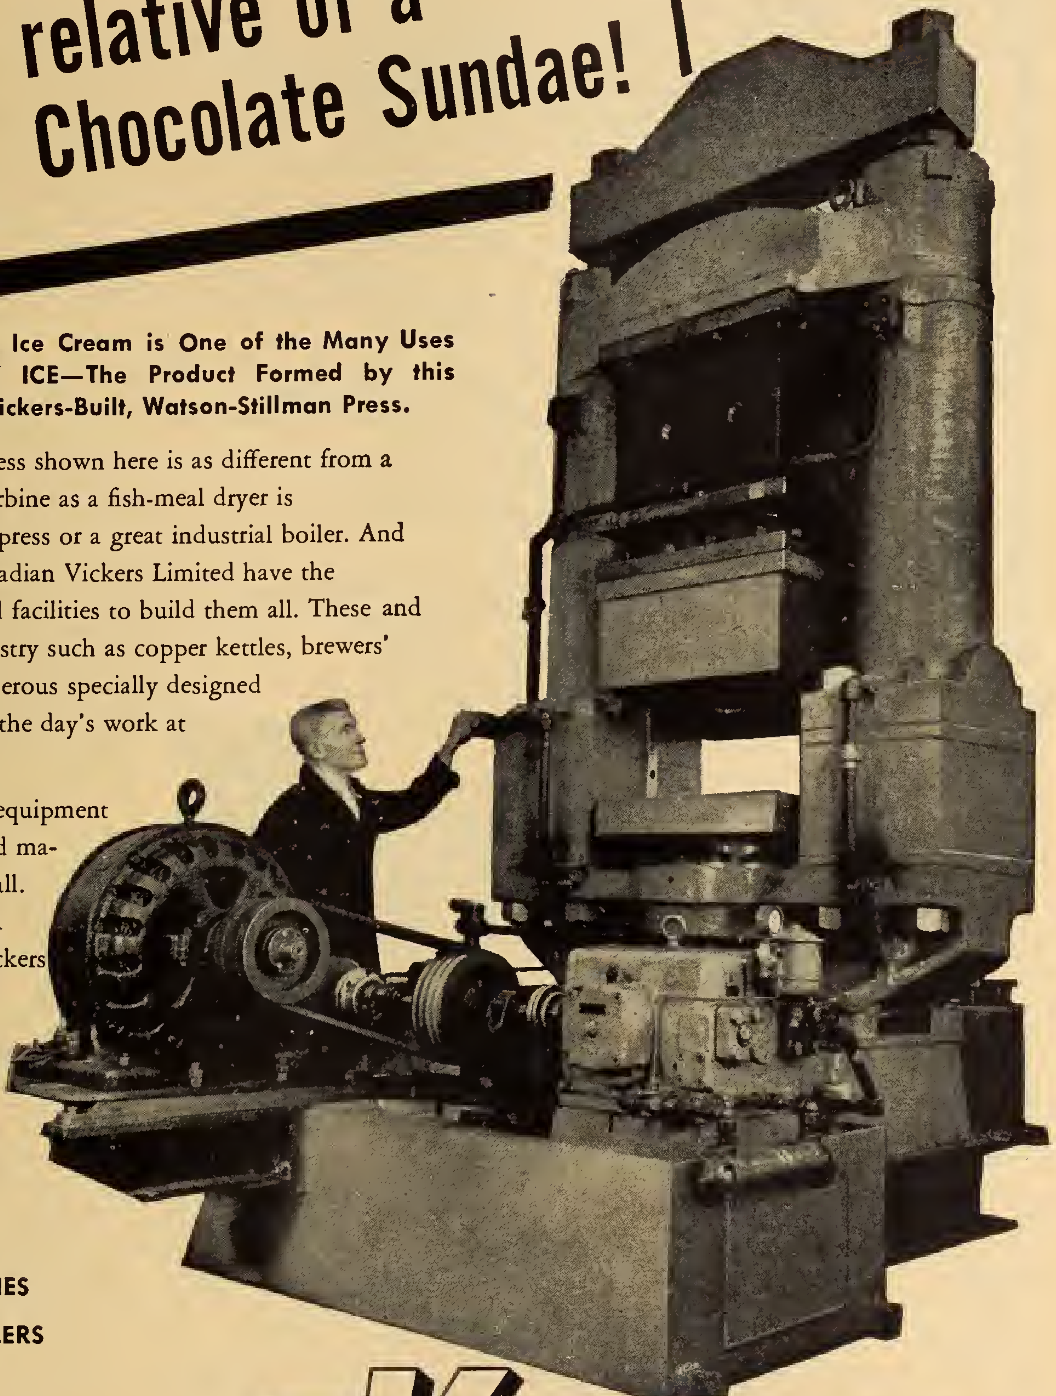
L. E. Kinsler and A. R. Frey. New York, Wiley, 1950. 516 pp., illus., $6.00.

This book presents the fundamental principles underlying the generation, transmission and reception of acoustic waves. The first nine chapters provide an analysis of the various types of vibration of solid bodies and of the propagation of sound waves through fluid media. The remaining seven chapters are concerned with a limited number of applications of acoustics. A knowledge of the fundamental principles of mechanics, electricity and calculus, including partial derivatives, is assumed. Problems for student solution are included.

FUNDAMENTALS OF QUANTUM MECHANICS:

E. Persico, translated and edited by G. M. Temmer. New York, Prentice-Hall, 1950. 484 pp., illus., $8.00.

In this book are presented the fundamental laws and principles of quantum mechanics, together with some applications. The first part provides an historical, overall view of the evolution of quantum mechanics using an intuitive and elementary approach. The second part, preceded by a mathematical introduction, considers the principles of the wave mechanics of a particle. In the third and last part, the transformation theory is developed, more advanced mathematical meth-



ods are used, and applications are considered.

GAS PRODUCERS AND BLAST FURNACES, Theory and Methods of Calculation:

W. Gumz. New York, Wiley, 1950. 316 pp., illus., $7.00.

Theory and calculation methods for gasification processes are developed in detail. In part one, gasification reactions, gas composition at equilibrium and at incomplete equilibrium, and gas-producer performance are treated mathematically. Part two deals with blast-furnace gas and computations. Reactive kinetics are considered in part three. The appendix contains valuable tabulated data.

LAPLACE TRANSFORMATION, Theory and Engineering Applications:

W. T. Thomson. New York, Prentice-Hall, 1950. 230 pp., illus., $5.00.

Following introductory material, the properties and dynamical and structural applications of the Laplace transformation are discussed. The theory of complex variables is reviewed to aid in the understanding of applications involving partial differential equations and difference equations. A variety of such applications including the field of closed-loop systems are considered. The closing chapter discusses two types of mechanical-electrical analogies frequently used in analysis.

NEUE THEORIE des STAHLBETONS:

R. Saliger, 2 ed. Franz Deuticke, Wien (Vienna), Austria, 1947. 110 pp., illus., $3.00 (obtainable from Stechert-Hafner, 31 East 10th St., New York).

The author presents a "new theory of reinforced concrete on the basis of plasticity in the fracture state." The several chapters discuss fundamental strength characteristics of concrete and steel, and analyze various compression and tension members, including a brief section on indeterminate structures. Some 200 broadly classified references are given.

POWER SYSTEM STABILITY, Volume II, Power Circuit Breakers and Protective Relays:

By E. W. Kimbark. New York, Wiley, 1950. 288 pp., illus., $8.00.

This is the second book of a three-volume work intended for use by power-system engineers and by graduate students. The present volume covers power circuit-breakers and protective relays, including material on rapid reclosure of circuit breakers and on the performance of protective relays during swings and out-of-step conditions. Both three-pole and selective-pole tripping and reclosure are discussed. Numerous references and a set of problems are included at the end of each chapter.

REVIEWS OF PETROLEUM TECHNOLOGY, Volume 9 (covering 1947), 340 pp:

Edited by F. H. Carner, E. B. Evans and G. Sell, published by Institute of Petroleum, Manson House, London, 1949-1950. Tables, 27s. 6d.

The 9th volume of this series deals with a review of developments in petroleum technology for the year 1947. In the 8th volume, the subjects of gasoline and light distillates, furnace fuel oils, and lubricants and lubrication, omitted in the 7th volume, are included and cover the years 1941-1946. In the 9th volume, two articles, "Refinery Plant and Engineering" and "Plant Instrumentation", are the last of the series dealing with the war period. "Aircraft engines" constitutes a new chapter heading in this volume.

THEORY OF THE INTERIOR BALLISTICS OF GUNS:

J. Corner. New York, Wiley, 1950. 443 pp., illus., $8.00.

This book is devoted to theoretical techniques used in the study of the phenomena that occur inside a gun or that are closely associated with it. Gun propellants, and simple and advanced ballistic methods are discussed. Similarity relations and optimum problems, the interior ballistics of leaking guns, some special types of guns, the hydronamic problems of interior ballistics, and heat transfer to gun barrels are among the special topics considered.

TV AND OTHER RECEIVING ANTENNAS (Theory and Practice):

A. B. Bailey. New York, Rider, 1950. 595 pp., illus., $6.00.

Of value both to the student and to the communications engineer, this practical book begins with a review of definitions and terminology, an analysis of the television signal, and discussion of the conditions that determine signal levels at the receiver. Succeeding chapters take up in turn the major types of receiving antennas, including discussion of their advantages and disadvantages and practical suggestions as to which are best for certain areas. Condensed data sheets are included for approximately 50 different antenna types.

UMLAUFRADERGETRIEBE:

H. Strauch. Carl Hanser Verlag, Munich, Germany, 1950. 122 pp., illus., 9 D.M.

This book provides a detailed discussion of planetary gear drives. Mathematical and tabular methods are used to describe the characteristics of the various types of gear drives. Many sketches as well as a bibliography are included.

FOR FLAT OR LOW-PITCHED ROOF DECKS

Fiberglas* Roof Insulation is designed for use on flat or low-pitched roof decks that are to be surfaced with a built-up bitumen-bonded roof. It may be laid over any type of roof deck, i.e., wood, steel, concrete, or precast slabs. It will not rot, swell, shrink or decay. It is a highly efficient insulation, and is installed by standard methods.

No significant dead load is imposed by Fiberglas Roof Insulation upon the roof structure yet its compression strength is great enough to permit normal traffic during application and subsequent maintenance.

Under the most severe conditions, on any type of steel, concrete, wood, or precast slab roof, Fiberglas Roof Insulation offers the most durable and satisfactory insulation for a built-up roof. *"Fiberglas Design Data Sheet RW6.A.2." contains further information and is available on request.*

BUSINESS & INDUSTRIAL BRIEFS

A Digest of Information received by The Editor

Appointments and Transfers

New Sheet-metal Working Firm.—A new company, Milbro Metal Products Ltd., has been incorporated to specialize in the manufacture and production of light gauge sheet metal work. George A. Davis has been elected President. The company's plant is located at 56 Abell Street, Toronto.

George A. Davis

Brick Company Address Change.—The Cooksville Co. Ltd., and the Interprovincial Brick Co. Ltd. are now located at 1055 Yonge Street, Toronto. The telephone No. is Midway 8466.

●

New Manufacturing Company.—Richardson-Allen Corporation, manufacturers of low voltage selenium rectifiers for the plating industry and high voltage rectifiers for other industrial uses, have incorporated a Canadian company under Dominion charter. The Company will manufacture many of the products now being manufactured in the United States. The new Company will be known as Richardson-Allen of Canada Limited. The address is 370 Victoria Street, Toronto. Wesley S. Block, Jr. is the president and C. E. Brigham is vice-president of the Canadian organization. The operations of the Canadian company will be under the direction of the secretary, Kergan Wells.

●

Ivan McDonald.—Ivan McDonald has been appointed sales manager, eastern region, Minneapolis-Honeywell Regulator Co. Ltd. He will continue to serve in the capacity of Montreal branch manager.

In his new capacity, Mr. McDonald will have supervision of sales of all Company divisions in Quebec, the Maritimes, and Newfoundland.

Mr. McDonald joined Minneapolis-Honeywell in 1931 and was transferred to the sales office in 1934. In 1936 he opened the Company's Winnipeg branch

Ivan McDonald

office. During the war he served as adjutant of the Winnipeg Grenadiers with the rank of captain. He rejoined the firm in Montreal in 1946.

●

H. J. Sissons.—Henry J. Sissons has been appointed director of the priorities division in the Department of Trade and Commerce.

While no formal priority system is in force in Canada, the existence of various systems such as the "Defence Order" arrangements in the United States, make the establishment of a priorities division necessary here. In addition to its work in connection with the U.S. sources of supply, the new division will deal with various problems of ensuring supply for defence orders in Canada in fields that are not covered by separate divisions, such as the steel and non-ferrous metals divisions.

Mr. Sissons is on loan from the Ontario Hydro-Electric Power Commission.

●

T. L. Chown

T. L. Chown.—George A. Davis, president of Plate and Structural Steel Ltd., and Plate and Structural Steel Sales Ltd., has announced the appointment of T. L. Chown to the board of directors of both companies. Mr. Chown is also the vice-president and assistant general manager of T. C. Chown Ltd., of Montreal.

●

Hugh D. Cameron.—Hugh D. Cameron has been appointed president of Air Reduction Canada Limited. Mr. Cameron will also continue as President of Ohio Chemical Canada Limited. He succeeds Hugh Chambers who is now chairman of the board of Air Reduction Canada Limited.

●

New Westinghouse Division.—To meet rapidly increasing demands for electronic equipment, Canadian Westing-

AT TRENCHE

At the great new Trenche Development of The Shawinigan Water and Power Company Dominion Bridge Co., Ltd. was privileged to supply:—

- ***All hydraulic regulating gates and hoisting machinery.***
- ***Head block travelling gantry crane: 40 tons capacity.***
- ***Power house crane: 250 tons capacity.***
- ***Penstocks and other platework.***
- ***Structural steelwork for power house.***

DOMINION BRIDGE

house Company, Limited, will immediately expand its production under a newly-formed division.

It is estimated that about 1,000 employees will be added to the electronics division within a year. This will increase the company's payroll by \$2½ million annually. The division will occupy approximately 180,000 square feet of floor space.

In addition to a rapid step-up in production, the projected electronics programme calls for extension of what is considered the largest research laboratory in the Canadian electrical industry.

The head of the division will be John D. Campbell, who has been connected with the firm since 1934. John D. Houlding has been appointed manager of the electronics marketing department.

•

Johns-Manville Appointments.—Leslie M. Cassidy has been elected chairman of the Board and Adrian R. Fisher has been elected president of the Canadian Johns-Manville Company Limited.

Mr. Cassidy succeeds the late Lewis H. Brown who was chairman and chief executive officer of Johns-Manville since 1929. Mr. Fisher, who succeeds Mr. Cassidy in the office of president, was previously vice-president for production and general manager of the Company's Asbestos Fibre Division.

•

Spectrographic Laboratory Amalgamation.—Expansion and development of Canada's only independent commercial spectrographic laboratory has just been announced by Technical Service Laboratories. Under a recent agreement, equipment of T.S.L. has been moved to the more spacious premises of the Canadian Research Institute at 46 St. George Street, Toronto, Ont.

Autonomy of both companies remains unchanged. Present policies place at the disposal of each firm the facilities of the other.

•

Fan Manufacturers' Officers.—At the Annual Meeting of the Canadian Fan Manufacturers' Association held on February 22nd at Hamilton, Ontario, J. H. Gregory was re-elected president for the coming year. W. E. Caldwell was re-elected vice-president and L. O. Monroe was re-elected secretary-treasurer.

Mr. Gregory is the sales manager of the Canadian Blower and Forge Company and Mr. Caldwell is the sales manager of Sheldons Engineering Ltd.

•

Note!

ANNUAL MEETING

May 9-10-11

New Equipment and Developments

Industrial Lamps.—Two high-wattage industrial lamps with built-in reflectors for use in the lighting of high-bay factories are available from Canadian General Electric Company. The new light sources are seen as a timely contribution to the nation's accelerated programme of defence and civilian production.

Because almost no dirt collects on the bottom of the bulbs, the new lamps are said to be especially desirable for use in such places as foundries, welding shops, and in other locations where dirt collection normally causes severe reductions in light levels. They are recommended particularly for use in high-bay areas where lamps can be reached for maintenance only at high cost or interference with production.

Produced in both 500 and 750-watt sizes, the lamps employ a new bulb design, the R-52 having a special contour to distribute the light downward for effective use in the working areas, and a cutoff to give reasonably comfortable brightness down to 35 degrees below the horizontal. The lamps measure six and one-half inches across the face, and eleven and three-quarter inches in length. The base is of the mogul screw type. The lamps are designed to be burned base-up, or within 25 degrees of that position. For complete details apply to any C.G.E. office.

●

New Automatic Controls.—Three types of controls, new to Canadian manufacture, were displayed recently by Minneapolis-Honeywell Regulator Co. Ltd. The display was in conjunction with the formal opening of a new addition to the Company's Leaside plant.

Commenting on the new controls W. H. Evans, vice-president and general manager, of the Company, said, "all three reflect expanding industrial activity in Canada and the growing acceptance of automatic devices which increase safety and efficiency in manufacturing processes, and economy and comfort in the field of home heating."

It was explained that production has been started on a line of industrial controls for use in all types of plants where it is necessary to measure or control temperature or pressure. On process applications they provide economies and greater uniformity of product than is otherwise obtainable through manually operated controls. Mr. Evans explained that the first instruments to go into production in the new plant are an industrial recording thermometer and a recording pressure gauge; electrically operated devices which not only indicate and maintain chart records, but which also can regulate industrial processing temperatures and pressures within extremely close limits. The line of industrial instruments will be expanded as tooling is completed.

The third type of control announced was a delayed opening oil valve, which can be installed on most existing and all new pressure type oil burners. This device will eliminate most of the causes of sooting. In operation, the new valve prevents the flow of fuel oil to the burner nozzle for approximately four seconds after the burner motor starts in order that the motor may come up to speed and deliver an adequate volume of air for proper combustion.

●

X-Ray Industrial Inspection.—Canadian General Electric Company claims a revolutionary discovery that promises to make possible for the first time the high-speed automatic X-ray inspection of thousands of industrial products. It may also be used to improve the performance of medical diagnostic and therapeutic X-ray apparatus.

The "heart" of the new inspection system is a tiny crystal, known as a "semi-conductor" which can be grown in size from a fraction of a millimeter to several millimeters in cubic size. When excited with X-radiation, it acts as an amplifier tube, releasing torrents of electrons that can be used to operate various types of mechanisms.

Complete information on this new crystal may be obtained from General Electric X-Ray Corporation Ltd., 212 King St. W., Toronto.

●

Civil Servants Visiting Britain.—Britain's Institute of Public Administration, at 76A New Cavendish Street, London, W.1, is anxious to get in touch with Canadian public servants, who will be visiting Britain this year for the Festival of Britain. The Institute has members throughout the Civil Service, in local government, the public corporations and the health services, all over Britain, and would like to arrange for introduction of Canadians to their members in those branches of the public services in which they may be interested.

●

Quebec Water Resources. — Quebec contains over 30 per cent of the total recorded water resources of Canada and ranks highest in developed power. Present installation is more than 6,000,000 hp., or over 37 per cent of the currently recorded resources of the Province.

●

British Instrument Display.—The first exhibition to be devoted exclusively to the British instrument industry, will take place at the National Hall, Olympia, from July 4th to 14th. Over 150 of the leading manufacturers engaged in the industry will be displaying their products with the purpose of acquainting instrument users in industry, medicine, and education throughout the world with the latest trends and advances in British manufacture in this particular field. Every exhibit will be of entirely British manufacture. The organizers, Messrs. F. W. Bridges and Sons Ltd., of Grand Buildings, Trafalgar Square, London W.C.2. are making elaborate preparations for the comfort of visitors from overseas. They will send, on request, a copy of the official catalogue which will be distributed when the exhibition opens.

●

New Degreaser.—A new non-inflammable and non-caustic aluminum degreaser, is being manufactured by Jenolite Limited, 433 Piazza Chambers, Covent Garden, London, England. It is claimed that this degreaser is non-injurious to rubber and quite harmless even to the surface of polished aluminum. It has been specially designed to clean and degrease aircraft wings, fuselages and cowlings, both inside and out.

The degreaser is manufactured in powder form for dilution in a ratio of 1 lb. to one gallon of water. It can be applied cold with an ordinary brush, or articles can be dipped in a mixture heated to a temperature not above 50 degrees Centigrade.

●

Electric Hammer Drill.—Victor Products Ltd., Wallsend-on-Tyne, Northumberland, England, claims to have developed an electric hammer drill which overcomes the technical problem of converting rotary motion to reciprocating motion. The Victor hammer drill has no connected parts, no possibility of stalling or overloading the motor, and generally approximates the approved design of the compressed air tool. Weighing only 16 lbs. it is available for brick, stone, wood or metal and can be used as a powerful chisel with a variety of tools. Complete details may be obtained from the manufacturer.

●

British Hand Tools.—The Federation of British Hand Tool Manufacturers, which along with the National Federation of Engineers' Tool Manufacturers and the Machine Tool Trades Association, is sponsoring the record 30,000 square foot joint British Machine Tool Section display at the 1951 Canadian International Trade Fair in Toronto, from May 28 to June 8, was formed in 1945.

The present membership totals approximately 400 firms, and membership is divided almost equally between "full members" and "associate members". The former comprise firms that are members through membership in one of nine affiliated associations. Associate members are firms whose products are not covered by any of the affiliated associations and which joined the federation individually.

President of the Federation is Thomas L. Elliott, chairman of Elliott-Lucas Ltd.

●

New Inhibitor.—Development of an inhibitor to protect shellac and other non-aqueous liquids from metal contamination has been announced by Monsanto Chemical Company.

H. J. Heffernan, Merrimac division general sales manager, said that the new product, is particularly valuable in view of the National (U.S.) Production Authority restrictions on shellac containers.

He said "the new inhibitor prevents iron pick-up" by forming a thin coating of a complex iron phosphate on the inner wall of the container. The reaction prevents the metal from becoming soluble in the shellac".

For complete details communicate with Monsanto (Canada) Ltd., 425 St Patrick Street, Montreal.

●

Large Quarry Plant.—A 90-foot long, 50-ton quarry plant which crushes rock into pebbles and loads them into lorries at the rate of 40 tons an hour is now being tested in Manchester, England.

●

British Cable in Canada. — Enfield Cables of Britain have won contracts totalling over $1,000,000 for the supply and installation of a pipeline compression cable for Ontario Hydro, and for the supply of 100,000 feet of self-contained compression cable for Quebec Hydro.

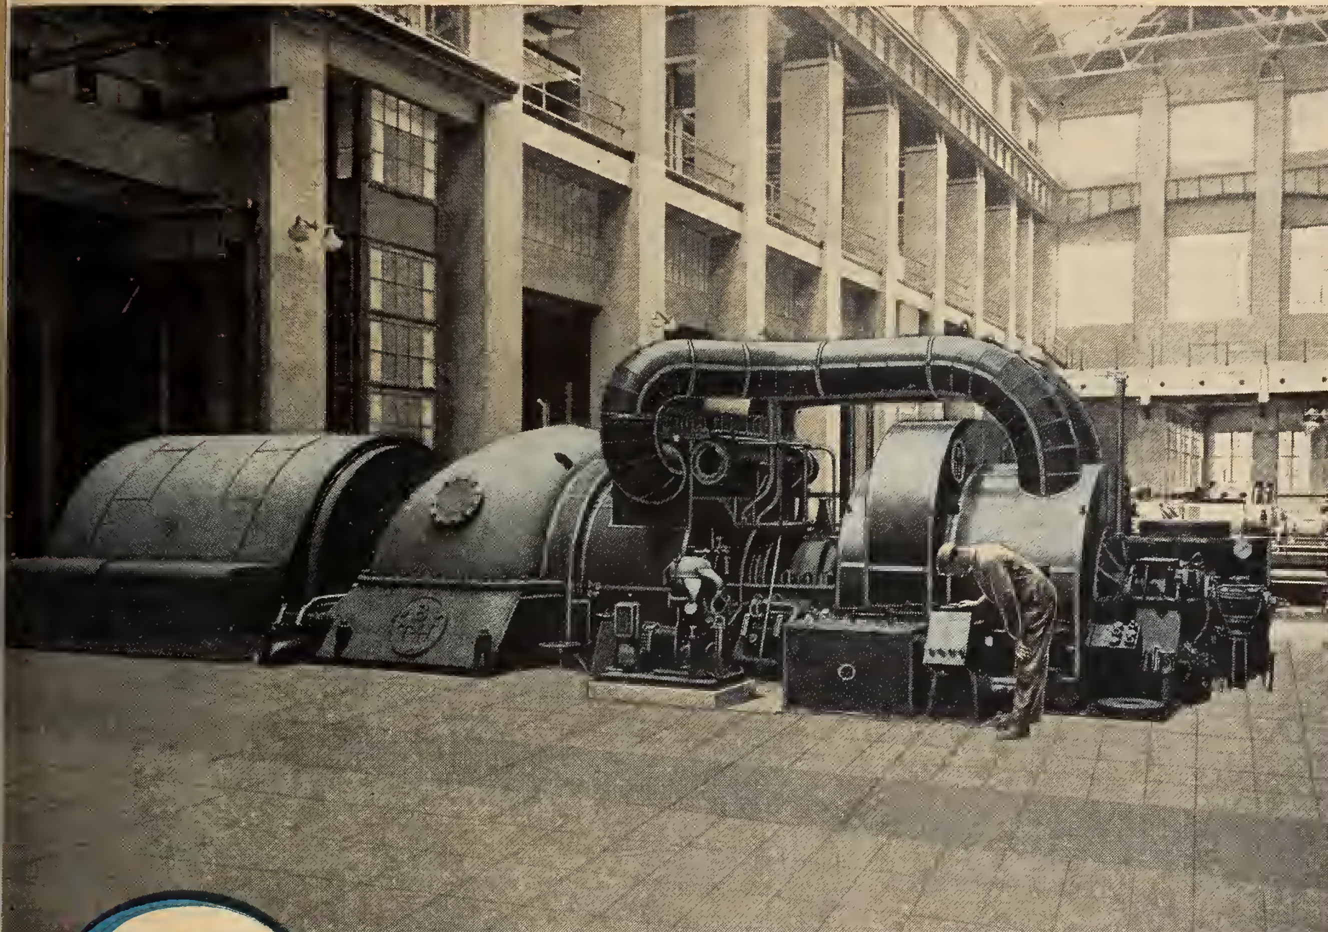
●

"Hevimet".—"Hevimet"—a non-cutting metal even heavier than cemented carbide and with 50 per cent greater density than lead — is available from the chemical division of Canadian General Electric Company. Important uses of this special metal, aside from its ability to resist the penetration of radioactive rays, are for balance weights on crankshafts, gyroscopes, variable-pitch propellers, centrifugal clutches and other similar moving parts. For static and dynamic balancing of such parts, as well as for balancing of aircraft control surfaces, etc., it has the advantage of maximum weight with minimum size. Its use for containers for radioactive materials will make it an important wartime product.

●

Nickel Statistics.—During 1950, International Nickel delivered 256,410,543 pounds of nickel in all forms. Its deliveries of special rolling mill products produced in the United States and Great Britain likewise established a new high record. In addition to increasing deliveries of nickel over 1949 by 22 per cent and delivering 267,316 ounces of platinum metals, an increase of 24 per cent over 1949, it delivered 212,947,394 pounds of refined copper, and also gold, silver, selenium, tellurium, and cobalt.

To provide this expanded supply of nickel, the Company brought into oper-



ation an additional blast furnace at its Coniston Smelter and an additional reverberatory furnace at its Copper Cliff Smelter.

During 1950 the Company spent over \$18,683,000 on capital improvements. The total length of underground development in the operating mines was brought, during the year, to more than 283 miles. Capital expenditures for 1951 are estimated at \$20,000,000.

To ensure continuity of nickel supplies, the Company accelerated and intensified its search for ore. In 1950 some 24,000 square miles of area were prospected chiefly by air, and detailed surveys made of 3,215 square miles. The depth of exploration drilling during the year was 260,127 feet.

●

Oil-burner Control.—A new electronic combustion safeguard system for commercial oil burners, which provides immediate cut-off of fuel in case of failure is available from Canadian General Electric's control division.

According to G-E engineers, the system assures positive protection against combustion failure because (1) if the gas pilot does not ignite, the oil valve cannot open and (2) if the oil flame does not ignite, the supply of fuel is cut off. After the cut-off the motor continues to operate for 30 seconds to purge the nozzle or cup of unburned fuel to prevent carbonizing and reduce field servicing. The system is then locked against further operation until manually reset. An oil-temperature thermostat can be used with the circuit to assure satisfactory fuel-oil temperature before the starting cycle begins. Upon resumption of service following a power failure, low water cut-off or limit-control operation during the starting cycle, the oil valve cannot open until the programme switch recycles.

When continued operation of the burner is prevented by ignition failure, a positive lock-out mechanism is actuated and a light on the cabinet cover indicates that the equipment has gone to lock-out. Operation cannot then be resumed until the reset button is pushed. Complete details may be obtained from any C.G.E. office.

●

Some Trade-fair Exhibitors.—Upton Bradeen & James Limited are distributors for machine tools and mill supplies, representing some 125 principals. They have branches in Montreal, Toronto, Windsor, Winnipeg, Vancouver, Moncton, Ottawa, and Hamilton.

Among the principals of this Company who will have exhibits at the Canadian International Trade Fair are—Projectile & Engineering Co. Ltd., London, England; S. A. des Forges, Charleroi, Belgium; Thompson Grinder Co., Sprinfield, Ohio; Racine Tool & Machine Co., Willow Grove, Pa.; Interwood Limited, London, England; The Auto-Nailer Co., Atlanta, Ga.; Cushman Chuck Co., Hartford, Conn.; Lion Grinding Wheels Ltd., Brockville, Ont.; Precision Welder & Machine Co., Cincinnati, Ohio; Paul Ford, Peddinghaus, Gevelsberg, Germany; Wilson Mechanical Instrument Co. Inc., New York, N.Y.; Baker Bros. Inc., Toledo 10, Ohio; S. A. Jos. Peterman, Moutier, Switzerland; R. McDougall Co. Ltd., Galt, Ont.; Smart Turner Machine Co. Ltd., Hamilton, Ont.

●

Lamp Pressure Latch.—Canadian Line Materials Ltd., Toronto 13, Ont., has announced a new automatic pressure latch for use with "Spherolite" luminaires. Described as "the first truly automatic pressure latch", it consists of a flexible band which is clamped around the glassware and fastened to the reflector by means of a spring latch and hinge. The glassware edge is smooth-surfaced and uniform and is held tightly against the machined reflector edge by a minimum of 40 lb. pressure.

Company engineers claim that the new latch cuts maintenance costs because it can be serviced from the ground. The spring latch can be released by means of a U-shaped attachment that fits the reverse end of regular lamp sticks. The U-shaped metal end fits under the latch. Tilting the stick outward slightly releases the latch, and the glassware swings down supported by the hinge on the opposite side. Glassware is easily replaced when servicing has been completed and an upward push closes the unit.

•

Corrosion Prevention. — In Britain, where prevention of corrosion must be reckoned as equivalent to saving tens of thousands of tons of metal annually, the subject is being closely studied, particularly in the laboratories of the Department of Scientific and Industrial Research.

Perhaps one of the most surprising of recent discoveries is that microbes of a certain type are able to eat their way through iron structures in the course of a few weeks. Water supply engineers, in particular, have found that iron pipes laid through water-logged clay soils fail rapidly. Examination of the damaged pipe shows that it is eaten through at various points and the surrounding soil is almost black in colour. It has been proved that this is due to the action of what is called sulphate-reducing bacteria — microbes which have the power of converting certain salts in the soil to sulphuretted hydrogen.

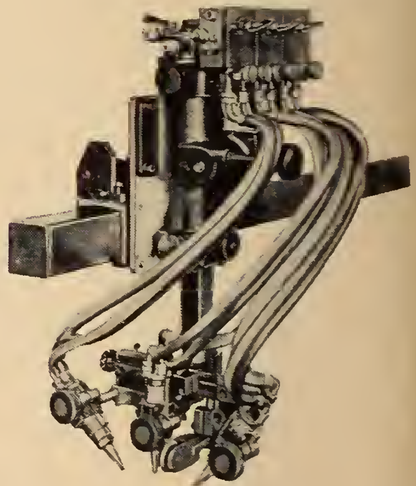
Various corrective measures have been proposed including the laying of pipes in this type of soil in a trench lined with gravel. Another is to protect the pipes with a coating of bitumen and concrete. In addition, twenty types of protective coating applied to buried sections of pipe, are being tested at premises of the Metropolitan Water Board near London.

In other research it has been found that a cheap and easily obtainable salt, sodium benzoate, has valuable properties for preventing corrosion. It has also been found that rubber latex containing a little sodium benzoate is an excellent material for protecting machine-steel surfaces and cast iron. Paper impregnated with sodium benzoate is also recommended as an effective anti-corrosion wrapping for steel objects.

•

Plate Edging.—Airco Company International, a division of Air Reduction Co. Inc., has announced the availability of a new plate-edge preparation device.

This device has been designed to increase production and insure clean-cut, accurate preparation of plate edges. Its ability to cut a single or double bevel accurately, with or without a land, recommends it especially for use in shops or factories which do any amount of steel fabrication work.



The Airco plate-edge preparation device employs a spring-balanced, free-floating carriage and caster-wheel assembly to permit bevel cutting over plate undulations while maintaining a constant tip-to-work distance. It may be mounted on any gas cutting machine equipped with a 3-in. square torch bar.

Torches may be individually positioned, vertically or laterally, without changing the bevel angle. Fuel and preheat pressures are initially set with individual torch valves and, once set, the master valve controls the turning-on and

(*Continued on page 431*)

BUSINESS AND INDUSTRIAL BRIEFS

(*Continued from page 412*)

shutting-off of gas supply without disturbing settings of the individual torch valves.

For further information on this new device communicate with Canadian Liquid Air Co. Ltd., 1111 Beaver Hall Hill, Montreal, Que.

●

Construction Activity. — According to information released recently, current expansion in Montreal is greater than that in Toronto.

From 1946 to 1950 inclusive, construction contracts in Montreal totalled $528,352,100 compared with $649,404,500 in Toronto.

New housing construction in the Montreal area accounted for 51,894 contracts amounting to $421,000,000. In Toronto there were 42,099 similar contracts amounting to $305,000,000.

Toronto is leading Montreal in the number of industrial construction awards of which there were 1,504 in that city as compared with 1,193 in Montreal. However, the aggregate dollar value of the Montreal post-war industrial construction totalled $122,000,000. This figure is 60 per cent greater than the $77,000,000 represented by the value of industrial construction in the Toronto area.

Business construction, other than industrial, amounted to $226,000,000 in Montreal and $174,000,000 in Toronto. Of this amount Montreal showed a value of $49,000,000 in office building construction compared with Toronto's $39,000,000 and a value of $36,000,000 in store construction compared with $25,000,000 in Toronto.

In the Toronto district, engineering construction was far in excess of the comparable Montreal outlay. Of Toronto's total of $92,000,000 some $41,000,000 is represented by new hydro-electric power and communications installations. Of Montreal's $57,000,000 outlay in engineering contracts, about $2,000,000 was represented by power and communications engineering projects. However, Montreal led Toronto in marine construction with $15,000,000 as compared with $2,000,000. In miscellaneous engineering projects, Montreal's construction figures were $22,000,000 as against $24,000,000 in the Ontario City.

●

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

British Electrical Manufacturing. — British General Electric Co. (Canadian) 1411 Crescent St., Montreal, has recently received from Great Britain a supply of a booklet entitled "G.E.C. Can Do It". General Electric Co. is the largest British electrical manufacturing organization. The publication describes the various plants operated by the Company and the different types of electrical equipment produced in those plants. This 28-page publication will be of great interest to electrical engineers. Copies are available; write to the address given above.

●

"Alcan Ingot".—In the March issue of the "Alcan Ingot" there is an interesting article entitled "Engineering Studies Continue for Proposed B.C. Project". This article is based on the text of a statement presented by R. E. Powell, president of the Aluminum Co. of Canada Ltd., to the Special Subcommittee on the study of Monopoly Power of the Committee on the Judiciary, House of Representatives, in Washington, D.C., on January 30th. For copies of this and other issues of the "Ingot" write to the Editor, the Alcan Ingot, c/o Department of Information, Aluminum Co. of Canada Ltd., 1700 Sun Life Bldg., Montreal, Que.

●

Finishing Aluminum. — Aluminium News is the title of a semi-technical publication issued monthly by the Aluminum Co. of Canada Ltd. In the February issue, under the heading Technical Notes, there is an interesting article "The Finishing of Aluminum". It describes a variety of results produced by different processes. To be placed on the mailing list of this publication write to Aluminium News, Box 6090, Montreal, Que.

●

Fire Brick.—Canadian Johns-Manville Co. Ltd., 199 Bay St., Toronto 1, Ont., have recently issued a 4-page illustrated folder on "JM-3000 Insulating Fire Brick". It presents the economic advantages, industrial applications and refractory properties of this product which, it is claimed, is the first insulating fire brick for sustained use at 3000F. Physical and thermal characteristics are given in table form. The folder also contains summarized information on accessory materials and other insulating brick made by Johns-Manville. Ask for copies of publication IN-126A.

●

Imperial Oil Limited.—Imperial Oilways is the title of an excellent semitechnical publication issued by Imperial Oil Ltd., 56 Church Street, Toronto. Ont. In the January-February 1951 issue, the articles are:— "He Made Rails Safer"—a tribute to I. C. Mackie of Dosco's Metallurgical Department; "Steel From Under the Sea", which describes steel manufacture in Nova Scotia; "Canadian Woods Operations", which describes the mechanical equipment at Kapuskasing, Ont., for the cutting and transportation of pulp wood.

A final article is "The Basic Principles of Lubrication". To be placed on the mailing list for regular receipt of this publication, please communicate with the editor at the above address.

●

Industrial Health.—The February issue of the "Industrial Health Bulletin" carries two interesting articles, one "Color Blindness in Industry" and the other "What Makes Successful and Unsuccessful Executives".

This publication is issued monthly by the Industrial Health Division of the Department of National Health and Welfare, Ottawa. It will be mailed to you on request to the Department.

●

Airline Communications.—The International Civil Aviation Organization, Montreal, Quebec, has issued a most interesting bulletin "The Language Problem in Radiotelephony Communications.

This article deals with the language difficulties in air-ground communications, and outlines the recommendations and decisions reached by the organization on this subject. The bulletin also contains a most interesting article by George A. Miller, Psycho-Acoustic Laboratory, Harvard University, entitled "Language Engineer".

For copies of the bulletin apply to ICAO Building, Dorchester Street, West, Montreal.

●

Canadian Johns-Manville. — "The Power Specialist" is published at regular intervals by Canadian Johns-Manville Co. Ltd., 119 Bay Street, Toronto 1, Ontario. In the January-February 1951 issue there is an interesting semi-technical article on the construction of the S.S. Independence and the S.S. Constitution by the Bethlehem Steel Company. The issue also contains an interesting description of the Brewing Process. Write to the Company for a copy of this and other issues of the publication.

●

Canadian Government Specifications. —The Canadian Government Specifications Board has issued two publications which should be of interest to those who do business with the government.

The first of these publications is a list of specifications for a great variety of materials and articles, ranging from anti-freeze liquids to zinc oxide. It also covers foods, liquid fuels, lubricants, paints and brushes, cloth, soaps, etc.

The second publication is a list of committees, including the names and affiliations of the members.

Both publications may be obtained by writing to — The Secretary, The Canadian Government Specifications Board, National Research Council, Ottawa.

●

Stainless Steel Publication. — "Atlas Steel News" is the title of a publication issued at regular intervals by Atlas Steels Ltd., Welland, Ontario. This publication should be of interest to all engineers who are interested in the manufacture and application of stainless steel of various types. For copies communicate with the company at the address given above.

●

Chamber of Commerce News.—The March issue of "News Letter" issued by the Department of Economic Development, The Canadian Chamber of Commerce, 530 Board of Trade Building, Montreal, contains an interesting analysis under the heading "Controls".

The article is a summary of the efforts which are being made to induce Federal Members of Parliament to take action to control prices. It outlines the remarks of Graham F. Towers, in the 1950 Report of the Bank of Canada, on this subject, and quotes a statement made by the Ministry of Finance.

After dealing with the average weekly wages over the past few years, the article turns to a description of what is now going on in Britain under the Labour Government. Copies of the bulletin may be obtained by applying to the Chamber at the address given above.

●

Civil Defence.—The following publications and films are available to those who are interested in civil defence.

"Organization for Civil Defence" is a pamphlet which may be obtained from the King's Printer, Ottawa, Ontario. The price is 20c. "Can You Survive" is issued by the Canadian Federation of Mayors and Municipalities and may be obtained for 10c per copy from the Federation office in the Mount Royal Hotel, Montreal 2, Que.

The United States Government Printing Office, Washington, D.C., offers the booklet "United States Civil Defense" for 25c. The Chamber of Commerce of the United States, Washington 6, D.C., has available at 20c each, copies of a publication "Civil Defense in Your Community".

A film offered for sale is "Pattern for Survival" (black and white—20 minutes) produced by Marsak Films, New York City. Write to the company for prices.

McGraw-Hill Co. of Canada Ltd., 50 York Street, Toronto, Ontario, offer a film, "You Can Beat the Atom Bomb". It is also in black and white and runs for 20 minutes. The price is $90.00.

●

Hand Operated Floor Sweeper.—Service Steel & Engineering Ltd., 4668 St. Catherine St. W., Montreal, announces a new hand-operated floor sweeper which cleans floors in plants, warehouses, stations, etc. in what is claimed to be less than one-third of the time required for hand methods. The machine is described in a 4-page folder which may be obtained from the Company.

●

Santocel "C" Booklet. — Monsanto (Canada) Limited, 425 St. Patrick St., Montreal, can supply copies of a 14-page booklet in which are described approved applications of Santocel C, a microscopically-divided silica aerogel, as a flatting agent.

The booklet terms Santocel "the most efficient flatting agent yet developed". Efficiency, oil absorption and the product's advantages in improving the resistance of clear films to weather, humidity and cold-check are covered fully in the literature.

The use of Santocel C for flat and semi-gloss varnish, including blending principles, additive screening test and typical grinding and reducing procedure for oleo-resinous and alkyd flat coatings, is explained. The booklet also gives details on the use of the product in lacquers, plastisols, organosols, and free film.

●

New Armco Publication. — Armco Drainage & Metal Products of Canada Limited, Guelph, Ont., have copies of a publication "Why Hire a Wrecking Crew to Install Underground Structures" which describes how underground work may be carried out by tunnelling with Armco liner plate.

The folder points out how these lightweight plates can be installed easily with a minimum of excavation and how their design insures ample strength for a wide variety of uses. Their physical properties are listed in a table, and photographs show their use as water and utility line tunnels, relining for highway and railroad tunnels, and underpasses. Copies are available.

●

Recorder Units.—Leeds & Northrup Co., 4934 Stenton Ave., Philadelphia 44, Penn., have issued a revised catalogue covering new recorder units and tachometers.

Ask for catalogue N-27.

●

Cutting & Grinding.—Sun Oil Co., Toronto, Ont., have available copies of an 80-page publication entitled "Cutting and Grinding Facts".

The publication contains data on more than fifty typical metalworking jobs.

Much of the operational data contained in the publication is based on information supplied by leading builders of automatics, grinders, lathes, millers, etc. The booklet also presents descriptions of Sun's straight and emulsifiable cutting oils. Of practical use to the shop man is a chart showing the correct Sun cutting fluids for many of the most frequently used metals and metalworking machines.

●

Industrial Brushes.—The Osborn Mfg. Co., 5401 Hamilton Ave., Cleveland 14, Ohio, has issued a 76-page, three-colour catalogue in which are described hundreds of brushes for doing many different types of jobs for industry.

For copies write to Mr. R. R. Schultz at the address given above.

●

New Caterpillar Booklet.—Caterpillar Products is the title of a new 40-page booklet recently issued by the Caterpillar Tractor Co., Peoria, Ill.

This publication, which is published annually, contains a complete listing, with illustrations and brief specifications, of all but two of the current line of Caterpillar products. Eleven new models were announced during 1950 and nine are included in the new booklet. Copies may be obtained by writing to the Caterpillar Tractor Co., Peoria 8, Ill. Ask for publication No. 30081.

●

Hole-punching Unit. — Wales-Strippit of Canada Ltd., 344 Sherman Ave. N., Hamilton, Ont., have recently released a 4-page bulletin in which is described the new extra-heavy-duty type "G" hole punching unit for punching holes in ½-in mild steel.

These new units are equipped with unique "split punches" which eliminate the tremendous stripping pressures and oversize stripping springs that have always been associated with stripping punches out of punched holes. Copies of the brochure are available. Ask for bulletin G.

●

Concrete Pump.—A revised bulletin on Rex pumpcrete has just been released by the Chain Belt Co. of Milwaukee, Wis.

Pumpcrete is a pump that pumps concrete through a pipeline. The publication describes the machine itself and the method of pumping concrete through a pipeline. It indicates on which type of jobs the equipment will work to advantage, what types of mixes it will handle, and the height and distance requirements of a placing job.

For copies of the publication ask for bulletin No. 51-31. The address is Chain Belt Co., 1600 W. Bruce St., Milwaukee 4, Wis.

●

Industrial Cooling Water. — A new product to control the formation of slime in industrial cooling waters is available in experimental quantities from Monsanto (Canada) Limited.

The product is known as Santophen 45. It is a technical grade of sodium trichlorophenate. Laboratory tests and field trials in large cooling water systems have shown it to be highly effective against bacteria and algae.

The trichlorophenols liberated by Santophen 45 are soluble in acid waters, and capable of maintaining the necessary activity against slime-producing microorganisms while some control agents are not. A bulletin on the product may be obtained by applying to the Canadian Company. Request technical bulletin O-76. The address is 425 St. Patrick St., Montreal.

●

Chain Drive Data.—Hamilton Gear and Machine Co. Ltd., 950 Dupont St., Toronto 4, have issued a new technical data sheet on silent chain drives. Copies of this bulletin, and of others issued by the Company, may be obtained on application.

●

Materials Handling.—A recent issue of the "Dominion Engineer" issued by Dominion Engineering Co. Ltd., P.O. Box 220, Montreal, is devoted to a description of the excavating and materials handling equipment manufactured in Canada by the Dominion Hoist & Shovel Co. It is a most interesting publication and copies will be forwarded on request. Ask for No. 3 of volume 18 the "Dominion Engineer".

●

Link-Belt Folder.—A new 4-page illustrated folder, No. 2363, has been issued by Link-Belt Limited, Eastern Avenue at Leslie and Keating Streets, Toronto. In the publication are described "RC" roller chain flexible shaft couplings.

Engineering information for proper application includes dimensions, weights, service factors, and horsepower ratings. Detailed data are also given on two types of protective grease-retaining casings—Style R (spun metal revolving type) and Style P (plastic, revolving type). Copies are available.

●

Thermobloc Units. — Substantial improvements in plant working conditions during the cold weather are reported by the Seaboard Foundry of Providence, R.I., because of five 550,000 btu Thermobloc units installed last year. Designed and manufactured by the Thermobloc division of Prat-Daniel Corporation, thermoblocs are made in five capacities from 100,000 to 1,000,000 btu output, and are self-contained, direct-firing units that circulate heated air down at working levels. Thermoblocs are also being widely used for tempering make-up air, for high temperature recirculating ducts in drying systems, and as heat curtains for doorways. A technical bulletin to aid in estimating heat losses and requirements may be obtained from the Company's Canadian representative T. C Chown Ltd., 1440 St. Catherine St. W., Montreal.

●

Motor Folder.—English Electric Company of Canada Limited, St. Catharines, Ont., have issued a four-page, three-colour folder on small induction motors. The copy and illustrations describe squirrel cage and wound rotor induction motors made to N.E.M.A. and C.E.M.A. standardized dimensions. Copies are available. Apply to the Company.

A Message from The President

On September the 10th, 1901, I took my first step towards becoming an engineer. That step was to start serving my apprenticeship as a machinist with the Robb Engineering Company of Amherst, building what in those days were called high speed steam engines.

The half century that has passed since that time has witnessed an almost unbelievable growth in the science and art of engineering. This may justly be termed the engineering era.

During this period the impact of the work of the engineer on our civilization and on our modern way of life has been very great. Because of this development in engineering the members of our profession face a grave responsibility not only as engineers but as citizens in a complicated and complex world. It is with a feeling of real humility that, as your president, I address this message to you, the members of the Engineering Institute of Canada.

During the years of the first half of the 20th Century the profession of engineering has changed from being one of the least known to one whose influence can hardly be measured. The field of professional activity has been expanded until today our membership embraces specialists in every phase of applied scientific endeavour.

It was to meet these changing conditions that, in 1918, the name of the Canadian Society of Civil Engineers (founded in 1887) was changed to *The Engineering Institute of Canada*. At that time also, the constitution was set up to permit the formation of branches throughout Canada with the governing council of the Institute composed of representatives from each branch. Under this form of organization we have a truly all-Canadian society with the members from coast to coast having a definite voice in the control of its affairs and including all classes of qualified engineers in the membership.

You will agree that we are fortunate to belong to such an organization—but the benefit which will accrue to the individual member will depend in large measure on the effort which that member puts into supporting the Institute.

Due to the increasing importance of the engineer in our present day economy, more young men each year are undertaking the study of engineering. Members who are established in the profession, can and should give their counsel and guidance to the younger men. Members must show by their own example that they are not only good technicians, but good citizens, living to fulfil the spirit of that code of ethics to which all subscribe.

These are troubled times—the world is out of balance. In our urge to keep pace with the growth of scientific knowledge and changing conditions, some of the spiritual values of life have been lost sight of. As engineers we must consider not only the purely technical aspects of our profession but must accept some of the responsibility for bringing back a realization of the great truth—man cannot live by bread alone.

If, during my term of office, I am able in any way to further the realization of these aims and the enhancement of our profession, I shall be happy.

I hope during the year to have the privilege of visiting each branch of the Institute and look forward to meeting many of you personally.

President.

Maintaining Engineering Services Under Bombing

by

N. M. Brydon, M.E.I.C.

President, Brydon Construction Company Limited, Glasgow, Scotland.

A paper to be presented before the 65th Annual General and Professional Meeting of The Engineering Institute of Canada at Montreal, May, 1951

The author, who commanded a company of Royal Engineers in Southeast London during the Blitz for maintaining vital engineering services, here describes the unit, its composition, organization and functions. Various types of raids are enumerated and the services affected by each are listed, as well as the priority each type of service takes for repairs. He relates many of the problems dealt with. No amount of planning and preparation for maintaining vital services, he warns, will be of avail without a philosophical outlook and a sense of humour, a sense of proportion, and a realization of urgency.

It is a sad reflection of the times that a paper of this nature should be of interest. It is sincerely hoped that, while information given may be of value from the point of view of preparedness, there will never be any need to put such preparedness to actual test. The paper, as its title implies, deals solely with the engineering side of vital services. Only items of personal experience are dealt with at any length. Engineering repairs and reconstruction not experienced however, present added problems of detail only, and not of principle. The paper makes no reference to the effects of atomic bombs except in comparing the effect of blast with that of penetration.

Maintenance to an engineer usually means something very different to that with which we are concerned here. This paper deals with repairs and reconstruction, and therefore the title specifically uses the word "maintaining" in preference to "maintenance".

The author, in preparing this paper has referred to the address of Sir T. Pierson Frank at his inauguration as president of the Institution of Civil Engineers in November, 1945. He commanded one of the Royal Engineer Companies mentioned in that paper, and is much indebted to Sir Pierson, and herewith acknowledges such indebtedness.

Bombing Raids

To form a plan for counteracting the effects of bombing it is necessary to understand the types of bombing raids and their various effects. These are listed in Table I. A combination of these raids may occur of course. For example, a type 4 raid may occur on two adjoining communities the same night, negativing prepared plans for mutual assistance. It is the author's opinion that effort much needed in other directions would be wasted in making special preparations for work within the scope of this paper, for any type of raid other than (5), (6), (8), (9), (10) in Table I. It will be noted that these types of raids may be expected to occur only on centres of highly strategic importance.

Types of Bombs

Various types of bombs have varying effects on vital services as shown in Table II.

It must be realized that the type of ground and the type of surface can very materially influence the effects of a bomb. For example, a medium-size bomb landing on a lightly surfaced road built on fill may cause far more subsurface damage than a heavy bomb falling on a hard surface with a hard subgrade.

It will be appreciated also that

TABLE I

Bombing Raids and Their Effects

Type of Raid	*Planes Involved*	*Time Intervals*	*Target Intention*	*Remarks*
1. Light	1–5	Once during war	Accidental or diversion.	No strain on normal peacetime resources.
2. Light	1–5	Weekly	Hit and run raids.	Requires slight increase in normal peacetime resources.
3. Light	1–5	Continuous	Not experienced	
4. Medium	5–50	Once during war	Spot Target	Aid from adjoining areas needed and sufficient.
5. Medium	5–50	Weekly	Slow down massed manufacture and decrease morale	Large increase required in normal peacetime resources but without special executive.
6. Medium	5–50	Continuous	As (5) but possibly on combined manufacturing and strategic area.	As (5) but requiring special executive.
7. Heavy	50 plus	Once during war	Reprisal or target	Special aid needed for say 2 weeks, no special executive.
8. Heavy	50 plus	Continuous	As (6)	Special aid and executive needed continuously.
9. Very heavy	200 plus	Continuous	As (6) (Hamburg Berlin)	
10. V1 and V2		Continuous	As (6)	As (6)

Figs. 1 and 2. Bomb damage at Cliveden Place (left) and South Harrow (right) in London. Note damaged sewers, water and gas mains, and electric utility lines.

the time taken for repairs of subgrade services is much greater than for overhead services, and therefore that the penetrating type of bomb is much more of a problem to the engineer than the blast type of bomb, though from a personal point of view we know only too well which is the lesser of the two evils.

Services Directly Affected by Bombing

Table III shows vital services affected, and the varying degrees of importance of damage, depending on the character of the service. As a general principle, those services which are duplicated or have alternative routings are of a lower priority. It should be noted that certain services can be given rapid "first aid" to enable them to function, which affects their priority for full repair.

. In general it must be assumed that further raids will occur within twenty-four hours, and priorities are *only* established when (as is usually the case) materials, labour and plant are restricted in supply.

Engineering works needed because of indirect threats to vital services would include demolitions mentioned above. In addition, work such as first aid repair to key offices, factories, and of course houses of workers would be required. Certain work not vitally necessary in itself is necessary from the point of view of morale.

Organization

This is fully dealt with in Sir Pierson Frank's paper, and flows from Governmental channels, through regions, to groups. Greater London was constituted a region in itself, and was subdivided originally into nine groups. A certain amount of exchange of plant, and personnel took place between regions and a much larger exchange between groups.

With the exception of certain exchanges between regions, organization for engineering repair starts at group level. The type of engineering labour, available, including designing and executive staff, comes from:

(1) municipally controlled public utilities' expanded maintenance squads,

(2) privately owned public utilities' expanded maintenance squads,

(3) contractors to (1) and (2),

(4) special assistance.

If types (1), (2), and (3) are self-sufficient, then there is little work for a group engineer, other than to co-ordinate work and establish priorities. It has been my experience that in raids of type (7) and (8), privately owned public utilities' expanded maintenance squads could not cope with repairs, and contractors organizations seemed to be overburdened with other work. In raids of type (7) the municipal organizations were also unable to cope with work.

Speaking as a strong supporter of private enterprise, the above observations simply emphasize that municipal organizations are generally overstaffed, and in addition have pools of labour, such as street cleansing personnel, which can in emergency be diverted to other work. It will be seen, therefore, that in a plan for maintaining vital services in areas thought subject to raids of type (8), special labour must be available. In addition special labour must be available and extremely mobile in the event of raids of type (7). It is of this type of repair unit that the author has special knowledge.

Material and plant pools must be available for all repairs. Specialized materials and plant required by public utilities will be held by these undertakings. Some general materials will be on hand at group level, but to avoid wasteful reserves, material and plant pools must be maintained (and dispersed) at regional level. Trans-

TABLE II

Types of Bombs and Their Effects

Type of Bomb	*General effect*	*Engineering services affected*
Up to 500 kilo.	No major subsurface damage except by direct hit. No major overhead damage.	Transportation.
Above 500 kilo.	Can cause serious underground damage, no serious overhead.	Sewers, water, gas and power mains. Possibly overhead wires. Transportation.
Land mines V1, V2	Surprisingly little underground damage. Heavy overhead destruction.	Transportation. All overhead services in wide radius.
U.X.B. and DA	Nuisance. Very heavy underground damage if it explodes.	Transportation.
Incendiary	Small.	Transportation indirectly. Flood control.

TABLE III

Priority for Repair of Vital Services

Service	*Character*	*Priority*
Roads including street car and bus depots and ancillaries.	Main routes for fire service.	High
	Street car and trolley bus routes.	High
	Strategic routes (including important factory, or food distribution entrances).	High
	Bus routes and main auto routes.	Medium
	Other routes.	Low
Railways including stations, signal systems, and ancillaries.	Main lines.	High
	Sidings (or approaches) of strategic importance.	High
	Heavily travelled workers lines.	High
	Other lines.	Medium
Bridges and tunnels.	As for roads and railways.	
Sewers.	Main soil at capacity.	High
	Main storm water capacity.	Medium
	Main soil and storm water under capacity.	Medium
	Main soil and storm water with cross connections to under capacity channels.	Low
	All branches.	High
Water	Main fire services.	High
	Non cross-connected main.	High
	Loop main already damaged.	High
	Cross-connected main.	Medium
	Branches.	Low
Flood control.	If threat to other high priorities.	High
Demolition.	If structures menace high priority roads.	High
	If damaged structures affect morale.	Medium
	Other demolition.	Low
Burial Grounds.	For mass burial.	High
	Disturbance of existing graves.	Medium
D.A. and U.X.B. bomb removal.	(Subject to military labour available).	As for services affected
Resurfacing roads.		One priority lower than roads.
Power supply.	With no alternative route.	High
	Other.	Medium
Telephone & Telegraph.	Underground (because of time taken in repair).	High
	All other (assuming alternative routes available).	Medium

port and tools *must* be held at group level, and in addition special assistance units must all have adequate transport and tools. A regional pool is of course necessary as well.

Special Assistance Units

Public utility and contractors organizations are much the same in an expanded form in War as they are in Peace, with the following exceptions:

(1) Staffs are not so easily disciplined under bombing.

(2) Full employment exists for labour and contractors.

(3) The homes and families of employees are subject to disturbance.

(4) Traffic routes are disorganized.

(5) A job in an area not subject to attack has a very real and understandable attraction.

Under these circumstances, it was therefore found necessary in London to have special assistance in the form of Construction Companies, Royal Engineers.

These units had none of the disadvantages mentioned above and, since they were recruited from construction workers, were well suited to the task. If there is one criticism I have of Sir Pierson Frank's address it is that this special assistance is stated to have been only a fraction of the total personnel engaged. From experience in South East London, special assistance would be estimated from 10 per cent to 20 per cent of the available force, and the work output as from 20 per cent to 3½ per cent of the total. These units proved invaluable in filling the gap between work to be done and skilled labour available.

The unit which the author had the honour and privilege to command was typical of other units in establishment, but he considers (like all military commanders) that it did more work, better and speedier than its fellow units. It was of course much smarter, in military bearing and training, administration, and morale. The following statistics are from memory, but are approximately correct:

(a) *Man Power* (available for work 7 days per week). See Table IV.

A unit consisted of approximately 280, of all ranks, but administration,

Figs. 3 and 4. (Left). Debris in Balham tube station under bomb crater. (Right). Repairs to brickwork of Euston Square — Kings Cross tunnel after bomb damage.

(cooking, office, etc.) sickness, and one rest day in ten reduced the available force to the numbers shown in Table IV. Hours worked were dawn till dusk.

(b) *Other labour*—One company of Royal Engineers could use the services of from one to two companies of the Pioneer Corps (approximately 180 available per company) for ordinary labour. While rendering valuable aid, it should be pointed out that these men were recruited from all walks of life, and were *not* construction workers.

(c) *Transport*—6 flat-bodied 5-ton trucks and 6 dump trucks plus occasional vehicles from a central pool were used to capacity, but proved generally sufficient for all tasks allotted.

(d) *Tools*—With the exception of certain tradesmen's tools, all were drawn from a group pool. This was a constant source of trouble, and could easily lead to inefficiency.

(e) *Plant*—All plant was drawn from a group pool.

(f) *Accommodation* — Units were housed in empty houses, reasonably close (400 yds.) to a central point, but efforts were made to concentrate no more than 20 men in one house.

Fig. 5. Surface damage over Balham tube station (see figure 3.)

Ideal Special Service Unit

In size the unit was ideal for the type of work to be controlled by what amounted to 1 man (O C). In its make up it would be much better as follows.

(a) *Man Power*—One officer, 2 sergeants should be mechanical engineers or electrical engineers in proportion 2 to 1 to maintain plant and supervise assistance on electrical work. One officer should be office trained. 8 sappers should be electricians. 16 sappers should be pipe jointers instead of 8.

(b) *Tools* — Simple tradesmen's tools, picks, shovels, bars, rubber boots, barrows, concrete carts, and general contractors' tools should be in ample (though not extravagant) supply and unit controlled.

(c) *Plant* — Certain concrete mixers, pumps, small cranes, and accessories should be unit controlled.

In six months the unit under the author's command carried out

Fig. 6. Approximately 90 thousand separate wire joints were required to re-establish telephone services after a bomb hit near St. Paul's Cathedral.

TABLE IV

Composition of Typical R. E. Construction Company

Category	*No.*	*Military Rank*	*Civilian Equivalent*
O.C.	1	Major	Chief Engineer. General Superintendent.
2 i/c	1	Captain	Office Manager.
Officer	1	Lieutenant	Design, quantities, technical reports.
Officers	5	Lieutenants	Superintendents.
N.C.O.'s	8	Sergeants	Foremen
N.C.O.'s	12	Corporals	Subforemen
Drivers	12	Drivers i/c	Truck drivers
Sappers	32	Sapper tradesmen	Carpenters
Sappers	24	Sapper tradesmen	Bricklayers
Sappers	8	Sapper tradesmen	Pipe jointers.
Sappers	..	Sapper tradesmen	Electricians.
Sappers	8	Engine fitters	Mechanics.
Sappers	80	Sappers (pioneer)	Semi-skilled labour.

work as shown in Table V, which would amount to approximately 20 per cent of the work done on vital services in a heavily populated and heavily bombed area of approximately 9 square miles.

Summary

With a maintenance gang supplemented to 50 per cent by public utilities plus a construction labour force subject to military discipline (or equal) amounting to 20 per cent of the above, vital engineering services will not break down under a heavy and continuous bombing attack using weapons such as were used by Germany in World War II.

It is the writer's opinion however, that such an organization would not be sufficient to cope with vital engineering services under very heavy and continuous bombing attacks, using weapons such as were used by the Allies on German cities in 1944-45.

Incidental Construction Problems Met With

(a) *Attitude of mind* — Under bombing one must have a sense of urgency and of proportion, and a sense of humour. Without these or any one of these the best man in the office or field will lose efficiency. Without the inborn sense of humour of the Cockney all the repairs to vital services would have been impossible or at least valueless. Again, one must always have in mind that "there will be another raid tonight", and no labour may be available tomorrow for the task we have not completed today. One must remember that although repairs must be made in good fashion there is no time to work to peacetime standards of finish.

(b) *Communications* — Reliance on telephonic communication in planning work must be ruled out and even with courageous and conscientious dispatch riders communication is sometimes difficult.

TABLE V

Repair Work Completed by the Author's Construction Unit in a Six-month Period

Type of Work	*Description*	*Approximate Value in dollars*
Main sewers	6′ diam. soil sewer (3 breaks)	$ 30,000
	6′ x 4′ egg shaped sewer	5,000
	13′ dia. soil sewer (2 breaks)	100,000
	6′ dia. twin storm sewer with tidal flaps damaged	15,000
	8′ dia. concrete outfall sewer	15,000
Branch sewers	Over 50 of miscellaneous nature (average 12″ dia.)	25,000
Watermains		
12″ to 36″	Over 30	15,000
Under 12″	Over 50	2,500
Gas Mains		
12″ to 36″ and over	Over 20	5,000
Under 12″	Over 400	50,000
Flood Control	Over 2000 lin. ft. of frontage	30,000
Road craters	Over 50 reinstated	25,000
Sewage plant	Out of action and restored	75,000
Pumping station	Out of action and restored	20,000
Demolition, General works, assistance to others.		100,000
	Total	$512,500

(c) *Guides* — Particularly when units are drafted from outside a group it is a great advantage to have guides with a first hand knowledge of every nook and cranny in the district. Maps must be available, but when an obvious map route is blocked with debris, a not too intelligent driver can easily waste many hours of a squad's time.

(d) *Blackout*—"No lights" practically precludes night work and dawn till dusk must be the time of working. In mid summer in Britain two intensive shifts can therefore be worked, but at other times a 10-hour day continuously is the practical limit of work. Anyone who has sincerely worked all out day after day for 10 hours will appreciate this.

(e) *Marshalling men for work*—Jobs change from night to night,

Fig. 7. Broken water mains and sewers on Bayswater Road, London.

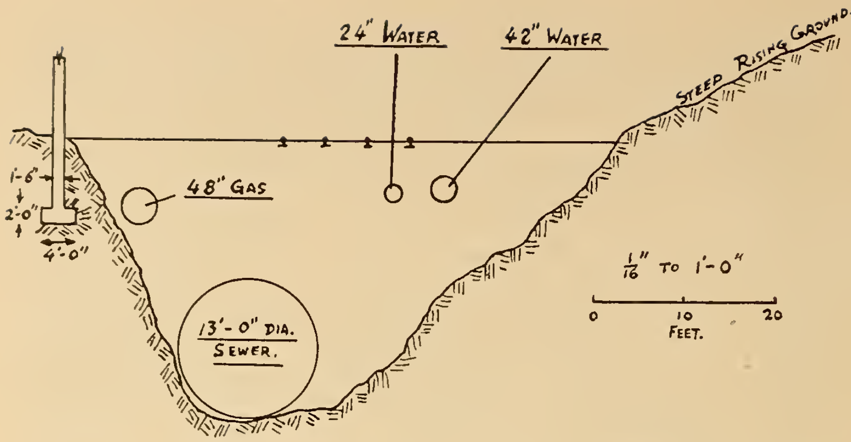

Fig. 8. Cross section of a typical bomb crater in a street in London.

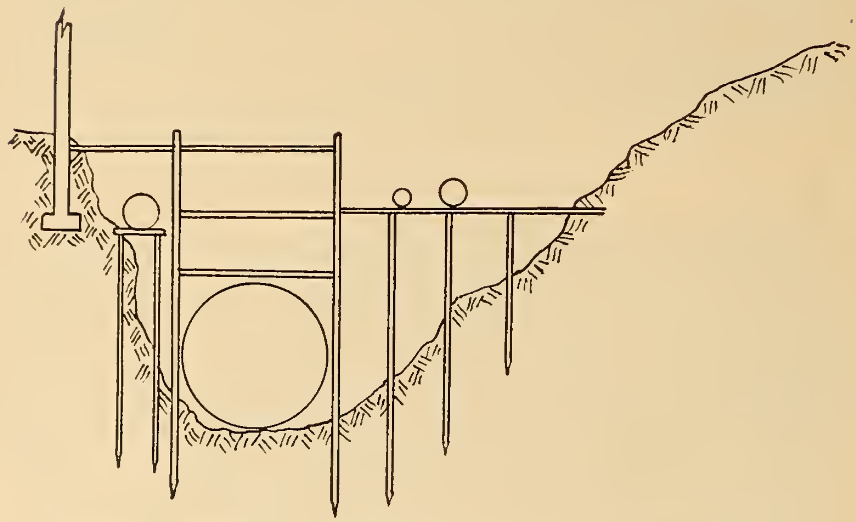

Fig. 9. Cross section of bracing and timbering for reconstruction after bomb damage.

and a job half completed one day may be completely abandoned on the next. It is necessary therefore for workers to be marshalled each morning in a central locality, and from there transported in various groups to the site of incidents. Information regarding incidents and priority from a group headquarters should generally be in the hands of the executive in charge of construction by 06.00 hours in winter, and earlier dependent on daybreak, so that jobs can be planned as to men, tools, materials and transport, for marshalling time.

(f) *Continuous working* — It is necessary to work seven days per week, though a man should have a complete day off every tenth day. This policy is not dictated so much by the need for urgency in repairs as by the danger to morale if civilians see no action on repairs which to them are of supreme importance.

(g) *Leave* — Even with all the work requiring attention, it is essential that workers from out of town get regular leave. Their wives and families may be suffering bombing too. Compassionate leave is essential for the man whose family has been "bombed out".

(h) *Morale* — It is essential to keep up morale in construction crews. Nothing is better for this than well planned hard work followed by complete freedom. Excitable foremen or supervisors, ill-planned and muddled work will very quickly get men down. It is in this connection that military assistance is very useful. Entertainment can be planned, and meals and services are of course assured.

(i) *Dispersal* — Offices, accommodation for men, material, plant and tool dumps, and transport *must* be dispersed. In one raid on a large British city all vital bomb disposal equipment for a complete and widely spread region was lost.

In cases of heavy raids of short duration (perhaps on two consecutive nights) and completely unexpected, such as occurred in the "Baedeker" raids, labour *must* be imported. The writer's unit handled one such case, with the assistance of a maximum of 1,500 troops under his command, as officer-in-charge of military assistance. In this case 90 per cent of services were functioning in two weeks and 100 per cent in four weeks.

A sketchy report by the official responsible to his region in listing services affected failed to make any mention of sewers, despite the fact that *all* sewage outlets from the city were completely destroyed. Work which had to be handled here in addition to services previously mentioned included mass burials; rescue work; setting up of public kitchens; water cartage; demolitions; and first aid repairs to service buildings, and to "bottleneck" factory.

Conclusion

Bombing is a nuisance, is noisy, and the author neither likes it nor approves of it. If, however, practical planning has been prepared, all concerned are freed from worry regarding the safety of their loved ones, and the job in hand is treated in a completely detached manner, the maintenance of vital engineering services under bombing, such as was experienced in South East London, is an engineering task well within human capabilities and giving all concerned in its accomplishment a very real sense of satisfaction.

Appendix A.

Specific Incidents

Incident 1

Here a (possibly) 1,000 kilo bomb dropped on a main roadway, penetrated through the chalky subsoil to a depth of 30 feet and exploded. A crater some 100 ft. in length, 25 ft. deep, to the full width of the roadway including sidewalks, was formed. (See Fig. 8)

Damage caused to vital services included destruction of roadway and sidewalks; street car rails and underground collectors; two 24-in. water mains; one 48-in. gas main, all over length of crater; one 400-pr. telephone cable; two main power cables; and one 13-ft. diameter brick sewer, including a large ength of invert. Little serious above-ground damage was caused.

Problems affecting restoration of services were:

(a) The width of the crater (caused partly by scouring from the water mains) left no room for temporary restoration of services.

(b) The depth of the crater, coupled with the necessity of allowing working space for restoration of the large sewer, made the work of supporting restored services on temporary shoring difficult.

(c) Some 1,500 cubic yards of earth and debris had been scoured downstream in the sewer.

To effect restoration the following sequence was followed. The upstream end of sewer (completely blocked) was cleared, and during this operation sewage was pumped from the nearest upstream manhole into the crater past the stoppage. At the same time sheeting with necessary bracing was placed along each side of the sewer. Timbers were placed to give temporary support to temporary water mains, and a temporary footway, for construction use only, was erected. (See Fig. 9)

Debris from downstream of sewer was hauled out by light railway and backfilled behind the sheeting. Light piling was then driven to give support to permanent water and gas mains. This proceeded simultaneously with backfilling. The sewer repair was effected by replacing the damaged portion by 9 ft. concrete pipe, the reduction in diameter being possible since the original sewer was over capacity.

It was not necessary to continue to pump sewage nor to by-pass it once the blockage was cleared, since because of overcapacity a 10-ft. removable dam upstream enabled at least four hours sewage to be stored. All services, exclusive of street cars were partially functioning in two weeks, and complete restoration was effected in six weeks.

Incident 2

The only major engineering repair the author experienced which was necessitated by the action of incendiaries was the replacement in concrete of a two-foot high dwarf retaining wall, built of 12 x 12 timbers around Surrey Commercial Docks. Some 12 miles of this had been completely burned away, and the high spring tide ebbed and flowed through the dock area. The work of replacement was of course of the simplest, but the incident is mentioned in view of the fact that there were, and may still be, some important timber engineering structures in Canada.

In connection with the gas industry, many hundreds of incendiaries penetrated the roofs of gasholders. Indeed one of the most lively nights was spent on the roof of a gasometer, plugging with clay the openings burned by incendiaries. One felt extremely naked in the light of the gas flaring through the openings, with enemy bombers booming away overhead.

Incident 3

In the City of Bath the large cross on top of a high spired church had become detached, due to some freak of blast, and dangled in the wind supported only by the lightning conductor cable. The situation was one which threatened a vital roadway. The highest fire ladder in the city was some 20 ft. short of the dangling cross, but a subaltern cast a very nice line across it with his fly rod from the top of the ladder, and the rest of course was routine.

Appendix B.

Statistics Regarding London "Blitz".

	Occasions
Water services:	
Reservoirs, filters, etc., hit	192
Mains damaged:	
Over 12 in.	942
Other	6,760
Gas services:

Main cables damaged	1,393
Distribution cables damaged	8,590
Drainage:	
Main sewers damaged	425
Branch sewers damaged . .	8,000
Highways:	
Damaged	9,862
Bridges:	
Damaged	140

Londoners Under Bombing

In an effort to gauge how severe London bombing raids were, I asked a man on my first evening in London to give me an idea as to the severity of the raid then in progress. Bombs were dropping at almost minute intervals, and every fifteen minutes a loud crash, near at hand, and the tinkle of broken glass, indicated a near miss. The hand of the steward shook badly in handing me my drink, and I took this to mean the raid was severe. My friend indicated the raid was only slightly more severe than average, and that to his certain knowledge the barman's hand had shaken for the last twenty-five years.

No one during a raid really bothered much unless machine gun fire was heard indicating that flares were overhead and that we were the specific target area. Indeed, an elderly lady living in a target area described bombing to me as "such a nuisance, so noisy and impossible to cope with the dust in the house"; this a day or two after her ceilings had fallen. My driver (a Cockney) picking me up on return from leave told me that it had been very dull during the past week. "A land mine in Tunnel Avenue, another on Shooters 'ill Road, two or three dozen H.E. in odd spots, but not a single bleedin' worthwhile sewer or water main 'it".

Shops immediately opposite a fresh incident whose whole front had been blown in would simply change the sign "Open as usual" to one reading "More open than usual". A lady running a tiny cigarette and candy shop in a slum area was deeply indignant that I had come to buy a packet of cigarettes and not to remove the daddy of all bombs the fins of which were sticking out of the ground ten feet from her back door. She insisted that it was the Government's duty to have me (a soldier) remove the bomb immediately and not talk silly nonsense about evacuating her. "Wot do the perishers think I'm paying taxes for?"

I mention these experiences to try to show the effect bombing had on the Londoners, and to try to put over to you that all the planning, all the préparations and all the organization put into force for maintaining vital services, will be of little avail without a philosophical outlook and a sense of humour.

THE AUTHOR.√

Atmospheric Pollution in Canada

The report and proposed model ordinance of a joint committee established in April, 1949

Report of the Committee

During the past decade the citizens of Canada, in common with those of other countries, have become increasingly aware of the damage, both human and material, caused by smoke and other forms of atmospheric pollution. Many papers have been read and conferences held on this matter but, in this Dominion, piecemeal and sporadic attempts only have been made to deal with the problem. Such attempts as were made took the form of smoke abatement by-laws which were adopted by several municipalities. Admittedly, these were better than nothing and resulted in some degree of amelioration, but they fell far short of being cures for the disease because pollution recognizes no municipal boundaries, because smoke is only one form of pollution and because there was little uniformity in the treatment prescribed by the various cities concerned. Some by-laws, moreover, were honoured more in the breach than in the observance and tended to become entangled with local politics.

Formation of the Committee

Recognizing the need for concerted action in this matter, several national organizations decided that the time had come to attack the general problem of atmospheric pollution on a Dominion-wide basis. Accordingly, a preliminary meeting of representatives was held in Toronto on April 20, 1949, at which were discussed the desirability and possibility of forming a committee to prepare a model by-law or ordinance that could be adopted and used, with suitable local modifications, in any part of Canada. The following representatives were appointed to form that committee:

Prof. E. A. Allcut
Mr. C. E. Baltzer
Mr. Robt. Broad
Mr. G. P. Cooper
Mr. E. Davis
Mr. John G. Hall
Dr. Morris Katz
Mr. W. J. Longeway
Dr. D. Y. Solandt
Mr. F. D. M. Williams

The following organizations through their appointed representatives participated in the deliberations of the Committee:

The Engineering Institute of Canada
Department of Mines and Technical Surveys
Stoker Institute of Canada
Canadian Manufacturers' Association
Canadian Steel Boiler Institute
Defence Research Board
Institute of Power Engineers
School of Hygiene, University of Toronto
American Society of Mechanical Engineers

Recommendations

At the first meeting, held on October 12, 1949, Professor E. A. Allcut was elected Chairman and Mr. W. J. Longeway, Secretary of the Committee. Mr. John G. Hall was appointed to represent the Committee on the corresponding body sponsored by the American Society of Mechanical Engineers, so that liaison might be maintained between the two groups. Subsequently, eight meetings were held to consider the form and details of the proposed ordinance concerning atmospheric pollution and the result of the Committee's deliberations is appended hereto. It is recognized that various factors have different degrees of importance in different localities and, therefore, some modifications of, or additions to, this model ordinance may be desirable. It is strongly recommended that the problem should be dealt with on a regional basis by means of appropriate control areas to be set up by the various provincial governments, because only those governments have the power to take such action. Cases where the control area must necessarily cross provincial boundaries (and such cases will be few in number) could be dealt with by joint boards set up by the two governments concerned. This procedure has been adopted in dealing with other problems and can be made to work satisfactorily, given good will on both sides. A skeleton type of organization has been suggested for operating the ordinance after the appropriate control boards have been set up.

While the general pattern characteristic of existing ordinances has been adhered to, an attempt has been made to rectify weaknesses in organization or procedure that have been discovered in practice. For instance, few reliable standards or standard methods are available for making measurements of atmospheric pollution in the field and the figures and proedures here recommended are, in he opinion of the Committee, the est available at this time. The veaknesses of the Ringelmann Chart as a means of measuring moke density were recognized but, o far, no reasonable alternative xists and the use of this method s, therefore, recommended. Definitions of such things as odours and nuisances are necessarily tentative and nebulous, and those recommended herein were based on he advice of the best available uthorities.

It is realized that the height of a stack, together with peculiarities of local topography and meteorological conditions, will affect the listribution of pollutants and, in some cases, may vary considerably he concentrations at ground level. These comments apply specifically o the tables contained in Section III, Clauses C (1) and C (3), and hese factors may justify local nodifications in the maximum quantities of pollutant which may be emitted.

The permit system that is frequently a feature of existing bylaws, has been deliberately omitted, though it could be included if desired, as one of the local modifications mentioned above. Nevertheless, the general feeling of the Committee is that it is ineffective and should not be included.

The penalties suggested are considered to be both reasonable and representative, but could be modified up or down if desired.

It is recognized that no man can be "legislated into heaven" and that the usefulness of an ordinance such as is suggested here will depend almost entirely on public support. Education and persuasion rather than coercion should be stressed in administering ordinances of this kind and, therefore, the publication and dissemination of information (Section VII C) form an important part of their administration. The objective throughout is to uphold the common right of all citizens to have the air that they must breathe come to them in a reasonably uncontaminated state. However, in establishing a permissible value for atmospheric pollution in any community, that which is possible must be distinguished from that which is ideal, and the responsible authorities must not forget that our civilization depends for its very existence on industrial activity.

Some thought was given to the best method of initiating a movement of this kind and it is suggested that, after the necessary legal steps have been taken, the responsibility for drafting and operating the ordinance should be vested in the most appropriate departments of the governments concerned. Those departments would then proceed to designate suitable control areas and would set up the necessary organizations to administer the ordinance within those areas.

The assistance of Professors J. Finkelman and J. Willis of the Faculty of Law (University of Toronto) in advising the Committee on various legal points in this report is gratefully acknowledged.

All of which is respectfully submitted.

E. A. Allcut, M.E.I.C.,
Chairman

Recommendations of the Committee

I. Title

It is recommended that this ordinance be designated "An Ordinance Concerning the Control of Atmospheric Pollution" (hereinafter referred to as the Ordinance).

II. Definitions

It is recommended that the following definitions be adopted for the various terms used in this ordinance:

Smoke means the exhalations, whether visible or not, resulting from oxidation or other chemical action, and containing either liquid or solid particles less than 1/10 micron in mean diameter;

Soot means the aggregated particles of carbon, produced by incomplete combustion, frequently intercharged with adherent tarry or sulphurous liquids;

Fumes means gaseous mixtures containing solid particles between approximately 1/10 and one micron in mean diameter. These may result from distillation, complete and incomplete oxidation, or other chemical reaction;

Mist means that atmospheric condition in which water-droplets of a size larger than 50.0 microns in diameter are suspended in the air. These droplets may be formed by condensation from the gaseous state or dispersion from larger liquid masses by splashing, foaming, or spraying.

Fog means an atmospheric phenomenon similar to that defined above as mist, but with a droplet diameter below 50.0 microns. Fog droplets commonly have a solid nucleus about which the fluid has collected and when this particulate centre is large, the fog droplet size may exceed that found in many mists.

Smog means an atmospheric state resulting from a mixture of smoke, fumes, gases, and fog, originating either from human or natural action;

Dust means gas-borne and air-borne particles larger than one micron in mean diameter;

Fly-ash means all solid particles not less than one micron (and usually not less than ten microns) in mean diameter, that are entrained in, and carried by, the gaseous, products of combustion. These may include both combustible and incombustible materials, such as fine ash particles, coke (partly burned fuel), cinders, dust, grit, and soot;

Dust-separating equipment means an apparatus or device for separating solid matter from the gas medium in which it is carried;

Nuisance means a condition deemed to interfere with common rights or to be materially disadvantageous or to cause physical or mental damage in the opinion of a reasonable person of goodwill supported by fellow citizens of like mind;

Unpleasant odour means any annoying, objectionable, or undesirable stimulation of the sense of smell in a reasonable person with normal olfactory responses, when exposed to one or more atmospheric pollutants;

Person includes a partnership, association, syndicate, trust, corporation, department, bureau, agency, or any other entity recognized by law as the subject of rights and duties;

Regulations means any resolution passed by the authority having jurisdiction;

Board means any committee set up by the authority having jurisdiction to administer the provisions of the ordinance;

Ringelmann Smoke Chart means the Ringelmann Smoke Chart as published by the United States Bureau of Mines in the current edition of their information circular No. 6888 when the same is used in accordance with the instructions published by the said Bureau;

Stack, chimney, or exhaust pipe includes a flue, conduit, or other opening arranged for emitting gases into the open air;

Fuel-burning equipment means a furnace, incinerator, engine, refuse-burning equipment, boiler, chimney, flue, stack, or any other apparatus, device, mechanism, or structure, used in or in connection with the process of burning fuel or other combustible material;

Internal combustion engine means an engine or turbine in which combustion of a gaseous, liquid, or pulverized solid fuel takes place within one or more cylinders or combustion chambers;

Vehicle includes a roller, derrick, crane, pile driver, trencher, portable hoisting engine, tar kettle or other apparatus which is not ordinarily permanently installed in one location but is used at various places.

III. Discharge of Smoke, Fumes, etc.

It is recommended that:

(A) The discharge or emission to the atmosphere, within the limits of the designated area, of smoke, dust, fly-ash, soot, fumes, or other solid or gaseous product, the shade or appearance of which is equal to or greater than No. 3 on the Ringelmann Smoke Chart, for a period of or periods aggregating six (6) minutes or more in any one hour, be prohibited.

The discharge or emission to the atmosphere, within the limits of the designated area, of smoke, dust, fly-ash, soot, fumes, or other solid or gaseous product, the shade or appearance of which is equal to or greater than No. 2 on the Ringelmann Smoke Chart, for a period of or periods aggregating ten (10) minutes or more in any one hour, be prohibited.

(B) No person should, in the designated area, cause, suffer, or allow to be discharged or emitted from any fuel-burning equipment, internal combustion engine, vehicle, outside open fire, or premises, any smoke, dust, fly-ash, soot or fumes or other solid or gaseous product of combustion in violation of paragraphs (A) or (C) of this section or to an extent which, in the considered opinion of the authority having jurisdiction, is detrimental to the property or health of any other person or is a nuisance to any person not being therein or thereupon engaged.

(C) The emission of pollutants to the atmosphere from any fuel-burning or other equipment should not exceed the amounts stated hereunder in sub-sections 1, 2, 3, 4, respectively.

1. *Combustion Processes Used for Steam Production.*

Steam generated (Pounds per hour)	Maximum emission of solid matter (Pounds per hour)
10,000	22
20,000	45
30,000	67
40,000	90
50,000	112
60,000	134
80,000	180
100,000	224
150,000	284
200,000	334
300,000	419
400,000	489
500,000	552
600,000	609
800,000	709
1,000,000	798
1,500,000	1200
2,000,000	1600
3,000,000	2400
4,000,000	3200

Note: For weights of steam generated between those tabulated, the corresponding values of solids emission may be found by linear interpolation.

In the above Table, steam generated is considered to be the average hourly output of all units connected to a chimney, for that continuous four-hour period during which the average output is the greatest, expressed as the equivalent of steam containing 1,000 British thermal units per pound.

The emission of quantities of solid matter as shown in the above Table may be exceeded for a period of, or periods aggregating, not more than two hours in any continuous twenty-four hours, during which time the gas swept passages of the boiler are being cleaned.

The quantity of solids being emitted from a chimney should be determined at any suitable sampling point in accordance with the procedures of a recognized established chimney dust test method.

2. *Combustion Processes for Purposes other than Steam Production.*

(a) *Combustion processes not used for steam generation, in which the solid pollutants are emitted through stacks or flues so that measurements of quantities can be made by standard methods.* The weight of dust, ashes, charred paper, soot, grime, or other particulate matter discharged into the atmosphere should not exceed, at the point of discharge, 0.40 grains per cubic foot (at 68° F. and 30″ of mercury).

(b) *Combustion processes not used for steam generation, in which the quantities of solid pollutants cannot be measured conveniently, as in the case of emission through windows, monitors, vents, and other similar openings.* In cases such as these, the emission into the atmosphere of dust, soot, cinders, fly-ash, or other solid pollutants in quantities sufficient to cause a nuisance should be prohibited.

3. *Processes which Emit Gases and/or Fumes of a Toxic Nature.*

(a) *Combustion processes involving carbonaceous fuels.* The emission of sulphur dioxide from a stack or chimney should not exceed 0.20 per cent by volume of the gases present, calculated to 68° F. and 30″ of mercury and with CO_2 content of 12 per cent. It is further recommended that the height of the stack be such that the maximum concentration of sulphur dioxide at ground level for one hour does not exceed 0.5 parts per million by volume.

(b) *Other chemical and metallurgical processes.*

The concentration of gases and or fumes in the atmosphere surrounding the plant should not be so great as to constitute a nuisance, be detrimental to health, or injurious to vegetation. Experience has shown that the following stack concentrations should not be exceeded:

ılphur dioxide	—4.0 grains per cubic foot, calculated as sulphur trioxide.
ydrochloric acid	—0.2 grains per cubic foot.
ydrofluoric acid	—0.2 grains per cubic foot, calculated as the sulphur trioxide equivalent of hydrofluosilicic acid.
hlorine	—0.2 per cent by volume.
luorine and fluorine-containing compounds	—should be removed by gas washing and scrubbing equipment (wherever feasible) before emission into the atmosphere.
itric acid and oxides of nitrogen	—sufficient gas washing and scrubbing equipment should be used to avoid the emission of coloured fume.
ydrogen sulphide and mercaptans	—should be not sufficient in quantity to constitute a nuisance, in accordance with the nuisance clause as stated above.

ead	Approximate process weight per week in tons	Max. permissible Stack discharge*	Max. total quantity discharged from a single plant
mall works	up to 15	0.10 grains per cu. ft.	200 lbs. per week
ledium works....	16-100	0.05 grains per cu. ft.	400 lbs. per week
arge works	101-850	0.01 grains per cu. ft.	1000 lbs. per week

inc and arsenic —the emission should not exceed 0.035 grains per cubic foot.

Note: All above references to volume in this clause are based on 68° F. and 30 inches of mercury.

*"The maximum permissible stack discharge of lead fumes for small, medium, nd large works, respectively, is based on the collection efficiency of dust recovery quipment which would normally be used in works of these respective sizes."

---

4. *Processes which Emit Solid Pollutants of a Non-Toxic Nature.*

For processes in which the quantities of dust or other solid pollutants emitted cannot be measured readily, as in the case of emission through windows, monitors, vents, and other similar openings or from piles of material, the emission into the atmosphere of such pollutants in quantities sufficient to cause a nuisance should be prohibited.

IV. Smoke Indicators

It is recommended that:

(A) Each stack or chimney of every plant that burns or is intended or designed to burn any fuel and has more than 500 square feet of boiler heating surface (50 H.P.) be equipped with an approved smoke indicator or recorder.

For the purpose of this section, "smoke indicator" is considered to include, in the case of a boiler room having a fireman in constant attendance, a mirror or other device that enables the fireman to see the conditions at the top of the stack or chimney from within the boiler room at all times. In the case of a boiler room not having a fireman in constant attendance, it is considered to mean a smoke indicator of a type which will sound an alarm or flash a signal to attract the attention of the fireman.

This section should not apply to a stack or chimney that is readily visible to the fireman from inside the boiler room without the aid or use of a smoke indicator if a fireman is in constant attendance in such boiler room.

V. Increasing Height of Existing Stacks and Chimneys

It is recommended that:

(A) Where any prior existing chimney or stack is so located that the emissions or discharges therefrom are a nuisance to the occupants of any building or structure subsequently erected, or where any building or structure subsequently erected adversely affects the draft of any such chimney or stack, such nuisance be abated, or the adverse effect upon such draft be corrected as the case may be, either by increasing the height of the chimney or stack, or by making such other provision as may be deemed effective by the designated authority.

VI. Control Area or Region

It is recommended that:

(A) As atmospheric pollution is a regional rather than a municipal or local government problem, appropriate control areas should be set up, preferably around the larger cities or industrial areas, to which this ordinance will then apply.

VII. Administering Body

It is recommended that:

(A) The duty of designating pollution control areas be vested in the provincial government or governments concerned, who may each appoint a person or persons to do the necessary planning in this regard.

(B) Each pollution control area be administered by a board or commission appointed by the provincial government or governments concerned.

It is strongly recommended that each board be composed of residents of the area affected.

(C) A competent technical director, experienced in the field of atmospheric pollution, be appointed by each board for the purpose of administering the provisions of the ordinance for the area under its jurisdiction.

He should have the assistance of an adequate and competent staff. His duties should be:

1. To investigate complaints, make observations of the extent of atmospheric pollution, and take the necessary and proper action under the ordinance to abate nuisances therefrom.
2. To issue permits, certificates and/or notices (if provision is made for these in the ordinance) and to keep records thereof.
3. To act in a liaison capacity with the local constituted authorities for the purpose of assuring, as far as possible, that new buildings and/or alterations to old buildings are designed and erected in such a way as to make it possible to carry out the provisions of the ordinance.
4. To publish and disseminate information on methods of reducing atmospheric pollution.
5. Provision should also be made to invest the director with discretionary powers which may permit deviation or exemption from the requirements of the ordinance to cover emergencies or special cases.

VIII. Powers

It is recommended that:

(A) The director and every person appointed to assist him in carrying out his duties under the ordinance should, at all reasonable hours, be empowered to enter upon any property in order to ascertain whether or not the provisions of the ordinance are being complied with.

(B) The director should be given power to require the owner, occupant, manager, or agent of any property to make such tests of, or alterations in, equipment thereon, or the manner of operating the same, as may be necessary to prevent or lessen the emission or discharge to the atmosphere of pollutants in violation of the ordinance.

(C) No person should be allowed in any manner to obstruct, hinder, delay, resist, prevent, or in any way interfere or attempt to interfere with the director or any person appointed to assist him in the carrying out of his duties under the ordinance or refuse them or any of them entry upon any property or premises at any reasonable time in the course of duty.

IX. Control Board

It is recommended that:

(A) A board, named the Atmospheric Pollution Control Board, consisting of from three to five members (hereinafter referred to as the Board) be appointed by the Provincial Government or governments having jurisdiction over the control area concerned, for the purpose of administering the ordinance. An advisory committee consisting of technically trained personnel should also be established to advise the Board on technical matters.

(B) The members of the Board should hold office for the term of four years and until their respective successors are appointed; and should be eligible for re-appointment. Their respective periods of appointment should be staggered so that continuity of policy may be maintained.

(C) Upon the death or resignation of any member of the Board, his successor should be appointed by the Provincial Government concerned for the balance of his term of office.

(D) A quorum should consist of a majority of the members of the Board.

(E) The Board should, at the first meeting in each year, appoint one of its members to be chairman.

(F) The Board may meet and adjourn from time to time at pleasure, or may be summoned at any time by its chairman or at the request in writing of a majority of the members of the Board.

(G) The Board should be empowered to hear and determine appeals from decisions and orders of the director, and to confirm, vary or reverse any such decision or order.

(H) The Board should take adequate measures to keep itself informed regarding developments in the control of atmospheric pollution and, if it be considered advisable, the Board should have power to recommend to the Provincial Government or governments concerned, amendments to the Ordinance.

(I) Suitable provision should be made for receiving and hearing appeals arising from any order or decision by the director including:

1. Method of notifying the Board regarding intention to appeal and the address to which notices should be sent by the Board.
2. The maximum time interval between the date when the decision is made and the date when the appeal is received by the Board. It is suggested that fifteen days is an appropriate period.
3. The maximum time interval between the receipt of the appeal and the day when the appeal is heard. It is suggested that fifteen days is an appropriate period.
4. The maximum time interval between the hearing of the appeal and the communication of the decision of the Board to the appellant. It is suggested that thirty days is an appropriate period.

X. Persons Liable

It is recommended that:

(A) All persons owning, operating, or in charge or control of any equipment, process, or property who violate or cause, suffer, or allow any violation of the Ordinance be jointly and/or severally liable (as may be determined by the courts) to the penalties imposed by the Ordinance.

XI. Penalties

It is recommended that:

(A) Every person who, after due warning, contravenes any of the provisions of the Ordinance, any decision or order of the Director pursuant to the Ordinance, or any decision of the Board should, upon conviction thereof, forfeit and pay, at the discretion of the convicting magistrate, appropriate penalties which may increase in severity for successive infractions of the same provision of the Ordinance. It is suggested that these might be a penalty not exceeding (exclusive of costs) fifty dollars ($50) for the first offence, one hundred dollars ($100) for the second offence, and two hundred dollars ($200) for the third offence.

(B) For offences subsequent to the third it is suggested that an injunction be sought by the Board to terminate the operation of the equipment, process, or property until the cause or causes of the pollution complained of have been ascertained and eliminated.

XII. Effective Date

(A) The provisions of the Ordinance should become effective at a date to be determined by the Board having jurisdiction over the control area concerned.

Anti-icing of Jet Compressor Blades

An electrically-heated blade has been developed at A. V. Roe Canada Limited for dealing with the problem of ice formation on the compressor blades of aircraft gas turbines.

Under certain atmospheric conditions an ice deposit tends to form on the initial stages of compressor blades. This ice deposit seriously obstructs the flow of air into the engine and reduces the aerodynamic efficiency of the blades. Moreover, should some of the ice break loose and be carried downstream into the moving blading it may result in serious damage to the engine. The Avro Canada blade is designed to overcome these difficulties by providing internal heating of the blade surface to prevent ice formation.

The heating element of the blade is built up on a mica form which is first wound with an electrical resistance ribbon and then insulated with helical windings of glass thread. The whole assembly is impregnated with ceramic material to form a core around which the blade form is cast.

Further details of the system are available from Avro Canada or from Canadian Patents and Development Limited of Ottawa to whom the patent rights have been assigned.

Law and the Engineer

by

Gordon R. Munnoch, K.C.

Toronto, Ont.

An address presented to the Toronto Branch of The Engineering Institute of Canada, on October 17, 1950

Editor's Note:

In the April and May issues of 1950, the *Journal* published, in two instalments, a paper by Dr. C. R. Young, entitled "The Legal Position of the Engineer", which dealt with the duties, rights, and privileges of engineers under the law.

Mr. Munnoch's paper supplements this earlier paper. Commenting on the responsibilities of engineers, he offers some valuable advice for the expert engineering witness on court procedure. The difference between engineer's certificates and arbitrations is explained. Procedure for arbitration under the Ontario Arbitration Act is discussed and the jurisdiction, powers, and limitations of an arbitrator are defined.

My earliest experience with Enneering relates to a group of rile young men who enjoyed nging in somewhat raucous tones:

"We are, we are, we are the
Engineers
We can, we can demolish forty
beers."

ut Engineers are really modest llows, and I shall proceed to rove that point. In recent years, have observed the erection of any great buildings in Toronto quiring the utmost of service om Engineers, Architects and ontractors. When the hoardings ave been put around the site, a acious sign board usually apears on which you can read in rge letters the names of the Conactor and the Architect, both rominently displayed. If any refrence whatever is made to the ngineers concerned, it is done in mall letters, but often it does not ppear at all.

Engineering is an exact science; aw is sometimes exact but is ften a speculative science, either ecause of its relation to a concept f the material facts, or because f differences of opinion in both he judicial and advisory fields. n speaking to you on the subject Law and the Engineer", I hope our professional exactitude of nind will not lead you to resent ome qualified statements as I eek to make contact between the wo professions.

Any one who offers professional ervices to the public, or services hich are known to require paricular knowledge, skill and exerience, represents by implicaion that he has such knowledge, kill and experience as will enable im to perform the services reuired. This principle is of broad application, and applies even to a skilled labourer or artisan.

It follows that any one practising an art or profession must be qualified for the task he undertakes. He is also bound to act with reasonable care and diligence in rendering services to those who employ him. If he does not possess a reasonable degree of skill, or if he does not display reasonable care and diligence in rendering services, he may be held liable for the omission.

The question whether a person has exercised reasonable and proper care, skill and judgment is one of fact. The test is whether or not any other persons exercising the same profession or calling, and being men of experience and skill therein, would or would not have come to the same conclusion or followed the same practices. When a person undertakes a task that obviously requires special skill, and in particular professional skill, there is an implied warranty on his part that he has the skill required for the task he undertakes.

However, if you are practising your profession as an engineer, it is not enough to make you liable that some engineer of far greater experience or ability might have used a greater degree of skill, nor is it enough that you might possibly have used some greater degree of care. The question is whether there was a want of competent care and skill to such an extent as to lead to an unfortunate result.

The law does not require you to rise to the level of genius. Supposing, however, that you are instructed to use new methods, either of construction or in any other department of engineering skill, the failure of such methods, if applied under your care, will not necessarily establish that you did not have the ordinary degree of skill and knowledge required. You are not bound to do more than keep abreast of the times, and to be knowledgeable in the established and accepted practice of the science which you practise.

If your professional duties are such that you must employ assistants, you must use every care to select proper and qualified employees. It is you that is retained, and if you entrust the work or part of the work to an employee you are taken to represent that the qualifications of that employee are sufficient. By using an employee to assist you in matters requiring professional skill and experience, you must remember that he who retains you for the task did not select the employee. That is your responsibility.

The Engineer in The Court Room

An engineer finds his way into the court room either as an expert witness, or because of his participation in some task that has gone wrong, whether or not he is in any way responsible for the failure. It may be because of his professional knowledge of particular facts that are material to a claim against some one else.

It is a tribute to your profession that engineers rarely find their way into the court room. This is mostly because you practise an exact science, and partly because many contracts which involve the services of an engineer stipulate for arbitration, certification or other voluntary procedures of reference.

It is always a challenge to a lawyer when a *professional witness* is called against his client. He usually anticipates that this will happen because of the nature of the case, and because he has himself sought the advice of an expert in the same field. He then proceeds with the help of his own expert to test the skill of the expert called against him. It is often a duel of wits, in which the lawyer adds his own ingenuity to that of the expert he has hired to help him.

For the purposes of an action, it was once my duty to sweat up a lot of special knowledge concerning an electrolytic process of refining ores in which nickel and copper are both present. The Mining Engineer whom I cross-examined was a man of experience and learning. But he was timid, and showed far too much respect for the smattering of knowledge that I had picked up.

You, too, may someday be called as a professional witness, and may find that you are being badgered by some lawyer whose objective is to win his case (and not necessarily to add to the sum of human knowledge on the subject of engineering). If so, always remember that you are really his master. If you are prepared to give evidence, you have real knowledge and skill, while he has only acquired some little knowledge for this particular show. You need only watch your step and retain your self-assurance, and you will soon have that lawyer bending over to whisper in the ear of the expert he has hired to hold his hand.

The atmosphere of a court room is usually artificial. The microscopic attention given to detail often distorts the picture. Remember, however, that behind it all is the judicial search for truth. Counsel for the plaintiff colours the picture to suit his client, and counsel for the defendant does likewise. Sometimes both do it unreasonably. But even this over-emphasis usually assists the truth to emerge.

When you are giving professional evidence, never develop the feeling that you are on trial. Counsel may probe your mind, your skill and your experience, and sometimes may not take time for the anaesthesia of courtesy. If he grows nasty, keep murder out of your heart and your knowledge in your head and you will always be top dog.

These remarks are also abundantly true if you are present as a witness in a case in which you are personally concerned as plaintiff or defendant. If you are called as an expert witness, counsel on both sides will make a study of you. You must also make a study of them. You have this advantage over the medical doctors; usually cases which involve a study of engineering skill are in the hands of counsel of experience, who are willing and anxious to show every courtesy to a member of another learned profession.

When it comes to cross-examination, a great judge once reminded counsel that cross-examination does not mean 'to examine crossly'. Counsel has the right to probe your experience, knowledge and ability, and your general qualifications. You should not take umbrage at this. The Court is entitled to know. No matter how high your professional standing may be, never hesitate to say "I don't know" if that should be the case. You should be responsive to the question, though it is wise not to volunteer information until asked. Trust the Counsel on your side of the case and let him take the responsibility of developing matters further when he exercises his right to re-examine.

If you are called as a purely professional witness, stick to your professional knowledge. Above all, do not become a mere advocate for the side that has retained you. If you do so, you will lose prestige with the judge, and he will discount your professional evidence. I do not think that engineers would be so prone to fall into this error, which is a common one among medical doctors. Insofar as you can, avoid the use of highly technical language. You are in the witness box to assist the judge. He is not an engineer, but he will do his best to understand your evidence. A parade of learning does not impress a judge. He is far too accustomed to the bombast of his own profession to fall into that error.

Perhaps it is elementary for me to say that as a witness you should show every respect to the Court. Do not think it is mere claptrap when a Justice of the Supreme Court is addressed as "My Lord". In our British tradition, the King is constructively present in all his Courts of Justice. The form of address "My Lord" really means and extends to "My Lord the King". I mention this because of the modern trend away from titles and formal courtesies.

Sometimes, as the wheels of justice grind, your scientific ear may detect some clashing of gears. You may think that the whole machine needs overhauling and a bath of oil. Yet our system of justice, with all its admitted failures, is perhaps the best yet devised by man. The great Edmund Burke once put it this way:

> "The science of jurisprudence is the pride of the human intellect—a science which, with all its defects, redundancies, and errors, is the collective reason of all ages, combining the principles of eternal justice with the infinite variety of human concerns."

Engineer's Certificates and Arbitrations

In substantial contracts relating to construction, it is quite usual to find a provision which confers important powers on the engineer or architect. Roughly speaking, these powers are divided into two separate classes, the one relating to the certification of facts, the other relating to the determination of matters in question or even in dispute. The certificate or decision given is usually intended to bind the parties concerned conclusively and so the responsibility is a serious one.

At common law, an agreement that deprived one or more parties of recourse to His Majesty's

Courts of Justice was considered to be contrary to public policy. Before the passing of legislation to which I shall later refer, the device used was to agree that no action be brought until the specified event had happened, namely, the giving of a certificate or the making of an award. Thus the jurisdiction of the Courts was not ousted, but the certificate or award was made a condition precedent to any recourse to the Courts.

It is important to distinguish between arbitrations on the one hand and appraisals, valuations and certificates on the other. Prima facie, persons who are appointed because of their skill, knowledge and experience of the particular subject to decide any questions, whether of fact or value or anything else, by the use of their own skill and knowledge, and without taking any evidence or hearing the parties concerned, are not arbitrators. Such a person is not acting judicially. He is using his own skill, and is not performing the functions of a judge.

A study of the decided cases shows that it is sometimes very difficult to determine when the engineer may be acting as an arbitrator and when he is not. Sometimes indeed contracts are drawn in which the engineer might be an arbitrator in respect of some of the matters submitted to him, and not in respect of others. When a contract raises doubts as to the precise legal jurisdiction of the engineer, it would be well to take competent legal advice as to the construction of the contract.

To illustrate, a construction contract provided that, upon certain defaults occurring, the builder would pay the employer such sums "as the engineer for the time being of the employer shall, in his opinion, *adjudge* to be reasonable and proper to be paid for such default." This was held to require an appraisal and not an award.

In another case, it was provided by the contract that the engineer "shall be the exclusive judge upon all matters relating to the construction, incidence and consequences of the contract and to the tender, specifications, schedule and drawings of the contract, and in regard to the execution of the works or otherwise arising out of or in connection with the contract, and also as regards all matters of account including the final balance payable to the contractor and the certificate of the engineer for the time being given under his hand shall be binding and conclusive on both parties."

It was held that this clause was not an arbitration clause, because the duties of the engineer were administrative and not judicial. They were related to his particular skill, knowledge and experience.

Generally speaking, when it is necessary to decide value or performance only, or matters relating to the administration of the contract, the engineer is not acting as an arbitrator. To constitute the engineer or architect an arbitrator, it must appear from the agreement that it was the intention of the parties that he should hold an inquiry in the nature of a judicial inquiry, hear the representations of the parties and decide upon the evidence presented.

When it comes to ARBITRATION it should be remembered that the arbitrator is clothed with the qualities of a judge. He is a judge selected by the parties to decide their controversies. There is this difference, however, between an arbitrator and a judge; that an arbitrator is not bound to observe strict formalities of law.

There is no basic disability on the part of any person to act as an arbitrator. If an incompetent appointment be made, that is the fault of the parties. There are, however, basic disabilities which the Court will recognize, and the books mention deafness, dumbness, blindness, idiocy, outlawry and conviction for perjury. I am not so sure of deafness, dumbness or blindness under modern conditions. I have been present at arbitrations where deafness might have been a distinct advantage; dumbness might have shortened the hearing and as to *blindness*—the classic representation of the Goddess of Justice shows her with bandaged eyes and holding the scales of even judgment in her hand.

The parties to an arbitration are entitled to expect from an arbitrator complete impartiality and indifference, both as between themselves and as regards all matters left to the arbitrator to decide. They are entitled to expect a faithful, honest and disinterested decision. However, there are exceptions to the precise application of this statement. For instance, if they agree to accept the judgment of the engineer who acts for or is employed by one of the parties, they will be taken to run the risk of some conflict between his loyalty and his professional ethics.

An arbitrator may have his decision disqualified, however, if he has a personal and pecuniary interest in the result. This is certainly so if that interest is concealed by him from the parties concerned. In order to be disqualified by interest, the interest must be so connected with his duties as an arbitrator as to render it inequitable that the parties should be held bound by their agreement to accept his decision.

Arbitration

In Ontario, it is usual to appoint either one arbitrator or three arbitrators. It is comparatively rare to appoint two arbitrators and an umpire. Strictly speaking, where two arbitrators and an umpire are appointed, the arbitrators may proceed independently of the umpire. They only have recourse to his aid should they fail to agree. If lawyers are employed to present the evidence in such cases, this practice has much to commend it, because they get paid for wrangling before the arbitrators and then for enjoying the same wrangle before the Umpire. Usually, it is the practice here to have three arbitrators sit together from the beginning of the arbitration, even though one of them is virtually an umpire.

Arbitration is given legal sanction in Ontario by the provisions of The Arbitration Act. Where the intention is to arbitrate, this Act applies whether or not specific reference is made to it in the contract. This Act is of general application, and a submission to arbitration cannot be revoked except by leave of the Court, unless it contains an express provision to that effect. Furthermore, a submission to arbitration includes the provisions set out in Schedule "A" to the Act, unless a contrary intention is expressed in the submission.

It would not be possible in the time at my disposal to take you through the various provisions of the Act and of the Schedule. I do say this, however, that no one should undertake the duties of an arbitrator without carefully considering the provisions of the Act and the obligations which it imposes. A particularly interesting feature is that it restricts the fees to be charged by an arbitrator to not less than $20 nor more than $40 for each day's sitting of not less than six hours, unless there be an agreement by the parties to pay more.

If you are asked to act as an arbitrator, you would be well advised to examine the submission to arbitration before agreeing to do so. There are a number of cases that fall near the border line of the judicial function of arbitration, and the administrative or valuing functions that are sometimes expected of engineers.

If you are satisfied that the parties intend you to use your own professional observation and skill in addition to any inquiries you may make, then there is much to be said for having the submission exclude the provisions of the Arbitration Act. It is quite competent to do this. I have more than once followed this course myself in arbitrations having to do with the broad field of labour relations. It is often well nigh impossible to conduct such an arbitration with a trade union on the one side and an employer on the other, and to follow all the rules strictly. If, on the other hand, a formal arbitration is really desired, you should pay strict attention to the provisions of the Act, or you may find some Court interfering with the Award.

The Act does not leave you to the mercy of the lawyer on questions of law. An arbitrator may at any stage of the proceedings, and shall if so directed by the Court, state a special case for the opinion of the Court on any question of law arising in the course of the reference. He may also state his whole award in the form of a special case to have the attention of the Court. While the power to state a case is discretionary, the Courts have held that it is a controlled discretion, in that the arbitrator must respect the right of either party to apply to the Court for an Order directing him to state in the form of a special case any question of law that may arise in the course of the reference.

The Courts will not tolerate the refusal to state a case and the making of an award, without giving either party an opportunity to apply to the Court to give directions to the arbitrator. It is seldom indeed that a whole award is presented in the form of a special case for the opinion of the Court. This may be done, however, if the conclusion of the arbitrators turns on a question of law and neither party has sought a stated case.

Where there is a full-dress arbitration with three arbitrators, with counsel appearing for each party and one or more applications for stated cases, it is my experience that an arbitration is frequently of greater expense to the parties than an action in Court. Arbitration has its chief value where arbitrators are appointed because of their special knowledge of the subject matter of the arbitration. If, in connection with a building or construction contract, any one should propose using lawyers as arbitrators, the parties would be well advised to get along to the Courts and have their difficulties settled there. Sometimes, however, a lawyer makes a good and useful umpire in a case of this kind as one of three arbitrators, the other two being professional engineers or architects, depending on the nature of the dispute.

I should add that when any question arises as to the jurisdiction of arbitrators, they are not permitted to determine the extent of their own jurisdiction. This usually involves the interpretation of the contract and is a matter for the Courts. There is one exception to this rule in the field of labour relations. The Labour Relations Act of 1950 (Ontario) provides for arbitration of labour disputes, and permits the arbitrators to determine whether or not a matter is arbitrable. This I regard as an unfortunate departure from good law and good sense.

Conclusion

During these remarks, I have only been able to deal generally with a very broad subject. I have endeavoured to touch the high spots where the lines of your profession cross those of mine. I have not touched on the legal aspect of the field of labour relations, though I believe the duties of many engineers require them to develop skills along those lines. However the law relating to labour relations is not very edifying. Most of it involves ready departure from tried legal principles; it is intermingled with political expediency and sometimes borrows from the law of the jungle.

You may all feel at this moment a little like the young man who had just graduated from University and agreed to hold the fort in his Uncle's law office while his Uncle went on a holiday. Meantime, he was to read some books and decide whether or not he would like to study law. When the Uncle returned, he asked the young man how he liked practising law and received the curt reply: "I don't like it at all, I am sorry I learned it!"

New Device Saves Man Power and Reduces Hazard on Headworks Gantries

The accompanying photograph shows a 25-ton electric gantry crane on the headworks of the Des Joachims development of The Hydro-Electric Power Commission of Ontario. It is used for handling trash racks, emergency stop logs and head gates, and incorporates an auxiliary high-speed hoist for lifting the trash rack cleaners.

As may be seen from the photograph, trash rack sections and emergency gate logs are lifted by a follower, which hangs on the main hook. The follower is provided with hooks or latches at each end which automatically engage when lowered into the gate or other item to be lifted. This arrangement eliminates the necessity of having a man walk along with the crane on the deck of the dam, close to the gate slots to retrieve the rope which was formerly required to operate these hooks.

The new automatic latching arrangement consists of a torque motor drive connected to the latch system in such a way that the rope is at all times kept taut. During hoisting operations the motor keeps a light tension on the rope so that it is automatically retrieved. When the time comes to release the latches, however, the crane operator has only to press a button in his cabin so that the full operating pull can be applied and the latches released.

Wartime Marine Structures

Their Influence on Post-war Construction

Condensation of an article "Survey of Marine Structures and their Influence on Post-war Construction", by Maunsell, Posford & Pavry, which appeared in the August, 1950, issue of "The Consulting Engineer".

The consulting engineer, as an ndependent authority, is always ound to come up against many ifficulties and very varied prob-ms in the solution of which there the opportunity to break fresh round, and this has, of course, een more than usually the case uring the past eleven years of ar and post-war conditions.

During the late war, there were nany instances where this was emonstated and the British con-ulting engineer was able to bring riginality of thought and concep-ion to the assistance of the Allies. The dangerous situation of Great Britain also served in the emer-ency of the times to encourage hose responsible to approve the xecution of novel engineering chemes that they would not nor-nally have ventured upon in peace ime. The experience so gained in dvanced design and methods of onstruction can now be, and has lready been, applied to peace-ime needs.

The Maunsell Forts

During the bombing of London n 1940, enemy planes had a com-paratively easy passage until close o the target, as they were able o approach up the Thames Estu-ry outside the effective range, at hat time, of shore batteries and ircraft detection apparatus. The uthorities spent many months considering various ways of com-bating the menace before even-ually agreeing to the construction of the Maunsell Forts, as they were referred to in Service Orders. They were of two types, the Naval Forts, manned by the Navy, and the Army Forts manned by A.A. Command.

The delay in embarking upon the project was largely occasioned by a natural reluctance to approve a scheme which embodied some original features, one of which was the "crash-diving" of a 4,000-ton reinforced concrete structure, loaded with delicate equipment, on to a completely unprepared sea bottom many miles off the English coast in an area often frequented by enemy E-boats and in a position only about 10 minutes' flying time from the enemy-held shore of the Continent. This, of course, preceded by some few years the Mulberry Harbour project, in which the dumping of the breakwater caissons on an unprepared sea bottom was again carried out.

The Naval Forts, of which there were four, were self-contained units, which were built at Gravesend, on the River Thames, partly in a dry dock and partly at a floating berth. Each fort was waterborne on its own pontoon, which was constructed of reinforced concrete, specially designed so that the eventual sinking of the fort at its action station out at sea by flooding of the hull should be automatically controlled by the manner in which its subdivisions and chambers allowed the water to enter. From the top of the pontoon, two hollow reinforced concrete cylindrical towers were raised. These were 24 feet outside diameter, 12 inches thick and 60 feet high.

The crew of 110 men, and the ammunition, water tanks, stores and electrical generators, were accommodated in eight decks within each tower. In the design, allowance had to be made not only for the simple hydrostatic pressures but also for the effect of waves 20 feet from crest to trough beating the fort when in its destined position miles out in the open sea. The towers were surmounted by a steel deck 110 feet by 32 feet, in the centre of which the officers' accommodation, galley, washrooms and control rooms, etc., were provided for in steelwork rising to a series of smaller decks. The fort, while still at Gravesend, was equipped with full electrical, plumbing, heating, ventilating, cooking and other services and the armament and other apparatus was fitted on the upper steel decks. Next the crew came aboard, and the fort was commissioned ready for action. Then the fort was towed to sea.

The First Fort

On the occasion of the first fort to be towed out, the distance was 70 miles. On reaching the grounding site previously selected and buoyed, the leading tug tied up to an anchored lighter with the fort lying downstream of the anchor and exactly over her grounding position. A 12-inch diameter sea-cock was then opened, admitting water to the forward compartments of the pontoon. After about 15 minutes the bow of the pontoon

Fig. 1. On this and the facing page is a panoramic view of a fertilizer factory adjacent to Immingham Dock, Lincolnshire. Raw materials enter at the right via quayside grabbing cranes, reception hoppers and the conveyor in the lower elevated gallery. The finished product is exported to ship by conveyor in the upper elevated gallery.

dipped under the water and sank, the forefoot striking bottom first. The centre and stern compartments filled in their turn and the pontoon settled down flat on the sea-bottom about 1½ minutes after the bow had dipped beneath the surface. The fort was then ready for action immediately, and one of them did in fact go into action against enemy aircraft within 20 minutes of being grounded.

These forts were built for about one-sixth of the cost which the authorities had anticipated and in less than one-third of the time. This was partly due to the technique evolved whereby large sections of the reinforced concrete work were prefabricated and then hoisted into position as soon as required in the building of the structure. This technique was extended a little further in the later series of forts—the Army forts—which were also prefabricated to the point of full availability for action in comparative safety away from their ultimate destination and then towed out to sea and sunk at their action stations. This second type consisted of groups each of seven separate towers linked together by light tubular steel bridges. They were placed less far out at sea than the previous type described and were not therefore quite so vulnerable to surprise attack. These ones, therefore, were not unceremoniously plunged down to the sea-bed, but were more sedately lowered from twin camels mounted with eight winches from which the forts were slung on steel ropes.

Fig. 2. Maunsell Sea Fort, ready for action, plunging to the sea bed.

Reinforced Concrete Tower Bases

The bases of the towers were constructed in reinforced concrete and were cruciform in shape, each limb being 82 feet long, 6 feet 9 inches high, and about 5 feet 6 inches wide, slightly tapered from top to bottom. They were hollow, the walls, bottom and top being 5 inches thick. They were built in a dry dock at Gravesend and were so designed that they would float, their displacement being 300 tons. The bases were built in pairs, each pair taking a fortnight to construct. They were then floated, at high tide, to specially constructed berths in the tidal river. As the tide receded, they settled on these berths and the hollow interior was flooded with water so as to prevent re-flotation on the next rising tide. Four hollow reinforced concrete legs, each precast in three sections, were then built up on the base. The legs were 3 feet external diameter, 6 inches thick and 65 ft. high. They were surmounted by a 4-ft. deep reinforced concrete cap in which the main steel beams supporting the "house" were embedded. The "house" was built of steel and contained two storeys.

A group of seven towers was fitted out with sleeping rooms, galleys, washrooms, control room, store rooms, workshops, power house, magazines, etc., etc., together with all the electrical, plumbing, heating, cooking and other services necessary for the

crew of 120. The armament and other apparatus was accommodated chiefly on the roof. Armour protection was provided where necessary. The work on the berths was scheduled to occupy eight weeks, but the time was later reduced to as little as five and a half weeks.

As the towers were successively completed, two camels were floated over the outer arms of the bases at high tide, and, as the tide receded, they settled on these arms. At low tide, the hollow base was emptied of water and special hooks, hung on wire ropes operated from winches on the decks of the camels, were engaged with heavy lugs incorporated in the base. As the tide rose again, flotation of the whole tower was obtained by means of the displacement of the camels and the hollow air-filled base. Four tugs towed the unit — camels and tower — to its action station in the sea, where, by manipulation of the winches on the camels, the tower was lowered on to the sea bed.

The camels were then cast adrift from the base of the tower and returned to the building site ready for the next unit. After the tower was grounded, the base was again flooded in order to apply the weight necessary to maintain it in position. The tubular steel bridges were towed out to the action station on a barge, and lifted into position between the towers. They were supported on sliding seatings having a 10-ft. travel. This was so as to allow for the presupposed margin of error in placing neighbouring towers accurately. In practice, it was found that towers could be and were placed within 12 inches of their ideal position.

It is gratifying to be able to record that all these forts proved in practice amply to fulfil their allotted role in the war effort, being responsible for putting a stop to enemy activity, both airborne and seaborne, in the Thames Estuary. General Sir Frederick Pile, Chief of Anti-Aircraft Command, after the war, in 1946, publicly stated that "if we had had them in the winter of 1940 the docks in London and the docks at Merseyside would not have suffered anything like the damage they did".

Reinforced Concrete Floating Docks

The heavy precast concrete slab technique was then taken a long step forward in the construction of reinforced concrete floating docks, of which five different types were built. They compared favourably as regards cost with steel docks, but their greatest advantage was in constructional time. These docks were required to lift tank landing craft up to the largest size, minesweepers, trawlers and similar naval craft, and the need for them was urgent. A steel dock would have taken some nine months to build and all of this time it would be occupying valuable dry dock space.

The first type of these reinforced concrete docks was design-

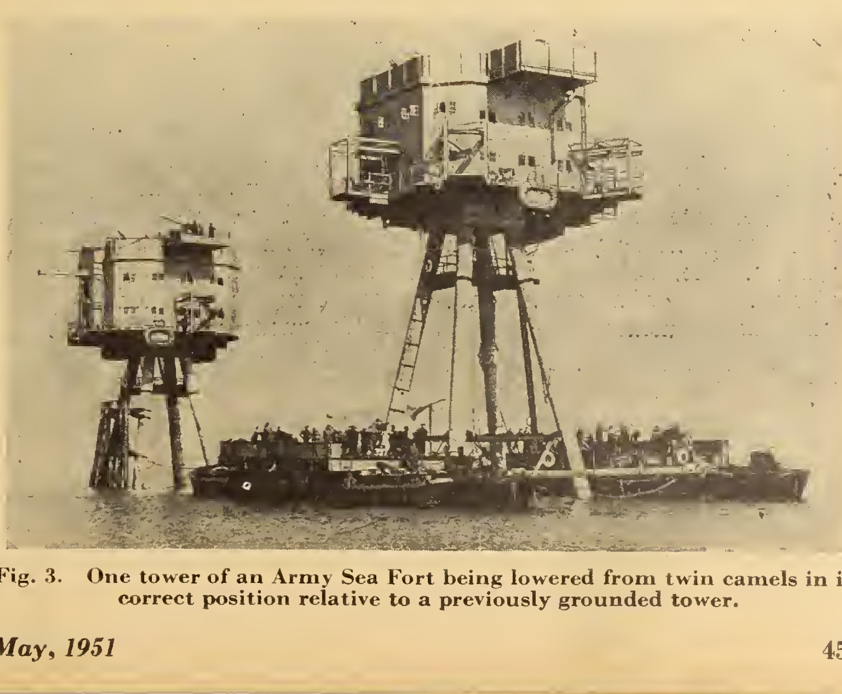

Fig. 3. One tower of an Army Sea Fort being lowered from twin camels in its correct position relative to a previously grounded tower.

Fig. 4. Storage and transit bunker, erected at Liverpool Docks for ship-to-truck movement of granite. All the wall panels and the supporting piers were precast.

ed and the contracts for construction were let within a fortnight of the problem being posed and the first one was floated out of its building basin only three months later. Thereafter, they issued from the same basin at four-week intervals. Two other sites in the United Kingdom were later opened up for construction of these docks, and as the war in the Far East developed, a site in India and one in Australia were added. Fifty-five docks in all were ordered to be built, of which about half were actually completed before the dropping of the atom bomb rendered the need for the remainder unnecessary.

These docks varied in size from 132 feet long by 54 feet wide to 270 feet long by 67 feet wide. The side walls were between 24 and 35 feet high. Some were fitted with "pound walls" at each end of the pontoon deck. This resulted in extra lifting capacity as it enabled the water level outside the dock to be above the level of the pontoon deck when the latter was dry, so providing the necessary additional displacement.

Elimination of In-situ Beams

The main principle in the design was the elimination of in-situ beams and also the virtual elimination of shuttering to vertical walls. The whole of the ribs of the dock and the vertical walls were precast in sections each about 4 inches thick and six or seven tons in weight, these precast slabs being cast flat one on top of another. They were then lifted into the vertical position and assembled in the dry dock basin like a house of cards, the bars projecting from the edges of a slab interlacing with those projecting from the neighbouring ones. A small shutter attached to the slabs at their meeting points was then quickly fixed and the splice joint so formed concreted up from bottom to top in one lift. The bottom floor of the dock and the decks were cast in-situ.

The docks proved very successful in use, some being used in England, Scotland and Normandy, while others were towed from England to Malta, Colombo and even as far as Singapore without showing any signs of leakage or other trouble. The Americans, who had already previously sent observers to watch the building of the Sea Forts, were keenly interested in the docks, two of which were handed over to them for their use. They found them to be an improvement on their own design and an article in the January, 1945 issue of "The Proceedings of the American Concrete Institute" officially confirmed this view.

Storage Bunker

This type of design was used on one or two other war-time jobs, but its first use in post-war work was in Liverpool in a storage bunker sub-divided into a numbe of bins to receive crushed an sized granite. The granite was t be unloaded from ship into th bunker and then loaded into lorry Considerable economy in cost an constructional time was achieve by the acceptance of a simply designed bunker, based on the precast flat slab principle with n conveyors at all and with th travelling grabbing crane for unloading the ship mounted on to of the bunker. The capacity o the bunker is 10,000 tons of granite and this whole compact depo is run by just three men. Th whole bunker is supported on pre cast concrete piers so as to allov the lorries to drive in beneath i for loading. All the bin walls wer precast flat in stacks, one sla upon another, and the slabs wer then lifted into their vertical posi tion. The joints between them wer then concreted in-situ, as also wa the floor. The overall size is 20 feet by 60 feet in plan, and th bins are 21 feet deep.

Fertilizer Factory

Another application of the sam flat slab principle was instanced i the bin walls of the various store required in a large fertilizer fac tory, adjacent to the deep wate dock. The several different mater ials that have to be stored in bul are imported from the Quaysid and distributed from there to th storage buildings by conveyo belt. The method of extractio from the stores varies for proces reasons from building to buildin and is in some instances by Chase side shovel, necessitating an ope side to the bin, in others by ove head travelling grabbing cran and so into hoppers served by con veyor belt, and in others again b drag scraper equipment to a sub floor hopper served by conveyo belt and elevator.

The properties of the store materials are such that in som circumstances it may be necessar to explode a small charge in th mass to loosen it before extractin from the store. This involved th segregation of the 15 ft. high stor age bin walls from the main struc ture of the building, so tha should the walls be shaken by th explosion, the effect would not b transmitted to the building fram carrying the cladding material an the overhead cranes and con veyors. The relative costs were c course dependent largely upon the quantity stored — the larger the quantity the smaller the unit cost —but also they were much influenced by the method of extraction. The least expensive method was by drag scraper, as this arrangement facilitated the erection on an A-frame building which conformed closely with the shape of the heap of stored material, so avoiding waste space internally and reducing wind loads externally. The bottom 8 ft. of the sides of this building were also constructed in thin precast reinforced concrete slabs, each weighing 6 or 7 tons.

Shellhaven Oil Refinery

The precast concrete slabs and sections to which reference has so far been made, both in the war-time and the post-war projects have been between 5 and 7 tons in weight. They were kept down to that weight largely so as to enable the contractors to use derrick cranes that were readily available, as the obtaining of other than reasonably standard contractors' equipment was practically impossible in war-time and immediate post-war conditions. However, more recently precast sections up to 14 tons in weight have been specified. An instance is provided in the cooling water culverts for another industrial project, the Shell oil refinery under construction at Shellhaven on the Thames.

Due to the presence of extensive mud banks which are exposed at low tide, the intake and outfall culverts, which are designed to carry 350 cusecs, had to be taken out to deep water. The internal dimensions of each of the twin rectangular outfall culverts are 8 feet by 6 feet, and the thickness of the concrete is 5 inches. They are precast in 14-ft. lengths, each section weighing 14 tons. A double row of piles are first driven, each pile being provided with a shoulder near its head. Precast concrete beams are next lowered on, to these shoulders, and the 14-ton sections of culvert are then placed upon the beams.

In the application of the use of heavy precast concrete sections, and particularly where they are associated with marine structures, it is necessary to specify to a greater extent than usual the plant and method of assembly which the contactor is to employ if the best advantage in economy is to be obtained. If this is not done, the contractor may lose the advantage by burdening the work with unsuitable or excessive plant due to his natural dislike of taking risks in a field of construction with which he may be unfamiliar.

Departures from Recognized Practice

Emergency conditions in the late war often enforced upon contractors and those commissioning new works a departure from recognized practice and as a result it is undoubtedly true that the new designs and methods of construction then tried out and proved have contributed to the speed and economy with which much post-war work has been carried out. In this connection it is interesting to note that a development of a special marine structure for deep sea oil drilling is a direct combination of the Army type Sea Fort design and the reinforced concrete floating dock design, both described above, neither of which would probably have ever been brought to reality but for the exigencies of the war. This oil drilling structure has, however, to date, only reached the model stage and is not yet under full-scale construction.

The Consulting Engineers responsible for design and supervision of construction of all the projects described in this article were Messrs. Maunsell, Posford & Pavry. Unfortunately, it is not possible to mention the names of the very many sub-contractors and suppliers of equipment who also contributed to the projects described in this article, but their assistance and co-operation with the Consulting Engineers is acknowledged. √

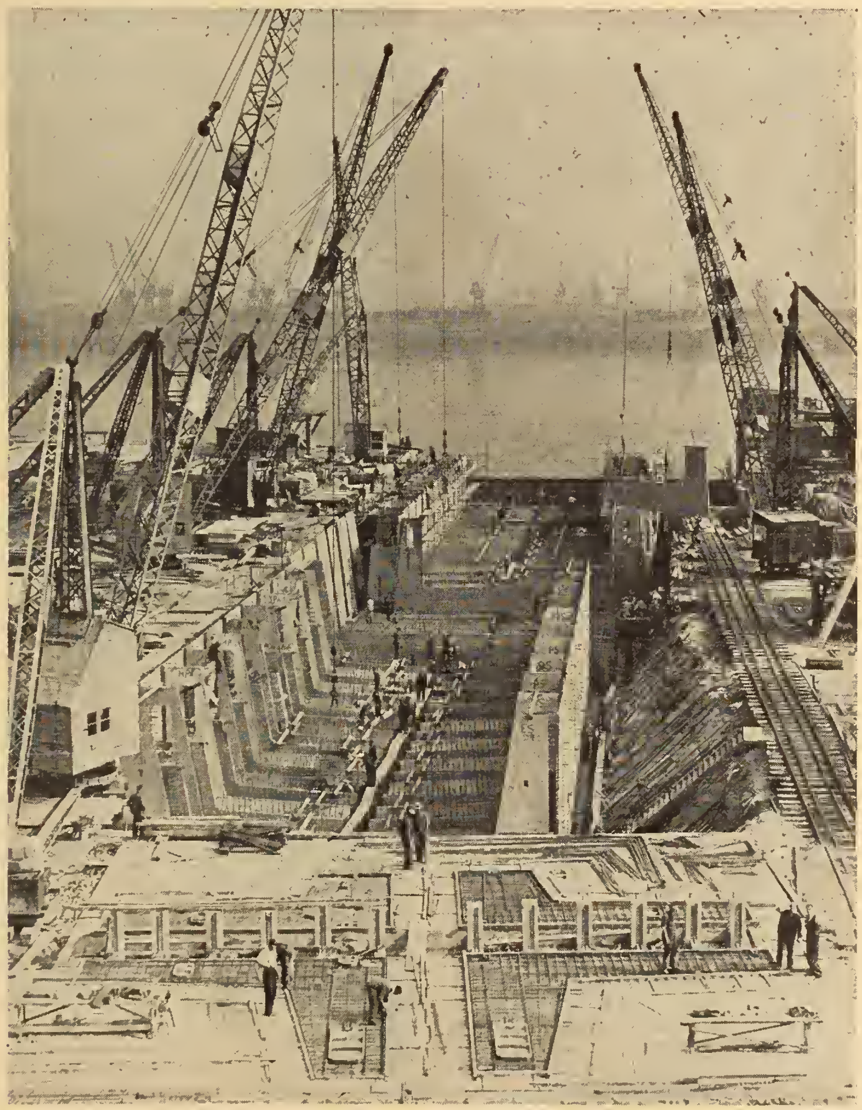

Fig. 5. Two reinforced concrete floating docks under construction. The 4-inch thick ribs are being precast in the foreground and one rib is being lifted into position (centre right).

Hot Shipment of Large Steel Ingots

Note from the Technical Staff,
Dominion Steel & Coal Corporation, Sydney, N.S.

Canada's largest steel ingots, 130,000 pounds, are now being shipped hot for the first time. The method now successfully developed marks the first known occasion when red-hot ingots were transported such distances by any means. The co-operation of the Canadian National Railways has been a key factor in this development.

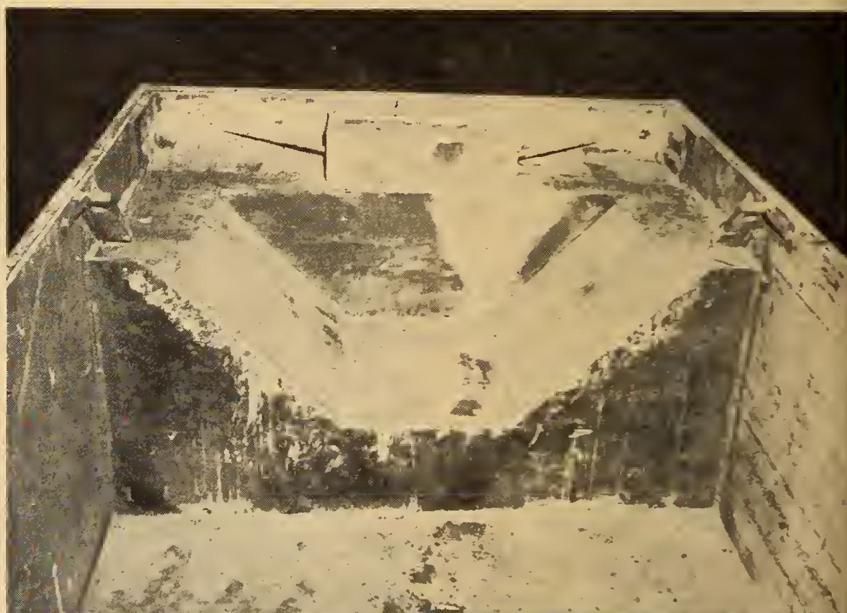
The ingots, one per car, leave the Dominion Iron & Steel Company's plant at Sydney, N.S., and arrive red hot at the Trenton Steel Works, Trenton, N.S., some twenty hours later. These two plants, both subsidiaries of Dominion Steel and Coal Corp. Ltd., are some 185 rail miles apart. The first hot ingot of this size was landed at Trenton on December 21st, 1950. Shipment of hot ingots from Sydney to Trenton was first undertaken some two months previously, but none of the ingots shipped hot prior to December 20th exceeded 15 tons.

After the steel is poured into the ingot mould it is allowed to solidify, and the ingot is removed from the mould while it is still at a high temperature. The ingot is placed in a special insulated steel box, carefully fitted and anchored to a flat car. This box is of a considerable size, because the ingot is approximately 15 ft. long and has a body nearly 6 ft. in diameter. The ingot is held in place by pre-moulded supports. The remaining space is filled with loose vermiculite and a steel cover, fastened on, after which the car is ready for dispatching.

The method of insulation is so efficient that the outside of the steel container is never noticeably above existing temperatures, despite the temperature of the ingot which may be 1600°F. Sixteen to twenty hours later, when the ingot reaches Trenton by C.N.R., its temperature is approximately 1500°F. It is charged directly into a heating furnace and brought up to forging temperature, about 2100°F. The accompanying photographs serve to illustrate the methods used.

Previously, all such special or alloy steel ingots were allowed to cool slowly at controlled rates at Sydney, shipped cold, and reheated very slowly at Trenton. The innovation eliminates the slow cooling and slow reheating at this stage, thus greatly speeding delivery of the finished product. Reheating fuel costs are also reduced, but there are extra freighting charges partially offsetting these savings. Danger of crack formation during cooling is reduced, hence it is expected that average product quality will be somewhat enhanced.

Trenton Steel Works Ltd. makes shafting and other components for Canada's shipbuilders, special shafting for large turbines and general hydro-electric work, and many other lines of heavy equipment, all from steel made at Dosco's primary steel producing plant at Sydney.



The upper photo shows the pre-moulded insulating supports in the box before putting in the ingot and loose insulation.

Lower photo. After being turned on its side, the red-hot steel ingot is lowered gently into the insulated steel box mounted on a C.N.R. freight car.

From Month to Month

Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers

"UPADI"

A new word has been added to the vocabulary of many nations. It was approved and put into use at Havana, Cuba on Saturday, April 21st, 1951.

The word is "Upadi". It is the sign of international understanding and engineering good sense. In Spanish it stands for Union Pan-Americana de Asociaciones de Ingenieros and in the English version The Union of Pan American Associations of Engineers.

It is a pleasing and encouraging experience in these troublesome times to find that many men from many countries consider their professional obligations, their common problems, and their usefulness to their fellow men of more importance than political differences, geographic divisions, and national prejudices.

At Havana, representatives from fifteen countries gathered for four days to work out a basis for collaboration and a constitution that would assure its continuity. It is doubtful if ever before in the history of the engineering profession there has been so remarkable a conference. In some instances citizens from countries whose governments are at great odds one with the other, worked together in close harmony and splendid unselfishness to bring about an international understanding that might well be an inspiration to the governments themselves.

The difficulties of language barriers were not allowed to divert these people from their purposes. Three languages were in constant use — Spanish, Portuguese, and English. Fortunately many delegates were able to speak more than one, so that with thoughtfulness, forbearance, and patience on the part of everyone there was complete understanding.

Surely the successful outcome of a conference of this kind must be of some significance to nations everywhere. It must mean something to troubled peoples all over the world, that men of fifteen nations can come together of their own free will and reach unanimous accord on terms for continuous co-operation.

The profession of engineering may well be proud of this achievement. It is further proof of the universality of engineering—if further proof were needed. It is a glowing example of the good that can come from the application of engineering thinking and engineering methods. As well, it is a demonstration of the fraternalism that is so important to the profession.

Great credit for this accomplishment must go to F. Saturnino de Brito of Brazil. It was his imagination, his intelligence, and his persistence over many years, that led the profession to this happy conclusion. In recognition of these things the Conference made him its Honorary President.

To the Cuban hosts headed by Manuel Puente, chairman of the Conference, much credit is due. Individually and collectively they have given strong support to the proposal and their part in the Conference was an influential factor in its successful achievement. Their abundant kindness to their guests from east, west, north and south will long be remembered.

The Engineering Institute of Canada was represented by its president, James A. Vance and its general secretary L. Austin Wright. Both had important committee duties assigned to them. In particular the Institute officers were associated with the ten delegates from the United States which in itself was a happy and helpful association. There was a complete unanimity of opinion at all times between these two delegations.

The complete list of participating nations in alphabetical order is Argentine, Bolivia, Brazil, Canada, Chile, Columbia, Cuba, Honduras, Panama, Peru, Porto Rico, Salvador, San Domingo, United States and Uruguay.

The United States delegates

Cover Picture

The sketch on the front cover shows a distillate drum, made of monel-clad material, being fabricated for the oil industry in the plate shop of Dominion Bridge Co. Ltd., at Lachine, Quebec.

This work is typical of a large range of pressure vessels and other equipment which "Dominion Bridge" manufactures for the oil industry.

The original sketch is by John S. Walsh, M.E.I.C., eastern sales development manager of Dominion Bridge Co. Ltd.

were representative of the senior professional societies including the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers, the American Institute of Mining and Metallurgical Engineers and the American Institute of Chemical Engineers. This representation was joined through the agency of the Engineers Joint Council (E.J.C.). In their delegation were included the president of the Civils, the president of the Electricals, and the president of E.J.C. itself, as well as the secretaries and the assistant secretaries of the Civils, Mechanicals and Chemicals.

The constitution of UPADI provides for one membership only from each country, consisting of national engineering bodies or groups of such bodies where there is more than one in a country. The conference is to meet every three years and, for 1954, New Orleans has been selected upon the invitation of the United States delegation.

The Board of Directors is made up of representatives of nine nations and is to be elected every three years. Canada is to be represented during the first three-year period.

The purposes of the Union are very wide. They include such things as the expansion of the usefulness of the profession to the public, the improvement in the status of the engineer, the development of rules of practice and professional ethics, the exchange of teachers, lecturers, and students; the interchange of technical, professional, economic, and social matters; the promotion of closer ties between societies and between countries, the study of technical problems that are common to two or more countries, as well as inter-American public works and economic problems, and strengthening the cause of peace by strengthening the ties between nations.

Engineering knows no boundaries but those of the laws of nature. It is an inspirational experience to see groups of earnest men working diligently and unselfishly to prove the truth of this statement and to build a structure that forever will be a sign of hope to many people and a material aid to the realization of much that is best in man.

News of Other Societies

The **Chemical Institute of Canada** (18 Rideau St., Ottawa, Ont.) announces the 34th annual conference in Winnipeg, Man., June 18 to 20, 1951.

Seventy-six technical papers will be presented, in the fields of chemical, engineering, chemical education, agricultural, biological, and organic chemistry.

Programme details may be obtained from C.I.C. headquarters.

Managing Director B. C. Fairchild, of the **Canadian Electrical Association** (Room 704, Tramways Building, Montreal 1, Que.) has advised of the Annual Convention of C.E.A., to be held at St. Andrews, N.B., June 18 to 21, 1951.

The Institute of the Aeronautical Sciences (2 East 64th Street, New York 21, N.Y.) announces the following meetings scheduled for the remainder of this year: the 1951 annual summer meeting at I.A.S. Western Headquarters, Los Angeles, Cal., June 27, 28; The Third International Aeronautical Conference arranged jointly with the Royal Aeronautical Society, Brighton, Sussex, England, September 3 to 7; and the fifteenth Wright Brothers Lecture, December 17, in Washington, D.C.

The programme has been announced for the 54th annual meeting of the **American Society for Testing Materials** (1916 Race Street, Philadelphia 3, Pa.), at Atlantic City, N.J., June 18 to 22, 1951.

The semi-annual meeting of the **American Society of Mechanical Engineers** (29 West 39th Street, New York, 18) is scheduled for June 11 to 15, 1951, at the Royal York Hotel, in Toronto, Ont.

The fourth annual meeting of the **Heat Transfer and Fluid Mechanics Institute** will be held at Stanford University, Stanford, California, on June 20, 21, 22, 1951.

The May issue of "Mechanical Engineering" includes the complete programme of the meeting.

The Applied Mechanics Division of the **American Society of Mechanical Engineers** (29 West 39th Street, N.Y.) announces that immediately following the aforementioned meeting, there will take place an applied mechanics conference, also at Stanford University, June 22, 23, 1951.

The summer general meeting of the **American Institute of Electrical Engineers** will take place in Toronto, Ont., June 25 to 29, 1951, at the Royal York Hotel.

O. W. Titus, M.E.I.C., of Canada Wire & Cable Co., Toronto Ont., is chairman of the general committee.

The Building Research Congress 1951, centred in the Institution of Civil Engineers and organized by the Department of Scientific and Industrial Research, will convene in London, England, on September 11th, 1951, for nine days, to review the progress made in research in relation to architecture, building and associated branches of civil engineering.

The organizing secretary of the Congress is at the Building Research Station, Watford, Herts, England.

The **British Standards Institution** (24/28 Victoria Street, Westminster, London, S.W. 1) announces the exhibition entitled "British Standards—the measure of industrial progress", which will take place June 18 to 28, at the Science Museum, South Kensington, England.

The first exhibition devoted to industrial standardization marks the Golden Jubilee of the British Standards movement.

The International Welding Conference will take place at London and Oxford, England, from July 14 to 21, 1951. The congress will include the annual meeting of the **International Institute of Welding,** and its various commissions and is being sponsored by British member societies in the Institute.

Information may be obtained from the organizing committee, (2 Buckingham Palace Gardens, Buckingham Palace Road, London, S.W. 1).

The American Society of Civil Engineers has announced the nomination as president of A.S.C.E., for 1952, Carlton S. Proctor, New York City consultant of the firm Moran, Proctor, Freeman & Mueser. A member of the Society since 1925, Mr. Proctor has served with distinction in several important posts.

Carlton S. Proctor

The **Joint Engineering Conference,** to be held by the Institutions of Civil, Mechanical and Electrical Engineers, in London, England, from June 4 to June 15, 1951, will record the contributions of engineers and scientists to the advance of civilization.

The Conference will be attended by members of the three Institutions, Commonwealth engineering organizations, European and American associations, and will include varied technical sessions, a full programme of social events, and visits to engineering industries and places of interest.

The programme of the 9th **International Management Congress,** Brussels, Belgium, July 5 to 11, 1951, has been released. The International Committee of Scientific Management (C.I.O.S.) and the Belgian national committee have announced subject matter, travel arrangements, etc.

Canada is collaborating in the presentation of several subjects. For further information, Canadians should contact the Canadian Management Council 549 Burnside Place, Montreal 25, Quebec.

Sessions of the **International Conference of Naval Architects and Marine Engineers** are scheduled as follows: London, England, June 25 to 30, 1951; Glasgow, Scotland, July 2 to 4, 1951; Newcastle, England, July 4 to 6, 1951.

The secretary of the conference is at 10 Upper Belgrave Street, London, S.W. 1.

Correspondence

Agricultural Engineering

Dear Mr. Vance:

As a follow-up to your very interesting talk to the E.I.C. branch meeting at Kitchener recently, may I send you this comment about agricultural engineering in Canada. I happen to be the agricultural engineer who mentioned, at that meeting, that he had helped supply the ventilation equipment for Mr. Schell's potato storage at Woodstock in 1950.

You spoke for a while about the need for water conservation in the world and what you had seen at the Milk River project of the P.F.R.A. in Alberta. When I worked in the Saskatoon office of P.F.R.A. in the summer of 1949, I came in contact with some of the investigational work, chiefly soil mechanics, on that project, and also for the projected dam on the South Saskatchewan River at Elbow. Those projects are giving employment to civil engineers on the actual design and construction, and when the water is led away to the irrigation ditches, agricultural engineers should be needed to orientate the farmers who are brought in from the 'dry' areas to farm 'under the ditch.'

Almost every time one sees a newsreel at the local cinema one is shown pictures of floods and the accompanying devastation. Right here in Ontario we have the Grand River Conservation Board which is trying to plan for a more even flow of that important river. Though we have had civil engineers working on such projects as the Shand and Conestoga Dams, and supervising dam and dyke building before and after the floods have passed, is there not a need for agriculture engineers to work farther back in the upper valleys advising and helping the farmers to hold the moisture in the Spring in their woodlots and in small dugouts? There is also a river basin east of Toronto which has been surveyed and found wanting in erosion control.

Where does the Agricultural Engineer fit in, in the Provincial departments of Agriculture?

As Agriculture is a provincial affair and often hemmed by regional bias, we have a situation that unless an agricultural engineer has been born and educated in the province there is often very little chance that he will be employed at the work he has been trained for. Up until recently Professor Hardy in Saskatoon has been running the only true agricultural engineering course in Canada. Ontario Agricultural College has been turning out very competent agricultural mechanics. (For an explanation of the difference between agricultural engineers and mechanics I would like to refer you to a letter in the Engineering Journal, April, 1950, page 294, by Norman Flaten.) Thus how is the province of Ontario going to hire agricultural engineers if it does not bring them in from outside the province? Thus there are agricultural engineers at O.A.C. in teaching and extension work, but there does not seem to be any in the departmental headquarters in Toronto.

The A.S.A.E. and the A.I.C.

Many agricultural engineers belong to the American Society of Agricultural Engineers, St. Joseph, Mich., U.S.A. I have just been elected to the Associate Membership grade of that Society. I am also a Jr.E.I.C., and a graduate engineer-in-training in the Assoc. of Prof. Eng. of Ontario. I can also join the Agricultural Institute of Canada (the old Canadian Soc. of Tech. Agriculturalists'). Though the A.I.C. has been operating for over 25 years, it is only within the past few years that an agricultural engineering group has been formed within its membership.

Recently at an A.S.A.E. student branch meeting at O.A.C. I heard a talk by a biologist employed by a manufacturer of aluminum pipe for irrigation work. Everything went well until he needed to explain the problem of pipe friction. Not being an engineer he had a hard time explaining the situation to an agricultural mechanics student who has not had much book-work in hydraulics. I would have thought that the company would have employed an engineer who has an agricultural background.

Farm machinery manufacturing organizations like the Massey-Harris Co., International Harvester Co., etc., employ agricultural engineers in their design and development departments, but prefer mechanical engineers and tool designers in their production departments. These organizations also employ agricultural engineers and graduates from agricultural colleges in their sales and service departments.

Another Field is Farm Structures. Farmers and growers need buildings for special purposes and. with the changes in supply and new developments in building materials, they are at a loss to know where to go for help. In the old days the farmer held a 'barn-raising bee' and put up a building like the other local farmers. Now that the old carpenters are dying out, the grower has to go to contractors to get advice on insulation, vapor-seals, ventilation, etc. The agricultural college can give him some help but they often have not the funds or the necessary staff.

Take the subject of *Common Storage Ventilation:* This is a method of using the natural cool air in the Fall months to cool down apple and vegetable crops so that they can be marketed more slowly and not dumped on the market in large volumes in October, and thus depress prices. The system was discovered by two horticulturists at O.A.C. Dr. J. H. L. Truscott and Prof E. W. Franklin. Mr. W. C. Wood of the W. C. Wood Co., for whom I am now working, assisted by supplying the materials for building the fans, control panel, and stirring units. It looks as if the horticulturists moved over the line separating them from engineers, instead of the opposite. Architects design large commercial and government buildings, etc., but there is a demand from growers for assistance in changing over storages to this work by using better insulation, vapor-seals, 'false-floors', etc. The growers have to make these changes before the ventilation equipment will operate properly. I have had requests for plans for 20,000 bushel storages twice recently, but as the company and the local college do not have them, I could only advise that the grower consult a particular engineer in Hamilton.

Every day we hear that the United Nations is hoping to rehabilitate certain areas of the world whose agricultural production and methods are not as far advanced as those in North America and Western Europe. President Truman's 'Point Four' programme is along this line too. If agricultural engineers are needed and desired in this work, the lack of advertisements in agricultural and engineering journals is an illustration that the problem and possible solution are unorganized as yet.

I trust that this letter has given you an insight into some of the conditions in the agricultural engineering field in Canada, and particularly in Ontario. The Engineering Institute of Canada, I trust, can give leadership to the young agricultural engineering graduates, many of us veterans of World War II, so that we can serve Canada to the full extent of our training.

This letter is written without prejudice to any person or organization mentioned above.

HUGH A. TEMPLETON, JR.E.I.C.

Airblast Circuit Breaker Interrupts 11-million k.v.a.

In tests carried out recently at Grand Coulee Dam a 220-kv., Brown-Boveri airblast circuit breaker successfully interrupted faults up to 11-million k.v.a., 3-phase equivalent.

Four line-dropping and one line-charging tests were made on 100, 200, and 300 miles of single phase conductor on March 14. Single-phase line-to-ground interruptions for a series of arcing faults and solid faults, with and without reclosing were made on March 18. The last three of these interruptions were made with the maximum short circuit capacity of the Grand Coulee plant and the Northwest Power Pool, which is believed to be the largest concentration of power anywhere in the world.

The breaker interrupted the currents in each case within $2\frac{1}{2}$ cycles after tripcoil energization without visible distress. Although there were signs of severe arcing in the eight sets of fixed and movable contacts, there was no damage which would have obviously interfered with further successful operation.

Several Canadian engineers, representing Canadian Power companies were present at the tests.

Elections and Transfers

At the meeting of Council held at Headquarters on Friday, April 6th, 1951, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

Members:

L. Balsys, *Montreal, Que.*
S. D. Ford, *Vancouver, B.C.*
H. L. Hewitt, *Toronto, Ont.*
J. L. Orr, *Ottawa, Ont.*
A. D. Sierzputowski, *Sault Ste. Marie, Ont.*
A. B. Steiner, *Vancouver, B.C.*
S. W. Woods, *Dundas, Ont.*

Juniors:

M. E. Bailey, *Kitchener, Ont.*
B. W. Henkin, *Montreal, Que.*
C. P. Layard, *Hamilton, Ont.*
R. F. Turner, *Winnipeg, Man.*
M. Wieckowski, *Coleman, Alta.*

Transferred from the class of Junior to that of Member:

W. J. Blackstock, *Calgary, Alta.*
W. F. Dawson, *Lakeside, Ont.*
W. S. Gerrie, *Toronto, Ont.*
D. D. Livingstone, *Sarnia, Ont.*
H. C. Palmer, *Windsor, Ont.*
D. R. Webster, *Three Rivers, Que.*

The following Students were admitted:

D. M. Baker	S. McCombie
A. Beaudry	K. A. Millions
F. J. Berto	J. F. Molloy
K. W. J. Butler	C. F. Moore
F. J. Canzi	B. L. Moreau
A. F. Collings	G. N. Neary
W. J. Cooper	R. O. Olsen
D. H. Cullen	A. M. Ottolenghi
M. de Atucha	S. H. Phillips
C. L. Dodge	G. F. Pierce
L. E. Downes	J. E. Prosper
A. Dubnie	D. E. Quail
H. B. Elhorn	J. D. Riddle
L. M. Etchegary	W. J. Romaniwicz
R. W. Evans	H. E. Sears
C. B. Fairn	A. Shaw
E. W. Fee	G. A. Skinner
A. G. Ford	K. G. Smith
D. H. Franklin	R. G. Smith
D. L. French	K. E. Sommer
E. H. Gilliatt	J. L. Stepan
G. Gracie	R. K. Sylvester
D. G. Hubley	H. D. Tanner
W. L. Inglis	C. T. Taylor
K. F. Jenkins	P. G. Temple
A. P. Johnsen	R. C. Trussler
V. W. E. Johnston	R. B. Turner
M. O. Jones	A. T. Wason
K. R. Langille	G. M. Wood
N. E. Laviolette	S. D. Wood
A. A. MacDonald	P. I. Woodruff
E. E. MacEacheron	G. W. Zelt
R. R. MacKean	

Applications Through Associations

By virtue of the co-operative agreements between the Institute and the Associations of Professional Engineers, the following elections and transfers have become effective:

ALBERTA

Members:

R. S. Nixon, *Nanton, Alta.*
D. B. Wood, *Edmonton, Alta.*

Junior to Member:

J. S. Barton, *Edmonton, Alta.*
E. J. Crowther, *Calgary, Alta.*

SASKATCHEWAN

Junior to Member:

K. E. Bell, *Estevan, Sask.*
D. A. Buhr, *Swift Current, Sask.*
H. C. Moulding, *Regina, Sask.*
M. B. Pierce, *Regina, Sask.*
P. G. Sundeen, *Regina, Sask.*

Student to Junior:

A. W. Kaeding, *Regina, Sask.*
D. J. Kelly, *Saskatoon, Sask.*
S. Kotyk, *Regina, Sask.*
S. F. Lee, *Regina, Sask.*
S. I. Stothers, *Prince Albert, Sask.*
R. C. King, *Regina, Sask.*

MANITOBA

Member:

C. E. Gossling, *Winnipeg, Man.*

NEW BRUNSWICK

Member:

W. J. Edington, *Moncton, N.B.*

Junior to Member:

M. E. Mersereau, *Juniper, N.B.*

Halifax Shipyards Builds Three Motorships for Argentina

The Argentine government's decision to embark on a programme of opening up Southern Argentina has brought about the building of three cargo passenger vessels of 3,100-ton deadweight each capable

of carrying 40 first and 60 tourist class passengers, as well as 800 troops or immigrants when required.

Designed by Milne, Gilmore and German, Naval Architects of Montreal, these ships have been built by Halifax Shipyards Limited, and equipped to the requirements of Lloyd's classification +100 A.1, and Canadian Steamship Inspection requirements for International Regulations for Safety of Life at Sea.

Constructed with cruiser sterns, semi-balanced streamlined rudders, three bladed, manganese bronze propellers of 10 ft. diameter and 7.28 mean pitch, the features of the fore end lines are a straight well raked stem and flared bow sections. Cargo barges are carried for loading and unloading in shallow estuaries and rivers, where port facilities are not available.

The overall length is 336 feet, breadth moulded 47 feet, depth moulded to upper deck 26 ft., gross tonnage 3828 tons, and displacement 5225 tons. Load draft with summer freeboard is 18½ ft., cargo capacity for grain 171,757 cubic feet, speed in service, —15 knots. The vessels are of long bridge superstructure design, with lower deck extending right fore and aft.

above the upperdeck is a forward mast house, bridge superstructure with promenade boat and bridge decks. Two masts and an elliptical funnel, appropriately raked, add to their appearance.

The ship structure conforms to requirements for a long bridge superstructure vessel with two complete decks. Electric welding of high quality has been employed. Vessels are framed transversely without web frames or side stringers except for machinery spaces and deep tanks. Cellular double bottoms, from collision bulkhead to tunnel recess, are divided into six sections, with solid floors fitted every third frame, except in engine room. All decks are of steel.

Accommodation is of a high standard. Decoration and furnishing was designed in co-operation with the T. Eaton Co. Ltd. Cabins and public rooms are painted in pastel shades, predominantly green with darker trim. All cabin and public room bulkheads are of steel to prevent and confine fire. The outfit of anchors, cables, hawsers and warps is one size above Lloyds requirements. Ships are each equipped with two 5-ton, two 10-ton, one 20-ton, and two 3-ton booms for cargo handling, of length to effect a 15-foot reach over shipside when topped at 30°. Vessels are equipped with combined heating and ventilating thermotank systems, as well as with combined smoke detecting and fire extinguishing systems. Emergency life rafts of 40-person capacity are carried. Each ship has 4 life boats and 2 jolly boats.

The propelling equipment consists of two sets of Nordberg type two-cycle, five-cylinder, direct reversing trunked piston diesel engines, developing a total of 3750 B.hp. continuously at 225 r.p.m. Electric power is supplied by two 192-kw., 220-volt d-c. generators and one 106-kw., 220-volt d-c. A 20-kw., 230-volt-d-c. emergency generator is added. Steam is supplied by a Foster Wheeler "D" type oil fired boiler rated at 3835 lb. per hour and a waste heat boiler rated 1540 lb. per hour both at 50 lb. pressure.

These handsome well equipped vessels are excellent proof of Canada's shipbuilding ability, and will help to establish this country's position in the world shipbuilding field.

Personals

News of the Personal Activities of Members of the Institute

John E. Armstrong, chief engineer of the Canadian Pacific Railway, and past-president of the E.I.C., was further honoured recently by election to honorary membership in the American Railway Engineering Association. The award, of which there are only ten among the group's approximately 3,100 members, was "in recognition of outstanding service to the railway industry, the engineering profession and the A.R.E.A."

Mr. Armstrong has served the Association as a director and a vice-president. He was elected to the presidency in 1934.

John E. Armstrong, M.E.I.C.

J. B. Stirling, M.E.I.C., president of E.G.M. Cape and Company, Montreal, received the honorary degree of Doctor of Laws at the recent science and commerce convocation of Queen's University in Kingston.

Mr. Stirling, past-president of the Corporation of Professional Engineers of the Province of Quebec, is vice-president of The Engineering Institute, representing the Quebec Zone.

John H. Parkin, C.B.E., M.E.I.C., of Ottawa, was appointed earlier this year, director of the newly-created National Aeronautical Establishment. Mr. Parkin was director of the Division of Mechanical Engineering of National Research Council, and a pioneer in Canadian aeronautical research and development. The National Aeronautical Establishment is designed to meet the need for improving aeronautical research and development facilities.

Policy direction for the N.A.E. will come from the National Aeronautical Research Committee, members of which are the Chief of Air Staff, the chairman of the Defence Research Board, the president of the Defence Resarch Board, the president of the National Research Council, and the chairman of the Air Transport Board. The new establishment will be administered by the N.R.C. on behalf of the Committee.

Mr. Parkin is a past councillor of the Engineering Institute.

J. A. H. Henderson, M.E.I.C., of Canadian International Paper Company, was elected president of the Dominion Council of Professional Engineers for 1951 at the meeting of the Dominion Council in April. Mr. Henderson is past-president of the Quebec Corporation of Professional Engineers.

His career started in 1912, at which time he worked with the Geodetic Survey of Canada in Ontario, Quebec, and British Columbia. Following war service overseas, he attended Queen's University, and graduated in 1922, as a civil engineer. In 1923 he joined the Riordon Pulp Corporation which was

J. A. H. Henderson, M.E.I.C.

aken over by the Canadian International Paper Company in 1925.

Mr. Henderson's many and varied activities have included investigation of pulp and paper mill sites in Ontario, Quebec and New Brunswick, planning housing facilities for new mill areas, co-operating with government power development projects. In 1941 he began his supervision of purchasing and supply for the Canadian International Paper Company, during that complex period of wartime restrictions. He has continued in this phase of the company's operations ever since.

Thomas H. Hogg, M.E.I.C.

Thomas H. Hogg, M.E.I.C., prominent consulting engineer, has been elected to the board of directors of John Inglis Co. Limited.

Dr. Hogg was for many years chief hydraulic engineer of the Hydro-Electric Power Commission of Ontario. He is a director of the Chartered Trust and Executor Company and also of Corporate Investors Limited.

Dr. Hogg was president of the Institute in 1940.

F. X. T. Berlinguet, M.E.I.C., of Three Rivers, Que., was tendered the Institute's congratulations on the occasion of his 96th birthday, March 14th last. Mr. Berlinguet is the oldest practising engineer in Canada.

Mr. Berlinguet studied civil engineering and land surveying at Laval University and was connected for a number of years with the development of the harbours at Quebec and Three Rivers. He retired from the Department of Public Works of Canada after 46 years of service with the government. Since then he has been actively engaged in private practice at Three Rivers.

A Life Member of the Institute, he joined as an Associate Member upon its foundation as the Canadian Society of Civil Engineers, in 1887, and was transferred to Member in 1890.

C O. Maddock, M.E.I.C., construction engineer of International Nickel Co. of Canada Ltd., is chairman of the Sudbury Branch of the Institute.

Mr. Maddock was born at Inwood, Ontario, and graduated from University of Toronto with a B.A.Sc. in 1918. His early work was with the Toronto & York Roads Commission as assistant to the chief engineer, and as foreman on bridge construction with McNiven Bros., Toronto. For two years he was detailer and designer with Kerry & Chace Ltd., consulting engineers, Toronto, on hydro-electric power development. As a partner in the firm of Scott & Maddock, contractors, he worked in reinforced concrete construction. For a time he was a building appraisal engineer with Sterling Appraisal Co. Ltd., Toronto. He joined the International Nickel Co. Ltd., in Copper Cliff, Ont., as a draughtsman in 1926.

A. B. Olson, M.E.I.C., superintendent for the Saskatchewan Power Corporation, Saskatoon, has been elected chairman of the Saskatchewan Branch of the Institute.

Mr. Olson was born in Minnesota. He graduated from the University of Saskatchewan in 1931, receiving a B.Sc. degree in mechanical engineering. He joined the Saskatoon power plant of the Saskatchewan Power Commission at Regina, as an assistant engineer and a records and test engineer in 1930. He was appointed plant engineer in 1937, and received the appointment to his present position in 1947.

A. C. Macnab, M.E.I.C., mechanical engineer, for Dominion Woollens & Worsteds Ltd., Hespeler, Ont., has been elected chairman of the Kitchener Branch of the Institute.

A. C. Macnab, M.E.I.C.

Mr. Macnab is a graduate of the University of Toronto where he received a B.A.Sc. degree in 1932 and that of M.E. in 1944. He joined the Dominion Woollens & Worsteds Ltd., in 1941, coming from Hamilton, Ont., where he was an engineer for Donald Ropes & Wire Cloth Co.

H. P. Hamilton, M.E.I.C., of Consolidated Mining and Smelting Co. Ltd., has been elected chairman of the Kootenay Branch of the Institute.

Originally from Regina, Mr. Hamilton, after graduating from University of Toronto in electrical engineering in 1934, worked with the Water Development Committee at Swift Current, Sask. He worked in 1936 to 1938 with the Churchill River Power Co. at Island Falls, Sask. In 1939 he went to the engineering department of the Hudson Bay Mining and Smelting Co. in Flin Flon, Man., as a designer and draughtsman. He joined the Consolidated Mining & Smelting Company in 1946 to work on design engineering.

H. P. Hamilton, M.E.I.C.

Jean Saint-Jacques, M.E.I.C., is the chairman of the Quebec Branch of the Institute.

Born in Montreal, Mr. Saint-Jacques studied at Mount St.-Louis College. He graduated in civil engineering from Ecole Polytechnique in 1929 and in electrical engineering from McGill in 1931. He started his career in engineering with The Shawinigan Water & Power Company. He has been continuously employed by Quebec Power Company since 1932. At present he is director of sales and contracts with Quebec Power Company, directing the power and gas contract department, the power and gas sales promotion department, the advertising department, and property and tax department and rate studies.

Has been a member of the Engineering Institute since graduation and has been a director and the secretary of the Quebec Branch of the Institute in the past. He is a registered professional engineer, and is active in Sea Cadet and Navy League work.

Jean Saint-Jacques, M.E.I.C.

H. R. Hayes, M.E.I.C., general supervisor of Standards for Burns & Company, Limited, Calgary, Alta., has been elected chairman of the Calgary Branch of the Institute.

Mr. Hayes is from Gleichen, Alberta, and a graduate of the University of

H. R. Hayes, M.E.I.C.

Alberta, where he received a B.Sc. degree in civil engineering in 1934. Upon graduation he was a transitman with the C.P.R. In 1937 he went to Burns & Co. Ltd., as time study engineer. He was appointed a supervisor of standards later that year and, in 1940, general supervisor of standards.

Col. H. W. Love, O.B.E., M.E.I.C., has been appointed commander of the North West Highway System, in Whitehorse, Y.T. Colonel Love was stationed previously at the Department of National Defence, Ottawa, with the appointment of chief engineer, Canadian Army.

Graduating as a B.Sc. from Queen's University in 1936, he joined the R.C.E. as a lieutenant, going overseas in 1940. He rose to the rank of Colonel, and received the appointment O.B.E., while still overseas. Returning in 1946, he was appointed the director of works and construction, in the Q.M.G. Branch of D.N.D.

E. R. Williams, M.E.I.C., of Shawinigan Chemicals Ltd., has been elected a director of the Company and vice-president in charge of manufacture. Mr Williams joined the Shawinigan organization in 1915, and has held a number of posts, including that of works manager at Shawinigan Falls.

He graduated in chemical engineering as a B.A.Sc. from the University of Toronto in 1912.

W. J. McAdam, M.E.I.C., has resigned from his position as chief engineer of J. L. E. Price and Company Limited, to form a partnership, with Mr. D. F. Wood, M.E.I.C., to be known as Wood and McAdam, consulting engineers, Montreal.

Lt.-Colonel H. D. Berry, R.C.E., M.E.I.C., has been posted to the office of the chief engineer (P. & T.) Army Headquarters, Department of National Defence, in Ottawa.

Lt.-Colonel Berry, as a major, went in 1949 to Fort Belvoir, Va., as Canadian liaison officer, at the Engineer Research and Development Laboratories.

Lorne P. Baker, M.E.I.C., has returned to Canadian General Electric Co. Ltd., Davenport Works, in Toronto, Ontario.

Mr. Baker, who graduated from University of Toronto in 1935, followed a practical electrical course with C.G.E. for ten months. The following years he worked on design and production with the company. During World War II he served with the Canadian Army (overseas). After retiring as officer commanding the Ottawa workshop, R.C.E.M.E., he was appointed assistant trade and industrial commissioner in London, England. In 1950 he joined the Anglo-Canadian Purchasers Ltd. in Toronto.

Major Leonard Martin, M.B.E., M.E.I.C., of Montreal, has been promoted to the rank of lieutenant-colonel and named to command No. 2 Technical Regiment, R.C.E.M.E., a Montreal Reserve Force unit. He is the managing director of H. L. Peiler & Co., Montreal.

Lt.-Col. Martin served at the start of the war with the 2nd Battalion, Canadian Grenadier Guards. An engineer by profession, he was appointed in 1942 to the Royal Canadian Ordnance Corps and later to the Royal Canadian Electrical Mechanical Engineers. He served with the latter corps in the United Kingdom, Italy and Northwest Europe.

Maj. L. Martin, M.E.I.C.

Lt.-Col. Martin received the M.B.E. for his war services and was mentioned in despatches. Since the war he has served in the R.C.E.M.E., Reserve Force.

Lt.-Col. Martin is a graduate of Clarkson College of Technology, Potsdam, N.Y., where he received a B.Sc. in mechanical engineering in 1934. Upon graduation he joined H. L. Peiler & Co. Limited.

Rolf Lockeberg, M.E.I.C., has been appointed controller of Canadian Ingersoll-Rand Co. Ltd.

He graduated from Queen's University receiving the degree of B.Sc. in mechanical engineering in 1940. He served with the R.C.A.F. for 5 years and then attended the Harvard Graduate School of Business Administration, where he received the degree of Master of Business Administration in 1947. Since that time he has been associated with Canadian Ingersoll-Rand Co. Ltd.

R. G. Johnstone, M.E.I.C., is vice-president and general manager of the St. Raymond Paper Limited, Montreal. Mr. Johnstone has been associated with the industry for many years. After graduating from N.S.T.C. in 1924, he joined the Newfoundland Pulp and Paper Co. Later he was with the Harland Engineering Company in Montreal, and he went to the E. B. Eddy Co., Hull, Que., as production manager in 1934. In 1949 he joined the Brompton Pulp and Paper Co., at East Angus, Que.

Raymond A. Frigon, M.E.I.C., is an assistant research officer in the Division of Building Research, National Research Council. He is also secretary, in association with Mr. R. S. Ferguson, of the Associate Committee on the National Building Code, and secretary of five of the technical sections of the committee on Civil Defence.

He went to Washington, D.C., in 1947, as scientific liaison officer between the Canadian and American Research Councils. He returned to Ottawa early in 1951.

A. C. Northover, M.E.I.C., has been appointed manager of the Leamington Public Utilities Commission. The Commission operates the municipal hydro water and gas services. Mr. Northover was formerly resident engineer for McKim Township, Sudbury, Ont.

Mr. Northover is a graduate of University of Toronto where he received a B.A.Sc. in 1934 and a C.E. in 1947.

Stewart Troop, M.E.I.C., is managing director of MacDonald Mines and Candego Mines with headquarters in Montreal.

Mr. Troop has been in the mining industry for many years, most recently as consulting mining engineer and manager for Chibougamau Properties, Ltd., and Cache Lake Chibougamau Lines Ltd.

P. G. W. Walker, M.E.I.C., has been appointed city engineer for Penticton, B.C. Previously he was the townsite manager with the Longlac Pulp and Paper Company at Terrace Bay, Ont.

C. O. P. Klotz, M.E.I.C., of Aluminum Company of Canada, Montreal, has been appointed production manager for the building industry. He has been with the Company since 1942, and has worked at Kingston, Ont., and at Arvida, Que., coming to Montreal in 1946 as a development engineer.

C. O. P. Klotz, M.E.I.C.

A. Scott, M.E.I.C., is now senior staff engineer, Defence Construction Ltd., Maritime Region, with headquarters at Halifax. He was previously division engineer for Canadian National Railways, Halifax, N.S., and a member of the staff of C. A. Fowler & Co. on the construction of Mount St. Vincent College, various schools and hospitals and on the preliminary surveys for the Halifax-Dartmouth Suspension Bridge.

R. E. McMillan, M.E.I.C., formerly electrical engineer for R. A. Hanright in St. Catharines, Ont., is now with H. G. Acres and Company at Niagara Falls.
He graduated from McGill University in electrical engineering in 1926. He was with the Saguenay Power Co. Ltd., and Aluminum Company from 1940 to 1944, when he joined the Canadian International Paper Company at Three Rivers, Que. He went to St. Catharines in 1949.

Lawrence MacIsaac, M.E.I.C., of New Glasgow, N.S., has been appointed industrial engineer, Atlantic Region, Canadian National Railways, Moncton. He is a graduate of Nova Scotia Technical College. He joined the engineering department of the C.N.R. in 1946.

W. M. Kellett, M.E.I.C., is industrial engineer with Coleman Stove & Lamp Co. Ltd., in Toronto, Ont. He was previously production engineer, for general Products Mfg. Corporation Ltd., in London, Ont.

Lorne C. Lambert, M.E.I.C., is now associated with John T. Hepburn and Sons Limited.
Mr. Lambert was on a research fellowship at the Ontario Research Foundation in Toronto since 1949. He was associated previously with the Aluminum Company of Canada.

G. P. Fielding, M.E.I.C., is a senior civil engineer with the Aluminum Company of Canada, at Arvida, Que. Formerly he was structural designer for the Department of Highways & Public Works, at Halifax, N.S. He graduated from Nova Scotia Technical College in 1945 in civil engineering.

T. A. G. Beeching, M.E.I.C., of Vancouver, B.C., is with the Indian Affair's Branch of the Department of Citizenship and Immigration at Vancover. He was previously an electrical engineer in the Dominion Water & Power Bureau at Vancouver.
Mr. Beeching is a graduate of the University of British Columbia, where he received a B.A.Sc. degree in electrical engineering in 1939.

Lt.-Col. W. Alton, M.E.I.C., has been promoted from the rank of major and officer commanding the Central Command H.Q., Signal Squadron, at Oakville, Ontario. His new appointment is that of general staff officer Grade I, in the Directorate of Signals, at Army Headquarters in Ottawa.

D. Collis, M.E.I.C., has been transferred from Dominion Atlantic Railway, headquarters at Kentville, N.S., to Canadian Pacific Railway Company, North Bay, as assistant district engineer, Algoma District.
Mr. Collis served with C.P.R. in Saint John, N.B., before going to Kentville.

Steve Dembicki, M.E.I.C., is with the engineering department of Canadian Industries Limited in Montreal. He was previously sales engineer for Dominion Electrohome Industries Limited in Kitchener, Ont.
Mr. Dembicki graduated from University of Alberta in Mining in 1940 and in mechanical engineering from McGill University in 1941.

C. H. Vatcher, M.E.I.C.

C. H. Vatcher, M.E.I.C., has joined the Toronto office of English Electric Company of Canada Limited. Mr. Vatcher was for four years in industrial sales and for three years in the engineering branch of the R.C.N.

W. O. Rowan, M.E.I.C., is associated with Canadian Brazilian Services, Ltd., Toronto, in the engineering procurement division, electrical section. He was formerly a sales representative for the Canadian General Electric Co. Ltd., in Fort William, Ont.

E. L. Paterson, M.E.I.C., of Imperial Oil Ltd., has been transferred from Vancouver, B.C., to Toronto, Ont., as assistant manager in the asphalt sales department.

W. L. Noble, M.E.I.C., is now vice-president of L. McGill Allan Limited, general contractors, Windsor, Ont.
Mr. Noble is a graduate of the University of Saskatchewan, having received the degree of B.Sc. in civil engineering in 1941. Prior to joining L. McGill Allan Limited, he was with the contracting department of the Canadian Bridge Company Limited, Walkerville, Ontario.

J. D. P. McPherson, M.E.I.C., previously assistant chief engineer for the Highway Paving Co. Ltd., Montreal, Que., has joined the Construction Equipment Co. Ltd., Montreal. He graduated from University of Alberta in 1943 with the degree of B.Sc. in civil engineering.
Mr. McPherson is a past-chairman of the Junior Section of the Montreal Branch of the Institute.

A. A. Johns, M.E.I.C., who was with the Department of Mines and Technical Surveys at Ottawa, is now associated with the Foundation Co. of Ontario, at Sault Ste. Marie, Ont.

E. A. Thompson, M.E.I.C., is with Mount Enterprise Ltd., at Morin Heights, Que. He was previously town manager of the Town of Sackville, N.B. He has also served as town engineer of Bridgewater, N.S.

E. A. Sprenger, M.E.I.C., has resigned his position as works manager at the gun division of Canadian Arsenals, Longueuil, P.Q., and has joined Sorel Industries Ltd. as production manager.

Will Smith, M.E.I.C., is now division manager with Newfoundland Light & Power Co. Ltd., at Corner Brook, Nfld.
Mr. Smith has worked previously with the National Light & Power Company, Moose Jaw, Sask., and with the Yellowknife Electric and Power Company at Yellowknife.

Malcolm Frank Wilding, M.E.I.C., is employed by the Aluminum Company of Canada Limited, Montreal.
Mr. Wilding, who graduated in 1944 from University of British Columbia went to the Northern Electric Company soon after as a sales engineer. He worked for Northern Electric in Montreal, Vancouver, and Calgary, as a power apparatus specialist.

F. D. Wolever, M.E.I.C., is with Ross & Greig. Reg'd., the engineers' supplies division of Upton Bradeen & James Limited, Montreal. He will have jurisdiction over engineering and sales of engine and pumping equipment. Previously he was a sales engineer for Canadian Fairbanks Morse Co. Ltd., Montreal.

John A. Fuller, JR.E.I.C., has been appointed manager of the Vancouver district office of John Inglis Co. Limited.
Mr. Fuller is a mechanical engineering graduate of the University of Toronto. He has been with the Company since graduation and during that time has completed a course of instruction with the Worthington Pump & Machinery Corporation of Harrison, N.J.

John A. Fuller, Jr.E.I.C.

Conrad Goldman, JR.E.I.C., is now employed with National Analine, in Buffalo, N.Y. Previously he was with Ross Productions Company in Montreal.

D. B. Kilpatrick, JR.E.I.C., of Montreal. has been elected George F. Baker Scholar at the Harvard Graduate School of Business Administration.
Mr. Kilpatrick received the degree B.Eng., from McGill University in 1949 Entering the Royal Canadian Artillery in 1942 as a private, he served in Sicily, Italy, Belgium and Holland and received his discharge in 1945 as a first lieutenant.

D. W. Blair, JR.E.I.C., is division engineer for the Montreal Terminals and St. Jerome divisions of Canadian National Railways, Montreal.

Mr. Blair graduated from the University of New Brunswick as a B.Sc. in civil engineering. He entered the railway service in 1946, as a junior assistant engineer in the Department of Research and Development, Montreal, and was appointed in 1948 assistant engineer at Levis, Que., and later in the year, division engineer, Laurentian division Quebec, Que. From 1940 to 1945 he was on naval service with the R.C.N.V.R., on loan to the R.N., rising from ordinary seaman to Lieutenant, and being awarded the M.B.E., in January, 1943.

Fernand R. Boucher, JR.E.I.C. formerly with the Aluminum Co. of Canada Ltd., Montreal, is now a sales engineer for Canada Creosoting Company, Montreal, Que.

R. R. Cheyne, JR.E.I.C., has accepted a position with the Alminum Company of Canada and for the next two years will be working for The Demerara Bauxite Co., Ltd., in British Guiana.

Mr. Cheyne is a graduate of the University of Saskatchewan, where he received a B.Sc. in mechanical engineering in 1949, he was formerly with General Steel Wares Ltd., London, Ont.

John C. Martin, JR.E.I.C., previously assistant engineer for Canadian National Railways, in Toronto, is now working for the Quebec North Shore & Labrador Railway, at Seven Islands, Que.

L. B. Murphy, JR.E.I.C., has been transferred from Canadian General Electric Co., in Toronto, Ont., to the Western Nova Scotia Electric Co. Ltd., Yarmouth, N.S.

A graduate of Nova Scotia Technical College, Mr. Murphy received a B.Eng. in electrical engineering in 1949.

R. A. Pollard, JR.E.I.C., is with Northern Construction Co., at Bridal Falls, B.C.

A graduate of the University of British Columbia, he received a B.A.Sc. in civil engineering in 1949.

John L. Pulford, JR.E.I.C., has been appointed district product manager, communications equipment and overhead and underground, for the new Alberta district of the Northern Electric Company Limited, with headquarters at Edmonton. Mr. Pulford commenced his career with the Northern Electric Company Limited in the installation department Western area in 1937 and after four years as a wireless electrical mechanic in the R.C.A.F. returned to university and graduated from the University of Toronto with the degree of B.A.Sc. engineering and business, 1950.

Upon graduation he rejoined the Northern Electric Company Limited at Montreal and in October, 1950 was appointed district telephone sales engineer for the Alberta-British Columbia District. With the division of that district into two separate districts he was appointed to his present position.

Richard A. Quance, JR.E.I.C., who was with Shell Oil Co. at Montreal East, Que., is now with the engineering department of Canadian Synthetic Rubber Ltd., Sarnia, Ont. He is a graduate in physics from Queen's University, class of 1946.

Arthur J. Robinson, JR.E.I.C., who was with Canadian Industries Limited, has joined Canadian Salt Company Limited, as an engineer at the plant at Windsor, Ont.

R. R. Scott, JR.E.I.C., is engineer for Bathurst Power & Paper, Bathurst, N.B. He had worked with the electrical engineering division of the National Research Council in Ottawa, Ont.

Andre St. Arnaud, JR.E.I.C., is with the provincial Department of Roads, at Mont-Joli, Que. Previously he was with Theresa Gold Mines, Longlac, Ont.

C. A. Groom, JR.E.I.C., is sales engineer for Creamery Package Mfg. Co. of Canada Ltd., in Toronto. He was previously associated with John Inglis Co. Ltd., Toronto, as refrigeration sales engineer.

Jean Bourassa, JR.E.I.C., is employed as junior electrical engineer for Montreal Tramways Co., in the power department in Montreal.

Douglas K. Campbell, JR.E.I.C., is a junior engineer at North Bay, Ont., and assistant to the line maintenance engineer, of the Hydro-Electric Power Commission of Ontario.

B. B. Denyes, JR.E.I.C., is employed by the Federal Department of Public Works at Ottawa. Prior to joining the Department he was mechanical engineer for The Steel Company of Canada, Ltd., at Gananoque, Ont.

Myer Dimentberg, JR.E.I.C., who was formerly with H. G. Acres & Co., in Niagara Falls, Ont., is now with C. D. Howe Co. Ltd., on an assignment in Montreal.

W. H. Garland, JR.E.I.C., is resident engineer for Defence Construction Limited at Wainwright, Alberta.

Jean-Louis Gregoire, JR.E.I.C., of Montreal, is with Shawinigan Water & Power Co., central maintenance department at Shawinigan Falls, Que.

E. W. Groves, JR.E.I.C., has joined the service department of General Motors Diesel Ltd., London, Ont. He is an operating instructor, travelling on deliveries of new locomotives.

B. T. Kerr, JR.E.I.C., who was working with The Shawinigan Engineering Co. Ltd., at Shawinigan Falls and at Trenche, Que., is now in Montreal associated with Purdy & Henderson Co. Ltd., as managing director.

A. H. Mallette, JR.E.I.C., is employed as a mechanical engineer with Donnacona Paper Co., Donnacona, Que. Previously he was plant superintendent for Coca Cola Ltd., at Quebec City.

W. D. Martin, JR.E.I.C., is with Brompton Pulp and Paper Co. Ltd., at Red Rock, Ont. He has worked previously in the paper industry, with Price Bros. Co Ltd., at Riverbend, Que., and in British Columbia.

Murdo Murchison, JR.E.I.C., is with the Montreal Engineering Co. Ltd., Montreal, Que. He was previously with Calgary Power Ltd., as a junior engineer.

J. W. McCarthy, JR.E.I.C., is a construction engineer with the Steel Co. of Canada, Hamilton, Ontario.

L. S. Thompson, JR.E.I.C., is employed by the Horton Steel Works Limited in the erection department, in Fort Erie, Ontario.

M. E. Thompson, JR.E.I.C., is with the National Defence Department in the inspection services (electronics and electrical engineering).

Lucien Trudel, JR.E.I.C., who has been with the Quebec Department of Mines for several years has been transferred from Noranda, Que., to Quebec City.

Dan F. Williamson, JR.E.I.C., is a field engineer representing Sandwell and Company Limited, consulting engineers of Vancouver, B.C. He is at the Howe Sound Pulp Company Limited Mill, Port Mellon, B.C.

Wm. N. Venables, JR.E.I.C., who was town engineer for Flin Flon, Manitoba, is now with the Wells Construction Co. in Flin Flon.

James C. Akerley, S.E.I.C., formerly of North Sydney, N.S., is working in Windsor, N.S., as resident engineer for J. Price on permanent building construction.

Mr. Akerley is a graduate of the University of New Brunswick, where he received a B.Sc. degree in civil engineering in 1950.

Joseph Badzioch, S.E.I.C., is taking a two-year post-graduate training course with A. Reyrolle & Co. Ltd., electrical manufacturers, in Durham, England. The course includes approximately nine months factory work, three months outside erection, and the rest of the time is spent in the contracts and engineering offices. He also intends to spend about six months with C. A. Parsons Co. Ltd., turbine manufacturers, after which he will return to Canada.

Mr. Badzioch received a B.Sc. degree from the University of Alberta in 1950.

Marc Bergeron, S.E.I.C., is with Concrete Repairs and Waterproofing Co. Ltd., Quebec, Que. He was formerly with Lalonde & Valois, consulting engineers in Montreal.

Mr. Bergeron graduated from McGill University, receiving a B.Eng. degree in civil engineering in 1950.

W. R. K. Coulthard, S.E.I.C., is presently employed as general construction engineer for Defence Construction Ltd., at Brandon, Man.

Mr. Coulthard graduated from the University of Man. with a degree of B.Sc., in civil engineering in 1950.

Charles E. Day, S.E.I.C. (University of New Brunswick, civil, 1950), is now employed as building inspector for the City of Halifax, N.S.

H. D. DeBeck, S.E.I.C. (the University of B.C., B.A.Sc., civil, 1950), is with the Water Rights Branch, at Kamloops, B.C.

Lino Dotto, S.E.I.C., is draughtsman with Sandwell & Company, consulting engineers in Vancouver, B.C.

Mr. Dotto graduated from the University of British Columbia, in 1950.

Charles A. Goldbloom, S.E.I.C., television engineer, representing Electrical Products Mfg. Co., Ltd., has spent the past month with the television department of National Co., Inc. On his return he will be associated with Fleetwood Television of Montreal.

Mr. Goldbloom graduated from McGill University in 1950. He was for four years in radar with the R.C.A.F.

J. G. Hamel, S.E.I.C., (McGill University B.Eng., civil, 1950) is at Lac St. Jean Que., as assistant resident engineer for Harold Doran, architects and engineers. Previously he was field engineer for Foundation Co. in Ottawa, Ont.

Iurray V. Harris, S.E.I.C., (University {ew Brunswick, B.Sc., civil, 1950) is a ivil engineer with the Bell Telephone 'o., Montreal, Que.

itanley Hodgson, S.E.I.C., (University of British Columbia, B.A.Sc., mining, 1950) s a junior engineer with Consolidated Iining and Smelting Company Ltd., at he Sullivan Mine in Kimberley, B.C.

Keith Jamieson, S.E.I.C., of Rossland, B.C., third year student in civil engineering at the University of British Columbia, has been awarded the Road Builders' and Heavy Construction Association scholarship.

var Johnsson, S.E.I.C., (Queen's University, B.Sc., mechanical, 1950) is now in Saint John, N.B., working for T. McAvity and Sons, Ltd., in the engineering lepartment.

M. J. Larose, S.E.I.C., (McGill University, civil, 1950) is now with Pentagon Construction Co., Parent, Que. After graduation he was with McColl Frontenac Oil Co., Montreal, Que.

G. S. Mander, S.E.I.C., is in charge of mechanical design for the firm of J. E. L. Walker, Consulting Engineers Ltd., of Hamilton, Ontario, working in the Toronto Office. During the summer of 1950 he was assistant engineer for Moody & Moore, architects, in Winnipeg, Man.

P. A. Monaghan, S.E.I.C., who was previously with the Geodetic Survey of Canada, Department of Mines and Technical Surveys, is now with the Photographic Survey Corp. of Canada Ltd., Toronto, Ont.

Joseph Y. McCarther, S.E.I.C., (Nova Scotia Technical College, B.Eng., mechanical, 1950) is a mechanical engineer in gas turbine engine development for A. V. Roe (Canada) Ltd., Toronto.

Gordon M. McKay, S.E.I.C., (University of Manitoba, B.Sc., electrical, 1950) from Winnipeg, Man., is now working for the Saskatchewan Power Corp. in Regina, Sask.

Robert Rice, S.E.I.C., University of Manitoba, B.Sc., electrical, 1950) is now working for the International Business Machines in Montreal.

Geo. A. Robinson, S.E.I.C., who was junior development engineer with Photographic Survey Corporation in Toronto, is now with The Central Mortgage and Housing Corporation at Ajax, Ontario.

D. M. Ryan, S.E.IC., (University of Manitoba, B.Sc., civil, 1950) is in Montreal working for C. D. Howe Co. Ltd.

S. B. Smith, S.E.I.C., (University of Manitoba, B.Sc., electrical, 1950) is a design engineer with A. V. Roe Canada Ltd., at Malton, Ont.

K. M. G. Tambon, S.E.I.C., (McGill University, mechanical, 1950) is a service engineer for Bailey Meter Co. Ltd., Halifax, N.S.

K. Toftdahl, S.E.I.C., is now with the Columbia Cellulose Co., at Terrace, B.C. He was previously at the Nanaimo River Camp of the Victoria Lumber Company.

John A. R. Cann, S.E.I.C., is assistant general manager for Canadian Aviation Electronics, Montreal, Que.

Mr. Cann is a graduate of McGill University, having received a B.Sc. degree in 1948.

F. H. Gardner, S.E.I.C., (University of Toronto, B.A.Sc., civil, 1950) is field engineer for Proctor, Redfern & Laughlin, consulting engineers in Toronto.

Ralph Karle, S.E.I.C., who has been working in England for one of the companies of Brush-Associated British Oil Engines, on a post-graduate training scheme, will return to Canada in June, 1951.

He will work in a new office of the Brush A.B.E.O. group of companies in Montreal.

He graduated from University of Manitoba in 1949, with a degree of B.Sc. in electrical engineering.

John P. Miller, S.E.I.C., of St. Thomas, Ont., who will graduate this year as a civil engineer from the University of Manitoba, has been appointed municipal engineer for Atikokan, Ont.

R. B. Welch, S.E.I.C., (Nova Scotia Technical College, civil, 1950) of Noranda, Que., is now working as junior engineer for Brian R. Perry, consulting engineer, Montreal.

J. W. Withrow, S.E.I.C., (University of New Brunswick, B.Sc., electrical, 1950) is in St. Catharines, Ont., employed with McKinnon Industries Ltd., as an electrical engineer.

Visitors To Headquarters

E. C. Thorne, M.E.I.C., Ottawa, Ont., April 2, 1951.

C. S. Landon, M.E.I.C., Winnipeg, Man., April 3.

Dean R. M. Hardy, M.E.I.C., Edmonton, Alta., April 3.

C. W. Gilchrist, Ontario Good Roads Association, Ottawa, Ont., April 3.

J. W. D. Farell, M.E.I.C., Regina, Sask., April 9.

J. F. Hole, S.E.I.C., Edmonton, Alta., April 11.

J. A. Van den Broek, M.E.I.C., Ann Arbor, Mich., April 11.

Krishna Swarup, Lucknow, India, April 11.

G. E. Cole, M.E.I.C., Winnipeg, Man., April 12.

J. F. MacLaren, M.E.I.C., Toronto, Ont., April 16.

J. E. B. Sawyer, JR.E.I.C., La Tuque, Que.

H. R. Hayes, M.E.I.C., Calgary, Alta., April 23.

F. W. Gray, M.E.I.C., Victoria, B.C., May 1.

Obituaries

The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.

H. L. Bucke, M.E.I.C., who was prominently associated with the building of the transcontinental railway and with development of hydro in Ontario, died at his home in London, Ont., on March 2, 1951.

Mr. Bucke was born at London, Ont., in 1879. He graduated from the Royal Military College in civil engineering in 1900. He was employed for 17 years by Canadian railways. With the Grand Trunk Pacific railway he was resident engineer on construction of the road for 250 miles east of Sioux Lookout. He was associated with the Hydro-Electric Power Commission of Ontario for 33 years. Most of that time was spent on the Queenstown-Chippawa development of Niagara Falls, Ont., of which he was appointed general superintendent in 1922. He retired in 1946 and returned to London a little more than a year ago.

He joined the Institute as a Student in 1900, transferring to Associate Member in 1904, becoming a Member in 1912. He attained Life Membership in the Institute in 1942.

Beaudry Leman, M.E.I.C., banker and engineer, chairman of the board of the Banque Canadienne Nationale, died at his home in Outremont, Montreal, on April 9, 1951. Mr. Leman's career had followed the unusual pattern of beginning with a distinguished record as an engineer and continuing with even greater distinction in banking.

Mr. Leman was born in Montreal in 1877. He was educated at Mont St. Louis College and under private tuition. He studied engineering at the University

Beaudry Leman, M.E.I.C.

of Lille in France, receiving a civil engineering degree there in 1899. He did post-graduate studies at McGill University which earned him a bachelor of science degree the following year. From

1900 to 1907 he was a civil engineer with the Shawinigan Water and Power Co., of which he was a director at the time of his death. During the last five of those six years, he was mayor of the Town of Shawinigan Falls, becoming, at 21 years of age, the first man to hold the position since it had been incorporated as a town.

Mr. Leman went into banking in 1912, with the old Banque d'Hochelaga, and two years later went to the newly-merged Banque Canadienne Nationale as general manager. He was vice-president of the bank in 1932, and was the president from 1934 to 1947.

Of the many commissions of which he was a member was the Royal Commission of Banking and Currency in 1933. In 1929 he was elected president of the Canadian Bankers Association. He was honorary president of that association from 1944 to 1949.

He was vice-president of the General Trust Co. of Canada. He held directorships in: Consolidated Bakeries of Canada Ltd.; Montreal Tramways Co.; Napierville Junction Railway Co.; Ogilvie Flour Mills Co. Ltd.; and Shawinigan Water and Power Company.

He was a member of the Canadian Record Council from 1939 to 1942.

He joined the Institute as a Student in 1901, becoming an Associate Member in 1902. He attained Life Membership in 1947.

He was awarded the Julian C. Smith medal of the Institute in 1941, for his contribution to the solution of public and municipal financial problems. At that time there was cited his service on Royal Commissions such as the Canadian Advisory Committee on the St. Lawrence Waterway in 1927-28; on the Railways and Transportation Commission in 1931-32; and later on the Allied Supplies Corporation.

Geo. H. Ferguson, M.E.I.C., consulting engineer of Ottawa, Ont., died on March 16, 1951.

Born in Toronto in 1883, Mr. Ferguson graduated from the University of Toronto with the degree of B.A.Sc., in 1906. Following graduation he was engaged on various work in the service of several consulting engineers, and later joined the staff of the Hydro-Electric Power Commission of Ontario as assistant hydraulic engineer, becoming hydraulic engineer of the Commission of Conservation of Canada in 1911.

He served overseas with the Royal Canadian Engineers during the First World War, and was awarded the Military Cross. He returned to duty at Ottawa in 1919. He joined the staff of the Grand Trunk Arbitration Board in 1920, and at the conclusion of that arbitration, served as special engineer to the general manager, Toronto Transportation Commission during the rehabilitation of the Toronto street railway. He returned to Ottawa in 1923, to develop the Public Health Engineering Division of the newly formed Department of National Health, of which division he became chief.

During the following 20 years, Mr. Ferguson actively co-operated with the engineers of the United States Public Health Service in regard to matters of public health engineering having a definitely international aspect. Also the work of the Public Health Engineering Division included many projects of active co-operation with the various provincial Departments of Health throughout Canada.

Mr. Ferguson was a member of the Engineering Board of Review that, at the invitation of the city of Toronto, in 1939 made the study and report in regard to sewage disposal for the city of Toronto.

During World War II he was actively engaged on public health engineering projects for the armed forces, prisoner of war camps and industrial developments.

Mr. Ferguson joined the Institute as a Student in 1906, transferring to Associate Member in 1919. He attained Life Membership in 1947. He was chairman of the Ottawa Branch in 1943.

Jerome Douglas Burbank, M.E.I.C., an electrical engineer at the Worthington Pump and Machinery Corporation died in Buffalo, N.Y., on February 6, 1951. He had been ill nearly a year.

Mr. Burbank was born at Toronto in 1897. He graduated as a B.A.Sc. from the University of Toronto in 1925. Later he did graduate work for which he received the electrical engineering degree in 1938. He had attended, during the First World War, the U.S. Naval Radio School at Harvard University. In 1926 he moved to Buffalo and was employed by the Niagara Hudson Power Corporation, where he remained until 1937. From 1939 to 1943 he was an electrical engineer for the City of Buffalo division of buildings. For two years he was with Colonial Radio Corporation in Buffalo, and in 1947 joined the staff of the Buffalo Board of Education as teacher of electricity and related subjects. He went to the Worthington Pump and Machinery Corporation in 1948.

He joined the Institute as a Student in 1921, transferring to Junior in 1926 and becoming an Associate Member in 1931 and a Member in 1940. He held membership, also, in the American Institute of Electrical Engineers, Institute of Radio Engineers, American Military Engineers, American Radio Relay League.

H. M. Watson, M.E.I.C., contracting engineer of Dominion Bridge Co. Limited Lachine, died in the Western Division of the Montreal General Hospital on April 3, 1951. Well known in engineering circles throughout Canada, he was born in Cornwall, Ont., in 1889.

H. M. Watson, M.E.I.C.

After graduating from McGill University in 1911, with a degree in civil engineering, he joined Dominion Bridge Company Limited and for nine years served in the capacity of draughtsman, designer, checker and squadleader. In 1920 he was appointed assistant chief draughtsman. In 1922 he joined the staff of the contracting department and six years later was appointed contracting engineer, a position he held continuously up to the time of his death. In the contracting department Mr. Watson played a considerable part in the negotiations for many of the large projects on which the Company was engaged.

He was a member of the Corporation of Professional Engineers of Quebec. He joined the Engineering Institute in 1927 as an Associate Member, transferring to Member in 1940.

V. H. Carruthers, M.E.I.C., district engineer, at Calgary, for the Board of Transport Commissioners of Canada, died on March 29, 1951.

Mr. Carruthers was born at Harcourt, N.B., in 1893. He was educated at Mount Allison Academy, and after service overseas in World War I, in the 6th Field Artillery, he attended University of Toronto, and received his degree of B.A.Sc. in 1923. He went to the Canadian Pacific Railways in 1919 working as transitman during the summers. He remained with the Company after graduation. He was roadmaster at Brandon, Fort William, Kettle Valley, Regina and Saskatoon. He was appointed division engineer at Winnipeg in 1938, serving later in that capacity at Edmonton and Revelstoke also. He became district engineer of the Board of Transport Commissioners in 1946.

He joined the Institute as a Member in 1948.

Portland Cement Research

The Portland Cement Association's $3-million laboratories, recently built near Chicago for research and development, are the largest and most completely equipped in the world devoted exclusively to research on cement and concrete.

Because concrete structures serve under widely differing conditions of climate and use, the staff constantly carries on observations of concrete under severe conditions of weather and wear. The Association's work has brought substantial savings through greater durability and longer service life for concrete structures. It is the Association's policy to make scientific discoveries and inventions relating to cement and concrete uses fully, freely and promptly available to the public.

News of the Branches

Activities of the Thirty-three Branches of the Institute and abstracts of papers presented at their meetings

Belleville

S. Sillitoe, m.e.i.c.
Secretary-Treasurer

The fifth meeting of the Belleville Branch of the Engineering Institute of Canada was held April 9th at the Kiwanis Centre with 55 members present. After Mr. F. F. Fulton, chairman, had called upon the secretary to read the minutes of the previous meeting, he called upon Mr. P. T. Seibert to introduce the speaker of the evening, Mr. John Dibblee, m.e.i.c., to deliver his paper, **Industry and Its Place in a Free World.**

Mr. Dibblee's discussion was attentively received by the interested audience and a stimulating effect of the meeting was evident in the formation of numerous discussion groups. At Mr. Dibblee's request no resumé of his paper is being attempted in these minutes because he is in the process of preparing this material for publication.

The thanks of those present was expressed by G. B. Daugharty.

Central British Columbia

M. L. Zirul, m.e.i.c.
Secretary-Treasurer

The regular general dinner and meeting was held at the club house of the Kelowna Golf Club, Kelowna, B.C., on March 16, 1951. Notices were sent to all members and branch affiliates and to practising engineers and others connected with engineering in the district. Twenty-eight persons were in attendance.

The meeting convened immediately after dinner with F. McCallum in the chair.

The secretary-treasurer gave a talk on **The Manufacture of Newsprint Paper at Powell River, B.C.** The talk was later illustrated by the film "River of Paper" loaned by the Power River Company.

A vote of thanks on behalf of the meeting was tendered by Mr. Lindsay Taylor.

The matter of the proposed formation of a branch of the B.C. Engineering Society in the interior was brought up for discussion. Mr. Harley Hatfield reported that a circular letter had gone out to all Professional Engineers in the district asking if they would support a local branch of the Society and that replies would be in shortly. The B.C. Professional Engineers present accepted the offer of the E.I.C. members to use the facilities of the next regular meeting of the Central B.C. Branch E.I.C., as an organizing meeting for the formation of the proposed Interior Branch of the B.C. Engineering Society.

The feeling was expressed that the matter of holding joint meetings between the E.I.C. and B.C. Engineering Society could be discussed if and when an Interior Branch of the Society was formed.

Cornwall

John A. Sarjeant, jr.e.i.c.
Secretary-Treasurer

A. A. B. McMath, m.e.i.c.
Branch News Editor

March 27th was Bell Telephone night for Cornwall Branch. Twenty-eight men turned out to hear Robert E. Martin describe present day telephone equipment, and some of the problems his company faces. During the past 10 years more than 800,000 telephones have been installed, and thousands of potential users are still waiting for service. Using energized demonstration equipment, the speaker described how relays "tell" equipment what to do, and also how they "forget" or "remember" what has taken place during a previous operation. Even on simple calls, hundreds of relays operate, while on long distance calls, a thousand or more come into play.

During a prolonged discussion period, Mr. Martin was assisted by J. F. Gardiner and H. B. Mison of the Cornwall Bell staff, in answering questions and outlining points not previously covered. J. F. Gardiner introduced the speaker, and R. L. Blackett thanked him. Chairman H. W. Nickerson presided at the meeting, held in the Howard Smith Assembly Room.

❖ ❖ ❖

After several unsuccessful attempts to visit the Cornwall Branch, President J. A. Vance arranged to attend the Branch meeting on April 5th. With him came J. B. Stirling, our good friend from Montreal.

During the dinner hour, the President met with seven members of the executive at the Cornwallis Hotel. Later on, 21 members assembled in the King George Hotel to hear the President's

The president at Cornwall. Mr. J. B. Stirling, vice-president of E.I.C., Montreal; Mr. Vance, and Branch Chairman H. W. Nickerson.

impressions of his visits across Canada. Showing a remarkable memory for places and names, Mr. Vance entertained his listeners with descriptions of many phases of engineering activity from Newfoundland to British Columbia.

In connection with world wide affairs, the speaker mentioned the Institute's contacts with American and British societies. He expressed the hope that greater contact could be made with England. He mentioned his forthcoming visit to Cuba, where American and Canadian engineering influence was expected to have a stabilizing effect on budding Latin-American societies. He gave his impressions of the South African Conference, which he attended with Dr. L. Austin Wright last summer. He closed his address with brief descriptions of parts of Africa which they had visited.

Donald Ross-Ross introduced Mr. Vance. Chairman H. W. Nickerson expressed the thanks of the Branch. Light refreshments were then served, and the president was introduced to most of those present. He left with them a fine impression of his friendly interest.

Edmonton

T. E. Bate, M.E.I.C.
Secretary-Treasurer

E. K. Cumming, M.E.I.C.
Branch News Editor

The Edmonton Branch was very fortunate in having a paper presented by Mr. P. H. N. White, of the Imperial Oil Limited, on December 12, 1950. Mr. White's paper was entitled, **Methods of Geophysical Prospecting for Petroleum.** Mr. White, who was born in South Africa and educated at Oxford, has worked in various parts of the world in the oil industry since 1937, and is now in charge of all geophysical exploration for Imperial Oil Limited in this area.

Mr. White stated that there are now various methods of exploring for petroleum. Usually the exploration begins with a reconnaissance of an area by geologists to determine whether or not it is practical to carry on a further search.

Various methods are used to obtain a picture of the geophysical formation.

One instrument used in surveying is a magnetometer. This instrument accurately measures variations in magnetic field. In the case of water borne and land borne instruments, the vertical and horizontal fields are measured and in the case of the air borne instrument the total field is measured. With this instrument, it is possible to map the magnetite content of the formation, thereby determining whether or not the area is favourable insofar as petroleum production is concerned.

A second instrument used in geophysical exploration is the gravity meter, a sensitive weighing device, which measures changes in gravity due to differences in density of the formation.

These two survey instruments will not, however, give a complete picture and it is necessary to make use of the seismograph to determine the physical characteristics of favourable formations. The seismograph depends upon the measurement of waves propagated through an elastic medium. In a seismographic survey, a number of holes are drilled in which a charge is exploded. The explosion sets up a wave which travels to an elastic discontinuity and then returns to the surface, where it is picked up by seismometers. When the wave velocities are known and times are measured, these can be converted into depth, thus providing information from which a reef can be located.

Mr. White pointed out that information obtained in this way would provide no guarantee that oil will be found in a favourable location, but it does indicate formations which are likely to produce oil.

Mr. White's paper was very much enjoyed by all members present. He provided a very excellent description of the methods used to aid in finding the oil which so vitally affects and interests all members of the Edmonton Branch.

❖ ❖ ❖

On January 10, 1951, 117 members of the Edmonton Branch were present to hear a paper presented by Mr. T. D. Stanley, M.E.I.C., production superintendent of the Calgary Power Company.

Mr. Stanley's paper described the activities of the Calgary Power Company in developing the Spray Lakes Power project. In his introductory remarks, Mr. Stanley pointed out that one of the most interesting features of the project was the foresight and engineering ingenuity which used the natural resources available in this area to provide a large source of power.

The project consists of five and one half miles of earth canal, 1,000 feet of rock canal, and a Penstock tunnel, 1236 feet on a 45-degree slope and 915 feet horizontal tunnel.

The project also includes four dams. At the South end of the Lower Spray Lake is the Canyon Dam and diversion tunnel. This dam is 175 feet high, 600 feet in length, and required one million cubic yards of earthfill. The Three Sisters Dam in Goat Pass is 48 feet in height, 980 feet long and required 2800 cubic yards of earthfill. The Dyke Dam across the Goat Valley is 15 feet in height, 370 feet long, and required 5,700 cubic yards of earthfill. The North Dam at Whiteman's Pass is 50 feet high, 520 feet long and required 7,500 cubic yards of earthfill. All Dams are of the rolled core and earthfill type of construction.

The water for the project is stored in the Spray Reservoir, which has a capacity of 180,000 acre-feet, and uses the natural basin of the Spray Lakes and Spray River. The reservoir has raised the elevation 165 feet above the present river elevation at the Canyon Dam and 140 feet above the Lower Spray Lake.

Power in this project will be produced by three power houses. The Three Sisters Power House in the Great Valley will have a capacity of 3600 hp. at an average head of 50 feet. The Spray Plant will have a capacity of 62,000 hp. at an average head of 900 feet and the Rundle Plant will have a capacity of 23,000 hp. at a head of 320 feet.

Mr. Stanley outlined the work required in building access roads to the project and the way in which the project has progressed to date. His description was very well illustrated by slides showing the dams, canals and power houses in various phases of construction. The method used in handling the turbine rotor and generator for the Spray Power house was very interesting in view of the fact that it was necessary to transport this equipment by truck from the railway siding in Canmore.

Mr. Stanley's paper was very much appreciated by the members, many of whom stated that they are looking forward to further papers of this nature, describing the development of the province's natural resources.

❖ ❖ ❖

On January 30, Chris Fisher, M.E.I.C., of Winnipeg, described to members of the Edmonton Branch, the engineering aspects of the Winnipeg Flood.

Mr. Fisher commenced by tracing the history of Winnipeg floods, quoting the writings of Sanford Fleming. In 1826, the flood level was 6 feet higher than in 1950, and the water rose 9 feet in 24 hours, forcing everyone to evacuate the area. Another quotation from the Bishop of Rupertland concerning the flood of 1882, contained a very picturesque description of the conditions at that time. From these records, Mr. Fisher made a comparison of the floods of 1826, 1852, and 1950. In each case, the water overflowed the bank of the Red River about May 3rd, and high level was reached within two days of May 21st.

Mr. Fisher pointed out the impossibility of controlling flooding in the Winnipeg area by storage due to the extreme flatness of the country through which the Red River flows. He stated that he felt that the problem was one of a combination of run-off control and flood control through dyking, diversion, etc. With the aid of a number of slides, the speaker described flooding at the Queen Elizabeth Hospital, Rover Street Power Plant, the bridges, and various other important points in the city. He described the building of a bridge as an escape route for the people of St. Vital, by a company of reserve engineers from Flin Flon. He also described the construction of the Lyndale Dyke using 11 drag lines, 75 bulldozers, 350 trucks, 11 scrapers and approximately 20,000 people. In his closing remarks, the speaker stated that the action of the people during this emergency provided a fine example of co-operation in our democratic way of life. It was his observation that the Army provided the authority and the communications for the operations, the engineers and contractors provided the useful "know-how" and the ordinary citizen did the work.

An interesting discussion followed Chris Fisher's talk, which dealt with various details of flood control. The Edmonton Branch is indeed indebted to Mr. Chris Fisher for an extremely interesting and educational description of the Winnipeg Flood.

Halifax Branch

W. E. Jefferson, M.E.I.C.
Secretary-Treasurer

M. F. Dean, M.E.I.C.
Branch News Editor

The March meeting of the Halifax Branch was on March 15, when Dr. P. L. Pratley, M.E.I.C., consulting engineer, spoke on **The Canso Bridge Plans.** Dr. Pratley gave details on all features of his design of the bridge, and displayed to the meeting slides of the alternate sites, giving sound reasons for his final choice. The speaker stated that there are forces natural to the site, not often found in any of a great many bridge projects. For example, the combination of ice and tidal flow is an important one dictating the design of the piers. This feature, he thinks, has been exaggerated by many people; icebergs do not find their way to the strait, but pan ice, when upended by shore crushing, is he source of the belief. Slides of photographs bore out this fact. The second important problem is deep salt water, and piers of Intrusion Prepakt concrete are the solution.

The bridge design features are: piers to withstand impact of 225-acre ice pan, 2 feet deep, moving at speed of 6 feet per second; clearance above water, 26 feet; depth of water 175 feet and 40 feet of overburden at centre piers; piers to be dowelled to rock with steel H-beams.

Dr. Pratley's lecture was attended by over 200 members, and was one of the most interesting the Branch has received this winter.

❖ ❖ ❖

The April meeting was the third 5.30 p.m. supper meeting held this year and again proved the popularity of this type of meeting. The speaker was the Secretary-Treasurer of the Branch, Mr. V. E. Jefferson, Chief Engineer of the Maritime Telegraph & Telephone Co. His subject was "Telephone Engineering."

Beginning with the invention of the telephone by Alexander Graham Bell, Mr. Jefferson traced briefly the subsequent development and history of the public use of the instrument. Very quick growth, and reception by the public, created many local operating companies. Manufacturing became specialized and depended on research by the holding companies. although many of the Manufacturers today carry out their own research projects also. Bell Laboratories is among the largest continuing study of new methods and equipment for telephone use and operation. The speaker described many examples of modern telephone equipment developed to improve service, such as, spliced amplifiers for long distance service improvement, recently used in a cable laid from Key West to Havana, Cuba, in which there were 13 spliced amplifiers; the latest cable of a single wire in lead sleeve, used in conjunction with frequency dividers, allows 400 conversations at one time; a new desk set that will not be in use for two years, is now in process of design.

A recent problem confronted by Maritime Tel. & Tel. was combating frequent winter damage by ice in Northumberland Strait, cutting Prince Edward Island off from service. These conditions were done away with by use of radio transmission to and from hills near New Glasgow and Charlottetown, which were in visual line, and using a micro-wave system with 6-channel low-frequency carrier. The service is 95 per cent efficient, failure occurring at sunset and during local fog conditions. At such times the operation is switched over to another frequency system. The Company also operates a 6-channel carrier between Halifax and St. John.

Operator toll-dialing is one of the newer innovations, whereby a subscriber in one centre can be reached by an operator of another centre by dialing, with no intermediate operator.

Mr. Jefferson stated that one example of their own research is looking for a method for operating a dial system in small communities. The operator system presents problems of difficult maintenance and loss of service.

Many questions followed Mr. Jefferson's lecture, and he was heartily thanked by the members for his interesting talk.

❖ ❖ ❖

A special meeting of the Branch was held recently with the students of the Nova Scotia Technical College. Mr. W. A. Take, welding engineer of Halifax Shipyards, gave a very worthwhile lecture on **Welding.**

A recent information campaign at Tech resulted in a 25 per cent increase in student membership in the E.I.C. Many students are genuinely interested and the credit for the large student membership in the Branch is due to the efforts of Mr. M. L. Baker and Prof. A. E. Flynn, both of the College staff, and to the present Branch chairman, A. R. Harrington, and recent past presidents, who have concentrated on enlarging the student membership in the Institute.

Kingston

I. Orloff, jr.e.i.c.
Branch News Editor

J. T. Provan, jr.e.i.c.
Secretary-Treasurer

"When a bridge or building is to be built in France, the contractors interested will submit their own designs, with their bids. Large contracting firms maintain staffs of engineers and engage the best consultants for the preparation of these designs. The work is awarded to the firm offering the most pleasing and most economical structure. This active competition has led to rapid and unique developments in the uses of concrete, in some instances outpacing American and Canadian practice."

Illustrating his points with slides, Dr. S. D. Lash held his audience of more than 100 engineers spellbound, as he talked on **Recent Developments in the Use of Concrete** to the Kingston Branch of the Engineering Institute of Canada on March 27 in the Officers Mess at R.C.E.M.E.

Unusual uses for concrete are not new. As early as 1868 a concrete boat was built, launched and used for water transport. The most commonly used concrete is made of Portland cement, water, coarse and fine aggregate. This concrete requires about 7 days to achieve enough strength to permit removal of forms. There is available however a special cement that hardens very rapidly achieving almost full strength in about 24 hours. There are also such developments as alkali-resistant concrete, and that produced by air entrainment.

Concrete is rarely designed for a strength of more than 4000 pounds per square inch, although concrete has been reliably tested with a strength of 40,000 lbs. More careful compaction, and more common use of vibrators would permit concretes with strengths of 7,000-10,000 pounds to be used.

Because of a severe shortage of timber in Holland and Belgium, the use of precast concrete has become highly developed. Fence posts, lamp posts, roof truss members, and even window frames and window sashes are being made by this method.

Great care is taken in the mixing of the concrete and in the preparation of the forms. The concrete is vibrated and jolted to a high degree of compaction which gives the finished product its great strength and durability.

Prestressed concrete was developed by a French engineer, Freyssinet, who took out his patents in 1928. With the recent expiry of his patent rights it is expected that the use of this development will be more common in Canada and the United States than hitherto.

Recently a very large bridge was constructed in Philadelphia by this technique. Great savings can be realized in the cost of a structure built by this method. Airport runways subjected to the landing loads of aircraft weighing up to 100 tons would have concrete up to 2 feet thick in addition to a prepared base of like thickness. By prestressing the concrete pavement the thickness could be cut about 60 per cent. Runways using this design have been constructed in both England and France.

The prestressing is done by stretching wires that run through pipes in the concrete with hydraulic jacks. The stretched wires are anchored by wedges or by grout. As they tend to regain their original size they put compression stress in the concrete. One European firm is manufacturing prestressed concrete beams of standard shapes and sizes on a commercial basis. The members are formed in long lengths and are sold to order by the foot, sawed to the desired lengths.

Another recent development is "the use of shell concrete". Very thin, and consequently very economical roofs of this type have been built over aircraft hangers, arenas, and factory buildings. Long spans with few columns are economically possible. In Canada, arenas with this type of roof have recently been built in Victoria and in Quebec City.

Dr. Lash expressed the opinion that the advanced achievements in Western Europe were largely due to their system of competitive designs. In Canada the owner of a proposed building, bridge, or dam has a single design prepared. Although care is taken to prepare economical and pleasing structures, a lack of competition is responsible for the relative slow development in the concrete field on this continent.

Mr. W. A. Trotter thanked Prof. Lash for his interesting, instructive and entertaining talk, and Mr. G. T. Andrews expressed the appreciation of the Branch to Col. J. R. Dunlop and his officers for the use of the mess.

Lakehead

G. S. Halter, m.e.i.c.
Secretary-Treasurer

J. W. Howe, jr.e.i.c.
Branch News Editor

The annual dinner dance of the Lakehead Branch took place in the Royal Edward Hotel on Wednesday evening, January 24. A beautiful rose corsage was presented to each lady as she entered the ballroom. Cocktails were served before the dinner and afterwards variety entertainment was provided by a piano-accordion duet and an impersonator. A five-piece orchestra provided the music for the dance.

Mr. O. J. Koreen, Branch chairman, presided at the dinner and there were 75 couples present.

Two large Engineering Institute shields were on proud display in prominent places. Mr. Halter thanked the guests on behalf of the executive for attending this annual event and making it such a success.

❖ ❖ ❖

On February 23 the Lakehead Branch held a dinner meeting at the Orpheum Grill, Port Arthur. Guest speaker for the occasion was Mr. Harry Thomasson, director, metallurgical section, research and development laboratory, Canadian Westinghouse Company. Coloured slides illustrated his talk on **The Modern Laboratory and Its Part in Quality Control.** He described several important machines, among them the microhardness machine, the impact testing machine, the weatherometer, and the master balance, which he claims is accurate to 40 millionths of a pound. He also gave a general picture of what the laboratory is doing, and of its importance to Canadian Westinghouse Company. Mr. Thomasson was introduced by Dave Hunter, local manager of Canadian Westinghouse, and the appreciation of the members was expressed by Les Emery. In addition to the 30 members of the Branch, five engineering students from the Lakehead Technical Institute attended the meeting. Mr. O. J. Koreen, Branch chairman, presided at the meeting.

❖ ❖ ❖

On March 30 the Lakehead Branch heard a talk by Mr. R. S. Williams, sales engineer for Canadian Johns-Manville Company, on the subject of **Modern Diesel Power.** He described the advantages of diesel locomotives over steam locomotives, and discussed the possible future use of gas turbine and steam turbine with electric traction, which are types of locomotives now under test. With the aid of slides and films he also explained the basic principles and different types of diesel engines now in use, and told how the various features of the modern diesels have been developed from the earlier models.

There were 35 members present at this meeting, which was a dinner meeting held in Fort William. Mr F. E. Ayers introduced Mr. Williams and the speaker was thanked by Mr. S. E. Flook.

Lethbridge

D. Cramer, M.E.I.C.
Secretary-Treasurer

J. T. Dokken, Jr.E.I.C.
Branch News Editor

The regular monthly dinner meeting of the Lethbridge Branch was held in the Marquis hotel on Saturday, March 17th. P. E. Kirkpatrick presided as chairman. The speaker for the evening was Mr. T. Cardell, an engineer at Calgary Power Co. Ltd.

Music was supplied by the Brown Instrumental Trio, and by vocalist Miss Joy Dalton accompanied by Mrs. P. Cull.

Mr. Cardell was introduced by P. E. Kirkpatrick. Mr. Cardell's topic was **Supervision and Remote Control of Power Plants.** The speaker first outlined the history and layout of his company's power development. There are at present six hydro plants supplying 110,000 kw. In the near future all plants will be under remote control, that is, centralized control by a single operator. The first reason for switching to remote control operation is for the savings involved. Instead of an operating crew for every plant only one is required. Further savings are encountered in decreasing the number of houses, schools, etc., required. Secondly an improved, faster and more reliable control is maintained since the whole system is under one operator's fingertips, and he is able to size up troubles instantly. Thirdly, personnel working conditions will be improved since all the staff will be in a centre handy to schools and stores and will work under clean and pleasant conditions. Lastly, hydro plants are easily adapted to automatic control.

The chief elements in a remote controlled system are the headgates, the penstock valves controlling water to the turbines, the turbine gates, the hydraulic governor, the ventilating system and all switchgear. Automatic plants provide their own protection, thus immediately trouble occurs the unit shuts down automatically.

Remote controlled systems perform operations, indicate what is happening at any time and telemeter hydraulic and electrical data.

Mr. Cardell illustrated his talk with interesting slides.

A. W. Rider moved a vote of thanks on behalf of all present to Mr. Cardell, for his interesting discussion.

❖ ❖ ❖

On Saturday, February 17, 1951, the Lethbridge Branch of the Institute and the Association of Professional Engineers of Alberta met at the annual joint dinner meeting at the Marquis Hotel. F. Austin Brownie, president of the A.P.E.A. presided over the meeting.

Dinner music was supplied by the Brown Instrumental Trio. For the musical programme R. S. Lawrence ably led in community singing; piano selections by Mrs. L. Kass, concert pianist, and violin selections by Mr. Jack Fowler accompanied by Mrs. Kass, were enjoyed by all.

Mayor L. S. Turcotte welcomed the engineers to the city stressing that engineers "are the backbone of the development of this country".

Mr. Brownie introduced the speaker, F. J. Stubbs, assistant general manager of Interprovincial Pipe Line Company. Mr. Stubbs outlined the vast amount of research and the many problems that had to be overcome by engineers to construct the pipe line. An aerial photographic survey for reconnaissance was the first step, followed by a ground survey.

Construction of the $90,000,000.00 line was divided into three parts: Edmonton—Regina; Regina—Gretna, Manitoba; and Gretna—Superior.

Discovery of the Leduc field first led to plans for an Edmonton—Regina line, but when the big Redwater oil field blew in engineers decided it was economical to build the line to Superior.

A total of 179,000 tons of high test steel went into construction of the line, with 20-inch pipe from Edmonton to Regina, 16-inch pipe between Regina and Gretna, and 18-inch with thinner walls from the latter point to Superior.

The tankage problem both at Redwater and Superior led to construction of storage space for 3,500,000 barrels. Some $6,000,000.00 worth of machinery was used to build the line at the rate of about 1.2 miles per day for each digging unit. The ditch in which the pipe was buried measured 32 inches wide and 5 feet deep—over plains, under rivers and through forests. A total of 3,000,000 cubic yards of dirt was moved.

The crude, moving at two miles per hour can flow from Edmonton to Superior in 26 days. A total of 20,000 barrels daily is taken out of the Superior end of the line.

The new tankers at Superior which haul the crude to Sarnia, Ontario, have a capacity of 115,000 barrels each, and can make the round trip in five days.

The flow of crude in the huge pipeline can be doubled with the addition of four more pumping stations in Canada and two more in the United States. The construction of these pumping stations is planned for 1951-52.

In conclusion Mr. Stubbs stated that the construction of the pipeline was sponsored by Imperial Oil, but that today the firm retains only one-third con-

trol with 42 per cent of the stock in the hands of the public and the remainder with other oil companies.

Coloured films depicting the construction of the pipe line were shown following Mr. Stubbs' talk.

On behalf of all present, A. L. H. Sommerville offered a vote of thanks to Mr. Stubbs for his interesting talk and films.

Moncton

V. C. Blackett, M.E.I.C.
Secretary-Treasurer

Gas, Arcs, Ships and Men, was the subject of an address on welding, delivered at a branch meeting held in the City Hall on February 20th. The speaker was P. H. Take, welding engineer, Halifax Shipyards, Ltd., and consultant for the Dominion Steel and Coal Corp., Ltd. N. B. Eagles, chairman of the Branch, presided.

According to Mr. Take, electric welding, both arc and resistance, has emerged from infancy. Its great versatility is demonstrated by its use in building a ship, or putting the iridium point on a fountain pen.

The new one thousand p.s.i. working pressure boilers for the City of Toronto, and the many electronic tubes used in radio, television and industrial electronics are all welded. Again, as an indication of the magnitude of the arc welding process, the figures of annual electrode consumption in Canada and the United States are astronomically high.

Besides providing a speedy, economical method of joining metals, the process makes obtainable many designs and many articles which would be impossible without its use.

However, electric welding and its allied processes of brazing and soldering require a greater knowledge of the laws of physics, chemistry and metallurgy, etc., than any other industrial process.

The art of welding which has to do with operator technique and qualifications is no longer a problem. The main problems today in arc welding have to do with elimination of notch points, "locked up" and residual stresses, and weldability. They are all on an engineering level.

In respect of this, particularly in construction and larger weldments, it has been found necessary to reconsider many of our former ideas about welded design. Mr. Take illustrated his remarks with a display of numerous samples of welding design.

The thanks of the meeting were extended to the speaker by the presiding chairman.

The following evening Mr. Take repeated his address at Sackville before a joint meeting of the Mount Allison Engineering Society and the Moncton Branch. The meeting was held in the Chemistry Building of the University, and was attended by engineering students and by Institute members resident in Sackville and in Amherst, N.S. The Branch chairman and several of the executive accompanied Mr. Take to Sackville. William Watson, president of the Engineering Society, presided and introduced the speaker. Following the address, a question period lasted one hour. The chairman thanked the speaker for the paper he had presented, and then called on Dr. H. W. McKiel, vice-president of Mount Allison University, who also expressed his appreciation of Mr. Take's address.

Peterborough

J. P. Watts, M.E.I.C.
Secretary-Treasurer

M. V. Powell, M.E.I.C.
Branch News Editor

On Thursday, March 29, the Peterborough Branch heard an address by Mr. Garth Wade on the **Operation of the Nashua Company.** The speaker has a thorough knowledge of his subject as he is the mechanical superintendent of the local plant and has personally supervised the installation of all the equipment in their new modern office and factory. This plant makes a specialty of wrappers such as multi-coloured and waxed covers for bread and produces gummed paper strips. The chief operations carried out at this plant are gumming, printing, waxing and sheeting or cutting into proper sheet sizes. The waxing process presents a few difficulties but printing is the most complicated and difficult part of the work. Modern methods are used by the Nashua plant in printing wrappers in three or more colours. The making of plates and type-setting is not ordinarily done at Peterborough but the rest of the work is carried on here. A powerful press makes the impression of the plate in the tympan sheet while it is flat and this sheet is then held in the arc of a circle in the casting box while type metal is cast against it to form part of the circular surface of a printing roll. For three colours, a press having three printing rolls, one for each colour, must be used and the registering of one colour with relation to the preceding presents an ever present and serious problem. Mr. Wade was introduced by the chairman, A. Bonney, and R. Hailey expressed the thanks of the audience.

After the lecture, the members and friends visited the Nashua Plant. The modern office building possesses up-to-date air-conditioning and lighting, fine furniture and large plate glass windows overlooking spacious grounds. During the trip through the factory, the visitors saw a large machine putting the gummed surface on brown paper and several large printing presses and waxing machines in operation. The power plant, pattern and repair shops were inspected, and in another department Mr. Wade demonstrated the operation of the various machines used in making the type metal printing rolls.

❖ ❖ ❖

The Peterborough Branch on March 1. heard a discussion by Mr. Ira Sylvester, technical sales engineer, Diesel Division of the Montreal Locomotive Works. His subject was **Canadian Diesel-Electric Locomotive Progress.** The speaker's experience in the application of diesels to railway motive power extends over 25 years. He served first with the C.N.R. and during this time was a member of the crew of the self-propelled diesel-electric car which made the first and record setting Montreal to Vancouver run of 3,000 miles in 67 hours in 1925.

Mr. Sylvester emphasized the fact that modern railways are continually demanding faster service and greater tonnage per day over their lines. This

calls for more and more power and pure electric locomotives have solved this problem only in special locations but it has been proven that the diesel-electric locomotives are the real solution as they combine the advantages of both steam and straight electric drives. With lantern slides, the speaker traced the evolution of the diesel-electric locomotive from the early self-propelled cars to the modern switchers and the stream-lined mainliners. The first important decision reached in the early investigation was that fuel oil was safer and much more economical than gasoline, or distillate. The diesel-electric switcher quickly evolved from the first plain box type to a wide cab and narrow engine for better visibility and finally to the modern steeple type cab located at the centre and raised above the engine giving a clear view in all directions. Switchers have retained the heavy frame at coupling level. The main line diesel-electric locomotives have their strength built into their side frames and also for passenger service must incorporate steam boilers. The main line diesel-electrics are built in two types, one with a cab and the other without a cab and arranged so that it may be coupled back of the first and controlled as a unit with it. Thus for specially heavy trains or winter service extra power is available without doubling the crew.

Diesel engines show greater fuel economy than steam and also do not require great quantities of water and such frequent overhauling. A great increase in power for the same cylinder size has been obtained by special scavenging pumps, adjustable plunger fuel injection pumps and recently a new type turbocharger driven by an exhaust gas turbine. This increase in power is illustrated by the fact that in the past 12 cylinders 12 in. by 12 in. developed 1,300 hp., whereas now only 12 cylinders 9 in. by 9 in. are required. Mechanically, the engines have been narrowed down to suit the space available. Bearing areas are larger, full lubrication employed and piston rings are cooled by lubricating oil. Cooling water spaces are smaller and cylinder liners and other parts are easily replaced.

A moving picture "Railroading on the Marybrook" illustrated that the use of diesel-electric locomotives greatly facilitated the sorting of up to 1,000 cars per day at the Marybrook yard and in hauling them up the heavy grade on their way east. Now a three-unit diesel-electric makes this climb more smoothly than four or more steam locomotives did previously. On the downhill run brakes are saved and finally higher speed can be maintained over the last bridge which is 200 ft. high.

Mr. Sylvester was introduced by Eric Whiteley and thanked by Hubert Sills. A. J. Bonney was chairman.

Saguenay

F. E. Hogg, M.E.I.C.
Secretary-Treasurer

W. A. Armstrong, Jr.E.I.C.
Branch News Editor

On March 13th a smoker was held in the Saguenay Inn on the occasion of the official visit to Saguenay Branch of the President, Mr. J. A. Vance.

The President and Mrs. Vance were welcomed on their arrival in Arvida by members of the Branch executive and their wives, and taken on a tour of the district.

The smoker was held at 8.30 p.m., and was attended by over fifty Branch members. B. L. Davis acted as chairman in the absence of F. W. Barker. Good fellowship was the keynote of the evening, with Dr. L. Austin Wright adding some of his interesting anecdotes.

Mr. Vance expressed confidence in Canada's future industrial development, and in the ability of the engineering profession to contribute greatly towards this development. He regretted the present deficiency of engineers, and foresaw a continued demand for more engineers than our universities are now graduating. In fact, many enterprises are being delayed due to the present shortage of trained men.

The president reviewed the highlights of his visits to the other districts, touching on his trip to South Africa to attend the conference of Commonwealth Engineering Societies. Dr. Wright described in some detail the efforts of the E.I.C. to promote the interests of the profession in Canada.

The matter of refreshments was in the capable hands of Jules Mercier.

Junior Section

R. H. Singleton, M.E.I.C.
Secretary-Treasurer

The annual dinner meeting of the Junior Section of the Saguenay Branch was held in the Grill Room of the Saguenay Inn, Arvida, Tuesday evening, April 10th. After a very enjoyable dinner, Chairman H. V. Page introduced Mr. A. C. Wilkinson, advertising and sales promotion manager of Electrolux (Canada) Limited, who spoke on **The Fitly Spoken Word.**

The speech, which was presented in a brilliantly eloquent manner, brought home the moral contained in the biblical quotation "The fitly spoken word is like apples of gold in baskets of silver". Simplicity and sincerity are the prime requisites of good speech. The hearers were definitely left with something to think about. Although of a serious vein, the speech was appropriately spaced with flashes of wit and humour. The speaker was thanked by Mr. M. Fredericks, vice-chairman, and the very keen appreciation of the audience was expressed by the enthusiastic applause.

Mr. Wilkinson's talk was followed by short speeches by Mr. L. C. Wellington, assistant manager of Canada's Aluminum Company of Canada's Arvida Works, and by Mr. A. Cunningham, chief engineer ,of the Price Brothers, Kenogami, paper mill. Following this, some interesting films were shown and the evening's entertainment concluded with a singsong.

❖ ❖ ❖

Mr. S. Mitescu of the Aluminum Company of Canada's Arvida Works addressed the Saguenay Junior Section Wednesday evening, March 28th. His topic was **Monetary Problems in Foreign Trade.**

Mr. Mitescu, a Rumanian chemical engineer, was in charge of Rumania's foreign trade office for a number of years between the World Wars. Despite his limited experience in conversing in the English language, the speaker presented a very informative general discussion of the topic with special reference to Rumania. The different types of international monetary systems, gold standard, etc., and the reasons why these systems were adopted were clarified as well as many other monetary aspects of foreign trade. A very lively discussion period followed.

Saint John

W. M. Brenan, M.E.I.C.
Secretary-Treasurer

S. V. Grisdale, M.E.I.C.
Branch News Editor

The joint annual dinner of the Saint John Branch of the Engineering Institute of Canada and the New Brunswick Association of Professional Engineers was held in the Admiral Beatty Ball Room on January 25th.

The speaker of the evening was Mr James M. H. Fraser, general superintendent of the Saint John Drydock Co. Limited. Mr. Fraser described at some length, the operation of the Drydock and related the details of some of the more interesting jobs which have been handled there in the past.

Mr. Fraser pointed out that the Drydock is large enough to handle practically any vessel afloat and facilities are available to make repairs of any kind. Special equipment for sewage disposal and to supply fresh water, power and telephone service permits the ship's company to live aboard, even when the ship is literally in the Drydock.

The speaker was introduced by Mr Andy Watt.

At the dinner the first award of the new scholarship of $200.00 was presented by Mr. J. P. Mooney, to Mr. Richard A. Hughes, a fourth year student at the University of New Brunswick. This scholarship was presented by the Association of Professional Engineers of the Province of New Brunswick and is to be open for annual competition.

Mr. W. R. Godfrey, director of works for the City of Saint John, and Chairman of the Saint John Branch of the Engineering Institute of Canada presided at the dinner.

Sarnia Branch

G. R. McMillin, M.E.I.C.
Secretary-Treasurer

C. M. Stewart, Jr.E.I.C
Branch News Editor

On February 22, 1951, the Sarnia Branch dinner meeting took the form of a forum on **Civil Defence.** This problem has been drawing a considerable amount of current interest, especially in Sarnia, the "Chemical Valley of Canada".

Guests of the Institute were Mr. H Turnbull, D.F.C., the Sarnia City Council representative on the Civil Defence Committee; Dr. R. E. Sidenberg, the medical adviser for Civil Defence; Mr. W. Greenwood, city engineer; and Group Captain D. Harding, O.B.E., A.F.C., who, together with Branch Chairman C. P. Sturdee, led the discussion and put forward a clear picture of what was required to provide an efficient, well-organized civil defence programme.

Civil defence becomes necessary when some form of attack, either by sabotage or bombing, is encountered. Its purpose is to keep the basic services functioning during the emergency period and to assist in restoring the situation to normal as soon as possible.

The primary aspects of civil defence

are public education for the emergency and the planning and organization work required to set up the machinery to handle the secondary problems such as warning systems, fire fighting, medical services, evacuation, and repair of damage which are actually encountered during the emergency period. These primary problems are at present under study and it was strongly emphasized, that with general public interest and assistance, together with the required financial support, this problem could be handled; but civil defence is everybody's job and its success or failure depends upon the individuals of the community.

As this problem is of international interest, a number of members of the Bluewater Chapter of the Michigan Society of Professional Engineers were in attendance.

The guest speakers were thanked by Mr. D. D. Livingstone for their interesting presentation of the various aspects of this problem and for their informative answers to the numerous questions raised by the membership at large.

❖ ❖ ❖

On March 7, the Sarnia section of the Institute, at a dinner meeting in the Sarnia Riding Club, honoured the occasion of the Presidential visit by Mr. J. A. Vance and his party.

Accompanying Mr. Vance was his wife, Mr. and Mrs. V. A. McKillop, London Branch councillor and Dr. L. Austin Wright, general secretary of the Engineering Institute of Canada. Mr. C. P. Sturdee, Chairman of the local section, as master of ceremonies introduced these guests and also the following from the Bluewater Chapter, Michigan Society of Professional Engineers—Mr. A. Carlisle, vice-president, and Mr. Howard H. Canfield, secretary of the Bluewater Chapter.

Mr. Vance extended his best wishes to the Sarnia Branch and stated that as a result of his recent trip to Western Canada he had found that everything points to Sarnia. For example, oil fields are being opened up in Alberta, pipelines are being built across Saskatchewan and Manitoba, new oil tankers are being constructed at the Lakehead cities and industries in the Sarnia area themselves are in the midst of considerable industrial expansion.

The president expressed satisfaction that some thinking had been done about civil defence since there is much that engineers can accomplish in this matter. An instance of their co-operation with the armed services was evident during the Manitoba floods in the spring of 1950. Mr. Vance also urged that engineers work closely for and with groups such as the Chamber of Commerce.

The president urged those who could contribute voluntary subscriptions should do so. There are two main purposes for asking voluntary subscriptions. First E.I.C. operational costs have increased as have all others; secondly, these subscriptions should help keep the assessed fees at their present level. The council is reluctant to raise fees—especially when there are so many young members who could not readily afford to pay increased fees, though they belong to other professional provincial engineering groups and American engineering societies. Many of these other groups have already decided to raise their fees.

Mr. Vance gave his views of recent trips to most parts of Canada. He has found that the demand for young engineers is on the increase and expressed the opinion that industry will be able to find places for all engineers our Universities can graduate for a good many years, in view of Canada's expanding industrial development. At present the Province of Alberta is leading in expansion and development. This is due to the oil and gas industries and also irrigation programmes. The St. Marys River Dams are examples of what Canadian engineers are learning about building earth dams and good irrigation projects.

Newfoundland is another region that has shown increased industrial development, especially in lumber, mining, and paper industries.

The president concluded his address by stating again that the future looks bright for all engineers and those who will graduate in future years from our engineering schools. He believes that for those young engineers who are not looking for security, the north and west will bring just and satisfying rewards.

❖ ❖ ❖

On Wednesday, April 4th, Mr. W. J. Muller of the Bingham Pump Company, New York, addressed a capacity audience of approximately seventy members of the Sarnia Branch, in the Imperial Oil Auditorium. Mr. G. R. McMillin presided in the absence of Chairman C. P. Sturdee, and conducted a short business meeting. The speaker, who was introduced by Frank Belshaw, spoke on the subject of **Centrifugal Pumps.**

Mr. Muller began his discussion of centrifugal volute type pumps by a consideration of the two major design factors in these types of pumps, namely those of axial and radial thrust forces. For example, a horizontal double suction

President J. A. Vance visited the Sarnia Branch in March. Upper photo, left to right, Dr. L. Austin Wright, general secretary; Mrs. C. P. Sturdee, Mr. and Mrs. J. A. Vance; and Branch Chairman C. P. Sturdee.

The lower photograph includes, from left to right, L. M. Dunn, state director of Michigan Society of Professional Engineers; R. A. Cosgrove, president of the Blue Water Chapter of the Michigan Society of Professional Engineers; H. B. Turnbull, city council representative on the Civil Defence Committee; C. P. Sturdee, chairman of the Sarnia Branch of the E.I.C.; and Dr. B. B. Hillary, past chairman of the Sarnia Branch.

volute pump is balanced axially because the suction pressure is equal on each side of the impeller. A single suction pump is not thus inherently balanced, and requires some method such as use of ribs or holes drilled through the back of the impeller to attempt to equalize this axial thrust. Also, the resultant of radial thrust forces may seriously affect the life of a pump, particularly on a single volute pump. At peak efficiency, this radial force tends to become balanced. Therefore if a pump is bought oversized for any particular service, it will necessarily be operating at a low efficiency and the radial thrust will be unbalanced. Flexing of pump shafts, resulting in bearing or mechanical seal difficulties frequently result.

The speaker illustrated his address with slides showing sections through the major volute pump types, such as the single and double suction, double volute and multi-stage horizontal and deep well turbine type pumps. The selection of various pump types to obtain the desired characteristics of head and capacity was explained. The importance of having a correct "net positive suction head" to prevent flashing of hydrocarbon liquids was also described. If the pump NPSH is unsuitable for the liquid to be pumped, vapour flashing within the pump could seriously upset hydraulic balancing forces for which it is designed, resulting in shaft deflection and seizure.

Following a question period, Mr. John Baxter expressed the appreciation of the gathering to Mr. Muller for his interesting address.

Sudbury

Dennis McKinty, jr.e.i.c.
Secretary-Treasurer

The Sudbury Branch was visited by the regional vice-president, Mr. W. J. W. Reid, on April 6, 1951. Mr. Reid was entertained at luncheon by the branch executive, all resident members being present to hear valuable counsel on branch problems.

In the afternoon, Mr. Reid was taken on a tour of the local Air Force radar station by Russ Eaton and Dennis McKinty, and was interviewed by radio station C.K.S.O.

The general dinner meeting was attended by thirty-seven members.

Mr. Reid, introduced by Russ Eaton, commenced by congratulating the Branch on its success during the first year since inauguration. He said the Branch could feel proud of its attendance record.

For his subject, Mr. Reid had chosen **Management,** and more particularly the art of dealing with people, this phase being the most foreign to those trained in engineering. He defined management as the art of directing human effort.

From among the many responsibilities of management, Mr. Reid elaborated on the following:

(a) unity of command; each man should be responsible to only one boss;
(b) division of responsibility; each man should know exactly what responsibility he has; this could possibly be achieved with a system of job description;
(c) co-ordination; the organization should be such as to encourage co-operation between departments on the same level without going through department heads—a true manager should only see people in trouble.

Mr. Reid stressed the necessity of employee co-operation to achieve maximum production. Yet no standard set of conditions would ensure the necessary harmony. Consequently no formula could be set up to give the answer to management's biggest problem

In conclusion, Mr. Reid pointed out that management should watch its public relations, to foster the goodwill of the people and, therefore, of the government.

Len Lane thanked the speaker on behalf of the Branch.

It was announced that the annual meeting would be held on May 7, 1951, and would be in the form of a "Ladies Night".

Vancouver Island

W. A. Bowman, jr.e.i.c.
Secretary-Treasurer

The Branch completed, early in April, a letter ballot on the change of name of the Victoria Branch. A decisive majority of returned ballots were in favour of the change, and the Branch is therefore officially known as the "Vancouver Island Branch."

Hamilton

Engineers' Wives Association

For the December 1950 meeting the Association tried to support the Branch by attending the Engineering Institute's First Ball, held at the Brant Inn where Mr. and Mrs. Vance were special guests.

The January 9th, 1951 meeting at the Cawesco Club, Hamilton (Engineers Club), was a business meeting wherein our constitution was discussed and the members became better acquainted.

The February 13th meeting was in the form of a Box Social, where the ladies had as guests their husbands, in the tune of St. Valentine's theme. An enjoyable time seemed to be had by all and dancing and cards were the entertainment.

A feature of the January meeting was a special motion that Mrs. L. C. Sentance became a permanent Executive during her lifetime in recognition of her deep devotion and work in developing the organization and to keep her special knowledge available to incoming Executive in the future.

Also, there has been some change in the Executive owing to demands of distance, and for convenience. The Honorary President is Mrs. Bailey; president, Mrs. George L. Schneider; vice-pres., Mrs. J. Arthur Reid; recording secretary, Mrs. Leslie C. Galloway; corresponding secretary, Mrs. V. T. L. Vollmer; treasurer, Mrs. F. J. Veale; social and programme convener, Mrs. John Carruthers; membership secretary, Mrs. J. Tyerman; permanent executive, Mrs. L. C. Sentance, who was honorary president last year.

Employment Service

THIS SERVICE is operated for the benefit of members of the Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

Notices appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

Personal interviews with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged *by appointment.*

Situations Vacant

CHEMICAL

TWO CHEMICAL ENGINEERS required by paper company located in Province of Quebec. Applicants should have at least one year's experience in chemical laboratory work or related fields. Recent graduates of chemical engineering or general science will also be favourably considered. Apply to File No. 2098-V.

CHEMICAL ENGINEERS required by organization in Ontario. Plant experience preferred but not necessary. Salaries open. Apply to File No. 3015-V.

CHEMICAL ENGINEER required in central Ontario, with three to five years experience, preferably in a petrochemical industry. Salary open. Apply to File No. 3016-V.

CHEMICAL ENGINEER required for Ontario bleached sulphate pulp and paper mill. Pulp and paper experience desirable but not essential depending on age. Apply giving full particulars as to personal, education, experience, references to File No. 3029-V.

CIVIL

CIVIL ENGINEER required by firm of consultants in Montreal with considerable experience in reinforced concrete and some pre-stressed concrete design work. Applicant must be capable of working with a minimum of supervision and be capable of taking charge of a design group. Apply to File No. 3001-V.

CIVIL ENGINEER 1949 or 1950 graduate required in Montreal with some experience in concrete design or construction. Salary open. Apply to File No. 3013-V.

PROFESSOR OF CIVIL ENGINEERING required by university located in Ontario. The person appointed will be required to take charge of courses in highway engineering and to assist in associated civil engineering courses. Applicants should have had not less than ten years practical experience, part of which must have been spent in highway engineering. They should have graduated from a recognized university and post-graduate study will be considered an asset. An interest in soil mechanics is desirable. Salary, according to qualifications, up to $5,000.00. Apply to File No. 3014-V.

GRADUATE CIVIL ENGINEER required as transitman for railway company located in Province of Quebec. Starting salary $250.00. Apply to File No. 3025-V.

CIVIL ENGINEER required with about six years experience on construction of all types, by young progressive organization located in Province of Quebec. Applicant must have good personality and be thoroughly bilingual. Excellent opportunities offered. Starting salary about $5,000.00. Apply to File No. 3031-V.

TWO GRADUATE CIVIL ENGINEERS with a few years experience in heavy construction, preferably with contractors and on power house construction, required by large public utility in Province of Quebec. Salaries open. Apply to File No. 3035-V.

CIVIL ENGINEER, experienced, required by city in Eastern Ontario to act as building and plumbing inspector and to assist in the engineering department. Full employee benefits, salary according to qualifications. Apply to File No. 3037-V.

ELECTRICAL

ELECTRICAL ENGINEER required in Ontario with experience in the application of electrical wire and cable, or electrical engineer who has had at least a few years experience in some aspect of the electrical cable industry, either with a cable manufacturer or in the distribution department of a public utility. Salary open. Apply to File No. 2097-V.

ELECTRICAL ENGINEER required in Ontario. Age 25 to 35 years. Duties include product design development and engineering of small AC and DC motors. Excellent starting salary and future prospects. Apply to File No. 3041-V.

MECHANICAL

YOUNG MECHANICAL ENGINEER to act as expeditor in the purchasing department of organization in Montreal. Applicant should be between 30 to 35 years and be free to travel 50% of the time. Material handled would be all types of heavy equipment in connection with smelting plant. Apply to File No. 3019-V.

MECHANICAL ENGINEER required by organization in Montreal. Applicant should have had experience in production planning and the design and application of mechanical equipment to production operations. Duties will include research and the development of mechanical equipment for one of the primary industries. Preferably single and free to travel. Apply to File No. 3020-V.

MECHANICAL ENGINEER 1949 or 1950 graduate with some experience in heating or combustion engineering or ventilating and air conditioning, required by firm in Montreal. Apply to File No. 3021-V.

MECHANICAL ENGINEER required by firm of consultants in Montreal with some knowledge of heating and ventilating. Apply to File No. 3023-V.

MECHANICAL ENGINEERS 1950 graduates required by manufacturer in Montreal of heavy industrial equipment. Salary open. Apply to File No. 3030-V.

MECHANICAL ENGINEER, with 3 to 5 years experience in steam plant design and layout, required for draughting, design and project engineering in West Coast consulting engineers' office. Salary open. Apply to File No. 3040-V.

MECHANICAL ENGINEER required by architect's firm in Ontario. Applicant should be 30-45 years of age and a graduate mechanical engineer and have from five to ten years experience in the design of heating, ventilating, plumbing and electrical installations. Starting salary will be $4,500 to $6,500 depending on qualifications. Apply to File No. 3042-V.

MISCELLANEOUS

TOWN ENGINEER required in Ontario. Duties to commence any time after April 15, 1951. Apply to File No. 2099-V.

PRODUCTION ENGINEER required as an assistant to the production manager of a company manufacturing electrical switchgear and allied products in British Columbia. Graduate engineer preferred with some experience in production work. Reply in writing with particulars of qualifications to File No. 3000-V.

A MATURE GRADUATE ENGINEER with 10 years experience in the operation of ore dressing and hydrometallurgy plants is required, to take charge of hydrometallurgical ore treatment plant of 750 tons per day with ultimate capacity 1500 to 2000 tons. Position requires sound background in chemistry and chemical plant control equipment. The position offers excellent opportunities for advancement in a growing organization. Reply with full details of experience, educational background, marital status to File No. 3002-V.

WE ARE SEEKING a top quality business minded engineer with good executive drive for a new and modern coal mining operation in Alberta. Both strip and underground operations are involved. This man will work with the mine manager and be responsible to the managing director for all business aspects; planning, control, purchasing, etc. Underground mining experience is not a prerequisite but some experience in business administration and/or in dirt moving operations with heavy equipment would be desirable. Present accommodation is limited but the opportunity for other interests controlled by the same principals, is excellent. The salary is open. Apply to File No. 3004-V.

YOUNG GRADUATE ENGINEER, preferably two or three years experience in instrument process controls, sales and estimating work. Preferably bilingual but not essential. Salary depending on experience. Apply to File No. 3005-V.

ENGINEERS REQUIRED by firm of consultants in Montreal. Civil, mechanical, electrical and structural engineers and draughtsmen, also petroleum engineer required with some experience. Salaries open. Apply to File No. 3007-V.

EXPERIENCED INSTRUMENT ENGINEER required in Montreal. Permanent appointment for a man between 25 and 35 years of age and A.1 medical category. He should be able to select proper equipment for new jobs also interpret results and calculate correction factors of instruments. He must have experience and ability to organize instrument maintenance and carry out normal repairs. Apply to File No. 3010-V.

WANTED RESEARCH SCIENTIST. Salary $5,850 to $6,850 depending on qualifications and experience. Duties to direct laboratory research and pilot plant development work in the chemistry of explosives and propellants. University graduate preferably at the Ph.D. level; five to ten years' experience in explosives or propellant research or in related fields; administrative experience. Canadian citizen. Apply to File No. 3011-V.

STRUCTURAL DESIGNERS AND DRAUGHTSMEN, familiar with structural steel and reinforced concrete work required by firm of consultants in Toronto. Apply to File No. 3012-V.

ENGINEERS REQUIRED by firm of consultants in Toronto capable of taking responsibility for phases of electronic and mechanical equipment sales and engineering, mining or industrial plant construction. Apply to File No. 3012-V.

DESIGN ENGINEERS, mechanical or chemical required in Ontario. Should have one or more years' experience in the chemical or allied industry. Salary open. Apply to File No. 3015-V.

SAFETY ENGINEER assistant, recent graduate in chemical or mechanical engineering with an interest in plant safety work. Location Ontario. Salary open. Apply to File No. 3015-V.

ELECTRICAL AND MECHANIAL ENGINEER required by electrical organization in Ontario, presently engaged in the conversion programme of industrial firms. Applicants should have some industrial experience. Apply to File No. 3017-V.

APPLICATIONS ARE BEING INVITED for the position of engineering assistant in the city engineer's department of city in Western Canada. Applicants must have a degree in civil engineering or equivalent and preferably some municipal or consulting engineering experience. The position could be permanent for the right type of man who is conversant with hydraulic and concrete design and who has the ability for dealing tactfully with the public. Salary $250.00 up depending on experience. Applicants should write giving concise details of age, marital status, education, experience, references and when available. Apply to File No. 3018-V.

RESIDENT ENGINEERS required by firm of consultants in Ontario, for large construction projects. Applicants should be experienced and be thoroughly bilingual. Apply to File No. 3022-V.

ESTIMATOR, preferably graduate engineer experienced in quantity survey as relative to building construction. This is a permanent position with a good initial salary and the prospects for advancement would be excellent for the right man. Location Ontario. Apply to File No. 3026-V.

SALES & SERVICE ENGINEER in the water treatment field for manufacturer supplying chemicals and equipment to all types of industries throughout Canada. Engineering graduates with 2 or 3 years experience or 1951 graduates Territory Quebec and Ontario with considerable travelling. Car provided travelling expenses paid. Salary based on qualifications. Apply to File No 3027-V.

JUNIOR ENGINEER with a knowledge of sanitary engineering required by large inter-municipal corporation in Western Canada. Duties include preparation of plans and specifications, to layout and supervise construction and maintenance, to make reports of investigations of special engineering problems. The immediate problems are additions to present facilities and enforcement of the regulations to industrial wastes. Salary open. Apply to File No. 3028-V.

SALES REPRESENTATIVE at Montreal and Toronto by British machinery and tool importers, experienced in pulp and paper making machinery of value but not essential. Apply to File No. 3033-V.

VACANCIES EXIST with major oil company having operations in several South American countries for:—District Electrical Superintendent, Electrical Engineer, Senior Chemist (refinery), Assistant Chief Chemist (refinery), Junior Mechanical Engineer. Interested parties should submit full details of qualifications. All replies will be held in the strictest confidence and should be addressed to File No. 3034-V.

THE PUBLIC SERVICE OF CANADA requires an engineer, a graduate in mining or metallurgical engineering with training in mineral economics $4,272.00 to $4,896.00, for the department of mines and technical surveys at Ottawa. Details and application forms at Civil Service Commission Offices, National Employment Service Offices and Post Offices. Apply to File No. 3039-V.

The following advertisements are reprinted from last month's Journal, not having yet been filled.

CHEMICAL

CHEMICAL ENGINEER required to take charge of process development group. Applicant should have at least five years development and production experience in chemical industry. Position in Ontario. Salary open. Apply to File No. 1335-V.

TWO JUNIOR OR INTERMEDIATE CHEMICAL ENGINEERS for the control department of pulp and paper industry in the Maritimes. Duties would be in connection with control and process work. Apply to File No. 1650-V.

CHEMICAL ENGINEERS with production ability, to operate chemical equipment such as filter presses, evaporators, vacuum jets, solvent recovery, etc. Location Valleyfield, Quebec. Excellent opportunity offered. Salary open. Apply to File No. 2053-V.

YOUNG CHEMICAL ENGINEER required in plant located in Province of Quebec. Applicant would be obliged after completing training period to take charge of analytical laboratory and to co-ordinate production with control both in alcohol distillery and in magnesia insulation plants. Preferably under 30 years of age with 1 or more years industrial experience. Apply to File No. 2054-V.

CHEMICAL ENGINEER 1949 or 1950 graduate required by large pulp and paper industry located in Province of Quebec. Apply to File No. 2059-V.

CHEMICAL ENGINEER required to head department of chemical technology in the Indian Institute of Science, Bangalore. Candidate should possess high academic qualifications in chemical technology, together with considerable research and teaching experience. Should have knowledge of design and operation of chemical pilot plants. No age limit is prescribed. Duties will involve instruction of personnel. This is the foremost research institute in India and has well established post-graduate departments of aeronautical engineering, electrical communication engineering, metallurgical engineering, internal combustion engineering, power engineering and electrical technology and chemical engineering and chemical technology. Post of head of chemical technology has been vacant for sometime. Apply to File No. 2077-V.

CIVIL

CIVIL ENGINEER required by large firm in Ontario, with about 10 years structural experience. Applicant must be experienced and able to assume responsibility. Apply to File No. 1644-V.

CIVIL ENGINEERS required by large construction company in Montreal. Applicants should have 2 or 3 years experience in field and general construction. Apply to File No. 2034-V.

YOUNG CIVIL ENGINEER with knowledge of reinforced concrete structures. Duties include supervision of concrete construction in Quebec, measurements on the work, drawings, reports and process estimates. Applicant must be bilingual. Reply in writing, giving full particulars as to experience, qualifications and salary expected to File No. 2060-V.

CIVIL ENGINEER required by engineering department of construction company. Duties include estimating, laying out construction work and engineering supervision. Salary dependent upon ability. Reply giving complete details of background and experience. Apply to File No. 2064-V.

CIVIL ENGINEER with at least ten years experience in design and detail of steel and reinforced concrete structures for Montreal office of consulting engineering firm. Salary open and possibility of association to right man. Apply to File No. 2091-V.

ELECTRICAL

GRADUATE ELECTRICAL ENGINEER required in the Province of Quebec as sales engineer for established wire and cable company. Experience in power field desirable. Salary open. Apply to File No. 1570-V.

ELECTRICAL ENGINEERS with experience in electronics and radar for positions in Ottawa. Salaries open. Apply to File No. 1588-V.

THE PUBLIC SERVICE OF CANADA requires Electrical Engineers (electronics and communications). Appointments at Ottawa, Toronto and Montreal. Salaries up to $4,740.00 per annum. Details and application forms may be obtained by writing Civil Service Commission, Ottawa. Competition No. 50-158-B. Apply to File No. 2016-V.

ELECTRICAL ENGINEER with at least five years professional experience, a substantial part of which should have been in hydro-electric central station and substation design. Salary $325.00 to $400.00 per month depending on qualifications and experience. Location Victoria, B.C. Apply to File No. 2073-V.

ELECTRICAL ENGINEER required by large organization in Montreal with about five years experience in general electrical engineering, preferably in the transportation field. Salary range $350.00 to $400.00 per month. Apply to File No. 2074-V.

YOUNG ELECTRICAL ENGINEER with about three years experience required by manufacturer located in Montreal. Applicant would be obliged to do some mechanical work in general plant engineering. Apply to File No. 2075-V.

ELECTRICAL ENGINEER required to head the departments of power engineering and electrical technology in the Indian Institute of Science, Bangalore. Candidate should have a doctorate or master's degree in electrical engineering from a recognized university, 15 years' experience in a responsible position in large power project, experience in guiding research and in the execution of large power projects. No age limit is prescribed. Duties will involve instruction of personnel. This is the foremost research institution in India, and has well established post graduate departments of aeronautical engineering, electrical communication engineering, metallurgical engineering, internal combustion engineering, power engineering, and electrical technology and chemical engineering and chemical technology. Post of head of the power engineering and electrical technology departments has been vacant for same time. Apply to File No. 2077-V.

ELECTRICAL ENGINEER, who is familiar with and particularly interested in the application of control equipment and the producing of wiring diagrams, required by manufacturer of conveying machinery located in Ontario. Apply to File No. 2082-V.

EXPERIENCED ELECTRICAL ENGINEER, preferably between 28 and 35 years of age required by paper industry located in Ontario. Not absolutely necessary, but preferably with design and practical experience in pulp and paper mill. Apply to File No. 2083-V.

ELECTRICAL ENGINEER, with at least 4 years experience in electrical field, preferably on substation layout and installation, required by P.U.C. with a total load of about 250,000 hp. and operate their own generating stations. Location about 100 miles north of Toronto. State wages expected, age etc. Apply to File No. 2096-V.

ELECTRICAL DRAUGHTSMAN, with at least 6 years experience required by P.U.C. of about 25,000 hp. State wages expected, age, etc. Apply to File No. 2096-V.

MECHANICAL

MECHANICAL DRAUGHTSMEN required by large coal mining firm in the Maritimes for simple designing, layout and detail drawings for ordinary colliery plants screening equipment. Hoists, simple steel structures, etc. Salary open. Apply to File No. 1332-V.

MECHANICAL DESIGN ENGINEERS required by West Coast pulp and paper mill. Previous pulp and paper experience desirable but not necessary and consideration will be given to all applicants with industrial experience. Salaries from $3,600.00 upwards commensurate with experience. These are permanent appointments in a well established mill. Apply to File No. 1582-V.

MECHANICAL ENGINEER required by large firm in Montreal. Applicants should have experience in the pulp and paper industry particularly in the design and for operation of paper making machinery. One or two years experience desired. Salaries open. Apply to File No. 1600-V.

MECHANICAL ENGINEER required by large firm in Montreal to act as railroad car engineer. Applicant should have 2 or 3 years (or more) of experience in the design of tank cars, as defined by the Association of American Railroads. Familiarity with the requirements of the A.A.R., the I.C.C., the Bureau of Explosives and the Board of Transport Commissioners is essential. Salary open. Apply to File No. 1603-V.

MECHANICAL ENGINEERS with design experience and ingenuity required for an aggressive Canadian firm manufacturing electronic and mechanical controls and instruments. Project engineers and junior engineers required. Salaries open. Apply to File No. 1609-V.

MECHANICAL ENGINEER required immediately for sales department. Large company requires the immediate services of mechanical engineer, for its sales department, preferably bilingual. This is a permanent salaried position, with well established company. State age, education and outline all experience. All replies treated in confidence Apply to File No. 1620-V.

MECHANICAL ENGINEERS required by large manufacturing firm located one hundred miles from Montreal. Excellent opportunities for experience and promotion in time study standards department eventually leading to shop management. Apply to File No. 1621-V.

MECHANICAL ENGINEER required in Province of Quebec with some plant experience. Duties include design and plant layout work. Apply to File No. 1648-V.

MECHANICAL ENGINEER with knowledge of industrial steam power plant design, heating system design and application of steam, air and hydraulics as applied to processes, required by large established company. 5 years or more experience desirable location Montreal. Salary open. Apply to File No. 1655-V.

MECHANICAL ENGINEER 25 to 30 years of age required for manufacturer of spun synthetic textile yarns at Granby, Quebec. The plant superintendent is a graduate mechanical engineer and the position is that of assistant superintendent. Duties will include planning production, the maintenance of the machines, planning and installation of a new machinery and daily contact with all levels of personnel. Salary will be dependent on the experience of successful applicant. Minimum $300.00 per month. Apply to File No. 1700-V.

MECHANICAL ENGINEER wanted, with designing experience and mechanical ability, plus a desire to become sales engineer. by manufacturer of road building machinery located in the Province of Quebec. Good speaking knowledge of French is necessary. Apply to File No. 2037-V.

MECHANICAL ENGINEER required as assistant to chief inspection of large oil company in Montreal. Applicant should have at least three years experience in plant maintenance, involving shop fabricating methods and inspection. Knowledge of metallurgy and familiarity with corrosion problems an asset. Salary open. Apply to File No. 2052-V.

MECHANICAL ENGINEER REQUIRED for engineering office of large oil company. Applicant should have minimum of two years' experience in design and layout of mechanical equipment. Working knowledge of pressure vessel design an asset. Location Montreal. Salary open. Apply to File No. 2052-V.

MECHANICAL ENGINEER with 3 to 5 years experience in maintenance engineering. An asset if bilingual but not necessary. Location: Valleyfield, Quebec. Excellent opportunity offered. Salary open. Apply to File No. 2053-V.

MECHANICAL ENGINEER, recent graduate, to act as plant superintendent in large bakery in Montreal. Apply to File No. 2055-V.

MECHANICAL ENGINEER of about 35 to 40 years of age to assist mechanical superintendent of plant located in Eastern Canada. Work will involve assisting supervision of construction, installation and maintenance of plant equipment including pumps, boilers, refrigeration, air-conditioning equipment, etc. Salary about $5,000.00. Apply to File No. 2056-V.

MECHANICAL ENGINEER required for large construction quarry and concrete company. Must have some experience in layout and design of plants. Salary commensurate with ability. Reply giving complete details of background and experience. Apply to File No. 2064-V.

CHIEF MECHANICAL ENGINEER or assistant chief mechanical engineer required by large firm of consultants in Toronto. Salary open. Apply to File No. 2068-V.

MECHANICAL ENGINEERS with experience in process layout, design of steam plants, water supply systems and sewage and industrial waste treatment facilities. Salaries commensurate with experience. Apply to File No. 2068-V.

MECHANICAL ENGINEER with at least two to three years' experience in the design and job fabrication of A.S.M.C. pressure vessels and heat exchangers required for design, estimate and inspection work by engineering company located in Montreal. Salary commensurate with ability. Apply to File No. 2070-V.

MASTER MECHANIC required for central waterpower, irrigation and navigation commission, New Delhi, India Candidate should have considerable experience as a mechanic and have held responsible positions in the field of mechanical engineering. Age, about 45 years. Duties will involve supervision of the operation and maintenance of machines employed on river valley projects, such as the construction of large concrete, earth and other types of dams, large power houses and transmission systems and the excavation of canals. He will also be required to train Indian personnel working under him. Apply to File No. 2077-V.

SEVERAL 1951 mechanical engineering graduates required by pulp and paper industry located in the Province of Quebec. Apply to File No. 2081-V.

YOUNG MECHANICAL ENGINEER required by manufacturer of various types of machinery located in Montreal, for extensive design. Good opportunity to right man interested in this type of work. Apply to File No. 2092-V.

METALLURGICAL

FOUNDRY METALLURGIST required in British Columbia. Applicant should have broad experience in research work. Apply to File 1118-V.

METALLURGIST, recent graduate required for cast iron foundry located in Province of Quebec. Apply to File No. 2050-V.

MISCELLANEOUS

EXPERIENCED DESIGN ENGINEER required by a large Western Canadian steel fabricating shop. Must be experienced in design of boiler and pressure vessels. Material handling equipment, structural steel. Apply to File No. 1502-V.

SENIOR DESIGN ENGINEER required in Ottawa, with a degree in mechanical or chemical engineering. Applicant should have a minimum of 5 years experience in mechanical design particularly with reference to chemical plant equipment and process. Apply to File No. 1507-V.

ASSISTANT PRODUCTION SUPERINTENDENT—Press Operations required in Ontario. Applicant should be familiar with die equipment and be able to assume responsibility of a production shift consisting of two foremen and approximately eighty men. He must have a thorough knowledge of standards, production control, cost control, labour relations, etc. Apply to File No. 1559-V.

ASSISTANT PRODUCTION SUPERINTENDENT finishing operations, required by firm in Ontario. Applicant must be familiar on various types of steel; polishing, electro plating (copper, nickel and chromium) and buffing and be in a position to assume responsibility of a production shift consisting of foremen and approximately one hundred men. He therefore must have a thorough knowledge of standards, production control, cost control, labour relations, etc. Apply to File No. 1559-V.

TECHNICAL DIRECTOR wanted for paper company producing from 100% rag to 100% sulfite papers. Applicant should be a graduate chemist or chemical engineer and must be bilingual. Surroundings are ideal and living conditions very good. Mills located near Montreal in the Laurentian mountains. Apply to File No. 1586-V.

DEVELOPMENT ENGINEER by nuclear engineering branch to do experimental and development work in the field of mechanical engineering related to the design of atomic energy reactors and associated equipment. Applicants should have an engineering degree with high academic standing and five or more years engineering development experience. Apply to File No. 1602-V.

SENIOR PETROLEUM ENGINEER required by independent Canadian Oil Company with headquarters in Calgary. Applicant should be particularly experienced in reservoir engineering and production practices. No one with less than 7 years experience in the industry need apply. Give synopsis of education, training and experience and supply recent photo. Apply to File No. 1675-V.

GRADUATE ENGINEERS AND DRAUGHTSMEN, mechanical, civil, electrical required for projects in Ontario and Quebec. Preference to those with 3 years practical experience. Apply to File No. 1697-V.

TOP FLIGHT MAN for methods and time study work on all operations incidental to manufacturing of light and heavy sheet metal products. Excellent opportunity for man of proven ability and experience to establish himself with a sound company employing 200 people. Salary open. Applicants to apply in writing giving complete facts on education, experience and personal history. Enclose recent photograph. Apply to File No. 2029-V.

HYDRAULICS ENGINEER for the water rights branch, department of lands, B.C. Provincial Government. Salaries: hydraulic engineer, Victoria, and assistant district engineer, Kamloops, $3,695.00 to $4,295.00; assistant hydraulic engineer, Victoria, $3,336.00 to $3,576.00. Positions permanent; superannuation plan. Candidates must be British subjects, preferably under 45 years of age; graduates in civil engineering or equivalent; eligible for full registration in Association of Professional Engineers of B.C. (in case of the last position, eligible for registration as engineer in training), knowledge of survey methods, photogrammetry hydraulics and hydrology of river discharge, dam design, soil mechanics and samplings; field and office experience on engineering work in hydro electricity, or irrigation and water supply or hydrology. Apply to File No. 2032-V.

GRADUATE ENGINEER required in the development and engineering department of firm located in Montreal. Applicants must have a minimum of 4 years experience in a steel manufacturing plant. Position involves technical assistance to the steel industry in use of our products and work on problems related to this field. The territory will be mainly in Quebec and Ontario with headquarters in Montreal. This is an excellent opportunity along technico administrative lines for the suitable person. Apply to File No. 2042-V.

SALES ENGINEER, preferably mechanical, required by organization in Montreal. Applicants should be around 33 to 37 years. Duties would include designing and selling under supervision of specialty machinery used in pulp and paper mills for handling pulp wood and newsprint. Starting salary $4,000.00. Apply to File No. 2043-V.

ECHANICAL AND STRUCTURAL ENGINEERS to act as project engineers to undertake the study and necessary design and drawing work in connection with a combination bar and strip mill located in Ontario. Salaries open. Apply to File No. 2048-V.

ROJECT ENGINEER graduate with at least ten years experience in design, construction and operation of petroleum chemical plants on petroleum refineries, required to supervise project division of company engaged in engineering and construction of gas processing plants located in Montreal, Canada. Salary commensurate with ability and experience. Apply to File No. 2051-V.

NGINEER, age 35 to 45 years as maintenance superintendent and chief engineer for large Montreal property, approximately 750 rooms. Must be certified for large boiler plant, and be experienced in controlling cost of maintenance trades, including plumbers, carpenters, painters etc. Bilingual preferred. Attractive opportunity to become established in permanent congenial situation. Apply to File No. 2057-V.

ESIGN AND DETAIL ENGINEERS required by a package handling conveyer concern located in Ontario. Promotion to responsible positions is offered to applicants having the necessary ability and qualifications. Apply to File No. 2058-V.

RAUGHTSMAN, Senior layout man, required for the engineering department of new plant in Western Ontario. Must be capable of making complicated layouts from specifications, drawings, sketches or notes furnished by engineers and have considerable knowledge of manufacturing processes and their limitations. Should be capable of doing some designing. Experience in structural work and piping. University degree would be helpful not necessarily required. Apply to File No. 2062-V.

CIVIL, ELECTRICAL AND MECHANICAN ENGINEERS, required by Vancouver, B.C., firm for office design on large hydro-electric development. Desire only working engineers with three or more years hydro or related experience. Applications should include complete record of experience, salaries received, salary expected and time required to make a transfer to Vancouver. Salaries commensurate with qualifications. Apply to File No. 2065-V.

WE REQUIRE QUALIFIED ENGINEERS experienced in construction work on reinforced concrete, structural steel and frame buildings, as well as incidental services. Administrative ability and technical knowledge are essential. Employee benefits include three weeks annual vacation, sick leave allowance and a liberal plan for life insurance, hospitalization, and surgical benefits for the employee and his family. Replies are to contain details concerning education, experience, salary requirements, age, marital status and date available. Apply to File No. 2066-V.

GRADUATE ENGINEER with three to four years welding experience in metal fabricating plant is required by a firm manufacturing gases and welding equipment. Position involves technical assistances to firms in the correct application of various welding processes. Salary commensurate with experience and qualifications. Apply to File No. 2071-V.

POWERHOUSE FOREMAN required for central waterpower, irrigation and navigation commission, New Delhi, India. Candidate should have considerable experience in the erection and maintenance of large hydro electric power plants. Age, about 45 years. Duties will involve erection and maintenance of diesel power houses for the supply of power on river valley projects, together with the erection and maintenance of large power houses, in connection with hydro electric projects. He will also be required to train Indian personnel working with him. Apply to File No. 2077-V.

WORKSHOP FOREMAN required for central waterpower, irrigation and navigation commission, New Delhi, India. Candidate should have considerable experience in the management of large workshops, in the manufacture of gates for dams, spillways, canals, sluices, and in the manufacture of electrical transmission towers. Age, about 45 years. Duties will involve supervision of large workshops required during construction of river valley projects and the instruction of Indian personnel working under him. Apply to File No. 2077-V.

MASTER ELECTRICIAN required for central waterpower, irrigation and navigation commission, New Delhi, India. Candidate should have considerable experience as an electrician and have held responsible positions in the field of electrical engineering. Age about 45 years. Duties will involve supervision of the operation and maintenance of electrical machinery employed on river valley projects, such as construction of large concrete, earth and other types of dams, large power houses and transmission systems. He will also be required to train Indian personnel working under him. Apply to File No. 2077-V

DESIGNING ENGINEER required for central waterpower, irrigation and navigation commission, New Delhi, India. Candidates should have considerable experience in the design of high tension transmission lines and tower structures. Age 45 to 50 years. Duties will involve design of high tension transmission lines and tower structures, in connection with large hydro-electric projects. He will also be required to act in an advisory capacity on the design of transmission lines, and to train Indian engineers working with him. Apply to File No. 2077-V.

INDUSTRIAL ENGINEER required by firm of management consultants. Should be experienced in plant layout, production control, time studies, wage incentives, cost and budget controls. Age 35 to 60. Free to travel. Apply to File No. 2079-V.

ENGINEERS required in the manufacturing department of large electrical organization located in Ontario. Duties include the line up of operations and tooling, to initiate cost reduction programs, to lay-out departments, etc., on various products. Limited number of openings in production control, foundry work and in test work. Apply to File No. 2080-V.

PLANT ENGINEERS are required to do engineering work in connection with plant expansion and with plant maintenance, particularly along electrical lines. Location Ontario. Apply to File No. 2080-V.

DESIGN ENGINEERS required by large electrical organization in Ontario. Engineers are required to do both mechanical and electrical design but principally the latter on all types of electrical equipment. Specific experience is desired but not absolutely necessary. Apply to File No. 2080-V.

CIVIL OR MECHANICAL ENGINEER required by paper industry located in Ontario. Applicant should have design and practical experience, preferably five or six years in pulp and paper mill. Apply to File No. 2083-V.

MECHANICAL AND CHEMICAL ENGINEERS required in the control department of paper mill located in Newfoundland. Applicants must be interested in control and process work. Salaries open. Apply to File No. 2085-V.

RESIDENT ENGINEERS AND INSTRUMENTMEN required for work on the construction of the Quebec North Shore and Labrador Railway. Applicants should have some experience on highway work. Good working conditions Salaries open. Apply to File No. 2086-V.

MECHANICAL EQUIPMENT SUPERINTENDENT required by woods department of pulp and paper company. Should have degree in mechanical engineering or equivalent. Capable of initiating and supervising preventive maintenance program and repair work to all mechanical and power equipment. This is a senior position for an active man with a proven record of success in this type of work. Candidate for opening must be bilingual. The salary will be commensurate to experience and qualifications. Apply to File No. 2089-V.

POSITIONS AVAILABLE with The Consolidated Mining and Smelting Company of Canada Limited, at Trail, B.C., for experienced mechanical, structural and electrical designers and draughtsmen, for work connected with the design and layout of equipment and buildings in our mining, metallurgical and chemical and fertilizer plants. Application should be made in writing giving full particulars on education, experience and stating approximate salary expected, to the manager, Personnel Division at the above address. Apply to File No. 2090-V.

ECHANICAL DRAUGHTSMAN with at least three to five years experience in equipment, tool and jig work for Montreal office. Supply full details in first letter. Apply to File No. 2091-V.

TRUCTURAL STEEL AND REINFORCED CONCRETE DETAILERS for Montreal office with a minimum of five years experience in either field State full particulars in first letter. Salary open. Apply to File No. 2091-V.

'OOL ENGINEERS and patent lawyer required by large automotive industry in Ontario. Apply to File No. 2094-V.

ESEARCH SCIENTIST to conduct research and development in food packaging and packing. This will involve work independently and in co-operation with manufacturers and other agencies on suitable container materials and methods of container fabrication and will require a knowledge of such materials as paper and paper products, plastic films, metal foils, metal cans, enamels, adhesives, inks, etc. Applicants should have a Ph.D. or M.Sc. degree in chemical engineering, organic chemistry, or physical chemistry and should have had some industrial experience with the container materials mentioned above. Apply to File No. 2095-V.

Situations Wanted

LECTRICAL ENGINEER, aged 36, 1st class honors degree, P.Eng., M.E.I.C., A.A.I.E.E., A.M.I.E.E. Apprenticeship and erection experience with large electrical manufacturing company and 10 years experience as electrical engineer for large industrial companies—all companies are of world renown. Two years Canadian experience. Desires post as electrical engineer for industrial company or other suitable post preferably in Southern Ontario or British Columbia. Available at short notice. Apply to File No. 391-W.

Attention, Members

Please telephone in advance and make an appointment if you propose using the Institute's Employment Department.

This will result in a better service to everyone concerned.

TELEPHONE PLateau 5078

Except in special cases all interviews will be arranged between the hours of 9 and 12.

GRADUATE CIVIL ENGINEER AND LAND SURVEYOR with proven ability to carry out responsibilities. Available on short notice. Over 23 years of wide experience on four continents. Experience includes design layout and field supervision of: roads, dams, buildings, drainage, irrigation works. Veteran C.R.E. and E.A.E., married, bilingual. Situations held in Canada: Chief of survey parties, resident engineer. Abroad: as district and assistant chief engineer for over 19 years in the British, Turkish, Iraqui, Government Services. Apply to File No. 489-W.

ELECTRICAL ENGINEER, S.E.I.C. graduate Nova Scotia Technical College 1950, married, veteran, 34, presently employed by large cable manufacturing company in Montreal as a junior development engineer in their electrical laboratory, desires position in Nova Scotia preferably Halifax area. Previous experience in surveying, communications, d.c. machinery. Willing to accept position in any branch of electrical engineering including sales. Available for interview in Montreal anytime and in Nova Scotia in July, 1951. Apply to File No. 1325-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Ontario) B.Sc. (Hons.) Birmingham, England, 1948. Age 28. Single. Ex-Sapper, Field Engineers of Union Defence Force (South Africa). Presently employed in temporary position in Toronto. Seeks permanent employment where hard work and initiative will lead to advancement. Fifteen months experience in municipal roads and drainage work in South Africa, including surveying, design and supervision. Also eleven months with waterworks in Canada on design of steel and reinforced concrete structures and writing of specifications. Willing to work anywhere. Apply to File No. 1465-W.

MECHANICAL ENGINEER, M.E.I.C., U.B.C., 1936. Age 37, married. 3 years experience as designer in paper machinery department of large manufacturer. 5 years as senior officer in the A.I.D. of the R.C.A.F. engaged on technical and administrative duties. 6 years as engineer in the paper and saw milling industry on the west coast, engaged on the layout, design and installation of wood-handling plant and equipment, including considerable experience in the design and erection of timber, steel and concrete structures. Desires position as resident engineer or senior engineering position covering industrial planning and development. Apply to File No. 1965-W.

INDUSTRIAL AND CIVIL ENGINEER, B.A.Sc., 1939, M.E.I.C., Prof. Eng., age 42, married, thoroughly bilingual. Experience: all phases of production, sales, maintenance, construction. Available on short notice. Apply to File No. 2157-W.

WORKS MANAGER and administrator with experience in mechanical, electrical and civil engineering work open for appointment. Apply to File No. 2429-W.

ENGINEER, MECHANICAL, M.E.I.C., interested in position offering opportunity as representative, plant or assistant engineer. Experience includes twelve years design, construction and maintenance with pulp and paper industry. Age 40, married. Apply to File No. 2642-W.

MECHANICAL ENGINEER, M.E.I.C., Queens, 1936, age 38, married. Currently engaged in research work, 2½ years. Desire to return to industrial or commercial field in Toronto district. Have had the following experience since graduation: About 10 years diversified work in plant engineering embracing dust control, 2½ years; application of control to metallurgical processes (primary metal producers), 3 years; industrial ventilation and air-conditioning, 1 year; general plant maintenance, 3½ years; about 2 years steel forging experience in small plant covering purchase, installation, and operation of equipment. Would be available at reasonable notice to present employer. Apply to File No. 2966-W.

CIVIL ENGINEER (London University, 1934) A.M.I.C.E., M.E.I.C., P.Eng., veteran, age 37 married. Executive experience in construction and design in building, services, refinery equipment, combustion equipment at home and abroad. Desires a responsible position with good prospects in a growing concern. Go anywhere. Adaptable, good organizer. Available at reasonable notice. Apply to File No. 3139-W.

Engineering Salesman

A large manufacturer requires salesman for heavy machinery and hydraulic equipment. Good background, engineering experience, successful record of sales in this field required. Reply in full first letter. Salary. File No. 3045-V.

MECHANICAL ENGINEER, Toronto, Jr. E.I.C., P.Eng. Age 29, married. Wishes to join a medium sized company to cooperate with management in reducing manufacturing costs by better production methods. Five years experience as chief engineer in charge of production and product design. Accustomed to working closely with shop and inspection department. Capable of acting as group leader and of assuming full responsibility relative to tooling, processing, and plant layout for increased productivity. Interested in working into management position. Apply to File No. 3361-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., with extensive experience at draughting, designing and estimating of all types of plate, structural and machine work, now fully employed, desires part time work for evenings and week-ends. Apply to File No. 3367-W.

CIVIL ENGINEER, M.Sc., M.E.I.C., P.Eng., age 39. Practical experience since 1934 in design of reinforced concrete and steel structures (warehouses, factory buildings, power station, boiler houses, heavy foundations, hydraulic structures, oil refinery plants, gas plants, jetties) estimate and surveying. Seeks position in Ontario or Quebec. Apply to File No. 3369-W.

BRITISH DIESEL and electrical engineer, A.M.I.E.E.; six years electrical officer R.N.V.R.; nine years commercial experience in U.K., Malaya and Ceylon in sales, contracts and servicing equipment ranging from generators to household appliances; accustomed to executive responsibility and currently chief engineer for leading British firm in Ceylon; has had brief experience of conditions in Canada and desires progressive position and permanency there. Age 36. Available July. Wife Canadian. Apply to File No. 3398-V.

BRITISH CIVIL ENGINEER 27 years of age, single. Graduate of Trinity College, Dublin, with B.A. degree geology: and B.A.I. in civil engineering. Technical officer with Royal Engineers, 5 years practical engineering experience. Presently employed in Canada. Desires position with a future, possibly administrative where academic training, technical knowledge and personal qualities may be combined. Willing to work hard and accept responsibility. Apply to File No. 3400-W.

WELDING ENGINEER, M.E.I.C., P.Eng., B.A., B.Sc., Queen's 1941. Age 34, married. 7 years production and development experience in the fabrication of heavy industrial equipment with particular reference to welded pressure vessels. Desires continued experience in this or related fields. Available on short notice. Apply to File No. 3407-W.

EXPERIENCED ENGINEER, A.M.I.C.E., M.E.I.C., Age 31. 14 years combined civil mechanical background. Design and construction in roadworks water supply, sewage systems and large factory construction in U.K. Hydro-electric construction and investigation in U.K. and Canada. Geophysical investigation and deep well drilling and operation for water supply in N. Africa. Aircraft component design and machine shop practice in U.K. Require progressive position where experience may be utilized combined with aptitude for administration organization and production. Apply to File No. 3435-W.

GRADUATE MECHANICAL ENGINEER, Jr.E.I.C. Sask. 1950. At present taking Masters degree at University of Toronto. R.C.A.F. veteran, 5 years practical engineering experience. Willing to work hard and accept responsibility. References and detailed experience on request. Available May 1951. Apply to File No. 3439-W.

ELECTRICAL ENGINEER, Higher National Diploma 1949 (Power Course), Dundee Technical College, Scotland. P.Eng. Ont. One year experience as field engineer on design and reconstruction transmission and distribution lines in Scotland. Six years as technical officer in R.E.M.E. Four years as apprentice technical with power company in Poland. Experience in diesel-electric and hydro-electric plants in planning office and line surveying. Wishes to find employment in power field or design, would like to learn from the start the Canadian way of work. Apply to File No. 3443-W.

CHEMICAL ENGINEER, Jr.E.I.C. (B.Sc. Queen's 1948). Age 29, married, one child. Two years experience production supervision and development engineering in chlorine-alkali industry. Some experience in coal tar refining. At present employed. Desires position in Ontario or Quebec. Apply to File No. 3452-W.

SALES AND TECHNICAL SERVICE engineering employment desired by young engineer (24 years, single) expecting to graduate in Metallurgical Engineering (McGill) in May 1951, S.E.I.C. Many summer months experience in the making, shaping and inspection of steel. Location is practically immaterial and applicant is willing to travel. Willing to start on training program if necessary. Available June 1st. 1951. Apply to File No. 3453-W.

METALLURGICAL ENGINEER, Jr.E.I.C., Toronto 1948. Business Administration, University of Western Ontario, 1951. Desires position in production engineering or as technical salesman for a manufacturer of durable producers' and consumers' goods. Age 28, married. Naval Veteran. Over two years' experience with a large Canadian manufacturing firm chiefly as a production supervisor. Conversant with French. Available in May. Apply to File No. 3457-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Ont.) B.Sc. University of Alberta 1945, age 27, married, 1 year in highway location, design, estimates and construction; 5 years field and office experience in surveys, design, layout and construction supervision in transmission lines, tower footings, reinf. conc. and pile foundations, also some knowledge of municipal engineering. Presently employed in Ontario. Desire position in Alberta with consulting engineers, construction company, or other company with own engineering staff. Available after September 1951. Apply to File No. 3458-W.

BRITISH SUBJECT, chartered electrical engineer, apprenticeship trained, presently holding technical and commercial managerial appointment in branch works of one of the premier manufacturing electrical companies in England, wishes to contact Canadian principals with view to ultimate emigration to Canada or with Canadian subsidiaries overseas. Three years wartime experience in Canada. Canadian references. Six years commissioned Naval Service. Age 37. Married. Apply to File No. 3463-W.

ELECTRICAL ENGINEER, Sask., 1950, S.E.I.C., P.Eng., age 30, married, veteran. Desires permanent employment anywhere in Canada. Experience includes 4 years radar mechanic, one summer sales, several months practical experience on wiring and installation of transformer banks switch gear, motors, etc Apply to File No. 3464-W.

AERONAUTICAL ENGINEER, Jr.E.I.C., graduate Mass. Institute of Tech., age 28, married, good health. Seven years experience with major airline on aircraft specifications and negotiations, mock-up, stress analysis, performance calculation, aircraft evaluation, detailed design, testing, report writing, correspondence, administration. Hard worker, willing to take responsibilities. Apply to File No. 3470-W.

GRADUATE ENGINEER, Jr.E.I.C., University of Saskatchewan, 1948, Age 25, single and in good health. Three years experience in farm implement design. Seeks employment in design or production engineering. Willing to undertake any required training. Presently employed but desires position leading to responsibility. Available on short notice. Apply to File No. 3472-W.

PLANT ENGINEER of medium sized company, Mechanical, McGill, 1948, Jr. E.I.C. Veteran, single, 27 years, desires affiliation with medium or large concern. Undertook and completed movement of two plants. Designed, costed and implemented major changes and installations of boiler house, air compressor house, air exhausting systems, electrical mains, instruments, heating and steam process mains. Staff of approx. 100, 20% licensed tradesmen. Collection of basic production machine data for time loading, scheduling, etc. Other studies and training courses. Excellent references. One month's notice. Apply to File No. 3476-W.

CIVIL ENGINEER, S.E.I.C., B.Sc., U.N.B., 1950, navy veteran, age 26, married with one child. Have considerable experience in highway construction in N.B. References on request. Apply to File No. 3477-W.

CIVIL ENGINEER, Jr.E.I.C., B.Eng., McGill, 1949, age 26, married, presently employed by construction firm in Montreal, would offer services for part-time employment in designing, estimating, etc., related to varied fields of building construction, especially reinforced concrete, steel or timber structures and foundations. Apply to File No. 3480-W.

ELECTRICAL ENGINEER, Jr.E.I.C., 1949, graduate of the University of Manitoba, about to complete two year apprenticeship in England, seeks employment in Canada, as from August, 1951. Experience includes testing of instrument transformers, testing of A.C. and D.C. motors and generators, 6 months in D.C. machine design engineers office, 3 months in electronic development laboratory, 6 months erection of steel mill rolling equipment. Undergraduate experience includes summer employment as student engineer in steel plant. Apply to File No. 3481-W.

GRADUATE ENGINEER, Jr.E.I.C., honors graduate, McGill, 1949, married, overseas R.C.A.F. veteran. Varied experience in the field of production control and planning, methods analysis, time-study quality control and allied engineering subjects. Desirous of obtaining a position in the management sphere. Location, Toronto area. Available immediately. Apply to File No. 3482-W.

CIVIL ENGINEER, B.Eng., McGill, 1944, M.E.I.C., P.Eng., married with two children, veteran R.C.E. Have had about ten years experience in construction, maintenance and industry including long-range planning, design and economic studies; also supervision and inspection as resident engineer. Familiar with general office routine and accounting procedures. Proven ability to handle labour, direct staff work and meet the public. Now enrolled in course on Modern Business with Alexander Hamilton Institute. Present employment highly responsible but wish to locate in Montreal area. Ambitious toward executive position requiring engineering and business training. Apply to File No. 3486-W.

CHEMICAL ENGINEER, B.A.Sc. Excellent background. 8 years experience. Presently employed on large scale production supervision. Seeks position of responsibility with promising future. Preferably in Ontario. Married, 3 children. Apply to File No. 3487-W.

ELECTRICAL AND MECHANICAL ENGINEER, S.E.I.C. Age 24. Experience 12 months powerhouse electrician, (Des Joachims). Graduating end of May. Undertaking valuation of European power plants this summer. Available October 1st. Interested in power plant equipment and operation—diesel steam or hydraulic. Apply to File No. 3488-W.

GRADUATE ENGINEER with qualifications and experience to handle position as works manager or plant superintendent, extensive experience in connection with mechanical equipment of mining and metallurgical industries as well as in metal-working establishments. Presently employed in responsible position. Interested in either domestic or foreign assignment. Apply to File No. 3493-W.

MECHANICAL ENGINEER, Jr.E.I.C., Sask., 1949. Age 27, married, ex-R.C.A.F. One year in office of management engineering company dealing with electric public utilities and one year in diesel plant (10,000 H.P.) of a Canadian public utility operating in South America—acting as Junior Engineer, Chief Operator and in charge of cooling water testing and treatment. Desire work in Canada along similar lines or in diesel field. However am willing to consider other work that has good opportunities for person willing to take responsibility. Location Ontario or west. Apply to File No. 3494-W.

MECHANICAL ENGINEER, Jr.E.I.C. Graduate University of Saskatchewan, 1950. Single, age 23. Have been employed in non technical work in the west. Desire position in maintenance or plant engineering work with an opportunity to gain experience and advancement. Type of position more important than remuneration. Apply to File No. 3495-W.

ELECTRICAL ENGINEER, M.Sc., Jr. E.I.C., completing a two year graduate training course with a large electrical manufacturer, seeks to better his position. Would consider professional employment with any progressive manufacturer or consulting engineer, however, prefer British Columbia or Alberta. Apply to File No. 3499-W.

ELECTRICAL ENGINEER: Sask, 1950. Three summers experience as electricians helper with industrial concerns. Also experienced in the installation of large power equipment. Desires position with consultant firm or in city engineering department. Available upon short notice. Married veteran with one child. Apply to File No. 3500-W.

CIVIL ENGINEER, S.E.I.C., University of Toronto 1951. Age 32. Married. Former radar mechanic in R.C.A.F. Summer experience includes construction labour, transmission line specification writing and testing soils. Desires work related to structural engineering. Prefer Montreal or Toronto areas but would go elsewhere for a suitable position. Apply to File No. 3506-W.

MINING AND STRUCTURAL ENGINEER, M.E.I.C. and P.Eng. Married. With long experience in open pit and underground mining, in design and inspection of construction dwellings, mine and mill buildings, railway trestles and conveyor belt trestles. At present employed. Available September 1st, 1951. Apply to File No. 3507-W.

SENIOR MECHANICAL ENGINEER, M.E.I.C. Four years' experience as chief engineer with small company. Nine years on board as designer. Sixteen years' total experience with medium to heavy machinery including hydraulic presses, forging machines, valves, pumps, controls, boilers, tanks, etc. Also in charge plant services and maintenance. Organization and administration. Experienced writer and lecturer. Apply to File No. 3508-W.

ABSTRACT

INSTITUTION OF ELECTRICAL ENGINEERS

'he Control of Hydro-Electric Plant:

A.C.H. Frost and W. Brittlebank. (IEE proof No. S 1049)

The rapid growth of both industrial and lomestic load in most countries since 1939 ıas forced the development of many water-›ower schemes, some of which had ›reviously been dormant owing to mar-;inal economies. Earlier schemes were ›ften isolated and (with certain notable :xceptions) of relative insignificance in :omparison with steam-driven generating ›lants. With the present need for develop-ng every practical source of power, ıowever, the problems of controlling ıydro-electric plant take on new aspects, nvolving consideration of uniformity and :conomy of operation and maintenance ;taffs, and the most efficient use of the :atchments on each river system as a vhole.

After the terms used have been defined, he nature of the control problems involved ıre examined. Certain control schemes are lescribed, with emphasis laid on the levelopment of sequential-parallel auto-natic control and the reasons why it is ›referred. Some practical aspects of the ıpparatus involved are described, after vhich the operating and maintenance equirements are examined. The electrical ınd hydraulic functions of group control ıre discussed in relation to a complete river ;ystem. Finally, those factors influencing he choice of a control scheme are sum-narized.

SELECTED ADDITIONS TO THE LIBRARY

TECHNICAL BOOKS, ETC.

\eronautical Engineering Catalog; 'th ed., 1951:

New York, Institute of the aeronautical sciences, c1951. 298 pp., illus.

\grarian Socialism; The Cooperative Commonwealth Federation in Sas-katchewan; A Study in Political Sociology:

S. M. Lipset. Toronto, Oxford University press, c1950. 315 pp., $5.00.

Behaviour of Engineering Metals:

H. W. Gillett. New York, Wiley, c1951. 395 pp., illus., $6.50.

Diesel-electric Locomotive Handbook; Electrical Equipment:

George F. McGowan. New York, Simmons-Boardman, 1951. 290 pp., illus., $4.95.

Diesel-electric Locomotive Handbook; Mechanical Equipment:

George F. McGowan. New York, Simmons-Boardman, 1951. 262 pp., illus., $4.95.

Dynamic Motion and Time Study:

James J. Gillespie. Brooklyn, Chemical pub. co., 1950. 140 pp., $3.75.

Electric Circuits for Engineers:

Edward K. Kraybill. New York, Macmillan, c1951. 212 pp., illus., $3.85.

Fer et Aciers frittés:

R. Kieffer and W. Hotop. Paris, Dunod, 1951. 573 pp., illus., 3200 fr.

Fuel Oil and its Combustion:

Cleveland, North American Manufacturing Co., c1943. 37 pp.

Hydraulics of Sediment-bearing Canals and rivers:

T. Blench. Vancouver, Evans Industries Ltd., c1951. illus., $4.75.

Jacobian Elliptic Function Tables; A Guide to Practical Computation with Elliptic Functions and Integrals Together with Tables of sn u, cn u, dn u, Z(u):

L. M. Milne-Thomson, New York, Dover 1950. 132 pp., $2.45.

K & E Catalog. Part 1, Drafting and Reproduction Equipment and Materials; Slide Rules. Part 2, Surveying Equipment and Materials; Measuring Tapes:

Montreal, Keuffel & Esser Co., c1949. 254 pp., 413 pp., illus.

Mécanique Théorique des Sols:

K. Terzaghi. Paris, Dunod, 1951. 474 pp., illus., 2950 fr.

M. M. Year Book 1951:

London, Machinery market, 1951. 602 pp., 15/-.

Molesworth's Handbook of Engineering Formulae and Data, 34th ed.:

A. P. Thurston ed. London, Spon, 1951. 1672 pp., illus., 25/-.

Montreal; By-law Concerning the Erection of Buildings in the City of Montreal, No. 1900:

Montreal, 1948, 489 pp.

Plant Layout Planning and Practice:

Randolph W. Mallick and Armand T. Gaudreau. New York, Wiley, c1951. 391 pp., illus., $7.50.

Society for Advancement of Management; Proceedings of the Annual Conference on Principles, Methods and Techniques for Increasing Productivity, Reducing Costs and Improving Human Relations:

New York, the society, c1951. 212 pp., $5.00.

Sound Reproduction; 2nd ed.:

G. A. Briggs. Montreal, C. W. Pointon, 1950. 246 pp., illus., 10/6.

Sourcebook on Atomic Energy:

Samuel Glasstone. Toronto, Van Nostrand, c1950. 546 pp., illus., $3.50.

LIBRARY REGULATIONS

Hours

Mon., through Fri. . . . 9 a.m. - 5 p.m.

Saturdays . . . . . . 9 a.m. to 12 noon

Summer Hours

9 a.m. - 5 p.m. Closed all day Saturdays.

Bibliographies and Literary Searches

Short subject bibliographies are compiled on request.

Extensive searches will be made at a charge of $3.00 per hour to members, and $5.00 per hour to non-members.

Please give as much detail as possible when requesting information of either type.

Borrowing and Purchasing

Books, periodicals, photostats, translation, etc. may be borrowed for two weeks at a time. **A fine of 25c. per day will be charged for each day borrowed items are retained beyond this period.**

A library deposit of $5.00 at par in Montreal is required before items may be borrowed. Books, periodicals, etc. may be ordered by members through the library. All carrying charges are payable by the individual concerned. Except in the case of library deposits, please make **no payments in advance.**

Non-members may consult the library, but may not borrow material.

Structure and Mechanical Properties of Metals:

Bruce Chalmers. London, Chapman, 1951. 132 pp., illus., 18 s. (Being volume 2 of a series of monographs on metallic materials published under the authority of the Royal aeronautical society).

Theory and Application of Electrical Engineering:

Eugene W. Schilling. Scranton, International textbook, c1951. 402 pp., illus., $6.50.

World Airline Record 1950-1951:

Chicago, Roy R. Roadcap & Associates, c1950. 263 pp., illus., $9.75.

TECHNICAL BULLETINS, PAMPHLETS, ETC.

American Water Works Association. Tentative Standard Specifications:

No. 5W1.10-T — Ammonium sulphate.
No. 5W1.31-T—Ferrous sulphate.

Community planning Association of Canada. Community Planning Review:

V. 1, N. 1, February, 1951.

County Sanitation Districts of Los Angeles County. Reports:

Collection and disposal of refuse, October 1950.

Edison Electric Institute. Specifications:

No. TD-3—Lag screws.

...Publications:

No. MSJ-3—AEIC-EEI-NEMA standards for metering current transformers for primary circuits.

National Institute of Agricultural Engineering. Reports:

Testing of grass driers.

National Research Council of Canada. Radio and Electrical Engineering Division. Publications:

New electronic aids to marine navigation.

Philips' Gloeilampenfabrieken Laboratoria. Separaat:

No. 1950—Induction phenomena in photosynthesis, R. van der Veen. No. 1951—Investigations on quinones and quinone-derivatives, H. O. Huisman. No. 1953—Le fer dans le verre, J. M. Stevels. No. 1956—Density variations in aluminium, J. L. Snoek. No. 1958—The relation between the dielectric losses and the composition of glass, J. M. Stevels, No. 1959—The fluorescence of magnesium germanate activated by manganese, F. A. Kroger and J. van den Boomgaard. No. 1962—On the deviations between theoretical and experimental values of the specific heat of superconductors, K. F. Niessen. No. 1963—Absorption spectrum and photodecomposition of o-hydroxybenzene-diazonium sulphate, J. de Jonge and others. No. 1964—Ferrite materials, D. Polder.

Royal Canadian Air Force. Experimental and Proving Establishment Reports:

No. 935—Harvard 2 standard and armament trainer; part 1—radio installations. (with 2 blueprints). No. 962—Improvements to survey camera optics. No. 967—Performance of Goose 2 aircraft; part 2—aerodynamic report.

Royal Commission on Transportion. Reports:

February 9, 1951.

Welding Research Council. Bulletin Series:

No. 8—Tests of columns under combined thrust and moment.

BRITISH STANDARDS:

British Standards Institution, 24/28 Victoria St., London, S.W.1. British Standards are available from the Canadian Standards Association, National Research Building, Ottawa, Canada.

B.S. 581: 1950—Electrically-driven Point-operating Machines for Railways, 2/-.

This standard covers electrically-driven machines for operating railway points, derailers, movable diamonds and facing-point or fouling bars. It lays down the sequence of operations, standard voltages, construction, etc.

B.S. 592: 1950—Carbon Steel Castings for General Engineering Purposes, 2/-.

The present work provides a comprehensive range of carbon steel castings for engineering purposes, including the construction of ships, marine engines and railway rolling stock.

B.S. 714: 1950—Cartridge Fuse-links for Use in Railway Signalling Circuits, 2/-.

This British Standard has been drawn up to apply to cartridge fuse-links only, and covers fuse-links suitable for use in railway signalling circuits in which the declared voltage does not exceed 250 volts between conductors or between conductor and earth.

B.S. 1644: 1950—Dimensions of Unscreened Camshaft Speed Magnetos, 2/6.

This publication deals only with the dimensions of unscreened, camshaft-speed magnetos (combined with distributor head) having shank and spigot mountings. The dimensions included are those necessary to ensure interchangeability.

B. S. 1649: 1950—Guards for Couplings and Associated Shafting, 2/-.

In this new standard, general requirements have been laid down for guards which should be applied to couplings between units such as a motor and a pump, and also guards that are required for a length of shafting and coupling.

B.S. 1658: 1950—Dimensions of Housings for Hydraulic Seals, 2/-.

This standard lays down the basic dimensions for the standardization of housings accommodating hydraulic seals for use with reciprocating shafts where the friction caused by the seal is not a major importance, and the working pressures do not exceed 5,000 lb. sq. in.

B.S. 1677: 1950 — Draughtsmen's Drawing Pins, 1/-.

Materials, dimensions, general requirements and finish are specified, and the two types of manufacture with domed and bevelled heads are illustrated.

B.S. 1686: 1950 — Equipment and Method for Long-period High-sensitivity tensile Creep Testing, 2/-.

B.S. 1687: 1950—Equipment and Method for Medium-sensitivity Tensile Creep Testing, 2/-.

B.S. 1688: 1950—Equipment and Method for the Determination of Time to Rupture Under Stress, with or Without Measurement of Creep Strain, 2/-.

These three standards originated in specifications that had been prepared specially to meet the needs of the aircraft industry.

B.S. 922: 1950—Electrical Refrigerators and Food Freezers for Household use in all Climates, 3/-.

B.S. 1691: 1951—Electrical Refrigerators and Food Freezers for Household Use in Temperate Climates Only, 3/-.

These two standards prescribe the general constructional requirements, the methods of determining the performance and computing the volume and shelf area of electrical refrigerators designed for household food storage and of electrical refrigerators designed as household food freezers and having a net volume up to and including 12 cubic feet.

BOOK NOTES

Prepared by the Library of
The Engineering Institute of Canada

AMENAGEMENTS HYDRO-ELECTRIQUES:

I. Leviant. Paris, Dunod, 1951. 148 pp., illus., 640 fr.

The purpose of this work is to make a synoptic survey of the most recent and the most representative information and schools of thought on hydro-electric installations. This synthetic study will be useful to thermic, hydraulic and electrical engineers, and also to all people concerned in one way or another with hydro-electric equipment. Most installations considered are French.

AUTOMATIC CONTROL OF INDUSTRIAL PLANT AND PROCESSES:

J. W. Ashley. London, Emmott, 1950. 65 pp., illus., 3/-. (Mechanical world monograph No. 60).

These notes were prepared to provide users of automatic controllers with a straight-forward, non-mathematical presentation of the fundamentals of automatic control. It will be gathered that any automatic control installation requires final tuning on the actual job; the monograph shows that controllers with the correct type of adjustable characteristics should be provided.

BLISS POWER PRESS HANDBOOK:

Toledo, E. W. Bliss Co., 1950. 717 pp., illus., $7.50.

The valuable information contained in this handbook is divided in six sections. The first section describes and illustrates the four major classifications of sheet metal working: blanking, forming, drawing, and squeezing; the second contains illustrations and descriptions of available Bliss presses, and mention of the work to which they are best suited; the third describes and illustrates the operation and design features of Bliss-Marquette die cushions; the fourth covers the operation and maintenance of various types of presses built by Bliss or its subsidiaries; the fifth is a reference table of comparative press numbers, shaft diameters, tonnage ratings, etc.; the sixth is a glossary of terms and expressions of popular usage in the pressed metal industry.

CAMS AND SPRINGS FOR POPPET VALVES:

W. H. Lee. London, Emmott, 1950. 42 pp., illus., 2/6. (Mechanical world monograph No. 61).

One of the components of internal combustion engines affected by higher rotational speeds is the valve gear. The aim of this monograph is to provide a collection of data whereby the nature and intensity of the forces generated by the cam and the characteristics of the spring to control them may be accurately computed. A complete mathematical treatment of the velocity and acceleration of commonly employed cams is given.

CANADIAN OFFICIAL RAILWAY GUIDE WITH AIRLINES, January 1951, No. 1021:

Montreal, International Railway Publishing Co. Single copies $4.00. Yearly subscription $10.00.

This monthly publication is devoted to the dissemination of information respecting the transportation lines of Canada. It contains the current timetables of Canadian railways, airlines, navigation routes and connecting lines in the United States. It includes the "Canadian Gazetteer and Shippers' Guide". This Gazetteer is an alphabetical list of places, showing the location of post offices, railway, airline and steamer line point, telephone or telegraph, customs houses, banks, populations, express offices, etc.

ELECTRICAL YEAR BOOK 1951; A COLLECTION OF ELECTRICAL ENGINEERING NOTES, RULES, TABLES AND DATA:

London, Emmott, 1951. 360 pp., illus., 3/-.

This 1951 issue of the Electrical year book contains tables of B.S. Whitworth bolts and nuts, B.A. screw threads, B.S. fine screw threads, and also many tables of general usefulness, like logarithms, decimal equivalents, price equivalents, etc. Useful information, in the form of short chapters is given on direct-current generators, turbo-alternators, electric motors, automatic protection, jointing conductors, etc. The time being opportune, the subject of space heating has been chosen for particular treatment.

EXPLANATORY HANDBOOK ON THE B.S. CODE OF PRACTICE FOR REINFORCED CONCRETE:

W. L. Scott and others. London, Concrete pub., 1950. 119 pp. illus., 9/-.

The present handbook is a completely revised work based upon the British standard code of practice for the structural use of normal reinforced concrete in buildings issued in 1948. It has been written in the light of recent knowledge and experience. The code which is reproduced in its entirety, is insetted and indicated by black lines in the left-hand margin, and the author's comments follow the clauses.

EXPOSES D'ECONOMIQUE. VOLUME 1, INTRODUCTION GENERALE; L'APPORT DES INGENIEURS FRANCAIS AUX SCIENCES ECONOMIQUES:

F. Divisia. Paris, Dunod, 1951. 158 pp., illus., 650 fr.

This first volume is devoted to the part played by French engineers in the development of economics. The book opens with a series of short biographical notices on the most important pioneers. This is followed by a chapter on what is being done currently on this subject, and another chapter on the most important works already published. A parallel between economics and technology is followed by the author's tentative synthesis and conclusion.

FUNDAMENTALS OF QUANTUM MECHANICS:

Enrico Persico. New York, Prentice-Hall, 1950. 484 pp., illus., $8.00.

In this book are presented the fundamental laws and principal working methods in quantum mechanics. The author has dwelled somewhat at length on the epistemological foundations of the new atomic mechanics. The book begins with a historical, overall view of the evolution of quantum mechanics, the approach being as primary and intuitive as possible. It goes on with a mathematical introduction establishing the principles of quantum mechanics, with a development of the old quantum theory of Bohr and Sommerfeld, and with a presentation of the principles of quantum mechanics in their most general form.

MEASURING DIAGRAM FOR DAYLIGHT ILLUMINATION:

P. S. Waldram. London, B. T. Batsford, 1950. 5/-.

The object of this brochure is to render available for architects the only precise method of predetermining the daylight which will enter an interior when the form of the obstructing building is complex. The Waldram diagram is, in England, the only authorized daylight predeterminator for those who wish to design their own buildings. The diagram measures 20 x 10 inches and is accompanied by full explanatory text.

PRESSURE VESSELS; A SIMPLE AND PRACTICAL APPROACH TO THEIR DESIGN AND CERTIFICATION:

William Buchan Ritchie. London, Emmott, 1950. 71 pp., illus. (Mechanical world monograph No. 58).

The primary object of this book is to draw attention to the legal, moral and financial responsibilities concerned with the design, manufacture and use of all pressure vessels having an explosion or implosion potential and by correlating the different aspects, to provide a realistic approach to the fundamentals entailed. This work will serve as a practical guide to all who are interested in the subject.

PROCESS ENGINEERING:

William H. Schutt. New York, McGraw-Hill, 1948. 309 pp., illus., $5.85.

The purpose of this book is to give training in process engineering to people who are already familiar with time and motion study. Process engineering as referred to in this book is that phase of industrial engineering which determines the means, the methods and the procedures of manufacturing an article economically. The application of established time values shown in the text for all manual movements together with the use of proved formulas for speeds and feeds will enable the process engineer to determine scientifically the correct labor cost of an article.

STANDARD METAL DIRECTORY, 1950; 12th ed.:

New York, Atlas Pub. Co., c1950. 818 pp., illus., $15.00.

This directory contains descriptive lists of iron and steel plants, foundries (ferrous and non-ferrous), metal rolling mills, smelters and refiners, steel rolling mills. These descriptive lists give, whenever possible, a company's address, names of members of executive, equipment, products, material consumed, location of plants, date of incorporation, capital, etc. This is followed by a very extensive list of industries grouped under their respective trades.

TECHNICAL DRAFTING ESSENTIALS FOR VOCATIONAL AND TECHNICAL STUDENTS:

Warren J. Luzadder and William S. Hornung. New York, Prentice-Hall, 1950. 326 pp., illus., $3.00.

This book has been prepared to fulfill the need for a text in the technical field that will present the basic fundamentals of engineering drafting in accordance with sound pedagogy. One objective has been to create a nearly self-teaching text that presents all the essential information covering the theory and the conventions of projection and dimentioning in accordance with present day up-to-date industrial practices. Other objectives such as simplicity and completeness of presentation determined the choice and construction of the illustrations.

The following book notes appear here through the courtesy of the Engineering Societies Library of New York. The books may be consulted at the Institute Library.

AIRPLANE AERODYNAMICS:

D. O. Dommasch. Pitman, New York, 1951. 520 pp., illus., $6.50.

Designed for students having a background in college physics, mathematics, calculus, mechanics and dynamics, this book is devoted to the "how" and "why" of modern aerodynamics. Emphasis is placed on high-speed flight and on modern developments. Considerable space is devoted to the fundamental principles of fluid mechanics and dynamics and to a detailed discussion of the stability and control of aircraft. Numerous illustrative examples and unworked problems are included with answers to many of the problems.

ASTM MANUAL ON MEASUREMENT AND SAMPLING OF PETROLEUM AND PETROLEUM PRODUCTS:

Philadelphia ASTM, 1951. 120 pp., illus., $2.00.

This new manual contains recommended methods for measuring the volume (or weight in some cases) of petroleum and its products and for obtaining representative samples. Included are methods of gaging, and temperature measurement; a recommended practice for volume calculations and corrections; and tests for water and sediment by centrifuge, and gravity by hydrometer. There is also a proposed method of sampling liquefied petroleum gases.

DIE DESIGN AND DIEMAKING PRACTICE:

Edited by F. D. Jones. 3rd. ed. Industrial Press, New York; 1951. 1014 pp., illus., $7.00.

This treatise for die designers and diemakers contains illustrated descriptions of a large variety of selected dies for all kinds of power press operations. Practical information and data on approved designing practice and die construction are provided. The third edition contains five new chapters, an expanded cross-index, and a detailed table of contents. The new chapters treat special aspects of sheet-metal working dies and the designing of dies for powdered-metal parts.

ELECTRIC ILLUMINATION:

J. O. Kraehenbuehl. 2nd. ed. Wiley, New York; 1951. 446 pp., illus., $10.00.

This book presents the principles underlying the specification and design of electric lighting for commercial and industrial buildings. Reflecting the advances made since the first edition, changes include new material on glare and glare calculations, a treatment of the calculation of illumination from line and surface sources, consideration of louverall lighting systems, revision of the material on wiring and on economies of light production, New illustrations and appendices are included.

ELEMENTS OF ORE DRESSING:

A. F. Taggart. Wiley, New York; 1951. 595 pp., illus., $10.00.

Serving as an introduction to the subject, this book is an analysis of the machines and processes used in ore dressing. Through the use of flow-sheet forms and the method of flow-sheet analysis, consideration of mills as process units is stressed. Reversing the usual approach to the subject, the author discusses separation prior to severance and the general accessory operations. The appendix contains detailed instructions for 18 laboratory experiments. Review questions follow each chapter, and references are given at the end of some.

INGENIOUS MECHANISMS FOR DESIGNERS AND INVENTORS, Volume III.

Edited by H. L. Horton. Industrial Press, New York, 1951. 536 pp., $6.00.

A companion to Volumes I and II of this series, this self-contained reference work is a part of a set which forms a comprehensive encyclopedia of mechanical movements. It contains illustrated descriptions of a large variety of standard and special mechanisms for use in designing automatic machines and other mechanical devices. Mechanisms of the same general type are grouped in chapters comparable with the arrangement in the previous volume.

PHYSICS IN CHEMICAL INDUSTRY:

R. C. L. Bosworth, Toronto, Macmillan, 1950. 928 pp., illus., $13.35.

This book considers the principles of those branches of physics which are of fundamental importance to many of the operations concerned in industrial chemistry. Part I is concerned with aspects of applied mathematics; Part II treats the properties of matter, with particular attention to those types of matter with properties intermediate between solids and liquids; Part III deals with motion, particularly molecular motion; and in the last part the principles of measuring and scientific instruments are discussed.

TRANSFORMER ENGINEERING:

L. F. Blume. 2nd ed. Wiley, New York; 1951. 500 pp., $7.50.

This book is written to help engineers solve the technical problems arising in the specification, selection, application, and operation of transformers. Emphasis is placed on presenting the essential physics concerned in each problem, rather than a complete or exact mathematical treatment. In this second edition, compiled twelve years after the first, the major changes occur in the chapters on insulation, thermal characteristics, and the load ratio control problem.

TRAVELING WAVES ON TRANSMISSION SYSTEMS:

L. V. Bowley. 2nd ed. New York; London, 1951. 545 pp., illus., $12.00.

This book is a collection of the modern theories of transient voltage phenomena on electric power transmission lines and in transformer windings. Special emphasis is placed on the use of these theories in the design of lightning-proof transmission lines. The present edition is enlarged by half to include new developments in the field and to include problems at the end of the chapters. A working knowledge of operational calculus is assumed.

TV MASTER ANTENNA SYSTEMS (Installation & Distribution).

I. Kamen and R. H. Dorf. New York, Rider, 1951. 356 pp., illus., $5.00.

Designed as a working manual, this book discusses the installation and distribution, maintenance, usage and merchandising of TV master antenna systems. Individual receiver antenna installations are first considered. The largest part of the text is devoted to detailed expositions of important master antenna systems now in manufacture, complete with schematic diagrams, performance figures, and design data. The latter chapters deal with video distribution systems and general sales methods.

WORLD GEOGRAPHY OF PETROLEUM:

Edited by W. E. Pratt and D. Good, Toronto, Saunders, 1950. 464 pp., illus., $11.25.

Based on information provided by a group of expert petroleum geologists and administrators, this book is a comprehensive discussion of the world oil situation. Part I is devoted to the discovery of oil-bearing areas. Part II describes the organization of the petroleum industry including development, production, storage, transportation, refining and distribution. The main section of the book, Part III considers all the great productive regions with the problems induced by their geology, topography, climate, vegetation, accessibility, population, culture, and industrial development. In Part IV the central theme is the geography of petroleum use. Fifty specially prepared maps, eleven diagrams, and ninety-eight photographs are included to supplement the text.

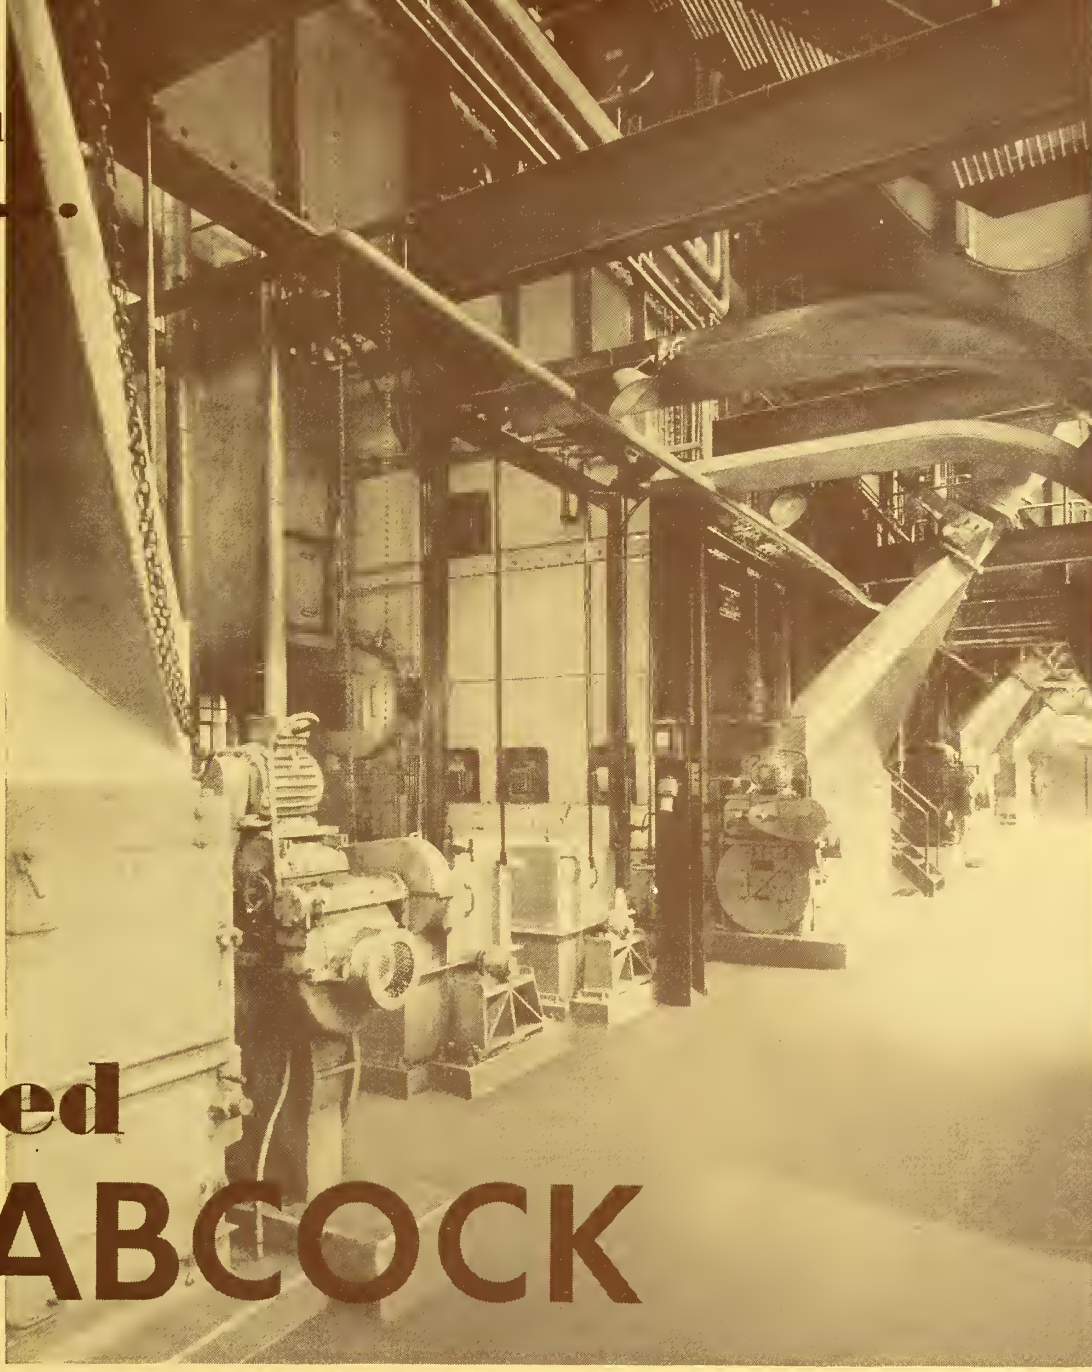
★The Procter & Gamble Company of Canada, Limited, Burlington Street East, Hamilton, have recently added two more Babcock boilers. This makes four in all, to serve the increased production, demanded by the growing popularity of their well-known products.



boilered by BABCOCK

Only the most careful attention to design and workmanship can guarantee the capacity and constant pressure requirements, essential to such large chemical processes as are employed here.

The two new boilers have capacities of 60,000 lbs. of steam per hour each and operate at 850 lbs. per square inch pressure. The two previously installed have a capacity of 40,000 lbs. of steam per hour each and operate at 160 lbs. pressure. All vigilantly meet the required load fluctuations and maintain a constant pressure. They are fired by Babcock chain grate stokers.

Investigate how such money saving efficiency can turn costs into profits. Small or large, Babcock boilers will meet your needs. Write us today.

A Digest of Information received by The Editor

Appointments and Transfers

J. L. Bourbonniere.—A new company Bogue Electric of Canada Limited, a subsidiary of Belco Water Treating Specialists has been formed. J. L. Bourbonniere has been appointed Canadian sales manager. Head office will be at 1405 Bishop Street, Montreal.

Crane Appointments.—Crane Limited announce the following retirement and appointments. Frank B. Thompson, manager of the Company's Winnipeg branch is retiring after more than forty-five years of service. F. (Pete) Hutchison, formerly manager at Regina, has been appointed to succeed Mr. Thompson. Previous to his new appointment Mr. Hutchison was manager at Regina where he will be succeeded by H. A. Welch formerly assistant manager in Winnipeg. Norman B. Wiles, formerly of Ottawa will serve as assistant manager in Winnipeg.

H. William Jewell.—H. William Jewell has been appointed chief of research and development for the National Sewer Pipe Co. Ltd., Toronto. He is a graduate civil engineer and has, for the past 15 years, been chief engineer of Pacific Clay Products Co., of Los Angeles, Calif.

Mr. Jewell has done a great deal of work in connection with the development of special joints, and in improved methods of manufacturing plain-end and unglazed vitrified pipe. He has also designed machinery for the manufacture of such pipe and joints. It is probable that the National Sewer Pipe Co. Ltd., will make use of many of his developments in the operation of their proposed new $1,400,000 plant to be built, this year, near Swansea, Ontario.

Bristol Aeroplane Co. Appointments.—Bristol Aeroplane Company Ltd., has started operations in Canada. The Canadian Company will market the Bristol Type 170 Freighter. The headquarters of the company which will be known as the Bristol Aeroplane Company of Canada Limited, are in the International Aviation Building, Mtl. R. J. Reynolds is a director and secretary-treasurer and W. S. Haggett is sales manager of the Canadian company.

Northern Electric Changes. — The Northern Electric Company have made the following appointments. K. P. Macpherson, formerly sales manager of the Wire and Cable Division, has been named to succeed L. P. Stiles as manager of central district. Mr. Macpherson's successor will be D. C. Borden, industrial supply manager of the general sales division.

J. S. Vanderploeg.—J. S. Vanderploeg has been named vice-president and managing director of Anaconda American Brass Limited, New Toronto. Announcement of the appointment was made by A. H. Quigley, president of the Company. Mr. Vanderploeg has been general manager of the Company for the past eight years.

George A. Mueller

George A. Mueller.—George A. Mueller has been appointed vice-president in charge of sales by the Canadian Locomotive Company. Mr. Mueller was educated at the University of Cincinnati and associated with Massachusetts Institute of Technology during World War II. He has had wide experience in the engineering and sales of Diesel products. He will make his headquarters at 980 St. Antoine Street, Montreal.

New Cement Distributor. — Canada Crushed Stone Ltd., Hamilton, Ont. has been appointed a stock-dealer of Ciment Fondu Lafarge (Canada) Ltd. Ciment Fondu is a high-alumina cement of British manufacture. It produces concrete of great strength in a much shorter time than is required to secure equivalent strength with ordinary cement.

New Jeffrey Office.—Jeffrey Manufacturing Co. Ltd., Canadian manufacturers of materials handling, mining, crushing and pulverizing, and electric vibrating machinery, has opened a district sales office in Halifax, N.S.

The Halifax office is located at 480 Barrington Street. It is under the direction of R. W. Ford, who was recently appointed district manager.

Mine Safety Appliances Changes.—W. G. Claus has been named purchasing agent for Mine Safety Appliances Company Ltd. He will be located at 500 MacPherson Avenue, Toronto. Mr. Claus was formerly manager of the Company's Montreal branch office. He will be succeeded in that post by Fred W. Curtis who has been on the sales staff of the Company in Western Ontario. The Montreal office and warehouse of the Company have been moved to 1271 Ducharme Street, Outremont.

Dodge Mfg., Address Change.—The Montreal Branch of the Dodge Manufacturing Division of United Steel Corporation is now located at 433 St. Martin Street, Montreal. The new premises contain the offices and complete warehousing facilities necessary for the expanded business of the branch. The office remains under the management of G. A. Ferrier.

Amalgamated Electric Changes.—H. J. Ashbee has been appointed district sales manager for the Vancouver district, by Amalgamated Electric Corporation Ltd. John W. Kennedy has been appointed application engineer in the engineering division of the Company. For the past three years he has been attached to the Montreal office as a sales engineer.

A new department of the sales division has been created. It will be known as the Duct System Sales and it will be under the supervision of James H. Wilson.

W. A. Dalrymple has been made manager of Lighting Equipment Sales and C. Jones is now manager of the Wiring Supply Sales in the Sales Division at Toronto.

D. W. Patterson has been named sales manager for the Montreal district of the Company.

●

R. M. Fowler.—On April 18, The Right Honourable C. D. Howe announced that R. M. Fowler, president of the Canadian Pulp and Paper Association, had been appointed director of a newly-formed pulp and paper division of the materials branch of the Department of Defence Production. F. L. Mitchell and J. M. Smith, also officers of the Canadian Pulp and Paper Association, will be associated with Mr. Fowler in the new division.

●

Webster Appointment.—Webster and Sons Ltd., Montreal 2, Que. announce that they have been appointed eastern Canadian representatives of the Crittall Mfg. Co. Ltd., of Braintree, Essex, England.

The Crittall Company makes steel sash. Their five factories in England and Scotland average an output of 800 tons of steel sash per week, apart from ancillary products. They also maintain factories in Australia, New Zealand, South Africa, Eire, and Germany.

A technical representative of the Crittall Manufacturing Co. has been appointed to a resident position in Montreal.

●

W. J. Morgan.—The organizing secretary of the British Machine Tool Section, Canadian International Trade Fair, Toronto, 1951 is William J. Morgan, M.B.E. Mr. Morgan's permanent position is that of general manager of the British Machine Tool Trades Association.

●

R. W. Asquith.—Robert W. Asquith, joint managing director and deputy chairman of William Asquith Limited, Halifax, England is chairman of the organizing committee for the British Machine Tool Section at the Fair. He succeeds Sir Holland Goddard, chairman of the Section's organizing committee last year.

●

Ontario Hydro Appointment.—E. D. Holdup, will be placed in charge of the J. Clark Keith power station at Windsor, Ont. when it goes into operation in the Fall. Mr. Holdup has spent 15 years in the British electricity supply industry, serving with the Central Electricity Board and later in the Deptford West and Battersea power stations of the London Power Company.

●

New C.I.L. President.—H. Greville Smith, C.B.E., is now president of Canadian Industries Ltd. and chairman of the executive committee. He succeeds George W. Huggett, who will continue to serve as chairman of the Board.

Mr. Smith was born in Sheffield, England in 1902. He graduated in chemistry from Oxford University. Formerly associated with Imperial Chemical Industries Limited of Great Britain, he joined C-I-L in 1932 in charge of the chemical development department. Two years later he became manager of the cellu-

lose products group and in 1939 he was made a vice-president of the Company. He was appointed a director in 1940 and elected vice-chairman of the executive committee in 1949.

•

A. M. Cameron.—A. M. Cameron has been appointed superintendent of Rolling Mills at Atlas Steels Ltd., Welland, Ontario. Previous to this appointment, Mr. Cameron was assistant superintendent of Rolling and Forging, South Plant. He joined Atlas in 1929 and was formerly with Jessop Steel, Washington, Pa., where he was a roll designer.

Mr. Cameron was born in Trenton, Nova Scotia and served his apprenticeship as roll turner with the Nova Scotia Steel and Coal Company (Trenton Industries Ltd.), Trenton, N.S. He was educated in Nova Scotia and at the Carnegie Institute of Technology, Pittsburgh, Pa.

•

New Peacock Directors.—Following the annual meeting of Peacock Brothers Limited on April 25th, F. T. Peacock, chairman, announced the election to the board of directors of The Honourable J. K. Weir, C.B.E., managing director of G. & J. Weir Ltd., Glasgow, Scotland, and J. D. Collier, Hopkinsons Limited, Huddersfield, England.

•

Publications

For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.

Please mention *The Engineering Journal* when writing.

Small Motors.—The English Electric Company of Canada Limited, St. Catharines, Ontario, have just released a new leaflet describing small induction motors. The leaflet, Number 11.5 is a completely new publication. Copies may be obtained from the Company.

•

Convection Heaters.—Trane Company of Canada Limited have introduced a complete line for all applications of the New Trane Code-rated Convector. Code-rated means that the ratings have been approved by the Convector Rating Committee of the U.S. Bureau of Standards. This standard is important to consulting engineers, heating contractors and architects, as it allows them to select with accuracy and confidence the proper size and type of unit to suit their requirements.

A particularly interesting addition to the line is the new Trane "picture window" Convector-radiator. It stands only 12 inches high, thus permitting unobtrusive installation beneath low picture windows. This style is available in either cabinet or recessed models.

In developing this new line of Code-rated Convector-radiators, which is the first to gain such approval in Canada, Trane have incorporated many new design, installation, and performance features. The radiators are described in bulletin A 4-31. Copies are available free, upon request to Trane Company of Canada Limited, 4 Mowat Avenue, Toronto, Ontario.

•

Plywood Publication. — "Sylvaply News" is the name of a publication of H. R. MacMillan Sales Ltd., 837 West Hastings, St., Vancouver. It is designed to be of interest to contractors and architects. To be placed on the mailing list apply to the Company at the above address.

•

Glass Data Sheets.—Pilkington Glass Ltd., 165 Bloor Street East, Toronto, Ont., are issuing a series of leaflets entitled "Facts by Pilkington about Glass". These leaflets are issued in loose-leaf form to facilitate binding. They carry some most interesting information. To be placed on the mailing list apply to the Company at the address given above.

•

Diesel Publication. — Russel-Hipwell Engines Ltd., Owen Sound, Ontario, eastern Canadian representatives of Cummins Engine Company are Canadian distributors of a two-colour, well-produced publication "The Dependable Diesel". It is a semi-technical publication and contains information of interest to those who are concerned with diesel engines. To be placed on the mailing list, apply to the Company at the address given above.

•

Roofing Booklet.—The Tremco Manufacturing Co. (Canada) Ltd., 57 Bloor Street West, Toronto, have recently released a 32 page publication "Solving Roof Problems". It describes various types of bases, the use of paper felts used in roofing, laying the built-up roof, various types of roofs, how to diagnose roof condition, how to plan roof repairs, the repair of copings and parapets, etc., etc. The publisher will be pleased to supply copies.

●

Bepco Journal.—No. 3 of volume 9 of the Bepco Journal contains an article "Modern Design Pumpsets" by J. B. McInroy, and a description by W. H. Crosby of a 2,000,000-volt impulse generator used for insulation testing. To be placed on the mailing list apply to Bepco Canada Ltd., 4018 St. Catherine St. W., Montreal 6, Que.

●

Timber-Concrete Bridges.—The B.C. Coast Woods Trade Extension Bureau, 837 West Hastings Street, Vancouver, B.C., has issued a four page folder "Modern Timber-Concrete Bridges". The Bureau will be pleased to forward copies.

●

"C.I.L. Oval".—The April issue of the C.I.L. Oval contains some interesting reading material. One article is entitled "Report from the Heavens". It describes the behaviour of cosmic rays and how they are recorded by a unique kind of balloon-borne photography. There is also another interesting article "War on Weeds". It describes the chemical control of weeds. For copies of the Oval apply to the Editor, C.I.L. Oval, Box 10, Montreal, Que.

●

"Dexion News".—Dexion News, published by Dexion Ltd., Triumph House, 189 Regent Street, London. W.1, is published at regular intervals to describe the use of the Dexion Angle, a product designed for rapid assembly for such things as benches, desks, scaffolding, etc. For copies of this and other Dexion publications apply directly to the Company.

●

Fiberglas Publications. — Fiberglas Canada Ltd., 1200 Bay Street, offers *Journal* readers copies of the following interesting publications. "Insulations for Heated Equipment"; "Fiberglas Aerocor —A versatile Thermal And Acoustical Insulation"; "Fiberglas Insulating Form Board"; "Fiberglas Pipe-Line Outer Wrap"; Fiberglas Roof Insulation"; "Dust-Stop Air Filtration Banks"; "Fiberglas Building Insulation in Residential construction"; "Fibreglas Perimeter Insulations"; "Fiberglas Duct Insulations"; "Fibreglas Ceiling Board for Suspended Ceilings".

The Company also offers a number of interesting technical bulletins describing the various uses and methods of application of "Fiberglas." For copies of any of the publications listed above, or for technical data on specific subjects, apply directly to the Company.

●

Car Shaker Bulletin.—Canadian Allis-Chalmers Limited, Lachine, Que., has issued a new bulletin describing the Allis-Chalmers Car Shaker for unloading granular material from hopper-bottom gondola cars. Construction features of the shaker are given together with specifications and a cross section through the vibrating mechanism.

For copies of the bulletin apply to Canadian Allis-Chalmers Limited, P.O. Box 37, Montreal. Ask for Bulletin No. 07B7221A.

●

Fork Lift Truck.—Coventry Climax Engines Limited, Widdrington Road Works, Coventry, England, have issued a six page bulletin describing their Fork Lift Truck. For copies apply to the company asking for descriptive literature. The Company will be represented at the Canadian International Trade Fair.

●

Non-Frosting Gauges. — Apply to Peacock Brothers Limited, P.O. Box 6070, Montreal, Que., for bulletins on Jerguson non-frosting large-chamber gauges, series REF-10 (reflex) or series TLF (transparent). These gauges are particularly adapted to the gauging of low temperature, light, gaseous fluids that tend to boil or surge because of the larger area at the meniscus—approximately 3 in. as against approximately 5 in. in the standard gauge. This results in less turbulence at the meniscus.

Use of the new Jerguson model in the chemical, petroleum, and other process industries, for low temperature ammonia, freon, propane, ethylene and other services, where low temperature fluids must be gauged, will speed up, as well as materially increase the accuracy of readings on all such applications.

●

Paper-Insulated Cables.—A 20-page illustrated booklet on "Paper-Insulated Cables" is now available from Canadian

General Electric Company for engineering departments of utilities, mines, and large industries.

The booklet covers both "Solid" and "Gas-Filled" cables, describing in each case their purpose, design, and installation. Diagrams and detailed data charts make the booklet a useful reference for engineers responsible for the design or installation of transmission and distributing systems.

Inquiries should refer to it by number — 4446 — Address inquiries to Canadian General Electric Co., Limited, 212 King St., West, Toronto 1.

•

Chains and Sprockets.—Jeffrey Manufacturing Co. Limited, P.O. Box 428, Montreal 32, Que., has available copies of a 215 page catalogue describing "Chains and Sprockets".

The catalogue describes the broad range of Jeffrey chains and sprockets and carries useful data on chains for elevating, conveying, and drive service.

It contains information on ultimate strengths, working values, and detailed dimension data, and a number of useful tables which simplify the selection of malleable and steel chains for most industrial applications.

Copies of this interesting publication are offered to *Journal* readers. Apply to the address given above and ask for Catalogue No. A-418.

•

Defence Production Organization. — The Department of Defence Production has prepared an organization chart of the department. For copies apply to the Department of Trade and Commerce, Ottawa, Ontario. Ask for a copy of "Department of Defence Production's Organization Chart".

•

Belting Manual.—Beardmore & Company Limited, 37 Front Street East, Toronto 1, are Canadian distributors of a two-colour 40-page publication "Uni-Pull Drive Manual". The publication describes the uni-pull drive and it contains tables designed to provide the designer, engineer, or maintenance man with a guide as to the correct selection of the proper size of belt, pulleys, and motor base for a given drive. All data in the publication are in agreement with the recommendations of the American Leather Belting Association and the National Electrical Manufacturers Association. Copies may be obtained from Beardmore & Company.

•

Expansion Joints. — Zallea Brothers, Wilmington, Delaware, announce publication of a new 4-page bulletin describing the complete line of Zallea Expansion Joints.

The bulletin gives sizes, dimensions, suggested applications, and other technical data on a variety of joints from small flexible connectors for use on Diesel exhaust lines to 30-foot diameter self-equalizing joints for use in such applications as wind tunnels, etc.

For copies apply to Zallea Brothers, Taylor and Locust Streets, Wilmington 99, Delaware, and ask for Bulletin No. 351.

•

Miniature Bearings.—Miniature Precision Bearings, Inc., Keene, New Hampshire, U.S.A., offers Catalogue No. 51-B. It describes the complete line of miniature bearings manufactured by the company.

•

Dust Precipitators.—A catalogue covering the latest design of Dust Precipitators made by Canadian Sirocco Company, Limited, Windsor, Ontario, is available.

The equipment is referred to as the Series 342 Precipitator and is designed to handle fly ash, cinders, and industrial dusts. It has been developed to meet the need and demand of industry for a simple, compact, economical, all purpose mechanical type dust precipitator.

The unit is built in a range of standard sizes with two basic arrangements and can be modified to fit special requirements. This line of mechanical collectors supplements Canadian Sirocco's complete line of air handling and conditioning equipment which already includes a wide variety of dust collectors and precipitators.

Ask for Bulletin No. 1728 and address inquiries to Canadian Sirocco Company, Limited. Dept. D-55, 310 Ellis Street, Windsor, Ontario.

•

Stainless Steel.—"Atlas Steel News" is the name of a publication issued at regular intervals by Atlas Steels Limited, Welland, Ont. It is a semi-technical publication which describes applications and methods of fabrication of stainless steel. To be placed on the mailing list apply to the Company.

•

- ★ Completely flexible and adaptable to rapidly changing traffic conditions.
- ★ Sectionally-built . . . all parts interchangeable without special fittings.
- ★ Keeps replacement parts inventory to a minimum.
- ★ Retains exceptional brilliance of former types.
- ★ Easy to maintain.
- ★ Light weight with strength and durability.
- ★ Low cost.
- ★ A product of Northern Electric's advanced Traffic Engineering.

Long-range, high-intensity lens provides clear and unmistakable attention-demand signals in all kinds of weather . . . Special super-brilliant parabolic reflector of silver-coated clear pat glass . . . Exceeds standards of Institute of Traffic Engineers.

Hose Connectors.—R. N. G. Oil Equipment Co., 5337 Papineau Ave., Montreal, are Canadian distributors of "Ever-Tite" quick coupling units. These units are intended for use on hoses ranging in size from ½ in. to 6 in. They are quickly connected, make absolutely tight joints, and are easily detached. They are specially designed for use with gasoline, fuel oil, gases, benzol, aromatics, steam, chemicals, paints, syrups, etc. For illustrated literature apply to the Company.

●

Silent Chain Drives.—Hamilton Gear & Machine Co. Ltd., 950 Dupont St., Toronto, have added an additional item to their series of technical data bulletins. The subject of the new publication is "Silent Chain Drives — Method of Design". For copies of this and other Hamilton Gear bulletins apply to the Company.

●

C.S.A. Bulletin.—W. R. McCaffrey, general manager of the Canadian Standards Association, has announced the release of the latest quarterly bulletin of the Association.

A brief review is given of all CSA committee meetings, including meetings on such subjects as wooden containers, control cable for electrical power plant equipment, marine valves and fittings, Canadian electrical code, part II on electrical approvals specifications, Canadian electrical code part VI on electrical approvals specifications for mining equipment, safety equipment for linemen, hydraulic lifts for service stations, drawing office practice, materials handling, reinforced concrete poles, structural timber. In addition, the bulletin announces new publications, personnel of the new committees, and covers many other items in which both producers and consumers will be interested.

To obtain copies apply to the Canadian Standards Association, National Research Building, Ottawa.

●

Oxy-Acetylene Booklet. — The Dominion Oxygen Company Limited, 159 Bay Street, Toronto 1, Ontario, have recently released a new publication "Oxy-Acetylene Flames and Metalworking — A Story of Industrial Progress".

The booklet gives a history of the flame, and also explains how industry is using it today. In addition to the more well-known uses of this flame, such as welding and cutting, the booklet describes many of the less known uses such as hard-facing, flame softening, flame hardening, powder-cutting, and steel conditioning. It is written in non technical style. Copies may be obtained by applying to the Dominion Oxygen Co. Ltd.

●

Cement Booklet.—Ciment Fondu Lafarge (Canada) Limited, 1405 Peel Street, Montreal 2, Que., have issued a small size leaflet on their product which it is claimed is "The most powerful concrete in the world".

The leaflet describes reconstruction of a railway bridge, a highway construction job, a new wharf construction. It also lists the Canadian distributors of Ciment Fondu.

●

New Equipment and Developments

Anaconda Expansion.—Following the annual meeting, on April 4, of Anaconda American Brass Limited, New Toronto, A. H. Quigley, president, announced that plans had been approved for expanding the firm's manufacturing facilities for products presently being fabricated.

The expansion will be accomplished by an extension to the tube mill in which both copper and copper-alloy tubes are currently produced; and by constructing a new copper department to absorb and provide extra capacity for copper strip, bus bar, commutator copper, etc., which now comprises a portion of the output of the existing rod and sheet mill. The transfer of such items from those two departments will automatically leave room therein for the expansion of brass and other copper-base alloys already being made.

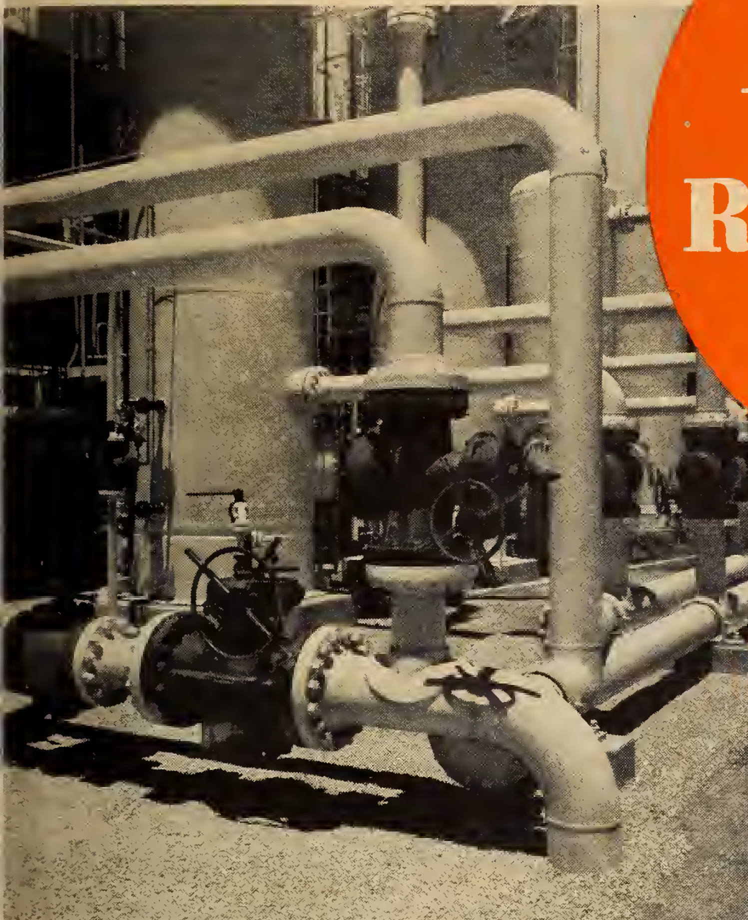
The plans for the new plant have been under contemplation for many months. They will involve an expenditure for buildings and equipment of approximately $4,000,000 and will enable Anaconda to render a more complete and rapid service to Canada's expanding industrial and commercial enterprises.

●

Drawing Device.—The Quickdraw Company, 127 Gunnerbury Avenue, London, England, are manufacturing a new precision instrument called "The Quickdraw".

Grinnell Welding Fittings for

MINIMUM RESISTANCE TO FLOW



Grinnell Welding Fittings on towers of natural gasoline plant.

TRUE CIRCULAR SECTION

True circular section at all points makes a Grinnell fitting easy to align and weld . . . no distortion or flattening to affect flow adversely.

FULL EFFECTIVE RADIUS

Pressure loss through Grinnell welding elbows is held to a minimum because of the full, effective sweep of the radius.

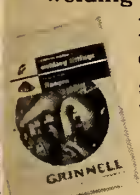
SMOOTH, CLEAN INSIDE SURFACE

Grinnell fittings have uniformly smooth inner walls . . . no waves or ridges to cause turbulence or accelerate erosion or corrosion. No pockets to trap solids or foreign matter.

EASY, SWEEPING TURNS

In Grinnell welding tees, the corners where the outlet joins the run are well-rounded and perfectly smooth to minimize resistance to flow and to prevent trapping.

Any qualified welder can make welds quickly and easily with Grinnell welding fittings. These fittings are made by a hydraulic forging process that assures uniform wall thickness at all points and true circularity throughout. Of seamless, one-piece construction, they can be cut at any angle to match up with standard weight, extra strong and heavier wall pipe in I. D. or O. D. sizes. Pressure-temperature ratings are equal to or greater than those of seamless steel pipe. Grinnell welding fittings are process stress-relieved.



Full data on the complete line of Grinnell carbon steel butt welding fittings and forged steel flanges is contained in the Grinnell Welding Fittings Catalog.

SEND FOR THIS CATALOG

GRINNELL

WHENEVER PIPING IS INVOLVED

GRINNELL COMPANY OF CANADA, LTD., Montreal • Toronto • Vancouver. Grinnell jobbers in principal cities.

This instrument "mechanizes" the drawing of sketches, plans, etc. and for the expert in the drawing office it can speed up work considerably.

It consists of a "Perspex" template, carefully cut with mathematical accuracy to produce varying angles, triangles and rectangles as well as circles. Graduations are marked both in inches and millimeters. The template is toggle-hinged to a folder which acts as a drawing-board holding the paper over which the instrument is moved to obtain the correct ruling guide.

There are nine vertical holes in the template, spaced an eighth of an inch apart. These enable the users to draw any number of parallel lines at exact distances apart.

The instrument fitted to the folder measures only 14 inches and is quite light in weight. Pockets are provided at the bottom corners to retain paper for drawings. One pin is required to secure the paper into position. The largest size of drawings that can be produced with the instrument is 13 inches by 10 inches.

●

Diesel Plant for St. Johns, Que.—On April 9 it was announced that a new plant to manufacture Diesel motor equipment will be established in St. John's, Quebec. It will employ more than 1000 workers.

The announcement was made by Mayor Georges Phaneuf of St. John's, Que.

●

Function Plotter.—The automatic compiling of two measurements and plotting of a curve to show their interrelationship, namely: Y equals f (X), is made possible by a new electronic instrument.

The instrument, the Brown ElectroniK function plotter, developed by Minneapolis-Honeywell Regulator Company, is said by the Brown Instruments division engineers, to incorporate two measuring systems, one of which actuates the recorder pen while the other motivates the instrument chart.

Through this arrangement the chart is driven up and down in response to the changes in one variable simultaneously with the movement of the pen in response to changes in a second variable. The result is a curve which continuously evaluates one variable in terms of the other.

Laboratory or over-all industrial investigations involving such inter-dependent non-linear variables are greatly facilitated with the function plotter. For such investigations, it is claimed, plotting curves manually from data collected point by point is a laborious, time-consuming process which has many disadvantages. By using the function plotter, the measurements are compiled and the curve is plotted automatically. Measurements of the entire curve are continuous; no interruption is needed to complete data between points of measurement. For complete information communicate with Minneapolis-Honeywell Regulator Co. Limited, Leaside, Ontario.

●

Avro Subcontracts.—About 400 Canadian plants, from the prairies to the maritimes, are participating in Avro Canada's defence work for the Royal Canadian Air Force, according to information released by A. V. Roe Canada, Ltd.

●

Canadian Defence Orders.—The volume of defence orders placed by the Canadian Government in the twelve months ending March 31, 1951, amounted to over $800 million. This was more than three times the defence orders issued in the fiscal year 1949-50.

Forty percent of the defence programme was accounted for by aircraft orders, amounting to about $330 million in the fiscal year. The bulk of the aircraft orders were for the F-86 Sabre jet fighter built by Canadair in Montreal and for the CF-100 all-weather fighter and the Orenda engine produced by A. V. Roe Canada Limited.

Orders for electronics and communications equipment were next in importance, amounting to approximately $90 million.

The shipbuilding programme showed a spectacular increase from $4 million in 1949-50 to $79 million in 1950-51. The bulk of new shipbuilding orders was for minesweepers and anti-submarine escort vessels.

Contracts were placed for military construction costing about $68 million dollars. These figures include expenditures on the repair and maintenance of military establishments, but new construction of airports, buildings, and other installations accounted for most of the volume of defence construction.

Orders for military vehicles and other automotive equipment amounted to $65 million.

Power Line Contract.—F. A. Tucker Canada Limited, of Montreal, have been awarded the contract for the erection of the 170,000 volt power line between Kootenay River and Kimberley, according to an announcement made recently by The Consolidated Mining and Smelting Company of Canada, Limited.

The contract calls for the clearing of a 66-foot right-of-way, erection of the H-frame pole line and stringing of the wires from Cominco's South Slocan power plant on the Kootenay River to a point adjacent to the Sullivan Concentrator at Kimberley.

New C.G.E. Office.—The Canadian General Electric Company's Toronto office has been moved to an ultra-modern building at 1350 Castlefield Ave.

The new building includes office and warehouse facilities to provide complete dealer and customer service for the Toronto area. It also provides a headquarters for Company offices throughout Southern Ontario (less the Ottawa valley) and Northern Ontario as far as Sault Ste. Marie. A complete stock of electrical equipment is maintained.

The building has 185,000 square feet of floor space and is of brick and steel construction with a full basement.

Canadian Truck Manufacture.—Preparations for the partial manufacture and complete assembly of a limited number of 2½ ton and ¾ ton trucks has started in two Canadian plants, according to a statement made recently by the Rt. Hon. C. D. Howe.

The initial order, to be completed in the current fiscal year, calls for approximately 456 of the ¾ ton trucks to be produced by Chrysler Corporation of Canada Limited, Windsor, and 780 of the 2½ ton trucks to be made by General Motors of Canada Limited. Both these types of vehicles will be built according to U.S. standards and specifications.

Mr. Howe explained that full tooling and production to meet the limited requirements of the three Canadian Services is out of the question at present. The possibility of securing U.S. orders for Canadian factories was carefully examined but there is excess capac[ity] in that country for producing these types of vehicles. Nevertheless, he claimed some production must be undertaken in Canada in order to encourage the production of components in this country and to ensure the highest possible Canadian content in these vehicles. It is also important to make arrangements for some tooling-up in Canadian plants and to give Canadian industry an opportunity to become familiar with these types of vehicles.

Negotiations are under way with the Willys Overland Company of Toledo for Canadian production of ¼ ton 4 x [4] jeeps by the Ford Company of Canada Limited, Windsor, Ontario, on a similar basis and it is expected that an announcement will be made shortly.

Controlled Chemicals.—On April 24 the Department of Defence Production announced that an Order-in-Council has been passed declaring certain chemicals to be essential materials under the Defence Production Act.

The most important chemicals covered by the Order-in-Council are sulphur and chlorine benzol and sulphuric acid. Other chemicals listed in the order are glycerine, formaldehyde phenol, toluol, soda ash, caustic soda, phthalic anhydride and zinc oxide.

C.P.R. Report.—The following points were covered in the 1950 annual report of the Canadian Pacific Railway Company.

The new St. Luc freight terminal ne[ar] Montreal, which was constructed at [a] cost of $12,000,000 has made possible the speedy and efficient handling of [a] substantially larger number of cars th[an] could be handled previously in separa[te] yards, which are now in the process [of] being closed down. New motive pow[er] delivered during the year consisted [of] 58 Diesel-electric units which were p[ut] into service on the Schreiber divisi[on] north of Lake Superior in Ontario. The[re] were 1,870 new freight cars and 1[...] passenger train cars placed in serv[ice] during the year. A new type of car, t[he] "restaurant sleeper" was introduced [on] two trains late in the year.

Two new vessels are being readied f[or] use by the British Columbia Coast Se[r]vice of the Company. The report sho[ws] that 569 new manufacturing, warehou[s]ing and distributing plants were locat[ed] on the lines of the company in 19[50] and to serve 156 of these, 26 miles [of] siding tracks were constructed.

During the year capital appropr[ia]tions to the extent of $28.7 million, in addition to those approved at t[he] last annual meeting, were authorized [by] the directors. Three thousand new b[ox] cars accounted for $21.4 million of t[he] total.

On itemized list totalling 54.5 milli[on] of expenditures for 1951 was placed b[e]fore the shareholders for approval. T[he] sum includes $41.91 million for new ro[lling stock]

ing stock, making provision for 3,575 freight cars, 25 baggage and express cars, and 272 work cars, as well as 40 diesel electric units, 28 of which will be placed in freight service on the Laggan and Mountain subdivisions on the main transcontinental line between Calgary and Revelstoke. The other 12 units will be yard switchers.

The 1950 railway dollar, the report shows, was earned on the following basis: 12 cents from passengers; 17 cents from products of the farm; 20 cents from products of mines and forests; 44 cents from movement of manufactures and miscellaneous; and seven cents from other or unclassified traffic. Expenditures, in divisions of a dollar were, pay rolls, 47 cents; materials and supplies, 30 cents; taxes and other expenses, 13 cents; fixed charges, four cents; dividends and improvements, six cents.

●

Industrial Design Contest.—A lack of understanding of mass production needs and techniques was shown by most of the 330 entrants in the National Industrial Design Committee's $10,000 competition for new designs in aluminum and wood, according to a government release received from Ottawa. As a result no first, second, or third prizes are to be awarded in this contest. The judges felt that some entries, while not fully professional in calibre, were of such original merit that the designers submitting them should be awarded special prizes of $500.00 each.

D. W. Buchanan, secretary of the National Industrial Design Committee, announced that immediate consideration will be given to a recommendation made by the judges that the $7,000 which remains unallotted out of the present contest, be applied later this year to another competition with more precise emphasis on mass production.

●

Telephone-type Jack.—A new telephone-type jack has been announced by Switchcraft Inc., 1328 N. Halsted Street, Chicago 22, Ill. Known as the "T-Jax" this jack was designed especially for high quality communication equipment, and to meet the exacting specifications of the armed services. It has a strong steel frame, produced in specially designed dies, and is press-welded to provide the rigidity and dimensional stability required for heavy service.

The springs are produced in dies of special design and are made of a special alloy of nickel silver insuring maximum spring life and corrosion resistance. Fine silver contacts are standard in switching circuits; palladium cross-bar contacts are also available. Insulation is in accordance with miltary standards. Further details may be obtained from the manufacturer.

●

Trade Fair Comments.—The 1951 International Trade Fair May 28 to June 8, promises to be the most successful to date.

The Fair will be bigger than in previous years and there will be a wider variety of products. The exhibits will be in excess of 160,000 square feet.

Great Britain will again be the major exhibitor. The section devoted to machinery, plant equipment, and related capital goods will be the largest, and in many ways the most impressive, of the show. The present trend indicates that it will almost certainly be larger than last year, and to date eight countries have booked space in this section.

Among the Canadian exhibits there will be a line of modern melting furnaces and other industrial furnaces. The electric melting furnace features hydraulically operated roof raising, swinging and tilting. Many features of the machine, such as the electric holders and parts of the regulator, are patented.

Another unique exhibit will be a new-

USE LIGHT WEIGHT CASTINGS

for

MAGNESIUM
ALUMINUM

LOWER PRODUCTION COSTS

Substantial reductions in production costs are often the result of a new product designed or an old one redesigned to use either magnesium or aluminum castings. Light metal castings save pounds and dollars at the same time—they are strong as they are light and can be cast to such close tolerances that much costly machining is eliminated.

We have case histories on record where changes in structural design to use light metals not only increased the originally planned strength but brought big savings in metal and machining. It takes experience and know how to produce high quality light weight castings. Our experience has been gathered through many hundreds of successful applications. It is at your disposal—simply write Light Alloys Limited, Renfrew, Ontario.

Magnesium Sand Casting

Magnesium Permanent Mold Casting

Magnesium Pressure Die Casting

LIGHT ALLOYS LIMITED

Subsidiary of Dominion Magnesium Limited, Suite 1505, 320 Bay Street, Toronto.

ly invented machine for inserting and tightening the spokes in bicycle wheels. This is the development of a large Canadian cycle firm. Before the introduction of this machine, one skilled operator could do about 50 wheels per hour. Through the use of the machine an unskilled man can operate two of the machines simultaneously and turn out from 150 to 200 wheels in an hour.

Other Canadian engineering equipment to be displayed will be marine boilers, chemical process equipment, rock crushers, steam and diesel engines, hydraulic gates, lime kilns, rolling mill machinery, oil equipment, mechanical presses, model ships.

The huge British exhibit of machinery and plant equipment this year includes two joint efforts by four trade associations. The Association of British Tool Makers and the Machine Tools Trades Association are combining in one exhibit, and the National Federation of Engineers' Tool Makers are joining with the British Federation of Hand Tool Manufacturers in another. Besides these displays, a great many British firms are exhibiting individually.

Among the British exhibits will be several types of fork lift trucks, and one British exhibitor will show a working model of an aerial ropeway and mechanical handling installation.

Another British exhibitor is introducing a number of machines designed entirely for the Canadian market. Among them are an electric hydraulic veneer press, an automatic belt-sanding machine, an overhead belt-sanding machine, and a double cut-off and squaring sawbench. A three spindle, quick acting, hand operated veneer press, which has been supplied to a few Canadian customers, will be generally introduced for the first time.

A British manufacturer of filters is exhibiting for the purpose of establishing an agency in Canada to supply a market which he feels has large potentials. His product has two distinctive features for reconditioning used oil and it is claimed that, with the filter, over 98 per cent of the oil drained from Diesel engines can be made available for re-use at a cost of about two cents a gallon.

●

Junction Boxes. — New, heavy-duty, weatherproof junction boxes made of non-corrosive, cast aluminum are announced by the Stone Manufacturing Company, Elizabeth 4, New Jersey.

This new list of products includes a variety of covers and fittings for universal use on almost any outdoor wiring or lighting job. Complete information may be obtained from the manufacturer.

●

British Engineering Exhibition.—What is claimed to be the largest display of engineering products in the world will once again be on view at the Engineering, Marine and Welding Exhibition which will be held in London, England, from August 30 to September 13, 1951.

The Exhibition has been held in alternate years since 1906, except for the interruptions caused by the two world wars.

The chief sponsor of the exhibition, the British Engineers' Association, 32 Victoria Street, London, S.W.1, England, will be pleased to supply further details.

●

Oil Refinery.—Engineering of several major processing units for Canadian Oil Companies' new $18 million refinery at Sarnia, has progressed from the planning stage to the production phase. Construction started in April according to the Canadian Kellogg Company Ltd. Canadian Oil Companies and Canadian Oil Refineries will own and operate the refinery.

Completion of the plant is scheduled for 1952. The combination unit, first of its kind to have the new Orthoflow catalytic cracker operating in combination with catalytic polymerization, will produce high-octane stock for both aviation and automotive gasoline. Gas oil feed for the cracker will be produced from 20,000 BPD of Alberta crude.

Rubber's role in defence is spot-lighted by the special fractionating equipment which will send butylenes to the nearby government-owned Polymer Corporation's synthetic rubber plant.

●

New British Jet Plane.—A new jet aircraft has just made its first flight in Britain. Named the FD 1, the plane's performance is still secret, but it is an extremely "swept-back wing" craft powered by a Rolls Royce jet engine.

●

aritime Power & Plant Expansion.—ıe Nova Scotia Light and Power Comıny has ordered from the Metropolitan ickers Co. in Britain for installation at alifax, a 20,000 kw. 3,600 r.p.m. turbonerator set complete with condenser ıd feed water heaters.

●

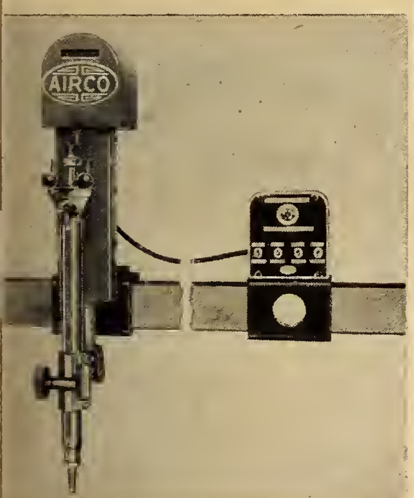
nperial Oil Refinery Contract.—A ntract for construction of an atmosıeric and vacuum distillation unit, a ıid catalytic cracking unit and a light ıds recovery plant at Imperial Oil's ırnia refinery has been awarded to the ınadian Kellogg Co. Ltd., Toronto. ıe distillation unit, with a capacity of ,500 barrels per day, and the catalytic acking unit with 23,250 barrels daily pacity, will be the largest of their kind Canada.

The contract price is in the neighborıod of $9 millions. A proposed new ıiler plant and increased water pumpg facilities are not included and will handled through other contracts.

●

otorized Torch Cutter.—A motorized rch holder for remote control raising ıd lowering of cutting torches mounted ı oxyacetylene cutting machines has ıen announced by Airco Company Inrnational, a division of Air Reduction ompany, Incorporated.

The device, which is designed for ounting on the 3 inch square torch bar an Airco Oxygraph or Travograph



ｘyacetylene gas cutting machine, raises lowers the cutting torch through 5 ches of travel. The remote control vitch box mounted on the torch bar the operator's control station provides switch to actuate each of four torches dividually and a master switch for multaneous control of all four torches. nother control box is added for each ur additional torches employed.

The torch holder can be positioned rtically, 90 deg. left or right parallel the longitudinal axis of the torch bar, ıd, with an adapter, can be positioned deg. forward perpendicular to the ırizontal axis of the torch bar.

Both motorized torch holder and reote control switch box can be placed the location most convenient to the ıeration being performed.

For further information write to Canaan Liquid Air Co. Ltd., 1111 Beaver all Hill, Montreal.

●

Radial Arm Saw.—Consolidated Machinery and Supply Co. Ltd., 2031 Santa Fe Avenue, Los Angeles 21, California, have recently introduced a large radial arm saw which will cut off or mitre construction timbers up to 17 by 17 inches. This machine, known as the Comet Timber Cutter, was designed primarily for use in mining, bridge building, shipbuilding, and other heavy construction work.

Comet Timber Cutters are available in three sizes from 7½ to 10 hp., 1800 or 1200 r.p.m. 220/440 volt motors that swing blades up to 44 inches in diameter.

The saw assembly is mounted on a rigid arm of hardened steel tubing supported by an adjustable steel column. Eight ball bearing rollers allow the saw to move forward and backward on milled tracks in this arm. These are totally enclosed and sealed from dirt and dust by felt wipers. Adjustment for depth of cut is made through a screw gear raising device with controls located at the front of the machine. Adjustment for mitre is made by rotating the column to the desired angle. Width of cut-off is controlled by a manually operated chain drive attached to the saw assembly. Complete information may be obtained from the manufacturer.

•

Regulator Controls.—Regulator controls that are at least 99 per cent accurate, regardless of changes in temperature or load, are now being supplied by Canadian General Electric Company, as standard equipment on all G-E station-type induction and step regulators.

All the control elements are individually pre-tested before assembly. A final check of the operation of all the completely assembled regulators assures coordination of all components.

For further information, communicate with Canadian General Electric Company Limited, 212 King St., West, Toronto 1, Ont.

•

G.E.C. Exhibit.—One of the exhibitors at the Canadian International Trade Fair this year will be the General Electric Company Limited, of England, Britain's largest manufacturer of electrical goods and equipment. The British company will be represented by its recently formed subsidiary, The British General Electric Co. (Canadian) Limited. This will be the first time since the inauguration of the Trade Fair that "G.E.C.", as the Company is generally known throughout most of the world, will have a comprehensive display of products for the Canadian market.

•

Mechanical Shaft Seal.—The Crane Packing Company, 1800 Cuyler Avenue, Chicago 30, Illinois, announce a new, improved mechanical seal.

The new seal is designated as Type 9 Mechanical Shaft Seal. It incorporates a flexible ring molded from Teflon. The Type 9 Seal has been designed for service on various rotating shaft applications, such as centrifugal pumps, turbines, positive displacement pumps and agitators. Complete information may be obtained from the Company at the address given above.

•

Vacuum Lifters.—Industrial Products Company, Philadelphia 33, Pa., announces an improved line of vacuum lifters for punch press feeding and other production uses. The lifter has been designed to prevent finger and hand injuries and to speed up the work. It is practical for both high and low stroke punch presses, lifting, feeding, and positioning blanks without requiring hands or fingers to be inserted within the danger zone. An additional advantage is the rapid transferring of blanks from piles or stacks, especially when oily or greasy and difficult to grasp with the fingers.

These punch press feeders are light, easy to handle, and respond instantly. A slight blow affixes vacuum cup to blank being handled. Release is instantaneous by a depressing thumb lever. The manufacturer will be pleased to supply prices and further details.

•

Controlled Materials.—The effect of the United States Controlled Materials Plan on Canada, and the mechanics of Canadian participation in the scheme, have been the subject of discussions recently concluded in Washington between government officials of both countries.

The Controlled Materials Plan, which will go into operation in the United States on July 1, 1951, will allocate steel, copper, and aluminum to producers of defence and other essential items on the basis of detailed requirements submitted in advance to the U.S. Government.

As a result of the recent discussions, it is believed that when it comes to meeting requirements for defence and other essential purposes from the United States, Canada will fit into the plan, in almost exactly the same way as in 1943 to 1945. It is anticipated that the Canadian system of programme classification will be necessary, under which the Canadian importers will show the general distribution of his products by principal classes of use.

Under the plan the U.S. Government will have quantitative measurement of materials available for defence and other essential purposes and can make allocations through government departments and agencies to prime contractors.

At the present time a single band priorities system is being used in the United States to channel materials and components into defence and other essential production. However, as the production programme builds up, and as the impact of defence orders spreads throughout the economy, such a system is inadequate to deal with the accumulation of demands for materials for essential purposes.

Under the current priorities system, essential materials are channeled to industry either by an outright directive, in the case of very urgent military programmes, or by a DO rating in the case of defence and essential industrial and civilian requirements. As C.M.P. comes into effect, there will be three methods for channeling materials:

(a) Directives;
(b) C.M.P. allotments, which will validate DO's in the procurement of the three controlled materials; and
(c) DO ratings for the procurement of items other than controlled materials.

The Department of Defence Production, Ottawa, emphasizes the fact that many aspects of the plan are still in the formative stage and procedures for Canadian participation will be developed and sent out to industry as quickly as possible.

•

Nickel Sponsored Fellowships.—Commemorating the two-hundredth anniversary of the isolation of nickel as an element, the International Nickel Company of Canada Limited, has established three graduate fellowships, each valued at $6,000 to encourage research in the fields serving the metal industries. They will be awarded yearly by the National Conference of Canadian Universities.

Professor D. L. Thomson, dean of the Faculty of Graduate Studies and Research of McGill, in announcing the awards, said "the fellowships are for research in the fields of geology, mining, ore dressing, metallurgy, and the physics and chemistry of metals. Each fellowship provides $2,000 a year and is tenable for three years. Applications will be considered from any Canadian university qualified to confer a Master's or Doctor's degree in the acceptable fields.

•

B.C. Mine In Operation.—The Consolidated Mining and Smelting Co. of Canada Limited, announced recently that it will bring the H. B. Mine, near Salmo, B.C. into production in the next two years at a cost of $2,750,000. The H. B. Mine a zinc-lead-silver operation, is about six miles from Salmo, and concentrates from the property will be trucked about 40 miles to Trail for treatment. The plans include the driving of a 4000 ft. haulage tunnel to the orebody and the erection of a 1,000-ton concentrator, together with necessary plant buildings adjacent to the portal of the haulage tunnel.

•

New Chemical Plant.—Dow Chemical of Canada, Limited, announce the completion of a plant at Sarnia for the pro-

duction of carbon tetrachloride, trichloroethylene, and perchloroethylene. This is the first production of carbon tetrachloride in Canada.

●

British Air Compressors.—Arpic Engineering Limited is a new British company, located at Glasgow, Scotland, which has been set up for the production of portable Diesel-driven air compressors.

Their range will be 75, 105, 160, 210, 315 and 500 c.f.m. actual output.

The compressors are of two-stage air-cooled design and possess a number of advanced features, such as group controls, patented oil operated clutch, electric starter, manifold heater, and fuel injector for cold weather starting.

The Canadian sales & service agents are J. T. Hepburn Limited, 916 Dupont St., Toronto.

●

Small pH Meter.—Analytical Measurements Incorporated, 585 Main Street, Chatham, New Jersey, announce a pocket-size pH meter and companion probe unit, which, it is claimed, permits instant, on-the-spot pH determinations anywhere.

Completely self-contained, with batteries, in bakelite case, this instrument is furnished, camera fashion, in an ever-ready case with novel plastic tubes of buffer and KC1 solutions. Total weight is 3 lbs.

The meter is scaled from 2 to 12 pH for easy reading, and a simple adjustment gives readings of from 0 to 14. Accuracy of 0.1 pH is obtainable. Hearing-aid type batteries provide up to 1300 hours of operation. The manufacturer has literature fully describing this equipment. Copies are available.

●

Non-ferrous Metal Control.—The following is the text of a news release issued by the Department of Defence, Non-Ferrous Metals Division. It is known as Order M-1.

(Primary Nickel and Electrical Resistance Alloys)

Under and by virtue of the powers contained in The Defence Production Act,

THE MINISTER OF DEFENCE PRODUCTION HEREBY ORDERS AS FOLLOWS:

1. *Interpretation*

For the purpose of this Order:

(a) "person" shall include any individual, partnership, corporation, co-operative or other association, society or organization;

(b) "primary nickel" shall mean nickel of any concentration in the following forms: Copper nickel shot used for remelting, electrolytic cathodes, ingot and shot;

(c) "electrical resistance alloys" shall mean any electrical resistance alloys containing 50% or more by weight of nickel or nickel plus chromium, produced by any hot or cold working processes.

2. *Authorization Required*

On and after May 1, 1951:

(a) No person shall purchase or otherwise acquire any primary nickel or electrical resistance alloy, as above defined, unless he has submitted his purchase order to the Director, Non-Ferrous Metals Division, and the Director has authorized the placing of such purchase order;

(b) No person shall supply or deliver any primary nickel or electrical resistance alloy to anyone until he has received a purchase order with the proper authorization as described in subsection (a) of this section.

3. *Reports*

Any person who acquires, sells, deals in, or carries an inventory of primary nickel or electrical resistance alloys shall give the Director of the Non-Ferrous Metals Division such information in such form and at such times as the Director may require.

4. This Order shall come into force on the 16th day of April A.D., 1951.

F. V. C. HEWETT,
Director,
Non-Ferrous Metals Division.

The Saint Lawrence Waterway

An All-Canadian and Very Deep Route

by

J. G. G. Kerry, M.E.I.C.

Port Hope, Ontario

A paper presented at the 65th Annual General and Professional Meeting of The Engineering Institute of Canada at Montreal, May 11, 1951.

Few subjects have been more exhaustively written up than the proposed St. Lawrence Seaway. The writer who tries to add anything of value to this mass of literature might reasonably be regarded as presumptuous. There is, however, one aspect of this problem to which little or no attention has been directed. That is the ultimate standard up to which the channels of the river are capable of being improved. All previous studies have been directed to designing improvements to meet some previously established standard of excellence. None have as yet been directed towards the ultimate possibilities.

Today it would appear that the optimum standard to be worked towards is a channel that will accommodate any vessel that can pass through the great inter-ocean canals of the world, and one that will keep itself clear of obstructing ice all winter long. Curiously enough a channel that will meet the needs of the second objective is sure to satisfy the needs of the first, for an indefinite period that cannot be foreseen. Great depth and volume are two most important features for a channel in which ice will not tend to form quickly.

This paper will consider only the so-called International Section of the Seaway, extending from the deeps of Lake Ontario to Lake St. Francis. Improvements to any standard that can be secured on it can also be secured all down the river to the head of the estuary. This section is sharply divided naturally into two parts, a lake section extending eastward as far as the head of the Galops Rapids, and a river section continuing on to Lake St. Francis, whose southern shore is cut by the International Boundary near its west end.

The author of this paper has devoted years of study to ice conditions, particularly in relation to the St. Lawrence River. He has long held the vision of an "all season" seaway, kept free of ice by utilizing the latent heat contained in the deep waters of Lake Ontario. Here he gives his ideas of how such an objective might be attained.

A second proposal is also advanced, namely diversion of Canada's share of St. Lawrence waters, from Galops Island across the St. Lawrence Lowland by canal, emptying it into the Ottawa River near Point Fortune. Here power would be developed along lines generally similar to Beauharnois, keeping the seaway as a national undertaking.

Lake Section

Viewed from the standpoint already set up in this paper, the lake section leaves little to be desired. It is amply deep, of more than ample cross section, and the present steamboat channel is distinctly international. This channel clings to the New York shore from Cape Vincent passing Clayton, Alexandria and Chippewa Point to cross over to the Ontario side and to pass through the Brockville Islands, past Brockville, through the McNair Islands and past Prescott to the head of the Galops Canal. It is abundantly deep but obstructed at many points by small shoals and rock islets.

If a channel 60 ft. deep be desired, it can be secured at reasonable expense. It would also be possible to build two independent and strictly national channels of satisfactory width and depth, but there seems to be little reason why this additional work should be undertaken unless it is found to be advantageous to build the winter channel in Canadian waters, a channel that could pass by Kingston and Gananoque to join the present channel near Grenadier Island or Whitney Point. This is quite feasible.

The maintenance of an ice-free channel calls for the creation of a fairly rapid current in the river. This cannot be achieved without cutting down the winter cross section of the river with the aid of an extensive group of dykes, levees, jetties and removable bulkheads.

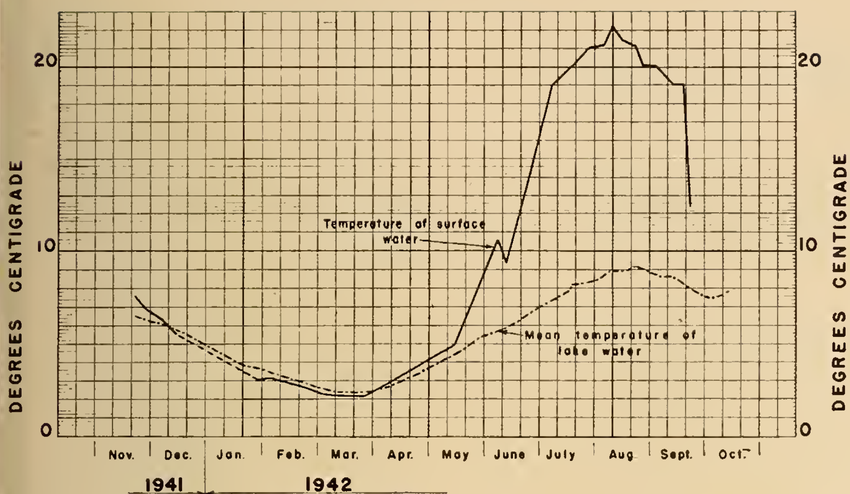

Fig. 1. Surface and mean temperatures of the waters of Lake Michigan.

The cross section throughout the lake section must be reduced to a width and depth suitable to the desired velocity, and to the volume of the discharge of the river. Dr. Barnes in his "Ice Engineering"* was the first to point out that such an improvement of the channel would keep the river free from ice. It may be that he did not realize how large a construction job would be necessary. Stagnant areas back of the levees must be allowed to freeze over and the movement of any of the ice into the open channel prevented.

*H. T. Barnes, "Ice Engineering", 1928, Renouf Publishing Co., Montreal.

Water Temperatures

Fig. 1 shows for one year the surface temperatures of the waters of Lake Michigan, and the simultaneous temperatures of the whole body of the waters in the lake, that is, in so far as it was possible to determine these by a necessarily limited number of observations. Note that during the winter months (December to April, inclusive) the average temperature of the body of the lake waters is practically the same as that of the surface waters.

Fig. 2 shows the depth temperatures of the lake, as observed on one cruise of a vessel across it. The waters are obviously isothermal from top to bottom, and the more rapid cooling off of the waters close to shore is made very evident. This diagram may be regarded as confirming the conclusion drawn from Fig. 1.

Fig. 3 shows the results of a series of depth temperature observations taken in the summer months, mainly in Lake Ontario. The form of the curves is typical for the Great Lakes in summer, always a warm shallow surface layer, and a deep mass of waters with a temperature approaching 39 deg. F.

Fig. 4 shows for a period of nearly three years:

(a) the temperatures of the surface waters of Lake Michigan during the winter months, when the

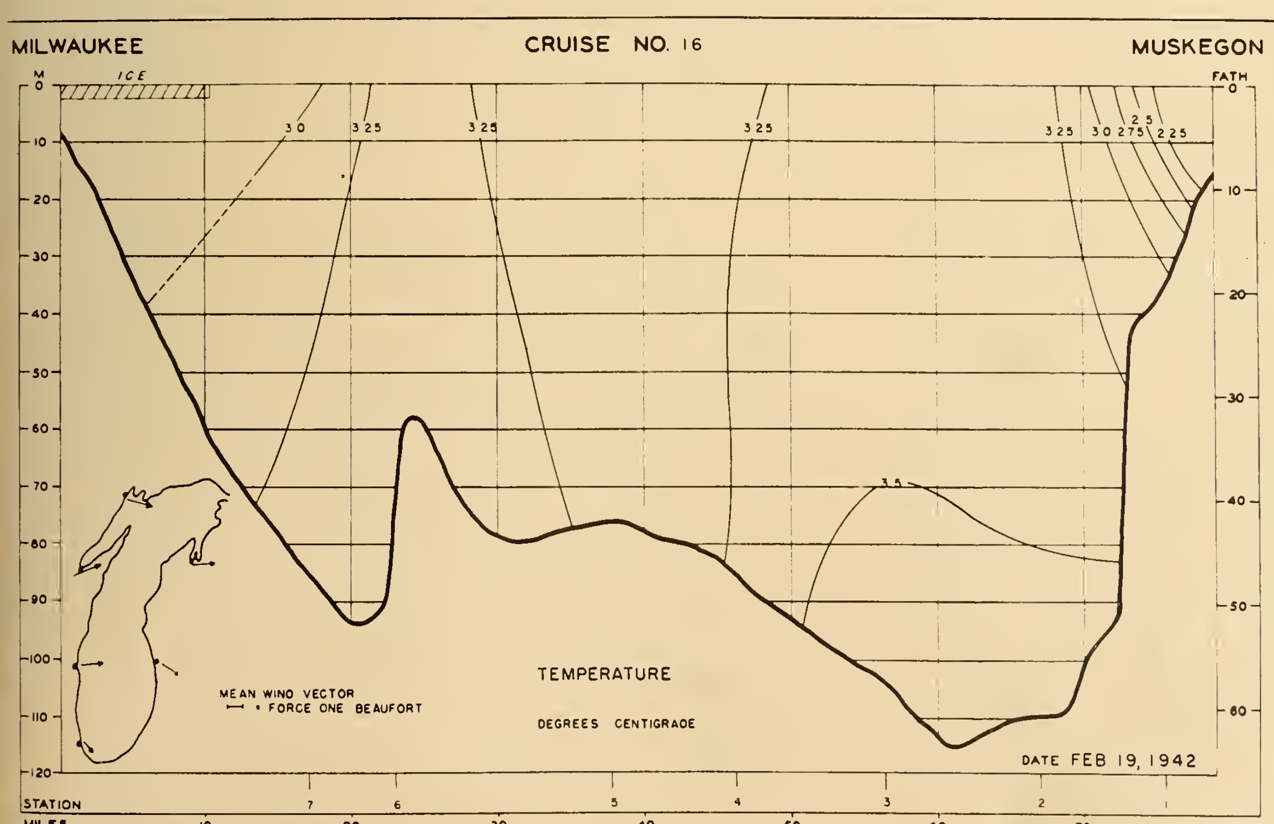

Fig. 2. Depth temperatures of Lake Michigan

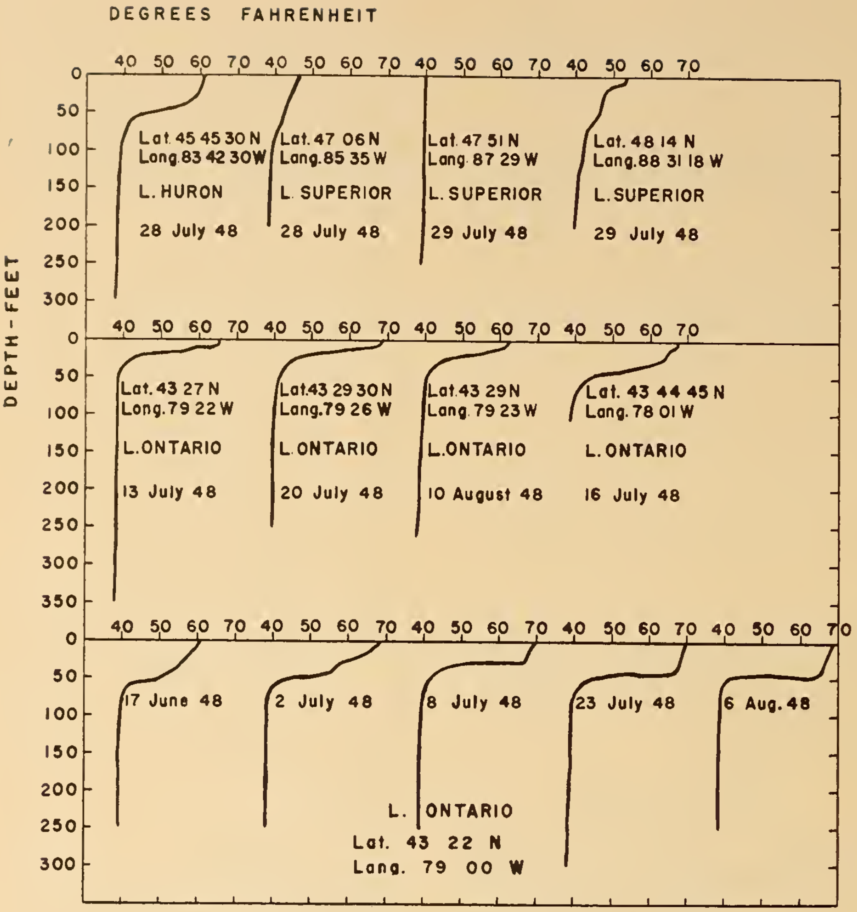

Fig. 3. Depth temperatures of Lake Ontario.

whole body of the lake waters was nearly isothermal.

(b) the air temperatures as observed at Milwaukee, (five day means). Daily observations would, of course, have been much more irregular.

(c) the heat content of the waters near the centre of the lake, given in calories per cm.^{2}, the heat content at 0 deg. C. being taken as zero. (To convert calories per cm.^{2} to B.t.u. per sq. ft. multiply by 3.68+)

The points to be observed from Fig. 4 are the very regular changes from day to day in the surface water temperatures and in the heat content of the lake. There is only a very general correspondence between the air temperatures and the heat content of the lake. Data drawn from the plotted curve of heat content are probably much more reliable guides for the purposes of design than calculations based on isolated observations of air and water temperatures.

It will be noted from the plotted curves that the rate of heat loss per day flattens off rapidly in February and becomes almost zero in March.

Fig. 5 shows water surface temperatures taken on Lake Ontario concurrently with the observations on Lake Michigan (Fig. 4). Surface temperature curves on the two lakes correspond closely, but the Lake Ontario temperatures do not show the low points observed on Lake Michigan in the winter of 1942-43, possibly due to the greater depth of Lake Ontario.

The distance from the deep waters of Lake Ontario to the open salt waters of the Estuary is about 420 miles., about six days travel at 3 m.p.h. The critical time for ice formation comes usually in February when the air temperatures are still low, and when lake waters have cooled to a minimum. If heat loss in February is taken from Fig. 4 and the lake temperature is assumed not below 34 deg. F. in February, after six days travel the waters will still be above the temperatures at which either sheet ice or frazil will form.

It is of course a truism that ice will not form in water which has not been cooled down to 32 deg. F. nor as the studies of Dr. Barnes have shown, is it likely that frazil will form in quantity under Canadian winter conditions if the temperature of the water is as high as 32½ deg. F. For a more precise defining of the relations between air temperature, water temperature and the formation of frazil, the reader should consult Dr. Barnes' "Ice Engineering".

Heat Energy in Lake Ontario

A speed of 3 m.p.h. or over is not unknown on the charts of the

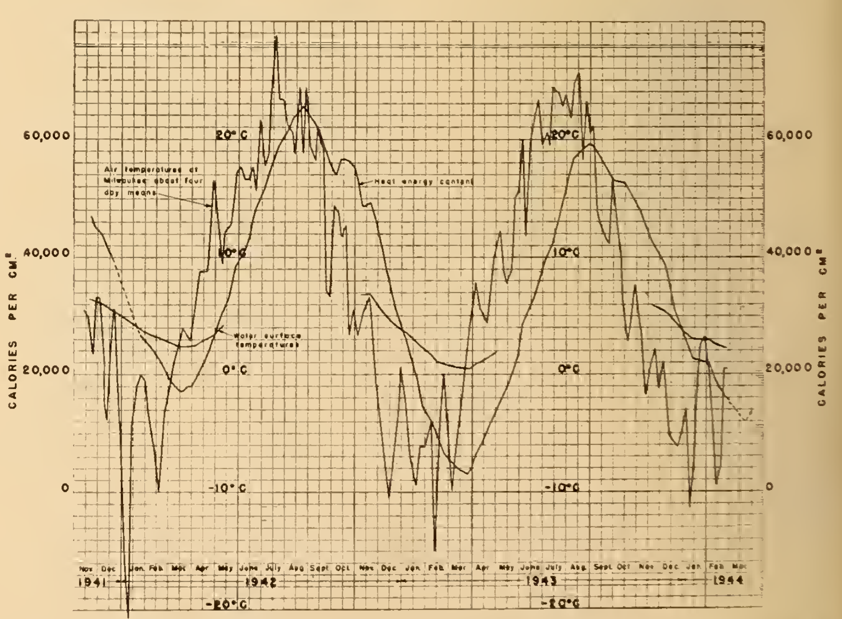

Fig. 4. Surface temperatures and heat content of Lake Michigan with air temperatures at Milwaukee.

St. Lawrence Ship Channel. It would appear that this velocity will be suitable both to navigation and to the carrying of the waters of the St. Lawrence River ice free over their appointed course. Such a supply of heat energy as is stored in the waters of Lake Ontario during the winter months is almost unique. It is a great national asset that the engineers of Canada should not fail to use to the greater advantage of Canada.

As the length of the lake section of the International Section is only about one-fifth of the whole active length of the St. Lawrence River, if this section of the river can be regimented to an even flow at 3 m.p.h. there will be little reason for difficulties with ice. The expense of the regimenting will be serious, but the benefit of this conservation will be felt all down the river even to the confines of Newfoundland.

The flow of the regimented river will reach the head of the Galops Rapids from the deep lake in a little more than one day. It may be well to compare this figure with present conditions. Fig. 6 shows the broad shallows lying between the reef that crosses Lake Ontario along the line of the Duck Islands and the actual mouth of the river. The time of water transit from the mouth of the river to the head of the Galops Canal is known from the observations of the Joint Board of Engineers to be about 11 days, making the total time of transit and of cooling off some 25 or 26 days. This means that the loss of heat from the river surface between Main Duck Island and the Galops Rapids can be reduced to about one-twentieth part by suitable regimentation.

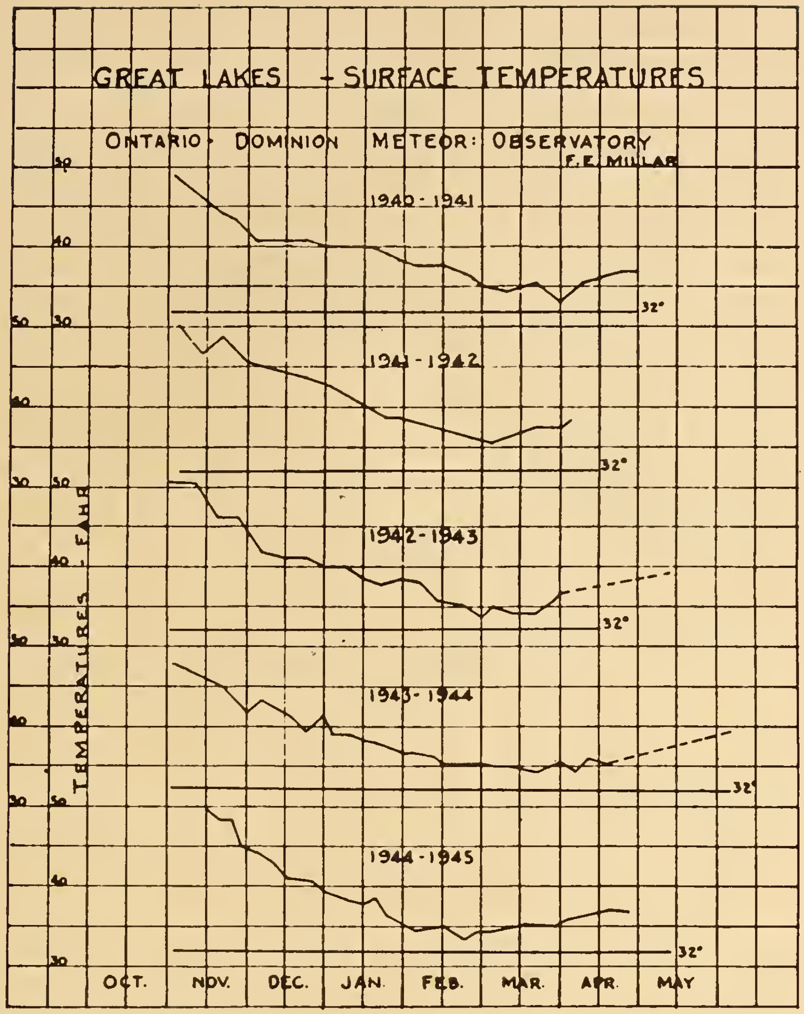

Fig. 5. Surface temperatures on Lake Ontario. These curves include the period covered by Figure 4.

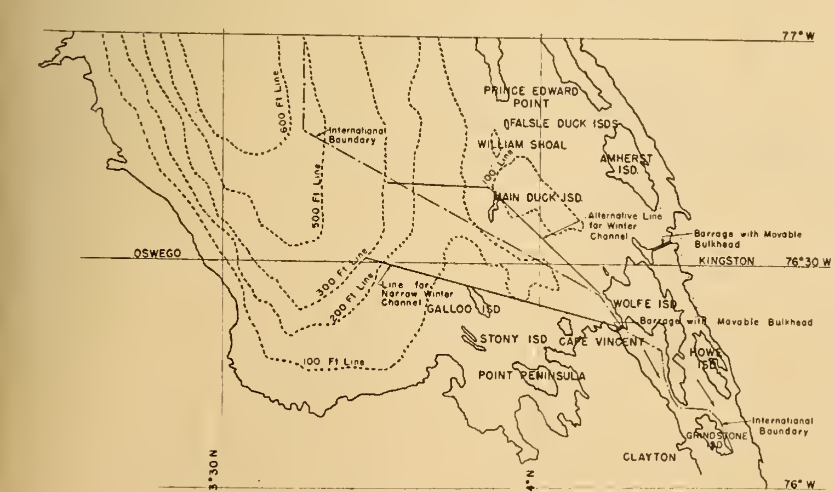

Fig. 6. Plan of the St. Lawrence river headwaters.

Cost of Open Channel — Moderate

It will be objected that the creation of a strongly flowing river in place of an arm of the lake will result in unnecessary loss of head. This objection is hardly tenable, for the Joint Board of Engineers places the loss of head at the Barnhart Island dam due to winter conditions at about 10 ft. It should not be difficult to provide under the conditions existing a regimented channel with a hydraulic radius of about 55. The value of C in the Bazin formula with such a radius can, from the observations made by the Joint Board of Engineers near Sorel, be placed at better than 125, say 135. The resulting slope with a current velocity of 4 ft. per sec. will be measured by a fall of about 1 ft. for every 12 miles, or 10 ft. in all from the Ducks to Barnhart Island.

There will therefore be no net loss of head in winter with an open strongly flowing channel. If

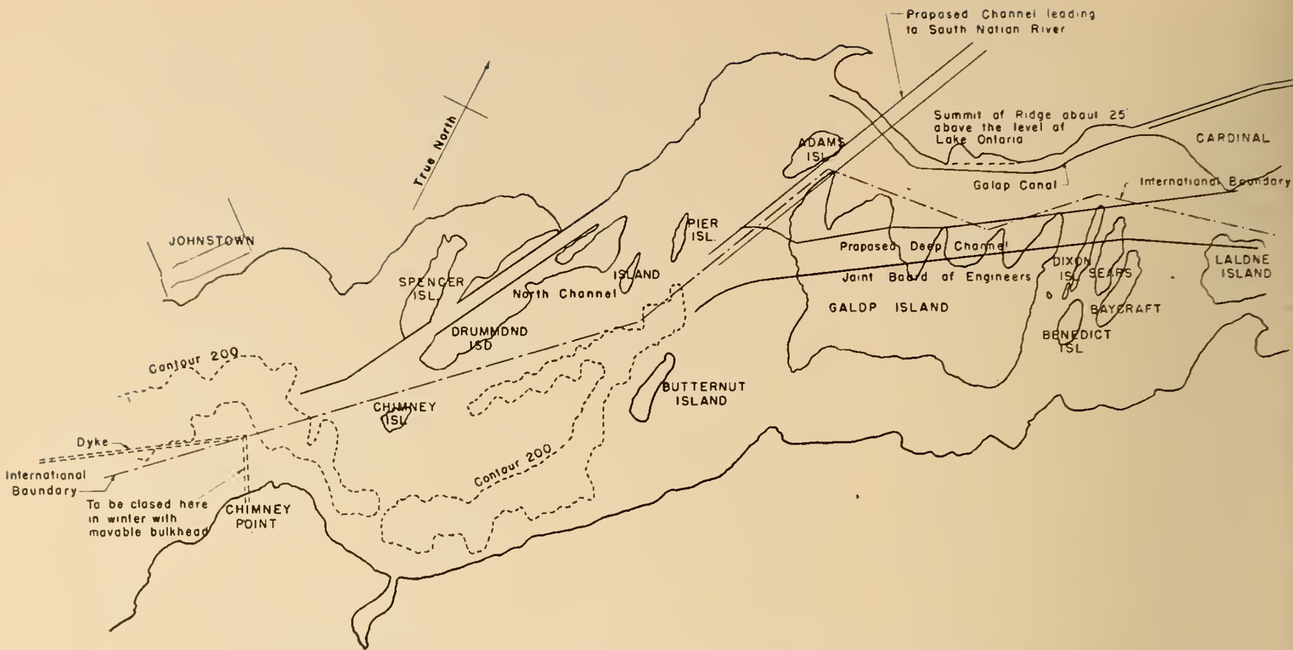

Fig. 7. Plan of the St. Lawrence river at the head of Galops Rapids.

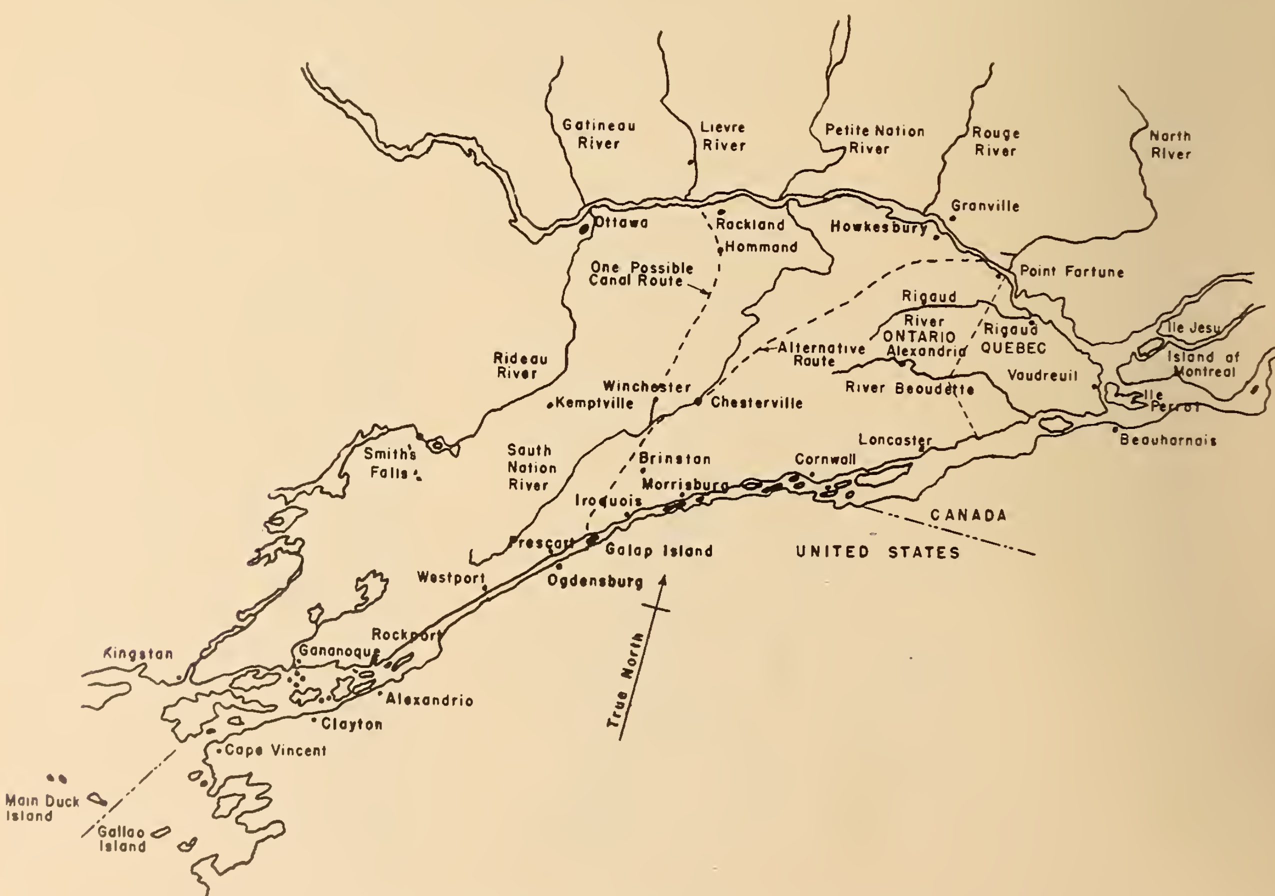

Fig. 8. Plan of the Ottawa-St. Lawrence Lowland.

necessity makes a demand for even higher velocities and for more water at the power houses, the result with the open channel will be simply more loss of head with a largely increased temporary output from the power houses. If such a special demand had to be met under ice cover conditions it is questionable whether the ice cover could successfully resist the attack resulting from the increased energy of the underflowing stream. It might well be that an ice jam at Ogdensburg such as that described by Dr. Barnes would develop. The privilege of maintaining an open channel all year long can apparently be secured at no cost over and above a moderate outlay on levees and dykes.

One change in the official plans will be desirable, the lowering of the sill level of the proposed cut through Galops Island to about elev. 190. This elevation shows in the soundings both above and below Galops Island and no weir, no matter how broad crested, should be permitted to cross the main line of river flow.

It will be noted from Fig. 6 that it will be necessary to confine the flow of the river between Main Duck Island and Cape St. Vincent by levees. In winter both the Canadian and American channels leading from the lake would be closed by dykes with movable bulkheads, thus forcing all the outflow from the lake to pass between the proposed levees.

The conclusion to be drawn from all the foregoing discussion is that down to the head of the Galops Rapids a river channel of ample depth, and one well designed to prevent the formation of ice on its surface, can be constructed at no unreasonable cost.

As success in maintaining an open river channel depends in large measure upon the amount of heat energy stored in Lake Ontario, it would seem to be appropriate that the Engineering Institute, as the recognized mouthpiece of the engineers of Canada, should represent to the Federal Government that it is most desirable that the annual temperature cycle of the waters of Lake Ontario be studied and recorded, particularly along a section extending from Oswego to Point Edward.

Two Channels Advocated in River Section

In view of the present conflict of interests in the United States it might be wise to study the improvement of the river from the Galops Rapids down to Lake St. Francis both from an international and a national standpoint. With a limited use of levees and dykes the open channel can be readily carried down to Barnhart Island and down into Lake St. Francis, thus avoiding all choking of the river flow, and the backwater below Barnhart's Island, specially allowed for in the report of the Joint Board of Engineers.

Fig. 7 shows certain contours and shore lines around the head of the Galops Rapids. It would not be too difficult a matter to divide the flow of the river into two at this point; one half of the flow, the American half, would discharge through the cut across Galops Island and then follow the existing main river channels. The development of this section both for navigation and for power would be left entirely in American hands, with flooding rights, etc., where necessary granted by the Canadian Governments.

The development of this section with only our half of the present flow to handle would undoubtedly be a much easier and cheaper job to undertake than the full development as recommended by the Joint Board. The dividing of the flow of the river would require the approval of the International Joint Commission, but it does not appear that the interests of either nation would be materially injured by the proposed division, and it has much to recommend it.

Lowland Triangle between the Rivers

It will be noted from Fig. 7 that a low divide exists on the north shore near Galops Island separating the St. Lawrence River from the valley of the parallel South Nation River. A cut through this divide, as indicated on Fig. 7, would carry the St. Lawrence waters into the valley of the South Nation River, and on to what is geologically known as the Ottawa-St. Lawrence Lowland.

The most notable feature of the Lowland is the absence of any continuing slope, it can be described as a level plain mildly affected by denudation and stream erosion. Its general position is shown on Fig. 8.

Geologically the Lowland is said to have been part of the bed of the vanished Champlain Sea, and into that sea poured the discharge of the Ottawa River. When the Champlain Sea withdrew, the Ottawa River proceeded to cut its own deep and beautiful valley from the city of Ottawa down to Carillon. The Lowland itself is now partly drained by the many branches of the South Nation River. Geologically this is a young drainage, and as yet it is by no means fully developed. A characteristic feature of the hydrography of the valley is the relatively very heavy annual spring floods of short duration. This is primarily due to lack of slope, and the area may be compared in some ways to the mossed-over areas in the James Bay district, where the moss continues to grow and to obstruct all drainage that tries to flow off these lands that have only a very modest slope. The South Nation River valley notably lacks an efficient drainage system.

Ottawa River Once Flowed Across It

It is noteworthy of the Lowland that its elevations along the Ottawa River edge are often higher than the elevation of Lake Ontario, and that the ground levels near Ottawa are no higher than those back of Hawkesbury and Point Fortune, some 70 miles downstream. The Ottawa and the St. Lawrence follow here roughly parallel courses about 45 miles apart. Near Ottawa the bed of the Ottawa is perhaps 100 ft. lower in elevation than that of the St. Lawrence.

Owing to the general flatness of the Lowlands a locating engineer would find that he could lay down a canal route to reach the Ottawa River at any point between Ottawa and Point Fortune. The problem of locating a canal to take the St. Lawrence waters across the Lowlands and to drop them into the Ottawa River is practically more one for the geologist and the geophysical engineer, rather than for an ordinary field survey party.

The Lowlands are known to be underlaid with rock beds, heavily faulted and to some extent disturbed in elevation. The rock beds are heavily covered with overburden, and the depth to rock must be determined by geophysical methods before the most economical route for a canal can be chosen. Geological opinion has been expressed to the effect that the waters of the Ottawa River once found their way across the original rock beds into the St. Lawrence

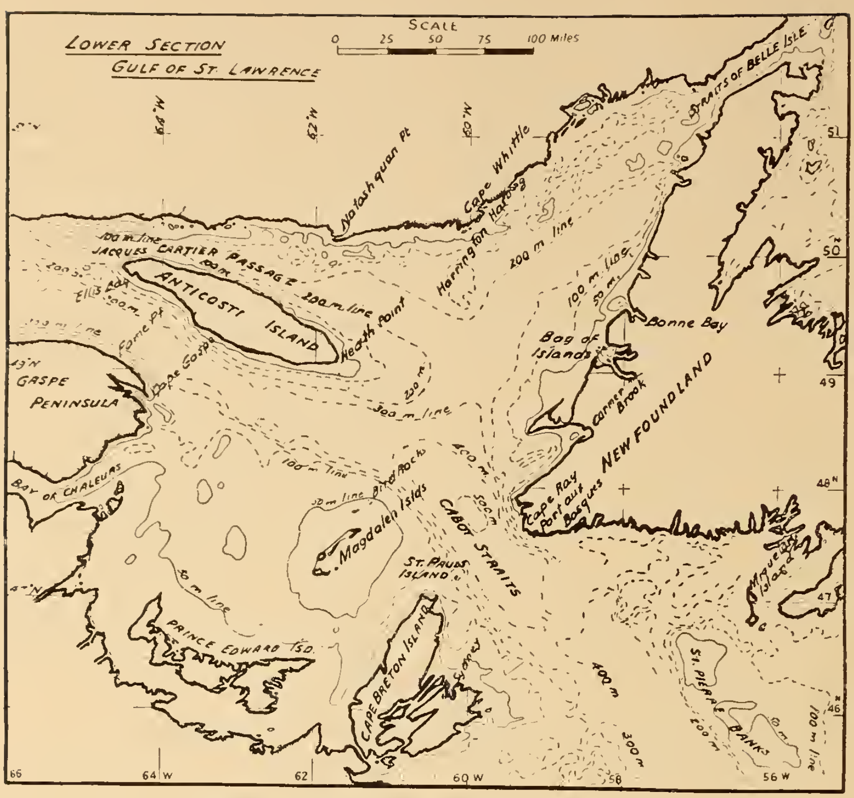

Fig. 9. Plan of the Gulf of St. Lawrence.

valley. A parallel instance is the buried channel of the St. Lawrence River underlying Massena Point with a rock surface nearly 70 ft. below Lake St. Francis.

Divert St. Lawrence into The Ottawa?

The idea of carrying the waters of the St. Lawrence across the Lowlands into the Ottawa River is not a new one, although a diversion on so large a scale as now suggested may not previously have been considered. The first proposal along these lines was made by the late Noulan Cauchon, M.E.I.C., about 1920. The idea was lost sight of when the United States, reversing a policy of over one hundred years standing, expressed a willingness to co-operate with Canada in the development of the St. Lawrence Waterway, the first step towards this end being the preparation of the well known Bowden-Wooton Report.

Mr. Cauchon's plans were subsequently reviewed by the late C. R. F. Coutlee, M.E.I.C., one of the brilliant engineers who have aided in building the canals of Canada, who called attention to the increased overall length of the Waterway that would result from accepting Mr. Cauchon's route. The cost of the necessary canal excavation will depend more on the quality of the material to be handled than on the quantity of it and the overall length of the route can be steadily reduced by moving the junction point between the canal and the Ottawa River eastward towards Point Fortune.

Generally speaking, the route of the proposed canal would run everywhere through cultivated lands. At such points as Winchester and Chesterville the elevations of the underlying rock beds are more or less established from depths of wells. This record is naturally what might be termed spotty, but it would not be surprising to discover that between Chesterville, where the rock level is satisfactory, and the head of the Galops there exists an area in which the rock elevations are relatively low.

Cost Comparable

Mr. Cauchon believed that the cost of building the cut off canal would be no larger than the cost of improving the waterway along the St. Lawrence Route. The data are not today available with which either to confirm or to refute this claim. It would be a great gain today if the representatives of Canada at Washington had available reliable estimates of the cost of building this cut-off canal; such estimates can be readily prepared once the contours of the buried rock surfaces are known. There are large quantities of alluvial soils to be excavated that would vanish before the impact of a powerful flow of water.

The Province of Ontario has already offered to invest about $250 millions in power plant construction on the St. Lawrence River. If this sum were made available for the construction of the proposed cut-off canal it would go a long way towards providing for the necessary costs of construction. The available head would be slightly greater than at Cornwall. A favourable site can be found on the banks of the Ottawa River for a power house, and many miles of the canal will run through cheaply-handled material. Some of the practices followed at Des Joachims might advantageously be used again on this canal.

In this study the writer has not dealt with the improvement of the Ottawa River between the proposed power house site and Lake St. Louis. The report on the Ottawa and Georgian Bay Ship Canal furnishes much information on this section of the river. If the proposed dam at Point Fortune is to be as bold in design as Des Joachims there will be little or no work required between the end of the canal, wherever it is located, and Point Fortune. Dredging will be required to deepen the channel across the Lake of Two Mountains, and a deep and long cut will be necessary at Vaudreuil to reach the channel of Lake St. Louis that lies west of Ile Perrot. There is little reason to think that the costs of these channel deepenings will exceed that necessary to deepen the Beauharnois Tailrace and to cut an adequate channel across Lake St. Francis. They can therefore be disregarded in a comparison.

Advantages of Wholly National Seaway

All things considered, the writer favours this plan for a wholly national power plant and waterway construction, subject always to a revision of opinion when more complete surveys have been made. This plan adheres to the principle of independent action which Canadians have observed for perhaps 150 years. It will probably not increase first costs materially and the design of the canal and all the operation details in connection with it in the future will be wholly in Canadian hands. Action will not need to be delayed by controversies within the United States, with which Canada has no direct connection.

The canal would also furnish a splendid site similar in nearly all respects to the Welland Canal for further industrial development. This alone would justify favourable action by the Government of Ontario. The adjoining lands are fertile and well settled and both road and rail transportation are well developed. The route lies close to great stores of low grade minerals.

Against this project must be recorded the increase in the overall length of the waterway, of 20 to 50 miles according to the location chosen; and the diversion of much of the water otherwise available for power at Beauharnois. However, as the power at Point Fortune would be under the same ownership as that at Beauharnois this objection is not too important.

A further advantage of the cut-off route lies in the opportunity it provides for equalizing the flow of the St. Lawrence from Lake St. Louis to the sea. When the Ottawa River is in flood, part of Canada's share of the St. Lawrence flow can be held back and stored in Lake Ontario. These reserves can then be drawn upon when the Ottawa passes into its regular low water stage.

Perhaps most important of all in the long run is the fact that there will be in Canadian hands a channel to the sea that can always be kept open and free from ice, whenever circumstances make an open winter waterway a national or provincial need. This writer has never been content to accept as a first principle in the design of a power house on the St. Lawrence, the building up of an ice cover over all the area above the proposed plant. Properly regimented, the river is fully capable of protecting itself from ice. The open channel to the markets of the world will in time become of immeasurable value to the Canadian cities along the Waterway, besides providing a sorely needed link between the markets of Central Canada and the naturally enterprising and mechanically gifted peoples in the Maritime Provinces.

As the advantages to be secured from this plan for a cut-off canal connecting the two main rivers would in large measure fall to the Province of Ontario, the Engineering Institute might wisely recommend to the Government of that Province that the possibilities of the project be explored by accurate surveys. The project is not without precedent. It is simply Beauharnois over again in a different setting, in a section of Ontario where industrial development is sadly lacking.

This study of certain problems connected with the development of the St. Lawrence Waterway is not to be considered as recommending any particular action or actions, other than further concentrated study of some of the great engineering problems that still remain to be solved in our own country.

If any student of the St. Lawrence problems cares to carry his studies down to the open ocean, he will find some information in this writer's paper on the Winter Navigation of the St. Lawrence Waterway which was published in November and December, 1950, by the Dock and Harbour Authority of London, England. Copies of this paper are on file in the Library of the Institute.

Indoor Environment and Human Comfort

by

G. Lorne Wiggs, M.E.I.C.

Senior partner, Wiggs, Walford, Frost & Lindsay, Consulting Engineers, Montreal and Toronto

A paper presented before the Mechanical Section of the Montreal Branch, Engineering Institute of Canada, March 12, 1951

This paper discusses certain problems involved in determining human comfort in indoor environments, which affect the engineer. It deals with the physiological and physical factors involved in radiant and convection heating and cooling, as well as those in air conditioning. It records some of the indices of human comfort in common use, and describes and illustrates the various comfort charts used in Canada, the United States and England. Finally, other physical factors affecting human comfort are given.

In all heating, cooling and air conditioning of enclosures for human comfort, in order to control these properly it is essential to first have a measure of human comfort. Unfortunately, as yet, no universal measurement of human comfort has been found and adopted, although a number of different methods of measurement and indices have been developed in different parts of the world. A number have been advocated by men with little or no practical knowledge of radiant heating and cooling of buildings. Consequently, most of the scales of human comfort, and also the comfort charts in common use on this continent, pay little regard to the radiant heat transfer between the human occupants of an enclosure and their surroundings.

It has been frequently said that anything which can be measured can be controlled. It is well known that dry bulb temperatures can be precisely measured, and also accurately controlled. Similarly wet bulb temperatures can be accurately measured, but close control for extended periods of time is more difficult. For a long time relative humidity was measured and controlled by human hair, or by animal membrane hydrometers and humidistats respectively, neither of which are usually classed as accurate instruments.

Recently the development of dew-point temperature instruments to measure precisely and control such temperatures has taken place. Accurate instruments are available for the measurement of air velocities, but such velocities are still difficult to control commercially with any high degree of accuracy. Thermopiles or radiation surface thermometers have been used considerably to measure the radiation from hot surfaces. But no known attempt has been made to use similar instruments to control the radiation from warm or hot surfaces. Thus we may say we have available all the instruments necessary for measuring the various components of the environment in an enclosure.

Radiant Heat Transfer Important

The author's long and extensive experience with radiant heating and some experience with radiant cooling has shown that radiant heat transfer between a human being and his environment is so significant that it cannot be neglected. It should be taken into consideration in all scientific investigations into human comfort, particularly into the development and use of comfort charts used by the heating and ventilating engineers, as well as those responsible for human comfort in buildings, railroad trains, etc.

Besides this, until recently the universal heating system used here has been convection heating. With convection heating, no method of controlling the mean radiant temperature of the floor, walls and ceiling is possible. As a result no one paid much attention to the mean radiant temperature of the enclosures. Now, by means of radiant heating and cooling systems combined with air conditioning, we are able to maintain the

ir temperature, the relative hu-
iidity and the air motion inde-
endently of each other, over the
ractical operating range of such
ystems.

Fig. 1 shows an installation in
'oronto by means of which this
accomplished. Aluminum radiant
eating and cooling panels are in-
alled around the exterior walls
f the room, to offset the heat gain
r heat loss through the exterior
alls. Similar panels are installed
nder the windows to do the same
r them. The lighting units are
nstructed with radiant panels,
hich absorb the heat from the
ghts and from the occupants of
e room below them.

Square diffusers are installed,
rough which conditioned air at
e desired temperature and rela-
ve humidity is supplied, in such
antities as to maintain the de-
red air purity and the required
r motion. The remainder of the
iling is composed of a highly
ficient sound absorbing material,
us assuring the room of the
oper acoustical condition. Thus
e have the ability to provide and
ntrol all the physical conditions
sired in the room. Now the prob-
m that remains is that of deter-
ining just what conditions should
maintained in the building, so
to give the optimum comfort
nditions.

Human Comfort

The purpose of this paper is to
view briefly some of the factors
hich enter into human comfort
d then to show and explain some
the indices of human comfort
d of the comfort charts in use
different parts of the world in
e light of our present knowledge
both convection and radiant
ating and of air conditioning.

It would be fortunate if human
mfort could be clearly and ab-
lutely defined, as well as meas-
ed directly. Unfortunately, no
own definitions or direct meas-
ements exist, although mean
in temperature offers some prom-
e as such a basis. Therefore we
e compelled to adopt some in-
x of human comfort, which takes
to account the various physical
ctors that affect it, and that can
measured or controlled directly.
et us consider for a moment some
the physiological properties of
e human body. It is these which
termine or affect human com-
rt.

The most important physiological property to practising engineers is metabolism. This is the term applied to the heat production of a human being, generally spoken of as the *chemical regulation* of the body temperature. The Basal Metabolic Rate refers to the metabolic rate of a subject who is awake, who is as nearly as possible at complete muscular and mental rest, and whose digestive processes are quiescent. It is usually taken at a room temperature of 20 deg. C. (or 68 deg. F.). It is usually determined in the clinic or laboratory by means of the Benedict and Roth apparatus, by which heat production is calculated from the oxygen consumption alone.

Fig. 1 Mock-up of ceiling system incorporating radiant heating and cooling combined with air and acoustic conditioning for the new Manufacturers Life Building, Toronto—Marani & Morris, Architects.

Basic Metabolic Rates

The average basal metabolic rate is constant for all normal men in proportion to their body surface area and not to their weight, being

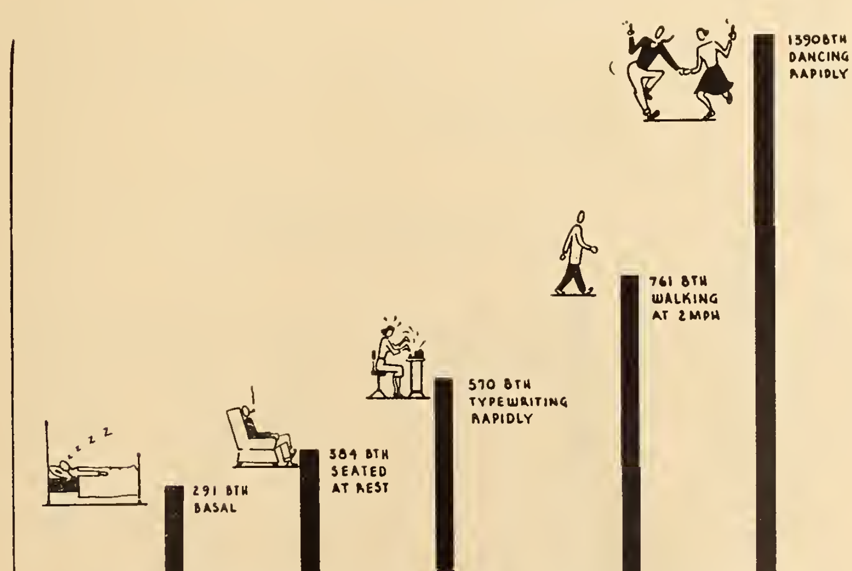

Fig. 2. Variation in metabolism for various occupations.

about 38 to 40 Calories per square meter (14.02 B.t.u. per square foot) of body service per hour. Actually the average basal rate diminishes progressively from infancy to old age, being about 50 Calories per meter (18.4 B.t.u. per square foot) per hour at the age of ten to twelve years down to about 32 Calories (11.8 B.t.u.) at ninety years. The average sur-

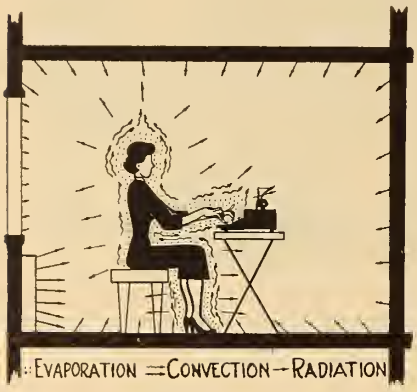

Fig. 3. Interchange of heat between a typist and her environment.

face area of adults on this continent is about 1.6 square meters (17.22 square feet) for women and 1.8 square meters (19.37 square feet) for men. The total basal heat production of the majority of normal adults, therefore, ranges between 1400 to 1800 Calories (5558 to 7146 B.t.u.) per day. (231.5 to 297.7 B.t.u. per hour.)

The heat production of an average man doing light work is about 3000 Calories (11.910 B.t.u.). Very strenuous work or exercise may increase this from 10 to 15 times above the basal level. The effect of some of the more common occupations is illustrated graphically in Fig. 2. On the other hand, mental effort causes an almost negligible increase in the metabolic rate. During sleep, when muscles are relaxed, the metabolism falls below the basal level, probably from 10 to 13 per cent.

The temperature of the human body is maintained constant by its efficient heat regulating mechanism, by maintaining a balance between the heat produced in the tissues (and the heat acquired in hot food) and the heat loss to the environment. This heat loss is dependent on physiological and physical factors, and is referred to as the *physical regulation* of body temperature. Fig. 3 shows how the heat loss is affected by the environmental conditions in an enclosure. Unfortunately the artist has reversed the direction of all the arrows shown emanating from the window, the ceiling, the wall and the floor. Actually these surfaces in winter are usually cooler than the average surface temperature of a normally clothed human being.

This shows that heat is lost from the body by evaporation from the skin and lungs, and by convection and radiation from the body. Heat loss also takes place by conduction, by contact with the floor and the furniture. Besides these, some heat is lost in raising the inspired air to body temperature, but this does not amount to more than 2 or 3 per cent of the total.

Calorimeter Tests

Figure 4 shows the results of careful calorimeter studies on a fasting, nude man by Dr. Eugene F. DuBois. The first column of each series represents the heat production as determined by indirect calorimetry, the second column, the heat elimination. Of the latter, the vertical lined section represents the heat loss by evaporation; the dotted area, the loss by convection; the unmarked area, the loss by radiation. It will be seen that at a low calorimeter temperature the greatest heat loss takes place by radiation. At the highest calorimeter temperature shown, the greatest heat loss takes place by evaporation, while the heat loss by radiation is almost negligible.

In most of the calorimeter tests the temperature of the air and of the surfaces of the enclosure is held constant, although in the partitional calorimeter of Winslow, Herrington, and Gagge, these temperatures may be varied or held constant independent of each other. In addition, both air motion and relative humidity may also be accurately controlled. For the purposes of this paper the methods used or the values obtained are relatively unimportant. The important thing is that, within certain limits of room conditons, heat loss and production can be balanced over a wide variation of each of the heat losses by radiation, convection and evaporation.

These calorimeter tests were made with nude subjects, but other studies have shown that the relation of skin temperature to comfort is close, and is identical for both nude and clothed subjects. Yaglow and Messer later verified the validity of skin temperature measurements, over a wide range of practical conditions and over an environmental temperature range of 30 deg. F. to 8? deg. F. They also found that the influence of humidities of less than 50 per cent on skin temperature appears to be negligible.

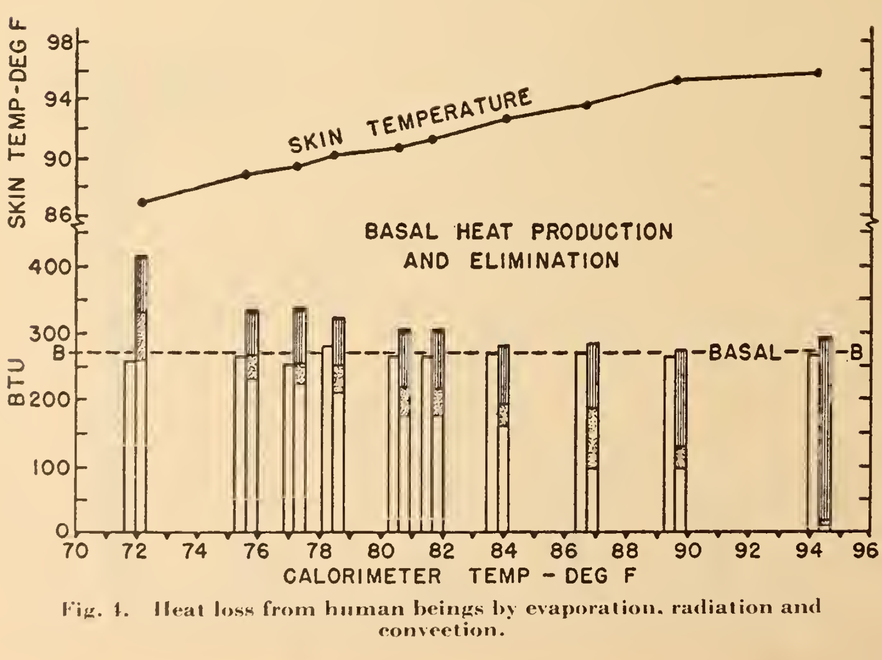

Fig. 4. Heat loss from human beings by evaporation, radiation and convection.

Ideal Conditions For Comfort

The function of a heating sys-
em, or of an air conditioning sys-
em, is to maintain in a building
he proper thermal environmental
onditions for human comfort. The
lifficulty is to measure and control
he proper thermal environmental
onditions. This becomes greatly
implified if the objective to be
ttained can be stated in precise
hysiological terms. According to
Vinslow, Herrington and Gagge
he ideal comfort conditions are
xperienced when the following
hree conditions are maintained; a
kin temperature of 30 deg. C., a
ninimal heat change in the body
issues, and a minimal evaporative
ate.

Such a precise statement of hu-
nan comfort may be satisfactory
o the physiologists. Unfortunately
t is not of practical value to prac-
ising engineers. They are there-
ore compelled to adopt some other
ndex of human comfort. They
nust deal with the various physi-
al factors in the environment
which affect human comfort.
These are the four factors of air
emperature, air motion, relative
humidity of the air and the mean
radiant temperature of the en-
losure.

Various attempts have been made to combine two or more of these factors in a single index. The first and best known to engineers here is the "effective temperature" index of the A.S.H.V.E. It is an empirical index, which indicates the sensation of warmth. This index represents the combined effect of air temperature and relative humidity in still air conditions. It completely disregards the mean radiant temperature. Figure 5 shows the A.S.H.V.E. Comfort Chart, showing the effective temperature lines of equal sensations of warmth. It also shows what are considered the summer and winter comfort zones. This chart is open to criticism as to its validity in the zone of optimum comfort. Because it neglects the mean radiant temperature of the enclosure, it is practically valueless in buildings heated or cooled by radiant heating or cooling systems, alone or in combination with air radiant heating.

For problems involving radiant heating only, Raber and Hutchinson have advocated the use of a simple formula, for determining the required radiant temperature to maintain comfort at any air temperature; that is, the required mean radiant temperature must equal 140 minus the air temperature. This is satisfactory for the design of simple radiant heating systems, but is of no value in determing the relative comfort under different conditions of air temperature and of mean radiant temperature.

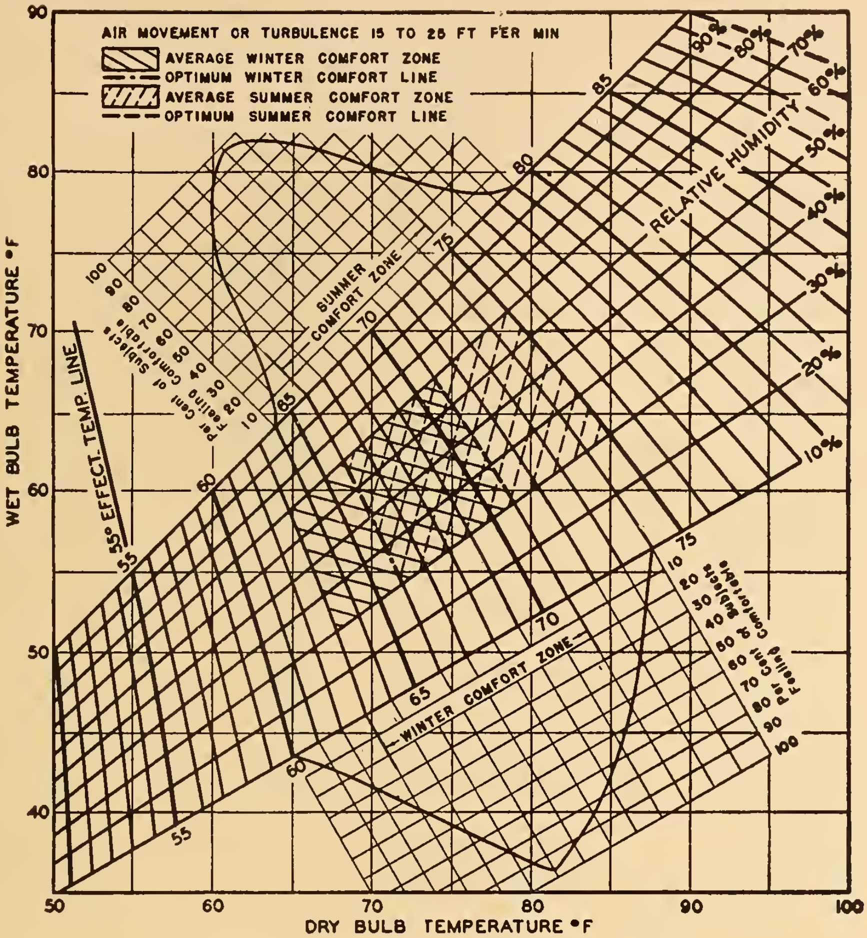

Fig. 5. A.S.H.V.E. Comfort chart for still air.

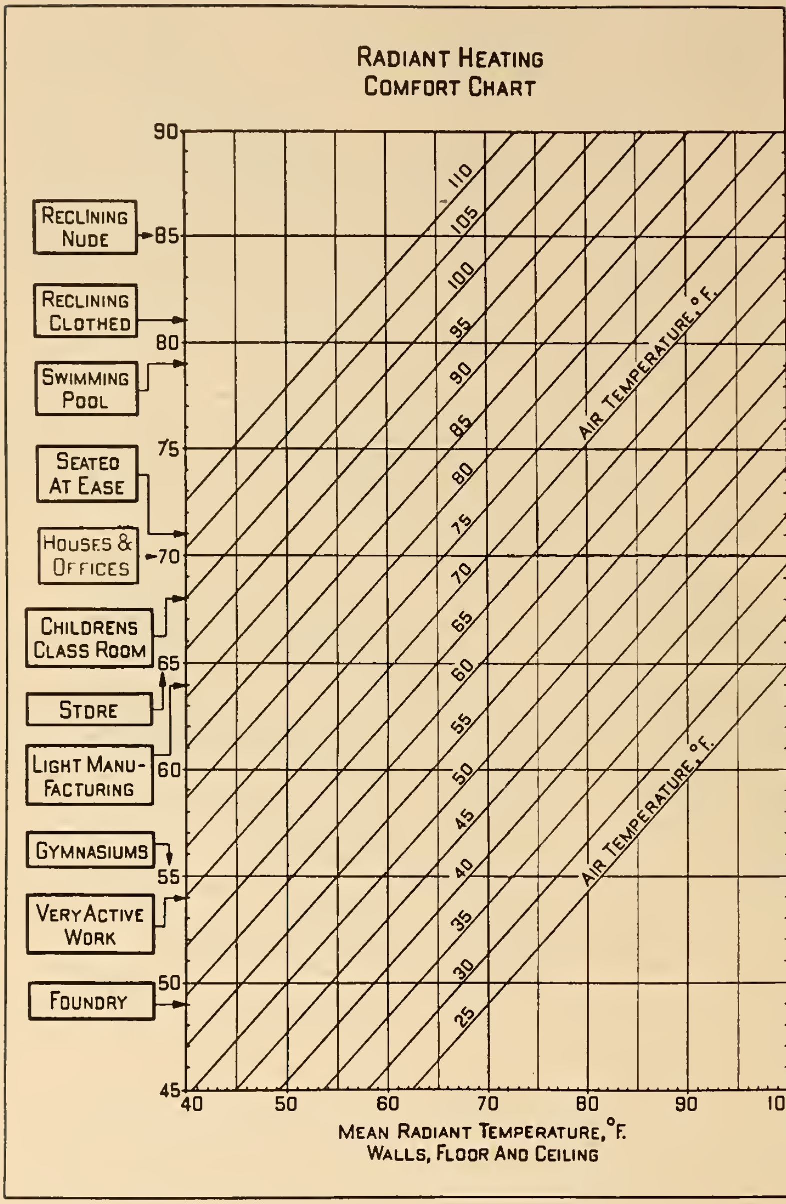
The Radiant Heating Comfort Chart

Figure 6 is a comfort chart called the Radiant Heating Comfort Chart. Its origin is not known, but it is a step forward from the Raber and Hutchinson formula. It introduces a new concept or index called "Operative Temperature", conceived by A. P. Gagge. This index takes into account the air temperature, the air motion and the mean radiant temperature of the enclosure surfaces. It disregards the relative humidity of the air and, based on the work of Dr. Thomas Bedford of the Medical Research Council of England, operative temperature is not necessarily an accurate index of the influence of the environment on thermal comfort. Besides this, it is the author's opinion that American physiologists are not thoroughly familiar with the present day practice of radiant heating. They are therefore not carrying on any of their research under conditions found in present radiant heating practice.

Equivalent Temperature Scales

In trying to find a comfort chart which is based on a sound knowledge of present day radiant heating practice, the writings of Dr. Thomas Bedford, an outstanding British physiologist thoroughly familiar with radiant heating, were consulted. Dr. Bedford advocates the use of the "Equivalent Temperature" scale, conceived by A. F. Dufton of the Building Research Station. This takes into account air temperature and motion, as well as the effect of mean radiant temperature of the sur-



Courtesy "Heating and Ventilating."

Fig. 6. Radiant heat comfort chart.

roundings. It makes no allowance for variations in relative humidity. It can be measured directly by means of an instrument called the "Eupathesoscope" but it can also be obtained from the readings of other instruments.

Equivalent temperature = $0.522\ t_a + 0.478\ t_w - 0.01474\ \sqrt{V}\ (100 - t_a)$,

where t_a is the air temperature in °F.; t_w is the mean radiant temperature in °F.; and V is the air velocity in feet per minute.

The index of equivalent temperature has been used in England for over fifteen years with some slight modifications.

Figure 7 is one of Dr. Bedford's charts, from which the equivalent temperature may be obtained from readings of air temperature, air motion and mean radiant temperature. The difficulty with this chart is the determination of the mean radiant temperature of the enclosure. However, in actual practice, equivalent temperature may be found readily by taking simultaneous readings of air temperature, air velocity and globe thermometer temperature. Then by the use of the alignment chart shown in Fig. 8, the equivalent temperature is obtained. Fig. 9 shows another alignment chart, by which equivalent warmth conditions may be obtained from dry bulb and wet bulb temperature, air velocity and mean radiant temperature.

In 1936 Dr. Bedford investigated the reliability of various scales of comfort in relation to environmental conditions, including the effective temperature scale, the dry kata thermometer cooling power, and the globe thermometer temperatures. He made slightly over 3,000 sets of observations, with nearly 2,000 different subjects doing light work. From these, he concluded that "up to a temperature of about 75 deg. F. the equivalent temperature scale is the best of the measures of warmth included in the comparison."

"It can be used," he said, "in calm atmospheres, or where there is much air movement, and it gives full weight to the effects of radiant heat. It is true that the scale makes no allowance for the effects of atmospheric moisture, but until the temperature approaches 75 deg. F. humidity exerts no great influence on warmth sensations." Furthermore, he added that "the reading of the globe thermometer is a good index of warmth where there is no great amount of air movement, as in the average workroom or office, since it makes adequate allowance for both air temperature and radiant heat."

Regardless of whether or not the comfort chart is correct, there is no doubt that in convected heated buildings, the air temperatures are invariably higher than the mean radiant temperatures of the rooms. H. M. Vernon and his colleagues of England in 1928 made a careful investigation of this. They found that, in general, in rooms heated by convection the mean radiant temperature was 3 deg. F. lower than the air temperature. Compared with this, they found that in panel heated rooms the mean radiant temperature was 3 deg. F. higher.

Lower Temperatures with Radiant Heat

As far as our experience goes, Canadians almost invariably maintain winter temperatures of 70 deg. F. to 72 deg. F. in convection heated buildings. We have found that most of the radiant heated homes are kept at between 66 deg. F. and 68 deg. F. with an air temperature of about 67½ deg. as the mean. In sub-zero temperatures we get a ceiling temperature averaging 90 deg. F. to 95 deg. F., and floor temperatures of about 72½ deg. F., with the air tempera-

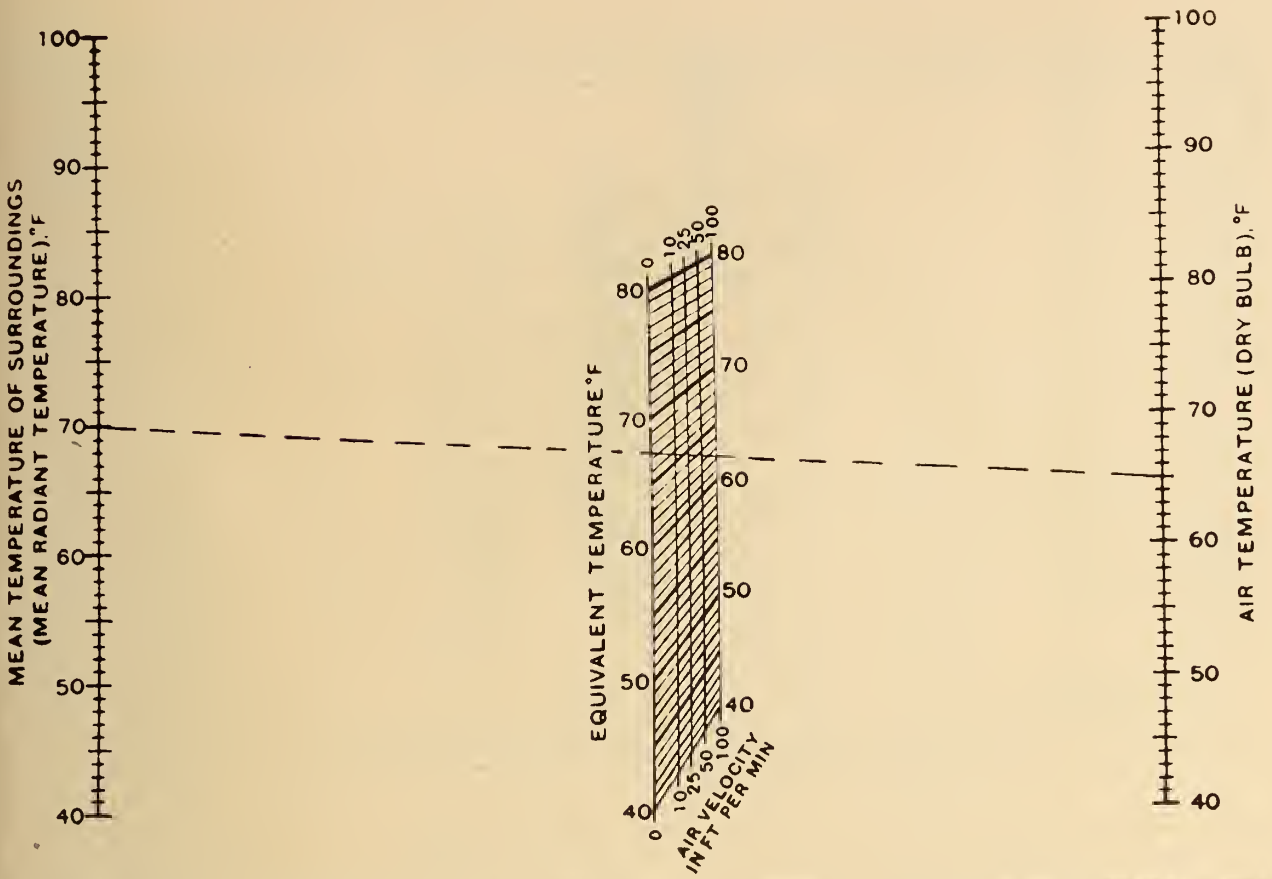


Fig. 7. Chart for the estimation of equivalent temperature for persons normally clad and doing sedentary or very light work. (I.H.R.B. Rept. No. 76, H.M.S.O.)

ture at 67½ deg. F. This provides a higher degree of comfort than is attained with convection systems, where the ceiling temperatures would be of the order of 72½ deg. F. when air temperature is 70 deg F. and the floor temperature is about 65 deg. F.

Fresh Air

In addition to the factors covered by the various comfort charts, there are also a few other physical conditions in an enclosure which have a very definite effect on human comfort. Bedford and Warner in their paper "Subjective Impressions of Freshness in Relation to Environmental Conditions" reached the following conclusions:

> The maintenance of a suitable degree of warmth is not the only requisite of a really satisfactory

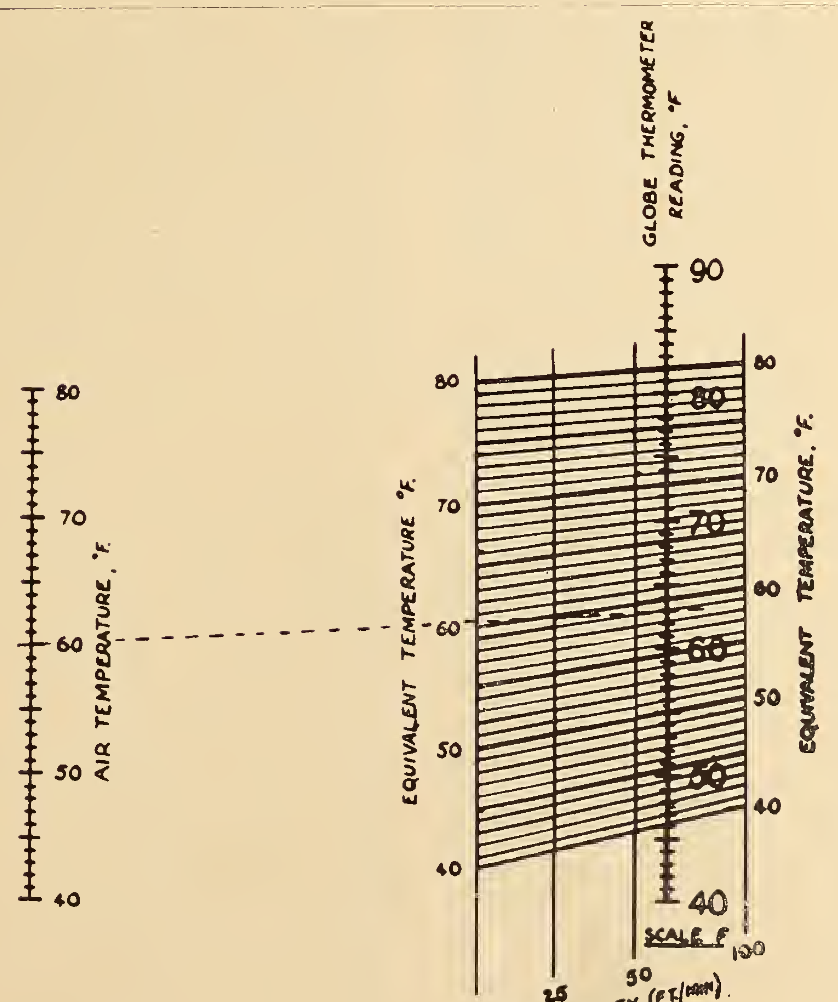

Fig. 8. Chart for the estimation of equivalent temperature from globe thermometer readings.

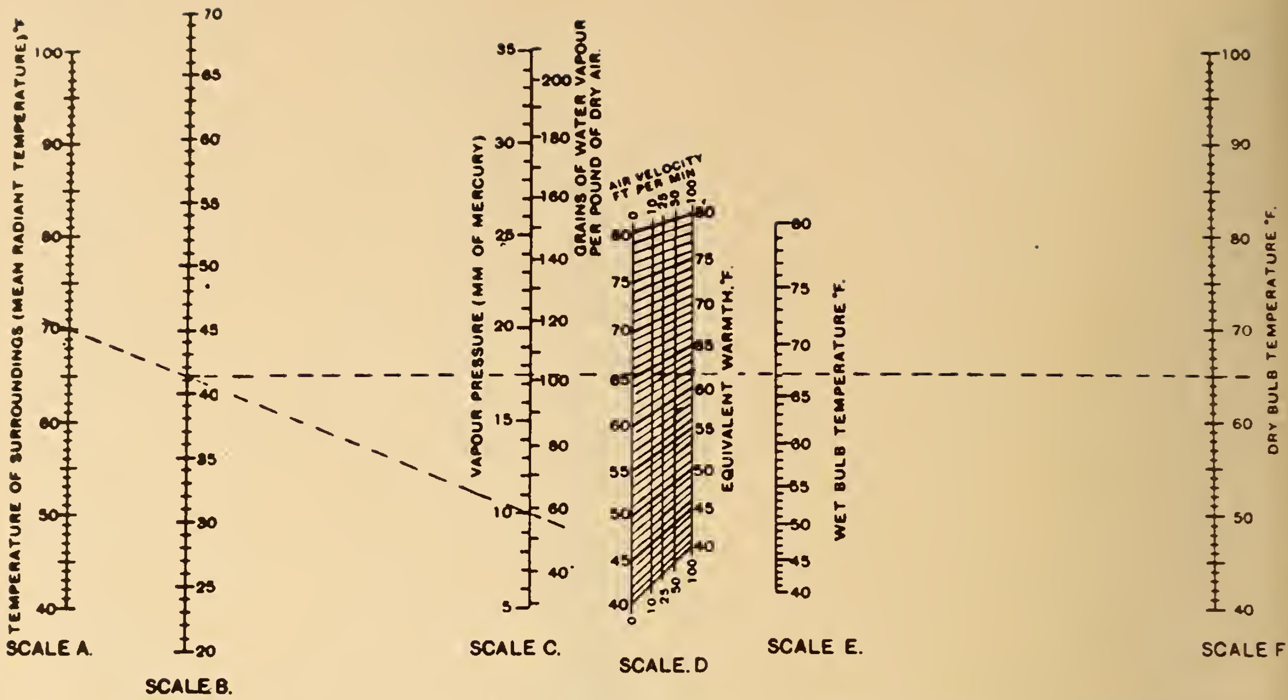

Fig. 9. Chart for the estimation of equivalent warmth conditions for persons normally clad and doing sedentary or very light work. (I.H.R.B. Rept. No. 76, H.M.S.O.)

system of heating and ventilation. It is not enough to ensure that the equivalent temperature, effective temperature, or other index of warmth is satisfactory, even though such an index makes adequate allowance for the thermal effects of the air movement and other variables. The factors which affect sensations of warmth also influence the invigorating properties of the environment, and help to determine whether a room will arouse feelings of freshness or of stuffiness in the occupants.

Dr. Bedford, in his paper "Radiant and Convection Heating" makes the following observations. "A room should be as cool as is compatible with comfort, since freshness tends to increase as the temperature is reduced. There should be adequate air movement, and that should be variable rather than uniform and monotonous. The relative humidity should be kept reasonably low. The air at head level should not be distinctly warmer than that near the floor, and the heads of the occupants should not be exposed to excessive radiant heat. We have noted the general recognition that an environment in which the mean radiant temperature is above air temperature tends to be pleasanter than one in which the air and walls are at the same temperature, or where the walls are cooler than the air." The author concurs with Dr. Bedford, for where people used to convection heating with the wall surfaces cooler than the air temperature enter a properly radiant heated room, many of them remark on the different, pleasant sensation they notice. It is believed this is due to the mean radiant temperature being invariably higher than the air temperature.

Value of Comfort Chart Doubtful

We have not made use of the Bedford charts, but our experience with radiant heating and cooling has convinced us that the A.S.H.V.E. comfort chart is of little value in radiant heating and cooling engineering. We had planned to carry on some investigations this winter to determine equivalent temperatures which occur in practice in Canada, both with convection heating and with radiant heating. The pressure of defence work, in addition to our already large practice has prevented this. A useful purpose has been served however in placing the information contained in this paper before members of the Engineering Institute. Thus others might be interested in pursuing this interesting subject. Also, manufacturers of measuring instruments and of automatic temperature control equipment might develop the instruments to better measure and control human comfort.

Canadian Industrial Preparedness

by

Major-General G. B. Howard

Executive Vice-President and General Manager,
Canadian Industrial Preparedness Association, Montreal

A paper presented at the 65th Annual General and Professional Meeting of The Engineering Institute of Canada at Montreal, May 9, 1951

Preparedness is a subject on which much has already been said, and much more will be said about it before we, in Canada, arrive at a state of satisfactory industrial preparedness for defence. It is proposed here to indulge in some generalities and definitions, in order to summarize the situation and the problems involved in its resolution.

First, what do we mean by Industrial Preparedness? It is generally accepted that we may be said to be prepared for our defence, insofar as industry is concerned, when we have prepared a plan for the most effective utilization of our industrial resources and potential to produce the requirements of our Armed Services, as well as those of our allies, and of our essential civilian economy.

Such a plan involves the allotment of emergency tasks to our major manufacturing facilities, the equitable distribution of manpower and materials between the Armed Services and essential civilian needs, including civil defence, as well as the control of power, transportation and communication utilities.

Such a plan must be broad in concept and, above all, flexible. It can never be considered complete. If we can plan the advance of a war, to meet some 60 per cent of the total requirements which are foreseeable, we will be doing well. Then too, in this day and age of rapid scientific, engineering and production development, what is new today is obsolescent tomorrow. Unless we are prepared to continue to work on our plan, to revise and amend it with changing designs and concepts, we may be better off without any plan whatever.

How Preparedness Fits in With Defence

Having roughly indicated what we mean by industrial preparedness for defence, and outlined briefly its scope and limitations, it would be appropriate to ask just how important this scheme for industrial mobilization may be. Where does it fit into the larger plan for the effective military defence of our country, and our western democratic way of life?

We accept the fact that we must have navies, armies and air forces in being. We must also have plans for the rapid expansion of these, should we be faced with the horrible expedient of another war. In short, we must have a military mobilization plan. We are also aware that warfare, and the means of waging it, are becoming more scientific by the day. Therefore, more nations have included, in their military set-up, armed service research, as well as design and development establishments.

Showing how industrial preparedness fits into the overall plans for mobilization, the author explains the reasons why industrial preparation takes more time than the training of fighting personnel. Outlining Canada's defence supply organization today, he shows how industry is being consulted and is giving advice to defence officials. The need for industrial planning for defence on an international scale is discussed, and the establishment of a joint board is recommended to co-ordinate national industrial efforts. Suggestions are added as to what may be done in the way of preparatory work to save valuable time.

With the ever increasing complexity of modern weapons and defence equipment, it is apparent that an increasingly greater load is being placed on the manufacturing facilities necessary to supply the armed services with what they need to fight a successful war. This being the case it does not require any great application of logic to place industrial mobilization on an equal footing in the scale of importance, with military mobilization. One is useless without the other. There are times, however, when one may be tempted to wonder if this equality of importance affords complete justice to the case for industrial mobilization, especially in North America.

Today's Supplies Move by Transport

About a hundred and fifty years ago, Napoleon remarked that an army moves on its stomach. That statement was generally correct until after World War I. It still has a considerable semblance of truth in so far as Russia and her satellites, slavic or oriental, are concerned. This is because the men and women in the armed services of those communistic slave states are treated somewhat less humanely than are the range cattle of our western plains. One has only to compare the number of what we call "employed personnel" in one of our combat units with the number of similar personnel in a Russian unit of the same size, to realize the difference between our potential enemies and ourselves.

Regarding our own fighting forces, Napoleon's opinion is strictly passé. Our armed services move on wheels and track treads. We use and need more rubber and petroleum products than we do food. We believe our men to be superior, man for man, to any against whom they may be placed. For this reason we place a much higher value on their lives, their welfare and their comfort. We extend our better standard of living to the very front line of battle. Thus we tend to be prodigal with our equipment, our labour and life saving devices, our weapons and ammunition. We rely on superior equipment, and more of it, to compensate for an inferiority in numbers. With us it is firepower and mobility against flesh.

Bulk of Equipment From America

Another point we must consider in North America, in assessing the relative importance of industrial mobilization in our defence preparations, is the fact that Western Europe has not, in the past, been materially self-sufficient in war time. The industrial potential of that part of the world is less than it was during the last war. Should there be another large scale conflict, we on this continent must be prepared to supply, in great quantity, that equipment which will enable our European allies to develop their full military power for their own defence, and to counter any communist aggression. We are making a start on such a programme in peace time. In time of war, the call on our resources will be immeasurably more pressing.

Industrial Mobilization Slower

Another factor which lends emphasis to the need for planning industrial mobilization is the time element. The time taken to enlist and train a sailor, soldier or airman, is much less than the time taken to start production of the weapons with which he must fight. Our Canadian Brigade is now in Korea, trained and ready to fight. A part of it has been in action for some time. Had it been necessary for them to wait until we could manufacture new weapons and equipment for them, they would not fight until some time next winter at the earliest. We do not, in peace time, maintain an arms industry in Canada, and we did an extraordinarily good job of converting our war plants of the last war to commercial output.

Considerations such as those might well lead us to the view that industrial mobilization planning in North America is of somewhat greater importance than military mobilization planning, even though the one be useless without the other. At this stage it seems appropriate to look at the organization which has been provided in Canada to be responsible for the provision of military supplies and equipment both now, and in the event of an emergency.

Canada's Supply Organization Today
