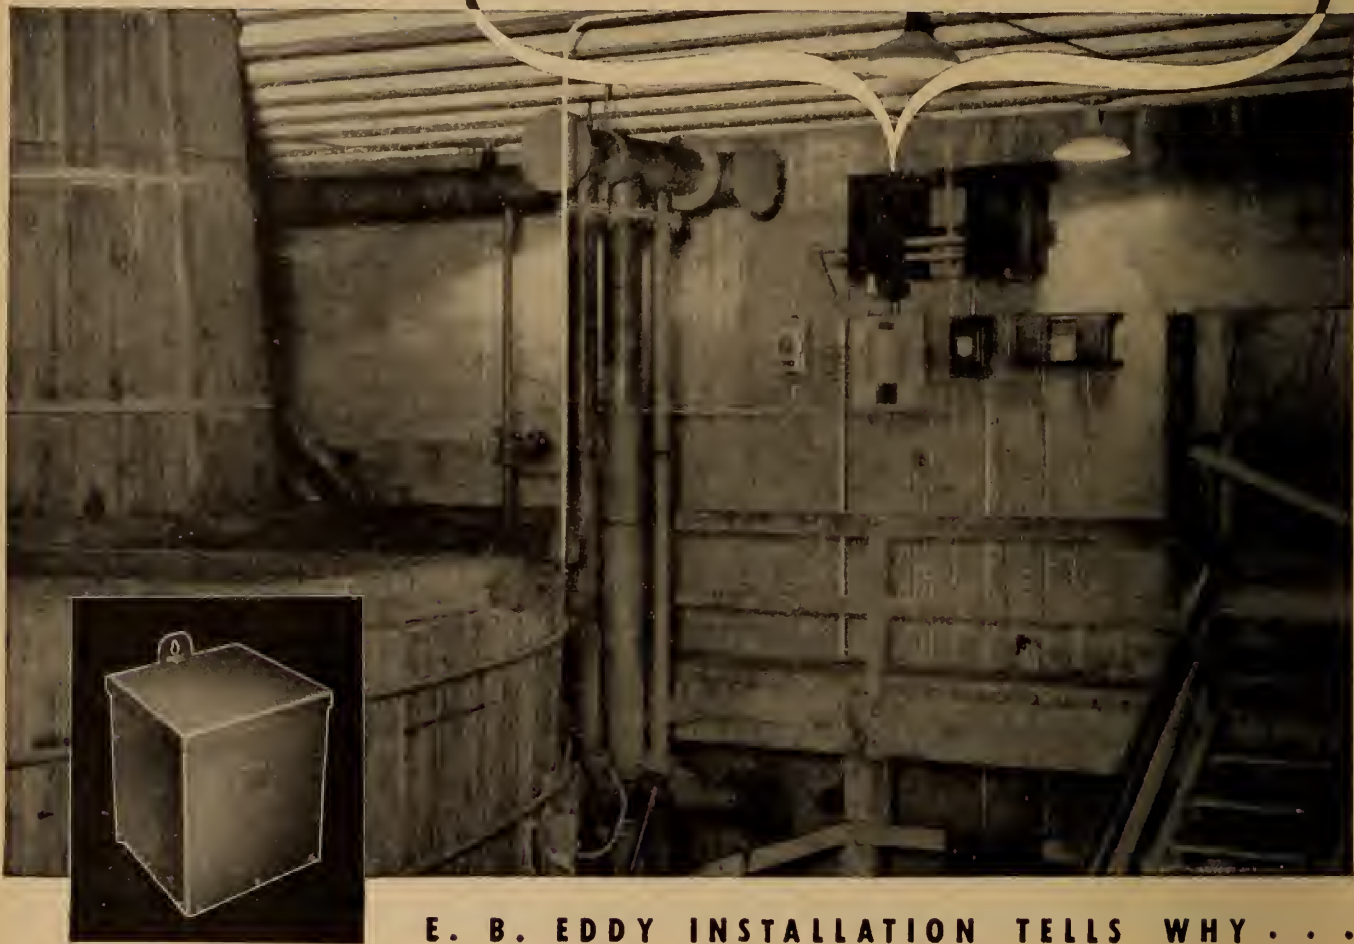
# WHY Westinghouse DRY TYPE "E" DISTRIBUTION TRANSFORMERS



## E. B. EDDY INSTALLATION TELLS WHY . . .

In the corrosive and moisture-laden atmosphere of the paper mill blow pits, the E. B. Eddy Company has installed two 15 KVA Westinghouse Dry Type "E" transformers for lighting service.

The Dry Type "E" replaces the more cumbersome and expensive oil-filled type previously used. They are neat, compact and simple to install, while the totally-enclosed factor makes them ideal for service conditions such as this.

Look at these advantages: AIR COOLED — eliminates fire hazard; TOTALLY ENCLOSED — can be installed in any non-explosive atmosphere; SPACE SAVING — Hipersil core; INSULATION — Class H Silicone; LOW MAINTENANCE AND INSTALLATION COSTS — no liquids to inspect, filter or change; no expensive vaults required.

If applications in your plant require transformers to operate in dust, corrosive or moisture-laden atmospheres, investigate the Westinghouse Dry Type "E." For further information contact your nearest Westinghouse District Office or write to the Industrial Products Division in Hamilton for Bulletin B-5812.

**Ideal for application in paper mills, textile plants, steel mills, chemical plants, lumber mills — or any industry with a dust, corrosive or moisture-laden atmosphere.** 540-46

# THE STABILIZATION

# OF

# SUSPENSION BRIDGES

*by*

F. P. Shearwood, Hon.M.E.I.C.

*Montreal*

The following discussion is an effort to visualize the action of suspension bridges and their unique behaviour as compared with all other types of bridges, when subjected to wind force. To modify these differences a change in the stiffening system is here proposed. Mr. Shearwood, for many years chief engineer of the Dominion Bridge Co. Ltd., Montreal, describes one method for attaining this end.

Few other types of bridge construction have called forth so much admiration for their beauty and graceful lines as have suspension bridges. These have an ancient history and are the only known type of bridge which can, economically and even successfully, be utilized for exceptionally long spans. But, as at present designed, they are often too limber and have a tendency to oscillate under even moderate winds. For these reasons they have been used only sparingly when in competition with other types of bridge construction.

With the constantly increasing demand for unobstructed highways involving spans of great length, the suspension type of bridge offers the only apparent solution. It is also probable that this type of bridge would be more used for spans of medium length, and even for railways, if the objectionable features of excessive deflection and undulation could be appreciably reduced.

It is with these ideas in mind that a modification in the stiffening construction is here suggested and presented for discussion and criticism. The suggested modification is to substitute diagonals for the vertical hangers and stiffening truss of the conventional type (Fig. 1); these, with the cable and stiff bottom chord would constitute a complete truss (Fig. 2), adequate to resist longitudinal forces from wind and to distribute partial loading. An article published in the *Engineering News Record* of October 24, 1941, by the staff of Modjeski and Masters, discussed the use of such diagonal hangers and the testing of a small model which showed remarkable advantages in the dampening of vibrations.

Most of the reported failures and troubles with suspension bridges have been due to wind blowing diagonally on the bridge, and to the fact that the resulting disturbing and disastrous movements were vertical oscillations and vibrations. Vertical live loads on these bridges, even on those with shallow stiffening trusses, have not been reported as producing dangerous or disturbing movements. These facts indicate that it is a longitudinal force that has caused the trouble.

Published reports on the extensive tests and investigations made in connection with the Tacoma bridge failure, indicate that these were largely conducted with a view to determining the resultant forces of the wind and their effect on a suspension bridge of the conventional design; i.e., on one with suspended stiffening trusses or plate girders. The effect of deflections of the cables on the bridge as a whole has been given scant attention, whereas it should be realized that every movement of the cables from their normal curvature causes a vertical deflection in the floor of the bridge and is probably the main cause of the oscillation.

All the external forces (wind and vertical loading) are duplicated for most bridges, not only for those of the suspension type, yet these other types have exhibited no similar undesirable tendencies. A comparison of the conventional suspension bridge design with that of the ordinary truss bridge should, therefore, indicate in what way they differ, and whether such differences are likely to account for the undesirable behaviour of the suspension bridge.

The outstanding difference between the suspension and other types of bridges lies in the provision for supporting and resisting external forces. In the suspension type it lies in the funicular lay of the cable, while in other types it lies in the elastic resistance of the structure.

The curve of the cable is acutely susceptible to variations of loading and, therefore, trusses are hung to the cables through which the moving loads are distributed over distances varying with the stiffness of these trusses. The trusses are also susceptible to variation in cable curvature, especially when it is deformed by other than vertical forces, e.g., by longitudinal forces or other movements.

Longitudinal force is chiefly derived from the longitudinal component of a diagonal wind force. This force acting on the suspended structure will swing it about the cables but if it is longitudinally connected to the cables, it will pull the cables towards one end, thereby sagging this end and straightening the other which in turn lowers and raises the suspended structure.

The resulting deflection of the trusses is an easy reversed curve between their extreme ends and, therefore, the elastic resistance to this bending of the trusses is small. The vertical loads on the trusses being equal, a seesaw action is liable to occur, and this may be aggravated by synchronizing with the gusts of wind.

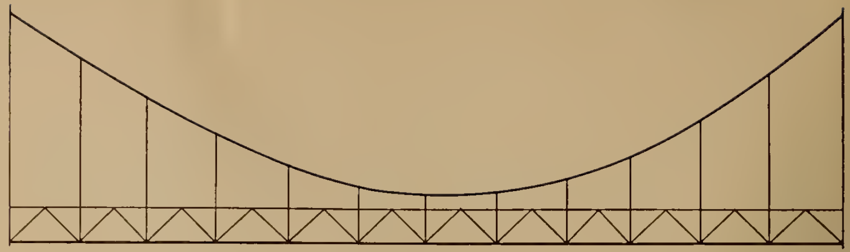

Fig. 1.

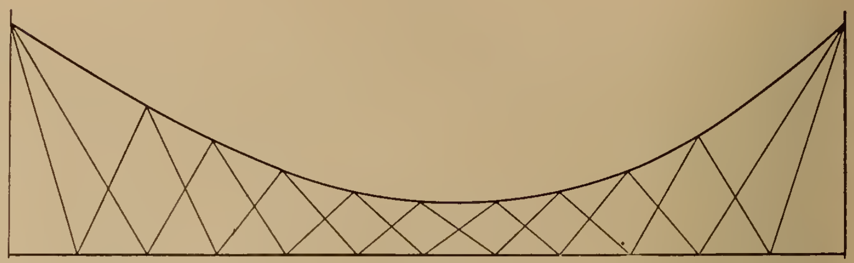

Fig. 2.

Since it is primarily the wind force acting against the members in the plane of the floor which causes the initial movement in a suspension bridge, it is probable that it is this movement, aided by the spring-like action of the cables, which starts undulations in the cables and produces the see-saw action of the whole structure that may lead to disturbing and sometimes disastrous results.

During strong gales, the wind, blowing in gusts, frequently varies slightly in both horizontal and vertical directions. This influence will often exert an uplifting pressure on the floor at one end of a bridge. In a suspension bridge this upward pressure will relieve the pull of the hangers on the cable there and allow the cable at that end to straighten out. The stiffening truss is then ineffective, since it cannot be the means of preventing deflection of the cable while at the same time causing this deflection.

This straightening of the cable at one end must be compensated for by increased sag at the other end, and also by a longitudinal movement of the whole structure. All of these complex adjustments tend to induce mixed disturbing oscillations of the bridge floor.

Modern suspension bridges have generally been designed with their stiffening trusses attached to the cables directly by means of vertical hangers. Some of the earlier ones, such as the Brooklyn Bridge, were also provided with diagonal ties, extending from the tower tops to adjacent floor panel points. These diagonals do brace the floor and prevent it from swinging longitudinally on the cables, but the distri-

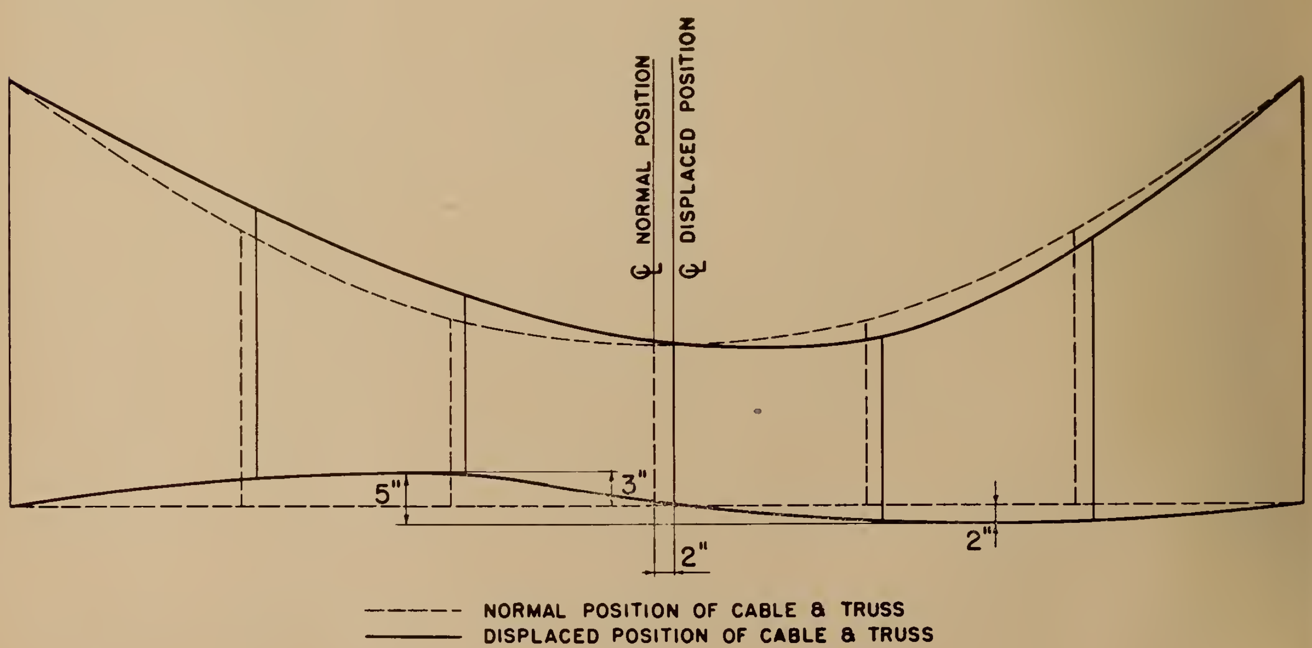

Fig. 3.

bution of stress between the diagonals and vertical hangers is very indeterminate and hence any analysis is unsatisfactory.

In some suspension bridges which showed a tendency to oscillate, ties have been installed, leading from the cables at some distance from the towers to the ends of the stiffening trusses or girders. These ties restrain the cables from straightening out their normal sags at the one end, but are ineffective in preventing the simultaneous increase of sag at the other end. They will reduce the general deflections of the cables and so help to dampen the oscillations of the bridge. In order to be effective, these ties must be fairly tight, and consequently they affect the distribution of loading and the stresses in the already indeterminate stiffening trusses.

In most suspension bridges the suspended weight is braced longitudinally only by means of some auxiliary connection to the cables at the centre of the span. Any induced resistance to longitudinally applied forces will then cause longitudinal movement of the span which, in turn, straightens out the cables on the windward end and sags them on the leeward end. This action deflects the truss into an S-shape, similar to that reported in the case of the Tacoma bridge failure (see Fig. 3). Wind, acting on a plate girder from any direction, except when blowing at right angles, will slide along the smooth surface of the web plate to meet the obstruction of the numerous stiffeners and so build up a severe longitudinal force, which normally must be resisted by the cables.

Longitudinal forces applied to the suspended structure must be resisted at their reaction points, i.e., at the tower tops. In a design which provides only the cables at the tower tops, the inclination of the cables at each tower must vary enough to give the required longitudinal reaction. This variation alters the symmetrical sag of the cables and therefore deflects the trusses and the floor of the suspended structure.

All of these movements and strains indicate that longitudinal forces and their consequent effect on the curvature of the cables, are potentially capable of producing the undulations in the floor which have caused troubles and disasters in suspension bridges. It is, therefore, reduction in the wind force, or increase in the resistance to its effect, that is desired.

Reduction in resistance to wind force has been extensively investigated and means for accomplishing it have been suggested. These will only reduce the deflections, but will not alter their character.

The increase in resistance to the distortion of the cable's curvature, which will alter the character of the movements, can be accomplished by changing the vertical hangers to diagonals, so as to form a complete truss system. This will carry most of the imposed force to its reaction points by direct stress, instead of by cross bending in subsidiary members combined with funicular cable distortion, as is achieved by the suspension truss system.

An example to show or verify the cause of undulations in a suspension bridge is experience with a comparatively short span (600 ft.), unloaded back stays, fairly high ratio of dead to live loads and stiffening girders well over conventional depth (6 ft.). This span developed vertical undulations amounting to over eleven inches in strong winds (probably 50 mph.) when blowing diagonally, and no noticeable vertical vibrations when blowing normally to the bridge. There were no complaints about vibrations when carrying heavy truck loads.

No other type of bridge of about that span would oscillate as this did and, therefore, one suspects the reason for the difference to be the unstable path from the applied load at the deck to its reaction points at the tower tops. This path is by the cable, the curved loaded panel points of which are held indirectly in only one direction by the suspended trusses, which themselves are hung to the member they should stiffen.

While the diagonal system will resist the longitudinal forces more efficiently, it must also distribute uneven and concentrated loadings without producing excessive local deflections in the floor.

The arrangement of the web members of the proposed system will be of the Warren truss type, as shown in Fig. 2. This is the type suggested for replacing the conventional stiffening truss design, shown in Fig. 1. For uniform loading the stresses in all the diagonals of Fig. 2 are tension, and nearly equal in each member of a pair meeting at a common panel point, but a concentrated load will tend to produce a reversal in all those diagonals located between the load and either pier, which are inclined from bottom to top away from the pier.

Owing to the lengths of many of the diagonal hangers and also for the sake of economy, as well as for simplicity of detail design, it is almost imperative to make the diagonals of strands, ropes or rods, i.e., purely tension members. If all the members in the proposed system could resist the stresses developed under all conditions of loading, it would form a more rigid structure than a suspended truss system, because of its greater average depth.

Assuming that the lower chord has no bending value, the diagonal system will function as a complete truss for all positions of the moving load, until the live load compression stress in some diagonal exceeds the dead load tension stress in it. The excess stress will then distort the curve of the cable and deflect the floor of the bridge until the components of the cable meeting at that point, balance the extra stress.

Considering the small amount of extra live load required to reverse the dead load stress in the diagonals, a very slight increase in the section of the lower chord would give it enough bending value to transfer the excess live load to the adjacent panel points and so prevent any excessive local deflection of the floor.

If the slight curvature in the cables between panel points be initially neglected, the stresses for a diagonally braced span, as shown in Fig. 2, can be closely calculated for uniform loading, because the reactions at the towers are determinate in amount and very nearly so in direction.

Moving loads will cause deflections of the cable at each panel point and so alter the component from the cable to be taken by the diagonals. Any increase from this cause is considered to be comparatively small and safe to neglect, especially as it tends to decrease the possibility of reversing the dead load tension in the diagonals.

The exact elastic stresses in all the members of such a system are indeterminate, but the maximum stress in any member when subjected to the most severe loading can be readily approximated. Therefore, if all reasonable assumptions of loading are considered, the safety of the bridge and its component parts will be assured.

The maximum stress in the cables occurs when the total design load is being carried; therefore, this maximum stress in the cables will not be exceeded if the cables are

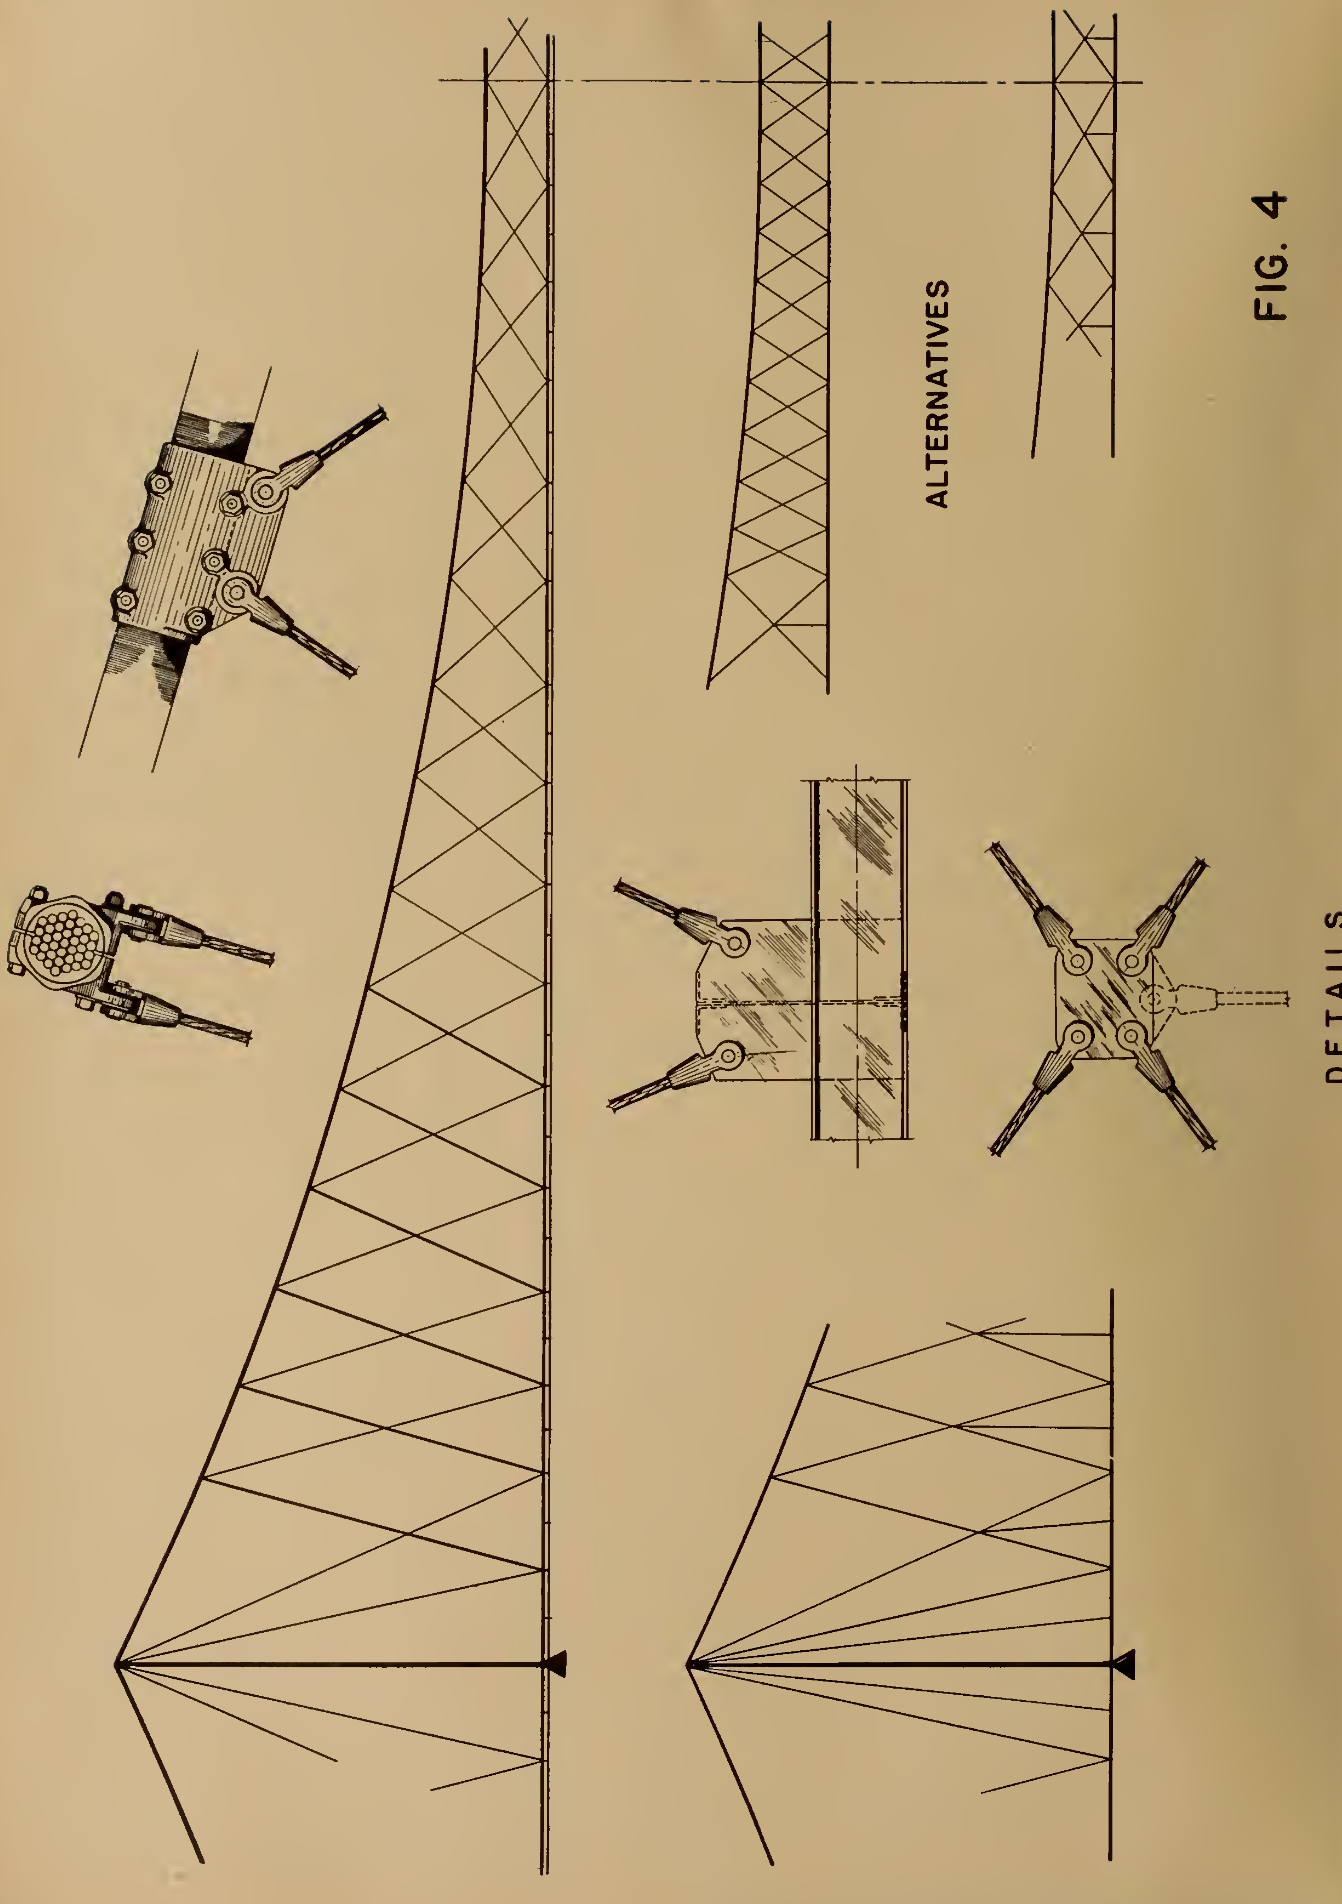

FIG. 4

incorporated into a truss system for the distribution of partial loadings.

The direct stress in the lower chord will be the sum of the components from each pair of diagonals. Since the inclinations of each pair are nearly equal, the result will be small for uniform loading; for moving loads these components will be influenced by the varying amount of continuity of stress in the cables at the towers.

The design of the lower chords will also be made to provide resistance to cross bending from intermediate panel loads and from the distribution of possible excess live loading; further, it will provide for the direct stress when it is acting as the chord of the lateral bracing system.

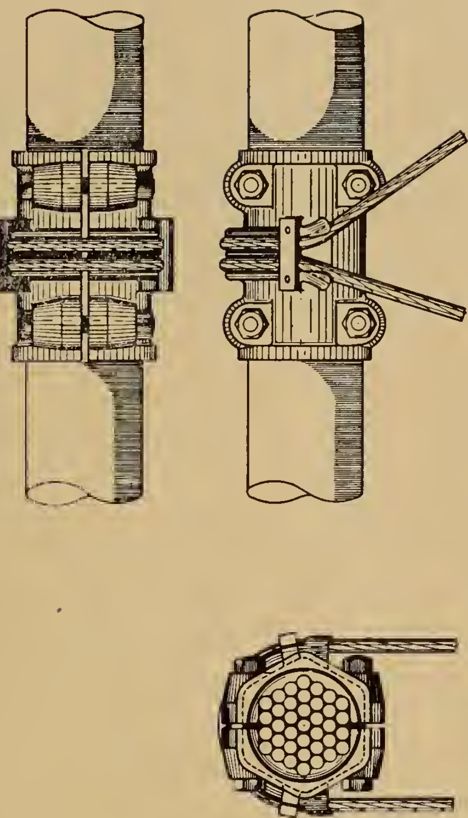
The maximum stress in any diagonal inclined from bottom to top towards its nearest pier cannot exceed that due to the maximum panel load, because of the lack of compressive value in the other diagonal meeting at that point, while the stress in the other diagonals, for non-uniform loading, must be less than that due to a full panel load.

Some of the advantages to be gained by using the proposed stiffening system, as compared with that in Fig. 1 are:

1. Longitudinal movement of the deck is prevented by complete trussing between the deck and the cables.
2. Complete trussing between the cable and the bottom chord greatly reduces local distortion of the cable from its normal curvature, resulting in reduced vertical deflections of the floor.
3. It provides the maximum possible depth of stiffening system and utilizes the great strength of the cable as a part of the system.
4. A more direct and stiffer path for distributing the shears to the cable and towers is provided.
5. The saving in the dead weight of the suspended truss is considerable.
6. It results in a slight reduction in the maximum cable stress.
7. It offers less exposure to the wind, due to the absence, or reduction in size, of conventional stiffening trusses.
8. It is in itself a basically complete truss and does not require additional members to stiffen it.

Some of the disadvantages are:

1. The greater variations of stress in the hangers.



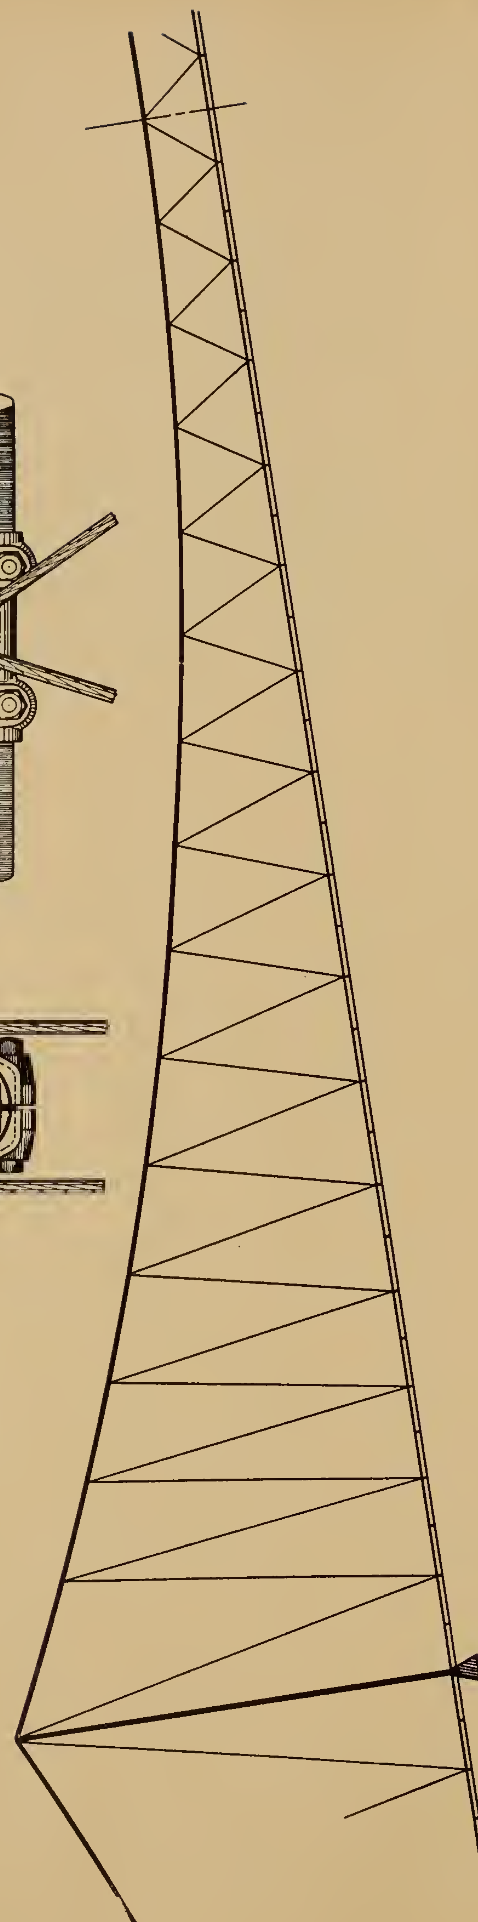


Fig. 5.

2. The greater shear between the cable bands and the cable, requiring higher adhesion of the bands to the cable.

To sum up:

1. It is the longitudinal component of the wind force that causes undesirable movements in existing suspension bridges.
2. The component force swings the suspended structure and so deforms the curvature of the cable, thereby causing undulations in the floor, and a torsional movement in it if the cable deformations become out of step with each other.
3. These movements can be reduced by providing more co-operative action among all the main members of the structure and by more definite bracing of the panel points of the cables, as provided by the diagonal system of hangers, which gives a complete trussing system between the final reaction points.
4. The type of deflection experienced in suspension bridges does not occur in other types. It is, therefore, probable that this is due to their different means of resistance, i.e., to funicular change and elastic deflections.
5. If most of the resistance to deflections from moving loads (wind and live loads) could be changed from distortion of the cable curve to an elastic deflection of a truss, the undulations and vibrating motions could be eliminated, or at least reduced.
6. The proposed diagonal system of hangers will function elastically as a complete truss for the greater part of the moving and wind loads. The excess from extreme conditions of loading will seldom occur and will generally be very small. If or when they do occur, only the excess must be counteracted by the funicular resistance of the cable, and only this excess will cause a corresponding local deflection in the floor, similar to that in the conventional type of bridge.
7. The great supporting power of the catenary cable curve and the stiffening qualities of a truss are efficiently utilized in the proposed diagonal system.

Figs. 4 and 5 are simply sketches indicating the application of this suggested trussing to an 1,100 ft. bridge, similar in dimension to the Island of Orleans bridge near Quebec. Only a few typical details are shown.

This paper was suggested by the study and observation of small four-foot models of suspension bridges with both vertical and diagonal systems of hangers. The models were made of string, cord and light chains, and they served to demonstrate visually many of the causes of oscillation, as well as to suggest the possible means of preventing it. The models also provided a visual demonstration of the distribution of stress, suggesting the idea of prestressing some of the diagonals to avoid reversal.

The suggested change in the stiffening system is discussed here in mere outline. There are many topics relating to the subject which have not been touched upon, e.g., the complicated problem of the amount of continuity at the tower tops for various conditions of loading. There are many others which will reveal themselves, but it is trusted that sufficient reasons have been here presented to show that the basic principle of the diagonal system of hangers is not only possible, but probably far more economical and stable than the system of vertical hangers.

In the preparation of the arguments set forth here, a great measure of assistance has been extended to the writer by the designing department of the Dominion Bridge Company, Ltd., Montreal. Grateful thanks are due for such aid, especially that accorded by the Chief Engineer of the Company, Mr. D. B. Armstrong, and also to Dr. Ammann and Dr. P. L. Pratley, M.E.I.C., for their most useful comments on a preliminary draft of this paper. √

---

# Industrial Electric Motors Re-rated

The Canadian Electrical Manufacturers' Association Motor and Generator Section recently announced new standards for re-rating industrial type electric motors. This is considered to be revolutionary since most industrial induction motors on the Canadian market today have been built according to basic frame size-horsepower relationships established almost 25 years ago. Because of the long service life of electric motors it has been difficult to take advantage of the technological advances made during this time.

The new standard covers the re-rating of squirrel cage, polyphase, 60-cycle, 2, 4, 6 and 8 pole induction motors in designs A and B, and rated 1 to 30 horsepower open type and 1 to 25 horsepower totally enclosed.

Basically the new design will allow more horsepower for each frame size. For example, in the old standard a motor with frame size 254 delivered 5 horsepower at 1,800 r.p.m. In the new setup the same frame size, designated 254U, will deliver 7½ horsepower at 1,800 r.p.m., an increase of 50 per cent. Similar increases are noted for each frame size.

Comparisons of the new and old frame assignments are shown in Table I. The old 200 and 220 series have been replaced by the 180 and 210 series respectively. Where the new re-rated motors have the same frame designation as the previous design the suffix letter "U" has been introduced to indicate larger shaft extension dimensions. Shaft sizes have been increased to maintain approximately the same size relationship to horsepower ratings.

**Table 1—Comparison of the New and Old Standard Frame Sizes for Open Squirrel-cage Induction Motors at 1,800 rpm.**

| *H.P.* | *New* | *Old* |
|---|---|---|
| 1 | 182 | 203 |
| 1½ | 184 | 204 |
| 2 | 184 | 224 |
| 3 | 213 | 225 |
| 5 | 215 | 254 |
| 7½ | 254U | 284 |
| 10 | 256U | 324 |
| 15 | 284U | 326 |
| 20 | 286U | 364 |
| 25 | 324U | 364 |
| 30 | 326U | 365 |

To ensure maximum interchangeability, the totally-enclosed, fan-cooled ratings have been assigned the same horsepower-frame relationship as the open type ratings up to and including 20 horsepower. Above 20 horsepower it is necessary to use larger frame sizes than for the open ratings in order to maintain the same standards of temperature rise, torque, etc.

July 1, 1954, is the tentative availability date set for frames 182 and 184. The remaining series are expected to be made available at five-month intervals.

A similar re-rating program has been adopted by U.S. manufacturers.

**Fig. 1. Diesel road freight locomotive, 3,200 hp.**

# Economics of the Diesel-Electric Locomotive in Railway Service

*by*

W. P. Moffat

*Transportation Engineer, Canadian National Railways*

*A paper presented before the Montreal Branch of The Engineering Institute of Canada, November 12, 1953*

In this paper the author compares the characteristics and performance of steam and diesel locomotives, and discusses the economic significance of the diesel in various classes of rail service.

Pointing out that with each additional diesel unit acquired it becomes increasingly difficult to obtain a high level of utilization, he observes that the Law of Diminishing Returns is applicable to this problem.

He concludes that while the diesel may ultimately lose its supremacy to the gas turbine or some other type of locomotive, the advantages of any new type will not justify scrapping the diesels for a long time to come.

The diesel-electric locomotive is described alternatively as a diesel engine with an electric transmission system, or as an electric locomotive carrying its own power plant. Whichever definition is preferred, common usage today has made it simply 'the diesel locomotive', and it is in such terms that it will be referred to here.

It is not intended to explore here the various mechanical and electrical intricacies of the diesel locomotive. The purpose, rather, is to discuss the fundamental differences between diesel and steam locomotives, and the economic significance of these differences in the various classes of railway service.

'Economics' is a word that is liable to a variety of interpretations, and its use in the title of an address might not normally be considered good psychology on the part of the author. Actually, the "economics" are vital with respect to dieselization, and it is in the "economics of the situation" that the railways have sought, and are seeking, the answer to the question "How far and how fast shall we dieselize ?"

Reduced to simple terms, the problem may be stated as follows: To what extent should we replace steam locomotives, which we own (regardless of how much depreciation we have accrued thereon), by diesel locomotives which have a lower operating cost, but each unit of which requires a capital expenditure of from $100,000 to $250,000 depending on size and type, and a further expenditure to provide servicing and maintenance facilities ? The answer must rest on how quickly we expect the operating savings of the diesel to amortize its capital cost.

It is proposed to deal with this question separately in relation to each of the various types of railway service, that is, through freight service, passenger service, yard switching service, and wayfreight service, and to indicate in general how the fundamental differences between diesel and steam locomotives affect the answer in each case. Before doing so, it seems that a description of the characteristics of the two types of locomotives, which are important when comparing their cost of operation, would be in order.

### The Steam Locomotive

The characteristics of the steam locomotive, which indicate its usefulness in transportation service, are: (1) Maximum tractive effort. (2) Weight on drivers. (3) Horsepower. (4) Maximum axle load. (5) Total weight. The same factors are applicable in the case of the diesel locomotive, but a sixth factor is sometimes important, namely, continuous tractive effort and short time ratings allowed in excess thereof. Maximum tractive effort of a locomotive determines the tonnage the locomotive can haul over a given grade, without any regard to speed.

Maximum tractive effort of a locomotive may be determined by horsepower, or by the coefficient of adhesion between wheel and rail, whichever is the limiting factor. Weight on drivers is important, because adhesion is based on this weight. Horsepower, to the extent that it can be utilized, determines speed. Maximum axle load is the criterion which determines whether the locomotive will be permitted to operate over any given piece of track with a given weight of rail. Total weight of the locomotives is usually the criterion which indicates whether the locomotive will be permitted to operate over any given bridge.

A Northern type steam locomotive has a 4-8-4 wheel arrangement, that is, 4 wheels in the leading truck, 8 driving wheels and 4 wheels in the trailing truck. The maximum tractive effort of this locomotive is 57,000 lb., its weight on drivers 246,000 lb., its maximum horsepower at the rim of the driving wheels approximately 2,600, and its maximum axle load 61,500 lb. Total weight is 400,000 lb., or 678,000 lb. including tender.

### The Diesel Locomotive

Figure 1 shows a 3,200 hp. diesel road freight locomotive, consisting of two 1,600 hp. units. This locomotive has a maximum tractive effort limited by adhesion, depending on rail conditions, to 25 or 30 per cent of its weight on drivers, which (unless the locomotive is specially ballasted), in this case is 480,000 lb. Thus the maximum tractive effort at 25 per cent adhesion would be 120,000 lb. The horsepower, normally stated as 3,200, is measured at the input side of the generator. It is exclusive of horsepower required for auxiliaries, that is, it is horsepower for traction purposes. At the rim of the driving wheels the horsepower amounts to about 2,600.

The weight is nearly equally distributed on all four axles, so that the maximum axle load is about 60,000 lb. It will be noted that, in contrast to the steam locomotive, all the weight is on driving axles. The continuous rating of this particular locomotive is 105,000 lb. It is generally conceded that, while the locomotive can, on starting, effectively exert a tractive force equivalent to 25 or 30 per cent of its weight on drivers, the maximum percentage adhesion that can be regularly counted upon in ascending a grade of any length is 19 per cent. In the case of this locomotive, 19 per cent adhesion amounts to 91,200 lb. which is well below the continuous rating.

Thus, the maximum tractive effort of this locomotive on grades is limited by adhesion rather than horsepower. This is generally true of diesel units now manufactured. It can be stated that the manufacturers, by increasing the continuous ratings, have eliminated to a great extent the possibility of burning out traction motors through overloading, since the factor of adhesion can be

**Fig. 2. Diesel yard switcher locomotive.**

expected to prevent the overload condition being reached for any significant time. Road passenger units are similar in appearance to road freight units.

### Comparisons

There are, of course, many other types of steam and diesel locomotives. The Northern type is the most modern steam locomotive in use on the Canadian National, our last purchases having been made in 1944. There are heavier locomotives than the Northern in use, for instance, the Texas type, with a maximum tractive effort, when booster equipped, of 89,100 lb. Other types range from the Santa Fe, with a 2-10-2 wheel arrangement and a tractive effort of 65,000 lb., to the lowly Moguls and 10-Wheelers with tractive efforts as low as 20,700 lb.

On the diesel side, there are two other general types, the yard switcher and the road switcher. Figure 2 illustrates an 800 hp. yard switcher, and Fig. 3 a 1,200 hp. road switcher. The latter, as the name implies, is suitable for operation both on the main line and in yard service. The diesel switchers now in use on the Canadian National vary from 380 hp.—three of which are in service in Newfoundland—to 1,200 hp., while the road switchers vary from 380 hp. to 1,500 and 1,600 hp.

To return to the comparison of the Northern type steam locomotive and the 3,000 or 3,200 hp. diesel, Fig. 4 shows a comparison of the tractive effort and horsepower curves. It will be noted that the diesel has a relatively constant horsepower throughout the speed range, whereas the steam locomotive horsepower gradually increases to a maximum, which is not reached until the speed is 35 to 40 miles per hour. These curves are significant in comparing the capabilities of the locomotive in different services. The greater tractive effort of the diesel at low speeds means that, in this particular comparison, it can handle almost twice the tonnage of the steam locomotive up any given grade.

In passenger service, or high speed freight service, the comparison is quite different. Here it is found that, with trains of equal weight, there is very little difference in the running time of a 3,000 hp. diesel and a Northern type—the diesel having greater tractive effort at lower speeds, and thus being able to accelerate faster up to about 30 miles an hour, while the steam locomotive has a slight edge at higher speeds. Thus, while a 3,000 or 3,200 hp. diesel locomotive in heavy freight service will perform the work of almost two steam locomotives of the Northern type, in passenger service the comparison is approximately one for one, without in either case, taking into account the greater mechanical availability of the diesel locomotive.

### Diesels are Slower

While on the subject of comparative tractive effort curves, it will be of interest to point out the reason why diesel locomotives in freight service are often found to be slow, in comparison to steam locomotives. It will be seen from the shape of these curves that if the two-unit diesel is just able to equal the running time of the Northern type steam locomotive with a train of equal weight, the diesel is bound to be slower when loaded down to the extent that its greater tractive effort at low speeds will permit.

The availability of a locomotive is defined as the percentage of time that it is available for use in transportation service. Diesel locomotives in road service should average about 85 per cent availability, while in switching service the percentage should be 90 or over. Steam locomotives, on the other hand, rarely have an availability greater than 65 per cent, and usually it is somewhat lower.

The greater mechanical availability of the diesel locomotive is important, not only because it reduces the number of locomotives required, but because it permits the use of diesel locomotives on much longer runs than is, or was, possible with steam locomotives. For instance, diesel locomotives on the Canadian National have regularly been handling freight trains between Montreal and Halifax, Montreal and Winnipeg, Toronto and Winnipeg, and Winnipeg and Jasper. This characteristic of the diesel locomotive is important in helping to obtain the maximum utilization of this type of power, a factor that is most significant economically.

Fig. 3. Diesel road switcher, 1,200 hp.

### Fuel Costs

The principal items affecting the comparison of diesel and steam locomotive operating costs are fuel costs (including such associated costs as water and lubrication), repair costs, and enginehouse expenses. In through freight service a saving in crew wages is also made whenever average train load is increased through dieselization.

With respect to fuel costs, care must be taken to make a true comparison, and also to see that all applicable costs are included, such as the cost of distribution and handling. When all costs are included it is found that the fuel and associated costs of diesel locomotives in freight service generally vary from ⅓ to ½ of steam fuel costs, with the probable average being about two-fifths. The lower fuel cost of the diesel locomotive arises chiefly from two factors, the greater thermal efficiency of the diesel locomotive and the low distribution costs of diesel oil compared with coal.

The above comparison refers to a coal burning steam locomotive. Fuel costs of oil burning steam locomotives, of which the Canadian National has over 300 operating in Western Canada and about 40 in Newfoundland, have varied between 65 to 90 per cent of coal costs, depending on distance from coal mines. However, recent changes in subvention rates have somewhat reduced the difference between oil and coal costs in Western Canada. In any event, the fuel savings of the diesel, as compared with steam locomotives, are less when the comparison is made with oil burning steam locomotives.

#### Repairs and Servicing

The comparison of repair costs of steam and diesel locomotives also requires care. With the average age of steam locomotives now in excess of 30 years, it is a safe assumption that steam locomotive repair costs, on an out-of-pocket basis, have reached their peak, at least in terms of a stable dollar. In fact, the life of a steam locomotive can probably be prolonged almost indefinitely at a repair cost not much in excess of the present, since it is a fact that many steam locomotives today have been practically rebuilt.

On the other hand, diesels now in service are relatively new, and cannot be expected to reach their peak repair costs for some years yet. Another factor is that when replacing steam locomotives with diesels, there is a significant proportion of steam locomotive repair cost in the form of overhead which will not be affected by scrapping steam locomotives unless complete locomotive shops are disposed of. Thus, the comparison to be made is that of an average future maintenance cost of the diesel locomotive at current prices, against the present out-of-pocket maintenance cost of the steam locomotive, excluding overhead items.

Such a comparison involves a judgment or estimate of the future trends in diesel maintenance costs. It also depends on the type of steam locomotive with which the comparison is made. Experience of other railroads owning diesel equipment which has been in service somewhat longer than our own is of some help in forming a judgment as to what the future diesel costs will be. As a result of studies of this matter, it is expected that repair costs of diesel locomotives will be on the average approximately 25 per cent less than those of steam locomotives.

Enginehouse expenses, which represent costs of servicing locomotives as distinct from maintaining or repairing them, are somewhat more difficult to compare. The diesel locomotive inherently has a great advantage over the steam locomotive in this respect, since it requires much less attention by enginehouse staffs and less frequent visits to the enginehouse. The difficulty in arriving at cost comparisons in this case is to obtain the true effect on enginehouse manhours. Operating one particular train with diesel power may not have any effect at all on enginehouse staffs and manhours paid for. However, on the whole, it is considered that diesel enginehouse expenses should be only about 30 per cent of steam enginehouse costs.

Crew wage savings in freight service are dependent on increasing the length of trains. In many cases, diesel operations has made this possible, the inherent advantage of the diesel in this respect being that additional units can be added to the locomotive without adding to the crew. However, there is a limit to what can be achieved along these lines. For one thing there is a practical limit to the length of freight trains; also there are many instances where the frequency of service is a governing factor. The savings to be achieved in crew wages vary so much from one application to another that it is difficult to assess any sort of significant average.

#### Savings Per Operating Ton Mile

To summarize the situation with regard to through freight operating costs, it may be stated that fuel savings constitute the most important item. These account on the average for more than three times the savings in repair costs and enginehouse expenses, while crew wage savings may or may not be important, depending on the extent to which train load is increased.

Total savings to be attributed to diesels can vary from 30c to $1.00 per 1,000 gross ton miles, depending on such factors as grades and curves, type of steam locomotives used, relative prices of fuel and length of haul on coal used in steam locomotives. A rough average would be 40c per 1,000 gross ton miles, but with such a wide variation it would be dangerous to apply the average to any specific case.

Having determined the operating savings per 1,000 gross ton miles to be expected from diesel operation, the next problem is to ascertain how many gross ton miles each diesel purchased is likely to handle. In cases where the diesels are to be assigned to regularly operated manifest freight trains, it is relatively simple to estimate the gross ton miles to be handled. Where the diesels are assigned to extra freight service, which, of course, fluctuates with the volume of traffic to be handled, the problem is more complex.

#### Law of Diminishing Returns

It will be evident that operating savings and return on invested capital from diesel locomotives are largely dependent on the gross ton miles handled. In other words, the busier a diesel locomotive is kept, the sooner its capital cost will be amortized by savings. The use of diesel locomotives on long manifest freight runs, such as Montreal-Halifax, and Montreal-Winnipeg, results in a high level of utilization. However, good utilization can also be obtained in the initial stages of dieselization on shorter runs in heavy density territory where the diesels are assigned to both manifest and extra freight trains.

A good example is the Montreal-Toronto run where, in the year 1949, six 1,500 hp. units handled the remarkable total of 1.6 billion gross ton miles, an average of 737,000 gross ton miles per unit per day. We naturally did not expect to equal this performance with every diesel unit purchased. In fact it was foreseen that with each additional diesel acquired, it would become increasingly difficult to obtain a high level of utilization.

This means that the law of diminishing returns is applicable to the utilization of motive power on a selective basis. This is true in all types of railway service, but the determination of how this law operates constitutes a more complex problem in through freight service than in other services. The reason for this is that the number of trains or train miles operated can be adjusted according to the type of locomotive available and the traffic offering to a much greater extent in through freight service than in other services.

Two basic steps are required to answer the question as to how many gross ton miles might be handled by each additional diesel operating between two specific points. One is to determine the maximum possible gross ton miles per locomotive, that

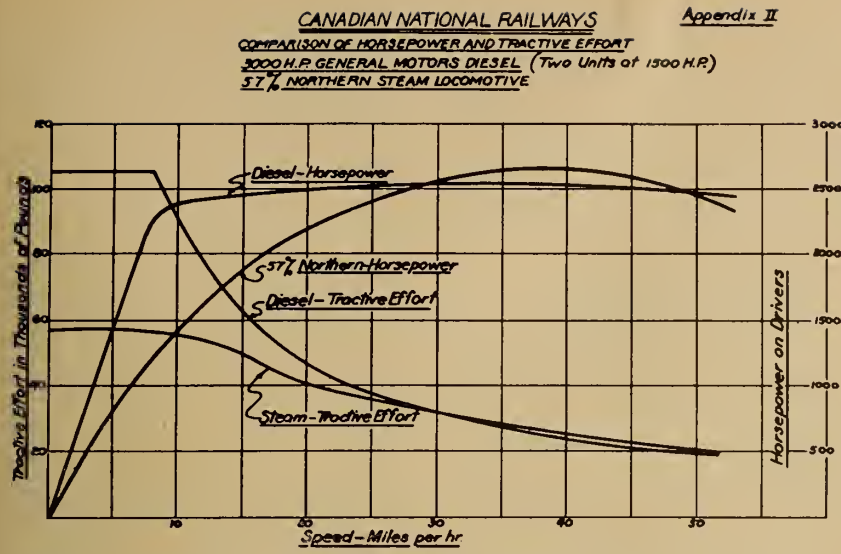

**Fig. 4. Comparison of tractive effort — diesel and steam locomotives.**

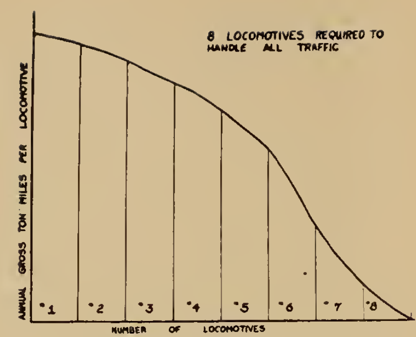

**Fig. 5. Maximum annual gross ton miles per locomotive.**

is, if only one diesel locomotive was assigned to the particular service in question, how many gross ton miles could it handle ? The second step is to determine how much less than the maximum gross ton miles each successive locomotive can be expected to handle.

#### Factors Determining Maximum Haul

The factors which determine the maximum possible gross ton miles per locomotive are: (1) Density of traffic. (2) Length of the run. (3) Average speed. (4) Average train load. (5) Average time taken by the locomotive to and from shop or roundhouse at each end of run, including time at shop, and (6) time spent at intermediate terminals. The second half of the problem, that of discovering how the law of diminishing returns behaves, almost defies precise calculation. If traffic was uniform from month to month throughout the year and the only fluctuations were daily or weekly fluctuations, it can be demonstrated that the law of diminishing returns would follow a curve similar to an inverted parabola.

Because of the fluctuations in traffic, however, the actual curve is shaped somewhat like that shown in Fig. 5. Here the upper part of the curve follows closely that of the inverted parabola, but departs from this form at the lower end. The shape of the curve for different runs varies according to conditions, but the factor which has the greatest influence in establishing the shape of the curve is the ratio of peak traffic to minimum traffic. This is understandable if it is considered that in dealing in monthly fluctuations of traffic, the upper part of the curve consists of the sum of 12 inverted parabolas; the next portion, 11 inverted parabolas and so on.

#### Five Year C.N.R. Program

By applying to this curve the operating savings per gross ton mile, a similar curve showing total operating savings to be expected from each successive diesel is obtained. To indicate the number of diesel units to be purchased, it is then only necessary to decide what minimum return on invested capital can be accepted.

In this discussion no mention has been made of the capital cost of steam locomotives.

Under current conditions the capital value of a steam locomotive consists only of the price that it will bring in the scrap market, since steam locomotives are no longer being manufactured on this continent. The scrap value of a steam locomotive is, of course, negligible in comparison with the purchase price of a diesel and, therefore, can be neglected in comparing operating and capital costs of the two types of power.

In the initial stages of through freight dieselization operating savings are sometimes quite spectacular, being sufficient in some cases to amortize the capital cost of diesels in two or three years. As more diesels are acquired, however, the savings per locomotive and return on investment decline, as has been demonstrated in the previous discussion. The five-year dieselization program of the Canadian National is based on these principles. This program was described in the Company's 1951 Annual Report in the following words:

> Following the completion of a comprehensive study, approval in principle has been given to a five-year program of partial dieselization directed towards those freight, passenger, and yard services where relatively intensive utilization of locomotives can be obtained, and advantage taken of the greater availability and lower operating costs of this type of power.

The Canadian National now has 194 diesel units of 1,500 or 1,600 hp. operating in through freight service, and currently over 35 per cent of the total gross ton miles are handled by diesel. Diesel locomotive utilization, while it has descended somewhat from the previously mentioned pinnacle reached in the Montreal-Toronto service during 1949, has generally lived up to expectations.

#### Diesels in Passenger Service

Public interest is naturally centred more on passenger service than freight service, and the question is often asked why the railways of Canada have not acquired more diesels for passenger service. The answer is that operating savings of diesels in passenger service are much less than in freight service. There are four principal reasons for this: (1) As demonstrated in the discussion of tractive effort curves, it takes more diesel horsepower to provide equivalent service to a steam locomotive in passenger service than in freight service. This tends to increase operating costs and reduce operating savings, and at the same time, increases diesel capital costs, reducing further the return on investment.

(2) While selective dieselization of passenger service will enable diesel locomotives to operate very high mileages (which of course, would tend to increase operating savings), this is more than offset by the fact that a passenger train consumes much less fuel per mile than a freight train. Thus fuel savings are less per diesel locomotive purchased than in freight service, despite the higher mileage.

(3) There is little or no opportunity for diesels to effect a saving in train miles, as there is in freight service.

(4) Capital costs of the diesels are increased by the necessity of providing a means of heating the train.

#### Yard Switching

Turning now to the use of diesels in yard switching services, it would perhaps have been more chronologically correct to commence this paper with a discussion of diesel yard switchers, since their introduction in railway service preceded that of the road units. The inherent advantages of the diesel switcher in yard service, such as high mechanical availability and lower operating cost than the steam switcher, have been recognized for many years.

There are many freight yards across the country where advantage can be taken of the high availability of the diesel switcher by assigning it to round-the-clock service. The intensive utilization thus obtained results in operating savings which yield a return on investment almost comparable with the more favourable applications in through freight service, but there is a greater percentage difference between steam and diesel fuel costs. Whereas a ratio of diesel to steam fuel costs of about two to five was indicated in through freight service, the ratio in switching service is less than one to four.

This is explained by the low fuel consumption of the diesel when idling and the greater proportion of idling time in switching service. At the end of last month the Canadian National had on hand 217 diesel switchers of various sizes. Most of these are used in round-the-clock assignments. The law of diminishing returns is beginning to take effect, and diesel switchers acquired in the future will be confined mostly to 16-hour or two-shifts per day operation.

#### Branch Lines

Wayfreight or branch line services offer a further field for dieselization. In this case, the anticipated return on investment is generally more favourable than in passenger service, but not so favourable as in through freight or yard switching service. The total fuel consumption per locomotive-mile is greater than in yard service, but the relatively high percentage of idling time makes for a ratio of diesel to steam fuel costs per mile of about one to four. The operating savings and return on investment from wayfreight dieselization is limited, however, by the mileage per locomotive which can be obtained. A locomotive in wayfreight service is generally confined to a single daylight run each 24 hours and perhaps only 5 or 6 days per week.

There are many instances, however, where further utilization in yard service or freight service can be obtained before the next day's wayfreight run, and in these cases operating savings and return on investment will be increased accordingly. The relatively low mileage per locomotive, which is characteristic of wayfreight service, also tends to increase the differential between steam and diesel locomotive repair costs. The reason is that diesel locomotive repair costs are more directly proportional to mileage than those of steam locomotives, which contain an appreciable element of cost assignable to time rather than mileage.

#### Dieselization of Territories

There remains one more subject about which a few observations may be appropriate. I refer to the complete dieselization of territories. Fundamentally, once it is accepted that the law of diminishing returns is applicable to this question of dieselization, it follows that in every territory where there is any appreciable fluctuation of traffic, a point must be reached where the purchase of the next diesel unit will not bring sufficient savings to yield a satisfactory return on investment.

This does not mean that complete dieselization of the territory is never justified, but it does mean that, in order to justify it, one of two conditions must apply. Either the additional savings possible through elimination of steam locomotive servicing and maintenance facilities must be sufficient to offset the low return on investment provided by the last few diesels required to complete the dieselization, or the project must be viewed from an earlier stage of dieselization, when the higher returns obtained from units acquired early in the program can be averaged out with the lower returns obtained in later stages.

The latter alternative is not basically correct in economics, but in individual cases it may be a rationalization forced by circumstances. For instance, although Management may realize that a higher return on investment can be obtained by partial, rather than complete dieselization of a certain territory, the complete dieselization of the territory may be desirable for policy reasons. If, in this case, the complete dieselization project, started from an early stage, provides on the whole an adequate return, management may decide that the expenditure of the additional capital to complete dieselization is justified.

#### Replacement Not Imminent

In conclusion, it may be said that the diesel locomotive represents one of the most important technological advances in railway history, although this fact is obscured by the present relatively unsatisfactory net income position of the Canadian railways. This unsatisfactory condition is not due to inadequate returns on the investment which has been made in diesel locomotives, but stems from the fact that railway revenues per unit of service have not kept pace with increases in wage rates and prices generally.

This is a statement of fact, the end result of many factors. The background for it is tied in with the complicated and controversial questions of the railway freight rate structure, freight rate increases and the loss of traffic to competing forms of transport. It is possible that the diesel locomotive will lose its present supremacy in the motive power field to the gas-turbine or some other type of locomotive. It will be surprising indeed, however, if the advantages of any new type of power are sufficient to justify scrapping the diesel locomotive for some time in the future. √

# The Engineer and Natural Resources

*by*

The Honourable Robert H. Winters, M.E.I.C.
*Minister of Public Works of Canada*
*Ottawa*

**This is an address delivered by invitation at the fall meeting of the American Society of Mechanical Engineers at Rochester, N.Y., on October 6, 1953. It is good evidence of the increasing interest in things Canadian in the United States and an excellent example of the kind of publicity Canada has long needed. What Mr. Winters has to say in the latter part of his address should help to convince even the most conservative that engineers have a role in society much wider than, and on the whole as important as, mere contributions of technical ability.**

At the time the invitation to speak to you at your Fall Meeting reached me I was in a peculiar position. It was less than a month to the date of our Canadian general election—the third successive one in which I was a candidate. The invitation took cognizance of that situation, and very understandingly stated that "even if some very strange things do occur and your party is not returned, we would still like to have you take on this speaking engagement." However, under such circumstances my position would have been unenviable, to say the least.

I would have found it difficult, I'm afraid, to speak with conviction on the subject of "The Engineer and Natural Resources" while occupying the role of an ex-Minister of Resources whose policies had been rejected by the electors. To anyone in public life there's nothing as reassuring as a renewed mandate from the electors. I've often felt that there are times when business executives would feel more comfortable if they had such an endorsation from their employees. However, although the election didn't bring about many changes, I have been involved in one since then, and as a result I am here tonight not as Minister of Resources and Development, but in my new capacity as Minister of Public Works.

No matter what position I hold, I am always glad to be in the presence of professional engineers. Although I have deviated some distance from the full-time practice of the engineering principles which involve the application of say, Bessel functions or Fournier series, I have been fortunate in my political life to have been associated with departments of government which rely greatly upon the special skills of the professional engineer.

In the Department of Resources and Development the traditional civil, electrical and mining divisions of the engineering profession were represented directly in the administrative and technical branches. So too, were the more specialized divisions of forestry and soils engineering. In my new post, for the functions of the Department of Public Works lay special emphasis on mechanical engineering and architecture, I know I am going to enjoy my continued association with the work of the various phases of our profession.

Historically, the growth and development of our two countries has been somewhat similar, except in the matter of pace. Exploration and discovery touched our shores and the earliest settlements were established at about the same time. The greater hazards of North Atlantic voyages and the rigors of the northern climate were probably the main reasons why the influx of immigrants was more rapid along the shores of New England and southward. For this was a fact long before political differences set the stage for the revolution that culminated in the Declaration of Independence.

When you think of it, I suppose there is no single group of specially trained people, that has been so long and so closely associated with the growth of our two nations from colonial days to our present equal status of sovereign, free nationhood, as has the group of professional engineers.

By their very natures, both our lands have been at the same time an invitation and a challenge to the engineer. At first, the need was to tackle the most obvious problems—the means for travel and for transportation in the wild, new land. There was space to be conquered and a landscape to be adapted to human needs. Canals were required to permit full utilization of natural waterways for river and lake transport. Railways were built so that steam locomotives, those early giants of mechanical engineering genius, could carry passengers and freight across the plains and over the mountains to make secure the precarious hold that wagon train pioneers had wrested from a difficult country and hostile natives.

Prospectors for gold and silver, and farmer settlers, each required the services of someone possessing one or another type of engineering skill. As problems were solved the pattern of progress spread. More population required increasingly more of the basic necessities of life, which themselves were multiplied by the growingly complex form of life in this western civilization. The engineer was the designer and oftentimes the builder of the equipment that is the basis of our physical well-being. He was in the forefront of every progressive step in our technological advance. Without the engineer, life as we know it today would be impossible.

The role of the engineer has been, and basically still is, integrated with the development and utilization of natural resources. Thomas Tredgold's classic definition still holds good today, as it did a century and a quarter ago when he said, "Engineering is the art of directing the great sources of power in Nature for the use and convenience of man."

It is when we consider the engineer in relation to the natural resources of our two countries that we begin to notice the trend away from similarity. I have mentioned the difference in the rate of growth and development in our countries. This is a fact that has been highlighted by the publication of the Paley Report. Among other significant statements about the potential and proven reserves of natural resources in the United States, the document contains the opinion that some time during the 1940's total production was less than total consumption, and that since that time the gap has continued to widen. This means that the United States is becoming dependent to some degree upon other countries for supplies of certain raw materials to keep its industrial machine running. Substitutes for some commodities have been found, but the sobering, thought-provoking knowledge that so many of our natural resources are not inexhaustible makes us pause and take stock of our own position in Canada.

Canada's standard of living is near enough to yours in the United States so that for practical purposes it can be said that our own use of raw materials, both in kind and volume, is about the same as the American per capita rate. But our rate of disappearance is greater in some cases, because we produce and export, for example, about 80 per cent of the world's nickel, half of its platinum and two-thirds of its asbestos. We rank second in zinc and gold production among the nations of the world, third in silver and fourth in copper. Canada also supplies about 30 per cent of world exports of wood pulp and 80 per cent of newsprint exports. We are a nation of barely 15 million people, but we produce and export surpluses from our rich storehouse of natural resources to such an extent that we are the third trading nation in the world.

Back of this record of development and utilization of natural resources is the engineer. It is his knowledge, skill and genius for solving problems that has helped us attain our present position of economic buoyancy. It was the engineer, or the application of engineering principles, that enabled Canada to be with you a veritable arsenal for democracy during World War II, and so quickly to manage the reconversion from newly established peace-time industry to a program of defence preparedness when Korea appeared to hold the threat of yet another world conflict. The extreme urgency of war-time needs of certain strategic materials was ample justification for venturing outside the bounds of strictly economic exploration and development. New discoveries were made that have since proven to be profitable commercial enterprises. The upsurge of development of one kind of natural resource stimulated, and in many cases made feasible, the development of another. The net result has been an expanding program, with projects established in every part of the country from Newfoundland to British Columbia, and from the International Boundary, north to the fringes, and even beyond the lines, of permanent settlement.

While all of these developments are significant in terms of their contributions to labour and industrial payrolls, and for the acquisition of new, strategic materials, some of them are notably spectacular. The Quebec-Labrador iron ore development which includes a 358-mile railway stretching between two sizable communities of workers' homes at Seven Islands, on the north shore of the St. Lawrence River, and Knob Lake, at the mine site, is a project comparable to the building of the Transcontinental. Last month, while enroute to northern Ungava, I flew the length of this railway grade and viewed it from a low elevation. I was greatly impressed by the manner in which a multitude of difficult engineering problems had been overcome in this stupendous undertaking. In 1946 Canada produced only about one and a half million tons of iron ore. We have great proven deposits which are already yielding several times that amount and which, as a result of spectacular engineering achievements, may be producing some 30,000,000 tons a year before very long.

Discovery of new oil fields in Alberta in 1947 led to large scale explorations and development there. This search and development has spread to other provinces and to the Northwest Territories and the Yukon. Where less than 10 years ago we were producing barely 10 per cent of our domestic needs of crude petroleum, Canadian oil wells are now supplying fully one-third of our present, greatly increased requirements. There are good prospects that within a few years after engineers have overcome transportation problems, we will be producing sufficient oil to meet all our home demands, and in fact, may be in a position to become an exporter of crude petroleum.

The huge aluminum undertaking at Kitimat in the north coastal mountains of British Columbia is an engineering feat that defies comparison for the size and daring of the plan to direct a "great source of power in Nature for the use and convenience of man". Reversing the direction of flow of a 200-mile circle of large lakes and connecting rivers; tunneling 10-miles through solid rock to carry the water to a great power-generating plant built entirely within the mountain, and then stringing 50-miles of transmission lines over the most hazardous, heart-breaking mountain terrain imaginable to serve the aluminum plant on the deep-sea harbour location at Kitimat, is all part of the price for being able eventually to produce at this plant alone 500,000 metric tons of aluminum a year. When completed, the total annual production capacity of Arvida, in the Province of Quebec, and Kitimat in British Columbia, will be more than the current output of aluminum in the United States.

Nickel-copper production in northern Manitoba is a new development, following the cross-country tractor-train move of the buildings of an entire mining town to provide shelter for workers and their families in the new location. A 150-mile railway is being constructed so that concentrates can be brought out to the former railhead point, and from there taken to a new smelting plant at Fort Saskatchewan, near Edmonton, Alberta, where vast supplies of natural gas make the cost of processing the ore concentrates economical enough to offset the expense of the long rail haul.

Lead-zinc-silver in the Mayo district of the Yukon; asbestos in northern British Columbia, prospects of base metals at Pine Point near the west end of Great Slave Lake; nickel prospects at Rankin Inlet on the west coast of Hudson Bay; iron ore deposits discovered at Payne Bay on Quebec's far northern coast; lead and zinc prospects near Bathurst, New Brunswick; titanium production at Allard Lake, Quebec, and the discovery of copper deposits in the Gaspe country—these are all Canadian natural resource developments that recently have been commanding the attention of engineers.

Uranium is being located in many places in Canada. Next to the original source of Canada's radio-active ores at Port Radium, Great Bear Lake, the most significant discovery and development is at Beaverlodge Lake in northern Saskatchewan; a new settlement, Uranium City, is being established there on a basis that indicates an orebody sufficiently large to warrant planning long-term development.

Water is perhaps the most basic natural resource. Its natural function of giving life to soil and of nourishing all manner of living things, vegetable and animal, is paramount, and at the same time it is one of the chief means of securing power by which our program of natural resource development is made possible. Canadians already use almost twice as much electric power per capita as Americans do, and it is developed and utilized at about half the cost per kilowatt hour. With less than one per cent of the world's population in Canada, we develop over 10 per cent of the world's hydro-electric energy. Even so, we are not yet using a quarter of our known potential.

Although new discoveries of oil and natural gas reserves or mineral deposits perhaps make more interesting headlines, in some ways the harnessing of additional hydro-electric energy is even more important to us and consequently really more newsworthy. We need more power in order to increase production of raw materials at lower unit costs. When power is available it stimulates industrial expansion, which in turn requires still more raw materials and more low-cost power to maintain output at economic rates. New communities spring up on the frontiers of resource development. They require power for domestic purposes. Industrial expansion in the older settled areas is making it necessary for us to expand present facilities, so that all the power that can be derived from the water resource at that point is developed and utilized.

During the twelve years following the outbreak of World War II Canada's hydro-electric capacity was enlarged by 60 per cent, and we have since been adding to it at just about two-and-a-half times the pre-war rate. Just a few miles west of here the Ontario Hydro-Electric Commission is well along with the work of developing power from the water allocated to Canada under the Niagara River Treaty of February 27, 1950. Almost everywhere there are signs of a move to increase the capacities of power projects whose outputs have fallen behind the need. Two outstanding examples of undeveloped power sites in Canada are the Yukon River drainage basin in the Yukon Territory and northern British Columbia, and the great Hamilton River system in Labrador. The potential of these two alone is estimated conservatively at over 8 million horsepower. Just to give you a basis of comparison, the world's largest power plant at Grand Coulee, Washington, has a capacity of some 2½ million horsepower. In Canada we have a known potential of about 66 million horsepower still waiting to be harnessed. Included in this total is the Canadian share of the 2½ million horsepower to be derived from the International Rapids section of the St. Lawrence River, a project which is close now, we hope and believe, to its long-awaited commencement.

It is not my main purpose this evening to give you a recital of the full extent and variety of Canada's natural resources. But knowledge of these facts helps to point up the tremendous job the engineer has been, and is, doing today in Canada. It also poses a great challenge. Because the engineer is the greatest developer and user of natural resources, he must, at the same time, become our chief conservationist. Not much can be done about the minerals and fuels that have been used, and which, by their nature are not renewable. But we can employ care and ingenuity to see that the very highest use is made of this type of natural resource in the future, avoiding wastefulness of all kinds, and developing substitutes made from renewable or more plentiful materials wherever possible. In the case of our renewable resources of forests and wildlife, and of soil and water which can be husbanded, the engineer can play an important part. By suggestion and advice—broadly, by using the tools of education—the engineer can induce a thoughtful approach to development and utilization, even to the point of convincing hard-headed finance that today's quick profits are likely to prove much too costly if they should contribute to loss of productivity of the resource at some future date. Ideally, this is application of the vital human privilege of showing concern for the future welfare of one's family and neighbours the world over. We are our brothers' keepers and the highest concept of the engineering profession is dedicated to this proposition.

This principle is a fundamental part of the Canadian Government's economic policy as it applies to the development of the natural resources of my country. During the last session of Parliament our Prime Minister said, "We recognize, as do all other Honourable Members, that the natural resources of Canada are a heritage to be developed and conserved for the purpose of providing the greatest possible measure of opportunity and security for all Canadians. We recognize that proper government policies are those which promote and develop the country's natural resources for the benefit of the people of every part of Canada."

So you see, our Government recognizes its responsibility too! While we are most happy when private industry does what is required to be done, there are times when it is appropriate that public authorities take the initiative. In Canada, however, as in the United States, we believe in free enterprise as a general policy. Under our constitutional system the natural resources of our country are the property of the people in the right of the provinces. The Canadian Government administers the natural resources in the National Parks, on federal forest experiment stations, on Indian lands, in the Yukon and the Northwest Territories, and in respect of fisheries the Federal Government has authority in Canadian territorial waters. All the rest come under Provincial Government authority.

By providing leadership and indicating certain desirable objectives which would benefit the people of the nation as a whole, the Canadian Government, working with the ten provincial governments, attempts to create the atmosphere in which free enterprise will want to step out and do things. Regulatory measures are kept to a minimum, and when they are enacted, they are designed to allow fullest scope for freedom of individual action commensurate with the common good.

There is much more I could say about our resource development program. I am sure any engineer would find most interesting such projects as the recently undertaken program to spray some 4,000 square miles of budworm infested forest in New Brunswick, the building of a causeway across the Straits of Canso; the construction of transcontinental pipe lines, and so on.

But I would like to change the emphasis a bit here and deal a little more directly with the engineer himself—the human side, which some people might think we engineers lack.

In reply to the question as to what is the role of the engineer in the development of natural resources, my answer is that the role of the engineer is, in short, anything we engineers want to make it. I wonder if therein doesn't lie the greatest challenge to the profession. The field has been so vastly widened by specialization, particularly in the manufacturing industries and in business, that the opportunities greatly outnumber the engineers available. Scarcity of a commodity usually enhances its value. Engineers are now in short supply. This not only increases the relative importance of each, but it puts us as a professional group in a better position than ever before to shape our own destiny. But the new importance of the engineer has tremendously increased the burden of responsibility he must bear. In Canada alone, there are excellent positions awaiting 2.000 young graduate engineers, and in our present buoyant, expanding economy the demand is continuing to outrun the supply as we see it today. There is a great responsibility imposed by this condition. We engineers have it in our hands to shape our own course, but we must know what that course is to be before we can steer it.

It was not long ago that the engineer was a pretty much stylized individual. He wore breeches and high boots even on the college campus, and the badges of his calling were the T-square over his shoulder and the slide-rule in his hip pocket. He liked to view himself as a specialist, and he tended to concern himself with a narrow field of activity. Naturally, that is the way the public came to regard him.

As time went on, the pattern changed. Our countries developed—and this is particularly true of Canada—and the frontiers were moved back so that the engineer often found himself a key figure in new municipalities. He was required to assume broader and heavier responsibilities. The good engineering colleges realized this trend and added to their curricula subjects designed to broaden the educational base of the engineer. He was asked to study literature, to learn accounting and business practices, and even to do some public speaking.

But we engineers, in many ways, are a conservative lot. We often, subconsciously, resisted these developments, considered them unnecessary frills and, accordingly, individually and through associations, we have in many instances been our own worst enemies. I believe that engineering is the best training any man, or for that matter any woman, can take. The technical side of it is precise, and if pursued any reasonable distance, especially in the field of research, it is one of the best of all mental developers. When this is rounded out by some background in the general arts, it provides a solid base from which to launch a successful career. Anyone who has demonstrated his mental capacities by weathering successfully the rigours of present day college training in engineering can most certainly, with equal success, apply his knowledge to virtually any other problem that confronts him, no matter in what field it happens to occur.

We engineers know this and yet, time after time, when an important administrative or executive position has been begging for occupancy, we have been guilty of saying, and permitting other people to say, that such positions are better filled by a lawyer, or an accountant or some type of commercially-trained person.

I cannot be convinced that engineers have ever lacked confidence, but there is a danger that as a group we may sometimes allow ourselves to be led into the belief that it is not, perhaps, in keeping with our profession, to deviate from the narrow, restricted, technical path. If and when that does occur, it is a great mistake.

Problems are a by-product of the day-to-day activities of normal human beings. Engineers are specialists in solving problems; the riddles of living give way to the same clarity of thinking, the same searching analysis, the same honest measuring of opposing factors and the same unselfish desire to find and use the right solution, as do the problems created by natural forces.

I am suggesting that the role of the engineer is not complete until the special skills of the profession are being applied to the utmost for the solution of our social and moral, as well as our material and economic problems. This leads to the thought that as a group, and as individuals, wherever the opportunity arises, we should be willing to accept posts of responsibility in the administration of industry and business, in government at all levels and in the social life of our communities.

The world is changing; developments are crowding upon developments; rates of obsolescence have quickened, and the Atomic age is closer than most people realize. In my own field as an electronics engineer, I have seen amazing developments during the past generation. And in all these fluid developments on a global scale, Canada and the United States, more than any other two countries in the world, can look forward to a bright future of growth and progress, to the benefit of our own peoples and mankind generally.

The challenge to the engineer is there. Because the role of the engineer is so completely integrated with the whole pattern of our development, principally through utilization of natural resources, our future, in very large measure, depends upon engineering genius for bridging the gap between the scientists' discoveries and our citizens' material needs.

The engineer is in a position of prior stewardship. The awakening of public interest in the need for conserving our natural resources is largely his responsibility. He is the man who knows why, and how much, care must be taken with our God-given treasures. It is in becoming more actively concerned with this enlightened aspect of his calling that the engineer contributes his best—more than just his knowledge as a scientist or technician—he becomes a leader, a teacher, a true citizen of his community in the broadest sense.

And if the major projects that have been planned or will become necessary within the next fifteen or twenty years, are completed—then we may look back and review what will surely be an even more impressive picture of the role of the engineer in the development of not only natural resources of rock, soil and water, but of our even more precious resource—people—men and women in nations striving together for a better world. √

*Chief Regional Engineer, London Telecommunications Region Post Office*

*A paper presented to the Institution of Electrical Engineers of England, and by radio link to a joint meeting of the Montreal Branch of The Engineering Institute of Canada and the Institute of Radio Engineers, on December 3, 1953.*

The arrangements of the sound and television broadcasts of the coronation of Her Majesty Queen Elizabeth II are described in detail after a brief comparison has been drawn between the coverage provided for this event and that for the coronation of King George VI in 1937. Both sound and television programmes were broadcast simultaneously to the United Kingdom and to much of Europe, temporary equipment being installed at several European centres to convert the 405-line signal to the several standards (441, 625 and 819 lines) used on the continent.

The problems of siting microphones and cameras in Westminster Abbey—where they had to be invisible—are enunciated, and the methods of overcoming the difficulties of siting the sound and vision control rooms at the Abbey and along the processional route are discussed.

The nature of this largest outside broadcast ever undertaken by the B.B.C. and the Post Office called for many special arrangements, and details are given of the signal circuits installed, the lip microphones which enabled commentaries to be heard above adjacent crowd noises, and the equalization and synchronization necessitated by the number of cameras televising the broadcast.

Finally, an account is given of the sound and television recording arrangements of the B.B.C. and the North American organizations, so that telefilms and commentaries could be screened in America within 24 hours of the event, and so that a permanent record of an historic occasion would be available for the future.

## Introduction

The broadcasting operation carried out on Coronation Day, 2nd June, 1953, was on a scale which far exceeded that of any previous broadcast undertaken in Great Britain and represented a very major undertaking by the authorities most directly concerned, namely the B.B.C. and the Post Office. Quite apart from the magnitude of the operation, however, the technical arrangements, particularly on the television side, included a number of novel features which were brought to fruition in time for this most important occasion.

It is perhaps of interest to make a broad comparison with the corresponding broadcasts at the time of the coronation of King George VI on the 12th May, 1937. On the sound side, in 1937 there were altogether 17 commentary positions, including 10 for oversea services, whereas in 1953 there were 95, including 84 for oversea services. Six B.B.C. transmitters were in service in 1937 to broadcast to oversea audiences, whereas 48 were employed in 1953.

On the television side the comparison is even more striking. In 1937, the B.B.C. television service had been in existence for only six months, and this was the first outside broadcast in which a mobile unit was used. It was stationed near Hyde Park Corner, and possessed three cameras using pick-up tubes of very low sensitivity by modern standards; pictures of the procession as it passed down East Carriage Drive were broadcast by the only transmitter then in operation, that at Alexandra Palace, to perhaps 30,000 viewers.

Sixteen years later, 21 cameras were used, five of which were in Westminster Abbey and were able to show viewers the solemnity of Her Majesty's coronation; the remainder showed views of the Royal procession to the Abbey and of the return proeession to Buekingham Palaee, in a broadeast whieh lasted some seven hours. The broadcast was transmitted by eight stations in Great Britain and 12 on the Continent, and the number of viewers has been estimated at 20 million in Britain and perhaps 1½ million on the Continent.

In addition, some millions of viewers in Canada and the United States, as well as many in Denmark, Italy, Cuba, Japan and Venezuela, saw recordings of the broadeast.

The description which follows deals separately with the sound and television broadeasts, which, in fact, were largely planned and executed as separate operations, although there were certain respects in which they were complementary. Notably, the television service relied on the sound service entirely for sound pick-up within the Abbey and on the route immediately outside the Abbey, while at certain sound-commentary points, television screens provided an indispensable guide to sound commentators. Moreover, from the Post Offiee aspect the requirements of the two services had to be treated, in eommon with other special com-

## Sound

### Outline of Arrangements

The broadcasting arrangements for the sound services had to cover the requirements both for home and oversea listeners, the latter including both the services radiated by the B.B.C.'s own European and oversea transmitters and broadcasts sent direct to the eountries concerned by Post Office links, both cable and radio, for broadcast by local transmitters.

In each case the broadeast was made up of two main parts, one the coronation ceremony in the Abbey, and the other the eommentaries, with appropriate background of effeets, from various points on the route to and from the Abbey.

For the Home Service it was desired—for programme rather than technieal reasons—to retain eontrol of the whole day's broadeast at one central point from which direetions and advice eould be given by the programme produeer throughout the broadcast. The mixing and control arrangements at the Abbey itself (in the head verger's room) were therefore extended to cover both the ceremony in the Abbey and the contributions from the commentary points on the route.

For Home Service listeners there was one commentary position in the Abbey, one in the Abbey Annexe and nine at various points on the route, including one in the Inner Court at Buekingham Palace.

For oversea broadcasting the commentators were grouped at four main observation points on the route, namely the Colonial Offiee site opposite the entrance to the Abbey Annexe (26 commentary positions), Trafalgar Square (27), Victoria Memorial (24) and Stanhope Gate, Hyde Park (7). At each of these points it was necessary to construet temporary huts to house the assoeiated control positions. At the Vietoria Memorial there were two such huts, one at Canada Gate handling 11 oversea commentary positions as well as the Home Service commentary position, and the other on the opposite side of the Memorial behind a Ministry of Works stand, whieh handled the remaining 13 oversea eommentary positions.

Each broadeast for overseas ineluded the Abbey ceremony, of course, and, in the majority of cases, commentaries from the first three, or all four, of the points named. All included the Colonial Office site, which was therefore made the central mixing point for each of these services.

There were a few isolated commentary positions at some of these sites which were connected direct to the broadcasting centre where the recording channel was located, and not via the Colonial Office site.

To provide the necessary programme, cue and control circuits between the various commentary points on the route and to the broadcasting centres for distribution, the Post Office installed 1,040 circuits, the general routing of which is indicated in Fig. 2.

### The Abbey Ceremony

Twenty-eight microphones were installed in the Abbey, as shown in Fig. 3; Table 1 indicates the purpose of each and Fig. 4 indicates how inconspicuously they were mounted. The music microphones for orchestra and choir were of the new B.B.C. design of ribbon microphone, but all the others were of the moving-coil type. Many of the latter were fully concealed or camouflaged, and were therefore surrounded closely by objects which altered their frequency response; appropriate electrical correction, as judged aurally, was therefore applied, being generally of the order of a 6-db cut at 100 c/s rising to a 4-db lift at 5,000 c/s, relative to 1,000 c/s.

When running cable to the microphone points within the Abbey it was required that no attachments of any kind should be made to the fabric of the building, save such as could be removed without leaving any permanent marks. This involved the use of clamps and ties of various descriptions in place of the more usual nails, screws, cleats, etc. Moreover, since microphone circuits of necessity use single-pair lead-covered cable, the long and awkward runs of cable for all purposes were a feature not encountered in normal installations. The final positioning of the wiring was particularly difficult in the vicinity of the altar, where microphones had to be sited within extremely narrow limits to avoid excessive background noise and pick-up from the public-address system. Another consideration was the need for so fixing the wiring and suspending the microphones that they would not obstruct the operation of film and television cameras.

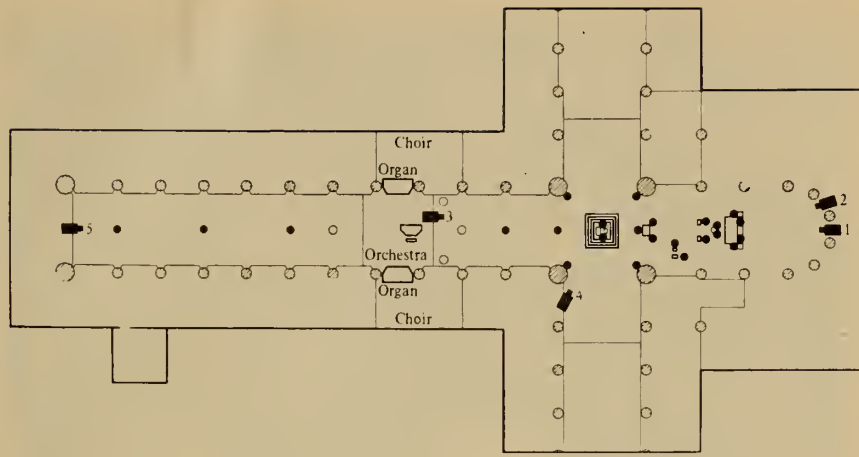

**Fig. 3. Location of microphones and cameras in Westminster Abbey.**

Television cameras ○ Ribbon microphones (No. 4, 5, 6, and 9) ● Moving-coil microphones

### Table 1
#### Location of Microphones in Westminster Abbey

| Microphones | Location and purpose |
|---|---|
| 1, 2, 3 | Nave processional microphones; suspended from triforium approximately 20 ft. above floor level. |
| 4 | Trumpet fanfares, general orchestra and choir, and general atmosphere; suspended from triforium approximately 35 ft. above floor level. |
| 5, 6 | Primarily main choir pick-up; suspended from triforium approximately 30 ft. above floor level. |
| 7, 8 | Choir processional and clergy responses; suspended from triforium, No. 7 approximately 20 ft. above floor level and No. 8 approximately 20 ft. from lantern flooring (enthronement area). |
| 9 | General music (orchestra and choir); approximately 50 ft. above choir-floor level. |
| 10, 11, 12, 14 | Recognition microphones; mounted in masonry crevices. |
| 13 | Point not used. |
| 15, 16 | Delicately concealed and mounted on top of each of the front legs of the homage throne. |
| 17, 18, 19 | One microphone on each ornamented base support of the front legs and one on the apex of King Edward's chair. |
| 20, 21 | Chair-of-estate faldstool; one facing outwards towards the theatre approximately 2 ft. above floor level and camouflaged behind silk covering; one below the kneeling cushion support and facing Her Majesty. |
| 22, 23 | Altar faldstools; one facing the altar in each faldstool approximately 2 ft. above floor level and camouflaged behind silk covering. |
| 24, 25 | Supported by candelabra facing the altar, for addresses, prayers, etc.; approximately 12 ft. above floor level. |
| 26, 27 | One on southern candlestick and one on northern candlestick; approximately 4 ft. above floor level and oriented towards candelabra for prayers, responses, etc. |
| 28, 29 | Concealed behind altar plate; for prayers, blessings, etc. |

The reconciliation of all these unusual requirements was an exceptionally difficult process.

All these microphones were connected to mixers at the central control point (the head verger's room), where a careful selection was made throughout the ceremony, the operator being assisted in this by being able to watch the ceremony on a television screen. The output from these mixers was passed through a standard B.B.C. outside-broadcast amplifier, which includes both a volume-control potentiometer and a volume indicating meter. The output of this amplifier was fed through trap valves to several destinations, to provide feeds respectively for the low-intensity loudspeaker system (over 200 loudspeakers) in the Abbey itself, for the public-address loudspeakers on the processional route and for newsreel film companies, etc., as well as for all the sound services (Home and Overseas) and for television. The only difference so far as the television service was concerned was that, in addition to receiving a feed of the whole of the ceremony from the sound service (clear of any commentary), they were given a split feed off two of the key microphones, one in the nave and one on the homage throne, to provide an independent pick-up when they found it more appropriate.

Fig. 4. View of Westminster Abbey from the triforium, near No. 2 camera position, showing some of the camera and microphone points and part of the special lighting.

#### Home Service Arrangements

The Home Service control position was also in the head verger's room and had available, on the associated mixers, outputs from the Abbey ceremony position described above, from the two commentators in a soundproof cubicle at triforium level in the Abbey, who respectively set the scene and read the rubrics for the benefit of listeners, from a commentator in a room overlooking and soundproofed from the Abbey annexe, which was the assembly point preceding the ceremony, and from the commentators at the nine points on the route (Fig. 5). Each of these commentary points was connected to the Abbey control room by three lines, one carrying the contribution from that point, one carrying the full mixed output (Home Service) back for cueing purposes and the third for normal telephone communication whereby the technical operators at the respective control positions could speak to each other; alternatively, the line could be extended at each end for the commentator or his assistant to talk to the programme producer in the Abbey control-room. The producer was also provided with a talk-back unit, whereby his talk-back microphone could be connected, via an amplifier and by selection of the appropriate key, to one of these cue lines in place of the normal programme, his headphones simultaneously being connected, via an appropriate attenuator and amplifier, to the incoming contribution line. By keeping each of these contribution lines continuously open (control amplifiers at the points concerned faded up), the producer had an easy and quick means of 2-way communication with each point for use when the point concerned was not actually broadcasting. Even during a broadcast he could use the facility for passing on urgent messages to the commentator's assistant, who would be listening on this cue line. A master key on the unit gave facilities for talking to all points simultaneously for general briefing when none of the nine points was broadcasting.

#### Standby Provisions

Very comprehensive safeguards were provided against possible failure of the Home Service at any point in the chain. All commentary microphones and circuits and all control amplifiers were duplicated, the latter being provided with standby battery supplies—which is a normal feature on all outside sound broadcasts. To guard against the failure of any of the circuits from the commentary points to the Abbey control-room, each point also fed the programme via a separate circuit direct to Broadcasting House, where it appeared on a mixer; this effectively duplicated the one handling the Home Service in the Abbey control-room. The output from the Abbey itself was also fed to Broadcasting House on a standby circuit and, as a final precaution, it was also sent via a short-wave radio link from a low-power transmitter mounted on the roof of Westminster Abbey and picked up on a receiver on the roof of Broadcasting House. An operator at the mixer in Broadcasting House continuously shadowed the mixer at the Abbey, and both outputs were made available to both the Home Service and Light Programme continuity rooms in Broadcasting House, from which the full networks of transmitters in this country are fed. The general arrangements at the Abbey are shown in Fig. 5.

#### Oversea Broadcasting

As mentioned in Section earlier, the central mixing point for each of the oversea networks was at the Colonial Office site. There were 26 such central control and mixing positions, apart from the one for the Home Service contribution from this point and another for the general-effects microphones. The output from the latter was distributed to the other positions and was attenuated at each position to a level suitable for mixing as a background to the commentator's microphone. The 28 control positions were installed in a temporary hut, 90 ft. x

20 ft., at the rear of one of the public stands. Each technical operator at an oversea control position had with him a programme assistant who spoke the language of the country concerned. Fig. 6 shows the general layout of one of these control positions.

Each position fed the mixed output back to the headphones of each commentator contributing to that service. A talk-back microphone was available at the control position for the programme assistant so that he and all the commentators on his network could talk together over their respective microphones before the broadcast began, to make any last-minute arrangements.

For direct oversea transmissions, circuits were provided to the continental trunk exchange and to the radio transmitter terminal via Bush House (B.B.C. Centre). The majority of these were programme circuits and therefore required a frequency band from 50 to 8,00 c/s, and their routing required special care. In all, about 75 circuits were concerned in oversea transmissions.

Since there were to be about 12 programme circuits to the Continent, all being set up simultaneously and routed to various cities on the Continent, many of them following the same route through a number of exchanges, it was thought advisable to make special arrangements to help the Post Office and other engineers *en route* to ensure that the respective circuits reached their correct destinations. For this purpose, disc recordings were made beforehand for each destination concerned, with a phrase such as "This is the B.B.C. circuit to Norway" repeated in the language of each country through which the circuit passed. This disc was played on an automatic repeating gramophone turntable and the output was fed via the spare control amplifier to the appropriate line for about an hour before the broadcast. This left the main control amplifier still available for last-minute briefing and tests, etc. For the American broadcasting companies special facilities were provided, at their request, whereby their New York headquarters could talk only to the producer at the central control position, and the producer could talk to the commentators while listening on the circuit from New York, with New York hearing this local discussion. For this purpose the producer was provided with facilities for switching his talk-back microphone either direct to New York, via the spare amplifier, or in parallel with the commentators on the main control amplifier, the earpieces of his headphones being separated so that one was connected to the incoming circuit from New York and the other to the output of the amplifier through which he was speaking. In this way over-elaboration of the equipment was avoided and the basic standard arrangements of apparatus were retained.

### Commentary Positions

All commentators used a lip microphone of the type which was first developed by the B.B.C. Research Department in 1937; it permits commentators to stand side by side, but not less than 4 ft. apart, without any danger of mutual overhearing. At the Colonial Office site, therefore, it was possible to have one line of 27 commentators talking simultaneously.

In every case a spare microphone circuit was installed. At each of the 11 commentary points on the route and in the Abbey contributing to the Home Service, a spare microphone was also installed, but in all other cases at each site one spare plug-in microphone was provided for every four or five commentary positions. In addition, each commentator had a communication unit which gave two-way light signalling with the technical operator at the local control position, and telephone communication, and also provided a choice of two programmes on his headphones, one of which was that on the network to which he was contributing and the other the Home Service programme whereby he could keep in touch with what the commentators on the latter were saying. At the Home Service commentary positions both feeds were of the Home Service, but one was 10db above normal to permit a commentator to listen at the higher level for his word cue when the crowd noises in his vicinity were particularly loud.

To meet these requirements, three separate cables were provided to cover the microphone, the spare microphone and the cue and control circuits, and where a number of commentator positions were concentrated the total number of the three types of circuit were arranged in three multi-core cables to a termination point central to the

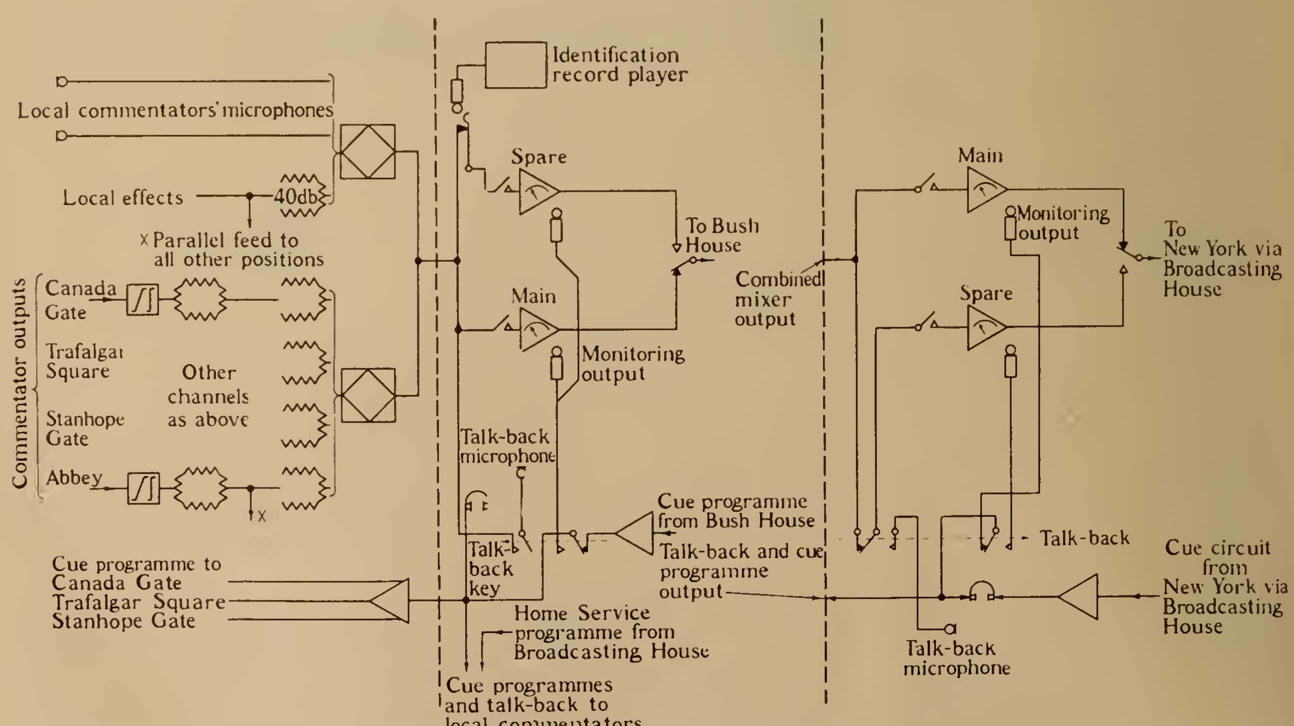

**Fig. 6. Overseas control positions at Colonial Office site.**

Four-channel mixer — Control amplifier with programme meter commentators' positions, whence two single-pair cables and one 7-pair cable served each position.

Finally, since it was not possible, other than for the French network, to accommodate any oversea commentators in the Abbey, they were helped to cover the ceremony in their own language by being provided at the Colonial Office site with a television screen each. This, coupled with the facility of listening to the Home Service, was undoubtedly of great assistance to them.

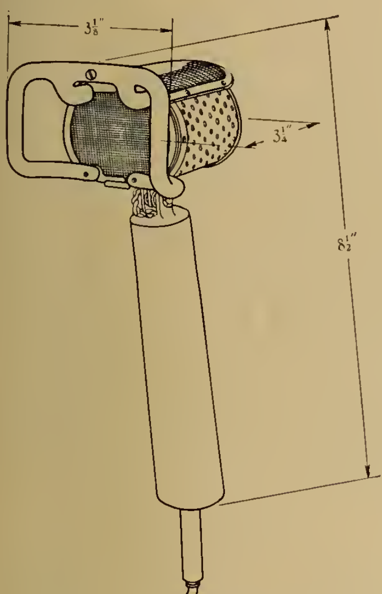

Fig. 7. Lip microphone.

### Lip Microphones

The type of lip microphone used was specially designed for commentators broadcasting in difficult conditions where extraneous unwanted sounds are so loud that the commentator would scarcely be heard if a normal type of microphone were used. It consists of a miniature ribbon microphone mounted in a protective case with a handle, the latest model being shown in Fig. 7. It exploits two characteristics of the pressure-gradient microphone, namely a figure-of-eight response characteristic—i.e. it is insensitive to sound arriving from the sides—and a great exaggeration of low frequencies for close-up speech.

In the lip microphone there is a mouth guard-ring which, for correct use, must rest on the lips of the commentator. The ribbon is then about 2½ in. from the mouth, and this, in a normal microphone of the pressure-gradient type, would result in exceedingly boomy speech quality; in fact, there would be an increase of about 20 db at 100 c/s compared with higher frequencies. However, in this lip microphone, partly by the use of silk-gauze screens in the protective case acting as an acoustic resistance and partly by an electrical network, the low-frequency rise is equalized. By acoustic screens, protection from wind noises is also obtained. The low-frequency components of sound originating from sources at least 2 ft. away from the commentator are greatly attenuated. By these means it is possible for a commentary to be given under conditions of very loud ambient noise.

### Recording

The recording of the coronation broadcasts for the purpose of repeating the events of the day in programmes to all parts of the world and for their preservation in the B.B.C. archive library was an operation which used all the B.B.C. recording resources. There were times on Coronation Day when 58 recording channels—47 disc and 11 magnetic tape—were in simultaneous use.

More than 20 recorded programmes, on 2,400 16-in. pressings, to explain the ceremony which would take place on June 2nd, had been sent to many parts of the world by the B.B.C. transcription service several months in advance. These were followed on the day itself by recordings of the Abbey ceremony which were flown to Canada, Australia, Bermuda, Fiji, Hong Kong, Malta, the United States, Tanganyika, Mauritius, Ceylon, Burma, Lebanon and South Africa, the first recordings being used in Canada and the United States on the evening of Coronation Day.

Because of the need to select with great speed comparatively short extracts from the long broadcast for subsequent B.B.C. programmes, the bulk of the Coronation Day recordings were handled on discs, and on this day more than 3,700 disc records were made. In addition, 85 miles of tape were recorded.

Some commentators from abroad brought their own recording equipments; the B.B.C. undertook the servicing of these, as well as the editing and dubbing of recordings made on them.

The selection and processing for permanent retention of recordings of the broadcast and of events leading up to it is still in progress at the time of writing the paper. When this task is finished, a valuable addition to the sound archives of the B.B.C. will have been made, not only for use by the B.B.C., but for the benefit of posterity.

## Television

### Outline of Arrangements

Like the sound broadcast, the television broadcast fell naturally into two sections, namely the ceremony inside the Abbey and the processions outside. In the matter of equipment and staff, however, the two services were very differently situated. A sound outside-broadcast (o.b.) unit nowadays costs about $1,000 and is operated by one or two men, whereas a television o.b. unit (mobile control room, cameras and sound equipment) costs about $50,000 and requires a technical team of ten men. It follows that, whereas it is economically practicable for a broadcasting organization to keep a stock of sound units over and above those required for normal operation, the same does not hold good in television.

Consequently, in planning the television coronation broadcast, careful thought was needed to make sure that o.b. units were withdrawn from their normal activities for the minimum period only, otherwise it would be impossible to handle many of the other important outside broadcasts both immediately before and after Coronation Day.

At the time, the B.B.C. possessed six television o.b. units, three normally based in London and one each at Glasgow, Birmingham and Bristol. It was decided at an early stage of the planning that all these would be needed for the coronation broadcast, and although at that time it was uncertain whether cameras would be allowed inside the Abbey, two units were allocated for this purpose, the remaining four being destined for separate points on the processional route. This was the plan finally adopted from the moment when permission was given to transmit the Abbey ceremony by television.

Each of the five control points (one at the Abbey and four on the route) was connected by cable to Broadcasting House, where a temporary television central control room had been installed, and this was the focal point throughout the day's broadcast.

Unfortunately, the rain which fell during most of Coronation Day reduced the clarity of outside pictures and particularly marred the wider scenes and distant views, such as that of the Mall from the roof of Buckingham Palace. By careful selection of those cameras giving the clearer pictures and the avoidance of too wide or too distant shots, it was possible to conceal the worst effects and to maintain a reasonable standard of quality.

Reserve arrangements for vision equipment on the scale provided in the sound service were out of the question. All vital items and links were duplicated, however, and, in particular, camera positions were so planned that had any one camera channel failed, the same scene could have been picked up, though perhaps not so effectively, by another camera in the same group.

The programme was broadcast by all existing television transmitters in France, the Netherlands and Western Germany, while in North America, recordings made by the B.B.C. as well as by Canadian and American broadcasting organizations were extensively used on Coronation Day and the succeeding days.

## Westminster Abbey

### *General.*

The equipment from the two mobile control rooms allocated to the Abbey was installed in a temporary hut erected outside the east end of the Abbey, alongside the King Henry VII Chapel, and amalgamated to form one composite control point. The cables to the cameras and other equipment inside the building had to be laid or suspended with the utmost care. Several circuitous routes were followed, and, allowing for duplicate cables to each camera, about 6,200 ft. of camera cable was installed, in addition to some 9 miles of other cables for communication and subsidiary purposes.

### *Camera Positions.*

The principal problem was that of the selection of camera positions which would give the required variety of views, be acceptable to the Earl Marshal and other authorities, and fit in with the space requirements of many other operators, such as B.B.C. sound broadcasting, newsreels, colour films, and others. Despite the compromises necessary in such circumstances, the B.B.C. had finally some excellent viewpoints. Fig. 3 shows the positions of the five cameras inside the Abbey; their effectiveness can also be judged by comparison with Fig. 4.

At cameras Nos. 1, 2 and 5 the operating boxes were so cramped that the cameramen had insufficient head-room, even when sitting, the maximum height being four feet; in one case the viewfinder fouled the roof and had to be removed and placed on the floor to one side. The cameraman attending No. 3 camera was so hemmed in by the orchestra that he could not stand in his normal position behind the camera but was obliged to stand to one side and to squint edgeways into the viewfinder. These and other limitations taxed the ingenuity and ability of the operators to the utmost. With the exception of No. 3, all cameras and cameramen were invisible to those present inside the Abbey.

### *Lighting.*

The special illumination of the principal areas concerned, i.e. the "theatre," choir and nave, was installed by the Ministry of Works; it consisted largely of about a hundred and twenty 1-kw. lamps mounted some 60 ft. above the scene and beaming vertically downwards. About 60 kw. of subsidiary lighting was disposed at lower levels (see Fig. 4).

Thus all the lighting was directly overhead—an arrangement which normally would not be considered photographically ideal. However, the light was "soft" in character and there was appreciable upward reflection from the carpet, so that the general effect was fairly acceptable; in any case, any other style of lighting involving lower-positioned lamps was out of the question for a setting in which participants, onlookers and cameras were at one time or another facing almost every angle of a full circle. The intensity of reflected light was higher than would have been necessary for television, having been prescribed by the needs of newsreel and colour-film cameras. Television benefited from this to some extent by the ability to stop lenses down to apertures of the order of $f$6.3, thus improving definition and depth of field, and also by the partial over-riding of the brilliance of certain naked lights, candles on chandeliers, which otherwise would have caused an excessive contrast range.

## Processional Route

Four mobile control rooms were disposed along the processional route at the points shown in Fig. 1. Point 1 ensured views of the procession, carriages and personages arriving at, and departing from, the Abbey (and entering and leaving through the Annexe). Two cameras were mounted in the Ministry of Works grandstand—one of them about 12 ft. above road level—to

**The Authors**

F. Williams

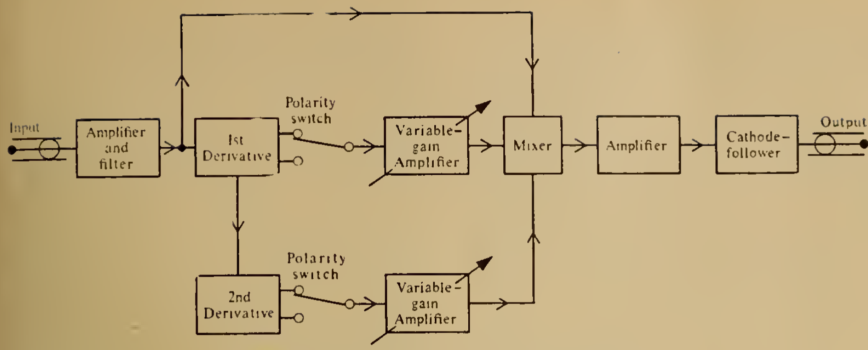

**Fig. 8. Variable derivative equalizer.**

take views through coach and carriage windows. The contents of the mobile control room had been installed in a temporary hut behind the stand, which was connected to these cameras by a few hundred feet of standard camera cable, but two other cameras associated with this control room were too remote to be linked to it in the normal way, and for these it was necessary to install the respective control and amplifying equipment close to each camera and then to carry the video output signal (at 1 volt d.a.p., i.e. standard level) by equalized telephone line provided by the Post Office. One of these cameras was installed on a platform outside a sixth-floor window of Abbey House, at the corner of Tothill and Victoria Streets, and commanded views not only of the west front of the Abbey but along Victoria Street and past the Abbey into Parliament Square. The second of these "remote" cameras peered through a small rectangular aperture let into the wall of the Annexe and only 10 ft. or so from the Royal entrance, this being used for intimate glimpses of Her Majesty's arrival and departure.

Point 2 was on the route of the procession to the Abbey only, and two cameras were supported by a 10-ft. scaffold platform erected on the pavement. A third camera associated with this group was installed on a 50-ft. launch which cruised on the river nearby and from which pictures were sent to the mobile control room by a portable v.h.f. (approximately 200 Mc/s) transmitter. The control vehicle was drawn up on the pavement against the river wall.

Point 3 was of great importance, since it covered the whole of the procession departing from and returning to Buckingham Palace. Victoria Memorial was taken over by the Ministry of Works, who provided stands for newsreel, press, sound broadcasting and television. Four camera positions were secured—one facing the Mall, one facing Buckingham Palace (with a clear view of the balcony) and two spaced intermediately on either side; the latter were used by one camera only, which was moved from the north side to the south side during the long interval between the departing and returning processions. The mobile control equipment for this site was removed from the vehicle in which it is usually operated and installed in a room provided by the Ministry of Works underneath the temporary stands. There were two other cameras associated with this unit, both of which were within the precincts of Buckingham Palace. One was in the main forecourt, just inside the front railings and hidden by one of the piers supporting the central gates; this covered the procession as it crossed the courtyard diagonally between the central archway of the Palace (leading through to the inner quadrangle) and the south gateway. The other camera was on the north-east corner of the roof of the Palace and commanded views over a wide arc, including the whole of the processional route along the Mall as far as Admiralty Arch. This camera was treated as a "remote" unit, with its control equipment installed in a top-floor room of the Palace and the video connection to the Victoria Memorial by Post Office telephone line, but the camera in the forecourt was connected direct by its own cable via an existing 6-in. underground duct which fortuitously crossed the road and broke surface close to the operating points at either end.

Point 4, in Hyde Park, was carefully selected to be about 100 yd. in advance of the head of the main return procession as it was formed up along the two miles of route back to Westminster Abbey. Thus, as soon as the procession began to move and the Queen left the Abbey, it was possible to switch over to Hyde Park and see the whole procession steadily through from beginning to end. Three cameras were installed on two tiers of a 12-ft. scaffold platform built on the grass alongside the pavement. After one or two obstructing tree branches and decorative banners had been displaced these cameras secured unobstructed views of the procession, both approaching and receding. The mobile control room was drawn up on the grass, directly behind the camera platform.

### Camera Tubes and Lenses

All cameras used the image orthicon type of pick-up tube. One camera in each group employed a 5:1 zoom lens[1] (in the Abbey, this was the camera over the west door), most of which had been received from the manufacturers only just in time for the event. Some of these were of a new two-range type with preselected ranges of focal length, either from 3 to 15 in. or from 6 to 30 in.

Long-focus lenses were used extensively, the most important example being the camera on the Victoria Memorial that secured close-ups of the Buckingham Palace balcony scenes. For this purpose, a double-folded 40-in. lens provided a horizontal viewing angle of only 1¾°, so that, although the object distance was 300 ft., the width of the screen was filled by about 9 ft. of the balcony.

### Camera Equalization

Eighteen of the 21 cameras were equipped with a new type of variable equalizer, primarily to compensate for the loss of resolution caused by deficiencies in the optical and electro-optical elements of the camera. It is convenient to classify all such losses under the heading "aperture distortion," since, in common with the distortion caused by a scanning aperture, the attenuation/frequency characteristic is not necessarily accompanied by phase distortion. Thus, while aperture effects may be partially compensated by means of a "top boost" circuit, [2–4] the phase characteristic of the circuit employed must be corrected if satisfactory equalization is to be achieved.

A further complication arises with the image orthicon camera tube in that the resolution of the target is affected by temperature, so that the characteristic required to compensate for loss of definition due to this needs to be variable. The form of equalizer used, which has been termed a "derivative equalizer,"[5] fulfils the requirements that attenuation may be compensated without affecting phase, and that the equalizing characteristic is continuously variable. It operates by virtue of the fact that almost all linear systems permit of equalization by adding to the response its successive derivatives or integrals with respect to time, each having the appropriate amplitude and sign.

This is true whether or not the system can be represented, by analogy, by a realizable electrical network, the only proviso being that it must be of the minimum-phase class. For the low-pass characteristic of a scanning aperture, only derivatives need be added; furthermore, if phase distortion is not present, only even-order derivatives are required.

For aperture correction it is found that subtraction from the response of the second derivative gives approximately the required characteristic. The equalizers used, however, included the additional facility of adding or subtracting the first derivative, since this affords some adjustment of the phase characteristic, which is often desirable to compensate for asymmetrical features of image orthicon target-redistribution effects.

A block schematic of the complete equalizer is shown in Fig. 8. Each derivative generator comprises a pentode with an open-circuited transformer in its anode circuit. The voltage developed across the transformer mutual inductance is thus the derivative of that applied to the pentode grid. The use of a transformer facilitates changing the polarity of the derivatives, which may either be added to, or subtracted from, the video signal. The two amplifying stages incorporate variable-mu valves, so that the gain of each may be adjusted independently by variation of grid bias to permit remote control of the equalizing characteristic from a position near the camera control unit where space is limited. The remote-control boxes are, in fact, only a few cubic inches in volume, each containing the two potentiometers which control the amplitude of the first and second derivatives, respectively, and a switch enabling a rapid comparison to be made of the picture with and without equalization. In order to prevent the equalizing characteristic from rising beyond the working frequency band, thereby reducing the signal/noise ratio, a low-pass phase-corrected filter with a cut-off frequency of 3 Mc/s is included in the unit.

An equalizer as described was installed in the camera channel between the camera head-amplifier and the first stage of the main amplifier in the camera control unit. In this position equalization was applied only to the video signal, and not to the synchronizing signals, which would have suffered distortion in the form of severe overshoots.

Operationally, the unit is simple to use and may be adjusted on a trial-and-error basis while viewing the picture. By adjustment of the second derivative the definition may be improved to a point where symmetrical overshoots are becoming obvious. Any residual asymmetrical defects may then be reduced by adjustment of the first derivative, the sign of which will depend upon the actual form of asymmetry. A limit to the degree of equalization is naturally set by the camera signal/noise ratio, but, because the noise spectrum associated with the image orthicon output signal is uniform and not triangular, it is usually possible to introduce about 10 db of equalization without a serious increase in the subjective annoyance of the noise.

#### Picture Synchronization

An operational feature not previously used in this country was the phase-locking of the frequencies of the frame waveforms from all cameras and sources, thus ensuring vision switching unaccompanied by any loss of frame synchronization. The cameras associated with any one mobile control room normally share one waveform generator; hence they are automatically phase-locked and there is no loss of synchronism when switching or fading from one to another. When changing to cameras from another source, fed by another waveform generator, the phase relationship, unless specially controlled, will be random. Generally this is of little consequence, since changes between sources, e.g. studio to o.b. unit to studio, are at relatively long intervals and one frame slip per programme (i.e. at the beginning and end only) would not be serious. But for the coronation o.b. the situation was quite different: with no fewer than five sources (and three "remote" cameras presenting an exactly similar problem) and quite rapid interchanging at certain periods, it was felt desirable to take steps to prevent any such disturbance or distraction as might otherwise have been caused by momentary frame-slipping.

Equipment was accordingly installed in the television central control room to overcome this. It included a master pulse generator producing, amongst others, a pulse at line frequency (10,125 c/s), which, by means of a conventional divider chain and reactance valve, is made proportional to the frequency of the supply mains. The fundamental 10,125-c/s sine wave is extracted from this signal by a suitable filter, is amplified and applied through a 90° phase-splitting network to the quadrature coils of a goniometer. In the goniometer a rotatable search coil derives from the field produced by the quadrature coils a 10,125-c/s voltage at any desired phase with respect to the ingoing signal. If the search coil is rotated by a complete revolution, there is a phase change of 360°, in advance or retard depending on the direction of rotation.

The 10,125-c/s signal from the search coil is passed by telephone line to the camera point, where it is used to lock the local camera waveform generator. The composite picture and synchronizing signal, after being passed over the link back to the central control room, is then compared in timing with the master waveform on a double-beam oscillograph.

Rotation of the goniometer can now be used to advance or retard the timing of the remote camera signal until it matches with the master signal. For each complete rotation of the goniometer a change of timing of one whole line occurs. If the need arises, therefore, the timing can be adjusted so that the signals are accurately in synchronism with regard to frame and line frequency signals, and also with respect to interlace, if desired.

A separate goniometer was provided at the central control room for each camera source used.

#### Sound

Throughout the broadcast the sound accompaniment of the pictures consisted of two parts commentary and "effects." For the broadcast within Great Britain these two ingredients were suitably combined in the control room of each main camera group and the composite sound was passed to the Central Control point at Broadcasting House. All commentators used lip microphones of the same type as those used by sound-service commentators and, in accordance with established practice, each had in front of him a television screen on which he could see the pictures being fed from his mobile control room to the central control point. The effects at some of the positions (including, of course, the Abbey) were shared between the sound and television services. In the Abbey, the television commentator occupied a soundproof box near the cameras in the triforium.

To meet the needs of the continental countries which were relaying the broadcast, a continental television control point was set up in a studio in Broadcasting House, which was the focal point for all television sound circuits associated with those countries.

For the French television service, complete coverage of the day's events was achieved by placing French commentators at three of the four television points on the route and by arranging that the French commentator in the Abbey should speak for the television as well as for the sound audience. Each of these commentators spoke into a lip microphone, and on a television screen in front of him he could see the picture leaving his own camera point. The outputs of these four microphones were fed to the continental control point for mixing, and from there were fed to Paris. Independently, the "effects" from the four points were fed to the same control point for mixing, which was performed by a French engineer. Thus the complete French commentary and the corresponding "effects" were fed to Paris on two separate lines, the two being combined in Paris.

For the Netherlands and Germany a less ambitious arrangement had to be adopted. "Clean" effects,

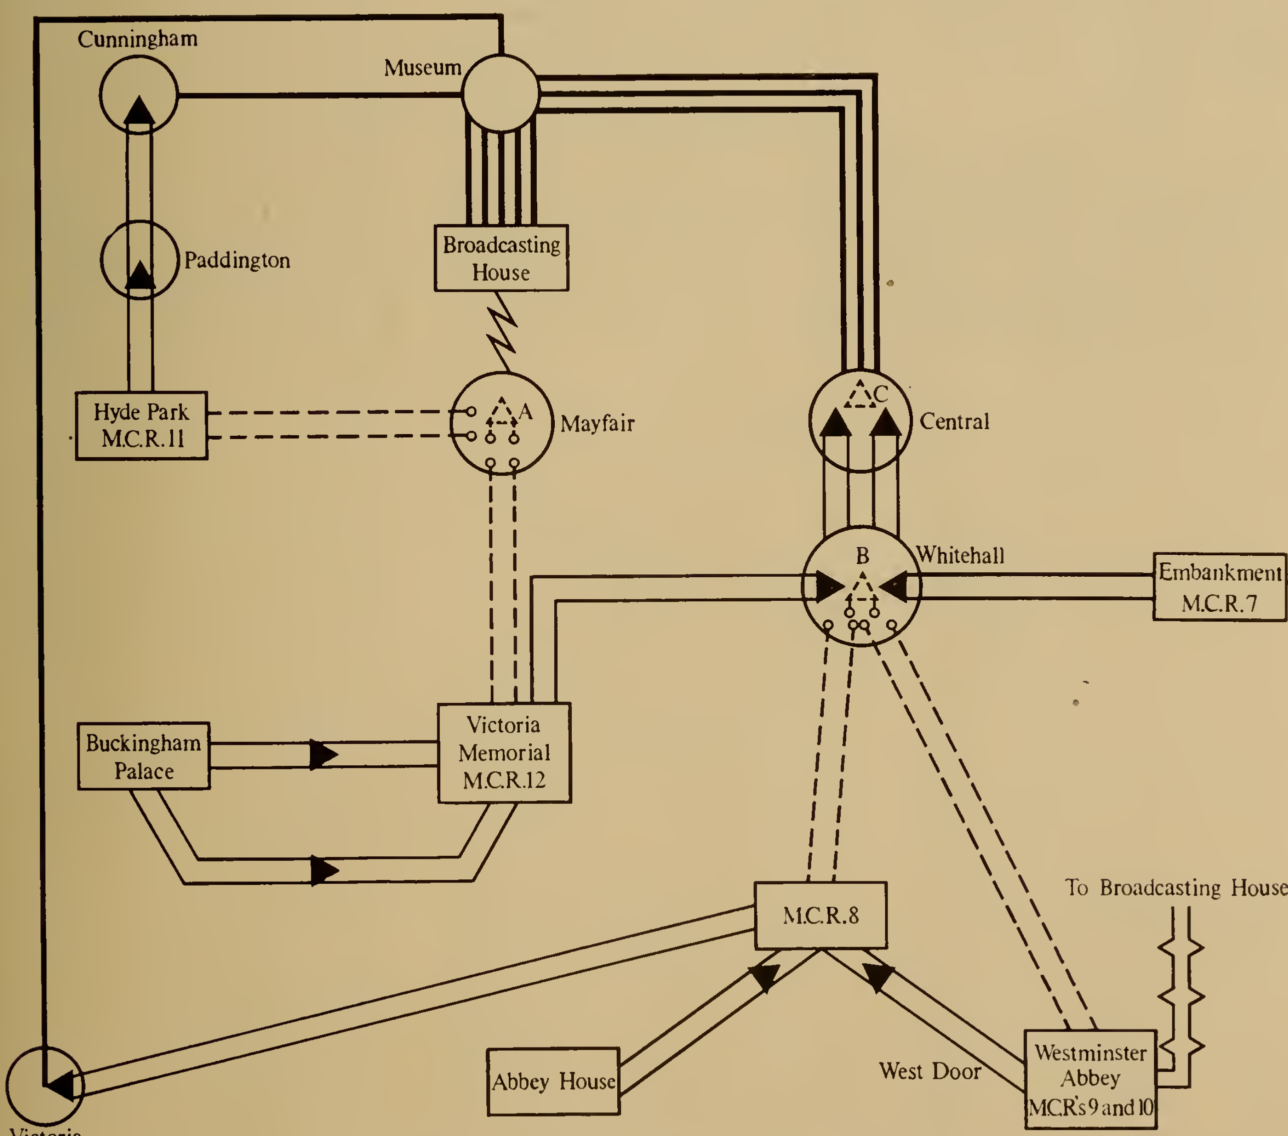

**Fig. 9. Television land lines and video repeaters.**

as fed to France, were fed also to these countries and, on a second line, the English commentary for cueing purposes. The Dutch and German commentators, who had been in London for several days previously for briefing, were back in their home countries on June 2nd, the Dutch commentators at Bussum and the Germans at Cologne. In each case the commentators were in sound studios, and while viewing the pictures superimposed their own commentary in the local language on the clean effects received from London, at the same time listening on headphones to the English commentary. So far as is known, this was the first time that this technique had been used, and it appears to have proved effective in both countries.

### Transmission

The vision transmission from the Abbey required the exclusive use of the special television balanced-pair cable originally laid in 1937 shortly before the coronation of King George VI. This cable now forms a main link to Broadcasting House for outside broadcasts from many points in the West End of London. The four other main circuits into Broadcasting House had therefore to be planned without using this cable. Several coaxial cables used for television outside broadcasts were available at points within the vicinity, and these were extended over ordinary telephone cables [6], [7] to the remaining four control points so that they could form main links. The final arrangement is shown in Fig. 9, and it will be seen that in all these cases the vision links had to take circuitous routes to Broadcasting House.

Seven video repeaters were in simultaneous use for the broadcast, and, in view of the importance of the occasion, three standby repeaters were made available. Since movement of vehicles within the area was likely to be difficult after 6 a.m. on the day of the broadcast, it was problematical where best to locate the standby repeaters. The circuit from Point 2 on the Victoria Embankment would be used only for a short period when the procession passed from Buckingham Palace to the Abbey, and it was decided to close this circuit after the procession had passed until the late evening, when it would be required again for the firework display. This allowed the associated repeater and the main portion of the circuit from Whitehall exchange to Broadcasting House to be used as a reserve link during the whole of the broadcast. Two of the reserve repeaters were installed, as shown by the broken lines in Fig. 9, and this arrangement enabled them to provide standby facilities for five operative repeaters and four main circuits. The third standby repeater was held spare at Central exchange. The reserve circuits were brought into use in accordance with the sequence of use for the various main circuits.

When the Royal procession left Buckingham Palace, pictures were available in Broadcasting House from all outside broadcast sites, and, in addition, duplicate pictures were available from the Victoria Memorial via Mayfair exchange. When the procession approached Westminster Abbey, duplicate pictures from the Colonial Office site were made available by switching out the Victoria Embankment cir-

### Table 2
#### Technical Features of Telerecording Equipments

| Recording authority | Film gauge | Location | System | Sound | Photographic process | Film standards | Processing |
|---|---|---|---|---|---|---|---|
| | mm | | | | | pictures/sec | |
| B.B.C. | 35 | Lime Grove | Mirror drum; continuous motion | Variable-area photographic | Negative to positive | 25 | Commercial laboratory |
| B.B.C. | 35 | Alexandra Palace | Suppressed frame; intermittent | Variable-area photographic | Negative to positive | 25 | Commercial laboratory |
| B.B.C. | 16 | Broadcasting House | Suppressed frame; intermittent | Variable-density photographic | Negative to positive | 25 | Commercial laboratory |
| N.B.C. | 35 | Blackbushe Airport | Fast pull-down; intermittent | Variable-density photographic | Negative only | 25 | High-speed machine integral with camera |
| N.B.C. | 16 | Blackbushe Airport | Fast pull-down; intermittent | Variable-density photographic | Negative only | 25 | Separate processing machine |
| C.B.C. | 16 | Alexandra Palace | Fast pull-down; intermittent | Variable-density photographic | Direct positive | 20 | High-speed machine integral with camera |
| C.B.S. | 16 | London Airport | Fast pull-down; intermittent | Separate magnetic tape | Direct positive | 20 | High-speed machine integral with camera |

cuit. Similarly, during the Abbey ceremony, duplicate pictures from Westminster Abbey were made available by switching at Whitehall. After the ceremony and the start of the main procession, duplicate pictures from Hyde Park and Victoria Memorial were arranged in turn. The change-over from one circuit to another, using the Mayfair repeater, required a change of equalization, but there was ample time between the uses of the circuits for this to be done. The change-over of the circuits at Whitehall had to be made quickly, and a remote-controlled switching relay was fitted at Whitehall (see Fig. 10) and operated from Broadcasting House.

#### Television Central Control Room

A television central control room was installed in Broadcasting House specially for this broadcast, and in it were terminated all the vision and sound circuits from the various sources. Here were displayed continuously, on separate screens, the pictures coming in from each source, so enabling the central producer to select the precise instant of switching from one scene to another. This vision switching was very simply carried out by quick-acting pushbutton switches, and the accompanying sound was faded over in the normal way. The producer was also able to speak by talk-back circuit direct to all his local producers at the camera points as well as to the commentators, thus ensuring full co-ordination of sound and vision between the various scenes and commentaries. The final composite programme emerging from this central control point at Broadcasting House was then fed into the British network, and the vision signals were sent simultaneously to the Continent.

#### Coverage in Great Britain

Every attempt was made to provide the maximum possible coverage within Great Britain for this supremely important broadcast. The first part of the B.B.C.'s post-war coverage programme, the erection of four high-power stations outside London, had been completed in August, 1952, with the bringing into service of the Wenvoe station. The second part, the erection of five medium-power stations, had been postponed, however, on instructions from the Government. But in October, 1952, the Government gave permission for three temporary low-power stations to be built near Belfast, Newcastle and Brighton, on the understanding that the B.B.C. would be able to bring them into service in time for the coronation. The stations would be required to continue in operation after the coronation until replaced by permanent stations.

To use efficiently the short time available for the construction of the temporary stations, it was decided to install the equipment in vehicles, thus permitting installation of all three to be completed at a base convenient for supplies and economical in engineering effort. Further time was saved in this way by avoiding the need for buildings to house the equipment.

Some improvisation of equipment was necessary also. The 500-watt vision transmitters and the associated sound transmitters were made by adapting transmitters bought from Armed Forces disposal stocks. The vision transmitters were arranged to operate in the 41-68-Mc/s band (Band I).

Each transmitting vehicle was equipped with duplicate vision and sound transmitters, to give reliability in service, and sufficient test and auxiliary equipment to operate independently on relatively remote sites. Where necessary, receiving equipment was provided for vision and sound programmes.

The sites selected for the three temporory stations were Glencairn, near Belfast, Pontop Pike, near Newcastle-upon-Tyne and Truleigh Hill, near Brighton. To each temporary station was allotted the channel frequencies of the permanent station which will replace it. The Glencairn station, which began regular transmission on the 1st May, 1953, is situated about four miles from the centre of Belfast, on a site 400 ft. above sea level. The aerial is a single-stack batwing powered by both vision and sound transmitters through a combining circuit and is mounted on a 250-ft. stayed lattice mast. The vision programme is received at a nearby Post Office receiving station by direct reception from the B.B.C.'s high-power television station at Kirk o'Shotts. Glencairn is far outside the normal range of Kirk o'Shotts, so that the signal is not always satisfactory, but this was the best arrangement that could be devised in the short time available.

A site at Pontop Pike had already been chosen for the permanent station to serve the north-east of England, and the temporary station was installed there, 1,000 ft. above sea level. An important advantage of this site was the proximity of one of the Post Office radio-link stations which carries programme from Manchester to Kirk o'Shotts. A branch line for the programme feed to the Pontop Pike transmitter was easily arranged. This station also came into service on the 1st May, 1953.

The transmitting vehicle for the Brighton area was stationed on an Air Ministry site at Truleigh Hill, just north of Brighton and Hove. A four-element array of inverted-V aerials on 70-ft. masts was made, in order to pick up the vision transmission at 45 Mc/s from Alexandra Palace, 48 miles away. The arrangement was found effective in rejecting the signal from the local transmitters and also in avoiding interference from the French 441-line transmitter in Paris, which radiates frequencies within the pass band of Alexandra Palace. The vision programme received in this way was reradiated by the local transmitter operating at 56.75 Mc/s, thus improving the service in the Brighton — Shoreham — Worthing area. The station came into service on the 9th May, 1953.

These three stations provide a satisfactory service to about $2\frac{1}{2}$ million people and have raised the coverage figure for Great Britain as a whole from 80% to nearly 84%.

#### Telerecording Arrangements

Seven sets of television recording equipment were in use for this broadcast, three by the B.B.C., two by the National Broadcasting Company of America (N.B.C.) and one each by the Canadian Broadcasting Corporation (C.B.C.) and the Columbia Broadcasting System of America (C.B.S.). All used standard 35-mm. or 16-mm. film.

Some of the technical features of these equipments are set out in Table 2. The B.B.C. mirror-drum (Mechau) cameras at Lime Grove recorded the complete broadcast for archive purposes, while the suppressed-frame cameras at Alexandra Palace recorded selected excerpts for retransmission during the evening of the 2nd June and to provide copies of a shortened version of the broadcast which were needed by foreign television services. About two hours of the programme was also recorded on an experimental 16-mm. suppressed-frame camera installed at Broadcasting House.

In the mirror-drum system the film is drawn through the camera at constant speed and both interlaced frames of the television picture are located correctly on the film frame by optical means; thus the whole picture information is recorded. The result of superimposing two television frames differing in time by 0.02 sec. on a single film-frame is to produce some blurring of outlines in any part of the scene in which rapid movement is taking place, and this is the principal disadvantage of this system. Fortunately, there was little rapid movement during the Abbey ceremony, and very satisfactory recordings were obtained.

In the suppressed-frame system

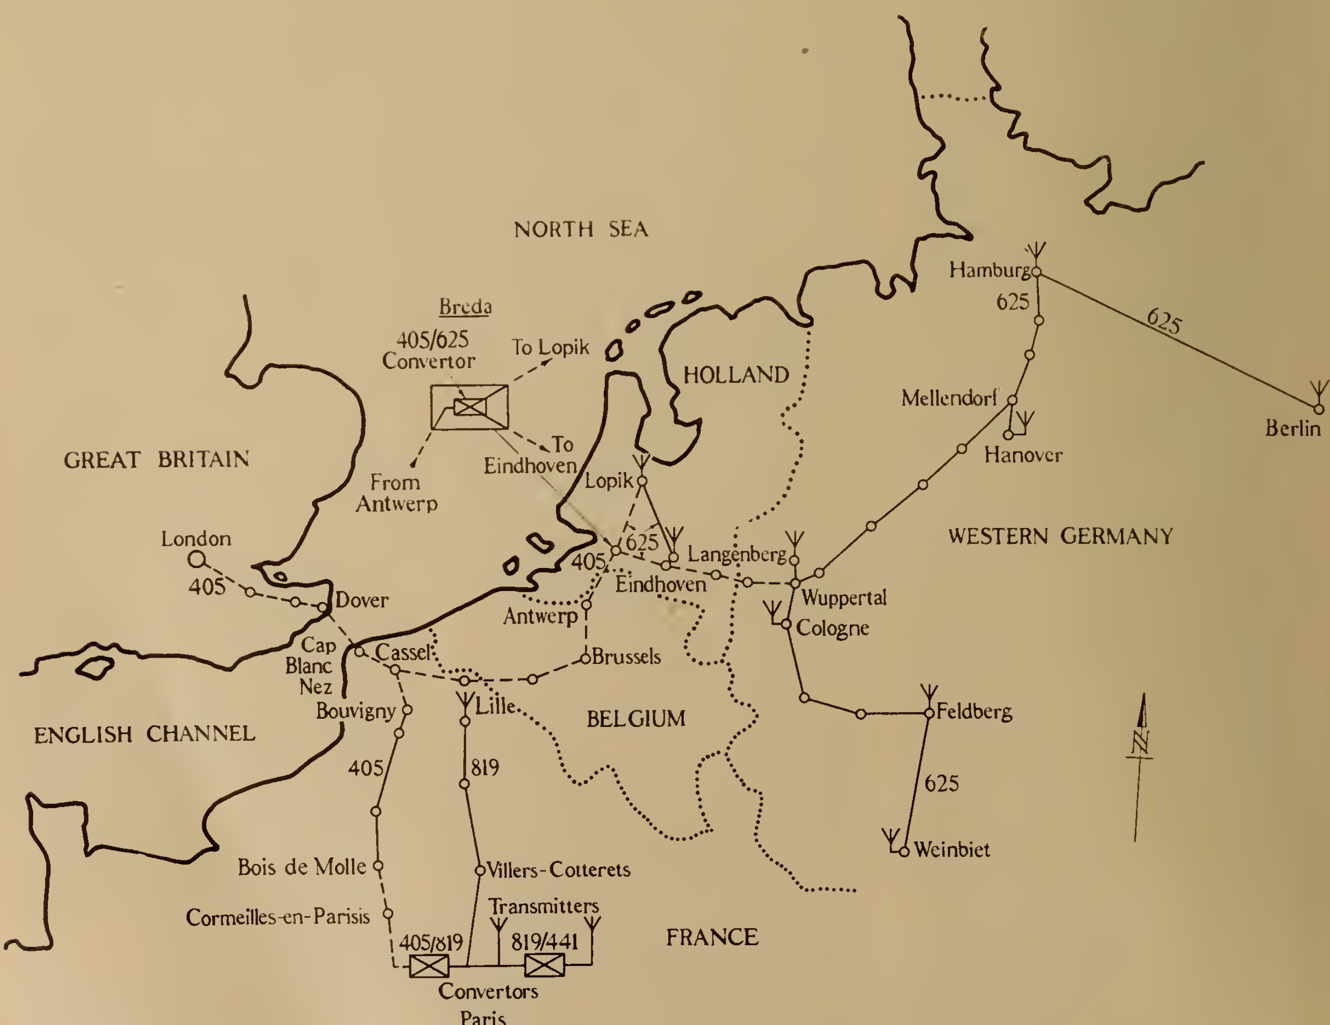

Fig. 11. Continental television circuits.

the film is stationary in the gate during one television frame (0.02 sec.) and is pulled down during the succeeding frame. Thus, only alternate frames are recorded, and consequently only half of the picture information. Line-broadening is adopted in the picture which is presented to the camera, so as to eliminate the line structure. The resulting picture on the film possesses a horizontal definition very nearly up to normal standards, but the vertical definition is, of course, equivalent to only 202½ lines. This system does not suffer from blurring, however, and is thus inherently more suitable for recording rapidly moving subjects.

The three transatlantic organizations used their standard fast-pull-down intermittent-motion cameras adapted to operate on British standards. The C.B.C. and C.B.S. operated their cameras at 20 pictures/sec. with an exposure time of 0.04 sec., so that a complete television picture was recorded on each film frame. Since the resulting film was non-standard, it had to be reproduced in Canada and in the U.S.A. on film scanners specially modified for the occasion.

The N.B.C. 35- and 16-mm. cameras were operated at 25 pictures/sec., so that a number of lines at the top and bottom of the picture had to be blanked out during the film-movement period. The speed of pull-down was not disclosed but appeared to be of the order of 30°, or 6 millisec., permitting about 340 of the 377 active lines to be recorded.

The C.B.C., C.B.S., and N.B.C. 35-mm. cameras were fitted with continuous high-speed processing plant which enables developed and dried film to leave the machine and to be run through a monitoring projector a minute or so after the film is exposed. Apart from the saving of time as compared with sending exposed film to an outside laboratory, this is a most useful facility in that it provides a continuous check on the correct adjustment of the apparatus. It may, however, introduce some loss of quality as compared with normal processing.

The N.B.C. 16-mm. films were developed in separate high-speed processing machines installed in the same room as the recording cameras.

The C.B.C. and the C.B.S. photographed a negative picture, so that the finished film was a positive ready for retransmission; the N.B.C. photographed a positive picture, thereby producing a negative film which was electrically reversed on retransmission.

Elaborate arrangements were made to get telerecordings to Canada and the United States in the shortest possible time, and at 9.15 p.m. B.S.T. (4.15 p.m. Eastern Daylight Time), immediately after Her Majesty's broadcast, viewers on the other side of the Atlantic were seeing, by this means, the start of the day's events in London.

#### Continental Relays

One of the aspects of the coronation television broadcasts which excited particular interest was the successful relaying of these broadcasts by television transmitters in France, the Netherlands and Western Germany. Technical interest centred on three features, namely the method of conveying the signals from London to their various continental destinations, apparatus for converting from the British television standards to those used in the relaying countries, and the techniques used for adding foreign-language commentaries to the effects picked up by B.B.C. microphones.

Solutions to the technical problems of temporary long-distance linkage and standards conversion had been demonstrated in July, 1952, when Radiodiffusion-Television Française (R.T.F.) and the B.B.C. had established a vision link between Paris and London, with a standards convertor, deriving from the French 819-line pictures corresponding signals on the British 405-line standards, at Cassel in Northern France. In spite of some technical troubles, the results were sufficiently successful to justify plans being made for the transmission of signals from Great Britain to the Continent, and over a greater distance, on the occasion of the coronation. Plans were made at a meeting in London in December, 1952, and full-scale trials were carried out from the 20th April to the 26th April, 1953. Towards the end of this period, B.B.C. programmes were successfully relayed by France, the Netherlands and Western Germany.

The circuit, details of which are given in Fig. 11, was reestablished on the 27th May and remained in operation until the 4th June. During this period, 21 programmes were relayed by France and the Netherlands and 24 by Western Germany.

The whole of the vision distribution network shown in Fig. 11 consists of radio links, many of which were temporary. The equipment for the five links from London to Cassel was provided and operated by a British firm acting as contractors jointly to the B.B.C. and R.T.F. This equipment was of the centimetre-wave type, by means of which a great concentration of the radiated energy in a narrow beam is possible, giving satisfactory communication over a line-of-sight path of 30 miles or more.

The departure point in London was the top of the tower of the University of London Senate House in Bloomsbury. This tower had on many occasions previously been used as a terminal receiving point for outside broadcasts, by arrangement with the University of London, but had never before been used as a transmitting point. The first relaying point was at the B.B.C. transmitting station at Wrotham in Kent, where use was made of the mast erected in connection with experimental v.h.f. transmissions. The next relay point was at the top of a hill at Warren Street, between Maidstone and Ashford, using a water-tower. The signals transmitted from Warren Street were received at the R.A.F. station at Swingate, which is on top of the cliffs near Dover, and from this point the signals were retransmitted across the Channel. The receiving point on the French coast was established by R.T.F. at a high point a little inland from Cap Blanc Nez. Here, special steps had to be taken to minimize the effects of fading which occur on centimetre wavelengths when the transmission path is above water. [8] The solution adopted was to use two separate receivers, the receiving dishes of which were mounted on the same mast with a vertical spacing of about 20 ft. When one receiver was exhibiting fading the other receiver was giving a steady signal, and it was found possible at all times, by manually selecting the better signal, to pass on to Cassel a satisfactory video signal.

At Cassel the received video signal was passed on to the French authorities and at this point bifurcation took place, the signal being fed (still on the British 405-line standard) southwards to Paris and eastwards to Lille. The route to Paris was accomplished mainly on a permanently installed circuit which had been recently set up by the French P.T.T. as part of a permanent circuit between Paris and Lille. In Paris the British 405-line signal was converted to the French 819-line standard and was used for feeding the two transmitters, one on 819 lines and the other on 441 lines (via another standards convertor). The signal was also used to feed the Lille 819-line transmitter by the normal R.T.F. distribution circuit. The other route from Cassel towards Lille was used to supply a series of links crossing Belgium via Lille, Flobecq, Brussels and Antwerp, to the first point in Netherlands territory, Breda. Belgium at that time had no television service in operation, but arrangements were made at the relay point at the Palais de Justice in Brussels to make the picture available for purely local viewing.

At Breda the 405-line signal was converted to the 625-line standard adopted by the Netherlands, Western Germany and other European countries. It passed from there to the main Netherlands television transmitter at Lopik, near Utrecht, to which a subsidiary transmitter at Eindhoven is permanently connected. The 625-line signal was also fed eastwards via relay points at Eindhoven, Helenaveen, on the Dutch side of the Dutch-German border, and Süchteln, which is on the German side of the border. At Süchteln the German authorities were also able to receive the Lopik transmission directly, thus giving them a reserve in the event of failure between Breda and Süchteln. The final temporary link in the chain was between Süchteln and Wuppertal, at which point the signal was fed direct into the permanent German network, running from Berlin via Hamburg, Hanover and Langenburg to Cologne, Feldberg (near Frankfurt) and Weinbiet (near Baden Baden).

In spite of the somewhat primitive arrangements which had to be made for some of the temporary links, the inclusion of standards conversion equipment, the absence of standby arrangements and the large number of different organizations which were concerned in providing equipment and setting up and operating the complete chain, remarkably satisfactory pictures were received on Coronation Day by viewers from a total of twelve transmitters in a large area of Western Europe.

The standards conversion equipment[9] used in Paris and Breda was basically the same as that used in July, 1952. The method used is to display the incoming picture on a cathode-ray tube, the phosphor of which is chosen so as to give a relatively long decay time. This picture is viewed by a camera operating on the standard to which conversion is required. In order to avoid any stroboscopic effect between the line structures of the two systems, the scanning lines of the incoming picture are broadened by superimposing a slight oscillation on the linear movement of the scanning beam. In this way the line structure of the incoming picture can be virtually eliminated. This solution to the problem of converting from one national standard to another, although it may appear somewhat inelegant, has in practice proved extremely effective, provided that suitable precautions are taken.

### Communication Circuits In Central London

The planning of the extensive network of communications provided by the Post Office to cover the organization, control, broadcasting and Press reporting of the coronation ceremonies was begun early in 1952, and it soon became obvious that the requirements for sound and television broadcasting would be very extensive and would form the major part of the total requirements. The spare cable pairs available in the area of the processional route were too few to meet requirements, and considerable additions to the line plant serving certain parts of this area were found necessary. The new ducts and cables were so planned that, after the ceremonies, they could for the most part be incorporated into the junction cable network and so provide for the normal growth of circuits serving the West End of London.

The main cable network finally decided upon is shown in Fig. 2. The principal new cables were an 800-pair type from Museum exchange via Broadcasting House and Mayfair exchange to the Victoria Memorial and then on to Victoria exchange; a 600-pair cable from near the Victoria Memorial to a large flexibility frame in Whitehall; and cables from this frame to the Colonial Office site, Broad Sanctuary, and the precincts and interior of Westminster Abbey. The huts provided for B.B.C. control rooms were sited on the cable route and outside Westminster Abbey. The cables were terminated on distribution frames at all these points, and, with the main distributing frames at the exchanges giving access to the junction cable network serving London exchanges, the network had a very high degree of flexibility, making it possible to provide a wide variety of main and alternative routings.

At the Canada Gate hut the equivalent of the cable trench of the orthodox telephone exchange was provided by erecting the hut over a double junction box, removing the covers and making removable that portion of the floor of the hut above the box.

New ductwork was required in several places, particularly in the neighbourhood of the Victoria Memorial. A 4-way duct was provided from a point near Mayfair exchange, across the Green Park and the Mall to Birdcage Walk. Because of the special nature of the red asphalt macadam carriageway in the Mall, trenching was out of the question and tunnelling was necessary. This work was completed by the end of January, 1953.

The cable sizes were designed so that most of the cable required could be provided from cable recovered in other parts of London. All recovered cable was cleaned, examined, reconditioned as necessary and thoroughly tested before being laid. Where required, suitable jointing lengths were obtained by splicing cable lengths together using unidiameter joints.

### Acknowledgments

The authors wish to record their thanks to the Director of Technical Services of the B.B.C. and to the Engineer-in-Chief of the Post Office for permission to publish the paper. They also wish to express their indebtedness to those members of the engineering staffs of the B.B.C. and Post Office who have made individual contributions to the paper.

# The ASME Boiler Code

In the July 1952 issue of *Mechanical Engineering*, the ASME commenced publication, in serial form, of a history of events leading up to the present ASME Boiler Code, from the first development of boilers in the 18th Century. This history, continued through some ten issues, was prepared by Arthur M. Green, Jr., of Princeton University.

As a preface to the regular publication in future issues of *The Engineering Journal*, of Boiler Code Regulations, this history is here presented in condensed form. It will appear in several issues of the *Journal*, of which this is the fourth.

## IV. Revisions by Annulment of Cases, 1936-1937

The short period between Editions of all sections of the ASME Boiler Code was not due to changes in practice of boiler construction, nor was it in harmony with announced policy of curtailing frequent changes in rules. It was rather because in 1936 there were too many active interpretations of the Code, and hence reference to replies for justification of procedures was difficult.

The need for annulment of inactive cases and transfer of some or all of the active cases into the Code was evident. The minutes of the Executive Committee are filled with records of annulments by revisions or by dropping. In October 1936 it was reported that a list of active cases had been studied, and found to contain 31 that could be annulled. The remaining 80 were reduced during 1937 to about 30 active cases.

It was reported to the Committee in February 1936 that tables for the gauges of tubes for the Power Boiler Code, the Codes for Boilers of Locomotives, and for Unfired Pressure Vessels hand been studied with care. As a progress report, a formula was proposed for allowable working pressure on seamless tubes, and one for minimum thickness. The report included three charts of allowable working pressure for various thicknesses of water tubes and showed curves, tables, and values from German standards for steels.

A proposed table for working pressures for seamless steel tubing was presented at the Executive Committee meeting in April 1936. If the proposed tables were adopted, similar tables could be developed for other types of tubes. The Executive Committee accepted the proposed table, with the understanding that the minimum gauges for different diameters given in the table were minimums for use at all lower pressures, and thicknesses for higher pressures should be determined by the formula, using next higher units of 10 above the determined values.

The Committee also voted that a new rule would be proposed; that for tubes exposed to radiant heat the thickness should be one gauge heavier than shown in the table. Tubes welded by the electric resistance process should be given a working pressure of 90 per cent of that in the table. Lap-welded tubes of Tables P-2 and P-3 should remain as before, except that they should be changed to the next higher unit of 10.

The Executive Committee met in an informal conference with representatives of tube manufacturers in April 1936. Participation by guests was greatly appreciated, and the Executive Committee expressed this by a vote of thanks. The Boiler Code Committee decided to report to the Conference, but to take no action at their meeting, except the approval of the increase of 100 p.s.i. in the tabular values for tubes of unfired pressure vessels and the rounding out of the values of Table 2 of the next higher figure ending in zero.

In May 1936, values in Table 5 Firetube Boilers of the Power Boiler Code, and Table L2 for Boilers of Locomotives in the 1935 Edition, were questioned. On recommendation of James Partington, however, the use of Table L2 was approved as an addendum, because of the increase of pressure in boilers of this type.

At the Executive Session of the Committee in June 1936, test data from one of the manufacturers of lap-welded tubes was reported. As some manufacturers of electric resistance welded tubes had indicated acceptance of 90 per cent efficiency of weld, it was considered advisable to indicate to lap-welded tube manufacturers, the efficiency the Committee had proposed for their product.

In October 1936, a new table was reported for maximum allowable working pressures for seamless steel tubing in water tube boilers, including illustrations. Minimum thicknesses for tubes 2 in. O.D. and under, were the same as in Table P-2. Allowable pressures for 3½ in. and 4 in. tubes of minimum allowable thickness were above those of Table P-2.

After discussion, including consideration of welded tubes, publication of the table was referred to the Executive Committee with power, after deletion of one point and inclusion of a statement that a rating of 90 per cent should be given to electric resistance welded tubes and 80 per cent for lap-welded tubes, provided the data submitted warranted these particular ratings.

Publication of the Table and an article accompanying it in the January 1937 issue of *Mechanical*

*Engineering* brought protests from the Ohio Board of Boiler Rules, and from those interested in electric resistance welds, claiming there were not sufficient data present to warrant a change in the Table. A second conference took place in March 1937 purpose of which was to obtain from all interested parties comments on the proposed revisions. Following considerable discussion, the Boiler Code Committee decided to take no action on the Table for firetube boilers until the table for water tube boilers had been adopted, and to leave the matter in the hands of the Executive Committee.

From communications received following the publication of the Table in January, and from the minutes of the conference, the Executive Committee believed the revised Table was approximately correct for the higher pressures. It appeared unnecessary to revise present values for lower pressures. A revised Table was presented and action on it was referred to the Executive Committee.

#### Conference on Safety Valves

The relieving capacity of safety valves had caused concern to the National Board of Boiler and Pressure Vessel Inspectors. In January 1936, tests on three types of safety valves purchased in the open market showed none of them complied with Code requirements. The National Board then decided to require all safety valve manufacturers furnishing valves for use in states and cities having National Board membership, to build in accordance with Code rules, and in addition to comply with certain test requirements.

A special committee was appointed to co-operate with the National Board in considering revisions of the Code to cover inspections. It was reported at a meeting of this special committee in February 1936, that revisions to paras. A-12 to A-17 would have to be made, and a conference with safety valve manufacturers was called for March 1936. At this conference, deletion of para. A-11 and parts of paras. A-13 to A-16 were approved, while it was agreed other proposed changes would await formulation by the Special Committee.

The Special Committee's report of September 1936 included revisions affecting 14 of the paragraphs between P-270 and P-289, with recommendations that some of these changes be made in the sections on Boiler Locomotives, on Low Pressure Heating Boilers, and on Unfired Pressure Vessels. The report was adopted for publication in *Mechanical Engineering* for comment. The changes appeared in the 1937 Edition of section I, with changes made on December 19, 1936.

#### Conference with Ohio Board of Boiler Rules

At the Boiler Code Committee meeting in December 1936 a letter presented by the chairman of the Ohio Board of Boiler Rules took exception to a statement which appeared in *Mechanical Engineering* preceding the interpretations of the Code, that anyone desiring information on the application of the Code should communicate with the committee secretary. This suggested that the Committee solicited requests for interpretations. When information was desired regarding application, the first request should be made to an administrative body. To clear this matter up, the chairman suggested a conference of representatives of the Committee and the Ohio Board of Boiler Rules.

The Special Committee met with the Ohio Board in March 1937. No notes were taken, since the committee could only give personal opinions, as Committee action would be required for the approval of definite actions. The chairman of the Ohio Board explained the legal requirements under which the Board operated, and why some activities of the Boiler Code Committee had made problems for them. He presented the views of the Board. Representatives of the Committee explained that the Committee welcomed constructive suggestions from various state boards and inspectors. In reporting to the Committee, they expressed belief the conference was helpful and resulted in a better understanding of the problems of the Ohio Board and of the Committee.

#### Conference on Specification S-26

A conference between the Boiler Code Committee and invited guests interested in the use of steel of specification S-26 was held in April 1937. Letters of comment on proposed revisions had been received from two boiler manufacturers. Questions coming under discussion were the limitation of 0.33 per cent carbon in samples taken at any point of the plate; reduction in plate thickness for shells and heads from 1½ in. to 1¼ in. for para. U-69 vessels; and reduction of the requirements for stress relieving in para. U-76(b). After discussions, the revisions to paras. U-13(c), U-69, and U-76(b) were approved by the Committee.

#### Welding

During the years 1936-1937, the Subcommittee on Welding considered many cases, but always in co-operation with the AWS Conference Committee, and at times with the Directors of AWS. In January 1936 the Special Committee on X-ray requirements reported that, as a result of adverse criticism of the master set of radiographs, a conference had been held in December 1935, at which agreement was reached; that from the master sets a new set of films should be selected, that the Special Committee should consider the inclusion or addition of consumer interests; that the enlarged Committee should consider the quality of negatives for different weld thicknesses; that in place of the Special Committee, a joint committee with the API-ASME Committee on Unfired Pressure Vessels should be appointed, with 12 members, four each of whom would represent consumers, manufacturers and neutrals. The Boiler Code Committee adopted the suggestions, and appointed the ASME group. This was a Special Committee of the Boiler Code Committee, the name was changed to Special Committee on Radiograph Examination of Welded Joints.

#### X-Ray Examination

In March 1937, this Special Committee reported that in June 1936, it had approved the grinding, chipping, or suitable machining of weld reinforcement of welds to be radiographed, so as to leave a weld that would merge smoothly into the plate. This should be used in paras. P-102(i) and U-62(i) since both provided for use of a penetrometer. On approval of the limit of 5¼ in. for plate, and the use of the Buckey type grid, the resulting changes were authorized in paras. P-102(i) and U-68(i), covering procedure for welds in plates thicker than 5¼ in., the preparation of welds for X-rays, and the use of a new form of penetrometer.

In April 1937, it was reported that the Special Committee had given consideration to selection of a new standard set of radiographic films, especially the set of five used by the U.S. Navy. The Committee agreed that No. 3 film should be that showing maximum porosity for the API-ASME Code, while No. 4 would apply to the ASME Code. It was reported the new penetrometer would give better information. To assure uniformity between the API-

ASME Code and the ASME Code, the Committee voted to use No. 3 as the maximum porosity for welds by the ASME Code.

#### Testing of Welding Operators

Omission of the full-section tension test specimen of a welded joint was referred to the Subcommittee on Welding and the AWS Conference Committee in April 1935, and in January 1936 a number of sections of para. U-69(c) were omitted on their favourable report, as well as changes in other paragraphs.

A letter of November 20, 1936 from the President of the AWS, enclosing copy of its tentative Rules for the Qualification of Welding Processes and Testing Welding Operators, was presented for consideration in revisions to the Code. These rules were referred to the Subcommittee on Welding, to determine what part of the rules should be incorporated in the Code revisions.

In March 1937, the Subcommittee on Welding reported seven pages of revisions to paras. U-69 and U-70, and to paras. UA-30 to UA-46 using the suggested rules of AWS. These rules were altered at the meeting of April 6, 1937, and the completed changes appeared in the 1937 Edition of section VIII of the Code.

#### Calorized Tubes

The subject of welding carbon steel ends on calorized tubes had been referred to the Subcommittee on Welding, and as there were no rules covering such welding in the Code, the matter was submitted to the National Board of Boiler and Pressure Vessel Inspectors in May 1936. In November 1936, the Boiler Code Committee decided it was not in a position to make rules regarding this procedure, and suggested the practice be tried on an experimental installation, with the approval of the proper inspection jurisdiction.

#### Special Steels

In November 1936, in Case 834, the Committee permitted the use of stabilized austenitic chrome-nickel steel, conforming to grade 4 of ASTM Specification A-167-35T, for an unfired pressure vessel with columbium ten times the carbon but not over one per cent, or titanium six times the carbon, but not over 0.6 per cent. In Case No. 836 the Committee permitted the use of a steel of ASTM Specification A-167-35T grade 6, with 2 to 4 per cent molybdenum. Such actions had been taken several times under paragraphs which permitted the use of new available materials, specifications for which often became parts of section II later.

#### Welding

In March 1937, the Committee approved omission of the radiograph of the final circumferential seams of para. U-68 vessels of inside diameters 24 in. and under, provided radiographs were made by qualified welding operators, and met requirements without cutting out welding repairs, and provided work on the first circumferential joint had been made by such operators. This was approved by the AWS Conference Committee.

In June 1937, the Committee gave as its opinion (Case 84) that a welding operator regularly qualified and engaged in welding U-68 vessels, was qualified thereby to weld U-69 and U-70 vessels, provided the same position was employed as that for which the operator had been qualified. Similarly, welding operators qualified for welding U-69 vessels were qualified to weld U-70 vessels. All such qualifications were not to be effective beyond six months, except as noted in paras. U-69(a) and U-70 (a) respectively.

#### Subcommittee to Revise Section VIII

Since adoption of the API-ASME Code for Unfired Pressure Vessels in 1934 there had been a desire on the part of some of the Committee to revise section VIII, so as to have it close to or the same as that Code, and to reduce the two Codes to one. For this a Special Committee was set up. In June 1936, its statement was published in *Mechanical Engineering*, proposing a revision with two parts. Part I would bring section VIII into the same arrangement as that of the API-ASME Code, with working stresses less than those of Part II. Part II would include such inspection as would justify a safety factor of four, so as to make this identical with the API-ASME Code. In Part I, the reference to paras. U-68 and U-69 would be eliminated, and U-70 would be retained, but with limitation to vessels to be X-rayed or stress-relieved. This report was revised on Sept. 18, 1936, for *Mechanical Engineering* for October.

#### Test of Boiler Drum

In October 1937, tests were reported on a welded drum with radial tube holes in various positions relative to the weld. It had been asked whether, based on data submitted, it would be permissible to modify the requirements of paras. P-105(c) and U-74, to permit drilling of holes 1/8 in. from the edge of the weld, made in accordance with requirements of paras. P-101 to P-109, or para. U-68. It was reported that a severe test on a vessel with the tube holes in the weld of less porosity had been made, and the vessel had ruptured at 190,000 repetitions of pressure to 1½ times the working pressure. The steel of Specification S-27 had a minimum tensile strength of 70,000 p.s.i., giving 21,000 p.s.i. as the maximum loop stress under the repeated load.

Following considerable discussion, during which several views were expressed, the Boiler Code Committee voted that it was permissible to allow unreinforced holes to be machine-cut through plates with welds made in accordance with paras. P-101 to P-109, but that these should not be placed closer than ¼ in. from the edge of the fused metal.

As the Committee had always ruled that only the base metal and none of the clad metal should be used in determining strength of vessels, frequent inquiries resulting in cases or communications had been made. In November 1936, the Subcommittee on Welding submitted the view that instead of considering one type, nickel cladding as in Case 828, the case should be formulated to cover all kinds of cladding material. Rules should be formulated to cover removal of cladding near the joint before welding, contamination of cladding avoided during welding, and cladding replaced to restore complete protection against corrosion.

A Special Committee was appointed to consider the subject of clad vessels. In April 1937 this committee reported that the rules applied to nickel-clad, stainless steel, and chromium-clad metals. Requests would be made to manufacturers for test data to show effectiveness of bond between layers, and twist and buckling tests should be made. Reverse bends and impact tests would be covered. Chemical and microscopic examinations might be advisable, as well as X-ray examination and fatigue tests.

#### Spherical and Hemispherical Heads

Inquiries were received regarding field construction of cylinders with hemispherical heads half as thick as shells, to be used for gas storage, asking if tapering was permissible. The Subcommittee on Unfired Pressure Vessels believed that Code should apply to hemispherical heads as well as other heads. The intent of the Code would be met, it felt, if the provisions of para. U-36(g) for semi-ellipsoidal forms of heads should be applied to these heads for thickness. The subject was referred to the Special Committee to revise section VIII.

In April 1937, the Babcock and Wilcox Company asked permission to use blank hemispherical heads on fusion welded vessels according to Code rules. The rules were submitted to the Subcommittee on Special Design, with the request that it prepare suitable rules and formulas to make this type of construction available for pressure vessels and boilers under Code requirements. The same company had sold two boilers for pressures of 200 2500 p.s.i., using S-27 material of 70,000 p.s.i. minimum tensile strength. The Committee recommended to State authorities where the Boilers were to be installed that the heads in question be sanctioned as a special installation.

The Chicago Bridge and Iron Co. applied in September 1937, to build structures made of two or more intersecting spheres, with a pierced equalizing opening on each plane of intersection. They asked if the design would meet Code requirements, if design complied with Code rules except for physical shape. The Subcommittee report of October 1937 stated that if the thickness of diaphragms were so proportioned as to result in equal stresses in all connecting members, the design could be acceptable for all vessels in which X-ray examination of welded seams was not required. The Boiler Code Committee accepted the report, and voted to transmit the intent thereof to the enquirer.

#### Fusion Welded Locomotive Boilers

In April 1936 blueprints were presented to the Committee of a proposed method of welding an attachment for the front tube sheet of an experimental locomotive by the American Locomotive Co. The attachment was not in accordance with any existing Code rules. The Committee voted to permit this construction for the welded locomotive boiler as an experimental installation. It became the first fusion-welded locomotive, and steps leading to its approval by the ICC and data on its operation are noted in a later chapter.

#### Vessels Subject to Collapse

The Rules for Vessels Subject to External Pressure in the 1934 Edition of the Code had resulted from studies of experimental results on certain ferrous metals listed in para. U-20. During 1936-1937, requests were made to include rules applying to other ferrous and nonferrous metals. In April 1937, the Special Research Committee had presented a report on the basis of theoretical and empirical operations used in section VIII, and advised its publication. The Boiler Code Committee approved this publication.

#### API-ASME Code

The first edition of the API-ASME Code for Unfired Pressure Vessels for Petroleum Liquids and Vapors, published in 1934, was followed by a second edition in 1936, on completion of its third section F, Design and Construction of Integrally Forged Vessels. Besides the new section of 31 pages, there were changes suggested by changes in ASME Codes. Added ASTM specifications were placed in the list of available materials for vessels and parts.

#### Materials

The Subcommittee on Material Specifications presented many reports during this period, on matters referred to it on the form of specifications required for new materials suggested by para. P-1(b). It also selected ASTM specifications where available, or conferred with ASTM on possible changes to suit new uses. Many of its reports dealt with changes necessary to bring Code specifications into agreement with new altered ASTM specifications. The Subcommittee on Ferrous Materials and Non Ferrous Materials had been appointed earlier.

A Special Committee on New Materials was appointed at an executive session of the Boiler Code Committee in May 1936. All recommendations dealing with specifications and welding practice were to be referred to the two subcommittees before presentation of new materials to the main Committee. The Subcommittee on new materials would be responsible for securing recommendations of the Subcommittee on Welding, the AWS Conference Committee, and the Subcommittee on Material Specifications, whenever welding or specifications were involved.

Use of steel of S-26 and S-27 with a certain amount of molybdenum for higher strength with carbon not over 0.25 per cent, was approved in February 1936. The Subcommittee on Ferrous Materials desired these to be silicon-killed. The Subcommittee was directed in March to consult the ASTM, through the Subcommittee on Material Specifications, on this matter. The revisions of allowable stresses of ferrous materials at elevated temperatures was accepted in April for publication. As adverse comments were made regarding the published table, a revised form of Table P-8 was presented in January 1937. The Subcommittee on Material Specifications reported 26 of the 34 adopted specifications, requesting retention of some, replacing or revising certain clauses of the later edition of the ASTM specifications, retaining some and omitting S-14 for the Arbitration Test Bar, as this was included in the revised S-13 for Gray Iron Castings adopted from ASTM A-48-36.

In March 1937, the Special Committee on New Materials recommended certain of the specifications in the 1935 Code that were questioned, should be retained, that four be omitted, three adopted, and two reported upon by the Special Committee on Ferrous Materials. In September 1936, the final form of the so-called Table U-3½ was adopted, and Table P-7½ for the maximum allowable working pressure for ferrous materials at different temperatures was approved.

In the final determination of specifications to appear in the 1937 Edition of section II, the old specifications from S-1 to S-31 were retained, with the exception of S-14, by revising some to agree with later printings of ASTM specifications, by bringing some into agreement with ASTM, or by adopting some from such standards. As a result, of the 30 remaining specifications appearing in the 1935 Edition of section II, 24 were identical with some ASTM specification, one in agreement, one based on and one adopted from such specifications, and 3 without any ASTM specification. The new specifications were numbered S-32 to S-41 inclusive.

#### Rules for Containers for Gas and Liquids at Sub-Zero Temperatures

The need for rules for vessels to be used for liquefaction of solid carbon dioxide (dry ice), other than ICC Rules, had been brought before the Committee by the Compressed Gas Association in January 1935. In January 1936, the Association expressed its desire to co-operate with the Committee on the formulation of rules. A Special Committee was appointed to confer with the Association.

Results of several meetings were reported in March 1936, and a set of rules were presented which were unanimously recommended. The rules had been approved by the Subcommittee on Ferrous Materials.

After discussion and the agreement on several suggested modifications and the inclusion of one or two acceptable forms of vessels, the proposed amended Rules were adopted.

Publication in *Mechanical Engineering* was directed as an addition to the Unfired Pressure Vessel Code. The title was changed to Rules for Containers for Gas and Liquids at Sub-zero temperatures down to —150°F. Minor revisions were made in June 1936, as a result of publication. The rules were issued as part of the Code in August 1936, becoming paras. U-140 to U-144 of section VIII.

In April 1937 objections were raised by the Carbonic Gas Equipment Company, because the rules differed from those of the ICC which that company had been using, and permission was asked to depart from section VIII. In July 1937 the Executive Committee replied that if a factor of safety of 5 was used in place of 4 in the design of dry ice converters, they could be built according to other paragraphs of section VIII of the Code.

#### Unfired Steam Boilers

As electrically operated steam generators were found in certain stations, a statement was added to Para. U-2 in March 1936, that such Unfired Pressure Vessels which generated steam for power or heat to be used externally to themselves, were to be classed as Unfired Steam Boilers. These vessels might be constructed under the Unfired Pressure Vessel Code, and equipped with safety devices required by the Power Boiler Code for the service of the particular installation.

#### Miscellaneous

The minimum size of hand holes was referred to the Subcommittee on Special Design in May 1936 for a report. After an earlier report, the size adopted in March 1937 was 2¾ in. by 3¼ in., with the added clause, "but it is recommended that, where possible, larger sizes be used."

During this period, rules relating to fusible plugs were revised to bring them into agreement with those of the Steamboat Inspection Service. These revisions were published in *Mechanical Engineering* for June 1935. The Service Rules did not permit refilling, and for this reason para. A-19(c) was revised for uniformity. This, and other changes which did not depart from the intent of the former fusible plug rules, were adopted in May 1936.

#### Backing up Water Walls

A letter from the Chief Safety Engineer of Detroit, requesting an opinion on the satisfactory form for supports for backing up the water walls of a certain cross-drum boiler, was reported in November 1936. The Subcommittee on Welding, to which this was referred, reported that no serious difficulty would arise from the proposed construction, but that they could not give a reply to which they could not give full approval.

A reply was sent, stating that there was nothing in the Code to prohibit the proposed practice, but such work should be done with careful supervision to assure good welds. On discussing brackets and supports, the Executive Committee agreed such construction should be covered in the Code, and appointed a Special Committee to consider the correspondence.

In March 1937 it was reported that the Babcock and Wilcox Company had prepared a set of rules for the attachment of supports to tubes by fusion welding, to cover the general subject, and these rules could be used in backing up water walls. These rules were referred to the Special Committee for approval and publication, as proposed revisions for discussion. This proposal, "Allowable Loading on Structural Attachment to Tube", was approved, and appeared as para. P-186(e) with Figs. P-17 and P-18, in the Power Boiler Code of 1937, and in the appendix of that Edition as paras. A-70 to A-73.

#### Acceptance in Massachusetts

The Acceptance of section I of the Code by Massachusetts was announced in May 1936, to become effective November 1, 1936.

#### Safety Valve Requirements

An inquiry from the Massachusetts Board of Boiler Rules, relative to safety valve requirements for boilers with different allowable waking pressures, was referred to the National Board of Steam Boiler and Pressure Vessel Inspectors for their recommendation in December 1936. The National Board in January recommended that the Boiler Code Committee take the necessary steps to provide rules and regulations governing safety valves on any steam headers connecting two or more boilers operated at different pressures.

A Special Committee consulted the National Board. In October 1937 they proposed an additional para. A-45, in which additional safety valve capacity was added to the low pressure side of the system, with at least one valve to be set at a pressure not exceeding the lowest allowable pressure, and the others within a range not to exceed three per cent above that pressure. It was voted to include this in para. A-45, and report it to the National Board. This appeared as para. A-45 of the 1940 Edition of section I.

#### 1937 Edition of Code

The 1937 Edition of the Code received final Council approval in August 1937. The preamble of section I classified Steam Fired Boilers as those in which steam was operated by heat from fuel combustion, to distinguish such boilers from Steam Generators using electrical energy, hot fluids, or vapors for the production of steam and called Unfired Steam Boilers. It ruled that material for forced circulation boilers and boilers with fixed steam or water line should conform with the requirements of the Code.

Para. P-Z(a) on boiler plate was enlarged to include a new specification as in para. P-11 for materials for superheaters and para. P-21(a) for tubes. Tables for working pressures in tubes and pipes were those of the 1935 Edition, except that valves were altered. Para. P-26 was added to cover non ferrous tubes, which included Table P-8 for allowable stresses in non ferrous materials at temperatures up to 450°F. Rules for fusion welding, beginning at para. P-101, extended the limits of the use of such welding, and enlarged para. P-102. The list of usable materials was increased by the inclusion of S-18 and S-40.

Para. P-108 called for pressure parts welded under para. P-101 to be stress-relieved, and para. P-109 was revised to exclude the hammer test on certain vessels. A new section para. P-112 on welded pipe connections, covered four and one-half pages. The new para. P-113 gave details of welding superheater tubes to manifolds and headers without expanding the tubes. Para. P-114 permitted fusion welding of front and back sheets of headers for water tube boilers.

Para. P-186(c) on welded joints was enlarged to permit fusion welding of the bottom edges of plates of water legs in vertical tubular and firebox boilers. Para. P-186(e) with table P.-17 and Fig. 18 was added, with samples of its application in paras. A-70 to A-73. Para. P-186(f) on seal welding was enlarged.

Para. 186(f) of the 1935 Edition became para. P-186(g). Minor changes were made in paras. P-194, and P-195 to P-198. Paras. on braced and stayed surfaces P-199 to P-229 inclusive were changed to define materials for washers in P-199(a), and to delete P-207 on waterleg staybolts.

The section on stays, paras. P-230 to P-244, was changed to permit fusion welding on longitudinal joints of an Adamson furnace flue. Small changes were made in para. P-249. Para. P-266 on hand holes was changed slightly by adding a paragraph. Para. P-268(o) was enlarged to include the use of an inserted nozzle opening in a new Fig. P-43. The safety valve section of the Code, paras. P-269 to P-290 and A-12 to A-17 necessitated the conference already mentioned, at which the final form of these paragraphs was discussed.

Paras. P-291 to P-298, Water and Steam Gauges, were changed only in regard to materials for connections. Under Fittings and Appliances paras. P-299 to P-322, sub-paragraphs were added for the use of cast iron valves, steel valves and fittings and plug type valves. Para. P-325 on settings contained a sub-paragraph giving details of a welded bracket connection for support of horizontal return tubular boilers. An access door was an addition to para. P-327. Paras. P-331 to P-333 on stamping were reworded to clarify the intent.

Para. A-11 on the discharge capacity of valves was deleted for the 1937 Edition, and new tables A-9 and A-10 were added. A sentence was added to para. A-18 on automatic water gauges. Paras. A-19 and A-30 on fusible plugs had been amended to conform with marine practice, and para. A-21 was unchanged, as well as paras. A-22 to A-30. Paras. A-31 to A-62 covering existing installations remained unaltered, except for omission of reference to deleted para. A-11. Paras. A-63 to A-68 showed changes in numerical values in para. A-64(b). New samples of allowable loading on attachments A-70 and A-73 were given at the end of the Appendix. An index for sections I, II, IV and Appendix closed the volume.

#### Section II—Material Specifications

Section II contained 46 specifications: S-1 to S-13 and S-15 to S-41, extending through 193 pages. The list contained 34 specifications identical with ASTM, one in substantial agreement, one based on ASTM and one adapted from such, while for three there were no ASTM specifications available.

#### Section III—Boilers of Locomotives

In the 1937 Edition of the Code for Boilers of Locomotives, the only important change from 1935 was the new Table L-2 on allowable working pressures for steel or wrought iron tubes conforming to material of S-17 or S-32, in place of former tables of minimum gauges. The pressures of the new Table were somewhat higher than those in the earlier edition.

#### Section IV—Low Pressure Heating Boilers

In the 1937 Edition of Low Pressure Heating Boilers, minimum allowable thickness of the tube sheet or heads of Table H-1 were increased, while for shells or other plates they were reduced. In para. H-12 all sheets except those having tube holes supported by braces were to be classified as shell plates, and in para. H-21 the allowable distance from a corner-welded joint to the nearest row of staybolts might be a full stay pitch. In the last paragraph of para. H-28 the limiting diameter for access openings was increased to 28 in.

Paras. H-38 and H-91 were enlarged to prohibit introduction of feedwater through openings used for the water column, etc. Paras. H-40 and H-93 described the form of stop valve when diameter exceeded 2 in. Diaphragm valve seats or rubber disks were prohibited for relief valves of paras. H-44 and H-93. In paras. H-65 and H-118 the valve of 30 p.s.i. for operating pressure was changed to 40 p.s.i. In paras. H-64 and H-117 the point of action of water relief valves was made not lower than bottom of water glass. In para. H-70, fusion welded joints might be considered as fully supported in figuring pitch of staybolts, except where joint was a flat surface.

#### Section V—Miniature Boilers

In the 1937 Edition of section V, para. M-1 was enlarged to include circulation boilers and those with no fixed waterline. Para. M-13 was enlarged to prohibit the introduction of feedwater through water column openings, etc., when the boiler was under pressure. In the Appendix, Fig. MA-2 was replaced by the former Fig. MA-3, while old figures MA-4 and -5 became MA-3 and -4. In para. MA-3 the last sentence on Reduced Section Tension Test Specimen was deleted.

#### Sections VI and VII

The 1937 Edition of Rules for Inspection was published in the same volume that contained sections I and II and the Appendix. The 1937 Edition of section VII, suggested Rules for Care of Power Boilers, of 88 pages, with paras. C-1 to C-341, and Appendix with paras. CA-1 to CA-27, was unchanged.

#### Section VIII—Unfired Pressure Vessels

In the 1937 Edition of section VIII, the preamble contained an addition to division (c) to include vessels containing air, the compression of which served only as a cushion, or in an air lift pumping system among excluded vessels mentioned. Para. U-1 contained the new limitation to the meaning of volume when used for a single vessel with jacket. A new paragraph limited the Code to vessels in which all materials used and type of construction complied with the Rules. Para. U-2 contained an added paragraph defining unfired vessels in which steam for power or heat was generated for external use.

Para. U-3 was shortened to require spring loaded safety valves to be ASME standard. Para. U-4 of the 1935 Edition was not needed, and the new para. U-4 provided for the effect of static head. Para. U-12(c) provided that parts of small size carried in stock might be used when suitable. Para. U-13(c) limited the use of S-26 steel, and U-13(c) permitted the use of S-32 for Electric Resistance Welded Steel and Open Hearth Iron for tubes. U-13(g) permitted the use of S-13 cast iron.

Para. U-19 was enlarged. Paras. U-20(c) and (d) on non ferrous tubes and pipes were added with Table U-4 for allowable stresses at different temperatures. A paragraph added to para. U-32 permitted welding of abutting edges of shell plates under certain conditions. In paras. U-36(a) the efficiency "E" and the values of stress "S" were fixed by Table U-3. Para. U-36(d) and (e) required the reinforcements of heads to be that required by para. 59(g) and para. U-36(f). A change was made in constant "C" in para. U-29. Paras. U-53 and 54 were rewritten and made more complete than in the 1935 Edition. Para. U-59(o) was enlarged to cover use of the inserted nozzle as described in para. P-268 section I.

Para. U-66 was enlarged to make intent more definite. Rules on test plates, para. U-68(a), had paragraphs added, but U-68(i) on non-destructive tests was altered extensively, as occurred to a similar section para. P-102(o) as described under section I. Para. U-69 was

**Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers**

## "Help Wanted"

The Council of the Institute has authorized the employment of an assistant to the General Secretary to be located at Headquarters in Montreal. The position carries excellent prospects for development on a permanent basis.

Applicants should have ability and experience in meeting people, in public speaking, and in writing. Personality is very important. Experience in organizing, in conducting meetings and in office routine is essential. Experience in editing can be used to good advantage.

Membership in the Institute is not essential but naturally a preference will be given to members. Persons who have been active in Institute affairs will also have an advantage.

Age requirement is not fixed rigidly but it is thought a senior person would be best suited to the work. The upper age limit would be about fifty.

This is a good opening for a person who is ambitious and energetic. Please mail applications with full particulars of education and employment experience to the General Secretary, Engineering Institute of Canada, 2050 Mansfield Street, Montreal, Que.

---

## Something New in Meetings

On December 3 the members of the Montreal Branch of the Institute met in the auditorium of the Bell Telephone Company's Head Office Building on Beaver Hall Hill to participate in a technical meeting with the members of the Institution of Electrical Engineers assembled in their headquarters' building, London, England.

As far as can be determined this is the first time that groups of this nature have met together to hear and discuss a paper through the medium of a two-way radio link. While the reception conditions were far from perfect the meeting was successful to the point that further endeavours along the same line should be made again in the future.

The paper appears in this issue of *The Engineering Journal* under the title "Technical Arrangements for the Sound and Television Broadcasts of the Coronation Ceremonies". The authors are M. J. L. Pulling and F. Williams, senior superintendent engineers of the B.B.C., and W. S. Procter, chief regional engineer, London Telecommunications Region Post Office.

The program was arranged so that it was opened by the president of the Institution of Electrical Engineers of London, England, Mr. H. Bishop. His greetings were replied to by the president of the Institute, R. L. Dobbin. Then the paper itself was presented by Mr. Pulling and was discussed on the Canadian side by J. E. Hayes, chief engineer of the Canadian Broadcasting Corporation.

The next speaker on the program was the Dean of Westminster, The Very Reverend Alan Campbell Don who added his praise for the work of the engineers and who, at the same time, spoke of the need of reconstruction and rehabilitation work within the Abbey.

The authors then followed with their response to the discussion and the meeting was closed by the president of the I.E.E. in London, followed by the president of the E.I.C. in Montreal.

The Institute is greatly indebted to the C.B.C. and the Bell Telephone Company without whose co-operation the whole affair would have been impossible. Not only did

### Cover Picture

The launching of M.V. *William Carson* depicted in the cover picture of this issue took place at the shipyard of Canadian Vickers Limited, Montreal, on November 26, 1953. This picture will be of special interest to the members of Cape Breton, Corner Brook and Newfoundland Branches because the *William Carson* is to operate as a ferry on the run between North Sydney, N.S., and Port aux Basques, Nfld. —*Photo courtesy Canadian Vickers Limited.*

they assist in the technical aspects of the program but the telephone company as well loaned its splendid auditorium which was filled to capacity with about 400 people.

In advance all the proceedings had been recorded on tapes and one complete set was in Montreal and the other in London. Both were ready for use in case the radio communications failed. This was a fortunate precaution because both in Montreal and London, the tapes had to be resorted to during certain portions of the program.

Members are advised to read the complete paper. It will be found that the story is a fascinating one, even for someone who is not an electrical engineer. The ingenuity of the British engineers in carrying out this unsurpassed performance is something which everyone, engineer and layman alike, must admire.

## International Council— ASME-EIC

This joint council was set up by a written agreement between the two societies in 1943. It has met twice a year ever since at the annual meeting of each organization. The meeting of the American Society of Mechanical Engineers in New York was the background for the meeting on December 3.

Delegates representing ASME were Frederick S. Blackall, president of the society, Thompson Chandler a vice-president, past-president Dr. A. G. Christie, R. R. Service and C. E. Davies, secretary. The Institute delegates were John G. Hall, G. N. Martin, H. S. Van Patter and L. Austin Wright, general secretary.

There were also some guests and observers including Fred Malette, Director of Research, ASME, H. Oatley, D. D. Panabaker and C. R. Davis, a member of the Council of the Institute representing the American Society. Dr. Christie, chairman of the Council, presided.

There were several interesting items on the agenda, some of which were concluded by resolutions to be presented to the Councils of each organization for approval and action. Others were referred to the next meeting of the Council for further consideration. All these will be reported in the *Journal* in due course as they are settled by the societies' governing bodies.

The next meeting will be at Quebec on May 14, 1954.

## The 1954 Graduate's Income

This is the time of year when the 1954 graduates' thoughts are turning more and more to their first permanent jobs. Many of them know what they are going to do, others are considering offers and only the dregs of the class, the last choice of any employer, are in any doubt as to the future.

The intelligent student realizes that salary is not everything, yet is important. More graduates than used to be the case are married, some have gone into debt to pay for their educations, both good reasons for needing a larger income than was formerly the norm, but most will start at about the same level as last year, if the figures of the Technical Personnel Section of the Department of Labour mean anything.

Neglecting a few salaries obviously out of line, 1953 graduates received from $195 to $400 a month at the start, with an average of $295 and a median of $300. There are no significant differences in the salaries paid to graduates in the various fields. In the six major courses, graduates in chemical, civil or mining engineering received median salaries of $300 a month; graduates in mechanical or metallurgical engineering, $285, and graduates in electrical engineering, $270, a spread of only $30 or 10 per cent.

Starting salaries for graduates have increased nearly 60 per cent since 1946, while the consumer price index has risen about 50 per cent in that time. Thus, salaries seem to be a little more than holding their own, perhaps because the demand for graduates during those years has been somewhat greater than the supply, a condition which seems likely to continue for some time to come.

Our recent mining, oil and gas development has created a sellers' market among mining engineers, metallurgists and geologists. The Department has the records of 2,349 in its files. Of the 2,209 who are in Canada, 451 are in Quebec, 953 in Ontario, 270 in Alberta and 345 in British Columbia, the other 190 being scattered from Newfoundland to the Yukon. It is noteworthy that 30 per cent of the geologists hold doctor's degrees and another 30 per cent master's degrees. Among engineers their nearest competitors are in the electrical field, where fewer than one per cent have doctor's degrees.

There must have been a considerable number of 1953 graduates who received starting salaries well above the median and not included in the figures given above. One of the writer's acquaintances began at $1,000 a month and he knows several who received more than $400. The man in question was older than his classmates, a brilliant student, with a lot of practical experience and his employment took him to a quarter of the world where most of us would not care to live.

Times change. Nearly 50 years ago, when the writer got his first job, he was paid $50 a month for 84 hours' work and that at night, too, a raise to $75 put him among the plutocrats, so much so that he promptly married.

## Correspondence

December 5, 1953.

Dear Mr. Editor:

Your interesting and informative article "What Causes This Sort of Thing" in the November issue, makes no attempt to answer the title question, and yet it would seem to me an answer *is* important.

Don't you think the answer is to be found in the fact that man tends to inflate the importance of anything he does not understand. Then, too, the doing is seeming proof of ability to do.

The whole thing leads back to comment I used to make to the membership when Chairman of the Sault Ste. Marie Branch between 1915-1920, that the engineer was too close to commercial practice to sit back and be a pure professional. As purchasing agent of a steel company I made more money than the chief engineer. If the engineer does not want to sell his wares, he needs must have contacts with construction concerns that will do so for him.

Lionel L. Jacobs, M.E.I.C.,
Lionel L. Jacobs & Sons,
Wayne, Pa.

# President's Travels

Starting off from Montreal by air on November 2, the president made his first stop at New Glasgow where he met with the branch and spoke to 250 students at St. Francis Xavier University at Antigonish. Vice-President Don MacNeil accompanied by the branch secretary D. G. Dunbar drove Mr. Dobbin to Sydney. Here there were tours through the industries and a meeting with the branch.

From North Sydney Mr. Dobbin left by boat on November 5 for Port aux Basques and Newfoundland. He held meetings with the two branches in that province at Corner Brook and St. John's. In the latter place he called on the Lieut. Governor, The Hon. Lieut. Col. Sir L. C. Outerbridge, the premier, Joseph Smallwood and the mayor, H. G. R. Mews. Also he spoke to the students at Memorial College.

From St. John's he flew to Halifax arriving on the evening of the 10th. In Nova Scotia, November 11 is a provincial holiday but Dean Bernard Cain, M.E.I.C. of Acadia had arranged for a meeting with the students, so the president accompanied by Frank Bennett, chairman of the Halifax Branch, travelled to Wolfville and had a very enjoyable talk with the students and members of the staff.

At Halifax the president was joined by the general secretary on November 12. That day, in the morning, the president spoke to the students at St. Mary's University and Nova Scotia Technical College. A luncheon was tendered by the Association of Professional Engineers, after which the president and general secretary attended the meeting of the Council of the Association. Then there was a meeting with the executive of the branch followed by a talk with the students at Dalhousie. Then followed the dinner meeting of the branch at the Nova Scotian Hotel. It was quite a day!

Eight a.m. on the 13th saw the party on the train en route to Amherst and Sackville. At Sackville the president spoke to the engineering students of Mount Allison University, accompanied by past president H. W. McKiel, vice-president of the University. The branch meeting was at the Fort Cumberland Hotel, Amherst. It was a very pleasant dinner meeting with the ladies present. After the dinner the executive met with the Institute officers to talk shop.

Early in the morning of the 14th, the chairman of the branch, L. F. Kirkpatrick drove the party to Moncton to catch the plane for Montreal.

# Smart Answers

Are scientists illiterate, inarticulate and irresponsible? A chap named Ritchie Calder, described as chairman of the Association of British Science Writers, says they are.

Here is how the news item runs as reported in the October journal of the Professional Institute of the Public Service of Canada.

LIVERPOOL, England. Sept. 8—(AP)—A body of august British scientists were told to their faces on Monday that their profession is "illiterate, inarticulate and irresponsible".

Scientists were so sized up by Ritchie Calder, chairman of the Association of British Science Writers, at the 115th meeting of the British Association for the advancement of science.

In his prepared address Calder justified his harsh judgement this way:

"1. Illiterate — because the test of literacy is the capacity to communicate ideas, and, in these days of specialization, scientists are the hostages of their own professional slang.

"2. Inarticulate — because they cannot, or do not bother to express themselves intelligently.

"3. Irresponsible — because they will not accept their responsibility to consider, and explain, how their work will affect ordinary people's lives, at a time when science is producing convulsive changes and dangerous stresses in our civilization.

"They are content to leave their discoveries on the doorstep of society like abandoned foundlings, without concern as to the way in which they are used, misused or not used at all."

Now sit back and enjoy yourself. Here is the answer given by the president of the National Research Council, Dr. E. W. R. Steacie as reported in the same publication.

"Mr. Calder suggests that scientists are illiterate because the test of literacy is the capacity to communicate ideas and because scientists are the hostages of their own professional slang. This statement is, I think, illogical in two respects. In the first place "professional slang" is merely a language designed for accuracy. It is in no way slang to the specialist and is the only way in which he can state what he means in such a way that other scientists will understand him. The language is not designed for the non-specialist.

"Mr. Calder states that the test of literacy is the capacity to communicate ideas. My own feeling is that a test of literacy is the capacity to communicate ideas to those who are capable of understanding them. Would Mr. Calder seriously suggest that a philosopher is illiterate because he is unable to communicate his ideas to a cow? Is not the cow perhaps the one that is illiterate? Or is the cow the hostage of her habit of mooing?

"Mr. Calder says scientists are inarticulate because they do not bother to express themselves intelligently. This overlooks the fact that the average scientist is primarily concerned with research and not with popular entertainment. The outlook of the average scientist on the relative importance of research and the writing of popular articles is naturally different from that of Mr. Calder, since the scientist makes his living from the former and Mr. Calder makes his from the latter.

"The statement is that scientists are irresponsible because they will not bother to explain how their work will affect ordinary people's lives. One does not have to understand nuclear physics to understand that an atomic bomb is a dangerous thing, and while it is no less the scientist's responsibility to interest himself in the sociological consequences of it, it is certainly no more his responsibility than that of anyone else. It should also be realized that scientific discoveries are merely pieces of information which may or may not be used by society. The work that leads to better explosives can be used in mining or in warfare. The development of the automobile is essentially the development of the tank. It is no more sensible to criticize the scientists for obtaining fundamental information which may be used for purposes of warfare than it is to criticize a dairy because a bottle of milk is a convenient weapon with which to hit someone on the head.

"In short I feel that it might be said with some justice that Mr. Calder is himself illiterate because he appears to be ignorant of the reasons for the existence of a specialized scientific language. He is irresponsible because he appears to be distributing scientific information without attempting to understand the basic philosophy behind it, but he is certainly far from inarticulate."

Another interesting comment appears, this time from Dr. K. W. Neatby, Director, Science Service, Canada Agriculture.

"To repudiate the charges that Ritchie Calder is reported to have levelled at scientists is no easier than to substantiate them. It is, perhaps, not fair to comment at all without first learning exactly what Mr. Calder said, but this I am unable to do. It is certain that he did not mean precisely what he is reported to have said, and we may confidently assume that he considers scientists to be illiterate, inarticulate and irresponsible only in relation to scientists of the past, to other classes of supposedly educated people, or to what they ought to be. After all, these qualities have no absolute values, nor can they be expressed in precise terms.

"Probably most scientists will agree Mr. Calder has focussed attention upon a very real and serious problem, but it is equally likely that they will credit him with no special powers of observation or that they will admit justice in singling out scientists for special attention. That scientists are less erudite and scholarly than they ought to be is certain; but surely this is only a symptom of a disease that is as apparent outside scientific circles as within them. Even parliamentarians will hesitate to affirm that they have maintained the standards of debate established by their fathers and grandfathers! While allowing for the tendency of an aging generation to feel that its own decay must inevitably be accompanied by a decline in virtue, evidence of a deterioration in scholarship is impressive. But not only among scientists. There are those who contend that musicians, writers and painters are illiterate and irresponsible . . . though anything but inarticulate!

"Perhaps the scientist has deteriorated and is deteriorating faster than his fellow man, and I think it would be surprising were this not so. The difficulty of becoming technically competent in any one branch of science is such that a broad knowledge is possible for the exceptionally gifted and, perhaps, privileged. If, in addition to general scientific learning, we expect or hope to find high standards of literacy, articulation and responsibility to the public, we shall probably be tempted to express our findings in terms akin to those employed by Mr. Calder.

"We must admit that modern scientific education and experience have produced but few gifted writers with (or without) a sense of public responsibility. I, for reasons other than the one just defined, am not ready to admit that the blame lies at the scientist's door. Nowadays it appears that education, at least to high school graduation, is concerned more with method than with matter. This, if true, combined with the necessity for "educating" thousands at our seats of learning when hundreds were enough for our fathers, and the inevitable concomitant lowering of minimum standards must surely produce results that will explain if not justify Mr. Calder's somewhat sweeping and decidedly unscientific generalization.

"To say that 'they (scientists) are content to leave their discoveries on the doorstep of society . . . without concern as to the way in which they are used . . .' is an assertion much more difficult to defend. Indeed, it could be argued that the application of scientific discovery is proceeding faster than discovery itself. Even in the realm of what might be called the sociological applications of biology, there is evidence of an increased awareness of personal responsibility. Surely, during the past decade, more has been said and written about the significance of preventive and curative medicine and the wise exploitation of agricultural resources in relation to population trends than ever before.

"Finally, no amounts of literacy, articulation and responsibility on the part of scientists will avail without corresponding virtue discernible in responsible governments and their electors.

"Lest my remarks be interpreted as an effort to justify the existing level of erudition among scientists, I hasten to confess that in an effort to establish justice, I may have inflated my defense arguments unduly. It is a fact that the proportion of scientists incapable of expressing themselves clearly is far too great. There is even evidence that muddled expression is sometimes a perfectly logical sequel to muddled thinking. Science cannot serve society if it is to be held in custody by technicians. Perhaps we shall discover, someday, that specialization not carefully disciplined and established on broad bases can be little better than ignorance."

A perusal of these comments gives one the definite impression that these two scientists at least are not illiterate, inarticulate or irresponsible. It would be interesting to know how Mr. Calder receives these cool, considered and crushing observations.

# New Building Research Centre Formally Opened

Believed to be the first of its kind anywhere, a new building to be devoted to building research has been formally opened on the Montreal Road near Ottawa. This "Building Research Centre," as it is to be called, will house most of the staff of the Division of Building Research of the National Research Council.

The new building is located on the site of the National Research Council's laboratories on Ottawa's outskirts, and is similar in external appearance to the other buildings located there. It differs from them, however, in that many functions are served by the one building instead of having a separate structure for each main branch of the work of the Division.

New building research centre.

The formal opening of the building took place on the afternoon of October 23, 1953, before its main entrance. Hon. C. D. Howe, Hon. M.E.I.C., minister of Trade and Commerce, who was introduced by Dr. E. W. R. Steacie, president of the Council, in his address at the opening ceremonies, before unveiling the plaque signifying the acceptance of the building, stated that the erection of such a building is an indication of the public recognition of the value of science and research as applied to construction. With advancing techniques, he said, the need for research in the solving of technical problems is one that must be met and in this case met by a public agency.

The opening ceremonies culminated a three-day Conference on Building Research, the sessions of which were held first at the Council's main building on Sussex street, Ottawa, and then at the Central Mortgage and Housing Corporation building on the Montreal Road.

Attendance at the Conference, due to limited accommodation, was by invitation. There was a good representation from United States. Dr. F. M. Lea, director of the British Building Research Station, recognized as a pioneer amongst building research organizations of the world, made a special trip to Canada to attend the Conference and to be present at the official opening.

Dr. Lea spoke before the Conference on the subject of Building Research in Great Britain. At the formal opening of the new building he extended felicitations and stated that he looked forward to continued co-operation with Canadian workers.

N. D. Lindqvist, secretary Swedish State Committee for Building Research, who has for the past year been with the National Research Council as a guest worker in Canada, outlined the progress of research in Denmark, Norway, Finland and Sweden. Research in these countries, as in most other countries, has only recently been placed on an organized basis. Production technique studies for engineers have been started by the four different countries but so far have been conducted to a limited degree only, except in Sweden where they have been carried on for about five years.

Speakers at the Conference from United States on various aspects of building and housing research in that country included: D. E. Parsons, chief Building Technology Division, National Bureau of Standards, U.S. Department of Commerce; W. H. Scheick, executive director Building Research Advisory Board, National Research Council; L. Haeger, director National Association of Home Builders Research Institute, all of Washington; and Prof. J. T. Lendrum, acting director Small Homes Council, University of Illinois, Urbana, Illinois. In addition there were technical talks by others relating to building science.

Canadian speakers included members of the staff of the Division of Building Research of the National Research Council; of the staff of the Central Housing and Mortgage Corporation; and others R. F. Legget, M.E.I.C., director of the Division of Building Research of the Council, who was chairman of the opening session of the Conference, gave a brief talk on future plans of the Division and stressed the value of co-operation between all organizations associated in any way with building and research.

Delegates to the Conference inspected the Building Research Centre after the formal opening. They toured the building and had the various features explained to them by members of the staff.

The building has a total "cubage" of approximately one million cubic feet. The total contract price with extras but not including furniture and equipping of laboratories was $1,174,000 so that its unit cost was $1.17 a figure that shows clearly the basic economy of its design. The figure is noteworthy when the large amount of plumbing and electrical work in the building is considered.

Founded throughout on solid rock, it consists of a reinforced concrete basement with two upper floors of structural steel framing and terra cotta tile outside walls finished with stucco on metal lath. A small penthouse is integral with the steel frame and is the only projection above the flat roof, most of which is of bonded tar and gravel construction but with one part tiled for outdoor experimental work.

The plan is basically that of a large T, the top being the front and office part of the building, the stem being the main open laboratory. Smaller laboratory facilities are provided on the three floors of a wing at the rear of the building. This wing and the main laboratory are so arranged that, if and when necessary they can be extended without difficulty.

## New York Reception, 1953

Following a custom started five years ago, the Institute has again held a reception in New York for its members in the United States and the officers of sister societies. The date was December 1st and the location, the Statler Hotel.

These functions are held at a time to coincide alternately with the annual meeting of the American Society of Mechanical Engineers and the American Society of Civil Engineers. This year it was the Mechanicals.

The president of the Institute, Ross L. Dobbin, and past-president James A Vance received the guests, who numbered just over one hundred. They came from many parts of the United States, and from Canada as well.

The Institute membership in the United States to a large extent is made up of American engineers who worked north of the border for some substantial period. Others came to Canada for their education and became Student members at that time. Others are Canadian engineers who have migrated south in following their professional careers. It is an extremely pleasant experience to bring these groups together occasionally under the auspices of E.I.C. It is apparent that the reception serves a useful purpose.

# Good Roads Association Meets at Victoria

More than 500 delegates and their ladies gathered at the Empress Hotel, Victoria, B.C., October 14-17, for the 34th annual convention of the Canadian Good Roads Association. Every Province and many States were represented, as well as some countries of Europe and Asia. They were greeted by Col. the Hon. Clarence Wallace, the Lieutenant Governor, and by Premier the Hon. W. A. C. Bennett, and welcomed to the City by His Worship Mayor Claude Harrison. The Hon. Gordon E. Taylor, Alberta Minister of Highways, was elected president of the Association for 1954.

Hon. E. S. Spencer, Minister of Public Works for Newfoundland and President of C.G.R.A., told the opening session that roads are "one of the highest ranking problems of municipal and provincial governments," and "in so far as it has become a problem affecting the national interest, it has become a problem of the Federal Government."

Though gratifying progress had been made in reconstructing roads and streets, the progress was modest in terms of need, he said. Predicting further increase in traffic congestion, he pointed out that in our major cities it had passed the critical point and is now desperate. C.G.R.A. activities in the field of public education were being reflected in a more favourable public attitude to adequate road budgets, and the task of administrators in obtaining money for road building was made easier in consequence.

### Road Building in 1953

Compared with $424 million for 1951 and $422 million for 1952, Canadian Governments and business will spend $449 million in 1953, according to the Dominion Bureau of Statistics. Atlantic Provinces will spend $28 million, Quebec $10 million, Ontario $173 million, Prairie Provinces $74 million, and British Columbia $67 million. Shortages of experienced engineers and technicians have imposed restrictions, while wet weather in the West has retarded construction during the current year. As reported by the Federal and various Provincial Governments for the annual "Roads Roundup", progress during the current year is as follows:

Newfoundland has been forced to build to low standards to connect outlying settlements. Only 52 per cent of revenue is collected from users in that Province. New Brunswick has been concentrating this year on secondary highway construction, and repairs on worst sections of main trunk highway. Nova Scotia is spending 7½ million, mostly on paving and will start work on the Trans Canada Highway next year. The bridge building program is lagging. Prince Edward Island is spending a third of its 1953 budget on roads, and has completed about half of its share of The Trans Canada Highway.

Quebec has been giving special attention to rural mileage, particularly in remote areas, and has been steadily increasing the road mileage it maintains. Nearly 26,000 miles are kept open in winter, compared with 4,000 miles a decade ago.

Ontario's current budget of $125 million is a record for that Province. Highlight of the 1953 construction program has been an emergency program for relief of congestion at or near major urban centres. By next year main highways will by-pass most large cities and towns.

Wet weather has retarded road construction during the 1953 season in all three Prairie Provinces. Manitoba has completed only two thirds of its Trans Canada Highway work scheduled for this year, though completion by 1956 is probable. In Saskatchewan, 1953 progress has been fair, in spite of a labour shortage. The Province's share of the Trans Canada Highway should be completed by 1956. Rural roads are still a major problem but much more has to be done to free urban tourists from mud, snow and dust. The present year's road program in Alberta is the most ambitious in its history. Progress on its share of the Trans Canada Highway is satisfactory. Some areas are suffering from a shortage of gravel supply.

Despite record expenditures and construction in recent years, British Columbia is still far from the ultimate goal of bringing highways up to standards necessary for ever-increasing traffic. Main objectives are completion of the Trans Canada Highway, the Southern Trans-Provincial Highway, the Cariboo Road, the John Hart Highway, and connecting and feeder roads.

### Army Axles Need Tough Roads

Canadian roads are insufficient for strategic military purposes, Lt.-Col. D. W. Cunnington, Commandant of the Royal Canadian School of Military Engineering, Chilliwack, B.C., told the convention. Any large scale military movement would suffer such interferences, that its arrival at its destination in a reasonable time and in condition to operate effectively would be a matter of conjecture, he said.

**Hon. Gordon E. Taylor.**

The Canadian Army is undertaking a study of Canadian roads. The study shows there are enough roads, though they are unsatisfacttory for military purposes. The most serious bottleneck is narrow bridges, less than half of which are suitable for military traffic. A carefully integrated plan for all new highway construction is essential, he warned, and there are many problems yet to be solved before Canada will have roads suitable to her military needs.

### Auto Industry Spokesman

D. C. Gaskin, President of the Studebaker Corporation of Canada, Ltd., told a convention luncheon that the automobile industry had a strong and immediate interest in the Nation's highway systems. "A better road system for the Nation will lead to better markets," he stated, "yet our interest is small compared to the Nation's interest in the health of the whole vast system of highway transportation. The automobile industry recommends strongly that the Nation's highway requirements be met."

### Who Shall Pay for the Roads we Need?

Participating in a Panel Discussion, numerous speakers emphasized that financing improvement and expansion of roads and streets has become one of the toughest and important of national problems. Dr. R. W. McColough, executive assistant to Minister of Highways of Nova Scotia, voicing the views of the provinces, noted that vehicle production and traffic growth exceeded the capacity of the provinces to provide new highways. Highway revenues, he stated, should be raised from the users and from those who benefit from the roads. Two-thirds of the cost of roads should be borne by users and one-third by those who benefit from them. The Government of Canada receives enormous revenues directly from highways, and should therefore go beyond assistance given in the Trans Canada Highway Agreement, he said.

Speaking for municipal governments, Dean F. C. Cronkite of the University of Saskatchewan stated that municipal governments cannot bear the cost of needed street and road improvement. The whole highway problem should be a national problem, he observed, and Federal funds should be used in amelioration. In allocating taxing privileges, the Fathers of Confederation did not foresee the coming of the automobile, nor the appalling potential obligations of municipal governments arising therefrom. Ottawa, he pointed out, has extended substantial Federal aid in fields of provincial responsibility such as health and welfare. There is no jurisdictional barrier to Federal aid for highways as well, if the public interest demands it.

R. W. Macdonald, a director of the Canadian Automotive Transport Association, representing commercial users of roads, pointed out that it was generally accepted that all roads have social and economic value, and there are other beneficiaries besides the motor vehicle users themselves. Motor vehicle owners obviously have a special tax-paying role in the provision of these roads. No reasonable person expects them to pay the entire bill, but they should pay their fair proportion.

The trucking industry, he said, was making a substantial and fair contribution, and stood ready to co-operate in any research on the subject of who shall pay for the roads we need. It would be better for the climate of trucking industry co-operation, he added, if such research were not railroad inspired and instigated.

"The Federal Government is incomparably the greatest and most opulent beneficiary of road use in Canada," Alex R. Morrison, president of the Canadian Automobile Association, stated. The British Royal Commission decided that roads should be financed first by users, second by those who benefit, and third by community interests which profit from them through higher property values and enhanced living standards. Was it not ironic, he asked, that our Federal Government was even today contributing but a small fraction of the income it derives from motor vehicle owners, towards the construction of highways?

W. G. Scott, Transport Economist for the Railway Association of Canada, pointed out that the C.G.R.A.'s estimate of needed annual highway expenditure is $600 millions. Highway user taxes are accounting for a progressively smaller part of total expenditures, seventy per cent before 1940, down to 63 per cent in 1951. By any measure—construction costs, cost of living, price of automobiles or repairs, or car insurance—highway taxes are unrealistically low, he said.

Using the principle of relative use based on weight carried and distance travelled, research studies by railways in the past year demonstrate the present inequality in highway taxation. A private auto pays 3½ to 6 times as much as a gasoline propelled tractor trailer combination for use of the roads. The growing tendency to provide roads at less than cost for large motor transports is one of the most serious competitive problems with which the railways are faced.

The Director of Research, Canadian Tax Foundation, J. H. Perry, told the Panel discussion highway construction is one of the three most pressing problems facing governments today. Defence and education are their other two biggest responsibilities. More vehicles, more traffic, more speed, plentiful fuel and a booming economy have called for an incessant demand for roads of better standards. Increasing costs per mile of these better roads and improved maintenance have been sharply accentuated by the rise in prices of labour and materials.

The argument for increasing taxes on users was that those who use the highways should pay for them, he pointed out. Yet highways and urban streets provide many direct and indirect benefits to persons other than vehicle owners, such as fire and police protection and garbage disposal. These benefits accrue in some measure to the whole community, and it therefore seems equitable that the general taxpayer should contribute. What his share should be will vary with time and place.

The share of revenue from trucks and buses exclusive of gasoline tax revenue has progressively increased. It represented more than 42 per cent of license revenue in 1951, he continued, but such vehicles comprised less than a fourth of all motor vehicles. It is generally assumed that commercial vehicles do more damage to roads and streets than lighter passenger vehicles, and that they should therefore contribute relatively more per vehicle in licenses and taxes. Moreover, proper compensation for highway use should be levied on commercial vehicles to offset the public aid they enjoy over competing carriers, notably railways.

These two approaches suggest that commercial users should contribute relatively more than other users. Based on 1951 data, each truck or bus accounts for more than twice the revenue of each other vehicle. A much more comprehensive study, he observed, would be needed to determine the real validity of alleged more scientific methods of charge, being developed by certain American States.

Advocating more Federal generosity towards provincial road aid, Mr. Perry pointed out that while Ottawa was under no onus to share its vehicle revenues, the heavy burden of Federal taxes on the automobile user makes it more difficult for provinces to obtain more money from him. Certainly, he felt, it was incumbent on the Federal Government to share heavily in any road vital to national defence. It should be possible to extend the Trans Canada Highway agreements to include other roads having an agreed national importance.

#### More Help for Grade Crossings

"The only real solution to the grade crossing problem is enlargement of the grade crossing funds," F. M. MacPherson, commissioner of the Board of Transport Commissioners, told the convention. The accident rate at level crossings had grown steadily worse, he said, giving the great increase in road traffic and more and faster trains as the main reasons.

An increase from the present $2 million yearly to $10 million was being advocated, he added. Other measures suggested were increasing the Federal share from the present 40 per cent, to 50 or even 60 per cent; maximum contribution for any one project to be doubled to $300,000; and availability of the fund for use on reconstruction of existing grade separations.

### Uniform Traffic Code Nearly Ready

Details of a draft Uniform Traffic Code for Canada, being prepared by a committee of the Canadian Bar Association, were revealed by A. C. DesBrisay, Q.C. Under preparation for several years, it is to be submitted to provincial governments in a year's time. The rules cover every aspect of highway movement and traffic regulation, including traffic devices and controls, passing, turning, starting and signals, right of way, pedestrians rights and duties, streetcars, safety zones and other subjects. The rules are very similar to the Uniform Act Regulating Traffic on Highways, which forms part of the Uniform Traffic Code recommended for adoption in the United States.

### Roads Vital to Small Business

The guest speaker at the Association's annual dinner was E. D. McPhee, director of the School of Commerce, University of British Columbia, who told delegates good roads, rather than railways, are the primary need of the small business man. Some four million Canadian workers are employed in manufacturing, commercial or service organizations, employing fewer than 20 persons, or are self employed as farmers, miners, fishermen or in the professions. Their success is essential to the economic welfare and health of the Nation.

While production has increased greatly, railways have not gained the increased tonnage, nor have large truckers carried the bulk of the great new movement—operators of single trucks, farmers, market gardeners, stores, plumbers and painters are carrying much of the Nation's commerce. Firms with their own small fleets of trucks carry a great volume.

The fact that the number of trucks has trebled in 12 years while vehicles on the road have increased 56 per cent in five years is evidence of this, he said. During this time our surface road mileage has increased only 19 per cent. Better roads must come, because they serve the needs of the greatest volume of people.

### Need More City Traffic Planning

Jacques Barrière, traffic engineer of Montreal, told delegates of a study of traffic conditions in the 19 largest Canadian cities. Traffic planning in Canada was "overly modest" and municipal budgets grossly inadequate, he said. Compared with the $134 million which the average Canadian motorist pays yearly in taxes, the most ambitious traffic planning by a major Canadian city cost $2.80 per registered vehicle, while the Canadian average was only 75 cents.

Trained traffic engineers were in short supply, he said, and there must be wider recognition of the need for training them. Much remained to be done to tighten up safety regulations. Two-thirds of the 19 cities had no compulsory driving tests, while none had compulsory blood tests for drunken drivers. Few cities provide off-street parking facilities.

### Other Business

J. H. Lowther of the Dominion Bureau of Statistics, called for a great increase in available statistics on all aspects of road-work. No comprehensive picture of the economic development of road transportation was criticized for delay in publishing statistics, they could only produce what they receive when they receive it.

W. N. Carey, project engineer of the U.S. Highway Research Board, as well as members of the C.G.R.A. Observer Committee, outlined experience to date on the traffic tests on flexible pavements, being conducted by the U.S. Highway Research Board.

L. R. Kain, chairman of the C.G.R.A. Operating Committee, forecast that motor vehicle registrations would grow to 3½ million by the end of 1953, and would reach four million by the end of 1954. Congestion would get worse, he said, and there was a critical need for road and street improvement.

### Convention Resolutions

Resolutions presented to the meeting called for the Federal Government to make a much larger contribution to the Grade Crossing Fund; to adopt a distinctive road sign at frequent and regular intervals along the Trans Canada Highway; to develop in co-operation with the Provinces a plan for road improvement that would meet the demands of national security; to initiate or support a nation-wide study or enquiry into the cause of traffic accidents; and to convene a meeting of governmental authorities to improve statistical information on roads and road transport.

## Duggan Medal

**The Duggan Medal is presented at Toronto to Prof. E. A. Allcut, M.E.I.C., for his paper "Possibilities of the Heat Pump in Canada". Left to right, R. L. Dobbin, president, Professor Allcut, John G. Hall, chairman, Toronto Branch.**

# Annual Meeting, ECPD-ASEE

The *Journal* is indebted to George M. Stetson, editor of *Mechanical Engineering*, for permission to use this material which in greater detail will also appear in that publication.—Editor

## The General ASEE-ECPD Program
## Presented at the Twenty-first Annual Meeting of ECPD, October 14-17, 1953

Success of the joint meeting of the American Society for Engineering Education and the Engineers' Council for Professional Development, held at Chicago in September, 1952, in connection with the Centennial of Engineering, prompted decision to hold another joint meeting at the Hotel Statler, New York, N.Y., Oct. 14-17, 1953.

### Sessions on Creativeness

Two sessions of a conference, one devoted to creativeness in the arts and the other to creativeness in engineering, were held at the Hotel Statler on Thursday morning and afternoon. These sessions were sponsored by the Engineering College Research Council and Engineering College Administrative Council and were open to all members and representatives of ASEE and ECPD and to the general public. The sessions were enthusiastically received and provoked considerable discussion.

At the morning session, Eric A. Walker, vice-president ASEE and dean of engineering, Pennsylvania State College, presided. The theme, Creativeness in the Arts, was developed by three speakers: Virgil Thompson, music critic, New York Herald Tribune; John Fevien, internationally famous painter: and Ralph Bates, Department of Literature, New York University.

W. L. Everitt, vice-president ASEE, and dean of engineering, University of Illinois, presided at the afternoon session where the theme, Creativeness in Engineering, was developed by Fred Olsen, vice-president for research and development, Olin Industries, who presented the industrialists' point of view, and Maurice Nelles, director, Borg-Warner Laboratory, the engineering point of view.

At the luncheon, with L. E. Grinter, president ASEE, and dean of engineering and director of research, University of Florida, presiding, Morris I. Stein, professor of psychology, University of Chicago, spoke on the subject, "A Psychologist looks at Creativeness, Its Environment and Its Measurement."

### Sessions on Engineering Accrediting

Recent developments in accreditation of educational institutions as a whole and of individual curricula, not only in ECPD and its constituent bodies, but in the institutions and other accrediting agencies as well, prompted the decision to devote the general program of the twenty-first annual meeting to the subject of engineering accrediting and the studies of the ASEE Committee on Evaluation of Engineering Education, with which the ECPD Education Committee, which is in charge of the ECPD accreditation procedures, is closely associated.

### Needs of Students in Choosing an Engineering School

The point of view of a consulting engineer who frequently has been asked to advise students and their parents on the choice of an engineering school and who criticized ECPD for issuing lists of accredited curricula based on the meeting of minimum standards only, was expressed by Gregory M. Dexter in a paper, "Our Neglected Future Engineers." He contended that wide variability in many important factors among institutions was not recognized in the ECPD lists and hence young people and their parents were uninformed in respect to these factors. He asserted that evaluation of the comparative merits of engineering schools involved, beyond the accreditation accorded by ECPD which is based on minimum standards, such factors as teacher load, cost per student, adequacy of laboratory equipment, and educational qualifications of instructional staff. Other factors of importance to prespective students, in his opinion, are the number of chapters of honorary fraternities in the institution, entrance requirements, fees, number of living alumni and their active interest in the institution, source of income, whether public or private, attitude of the institution on academic freedom, and the size of endowment funds. He also cited ten criticisms of accrediting agencies, and closed with a plea for publication of the data needed by our future engineers in making a choice of the college they should attend.

### Evaluation of Engineering Education

The third speaker at the Friday morning session was L. E. Grinter, dean of the graduate school, University of Florida, president ASEE, and chairman of the ASEE Committee on Evaluation of Engineering Education.

Dean Grinter stated that the Committee on Evaluation of Engineering Education had been appointed in May, 1952, by Dean S. C. Hollister, at that time president of ASEE. "The charge to the committee," he said, "was to determine the pattern or patterns that engineering education should take to provide the leadership that the profession must have 25 years from now." He then cited examples of the "increased importance of the basic sciences in engineering progress," and the reorientation of research physicists toward nuclear problems, which made it seem doubtful "if the interest will ever be returned in sufficient measure to influence greatly research in vibrations, elasticity, heat transfer, engineering thermodynamics, fluid flow, and other engineering sciences. Hence," he continued, "engineers have become responsible for the continuity of research in all the fields of engineering science. The leaders of the engineering profession 25 years hence must be engineers who are at no loss in interpreting or themselves contributing to the extensions of the fields of engineering science."

In respect to curricula changes, Dean Grinter, who was presenting a summary of the preliminary report of his committee, stated, as regards the basic sciences, which include mathematics, physics, and chemistry, that "mathematics through ordinary differential equations seems close to a minimum essential for all engineers. Chemistry deserves increased emphasis . . . and for a larger portion of engineers considerably more than the usual freshman chemistry course is necessary." He asserted that the Committe has "indicated its belief that modern physics including nuclear and solid-state physics has become an essential study in engineering. Since the physicists' teaching of mechanics, thermodynamics, and electricity is largely duplicated in engineering courses, it is believed that better co-ordination would provide opportunity for the study of modern physics. The Committee, therefore, recommends greater emphasis upon basic science in engineering curricula."

Nine important background sciences of engineering have been recognized by the Committee, said Dean Grinter. They are: statics, dynamics, strength of materials, fluid flow, thermodynamics, electrical circuits, fields, and electronics, heat transfer, engineering materials, and physical metallurgy. "It is believed," he reported, "that all of these studies should be represented in curricula that train engineers in research, development, or design and that no less than seven should be integrated into every curriculum that is represented as education for engineers."

Studies in analysis, design, and engineering systems, along with the necessary background of the engineering sciences, "represent the features that distinguish engineering education from education in science on the one hand or technical institute education on the other," Dean Grinter asserted. "In all curricula except those intended for training in management or other general professional service, studies in design or in analysis leading to design, should occur as an integrated study over four successive semesters. Even the most general curricula should include such studies as a continuing program for at least two semesters."

Turning his attention to "engineering courses selected for broadening purposes such as electrical engineering for nonelectricals," Dean Grinter stated that "such courses should avoid the study of special machines or devices including their construction, production, or operation. The Committee affirms its conviction," he said, "that the most important broadening courses in engineering are those listed as the engineering sciences. Additional studies in these fields are recommended in place of survey courses in engineering practice."

Dean Grinter stated that "the Committee recognizes the importance of social studies and the humanities as an important part of an engineer's education. . . . The Committee recommends a much broader study of the effectiveness of the social-humanistic stem of engineering education."

Dean Grinter then went on to discuss faculty selection and development, "An educational background which includes the PhD. degree is the strongest evidence usually available to measure the probable usefulness in teaching and research of a relatively young candidate for a faculty position," he said, "For older persons evidence of the productivity of the individual in creative teaching and research may be gaged by other criteria, and the formal educational background is of less significance."

In respect to the development of superior teachers, Dean Grinter said: "A faculty that can be expected to provide adequate leadership for students will have at least one member in five who has achieved professional distinction by creative activities. Such persons will (1) be conducting high-grade research of an engineering or educational nature or other creative activity, including publishing of good quality; (2) be engaged in consulting work at a creative level; (3) be exercising leadership in scientific, educational, and professional societies; or (4) preferably be serving in a combination of such activities."

Another section of Dean Grinter's report deals with accreditation of curricula. "For proper handling of accreditation," he said, "ECPD needs improved standards for measuring the effectiveness of the educational process and also criteria that distinguish engineering curricula from those in science and from those in technical institutes." The Committee has devised the terms "professional-scientific" and "professional-general" education to distinguish between curricula designed for the training of two separate groups of engineers. In order to raise the standards of accreditation of engineering curricula, Dean Grinter recommended that "the accreditation process be reorganized on the basis of a distinction between professional-scientific curricula and professional-general curricula." Professional-scientific curricula are those, embodying the characteristics previously mentioned, intended for the instruction of engineers for research, development or design. Professional-general curricula are those designed to produce engineers "(1) to serve in areas between engineering, management, law, real estate, or agriculture; (2) between engineering and a branch of science where the opportunities to apply engineering analysis and design may be limited; (3) between engineering and a highly applied technology, such as production processes, operation, construction, or air conditioning, welding, or wood technology."

To ECPD, Dean Grinter recommended "liberal acceptance of experimental programs that meet the definition given of engineering education. . . . The length of the curriculum should be one such factor subject to wide experimentation. The Committee does not foresee difficulty in meeting within a four-year program its recommendations for an accredited professional-scientific engineering curriculum plus all of the specialized courses of the degree-granting department, but it believes that specialized engineering courses are of far less value in professional-scientific education than a broad background of engineering science and its application in one field of analysis and design."

Dean Grinter's report ended with a statement that "there appears (to be) merit in identifying those curricula which meet criteria substantially above the minima. The major factor in such identification should be the background and eminence of the faculty and its attention to creative teaching."

#### Discussion of Accreditation and Evaluation

The extensive and spirited discussion which followed Dean Grinter's report was summarized by S. C. Hollister who said that the speakers had approached the subject of accreditation from three points of view, (1) that of the institution seeking accreditation, (2) that of the student and his parents, and (3) that of professional licensure. He cited as three concepts of the accreditation process (1) the classification of the relative qualities of a college; (2) the minimum standards of an institution; and (3) stimulation of the improvement of individual programs.

There was evidence that the needs of the profession are changing rapidly, and he asked what was being done to meet change. Also, there had been introduced into the accreditation picture a new element which suggested the possibility of indicating schools that are doing a superior job in engineering education. The central theme which ran through the discussions, he said, was an indication that the public does not understand the engineering schools.

The most important need at present, he said, lay in the evaluation of engineering education. There was a need for a definitive statement of objectives and a unification of patterns to meet these objectives. What would be done at the campus level with the preliminary report of Dean Grinter's committe was therefore of great importance, and the question of accreditation would be secondary until other facts were known. It was the quality of the faculty, he said, which defined the nature and set the tone, level, and objectives of engineering operations. However, there was no good way to measure the functions of the faculty. Judgement and experience counted greatly, he asserted, but quantitative specifications might result in a "hardening of the categories." Accreditation must not standardize or paralyze education, he contended, nor must it interfere with the growth of sound experimentation. It must provide for a shift of educational attack, but not a shift of objectives to meet standards of a quantitative nature.

There was confusion in respect to the objectives of higher education, he said, and then listed three objectives which appeared to him to be valid; (1) Education for leadership for intelligent progress in a dynamic world; (2) high scholarship; and (3) training for responsible practice of engineering, which is something the engineering profession owes to the community.

In closing he stated that accrediting was not an end in itself but an aid to the objectives which education sets for itself.

#### General McNaughton Discusses Water Problems

Despite large hydroelectric resources and recent power developments, Canada has no power surplus, General A. G. L. McNaughton, chairman of the Canadian Section of the International Joint Commission, told the luncheon group on Friday.

Presently foreseen expansions in the Canadian economy will employ all of Canada's available economical power, General McNaughton said. Future power developments in two important areas, he pointed out, are involved in Canadian negotiations with the United States. These are the St. Lawrence Seaway and Columbia River system.

Canada is hoping to begin power works development along the St. Lawrence next spring, General McNaughton said. It seems to Canadians "that every conceivable argument against the St. Lawrence project has been answered," he declared. The issue of American association with the Ontario Hydro Electric Power Commission for construction of power works is still in the U.S. Courts, he said.

Turning to the Columbia River basin, General McNaughton reported "sharp differences" in hearings on the U.S. application to erect a dam at Libby, Mont. The project would produce about 1,000, 000 hp. at the site and would benefit industrial plants in both countries. While financial compensation can be negotiated for lands, rebuilding of roads, railways and communications, damaged forests and minerals and resettlement of residents, major disagreement centres on the lands that will be flooded 42 miles over the border into Canada.

Downstream interests will settle only in terms of monetary compensation, while the flooded areas are asking for recompense in the form of increased power allocations, General McNaughton said.

The use of the Watertown and Belly Rivers for irrigation in Alberta has also aroused a "sharp, determined, and long enduring" controversy, General McNaughton said. The rivers rise in Montana and flow into Alberta. Their application to irrigation, he said, would transform a desert into productive farm land.

In contrast to the St. Lawrence, Columbia, and Montana-Alberta difficulties, General McNaughton said, cases concerning the St. John River (between Maine and New Brunswick) and remedial work at Niagara Falls are being concluded in "the spirit of close co-operation and understanding of the points of view of those on both sides."

Col. L. F. Grant, chairman of the Engineers' Council for Professional Development, presided at the luncheon meeting.

#### Post-College Training

A community project to assist in the professional development of young engineers was described by Cornelius Wandmacher, professor of civil engineering, University of Cincinnati, Cincinnati, Ohio, during Friday afternoon's session.

Local engineering societies, industrial companies, and the University joined forces in a program of post-college training, he said.

Professor Wandmacher, who is chairman of the ECPD Training Committee, is working with others in the Cincinnati area on a "pilot" project to assist young engineers in their professional development. Cincinnati was chosen as a typical American industrial community in which to test the Committee's recommendations.

The program embraces the following six basic points of endeavor: Orientation and training in industry, continued education, integration into the community, professional registration, self appraisal, and recommended reading. Nine of the city's industrial companies, 23 local sections of national technical and scientific societies, and members of the administration of the University are participating in the program.

A total of 285 engineers and scientists have enrolled in advanced evening courses at the University of Cincinnati.

#### Engineering Manpower Utilization

The steps taken by two firms toward more effective utilization of engineering manpower during the present acute shortage of engineers were also discussed at this session.

Guy Kleis, manager of the Central Technical Departments of the Westinghouse Electric Corporation, Pittsburgh, Pa., explained the Westinghouse "Three-Point Program," and Chester L. Brisley, chief industrial engineer for the Wolverine Tube Division, Calumet & Hecla, Inc., Detroit, Mich., illustrated the "sampling" techniques employed by his firm.

The "Three-Point Program" at Westinghouse, Mr. Kleis said, includes (1) employing non engineers for "fringe area" jobs; (2) purifying "engineering area" jobs; and (3) raising the performance level of both professional and supporting personnel through an educational assistance program.

Fringe area jobs in the electrical manufacturing industry, he stated, include semi-technical sales, purchasing, production planning and control, time and motion analysis, quality control, industrial relations, and shop supervision. Experience has proved that business adminstration, liberal arts, and law graduates, with supplemental training in engiеering fundamentals and industry methods, can perform these functions as well as engineers, derive more honest satisfaction from the work, and possess equal or greater potential for advancement into management positions.

He described "engineering area" jobs as those in which a bachelor's degree in engineering or science is a minimum requirement. At Westinghouse they were "purified" by the delegation of "all extraneous detail" to clerks and technicians. Mr. Kleis said this resulted in a 15 to 20 per cent increase in engineering output.

The "long-range, wide-range" educational program was established to meet the varying needs of all Westinghouse employees. It includes graduate and undergraduate study in engineering, science, business, and management at 16 affiliated universities, and a technical institute program for high school graduates who want to become technicians. The management of Westinghouse not only encourages participation, but also makes substantial contributions by refunding tuition, he declared.

The second speaker, Mr. Brisley, defined sampling as an intelligent application of the laws of chance. Stating that management too often plays hunches, he asserted that the gamble can be taken out of production or management problems by making use of the work-sampling technique.

At the Wolverine Tube Division, said Mr. Brisley, the technique was used to determine time-study allowances. The general practice, he observed, is to make continuous time studies over a long period of time. However, this takes a lot of specially trained manpower, he said. Now we get the same data by work sampling, he declared, and it requires only a fraction of the man-hours needed to make continuous time studies. Observers need much less training than a qualified time-study man. Experience, he pointed out, has taught us all that the data are sufficiently accurate.

The technique, he said, was successfully applied to determine how engineers in the firm's Decatur, Ala. plant could increase their productivity. It was also used in the Detroit plant to help executives make better use of their time.

T. H. Chilton, chairman, Engineering Manpower Commission, served as chairman of the session.

### Annual Dinner

Nearly 200 engineers and engineering educators, in attendance at the Annual Engineers Dinner, heard Horace P. Liversidge, chairman of the board, Philadelphia Electric Company, Philadelphia, Pa., review the present engineering manpower shortage. This shortage, he said, has been occasioned in large measure by the rapid and broad industrial expansion of recent years without corresponding attention being given to concurrent demands for more technically trained men and women.

Mr. Liversidge's speech will appear in full in an early issue of the *Journal.*

As part of the dinner program, Col. L. F. Grant, chairman of ECPD, briefly reviewed the ECPD Annual Report, which includes reports of the chairmen of the various committees and reports of the representatives of the constituent organizations.

Henry T. Heald, vice-chairman, ECPD, and Chancellor, New York University, presided.

## R.C.E.M.E. Corps Association Annual Meeting

The eighth annual general meeting and annual dinner of the Royal Canadian Electrical and Mechanical Engineers Corps Association was held on Saturday, October 24, at the R.C.E.M.E. School at Barriefield, Ontario.

The meeting, convened by the president, Lt. Col. F. W. Cranston, E.D., of Toronto, was attended by delegates Lt. Col. J. K. Bradford, O.B.E., Toronto (Central Command); Lt. Col. A. G. Edward, D.F.C., M.C., Montreal (Quebec Command); Capt. H. G. Bowes, M.E.I.C., Halifax (Eastern Command); and Lt. J. E. McCann, Vancouver (Western Command).

The Hon. Brooke Claxton, D.C.M., K.C., M.P., Minister of National Defence, and Lt. Col. A. O. Monk, M.E.I.C., representing the director of electrical and mechanical engineering for the Canadian Army, were speakers at the meeting.

Addressing the executive meeting were Lt. Gen. C. B. Simonds, C.B., C.B.E., D.S.O., Army Chief of Staff, and Brig. A. Wrinch, O.B.E., Deputy Quartermaster General and the Kennedy Commission on Reserve Army Affairs.

Lt. Gen. Sir Archibald Nye, G.C.S.I., C.G.M.G., G.C.I.E., K.C.B., K.B.E., British High Commissioner to Canada, was guest speaker at

Members of the R.C.E.M.E. Corps Association, attending the annual meeting in Barriefield, in October 1953.

the dinner. He spoke on some of the problems experienced in the mobilization of men and equipment in England during World War II. Other guests at the dinner included Dean D. S. Ellis, D.S.O., V.D., M.C.E., M.E.I.C., dean of the Faculty of Applied Science at Queen's University; Brig. G. M. Grant, C.B.E., chairman of the Conference of Defence Associations; and Lt. Col. T. M. Medland, executive director of the Association of Professional Engineers of Ontario.

Lt. Col. F. W. Cranston, E.D., and Lt. Col. LeSueur Brodie, E.D., of Toronto, were re-elected president and secretary-treasurer, respectively, of the Association for 1953-54.

---

# Evaluation of Engineering Education

## Summary of Preliminary Report

## Committee of American Society for Engineering Education

### The Committee

H. H. Armsby, U.S. Office of Education.
M. M. Boring, General Electric Company, Schenectady, N.Y.
G. G. Brown, University of Michigan.
A. B. Bronwell, Northwestern University.
R. S. Burington, Bureau of Ordnance, Navy Department.
J. F. Calvert, Northwestern University.
A. P. Colburn, University of Delaware.
C. S. Crouse, University of Kentucky.
N. W. Dougherty, University of Tennessee.
T. H. Evans, Colorado A. & M. College.
R. C. Ernst, University of Louisville.
D. F. Gunder, Cornell University.
G. A. Hawkins, Purdue University.
H. L. Hazen, Massachusetts Institute of Technology.
P. Hemke, Rensselaer Polytechnic Institute.
J. A. Hrones, Massachusetts Institute of Technology.
L. H. Johnson, Tulane University.
J. H. Lampe, North Carolina State College.
F. C. Lindvall, California Institute of Technology.
J. Marin, Penn State College.
G. Murphy, Iowa State College.
M. P. O'Brien, University of California, Berkeley.
R. L. Pigford, University of Delaware.
J. H. Rushton, Illinois Institute of Technology.
T. Saville, New York University.
R. J. Seeger, National Science Foundation.
H. H. Skilling, Stanford University.
R. L. Sweigert, Georgia Institute of Technology.
K. F. Tupper, University of Toronto.
E. A. Walker, Penn State College.
E. Weber, Polytechnic Institute of Brooklyn.
H. E. Wessman, University of Washington.
W. C. White, Northeastern University.
W. R. Woolrich, University of Texas.
D. Young, University of Minnesota.

### Co-Chairmen of the Four Sub-Committees

L. E. Grinther, University of Florida, *Chairman.*
D. H. Pletta, Virginia Polytechnic Institute, *Secretary.*
L. M. K. Boelter, University of California.
W. L. Everitt, University of Illinois.
S. C. Hollister, Cornell University.
B. R. Teare, Jr., Carnegie Institute of Technology.

The Committee on Evaluation of Engineering Education was appointed in May, 1952 by Dean S. C. Hollister, then President of the American Society for Engineering Education. The charge to the Committee was to determine the pattern or patterns that engineering education should take to provide the leadership that the profession must have 25 years from now. It had become evident that the tremendous strides taken in the physical sciences during the past decade had begun to influence requirements being placed upon the profession of engineering while only minor adjustments have occurred in engineering education.

As examples of the increased importance of the basic sciences in engineering progress one can point out that electronic developments have demanded greater knowledge of physics from electrical engineers. Such problems as continuity between structural members produced by welding and problems of vibrations of suspension bridges have demonstrated the need for greater scientific background for civil engineers. Mechanical engineers found new fields for research in heat transfer, fluid mechanics and later in jet and rocket propulsion. Practical metallurgy has changed from an art to a science based upon physical chemistry and physics of the solid state. The need for new reactor materials, new nuclear-thermal processes and new materials and systems for radiation protection add to our picture of the increasing influence of science upon engineering practice. Hence, even without considering the major changes that are inevitable in engineering as nuclear power becomes available, we conclude that the many developments of the past ten or fifteen years would inevitably necessitate major changes in the character of engineering education.

From another direction there comes an even greater influence upon education in engineering. Since 1940 a large percentage of research physicists have had their interests reoriented toward nuclear problems, and it seems doubtful if the interest will ever be returned in sufficient measure to influence greatly the research in vibrations, elasticity, plasticity, heat transfer, engineering thermodynamics, fluid flow, and the other engineering sciences. Hence, engineers have become responsible for the continuity of research in all the fields of engineering science. The leaders of the engineering profession 25 years hence must be engineers who are at no loss in interpreting or themselves contributing to the extension of the fields of engineering science. Typical curricula of the era 1910-1940 were not designed with such an objective in mind.

### Curricula Considerations

#### *Basic Science*

The basic sciences for all engineering curricula include mathematics, physics and chemistry. Mathematics through ordinary differential equations seems close to a minimum essential for all engineers. Chemistry deserves increased emphasis in engineering education and for a larger proportion of engineers considerably more than the usual freshman chemistry course is necessary. The Committee has on three occasions indicated its belief that modern physics including nuclear and solid-state physics has become an essential study in engineering. Since the physicists' teaching of mechanics, thermodynamics and electricity is at least partly duplicated in engineering courses, it is believed that better coordination would provide opportunity for the study of modern physics. The Committee, therefore, recommends greater emphasis upon basic science in engineering curricula.

#### *Engineering Sciences*

The Committee has recognized nine important background sciences in engineering. They are statics; dynamics; strength of materials; fluid flow; thermodynamics; electrical circuits, fields, and electronics; heat transfer; engineering materials; and physical metallurgy. It is believed that all of these studies should be represented in curricula that train engineers for service in research, development or design and probably no less than seven should be integrated into every curriculum that is represented as education for engineers.

#### *Analysis, Design and Engineering Systems*

Such studies of the junior and senior years, along with the necessary background of the engineering sciences, represent the features that distinguish engineering education from education in science on the one hand or technical institute education on the other. In all curricula except those intended for training in management or other general professional service, studies in design, or in analysis leading to design, should occur as an integrated study over four successive semesters. Even the most general curricula should include such studies as a continuing program for at least two semesters.

#### Non-Departmental Engineering Courses

Curricula often contain certain engineering courses selected for broadening purposes such as electrical engineering for non-electricals and heat engines for non-mechanicals. When given, such courses should limit the study of special machines or devices including their construction, production or operation. The Committee affirms its conviction that the most important broadening courses in engineering are those listed as the engineering sciences.

#### Humanistic-Social Studies

The Committee recognizes the importance of social studies and the humanities as an important part of an engineer's education. Such studies reveal the richness of human experience so that students may in turn enrich their own lives. They should trace the political, economic and social history of mankind to give students a clearer perspective of our civilization today. They should provide inspiration for seeking greater knowledge and understanding. They should aid the student to develop judgment and discrimination, a sense of value, and a sound personal philosophy.

The seeking for immediate usefulness in the social studies and humanities, as tool subjects in engineering, may well lead to failure to achieve the objectives set forth above. Such courses as accounting, industrial psychology, investment economics, comparative costs, or city management may be just as technical as engineering studies. It is outside of such fields that the social-humanistic studies must lead the student. The Committee recommends a much broader study of the effectiveness of the social-humanistic stem of engineering education.

### Faculty Selection and Development

Since a more scientific approach to engineering education is needed it will be essential to improve the scientific background of engineering faculties. Within a given faculty there should exist a balance of experience in both the science and art of engineering. An educational background which includes the Ph.D. degree is the strongest evidence usually available to measure the probable usefulness in teaching and research of a relatively young candidate for a faculty position. For older persons evidence of the productivity of the individual in creative teaching and research may be gauged by other criteria, and the formal educational background is of less significance.

Engineering education cannot develop superior students without developing superior teachers who will be recognized as creative leaders in the fields in which they teach. A faculty that can be expected to provide adequate leadership for students will have at least one member in five who has achieved professional distinction by creative activities. Such persons will (1) be conducting high grade research of an engineering or educational nature or other creative activity including publishing of good quality, (2) be engaging in consulting work at a creative level, (3) be exercising leadership in scientific, educational and professional societies, or (4) preferably be serving in a combination of such activities. It is recognized that development is quite as important as selection of a faculty and also that a definite policy on termination of employment for those who do not live up to their expected performance is a necessary factor in faculty development.

### Accreditation of Curricula

A request from ECPD brought the Committee on Evaluation into the discussion of accreditation. For proper handling of accreditation ECPD needs improved standards for measuring the effectiveness of the educational process and also criteria that distinguish engineering curricula from those in science and from those in technical institutes. As already indicated the Committee on Evaluation concluded that an increased background in mathematics, physics and chemistry, a study of nine engineering sciences, and a continuity of study of engineering analysis and design, or of engineering systems, extending through four semesters should distinguish an engineering curriculum intended for the training of engineers for professional - scientific service such as research, development or design. Then recognizing the need for additional engineers for general professional engineering services, the Committee concluded that a bifurcation in engineering education is the practical answer to such diverging functional objectives. It has, therefore, devised the terms *professional-scientific* education and *professional-general* education to designate the two broad functional objectives of engineering education.

*Professional-general* education is that designed for producing engineers qualified (1) to serve in areas between engineering and business, management, law, real estate, or agriculture, (2) between engineering and a branch of science where the opportunities to apply engineering analysis and design may be limited, (3) between engineering and a highly applied technology such as production processes, operation, construction, or air conditioning, welding, or wood technology. Such programs may have somewhat reduced requirements of mathematics, physics and chemistry, and only seven of the nine engineering sciences need be included. Also, the study of engineering analysis and design may be reduced from four to two continuous semesters. However, the decision as to whether a planned program curriculum is really engineering education is to be made wholly upon its content of the engineering sciences and the use made thereof in the study of engineering analysis, design and engineering systems.

A decision has been reached by ECPD, upon the recommendation of the Council of ASEE, that the standards of accreditation of engineering curricula shall be raised. To achieve this result without undue hardship it is here recommended that the accreditation process be reconsidered on the basis of a distinction between *professional-scientific* studies and *professional-general* studies. Some institutions may choose one function or the other for all programs; other institutions may have a bifurcation between the objectives selected by different departments; and in large departments dual curricula serving different functions may develop. The Committee on Evaluation recommends that each engineering college determine for itself the best way to meet either or both of the dual objectives that the Committee has defined for engineering education. To ECPD it recommends liberal acceptance of experimental programs that meet the definition given of engineering education, i.e., those that include an adequate content of engineering science and of applications thereof to engineering analysis and design. The length of curricula should be one such factor subject to wide experimentation. The Committee does foresee difficulty in meeting within a four-year program its recommendations for an accredited professional-scientific engineering program plus all of the specialized courses of the degree-granting department, but it believes that specialized engineering courses are of far less value in professional-scientific education than a broad background of engineering science and its application is one field of analysis and design.

#### Special Designation of Accredited Curricula

There appears merit in identifying those curricula which meet criteria substantially above the minima. The major factor in such identification should be the background and eminence of the faculty and its attention to creative teaching. When the program conducted by this faculty is of such a nature as to develop in a considerable proportion of the graduates a capacity for creative technical activity or creative leadership in engineering it is the recommendation of the Committee that this curriculum should be given special designation. For such designation curricula should be taught by faculties including a substantially larger proportion of distinguished staff members, as defined previously, than is required for minimum accreditation. The recommendation of a curriculum for special designation should be referred by the Inspection Committee for final action to a group of national representatives whose background of examination of institutions covers a wide geographical area.

#### Conclusions

1. By joint action of ASEE and ECPD the Education Committee of ECPD has been instructed to develop higher standards for accreditation of engineering curricula.

2. One objective of the Committee on Evaluation has been to establish a philosophy of engineering education appropriate to the training of engineers for leadership a generation hence, and to clarify the significant factors that contribute to high standards of engineering education.

3. Another objective has been to study the influence of higher standards of accreditation upon the Engineering Colleges and to consider ways in which institutions may appropriately justify accreditation based upon the performance of different functions in the broad field of engineering education, if they so desire.

4. The functional divergence so evident in engineering activities, which range from research to management and sales has led to the Committee's recommendation that accreditation be based upon either of two defined functions in engineering education, i.e., *professional-general* education and *professional-scientific* education. Such divergence should not necessarily require curricula but might be based upon options, groups of electives, thesis study, etc.

5. In order that the decision to develop advanced standards of accreditation may not unduly restrict the number of possible accredited curricula, the Committee recommends that a special designation be given to any curriculum taught by a faculty of unusual distinction where the program conducted by the faculty is of such a nature as to develop in a considerable proportion of the graduates a capacity for creative technical activity or creative leadership in engineering.

#### Further Studies

The Committee on Evaluation has made the report summarized above as a *Preliminary Report* for study by each College of Engineering. Each of the recommendations tentatively adopted will be reconsidered in the light of the suggestions, criticisms and revisions presented by reports from Institutional Committees on Evaluation and Deans of Engineering Colleges. Resolutions from engineering groups will be welcomed although mere criticism or approbation without supporting analyses will not be very helpful to the Committee in revising its report into final form. Therefore, the Committee on Evaluation particularly requests thoughtful, mature analyses of the Preliminary Report without undue emphasis upon the form or mechanism of accreditation which is of secondary importance in this study.

---

## THE ASME BOILER CODE. Part IV

(*Continued from page 38*)

slightly changed and a paragraph was added. Similar additions were made in para. U-70. Para. U-71(b) was changed to permit use of castings. Para. U-72, Preparation for Welding, contained only one addition, excluding any welding process where proper fusion and penetration were obtained without impurities.

Changes were made in para. U-73 on joints and in U-76 on stress relieving, and a new limitation for thickness appeared in para. U-69. Rules for Brazing, paras. U-91 to U-96, contained an addition to U-95 permitting welding of unbrazed edges where the joint did not extend the full length of the sheet, and where weld was not over four times the plate thickness.

Rules for containers for gases and liquids at low temperatures were found in paras. U-140 to U-144. The preamble limited the rules to vessels containing uncorrosive gases and vessels and to temperatures not lower than -450°F. Para. U-140, Seamless Containers, prohibited their use where holes might be made in the shell, and called for S-18 material and the Charpy impact test. Para. U-140(c), Design, gave maximum stresses for three grades of S-18 material.

Para. U-141 placed seamless containers under all of the requirements of section VIII, prescribed welding under para. U-68 with impact test, and para. U-141 required the same number of such tests. Para. U-143 called for safety devices of para. U-2, but excluded those of paras. U-3 to U-10. Para. U-44 provided for stamping.

The Appendix contained the Standard Practice for Hydrostatic Tests to determine maximum allowable working pressure, paras. VA-1 to VA-9. Paras. UA-10 to UA-15 and VA-16 to VA-29 were unchanged from the 1935 Edition, except that in para. VA-29 paragraph (e) was added for ring and hubbed flanges. The new extensive section on rules for qualification of welding process and testing of welding operators comprised paras. VA-30 to VA-46. The Appendix closed with forms of the manufacturers' partial data report and manufacturers' data report for unfired pressure vessels. An index of seven pages was added in this section VIII. √

# Elections and Transfers

At the meeting of Council held at Headquarters on Friday, December 18, 1953, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

*Members:*

A. I. Archavsky, *Montreal.*
S. Babkin, *Sorel.*
A. Baptist, *T. Rivers.*
R. A. Boorne, *Sackville.*
L. E. Burrill, *Amherst.*
J. F. Chantler, *Temiskaming.*
J. A. de Monte, *Goose Bay.*
A. L. Dempster, *Montreal.*
A. W. Gilmour, *Victoria.*
J. T. Henderson, *Ottawa.*
J. T. Higgins, *Trail.*
J. F. Hirshfeld, *Detroit.*
T. A. Hughes, *Montreal.*
T. K. Hum, *Hong Kong.*
T. G. Irving, *Toronto.*
M. M. Kennedy, *Hamilton.*
L. R. Marsh, *Montreal.*
A. H. Mingail, *Calcutta.*
D. E. Peatfield, *Kingston.*
C. J. Scott, *Montreal.*
A. Skarzynski, *Montreal.*
A. S. Townshend, *Toronto.*
L. Williams, *Trail.*

*Juniors:*

N. J. Deck, *Lethbridge.*
T. de Haas, *Montreal.*
T. M. Dick, *Port Arthur.*
F. F. Eccheli, *Montreal.*
G. C. Heaton, *Toronto.*
R. M. Heaton, *Hamilton.*
M. J. Masterson, *Montreal.*
L. F. Speed, *Toronto.*

*Transferred from the class of Junior to that of Member:*

R. S. Allison, *Montreal.*
L. G. Bratty, *Montreal.*
R. F. Brooks, *Shawinigan Falls.*
J. A. Brown, *Fort William.*
D. A. Burris, *Montreal.*
J. A. D'Angelo, *Windsor.*
S. Gagliardi, *Montreal.*
A. H. D. Haiblen, *Toronto.*
L. J. Hammerschmid, *Montreal.*
K. E. G. Hellstrom, *Montreal.*
J. W. Howard, *Vancouver.*
R. C. Hughes, *Arvida.*
L. C. Johnson, *Victoria.*
R. O. Lafond, *Montreal.*
P. Laporta, *Montreal.*
R. A. LeBlanc, *Montreal.*
A. R. Leger, *Grand Falls.*
J. P. Lemieux, *Quebec.*
A. M. Lount, *Toronto.*
R. P. Lynch, *Fredericton.*
B. W. McCrae, *Hamilton.*
J. C. Macdonald, *Winnipeg.*
R. M. McKnight, *Kingston*
G. L. Metcalfe, *Lloydminster.*
J. E. Mews, *Toronto.*
J. R. Moore, *Toronto.*
J. R. Morris, *Winnipeg.*
J. R. O'Grady, *Temiskaming.*
H. D. Paavila, *Espanola.*
K. B. Parkinson, *Ottawa.*
J. W. Powers, *Lunenburg.*
G. E. M. Proctor, *Toronto.*
C. W. Ross, *Ottawa.*
G. Ross, *Windsor.*
J. F. Runge, *Guelph.*
F. O. St. Pierre, *Iberville.*
T. F. Scott, *Prescott.*
A. C. Shamess, *Niagara Falls.*

# *Students and IAESTE*

***IAESTE*** means the International Association for the Exchange of Students for Technical Experience.

This organization with headquarters at the Imperial College in London, England, is engaged in finding employment in 18 different countries for engineering students who have just one year to go to finish their courses. In 1953 almost 4,000 students were exchanged.

***Canada*** has just recently joined the organization and the activity is carried out by the Engineering Institute of Canada. Last year 21 students came to Canada from Great Britain, Holland and Germany.

***In 1954*** it is proposed to send Canadian students abroad. If you are interested, write the Institute at 2050 Mansfield Street, Montreal, for all the information. Bear in mind that you must be in the year before your final year; you have to pay your own expenses including travel, but you receive wages for your work. Tell us the type of experience you want and name the country or countries in which you would like to get it.

Here are the countries that belong to IAESTE:

*Austria, Belgium, Canada, Denmark, Finland, France, Germany, Great Britain, Iceland, Israel, Italy, Netherlands, Norway, Spain, Sweden, Switzerland, United States, Yugoslavia*

# The *Journal* Thirty-five Years Ago

Here at the turn of the year a person can look back at the first issues of *The Engineering Journal* published in 1918 and forward to the year's volume for 1919... It is apparent immediately that the *Journal* has gone ahead with great strides. Not only are the issues for 1919 better prepared but the contents are more varied and in greater volume.

As was pointed out at the time this series was started the re-reading of the old issues is an interesting occupation. Again it is recommended to all readers of the *Journal* who have the old volumes that they should read them over in detail. These brief references in the current issues of the *Journal* do not do justice to the originals.

So much of the business of the Institute and the profession of today is related to these early publications. There we find the beginning of registration, the setting up of branches, the interest in the salaries of engineers, particularly in the government services and so on. It is too bad that space does not permit publishing many of these references in their entirety. They would make fascinating reading to the present generation of engineers.

#### Volume Two, Number One, January 1919

The leading article is a draft of model by-laws for a branch. Several times an endeavour has been made to provide a set of by-laws acceptable to all the branches so that there could be complete uniformity. However, each time the effort has failed, although even to-day differences in branch by-laws are not great.

H. K. Wicksteed presents an interesting paper on "The Montreal Tunnel from an Economic Point of View". This paper was read before the Toronto Branch. It is filled with references and information that are fascinating in the light of developments within the last thirty-five years. For instance, the article touches on the matter of terminals, including ocean freight, passenger, express and so on. It tells of the advent of Canadian National Railways and of its effect on the transportation of Canada. Reference is made to the financial aspects of the tunnel, the selection of a route, the model city at the back of Mount Royal, the selection of the two portals, the station site, the grades, the head room, the lining, the instrument work, ventilation and so on. It's too bad it cannot be reproduced in its entirety.

The memory of Mr. Wicksteed was honoured recently by the unveiling of a tablet in the new Canadian National Terminal in the City of Montreal. His work on the tunnel and on the whole terminal's early planning was very important and it is certainly fitting that such a tablet should be erected to him in such a place.

J. M. de Stein has an interesting article on "Remarks Regarding Rural Roads". This paper was presented to the Saskatchewan Branch. In fact, the January issue looks very much as though it might well have been called the Saskatchewan issue because there is another article entitled "Doubly Reinforced Beams" by E. G. W. Montgomery also of Saskatchewan.

In the editorial section there is an article based on a statement made by Julian C. Smith, at that time a member of the Council of the Institute, and later president of Shawinigan Water & Power. In this article Mr. Smith speaks of Canada's future and indicates how closely it is related to the development of water power in its different provinces. All of the prophecies made in that article by Mr. Smith have since come true in full measure.

There is reference to the creation of a new membership certificate which superseded the one established in 1888. The certificate used today is the same one.

There are several references to the salaries paid to engineers in the government service. One article gives the history of all the many efforts made by members of the Institute to influence the Federal Government favourably towards engineers. It refers to "a strong committee of the Council which has been appointed, consisting of W. F. Tye, chairman, president H. H. Vaughan, and president-elect Lieut.-Colonel R. W. Leonard, to represent the Institute in securing more adequate recognition and remuneration from the government for engineers". Later on this committee met with the officials of the Federal Government and in commenting on this the article says "In meeting the representatives of the Institute the commission has shown a willingness to be educated in this connection, and the education they will receive from the committee will work for the advantage of every engineer employed in the government."

It seems as if that problem would never be solved. The Institute has kept closely in touch with it for all the thirty-five years that have passed since that article was written, and in the period there have been several increases but even as things stand today, they are far from satisfactory.

#### A Special Meeting of Council

This meeting was called to consider an urgent request received from the Saskatchewan Branch "that approval be given for the submission of an act to the Saskatchewan Legislature immediately". This act was to set up the conditions for controlling the profession in that province.

Council decided at that time it had no authority to approve an act for submission to a provincial legislature without a mandate from the membership. The minutes however, stated that Council was sympathetic towards the idea and urged that the other provinces as well consider the matter, in the hope that an act uniform across Canada might be developed.

A proposal was presented for the inauguration of a branch at Sault Ste. Marie. The committee which was handling this was J. W. LeB. Ross, chairman, B. E. Barnhill, C. H. E. Rownthwaite, J. H. Ryckman, N. L. Somers, L. R. Brown, secretary.

#### Branch News

Under news of the Ottawa Branch there is reference to a discovery by E. Viens, Director of the Public Works Laboratory, for testing materials. The invention related to a type of concrete used for floors in the new Parliament Buildings. While its strength greatly exceeded that of wood and its durability equalled that of ordinary concrete its composition was such that a nail could be driven into it and would hold just as well as in wood. The material was called "Nailcrete".

The branch news also tells of a visit of the branch to inspect the new House of Commons which was carried out under the guidance of G. Gordon Gale, chairman of the branch. There were a hundred and thirty-five members in attendance.

In the correspondence section there are several letters dealing with the remuneration of engineers in the Civil Service, both for the province and for the Federal Government. The Institute and the *Engineering Journal* are commended for the active part they have taken in presenting the engineers' case to the employers.

In the Personals there is an announcement that Lieut. Frederic Alport had been decorated recently with the Military Cross for bravery exhibited during the war.

Another personal that is of special interest today states that Boris A. Bakhmeteff, a member of the Institute and Russian Ambassador to the United States was in Paris "with other Russian Diplomats seeking to preserve a United Russia. In an announcement to the Associated Press, Mr. Bakhmeteff stated that Russia has been granted a respectful hearing by the Allies in her request for representation at the peace conference." His Excellency, Professor Bakhmeteff, for many years was engaged as a consulting engineer and as a professor at Columbia University.

Another personal relates to the appointment of F. L. C. Bond to the position of chief engineer of the Grand Trunk Railway. Subsequently Mr. Bond became the vice-president of the company.

## The ASME Boiler Code

Following on the publication of a condensation of the articles written by the late Professor Arthur M. Greene, Jr., on the history of the ASME Boiler Code, it had been intended to commence regular publication, simultaneously with Mechanical Engineering, of Interpretations and Proposed Revisions to the ASME Boiler Code, commencing in this issue. It so happens that there is only a brief announcement to be made at this time, and we will therefore wait until there is further material available before initiating this new service to our members.

## Annual Meeting of C.I.P.A. Held in Ottawa

The Canadian Industrial Preparedness Association held its annual meeting at Ottawa on October 22, marking the Sixth Anniversary of its founding in 1945, as the Canadian Ordnance Association. T. R. McLagan, M.E.I.C., president of Canada Steamship Lines, was re-elected president, as well as four vice-presidents. James Morrow of Stelco was elected vice-president. The present management was returned to office.

President McLagan, recording the original objectives of the Association, recalled that after the war, munitions manufacturers had decided it was advisable to join in a preparedness effort so they could co-operate with the Government in an emergency. Industrial surveys were made of firms, to tabulate the equipment and facilities of each, so the Nation's industrial forces could be quickly marshalled to produce weapons, without duplication.

Today, he said, the work of preparedness is in full swing and the peak of the Country's effort will probably be reached next year. Many agencies had been set up. Today, it was more difficult for the Association to justify itself, than when it was trying to wake people up. A policy had been followed of keeping the industrial community fully informed of what was going on, and of arranging trips to various stations of the Armed Services for actual demonstrations of weapons in action.

In modern war, the Services are useless without properly equipped manufacturing plants behind them, staffed with well trained personnel. The "knowhow" for such manufacturing is vastly different to that for ordinary peacetime products. "What is to be done after the present arms program is completed?", he asked. "If, as after other wars, the personnel is laid off, the "knowhow" will be lost and our defence weakened."

In 1951-52, expenditure for national defence, he reported, was $1.4 billion or 37 per cent of the total. In 1952-53 it was $1.84 billion, or 42 per cent of the total. In 1953-54 the estimate is $2 billion, or 45 per cent of the total. Half of the $2 billion is for equipment, equivalent to the total value of export in 1939. Most of this money is spent in Canada, and affects employment considerably. Only a fraction of it is spent in the prime contractor's plants. Almost any kind of manufacturer participates in this specialized effort. Only some 35 per cent of the cost of a large merchant ship, for example, is spent in the shipyards.

Commending the Government for its decision to build and create all forms of defence projects in our own Country, and warning that we must see we do not undo all that has been done, he told the meeting that the Directors were convinced the Association should be kept alive, for greater service if war should come, or continued preparedness even if we have real peace.

### General Manager's Report

Major General G. B. Howard, executive vice-president and general manager, announced that the Association membership now stood at 52 sustaining members and 236 company members in good standing. He urged manufacturers to give thought now to the safeguarding of their plants, for security from sabotage in the event war should come. At such a time all plants would be engaged in defence work. Materials such as fencing and alarm equipment might be in short supply or even unobtainable.

Sound long-range planning well beyond the current program was called for, he warned. Fluctuations in requirements would call for changes in any industrial mobilization plan, as well as changes in policy regarding the means to make that plan effective. For example, we might be faced with the decision to concentrate production capacity into as few facilities as possible, as seems to be the trend in the U.S.A., or to broaden the base, which is now considered uneconomical. Flexibility is vital, and revision should be a continuing process.

Manufacturers, he concluded, could assist in the preparedness effort, by providing a survey of types of fast-wearing parts and components of certain quasi-commercial types of defence equipment, with a view to standardization. The first step must of course come from the Services themselves, the next would be for industry to overhaul its existing designs and agree on standard parts.

### Defence Research Board

Dr. O. M. Solandt, chairman of Defence Research Board, described in general terms the weapons and equipment being supplied for the Armed Forces, and outlined briefly how research and development is organized and how this affects industrialists and manufacturers for defence. He explained the difference between fundamental, basic and applied research.

The whole progress of science and industry depends, he said, on free interchange of ideas and information between the scientific communities of different countries. While we must keep from potential enemies any information that might increase their ability to attack us, yet secrecy must not be allowed to interfere unnecessarily with the free exchange of scientific information.

Describing the relationship of the

Defence Research Board to the Services and to industry, he illustrated the concept of a weapons system by comparing the problems of air defence in World War I with those of today. The former called for aircraft, weapons and pilots. The latter called for a vastly complex and closely integrated weapons system; radar, radio communication and navigation systems, guns and guided missiles, a vast amount of highly complex equipment and large numbers of skilled and experienced operators.

Scientists, he said, are an essential and integral part of the air defence team. The same sort of concept affects the other services, Army and Navy. With a new weapons system, extensive research may be necessary, with constant collaboration between scientists, the Armed Services and industry, and this takes a lot of time.

While large industries can and should take a longer term view of research, and pursue programs to produce important though not necessarily immediate benefits, Doctor Solandt advised small industries to do only research that applies to their own problems and which pays off quickly.

#### Meeting Addressed by Minister of Finance

The Hon. D. C. Abbott, Federal Minister of Finance spoke on some of the financial aspects of preparedness. Preparedness, he said, was a long-pull proposition. We must be reasonably ready for emergency, yet many methods appropriate for marshalling the resources of industry, the necessary purchasing power and the man power, during war, will work awkwardly and unfairly during a long-pull part-out defence effort.

We were urged from many quarters in 1950, he said, to impose price ceilings and controls. But as we found during the last War, they in time develop awkward strains and stresses, and adjustments are more and more difficult to make without being unfair to someone, and equally unfair to others to make no adjustment.

Thus in 1950 we chose to rely on general financial and monetary policies. The central problem in financing our defence effort is:—how to pay for defence without inflation. During an intense short-term effort, when a great portion of the gross national product must be war goods, we could use taxation, intense savings campaigns and borrowing to direct sufficient purchasing power towards financing war expenditures. But in the long-pull effort this is unwise.

In our post-Korea Budgets, he continued, we have had to find revenue to cover an increase of some 50 per cent in total expenditures. In our tax policy we have had to remember the desirability of increasing national production, encouraging savings and keeping consumption within reasonable bounds.

We had to find a reasonable balance between taxes on earnings and taxes on spending. We applied taxes on spending to bring in 45 per cent of the needed revenue. This was a valuable brake on inflation. Too high taxes on earning might well encourage extravagant expenditure by business and blunt the incentives of both management and labour to produce more.

We have used monetary policy to buttress this budget policy. The Bank of Canada raised its discount rate and suggested to the chartered banks that they should not allow expansion of credit. Their selective policy in making loans prevented considerable non-essential or deferable expenditure. But experience shows that monetary policy cannot do the job alone.

These policies were supported with restrictions on consumer credit and deferred depreciation, which helped prevent an intolerable pressure on scarce materials. Government expenditures needing scarce funds and materials were postponed. We continued the issue of Canada Savings Bonds as part of the policy of restraining inflation.

Many of these policies are already relaxed or withdrawn, he said. As the nature of the long-pull effort has become clearer, we have come to rely almost entirely on general monetary and fiscal policy, and have put aside the more limited direct controls. If we have to retain our present rate and scale of preparedness, further tax reductions can only come from further growth in total output and efficiency. If real progress is made in reducing world tensions, real reductions in defence costs could come our way, perhaps in 1955 an l later.

However you finance preparedness, Mr. Abbott added in concluding, the public will have to pay, — resources will be diverted from investment and consumption to defence expenditure. Inflation is one way of doing the job, but it is grossly unfair and its long-run social effects are most dangerous. Paying by taxation raises some problems, but it makes for greater fairness, as well as for financial and social stability.

---

## News of Other Societies

The Canadian Conference on Prestressed Concrete will be held in Hart House Theatre, University of Toronto, January 28 and 29, 1954.

The conference is intended to be a concise review of prestressed concrete for Canadian engineers, architects and builders. The program was announced in the November issue of the *Journal*, page 1482.

---

The **Society for Advancement of Management** is a national professional society of management people in industry, commerce, government and education.

The *Journal* has been advised of the 1954 program of the Montreal Chapter:

February 10—Public Relations, a Must for Management, Paul McFarlane, Manager, South District, Bell Telephone Company of Canada, Montreal.

March 10—Industrial Engineer's Contribution to Product Design, H. E. Blank, Jr., Vice-President, Dunlap & Associates, Stamford, Conn.

March 19—The Fifth Annual Industrial Engineering Conference.

April 14—Management Reduces Overhead through Paper Work Simplification, Ben S. Graham, Director, Future Demands Department, Standard Register Co., Dayton, Ohio.

May 12—Annual Business Meeting.

Membership Chairman is Bill Borland at Imperial Tobacco Co. of Canada, Montreal.

---

The 10th International Management Congress, will take place at Sao Paulo, Brazil, from February 19-24, under the auspices of the International Committee for Scientific Management (CIOS).

The program of this important international meeting was announced in detail in the *Journal*, September 1953, page 1163, in a letter from the president of the Canadian Management Council, the Canadian affiliate of CIOS.

---

The *Journal* corrects an announcement appearing in the December issue, page 1648, as follows: The western meeting of the engineering, sales, and general divisions of the *Canadian Electrical Association* will be held from March 1-3, 1954, at Winnipeg, Man.

# Personals

## News of the Personal Activities of Members of the Institute

**F. G. Ferrabee,** M.E.I.C., was recently elected president of Canadian Ingersoll-Rand Company Limited. He was formerly executive vice-president and general manager of the Company.

F. G. Ferrabee, M.E.I.C.

A Montrealer by birth, Mr. Ferrabee received his education at Lower Canada College, the Royal Military College and McGill University where he graduated in mechanical engineering in 1924.

Upon graduation he was selected to take the students' training course at the Phillipsburg, N.J. works of the Ingersoll-Rand Company, and upon completion of this course he joined the Company's sales organization and was promoted successively to the Huntingdon, W.Va., and Pittsburgh branches, and the General Sales Division in New York.

In 1934 he returned to Canada as general sales manager of Canadian Ingersoll-Rand Company Limited. He was elected a director in 1937, and appointed vice-president of the Sales Division in 1939. Three years later he was elected vice-president and assistant general manager, and in 1943 he became executive vice-president and general manager.

Mr. Ferrabee is also executive head of Sherbrooke Pneumatic Tool Company Limited.

Before leaving Canada in 1924, Mr. Ferrabee was an officer in the N.P.A.M. and on his return, was re-commissioned at the organization of what later became the R.C.E.M.E. During World War II he was appointed senior reserve ordnance mechanical engineer in M.D.4 and commanded the No. 4 Reserve Divisional Ordnance Workshop with the rank of major. During this same period Mr. Ferrabee was director of the Compressed Air and Gas and Refrigeration Equipment Division of the Wartime Prices and Trade Board.

**D. S. Lloyd,** M.E.I.C., vice-president and general manager of Dominion Oxygen Company Limited, has been named president of the Company.

Mr. Lloyd graduated from the University of Toronto in 1925 in electrical and hydraulic engineering, and that same year joined the staff of the Dominion Oxygen Company as a service engineer.

D. S. Lloyd, M.E.I.C.

In 1936 he was named sales manager, and two years later was appointed general manager. He was elected vice-president and general manager in 1941.

Mr. Lloyd is a member of the Association of Professional Engineers of Ontario, past chairman of the administrative board of the Canadian Welding Bureau, and a director of the Canadian Standards Association. He is also a past chairman of the Canadian section of the Compressed Gas Association.

**Walter Hindle,** M.E.I.C., has been appointed manager of the manufacturing department of Canadian Westinghouse Company's Power Products Division.

Walter Hindle, M.E.I.C.

A graduate of the University of Alberta, Mr. Hindle joined Westinghouse in 1937 as a graduate student trainee and spent ten years as an erecting engineer in the apparatus service department.

From 1949 to 1952 he was manager of field installation and in 1953 was appointed general superintendent of the Power Products Division.

During his 16 years with the Company, Mr. Hindle has been engaged in some of the largest projects carried out in Canada. Some of these include the 1941 installation of Canada's first ignitron rectifiers at Alcan; hoists for International Nickel; the 1943 Shipshaw power development where Westinghouse installed seven generators; the installation of 32,000 kva. machines for Consolidated Mining and Smelting in 1944; ignitrons for Consolidated and B.C. Electric Railway; generators of Calgary Power and B.C. Power Commission, and this year, the Westinghouse apparatus for Alcan's giant Kemano job.

**J. H. Smith,** M.E.I.C., general manager of the Wholesale Division of Canadian General Electric Company Limited, has been appointed a vice-president of the Company.

Mr. Smith is a graduate of the University of New Brunswick in electrical engineering, receiving his M.Sc. degree in 1942.

After completing the Canadian General Electric's test training, he held a number of sales engineering appointments in Toronto and Hamilton. In the Toronto district he was Supply Division manager from 1945 until 1948, and Apparatus Division manager from 1948 until 1951.

J. H. Smith, M.E.I.C.

Mr. Smith was elected president of the Association of Professional Engineers of Ontario in 1953. He is a member of the A.I.E.E. and the Toronto Board of Trade.

J. S. Keenan, M.E.I.C.

**J. S. Keenan,** M.E.I.C., general manager of the Industrial Products Division of the Canadian General Electric Company, has been named a vice-president of the Company.

A graduate of the Massachusetts Institute of Technology in electrical engineering, Mr. Keenan joined the General Electric Company in Schenectady in 1923, and a year later transferred to the Canadian General Electric Company where he held a number of appointments in the field of supplies and apparatus.

In 1936 he was appointed manager of the Company's supply department, and in 1952 he was named general manager of the Industrial Products Division.

Mr. Keenan has served as president of the Canadian Electrical Manufacturers Association and the Electric Club of Toronto; also as vice-president of the Electric Service League of Ontario and the Canadian Electrical Council.

**Sidney Hogg,** M.E.I.C., president of Western Bridge and Steel Fabricators Limited in Vancouver, was recently appointed a director of the White Pass and Yukon Corporation Limited, the holding company for the White Pass and Yukon Route in Whitehorse, Y.T.

S. Hogg, M.E.I.C.

**Roy H. Smith,** M.E.I.C., has been appointed technical consultant of North Star Oil Limited.

He has had wide experience in Canada and the United States in all phases of the oil industry including pipe line operations.

Mr. Smith recently retired as assistant manager of the co-ordination and economics department of Imperial Oil Limited with whom he had been associated since 1923.

A graduate of McGill University, class of 1921, Mr. Smith is a Fellow of the Chemical Institute of Canada, and a member of the American Petroleum Institute and the Association of Professional Engineers of Ontario.

**Robert Thistlethwaite,** M.E.I.C., has been appointed surveyor general by the Alberta Department of Mines to succeed B. W. Waugh, M.E.I.C., who has retired.

Mr. Thistlethwaite, who becomes chief of the mines department's legal surveys and aeronautical charts division, was born in Winnipeg and graduated from the University of Manitoba in 1933.

In 1936 he worked for the department in the Northwest Territories, and was later associated with oil companies in Colombia and Ecuador.

He rejoined the department in 1944, working on the development of the Columbia River basin in British Columbia. Later he returned to South America, working this time in Peru.

In 1951 he came back to the Mines Department and became assistant surveyor general, the position he held until his present appointment.

As surveyor general he also will serve as chairman of the Board of Examiners for Dominion land surveyors.

W. K. Wiley, M.E.I.C.

**W. K. Wiley,** M.E.I.C., has been appointed manager of power apparatus sales in the Alberta district of Northern Electric Company Limited.

Mr. Wiley was born in Missoula, Montana, and spent most of his youth in the Maritime Provinces, graduating in electrical engineering from the University of New Brunswick in 1931.

Mr. Wiley's experience in the electrical industry began in Seattle where he worked for ten years before returning to Canada in 1944 to join Northern Electric in Montreal.

After service in the illumination department, Mr. Wiley was subsequently appointed industrial heating supervisor and industrial heating manager.

**E. A. Thompson,** M.E.I.C., has been appointed manager of Canada Creosoting Company Limited, the Creosoting Division of Dominion Tar and Chemical Company Limited.

Before his appointment as manager of the Creosoting Division, Mr. Thompson held a variety of positions with both Dominion Tar and the Creosoting Division, the most recent of which was that of assistant to the president.

E. A. Thompson, M.E.I.C.

J. H. Ingham, M.E.I.C.

J. A. Stewart, M.E.I.C.

**J. H. Ingham,** M.E.I.C., has been appointed district manager of the newly opened Toronto office of Walter Kidde and Company of Canada Limited.

He attended McGill University and before graduation in 1935, was associated with the Beauharnois Construction Company, the Dominion Bridge Company, Chas. Walmsley and Company of Canada Limited, and Dominion Engineering Works.

After graduation, Mr. Ingham served on the mechanical design staff of the Dominion Bridge Company in Lachine, Quebec, until 1941 when he joined the Walter Kidde Company as factory manager.

Three years later he was appointed secretary of the Company, and in 1946 became contract engineer and special assistant to the managing director. In 1948 he was appointed sales manager, which position he held until August, 1953, when he was transferred to Toronto to manage the Toronto district office.

**James A. Stewart,** M.E.I.C., former assistant to the managing director of Walter Kidde and Company of Canada Limited, has been appointed manager of sales and engineering.

Mr. Stewart graduated in mechanical engineering from Queen's University in 1934. After graduation he was employed with Ford Motor Company of Canada Limited until 1937, when he joined International Nickel Company of Canada Limited where he remained until 1941.

During World War II he served overseas with the R.C.E.M.E. and was discharged in 1946 with the rank of major.

Upon his return from overseas he joined Walter Kidde and Company of Canada Limited, and was successively contracts manager, works manager and a director of Cresswell Roll Forming Company Limited, and Cresswell Pomeroy Limited in Montreal and Granby, Quebec.

**Major Malcolm Turner,** R.C.E., M.E.I.C., proceeded to England early in January, 1954, to attend the Staff College at Camberley.

**Denton Massey,** O.B.E., M.E.I.C., has recently joined the Standard Motor Company Limited of Coventry, England, as general manager of the United States Division. He will be located in Beverly Hills, California.

He was formerly president of Denton Massey Motors (Canada) Limited in Toronto.

Mr. Massey is a graduate in general engineering of the Massachusetts Institute of Technology class of 1924.

**Dr. George Sinclair,** M.E.I.C., associate professor of electrical engineering at the University of Toronto, and president of Sinclair Radio Laboratories Limited, has been named a Fellow of the Institute of Radio Engineers. The presentation of his award will take place at the annual convention in New York in March, and the citation accompanying the award will read, "For contributions to the development of radiating systems and model techniques in antenna measurements."

Dr. Sinclair was director of the antenna laboratory of Ohio State University during World War II and for his work was awarded a certificate of appreciation by the United States War Department.

Dr. Sinclair was born in Hamilton. Ont., and lived in Edmonton, Alta. for many years. He received his B.Sc. and M.Sc. degrees in electrical engineering from the University of Alberta, and his Ph.D. degree from Ohio State University.

**G. R. Davis,** M.E.I.C., is now with the Kingston Public Utilities Commission in Kingston, Ont.

He was formerly general manager and chief engineer with the Ottawa Hydro-Electric Commission.

Mr. Davis is a 1927 graduate in electrical engineering of Queen's University.

**H. D. Forbes,** M.E.I.C., is superintendent of the Technical Division at the Shawinigan Falls Works of Aluminum Company of Canada Limited.

He was previously assistant to works metallurgist with the Company in Kingston, Ont.

Mr. Forbes graduated in metallurgy from the University of Toronto in 1943.

**J. B. Eldridge,** M.E.I.C., has accepted the position of chief engineer with Atlantic Sugar Refineries Limited in Saint John, N.B.

He was previously with St. Lawrence Corp. Ltd. in Dolbeau, Que.

Mr. Eldridge is a graduate of the University of New Brunswick in electrical engineering, class of 1936.

**Louis Trudel, M.E.I.C.**

**Louis Trudel,** M.E.I.C., manager of the public relations and advertising department of the Shawinigan Water and Power Company, has been named a vice-president of the Public Relations Society of America at its meeting in Detroit.

**M. W. Koslowski,** M.E.I.C., is water and sewer works construction supervisor with Haddin, Davis and Brown Limited in Calgary, Alberta. He was previously resident engineer with this company.

Mr. Koslowski graduated in mining engineering from the University of Alberta in 1949.

**Jack H. Hole,** M.E.I.C., has been appointed manager of the Alberta District Apparatus Division of Canadian General Electric Company Limited.

Mr. Hole graduated in electrical engineering from the University of Alberta, class of 1938.

**Stefan Mitescu,** M.E.I.C., is now associated with Canadian Petrofina Limited in Montreal.

He was formerly with the Aluminum Company of Canada in Arvida, Que.

Mr. Mitescu is a graduate of the Polytechnical School of Bucharest, class of 1928.

**James Morgan,** M.E.I.C., has been transferred from Montreal to Toronto by The Foundation Company of Canada Limited.

Mr. Morgan is a graduate of Loughborough College, class of 1944.

**G. R. Duncan,** M.E.I.C., is now with Canada Iron Foundries Limited in Montreal.

He was previously general sales manager (electrical) of Electric Tamper Company Limited in Lachine, Que.

Mr. Duncan graduated in electrical engineering from McGill University in 1935.

**Wm. A. Lowe,** M.E.I.C., is now industrial representative with the British Columbia Electric Company in Vancouver, B.C.

He was previously assistant to the sales and merchandizing manager of the Winnipeg Electric Company in Winnipeg.

Mr. Lowe received his B.Sc. degree from the University of Manchester in 1936.

**P. R. Woodfield,** M.E.I.C., is chief staff engineer in the gas turbine engineering department of A. V. Roe Canada Limited.

He was formerly head of the Company's Gas Turbine Mechanical Testing Laboratories.

Mr. Woodfield is a 1939 electrical engineering graduate of the University of Manitoba.

**C. J. Connolly,** M.E.I.C., is with Central Mortgage and Housing Corporation in Edmonton, Alta.

He was previously with the Corporation in Halifax, N.S.

Mr. Connolly is a B.Sc. graduate of St. Francis Xavier University, class of 1936.

**E. G. Mcnutt,** M.E.I.C., is with Maritime Steel and Foundries Limited in Montreal.

He was previously with Canadian Car and Foundry Co. Ltd. in Montreal.

Mr. Mcnutt is a 1937 graduate in mechanical engineering from McGill University.

**W. R. Caron,** M.E.I.C., is now associated with Bedard-Girard Limited of Quebec City. He was previously with McDougall and Friedman of Montreal.

**Francois Paul Rousseau,** M.E.I.C., is now chief engineer of the Power Development Division of the Quebec Hydro-Electric Commission.

He was formerly superintending engineer of construction for Beauharnois Light, Heat and Power Co. Ltd. in Beauharnois, Que.

Mr. Rousseau graduated in architectural engineering from the Massachusetts Institute of Technology in 1927.

**Lt. Cmdr. K. W. Salmon,** R.C.N., M.E.I.C., has been posted to Ottawa. He was previously commercial engineer with the New Brunswick Telephone Company Limited in Saint John, N.B.

Lt. Cmdr. Salmon graduated from the University of New Brunswick in electrical engineering in 1941. Immediately after graduation he joined the Royal Canadian Navy with which he served until the end of the war.

**Chas. D. Borror,** M.E.I.C., is production engineer in the Asbestos Fibre Division of Canadian Johns-Manville Company Limited in Asbestos, Que.

He was previously technical assistant to the Company's mine manager.

Mr. Borror is a 1926 graduate in mining engineering of the University of Illinois.

**John Francis Frisch,** M.E.I.C., is a mechanical engineer in the technical section of the Canadian Pulp and Paper Association in Montreal.

Mr. Frisch was previously with the Canadian International Paper Company in Temiskaming.

He is a graduate of the Technical Institute of Horten, Norway, class of 1906.

**G. T. Hughes,** M.E.I.C., is special lecturer at the College of Engineering at the University of Saskatchewan in Saskatoon.

He received his B.Sc. degree in civil engineering from the University of Alberta in 1951, and his M.Sc. degree from the same university in 1953.

**Bruce F. Booth,** M.E.I.C., is plant engineer with Price Brothers and Company Limited in Riverbend, Que.

He is a 1941 B.A.Sc. graduate of the University of Toronto.

**G. A. Duey,** M.E.I.C., is now employed as services engineer with Canadian Industries Limited in Edmonton, Alta.

He is a graduate in electrical engineering from the University of Manitoba, class of 1946.

**Marian Pona,** M.E.I.C., designing engineer with the Hydro-Electric Commission of Ontario, has recently been named a Member in the Institute.

Miss Pona is a 1951 civil engineering graduate of the Polish University College.

**Mary Ellen Dougherty,** M.E.I.C., has recently been named a Member of the Institute.

Miss Dougherty is secretary-treasurer and general operation engineer for The Valley Gas Co. Ltd. in Turner Valley, Alta.

She is a 1949 graduate in engineering physics of the University of Alberta.

**Capt. W. A. McDill,** R.C.E., Jr.E.I.C., has completed the sixth technical staff course at the Royal Military College of Science, and has been appointed Canadian engineer liaison officer in the War Office at Whitehall.

Capt. McDill received his B.A.Sc. degree in mechanical engineering from the University of British Columbia in 1948, and his B.E. and M.E. degrees from Colorado Agricultural and Mechanical College in 1938 and 1948, respectively.

**Bruce M. Hudd,** Jr.E.I.C., formerly associated with the Ontario Hydro-Electric Power Commission in Toronto, has joined the staff of Abitibi Power and Paper Company Limited in Toronto.

Mr. Hudd is a mechanical engineering graduate of the University of Saskatchewan, class of 1945.

**Donald N. Brockhurst,** Jr.E.I.C., is a trainee at the Cincinnati Milling and Grinding Machine Company in Cincinnati, Ohio.

He was formerly with the General Electric Company in Allentown, Pa.

Mr. Brockhurst graduated in mechanical engineering from McGill University in 1947.

**D. J. Bird,** Jr.E.I.C., is now associated with Cameron Contracting Limited in Halifax, N.S., after his recent return from Inagua, Bahamas, B.W.I.

Mr. Bird is a graduate in civil engineering of the Nova Scotia Technical College, class of 1948.

**W. Nord,** Jr.E.I.C., has been transferred by Canada Wire and Cable Company from Montreal to the Company's head offices in Toronto.

Mr. Nord has been with the Company since graduation from the University of Toronto in mechanical engineering in 1948.

**Cecil Scott McKinley,** Jr.E.I.C., is now district engineer with the New Brunswick Electric Power Commission in Fredericton, N.B.

He was formerly with the Shawinigan Water & Power Company in Shawinigan Falls, Que.

Mr. McKinley is an electrical engineering graduate of the University of New Brunswick, class of 1948.

**J. R. A. Walker,** Jr.E.I.C., has been assigned to the Toronto sales office of Aluminum Company of Canada, Limited.

During the past three years Mr. Walker has been resident engineer of the Arvida-Port Alfred District. His major projects during that period were the construction and installation of a sulphuric acid plant (present capacity 175 tons per day), a 4,000-ton magnesium plant, a bauxite storage building, and the formation of a new "red mud lake" for the disposal of the Company's waste product. This involved the construction of a series of 60-foot high earth dams.

Mr. Walker is a graduate in civil engineering of the University of Toronto, class of 1949.

**E. J. Okins,** Jr.E.I.C., is now employed by H. H. Angus Limited, consulting engineers, in Toronto.

Mr. Okins is a 1949 graduate in mechanical engineering of the University of Saskatchewan.

**F/O E. W. McConnell, R.C.A.F.,** Jr.E.I.C., is construction engineering officer at the R.C.A.F. Station in Claresholm, Alberta.

F/O McConnell is a graduate in mining engineering from the University of Alberta, class of 1949.

**Walter T. Clarke,** Jr.E.I.C., has been elected president of the Committee of Young Engineers of the Corporation of Professional Engineers of Quebec.

Mr. Clarke is associated with Gunite and Waterproofing Ltd. in Montreal.

**George S. Bowes,** Jr.E.I.C., is superintendent of Brantford Felt and Paper Company Limited in Brantford, Ont.

He was formerly plant engineer with Brantford Roofing Co. Ltd.

Mr. Bowes is a 1949 graduate in engineering and business of the University of Toronto.

**H. M. Lapp,** Jr.E.I.C., former assistant agricultural engineering specialist in the Extension Service of the Manitoba Department of Agriculture in Winnipeg, is now assistant professor of the Department of Engineering at the University of Manitoba.

Mr. Lapp graduated in agricultural engineering from the University of Saskatchewan, class of 1949.

**George A. Smith,** Jr.E.I.C., is now associated with Meschino & Associates in Toronto.

He was formerly with Margeson, Babcock & Associates in Toronto.

Mr. Smith graduated in electrical engineering from the University of Manitoba in 1949.

**Michael Hugh Walsh,** Jr.E.I.C., is now field engineer with Pigott Construction Company Limited in Toronto, Ont.

He was formerly with the Ontario Department of Highways.

Mr. Walsh graduated from McGill University in civil engineering in 1950.

**Laurance W. Clark,** Jr.E.I.C., is now assistant superintending engineer with the Department of Transport. Rideau Canals, in Ottawa.

Mr. Clark graduated in civil engineering from the University of New Brunswick in 1949.

**Desmond James Clements,** Jr.E.I.C., has been transferred by Bailey Meter Company Limited from Montreal to Halifax, N.S.

Mr. Clements is a 1951 mechanical engineering graduate of Queen's University.

**Richard M. Cook,** Jr.E.I.C., has joined the staff of the research department of Ferranti Electric Limited in Toronto, and is presently engaged in an electronic project in Ottawa.

Mr. Cook was formerly with the B.C. Research Council in Vancouver, B.C.

He is a graduate in engineering physics of the University of British Columbia, class of 1949.

**R. M. Harry,** Jr.E.I.C., has joined the Montreal staff of Canadian Allis-Chalmers after serving in the Company's training department in Milwaukee, Wis.

Mr. Harry is a 1949 graduate in civil engineering of the University of Saskatchewan.

**Norman Batt,** Jr.E.I.C., has joined the plant maintenance engineering department of the Ford Motor Company in Windsor, Ontario.

Mr. Batt graduated in electrical engineering from the University of Manitoba in 1950.

**M. D. Daunais,** Jr.E.I.C., has been transferred by the Dominion Tar and Chemical Company in Winnipeg, Man., to Calgary, Alta. In his new position he will be assistant works manager.

Mr. Daunais is a 1950 graduate in electrical engineering of the University of Saskatchewan.

**W. R. Cooke,** Jr.E.I.C., is now resident engineer with Central Mortgage and Housing Corporation in Gander, Nfld.

He was formerly with Defence Construction Limited in Halifax, N.S.

Mr. Cooke is a 1950 graduate in civil engineering of the University of New Brunswick.

**Peter J. Waugh,** Jr.E.I.C., is now with de Havilland Aircraft of Canada Limited in Toronto.

Mr. Waugh is a 1951 graduate in mechanical engineering of the University of Manitoba.

**W. L. Hatton,** Jr.E.I.C., research scientist with the radio physics laboratory for the Defence Research Board in Ottawa, is on loan as a lecturer at the Royal Military College of Science at Shrivenham, England.

Mr. Hatton received his M.A.Sc. degree from the University of British Columbia in 1951.

**Nicholas Engelman,** Jr.E.I.C., formerly in the employ of the Canadian Liquid Air Company, is now assistant structural field engineer in the central region of Canadian National Railways in Toronto.

Mr. Engelman is a graduate in civil engineering of the University of Toronto, class of 1951.

**Charles S. Walker,** Jr.E.I.C., has joined the Apparatus Division of Canadian General Electric Company Limited in Toronto after completing a two-year course toward his master's degree in business administration at the Graduate School of Business of Stanford University.

Mr. Walker received his B.A.Sc. degree in electrical engineering from the University of British Columbia in 1951.

**G. J. Maier,** Jr.E.I.C., is with the Hudson Bay Oil and Gas Company in Calgary, Alta.

Mr. Maier graduated in petroleum engineering from the University of Alberta in 1951.

**Jack C. Morris,** Jr.E.I.C., has joined Canadian Copco Limited in Toronto.

He was formerly Ontario sales representative for Sandrik Canadian Limited in Toronto, and with Bailey Meter Company Limited.

Mr. Morris is a 1951 graduate of the University of Toronto.

**J. A. Brenchley,** Jr.E.I.C., is now attending the Graduate School of Business at the University of Western Ontario.

He was previously with the Dominion Engineering Company in Lachine, Que.

Mr. Brenchley graduated from McGill University in mechanical engineering in 1951.

**Georges D. Coates,** Jr.E.I.C., of Vancouver, B.C., is now attending the Harvard University Graduate School of Business Administration.

He is a graduate in civil engineering of the University of British Columbia, class of 1951.

**A. G. Westaway,** Jr.E.I.C., has joined Clayburn Company Limited in Abbotsford, B.C., as assistant plant engineer.

Mr. Westaway is a graduate in mechanical engineering from the University of British Columbia, class of 1951.

**F/O J. L. Bourret, R.C.A.F.,** S.E.I.C., is presently stationed at the R.C.A.F. station in Rockliffe, Ottawa, Ont.

He is a 1952 graduate in civil engineering of Ecole Polytechnique.

**Walter Bloch,** S.E.I.C., previously with W. C. Becker Equipment Company Limited in Toronto, is now on the staff of Chemical Construction (Inter American) Limited in Toronto.

Mr. Block graduated in electrical engineering from the University of Toronto in 1952.

**W. G. Clarke,** S.E.I.C., has joined the staff of Algoma Ore Properties, Helen Mine, Ont.

He was previously contract engineer with International Nickel Co. Ltd. in Creighton, Ont.

Mr. Clarke is a graduate in mining engineering from the University of British Columbia, class of 1952.

**D. G. MacGowan,** S.E.I.C., is now employed with H. G. Acres and Company Limited in Niagara Falls, Ontario.

Mr. MacGowan is a 1952 graduate in mechanical engineering of McGill University.

**George S. Williams,** S.E.I.C., an Athlone Fellow, is now with the Aero Engine Division of Rolls-Royce Limited in Derby, England. In his second year he will study production engineering at the University of Birmingham under Prof. T. U. Matthew.

Mr. Williams is a graduate of McGill University in mechanical engineering, class of 1952.

**Andre Dupre,** S.E.I.C., is an equipment engineer with Northern Electric Company Limited in Montreal, Que. He was formerly with the Company in Hamilton, Ont.

Mr. Dupre is a 1953 mechanical electrical engineering graduate of Ecole Polytechnique.

**James W. K. Moores,** S.E.I.C., has joined Imperial Oil Limited as junior engineer at the refinery in Dartmouth, N.S.

Mr. Moores graduated in mechanical engineering from the Nova Scotia Technical College, class of 1953.

**James Quintard Calkin,** S.E.I.C., has joined A. V. Roe Canada Limited as an engineer in training.

Before graduating from the University of New Brunswick in mechanical engineering in 1953, Mr. Calkin worked during the summers with the Highway Division of the New Brunswick Public Works Department; Shawinigan Engineering Company Limited at La Trench, Quebec; and Canadian National Railways, Atlantic Region, in Moncton, N.B.

James Q. Calkin, S.E.I.C.

**Kenneth G. Clarke,** S.E.I.C., formerly with the Shell Oil Company in Calgary, Alta., is now on the staff of Queen's University as laboratory instructor in electrical engineering.

Mr. Clarke graduated in electrical engineering from Queen's University, class of 1953.

**R. C. Cook,** S.E.I.C., is now employed by Anglo Canadian Pulp and Paper Mills Limited at Forestville, Que.

Mr. Cook is a 1953 graduate in mechanical engineering of Queen's University.

**Victor A. Harvey,** S.E.I.C., is now employed as junior engineer in the design department of the Ontario Hydro-Electric Power Commission in Toronto.

Mr. Harvey is a graduate in civil engineering of the University of Toronto, class of 1953.

**B. L. Burke,** S.E.I.C., is now associated with C. D. Howe Company Limited in Montreal.

He was previously design draughtsman with Eldorado Mining and Refining (1944) Ltd.

**A. W. Dewhurst,** S.E.I.C., is a metallurgical engineer with Aluminum Company of Canada Limited in Montreal.

**F/O Bernard Charbonneau, R.C.A.F.,** S.E.I.C., is air material command headquarters project officer for the flight simulator section in Ottawa.

F/O Charbonneau is a 1953 graduate in mechanical engineering of Ecole Polytechnique.

## Visitors to Headquarters

**Theo. V. Berry,** M.E.I.C., Vancouver, British Columbia, November 25, 1953.

**C. C. Marshall,** M.E.I.C., Toronto, Ontario, November 25, 1953.

**J. N. Franklin,** M.E.I.C., Corner Brook, Newfoundland, December 7, 1953.

**L. J. R. Sanders,** M.E.I.C., Galt, Ontario, December 7, 1953.

**R. O. Darling,** M.E.I.C., Victoria, British Columbia, December 7, 1953.

**S. J. Carew,** M.E.I.C., St. John's, Newfoundland, December 12, 1953.

**C. H. Conroy,** M.E.I.C., St. John's, Newfoundland, December 14, 1953.

**John Reed,** M.E.I.C., Saint John, New Brunswick, December 15, 1953.

**Alex J. Grant,** M.E.I.C., Montreal, Quebec, December 28, 1953.

**James A. Ogilvy,** M.E.I.C., Toronto, Ontario, January 4, 1954.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Alfred Swatton Mansbridge,** M.E.I.C., project engineer with Pacific Mills Limited at Ocean Falls, B.C., died on March 12, 1953.

Mr. Mansbridge was born at Manchester, England, on December 17, 1886. He received his early education there after which he served his apprenticeship for five years in a machine shop in Scotland. Upon his arrival in Vancouver, British Columbia, he served two and a half years as rodman.

In 1909 he joined the staff of the British Columbia Electric Railway as draughtsman and engineer and four years later entered the employ of Pacific Great Eastern Railway as assistant to the chief draughtsman.

Mr. Mansbridge enlisted as a gunner in the Canadian Field Artillery in July, 1915. After service in France, he was discharged in April, 1919, with the rank of lieutenant.

Upon his return to Canada in 1919 he joined the Trussed Concrete Steel Company of Canada Limited as a draughtsman in Walkerville, Ontario, and was transferred to the Vancouver, British Columbia, office in 1923. In 1931 he was for a time structural engineer with the Powell River Company at Stillwater and Powell River, British Columbia, and later was attached to the engineering department of the West Kootenay Light and Power Company at South Slocan, British Columbia, and in 1936, entered the engineering department of the Consolidated Mining and Smelting Company at Tadanac, British Columbia.

In 1945 he joined the engineering department of the pulp division of Bloedel, Stewart and Welch Limited, as designer for their sulphate plant at Port Alberni, British Columbia, and a year later became designing engineer for Pacific Mills Limited in Vancouver, B.C. He returned to Bloedel, Stewart and Welch Limited as chief designing engineer in 1948, and in 1950 became project engineer with Pacific Mills Limited at Ocean Falls.

Mr. Mansbridge joined the Engineering Institute of Canada as a Junior in 1920, transferring to Associate Member in 1922, and to Member in 1940.

---

**Wilfrid Arthur Winfield,** M.E.I.C., former president and chairman of the board of directors of the Maritime Telegraph and Telephone Company Limited in Halifax, Nova Scotia, died in Guelph, Ontario, on December 3, 1953.

Mr. Winfield was born at Derby, England, on February 11, 1880. After completing his high school education, he studied mechanical and electrical engineering through the International Correspondence School.

He entered the telephone industry in 1896 as a night operator with the Nova Scotia Telephone Company. Seven years later he became local manager of the Company at Windsor, and, subsequently, superintendent at New Glasgow. In 1903 he was appointed general manager of the Telephone Company of Prince Edward Island, a position he held until 1917, when he was named superintendent of the Cape Breton Division of the Maritime Telegraph and Telephone Company at Sydney. That same year he was appointed plant general superintendent in Halifax.

He became general manager of the Maritime Telegraph and Telephone Company in 1935, and its managing director in 1941 Three years later he was elected president. He then became chairman of the board of directors, and retired from that position in 1952 .

Mr. Winfield was a governor of King's Collegiate School, and of the University of King's College. He was a member of the board of the Halifax Ladies' College and the Halifax Conservatory of Music. Keenly interested in music, he served as a member of the choir of the Cathedral of All Saints and the Temple Choir and as vice-president of the Halifax Musical Festival.

Mr. Winfield joined the Engineering Institute as a Member in 1920 and was granted Life Membership in January, 1951.

---

**Edward Walter Wall,** M.E.I.C., former vice-president and general manager of The Atlas Construction Company Limited, died in Montreal on October 8, 1953.

Mr. Wall was born at Easthampton, Massachusetts on August 28, 1888. He graduated with a B.Sc. degree in civil engineering from Brown University in 1910.

Previous to joining The Atlas Construction Company Limited in Montreal as construction engineer in 1911, Mr. Wall had been employed in general engineering work with the Town of East Providence, Rhode Island; with Frank T. Westcott in North Attleborough, Massachusetts; and with the New York, New Haven and Hartford Railroad in Providence and Westerley, Rhode Island.

After a year's association with The Atlas Construction Company, Mr. Wall was named construction superintendent in 1913. In this capacity he was in full charge of the laying out and construction of such works in Montreal as the Southam Building, the Grey Nun's Orphanage and Old People's Home, the British Munitions Building and Loew's Theatre. In March, 1914 he was appointed general superintendent of the company. He was responsible for the erecting of numerous structures, including the Thompson-Norris, Capitol Theatre, Dawes Brewery, Dow Brewery and Court House buildings in Montreal, the Dominion Tire Building in Kitchener, Ontario, and the Protestant School in Three Rivers, Quebec.

Mr. Wall was subsequently appointed general manager and vice-president of the company.

He retired from active work in the engineering field in 1932 because of ill health.

He was a member of the American Society of Civil Engineers and the Association of Professional Engineers of Quebec.

Mr. Wall joined the Engineering Institute of Canada as a Member in 1923.

---

**Oliver Gauf Kelly,** M.E.I.C., district airway engineer of Alberta for the Department of Transport, died on November 19, 1953.

Mr. Kelly was born at Namao, Alberta, in 1905. He received his early education at Namao and Edmonton public schools and Portland, Oregon, Private School. In 1926 he attended the University of Alberta for a year and then entered the Oregon State College in 1927, graduating with a B.Sc. degree in mining engineering in 1932.

From 1920 until 1924, Mr. Kelly served as a coal mining labourer. Four years later he was employed with the Britannia Mining and Smelting Company at Britannia Beach, British Columbia, and during the following year as junior engineer with Atlin Ruffner Mines Limited in Atlin, British Columbia. From 1932 until 1936 he was engaged in coal mining in Edmonton, Alberta, and in field and prospecting work in the North West Territories.

From 1937 until 1942, Mr. Kelly was associated as junior engineer with the Palaris Taku Mining Company at Julsequah, British Columbia, and with Hedley Mascot Mines Limited at Hedley. He then became assistant survey engineer for the Alaska Highway under the United States Public Roads administration, and was engineer on location and resident engineer for Contractor Mile 108 Fort Nelson. He was also employed as engineer with Metcalf-Hamilton and the Kansas City Bridge companies on airport construction on the Northwest staging route.

Mr. Kelly joined the Department of Transport, Civil Aviation, Air Services Branch, in 1943 as assistant to the district airway engineer in Alberta. He was subsequently appointed district airway engineer, the position he held at the time of his death.

Mr. Kelly was a holder of the mine surveyor's certificate No. 2 of the Alberta Coal Mines Regulator Act. He was a member of the Association of Professional Engineers of Alberta, and formerly a member of the Edmonton Branch executive of the Engineering Institute of Canada.

Mr. Kelly joined the Engineering Institute as a Member in 1946.

D. E. Hebb, M.E.I.C.

**Donald Eugene Hebb,** M.E.I.C., engineer at Elder Mines Limited, Rouyn, Quebec, died on September 3, 1953, as the result of falling timbers at the bottom of a shaft.

Mr. Hebb was born at Bridgewater, Nova Scotia, on June 13, 1925. After receviing his early education at the Bridgewater schools, he entered Dalhousie University in 1942. Interrupting his university course, he served with the Canadian Army for two years. At the end of the war he returned to Dalhousie and graduated with a B.Sc. degree in 1947. Two years later he received his B.Eng. degree in mining engineering from the Nova Scotia Technical College.

Immediately after graduation, Mr. Hebb joined National Gypsum Canada Limited as plant engineer at Dingwall, Nova Scotia. In 1951 he accepted the position of production and methods engineer in Stadacona Mines Limited at Rouyn, Quebec, and in 1953 was appointed engineer of Elder Mines Limited in Rouyn.

Mr. Hebb was a member of the Association of Professional Engineers of Nova Scotia, and a member of the Canadian Mining and Metallurgical Association.

He joined the Engineering Institute of Canada as a Student in 1947, transferring to Junior in January, 1951 and to Member in December, 1951.

---

**Murray Brettschneider,** S.E.I.C., of the Ontario Department of Highways in Toronto, died on July 31, 1953.

Mr. Brettschneider was born in Montreal on December 23, 1930. He obtained his general education at Strathcona Academy and entered McGill University in 1948, graduating with a B.Eng. degree in civil engineering in 1953.

During the summer months of his university course, Mr. Brettschneider was employed as assistant to the town engineer of Pointe Claire, Quebec.

After graduation from McGill, he joined the Department of Highways of Ontario and was engaged in survey work in Toronto.

Mr. Brettschneider joined the Engineering Institute of Canada as a Student Member in 1952.

# Employment Service

**THIS SERVICE is operated for the benefit of members of The Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.**

**NOTICES appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.**

**REPLIES to advertisements should be addressed to File No. 000, Employment Service, The Engineering Institute of Canada, 2050 Mansfield Street.**

**INTERVIEWS with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged by appointment.**

## Situations Vacant

### CHEMICAL

KEY POSITIONS in a new expanding, research lab. are open to competent scientists. Must have sound theoretical background, and at least five years practical experience in (a) natural and synthetic fibers—paper (b) high polymers—adhesives. Applicant should have M.Sc. or Ph.D. degree in chemical engineering or physical chemistry. Must be qualified to organize, plan and supervise the work of a group of men. In reply please submit personal resume, education and experience which will be held confidential. Remuneration to be negotiated. File No. 4725-V.

CHEMIST OR CHEMICAL engineer with experience in the pulp and paper industry, to supervise control work in a section of the technical department. Applications will be held confidential. File No. 4729-V.

### CIVIL

CIVIL GRADUATES, 1954, required by paving company in Province of Quebec. Applicants should be preferably bilingual. File No. 4726-V.

FULLY EXPERIENCED structural steel checker required in middle west organization. Applicant should have about fifteen years or more experience in structural steel and have previous checking experience. File No. 4727-V.

YOUNG GRADUATE ENGINEER PREFERABLY CIVIL or mining, required by manufacturer of drainage and all kinds of metal products. Applicant should not have more than two years experience and have a definite interest in sales work. Location Ontario. File No. 4733-V.

APPLICATIONS ARE INVITED for the position of a planning engineer. Applicants should have university graduation in civil engineering or architecture or related field preferably including or supplemented by courses in municipal planning. Considerable professional experience in municipal planning desirable, including some supervisory responsibility or an equivalent combination of training and experience. Applicants to state age, marital status, education qualifications and experience history. File No. 4736-V.

ASSISTANT TOWN ENGINEER required in Ontario. Graduate with 2 to 4 years experience and with some construction experience. Municipal experience is preferred but not essential. Work involved is the supervision of surveys and the inspection and control of various municipal engineering projects. Salary open. File No. 4742-V.

CIVIL ENGINEER with good experience in field layout and draughting required by pulp and paper company in the Maritimes. File No. 4743-V.

CIVIL ENGINEER University graduate and registered Professional Engineer required for sales promotion work by large company with Canada-wide interests. Applicants should have at least 5 years' experience in reinforced concrete structural design, should be in the twenty-five to thirty-five age group and should be prepared to do considerable travelling. Please apply giving full details of academic training and professional experience, references and salary requirement. File No. 4749-V.

APPLICATIONS WILL BE received for the position of Township Engineer and road superintendent for the Township of Sandwich West, Ontario; population now 13,000. Applicants must be qualified civil engineers and should be prepared to handle all problems in connection with roads, water works, etc., in a growing municipality. We employ a work supervisor. Applicants should state age, qualifications, past experience, references and salary expected. File No. 4751-V.

### ELECTRICAL

ELECTRICAL ENGINEER, registered professional engineer with five years experience in industrial design in Canada or U.S.A., must be familiar with industrial power distribution, automatic controls, switch gear (high and low voltage), lighting. Must be able to make detailed designs and undertake supervision of draughtsmen. Required by firm of consulting engineers located in West Ontario. File No. 4718-V.

APPLICATIONS ARE INVITED for the position of assistant professor dept. of electrical engineering University of British Columbia, Vancouver, Canada. Candidates should have post-graduate training preferably at the Doctor's level in electronics and servo-mechanisms. Duties include teaching under graduate courses in electrical engineering, post graduate studies in some phase of servo-mechanism or electronics. Starting salary $4.500 to $5,000 per year. Date of appointment July 1, 1954. Further information may be obtained by writing to the head of the department. File No. 4720-V.

GRADUATE ENGINEER preferably electrical with one to four years experience and a desire for sales engineering is required by small nationally recognized electrical manufacturer. Six months to one year orientation at Toronto factory then sales engineering work in Montreal office on salary plus commission basis. File No. 4721-V.

ELECTRICAL ENGINEER for system planning division. Should have at least ten years' experience in the designing and operation of hydro and/or thermal generating plants and transmission systems, with particular qualifications as follows: Application of the method of symmetrical component to the solution of unbalanced conditions on A.C. systems, experience in the use of the A.C. net work analyser on load flow studies, relay problems and stability studies, both transient and steady state. Familiarity with problems associated with the operation of a power system such as fluctuating loads, and methods used to mitigate the effect of some; also some knowledge of the operation problems associated with the inter-connection of two or more systems. Experience also desirable in A.C. system operation with particular regard to the maintenance of voltage levels, reactive and real power flow and speed covering problems. Address all applications giving full details of qualifications and experience and salary required. File No. 4723-V.

REPRESENTATIVE REQUIRED for Quebec and Ontario areas by electrical manufacturer to contact architects, consulting engineers and electrical contractors covering lighting equipment and wiring devices. Reply in handwriting stating qualifications and experience. File No. 4724-V.

ELECTRICAL ENGINEER required to design and develop rectifiers and communication equipment. Applicant should have better than two years experience in this field. Starting salary depends on qualifications. File No. 4728-V.

WANTED JUNIOR ENGINEER as estimator with large electrical manufacturing company. State full details technical and practical training and experience. Location Montreal. File No. 4730-V.

THREE GRADUATE ELECTRICAL engineers interested in design development, technical control on application engineering. The duties include: learning and preparing specifications for internal use of electrical conductors, the study of insulants and dielectric behaviour, the preparation of calculations and line design, assessment of the quality of raw materials, designing cables developing new products, and writing technical brochures and catalogue sections. Locat.on Ontario. File No. 4738-V.

YOUNG GRADUATE ELECTRICAL engineer, bilingual, required by manufacturer of vacuum tubes and fluorescent and incandescent lamps. The plant of this company is located at 60 miles from Montreal. The position offered would involve work in production engineering, quality control, testing. Please state salary expected and full details of qualifications and experience. File No. 4740-V.

### MECHANICAL

GRADUATE MECHANICAL ENGINEER wanted, experience in heater coil manufacture or design required. To assist also in technical sales. Salary commensurate with qualifications and experience. Location Montreal. File No. 4732-V.

SALES ENGINEER REQUIRED by large manufacturer of industrial equipment for sales and service of pulp and paper mills on west coast. Previous mill experience desirable. Excellent opportunity. File No. 4735-V.

GRADUATE MECHANICAL ENGINEER required to take over the preventive maintenance program of a fleet of transport vehicles operating interprovincially in Western Canada. Applicant should be prepared to spend some two to three months in the U.S.A. then put into operation a preventative maintenance program for this organization. File No. 4739-V.

MECHANICAL ENGINEER with at least five years experience for expanding Canadian organization to supervise the design and marketing of a specialized line of construction equipment. This opening will interest you if you have a flair for design and business administration. Salary open. File No. 4750-V.

### MISCELLANEOUS

AN ASSISTANT CHIEF, Water Resources Division, at Ottawa. Salary $7,500 to $8,100. Details and application forms at your nearest Civil Service Commission Office, National Employment Office and Post Office. File No. 4716-V.

YOUNG MECHANICAL (or civil) engineer bilingual, with sales experience in—or good knowledge of diesel engines, road-building and municipal equipment required by important company for its Montreal sales staff. This position provides an ideal opportunity for an engineer seeking a future in the heavy equipment sales field. File No. 4717-V.

APPLICATIONS ARE INVITED for the following positions: 1. Research officer, to engage in theoretical and experimental studies relating to building acoustics. Duties may include supervision of standard acoustical testing, field measurements and laboratory research in acoustics. 2. Research officer, to engage in studies of soil vibrations and their effect on buildings. Duties may include theoretical and experimental studies of wave propagation in soils and design of suitable apparatus for vibration studies in both field and laboratory. General qualifications: University degree in physics or engineering and at least two years of post graduate training or pertinent industrial experience. File No. 4719-V.

GRADUATE ENGINEER with degree preferably, but not necessarily, in mechanical, plastics experience useful, for position of assistant superintendent in a medium sized plant location in Hamilton. File No. 4722-V.

STREET LIGHTING sales engineer required by a long established manufacturing company in the field of scientific illumination. Duties after a specific training program will involve the sale of light directors to municipalities and public utilities chiefly. Diligence, dependability, an agreeable personality, and determination to make a career in this field are of highest importance. File No. 4731-V.

AUTOMOTIVE INDUSTRY IN ONTARIO requires work standards men to be employed on time study and methods work. File No. 4734-V.

LAND SURVEYORS salary $4,680 to $5,400 required by the Department of mines and technical surveys, Ottawa. Details and application forms at nearest Civil Service Commission, and National Employment Office. Apply before February 26, 1954. File No. 4737-V.

POSITIONS BECOMING available at Winnipeg in Air Line for graduate engineers having comprehensive experience in aircraft structures, mechanical, electrical and radio systems. Also senior draughtsmen with experience in aircraft structural or mechanical engineering. File No. 4741-V.

APPLICATIONS ARE INVITED for the position of assistant professor, Department of Civil Engineering, University of British Columbia, Vancouver, Canada. Candidates should have had post-graduate training preferably at the Ph.D. level in fluid mechanics. Duties include teaching fluid mechanics and other courses in the under-graduate school and teaching one post-graduate course in some phase of fluid mechanics. Starting salary from $4,500 to $5,000 depending on experience, with the possibility of augmenting income with summer work on hydraulic models or other hydraulic projects. Date of appointment is July 1, 1954. File No. 4744-V.

POWER PLANT ENGINEER for large industrial concern near Montreal to take charge of high pressure steam plant turbo-generators and refrigeration. Only those having both practical experience and technical knowledge need apply. Young graduate engineer preferred. State age, experience and salary expected. File No. 4745-V.

PLANT LAYOUT AND material handling engineer required by automotive industry in Ontario. Applicants should have either specific experience in these particular fields or with plant or maintenance engineering experience, such as construction, piping, conveyors, etc. File No. 4747-V.

TWO GRADUATE ENGINEERS required for large plant manufacturing various types of explosives, situated in P.Q. Duties required would be in maintenance department as project engineers and some design and alteration projects. Mechanical engineer required with from five to seven years experience. Other position requires chemical and mechanical engineer with two or three years experience. File No. 4748-V.

PLANT LAYOUT ENGINEER—Large U.S. manufacturer with plants located in Latin America requires capable Plant Layout Engineer for work in consulting office located in New York State. Must have experience in metal working industry in plant layout work with sound knowledge of building design and manufacturing methods. Please send complete resume covering education, experience and family, including recent photograph. File No. 4752-V.

MOTOR DESIGN ENGINEER—Large U.S. manufacturer with factory in South America needs experienced induction motor design engineer with sound knowledge of manufacturing methods. Motor sizes to range from small fractional horsepower through 50 HP. Please send complete resume covering education, experience and family, including recent photograph. File No. 4752-V.

*The following advertisements are reprinted from last month's Journal, not having yet been filled.*

### CHEMICAL

CHEMICAL ENGINEER with experience in production, or allied engineering services is required as technical representative of manufacturer of centrifugal separators, heat exchangers, special process equipment and plants. Wide field of inquiry is afforded since such equipment finds application in virtually all types of industry. In reply please outline personal and technical history. File No. 4682-V.

CHEMICAL ENGINEER, recent graduate required by Montreal firm in the chemical construction and lining field. This opening includes designing, estimating and recommending for specific chemical problems, the handling of some technical correspondence as well as field supervision. Replies should include age, marital status, salary expected and if possible, a recent photograph. File No. 4688-V.

### CIVIL

CIVIL ENGINEER preferably college graduate and registered professional engineer with at least fifteen years practical experience in a supervisory capacity, specializing in design of structural steel and reinforced concrete buildings, to supervise group of engineers and draughtsmen in consulting engineer's office in Windsor. Please write giving full details including experience, age, salary requirements, references, etc. Interview will be arranged. File No. 4649-V.

FOUR GRADUATE CIVIL engineers are required by the Department of Public Works of Newfoundland for surveying, planning, estimating and supervising construction of highways and two others to assist in design and to supervise construction of reinforced concrete bridges. Salary range $3,400 to $6,000 per annum depending upon qualifications and experience. Apply by letter giving full information and salary expected. File No. 4685-V.

STEEL MAN experienced in structural detail design and estimating required for engineering and sales work with steel fabricator located in Niagara Peninsula. Apply stating age, experience and salary expected. File No. 4690-V.

CIVIL ENGINEER, age 35 to 40, for a position in the Steel work section of the Engineering Structural Division. Applicants should be either registered professional engineers in the Province of Ontario or capable of being so registered. They should have a wide experience in the design and fabrication of structural steel preferably for power developments and experience in tower design would be an additional qualification. They should be capable of writing reports and handling correspondence, and also capable of handling

# Planning Engineer

**Applications are invited and will be received by the undersigned for the position of a Planning Engineer. Applicants should have university graduation in Civil Engineering or Architecture or related field; preferably including or supplemented by courses in Municipal Planning. Considerable professional experience in Municipal Planning desirable, including some supervisory responsibility or an equivalent combination of training and experience. Applicants to state age, marital status, educational qualifications and experience history.**

**E. A. FOUNTAIN,**
**Personnel Director,**
**Corporation of Burnaby,**
**1930 Kingsway,**
**South Burnaby, B.C.**

**Salary commencing at $4,284.00 increasing to $5,136.00 per annum over a four year period.**

personnel. The salary will be dependent upon qualifications. Location Ontario. File No. 4715-V.

ELECTRICAL

ELECTRICAL SALES ENGINEER wanted in Toronto by manufacturer of low tension signalling equipment. Preferably with experience in contracting or electrical distributing. Salaried position. Car supplied. File No. 4679-V.

NATIONAL SERVICE MANAGER required by manufacturer in Ontario. Applicant should be graduate engineer, with communications option, from a recognized University. He should have administrative ability and experience in radio communications in the frequency modulation field. File No. 4684-V.

TWO PRODUCT managers required by manufacturer of radio communications and electronic equipment. Graduate in engineering with experience in sales and marketing. Applicants will be expected to plan and organize a sales programme. on a country-wide basis. File No. 4684-V.

ELECTRICAL ENGINEER required by large paper company located in the Quebec City area. Graduate with two or three years experience preferred. In reply, please give complete details of experience and personal history. File No. 4686-V.

ELECTRICAL ENGINEER with one or two years experience in distribution planning, which eventually could lead to the position of Superintendent of distribution. The immediate work would consist of making up maps of our distribution system, planning and layout in the field, any new extensions or reconstruction of present facilities, voltage and load studies, substation design and layout, with a gradual breaking-in to supervise of operating and maintenance personnel. Location Ontario. File No. 4695-V.

RECENT ELECTRICAL ENGINEERING graduate required by large Canadian electrical manufacturer for sales and engineering work in Western Canada. Applicant should provide information in respect of educational qualifications and background in sales work, past experience, etc. File No. 4697-V.

ELECTRICAL ENGINEER required by large public utility in Brazil. Recent graduates having test course experience with large electrical manufacturer. Applicants must be single. Excellent pension plan. Apply in writing with complete details of past experience. File No. 4698-V.

JUNIOR ELECTRICAL ENGINEER required by large transportation company in Montreal in the motive power department staff. Duties will entail the designing and draughting of building and yard power supply equipment. File No. 4700-V.

SENIOR ELECTRICAL ENGINEER required in Ontario, preferable with at least 6 years experience in 2.3 K.V. and 4.0 K.V. distribution construction and maintenance. Please state age, education, experience and salary expected. Replies will be held strictly confidential. File No. 4705-V.

SALES ENGINEER required by the Canadian organization of a very prominent United States manufacturer of electric controls for heating, refrigeration, and air conditioning. Some experience with electric controls preferred. Would be located in Toronto area. Good opportunity to grow with a new Canadian company. Salary commensurate with ability. Not absolutely necessary that the applicant be a graduate engineer. File No. 4708-V.

ELECTRICAL ENGINEER required in junior capacity, in utility located in Prairie City. Experience not necessarily required but desire to learn all aspects of civic electrical utility will be decided asset. State salary required and full details of qualifications and experience. File No. 4710-V.

MECHANICAL

CHIEF ENGINEER HOME APPLIANCES. A well known Canadian manufacturer of refrigerators, ranges, washing machines, furnaces and other home appliances requires a chief engineer to head up their engineering department for home appliances. Should have proven ability to run a creative design department including basic development mechanical design, styling, standardization, lab., etc. Canadian engineer with experience in home appliances, design, age 35 to 40 preferred. This is is an excellent opportunity for creative engineering since this company is Canadian owned and wishes to produce Canadian designs for the Canadian market. Location Ontario. File No. 4616-V.

MECHANICAL ENGINEER, bilingual, single man with a desire to travel to conduct a diesel service training sessions in distributor territories throughout Canada. This position is an ideal opportunity for an engineer desiring to advance in the diesel field. File No. 4676-V.

JUNIOR SALES ENGINEER, graduate with sales experience, technical knowledge of diesel engines and their application an asset. There is a definite future to this job with possibilities leading to executive levels. File No. 4676-V.

JUNIOR MECHANICAL ENGINEER to work under the direction of a senior engineer in a research branch to develop, test and modify remote control equipment, instruments and techniques. Recent graduate in mechanical engineering with some training in shop or instrument work. Should be fond of gadgeteering. Salary according to qualifications. State particulars including age, marital status, education and experience in 1st letter. File No. 4693-V.

GRADUATE MECHANICAL engineer, preferably with sales experience to handle complete line of mechanical power transmission and materials handling equipment. Location Montreal. Age 35 to 45. Substantial income possible for qualified person. File No. 4699-V.

SALES ENGINEER, graduate mechanical, required by steel fabricating shop located in Montreal. Applicant should have 4 or 5 years shop experience. Salary open. File No. 4702-V.

MECHANICAL ENGINEER preferably college graduate and registered professional engineer with at least 5 years experience in design of pressure vessels, pressure piping and steam plant design. Also design experience in piping, heating, plumbing and boilers for industrial installations is desired. Please write giving full details, including experience, age, salary requirements, references, etc. Interview will be arranged. File No. 4707-V.

MECHANICAL ENGINEER required to assist mill engineer in large paper company in Province of Quebec. Duties would involve mechanical maintenance, construction and repair work. Starting salary would depend on past experience. A low rental company house available. File No. 4711-V.

MECHANICAL ENGINEER REQUIRED as assistant in the materials handling department of leading paper manufacturer in Eastern Canada. Applicant should have experience and the ability to take over the responsibility of entire department. Good salary to successful applicant. File No. 4712-V.

THREE GRADUATE MECHANICAL ENGINEERS TO ACT as sales engineer for large coal mining company with offices in Montreal and the Maritimes. One should be bilingual to cover Montreal and surrounding area, other to locate in Maritime office. File No. 4713-V.

MISCELLANEOUS

RECENT GRADUATES ('51, '52, '53) required for positions open in design, technical sales, technical service, process development, process supervision. Location Ontario. File No. 4672-V.

A CO-ORDINATOR of basic material practices. $6,420-$7,200. Competition 53-583 and an assistant co-ordinator of basic material practices $5,640-$6,360. Competition 53-584 for the Department of National Defence at Ottawa. Full particulars on posters displayed at your nearest Civil Service Commission office, National Employment Office and Post Office. Application forms obtainable thereat, should be filed immediately with the Civil Service Commission, Ottawa. File No. 4683-V.

THE PAKISTAN INDUSTRIAL Development Corporation invites applications for position of Works Manager for a paper mill to produce 100 tons per day of fine and superfine papers, utilizing bamboo as raw material. Also position of Works Manager for a high grade board mill and Works Manager for a straw board mill, utilizing cereal straws. Qualifications a degree in mechanical or chemical engineering or at least 10 years practical experience of management of a comparable mill and for board mill jobs a degree or at least 5 years practical experience of management of a comparable mill. Salary in accordance with qualifications and experience. File No. 4687-V.

QUALIFIED MINING ENGINEER to take care of development in N. Saskatchewan. Applicant must be prepared to live on site and devote entire time to one project and be capable of handling the entire project. Excellent salary to applicant with ability and good record. File No. 4692-V.

YOUNG GRADUATE ENGINEER urgently needed for new expanding oil company in Quebec and Eastern Ontario, with headquarters in Montreal. Work will include field inspection and contract control of construction of all service stations, bulk plants and larger petroleum handling installations. Position will also involve some travel and responsibility. Applicant should have necessary qualifications for membership in the Corp. of Professional Engineers. Previous experience is an asset but not absolutely essential. Replies should state age, qualifications and salary expected. File No. 4694-V.

ENGINEERING CO-ORDINATOR to supervise sales for organization in Montreal, representing leading American manufacturers in power plant process and industrial equipment field. File No. 4701-V.

EXPERIENCED CONTRACTING engineer to organize contracting department for old established firm specializing in brick floors, tank linings and tile setting. Headquarters in Montreal. Jobs throughout Eastern Canada. File No. 4703-V.

ELECTRICAL OR MECHANICAL project engineer required by electrical manufacturer in Ontario, a young graduate engineer to supervise the development of special prototypes through laboratory to production stage. This is a rapidly growing company and men with initiative should progress favourably. File No. 4709-V.

LONG ESTABLISHED company located in Toronto area has interesting vacancies for sales engineers preferably experienced on pumps and compressors or would consider men with a good knowledge of heavy machinery or power plant equipment. All replies in strictest confidence. File No. 4714-V.

## Situations Wanted

PIPING ENGINEER: nine years piping experience including gas and water. Presently completing $1½ million piping project including supervision of design, purchasing, construction. Canadian, aged 40, married. B.A.Sc., C.E., M.E.I.C., P.Eng. Present contract expires early 1954. Desires position as gas project engineer or superintendent anywhere in Canada. File No. 2466-W.

MECHANICAL ENGINEER, McGill 1944, single, age 34, with industrial eng. background. Wide experience in administration and supervision, production control, maintenance, plant eng., personnel work, wage incentives, time-study, cost study, welding, fabrication. In welding industry, heavy equipment, production, printing. Seeks opportunity to join progressive firm in engineering, production, or sales. Will relocate or travel. File No. 2920-W.

MECHANICAL ENGINEER, age 30, graduate. Experience in design and development, machinery, heat transfer, heating and ventilating, aircraft. Location immaterial. Available immediately. File No. 3012-W.

CIVIL ENGINEER, M.E.I.C., P.Eng., B.Sc. (Alberta) 1949, married, age 34, with administrative experience in handling contracts, contractors and purchasing of construction materials for government work. Experience in hydraulics and hydrologic investigations. Desires change with responsibility and a future. File No. 3223-W.

PHYSICO METALLURGIST, M.E.I.C., P.Eng., specialized in statistical elucidation of production data toward solution of workshop problems in metallurgy, specially in quality and process control in steel making-shaping-heat treating. As a statistical analyst experience second to none in sinchronization of production factors so that optimum conditions for the lowest occurrence of pipe in steel ingot, of segregation in steel can be attained, and maintained for a predictable length of time. Also in sinchronization of factors toward highest capacity of Bl.Fce. at lowest coke rate. File No. 3521-W.

GRADUATE ENGINEER, B.Sc., St. Francis Xavier University 1947, B.E. in Mechanical Engineering N.S.T.C., 1949, Jr.E.I.C. Age 29, married, one child. Two years as engineer in charge of machine and maintenance workshops for a research establishment. Two years as tool engineer and technical assistant to superintendent of a manufacturing division of a machinery manufacturing plant. Desires position with opportunities for advancement, where experience would be valuable. File No. 3547-W.

ADMINISTRATIVE EXECUTIVE post desired by civil engineer, B.Sc., M.E.I.C., with ten years of varied consulting and construction experience. Experienced in design of steel, reinforced concrete, earthworks, the preparation of contract documents, specifications, and estimates; also in the site supervision of construction of an industrial plant, hydro - electric installations, bridges, roads, and railways. File No. 3796-W.

CIVIL ENGINEER, B.Sc., University of Manitoba, 1939, M.E.I.C., P.Eng., age 36, married, 3 children, veteran R.C.A.F. 10 years experience in all phases of construction and management, mechanical superintendent. At present managing construction company. Desires position with progressive company offering responsibility and sound future. File No. 3831-W.

MANAGEMENT ENGINEER, specialized in industrial engineering and management techniques, married, bilingual, wants to find suitable position. Has had wide experience in various phases of industrial engineering as investigator, organizer, production planning supervisor, management consultant, etc., in companies of all sizes and in various fields, such as: automobile industry, foundries, electric cable and wire, machine shop, rubber, sheet metal, mining, etc. Expert in improving efficiency, methods and productivity, increasing output, cutting down of costs, materials handling, plant reorganization, survey analysis. File No. 3981-W.

CIVIL ENGINEER (European) graduate from McGill and Master's degree from Toronto (52) wishes to work on design and construction of buildings. Possessor of professional engineers certificate and experience on highway construction, surveys, soil borings and soil testing. Age 26, single, available in two weeks notice. File No. 3988-W.

CIVIL ENGINEER, N.S.T.C. 1952, age 28, married. Have had some highway construction experience. Presently employed in job requiring very little engineering training. Would like to obtain experience along any line of engineering. Present location Nova Scotia. File No. 4070-W.

SENIOR MECHANICAL ENGINEER (34), M.E.I.C., A.M.I., MechE., seeks responsible post in Toronto or district. 10 years experience in design and construction of medium and heavy machinery, rolling mills, chemical plant, hydraulic equipment. 3 years experience research and development in noise and vibration science. Also administrative experience, personnel and purchasing. Good knowledge French and Italian. File No. 4091-W.

GRADUATE CIVIL ENGINEER with B.A. (honours in mathematics) B.Sc. (civil eng.) degrees and post graduate work for Master's degree at McGill university seeks diversified work in connection with dam design and construction and other hydro works. Past experience for 1½ years includes work on dam design, dewatering of foundations and mass concrete for a big power house and bridge erection work. Presently working as a field engineer supervising earthern dyke construction. Location of job site and salary no consideration if job offers interesting technical experience in design office or in the field. Married, one child. Age 25. Highest references and outstanding academic record. File No. 4108-W.

CIVIL AND INDUSTRIAL ENGINEER, B.Eng., M.E.I.C., age 29, married, small family. Experienced in planning of major expansions and plant improvements for pulp and paper industry, including reports, costs, and design (civil and some mechanical). During 5 years in pulp and paper, reaching supervisory capacity, have obtained broad field and office experience in structural design, plant engineering, materials handling. Spent 1 year on design of power plants with hydro-electric consultants. Seek responsible position with industrial organization anywhere in Canada. File No. 4171-W.

MECHANICAL - CHEMICAL ENGINEER, (M.Eng. Dresden Karlruhe) M.E.I.C., P.Eng. Former lecturer at McGill. 15 years experience as plant engineer and assistant manager in heavy industrial and chemical plants. Process and design for chemical plants. Bilingual. Single. Location anywhere. File No. 4183-W.

MECHANICAL ENGINEER, graduated, married, over 20 years experience in piping, heating, plumbing, ventilating, air conditioning, refrigeration, waterwork and sewer installations, experience in process industries, steam-power plant, boilers, pumps, valves and layouts related to steel and reinforced concrete structures, desires adequate position with possibilities for advancement. Experience includes, design, construction, maintenance, planning. Qualification for administration, organizing, sales, has been used too. Location with preference for Montreal. Available 1st December. File No. 4211-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng., B.Sc. (Queen's 1948), veteran age 32, married, 1 child, over five years experience on layouts, steel and concrete design in a chemical plant. Ability to supervise projects and some knowledge of estimating and costs. Desires a responsible position where above experience would be an asset. Available on one month's notice. Preferable location southern Ontario. File No. 4238-W.

MECHANICAL ENGINEER, Jr.E.I.C., B.E. (mechanical) Nova Scotia technical College 1949. Several years experience in machine shop practice, some experience in the design and installation of mechanical drying systems, three summers experience on survey parties, desires an engineering position, not necessarily in the mechanical field, in or in the vicinity of St. John's, Newfoundland. File No. 4255-W.

GRADUATE MECHANICAL ENGINEER, married, with family, requires employment. Diversified industrial experience. Purchasing, maintenance and machinery shop practice. Sound business training. Experience includes heating, sheet metal industries and general machinery equipment. Bilingual. Has good personality, enthusiastic, keen business acumen. Desires employment on production, sales or engineering administration. Location Montreal area. Available immediately. File No. 4300-W.

MECHANICAL ENGINEER, Jr.E.I.C., B.Eng., McGill 1950, age 29, married. Completed Canadian General Electric test course after graduation and am presently employed as mill superintendent of a small textile mill. Would consider a position with a textile company. Would also consider production or service engineering in other fields. File No. 4309-W.

YOUNG MAN, ENGINEERING PHYSICIST, S.E.I.C., B.C.S., Georgia, 1950 (psychology with chemistry), B.Eng., North Carolina, 1953 (physics with mathematics), English and French languages. Two years general practical electromis, three years university teaching experience. Canadian Army veteran. Desires permanent position with opportunity of furthering interests in research organization. Location anywhere in Canada. File No. 4321-W.

CIVIL ENGINEER, O.L.S., Jr.E.I.C., P.Eng. (Queens 1951), desires to extend his experience in the municipal engineering field. Has worked since graduation with a consulting civil engineering and Ontario land surveying firm. Experience includes consulting for local improvements (field work, design and report writing), farm drainage, small concrete bridge design, filtration plant design, and all types of land surveys. Married. 1 child, has a car. Available on approximately 1 month's notice. File No. 4342-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng., power option, McGill 1950. Age 32, bilingual, single. Post graduate experience includes two year industrial training course and engineering sales work with large electrical manufacturing company. Also possesses B.Sc. in physics and background of diversified experience. Presently following evening courses in business administration. Desires position with responsibility. File No. 4343-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng., 31, married and presently employed by a consulting engineering firm. Experience consists of over 4 years in reinforced concrete design, structural design, and some field work. Desires a position with complete supervision of design and/or field work with a real opportunity for advancement. Locality is no barrier. File No. 4347-W.

CIVIL ENGINEER, P.Eng. (Ontario), D.L.C. Hons (civil engineering), S.E.I.C., age 22, single. Seeking a position entailing responsibility with a consulting or contracting firm dealing with hydro-electric power developments, oil fields or construction. Interests: economic studies design, construction, sales and research. Fully familiar with office procedure. Past experience with highway and general construction in England. Party chief on location surveys with department of highways of Ontario, and at present with consulting engineers on a hydro-electric power project. Prefer position offering advancement to an ambitious engineer. Excellent references. File No. 4348-W.

ELECTRICAL ENGINEER, U. of Alberta 1951. Have 4 years communications and commercial radio experience prior to graduation; 2 years in heavy electrical manufacturing since. Graduate, Westinghouse Graduate Student Course. Have supervised assistants varying in number from one to three. At present manufacturing engineer in an industrial engineering department. Desire work of professional calibre in Edmonton district. Hard work and responsibilities taken for granted. Can speak and write well. Salary desired: $5,000 or equivalent. File No. 4349-W.

ENGINEERING EXECUTIVE, B.Sc. (Zurich, Switzerland), M.E.I.C., 35 years old, presently employed, having 12 years diversified industrial experience in Switzerland, Great Britain, United States and Canada which includes design of machinery, research work, development of domestic appliances, works management and general management including control of sales. Particularly interested in a position of chief engineer or works manager in machine, metal or appliance industry. Hard worker, energetic, accustomed to assuming responsibility. Location preferably Toronto area. File No. 4355-W.

QUALIFIED MANAGER, M.E.I.C., A.M.I. Mech.E., A.M.I.P.E., 16 years experience in U.K. Full apprenticeship tooling and production. Planning and control, plant and design. Sales and service. Bilingual. Managerial appointment sought in Montreal area. Minimum salary required $7000 p.a. File No. 4356-W.

CIVIL ENGINEER, Jr.E.I.C., B.Sc. U. of A. 1951, married age 29, experience in municipal engineering, also highway construction and some reinforced concrete. Would like permanent position in municipal engineering anywhere in Western Canada. File No. 4357-W.

CIVIL ENGINEER McGill 1953, S.E.I.C., considerable construction experience seeks position in the construction field. Presently employed in non-construction work. Single, willing to work anywhere. File No. 4358-W.

CHEMICAL ENGINEER, 1945 graduate, M.E.I.C., P.Eng. (Ont.) with several years work in anodizing, lacquering, plating, plastic and metal-spraying, phosphatizing, electropolishing. Particular consideration of corrosion problems in the chemical, beverage, textile industry. Has practical experience in managing, as well as laboratory work in the field of analizing and material testing. Did extensive research on chemical durability of lacquers and on adhesion of metals and paints on aluminum and steel. Desires a position in a plant or in a developing and research laboratory. File No. 4359-W.

CIVIL ENGINEER, M.E.I.C., with two years experience in Canadian structural design and detailing for industrial plants. 15 years broad and varied European experience as designer in structural, reinforced concrete and steel. Field and project engineer on foundations, bridges, harbour work, power and industrial plants, residential buildings, also cost estimating. Desire position where any past experience could be best utilized with contracting, consulting or operating company, preferably in Quebec, Ontario or Alberta. File No. 4360-W.

CIVIL ENGINEER, graduate 1950, Jr. E.I.C., married with one child, age 29. 3½ years of experience with a structural steel fabricating firm estimating material and labor for structural steel and miscellaneous iron for buildings and also platework. Desires work with a firm with a future and opportunity for advancement. Available on one month's notice to present employer. File No. 4361-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.Eng. (Ont.), B.Sc. (Eng.) Man. 1949, age 25, single. Experience in steel fabricating design, welding and estimating. Complete familiarity with ASME and APJ codes. Desires responsible position preferably with petroleum industry in Winnipeg or immediate vicinity. Presently employed in Ontario. File No. 4362-W.

ENGINEER DESIRES design, development, or research work requiring limited travel. Experience with Dominion Government 4½ years on flood control, drainage, report writing; plus field experience, design and construction of small dams and sprinkler irrigation systems. B.S. degree in Agricultural engineering, 1949, University of Saskatchewan. Age 25. Married. File No. 4363-W.

CIVIL ENGINEER, S.E.I.C., P.Eng. Que., B.A.Sc., Toronto, age 28, married, presently employed. Seeks advancement, preferably in Southern Ontario. Have had limited experience in municipal surveys and planning, sewer design, construction and production. Also experienced in general plant engineering, structural steel and reinforced concrete design. Available on 30 days notice File No. 4364-W.

CHEMICAL ENGINEER, M.E.I.C., M. of Sc., 1946, Denmark. Age 30. Canadian wife. Have worked in Canada since January 1952, presently employed. Experience in petroleum products, and in vegetable oils for paint and varnish. Desires position with opportunities in product development or research. File No. 4365-W.

PRODUCTION ENGINEER, M.E.I.C., age 35, 1938 graduate, with successful record in plant management field. Extensive experience at responsible level in labour negotiations and all details connected with the operation of an independent production unit employing over 350 men, with special emphasis on the development of new production methods and machines to maintain maximum plant effort. Interested in position where creative ability and imagination coupled with a sound engineering background are required. File No. 4366-W.

ELECTRICAL ENGINEER, B.Sc. (Hons.). 1941, St. Andrews University, Scotland, A.M.I.E.E., P.Eng., married. R.N. veteran. 3 years major oil company supervision maintenance and installation, 1½ years Canadian municipal utility in charge all electrical aspects. 2 years major electrical manufacturer in Ontario as applications engineer. Linguist, versatile, teaching experience, sound background electronics and instrumentation, experienced in all aspects distribution, system studies, etc. Seeks job with greater responsibility, location secondary, available reasonable notice. File No. 4371-W.

MECHANICAL ENGINEER, 1950 graduate Polish University College, London, age 31, married, two years experience in diesel engine design and development, one year in water-tube boilers, and one year in industrial furnaces design. Also two years general machine shop experience prior to university studies. Seeks employment in Toronto in any engineering field, which offer a good opportunity for advancement. File No. 4372-W.

CIVIL ENGINEER, Man. 1948, Jr.E.I.C., age 29, married, 2 children, veteran. One year surveying. For past 5½ years worked on large diversification of milling and refining equipment and buildings for mining and smelting company whose plant has undergone expansion. Experience in layout, design and detail of refining plants, small mines, shops, warehouses, townsite and other works required for isolated location; estimating and preparing specifications. Could supervise drafting office but would prefer position offering responsibility and advancement to intelligent and personable engineer. Will accept position anywhere in Canada. File No. 4373-W.

YOUNG ENGINEERING EXECUTIVE, Mechanical engineering graduate, M.E.I.C., P.E. of Alberta, age 33. Engineering experience, tool designing, design of pressure vessels, plate weldments, processing vessels and equipment. General experience; shop and field inspection, purchasing and sales. Executive experience, director and general manager of small steel fabrication plant (70 employees), located in Western Canada. Desires position requiring initiative, organizing, and supervisory ability. Anything offering future advancement in responsble position. File No. 4374-W.

ELECTRICAL ENGINEER, Jr.E.I.C., 28 years old, married, B.A.Sc. (E.E.) 1951-U.B.C., 2½ years practical machine shop experience, 2 years radio and radar R.C.N.V.R., 8 months preparing specifications for telephone power equipment, 2 years steel mill experience—design and layout of conduit and cable for strip mill equipment including the devising of electrical control and interlock circuits—design of power distribution system including main substation and low voltage distribution transformer vaults. Complete resume on request. Location no object. File No. 4377-W.

CHEMICAL ENGINEER, Jr.E.I.C., war veteran, 34, married. Experience includes two years supervision in a large chemical plant in Quebec. Desires employment on production or sales. Location preferred Southern Ontario. File No. 4383-W.

CHEMICAL ENGINEER, B.A.Sc., P.Eng. Graduated in 1950 from University of Toronto. Age 25, married with one child. Have excellent experience in time and motion study, methods study, cost control, and all phases of production. Presently employed as assistant plant superintendent in a small manufacturing concern in Ontario. Desires permanent responsible position with good prospects for the future. Location anywhere in Canada. Available on reasonable notice to present employer. File No. 4384-W.

CHEMICAL ENGINEER, Jr.E.I.C., B.A.Sc., 1952, war veteran, 31, single; experience in production and instrumentation. Desires new position in engineering, development or instrumentation. Location: Ontario, Quebec. File No. 4385-W.

MECHANICAL ENGINEER, Jr.E.I.C., B.A.Sc., 1948, 6 years pulp and paper and heavy industrial equipment experience before graduation as project designer and 2 years after graduation. For several years engaged in the combustion engine field mainly diesel equipment. Desires position in either field with more responsibility. File No. 4386-W.

CIVIL ENGINEER, M.Sc., Technical University Danzig 1935, D.Sc. Technical University Munich 1947, M.E.I.C., age 40, bilingual. 17 years experience in Europe and Near East in architectural and structural design of residential, industrial, hospital buildings and in town-planning. One year Canadian experience in Toronto in residential, industrial, and theatre design. Seeks responsible position with firm of engineers or architects. File No. 4387-W.

MECHANICAL ENGINEER, D.I.C., G.I. M.E., 27, single, bilingual, three years experience in design office and manufacturing of fabricated steel and structural steel, 1½ years research experience, sound knowledge of shop procedure, electric and electronic bias, seeks permanent position in Montreal area but willing to travel. Presently employed below technical ability. Loyal, responsible and willing to start at junior level if opportunity for advancement is provided after ability has been shown. File No. 4388-W.

MECHANICAL ENGINEER and Chemist, B.A.Sc.—1952; B.Sc. (Chemistry and Physics) 1946 M.C.I.C.; Junior A.S.M.E age 28. Married, with two years experience in all phases of instrumentation in pulp and paper industry, also one and one half years work as junior chemist in the petroleum industry. Desires job with definite opportunity for advancement. Presently employed, but available on reasonable notice. File No. 4390-W.

CHEMICAL ENGINEER, P.Eng., B.A.Sc (Toronto '50), Jr.E.I.C., M.C.I.C., 32, married, 1 child, veteran 3½ years R.C.N., four years general office work, four years development control and supervisory experience in chemical process industry. Working knowledge of French, some German. Desire more responsible position in technical service, development or similar work, Canadian or foreign. All replies acknowledged. Resume on request. File No. 4391-W.

ELECTRICAL ENGINEER, Canadian, M.E. I.C., B.Sc. (Alta., 1944), M.S. (Carnegie Institute of Technology, 1952), expecting Ph.D. Carnegie Tech. 1954. Married, 1 child. 4½ years with large Canadian electrical manufacturer including test course and design experience. 3 years in electrical sales. Desires teaching position in power field, or research and development in servomechanism and control field. Doctoral thesis being written on fundamental study of magnetic amplifiers. File No. 4392-W.

JR. E.I.C., Graduate Polytechnique 1950, fully bilingual. Has been working for 2 years as estimator and construction engineer. Had 1 year experience in construction works in Europe. Position wanted in Montreal or surroundings, but would consider going anywhere in Canada. File No. 4398-W.

EXECUTIVE ENGINEER, M.E., M.E.I.C., P.Eng. (Ont.), twenty-three years varied design-manufacturing and management experience of which eleven years chief engineer with equipment manufacturing concern. Since 1946 practising privately and activities consisted mainly of larger engineering assignments including project development and execution, also extensive consulting with steel, pulp and paper industries as well as equipment manufacturers. Interested in an association with a really progressive organization offering appropriate opportunities preferably in connection with larger scale Canadian and/or foreign developments, or other responsible activities requiring engineering background, leadership qualities, a realistic approach to problem and analysis, diplomacy, practical imagination and acknowledged design talent. Present income considerably above average but would consider reasonable compromise if proposition otherwise attractive. File No. 4399-W.

# News of the Branches

**Activities of the Forty-six Branches of the Institute and abstracts of papers presented at their meetings**

## Belleville

C. H. Lusk, Jr.E.I.C.,
*Secretary-Treasurer*

**Steel Manufacturing Is Meeting Topic**

The Belleville Branch held its regular meeting at the Masonic Temple in Belleville on November 9, with 35 members present.

C. R. Whittemore, chairman of the Branch, presided. Mr. Whittemore noted that unfortunately the speaker for the evening, C. A. Robinson of the Steel Company of Canada Ltd., was unable to be present due to a death in his family. The chairman then outlined the proposed agenda for future meetings of the Branch.

The members were advised that the president, R. L. Dobbin, would visit the Peterborough Branch on November 27. The chairman hoped that as many as possible from Belleville would attend this meeting.

Mr. Whittemore advised that he had received a letter from G. E. Currie, principal of the Belleville Collegiate thanking the Branch for its $25.00 prize presented to the Grade XIII student, planning to take engineering, who had the highest standing in English, Algebra, Trigonometry, Geometry, Physics and Chemistry. This prize was won by William M. Campbell and was presented by C. R. Whittemore at the commencement exercises.

E. G. Gurnett made a few remarks regarding the forthcoming campaign of the Belleville General Hospital to raise funds for the construction of a new wing. He pointed out the responsibility of engineers as professional men in this request for funds.

A film entitled "Steel for Canadians" was shown. This film, produced by the Steel Company of Canada Ltd. and narrated by John Fisher, depicted the processing of steel from the ore to the ingot and steel bars. In view of the fact that C. A. Robinson of the Steel Co. of Canada could not be present, the chairman, C. R. Whittemore, elaborated on the steel manufacturing process and ably described the various procedures which were followed in securing a high grade steel.

Refreshments were served at the conclusion of the meeting.

## Calgary

Wm. E. Hawkins, M.E.I.C.,
*Secretary-Treasurer*
R. F. Bailey, M.E.I.C.,
*Branch News Editor*

**Dr. Hugh Beach Is October Speaker**

The speaker of the evening at the October meeting of the Calgary Branch was Dr. Hugh Beach of the Texaco Exploration Company who was introduced by W. C. Gussow.

Dr. Beach's paper, "The Heritage of Western Canadian Exploration", dealt with the past 200 years of exploration in Western Canada from the time that the first white man entered the Calgary-Edmonton region in 1754.

Dr. Beach, who has made an intensive study of early Western Canadian history, traced the development of geologic exploration from the time of Alexander McKenzie and David Thompson to the present. He said that the exploration of Western Canada was among one of the most orderly developments in the world. Dr. Beach illustrated his talk by many interesting slides of early days.

H. H. Hunter expressed the appreciation of the meeting to the speaker.

**Television Demonstration, November 5**

The speaker of the evening on November 5 was W. K. Allan who was introduced by W. E. Hawkins, secretary-treasurer of the Calgary Branch.

Mr. Allan gave a paper on "Television" which was demonstrated by a unique working model of a television receiver. He traced a picture signal from its origin in the camera tube through the transmitter, into the receiver and thence to the picture tube. He discussed such items as antennas for television reception and tuned circuits with the aid of interesting water analogy diagrams. With the aid of considerable wit and humour Mr. Allan made an unusually technical subject one which was very enjoyable.

Mr. Allan made several predictions for the future. He anticipated the general use of colour television by next year. He also believed that developments in transistors would revolutionize the radio-frequency field. Since the thought processes of the human brain are now being explained, as electromagnetic waves of incredibly high frequencies, Mr. Allan predicted the day when "tuning in" on human thoughts and ideas would be a reality.

After a question period, the speaker was thanked by W. C. Gussow, program chairman of the Calgary Section.

**R. A. H. Hayes Is Calgary Branch Speaker**

The speaker of the evening on November 19 was R. A. H. Hayes, chief electrical engineer for H. G. Acres and Company Limited, Niagara Falls, who was introduced by W. C. Gussow, program chairman of the Calgary Branch.

Mr. Hayes gave a paper entitled "Influence of Future Power Requirements on the Science of Transmission". He stated that on the basis of increase in power requirements between 1920 and 1954, by 1975 Canada would have a deficit of some 13 million kw. This assumes full development of the remaining power sites located mainly in British Columbia, Manitoba and Northern Quebec, all of which lie between 150 and 300 miles north of the present population concentration boundary of Canada. This deficit Mr. Hayes said, could be made up by steam and other thermal generation. Since thermal efficiencies in modern plants are now reaching the 40 per cent figure, the speaker felt that at least 30 per cent of the total generating capacity in Canada could be justified by thermal generation.

Because of the location of the remaining power sites and also since the power requirements of Canadians lie in an east-west direction, the problem of transmission is a major one. Mr. Hayes envisioned the day when all power companies in Canada would be interconnected in a pool. Because of the distances involved, the problem of stability becomes great in an a-c. system and this would lean toward the use of high-voltage d-c. transmission. The problems of such transmission have now been solved and a d-c. bus across the entire length of Canada would be possible.

Mr. Hayes concluded that the problem of increasing the present capacity three times in the next twenty years must be met by well thought-out stable transmission systems supplemented by strategically placed thermal plants.

After an active question period, Mr. Hayes was thanked by J. McMillan.

## Cornwall

L. Snelgrove, M.E.I.C.,
*Secretary-Treasurer*
John E. Pescod, Jr.E.I.C.,
*Branch News Editor*

**Film Showing, November 9**

The November general meeting of the Cornwall Branch was held on the evening of November 9 in the assembly room of Courtauld's (Canada) Limited.

Mr. Aitken of the Combustion Engineering Company presented two films. The first film, "Steam Progress", outlined the development of commercial steam boilers from the early low output, low pressure boilers of the late 19th century, to the modern, efficient, high pressure, high output ones of the present day.

The second film, "Walls Without Welds", showed the stages of manufacture of seamless steel pipe of various diameters up to 26 inches. This type of pipe is used extensively in the chemical, steam generation and oil refining industries.

Mr. Aitken was introduced by G. B. Stidwill and thanked by D. Ross-Ross.

280 feet from stem to stern, the 2500-ton "Hydro-Quebec" is shown in a rore idle moment. Over o period of several yeors of dredging, the 26-ton cutter will chew out an estimated 50 million tons from the 3,300 feet wide and 15 mile long canal, deepening the whole conol to 35 feet. Submarine cable supplies 13,800 volts for the vessel's electrical equipment.

# How the world's largest dredge

G-E three-unit mg set provides current for the adjust-oble-voltage cutter drive. This unit is mode up of o 1200-hp 900-rpm synchronous motor, on 800-kw 600-volt generator and o 20-kw 125-volt d-c exciter.

The dredge's switchgear—15-kv vertical-lift drowout metal-clad type—is built for ol weather duty. It consists of a 1200-hp synchronous motor starter, an 8000-hp motc starter, a 600-kw tronsformer feeder, a 600-hp synchronous motor storter, a com bination bus entrance and auxilliary comportment, and a set of metal-clod accessorie

Dredging unblasted clay and three-quarter ton boulders from the Beauharnois Canal, the "Hydro-Quebec" is equipped to take a lot of punishment. The precision-engineered C-G-E equipment that powers and controls its operation is built to stand the strain of operating twenty-four hours a day. C.G.E.'s 61 years of experience in the manufacture and use of electrical equipment is available for your applications—large or small—through a nation-wide system of sales and engineering offices.

Critchley, the president, John Critchley, Mrs. Bourque, Gaston Massé. Standing, Colonel Gaetan J. Côté, Mrs. Massé, George Dick, Mrs. Antonin Deslauriers, Mrs. George Dick, Colonel H. G. Thompson, Mrs. Côté, Antonin Deslauriers.**

J. Morris, vice-chairman of the Branch and acting chairman for the evening, announced that the next meeting would be a combined presidential visit and annual meeting, to be held on December 19.

## Eastern Townships

W. J. Sutherland, Jr.E.I.C., *Secretary-Treasurer*

Jacques Brisson, Jr.E.I.C., *Branch News Editor*

***President Dobbin Visits Sherbrooke***

President Ross L. Dobbin was the guest speaker at the annual Ladies' Night of the Eastern Townships Branch held at the New Sherbrooke Hotel on December 7.

The major part of the president's address was devoted to the description of some engineering aspects of the Coronation ceremony at which President Dobbin represented the Institute last May. He also gave enlightening information on the industrial development and the labour conditions in the United Kingdom.

Colonel Thompson, assistant general secretary, who was also present, outlined briefly the development of the Institute across Canada. He also spoke about the tremendous task undertaken by the Headquarters staff in the publication of the new directory.

The guests were introduced by Gaston Massé, vice-chairman of the Branch and they were thanked by George Dick, immediate past-chairman.

Hon. John S. Bourque, Quebec Minister of Lands and Forests and Natural Resources, presented Provincial greetings. He declared himself against the bill presented in Quebec by the Corporation of Architects whereby engineers would not be allowed to prepare plans for engineering structures such as power dams and power houses.

Antonin Deslauriers, Sherbrooke city clerk, representing His Worship Mayor Emile Levesque, greeted and welcomed guests and members in the Queen City of the Eastern Townships.

The banquet was presided over by John Critchley, chairman of the Branch.

**Manning K. Ells addressed the Halifax Branch on October 22. Left to right, R. M. Barteaux, Dr. F. H. Sexton, A. R. Harrington, Manning K. Ells, guest speaker, G. F. Bennett, chairman.**

## Halifax

W. A. Logan, M.E.I.C., *Secretary-Treasurer*

W. A. Devereaux, M.E.I.C., *Branch News Editor*

***M. K. Ells at Wolfville Meeting***

On October 22, 1953, the monthly meeting of the Branch was held at Wolfville, Nova Scotia in the Annapolis Valley. This was one of the first meetings to be held out of town so that out-of-town members of the Branch might have a better opportunity to attend. More such meetings have been planned for the future. Approximately 40 students in pre-engineering at Acadia University, Wolfville were at the meeting. G. F. Bennett, chairman of the Branch, welcomed the students and expressed a hope that they would have an opportunity of attending more meetings in the future.

The guest speaker for the occasion was Manning K. Ells, President of Cyrus & Manning Ells Limited, one of the largest commercial producers of poultry and eggs. The guest speaker was introduced by W. Ralph Lewis of Kentville who is a member of the Branch executive.

Mr. Ells pointed out that in the past 15 years the poultry branch of farming in the Valley had increased considerably and is now playing a very important part in its economy. Prior to this period, practically all poultry and eggs for Nova Scotia were imported from Western Canada. It is only recently that egg production passed the total of six thousand (6,000) cases per week which the people of Nova Scotia now consume; he predicted that consumption this year would rise to seven thousand five hundred (7,500) cases per week. At present eggs are being exported to Newfoundland, Bermuda, and other countries.

The speaker gave some interesting statistics on this type of business. Ten years ago 9 lb. of feed were required to produce a dozen eggs whereas today less than 4.5 lb. is required. A poultryman may have an investment of $7.00 per bird. It costs from 75 cents to $1.00 per month to feed and keep a laying bird. Mr. Ells' organization has one of the largest individual hatcheries in Canada consisting of five units, each with a capacity of 66,000 eggs.

There has been a 29 per cent increase in the use of eggs since 1939. In 1951 Canadians consumed eighty-two thousand (82,000) cases a week and in 1953 this number increased to ninety-two thousand (92,000) cases per week.

Although the talk was not exactly on an engineering subject, it was most interesting to all who attended.

The members at the meeting were pleased to hear a few words from Dr. F. H. Sexton, president emeritus of Nova Scotia Technical College, who is now living in Wolfville.

***President Dobbin Visits Branch***

On November 12, the Branch was honoured by a visit from President Ross L. Dobbin. A dinner meeting was held at the Nova Scotian Hotel in Halifax and many members of the Branch were on hand to greet the president and Dr. L. Austin Wright, general secretary. President Dobbin gave a very interesting and humorous talk on his trip to England as a guest at the Coronation. Dr. Wright outlined some of the current business matters with which the Institute is now dealing.

## Huronia

L. Morgante, jr.e.i.c.,
*Secretary-Treasurer*

***Engineers Make Tour of Plant***

The second meeting of the Huronia Branch, with headquarters in Orillia, was held at the plant of E. Long Limited.

Two very interesting films were shown. One of these was obtained on loan from the Consolidated Mining and Smelting Company of Canada, and was entitled "No Man is an Island". This excellent film in technicolor showed the various operations of the Consolidated Mining and Smelting Company in British Columbia.

The second film was submitted by E. Long Limited and illustrated the production and engineering features of Meehanite metal. E. Long Limited has the first Meehanite foundry in Canada. The metal produced is a special close-grained iron which combines some of the properties of steel with some of the properties of cast iron. Following the film, a very interesting discussion period took place and Bert Lamble, foundry metallurgist of E. Long Limited, gave a short address on Meehanite, and answered questions.

There were some 30 engineers at the meeting and there were a considerable number of out-of-town guests from Owen Sound, Barrie, Midland, Collingwood, Toronto and one from Detroit, Michigan.

***Seek New Members***

The Huronia Branch embraces a considerable district including Barrie, Stayner, Collingwood, Beaverton, Owen Sound, Midland, Orillia, Gravenhurst, Bracebridge, Huntsville, Parry Sound and Nobel. A drive is on for new members for the year 1954, and it is anticipated that the Branch will be a very successful one.

Following the meeting, the guests were escorted through the plant of E. Long Limited where they observed equipment under construction, such as vacuum filters, mine skips and cages, overhead cranes, etc.

This was the second meeting since inauguration. The meeting a month ago was held in Barrie, where the Huronia Branch were the guests of J. A. Muchison, general manager of the Canadian General Electric Company Limited.

## Hamilton

J. A. Reid, jr.e.i.c.,
*Secretary-Treasurer*

F. S. Gue, jr.e.i.c.,
*Branch News Editor*

***J. L. Gray Describes NRX Reactor Repair***

On October 22 the Hamilton Branch was privileged to hear an address by J. L. Gray, general manager, Atomic Energy of Canada, dealing mainly with the repair and rebuilding of the NRX reactor at Chalk River.

Mr. Gray's talk dealt with many of

PUGWASH

HALIFAX

Launching one of the concrete cribs built for the Seaward project at Halifax.
Owner: Department of National Defence.
*General Contractors:* Foundation Company of Canada Limited.

At Pugwash, N.S., a total of 27 concrete cribs, requiring 32,000 barrels of cement, was used in wharf expansion.
Owner: Department of Transport.
*General Contractors:* Angus Robertson Limited, Montreal.

# NEW WHARVES FOR THE MARITIMES..

# CONCRETE

***REPLACES LESS PERMANENT MATERIAL AT HALIFAX AND PUGWASH, N.S.***

IN BOTH of these dock jobs, concrete was used to replace less dependable material. For in wharfage work, as in other forms of construction, concrete provides the utmost in rugged strength, durability and economical over-the-years service.

***Send for free booklet describing concrete crib work in detail.***

**Canada Cement Company Limited**

*CANADA CEMENT BUILDING, PHILLIPS SQUARE, MONTREAL*

*SALES OFFICES: MONCTON, QUEBEC, MONTREAL, OTTAWA TORONTO, WINNIPEG CALGARY* the points brought out in his paper published in the November issue of the *Journal*. In addition, members who attended the meeting had the added advantage of hearing a good deal which could not be published and of questioning Mr. Gray closely on many of the details with which he proved himself to be very capably, and frequently, whimsically, familiar.

#### Hamilton Branch Receives the President

The day of the national president's visit to Hamilton — Thursday, November 19—was a busy one for the Hamilton Branch executive. Mr. R. L. Dobbin and his party joined the Executive for a meeting held in the Thistle Club during the afternoon, during which a valuable exchange of opinions on national and local matters took place.

A well-attended meeting of the Branch, in the form of a buffet supper at the Wentworth Arms Hotel, followed the executive meeting.

Mr. Dobbin, introduced with the familiarity of long association by Dr. L. A. Wright, spoke briefly and entertainingly upon his experiences as the representative of Canada's engineers at the Coronation, emphasizing the magnitude of the engineering problems involved in the successful functioning of this piece of modern pageantry.

After Mr. Dobbin's remarks, G. L. T. Vollmer introduced the speaker of the evening, T. B. Doherty, of Imperial Oil Limited, who spoke on "Oil Refineries".

Mr. Doherty, using skilfully a blend of oral, pictorial, diagrammatic and practical illustration presentations, brought his listeners in a short time to a surprising degree of familiarity with the complex functions of a modern refinery. His audience was, however, good-naturedly disappointed when, he smilingly declined to commit himself concerning how often the oil in the family car should be changed.

Mr. Doherty was thanked by N. Metcalf.

On the evening of December 3, three representatives of the Hamilton Branch journeyed to Toronto at the invitation of the Toronto group and were well rewarded by the address of F. G. Gardiner, chairman of the Metropolitan Commission, who delivered a worthwhile discussion on the problems of the Toronto Metropolitan area.

W. A. Dawson, in his remarks to the Toronto branch, extended an invitation for a reciprocal visit and a challenge to a curling match which was promptly accepted by the Toronto executive.

Those accompanying Mr. Dawson, the Hamilton Branch chairman, on his Toronto visit were F. E. Milne, vice-chairman elect, and F. S. Gue, Branch news editor.

## Kingston

G. D. Burwash, Jr.E.I.C.,
*Assistant Secretary*

#### November Meeting

The monthly meeting of the Kingston Branch was held on November 17 at the Royal Military College.

The guest speaker of the evening was Lt.-Col. P. C. King of the Royal Military College who was introduced by Lt.-Col. J. E. Styles of Queen's University.

Col. King spoke on the development of an underseas search craft which he has conducted at R.M.C. over the past year and a half. The idea stemmed from a meeting in June of 1951 between the Historical Society and a group of naval officers with a view to recovering certain relics from Navy Bay by use of a diver. After some discussion it became evident that it would be advisable and advantageous to have a means of underwater propulsion entirely free from surface craft. Other uses were foreseen, such as the defence of harbours from mines in wartime and the examination of the submerged portion of vessels. It was also decided that it should be possible for a diver to enter and leave the craft while it was submerged.

Approval was obtained from Ottawa to design and build the vessel, and work began in March 1952. Shortly after this Lt.-Col. Styles became associated with the project. The first trial was on October 15, 1953. As a result of data collected on this run modifications were made and a successful trial was conducted on August 6, 1953.

Col. King showed details of the craft by means of slides and sketches. The vessel was designed for two persons and utilizing equalized pressures or the diving bell principle. The source of energy is compressed air fed to radial engines built at R.M.C. It was stressed that with one or two exceptions all parts were made there. The engines drive pumps, forcing water through eight jets, placed around the outside of the shell, enable the vessel to be manoeuvered quite readily in all directions.

An extremely interesting movie was presented to show the search craft in action. At the conclusion of the talk Col. King was thanked by Philip Roy.

Refreshments were afterwards served at the Faculty Club.

**The president at Kitchener. Front row, M. A. Montgomery, councillor, President R. L. Dobbin, Chairman A. J. Girdwood. Back row, W. R. Roberts, past-chairman; J. F. Runge, secretary; B. Nichols, director; L. J. R. Sanders, director.**

## Lakehead

G. E. Cook, Jr.E.I.C.,
*Secretary-Treasurer*

H. Penner, Jr.E.I.C.,
*Branch News Editor*

#### Dryden Paper Company Hosts to Branch

Acting on a decision made in the autumn of 1952, the Lakehead Branch held its second out-of-town meeting within a year. At that time it was decided to help out-of-town members to keep in closer contact with their Branch. The first meeting took place in May of this year when a group of engineers motored to Dryden, Ontario, where the Dryden Paper Company played host to the group. Members from Kenora and Fort Frances were invited to this meeting.

#### Engineers Visit Marathon Paper Mill

On October 17 a motorcade left the Lakehead stopping en route at Red Rock and Terrace Bay where they were joined by more members. About 24 in all reached Marathon that afternoon, and were taken through the Marathon Paper Company mill. All technical personnel of the mill were invited to attend the evening meeting. Col. L. F. Grant, Field Secretary, was present at this, as well as the Dryden meeting and spoke on the topic "Engineers in Architecture". This was followed by a general discussion.

#### Joint Meeting at Thunder Bay Mill

On November 6 the Lakehead Branch of the E.I.C. and the Midwest Branch of the Technical Section of the Canadian Pulp and Paper Association held a joint meeting at the Thunder Bay Mill of the Abitibi Paper Company. A formal paper was presented by W. Kozny of Red Rock on "The Dorrco Fluosolids System". The group then proceeded to the Thunder Bay Mill to inspect the new pyrite plant. At 9:45 everyone returned to the engineering department where they were served a very delicious lunch.

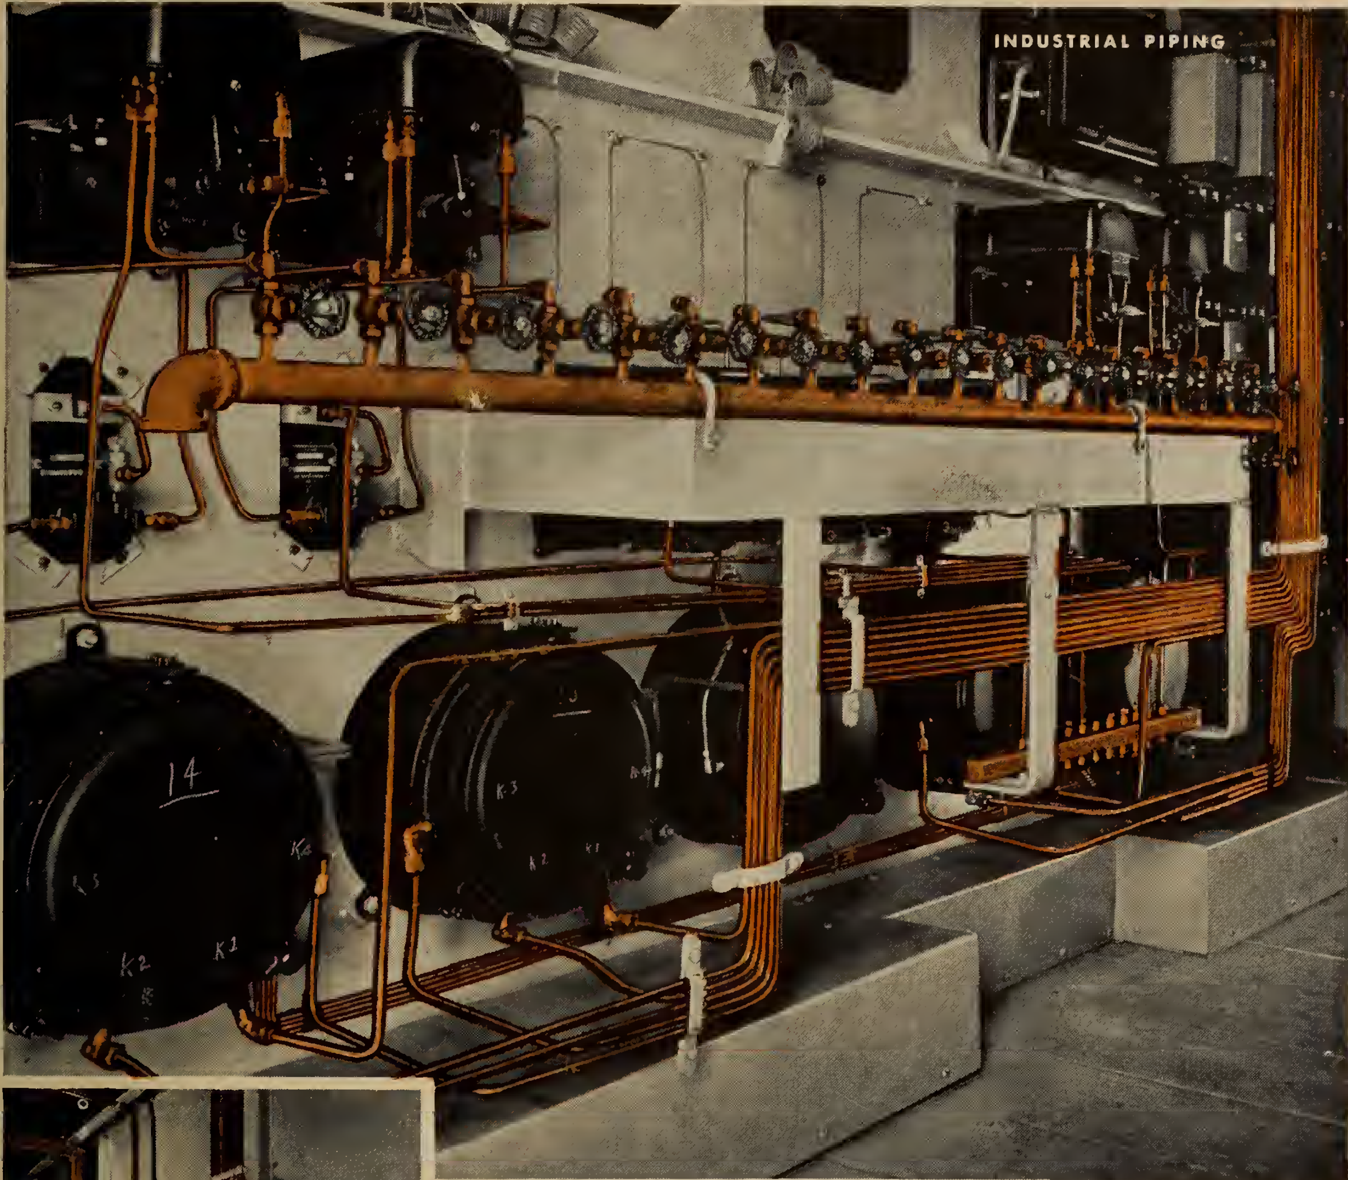
## Lethbridge

R. D. Hall, Jr.E.I.C.,
*Secretary-Treasurer*

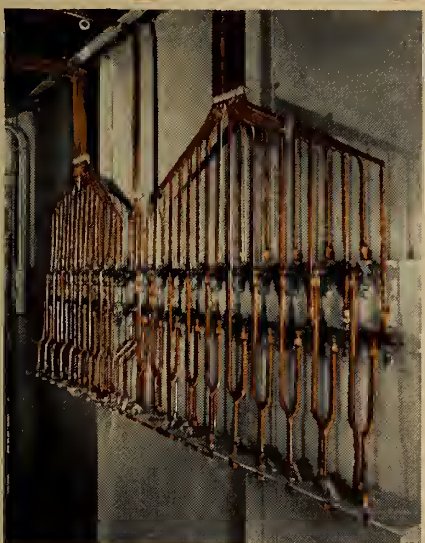
Paul Harding, S.E.I.C.,
*Branch News Editor*

#### W. Bird Speaks on Coal Industry

Thirty-eight members and guests attended the November dinner meeting of the Lethbridge Branch. Following dinner Bob Lawrence and George Brown led in community singing. Dave Howell favoured the meeting with two vocal selections "Where E'er You Walk" and "Old Man River". He was accompanied by Mrs. Brown at the piano. Dinner music was presented by Browns Orchestra.



THESE AIR SIGNAL LINES in Toronto's Richard L. Hearn Power Station use copper tube in long lengths, change direction and avoid obstructions without fittings.



MOIST COMPRESSOR AIR can never form rust or scale to impede control in this installation made by Bailey Meter Co., Ltd.

# Wet air can't rust this copper control piping

CONTROL would be impaired if moisture could create rust or scale in these pneumatic control lines for coal-pulverizing equipment installed by Bailey Meter Company, Limited, in Toronto's Richard L. Hearn Power Station. A number of these copper tubes convey differential pressures to the pulverizer feeder controllers, while others transmit an air signal to the pulverizers to selectively limit the rate of coal feed. Rust particles which might interfere with the satisfactory operation of the control system cannot form, and the smooth bore keeps flow resistance at a minimum.

Here, as in all copper tube systems, the long lengths, the light weight and the elimination of many fittings by bending all make important savings in installation costs. Where flare or solder-type fittings are used, there are no threads to cut, and connections stay tight.

Publication C-24 offers many additional facts on how ANACONDA Copper Tubes can help improve product quality, reduce operating and maintenance costs and avoid costly shutdowns. Write to: *Anaconda American Brass Limited, Main Office and Plant, New Toronto, Ont.—Montreal Office: 939 Dominion Square Building.*

**ANACONDA®**

***FIRST* in Canada for Copper, Brass and Bronze**

*Copper tubes for industrial process lines, water, heating and sanitary drainage systems.*

The speaker for the evening, W. Bird, General Manager of West Canadian Collieries Ltd., was introduced by P. E. Kirkpatrick.

In his address entitled "Run of Mine", Mr. Bird stated that coal plays a very important part in the Canadian economy. Although the coal industry is now passing through a difficult, yet not critical stage, the industry will not only survive, but will continue to be our main source of energy for many years, Mr. Bird said. To insure success, a staff of good engineers is required, people with originality and creative spirit as well as technical skill.

West Canadian Collieries have been producing about one million tons of bituminous coal per annum, and whereas this used to be sold almost entirely as "Run of Mine", it is now graded into six different sizes.

In the field of coal cleaning, drying and briquetting, the Canadian industry is well advanced. Many mines in the United States are now using cleaning machinery developed in the Crow's Nest Pass.

"Run of Mine" is screened into the various sizes, and the one and one-half-inch-plus size is cleaned in a sink and float machine which uses loes as its medium. One-quarter to one-and-one-half inch sizes are cleaned by air tables, and the refuse is crushed and then passed through another sink and float machine which uses its own dust as medium.

The one-quarter-inch-minus size presents a real problem in cleaning. Vacuum jigs invented by J. A. Brusset, vice-president of West Canadian Collieries, are used quite successfully. The mine also uses the only Lamex patented wet cleaning plant in Canada. Five "Parry" dryers are used to dry the fine coal.

Improved cleaning using magnetite now makes it possible to recover between twenty-five and thirty tons of coal per hour from previously discarded refuse.

Because of the limited market for fine coal in Canada, and the necessity of finding a means of marketing this commodity, West Canadian Collieries are now producing about 1,200 tons of briquettes per day, said Mr. Bird.

Coal has been essential to the progress of our civilization. In 1950 world production of all classes of coal amounted to 1,741,000,000 tons.

In the United States the percentage of power from all sources in 1950 was as follows: crude petroleum, 37.3; natural gas, 18.7; water power, 4.2; coal, 39.8. Comparable figures for Canada are as follows: petroleum fuels (fuel oil, gasoline, and kerosene), 27; natural gas, 5; hydro electric power, 27; coal, 41.

Coal was used for copper smelting in China two or three thousand years ago. In Europe coal was first used about the tenth century, and in North America, Nova Scotia coal was first used around 1637.

In addition to the commonly known uses, such as heating and power, metallurgy and the manufacture of gas and coke, coal is used in the production of dyes, medicines, disinfectants and the conversion into liquid fuel.

Engineering developments have so advanced that now only two-thirds of a pound of coal are required to produce one kilowatt hour of electricity, whereas a few years ago four to five pounds were required.

**The Junior Section of the Montreal Branch formed a ladies' committee under the direction of G. L. MacLean, Program Chairman, and presented a fashion show with proceeds going to the Canadian Cancer Society. They obtained the services of Juliette Hat Shop for fashions and held the event at Victoria Hall, Westmount. Over six hundred attended the event. The ladies' committee was composed of the following: Mrs. E. R. Frigon, convener; Mrs. G. L. MacLean secretary-treasurer; Mrs. J. P. Dagenais, Mrs. L. J. Hammershmid, Mrs. J. Soucy, Mrs. W. T. Clarke, Miss Giselle Desrosiers.**

In 1950 some 23,400 people were employed in the Canadian coal industry, and these persons were paid some sixty-one million dollars. This industry pays out a greater percentage of the receipts from the sale of its product in the form of wages than any other industry on the continent.

The major coal producing areas in Canada are in the West while the major markets are in the East. Canadian railways in 1950 hauled 19,139,000 tons of coal compared to a total tonnage of 13,832,000 tons of wheat. Coal imports in 1950 amounted to 26,500,000 tons of coal while Canadian production amounted to only 18,750,000 tons. Thus it is apparent that one of the major problems affecting the bituminous coal industry is the relative location of the supply and the market.

In conclusion, Mr. Bird stated that increased industrialization in Western Canada would greatly assist all Western Canadian coal mines, and that in time of war sufficiently developed reserves of coal are essential if the war is to be won.

A. G. Donaldson expressed the thanks of the Branch to Mr. Bird for his very interesting and educational address.

## Montreal

R. J. Harvey, M.E.I.C.,
*Secretary-Treasurer*

S. T. Rudkin, M.E.I.C.,
*Publicity Vice-Chairman*

#### *Owen Lake Guest Speaker on November 10*

Under the sponsorship of the Civil Section, Owen Lake, general manager of Construction Borings Ltd., delivered a paper on "Piling in Engineering Practice" to some hundred branch members on November 10. Mr. Lake obtained his early training in Norwich, England, with Dawnays Bridge, construction engineers; with the British Air Ministry; and later, as general design engineer of the British Steel Piling Company.

The speaker stated that piling has been used since primitive times. Pile-driving formulae of the dynamic type, he said, do not always give satisfaction. The bearing capacity of a single pile does not necessarily bear any relation to that of a group of piles, and adequate and appropriate soil investigation is necessary, requiring expert interpretation of soil properties. The type of pile used, and method of installing, have a great effect on bearing capacity. A question period followed the paper. Mr. Lake was introduced by meeting chairman D. H. Sharp, and thanked by W. Sefton. J. S. Lochhead was responsible for meeting arrangements.

#### *W. P. Moffat Discusses Diesel-Electric Locomotive*

"The Economics of the Diesel-Electric Locomotive in Railroad Operations" was the subject of a talk given on November 12 by W. P. Moffat, head of the Transportation Engineering Section, Operating Division, C.N.R., and sponsored by the Transportation Section of the E.I.C. Some 55 members were present at the meeting for which J. D. Sylvester was in charge of arrangements.

In determining the extent to which steam locomotives, with no resale value except scrap, should be replaced with diesels costing from $100,000 to $250,000 each, exclusive of the cost of the additional serving facilities required, Mr. Moffat said the following factors must be taken into account:

1. The diesel of equal hp. has greater tractive effort at low speed and on grades.
2. Diesel available for road duty 85 per cent of time vs. 65 per cent or less for steam.
3. Diesel fuel costs about 40 per cent of coal-burning steam locomotive and 60 per cent of oil-burning steam locomotive.

4. Future maintenance of diesel estimated about 25 per cent lower than steam.
5. Operating maintenance of diesel about 30 per cent of that of steam.
6. Wage saving in operating staff due to longer train lengths and unit construction.
7. Diesel savings are highest in manifest freight and switching service; smaller in way freight and passenger service.

Mr. Moffat was introduced by meeting chairman G. A. Morison, and thanked by Frank Haney.

#### Prof. D. L. Mordell Speaks on Gas Turbine

On November 16 the Electrical Section sponsored a joint meeting with the A.I.E.E., at which the speaker, Professor D. L. Mordell, chairman of the Department of Mechanical Engineering at McGill University, spoke on the "Development of the Gas Turbine and its Application as a Source of Electrical Power". Over one hundred persons were present. Professor Mordell has carried out considerable research on the gas turbine, recently on its possibilities as a coal-fired prime mover for driving electric generators. This talk was divided into three main headings:

1. Base Load Units—Several installations in the 25,000 kilowatt class have been built, but they are in a sense experimental, and not necessarily cheaper to operate than conventional steam units. He suggested the use of four jet engines, all impinging on a common turbine, as an interesting unit from a cost point of view.
2. Standby Units—This is the ideal use for the gas turbine, with its low cost and small size, and where, with operation for a relatively short period of time, thermal efficiency and fuel costs are not over important points.
3. Topping or Boosting Units — The addition of the gas turbine to an existing steam plant actually increases the efficiency of the entire plant, as the waste gas from the turbine heats the feed water for the steam plant.

A lengthy question and answer period followed. E. D. Gray-Donald was meeting chairman, and introduced the speaker, who was thanked by R. H. King, also in charge of meeting arrangements.

#### Sir Robert Watson-Watt Addresses Joint Meeting

"Dial K for Knowledge" was the title of a discussion on the philosophy of instrumentation in industry, given by Sir Robert Watson-Watt, C.B., F.R.C., on November 17, before a joint meeting of the E.I.C. and the Instrument Society of America. Lt. Col. J .Martin, M.B.E., was meeting chairman, and D. Woods, program chairman of the I.S.A., was responsible for meeting arrangements. Well over one hundred members of the two societies were present.

As introduced by Mr. John More, president of the I.S.A., Sir Robert, known as the "Father of Radar", is governing director of Sir Robert Watson-Watt and Partners Limited; President of Adalia Incorporated, and President of the Continental Oil Company. Sir Robert emphasized in his talk, which was tape-recorded by the I.S.A., the necessity for the instrument engineer to know management's mind and to talk its language, in order to sell instrumentation effectively. The utilization of suitable instruments could serve to improve the product, cut costs, boost production, protect worker and plant, increase efficiency, and interest of the worker, develop new products, and thus create new industries.

The gift of original and creative thought, he said, is still the finest tool in the instrument engineer's mental kit, along with the necessary knowledge, and the judgment and wisdom that comes from experience. To get the right information in the right form, at the right time, the instrument engineer must be human in his approach, but cold-blooded in his conclusion.

A question and answer period followed Sir Robert's talk, after which he was thanked by G. N. Martin, Montreal Branch Chairman.

#### Montreal's Economic Role Discussed by G. S. Mooney

On November 19, under the sponsorship of the Special Section, George S. Mooney, industrial commissioner and co-director of Montreal's Economic Development Bureau, gave a talk on "Montreal's Economic Role in the Life of the Nation".

Tracing the development of Canada from its original discovery by Norsemen around 1000 A.D., to the present day, Mr. Mooney pointed out how Montreal, first as a military and fur-trading centre after its settlement by Maisonneuve in 1642, and then as a port

# POWER

and growing industrial centre, and finally as the major financial centre, maintained its position as the hub of the expanding nation.

The deepening of the channel was a key factor in maintaining a flourishing port and encouraging industrial development.

Some of the many interesting statistics involving Montreal, given by the speaker, showed that it was the headquarters of six banks, having 60 per cent of all banking assets; the locale of thirty-eight consulate general offices, and Canada's principal economic listening post. One-tenth of Canada's population lives on the Island of Montreal, and huge natural resources of minerals, hydro-electric energy, and timber are at her doorstep.

Orby R. Brumell was meeting chairman and in charge of arrangements, and Mr. Gauthier thanked Mr. Mooney for his fine talk.

#### C. F. B. Stevens Speaks on Pulp and Paper Research

"Co-operative Engineering Research in the Pulp and Paper Industry" was the theme of an address given on November 24 by C. F. B. Stevens, technical assistant to the president of the Pulp and Paper Research Institute of Canada.

The meeting was sponsored by the Chemical Section. It was chaired by Dr. L. R. Thiesmeyer, president of the Pulp & Paper Research Institute, and arranged by Dr. W. H. Gauvin.

In the course of his talk, Mr. Stevens stated that an Institute team has been working under the sponsorship of and in co-operation with 17 paper mills in seeking to design a pulpwood holding system to withstand the pressure of river currents and weight of pulpwood in river storage. Such booms would cost a great deal, but a relatively small percentage of the millions of dollars' worth of pulpwood they contain.

Another team, he said, is seeking a pretreatment process to shorten the cooking time of pulp, and thus increase the quality of the finished product, and at the same time reduce operating costs.

The problem of corrosion in alkaline pulping equipment is being investigated by still another team of researchers.

#### Dr. Don Leet Is Civil Section Guest

Judging from the question and answer period, it was a debatable point as to whether insurance adjusters outnumbered engineers in the audience of over 125 which listened to Dr. Don Leet expound his theories on "Vibrations from Blasting" at a meeting sponsored by the Civil Section on November 26.

As chairman, Division of Geological Sciences, Harvard University; seismologist in charge, Harvard Seismograph Station; president of the Vibration Engineering Company, and consultant in the measurement of earth motion at the test of the first atomic bomb in 1945, Dr. Leet is no stranger to the effects of man-made explosions of any conceivable magnitude.

Based on the results of thousands of seismograph records of vibrations caused by blasting, certain criteria for safe limits have been set up, he said. With the relatively new system of short period delay blasting, wherein the explosives in a series of holes are detonated at pre-determined intervals separated by thousandths of a second, as many as 20 holes can be fired with no more vibration than formerly resulted from two. However, there is an optimum condition for any given location. The frequency of vibration has a distinct bearing on its effect on buildings, with a rapid vibration being much more liable to cause damage than a slow vibration of even greater amplitude. The slamming of doors is more prone to cause plaster cracks than the vibration caused by a large blast in the vicinity, provided the safe limit regulations have been observed, Dr. Leet stated.

The lively question period was testimony to a thoroughly enjoyed talk. H. John Racey, as meeting chairman and arranger, introduced Dr. Leet, who was thanked by Mr. Tait.

## Newfoundland

M. A. Foley, M.E.I.C.,
*Secretary-Treasurer*
R. P. Hunt, Jr.E.I.C.,
*Branch News Editor*

#### President's Visit

Ross L. Dobbin, the president of the Engineering Institute of Canada, accompanied by Donald Dunbar, the secretary-treasurer of the North Nova Scotia

**The Honorable J. R. Smallwood, Premier of Newfoundland, and President Dobbin.**

**The president at Newfoundland. S. J. Carew, Dean of Engineering, Memorial College; Chairman C. A. Knight; G. R. Jack, Vice-President of the Association of Professional Engineers of Newfoundland; President R. L. Dobbin, and Dr. R. Gushue, President of Memorial College.**

Branch of the Engineering Institute, arrived in St. John's by train on Sunday morning, November 8, following a visit to the newly-formed Corner Brook Branch of the Institute.

The president and Mr. Dunbar, with C. A. Knight, chairman of the Newfoundland Branch, and S. J. Carew, immediate past chairman, visited the Dominion Steel and Coal Corporation iron ore mines on Bell Island on Sunday. There they were met by Herbert P. Dickey, general manager, and other company officials. The party enjoyed an inspection tour of the operation and were entertained at a luncheon by the company. On return to the city the president held a press conference with representatives of the St. John's newspapers and radio stations.

Accompanied by the Branch chairman and vice chairman, Mr. Dobbin made official calls on the Premier of Newfoundland and His Honour Mayor Mews on Monday morning. The Branch executive joined the party in an inspection tour of Job Brothers Limited Fresh Fish Plant, after which they had lunch as guests of C. A. Pippy, president of the company. Luncheon featured a special fish menu in keeping with Newfoundland's sea-harvesting heritage.

A reception for the president was held on Monday evening at the Newfoundland Hotel. It was well attended by special guests, members and their wives.

Later the same evening Mr. Dobbin attended the regular monthly meeting of the Branch, at which he was the special guest speaker. He told the members of the growth and the increasing prestige with which the Institute was held in all parts of the Western World, especially in England, where he was so well received by various engineering bodies. He described the most colourful Coronation ceremonies which he attended at the invitation of the Queen as the official delegate of the Engineering Institute of Canada. Mr. Dobbin also spoke of the many engineering feats that were accomplished to make the Coronation the efficient function that it was. The Engineers' Wives' Club served refreshments after the meeting.

The president addressed the engineering students at Memorial University on Tuesday morning, November 10, and spoke on the wonderful opportunities offered to the young engineer in Canada. He wished them every success in their studies and hoped they would be active participants in E.I.C. endeavours as students and assured them that they would be most welcome as members of the Institute.

Immediately after the meeting with the students, the president and Mr. Dunbar were guests at a luncheon given by the Association of Professional Engineers of Newfoundland. Mr. Dobbin was welcomed by E. Dickinson, president of the Newfoundland Association, who offered the friendly and close co-operation of that body. Following the luncheon, a joint meeting of the executives of the local Branches of the Institute and the Association was held. Matters of common interest were discussed, the continuing of friendly relations and co-operation between the two bodies were stressed.

#### C. H. Conroy Is Speaker

At a regular monthly meeting of the Newfoundland Branch, held at Memorial University on October 19, 1953, Branch Chairman C. A. Knight, presided. C. H. Conroy, chief engineer, Buildings Division of the Provincial Department of Public Works, presented a paper entitled "Control of Moisture in Frame Walls".

The speaker outlined the basic principles involved in the control of moisture in frame walls and, with the aid of sketches and diagrams, explained how these principles should be applied in this type of construction. Mr. Conroy stressed the proper use of vapour barriers and analyzed and discussed several instances of local construction failure due to lack of fundamental knowledge in their use.

A lengthy discussion period followed, during which the members asked questions, commented and gave their opinions on the subject.

Gerald Knight extended a vote of thanks to Mr. Conroy on behalf of the Branch for his most interesting paper.

Following the meeting refreshments were served by the Engineers' Wives' Club.

*Secretary-Treasurer*

J. H. Saldat, jr.e.i.c.,
*Branch News Editor*

**R. S. Ritchie Speaks on Oil Developments**

R. S. Ritchie was guest speaker at a dinner meeting of the Niagara Branch held on the evening of October 22 at the Queensway Hotel, St. Catharines, which was attended by some 35 members. The speaker, who is assistant manager, Ontario Division of Imperial Oil Limited, spoke on "Recent Oil Developments in Canada".

Mr. Ritchie indicated how the impact of the oil development in the last six and a half years has boosted Canadian economy. Before 1946 we produced 10 per cent of our oil consumption as compared to today's reserves which are nearly 100 times those of 1946. Canada's per capita oil consumption is 70 per cent of that of the United States, with our present production equal to some 45 per cent of our consumption. Canadians have invested one and a half billion dollars in oil since 1947, and have laid some 3,000 miles of oil pipelines.

Pointing out some of the economic implications, Mr. Ritchie said that in 1946 our largest import cost was in petroleum, but that this cost is now decreasing despite a much greater consumption. The impetus of the oil boom of other resource development programs has strengthened the Canadian dollar. Foreign capital accounts for only about 50 per cent of the capital invested in oil expansion in the past six years.

The fact that Canada is such a large oil consumer contributes to our standard of living. Canada has been investing 20 per cent of its production into the development of its resources.

An active program for developing resources makes for the economic integration of Canada.

The American continent consumes 60 per cent of all the oil consumed in the world. The United States has become a deficit country in oil since 1948, and Canada's deficit is decreasing daily. Oil is vital for survival in world conflicts and will play an important role in Canadian efforts in the event of war.

The future for the oil industry and petroleum exploration is bright. A known reserve of 2 billion barrels exists, with a possible 20 billion barrels yet to be discovered. It is believed that the oil sands of the Northwest Territories may contain more petroleum than the existing world's reserves.

The speaker was introduced by W. Scott, and Mr. Climo thanked Mr. Ritchie on behalf of the Niagara Falls Branch.

Mr. A. Bennett was chairman of the meeting.

**Presidential Visit**

Members of the Niagara Penninsula Branch turned out on November 17 to meet President R. L. Dobbin, and his party, visiting the Sir Adam Beck Niagara Generating Station No. 2. During the afternoon Mr. Dobbin and party were the guests of W. M. Hogg of the Ontario Hydro-Electric Power Commission as they toured the local development.

At a dinner at the Red Casque Inn, the president addressed some 40 members of the Niagara Branch. J. A. Ogilvie introduced the president, who informed the group that the E.I.C. has grown to the extent of 16,000 registered members, with some 47 branches. Mr. Dobbin expressed hopes for having a total of 50 branches. The pronounced growth of the E.I.C. is heartening to the president and it is his plan to spend all his time and effort towards the work and expansion of the Institute.

The British Empire's recognition of the E.I.C. was indicated by the Lord Chamberlain's command invitation to the president to attend the Coronation service in the Abbey. The president was also a royal guest at the Queen's Garden Party held on May 28, which some 7,000 Commonwealth guests attended. A detailed and pictorial account was given of the Abbey services and the Coronation day.

Mr. Dobbin related how the electrical system for televising and broadcasting of the Coronation was installed and operated with unbelievable precision and efficiency.

The president had visited many firms and manufacturing industries in Britain. He expressed confidence that his tour of England did much to introduce knowledge of the Engineering Institute in England.

Mr. Bush thanked Mr. Dobbin for his interesting talk. Chairman A. J. Bennett presided at the meeting.

## Ottawa

G. A. Sutherland, m.e.i.c.,
*Secretary-Treasurer*

C. E. Howard, m.e.i.c.,
*Branch News Editor*

**Elsie MacGill Guest Speaker**

On Tuesday, December 8, the 1953 activities terminated with a joint meeting arranged by the Engineers' Wives' Association of Ottawa. The meeting was held in the cafeteria of the National Research Council Building on Sussex Street.

Miss Elsie MacGill, m.e.i.c., the only female aeronautical engineering consultant in North America, was guest speaker, her topic being "Implications of Civil Flying at High Speeds".

Miss MacGill discussed the growth in civil transport aircraft performance from the days of the early bi-planes up to the highly streamlined monoplanes. She pointed out that the present piston-engined airliner had about double the speed of the early bi-plane transports and represented the ultimate in development in aircraft with piston engines. The jet transport aircraft, however, is completely new and relatively undeveloped.

The changing equipment on airlines and the increased speed of jet transports have and will continue to revolutionize all our established concepts of airline operations, servicing and maintenance, she said.

Mrs. W. R. McClelland, president of the Engineers' Wives Association was in the chair. Miss MacGill was introduced by Dr. J. J. Green and thanked by Group Captain H. R. Foottit.

**Discussion of N.W.T. and the Yukon**

On November 12, Major General Hugh A. Young, Deputy Minister of Public Works, spoke to a large attendance on "Resources Development in the Northwest Territories and the Yukon".

"Development of vast mineral and oil wealth in the Yukon and N.W.T. is making Canada conscious of a 'northern movement' to new frontiers," he said. "We have the greatest possible grouping of resources in our north country and development of them will depend largely upon the opening up of power supplies, roads, railroads and transportation facilities to the production areas".

A power operating company has been formed and is working on development of four to five million horse power in the Yukon, he said. This development of power is leading to tremendous happenings. The Yukon and the Northwest Territories are rich in uranium, gold, silver, lead, zinc and nickel, and exploration at Pine Point offers "potential for the greatest base metal development on the North American Continent."At Ferguson Lake, the International Nickel Company has already spent large sums of money and extensive investigation into the nickel deposits at Rankin Inlet Bay have been carried out.

Dealing with oil producing possibilities, the speaker said 28 million acres are under permit in the Northwest Territories for oil exploration.

Major General Young was introduced by Dr. John J. Green, chairman, and thanked by Major General Guy Turner.

**W. Sefton Discusses Concrete Shell Roofs**

At the luncheon meeting held in the Chateau Laurier on November 26, the design and construction of "Concrete Shell Roofs" was the topic discussed by W. Sefton, senior engineer with C. D. Howe Company, Montreal. Dr. J. J. Green, chairman of the Branch, presided.

Concrete shell roofs, Mr. Sefton explained, are arched concrete structures of exceptionally small thicknesses which span very large distances. For example the roof of the Quebec Stadium is only 4 inches thick and spans 240 ft. On the other hand, some structures have been built of concrete only half an inch thick, spanning 24 ft. and carrying large loads.

All such structures find their strength in the same way as does an egg shell. It is well known that one cannot break a raw egg with the pressure of the human hand, when such pressure is applied at both ends without touching the sides. Both shells, egg and concrete, absorb considerable external loads as membrane stresses are parallel to their surface.

The speaker showed many examples of shells constructed in Europe and in North America, and discussed the different types, their history, and principles of design, construction methods, costs and modern developments, including his own fully precast poststressed shell, as well as the future of shells in Canada.

Ralph Johnson thanked Mr. Sefton on behalf of the Branch.

Under the chairmanship of Dr. J. J. Green, a sub-committee has been formed to survey the possibility of locating a memorial to Colonel John Bye, somewhere in the centre of the City of Ottawa. When plans crystallize a report will be submitted to the members.

## Nipissing and Upper Ottawa

R. A. Booy, jr.e.i.c.,
*Secretary-Treasurer*

**December Meeting**

The December meeting of the Nipissing and Upper Ottawa Branch was held at the Marine Room, Trout Mills on Wednesday evening December 2. Robert Dye of Temiskaming, chairman of the Branch, was in charge of the meeting which was attended by 40 members and guests from North Bay and district points.

# Let's think About Lubrication

## AND PREVENT 80% OF BREAKDOWNS TOO!

FIGURE 1

Yes, you **can** save the costly time that's spent on manual lubrication, and yet, still be sure that your equipment is thoroughly and regularly lubricated! How? By installing Tecalemit Automatic Lubrication. It's as simple as that!

With Tecalemit Automatic Lubrication, lubricants are supplied continuously or at fixed intervals direct to all lubrication points while the machine is working. No hold-ups!—and that means increased production and lower overhead costs.

What's more, Tecalemit Automatic Lubrication is so much more efficient that it helps to cut breakdowns by 80%!

Write us, or get in touch with your local agent.

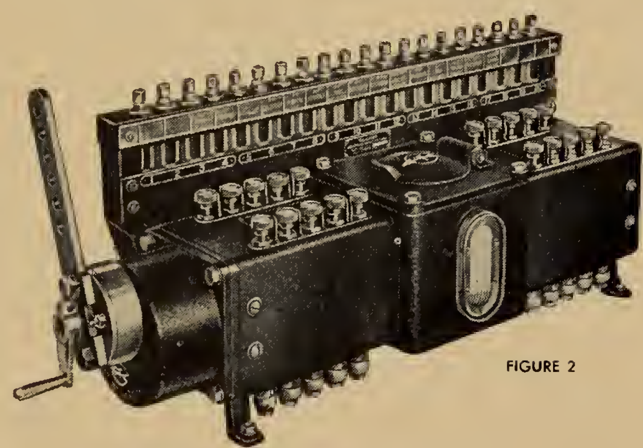

FIGURE 2

Complete Tecalemit range for industrial and marine machnery.

# TECALEMIT
**(CANADA) LTD.**

***The Authority on Lubrication***

**431 KING ST. WEST TORONTO, ONT.**

Following dinner, H. R. D. Graham, manager of the northeastern region of the Hydro-Electric Power Commission of Ontario, presented an illustrated lecture on the construction of the new Sir Adam Beck Generating Station No. 2 now being built at Niagara Falls.

The outstanding engineering features of this development are two huge tunnels conveying water five and one half miles from an intake structure above the falls down under the city of Niagara Falls and then connecting together in a two and one quarter mile open-cut canal leading to the power house. When completed the plant will generate 1,200,000 horse power, with the first unit scheduled to deliver power in March, 1954. Since much of the province is now interconnected with tie lines, Mr. Graham stated, northern as well as southern Ontario would benefit.

Mr. Graham also stressed the remedial works being undertaken above the falls to distribute the water more evenly over the width of the cataract to preserve its natural beauty. The power house, too, was being designed to blend as far as possible into the natural appearance of the Niagara gorge.

## Quebec

Roger Desjardins, M.E.I.C., *Secretary-Treasurer*

Guy Babineau, Jr.E.I.C., *Branch News Editor*

**President's Visit**

In reporting the activities of the past year, the Branch recalls with pleasure the visit of President J. B. Stirling on May 8. After the executive meeting in the afternoon, President Sterling and General Secretary Austin Wright met informally a large section of the membership at a dinner at Le Cercle Universitaire.

After outlining the highlights of his tour of the various branches across Canada, Dr. Stirling urged the engineers toward increasing activity in the public service so that the public's respect for the profession could reach a still higher level. Since engineers cannot be legislated into higher salaries, the president expressed the opinion that constant personal effort and willingness to achieve results are still the best means of improving their situation.

After reviewing the activities of the Institute, the general secretary answered some questions from the floor during the informal discussion which followed.

G. E. Sarault, vice-chairman of the Quebec Branch, presided at the dinner meeting in the absence of Chairman A. E. Paré.

**Armand Mayer Addresses May Meeting**

The speaker at a meeting of the Quebec Branch on May 18 was the French consulting engineer Armand Mayer, M.A.S.C.E., president of the Centre d'Etudes et de Recherches des Liants Hydrauliques, Paris, France, and vice-president of the French Committee on Soil Mechanics. The subject of his discussion was "Some Aspects of Soil Mechanics as Applied to Dam Construction".

The meeting was under the chairmanship of P. A. Duchastel.

Reviewing the main stages of the design and construction of a modern hydraulic power dam, Mr. Mayer showed by means of graphs and actual field measurement data obtained on various projects he was responsible for, how the various aspects of soil mechanics applied to each of the above stages and particularly to dam foundations, water-proofing and embankment static equilibrium. Describing briefly some of the measurement methods used in the study of rock mechanics, he said that further investigation and research in this new aspect of soil mechanics might possibly result in the water intake tunnels' steel lining being eliminated or replaced by concrete lining in some specific cases.

Mr. Mayer's paper was followed by films on the recent French Rhône River major water power developments, Donzere-Mondragon and Gemissiat.

Introduced by the Branch Chairman A. E. Paré, Mr. Mayer was thanked by G. Piette. The meeting was under the chairmanship of P. A. Duchastel.

**Annual Golf Tournament**

The Quebec Branch annual golf tournament was held on Monday, September 14 at the Royal Quebec Golf Club in Boischatel.

With a gross score of 85, C. E. Rochette won the George T. Davis Cup. The Talbot Cup went to P. Vincent *ex-aequo* with C. Beaudoin; both these players had a 70 net. With a gross of 76, A. Tessier had the best score among the guest players.

The engineers' and guests' wives took part in a nine-hole contest which was won by Mrs. P. Vincent and Mrs. Y. Hyndman, with a score of 56 and 55, respectively. The ladies' putting contest first prizes went to Mrs. O. Longpré in the "expert" class and to Mrs. G. E. Sarault, C. Beaudoin and A. Desrivières all *ex-aequo* in the "beginner" class.

Despite rather unfavourable weather conditions, the annual golf tournament attracted a large portion of the membership. The prize distribution took place immediately after the buffet. This was presided over by P. A. Duchastel who was also responsible for the organization of this year's golf tournament.

The remainder of the evening was spent most pleasantly in dancing.

## Vancouver Island

P. F. Fairfull, M.E.I.C., *Secretary-Treasurer*

**Douglas Fir Plywood Manufacture Described**

A joint meeting of the Vancouver Island Branches of B.C. Engineering Society and Engineering Institute of Canada was held on Friday, November 27.

The speaker was S. G. Gardiner, Jr.E.I.C., mechanical engineer of B.C. Forest Products Ltd., Victoria, who spoke on the subject, "The Manufacture of Douglas Fir Plywood". Mr. Gardiner explained in detail the various processes entailed in the production of Douglas Fir plywood panels. Commencing with the virgin logs in the pond, he traced each step, the barking of the logs; the veneer cutting lathe which takes timber up to 7 ft. 6 in. in diameter and reducing it to 8 in. in diameter; the drying, grading, glueing and pressing.

It was interesting to learn that the dryers at this plant are believed to be the largest in the Pacific Northwest, and that 1,500 lb. of special phenol-formaldehyde waterproof glue are used every hour. The plywood panels are hot pressed at 285 deg. under a pressure of 200 lb. per sq. in, the pressing process varying from five to 15 minutes, depending upon the panel thickness. Test samples are taken at regular intervals and subjected to a severe freezing and boiler water test, the cycle being carried out three times.

On Wednesday December 2, a field trip was made to the Plywood Division of the B.C. Forest Products in Victoria where the members saw in practice the various machines and processes described in the address previously given by S. G. Gardiner.

## Winnipeg

C. S. Landon, M.E.I.C., *Secretary-Treasurer*

### Electrical Section

G. Flavell, Jr.E.I.C., *News Editor*

**G. W. Clayton Is Speaker**

On November 5 a large number of the section members attended a meeting at which G. W. Clayton, application engineer of the Canadian General Electric Company, Peterborough, Ontario, presented a paper on "Voltage Regulation of Subtransmission and Distribution Lines".

Mr. Claxton explained in detail the causes and cures of voltage regulator troubles. With the aid of graphs, he emphasized the many disadvantages of poor regulation, pointing out that it not only affects the efficiency of electrical apparatus, but also, incurs increased losses on the power supplier.

The speaker described briefly the various types of regulating equipment now being used, such as the load ratio control transformer, step-voltage regulator and induction voltage regulator. The choice of apparatus depends upon the frequency of operation and the degree of regulation required.

By means of slides the members were shown the extent to which poor regulation affects the performance and life of lamps and motors.

A discussion period followed this interesting talk, and Mr. Clayton was thanked on behalf of the attending members by R. T. Harland, executive member of the Section.

**Eighth Annual Dinner and Dance**

Over 250 guests attended the eighth annual dinner and dance of the Electrical Section, which was held in the Marlborough Hotel on November 20.

Guest speaker of the evening was Dr. Lennox G. Bell, head of the Medical College of the University of Manitoba. Dr. Bell presented a humorous philosophy of the evolution of life from the amoeba to the human being and back to the amoeba again. He was introduced by Professor N. A. Williams, vice-chairman of the Electrical Section, and thanked by R. T. Harland, executive member of the Section.

E. Scott, past chairman of the Section, proposed a toast to the ladies, and the response to the toast was ably made by Mrs. J. S. Merritt.

C. D. Osterland, chairman of the Section, thanked the convenor of the dance, L. Marrin, for the work he and his staff had done to insure a successful evening.

### Civil Section

K. R. Ebbern, Jr.E.I.C., *News Editor*

**Supercrete Plant Tour**

On Saturday afternoon, September 19, approximately 50 members and guests

**At the annual dinner and dance of the Electrical Section, Winnipeg. Left to right, C. D. Osterland, chairman of the Section; Mrs. Osterland, Dr. Lennox G. Bell, the speaker, Dean of the Medical College, University of Manitoba; Mrs. A. E. MacDonald, and Dean of Engineering A. E. MacDonald of the University of Manitoba.**

were shown through the Dawson Road Plant of Supercrete Limited which at that time was casting the pre-cast roof joists and slabs and the pre-stressed roof girders for the two Royal Canadian Ordnance Corps warehouses at Tuxedo, Man. These warehouses are the first pre-stressed structures of their kind to be built in Western Canada. The visiting engineers were fortunate in seeing the girders in various stages of completion starting from the make-up of the forms.

J. Boux and W. Taylor of Supercrete Limited, together with their staff, described the pre-stressing operation as it progressed and later entertained the visitors at coffee.

#### R.C.A.F. Stevenson Field Visit

On Saturday, October 10, the section visited the R.C.A.F. Cantilever Hangar under construction at Stevenson Field in Winnipeg. The visit was supervised and arranged jointly by the R.C.A.F., Central Mortgage & Housing Corp., and the Bird Construction Company, general contractors on the job.

Messrs. Hay and McKenna of Central Mortgage & Housing Corporation briefed the group in one of the completed 160-foot span steel arch hangars. After this the section was shown the unique cantilever hangar with its massive three storey concrete centre section and its 147-foot structural steel cantilevers. The structural steel on this hangar is being fabricated and erected by the Dominion Bridge Company at Winnipeg. This job was at an interesting stage for the visitors to see the cantilevers in various stages of erection. Some of the features shown to the group were the expansion devices used in the centre section, and tension ties used to prevent complete collapse of the structure should one cantilevered side be demolished by enemy action. Following this inspection tour the officers' mess was opened to members and their guests for refreshments.

#### Chas. J. Poppe Guest Speaker

On Thursday evening, November 12, the Civil Section held a meeting at which Charles J. Poppe, project engineer for Construction Aggregates Corporation of Chicago, was the guest speaker. Mr. Poppe has been active in the contract which his company has for the hydraulic stripping of mud overburden at the Steep Rock Lake Iron Mines.

He said that after the lake had been drained, there remained the problem of the removal of approximately 100 feet of mud including insulated boulders. The Construction Aggregates Corporation eventually employed two hydraulic dredges and actually pumped mud and water through steel pipes to a nearby lake reservoir. This operation was well illustrated by a coloured motion picture which showed the tremendous difficulties to be overcome particularly in winter operations.

Mr. Poppe was thanked by W. L. Wardrup.

## Yukon

John L. Phelps, m.e.i.c.,
*Secretary-Treasurer*

#### First Report from the New Yukon Branch

The first annual meeting of the Yukon Branch was held at Whitehorse on November 13 at the Whitehorse Inn for members and prospective members of the new organization.

Twenty-eight persons were present at the dinner and ballots for officers for the coming season, which had been previously mailed out to members, were reported by the scrutineers, Brig. H. W. Love and E. O. Greening. The following officers were elected: president, Lt.-Col. M. C. Sutherland-Brown, secretary, John L. Phelps; directors, C. E. White, Lt. K. Baker, and F/L G. H. Hicks.

Lt.-Col. Sutherland-Brown gave a short talk on the aims of the Institute. A general discussion followed, during which it was decided that meetings should be held at approximately one month intervals, at the discretion of the executive.

After the meeting, the film "Man with a Thousand Hands", was shown.

**First annual meeting of Yukon Branch, November 13, 1953. Seated, left to right—N. S. Tate, B. Sigurdson, C. E. White, J. L. Phelps, Brig. H. W. Love, Lt.-Col. M. C. Sutherland-Brown, E. O. Greening, Capt. R. W. Libby, F/L G. H. Hicks. Standing, left to right—Capt. D. J. Kempster, M. E. Almstrom, Lt. W. E. Royds, W. D. Gordon, Lt. R. G. Armstrom, P. Yurkiw, Capt. S. M. Bancroft, Alec. Berry, Maj. J. Burgoin, K. N. Domas, Lt. G. V. Clarke, E. McCarney, G. R. E. Leverman, E. O. Chrisholm, W. M. Emery, D. E. Finlayson, A. B. Yates, Ross Scrimger, N. Gritzuk.**

# Phillips

## makers of Wires and Cables

**announce. . .** effective January 1st., 1954, the completely independent operation of its own sales organization with offices, warehouses and agents from coast to coast.

There will be no disruption of services . . . the same sales staff as formerly will continue to call on their customers.

Phillips, Canada's pioneer wire and cable company with factories at Brockville and Montreal now offer you the most complete range of wires and cables in Canada.

## Additions to the Institute Library

Reviews — Book Notes — Abstracts

## BOOK REVIEW

**Proceedings of the international congress on pre-stressed concrete, 1951.** London, Concrete publications, 1951. 705 pp., $15.00.

Three languages, English, French and Dutch, are all used throughout this volume, depending on the nationality of the specialist presenting the paper. In many cases, but not all, there is a digest in one or both of the other languages, and the discussion is reported.

Commonly known as A.I.G. (Association Internationale de Gand) the proceedings are divided into two parts, i.e., 1, Applications, and 2, Theories and tests. Papers presented are by the acknowledged leaders in the field from ten different countries, and illustrations both photographic and diagrammatic, are liberally dispersed throughout the volume.

Subjects treated include factory problems with pre-stressed joists, posts and pylons in pre-stressed concrete, floors, reservoirs, beams for vibration tables, bridges, pre-stressing of natural stone, and various types of bridge reconstruction.

Another interesting treatment is the results of use of formulae typical of one country being used in another, for instance, the Belgian process in Germany, and the Magnel-Blaton system in the United States.

Theories and tests include the Vacuum process, test of composite beam with a pre-stressed slab; trace of concordant cables in a hyperstatic pre-stressed construction; ultimate strength of simply supported pre-stressed concrete beams and their design; frames in pre-stressed concrete; beam fatigue; maximum bridge span lengths, and self anchored suspension bridges.

This volume is really a mine of up-to-date information in one of the most popular fields of engineering today. —E.K.

## LIBRARY REGULATIONS

### Hours

Mon.–Fri. . . . . . . . . 9 a.m. - 5 p.m.
Saturdays . . . . . . 9 a.m. - 12 noon

### Bibliography and Reference Service

Short subject bibliographies are compiled on request. When placing these requests, please give as much detail and background information as possible.

### Borrowing

Books, periodicals, pamphlets and films may be borrowed for two weeks at a time. All books included in the Library Notes Section of *The Engineering Journal* are available for loan. **A fine of 25c per day is charged for each day borrowed items are retained beyond the two-week period.**

A library deposit of $5.00 at par in Montreal is required, for which two items may be borrowed at a time. Temporary deposits (30 days or less) $10.00. Books are sent anywhere in Canada, and carrying charges are payable by the member concerned.

### Ordering

Any book or pamphlet may be ordered through the library. All publications of affiliated societies, whether books, pamphlets, or periodicals, should be ordered through the library, as reduced rates are applicable on these to all members. Except in the case of library deposits **please make no payments in advance.** Non-members may consult the library, but may not borrow material. Please address all requests to **The Library.**

## BOOK NOTES

**Prepared by the Library**
**The Engineering Institute of Canada**

*Book notes marked by an asterisk have been provided through the courtesy of the Engineering Societies Library in New York.

**Alternating current electrical engineering,** 8th ed. Philip Kemp, Toronto, McMillan, 1953. 680 pp, figs., $6.15.

First published in nineteen hundred and eighteen, and now in its eighth edition, this volume has long been established with electrical engineers. As in the past, machinery principles are stressed rather than descriptions of particular types of machinery and apparatus.

As late head of the School of Engineering at the Polytechnic in London, the author includes the requirements of study for courses preparing for both the "ordinary" and the "higher" National Certificates, as well as presenting the general principles of alternating currents.

Three chapters on design are intended to portray the principles and processes by which actual designs are involved, such knowledge being invaluable towards an understanding of the functions of various parts.

Thermionics have been totally excluded except for mercury-arc rectifiers.

British Standards symbols, notations and definitions are used, except for the use of the term "Alternator", instead of the recommended term "A.C. Generator".

The figure illustrations throughout the volume are numerous, and excellent. Numerical examples are included with the chapters, with solutions in the appendix, and the book is well indexed.

**Les atmosphères contrôlées dans le traitement thermique des métaux.** Ivor Jenkins. Paris, Dunod, 1953. 522 pp., illus., 4,800 fr.

Originally published in nineteen hundred and forty-six in London, by Chapman & Hall, under the title CONTROLLED ATMOSPHERE FOR THE HEAT TREATMENT OF METALS, this book has now been translated into French by J. Bernot, and will

be warmly welcomed by our French speaking members.

The use of controlled atmosphere in the thermal treatment of metals is largely a development of the last twenty years.

Prior to this, an immediate change of temperature following the thermal treatment itself, often made additional measures necessary to counteract oxidation, the decarburation of carbonized metals, or the loss of zinc in brasses.

Besides presenting the principles and results of controlled atmosphere, the author also deals with the practical aspect of putting these principles to use.

Most of the chapters include detailed bibliographies, and the book carries an index of names of authors, as well as a very complete subject index.

**Beam formulas.** A. Kleinlogel, tr., enl. and adapted by H. G. Lorsch. New York, Ungar, 1953. 143 pp., illus., $5.50.

Translated from the author's Belastungsglieder, this volume forms the third and complementary part of Multi-Column Frames and Rigid Frame Formulas of the same author, but can, at the same time, be used independently for the computation of statically determinate and indeterminate structures.

Over seventy loading conditions are covered, which is sufficient for most normal engineering requirements.

No other reference is necessary for computing, and this translation has in addition, been enlarged and specially adapted for engineers on this side of the Atlantic.

All loading conditions are just as presented by Kleinlogel. The data for beams with end restraints has been added as the original dealt only with simply supported beams.

The whole section "Use of Formulas and Tables" has been rewritten, as has also a large part of appendix one.

From requests we have had in the past, we know this book will fill a definite need for a number of our readers.

**Blaine's the slide rule as an aid in calculating, with numerous worked examples,** 7th revised ed. A. T. J. Kersey, ed. London, Spon; Toronto, British Book Service, 1952. 120 pp., illus., $2.50.

Now generally regarded as the textbook on the slide rule, this volume describes the different instruments available, in the simplest possible language.

The principal changes in this edition are concerned with additions on the use of the log-slide rule relating to calculation on the compression and expansion of gasses, particularly in the use of gas turbines.

Detailed descriptions of the long scale rules, or calculators, omitted from the last edition, have been reintroduced to this one; and, for reasons of history, or record, some old time information, such as railway fare computations in nineteen hundred, have been retained.

**Boiler house practice.** J. N. Williams. London, Allen and Urwin, Toronto, British Book Service, 1953. 600 pp., illus., 60/–.

"Combustion is generally understood as the phenomenon resulting from oxidation with the evolution of light and heat. There are other chemical reactions which furnish light, heat and flame which are included under the term, even though oxygen be absent . . . In steam boiler practice, a "combustible" is a substance capable of combining with oxygen to liberate heat, yet it is usual to employ the term to cover the portion of the fuel remaining after the subtraction of moisture and ash."

With this introduction, basic information is defined, and theory and practice of combustion and heat transmission are discussed.

Shell and water tube boilers are then detailed, followed by various types of mechanical stokers, and their suitable furnaces and grates.

The several types of fuel, their storage and their handling are considered, along with boiler control and the treatment of water.

Refractorics and temperature control, chimney emissions, and the cleaning of flue gas and boilers are all discussed.

Thirty pages of measurements and tests conclude the main body of the text, and the whole thing is summed up in a Finale, followed by seven pages of tables, and a comprehensive index.

**Calcul et exécutions des ouvrages en beton armé.** V. Forestier. Paris, Dunod, 1953. Tome 1, 263 pp., illus., 1,060 fr.

This is the first volume of the above title, dealing with general methods of calculating and working.

The three source documents on which the writing is based, are as follows:

1. The circular of July nineteenth, nineteen hundred and thirty-four, published by the authority of the Ministry of Public Works,
2. Rules for the use of prestressed concrete for works under the jurisdiction of the Ministry of Reconstruction and Town Planning, and private works (of December nineteen hundred and forty-five and March nineteen hundred and forty-eight),
3. Rules defining the effects of snow and wind on constructions, in the same category as number two.

The first of these deals primarily with Civil Engineering, including works of art, retaining walls, and road, river and marine transportation, all under the Department of Public Works.

Those under the Ministry of Reconstruction and Town Planning include industrial and commercial buildings, private structures, domestic buildings, etc. There are a few footnote references and a detailed table of contents.

**The characterization of organic compounds,** rev. ed. S. M. McElvain. Toronto, Macmillan, 1953. 303 pp., $4.50.

The author states in his preface that training in the identification, or characterization, of organic compounds is now practically essential for students in chemistry. His reasons for this are that without such training students cannot easily organize and consolidate the vast amount of information acquired in studying elementary organic chemistry. He also believes that this training can easily be applied in any future research which students may pursue.

The outlines of procedure for the characterization of organic compounds are given in the first chapter, and the four steps listed are developed in the subsequent chapters of the book. First, the purification of organic compounds, the determination of the more useful physical properties and the relation of boiling point to structure are discussed; following this are discussions of the relationship between structure and solubility and the use of solubility behaviour in the process of characterization. The class reactions of various groups of compounds are next dealt with, together with experiments illustrating their use. The last chapter deals with some of the more useful derivatives available for different classes of compound, the experimental procedures by which they can be prepared, and tables listing the properties of about fifteen hundred of the more common members of the different classes, and their distinguishing derivatives. These compounds are listed alphabetically in the index, with page references to this chapter.

The fact that this is a second edition would seem to prove its value to students of chemistry. The book has been brought up to date; the final chapter has been revised and enlarged, and references to other derivatives not listed in the tables have been appended.

**Les circuits de contrôle électronique dans l'industrie.** W. D. Cockrell. Paris, Dunod, 1953. 334 pp., illus., $9.00.

Originally published by McGraw-Hill in nineteen hundred and forty-four, and again in nineteen hundred and fifty, under the title Industrial Electronic Control, this volume will now be welcomed by our French speaking members in a translation by G. Henry-Bezy.

There have been many books on the theory and construction of electronic tubes, and their use in high frequency communication circuits.

This volume, therefore, deals only with applications of a general character, with the same circuit used over and over to illustrate the different types of applications. This basic circuit is for this reason used throughout, to illustrate an infinite variety of complete circuits.

By the same token, the publication is limited to electronic circuits, magnetic, optical and mechanical being completely ignored.

The whole presentation is for industrial use, presented in as practical a manner as possible, to be of real value both to the consultant and engineer in charge of installations of equipment in unfamiliar industrial surroundings and machinery.

It has an alphabetical index, and carries bibliographies and/or questions with a number of chapters.

**Corrosion testing procedure.** F. A. Champion. London, Chapman & Hall, Toronto, British Book Service, 1952. 369 pp., figs., $7.25.

"Corrosion consists essentially of reactions between a metal and its environment . . . Thus corrosion behaviour is a conjoint property of the metal and the environment to which it is exposed. There is, therefore, no universal test . . ."

These tests may be carried out for qualitative or quantitative results, or for both.

To achieve the maximum in satisfactory results, the book has been divided into five stages, and each one treated individually.

1. The choice and preparation of metal corrosive.
2. Exposure of the metal to the environment in laboratory, field or service tests.
3. Cleaning of the specimens preparatory to examination.
4. Examination of the specimens or the corrosive, for the effects of corrosion.
5. The expression and interpretation of results with particular reference to the form of the corrosion/time curve.

A little more detail in the index might be desirable, but the illustrations, both figures and photographs, are good, and excellent bibliographies accompany each chapter.

# NO BREAKDOWNS NO SHUTDOWNS

▲ *This highly efficient, low-cost installation on double exhaust fans is at Builders' Flooring and Millwork Ltd., Toronto, Ont.*

HERE is a unique bargain in trouble-free transmission. This Goodyear Compass Belt installed 2½ years ago at a cost of only $50.54 has given continuous service on a 16-inch pulley running at 750 r.p.m.

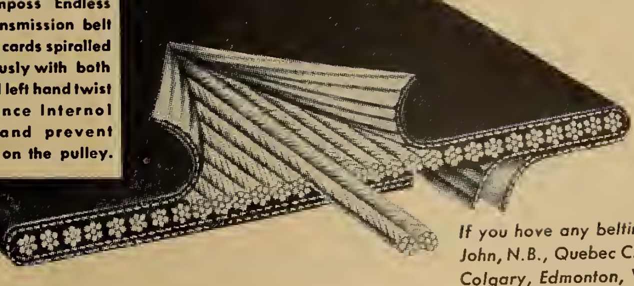
The complete operation of this large mill depends entirely on this one belt which drives the exhaust fans. Stop the fans and the whole mill must shut down.

A breakdown would be very costly as it would be necessary to tear down one complete unit of this double exhaust fan assembly to remove or replace the endless belt.

**GOODYEAR**

**INDUSTRIAL RUBBER PRODUCTS ENGINEERED FOR THE JOB**

**The Compass Endless Cord Transmission belt has rope cords spiralled continuously with both right and left hand twist to balance internal torque and prevent "travel" on the pulley.**



*If you have any belting problems consult your nearest Goodyear Branch at Saint John, N.B., Quebec City, Montreal, Toronto, London, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Vancouver.*

**Diesel engineering handbook,** 8th ed. A. B. Newell, editor. New York, Diesel Publications, 1953. 827 pp., illus., $8.50.

As in the previous editions, detailed information is given on the Diesel cycle, fuels, engine components, and auxiliary equipment, including some specialized topics such as dual-fuel engines. In this new edition there is a brief chapter on marine Diesels and a new section has also been added describing representative American makes and types, with tabulated up-to-date specifications of all makes and models.

**Dislocations and plastic flow in crystals.** A. H. Cottrell. Toronto, Oxford, 1953. 223 pp., $3.75.

"When a large force is applied to a crystal two things may happen; the atoms in the crystal may slide past one another; and they may pull apart. The purpose of this book is to describe the theory of the first of these processes."

An advance in the still far from complete theory of dislocation of crystals has been made possible only by the basic orderliness of the crystal. But, by the same token, this theory is dependent on the peculiarities of abnormal places when the structure goes wrong.

In this study, the author has kept mathematics to a minimum, stressing rather the qualitative physical ideas, for the benefit of the experimental physicist interested in crystals; and the metallurgist and engineer working to improve the mechanical properties of engineering materials.

The work is clearly arranged in a logical sequence. Opening with the interpretation of slip, dislocation and their elastic properties follow. The second half deals with theories of yield strength, and work hardening, annealing, and creep.

The book has both author and subject index, and footnote bibliographical references.

**Electric motors and control gear.** E. Molloy, ed. London, Newnes. Toronto, British Book Service, 1952. 180 pp., illus., $4.00.

Number four in Newnes practical electrical engineering series, this volume consists of contributions from seven engineers, all specialists in their field. The information includes detailed information on design, principles of operation, and practical application of electric motors and their allied control gear.

This should prove a practical and useful little manual.

**Electrical equipment of buildings.** E. Molloy, ed. London, Newnes. Toronto, British Book Service, 1952. 260 pp., illus., $4.00.

The second in the series, Newnes practical electrical engineering series, this volume treats of the requirements of buildings from a business and industrial angle, of lamps, socket outlets and power points, and the selection and installation of electrical services, such as elevators, bells and indicators, house telephones, cooking and heating appliances, electric clocks, etc.

The actual presentation of material has been done by a group of fourteen engineers, specialists in the field, and it is all of a very practical and useful nature.

**Electrical instruments, meters, and electronic control.** E. Molloy, ed. London, Newnes. Toronto, British Book Service, 1952. 196 pp., illus., $4.00.

Accuracy of present day electrical instruments is responsible, in no small measure, for the recent extraordinary progress in electrical engineering.

Electricity meters are discussed in the first half of the book, including the electricity supply meter, and the theory, operation and use of portable indicating instruments and laboratory electrical instruments.

Automatic control through electronics, and the construction and operation of the magnetic amplifier are then discussed. The book is indexed and illustrated, and is another of Newnes practical electrical engineering series.

**Eléments de construction à l'usage de l'ingénieur, tome 10. Moteurs à combustion interne, 2nd ed.** G. Lemasson and A. L. Tourancheau. Paris, Dunod, 1953. 156 pp., diagrs., 420 fr.

As the invention of the steam engine was the start of the phenomenal development in modern machinery, so also has the internal combustion engine contributed in comparable importance to the more recent revolution in this field.

Internal combustion of variable cycles, diesel, and finally gas turbine have continued this struggle for development in the engine field, and it is this development that is considered in the first part of this volume.

The second, and more important part deals with the construction of motors, two chapters being devoted to mixtures, one for Diesels, and one for explosive motors.

The study of gas turbines is condensed in the third part into twenty-five pages.

The book is elementary in that it gives detailed explanations and illustrative diagrams of the various types of motors being considered, and will be most valuable to advanced technical school students and young engineers.

It has a bibliography, but the entries are only in briefest form, and are undated.

***Elements of heat treatment.** G. M. Enos and E. Fontaine. New York, Wiley, 1953. 286 pp., $5.50.

This volume describes the basic theory involved in the heat treatment of metals in simple, straightforward language. Following introductory chapters on the properties of metals and alloys, the major heat-treatment processes — annealing, normalizing, hardening and tempering — are discussed in detail. Other operations such as forging, rolling, pressing, machining, welding, and casting are briefly described. Graphs and tables of pertinent data are included.

***Engineering mechanics.** L. E. Grinter. Toronto, Macmillan, 1953. 408 pp., diagrs., $5.75.

This elementary textbook covers the normal subject matter of statics, dynamics, and kinetics, with a final chapter on virtual work. The author's aim has been to present the material in a logical and unified form which will aid the student in formulating an analytical approach to problems as well as give him the necessary factual information.

***Experimental nuclear physics,** vol ume 2. E. Segre, ed. New York, Wiley-1953. 600 pp., $13.20.

This is the second volume of a three-volume work on the experimental techniques and theoretical interpretation of the data in nuclear physics. It includes a treatise on nuclear reactions and an extensive discussion of the properties, sources, detection, and interactions of the neutron. Each treatise with its accompanying bibliography provides the reader with the main results obtained in nuclear physics up to the end of 1952.

***Fields and waves in modern radio,** 2nd ed. Simon Ramo and J. R. Whinnery. New York, Wiley, 1953. 576 pp., illus., $9.63.

The electromagnetic theory essential to an understanding of the subject is fully treated at an intermediate level. This second edition contains much new material, including an entirely new chapter on microwave networks, new developments on slow-wave guiding structures and other miscellaneous guiding systems, and various recent developments concerning horns, slot antennae and receiving antennae.

***50-100 binomial tables.** H. G. Romig. New York, Wiley, 1953. 172 pp., $4.40.

This volume gives the tables for positive binomial $(q+p)^n$ where $q=1-p$, and covers the range of n values from 50 to 100 in steps of 5 and the range of p values from .01 to .99 in steps of .01. Directions for the use of the tables, including a brief discussion of interpolation, indicate their many possible uses, especially in the field of quality control.

**Heat transfer and fluid mechanics institute, 1953.** Preprints of papers. Stanford, University Press, 1953. 240 pp., illus., $5.50 (U.S.).

The sixteen papers in this collection were prepared for presentation at the nineteen hundred and fifty-three Heat Transfer and Fluid Mechanics Institute, which was the sixth in a series started in nineteen hundred and forty-eight to make available to engineers a program of high caliber representing fundamental contribution to the engineering sciences. The papers are discussions of the latest scientific contributions of research and development centres in the United States and cover various aspects of heat transfer, and related topics. Some idea of the contents of the papers can be best given by quoting some of the titles:

> Experimental investigation of heat transfer at hypersonic mach number.
> Temperature measurements in the wake of bodies in supersonic flow.
> Heat transfer in curved flow channels.
> Evaporation from liquid wall films into a turbulent gas stream.
> Open channel flow of water-air mixture.

All the papers are accompanied by tables, graphs and diagrams, and some have bibliographies appended.

The compilation should prove of interest to all those concerned with these subjects, as they are here given an opportunity to read, in one volume, all the papers presented at the Institute, before they appear in the publications of the societies which sponsored it.

**Industrial specifications.** E. H. MacNiece. New York, Wiley, 1953. 158 pp., illus., $5.50.

Dedicated to the American Society for Quality Control, the American Society for Testing Materials, and the American Standards Association, this work is an effort to assist companies wishing to solve their specification problems, and improve their effectiveness by the application of statistical quality control techniques.

Carefully chosen samples explain and amplify the author's principles and generalizations. He stresses the need for better specifications, of the simplification of standards and standardization, and good co-operation between purchaser and supplier. Specifications of various recognized organizations are then discussed, and the whole summed up in a final chapter entitled "Maintenance and application of specifications".

The book is well indexed and illustrated, and well documented with facsimiles of illustrative standards.

**An introduction to power system analysis.** F. S. Rothe. New York, Wiley, 1953. 187 pp., figs., $5.00.

With the use of electric power increasing in the United States at the rate of one hundred per cent each eleven years, power systems have not only increased in size to meet this demand, but they have also increased in complexity. The result of this is an increased difficulty in the analysis required for their economic design.

The analysis included in this volume considers the characteristics of the generator, the transformer, the transmission line, and the load. The transient behaviour of the components during disturbances is thoroughly investigated, and the problem connected with the fundamental operating frequencies are covered.

The book is briefly indexed, and worked problems are included with the chapters.

***An introduction to relaxation methods.** F. S. Shaw. New York, Dover Publications, 1953. 396 pp., $5.50 (U.S.).

A detailed guide for solving problems arising in fluid mechanics, the design of electrical networks and machinery, forces in structural frameworks, stress distribution, electron-optics, and many other fields. The broad application of the book has been made possible by emphasis on the different types of equations solvable by these methods rather than on specific subject problems. The treatment is logical and fully detailed.

(This new Dover edition is an unabridged reissue of the original English translation first published in 1914). (Ed. note).

**Newfoundland fisheries development committee report.** St. John's, The Committee, 1953. 136 pp., fold. maps, $1.00. (Published by authority of The Honourable James Sinclair, Minister of Fisheries, and the Honourable W. J. Keough, Minister of Fisheries and Co-operatives.

Founded in January nineteen hundred fifty-one through co-operative effort on the part of the governments of Canada and Newfoundland, the aims of the Fisheries committee were to find the best method of examining the fisheries problems of Newfoundland.

Their three methods of approach were:

1. To examine into fisheries resources available to the Province of Newfoundland, with a view to the fullest utilization of known resources, and the discovery and development of others.
2. To examine into the economics of existing methods of fishing, and of other methods which may be applicable.
3. To examine into the economics of existing methods of processing and other methods which may be applicable.

The arrangement and presentation of the material is excellent. The book is divided into five sections, namely: The problem and its setting; The fishery resources of Newfoundland; Fish production and distribution; and, A program of development.

Under these headings, types of fish, of craft, of processing, and of development are clearly differentiated and arranged, and are all in turn enumerated in the table of contents.

Appendices include statistics, geographically arranged and otherwise of volume and values of catches, with all related information, and a bibliography.

Three folded maps complete this valuable little volume, showing "approximate location of fishermen, on June 1, 1951"; "Distribution by districts of average annual landings, nineteen hundred forty-five to nineteen hundred fifty"; and "Value of annual fish production by districts, nineteen hundred forty-five to nineteen hundred fifty".

**Power cables; their design and installation.** C. C. Barnes. London, Chapman and Hall, Toronto, British Book Service, 1953. 272 pp., illus., $7.00.

The aim of the series of monographs on Electrical Engineering, of which this book is a volume, is to provide up-to-date authoritative works on subjects which are either not touched upon, or inadequately dealt with in standard text books, and which often can only be found in periodicals. This particular volume is devoted to a review of the practical and theoretical considerations necessary for the successful design, manufacture and installation of paper-insulated power cables.

The chapters on the design of power cables are extensive, and include notes on design and testing requirements, protection, dimensions and weights, and current rating. The author reviews American and Continental super-voltage cable systems, and discusses the use and development of oil filled and gas pressure cable systems. He also provides some observations on the use of aluminum as a substitute for lead in the metallic sheathing of cables, which has developed in recent years owing to the high cost of lead.

Considerable space is given to the installation of underground cables, for, as the author points out, transmission and distribution cables in England are more and more frequently placed underground.

A short bibliography, and many illustrations are included. It is expected that the book will be useful to designers, engineers, students, and cable-users who are interested in the specialized field of paper-insulated power cables.

**Pulp and paper manual of Canada, 1953.** Gardenvale, Que., National Business Publications, 1953. 452 pp., illus., $7.50.

This 1953 edition of the Pulp and paper manual includes all the features found in previous years, some in an expanded form. The sections on equipment and engineering include papers with such titles as: The load control of wood grinders; A study of recovery boiler cleaning; Valve sizing accuracy; The use of small tractor in pulpwood logging; Watering pulpwood, etc. There is also a section describing recent advances in equipment and processes.

The flow sheets of pulp and paper mills have been checked and brought up to date, and several additional ones included. The information in the tables and charts prove very useful for quick reference, whilst equally useful, although completely different in content, is the list of machinery, supply and service companies. These companies are listed in alphabetical order, and for each are given locations of head, branch and sales offices, and personnel, both officials and salesmen.

Trade names of many items of machinery and equipment are listed with their manufacturers; and there is also a listing of Canadian representatives of foreign manufacturers.

This manual should prove useful to all those interested in the pulp and paper industry in Canada, and will be a valuable reference book for those in either engineering or purchasing divisions.

**Sewerage and drainage of the great Vancouver area, British Columbia.** Vancouver, Joint Sewerage and Drainage Board, 1953. 278 pp., illus., $10.00.

With the rapid expansion of cities all over the continent, this detailed report on the findings of the Joint Sewerage and Drainage Board of Vancouver will be of inestimable value to many sanitary and civil engineers.

It includes all sewerage projects considered feasible, in the greater Vancouver area, each being considered with regard to general suitability and total annual cost.

Minimum service necessary for drainage of storm water for the protection of potential flood areas are studied, and costs approximated.

Eight locations for final disposal of sewage are detailed, and in all but two, sewage can be discharged to the receiving waters without treatment.

Plans, discussions, and estimates are considered for the general system and for the two proposed processing and disposal plants.

Construction costs and estimates are figured up to the year two thousand with a history in graph and table form, of existing facilities, with their date, time and cost of construction. Also included are present costs of servicing, corrosion problems, etc. and the staff employed to maintain them.

Maps, plans, tables and graph sheets accompany the text all the way through, constituting an invaluable volume for the thousands of engineers now engaged in this type of work.

**Strength and testing of materials.** Technical information and document unit, D.S.I.R. London, Her Majesty's Stationery Office, 1952. Part 1, Theoretical papers on strength and deformation, 260 pp., illus. Part 2, Testing methods and test results, 244 pp., illus., £2 15s. 0d. each volume. (Selected government research reports, volume 6).

Selected from research work carried out under the direction of the Ministries of Supply and Aircraft Production, now combined as the Ministry of Supply, this publication was undertaken primarily for the benefit of British industry by the Technical Information and Documents Unit of the Department of Scientific and Industrial Research.

Volume one includes papers on indentation and hardness tests, wedge indentation and penetration, plastic and elastic deformation, autofrettage of a closed end tube, compression, notch brittleness and ductile fracture, extrusion, wire-drawing, the axially symmetric problem in plasticity, and the yielding and plastic flow of anisotropic metals.

Part two covers testing methods and results, and includes papers on all the regular testing methods.

Among the less common research reports are the effect of skewness of the frequency distribution on the relationship between required test factors and strength variation; the detection of peel on white-heart malleable iron track links by a non-destructive test; the transformation of components of stress and strain in two-dimensional elasticity; and the distribution of stress in a decelerating elastic sphere.

Most of the papers include a bibliography.

This will be an invaluable pair of volumes for our many hundreds of members interested in any phase of materials testing.

**Three-phase motors: theory and operation.** T. F. Wall. London, Newnes. Toronto, British Book Service, 1952. 232 pp., figs., $6.00.

"The three-phase induction motor is far and away the most widely used type of electric motor and its operation is based on the fact that, if a symmetrical three-phase current is supplied to a symmetrical three-phase winding, a uniformly rotating magnetic field of constant magnitude will be produced in the air gap."

The first man to produce such a machine was Nikola Tesla, who was searching for an electric motor operable with neither commutator, nor brushes. In eighteen hundred and eighty-seven, he completed the first such motor. His patents for it were acquired by George Westinghouse, who erected the first three-phase generator station in eighteen hundred and ninety-one, at Niagara Falls.

Symmetrical component analysis for solving performance problems of these motors is considered, as is also the "Electric Shaft"; the "Kusa" method of speed control; and the Kloss Formula.

The whole of chapter five is devoted to the control of power factor, and the functions of reactive current, which is becoming so vital a consideration with world-wide developments in electric supply installations.

The circle diagram, squirrel cage type, Selsyn and Electric shaft systems, and "Shunt"-type induction motors are all detailed for treatment.

Mathematical tables and a good index complete this rather unique volume.

**Trees to news: a chronicle of the Ontario Paper Company's origin and development.** Carl Wiegman. Toronto, McClelland & Stewart, 1953. 364 pp., illus.

Although primarily a history of the Ontario Paper Company, this book also tells in non-technical language how pulpwood is cut and floated to the mills, how newsprint is made, and discusses some of the technical advances in the industry, and the by-products recently developed, which ensure that greater use will be made of the resources of the forests. The author relates the career of Colonel Robert R. McCormick who, before becoming editor of the Chicago Tribune, was a successful paper manufacturer in Canada. The book also tells of the opening up of the Quebec North Shore of the Gulf of St. Lawrence, the development of widespread logging operations in Ontario, and the growth of the Company's manufacturing interests on the Niagara Peninsula.

**Ultra high frequency propagation.** H. R. Reed, and C. M. Russell. New York, Wiley, 1953. 562 pp., diagrs., $10.45.

Under the authorization of the United States Bureau of Aeronautics, Department of the Navy, propagation studies were made at the United States Naval Air Test Center, Patuxent River, Maryland.

This volume is the result of the findings at this time, its primary purpose being to present current information on UHF radio wave propagation, and include a review of all other related system parameters.

The second purpose is to create "systems-minded" personnel, i.e., the engineer in his application of engineering principles to the propagation problem, and the pilot in his appreciation of the multiple effects when attempting to communicate with a ground station, or another plane in flight.

How to determine operational ranges when using UHF communications systems is also explained, and a good deal of the work deals with dynamic system performance characteristics.

Discussions include, in addition to the three hundred to three thousand megacycles per second frequency band, the upper regions of the UHF band, and the lower regions of the higher SHF band.

Problems are included with the chapters, and the book is well indexed.

## BOOKS RECEIVED

**Behaviour of metals at low temperature.** R. M. Brick, J. R. Low, Jr., and C. H. Lorig. Cleveland, American Society for Metals, 1953. 112 pp., figs., $3.00 (U.S.)

**Canadian master tax guide,** 9th ed., 1954. Toronto, CCH Canadian, 1953. 317 pp., $3.00.

**Catalogue of ferrous alloy specifications (Commercial and service).** Canada, Department of National Defence, 1949. 932 pp.

**Cooling towers, with special reference to mechanical-draught systems.** J. Jackson. Toronto, Butterworth, 1951. 104 pp., illus., $3.50.

**Employment and wages in the United States.** W. S. Woytinsky (and others) New York, Twentieth Century Fund, 1953. 777 pp., $9.00.

**Foams: theory and industrial applications.** J. J. Bikerman. New York, Reinhold, 1953. 347 pp., illus., $10.00 (U.S.)

**Gas turbines.** H. A. Sorensen. New York, Ronald Press, 1953. 460 pp., figs., $6.50 (U.S.)

**Handbook of personnel management,** rev. ed. G. D. Halsey. New York, Harper, 1953. 468 pp., $6.00 (U.S.)

**Introduction to mechanical design.** T. B. Jefferson and W. J. Brooking. New York, Ronald Press, 1953. 612 pp., illus., $6.50 (U.S.)

**Kinematics of machines.** R. T. Hinkle. New York, Prentice-Hall, 1953. 231 pp., illus., $4.75 (U.S.)

**Metallic creep, and creep resistant alloys.** A. H. Sully. Toronto, Butterworth, 1949. 278 pp., figs., $5.00.

**Outline of executive development.** Lee Stockford, comp. Pasadena, California Institute of Technology, 1953. 46 pp., pa. $2.00 (U.S.) (Bulletin no. 23).

**Pipe and tube bending.** P. B. Schubert. New York, Industrial Press, 1953. 183 pp., illus., $5.00 (U.S.)

**Principles of automatic control.** F. E. Nixon. New York, Prentice-Hall, 1953. 409 pp., $9.35 (U.S.)

**Protective atmospheres.** A. G. Hotchkiss and H. M. Webber. New York, Wiley, 1953. 341 pp., illus., $7.00.

**Technology of engineering materials.** B. R. Hilton. London, Lange, Maxwell & Springer, Toronto, Butterworth, 1953. 389 pp., illus., 36/-.

**Theory and practice of structural design applied to reinforced concrete.** B. Eriksen. London, Concrete Publications, 1953. 401 pp., figs., $5.50.

**Traffic management in industry.** L. A. Bryan. New York, Dryden, 1953. 452 pp., $5.50 (U.S.)

## TECHNICAL BULLETINS AND PAMPHLETS RECEIVED

**American society for testing materials:** Review of ASTM research, May 1953. Year Book, 1953.

**British electrical and allied industries research association. Technical reports:**

No. 6/T262—Gas-blast circuit-breakers. Effect of arcing on the mass-flow of air through the nozzle and on nozzle pressure. (Second progress report) by A. A. Hudson. No. L/T271—Discharges in dielectrics at high voltages and in the presence of harmonics, by J. H. Mason. No. V/S1—Recommended definitions of terms used in power system studies.

**CCH Canadian Limited. Canadian income tax act consolidated:** 20th edition, 1953.

**Canada. National research council. Canadian government specifications board. Specifications:**
1-GP-12a—Schedule of standard paint colors (Amendment No. 3). 23-GP-4—Metallizing operators' qualification procedure. 23-GP-8—Recommended methods for inspection of metallizing. 43-GP-8—Barrier materials, grease resistant; flexible non-corrosive, non-transferable coating. 43-GP-131—Barrier materials, water vapor resistant; flexible. 43-GP-10547—Linners, case; water resistant. 50-GP-1—Identification of steels.

**Canada. Department of resources and development:**
Surface water supply of Canada: Arctic and western Hudson Bay drainage: 1947/48 and 1948/49. (Water resources paper No. 105).

**Canada's atomic energy project, Chalk River, Ontario.** March 1953.

**Canadian standards association. Approvals laboratories:**
List of approved equipment, 4th ed., Supplement B, May 1953.

**Conservation des richesses naturelles renouvelables.** Laval, Presses Universitaires, 1953.

**Electricals Limited:**
Ampo-Lite diffused lighting fittings catalogue.

**McGill University:**
Report of McGill demonstration training course for construction industry integration. Montreal, August 1953.

**Montreal Board of Trade, Young Men's Section.** Blue book.

**Resources for tomorrow: the engineer's stewardship.** R. F. Legget. 6th Wallberg lecture, 1953, University of Toronto.

**United Nations scientific conference on the conservation and utilization of resources, 1949, Reprint:** Volume 4, Water resources.

**Yearbook of the heating and ventilating industry.** Volume 7, 1953. London, Technitrade Journal Ltd., 1953. 302 pp.

## STANDARDS REVIEWED

**Canadian standards, Canadian standards association, National research building, Ottawa, Canada.**

**C.S.A. A60-1953 — Vitrified clay pipe,** 2nd ed. 75 cents.

This new edition of the original 1941 Specification has been necessitated by the developments which have taken place since that date. This Specification covers the requirements for physical dimensions, methods of testing, and permissible variations, of vitrified clay pipe and fittings intended for the conveyance of sewage, commercial and industrial wastes, chemical liquids and vapours, and storm water, or as thermal ducts and vents. It also contains suggested ideas for the installation of vitrified clay pipe. Reference to this Specification is made in the National Building Code.

**C.S.A. Comparison of the fifth and sixth editions, Canadian Electrical Code, Part 1.** 25 cents.

This 22-page booklet compiled by L. A. Shaver, the Vice-Chairman of the Committee on the code, is sub-titled A summary of major rule changes and a cross reference to corresponding rules. It contains a brief summary of the changes, and a cross reference index to the rules of both editions. It will be a valuable aid to those who are familiar with the fifth edition in locating the corresponding rules of the sixth edition which have been renumbered and re-arranged.

**C.S.A. G110 Series—Specifications for stainless steel.** Complete set, $4.25.

This is the first edition of the specifications for wrought stainless steel in the forms made in Canada. Wherever possible, these Canadian specifications are based on those of the ASTM for stainless steel, although the latest American Iron and Steel Institute tolerances are employed. Where applicable, the ASTM specification number is shown. The specifications are of a fairly general nature, so as to serve industry in the broadest way possible. The titles of the seven individual specifications which at present form this series are as follows:

Corrosion-resisting and heat-resisting steel billets and bars for reforging:

Hot rolled-cold-worked, and cold-finished corrosion-resisting and heat-resisting steel bars:

Corrosion-resisting and heat-resisting chromium steel plate, sheet and strip.

Corrosion-resisting and heat-resisting chromium-nickel steel plate, sheet and strip:

High-strength corrosion-resisting chromium-nickel steel sheet and strip.

Corrosion-resisting and heat-resisting wire:

Corrosion-resisting chromium and chromium-nickel steel plate, sheet and strip for fusion-welded unfired pressure vessels:

The scope of each specification is stated, and many include diagrams and tables.

**C.S.A. Z7.2.4.11-1953 — Specification for attachment threads for lens accessories.** 25 cents.

**C.S.A. Z7.3.4.2-1953—Specification for standard format sizes, focal lengths, and operating temperatures for air cameras.** 25 cents.

**American society for testing materials. 1916 Race Street, Philadelphia 3, Pa. Special technical publications:**

**No. 128 — Symposium on strength and ductility of metals at elevated temperatures.** pa. $3.25.

The papers and discussions in this Symposium, sponsored by the Joint ASTM-ASME Committee on Effect of Temperature on the Properties of Metals, were presented at the 1952 Annual Meeting of the American Society for Testing Materials held in New York City.

The material presented in this Symposium concerns the effects of notches on metals at elevated temperatures, under either static or dynamic loading, and discusses results of current research on the subject. It also deals with another aspect of the behaviour of metals at elevated temperatures, namely, the metallurgical changes which occur during heating at elevated temperatures, and the effects of these on strength and ductility.

**No. 130 — Symposium on continuous analysis of industrial water and industrial waste water.**

This Symposium was arranged by the Advisory Subcommittee of ASTM Committee D-19 on Industrial Water, because of the great interest in the continuous analysis of water, and the rapid development in electronic procedures and their use in control operations, many of which have been partially applied to analytical methods. The topics covered by the five papers in the Symposium include pH, conductivity, oxidation reduction potential, alkalinity, acidity, chlorine demand and residual, colour, turbidity, hardness, oil, silica, and dissolved gases.

**No. 142 — Symposium on exchange phenomena in soils.** pa. $1.75.

Because of the recognized significance of physico-chemical properties of soils in engineering, ASTM Committee D-18 on Soils for Engineering Purposes authorized this present Symposium to deal with this field. Emphasis is placed upon the influence of molecular and ionic exchange upon properties and responses of soils, thus leading to methods by which soils are altered to achieve adequate engineering performance even under adverse circumstances. It is also demonstrated that exchange phenomena are dynamic.

This Symposium should encourage interest in the fundamental characteristics of fine-grained soils. Work in this direction can lead to improved soil mechanics testing and analysis as well as to design and construction practices which will improve unstable materials and ameliorate difficult conditions on the job.

**British Standards, British standards institution, 24-28 Victoria Street, Westminster, London, S.W.1. British standards are available from the Canadian standards association, National research building, Ottawa, Canada.**

**B.S. 2030: 1953 — Dimensions of X-ray films for crystallography.** 2/–.

The special needs of crystallographers cannot be satisfactorily met by the sizes of X-ray film specified in B.S. 1443 — Sizes of X-ray film and intensifying screens — and this standard B.S. 2030 has, therefore, been prepared to deal with the sizes of X-ray film used in the various instruments peculiar to the Crystallographer, e.g. diffraction powder cameras as specified in B.S. 1693.

It is hoped that this British Standard will give guidance relating to the future design of crystallographic equipment and apparatus.

# Business & Industrial Briefs

## A Digest of Information received by The Editor

## Appointments and Transfers

**Horton Steel Works, Limited.**—Horton Steel Works, Limited opened a new sales office at 313—8th Avenue, West, Calgary, Alberta, Canada, on September 1st. George Crase, Jr. is manager of the office.

**Sandwell and Company Limited.** — Senior technical staff appointments have been made by Sandwell and Company Limited, consulting engineering firm of Vancouver, B.C., and Seattle, Wash., to its Murapara project in New Zealand, near Auckland.

E. S. Barton, of Vancouver, is resident engineer for Sandwell and Company Limited on the $40,000,000 design and construction project for Tasman Pulp and Paper Company Limited.

C. Victor Rapson, of Auckland, is civil engineer; Robert D. Wilson, formerly of Boyer, Tasmania, is electrical engineer; Thomas J. McKie, of Wanganui, New Zealand, is field engineer; James G. Brown, of Auckland, New Zealand, is cost control auditor.

**W. P. Favorite Company of Canada, Limited.**—The W. P. Favorite Company of Canada, Ltd., 418 Main Street East, Hamilton, Ontario, has been appointed sales representatives in Canada for the equipment in the Dempster-Dumpster System of materials handling and Dempster-Balester scrap metal baling presses. Announcement was made by Mr. Goodloe Walden, sales manager of Dempster Brothers, Inc., Knoxville, Tenn.

In the Favorite organization, Mr. T. P. Partridge will be in charge of Dempster-Dumpster equipment sales and Mr. L. V. Potvin will be in charge of Dempster-Balester sales, the same capacity each held while with the Hamilton Bridge Company, Ltd. Hamilton Bridge will continue the manufacture of Dempster Brothers' equipment in Canada.

L. A. Cox

**Lionel A. Cox.** — The appointment of Dr. Lionel A. Cox as Director of Research of Johnson & Johnson, Limited, Montreal, is announced.

A graduate of the University of British Columbia, Doctor Cox received his doctorate at McGill University.

His extensive background includes a number of important positions in chemical research both here and in the United States.

**J. McL. Schell.**—The appointment of J. McL. Schell as manager of engineering sales for Northern Electric's communications equipment division has been announced.

**Professor George Winter.**—Prof. George Winter of Cornell has been appointed to the American Concrete Institute's Standard Building Code Committee, whose decisions govern nearly all reinforced concrete construction in the United States.

Professor Winter is head of the Department of Structural Engineering in the School of Civil Engineering at Cornell.

**Cleaver-Brooks Company.** — James M. Sturman has been designated Sales Manager of the Escher Wyss Division. Mr. Sturman has 10 years' service with the company, the last three of which have been spent in San Francisco as West Coast Sales Manager of distillation units.

**Canadian General Electric Company.**—The general managers of the five self-contained operation divisions of Canadian General Electric Company have been elected vice-presidents. H. M. Turner, president, made the announcement in Toronto following a meeting of the company's Board of Directors.

The vice-presidents and general managers are: A. M. Doyle, Apparatus Division; J. S. Keenan, Industrial Products Division; E. H. Lindsay, Lamp Division; R. M. Robinson, Appliance Division; J. H. Smith, M.E.I.C., Wholesale Division.

**The Baker-Raulang Company.** — John A. Matousek, formerly vice-president of Manufacturing for the Baker-Raulang Company, has been named vice-president and general manager. Ernest R. Scovil, formerly secretary of the company, has been named secretary and treasurer.

**A. F. McLachlin.**—The appointment of A. F. McLachlin to the Directorate of the Board of Canada Iron Foundries Limited, is announced by Mr. T. F. Rahilly, Chairman of the Board and President of Canada Iron Foundries Limited, Montreal. Mr. McLachlin is President and Director of Railway & Power Engineering Corporation Limited.

W. M. Davidson

William M. Smart

Ewart Greig

G. D. Garrett, Jr.

A. A. Cumming

G. O. Loach

**Union Carbide Canada Limited.** — Announcement has been made of the election of Mr. Ewart Greig as President, and Mr. William M. Smart as Vice-President, Secretary and Treasurer at Union Carbide Canada Limited.

Announcement was also made by Mr. Ewart Greig of the appointments of Mr. A. A. Cumming as President, National Carbon Company, Mr. D. S. Lloyd, M.E.I.C., as President, Dominion Oxygen Company (see Personals), Mr. G. O. Loach as President, Electro Metallurgical Company, Mr. George D. Garrett, Jr. as President, Carbide Chemicals Sales Company and W. M. Davidson as President, Bakelite Company, divisions of Union Carbide Canada Limited.

●

**Douglas Willmot.**—Provincial Engineering Ltd. announce the appointment of Mr. Douglas Willmot to the post of Ontario Sales Manager, Mechanical Construction Division, operating from their Hamilton office.

●

**Provincial Engineering Ltd.** — Provincial Engineering Ltd., Montreal and Niagara Falls, announce the opening of their Lake St. John District Office at Chicoutimi, Quebec, with Mr. Eric Gautby as superintendent in charge of operations.

●

**Lance H. Cooper.**—Lance H. Cooper, of London, Eng., Chairman of The Mond Nickel Company, Limited, has been elected a Vice-President of its parent company, The International Nickel Company of Canada, Limited, Dr. John F. Thompson, Chairman of the Board of Directors of Inco, announced. He assumed his new office on January 1, 1954.

●

**Canadian Marconi Company.** — Mr. Stuart M. Finlayson, President of Canadian Marconi Company, announced that Mr. H. G. Nelson had been named to the Board of Canadian Marconi Company.

●

**W. S. Cowell.**—Mr. D. Vance, President of Wheel & Rim Company of Canada Limited, announces the appointment of W. S. Cowell as Vice-President and General Manager. He has been associated with the automotive industry for many years and is past chairman of the Montreal Section of Society of Automotive Engineers, past president of Canadian Automotive Wholesalers and Manufacturers Association, Director of Automotive and Aircraft Manufacturers Association and a Councillor of Society of Automotive Engineers.

●

**Editor's Note.**—The "Interesting Advertising Appointment" in our November issue was not, as reported, a first in the annals of Canadian advertising.

T. S. Glover, M.E.I.C., informed us that he was appointed a director of Ferres Advertising Service in 1952 and that he has been engaged exclusively in industrial advertising for 25 years.

●

# New Equipment and Developments

**Management Transfer.** — The decision to power the F86 Sabre with the Orenda engine in place of General Electric's J-47 has resulted in a transfer of management of the Crown-owned repair and overhaul plant at Downsview airport, Toronto. The Department of Defence is negotiating with the DeHavilland Aircraft of Canada Ltd. on the basis of that company assuming the management of the Downsview plant on Jan. 1, 1954.

DeHavilland is being chosen because of it's capabilities and because it is currently managing a government-owned engine facility which is contiguous to the Downsview plant.

**Hydraulic Press.**—A 50 000-ton capacity hydraulic press, believed to be the largest of its type in the world, is now under construction for the U.S. defence program and will be used for the manufacture of aircraft parts.

Dominion Bridge Co., Lachine plant, have just completed two large weldments, consisting of loading girders for a sliding table which forms part of this huge press. The girders will act as supports for the ways of the lower bolster which slides out of the press to facilitate the setting of die holders and dies. The girders also serve to support the hydraulic equipment which powers the movement of the sliding table. An indication of the size of each weldment may be obtained from the following dimensions: Length 66 ft. 4 ins., height 6 ft. 9 ins., webs and flanges 3 ins., in thickness with some portions of the weldments 7 to 8 ins. thick. Each girder weighs 60 tons. This weight is necessary to counteract deflection in operation.

The bottom flange of each girder has a double bend which is produced by first bending the plate and then burning the profile to suit. The rail slab, 6½ ins., thick, was machined all over to produce a flat surface for contact with the web and also to secure the desired dimensions on the outer face.

Pre-heating was carried out by a system of block welding. Local pre-heating to 400 F., then welding for the full weld section in block increments.

**Electric Power Industry.** — The electric power industry marked an important "birthday" recently—the 60th anniversary of the signing of contracts that led to the world's first large power installation and the harnessing of Niagara Falls.

On Oct. 27, 1893, Westinghouse and the Niagara Falls Power Co. signed contracts for the building and installation of three alternating current waterwheel generators.

The installation of the three units was completed two years later and they are still operating today—58 years later.

**Fellowship.**—The School of Civil Engineering of Cornell University has announced the establishment of a two year fellowship for graduate study in the use of bituminous materials and aggregates for bituminous paving mixtures.

This fellowship has been made possible by the New York State Bituminous Concrete Producers Association.

Applicants for the spring term 1954 are now being considered. Information about the fellowship may be obtained from Professor Taylor D. Lewis, Lincoln Hall, Cornell University,' Ithica N.Y.

# Publications

**For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.**

**Please mention *The Engineering Journal* when writing.**

**Plant Modernization.**—"Basic Planning—Plant Modernization and Expansion" is the title of a new study published by Walter Kidde Constructors, Inc., to help guide company management and engineers in dealing with the complex problems of modernizing and expanding plant facilities.

The 16 page publication outlines a detailed step by step procedure for analyzing existing plant facilities to establish the type, quantity and value of products which should be manufactured; type, number and cost of tools, equipment and machinery required; and size, location and cost of floor space needed for projected modernized or expanded plant and production facilities.

Copies are available on request to Walter Kidde Constructors Inc., 140 Cedar St., New York 6, N.Y.

**Measurement of Surface Temperatures.**—Literature is available describing the use of RdF Stikon resistance thermometer elements and Minneapolis Honeywell Electronik recorders for the measurement of surface temperatures in the range of —100 to +400F.

For information write for Instrumentation Data Sheet 10.1-3 to Minneapolis-Honeywell Regulator Co., Ltd.; Leaside, Toronto 17 Ont.

**Surface Finishing.**—The complete story on the newly developed Metablast process for controlled surface finishing is available in a four-page, two-colour bulletin issued by the American Metaseal Manufacturing Corporation, West New York, N.J.

Photographs show how a pre-determined, consistent finish can be applied to metal parts through the use of a special abrasive suspension applied to parts by means of air pressure.

Special sections explain the variety of problems the process can solve. Write to the company for this bulletin.

# WHY Westinghouse DRY TYPE "E"

## DISTRIBUTION TRANSFORMERS

## E. B. EDDY INSTALLATION TELLS WHY . . .

In the corrosive and moisture-laden atmosphere of the paper mill blow pits, the E. B. Eddy Company has installed two 15 KVA Westinghouse Dry Type "E" transformers for lighting service.

The Dry Type "E" replaces the more cumbersome and expensive oil-filled type previously used. They are neat, compact and simple to install, while the totally-enclosed factor makes them ideal for service conditions such as this.

Look at these advantages: AIR COOLED — eliminates fire hazard; TOTALLY ENCLOSED — can be installed in any non-explosive atmosphere; SPACE SAVING — Hipersil core; INSULATION — Class H Silicone; LOW MAINTENANCE AND INSTALLATION COSTS — no liquids to inspect, filter or change; no expensive vaults required.

If applications in your plant require transformers to operate in dust, corrosive or moisture-laden atmospheres, investigate the Westinghouse Dry Type "E." For further information contact your nearest Westinghouse District Office or write to the Industrial Products Division in Hamilton for Bulletin B-5812.

**Ideal for application in paper mills, textile plants, steel mills, chemical plants, lumber mills — or any industry with a dust, corrosive or moisture-laden atmosphere.**

# Recent Studies of Foundation Behaviour

*by*

Dr. G. G. Meyerhof, M.E.I.C.

*Foundation of Canada Engineering Corporation, Limited, Montreal, Que.*

Perhaps the most striking phenomenon in foundation design during the past decade or two is the growing tendency to bring the theories of soil mechanics out of the laboratory and onto the job. The rough and ready methods of the prewar years are no longer adequate or economical.

This paper, presented before the Montreal Branch, on January 28, 1954, gives a clear idea of the lines along which foundation experts are thinking and describes in simple language how theory may be applied to practice.

Until recently allowable bearing pressures were commonly used for the design of shallow foundations and the bearing capacity of piles was estimated from the results of pile driving formulae. It was considered also, that an equal bearing pressure or pile load all over a site caused a negligible and uniform settlement over the whole loaded area. Structures were thus almost invariably designed and erected on the assumption of perfectly rigid foundations. The study of foundation behaviour and of the performance of structures, amplified by laboratory research, has led to a more rational approach. It is now recognized that a site exploration and soil tests are required to ascertain the nature and probable behaviour of the ground during and after the construction of the works, so that an economical and safe foundation design can be prepared.

Since foundations form the link between the superstructure and the soil, they have to fulfil two main and interrelated functions. First, the stability of the foundation must be assured with an adequate margin of safety and second, the movement of the foundation must be within limits that can be tolerated by the superstructure.

### Stability of Foundation

In order to ensure the stability of a structure, the foundation loads must be within the ultimate bearing capacity of the soil. This bearing capacity depends on the soil properties, mainly the shearing strength and ground water conditions, and the foundation characteristics, mainly the size and depth. An estimate of the bearing capacity at which shearing failure of the soil occurs can be obtained from plastic theory (1, 2), which is supported by extensive research on model foundations and field loading tests. According to this analysis the unit base resistance is

$$q = cN_c + \gamma \frac{B}{2} N\gamma \quad \ldots\ldots\ldots (1)$$

in which $c$ = cohesion of soil, $\gamma$ = effective density of soil i.e., the submerged density below ground water table, $B$ = width of the foundation, and $N_c$ and $N\gamma$ are bearing capacity factors, depending mainly on the angle of internal friction $\phi$ of the soil, the depth and shape of the foundation and the inclination of the load.

For clays (purely cohesive materials, $\phi = 0$), Equation (1) may be simplified to

$$q = cN + \gamma D \quad \ldots\ldots\ldots\ldots (1a)$$

where $N_c = N\,(1 + D/4B)$, very nearly, with a maximum of $N_c = 1.5N$, and

$N = 5$ for strip foundations,

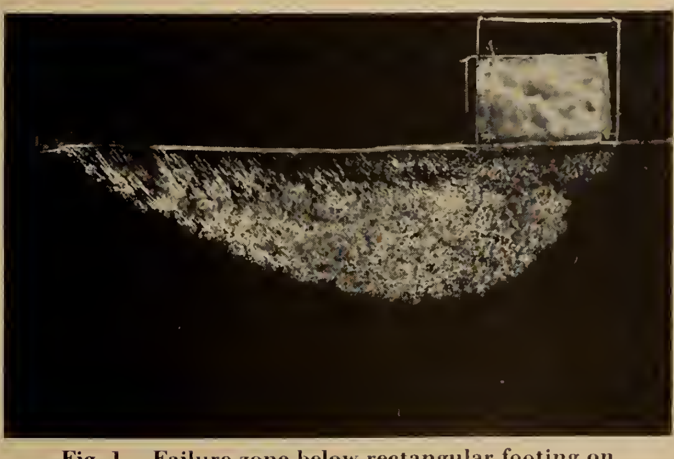

**Fig. 1. Failure zone below rectangular footing on surface of dense sand.**

**Table 1 — Relation of Consistency and Shearing Strength of Clays**

| Consistency . . . . . | Soft | Firm | Stiff | Very stiff | |
|---|---|---|---|---|---|
| Shearing strength, (c) tons/sq. ft. | 0.13 | 0.25 | 0.5 | 0'1 | 2.0 |

$N$ = 6 for circular or square foundations
and $D$ = depth of foundation.

The consistency and shearing strength of clays are commonly related as indicated in Table 1.

For sands and gravels (cohesionless materials, $c = O$) Equation (1) may be simplified to

$$q = \gamma \frac{B}{2} N\gamma \ldots\ldots\ldots\ldots\ldots\ldots (1b)$$

in which $N\gamma = N\ (1 + D/B)$, very nearly and $N$ is given in Table 2, together with a suggested relationship between the state of packing and angle of internal friction of sands and gravels (see Appendix).

For silts and other materials having both cohesion and internal friction, the ultimate bearing capacity is determined from Equation (1); reference should be made to the papers (1, 2) mentioned for further details.

In practice, foundations are frequently subjected to a horizontal thrust and a bending moment in addition to a vertical load. This condition has recently been investigated both theoretically and experimentally for shallow foundations(3). These investigations show that the bearing capacity decreases rapidly with eccentricity of the load. The customary practice of taking the maximum toe pressure as governing the bearing capacity was found to be generally safe for small eccentricities, but not for large ones. A more rational method is obtained by assuming that the contact pressure distribution under an eccentric load is identical with that of a centrally loaded foundation of reduced area. Similarly, the investigations show that the bearing capacity decreases considerably with inclination of the load, for which no allowance was previously made. As a result of this study, a method has been suggested of combining the effects of eccentricity and inclination to determine the bearing capacity under eccentric inclined loads.

For deep foundations, such as piers and piles, the skin friction (adhesion of the shaft) is added to the base or toe resistance to obtain the total bearing capacity of the foundation. The skin friction can be estimated from the mechanical properties of the soil, from ground water conditions and from the physical characteristics and method of installing the foundation. In clays the adhesion varies between wide limits and, except in the case of piers, governs the bearing capacity. Field loading tests (4) on bored *in situ* piles installed in unlined auger boreholes in stiff clay show that water from the concrete softens the clay and reduces the adhesion to 0.15-0.35 tons/sq. ft. On the other hand, tests on driven piles, even in very sensitive clays, indicate (2) that a month or so after driving the adhesion may be taken as equal to the undisturbed shearing strength of the soil within a limit of about 1 ton/sq. ft.

The total bearing capacity of a pier or pile is

$$Q = 9cA + c_a F \ldots\ldots\ldots (2)$$

in which $c$ = average cohesion of clay near pile toe
$c_a$ = average unit adhesion along pile shaft
$A$ = area of toe
and $F$ = embedded surface area of shaft.

In sands and gravels the skin friction is frequently small compared with the point resistance and can be ignored, so that the total bearing capacity of a pier or pile is then

$$Q = \gamma ADN/2 \ldots\ldots\ldots (3)$$

where $\gamma$ = effective density of soil near pile toe
$A$ = area of toe
$D$ = depth of toe below sand surface
and $N$ = bearing capacity factor, depending on the angle of internal friction of soil near the toe (see last line of Table 2 just preceding).

Where piers or piles pass through clay and rest in underlying cohesionless material, the adhesion of the clay to the shaft can be added to the toe resistance corresponding to the embedment of the toe in the cohesionless soil.

Where the pier or pile spacing is less than about four times the base or toe width, the bearing capacity of a group is usually given by the base resistance of piers or piles and enclosed soil plus the skin friction of the perimeter of the group; for stratified soil the method of estimating the bearing capacity is similar to that outlined above.

**Table 2 — Suggested Relationship Between the State of Packing and Angle of Internal Friction of Sands and Gravels**

| Type of material | State of packing | | | |
|---|---|---|---|---|
| Uniform sands | Loose | | Compact | Dense |
| Well-graded sands and gravels | Very Loose | | Loose | Compact |
| Angle of internal friction ($\phi$) | 30° | 35° | 40° | 45° |
| Factor N for strip foundations and shallow circular or square foundations ($D/B \leq 1$) | 23 | 48 | 114 | 300 |
| Factor N for deep circular or square foundations ($D/B \geq 10$) | 25 | 60 | 240 | 960 |

### Settlement of Foundation

If the foundation is located below the depth at which the soil is subject to volume changes because of climatic or artificial influences, movements due to structural loads govern the allowable bearing pressures or loads. To ensure a reasonable margin of safety against shearing failure of the soil, it has been suggested (5) that allowable foundation loads should not exceed one-third of the ultimate bearing capacity under normal loading conditions, nor one-half of the ultimate under the most unfavourable conditions. These allowances give factors of safety of the same order as those normally used in structural design.

The total settlement of foundations depends on the soil properties, mainly on the thickness and compressibility of the strata within a depth of one or two times the width of the building, and the foundation characteristics, mainly the size and loading. Settlement can be divided into immediate settlement due to deformation of the soil without volume change, and consolidation settlement due to closer packing of the grains. Immediate settlement occurs essentially on application of the load and consists of an elastic (recoverable) portion, which can be estimated from elastic theory (1), and a plastic (irrecoverable) portion, which can be estimated from plastic theory (6). The magnitude and rate of consolidation settlement can be estimated from consolidation theory (1); the maximum time to be considered depends on the economic life of the structure. Field observations (5) on structures have shown that these methods of estimating settlement are adequate for most practical purposes in the case of clays and silts; for sands an empirical extrapolation of field loading tests is required at present to estimate the probable movement of structures. With a factor of safety of three on the ultimate bearing capacity of the soil, the settlement usually varies from one to ten per cent of the width of the foundation.

While total settlement is mainly important in relation to access to, and services of a structure, the differential settlement must be limited to avoid harmful distortion of the superstructure. Relative movement depends on the layout and rigidity of the structure and on the variation of the compressibility of the soil under various parts of the foundation. For uniform soil and loading conditions, the differential settlement is about one-half of the total movement, but for non-uniform soil conditions it may be as much as the total settlement.

The movements which can be tolerated in a structure must be fixed in each particular case on the basis of structural analysis. For this purpose a method has recently been proposed (7, 8) in which the foundation and settlement characteristics of the soil at a site can be inter-related with the loading, layout and rigidity of the structure on the site. This method treats the superstructure, its foundations and the underlying soil as one complete statically-indeterminate system. The analysis is based on elastic theory for both structure and soil, which would appear to be reasonable for working stresses of one-third or less of the ultimate. On this basis, the total and differential settlements, bending moments and shearing forces in foundations and structures of different types and relative stiffness in relation to the soil can be estimated. Since in practice the flexural rigidity of the whole foundation is frequently small compared with that of the superstructure, approximate methods have been suggested for estimating the stiffness of open and enclosed multistorey building frames and of load bearing walls.

The results of this analysis, which can also readily be applied to the design of footings and raft foundations (8), show that the total settlement is not much affected by the relative stiffness of the structure as compared to that of the soil. The differential settlement, however, decreases rapidly as the relative stiffness increases, while correspondingly greater bending moments and shearing forces are induced in the structure. Analysis of a few typical building frames indicates that considerable settlement stresses could be induced in all structural members and would be largest in beams at external joints and in all but centre columns, especially in the lower storeys. It is also shown that in

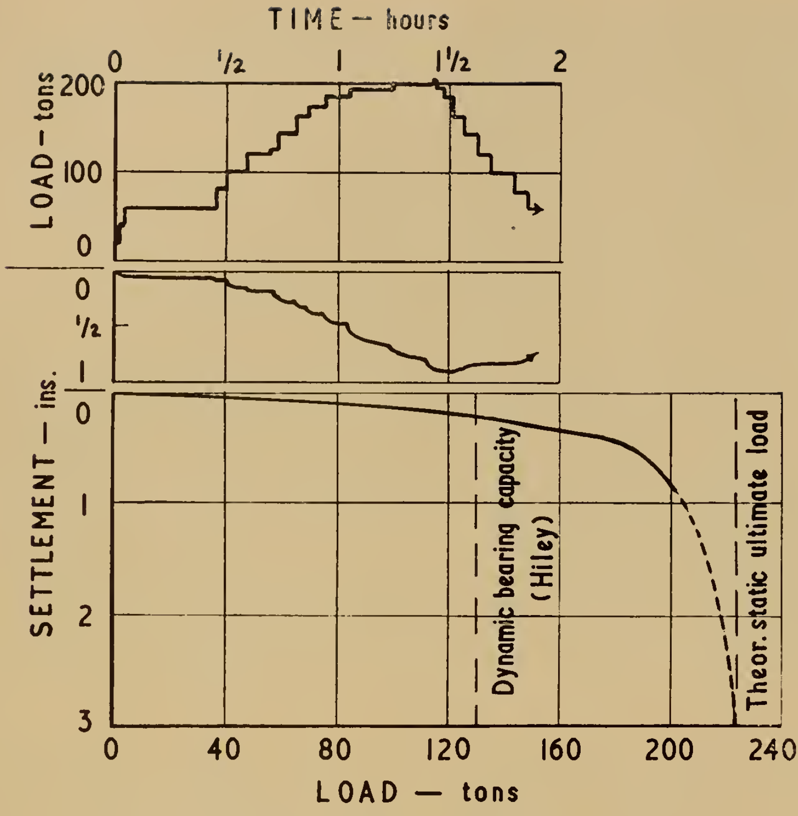

Fig. 2. Results of pile loading test on dense sand and comparison with estimates.

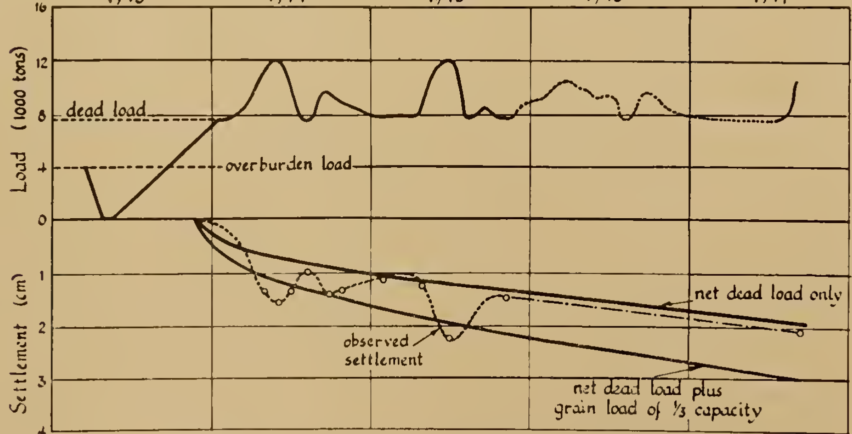

Fig. 3. Comparison of observed and estimated settlement of grain elevator on clay with variable foundation load.

Fig. 4. Distortion of long factory building on fill.

order to prevent overstressing, as distinct from collapse, the permissible bearing pressures or loads for a given layout of the foundation have to be reduced as the structure becomes stiffer. Panels and other wall enclosures stiffen exterior building frames appreciably, and the proportion of the load carried by curtain walls and by the framework depends on their relative flexural rigidity. Recent observations on the behaviour of building frames and load-bearing brick walls have enabled tentative safe limits to be suggested (8) for the deformation and stresses of such structures in practice; the results are summarized in Table 3.

In order to obtain information about the behaviour of framed buildings undergoing settlement, the total and differential foundation movements and the stresses in the two bottom storeys of a new government office building in London, England, have been recorded(8). This fairly stiff, enclosed, steel framed structure of 12 storeys rests on a raft foundation on stiff clay, with a maximum net bearing pressure of 0.8 ton/sq. ft. The total settlement observed to date varies from about ¾ to 2 in. At a section where the maximum differential settlement between adjacent columns since substantial completion is of the order of 3/16 in. on a span of 25 feet, the originally observed maximum stress in the steelwork of the order of 6,000 lb. per sq. in. has been increased to about 7,500 lb. per sq. in. by the differential settlement. On account of the enclosure of the frame and its composite behaviour, an action verified by the results of loading tests on the building, both the original and the settlement stresses are smaller than those estimated for rigidly-connected bare sections. Nevertheless, the present settlement stresses are about one-quarter of the stresses due to normal structural loads.

Table 3 — Tentative Safe Limits for the Deformation and Stresses of Building Frames and Load-Bearing Brick Walls

| Type of structure | Maximum allowable differential settlement | Maximum allowable tensile stress |
|---|---|---|
| Open reinforced concrete and encased steel frames | 1/300 of span between adjacent columns | 2/3 tensile strength of concrete |
| Ditto with enclosing walls | 1/1000 of span between adjacent columns | Ditto for the frame; ½ tensile strength of walls |
| Load-bearing brick walls | 1/2000 of length of wall | 30 lb. per sq. in. |

#### Horizontal Movement and Tilting of Foundation

Where a foundation is subjected to a horizontal thrust and a bending moment in addition to a vertical load, horizontal movement and tilting must be expected as well as settlement. The horizontal and tilting movements, which can be estimated in a way similar to those due to settlement, are especially important in single-storey arched and framed structures. In multistorey building frames the effect is greatest in the bottom storey and decreases with distance from the base. The bending moments and shearing forces induced by the movement are determined by a structural analysis, in conjunction with the deformation characteristics of the soil. Such an analysis has been made (8) for building frames on footings with "hinged" and "fixed" feet to determine the horizontal thrust and bending moment at footing level after movement. The results show that the original thrust and moment decrease rapidly as the relative stiffness of the lowest columns compared to that of the soil increases and as the footing width increases. The reduction in bending moment is particularly marked, because it depends on both the lateral movement and the tilt of the footing. Unless the footings are small, the moment may be practically zero, or even be reversed, due to lateral movement changing the eccentricity on the base; this may affect the mode of failure and limit the collapse load of superstructures.

To study the interaction between simple framed structures and the soil, especially in relation to horizontal movements and tilting of the foundation, some loading tests have been made on model steel portal frames resting on clay and sand (8). It was found that under a given load the horizontal and tilting movements of the footings of a frame, which was stiff in relation to the soil, were less than those of a similar flexible frame and led to a much smaller horizontal thrust and bending moment at the footings. The results also indicated the beneficial effect of a tie between the feet and showed that the bending moment at the footings may be practically zero unless the footings are well restrained. While the stiff frames failed because of insufficient bearing capacity of the soil, the slender frames failed generally by structural collapse, in accordance with predictions based on plastic theory. The collapse load varied from a maximum for portals with tied and deep footings, to a minimum for frames without ties on the surface, when the soil resistance to lateral and rotational foundation movement was insufficient to permit plastic hinges to develop at the joints and thus reduced the collapse load by up to about 40 per cent. Field observations should be made on full-sized structures to ascertain the lateral and rotational movement of the foundations, as well as the settlement, in order to study their effect on the behaviour of different types of superstructures.

### Conclusions

Rational foundation design requires an estimate of the stability of the soil, of the movement of the foundation and of its effect on the behaviour of the superstructure. The ultimate bearing capacity of shallow and deep foundations can be determined from soil and foundation characteristics under most conditions.

Settlement of foundations can also be estimated in most cases from the results of a site investigation. Differential settlement depends on the layout and rigidity of the whole structure, as well as on the soil and foundation characteristics. Methods have recently been developed to estimate the stiffness of structures and to relate it to the deformation characteristics of the soil. Such an analysis shows that differential settlement decreases rapidly as the relative stiffness of structure to soil increases, while correspondingly greater bending moments and shearing forces are induced in the structure.

Recent observations on the behaviour of brick walls and enclosures for building frames have been analysed to suggest tentative safe limits for deformation and stresses. Observations on a multistorey steel frame building undergoing settlement have shown that appreciable stresses can be induced in frameworks by differential settlement of the foundations. Horizontal movement and tilting of foundations has a considerable influence on the behaviour of walls and single-storey structures. Some support for an analysis of this problem has been obtained from the results of loading tests on model portal frames on clay and sand, which also indicated the beneficial effect of a tie between the feet.

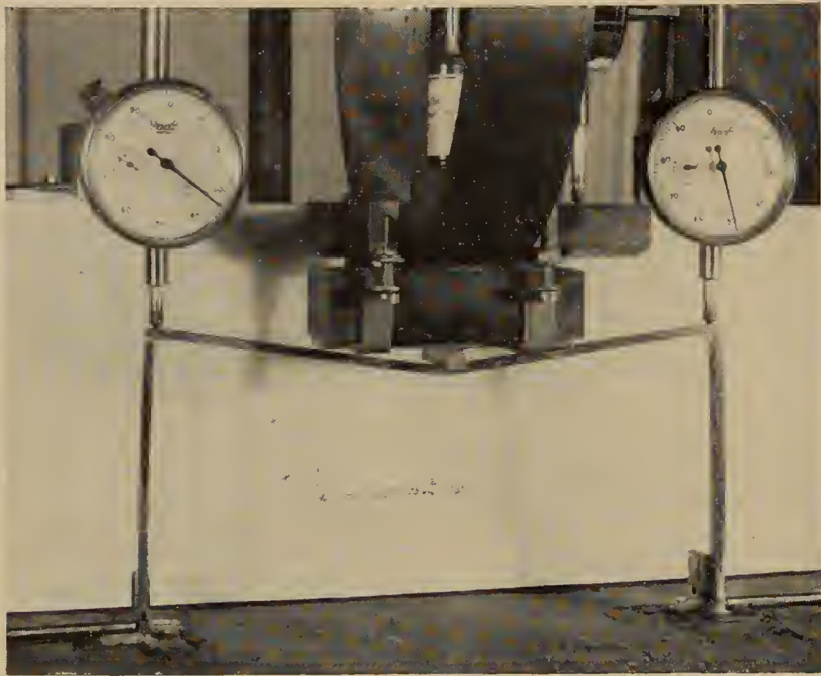

Fig. 5. Failure of slender portal frame under vertical load on clay; structural collapse.

### Appendix

#### State of Packing and Angle of Internal Friction of Sands and Gravels

On account of the difficulty and expense in procuring and testing undisturbed samples of sands and gravels, it is frequently preferable to use mainly the results of field penetration tests to ascertain the relative density of the soil from which the angle of internal friction and bearing capacity are estimated (see under "Stability of Foundation"). For this purpose either dynamic or static penetration tests are made.

In dynamic (standard) penetration tests a 2 in. diameter sampling spoon or solid drive point is driven into the ground by a drop hammer under about 350 ft.-lb. energy, and the number of blows per foot of penetration is measured(5). In static (deep sounding) penetration tests a 60° cone is pushed into the ground by a jack at a controlled rate, and the bearing pressure during penetration is measured. While the penetration resistance determined by both methods depends not only on the density but also on the depth of the soil below the surface, an approximate correlation between the relative density, penetration resistance and angle of internal friction of sands and gravels is given in the following table.

Table 4. Approximate Relationship Between Relative Density, Penetration Resistance and Angle of Internal Friction of Sands and Gravels.

| State of Packing | Relative Density | Penetration Resistance | | Angle of Internal Friction ($\phi$) | |
|---|---|---|---|---|---|
| | | Dynamic Blows/Foot | Static T/Ft.$^2$ | Uniform Sands | Well-graded Sands and Gravels |
| Very Loose | <0.2 | <4 | <20 | <30° | <35° |
| Loose | 0.2 – 0.4 | 4 – 10 | 20 – 50 | 30° – 35° | 35° – 40° |

# Vapor Phase Corrosion Inhibitors

*by*

I. D. G. Berwick *and* B. H. Levelton

*British Columbia Research Council, Vancouver, B.C.*

**The prevention of corrosion is a universal problem. The types of inhibitors described in this paper, and the methods of their application, should be of value to engineers in many branches of industry.**

One of the commonest methods of controlling metallic corrosion consists of adding chemical agents to the system to modify the corrosive solution. For instance, one way of stopping acid corrosion is to neutralize the acid by the addition of sodium hydroxide,—a method frequently employed in the treatment of boiler water. Other corrosion promoters, such as hydrogen sulphide or certain bacteria, may also be removed or rendered inactive by chemical additions.

However, the most important class of chemical agents used for arresting corrosion, function not by reducing or removing corrosive agents, but by changing the electrochemical processes occurring at the metallic surface. These substances are known as corrosion inhibitors, and include chromates, nitrites, phosphates, silicates and numerous organic substances.

Since the chemistry of corrosion problems is complex, and since many variables are involved, there is no universal corrosion inhibitor. Indeed, the action of inhibitors is highly specific, and an inhibitor which completely suppresses corrosion in one system may be of no benefit in a system which is only slightly different.

In most cases the inhibitor can be conveniently added to the corrosive solution in contact with the metal to be protected. However, there are some systems where such a procedure is impossible. For instance, moisture condensing from the atmosphere on a metallic surface cannot be practically inhibited by this method.

In order to combat corrosion by condensed moisture, special compounds known as vapor phase inhibitors, have been developed. These vapor phase inhibitors have the advantage of being volatile, which enables them to exert their protective influence throughout a gaseous space without requiring them to be in contact with the metal surface to be protected.

The development of vapor phase inhibitors arose out of a war-time problem concerning the corrosion of metal stores packed in cardboard containers. It was found that heavy rusting of steel surfaces often occurred during transit due to the penetration of moisture. The problem was particularly aggravated in tropical climates, where high relative humidities and extreme temperature variations were encountered.

The first patent application covering the new type of inhibitor was filed in Britain in 1945 by the Shell Development Company (1). Subsequent research both in Britain and in the U.S.A. has disclosed a number of compounds which possess the valuable property of "protecting across space". So far, however, few have reached the stage of commercial production and sale. Extensive tests on some of these volatile inhibitors, both in the laboratory and under service conditions, have proved that corrosion of packaged metal articles by moisture that enters or is present within a package, can often be completely prevented.

### Principal Vapor Phase Inhibitors

A successful vapor phase inhibitor must possess certain properties other than its ability to reduce corrosion. It must be stable and water-soluble, and must be sufficiently volatile to maintain an adequate inhibiting concentration in the atmosphere around the metal to be protected. In addition, the vapor must be readily transported by convection and diffusion.

There are three principal categories of substances which fulfil all these requirements, namely, the amine and other nitrites, the esters of carboxylic acids, and the amine carbonates. As well as these main groups, there are a number of additional compounds such as the heterocyclic nitro-compounds or nitro-heterophenes, (2) which exhibit favorable inhibiting properties.

#### *1. Amine Nitrites*

Nitrites have long been recognised as efficient inhibitors of the corrosion of steel immersed in oxygen-containing water. Thus, it was natural that the search for compounds possessing adequate stability and volatility should begin with the nitrites. Many inorganic and organic nitrites have been found to be suitable, including ammonium and stannic nitrites, copper ammonium nitrite, nitrite salts of hydrocarbon substituted ureas, hydrazines, etc., as well as a whole range of alkyl, aryl, heterocyclic and alicyclic nitrites.

In particular, dicyclohexylammonium nitrite and diisopropylamine nitrite have been singled out for manufacture on a commercial scale. Both dicyclohexylammonium and diisopropylamine nitrites have a natural pH of about 7.0 and, if used in solution, operate best at a pH of 7.0 to 8.0. More alkaline conditions make them more stable, while acid conditions convert the compounds to nitrose amines which are not effective inhibitors.

The vapor pressure of dicyclohexylammonium nitrite is about one tenth that of mercury at room temperature, and 1 gram would saturate 20,000 cu. ft. (3). It is extremely stable. Diisopropylamine nitrite has a higher vapor pressure but is less stable. Several investigations on amine nitrites, particularly dicyclohexylammonium nitrite, have been carried out (3. 4, 5).

A recent process that has been developed in the nitrite field for the packaging industry depends on the formation of an inhibitor, by chemical interaction between its components in the presence of a carrier, which is normally paper (6). The components, an organic amine salt and a metal nitrite, interact and the vapor phase inhibitor which is formed becomes fixed to the fibrous carrier.

*2. Organic Esters*

Early research (7) suggested that certain esters of benzoic acid had appreciable inhibiting properties in the vapor phase. More recent work (8) has shown that various esters, including n- and iso-propyl benzoates, n-butyl benzoate and methyl cinnamate, afford good protection to steel exposed to moisture-laden air. Several other compounds, such as ethyl dihydrocinnamate, cyclohexylamine cinnamate and dicyclohexylamine cinnamate, also showed promise as vapor phase inhibitors, but have not been examined in detail.

*3. Amine Carbonates*

Complete inhibition of steel and cast iron is effected in moist air by some amine carbonates, even when the air is heavily contaminated with sulphur dioxide. Cyclohexylammonium carbonate has been found to give excellent protection, even to iron and steel surfaces which have commenced to rust (8, 9).

### Methods of Application

The chief use of vapor phase inhibitors is in the preservation of packaged equipment and of the interior of engines and similar machinery. In all cases it is essential that the inhibitor be located within effective range of the surface to be protected from corrosion.

The choice of method of application depends on the general dimensions and configuration of the article, but there are three principal methods. First, a solid powder of the inhibitor may be used; it may be put into small muslin bags or sprinkled loose in the bottom of the packing container. The powder method has been found to be particularly effective for complex pieces of machinery (10).

Secondly, the inhibitor may be dissolved in acetone, alcohol, benzene, etc., and sprayed on to the article so that the inhibitor remains after evaporation of the solvent. Good protection for periods of many months has been achieved by this method using dicyclohexylammonium nitrite dissolved in ethanol(10).

Thirdly, the packaging material may be impregnated with vapor phase inhibitor, i.e. as outlined earlier. This has become the most popular method of application of dicyclohexylammonium nitrite. Figures 1 and 2 show methods of packing wire and machine parts in paper impregnated with vapor phase inhibitors.

### Action of Vapor Phase Inhibitors

Stroud and Vernon (8) consider that the protection given to a metallic surface by these volatile substances is due to the absorption of the vapor in a thin film of precipitated moisture. Wachter et al (3) agree with this point of view and state that, in the case of dicyclohexylammonium nitrite, the inhibitor is vaporized and transported to the metal surface where it condenses or dissolves in condensing moisture. It is considered that the inhibition is due to the nitrite ion, and that the volatility is merely a means of transport for the inhibitor.

An alternative explanation has been advanced by Baker (11), who considers that the vapor adsorbs so that the organic group is close to the metal surface and the nitrite faces away, forming a hydrophobic film. As pointed out by Wachter (3), this view is unlikely to be correct since the amine nitrites are water-soluble. However, whatever the exact mechanism of protection may be, it is indisputable that these inhibitors operate through space over appreciable distances.

### Pseudo-Vapor Phase Inhibitors

It may be of interest to mention another type of inhibitor which is becoming popular for the impregnation of wrapping materials (12). Sodium benzoate and other soluble benzoates, although not true vapor phase inhibitors, can be used for the production of corrosion-inhibiting wraps by the impregnation of materials such as paper, straw-

**Fig. 1. Wire is cleanly and quickly packed with paper impregnated with the volatile inhibitors.**

board, regenerated cellulose films and waxed papers. Provided that the chloride content of the wrap is sufficiently low (below 0.1 per cent), complete protection is effected for steel under adverse conditions of storage or transportation, by spraying or dipping the wrap in a 6 per cent sodium benzoate solution.

Sodium benzoate has no significant "vapor phase" properties but, surprisingly, one hundred per cent contact between the wrapper and the article to be protected is not essential. Naturally, at high relative humidities the inhibitor comes into operation, keeping the metal unattacked at places where the moistened wrap clings to the surface. However, other parts of the metal surface, not in contact with inhibited wrap, also remain bright. This is attributed by Stroud and Vernon (12) to the property of benzoate compounds to "creep" under moist conditions.

Wraps impregnated with sodium benzoate do not increase the corrosion of non-ferrous metals; in some cases the corrosion is substantially reduced, e.g. soldered joints. For the protection of cast iron surfaces it is necessary to introduce a nitrite to the wrapping, such as sodium nitrite, in addition to the benzoate.

Sodium benzoate, although not as efficient as inorganic inhibitors such as chromates, has a specific advantage. If used in insufficient concentration, the benzoate gives rise to general or "safe" attack on steel, whereas chromates under similar conditions may permit seriously localized corrosion. In addition sodium benzoate is non-toxic, does not cause skin irritation and possesses fungicidal properties.

Sodium benzoate inhibitor has also been used to impregnate rubber latex strippable coatings (13). In this application it has been found suitable for protecting steel, cast iron, tinplate and non-ferrous metals (excepting cadmium and magnesium) in adverse environments. Small amounts of sodium nitrite along with the benzoate increase the degree of protection.

Protective films which are hard and non-strippable may be obtained by the addition of sodium benzoate to emulsions of other organic high polymers such as polyvinyl acetate, polyvinyl chloride and copolymers.

### Selection of a Vapor Phase Inhibitor

Although protection is afforded to ferrous materials by most of the inhibitors mentioned above, the corrosion of some of the common non-ferrous metals is sometimes stimulated (7). For example, amine carbonates inhibit the corrosion of aluminum, zinc, chromium plate on steel, solder and soldered joints, but substantially increase the corrosion rate of copper, copper-rich alloys and magnesium.

Nitrites of nitrogenous organic bases are highly inhibitive towards steel and afford varying degrees of protection to cast iron and certain non-ferrous metals, but are severely corrosive towards solder. The behaviour of amine nitrite inhibitors is also reported to be affected by the relative humidity. At extremely low humidities they are corrosive towards magnesium and zinc and at higher humidities they also affect lead and cadmium (14). Consequently, it is most important to exercise care in the choice of vapor phase inhibitors, particularly if non-ferrous metals are likely to be present.

### Industrial Applications

Considerable interest has been aroused by the advent of vapor phase inhibitors. They are rapidly coming into practical use for preserving metallic equipment, either for short term transit or permanently. For instance, cars are frequently exported from the United Kingdom in a dismantled condition (10). Nests of about 12 pressed steel parts are packed together, each part being separated from the next by a layer of paper impregnated with dicyclohexylammonium nitrite. The shipments arrive in excellent condition and the cars can be assembled speedily. The only surface covering these parts have is a thin film of oil which, of course, is quite inadequate to prevent corrosion by itself.

The internal surfaces of aircraft engines are also protected during shipment by blowing a small amount of powdered inhibitor into the cylinders. Other vapor phase inhibitors are used in conjunction with the strippable plastic coatings, which are now often employed for corrosion prevention during shipment. The inhibitor is introduced into the fibre webbing on to which the plastic "cocoon" is sprayed (15).

Other applications of the inhibitors are in the packaging of canned goods, ordinance, electrical equipment, precision instruments and machinery of all kinds. Research is also in progress into the possibilities of adding these inhibitors to fuels, in order to reduce corrosion by condensed moisture in inaccessible tubes, pumps or storage tanks.

### Advantages of Vapor Phase Inhibitors

Since there is no need for direct contact between the inhibitor and

**Fig. 2. Packing pump parts in wrappers impregnated with vapor phase inhibitors.**

**Fig. 3. The rifle packed in paper impregnated with vapor phase inhibitor (right), is clean and ready for immediate use, while the rifle packed in grease must be cleaned before it is ready for firing.**

the article to be protected, the metal remains clean and the article is ready for use as soon as it is removed from its packing. This point is illustrated by Figure 3 which shows one rifle packed in grease and one packed in inhibitor-impregnated paper. The latter pack eliminates a 3-hour cleaning job and the rifle is ready for firing the moment it is taken from the bag.

Vapor phase inhibitors are easy to apply, and are efficient provided that the selection is made carefully, and that the inhibitor is placed close to the metal surfaces, in a relatively static atmosphere. It must be stressed that the use of vapor phase inhibitors is no substitute for good packing.

Excess moisture ruins the effectiveness of most inhibitors, and, although the vaporization losses are small in a static atmosphere, air currents sweeping over the inhibitor crystals greatly increase the inhibitor loss. The inhibitors can function successfully over a long period, sometimes for several years, and have the property of suppressing corrosion on inaccessible metal surfaces, even in moist, corrosive atmospheres.

The development of vapor phase inhibitors offers a new and practical method of combatting the ever-present problem of corrosion. The scope of these inhibitors is vast and the present applications constitute only a fraction of the possible uses.

# Hydro-Electric Design in Germany

by

Kurt A. Scholz

*The Rankin Co., Ltd.,*
*Montreal.*

The writer was formerly a civil engineering designer with Elektrizitaets-Actien-Gesellschaft, Frankfurt-on-Main, Germany. This company is a utility holding, management and engineering concern with many subsidiary and associated power companies in central Europe. The writer worked on the design of various river-basin developments, high-head projects and pumped-storage schemes, had also to be well informed about the methods and trends of hydro-electric developments elsewhere.

It is the intention of this paper to make available to Canadian engineers a comprehensive survey of developments and trends in the design of hydro-electric projects in Central Europe.

To those of us who are not specialists in hydro-electric power, it may come as something of a surprise that there is so much variation in design and construction in various quarters of the world.

This paper offers a general survey of German practice by an engineer who was closely concerned with it for some years. Though not much detail is given, it should perhaps stimulate thinking among our own hydro-electric experts; at least, it should interest them, as well as many of the rest of us who do not fall in that category.

### The Role of Hydro-Electric Power in Germany

In 1952, West Germany had an installed power capacity of 13.5 million kw. and the total power output of that year amounted to 56.2 billion kwh. West Germany relies to a great extent on steam power, especially from lignite won by open pit mining. Lignite costs two and a half times less than hard coal and gives economic power, if mined near the site of the power plant. It is intended to increase the number and capacity of such plants soon. If steam plants are not located close to the mine and hence the transport of fuel is required, hard coal from the Ruhr valley comes into the picture. Generally speaking, approximately 50 per cent of the public power comes from hard coal about 25 per cent from lignite and only about 25 per cent is hydro-electric power.

The congested industrial regions impose high loads during working hours, and, even if electro-chemical industry increases the night load somewhat, the load curve still shows heavy peak demands for certain hours of the day (Figure 1).

High pressure steam plants are not best suited for interrupted operation; it reduces their life and increases the inconvenience of frequent starting. As the West German grid relies to a great extent on this type of plant to carry the base load, requirements for the hydro plants are different from those in a country where they supply the base load. Thus, hydro-electric plants in Central Europe have to supply most of the peak load, besides delivering the basic load from the natural flow of the rivers.

Extensive use is made of hydraulic models in the design of structures and of equipment.

The normal peak load suppliers among the hydro-electric plants are those with large storage capacities and with high or medium heads, but some run-of-river developments also contribute. Sometimes more than one power company shares the power resources of a river basin. The downstream partner appreciates the improvement of the river flow characteristics by the upstream partner, but would protest if water were stored and used for peak loads, and the flow of the river changed to his disadvantage.

Therefore the scheme shown in Figure 2 is now often used in the design of river-basin developments. During the night only about 200 to 300 cfs. pass through the plants and all excess water is stored in the reservoir upstream of the first plant. This water is shunted through the reservoirs during the day and is stored in the one just upstream of the last plant of the scheme. This last plant has a constant discharge and equalizes the river flow in accordance with the inflow into the reservoir at the first plant. So peak load is provided for within the scheme without affecting the downstream partners. This is the reason why the rating of recently built plants is higher than it would have been formerly.

An interesting characteristic of this scheme is the choice of intermediate heads. The head of the downstream plant always submerges the tail race of the upstream plant one or two feet. A better use of the potential power of the river is achieved by this arrangement.

### Low-Head Projects

The Kaplan-type turbine is used mainly in low-head field in Germany. Its main advantages are its high specific speed, which effects a substantial saving in turbine and generator weight and cost, and its high, flat efficiency curve over nearly the entire range of discharge, irrespective of changes in heads. The discharge capacity of the Kaplan-type turbine may be increased for reduced head operation during flood flow. Kaplan-type turbines are used up to heads of 185 feet and are preferred to Francis-type turbines within this range.

In Central Europe, restrictions imposed by towns, railways and highways do not permit any material increase in water levels above flood stage, so the normal practice is to build a low weir across the river channel, surmounted by large gates that can be raised at time of flood. Generating stations are generally located at one end of the dam, out of the river if possible, but more frequently encroaching on the river; encroachment may complicate providing adequate spillway capacity. To eliminate channel restrictions the piers supporting the gates are sometimes used for the installation of power generating units.- This arrangement also improves the power output during times of flood flow. Jet action through the spillway openings depresses the tailwater below the dam and so has the effect of recovering in part the head that otherwise would be lost due to high tailwater. On the other hand, the spreading of generating units across the river requires longer transmission cables and impedes supervision. (Figure 3.)

This article describes three typical developments and will mention briefly some sidelines of design which apply only to individual projects. The normal fully enclosed power house design, which is still used at most projects everywhere, is not dealt with in this article.

A canal connection between the Rhine and Danube rivers is built in the valley of the Main. The Rhein-Main-Donau A.G. has been granted a license for the construction of a modern waterway and the use of the existing power sites for hydro-electric power generation. More than 60 power stations are planned and approximately one-third of the scheme is already in operation. The individual multi-purpose dams each consist of three sections:

The navigation locks, at a bend on the inside of the curve.

The spillway crest gates.

The power house. (Figure 5).

Roller gates are installed for spillway crest control (Figure 4). The rigid and robust roller allows long spillway sections, single side drive and good overflow conditions, unaffected by ice and debris. The roller is normally provided with an apron and a timber seal on the gate sill. At the ends timber-lined plate seals are forced by the water pressure against the concrete of the piers. The gate is opened and closed by raising and lowering it on in-

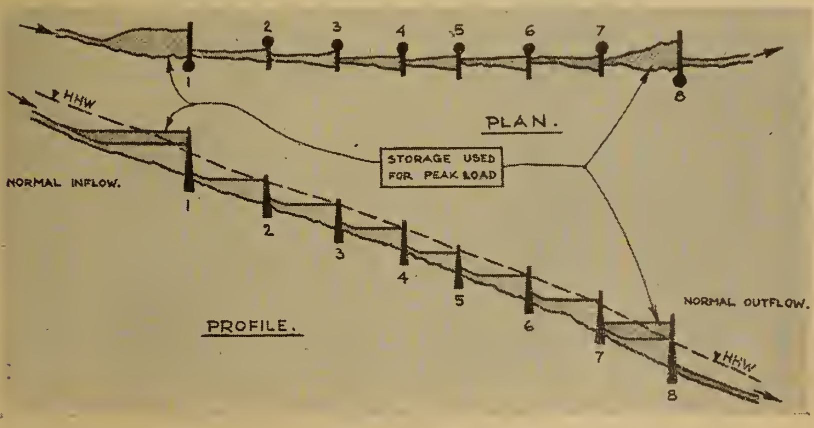

**Fig. 2. Peak Load Scheme in River Basin Developments.**

clined racks installed in recesses in the piers. The drive consists of a sprocket chain operated electrically or manually. A retaining chain winds counter to the raising chain on the free end of the roller and prevents any slip. Submersible rollers are installed where accurate water levels are important and to avoid waste of water when clearing away ice and floating trash. The seal of the apron is pressed against the sill by water pressure or springs. Fitting a movable flap to the roller has the same advantages as the submersible roller, but avoids the scaling difficulties at the sill and the curved sill forming. Rollers with attached hinged flaps are now the most common and have worked for years under extremely severe conditions. Electric heating can be installed where required.

The power stations of the Rhein-Main-Donau type are fully enclosed, but introduce new features resulting in substantial savings in construction cost and in pleasing architectural appearance (Figure 5). The scroll case is of the siphon type, i.e., the bottom of the wicket gates is above headwater level. The air is pumped out before starting the plant and the air valve is opened to stop the plant in emergencies, so head gates are omitted. The draft tube is raised; deep power house foundations are avoided by this arrangement. A cast-iron stay ring around the turbine supports part of the concrete and the machinery. The turbine and generator shaft is in one piece and has only two bearings. The thrust-bearing is located on the cover of the turbine. The adjustable runner blades are steel castings and plate-welded with cavitation-resistant material. The servo-motor is built into the hollow shaft above the upper guide bearing. A special light bridge carries the oil supply head for the turbine. Coolers are mounted on the back of the stator of the generator to keep the temperature of the power house low. The governor is operated by an electric motor which is fed by a small generator on the shaft. The exciters are separated from the main unit. Little crane clearance is required for these units and this allows a low power house superstructure.

A typical dam for non-navigable rivers has been developed by the Innwerke A.G. in southern Bavaria (Figure 5). It consists of spillway and power house sections only. An ingenious two-tier gate is used for spillway crest control (Figure 6). The upper hook-shaped leaf is

higher than in normal two-tier gates and allows for the discharge of minor flood water if entirely lowered. This upper leaf has only one upper cross-girder and is supported by rollers on the lower leaf. The shape causing the minimum load due to the overflow is given to the rear side. The main advantage of the hook-shaped gate is that at either end of the gate there is only one common track for the two leaves and therefore only one groove, of the same type as for a one-tier gate, is required. The gates move in the groove on roller trains fastened to the leaves and also positioned clear of flood water when the gates are raised. This constitutes a substantial advantage over freely moving roller trains, e.g., in Stoney gates. Where high pressures are likely to occur, the rollers are mounted in roller bearings. Rollers and slide plates act as guides in both longitudinal and transverse directions and along the grooves. The upper and lower leaves are normally raised and lowered by a common hoist. The hoist, both when lowering the upper gate below the normal head water level and raising it to this level, acts only upon the upper gate. If raised further, the lower gate will be carried with it. Link chains with triple pin support at the pinion offer particularly favourable conditions as to stress and wear. The piers between the spillway openings are kept low and

The power plant section is of the semi-open type (Figure 7). There are hatchways in the roof for the installation and removal of equipment and two gantry cranes travelling the full length of the power house and also of the spillway section, because they were used for the installation of the gates and later for the installation and removal of stop-logs in spillway openings and turbine conduits. The turbines have such advantageous features as a stay ring, the thrust-bearing on the generator head cover, a one-piece common shaft for turbine and generator, and cast steel runner blades with cavitation-resistant plate weldings. There are other features worth mentioning. The steel head cover consists of two sections which are field-welded together. The throat-ring is concave inside and installation of the propeller is made possible by vertical slots in its inner surface. Thus the space between blades and ring is kept equal at all positions of the runner blades, increasing efficiency. The shaft is held by two additional bearings in addition to the thrust bearing. The lower guide bearing is in the turbine head cover (grease lubrication) and the upper one is in the ventilation cone (pressure oil lubrication), containing also the oil supply for the servomotor. Exciter, governor and oil pumps are operated from the turbine shaft by bevel gears. The discharge ring (guide case) is conical and the wicket gates may be removed inwards and downwards into the throat-ring. They are operated by ring-shaped servomotors on the head cover.

The fixed-blade propeller turbine is not much used in Europe although it is cheaper than the Kaplan-type; its efficiency curve is less favourable for a variable load. However, a turbine with fixed wicket gates and adjustable blades has been developed for very low heads and units up to 1,000 kw. It may be installed with a horizontal shaft as shown in Figure 8.

These horizontal shaft units inspired the development of the Arno-Fischer turbine-generator unit for submersible operation. The arrangement for such plants is similar to that of pier unit stations, i.e., turbine conduits and discharge sluices alternate in the base of the dam. (Figure 5). The discharge of floods is further facilitated by bascule flaps on the dam crest, across the entire river channel if necessary. The cross section of these flaps is frequently fish-bellied and therefore they can withstand considerable torsional stresses, providing at the same time the most favourable hydro-dynamic conditions and thus preventing vibration. The flaps are supported over their full length on the dam top and secured to continuous water-tight articulation. The drive is operated from winch chambers within the dam. The discharge sluices in the dam are normally controlled by Taintor gates with the winch chambers inside the dam.

The capacity of the Arno-Fischer units is smaller than it would be if Kaplan units were installed. The turbine generator unit consists of two fixed enclosing pipe sections, which contain fixed wicket gates supporting the bearings, and the rotating runner band between these two pipe sections (Figure 9). The runner blades are supported on the central shaft and on the exterior rotating pipe section. They are moveable, similar to Kaplan blades. The electric generator rotor is built around the pipe outside the runner. A major problem in the design of this type of unit is that of minimizing leakage between the runner band and the fixed parts of the enclosing pipe, but this has been satisfactorily solved. The efficiency curves are comparable to those of Kaplan or Francis turbines, but somewhat lower in the maximum zone (88 to 92 per cent).

Power house equipment and cable ducts are located within the dam and individual operating chambers are connected by a gallery across the entire river. Ventilation towers are provided at the ends of the dams.

Comparative bids on power stations with spiral-casing Kaplan turbines and with conduit type turbines showed that the latter were cheaper. No comparison of real construction costs is available because the completion of the plants on the Lech and Iller rivers fell in the Second World War and in postwar periods.

#### Medium- and High-Head Projects

Although the turbine types for medium-head and high-head projects are different, the projects are similar with regard to their layouts and structural features. The Francis turbine is generally used in the 100-foot to 1,500-foot head range. Designers try to extend its range into the higher heads, so as to save in the weight and cost of turbine and generator achieved by the higher specific speed. So far as high heads are concerned, the Pelton wheel is used from 1,200 foot up to 6,000 foot. Both types are available with vertical or horizontal shafts.

Concrete gravity dams are normally favoured because of their safety factor. Arch dams and other thin wall constructions are used only at sites not endangering settled areas and if they bring really substantial savings in cost. Experience from air bombing and the introduction of heavy earth moving equipment will result in the construction of more earth and rock-fill dams. One of the biggest in Germany is presently under construction in the Lech river valley. Its crest will be rounded and the downstream slope landscaped to create a pleasant appearance.

Pipelines of high-head projects are steel pipes with flame or electrically-welded joints. Special steels are used for high stresses. The Unionmelt submerged-arc process allows welding of steel plates up to 3 inches thick. Therefore bandaging of the pipes will not be required in future. Small diameter pipes are buried to save anchors and supports. Pipes of 10 feet diameter or more, usual at medium-head projects, have rivetted joints and are exposed. Expansion joints are provided downstream of the anchorages. It is now normal practice to provide a penstock for each turbine unit. The penstocks run parallel and spread from the last anchor at high-head stations, or from the surge tank at medium-head stations, to the turbines in the power house. The power house substructure is used as an anchorage, too, and no expansion joint is used in the last penstock length.

Tunnels are normally circular and concrete lined. A special compressed concrete lining is applied in some cases where the water pressure is high and a normal concrete lining would not guarantee a tight tunnel. Where water pressures are exceedingly high, welded steel plate is inserted and the space

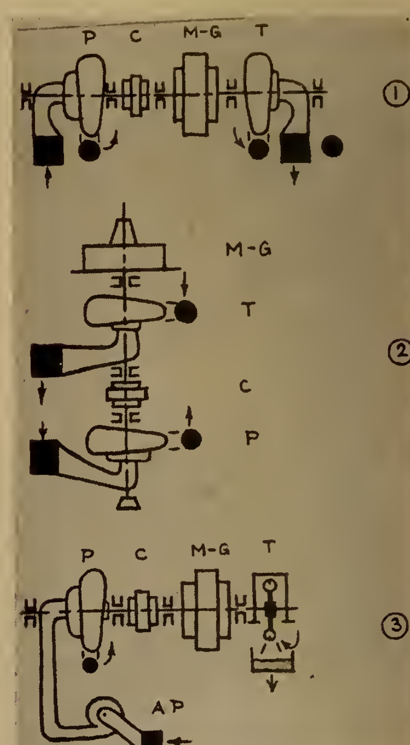

**Fig. 10. Typical Pumped-Storage Tandem Units.**

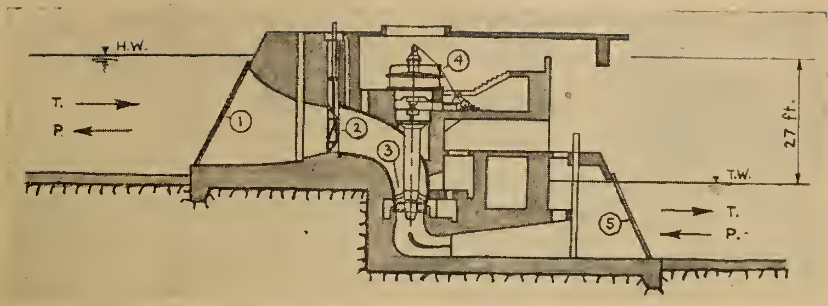

**Fig. 11. Kaplan-type Reversible Pump-Turbine.**

(1) Turbine trash-rack. (2) Hydraulically-operated emergency gate. (3) Reversible pump-turbine. (4) Motor-generator. (5) Pump trash-rack.

between steel and rock surface is pressure-grouted. The steel lining is calculated to take the bursting stress in case the bond between lining and surrounding rock fails.

Pipe lines or tunnels are controlled by two butterfly valves. One has an automatic safety control operating in case of penstock failure. This is a plate on a pendulum which swings out if the velocity of the water becomes too high. In some new projects, the difference in velocity at the conduit entrance and at its end, both measured by Venturi meters, will actuate the valve mechanism.

Some new projects in the Alps have underground power houses. Although their costs are somewhat higher than of those above grade, they have low maintenance cost and are safe from avalanches and bombing.

Francis turbines of high capacity with vertical shafts are normally preferred to horizontal units, because they allow a lowering of the setting of the runner with reference to the tailwater to avoid cavitation. Where the Francis turbine overlaps the head range of the Pelton wheel, air ventilation (sometimes compressed air) of the draft tube and a pressure regulator with auxiliary bypass must be provided to protect against cavitation and water hammer.

If Pelton wheels with horizontal shafts are used, two wheels usually drive the generator. The latter is placed in the centre on two bearings and the wheels are overhung at each end of the shaft. Double and multi-jet units increase the specific speed, reducing the weight and cost of the generator. Three- and four-jet units have vertical shafts and the wheel-housing supports the generator. Runner disk and bucket bowls are cast separately and bolted together for economy. Nozzles and needle valves are designed to give a truly circular jet. Jet-deflectors are provided to allow slow operation of the penstock valves to obviate water hammers. A small reverse jet is used as a brake.

### Pumped Storage Projects

The importance of pumped storage plants in the West German grid has been discussed in a previous paper.* Although reversible pump-turbines of the Francis type have been constructed by German manufacturers, it is present day practice to install tandem units for operational reasons. However, opinion may change with further progress in the development of the reversible pump-turbine. The tandem units consist of a Francis or Pelton turbine, a generator-motor, a clutch-coupling and a pump. Figure 10 shows diagrams of typical tandem units.

Hydraulically operated couplings of the friction-clutch type are not now used; the dog-clutch type is installed in new projects. These are safer and wear on the teeth of the coupling is small. A small impulse turbine raises the pump shaft to the speed of the turbine before the clutch is engaged. Full jet is used at the beginning of the starting operation and reduced as the revolutions of the two shafts approach synchronization.

Pumps for new pumped storage projects have fixed guide vanes. The pumps are always used at full load, so there is little advantage in adjustable guide vanes, which required frequent repairs.

Needle valves are commonly used now at the pumps instead of the cone (rotary) valves. Two-stage pumps are used for high heads; multistage pumps in high capacity projects are avoided for construction and economic reasons. Modern pump design has increased the limit of one stage to over 600 feet head. Pumps working against high heads require a setting deep below the water level of the suction pool. Auxiliary pumps are installed to reduce the suction lift of the main pump if the foundation should be otherwise too deep and expensive. An auxiliary pump is also required if the tandem unit includes a Pelton wheel, which must clear tail water level.

Finally, a reversible pump-turbine of the Kaplan type will be briefly mentioned. This unit was installed in the Baldeney plant on the Ruhr river (Figure 11). The average head is about 30 feet, the discharge as a turbine is 520 c.f.s. and as a pump, 280 c.f.s. The asynchron generator-motor changes the direction of rotation for the generating and for the pumping cycle, and the stator has two different pole arrangements (24 poles generating and 18 poles pumping). The rating for generating is 1,100 kw. at 0.38 power factor, 50 cycle, 1,200 v., 255 rpm., and for pumping 1,300 kw. at 0.86 power factor, 50 cycle, 1,600 v., 326 rpm. The guide-vanes are fixed and close to the runner to ensure a smooth decrease of water velocity in the upper conduit, when pumping. Preference is given to the generating cycle and the maximum efficiencies are 90 per cent as a turbine or 78 per cent as a pump.

### Conclusions

There is little room left for improving the turbine efficiencies. Therefore the tendency of new designs is to increase the size and capacity of the individual unit. Turbine types reach higher and higher head ranges to permit the economy of higher-speed, lower-cost machinery, cutting down space requirements and lowering power house costs. Further improvement may be expected in simplifications and in safety controls.

The cost of a hydro plant in Germany is approximately two and a-half times the cost of an equivalent steam plant. But operation and maintenance are cheaper, and the life of a hydro plant is three or four times greater than that of a steam plant. In Germany, therefore, hydro plants are an economical investment in the long run. The country's water resources will certainly be further developed, though hydro power will never play the role it has acquired in Canada. √

*"The Schluchseewerk Project", by Kurt A. Scholz, *Engineering Journal*, July, 1953, pages 856-862.

# Report of Council

## For the Year

## 1953

### Together with Committee and Branch Reports

After reviewing the events of 1953 and comparing them with 1952 and earlier years it appears that one year is very much like another. Within a year the changes are not noticeable, but over a longer period, say ten or fifteen years, great changes are in evidence. It is wise for an organization to make these studies from time to time in order to determine if its policies have suited the times, and if its officers in the light of all the surrounding conditions have given it the best guidance and direction.

The last fifteen years have been portentous ones, taking in the great holocaust of the second world war and out of it seeing develop the greatest period of expansion and prosperity ever known to this great Dominion. Any society living in such times must react to them, and either adjust itself to meet the quickly changing conditions or go down in the struggle.

The record of the Institute indicates that it has met the challenge. Not only have income and membership increased, but the activities have expanded almost beyond comprehension. Those giants of the profession who created the society in 1887, would never have thought that their membership of 423 in those days would have multiplied 37 times in 67 years. Over the same period the population of Canada has multiplied 3 times. This suggests that from the growth aspect, the Institute has kept pace with the nation.

#### Comparisons

In the last fifteen years the Institute membership has increased four times. The income has increased almost seven times, the number of branch organizations has doubled, the pages in *The Engineering Journal* have increased two and a half times, the staff at Headquarters has increased three times and the number of people working on committees has risen to almost 700.

What other figures are there to indicate growth? Fifteen years ago postage amounted to about $1,812.08 a year. In 1953 it reached the staggering sum of $10,445.66. In those days the printer's bill for the *Journal* was about $1,000.00 a month. Today it runs a little up or a little down from $12,000.00 a month. The number of inquiries in the library has reached the impressive figure of 15,000. The telephone calls are proportionately greater and the bills are proportionately greater. In the month of December, 1938, the telephone bill was $42.67. Last December it was $160.30.

This comparison could be carried into many other fields, but perhaps already the point has been gained. The Institute has expanded in every dimension to meet the growth of this great country and of this great profession. It would appear that the answer to the query set out at the beginning of this review is that the policies of the Institute have been suitable to the times and the officers have given good guidance and direction. With such support the promise of the future is even greater than the past.

#### New Branches

The year just concluded did not see as many new branches as 1952, but with branch sections included, the showing was comparable. A year ago eight branches were authorized. In 1953 there were 7 branches and 3 branch sections, at Amherst, Corner Brook, Huronia (Orillia), North Nova Scotia (New Glasgow), Northern New Brunswick (Bathurst), Brockville, the Yukon, Moose Jaw, Swift Current and Lloydminster.

#### Counselling and Guidance

Various branches have continued their activity in providing good advice and information to high school pupils who are contemplating their after high school careers. Not all branches are equally active in this field but the overall picture is good.

The Canadian Committee on Counselling in Engineering and Science held several meetings through the year, and made considerable progress in the Trans-Canada organizational set-up. The most important piece of finished business was the publishing of the guidance booklet "After High School What?" This is directed to the high school pupil "who is above average" and will be distributed widely to high schools and counsellors during 1954.

Last year's report speaking of this booklet said "It is expected that shortly the material of the booklet will be put into the hands of the printer." A whole year has passed and it is just now that the task is accomplished. The publication of any material that relates to the interests of several persons or organizations, if done jointly, is a slow process.

#### International Relations

The year showed many opportunities for maintaining and developing good international relations with friends in many parts of the world. For instance past president Colonel L. F. Grant attended a joint international conference on engineering education in London, England in January. Also at that time he held a reception in the premises of the Institution of Electrical Engineers, for members of the Institute living in the Old Country and for the officers of British engineering institutions.

Besides representing the Institute at the Coronation, President R. L. Dobbin attended the annual meeting in New York of the American Society of Civil Engineers, the American Society of Mechanical Engineers, the Engineers Council for Professional Development and the Fall meeting of the American Society of Mechanical Engineers at Rochester. He will be present in January for the annual meeting of the American Institute of Electrical Engineers.

#### International Meeting by Radio

Another international event of some importance was the two-way radio meeting with the Institution of Electrical Engineers in London, England. The subject discussed was the story of the electrical engineering back of the Coronation. The presidents of both organizations participated in the broadcast as did also the Dean of Westminster.

## UPADI

The Institute continues its interest in the Pan American engineering conference known as UPADI, and likely will be well represented at the conference which takes place in Brazil in 1954.

### Commonwealth Conference

The Conference of Representatives of Commonwealth Engineering Institutions continues to be an important interest of the Institute. Meetings are held at four year intervals and the next one will be in London in May, 1954. Because of this organization many members of the Institute enjoy guest privileges when in the countries of the other members, and many of their members are Institute guests here.

## ASME-EIC

Another international activity of real value to Canadian engineers is the outcome of the agreement with the American Society of Mechanical Engineers. By this agreement there has been created the ASME-EIC International Council—a joint body to develop cooperative projects between the two societies. Already several ideas have been put into effect for the benefit of all members and more are now in the process of development.

## ECPD

The Engineers Council for Professional Development has continued to be of benefit to all eight member organizations and to the profession generally. Colonel L. F. Grant was re-elected chairman at the annual meeting in October, 1953. Next year's annual meeting is to be in Cincinnati. The Institute has representation on all the main committees as follows:

Education, W. S. Wilson, Toronto.
Student Development, J. F. Harris, Toronto.
Training, George L. Schneider, Hamilton.
Recognition, E. V. Buchanan, London.
Ethics, C. R. Young, Toronto.
Information, L. Austin Wright Montreal.

## IAESTE

For the first time Canada participated in the work of the International Association for the Exchange of Students for Technical Experience. Early in the year 21 students came from Europe to spend this summer here in acquiring experience. From Great Britain there were 13, from the Netherlands 4, and from Germany 4.

No Canadians were sent abroad by way of an exchange but it is intended in 1954 to develop the movement both ways. Already several Canadian students have indicated their interest.

During 1953 the Association arranged exchange for almost 4,000 students with 18 countries participating. Here is an unusual opportunity for Canadians to show the young men of other countries the advantages of a real democracy. In 1954 it is expected that Canada's participation will be increased greatly.

### New By-laws

One of the most important developments of the year was the successful ballot on amendments to the by-laws. These all carried with substantial majorities. All the changes are in effect now, and already the benefits are easily discernible.

### Directory

A great portion of the year was devoted to preparing material for the new membership directory. This is a colossal task which required the temporary employment of extra staff. However the year end sees the work completed with the last stages wholly in the hands of the printer. Over 11,000 forms were returned by the members, which is an indication of the interest in an up-to-date directory.

### The Coronation

No review of the year would be complete without reference to the Coronation of Her Gracious Majesty Elizabeth II. The event was of special interest to the Institute because of the presence of the president in Westminster Abbey. This was a new acknowledgment of the rise of the profession of engineering in Canada to the level of the other learned professions. Coming from the British government itself the command invitation held unusual significance to all engineers in Canada.

Coupled with the honour of being represented in the Abbey was the further honour of having His Royal Highness the Duke of Edinburgh accept Honorary Membership in the Engineering Institute.

It was a great year of recognition for the Institute.

### Roll of the Institute

The membership of all cassifications now totals 15,131. New names added for the year amounted to 1,320, but deaths, resignations and removals amounted to 1,715. The reduction in figures for the overall membership is caused by several things but is principally due to the removal from the list of many Students and Juniors who are in arrears of fees. It was felt by the Finance Committee that there was no use carrying these cases any longer but that every endeavour would be made to secure applications for reinstatement.

During the year 1,233 candidates were elected. These were classified as follows: Members 369, Juniors 208, Students 714, Affiliates 2. The elections for the previous year totalled 1,407. Eighty-seven reinstatements were effected. Life Membership was conferred on forty-six members under by-law 26.

Transfers from one grade to another were as follows: Junior to Member 310, Student to Member 7, Student to Junior 860, a total of 1,177.

### Removals from the Roll

There have been removed from the roll during the year for non-payment of fees and by resignation: Members 256, Juniors 1,021, Students 365, Affiliates 4, a total of 1,646.

### Deceased Members

During the year the deaths of sixty-nine members of the Institute (including one Honorary Member) have been reported as follows:

#### Honorary Members

Stirling, Grote

#### Members

Baird, Earle Meharg
Bell, George Edward
Bleau, Jean-Marie
Bronson, Frederic E., The Honorable
Brunner, Godfrey H.

Respectfully submitted on behalf of the Council

R. L. Dobbin, M.E.I.C.,
*President*

L. Austin Wright, M.E.I.C.,
*General Secretary*

## Treasurer's Report

During the past year income from Membership fees amounted to $152,503.34, an increase of $8,731.58 over that for 1952. There was no voluntary assessment in 1953 but in its place contributions to the Harry F. Bennett Education Fund were received in the total amount of $4,842.86. Excluding voluntary contributions the total receipts from fees in 1953 showed an increase of 16½% over those for 1952.

The *Journal* produced a total revenue of $230,634.01, an increase of $41,117.66 over that for 1952 but at the same time total publication expenses for the *Journal* increased by $37,863.17 to reach a figure of $220,571.99. The profit for the year was $3,254.49 over that for 1952.

Further purchases of securities were made during the year amounting to $31,628.25. Already the benefit from this investment policy has been reflected in the increased income from investments amounting to $2,816.25 as compared with $1,490.24 in 1952.

A. Duperron, m.e.i.c.,
*Treasurer*

## Finance Committee

The total revenue for the year 1953 amounting to $386,297.14 once more constitutes the largest receipts for any year to date being $44,213.46 more than for the previous year. This large total does not include an amount of $4,842.86 which was obtained by voluntary contributions from many of the members. These contributions were requested last year in the name of the Harry F. Bennett Education Fund of the Institute which is doing good work in aiding deserving students to finance their education.

However, in spite of the high revenue for the year, due to increased costs in printing the *Journal* and operating our headquarters and field offices, the expenditures showed an excess of $2,613.62 over the receipts for the year. Increased advertising rates for the *Journal* were put into effect during the year for new accounts and the new rates will apply to all advertisers in 1954. This, together with the increase authorized for membership fees, will assist the Insti-

# Comparative Statement of Revenue and Expenditure

| | $386,297.14 | $342,083.68 |

tute in its financing during 1954 and to cover the costs of publishing the new Membership Directory.

The amount of the Building Fund was augmented by $16,000.00 during the year in accordance with Council decision some three years ago. However, no money was available to increase the contingent reserve fund which will be considerably depleted in 1954 due to the final judgment rendered in connection with the suit brought against us by our previous advertising agency.

The present office space is taxed to the limit and with growth of the Institute membership and number of branches, consideration is being given to the most effective way to cope with the increased work involved. An assistant field secretary has been secured and is located in the Toronto office.

*The Engineering Journal* has again completed a successful year with receipts in excess of expenditures. However, a full-time editor is needed more than ever and although an extensive search has been made for one, a suitable person has not yet been found.

Regular monthly meetings of the Finance Committee were held during the year and agreements reached for appropriate recommendations to Council at each of its meetings.

The able assistance and co-operation of the General Secretary, the Assistant General Secretary, and their staff continued in full measure during the year and was greatly appreciated by all the members of your committee.

IRVING R. TAIT, M.E.I.C.,
*Chairman*

## Committee on Employment Conditions

This Committee wishes to report to Council that no specific problem was brought to its attention during the last year.

G. N. MARTIN, M.E.I.C.,
*Chairman*

## Legislation Committee

No matters concerning legislation came to the attention of the Committee during the year, and as a result it has nothing to report.

E. D. GRAY-DONALD, M.E.I.C.,
*Chairman*

## Publications Committee

*The Engineering Journal* in 1953 had the biggest year in its 35 years of pub-

AUDITORS' CERTIFICATE

We have examined the statement of assets and liabilities of The Engineering Institute of Canada as of December 31, 1953, and the statement of revenue and expenditure for the year ended on that date and have obtained all the information and explanations we have required. Our examination included a general review of the accounting procedures and such tests of accounting records and other supporting evidence as we considered necessary in the circumstances.

In our opinion the above statement of assets and liabilities and accompanying statement of revenue and expenditure are properly drawn up so as to exhibit a true and correct view of the state of the affairs of the Institute at December 31, 1953, and the results of its operations for the year ended on that date, according to the best of our information and the explanations given to us and as shown by the books of the Institute.

PEAT, MARWICK, MITCHELL & CO.,
*Auditors*

MONTREAL, QUE., JANUARY 21, 1954.

lication. The number of copies printed totalled 195,480, an average of 16,290 per month. The circulation of 191,040, averaging 15,920 per month, was again the largest circulation of all Canadian technical publications.

The number of pages of reading material printed during the year totalled 1,029, an increase of 17% over 1952 and an average of 86 pages per issue. The *Journal* carried a greater volume of reading material as compared with advertisements than any other Canadian technical publication. Technical papers averaged 44 pages per month. The balance of the reading material, averaging 42 pages per month, was made up of items of topical interest.

In the technical section your Committee and members of the *Journal* staff made every effort to cover all phases of engineering development. The breakdown by engineering branches of the 82 papers published follows:

| | |
|---|---|
| Aeronautical | 3 |
| Chemical | 8 |
| Civil | 22 |
| Electrical | 10 |
| Mechanical | 14 |
| Mining | 5 |
| Miscellaneous | 20 |

The thanks and appreciation of the Committee are extended to all contributors.

Many of the papers published proved to be of such great interest that over 18,000 reprints of technical papers were ordered. This, together with the usual letters of commendation received during the year, indicates a continued satisfaction with the *Journal*.

Publication costs were up from the previous year to the extent that the average gross cost of production for 1953 was 83.4 cents per copy, or $10.02 per subscriber for the full year. The corresponding figure for 1952 was $8.53, representing an increase of just over 17 per cent.

With the steady increase in circulation the cost of advertising per page per copy reached a point where it was lower than for almost any other corresponding publication in Canada. Because of this and the steadily increasing cost of publication, the decision was taken during the year to approve a general increase in the *Journal* advertising rates of 50%. Even with this increase our rates per page per copy are still lower than many publications and the increase has been quite well received to date.

In accordance with a decision taken by Council a year ago, arrangements were made to publish a 1953 Membership Directory and Catalogue. The lists were closed as of October 15th and the final proofs were returned to the printer just before the end of December. It is expected that copies will be in the hands of most members before this report is printed.

It has been found that periodically the backlog of papers for publication in the *Journal* dwindles considerably. Your Committee has recommended therefore that every effort be made during 1954 to create and maintain a larger reserve of technical papers for publication.

Your committee held seven meetings during the year. All were well attended by its members as well as by the staff at headquarters.

Henri Gaudefroy, M.E.I.C.,
*Chairman*

## Papers Committee

Under the present by-Laws this committee has no specific duties.

However this year it was decided by Council that the Committee should have a part in the preparation of the papers program for annual meetings of the Institute.

The standing committee was enlarged to include the following members: Dean R. M. Hardy, Edmonton, Prof. L. P. Bonneau, Quebec, A. R. Harrington, Halifax, Dean H. Gaudefroy, K. G. Cameron, F. L. Lawton, H. S. Van Patter and C. E. Frost of Montreal.

The work of preparing the annual meeting papers is well under way.

Three meetings have been held.

After the annual meeting it will be possible more accurately to appraise the value of the new duties of the committee. A report will then be made to Council.

E. R. Smallhorn, M.E.I.C.,
*Chairman*

## Library and House Committee

Arrangements were made by your Library and House Committee for the carrying out of certain repairs and renovation of the Institute Headquarters building on Mansfield Street during the past summer.

These included the following:

Repairs to fire escape.

Painting of foundation wall of the original house.

Rearrangement and extension of ladies' washroom facilities.

Painting of cloak and washrooms, library and offices on main floor below lecture hall.

Rebuilding of fence in rear of property on north side.

A. S. Rutherford, M.E.I.C.,
*Chairman*

## Board of Examiners

In June of the past year, Dr. C. A. Robb, who acted as Chairman of the Board of Examiners for two years, resigned his post. The Board considers that the Institute is greatly indebted to Dr. Robb for his extensive contribution to its work, and wishes to take this opportunity of recording its appreciation.

During the year 1953, fourteen applications for membership were considered. Four of these were successful in passing the examinations of the Board and were recommended to Council for admission. For two of the applicants, arrangements for examination are presently being made. Six applications are under consideration and will be reported on when the findings of the Board have been completed.

J. L. de Stein, M.E.I.C.,
*Chairman*

## Membership Committee

This Committee reports to Council that it has, as yet, discovered no successful means of assisting the local branches to increase their membership from the eligible engineers in their district. The most successful means observed so far of bringing a greater proportion of the eligible engineers in an area into the Institute has been the breaking up of large branches into a number of local branches.

H. R. Sills, M.E.I.C.,
*Chairman*

## Admissions Committee

During 1953 the committee held eleven meetings and examined 1642 cases. These consisted of—

## Library Report

Looking back on 1953, the overall impression is one of giving out of information of all types, much of which cannot necessarily be recorded in statistics.

A number of firms have sent in employees requesting information on the organizing or recording of library and record material. Also, two representatives from the National Library in Ottawa, have spent considerable time discussing details and practices, as they are considering installing the type of classified catalogue we have at headquarters.

Inter-library loans were almost exactly doubled from the previous year. Items loaned to other libraries totalled 614, and we, in turn, borrowed 113 from them. 2,274 items were loaned out to members, and those used in the reading room totalled 4,874.

During the same period 182 members registered as new library borrowers. Of these, 66 requested repayment of their deposits, which left 718 active registered borrowers.

In addition to countless letters requesting two or three book titles on a given subject, 51 pages of bibliographies were prepared for members on 42 different subjects. It is interesting to note that these requests came from Canada, United States, British West Indies, and the United Kingdom.

Four hundred and seventy-three orders have been placed for books, magazines, standards or pamphlets, and the total number of requests by phone and by letter was 3,620, an average of 12 per working day.

Accessions for the year in review copies, totalled $2,510, representing 346 books, 150 standards and specifications, and 25 pamphlets.

Twenty-three exchanges and presentations in the periodical field totalled $108.00, which now brings the value of these acquisitions up to $842.00. This makes the total value of material received in this manner during 1953, $3,352.00.

Last February, due to illness and shortage of staff, winter library hours were cut to 9 a.m. to 5 p.m.

Last October, they were again extended to 9 a.m. to 6 p.m., and 9 a.m. to 8 p.m. on Thursdays, on the understanding that these hours would continue through the winter if the enthusiasm of the members warranted it.

During the five months of late hours, the attendance averaged 1 person per night between five and six o'clock, and 3 persons per night between six and eight o'clock. The inconvenience and expense of this extra library service was not considered justified by this sparse attendance.

At the end of December it was therefore decided to keep the library hours nine a.m. to five p.m. permanently, regardless of meetings or seasons.

(Miss) Emily Keeley,
*Chief Librarian*

## Employment Service

The activities of this department during the early months of 1953 maintained somewhat the same level as was reported during the latter period of last year. There were fewer Canadian personnel listed to fill existing vacancies and the demand for engineers exceeded the supply.

The majority of vacancies required a specialized type of experience and employers were willing to wait for the candidate with the necessary qualifications. It was noted that employers failed to find engineers for municipal work of many kinds and those specially skilled or trained in the field of electronics.

A number of these vacancies still exist.

The volume of correspondence dropped from last year's figure, despite the fact that 2,000 letters were sent out. One reason seemed to be that letters from Europe showed a decline. However, letters from the United Kingdom requesting information were still very numerous.

As in the past the Institute's Employment Service is more than willing to be of assistance to engineers presently resident in Canada. It does not actively encourage non-residents, as Canadian employers hesitate to hire technical personnel prior to a personal interview. Exception to this rule is made only when a vacancy is requiring specialized training, which the department is unable to fill from existing records.

As in former years we offer our services to the graduating classes. We have noted in the past few years that very few have found it necessary to take advantage of this offer. Due to low enrolment in our universities, employers find it difficult to fill their anticipated needs. The greatest demand is still for the young engineer in all fields.

The employment service bulletin, introduced six years ago has proved to be of great value. It still enjoys a wide circulation, not only in Canada but also the United Kingdom and it is our sincere hope it will continue to be of help to the employer and employee during the coming year.

The employment situation was fairly active during the early part of 1953, as many large projects reached their peak during this period. The latter months showed a distinct levelling off of activity. The year ahead from all indications will again be a tremendous one, in the field of construction.

It is most gratifying to receive letters from many of our members and member-employers expressing their appreciation of the department's services. We do hope it will continue to be of service during 1954.

(Miss) A. Summers,
*Employment Service*

## Prairie Water Problems Committee

The report of the Royal Commission on the South Saskatchewan River Development, of which your chairman was a member, was published early in the year and the findings of this Commission are, therefore, a matter of record.

Irrigable land is being added to the existing acreage as the Province of Alberta proceeds with the construction of the distribution works of the St. Mary River Project, as the Canada Land and Irrigation Project, recently acquired by the Dominion Government, is extended, and as minor projects are undertaken by the P.F.R.A. As a result, irrigable land is now becoming available at least as rapidly as effective colonization can be carried out.

G. A. Gaherty, M.E.I.C.,
*Chairman*

## Committee on Professional Interests

No special problem was placed before this Committee during the year 1953.

It is particularly gratifying to record the establishment of five new branches in the Institute, bringing the total to 48. The new branches are as follows:

Corner Brook, Newfoundland
Huronia, Ont., (Orillia)
North Nova Scotia, (New Glasgow)
Northern New Brunswick (Bathurst)
Amherst, Nova Scotia

In addition, applications were approved by Council for the establishment of branches in the Yukon and at Brockville, Ont.

One of the original terms of reference of this Committee was the promotion of co-operation between the Institute and the provincial professional associations. In this respect, the Committee feels that, although the time is not yet opportune to press for the signing of agreements in provinces where there is no such form of co-operation, progress is being made towards that objective.

During the year, an offer of space in *The Engineering Journal* for reporting their news was made to provincial associations. Although no definite answers had been received at the end of the year, it seems that some of the Associations will avail themselves of this offer which should further promote co-operation.

Louis Trudel, M.E.I.C.,
*Chairman*

## Committee on the Training and Welfare of the Young Engineer

During the year 1953 the Committee on the Training and Welfare of the Young Engineer, by virtue of the untiring energy of Col. L. F. Grant, has continued to sponsor Professional Development Courses for young engineering graduates. The program is aimed to implement in part the report of the E.C.P.D. Training Committee "The First Five Years of Professional Development" known as the Monteith Report and recommended by Engineers' Council for Professional Development.

Professional Development Courses

The courses include such subjects as public speaking, management, labour relations, economics, finance, international affairs, what the employer expects of the young engineer, technical subjects, and others.

A comparison of the number of courses operating in the various E.I.C. branches during the past year shows a falling off during the year 1953:

1950-51—One course.
1951-52—Eight courses — Halifax to Saskatoon.
1952-53—Twenty-one courses—Sydney to Vancouver.
1953-54—Six courses in operation. Three courses will probably come into being. Three further courses are possibilities.

The chief reason for the decrease in the number of courses is that Colonel L. F. Grant, the mainspring of this movement, has not been able to visit all the branches that he wanted to during the past year. A second reason is that a good many branches having finished one course have not been able to lay out a program for another course.

Col Grant believes that he could have helped the branches had he been able to visit them in time.

### High School Level

The Canadian Committee on Counselling in Engineering and Science (C.I.C., C.I.M.M., E.I.C., and Prof. Assoc.'s) is currently organizing the counselling in engineering and science at the high school level throughout the Dominion. Counsellors have been appointed in most of the principal centres from coast to coast from among the members of the constituent bodies. A new guidance pamphlet entitled "After High School What?" has been prepared by the committee and 25,000 English and 10,000 French copies have been printed.

### Montreal Branch Guidance Committee

The Montreal Branch Guidance Committee merits special mention having completed another successful year under the chairmanship of Professor Jacques Laurence of Ecole Polytechnique.

During the year two French forums and one English forum were held. The speaker at both French forums was Dr. Huet Massue whilst Mr. I. R. Tait was the speaker at the English forum.

A total of approximately six hundred and twenty-five (625) high school students attended the forums.

### Undergraduate and Graduate Levels

The Canadian Committee on Counselling in Engineering and Science is fully occupied in organizing the counselling of high school students. It is the intention of the committee to expand in the future into the fields of counselling among undergraduates and graduates recently out of college. There is, however, a possibility that the work of counselling in engineering and science at high school, undergraduate and graduate levels cannot be successful without a permanent paid secretariat.

It is assumed that the Professional Development Courses for young engineers now being sponsored by our Committee on the Training and Welfare of the Young Engineer will eventually be taken over by the Canadian Committee on Counselling. This in effect is the understanding between the two committees so that there will be no overlapping of efforts.

### ECPD Regional Guidance Committee in Canada

In the natural course of developing the overall picture of guidance and counselling in Canada the Canadian Committee on Counselling in Engineering and Science will now function as the ECPD Regional Guidance Committee in Canada as shown in the Twenty-first (1953) Annual Report of Engineers' Council for Professional Development, page 65. R. F. Shaw should have been listed as the Chairman of the Regional Committee for the current year.

### Conclusion

The Training and Welfare Committee continues to sponsor Professional Training Courses for young engineers.

The committee encourages branch guidance committees to co-operate with the Canadian Committee on Counselling and with the guidance committees of the Chemical Institute of Canada and the Canadian Institute of Mining and Metallurgy.

In establishing programs for the guidance and training of the young engineer the committee aims to provide the opportunity and environment for professional development. The final responsibility for his professional advancement rests with the individual himself.

George B. Moxon, m.e.i.c.,
*Chairman*

## Report of the Field Secretary

During 1953 the Field Secretary made two trips to Western Canada. The first one in April and May during which he visited the branch executives of the Winnipeg, Saskatchewan, Edmonton, Calgary, Lethbridge, Kootenay, Central British Columbia, Vancouver Island and Vancouver branches. He also met "Orphan Groups" at Nelson (third visit), Nanaimo (second visit), Yellowknife (first visit) and Whitehorse (first visit). There is now a flourishing Yukon branch with headquarters at Whitehorse.

The second trip to the West in November and December included meetings with the executives of the Winnipeg, Saskatchewan, Lethbridge, Calgary and Edmonton branches, and orphan groups at Pine Falls (first visit), Dauphin (second visit) in Manitoba; Flin Flon (second visit) which is in either Manitoba or Saskatchewan depending on what part of the town one is in; Lloydminster (second visit) where the visitor is likewise uncertain as to his provincial locality; Yorkton (first visit), Moose Jaw (second visit) and Swift Current (second visit), all of which Saskatchewan can claim without reference to any other province. There are now strong sections of the Saskatchewan Branch at Moose Jaw, Swift Current and Lloydminster, the latter of which will no doubt cause several headaches to the secretaries of the Edmonton and Saskatchewan branches in settling the question of who owns who!

In Alberta, Medicine Hat (second visit), Blairmore (second visit), and Red Deer (second visit). In British Columbia, Kimberley for the first time, and Fernie and Cranbrook each for the second time.

In Ontario, the branches at Hamilton, Huronia, Niagara Peninsula, London, Border Cities and Sarnia were visited. It was also a pleasure to attend meetings arranged by the Lakehead Branch for its orphan groups at Dryden and Marathon.

A visit was also paid to the Quebec Branch.

The Field Secretary regrets that he was not able to make a Maritime trip in 1953, but in February of 1954 a tour will be made which will include beside the branches in the Atlantic Provinces, the Saguenay and Lower St. Lawrence branches and some orphan groups.

The custom has been instituted of taking photographs of orphan groups for reproduction in the *Journal*. This has resulted in the Field Secretary himself being photographed more than anybody in North America except Marilyn Monroe.

A large part of the work of the Field Secretary's office has been concerned with the starting of professional development courses. At present a proposed Dominion-wide programme is in preparation, whereby good speakers may be obtained for the professional development meetings across Canada.

Finding engineering positions, especially for young engineers newly arrived in Canada from other countries is another important feature of the work of the Field Secretary's office, and nearly all of these young men show their appreciation by becoming, in due course, members of the Institute.

The Field Secretary takes this opportunity of thanking the branch executives and the members of the orphan groups for the warm reception and the friendly hospitality which he has received from them. It makes his visits thoroughly enjoyable to him at least. If there are anywhere in Canada orphan groups, however small, which have not been visited and who would like the doubtful pleasure of a visit from the Field Secretary (or Assistant Field Secretary) he hopes that they will inform him. He will be happy to visit them as soon as possible.

The Assistant Field Secretary, Mr. James A. Ogilvy, whose duties began on September 16th, has been of great assistance in visiting other branches and groups.

L. F. Grant, m.e.i.c.,
*Field Secretary*

## Life Members' Committee

At the meeting of Council in 1946 it was decided that members who had been in good standing in the Institute for thirty-five (35) years or who had been members for thirty (30) years and had reached the age of seventy (70), should be granted Life Membership and be exempted from payment of further annual fees.

By the end of 1953 the number of Life Members was five hundred and thirty (530). Of these four hundred and ninety-six (496) reside in Canada, twenty (20) in other British Commonwealth countries, thirty-eight (38) in the United States and four (4) in other foreign countries.

After communicating with all members in Canada and learning their opinions, it was decided to establish a yearly Life Members' Fund to which each member could voluntarily contribute if he desired.

The contributing members felt that this money should be used to help defray the expenses of student representatives from our universities to the annual meeting and also to help obtain speakers for the smaller branches.

The response of the members was most encouraging. Two hundred and twelve (212) members contributed a total of $1,855 during the past twelve months.

J. A. Freeland, m.e.i.c.,
*Secretary*

## Canadian Chamber of Commerce

The 24th Annual Meeting of the Canadian Chamber of Commerce at Edmonton, September 14th to 17th, inclusive marked the termination of another very active year.

On January 20th a delegation of

officials of the Chamber, headed by President Lewis W. Simms, called upon the Prime Minister and members of his cabinet in Ottawa to lay before them the policy statements and resolutions approved by the delegates at the previous annual meeting. The matters brought to the attention of the Prime Minister and his cabinet comprised 38 policy statements and resolutions covering a wide range of subjects, from "administrative law" to "voting procedures".

In its statement on administrative law the Chamber expressed concern at the extent to which the legislative, administrative and judicial powers of Parliament are being exercised under orders in council or by officials or boards. It urged the government to limit such delegation of the powers of Parliament to the minimum degree "consistent with good government and in no case to deny access to the courts".

Another highlight of the policy declarations was that dealing with international trade relations in which reference was made to the continued restrictions limiting Canada's trade with the sterling area, and to the necessity for simplification of customs procedures in trade with the United States.

Following the presentation of the Policy Declarations and Resolutions to the Prime Minister and his cabinet, a delegation from the Executive Council presented a brief concerning the government's fiscal policy to the Ministers of Finance and of Internal Revenue. To summarize, the brief recommended "that the fiscal policy should be concerned with reducing government expenditures, which are both large and relatively inflexible; with reducing a tax burden that leaves little reserve for taxing power and is dulling incentive; with encouraging a volume of savings which will be adequate to meet the requirements of our investment program, and with keeping down a cost structure which might otherwise make the meeting of competition in foreign markets more difficult.

On March 3rd a Town Meeting of the Air was broadcast from Montreal under the sponsorship of the Canadian Chamber, the Chambre de Commerce de Montreal and the Montreal Board of Trade. The discussion of the subject "How Can We Strengthen the Canadian-U.S. Partnership" was led by Mr. Lionel A. Forsyth, Q.C. of Montreal and Mr. R. L. Bowditch of Boston. This broadcast, a regular Tuesday evening feature of the Columbia Broadcasting System in the United States, is believed to have made an important contribution to the development of a greater measure of understanding between citizens of Canada and of the United States.

A joint meeting of the Boards of Directors of the Canadian Chamber of Commerce and of the Chamber of Commerce of the United States was held in Montreal on June 18th. This was an historical occasion as it inaugurated what is expected to be an annual event between the boards of the two organizations. It is a logical outgrowth of the meetings of the Canada-U.S. Committee which has been held periodically for several years, and of the close and friendly relations that exist between the two organizations.

The annual meeting, as noted above, was held in Edmonton September 14th to 17th incl. A special feature was the tour that was arranged to enable the delegates to get acquainted with the west. Special trains left Montreal and Toronto and stopped at Winnipeg, Wainwright and Saskatoon on the way out, toured the Peace River country after the meeting, with stops at Bycroft, Grande Prairie, and Peace River town, and returned via C.P.R., stopping en-route at Red Deer, Calgary, Medicine Hat, Regina, the lakehead cities and Sudbury. As an alternative to the Peace River tour a plane load of the delegates flew up to Yellowknife and saw the real frontier.

Most of the stops that were made were of several hours' duration, affording the delegates an opportunity of seeing the town and the surrounding country and of sampling western hospitality provided by the local Chamber of Commerce. The experience of seeing that country and getting acquainted with its people is one that the delegates will long remember.

This report closes my tour of duty as the representative of the E.I.C. on the Canadian Chamber of Commerce. As a member of the Board of Directors, I have had an opportunity of getting acquainted with many of the leaders of Canadian business and I want to express my appreciation to the Institute for affording me this opportunity.

J. A. McCrory, M.E.I.C.,
*Institute Representative*

## Canadian Standards Association

The year 1953 was a very eventful, as well as active one for the Canadian Standards Association. A new set of by-laws for the Association became effective in April, 1953. Two basic changes in the administrative arrangements of the Association have been made, the first dealing with business administration which, under the new by-laws, is in the hands of a Board of Directors of 20 members, and secondly, concerning the acceptance and authorization of CSA standards, the final acceptance of technical details of draft standards is now the responsibility of a Technical Council of 100 members representing a broad range of diversified interests and distributed geographically throughout Canada. Authority to publish these drafts, as CSA standards, is now the responsibility of the Board of Directors. Furthermore, in connection with constitutional questions, the voting power has been extended to all members of the Association and Sustaining Members now have voting privileges commensurate with the number of membership that each such organization holds in the Association.

Under the guidance of 19 Sectional Committees work on 241 projects was carried out, necessitating 59 technical meetings and 8 administrative meetings. During the year, the Association published 54 standards, 40 of which were completely new standards and the remainder comprised new editions of existing standards. In this report it will also be noted that 27 projects have reached the near publication stage, 13 of which concern new standards and 14 new editions of existing standards. Under development were 128 standards, comprising 97 new and 31 revised editions. In addition, revision slips were published for 16 standards and revision slips for 16 other standards have reached the publication stage. It should also be mentioned that 51 reprints of existing standards were made to meet increasing demand for CSA standards.

The Association has also been very active in international standardization. In this field are the ABC — America-Britain-Canada standardization projects, which concern the development of unified screw threads, limits and fits and drawing practice. In the broader international field the CSA has "Observer" or "Participating" membership in 44 technical committees of the International Organization for Standardization (ISO). In the International Electrotechnical Commission (IEC) the CSA is actively participating or observing in the work of 39 technical committees dealing with international standards in the electrical field. These international standardization activities are carried on in the interests of better mutual understanding between nations engaged in international trade — particularly in relation to terminology and test procedures. It should be noted that in this particular field, no commitments as to the adoption of international standards will be made by the CSA without the approval of producer and consumer interests in Canada.

The two very active divisions, Approvals Division and Canadian Welding Bureau, have shown very satisfactory progress.

Under the Sectional Committee on Building Materials, 32 projects have been under active development. Sixteen standards for Asphalt and Tar Roofing Materials and a new edition of the standard for Vitrified Clay Pipe, were published, as well as a new standard for Gypsum Products. In addition, projects reaching the near publication stage are 4 on Gypsum Products and 6 for Brick and Hollow Tile. Under development were a new edition of a Gypsum standard and a new standard on Plastic Tile.

Six projects concerning the general revision of CSA Specification A23 on Concrete and Reinforced Concrete, Masonry Cement, Precast Concrete Units; revision slips for Specification A5 on Portland Cements, and 2 standards on Reinforced Concrete Poles, comprise the year's work for the committees under the jurisdiction of the Sectional Committee on Concrete. The 2 specifications for Concrete Poles — A14.1 on Concrete Poles (Not Prestressed) and A14.2 on Concrete Poles (Prestressed), were published.

In connection with the Sectional Committee on Mechanical Work, 17 projects were brought to various stages of completion. One standard, B96 for Compressed Gas Cylinder Valve Outlet and Inlet Connections (2nd Edition) was published. The new edition of Specification B97 for Limits and Fits for Engineering and Manufacturing reached the publication stage, and 12 other proposed standards are in various stages of development. Revision slips were issued for the CSA Code B51 on Boilers and Pressure Vessels, and a review was made of proposed revision slips for Specifications B12 on Galvanized Steel Wire Strand and the Code B44 on Passenger and Freight Elevators. Fifteen committee meetings were held concerning developments and projects for screw threads, screw products and small rivets, wire rope for marine purposes, identification of piping systems and conduit, cast iron pipe, drawing practice, limits and fits, marine aluminum valves, and boilers and pressure vessels.

The Sectional Committee on Fire Prevention and Protection held one meeting and meetings were held by subsidiary technical committees on Fire Tests on Building Construction and Materials, Automobile Fire Fighting Apparatus, Fire Hose, and Forestry Hose. One new edition of a standard was published — B89.3 for Automobile Fire Fighting Apparatus.

Under the Sectional Committee on Electrical Work a new edition of Specification C21, for Control Cable for Electrical Power Plant Equipment, was published and a new edition of Specification C68A, for Insulated Power Cable, neared the publication stage. In addition, considerable development work was carried on regarding 14 other projects concerning distribution transformers, galvanized steel line wire, electricity meters, aluminum cable, transformer and switch oils, oil circuit breakers, pivot-type transformers, magnet wire, safety equipment for linemen, fibre and asbestos cement conduit, instrument transformers, lightning rods, and oil-less circuit breakers.

In the field of Illumination, considerable progress was made in the development of proposed CSA Specifications for Industrial Lighting, School Lighting, and Street and Highway Lighting.

The 6th edition of the Canadian Electrical Code, Part I — Inside Wiring Rules, was published during August. In addition, a special pamphlet was published providing a very useful comparison of the 5th and 6th editions of the Code. The Committee on the Canadian Electrical Code, Part I, held 2 meetings during the year. The Committee on Canadian Electrical Code, Part II, held 3 meetings during the year. Thirty-six Part II projects were under development during the year, 9 of which resulted in published standards, 11 standards reached the publication stage, the others moving along normally.

Considerable progress was shown on projects under the Canadian Electrical Code, Part III — Outside Wiring Rules, where a new Standard C22.3 No. 1(D) "Joint Use of Poles to Support Supply and Communication Crossarms," was published. Seven other projects reached varying degrees of development.

One new Standard C22.4 No. 101 for Interference Measuring Instruments and Methods of Measurement, was published under the Canadian Electrical Code, Part IV — Radio. Attention was also given to the development of 7 other projects concerning general requirements; interference from vehicles using internal combustion engines; interference from electrical appliances and equipment; private and commercial receivers; transformers and RF transmission lines; antennae towers and antennae supporting structures; and amateur and domestic antennae supporting structures. Committees held 5 meetings during the year.

Under the Sectional Committee on Ferrous Metals, 8 new standards were published; one for Wire Nails, Spikes and Staples; and 7 in the G110 Series for Stainless Steel. One new edition of G38 — Carbon Steel Forgings, was also published. Three standards for Reinforcing Materials for Concrete are nearing the completion stage, while 3 other projects have reached various phases of development.

Some activity was reported by the Sectional Committee on Non-Ferrous Metals, which held one meeting during the year and at which 9 projects were reported in varying degrees of development, including revisions in the HN Series on Nickel and Nickel Alloys.

The Sectional Committee on Timber held its annual meeting in December. A new edition of Specification 043 for Structural Timber and 4 new standards, 0116 "Crossarms and Wood Pins for Power and Communication Lines"; 0118 "Western Red Cedar Shingles and Machine Grooved Shakes"; 0121 "Douglas Fir Plywood and Western Softwood Construction Plywood"; and 0122 "Glued-Laminated Structural Timber", were published. Considerable activity occurred in the development of a new edition of Specification 056 for Wood Piling; 35 new standards for Preservative Treatment of Timber; 2 standards for Millwork; and a new standard for Wood Insulator Pins. The total number of projects for the year was 48 and 3 committee meetings were held.

With regard to the Sectional Committee on Steel Construction, the proposed new edition of Specification S16 for Steel Structures for Buildings, neared completion after prolonged discussion, while a start has been made on the proposed new edition of the Specification S20 for Movable Bridges.

Specification W48.2, for Corrosion-Resisting Chromium and Chromium-Nickel Steel Welding Electrodes, was published under the Sectional Committee on Welding. A new standard W55.2 for Resistance-Welding reached the publication stage and a revision slip for Specification W47 "Welding Qualification Code", was published.

A meeting of the recently organized Sectional Committee on Marine Welding was held, during which a number of pertinent sub-committees were organized with a view to having consideration given first to the preparation of an appropriate Code for Marine Welding.

In the Miscellaneous field, 22 projects were under development and 9 committee meetings were held. In the general field, considerable progress was made in the development of appropriate standards for Hydraulic Lifts, Convector Radiation and Insecticide Vapourizers. Investigational work was carried on under the guidance of the Sectional Committee on Abbreviations.

Under Protective Packing, the new Standard Z102.12T for Corrugated Fibreboard Boxes and Products for Use by the Defence Services, was published. The proposed Standard Z102.10 for Skidding of Machinery has reached the publication stage, while 10 other projects have reached various stages of development.

Two new standards, one on Still Photography and the other on Survey Photography, were published under the Sectional Committee on Photographic Equipment. A new standard for 16-mm Projectors has reached the draft stage, and a committee meeting was held in this connection.

In conection with Oil Burning Equipment, considerable progress has been made in the proposed new edition of the Specification Z93.3 for Atomizing Type Domestic Oil Burning Equipment.

To repeat the opening sentence it has been a very active year.

# OFFICERS OF THE BRANCHES

### AMHERST

*Chairman,* L. F. KIRKPATRICK
*Vice-Chair.,* R. ROBSON
*Executive,* J. R. MacQUARRIE A. G. BAXTER
D. H. STONEHOUSE
*(Ex-Officio),* C. D. CARTER J. N. RITCHIE
*Sec.-Treas.,* J. J. LEYDON,
10 Victoria St. W., Amherst, N.S.

### BELLEVILLE

*Chairman,* C. R. WHITTEMORE
*Vice-Chair.,* A. O. DRYSDALE
*Executive,* A. E. ARGUE J. H. LEGATE
T. E. FLINN E. L. LITTLEJOHN
A. D. JANITSCH
J. C. R. PUNCHARD
*(Ex-Officio),* G. A. BRADFORD S. SILLITOE
*Sec.-Treas.,* C. H. LUSK,
P.O. Box 40, Belleville, Ont.

### BORDER CITIES

*Chairman,* P. S. DEWAR
*Vice-Chair.,* W. G. MITCHELL
*Executive,* W. D. DONNELLY
J. E. DYKEMAN
C. M. ARMSTRONG
*(Ex-Officio),* J. C. AITKENS J. G. HOBA
*Secretary,* R. J. TRINDER,
706 Irvine St., Windsor, Ont.
*Treasurer,* P. N. BROWN

### BROCKVILLE

*Chairman,* J. S. WADDINGTON
*Vice-Chair.,* F. F. WALSH
*Executive,* R. E. DAVEY R. M. POWELL
J. F. PRESTON R. H. WALLACE
*(Ex-Officio),* H. B. BREWER
*Sec.-Treas.,* J. G. KERFOOT,
Phillips Electrical Works Ltd.,
Box 100, Brockville, Ont.

### CALGARY

*Chairman,* K. W. MITCHELL
*Executive,* WM. C. GUSSOW J. A. WEBB
D. C. HUTCHINSON
A. H. NICHOLSON
*(Ex-Officio),* R. T. HOLLIES C. E. McNEVIN
T. D. STANLEY J. J. HANNA
*Sec.-Treas.,* WM. E. HAWKINS,
1708-26A St., S.W., Calgary, Alta.

### CAPE BRETON

*Chairman,* G. W. ROSS
*Vice-Chair.,* M. R. CAMPBELL
*Executive,* W. A. BURGESS C. A. CAMPBELL
A. W. GREENIUS
B. St. C. LANGILLE
H. C. MAITLAND G. V. SMYTHE
J. E. TERRY
*(Ex-Officio),* C. N. MURRAY J. R. WALLACE
*Sec.-Treas.,* E. J. PRINCE,
62 Castle Drive, Sydney, N.S.
*Ass't. Sec.,* W. L. DODSON

### CENTRAL BRITISH COLUMBIA

*Chairman,* M. L. ZIRUL
*Vice-Chair.,* W. A. KER
*Executive,* H. D. DeBECK A. F. JOPLIN
P. G. W. WALKER
*(Ex-Officio),* R. L. BIGG M. L. WADE
*Secretary,* H. D. DeBECK,
c/o Water Rights Branch,
515 Columbia St., Kamloops, B.C.

### CORNER BROOK

*Chairman,* E. HINTON
*Vice-Chair.,* W. R. HUGHSON
*Treasurer,* W. S. READ
*Secretary,* B. C. McGRATH,
c/o Bowater's Nfld. Pulp and Paper
Mills, Corner Brook, Nfld.

### CORNWALL

*Chairman,* J. HAWKES
*Vice-Chair.,* J. MORRIS
*Executive,* T. WEBSTER R. BLACKETT
G. B. STIDWILL D. C. McEWAN
H. CAMPBELL
*(Ex-Officio),* D. ROSS-ROSS B. T. YATES
*Sec.-Treas.,* L. H. SNELGROVE,
Courtauds (Canada) Ltd.,
Cornwall, Ont.

### EASTERN TOWNSHIPS

*Hon. Chair.,* A. C. CREPEAU
*Chairman,* J. CRITCHLEY
*Vice-Chair.,* GASTON MASSE
*Executive,* B. R. BRADLEY H. V. RANKIN
J. BRISSON D. K. SHERRY
T. W. HOUGHTON G. P. COTE
*(Ex-Officio),* G. M. DICK G. J. COTE
*Treasurer,* L. G. CARIGNAN
*Secretary,* W. J. SUTHERLAND,
663 Vimy Street, Sherbrooke, Que.

### EDMONTON

*Chairman,* N. J. ALLISON
*Vice-Chair.,* E. K. CUMMING
*Executive,* C. A. DAVIDSON R. NURSE
R. N. McMANUS D. ROSS
C. Z. MONAGHAN
J. A. SIRDEVAN
*(Ex-Officio),* J. F. McDOUGALL E. L. SMITH
J. L. PULFORD B. F. WILLSON
*Sec.-Treas.,* P. M. BUTLER,
c/o Angus, Butler and Associates,
Northern Hardware Bldg.,
Edmonton, Alta.

### FREDERICTON

*Chairman,* C. E. WEYMAN
*Vice-Chair.,* R. E. TWEEDDALE
*Executive,* D. E. REELEDER D. A. FORBES
H. W. McFARLANE S. B. CASSIDY
H. E. MARSHALL
C. E. CAMPBELL
*(Ex-Officio),* D. J. BREWER H. G. HUGHSON
*Treasurer,* G. H. LOANE
*Secretary,* I. M. BEATTIE,
P.O. Box 974, Fredericton, N.B.

### HALIFAX

*Chairman,* O. N. MANN
*Executive,* W. A. DEVEREAUX M. S. HICKS
R. M. BARTEAUX J. D. FRASER
W.A.LOGAN G.A.CUNNINGHAM
W. R. LEWIS S. W. KENNEY
D.A.EISENHAUER O.H.MANUEL
*(Ex-Officio),* W.H.CHISHOLM G.F.C.BENNETT
A. E. FLYNN A. R. HARRINGTON
J. W. MacDONALD I. P. MACNAB
*Sec.-Treas.,* W. A. LOGAN,
P.O. Box 33, Halifax, N.S.

### HAMILTON

*Chairman,* W. A. WHETEN
*Vice-Chair.,* F. E. MILNE
*Executive,* I. M. MACDONALD D. J. HAINS
R. A. ADAMS J. J. KELLY
*(Ex-Officio),* N. METCALF W. A. DAWSON
J. A. REID
*Sec.-Treas.,* N. A. PARRY,
620 King St. East, Apt. 3,
Hamilton, Ont.

### HURONIA

*Chairman,* F. ALPORT
*Sec.-Treas.,* L. MORGANTE,
63 Penetang Street, Orillia, Ont.

### KINGSTON

*Chairman,* S. H. ROCHESTER
*Vice-Chair.,* C. H. R. CAMPLING
*Executive,* A. V. CORLETT
A. E. HYDE S. F. PAULEY
C. W. JONES W. A. TROTTER
*(Ex-Officio),* G. T. L. ANDREWS
J. S. CAMPBELL D. L. RIGSBY
*Sec.-Treas.,* D. R. GRAHAM,
260 Park St., Kingston, Ont.

### KITCHENER

*Chairman,* J. A. TOD
*Vice-Chair.,* L. J. SANDERS
*Executive,* B. N. NICHOLS W. A. RUNGE
B. R. McCAFFREY J. L. FAIR
*(Ex-Officio),* W. R. ROBERTS A. J. GIRDWOOD
M. A. MONTGOMERY
*Sec.-Treas.* J. F. RUNGE,
c/o Armco Drainage and Metal
Products, Guelph, Ont.

### KOOTENAY

*Chairman,* E. B. BROADHURST
*Vice-Chair.,* W. K. GWYER
*Executive,* A. A. LAMBERT T. W. LAZENBY
W. G. SMALL H. T. MIARD

Montreal 29, Que.

### NEWFOUNDLAND

*Chairman,* C. A. KNIGHT
*Vice-Chair.,* WM. WATSON
*Executive,* A. BUTT, B. HIGGINS, E. L. BALL, R. P. HUNT, E. COOPER
*(Ex-Officio),* S. CAREW, E. DICKINSON
*Sec.-Treas.,* M. A. FOLEY,
P.O. Box E-5035, St. John's, Nfld.

### NORTH NOVA SCOTIA

*Chairman,* F. C. MORRISON
*(Ex-Officio),* D. J. MacNEIL, F. C. MORRISON
*Sec.-Treas.,* D. G. DUNBAR,
Pictou County Power Board,
New Glasgow, N.S.

### NIAGARA PENINSULA

*Chairman,* A. J. BENNETT
*Vice-Chair.,* H. E. TREBLE
*Executive,* H. D. DAVISON, H. C. RYNARD, G. L. T. ELLIS, W. A. SCOTT, C. A. McDONALD, J. D. SMITH, G. W. T. RICHARDSON
*(Ex-Officio),* P. A. PASQUET, P. E. BUSS
*Sec.-Treas.,* H. C. L. JOE,
c/o English Electric Co. of
Canada Ltd.,
St. Catharines, Ont.

### NIPISSING AND UPPER OTTAWA

*Chairman,* R. G. DYE
*Vice-Chair.,* J. W. MILLAR
*Executive,* N. A. BURKE, R. R. PRESCOTT, T. C. MacNABB, F. R. MARSHALL, G. J. BIALIK, J. TUTECKY
*(Ex-Officio),* G. L. HOOD, A. K. GRIMMER
*Sec.-Treas.,* R. A. BOOY,
P.O. Box 1, Temiskaming, Que.

### NORTH EASTERN ONTARIO

*Chairman,* G. M. LYON
*Executive,* F. B. WHITLEY, W. B. JACKSON, A. S. MILLAR, R. A. CARTER
*(Ex-Officio),* T. G. D. WHILLANS
*Sec.-Treas.,* C. D. McCULLOCH,
Abitibi Power & Paper Co.;
Iroquois Falls, Ont.

### NORTHERN NEW BRUNSWICK

*Chairman,* R. C. EDDY
*Vice-Chair.,* G. A. ROBB
*Executive,* D. MacCALLUM, D. A. STACK, G. P. MILTON, C. F. TAYLOR, M. CYR, T. GOULD
*(Ex-Officio),* W. C. BAGGS
*Sec.-Treas.,* L. L. MARSHALL,
P.O. Box 541, Bathurst, N.B.

### OTTAWA

*Chairman,* R. E. HAYES
*Vice-Chair.,* R. F. LEGGET
*Executive,* C. E. HOWARD, D. B. REES, C. B. CRAWFORD
*(Ex-Officio),* W. R. MEREDITH, T. FOULKES, B. G. BALLARD
*Treasurer* H. CHAPUT
*Secretary,* G. A. SUTHERLAND,
Radio and Electrical Engrg. Div.,
National Research Council, Ottawa

### PETERBOROUGH

*Chairman,* J. P. WATTS
*Executive,* J. G. LUCAS, D. T. BATH, G. T. DAVIS, A. BONNEY, D. G. DONALDSON
*(Ex-Officio),* G. S. WADE, R. L. DOBBIN, A. R. T. HAILEY, H. R. SILLS
*Sec.-Treas.,* R. A. BLOUNT,
c/o Canadian General Electric Co.
Ltd., Peterborough, Ont.

### PORT HOPE

*Hon. Chair.,* J. G. G. KERRY
*Chairman,* W. S. RAYNOR
*Sec.-Treas.,* J. L. SYLVESTER,
71 Walton St., Port Hope, Ont.

### PRINCE EDWARD ISLAND

*Chairman,* R. B. SMITH
*Vice-Chair.,* J. H. HEARN
*Executive,* E. K. MACNUTT, L. E. SLAGHT, K. C. MARTIN, A. H. GILLIS
*(Ex-Officio),* G. J. HAYES
*Sec.-Treas.,* K. C. MARTIN,
59 Ambrose St., Charlottetown,
P.E.I.

### QUEBEC

*Life Hon. Chair.,* A. R. DECARY
*Chairman,* A. E. PARE
*Vice-Chair.,* G. E. SARAULT
*Executive,* BEN. O. BAKER, A. deLERY, L. P. BONNEAU, G. LEGAULT, P. A. DUCHASTEL, R. PAINCHAUD
*(Ex-Officio),* L. GAGNON, J. ST-JACQUES, G. DEMERS
*Sec.-Treas.,* ROGER DESJARDINS,
Public Service Board, Court House,
Quebec, Que.

### SAGUENAY

*Chairman,* G. K. CLEMENT
*Vice-Chair.,* F. A. DAGG

*(Ex-Officio),* D. F. NASMITH, H. R. FEE, W. P. C. LeBOUTILLIER
*Sec.-Treas.,* C. LOUTTIT,
527 Normandie St., Arvida, Que.

### SAINT JOHN

*Chairman,* R. M. RICHARDSON
*Vice-Chair.,* W. M. BRENAN
*Executive,* J. J. DONAHUE, F. L. DOTY, T. C. HIGGINSON, C. G. CLARK
*(Ex-Officio),* A. G. WATT, E. E. WHEATLEY, J. REED
*Sec.-Treas.,* J. A. B. BRENAN,
362 Martello Road,
Lancaster, N.B.

### ST. MAURICE VALLEY

*Chairman,* L. A. ROBILLARD
*Vice-Chair.,* E. R. McMULLEN
*Executive,* T. G. EDGEWORTH, J. O. KELLY, A. M. HUBLEY, J. W. KORCZ, J. M. JOPP, J. R. SWEENEY
*(Ex-Officio),* D. E. COVEY, C. M. YOSHIDA, E. E. COPPING
*Sec.-Treas.,* D. M. McKIM,
Shawinigan Chemicals Limited,
Shawinigan Falls, Que.

### SARNIA

*Chairman,* S. V. ANTENBRING
*Vice-Chair.,* J. E. HARRIS
*Executive,* K. O. OLIVER, R. G. SHATFORD, K. E. BENTLEY, C. N. LUND, C. S. PHELPS
*(Ex-Officio),* E. W. DILL, G. R. McMILLIN
*Treasurer,* J. L. McKAY
*Secretary,* R. A. McGEACHY,
c/o Imperial Oil Ltd.,
Sarnia, Ont.

### SASKATCHEWAN

*Chairman,* ALLAN TUBBY
*Vice-Chair.,* G. N. MUNRO
*Executive,* A. F. G. CARROLL, K. C. GRAHAM, J. E. MOLLARD, R. PETERSON, W. R. STAPLES, W. L. SHARPE
*(Ex-Officio),* P. G. McARA, J. G. SCHAEFFER, I. M. FRASER, J. JONSSON, G. W. PARKINSON, M. J. SPRATT
*Sec.-Treas.,* R. BING-WO,
2043 Cameron St., Regina, Sask.

### SAULT STE. MARIE

*Chairman,* W. T. BUTLER
*Vice-Chair.,* W. D. ADAMS
*Executive,* G. B. DEWART, G. L. BROWN, D. SCHMIDT, T. HAMLIN
*(Ex-Officio),* O. A. EVANS, D. C. HOLGATE
*Sec.-Treas.,* A. B. PLATT,
1162 Queen St. E., Apt. 6,
Sault Ste. Marie, Ont.

### SUDBURY

*Chairman,* W. J. RIPLEY
*Vice-Chair.,* F. A. ORANGE
*Executive,* L. T. LANE, J. E. QUANCE, J. F. McCALLUM
*(Ex-Officio),* W. F. MILLER, E. R. EATON
*Sec.-Treas.,* G. W. FLEMING,
297—6th Avenue, Lively, Ont.

### TORONTO

*Chairman,* J. G. HALL
*Vice-Chair.,* M. McMURRAY
*Executive,* J. H. ROSS, C. E. POTTER, R. H. SELF, R. W. TEAGLE, F. E. WELLWOOD, I. S. WIDDIFIELD
*(Ex-Officio),* A. E. BERRY, C. R. DAVIS, C. D. CARRUTHERS, E. R. GRAYDON, W. H. PATERSON
*Sec.-Treas.,* LOUIS BRESOLIN,
c/o Engineering Institute of Canada,
236 Avenue Road, Toronto, Ont.

### VANCOUVER

*Chairman,* E. L. HARTLEY
*Vice-Chair.,* W. O. RICHMOND
*Executive,* P. N. BLAND, J. C. OLIVER, F. M. CAZALET, L. B. STACEY, K. Y. LOCHHEAD, R. A. McLACHLAN
*(Ex-Officio),* H. T. LIBBY, S. S. LEFEAUX, G. FAULDER, S. HOGG, J. E. MACDONALD
*Treasurer,* I. D. SMITH
*Secretary,* C. P. JONES,
4130 Capilano Road,
North Vancouver, B.C.

### VANCOUVER ISLAND

*Chairman* W. A. BOWMAN
*Vice-Chair.,* A. G. BALLANTYNE
*Executive,* N. J. GOODE, H. C. THURBER, W. G. H. CAM, J. ALTON, G. W. C. LAKE
*(Ex-Officio),* J. A. W. IZARD, T. A. J. LEACH
*Sec.-Treas.,* Cmdr. P. F. FAIRFULL,
Esquimalt Drydock,
Box 248, Victoria.

### WINNIPEG

*Chairman,* J. L. CHARLES
*Vice-Chair.,* D. M. STEPHENS
*Executive,* E. S. KENT, L. A. BATEMAN, J. HOOGSTRATEN, C. D. WORBY, G. B. WILLIAMS, N. A. R. HANKS, T. H. KIRBY, C. D. OSTERLAND, J. C. TRUEMAN, G. W. LAWSON, E. M. SCOTT, N. S. BUBBIS
*(Ex-Officio),* C. L. FISHER, T. E. STOREY, C. V. ANTENBRING
*Sec.-Treas.,* C. S. LANDON,
P.O. Box 541,
Winnipeg, Man.

### YUKON

*Chairman,* M. C. SUTHERLAND-BROWN
*Sec.-Treas.,* JOHN L. PHELPS,
P.O. Box 300, Whitehorse, Y.T.

### ONTARIO DIVISION

*Chairman,* W. L. SAUNDERS
*Vice-Chair.,* W. A. T. GILMOUR
*Treasurer,* G. R. TURNER
*Board of Management,* E. A. CROSS, F. R. POPE, C. P. WARKENTIN
*Secretary,* L. C. SENTANCE,
c/o Canadian Westinghouse Co.
Ltd., Hamilton, Ont.

# Abstracts of Reports from Branches

**Note—For Membership and Financial Statements see pages 154-156**

## Amherst District Branch

The Amherst District Branch came into being on March 6th, 1953, climaxing over two years' effort on the part of Institute members in this area to obtain a charter. Some of the men instrumental in organizing support for the idea during the early stages are now in other parts of Canada while others are no longer with us. The Branch, however, owes these men a debt of gratitude and would like to pay public recognition to the role they played in its formation. We have in mind men like W. G. Muir, J. F. MacKenzie, E. G. DeWolf, D. J. Bird and S. W. Crowell.

The Branch was highly honoured this year in having two presidential visits. The March inaugural dinner when the charter was presented by Dr. J. B. Stirling, immediate past-president, E.I.C. together with the November visit of President Ross Dobbin and Dr. Wright, were the highlights of the year's activity.

Enthusiastic plans for the coming year are now in preparation and include an iron ring ceremony scheduled to take place in January. The Branch has also contacted the Field Secretary requesting assistance in launching a Professional Development Course sometime in the new year.

## Belleville Branch

There were seven general meetings throughout the year, the minutes of which have been reported in the Journal. The topics of the various addresses represented a wide variety of engineering subjects. The attendance was exceptionally good at all meetings and particularly so at the March meeting when Dr. G. N. Patterson, Director of the Institute of Aero-Physics at the University of Toronto, addressed the Branch on "Shock Waves and Supersonic Flight". Many guests from the R.C.A.F. Station at Trenton were present for this meeting.

The annual visit of the President took the form of a dinner and dance. Mr. Dobbin delighted his audience with his stories of the Coronation. Several members of the Peterborough Branch were present for this meeting.

A very successful Professional Development Course, sponsored by the Junior Members of the Branch, was concluded in the Spring.

The Branch sponsored a $25.00 prize to be given to a Grade XIII student at the Belleville Collegiate who planned to take an engineering course and who had the highest standing in English, Algebra, Trigonometry, Geometry, Physics and Chemistry. This prize was won by William Campbell and presented by Mr. C. R. Whittemore at the commencement exercises.

## Border Cities Branch

The Professional Development course, which last year was very active with a great variety of topics, has lain dormant this fall due to the fact that many members prefer to take one course that would result in a more detailed and comprehensive coverage. This has been difficult to arrange primarily due to the very heavy workload most members in this area are subjected to. We hope to create more activity in this item in 1954.

This year, as last, the operation of the Ladies' Auxiliary was very successful, the membership this year being 95.

Our meetings were varied, all quite successful, with only three this year at Assumption College, two dinner meetings at the Prince Edward Hotel, one in a school auditorium, and one at Hiram Walker's Distillery. The Dinner Dance for the President's visit was very successful.

## Calgary Branch

During the year nine general meetings were held. Technical subjects included were, "Television" and "Influence of Future Power Requirements on the Science of Transmission". General interest subjects included "Colonization of Irrigated Areas in Alberta", "Refugee Problems in the Middle East", and "The Heritage of Western Canadian Exploration". Two film nights were also held. In addition, a panel discussion was held on the topic of Industrial Development in the Calgary Area. This panel discussion was very well received and the Program Committee is considering more meetings of this nature.

Attendance at the general meetings has been very good, averaging about 100 and on some occasions as high as 200.

A Men's Smoker was held this fall in order that the members might get more acquainted with one another.

The Luncheon Club has enjoyed phenomenal success this year and meets every Monday during the year with the exception of June, July and August. The attendance averages well over 50.

A very successful Ladies' Night was held last February. This was a formal affair and held under the name of "Slide Rule Soiree".

There was no presidential visit to the Branch during 1953.

In general, the Branch has enjoyed a very successful year and interest in the various activities has been high.

## Cape Breton Branch

There were seven meetings in 1953, six of them being held in the Isle Royale Hotel, Sydney, N.S. Apart from the two meetings, one in March on the occasion of President Stirling's visit and the other when President Dobbin visited us in November, attendance averaged 31. Inclement weather reduced attendance at the February meeting and also at the June Lobster Party. Attendance at two other meetings was affected by the closeness of other prominent functions taking place either the day before or the day after the Branch meetings.

The Professional Development Course sponsored by the Branch was organized and run by the Juniors under the capable chairmanship of Mr. Vince Palmer and keen interest was shown by all grades of membership.

The Cape Breton Branch was well represented by members and wives at the Annual General Meeting in Halifax. The decision to hold the 1953 meeting in Halifax was greatly appreciated by this Branch.

The decrease in membership in the year was largely due to the formation of the New Glasgow Branch. Previously, the Cape Breton Branch had several members resident in the mainland of North Nova Scotia.

## Central British Columbia Branch

There have been no achievements of note during the past year. From the viewpoint of getting together, in joint meetings, with the Central B.C. Branch of the Engineering Society, these have been generally successful. Excellent addresses and illustrated talks on a variety of subjects have been enjoyed, and with the exception of one meeting, attendance has been good.

The last Annual Meeting was highlighted by the visit of President Stirling and Mrs. Stirling, accompanied by Mr. and Mrs. Jubien of the Montreal Branch. We have not yet had a visit from President Dobbin this year, so we still have this pleasure to look forward to.

During the year we had a very enjoyable visit from our Field Secretary Past-President Grant. He entertained the members at Penticton, and was entertained by the members in Kamloops. Past-President Vance, on his way through, also favoured our Branch with a visit. The members in Kamloops, who could get together on short notice, spent a very enjoyable and informative evening with Mr. Vance and Mr. M. W. Maxwell of the C.N.R., Montreal.

Unfortunately the Student Guidance Committee, after a very auspicious start last year, did not get operational this year, as a committee. Due to a delay in the earlier part of the year waiting for promised help in the way of pamphlets and films from the E.C.P.D., which did not materialize, the committee was not organized in time to give assistance through the school career days, as was done last year. Several of our members, however, did participate in the career day talks at Kamloops and Penticton school. It is hoped that this committee will become active again next year, and that promised assistance will be forthcoming from the E.C.P.D.

## Corner Brook Branch

Since the inception of this Branch in May 1953 there have been three business meetings and three technical discussions. The attendance at these meetings was fair and with the Winter approaching it was hoped to plan regular meetings both technical and business and better attendance was expected.

During the short life of the Branch, we have lost both a secretary, Mr. Tasker, and a vice-chairman. Mr. J. N. Franklin. Both these gentlemen were active in the Branch and were missed very much on their departure. In both cases a farewell party was held and suitable presentations made.

The main highlights of the year's activities were the Inaugural Dinner and Dance held at the Community Center and the Banquet and Dance held at Wellon's Night Club in honour of the President's visit.

The Inaugural Dinner was well attended, there being twenty-four members and their partners and nine guests accompanied by their wives. After a very pleasant dinner and the usual after dinner speeches, a dance followed. During the dance "Muriel's Room" supplied liquid refreshments of a suitable nature.

Twenty-seven members and their partners attended the banquet held in honour of Mr. Dobbin's visit. The evening consisted of cocktails at 7.30 p.m. followed by dinner. The Chairman, Mr. E. Hinton, introduced the President, who gave a very interesting account of his attendance at the Coronation. At 9.45 p.m. the banquet adjourned and dancing followed for the balance of the evening.

This gives an outline of the main year's activities and the Branch looks forward to a more active year in 1954.

## Cornwall Branch

The Executive of the Cornwall Branch considers that the past year has been very successful. Meetings were well attended and a wide variety of subjects were offered. The Program Committee has established a pattern which it recommends be followed by future Committees. The pattern set out by the Program Committee calls for two Joint Meetings per year, one with the Chemical Institute of Canada, and the other with the local section of the American Institute of Electrical Engineers. The speaker for the Joint Meeting held in January with the Chemical Institute of Canada was Professor F. K. Hare, of McGill University, who spoke on "Canada's Natural Resources". The speaker for the Joint Meeting with the American Institute of Electrical Engineers held in October was Mr. J. R. Montague of the Hydro-Electric Power Commission of Ontario, who spoke on "The St. Lawrence Power Project."

In addition to the above, a Smoker, a Ladies' Night, a Branch Night and a Dinner are established customs. This year I. R. Tait and Colonel H. G. Thompson were present to discuss Institute affairs at the Smoker. The Ladies' Night was a well-received Supper Dance.

The Branch Night provided an opportunity for one of the Branch members to present a paper. This year Mr. L. Snelgrove spoke on "Plant Maintenance."

The Dinner was held prior to the summer recess. Air Vice-Marshall James presented an interesting talk on "Canada's Air Defences".

Two other meetings were reserved for obtaining speakers to present subjects of particular interest. Mr. J. Lefort of J. Edgar Dion, Consulting Management Engineers presented a paper on "Job Evaluation and Merit Rating"; Mr. R. W. Foster-Pegg, of the Gas Dynamics Laboratory of McGill University spoke on "Coal Burning Gas Turbines". The first meeting was held in May, and the second in September.

This year the Presidential Visit and Annual Dinner were combined to make a very enjoyable meeting which was the highlight of the year.

## Eastern Townships Branch

The year 1953 has been an outstanding one for the Eastern Townships Branch. Highlights of the many meetings were the visits of two presidents of the Institute, one in the spring and one in the fall.

On April 23rd the members and their lady guests entertained at the Tuque Rouge Club with J. B. Stirling, President, and L. A. Wright, Secretary, as the principal speakers. Also at the head table were His Worship, Mayor Emile Levesque, and Mr. G. M. Dick, Chairman of the Branch. A group of some 150 attended, and the affair was pronounced a great success.

Again on December 7, 1953, we were honoured with a visit from President R. L. Dobbin and the Assistant General Secretary, Colonel H. G. Thompson. For Mr. Dobbin this was the first visit to Sherbrooke, but Colonel Thompson came to renew many old acquaintances made on previous visits. The meeting was held at the New Sherbrooke Hotel, with some 85 ladies and gentlemen in attendance. The program included dinner and dancing, as well as short speeches by various notable guests. Included at the head table with Mr. Dobbin and Colonel Thompson were The Honorable Johnny Bourque and Mrs. Bourque, Mr. Deslauriers, representing the Mayor of Sherbrooke, and Mrs. Deslauriers, and Mr. J. C. Critchley, the Branch chairman.

An election of officers took place at the meeting on May 16, 1953. The nominating committee proposed the following names as members of the Executive Committee:

Chairman—John C. Critchley, Vice-Chairman—Gaston Masse, Committee Member—T. W. Houghton, Committee Member—Bruce R. Bradley, Committee Member—George P. Cote, Secretary—T. E. Chalmer.

The membership unanimously approved these proposed names.

One of the most interesting meetings of the year was a visit to the underground workings of the Ascot Metals, Suffield Mines, and the mill at Moulton Hill. The tour was personally conducted by the mine and mill executives, and the group was able to see and hear about the processing of the copper, lead and zinc ore from mine to mill. The outstanding feature of the trip was, of course, seeing the miners operate at the ore face, some 800 feet underground.

It was our pleasure to co-operate in a joint meeting with the Corporation of Professional Engineers of Quebec on the occasion of the visit of their President, Mr. R. F. Shaw, to Sherbrooke. As a majority of engineers in the Eastern Townships belong to and participate in the activities of both the Corporation and the E.I.C., this meeting was well attended.

This year, as in the past, many local industries graciously sponsored the buffet lunches which always add that final grand touch to each meeting.

## Fredericton Branch

The Branch has had a very successful year with ten general meetings and ten executive meetings being held. The executive meetings were usually held on the first Monday of each month and the general meetings on the third Monday.

Resolutions were presented to various Government bodies supporting the appointment of qualified professional engineers to vacant positions which required men with engineering training.

The Branch enjoyed the close cooperation of the Student's Society at the University of New Brunswick and is doing everything possible to assist the Engineering Departments of the University in their celebration of the centennial of engineering instruction at the University.

During the year Professor H. W. McFarlane addressed the Branch on the general topic of "Soil Mechanics" and Mr. Ketchen of Fraser Companies, Edmundston, gave a very interesting talk on the Pulp and Paper Industry. A very spirited panel was conducted on Collective Bargaining.

In May the graduating engineers from the University of New Brunswick were entertained and in June our ladies joined us in a very enjoyable dance.

The November meeting was held in Perth for the convenience of our non-resident members in the Saint John River Valley and Mr. J. L. Feeney, Chief Engineer, N.B. Electric Power Commission, spoke on "Coal vs. Water".

A successful Professional Development Program was conducted; six lectures were heard in this series.

## Halifax Branch

The year 1953 was unique in the history of the Halifax Branch in that we had an official visit from two Presidents. We held our first Field Meeting which we hope will be an annual event; and the Sixty-seventh Annual Meeting of the Institute was held in Halifax. Also during this past year, Branches were opened in Amherst and New Glasgow with the result the Halifax Branch lost many active and loyal members. The opening of these Branches has resulted in the Halifax Branch district being reduced to Halifax County and that part of Nova Scotia from Halifax through to Yarmouth.

The year started off with the Joint Annual Meeting of the Engineering Institute of Canada and the Association of the Professional Engineers of Nova Scotia which was held in the Nova Scotian Hotel on Monday, January 26.

Dr. Will R. Bird was the guest speaker. There were 236 present.

On Thursday, February 19, Mr. Hugh L. Pratley spoke on the Lions Gate Bridge. In view of the construction of the Halifax-Dartmouth bridge this was a most popular subject and there were 135 present.

Dr. J. B. Stirling made his presidential visit on Monday, March 9, and this was made the occasion of a ladies' night. The dinner was well attended, there being 164 present.

On April 8, Mr. R. M. Richardson, President of the Dominion Council of Professional Engineers, spoke on the "History of Engineering in Canada". There were 40 present.

The annual meeting was held in Halifax from May 20 to May 22 inclusive. From the statistics we have obtained from this annual meeting we understand the Wednesday dinner at which the recorded attendance was 492 was the largest Wednesday dinner in the history of the Institute. The total registration for the convention was 770, the second largest on record and we understand the Banquet and Dance, which approached the 1,000 mark in attendance, was the largest ever. We would also like to pay tribute to the Royal Canadian Navy for their co-operation and assistance without which we could not have held the Banquet and Dance.

The next meeting was our first Field Meeting held in the Paramount Hotel in Wolfville on Thursday, October 22, at which our guest speaker was Mr. Manning K. Ells. There were 87 present including a number of engineering students from Acadia University. From the enthusiasm expressed we hope this will become an annual event.

We had a second official presidential visit from Ross L. Dobbin who spoke to us on Thursday, November 12. This was also a combined meeting with the Nova Scotia Technical College Alumni Association, and there were 92 present.

The Annual Meeting was held in the Nova Scotian Hotel on Tuesday, December 15 at which the various yearly reports were read; the retiring chairman gave a brief account of the year's activities and the incoming executive was installed.

## Hamilton Branch

During 1953 membership in the Branch increased from 456 to 465.

The eight meetings held this year were well supported by the membership. A visit to the Steel Company of Canada in September commanded the largest attendance. Again this year the November meeting was held in conjunction with a buffet supper which proved very popular with a result that the executive are considering holding all meetings on this basis.

The Annual Engineers' Ball was held in October and the attendance was above all expectation. This was due to holding the ball on a Friday evening and in the city of Hamilton, whereas in the past it was held on a Thursday and approximately ten miles from the centre of the city.

Three committees deserving special mention were the Students' and Juniors' Paper Competition Committee, the Professional Development Program Committee and Budget Committee. Five contestants participated in the paper competition, all of whom presented excellent papers. The third session of the Professional Development Program was organized into four groups with approximately seventy-five Branch members participating. The organization of this committee was exceptionally good through the efforts of G. L. Schneider and E. W. Hill. Their annual meeting consisted of an employer's night which was well attended by local business men, all of whom expressed keen interest in the course. The Budget Committee are to be commended for their efforts in drawing up a practical budget which was closely matched by the expenditures for the year.

We record with regret the passing of J. T. Thwaites and A. G. Riddell.

## Huronia Branch

Our Branch was inaugurated on September 11. This occasion which took place at a summer resort near Orillia proved to be very memorable and pleasant. The Huronia Branch is truly grateful to the many people who have assisted in the organization of our Branch.

The inauguration was followed by a meeting in October and one in November. The October meeting was in the form of a visit through the Barrie plant of Canadian General Electric. This was made possible through the kindness of Mr. J. A. Mitchison. The November meeting consisted of the showing of two films and a discussion on Branch activities etc., to the many prospective members who were in attendance. The one film was technical, the other pertained to human relations.

For the coming year the Branch is looking forward to further plant visits and interesting speakers.

## Kingston Branch

The Kingston Branch enjoyed another very successful year. Interest and attendance were high at all eight meetings. Branch membership reached an all-time high with a total of 349 Members, Juniors and Students being registered. One buffet supper meeting and one dinner meeting were held. The dinner meeting was held in December and was the first such venture other than Ladies' Night. Because of the favourable comments received two more dinner meetings are planned for the spring program.

A joint dinner meeting was held in March with the local Branches of the Chemical Institute of Canada and the Junior Chamber of Commerce. Another joint meeting is being planned in the 1954 spring program.

The Branch also sponsored a Student papers by Queen's students and R.M.C. Cadets.

## Kitchener Branch

The total income for the year was $440.08 with disbursements $496.19, leaving a deficit of $56.11 for the year's operation.

The executive of the Kitchener Branch feel that we have had a most successful year regardless of the above financial statement. A pattern of meetings has now been set up and it is expected that this system will be continued as long as the Branch exists.

During the year we had a very successful field trip to General Motors at Oshawa, a Ladies' Night at Leisure Lodge, Preston, and a Stag in September just outside of Kitchener. In addition, a golf tournament was held in August.

We now have an annual joint meeting between the Grand Valley group of engineers and ourselves, alternating between Kitchener and Brantford and a joint meeting with the Kitchener Rubber groups is planned for December.

All regular meetings are held at the Officers' Mess, Knollwood Park, Kitchener, and excellent facilities are provided for conducting the engineering meeting along with the social hour afterwards. Our usual practice has been to provide a light lunch of cold meats, cheese and pickles, etc., to provide the members with an opportunity to get to know each other.

## Kootenay Branch

During 1953 the Kootenay Branch continued its policy of holding different types of meetings as much as possible. In a small, relatively isolated branch such as ours, this policy has proved necessary to stimulate continued attendance.

Five Dinner Meetings and a Smoker were held during the year. The Smoker drew the largest attendance: 120 members and guests. The program consisted of showing two 45 minute films followed by the usual smoker, refreshments and discussions. The two films which were shown, "Information at Work" by the Taylor Instrument Companies and "Oil Across the Rockies" by Trans Mountain Oil Pipeline Company, are highly recommended.

"Junior Nite" again drew forth some interesting papers by the Juniors and a very attentive audience.

A "Ladies' Nite" was tried to give the wives of members a chance to see what goes on at a Branch meeting. A large attendance, a good dinner, a snappy business session and an excellent address on current affairs by Sir Patrick Hamilton, the British Industrialist, all contributed to making this a very successful evening. "Ladies' Nite" will no doubt become an annual event.

## Lakehead Branch

The Lakehead Branch had a very successful year with a special effort being made to bring the members together. Ten meetings were held, five in Fort William, three in Port Arthur, one in Dryden and one in Marathon.

The meeting in May was held in Dryden, 220 miles west of Fort William. Marathon, 200 miles east of Fort William, was visited in October. Both meetings included a tour of the towns' leading industry and a dinner. Col. L. F. Grant was guest speaker at the October meeting.

The annual dance, held in January, was very well attended.

During the year Mr. S. E. Flook, a member, gave an interesting talk about the early history of this area, Mr. Lorne Goodall spoke on "Some Economic Aspects of the Paper Industry" and Mr. B. G. Ballard discussed the work of the Radio and Electrical Engineering Division of the National Research Council. Films about recent engineering achievements were also shown.

The Student Guidance Committee continued a program similar to that of 1952.

## Lethbridge Branch

The Branch held six regular meetings during the year with an average attendance of 54. Five Executive meetings were held for the transaction of Branch business.

During 1953 the Branch held two ladies' nights which were well attended and proved to be quite popular with the members.

A very enjoyable and successful field trip to the Calgary Power Limited Spray Lakes Project near Banff was held during September.

## London Branch

The largest and most enthusiastic meeting of the spring session took place on May 26th, when Mr. H. E. Rice, manager, Electronics Division, Canadian Westinghouse, discussed "Television". In view of the anticipated T.V. station for London the members and Association members were greatly interested in the topic.

During the fall term Mr. W. Hogg, M.E.I.C., described, with the assistance of excellent slides, "Sir Adam Beck No. 2". Both these meetings proved to be the most popular of the regular meetings. However we had a wide range of subjects for our meetings. Mr. E. V. Buchanan spoke at the February meeting on industrial applications of isotopes. Prof. A. E. Allcut, University of Toronto, spoke on Fuel Conservation at the April meeting.

Opening the fall meetings Dr. A. E. Misener, University of Western Ontario, spoke on "Possibilities for Commercial Heat Pumps in Canada".

One plant tour was held this year, almost 90 turned up for an interesting trip through General Motors Diesel, Ltd., London.

A golf tournament and dinner closed our spring sessions but the expected golfers failed to turn up. It is unlikely this experiment will be repeated. Many missed T. M. Medland's after dinner speech.

The year was highlighted by the President's visit in November. We took this opportunity to hold a dinner in his honour and were gratified to welcome members of many of the Ontario and Montreal Branches who were present at the afternoon Council session.

The new executive will be introduced at a Supper Dance to be held in Hotel London on Tuesday, January 19th.

## Lower St. Lawrence Branch

The executive of the Branch held three meetings and four various meetings took place in February, March, September and December, 1953.

On February 13, a group of sixty attended the Annual Ladies' Night, presided by Mr. and Mrs. Leo McLaren, chairman of the Branch.

The Institute President, Dr. J. Stirling and his wife visited our Branch. The group, including Dr. Wright and some members of the executive, were shown the installation of The Canada Wire and Cable Company, which is assembling the submarine cables for the transportation of electrical power between both shores of the St. Lawrence River, a distance of 32 miles. They also visited the New Marine School. A cocktail was served, followed by a dinner and a dance. The President and the General Secretary addressed the meeting.

The new President of the Institute, R. L. Dobbin, and the General Secretary spent a whole week with the Branch, visiting various centres of our territory on the first day. A meeting of the executive in Rimouski was attended by the President, followed by a visit to The Canada Wire and Cables' plant and a dinner with Messrs. Dobbin and Wright.

The next day, the President with the General Secretary and the Branch Secretary flew across the St. Lawrence to visit the Branch sections on the North, i.e., Seven Islands, Baie Comeau and Forestville. At these various centres, the group was warmly entertained and a great number of engineers attended all social events.

The President and the General Secretary had the opportunity to observe "de visu" the gigantic projects which are under way in this region.

It took a full week to rush through these important centres and yet the section around Gaspe and the new site of Gaspe Noranda Mines could not be visited this year. This shows the immensity of the territory covered by this Branch and the problem of inter-communications. Every possible means of transportation was used during their stay within the limits of our Branch. Railway, planes, boat and cars (a month later, they could have used snowmobiles and dog-sleighs).

It is the first time in the Institute history that a president spent so many days with a Branch and saw so much.

This was an experience enjoyed by everybody and we hope that it will be repeated.

On December 7, a meeting was held where four interesting films were shown. The showing of these films was made possible due to an agreement between "La Société des Ingénieurs Civils de France and Geo. Demers, Consulting Engineer.

## Moncton Branch

During the year, the Branch was host to two presidents of the Institute. On January 27th, the then president, Dr. J. B. Stirling, addressed a dinner meeting of the Branch and on September 23rd the Branch was visited by President R. L. Dobbin.

There were three technical meetings held. An address on the History of Engineering in Canada, was given, on April 14th, by R. M. Richardson, president of the Dominion Council. In October, M. A. Forbes, of the Chrysler Corporation, addressed the Branch on the subject, the Design of New Car Models. On November 30th, a record meeting for the year, heard Dr. P. L. Pratley, assisted by H. H. L. Pratley, speak on the Design and Construction of the Halifax Harbor Bridge.

The social events of the season were, a ladies' night and dance, in February, and, a yachting trip on Shediac Bay, on July 18th, when Branch members were the guests of Mr. and Mrs. R. L. Parsons.

## Montreal Branch

The policy of promoting cooperation with other societies has been very actively pursued during the past year.

Under a mutual agreement between the British Institutions of Civil, Electrical and Mechanical Engineers, and the Engineering Institute of Canada, resident members of the British Institutions have been given a six months free membership in the E.I.C. Welcoming letters from the Executive have been sent out to more than 150 such resident members in the Montreal area.

The Electrical Section of the Branch once again worked in close cooperation with the local section of the American Institute of Electrical Engineers in providing a complete joint program for the two sections. Members of the American Society of Mechanical Engineers and The American Institute of Chemical Engineers received notices of Branch meetings and were cordially invited to attend. Joint meetings were also arranged with the Institute of Radio Engineers, the Illuminating Engineers Society, the American Society of Heating and Ventilating Engineers and the Instrument Society of America.

A very successful meeting was also held with the Province of Quebec Association of Architects.

Recently the I.E.E. combined forces with the local branches of the I.R.E. and E.I.C. to hold a unique joint meeting via a two-way radiotelephone link between London, England and Montreal.

Members of the C.P.E.Q. and Montreal Branch once again enjoyed the annual golf tournament sponsored jointly by the two organizations.

During the latter part of the year the Executive Committee gave considerable thought to the workability of the present by-laws with regard to the Junior Section. Plans are being formulated to ensure that the young engineers have adequate representation on the Executive and other committees of the Branch.

The Executive met eleven times during the year to conduct the business of the Branch.

The Program Committee held three dinner meetings during the year at which plans for the year's program were arranged.

Average attendance at meetings for this year has been approximately 91.

The chemical section was responsible for two Branch meetings and six section meetings. The civil section arranged three Branch meetings and six section meetings. The electrical section organized one Branch meeting and held fourteen section meetings. The management section contributed five Branch meetings and held three section meetings. Five meetings of the mechanical section were held. That section also arranged four Branch meetings. The transportation section organized four Branch meetings.

Three forums for high school students were held during the year, one in English and two in French. Approximately 625 students attended the meetings.

## Newfoundland

Two presidential visits highlighted the activities of this Branch. President J. B. Stirling visited the Branch in April and President Ross L. Dobbin in November.

Col. R. F. Schirmer, U.S.A.F., spoke to the Branch at the January meeting on "Master Planning of Air Bases".

At the February meeting Capt. M. Perkins, U.S.A.F. took his audience on a tour, via colour photographs, of Greenland air bases, parts of Newfoundland and finally Berlin and Northern Germany.

Approximately 100 couples attended the second Annual Dance held on Feb. 5 at the Old Colony Club.

Three students from Memorial Uni-

(*Continued from page 153*)

versity presented papers at the March meeting. A. Ryan chose as his subject "The Kitimat Power Development", G. Staples spoke on "The Preparation of Wood Pulp" and W. Tucker's topic was "C.O.T.C. Summer Practical Training Phase". Prizes of $20, $15 and $10 were awarded to the speakers.

On April 27, R. W. Pike spoke on "The Bailey Bridge". Dr. J. B. Stirling, who was to arrive on this day, was grounded at Gander because of weather conditions. He arrived the next day and spent two very busy days with members of the Branch.

Meetings were adjourned for the summer months on May 11.

C. H. Conroy, chief engineer of the Buildings Division of the provincial Department of Public Works, spoke on "Control of Moisture in Frame Buildings" at the meeting held on October 19. A lengthy discussion period followed.

President Ross L. Dobbin paid a visit to the Branch Nov. 8. He concluded his visit on Nov. 10 with a joint meeting of the local branches of the Institute and the Association of Professional Engineers of Newfoundland. Matters of common interest were discussed, and continued friendship and co-operation between the two bodies stressed.

## Niagara Peninsula Branch

The highlights of the Niagara Peninsula Branch for the year 1953 were its Branch meetings and plant tours. The largest turnouts were to the joint meetings with the Niagara Chapter of the Association of Professional Engineers of Ontario. The first joint meeting was held on Tuesday, March 24th, with Col. L. F. Grant, M.E.I.C., Field Secretary, giving a very timely talk, "Canada—How Big or How Good".

On September 24th a joint tour of the Sir Adam Beck Generating Station No. 2 Project was held and the 350-odd members in attendance proved its tremendous success. The steak dinner Hydro treated us to was also a great success. We are indeed fortunate to have such a great engineering project in our area.

A third Professional Development Course is under way and it will, no doubt, be as successful as its predecessors. This year's program centres around Personal Development, Leadership, Supervision and Professional Ethics. The senior members of the Branch are very proud of the success of the past courses and they themselves are partly responsible for this by attending some of the courses' lectures.

A high attendance at each meeting, despite hazardous winter driving conditions, illustrates the enthusiasm supporting this course. The members from each centre pooled their transportation to overcome the difficulties encountered on the winding roads leading from centres such as Port Colborne, Fort Erie and Welland to the Queenston Gate House of the Sir Adam Beck Generating Station No. 1.

## Nipissing and Upper Ottawa Branch

The first full year of operation of the Branch showed a total of eight meetings. All of these meetings were dinner meetings, with an average attendance of 55%.

Three meetings proved most popular. One, in February at North Bay, showed an interest in Colonel Grant's address on the "St. Lawrence Waterway and Power Project": Another in March at Temiskaming had two speakers, H. H. Watson, who spoke on "Safety Records and Programs" and Richard H. Foy, on "Electronic Trends." Members of the Gateway Amateur Radio Club were invited to attend.

With the beginning of activities in the Fall, the members again appeared in force to be treated to a preview of the new Ontario Northland Railway Diesel-shops to be opened in North Bay. Mr. J. W. Millar, Chief Mechanical Officer for the C.N.R., and Branch Vice-Chairman, also delivered an informative address on "Railway Diesel Locomotives".

Speakers at other meetings were Frank Hayward, "Boiler Water Treatment," J. G. A. Stevenson, "Developing a Successful Mining Operation"; E. J. Howard, "From Wood to Rayon"; and H. R. D. Graham, "Sir Adam Beck No. 2 Generating Station". Of the eight meetings, five were held in North Bay and three in Temiskaming.

The Annual Meeting and Ladies' Night was held in May in Temiskaming, at which time the Committee Reports were read and the election of officers was conducted.

## North Eastern Ontario Branch

There were two Branch meetings held during 1953, both of which were held at Iroquois Falls. The first meeting (March, 1953) was held primarily to elect a new slate of Branch officers. The business meeting was followed by dinner and a novelty curling bonspiel. The second Branch meeting was held in December. Guest speaker for the evening was the Hon. T. P. Kelly, Minister of Mines for the Province of Ontario.

Numerous section meetings were held throughout the year with the Western (Kapuskasing) section being the most active.

The Western section held six meetings throughout 1953. The average attendance was between 25-30 which was excellent representation since the total membership is 43. The meetings included a talk by Col. L. F. Grant, Field Secretary of the E.I.C. on "Engineering Achievement in Canada"; an address by T. C. Keefer, Field Secretary of the Professional Engineers, Ontario, who spoke on the growth of the engineering profession and an address by Kapuskasing Mill Manager G. M. Minard who spoke on "Impressions of India" where he served during World War II.

The Western section has also set up a committee for Professional Development. The committee is attempting to offer courses on Investing and Public Speaking.

The Eastern (Iroquois Falls) section has lost a number of its executive personnel over the past year and as a result its program has suffered. However, in addition to being host for the two Branch meetings the Eastern section has held two organizational meetings to fill vacant posts on their executive. The last meeting of the "Industrial Management" series was held in February when Mr. G. Sharp of Abitibi's Industrial relations department spoke on Job Evaluation.

The total Branch membership has been reduced from 77 to 66 over the past year, a drop of eleven, ten of whom have been lost by the Eastern section.

The problem of distance and difficult winter travelling conditions has been apparent again this year. Thus the Western section which includes Smooth Rock Falls as well as Kapuskasing has had very poor representation from Smooth Rock since the meetings are held in Kapuskasing. A similar situation occurs in the Eastern section which embraces Timmins, Cochrane and Iroquois Falls. Most of the meetings have been held in Iroquois Falls. The members from Cochrane have been very interested and are attending the meetings very well although a road trip of about 40 miles is necessary.

## Northern New Brunswick Branch

The early months of 1953 were spent on ground work leading to the formation of our Branch, called the Northern New Brunswick Branch. This Branch includes the counties of Restigouche, Gloucester, and most of Northumberland in the Province of New Brunswick.

The outstanding meeting was our Inaugural Dinner meeting on March 12, which coincided with President Sterling's annual visit and that of the General Secretary, Dr. Wright. Members of the Moncton and Fredericton Branches were in attendance.

A dinner meeting was held on September 30, the occasion being the visit from the new President of the Institute, Mr. R. L. Dobbin, accompanied by Dr. Wright, General Secretary. Mr. Dobbin spoke on his visit to the Coronation, which was well received by the members.

A very interesting meeting was held at the Chatham station of the R.C.A.F. on November 6. The tour of the base, a paper by Mr. W. A. Purdy of Maritime Cement, and an oyster smoker proved very popular with the members.

Due to the late start there were only four general meetings during the year. Two in Bathurst, one in Dalhousie, and one in Chatham. Attendance was very good considering the travelling which is necessary to attend all meetings. Three executive meetings were held and it appears as though our Branch has consolidated its position and great things are expected in future years.

## Ottawa Branch

The policy of arranging the majority of the programs as noonday luncheons was maintained and again proved to be most popular from attendance aspects.

The Committee endeavoured to make each program financially self supporting. Only small expenses were evident due mainly to complimentary tickets for guests of honour and the press.

Although there were no joint meetings with other technical societies, your Committee cooperated with the Engineers' Wives Association for an evening dinner meeting in December and with the Junior Section for a luncheon meeting in February.

The Committee attempted to vary the year's program with as many engineering topics as possible.

At the Management Committee meeting of November 12th Mr. Claude Howard was made Branch Editor to attend to publicity of Branch events in the local press and *The Engineering Journal*.

All ten luncheon meetings were held at the Chateau Laurier. The highest attendance was 115; the lowest was 69 and the average was 92. Four evening meetings were held, including the annual meeting. Although accurate figures were not recorded, the approximate attendance was 75 per meeting. One field trip was arranged to the International Fibreboard and Plywoods Plant at Gatineau, P.Q. Approximately 70 attended.

Following the President's Dinner in October, a dance was held in the N.R.C. Cafeteria. Dinner and Golf at the Tecumseh Golf Club was a sequel to the Field Trip at Gatineau in September.

It was recommended that a smoker should be arranged for the spring, perhaps in cooperation with the Junior Section and that a meeting might be organized in one of the towns of the Ottawa Valley within the Branch limits with our Proceedings Committee to arrange for a speaker.

General arrangements of programs seemed satisfactory and a similar pattern is recommended for the following year.

## Peterborough Branch

During the past year eight papers were presented to the membership at eight separate meetings. The average attendance at these meetings was approximately 30% of our membership.

The annual meeting was held late in February and took the form of a smoker at the Kawartha Golf and Country Club. This meeting was attended by approximately 40% of the membership.

On the last Saturday in May the Branch visited the Marmortan Iron Mines development at Marmora. The morning was spent at the site of the mining development. At noon a group of women in Marmora prepared a meal for the group for a very reasonable charge. The afternoon was spent at a summer camp on Crow Lake where the members were able to demonstrate their various talents at sporting events. Attendance was about 30%.

In October we opened our winter season with a smoker. The feature of the evening was a symposium on the Labrador Iron Ore development by local members. Fifty-five per cent of the membership was on hand.

The highlight of the season of course was the reception and dance held for President Dobbin on November 27th. Fifty-six couples attended this event.

Representation was made at the Inauguration of the Orillia Branch in September. Six of our members attended the party held for President Dobbin in Belleville in early October.

## Prince Edward Island Branch

The Branch enjoyed a successful year. Five regular meetings and three special meetings were held. The latter included two presidential visits and the summer outing with wives and families invited.

The general form of the regular meetings has been dinner meetings with guest speakers or informal discussions among the members.

Three of the regular meetings were held in Summerside, the balance in Charlottetown.

## Quebec Branch

The Executive Committee held nine meetings for the transaction of Branch business. The average attendance was eight.

The program of activities this year was varied. Meetings were well attended.

The Branch has continued a series of lectures under the general title "The Engineer and His Activities". Eighty members have registered to attend these lectures. Part of the lectures were given in the months of October and November of last year. The balance of these lectures were delivered from January 3, 1953, to the end of April of 1953.

The Faculty of Science of Laval, at the request of the Quebec Branch, has established a series of lectures on Steel Structure and Concrete, 50 graduate engineers attended these lectures. The Provincial Government of Quebec has contributed financially to the organization of these lectures in a very generous way. We are thankful to the Honourable Paul Sauvé, Minister of Social Welfare and Youth, for his great help in this matter.

The program of activities was as follows: (Attendance is given in brackets.)

Jan. 13, 1953—Seventh of the series "The Engineer and His Activities". Title: The Engineer and Labour (Point of view of the government). Speaker: Donat Quimper, Assistant to the Deputy-Minister of Labour for the Province of Quebec (15).

Jan. 20, 1953—Eighth of the series "The Engineer and His Activities". Title: The Engineer and Labour (Point of view of the Employer). Speaker: P. Filteau, Canadian Johns Manville (25).

Jan. 27, 1953—Ninth of the series: "The Engineer and His Activities". Title: The Engineer and Labour (Point of view of the employee). Speaker: M. Jean Marchand, sec. of C.T.C.C. (35).

Feb. 21, 1953—Curling competition between Architects and members of the Institute at the Jacques-Cartier Curling Club (125).

Feb. 24, 1953—Tenth of the series "The Engineer and His Activities". Title: The Engineer and Private Practice. Speaker: Geo. Demers, M.E.I.C., Consulting Engineer of Quebec (45).

March 21, 1953—Eleventh of the series: "The Engineer and His Activities". Title: "The Engineer and National Harbours". Speaker: Brig. Maurice Archer, M.E.I.C., Vice-President of the National Harbour Board (60).

May 8, 1953—Visit of President Stirling (50).

May 19, 1953—Paper: "Certaines Applications de la Mécanique des Sols dans la Construction des Barrages". Speaker: M. Armand Mayer, M.A.S.C.E., Consulting Engineer of France (50).

Sept. 4, 1953—Annual Golf Tournament (119).

Oct. 8, 1953—Paper: Les Merveilles Inconnues de l'Hydraulique". Joint meeting with ACFAS. Speaker: M. Pierre Danel, Ph.D., Consulting Engineer of France.

Oct. 22, 1953—Twelfth of the Series. "The Engineer and His Activities". Title: The Engineer and His Professional Responsibilities. Speaker: Colonel F. K. Grant, M.E.I.C., Field Secretary of the Institute.

Nov. 12, 1953—Joint meeting with ACFAS. Paper: "John Hopkinson, Ingénieur et Physicien Anglais. Speaker: Mr. James Grieg, professor at London University.

Nov. 14, 1953—Retraite Fermée pour les Ingénieurs à la Villa Manrèse.

Dec. 3, 1953—Films: 1: Reconstruction de l'Ilet V-4 au Hâvre; 2: Pipe-Line au Maroc; 3: Galerie de dérivation de la Rhue; 4 Construction de Hangars d'avions à Marignane (120).

Dec. 9, 1953—Visit of President Dobbin (60).

## Saguenay Branch

The general pattern of the year's activities was similar to last year's. The mixed dinner meeting appeared to be very popular and was very well attended. The informal smoker type meetings with coffee and sandwiches at the close of business were well received. Extra costs of this type of meeting above room rental were defrayed by a small admission charge. The social period so provided was enjoyed by all and gave new members a chance to become acquainted.

A particularly successful Student Guidance meeting was held at which students from the Arvida High School were present to listen to short talks by a group of senior members, and obtained answers to their questions on the engineering profession as a career. The keen interest of the students was revealed by the number and variety of questions asked.

Study groups, patterned after those in existence several years ago, were organized by the Junior Section after a visit by Col. Grant regarding the possibility of starting a Professional Development Course. These commenced after the New Year and ran until spring with very good success. A new series for this season has been arranged.

Field trips are always popular. There was only one trip held during 1953 which was a follow-up to a paper presented to the Branch a week before. This idea of follow-up field trips allowed all to benefit to a greater extent from both paper and trip.

## Saint John Branch

During the past year this Branch held five dinner meetings and five Professional Development Lectures. Plans are being made to continue with more of these lectures in the coming year.

The speakers at the dinner meetings were: R. M. Richardson, M.E.I.C., who spoke on the "Necessity of a Strong Dominion Council", Harold Issacs who spoke on "The History of Communications", and J. G. Bishop, M.E.I.C., whose subject was "Television".

We were visited by two presidents during the year—President Stirling in the spring and President Dobbin in the fall.

## St. Maurice Valley Branch

During the past year this Branch with its Junior Sections in Shawinigan Falls and Three Rivers, held sixteen meetings with fair attendance. These meetings included technical addresses, three technical film nights and two presidential visits. The technical topics covered a wide field of subjects in order to be of interest to all, e.g. rubber in conveying materials, arc welding, stainless steels, fluidization, problems facing engineers as a whole, the "ins" and "outs" of centrifugal pumps, job satisfaction to the engineer and cellophane.

Social events consisting of two stag parties, a film on the 1952 Canadian Open Golf Championship and two Engineering Balls were also held.

Four local plant tours were especially well attended and appreciated by the new engineers in our valley.

Perhaps one of the most interesting meetings was that with Dr. Lillian M. Gilbreth, noted consulting engineer, who graciously came to our Branch and discussed with us the part that engineers are playing in world and national affairs and also some of the problems that we are encountering within our engineering profession.

## Saskatchewan Branch

Ten Executive meetings were held during the year for the transaction of Branch business.

Two events of note which occurred during the year were the increase in representation from one to two members on the Council allowed due to the increased membership; and the election of Mr. Stewart Young to Honorary Membership, believed to be the first to be granted to a Saskatchewan member while resident in the Province.

Dean I. M. Fraser, Zone Vice-President, attended the Annual Meeting of the Institute held in Halifax in May.

The visit of Col. L. F. Grant between November 12 and December 5, to Yorkton, Regina, Moose Jaw, Swift Current, Lloydminster, and Saskatoon, did much in contributing to a feeling of unity, not only between the members of the Branch, but between the Branch members and Institute members all across Canada.

All lecture meetings were held jointly with The Association of Professional Engineers of Saskatchewan, with an average attendance of 50.

## Sudbury Branch

Eight general meetings were held during the year with an average attendance of forty. No meetings were held from June to September.

One Ladies' Night was held during the year, on the occasion of the annual meeting.

The December meeting featured a trip through the ONR shops at North Bay.

## Toronto Branch

The interest of the membership in the general activities of the Toronto Branch and in the technical meetings is increasing. A full measure of credit must go to the various committees, who, in some cases ended as a one man committee, for the service they gave in providing interesting programs.

The increased interest of the younger engineers stemmed largely from participation in the Professional Development Courses. This fall an advanced course was inaugurated in addition to the regular course and was well attended. The directors of these courses are to be congratulated.

Of the six technical meetings which followed our Annual Meeting during the winter and spring program, it was generally felt that Students' Night held in February, and the panel discussion held in March, were outstanding, the latter drawing many favourable comments from the membership, who requested a similar meeting next year.

The inauguration of the Huronia Branch in Orillia during the summer gave many of our members an opportunity to spend a very sociable and enjoyable time at Fern Cottage, where the inaugural ceremonies were held. The Toronto Branch appreciated the opportunity to assist in the inauguration of this the newest branch of the Institute.

The interest shown at the meetings during the fall program reflected the efforts of the committees responsible. The interest in the hydraulic tunnel at Niagara and in the Toronto Metropolitan area brought many more members out to these meetings than were expected.

The President's Visit and Ladies' Night was a very enjoyable evening. Everyone there found Mr. Dobbin's remarks on 'The Coronation From an Engineer's Point of View' interesting and all enjoyed his humorous anecdotes of his visit to England.

During the fall an amendment to the Branch By-Laws was passed to enable four Junior Members to be added to the executive committee. The executive is looking forward to their joining the committee, and to an even more active participation by all members in Branch activities.

## Vancouver Branch

The past year has been a rewarding one for the membership of the Branch. Monthly meetings on technical subjects have been held usually jointly with the Vancouver Branch of the Engineering Society. To be long remembered is the visit from the Seattle Chapter of the American Association of Civil Engineers in May when the Vancouver Branch of the E.I.C. were hosts. An afternoon of sightseeing covered the new Granville Street Bridge, the Cleveland Dam and the Fraser River Model. This was followed by an evening of fellowship and fun during which new and old friendships with the American guests were firmly cemented.

## Vancouver Island Branch

The Branch held nine meetings during the year, seven of which were joint meetings with the Victoria Branch of the B.C. Engineering Society. All of the meetings were of an instructional nature, with addresses by guest speakers or the showing of interesting films on wide and varied subjects.

The Branch Executive met on five occasions during the year.

Three field trips were taken, one to the Douglas Fir Plywood Plant of B.C. Forest Products Company and another to the shipyard of Yarrows Limited where the fabrication of tubular aluminum power transmission line towers proved to be of great interest. These towers were being shipped North to the Aluminum Project at Kitimat, B.C.

A third field trip was made to H.M.C. Dockyard at Esquimalt where, after an explanatory talk by our host Commodore (E) B. R. Spencer, Superintendent of the Dockyard, the members were taken on a tour through the various shops and departments. This was followed by a short trip to sea in H.M.C.S. *Sault St. Marie* the first Algerine Class Minesweeper built in Canada in 1943 at Port Arthur, Ontario.

## Winnipeg Branch

There were more meetings of the Winnipeg Branch in 1953 due to keener interest on the part of the members and to the formation and operation of a Civil Section.

The attendance was considerably better than in the previous year and the public came in larger numbers. It was gratifying to note the interest shown by non-members at the meetings. Many of the questions put to the speakers during the question period were asked by them.

Branch meetings have, in general, been devoted to the presentation of engineering subjects handled in a non-technical manner and speakers have been chosen specifically for this purpose. The description of the carrying out of well known national and local, public and private projects, and the showing of films illustrating the work being done has always struck a responsive note.

The meetings of the Sections of the Branch, however, have been largely given over to the consideration of purely technical subjects and those attending are in the main, engineers who are engaged in particular fields in line with the subject being dealt with or in those allied with them.

Entertainment has not been neglected in the year's operation. The Electrical Section held another successful dinner and dance and the Branch as a whole again co-operated with the Association of Professional Engineers in holding a Supper Dance. This is recognized as one of the important social events of the winter season in Winnipeg.

The Branch also held two golf tournaments in conjunction with the Association of Professional Engineers. This is an annual affair and a Silver Cup, donated by the late J. G. Sullivan, a past-president of the Engineering Institute of Canada, is a yearly competition.

## Yukon

The first annual meeting of the Yukon Branch was held at Whitehorse on November 13 at the Whitehorse Inn.

Ballots for officers for the coming season, which had been previously mailed out to members, were reported by the scrutineers, Brig. H. W. Love and E. O. Greening. The following officers were elected: president, Lt.-Col. M. C Sutherland-Brown; secretary, John L. Phelps; directors, C. E. White, Lt. K. Baker, and F/L G. H. Hicks.

Lt.-Col. Sutherland-Brown gave a short talk on the aims of the Institute. A general discussion followed, during which it was decided that meetings should be held at approximately one month intervals, at the discretion of the executive.

Twenty-eight persons were present at the dinner.

## Seventh Annual Meeting of IAESTE

The seventh annual meeting of the International Association for the Exchange of Students for Technical Experience took place in Stockholm, Sweden, starting on Monday, January 11 and continuing until Saturday, January 16. The National Committee for Canada which is a Member of IAESTE was represented by the general secretary of the Institute. This is the first time that Canada has been represented although the activities of the association were started here more than a year ago. The transportation to Stockholm was provided by UNESCO. The expenses of all delegates while in Sweden were taken care of by the Swedish Federation of Industries. This included hotels, meals, entertainment, transportation and so on. The delegate from the United States also travelled under these auspices.

As has been explained before in the *Journal*, the purpose of IAESTE is to find employment opportunities in any one of the eighteen participating countries for students in engineering and science who have one year to go to complete their university courses. Last year over 3,800 students were exchanged but at this year's conference it was indicated that the numbers for 1954 would amount to over 4,200.

The member nations represented were Austria, Belgium, Canada, Denmark, Finland, France, Germany, Great Britain, Israel, Italy, the Netherlands, Norway, Spain, Sweden, Switzerland, the United States and Yugoslavia. The eighteenth member country, Iceland, was not represented.

In addition to the delegates from the member countries, there was a delegate from Portugal, who submitted an application on behalf of their national committee for admission to the Association. This was accepted. Also there were observers from India and Pakistan. During the course of the conference a cable was received from Turkey to say that they would be joining the Association this year.

The purpose of the annual meeting is to negotiate exchanges and as well to discuss matters of business and of policy. The exchange of this many people has developed many complications. For instance, arrangements have to be made in all the countries with the departments of immigration, also adjustments made with regard to income tax and unemployment insurance; also accident and health insurance has to be placed on each student so that in the event of anything of the serious nature developing while the student is away from his own country, money would be provided to take care of his needs.

When one considers the permutations and combinations of eighteen

**The students of the Royal Institute of Technology entertain the convention in their air raid shelter. This is the head table.**

nations, exchanging 4,200 students, it is possible to see some of the complexities of the exchange business. The actual negotiating between nations took up almost three days of the conference, and even at that some of the countries had not completed their negotiations, but will have to do so through correspondence.

The Canadian Committee had 21 offers of employment at the time the general secretary left Canada. However it is expected that more offers will be received and it is planned that fifty students from abroad will be taken care of this summer in this country. Also it is hoped that fifty Canadian students will be found who will be prepared to go abroad for their experience.

All meetings were held in the premises of the Swedish Institute of Technology. These splendid facilities were very much appreciated by all delegates. Within the society's headquarters there are splendid club facilities including a beautiful auditorium, where the meetings were held, club rooms, a general dining room, private dining rooms, bar, library and so on. Such a location was ideal for a meeting of this kind.

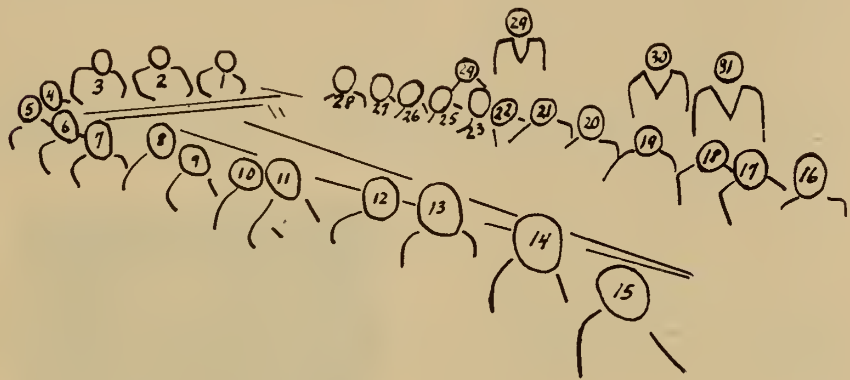
The hospitality of the Swedish people was all that it is reputed to be. Not only were all costs taken care of, but every detail of the delegates' comfort was attended to almost in advance of his needs.

The conference was presided over by Mr. R. A. Beijer, of Stockholm. In spite of the many complications that can develop between delegates of that many nations, Mr. Beijer carried off every meeting smoothly and without incident. He was very substantially supported by Mr. J. Newby of The Imperial College, London, England, the British delegate who is also the general secretary of the association. These two gentlemen deserve great credit for all the advance organization work and for the conduct of the meeting itself.

An opportunity to attend an annual meeting has given the general secretary a much greater appreciation of the work done by this association. Although it is set up primarily to obtain technical experience for students, its greatest

## Cover Picture

The Cover Picture shows the Seventh Annual Conference of IAESTE in session in Stockholm, Sweden, in January 1954. The conference is reported on these pages.



The delegates can be identified by means of the chart. They are, from left to right around the table, starting at the chairman's left:

1. Mrs. Ingrid Petterson, Sweden.
2. Mr. R. A. Beijer, Sweden.
3. Mr. J. Newby, Great Britain.
4. Mr. R. Kratochwill, Austria.
5. Mr. J. T. Bollansee, Belgium.
6. Dr. L. Austin Wright, Canada.
7. Mr. H. V. Dahlerup-Petersen, Denmark
8. Mr. Y. Toivola, Finland.
9. Mr. K. Fernstrom, Finland.
10. Miss Vidal-Hall, France.
11. Inspector-General Legay, France.
12. Mr. M. Roth, France.
13. Mr. K. H. Tessmann, Germany.
14. Mr. K. Wyneken, Germany.
15. Dr. Rozario, India.
16. Mr. R. Hammer, Norway.
17. Mr. A. Thorssen, Norway.
18. Prof. M. Correa de Barros, Portugal.
19. Mr. J. Eden, Israel.
20. Mr. O. Janssen van Raay, Netherlands
21. Mr. G. E. Candiani, Italy.
22. Prof. A. Capocaccia, Italy.
23. Prof. A. Tichenor, United States of America.
24. Mr. B. Blomstad, Sweden.
25. Mr. M. Milosavljevic, Yugoslavia.
26. Mr. J. Bogdanovic, Yugoslavia.
27. Mr. F. Zschokke, Switzerland.
28. Dr. H. Bosshardt, Switzerland.
29. Mr. G. Fredrikson, Sweden.
30. Mr. N. Klingenberg, Spain.
31. Prof. J. Pazo Montes, Spain.

Missing from photograph—Mr. A. A. Shaikh from Pakistan.

**At left—Left to right, J. Newby, general secretary of IAESTE, Mr. Anderson, representing the Federation of Swedish Industries.**

value lies in its ability to move students from one country into another where in addition to the technical experience they also learn something of the people and their ways. Thousands of young men moving about this way must have a great beneficial influence on international relations. When it is considered that these young men are likely to become leaders in their own country it is more than ever apparent that the influence of IAESTE is tremendous.

In Canada the work is carried out by a committee set up by the Engineering Institute. On it are represented two universities, several divisions of industry and the student body itself. It is now proposed to enlarge the committee somewhat in order to get an ever broader representation. Up to the present time the Engineering Institute has done all the office work and has borne the entire expense of the operation. Council has felt that this activity is good for Canada and therefore has given support to it.

In order to fulfil Canada's commitments it is necessary to find about twenty-five more openings here for students from abroad. Many industries who have been circularized have not yet replied, but it is hoped that shortly some word will be received from them and without too much difficulty the objective of fifty openings in Canada will be attained. If any persons interested in this activity have any employment opportunities it would be appreciated if they would communicate with the Institute headquarters in Montreal.

As well students are being sought who wish to go abroad for their summer experience. Openings are available in Great Britain, France, the Netherlands, Switzerland, Denmark, Norway, Sweden, Finland and Italy. Students who are interested should communicate with the Deans of their faculty who in turn will advise headquarters of the committee in Montreal.

Here is an unusual opportunity to aid in the improvement of International relations which of course is a great aid to maintaining a permanent peace. At the same time employers who accept these young students are receiving something in return for the wages they pay. It has been the experience of many employers that they have not been able to get an adequate supply of students from Canadian universities. Perhaps their temporary needs can be met by students from other lands.

# Canadian Awarded Kelvin Medal

### Dr. C. J. Mackenzie Wins Coveted Science Prize

Dr. C. J. Mackenzie, past president and honorary member of the Institute has been awarded the Kelvin Medal, the most coveted prize in the world of science-engineering.

The retired president of Atomic Energy of Canada Ltd., and former president of the National Research Council, is the ninth scientist to receive the medal. The decoration is awarded every three years in recognition of achievement in the field of science-engineering and commemorates the life-work of Lord Kelvin, the distinguished British physicist.

*Copyright by Karsh*

**Dr. C. J. Mackenzie, M.E.I.C.**

The medal is awarded after consultation among officials of the major engineering institutions of the world. They include the Institution of Civil Engineers, the Institution of Mechanical Engineers, the Institution of Electrical Engineers, the Institution of Naval Architects, the Institution of Mines and Metallurgy, the Institution of Mining Engineers and the Institution of Engineers and Shipbuilders in Scotland.

Dr. Mackenzie is the first Canadian to receive the medal since the decoration was instituted in 1920.

Lord Kelvin, was the most outstanding British physicist, scientist and engineer of the 19th century. He is recognized as the man who made the electrical age possible through his work with the telephone, the electric light and the cable.

The medal was awarded in 1920 to Dr. W. C. Unwin, British physicist; Marconi the inventor of radio received it in 1932, and Sir Frank Whittle, inventor of the jet engine, in 1947.

The other award winners include Dr. Elihu Thomson, American physicist, in 1923; Sir Charles Parsons, British inventor of the steam turbine, in 1926; Andre Blondal, French physicist, in 1929; Sir John A. Fleming, British engineer, in 1935; Sir J. J. Thompson, British physicist, in 1938; and Prof. Theodore von Karnan, aeronautical engineer at the California Institute of Technology, in 1950.

Dr. Mackenzie succeeded Gen. A. G. L. MacNaughton as president of the National Research Council in 1944. He held that post until 1952, when he was named president of Atomic Energy of Canada Ltd., and retired at the end of October.

Now, Dr. Mackenzie holds the post of chairman of, the Atomic Energy Control Board.

# Athlone Fellowships — 1954

Thirty-eight of Canada's young engineering graduates are to be selected to go to Britain in 1954 as Athlone Fellows. Mr. John Hunt, of the United Kingdom High Commissioner's Office, and Dr. William Abbott left Ottawa on January 17 to undertake a coast-to-coast tour, visiting Canadian universities to make the selection. Dr. Abbott, representing the United Kingdom Ministry of Education, was crossing the continent for his fifth consecutive year, as they visited Halifax, Fredericton, Quebec, Montreal, Kingston, Toronto, Winnipeg, Saskatoon, Edmonton and Vancouver.

The first Athlone Fellows, selected in 1951, are now beginning to make their mark in Canadian industry. Many of them have paid tribute to the value of the Fellowships, thirty-eight of which are offered each year —28 to students in their final year, and 10 to graduates who have spent some time in industry.

The Athlone Fellowships are financed by the United Kingdom Government, and the award covers all travel costs, living expenses, and any academic fees that have to be met, during the two-year stay. The complete list of provisions and conditions appeared in the November 1953 issue of the *Journal.*

# 68th ANNUAL GENERAL

and

# PROFESSIONAL MEETING

## MAY 12-13-14

Registration and hotel reservation cards will be mailed to all members with advance copies of our program on or about April 1st.

All rooms will be allotted in accordance with reservation cards as received at Headquarters.

*No reservations can be accepted by the Chateau Frontenac, so please do not write this hotel.*

Also, members are requested not to write Headquarters beforehand for reservations.

## CHATEAU FRONTENAC, Quebec City

The complete program will be printed in the March issue of the *Journal.*

# James A. Ogilvy Joins Institute Staff

Since many of our members are going to meet him sooner or later, it is fitting that we should introduce the new assistant field secretary, James A. Ogilvy, M.E.I.C., whose picture appears on this page.

Mr. Ogilvy is the son of R. Forrest Ogilvy, M.E.I.C., and was born in Westmount, Quebec, in 1907, but spent most of his early years in Hamilton, Ontario. Graduating from the Central Collegiate there, he entered McGill University's course in mining engineering and received his bachelor's degree in 1930.

James A. Ogilvy, M.E.I.C.

Like most engineering students, Mr. Ogilvy spent his summers working with such employers as the City of Hamilton, the Fraser-Brace Engineering Co., Ltd., and Dome Mines, Ltd. Joining McIntyre-Porcupine Mines, Ltd., after graduation, he rose to acting mine captain when he left in 1934, to spend the next eighteen months in mining development work and in travel.

In 1936 he was with Robinson Deep, Ltd., in Johannesburg, S.A., and from 1937 to 1940 again in mining development work. In the latter year he joined the General Engineering Co., Ltd., of Toronto as assistant job superintendent, leaving in 1941 to became assistant chief of the Naval Gun Production Branch of the Department of Munitions and Supply. He enlisted in the Royal Canadian Navy in 1944, was assigned as assistant supply officer (guns and mountings) and was honourably discharged in 1946.

After a third short interlude of mining development, he became plant engineer for National Gypsum, Ltd,. at its mine at Dingwall, N.S., and then sales engineer with Canadian Allis-Chalmers, Ltd., in Toronto. In 1949 he joined the Toronto Transportation Commission as office engineer in charge of work records and payment certificates for the Toronto subway. This is the post he left to join the Institute.

# Sixty-eighth Annual General Meeting

Notice is hereby given, in accordance with the by-laws, that the annual general meeting of The Engineering Institute of Canada for 1954 will be convened at the Chateau Frontenac, Quebec City, at ten o'clock a.m. on Wednesday, May 12, 1954.

# Professional Associations Elect 1954 Officers

### Association of Professional Engineers of Ontario

One of Canada's foremost authorities on soils and construction materials, William Lister Sagar, M.E.I.C., professor of civil engineering at the University of Toronto has been elected president of the 12,000-member Association of Professional Engineers of Ontario.

He succeeds J. Herbert Smith, M.E.I.C., general manager of the Wholesale Division of Canadian General Electric Co. Ltd. in Toronto, to the top post in the engineering organization which under provincial charter serves as the licensing body for registering professional engineers in Ontario.

Professor Sagar is also vice-president of the Dominion Council of Professional Engineers. A member of the engineering faculty of the University of Toronto since 1937, he continues to serve as a consultant in construction work taking place in Ontario.

Coincidentally, his election as president of the Association comes at a time when the central theme of the Association's current program is vocational guidance, a program aimed at encouraging more high school students to enroll in engineering courses at universities.

Professor Sagar is a veteran member of the Association of Professional Engineers of Ontario, having joined it in January, 1923, about six months after it was given a provincial charter. He has been actively associated with its work during the past eight years.

The officers elected to the Association's Executive Council for 1954 are: John R. Montague, M.E.I.C., director of engineering for the Hydro-Electric Power Commission of Ontario, first vice-president; John H. Waghorne, engineer in charge of electrical research of the Hydro-Electric Power Commission of Ontario, second vice-president; councillors, John S. Ellis, Jr.E.I.C., design engineer with H. G. Acres and Co. Ltd., Niagara Falls, and Robert C. McMordie, Jr.E.I.C., program planning and control engineer of the Hydro-Electric Power Commission (civil branch); Gordon W. Ames, M.E.I.C., process engineer with Polymer Corp., Ltd., Sarnia, and James M. King, M.E.I.C., of Canadian General Electric Co. Ltd., Peterborough (chemical and metallurgical); Gordon M. McHenry, western region consumer service engineer for the Hydro-Electric Power Commission of Ontario, London, and Harold R. Osborne, chief engineer for Ferranti Electric

William Lister Sagar, M.E.I.C.

Limited, Mount Dennis (electrical branch); John H. Fox, M.E.I.C., general sales manager of Minneapolis-Honeywell Regulator Co. Ltd., in Toronto, and John H. Ross, M.E.I.C., Toronto consulting engineer (mechanical and industrial branch); Duncan R. Derry, chief geologist of Ventures Limited, Toronto, and Reginald C. Mott, manager of the Mining and Reduction Division of Falconbridge Nickel Mines Ltd., Falconbridge.

The executive director of the Association is T. M. Medland; the registrar is J. Murray Muir; and the field secretary is Thomas C. Keefer, M.E.I.C.

### Association of Professional Engineers of British Columbia

Charles Bentall, M.E.I.C., president and general manager of Dominion Construction Co. Ltd., and president of New Building Finance Co. Ltd., Vancouver, was elected 1954 president of the Association of Professional Engineers of British Columbia. He succeeds John C. Oliver, M.E.I.C., city engineer of Vancouver.

Dr. H. C. Gunning, dean of the faculty of Applied Science and head of the department of geology and geography of the University of British Columbia, was elected vice-president.

The new councillors of the Association are F. R. Phillips, M.E.I.C., of Pearson, Phillips & Barrat, Vancouver; J. D. McMynn; Col. G. M. Letson, M.E.I.C., of Letson & Burpee Ltd., Vancouver; and Jack L. Miller, M.E.I.C., Vancouver consulting engineer. Councillors appointed by the Government of British Columbia are E. C. Roper, manager of the Britannia Mining and Smelting Company; Professor W. O. Richmond, M.E.I.C., of the University of British Columbia; J. H. Steele of the B.C. Electric Company; and William Hall, chief engineer of the surveys division of the Department of Lands and Forests.

Membership in British Columbia's Association, which came into existence through a legislative act passed in 1921, has grown from 586 to 3,333. Of this number 1,444 are registered engineers, 1,302 are engineers-in-training, and 587 are engineering pupils.

J. A. Merchant, M.E.I.C., is registrar of the Association, and H. M. McManus serves as assistant registrar.

## Canadian Soils Mechanics Conference

Ninety engineers, geologists, and soil scientists came from points across Canada to attend the seventh annual Canadian Soil Mechanics Conference in Ottawa on December 10 and 11, 1953. This meeting was sponsored by the Associate Committee on Soil and Snow Mechanics of the National Research Council in order to discuss soils as engineering materials.

Many interesting activities in Canadian work in this field were reported. C. F. Ripley, M.E.I.C., consulting engineer from Vancouver, described various soil formations encountered in British Columbia and the engineering problems associated with such soils. Dean R. M. Hardy, M.E.I.C., dean of engineering of the University of Alberta, spoke of studies made under his direction in the electro-osmosis of soils. He cited one instance where this principle was used successfully in the excavation of a deep shaft in which a layer of water-bearing sand was encountered. Other work involved the application of electro-osmosis to assist in the injection of lignosol into soil to limit frost heaving.

R. Peterson, M.E.I.C., soil mechanics and materials engineer of the Prairie Farm Rehabilitation Administration, discussed the stability of slopes in plastic clays, with particular reference to earth dam construction. The Department of Transport, Ottawa, has prepared a freezing index map of Canada from which it should be possible to predict frost depths for many areas. E. B. Wilkins, M.E.I.C. of that Department explained this map and its uses but pointed out that it is based on only five years' observations and does not include areas of Ungava and large sections of the Northwest for which there were no records available.

Dr. G. G. Meyerhof, M.E.I.C., of the Foundation Company of Canada described an investigation his Company had conducted for the Quebec Streams Commission on the landslide at Rimouski, Quebec. Dr. Meyerhof discussed the causes and mechanism of this slide which occurred in August 1951 and resulted in the damming of the Rimouski River for a short time.

Canadian delegates to the Third International Conference on Soil Mechanics and Foundation Engineering reported on the proceedings of that Conference. Dr. N. W. McLeod, M.E.I.C., consultant to the Department of Transport, and N. D. Lea, M.E.I.C., Foundation Company of Canada; G. C. McRostie, M.E.I.C., consulting engineer, Ottawa, and W. R. Schriever of the Division of Building Research, National Research Council, reviewed the technical and business sessions of the International Conference. Six Canadian papers had been presented to the international gathering which was held in Switzerland in August, 1953.

A record of the Canadian meeting will be prepared as a Technical Memorandum of the Associate Committee and should be available in the spring of 1954. Requests for copies should be directed to the Secretary, Associate Committee on Soil and Snow Mechanics, National Research Council, Ottawa.

## American Power Conference

The sixteenth annual meeting of the American Power Conference, formerly Midwest Power Conference, will be held on March 24, 25 and 26, 1954, at the Sherman Hotel in Chicago. The Conference is sponsored by the Illinois Institute of Technology in co-operation with twelve universities and ten local and national engineering societies.

Briefly the program will include papers on the following subjects:

*Wednesday, March 24, 1954:*

2.00-5.00 p.m.
Central Station Steam Generation.
Hydroelectric Power Development in the United States.
Industrial Plant Session.

2.00-3.30 p.m.
Station Apparatus.

3.30-5.00 p.m.
Industrial Electrical Session.

*Thursday, March 25, 1954:*

9.00-12.00 noon
Central Station Steam Turbines.
Fuel Economics.

9.00-10.30 a.m.
Year Round Air Conditioning.

10.30 a.m.-12 noon
Water Technology Number 1. Distribution Systems.

2.00-5.00 p.m.
Central Station Steam Power Plants.
Water Technology Number 2, Symposium on Demineralization.

2.00-3.30 p.m.
Industrial Power Plants.
Electrical Systems.
3.30-5.00 p.m.
Cables for Transmission and Distribution.

*Friday, March 26, 1954:*
9.00-12.00 noon
Nuclear Energy.
9.00-10.30 a.m.
Water Technology Number 3.
Steam and Diesel Power Plants.
Electronics.
10.30-12.00 noon
Water Technology Number 4.
Gas Turbines for Power Generation.
Circuit Breakeis.
2.00-5.00 p.m.
Developments in Gas Turbines and Diesel Engines.
Industrial Steam Generation.
Symposium on Network Analyzers and Computing Aids.
Electrical Circuit Breakers.

For further information, write to E. R. Whitehead, Secretary, American Power Conference, Illinois Institute of Technology, Technology Center, Chicago 16, Illinois.

# Montreal Thinks About a Subway

Whatever the advantages to Montreal of having Mount Royal in its midst, the mountain could hardly be in a worse place, so far as transportation for Montrealers is concerned. In the area which it occupies, roughly a mile and a quarter east and west by a mile north and south, there are no streets. Add to this the narrow and sometimes crooked streets in the business district inherited from colonial times, some steep grades, an annual snowfall greater than any other large city save Leningrad, steadily mounting traffic density, and it is no wonder that the city was long ago forced to take its transportation difficulties seriously.

Studies began early in the automobile era and led to many suggestions for improvement, such as street widening and extensions, one-way streets, the abolition of railway grade crossings, vehicular tunnels under the Lachine Canal, highspeed freeways, off-street parking, and increasingly severe parking regulations. Some of these suggestions have become actualities. The city is doing much to put its street system in order, but it is quite apparent that improvements of this kind, no matter how extensive, are not the final answer to the problem.

When the Montreal Transportation Commission was set up in 1951 and took over the Montreal Tramways Company's street car and bus services, it was specifically charged with the duty of producing by 1953 a scheme for better mass transportation. Its report on this matter has just been submitted to the city authorities. Nobody is surprised to learn that the Commission feels that the only practicable scheme is the construction of a subway and the rearrangement of surface lines to feed it. The Commission is already committed to the abolition of street cars; several important routes have already been shifted to bus operation and others will follow as rapidly as practicable. The complete change-over is expected to take about ten years.

The routes of the proposed system are shown in Fig. 1. The section recommended for immediate construction starts at the Commission's Youville yard and shops (Legendre St.), where there is room for a terminal and new yards and shops for the maintenance of subway rolling stock, runs south under St. Denis St. and swings west under the Champ de Mars to St. James St., thence west under the latter to Victoria Sq., then northwest under private property to Dominion Sq. and the intersection of Peel and St. Catherine Sts., and then west again under St. Catherine St. to Atwater Ave., where there is now unoccupied land available for turnaround cross-overs and a terminal. The total length of the proposed line is 7.78 miles, 3.15 miles of which will be in rock tunnel (Fig. 2), 0.24 mile in earth tunnel and the rest, 4.39 miles, built by cut-and-cover methods (Fig. 3).

There would be 16 stations, with mezzanines where the subway is deep enough to permit it. All would have reversible escalators. There would be a pedestrian tunnel northward from the Place d'Armes station to the present Tramways Terminal on Craig St., where many surface lines originate, and a similar connection at Atwater Ave. to the Forum, the home of "Les Canadiens" and the site of many sports events. Similar connections to other buildings along the route might also be made, though none are apparently provided for. The Atwater Ave. (Western Sq.), de Fleurimont and Youville (Legendre St.) stations would also have surface bus shelters and the St. Catherine and St. Denis St. station would be arranged for the interchange of traffic with the future east-west subway in the former street.

This east-west extension would extend from Peel St. eastward to Viau St. under St. Catherine and Ontario Sts. Its western section would run from Atwater Ave. to Girouard Ave. under Sherbrooke St. The distance from Girouard Ave. to Viau St. is 6.56 miles. A further component of a comprehensive system is a line northward on Frontenac and Iberville Sts. from Ontario St. to Jean Talon St., thence under the latter to Pie IX Blvd. This would be 3.90 miles long.

The western extension would ultimately be further extended to Church St. in Ville St. Laurent, under Girouard Ave. and Decarie Blvd., a distance of 4.42 miles. The completed system, then, would comprise something over 22 miles of subway, with 37 stations.

Routes were selected only after prolonged and careful study of all practicable locations. Those chosen will give the best service to the greatest number of passengers. It is estimated that in about half the area tributary to the initial subway, travelling time will be reduced by from 30 to 45 per cent, while the time saving in the rest of the area will be of the order of from 15 to 30 per cent. In addition, of course, subway travel is incomparably faster than surface transportation, can offer much more frequent service and is unaffected by the weather.

It is proposed to operate eight-car trains during the rush hours and four or six-car trains at other times, with either three- or six-minute headways. The schedule contemplated will handle about 400,000 passengers per day and capacity can easily be increased by running more long trains and by using more of the short headways.

Details of construction, of rolling stock, of power supply and of control would conform generally to standards found satisfactory by other subway systems. The piston action of trains would generally be relied upon for ventilation, but fans would be installed at some ventilation outlets. Nine drainage sumps would be provided, each with duplicate 750 g.p.m. pumps.

Six-hundred-volt direct current would be used for traction power, produced from 12,000 v. alternating current at seven substations. A protected over-running third rail would be used for delivering current to trains. Station and tunnel lighting and power for pumps, fans, etc., would be from alternating current circuits.

There would be a complete private telephone system, and, of course, the most modern of block

Comprehensive Plan of Proposed Subway System, with Possible Pattern of Surface Routes. : : Forecast of population distribution, 1971. ▬ Initial subway project. - - - - Future subway. ⁻O Subway stations. —— Surface transit routes. ++++ Passenger railway lines.

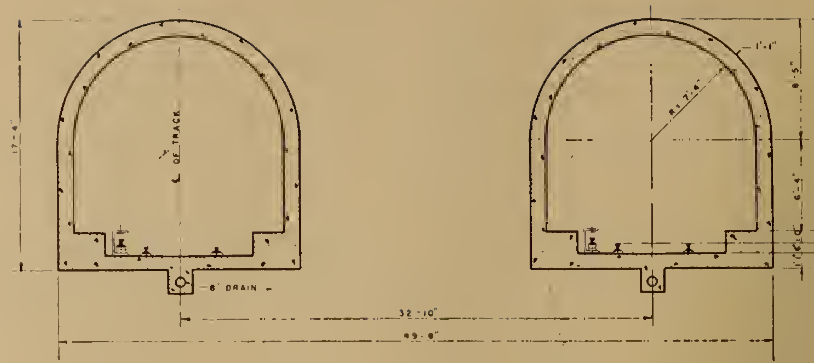
signal systems, with automatic stops. All electrical equipment, except that on the trains themselves, would be controlled from a supervisory station in the vicinity of the Tramways Terminal on Craig St. Those on duty there would know at all times the position of every train and of every switch and the condition of every signal, as well as the state of all the auxiliary apparatus. In short, every precaution which would contribute to safety would be taken.

The subway cars proposed are practically duplicates of those already purchased for the Toronto subway. They would be from 55 to 60 ft. long by about 10 ft. wide, with thermostatically - controlled constant-temperature heating, good ventilation, a lighting system that would give 20 foot-candles at reading level and emergency lighting for use in case of power failure. Two cars would make up a unit and any number of units could be combined into a train. Pneumatic tires are being used experimentally in the Paris Metro; perhaps they could be used in Montreal.

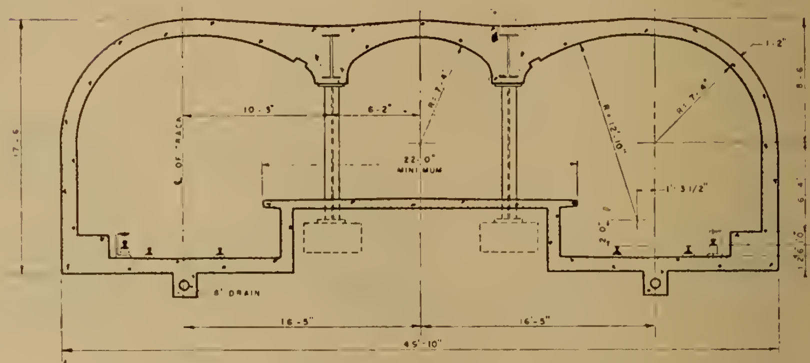
For purposes of study, Montreal and its environs were divided into two areas, inner and outer. The inner area includes Montreal itself and 17 nearby communities, with a 1951 population of 1,273,540 and an estimated 1971 population of 1,750,000. The corresponding figures for the 29 communities of the outer area are 123,434 and 450,000.

There is little doubt that Montreal needs a subway, though there are those who think that there are other and less costly methods of meeting its mass transportation needs. This is not the opinion of the majority of the Montreal Transportation Commission, nor do we think it is the opinion of most citizens of the Montreal metropolitan area. Most of them want a subway. The question is, "How is it to be paid for?"

The Commission suggests that the $87 million estimated cost of the subway structure proper, without equipment, should be borne by the public benefited, i.e., by the citizens of Montreal and of the 45 suburbs included in the inner and outer areas. The Commission does not start with $30 million in hand,



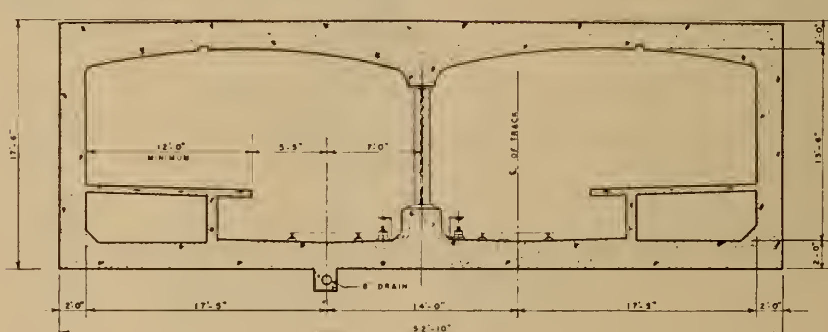
SECTION BETWEEN STATIONS



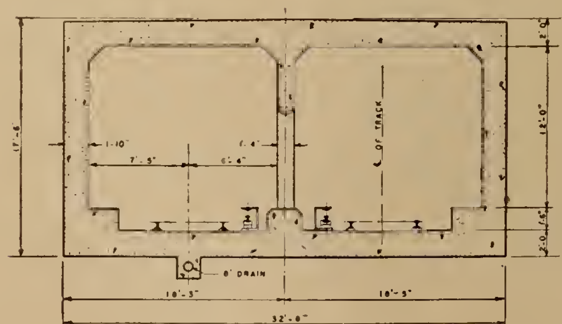
SECTION AT STATIONS

**Above. Typical Construction in Rock Tunnel.**

**Below. Typical Construction in Open Cut.**



SECTION AT STATIONS



SECTION BETWEEN STATIONS

as did Toronto. What method of distributing this cost fairly should be used, the Commission does not say. It is suggested that the Commission itself find the $30 million which would be required to equip the subway with track, and third rail, power distribution and control, telephone and signal systems, cars, yards and storage and repair facilities, in short, all that would be needed to turn the bare structure into an operating entity.

If the $87 million referred to were borrowed at 4½ per cent, it would take $4.4 million annually to amortize it in 50 years, and if this latter sum were assessed equally on each of the 1,396,974 people in both inner and outer areas in 1951, it would amount to about $3.15 per capita annually, or perhaps $12.50 per family. Of course, an even distribution is not proposed; it would be manifestly unfair. The further one lives from the subway, the less one should contribute. As a guess, the annual family contribution might run from $5 to $25, surely not exhorbitant figures.

As to meeting the annual cost of servicing the Commission's debt of $30 million and that of operating the subway as part of a comprehensive mass transportation system, it is estimated that this would add about six-tenths of a cent to each fare.

The people of the Montreal area have a very direct interest in seeing that the city's mass transportation problem is solved as promptly and in as satisfactory and economical manner as possible. Even if they will not benefit directly from such a solution, they will benefit indirectly through reduction in street congestion.

The report is accompanied by 111 sheets of general plans, by Appendix A, "Subsurface Investigations for the Initial Subway" (447 pages and 2 maps) and by Appendix B, "Estimate of Costs for the Initial Subway" (110 pages).

In the preparation of the report on which these notes are based, the Commission was advised by Charles E. DeLeuw, M.E.I.C.; Robert F. Legget, M.E.I.C., director, Division of Building Research, National Research Council, Ottawa, assisted in the subsurface investigations. The Commission consists of Arthur Duperron, M.E.I.C., chairman and general manager, Richard F. Quinn, vice-chairman, Jean Constantin, Leonard Leger and C. A. Sylvestre. One commissioner disagreed with the recommendations of the report and hence did not sign it.

# Elections and Transfers

At the meeting of Council held at Brockville on Friday, January 15, 1954, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

*Members:*

P. A. Beckerich, *Montreal.*
E. W. Blackmore, *Cornwall.*
S. S. de Kottas, *Montreal.*
W. L. Gibson, *Toronto.*
A. A. Goldes, *Winnipeg.*
R. C. Golding, *Toronto.*
H. Loo, *Vancouver.*
T. J. McQuaid, *Belleville.*
N. Roehberg, *Montreal.*
K. Tubbesing, *Montreal.*

*Juniors:*

M. Boruta-Spiechowicz, *Copper Cliff.*
C. R. Cupp, *Copper Cliff.*
R. J. Fletcher, *Montreal.*
J. L. Gordon, *Montreal.*
E. T. Hilbig, *Belleville.*
G. R. McLinton, *Valleyfield.*
H. A. Mitchell, *Fort Erie.*
V. A. O'Kelly, *Montreal.*
D. L. Paterson, *Hamilton.*
C. J. Purcell, *Montreal.*
G. B. Taylor, *Montreal.*
W. A. Turmeau, *Montreal*

*Transferred from the class of Junior to that of Member:*

F. Belshaw, *Sarnia.*
P. W. Bishop, *Victoria.*
G. A. E. Campbell, *Winnipeg.*
J. R. Daye, *Montreal.*
W. M. Gow, *Ft. Frances.*
G. W. Herzog, *Peterboro.*
G. M. Nixon, *Vancouver.*
J. E. Pickering, *Maitland.*
E. T. Quirk, *Montreal.*
W. C. Robertson, *Sao Paulo.*
F. A. Ross, *Montreal.*
W. A. Stocker, *Montreal*
F. R. Thompson, *Asbestos.*
E. A. Walker, *Windsor.*
D. F. Williamson, *Pt. Mellon.*

The following Students were admitted:

R. J. Couture, *Queen's University.*
E. A. Eriksen, *Queen's University.*
J. B. Fenton, *Nova Scotia Tech. Coll.*
C. A. Freitag, *Queen's University.*
D. W. R. George, *Queen's University.*
E. C. Hill, *University of Toronto.*
B. G. Roy, *Laval University.*
I. V. Silgailis, *Nova Scotia Tech. Coll.*
R. P. Winstall, *Sir George Williams.*

### Applications through Associations

By virtue of the co-operative agreements between the Institute and the Associations of Professional Engineers, the following elections and transfers have become effective:

ALBERTA

*Member:*

T. K. Fowler

*Junior to Member:*

G. N. Campbell
R. S. White

SASKATCHEWAN

*Members:*

R. B. Dupuis
G. O. P. Handegord
G. E. Johnson

*Students:*

L. G. Andrego
P. A. Baker
A. P. Belyk
D. J. Coward
D. M. Derworiz
M. E. Famulak
W. C. Highet
B. A. Holmlund
G. N. Listwin
D. E. J. McGrath
R. Petrowitsch
L. S. Wilson

*Junior to Member:*

R. J. Larson

QUEBEC

*Member:*

W. S. Leggat

*Junior:*

D. A. Findlay

# The *Journal* Thirty-five Years Ago

What strikes one forcibly on looking over the February, 1919, issue of the *Journal* is how different from current numbers it appears. Cover illustrations are things of the future. In 29 pages of advertising there are only 24 cuts, but apparently all the type faces the printer had in stock were used. Many of the advertisers are still with us, but the emphasis on their products has changed.

The Pratt & Whitney Co., known today for its airplane engines, was boosting small tools, Imperial Oil was making a drive to "improve our country roads, too", and so were the Canada Cement Co. and the Barrett Co. Imperial Oil also extolled the virtues of oil as a fuel, a promotional effort long ago rendered quite unnecessary. The Nova Scotia Construction Co. used a page to inform readers that "Hydrostone" would be used by the Relief Commission in rebuilding "devastated Halifax". The Department of Public Works of Nova Scotia had half a page asking someone to undertake a hydroelectric development "in the immediate vicinity of extensive and well-proven gold areas". "Leather, like gold, has no substitute", according to Sadler & Haworth, belting makers.

One of the few illustrations in the advertising pages shows a tank, one would say about 15 feet in diameter by 20 feet deep, being hauled on a sled drawn by four horses and driven by a man in a bowler hat. Shawinigan Power's map shows its system ending at Shawinigan Falls in the north.

This *Journal* was printed by the Modern Printing Co., which used half a page to say so, and the Institute uses another half to announce that "The *Journal* of the Engineering Institute of Canada is the medium to strengthen your contacts with the engineering profession."

A good part of this February number was taken up by the report of Council for 1918, by committee reports and the like. Council's report was short and to the point; it occupied less than a single page. It expressed thankfulness for the ending of the war and paid homage to Institute members who lost their lives in that great struggle. It noted the adoption of a set of new by-laws and the legal change of the Institute's name to its present form. It spoke of three professional meetings—in Toronto, in Saskatoon and in Halifax—held during 1918 and of the formation of the Montreal, Halifax and Saint John branches.

Council's report gave considerable space to reviewing the Institute's efforts to "place the engineering profession on a higher plane" and approved of the "principle of securing legislation for this purpose . . . originated with the western provinces". The *Journal* had "received the hearty approval and commendation of the membership". It prided itself on having secured permission to publish the Engineering Index month by month, 21 pages of which appeared elsewhere in the number, an easy way to fill it which the present editors would probably welcome.

Council thought that interviews with the Civil Service Commission, at which the Institute was asked to "make recommendations regarding salaries will be a powerful factor in raising the standard . . . throughout the Dominion."

Council's report was signed by H. H. Vaughan, president, and Fraser S. Keith, secretary.

Total membership was reported at 3,203, of whom 175 were admitted during 1918. Seventeen casualties among members on active military service were reported. Fourteen branches were listed, all functioning except that at Kingston, where activities were suspended during the war. The Montreal Branch took over the responsibility for February, 1918, for meetings at Headquarters.

In reading over the list of committees, the frequency with which the same names occur is noticeable. The willing horse carried the load, then as now. Many of the 1918 committees have disappeared—by-laws, electro-technical, Board of Examiners (Quebec Act), Gzowski medal and students' prizes, fuel power, steel bridge specifications, steam boiler specifications, roads and pavements, and honour roll. The last committee reported 871 members on active service. The library and house committee reported accessions of about 40 volumes, including "Voyages en Egypte et Planche des Voyages dans la Basse et la Haute Egypte".

The finance committee set the cost of producing the *Journal* for 1918 at $6,032. Our total income was $30,644.19 and we finished the year with a deficit of $1,707.34.

The writer finds he read a paper before the Montreal Branch in 1918; it was later published in the *Journal*. This he remembers very well. He prepared drawings especially for reproduction and headquarters lost them, so the illustrations had to be made from a set of white prints which he had been lucky enough to have made. These were probably the worst illustrations the *Journal* ever published.

The first paper of the February, 1919, *Journal* was one on "Mean Sea Level as a General Datum for Canada", by W. Bell Dawson, arguing that, since precise level bench marks were now becoming available throughout Canada, the Institute should encourage their use, except for dredging operations, where low tide "must be used". Col. R. W. Leonard, president for 1919, followed with a description of the "Mining and Metallurgy of Cobalt-Silver Ores". He thought the Pre-Cambrian Shield "offers to prospectors better chances of locating valuable mineral deposits than can be found in any other country in the world." How right he was!

In "National Highways and Good Roads", Capt. J. A. Duchastel de Montrouge appeals for Federal aid, comparable to that provided in the United States. His plea fell on deaf ears; except for small appropriations many years ago and for the present Trans-Canada Highway scheme, the Federal government has left highway finance strictly to the provinces. Another transportation paper was the "Design and Construction of Reinforced Concrete Viaducts", by B. O. Eriksen and H. S. Deubelbeiss, dealing with two trestles for the Canadian Pacific Ry. between Leaside and North Toronto, Ont. They are notable as early examples of the combination of poured-in-place bents and pre-cast deck slabs. The unit prices on this job are interesting:

Materials:

| | |
|---|---|
| Lumber . . . . | $38.50 M |
| Stone . . . . . | .993 ton |
| Sand . . . . . | .295 ton |
| Cement . . . . | 2.00 bbl. |

Labour:

| | |
|---|---|
| Carpenters . . . . | 0.51 hr. |
| Helpers . . . . . | .40 hr. |
| Labourers . . . . | .37.5 hr. |
| Mixer operators . . | .55 hr. |
| Cement finishers . | .41 hr. |

J. M. R. Fairbairn, later president of the Institute, was then chief engineer of the C.P.R., and P. B. Motley its engineer of bridges.

H. S. Carpenter, Deputy Minister of Highways of Saskatchewan, asked "Can Earth Roads be Made Satisfactory?" and answered himself by saying that they can if properly built and maintained, with the emphasis on maintenance.

A. W. Robinson's "Economy in Ocean Transportation" supports the thesis that ocean shipping and ocean ports should be standardized in a complementary way. He seems to have felt that Canada was headed toward being a great maritime nation. Anyone who has read the newspapers over the past six months knows the present answer to this prophecy.

F. A. Combe, now a consulting engineer in Montreal, but then the Canadian engineer for Babcock & Wilcox, Ltd., discussed "Modern Boiler Practice". This paper strikes the writer as being an excellent one even today, though it is probably somewhat out of line with today's practice.

Legislation was much in the limelight. The Saskatchewan Branch had an act ready for presentation to the provincial legislature, but was asked to hold its hand until all branches had had an opportunity to study the draft. Later, at a special meeting of Council, it was decided that Council could not support the Saskatchewan draft without a special mandate from Institute members. In accordance with requests from several branches, it was also decided to ask representatives from each branch to meet as soon as practicable to discuss the whole matter of legislation. It is quite apparent what was uppermost in the minds of all members in 1919.

The establishments of the Ontario Provincial Division was announced, with Peter Gillespie (Toronto) as chairman pro-tem and an executive committee of Mr. Gillespie, J. R. W. Ambrose (Toronto), E. D. Lafleur (Ottawa), G. A. McCarthy (Toronto), John Murphy (Ottawa), James White (Ottawa), and N. H. McLeod (Toronto). The branch representatives were J. B. Challies (Ottawa), George Hogarth (Toronto), E. R. Gray (Hamilton) and W. S. Wilson (Sault Ste. Marie), and the non-resident members were W. H. Magwood (Cornwall), G. R. Munro (Peterboro), J. L. Morris (Pembroke), R. J. McClelland (Kingston), G. H. Bryson (Brockville), A. C. D. Blanchard (Niagara Falls), T. H. Jones (Brantford), J. L. Weller (St. Catharines), S. B. Clement (North Bay), J. A. Bell (St. Thomas), R. L. Dobbin (Peterboro), L. K. Jones (Port Arthur), and V. A. Belanger (L'Orignal).

There was a spirited letter from John Taylor continuing a controversy begun in October 1918, over priority in the use of a diving bell, and there were a score of letters of thanks for cigarettes sent by the Institute's tobacco fund to members in the services.

The report of the January Council meeting shows that Council instructed the secretary to summarize the legislation situation and to publish the summary in the *Journal*, approved the attempts of the Institute to secure salary increases for engineers in the Civil Service and accepted the design of the Institute emblem—the familiar beaver—as submitted by a committee of which Walter J. Francis was chairman.

The branch reports contain little of interest to us now, save that one from Sault Ste. Marie appears for the first time, that branch having been inaugurated on January 9, 1919.

From two columns of personals we learn that W. A. Mather has been appointed general superintendent of the C.P.R. at Moose Jaw, that A. W. Haddow is the new professor of civil and municipal engineering at the University of Alberta and that Stewart F. Rutherford has been elected to the city council of Westmount, Que., leading the poll.

The employment bureau offered one job—"Splendid opening . . . must be young . . . speak French fluently . . . have business instincts (!) . . . very desirable position". For all this no salary is mentioned nor even hinted at.

## News of Other Societies

The **Canadian Institute of Timber Construction** was formed recently in Ottawa.

The Association's activities will be directed toward standardization of constants of size, quality and terminology of materials in the glulam timber engineering industry; promotion of C.S.A. and N.B.C. Codes shortly to be adopted; the provision of high quality workmanship; the dissemination of information; co-ordination with the construction industry, through statutes and regulations; and the establishment of equitable fire regulations.

Information concerning membership can be obtained from the Association's temporary offices, c/o W. A. Nicholson, 68 Ontario Street, Burlington, Ont.

Pro-tem officers serving until the first annual meeting, are president D. D. Millar, vice-presidents, R. F. DeGrace, and W. Thornber, and secretary-treasurer, W. A. Nicholson.

It is tentatively proposed that the first annual meeting will be held in New Orleans, March 28 to April 4, in co-operation with that of the American Institute of Timber Construction.

---

The **Canadian Industrial Safety Conference**, a new organization, will work on a national basis for the prevention of industrial accidents and the safety of workers in industries covered by Workmen's Compensation in each province.

Officers are, president, Wills Maclachlan, Electrical Employers Association of Ontario, Toronto; vice-presidents, R. C. Patterson, N.B. Accident Prevention Association, Saint John; E. E. Owen, Workmen's Compensation Board, Edmonton; secretary-treasurer, R. G. D. Anderson, Industrial Accident Prevention Associations, Toronto; and executive member, T. H. Miller, Quebec Association for the Prevention of Industrial Accidents, Montreal.

Membership will include associations primarily concerned with the prevention of industrial accidents, as well as large organizations such as the C.P.R., C.N.R., and Bell Telephone Company of Canada. Three organizational meetings have been held, and the next meeting will be on April 7, 1954 at the Royal York Hotel, Toronto.

# The ASME Boiler Code

### Interpretations

The Boiler Code Committee meets monthly to consider "Cases" where users have found difficulty in interpreting the Code. These pass through the following procedure: (1) Inquiries are submitted by letter to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.; (2) Copies are distributed to Committee members for study; (3) At the next Committee meeting interpretations are formulated to be submitted to the ASME Board on Codes and Standards, authorized by the Council of the Society to pass upon them; (4) They are submitted to the Board for action; (5) Those which are approved are sent to the inquirers and are published in Mechanical Engineering.

(The following Case Interpretations were formulated at the Committee meeting October 30, 1953, and approved by the Board on January 12, 1954.)

**Case No. 1164-1**

(Reopened)

Special Ruling

***Inquiry:*** When carbon steel plates, forgings, pipes, tubes and castings conforming to an approved specification and having a specified minimum yield strength of 30,000 lb. per sq. in. are used for the construction of vessels under external pressure, under what rules shall they be designed and fabricated?

***Reply:*** It is the opinion of the Committee that carbon steel plates, forgings, pipes, tubes and castings that conform to the requirements of an approved specification and have a specified yield strength of at least 30,000 lb. per sq. in. may be used for the construction of vessels under external pressure and the vessels may be stamped with the Code symbol provided the following requirements are complied with:

(1) The applicable rules in the 1952 Edition of Section VIII of the Code covering vessels under external pressure when constructed of carbon steel shall be adhered to;

(2) The thickness of shells and heads and the required moment of inertia for stiffening rings shall be determined from the chart in Fig. UCS-28.2.

NOTE: The chart in Fig. UCS-28.2, "Chart for Determining Shell Thickness of Cylindrical and Spherical Vessels Under External Pressure When Constructed of Carbon Steel (Specified Yield Strength 30,000 to 38,000 lb. per sq. in.)" is the same chart published previously as Addenda to 1952 Sec. VIII for carbon steel with specified yield strength 31,000 to 40,000 lb. per sq. in., it will also be included in the published Interpretations.

**Case No. 1177**

Special Ruling

***Inquiry:*** Expansion joints are being used in pressure vessel installations. The Code makes no specific provisions for them. Under what conditions may an expansion joint be used as an integral part of a Code pressure vessel?

***Reply:*** It is the opinion of the Committee that, pending the adoption of Code rules for expansion joints they may be used as integral parts of Code pressure vessels provided they satisfy the following conditions:

1) The combined bending and direct stress due to flexing and pressure in the flexing elements shall be controlled as follows:

The manufacturer of the joint shall submit to the authorized inspector satisfactory evidence, in the form of certified test data supplemented by service records if applicable and available, that:

(I) The joint will withstand the hydrostatic test prescribed for the vessel;

(II) The joint, while subject to the design pressure and design temperature will withstand four times the number of design amplitude direct flexings or other form of movement required by the purchaser of the vessel;

(III) The joint, while at the design temperature, is capable of withstanding a single application of four times the design pressure without rupturing the joint and regardless of the amount of distortion.

(2) All of the requirements of Part UW of the 1952 Section VIII with the exception of the higher stresses implied in (I) of the Reply, shall be complied with.

(3) The expansion joint shall not be stamped with the Code symbol but in addition to the certified data of (1) of this Reply the manufacturer of the joint shall execute a partial data report as required by Par. UG-120 (b) using Form U-2 insofar as applicable in order that the final inspector of the completed vessel may have the information necessary to satisfy him that the expansion joint is adequate for the vessel in which it is to be used and that the materials and welding are in accordance with Code rules.

The certified data of (1) of this Relay and the partial data report shall be the final inspector's authority to witness the application of a Code symbol to the completed vessel.

### Case No. 1178

Interpretation of Tables A-5, A-6 and P-15 of Section I and Tables UA-451 and UA-452 of Section VIII

***Inquiry:*** Section I, Tables P-15, A-5 and A-6; Section VIII, Tables UA-451 and UA-452 contain pressure temperature ratings for flanged fittings, flanges and valves produced in accordance with ASA B16e-1949 Supplement No. 1. This standard has been revised and reissued as ASA B16.5-1953. May the pressure temperature ratings contained in the revised standard be used in place of the tables currently in the Code?

***Reply:*** It is the opinion of the Committee that the pressure temperature ratings contained in ASA B16.5-1953 meet the intent of the Code, and may therefore be used.

### Case No. 1179

Special Ruling

***Inquiry:*** When nickel, nickel-copper alloy, or nickel-chromium-iron alloy plates, sheets, pipes, tubes, and shapes conforming to an approved specification are used for the construction of vessels under external pressure, under what rules shall they be designed and fabricated?

***Reply:*** It is the opinion of the Committee that nickel, annealed nickel-copper alloy, or annealed nickel-chromium-iron alloy plates, sheets, pipes, tubes and shapes that conform to the requirements of an approved specification may be used for the construction of vessels under external pressure and the vessels may be stamped with the Code symbol provided the following requirements are complied with:

(1) The applicable rules in the 1952 Edition of Section VIII of the Code covering vessels under external pressure when constructed of non-ferrous materials shall be adhered to.

(2) The thickness of shells and heads, and the required moment of inertia for stiffening rings shall be determined from the charts in Fig. UNF-28.6 for nickel, Fig. UNF-28.7 for annealed nickel-copper alloy, or Fig. UNF-28.8 for annealed nickel-chromium-iron alloy.

Note: The following charts are available from the Secretary of the Boiler Code Committee, and will also be included in the published Interpretations:

Fig. UNF-28.6—Chart for Determining Shell Thickness of Cylindrical and Spherical Vessels Under External Pressure When Constructed of Nickel.

Fig. UNF-28.7—Chart for Determining Shell Thickness of Cylindrical and Spherical Vessels Under External Pressure When Constructed of Annealed Nickel-Copper-Alloy.

Fig. UNF-28.8—Chart for Determining Shell Thickness of Cylindrical and Spherical Vessels Under External Pressure When Constructed of Annealed Nickel-Chromium-Iron-Alloy.

### Case No. 1154

Case Annulled

Case No. 1154 can be annulled as a result of the revision to Table UCS-23 of Sec. VIII.

## Proposed Revisions and Addenda to Boiler and Pressure Vessel Code

As need arises, the Boiler Code Committee entertains suggestions for revising its Codes. Revisions approved by the Committee are published here as proposed addenda to the Code to invite criticism. If and as finally approved by the ASME Board on Codes and Standards, and formally adopted by the Council, they are printed in the annual addenda supplements to the Code. Triennially the addenda are incorporated into a new edition of the Code.

In the following the paragraph numbers indicate where the proposed revisions would apply in the various sections of the Code.

Comments should be addressed to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.

### Material Specifications, 1952

The Boiler Code Committee has approved adding to Section II the following new specifications: SA-6-52aT and SA-20-52T.

The following four specifications have been superseded by SA-335-52aT:

SA-158-51T
SA-206-51T
SA-280-51T
SA-315-51T

Specification SA-157-50T has been superseded by SA-351-52T.

### Unfired Pressure Vessels, 1952

***Members of Committee:*** Add "George S. Chadwick, Jr." to the membership of the Subcommittee on Unfired Pressure Vessels.

***Contents "Appendix A — Porosity Charts"*** should be listed under the Mandatory Appendixes as "Appendix IV—Porosity Charts". The change from "Appendix A" to "Appendix IV" should be made in Par. UW-51(m) (4) and throughout.

***Par. UG-32(l).*** Revise to read:

(1) An ellipsoidal torispherical or toriconical head which is attached to a shell by a butt joint need not be provided with a skirt when the nominal head thickness does not exceed 1¼ times the nominal shell thickness. When the nominal head thickness exceeds 1¼ times the nominal shell thickness, a skirt shall be provided having a length not less than three times the nominal head thickness or 1½ in., whichever is smaller. When a skirt is used it shall meet the requirements for shell thickness in Par. UB-27 (c).

***Par. UG-41 (d).*** In line 3 change "section" to "parts".

***Par. UG-44.*** Revise the last sentence to read: "Other flanges shall be designed in accordance with the rules in Appendix II, except that flanges within the size and pressure ranges of the above Standards may be designed by interpolation."

***Par. UG-45.*** Revise subparagraph (1) to read:

(1) The required thickness of the shell or head assuming E=1, plus the design corrosion allowance.

***Par. UG-101 (o).*** Change "deformation" to "displacement" in the first line of subparagraph (3) and the fourth line of subparagraph (4).

***Par. UG-99 (g).*** Revise to read: "Following the application of the hydrostatic test pressure an inspection shall be made of all joints and connections. This inspection shall be made at a pressure not less than 2/3 of the test pressure."

***Fig. UW-9(c).*** Change "Hemispherical Shape" to "Heads Thinner than Shell".

***Par. UW-(2b).*** Revise the first sentence to read: "Vessels that are to operate below —20F. shall have all longitudinal and circumferential joints of the double-welded butt type or its equivalent when impact tests in accordance with Par. UG-84 are required for the material or weld metal."

***Table UW-12.*** In footnote 4, change "UA-61" to "UA-60".

***Fig. UW-16.1.*** This figure has been revised; copies can be obtained from the Secretary of the Boiler Code Committee, and will also be included in the published Addenda.

***Fig. UW-16.2.*** A minor change has been made in the dimensioning of this figure; copies can be obtained from the Secretary of the Boiler Code Committee, and will also be included in the published Addenda.

***Par. UW-16.*** Revise to read:

UW-16. Minimum requirements for Attachment of Welds.

(a) General. The location and minimum size of attachment welds for nozzles and other connections shall conform to the requirements in this paragraph.

(b) Symbols. The notations used in this paragraph and in Figs. UW-16.1 and 16.2 are defined as follows:

$t$ = nominal thickness of vessel shell or head less corrosion allowance, inches;
$t_n$ = nominal thickness of nozzle wall less corrosion allowance, inches.

$t_e$ = thickness of reinforcing element, inches;

$t_w$ = dimension of partial-penetration attachment welds (fillet, single-bevel, or single-J) measured as shown in Fig. UW-16.1 inches;

$t_c$ = the smaller of ¼ inch or $0.7t_n$; (inside corner welds may be further limited by a lesser length of projection of the nozzle wall beyond the inside face of the vessel wall);

$t_{min}$ = the smaller of ¾ inch or the thickness less corrosion allowance, of either of the parts joined by a fillet, single-bevel, or single-J weld, inches;

$t_1$ or $t_2$ = not less than ⅓ $t_{min}$ or ¼ inch.

(c) Necks Abutting the Vessel Wall. Necks abutting the vessel wall shall be attached by a full-penetration groove weld. Backing strips shall be used with welds deposited from only one side when the shell thickness is over ⅜ in. or when complete joint penetration can be verified by visual inspection (see Fig. UW-16.1 (a) and (b).)

Necks or tubes recessed into thick-walled vessels or headers may be welded from only one side by cutting a welding groove in the vessel wall to a depth of not less than $t_n$ on the longitudinal axis of the opening. It is recommended that a recess 1/16 in. deep be provided at the bottom of the groove in which to center the nozzle. The dimension $t_w$, of the attachment weld shall be not less than $t_n$ or less than ¼ in. (For examples see Figs. UW-16.1 (y) and (z).)

(d) Inserted Necks without Added Reinforcing Elements. Necks inserted into or through a hole cut in the vessel wall and without additional reinforcing elements shall be attached by a full-penetration groove weld or by two partial-penetration welds, one on each face of the vessel wall. Permissible types of welds are shown in Fig. UW-16.1 (c) to (h).

Backing strips shall be used with full-penetration welds deposited from only one side when the shell thickness is over ⅜ in. or when complete joint penetration can not be verified by visual inspection. The two partial-penetration welds may be any desired combination of fillet, single-bevel, and single-J welds. The dimension $t_m$ to each weld shall be not less than ⅓ $t_{min}$ nor less than ¼ in. and their sum shall be not less than 1¼ $t_{min}$. (See Fig. UW-16.1).

(e) Inserted Necks with Added Reinforcement. Inserted-type necks having added reinforcement in the form of one or more separate reinforcing plates shall be attached by welds at the outer edge of the reinforcement plate and at the nozzle-neck periphery. The weld at the outer edge of the reinforcement shall be a fillet weld with a minimum throat dimension of ½ $t_{min}$. The welds attaching the neck to the vessel wall and to the reinforcement shall consist of one of the following combinations:

(1) A single-bevel or single-J weld in the shell plate and a single-bevel or single-J weld in each reinforcement plate. The dimension, $t_w$ of each weld shall be not less than 0.7 $t_{min}$ (Fig. UW-16.1(n).)

(2) A full-penetration groove weld in the shell plate, and a fillet, single-bevel or single-J weld with a weld-dimension, $t_w$, not less than 0.7 $t_{min}$ in each reinforcement plate (Fig. UQ-16.1(m).)

(3) A full-penetration groove weld in each reinforcement plate, and a fillet, single-bevel, or single-J weld with a weld-dimension, $t_w$, not less than 0.7 $t_{min}$ in the shell plate (Fig. UW-16.1 (l).)

(f) Nozzles with Integral Reinforcement. Nozzles and other connections having integral reinforcement in the form of extended necks or saddle-type pads shall be attached by a full-penetration weld or by means of a fillet weld along the outer edge and a fillet, single-bevel, or single-J weld along the inner edge. The throat dimension of the outer weld shall be not less than ½ $t_{min}$. The dimension $t_w$ of the inner weld shall be not less than 0.7 $t_{min}$ Fig. UW-16.1(k), (r), (s) and (t).)

(g) Fittings with Internal Threads. The attachment of internally threaded fittings shall meet the following requirements.

(1) Except as provided for in (2), (3), and (4), internally threaded fittings shall be attached by a full-penetration groove weld, or by two fillet or partial-penetration welds, one on each face of the vessel wall. The minimum weld dimensions shall be as shown in Fig. UW-16.1(u), (v), (w) and (x).

(2) Fittings shown in Fig. UW-16.1 (u2), (v2), (w2) and (x) not exceeding 3 in. pipe size may be attached by welds that are exempt from size requirements other than those specified in Par. UW-15(a).

(3) Internally threaded fittings or equivalent bolting pads not exceeding 3 in. pipe size may be attached to vessels having a wall thickness not greater than ⅜ in. by a fillet weld deposited from the outside only, having the minimum dimensions shown in Fig. UW-16.2.

(4) Internally threaded fittings not exceeding 3 in. pipe size may be attached by a fillet groove weld from the outside only as shown in Fig. UW-16.1 (w3). The groove weld $t_w$ shall not be less than the thickness of schedule 160 pipe (ASA B36.10 — 1950).

***Fig. UW-19.1.*** Delete diameter of staybolt d = ⅞″ max. from each of drawings (a), (b), (c), (d), and (e).

***Par. UW-52(g).*** In the second line of the second column, change "operator" to "welder".

***Table UCS-23.*** In the stress values for Low-Alloy Steels SA-193-B7, add "8500" in the 950 F column and "4500" in the 1000 F column.

***Par. UCS-28(a).*** Revise to read:
(a) Cylindrical and spherical shells under external pressure shall be designed by the rules in Par. UG-28, using Fig. UCS-28.

***Par. UCS-56(a) (1).*** Add "SA-301 Grade B" and change "SA-302 Grade B" to "SA-302".

***Par. UCS-56(a) (2).*** Add "SA-301 Grade A".

***Par. UNF-28(a).*** Revise to read:
(a) Cylindrical and spherical shells under external pressure shall be designed by the rules in Par. UG-28, using Fig. UNF-28.

***Par. UHA-28(a).*** Revise to read:
(a) Cylindrical and spherical shells under external pressure shall be designed by the rules in Par. UG-28, using Fig. UHA-28.

***Par. UCI-28(a).*** Revise to read:
(a) Cylindrical and spherical shells under external pressure shall be designed by the rules in Par. UG-28, using Fig. UCI-28.

***Par. UA-250.*** Delete subparagraph (d).

***Par. UA-276(a).*** In the last line of Step 1, change "2.44" to "244".

***Par. UA-48(a) (3).*** Revise to read: "This classification covers types of construction where the attachment of the flange to the neck or vessel wall is such that the assembly is considered to act as a unit which should be calculated as an integral flange. For simplicity the designer may calculate the construction as a loose-type flange provided none of the following values is exceeded.

$g_o = \frac{5}{8}$in; $\frac{B_o}{g_o} = 300$; $P = 300$ psi.; operating temperature = 700 F.

***Par. UA-280.*** Revise Example 4 to read:

Example 4

A 16-inch, 600-pound welding-nozzle conforming to Specification SA-105, Grade II, is attached to a vessel that has an inside diameter of 96 in. and a shell-thickness of 2 in. The shell-material conforms to Specification SA-212, Grade A. The vessel operates at 425 psi. and 800 F. An allowance of 1/16 in. for corrosion is included in the shell and nozzle thickness. The vessel is stress-relieved and radiographed. Check the adequacy of the attachment welds shown in Fig. UA-280.4. Wall thickness required.

Shell $t_r$

$$= \frac{425 \times 48.06}{11{,}400 \times 1.0 - 0.6 \times 425} = 1.833 \text{ in.}$$

Nozzle $t_{rn}$

$$= \frac{425 \times 8.06}{{}^{*}11\,400 \times 1.0 - 0.6 \times 425} = 0.308 \text{ in.}$$

Size of weld required (see Par. UW-16(f).)

Outer perimeter weld = 1.41 × 0.5 × 0.75 = 0.53 in.

Inner perimeter weld = 0.7 × 0.75 = 0.53 in.

The weld sizes used are satisfactory.

Area of reinforcement required.

A = 16.125 × 1.833 = 29.56 sq. in.

Area of reinforcement provided.

$A_1 = 16.125\ (1.937 - 1.833) = 1.68$ sq. in.

$A_2 = 2 \times 4.84 (1.687 - 0.308) = 13.35$ sq.in.

$A_3 = 2 \times \frac{1}{2} \times (0.75)^2 = 0.56$ sq. in.

$$A_4 = 2 \times 2.0 \frac{(26 - 19.5)}{2} + 2 \times \frac{1.5}{2} \frac{(26 - 19.5)}{2} = 17.87 \text{ sq. in.}$$

Total area furnished = 33.46 sq. in.

Load to be carried by welds (Par. UG-41 (b) (2).)

$W = (29.56 - 1.68)\ 11{,}400 = 317{,}800$ lb.

Unit stresses

Shear in fillet weld = 0.49 × 11,400 = 5590 psi.

Shear in groove weld = 0.60 × 11,400 = 6840 psi.

Strength of connection elements

*A* Fillet weld in shear = 1.57 × 26.0 × 0.75 × 5590 = 171,100 lb.

*B* Groove weld in shear = 1.57 × 17.0 × 0.875 × 6840 = 159,700 lb.

The connection elements *A* and *B* have a design strength of 330,800 lb., which exceeds the required strength of 317,800 lb.

*See Par. UG-41(a).

***Par. UA-500.*** In the first line of the second paragraph on page 162 insert "the" before "transition".

## Announcement

Addenda for the 1952 (Ferrous) Edition of Section IX, ***Welding Qualifications***, has been printed and is available from the Society.

# Personals

## News of the Personal Activities of Members of the Institute

### Associations Elect Officers

**William Lister Sagar,** M.E.I.C., professor of civil engineering at the University of Toronto, and one of Canada's foremost authorities on soils and construction materials, has been elected 1954 president of the Association of Professional Engineers of Ontario. Professor Sagar is also vice-president of the Dominion Council of Professional Engineers.

A member of the engineering faculty of the University of Toronto since 1937, he continues to serve as a consultant in construction work taking place in Ontario.

During the earlier years of Professor Sagar's career, he worked in the construction field as a contractor and helped in the construction of such buildings as the T. Eaton Company College Street Store, and the Robert Simpson Company store in downtown Toronto. He also took part in the building of the Humber River Bridge, and has served as a consultant on foundation projects at the Imperial Oil Limited refinery at Sarnia.

In the 1930's he assisted in the soil work undertaken by the old Department of Northern Development (now absorbed into the Ontario Department of Highways) and Brunner, Mond (Canada) Ltd., in carrying out early highway building in Northern Ontario. During that time he became interested in mining, and served as president of Monarch Mines Ltd., operating in both the Great Bear Lakes and Quebec mine fields.

He is a veteran of both world wars, and holds the rank of lieutenant-colonel in the R.C.E.M.E.

Professor Sagar joined the Association of Professional Engineers of Ontario in January, 1923, about six months after it was given a provincial charter. He has been actively associated with its work during the last eight years.

---

The following officers were elected to the executive council of the Association of Professional Engineers of Ontario for the year 1954:

First vice-president, **John R. Montagne,** M.E.I.C., director of engineering of the Hydro-Electric Power Commission of Ontario; second vice-president, **John H. Waghorne,** engineer in charge of electrical research of the Hydro-Electric Power Commission of Ontario; councillors, **John S. Ellis,** JR.E.I.C., design engineer with H. G. Acres and Co. Ltd., Niagara Falls, Ont,, and **Robert C. McMordie,** JR.E.I.C., program planning and control engineer with the Hydro-Electric Power Commission of Ontario (civil branch); **Gordon W. Ames,** M.E.I.C., process engineer with Polymer Corp. Ltd. in Sarnia, and **James M. King,** M.E.I.C., of Canadian General Electric Co. Ltd. in Peterborough, (chemical and metallurgical); **Gordon M. McHenry,** Western Region consumer service engineer for the Hydro-Electric Power Commission of Ontario in London, and **Harold R. Osborne,** chief engineer for Ferranti Electric Limited in Mount Dennis (electrical branch); **John H. Fox,** M.E.I.C., general sales manager of Minneapolis-Honeywell Regulator Co. Ltd. in Toronto, and **John H. Ross,** M.E.I.C., Toronto consulting engineer, (mechanical and industrial branch); **Duncan R. Derry,** chief geologist of Ventures Limited in Toronto, and **Reginald C. Mott,** manager of the mining and reduction division of Falconbridge Nickel Mines Ltd. at Falconbridge.

The executive director of the Association is **T. M. Medland;** the registrar is **J. Murray Muir,** and the field secretary is **Thomas C. Keefer,** M.E.I.C.

---

**Charles Bentall,** M.E.I.C., president and general manager of Dominion Construction Co. Ltd., and president of New Building Finance Co. Ltd., in Vancouver, B.C., was recently elected president of the Association of Professional Engineers of British Columbia during the Association's two-day convention in Vancouver.

Newly elected council members of the Association of Professional Engineers of British Columbia are **F. R. Phillips,** M.E.I.C., of Pearson Phillips & Barrett, Vancouver; **J. D. McMynn, Col. G. M. Letson,** M.E.I.C., of Letson & Burpee Ltd., Vancouver, and **Jack L. Miller,** M.E.I.C., Vancouver consulting engineer.

The government of British Columbia has appointed four engineers to the council of the Association of Professional Engineers of British Columbia.

The new members are **E. C. Roper,** manager of Britannia Mining and Smelting Company; **Prof. W. O. Richmond,** M.E.I.C., of the Universtiy of British Columbia; and **William Hall,** chief engineer of the surveys division of the Department of Lands and Forests, and **J. H. Steele,** B.C. Electric Company.

---

At a recent dinner in the Windsor Hotel in Montreal, long service awards were made by the Shawinigan Water and Power Company, Shawinigan Engineering Company Ltd., and Shawinigan Chemicals Ltd., to men with 25 years' service or more.

Among the men in the firms receiving awards were **C. R. Lindsey,** M.E.I.C., of Shawinigan Engineering, with 47 years; **R. E. Heartz,** M.E.I.C., president of Shawinigan Engineering, with 33 years; **R. J. Beaumont,** board chairman of Shawinigan Water and Power, with 43 years; **L. F. Lontrel,** president of Shawinigan Products Corporation, New York, with 33 years; **V. G. Bartram,** president of Shawinigan Chemicals, with 38 years; **J. A. McCrory,** M.E.I.C., former board chairman of Shawinigan Engineering, with 37 years; and **J. A. Fuller,** president of Shawinigan Water and Power.

**John B. Shallenberger,** M.E.I.C., president of the Connellsville Manufacturing and Mine Supply Company and chairman of the Board of Shallway Corporation, has been appointed assistant to the director of the Stanford Research Institute of Palo Alto, California.

**John B. Shallenberger, M.E.I.C.**

The Stanford Research Institute, created five years ago by a group of American business men and organized under the auspices of Stanford University, is a non-profit public service organization which assists industry in the United States, Canada and several

countries overseas in applied research fields of chemistry, physics, electronics, and economics. It is a separate corporation, employing 700 people, most of whom are industry-trained professionals.

Mr. Shallenberger was formerly assistant to the president of Canadair Limited, and spent two years gathering case material and lecturing at Aluminium Limited's School of international business administration, the Centre d'Etudes Industrielles in Geneva. He has been Washington representative for the Douglas Aircraft Company, and last year set up an executive development program as training manager for the international division of the Ford Motor Company.

He has lectured on a part-time basis at McGill University, Columbia University, New York University and Stanford University.

### Correction

In the January Journal, Personals Section, information about John F. Frisch, JR.E.I.C., was printed incorrectly. This was brought about by the confusion of his name with that of his father, John Frisch, M.E.I.C.

Correct information is as follows:

**John Frisch,** M.E.I.C., is a project engineer with Canadian International Paper Company in Hawkesbury, Ont.

Mr. Frisch was previously with Canadian International Paper Company at Temiskaming.

He is a graduate of the Technical Institute of Horton, Norway, Class of 1906.

**John F. Frisch,** JR.E.I.C., is the mechanical engineer in the Technical Section, Canadian Pulp and Paper Association in Montreal.

He is a graduate in mechanical engineering of McGill University, class of 1952.

David Cramer, M.E.I.C.

**David Cramer,** M.E.I.C., P.F.R.A. office engineer in Lethbridge, Alta., has been elected chairman of the Lethbridge Branch of the Engineering Institute.

Mr. Cramer was born at Sheho, Saskatchewan. He obtained his early education in Saskatoon, Saskatchewan. While attending the University of Saskatchewan, Mr. Cramer was employed during the summer months by the Department of Transport as chainman on airport construction; by P.F.R.A., as rodman for two summers on a survey party, and as instrumentman on a survey party.

After receiving his B.Sc. degree in civil engineering in 1944, Mr. Cramer joined P.F.R.A., Department of Agriculture, in Regina, Saskatchewan, as a design engineer. The following year he was transferred to Calgary, Alberta, to work on the St. Mary Irrigation Project as design engineer.

In 1946 Mr. Cramer was transferred to Lethbridge, Alberta, to take part in construction work on the St. Mary Project. Two years later he was appointed office engineer in Lethbridge.

Mr. Cramer was elected secretary-treasurer of the Lethbridge Branch of the Engineering Institute in 1948 and served in that capacity until 1951 when he was named vice-chairman of the Branch.

**John Zabinski,** M.E.I.C., has been appointed eastern district manager of chemical sales for Canadian Chemical Company. He will make his headquarters in Montreal and will be responsible for the sales district comprising the eastern part of Ontario, all Quebec and the Maritimes.

Mr. Zabinski graduated in chemical engineering from the University of British Columbia in 1943. Since that time he has concentrated on chemical sales and served with the industrial chemical sales department of Dow Chemical of Canada Ltd.

**R. E. P. Bowman,** M.B.E., M.E.I.C., has been appointed general manager of the Pacific Great Eastern Railway.

Mr. Bowman comes to the Pacific Great Eastern Railway from the Canadian Pacific Railway with which he had been serving as acting superintendent at Medicine Hat, Alberta.

A graduate of the University of Alberta, Mr. Bowman held the rank of major in the Royal Canadian Engineers with which he served from 1940 until 1945. During that time he formed and commanded the No. 2 Railway Company and later served as assistant director of transportation at the headquarters of the 21st Army Group and at the headquarters of the 1st Canadian Army. He was awarded the M.B.E. for his services.

Mr. Bowman first entered the Canadian Pacific Railway in 1926 and has very extensive railroad experience.

**Lt. Col. M. C. Sutherland-Brown,** M.E.I.C., senior highway engineer on the Alaska Highway for the Department of National Defence in Whitehorse, has been elected chairman of the Yukon Branch of the Engineering Institute.

Lt.-Col. Sutherland-Brown was born in London, England. He received his general education at University School, Victoria, British Columbia, and his engineering training at the Royal Military College and Queen's University, graduating from the latter with a B.Sc. degree in civil engineering in 1939.

During 1938 and 1939 he was employed on general construction as works officer with the Royal Canadian Engineers, and as assistant district engineer officer in Calgary, Alberta.

From 1939 until 1945 he served in various military engineering units overseas, during which time he rose from the rank of lieutenant to that of lieutenant-colonel.

For two years after the war, Lt.-Col. Sutherland-Brown was district engineer officer on general construction in Vancouver, B.C. Then, in 1947, he was posted to Army Headquarters as assistant director of works and accommodation. As such, he was responsible for general construction, including hospitals for the Department of Veterans Affairs, highway and general construction for the Defence Research Board, as well as town planning and development for new Army camps in isolated areas.

Lt.-Col. Sutherland-Brown has been in the Yukon since 1952.

Claude E. Howard, M.E.I.C.

**Claude E. Howard,** M.E.I.C., has been appointed staff manager of the government department of Canadian Johns-Manville Company, Ltd. In this capacity he will serve as liaison between the Company and all branches of government in Canada.

Prior to his joining Johns-Manville, Mr. Howard was an engineer with the Bell Telephone Company of Canada.

A native of Smiths Falls, he received his B.Sc. degree in mathematics and physics from St. Patrick's College, Ottawa, in 1939, and his B.Eng. degree in civil engineering from McGill University in 1950.

From 1943 until 1946 he served as flight lieutenant in the Royal Canadian Air Force.

**H. C. T. Boyd,** M.E.I.C., has been appointed assistant chief of research for the Canadian National Railways.

Born of Scottish parents on the Island of Penang off the Malay Coast, Mr. Boyd was educated at Charterhouse and the University of Cambridge, England. He graduated from Cambridge in 1927 with a Master of Arts degree in mechanical sciences.

After graduation he served as engineer on a hydro-electric development in Scotland. He came to Canada in 1929, and, after working in private business and with various engineering firms here, went to India to serve with the Military Engineering Services in 1936. He returned to Canada in 1939 and was engaged in the construction of defence projects until 1944. He then joined Canadian National Railways as assistant engineer in the research and development department.

Mr. Boyd is an associate member of the Institution of Civil Engineers in London, England.

**Alfreds Vikmanis,** M.E.I.C., is with the Foundation Company of Canada Limited in Montreal.

He was previously with this Company as designing engineer in Sault Ste. Marie, Ont.

Mr. Vikmanis graduated in civil engineering from the University of Latvia in 1938.

**J. G. McLellan,** M.E.I.C., wiring materials and marine equipment manager of the Northern Electric Company Limited's general sales department in Montreal, has been named manager of the Company's Fort William branch.

J. G. McLellan, M.E.I.C.

Mr. McLellan was born in Prince Rupert, B.C., and received his electrical engineering degree from the University of British Columbia in 1936.

He joined the Northern Electric Company in 1936 in Vancouver in the power apparatus and electronics sales department, and in 1942, was appointed power apparatus specialist in Calgary. Later in the same year he moved to Montreal as marine fittings supervisor in the general sales department. He became power apparatus engineer in 1945, and equipment engineer the following year. He was appointed wiring materials and marine equipment manager in 1947.

**James D. Murdoch,** M.E.I.C., former drilling engineer with British American Oil Co. Ltd. in Edmonton, Alta., has joined the Amurex Oil Development Company as senior petroleum engineer in Calgary, Alta.

He is a graduate in petroleum engineering of the University of Oklahoma, class of 1949.

**Donald D. Love,** M.E.I.C, has accepted the position of equipment engineer in the construction and maintenance department of the Marketing Division of Imperial Oil Limited in Toronto.

He was formerly plant engineer with Moore Business Forms Western Ltd. in Fort Garry, Man.

Mr. Love is a graduate in electrical engineering of McGill University, class of 1947.

**Eric A. Mackenzie,** M.E.I.C., is now chemist with Cables, Conduits and Fittings Limited in St. John, Que.

He was previously methods engineer for Northern Electric Limited in Lachine, Que.

**E. Armbruster,** M.E.I.C., has been transferred by the Fraser Brace Engineering Company, from Maitland, Ont., to Montreal, Que.

Mr. Armbruster is a 1941 civil engineering graduate of the University of Saskatchewan, class of 1941.

**George I. Loucks,** M.E.I.C., has opened a business under the name of Loucks Motors Limited at Ponoka, Alta.

He was formerly zone manager of the McColl-Frontenac Oil Company in Calgary, Alta.

Mr. Loucks is a graduate in mechanical engineering of the University of Saskatchewan, class of 1943.

**P. L. O'Shaughnessy,** M.E.I.C., is at present employed as construction manager of Commercial Leaseholds Limited in Hamilton, Ont.

Before joining this Company, Mr. O'Shaughnessy was associated as construction superintendent with Pilkey Noble Construction Co. Ltd. in Hamilton.

He is a graduate of McGill University in civil engineering, class of 1923.

**Major D. C. MacMillan,** M.E.I.C., formerly in the office of the Director of Works at Army Headquarters in Ottawa, has been promoted to the position of area engineer of Western Ontario in London, Ont.

Major MacMillan graduated in civil engineering from Queen's University in 1938.

**R. L. Morrison,** M.E.I.C., is now manager of Blairmore Iron Works at Blairmore, Alta.

He was formerly with Western Canadian Collieries in Blairmore, Alta.

Mr. Morrison is a B.A.Sc. graduate in electrical engineering of the University of British Columbia, class of 1929.

**Roland Webb,** M.E.I.C., has been appointed resident partner in Saint John, N.B., of Kearns & Bromley, associate consulting engineers, of Wolfville, N.S.

He was formerly consulting electrical engineer of The Webb Electrical Company in Saint John.

Mr. Webb graduated in electrical engineering from the University of New Brunswick in 1935.

**R. D. Rosser,** M.E.I.C., has been appointed sales engineer of the Brown Boveri (Canada) Ltd. Calgary Office.

A native of Calgary, Mr. Rosser graduated in electrical engineering from the University of Alberta in 1949, after serving as an electrical artificer in the Navy during the last war.

He was previously associated with Canadian Westinghouse Company Ltd. for four years.

R. D. Rosser, M.E.I.C.

**Z. Przygoda,** M.E.I.C., is now designer in the office of Kaplan and Sprachman, Toronto architects.

Mr. Przygoda received his engineering diploma from the University of Danzig in 1935 and his doctor of engineering degree from the University of Munich in 1947.

**John N. Franklin,** M.E.I.C., has recently rejoined Bowater's Central Research Laboratories in Gravesend, Kent, England.

He was previously technical director of Bowater's Newfoundland Pulp & Paper Mills Ltd. in Corner Brook, Nfld.

Mr. Franklin graduated in mechanical engineering from the University of Toronto in 1931.

**P. E. Goodwin,** M.E.I.C., was recently elected a member of the American Society of Mechanical Engineers.

Mr. Goodwin is executive engineer with Vectron Incorporated of Waltham, Mass.

**Richard Walsh,** M.E.I.C., of the Ontario Department of Highways in Kingston, Ont., has been transferred to Sharbot Lake, Ont.

Previous to joining the Department, Mr. Walsh was associated with Dominion Tar and Chemical Company Limited in Trenton, Ont.

Mr. Walsh is a 1948 civil engineering graduate of the National University of Ireland.

**Chas. R. Phillips,** M.E.I.C., previously with Northern Electric Co. Ltd. in Belleville, Ont., has joined Kelvinator Company of Canada, Ltd. in London, Ont.

Mr. Phillips is a graduate of the University of Toronto in mechanical engineering, class of 1939.

**Claud N. Rands,** M.E.I.C., general manager of Northern Exploration Service in Dawson Creek, B.C., has opened consulting offices under the name of Rands Exploration Company in Calgary, Alberta.

Formerly district geologist for Technical Oil Consultants Limited in British Columbia, Mr. Rands is a geology graduate of London University and has undertaken post-graduate research at the University of Chicago.

**Harold R. Young,** Jr.E.I.C., is now attending the Harvard Business School in Boston, Mass.

Mr. Young was previously employed by Margison, Babcock and Associates in Toronto, Ont.

He received his civil engineering degree from McGill University in 1943.

**Wm. B. Scott,** Jr.E.I.C., has joined the staff of Consolidated Paper Corporation Ltd. in Grand'Mere, Que.

He was formerly with the Cornwall Division of Howard Smith Paper Mills, Limited, and with the Quebec North Shore Paper Co. Ltd., at Baie Comeau, Que., and with the Canadian Paper Company in Windsor Mills, Que.

Mr. Scott graduated in civil engineering from McGill University in 1944.

**Edward A. Walker,** Jr.E.I.C., previously assistant works engineer with Canadian Industries Limited in Montreal, Que., has joined Technical Mine Consultants Limited in Toronto, Ont.

Mr. Walker is a 1946 graduate in civil engineering of Queen's University.

**F. C. Totino,** Jr.E.I.C., has accepted the position of construction engineer for the Cleve Construction Company in Lloydminster, Sask.

He was previously township engineer for McKim Township in the District of Sudbury, Ont.

Mr. Totino is a 1947 graduate in civil engineering of the University of Toronto.

**W. E. Van Steenburgh,** Jr.E.I.C., is now employed by the Ontario Hydro Electric Power Commission in Belleville, Ont.

Mr. Van Steenburgh was previously with the Canadian General Electric Company in Peterborough, Ont.

He graduated in electrical engineering from Queen's University in 1948.

**M. E. Thompson,** Jr.E.I.C., has been transferred by Sperry Gyroscope Co. of Canada Ltd. from the airport at North Bay, Ont., to St. Hubert, Que.

Mr. Thompson is a graduate of the University of Manitoba in electrical engineering, class of 1949.

**F/L E. A. MacNair,** R.C.A.F., Jr.E.I.C., who for the past year has been attending the Massachusetts Institute of Technology under the sponsorship of the Royal Canadian Air Force, and was awarded the degree of Master of Science in electrical engineering in September, 1953, is now on the telecommunications staff at Royal Canadian Air Force headquarters in Ottawa.

F/L MacNair received his B.Sc. degree in electrical engineering from the University of Manitoba in 1949.

**P. E. Kelly,** Jr.E.I.C., has joined Velto Exploration Co., Inc., in Jackson, Mississippi.

He was previously associated with Rock Wool Products, Ltd. in Exshaw, Alta.

Mr. Kelly is a graduate of the University of Alberta in chemical engineering, class of 1949.

**D. J. Kay,** Jr.E.I.C., formerly a designer with Dominion Engineering Co. Ltd. in Lachine, Que., has joined the staff of Ste. Anne Paper Co. Ltd. at Beaupre, Que.

Mr. Kay graduated in mechanical engineering in 1949 from the University of Saskatchewan.

**K. G. Lightwood,** Jr.E.I.C., until recently with Armco Drainage and Metal Products of Canada Limited, has joined Steel Building Sales and Supply Ltd. as district sales engineer in Toronto, Ont.

He is a 1949 graduate in civil engineering of the University of Toronto.

**F/L Robt. C. White,** R.C.A.F., Jr.E.I.C., is construction engineering officer at C.J.A.T.C. at Rivers, Man.

He was previously stationed at Lincoln Park, Alberta.

F/O White is a 1950 graduate in civil engineering of the University of Alberta.

**Capt. J. A. MacDonald,** R.C.E.M.E., Jr.E.I.C., has been posted to 205 Base Workshop at Camp Borden, Ont. He was previously stationed at the R.C.A.F. station in Fort Nelson, B.C.

Capt. MacDonald is a 1950 graduate in mechanical engineering of the Nova Scotia Technical College.

**Theodore Elidoros,** Jr.E.I.C., has joined the staff of the Timken Roller Bearing Company in Canton, Ohio.

He was previously junior research engineer with Canadian Pacific Railways in Montreal.

Mr. Elidoros is a graduate in mechanical engineering of the University of Toronto, class of 1950.

**John Waldman,** Jr.E.I.C., is a designer with Canadian Allis Chalmers Co. Ltd. in Lachine, Que.

Before joining the Company, he was on the staff of Dominion Engineering Works in Lachine, Que.

Mr. Waldman is a mechanical engineering graduate of the University of Budapest, class of 1950.

**Brian W. Cole,** Jr.E.I.C., has joined McMillan and Bloedel (Alberni) Limited as a mechanical engineer.

Mr. Cole is a 1950 graduate in mechanical engineering of the University of British Columbia.

**C. R. Nash,** Jr.E.I.C., is now laboratory engineer in the structures laboratory of Chrysler Corporation's Central Engineering Division in Detroit, Mich.

He was previously layout draughtsman with Harry Fergusion Inc. in Detroit, and with the Ford Motor Company in Windsor, Ont.

Mr. Nash is a 1950 mechanical engineering graduate of the University of Manitoba.

**D. W. Clark,** Jr.E.I.C., is an electrical engineer with Canadian Johns-Manville Company Limited in Asbestos, Que.

He was previously a graduate student in the Canadian Westinghouse test course in Hamilton, Ont.

Mr. Clark is a McGill University graduate in electrical engineering, class of 1950.

**Jas. K. Ross,** Jr.E.I.C., has joined Eastern Power Devices Ltd. in Toronto, Ont.

He was formerly assistant electrical engineer in maintenance at Shipshaw (Alcan) Power House.

Mr. Ross is a graduate in electrical engineering of the University of British Columbia, class of 1950.

**Geo. E. Bawden,** Jr.E.I.C., is now station foreman with Sun-Canadian Pipe Line Co. Ltd. in Burlington, Ont.

He was previously with Chas. Warnock & Co. Ltd. in London, Ont.

Mr. Bawden is a graduate in civil engineering of McGill University, class of 1950.

**Lieut. K. R. Gillespie,** R.C.E., Jr.E.I.C., has recently been posted from the Royal Canadian School of Military Engineers at Chilliwack, B.C., to the

School of Military Survey in Hermitage, England.

Lieut. Gillespie graduated in civil engineering from the Nova Scotia Technical College in 1950.

**A. J. Moffat**, Jr.E.I.C., is now employed as an electrical engineer with the Canadian Westinghouse Company in Hamilton, Ontario.

Mr. Moffat was previously in Rugby, England, completing Athlone Fellowship training.

He is a 1951 graduate in electrical engineering of the University of Manitoba.

**Walter M. Balke**, Jr.E.I.C., is on the staff of the University of Alberta as lecturer in the department of electrical engineering.

He was formerly in the technical department of the Canadian Industries Limited cellophane plant at Shawinigan Falls, Que.

Mr. Balke graduated in electrical engineering from the University of Alberta in 1949, and in commerce and business administration from the University of Toronto in 1951.

**F/O G. R. E. Dube**, R.C.A.F., Jr.E.I.C., has been transferred from the R.C.A.F. Station in North Bay, Ont., to the Royal Military College in St. Johns, Que.

He is a 1951 graduate in civil engineering of McGill University.

**Jean Roch Boisvert**, Jr.E.I.C., has been transferred from the engineering department of Canadian Industries Limited in Montreal to Maitland, Ont.

He is a 1951 graduate in civil engineering of McGill University.

**Lieut. B. J. Bennett**, R.C.E.M.E., Jr.E.I.C., is now stationed at the R.C.E.M.E. School at Kingston, Ont.

Lieut. Bennett graduated in electrical engineering from the Nova Scotia Technical College in 1951.

**F/O W. Henry**, R.C.A.F., Jr.E.I.C., has been posted to No. 3 F.W.H.G., Royal Canadian Air Force, in Zweibruecken Pfalz, Germany. He was previously stationed in Ottawa.

He is a 1951 graduate in civil engineering of the University of British Columbia.

**Jas. Ian McGibbon**, Jr.E.I.C., is presently attending the Graduate School of Business Administration of the University of Western Ontario.

Mr. McGibbon received his B.Eng. degree in mechanical engineering from McGill University in 1951.

**Howard E. MacIntyre**, Jr.E.I.C., has joined Dominion Iron and Steel Corporation in Sydney, N.S., as a mechanical engineer.

Mr. MacIntyre is a mechanical engineering graduate of the Nova Scotia Technical College, class of 1951.

**J. C. Wood**, Jr.E.I.C., is now with Canadian General Electric Company Limited in Toronto, Ont., after completing the Company's test course in Peterborough, Ont.

Mr. Wood graduated in electrical engineering from Queen's University in 1952.

**Jas. H. Stuart**, Jr.E.I.C., has joined the staff of Canadian Bridge Co. Ltd. in Walkerville, Ont.

He was formerly with the Canada Paper Company at Windsor Mills, Que.

Mr. Stuart is a 1952 graduate in mechanical engineering of the Nova Scotia Technical College.

**J. C. Wesch**, Jr.E.I.C., has joined Aluminum Company of Canada Limited in Arvida, Que.

Mr. Wesch received his B.A.Sc. degree in chemical engineering from the University of British Columbia in 1952.

**Colin B. Fairn**, Jr.E.I.C., has been transferred by T. C. Gorman (Nova Scotia) Limited to Port Hastings, Cape Breton, N.S., from N. Beaver Brook, N.S.

Mr. Fairn graduated in civil engineering from the Nova Scotia Technical College in 1952.

**George Suhanic**, Jr.E.I.C., has joined T. D. K. Rooney (Canada) Limited in Montreal, Que.

Mr. Suhanic is a 1952 graduate in civil engineering of the University of Toronto.

**R. de St. Croix**, Jr.E.I.C., is at present studying toward his master's degree in business administration at the University of Michigan.

Mr. de St. Croix was previously employed with Ford Motor Co. of Canada, Ltd. in Windsor, Ont.

He is a 1950 graduate in mechanical engineering of McGill University.

**R. E. Finch,** s.e.i.c., who has been employed as aerodynamicist by A. V. Roe (Canada) Ltd., has joined Consolidated Vultee Aircraft Corporation in Fort Worth, Texas, as aerophysics engineer.
Mr. Finch graduated in aero engineering from London University in 1950.

**H. L. J. Maisonneuve,** s.e.i.c., previously with Canadian General Electric Co. Ltd. at Quebec City, has joined the staff of Northern Electric Co. Ltd. in Montreal.
Mr. Maisonneuve is a 1952 graduate in applied science of Ecole Polytechnique.

**John G. Malus,** s.e.i.c., has been transferred by Canadian Pacific Railway from Vancouver to the Regina Division.
Mr. Malus is a 1952 graduate in civil engineering of the University of Manitoba.

**Robert M. Bell,** s.e.i.c., now a draughtsman in England, recently received an award from the American Society of Mechanical Engineers at their annual meeting.
A 1953 graduate of Queen's University, Mr. Bell was presented the undergraduate student award for a paper on a boring mill, written after summer employment with an engineering firm in Dundas, Ont., following his third year in college.

**J. R. Mutch,** s.e.i.c., has been transferred by the Socony-Vacuum Exploration Company to Regina, Sask., from Calgary, Alta.
Mr. Mutch is a 1953 graduate in petroleum engineering of the University of Alberta.

**Glen A. Jones,** s.e.i.c., is now architectural sales representative with Canadian Pittsburgh Industries in Edmonton, Alta.
Mr. Jones graduated in civil engineering from the University of Alberta in 1953.

**F/O P. Bussieres,** R.C.A.F., s.e.i.c., is now located at the R.C.A.F. station in Aylmer, Ont.
F/O Bussieres is a mechanical engineering graduate of McGill University, class of 1953.

**J. Sheinin,** s.e.i.c., a 1953 honours graduate in civil engineering of the University of Toronto, is studying toward his M.A.Sc. degree at the same university.

**J. P. Wolofsky,** s.e.i.c., is at present studying toward his master's degree at the University of Illinois.
Mr. Wolofsky graduated in 1953 in mechanical engineering from McGill University.

**Kenneth C. Scott,** s.e.i.c., is now on the staff of Central Mortgage and Housing Corporation as resident engineer at Shannon Park, Halifax, N.S.
Mr. Scott is an honours civil engineering graduate of the Nova Scotia Technical College, class of 1953.

**L. S. O'Connor,** s.e.i.c., has been transferred by Price Brothers & Co. Ltd. from Chicoutimi, Que., to Rimouski, Que.

**C. D. Wickes,** s.e.i.c., has joined the staff of the power plant section of Canadair Limited in Cartierville, Que.

**J. A. Marin,** s.e.i.c., previously with Dominion Tire Factory in Kitchener, Ont., has recently joined Canada Starch Co. Ltd. in Cardinal, Ont.

**David Inkster,** s.e.i.c., has joined the staff of H. K. Ferguson Co. Inc., New York, as an electrical draughtsman.

**Lieut. Richard Poulin,** s.e.i.c., recently received a scholarship presented by the Canadian Engineers' Memorial Fund. The scholarship, awarded annually to science students, was created in memory of engineering officers who died during the war. Brig. Frank Fleury, commander of Eastern Quebec area, made the presentation before Father Adrien Pouliot, dean of the science faculty of Laval University.

**K. R. Crean,** s.e.i.c., is now employed by Canadian Sirocco Company, Limited of Windsor, Ont., as sales engineer from the Hamilton office.
He is a graduate in mechanical engineering of the University of Toronto, class of 1953.

## Visitors to Headquarters

**P. E. Ellestad,** jr.e.i.c., Moose Jaw, Saskatchewan, January 7, 1954.
**A. H. Elliott,** m.e.i.c., Montreal, Quebec, January 11, 1954.
**H. F. McCorkney,** Montreal, Quebec, January 20, 1954.
**Gilbert H. Bancroft,** m.e.i.c., Vancouver, British Columbia, January 27, 1954.
**F. C. Mechin,** m.e.i.c., Toronto, Ontario, January 28, 1954.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**James Gekke Campbell,** M.E.I.C., of the All Steel Company in Toronto, Ontario, died on November 28, 1953.

Mr. Campbell was born at Glasgow, Scotland, on July 24, 1882. After two years at the Glasgow and West of Scotland Technical College, he served five years' apprenticeship with Somervail & Company in Dalmuir, Scotland

In 1904 he joined the Cleveland Bridge Company in Yorkshire, England, and a year later came to Canada and entered the Montreal Locomotive & Machine Company where he was employed for two years.

Then, in 1907, he became draughtsman and checker in the Structural Steel Company in Montreal. The following year he was placed in charge of this Company's detailing on bridges, mill and office buildings, elevators and other works. In 1912 he was appointed assistant chief draughtsman, a position he held until 1917 when he became structural engineer with the Canadian Steel Corporation in Ojibway, Ontario.

Mr. Campbell joined Hamilton Bridge Works Company Limited in Hamilton, Ontario, in 1919 and remained with that Company until 1926 when he became associated with the Canadian Bridge Company as draughtsman and checker in Walkerville, Ontario.

More recently, Mr. Campbell had been connected with the All Steel Company in Toronto.

He joined the Engineering Institute of Canada as an Associate Member in 1919, transferring to Member in 1940. On January 1, 1953, he attained Life Membership in the Institute.

**James Norman Smith,** M.E.I.C., who retired seven years ago as supervising engineer of the City of Westmount power house, died at the Montreal General Hospital on December 16, 1953.

Mr. Smith was born at Toronto, Ontario, on September 17, 1868. He received his general education at the public school and Dr. Tassie's School, and then completed in 1886 an electrical course at the School of Science in Toronto.

The year following graduation he was appointed general superintendent and electrical engineer of The Ball Electric Light Company in Toronto. He remained in that position until 1895 when he joined the staff of the Canadian General Electric Company as assistant works engineer in Peterborough, Ontario. Two years later he was appointed chief engineer of the United Electric Company; and in 1901, general manager and engineer of Canadian Motors Limited.

From 1902 until 1913, Mr. Smith was associated with Messrs. Ross & Holgate in Toronto and with R. A. Ross and Company in Montreal.

When World War I broke out, Mr. Smith was appointed district inspector of fuses for Canada by the Imperial Ministry of Munitions. After the end of the war he became deputy power controller, representing Sir Henry Drayton at Niagara Falls, Ontario, during the power shortage.

In 1918 Mr. Smith joined the Toronto Power Company as research engineer on electrolytical production of oxygen, hydrogen and chlorine. He remained with this Company until it was absorbed by the Hydro-Electric Power Commission of Ontario. Mr. Smith then became associated for a brief time with the Toronto Railway Company.

In 1931 he returned to Montreal to join R. A. Ross and Company. Four years later he became supervising engineer of the power plant of the City of Westmount, a position he held until his retirement in 1947.

He was a member of the Association of Professional Engineers of Ontario, and a member of Westmount Council, Royal Arcanum.

Mr. Smith joined the Engineering Institute of Canada as a Member in 1921, and he attained Life Membership in 1951.

**The Honourable Michael Dwyer, M.B.E.,** M.E.I.C., one-time minister of mines, public works and labour in the Nova Scotia Government, and former president of the Nova Scotia Steel and Coal Company in Halifax, died in New Glasgow, Nova Scotia, on December 28, 1953.

Mr. Dwyer was born in Parkstown, Tipperary, Ireland, on February 4, 1877, and came to Nova Scotia as a child with his parents. He received his early schooling in New Glasgow and completed his high school education by means of night classes and correspondence courses.

He began his engineering career in 1895 as an office boy with the Nova Scotia Steel Company in New Glasgow. In 1902 he became chief draughtsman, and a year later, master mechanic. He continued in this position until 1913 when he was named assistant manager of colleries, coke ovens and wash plant. By 1915 he had become mechanical superintendent, and five years later assistant works superintendent.

In 1922 Mr. Dwyer resigned his position as works superintendent of the Company's steel mill at Sydney Mines to become president and general manager of the Indian Cove Coal Company there. He remained in that position for ten years.

Keenly interested in community affairs, Mr. Dwyer was elected mayor of Sydney Mines in 1926 by acclamation. He held this post for six successive years during which time he ran in only one election.

In 1926 and in 1930 he unsuccessfully contested Cape Breton North and Victoria federal constituency, but in 1933, he led the polls as a Cape Breton member of the legislature. He resigned from the Cabinet in 1938 and the following year he was appointed president of the Nova Scotia Steel and Coal Company in Halifax. In 1949 Mr. Dwyer was elected mayor of New Glasgow.

In 1936 he personally directed the rescue of two gold miners from the Moose River Mine. In directing the operation he was constantly on the job, his miner's helmet and clothing covered with mud.

Mr. Dwyer was closely associated with the early work of the Vocational Training Program in the mining industry in Nova Scotia.

He was a member of the Canadian Institute of Mining and Metallurgy and the Association of Professional Engineers of Nova Scotia, and served as president of the Nova Scotia Mining Society in 1931.

Mr. Dwyer joined the Engineering Institute of Canada as an Associate Member in 1925. Four years later he was elected chairman of the Cape Breton Branch. In 1940 he was transferred to Member of the Institute.

**Earle Meharg Baird,** M.E.I.C., Scarboro commissioner of works, died suddenly en route to the hospital after he had taken ill at a hockey game at Maple Leaf Gardens in Toronto on December 9, 1953.

Mr. Baird was born at Scarboro on February 18, 1901. After receiving his general education at the Scarboro Village school and Malvern Collegiate, he entered the University of Toronto in 1919 and graduated with a B.A.Sc. degree in engineering in 1923.

Immediately after graduation he became associated with the Township of Scarboro as an assistant engineer. Six years later he was appointed township engineer and continued in that position until 1953 when he was named commissioner of works.

Mr. Baird was a member of the Association of Professional Engineers of Ontario.

He joined the Engineering Institute of Canada as a Junior in 1925 and transferred to Member in 1948.

**Walter Bernard Maxwell,** JR.E.I.C., petroleum engineer of Imperial Oil Limited in Chatham, Ontario, died of poliomyelitis on September 23, 1953.

Mr. Maxwell was born at Anyox, British Columbia on August 4, 1928. He attended Upper Canada College in Toronto for five years before entering the University of Toronto where he obtained his B.A.Sc. degree in chemical engineering in 1950.

After graduation from the University of Toronto, he joined the staff of the Engineering and Development Division of Imperial Oil Limited in Sarnia, Ontario, as a process design engineer. He was transferred to Toronto in 1952, and a year later, to Chatham, Ontario, where he served as a petroleum engineer until the time of his death.

Mr. Maxwell joined the Engineering Institute of Canada as a Student in 1951, transferring to Junior Member in 1952.

# Employment Service

**THIS SERVICE is operated for the benefit of members of The Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.**

**NOTICES appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.**

**REPLIES to advertisements should be addressed to File No. 000, Employment Service. The Engineering Institute of Canada, 2050 Mansfield Street.**

**INTERVIEWS with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged by appointment.**

## Situations Vacant

### CHEMICAL

CHEMICAL ENGINEER with rubber experience to sell rubber chemicals and compounds for Canadian manufacturer in Eastern Ontario and Quebec. Salary and profit sharing. Opportunity for an aggressive sales minded man. File No. 4764-V.

### CIVIL

UTILITIES ENGINEER required salary $6,120 to $6,840 plus Fort Churchill allowance by Department of National Defence, Fort Churchill, Manitoba. Details and application forms at nearest Civil Service Commission office and National Employment Office. Quote No. 53-1205. File No. 4753-V.

CIVIL ENGINEER, graduate of a Canadian University and registered professional engineer with at least 10 years practical experience in a supervisory capacity specializing in design of structural steel and reinforced concrete building to supervise group of engineers and draughtsmen in consulting engineers office in Windsor, Ontario. Salary range $7,500 to $9,000 depending on qualifications. Please write giving full details including experience, age, references, etc. File No. 4769-V.

CIVIL ENGINEER wanted by private consultant located in Ontario. Requirements are at least 5 years experience in Canada or U.S.A. in the design and construction of storm and sanitary sewers, water mains and general municipal services. Preference will be given to applicant having commission as land surveyor. Salary $5,000. Please state age, education and experience to the fullest extent, and availability. File No. 4770-V.

### ELECTRICAL

FIELD ENGINEERS preferably with electrical background by oil well service company operating in Western Canada. Five months training period. Comprehensive employee benefits. Work is substantially in the field for initial years with irregular hours. Age limit of 28 preferred. Engineers will be based in active oil exploration area of Western Canada. Well established company active throughout world. Inquiries welcomed. File No. 4754-V.

ELECTRICAL ENGINEER required to fill position as Senior product engineer with long established and expanding company manufacturing rectifiers and distribution equipment for public utilities. Must have proven technical and administrative ability to assume responsibility for all design, development and product engineering and supervision of engineers, technicians and draughting staff. File No. 4756-V.

ASSISTANT PROFESSOR required in the department of electrical engineering of University located in Maritime Provinces. Preferably Canadian, under 35, and with at least two years experience. The course involves D.C. machinery A.C. circuits and introductory electronics. File No. 4760-V.

### MECHANICAL

PROCESS OR PRODUCTION ENGINEER required by locomotive firm. Excellent opportunity for progressive engineer who can initiate and follow through on cost reduction, machine and process improvement, and scrap reduction programs. Should have three or more years experience in modern machine shop and steel fabrication practice. This job offers splendid opportunity for advancement. Salary commensurate with ability and experience. File No. 4761-V.

INDUSTRIAL ENGINEER required by large organization. Applicants should be preferably graduate engineers in mechanical. The age range could be from 25 to 40 and the duties involved will be engineering studies of manufacturing operations for the purpose of improving operating methods, equipment material, handling, etc. Experience in time study for the establishment of production standards for large incentives, would be a decided advantage. Due to rapid expansion opportunities for advancement are excellent. Starting salaries range from $4,000 to $6,500 depending on qualifications and experience. File No. 4762-V.

MECHANICAL ENGINEER required by air conditioning and ventilating contractor in Montreal. Duties to include field supervision and estimating. Man must be familiar with sheet metal work and installation of air-conditioning equipment. Must be bilingual. File No. 4767-V.

MECHANICAL ENGINEER, graduate of a Canadian College and registered professional engineer with 15 years experience in design of pressure vessels, pressure piping, for work in Windsor, Ontario. Salary ranges between $8,000 and $10,000 depending on qualifications. Please write giving full details including experience, age, references, etc. An interview will be arranged. File No. 4769-V.

GRADUATE MECHANICAL ENGINEER, 23 to 28, interested in sales, to work as assistant in general engineering and sales department of growing engineering company. Company specializes in aircraft parts and industrial work. Location Montreal. Please write giving full details. File No. 4772-V.

### MISCELLANEOUS

SALES ENGINEER required in the Industrial division of large manufacturer of metal products for steel mills power plants and other industrial operations. Applicant should also be able to evaluate possible new business in the light of expanding manufacturing facilities, therefore a manufacturing background is essential. Good deal of travel is involved. Age range 35 years. Located in Montreal. Company has been serving Canada's railroads and industry for more than 50 years. File No. 4757-V.

GEOLOGISTS OR GEOLOGICAL engineers with a minimum of 5 years experience in geological exploration in Western Canada and/or Northwestern U.S. required by consulting firm. Must be qualified to assume complete responsibility of large exploration projects involving photogeological techniques. Occasional field work only. Top salary to qualified applicants. File No. 4758-V.

NATIONAL ORGANIZATION requires a sales engineer for the Province of Quebec. Applicants must be fluently bilingual. Engineering graduates. Those having a thorough knowledge through experience of road building and materials will receive preference. Age 30 or over. This is a well salaried position deserving consideration by qualified persons. Apply in writing. File No. 4759-V.

UNIVERSITY GRADUATE in electronics or applied physics required to act as assistant (technical) to the sales manager of a medium sized company engaged in the development and manufacture of advanced defence apparatus and systems. To draft specifications, prepare technical requests, edit instruction manuals, catalogues, price lists, etc. Work is concentrated in Montreal however, there is a possibility of frequent travel mainly in Quebec and Ontario. File No. 4763-V.

GRADUATE ENGINEER required immediately by the Department of Engineering at Carleton College, Ottawa. He will be required to teach in and direct the work of the present two-year engineering course and in addition to explore the possibilities of developing this into a degree course in general engineering. Qualifications a degree in engineering or its equivalent, together with some practice experience and proven ability to impart knowledge. Salary in accordance with the responsibilities of the position. File No. 4765-V.

YOUNG CIVIL OR mechanical engineer required by a pulp and paper company in Quebec. Applicant should have a minimum of three years experience in engineering and maintenance preferably in the pulp and paper industry. Applicant should be fluent in either French or English and should be able to get along in both. Replies should outline qualifications, experience, age and salary expected. File No. 4768-V.

SALES ENGINEER required by firm located in Montreal. Applicant should be acquainted with combustion lines, have sales experience, entries to architects, consulting engineers. This position could be either full or part time on a commission or drawing account basis or other arrangements could be made after discussion. File No. 4771-V.

*The following advertisements are reprinted from last month's Journal, not having yet been filled.*

### CHEMICAL

KEY POSITIONS in a new expanding, research lab. are open to competent scientists. Must have sound theoretical background, and at least five years practical experience in (a) natural and synthetic fibers—paper (b) high polymers—adhesives. Applicant should have M.Sc. or PhD. degree in chemical engineering or physical chemistry. Must be qualified to organize, plan and supervise the work of a group of men. In reply please submit personal resume education and experience which will be held confidential. Remuneration to be negotiated. File No. 4725-V.

CHEMIST OR CHEMICAL engineer with experience in the pulp and paper industry, to supervise control work in a section of the technical department. Applications will be held confidential. File No. 4729-V.

### CIVIL

CIVIL ENGINEER, age 35 to 40, for a position in the Steel work section of the Engineering Structural Division. Applicants should be either registered professional engineers in the Province of Ontario or capable of being so registered. They should have a wide experience in the design and fabrication of structural steel preferably for power developments and experience in tower design would be an additional qualification. They should be capable of writing reports and handling correspondence, and also capable of handling personnel. The salary will be dependent upon qualifications. Location Ontario. File No. 4715-V.

CIVIL GRADUATES, 1954, required by paving company in Province of Quebec. Applicants should be preferably bilingual. File No. 4726-V.

FULLY EXPERIENCED structural steel checker required in middle west organization. Applicant should have about fifteen years or more experience in structural steel and have previous checking experience. File No. 4727-V.

YOUNG GRADUATE ENGINEER PREFERABLY CIVIL or mining, required by manufacturer of drainage and all kinds of metal products. Applicant should not have more than two years experience and have a definite interest in sales work. Location Ontario. File No. 4733-V.

APPLICATIONS ARE INVITED and will be received by the undersigned for the position of a planning engineer. Applicants should have university graduation in civil engineering or architecture or related field preferably including or supplemented by courses in municipal planning. Considerable professional experience in municipal planning desirable, including some supervisory responsibility or an equivalent combination of training and experience. Applicants to state age, marital status, education qualifications and experience history. File No. 4736-V.

ASSISTANT TOWN ENGINEER required in Ontario. Graduate with 2 to 4 years experience and with some construction experience. Municipal experience is preferred but not essential. Work involved is supervision of surveys and the inspection and control of various municipal engineering projects. Salary open. File No. 4742-V.

CIVIL ENGINEER with good experience in field layout and draughting required by pulp and paper company in the Maritimes. File No. 4743-V.

RESIDENT ENGINEER, for the construction of a 10 million plant, near Quebec city, a professional engineer is wanted for one year and a half, from early part of 1954 or later. Minimum age 35 years. 5 years practice as independent resident engineer on large job absolutely necessary. Bilingual. Attractive salary. File No. 4746-V.

CIVIL ENGINEER University graduate and registered Professional Engineer required for sales promotion work by large company with Canada-wide interests. Applicants should have at least 5 years' experience in reinforced concrete structural design, should be in the twenty-five to thirty-five age group and should be prepared to do considerable travelling. Please apply giving full details of academic training and professional experience, references and salary required. File No. 4749-V.

APPLICATIONS WILL BE received for the position of Township Engineer and road superintendent for the Township of Sandwich West, population now 13,000. Applicants must be qualified civil engineers and should be prepared to handle all problems in connection with roads, water works, etc., in a growing municipality. We employ a work supervisor. Applicants should state age, qualifications, past experience, references and salary expected. File No. 4751-V.

### ELECTRICAL

RECENT ELECTRICAL ENGINEERING graduate required by large Canadian electrical manufacturer for sales and engineering work in Western Canada. Applicant should provide information in respect of educational qualifications and background in sales work, past experience, etc. File No. 4697-V.

ELECTRICAL ENGINEER required by large public utility in Brazil. Recent graduates having test course experience with large electrical manufacturer. Applicants must be single. Excellent pension plan. Apply in writing with complete details of past experience. File No. 4698-V.

ELECTRONIC ENGINEER required to take complete responsibility for the supervision of maintenance of extensive radar and communications installation. To provide technical liaison and able to work under adverse conditions. Must have Canadian or United States citizenship or a British subject. Salary commensurate with experience. Living expenses paid. Graduate electrical engineer or equivalent with minimum of 3 years experience. File No. 4704-V.

SALES ENGINEER required by the Canadian organization of a very prominent United States manufacturer of electric controls for heating, refrigeration, and air conditioning. Some experience with electric controls preferred. Would be located in Toronto area. Good opportunity to grow with a new Canadian company. Salary commensurate with ability. Not absolutely necessary that the applicant be a graduate engineer. File No. 4708-V.

ELECTRICAL ENGINEER required in junior capacity in utility located in Prairie City. Experience not necessarily required but desire to learn all aspects of civic electrical utility will be decided asset. State salary required and full details of qualifications and experience. File No. 4710-V.

ELECTRICAL ENGINEER registered professional engineer with five years experience in industrial design in Canada or U.S.A. Must be familiar with industrial power distribution, automatic controls, switch gear (high and low voltage), lighting. Must be able to make detailed designs and undertake supervision of draughtsmen. Required by firm of consulting engineers located in West Ontario. File No. 4718-V.

APPLICATIONS ARE INVITED for the position of assistant professor dept. of electrical engineering University of British Columbia, Vancouver, Canada. Candidates should have post-graduate training preferably at the Doctor's level in electronics and servo-mechanisms. Duties include teaching undergraduate courses in electrical engineering, post graduate studies in some phase of servo-mechanisms or electronics. Starting salary $4,500 to $5,000 per year. Date of appointment July 1, 1954. Further information may be obtained by writing to the head of the department. File No. 4720-V.

GRADUATE ENGINEER preferably electrical with one to four years experience and a desire for sales engineering is required by small nationally recognized electrical manufacturer. Six months to one year orientation at Toronto factory then sales engineering work in Montreal office on salary plus commission basis. File No. 4721-V.

ELECTRICAL ENGINEER for system planning division. Should have at least ten years' experience in the designing and operation of hydro and/or thermal generating plants and transmission systems, with particular qualifications as follows: Application of the method of symmetrical component to the solution of unbalanced conditions on A.C. systems, experience in the use of the A.C. net work analyser on load flow studies, relay problems and stability studies, both transient and steady state. Familiarity with problems associated with the operation of a power system, such as fluctuating loads, and methods used to mitigate the effect of some; also some knowledge of the operation problems associated with the inter-connection of two or more systems. Experience also desirable in A.C. system operation with particular regard to the maintenance of voltage levels, reactive and real power flow and speed covering problems. Address all applications giving full details of qualifiactions and experience and salary required. File No. 4723-V.

REPRESENTATIVE REQUIRED for Quebec and Ontario areas by electrical manufacturer to contact architects, consulting engineers and electrical contractors covering lighting equipment and wiring devices. Reply in handwriting stating qualifications and experience. File No. 472?-V.

ELECTRICAL ENGINEER required to design and develop rectifiers and communication equipment. Applicant should have better than two years experience in this field. Starting salary depends on qualifications. File No. 4728-V.

WANTED JUNIOR ENGINEER as estimator with large electrical manufacturing company. State full details technical and practical training and experience. Location Montreal. File No. 4730-V.

THREE GRADUATE ELECTRICAL engineers interested in design development, technical control or application engineering. The duties include: learning and preparing specifications for internal use of electrical conductors, the study of insulants and dielectric behaviour, the preparation of calculations and line design, assessment of the quality of raw materials, designing cables developing new products, and writing technical brochures and catalogue sections. Location Ontario. File No. 4738-V

YOUNG GRADUATE ELECTRICAL engineer bilingual required by manufacturer of vacuum tubes and fluorescent and incandescent lamps. The plant of this company is located at 60 miles from Montreal. The position offered would involve work in production engineering quality control, testing. Please state salary expected and full details of qualifications and experience. File No. 4740-V.

### MECHANICAL

JUNIOR MECHANICAL ENGINEER to work under the direction of a senior engineer in a research branch to develop test and modify remote control equipment, instruments and techniques. Recent graduate in mechanical engineering with some training in shop or instrument work. Should be fond of gadgeteering. Salary according to qualifications. State particulars including age, marital status, education and experience in 1st letter. File No. 4693-V.

GRADUATE MECHANICAL engineer preferably with sales experience to handle complete line of mechanical power transmission and materials handling equipment. Location Montreal. Age 35 to 45. Substantial income possible for qualified person. File No. 4699-V.

SALES ENGINEER, graduate mechanical, required by steel fabricating shop located in Montreal. Applicant should have 4 or 5 years shop experience. Salary open. File No. 4702-V.

MECHANICAL ENGINEER REQUIRED as assistant in the materials handling department of leading paper manufacturer in Eastern Canada. Applicant should have experience and the ability to take over the responsibility of entire department. Good salary to successful applicant. File No. 4712-V.

THREE GRADUATE MECHANICAL ENGINEERS TO ACT as sales engineers for large coal mining company with offices in Montreal and the Maritimes. One should be bilingual to cover Montreal and surrounding area, other to locate in Maritime office. File No. 4713-V.

LONG ESTABLISHED company located in Toronto area has interesting vacancies for sales engineers preferably experienced on pumps and compressors or would consider men with a good knowledge of heavy machinery or power plant equipment. All replies in strictest confidence. File No. 4714-V.

GRADUATE MECHANICAL ENGINEER wanted, experience in heater coil manufacture or design required. To assist also in technical sales. Salary commensurate with qualifications and experience. Location Montreal. File No. 4732-V.

SALES ENGINEER REQUIRED by large manufacturer of industrial equipment for sales and service of pulp and paper mills on west coast. Previous mill experience desirable. Excellent opportunity. File No. 4735-V.

GRADUATE MECHANICAL ENGINEER required to take over the preventative maintenance program of a fleet of transport vehicles operating interprovincially in Western Canada. Applicant should be prepared to spend some two to three months in the U.S.A. then put into operation a preventative maintenance program for this organization. File No. 4739-V.

APPLICATIONS ARE INVITED for the position of assistant professor, Department of Civil Engineering, University of British Columbia, Vancouver, Canada. Candidates should have had postgraduate training preferably at the Ph.D. level in fluid mechanics. Duties include teaching fluid mechanics and other courses in the under-graduate school and teaching one post-graduate course in some phase of fluid mechanics. Starting salary from $4,500 to $5,000 depending on experience, with the possibility of augmenting income with summer work on hydraulic models or other hydraulic projects. Date of appointment is July 1, 1954. File No. 4744-V.

POWER PLANT ENGINEER for large industrial concern near Montreal to take charge of high pressure steam plant turbo-generators and refrigeration. Only those having both practical experience and technical knowledge need apply. Young graduate engineer preferred. State age, experience and salary expected. File No. 4745-V.

PLANT LAYOUT AND material handling engineer required by automotive industry in Ontario. Applicants should have either specific experience in these particular fields or with plant or maintenance engineering experience, such as construction, piping, conveyors, etc. File No. 4747-V.

MECHANICAL ENGINEER with at least five years experience for expanding Canadian organization to supervise the design and marketing of a specialized line of construction equipment. This opening will interest you if you have a flair for design and business administration. Salary open. File No. 4750-V.

MOTOR DESIGN ENGINEER—Large U.S. manufacturer with factory in South America needs experienced induction motor design engineer with sound knowledge of manufacturing methods. Motor sizes to range from small fractional horsepower through 50 H.P. Please send complete resume covering education, experience and family, including recent photograph. File No. 4752-V.

### MISCELLANEOUS

ENGINEERING CO/ORDINATOR to supervise sales for organization in Montreal, representing leading American manufacturers in power plant process and industrial equipment field. File No. 4701-V.

EXPERIENCED CONTRACTING engineer to organize contracting department for old established firm specializing in brick floors, tank linings and tile setting. Headquarters in Montreal. Jobs throughout Eastern Canada. File No. 4703-V.

ELECTRICAL OR MECHANICAL project engineer required by electrical manufacturer in Ontario, a young graduate engineer to supervise the development of special prototypes through laboratory to production stage. This is a rapidly growing company and men with initiative should progress favourably. File No. 4709-V.

AN ASSISTANT CHIEF water resources division, at Ottawa. Salary $7,500 to $8,100. Details and application forms at your nearest Civil Service Commission Office, National Employment Office and Post Office. File No. 4716-V.

YOUNG MECHANICAL (or civil engineer), bilingual, with sales experience in-or good knowledge of diesel engines, road-building and municipal equipment required by important company for its Montreal sales staff. This position provides an ideal opportunity for an engineer seeking a future in the heavy equipment sales field. File No. 4717-V.

APPLICATIONS ARE INVITED for the following positions: 1. Research officer, to engage in theoretical and experimental studies relating to building acoustics. Duties may include supervision of standard acoustical testing, field measurements and laboratory research in acoustics. 2. Research officer, to engage in studies of soil vibrations and their effect on buildings. Duties may include theoretical and experimental studies of wave propagation in soils and design of suitable apparatus for vibration studies in both field and laboratory. General qualifications: University degree in physics or engineering and at least two years of post graduate training or pertinent industrial experience. File No. 4719-V.

STREET LIGHTING sales engineer required by a long established manufacturing company in the field of scientific illumination. Duties after a specific training program will involve the sale of light directors to municipalities and public utilities chiefly. Diligence, dependability, an agreeable personality, and determination to make a career in this field are of highest importance. File No. 4731-V.

AUTOMOTIVE INDUSTRY IN ONTARIO requires work standards men to be employed on time study and methods work. File No. 4734-V.

LAND SURVEYORS, salary $4,680 to $5,400 required by the Department of mines and technical surveys, Ottawa. Details and application forms at nearest civil service commission, and national employment office. Apply before February 26, 1954. File No. 4737-V.

POSITIONS BECOMING available at Winnipeg in air line for graduate engineers having comprehensive experience in aircraft structures, mechanical, electrical and radio systems. Also senior draughtsmen with experience in aircraft structural or mechanical engineering. File No. 4741-V.

TWO GRADUATE ENGINEERS required for large plant manufacturing various types of explosives, situated in P.Q. Duties required would be in maintenance department as project engineers and some design and alteration projects. Mechanical engineer required with from five to seven years experience. Other position requires chemical and mechanical engineer with two or three years experience. File No. 4748-V.

PLANT LAYOUT ENGINEER—Large U.S. manufacturer with plants located in Latin America requires capable Plant Layout Engineer for work in consulting office located in New York State. Must have experience in metal working industry in plant layout work with sound knowledge of building design and manufacturing methods. Please send complete resume covering education, experience and family, including recent photograph. File No. 4752-V.

## Situations Wanted

SANITARY ENGINEER, Civil engineer, B.Sc., Queen's 1948, M.A.Sc., U. of Toronto 1949, P.Eng., Jr.E.I.C., age 29, single. Four and a half years practical experience in municipal and sanitary engineering. Was chief municipal engineer for one and a half years responsible for design and development of waterworks and sewage projects. Also experienced in supervision of construction of various municipal projects, as well as in administration of a municipal engineering department. Recently employed as design engineer dealing with sewage treatment plants, water works projects, sewer designs, roads and pavements. Am seeking a responsible position, preferably with a firm of consulting engineers where individual initiative, hard work and proven ability will be recognized. Am a member of the Canadian Institute on Sewage and sanitation and the American Waterworks Association. File No. 250-W.

PIPING ENGINEER: nine years piping experience including gas and water. Presently completing $1½ million piping project including supervision of design, purchasing, construction. Canadian, aged 40, married. B.A.Sc., C.E., M.E.I.C., P.Eng. Present contract expires early 1954. Desires position as gas project engineer or superintendent anywhere in Canada. File No. 2466-W.

MECHANICAL ENGINEER, McGill 1944, single, age 34, with industrial eng. background. Wide experience in administration and supervision, production control, maintenance, plant eng., personnel work, wage incentives, time study, cost study, welding, fabrication. In welding industry, heavy equipment, production, printing, seeks opportunity to join progressive firm in engineering, production, or sales. Will relocate or travel. File No. 2920-W.

MECHANICAL ENGINEER, age 30, graduate. Experience in design and development, machinery, heat transfer, heating and ventilating, aircraft. Location immaterial. Available immediately. File No. 3012-W.

PHYSICO METALLURGIST, M.E.I.C., P.Eng., specialized in statistical elucidation of production data toward solution of workshop problems in metallurgy, specially in quality and process control in steel making-shaping-heat treating. As a statistical analyst experience second to none in sinchronisation of production factors so that optimum conditions for the lowest occurrence of pipe in steel ingot, of segregation in steel can be attained, and maintained for a predictable length of time. Also in sinchronisation of factors toward highest capacity of Bl.Fce. at lowest coke rate. File No. 3521-W.

GRADUATE ENGINEER, B.Sc., St. Francis Xavier University 1947, B.E. in Mechanical Engineering N.S.T.C., 1949, Jr.E.I.C. Age 29, married, one child. Two years as engineer in charge of machine and maintenance workshops for a research establishment. Two years as tool engineer and technical assistant to superintendent of a manufacturing division of a machinery manufacturing plant. Desires position with opportunities for advancement, where experience would be valuable. File No. 3547-W.

ADMINISTRATIVE EXECUTIVE post desired by civil engineer, B.Sc., M.E.I.C., with ten years of various consulting and construction experience. Experienced in design of steel, reinforced concrete, earthworks, the preparation of contract documents, specifications, and estimates; also in the site supervision of construction of an industrial plant, hydro-electric installations, bridges, roads and railways. File No. 3796-W.

MECHANICAL ENGINEER, Queen's 1944, M.E.I.C., P.Eng., married, age 34, eight years' experience as plant engineer, including planning, design, erection and maintenance on process steam, refrigeration, air conditioning systems, seeks employment in plant engineering, preferably, but not necessarily, in smaller city or town in Ontario or Western Canada, with growing company. Available on three months' notice. References include present employer. File No. 3935-W.

CIVIL ENGINEER (European) graduate from McGill and Master's degree from Toronto (52) wishes to work on design and construction of buildings. Possessor of professional engineer's certificate and experience on highway construction, surveys, soil borings and soil testing. Age 26, single, available in two weeks' notice. File No. 3988-W.

CIVIL ENGINEER N.S.T.C. 1952, age 28, married. Have had some highway construction experience. Presently employed in job requiring very little engineering training. Would like to obtain experience along any line of engineering. Present location Nova Scotia. File No. 4070-W.

SENIOR MECHANICAL ENGINEER (34) M.E.I.C., A.M.I., Mech.E. seeks responsible post in Vancouver or district. 10 years' experience in design and construction of medium and heavy machinery, rolling mills, chemical plant, hydraulic equipment. 3 years' experience research and development in noise and vibration science. Also administrative experience, personnel and purchasing. Good knowledge French and Italian. File No. 4091-W.

GRADUATE ENGINEER, B.Sc. Mining Engineer, University of Leeds, England 1951, Jr. E.I.C. Age 25, married, one child. 18 months' experience in municipal and general civil engineering, 8 months mechanical drafting. Desires change to position with a future. File No. 4207-W.

CIVIL ENGINEER, Jr. E.I.C., P. Eng., B.Sc. (Queen's 1948), veteran, age 32, married, one child, over five years' experience on layouts, steel and concrete design in a chemical plant. Ability to supervise projects and some knowledge of estimating and costs. Desires a responsible position where above experience would be an asset. Available on one month's notice. Preferable location southern Ontario. File No. 4238-W.

GRADUATE MECHANICAL ENGINEER, married, with family, requires employment. Diversified industrial experience. Purchasing, maintenance and machinery shop practice. Sound business training. Experience includes heating, sheet metal industries and general machinery equipment. Bilingual. Has good personality, enthusiastic, keen business acumen. Desires employment on production, sales or engineering administration. Location Montreal area. Available immediately. File No 4300-W.

MECHANICAL ENGINEER, Jr. E.I.C., B.Eng., McGill 1950, age 29, married. Completed Canadian General Electric test course after graduation and am presently employed as mill superintendent of a small textile mill. Would consider a position with a textile company. Would also consider production or service engineering in other fields. File No. 4309-V.

CIVIL ENGINEER, graduate 1950, Jr. E.I.C., married with one child, age 29 3½ years of experience with a structural steel fabricating firm estimating material and labor for structural steel and miscellaneous iron for buildings and also platework. Desires work with a firm with a future and opportunity for advancement. Available on one month's notice to present employer. File No. 4361-W.

MECHANICAL ENGINEER, Jr. E.I.C., P.Eng. (Ont.), B.Sc. (Eng.) Man. 1949, age 25, single. Experience in steel fabricating design, welding and estimating. Complete familiarity with ASME and APJ codes. Desires responsible position preferably with petroleum industry in Winnipeg or immediate vicinity. Presently employed in Ontario. File No. 4362-W.

ENGINEER DESIRES design, development, or research work requiring limited travel. Experience with Dominion Government, 4½ years on flood control, drainage, report writing; plus field experience, design and construction of small dams and sprinkler irrigation systems. B.S. degree in Agricultural engineering, 1949, University of Saskatchewan. Age 25. Married. File No. 4363-W.

CIVIL ENGINEER, S.E.I.C., P.Eng., Que., B.A.Sc., Toronto, age 28, married, presently employed. Seeks advancement, preferably in Southern Ontario. Have had limited experience in municipal surveys and planning, sewer design, construction and production. Also experienced in general plant engineering, structural steel and reinforced concrete design. Available on 30 days' notice. File No. 4364-W

CHEMICAL ENGINEER, M.E.I.C., M. of Sc. 1946 Denmark. Age 30. Canadian wife. Have worked in Canada since January 1952, presently employed. Experience in petroleum products, and in vegetable oils for paint and varnish. Desires position with opportunities in product development or research. File No. 4335-W.

PRODUCTION ENGINEER, M.E.I.C., age 35, 1938 graduate, with successful record in plant management field. Extensive experience at responsible level in labour negotiations and all details connected with the operation of an independent production unit employing over 350 men, with special emphasis on the development of new production methods and machines to maintain maximum plant effort. Interested in position where creative ability and imagination coupled with a sound engineering background are required. File No. 4366W.

ELECTRICAL ENGINEER, B.Sc. (Hons). 1941, St. Andrews University, Scotland, A.M.I.E.E., P.Eng., married. R.N. veteran. 3 years major oil company supervision maintenance and installation, 1½ years Canadian municipal utility in charge all electrical aspects. 2 years major electrical manufacturer in Ontario as applications engineer. Linguist, versatile, teaching experience, sound background electronics and instrumentation, experienced in all aspects distribution, system studies, etc. Seeks job with greater responsibility, location secondary, available reasonable notice. File No. 4371-W.

MECHANICAL ENGINEER, 1950 graduate Polish University College, London, age 31, married, two years experience in diesel engine design and development, one year in water-tube boilers, and one year in industrial furnaces design. Also two years general machine shop experience prior to university studies. Seeks employment in Toronto in any engineering field, which offers a good opportunity for advancement. File No. 4372-W.

CIVIL ENGINEER, Man. 1948, Jr.E.I.C., age 29, married, 2 children, veteran. One year surveying. For past 5½ years worked on large diversification of milling and refining equipment and building for mining and smelting company whose plant has undergone expansion. Experience in layout, design and detail of refining plants, small mines, shops, warehouses, townsite and other works required for isolated location; estimating and preparing specifications. Could supervise drafting office but would prefer position offering responsibility and advancement to intelligent and personable engineer. Will accept position anywhere in Canada. File No. 4373-W.

YOUNG ENGINEERING EXECUTIVE, mechanical engineering graduate, M.E. I.C., P.E. of Alberta, age 33. Engineering experience, tool designing, design of pressure vessels, plate weldments, processing vessels and equipment. General experience, shop and field inspection, purchasing and sales. Executive experience, director and general manager of small steel fabrication plant (70 employees) located in Western Canada. Desires position requiring initiative, organizing, and supervisory ability. Anything offering future advancement in responsible position. File No. 4374-W.

ELECTRICAL ENGINEER, Jr.E.I.C., 28 years old, married, B.A.Sc. (E.E.) 1951-U.B.C., 2½ years practical machine shop experience, 2 years radio and radar RCNVR, 8 months preparing specifications for telephone power equipment, 2 years steel mill experience—design and layout of conduit and cable for strip mill equipment including the devising of electrical control and interlock circuits—design of power distribution system including main substation and low voltage distribution transformer vaults Complete resume on request. Location no object. File No. 4377-W.

CHEMICAL ENGINEER, Jr.E.I.C., war veteran, 34, married. Experience includes two years supervision in a large chemical plant in Quebec. Desires employment on production or sales. Location preferred Southern Ontario. File No. 4383-W.

CHEMICAL ENGINEER, B.A.Sc., P.Eng. Graduated in 1950 from University of Toronto. Age 25, married with one child. Have excellent experience in time and motion study, methods study, cost control, and all phases of production. Presently employed as assistant plant superintendent in a small manufacturing concern in Ontario. Desires permanent responsible position with good prospects for the future. Location anywhere in Canada. Available on reasonable notice to present employer File No. 4384-W.

CHEMICAL ENGINEER, Jr.E.I.C., B.A.Sc., 1952, war veteran, 31, single. Experience in production and instrumentation. Desires new position in engineering, development or instrumentation. Location: Ontario, Quebec. File No. 4385-W.

MECHANICAL ENGINEER, Jr.E.I.C., B.A.Sc. 1948. 6 years pulp and paper and heavy industrial equipment experience before graduation as project designer and 2 years after graduation. For several years engaged in the combustion engine field mainly diesel equipment. Desires position in either field with more responsibility. File No. 4386-W.

CIVIL ENGINEER, M.Sc., Technical University, Dansig 1935; D.Sc., Technical University, Munich 1947, M.E.I.C., age 40, bilingual. 17 years experience in Europe and Near East in architectural and structural design of residential, industrial, hospital buildings and in town-planning. One year Canadian experience in Toronto in residential, industrial, and theatre design. Seeks responsible position with firm of engineers or architects. File No. 4387-W.

MECHANICAL ENGINEER, D.I.C., G.I. M.E., 27, single, bilingual, three years experience in design office and manufacturing of fabricated steel and structural steel, 1½ years research experience, sound knowledge of shop procedure, electric and electronic bias, seeks permanent position in Montreal area but willing to travel. Presently employed below technical ability. Loyal, responsible and willing to start at junior level if opportunity for advancement is provided after ability has been shown. File No. 4388-W.

MECHANICAL ENGINEER and Chemist, B.A.Sc., 1952; B.Sc. (Chemistry and Physics), 1946; M.C.I.C., Junior A.S.M.E., age 28. Married, with two years experience in all phases of instrumentation in pulp and paper industry, also one and one half years work as junior chemist in the petroleum industry. Desires job with definite opportunity for advancement. Presently employed, but available on reasonable notice. File No. 4390-W.

CHEMICAL ENGINEER, P.Eng., B.A.Sc. (Toronto, '50), Jr.E.I.C., M.C.I.C., 32, married, one child, veteran 3½ years R.C.N., four years general office work, four years development control and supervisory experience in chemical process industry. Working knowledge of French, some German. Desire more responsible position in technical service, development or similar work, Canadian or foreign. All replies acknowledged. Resume on request. File No. 4391-W.

ELECTRICAL ENGINEER, Canadian, M.E I.C., B.Sc. (Alta., 1944), M.S. (Carnegie Institute of Technology, 1952), expecting Ph.D., Carnegie Tech. 1954. Married one child. 4½ years with large Canadian electrical manufacturer including test course and design experience; 3 years in electrical sales. Desirs teaching position in power field, or research and development in servomechanism and control field. Doctoral thesis being written on fundamental study of magnetic amplifiers. File No. 4392-W.

JR. E.I.C., graduate Polytechnique 1950, fully bilingual. Has been working for two years as estimator and construction engineer. Had one year experience in construction works in Europe. Position wanted in Montreal or surroundings, but would consider going anywhere in Canada. File No. 4398-W.

EXECUTIVE ENGINEER, M.E., M.E.I.C., P.Eng. (Ont.), twenty-three years varied design-manufacturing and management experience of which eleven years chief engineer with equipment manufacturing concern. Since 1946 practising privately and activities consisted mainly of larger engineering assignments including project development and execution, also extensive consulting with steel, pulp and paper industries as well as equipment manufacturers. Interested in an association with a really progressive organization offering appropriate opportunities preferably in connection with larger scale Canadian and/or foreign developments, or other responsible activities requiring engineering background, leadership qualities, a realistic approach to problem analysis, diplomacy, practical imagination and acknowledged design talent. Present income considerably above average but would consider reasonable compromise if proposition otherwise attractive. File No. 4399-W.

ELECTRICAL ENGINEER, B.E. (University College, Dublin), Associate Member, Institute of Civil Engineers of Ireland. Age 34, married, with children. Nine years experience with electricity supply organization. Experience mainly in electrical distribution design and construction overhead and underground networks. Arriving Canada, March or April. Seeking interviews for position as distribution engineer. Location unimportant. File No. 4400-W.

ELECTRICAL ENGINEER, B.Eng. (Hons.), M.A.Sc., M.E.I.C., P.Eng., age 35, married, and presently completing eighth year as Professor of Electrical Engineering. Has taught many different courses on senior and graduate level with emphasis in power. Broad general experience in construction, public utility work and as a naval officer. Has done considerable consulting work of general nature. Seeks appointment which should offer a broad challenge in keeping with background proffered. File No. 4402-W.

DIPLOMA ENGINEER, Mechanical, P. Eng., M.E.I.C., with comprehensive technical knowledge, creative ability and 18 years experience in design and manufacture of diversified machinery and devices such as power shovels, hydraulic presses, aircraft engines, pumps, machine tools, electric automatic controls, welded products, as well as experience in organizing and managing plants with up to 5,000 workers, economical minded with mature judgment, at present engaged in machine tool development, seeks a position with a progressive company where his past experience could be utilized best. File No. 4403-W.

PROFESSIONAL ENGINEER (Ont.), B.Sc. (E.E.) U. of Manitoba, veteran, age 28, married, two children, Canadian Westinghouse Training course. Nearing completion of Post-graduate work in Business Administration, consisting of evening classes leading to M.Com. Presently employed as project engineer responsible for co-ordination of all phases of manufacture of projects. Desires responsible position in administration or production. File No. 4404-W.

CIVIL ENGINEER, B.Sc., Jr.E.I.C., now employed with 3 years' foreign experience, construction and structural design (reinforced concrete) and one year Canadian experience in building construction and draughting (not in structural design) is seeking a junior position with prospects in structural design, preferably in Toronto. File No. 4407-W.

ELECTRICAL ENGINEER, Jr. E.I.C., U. of Alberta, 1949, veteran, age 33, married. 1½ years in industrial and commercial construction, 3 years design and development of power plants for large communication company. Experienced in electrical controls. Prefer Alberta or B.C., but willing to locate anywhere if work is interesting and has advancement possibilities. File No. 4411-W.

CHEMICAL ENGINEER, S.E.I.C., Jr. C.I.C., B.Sc. (Queen's 1952), single, age 22, desires position with responsibility in industry or technical sales. Three years summer employment in the paper industry. Have two years municipal engineering administrative experience working with senior executives and meeting the public. Location headquarters preferred in E. Ontario. File No. 4414-W.

SANITARY ENGINEER, M.A.Sc. University of Toronto as of April 1954. S.E.I.C., B.Sc. (C.E.) University of Manitoba 1952. One year's experience in building construction. Desires position offering experience in sanitary or Public Health Engineering. Location immaterial. Available beginning of May. File No. 4415-W.

OVERSEAS POSITION preferred by graduate chemical engineer, Jr.E.I.C., McGill 1949, war veteran. Considerable experience in mechanical work such as all phases of design fabrication and erection of heavy structural, plate and mechanical products. Also process plant experience and considerable customer contact experience. Presently employed in a supervisory capacity. File No. 4416-W.

MECHANICAL ENGINEER, Jr.E.I.C., 1950 graduate, Toronto, Veteran, 32, single, some research experience, over three years in chemical industry on project and design work, involving process and services equipment and piping, instrumentation and building construction, including some estimating, purchasing, expediting and inspection. Desires position of greater responsibility in similar work or in maintenance work of a general nature. File No. 4418-W.

CIVIL ENGINEER, B.Sc., C.E., U.N.B. 1950, Jr.E.I.C., age 30, married. 4 years experience as construction engineer on highways, including reinforced concrete bridges. 2 years in charge of building construction, including sewage disposal systems, water supply etc. One year as design engineer of municipal street layout, landscaping etc. Available on short notice anywhere in Canada. File No. 4419-W.

CIVIL ENGINEER, D.L.C. Hons. (civil engineering), M.E.I.C., grad. Inst. Struct. Eng. awaiting election to A.M.I.C.E. and P.Eng., Ont.), age 28, single, 6 years experience on construction of dry dock and deep-water quay, power station, airfields, bridges, roads and railways, survey, design of steel-piled cofferdams, track layout and construction schemes. Responsible for supervision of layout, construction, concrete inspection, pile-driving, underwater drilling, pressure grouting, test bore-holes, diving operations, measurement of quantities and cost reports. Presently employed as area engineer on construction of chemical plant. Desires position of responsibility suitable to past experience. Location—anywhere in Canada. File No. 4420-W.

---

# SITUATION VACANT

**Chemical or mechanical engineer required for coal preparation research. Experience in coal cleaning, especially with Driessan cyclones and dense media, desirable but not essential. Starting salary will depend on training and experience and will be in a bracket of $4,000 - $5,000 per annum, plus cost of living bonus based on the consumer's index. The present bonus approximates $300 annually.**

**Apply with all particulars, recent photo and addresses for reference to Secretary, Research Council of Alberta, University of Alberta.**

Activities of the Forty-seven Branches of the Institute
and
abstracts of papers presented at their meetings

## Belleville

C. H. Lusk, Jr.E.I.C.,
*Secretary-Treasurer*

**General Meeting**

The Belleville Branch of the Engineering Institute of Canada held its regular meeting at the Masonic Temple on December 14 with 24 members present.

A. O. Drysdale acted as chairman, in the absence of C. R. Whittemore. Mr. Drysdale advised that the next meeting of the Branch would be held on January 11. He also noted that Jack Both, mayor-elect of Belleville, is an affiliate of the Engineering Institute.

D. Pullan introduced the speaker for the evening, R. Worrall, of the British-American Oil Company Ltd. Mr. Worrall showed a film entitled "Via Pipe Line", which illustrated the construction of the pipe line from Montreal to Burlington by the Trans-Northern Pipe Line Company Ltd. Mr. Worrall also noted that this pipe line was constructed at a total cost of $42,000,000.00. One hundred and twenty-two million barrels of petroleum products are pumped through the line in one year. The normal rate of flow of the products is 4 m.p.h. which means that it would take approximately four days for the products to traverse the entire length of the line.

The appreciation of the Branch was extended by H. T. Floyd.

## Border Cities

R. J. Trinder, Jr.E.I.C.,
*Secretary-Treasurer*

H. C. Palmer, M.E.I.C.,
*Branch News Editor*

**October Meeting**

The first fall meeting of the E.I.C. was held at the Prince Edward Hotel in the latter part of October. An invitation was extended to the Association of Professional Engineers of Ontario and there was an excellent turnout to both the dinner and the meeting afterward. The guest speakers were, J. Herbert Smith and Col. Tom Medland. Mr. Smith, who is president of the A.P.E.O., gave an interesting talk covering the manner in which dues to the A.P.E.O. are spent and how efforts are made to obtain favorable legislation on behalf of the professional engineer.

**President's Visit**

The president visited the Branch on the 25th of November and the annual dinner and dance was held at the Beach Grove Golf Club. The president spoke on his trip to the Coronation for some minutes following the dinner gathering of engineers, their wives and girl friends.

**Annual Meeting**

The annual meeting of the Branch was held at the Prince Edward Hotel, December 16, 1953. A good attendance of the members was on hand for the dinner and following that there was a general meeting where officers of 1953's executive presented their annual reports. The officers for 1954 were elected by acclamation. The new executive is composed of: P. S. Dewar, chairman; W. G. Mitchell, vice chairman; J. C. Aitkens, past chairman; R. J. Trinder, secretary; J. G. Hoba, councillor; Morris Armstrong, papers committee; P. N. Brown, treasurer; D. Donnelly, branch news editor; E. Dykeman, membership committee.

Following the election of officers, a pin was presented to N. A. McDougall, a former member of the Border Cities Branch who has moved away and who had been a member of the executive for several years. After the business was cleared away two films were shown. The first one was on the Aluminum Company's Kemano Project in British Columbia, called "A Man With a Thousand Hands". It presented in technicolor one of the largest construction developments to be undertaken in Canada. At the completion of the picture a representative of the Aluminum Company of Canada answered a multitude of questions asked by the members. In the opinion of the writer this was one of the finest pictures of its kind he had seen and the other members were equally enthusiastic. The second film was on sports in the Rocky Mountains photographed by the C.N.R.

Following all this refreshments were served and everyone went home feeling that the last meeting of 1953 had been a very successful one.

## Central British Columbia

H. L. Topham, Jr.E.I.C.,
*Secretary-Treasurer*

**Annual Meeting**

The annual meeting was held at the Central Hotel in Kamloops on November 27, 1953. A total of 19 persons, including guests, was present.

Refreshments were made available from 6:30 to 7:00 p.m., at which time dinner was served. Following dinner the business of the meeting was introduced by the chairman, R. L. Bigg.

In his remarks to the meeting Mr Bigg expressed the hope that the whole of the membership would assist the incoming executive by attending the dinner meetings regularly and participating in student guidance work and other Branch activities. He expressed his sincere thanks for the assistance which he had received from the other members of the executive, and he wished the new chairman and executive every success in their endeavours.

The minutes of the previous meeting, held on September 18, 1953 were read and adopted. It was moved by Mr. Joplin and seconded by Mr. Hatfield that the increase in *Journal* dues of $2.00 per annum be added to the annual fees of our Branch Affiliates. This increase will raise their annual fees from $7.00 to $9.00.

Mimeographed copies of the Branch Annual Report were distributed by the secretary-treasurer to all Members and Juniors present at the meeting.

Following this, the Branch Councillor, M. L. Wade, suggested that our Branch members in each of the larger centres endeavour to meet informally with high school students who are interested in the engineering profession. He did not feel that it should be at a dinner meeting, as this might prove too expensive and would possibly not hold student interest as much as a more informal gathering.

The election of next year's executive then followed, and the results of the election by ballot are as follows: chairman, M. L. Zirul; vice-chairman, W. A. Ker; committeemen, H. D. DeBeck, A. F. Joplin and P. G. W. Walker.

Mr. Kanester and Mr. Owen were scrutineers for the election.

This brought the annual meeting to a close at 9:30 p.m., at which time the officers of the B.C. Engineering Society convened their Annual Meeting.

## Cornwall

L. H. Snelgrove, Jr.E.I.C.,
*Secretary-Treasurer*

John E. Pescod, Jr.E.I.C.,
*Branch News Editor*

**December Meeting**

The annual dinner meeting of the Cornwall Branch of the Engineering Institute of Canada was held at the Cornwall Golf and Country Club on the evening of December 14. R. L. Dobbin, the president of the Engineering Institute and Dr. Austin Wright, general secretary, paid their annual visit to the Branch on this occasion.

The committee chairmen of the 1953 executive read their reports of the activities of the past year. The nominating committee announced the election of J. Hawkes, H. Campbell, T. Webster, J. Morris, B. Stidwill, R. Blackett and D. McEwan to the 1954 executive, with J. Hawkes to serve a second term as chairman.

The president, R. L. Dobbin, in his address to the meeting, told of the magnitude of the development of Canada's natural resources that he had seen on his visits to twenty-four branches of the E.I.C. in Ontario, Quebec, the Maritimes and Newfoundland. He also related some of his impressions of the Coronation, which he attended as the official representative of the Engineering Institute of Canada. He was particularly impressed by the exceptional planning and co-ordination that made the ceremony so successful.

Dr. Wright also addressed the gathering. He dwelt at some length on the challenge to Canadian consulting engineers and contracting firms presented by foreign contractors and engineering firms who are entering the Canadian field and securing an ever-increasing amount of Canadian business.

Mr. Dobbin and Dr. Wright paid official visits to the Mayor of the City of Cornwall and the Reeve of the township of Cornwall on December 15.

## Edmonton

P. M. Butler, Jr.E.I.C.,
*Secretary-Treasurer*

K. Provost, M.E.I.C.,
*Branch News Editor*

***Panel on Engineers and Government***

On December 9 the Edmonton Branch of the Institute held its regular dinner meeting under the chairmanship of N. J. Allison.

The program for the evening consisted of a panel discussion on the topic "The Engineer and the Legislative Committees and Administrative Boards of Government". Keith Cumming, chairman of the program committee introduced the members of the panel who were, G. M. Blackstock, Q.C., former chairman of the Board of Public Utilities Commissioners; G. W. Govier, member, Petroleum and Natural Gas Conservation Board; J. E. Oberholtzer, deputy minister, Department of Industries and Labour, and F. A. Brownie, president, Canadian Western Natural Gas Company Limited, who although unable to attend personally, sent his views on the subject through Bruce F. Willson, management assistant for Northwestern Utilities, Limited.

Mr. Blackstock traced the development of boards throughout the years, and went on to illustrate the mental qualities required of board members. He pointed out that members of boards should be educated men, able to size up witnesses, weigh a mass of evidence and put aside preconceived ideas. This requires that a member have a "judicial mind", or be so mentally constituted as to be able in time to develop a "judicial mind". The "judicial mind", Mr. Blackstock observed is a monopoly of the law profession. Engineers were generally too rigid in their thinking, and they would have a place only in relation to, but not on boards, unless they could forget that they were engineers and had the mental capacity to develop a judicial mind.

Mr. Oberholtzer asserted that government administrators welcomed the assistance of boards and that engineers had an important place on these boards. As individuals, more or less removed from political influence, it was advantageous to have engineers as board members. Mr. Oberholtzer pointed out that boards should generally be representative of all levels of society, and that engineers, in representing the scientific level of society, tended to give glamour and stability to boards, and may even add some ideas!

A disadvantage of having engineers as members of boards could be the tendency to place too much weight on the facts provided by engineers, in instances where factors other than technical must also be considered.

Mr. Govier warned members against the danger of delegating too much authority to boards and advised that people, subject to the decisions of boards, should always insist on such minimum safeguards as boards consisting of members who are responsible thinking men and have access to the courts to prevent boards from going beyond their jurisdiction. As professional men trained in the "engineering method", that is, the ability to start from known facts and proceed step by step with an orderly dispassionate method of thinking to a final conclusion, engineers were valuable members of boards. Through the application of this "engineering method", the board could be helped to reach a sound decision with no room for prejudice or preconceived ideas.

Mr. Brownie in his message presented by B. F. Willson, to a degree, reaffirmed Mr. Blackstock's opinion. He pointed out that engineers, with their specific knowledge and training in the processes of gathering facts, analysing and drawing conclusions, were valuable in an advisory capacity to boards, but that training by itself was not enough. As a member of a board the engineer must, in addition, be judicial, articulate, intelligent, and, at times, even courageous.

H. LeM. Stevens-Guille thanked the panel on behalf of the members of the Institute.

## Halifax

W. A. Logan, M.E.I.C.,
*Secretary-Treasurer*

W. A. Deveraux,
*Branch News Editor*

***Annual Meeting, December 15***

O. N. Mann, administrator for the Nova Scotia Department of Trade and Industry, was elected as the new Chairman of the Branch at the annual meeting. He is a native of Sydney, Nova Scotia, and a graduate of the Nova Scotia Technical College. After spending several years in Quebec and Ontario doing engineering and management work, he returned to Nova Scotia to take his present position.

New members were elected for the Branch executive as follows: G. A. Cunningham, M. S. Hicks, and J. D. Fraser all of Halifax and for outside of Halifax, S. W. Kenney of Yarmouth and O. H. Manuel of Lunenburg.

The proposed program for the Committee on Professional Development Courses was outlined by G. D. Mader, chairman. Lectures this winter will cover Citizenship, Finance, and Management In Business. Prof. A. E. Flynn outlined the work of the Students' Guidance Committee and pointed out that eighty high school pupils were interested in this guidance and had been interviewed. This was almost double the number in the previous year.

An outline of the work of the Council of the Institute was given by A. R Harrington, who is one of the councillors for the Halifax area.

G. F. Bennett the retiring chairman reviewed the year's work and mentioned that one of the highlights was the holding of the annual meeting here last May. He thanked the committee which had handled arrangements in connection with this function under the chairmanship of R. F. McAlpine. He spoke of the new policy of having some out-of-town meetings for the Branch so that Institute members outside of the city might have a better opportunity to attend. A desire was voiced for more technical meetings in each year's activities. Upon retiring from his office, Mr. Bennett hopes to be of continuing service to the Branch.

A vote of thanks to Mr. Bennett was moved by G. J. Currie, president of the Association of Professional Engineers of Nova Scotia. Mr. Currie also congratulated the new chairman and the new members of the executive.

It was announced that the joint annual banquet with the Association of Professional Engineers of Nova Scotia would be held in Halifax on January 28.

## Hamilton

J. A. Reid, Jr.E.I.C.,
*Secretary-Treasurer*

F. S. Gue, Jr.E.I.C.,
*Branch News Editor*

***Annual Meeting***

The annual meeting of the Hamilton Branch was held in the Century Room, Fischer's Hotel, on Jan. 14, beginning with refreshments and dinner at 7:00 p.m.

Following greetings from W. A. Dawson, retiring chairman, J. A. Reid reviewed Branch business for 1953. Increases in membership, a successful and popular annual ball, a well supported Professional Development Program, and the arrangement of an excellent series of features for the regular meetings all contributed to a successful year.

The following slate of officers was elected: chairman, W. A. Wheten; vice-chairman, F. E. Milne; secretary-treasurer, N. A. Parry; executive committee, Ralph Adams, I. MacDonald, J. Kelly, D. Hains; councillor, N. Metcalf; councillor-elect, N. Eager; ex-officio, W. A. Dawson and J. A. Reid.

Thanks to the Canadian Westinghouse Company for frequent use of their attractive new Auditorium at the Longwood Road plant were tendered by D. J. Hains, and accepted on behalf of the Company by E. M. Coles, vice-president.

Mr. Coles also introduced the speaker of the evening, J. R. Montague, director of engineering, Hydro-Electric Power Commission of Ontario, whose topic was "Sir Adam Beck No. 2 and Associated Developments".

In his preamble, Mr. Montague brought out the following facts:

(a) Hydro has progressed from its founding 50 years ago to a serious consideration of atomically generated power today.

(b) H.E.P.C.'s present peak capacity is 4,800,000 h.p.—an 85 per cent increase over 1945.

(d) Canada's per capita installed horsepower is 60 per cent higher than anywhere else in the world.

Mr. Montague began the body of his talk, which was well illustrated with up to date colour pictures of the Queenston project, with a discussion of some of the geological conditions which have had to be met in the construction of electric sites at Niagara, and which have forced the adoption of many ingenious engineering expedients to get water to the turbines located far downstream from the lip of the Falls.

An idea of the magnitude of the forces under control in the project was

**New executive of Halifax Branch: Left to Right, W. A. Logan, G. A. Cunningham, O. N. Mann, J. D. Fraser, G. F. Bennett.**

given in the information that the water travelling through the intake tunnels has a momentum equivalent to that of a freight train 45 miles long travelling at 40 m.p.h. To bring this water to a halt requires a gate closure time of 1.5 hours.

The passing of huge volumes of water through areas which are now densely populated has involved full-scale mining undertakings. 14,000,000 yards of rock have been excavated—enough to fill a double line of 15-ton trucks lined up from Halifax to Vancouver. The resulting tunnels work as inverted siphons, carrying the water under the city. Finished diameter of each of the two tunnels is 45 feet. Originally, one tunnel was to be built, "with provision for a second if the load necessitated it." No sooner had the first been begun than the load necessitated the second, which was then driven simultaneously.

Millisecond blasting techniques have been extensively used in the open canals, with hydraulically smooth walls and greatly reduced cleanup time resulting.

Mr. Montague also discussed briefly the pump-storage scheme being developed to use off-peak power for storage of water above the cliff, using two of the turbines as pumps.

Many engineers in the employ of Westinghouse in Hamilton were particularly interested in details of the developments, since 600,000 hp. of the installed capacity of the new station will be built in Hamilton.

Mr. Montague was thanked by E. T. W. Bailey, past chairman of the Hamilton Branch.

Following the speaker's address, W. A. Dawson turned over the chairman's gavel to W. A. Wheten, the 1954 chairman.

## Kingston

D. R. Graham, Jr.E.I.C.,
*Secretary-Treasurer*

#### W. M. Hogg Is Speaker

The December meeting of the Kingston Branch was held Wednesday, December 16, and took the form of a dinner at the LaSalle Hotel. The guest speaker was W. M. Hogg, assistant field project engineer for the Ontario Hydro-Electric Power Commission at the Sir Adam Beck No. 2 development.

Mr. Hogg, making ample use of illustrated slides outlined the history of power development at Niagara and dwelt with great detail on the problems involved in the digging of the two giant tunnels, eight miles long, under the city of Niagara Falls. These tunnels are 51 feet in diameter, wider than a four lane highway. The latest estimates call for the job to cost $344,000,000.

Some idea of the magnitude of the task of boring the tunnels is the fact that 1,400 cu. yd. of concrete are poured in an 8 hour shift, and 125 railway cars of cement are required per week.

By the use of trucks costing $44,000 each and electric shovels, $300,000 each, the rock removal is being done cheaper than had ever been done before. As an illustration as to how costs have been scientifically computed and reduced, it was disclosed that at the start, without good roads, tire costs on the big trucks were running to 60 cents per tire per hour. This has since been reduced to 25 cents mainly by the improvement of roads on the project.

Mr. Hogg also mentioned problems relating to the limitations on the amount of water which can be diverted from the Falls, in order to maintain the scenic beauty and of the reservoir being constructed to overcome the problem.

The speaker was introduced by Dean D. S. Ellis of the Faculty of Applied Science at Queen's University and was thanked by Prof. W. Dolphin of the Royal Military College.

#### Dinner Meeting, January 13

The January meeting of the Kingston Branch took the form of a dinner at which members' wives were present.

The guest of honour was Ross L. Dobbin, president of the Engineering Institute of Canada who was making his annual visit to Kingston. As a topic for his address to the Branch Mr. Dobbin sketched, in an extremely humorous manner, his trip to the Coronation as representative of the Institute. Anecdotes were numerous and incidents hitherto unpublished were related.

On the serious side Mr. Dobbin said he was impressed with the extreme loyalty of the British people for their Queen. He also congratulated the British engineers for their part in the Coronation arrangements.

Mr. Dobbin was introduced by Professor H. Conn of Queen's University and thanked by Lt.-Col. C. W. Jones, R.C.E.M.E.

In addition to the dinner meeting, an executive meeting was held with the President in the afternoon at which the problem of amalgamation of the Institute and the Association of Professional Engineers was discussed in some detail.

During his visit to Kingston, Mr. Dobbin also addressed the cadets of the Royal Military College and engineering students at Queen's University.

## Lethbridge

R. D. Hall, Jr.E.I.C.,
*Secretary-Treasurer*

P. Harding, Jr.E.I.C.,
*Branch News Editor*

#### Ladies' Night

On December 19, 1953, the Lethbridge Branch held a "Ladies' Night" supper at the Marquis Hotel. Dinner music was provided by Mr. and Mrs. George Brown and the sing song was conducted by George S. Brown. Two solos were rendered by Miss Ella Findlay, "O Holy Night" and "White Christmas" and Mrs. Max Baines gave two very entertaining recitations. Art Hunt sang "Stout Hearted Men" and "Because".

R. Lawrence introduced the speaker, A. J. Cullen, who spoke on "Our Heritage". Mr. Cullen explained how the different degrees of engineering have changed our everyday lives in a manner that seemed sheer magic to the layman. It is interesting to notice how our heritage came into our hands. Since the 13th Century when Marco Polo toured through Asia, explorers and adventurers have conquered many deserts, jungles, mountains, rivers and plains. North America was found to be a very favourable country for the white race. Canada, the last great frontier, is rich in natural beauty and pioneer ruggedness. Men with work and vision began to reap the profits of Canada's resources. Trade was built on industry and industry on power.

Mr. Cullen pointed out that Canada has all the resources for power development, coal, hydro-electric, gas, oil and uranium. With the ingenuity of the engineers, Canada has progressed rapidly. The natural increase (without immigration) in four years was one million, while in the United States it is two and one-half million per year.

In addition to such resources and power, Mr. Cullen added another very important heritage, that of freedom brought from the mother country. This freedom should be exercised by voting and participating in civic affairs. We should protect and augment for future generations the work, vision, and freedom that our forefathers bore on their shoulders.

A vote of thanks was extended by N. H. Bradley.

## Montreal

R. J. Harvey, M.E.I.C.,
*Secretary-Treasurer*

S. T. Rudkin, M.E.I.C.,
*Publicity, Vice-President*

#### Panel Discussion on Lighting

"What Factor is Lighting in the Modern Electrical Load" was the subject of a panel discussion held before a group of some eighty interested engineers on November 30 and sponsored jointly by the Electrical Section of the E.I.C., the A.I.E.E. and the I.E.S. The panel of three consisted of a utility representative, Jean Lafontaine of Shawinigan Water & Power Co.; a consulting engineer, Don Heywood of McDougall & Friedman, and an illuminating engineer, E. Doray of Shortall Electric. R. K. Owen acted as meeting chairman and moderator. Considerable audience participation, in the form of written questions, was a feature of the meeting. R. D. Merritt was responsible for meeting arrangements.

#### Civil Section Meeting

On December 1, the Civil Section were sponsors of a meeting at which G. H. Kohl, a consulting engineer with considerable and varied experience in heavy construction, spoke on the subject of "Specifications". He demonstrated, by examples drawn from his own experience, how specifications should be drawn up in order to help and expedite the work on a project. Charles Miller was meeting chairman, with H. J. Racey in charge of meeting arrangements.

#### Trans-Atlantic Joint Meeting

On December 3, for the first time in Canada, a joint trans-Atlantic meeting by radio telephone was held between the auditorium of the Bell Telephone Company, where sat some 300 members of the E.I.C. and the Institute of Radio Engineers and guests, and the Government Post Office building in London, England, occupied by a similar number of members of the Institution of Electrical Engnieers. The meeting involved a discussion of the intricate preparations and equipment required for the televising and broadcasting by the BBC of the ceremonies last June for Queen Elizabeth's Coronation. As editorial mention is being made of this meeting, and the paper reproduced in the *Journal*, no further comment will be made in this column except a word of praise for the wonderful job of co-ordination carried out by D. Danylkiw, who was responsible for meeting arrangements.

##### *Management Section*

W. T. Wilson, assistant vice-president, and chairman of a C.N.R. committee set up to study the training of executive officers from junior staff members, was the speaker at a meeting sponsored by the Management Section on December 3. His subject was "Trends for Training for Management", and during the course of his talk, Mr. Wilson discussed the pitfalls and problems experienced by other organizations in management training, and outlined the structure of his company's staff training course, and its aims in conducting it. C. A. Peachey was meeting chairman, and D. A. J. McDonald was in charge of meeting arrangements.

##### *Aircraft Discussion*

"Rotary Wing Aircraft Development" was the subject of a very interesting talk given by Everett B. Schaefer, chief technical engineer with Canadair Limited on December 10. Based on the interest presently being displayed, he said, it did not appear rash to predict airline operation of helicopters in the next decade, but as an important supplement rather than any threat to the airline systems. Two or three basic types, with superior characteristics, would probably evolve from the diversified field in existence today. Already several years' experience has been gained in the carrying of air mail from airport to downtown central post offices in Los Angeles, Chicago and New York, and passenger shuttle services in New York between Idlewild, La Guardia and Newark airports indicate the steadily growing civil aviation side of the picture. Sabena Airlines of Belgium operate a helicopter service between Brussels and eight other cities within a range of 65 to 185 miles, and T.C.A. is seriously considering the potentialities of such a service. The first helicopter to be designed, built and flown in Canada, said Mr. Schaefer, was a three-phase single-rotor craft developed by Bernard Sznycer and Selma Gattlied in 1947. Sponsored by the Mechanical Section, the meeting was chaired by O. R. Brumell, and arranged by W. D. Kerr.

##### *R. J. Roberts Is Speaker*

On December 14, at a meeting sponsored jointly by the E.I.C. Electrical Section and the A.I.E.E., R. J. Roberts, assistant electrical engineer, equipment for the C.N.R., spoke on "Trends in Electrical Equipment for Railway Cars". Having been directly involved with the electrical systems for 300 ultra-modern passenger cars being delivered to the railway, Mr. Roberts was well qualified to discuss the lighting, air-conditioning, batteries and generating equipment of the modern railway car. Noll Wright acted as meeting chairman, and R. H. Tivy was responsible for meeting arrangements.

##### *Chemical Section Meeting*

The final meeting of the year 1953, sponsored by the Chemical Section, was held on December 15. Morris Katz, M.Sc., Ph.D., Chairman of the Canadian Section of the Technical Advisory Board on Air Pollution spoke on "Recent Developments in Atmospheric Pollution". Smog disasters, chemical reactions of atmospheric contaminents, and industrial pollution control were a few of the highlights present by Dr. Katz in his most interesting talk. J. B. Phillips, Ph.D., was meeting chairman; E. W. Coderre in charge of arrangements.

##### *Report on Symposium Held in November*

A symposium on student guidance for the French-speaking colleges was held November 26. The guest speaker was Dr. Huet Massue, P.Eng., in charge of the Department of Statistics and Economics of the Shawinigan Water and Power Company, who gave an "Exposé Général sur la Profession d'Ingénieur" The talk was extremely interesting and well illustrated by slides.

The students asked, in writing, a good number of questions which were answered during a period of nearly an hour by one or the other of the group of guest engineers. This group included Dean Gaudefroy, Professor Godin, Secretary, Professors Boucher, Brais, Maufette, and Professor Laurence, chairman of the Student Guidance Committee, all of the Ecole Polytechnique. Mr. Bournival, registrar of the Corporation of Professional Engineers of Quebec, was also present.

After the period of questions and answers, a short film entitled "L'art de l'Ingénieur" was shown. This film was lent free to us by the "Office Provincial de Publicité".

Altogether, twenty colleges were invited by a letter dated November 18, 1953. Only five colleges were represented by students and the total number of students present was twenty-five.

The most probable cause for this poor showing was the timing. It was concluded afterwards that a much greater number of students would have showed up if the meeting had been held in the afternoon of the same day. Unfortunately, this was not possible because of a meeting of the Faculty of the Ecole Polytechnique on that afternoon. Furthermore, it was not possible to hold the meeting later because many colleges would then be having their examination period, and also not possible to have meetings on other days of the week because these colleges have their holiday on Thursday afternoons.

It is concluded that the next symposium for the French-speaking colleges should be organized in the afternoon for a better chance of the success which should normally be expected.

## Northern New Brunswick

L. L. Marshall, Jr.E.I.C.,
*Secretary-Treasurer*

R. W. Rankine, Jr.E.I.C.,
*Branch News Editor*

**Review of 1953**

On December 19, 1952, a meeting was held in Bathurst, N.B., to discuss the possibility of forming a branch of the Engineering Institute of the northern part of the province.

It was decided that this meeting go on record as being in favour of forming a branch and that petitions be sent to Chatham, Newcastle, Bathurst, Dalhousie and Campbellton.

R. C. Eddy was appointed provisional chairman and L. L. Marshall provisional secretary-treasurer. A committee consisting of E. C. Bannerman, G. P. Milton and C. F. Taylor was asked to make a study of by-laws for the branch.

The inaugural meeting of the branch was held on March 12, 1953, beginning with a reception at the Canadian Legion Hall in Bathurst. Cocktails were served buffet style.

At 8.00 p.m. a turkey dinner was served to eighty-four members and guests at the Donald Eddy Memorial Hall. R. C. Eddy was chairman of the meeting and among those at the head table were: Dr. J. B. Stirling, Dr. L. Austin Wright, W. S. C. Stratton, chairman of the Moncton Branch; A. J. Fenwick, Deputy Mayor of Bathurst; J. G. Chalmers, administrative vice-president of Bathurst Power and Paper Company Limited and H. G. Rogers representing the Association of Professional Engineers of New Brunswick.

The toast to the new Branch was given by Mr. Stratton, who also presented the Branch with the Institute banner and a cheque for twenty-five dollars from the Moncton Branch.

Mr. Fenwick expressed the pleasure of the town council upon the formation of this new branch, a further step in the development of Northern New Brunswick.

Mr. Chalmers read a teletype message from R. L. Weldon, president of the Bathurst Power and Paper Company Limited and a member of the finance committee of the Engineering Institute of Canada, in which he expressed his good wishes for the Branch.

Mr. Rogers, speaking for the Association of Professional Engineers, stated that the Association was pleased to see a branch of the Engineering Institute of Canada formed in this section of the province.

Dr. Stirling, the main speaker of the evening, centred his talk around the engineers and this community. He stressed the fact that they should exert themselves to take part in municipal affairs and in local projects.

Dr. Wright followed by giving a brief talk on engineers in general and went on to give a picture of what was being planned for the annual meeting of the Institute to be held in Halifax on May 20, 21 and 22.

The meeting was then adjourned and the members and guests retired to the Legion Hall where a dance was held.

**General Meeting, September**

A general meeting was held in Bathurst on September 30. Guests were: the new president, R. L. Dobbin, and the general secretary, Dr. Austin Wright.

Twenty-four members of the Branch were in attendance and the meeting began with a very enjoyable supper. R. C. Eddy was the chairman.

During the following business meeting the report of the scrutineers on the recent election was received. They reported that the following officers were elected: vice-chairman, G. A. Robb, Dalhousie, N.B.; executive members, Restigouche County, D. MacCallum, D.

A. Stack; executive members, Gloucester County, G. P. Milton, C. F. Taylor. The following officers had been elected previously by acclamation: chairman, R. C. Eddy, Bathurst, N.B.; secretary-treasurer, L. L. Marshall, Bathurst, N.B.; executive members, Northumberland County, Martin Cyr; Tracy Gould.

The chairman called upon Dr. Wright to introduce the president of the Institute. President Dobbin gave a short, but informative talk on his trip to the Coronation as representative of the Institute. He then presented the meeting with two topics for discussion. First, the admission of science graduates to the Institute as members without examination; and second the feeling of the Branch if in the future it was found impossible for the president to visit all branches in one year.

These topics brought forward a lively discussion with a large number of views put forth. The president's intention is to present the views of the various Branches to the Council for discussion.

**November Meeting**

The next meeting of the Branch took place at the R.C.A.F. Station, Chatham, N.B. on November 6.

Previous to the business meeting twenty-four engineers were conducted on a very interesting tour of the base by F/Lt. Martin. The group visited in particular the sewage disposal plant and a reinforced concrete hangar.

Following supper, served in the Officer's Mess, the business meeting was called to order. The special speaker for the evening was F. W. Purdy, sales manager for Maritime Cement Company Limited.

Mr. Purdy gave a fine talk on portland cement, tracing the history of the product and giving a resume of the present day uses and went on to look at the future. To augment his talk Mr. Purdy used a film showing the methods of manufacturing portland cement.

The meeting was adjourned to an oyster smoker and refreshments.

## Quebec

Roger Desjardins, M.E.I.C.,
*Secretary-Treasurer*

Guy Babineau, Jr.E.I.C.,
*Branch News Editor*

**December Meeting**

A joint meeting of the E.I.C. Quebec Branch and the "Association des Diplômés de Polytechnique—Section de Québec" was held on December 3, at the "Faculté des Sciences" building of Laval University. This meeting consisted in the presentation of four films the showing of which was made possible following an agreement between "La Société des Ingénieurs Civils de France", "Le Directeur des Laboratoires de Bâtiments et Travaux Publics", Paris, France and Messrs. Georges Demers, P.Eng., M.E.I.C., and P. A. Dupuis, P.Eng., M.E.I.C., who visited France early in 1953.

The first film shown, "Reconstruction of Block V-4 at Le Hâvre, France", described the process used in reconstructing part of the city apartment houses destroyed during World War II. This method consists of prefabricating *in situ* all reinforced concrete structural and decorative elements of the building. The method of fabricating and assembling these various elements was well covered.

The second film described the construction of a steel pipe-line in Maroc where new techniques were being used for laying the pipe across natural obstacles as well as for lining the conduit with a special protective coating.

The next picture was devoted to the building of a 12 kilometer tunnel for diverting water from the Rhue River in France "Massif Central" region. A scientific method of blasting was used in this instance as well as a new technique for the concrete lining of the tunnel walls whereby concrete is forced by means of compressed air in between the walls and reusable forms moving on rails.

A new and most daring technique of constructing an aircraft hangar in the vicinity of the city of Marseille was the subject of the last film. Due to the particular weather conditions prevailing in this region, the thin-shell concrete roof structure had to be erected on the ground and then raised into its final position at some 60 feet above ground.

A considerable number of engineers and architects were present at this meeting which was under the chairmanship of Georges Demers; the thanks were expressed on behalf of the Branch by its chairman, A. E. Paré.

#### President's Visit

The president of the Institute, R. L. Dobbin, paid his annual visit to the Quebec Branch on December 9. After devoting the greater part of the afternoon to a Branch executive meeting, President Dobbin, General Secretary Austin Wright and members of the Branch executive met the engineering students of Laval University; the Institute prize for the best academic record was awarded upon this occasion to Bernard Michel, fifth year student in civil engineering.

A large section of the Branch membership met afterwards with the president at a dinner held at the "Cercle Universitaire". Mr. Dobbin's remarks were confined mostly to describing the important role played by British engineers in providing all necessary lighting, public address, broadcasting and television facilities for the coronation of Queen Elizabeth II of Great Britain. The fact that for the first time Institute representatives were officially invited to attend the ceremony in Westminster Abbey, the president added, is to be regarded as a tribute of recognition to the engineering profession.

General Secretary Austin Wright briefly reviewed the Institute activities pointing out how fast they had been growing in the last few years. "The financial situation of the Institute is good", added the secretary. He also warned existing Canadian consulting and contracting firms to get ready to meet a much stiffer competition following what he termed the ever increasing invasion of foreign firms now incorporating in Canada. The Institute has always been happy to provide its full help and support when required so that contracts may be awarded to existing domestic firms, and it will continue to do so, stated Mr. Wright. But it belongs to them now more than ever to go out and sell their services and facilities through proper advertising and aggressive salesmanship, he said.

The dinner was under the chairmanship of the Quebec Branch president A. E. Paré, who introduced Mr. Dobbin; thanks and good wishes were expressed to the visiting president in behalf of the local Branch by a member of its executive, B. O. Baker.

## Saguenay

C. C. Louttit, Jr.E.I.C.,
*Secretary-Treasurer*

#### President Dobbin Visits the Branch

A meeting of the Saguenay Branch of the Engineering Institute of Canada was held on December 10, 1953 in the Assembly Room of the Saguenay Inn, Arvida. Guests for the evening were President R. L. Dobbin, and Assistant General Secretary Col. Thompson.

G. K. Clement, branch chairman, introduced the president to the members. President Dobbin outlined his visit to the Coronation ceremony in England and his visits to various engineering societies, schools and factories. He reported that the Canadian engineer is held in high esteem by their British counterparts and every courtesy was shown to him in his office as president. Mr. Dobbin outlined his visits to the Branches so far, having covered all of Eastern Canada with the exception of a few Branches in western Ontario. During his trip he had remarked how few of the Branches asked mayors, councillors and other municipal and government members as speakers, thereby missing opportunities for good publicity and the furtherance of good public relations. Other opportunities for enhancing the reputation of the E.I.C. are found by serving in an advisory capacity in disputes and making general recommendations for the guidance of city councils, etc.

Mr. Clement asked Col. Thompson if he would say a few words. Col. Thompson outlined the activities of headquarters staff, showing how these had increased during the past year. Speaking of the *Journal*, the editorial staff had been able to advance the date of publication by two weeks, even though the *Journal* had increased in size by about 30 per cent. It was anticipated that the new membership directory would be mailed by December 1. However, this was not possible but it will be mailed before December 25. To cover the cost of issuing the list advertising space has been sold. Had this not been done, the cost to the Institute would have been about $1.50 per copy. Col. Thompson also outlined the E.I.C.'s part in the student's exchange this past summer, when 30 European engineering students paid their passage to and from Canada and worked during the summer for various Canadian companies. No Canadian students made the trip to Europe. It has been requested that a representative of the E.I.C. be present at a meeting in Stockholm in January to discuss plans for the coming summer.

A lively discussion period followed the talks. President Dobbin was asked to give Headquarters' views on the admission of science graduates. Stemming from this, Col. Thompson told the meeting that in only one case was the E.I.C. compelled to accept, by agreement, a member of the professional body as a member of the E.I.C. This was in the Province of Alberta, whose Professional Association presently admitted geologists and scientists who would not normally be admitted as members. In all other provinces, the Institute accepted a man's educational qualifications as satisfactory if he were a member of the Professional Association and only passed on his engineering experience before granting membership. The rest of the evening was taken up by discussion of an explanatory nature on points raised during the talks by the president and assistant general secretary.

The meeting was adjourned at 10.30 p.m. and discussion continued over coffee and sandwiches.

## Saint John

John A. B. Brenan,
*Secretary-Treasurer*

#### Annual Meeting

The annual meeting of the Saint John Branch was held December 8 with Chairman A. G. Watt presiding.

Reports of the year's activities, the treasurer's report and a report on the professional development courses were read and after the counting of ballots the following slate of officers was declared elected for 1954. Chairman, R. M. Richardson, vice-chairman, W. M. Brenan, secretary-treasurer, J. A. B. Brenan. Members of the executive are J. J. Donahue and F. L. Doty.

Two members of the 1953 executive, T. C. Higginson and C. G. Clark still have one year to serve. H. S. McCleave was appointed representative to the E.I.C. Nominating Committee for 1954.

Mr. Watt welcomed the new chairman and presented him with the E.I.C. charter, and Lorne Cass, on behalf of the members, thanked Mr. Watt for his work as chairman during the past year.

The matter of city engineers for Saint John and Lancaster was discussed at some length. It was decided to forward a resolution to the Saint John Common Council and the Lancaster City Council protesting the fact that no qualified engineer is at present employed by either city. The cooperation of the Association of Professional Engineers of the Province of New Brunswick is to be sought in this matter.

Three films were shown before the meeting was brought to a close.

## Sudbury

George Fleming, M.E.I.C.,
*Secretary-Treasurer*

T. C. Robertson, M.E.I.C.,
*Branch News Editor*

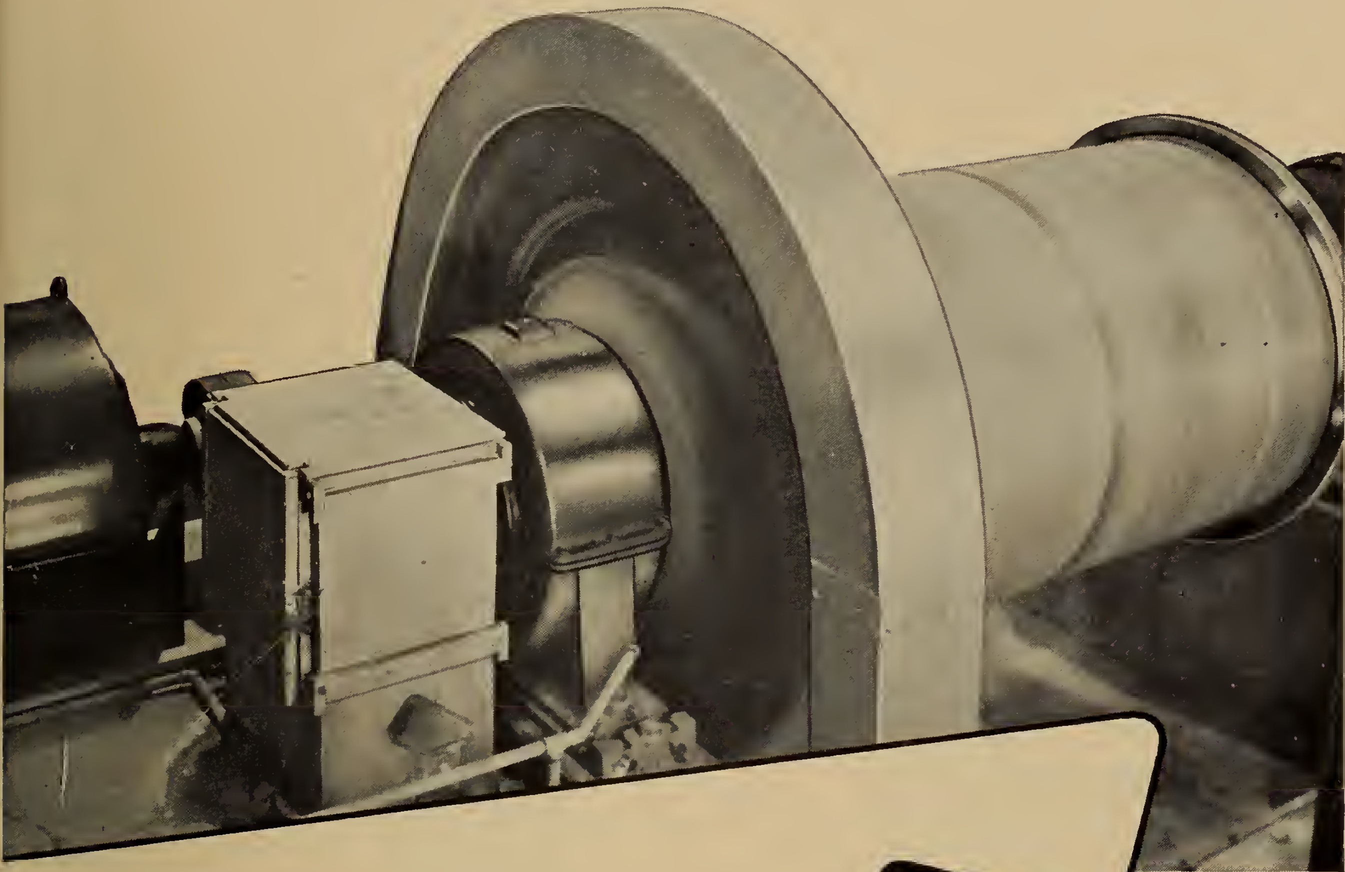
#### Pipe Line Construction Illustrated

On October 16, 1953 the first oil from Alberta reached Vancouver by way of pipe line. The laying of this oil pipe line was the topic presented at the January dinner meeting of the Sudbury Branch of the Institute held at the Sudbury Granite Club. The speaker, Bill Skully, was introduced by J. Quance. Mr. Skully was born in Montreal but spent many of his younger years in New York. He served in the Canadian Navy aboard H.M.C.S. *Huron* with the rank of lieutenant. He now lives at Jordan Station where he is within commuting distance of Toronto or St. Catharines as manager of public relations for the Canadian Comstock Co.

In introducing the coloured sound film "Man Against Mountain", Mr. Skully stated that the construction of such pipe line over the scenic mountains, across great marsh lands, under roads and under rivers presented one of the most unpredictable problems which modern engineers have been called upon to conquer. As a result of the inherent uncertainties no Canadian company felt able

# Grinding Costs Go Down...

## WHEN YOUR MILL IS TAILORED TO YOUR JOB



**ALLIS-CHALMERS GRINDING MILLS**

### Test Facilities Assure Correct Selection

You get the best grinding efficiency and economy only when the type and size of your grinding mill is tailored with your grinding job. The Allis-Chalmers Research Laboratory, with complete test facilities for batch and pilot mill runs, assures you of exactly the right mill for top, economical performance year in, year out.

A-C Grinding Mills, manufactured in a complete range of types and sizes for wet or dry grinding, are designed to give long, trouble-free operation. Maintenance and downtime are cut to a minimum. Check these important features:

- **Hand operated, high pressure hydraulic pump "floats" the mill after shut-down . . . eliminates dry starting.**
- **Continuous, uniform lubrication of trunnion bearings.**
- **Improved diaphragm . . . cuts maintenance and replacement parts costs.**

**MADE IN CANADA**

Now available—a 44 page bulletin of valuable tables and information. Contact your nearest CA-C Sales Office, or write to Canadian Allis-Chalmers Ltd., P.O. Box 37, Montreal, Quebec, for Bulletin CAC-6045.

# CANADIAN ALLIS-CHALMERS

A-C ALLIS-CHALMERS

53-CAD-5

to take the risk involved so a company "Comstock Mid Western" was formed. This was a combination of Canadian Comstock and Mid Western of. Tulsa, Oklahoma. It was interesting to note that at the outset the engineering staff was 75 per cent American but for the last 2 years of construction this percentage had been changed to 80 per cent Canadian. The picture was taken near Jasper, Alberta about one year ago on one of the spreads. In the construction of the 425 mile section of the pipe line there were three such spreads. Each spread required over a million dollars worth of capital equipment.

The film "Man Against Mountain" depicted Alberta as a country of wheat, cattle, Chinook winds etc. There were the bituminous sands at Fort McMurray. Oil was discovered in the Turner Valley in 1912 but not until 1950 did the oil developments become fantastic making a pipe line the answer to the marketing problems. The 780 mile survey required 2 years to complete with all its detours around lakes, creek crossings and mountainous climbs. However, this great tourist country crowned with 100 square miles of ice presented engineering problems even more rugged than its rugged beauty. In the building of this billion seven hundred and eighty million dollar pipe line the men were housed in trailer camps near the location and all the equipment serviced on the job. The 50 foot right of way had to be cleared and grubbed by heavy bulldozers in some places, in others the rock had to be blasted ready for the big cats to take over, and in still others timbers had to be laid to support the machinery which followed. All this and much more in preparation for the 3 ft. wide and 5 ft. deep trench which was to be the resting place for the new pipe line.

The 24 in. diameter and ¼ in. thick pipe was transported on 5,000 railway cars, each length weighing one ton. After the pipes were cleaned and buffed the cats with side beams aligned the pipes on blocks beside the trench. They were then held in place by a line-up clamp ready for welding. The welding was done in three operations. The stringer bead of weld was followed by another which must be free of pin holes of any kind and then came the finish pass which had to be smooth and regular. After the completion of the welding a special gamma ray machine was inserted in the pipe and photographic film placed on the outside of the pipe gave a record of any flaw which may have been present in the weld. The pipes were then covered with a primer paint and when dry a wrapping of asbestos and fibre glass saturated with asphalt or coal tar was applied. In crossing rivers or marshes the pipes had to be weighted with concrete blocks which were poured on the site and then fastened to the pipe. In these cases the pipe was welded in long sections and then moved into place. The piping used in these locations was ½ in. in thickness in order to withstand the extra strain to which it might be subjected.

After the piping was completed in one continuous length the cats lowered the pipe into place and covered it to a depth of 3 ft. except in the river or road crossings where the covering was increased to 6 ft. All that then remained to be done was to level off the right of way and the line was ready to begin its work of transporting 150,000 barrels of crude oil per day from the wells to the refineries at the Pacific coast.

At the end of the film Mr. Skully answered many pertinent questions regarding this enormous undertaking. Al Cameron, on behalf of the Branch, expressed the appreciation of the gathering and extended a most hearty thanks to the speaker for such an interesting evening.

#### Meeting At North Bay

The Sudbury Branch of the Institute journeyed to North Bay for the December meeting on Saturday December 5, where they were conducted through the diesel locomotive servicing and repair shop of the Ontario Northland Railway. Jack Cooper, the assistant chief engineer met the party and had members of his staff on hand to conduct the tour. After the trip through the shops Mr. Cooper entertained the members of the branch at his home prior to the dinner at the St. Regis Hotel in North Bay.

Officially opened in October the million dollar shop contains the newest equipment available for the speedy and efficient servicing of modern diesel locomotives. One of the most important pieces of equipment is the "drop table" which consists of an electrically operated elevator for changing locomotive trucks. The engine is positioned so that the damaged truck is over the elevator which is at track level. The body of the locomotive is then supported by two beams and the truck uncoupled. The elevator lowers the truck to a depressed track where it is moved from under the locomotive on a transfer track to the repair area where it is again raised to track level. This procedure reduces the time required to change trucks from one and one half days to two hours.

The exhaust ventilating system is the first of its kind in Canada. A continuous duct is suspended over each of the two service tracks and runs the full length of the building. All gases are discharged into this duct and are carried off by motor driven exhaust fans. These fans are automatically started and stopped so that the maximum amount of heat is conserved in the winter months.

The main shop is 104 feet long and consists of two sections each of which is 52 feet wide. The one section is for servicing and has platforms on both sides and between the two service tracks, as well as a depressed floor between the tracks. All necessary servicing equipment is readily available, in production line order, so that a minimum of time is consumed before the train is back in service again. The other section is the repair area and has two short tracks on either side of the drop table. One of these tracks is used for truck repairs and the other for electric motor servicing.

In an adjoining section of the building are many auxiliary rooms such as lunch room, lecture room, apprentice class room, wash room, fan room, oil room, offices and several special servicing rooms.

The wheel conditioning room houses two of the most up-to-date lathes available. The wheel turning lathe is capable of increasing the number of axles turned out in an eight hour shift from nine by the old method to twenty-four by the new method.

All in all the engineers of the O.N.R. are to be congratulated on having assembled the most modern equipment and incorporated speedy servicing techniques so that now the O.N.R. is prepared to continue in their program of complete dieselization.

After the dinner a short business meeting was held and it was announced that the first meeting of the educational and professional development section would be held December 7 and would be addressed by J. Berger, chief constable for Sudbury, who would speak on traffic problems as they affect the city.

## Vancouver Island

P. F. Fairfull, M.E.I.C.,
*Secretary-Treasurer*

***Annual Dinner Meeting***

The annual dinner meeting of the Vancouver Island Branch was held at the Oak Bay Beach Hotel on Friday, December 11, 1953, when 33 members attended.

R. E. Haskins of the B.C. Cement Company introduced the speaker of the evening, Les Willoughby, who spoke on the design and control of concrete. By courtesy of the Portland Cement Association the very instructive film on the same subject was shown and at the conclusion Mr. Willoughby answered innumerable questions. The speaker was thanked for his enlightening talk by A. S. G. Musgrave, past chairman of the Branch.

## Hamilton

N. A. Perry, Jr.E.I.C.,
*Secretary-Treasurer*

***Hamilton Engineers' Wives Association Report of 1953 Activities***

At the close of 1953 the membership was 67 with an average attendance of 42.

The program for the year consisted of three business meetings, three parties, a dinner and a penny bake sale. Speakers at sessions following the business meetings were J. D. Witmer, interior decorator, Mrs. Marjory Freeman Campbell, author, and a demonstrator of Elizabeth Arden products.

In addition to the monthly meetings there were four interest groups—craft, service, music appreciation and bridge. The craft group made hats, aluminum trays, brass jewelry and Christmas candles and poinsettias. In addition to regular meetings the music appreciation group attended the Toronto Symphony concerts. The service group did work for the Red Cross and Mountain Sanitorium. These groups' meetings were very interesting and well attended.

***Executive for 1954***

Executive of Hamilton Engineers' Wives Association for 1954 is as follows: honorary president, Mrs. W. Wheten; past president, Mrs. F. J. Veale; president, Mrs. J. A. Tyerman, vice president, Mrs. J. J. Dravis; recording and corresponding secretaries, Mrs. P. J. McNally, Mrs. H. K. Craibbe; treasurer, Mrs. J. M. Skinner; program and social convenors, Mrs. R. J. Northrup, Mrs. V. J. A. Derraugh, and membership secretary, Mrs. D. Friesen.

## BOOK REVIEW

**Lost trail: The story of Klondike gold and the man who fought for control.** Francis Cunynghame. London, Faber, Toronto, British Book Service, 1953. 213 pp., illus., $4.00.

"On the 2nd January, off I went aboard the old 'Etruria' bound for New York, and reached Dawson City in early June, 1898."

Such is the brief record which Arthur Newton Christian Treadgold, commonly known as "Treader" made of the start of his fabulous history-making adventure in the Klondike gold field.

Descended from Sir Isaac Newton, and proud of that lineage, Treader had a will of his own, an independent spirit, and an iron constitution. He went to a good public school, and then took his Mus. Bac. degree at Cambridge. For a few years he schoolmastered at Bath, but soon his adventurous spirit got the better of him.

In eighteen hundred and ninety-seven, he met Grace Henderson, a Canadian student from Toronto, and less than a year later he was on his way to the Klondike, excited by letters from Miss Henderson's sister, then married to a Mountie stationed in the gold area.

An excellent overall description of the early miners is given in the author's own words:

> There was only one drawback, one great worry in all this get-rich-quick population. There was a great scarcity of provisions. Flour was twelve to sixteen dollars a hundredweight, bacon fifty cents a pound, blankets twenty-five dollars; heavy prices in those days. At times it was impossible to buy anything at all. In Dawson City hungry millionaires paraded the streets and tried to forget their unappeased appetites by improving their shacks or going to the saloons and dance-halls. There was no real poverty, but no one knew where he was going to get his next meal. They just had to sit with empty stomachs and wait patiently for a steamer to come up with food. There was plenty of salmon in the rivers and plenty of moose on the hills. Were they too lazy or too glutted with gold to fish or hunt?
>
> Vanity of vanities! It was truly an amazing world.

During the first summer, Treadgold examined the workings by open cut, by drifts, and by prospecting shafts in the several valleys being actively worked. His conclusion, which he set out to report back to England, was that an adequate supply of water and electric power was the prime need for the area. Camped on Bonanza Creek, he met the now well known geologists, R. G. McConnell and J. B. Tyrrell. These two specialists were reporting these same needs, namely, water and electric power.

Names that are familiar, and even legendary, live through the pages of the book: F. H. Chrysler, Major Cunynghame, Colonel Feilding, Sir John Latta, D. M. McCarthy, William Trask, J. B. Watson, and Raleigh Smallman, Big Alec Macdonald, Andy Hunker and Joe Boyle.

Treader's speculative borrowing, and indiscriminate buying and transferring of shares, are all brought out in the trial in nineteen hundred and thirty-two and nineteen hundred and thirty-three.

The latter part of his life, when he returned to his old digs at Oxford, the final judgment of nineteen hundred and thirty-three, and a most interesting summing up of his activities and character, conclude this quite refreshing and different book. And the reader will find the index a great convenience. E.K.

## BOOK NOTES

**Prepared by the Library**
**The Engineering Institute of Canada**

* Review provided through the courtesy of the Engineering Societies Library in New York.

**Catalogue of ferrous alloy specifications (Commercial and service): American-British-Canadian armies standardization program.** Canada, Department of National Defence, 1949. 932 pp.

This publication, which came into effect in January, 1950, "correlates the standard and service ferrous alloy specifications currently in use in the United States, the United Kingdom, Canada, and Australia, in use as of 1 January 1949. The purpose

## LIBRARY REGULATIONS

### Hours

| | |
|---|---|
| Mon.–Fri. | 9 a.m. - 5 p.m. |
| Saturdays | 9 a.m. - 12 noon |

### Bibliography and Reference Service

Short subject bibliographies are compiled on request. When placing these requests, please give as much detail and background information as possible.

### Borrowing

Books, periodicals, pamphlets and films may be borrowed for two weeks at a time. All books included in the Library Notes Section of *The Engineering Journal* are available for loan. **A fine of 25c per day is charged for each day borrowed items are retained beyond the two-week period.**

A library deposit of $5.00 at par in Montreal is required, for which two items may be borrowed at a time. Temporary deposits (30 days or less) $10.00. Books are sent anywhere in Canada, and carrying charges are payable by the member concerned.

### Ordering

Any book or pamphlet may be ordered through the library. All publications of affiliated societies, whether books, pamphlets, or periodicals, should be ordered through the library, as reduced rates are applicable on these to all members. Except in the case of library deposits **please make no payments in advance.** Non-members may consult the library, but may not borrow material. Please address all requests to **The Library.**

of this standard is to facilitate production in one country when using production data referencing ferrous metal specifications of another country, by providing the characteristics, nomenclature and related information in this form."

"This Standard is promulgated by authority of the Technical Procedures Committee established in Washington, D.C., in accordance with the standardization agreement between the United States, the United Kingdom, and Canada."

It "was developed as Project No. 9.6.1.1, assigned to the Canadian Army as the monitoring country, and developed by the Canadian Arsenals Limited, Ottawa, Canada, as monitoring agency."

The volume is divided into two main sections: Table I, which designates chemically equivalent specifications, and Table II, which gives chemical compositions and mechanical properties.

The classification of ferrous alloys is based on the numbering system for steels of the American iron and steel institute and the Society of automotive engineers, except in the tables for Cast iron and steel, Ferro alloys, Nitriding steels, Nickel base steels, and Special steels.

The tables are so arranged that it can be seen at a glance the corresponding numbers for each specification in the different countries.

The index to this volume lists alloys under the product for which they are to be used — Bars, billets, forgings, etc. — and according to their A.I.S.I.-S.A.E. series number, but alongside the series number is also listed the type of alloy which this number represents.

Although intended primarily for use by the manufacturers of service equipment, the tables should prove useful to all those interested in ferrous alloys as not only are the specifications of the four countries concerned linked together, but the chemical composition of the alloys, and their mechanical properties are also given.

**Direct current machines for control systems.** A. Tustin. London, Spon, Toronto, British book service, 1952. 306 pp., $10.00.

One of the most remarkable recent developments in engineering is the application of automatic precision controls in industry, transport, and the defence services, and it is the object of this book to describe some of the different types of direct current machines and machine combinations which are suitable for use in this connection. In this book, the term automatic control has been used to include all kinds of automatic regulating, control, and positioning devices.

The author describes various different types of machine, such as Normal shunt, series and compound wound generators and motors, and Ward-Leonard control, the Rosenberg generator, the Amplidyne, and the Magnavolt. These machines are used in control systems, both separately and combinations, as when one machine is used to excite a larger one. Although the various types seem quite different, Mr. Tustin states that they conform to a common pattern, that of a sequence of stages of power amplification, and, as far as possible, he has treated the machines in common, pointing out the similarities and differences between the various types.

The choice of electric machines for control purposes depends partly upon their "static" characteristics, but even more upon their dynamic or "response" characteristics, that is, the way in which the output (current or voltage) responds to the variations of the input (the exciting current or voltage). For this reason, the author has given enough of the theory of control systems to make clear the part played by the dynamic characteristics in determining its suitability for use in such systems.

The book has been written for engineers connected with the manufacture of electrical equipment, industrial engineers and research workers. It should also be useful for students of electrical engineering as an additional text on d-c machines.

**The editorial directory: business, industrial, professional, farm, consumer publications, 1953.** New York, Galub publishing company, 1953. 232 pp., $27.00.

Readers who already know this publication need only be told that this edition has been increased to include Farm and Consumer publications, and additional new editorial data, such as complete matphotocut information, type and page size and column width, payment policies for material purchased and charge policies for handling publicity, description of readership, circulation affiliation, and subscription rates.

Contributing magazines are indexed alphabetically in the front, and reference is to their section number rather than the page, listings being alphabetical under each section; there is also a numerical group number index.

It seems slightly puzzling as to why Canadian publications are listed separately, and we also wonder why the Consumer and Farm publications were not incorporated into the general alphabetical index.

Information provided, when available, includes, name of magazine, address, publisher, telephone number, news and feature deadlines, editors both general and local, size, type, use of photographs, etc., and a general description of material published and type of readers, as well as new information mentioned above.

The use of the volume will be limited in Canada, as the Canadian listings are so few. But it will be of special value to library reference shelves all across the country who deal with many questions on editorial or publication information matters.

**Electrical installation rules and tables,** 5th ed. W. S. Ibbetson, ed. P. A. Rowland. London, Spon, Toronto, British Book Service, 1953. 210 pp., $1.50.

First published in nineteen hundred and twenty-one, and now in its fifth edition, 1953, this is a handy compendium for practical wiremen, electricians, engineers, contractors and architects. It is also prepared to be of value to students studying for the City and Guilds examination in electrical installation work.

Conversion data on work and energy units, British and metric equivalents, electrical symbols, graphical symbols for numerical values, the Greek alphabet and mensuration, along with general definition and electrical regulations are extremely useful additions to the volume.

The book itself is a thoroughly practical handbook for on the spot installation information, or for practical study purposes. It is well indexed, as well as being logically arranged, and should be a boon particularly to our younger electrical members.

***Foams; theory and industrial application.** J. J. Bikerman. New York, Reinhold publishing corp., 1953. 347 pp., $10.00.

This first complete treatise on foams reviews the literature and practice in the field and discusses the physical chemistry and industrial uses of foams. The first part of the book deals with the fundamental knowledge of the subject, and the second with applications in fire-fighting, froth flotation and in other miscellaneous applications such as building materials, plastics, etc. The last chapter is on chemical antifoaming agents. Extensive lists of references are included.

**Gas turbines.** Harry Sorensen. New York, Ronald press, 1951. 460 pp., illus., $6.50.

This volume received normal new book publicity by direct mail advertising in October, nineteen fifty-three, although the author completed his work on it in October, nineteen fifty.

It is just another example of what a number of technical publishers have been doing for some time, and which is most confusing to book dealers, librarians, and technical readers alike. When sales lag and stocks are still high, brochures come out which lead people to believe that a new edition of an old title has been published.

Although the author's references and acknowledgments throughout the volume seem copious, we fail to find, for instance, any reference to the very obvious assistance of Mr. D. G. Shepherd. One engineer very aptly described it, "it is a good collection of other peoples' work", useful in its way, in that it collects scattered data into one place, but this fact is also the obvious reason for its needing shot-in-the-arm publicity by the publishers at so late a date.

***Introduction to aeronautical dynamics.** M. Rauscher. New York, Wiley, 1953. 664 pp., $12.00.

Intended as a two-semester course for undergraduates, this text provides a thorough coverage of particle dynamics, fluid dynamics, airfoil theory, rigid dynamics, and vibration analysis.

The detailed analytical treatment is kept within the range of the student's mathematical background, the main object being to lay a solid foundation, along with the applied courses, for the subsequent study of aircraft stability.

**Manual of traffic engineering studies,** 2nd ed. Association of casualty surety companies. New York, The association, 1953. 278 pp., illus., $3.75 (U.S.)

Specially designed to meet the needs of communities with populations ranging from twenty-five thousand to five hundred thousand, this volume is now in its second edition, which is ample evidence of its value.

And this value is no doubt due to the very practical arrangement and presentation of its material.

The introductory chapter contains a general discussion of the importance and need of traffic studies, types of studies, basic transportation planning, traffic safety and parking surveys and their financing, and general survey planning.

The general text presents twenty-eight separate studies, ranging from all types of traffic rule observation, motor vehicle occupancy, rates of speed, parking, traffic trends, pedestrian volume, and staggered hours.

Appendices include an analysis of traffic trends, statistical treatment of traffic data, comparisons of studies and drawing up of questionnaires, the preparation of reports, and a seventeen item bibliography of selected traffic references.

Practically every page carries reproductions and graphs, charts, maps and forms for data collected, and no effort seems to have been spared to make this a most practical, as well as interesting and useful manual to all our members interested in traffic engineering or town planning of any type.

***Mechanical vibrations.** W. T. Thomson. New York, Prentice, 2nd ed., 1953. 252 pp., figs., $6.00 (U.S.)

Intended for a first course in the subject this text presents the fundamentals of vibration theory and provides a general background for advanced study in the field. The last two chapters deal with the vibration of elastic bodies and with electromechanical systems and analogics. Numerous problems are presented throughout to illustrate the method of analysis.

**Modern wiring practice.** W. E. Steward. London, Newnes, Toronto, British Book Service, 1953. 228 pp., illus., 1952. $4.00.

Wiring both for light and for power, on industrial and domestic premises, is covered in this volume, with numerous and detailed illustrations and pictorial diagrams.

Modern wiring systems and methods, and the use of steel, copper, aluminium, flexible metallic and non-metallic conduits, is thoroughly explained and illustrated.

The permissible deviations from standard practice are set out for temporary wiring for garden parties, etc., and the special techniques required for dealing with mineral insulated metal-shathed cables and paper-insulated metal-sheathed cables are dealt with in detail, along with earthing and installation-testing.

The volume is indexed, and appears to be number one in the Newnes Practical Electrical Engineering Series.

***Principles of transistor circuits.** R. F. Shea, ed. New York, Wiley, 1953. 535 pp., figs., $11.00.

This first comprehensive treatment of the subject divides roughly into three main parts covering essentially low-frequency, and large-signal non-linear applications. Each part includes the presentation and analysis of equivalent circuits, analysis of the mathematical relationship, and development of the applicable circuits. Basic semi-conductor principles are discussed, and the treatment throughout enables the engineer with vacuum-tube experience to utilize the material effectively.

***Protective atmospheres.** A. G. Hotchkiss and H. M. Webber. New York, Wiley, 1953. 341 pp., illus., $7.00.

The practical aspects of the subject are emphasized with the intent of providing an operating manual for process engineers and metallurgists. The first chapter gives a tabulated summary of data on compositions and costs of typical protective gases, processes for which they are used, and recommended gases for particular applications. Succeeding chapters develop the subject, with separate chapters on types of atmospheres, instruments, storage and handling, applications, and practical remedies for operating difficulties.

**The spirit of philosophy.** Marcus Long. Toronto, University press, 1953. 306 pp., $3.00.

The basis of this volume was a series of introductory lectures in philosophy, over a period of several years on the University of Toronto campus. Simple demand on the part of hearers resulted in the author presenting the information in book form.

The spirit of the enquirer, of the searcher for truth, rather than that of the teacher, permeates the volume, and the chapter headings give a good idea of the clarity and well thought out presentation of the subject on the part of the author.

They are, The meaning of philosophy, Things, Quality, Quantity, Space and time, Causality, Mechanism, Teleology, God, Value, Truth, Reason and Skepticism.

Classic, mediaeval, and modern philosophers and philosophies are all discussed under their appropriate headings, and a reading of this book should be a welcome relief to some of our members, in contrast to the usual technical publications listed in these pages.

**Standard RLM specifications for industrial lighting units,** 3rd rev. ed. Chicago, Reflectors and lighting equipment manufacturers standards institute, 1953. 52 pp., gratis.

These specifications for industrial lighting have been prepared by the Reflector and lighting equipment manufacturers standards institute as a standard which must be attained by manufacturers before the RLM label can be attached to their products. The Institute, therefore, provides a nationally recognized standard similar to those issued by the American standards association, the American society for testing materials, and other official bodies.

The specifications cover different types of porcelain enamel reflectors and fluorescent lamp units of varying lengths, from 48" to 96", and containing two or three lamps. In this edition, new specifications are included covering fifteen variations of semi-direct fluorescent units which direct twenty to thirty per cent of their light upwards. Revisions have also been made in existing RLM specifications.

**Standard specifications for highway bridges,** 6th ed. Washington, American association of state highway officials, 1953. 328 pp., $4.00 (U.S.)

These specifications are intended to serve as a guide in the preparation of State specifications for highway bridges, and also as references for bridge engineers. They apply to ordinary highway bridges with maximum span of 400 feet, and set forth minimum requirements which may be modified according to local conditions. Reference is made to relevant specifications of the American society for testing materials, the American welding society, the American wood preservers' association, and the American association of state highway officials.

The book is arranged in four divisions: General provisions, Construction, Design, and Materials. The first section covers general matters, such as award of contract, control of work, legal responsibility to the public, and payment for work. The second deals with all phases of construction, including excavation and fill, piles, different types of structure (concrete, brick, steel, and timber) painting, flooring, and railing. All aspects of design are covered in the section devoted to that topic, and there are many examples and tables. The last section covers materials used in construction, and gives required standards for each; here too frequent reference is made to the standards of the organizations listed above. Formulas for steel columns, and loading, constitute the appendices, and the standards are all

alphabetically listed in the back with reference to page and article number.

Even though intended primarily for use in the United States, this volume should prove useful to our members in Canada interested in bridge construction, as the application of the standards is general.

**The structural analysis of the dome of discovery.** T. O. Lazarides. London, Crosby Lockwood, 1952. 64 pp., illus., 25/.

The main framework of the Dome of Discovery roof consists of a triangulated system of rigidly connected aluminium alloy arch ribs, forming part of a sphere. Approximately equilateral spherical triangles are formed by these ribs, some lying exactly, and some approximately, on the circles of the sphere.

By taking full advantage of symmetry of structure and modern methods of analysis, work on the dome was reduced to manageable proportions.

The book is packed throughout with detail of statistical properties, limits of accuracy, influence co-efficient, conversion tables, operational tables, loads, stresses and support reactions, besides eighteen folded tables at the back of the book.

But in spite of all this detailed information, the chief value of the book lies in its general application of modern analysis methods, as the method devised by the author is applicable to any highly redundant space frames. For this reason it will be a welcome addition to the analysis field for both theory and practice.

**Theory and practice of structural design applied to reinforced concrete.** B. Eriksen. London, Concrete publications, 1953. 401 pp., figs.

"Due to the monolithic nature of reinforced concrete structures they are more often than not statically indeterminate, that is they cannot be analysed by means of the statical conditions of equilibrium. Although reinforced concrete structures may not be truly elastic they are considered to be so for the purposes of analysis, and the theory of elasticity is adopted as a means of obtaining additional data to enable the bending moments and forces to be determined."

Ordinary building frames can be provided with codes, by-laws, and approximate formulae for bending moments. For larger members, no one but the professional engineer can safely introduce simplifications.

The purpose of this volume is to enable students to apply the principles of statics and theory of elasticity to the design of structures for which formulae are not available.

Part one deals with elementary principles of statics, deformation, and strain.

Part two states the fundamental principles of the theory of elasticity, their adaptation to special types of structures and their translation to special methods, as related to statically indeterminate structures.

In cases where calculus is used to demonstrate principles and formulae, the meaning of integrals is explained in terms of simple mechanics and geometry.

The book carries a brief index, but a detailed table of contents.

**Welding practice.** E. Fuchs and H. Bradley, eds. Toronto, Butterworth, 1951-52. 3 v., illus., $8.50. v. 1, **Welding methods and tests,** 130 pp., $2.75; v. 2, **Welding of ferrous metals.** 198 pp., $3.50; v. 3, **Welding of non-ferrous metals.** 183 pp., $3.50.

Divided into three volumes, the aspects common to all applications of welding are collected in volume one. The other two volumes deal with the specific problems arising in the welding of the ferrous and non-ferrous metals groups respectively, making the first volume complementary to the other two.

The primary object of welding practice is to meet the needs of designers, draughtsmen, works and research engineers, engineering inspectors, and foremen in charge of welders, and in its original form it was a series of pamphlets prepared by members of the staff of Imperial Chemical Industries.

The glossary is the same in all three volumes, but the indices are separate and individual to each volume, and are in good detail.

The editor makes no claims to have included bibliographies, but publications listed with the chapters are those considered specially important and of practical use.

# the Civil Engineer and FAIRBANKS-MORSE

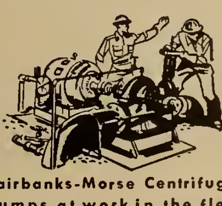
The Civil Engineer . . . builder of roads, railways, bridges, dams . . . builder of a greater Canada. Through his skill and knowledge Canada's power and transportation facilities are constantly expanding—pushing back our frontiers in the development of a great treasure chest of natural resources.

In the twentieth century's mechanization the engineer is a key figure . . . member of a profession that is working steadily and successfully to extract the greatest value from our natural resources—to improve manufacturing techniques—to increase knowledge and in so doing contribute to a better way of living.

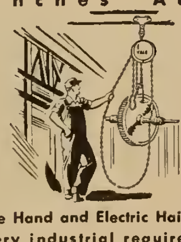
Fairbanks-Morse has been privileged to work with the engineer in Canada for over 50 years. This is chiefly due to the engineering products and services available at our sixteen branches across Canada . . . equipment such as Fairbanks-Morse Diesel Engines, Generators, Pumps, Scales, Machine Tools and Materials Handling equipment, as well as a wide range of supplies for contractors, railways and general industry.

THE CANADIAN
**FAIRBANKS-MORSE**
COMPANY LIMITED
Sixteen Branches Across Canada

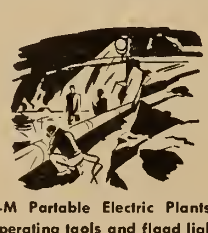
Thor Pneumatic Tools for mining and construction work



Fairbanks-Morse Centrifugal Pumps at work in the field



Yale Hand and Electric Hoists for every industrial requirement



F-M Portable Electric Plants for operating tools and flood lighting

Marine and Stationary Diesel engines and electrical equipment

FM

**British Standards, British standards institution, 24-28 Victoria Street, Westminster, London, S.W.1. British standards are available from the Canadian standards association, National research building, Ottawa, Canada.**

**B.S. 1133: Section 4:1953—Packaging code for mechanical aids in package handling.** 6/–.

Packers are often discouraged by the evidence of poor handling of containers in transit and there is little doubt that much of the damage sustained by packages is due to inefficient handling. There is little that the packer can do to control the treatment given to his goods after they leave his factory. There is, however, a great deal that can be done to improve the handling of packaging materials and filled containers during movement from one part of the factory to another or during the loading on to vans or wagons for the first stage of their journey. Manual handling, however experienced the operator, is expensive in time and labour and the use of an efficient system of mechanical handling generally results in a reduction of accidents with a consequent greater safety to the operatives and less damage to the goods.

With this in mind B.S.I. has prepared this section of the Packaging Code dealing with mechanical aids in package handling. It describes the many types of equipment available and gives notice to assist users in selecting equipment and using it to the best advantage. This section contains about 80 illustrations of typical pieces of equipment likely to be of use to packers.

**B.S. 1728: Part 5:1953—Methods for the analysis of aluminium and aluminium alloys. Copper (absorptiometric method).** 2/–.

The British Standards Institution has just published Part 5 of B.S. 1728 'Methods for the analysis of aluminium and aluminium alloys'.

This British Standard method for the absorptiometric determination of copper is intended for use with alloys containing smaller percentages of copper than those covered in B.S. 1728, Part 1 (of the order of 0.01 — 0.3 per cent.)

The method specifies the reagents used, recommended methods of sampling and test procedure. An indication of the reproducibility expected is given and is derived from experiments carried out by a number of independent analysts.

**B.S. 2032: 1953 — Aluminium bronze rods, sections and forgings for general engineering purposes.** 2/6.

**B.S. 2033: 1953 — Aluminium nickel iron bronze rods and forgings for general engineering purposes.** 2/6.

These standards have been prepared to reduce the number of alloys in this field, the two compositions chosen being those which have characteristics and mechanical properties which cover as far as possible all known applications.

In B.S. 2032 the composition is a compromise between those of two Ministry of Supply material specifications D.T.D. 160, 'Aluminium bronze for valve seats, and D.T.D. 174 'Aluminium bronze sand or die castings', while in B.S. 2033 it approximates to that of D.T.D. 197 'Aluminium nickel iron bronze bars, forgings and stampings'. It is hoped that these two British Standards will be used wherever aluminium bronze is required for general engineering purposes.

**B.S. 2039: 1953 — Enamelled round copper wire (Enamel with vinyl acetal base) (Metric units).** 4/–.

The British Standards Institution has now published as B.S. 2039: 1953, a metric edition of B.S. 1844 which has the same title. This has been prepared primarily from the point of view of exports and it differs from the 1952 edition of B.S. 1844 only in that all qualities are expressed in metric units, and the range of diameters covered is 0.050 mm. to 4.00 mm.

For normal purposes in the United

Kingdom, B.S: 1844 is still the appropriate standard to be used. The technical details contained in the new specification are taken entirely from B.S. 1844, with the addition of an appendix giving constants for converting resistances of annealed high-conductivity copper at various temperatures to the standard temperature of 20°C. It gives details of diameters, resistances and thickness of enamel (including tolerances) together with tests on the enamel insulation. These tests relate to hardness, flexibility and adhesion, heat shock, heat ageing and electric strength.

**Canadian standards, Canadian standards association, National research building, Ottawa, Canada.**

**C.S.A. B89.3-1953—Automobile fire fighting equipment.** $1.75.

This specification on Automobile fire fighting apparatus covers types of apparatus which are believed to fit the needs of the average town or city. It covers the minimum requirements and performance of the following types of apparatus: Pumper (Triple Combination); Ladder Truck (Aerial); Ladder Truck and Pumper (Quadruple Combination).

The rating of pumpers, the capacity of pumps, and the standard which they should reach are all discussed. In addition to the material dealing with the actual pump, the standard lists requirements for the automobile or truck to which the pump is connected. Here are included such topics as ignition, wiring, clutch, tires, lights, etc. It also deals with the question of hose and ladders.

Additional sections list the equipment, both "basic" and "extra", which is carried on fire fighting apparatus.

This second edition has been drafted with two objectives. First, to bring the technical and performance requirements into closer harmony with the equipment normally available on the Canadian market, without depreciating the Standard, and second, to establish a specification consistent with the testing and listing requirements of the Dominion Board of Insurance Underwriters.

**C.S.A. C22.2 No. 90-1953—Construction and test of mechanisms and motors for sound recording and reproducing equipment.** 75 cents.

This specification applies to mechanisms for record players, recording mechanisms and motors for these mechanisms intended as components for approved phonographs, radio-phonographs, record players, or recording apparatus, and designed to be used on supply circuits operating at not more than 150 volts to ground, employed in accordance with the rules of Part I of this Code." It covers both domestic and commercial use, and includes record changers, wire or tape recorders, or any other form of recording in addition to standard disc recording.

The topics under the heading Construction include motors, switches, conductors, bushings, wiring, insulation, and spacings. Where applicable, the specifications of the C.S.A. to which individual parts should comply are listed.

The final sections of the specification enumerate the approval tests for the equipment.

**C.S.A. C22.2 No. 106-1953 — Construction and test of HRC fuses (Low-voltage power fuses).** $1.00.

HRC (High-Rupturing Capacity) fuses are used for the protection of electrical circuits and equipment and in particular where the fuses covered by the latest issue of CSA Specification C22.2 No. 59. 'Fuses (Both plug and cartridge-enclosed types)' are unsuitable or inadequate because of insufficient rupturing capacity. This Specification applied to HRC non-renewable cartridge fuses to be employed in accordance with the rules of Part I of this Code, and for the following voltage and current ratings:

(a) At 600 volts a-c, for current-ratings up to and including 600 amperes;
(b) At 250 volts a-c, for current-ratings up to and including 600 amperes;
(c) At 600 volts d-c, for current-ratings up to and including 600 amperes;
(d) At 250 volts d-c, for current-ratings up to and including 600 amperes.

Included in the Specification are information on general requirements, construction and marking, and temperature and overload tests, and rupturing-capacity tests.

**C.S.A. C22.3 No. 1 (D)-1953. Rules, requirements and specifications for the joint use of poles to support supply and communication circuits.** $1.00.

The recent expansion in construction of power and communication lines has emphasized the need for a specification providing guidance for the solution of problems arising out of this construction. The specification is intended to apply to steel and concrete poles, as well as to wood poles, although the requirements may be subject to modification for the former. The standard lists general requirements for pole steps, vertical runs, communication suspension strands, climbing space, insulators, etc. Sections 2 and 3 deal with clearances and separations and strength requirements, whilst the Appendices and plates cover such topics as timber strength separation between line conductors, street lamp installation, clearance of communication cables from luminaire bracket, and a typical crossover attachment.

**C.S.A. Z102.12T-1953. Temporary specification for corrugated fibreboard boxes and products for use by defence services.** 75 cents.

This specification is intended to provide appropriate requirements for the purchasing of containers of this type, by the Defence Services, and also to specify the details of suitable containers for shipments of products required on government contracts. It is not intended to apply in cases where authorities having jurisdiction specify the details for containers for special products, such as explosives, which are to be transported by rail or motor vehicle.

Pending the rendering of a decision by the Canadian Freight Association, in the matter of Revision of Rule 1 of the Freight Classification, this Specification is published as "Tentative".

The standards listed all apply to corrugated fibreboard, and cover 3 types of boxes; cutout wrappers; liners; cells; pads; sheets and rolls.

**American Standards, American standards association, 70 East 45th Street, New York 17, N.Y.**

**A21.2-1953 — Cast iron pit cast pipe for water or other liquids.** 45 cents.

**A21.3-1953 — Cast iron pit cast pipe for gas.** 25 cents.

**A21.4-1953 — Cement mortar lining for cast iron pipe and fittings.** 35 cents.

**A21.6-1953 — Cast iron pipe centrifugally cast in metal molds, for water or other liquids.** 40 cents.

**A21.7-1953 — Cast iron pipe centrifugally cast in metal molds, for gas.** 25 cents.

**A21.8-1953 — Cast iron pipe centrifugally cast in sand-lined molds, for water or other liquids.** 45 cents.

**A21.9-1953 — Cast iron pipe centrifugally cast in sand-lined molds, for gas.** 25 cents.

**A21.11-1953 — A mechanical joint for cast-iron pressure pipe and fittings.** 35 cents.

These eight standards, together with A21.10-1952 — Short body cast-iron fittings, 3 inch to 12 inch, for 250-p.s.i. water pressure plus water hammer — provide uniformity in methods of determining the thickness and length of cast iron pipe, depending upon the pipe's diameter and the pressure it must withstand. These specifications, dealing with both spun pipe and cast or molded pipe, also include data on reasons for failure of cast iron pipe and methods for preventing corrosion.

The standards were developed under ASA Committee A21, which was formed in 1926 to undertake this project. Committee chairman since that time has been Thomas H. Wiggin, consulting engineer. Mr. Wiggin represents the American Water Works Association in the project.

Mr. Wiggin stated: "Our committee has one important task remaining. That is to recommend dimensions, thicknesses, and pressure ratings for fittings over twelve inches in diameter. This is the committee's present undertaking."

The committee, organized under the auspices of ASA, is made up of 35 producers, users and other groups interested in standardization of cast-ron pipe. Administrative leadership of the project was furnished by the American Gas Association, American Society for Testing Materials, American Water Works Association, and New England Water Works Association, acting as sponsors.

## BOOKS RECEIVED

**British standards 1953 year book.** London, British standards institution, 1953. 488 pp., $2.25.

**Ceiling unlimited.** Lloyd Morris and Kendall Smith. Toronto, Macmillan, 1953. 417 pp., illus., $7.25.

**Central building research institute, Roorkee** — Issued on the occasion of the opening of the Institute, April 12, 1953. New Delhi, Council of scientific and industrial research, 1953.

**Communication theory.** Willis Jackson, ed. Toronto, Butterworth, 1953. 532 pp., $11.00.

**Defense and the dollar.** A. G. Hart. New York, Twentieth Century Fund, 1953. 203 pp., $2.00 (U.S.)

**Design for decision.** I. D. J. Bross. Toronto, Macmillan, 1953. 276 pp., $4.75.

**Design in structural steel.** J. E. Lothers. New York, Prentice-Hall, 1953. 454 pp., figs., $10.00 (U.S.)

**Economic controls and defense.** D. W. Wallace. New York, Twentieth Century Fund, 1953. 260 pp., $2.00 (U.S.)

# Business & Industrial Briefs

## *A Digest of Information received by* The Editor

## Appointments and Transfers

**Shawinigan Chemicals Limited.** — Hugh D. Ross, senior superintendent of the plants of Shawinigan Chemicals Limited at Shawinigan Falls, and superintendent of the carbide division, has been appointed assistant vice-president of the Company at the head offices in Montreal, it is announced by V. G. Bartram, president.

Mr. Ross is being succeeded as superintendent of the carbide division by A. Clifford Holm, formerly manager of the research department of the parent Shawinigan Water and Power Company.

Three new appointments among staff of Shawinigan Chemicals Limited were also announced.

D. C. Downing, until now stationed in the research laboratories at Shawinigan Falls, has been transferred to the Montreal office as assistant director of the development department. Conrad Monfet, a member of the same department, has been appointed economic analyst, and John F. Goudey has been named development engineer in the Montreal Office.

G. E. Hill, Q.C.

**B. F. Goodrich.**—V. O. Griffin, manager of belting and hose of B. F. Goodrich in Canada, joined the International Division of the company in Akron in January, 1954. The international promotion was announced by H. P. Hawkins, general manager of the Industrial Products Division.

M. E. Bailey has been promoted to manager of the Belting and Hose Sales.

**Toronto Brick Co. Limited.** — The Company wishes to advise that on and after January 11, 1954 their head office and showroom will be located in new quarters at 425 Bayview Avenue, Toronto.

**Peacock Brothers Limited.**—Effective January 1, T. P. Wall, formerly in charge of the company's sales to the pulp and paper industry, has moved from Montreal to become manager of the Toronto office. He succeeds W. S. Mills, who is forming a new industry sales division known as the waterworks and sewerage department, with headquarters in Toronto. At the same time, H. N. Hill has taken over the management of the pulp and paper department.

**Trane Company of Canada Limited.**—Grant E. Cole, executive vice-president and general manager of Trane, announced that at a recent meeting of the Board of Directors, E. C. Phillips and G. E. Hill, Q.C., were elected directors of the company.

Mr. Phillips is vice-president and assistant general manager. Mr. Hill is a partner in the law firm of Holmstead, Sutton, Hill and Kemp and a director of other companies.

At the same meeting Wayne J. Hood was appointed treasurer and L. V. Sutton, Q.C., secretary.

**Dahl Brothers.**—Dahl Brothers (Canada) Limited announces the appointment of Ross Watson and H. Willy Kennals as sales representatives to the plumbing and heating trade in the Province of Ontario.

**John Fisher.** — John Fisher, internationally-known Canadian, has been appointed to the board of directors, BLM Automatic Clutch Corp., it was announced by N. Bruce Wilson, president and chairman of the board.

(*Continued on page 225*))

E. C. Phillips

(*Continued from page 221*)

**Chrysler Corporation of Canada, Limited.**—W. E. McGraw became a member of the company's management staff after serving for 24 years as chief engineer. J. P. Cummings will succeed him as chief engineer.

●

**Letourneau-Westinghouse Company.**—W. E. Hendricks, who has served as assistant to the general sales manager for Letourneau-Westinghouse Company since last June, has been named domestic sales manager, company officials announce.

Also announced is the appointment of Lloyd Rager as sales promotion manager.

●

**Union Carbide Canada Limited.** — William B. Humes has been named manager of operations for Union Carbide Canada Limited, it was announced by Ewart Greig, president.

**William B. Humes**

●

**B. F. Sturtevant Company.**—K. W. Kraser, general manager of the B. F. Sturtevant Company of Canada Limited has announced the appointment of K. J. Dewhirst to the post of manager of sales for Canada.

Douglas G. Forster will assume managership of the B. F. Sturtevant Company Toronto district office, succeeding K. J. Dewhirst.

●

**Taylor Instrument.** — Taylor Instrument Companies of Canada Limited have recently completed a move to expanded facilities in Montreal.

Taylor's new address is 190 Rockland Road—at Graham Boulevard traffic circle, in the Town of Mount Royal. Telephone numbers are REgent 3-8246-7.

The Montreal staff has been augmented by the appointment of R. H. Shand to sales.

●

**New Office Location.** — Mickelson & Fraser, Engineers and Architects, announce the removal of their offices from the Cuthbertson Block Fort William, Ontario to Mills Building, 16th Avenue at Memorial Avenue, Intercity.

●

# New Equipment and Developments

**Advanced Welding Course.** — The Canadian Welding Bureau, division of the Canadian Standards Association, Ottawa, announces that details are now available concerning the major options of an advanced welding course.

Written by university professors in conjunction with the Bureau's staff of welding engineers, the course has been sanctioned by the Bureau's Board of Directors as a result of requests from engineers and others for a course more advanced and complete than that originally sponsored by the Bureau and entitled "Welding Fundamental Principles and Practices."

Consisting of a number of options, the advanced course will be made available over the next two or three years. These will include: The Elements of Structural Steel Design (An Introductory Course), Structural Design, Mechanical Design, Metallurgy, Resistance Welding, Submerged Melt and Inert Gas Welding, Inspection, and Welding Physics.

Details of each of these options with date of commencement and duration, together with fees and instalment payment plan may be obtained from the Canadian Welding Bureau, 1393 Yonge Street, Toronto.

●

**Welding Goggle "Defroster".**—A new ventilation principle has been developed by Dominion Oxygen Company, Ltd., to provide welding goggles that won't steam up or fog even in hot damp weather. The Oxweld No. 24 coverall goggles depend upon a steady stream of air to prevent steaming and moisture condensation. Sixteen vents, located behind the lens retaining rings, permit continuous circulation of fresh air across the inside surface of the lens.

●

**Monsanto Canada Limited.**—Start-up operations of Monsanto Canada Limited's new $400,000 petroleum additive plant at Montreal began recently with production of the first run of crankcase additives entirely manufactured in Canada.

Scheduled for initial production are several types of detergents and inhibitor additives, both essential components in modern high-performance engine oils. Certain special compounds for gear lubricants will also be manufactured.

●

**German Industries Fair Hannover.**— The German Industries Fair will take place next year, not in two parts as in the past few years, but in one gigantic display on the Hannover Trade Fair Grounds which will cover both consumer and industrial goods, and will be open from April 25 to May 4, 1954.

●

**New Machinery Quarters.**—Plans have been completed and a contract awarded for the erection of a modern building on Kempt Road for the construction machinery division of William Stairs, Son and Morrow Limited, A. D. Stairs, president of the old Halifax firm announced recently.

Cameron Contracting Limited has been awarded the contract for the building, which was designed by J. Philip Dumaresq and Associates.

●

**New Office and Warehouse.**—Canadian General Electric Company's new office and warehouse building at 5000 Namur Street, at Decarie Boulevard, in suburban Montreal, opened for business on January 1. The building, which serves the Province of Quebec generally —with the exception of the Ottawa trading area—will be occupied by the Montreal staffs of the company's Wholesale and Industrial Products Divisions.

●

**Refractories and Plastics.** — J. L. Spence, president of Refractories Engineering & Supplies Limited, announces the opening of the Company's new plant at Bronte, Ontario. This new plant will manufacture, under license, internationally known refractory specialties: plastics, castables and cements.

●

**Carboloy Tools.**—According to Canadian General Electric Company's Carboloy Sales the surface finish on a carbide tool tip has little effect on tool life for average machining on steel. During roughing operations, it points out, carbide tools perform satisfactorily whether they are ground on a diamond or silicon carbide grinding wheel — or even if left with the surface in as-sintered condition.

These are the surface finishes which can be obtained on cemented carbides by various methods of grinding or lapping.

As-sintered carbide tools provide a tool surface finish of 30 plus micro inches. Those ground on silicon carbide grinding wheels provide 15 plus micro inches. Eight to fifteen micro inches are obtained with diamond grinding wheels, and lapping and super finishing reduce surface finish to 0.5 to 5 micro inches.

Tests conducted indicate that a lapped or superfinished tool fails more rapidly in making roughing cuts than one ground on a diamond wheel. This is because the lapped surface over which the chip slides offers more area contact, increasing both the rate of heat transfer from chip to tool tip and friction due to sliding. A slightly rougher tool offers less surface contact and operates at lower temperatures.

Tools employed for finishing and precision finishing aluminum, magnesium, etc., must have a good surface finish. Lapping of the top face and cutting edges is a must for good tool life.

For a precision finishing operation involving steel, it is necessary to finish grind the tool cutting edges with a diamond wheel. Long-run jobs, using quick-change tool holders, require the use of a duplicating type grinder to control uniformity of the cutting tool shape. These duplicating grinders often use a 400 grit resinoid bonded diamond wheel. But in this operation, very little stock is removed since it is more of a truing up operation.

Rough grinding of precision finishing tools may be done by off-hand grinding with a 100-grit silicon carbide or diamond wheel.

●

**Cast Iron Segments.**—A delegation of engineers of the Port of New York Authority visited the Bethlehem Steel Company plant to watch the manufacture of segments for the Lincoln Tunnel between Manhattan and New Jersey.

They began their tour at the iron foundry where 50 of the 3,400 pound segments are being poured daily. The hot metal is brought to the mold by ladle from a cupola with an hourly capacity of 25 to 30 tons. The segments are made individually, the metal being poured into a long row of molds on the foundry floor.

●

**Diesel Locomotives.** — An increase in horsepower, up to 17% is one of the major features of the improvements in a new line of six types of railroad locomotives announced by General Motors Diesel Limited, at London, Ontario.

Most of the increases in ratings or in service life stem from the introduction of a new General Motors diesel engine, the 567 C series, upon which General Motors engineers have been working for five years; and from a new traction motor which has been so greatly improved that it has "made possible the elimination of arbitrary short-time ratings for all models and all gear ratios."

Deliveries of the six types of new locomotives began January, 1954.

●

**New Testing Station.** — Underwriters' Laboratories of Canada marked the formal start of construction of their 10,000 square foot office and laboratory at a simple ceremony held recently at the new Scarborough, Ont., site.

The office and laboratory will provide the nucleus for an extensive long range building program designed to provide up-to-date and complete facilities for the Laboratories.

●

**Blasting Agent.**—A blasting agent, powerful, yet not subject to accidental detonation by blasting caps, flame, friction, or impact, including that of a rifle bullet, is now being produced in Canada for use in mine and open-quarry blasting.

Know as "Nitrone" it is manufactured in Canada by Canadian Industries Limited in a plant recently constructed at C-I-L's commercial explosives works at Beloeil, Que.

Nitrone has no liquid content and is packaged for use in sealed metal cans. In addition to its safety feature, it is not affected by water as long as the can is not punctured or by any outdoor temperature experienced in Canada.

Nitrone was first introduced in the United States in 1935, and has found widespread use in that country for many surface blasting operations.

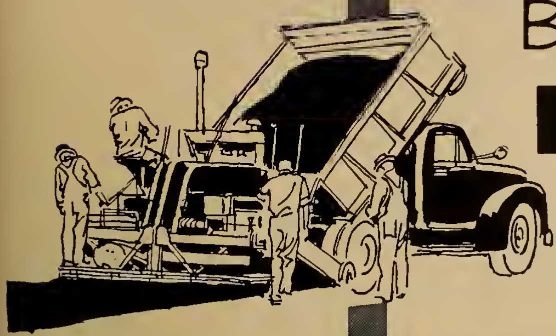
●

**Employee Participation.** — Canadian Westinghouse employees were in line for a $40,000 windfall after the company asked for their help in an all-out drive to meet competition.

In announcing that the firm will double suggestion awards, vice-president W. A. Campbell said, "The decision is part of a determined effort to maintain a competitive position and improve job security. Many of the best ideas on quality improvement, waste reduction and better manufacturing methods come from people who build or service our products."

A pioneer in the use of suggestion plans, Westinghouse receives 2,500 ideas

*(Continued on page 230)*



Better roads begin with

# IMPERIAL ESSO PRODUCTS

# IMPERIAL ASPHALT

MEMBER
CANADIAN GOOD ROADS ASSOCIATION

Roads built of Imperial Asphalt are easy-riding and long-lasting . . . more economical to construct and less expensive to maintain. Imperial Asphalt is available for all types of applications on highways, driveways, sidewalks, or anywhere a smooth, durable, waterproof surface is desired. Enquire about the many advantages of paving with Imperial Asphalt.

*Other fine products for the highway builder—*

**ESSO AND ESSO EXTRA** Gasolines that give a better combination of power, acceleration, and mileage on hauling and road-building operations.

**MARVELUBE CHASSIS LUBRICANTS** High-quality lubricants that lower maintenance costs by helping to reduce wear under all conditons of service.

**IMPERIAL ESSOLUBE HD** A detergent-type, heavy-duty motor oil that helps keep engine upkeep to a minimum, stands up to tough working conditions.

**MARVELUBE GEAR OILS**
Give reliable lubrication when you need it under all types of heavy service and gruelling wear.

## IMPERIAL OIL LIMITED

IMPERIAL ESSO PRODUCTS

(*Continued from page 226*)

annually for reducing costs or improving products and services.

**Power Contract.** — Prime Minister Duplessis announced a contract by which the Quebec Hydro-Electric Commission will sell the Shawinigan Water and Power Co., 400,000 horsepower of electrical energy from the Commission's giant development on the Bersimis River.

The Bersimis hydro electric development, now under construction on the Bersimis River about 90 miles above its confluence with the St. Lawrence, and about 200 miles northeast of Quebec, will have a capacity, eventually, of nearly 2,000,000 horsepower. The first generators are expected to be in operation late in 1956.

**Production Cut.** — The Consolidated Mining and Smelting Company announced that owing to unfavourable market conditions it has become necessary to curtail certain of its zinc operations. The zinc oxide plant and one slag fuming furnace was shut down at the year end. In excess of 200 men are normally employed in the operation and maintenance of these plants. The cut in production will amount to 130 tons of slab zinc per day or about 25 per cent of the Company's present output. Cominco officials, in expressing their regrets at this unavoidable curtailment, said that employees hired since early 1951 would probably be affected.

**New Passenger Cars.**—C.P.R. recently announced a 38 million dollar order of stainless steel streamlined passenger cars. The most outstanding of the many new features of the equipment will be the "Scenic Dome" cars, which the Canadian Pacific will introduce for the first time on any railroad in Canada. The new cars will be placed in service as received.

**Pallet Rack.**—A new economical and sturdy pallet rack which can be instantly erected or dismantled is now available. It is an all welded construction, fabricated from heavy gauge steel tubing which combines great stability with economy. The "L" sections hook into the "H" sections without use of nuts and bolts or wrenches.

Sections are set in place as they are unloaded from the transport or railway car. Literature on request from Service Steel & Engineering Ltd., 232 King Street East, Hamilton, Ontario.

**Plant-Office Addition.**—The diversity of its own lines is to be seen in the new plant-office addition to the Toronto division of Westeel Products Ltd.

In addition to the steel roof deck and newly developed windows, hollow metal doors, door frames, skylights, office and toilet partitions, lockers, counters, cabinets and shelving are products of the company's own plants.

The new addition has also made it possible to increase production facilities for the wide variety of sheet metal products now being fabricated by the Toronto division.

**Engineering and Manufacturing Alliance.** — Riverside Iron and Engineering Works, Ltd., of Calgary, Alberta, manufacturers of coal preparation equipment have formed an engineering and manufacturing alliance with the McNally Pittsburgh Corporation of Pittsburgh, Kansas, it was announced by Mr. Thomas Bishop, manager of the Riverside Iron and Engineering Works, Ltd.

Under the arrangement all McNally Pittsburgh engineering services, patents, drawings, etc., will be placed at the disposal of the Riverside Iron and Engineering Works, Ltd.

**Basic Materials Exposition.**—A group of 14 leading industrialists will serve as a board of sponsors for the second Basic Materials Exposition, the product development show, which will be held at the International Amphitheatre, Chicago, May 17-20, it was announced by Clapp & Poliak, Inc., New York, producers of the event. Don G. Mitchell, chairman of the board, Sylvania Electric Products, Inc., New York is chairman of the sponsoring board.

**Metal Detector.** — A general-purpose metal detector which can be installed around conveyor systems without cutting the belt and can be adapted to special applications, is available from Canadian General Electric Company's Apparatus Division.

The new device can be used in manufacturing processes involving the inspection of non-magnetic and non-conductive materials. Belt speeds can range from 90 to 500 ft. per minute.

In operation, the device detects metals by perceiving the effect of the metal particles on the characteristics of an inductance bridge circuit. The coils which make up the inspection unit are elements of this bridge circuit, and a metal particle coming into the inspection aperture causes the bridge to become unbalanced electrically. The output (or unbalance signal) of the bridge is then amplified and used to operate an appropriate alarm or control.

**Transducer System.**—After three years' research and development work in collaboration with the Research Laboratories of The General Electric Co. Ltd. of England, a new system for measuring pressures, temperatures and mechanical movements electrically and indicating the results at a distance has been introduced by The British General Electric Co. (Canadian) Ltd. This new system is a development of the original electro-mechanical converter system and introduces a smaller transducer with a wide range of applications. These include the direct measurement of mechanical movements of 0-20, 0-50 and 0-100 thousandths of an inch by a spring-loaded stylus, the measurement of pressures, utilizing a diaphragm or other pressure mechanical conversion device, and the measurement of any quantity which can be converted into a mechanical movement.

The instrument, which is of similar construction to the standard moving coil switchboard instrument with a 100° scale, may be located at any distance from the transducer, provided the resistance of any one conductor does not exceed 25 ohms. To prevent errors due to stray a-c. pick-up, all three conductors should run within the same cable or conduit. With the standard type of 3-core cable, the maximum distance between the transducer and the instrument is 1,000 yards, but greater distances are permissible.

If desired, certain types of a-c. potentiometric recorder may be used in place of the instrument, whilst it is possible to switch the output of up to ten transducers on to one instrument.

# Publications

**For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.**

**Please mention *The Engineering Journal* when writing.**

**Outdoor Bushings.**—A manual of Outdoor Bushings, Technical Data H-33-156, is available from Westinghouse District offices.

A general description, electrical characteristics and operating power factor curves are given in the introduction.

Also included are, dimension tables, bushing outline and detail assembly drawings, and handling, installation and maintenance instructions.

**Thermocouple Protection Tube.**—Publication of a new bulletin describing a metal-ceramic thermo-couple well, just put on the market, has been announced by the Bristol Company of Canada Limited, 71-79 Duchess Street, Toronto. The bulletin outlines all properties and specifications of the new protection tube, which combines the thermal conductivity and shock resistance of metal with the corrosion and deformation resistance of ceramics. The wall of the tube has the same thermal conductivity as cast iron, and although it is only 1/8 inch thick, only single wall construction is needed.

The bulletin is available from the company.

**High Slip Motor.** — A new four-page bulletin describing the company's totally-enclosed, fan-cooled, high-slip induction motor for punch press service has been announced as available from the Canadian General Electric Company, 212 King Street West, Toronto.

Designated as GEA-5968, the four-colour publication discusses the design of the Type KRX motor and explains how an extended bar rotor helps reduce the problem of rotor heat. Cutaway drawings illustrate the ventilation and construction features of the motor which is specifically designed for heavy-duty high-inertia applications on drawing and forging presses in the automotive and metal working industries. Also included are rating and frame sizes, a speed-torque curve, and detailed dimension information.

**Hypochlorite Specification.**—Tentative specifications for calcium and sodium

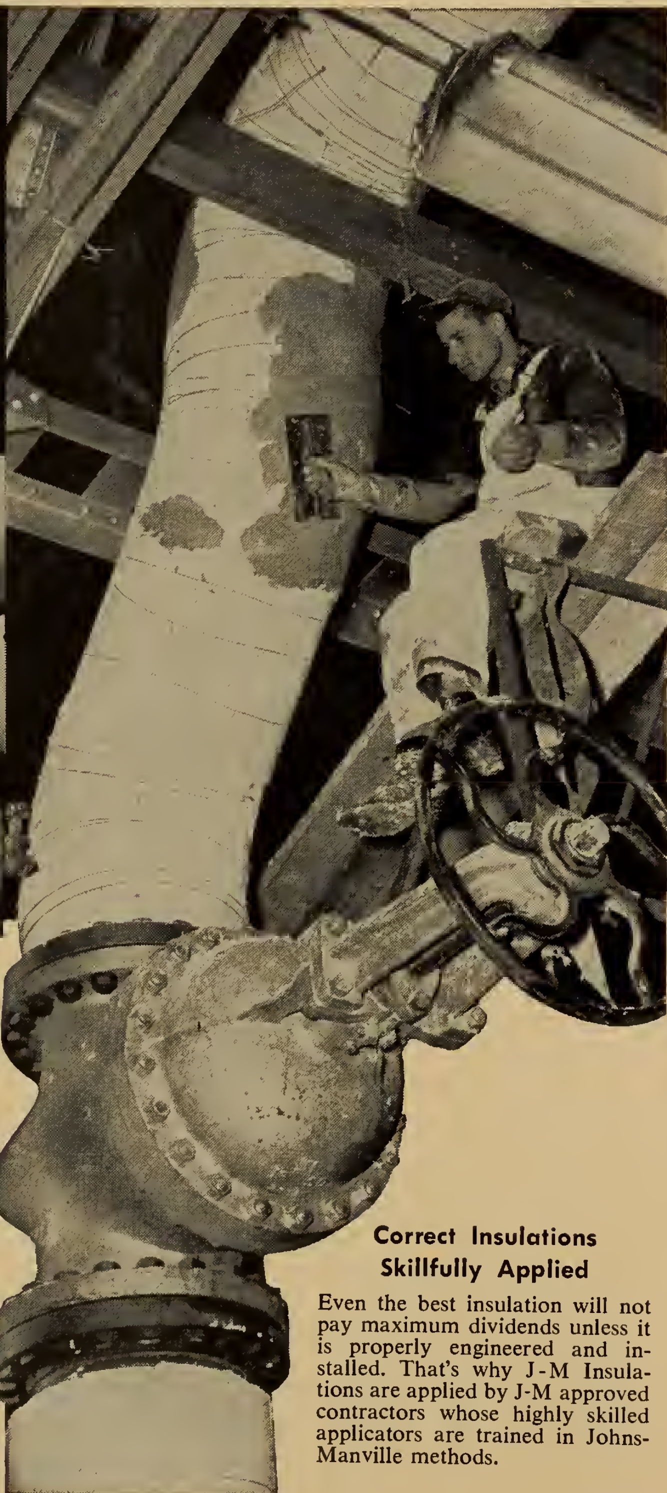
# THERE ARE FUEL SAVINGS IN FORD'S FUTURE!

**At the mammoth Oakville assembly plant, over 63,000 feet of steam and water lines are insulated with J-M 85% MAGNESIA and J-M WOOL FELT**

(Above) A partial view of the 1700 foot underground tunnel which houses mains carrying steam and water from power house to assembly plant.



It's not necessary to gaze into a crystal ball to forecast years of top performance from the J-M Insulations installed at Ford-Oakville. Past records prove that these quality insulations will pay dividends through the years in maximum fuel savings.

Johns-Manville's "New Process" 85% Magnesia is Canada's leading insulation for temperatures up to 600F. Bonded with asbestos fibres, this rugged insulation will not distort regardless of the length of time it stays in service. It fits snug and stays put. Heat savings, therefore, remain constant for the life of the equipment on which it is applied.

To meet industry's varied needs, Johns-Manville manufactures insulations that span the entire range from 400F below zero to 3000F above. If you are contemplating an insulation installation, it will pay you to contact J-M. For details write Canadian Johns-Manville, 199 Bay Street, Toronto.

JOHNS-MANVILLE JM PRODUCTS

**Correct Insulations Skillfully Applied**

Even the best insulation will not pay maximum dividends unless it is properly engineered and installed. That's why J-M Insulations are applied by J-M approved contractors whose highly skilled applicators are trained in Johns-Manville methods.

*(Continued from page 230)*

hypochlorites for water treatment have been published by the American Water Works Association, 521 Fifth Avenue, New York 17, New York, and may be obtained upon advance remittance of 20c. The 7-page standard, known as AWWA B300, includes material specifications and standards for sampling, inspection, packing, marking and testing.

●

**Underwriters' Products List.**—Distribution has commenced on the latest list of inspected appliances, equipment, and materials, published annually by Underwriters' Laboratories of Canada. The list is dated September, 1953, and supersedes the 1952 edition with the March, 1953, Supplement thereto.

The present list, which has 172 pages compared to 152 in 1952, contains 537 listings (467 in 1952) of products which have been examined and tested as to their life, fire, and casualty hazards, and crime prevention.

Requests for copies should be addressed to the Head Office at 340 Richmond St. West, Toronto 2B, Ontario.

●

**Fire Protection.**—A number of colorful bulletins have been issued by the Automatic Sprinkler Company of Canada, Limited, 7000 Jeanne Mance Street, Montreal.

"The ABC of Fire Protection" and "Design and Application of Automatic Fire-Fog" are included.

Complete information may be had from the company.

●

**Electric Plants in Africa.**—The story of four Onan electric plants, and how they performed their rugged duties in the heart of darkest Africa is told in a beautifully illustrated, 28-page booklet written by Commander Attilio Gatti and published by D. W. Onan & Sons Inc.

Gatti describes his life "on location" in the heart of Zululand and the many problems involved in taking moving pictures of wild game in the jungle. Photographs taken by the expedition illustrate the booklet which is available, free from D. W. Onan & Sons Inc., Minneapolis 14, Minn., upon request.

Ask for the booklet "Onan on Safari."

●

**Flooring Materials.**—Following numerous requests, a revised and more comprehensive edition of Webster & Sons Limited book on flooring materials has been prepared. Copies available from Webster & Sons Limited; 724 Canada Cement Building, Montreal 2, Quebec.

●

**Pumps.**—Catalogues showing the line of Aurora turbine-type and centrifugal pumps are available from the Air Conditioning Engineering Company (Canada) Limited, 636 St. Paul Street W., Montreal. Each catalogue consists of eleven pages, and includes three separate sheets of table to help in the rapid selection of pumps for hot water heating and for cold water circulation or for cooling towers.

List prices are also available from the company, with the necessary horse power data for the motor required to drive the pumps at different loads.

●

**Plastic Pipe.**—A new booklet describing Uscolite plastic pipe, fittings, and valves has been issued by Mechanical Goods Division, Dominion Rubber Company Limited.

The booklet lists both the physical and chemical properties of Uscolite, and includes complete directions for handling and installing in use. Dimensions of pipe, fittings, and valves, and recommended working pressures, are also given.

Copies of the folder are available from any Dominion Rubber Company branch.

●

**Announcement of New Publication.**—Tables of Coefficients for the Numerical Calculation of Laplace Transforms, National Bureau of Standards Applied Mathematics Series 30, 36 pages, 25 cents.

The tables presented served to facilitate the numerical evaluation of infinite integrals expressible in the form of Laplace transforms, such as arise in the theory of heat condition and in various branches of electrical engineering. Applications and illustrations of the various uses of the volume are given, and a schedule of the explicit expressions of the Lagrange interpolation coefficients is provided. In addition to the tables of the Laplace transforms of the Lagrange coefficients for the two-point through the eleven-point formula, there is also included a short table of $n!/p^{n-1}$. Order from the Government Printing Office, Washington 25, D.C.

●

**Temperature Control Systems.** — Bulletin F6149 on temperature control systems is now available to everyone interested in industrial process temperature control.

An informative section will help in the selection of sensing elements and their correct use for the most satisfactory results. Instrument industry control terminology is given in this bulletin as well as rules to follow in selecting the proper method of temperature control for process characteristics or reaction.

Write to the Wheelco Instruments Division, Barber-Colman Co., Rockford, Ill.

●

**Corrosion.**—A folder which describes in detail the services offered industrial and commercial establishments in which chemical and corrosion conditions exist has been issued by Canadian Stebbins Engineering and Mfg. Co. Ltd., Castle Building, Montreal, Que.

●

**Gage Pressure Potentiometer.** — A 4-page brochure No. 3553 describes a new miniature gauge pressure potentiometer in standard ranges from 0-100 to 0-5000 psi. Photographs illustrate the method of accurately transmitting the movements of the bourdon tube to the sliding contact of the wire-wound potentiometer. Diagrams, curves, charts and outline drawings provide additional technical information.

Write Dept. NL, Bourns Laboratories, 6135 Magnolia Ave., Riverside, California.

●

**Poweractor Positioner.** — Bulletin 473, just issued, describes the Poweractor, a force-balance type of positioner for cylinder operated devices. The unit will position equipment requiring high power and long stroke, such as large size control valves, large dampers and variable speed drives, through pneumatic cylinder (or springless diaphragm) operating mechanisms. It is designed especially for use with the Foxboro stabiload cylinder.

Copies of the bulletin will be sent on request from Peacock Brothers Ltd., Ville LaSalle, P.Q., agents for the Foxboro Co. in Canada.

●

**Pyrometer Calibration Data.** — The Bristol Company of Canada Limited has announced the publication of their new issue of "Pyrometer Thermocouple Calibration Data". These tables are based on data recently released by the National Bureau of Standards. Adopted by the Scientific Apparatus Makers Association and the Instrument Society of America, the tables are corrected to the absolute volt and to the International Temperature scale of 1948. The iron-constantan table has also been corrected to a new curve which has been adopted by SAMA.

Copies of the new tables are available from the Company at 71-79 Duchess St., Toronto, Ont. Ask for bulletin P1259.

●

**Conveyor Systems.** — Link-Belt News, published by the Link-Belt Company, 307 N. Michigan Ave., Chicago, Ill., devoted to the application of materials handling and power transmitting machinery for solving the problems of modern industry is available to anyone requesting it on business letterhead.

Featured in the Nov.-Dec. issue is the mining operation of a potash mine at Carlsbad, New Mexico.

●

**Roll Crushers.** — Double roll crushers, manufactured in Canada by Jeffrey Manufacturing Company Ltd., are completely described in their recent bulletin No. 848.

Four types of crushers are listed: Junior-Standard-Heavy Duty and Special Heavy Duty. Tables of capacities, overall dimensions, a general description of each type with illustrations explain the use of this type of crusher.

The bulletin may be had by writing to Jeffrey Manufacturing Company Limited, P.O. Box 428, Montreal, Que.

●

**Air Heater.**—Peabody Engineering Corporation, has released a six page air heater bulletin.

Printed in seven colours, the bulletin describes in both print and detailed flow diagrams the operation and application of the air heater.

Bulletins available from Peabody Engineering Corporation, 580 Fifth Ave., New York 36, N.Y.

●

**Non-Metallic Pinions.** — The Hamilton Gear and Machine Company, 950 Dupont St., Toronto, Ont., have issued a technical data sheet and information required to supply or quote on non-metallic pinions. The sheet describes the properties of the materials used in silent pinions and includes information on design and operation.

Copies are available from the company at the above address.

*. . . . . the latest in Power Distribution!*

1350 ampere Bus Duct feeder from secondary switchboard powering one of four main risers.

View of motor control panelboard located in sub-basement. Motors on all floors can be controlled from this location.

Look for the latest in Power Distribution in a great modern building like the Manufacturers' Life! Westinghouse Bus Duct and Westinghouse Switchboards supply complete Power Distribution for this new eleven-storey addition. Westinghouse Bus Duct is the most efficient, most compact, most flexible method for carrying heavy current loads. Complete steel enclosure of the current-carrying copper bars assures absolute safety. Built-in transformers control flow of cooling water to the building's lighting fixtures. Westinghouse Switchboards control all lighting for the new addition — give push-button control of each of the many motors on all eleven floors. Built-in breakers automatically cut-in emergency diesel power supply. For the latest in Power Distribution specify Westinghouse Bus Duct and Westinghouse Switchboards.

YOU CAN BE SURE .. IF IT'S Westinghouse

# Ontario Hydro's All Welded Multistorey Building

*by*

**M. McMurray, M.E.I.C.**
*Welding Engineer*
*Dominion Bridge Company, Limited*
*Ontario Division*

*and*

**T. H. Ivory, Jr.E.I.C.**
*Project and Resident Engineer*
*Hydro-Electric Power Commission of Ontario*
*Toronto, Ontario*

The Hydro-Electric Power Commission of Ontario is now erecting the first multistorey all welded building in Canada of rigid frame and continuous beam design. The Commission is a large employer of professional engineers and the completion of this building will bring a number of widely scattered engineering units under one roof.

Located in Toronto on the west side of Murray Street to the rear of the present Administration Building on University Avenue, the new building has a steel frame, clad with Queenston limestone. It is 230 feet long, 115 feet wide, and consists of a basement, five storeys and a two-storey penthouse over the elevator shafts.

The building was originally designed as a flat slab frame in reinforced concrete with a basement and three storeys, but it became necessary to add two more storeys because of staff expansion. The load of the two additional floors proved excessive for the existing soil conditions. The design was therefore changed to steel construction, with cellular precast concrete floor slabs to reduce the dead weight of the structure.

On the west side, this engineering building is connected to an existing three-storey, flat slab reinforced concrete office building. It was essential that the floor to floor height, (13 feet) and the window head elevations be the same for the two buildings. Steel construction presented a major problem when consideration was given to the restricted clearance for air conditioning and electrical installations.

Methods of designing rigid frames and continuous beams have been well known for many years, but it is only since we learned how to make acceptable welded joints that these methods could be satisfactorily and economically applied to actual structures. The building described in this article is a good example of such a welded structure and is noteworthy as it is the first of its kind in Canada.

The Commission's engineers had watched with interest the growth of welded structures in the United States and decided to see if welding would solve their problem. After

The above illustration is a view of the structural framework prior to erection of penthouse steel.

considerable study it was decided to make the building of rigid frame steel construction, thus keeping the depth of the beams to a minimum. The close proximity of hospitals and office buildings also made welding attractive, as it would reduce erection noise.

The method followed in designing the building was to consider the bents in the east-west direction (short dimension) as rigid frames and the beams running north and south (long dimension) as continuous. The columns are set with the webs running east and west and the girders span the same direction. The column spacing of the building is 23 feet; to carry the precast floor slabs the beams running north and south are spaced at 7 ft. 8 in. centres. The spandrels are also designed as continuous beams making all connections suitable for welding.

By taking advantage of continuity in design the required section moduli became 20 to 25 per cent less than for comparable simply supported members. The depth of the girders is kept to a maximum of 14 inches, and the floor beams to 10 and 12 inches for spans of 23 feet.

The original design in 1948 made full use of American wide flange sections. Unfortunately, before any work was done the steel control program was instituted and these sections could not be procured. The Commission, however, was able to secure most of the required steel in Great Britain. By the time it arrived here, the Canadian government had banned all office building construction.

Analysis showed that the British sections were not as desirable as the American because of a more limited selection. The total weight of American beams, excluding built-up sections, was 677 tons compared to 750 tons of British beams. Also, the British steel was largely standard I-beam shapes with tapered flanges. This section does not serve nearly as well for butt welds as the American wide flange section. Butt welds from beam to column were used wherever possible, but generally a plate connection was required (Figure 1). This increased the cost of these connections by approximately 25 per cent. The advantage of continuity was therefore reduced; this fact should be borne in mind when comparing the relative economics of this welded frame and conventional rivetted structures.

Because steel was in short supply before the ban on the construction of office buildings, the Commission awarded the contract for the steel superstructure at the earliest possible date, January 12, 1951. Anticipating that this ban would be lifted early in 1953, the contract for the substructure was awarded on June 23, 1952. Thus the detailing, but not the fabrication, of the steel was going on while the substructure was being constructed. The final contract for the completion of the superstructure was awarded on January 15, 1953, only fifteen days after the ban was lifted.

**Fig. 1. Typical girder and beam connections to column before welding.**

There were several architectural details which presented difficulties. By a proper balance of good design and compromise on the part of the engineers and the fabricators, these were overcome. One of the difficulties was that a precast floor system which had interior cells for service conduits was used. Close tolerances were necessary for the thickness of the top flange plate connections to meet the floor requirements. This requirement was met by using special channel slabs over the girders where slabs with cells were not required.

Tolerances in steel work were:

Outside columns—Permissible slope, 1:1000, but not outwards.

Inside columns—Permissible slope, 1:500 in any direction.

Spandrel beams—vertical plane, one-eighth inch outwards or one-quarter inch inwards. Horizontal plane one-eighth inch above or below.

The close tolerances required on the spandrels were difficult to meet. When the construction of the building was changed from reinforced concrete to steel, its exterior was not altered. With reinforced concrete construction, it is a simple matter to mould the spandrel beams to suit the stonework, but with steel the problem is different. As the stone must be supported at a maximum distance of 1¼ inches back from its face, the outside perimeter of the steel beams must parallel the face of the building. To meet this requirement, built-up sections of steel plate varying in thickness from ⅜ inch to 1 inch were used.

In detailing the steel use was made of "Arc Welded Steel Structures", by Lamotte Grover, and of standards established by the fabricators on other welded frame buildings. Wherever possible joints were designed for the use of downhand welding and over-head welds were kept to a minimum. In the preparation of standard sheets (Figure 2) the field welding was indicated by the use of heavier lines and these standards were keyed to an erection floor plan on which all the joints were indicated. This was a new departure and proved useful in the field, as the foreman welder was able to distribute these sketches for the guidance of the individual welder.

Canadian shops in general are laid out for the production of rivetted structures and do not lend themselves to the economical production of welded work. The advantages of structural welding will increase as shops are rearranged and new ones built more suitable for welding production. From experience gained on this job and elsewhere it would appear that welding is competitive, but to make it so co-operation in design must exist among architect, engineer and fabricator.

With the exception of the built-up spandrel beams, which had an unusual eccentric shape, shop fabrication presented no problems. On the spandrels the original idea was to use automatic welds on the fillets, but this proved awkward and so they were manually welded. The welds were intermittent, but the heat input on this odd shape still caused distortion. The top plate was given a slight camber, which took care of most of the out-of-tolerance conditions. However, many had to be straightened by bumping them in a straightening press (fiddle). Incidentally, sometimes it is easier to straighten members in a press, if the necessary welding control to achieve the same purpose becomes too cumbersome. These beams were assembled and tack-welded together in a jig, and then welded by two welders working opposite each other, the sequence of welding being from the centre towards the ends.

Field erection is the showy part of any structural job and also provides the major headaches. When it comes to a welded frame, a careful erection sequence must be worked out in advance or one is left with locked-up stresses, or distortion, or both. In any welding program a compromise must be arrived at between these two factors. On this job it was decided to minimize the distortion effects without allowing the locked-up stresses to become excessive.

The fabricator consulted at length with the Commission's engineers on a suitable erection procedure. The erection could not be accomplished from the perimeter of the site, because of the existing building and the busy city streets bounding the property. The original intention was to erect the whole five storeys by means of a crawler crane, working in the interior of the building site and backing out at one end. It was decided to hold up

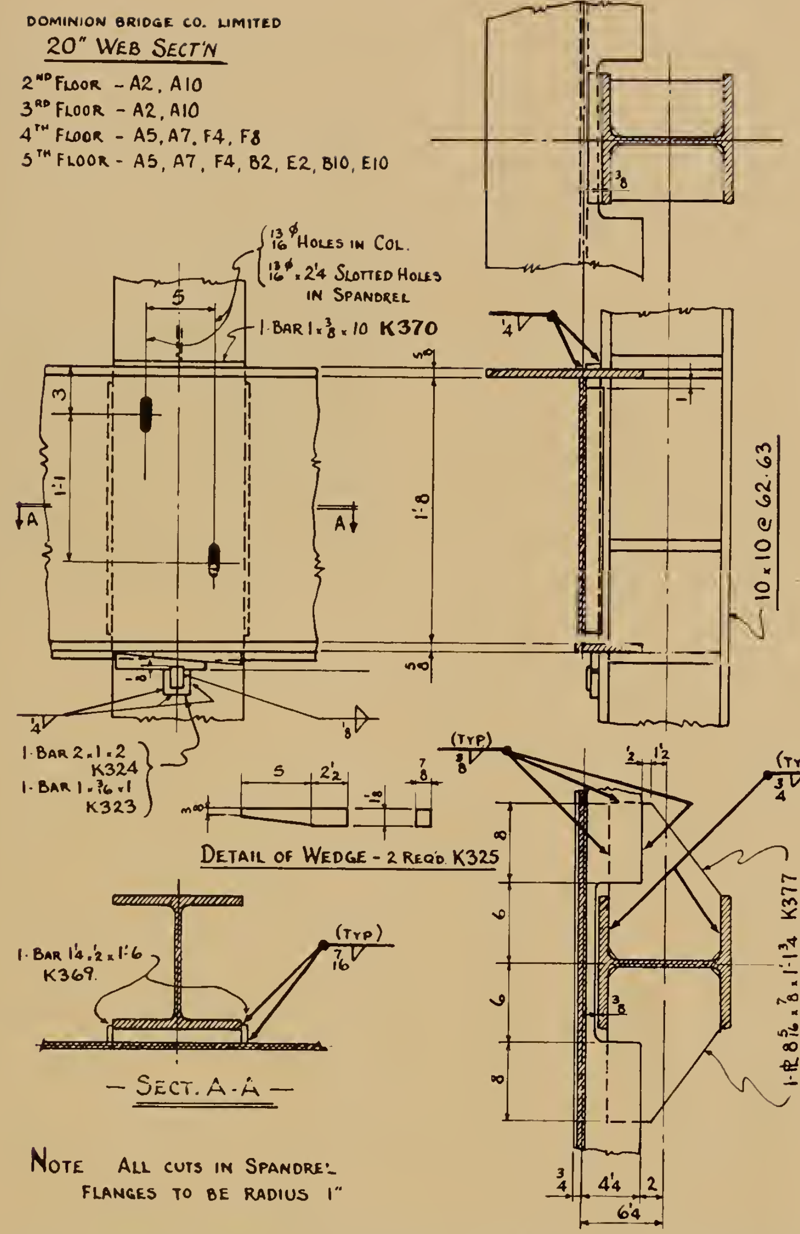

**Fig. 2. Standard sheet for a typical spandrel beam to column connection.**

Notice slotted holes and provision for shims to adjust elevation of spandrel. Shear connection also allows for movement in relation to face of column.

welding until at least half the building was erected, and then start in the centre, radiate from the centre to the outside walls and do the final adjusting on the wall joints.

This scheme was practicable, but it meant that the general contractor would be unable to work efficiently until the structural steel was virtually completed. This situation did not suit the time schedules, and the fabricator was asked to reconsider. The next idea was to treat the structure as two separate buildings, making a division at half length. This meant making a final adjustment on the centre line, if required. This scheme was finally adopted, with some variation, and proved satisfactory.

The building was fabricated with columns three floors high, making two tiers of steel. The north half, lower tier was welded first, starting from the centre bay and working outward radially in all directions. In the meantime, the upper tier was erected and there were some gaps in the south half, lower tier. After completion of the lower tier welding, the welders moved to the upper tier. When the south half erection was completed, a similar welding procedure was followed, and final closure was made at the centre line.

Upon completion of the lower tier of the north half of the building, the shrinkage in the east-west direction was thought to be excessive and was taken up by the use of fills on the outside columns. On the remainder of the building care was taken to distribute the shrinkage effect by individual joint adjustment as the work progressed.

Welders worked in teams of two and four teams welded around the column points of a bay at once. They worked on opposite sides of the columns in order to balance the heat input. Definite sequences for welding were followed. This provided for maximum control and yet allowed for some flexibility, so that the operator did not have to change his machine setting too often.

The beams were first field-bolted in position and then welded. The use of erection clips was considered, but these were not used, because of the tapered flanges on the beams and also because the columns were three floors high.

The fabricator started work in the field on February 1, and began with a maximum crew of 12 welders in order to complete the job in 21 weeks. The crew was increased to 20 welders and, by working on several Saturdays, the job was completed in 15 weeks, so that the general contractor could proceed with the stonework and have the building enclosed before severe winter weather.

At times, the large crew proved to be unwieldy, because continuous care had to be taken that no areas were locked out of the sequence program. It was necessary to adhere closely to welding sequences to facilitate keeping the building plumb. If changes had been made, it would have been difficult to trace the causes of discrepancies.

The spandrels were the last items on each floor adjusted and welded, to ensure that they would meet the required tolerances. Adjustments by wedges were provided, both vertically and horizontally. Two field engineers were kept busy throughout the whole job, plumbing and aligning, to secure accuracy. This supervision is felt to be excessive, but was necessitated by the spandrel design. The care was worth while, however, as the masons have had very little trouble in setting the stone.

Canadian winters are not ideal for outdoor welding. In spite of the relatively mild winter, there were many days in February and March when special precautions were necessary. When the temperature fell below 32°F., the joints were preheated with oxygen and acetylene torches. The welders and the working area were protected from the wind by tarpaulin houses.

**Fig. 3. The building nearing completion.**

Most of the work was done from hanging bracket-type scaffolds. These were light angle frames which clamped over the top flanges of the beams. They were used in pairs and planks were used as a floor. These scaffolds could support two men and were easy to erect and to move.

All welders employed were tested and approved by the Canadian Welding Bureau. The main inspection on the job was by the Commission. It was visual only, the capability of the individual welder being judged by the steadiness of his arc and the appearance of the weld. Welds were inspected upon completion of the operation for penetration, undercutting and size, and a day later for shrinkage cracks. This inspection was rigid, but fair, and good co-operation existed between the Commission staff and fabricator.

The following information is of general interest.

(1) A synopsis of the cost of the steel frame of this building is as follows:—

| | |
|---|---|
| 750 tons of English sections, f.o.b. Toronto, . . . . | $62,860.76 |
| 178 tons of plate and 47 tons of Canadian I-beams, plus fabrication and erection of all steel . . . . | 221,912.56 |
| Total tonnage, 975. Total Cost— | $284,773.32 |

Cost per ton, $292.00

(2) Gross area of the building, 146,000 sq. ft. Steel per square foot, 13.4 lb. Cost per square foot, $1.97.

(3) Average rate of erecting steel, excluding welding, 106 tons per week.

(4) Total weight of welding rod 13,850 lb. or 14 lb. per ton.

(5) Time to complete erection and welding of the steel frame, 15 weeks.

(6) Burn-off rate of welding rod, 1.6 pounds per hour per welder. This includes downtime for changing of scaffolding and machine adjustment, relief, etc.

(7) On this job standard steel erection tolerances were used, but it is suggested that on future jobs the fittings be snug because of shrinkage.

(8) The material and work conformed to the following specifications:
British steel—B.S.S. No. 15.
Canadian steel—C.S.A. No. G40—1935.
Connections and welding—C.S.A. No. W59—1950.
Fabricators—Approved by Canadian Welding Bureau to C.S.A. No. W47—1947.

E. P. Muntz, M.E.I.C., and Prof. M. W. Huggins, M.E.I.C., acted as consulting engineers and A. M. Lount, M.E.I.C., was structural engineer, T. H. Ivory, JR.E.I.C., project and resident engineer, and W. D. Walcott, Welding engineer, for the Commission.

The Carter Construction Co., Ltd., was contractor for the foundations and substructure and the Foundation Co. of Ontario, Ltd., held the general contract. The steel was fabricated and erected by the Ontario Division of the Dominion Bridge Co., Ltd., under the direction of E. R. Graydon, M.E.I.C., chief engineer, M. McMurray, M.E.I.C., welding engineer, W. Wells, erection superintendent, and R. Boyd, resident engineer. √

# MANAGEMENT

## Its Responsibility for Equalizing Development

of

## Technical and Social Sciences

*A panel discussion held at the Sixty-seventh Annual General and Professional Meeting of the Engineering Institute of Canada at Halifax, May 22nd, 1953.*

*Chairman*

**S. M. Finlayson**

*President — Canadian Marconi Company, Limited, Montreal.*

PANEL

**P. J. Nicholson, President of St. Francis Xavier University, Antigonish; F. C. Toombs, University of Toronto, Institute of Business Administration, Toronto; N. T. Smith, General Manager, Nova Scotia Light and Power Company Limited, Halifax; J. W. Simpson, Management Consultant, Leetham Simpson Limited, Montreal.**

The following text has been compiled from miscellaneous notes supplied by the speakers. The verbatim report being unusable, the discussion from the floor was not available for publication.

*Mr. Finlayson*—Ladies and Gentlemen, this afternoon we are to discuss the subject "Management — Its Responsibilities for Equalizing Development of Technical and Social Sciences". This is a very broad subject and probably carries a different meaning to each of you, it certainly has to each of your panel. With such a broad subject we can't do much more than poke around the edges a little and certainly we cannot reach any decisions in the short space of an hour and a half. We hope that a discussion of this subject, or certain phases of it, will promote thought which may someday help to improve the understanding, by management personnel, of the social problems that affect their day to day job.

To obtain diverse opinions on this subject, your panel has been selected from top level administrators in education, industry and management consulting.

#### Introduction of the Panel

I would like to introduce the panel to you — On my left is Dr. P. J. Nicholson, President of St. Francis Xavier University at Antigonish. St. Francis Xavier has long been noted for its work in the social sciences. Next on my left is Mr. Norman T. Smith, General Manager of the Nova Scotia Light and Power Company. Mr. Smith will discuss this subject from the industrial viewpoint flavoured by his experience in Great Britain. On my right is Mr. F. C. Toombs of the University of Toronto Institute of Business Administration. Since he was involved in the now famous Hawthorne experiment, he can approach this subject from a different angle than Dr. Nicholson. Next to Mr. Toombs is Mr. J. W. Simpson of the Management Consulting Firm, Leetham Simpson Limited of Montreal. In this work, Mr. Simpson comes in contact with a great many managers and consequently will have a broader viewpoint than any of us who see management problems in our one location.

Since our time is limited, I will call on Dr. Nicholson to lead off.

*Dr. Nicholson* — The topic proposed for discussion seems to me to call attention to the vast difference existing between the sciences that deal with human beings and those that deal with machines. The training of engineers produces experts in dealing with machines; nevertheless, in the practice of their profession engineers must usually be dealing with human beings as well as with machines, and the human sciences have been almost crowded out of the engineering curriculum. The prestige of the engineer as a citizen is very great; his influence should therefore be really felt in the operation of democracy, national and international. Perhaps the fact that human sciences have been receiving relatively less attention has something to do with the fact that although natural science has built a new order in the subjection of the physical world to the human mind, our generation has been cursed with two world wars and one world-wide depression. And the problems involved in human relations are becoming progressively more complicated even than the problems of natural and applied science. At the same time, more and more attention is being given to the natural sciences; less and less to the studies that deal with human nature. It took World

War I to awaken Canadians to the necessity of organizing the National Research Council and to the system of fellowships, scholarships and bursaries that it administers. Nearly forty years later we are beginning to discuss the setting up of a Humanities Council. Any university student who has a good record in natural science is sought out and positions are offered him during his vacations before he has completed his training; the humanities student very often has to search for employment and possibly in the end be happy to earn part of his next year's expenses as a common labourer.

The situation is being viewed with alarm by many of the leading thinkers of the day. As eminent a physicist as the Nobel Prize Winner Harold Urey has declared, "I am a frightened man. All the scientists I know are frightened — frightened for their lives — and frightened for your life". Another eminent scholar, Professor Elton Mayo of the Harvard School of Business Administration speaks of the "successful sciences — chemistry, physics, physiology, and the unsuccessful sciences — sociology, psychology, political science". He shares a common opinion that if social skills had been developed as rapidly as technical skills, the Second World War could have been averted. This conclusion presents a great challenge to those who are prominent in technological fields.

That internationally famous scholar Alexis Carrel in "Man, the Unknown" has suggested that the complexity of modern problems may require the recruiting of a community of geniuses who will sacrifice all their talent and training and time to the task of counselling the race regarding its problems. Such a solution is hardly feasible; but certainly it is necessary that more attention be given to questions of human welfare other than technical ones. And it is fair that industry which has been doing so much to raise the efficiency of machines should also concern itself with all that concerns the welfare of the people who operate the machines.

We of this panel have been urged to be provocative, and this encourages me to make three suggestions.

1. Quite a considerable number of scholarships are sponsored by industry for young men to enable them to pursue higher studies in technology. Each one of these should be matched by a scholarship for those who wish to pursue higher studies in the "unsuccessful sciences".

2. A considerable number of scholarships should be established for engineering students of superior talent who have already qualified for the degree of Bachelor of Arts.

3. Industry should sponsor programs of Adult Education that include humanistic studies and the "unpopular sciences" along with programs in Applied Science.

*Mr. Finlayson* — Thank you, Dr. Nicholson. I am sure you have left food for thought and have stirred up questions. I might add that if anyone in the room has questions, please feel free to interrupt the speaker. We want to keep the meeting as informal as possible.

Mr. McDonald tells me that he has passed paper out to you on which you may write your questions if you wish. These questions will be collected and we will endeavour to discuss them, if not answer them, after the panel members have finished speaking.

Mr. Smith will now give us his views on this problem.

#### The Broadening of Staff Education

*Mr. N. T. Smith* — In considering the title of the management panel discussion I have found difficulty in interpreting the meaning of social sciences. As one engaged in industry, my interpretation of the expression may differ considerably from the academic understanding of the subject. My contribution to this discussion deals with the broadening of the education of staff beyond the pure technical science into the study of human relations. I feel that the primary responsibility of the equalizing development must remain with the university or technical college as they receive human material at a young age and are responsible for their primary moulding. This early training must instill into the mind of the student the urgent necessity of broadening his mind and outlook, beyond the pure technical science upon which he has decided to devote his life, and the colleges should provide the facilities for the student to engage upon a course leading to this objective. I fully concur that industry must also play its part in this equalizing development in the student's post graduate days, but I would like to be very emphatic that the student himself must also play his part and not assume that university and industry are going to coddle him from the cradle to the grave. I have had the unfortunate experience with students who, having obtained a degree, discard their technical and other studies and have decided that the time has come to cash in immediately on leaving the university. I have experienced, as many of you will similarly experience, the student who interviews industry rather than is interviewed by industry.

When the student enters industry, he naturally finds himself in a new world and somewhat at a loss to understand his future career and promotion through that industry. This is where I feel management responsibility commences in the guidance of the student to his proper niche in the line of business that he has chosen. The Monteith report of Engineers Council for Professional Development is in many ways a good outline that might be followed. It is management's desire in every industry today to encourage a harmonious and happy spirit throughout the organization and my own experience has been shown that such desire is not too difficult if a proper approach is made to the subject with every phase of development of the employee.

There are two separate fields, one internal to the company and the other external.

I am a firm believer of the principle of pressing responsibility down through the organization as far as possible and I have rarely found that if responsibility is given to the more junior people that they have not lived up to the confidence placed in them. At the same time their outlook generally of the company's affairs have been broadened, and their enthusiasm in the company considerably fanned.

Dealing with internal affairs, I am a firm believer in holding:

1. Senior staff meetings where all major items are discussed between management and senior staff with free discussion.

2. Executive staff departmental meetings for explaining and understanding company policy as determined at the senior meeting.

3. Regular annual or even biannual meetings of foremen and supervisory staff with senior management. This latter group might well be called a team of management where papers are given by senior staff explaining the work of individual departments and also by the men in the field explaining their viewpoints.

4. Local meetings of foremen with the rank and file at sub-department level where papers can be given at the request of the rank and file to enable them to understand the workings of the company outside their normal orbit.

5. Meetings with labor union

representatives to explain changes in policy and conditions. This should not be confused with the management committees advocated by some unions.

In addition, monthly technical meetings should be held when other phases of the industry's technical and operation departments can be ironed out by free discussion.

External to the company's affairs, selected members of the staff should be encouraged to enter community and institutional activities in the area, with the object of making themselves and the company they serve, good citizens. Industry should assist in every way possible, universities and vocational schools to broaden the scope of the employee associated with their profession or divergent from their jobs. In this connection, the university can further assist in the equalizing development by the provision of evening classes covering a variety of subjects desirable in the particular community. Management should at all times encourage the art of free expression and public speaking, even to the extent of providing prizes for such activities. Such courses should not be made available to the student under compulsion or entirely free of cost to the student, with the thought that full appreciation and advantage is dependent upon some personal effort and sacrifice, but finance should not be a deterrent to the adoption of such training.

*Mr. Finlayson* — Thank you, Mr. Smith. You will notice Mr. Smith has lived close to this problem throughout his career.

Now Mr. Toombs will give us a slightly different slant.

### Spiritual Enhancement and Human Love

*Mr. Toombs* — The following brief story that has come into circulation recently interests me, and I would like to share it with you. I am not pushing a particular moral. You may take from it as you choose. At any event, I hope that you will find it amusing.

This story concerns a report purported to have been made by experts from the British Treasury's Office of Organization and Methods, following attendance at a program being performed in the Royal Festival Hall, London, England. The report reads as follows:

For considerable periods the four oboe players had nothing to do. The numbers should be reduced, and the work spread more evenly over the whole of the concert, thus eliminating peaks of activity.

All the twelve first violins were playing identical notes. This seems unnecessary duplication. The staff of this section should be drastically cut; if a large volume of sound is required, it could be obtained by means of electronic amplifier apparatus.

Much effort was absorbed in the playing of demi-semi-quavers. This seems an excessive refinement. It is recommended that all notes should be rounded up to the nearest semiquaver. If this were done, it would be possible to use trainees and lower grade operatives more extensively.

**The Management Panel. Left to right: J. W. Simpson, managing director of Leetham Simpson Limited, Montreal; F. C. Toombs, associate professor, Institute of Business Administration, University of Toronto; S. M. Finlayson, Chairman, president of Canadian Marconi Limited; Dr. P. J. Nicholson, president of St. Francis Xavier University; N. T. Smith, general manager, Nova Scotia Light & Power Co.**

There seems to be too much repetition of some musical passages. Scores should be drastically pruned. No useful purpose is served by repeating on the horns a passage which has already been handled by the strings. It is estimated that if all redundant passages were eliminated, the whole concert time of two hours could be reduced to twenty minutes, and there would be no need for an interval.

The conductor agrees generally with these recommendations, but expresses the opinion that there might be some falling-off in box-office receipts. In that unlikely event it should be possible to close sections of the auditorium entirely, with a consequential saving of overhead expenses . . . lighting, attendants, etc. If the worst came to the worst, the whole thing could be abandoned, and the public could go to the Albert Hall instead.

It seems to me that the title of our panel discussion: "Management — Its Responsibility to Stabilize the Development of Technical and Social Sciences", is symptomatic of the problem that confronts us. We have learned to enhance our material and physical circumstances through improved technology, and we have endeavoured to cope with our human or social relations through improved technology . . . "social technology". We are finding that spiritual enhancement is much more dearly won. I suspect that we are fearful in the face of technological development that does not appear to give us the security and inner space that we would like.

May I tell you of two bits of evidence that should make us all think. A number of years ago, a curious physical disability found in infants was identified with some clarity. It is called "marasmus". Infants of a week or so old may very suddenly begin to waste away: refuse to assimilate food; lose muscle-tone; and generally disintegrate to the point of death. It was found in such cases that these infants could have this disintegrative process stopped and customary development processes restored by giving them tender human love . . . fondling and affectionate care seem to be needed to support life. This suggests that man literally may need affection to grow and develop. The second piece of evidence comes from the research done under the auspices of the National Research Council of the United States. When endeavouring to understand more about the conditions of "fatigue" and "monotony" in work situations, it became quite clear that these concepts were most complex. Human beings fatigued or tired most easily and found work monotonous when the work was meaningless to them or when they were emotionally disturbed. Neither fatigue nor monotony could be understood on the basis of a simple absolute condition, such as "overwork" or "repetition".

With these brief notes, I shall stop . . . only to raise the questions: How do we teach people to "love" . . . to have affection for another . . . and how do we stimulate in another person interest in work and freedom from fear and anxiety ?

Perhaps the most important bit of information the social sciences can offer you as engineers is the knowledge that "listening" is the most crucial facility in the process of interpersonal relations. Perhaps I behave as a person with a mission on this score, for I believe that until we can listen well there is slight chance that we can understand the meaning of human feelings and behaviour.

*Mr. Finlayson* — Thank you Mr. Toombs. We now have some scientific facts to ponder, these may promote questions with which I hope you will test the merit of our panel.

Mr. Simpson will now discuss this problem from the management consulting viewpoint.

#### Statistics Not the Complete Answer

*Mr. Simpson* — Management's responsibilities are certainly not disproportionately divided between the technical and social aspects.

But too many management men today are prone to size up their performance not in terms of what changes and improvements have taken place in the company's employees, but rather through an extensive use of statistics, reports, trend charts and so on.

Since the only way in which management can obtain its objectives, is by obtaining efficient performance from its personnel through increasing their knowledge, adding to their skills, changing habits and influencing their attitudes, then perhaps a more realistic appraisal of management effectiveness might be obtained by getting an answer to the question—what changes are taking place in the "climate" of the workplace, the calibre of the workforce, the relationship of supervisor and supervised ?

What can be done to improve in these areas, because improvement in these areas will certainly be a most major factor in controlling the economical and profitable operation of any business. What do employees want ? Are they unreasonable or have we brought an apparent unreasonableness upon ourselves by neglecting to provide job satisfaction and sufficient motivation to ensure the urge and desire to produce effectively—to be part of a team—to be respected—to be a person rather than a number.

I do not believe that the average employee is unreasonable—I speak from my own personal experience, since a good part of our work involves direct dealings at, and below the supervisory level.

Then, if this is true, where are we falling down and what can be done about it—or to put it another way—how should we go about harnessing this "reasonableness" ?

What makes an employee a satisfied worker ? Many surveys have been carried out recently by universities, leading business publications as well as by consultants, directed towards trying to formalize an answer to this question. While it is impractical to say that any cut and dried formula can be established from these surveys, I believe the following points summarize the main objectives of the worker:—

1. Security—not the security necessarily of guaranteed wages, sick benefits, pensions, etc., but the security emanating from a healthy and fundamentally strong business structure, in which all employees can have a justified confidence.
2. Fair and just pay, as compared with pay in neighbouring plants and as between different jobs in the same plant.
3. An opportunity to utilize his skills to the fullest.
4. Recognition—a desire to be known to his fellow employees and neighbours as an important part of an enterprise.
5. Superiors he can look up to and be guided by.
6. A job he enjoys and is capable of doing.

None of these points are really any different than what each of us is after in his respective job.

How then should management go about satisfying these "wants" ? If we were just starting a new company, the problem would be much simpler than it is in the case of the vast majority of companies who have already been in business for years and who are only now starting to wonder what part human relations can play in making a more efficient operation.

First of all, you must find out where you are falling down. This can be done in a variety of ways through attitude surveys, appraisal of supervisory practices, method of upgrading, selection of employees for a given task, effectiveness of communication, pre-job training, etc.

Once you feel you know where you do not measure up, then, and only then, can you instigate corrective action.

In our work, we have found that generally management fails to appreciate the significance of "humanics"—they are too prone to say "give us the good old days when people were glad to do a good day's work", rather than "there's something wrong with our approach—let's try and find out what it is and try to improve it".

One approach is destructive—the other constructive. Unfortunately, there seems to be more of the former than the latter.

I believe that a more desirable substitute to the rather prevalent hit or miss approach in dealing with people can be achieved through—

1. Proper selection of personnel.
2. Development of pride of workmanship in the employee by "glamorizing" the job—bringing out his importance in the scheme of things.
3. Development of effective supervision.
4. Provision of a "bank" of qualified personnel.
5. Development programs tailored to individual or group requirements.

There is no magic formula—no easy way out. "Human" management is something that has to be worked at—continuously—and if we are to achieve our maximum effectiveness, it is something we cannot afford to ignore.

#### Questions and Answers

*Mr. Finlayson* — Thank you Mr. Simpson. I see we already have some written questions, and I am sure Mr. Simpson's remarks will stir up more. I was asked to speak on the subject as well, but as time is slipping by and I have said enough already, we will proceed to the questions. May I reiterate that it is quite in order for you to raise your questions from the floor or to enter the discussion of any particular question if you will indicate your desire to do so. The first question I have, reads as follows:

#### The "Spare Time" Problem

"Is the basic problem underlying the panel discussion not that of extra spare time enjoyed by elements of the community, especially labour, which they do not know how to utilize intelligently and constructively"?

Mr. Toombs, would you like to try this one?

*Mr. Toombs* — I am not clear about this question. It appears that the assumption is that hourly-rated workers know less how to manage their time constructively than do administrative workers. I would like to tell you of a graduate seminar that I have conducted for the past few years. A good many engineers have been in it. It has alarmed me to discover that many of these men cannot undertake the responsibility of thinking freshly for themselves. They expect "the teacher" to "tell" them, and they are most annoyed and confused when he refuses to play this role. This suggests, I believe, that we have a problem in reference to our system of education. Perhaps we are more interested in conformity and security than we are in creativity and experimentation. For some reason we cannot tolerate deviation. I suspect that the inability to utilize time—to think and play meaningfully—is not only a problem for the hourly-rated worker but also for management personnel. It is a problem of our society.

### Remuneration Scale

*Mr. Finlayson* — Our next question is not directed to any particular member of the panel but has to do with remuneration, so I will pass it to our representative of industry, Mr. Smith. The question reads:—

"Does the panel consider that management has any basic responsibility for the lack of appreciation on the part of labour of the relative contribution of unskilled and semi-skilled labour to the overall welfare of the community as compared with that of say, the engineer, as evidenced by the relative scales of remuneration which labour unions seek and which engineers enjoy"?

*Mr. Smith* — I find it very hard to answer this question and I don't think that the scale of remuneration is responsible for the lack of appreciation on the part of labour to the overall welfare of the community. I don't know that I agree that labour does not appreciate the overall welfare of the community. The suspicion that existed between management and labour of over 50 years ago is at last dying out, but tradition dies hard.

In Great Britain several years ago, management and labour in the coal mining industry were so far apart that it was doubtful that they would ever come together and the government felt there was only one solution—nationalization. The very first morning of nationalization, the unskilled men were surprised to find that the various foremen and under managers were still employed as such, showing that they could not understand the meaning of the word "management". Management has a responsibility to try and break this misunderstanding down and it is slowly being overcome. This barrier can be broken down by giving an opportunity to all unskilled trades to train in a trade or even a profession by giving them opportunities to go through college or to obtain a degree in later years.

### Technical Progress and Social Amenities

*Mr. Finlayson* — Our next question reads as follows:—

"Are not social amenities obtained by really forcing technical progress to keep industry in business at all? Industries now have—short work week, pension plans, sickness plans, training plans, etc., etc. All of this is pricing Canadian products out of overseas markets and it is only technical progress that keeps us alive, why worry about technology"?

Perhaps Mr. Simpson would undertake to reply to this one.

*Mr. Simpson* — This could be a very involved question to answer since so many factors enter into it other than that being discussed this afternoon, such as standards of living, tariffs, foreign currency values, etc. However, let's look at it from the standpoint of whether or not the cost of bettering the employees' lot can result in pricing a product out of the market or placing the onus on technology to maintain a competitive price structure.

There is certainly no contention that technology should assume any minor role as against the social aspects in business. However, it seems reasonable to assume that industry cannot get by on technology alone, since employee productivity is a conclusive force in determining the end result—a profit or a loss. Therefore, it would seem desirable to exert equal efforts towards increasing productivity through not only technological improvements, but also through employee improvement, which can only be brought about by making a concerted effort towards providing job satisfaction and the desire on the part of employees to produce effectively.

Time and money objectively used in this direction—towards increased productivity—will certainly not result in a company pricing itself out of the market, either at home or abroad. Technological improvement and employee improvement must go hand in glove, if we are to maintain and better our present standard of living.

*Mr. Finlayson* — We still have a number of questions to discuss, but we have been informed by the committee that our time has been used up and we must close our session so as not to jeopardize the plans for this evening.

I would like to say that I have enjoyed every minute of this discussion and from your attention and desire to continue, it is evident you are enjoying it also. It seems a shame to close here, when I am sure we could go on for another hour without losing interest.

We must bow to the wishes of the committee, however, and I would like to thank you for your panel and myself for your attention and participation in the discussion.

The meeting is now adjourned.

NOTE — The following members participated in the discussion, but the text of their remarks were not satisfactorily recorded: Dr. Lillian Gilbreth, Mr. Nelson Mann, Mr. J. L. Wickwire, Mr. J. T. M. Smith, Mr. Fred Lawton.

# Marginal Cost in Engineering Design

by

**D. F. Coates, M.E.I.C.**

*Department of Civil Engineering,*
*McGill University, Montreal.*

Mr. Coates applies the method of marginal cost analysis to determining the economic height of a hydro-electric dam, but it can equally well be used in the solution of many other similar problems. This type of analysis is shorter than others and when it has been completed, the user has the satisfaction of knowing that he has covered every possible case within the limits he has set for himself.

"It is a subject that will bear repeated emphasis and Canadian engineers will no doubt welcome this latest presentation", was the comment of one engineer who read this paper before publication.

The design engineer is dealing not only with technical problems, but also with financial problems. If the structure the engineer designs is to be built, someone must put up the money and thus an investment will be made. Of course, the investment will be made only if there be some prospect of earning a reasonable return on the immobilized capital. Therefore, the engineer must not only provide a technically sound design, but he must also show that the project is economically feasible and that it is the most economic of all possible methods of providing the service.

Usually, there is more than one solution for a given problem, so the financial aspect requires that at least alternate designs be studied. In many cases the design problem is not simply to choose the best from a few possibilities, but to select the most economic among a large or infinite number, e.g., to determine the optimum diameter of pipe for an oil line. To calculate the comparative costs of all possible designs would require a long time. In many cases it is simplest to use marginal cost analysis.

Marginal cost analysis was originated and developed by academic economists. The principal conclusion in applying this analysis to the theory of the firm is that if the production of a company is expanded to the point where the cost of an extra unit of production is just equal to the revenue from that extra output, then profits will reach a maximum. If the firm is operating in the red, then losses are reduced to a minimum when the marginal cost equals the marginal revenue. This simply means that one or two factors are usually in operation: (1) continuing expansion of production from a single plant will eventually result in higher unit costs, and (2) if a significant part of the market is being supplied, this expansion may result in a lowering of the market price. Consequently, by increasing output a point will be reached where the increase in output costs more than the increase in revenue.

As engineers we can express this principle mathematically:

$$R_n = R_g - C_t$$

where $R_n$ = net revenue,
$R_g$ = gross revenue.
$C_t$ = total cost of production.
$R_n$ will be a maximum when

$$\frac{R_n}{dZ} = 0$$

or

$$\frac{dR_g}{dZ} = \frac{dC_t}{dZ}$$

where $Z$ = output per unit time.

This theory has been of great interest and value to academic economists, but owing to the complexity of business activity, it seldom has been used in practice. However, it would seem that it can be useful in solving those types of purely engineering problems of design that either cannot be analysed under conditions of constant output, or that offer a continuous series of possible solutions.

One of the problems that may best be solved by using this analysis is that of determining the economic height of a hydro-electric dam. The equivalent annual cost of the dam can be considered to be composed of investment and of operating costs. The investment costs will include capital recovery (or depreciation), interest (or a minimum attractive return), property taxes and insurance; these items will be a function of the size of dam. The operating charges will be composed of such items as maintenance, repairs, inspection, gate operation, etc. Without being much in error these charges may be assumed to be constant for dams of the same order of size.

The gross revenue from a dam is the value of the electrical energy that can be produced; this is principally dependent on the head and on the volume of water that is delivered to the turbines. The head is a function of the size of the dam, where the power house is at the dam or connected to it by a penstock. The volume of water delivered to the turbines is a function of the size of the dam where it provides storage capacity, i.e., where it reduces the volume of water lost to the turbines by spilling over the dam.

A storage dam, remote from the power house and thus not influencing the head, presents a simple case. Here the gross revenue from the dam is influenced by only one variable, the volume of water stored.

Expressing these conditions mathematically, it was shown above that $R_n$ will be a maximum when

$$\frac{dR_g}{dZ}=\frac{dC_t}{dZ}$$

where $R_n$ = net revenue in \$/yr.
$R_g$ = gross revenue in \$/yr.
$C_t$ = total cost of production in \$/yr.
$Z$ = output in kwh/yr.

but $C_t=C_i+C_o$

where $C_i$ = investment charge in \$/yr.
$C_o$ = operating cost in \$/yr.

and $\frac{dC_t}{dZ}=\frac{dC_i}{dZ}+\frac{dC_o}{dZ}$

or $\frac{dC_t}{dZ}\cdot\frac{dZ}{dH}=\frac{dC_i}{dZ}\cdot\frac{dZ}{dH}+\frac{dC_o}{dZ}\cdot\frac{dZ}{dH}$

where $H$ = dam height at the maximum section in ft.

or $\frac{dC_t}{dH}=\frac{dC_i}{dH}+\frac{dC_o}{dH}$

thus $\frac{dC_i}{dH}=\frac{dC_t}{dH}$

if $H$ is limited to a range where $C_o$ can be assumed to be constant with respect to $H$.

Also, $R_g=W_s.p$

where $W_s$ = average volume of water stored for use during the dry seasons in acre-feet (AF) per year.
$p$ = value of this water in generating electricity in \$/AF, derived from the retail price of electricity, which in turn is usually, by rate setting procedures, based on the cost of production at existing plants, both thermal and hydro, in the area.

and $R_g=(W_t-W_w)p$

where $Wt$ = average total amount of water available to be stored in AF/yr,
$Ww$ = average amount of water wasted or spilled in AF/yr.

Thus, $\frac{dR_g}{dZ}=(\frac{dW_t}{dZ}-\frac{dW_w}{dZ})p$

and $\frac{dR_g}{dZ}=-p.\frac{dW_w}{dZ}$

as $W_t$, an average, is constant.

or $\frac{dR_g}{dH}=-p.\frac{dW_w}{dH}$.

Therefore $R_n$ will be a maximum when

$$dC_i=-p.dW_w.$$

In other words, the optimum height of the dam is such that any increase in size will result in a greater increase in the annual cost, due to the increased investment charge, than the increase in gross revenue from the increased electricity generated.

Consider the following example. The economic height for a concrete storage dam for a hydro-electric development is to be determined.

**Table I. Value of Reducing Spilled Water**

| Year | Volume of floods* AF | Water lost with various dam heights and storage: 80 ft. 70,000 AF | 85 ft. 80,000 AF | 90 ft. 90,000 AF | 95 ft. 130,000 AF | 100 ft. 150,000 AF |
|---|---|---|---|---|---|---|
| 1 | 130,000 | 60,000 | 50,000 | 40,000 | | |
| 2 | 110,000 | 40,000 | 40,000 | 20,000 | | |
| 3 | 90,000 | 20,000 | 10,000 | | | |
| 3 | 80,000 | 10,000 | | | | |
| 4 | 160,000 | 90,000 | 80,000 | 70,000 | 30,000 | 10,000 |
| 5 | 120,000 | 50,000 | 40,000 | 30,000 | | |
| 6 | 150,000 | 80,000 | 70,000 | 60,000 | 20,000 | |
| 7 | 70,000 | | | | | |
| 8 | 90,000 | 20,000 | 10,000 | | | |
| 9 | 110,000 | 40,000 | 30,000 | 20,000 | | |
| 10 | 100,000 | 30,000 | 20,000 | 10,000 | | |
| Totals.... | 1,220,000 | 440,000 | 350,000 | 250,000 | 50,000 | 10,000 |
| Av./yr.... | 122,000 | 44,000 | 35,000 | 25,000 | 5,000 | 1,000 |
| Marginal Revenue ($p.dWw$) \$/yr/ft.......... | | | 1,800 | 2,000 | 4,000 | 800 |

(*Volume in excess of usable flow).

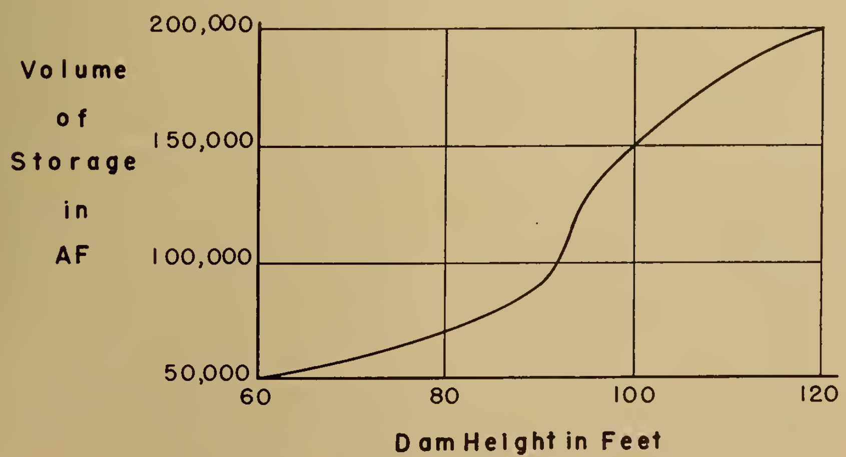

Fig. 1. Storage capacity curve.

**Data and Assumptions:**

1. Flow records at the dam site for 10 years.
2. Topography of the reservoir area and of the dam site.
3. The value of a kwh of energy at the low-tension side of the stepup transformer is 7.5 mills; the overall efficiency of the plant to this point is 82 per cent.
4. The stored water will be used at only one power house, where the average net head on the turbines during the time when the stored water will be used is 159 ft.
5. The write-off period or economic life of the dam is considered as 30 years.
6. Being a publicly owned utility

the cost of money to the owners is estimated to be 6 per cent, including both interest and administrative charges connected with borrowing: no property taxes or insurance charges are assumed to be incurred by this structure.

### Procedure

1. Determine the feasible range of heights to study by plotting the storage capacity curve (Fig. 1):. By comparing this curve with the volume of flood flows that occurred each year of record (see Table I) it is judged that between 80 and 100 feet is the most likely range of economic height.

2. Determine the change in revenue with a change in dam height. First, the value of one AF of water, $p$, is found by calculating the energy it will generate.

Energy from one AF of storage
$= 4{,}840 \times 9 \times 62.4 \times 159 \times 0.82 \times 3.77 \times 10^{-7}$
$= 133$ kwh.

Value of one AF of storage
$= 133 \times 0.0075 = \$1.00$.

3. Determine the change in annual cost with a change in dam height. For a first approximation it may be assumed that the cost of a dam between 80 and 100 feet high is principally a function of the cost of concrete.

Thus $C_i = Y + y.C_c + C_c$

where $Ci$ = investment charge for the dam in \$/yr.

$Y$ = constant cost in \$/yr., covering such items as design cost, job and general overhead.

$y$ = constant in \$/\$ of concrete cost, covering such items as excavation, grouting, outlet structure, i.e., those that can be assumed to vary directly as concrete costs.

$C_c$ = equivalent annual cost of the concrete in \$/yr.

From estimates it is determined that the other variable items in the cost of the dam will be about 52 per cent of the cost of concrete for heights between 80 and 100 feet, thus

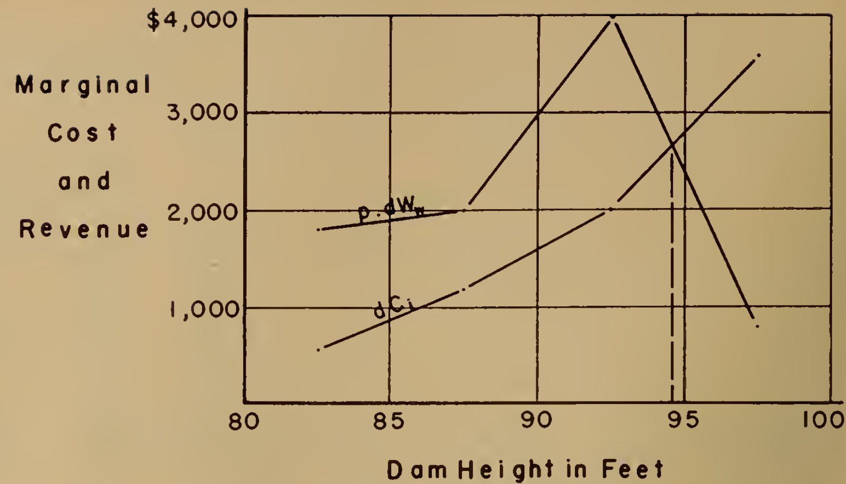

**Fig. 2.** Economic height of dam.

$$C_i = Y + 1.52C_c$$
$$\text{and } dC_i = 1.52dC_c.$$

Note in Table II that the amortization of the capital cost of the structure with a return of 6 per cent requires a yearly payment of \$0.07265/\$ of capital cost, i.e., $\frac{0.06}{1-1.06^{-30}}$; thus the equivalent annual cost of \$400,000, the capital cost of the concrete in a dam of height 80 feet, is \$29,000. As an example of the marginal cost determination,

$$\frac{1.52\ (31{,}000-29{,}000)}{5} = 610$$

for the height interval of 80 to 85 feet.

4. Draw the curves of marginal cost $dC_i/dH$, and marginal revenue, $p.dWw/dH$, (Fig. 2).

The most economic height of this dam, for the assumptions that have been made, is close to 95 feet.

5. Determine the total cost of a dam 95 feet high; then find the rate of return on the investment (the economic height can be the point simply where losses are the least): The capital cost of a 95 foot dam is estimated as \$1,200,000. The operating cost is estimated as \$4,000 per year.

Over the 10 years of record an average of 122,000AF/yr. of water was available for storage. With a 95 foot dam an average of 5,000 AF/yr. would have been wasted, leaving a net average volume of usable storage of 117,000 AF/yr. With one AF of stored water being worth \$1.00 a 95-foot dam would earn a gross revenue of \$117,000 per year. The revenue net of operating expense would be (\$117,000 − \$4,000) or \$113,000 per year.

The rate of return on the investment would thus be 9 per cent, obtained from the expression

$$1{,}200{,}000 = 113{,}000\frac{1-(1+i)^{-30}}{i}.$$

where $i$ is the rate of return. This means that not only would the capital be recovered and the interest paid, but that there would also be an extra return of 3 per cent on the investment.

It is sometimes concluded at this stage that, as the owner is a government commission, this extra 3 per cent need not be earned and that therefore the dam should be built higher, so as to use all the water available for generating electricity. This, of course, is a false conclusion. One of the most favourable aspects of the marginal approach is that it makes this point clear. Beyond the optimum height, 95 feet, the *additional* revenue earned is exceeded by the *additional* cost, thus the *extra* investment would be made at a loss, notwithstanding the fact that the project as a whole would still earn a return great enough to pay all charges.

6. The final step, as in all studies, would be to consider the extreme values which each item, estimated or assumed, could have and then to determine their combined effects on the conclusion. The ultimate decision would probably be made by superior executive judgement, taking into account this mathematical analysis and factors that cannot be reduced to quantitative terms. √

**Table II. Cost of Increasing the Height of the Dam**

| Height ft. | Capital cost of concrete | Equivalent Annual cost of concrete ($Cc$) | Marginal cost, ($dCi$) |
|---|---|---|---|
| 80 | \$400,000 | \$29,000/yr. | |
| | | | \$ 610/yr./ft. |
| 85 | 426,000 | 31,000 | |
| | | | 1,190 |
| 90 | 480,000 | 34,900 | |
| | | | 2,000 |
| 95 | 571,000 | 41,500 | |

# Air Pollution Control in Canada

*by*

**Professor E. A. Allcut, M.E.I.C.**

*Head of the Department of Mechanical Engineering, University of Toronto.*

A general consideration of the Canadian situation is followed by an analysis of the by-laws pertaining thereto. Details are given of the results obtained in Toronto from 1950-53. Special cases are then described, including sulphur dioxide pollution in Trail, Sudbury and Detroit-Windsor. The work of the International Joint Commission is briefly described and a summary is given of the arsenic trioxide investigation at Yellowknife. Smoke from railways and steamships and danger from radioactive emissions are also discussed.

A paper presented before the joint session of the Committee on Air Pollution Control and Fuels and Power Divisions at the Annual Meeting, New York, N.Y.—November 29 to December 4, 1953, of The American Society of Mechanical Engineers.

Canada is a sparsely populated country and, therefore, the problem of atmospheric pollution has not yet become serious, save in certain industrialized areas, most of which are situated near the United States border. As smoke is the most obvious kind of pollution, most of the early attempts at control took the form of smoke abatement ordinances or of clauses in a local building or other by-laws. These were very general in form and, in most instances, did not contain any definite provisions for measurement or enforcement.

The bibliography appended to this paper contains references to papers by Canadian authors or relating specifically to Canadian situations. The earliest of these papers(1) appeared in the Fourth Annual Report of the Commission of Conservation (Ottawa 1913). It dealt entirely with smoke, but was a good general summary of experience in the United States and Europe and contained recommendations suitable for appropriate action in Canada. It emphasized the importance of public opinion in facilitating enforcement and stated that "the smoke nuisance is an economic question and that the people most concerned are not those who make the smoke, but those who suffer because it is made."

Subsequently, attention was drawn to pollution by sulphur dioxide. This culminated in an investigation made by the International Joint Commission(23), including the assessment of damages and the adoption of remedial works by the company concerned. Similar conditions now exist elsewhere, albeit to a smaller extent.

The rapid and extensive industrialization of Canada, the greater prevalence of metallurgical and chemical plants and the danger from radioactive materials has directed increasing attention to the broader aspects of the problem. These factors largely account for the considerable number of investigations made and papers published since 1930, and the more elaborate and specific by-laws which have been adopted by the larger cities since the end of World War II. (Table 1).

### Anti-Pollution Ordinances and By-laws

Benner and O'Connor(1) quote S. B. Flagg of the United States Department of Mines, as follows:—"The requirements should represent the best practice, the standard set should not be an impossible nor an impracticable one, neither should it represent ordinary or poor practice." By and large, this wise admonition is observed in the anti-pollution laws of Canada and their enforcement. Education and persuasion are preferred to coercion and only in recalcitrant cases is the offender prosecuted.

Information obtained from 44 of the larger population centres in different parts of Canada is summarized in Table 1. In most of the cases in Ontario and Quebec the smoke clauses are based on the Ringelmann chart which, with all its faults, is the most convenient means available to outside inspectors for checking pollution. In a few cases, the emission of dust and fly-ash is limited to a maximum stack loading of 0.85 lb. per 1,000 lb. of gases (adjusted to 12 per cent $CO_2$) but this provision is of doubtful value, owing to difficulties of measurement and enforcement.

Most by-laws prescribe smoke indicators (or some means whereby the operator can see the top of the stack) and require installation and operating permits. Suppliers of combustion equipment are also directed to report all sales of such equipment, but in very few cases is there any limit to the volatile content of the coal that may be sold.

The fees for permits vary in amount and in some instances they are scaled to suit variations in the size or capacity of the equipment. One or two corporations also specify annual inspections of combustion apparatus. In most cases, domestic installations are exempted from the provisions of the by-law. Most of the ordinances contain general statements prohibiting the emission of odours and noxious gases, but no provision is made otherwise for their measurement or control.

In view of these variations and envisaging the greater necessity of standardization with increasing in-

dustrialization, the Committee on Atmospheric Pollution in Canada was appointed in 1949 to study the situation and to draw up a skeleton code which would cover all types of pollution, a variety of possible sources of pollution and recognize differences that exist in the prevailing conditions across the Dominion.

It is recognized that in many instances control measures have been deferred because of the absence of suitable standards and because enforcement in the smaller cities would be too expensive. The committee considered, moreover, that pollution is a regional and not a municipal problem and reported in favour of setting up pollution control areas(18) under the jurisdiction of the provinces. They also considered that the crux of the problem is the amount of pollutant emitted and not its density in stacks of different sizes.

Recommendations were made regarding the organization and powers of the controlling body, with provision for variations to suit different local conditions. There still remains, however, the necessity of a greater degree of standardization and instrumentation in methods of measurement, so that results obtained in one area may be comparable with those in other areas.(17)

### Results Obtained

There appear to be no reports available comparable with those from Great Britain and some of the larger American cities (e.g. Pittsburgh) but Table 2 gives some idea of the activities of the Smoke Abatement authorities in Toronto, and shows that the number of convictions obtained varied from 80 to 90 per cent of the number of summonses issued. Both Toronto and Windsor report the willingness of building owners and industrial firms to spend large sums of money to reduce or eliminate their own contributions to the general pollution problem.

An air pollution survey is presently being made in Toronto, under the direction of Dr. D. Y. Solandt of the University of Toronto, and it is hoped that a comparison of the results obtained, with those of a similar survey made in 1932-3, will indicate what progress has been made during the past twenty years. The scope of the survey is less than that originally planned owing to the difficulty of getting competent technical assistance.

Some difficulties have been experienced in urban areas due to the emission of fly-ash or oxides from

foundry cupolas and metallurgical furnaces. In at least two Ontario cases injunctions have been obtained and damages assessed. This situation is complicated by the fact that existing plants of this kind have been exempted by the Provincial Government from the requirements of the by-law and, on account of the expense involved, some operators threaten to move their plants out of the municipal area if the by-law is amended to include them. These difficulties will disappear in time, however, as all new plants must obtain permits and observe the by-laws.

No detailed studies have been made (as far as the author is aware) regarding the contributions of automotive engines to atmospheric pollution in the larger cities, but experience in Toronto appears to indicate that this factor is not important save, perhaps, when temperature inversions occur.

### Special Cases

#### *(A) Sulphur*

This element is vital for many industrial processes, but deposits of native sulphur are comparatively limited. However, large quantities of sulphur dioxide and hydrogen sulphide are wasted annually from smelting, refining and combustion processes. These gases add to atmospheric pollution, poison living matter and cause corrosion. The Committee on Atmospheric Pollution in Canada, therefore, recommended a limit of 0.20 per cent of $SO_2$ (by volume) in the stack gases and a maximum concentration at the ground level of 0.5 parts per million, for one hour.

In 1925, complaints were received of damage to farm and forest lands in northern Stevens County, Washington, from sulphur dioxide originating in Trail, B.C., and travelling along the Columbia River Valley. During the next five years the capacity of the plant was doubled and the emission of $SO_2$ rose to 600-650 tons daily. Substantial damages were awarded by an international tribunal(23) and the matter was investigated by the National Research Council of Canada 1929-1937(5) (6) (22).

The $SO_2$ concentrations are now recorded continuously by Thomas autometers and the mass rate of emission is controlled by regulating the operation of the roasting furnaces in accordance with the prevailing meteorological conditions(23). The current loss to the atmosphere is less than 9 per cent of the sulphur charged and the six acid plants have a capacity of 1,300 tons of sulphuric acid a day(22). Thus is a liability transformed into a valuable asset.

A similar situation exists in the Sudbury, Ontario area where about 90,000 tons of sulphur dioxide are now being recovered annually from stack gas in nickel-copper smelting. Nevertheless, Katz states(22) that the annual emission of sulphur from the three smelters in this area may be as high as 1,000,000 tons. He further states that other plants now operating, or under construction, have an additional capacity of 246,000 tons per annum.

*(B) Arsenic Trioxide at Yellowknife.*

The emission of arsenic trioxide from the roasters at Yellowknife, N.W.T., has resulted in a somewhat unusual problem that is being studied by Dr. Kingsley Kay, Chief of the Occupational Health Laboratory, Ottawa. This study has been under way for the past eighteen months and is still going on. The two mines concerned are three miles apart and the town of Yellowknife lies between them. Their two stacks emitted twelve tons per day of arsenic trioxide in submicron form and, as a result, twenty expensive cattle died, wild life was destroyed and people siekened by arsenical poisoning.

To meet this difficulty, one mine installed Cottrell precipitators and the dry dust was dumped into caverns in the permafrost zone. The other requested, and ultimately obtained, permission to use wet scrubbers from which the wet effluent was pumped into a nearby lake. This ultimately produced a water pollution problem, as the arsenic spread from one lake to another and contaminated drinking water. A bio-chemical survey was made and it was noted that, as the evolution of pollutants into the air and the surrounding environment was reduced, the concentration of arsenic in the urine of a selected group was also reduced.

A new roaster was installed, doubling the capacity (and the loading of the Cottrell) and the environmental levels rose again. Measurements of arsenic content are now being made in the air, water, soil and vegetation for the purpose of throwing more light on the allowable limits of contamination.

*(C) The Windsor-Detroit Border Problem*

Another investigation undertaken by the International Joint Commission, relates to the Detroit-Windsor area, which is the third largest manufacturing area in North America. Coal consumption amounts to about 16 million tons annually and it is estimated that about 430,000 tons of $SO_2$ are released by combustion. There are also other contaminants.

From 1949 onward, records have been kept of meteorological data, smoke emissions from vessels, $SO_2$ concentrations, gaseous and particulate contaminants and deposited matter (dustfall). These investigations have already been published in detail by Dr. Katz(23) (25) (26). It is a notable and gratifying example of international co-operation in this important field.

*(D) The St. Clair River Research Group*

In February 1952, a research group was set up under the auspices of the Ontario Research Council, to study air and water pollution in the St. Clair River Basin. The committee appointed included representatives of the local industries concerned and of government departments. Initially a research program was arranged to determine the extent and nature of the air pollution in the Sarnia area. This, also, is a border problem, as Port Huron (Mich.) is situated on the opposite side of the St. Clair River.

The funds necessary for the study were provided jointly by the companies concerned and by the Ontario Research Council; the actual survey was commenced in October 1952 and is expected to continue for at least two years. Collaboration is being arranged with the International Joint Commission and the techniques employed are similar to those used in the Windsor-Detroit area.

A fixed station for collecting meteorological data was set up along the lines of prevailing winds in the residential area of Sarnia. This station contained apparatus for determining wind velocity, a Thomas Autometer for $SO_2$, dust collecting equipment, etc. A similar station mounted on a trailer has also been provided by the Research Foundation for a complete analysis of air in other locations in the area.

A number of dust cans have been set up at various points in the Sarnia area to determine dust fall. Advice on the meteorological aspects of the problem is being received from the Canadian Meteorological Service.

In addition to the above activities, the Council of the City of Sarnia have authorized the formation of an Advisory Committee on Smoke Abatement and have asked the St. Clair River Research Group to appoint a representative to sit on the committee. The function of the committee is to provide technical advice to the City Manager's Department in respect to ways and means of reducing air borne contaminants.

This is a long range project and no significant results have yet been obtained, but there is some evidence to indicate that the dust-fall in the Sarnia residential area is low compared to other cities having a similar concentration of industry.

*(E) Transportation*

Among the worst offenders with regard to smoke emission are the railroads and steamships, but the municipal authorities have no control over these agencies, as they are under the jurisdiction of the Board of Transport Commissioners for Canada. This is a Federal board and has the usual characteristics of a governmental department.

The problem has been acute in the Detroit River, where about 28,000 passages are made in a season and thousands of smoke readings have been taken by the Ringelmann chart method. These reveal that, as a result of improved boiler equipment, firing methods and the use of over-fire air jets, the percentage of the time of smoke observations from vessels, corresponding to No. 3 Ringelmann chart or darker, fell from nearly 51 per cent in 1950 to 27.5 per cent. in 1953. Table 3 was taken from the 1953 report of the Technieal Advisory Board of the International Joint Commission.

Other cities with port areas have similar problems which are very difficult to solve, particularly when the ships are of different nationalities. However, as far as the Great Lakes and St. Lawrence areas are

**Table 3. Smoke Performance of Vessels on Detroit River**

| Year | Total Time of Observations in Minutes | | Percent Time Corresponding to Ringelmann Number | | |
|---|---|---|---|---|---|
| | No. 1 or lighter | Readings at all densities | No. 1 or lighter | No. 2 | No. 3 or darker |
| 1950 | 12,331 | 33,676 | 36.5 | 12.8 | 50.7 |
| 1951 | 31,447 | 66,919 | 47.1 | 18.15 | 34.75 |
| 1952 | 31,001 | 63,028 | 49.4 | 19.45 | 31.15 |
| 1953 | 31,276 | 52,297 | 59.8 | 12.7 | 27.5 |

concerned, the local steamship lines are showing willingness to co-operate.

The railways also are causing some trouble, particularly in the round houses. They are, however, installing oil lighting-up systems and external steam-starting equipment in several places. They are also giving special instruction to firemen on proper methods of lighting up and feeding the fires. They have their own inspectors to observe results.

A general order was issued in 1908 prohibiting the unnecessary and unreasonable emission of dense smoke from locomotives in cities, towns and villages which have anti-smoke by-laws, but this is a general and not a specific directive. Its effectiveness is doubtful. The principal relief would appear to come from the increasing use of diesel engines to replace steam locomotives.

The following figures give an indication of the rate at which oil is replacing steam on the two principal Canadian railways:—

Canadian National Railways
- 1948 1928 steam locomotives and 500 switchers
- Aug. 1953 1901 steam locomotives and 500 switchers; 445 diesel locomotives (50 in 1953)

Canadian Pacific Railway
- 1948 Nearly 2,000 steam locomotives
- Aug. 1953 1654 steam locomotives; 367 diesel locomotives (50-60 per annum)

While this trend is eminently desirable from the standpoint of atmospheric pollution, it accelerates the present tendency to put all our transportation on a liquid fuel basis. The reasons for this are obvious, but, in time of crisis, our almost total abandonment of solid fuels may be catastrophic. In such times, the North American continent will probably have to be self-supporting, as far as liquid fuel is concerned.

It is true that oil supplies from Canada are increasing and that new sources are being discovered elsewhere, but for how long can this self-sufficiency be maintained ? The United States is already importing about 7.7 per cent (net) of its petroleum requirements and the rise in the American consumption curve is phenomenal. One can only regard this aspect of the fuel situation with apprehension.

### (F) Miscellaneous

Potential danger arising from the emission of radio-active materials from atomic energy plants is illustrated by a small leakage that occurred at Chalk River in December 1952. It was described as a "pin point break in the outer structure" but all operations throughout the 100 odd buildings in the 500 acre plant site were shut down for some time.

The concentration of radioactive material at ground level was attributed in this case to a down draft. In most cases, ground level concentrations are prevented by dispersing waste gases at high levels, sometimes using stacks 450 to 550 feet high(17) (23). Bosanquet and others have studied the theoretical distribution of pollutants from factory chimneys but their results are always subject to considerable modification with changing meteorological conditions.

Apart from combustion processes, considerable pollution can arise from dust produced in pulverizing, grinding and other similar operations. If this occurs in enclosed spaces, the situation can be met by installing the usual cyclones or filters but, in the case of open fires, or where there is no agency for collecting the particles by suction or otherwise, the measurement of the amount of pollution may be impracticable. In such instances, the only form of protection possible appears to be under a general nuisance clause and a nuisance is a difficult thing to define or prove.

### Acknowledgments

The assistance of Drs. Morris Katz, A. E. R. Westman and Kingsley Kay, Mr. L. J. Cudbird, Mr. A. D. McRae and the City Clerks of the various municipalities concerned is gratefully acknowledged.

# The ASME Boiler Code

In the July 1952 issue of *Mechanical Engineering*, the ASME commenced publication in serial form, of a history of events leading up to the present ASME Boiler Code, from the first development of boilers in the 18th Century. This history, continued through some ten issues, was prepared by Arthur M. Green, Jr., of Princeton University.

As a preface to the regular publication in future issues of *The Engineering Journal*, of Boiler Code Regulations, this history is here presented in condensed form. It will appear in several issues of the *Journal*, of which this is the fith.

## V. Administration of the 1937 Code and More Revisions 1938-40

A protest from the Ohio Board of Boiler Rules against the large number of revisions acted upon by the Committee for adoption during 1938, was discussed at a committee meeting in June 1938. The Board had not been called upon by its Industrial Commission, by industry or by operators to change the Ohio Rules as broadly as indicated by the Committee, and until called upon for relief from present boiler and pressure vessel regulations by its constituents, it would not consider further revisions.

A minute from the Engineers' Conference of the National Bureau of Casualty and Surety Underwriters was read at this meeting, directing that it be placed before the Boiler Code Committee in opposition to the great number of revisions and interpretations of the Code. It recommended these be carefully analyzed from a safety point of view, and if costs only were involved, no revisions should be made.

At the July, 1938 meeting of the Committee, the chairman called attention to the growing criticism from the States about this activity of the Boiler Code Committee. It was feared some of the states would refuse to adopt some of the revisions, then others would follow, and no one could foresee the result of differences in state laws. The chairman recommended that the Committee follow the suggestion of the "Engineers Conference", presented in June. It was also suggested that the Committee should not try to standardize details, but use broad requirements for safety and so reduce the need for many revisions.

### Hearings

#### A—Stainless Steel

An informal hearing and conference was held in February, 1938, with manufacturers of stainless steel and high alloy steels. The need of fabricating companies for rules which would control the use of stainless steel was expressed. A set of rules prepared by the Committee and the AWS was read and discussed.

Five suggestions were made: (1) Allow stabilized materials for vessels under Para U-68; (2) Allow a U-69 vessel of not more than 5/8 in. thickness of stabilized steel with stress relief; (3) Allow unstabilized steel without relief for U-69 and U-70 vessels, if not over 3/8 in. thickness; (4) Limit all U-69 vessels to a pressure not over 400 p.s.i. and a maximum temperature of 600°F. and (5) Limit U-70 vessels of unstabilized steel to maximum pressures of 100 p.s.i. and maximum temperature of 250°F. These suggestions were referred to the Subcommittee on Ferrous Metals and on Welding.

#### B—Safety Valves

In July, 1938, it was reported that tentative agreement had been reached with manufacturers of safety valves regarding Table P-16, Relieving Capacity of Safety Valves. It was pointed out that there was no change in principle from that which had been in the Code for 15 or 18 years. The recommendations were approved for publication, after the special committees had received and reviewed comments from manufacturers. After changes made at a number of meetings the final form was approved in June, 1939.

#### C—Table P-2 for Tubes

A hearing with manufacturers of tubes, held in June 1939 to discuss table P-2, was reported the same month. It was held at request of the manufacturers of seamless tubes, who maintained that Table P-2 gave equal value to welded and seamless tubes, and this had not been sustained by tests at Purdue University. No agreement was reached.

At the committee meeting, after discussion, it was finally voted that adoption of Table P-2 as published be considered at the September meeting. A special committee was appointed to consider how the Table as published, could be made more acceptable. This Committee suggested, in September, the use of Table P-2 as published in April, 1939, as far as the formula; the insertion of two formulas; renumbering the stepped lines on Tables I, II and III; and statement of their use as given in the report.

As the Committee could not make a unanimous report, it was discharged, and reappointed with two added members. It was directed to report at the November meeting. A unanimous report was presented in December, 1939, to the effect that Table P-2 be revised in accordance with the form appearing in the appendix of the minutes. This report had the approval of tube manufacturers, and appeared in the January 1940 issue of *Mechanical Engineering*. After the many conferences and hearings, Table P-2 was approved by the Council in March, 1940.

#### *D—Conference on Para. U-1(a)*

A controversy arose between the Westinghouse Air Brake Company and the Inspection Department of California as to whether air reservoir cylinders should be built in compliance with the ASME Code for unfired pressure vessels. A letter from the Industrial Accident Commission of California describing the situation was discussed by the Committee in December 1939. This Commission contended the Code should state what a Code vessel was, and allow the states to fix minimum limits. A revision was suggested, fixing the minimum limits of the application of the Code, and providing that all vessels, regardless of size, should be equipped with safety devices.

At the meeting of June, 1940, it was decided to call a public hearing in October 1940. This hearing resulted in the form of paragraph U-1(a), allowing vessels below 5 cubic feet and sectional area of 64 sq. in. to be accepted without inspection, and permitting stamping if accompanied by manufacturers certificates. The Boiler Code Committee referred the recommended revisions to the Subcommittees on Unfired Pressure Vessels. The Committee did not report on this suggestion during 1940, as time did not allow its inclusion in the 1940 Edition.

#### *E—Hearing of Manufacturers of Dished Heads*

A hearing on under-tolerances of thickness for dished heads was held in September 1939, attended by the Executive Committee and representatives of five manufacturers. The rejection of the ASME type of flanged and dished heads for non-conformance with Code requirements by insurance inspectors was discussed. The purpose of the hearing was not to discuss acceptance of non-standard heads, but to clarify the rules for proper use by all dished head fabricators.

The Committee pointed out that its belief was that an under-thickness tolerance was not in harmony with Committee practice. Committee members expressed reluctance to make changes in the Code to provide under-gage tolerances. Steel manufacturers' representatives made it plain they did not object to elimination of under-tolerances in Code type heads, but they objected to elimination or change of the amount of under-gage of 0.10 in. permitted by Code material specifications.

#### Miscellaneous Welding—Penatrameters

In February, 1938, the Henry Vogt Machine Company pointed out that the penatrameter (Para. P-102(i) of the Code) took up considerable space on the X-ray film, and asked whether individual strips of 2 per cent of the base plate in thickness would be permitted, placed at the end of each exposed section of the weld. Their letter was referred to the Special Committee on Radiographic Examination of Welded Joints.

At the meeting of March, 1938, the Executive Committee reported that permission to use the single strip should not be granted without informing other manufacturers, hence a proposed revision should be formulated and published. This action was not approved, and the Henry Vogt Machine Co. was informed that the subject was being considered by the Special Committee and a report was expected in June.

The Special Committee considered the matter at its meeting of June, 1938, but no final action was taken. In June, 1939, it was agreed to confirm the action of June 1938, and to recommend revisions to paragraph P-102(i) and paragraph U-68(i) providing for the use of the strip penatrameters. This was accepted by the Committee for publication as a revision. It became part of I(e) of paragraph P-102(i) and paragraph U-68(i)b as appearing in the two sections of the Code of 1940.

#### Porosity

In September, 1940, the Special Committee on Radiographic Examinations of Welded Joints recommended the eliminations of films No. 1 and No. 2 and a change of label on No. 3, due to inspectors' complaints that many films as good or better than No. 3 had been rejected. Porosity less than that of No. 4 would be acceptable, and such change would eliminate half of the present unwarranted rejections.

This report was discussed at the Committee's October 1940 meeting, some members strongly urging a film showing less porosity than No. 3. The matter was referred back to the Special Committee.

#### Welded Tubes and Standard Qualifications

The Special Committee on Extension of the Use of Fusion Welding, in March 1938, reported proposed additions to the Code on Welded Joints in Boiler and Other Tubes, paragraph P-112, defining tubes and their positions, qualifications of process, tests of welds and operators, details of welded joints, and use of a backing ring. The Special Committee asked the Committee's opinion about the stress-relieving of welded joints of tubes, and the magnaflux test on circumferential joints of pipes and tubes.

After discussion, the Committee voted that stress-relieving should be required for welded joints in tubes in contact with furnace gases, irrespective of size and thickness, and that no provision be made for magnafluxing welded tubes. They then presented a new arrangement of paragraph P-112, Welded Connections. In March, 1939, the Special Committee reported a revision of their proposal for paragraph P-112. The Boiler Code Committee adopted the revision and with it the Qualification Rules mentioned in P-112 as part of the Appendix.

A recommendation was made to the subcommittee on Unfired Pressure Vessels that the latest AWS qualifications be considered as promptly as possible for incorporation in the Code. Minor revisions or additions to the Qualifications Procedure were made in April and May, 1939, and in June 1940 the Procedure became paragraphs UA-30 to UA-70 of the Appendix. After some further revisions and additions the final form of the AWS Qualifications Procedure, with modifications, were approved for publication in March, 1940.

#### Qualifications for Operators for Machine Welding

The Vancouver Iron Works requested an opinion in February, 1939, on the qualifications of operators of an automatic welding machine requiring no skilled operator. The Subcommittee on Welding was not in accord with the suggestion that no qualification be required for the operators. The Committee voted to reply that no evidence had been submitted to the Committee to justify a revision to the Code at that time.

#### Repairs by Fusion Welding

In November, 1940, the Executive Committee of the National

Board of Boiler and Pressure Vessel Inspectors had considered recommended revisions to rules for repairs by fusion welding, proposed by the Engineers Conference of the NBCSU. The need for changes appeared most urgent in New York and Maryland. The Boiler Code Committee considered the rules were so old that they did not cover welding work. The Committee voted that a copy of the revised rules be sent to each committee member, and that comments be sent to a designated special committee.

#### Welding Dissimilar Metals

An inquiry in September 1940, with drawing showing a silicon bronze coupling welded to a copper lined steel hull, asked whether the Code covered the welding of dissimilar metals. The Subcommittee on Welding reported that under procedures a satisfactory structure could be made, but to consider the broad subject a procedure would have to be established. A reply was approved to the effect that if the manufacturer could set up a procedure and demonstrate that satisfactory welds could be made, permission for the constructions presented would be given.

#### Shop Examination of Welded Joints

The 1940 edition of section VIII contained paragraph U-78(g), Shop Examination of Welded Joints. At a meeting in April, 1938, the Subcommittee on Unfired Pressure Vessels reported a draft of this paragraph intended to answer questions on the determination of the nature of the weld after completion, and stated insurance companies had worked out a satisfactory method of trepanning. A revision of the draft was reported at the June 1938 meeting. The Subcommittee considered this matter again in July, 1938, and authorized a special committee to review the rules for shop examination of welded joints. They voted that its final report be referred to the Executive Committee, with power to authorize publication.

These paragraphs referred to welds in vessels built in accordance with paragraphs U-69 and U-70 only, and fixed the size and frequency of trepanning plugs at locations designated by an authorized inspector. Modifications were made in paragraph U-78(g), and in September, 1939, three minor changes were approved, as well as paragraph UA-47 on etching of the removed specimen of the weld metal of paragraph U-78(g).

#### Stress Relieving

Stress relieving of vessels of ordinary steel and chrome nickel steel was discussed in January 1939, in a letter from the Struthers Wells Co., regarding such relief for a vessel containing parts of each of these steels. The Subcommittee on Welding, after discussion, referred the inquiry to the Special Committee on Approval of New Materials, to secure additional information. The Special Committee pointed out in September, 1940, that the rules for stress-relieving should be permitted in this case.

In October, 1940, the Special Committee formulated a reply, also proposing revisions for paragraph U-59(n), (p) and (r). This was discussed and referred back to the Special Committee. In November another form of reply was made, proposing that nozzles and other welded attachments to unrelieved U-69 vessels need not be stress-relieved, but that this be done before attachment. Because of objections raised by the Committee members, the reply was again referred to the Special Committee.

#### Special Committee to Revise Section VIII

Publication of the joint API-ASME Code for Unfired Pressure Vessels in 1934, with its lower factor of safety of four, led some Committee members to suggest that a revision of section VIII might serve the petroleum industry, and eliminate the need for two Codes. With this purpose the Special Committee to Revise Section VIII had been appointed in February 1935.

In January, 1939, the Subcommittee on Ferrous Materials was asked by the Boiler Code Committee to prepare additional tables for the revision of section VIII, giving working stresses for ferrous material using a safety factor of four. In February it requested the Subcommittee on Non-Ferrous Materials to prepare a similar table for non-ferrous materials.

In October, 1938, the Special Committee to Revise Section VIII held a three day session, covering the high spots of the revision. By April, 1940, a draft of the revision had been sent to certain members of the Boiler Code Committee. The report was sent to the Committee in April, suggesting the calling of a Committee meeting to consider the advisability of sending the report out for discussion. This meeting was called for April 30. The release of the report was discussed by the Committee, which voted to transmit the draft of the revision to the API through the proper channels.

The feeling of the Committee members connected with the petroleum industry was that the API should have representation equal to that of the Committee in matters relating to Unfired Pressure Vessels. At the Committee meeting of May, 1940, objections were made to the action at the special meeting of April 30. Attention was called to the confusion resulting from the issuance of the 1934 API-ASME Code. It was suggested there was no reason why one committee could not be responsible for power vessels and another for unfired pressure vessels.

In October 1940, it was reported a draft of the proposed revisions of section VIII had been considered at a meeting of the API. Certain administrative principles were considered essential before the revised Code could replace the API-ASME Code. It was proposed that comments received by the Special Revision Committee should be sent to the API Code Committee, which was to meet in Chicago in November.

#### Materials

*A—Specifications*

During the period 1938-40 the Subcommittee on Material Specifications arranged for the introduction of the latest ASTM specifications to replace their predecessors in the 1937 edition of section II of the Code. Much of the work was the examination of ASTM specifications of materials for which the Committee, in replies to cases, had given permission for use in vessels. The replies had contained limitations for the use of these materials.

The added specifications were S-42 to S-57 inclusive. These were all identical with ASTM specifications. Deletions included specifications S-3, S-6, S-12, S-26, S-27, S-29, S-30 and S-31. A few of the specifications were changed to those for similar materials of slightly different properties. Of the 47 specifications of section II, all were identical with ASTM specifications except four, of which one was based on ASTM, one was in substantial agreement, one adapted from, and one for which there was no ASTM equivalent.

The grouping of these specifications under their ASTM designation number had been suggested by the Subcommittee on Ferrous Materials in January, 1938. This

Subcommittee also recommended the publication of section II as a special volume. The policy established for the 1940 editions was the printing of sections I and VI in one volume, with the Appendix and the other Sections, including section II, as separate volumes.

*B—Use of Non-Code Materials*

Paragraphs such as P-1(b), L-1(b) and V-12(b) provided for applications for use of materials other than those for which specifications were given in section II. In October 1937, a Special Committee was appointed to prepare a schedule of the chemical and physical properties of new materials needed by the Committee in these applications.

This Special Committee reported in February 1938, and after acceptance of its report the requirements it specified became Paras. A-78 to A-85 of the Appendix, entitled "Approval of new Materials under the ASME Boiler Construction Code". These were added to the other sections. They identified the materials as the same as, or similar to, one of the ASTM specifications, or stated the properties in the order found in the text of ASTM specifications.

*C—Clad Vessels*

The Lukens Steel Company asked permission to use the strength of full-thickness nickel-clad steel plate in designing any type of pressure vessel, instead of the steel thickness only, and for a hot water storage tank, under paragraphs U-69 and U-70. The Special Committee on Clad Vessels (April 1938) did not agree. The Committee referred to this Special Committee the preparation of an interpretation covering the various recommendations made by it for granting the requests. This was made Case 860.

In January, 1940 the Special Committee reported it had considered an inquiry from the Jessop Steel Co., asking permission to use stainless clad steel in welded unfired pressure vessels. It recommended annulment of the earlier cases Nos. 828 and 860, relating to nickel clad sheets, and the reopening of Case 828 to have it cover nickel-clad material for all fusion welded construction.

The Special Committee then presented a reply to a similar case for the use of chrome-nickel steel. This resulted in a unanimous report for the reopened Case 828 and Case 896 (chrome-nickel steel) which were adopted to issue as interpretations. Although the Special Committee voted that the quench test or the reverse bend test might be applied to a sample cut from the plate, the efficiency of the weld was more important than the efficiency of bond.

*D—Material Committees*

During 1938-40 the Special Committee on Approval of New Material was seeking materials which might cover a number of interpretations, while subcommittees on Ferrous and Non-Ferrous Materials were fixing allowable stresses and considering their properties and treatment.

In December, 1938, the Timken Roller Bearing Co. asked a ruling on conditions for the use of carbon molybdenum intermediate and high-alloy boiler and superheated tubes, which could be certified as satisfactory under Code requirements. This was referred to the Subcommittees on Ferrous Materials and on Material Specifications.

The reply stated that in the absence of a suitable ASTM specification, and until one was adopted, the material proposed met requirements of the Code if (1) requirements of S-17, S-40, S-48 and S-49 were met: (2) test requirements and other applicable parts were met: (3) the hardness be limited where tubes were to be expanded and (4) the material be of weldable quality.

In March, 1940, the Special Committee for Approval of New Materials reported Cases 834, 836 and 861 could be combined in a new Case 897, by the use of ASTM-A-167-38T for chrome-nickel steel. The Special Committee was directed to reply to Case 791 as for new Case 897.

*E—Cast Aluminum Heads*

A request by the American Laundry Machinery Co. to use cast aluminum heads on steam containers was considered in April, 1939. These heads were tested according to paragraphs UA-1 and UA-9, which referred to tests on steel, and did not apply for non-ferrous materials. Moreover the material was one, the specifications for which could not be used under the Code, because of lack of stress requirements.

The need for a specification for aluminum under the Code was expressed, because of demands from industry that vessels using this material be stamped as complying with the Code. The Special Committee on Non-Ferrous Pressure Vessels wrote to the Industrial Research Division of the Welding Research Committee, stressing the need of a satisfactory ASTM specification for aluminum.

*F—Wrought Iron*

A letter from the A. M. Beyers Co. in September 1938, asking as to the possible use of wrought-iron plates and structural shapes for boiler and vessel parts, was considered by the Committee. It was voted to advise the inquirer that to provide for the use of this metal, except as already provided for pipes, tubes etc., would require new rules, and unless there was evidence of a demand for such, the Committee did not feel warranted in preparing them.

*G—Bronze Fittings in Heating Boilers*

Letters asking permission to use bronze fittings and Tobin bronze fittings and silver alloys in heating boilers, were discussed in October, 1938. The Miniature Boiler Code provided for the use of bronze. Permission to use these fittings brazed to copper tubes was asked. The report on the subcommittee findings recommended permission be granted.

*H—Allowable Stresses for Non-Silicon-Killed Steel*

Tables P-9 and U-3 on maximum allowable stresses, prepared by the Subcommittee on Non-Ferrous Materials, was amended to include steels in a number of the adopted specifications providing for several grades of non-silicon-killed steel. This action was approved in December, 1938, as well as additions for materials which had been added to section II.

*I—Proposed Reduction of Ductility*

The A. O. Smith Corp. recommended that elongation requirements of Paras. P-101 (later P-102) and U-68(e) be decreased with an increase in tensile strength of the weld. The Subcommittee on Welding reported in June, 1938, that much information was needed before action could be taken, and suggested the question be referred to the AWS Conference Committee.

In July the AWS Conference Committee expressed agreement, though without test results nothing could be fixed. The A. O. Smith Corp. agreed to carry out tests on welds and steels if the Boiler Code Committee would supply "run-of-mill" welds, and steel from various manufacturers, for determining ductility of steel and specimens.

Other manufacturers maintained it was always possible to secure 20 per cent ductility by proper welding, and recommended no change, as it was of advantage to have the weld metal ductile. It was voted to inform the A. O. Smith Corp. that the Committee was of the opinion that no change was desirable in the requirements for ductility in weld metal.

*J—Cast Iron*

The strength of cast iron was considered at the meeting of February, 1939. Though the three classes had tensile strengths of 20,000, 30,000 and 40,000 p.s.i. respectively, paragraph U-13(g) limited the working stress to 2,500 p.s.i. for any of them. Some members expressed belief that higher strengths cast iron should be allowed a higher working stress. Others stated if cast iron were used, the working stresses in tension, compression and bending should also be given. The question was referred to the Subcommittee on Ferrous Materials.

*K—Special Emergency Use of Steels*

A letter from a boiler inspector of California was considered in November, 1940. He enquired if, in view of the demand from the defence program, if it would be permissible to build fusion welded vessels for hot water tanks not in contact with products of combustion, of steels of ASTM specifications A-7, A-28 and A-30. In view of the emergency, the Committee advised the inspector as a state official to act so as to allow this.

*L—Monel Metal Seamless Tubes*

Permission was asked by the Griscom Russell Co. to use and circumferentially weld seamless-Monel-metal tubes under paragraph U-71(c), as there were no specifications for Monel-metal tubes in section II, nor were they mentioned in paragraph U-71(a). The reply, formulated by the Special Committee on Welding Requirements and the Subcommittee on Welding, was discussed in June, 1939. The inquiry was then formed to include the properties of Monel-metal to be used, and to call for the use of Specification S-47 for copper-nickel tubing for oxyacetylene welding, provided: (1) tests were made on flat 3/8 in. plates (2) tubes were welded in horizontal positions and revolved, (3) hydrostatic tests were made at minimum of 1,000 p.s.i., and (4) stress relieving was not required. Similar action was taken in Case 880, giving permission to use naval rolled brass, after consideration by the Subcommittee on Non-Ferrous Materials.

*M—Stainless Steel*

In May, 1939, the Special Committee on the Approval of New Materials made a full report of the required changes in replies to Cases 836 and 861 on the use of stainless steel, as well as for three other cases on the same grade of an ASTM specification for chrome-nickel sheet. The only change in Case 836 was in the minimum temperature of heat treatment from 190°F. to 195°F.

In Case 861, the inquiry and reply related to stabilized austenitic chrome-nickel steel of ASTM specification A-167-38T. This was limited to grades 5 and 9 using columbium or titanium, for stabilizing with the last heat treatment, at not less than 185°F. The inquiry referred to vessels conforming to paragraph U-69. The reply covered this point, and a paragraph gave conditions permitting stamping under paragraph U-70. The reply gave chemical treatment of the weld material with each kind of stabilization.

The new Case A referred to the use of grades 2, 4 and 6 of Specification A-167-38T for vessels built to conform with paragraph U-69, chemical composition and heat treatment before welding were given, and limitations of 3/8 in. in thickness, 600°F. maximum temperature, 15,000 p.s.i. allowable working stress, with joint efficiency 80 per cent. This also applied to U-70 vessels.

The new Case B was drawn for the use of grade 6 steel for paragraph U-68 vessels, and inquired into the applicability of the same heat treatment to U-69 vessels. The new Case C for grades 5 and 9 was for U-69 vessels, and the reply gave minimum temperatures of 1,550°F. for heat treatment of the complete vessel of columbium-bearing steels and 1,650°F. for titanium-bearing steels.

These requirements were considered again in March, 1940. Cases 834, 836 and 861 were annulled, and replaced by Case 897, in answer to the inquiry: "May chrome-nickel steel as such, or alloyed with columbium, titanium or molybdenum, be used for unfired pressure vessels under ASTM Code rules ?"

The reply stated they might be used for unfired pressure vessels with certain limitations: (1) Users were recommended to assure themselves by tests or otherwise that the alloy selected, and the treatment following fabrication, were suitable for the intended service. Where service data were not available, the procedure under paragraph U-11(b) would apply. (2) The chrome-nickel material should conform to ASTM Specification A-167-38T, and only the grades tabulated should be used, subject to certain added restrictions and requirements. (3) Different heat treatments (a), (b), and (c) were described for different classes and use of these steels. Check tests of heat treatments were required for each lot. (4), (5), (6) and (7), Limitations for thickness, pressure, temperature and allowable working stresses were listed, and (8) Welding was to be done in accordance with paragraphs U-68, U-69, and U-70, with additional requirements (a) to (e) inclusive.

In April and May, 1940, certain changes were made in the wording of the reply, and specification A-167-39 replaced that of 1938. In April special item 4 was introduced, dealing with heat treatment of U-68 vessels, subsequent numbers being changed. Later, seamless forgings were added as the tenth item.

*N—Materials for Vessels Under External Pressure*

A joint meeting of groups of two committees of AWS and the Subcommittee of Ferrous Materials of the Boiler Code Committee was held in October, 1940, to consider questions of mutual interest. The group recommended the following: (1) A note should be added to the Boiler Code text, stating that the quality factors for castings in Tables P-9 and U-3 did not apply to cast steel fittings and dimensional standards of ASA Stand B16(c)-1939, since a 50 per cent shape factor was inherent in the designs. (2) When the welding end of cast steel valves or fittings was finish-machined and inspected, a quality factor of 100 per cent might be applied, but thickness of the welding end should not be less than that of the adjoining pipe. (3) Members of ASA Committees B-16 and B-31 who were actively engaged in setting allowable stresses should be appointed to the Subcommittee on Ferrous Materials. (4) A co-ordinating committee should be appointed fo Boiler Code Committee members and those of the ASA B-16 and B-31 groups to promote uniform action.

In November, 1940, the Committee appointed members to recommend a suitable revision of the Code to provide for (1) and (2) above. Recommendation (3) was questioned. Committees B-16 and B-31 would be invited to suggest representatives to serve on the Sub-Committee to co-ordinate the work. (4) was referred to the Special Committee on the Work of the Boiler Code Committee, to work out a procedure to accomplish the object of the recommendation.

### Testing Large Welded Gas Containers

In earlier years, the Committee had made an interpretation and an addition to paragraph U-64(b) (e) for the testing of large riveted gas containers, for which the foundations, and possibly the vessels, could not resist the weight or pressure brought on them from the weight or head of water. An inquiry from the Maryland Casualty Co. was considered at the June, 1938, meeting, asking if paragraph U-64(e) for riveted vessels could be applied to similar vessels of welded construction. This was referred to a special committee, which reported in December, 1938, that it could not reach agreement, and that this should be referred to the Special Committee to Revise Section VIII.

### Revision of Inspection Requirement in Code

Difficulties resulting from the inclusion of inspectors of municipalities in the Code arose when a state had not adopted the Code, and one of its municipalities had passed an ordinance creating a bureau of boiler inspection. In March, 1938, a Committee member recommended the word "municipality" be deleted from paragraph P-332.

### Written Examination for Qualification of Inspectors

In June, 1938, a major revision of paragraph P-338 was proposed, calling for inspection by a state inspector, a municipal inspector, or one regularly employed by an insurance company. Another sentence required that these inspectors be qualified by a written examination under rules of the State adopting the Code. In January 1939 a committee was appointed to consider the proposed form of revision of paragraph P-332.

The final draft was reported in January 1940, and adopted as it appeared in the 1940 edition. Inspection sections of the Codes for Locomotive, Miniature and Low Pressure Heating Boilers were amended to bring them into general agreement with the important parts of paragraph P-332.

### Hydrostatic Test After Seal Welding

An inquiry considered in July, 1938, related to the welding of screwed sections and nozzles installed on superheaters, economizers and water wall headers. The reply in this case, No. 862, permitted seal-welded threaded sections or nozzles not exceeding 2½ in. pipe size, without making a hydrostatic test before welding, provided the requirements of paragraph P-268(b) were met.

### International Relations

#### *A—Canadian Use of the Code*

At the February, 1938, meeting, it was announced that Canada had proposed the adoption of sections I, VIII and IX of The ASME Boiler Code. The Toronto Iron Works planned to build an unfired pressure vessel under paragraph U-69, and the customer asked that it should bear the ASME Code symbol stamp.

The Special Committee on the Issuance of Code Symbols reported that the usual form letter and form of agreement should be sent to this company. When the application was received, a letter would explain inspection and stamping requirements. The form of this letter, approved by the Special and Executive Committees, was read and all actions were accepted by the Boiler Code Committee.

#### *B—Australian Use of the Code*

A draft of a proposed revision of the section of the Boiler Code of the Standards Association of Australia was presented to the Committee in March, 1938, for comment. This related to a hydrostatic test under paragraphs A-22 to A-30 of the ASME Boiler Code. The ASME Secretary was requested to transmit the comments, with the appreciation of the Society that the SAA had so approved the ASME Code that it had used parts of it.

#### *C—Brit'sh Use of the Code*

In March, 1940, the British Standards Institution submitted the draft of its Rules for Carbon Steel Welded Boiler Drums, for comment. In its reply the Committee called attention to Tables P–2, P-3, P-9 of section I, and U-3 of its Code. Following further correspondence, D. B. Rossheim was requested to prepare a reply for consideration of the Executive Committee.

### Technically Qualified Secretary

In discussing the future work of the Committee in January 1939, mention was made of the increasing volume of work, and the fact that most of it was being carried by a small group of members. The Special Committee to Revise Section VIII called attention to the need of permanent highly qualified help.

Suggestions by the Special Committee on the Work of the Boiler Code Committee were reported in April, 1939, and included changes in the rules of procedure of the Code Committee, a review of membership of all Committees by the Executive Committee, recommendations for membership on the Executive Committee, a new Subcommittee on Power Boilers, and the setting up of a Special Committee, a new Subcommittee on Power Boilers, and the setting up of a Special Committee to study the problem of a secretarial technical staff.

In October an extensive report was presented, including a review of the membership of the 32 committees. The scope of the Boiler Code Committee's work was pointed out, and the conditions that would result if some of its members were prevented from devoting much of their time to Boiler Code Committee activities, were stressed.

In January, 1940 it was reported that the Special Committee of the ASME Council and Secretary Davis favored the appointment of a technical secretary when the problem of sufficient funds had been solved. A list of subscribers to a fund was suggested from corporations, individuals or holders of the Code symbol, in return for which they would receive interpretations and copies of the Code. The report was made to ascertain members' views regarding other methods of securing such a fund.

### API—ASME Code for Unfired Pressure Vessels

A third edition of the API-ASME Code for Unfired Pressure Vessels bore the date of 1938. New acceptable materials for which ASTM Specifications had been issued appeared in the Code, and some paragraphs were altered. Allowable stresses were indicated on charts rather than by a table. Section W on Fusion Welded Vessels was increased to 75 pages. Section R was smaller by one page. Section F was slightly increased. Section I was unchanged in length. Section S on Specifications was omitted. In all parts of the Code changes were made to meet requirements of the petroleum industry, and in certain parts by changes in the ASME Boiler Code.

### Tube Holes Through Welds

Permission had been granted in Case 850 for drilling holes in welded vessels to within ¼ in. of the weld metal, because results from tests had shown the practice a safe one. Since the tests of 1937 further tests had been carried out on vessels, with holes intersecting the welds.

Based on these tests, the Committee was asked to sanction the drilling through welds. Many reports and tests were made through 1940, and the matter was discussed at several committee meetings. Finally at the meeting in November, 1940, the Committee voted to hold the matter in abeyance until results from further tests to be made by the Combustion Engineering Company were made availailable through the Special Committee.

#### Non-Pressure Welding for Fusion Welding

In October 1938 the AWS had proposed to change the term "fusion welding" to "non-pressure welding", and to abandon the definition of fusion welding adopted by it and the Committee in 1931. Dr. Jacobus had written letters of protest, pointing out that the term fusion welding had a firmly established meaning in industry and in foreign rules and Codes. The Committee approved these letters of protest.

#### Caustic Embrittlement

In October, 1939, the Subcommittee on the Care of Power Boilers, pointed out that section VII had first been planned for small industrial plants with steam below 260 p.s.i. There had been no requests by revisions, though there had been requests for statements on the sulphate ratio for caustic embrittlement, paragraph CA-5. The Subcommittee believed the remainder of section VII should be extended to include superheat and high pressure.

In January, 1940, it reported an enlarged committee of chemists and feedwater specialists had been working on caustic embrittlement remedies for two years. Questionnaires had been sent out to some 500 plants operating at 400 p.s.i. and over. The chairman of the Feedwater Committee reported the investigation was being continued for boilers working at pressure below 400 p.s.i.

#### Misuse of Code Symbol

Improper uses of the Code Symbol in Florida, Oklahoma and Texas were discussed at many meetings of the Committee during 1939 and 1940. Mr. C. O. Myers made a number of trips to the Southwest for conferences with various state and city authorities, with the Railroad Commission of Texas, the National Board of Boiler and Pressure Vessel Inspectors, and many individuals, with a view to clearing up misunderstandings.

At the Committee meeting of January 1940 Mr. Myers was commended by vote for the excellent way he had conducted these matters and at a later meeting of the A.S.M.E. Council that body expressed its appreciation and thanks. A statement was made at one time during this period that over 1,000 symbols were on record at the office of the Boiler Code Committee.

#### Future Editions

In February, 1938, it was proposed that no future printing of all Sections of the Code in one volume, similar to the 1935 edition, would be issued, as at least three of the sections had become too large.

In October, 1939, the Special Committee on the Work of the Boiler Code Committee reported on the revised rules of procedure of the Boiler Code Committee, 13 Subcommittees and 18 continuing Special Committees.

#### Investigation by Department of Justice

The minutes of June 28, 1940, record that a representative of the Anti-Trust Division of the Department of Justice had called that day for information about the activities of the Boiler Code Committee, and that four members of the Committee had been designated to meet with him. After receiving much information about the Committee's practices, access to the minutes of Committee meetings was requested. No objection was offered except that the request should have come through the office of the ASME Secretary. The cause of the Department's action was evidently the complaints of actions by certain insurance companies in refusing inspection for just reasons.

### The Codes of 1940

#### *Section I, Power Boilers*

Section I, Power Boilers, VI, Rules for Inspection and the Appendix, were published in one volume in the 1940 Edition. Addenda included additional materials available and significant changes in welding requirements. Paragraph P-1(b) now called for submission of properties of materials other than described in the Code, as given in the Appendix paragraphs A-75 to A-85. Paragraph P-2(a) listed specifications for proper steels for plates, and paragraph P-3 dealt with available tubes for drums or parts exposed to the fire, and pipes.

Changes were made in tables for crushing strengths of steel plates and for shearing strength of rivets. The available specifications for superheater tubes and pipes were changed. A new Table P-2 for working pressures for tubes and nipples was added. Table P-3 for pressures on copper tubes was unchanged from the 1937 edition. Table P-5 for the factor "S" was greatly extended. Table P-6 for working stresses of non-ferrous materials for pipes in the formula of paragraph P-26, was enlarged.

Table P-7, Stresses in Ferrous Materials, was extended up to 950° and 1,200°F. paragraph P-101, Rules for Fusion Welding now included superheater headers. The specific gravity test of weld metal was omitted from former paragraph P-102(g), and paragraph P-102(h) was altered to use a new form of penetrameter. Paragraph P-103 contained five new specifications. Minor changes were made in paragraph P-104. Paragraph P-111 was enlarged but P-112 was reworded and enlarged. 30 pages of new rules for welding and operators were given in the Appendix.

Paragraphs A-100 to A-123. Use of the Lame formula for allowable pressure was introduced in paragraph P-180(b). Paragraph P-194(b) on domes was added. Throughout the 1940 edition, stress was to be taken from Table P-7, or P-6 where temperature exceeded 650°F. Paragraph 195(m) contained an additional formula and other new paragraphs. One new category for flat heads was added to paragraph P-198(a) and a paragraph P-212(e) was added. The minimum size of hand holes was given in paragraph P-258.

In paragraph P-269 parts were omitted and paragraph P-269(b) was added. Paragraph P-273(b) was changed and a new Table P-14 replaced the former table. Table P-15 was enlarged, paragraph P-322 was reworded. Changes were made in paragraph 329 on Hydrostatic Pressure Tests, and a paragraph was added.

#### *Changes in Appendix*

The Appendix contained the latest tables of American Standards for Steel Pipe Flanges and Fittings (1939), extended to 2,500 p.s.i., and new Tables A-6, A-7 and A-8. New Tables A-9, A-10, and A-12 were added. Paragraphs A-22 to A-32 on Hydrostatic Tests were altered and contained additions. Fig. A-13 was added.

A new section on approval of new materials under the ASME Boiler Construction Code, paragraphs A-75 to A-85, described how application should be made to the Committee for permission to use a material not included in section II.

Paragraphs A-100 to A-110 were more extensive than paragraphs UV-30 to UA-46 of the 1937 edition, and included Standard Qualification for Welding Procedure and Welding Operators, Manual Arc and Gas-Welding for Ferrous Materials, and a four page Appendix was added.

Section I of the Code contained 136 pages of text with an appendix of 107 pages. Section I, Power Boilers, showed a decreased list of cities.

*Section II—Material Specifications*

Paragraphs S-12, S-3, S-6 and S-27 were deleted. There were 16 new specifications, S-42 to S-57 inclusive.

*Section III—Boilers of Locomotives*

The 1940 edition contained no paragraphs dealing with fusion welding of the boiler shell. S-27 and S-28 had been omitted from the list of available materials in paragraph L-2. The table for crushing strengths of steel plates was increased by giving values for S-42, S-43 and S-44. Paragraphs L-59 to L-71 were altered to agree with the Power Boiler Section. Paragraph L-82 was changed for the same reason. The Appendix contained the same paragraphs in paragraphs LA-1 to LA-11 as appeared in the 1940 edition of the Power Boiler Code. The Appendix closed with Fig. LA-1. This covered 29 pages and a 3 page index was added.

*Section IV—Low Pressure Heating Boilers*

In this section, the principal changes were in paragraphs H-43 to H-54 of Part I, and the corresponding paragraphs H-96 to H-107 of Part 2. Tables H-6 and H-7 and their correspondents in part 2, Tables H-9 and H-10 were unchanged. Provision for applications to use materials other than those of section II was added, requiring the use of new rules, paragraphs HA-1 to HA-11, given in the Appendix. A paragraph in paragraph H-12 defined the application of Table H-1. New paragraphs H-64(c) and H-117(c) were added.

Alterations were made in paragraph H-65 of Section I and paragraphs H-118 of Part 2 on Hydrostatic Tests, to fix test pressures on vessels to operate above 40 p.s.i. and below 30 p.s.i. Inspection was described in paragraph H-66 to H-68 in the 1937 edition, but in the 1940 edition inspectors were required to have been "qualified by written examination . . ." A new Form No. H-1 was added to the appendix. This section covered 44 pages and an index of 4 added pages.

*Section V—Miniature Boilers*

In this Section, paragraphs MA-30 to MA-40 were added respeeting permission to use materials other than those listed in section II. Paragraph M-2 referred to them. Paragraph M-16 was changed to agree with changes in the Power Boiler Section. This enlarged section of the Appendix included Standard Qualifications of Welding Procedure, described under the Power Boiler Code.

This part of the Appendix covered 30 pages, while paragraphs M-1 to M-20 covered only eight pages. A paragraph was added to paragraph M-13. Low water fuel cutoffs were called for in paragraph M-18, and inspectors "must have been qualified under state rules". The Appendix now contained paragraphs MA-30 to MA-40. Section V was extended to 42 pages, with an index of 1½ pages.

*Section VI—Rules for Inspection*

The 1940 edition of Rules for Inspection contained no changes.

*Section VII—Care of Power Boilers*

The only changes made in this Section, as described earlier, were those in paragraph CA-5 of the Appendix, dealing with caustic embritement. The statement was made that insufficient operating data at present did not indicate the value of other preventive measures. Section VII contained 88 pages with no index, but a table of contents of 2½ pages preceded the text.

*Section VIII—Unfired Pressure Vessels*

The 1940 edition of Section VII was made more definite. The number of available materials was increased. Tables for allowable stresses were more extensive and more detailed. Paragraph U-3(b) included marking and paragraph U-9 was omitted. Paragraphs U-3(a) and U-4 were changed. Paragraph U-11(b) recommended frequent inspections of vessels containing corrosive substances. Two specifications for shell plates were removed, but four were added for alloy steels. New specifications for tubes were added. Paragraph U-13 (g) (3) gave maximum stresses and paragraph U-13(g) (6), required use of the American Standard as given in Tables UA-3 and UA-4.

A new paragraph U-13(j) on non-ferrous plate material was added. New Table U-2 was the same as Table P-7 of the Power Boiler Code. Paras U-20(e) and U-20(f) listed additional requirements. Figure U-1 contained an added note. The Section on Dished Heads, paragraphs U-36 to U-38, was altered, and paragraphs U-37(c) and U-37(d) were added, with a formula and new Fig. U-2. Paragraph U-39 contained an additional figure, and minor changes were made in paragraphs for manholes, handholes and nozzle openings.

Paragraph U-61(c) on marking of plates was new. Paragraph U-64 was altered. Inspectors described in paragraph U-65 were now required to have written examinations. Minor changes were made in paragraphs U-67 and U-68 on fusion welding. The test for specific gravity of the weld metal was deleted, and a paragraph was added to those on retests. Paragraph U-68(b) contained one new paragraph.

Paragraph U-69(c) referred to qualifications given in Appendix, Paras U-30 to U-53, and rules for this in paragraphs U-54 to U-70, thus removing much from the body of the 1937 edition. Paragraphs U-69(d) and U-70(d) now provided for certain procedures when paragraphs of the Appendix were used. Paragraph U-71 provided for four new specifications, though four former ones were deleted from those of 1937, and four new specifications for tubes were added. Paragraphs U-71(c) was amended. The use of 65F for fixing hydrostatic test pressure in paragraph U-77(c) was the same as that then given in paragraph U-64

Paragraph U-78(g) gave the manufacturer the right to remove specimens from the weld metal of joints, for examination for soundness during inspection. New paragraphs U-88 and U-93 permitted openings for pipe connections. Paragraph U-91 permitted material for brazing to be taken from shells conforming to specifications under paragraph U-71. No changes were made in paragraphs on enamelled vessels, or in those on electric resistance butt welding.

Paragraph U-120 gave eight new specifications for steel plates and tubes, retaining seven from the 1937 edition. In paragraph 140 the tensile properties called for in S-18 were made minimum requirements. Four illustrations were added to Fig. U-28. A number of additional paragraphs were given in paragraph U-142. Paragraph U-142(b) was altered. U-142(c) was made U-142(e) and paragraphs U-142(c) and (d) and (f) were added, the latter being accompanied by Fig. U-29.

Two additional record forms, Form No. U-1 and Form No. U-2,

*An address delivered at the Annual Meeting of the Engineers' Council for Professional Development, New York City, October 16, 1953.*

# The Great and Growing Need for More Trained Engineers

*by*

Horace Liversidge

*Chairman of the Board, Philadelphia Electric Company.*

#### Little Things Make Lasting Impressions

Little things that happen during the formative period of our lives oft'times leave lasting impressions. I can well recall one of my earliest experiences as an embryo engineer under the practical tutelage of a man who was given two weeks' time to discover whether I had the requisite amount of brains and brawn to fill the job for which I had applied. On the tenth day, with a hodgepodge knowledge of the rudiments of the job I hoped I might be given, my instructor said, "I'm going to turn you in tomorrow with a good record." "But," I protested, "I hardly know anything yet about this job." "Well," said he, "I think you do; you're the only fellow with a college education who, in my time, has ever applied for a job with this company who didn't try to tell us all he knew before he had been here a week."

That observation has served me well these many years. It appears particularly apt on this occasion, for I am keenly aware of the fact that this audience is more familiar than I am with the subject of this evening's presentation. It behooves me, therefore, to be exceptionally careful to stay well within the bounds of factual information.

#### Serious Shortage of Engineers

However, I can at least hope that my comments will serve to emphasize the seriousness of the present shortage of engineers, and perhaps help to create a better understanding of what must be done by those interests which have not only the greatest stake in America's future, but the greatest potential resources to safeguard the *well-being of that future.*

It appears self-evident that the shortage of engineers today has already produced some highly precarious situations in our economic life. It is also apparent that this shortage has been occasioned in large measure by the rapid and broad industrial expansion of recent years — without corresponding attention being given to concurrent demands for more technically-trained men and women. The most disturbing feature of all is that there seems no practical way to substantially improve matters before they become worse. It is a subject which presents so many complex and diversified problems that any attempt by me to point out more than a few of the reasons for the crisis or to suggest any all-inclusive solution would indeed be presumptuous.

Back in the 30's, — in fact even as late as the middle 40's, there was much loose talk about overcrowding in the engineering professions. Some of that talk came from industrialists themselves. These men not only underestimated the number wanted for strictly professional employment in engineering posts, but also disregarded or discounted industry's need for technically-trained men in management, in sales, and in fact at every point where scientific knowledge is transforming our methods of production and control. We are all acquainted with the wide publicity given similar unsound forecasts in government publications, popular magazines, and newspapers which discouraged young people from scientific careers. Yet, contrasted with this, a recent statement estimates that while industrial research and development has increased nearly 500 per cent in a little more than the past decade, the number of scientists and engineers has barely doubled in that same period.

#### Problem Not Widely Recognized

Two major segments of our society — our educators and our industrial leaders — have a vital interest in this problem. The educators have been especially cognizant of it during the past decade and their studies and recommendations deserve great credit. Industry, on the other hand, has only lately shown any serious concern about the matter. Even so, this concern largely has been devoted to wishful thinking, which concludes that the problem will somehow correct itself. In fact, we can count on the fingers of one hand those few outstanding leaders in industry who have demonstrated a clear-cut appreciation of the situation and have taken some steps towards its improvement.

The general public has little awareness of the problem and the serious consequences it may portend. People traditionally accept the contributions of science and engineering as an everyday matter. And what serves to aggravate things is that it has come to expect an ever-increasing improvement in their standards of living. But, just as surely as we are here today, this improvement will cease if we fail to recognize the interdependence of industry and technology in our social and economic future.

#### Science Adds to Cultural Values

And right here I would like to make this personal observation. It seems to me that we often underestimate the true social and cultural values of industrial science and technology. We speak as if our modern progress in engineering had merely given us new tools and physical comforts. But the civilizing influences, even the spiritual powers of our people, have been strengthened and broadened as a result of our progress in applications of science. I would like to add further that in the industrial expansion ahead, we make certain that these same influences are given even greater attention than has been shown them in the past.

It is surely no mere coincidence that the period of growth of our school system and the growth of all our colleges and universities is precisely the period of our greatest gains in industrialization. Our hope of a general school system was not possible until we had mechanical power to replace hand power. Until then the young people could not be released from daily work on farms and in mills to attend school. Today in the United States we have some 34 million young people in our schools, easily ten times the number that we had fifty years ago. Our colleges and universities have ten times the total population they had in 1900. This is a cultural value added to our common weal because we have acquired new tools, new methods, new economic organizations, and new national economy. All of these, to a considerable part, are derived from the improvement in our knowledge and use of technology.

#### Technological Progress

We have not yet come to realize how fully and how vitally modern technological progress has changed our national thinking. When you put new tools into men's hands you change everything, even their systems of government and the relationships between governments.

We used to hear a great deal about technological unemployment. The phrase is not so familiar now because when one looks at the total balance sheet of productive employment in this country, he finds that the use of new tools and new methods, although inconvenient at a given time or at a given place, in the long run increases both total employment and the number of jobs which require the higher skills.

Our great national strength, whether for war or for peace, lies in the industrial power we can mobilize. Our greatest dangers come from the abuse by us or by others of the technology we now command. Our greatest opportunity to make conditions favorable to freedom elsewhere in the world and more secure in our own country is by helping to spread technological knowledge and skill.

#### Engineering Shortage Slows Progress

It is a recognized fact today, supported, if you please, by columns of bold-faced, help-wanted advertisements covering every known branch of science and technology, that engineering developments basic to our country's long-range planning will require not only all the brains available, but if we are not careful, may deplete the supply of engineers to the point where it is likely to have serious effects on our future standards of living.

#### Lure of Atomic Research

Today in all the various plans of industrial expansion we hear much about the great and growing field of atomic energy and electronics. Important as they are, the real significance of these developments, so far as demand for skilled engineers is concerned, is that nuclear physics and electronics have drawn heavily on an already limited supply of technically-trained youths who are badly needed both for expansion and for replacements in engineering ranks generally.

The public concept of the great need of the electronic and nuclear sciences for large numbers of engineers is greatly distorted, and somewhere along the line this should be corrected. (At present, in the senior electrical group at one technical school, three out of four men want to enter the electronics field. This is out of all proportion to industrial requirements. This is clearly illustrated by the fact that one large electrical manufacturing company used only 25 per cent of its new engineers in direct electronics applications.)

Our future industrial program, however, *does* call for more and more technical researchers. In fact, one large manufacturing corporation recently reported it now has in its research organization *alone* more than twice the number employed in the entire company about twenty years ago.

#### Shortage Will Continue

The discouraging part of this manpower situation is that there is no apparent means whereby we can quickly prevent a further shortage. Personally, I am inclined to believe we will continue to have a serious shortage for a long time to come.

Highly-trained technical assistance is an absolute essential to the business life of our nation. The supply must keep pace with the expanding industrial economy. Yet a backward glance will show that for years we have concentrated our principal attention on production facilities and have left the developing of engineering and scientific brains to our educators. Thus far we have been extremely fortunate. I sympathize with those educators, who for many years have been sounding the alarm of an increasing critical scarcity of engineers, but in frustration have felt like a voice crying in the wilderness.

The urgency of the present shortage is compellingly dramatized by the fact that the placement office of just one school in which I am personally interested, Drexel Institute of Technology, had 8,344 positions described to it as available to its graduates at a time when the school was graduating a grand total of only 414 engineering and business administration students.

#### New Era of Expansion

We would be blind indeed if we failed to recognize that the door has been opened to an era of industrial and commercial development unequalled in world history. The leaders of industry will be extremely short-sighted if this program is carried forward without a parallel expansion of facilities for higher technological education.

We have already experienced a totally unexpected increase in the number of professional engineers in this country — an increase in the order of tenfold since 1900 — but there has also been a corresponding rise in the ratio of engineers to the total number of industrial workers. In 1900 there was in round figures one engineer for every 255 workers. In 1950 there was one engineer for every 65 workers. Dean Hollister of Cornell University has estimated that there was one engineer for every 50 workers last year, and I have no doubt that if he has reviewed his data recently they will show an even greater need for engineers.

### Great Opportunities for Engineers

It seems quite obvious that an initial step toward relieving the shortage of engineers can be taken by creating an atmosphere of better public understanding and an appreciation by young people of the great opportunities in the field of engineering and scientific pursuits.

An interesting illustration of this conclusion and one that sounds an encouraging note in one instance occurred about a year ago when the Drexel Institute of Technology, which has an enrollment in its engineering courses of approximately 1,500 students, made a survey of Philadelphia and suburban high schools to ascertain what percentage of graduates planned to study engineering. The results showed that the percentage of graduates preparing for college had not changed during the previous year, but that there was an increase of 20 per cent in the number *planning* to enter engineering colleges.

The American Institute of Electrical Engineers, The American Society of Mechanical Engineers, The American Society of Engineering Education, The Engineers' Joint Council, and others have committees on guidance and on manpower which advertise in the secondary schools not only the public need for engineers, but also the opportunities for technical and general education which are offered by colleges of engineering. These efforts have been well timed, and should be productive of great good.

### Need for Greater Educational Facilities

However, this is but one phase of the problem. In addition to attracting increasing numbers of young people to the engineering profession, the colleges must be prepared to cope successfully with a vastly increased student body through additional instructors; by providing for the higher costs of technical instruction; and by expanding their facilities in building and equipment.

This need for expansion is one of the most important phases of the problem and, in my opinion, should be given a primary place in our future planning. Its solution will certainly require the combined attention of both educational administrators and industrial leaders. Right here, it seems to me, we have a pretty hard nut to crack. While industry is the principal cause of this shortage of engineers, it does not seem to understand the problem and thus far has evidenced almost an indifferent attitude toward its solution. Now please don't ask me to give a reason for this. I don't know. I only know it is a real problem, and one that must be solved before ready headway can be made.

### Realistic Approach Needed

As I view the matter, the correction of today's shortage of engineers requires a realistic approach in which stockholders, directors, and executives realize that their business future demands an ever-increasing number of trained scientists and engineers. They must be thoroughly aware of the fact that such personnel cannot be picked off the sidewalks. It takes years of training and costly facilities to produce the needed technological manpower.

Now there is very little in what I have said that is not already common knowledge to most of you in this audience. Nevertheless, I hope it will serve to emphasize a situation that seems quite clear to educators, quite hazy to industrialists, and is neither understood nor appreciated by the general public.

Unfortunately, industry's apparent well-being today is largely taken for granted. This is one of the reasons for the dilemma in which we find ourselves. The bold conclusion we are forced to accept is that industry should pay for its additional scientific and engineering brains just as it now pays for its other facilities for doing business. Industrial leaders must learn to understand that contributions in support of engineering and scientific education should be a direct charge against the business, not a charitable gift. Management has the responsibility of selling this to directors and stockholders. The outstanding fact is that the problem will not be solved unless and until those responsible for directing industry take the lead.

### Action Needed Now

So that I may not be misunderstood, permit me to re-emphasize briefly what has already been pointed out, that our industrial economy is in the initial stage of an emergency. There is a definite scarcity of scientists and engineers, and this scarcity will become worse rather than better during the next decade. It may well be longer before conditions return to normal. This situation demands action now, not five or ten years hence. Our engineering colleges are presently the only available sources of supply of technically-trained men and women. We know there is little possibility of increasing their student bodies without greatly expanding their facilities and teaching forces. This requires large cash outlays. The one segment of our economy that has the greatest stake in this program is industry and, in my opinion, industry must assume the responsibility of providing the major part of such requisite financial aid.

I repeat, we are in an emergency, but on the other hand, one that *can be* short-lived if we face it squarely and act accordingly. Furthermore, this is not a problem to be confused with the complexities of higher education generally. In simplest terms, it is the problem of insuring an adequate supply of scientific and engineering students. It is a problem which rests squarely on the shoulders of industry, a problem which industry in its spectacular developments has itself created. Actually, industry and educational institutions share in the responsibility to provide a workable solution.

### Electric Utilities Vitally Concerned

Electric utilities particularly should be energetic in the support of such a program. Here we have a business that is strongly dependent on the industrial growth of the community for its own expansion. It not only has an individual interest in obtaining engineering personnel, but should have a vital interest in the health of business generally. I suggest that utility executives have an especial obligation for leadership in seeing that the needs of engineering colleges in their particular communities are met.

### American Industry Cannot Fail

The development of our national economy is predicated on the latent ability of American industry to meet crises as they arise — to grasp, as well, the opportunities the future may have in store. I, for one, am confident that business men, properly alerted to the problems confronting them, will not fail to respond adequately and promptly to these emergencies.

Humanity is today poised on the threshold of an unpredictable future. Yet who is there among us to say that we are not woefully unprepared spiritually, morally, and physically to cope with the problems confronting us ? The present generation has created these conditions — now it faces the responsibility of determining whether these fantastic forces that have been unleashed shall be used for our ultimate destruction or for a future un-

# Metropolitan Toronto

*by*

**Frederick G. Gardiner, Q.C.**

*Chairman, Toronto Metropolitan Council, Toronto, Ontario.*

Though this paper is not directly concerned with engineering, it is of interest because it describes the organization of a form of administration designed to overcome the difficulties of municipal government in metropolitan areas. It discusses a unique venture on this continent, the operations of which are sure to be closely watched by engineers, so many of whom have a professional interest in municipal affairs.

Our article is a condensation of an address delivered before the Toronto Branch on December 3, 1953.

In the Toronto area a contributing factor to the creation of satellite municipalities around the city was the decision made by the city fathers in 1912 that there should be no more annexations. The Town of East Toronto was annexed in 1909, the Town of West Toronto in 1910 and the Town of North Toronto in 1912. These annexations gave rise to administrative difficulties, the city government contended that after each annexation the city taxpayer paid $2 for each $1 paid by the taxpayer in the annexed area to bring the municipal services in that area up to standards prevailing in the city. The decision that there should be no more annexations was as final as it was unfortunate; it failed to recognize that time marches on and that you cannot stand in the way of progress.

Over the forty years from 1912 to 1952 the metropolitan area became divided into 13 separate municipalities, composed of one city, three villages, four towns and five urbanized townships. Each was geared to a local pattern of development, none was much concerned about what was happening to its neighbour and none was interested in the general and proper development of the whole area. With this impractical and unrealistic development something was bound to happen and it did not take long to occur.

The Toronto and York Planning Board lined its walls with maps, but in the absence of power to tax the constituent municipalities nothing was accomplished. We had to be driven by intolerable inconvenience and the threat of financial difficulty to necessary steps to solve our problems. When some of our municipalities had difficulty in selling their bonds it was evident that a major operation was necessary.

### Toronto Metropolitan Act

The Toronto Metropolitan Act was the result of an application by the City of Toronto to the Ontario Municipal Board for an order directing the amalgamation of the 13 municipalities into one municipal corporation.

Eleven of the 12 suburban municipalities righteously and indignantly defended their local autonomy. In the face of violent and vitriolic opposition the Board concluded that it was not advisable to force the opposing municipalities arbitrarily into one amalgamated unit. On the other hand it recognized that the dangers inherent in the situation required early and effective action and so recommended that the Province pass legislation to establish a metropolitan system of municipal government for the whole area. Because of the comprehensive nature of the services which will be administered by the Metropolitan Corporation, the plan is unique in North America. The closest approximation is the London County Council in England, which is composed of 150 members from 28 boroughs and provides metropolitan services for 3½ million people.

The Metropolitan Toronto Act establishes a system whereby the 13 municipalities may preserve their identity and continue to administer those services which are local in nature and at the same time combine for the provision of those services which are metropolitan in nature. By establishing an additional level of government for the provision of metropolitan services, the way is left open for eventual amalgamation of the constituent municipalities if that is considered to be the best course to follow. On the other hand, if this new metropolitan form of government operates successfully, there may never be any necessity for actual amalgamation and enforcement upon the dissenters of that political union which they so violently oppose.

The services for which the Metropolitan Corporation is responsible are water supply, sewerage and sewage disposal, housing, education, arterial highways, metropolitan parks, certain welfare services and the overall planning of the area.

### Responsibility for Services Outlined

With respect to water supply, on January, 1954, the Metropolitan

Corporation will automatically become the owner of all pumping stations, treatment plants, reservoirs and trunk mains in all the 13 municipalities. No compensation for these works will be paid to the local municipalities, but the Metropolitan Corporation will assume outstanding debentures issued in connection with their establishment. The Metropolitan Corporation will sell water to each of the 13 municipalities by meters at a rate sufficient to pay the cost of the operation and extension of the metropolitan water system. The local municipalities will continue to own their water distribution systems and will sell water to individual consumers at prices fixed by themselves.

With respect to sewage disposal the situation is the same. The Metropolitan Corporation will own all sewage treatment plants and trunk mains and will accept sewage from the 13 municipalities through meters at a fixed rate. The municipalities will retain their local collection systems and will charge their residents for sewage service upon such basis as the municipalities may determine.

As to arterial highways, the Metropolitan Corporation will designate those highways which will become metropolitan roads on January 1, 1954, will assume the outstanding debentures issued for their construction and will pay the cost involved in the maintenance and extension of such highways. The Metropolitan Corporation will also undertake the building of future expressways, parkways and arterial highways and will provide the area with an adequate system. Metropolitan roads will be paid for 50 per cent by the Metropolitan Corporation and 50 per cent by the Province.

With respect to public transportation, the Toronto Transportation Commission, which has been a separate authority for 30 years, will be expanded into the Toronto Transit Commission. The new Commission will have a monopoly of public transportation in the metropolitan area, with the corresponding responsibility of providing public transportation throughout it. The Toronto subway, which is now nearing completion, will become the main stem of the transit system, which, with surface lines, trolley coaches and bus facilities, will provide the required public transportation.

All independent bus lines now operating in the suburbs will be acquired by the new Toronto Transit Commission on July 1, 1954. Compensation will be paid to their proprietors, such compensation to be settled by mutual agreement, or, if mutual agreement cannot be arrived at, by the Ontario Municipal Board.

#### Education, Health, Housing

In order to equalize the cost of education throughout the area, the Metropolitan Corporation will assume all outstanding debenture debt for schools in the whole area and will pay each year to the school boards in each of the constituent municipalities a maintenance grant of $150 for each primary pupil, $250 for each secondary pupil and $300 for each vocational pupil. This will permit each of the local municipalities to provide a reasonable standard of education for its children. If any local municipality desires to provide a higher standard of education than these payments will permit, it may do so, but at extra cost to its taxpayers.

The Metropolitan Corporation will be paralleled by a Metropolitan School Board, which will choose the location of new schools and coordinate the activities of each of the local school boards, which will be continued.

Certain health and welfare services, such as the hospitalization of indigent patients, the provision of homes for the aged and the maintenance of wards of children's aid societies, will become the financial responsibility of the Metropolitan Corporation. The Metropolitan Corporation will also provide and maintain a courthouse and a jail.

The Metropolitan Corporation will have all the powers of a municipality with respect to the provision of housing and redevelopment, which will be one of its major problems.

A Metropolitan Planning Board will have jurisdiction not only throughout the metropolitan area, but also on a regional basis, extending over each of the adjoining townships on the borders of the metropolitan area.

The Metropolitan Corporation is empowered to establish metropolitan parks and green belts; up to date it has been quite impossible to procure the necessary cooperation between the 13 municipalities.

#### Metropolitan Budget

The whole metropolitan undertaking will be financed by a metropolitan budget. The cost of operating the Metropolitan Corporation will be charged to the 13 municipalities in the ratio of their aggregate assessments. During the past two years, the Greater Toronto Assessment Board, established by the Provincial government, has been reassessing all the industrial, commercial and residential properties in each of the 13 municipalities on the same basis. This reassessment will be completed before December 31, 1953, so that each of the local municipalities will contribute to the cost of operating the Metropolitan Corporation in the ratio that its total assessment bears to the total assessment of the whole metropolitan area. The aggregate assessment of all properties in the metropolitan area will be approximately $2½ billion.

The Metropolitan Corporation will issue tax bills to each of the 13 municipalities. The metropolitan tax rate will be sufficient to provide the funds necessary for its current operation and to finance the capital expenditures to be undertaken. Each of the 13 individual municipalities in turn will incorporate its contribution to the Metropolitan Corporation in its local budget. Thus each municipality will pay its appropriate share to the Metropolitan Corporation and, in addition, will tax its taxpayers for the amount needed to provide the local services for which it remains responsible.

The local municipalities will no longer issue debentures for any of their requirements If they need capital for local undertakings, they will apply to the Metropolitan Corporation to issue such debentures; if the Metropolitan Corporation agrees that the debentures tures should be issued it will issue them; if the Metropolitan Corporation considers that such debentures should not be issued, the local municipality may appeal to the Ontario Municipal Board, whose decision is final. All debentures will be backed by the total assessment of the whole area. In respect of debentures issued for the account of a local municipality, that municipality will tax its proprietors each year an amount sufficient to carry the annual payments necessary to amortize such debentures.

The Province of Ontario, recognizing that substantially increased expenditures will have to be made to correct a situation which is the accumulation of 40 years of unsound municipal development and that the only tax source for municipalities is real property has established a system of grants which will be made by the Province to the Metropolitan Corporation. The Provincial grant will be $4 per capita; as there are approximately 1¼ million people in the Metropolitan area, the Metropolitan Corporation will receive initially from the Province about $5 million. This Provincial contribution will lighten the burden on the taxpayers of the area and will make it possible for the necessary metropolitan services to be provided over a reasonable period, in accordance with well defined plans and without increased taxation.

In addition to the annual grant, the Province has paid the organizational costs of the Metropolitan Corporation up to January, 1954, when the Metropolitan Corporation actually took over the administration of metropolitan services.

### Council of Elected Members

The Metropolitan Corporation will be governed by a Metropolitan Council of 24 members, which is already in operation. Twelve members are from the City of Toronto and 12 are from the 12 suburban municipalities. In order that the plan may conform to the accepted principle that there should be no taxation without representation, the 24 members are elected members of their local councils. The 12 from the City of Toronto are the mayor, the two controllers who led the poll at the latest municipal election and the 9 aldermen who led the poll at that election. The 12 representatives from the suburbs are the heads of their respective municipalities, whether they be mayors, as is the case in the four towns, or reeves, as is the case in the three villages and the five townships.

For the rest of 1953 and for 1954, the chairman of the Metropolitan Council was appointed by the Province commencing on January 1, 1955, the 24 members of the Metropolitan Council will elect their own chairman from among their own number or from outside, as the council decides.

This metropolitan system of municipal government is the solution offered by the Province of Ontario for the problems that confront metropolitan areas. It is a calculated attempt to allow the municipalities in a metropolitan area to preserve their autonomy in respect of matters which are local in nature and to combine them for the provision of municipal services which are metropolitan in nature. √

## THE ASME BOILER CODE. Part V

(*Continued from page 261*)

were added. The Appendix was enlarged to include Tables UA-1 to UA-4 and Table UA-5, taken from the 1939 edition of American Standards. Paras. UA-1 to UA-11 were enlarged. No changes were made in paragraphs UA-12 to UA-17, but slight changes were made in paragraphs U-18 to U-24.

Reports and bulletins of the AWS led to a new section, paragraphs UA-30 to UA-70, which replaced the matter in the Appendix of 1937 on welding. This dealt with Standard Qualifications for Welding Procedure UA-30 to UA-40, and Operator Qualifications UA-41 to UA-53, with an appendix of four pages. The former rules in paragraphs U-69 to U-70 vessels now only referred to paragraphs U-54 to U-61 and paragraphs U-63 to U-70. The standard qualification contained 24 figures and five tables. The Rules contained 10 figures.

The new Section on the Approval for New Materials, paragraphs UA-71 to UA-81, was simliar to that of Sections I, II, IV and V. Fig. UA-44 gave acceptable forms of rivet heads after driving. A section on Etch Tests, paragraph U-85 and Fig. UA-45, were added to the Appendix. Section VIII of the Code contained 177 pages, with an index of 11 pages. √

## THE GREAT AND GROWING NEED FOR MORE TRAINED ENGINEERS

(*Continued from page 264*)

believable in its potentital contributions to mankind's social and economic well-being.

If our groping steps shall lead to this better future — as I firmly believe they will — then we must face the startling fact that the demands for technological know-how is not something that can wait until the next decade or so to be satisfied. These demands will become more insistent as time goes on. It may prove of even greater importance in the ultimate scheme of things than the most extravagant ideas of our present day forecasters.

If we accept this view of the future as a real possibility, then our obligation demands that we take positive steps now to insure a reasonable solution of this problem before it reaches unmanageable proportions.

However, our immediate concern is not the distant future but a demanding problem of the present. What we plan now, what we do now is certain to have far-reaching effects on our long-range program. To express it mildly, very mildly, if you please, it behooves all of us, industry especially, to take a far greater interest in the future of technological education than has been shown in the past.

Should this be neglected, industry will fail to meet its full responsibilities and the only alternative remaining appears to be complete government subsidy.

Heaven protect us from such an eventuality. √

---

# Trans-Canada Highway Progress

Construction rate of the Trans-Canada Highway increased during the year 1953, according to a report issued in January by Public Works Minister Robert H. Winters, M.E.I.C. Ontario, Saskatchewan, Alberta, British Columbia and Manitoba, in that order, have the longest stretches of completed highway. P.E.I. with better than 44 per cent of its total mileage completed leads the field in this respect.

Nova Scotia spent the first year since the provincial government signed the Trans-Canada Highway agreement, conducting tests and surveys along the proposed route. Construction was expected to start early this year. The Canso Causeway which will provide an important link in the Trans-Canada Highway system will be completed in 1955.

Contractual commitments made by the provincial governments and authorized for Trans-Canada Highway construction as at the end of December 1953, amounted to $137,825,383.97.

# "Progress of Engineering Science" Part 3

From the London Quarterly Review, October, 1863

Art I.—1. *Lives of British Engineers.* By Samuel Smiles, 3 vols. 8 vo. London, 1862.

2. *Proceedings of the Institute of Civil Engineers*, 1842 to 1863.

3. *Sir W. Armstrong's Address delivered at the Meeting of the British Association at Newcastle*, 1863.

Among the various contrivances which have been introduced to assist in rendering the great ocean available as a highway to the nations, none are more beautiful than the lighthouses that crown the headlands of every maritime country, or point out the dangers of the mid-ocean. Those that are erected on the shore too often, it is true, partake of the absurdities of modern shore-going architecture in general. There are Grecian and Gothic lighthouses, and even Egyptian towers, that would fain cheat us into the belief that they belong to long past ages; but even then we forget these absurdities in contemplating the beauty and perfection of their photogenic arrangements. These have occupied the attention of some of the ablest scientific men of modern times, and they now send their rays through the darkness with a space-penetrating power that a few years ago would have been deemed impossible, and vary or alternate them with a steadiness and precision that has given confidence to thousands, and saved many a storm-tossed vessel from destruction.

To Smeaton is due the honour of having fixed the form of the best class of these structures; and even now the Eddystone remains a model which has hardly been surpassed. Nothing could exceed the patient ingenuity with which that great engineer mortised his tall tower to the wave-worn rock, and then dovetailed the whole together so as to make rock and tower practically one stone, and that of the very best form for resisting, or rather for deadening, the action of the waves. The Bell Rock of the elder Stevenson, which succeeded this, is taller, and even more graceful, but its foundation was larger, and the difficulties far less. The Skerryvore lighthouse of the younger Stevenson surpasses both, whether in beauty of construction or grace of form, and would excite equal admiration for skill in overcoming difficulties, were it not that it is the third of its class, and the work was lightened by the experience previously gained.

It is to be regretted that these structures are generally placed so far at sea that they are very little seen, for they are, taken all together perhaps the most perfect specimens of modern architecture which exist. Tall and graceful as the minar of an Eastern mosque, they possess far more solidity and beauty of construction; and, in addition to this, their form is as appropriate to the purposes for which it was designed, as anything ever done by the Greeks, and consequently meets the requirements of good architecture quite as much as a column of the Parthenon.

Among English lighthouses that on the pier at Sunderland is remarkable, not for the beauty of its form, certainly, but for the operation performed upon it by Mr. Murray in 1841. In consequence of a breach made in the pier by the sea, and the pier being lengthened, it was requisite either to take the lighthouse down, or to carry it a distance of 475 feet, to a spot one foot, seven inches higher, at the end of the new pier, and it was necessary to carry it round a corner, and turn it partly round, to suit its new situation; a task from which the mightiest Genie of Oriental fable might have shrunk appalled.

The mode in which this was effected was simple as it was ingenious. Holes were first cut through the building north and south, a little above the foundation, and timbers passed through them and wedged tightly up against the masonry. The same operation was repeated east and west, and, alternately supporting each portion in succession, a complete platform of timber was placed under the building. Each portion of this was again supported in succession by screws and wedges, and eight lines of rails were inserted, and over these eight baulks of timber, to the underside of which were attached 144 little wheels, each five inches in diameter. Another platform was inserted under the

October, 1863 — Queen Victoria has recently celebrated the twenty-fifth anniversary of her accession, the American civil war is at its height, Confederation is nearly four years from birth, and the "London Quarterly Review" publishes an article on the "Progress of Engineering Science" by an unknown author.

At first, we thought of trying to digest this article, with frequent quotations, but have come to the conclusion that the flavour of the original would be wholly lost by any interference with its continuity and so have decided to publish it in full in four instalments. We hope our readers may enjoy as much as we have the relaxing rhythm of the writer's Victorian prose, the profundities of his rhetoric, his prophesies — right and wrong — his comments on current engineering projects and his breathless admiration for the engineers of his day.

To turn the author's pounds sterling into 1953 Canadian dollars, multiply by fourteen.

lantern, and tied to the lower platform by a chain inside the tower, and straps of iron outside; and great shores from the outriggers of the lower platform completed the cradle in which the building was supported. It was then pushed and pulled by screws 28 feet northward, when the railway and the wheel baulks were taken out one after the other and reversed, and it was then drawn by winches 447 feet eastward, at an average rate of 33 feet per hour; but at one time it was moved 84 feet in one hour. The light was never extinguished, and no hitch or accident occurred, though the building was sixty-nine feet seven inches in height (of masonry) and weighed 338 tons. And such is the familiarity since acquired with works of that class, that twice the dimensions, or thrice the weight would hardly make an engineer pause if asked to undertake such an operation.

At present the tendency, unfortunately, is to abandon these beautiful and permanent structures, and to adopt wrought-iron cylinders instead. Their cheapness is, of course, the great recommendation, but there is also the rapidity with which they can be designed and erected, which saves both time and thought, and is consequently too great a temptation. But harbour works in general are of so grand and so enduring a character that it may be hoped that something better than these flimsy expedients will soon again be adopted, for we have so few real works of architecture in modern times, that it is a pity to forego any chance that may procure us such examples as these sea-girt lighthouses certainly afford.

Strange though it may at first sight be thought, it seems nevertheless true that men sailed over the sea in ships, and provided ports and piers to shelter them, long before they thought of making roads to facilitate traffic on shore. In early times nations were content—as they are in most parts of the East now—with such loads as could be carried on the backs of beasts of burden. Long strings of camels or mules, or droves of bullocks wandering over the half cultivated plains, sufficed for all the rude wants of the Phœnician epoch. The Romans, living in a more closely-cultivated country, and with a more extended empire than had previously been known, seem to have been the first to think of employing wheeled carriages for purposes of transport, and consequently the first who deemed it necessary to make permanent roads or to build bridges.

In those days, however, the mechanical branch of the profession was so immeasurably behind that which we now designate as civil engineering, that the professors of the latter were content to effect by brute force what we now accomplish by infinite scientific contrivance. They drove their roads straight as an arrow up hill and down dale, and paved them with blocks of stone, that not only must have enormously increased the friction, but must have tended to destroy any waggon not provided with springs, and have required a Roman's power of endurance to survive a journey long upon them.

In order to understand this, it is necessary to bear in mind that the resistance to a load drawn along a road is made up of two parts, friction and weight. No human ingenuity has yet succeeded in taking one ounce off the weight, though by distributing it over a very long surface, by means of low gradients, it may to a certain extent be rendered practically innocuous. All our skill has been applied to the task of getting rid of friction, and on our railroads we have so far succeeded as to diminish the relative importance of these two elements to an extent never before dreamt of. An active horse, for instance, will draw a cart weighing a ton with tolerable ease along a well-made level road; and when he comes to such an incline as shall require a tractive force equal to what would draw two tons on a level, he can double his power for a short distance and overcome it. The same horse, however, will draw ten or even thirty tons along a perfectly level railway; but a very slight incline will double this, or require the exertion of ten or twenty times greater force to lift the train up the incline, than what is required to move it on the level, and no horse could even for a few yards accomplish this. Indeed up some such inclines as the locomotive now climbs he would require to put forth the power of 100 horses to lift the train while the friction remains constant at one horse power. With the Romans all this was reversed. Clumsy mechanical arrangements made friction the element to be overcome; so much so that it is difficult for us to understand how a four-wheeled plaustrum, without a perch, was ever coaxed round a curve—how it turned nobody knows—and with the rude wheels keyed on to the axles, as was generally the case in baggage-waggons, and without grease, the friction must have been so enormous that a slight addition to the lifting power required by a steep incline must have been of comparatively little consequence. Where pack-saddles are used this is even more apparent; the load a horse can carry on its back is so small in proportion to its tractive power, that the steepness of the road is of comparatively little consequence.

The mode by which all these difficulties were overcome was so graphically described by Sir W. Armstrong, in his opening address at the meeting of the British Association at Newcastle, that it may as well be given in his own words:—

"When coal was first conveyed in this neighbourhood from the pit to the shipping-place on the Tyne, the pack-horse, carrying a burden of 3 cwt., was the only mode of transport employed. As soon as roads suitable for wheeled carriages were formed carts were introduced, and this first step in mechanical appliance to facilitate the transport had the effect of increasing the load which the horse was enabled to convey from 3 cwt. to 17 cwt. The next improvement consisted in laying wooden bars or rails for the wheels of the carts to run upon, and this was followed by the substitution of the four-wheeled waggon for the two-wheeled cart. By this further application of mechanical principles the original horseload of 3 cwt. was augmented to 42 cwt. The next step in the progress of railways was the attachment of slips of iron to the wooden rails. Then came the iron tramway, consisting of cast-iron bars of an angular section; in this arrangement the upright flange of the bar acted as a guide to keep the wheel on the track. The next advance was an important one, and consisted in transferring the guiding flange from the rail to the wheel; this improvement enabled cast-iron edge rails to be used. Finally, in 1820, after the lapse of about 200 years from the first employment of wooden bars, wrought iron rails, rolled in long lengths, and of suitable section, were made in this neighbourhood, and eventually superseded all other forms of railway. Thus, the railway system, like all large inventions, has risen to its present importance by a series of steps; and so gradual has been its progress that Europe finds itself committed to a gauge fortuitously determined by the distance between the wheels of the carts for which wooden rails were originally laid down. Last of all came the locomotive engine, that crowning achievement of mechanical science, which enables us to convey a load of 200 tons at a cost of fuel scarcely exceeding that of the corn and hay which the original packhorse consumed in conveying its load of 3 cwt. an equal distance."

At the point at which we now stand our mechanical skill has become so great, that the civil engineers have been forced to seek out the lowest levels, to carry long viaducts across our valleys, to bore tunnels through mountains, and to scheme out a whole new system of intercommunication, in order to prevent the necessity of lifting a train up an incline from neutralising the advantages derived from the conquest achieved over the frictional element. Notwithstanding all our ingenuity, we can never, of course, get entirely rid of this difficulty; but we have done wonders in this direction, and are daily accomplishing more.

In addition to the normal difficulties from friction and weight, the crossing of rivers formed a third, that long impeded transport by land. Fords are not always practicable, ferries are always inconvenient; but to make a permanent roadway across a running stream was a difficulty which in early stages of the science seemed nearly insuperable. With all their architectural skill, the Egyptians never seem to have attempted it, at least they never tried to bridge the Nile; and as they made their own canals, and these were dry more than half the year, they had it all their own way as to how they would cross them, and were probably content with planks, or at the utmost with flags of stone resting on upright supports. The Greeks had few rivers that were not fordable, and never consequently gave their minds to the subject; but the Romans faced the problem boldly, and with that grandeur of conception which characterised most of their architectural undertakings. There are still standing arches built by them of more than 100 feet span, springing at more than 100 feet from the bed of the river. Their greatest undertaking of this sort was probably Trajan's Bridge, over the Danube; but the superstructure was only of wood, though the piers were of stone and 180 feet apart, as near as can now be ascertained.

In modern times the bridge over the Dee at Chester is the largest arch that has yet been attempted in stone. It is 200 feet span, with a rise of only 42 feet; and Brunel built a bridge of brick over the Thames at Maidenhead of two elliptical arches, each 128 feet span, with only 22 feet rise. Though these surpass all that has been done elsewhere in their respective materials, it is probable that these dimensions might be exceeded, if it were worth while; but it is scarcely probable it will be found worth while, as iron is every day more and more employed in the composition of such structures. Before, however, it entirely supersedes the more durable materials, it is fortunate for us that we possess such a beautiful building as London Bridge, perhaps the most perfect specimen of its class in the world. It is constructed wholly of granite, with a centre arch 152 feet span, and with a roadway slightly but gracefully curved. This is far more pleasing than a straight line, with elliptical arches, as may be seen by comparing it with Waterloo Bridge, which, with all its grandeur, fails in reaching the perfection of its younger rival, though this may perhaps be partly owing to the Doric columns, which were absurdly added with an idea of ornamenting its piers.

Long before these great bridges were erected, it had occurred to engineers that iron might probably be employed in building bridges. As early as 1775 Mr. Pritchard built one at Colebrook Dale, 100 feet span, and in 1795 Thomas Wilson erected one at Sunderland, 237 feet clear span, with only 260 tons of metal, while the centre arch of Southwark Bridge, only 3 feet more in width, contains 1665 tons. Hitherto these two have not been surpassed by any arches of the same kind; but Telford proposed to replace old London Bridge with one of a single arch, 600 feet span, and afterwards begged to be allowed to span the Menai Strait with one of nearly the same extent. More recently Mr. Page proposed to cross the Thames just above the Tower with a single arch of 750 feet clear span, to carry two lines of rails and a roadway 24 feet wide, besides footways. Bold as the project may appear, still Mr. Page's experience and admitted knowledge of the subject are such that no one doubts its feasibility. From various causes none of these great schemes have been carried out, though there seems no reason to doubt that they might have been executed with success. As the resistance to pressure in cast iron is as nearly as may be ten times that of stone, there seems at first sight no reason why an arch of iron, 1000 feet span, should not be made as easily with the same weight of material as one of 100 feet of stone; and as blocks can be cast with more precision than they can be hewn, and fitted with flanges and other constructive expedients, even the most gigantic arches ought to be far easier to build in this material. The one element of uncertainty is the contraction and expansion of the metal from heat; but there seems little cause to fear it. When we first made railroads we allowed a quarter of an inch free space between each bar, and took every precaution for freedom of expansion and contraction till one man, bolder than the rest, proposed to butt them one against the other and join them with fish-plates. This has now been done, so that the rail from London to Aberdeen is one continuous unbroken bar; it neither expands nor contracts, but submits, and so probably would a bridge, provided the abutments were sufficiently firm, or if it did expand, it would probably be marked only by a slight elevation at the crown of the arches.

Before, however, engineers had proceeded far in the application of iron to bridges, they perceived that though the metal possessed the quality of resisting compression to ten times the extent of the materials they had usually been employing, it was even more remarkable for its tenacity; nor were they long in finding out how best to avail themselves of this peculiarity. By suspending the roadway from a chain hanging from the summits of two tall towers, they in the first place got wholly rid of the bugbear of expansion or contraction, and were also able to span a greater space with an infinitely smaller quantity of metal than was required for a bridge in compression. So great, indeed, was the economy of weight, that there seemed no practical limit to the extent of the span, while all other structures were liable to be broken by their own weight when extended beyond certain moderate dimensions.

Unfortunately these good qualities were accompanied by others which disappointed the sanguine hopes that were at one time entertained of this mode of construction. Its very lightness rendered it liable to undulation, always unpleasant and sometimes dangerous; and its weight was frequently not even sufficient to resist the action of the wind, which ruined at one time the chain pier at Brighton, and seriously damaged the bridge over the Menai Straits, as well as that at Montrose. Notwithstanding this, Telford's great work has answered its purpose perfectly for the last thirty-seven years, and now that it has been strengthened, may still span the Straits for the next three centuries; while, considering the time when it was erected, it is one of the boldest as well as one of the most graceful works of modern engineering skill.

On the Continent, where scientific knowledge is generally in advance of practical skill, they have carried this principle to excess, by using wire, which is iron in the most perfect form for tenacity. This has reduced the weight of the bridge so much relatively to the load, as to render the undulation excessive, and frequently to lead to the most frightful accidents. Still the bridge over the Sarine at Friburg has stood for thirty years, with very slight repairs, though its span is 870 feet, while that of the Menai Strait is only 570, and the bridge which recently crossed the Thames at Hungerford Market, which was our largest and typical example of the class in England, was only 676½.

The boldest and grandest application of this principle is the bridge constructed for railway traffic by Mr. Roebling, just below the Falls of Niagara. So rapid has been the progress of engineering science, that if any one had proposed twenty years ago to throw a railway bridge over a chasm 800 feet wide and 245 feet above such a foaming torrent as that of the Niagara, he would have been looked on as a madman. Yet this has now been accomplished, and by very simple means. The bridge consists of a rectangular tube 20 feet deep by 26 feet wide, or rather two floors 18 feet apart—the upper carrying the railway, the lower the roadway for ordinary traffic. These are connected together by diagonal iron tie-rods. By bracketing out from the rocks, the free length of the tube is reduced to 700 feet, and it is then suspended from towers 821 feet apart from centre to centre by four wire cables of 10 inches section, and each containing 3640 separate wires. These are further assisted by numerous braces radiating from the towers, and a multitude of ingenious minor contrivances.

When a train weighing more than 300 tons passes over the bridge, the deflection is said to be only 10 inches; and certain it is that so far it has answered all the purposes for which it was intended, but nevertheless it seems too frail and fairy-like a structure for the rough usage of railway traffic; and trains are not allowed to move across it at a higher velocity than a man can walk. With great care and continuous repairs it may do its work for years to come, but it may any day deposit its load in the boiling flood beneath, and so again separate the provinces it has so boldly united. Indeed, taking it altogether, there can be little doubt that the tubular girder proposed by Robert Stephenson for the same purpose would have been a better piece of engineering. It would have cost more in the first instance, for if the published accounts are to be believed, the suspension bridge cost only 100*l.* per foot forward; but the durability of the tube would have been practically unlimited, its safety undoubted, and an occasional coat of paint all the repair it would have required.

Fortunately for the engineers it is their privilege to be allowed to think. They are not, like the architects, first forced to inquire whether or not a thing was done in the fifth century before, or the thirteenth century after Christ, before they are allowed to act, and the progress of improvement in iron bridge building has consequently been rapid. For certain purposes a cast-iron bridge, wholly in compression, was no doubt a very perfect thing, so also was a wrought-iron bridge wholly in tension; but it was easy to predict that the most perfect result would be attained by a structure which should combine these two properties, so as to take the greatest possible advantage of both.

The best method of effecting this was fully investigated, and practically settled, by the very complete and exhaustive set of experiments which were undertaken by Robert Stephenson and his associates before commencing his great work, the Britannia Bridge. The conclusions then arrived at were so sound and satisfactory that it is scarcely probable any extensive railway structures will in future be carried out on any other principle, though for local traffic simple compression or tension structures may still be used.

Although the principles then evolved are now thoroughly understood by every engineer, they are so novel and so little appreciated by the general reader, that it may be worth while to try to explain what they are before proceeding further.

In the above diagram the left-hand side represents the usual form of a cast-iron bridge, supported by abutments, in the same manner as stone bridges are; and its stability of course depends wholly on their immovability. Instead of this, let us suppose that the ends of the arch rested on iron shoes, as at A, and that these were tied together by a chain or bar of iron B: it is evident that by this expedient the arch would be prevented from spreading as well as by the abutments. It will also have this further advantage, that, as the tie expands equally with the arch, and the structure is one homogeneous whole, with only a perpendicular bearing in its supports, you have a better bridge than before.

It is remarkable that the Italian architects in the Middle Ages tried this principle in all their Gothic structures; but an iron tie to a stone arch is both mechanically and artistically a mistake. The expansion and contraction of the metal is always working when the stone is at rest, and the flimsiness of the one compared with the mass of the other always produces an effect so disagreeable that the true Gothic architects on this side of the Alps never adopted it. They always applied a stone abutment to a stone arch, which was as essentially the proper and legitimate mode of construction as the iron tie to the iron arch is now seen to be.

This principle of construction, once seized, was used in fifty different forms. One of the most obvious was to frame the arch and the tie strongly together, as shown in the right-hand side of the diagram, making what is called the bow-and-string bridge, and to run the roadway along the tie, in which form it has been extensively employed in railway structures. At the High Level Bridge at Newcastle the spandrils are filled up level (as on the left of the diagram), and the railway runs along the top, the roadway along the string. At Saltash and Chepstow, Brunel substituted a bent wrought-iron tube for the cast-iron arch, and tied the ends together by a chain drooping in the centre, and suspended his roadway from both. At Mayence, Dr. Pauli improved on this by substituting a wrought-iron T girder for the tube, and proportioning all the other parts more scientifically together, so as to produce what is theoretically perhaps the most perfect truss yet executed. The three spans of the German bridge are only 333 feet each, while the span of the two at Saltash is exactly 100 feet more; but the proportion of the parts is so perfect, that the principle admits of extension up to the limit at which a girder would tend to break itself by its own weight.

The defect of these bridges is that they are a little too clever. If the load were always evenly disposed over their whole surface, and at rest, no doubt every cubic inch of iron would always be doing all its work; but a railway train weighing 400 or 500 tons, and rushing at a speed of forty miles an hour, is a sad disturber of equilibriums; every part that ought to be in tension is at times thrown into compression, and every strut at times becomes a tie, so that engineers generally have agreed to adopt a plain straight girder instead of those with these beautifully calculated curves. The same thing occurred with rails in the infancy of the system. Every mechanic saw, and every mathematician calculated, that a fish-bellied rail must be stronger than a straight one; but the practical result is, that all rails are now made with parallel sides, and there is not one of the other class in existence on any locomotive railway in Europe. It will probably be the same with bridges when the true conditions of the problem come to be more perfectly appreciated, except, perhaps, in structures of such magnitude that the weight of the load bears a very small proportion to the weight of the girder, and where the saving of every ton of iron becomes of importance lest the weight of the bridge should itself become a source of weakness.

Barring such exceptional cases, engineers are generally agreed in making the top and bottom flanges of their girder bridges practically parallel to one another, and when these are of wrought-iron, in putting the same quantity of metal into both. According to strict calculation, the proportions between the top and bottom ought to be as six to five; but as the lower or tension part depends wholly on its rivets, and the top or compression piece might almost be stuck together with glue, the same amount of metal is practically required for both, and the form in which it is disposed is mechanically immaterial. The cellular system has some convenience, but it does not seem to give any strength proportioned to the additional cost and difficulty of construction.

One of the most obvious ways of applying these principles is by means of what is called the Warren girder. This consists of a series of straight cast-iron tubes above, butting one against the other, and a chain of wrought-iron links below, and then connecting these two systems by struts and ties placed diagonally where wanted. Theoretically nothing can be more perfect than this arrangement: it is simple, but almost too simple; if one thing goes wrong all goes wrong; and more margin is wanted for the violent irregularities of railway traffic.

Perhaps, after all, there is nothing better than the simple tubular girder, which was evolved out of the first experiments, and used with such success in carrying the Holly-head Railway across the Menai Straits. The first and most obvious proposal for this bridge was one of cast-iron in compression, which would have been the cheapest and most architectural mode of effecting the object, but the Admiralty interfered, and insisted that a clear head-way of 100 feet above high water should be maintained throughout. To meet this difficulty, a tube suspended by chains was then suggested, nearly similar in principle to the one recently erected at Niagara; but as the investigation proceeded, it was found that the chains might be dispensed with, if a tube of sufficient rigidity could be constructed to carry any railway train across the greatest opening, which here was 460 feet clear. So complete were the investigations, and so careful the execution of the whole work, that subsequent experience has added little to the knowledge then attained; and, besides being the first, it is, considering the difficulties of the execution, one of the most perfect works of its class. In extent, and in some respects for cleverness of execution, even this bridge is surpassed by that across the St. Lawrence at Montreal, which, though only a single tube, is 6,592 feet long, but the centre span is only 330 feet, and the remaining 24 openings average 242 feet. The great engineering difficulty was the erection of such a structure on so rapid a river, frozen at times, and at the breaking up of the ice bringing down great bergs which threaten to overwhelm everything. All these difficulties have been successfully surmounted, and the bridge promises to be as stable as it is efficient.

Neither of these, however, has reached the limits of the system. When, for instance, it was proposed to erect a railway bridge across the Rhine at Cologne, Mr. Fairbairn gave two designs: one for a bridge in four spans, which it was estimated would cost when complete 230*l.* per foot, and one in two spans, the expense of which would have been 280*l.* The latter would have consisted of two tubes, carrying the railway with the roadway between them and footways outside, each tube measuring 1140 feet, supported by one pier in the centre; the two spans being thus 100 feet in excess of those of the Menai Bridge. Indeed, there seems no reason why openings of 700 or 800 feet might not be bridged by these means. Whether or not this is the cheapest mode of accomplishing the object is not quite clear. The Menai, with its double road, cost 400*l.* per foot; and the Montreal, with its single line, 171*l.* But the only economy that could be made is in the vertical web that connects the top and bottom. All engineers are pretty well agreed as to the amount of metal which is required to provide a given amount of strength to the top and bottom for a given span, but they differ as to the mode of forming the sides. Thus the great tubes of the Menai Bridge weigh about 1,600 tons; 500 tons of this weight is in the top, and a like quantity in the bottom, and consequently 600 in the sides.* Half that quantity would suffice according to some, and consequently all conceivable forms of lattice girders and trusses have been employed for this purpose, and have economized metal to a great extent; but it has yet to be ascertained whether they are as stable. There is a grand simplicity in a wall of iron, every inch of which is as available in tension as it is in compression, and consequently can take all the varying strains of the traffic without suffering from the inequality; whereas the best designed truss must always be stronger and better in one position than another, and depends more or less on bolts and fastenings, which any inequality or sinking may throw out of work. If such be the case, it is to be regretted, for it is to be feared that the tubular girder can never be other than ugly; while many of those composed of diagonal framings are pleasing in themselves. A mere lattice like that at Cologne is not better than a tube, and is as flimsy as it looks; but a well-designed truss like that of the Charing-cross Bridge is a beautiful thing in itself, and, if the bridge really cost only 130*l.* per foot for four lines of rails, is as cheap an expedient as can well be adopted. The spans, however, are only 154 feet, which, of course, prevents its being compared with the great works just mentioned.†

---

* The smaller Montreal tubes weigh 252 tons, made up thus:—

| | Tons. |
|---|---|
| Top | 76 |
| Bottom | 92 |
| Sides | 84 |
| | 252 |

So the only economy could be effected in the last item, and this is very inconsiderable compared with the whole cost. For according to the published account the masonry of the piers cost 114*l.* per foot of the bridge, leaving only 57*l.* for the iron work, and the only saving that could be effected would be one-third of this.

† For the railway bridge now erecting between Southwark and London bridges Mr. Hawkshaw proposed, in order not to interfere with the traffic, to make the central arch 300 feet span,—which would have been a really grand object,—the side arches 150. The authorities decided that if there was one arch larger than the others all the traffic would go through it, and consequently ordered them all to be made equal, so that the bargees might be puzzled which to choose!√

Discussions on

# Prestressed Concrete

## Modern Developments in Prestressed Concrete

By Niels Thorsen, Chief Engineer, Freyssinet Company Inc., New York City.
*The Engineering Journal*, October 1953 issue, Page 1278.

**R. David, M.E.I.C.**[1]

The author of this paper, Mr. Thorsen, has said that recently in North Carolina there had been an advantage costwise in a design using prestressed concrete girders over that using steel trusses. If the author refers to the high school gymnasium recently built in Greensboro, N.C., I would like to point out the following:

The only valid comparison that can be made between the cost of prestressed concrete and that of structural steel is for the prestressed concrete girders only vs. steel trusses. Fortunately such a comparison can be made from bids to the general contractors by the prestressed concrete sub-contractor and the structural steel sub-contractor.

The prestressed concrete sub-contractor, who also furnishes and bids on precast concrete joists and Channelcrete roof slabs, first quoted general contractors a lump sum of $78,000.00 for all items he proposed to furnish. After an alternate bid on steel was required, he broke this down as follows:

| | |
|---|---|
| Precast concrete joists for 1st and 2nd floors | $31,330.00 |
| Channelcrete roof slabs | 20,220.00 |
| Seven prestressed concrete girders, precast concrete roof purlins and furnishing and placing cables in columns . . . . . . | 26,450.00 |
| | $78,000.00 |

From the above amount of $26,450.00, a deduction of $3,680.00 must be made for cost of roof purlins and column cables to arrive at the price of the girders only, namely $22,770.00.

The structural steel sub-contractor's price for the seven steel trusses and bracing was $13,735.00. Brick encasement for fire-proofing was required for the two end trusses over the balcony at a cost of $1,924.00.

The comparative cost of the two types of main roof framing, as separated from bids by the sub-contractors can then be summarized as follows:

| | |
|---|---|
| I. 7 prestressed concrete girders and bracing . . . . . . | $22,770.00 |
| II. 7 structural steel trusses and bracing . | 13,735.00 |
| Brick encasement of two end trusses and brick wall at ends of trusses | 9,924.00 |
| | $15,659.00 |
| Net saving in favor of steel . . . . . . . . | $ 7,111.00 |

**Niels Thorsen:**

It is correct that in the above-mentioned paper I referred to the High School in Greensboro, North Carolina, for which the prestressed concrete roof was designed by the Freyssinet Company Inc.

I disagree with Mr. David's cost comparison. Final judgment in this matter is best obtained by considering the actual bids for the job. The low bidding contractor priced the prestressed concrete alternate $10,000 below the steel design, which disagrees with Mr. David's "theoretical cost comparison". The total cost of the gymnasium was $348,500.

In this connection it will undoubtedly interest the readers to know that on other jobs too, similar economics have been achieved by the use of prestressed concrete, for example, in the Gymnasium for the Bishop Dubourg Catholic High School in St. Louis, Missouri, where similar spans are used (94 ft.) and a saving of approximately $15,000 was made over the steel design.

In comparing cost of long span prestressed girders only with steel trusses, the trusses will in most cases be cheaper but the prestressed girders afford considerable savings in the overall construction.

## Prestressed Concrete Buildings

By Philippe A. Benn, General Manager and Chief Engineer, Pre-Compressed Concrete Engineering Co. Ltd.

*The Engineering Journal*, December 1953 issue, Page 1613.

**F. P. Shearwood, Hon.M.E.I.C.:**[2]

In the introductory statements concerning prestressed concrete buildings, published by Philippe A. Benn, in the December number of the *Journal*, certain claims are made that there are numerous advantages in prestressed concrete over other types of construction. The conclusion of the introduction states that prestressed concrete alternatives were chosen on the basis of their structural or economic merits in competition with conventional reinforced concrete, or with structural steel. These remarks can only apply to reinforced concrete, since all of the here claimed structural advantages are more effectually met by structural steel designs, as for example, in bridging long spans with slim members, savings in time and trouble in erection, interference from climatic conditions and saving in total weight on foundations.

The claim of economy in the prestressed concrete is probably due to the use of a much smaller factor of safety (i.e., less than 2.), as compared with that demanded by standard specifications for structural steel (i.e., over 3.).

It is extremely difficult to follow the methods of construction as given in the description of the buildings, and therefore, the actual distribution of stresses; but there is

[1]District Engineer, Canadian Institute of Steel Construction, Montreal.

[2]Consulting Engineer, Dominion Bridge Co. Ltd., Montreal.

the fact that the prestressing cables are designed for an initial stress of more than half their ultimate strength before any external load, and fully half the dead load, is applied.

The application of a load on a beam, whether prestressed or not, must create a bending strain in it, causing tension and elongation in its tension flange. In prestressed beams, this will relieve some compression in the concrete but will also cause a corresponding increase in tension in the reinforcement of the prestressed flange.

The cable being already prestressed to over half its ultimate strength, the addition of the stress from bending will bring its factor of safety far below conventional practice.

Since the cable is the only member of the prestressed concrete beam capable of resisting tension, the safety factor of the whole structure is dependent on its strength.

Prestressed concrete has not been long enough in use in Canada to ensure complete confidence in its safety when meeting its alteration in volume from age and climatic changes. There is increasing evidence that concrete will sometimes grow in length, which would result in extremely dangerous strains in the cables.

At the present time it appears that this new form of construction is not subject to any standard specification or control but is often designed by advocates of prestressed concrete who might possibly design with the main object of underbidding designs of their competitors in structural steel, and reinforced concrete, which is controlled by officially recognized and accepted specifications.

To ensure public safety, this new type of construction, requiring precise manipulated straining in the field, should have its design and construction controlled by standard and accepted specifications just as structural steel and other types of construction are required to have.

**P. A. Benn:**

In my paper concerning prestressed concrete buildings, I have intentionally omitted to make any analysis, comparison or statement as to the advantages of prestressed concrete *over* other methods of construction and simply enumerated some of the characteristics and merits which made it in Canada a *competitive material* for numerous structural applications. I believe, indeed, that the relative or more effective advantage of a material or method of construction as compared with another for a given structure is only possible to establish by a thorough analysis of all the aspects of its functional and economic requirements.

The prestressed concrete buildings described in my paper were always constructed on the basis of alternative designs approved by a wide range of architects and consulting engineers both in private practice and government service. This fact, I believe, would probably constitute the best guarantee that any economy gained by the prestressed concrete alternative has not been obtained to the detriment of the safety of the structure.

As a matter of fact, contrary to the assumption of Mr. F. P. Shearwood, it is a well-proven fact by test that the safety factor of prestressed concrete structures is generally equal if not higher than the one secured by structural steel.

The notion of a safety factor of course has first to be established and defined corresponding to the function of the structure and its requirements for safety.

We know, indeed, that medium structural steel with an admissible working stress of 18,000—20,000 lb. per sq. in., minimum yield stress of 33,000 — 40,000 lb. per sq. in. and ultimate tensile stress of 55,000 — 70,000 lb. per sq. in. will present a safety factor of approximately 3-3½ as far as collapse under ultimate stress is concerned. However, under a slightly higher stress than the yield point stress, the plastic flow and deformation of the steel members will cause such deflections that for all practical purposes the structure will have to be abandoned. Under that consideration, the value of the safety factor will drop therefore to slightly less than 2.

On the other hand, these same values will be considerably less in cases where fatigue due to repeated stress-variation may occur, such as in bridge structures for instance and where the factors of safety of course depend to a large extent on the range to be allowed in the stress-variation.

Several tests have been carried out in Canada and United States on full scale prestressed concrete beams. A 60-ft.-long prestressed concrete girder, as used in the Mosquito Creek Bridge, Vancouver, B.C., was tested to failure which occurred under deadload + 5¼ times the maximum liveload, nearly twice as much as required by the specifications of the bridge engineer. (See August 1953 issue of *The Engineering Journal*, Page 996.)

A 100-ft.-long continuous prestressed concrete girder, as used in the Army Warehouse roof structure at the Central Ordnance Depot, Cobourg, Ont., has been tested on the site by the National Research Council. Final results, we understand, will be available shortly, but under deadload + 5¼ times the maximum liveload (more than three times the load required by the National Building Code for acceptance of a structural member), the beam still stood up and did not fail.

A 166-ft.-long prestressed concrete girder, as used in the Walnut Lane Bridge, Philadelphia, U.S.A., was tested to destruction which occurred under deadload + 7 times the maximum liveload, more than twice as much as required by the Specifications. (See Prestressed Concrete by Gustave Magnel, London Concrete Publication Limited, Second Edition Page 164.)

It is quite true that the application of a load on any beam creates a bending stress and induces tensile stresses in the tension flange. Contrary to Mr. F. P. Shearwood's statement however, the resultant increase in tension in the prestressed concrete wires is only 0-6% under maximum design load, more than compensated by the loss in prestressed concrete due to shrinkage and plastic flow which varies from 4% to a maximum of 12%. A justification of these figures can be found in any basic manual on prestressed concrete and easily checked by the following simplified example: Assuming that the concrete, as used, has generally an ultimate compressive strength of 5,000 lb. per sq. in. after 28 days, its admissible working stress according to Canadian Specifications will then be 0.4 x 5,000 = 2,000 lb. per sq. in. compression. Since generally no tension stresses are allowed to be taken by the concrete, the maximum stress in the flange of the prestressed concrete beam will not exceed 2,000 lb per sq. in. compression under prestress + deadload and the minimum stress equal to approximately 0 lb. per sq. in. under prestress + deadload + maximum liveload.

The maximum variation of the stress in the concrete is therefore 2,000 lb. per sq. in.

Assuming the module of elasticity of a 5,000 lb. per sq. in. strong concrete at 5,000,000 lb. per sq. in. and the module of elasticity of high tensile wire at 30,000,000 lb. per sq. in., the factor $n=\frac{E_s}{E_c}=6$ and the maximum variation in the stress in the steel, if placed at the very bottom of the beam will not exceed $6 \times 2,000 = 12,000$ lb. per sq. in.

Since the admissible working stress of high tensile wire is approximately 140,000 lb. per sq. in., this maximum variation under full live-load will not exceed 8½% and be, as stated, much less, depending on its position in the beam and on the initial compressive stress of the concrete at the bottom flange.

A similar analysis of possible strain variation due to eventual growth of concrete will prove it to be safe and insignificant when compared with the growth influence in conventional reinforced concrete.

Sufficient, if not abundant data are to-day available to assure a safe design by any engineer who so desires. Of course, prestressed concrete as well as reinforced concrete and structural steel has and will have its own specific problems which are constantly solved exactly as all our other engineering problems: By unprejudiced analysis of scientifically conducted tests which, explained by a reasonable theory and based on past experience, will guarantee a satisfactory safety for further applications.

**D. C. Beam, M.E.I.C.[3]:**

The use of prestressed concrete in buildings immediately raises the problem of relative fire resistance now that building codes are being based on performance under standard fire tests. It is now known, according to recent publications of fire test, that the steel in ordinary reinforced concrete must be better protected than hitherto thought necessary in some cases in order to attain the required hourly ratings in fire resistive buildings. This was forcibly brought out by the Rimouski fire during which concrete-framed buildings were destroyed by relatively light fire loads.

What does this mean in terms of fire resistance ratings for prestressed concrete ? The complete answer will not be known until full-scale tests are made. In the meantime preliminary tests on post-tensioned precast beams by the British Building Research Station indicate the trend. In a press release by the Department of Scientific and Industrial Research in Great Britain in February of 1953, and as reported by the *Architectural Forum*, May, 1953, the conclusions are summarized as follows:

> "For fire safety prestressing wires need a greater thickness of concrete around them than steel bar reinforcing. In heavy concrete members the prestressing steel will probably be covered enough but in smaller members additional fire proofing may be necessary.
>
> "The time of collapse is determined mainly by a temperature rise in the cables. Tests show that failure becomes imminent when the temperature of the steel exceeds 400°C. (as against about 600°C. for mild steel bars). A 2½ inch cover gives a fire resistance of about 2 hours (a 2 inch concrete cover on mild steel bars earns a 4-hour rating). For a 4-hour fire resistance the beams would probably be fireproofed in insulating plaster keyed into the concrete, or, if a thicker concrete is used, it should contain steel mesh to check spalling.
>
> "Sudden failure is not likely, but there is a noticeable progressive sagging. Cracks and a marked increase in deflection indicate that collapse is imminent. Explosive spalling is unlikely in sections over 2 inches thick. Beams partially exposed to fire retain same strength upon cooling but with marked deflection and loss of prestress."

Further tests are being carried out at the British Building Research Station and at the National Bureau of Standards in Washington. The results should indicate the proper classifications of fire resistance as measured by standard fire tests.

**P. A. Benn:**

The relative fire resistance of prestressed concrete as compared with other structural materials, is without any doubt a matter of interest to anybody concerned with the performance of structures under fire.

We agree with Mr. D. C. Beam that a complete answer will not be known until full scale test for all materials *under exactly the same conditions* will be made. We regret however to state that his very interesting quotation concerning some prestressed concrete fire resistance test results as released by the Department of Scientific and Industrial Research omits a very important and maybe principal conclusion made in that report and which states:

> "It appears that if the thermal shock can be minimized and the soffit concrete allowed to heat slowly, prestressed concrete units will tend to behave similarly to ordinary reinforced concrete."

The general conclusion of this report has been confirmed by a full scale test on a 40-ft.-long prestressed concrete beam carried out in Holland. The usual 2 in. cover with proper grouting provided adequate protection for the cable at temperatures up to 1,400°F. and a recovery of approximately 70% of the deflection occurred immediately after the heat has been turned off.

Since in addition the danger of buckling and twisting is non-existent in prestressed concrete members, it can be expected that due to final tests, prestressed concrete will have an even higher rating than reinforced concrete as fire resistant structure. √

[3]Chief Engineer, Canadian Institute of Steel Construction, Toronto.

# 68th
# Annual General
# and
# Professional
# Meeting

## Quebec City, May 12, 13, 14, 1954

- Twenty-eight highly informative papers.
- Two panel discussions.
- Splendid ladies' program.
- Ample opportunities for sightseeing.
- Advance registration forms (to be mailed to members early in April to prevent last minute confusion).

## PROGRAM*

Mining Development and Engineering in Quebec:

JEAN-PAUL DROLET, M.E.I.C., Chief, Technical Information, Department of Mines, Quebec.

The Impact of Transistors on the Electrical Industry:

E. L. R. WEBB, in charge Electronic Equipment for Air Defence Group, National Research Council.
P. A. REDHEAD, in charge Electron Tube Development Laboratory, National Research Council.

Design of a 7,000-ton Press:

HANS ULMANN, M.E.I.C., Chief Engineer, Industrial Division, Dominion Engineering Works Limited.

The St. Lawrence Cement Company Plant at Quebec:

DR. BERNARD ULRICH, General Manager, St. Lawrence Cement Company.

The Impact of Electronic Computors on Industry:

W. J. M. MOORE, M.E.I.C., National Research Council.
N. L. KUSTERS, National Research Council.

Development of the Axial Flow Compressor for the Orenda Engine:

F. H. KEAST, Assistant Chief Engineer, Gas Turbine Division, A. V. Roe Canada Limited.

Quebec North Shore and Labrador Railway, Location, Construction and Terminal Facilities:

B. M. MONAGHAN, M.E.I.C., Assistant Chief Engineer, Quebec North Shore and Labrador Railway Company.

Underwater Television and its Application:

CAPT. H. R. SMYTH, National Research Council.

Electronics in the Paper Industry:

W. A. MESSERVEY, Pulp and Paper Application Engineer, Apparatus Division, Canadian General Electric Company Limited.

Menihek Power Development, Labrador:

L. A. CAREY, Jr.E.I.C., Resident Engineer, Montreal Engineering Company.

Job Control on the Yonge Street Subway:

W. H. PATERSON, M.E.I.C., Chief Engineer, Toronto Transit Commission.

*Subject to change.

Some Fire Protection Aspects of Building Design:

D. R. ABBEY, M.E.I.C., Engineer, Fire Protection Section, Underwriters' Laboratories of Canada.
W. E. EMMERSON, Jr.E.I.C., Division Engineer, Underwriters' Laboratories of Canada.

Hydro-Electric Developments on the Canadian Side of the Niagara River:

R. L. HEARN, M.E.I.C., General Manager and Chief Engineer, Hydro-Electric Power Commission of Ontario.

Installation of Electrical Equipment in the Yonge Street Subway:

J. Y. DORAN, Electrical Engineer, Toronto Transit Commission.

Natural Resources and the Engineer:

J. L. VAN CAMP, General Manager and Secretary, Canadian Forestry Association Inc.

Construction of 28,000-ton Tanker:

W. H. WHITE, Naval Architect.
R. W. McGILVRAY, Chief Engineer, Design, Davie Shipbuilding and Repairing Company.

Cars, Shops and Mechanical Equipment of the Toronto Subway:

J. G. INGLIS, Assistant Manager of Equipment, Toronto Transit Commission.

Transmission of the Power Developments on the Canadian Side of the Niagara River:

J. E. SPROULE, M.E.I.C., Consulting Transmission Engineer, Hydro-Electric Power Commission of Ontario.

Peribonka Power Plants:

R. E. HEARTZ, M.E.I.C., President, Shawinigan Engineering Company.

Instrumenting a Nylon Intermediates Plant:

F. G. CARSON, Chief Supervisor of Maintenance, Canadian Industries Limited, Maitland.

A Rational Design for Building Frames:

J. L. De STEIN, M.E.I.C., Assistant Professor of Civil Engineering, McGill University.

Kitimat Potroom Foundations:

R. M. HARDY, M.E.I.C., Dean of Engineering, University of Alberta
C. F. RIPLEY, M.E.I.C., Manager, Ripley & Associates.

The Development of a New Concept in Modern Office Building Construction:

G. LORNE WIGGS, M.E.I.C., Consulting Engineer.

Highway Approaches to the Quebec Bridge:

P. A. DUPUIS, M.E.I.C., Joint Chief Engineer, Department of Public Works, Quebec.

Design and Construction of Alcan's Kitimat Terminal Wharf:

W. L. PUGH, M.E.I.C., Chief Engineer, Aluminum Company of Canada Limited.

Telecommunications in Canada:

A. G. LESTER, Assistant General Manager, Bell Telephone Company of Canada.

Photography for Armament Development:

E. W. GREENWOOD, Canadian Armament Research and Development Establishment.

Instrumentation for Armament Development:

E. J. BOBYN, Canadian Armament Research and Development Establishment.

Air Pollution Control—A Panel Discussion:

Chairman, E. A. ALLCUT, M.E.I.C., Professor and Head of Department of Mechanical Engineering, University of Toronto.

Management—A Panel Discussion:

Chairman, J. EDGAR DION, M.E.I.C., Consulting Management Engineer, Montreal.

● See page 278 of this issue for further details about the program.

The Chateau Frontenac, Quebec City, where all meetings will be held.

# From Month To Month

**Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers**

## 68th Annual General and Professional Meeting

Arrangements for the forthcoming Annual General and Professional Meeting at the Chateau Frontenac in Quebec are well under way. The program commences Wednesday morning, May 12 and concludes Friday evening, May 14.

#### Transportation

It is expected that special reduced convention fares will be available for rail travel in Canada and special fare certificates will be sent to all members requesting same at time of registration. Please make your own travel arrangements through your local ticket agent.

#### Hotel Accommodation

All room accommodation for the meeting is in the Chateau Frontenac where all technical meetings and social events will take place.

#### Advance Registration

Registration and Advance Reservation cards will be mailed with advance copies of the meeting program, during the early part of April. Room allotments will be made in accordance with the receipt of reservation cards at Institute Headquarters. It is expected that all social functions will be fully attended, therefore members are urged to make reservations for luncheons, dinners, etc., as promptly as possible.

#### Annual Banquet and Ball

Friday evening, May 14, will mark the climax of the meeting when the Chateau will serve as the setting for the Annual Banquet and Ball.

#### Ladies' Events

As usual, there will be several special attractions for the ladies in addition to the joint functions which are open to all.

#### Muriel's Room

The usual hospitality will be dispensed on all appropriate occasions by that inimitable hostess, Muriel.

Detailed arrangements are being prepared for other entertainment features and announcements covering these will be made in the near future.

## Brockville Branch Opening

The inaugural meeting of the recently formed Brockville Branch of the Institute took place on Friday evening, January 15 at the Hotel Manitonna, Brockville, Ontario. The meeting took the form of a dinner followed by a dance and was attended by more than 180 members and guests with their wives.

President Ross L. Dobbin of Peterborough, Ontario, presented the Charter of the new branch to its chairman, J. S. Waddington of Brockville and S. H. Rochester, chairman of the Kingston Branch presented an E.I.C. banner to the newly-formed branch from the members of the parent Kingston Branch. The vice-chairman, Fred Walsh, on behalf of the local branch, expressed thanks to President Dobbin, Mr. Rochester and others for their expressions of appreciation and good will.

Brockville is the forty-seventh branch of the Institute and its territory includes the County of Leeds, formerly in the Kingston Branch, the County of Grenville formerly in the Cornwall Branch and the southern part of Carleton County formerly in the Ottawa Branch. The principal cities and

## Cover Picture

The cover picture shows a "worm's-eye" view of the 1200-kv. impulse generator built by the National Research Council to produce artificial lightning for industrial testing and research.

This phase of N.R.C. research is described in the paper "Modernization of N.R.C. Impulse Testing Facilities", by F. C. Creed, N. L. Kusters, and W. J. Purvis, which will appear in the April issue of the *Journal.*

towns in the area, outside of Brockville are Prescott, Cardinal, Perth and Smiths Falls. The first executive of the Branch consists of J. S. Waddington, chairman, Fred Walsh, vice-chairman, J. G. Kerfoot, secretary-treasurer, J. F. Preston, R. M. Powell and R. E. Davey. The Branch representative on the Institute Council is H. B. Brewer.

Many prominent local dignitaries attended the opening ceremonies and amongst the head table guests were Mayor Graeme Gorrie, C. G. MacOdrum, Q.C., M.L.A., H. Stanton, M.P., and G. T. Fulford. Mayor Gorrie in extending the greetings and good wishes of the citizens of Brockville invited all members of the new Branch to take an active part as well as an interest in the affairs of the communities in which they lived and worked.

Institute representation was drawn from many parts of the country and in addition to the chairman of the Kingston Branch, S. H. Rochester, the Cornwall chairman, J. M. Hawkes and J. P. Watts, Peterborough were present, as well as Past Vice-President W. L. Saunders, Councillors B. G. Ballard and T. M. Foulkes from Ottawa, D. Ross-Ross, Cornwall, S. Sillitoe, Belleville, D. L. Rigsby, Kingston, W. H. Paterson, Toronto, F. Alport, Orillia, as well as others. The Montreal delegation included Vice-President I. R. Tait, Past-President J. B. Stirling, Councillors A. S. Rutherford, E. R. Smallhorn, E. D. Gray-Donald, Henri Gaudefroy, F. L. Lawton, J. Benoit, A. D. Ross, Chairman G. N. Martin, Past-Councillor R. C. Flitton. As well as these, Branch representatives L. F. Grant, past president and field secretary with J. A. Ogilvie, assistant field secretary, Toronto, and Miss M. McLaren, assistant to the general secretary and H. G. Thompson, assistant general secretary were also present.

During the afternoon preceding the inauguration, a regional meeting of Council was held in the Manitonna Hotel at which President Dobbin presided, and a heavy agenda of varied matters of business was dealt with.

President R. L. Dobbin presented the charter of the new Brockville Branch to Chairman John Waddington. From left to right, front row: John F. Preston, Fred Walsh, John Waddington, R. L. Dobbin, I. R. Tait. Back row, left to right: R. M. Powell, John G. Kerfoot, Col. H. G. Thompson, R. D. Davey.

## Association of Professional Engineers of New Brunswick

J. M. M. Lamb, M.E.I.C., district marine agent of the Department of Transport, Saint John, was elected president of the Association of Professional Engineers of New Brunswick at the annual meeting on January 28.

The vice-president is D. J. Brewer, M.E.I.C., president of Planet Construction Co., Ltd., Fredericton; and the past-president is D. O. Turnbull, M.E.I.C., consulting engineer, Saint John. The secretary-treasurer is R. D. C. Clark, M.E.I.C.

Seven councillors will serve the Association in four districts, as follows: Saint John, D. R. Webb, M.E.I.C., and K. V. Cox, M.E.I.C.; Moncton, W. D. G. Stratton, M.E.I.C., and R. L. Parsons, M.E.I.C.; Fredericton, E. E. Wheatley, M.E.I.C., and S. B. Cassidy, M.E.I.C.; Chatham, H. G. Rogers, M.E.I.C.

A large number of Association members from all parts of the province were present for a business session held in the morning and afternoon. An estimated 110 persons attended a dinner at which the Engineering Institute's Saint John Branch members were hosts to the Association. Brigadier T. Eric Snow, officer commanding the New Brunswick Military area, was the guest speaker.

## Resources Conference

The present status of Canada's soils, waters, forests, wildlife and recreational resources will be surveyed by representatives of five of Canada's national organizations. Sponsors of the public Resources Conference, to be held at the Chateau Laurier, Ottawa, April 22-23, 1954, are the Canadian Institute of Agriculture, Canadian Chamber of Commerce, Canadian Forestry Association, Canadian Institute of Forestry, and the Engineering Institute of Canada. Delegations from more than 100 public service organizations will be in attendance.

The importance of the perpetuation and profitable use of natural resources by industry and government, will in this way be brought to the attention of the Canadian public; and the views of the Conference will be made available to industry and to provincial and national governments. The objective of the Resources Conference is to check known abuses, obtain greater co-ordination at all levels, and give the people of Canada the fullest possible advantage from their great wealth of resources.

All members of the Engineering Institute are invited to attend.

The program appears on the following page.

## Program of the Resources Conference
## Chateau Laurier, Ottawa

**April 22, 1954.**

**9.45 a.m.**

**Welcome:** Chairman of the Board, Canadian Forestry Association, James A. Vance, M.E.I.C.

**Official Opening:** For the Government of Canada, the Rt. Hon. C. D. Howe, Hon. M.E.I.C.

**"National Forestry Objectives and Policies"**—R. M. Fowler, President Canadian Pulp and Paper Association.

Discussion papers by four leading Canadians representing: (a) Quebec and Atlantic Provinces, Omer Lussier; (b) Ontario, Dean J. W. B. Sisam; (c) Prairie Provinces, Donald H. F. Black; (d) British Columbia, John Liersch.
Discussion of papers, and open forum.

**2.30 p.m.**

**Soil and Water:** Chairman, J. S. McGowan, F.A.I.C.

**"National Soil and Water Objectives"** —M. M. Porter, Q.C., Calgary.

Discussion papers by four leading Canadians representing: (a) Maritimes, John Walsh; (b) Quebec and Ontario, John A. Stewart; (c) Prairie Provinces, Dr. W. J. Parker; (d) British Columbia, Dr. D. B. Turner.
Discussion of papers and open forum.

**8.00 p.m.**

**Committee Meetings, Exhibits, Motion Pictures,** for delegates and guests.

**April 23, 1954.**

**9.45 a.m.**

**Wildlife and Recreation:** Chairman, F. H. Kortright, Toronto.

**"National Wildlife and Recreational Objectives"** — R. L. Haig-Brown, Campbell River, B.C.

Discussion papers by four leading Canadians representing: (a) Quebec and Atlantic Provinces, Dr. Harrison F. Lewis; (b) Ontario, Dr. W. W. H. Gunn; (c) Western Canada, Dr. W. F. Tisdale; (d) British Columbia, E. G. Oldham.
Discussion of papers and open forum.

**2.30 p.m.**

**Summary Session:** Chairman, Francis G. Winspear, Edmonton, Chamber of Commerce.

Forestry objectives, W. A. Delahey, president Canadian Forestry Association; Soil and Water Objectives, Dr. G. R. Smith, president Agricultural Institute of Canada; Wildlife and recreational objectives, R. L. Haig-Brown.
Committee to determine educational action from the Conference: Messrs. W. J. Borrie, R. L. Dobbin, W. A. E. Pepler, G. R. Smith, James A. Vance, chairman.

**6.00 p.m.**

**Reception:** E. B. Eddy Company.

**7.30 p.m.**

**Banquet.**

**"Our Renewable Natural Resources"**, address by Rt. Hon. Louis S. St. Laurent, Prime Minister of Canada.

---

# Hydro-Electric Progress in Canada, 1953

Although a tremendous amount of hydro-electric construction was underway in Canada in 1953, the amount of capacity brought into operation during the year was somewhat lower than that of recent years, although still appreciably above that of the pre-war period. New capacity in 1953 amounted to 638,012 hp., bringing the total capacity of all water-power plants in Canada to 14,921,459 hp. Plants and extensions under construction for operation in 1954 total 1,500,000 hp. Total power consumption in 1953 was about seven per cent above 1952.

The British Columbia Power Commission completed the installation of the final two units each of 28,000 hp. in the John Hart development on the Campbell River, Vancouver Island. Redevelopment of the Puntledge River plant has been undertaken; a single unit of 35,000 hp. driving a 30,000 kva. generator will be installed with initial operation probably in 1954. Diesel installations totalling 2,835 kw. were placed in operation during the year. Transmission lines built include 100 miles of 63-kv. line, 22 miles of 60-kv. line, and 8 miles of 132-kv. line.

The British Columbia Electric Company Limited continued construction towards the installation of a fourth 62,000 hp. unit in its Bridge River plant for 1954 operation. The raising of the La Joie storage dam also was continued. Surveys were made covering a proposed development on Seton Creek to further utilize the water diverted through the Bridge River plant; active construction will begin in 1954. The company extended its 60-kv. lines and new substation facilities were provided at Vancouver, Victoria, Haney, Ladner and Langford.

The Consolidated Mining and Smelting Company expects to complete the construction of its Waneta development on the Pend d'Oreille River early in 1954. The plant will contain two turbines each of 105,000 hp. Favourable progress has been made on the Kemano-Kitimat project by the Aluminum Company of Canada. Drilling of the 10 mile, 25-foot diameter diversion tunnel from Tahsta Lake and of the penstock tunnel was expected to be completed by the year's end. The underground power-house has been completed and the work of installing three 140,000 hp. turbines and 106,000 kva. generators is well advanced. The 50-mile transmission line from Kemano to Kitimat has been completed.

Alaska Pine and Cellulose Limited completed the installation of a 3,200 hp. turbine. The East Kootenay Power Co. has completed the construction of a new dam on the Bull River. The Northern British Columbia Power Company Limited has installed a unit of 2,750 hp. and the Powell River Company Limited has added a 13,125 kw. steam turbo-generator to supply additional power to its mill at Stillwater. The city of Nelson has rebuilt its 10-mile transmission line from the Kootenay River plant and raised the voltage to 66 kv. New substations at both ends of the line have been completed.

A Pelton wheel of 940 hp. driving an 875 kva. generator was added to the Porter Creek plant of the Yukon Hydro Company Limited.

In Alberta, the Calgary Power Limited has under installation a third unit rated at 33,000 hp. in its Ghost plant on the Bow River. Construction of a 22,000 hp. installation is proceeding on the Bearpaw development and the addition of two pump stations at Goat Creek is expected to increase the annual output of the Spray and Rundle plants by about 75 million kw.-hrs. The transmission system was extended by 84 miles of 138-kv. line, 24 miles of 66-kv., 7 miles of 33-kv., and 76 miles of 22-kv.

Canadian Utilities Limited increased the capacity of their Diesel plants by 1,825 kw. New transmission lines included 37 miles at 69 kv. and 80 miles at 22 kv. The city of Medicine Hat added a steam-turbo generator of 30,000 kv. capacity. Edmonton completed the installation of a 30,000-kw. gas fired steam turbo-generator unit and substation capacity was increased by 15,000 kva. The city of Lethbridge completed the installation of 5,000 kw. in its steam-electric plant.

In Saskatchewan, the Saskatchewan Power Corporation completed a 20,000-kw. single unit addition to its steam plant at Estevan, and has undertaken for 1954 operation, the installation of a 25,000-kw. unit in Saskatoon. A 4,300-kw. gas engine generator set was installed at Unity. A new 69-kv. transmission line was built from Unity to Luseland and Kindersley, a distance of 45 miles. New substations were built for a total increase of 25,000 kva.

No new hydro-electric units were brought into operation in Manitoba in 1953, but the Manitoba Hydro-Electric Board continued construction on its McArthur Falls development of 80,000 hp. on the Winnipeg River. Improvements and repairs were carried out at the operating plants on the Winnipeg River. In connection with the Laurie River development of Sherritt-Gordon Mines Limited, a control dam was completed on the Loon River.

The Manitoba Power Commission continued to expand its distribution system. New transmission lines built include 85 miles at 115 kv., 64 miles at 66 kv., 32 miles at 33 kv., and 78 miles at lower voltage. The Parkdale and Neepawa terminal stations were increased by 15,000 kva. and distribution substations by 13,000 kva.

In Ontario, the eighth unit of 33,000 hp. at the Otto Holden Station was placed in service in April 1953. Construction progress on the 1,260,000 hp. development at the Sir Adam Beck-Niagara station on the Niagara River at Queenston is well advanced and the first units are expected to be placed in service early in 1954. In 1952 the Commission decided to install a third unit at the Pine Portage station and in April 1953 it was decided to proceed with a fourth unit; each of these units will be rated at 45,000 hp. and are scheduled for operation in September and December of 1954. At the Manitou Falls station three generating units which will have a combined capacity of about 46,000 hp. will be installed for scheduled service in 1956. All generating units at the Richard L. Hearn and J. Clark Keith steam-electric stations are now in service.

Extensions to transmission lines during the year are expected to be as follows: 42 miles of 230-kv. line; 204 miles of 115-kv.lines; 252 miles of 44 to 13-kv. lines; and 1,450 miles of rural lines.

Aside from the Commission's operations, the Great Lakes Power Company completed the construction of its development of 20,000 hp. at Scott Falls on the Michipicoten River. The Ontario and Minnesota Power Company will replace nine units at their Rainy River plant by eight turbines of 2,000 hp. each, for an overall increase of 650 hp.

The Quebec Hydro-Electric Commission added two units, one of 55,000 hp. and one of 56,000 hp. to its Beauharnois development on the St. Lawrence River.

On the Upper Ottawa, the construction of the two unit 32,000-hp. Rapid II development is proceeding on schedule and operation is expected in June 1954. Construction was commenced on a major hydro-electric development on the Bersimis River about 62 miles above its mouth. The site has an estimated capacity of 1,200,000 hp. of which 300,000 hp. will be developed initially, with operation scheduled for 1956. Preliminary field work for a line from the Bersimis development to Quebec was underway in 1953.

The Aluminum Company of Canada completed its Chute à la Savanne development of 285,000 hp. on the Peribonka River and Price Brothers and Company Limited completed its two plants on the Shipshaw River for a total capacity of 79,000 hp. The Manicougan Power Company brought into operation in January the second unit of 56,200 hp. The Shawinigan Water and Power Company has undertaken the installation of one additional unit in each of the Rapide Blanc, La Trenche and La Tuque plants, involving a total additional capacity of 149,500 hp., expected to be available in 1955. The Ste. Marguerite Power Company expects to complete, in May 1954, the construction of its hydro-electric development of 17,000 hp. in two units at "61 Falls" on the Ste. Marguerite River.

While not adding to their generating capacity, other companies extended their distribution systems and enlarged their storage facilities.

In New Brunswick, the New Brunswick Electric Power Commission brought into operation its two-unit 27,000-hp. plant at "The Narrows" on the Tobique River. In its steam plant at Grand Lake the addition of a 18,750-kw. unit was completed.

The Nova Scotia Light and Power Company completed the installation of an additional unit of 22,000 kw. in its steam plant at Halifax. No new developments were completed in 1953.

The Nova Scotia Power Commission extended its transmission lines with 7 miles at 23 kv. and 126 miles of secondary distribution lines. Proposed developments for 1955 include a 6,000 hp. unit on the Mersey River near Liverpool and a 20,000 kw. turbo generator for the steam plant at Trenton.

The Newfoundland Light and Power Company completed the construction of its second plant on the Horsechops River, a 10,000 hp. unit. A 3,850 hp. diesel unit has been installed at St. John's for stand-by purposes.

In Labrador, the Iron Ore Company made favorable progress on its 12,000 hp. development at Menihek Rapids on the Ashuanipi River.

Investigations and transmission line extensions were carried out by other companies.

---

# Prestressed Concrete

Like any new material or method of design, prestressed concrete made but slow headway in its early years, but now that its promoters can point to real accomplishment, it seems to be in a fair way to find its proper place in the engineer's tool chest. Like conventional reinforced concrete in the first years of this century, it has had to prove itself and its methods of design and of construction have had to be established. Now the educational process of making these familiar to engineers outside the immediate circle of its proponents is in progress.

Engineering interest here in prestressed concrete is shown by the fact that 450 engineers and others gathered in Toronto on January 28 and 29 last, to listen to and discuss nine papers on the subject. These meetings, called the "Canadian Conference on Prestressed Concrete", were sponsored by the extension department of the University of Toronto and were arranged by a committee headed by Professor C. F. Morrison, M.E.I.C., representing both engineers and material suppliers. Its proceedings may be obtained for $2.50 in advance from J. R. Gilley, Simcoe Hall, University of Toronto, Toronto 6, Ont.

While all the papers deserve careful reading, to this writer there were two outstanding ones: "Why

Should we use Prestressed Concrete?", by R. F. Shaw, M.E.I.C., vice-president, The Foundation Co., Ltd., Montreal, and "An Introduction to Prestressed Concrete Theory", by Harold Fealdman, M.E.I.C., assistant research engineer, the Hydro-Electric Power Commission, Toronto.

Mr. Shaw quite properly asks a lot of questions, many of which have long been in the minds of engineers and contractors who have drawn their knowledge of prestressed concrete from the rather general — and laudatory — material which has been appearing in print about it. He wants a good definition of prestressed concrete and to know by whom and under what codes it will be designed. In more detail, he asks, "How do you handle spalling, bursting and bond? Are the anchorages safe? What about friction, shrinkage, deferred strain, end slip and thermal expansion? How fireproof is it? Will it stand up to weathering? Is construction difficult?"—and the burning question, "How much does it cost?" It may be that definite answers to all these questions now exist; if so, Mr. Shaw and most of the rest of us haven't heard them.

But Mr. Shaw is no pessimist. He concludes that prestressed concrete will find its rightful place if it can be proved that it is a step forward in structural design and says quite positively that he thinks the proof can be made.

Mr. Fealdman presents the theory underlying prestressed concrete design simply and logically enough so that any engineer familiar with conventional reinforced concrete designs can easily follow his paper. And unlike some authors, he works out some numerical examples, always a help to the uninitiated.

There are seven other papers, but it would take too much of our space to abstract them all in detail.

M. A. T. Waidelich, vice-president, The Austin Co., Cleveland, discusses the results of tests made under his direction on two prestressed concrete beams. R. B. Young, M.E.I.C., and J. B. Mustard, the Hydro-Electric Power Commission, Toronto, in "Control of Quality in Prestressed Concrete", feel that it is not too difficult to design and produce concrete having the 5,000-6,000 p.s.i. compressive strength required, but that trouble, if any, will come from what is done with the concrete after it is made, i.e., it is useless to make good concrete and then transport, place and cure it carelessly. They think there is plenty of room for improvements of our present methods in these operations.

"Steel for Prestressed Concrete" is discussed by Professor M. W. Huggins, M.E.I.C., University of Toronto; Professor G. Magnel, of the University of Ghent, known as one of the leading figures in the development of prestressed concrete, writes on "Significant Features of Prestressed Concrete". He limits his remarks to seven topics: (1) design and construction of statically indeterminate structures in prestressed concrete; (2) friction loss along poststressed cables; (3) design based on ultimate load for both statically determinate and indeterminate structures; (4) allowable working stresses; (5) has the time come for standard specifications and codes?; (6) can prestressing be applied to materials other than concrete?; (7) why has Europe been ahead of America in prestressed concrete?

Dr. T. O. Lazarides, consulting engineer, Toronto, emphasizes that prestressed concrete is a statically indeterminate material and must be so treated. This concept leads to rather definite procedures in construction. A. L. Parme, the Portland Cement Association, Chicago, gives a brief review of past research in prestressed concrete and some account of work in this field now going on.

And finally, Robert Shama, chief engineer, Empresas Campenon Bernard de Venezuela, Caracas, presents the only wholly descriptive paper of the conference, "The World's Largest Prestressed Concrete Spans", the three arch bridges on the new road, the "Autopista", between Caracas and its port, La Guaira. The ingenious methods of construction used there will no doubt impress all readers.

Every engineer with the slightest interest in prestressed concrete would do well to purchase these proceedings. They differ from some; these are well printed and copiously illustrated and appeared promptly—less than two weeks after the conference and while interest in it was still running high.

---

# C.E.A. Winter Conference Held in Quebec

The twentieth annual winter conference of the Canadian Electrical Association was held at the Chateau Frontenac, Quebec City, January 18 to 22 inclusive. Some 300 delegates from Eastern Canada were in attendance, and discussed various problems concerning the generation, transmission, distribution and use of electricity to assure continued good service to customers at continued low cost.

Sessions on the opening day included those of the Residential and Farm Section, where problems relating to residential and farm customers were discussed, and the Lighting Section, where papers were presented on industrial, commercial and home lighting, as well as street and highway lighting.

The second day's sessions were devoted to affairs of the Industrial Power, Wiring, Accident Prevention, Public Relations and Commercial Power Sections. The Wiring Section heard a paper on "The Electric Utility and Television" by J. A. Winterbourne, who pointed out that safety is neither appreciated nor understood by the public, and regulations must be made to compensate for this. There was no section of the Canadian Electrical Code dealing with proper installation of TV and FM antennas, he said. If utilities would undertake employee training for linemen and field men to report on dangerous installations, and answer the more common technical questions by customers, many fatal accidents would be avoided.

Three papers were presented before the Public Relations Section; one on "The Industrial Film"; another on "The Promotion of a Film Library"; and a third on "The Need of a Public Relations Program and Its Planning". The Commercial Section heard a paper on "Commercial Cooking, A Utility Load Builder". The Accident Preventions Section saw a film entitled "Pole-Top Rescue".

Meetings were held the third day, January 20, for the Rate Research, Personnel Relations, Transmission and Distribution, and Thermal Power Sections. The Personnel Relations Section saw a film entitled "First Impressions Can Make or Break the Foreman", and heard papers on "Who is Responsible for Giving a New Employe a Good Start", and "How a Foreman Should Improve or Simplify Methods of Work".

The Thermal Power Section heard a paper on "Pulverized Fuel Furnaces" by W. H. D. Clarke. During the day, C.E.A. President C. I. Bacon, M.E.I.C., was honored by receiving a degree of doctor of science from Laval University. Dr. Bacon, who is also vice-president and general manager of the Cornwall Street Railway Light and Power Co., was also the speaker at the Association's dinner held on January 20.

Pointing out that Canada's per capita consumption of electricity was exceeded only by that of Norway, Dr. Bacon called for forward thinking by management and by power engineers; reasonable governmental attitudes on taxation; and wholehearted cooperation and understanding of the industry's problems by governments, management, and labor. The addition of 638,000 hp. during 1953, he said, had raised Canada's installed power to 14,921,459 hp., or some 23 per cent of Canada's resources, but we were hardly keeping pace with growing demands. Installations under way will add a further 1,500,000 hp. during 1954. The addition of the further 15 million horse power needed over the next decade, he said, presented many problems, but with faith in Canada's future by all, these needs would be met.

On the fourth day, sessions of the Thermal Power Section were continued. Delegates heard papers on "Modern Steam Turbine Discs and Blades" by J. K. Leeming, and "The Electrical Melting of Non-Ferrous Metals" by J. O. Edwards. Other papers related to coal-fired gas turbines, hydrogen cooling of steam turbo-generators, powdered fuel furnaces and thermal power station chemistry, while several films relating to steam power were shown.

The Electrical Apparatus Section reviewed progress on "Interchangeability of Transformer and OCB Bushings". The System Planning Section heard several papers, including one on "Operation of Phase Shifters on the Montreal System" by J. J. Villeneuve of Hydro-Québec. The Service Connections and Metering Section heard papers relating to new type meters, including one entitled "The Sangamo One-Second Thermal Converter and Its Uses". The Motor Vehicles Section discussed operational costs of aluminum bodies for line trucks, following a paper on the subject by J. R. Beale of the Aluminum Co. of Canada.

At a dinner on the evening of January 21, the Hon. Lionel Chevrier, federal minister of transport, addressed the delegates on the subject of the St. Lawrence Seaway and Power Project. Pointing out that two alternative projects were being considered for the Lachine Section, he stated the one solely for navigation "would be an exclusively federal undertaking", if the provincial authorities were not interested at this time in a joint power and navigation development.

Mr. Chevrier reiterated Canada's determination to build an all-Canadian seaway, but pointed out that Canada was committed to consider any firm proposal for U.S. participation that would not upset present power plans nor unduly delay completion of the Seaway.

During the fifth day, meetings of the Standardization Co-ordination, Hydraulic Power, Communications, Telemetering and Supervisory Control, Major Industrial Power, and Grounding Sections, were held. Among the papers presented was one on "Application of Supervisory Control to Hydro Electric Plants" by J. E. Hardy of the Canadian Westinghouse Co., before the Communications Section. The conference concluded on January 22.

---

# 1953 E.I.C. Membership Directory

## Errata

With the completion and distribution of our 1953 Membership Directory, a small number of errors have come to light. Naturally these are very much regretted, but since the work had to be done under pressure against time, a certain number of mistakes were almost inevitable.

For the convenience of all members we are printing below the listings as they should have appeared in the Alphabetical Section where they were in error. For errors in the Geographical Section, the necessary correction is simply noted.—Editor.

**BURBIDGE, H. G.**, Queen's '44, Engr., Gen. Engrg. Dept., Aluminum Co. of Can., Sun Life Bldg., Montreal. S'43. J'46. M'51.

The April issue will contain . . .

- Eight important technical papers
- Biographies of E.I.C. officers-elect
- The program of the Annual Meeting

# C.C.A. Meets in Vancouver

The 36th Annual Convention of the Canadian Construction Association was held at the Vancouver Hotel, Vancouver, B.C., January 24-27 inclusive, with an attendance of some 400 out-of-town delegates and as many local members and guests. On arrival, President John Flood was honoured by presentation of Indian regalia, signifying his election as Honorary Chief of the Squamish Tribe, by Chief Joe Mathias.

The first official business was the Sunday luncheon for Builders Exchange secretaries, who heard a report on the International Association of Builders Exchange Managers, and engaged in discussions led by Harold Cole of Vancouver. Hope was raised that this inter-exchange consultation would be broadened in frequency and scope.

As usual, the Monday session began with presentation of committee reports. Lorne Bain reported for the Membership Committee that 115 new members and 25 resignations had brought the total to 1013. Chairman V. L. Leigh of the Housing Committee warned it was the industry's responsibility to see that increased costs did not nullify the advantages to purchasers through the proposed housing legislation. This responsibility, he said, was shared with labour, designers, suppliers and real estate agents.

Chairman R. A. Seasons of the Legislation Committee reported many important pieces of federal and provincial legislation are under review or likely to be reviewed this year, and urged maintenance of a close watch by the Association and by provincial and local bodies. For the Research and Education Committee, Chairman J. F. Parsons reported on C.C.A. grants to aid research programs. Proposed by the Committee and approved in principle by the management were four annual fellowships of $1,200 each for graduate study in construction. One of the maritime universities would inaugurate a construction engineering course in 1954.

Allan Ross, chairman of the Labour Relations Committee, told the meeting that building trade wage rates had been more stable in 1953 than in 1952. Only 15 per cent of the rates had risen more than 10 cents an hour. Average hourly earnings of construction workers had increased about five per cent. Time lost through work stoppages had decreased sharply from 1952.

An August 1953 amendment to the Unemployment Insurance Act, he said, provided benefits to insured persons who, otherwise unemployed, became incapacitated through illness or injury. Major labour bodies are urging a broader amendment, by which benefits would be paid to unemployed who had lost their jobs because of illness. This, he pointed out, would mean unemployment insurance funds would become a form of health insurance, which was not the intent of the Act. He urged employer representatives to watch any demands made on the fund or changes in the Act.

E. R. Smallhorn, chairman of the Publicity Committee, urged increased use of publicity to inform the construction purchasing public of the capacity and experience of Canadian firms.

J. M. Pigott, O.B.E., chairman, Apprenticeship Committee, stated there had been a gain of about 10 per cent in active apprentices in 1953 over 1952. Quebec showed 13,272 for 1953 compared with 10,000 for 1952; all other provinces showed 6,169 vs. 5,216 the previous year. The extraordinary growth of training in Quebec province, he said, illustrated the capacity of the industry as a whole to absorb this all-important work of training new mechanics for our growing needs.

Chairman J. M. Soules, speaking for the Provincial Activities Committee, recommended that the Association should enter more vigorously into provincial matters affecting the industry, through provincial or regional counterparts of builders exchanges or by the C.C.A. itself.

#### President's Address

C.C.A. President John N. Flood, in his annual address, told delegates that the year 1953 had broken all records with an estimated volume of work at $4½ billions, or some 2½ times the 1939 volume. The most significant development had been the strong effective demand for new houses. Volume had been divided 30 per cent for residential, another 30 per cent for industrial, commercial and institutional, and the remaining 40 per cent engineering construction. Of the latter, road building at $450 millions was the largest component.

Mortgage credit availability had been the most serious factor limiting the size of the housing program, but the announcement that chartered

**At the Canadian Construction Association's annual meeting in Vancouver. Left to right: Raymond Brunet, the new president; F. G. Rutley, M.E.I.C., Montreal; Robert Drummond, M.E.I.C., Toronto; Pipe Major Esson of the Seaforth Regiment; John N. Flood, M.E.I.C., Saint John, N.B., retiring president; John Clarke, M.E.I.C., of Toronto, a past-president.**

banks will be permitted to enter the direct residential mortgage field had been a major 1953 accomplishment, and should bring housebuilding closer to meeting the needs of our rising population.

In spite of large road building programs in recent years, rising volume and speed of highway traffic was steadily building up a growing backlog of road requirements. The success of federal-provincial co-operation in building the Trans-Canada Highway, he felt, showed the desirability and feasibility of continued federal participation in the expansion of our highways of national importance, without infringing upon provincial rights.

From all corners of Canada, signs pointed to long-term prospects for an increasing volume for the industry. A positive approach to the problems accompanying it, he observed, was to assure steady expansion of capacity to handle the greater tasks ahead, by developing greater supplies of trained manpower, materials and money. Any vacuum left by Canadian firms would be quickly occupied by foreign firms.

Costs, he warned, must be kept at levels that will continue to attract investors. Designers, manufacturers, suppliers, contractors and labour all shared the responsibility for producing projects speedily, efficiently and economically. Since over 90 per cent of costs, from raw materials to the completed job, appears in somebody's pay envelope, labour could affect the final price very materially.

When costs rise above competitive levels in any field, buyers invariably turn to other sources. Only recently we had seen merchant vessels changing registry, mines closed, the totem-pole industry threatened by Japanese imports, production cut in our textile mills. The lesson was clear. We must watch that our cost structure does not get out of balance.

A great disservice to all workers and to industry could result, he continued, if incentive and initiative were seriously impaired by too wide a range of guarantees and fringe benefits, under the guise of security. Economic security does not lie in that direction. The price of "complete security", if there is such a thing, is the loss of freedom. The delicate balance between the two must not be upset. But incentive to employers, a reasonable return on risk capital, are equally essential ingredients of a healthy economy.

Deploring the diminishing degree of personal contact between employer and worker, he pointed out that second-hand relationships through experts are all too often second-best for either party. Conciliation boards have gained a reputation from recommending middle-of-the-road settlements as a compromise, resulting in initial union proposals being often tailored to this formula, rather than as a basis for true negotiations and examination of facts. Conciliation boards tend to make everything secondary to the effecting of a settlement.

Following the afternoon discussions at the sectional meetings, those attending the "Burns Nicht Supper" were addressed by the Hon. R. W. Bonner, Q.C., attorney general of British Columbia.

#### Panel on Merchandizing

During the Tuesday morning sectional sessions, the Manufacturers and Supply Section heard a talk by W. G. Leithead on "How Manufacturers and Suppliers Can Be of Greater Assistance to Architects". He described the functions of the architect, and suggested ways in which successful collaboration between architects, structural, mechanical and electrical engineers, and contractors, manufacturers and suppliers could be achieved. This was followed by a "Panel Discussion on Merchandizing Methods", in which Past President "Bob" Drummond, R. F. Legget, director of building research, National Research Council and Mr. Leithead participated.

#### Forum on Better Transportation—Highway Transport

The luncheon meeting heard an address by G. M. Parke, president, Canadian Automotive Transport Association, one of four speakers during the convention on the question: "How Would You Spend a Billion Dollars to Improve Transportation in Canada ?"

Referring to the growth in the numbers of trucks to a total of 770,000 in 1952, of which the trucking industry's 70,000 vehicles earned $200 millions in freight haul during 1953, and another 200,000 of which were used on Canadian farms, he called attention to the flexible, personalized and specialized services that trucks can provide.

If Canada's rate of growth over the past quarter century continues at the same rate, by 1978 we would have a population of close to 21 millions and 5.7 million motor-vehicle registrations, he predicted, but only 260,000 miles of roads. This indicated we would then have over 22 vehicles per mile of road by 1978 as against 18.5 vehicles per mile today. Unless road building was stepped up, we would then find ourselves even more deeply bogged down in the traffic quagmire.

It was unlikely, he said, that the trucking industry would seek any part of that hypothetical billion dollars as a subsidy, but if other forms of transportation were to receive such aid to enhance their competitive position with the trucking industry, then the latter might in self-defence be forced to seek its share.

#### What Water Transportation Needs

Tuesday's dinner meeting was addressed by J. R. McLagan, O.B.E., president, Canada Steamship Lines. Outlining the history and development of water transport in Canada, and particularly through the Great Lakes, he showed how it had stimulated Canada's growth. Tonnage carried by American and Canadian inland fleets combined had approached 200 million tons in 1953, he said, while of this a record 129 million tons passed through St. Mary's River canals, exceeding the tonnage through Suez and Panama combined. Combined inland fleets comprised 696 ships with capacity of nearly five million tons. The Canadian fleet comprised 264 ships with total capacity of 1,222,000 tons.

Foreign ships could use our canals, he explained, but cannot carry cargo from one Canadian port to another. British ships, however, can engage in this coastwise trade, which places Canadian ships at a great disadvantage. A British sailor earns $80.00 a month, while a Canadian sailor receives more than $200.00

Completion of the Seaway would create a huge international trade movement between Quebec ports and United States ports on Lake Erie. Does it seem good business to spend our money, he asked, and then hand over the trade to those who don't pay our taxes and who pay only a fraction of what we pay in wages ?

He advocated the signing of a proposed treaty between Canada and the United States, restricting this trade between our two countries to American- and Canadian-built and registered ships. Canadian shipbuilders also wanted our Pacific and Atlantic coasts restricted to Canadian built ships. Canadian shipbuilding wage rates are three to four times the wage rates paid on the Clyde. This, he said, was part of the price of being a Canadian.

At this moment our Canadian ships are being transferred to the British flag, and that meant repair work would be done in the U.K. We hope, he added, that our government will relent and take remedial measures to protect Canadian deep-sea vessels. The "Lifeline of Industry" can disappear very quickly if not protected. We cannot depend on foreign shipping. In time of war it will be withdrawn.

#### The Railroad Viewpoint

At the Wednesday morning session, the speaker was J. Hugh Campbell, director of personnel relations, Canadian Pacific Railway. In spite of the very high level of Canada's economic activity, he pointed out, the railways had shown a serious decline in net earnings. Carloadings for 1953 were lower than those of the previous year by 24 million tons. There had been a steady spiral climb in operating costs, material prices and wage rates, while on the other hand freight rate increases had been "too little and too late". It was a constant struggle to achieve net earnings which would even approach the amount needed to keep the plant in operation.

Regulations, he said, define all phases of responsibilities, regardless of cost, and control the rates the railways may charge, many of them obsolete. The railway business was in a "strait jacket" of regulations and controls and was unable to adjust its rates to meet the conditions of the times.

The two great wars had demonstrated the nation's dependence on rail transport, which was called upon to move bulk commodities at the lowest commodity rates. Highway competitors could select the better paying traffic, thereby taking the cream and leaving the railways the skim milk. This was the reason, he explained, why the railroads advocate removal of the controls that prevent them from bidding successfully for the kind of traffic that would pay their way and provide funds for improvements.

#### Air Transport's Requirements

R. A. Keitts, assistant to the president, Canadian Pacific Air Lines, addressed the final luncheon meeting, on behalf of aviation, as the fourth speaker of the "Forum on Better Transportation".

Briefly reviewing the rapid growth of air transportation, he observed that while the industry merited a substantial investment in its future, the value of a transportation service could not be measured in dollars only, and this was particularly true of the role of aircraft in developing our northern resources.

Giving examples of the tremendous strides made in the movement of air freight, he emphasized that northern airports and navigation equipment warranted top priority in any program of this nature. A few million dollars wisely invested in airstrips could benefit the Canadian economy beyond calculation.

He also advocated the improvement of passenger terminals at our major airports, particularly the international terminals at Montreal and Vancouver, which were sadly out of harmony with other phases of airway development.

#### C.C.A. Policy and Resolutions

A statement of C.C.A. policy reaffirmed the Association's belief that free enterprise will operate to the greatest advantage and in the best interest of our country, and advocated:

(1) Fullest co-operation by management, labour, and government to improve efficiency and reduce costs; increased apprenticeship and immigration; and participation of labour organizations in a National Joint Conference Board; negotiation of labour agreements for periods of not less that two years.

(2) Acceleration of the flow of construction materials; emphasis on processing Canadian raw materials; quotation of firm prices; standards, methods and techniques leading to economies in material usage.

(3) Unrestricted C.C.A. co-operation with National Defence, Defence Production, the I.D.B. and Civil Defence Authorities.

(4) Maintenance of the National Housing Act to serve the essential housing market.

(5) Use of Trans-Canada Highway experience in establishing a Dominion Provincial Highways Commission for long term planning and construction of resource, tourist and strategic highways; replacement of level crossings with grade separations, and standard traffic signs and signals.

(6) Centralized control of projects under a general contractor; security deposits only on public projects; unit prices on lump-sum building projects limited to excavation, concrete, forms and reinforcement only; wider use of C.C.A.-R.A.I.C.-E.I.C. standard contract and tender forms.

(7) Continued support of N.R.C. and other technical building research; wider use of the 1954 National Building Code; complete utilization of Canada's forest resources through assistance under the Federal Forest Conservation Act; and continued support of the Community Planning Association towards achieving reasonable standards of housing and community development.

Resolutions adopted at the Convention were as follows:

(1) Appreciation of proposed federal amendments to housing legislation; advocation of an annual program of 125,000 dwelling units; extension of the 90 per cent provision beyond $8,000 value limit; consideration of age and future prospects of borrowers; co-operation by provinces and municipalities in N.H.A. land assembly schemes; open-end mortgages; an advisory committee under Section 34 of Bill 102; improved inspection services; and limitation of subsidized low rental housing to only the aged and underprivileged.

(2) Fullest use of the Canadian-owned and -controlled construction industry on the St. Lawrence Seaway; and disallowance of Department of National Revenue regulations which permit entry of construction equipment on a monthly proportionate tariff basis.

(3) Amendment of existing labour relations legislation by Federal and Provincial Governments, so as to require the use of secret ballots under supervision when trade unions vote on strike action, and enforcement of strict compliance with Canadian laws during strikes.

(4) Extension of the scope of Federal Sales Tax exemption to include all construction materials.

(5) Necessary subsoil information based on tests, and equitable adjustments with the contractor where conditions vary from the conditions described; and discontinuance of retention of holdbacks past the limits set by mechanics requirements.

(6) Contractors moving to a new area to recognize and respect principles set down by local Builders Exchanges.

The Convention closed with a joint meeting of the 1953 and 1954 executive committees, and election of officers for the coming year. Raymond Brunet, O.B.E., of Hull, Quebec was installed as president, with John Flood of Saint John as Immediate past-president, and W. G. Malcom of Winnipeg and Alan Turner Bone of Montreal as national vice-presidents.

# Sixty Years of the Faculty of Applied Science at Queen's

By Dean D. S. Ellis, M.E.I.C., *Queen's University*

**An address given at the Queen's University Convocation, October 1953, which marked the Diamond Jubilee of the Faculty of Applied Science.**

Sixty years ago in October 1893, the first classes in applied science were held by the newly formed School of Mining and Agriculture in the buildings of Queen's University. The School was not a part of Queen's University but was organized under its own Board of Governors representing those who had subscribed toward the formation of the new institution.

The members of this first board were: C. F. Gildersleeve, M. H. Folger, J. B. Carruthers, G. M. Grant, G. M. Macdonnell, Wm. Harty, Jas. Swift, J. L. Whiting, Hiram Calvin, E. W. Rathbun Jas. Haydon.

It is right to note their names because through their efforts engineering education was undertaken here.

Classes were held either in the Arts Building or Carruthers Hall. To the west of them lay an area of waste land extending to Gordon St. (University Ave.). In the southwesterly part of this area was laid out a rather rough football field. The team whose home field it was were champions of Canada that fall.

The initial subjects for the engineering course were mathematics, science and English, which were taught by the Queen's staff, while for the elementary drafting and surveying, special part time instructors were used for a few years. The appointment of W. G. Miller to the chair of geology brought to Queen's a truly great geologist who, unfortunately, left to be Provincial geologist. But he was the founder and first of a long line of distinguished geologists at Queen's.

We can picture a handful of perhaps six or eight students waiting uneasily that October morning sixty years ago for the opening lectures of the new course. They would be garbed in the rather unimaginative style of the early nineties—tight trousers with no crease or cuff, tight coats with waistcoats buttoned very high, stiff straight collars with murderous points and with hard felt hats, now rarely seen but then universally worn, and known facetiously as kaydees or christy stiffs.

From among the early graduates a surprisingly large number attained prominence in their profession, showing that when the basic training in mathematics, science and English is good, it becomes a determining factor in a man's progress in his profession. To mention only a few—T. S. Scott was an outstanding civil engineer and contractor. S. N. Graham later was professor of mining here. Charles Fortescue, a graduate in electrical engineering, rose to a position of eminence with the Westinghouse Company and made a world wide reputation as a designer of electrical machinery. He is still regarded as having been a leader in his profession. Another electrical graduate, H. S. Baker, also with Westinghouse and later with Hydro, became one of the outstanding authorities on electrical measurement. He had a great number of fundamental patents in relation to this work. Another man was M. B. Baker who for many years was professor of geology at Queen's.

Moving on now to the year 1905, we find 156 students attending the classes given by a staff of 17. This staff was a really outstanding one as the names of some will show. Among the Queen's staff were N. F. Dupuis, W. L. Goodwin, Wm. Nicol, R. W. Brock, M. B. Baker and W. C. Baker. On the engineering side were A. K. Kirkpatrick and four young McGill graduates who did so much to form the tone of the School, Gwillim, Stafford Kirkpatrick, Gill and Macphail. They made a very strong faculty, one of which the students were proud and also very fond.

Necessary new buildings appeared The mill for mining and metallurgy was erected about 1897. And in 1902 were built Ontario Hall for physics, mining, metallurgy, geology and mineralogy, and Fleming Hall for civil, electrical and mechanical and also botany. Thus the new school was provided with relatively adequate and comfortable quarters.

Going forward another ten years to 1914, we find the attendance had risen to 281 and the number of the staff was 28. That year A. K. Kirkpatrick died and W. P. Wilgar, a graduate of 1903 and an outstanding civil engineer, was appointed to the civil staff and Alexander Macphail became head of the department. However he did not assume this position till after the war, which flared up so quickly in August. He had organized a militia unit, the Fifth Field Company, among the engineering students in 1909. It trained faithfully. So when war came there was a marked movement of the staff and students into the Engineer units of the Army. Contrary to the impression gained from the local press, the Queen's engineers were not responsible for all the advances in the campaign but they did their part.

In the midst of this anxious time the negotiations to release the University from its formal ties to the Presbyterian Church were completed. Under its independent status, Queen's was eligible for government assistance which it could not receive as a church-affiliated institution. The result was that the School of Mining was reorganized as the Faculty of Applied Science of the University. Dr. W. L. Goodwin acted as dean for a few months and on his retirement Dr. A. L. Clark HON.M.E.I.C. was appointed to the post which he held with great distinction and greatly to our advantage for almost twenty-five years.

In the autumn of 1919 after four rather meagre years in educational circles from the point of view of supply of students, a surge of nearly 250 freshmen appeared for registration. Most of them were freshly demobilized soldiers, with all that that implies. However the new dean and his staff were equal to the task and showed themselves masters of improvisation in class rooms, teachers and timetables. Soon everything was running smoothly and much as in the old days, except for the practice of playing crown and anchor between classes.

There were a number of staff changes. Jemmett became head of electrical, Arkley of mechanical and MacKay took over metallurgy. N. L. Bowen, perhaps our most distinguished graduate in science, returned for a brief while as professor of mineralogy but we couldn't keep him and that department passed into another classmate's hands, E. L. Bruce, who later held the research chair in geology.

All departments were expanding their work and the student body continued to grow. The financial slump of 1929 and early thirties seemed to indicate to us that enrolment must drop. Strangely the opposite occurred, and during the bad economic years of the thirties, our enrolment rose more steeply than before, and by 1939 we had a staff of 46 and 646 students in the Faculty. In 1937 Lindsay Malcolm, for 30 years on our staff, was made director of the Civil Engineering College at Cornell—a marked recognition for Queen's.

Then came another great war. There were insufficient engineers for the now highly mechanized service units. However the decision was made to compel those students in engineering to finish their training before joining the forces. This proved a wise though unpopular decision. There were some suspicious-looking failures. Numbers dropped slightly and younger staff members went with the units of the technical services.

The surge of returned men experienced after the first war was recalled vividly by most of our staff, and preparations were made to deal with increased numbers. Our estimates, while not precise, were helpful and our preparations were adequate. For several years it was necessary to carry alternate groups through the summers. It allowed us to handle greatly increased numbers without enlarging materially the classes and still use adequate and customary classrooms. The result was, we think, excellent and it is with happiest memories that we look back to these days. The support we received from these men, and indirectly from their wives, made no effort on our part seem too great. It was a great privilege to have worked with them.

Now we are back to the high school graduate whose average age is say 19 on entrance and who has not much experience working with men, or sometimes perhaps of working. That is not his fault. However they are, as you can see, a promising looking lot. Their numbers are again increasing and this fall we have 794 undergraduates and 23 graduates.

Our class room space and laboratories are crowded but we can manage. The technical equipment in the various departments is expanding every year. Some recent additions are new hydraulic equipment in our laboratory and improvements in the Sanitary laboratory and improved testing equipment for highways materials: new transmitter in electrical and extended facilities in chemistry and chemical engineering; synchrotron in physics, X-ray and relay analytical equipment in geology; and last, but certainly not least, the truly magnificent mechanical building, McLaughlin Hall. All this equipment is actively used for research either at the master's level or by work the staff members are doing themselves.

Undergraduate instruction is our principal task but we believe that research is one of the best ways to improve this instruction and widen the horizon of both the teacher and the student. So our aim in graduate work is to have a relatively small body of good men who can be given adequate attention. The standards have purposely been made high. The results of this policy are shown in the uniformly good reports we receive of these men, most of whom go on for higher degrees elsewhere. Another confirmation of this policy is in the number who come here from other universities. Such work is done to a great extent in the sciences—chemistry, physics and geology and chemical engineering, where it has been found necessary to have a doctor's degree for advancement. Now even against the attraction of relatively high salaries in industry, graduate work is increasing in the professional departments.

About three years ago through the suggestion of Dr. N. F. Tisdale, an Advisory Council for Engineering was set up. It consists of three outside engineers for each engineering department. Of the three, one must be a graduate of another university, and the other two are Queen's graduates. The purpose of this Council is to study critically our work and to suggest changes to faculty. The general idea back of it is to get a truly impartial opinion on our work. Frankly we went into this with some misgivings, which have been swept away by the warm response we received when we asked men to serve on the Council, but when they met and went to work, we were somewhat lost in admiration and amazement. Subsequent meetings strengthened this feeling. We are very grateful to these men who have given so freely of their time and labor. And especially we thank here those men of other universities whose help has been so generously given. Apart from this, we the staff do enjoy talking once a year to someone who can listen sympathetically to our problems and doubts. Dr. Tisdale did better for us than we knew.

Some of you may think that staff and officials run the faculty. This is anything but true, for a large number of problems concerning students—and there are few which do not—are dealt with by consultation between staff and the Engineering and Year Societies. I wish now to pay tribute to the wise way in which the students carry on their affairs. They have always been a real help to us. A very tangible result of the Engineering Society's efforts is the modern book store which we now have.

So now we face the future with good advisers, good equipment, a strong student body and a staff which by tradition and inclination works as a good team should. We think that we have a good chance of progressing to even better things.

---

# Engineering Education Statistics

In the academic year ending June 30, 1953, 21,612 Baccalaureate degrees were awarded to men and 30 to women by the engineering schools having E.C.P.D. accredited curricula. These schools awarded Masters degrees in the same period to 3,603 to men and 15 to women and Ph.D. degrees to 588 men and 4 women.

These schools have currently 18,000 persons enrolled for Master degree work (10,000 of these are evening students) and 3,000 are studying for their Ph.D. degrees.

The number of Baccalaureate degrees awarded by these same schools this year (ending June 30, 1954) will drop to about 17,000. Growing graduate school enrollments indicate, however, that more Masters and Ph.D. degrees will be awarded in 1954 than 1953. The variables in individual programs make numerical estimates impossible.

The figures quoted above were obtained from the U.S. Department of Health, Education and Welfare.

# The ASME Boiler Code

### Interpretations

The Boiler Code Committee meets monthly to consider "Cases" where users have found difficulty in interpreting the Code. These pass through the following procedure: (1) Inquiries are submitted by letter to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.; (2) Copies are distributed to Committee members for study; (3) At the next Committee meeting interpretations are formulated to be submitted to the ASME Board on Codes and Standards, authorized by the Council of the Society to pass upon them; (4) They are submitted to the Board for action; (5) Those which are approved are sent to the inquirers and are published in Mechanical Engineering.

The following Case Interpretations were formulated at the Committee meeting December 11, 1953.

**Case No. 1180**

Special Ruling

***Inquiry:*** The 1952 Edition of Section VIII, Table UCS-23 lists stress values for carbon-steel bar stock material furnished in accordance with Specification SA-306. May bar stock complying with Specification SA-7 be used in the construction of unfired pressure vessels?

***Reply:*** It is the opinion of the Committee that, pending the time when bar stock complying with Specification SA-306 becomes generally available, it is permissible to use bar stock furnished in accordance with Specification SA-7, in the construction of unfired pressure vessels under Section VIII of the Code, provided that:

(1) The steel is manufactured by the electric furnace or the open-hearth process.

(2) The design temperature at which the material is used is between 20 and 650° F.

(3) The stress value used in design is 12,650 p.s.i.

(4) The procedure classification for this material in Table Q-11.1 in Section IX of Welding Qualifications is P No. 1.

**Case No. 1170-1**

(Reopened)

Special Ruling

In the Inquiry, revise the first line of the tabulation to read: "0.095 in. for tubes 1¼ in. O.D. and smaller"

**Case No. 1091**

Covered by Specification SB-247 and revised footnote 5, Table UNF-23 1952 Section VIII.

**Case No. 1133**

Case Annulled

Covered by Table UNF-23 1952 Section VIII.

### Proposed Revisions and Addenda to Boiler and Pressure Vessel Code

As need arises, the Boiler Code Committee entertains suggestions for revising its Codes. Revisions approved by the Committee are published here as proposed addenda to the Code to invite criticism.

In the following the paragraph numbers indicate where the proposed revisions would apply in the various sections of the Code.

Comments should be addressed to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.

#### Unfired Pressure Vessels, 1952

***Table UNF-23.*** Footnote 5 revise to read:
The stress values given for this material are not applicable when either welding or thermal cutting are employed.

***Table UNF-23.*** Copper-Silicon, A, C, D, SB-96 Plates and Sheet (1), revise to read under "Subzero to 150" to "12,000" instead of "10,000".

***Par. UA-280.*** Example 1 insert the words "ring type joint" between the word "pound" and "welding neck".

#### Editorial

***Table UCS.-23*** Footnote (1). Change to "(1). See Par. UCS-6(b)".

***Par. UG-45(2).*** Add the reference "See Par. UG-31(c) (3) )."

***Par. UG-41(b).*** First and second lines, change "Par. UG-40(c)" to "Par. UG-40(a)".

***Example 1.*** Pages 148 and 149. In the first line on page 149 change "400F" to "150F".

***Par. UG-37(b).*** In (1), last line, change "M-1" to "E-1 and M-1"; in (2), second line, insert "seamless" before "cone"; in (3), seventh line, insert "seamless" before "sphere".

#### Non-editorial

***Table UCS-23*** and also to ***Table UHA-23:***—Add the following notes: "All stress values in shear are 0.80 times the values in the above table."

"All stress values in bearing are 1.60 times the values in the above table".

***Par. UG-44.***—Fifth line, change "ASA B-16e –1939" to "ASA B16.5–1953"; in the 6th and 7th lines, change "MSS 150 and 300 lb. Bronze flange and Flanged Fittings Standard, MSS SP-2-1946 (R-1949)" to "ASA B16.24-1953 Brass or Bronze Flanges and Flanged Fittings 150 and 300 lbs."; in 10th line, change "MSS SP-42-1951" to "MSS SP-42-1953"; in 13th line, change "B16e-1939" to "B16.5-1953".

***Table UA-450, Appendix O.*** Change the parenthetical note in the heading, from "(Table from ASA B16e-1939)" to "(Table from ASA B16.5-1953".

***Table UA-451.*** Change Footnote 5, page 159 from " . . . as given in ASA B36.10-1935, Schedule 4" to " . . . as given in ASA B36.10-1950 Schedule 40".

***Table UA-451.*** Change Footnote 6, page 159, from " . . . of the ASA B16e-1939" to " . . . of the ASA B16.5-1953".

Replace the tables on pages 160 and 161 with new B16.5-1953, Table 2 through 15 inclusive.

***Par. UG-41(c).*** Add the following sentence: "For obrotund openings, consideration shall also be given to the strength of the attachment joint on one side of the plane passing through the intersection of a semicircular end with the parallel sides of the opening".

***Par. UG-39.*** Reletter Pars. (a), (b), and (c) to (b), (c) and (d), respectively, and add a new paragraph reading:—

"(a) General. The rules in this paragraph apply to all openings other than small opening covered by Par. UG-36(c) (3).

***Par. UG-36(c) (a).*** Change "3 in. pipe size in vessel walls 3/8 in. or less" to "3 in. pipe size in vessel shells or heads 3/8 in. or less" and "2 in. pipe size in vessel walls over 3-8 in." to "2 in. pipe size in vessel shells or heads over 3/8 in".

***Par. VW-14.*** Reletter present (b) and (c) to (c) and (d) respectively. In present (c) (new (d), change last line of reference from "(a) (2)" to "(b)".

Replace present (a) with the following (a) and (b):

"(a) Any type of opening that meets the requirements for reinforcement given in Par. UG-37 may be located in a welded joint.

(b) Openings within the limits given in Par. UG-36(c) (*3*) that do not fully meet the requirements for reinforcement in Par. UG-37 may be located in head-to-shell and other circumferential joints, provided the weld meets the radiographic requirements in Par. UW-51(m) for a length equal to three times the diameter of the opening with the center of the hole at midlength. Defects that are completely removed in cutting the hole shall not be considered in judging the acceptability of the weld.

***Par. UW-11(b).*** Revise to:

"(b) Butt welds joining the flange or saddle of an inserted type nozzle as shown in Fig. UW-16.1(q) (1) and (q) (2) shall be radiographed when the vessel or vessel section to which the nozzle is attached is required to be radiographed. Nozzles attached by fillet or corner welds, or both, need not be radiographed. Delete Fig. UW-11.

***Fig. UW-16.1(q) (1).*** Note—Now UW-16.1(q), change this figure to show the acceptance of attaching an inserted type nozzle to a shell of thinner wall thickness by use of a 1:3 taper beginning at the shell side of the attaching butt weld. (Fig. UW-16.1(q) (1) attached as Appendix V.)

***Fig. UW-16.1(q) (2).*** Add this figure showing the attachment of inserted type nozzle to the shell and employing the compound taper recommended by the AWS and adopted by the ASA for joining thick body welds to relatively thinner pipe shells. This permits a 30 deg. maximum taper beginning at the inserted side of the attachment weld, and extending 1½ times the pipe shell thickness. From there to the nozzle neck, a taper of 45 deg. maximum is permitted. (Fig. UW-16.1(q) (2) attached as Appendix V).

Delete the present Fig. UW-16.1(q) and use the above two figures in its place.

***Par. UG-38.*** Revise as follows:

"UG-38 Flued Openings in Formed Heads (a) Flued openings in formed heads made by inward or outward forming of the head plate shall meet the requirements for reinforcement in Paragraph UG-37.

(b) The minimum depth of flange of a flued opening exceeding 6 in. in any inside dimension, when not stayed by an attached pipe or flue, shall equal 3t or (t+3) inches, whichever is less, where t is the required head thickness. The depth of flange shall be determined by placing a straightedge across the side opposite the flued

opening along the major axis and measuring from the straightedge to the edge of the flanged opening.
(c) The minimum width of bearing surface for a gasket on a self-sealing flued opening shall be in accordance with Par. UG-46(j). (Figure required for the revision of Par. UG-38 is attached as Appendix V).

*Par. UG-37.* Revise (a) to:
(a) General. The rules in this paragraph apply to all openings other than small openings covered by Par. UG-36(c), large head openings covered by Par. UG-36(b) (2), and openings in flat heads covered by Par. UG-39.

*Par. U-1(d) (2).* Revise to:
(2) Vessels for containing water under pressure for domestic supply including those containing air, the compression of which serves only as a cushion.
(3) A domestic hot-water supply storage tank heated by steam or any other indirect means when none of the following limitations is exceeded:
(a) a heat input of 100,000 BTU per hour,
(b) a water temperature of 200° F.,
(c) a nominal water containing capacity of 120 gallons.
Renumber present (3) and (4) to (4) and (5) respectively.

### Welding Qualifications, 1952

*Table Q-11.1.*—Delete SA-203, Grade D and Grade F from Table P-5 and insert in Table P-9. At the same time change Grade F to Grade E.

### Announcement

The 1952 edition of ASME Suggested Rules, Care of Power Boilers is now available through the Order Department, ASME, 29 West 39 Street, New York 18, N.Y.

## Thirty-five Years Ago

### Comment on the *JOURNAL* of March 1919

The annual meeting was held in Ottawa on February 11, 12 and 13, 1919. This was counted as the thirty-third, dating from the foundation of the old Canadian Society of Civil Engineers. The March *Journal* is devoted almost entirely to the doings at this meeting; most of the papers were printed in the February *Journal.*

Perhaps the most important step taken at the meeting was the appointment of a special committee composed of one member from each branch, to meet at Headquarters before April 15, 1919, "draw up such sample legislation as it may deem necessary and advisable in order that members of the Institute throughout the different provinces may ask for legislation on the same uniform basis," and report to Council before May 1, 1919. Council was ordered to "ask by letter ballot, before June 1, 1919, the opinion of all the members of the Institute regarding the adoption of the legislation proposed by the said committee of the Institute."

The Finance Committee got a pat on the back because its report showed that the first year of the *Journal* ended with a surplus, this in spite of the fact that "full postage" had been paid on all issues "owing to opposition from existing technical papers." President Vaughan thought that when the *Journal* reached a "certain point" it would "really be an index to the manufacturing concerns of the country," but, like any cautious engineer, he did not say where that point was.

The Canadian Engineering Standards Association, now the Canadian Standards Association, is mentioned for the first time as an incorporated body. Its main committee was made up of three members from the Institution of Civil Engineers, three from the Institute, three from the Canadian Institute of Mining and Metallurgy, three from the Canadian Manufacturers' Association, three each from the universities — Laval, McGill and Toronto — and three from government departments. Though the Association may be "of comparatively little value in Canada, there is quite a prospect that we shall find an important and useful work to do."

The Honour Roll Committee reported 960 on its list, of whom 943 were officers, including three generals; 110 decorations were noted, including two Victoria Crosses.

Some remarks by branch representatives bring back old times. For example, the Ottawa Branch spent $116 for "expenses in connection with branch contribution of exhibit beavers to main Institute rooms, Montreal." The epidemic of Spanish influenza "adversely affected" the activities of the Toronto Branch. The Halifax Branch was busy absorbing the former Nova Scotia Society of Engineers. One speaker thought that the possibility of publication in the *Journal* would improve the quality of branch papers.

The Governor General, the Duke of Devonshire, was the speaker at one luncheon. At another time, Alfred D. Flinn, secretary of the United Engineering Council, New York, told of the efforts of engineers of all kinds in the United States to get together, something which did not bother Canadians, for the Institute was a home for all. Another luncheon speaker was Dr. Ira N. Hollis, representing the American Society of Mechanical Engineers. Dr. Hollis congratulated the Institute on the succinct statement of its aims — "To facilitate the acquirement and interchange of professional knowledge . . . " — which in those days appeared on the *Journal's* cover, and now will be found just over the table of contents on the page preceding the text. American engineers had not succeeded in developing a similar statement, though they had tried to many times.

Hon. F. B. Carvell, Dominion Minister of Public Works, spoke at another luncheon, delivering a "somewhat lengthy address filled with optimism regarding the future of Canada." He did not see how the country could get along on a budget smaller than $300 to $350 million for the next few years. Look at 1953's budget.

The Parliament Buildings, burned in 1916, were under reconstruction, so the Institute members and their friends were treated to a tour of them personally conducted by John A. Pearson, chief architect, and J. B. Hunter, Deputy Minister of Public Works.

The principal paper in this March *Journal* of 1919 was M. R. Riddell's "Development and Future of Aviation in Canada." His first craft was the "Canada", a Curtiss flying boat with 76-foot wing spread and two 170 hp. Curtiss engines. With two 90-hp. motors temporarily installed, she made 87 m.p.h. and climbed to more than 3,500 feet in less than seven minutes. She was shipped to England in late 1915 or early 1916, where, with her regular engines, she touched 102 m.p.h. She carried 1,000 pounds of pay load and had a flying radius of 500 to 600 miles at full power.

Other early planes, nearly all military were described by Mr. Riddell, but the most interesting part of his paper to today's reader is his thoughts on the future of aviation. According to him, aviation would have to overcome "the aversion that many have to leaving the safety of terra firma." For reasons as valid today as they were in 1919, he thought that "for short distances . . . it would seem that aerial transport is not likely to be commercially possible". Of course, he counted without the helicopter.

"Passenger service will probably begin by the use of single machines for rapid journeys in any direction, but later it will become possible to institute regular services along settled routes on scheduled time . . . Some form of comfortable enclosed cabin will have to be supplied and the method of entrance will have to involve less of an acrobatic performance than at present . . . The class of freight that can be commercially handled . . . will be limited to articles of high intrinsic value and small weight.

"(For) regular aerial service over the Atlantic . . . the airplane will not be the type of air vessel generally employed . . . The lighter-than-air ship . . . appears to offer superior advantages in the way of comfort and safety.

"As commercial aerial service extends, new uses for the aeroplane will be continually found and in a comparatively small number of years, instead of considering it an interesting but somewhat impractical toy, flying will have become a matter of everyday life and we will wonder how we ever got along without it."

George K. McDougall's paper on "Industrial Illumination" takes up six pages, an excellent primer of principles which have not changed much to this day.

Someone, perhaps a bored member at the Ottawa meeting, amused himself by making thumbnail silhouettes of the more prominent participants. About 50 are published as page-wide spreads. Most of the subjects long ago passed to their rewards, but a few are happily still with us — F. S. Keith, J. B. Challies and J. L. Busfield, among others.

The diving-bell controversy was still going on, with no decision in sight. Both Mr. Taylor and Mr. Macdonald stuck to their guns and each one needled the other, in a nice way, of course. This month Mr. Macdonald was the attacker.

"Sapper" writes in with a grouse about salaries. He quotes a Civil Service notice:

| | *Salary* |
|---|---|
| Reporter for the House of Commons | $2,200 |
| Fruit inspector | $2,000 |
| HYDROMETRIC ENGINEER. | $1,500 |
| Legal clerk | $1,500 |
| Storekeeper | $1,500 |

And he says, "C'est à rire!"

Two Council meetings held in February and reported in this issue do not seem to have dealt with any very important matters. The committee engaged in trying to raise salaries of engineers in the Civil Service reported "progress"; this frequently means "no progress".

The employment bureau had twelve jobs listed, five of them in the Civil Service, including a commissioner of immigration, perhaps a tribute to the adaptability of engineers. An electrical engineer who could "design the layout of a power plant" was wanted at $3,000 and a city engineer at $2,400 to $3,000.

## News of Other Societies

The annual meeting of the **Canadian Institute of Mining and Metallurgy**, 906 Drummond Bldg., Montreal, Que., is scheduled for April 26-28, 1954, at the Mount Royal Hotel, Montreal.

---

The 1954 annual assembly of the **Royal Architectural Institute of Canada,** 57 Queen St. W., Toronto 1, Ont., will be held in Montreal, May 11 to 15.

---

The **Canadian Good Roads Association,** 270 MacLaren Street, Ottawa 4, Ont., will award this year a scholarship valued at $1,800 to a Canadian engineer. The recipient will take special advanced studies in field of highway transportation, probably following courses in the United States which are not available in Canada.

Applications for the academic year 1954-55 must be submitted by May 1, 1954. Information can be obtained from the C.G.R.A. Office.

---

The 1954 annual convention of **Canadian Electrical Association,** Room 704, Tramways Bldg., Montreal, will be at Murray Bay, Que., June 24-26.

---

The **Society for Experimental Stress Analysis** will hold the spring meeting and the educational lecture and exhibit on April 14, 15, 16, 1954, at the Netherlands Plaza Hotel, Cincinnati, Ohio. Information may be obtained from Harry LaTour, chairman of the spring meeting, 134 Kensington Street, Middletown, Ohio.

---

The second welding and allied industry exposition in the Memorial Auditorium, Buffalo, N.Y., has been arranged to coincide with the **American Welding Society's** spring technical meeting at the Hotel Statler, Buffalo, May 4-7, 1954.

---

The calendar of the **American Institute of Chemical Engineers,** 120, East 41st Street, New York 17, N.Y., lists for May 16-19, 1954, a meeting at Springfield, Mass.; June 20-25, a special meeting on nuclear energy, at University of Michigan, Ann Arbor; September 12-16, a meeting at Glenwood Springs, Colorado, and December 12-15, the annual meeting in New York City.

---

The **American Association of Spectrographers** is presenting a symposium on Direct Reading Emission Spectroscopy, in Chicago, May 7, 1954. The subject will be treated under the following subtitles: iron and steel, non-ferrous metals, and metal in non-metallic materials, and contributed papers are welcome. Please address all inquiries to: M. E. Slagel, chairman, U.S. Reduction Co., Box 30, East Chicago, Indiana.

---

The **American Society for Engineering Education** will hold its 62nd annual meeting, June 14-18, with the University of Illinois, Urbana, as host institution. The Society's headquarters are at Midwestern University, Evanston, Ill.

---

Meetings of the **Institute of the Aeronautical Sciences,** 2, East 64th Street, New York 21, N.Y., June 21-24, IAS annual summer meeting, IAS Building, Los Angeles, Calif.; August 9-11, Turbine-Powered Air Transportation meeting, Seattle, Washington.

---

The Oregon Section of the **American Institute of Mining and Metallurgical Engineers** will be host for the AIME Pacific Northwest Metals and Minerals Conference to be held in Portland, Oregon, April 29 through May 1, 1954.

The technical program, which will be open to the public, will cover metals technology of iron and steel, extractive and physical metallurgy, industrial minerals, engineering geology, groundwater and mineral industries education. Information can be obtained from A. O. Bartell, 308 Woodlark Bldg., Portland 5, Ore.

---

A conference on oxidation will take place at the Hague, Netherlands, on May 6 and 7, 1954, under the auspices of the Institution of Chemical Engineers, the Society of the Chemical Industry, the Royal

Institution of Engineers (Netherlands) and the Netherlands Chemical Society.

Information can be obtained from the secretary of the British Organizing Committee, the Institution of Chemical Engineers, 56 Victoria Street, London, S.W. 1.

### Officers of Other Societies

The Journal has received news, during the past few months, of the election of officers to the following professional societies:

**The Engineers Joint Council.** Dr. Thorndike Saville, dean of the College of Engineering, New York University, is president for 1954.

**The Community Planning Association of Canada.** Sir Brian Dunfield is president. He is a judge in the Supreme Court of Newfoundland. C. E. Campeau, M.E.I.C., Montreal and P. R. U. Stratton, Vancouver, are vice-presidents.

**National Association of Corrosion Engineers.** Aaron Wachter, is president. F. L. Whitney, Jr., is vice-president, and Russell A. Brannon, treasurer.

**American Society of Refrigeration Engineers.** Four new directors are George K. Iwashita, Schenectady, N.Y.; T. P. Neff, Chicago; R. H. Lock, Toronto; A. L. Hesselschwerdt.

**British Standards Institution.** Sir Roger Duncalfe was elected president, to succeed Viscount Waverley. Sir Roger Duncalfe is chairman of British Glues and Chemicals Ltd., a vice-president of the Federation of British Industries.

**Institute of the Aeronautical Sciences.** John Leland Atwood, president and director of North American Aviation, is president. Four vice-presidents are: William A. M. Burden, E. S. Thompson, Edmund T. Price, John W. Larson. Treasurer is Elmer A. Sperry, Jr.

**Society of Automotive Engineers, Inc.** William Littlewood of Washington, D.C., the new president, is vice-president of American Airlines, Inc. Vice-presidents are: R. W. Rummel, F. W. Fink, G. W. Newton, G. M. Buehrig, John Dickson, A. L. Boegehold, Kenneth Boldt, Harold Nutt, E. D. Kemble, H. L. Brock, H. L. Willett, Jr., R. C. Wallace.

**American Institute of Chemical Engineers.** Chalmer G. Kirkbride, president and director of Houdry Process Corporation, Philadelphia, Pa., is president for 1954. Barnett F. Dodge, of Yale University, is vice-president; George Granger Brown, of University of Michigan is treasurer, and Stephen L. Tyler has been re-elected secretary.

**Canadian Radio Technical Planning Board.** R. A. Hackbusch of Toronto, president of Hackbusch Electronics Ltd., was re-elected president at the ninth annual meeting. C. W. Boadway, Toronto, is vice-president and Stuart D. Brownlee is secretary-treasurer of the Board.

# Elections and Transfers

At the meeting of Council held in Regina, Sask., on Friday, February 5, 1954, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

*Members:*

M. E. Almstrom, *Whitehorse*
W. L. Anderson, *Edmonton*
E. Beck, *Montreal*
F. R. Denham, *Quebec*
F. G. East, *Toronto*
H. Farah, *Toronto*
L. Fieldman, *Malton*
K. Hulmdorf, *Toronto*
E. W. Jupp, *Georgtown, B.G.*
T. Kraulis, *Montreal*
E. L. Lyons, *Hamilton*
O. Margison, *Toronto*
A. Rose, *Toronto*
O. Rudzitis, *Montreal*
J. L. Shirley, *Toronto*
A. H. R. Thomas, *Toronto*
A. Valter, *Toronto*
E. Visan, *Montreal*
E. M. Warnes, *Montreal*
L. Warycha, *Montreal*
J. P. Wright, *Toronto*

*Juniors:*

K. Czerwinski, *Montreal*
P. M. Dimitroff, *Fort Erie*
A. E. J. Dubois, *Ste. Dorothee*
A. Favilla, *Shawinigan Falls*
D. H. Giddy, *Johannesburg*
F. G. Holroyd, *Montreal*
N. E. Katsicadamas, *Montreal*
M. S. P. Reszetnik, *Kitchener*
H. S. Siré, *Montreal*

*Transferred from the class of Junior to that of Member:*

M. B. Allan, *Montreal*
G. Babineau, *Quebec*
C. Belanger, *Three Rivers*
J. M. Bennett, *Toronto*
R. P. Boucley, *Montreal*
J. Brissette, *Montreal*
D. N. Brown, *Winnipeg*
P. M. Butler, *Edmonton*
L. G. Crutchlow, *Ottawa*
W. R. Denford, *Guelph*
A. T. Farmer, *Three Rivers*
J. M. Ferguson, *Cochrane*
W. J. Gall, *Arvida*
T. S. Gamble, *Weston*
C. E. E. Gelinas, *Montreal*
D. R. Graham, *Kingston*
A. W. Greenberg, *Winnipeg*
H. J. Harding, *Winnipeg*
J. H. Hearn, *Summerside*
S. B. Howlett, *Merritt*
I. C. Johnson, *Toronto*
R. S. Kittlitz, *Edmonton*
W. Lemiski, *Sault Ste. Marie*
A. N. Oldfield, *Montreal*
C. E. Paget, *Terrace Bay*
E. R. Renouf, *Toronto*
R. J. Schneider, *Toronto*
T. A. Sissons, *Medicine Hat*
A. W. S. Tite, *Hamilton*
H. L. Topham, *Kamloops*

The following Students were admitted:

*McGill University*

# Personals

## News of the Personal Activities of Members of the Institute

**Dr. R. S. Stephen Jane,** M.E.I.C., vice-president and director of Shawinigan Chemicals Limited, in charge of research, since 1946, has been appointed executive vice-president of the company.

**Dr. R. S. Jane, M.E.I.C.**

Dr. Jane received his B.Sc. degree from the University of British Columbia in 1922. He obtained his M.Sc. degree from McGill University in 1923 and his Ph.D. degree from that university in 1925. His work there won him a Wembley scholarship for two years' study at the University of London.

Upon his return to Canada in 1927, Dr. Jane became chief chemist of the Canada Carbide Company at Shawinigan Falls. When that company became the carbide division of Shawinigan Chemicals Limited a few months later, he took charge of plant research for the division. He moved to head office at Montreal in 1936, and in 1943 was transferred to the parent Shawinigan Water and Power Company to take charge of the industrial research department which was formed at that time.

In 1946 Dr. Jane returned to Shawinigan Chemicals Limited as a director and vice-president in charge of research and development. He is also a director and vice-president of Canadian Resins and Chemicals Limited, and a director of B.A.-Shawinigan Limited, Montreal; of Shawinigan Resins Corporation, Springfield, Mass.; and of Gelvatex Coatings Corporation, Pasadena, Cal.

President of the Chemical Institute of Canada in 1952-53, Dr. Jane is a fellow of that organization, and a member of the Society of Chemical Industry and of other professional bodies.

**A. B. Hunt,** M.E.I.C., general manager of the communications equipment division of Northern Electric Company Ltd., has been appointed director of the electronics division of the federal Department of Defence Production.

Mr. Hunt, who will be on loan to the Canadian government, has been actively associated with the communications field since graduating from the University of Toronto in 1928 with the degree of B.Sc. He also earned the medal given by the British Association for the Advancement of Science, the highest engineering award the university has to offer.

A native of London, Ont., he received his early education in that city and, after graduation from university, joined Northern Electric in 1928 as a manufacturing methods engineer in connec-

**A. B. Hunt, M.E.I.C.**

tion with theatre sound systems and vacuum tube production. In 1933 he was appointed special products manufacturing superintendent, and in 1935, took over the added duties of radio receiver engineer. Two years later he was made special products superintendent in charge of manufacturing, engineering and installation, and the following year he became manager of a separate division of the company established to handle expanding electronics business.

In 1948 he moved with the electronics division to Belleville, Ont., where he stayed until 1950 at which time he returned to Montreal to accept the position of assistant manager of Northern's telephone division. With the amalgamation of the telephone and electronics division into the communications equipment division three months later, Mr. Hunt became general manager of the communications equipment division.

Mr. Hunt was a winner of the R. A. Ross Medal in 1946 for his paper "The Future of Radio Communications in Canada". He is a former president of the Radio-Television Manufacturers Association (1952-53), and a member of the Corporation of Professional Engineers of Quebec, the Institute of Radio Engineers, Canadian Manufacturers Association, and the Canadian Industrial Preparedness Association. He also holds the rank of lieutenant-colonel in the reserve army having served as commanding officer of the 2nd Corps H.Q. Signals Regiment.

**C. A. Peachey, M.E.I.C.**

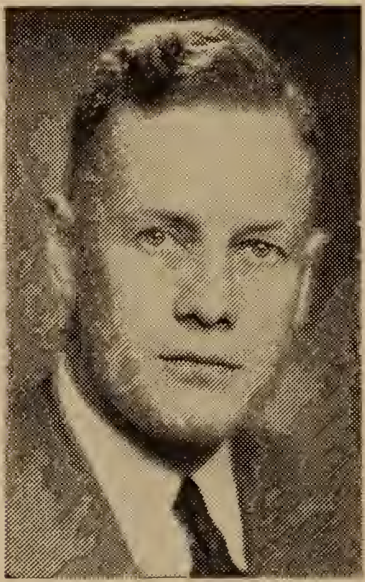
**C. A. Peachey,** M.E.I.C., has been appointed general manager of the communications equipment division of Northern Electric Co. Ltd., succeeding A. B. Hunt, M.E.I.C., who has been named director of the electronics division of the Department of Defence Production.

Mr. Peachey, who is a graduate of the University of Toronto, has been with Northern Electric since 1927, joining as an engineer in connection with vacuum tube production. In 1930 he was made a supervisor with the engineering group, and three years later was put in charge of shop methods. He assumed the title of technical engineer in 1936, shop superintendent in 1939, and works manager of the electronics division in 1942. In 1945 Mr. Peachey became works manager of the telephone division, and retained the title of works manager with the formation of the communications equipment division in 1950.

Mr. Peachey is a member of the Corporation of Professional Engineers of Quebec. He is president of the Canadian Management Council, Canadian representative on the International Committee of Scientific Management, a past chairman of the Institute of Administration and, in 1951, was metropolitan chairman of the Canadian Red Cross Society Campaign for funds.

**D. D. Panabaker,** M.E.I.C., **has been** elected director and secretary-treasurer of Otis Elevator Company Limited.

Mr. Panabaker graduated with a B.A.Sc. degree from the University of Toronto in 1933. He was for a time assistant professor at the university, and since then has had varied and extensive experience in many branches of the Otis organization including production, cost control, construction, sales and management.



D. D. Panabaker, M.E.I.C.

He recently relinquished the Toronto district managership to become administrative assistant to the president.

Mr. Panabaker will discharge his new responsibilities, covering all fiscal aspects of company business in Canada, from the company's head office in Hamilton, Ont.

**Franklin E. Holland,** M.E.I.C., **formerly** vice-president of the Murphy Paint Company, has been appointed vice-president of Canadian Pittsburgh Industries Ltd. The new organization is composed of three parts: The Murphy Paint division, Pennvernon division and Hobbs Glass division.

Mr. Holland is a civil engineering graduate of Cornell University, class of 1912.

**J. H. Wallis,** M.E.I.C., vice-president and manager of Dominion Hoist & Shovel Company Limited, has been named a vice-president of Dominion Engineering Works Limited and manager of the Power, Crane and Shovel Division, the new name given to the former company to conform with recent developments in the operations of Dominion Engineering Works Limited.

J. H. Wallis, M.E.I.C.

For the past 23 years the Dominion Hoist and Shovel Company has been a wholly-owned subsidiary of Dominion Engineering Works Limited and was comprised of five divisions: paper making machinery, hydraulic, industrial, diesel and manufacturing. Recently a plan was put into effect to streamline the operations and integrate still further the functions of Dominion Hoist and Shovel with those of the parent organization. The new name — Power, Crane and Shovel Division — confirms the accomplishment of this plan. However, the name change does not in any way affect personnel or sales and service policies.

**H. M. Black,** M.E.I.C., has been appointed a vice-president of Dominion Engineering Works Limited.

Mr. Black is manager of the company's industrial division and has been associated with Dominion Engineering Works Limited since 1940, having served as manager of the Longueuil Plant during the war and later as manager of the Ontario division.

H. M. Black, M.E.I.C.

Mr. Black graduated from McGill University in 1923 with the degree of B.Sc. in mechanical engineering and subsequently joined the staff of the Allis-Chalmers Company in Milwaukee. In 1927 he became associated with English Electric Company of Canada Limited and remained with that company for 13 years before joining Dominion Engineering Works Limited as manager of the Longueuil Ordnance Plant.

**I. S. Patterson,** M.E.I.C., has been appointed sales manager of Canadian Controllers Limited.

Until his recent appointment Mr. Patterson was sales manager of the English Electric Company of Canada.

Mr. Patterson is an electrical engineering graduate of the Nova Scotia Technical College, class of 1928. Upon graduation he joined the Canadian General Electric Company at Peterborough, Ont., and after a period of training there, in Toronto, and in Schenectady, N.Y., he was appointed a sales engineer in the company's Montreal office in 1930.

I. S. Patterson, M.E.I.C.

In 1942 Mr. Patterson, then industrial control specialist with the company in Montreal, was loaned to the Wartime Bureau of Technical Personnel at Ottawa. Four years later he accepted the position of sales manager of the Winnipeg district office of the English Electric Company of Canada Limited.

**F. W. Gray,** M.E.I.C., of Victoria, B.C., represented the Dominion Steel and Coal Corporation as an employer-delegate at the fifth meeting of the Coal Mines Committee of the International Labour Organization held at Dusseldorf from November 30 to December 12, 1953. His fellow employer-delegate was Norman Avard of Joggins Mines and the Canada Electric Company, of Amherst, N.S.

The hosts of the Coal Mines Committee were the German Government of the Rhenish-Westfalische Lande. Eighty-seven countries were represented by tripartite delegates—Chili and Mexico for the first time, and Germany and Japan for the first time since the cessation of hostilities. The committee has been invited to meet in Turkey in 1955.

**Harold M. Finlayson,** M.E.I.C., has been named manager of the hydraulic resources department of The Shawinigan Water and Power Company.

A student at Montreal High School when World War I broke out, Mr. Finlayson interrupted his education to join the forces, and served with the Royal Flying Corps at that time. He returned to Montreal and attended McGill University, graduating in civil engi-

H. M. Finlayson, M.E.I.C.

neering in 1923. Upon graduation he joined the St. Lawrence Deep Waterway Commission.

In 1928 he entered The Shawinigan Engineering Company Limited, and for two years led a hydrographic survey party in measuring the flow of the St. Maurice River at sites which have since been developed or planned for hydroelectric power generation. He was then transferred to the generation and transmission department of the parent power company to undertake studies of water-storage and potential power-sites on many rivers in Quebec and elsewhere.

Mr. Finlayson is vice-president of the international Eastern Snow Conference, and a member of the Arctic Institute of North America, the American Geophysical Union, the American Society of Photogrammetry, the American Institute of Electrical Engineers and the Corporation of Professional Engineers of the Province of Quebec.

**Matthew Balls,** M.E.I.C., a life member of the Engineering Institute of Canada, has recently retired as manager of the hydraulic resources department of The Shawinigan Water and Power Company, a post which he has occupied since 1941. He has also served as an assistant vice-president of the company since 1948.

Mr. Balls joined The Shawinigan Water and Power Company in 1928. He was previously engaged for 20 years in survey, construction and hydraulic engineering work in western Canada, the United States and Alaska. For several years he was a member of the National Research Council's sub-committee on ice and snow research.

**Raymond A. Frigon,** M.E.I.C., program officer in the division of planning and co-ordination of technical assistance administration of United Nations in New York, has recently returned to New York after accompanying, as technical secretary, a three-man mission to Central American republics. The purpose of the mission was to make recommendations on the establishment of a central technological research institute for the five countries of Costa Rica, Guatemala, Honduras, Nicaragua, and El Salvador. One of the members of the mission was Dr. W. H. Cook of the National Research Council.

Mr. Frigon spent about two months in Central America during which time necessary information on which to base recommendations was gathered for a report now being prepared.

**Fraser F. Fulton,** O.B.E., M.E.I.C., has been appointed general manager of the sales division of Northern Electric Company Limited.

Mr. Fulton was born in Saint John, N.B. He received his engineering certificate from Mount Allison University in 1926, and his B.Sc. degree in electrical engineering from McGill University in 1928.

He joined Northern Electric in Montreal in 1928, devoting the early part of his career to the field of electronics. At the outbreak of war in 1939 he joined the Army as a lieutenant in the Royal Canadian Corps of Signals and proceeded overseas the following year.

His military career included tours of duty in England, North Africa, Italy and North-West Europe, and culminated in his appointment as chief technical officer for the Canadian Army overseas with the rank of brigadier. In 1943 he was awarded an O.B.E. in the King's first Honours List for the Canadian Army.

F. F. Fulton, M.E.I.C.

Upon his return to Northern Electric in 1946, Mr. Fulton was appointed chief engineer of the company's electronics division and three years later, government contracts manager. In 1950 he became manager of Northern Electric's electronics plant at Belleville, Ont., and the following year was named assistant to the vice-president and managing director of the company.

In 1952 he was appointed general sales manager reporting to the head of the division, a position he held until his recent appointment.

**Group Captain E. C. Luke,** O.B.E., R.C.A.F., M.E.I.C., has assumed the position of director of construction in the North Atlantic Treaty Organization under a recent reorganization of the Allied Air Forces Central Europe Headquarters at Camp Guynemer, Fontainebleau, France.

The international cost of the airfield construction program for which Group Captain Luke's staff is the responsible NATO military agency will exceed $700,000,000.

Group Captain Luke's tour of duty in France has been extended another year.

NAME ........................................

POSITION ........................................

COMPANY ........................................

ADDRESS ........................................

**L. G. Grimble,** M.E.I.C., has resigned his position as chief bridge engineer for the Alberta Department of Highways to enter private practice.

Mr. Grimble entered the department in 1946 as assistant bridge engineer. Three years later he was appointed chief bridge engineer.

Mr. Grimble graduated from the University of Alberta in civil engineering in 1942 after which he joined the Royal Navy Fleet Air Arm and saw service in the Pacific. He received his M.Sc. degree from the University of Illinois in 1948.

**Leslie H. McManus,** M.E.I.C., has been appointed chief bridge engineer of the department of highways of Alberta. He previously occupied the position of assistant chief construction engineer.

Mr. McManus, a 1934 civil engineering graduate of the University of Alberta, joined the highways department in 1938 as assistant chief engineer. Since that time he has worked in the department's laboratory and has done considerable field work in connection with the testing of road-building materials.

**C. H. Allen,** M.E.I.C., former manager of industrial sales, has been named central stations sales manager of Canadian Westinghouse Company Limited in Hamilton, Ont.

Mr. Allen joined Westinghouse in 1924 and graduated from the company's four-year student training course.

He spent ten years in the service department during which time he was responsible for the erection of switchgear and control equipment at many large power projects such as Queenston, Chats Falls, Masson and Rapide Blanc. He was appointed industrial sales manager in January, 1952.

**Robert H. Stevenson,** M.E.I.C., formerly district sales manager in the Halifax apparatus sales office of Canadian Westinghouse Co. Ltd., has been named assistant to E. E. Orlando, M.E.I.C., general manager of the District Apparatus Division. He will make his headquarters in Hamilton.

R. H. Stevenson, M.E.I.C.

Mr. Stevenson completed the two-year Westinghouse graduate student training course in 1938 following graduation from the University of New Brunswick. He was in the Montreal apparatus office before wartime service, and from 1946 to 1951 was branch manager of the Westinghouse office in Moncton before moving to Halifax.

He is a member of the Association of Professional Engineers of Nova Scotia.

W. O. Sorby, M.E.I.C.

**Walter O. Sorby,** M.E.I.C., manager of central station sales in Montreal for Canadian Westinghouse Company Limited during the past two years, has been appointed district sales manager for the Halifax district.

Mr. Sorby joined the company in 1925 from the University of Toronto. For 12 years he was a sales engineer in Winnipeg and in 1946 was transferred to the Montreal office. He was appointed manager of central station sales in 1951.

During World War II Mr. Sorby served with the Royal Canadian Artillery.

He is a member of the Association of Professional Engineers of Quebec.

**Adam W. S. Smith,** M.E.I.C., consumer service engineer for the western region of the Hydro-Electric Power Commission of Ontario, has been appointed manager of the Toronto region.

Mr. Smith has been associated with the Hydro-Electric Power Commission of Ontario for 30 years having served first as rural superintendent in Brantford.

He was appointed assistant engineer-municipal in 1929, and consumer service engineer of the western region in 1947.

He is an electrical engineering graduate of McGill University, class of 1923.

**Stanley H. Frame,** M.E.I.C., retired hydraulic engineer with the water rights branch of the government of British Columbia, has been honoured with a life membership in the American Society of Civil Engineers.

Mr. Frame, who lives in Victoria, B.C., worked for the Canadian Pacific Railway on irrigation projects in the prairie provinces before coming to British Columbia in 1928. His work with the government required surveys in the Kitimat and Kemano regions where Aluminum Company of Canada Limited's development is now being installed. He retired in 1947 after completing 44 years of engineering service.

**MacKenzie McMurray,** M.E.I.C., divisional welding engineer with Dominion Bridge Company Limited, has been elected chairman of the Toronto Branch of the Engineering Institute.

M. McMurray, M.E.I.C.

Mr. McMurray received his B.A.Sc. degree in metallurgical engineering from the University of Toronto in 1939, and spent some time as a demonstrator in mining engineering at that university before joining Dominion Bridge Company Limited in 1940 as metallurgist and chief inspector at the Sorauren Avenue munitions division. He occupied that position until 1945 when plant operations were brought to a close. He

MAKING THE THINGS THAT MAKE THE THINGS YOU NEED

## gives you a real interest in CANADIAN VICKERS

No matter what your station in life, you are living a better life than your grandparents. Greater comforts and more leisure to enjoy them; better food with less preparation; better fabrics to keep you warm or cool; better care for the unfortunate sick . . . in every way, you live a better life.

This is due mostly to the wonderful machines which produce the good things of life at great speeds and in huge quantities thus lowering costs and raising the standard of living of all Canadians. And this fact gives you a real interest in Canadian Vickers Limited because Canadian Vickers designs and builds the machines that manufacturers use to make the things that help you live the good life.

Mining machinery that processes raw ore into the metal of which so many good things are made; Chemical Process Equipment needed to produce plastics or nylon and other fabulous fabrics; Industrial Boilers, Paper Machinery . . . machinery and equipment of every kind to make the good things that you enjoy. And more, Canadian Vickers builds ships and ships' engines that enrich Canada by carrying Canadian goods throughout the world. Yes, you live a better life because of the machinery, equipment and ships made by . . .

CANADIAN VICKERS LIMITED MONTREAL

IF INDUSTRY NEEDS IT . . . CANADIAN VICKERS BUILDS IT . . . BETTER then became engaged in design work both in Toronto and at the boiler division of the company's head office in Lachine, Que.

In 1948 Mr. McMurray was appointed as sales engineer in the boiler division of the company, and a year later, as welding engineer of the Ontario division.

**D. D. Morris,** M.E.I.C., manager of the research and development division of Consolidated Mining and Smelting Co. Ltd., has been appointed administrative assistant.

**D. D. Morris, M.E.I.C.**

Mr. Morris was born in Edmonton, Alta., and attended the University of Alberta where he received his chemical engineering degree in 1928.

He first joined the company's staff as an assayer in 1928. Ten years later he was transferred to research work in the chemicals and fertilizer department. In 1940 he was named assistant general foreman of the ammonia group.

Mr. Morris served as superintendent of the ammonia plant at the Alberta nitrogen department in Calgary from 1941 until 1943. In that year he was appointed general superintendent of the Calgary department, continuing in that position until coming to Trail as general superintendent of the research and development division in 1949. He became manager of this division in 1951.

He is a fellow of the Chemical Institute of Canada and a member of the Association of Professional Engineers of Alberta.

**A. D. Turnbull,** M.E.I.C., assistant manager of the metallurgical division, has been appointed manager of the research and development division of Consolidated Mining and Smelting Company of Canada Ltd.

Mr. Turnbull was born in St. Mary's, Ont. He received his B.A.Sc. degree in metallurgical engineering from the University of Toronto in 1925 and joined Consolidated Mining and Smelting Company of Canada Ltd. as a chemist at Trail that same year.

He served for a number of years in the refining department and in 1936 was appointed assistant superintendent of refineries. Four years later he became assistant chief metallurgist, and in 1948 was named assistant manager of the metallurgical division.

In 1949 Mr. Turnbull was elected member of the legislative assembly for the Rossland-Trail riding. The following

**A. D. Turnbull, M.E.I.C.**

year he was appointed minister of health and welfare for British Columbia. He rejoined Consolidated Mining and Smelting Company of Canada Ltd. in 1952 in his former capacity.

Mr. Turnbull is a member of the Canadian Institute of Mining and Metallurgy, the American Institute of Mining and Metallurgical Engineers and the Association of Professional Engineers of British Columbia.

He has served as reeve of Tadanac, was chairman of the Trail-Tadanac hospital board, and has been active in chamber of commerce work.

**T. H. Weldon, M.E.I.C.**

**T. H. Weldon,** M.E.I.C., superintendent of the zinc department of Consolidated Mining and Smelting Company of Canada Ltd. has been appointed general superintendent of the metallurgical division.

Mr. Weldon was born in Montreal. He graduated from McGill University in 1922 with a B.Sc. degree in mining. He was awarded the Douglas Fellowship and the following year received an M.Sc. degree in ore dressing and metallurgy. He won the British Association medal in mining in 1922.

His service with Consolidated Mining and Smelting Company of Canada Ltd. started as an assayer in 1923. He was appointed superintendent of the Tadanac concentrator in 1928. In 1929 he became superintendent of the leaching plant.

In 1940 Mr. Weldon was appointed assistant chief metallurgist and, three years later, was named assistant superintendent of the zinc department, subsequently becoming superintendent, the position he held until his present appointment, in 1948.

Mr. Weldon is a member of the Canadian Institute of Mining and Metallurgy, the American Institute of Mining and Metallurgical Engineers and the Association of Professional Engineers of British Columbia. He is a member of the Trail chamber of commerce and served on the Trail district school board for eight years, two of which as chairman.

**A. F. White,** M.E.I.C., has retired as chief engineer of the Toronto, Hamilton and Buffalo Railway Company having completed 41 years' service with the company.

Mr. White joined the engineering department of T. H. & B. Railway Company in January, 1913, after being employed by the Michigan Central Railroad at St. Thomas since 1906.

In 1938 he succeeded the late R. L. Latham as chief engineer.

Mr. White is a member of the Association of Professional Engineers of Ontario, and has served as a member of the engineering committee of the Railway Association of Canada.

**George F. West,** M.E.I.C., has been appointed deputy commissioner of works for the City of Halifax.

He was previously a divisional engineer in the Halifax works department.

Mr. West is a 1942 electrical engineering graduate of the Nova Scotia Technical College.

**Stanley Morton,** M.E.I.C., has formed a new company, Morton Engineering Limited, in Vancouver, B.C. The new firm of which Mr. Morton is president is a distributor in British Columbia for Browning Manufacturing Company of Maysville, Kentucky, makers of mechanical power transmission equipment. In addition the new company handles other parts and equipment allied to mechanical power transmission requirements.

Mr. Morton was formerly B.C. manager of Ronald Coventry Ltd. and R. & M. Bearings Canada Ltd. in Vancouver.

**J. W. McCarthy,** M.E.I.C., formerly a resident engineer with Angus, Butler & Associates Ltd. in Edmonton, Alta., has joined the staff of Stewart & Phillips (Alta.) Ltd. in Calgary.

Before joining the Edmonton firm, Mr. McCarthy was associated with the Steel Company of Canada in Hamilton, Ont.

He is a graduate of the University of Alberta in electrical engineering, class of 1950.

**G. W. C. Lake,** M.E.I.C., recently resigned his position as hydraulic engineer in the water rights branch of the B.C. Department of Lands in Victoria to accept the position of municipal engineer for the Township of Richmond in Vancouver, B.C.

In his present position Mr. Lake is responsible for the township's drainage and dyking system in addition to the municipal engineering department.

**Donald McN. Lowe,** M.E.I.C., formerly manager of civil engineering and maintenance at H.M.C. Dockyard in Hali-

FOR TOUGH SERVICE...

SPECIFY

# HOPKINSONS' VALVES FROM PEACOCK

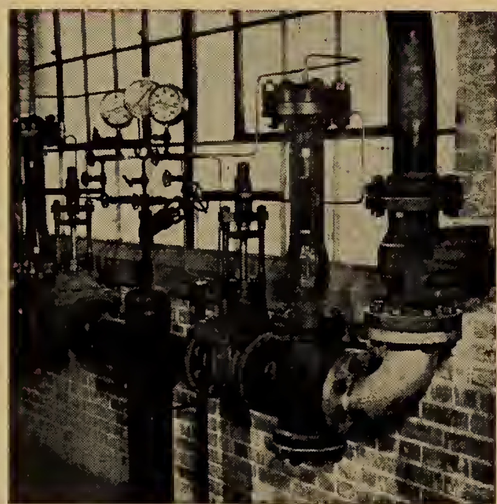
*. . . on services too tough for other valves, specify the finest . . . Hopkinsons' from Peacock Brothers.*

The robust construction of Hopkinsons' valves guarantees reliable performance on the toughest applications for maximum periods of service.

Standard material for all valves, discs and seats is Hopkinsons' own "Platnam"—the most satisfactory alloy so far developed for this purpose, having extreme resistance to erosion and corrosion.

Hopkinsons' valves are available in all pressure ranges up to 2,000 pounds per square inch steam and can be supplied for temperatures up to 1,000°F.

Hopkinsons' valves are unsurpassed for long life and hard-wearing toughness. They are made by the oldest and largest manufacturer of valves and boiler accessories in the world.



Three 6" Hopkinson steam stop valves in process steam lines in the boiler room of the Cornwall Division of Howard Smith Paper Mills Ltd.

## PEACOCK BROTHERS LIMITED

MONTREAL

SYDNEY · TORONTO · SUDBURY · WINNIPEG · CALGARY · VANCOUVER fax, N.S., is now office engineer for Defence Construction Ltd. at Camp Gagetown, Oromocto, N.B.

**Dennis P. Herring,** M.E.I.C., former chairman of the Sarnia Hydro-Electric Commission and president of District 8, Ontario Municipal Electric Association, has entered into private consulting engineering practice in Hamilton, Ont.

A graduate of the University of Saskatchewan in mechanical engineering, class of 1942, Mr. Herring is now associated with Edgar G. Brown, Hamilton consulting engineer.

Mr. Herring was associated with Polymer Corporation as senior project engineer for six years.

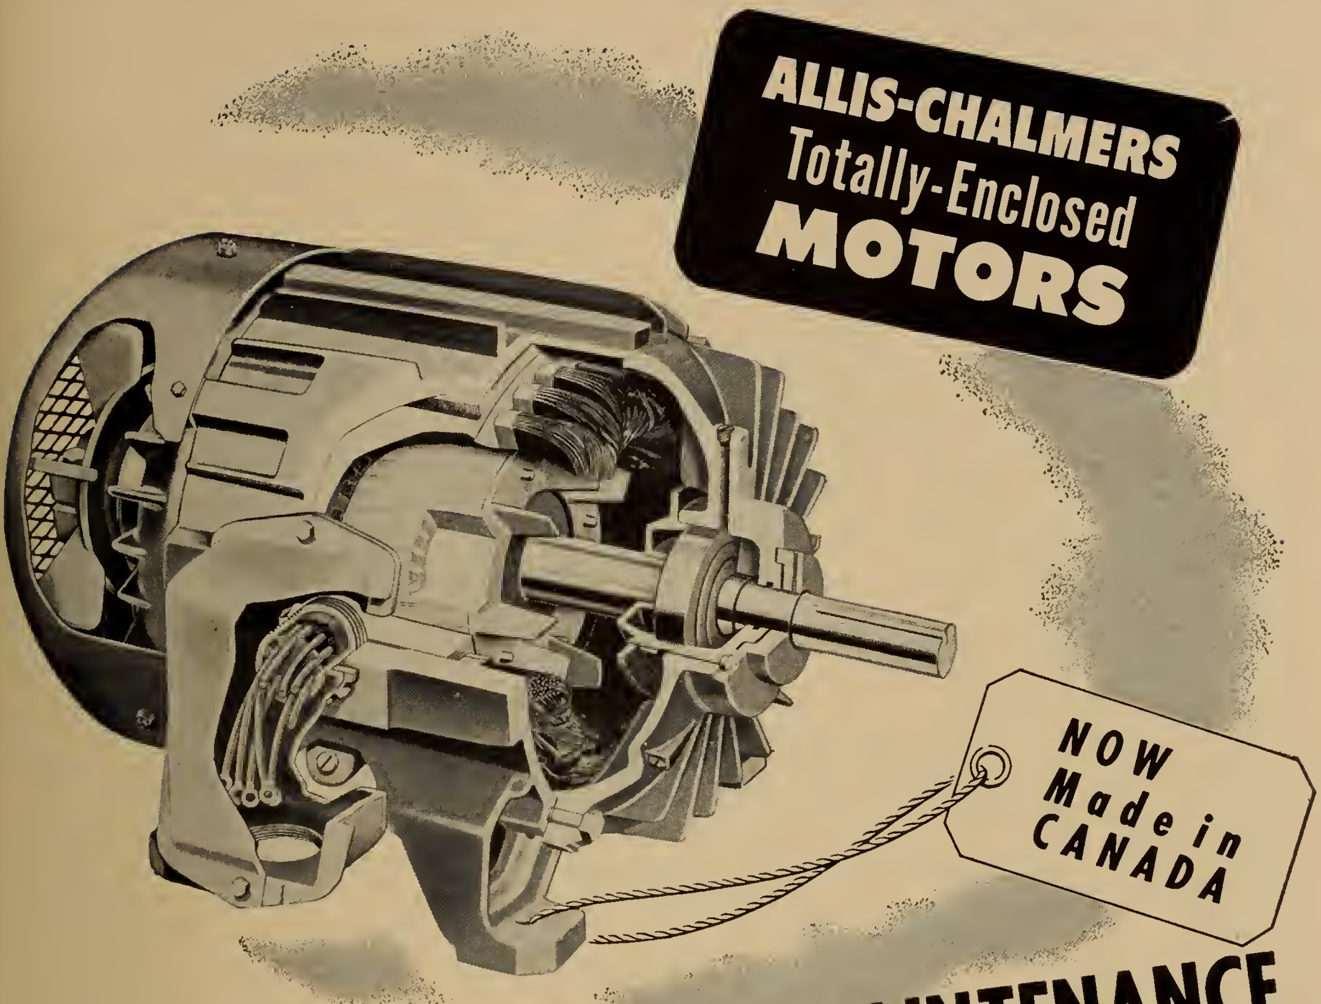
D. P. Herring, M.E.I.C.

**G. R. McMillin,** M.E.I.C., has been appointed superintendent of Imperoyal refinery at Halifax, N.S.

Mr. McMillin joined Imperial Oil Limited at Sarnia, Ont., in 1933 as a laboratory assistant after graduating in chemical engineering from the University of Toronto. He subsequently became senior chemist there, and in 1938 was loaned as assistant chemist to International Petroleum Company at Talara, Peru.

G. R. McMillin, M.E.I.C.

Upon his return to Canada he was appointed chief chemist at Imperoyal, and in 1944 was named assistant superintendent.



# GIVE YOU... 3 LOW MAINTENANCE Features

### *(1) Wide Open Air Flow*

No enclosed external air passages to clog. Easy to clean with cloth, brush, air hose or vacuum. Simply remove fan cover and whole radiating surface is exposed for inspection and cleaning.

### *(2) Cast Iron Construction*

Frame and conduit box of cast iron to resist corrosion. Fan is non-sparking, corrosion-resistant material. Well suited to outdoor operation.

### *(3) Pre-lubricated Bearings*

Ball bearings are double-shielded type, pre-lubricated at the factory. Periodic lubrication is not required under normal operating conditions, but provision is made for in-service lubrication if necessary.

CA-C now provides a complete range of Canadian-built motors for all types of service. Also a full line of manual and magnetic control equipment for all motors. For full details on A-C Totally-Enclosed and other types of motors contact your nearest CA-C Sales Office, or write for Bulletin CAC6057 to Canadian Allis-Chalmers Limited., St. Thomas, Ont.

# CANADIAN ALLIS-CHALMERS

A-C ALLIS-CHALMERS

54-CAE-2

Mr. McMillin was appointed group supervisor in the engineering and development division at Sarnia in 1948, and two years later was named assistant superintendent of the Sarnia refinery. Since October, 1952, he has occupied the position of superintendent.

Mr. McMillin served as chairman of the Sarnia Branch of the Engineering Institute last year.

**Roy Stenberg,** M.E.I.C., has been promoted by The Shawinigan Engineering Company Limited at Shawinigan Falls to the position of mechanical superintendent with general supervision over all construction yard operations.

Mr. Stenberg was born at Starbuck, Man. He served with the Royal Canadian Air Force as an aero-engine mechanic from 1939 until 1945, after which he entered the University of British Columbia where he received his mechanical engineering degree in 1951.

He was employed by The Shawinigan Engineering Company Limited during the summers of 1949 and 1950 at Trenche, and on June 1, 1951, he joined the permanent staff.

Since that time he has served at Trenche, Rapide Blanc, Clova and Shawinigan Falls.

**P. R. Woodfield,** M.E.I.C., is at present chief staff engineer of the gas turbine engineering department of A. V. Roe Canada Limited.

He was formerly head of the gas turbine mechanical testing laboratories of this company.

Mr. Woodfield graduated from the University of Manitoba as an electrical engineer in 1939.

**F. W. Barnhouse,** M.E.I.C., has been appointed general sales manager of Phillips Electrical Co. (1953) Ltd.

He was formerly manager of the wire and cable section of Canadian General Electric Co. Ltd., and has more than 18 years experience in this field.

Mr. Barnhouse is a 1934 graduate in electrical engineering of the University of Alberta.

**A. Sandilands,** M.E.I.C., has been appointed manager of the western region of Phillips Electric Company (1953) Ltd.

Mr. Sandilands, who has been specializing in the wire and cable field for the past 15 years, was formerly district manager in Winnipeg for Automatic Electric (Canada) Ltd.

He is a graduate in electrical engineering of the University of Manitoba, class of 1934.

**Michael Broadbent,** M.E.I.C., has been appointed equipment design engineer in charge of equipment design and modification for the Montreal and Brockville factories of Phillips Electrical Co. (1953) Ltd.

**F. H. Chapman,** M.E.I.C., has recently been appointed consulting metallurgist by Anglo American Corporation of South Africa Ltd. in Kitwe, Northern Rhodesia. He will be concerned principally with the metallurgical developments and problems of the Rhokana Corporation Ltd., Nchanga Consolidated Copper Mines Ltd., Rhodesia Copper Refineries Ltd., Rhodesia Broken Hill Development Co. Ltd., and Bancroft Mines Ltd.

Before his new appointment Mr. Chapman was assistant consulting metallurgist of the Anglo American Corporation which he joined in 1949 after resigning his position as executive secretary of the Association of Professional Engineers of British Columbia. He was previously associated with Consolidated Mining and Smelting Co. of Canada, Ltd. in Trail, B.C.

**Robert Black,** M.E.I.C., is general manager of the Davie Shipbuilding & Repairing Company at Lauzon, Que. Mr. Black joined this company in 1944 as a draughtsman.

He is a member of the Institute of Naval Architects in both Britain and the United States.

**J. J. Waller,** M.E.I.C., has been named chief material and process engineer responsible for administration of material and process engineering laboratory functions for Canadair Limited.

He is a graduate in chemical engineering of McGill University, class of 1936.

**R. D. Richmond,** M.E.I.C., has been appointed chief development engineer responsible for the administration of special weapons, experimental, aerodynamics and preliminary function for Canadair Limited.

He was previously aerodynamic section chief.

Mr. Richmond is a 1942 graduate in aero-engineering of the University of Manitoba.

**A. L. van den Brandeler,** M.E.I.C., of British Columbia International Engineering, has joined T. O. Lazarides, Lount and Partners, as chief engineer in charge of the Vancouver office.

Mr. van den Brandeler is a graduate of Delft and Grenoble universities.

**A. P. Benoit,** M.E.I.C., has been appointed commodity manager of hose products of Dominion Rubber Company Limited in Montreal.

A. P. Benoit, M.E.I.C.

Mr. Benoit, who has been associated with the Dominion Rubber Company for the past 18 years, served as sales engineer prior to his recent appointment.

He is a civil engineering graduate of McGill University, class of 1934.

**William Tkacs,** M.E.I.C., formerly cost reduction engineer with the International Register Company, is now chief industrial engineer of Omar Incorporated of Omaha, Nebraska. The firm is a multi-plant baking company and retail selling organization covering the states of Nebraska, Iowa, Wisconsin, Illinois, Indiana and Ohio.

Mr. Tkacs received his B.Sc. degree in mechanical engineering from Queen's University in 1941. After service with the Royal Canadian Navy, he entered the University of Michigan where he received his M.Sc. degree in mechanical engineering in 1947.

**J. D. Williams,** M.E.I.C., has been transferred by his company, Alberta Salt Co. Ltd., from Lindbergh, Alta., to La Salle, Ont. He is production and engineering supervisor.

Mr. Williams is a graduate chemical engineer of the University of Alberta, class of 1946.

**John J. Rowan,** M.E.I.C., has been transferred by Imperial Oil Limited from Sarnia, Ont., to Montreal.

Mr. Rowan joined the Imperial Oil Company in 1936. He received his civil engineering degree from Ecole Polytechnique in 1935, and his mechanical engineering degree from the Massachusetts Institute of Technology in 1936.

**A. I. Wotherspoon,** M.E.I.C., of the structural design department of Dominion Bridge Co. Ltd., Lachine, Que., has been transferred to The Sault Structural Steel Co. Ltd. in Sault Ste. Marie, Ont.

He is a 1949 graduate in civil engineering of Glasgow University.

**Alex Glassman,** M.E.I.C., has resigned his position as technical superintendent at the St. Lawrence Corporation in Three Rivers, Que., and is now on the staff of R. R. Donnelly and Sons Company, Chicago, Ill.

He graduated in chemical engineering from McGill University in 1946.

**R. F. Hawkins,** M.E.I.C., formerly with the Montreal Road Laboratories of the National Research Council in Ottawa, Ont., has been appointed chief engineer with Guardian Assurance Co. Ltd. in Montreal, Que.

Prior to joining the National Research Council staff, Mr. Hawkins was marine engineer with Imperial Oil Limited.

He is a mechanical engineering graduate of the College of Technology in Belfast.

**S. G. Jones,** M.E.I.C., is now supervisor of Industrial and Commercial Sales for the Province of British Columbia.

He was previously industrial engineer with Imperial Oil Limited in Toronto.

Mr. Jones is a 1941 chemical engineerig graduate of Queen's University.

**R. T. Bogle,** M.E.I.C., is manager of the manufacturing services department of Canadian General Electric Co. Ltd. in Toronto.

He was formerly works manager in this same department.

Mr. Bogle is a graduate in mechanical engineering of the University of British Columbia, class of 1940.

**Ernest J. Ollerton,** M.E.I.C., formerly in the employ of the Lee Wilson Contracting Company of Cleveland, Ohio, is now senior methods engineer with

the general products planning group of the Westinghouse Air Brake Company in Swissvale, Penn.

Before joining the Lee Wilson Contracting Company, Mr. Ollerton served as mechanical engineer in charge of design in the engineering department of Dominion Foundries and Steel Limited in Toronto, Ont.

## Errata

**Marian Pona,** M.E.I.C., was referred to in error as "Miss Pona" in the January issue of the *Journal.*

Mr. Pona, who is a 1951 civil engineering graduate of the Polish University College, is a designing engineer with the Hydro-Electric Power Commission of Ontario in Toronto.

Information presented in the February "Personals" about **William B. Scott,** Jr.E.I.C., of Consolidated Paper Corporation Ltd., Grand'Mere, Que., was not completely correct. This resulted from confusion of his name with that of Walter B. Scott, M.E.I.C., engineer on transmission line construction, Shawinigan Engineering Co. Ltd., Shawinigan Falls, Que.

William B. Scott, before joining Consolidated Paper Corporation Ltd. in Grand'Mere, was assistant to the mechanical superintendent of the Canada Paper Company in Windsor Mills, Que.

He is a 1951 mechanical engineering graduate of the Nova Scotia Technical College.

**John Douglas Barber,** Jr.E.I.C., is an instructor on the staff of the civil engineering department of the University of Toronto. At the same time he is undertaking post-graduate study at the university.

Mr. Barber was formerly a structural draughtsman with Stone & Webster Engineering Corporation in Boston, Mass.

He received his B.A.Sc. degree from the University of Toronto in 1951.

**I. R. Hudson,** Jr.E.I.C., of Sandwell and Company Limited in Vancouver, B.C., has been transferred to Auckland, New Zealand, for a period of two years during which time he will be employed on the construction of a pulp mill, newsprint mill and sawmill for Tasman Pulp and Paper Company Limited.

Mr. Hudson is a graduate mechanical engineer of the University of British Columbia, class of 1951.

**W. D. Goodings,** Jr.E.I.C., has joined the staff of Sidney Wood, provincial land surveyor in Hamilton, Ont.

He was formerly associated with L. P. Stidwell in Cornwall, Ont.

Mr. Goodings is a 1951 civil engineering graduate of Queen's University.

**Gordon W. Oliver,** Jr.E.I.C., is presently employed as industrial salesman with British American Oil Co. Ltd. in Edmonton, Alta.

He was previously associated with the Department of Natural Resources in Regina, Sask.

Mr. Oliver is a graduate in mechanical engineering of the University of Saskatchewan, class of 1949.

**W. Nesplak,** Jr.E.I.C., is at present employed as resident engineer for Defence Construction Limited at the new Army development at the Fort Osborne Barracks in Winnipeg, Man.

He was formerly assistant resident engineer with Central Mortgage and Housing Corporation, Winnipeg.

Mr. Nesplak graduated in civil engineering from the University of Manitoba, class of 1950.

**Robert J. Hollingshead,** Jr.E.I.C., has been appointed assistant chief construction engineer for the Alberta Department of Highways.

Previously materials engineer, Mr. Hollingshead has been with the department since 1946. He has made a specialty of soil mechanics.

Mr. Hollingshead received his B.Sc. degree in civil engineering from the University of Alberta in 1946 and his M.Sc. degree from the same university in 1948.

**J. C. Platt,** Jr.E.I.C., is assistant engineer in the structural research department of the Hydro-Electric Power Commission of Ontario.

Mr. Platt is a graduate in mechanical engineering of the University of Toronto, class of 1952.

**James Radford,** Jr.E.I.C., is now employed by the Polymer Corporation in Sarnia, Ont.

He was formerly civil engineer for Montreal Engineering Co., Montreal.

Mr. Radford graduated in 1952 in civil engineering from the University of Belfast.

**G. Campagnola,** JR.E.I.C., is an electrical engineer in the plant engineering department of the tire factory of Dominion Rubber Co. Ltd. in Kitchener, Ont.

He was previously connected with Walker & Associates Ltd. in Hamilton, Ont.

Mr. Campagnola graduated in electrical engineering from Queen's University in 1950.

**T. J. Hall,** JR.E.I.C., has recently joined the staff of the Seaboard Oil Company of Delaware in Calgary, Alta.

He was previously associated with Husky Oil & Refining Ltd., Sask., as production engineer.

Mr. Hall graduated in chemical engineering from the University of Alberta in 1950.

**S. B. Howlett,** JR.E.I.C., has been transferred as district manager of the B.C. Power Commission from Merrit, B.C. to Sechelt, B.C.

Mr. Howlett joined the B.C. Power Commission after his graduation in electrical engineering from the University of British Columbia in 1946.

**Samuel Rabin,** JR.E.I.C., has joined the staff of Mofax Electric Limited in Montreal, Quebec.

He was previously associated with Stadler Hurter & Co. in Montreal.

Mr. Rabin graduated in electrical engineering from McGill University in 1946.

**C. S. White,** JR.E.I.C., formerly with the industrial products division of Canadian General Electric Company Limited, has been transferred to the Company's apparatus division at the Montreal district office.

A 1950 mechanical engineering graduate of the University of British Columbia, Mr. White entered the Canadian General Electric Company as an engineer in training in Toronto. Since 1952 he has been associated as sales engineer with the company's aircraft equipment division in both Ottawa and Montreal.

**E. Edward MacPhail,** JR.E.I.C., is in the divisional engineers' office of Canadian National Railways in Belleville, Ont.

He was formerly associated with Demerara Bauxite Co. Ltd., British Guiana.

Mr. MacPhail graduated in civil engineering from Queen's University in 1949.

**Hugh Coleopy,** JR.E.I.C., formerly associated with Vancouver Iron Works Ltd., Vancouver, has returned to Vivian Diesels and Munitions, Ltd. in Vancouver, as assistant engineer.

Mr. Coleopy is a graduate mechanical engineer of the University of British Columbia, class of 1951.

**Lieut. H. T. McCall,** R.C.E.M.E., JR.E.I.C., has been transferred by the Department of National Defence from No. 2 Works Company, R.C.E., in Toronto, to No. 17 Works Company, R.C.E. at Whitehorse, Y.T.

Lieut. McColl graduated from the University of Manitoba in civil engineering in 1949.

**Jack C. Morris,** JR.E.I.C, is now field engineer with Carter Construction Co. Ltd. in Toronto, Ont.

Prior to accepting this appointment he was briefly associated with Canadian Copco Company Limited in Toronto.

He was formerly on the sales staff of Sandrik Canadian Limited and Bailey Meter Company Limited.

Mr. Morris is a graduate engineer of the University of Toronto, class of 1951.

**M. A. Nelson,** JR.E.I.C., is presently employed as an engineer in the mechanical department of Stock, Ramsay & Associates, Regina architects and consulting engineers.

Mr. Nelson was previously associated with the Saskatchewan Department of Highways, and with the Swift Current Collegiate as an instructor.

Mr. Nelson is a graduate in mechanical engineering of the University of Saskatchewan, class of 1947.

**H. E. Cole,** JR.E.I.C., is project engineer for Defence Construction (1951) Ltd. at Wolsley Barracks, London, Ont.

He was previously on the staff of Central Mortgage and Housing Corporation in Centralia, Ont., and was plan examiner in the building department of the City of Toronto.

Mr. Cole is a 1948 civil engineering graduate of the University of Toronto.

**Fred I. Morton,** JR.E.I.C., until recently associated with the Shawinigan Water and Power Company, has joined the special projects branch of the Department of Transport.

Mr. Morton is an engineering physics graduate of the University of Saskatchewan, class of 1949.

**James H. Toms,** Jr.E.I.C., has recently been transferred from Trail, B.C. to Toronto, Ont., by Stone & Webster Canada Limited.

Mr. Toms is a graduate civil engineer of the University of British Columbia, class of 1951.

**R. Waterfall,** Jr.E.I.C., is designer draughtsman in the engineering department of Mathews Conveyer Company Limited in Port Hope, Ont.

He was formerly associated with Dominion Hoist & Shovel Co. Ltd. in Lachine, Que.

**S. Okumura,** Jr.E.I.C., is presently employed as superintendent of the Perth Laundry and Cleaners in Winnipeg, Man.

Mr. Okumura graduated in mechanical engineering from the University of Manitoba, class of 1949.

**Jacques Perreault,** Jr.E.I.C., is now construction supervisor at the Beloeil works of Canadian Industries Limited in McMasterville, Que.

Mr. Perreault received his engineering degree from Ecole Polytechnique in 1952.

**Michael Staryk,** Jr.E.I.C., is presently employed in the special products department of the Electronics Division of Canadian Westinghouse Company Limited in Hamilton, Ont.

He was previously associated with the City of Winnipeg Hydro-Electric System.

Mr. Staryk is a 1950 graduate in electrical engineering of the University of Manitoba.

**Zane Bakun,** Jr.E.I.C., is presently employed as a community planning engineer in the Department of Municipal Affairs of the Saskatchewan government.

Zane Bakun, Jr.E.I.C.

A 1952 civil engineering graduate of the University of Manitoba, Mr. Bakun was one of the nine students in Canada in 1952 to be awarded the $1,200 fellowship in community planning by Central Mortgage and Housing Corporation. He received his master's degree in December, 1953. Mr. Bakun's thesis for his degree was entitled "The Design of an Area for Light Industry in the City of Winnipeg (with emphasis on the survey of utility facilities available)".

**J. Ghanime,** Jr.E.I.C., has completed the Canadian General Electric Company training course and is now employed as meter engineer in the Company's Quebec works.

Mr. Ghanime is a graduate of Ecole Polytechnique in mechanical and electrical engineering, class of 1952.

**J. N. Robertson,** Jr.E.I.C., is presently employed as a mechanical engineer in the maintenance and power branch of Atomic Energy of Canada Limited in Chalk River, Ont.

He was previously associated with Canadian Industries Limited in McMasterville.

Mr. Robertson is a mechanical engineering graduate of Queen's University, class of 1950.

**David H. Kennedy,** Jr.E.I.C., is now in the structural design department of Dominion Bridge Company Limited in Lachine, Que.

Mr. Kennedy is a civil engineering graduate of McGill University, class of 1952.

**T. B. J. Kruselnicki,** Jr.E.I.C., is at present on the staff of North Star Oil

Limited as refinery engineer in St. Boniface, Man.

He was previously connected with the Algoma Steel Company in Sault Ste. Marie, Ont.

Mr. Kruselnicki is a mechanical engineering graduate of the University of Manitoba, class of 1950.

**Samuel S. Lazier,** jr.e.i.c., is now in Kingston, Ont., following the move of the hydraulic laboratory of the Pulp and Paper Research Institute of Canada from the National Research Council in Ottawa to Kingston where facilities at Queen's University have been made available.

Mr. Lazier is continuing in Kingston a project begun in Ottawa and entitled "The Economical Construction of Safe Pulpwood Holding Grounds". This project is under the supervision of Professor R. J. Kennedy, m.e.i.c., of Queen's University.

Mr. Lazier received his B.A.Sc. degree in mechanical engineering from the University of Toronto in 1949, and his M.A.Sc. degree in 1951.

**R. Matte,** jr.e.i.c., is now purchasing agent with Lynn, MacLeod Engineering Supplies in Montreal, Que.

He was formerly director of the rates department of A. Belanger Industrial Engineering Ltd., Montmagny, Que.

Mr. Matte is a 1950 civil engineering graduate of Ecole Polytechnique.

**Marc St. Jacques,** jr.e.i.c., has been recently appointed superintendent of operations at the Thor Mills in Granby, Que.

Mr. St. Jacques was previously industrial engineer.

He is a mechanical engineering graduate of Ecole Polytechnique, class of 1952.

**J. Ross Moore,** jr.e.i.c., is now located at the new Guelph works of Canadian General Electric Company Limited. In his present position he is supervisor of works facilities and is in charge of maintenance and related services.

He is a graduate in mechanical engineering from the University of Toronto, class of 1946.

**D. R. Snider,** jr.e.i.c., formerly with the Steel Company of Canada in Hamilton, Ont., has joined Dominion Electrohome Industries Ltd. in Kitchener, Ont.

Mr. Snider graduated in mechanical engineering from the University of Toronto, class of 1950.

**Walter Bloch,** jr.e.i.c., has been recently appointed chief engineer of El-Met-Parts, Limited in Dundas, Ont.

He is a 1952 electrical engineering graduate of the University of Toronto.

**W. H. Nord,** jr.e.i.c., has been transferred as assistant equipment superintendent of Canada Wire & Cable Company, Limited to Toronto, Ont., from Montreal, Que.

Mr. Nord graduated with a B.A.Sc. degree in mechanical engineering in 1948.

**E. C. Walton,** jr.e.i.c., has resigned his position with Stone & Webster Engineering Corporation, and has joined Timber Structures of Canada Limited in Peterborough, Ont.

He is a graduate in civil engineering of the University of London, class of 1949.

**G. A. Eby,** jr.e.i.c., is chief engineer in the fuel cell division of the Dominion Rubber Company in Kitchener, Ont.

He was formerly associated with the E. B. Magee Ltd., in Port Colborne, Ont.

Mr. Eby is a graduate in chemical engineering of McGill University, class of 1949.

**Walter J. Francl,** jr.e.i.c., is now inspecting engineer for Associated Engineering Services Ltd. in Vegreville, Alta.

He was formerly field engineer with Engineering & Construction, Edmonton, Alberta.

He received his diploma in agricultural engineering at the University of Hochschule, Vienna, in 1948.

**Major W. A. McDill,** r.c.e., jr.e.i.c., Canadian engineer liaison officer at the War Office at Whitehall, London, has been recently promoted from the rank of captain.

Major McDill received his B.A.Sc. degree in mechanical engineering from the University of British Columbia in 1948, and his B.E. and M.E. degrees from Colorado A & M College in 1938 and 1948, respectively.

**J. M. Matthew,** jr.e.i.c., is engineer and manager of Schumacher-MacKenzie (Alberta) Ltd. in Edmonton, Alta.

Mr. Matthew is a 1951 electrical engineering graduate of McGill University.

**D. I. Ourom,** jr.e.i.c., is now a metallurgist with Aluminum Company of

Canada Ltd. in Kingston, Ont. He has been associated for the past two years with the Demerara Bauxite Company at MacKenzie, British Guiana.

Mr. Ourom graduated in civil engineering from the University of Saskatchewan in 1949.

**Harry E. Thiessen,** S.E.I.C., is now a transitman in the engineers' office of the Canadian Pacific Railway Vancouver Division.

Mr. Thiessen is a 1953 graduate in civil engineering of the University of British Columbia.

**Albert R. Towell,** S.E.I.C., has joined the staff of the Co-Op Refinery in Regina, Sask.

Mr. Towell is a graduate in mechanical engineering of the University of Saskatchewan, class of 1953.

## Visitors to Headquarters

**Philip H. Morgan,** M.E.I.C., Shooters Hill, Jamaica, B.W.I., February 11, 1954.

**W. A. Herron,** M.E.I.C., Montreal, Quebec, February 11, 1954.

**P. C. Kirkpatrick,** M.E.I.C., and **Mrs. P. C. Kirkpatrick,** Ste. Anne de Bellevue, Quebec, February 11, 1954.

**M. J. Green,** Montreal, Quebec, February 12, 1954.

**R. A. Watt,** Montreal, Quebec, February 12, 1954.

**Mrs. R. J. Simpson,** Valois, Quebec, February 12, 1954.

**G. Vogel,** Lachine, Quebec, February 12, 1954.

**Mr. and Mrs. R. Simms,** Montreal, Quebec, February 12, 1954.

**H. Boardman,** M.E.I.C., Altringham, Cheshire, England, February 16, 1954.

**A. C. Northover,** M.E.I.C., Corner Brook, Newfoundland, February 18, 1954.

**A. B. Whelan,** A.M.I.C.E., Bedford, England, March 10, 1954.

**G. G. Meyerhof,** M.E.I.C., Montreal, Quebec, March 10, 1954.

**O. N. Mann,** M.E.I.C., Halifax, Nova Scotia, March 3, 1954.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**John Taylor Farmer,** M.E.I.C., who had been associated with Montreal Engineering Company Limited for the past 25 years, died suddenly at Ste. Anne de Bellevue on February 2, 1954.

Mr. Farmer was born in Liverpool, England, on December 14, 1874. He received his B.Sc. and M.Sc. degrees from the University of Liverpool in 1894, standing first in his class. In 1897 he was awarded a "1851 Exhibition Scholarship" for study abroad. He came to Montreal for research work in hydraulics at McGill University. His work was of such merit that the scholarship was renewed for a second year.

Mr. Farmer joined the Canada Patent Office as an assistant examiner in 1897. A year later he became associated with the Crosby Steam Gage & Valve Company in Boston, Massachusetts, and a year afterwards with the Ball & Wood Company in Elizabeth, New Jersey, where he was employed for a brief time before entering the Watts-Campbell Company in Newark, New Jersey, in 1901.

He was for three years assistant to the mechanical engineer and sales engineer of the Green Fuel Economizer Company in New York, and from 1905 until 1925 he served as a consultant in mechanical and hydraulic engineering in Montreal. At the same time he was district manager of Green's Economizer Limited of Canada, and represented Glenfield & Kennedy Limited of Kilmarnock, Scotland; Drysdale & Company Limited of Glasgow, Scotland; and the Uehling Instrument Company and Combustion Engineering Corporation, both of New York.

In 1925 he was appointed chief engineer of the newly-formed Combustion Engineering Corporation, Ltd. of Toronto.

Mr. Farmer joined Montreal Engineering Company Limited in 1928 as an expert in steam generating plants, auxiliary to hydro-electric developments. During his 25 years with this company he was in charge of hydraulic projects across Canada as well as in Mexico and Venezuela. During the past year he had been working on a project in Medicine Hat, Alberta.

For more than 30 years Mr. Farmer was a member of the Protestant School Board of Ste. Anne de Bellevue. Upon the formation of the Macdonald Protestant Central School Board four years ago, he represented Ste. Anne de Bellevue on that board also.

Mr. Farmer was a member of the St. James Literary Society of Montreal. It was while returning from a meeting of this society that he met his death.

Mr. Farmer joined the Engineering Institute of Canada as a Student in 1897, transferring to Associate Member in 1905 and to Member in 1919. Always keenly interested in Institute activities, Mr. Farmer served as chairman of the Montreal Branch in 1923. On January 1, 1947, he attained Life Membership in the Institute.

**Albert Ernest Sharpe,** M.E.I.C., former assistant engineer on construction with the Canadian Pacific Railway, died in Vancouver, British Columbia, on February 20, 1954.

Mr. Sharpe was born in Palmerston, Ontario, in January 28, 1877. After receiving his general education in public schools and through private instruction, he began his career with the Canadian Pacific Railway in 1897 as rodman and timekeeper. In the years following 1901 he served as transitman, reconnaissance engineer and resident engineer until 1918 when he was appointed assistant engineer in charge of construction work throughout the prairie provinces and British Columbia. After 46 years with the company, Mr. Sharpe retired in 1943.

A. E. Sharpe, M.E.I.C.

He joined the Engineering Institute of Canada as an Associate Member in 1909, transferring to Member in 1922. In 1941 he was granted Life Membership in the Institute.

**Albert Holland,** M.E.I.C., former civilian garrison engineer with the Royal Engineers, died at Old Cleve, Watchet, Somerset, England, on January 24, 1954.

Mr. Holland was born at Nerguis, North Wales, on September 23, 1879. He received his formal education at Chester College and the Technical Engineering School, at the same time serving in the county district surveyor's office and with Thomas Foster, a civil engineer in Hoylake, Cheshire, for four years.

In 1900 Mr. Holland became assistant to the municipal engineer and surveyor at Hoylake West Kirby, and in 1903, a civil engineer with Watrous Limited, contractors on the construction of docks and a breakwater on the west coast of Ireland. In 1905 he served as resident engineer to the Rt. Hon. Lord Stanley of Alderley on the construction of a sea wall at Hoylake.

Mr. Holland came to Canada in 1906 and became assistant superintendent of the Canadian White Company on the construction of the power house for the Montreal Street Railway. Within five months he was appointed superintendent on the construction of a cement plant at Longue Pointe, Quebec. In 1908 Mr. Holland was appointed civil engineer with Vulcan Portland Cement Co. Ltd. in Montreal. The following year he joined the engineering department of Canada Cement Co. Ltd. in Montreal and continued his association with this firm until his enlistment in the Army as a lieutenant in 1916. After service in France with the Royal Canadian Engineers, he was discharged in 1919.

Upon his return to England he was appointed executive engineer in the Public Works Department at Accra, West Africa, and subsequently at Puerto Cruz in the Canary Islands.

In 1937 Mr. Holland was named colonial engineer and surveyor general in the Public Works Department at Roseau, Dominica, B.W.I. At the outbreak of World War II he was appointed civilian garrison engineer and personal assistant to the deputy commander of the Royal Engineers at Dover, England. In 1946 he was transferred as civilian garrison engineer for the Royal Engineers to Liddymore Camp, Watchet, Somerset, England, and subsequently retired from active work.

Mr. Holland joined the Engineering Institute of Canada as a Student in 1908, transferring to Associate Member in 1915, and to Member in 1940. On January 1, 1950, he was granted Life Membership in the Institute.

**John Leslie Rannie,** M.E.I.C., former dominion geodesist and international boundary commissioner, died suddenly in Ottawa on February 8, 1954.

**J. L. Rannie, M.E.I.C.**

Mr. Rannie was born in Newmarket, Ontario, on May 27, 1886. He received his B.A.Sc. degree in civil engineering from the University of Toronto in 1909, and held certificates of Dominion Land Surveyor, Quebec Land Surveyor, and Dominion Topographical Surveyor. The holding of the last certificate required his passing one of the most difficult surveying examinations in the British Commonwealth.

During his summer holidays as a university student, Mr. Rannie was employed as a chainman and rodman on Canadian Northern Railway construction and location work; as an engineer's assistant on Canadian Northern Railway bridge construction over the South Saskatchewan River; and as a leveller on a Canadian Northern Railway location party.

From May, 1907, until January, 1913, Mr. Rannie served as an observer on geodetic survey parties and international boundary survey parties. He was next placed in charge of survey work on Lake of the Woods for the International Joint Commission, and in 1915 he was made responsible for survey parties on the New Brunswick-Maine boundary for the International Boundary Commission. Two years later he was appointed supervisor of triangulation for the Geodetic Survey of Canada.

In 1943, Mr. Rannie was appointed assistant dominion geodesist. Four years later he was named dominion geodesist and international boundary commissioner and continued as such until his retirement in May, 1951.

Mr. Rannie was internationally known for his interest in instrument design, and his ideas contributed in a marked degree to increased precision in present-day theodolites.

He attended as Canadian delegate the Oslo (1948) and Brussels (1951) conferences of the International Union of Geodesy and Geophysics. He was also author of numerous technical papers.

Mr. Rannie's grandfather, John Thomas Stokes, a prominent architect, engineer and surveyor in York and the neighbouring counties of Ontario, was one of the first members of the (then) Canadian Society of Civil Engineers, being elected on January 20, 1887, on the same date as such well known figures as Dean John Galbraith, Sir Casimir Gzowski, W. T. Jennings and Professor C. H. McLeod.

Like his grandfather, Mr. Rannie took a very active interest in technical organizations of particular interest to engineers and surveyors. He was a past-president of the Canadian Institute of Surveyors and a past vice-president of the Professional Institute of the Civil Service of Canada. He also served as chairman of the Ottawa Branch of the Engineering Institute of Canada in 1924, and as councillor representing the Ottawa Branch in 1926-27.

He joined the Engineering Institute of Canada as an Associate Member in 1918, transferring to Member in 1922. On January 1, 1953, he attained Life Membership in the Institute.

**Leroy Francis Harza,** M.E.I.C., president of Harza Engineering Company Limited of Chicago, Illinois, died at his home in Highland Park, Illinois, on November 22, 1953.

Mr. Harza was born in Brookings County, South Dakota on February 6, 1882. He received his B.S. degree in mechanical engineering from the South Dakota State College in 1901, and his B.S. degree in civil engineering from the University of Wisconsin in 1906. Two years later he obtained his C.E. from the latter university.

Mr. Harza was employed in various field engineering, surveying, construction and draughting jobs from 1901 until 1912 at which time he opened his private consulting practice in Chicago. His company has been concerned with investigation, design, and construction of dams, hydraulic works, hydro-electric projects and bridges in the United States, Canada, Uruguay, Argentina, India, the Philippines, El Salvador, Nicaragua, Iraq, Egypt, Greece, Turkey and France.

Mr. Harza was a member of the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers, and the Western Society of Engineers. He was also a member of the Water Resources Board. In 1930 he served as United States delegate at the World Power Conference in Berlin, and in 1951 he was United States representative at the Fourth Conference on Large Dams in Bombay.

In 1949 he received a citation from the University of Wisconsin, and the following year was awarded the degree of doctor of engineering from the South Dakota State College. He was the recipient of the John Cross Medal awarded by the American Society of Civil Engineers in 1950.

Mr. Harza joined the Engineering Institute of Canada as a Member in 1928.

**J. Alide Trahan,** M.E.I.C., former consulting engineer with Mag'oire Cauchon Limited of Quebec City, died on June 6, 1953.

Mr. Trahan was born at Yamachiche, Quebec, on July 6, 1901. He received his general education at the Three Rivers Seminary, and in 1923 entered Ecole Polytechnique in Montreal, graduating with a B.A.Sc. degree in 1928.

Upon graduation Mr. Trahan joined the Truscon Steel Company where he remained until 1931 when he entered the bridge and tunnel department of the City of Montreal.

In 1934 he joined the Department of Roads of the Province of Quebec and was placed in charge of survey, design and road construction for the eastern part of the province. He continued in this position until 1942 at which time he entered the general construction firm of A. Deslauriers & Sons in Quebec City. During his association with this firm he was in charge of the construction at Princess Louise Basin, Quebec.

Mr. Trahan joined the engineering and contracting firm of Magloire Cauchon Limited as consutling engineer in 1944.

He was a member of the Corporation of Professional Engineers of Quebec.

Mr. Trahan joined the Engineering Institute of Canada as a Member in 1945.

**Joseph Edward McPherson,** M.E.I.C., district engineer for the Department of Highways of the Province of Alberta in Grande Prairie, died in September, 1953.

Mr. McPherson was born in Cochrane, Alberta, in 1894. He received his general education at Western Canada College in Calgary, Alberta. He joined the Department of Public Works of Alberta in 1926, serving for his first three years as rodman, gravel checker, instrumentman, and inspector on gravel research. In 1929 he was appointed junior engineer and served in this capacity until 1941 when he joined the Royal Canadian Engineers with the rank of lieutenant. The following year he was promoted to the rank of major.

After his discharge in 1947, he returned as resident engineer to the Department of Public Works of Alberta and was placed in charge of asphalt and gravel surfacing and drainage work at Edmonton and Newbrook. Three years later he was appointed district engineer at Grande Prairie, the position he held at the time of his death.

Mr. McPherson was a member of the American Association of Engineers, the Military Engineers Association of Canada, and the Association of Professional Engineers of Alberta.

He joined the Engineering Institute of Canada as a Member in 1948.

# Employment Service

**THIS SERVICE is operated for the benefit of members of The Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.**

**NOTICES appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.**

**REPLIES to advertisements should be addressed to File No. 000, Employment Service, The Engineering Institute of Canada, 2050 Mansfield Street.**

**INTERVIEWS with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged by appointment.**

## SITUATIONS VACANT

### CHEMICAL

KEY POSITIONS in a new expanding, research lab. are open to competent scientists. Must have sound theoretical background, and at least five years practical experience in (a) natural and synthetic fibers—paper (b) high polymers—adhesives. Applicant should have a M.Sc. or Ph.D. degree in chemical engineering or physical chemistry. Must be qualified to organize, plan and supervise the work of a group of men. In reply please submit personal resume education and experience which will be held confidential. Remuneration to be negotiated. File No. 4725-V.

CHEMIST OR CHEMICAL engineer with experience in the pulp and paper industry, to supervise control work in a section of the technical department. Applications will be held confidential. File No. 4729-V.

CHEMICAL ENGINEER with rubber experience to sell rubber chemicals and compounds for Canadian manufacturer in Eastern Ontario and Quebec. Salary and profit sharing. Opportunity for an aggressive sales minded man. File No. 4764-V.

CHEMICAL GRADUATE with experience, preferably sales, in metal cleaning, electroplating and/or painting. This is a salaried position plus expenses, commission and annual bonus. Firm also provides a liberal retirement insurance and hospitalization program. Location working out of Toronto. File No. 4783-V.

### CIVIL

CIVIL GRADUATES, 1954 required by paving company in Province of Quebec. Applicants should be preferably bilingual. File No. 4726-V.

FULLY EXPERIENCED structural steel checker required in middle west organization. Applicant should have about fifteen years or more experience in structural steel and have previous checking experience. File No. 4727-V.

YOUNG GRADUATE ENGINEER PREFERABLY CIVIL or mining, required by manufacturer of drainage and all kinds of metal products. Applicant should not have more than two years experience and have a definite interest in sales work. Location Ontario. File No. 4733-V.

APPLICATIONS ARE INVITED and will be received by the undersigned for the position of a planning engineer. Applicants should have university graduation in civil engineering or architecture or related field preferably including or supplemented by courses in municipal planning. Considerable professional experience in municipal planning desirable, including some supervisory responsibility or an equivalent combination of training and experience. Applicants to state age, marital status, education qualifications and experience history. File No. 4736-V.

CIVIL ENGINEER with good experience in field layout and draughting required by pulp and paper company in the Maritimes. File No. 4743-V.

CIVIL ENGINEER, university graduate and registered Professional Engineer required for sales promotion work by large company with Canada-wide interests. Applicants should have at least 5 years' experience in reinforced concrete structural design, should be in the twenty-five to thirty-five age group and should be prepared to do considerable travelling. Please apply giving full details of academic training and professional experience, references and salary requirements. File No. 4749-V.

APPLICATIONS WILL BE received for the position of Township Engineer and road superintendent for the Township of Sandwich West, Ont., population now 13,000. Applicants must be qualified civil engineers and should be prepared to handle all problems in connection with roads, water works, etc., in a growing municipality. We employ a work supervisor. Applicants should state age, qualifications, past experience, references and salary expected. File No. 4751-V.

UTILITIES ENGINEER required salary $6,120 to $6,840 plus Fort Churchill allowance by Department of National Defence, Fort Churchill, Manitoba. Details and application forms at nearest Civil Service Commission office and National Employment Office. Quote No. 53-1205. File No. 4753-V.

CIVIL ENGINEER, graduate of a Canadian University and registered professional engineer with at least 10 years practical experience in a supervisory capacity specializing in design of structural steel and reinforced concrete building to supervise group of engineers and draughtsmen in consulting engineers office in Windsor, Ontario. Salary range $7,500 to $9,000 depending on qualifications. Please write giving full details including experience, age, reference, etc. File No. 4769-V.

CONSTRUCTION ENGINEER required by company located in P.Q. engaged in the construction of small houses as well as commercial and industrial. The responsibilities would include the preparation of estimates and the complete charge of execution. File No. 4779-V.

CHIEF ENGINEER and director required by structural engineers Toronto. Applicants must be structural engineers specialized in design and full control of drawing office for many years in position of entire responsibility for the design of work of great magnitude in both reinforced concrete and structural steel. Suitable age between 35 and 45. File No. 4785-V.

CIVIL ENGINEER required by private consultant located in Ontario. Requirements are at least five years experience engineering. Preference will be given to applicant having commission as land surveyor. Salary $4500.00. Please state age, education and experience to fullest extent and ability. File No. 4786-V.

ENGINEER REQUIRED with experience in structural steel for design and sales work, by steel fabricator in Montreal. Salary open depending upon qualifications. File No. 4790-V.

RECENT GRADUATES in civil engineering for employment in Southern Ontario as sales representatives of national manufacturer and erector of steel construction products. Preparatory training course provided. File No. 4793-V.

REQUIRED GRADUATE civil engineers for specialized work in soil mechanics and foundation engineering. Graduate soils work desirable. Locations: Montreal and Toronto with some travelling. File No. 4794-V.

### ELECTRICAL

APPLICATIONS ARE INVITED for the position of assistant professor dept. of electrical engineering University of British Columbia, Vancouver, Canada. Candidates should have post-graduate training preferably at the Doctor's level in electronics and servo-mechanisms. Duties include teaching under graduate courses in electrical engineering, post graduate studies in some phase of servo-mechanisms or electronics. Starting salary $4,500 to $5,000 per year. Date of appointment July 1, 1954. Further information may be obtained by writing to the head of the department. File No. 4720-V.

GRADUATE ENGINEER preferably electrical with one to four years experience and a desire for sales engineering is required by small nationally recognized electrical manufacturer. Six months to one year orientation at Toronto factory then sales engineering work in Montreal office on salary plus commission basis. File No. 4721-V.

ELECTRICAL ENGINEER for system planning division. Should have at least ten years' experience in the designing and operation of hydro and/or thermal generating plants and transmission systems, with particular qualifications as follows: Application of the method of symmetrical component to the solution of unbalanced conditions on A.C. systems, experience in the use of the A.C. net work analyser on load flow studies, relay problems and stability studies, both transient and steady state. Familiarity with problems associated with the operation of a power system, such as fluctuating loads, and methods used to mitigate the effect of some; also some knowledge of the operation problems associated with the inter-connection of two or more systems. Experience also desirable in A.C. system operation with particular regard to the maintenance of voltage levels, reactive and real power flow and speed covering problems. Address all applications giving full details of qualifications and experience and salary required. File No. 4723-V.

REPRESENTATIVE REQUIRED for Quebec and Ontario areas by electrical manufacturers to contact architects, consulting engineers and electrical contractors covering lighting equipment and wiring devices. Reply in handwriting stating qualifications and experience. File No. 4724-V.

ELECTRICAL ENGINEER required to design and develop rectifiers and communication equipment. Applicant should have better than two years experience in this field. Starting salary depends on qualifications. File No. 4728-V.

THREE GRADUATE ELECTRICAL engineers interested in design development, technical control or application engineering. The duties include; learning and preparing specifications for internal use of electrical conductors, the study of insulants and dielectric behaviour, the preparation of calculations and line design, asesssement of the quality of raw materials, designing cables developing new products, and writing technical brochures and catalogue sections. Location Ontario. File No. 4738-V.

YOUNG GRADUATE ELECTRICAL engineer bilingual required by manufacturer of vacuum tubes and fluorescent and incandescent lamps. The plant of this company is located at 60 miles from Montreal. The position offered would involve work in production engineering quality control, testing. Please state salary expected and full details of qualifications and experience. File No. 4740-V.

FIELD ENGINEERS preferably with electrical background by oil well service company operating in Western Canada. Five months training period. Comprehensive employee benefits. Work is substantially in the field for initial years with irregular hours. Age limit of 28 preferred. Engineers will be based in active oil exploration area of Western Canada. Well established company active throughout world. Inquiries welcomed. File No. 4754-V.

ELECTRICAL ENGINEER required to fill positions as Senior product engineer with long established and expanding company manufacturing rectifiers and distribution equipment for public utilities. Must have proven technical and administrative ability to assume responsibility for all design, development and product engineering and supervision of engineers, technicians and draughting staff. File No. 4756-V.

ASSISTANT PROFESSOR required in the department of electrical engineering of University located in Maritime Provinces. Preferably Canadian, under 35, and with at least two years experience. The course involves D.C. machinery A.C. circuits and introductory electronics. File No. 4760-V.

ELECTRICAL ENGINEER bilingual, required for system planning studies of rapidly expanding utility located in P.Q. Duties will involve problems of distribution, transmission and hydraulic generation. Educational requirements: graduation in electrical engineering from a recognized university and from 3 to 7 years experience preferably in a utility or allied field. Employee benefits include: pension, group insurance, and hospitalization plan. In reply please give age, marital status, summary of experience and salary required. File No. 4781-V.

GRADUATE ELECTRICAL ENGINEER required for new plant in Ontario. Applicants should have experience in the telephonic communications field. Company is engaged in the manufacture of telephone dial switching equipment and associated apparatus such as telephone relays etc. The work involves the following detailed engineerings. The preparation of specifications detailing each item of equipment to be supplied for a particular installation. The preparation of exchange drawings to be used by installers in the installation of equipment. File No. 4684-V.

ELECTRICAL ENGINEER required by paper company located in Eastern Canada. Young graduate with some experience not necessarily in paper mill. File No. 4799-V.

ELECTRICAL ENGINEER required by hydro commission in Ottawa. Should have at least 4 years experience in urban electrical distribution, and to act as an assistant to the distribution engineer. File No. 4801-V.

## MECHANICAL

GRADUATE MECHANICAL ENGINEER wanted, experience in heater coil manufacture or design required. To assist also in technical sales. Salary commensurate with qualifications and experience. Location Montreal. File No. 4732-V.

SALES ENGINEER REQUIRED by large manufacturer of industrial equipment for sales and service of pulp and paper mills on west coast. Previous mill experience desirable. Excellent opportunity. File No. 4735-V.

GRADUATE MECHANICAL ENGINEER required to take over the preventative maintenance program of a fleet of transport vehicles operating interprovincially in Western Canada. Applicant should be prepared to spend some two or three months in the U.S.A. then put into operation a preventative maintenance program for this organization. File No. 4739-V.

PROCESS OR PRODUCTION ENGINEER required by locomotive firm. Excellent opportunity for progressive engineer who can initiate and follow through on cost reduction, machine and process improvement, and scrap reduction programs. Should have three or more years experience in modern machine shop and steel fabrication practice. This job offers splendid opportunity for advancement. Salary commensurate with ability and experience. File No. 4761-V.

INDUSTRIAL ENGINEER required by large organization. Applicants should be preferably graduate engineers in mechanical. The age range could be from 25 to 40 and the duties involved will be engineering studies of manufacturing operations for the purpose of improving operating methods, equipment material handling, etc. Experience in time study for the establishment of production standards for large incentives, would be a decided advantage. Due to rapid expansion opportunities for advancement are excellent. Starting salary range from $4,000 to $6,500 depending on qualifications and experience. File No. 4762-V.

TWO RECENT ENGINEERING graduates, preferably mechanical required by large beverage company for plant work in Toronto and Montreal. File No. 4766-V.

MECHANICAL ENGINEER required by air conditioning and ventilating contractor in Montreal. Duties to include field supervision and estimating. Man must be familiar with sheet metal work and installation of air-conditioning equipment. Must be bilingual. File No. 4767-V.

MECHANICAL ENGINEER graduate of a Canadian college and registered professional engineer with 15 years experience in design of pressure vessels, pressure piping, for work in Windsor, Ontario. Salary ranges between $8,000 and $10,000 depending on qualifications Please write giving full details including experience, age, references, etc. An interview will be arranged. File No. 4769-V.

GRADUATE MECHANICAL ENGINEER 23 to 28, interested in sales to work as assistant in general engineering and sales department of growing engineering company. Company specializes in aircraft parts and industrial work. Location Montreal. Please write giving full details. File No. 4772-V.

MECHANICAL ENGINEER with about three to eight years experience required by manufacturer and distributor of a comprehensive line of plumbing and heating products consisting mainly of cast iron soil pipe and fittings, cast iron and convector radiation, cast iron domestic and commercial size boilers, steel furnaces, tank fabrication and allied lines. Duties would be plant engineering in plant located in Ontario Applicant should be above average ability as it is the intention to move him into the field of general supervision of service department as soon as ability is indicated. File No. 4775-V.

PROFESSOR OF MECHANICAL and head of mechanical engineering department required by the University of Roorkee founded in 1949 as the first technical university in India. Roorkee is about 100 miles north of Delhi. Applicant should be a mechanical engineer with a sound background of modern mechanical science. He should have a high academic qualification preferably Ph.d. or D.Sc. The direction of specialization is not important. Age preferably not under 38-40 years. Duration of appointment minimum two years preferably three. Living accommodation provided and free medical attention. File No. 4780-V.

MECHANICAL ENGINEER required to work with electronic engineer in the design of commercial and government military equipment. This includes wave guide and cavity design and layout. At least one or two years' mechanical design experience required not necessarily with electronic equipment. Location Ontario. File No. 4788-V.

SALES ENGINEER required in the diesel engine department, Montreal Branch of large manufacturer. Recent graduate, preferably bilingual, professional training should not be too specialized, as work is of a general mechanical type that requires a preparation of estimates on diesel engines for stationary service generating sets, marine propulsion and marine auxiliaries, etc., in the early stages, travelling would not be necessary, but the potential of the job includes the complete coverage of all diesel engine contracts of this territory. Salary depending upon qualifications and experience. File No. 4789-V.

INSTRUCTOR OF MECHANICAL engineering to teach mechanical drawing and assist in mechanical engineering laboratory courses. Preference will be given to an applicant with experience in the field of machine shop practice and industrial engineering, who would have an opportunity to develop courses in this field. Location University of B.C., Vancouver. File No. 4791-V.

MECHANICAL ENGINEER required by plant engineering branch of large research organization at Ottawa. Applicants should be B.Sc. graduates in mechanical engineering with at least three years' experience in the design of heating and ventilating of offices and industrial buildings. Duties include the preparation of drawings and specifications for heating and ventilating, and the assistance in the design, layout, and adjustment of refrigeration and air conditioning equipment. Initial salary up to $5,750, depending on qualifications. Apply by letter giving full details of education and experience. File No. 4798-V.

SALES ENGINEER for field work to represent manufacturers agency selling original and maintenance equipment used in mines, paper mills and heavy industry. Company operating in Northern and Northwestern Ontario, also Northwestern Quebec. Progressive training for suitable applicant. Technical, mechanical maintenace or mill experience desirable. Submit record of education, experience, references and photograph, to File No. 4803-V.

### MISCELLANEOUS

LONG ESTABLISHED company located in Toronto area has interesting vacancies for sales engineers preferably experienced on pumps and compressors or would consider men with a good knowledge of heavy machinery or power plant equipment. All replies in strictest confidence. File No. 4714-V.

AN ASSISTANT CHIEF water resources division, at Ottawa. Salary $7,500 to $8,100. Details and application forms at your nearest Civil Service Commission Office, National Employment Office and Post Office. File No. 4716-V.

YOUNG MECHANICAL (or civil engineer), bilingual, with sales experience in, or good knowledge of diesel engines, road-building and municipal equipment required by important company for its Montreal sales staff. This position provides an ideal opportunity for an engineer seeking a future in the heavy equipment sales field. File No. 4717-V.

APPLICATIONS ARE INVITED for the following positions: 1. research officer, to engage in theoretical and experimental studies relating to building acoustics. Duties may include supervision of standard acoustical testing, field measurements and laboratory research in acoustics. 2. Research officer, to engage in studies of soil vibrations and their effect on buildings. Duties may include theoretical and experimental studies of wave propagation in soils and design of suitable apparatus for vibration studies in both field and laboratory. General qualifications: University degree in physics or engineering and at least two years of post graduate training or pertinent industrial experience. File No. 4719-V.

STREET LIGHTING sales engineer required by a long established manufacturing company in the field of scientific illumination. Duties after a specific training program will involve the sale of light directors to municipalities and public utilities chiefly. Deligence, dependability, an agreeable personality, and determination to make a career in this field are of highest importance. File No. 4731-V.

AUTOMOTIVE INDUSTRY IN ONTARIO requires work standards men to be employed on time study and methods work. File No. 4734-V.

POSITIONS BECOMING available at Winnipeg in air line for graduate engineers having comprehensive experience in aircraft structures, mechanical, electrical and radio systems. Also senior draughtsmen with experience in aircraft structural or mechanical engineering. File No. 4741-V.

APPLICATIONS ARE INVITED for the position of assistant professor, Department of Civil Engineering, University of British Columbia, Vancouver, Canada. Candidates should have had postgraduate training preferably at the Ph.D. level in fluid mechanics. Duties include teaching fluid mechanics and other courses in the under-graduate school and teaching one post-graduate course in some phase of fluid mechanics. Starting salary from $4,500 to $5,000, depending on experience, with the possibility of augmenting income with summer work on hydraulic models or other hydraulic projects. Date of appointment is July 1, 1954. File No. 4744-V.

PLANT LAYOUT AND material handling engineer required by automotive industry in Ontario. Applicants should have either specific experience in these particular fields or with plant or maintenance engineering experience, such as construction, piping, conveyors, etc. File No. 4747-V.

PLANT LAYOUT ENGINEER — Large U.S. Manufacturer with plants located in Latin America requires capable Plant Layout Engineer for work in consulting office in New York State. Must have experience in metal working industry in plant layout work with sound knowledge of building design and manufacturing methods. Please send complete resume covering education, experience and family, including recent photograph. File No. 4752V.

MOTOR DESIGN ENGINEER — Large U.S. manufacturer with factory in South America needs experienced induction motor design engineer with sound knowledge of manufacturing methods. Motor sizes to range from small fractional horsepower through 50H.P. Please send complete resume covering education, experience and family, including recent photograph. File No. 4752-V.

SALES ENGINEER required in the Industrial division of large manufacturer of metal products for steel mills power plants and other industrial operations. Applicant should also be able to evaluate possible new business in the light of expanding manufacturing facilities, therefore a manufacturing background is essential. Good deal of travel is involved. Age range 35 years. Located in Montreal. Company has been serving Canada's railroads and industry for more than 50 years. File No. 4757-V.

GEOLOGISTS OR GEOLOGICAL engineers with a minimum of 5 years experience in geological exploration in Western Canada and/or Northwestern U.S. required by consulting firm. Must be qualified to assume complete responsibility of large exploration projects involving photogeological techniques. Occasional field work only. Top salary to qualified applicants. File No. 4758-V.

NATIONAL ORGANIZATION requires a sales engineer for the Province of Quebec. Applicants must be fluently bilingual. Engineering graduates. Those having a thorough knowledge through experience of road building and materials will receive preference. Age 30 or over. This is a well salaried position deserving consideration by qualified persons. Apply in Writing. File No. 4759-V.

UNIVERSITY GRADUATE in electronics or applied physics required to act as assistant (technical) to the sales manager of a medium sized company engaged in the development and manufacture of advanced defence apparatus prepare technical requests, edit instruction manuals, catalogues, price lists, etc. Work is concentrated in Montreal however, there is a possibility of frequent travel mainly in Quebec and Ontario. File No. 4763-V.

GRADUATE ENGINEER required immediately by the Department of Engineering at Carleton College, Ottawa. He will be required to teach in and direct the work of the present two-year engineering course and in addition to explore the possibilties of developing this into a degree course in general engineering. Qualifications a degree in engineering or its equivalent, together with some practice experience and proven ability to impart knowledge. Salary in accordance with the responsibilities of the position. File No. 4765-V.

YOUNG CIVIL OR MECHANICAL ENGINEER required by a pulp and paper company in Quebec. Applicant should have a minimum of three years experience in engineering and maintenance preferably in the pulp and paper industry. Applicant should be fluent in either French or English and should be able to get along in both. Replies should outline qualifications, experience, age and salary expected. File No. 4768-V.

SALES ENGINEER required by firm located in Montreal. Applicant should be acquainted with combustion lines, have sales experience, entries to architects, consulting engineers. This position could be either full or part time on a commission or drawing account basis or other arrangements could be made after discussion. File No 4771-V.

ASSISTANT CITY ENGINEER required in Western Canada. Duties will be general municipal engineering, including operation of the pumping and purification plant, cleansing and water delivery branch, asphalt plant, also maintenance construction of street paving, concrete curbs, sidewalks, sewer and water mains, also building inspection. Applications giving full particulars as to qualifications, experi-

THE CITY OF EDMONTON
ALBERTA, CANADA
REQUIRES AN ASSISTANT
CITY ENGINEER

DUTIES:

As first assistant of the City Engineer to assist in administration of the Department involving planning, co-ordinating and supervising of various municipal projects, including construction and maintenance of roadways, walks, bridges, sewers, sewage disposal, garbage collection and disposal, traffic control, and related work.

QUALIFICATIONS:

University graduate in Civil Engineering and preferably considerable varied administrative and supervisory municipal engineering experience in the above noted work.

Apply in writing, stating salary requested, to the City Engineer, Civic Block, Edmonton, Alberta, not later than April 30th, 1954.

NATIONAL RESEARCH COUNCIL CANADA
requires at Ottawa a
SAFETY ENGINEER

Under direction, to develop a program of safety consciousness throughout the laboratories of the Council.

The duties will include the investigation of accidents and fires, potential accident and health hazards and the recommendation of safety measures.

Graduation in Engineering or Chemistry (Chemical Engineering preferred) from a university of recognized standing is required; must be physically fit, and have several years industrial experience in technical work; safety engineering experience desirable but not essential.

Initial salary up to $5150 per annum depending on qualifications.

Apply to the Employment Officer, National Research Council, Sussex Street, Ottawa, giving full details of qualifications and experience.

# Mechanical Engineer

$6,420 — $7,200

Department of Public Works
Ottawa

Details and application forms at your nearest Civil Service Commission Office, National Employment Office, Post Office and University Placement Office.

Quote Competition No. 54-1202
CIVIL SERVICE OF CANADA

ence, salary desired etc. to be received not later than March 15/54. File No. 4773-V.

MACHINERY MANUFACTURERS' agents require sales engineer preferably bilingual to cover Quebec and S. Ontario. In applying indicate knowledge of previous sales experience and territory covered. File No. 4776-V.

THREE ENGINEERS REQUIRED by manufacturer of multiwall kraft bags and related paper products 1954 graduates to 6 years of experience. Training period in Montreal. Subsequent work in variety of locations. File No. 4777-V.

CHEMICAL OR MECHANICAL engineer required for coal preparation research. Experience in coal cleaning, especially with driesson cyclones and dense media desirable but not essential. Starting salary will depend on training and experience and will be in a bracket of $4,000 to $5,000 per annum plus cost of living bonus based on the consumer's index. The present bonus approximates $300 annually. Apply with all particulars recent photo and addresses for reference. File No. 4778-V.

THE COMMUNITY PLANNING ASSOCIATION OF Canada invites applications for the principal staff position in its national office. Applicants should have a general knowledge of community planning and municipal affairs, and must have an ability to prepare information and publications on planning subjects in non-technical language. Applicants need not possess professional qualifications as planners. The salary will be commensurate with the qualifications and experience of the person appointed. File. No. 4800-V.

ENGINEER REQUIRED by manufacturer located in Maritime Province planning to enlarge research facilities. Applicant should have been connected with the chip board companies in Europe and have sufficient technical knowledge and related experience to proceed along certain lines of development. File No. 4782-V.

SENIOR ENGINEER quality control university graduate in engineering physics, electrical engineering or mathematics and physics, majoring in electronics. 5 years experience in radio manufacturing preferably in a technical function. Knowledge of shop methods and inspection practice. Familiarity with all types of radio technical equipment. Knowledge of radar and especially in testing. File No. 4787-V.

RADAR ENGINEER required for the design of airborne and marine radar equipment. Must be familiar with government specifications. About five years experience is required, wartime experience desirable. Location Ontario. File No. 4788-V.

COMMUNICATIONS ENGINEER required in either microwave or V.H.F. design work. Must have at least five years experience in laboratory or industry and be thoroughly familiar with latest design techniques. Wartime experience desirable. Location Ontario. File No. 4788-V.

BROADCAST ENGINEER required for the production engineering of large broadcast and TV equipment. Must have previous production experience. Location Ontario. File No. 4788-V.

THE TOWNSHIP OF TORONTO requires a graduate civil engineer to act as an assistant engineer in their engineering department on design and construction work in connection with water and sewer systems. Applicants should have from 2 to 4 years experience on water and sewer work. Apply stating age, qualifications and salary expected. File No. 4792-V.

POWER PLANT ENGINEER required for large industrial concern near Montreal to take care of high pressure steam plant turbo-generators and refrigeration. Only those having both practical experience and technical knowledge need apply. State age, experience, and salary expected. File No. 4795-V.

DESIGN ENGINEERS, experienced in the engineering design of aircraft instruments and accessories or equivalent industrial products, required to join a small progressive company located in Montreal. Excellent working conditions and benefit plans. Apply outlining qualifications and salary expected. File No. 4796-V.

GRADUATE ENGINEER to fill the position of plant engineer, and should have some product design and cost estimating experience. Plant maintains press, foundry, plating, wire forming, etc. facilities. Location Province of Quebec. File No. 4797-V.

EXPERIENCED MECHANICAL ENGINEER required immediately. Must be capable of repairing complete designs and specifications for heating and plumbing systems in buildings. Thorough knowledge of steam and hot water heating, ventilation and air conditioning essential. Applicants must have had practical experience. Starting salary six thousand ($6,000) dollars. Apply by mail giving full particulars and references in first letter to File No. 4804-V.

## SITUATIONS WANTED

BILINGUAL MECHANICAL INDUSTRIAL graduate engineer, age 42, with personality and experience, presently employed. Seeks opportunity where diplomatic ability, technical knowledge could be used in supervisory capacity. All offers considered. File No. 140-W.

SANITARY ENGINEER, Civil engineer, B.Sc., Queen's 1948, M.A.Sc., U. of Toronto 1949, P.Eng., Jr.E.I.C., age 29, single. Four and a half years practical experience in municipal and sanitary engineering. Was chief municipal engineer for one and a half years responsible for design and development of waterworks and sewage projects. Also experienced in supervision of construction of various municipal projects, as well as in administration of a municipal engineering department. Presently employed as design engineer dealing with sewage treatment plants, water works projects, sewer designs, roads and pavements. Am seeking a responsible position, preferably with a firm of consulting engineers where individual initiative, hard work and proven ability will be recognized. Am a member of the Canadian Institute on sewage and sanitation and the American Waterworks Association. File No. 250-W.

CIVIL ENGINEER and land surveyor, M.E.I.C., 26 years of varied experience abroad and Canada, in: railroad, airport, road, dam, watersupply, irrigation, building, factory construction and related survey of layouts and location. In charge of survey parties and supervising and directing construction. Service with the Royal Engineers in the Middle East and East Africa. Married, bilingual. Seeks responsible position in Ontario or Quebec, where experience will be of value. File No. 489-W.

MECHANICAL ENGINEER, graduate 1944, single, age 34, with experience in mechanical and industrial engineering. Administrative and supervisory experience with responsibility at management level. Assistant plant manager, maintenance supervisor, plant engineer and industrial engineer in welding industry, heavy equipment, printing industry. Cost study, wage incentives, production control, plant layout, and time study. Seeking opportunity to join progressive firm in engineering, production or plant. File No. 2920-W.

PHYSICO METALLURGIST M.E.I.C., P.Eng., specialized in statistical elucidation of production data toward solution of workshop problems in metallurgy, specially in quality and process control in steel making-shaping-heat treating. As a statistical analyst experience second to none in sinchronization of production factors so that optimum conditions for the lowest occurrence of pipe in steel ingot, or segregation in steel can be attained, and maintained for a predictable length of time. Also in sinchronization of factors toward highest capacity of Bl. Fce. at lowest coke rate. File No. 3521-W.

MECHANICAL ENGINEER, Queen's 1944, M.E.I.C., P.Eng., married, age 34, eight years experience as plant engineer, including planning, design, erection and maintenance on process steam, refrigeration, air conditioning systems, seeks employment in plant engineering, preferably, but not necessarily, in smaller city or town in Ontario or Western Canada, with growing company. Available on three months notice. References include present employer. File No. 3935-W.

CIVIL ENGINEER (European), graduate from McGill and Master's degree from Toronto (52) wishes to work on design and construction of buildings. Possessor of professional engineers certificate and experience on highway construction, surveys, soil borings and soil testing. Age 26, single, available in two weeks notice. File No. 3988-W.

ENERGETIC YOUNG civil engineer, M.E. I.C., P.Eng., single. Varied heavy construction experience; pulpmill, steam and diesel plants, docks, houses, barracks, hangars, runways, highways, sewer and water systems, surveying. Finishing assignment as resident engineer on $16,000,000 project. Available for responsible position, field or office. File No. 4015-W.

CIVIL ENGINEER, N.S.T.C. 1952, age 28, married. Have had some highway construction experience. Presently employed in job requiring very little engineering training. Would like to obtain experience along any line of engineering. Present location Nova Scotia. File No. 4070-W.

SENIOR MECHANICAL ENGINEER (34), M.E.I.C., A.M.I., Mech.E., seeks responsible post in Vancouver or district. 10 years experience in design and construction of medium and heavy machinery, rolling mills, chemical plant, hydraulic equipment. 3 years experience research and development in noise and vibration science. Also administrative experience, personnel and purchasing. Good knowledge French and Italian. File No. 4091-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.A. Sc., U.B.C. 1950. Age 29, married, 2 children. Two year graduate training course with large electrical manufacturer. 14 months pulp and paper experience including maintenance and new installations. Desires position with more responsibility. File No. 4153-W.

CIVIL ENGINEER, M.Sc., M.E.I.C., P.Eng. (Ont.), graduated 1947, is available. First class designer of all types of modern structures, inventive, enterprising and with flair for structures involving complex statistical problems. File No. 4173-W.

ELECTRICAL ENGINEER, Jr.E.I.C., P.Eng., McGill 1951, power option, seeks employment in construction or manufacturing line. Maintenance and construction experience. Presently employed as resident electrical engineer on large project for a firm of consulting engineers. Location no object. File No. 4202-W.

GRADUATE ENGINEER B.Sc. Mining Engineer, University of Leeds, England 1951, Jr.E.I.C. Age 25, married one child. 18 months experience in municipal and general civil engineering, 8 months mechanical drafting. Desires change to position with a future. File No. 4207-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng., B.Sc. (Queen's 1948), veteran age 32, married, 1 child, over five years experience on layouts, steel and concrete design in a chemical plant. Ability to supervise projects and some knowledge of estimating and costs. Desires a responsible position where above experience would be an asset. Available on one month's notice. Preferable location southern Ontario. File No. 4238-W.

GRADUATE MECHANICAL ENGINEER. Married, with family, requires employment. Diversified industrial experience. Purchasing, maintenance and machinery shop practice. Sound business training. Experience includes heating, sheet metal industries and general machinery equipment. Bilingual. Has good personality, enthusiastic, keen business acumen. Desires employment on production, sales or engineering administration. Location Montreal area. Available immediately. File No. 4300-W.

MECHANICAL ENGINEER, B.Sc. University of Saskatchewan 1950. Jr.E.I.C., age 28, married. Have been doing plant engineering work since graduation. Desire position with opportunity, location not important. File No. 4328-W.

CHEMICAL ENGINEER, 1945 graduate M.E.I.C., P.Eng. (Ont.) with several years work in anodizing, lacquering, plating, plastic and metal-spraying, phosphatizing, electropolishing. Particular consideration of corrosion problems in the chemical beverage, textile industry. Has practical experience in managing as well as laboratory work in the field of analyzing and material testing. Did extensive research on chemical durability of lacquers and on adhesion of metals and paints on aluminum and steel. Desires a position in a plant or in a developing and research laboratory. File No. 4359-W.

MECHANICAL ENGINEER Jr.E.I.C., B.A.Sc. 1948, 6 years pulp and paper and heavy industrial equipment experience before graduation as project designer and 2 years after graduation. For several years engaged in the combustion engine field, mainly diesel equipment. Desires position in either field with more responsibility. File No. 4386-W.

CIVIL ENGINEER, M.Sc. Technical University Dansig 1935, D.Sc. Technical University Munich 1947, M.E.I.C., age 40, bilingual. 17 years experience in Europe and Near East in architectural and structural design of residential, industrial, hospital buildings and in town-planning. One year Canadian experience in Toronto in residential, industrial, and theatre design. Seeks responsible position with firm of engineers or architects. File No. 4387M.

MECHANICAL ENGINEER, D.I.C., G.I.M.E., 27, single, bilingual, three years experience in design office and manufacturing of fabricated steel and structural steel, 1½ years research experience, sound knowledge of shop procedure, electric and electronic bias, seeks permanent position in Montreal area but willing to travel. Presently employed below technical ability. Loyal, responsible and willing to start at junior level if opportunity for advancement is provided after ability has been shown. File No. 4388-W.

MECHANICAL ENGINEER and Chemist B.A.Sc.—1952; B.Sc. (Chemistry and Physics) 1946 M.C.I.C., Junior A.S.M.E. age 28. Married, with two years experience in all phases of instrumentation in pulp and paper industry, also one and one-half years work as junior chemist in the petroleum industry. Desires job with definite opportunity for advancement. Presently employed, but available on reasonable notice. File No. 4390-W.

CHEMICAL ENGINEER, P. Eng., B.A.Sc. (Toronto '50) Jr.E.I.C., M.C.I.C., 32, married, 1 child, veteran 3½ years R.C.N., four years general office work, four years development control and supervisory experience in chemical process industry. Working knowledge of French, some German. Desire more responsible position in technical service, development or similar work, Canadian or foreign. All replies acknowledged. Resume on request. File No. 4391-W.

ELECTRICAL ENGINEER, Canadian, M.E.I.C., B.Sc. (Alta., 1944), M.S. (Carnegie Instiute of Technology, 1952), expecting Ph.D. Carnegie Tech. 1954. Married, 1 child. 4½ years with large Canadian electrical manufacturer including test course and design experience. 3 years in electrical sales. Desires teaching position in power field, or research and development in servo-mechanism and control field. Doctoral thesis being written on fundamental study of magnetic amplifiers. File No. 4392-W.

JR. E.I.C., Graduate Polytechnique 1950—fully bilingual. Has been working for 2 years as estimator and construction engineer. Had 1 year experience in construction work in Europe. Position wanted in Montreal or surroundings, but would consider going anywhere in Canada. File No. 4398-W.

EXECUTIVE ENGINEER, M.E., M.E.I.C., P.Eng. (Ont.), twenty-three years varied design-manufacturing and management experience of which eleven years chief engineer with equipment manufacturing concern. Since 1946 practising privately and activities consisted mainly of larger engineering assignments including project development and execution, also extensive consulting with steel, pulp and paper industries as well as equipment manufacturers. Interested in an association with a really progressive organization offering appropriate opportunities preferably in connection with larger scale Canadian and/or foreign developments, or other responsible activities requiring engineering background, leadership qualities, a realistic approach to problem analysis, diplomacy, practical imagination and acknowledged design talent. Present income considerably above average but would consider reasonable compromise if proposition otherwise attractive. File No. 4399-W.

ELECTRICAL ENGINEER, B.E. (University College Dublin), Associate Member Institute of Civil Engineers of Ireland. Age 34, married, with children. Nine years experience with electricity supply organization. Experience mainly in electrical distribution design and construction overhead and underground networks. Arriving Canada March or April. Seeking interviews for position as distribution engineer. Location unimportant. File No. 4400-W.

CIVIL ENGINEER, B.E. (National University of Ireland), Jr.E.I.C. Two years experience in structural steel design; 6 months with Canadian structural firm; also worked for short time on traffic survey. Presently employed (Montreal) in job requiring very little engineering training. Desires position offering experience in various branches of municipal engineering. Taking course leading to A.M.I. Mun.E. Location of little importance; available on reasonable notice. Age 23, married. File No. 4401-W.

ELECTRICAL ENGINEER, B.Eng. (Hons.)., M.A.Sc., M.E.I.C., P.Eng., age 35, married, and presently completing eighth year as Professor of Electrical Engineering. Has taught many different courses on senior and graduate level with emphasis in power. Broad general experience in construction, public utility work and as a naval officer. Has done considerable consulting work of general nature. Seeks appointment which should offer a broad challenge in keeping with background proffered. File No. 4402-W.

DIPLOMA ENGINEER, Mechanical, P Eng., M.E.I.C., with comprehensive technical knowledge, creative ability and 18 years experience in design and manufacture of diversified machinery and devices such as power shovels, hydraulic presses, aircraft engines, pumps machine tools, electric automatic controls, welded products, as well as experience in organizing and managing plants with up to 5,000 workers, economical minded with mature judgment, at present engaged in machine tool development seeks a position with a progressive company where his past experience could be utilized best. File No. 4403-W.

PROFESSIONAL ENGINEER (Ont.), B.Sc. (E.E.), U. of Manitoba, veteran, age 28, married, 2 children. Canadian Westinghouse Training Course. Nearing completion of post-graduate work in Business Administration, consisting of evening classes leading to M.Com. Presently employed as project engineer responsible for co-ordination of all phases of manufacture of projects. Desire responsible position in administration or production. File No. 4404-W.

CIVIL ENGINEER, B.Sc., Jr.E.I.C., now employed with 3 years foreign experience, construction and structural design (reinforced concrete), and one year Canadian experience in building construction and draughting (not in structural design), is seeking a junior position with prospects in structural design, preferably in Toronto. File No. 4407-W.

CIVIL ENGINEER, B. of Sc. in Eng. M.E.I.C., P.Eng., Danish citizen, age 46, married seeks responsible position with future possibilities. Over twenty years experience in all sorts of heavy construction: roads, concrete pavings, excavation, dikes, sewers, reinforced concrete: bridges, piles, buildings, hangars, design. Fully familiar with administration and thoroughly experienced in preparation, organization and supervision of construction. Preferably in larger city. Available on approximately one month's notice. Future possibilities will be considered more than starting salary. File No. 4409-W.

ELECTRICAL ENGINEER, Jr.E.I.C., U. of Alberta, 1949, veteran, age 33, married. 1½ years in industrial and commercial construction, 3 years design and development of power plants for large communication company. Experienced in electrical controls. Prefer Alberta or B.C., but willing to locate anywhere if work is interesting and has advancement possibilities. File No. 4411-W.

CHEMICAL ENGINEER, S.E.I.C., Jr.C.I.C., B.Sc. (Queen's 1952), single, age 22, desires position with responsibility in industry or technical sales. Three years summer employment in the paper industry. Have two years municipal engineering administrative experience working with senior executives and meeting the public. Location headquarters preferred in E. Ontario. File No. 4414-W.

SANITARY ENGINEER M.A.Sc. University of Toronto as of April 1954. S.E.I.C., B.Sc. (C.E.) University of Manitoba 1952. One years experience in building construction. Desires position offering experience in sanitary or Public Health Engineering. Location immaterial Available beginning of May. File No. 4415-V.

OVERSEAS POSITION preferred by graduate chemical engineer, Jr.E.I.C., McGill 1949, war veteran. Considerable experience in mechanical work such as all phases of design fabrication and erection of heavy structural, plate and mechanical products. Also process plant experience and considerable customer contact experience. Presently employed in a supervisory capacity. File No. 4416-W.

MECHANICAL ENGINEER, B.Sc. 1st class hons. Ph.D. (Durham) G.I.Mech.E., married, age 24, recently arrived from England seeks position in development or production. Experience includes 18 months in general engineering and 3 years supervision and direction of a research project in the field of applied thermodynamics. Training includes stress analysis, gas and fluid dynamics and industrial management. Has also had experience in writing and editing reports and publications. Available immediately, location anywhere. File No. 4417-W.

MECHANICAL ENGINEER, Jr.E.I.C., 1950 graduate, Toronto. Veteran, 32, single, some research experience, over three years in chemical industry on project and design work, involving process and services equipment and piping, instrumentation and building construction, including some estimating, purchasing, expediting and inspection. Desires position of greater responsibility in similar work or in maintenance work of a general nature. File No. 4418-W.

CIVIL ENGINEER, B.Sc. C.E. U.N.B. 1950, Jr.E.I.C., age 30, married. 4 years experience as construction engineer on highways, including reinforced concrete bridges. 2 years in charge of building construction, including sewage disposal systems, water supply etc. One year as design engineer of municipal street layout, landscaping etc. Available on short notice anywhere in Canada. File No. 4419-W.

CIVIL ENGINEER, D.L.C. Hons (Civil Engineering), M.E.I.C., P.Eng., (Ont.), Grad. Inst. Struct. Eng., awaiting election to A.M.I.C.E., age 28, single, 6 years experience on construction of dry dock and deepwater quay, power station, airfields, bridges, roads and railways, survey, design of steel-piled cofferdams, track layout and construction schemes. Responsible for supervision of layout, construction, concrete inspection, pile-driving, underwater drilling, pressure grouting, test boreholes, diving operation, measurement of quantities and cost reports. Presently employed as area engineer on construction of chemical plant. Desires position of responsibility suitable to past experience. Location—anywhere in Canada. File No. 4420-W.

ADMINISTRATIVE ASSISTANT. B. Eng., Jr.E.I.C., McGill 1952, age 26. Experience includes time and methods study, job classification and plant engineering. Presently graduate student in business administration at University of Toronto. Desires position as staff assistant to an executive in a company in Toronto. Available in May. File No. 4421-W.

MECHANICAL ENGINEER (McGill-1951) Jr.E.I.C., single, age 27. At present attending Graduate School of Business Adminitsration (Western). Two years experience in engineering department of a newsprint mill, layouts, maintenance, reports, budgets, field work and 4 summers varied experience in construction, manufacturing, etc. Seeking employment with medium or small sized manufacturing concern Location preferably Ontario. Available mid-May. File No. 4423-W.

MECHANICAL ENGINEER. Bilingual, M.E.I.C., P.Eng., age 41, M.Sc. 1938, veteran, presently employed. 16 years diversified technical experience in Air Force and industry, including 6 years Canadian experience in design and maintenance of steel mill equipment, structural steel, piping, handling equipment, transmissions, plant layouts, reinforced concrete, building etc. — desires position requiring initiative, organizing and supervisory ability. File No. 4425-W.

ELECTRICAL ENGINEER, Jr.E.I.C., P.Eng. Nova Scotia Technical College 1952. Age 28, married, one child. Presently engaged as electrical inspector with corps of engineers, U.S. Army on defence projects in Labrador. Duties include diesel and steam power plants, power transmission and distribution facilities and the installation of electrical equipment in connection with extensive P.O.L. distribution Have open mind regarding position offered. Foreign location preferred. Available upon reasonable notice to present employer. File No. 4428-W.

CIVIL ENGINEERING GRADUATE (B.Sc. St. Andrews University, Scotland) 1953, with some field experience, desires position anywhere in Canada. File No. 4429-W.

ENGINEERING PHYSICIST M.Sc. (Physics) Delft U. (Netherlands) 1950, B.Sc. (Electrical Engineering) 1936, 7 years service and sales engineering of medical X-ray equipment, 2 years development of X-ray tubes, 3 years electrical and electronic instrumentation in university lab. 4 years representation of large European manufacturer of radio and electronic equipment, electron tubes and electronic components in national and international electro technical standardization committees. Experienced secretary of international technical conference, good specification writer, fluent English and German, working knowledge of French. Married, three daughters. Detailed resume on request. Interview preferably in first week of April. Location Western Canada or Southern Ontario. File No. 4430-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.A.Sc. University of British Columbia 1951, single, age 35. Seeks position in communications in British Columbia. Two years experience in meteorology and marine and aviation radio communications prior to graduation. Post graduate experience; 1¾ years of development, production, and maintenance engineering in quartz crystals manufacture; 1 year development work on microwave equipment. File No. 4431-W.

MECHANICAL ENGINEER, P.Eng., G.I.Mech.E., single, age 27. Experience: 2 years general workshop practice including overhaul of steam and diesel engines and factory machinery repair. 18 months machine and structural design and draughting. Desires work on production or plant maintenance in Montreal or B.C. File No. 4436-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng. Age 32, married, bilingual. Seven years varied experience in electric generation and distribution. Some familiarity with relays. Good mathematical background. Desires opportunity to train as relay engineer with large utility. Would consider attending G.E. or Westinghouse relay course and willing to sacrifice for this opportunity. Location no object. File No. 4437-W.

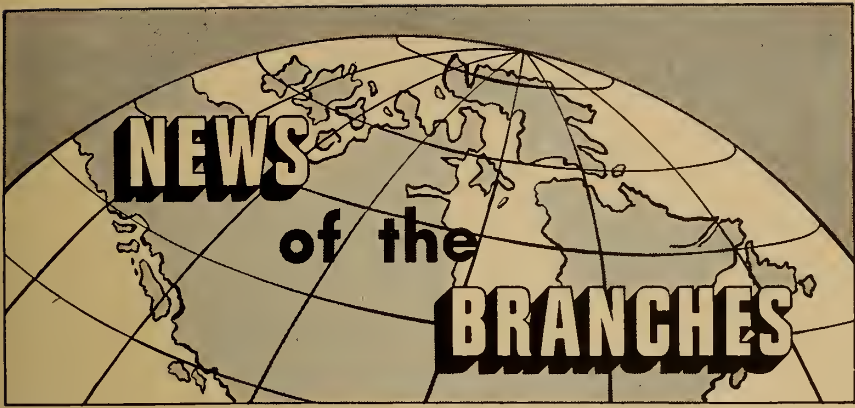
# Attention, Employers

**• Available to you in June 1954 will be seventeen Canadians with engineering degrees and who have also graduated in Business Administration from Harvard University.**

***Please Communicate with Placement Officer***

**Canadian Club**

**Harvard Business School** **Boston 63, Mass.**



**Activities of the Forty-seven Branches of the Institute and abstracts of papers presented at their meetings**

## Belleville

C. H. Lusk, Jr.E.I.C.,
*Secretary-Treasurer*

***Isotopes in Industry***

The Belleville Branch of the Engineering Institute of Canada held its regular meeting at the Masonic Temple in Belleville on January 11 with 46 members present.

As there was no general business to bring before the meeting, C. R. Whittemore, chairman, called on J. H. Legate to introduce the speaker.

C. H. Hetherington, a representative of the Commercial Products Division of Atomic Energy of Canada Limited, addressed the Branch on the subject, "Isotopes in Industry". In his introduction, the speaker briefly traced the history of Atomic Energy of Canada Limited and, in particular, the growth of the Commercial Products Division.

Mr. Hetherington then showed slides and gave a brief description of the atomic reactor NRX at Chalk River. NRX is a heavy water pile which is considered to have certain advantages over the graphite pile. There are three main types of product obtained from an atomic reactor, namely, fission products, irradiated products and separated isotopes. The industrial use of isotopes can be broken down into two main categories. These are a source of ionizing radiation and a tracer.

The speaker then outlined the various ways in which isotopes are used as a source of ionizing radiation. These include the science of radiography by which metal castings are tested and examined, the control of liquid levels and densities in tanks, the detection of leaks in pipes, the elimination of static, and the determination of soil moisture. It was also explained how the use of isotopes is applied to thickness gauges in paper mills and sheet metal mills.

Mr. Hetherington also explained briefly, the application of isotopes in chemical analyses and in the sterilization of meats and various types of food. He also noted that in the future, atomic energy would undoubtedly be used to generate electricity in steam plants. In this regard, he remarked that if it could be completely burned, one pound of nuclear fuel would produce the equivalent heat energy of 1,300 tons of coal.

In conclusion, the speaker showed some slides and explained the application of cobalt 60 in the treatment of cancer.

The appreciation of the Branch was expressed to Mr. Hetherington by J. C. R. Punchard.

## Calgary

W. E. Hawkins, M.E.I.C.,
*Secretary-Treasurer*

R. F. Bailey, M.E.I.C.,
*Branch News Editor*

***January 7 Meeting***

The speaker of the evening was Harold W. Riley, Q.C., who spoke on the subject "What Makes a Substance a Mineral in Law as Distinct from the the Engineering World."

For his talk, Mr. Riley discussed the now famous "Sand and Gravel" case and the more recent "Borys" case both of which centered around the Edmonton area.

In the case of the former, the Alberta Courts applied an English rule which ruled that a mineral is a substance which is:

1. Taken from under the surface for profit.
2. Rare and exceptional to the area.
3. Valuable in the vernacular sense of mining and commercial men and landowners at the time of the reservation.

The Province of Alberta then passed an Act saying that sand and gravel were not minerals. The Supreme Court then upheld the Act by ruling that sand and gravel were not minerals since they represented a stage in the geologic development of agricultural soil.

In the "Borys" case, petroleum, coal, and valuable stone were reserved and the court had to decide if the word "petroleum" included the natural gas in its original meaning in 1906. It was argued that in 1906 gas was considered as a waste product only. Finally, the Privy Council ruled that petroleum included oil and natural gas in solution but not the gas cap. However, Mr. Riley pointed out that this ruling has very limited application since most reservations since 1912 were for all mines and minerals.

***Building Research***

R. F. Legget, director, Division of Building Research, National Research Council, Ottawa, spoke to the Calgary Section on January 21 on "Building Research and the New National Building Code."

For his introductory remarks the speaker traced the historical background of building codes from the earliest times.

Building research in Canada had its beginnings in 1933 but progress was hindered due to the depression. The need for a uniform building code was realized more fully in 1936-37 when the National Housing Act was instituted. By 1947 the Building Research Division of the National Research Council was formed with its basic policy being the study of problems which are peculiar to Canada only.

The basic problems being studied by the Building Research Division are as follows:

1. Building Materials
2. Climate
3. Fire Research
4. Cold Weather
5. Northern Building
6. Snow and Ice Research

Canada's first National Building Code was published in 1941 as an advisory document and was adopted by 120 Canadian cities, towns, and municipalities. While considered an excellent work both in national and international circles, the original code had many confusing and sometimes contradictory references. As a result, a twenty man committee was set up to bring the code up to date and to eliminate the faults of the old code.

The speaker stated that the new code was now in the printer's hands and would be published in separate sections each in pamphlet form. These sections are:

1. Administration
2. Climate
3. Use and Occupancy
4. Design
5. Materials
6. General Services
7. Plumbing
8. Construction Safety Measures

It was the speaker's hope that the new building code would find ready acceptance by all cities and municipalities across Canada.

## Central British Columbia

H. L. Topham, Jr.E.I.C.,
*Secretary-Treasurer*

***Joint Meeting***

The meeting of the joint executives of the Central British Columbia Branch and the British Columbia Engineering Society was held in Kelowna, B.C., on January 8, 1954, at the Water Rights Office, 435 Bernard Avenue. The meeting convened at 7:30 p.m.

The following executive members were in attendance:

M. L. Zirul, chairman of the E.I.C.; W. A. Ker, vice-chairman, E.I.C.; R. L. Bigg, immediate past chairman, E.I.C.; H. DeBeck, committeeman; E.I.C.; H. Topham, secretary-treasurer, E.I.C.; A Dimock, committeeman, E.I.C. and B.C.E.S.; R. G. Harris, chairman, B.C.E.S.; T. S. Hughes, secretary-treasurer, B.C.E.S.

The minutes of the last executive meeting held at Penticton on July 10 were read and adopted.

It was moved by Mr. Bigg and seconded by Mr. Dimock that the secretary-treasurer acknowledge the selection of Mr. Stephens as president of the Institute for the coming year.

After some discussion it was suggested that the secretary-treasurer advise Headquarters that if the annual meeting of the Engineering Institute of Canada is to be held in Zone A in 1957, that Jasper would be favored as the choice of this executive.

It was moved by Mr. Ker, seconded by Mr. Hughes, that R. L. Bigg be appointed as our Branch representative on the Nominating Committee for the year 1954.

It was moved by Mr. DeBeck and seconded by Mr. Harris that D. W. Simon, Bruce Gilmour and Gordon Jones be accepted as Branch affiliates.

The following dates and locations were selected for the dinner meetings which are to be held during 1954:

February 13, Kelowna: This meeting is to be sponsored by the E.I.C. It will be a mixed dinner meeting, as the President and Secretary from Headquarters will be present. The Kelowna convenor is to invite the local civic officials who would care to attend.

April 9, Kamloops: Sponsored by the B.C. Engineering Society.

June 11, Penticton: Sponsored by the E.I.C.

September 10, Vernon: Sponsored by the B.C. Engineering Society.

November 26, Kelowna: Sponsored by the E.I.C. It was decided that this should be a joint annual meeting of both Branches in order to ensure a maximum attendance of each Branch.

The following were appointed to the convening committee in each centre, and they were to act jointly in all the arrangements and to endeavor to ensure a good attendance of the membership located in their respective centres.

Kamloops—H. DeBeck, F. Dembiske
Vernon—F. G. DeWolfe, A. Dimock
Kelowna—G. Meckling, R. Harris
Penticton—A. F. Joplin, W. J. M. Owen.

Mr. Ker of Kelowna and Mr. Wade of Kamloops were appointed as a committee to arrange for a program at each of the meetings.

Mr. Bigg was appointed as Chairman of the By-laws Committee for the coming year.

It was moved by Mr. Dimock and seconded by Mr. Bigg that at each general meeting in 1954 the refreshments, when served, be from 6:00 to 6:30 p.m. with dinner at 6:30 sharp, instead of 7:00 o'clock approximately, as it has been heretofore.

It was suggested that during the business session of the dinner, the minutes of the previous meeting be read and all other correspondence which could be dealt with by the executive, should be referred to the next executive meeting.

It was moved by Mr. Bigg and seconded by Mr. DeBeck that Mr. Harris, the convenor of the presidential dinner, to be held in Kelowna on February 13, should be advanced $30.00 from our Branch treasury in order to make dinner arrangements.

It was requested that the secretary-treasurer contact Mr. Hatfield and Mr. Walker of Penticton about meeting the presidential party and arranging for their transportation to Kelowna for the dinner meeting.

It was moved by Mr. Bigg and seconded by Mr. DeBeck that a vote of thanks be conveyed to the present secretary-treasurer, H. L. Topham, for his services during the past two years.

It was moved by Mr. Dimock and seconded by Mr. Bigg that the meeting be adjourned. The time was 10:00 p.m.

## Edmonton

Percy M. Butler, jr.e.i.c.,
*Secretary-Treasurer*

K. Provost, m.e.i.c.,
*Branch News Editor*

***Traffic Problems***

The Edmonton Branch held its January meeting at the "Seven Seas" under the chairmanship of N. J. Allison.

The program for the evening consisted of a discussion of some of Edmonton's traffic problems by members of the Public Speaking Group. Evans Moore acted as Master of Ceremonies and introduced the speakers.

Bob Kerr, who was the first speaker in the group, presented statistics which showed that the 45,000 cars registered in Edmonton in 1953 represented a 300 percent increase over the number in 1946. During the same period the population increased 60 percent. Edmonton's per capita car density is now one car for every four people. This density is surpassed only by the city of Los Angeles.

The number of accidents in the city has increased by about the same ratio as the number of cars. The number of fatalities, however, was 16 in 1953 as compared to 12 in 1946.

Mr. Kerr described how the present day traffic problems were being answered by the extended use of traffic lights, introduction of one way streets, control of parking through the use of parking meters and no parking areas, police direction, the elimination of level railway crossings, the use of "clover leafs" and by driver education.

The second speaker was Stan Hampton. He described the difficulties encountered by the driver in travelling from Edmonton's Strathearn district to the downtown area. Mr. Hampton suggested three alternative ways in which traffic crossing the river in this area could be accelerated. These were the installation of traffic actuated signals on the approaches to the Low Level Bridge, the building of "clover leaf" approaches, or the building of a new bridge. The use of traffic actuated signals is the system being given serious consideration by city authorities at the present time.

The third speaker, Paul Buckland, described how the C.N.R. and C.P.R. trackage presented man-made barriers to the free flow of traffic out of the downtown area. He suggested how the bottlenecks could be relieved by constructing additional overpasses or subways at critical points.

After an interesting question period the group was thanked by L. F. Grimble.

## Huronia

Louis Morgante, jr.e.i.c.,
*Secretary-Treasurer*

On January 21 at the Orillia High School a very interesting meeting was held of the Huronia Branch of the Engineering Institute of Canada. Some forty Engineers and guests were present.

The highlight of the evening was an address by Orval Johnston, Project Engineer. His subject was Ontario Hydro's Sir Adam Beck Niagara generating station No. 2.

The address dealt with the complete development of this $350,000,000.00 project.

Spread across an eight mile distance, this project includes the intake structure some 2 miles above the Falls near Chippawa, twin tunnels under the City of Niagara Falls, an open cut canal following the tunnels, and a new powerhouse located at Queenston some six miles below the cataracts.

Two 500 ft. gathering tubes are like gigantic mouth organs in appearance, and from these the water proceeds down underneath the City of Niagara Falls, through twin tunnels 5½ miles long and some 45 ft. in finished inside diameter and located some 330 ft. below the ctiy. These tunnels emerge into a 2¼ mile open cut canal which in turn carries the water to a huge forebay for delivery to the penstocks.

Construction of the tunnels was a major feat of modern mining engineering. Five access shafts were sunk into the rock past the depth of the tunnels and located 6,225 ft. apart along the tunnel route. Broken rock was loaded with power shovels into 15 ton trucks and hoisted to the surface in skips.

The twin hydraulic pressure tunnels are, as far as is known, the largest of their type in the world. They have a rough diameter of 51 ft. which is reduced to a finished diameter of 45 ft. by the 3 ft. thick circular concrete linings. Approximately 1,056,000 cu. yd. of concrete was required to line the tunnels. Almost 10,000,000 tons of rock had to be excavated from the tunnels. Some 38,290 tons of structural and reinforcing steel was used in supporting the roof and sides of the tunnels.

It was pointed out in this talk that the use of models saved millions of dollars in the overall project. Models made it possible to determine how current would act and saved a tremendous amount of rock excavation that otherwise would have been necessary.

One very interesting aspect was the intersection of the power canal for the new project with the original No. 1 Sir Adam Beck power canal development.

Another very interestering aspect is that arrangements are made such that the huge tunnels can be pumped out in about one week so inspection can take place if and when found necessary. Electric pumps are located down on the bottom of these tunnels completely housed in and protected from the water, and the only connection to the surface is by means of an electric cable. Such pumps may be idle for years at a time and then it may be necessary to start them at a moment's notice. They are designed for this service.

Velocities through the tunnels are such that silt will not deposit.

The site of the powerhouse six miles below the cataracts enables 295 ft. of the 315 ft. difference in level between the intake and the powerhouse to be

# B.F. Goodrich OFFERS YOU A NEW ANGLE (45°) ON CONVEYOR BELTS

## NEW RIBFLEX **GRIPTOP** IS SELF-CLEANING, GRIPS BETTER SAVES SPACE, LASTS LONGER!

This new B. F. Goodrich RIBFLEX GRIPTOP is an important advance in conveyor belts. With RIBFLEX you can increase the incline angle up to 45 degrees . . . use a 29% shorter conveyor, and *save 42% floor space.* Check these *premium* features . . . and you will specify a "BFG" RIBFLEX GRIP TOP Conveyor Belt.

1. RIBFLEX has special flexing ribs with over 5700 non-slip grip blocks to each square foot of belt.
2. RIBFLEX "flexible fingers" grip surely, safely. It gives 16% longer life than other rough surface belts. Design permits most efficient use of rubber in top cover.
3. RIBFLEX is completely self-cleaning. Can't clog. It's flexible ribs fan out over pulleys and discharge material lodged in grooves.
4. RIBFLEX saves you money by making your materials handling cheaper and more efficient.

Before you buy another replacement belt—or design a new installation—*get all the facts about this new, radically improved "BFG" GRIPTOP Conveyor Belt.* Contact your nearest B. F. Goodrich office, distributor or conveyor manufacturer.

utilized for the production of electric power. This means only a 20 ft. friction head loss for the whole length of the eight mile project; 50 per cent more power can be produced than if the powerhouse were built immediately below the falls where a head of only 200 ft. could be obtained.

The project has been designed such that the scenic beauty of the falls and the gorge will not be impaired. A treaty between the Canadian Government and the United States Government specifies a minimum of 100,000 cu. ft. per second flow during daylight hours in the tourist season and 50,000 cu. ft. per second at all other times. The balance of the water available is split evenly between the United States and Canada.

As an indication of the quantity of flow, the building intake structure will divert 15,000,000 gallons of water a minute to the two tunnels. This is enough water to supply the citizens of Niagara Falls for one week.

Plans are under way to provide further power by storing water. A storage reservoir containing 650,000,000 cu. ft. of water is to be built and a pumping plant will pump the water into this storage basin at night. Then during periods in the daytime when peak power is required, this water will be used for generating power.

In answer to a question from the floor, Mr. Johnston gave it as his estimate that the capital cost of the project was approximately $190.00 per installed horsepower. This is a very low capital cost considering present construction costs.

Some forty engineers present agreed that this was one of the most interesting talks they had heard at the Huronia Branch.

## Lakehead

G. E. Cook, M.E.I.C.,
*Secretary-Treasurer*

H. Penner, Jr.E.I.C.,
*Branch News Editor*

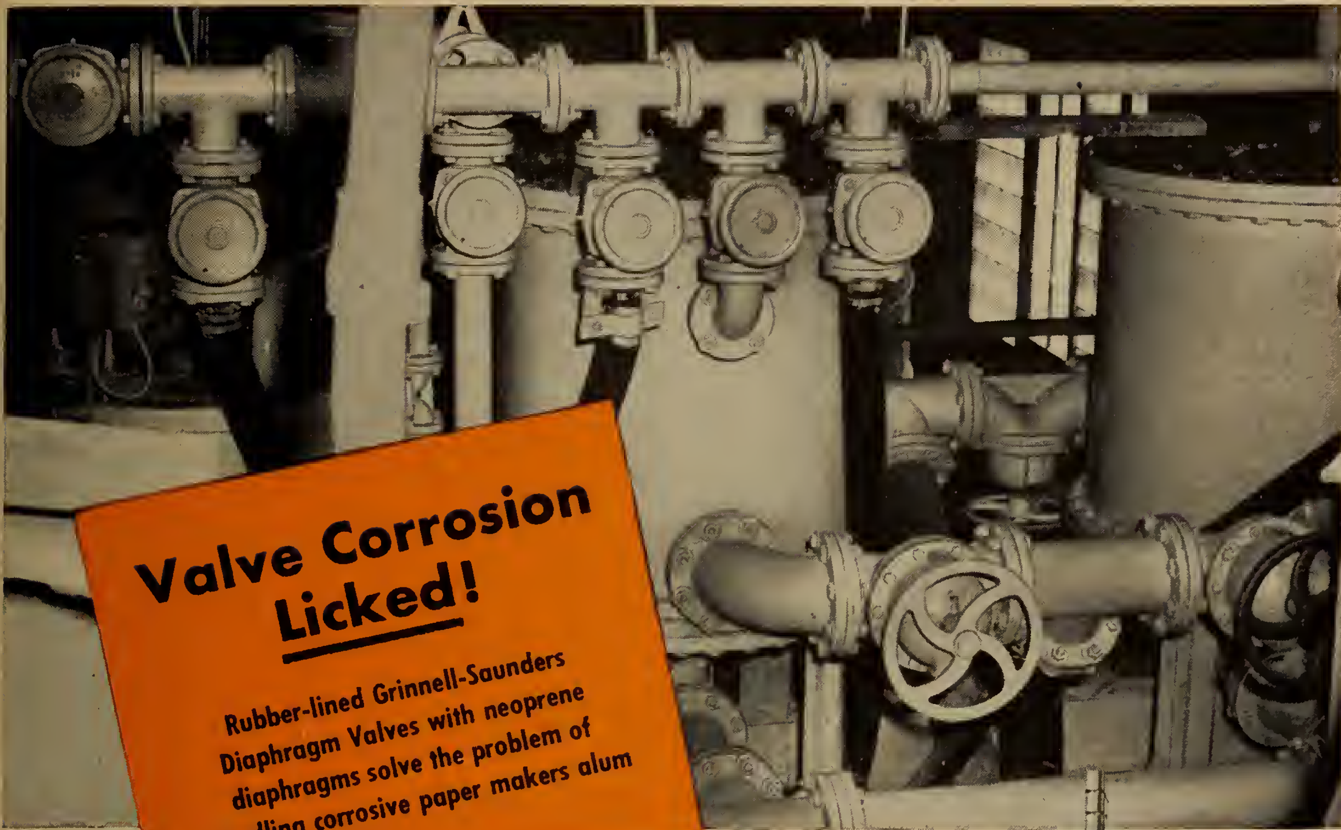
**Annual Dinner and Dance**

The annual dinner and dance of the Lakehead Branch was held on January 30 at the Royal Edward Hotel, Fort William. Since the tentative date for this affair coincided with the president's annual visit, it was decided to combine the two events in one evening. The evening as planned called for a dinner, a talk by the president, followed by a dance. The evening was very successful even though it was incomplete. Due to weather conditions, President Dobbin was marooned at Sault Ste. Marie after a visit to the branches there.

Cocktails were served at 5:30 and the dinner served at 7:00 featured roast veal on the menu.

G. S. Halter, chairman of the Lakehead Branch, called on J. M. Fleming, D. I. Nattress and J. Antonisen who were to have introduced and thanked the speaker in turn. These members outlined briefly Mr. Dobbin's previous associations and activities. Mr. Antonisen carried on a fifteen-year-old tradition in that he was again called on to move the vote of thanks to the visiting president. At close to 85 years of age Mr. Antonisen, who takes a keen interest in Institute affairs, is the oldest member of the Lakehead Branch.

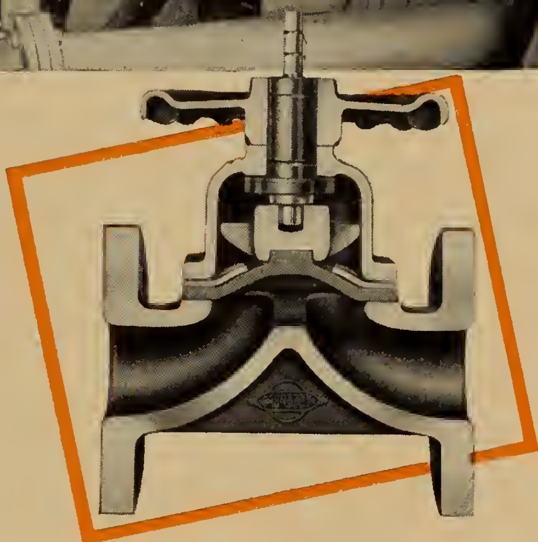
After the dinner and abbreviated speeches were over, the guests danced until midnight. A crowd of about 150 were present.



## Valve Corrosion Licked!

**Rubber-lined Grinnell-Saunders Diaphragm Valves with neoprene diaphragms solve the problem of handling corrosive paper makers alum**

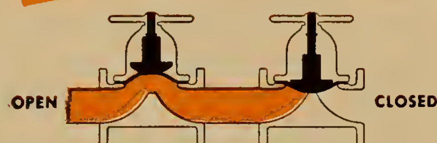
# GRINNELL-SAUNDERS DIAPHRAGM VALVES



Commercial aluminum sulphate can be everlastingly troublesome, as anyone knows who has ever had to work with it. That's why in the manufacture of "paper makers alum" the preference is for Grinnell-Saunders Diaphragm Valves. In fact, the wide range of body, lining and diaphragm materials available with Grinnell-Saunders valves offers flexibility in handling a variety of corrosive fluids.

The basic design of the valve is an advantage. Working parts are completely isolated from the fluid stream which, in the case of corrosive acids, means longer valve life. Also, there is the matter of economy. With Grinnell-Saunders Diaphragm Valves, it is usually possible to go to less expensive body materials, to which special body linings can be added. Replacement and maintenance expenses, moreover, are greatly reduced.

Orginally designed and ideally suited for air and water service, Grinnell-Saunders Diaphragm Valves also are recommended for almost every regular or special service. This is backed up by the excellent performance records achieved by valves now in use.



***Features of Grinnell-Saunders Diaphragm Valve:***

- Diaphragm absolutely isolates working parts from fluid
- Diaphragm lifts high for streamline flow in either direction
- Diaphragm presses tight for positive closure
- Body, lining and diaphragm materials to suit service
- Simple maintenance — diaphragm easily replaced without removing valve from line

## Montreal

R. J. Harvey, M.E.I.C.,
*Secretary-Treasurer*

S. T. Rudkin, M.E.I.C.,
*Publicity Chairman*

#### General Semantics

On January 7, under the sponsorship of the Management Section, James T. McCay, vice-president of the consulting firm of Bois, McCay and Associates, gave a most interesting talk to a large audience on the subject "General Semantics and Executive Methods". He told how this new science can help executives acquire additional skills in analyzing situations, planning, communicating, and human relations, with particular emphasis on its application in creative thinking. The speaker made use of his audience to give practical demonstrations of some of his points. The meeting chairman was D. A. J. McDonald, and arrangements were by R. M. Lester.

#### Joint Meeting

"A Review of Protective Gear Practice in the United Kingdom" was the topic under discussion at a joint meeting of the Electrical Section and the A.I.E.E., held on January 11. The speaker, C. H. W. Lackey, is engineer-in-charge of research at A. Reyrolle & Company in England, manufacturers of electrical switchgear. He is the author of a number of papers on protective gear and of a book entitled "Fault Calculations". In his talk, the speaker gave a broad outline of British practice in providing protection for generators, transformers, busbars and transmission lines,. J. M. Crawford was meeting chairman, and J. R. Auld was in charge of arrangements.

#### Road Test

On January 14, the Transportation Section were sponsors of a meeting at which a film entitled "The Maryland Road Test 1-MD" was shown to an appreciative audience. In order to determine the relative effects of mobile loads of varying magnitudes on concrete highways, the United States Highway Research Board, in co-operation with a number of other organizations, conducted an actual operating test, lasting six months, on what was considered a typical section of concrete highway, in the State of Maryland. This operating test, in great detail, correlated with laboratory experiments on models, was documented on the above film of some ninety minutes duration, and is becoming of increasing interest to those in the engineering profession concerned with the construction of our great highway systems. E. Gohier, the meeting chairman, spoke briefly on Quebec's highways and loading regulations. J. D. Sylvester was in charge of meeting arrangements.

#### Strategic Metals

"Strategic Metals in the Canadian Defence Program" was the subject of a talk given on January 19 at the Royal Canadian Engineers Armoury by Dr. John Convey, Director of the Mines Branch of the Department of Mines and Technical Surveys. The meeting was jointly sponsored by the Chemical Section and the Military Engineers Association. The speaker stated that two world wars have shown that Canada must be prepared to solve her own mining and metallurgical problems, and an integrated and co-operative development program between private industry, government and the universities is accomplishing this. Among the strategic metals referred to were titanium, strong, light and high corrosion resistant; uranium, the key essential in the atomic energy process; columbium, essential in the production of stainless steel and steels used in high temperature parts of aircraft engines; cobalt, much used in radar equipment and high speed cutting steels; sulphur, scarce but approaching self-sufficiency thanks to extraction techniques developed. Major J. N. Davies was meeting chairman, and L. A. Phillips was in charge of meeting arrangements.

#### "Quality Acoustics in Radio Broadcasting"

On January 25, the Electrical Section, jointly with the A.I.E.E. and the I.R.E. sponsored a meeting at which Reginald E. Penton spoke on a "Popular Approach to Problems of Quality Acoustics in Radio Broadcasting". For the last seven years, the speaker has been with the C.B.C. working principally with the Transmission and Development Department of the Engineering Division, specializing in acoustics. He stated that today's growing noise problem is a forerunner of acoustic regulations in building codes and machinery construction specifications. Such regulations would have to be extremely explicit, in order to meet the recommended noise levels set by the Noise Abatement Society, which studies the problem of noise. The speaker pointed to soundproof broadcasting studios as evidence that the nuisance can be overcome, and the methods need not always be expensive. Allan B. Oxley was meeting chairman, and J. E. Hayes was in charge of meeting arrangements.

EVERY INSTALLATION YOU MAKE IS

# HEAT PROTECTED

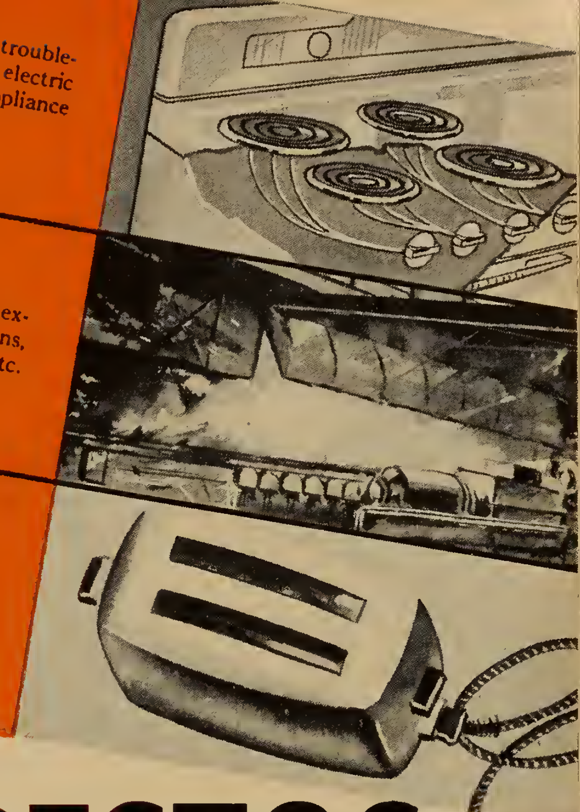
WHEN YOU USE

# Phillips

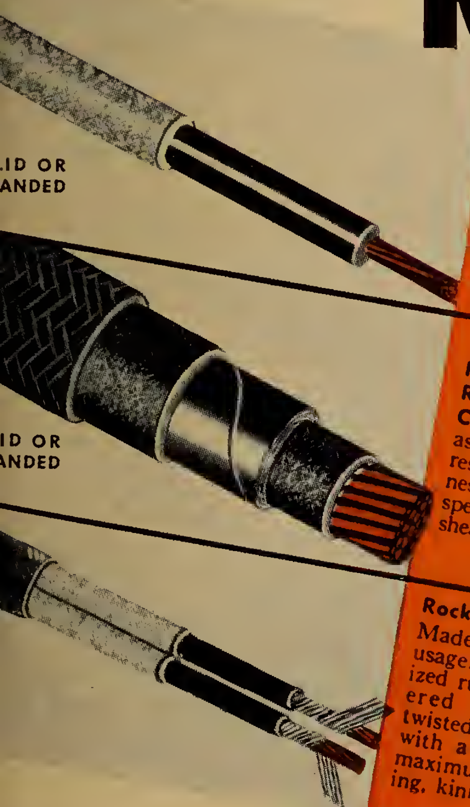
. . . for long-life, trouble-free service on electric ranges and appliance leads.

. . . where conduit is exposed to furnaces, ovens, soaking pits, boilers, etc.

. . . on portable heaters, toasters, movie projectors and other portable heat-generating appliances.



# ROCKBESTOS WIRING



**This Rockbestos Wire** comes in two basic types:

- For use in Electric Ranges
- For Lead Wires on Small Appliances

Both are heavily insulated with felted asbestos for heat protection.

**Rockbestos A.V.C. Boiler Room Wire and Power Cable** can be run in conduit as it has ample moisture resistance to withstand dampness. For excessive moisture specify Rockbestos with lead sheathing.

**Rockbestos Heater Cords** Made to withstand rough usage. Insulated with vulcanized rubber, generously covered with dry asbestos, twisted together and covered with a braid that provides maximum resistance to flexing, kinking and *twisting.*

You can't beat PHILLIPS Rockbestos insulated wires for heat endurance and resistance . . . on any job! They are insulated with fireproof asbestos, compressed and impregnated with neutral insulating compounds, so that they're not only fireproof, but resist oils, greases, corrosive fumes and age. When you finish any wiring job with Rockbestos, you can consider it a job well done—one that will stand up for years and years, without need for replacement. Rockbestos is easy to work with, too—it's very pliable and strips easily, allowing you to do jobs faster . . . cutting down on labour costs.

Before doing that next wiring job, investigate PHILLIPS Rockbestos Wires . . . and see how much better they are.

A WIRE FOR EVERY JOB

**Phillips**

NAME ..........................................................

FIRM NAME ..........................................................

ADDRESS ..........................................................

CITY or TOWN ..........................................PROV. ....................

5303 E.J.

***Foundation Behaviour***

On January 28, under the sponsorship of the Civil Section, Dr. G. G. Meyerhof, of the Foundation Company, addressed a meeting of some seventy engineers on the subject "Recent Studies of Foundation Behaviour". He outlined the practical results of research on the bearing capacities and settlements of various types of foundations, and clearly illustrated by examples of existing structures, that settlement could be reasonably predicted from field and laboratory test results. In presenting a new design approach linking wall materials and structural frame with the foundation behaviour, Dr. Meyerhof suggested that the relative stiffness of structure and soil foundation could be co-related when considering the expected behaviour of the foundation. R. F. Ogilvy was meeting chairman, and the speaker was thanked by J. Racey. W. Sefton was in charge of meeting arrangements.

***Professor Magnel Is Guest Speaker***

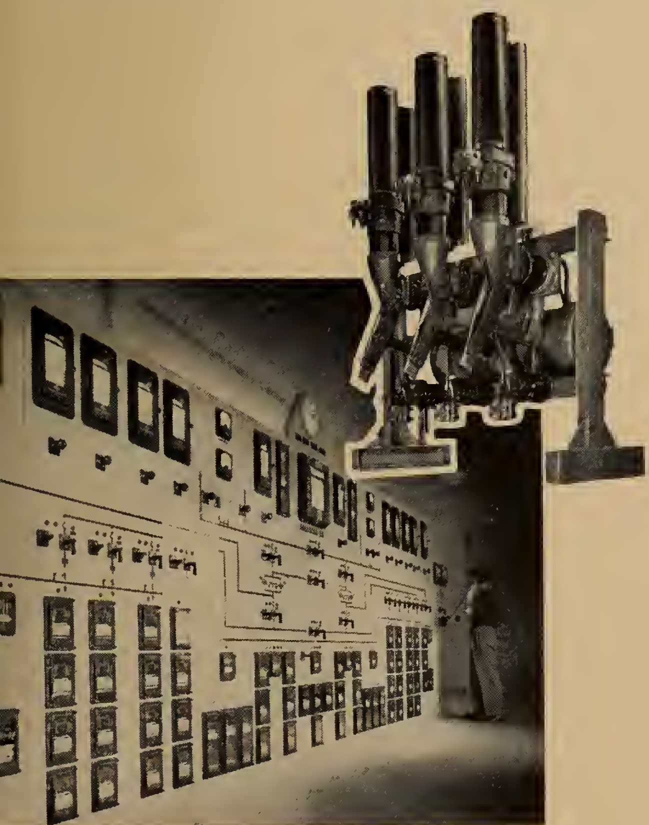
To an overflow crowd of over two hundred engineers and architects, at a joint meeting held on February 1 between the Civil Section and the P.Q.A.A., Professor G. Magnel spoke on "Recent Developments in Prestressed Concrete". A member of the Royal Belgium Academy, Professor of Reinforced Concrete at the University of Ghent, a Director of the Precompressed Concrete Engineering Company Limited, and author of many fundamental treatises on reinforced and prestressed concrete, the speaker is universally acknowledged as one of the outstanding authorities in that field. He suggested that the development of prestressed concrete design must be a logical step-by-step advancement of thorough research and ideas. In the last three or four years, design methods for continuous structures were being developed and tested, whereas previously only statically determinate structures were fabricated in prestressed concrete. Professor Magnel advised the use of a design based on ultimate load rather than the elastic theory, and suggested the use of an empirical formula based on experimental results. In their proper application, prestressed structures could compete economically with other types. The speaker emphatically stated that the time for writing codes or specifications for prestressed concrete had not yet arrived, as the ultimate system of design was yet to be found, and would probably be a combination of the ideas of many systems. The use of prestressing of materials, such as structural steel and stone, was shown on a number of slides. Canadian engineers and construction men were complimented on the high quality of their projects, among which was the biggest industrial prestressed roof ever built, at the Central Ordnance Depot at Cobourg, Ontario. Whereas winter construction is expensive and difficult, low temperatures actually increase the strength of prestressed structures. Dr. I. Brouillett was meeting chairman, and R. F. Shaw, P.E.Q. president, thanked the speaker. J. E. Hurtubise was responsible for meeting arrangements.

***President's Visit and Annual Meeting***

The Annual Meeting of the Montreal Branch and E.I.C. President R. L. Dobbin's official visit both took place on January 21. At noon and 4:30 p.m. respectively, the president visited student engineers at Ecole Polytechnique and McGill, and presented Jean Blouin and Stanley McGurk with the E.I.C. students' prizes for 1953. At 6:00 p.m., Mr. Dobbin was entertained at dinner at the St. Denis Club by members of the executive and committee chairman. At 8:15 p.m. the Branch Annual Meeting was held at Ecole Polytechnique, with a large gathering of members present. The business portion of the meeting consisted of the presentation of the annual report, the induction of new officers, presentation of Institute awards and an address by President Dobbin. In the course of this most interesting talk, Mr. Dobbin described his visit to the Coronation services as official E.I.C. representative and spoke most highly of British engineers as very active and up to date. He also told of a trip to Newfoundland, where he considered there were excellent opportunities for young engineers. Retiring Branch Chairman, G. N. Martin, thanked his committee for their excellent cooperation during the year. He stated that eleven branch members were presented with life memberships, and the gathering was asked to observe two minutes silence for sixteen branch members who had died during the year. Mr. Martin then turned over the chair to the new branch chairman, R. L. Dunsmore.

In recognition of services to the E.I.C. and the profession generally, President Dobbin conferred Honorary Membership certificates on F. R. Shearwood, former chief engineer of the Dominion Bridge Company, and Arthur Surveyor, promin-

TRANSF.2D.
C B A



ent consulting engineer. The Ross Medal, awarded for the best paper of the year on an electrical engineering subject, was presented to John S. Kendrick, co-author with F. L. Lawton of a paper entitled "Nechako-Kemano-Kitimat Hydro-Electric Power Development and Aluminum Reduction Plant." Mr. Lawton had received his medal at the Halifax Annual Meeting. The Julian C. Smith medal, awarded for achievement in the development of Canada, was presented by Mr. Dobbin to John E. Armstrong, former chief engineer of the C.P.R. At the conclusion of the meeting, those present were taken on a conducted tour of the Ecole Polytechnique laboratories, after which refreshments were served, and enjoyed by all.

The following are the members of the 1954 Executive Committee:

Chairman, R. L. Dunsmore; Past chairman, G. N. Martin; Vice-Chairman, C. E. Frost; Secretary-Treasurer, R. J. Harvey; Committeemen: W. H. Gauvin, C. G. Kingsmill, H. A. Mullins, Jules Archambault, R. Brais, P. W. Gooch.

Committee Chairmen are: Program, R. A. Phillips; Membership, S. W. Pappius; Policy and Coordination, C. E. Frost; Publicity, S. T. Rudkin; Student Guidance, W. H. Moore; Admissions, W. H. Gauvin; Reception and attendance, E. D. Gray-Donald; Entertainment, L. Scharry; Chairman, Junior Section, L. T. Hammerschmid.

## Peterborough

D. G. C. Donaldson, M.E.I.C.,
*Secretary-Treasurer*
G. L. Davis, M.E.I.C.,
*Publicity Chairman*

***Annual Meeting***

The annual meeting of the Peterborough Branch of the Engineering Institute of Canada was held in Peterborough on January 11 at the Kawartha Golf and Country Club. The retiring chairman, Garth Wade, presided.

The meeting was honoured with the presence of Institute President Ross Dobbin. Approximately 30 members of the Branch were in attendance.

Reports of the committee chairmen during the past year were heard and the secretary's report was read. The scrutineer's report was also presented. The following members were elected to the executive for the coming year:

J. P. Watts, Chairman; J. G. Lucas, Meetings and Papers; L. H. Higgins, Membership; D. T. Bath, Property Committee; R. A. Blount, Secretary-Treasurer; G. T. Davis, Publicity; C. W. Holman, Historian; E. R. Shirley, Auditor; A. Bonney; D. G. Donaldson, Past-Secretary; G. Wade, Past-Chairman.

After the report of the scrutineer had been presented the gavel was formally turned over to Mr. Watts by Mr. Wade.

The speaker of the evening was Charles Weir of the Lindsay Division of the Ontario Department of Lands and Forests. Mr. Weir is a biologist with the department and is presently working in connection with the fish and wild life functions of this department. He presented a very interesting and informative talk on the types and geographical locations of game fish within his district. He described the work that is being done by the department towards restocking of lakes and streams and answered many questions raised by the anglers in the audience, including those of President Dobbin.

Following this, two films were shown. The first of these was a description of a fishing trip to Lake Shoshone in Wyoming and the second described a fishing expedition to South America. Following this a light lunch was served.

## Ottawa

G. A. Sutherland, M.E.I.C.,
*Secretary-Treasurer*
C. E. Howard, M.E.I.C.,
*Branch News Editor*

***Annual Meeting***

The 44th Annual Meeting of the Ottawa Branch was held on January 21, 1954, at the National Research Council Auditorium. The immediate past Chairman Dr. J. J. Green remarked on the excellent co-operation he had received

The passenger is seldom aware of door movement

from the two councillors from the Ottawa Branch, G. Ballard and T. Foulkes.

The financial report showed an operating surplus for the year of $465.42 and a bank balance as of December 31, 1953, of $1,244.59.

With regard to the Colonel By Memorial in Ottawa, negotiations have been carried out with the City of Ottawa, the Federal Government and E.I.C. Headquarters. The recommendation suggests that the memorial take the form of an ornamental fountain on a section of lawn near the National War Memorial.

Presentation of prizes to engineering students at Carleton College and University of Ottawa for $25.00 and to Ottawa Technical School and Hull Technical School for $10.00, was approved.

#### A Plan for Unity

The following motion of more than passing interest was moved by C. G. McRostie, seconded by D. E. Kennedy and passed. "Resolve that this annual meeting of the Ottawa Branch of the E.I.C. held on 21st January, 1954,

1) Express its approval of the principle that unification of the engineering profession in Canada along the lines laid down by J. H. Smith in a "Plan for Unity" is essential for the proper organization of the profession.

2) Authorize the Branch Management Committee to follow up actively through

**The Ottawa Branch management committee. Dr. J. J. Green, retiring chairman, right foreground, is shown handing over responsibilities to R. E. Hayes, the new chairman. Second row, left to right: J. K. Gordon, Hector Chaput, E. Pennock. Third row, W. E. Wakefield, T. Foulkes, G. A. Sutherland and C. E. Howard. Absent, R. F. Leggett, C. Crawford.** *Photo by Newton Associates.*

CUT GEARS

# Industrial Cut Gears of Every Type

Bevel Gears must be planed with every tool stroke converging toward the cone center. The cone center of the gear and of the pinion and the intersection of the centre lines of the two shafts must all be one and the same point. The gear and pinion must be set correctly, relative to this point, to give the right tooth contact. Small changes of position change the tooth surface bearing.

the Branch's representative on the council of the Institute the question of unification and re-organization.

The newly elected Management Committee is as follows:

Chairman, R. E. Hayes, M.E.I.C.; Vice-Chairman, R. F. Leggett, M.E.I.C.; Secretary, G. A. Sutherland, M.E.I.C.; Treasurer, H. Chaput, M.E.I.C.; Committee: C. E. Howard, M.E.I.C., D. B. Rees, M.E.I.C., C. B. Crawford, M.E.I.C.

The meeting closed with a film "Man with a Thousand Hands", depicting operations at Kitimat, B.C.

## Sudbury

George Fleming, M.E.I.C.,
*Secretary-Treasurer*

T. C. Robertson, M.E.I.C.,
*Branch News Editor*

On January 28, 1954 the Sudbury Branch of the Institute played host to R. L. Dobbin, president of The Engineering Institute of Canada. Mr. Dobbin was accompanied on his visit by J. Ogilvy, assistant field secretary. During the afternoon W. J. Ripley, chairman of the Sudbury Branch, conducted the visitors on a short tour of some of the International Nickel Company developments. After a dinner at the Granite Club for members and visitors with their ladies, Jim Smith announced that our next meeting would be March 11 and would be members' night. He had three local and very interesting speakers lined up. The business of the evening was transacted quickly in order to have as much time as possible for the more interesting events to follow.

The speaker of the evening, Mr. Dobbin, was introduced to the gathering by Percy McAdam, who outlined Mr. Dobbin's attainments and attestations to his public popularity.

In his address Mr. Dobbin showed his versatility by digressing for a time from engineering topics to describe his trip to England to witness the coronation of Queen Elizabeth. This was a most pleasing surprise for the ladies who had visions of a purely technical discourse His personalized views on the Coronation were most interesting to both engineer and his lady. Mr. Dobbin made many new friends as well as renewing many old friendships. He was high in his praise of the hospitality of the English people and felt that they particularly liked Canadians. He described them as intensely loyal, full of respect, friendly and public spirited. In spite of himself, however, Mr. Dobbin made many references to engineering and was particularly amazed at the ingenuity of the engineers in concealing 5 cameras, including television, and 500 microphones in the sanctuary of the Abbey. He could not find any of them and was forced to ask an attendant where they were.

Before thanking the speaker, Bob Moore gave a very brief résumé of the founding of the Sudbury Branch in 1949 and the growth it has experienced since that time.

Mr. Ogilvy then spoke briefly of the Institute. The present 48 branches from Newfoundland on the east to Whitehorse in the north represented an increase in membership of 50% in the past 10 years. The library now furnished the most up-to-date information available and the employment service was functioning to the advantage of everyone. He had high hopes of further advances in the professional development field.

W. Miller presented Mr. Dobbin with a copper dish poured in the Copper Refining Division of the International Nickel Company as a memento of his visit to this mining city.

A spirited display of fencing was introduced by J. Grey of the local Y.M.C.A. The use of the epi, foil and sabre was outlined and the teams in action were very entertaining. Following this the orchestra took over and dancing was the order of the evening.

## Toronto

L. F. Bresolin, Jr.E.I.C.,
*Secretary-Treasurer*

H. Fealdman, Jr.E.I.C.,
*Branch News Editor*

**"A Plan of Unity"**

The annual meeting of the Toronto Branch of The Engineering Institute of Canada was held in the Northgate Hotel on Wednesday, January 13, 1954.

A very large turnout welcomed as guest speaker J. Herbert Smith, immediate past-president of The Association of Professional Engineers of Ontario. Mr. Smith's subject was "A Plan for Unity" which detailed a merger between The Engineering Institute of Canada and The Association of Professional Engineers of Ontario.

Mr. Smith closed his address by suggesting that a joint committee of the Dominion Council and The Engineering Institute of Canada meet to form a constitution.

Following Mr. Smith's address the meeting passed a resolution recommending that the Council of The Engineering Institute of Canada appoint a committee of the Institute as a whole, to meet a committee of the Dominion Council to discuss Mr. Smith's proposal provided that the Dominion Council will also appoint such a committee.

The following elections of the 1954 executive were announced: Chairman: M. McMurray, M.E.I.C.; Vice-Chairman: M. W. Huggins, M.E.I.C., Secretary-Treasurer: L. F. Bresolin, Jr.E.I.C.; Assistant Secretary-Treasurer: B. K. Willard, Jr.E.I.C.; Committee Men Corporate: R. H. Self, M.E.I.C., C. E. Potter, M.E.I.C., J. W. Ross, M.E.I.C., R. S. Bleackley, M.E.I.C., E. R. Davis, M.E.I.C., R. S. Segsworth, M.E.I.C.; Committee Men Junior: D. R. Burns, Jr.E.I.C., R. C. Norgrove, Jr.E.I.C., H. Fealdman, Jr.E.I.C., R. T. Worden, Jr.E.I.C.

**Joint Meeting with the R.C.I.**

On Saturday, January 30, the Branch met with the Royal Canadian Institute to hear a paper by Robert Shama, MASCE, MFFCE, MIBSE, Director Gerente, Empresas Canpenon, Bernard do Venezuela, South America, on "The World's Largest Pre-stressed Concrete Spans". The meeting, which came as a fitting climax to the Canadian Conference on Prestressed Concrete held in Toronto on the previous two days discussed the cost of three concrete arch bridges on the Caracas to LeGuaira super highway which were a magnificent and daring departure in conception and design. The meeting which was exceptionally well attended augurs well for such future joint meetings.

On February 4, F. R. Whatmough, chief engineer, Canadian Standards Approval Laboratories, addressed the Toronto Branch on "The Canadian Standards Approval Laboratories". The meeting which produced a good attendance concluded with some lively discussion.

*Secretary-Treasurer*

W. Victor Morris, M.E.I.C.,
*Branch News Editor*

**Professional Development Discussed**

On January 12, an informal general meeting of the Winnipeg Branch was held to discuss the possibility of instituting a course in professional development for engineers in the Winnipeg area, such a course to embrace subjects which the engineer might find useful in his profession, but which are not normally taught in university engineering courses. Those members who attended were enthusiastically favourable to the idea of such a course, though there was some minor disagreement as to exactly what subjects would be most desirable. After discussion of courses of this nature which are already in operation in Toronto and Hamilton, as well as in other centres, a committee was appointed to see to the organizing of such a course.

It was decided that the problems of organization would be such that no attempt should be made to begin the course this spring, but that two or three "sample" lectures might be arranged before June of this year, open to all members who might be interested, and that the actual course would be planned to commence in the fall of 1954.

It was also tentatively decided that each course should be limited to about 30 members, the exact details of the course to be arranged by these members; and, if more than 30 persons were desirous of taking such a course this fall, two or more classes should be formed, so that each class would be maintained to a size capable of operating reasonably as a discussion group.

The members appointed to the organizational committee were E. M. Scott. F. S. Heeley, W. J. Patton, T. E. Weber, J. S. Merrett, G. T. Haig, R. A. Jeske, and D. G. Curiston.

**Annual Meeting**

The annual meeting of the Winnipeg Branch was held on January 28. Presiding over the meeting was G. B. Williams, the new chairman of the Branch. The business of the meeting, which included the secretary-treasurer's report and the announcement of the names of the members of the Branch Management Committee by the secretary-treasurer, C. S. Landon, was quickly concluded.

**Coal-Burning Gas Turbine**

Following the business meeting, the members were privileged to hear a paper presented by Professor R. E. Chant of the University of Manitoba Mechanical Engineering Department. Professor Chant's talk was an outline of the experimental work which has been done on the coal-burning gas turbine for locomotive application. In particular it was a discussion of the research which has been carried out in the Gas Dynamics Laboratory of McGill University, on which research Prof. Chant was engaged from 1950 to 1953.

Giving a brief historical background of the reasons for attempting to develop such a power plant, the speaker indicated that similar research was being carried on in Great Britain, France,

the United States, Australia and India as well as in Canada and emphasized the point that there was extreme co-operation between all agencies involved in the way of exchange of information and also in a more tangible way such as the loaning of equipment. The main reason why the intensive research is being carried on in so many countries is that at the present rate of use the world's supply of oil is likely to be exhausted in 12 years, whereas there is a 100-years' supply of coal in present sight. The tendency to use oil is increasing whereas the use of coal is constantly decreasing, and this trend indicates that in a few years coal will be used only in a few power plants close to coal fields.

As this trend is not an entirely healthy one, the Canadian Government was anxious to co-operate in the development of a coal-burning gas turbine, which would make more efficient use of coal as a fuel, and when in 1950 Professor Mordell of McGill University put forward a planned research program in this field, a contract was negotiated between McGill University and the Department of Mines and Technical Surveys of the Canadian Government.

Professor Chant then went on to review the various gas turbine cycles which can be adapted to burn coal, pointing out the advantages and disadvantages of each cycle, in order to make clear the reasons why Canada's development program was concentrated on the particular cycle known as the exhaust-heated cycle. Other cycles have been and are being investigated by other countries. The open cycle, in which the pulverized coal is fired before the turbine, is being investigated by the Bituminous Coal Research Inc. of the United States and the English Electric Company of Britain. The closed cycle, in which compressed air is heated by an external source, and after passing through the turbine is cooled by a cooler and recirculated, was investigated by the North Scotland Hydro-Electric Board, and a 500 horsepower experimental unit was placed in service a year ago to burn peat. This cycle has the advantage that no separator is needed, as the heat source is external, rather than being a part of the cycle.

In the exhaust-heated cycle, the coal is burned in a combustion chamber placed after the turbine, so that it shares the advantage of the closed cycle in that no separation is needed. Two heat exchangers transfer the heat of combustion to the air entering the turbine. This cycle, while having the advantage of the closed cycle in requiring no separation, does not require the large amounts of cooling water needed in the closed cycle type, and therefore is considered to be more suitable for locomotive use. Another advantage of the exhaust-heated cycle is that the combustion chamber is not under pressure, and therefore the coal may be blown into the chamber instead of having to be pumped.

Professor Chant, having pointed out the general advantages of the exhaust-heated cycle, went on to describe, with slides, some of the details of the actual research project as it was carried out in McGill University's Gas Dynamics Laboratory. The engine used was an early experimental Rolls-Royce turboprop engine, the Dart, which had developed 1,000 horsepower as an aero-engine, but under the lower temperatures and lower speeds used in the locomotive experiments, the horsepower was reduced to 550. The design achieved a thermal efficiency of 16 per cent, with a compressor and turbine efficiency of 75 per cent.

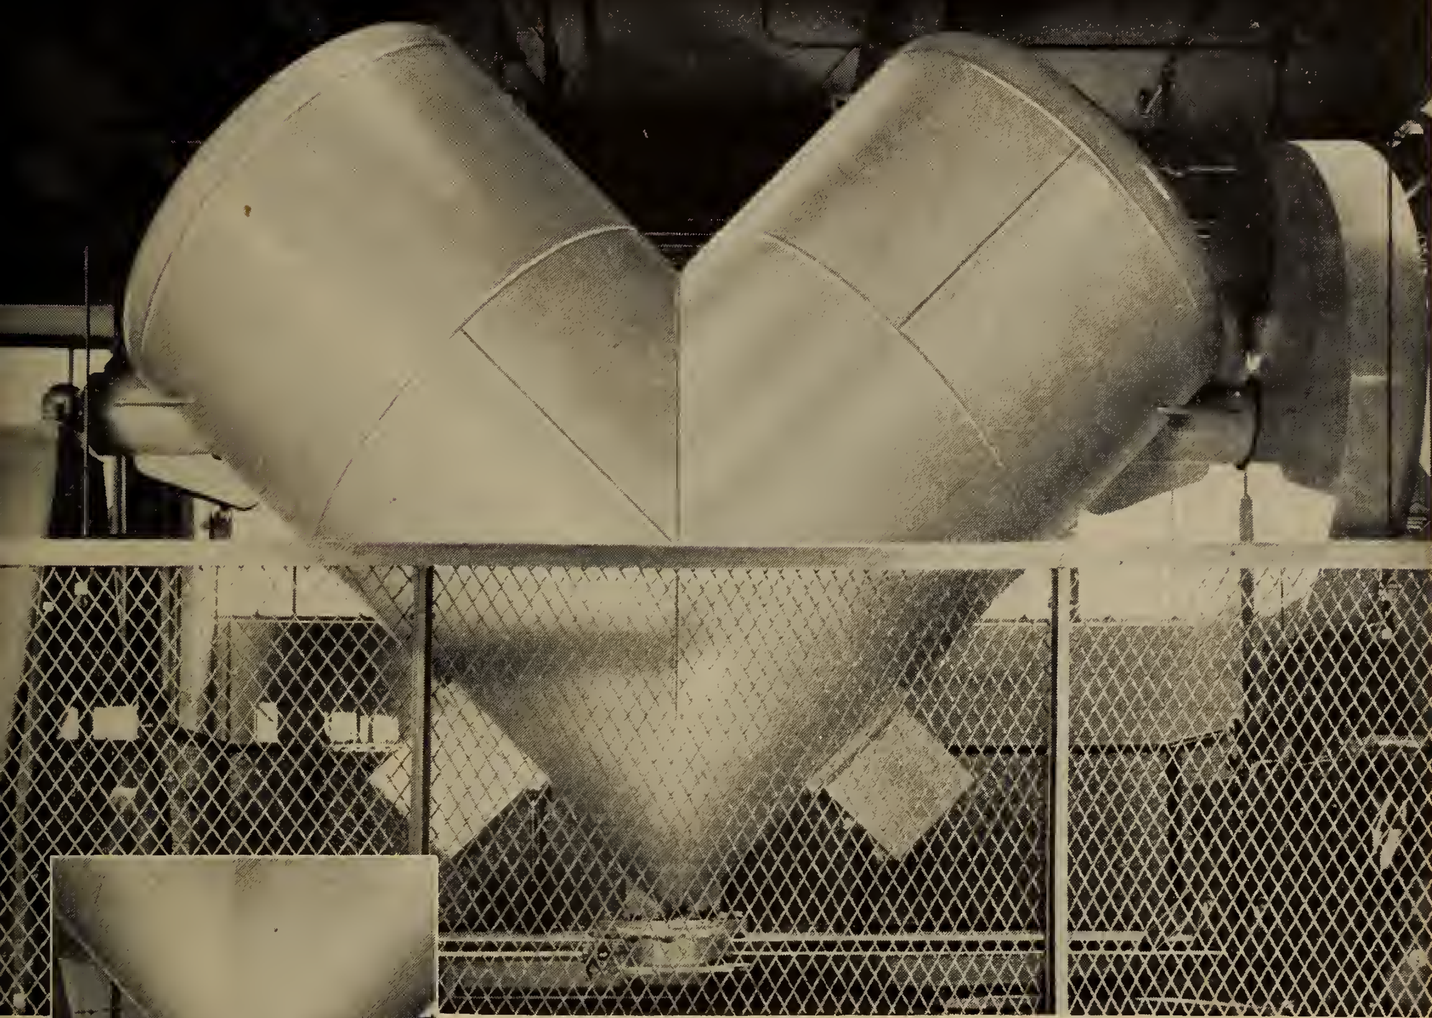
Going on to describe the heat exchangers and the testing of the furnace, Professor Chant estimated that certain changes in design of the furnace, which was a Babcock-Wilcox Cyclone slagging furnace, would make 80 to 85 per cent of the heat put in by the coal available at the heat-exchanger unit. The coal was conditioned for this furnace by a hammer-mill pulverizer fitted with a ⅛-inch mesh screen.

In conclusion, the speaker mentioned several related problems which had been only cursorily considered—for instance, some improvements which could be made in the design by a more liberal use of cooling water, which in the present design had been kept to a minimum. Also the question of drive was unsolved—especially whether a direct drive or an electrical transmission would be most suitable. Direct drive, in conjunction with the speeds of the order of 10,000 rpm. attained by the turbine, would require aircraft-quality gears.

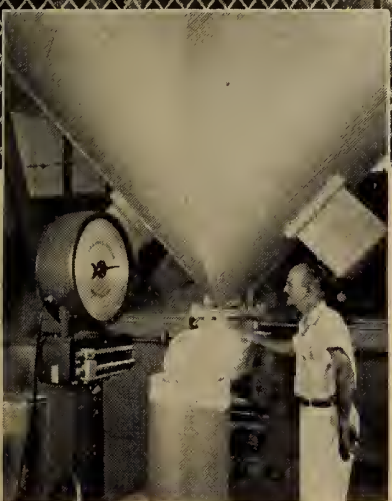
ROCHE

# HOFFMANN-LA ROCHE, INC.

## blends a 3-ton dose of vitamins



150 cubic ft. p-k blender of stainless steel-clad construction is charged through opening in floor above.



Shown is ease of discharge of p-k blender.

Hoffmann-LaRoche, Inc., Nutley, N. J., leading pharmaceutical manufacturers, find blending a three-ton dose of vitamins in one batch an easy matter with a p-k twin shell dry blender.

And, at the same time, the patented p-k blender provides perfect dispersion of the ingredients, as uniformly as a druggist compounds a single prescription.

The 150 cubic foot p-k blender shown here is at work every day in the modern Hoffmann-LaRoche plant at Nutley, N. J. Five different particle sizes are perfectly blended in 6600-lb. batches in this p-k blender. Clinical cleaning is easy, because of the wide openings of the p-k blender.

If your blending needs a shot in the arm, write today for complete information on sizes and capacities.

**sarco**

*Canadian distributors for the Patterson-Kelley Co., inc.*

**SARCO CANADA LIMITED, 611 GERRARD STREET, E., TORONTO 8, ONT.**

Factory at Claremont, Ontario • Branches in Principal Cities

1893

Professor Chant estimated that the first coal-burning turbine locomotive to go on the rails would be the American experimental model, a direct-fired unit. Several coal-burning turbines are already in operation, the most successful being the closed cycle of John Brown Company Limited, which went into operation in November of 1952. No indication was given as to when a Canadian coal-burning gas turbine locomotive would be completed, but the prediction was made that a small unit would probably become part of a power station in the very near future.

A question period followed the speaker's talk, and the interest shown in the subject was evidenced by the spirited discussion which ensued. Professor Chant was thanked on behalf of the members by Professor N. M. Hall, chairman of the Mechanical Engineering Department of the University of Manitoba.

## Electrical Section

G. Flavell, jr.e.i.c.,
*News Editor*

**Regulators**

On Dec. 17, 1953, approximately 50 members of the Electrical Section were fortunate in hearing a paper by R. A. Harvie, manager of the Industry Application Division for Canadian Westinghouse Company at Hamilton, Ontario.

Mr. Harvie's topic was "Regulators—Superhuman in Thought and Motivation". He explained superhuman in thought, they sense or anticipate undesirable changes that are about to take place, and more quickly than humanly possible they decide what corrective action must be taken. Superhuman in motivation, they bring into play the necessary corrective forces with a faster and more unerring skill than any human operator could. Superhuman in their ability to stay on the job, alert and ready every second of the twenty-four hour day, they have become a keystone of this automatic machine age.

He discussed the fundamentals of regulators and with the aid of slides he described the examples of regulators from the simplest type to the newest magnetic amplifier. The remainder of his paper was devoted to the magnetic amplifier, its advantages and many and varied applications.

Mr. Harvie pointed out that the principle of the magnetic amplifier is not new, but recent improvements in grain oriented nickel iron core materials and in the characteristics of rectifiers have allowed manufacturers to apply them in many new ways.

After outlining the fundamental circuits, Mr. Harvie showed results of the use of a magnetic amplifier on a waterwheel generator at the Otto Holden Station of the Hydro-Electric Power Commission of Ontario. Curves taken from this experimental project showed that for a sudden reduction in voltage of 13.5%, the generator voltage would turn to within one per cent of its final value in 1.9 seconds.

Mr. Harvie provided a detailed description of typical uses for magnetic amplifiers as a steel mill regulator and a paper machine regulator.

The group was given the opportunity to view samples of magnetic amplifiers that Mr. Harvie had brought with him —one being as small as a ring on a man's finger.

Thanks was expressed on behalf of the group by E. Scott. Chairman, C. D. Osterland adjourned the meeting for the usual refreshments.

**Annual Meeting**

On January 7, the Eighth Annual Meeting of the Electrical Section was held before 120 members and guests, and the following were elected to office for 1954:

Chairman: Professor N. A. Williams; Past Chairman: C. D. Osterland; Vice-Chairman: R. T. Harland; Executive Member for one year: S. Barkwell; Executive Member for two years: P. Shane.

The meeting was held in the new C.B.C. building and the speaker for the evening was R. D. Cahoon, Prairie Regional Manager for the C.B.C. He described the new building, pointing out the facilities available for the transmission of radio and television for Manitoba listeners.

Since interest in television in Manitoba is becoming increasingly great, Mr. Cahoon dwelled mainly on this aspect of his work. Television is expected to be available in Winnipeg by May. The new station will have one camera chain to televise local plays and skits and one mobile unit for sports events and other activities around the city, but most of the programs will be Kinerecordings from the C.B.C. network shows in Eastern Canada. It is expected that there will be direct hookups with the Eastern networks by 1956.

The T.V. transmitter will operate at 7000 megacycles with an output of 10 kw. for the pictures and 5 kw. FM for sound, but due to the design of the 240 foot antenna located on the roof, the effective power output will be 53 kw. and it's expected that the station will cover most of the populated areas of Manitoba.

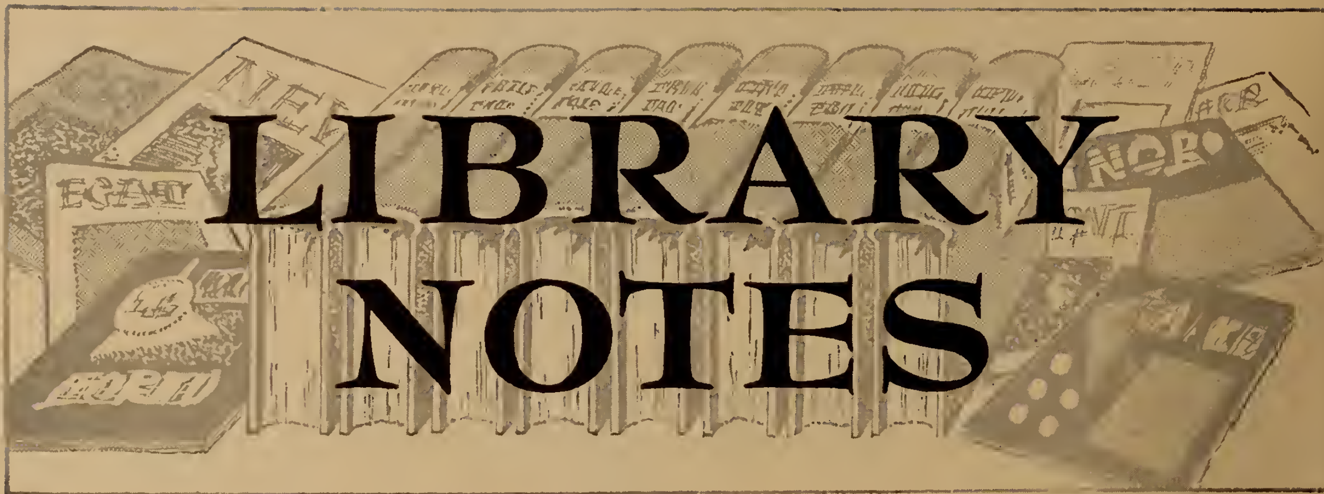
Mr. Cahoon warned the audience of such occupational diseases as television stoop, television squat and peculiar to children, "television jaw" which is caused by youngsters lying on their stomachs in front of their sets with their heads propped up by their hands.

The group enjoyed a tour through the building, visiting the transmitter control room, the 7 soundproof studios, and the various recording rooms, film processing and editing rooms and offices.

Refreshments provided by C.B.C. concluded a very interesting and enjoyable evening.

## E.I.C. Annual Meeting, 1954

**May 12, 13, 14, Chateau Frontenac, Quebec**



## Additions to the Institute Library

### Reviews — Book Notes — Abstracts

## BOOK REVIEW

**Handbook of personnel management,** rev. ed. G. D. Halsey. New York, Harper, 1953. 468pp., $6.00 (U.S.).

"A major objective of personnel management is to increase the individual effectiveness of each worker . . . The difference is in how each endeavors to accomplish this objective."

The idea of continually keeping open the channel of communication between management and worker, and worker and management is now considered a major factor in personnel work, and developments in techniques of employee rating are constantly receiving consideration and attention.

Since the last edition of this handbook in nineteen hundred and forty-seven, the forementioned subjects have been revised, the chapter on pre-employment tests has been entirely re-written and a completely new chapter on Organization for personnel management has been added.

Stress is placed primarily on the problems of executives responsible for staffs of about three thousand total, and each chapter includes a selected bibliography for more detailed reading.

The author intends the book to be of use as a text for university students, and has arranged it accordingly. Basic principles and methods are discussed from a practical aspect, and the advantages or disadvantages of each are considered, with direct applications.

And the author himself states the suggestions on practices and procedures to be the result of pooled resources of many individuals and companies.

Job analysis and job description forms are reproduced, and also tables for rating of vocationally significant qualities.

Employment procedure and forms include reproductions for applications for employment, background survey, and references.

The logical and practical presentation of all possibly pertinent information follows through the volume in normal sequences. After the acquisition of staff is thoroughly covered, topics such as job evaluation, wage incentive plans, employment stabilization, employment and supervision of women, and consideration of old or physically handicapped personnel are all dealt with.

Accident prevention, employee welfare and insurance and retirement schemes are next considered, followed by collective bargaining, unionized or non-unionized plants, and records and statistics.

Bold type section and paragraph headings make use of the book easy and pleasant.

Perhaps the pièce de resistance of the book, however, is the last chapter entitled "Outline for a self-audit of personnel management", which appears to be a complete resumé of the information in the book in the form of unanswered questions, including suggested supplementary reading.

An appendix following this lists "Sources of information and help in personnel management", and a detailed index adds further to its usefulness.

The author is a graduate of the University of Cincinnati, and has been General Superintendent of Bloomingdale Brothers in New York, Store Manager of Gimbel Brothers in Milwaukee, Personnel Director of Woodward and Lothrop in Washington, and presently Personnel Director of the Farm Credit Administration in Columbia, South Carolina.

E.K.

## BOOK NOTES

**Prepared by the Library**
**The Engineering Institute of Canada**

**Automatic control of heating and air conditioning.** J. E. Haines. Toronto, McGraw-Hill, 1953. 370pp., figs., $8.10.

"To understand the operation of an automatic control system, it is necessary to understand the purpose and operating principle of every control unit used in the system."

Working on this hypothesis, and also recognizing the fact that many control units must be individually designed for

## LIBRARY REGULATIONS

### Hours

Mon.–Fri. . . . . . . . . 9 a.m. - 5 p.m.
Saturdays . . . . . . 9 a.m. - 12 noon

### Bibliography and Reference Service

Short subject bibliographies are compiled on request. When placing these requests, please give as much detail and background information as possible.

### Borrowing

Books, periodicals, pamphlets and films may be borrowed for two weeks at a time. All books included in the Library Notes Section of *The Engineering Journal* are available for loan. **A fine of 25c per day is charged for each day borrowed items are retained beyond the two-week period.**

A library deposit of $5.00 at par in Montreal is required, for which two items may be borrowed at a time. Temporary deposits (30 days or less) $10.00. Books are sent anywhere in Canada, and carrying charges are payable by the member concerned.

### Ordering

Any book or pamphlet may be ordered through the library. All publications of affiliated societies, whether books, pamphlets, or periodicals, should be ordered through the library, as reduced rates are applicable on these to all members. Except in the case of library deposits **please make no payments in advance.** Non-members may consult the library, but may not borrow material. Please address all requests to **The Library.**

many different situations, the author has tried to collect and deal with these varying details of construction within this volume.

Both domestic and commercial heating and automatic control are covered, including unit heaters, unit ventilators and radiant-panel heating systems; the explanation and illustration of basic problems in the above fields is the main purpose of the book, and actual control devices are not identified as to manufacturer.

Presented as an elementary textbook, rather than a technical treatise, the whole volume has been kept as simple and non-mathematical as possible, and is well indexed.

***Behavior of metals at low temperatures.** R. M. Brick, J. R. Low, Jr., and C. H. Lorig. New York American Society for Metals, 1953. 112 pp., $3.00.

Three lectures are reprinted in this volume: behavior of single crystals and of pure metals, dealing primarily with mechanical properties and basic related phenomena; the influence of mechanical variables, considering the effect of stress-state, rate of loading, etc., on strength and ductility; influence of metallurgical factors, mainly concerned with ductility and brittle fracture susceptibility.

**Communication theory.** Willis Jackson ed. Toronto, Butterworth, 1953. 544 pp., illus., $11.00.

Numerous techniques and ideas of communication theory have been produced, nurtured and cultured during the past one hundred years.

However, the newest developments, which we owe principally to Norbert Wiener and his followers, take account of the prior information which we possess, of the signals to be transmitted. In consideration of this background, the mathematicians now consider modern communications theory to be the application of probability theory to communication problems.

Studies of speech and hearing mechanisms, speech compression, television channels, recognition of speech under noisy conditions, all these vital and present day problems are included in this moderately simple heading.

The papers included in this symposium were presented and discussed in nineteen hundred and fifty, and are now available in book form.

Well known specialists in their respective fields, the writers come from Africa, Denmark, France, Germany, Great Britain, Holland, and the United States.

Eight pages of "Concluding discussion" sum up the thirty-eight papers presented.

As one examines this volume in detail, one realizes how almost limitless the field of appeal will be to a large number of our members.

**Cooling towers: with special reference to mechanical-draught systems.** Toronto, Butterworth, 1953. 104 pp., illus., $3.50.

Published in association with Imperial Chemical Industries, this handbook is the result of practical experience in the plants of that company.

In concise and ordered handbook form, it explains how cooling towers can be designed, tested, and the test data interpreted. It also includes design information on a grid-packed induced-draught tower, which uses a serrated wooden grid packing.

It is only fairly recently that the importance of the absorption methods and techniques has been realized in the design of water cooling towers, and the results of this application to the tower designs are described.

**Defense and the dollar: federal credit and monetary policies.** A. G. Hart. New York, Twentieth Century Fund, 1953. 203 pp., $2.00 (U.S.).

Having heard President Eisenhower, two days prior to this writing, state that the United States is now in a transition stage from war to peace, it seems confusing to see the executive director of the Twentieth Century Fund state that the United States is "in a period of major defense rearmament".

However, points of view be what they may, this little volume will be of both interest and value in the field of business, finance, and government, and even to the private individual.

It is simply a sensible discussion of economic stability and the value and use of money, credit controls, use of reserves, private saving and public debt, compulsory lending or saving, and long term strategy.

The text concludes with a recommendatory report from the committee and is indexed.

Although the outlook is American, the principles still apply in other countries.

**Employment and wages in the United States.** W. S. Woytinsky and others. New York, Twentieth Century Fund, 1953. 777 pp., tables, $7.50 (U.S.).

Recognizing the desire of industry for a "comprehensive factual survey, within the covers of a single volume, of the working people of the United States and their conditions of labour" this volume is an attempt to meet this pressing need.

Size and distribution of labour, occupations represented and persons employed in each; seasonal employment, wages paid and method of determining these, government controls and their effect; security schemes, and hours and conditions of labour are all covered.

The general editor and author, Mr. Woytinsky, had two major assistant directors. T. C. Fichandler prepared the chapters on labour unions and unemployment, and M. C. Bishop the preliminary study and report on labor and management opinions. Of the seventeen co-editors, each was picked from experts in the several fields, and carefully chosen for varying backgrounds of opinions, that a balanced whole might be presented in the completed volume. The Twentieth Century Fund also hopes that the facts presented may be of practical value in both private industry, and government, and to all people involved in labour management relations.

Following the committee findings are twenty-five pages of conclusions and recommendations.

Appendix notes refer back to chapters, and nearly two hundred pages of statistical tables cover wages, institutional setting, employment and unemployment, and wages and earnings. Also the book is well indexed.

**FBI register of British manufacturers —1954,** 26th ed. Federation of British Industries. London, Kelly's Directories & Iliffe, 1953. 952 pp., $8.00.

The FBI Register of British manufacturers needs no introduction to those of our members interested in British products. It is a standard export reference book to British industry, and is the only authorized directory of the FBI.

First published in 1920, this 26th edition of the Register lists some 6,600 firms and their products, which are grouped under more than 5,000 headings, and cover the whole field of British industry.

The book is divided into seven sections. The first is a classified buyers' guide of products and services, giving under each an alphabetical list of firms supplying them. A later section lists the addresses of these firms.

Section 4 provides a list of British trade associations, and other sections list brand and trade names, and trade marks.

The introductory information and the instructions on the use of the Register are translated into French and Spanish. This new edition of the Register will be a useful edition to the library reference shelf, providing as it does up-to-date information on British manufacturers and their products.

**How to troubleshoot a TV receiver.** J. R. Johnson. New York, Rider, 1953. 128 pp., illus., $1.80 (U.S.).

This handy little volume is subtitled "The physical and mental approach", and concentrates on the actual business of finding the cause and location of the trouble, rather than going into details about servicing receivers.

The book starts with a general chapter on how to get the most out of available service data, including the schematic diagram. The author then discusses the various sections of the receiver which may cause trouble, and the tools, etc. which are needed for servicing. The remaining chapters are devoted to the actual location of the trouble, and include the preliminary steps to take, and the order in which to take them, as in the opinion of the author it often takes three times as long to locate the trouble as it does to remedy it. There is a chapter on the use of test patterns and cross-hatch patterns in locating trouble, and also chapters dealing with controls, tubes, dead receivers, picture distortion and sound troubles.

There are many diagrams and illustrations in the book, which should prove useful to both TV technicians, and those of our members who may be attempting to locate their TV troubles for themselves.

***Information theory.** S. Goldman. New York, Prentice-Hall, 1953. 385 pp., figs., $9.00 (U.S.).

A comprehensive treatment for the first-year graduate student in electrical engineering, based on the pioneering and classical work of Shannon and Wiener with modifications so that the information aspects of individual messages can be treated more readily. Major topics are the transformation of both information and constraints from the time to the frequency domain, sampling theorems, and the information theory aspects of random noise.

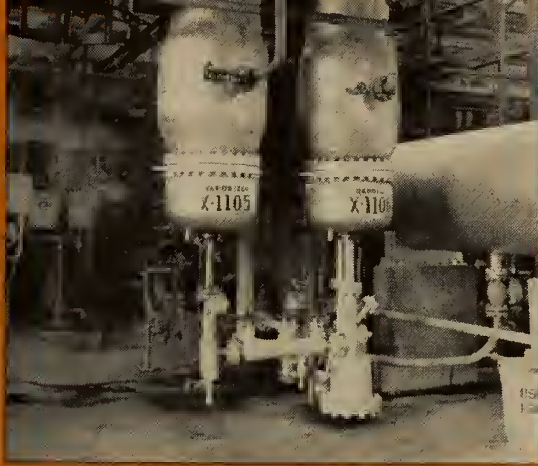
**The international year book and statesmen's who's who, 1953.** London, Burke's Peerage, 1953. 447 pp., £8. 8s. 0d.

There is something indefinable about this volume, which makes it both pleasing and easy to use. And besides this, one finds immediately information one is so often needing.

To begin with, the list of abbreviations does not always include the obvious, which can be found almost anywhere, but does list a good many of the lesser known combinations, particularly German, French, Italian and Spanish.

Reigning royal families of the world follows Mr. Bartlett's introduction, and this is logically arranged alphabetically by country, including all the immediate family members.

# Inco nickel alloys



*Monel tubes are used in this DPS reboiler and vaporizer bundles at the new Shell Oil Company of Canada Limited petrochemical plant.*

*This 33-inch vapor condenser built for McColl-Frontenac's Montreal refinery is lined with 20% Monel-clad to resist corrosion from hot oil vapors. Cooling tubes inside are 70-30 cupro-nickel.*

*This new fractionating tower at Imperial Oil's Ioco Refinery is lined with Monel strip to resist corrosion present. Monel's strength, toughness and ease of fabrication were necessary, too, for this application.*

# widely used by Canadian oil companies

The important *combination of properties* found in INCO Nickel Alloys has led to their wide application in the petroleum and petrochemical industries. As a group, they are noted for their resistance to corrosion, their strength and ease of fabrication. Individually their properties cover an extensive range of service requirements. Important, too, they are all readily available in standard mill forms and castings.

**INCO *proven* SERVICE**

Inco's technical staff, and the benefit of years of on-the-job experience solving metal problems, is available to you. Their help, assisting you with your corrosion problem or finding the right material for your particular job, is yours for the asking.

INCO

D-4

International organization is an invaluable section, although the order of precedence, preference, or presentation has us completely baffled.

States of the world, comprising part two, has useful statistical information (though based on nineteen hundred and forty-one census for Canada, at any rate), and the states or countries are arranged alphabetically.

This concludes with sixty pages of Diplomatic section, in which the appropriate dignitaries are listed under the capitals of their respective countries, these capitals being alphabetically arranged.

The second main section, Biographics, presents some eight thousand entries, the number of entries being limited by the canons of selection: "Statesmen and politicians, those in office and those who have been in office, are included; so are ambassadors, heads of government departments, military chiefs, great ecclesiastics and lawyers of eminence, heads of the greater industries, leading bankers and merchants".

We quote the above from the editor's preface, as no one but the august house of Burke's peerage could use such expressions for the limiting of a who's who, and get away with it.

This will be a most valuable reference volume.

**Introduction to mechanical design.** T. B. Jefferson and W. J. Brooking. New York, Ronald Press, 1951. 612 pp., illus., $6.50 (U.S.).

This volume is based on the authors' experience in designing machines, and on information already presented in textbooks, handbooks, and catalogues on machines, machine design and related subjects. It has been written keeping in mind the needs of college students, and also of pre-engineering and technical institute students who may not have a very wide technical background. For this reason various topics have been treated in more detail than is usual in books of this type: for example, the fundamentals of mechanics of materials are discussed fully.

The authors approach the subject from the point of view of the functional purposes of a machine, its configuration requirements, economic considerations, the use of rational and empirical design data, and the final appearance of the machine.

The text emphasizes certain subjects which the authors feel are more important than their treatment in other works would lead one to believe. These topics include materials, of which there are many new ones, the processes for which the machines are designed, machine frames, lubrication, pipes, tubing, tanks and containers, styling, and the use of standardized machine elements already available.

There are useful bibliographies at the end of each chapter, and many tables and illustrations throughout the text.

**Irrigation engineering.** K. R. Sharma, Jullundur, India, India printers, 1953. 3 v., illus., $17.00.

Prepared primarily as a textbook for students preparing for the engineering degree examinations in the various universities in India, the aim of this work is to present modern irrigation engineering developments in as concise a form as is practicable.

It is roughly divided into six parts, namely, Lift, Flow, and Tank irrigation, Drainage engineering, Groundwater engineering, and General information. These topics are covered in the first two volumes.

Volume three consists wholly of diagrams and graphs used in irrigation designs.

The work in this edition is a translation, and a very rough one. Bibliographies are brief, and give no detail as to publisher, price or date, and examination questions are included with each chapter.

The chief value of this book will be in its unique documentary information on what is being done in India in the field of irrigation engineering, and should be of great interest to a number of our members.

**Kinematics of machines.** R. T. Hinkle. New York, Prentice-Hall, 1953. 231 pp., illus., $4.75 (U.S.).

"Kinematics of machines is usually defined as the study of the relative motions of machine parts. The emphasis has been placed here rather than on the descriptions of mechanisms."

Relative motion, inversion, and the angular velocity theorem have all been treated in detail, and the book pre-supposes a knowledge of engineering mechanics.

Also special attention has been given to velocity and acceleration polygons, equivalent linkages, special constructions, chains, rolling bodies, gears, and miscellaneous mechanisms.

Each chapter includes a series of problems, and the book is indexed.

**Mathematical methods for scientists and engineers.** L. P. Smith. New York, Prentice-Hall, 1953. 452 pp., $13.35 (U.S.).

Not written from the standpoint of the mathematician, the object of the writer of this volume is "to present the substance of the mathematical methods along with clear and understandable statements of the conditions which must be satisfied in order that the method or mathematical manipulation in question can be validly carried through".

Proofs of the methods included are not presented, as the main objective of the book is that the student may through its use, acquire facility and practice in the use of available methods of solving physical problems. Only mathematics definitely involved in engineering and science are therefore treated.

Important and typical illustrative problems have been included, along with practice problems at the end of each chapter, and short bibliographies.

Workers in science and engineering, as well as advanced seniors and graduate students should find this work of great value.

**Metallic creep and creep resistant alloys.** A. H. Sully. Toronto, Butterworth, 1949. 278 pp., figs., $5.00.

"Creep may be defined as the time dependent part of the deformation which accompanies the application of stress to a solid." It was first scientifically observed and recorded by F. Phillips, in nineteen hundred and five.

During recent years, there has been a tendency for academic experimentalists on creep, and industrial workers' observations on creep, to be kept strictly apart. In this volume the writer attempts to bring together these two aspects. The development of the existing theory of strength of metals is described with special reference to creep, and an explanation of certain metallurgical factors affecting creep is suggested, along with a survey of creep properties of most of the well-known ferrous and non-ferrous alloys.

Appendices include British and American Society for Testing Materials Standards, characteristics of test equipment, and forms for reporting data, and the book is indexed.

**National directory of the Canadian pulp and paper industries, 1953.** Gardenvale, Que., National Business Publications, 1953. 478 pp., $4.50.

Prepared from the latest statistics available at the time, and from information obtained from the companies themselves, up to the end of September 1952, this 1953 edition of the National directory of the Canadian pulp and paper industries includes information on the manufacture and distribution of pulp, paper and board.

Mills are listed alphabetically by province, for each being given the addresses of head office and mills, names of directors, officers and personnel, capital, rail and steamship connections, timber supply, equipment, production, products, etc. Also included in the book are a directory of paper converters, lists of paper distributors in Canada and foreign countries, Canadian paper merchants, foreign trade service and trade commissioners, Canadian forestry officials, and trade associations.

There are general articles on various aspects of the paper industry in Canada in 1951, the pulp and paper industry, the paper box and bag industry, and roofing paper and miscellaneous paper goods.

**National research council of Canada review, 1953.** Ottawa, Queen's printer, 1953. 244 pp., 75 cents.

This report reviews the work of the National research council for 1952-1953. It summarizes the work of the Council in a general article, and gives some information on its organization. Following this, the annual reports of the directors of the various divisions are presented, together with lists of their publications. The reports of the various special committees are also given, with a list of the members of each committee appended.

**Partial differential equations in engineering problems.** K. S. Miller. New York, Prentice-Hall, 1953. 254 pp., $6.35 (U.S.).

Written primarily for the engineering student, only an elementary knowledge of ordinary differential equation is needed for its comprehensive study, and practical solutions are provided throughout the text.

Four chapters treat of Fourier series analysis, and variables and integrals, and consideration is given to various elementary properties of the Legendre, Bessel and Mathieu functions.

Methods of solution, such as the Laplace transform and numerical procedures have purposely been omitted as first rate texts are available covering these subjects.

Problems are included, and two pages of bibliography and an index conclude the volume.

**Principles of automatic controls.** F. E. Nixon. New York, Prentice-Hall, 1953. 409 pp., $9.35 (U.S.).

The aim of this book is to present the various principles used in the design of automatic control systems. It is concerned chiefly with linear system design, there being one chapter serving as an introduction to nonlinear systems. Covered in the text are transient response, frequency response, stability criteria, numerical integration, automatic computors and transient analysis.

The author points out that simple control systems can be defined by mathematical equations for which the solutions are relatively simple, whereas the more intricate systems involve complicated interacting equations for which the solutions are very difficult by ordinary methods. It is, therefore, of great interest to designers to know the principles behind these systems, especially if they can be

easily applied, interpreted and understood.

The six Appendices give reference material often used in control analysis systems, and include topics such as Design data for cascaded functions, a table of Laplace transform pairs, and the derivation of the Nyquist criterion.

This book has grown from a company training course given by the author, and is for use as a reference book, or undergraduate text. Except for the appendix on the derivation of the Nyquist criterion, no mathematical background beyond first year calculus should be required to understand the book, although a course in first year physics is assumed, and one on electrical circuits would be helpful.

***Procedures in experimental metallurgy.** A. U. Seybolt and J. E. Burke. New York, Wiley, 1953. 340 pp., $7.00.

Intended for those new to the field, this reference work emphasizes the laboratory preparation of metal and alloy specimens up to the point of making observations on their properties. It covers furnaces, refractories, controlled atmospheres, vacuum systems, and high-temperature control; describes melting, casting, heat-treating, and basic fabrication techniques; and devotes separate chapters to powder metallurgy, the preparation of pure metals and single crystals.

**Recent developments in mineral dressing; proceedings of a symposium.** London, Institute of Metals, 1953. 766 pp., diagrs., $9.00.

Including thirty-nine papers on all aspects of mineral dressing, and also the Third Sir Julius Wernher Memorial Lecture by Professor A. M. Gaudin, this volume is the proceedings of the Symposium arranged by the Institution of Mining and Metallurgy in London, September twenty-third to twenty-fifth, nineteen fifty-two.

The depletion of rich ore reserves due to rapidly increasing demand for metals over the past century has created a great interest in improved methods of mineral dressing and mineral concentration among metallurgists.

At the time of the organization of this symposium, papers were invited to cover the following branches of the subject:

(a) Fundamental concepts and experimental methods.
(b) Advances in machine construction and in plant design.
(c) Recent practice at specific plants.

In each instance the paper is presented along with the ensuing discussion, and the author's written reply. Bibliographic footnotes occur throughout the volume, and some papers include an extensive bibliography.

The line drawing diagrams are excellently reproduced, and three folded Mill Flow sheets are also included.

The volume is indexed by both author and subject, and will be an invaluable contribution to its field.

**Statically indeterminate structures; their analysis and design.** Paul Anderson. New York, Ronald, 1953. 318 pp., figs., $7.50 (U.S.).

Assuming a knowledge of elementary stress analysis and design of simple framed structures, the author presents this work as a suitable text for a first course in statically indeterminate structures.

Application of methods to design is stressed, rather than theorems of analysis. Also most of the problems considered deal with steel structures, as nearly all structural curricula cover separate courses in reinforced concrete.

Deflection and the behaviour of a structure under load are stressed; one chapter is devoted to typical problems of design and examples of actual practice and the last two chapters consider wind pressure analysis and space structures.

Twenty-eight pages of invaluable charts and tables are reprinted with acknowledgments to the Portland Cement Association, and problems are included with each chapter.

This will be a valuable contribution to the field of statically indeterminate structures.

**Television tube location guide,** v. 4. Indianapolis, Sams, 1953. 189 pp., illus., $2.00 (U.S.).

This is the fourth volume in a series of books on tube location issued by this publisher. Their purpose is to help technicians repair receivers quickly and efficiently, as many troubles in television receivers are caused by tube failures.

The location of the blank pin or locating key in the tube socket is shown as it has been in previous volumes, as it aids in replacing tubes in sockets which cannot be seen by the technician. There is also data on the fuses used in receivers.

This volume follows the pattern of previous ones, in that it shows by diagrams the location of the various tubes in different makes of receiver, and also lists the tubes which may be responsible for different types of trouble. There is a combined index to volumes one to four.

***Temperature measurement in engineering,** volume 1. H. Baker, and others. New York, Wiley, 1953. 179 pp., $3.75.

This first volume of a two-volume work is primarily concerned with thermocouple techniques and includes introductory chapters on fundamentals, basic information necessary for the design of temperature measuring apparatus, and specific designs for measuring internal temperatures and temperature gradients in solid bodies. The emphasis is on specific procedures and techniques for various circumstances, classified on a physical basis rather than by industry or type of instrumentation.

**Traffic management in industry.** L. A. Bryan. New York, Dryden press, 1953. 452 pp., $5.50 (U.S.).

The smooth functioning of industry is becoming more and more dependent on a well trained traffic manager, so much so that traffic management is fast being accepted as a profession in itself.

As the author is professor of management and director of the Institute of Aviation at the University of Illinois, he has had ample experience in the organization and presentation of information.

The volume opens with a general discussion of the whole field of traffic management, its function, organization, and administration. All aspects of receiving and despatching are later covered, including routing, classification and tracing, intra-plant, local and long distance despatching by express, mail and passenger, and finally an excellent glossary of terms.

Five pages of supplementary reading are arranged by application to chapter. Appendix A lists general traffic publications, and Appendix B, American Society of Traffic and Transportation, Inc. examination number two, on Principles of Traffic Management.

One item for consideration by our Canadian readers is that specific rates and regulations, though probably similar, do not necessarily apply in Canada.

Discussion questions are included with each chapter, and the book is well indexed.

## BOOKS RECEIVED

**The atomisation of liquid fuels.** A. Muraszew. London, Chapman & Hall, Toronto, British Book Service, 1953. 246 pp., illus., $7.25.

**British petroleum equipment,** 1951 edition. London, Council of British manufacturers of petroleum equipment, 1951. 751 pp., illus., $7.00.

**The casting of non-ferrous ingots.** Leslie Aitchison and Voya Kondic. London, Macdonald & Evans. Toronto, Burns & MacEachern, 1953. 370 pp. diagrs., $9.25.

**The control of quality in melting and casting. Institute of metals—symposium, March 1953.** London, The Institute, 1953. 88 pp., illus., $2.50. (Monograph and report series, No. 15).

**Cybernetics.** Heinz von Foerster, ed. New York, Josiah Macy, Jr. Foundation, 1953. 184 pp., illus., $4.00 (U.S.).

**Diesel engine design,** 2nd ed. T. D. Walshaw. London, Newnes, Toronto, British Book Service, 1953. 416 pp., illus., $7.00.

**Director of the international rubber industry,** 1953 ed. Zürich, Verlag fur Wirtschaftsliteratur G M B H, New York, Swiss American Advertising, 1953. 416 pp., $12.60 (U.S.).

**Electro-magnetic machines.** R. Langlois-Berthelot. London, Macdonald., 1953. 535 pp., diagrs., 65/-.

**The Financial Post survey of mines,** 1954. Financial Post. Toronto, Maclean-Hunter, 1954. 382 pp., $3.00.

**Guide to audio reproduction.** David Fidelman. New York, Rider, 1953. 232 pp., illus., $3.50 (U.S.).

**Handbook of probability and statistics, with tables.** R. S. Burlington and D. C. May. Sandusky, Ohio, Handbook Publishers, 1953. 332 pp., diagrs., tables, $4.50 (U.S.).

**Housing and building in hot-humid and hot-dry climates. Proceedings of a conference, November 1952.** Washington, D.C., National research council, Building research advisory board, 1953. 179 pp., $6.00 (U.S.). (Research Conference report No. 5).

**Industrial wastes: their disposal and treatment.** Willem Rudolfs. New York, Reinhold, 1953. 497 pp., illus., $9.50 (U.S.).

**International brewers' directory.** Zürich Verlag fur Wirtschaftsliteratur, G M B H, New York, Swiss American Advertising, 1950. 504 pp., $12.60 (U.S.).

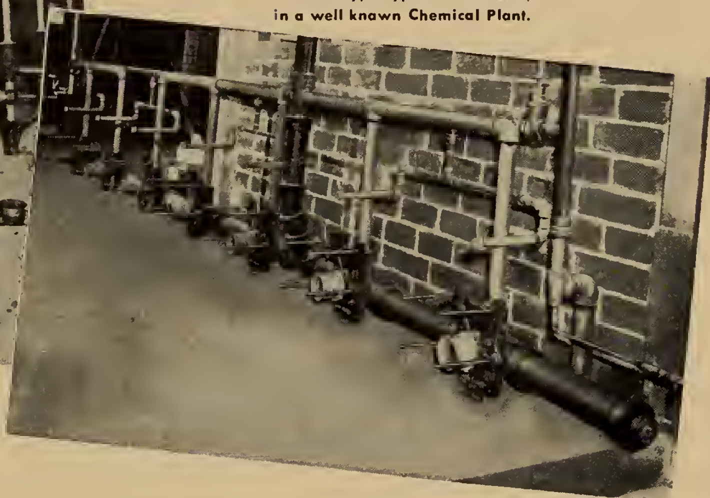
**Introductory circuit theory.** E. A. Guillemin, New York, Wiley, 1953. 550 pp., figs., $8.50.

**Marine steam boilers.** J. H. Milton, London, Newnes, Toronto, British Book Service, 1953. 256 pp., illus., $5.50.

# less installation time . . .

ZURN Horizontal Adjustable Wall Closet Fittings for Blow Out Closets Installed in large Office Building.

Battery of ZURN Horizontal, Adjustable Wall Closet Fittings for Wall-Type Syphon Jet Closets, in a well known Chemical Plant.



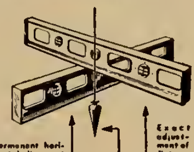
## THE ZURN system

### *simplifies fixture installation . . . reduces time costs!*

THE ZURN WAY

**PERFECT ALIGNMENT IN ALL 3 DIRECTIONS**

Obtained with Exclusive Adjustment Features of Zurn Wall Closet Fittings And Carriers...For The Support of All Types And Makes of Wall Type Fixtures



The flexibility of a Zurn System for installing wall-type fixtures assures speed in assembly and accurate alignment in all three directions during installation; rigid water-tight connections insure minimum final adjustments when installing wall-type toilets; bulk of assembly can be precut in shop; unique waterway allowing a 4″ vertical adjustment does away with numbered fittings.

A Zurn System is available for any make of wall-type plumbing fixture and can be assembled into an almost limitless variety of installations for all types of buildings. Installations are above the floor, behind the toilets, behind the wall; no delays waiting for other crafts. Write for free booklet, "You Can Build It and Maintain It for Less A NEW WAY."

# STANDARDS REVIEWED

**British Standards, British Standards institution, 2 Park Street, London, W.1. British standards are available from the Canadian standards association, National research building, Ottawa, Canada.**

**B.S. 2045: 1953—Preferred numbers. 2/6.**

The series of standardized numbers known internationally as 'Preferred numbers' are finding increasing application in the preparation of standards and in the devising of ranges of products and processes. The technical features, advantages and practical applications of these numbers are discussed fully in B.S. 1638: 1950 'Report on the selection of ranges of types and sizes (preferred numbers)', by J. E. Sears, C.B.E. The present standard B.S. 2045: 1953, has been prepared with the objects (a) of giving authoritative status to these numbers for application, where appropriate, in British practice, and (b) of providing readily accessible information on the numbers themselves for those who may have occasion to use them.

The British Standard lists the preferred numbers in the four principal series (R5, R10, R20 and R40), as well as the additional R 80 series intended for special application. These numbers are the same as those agreed internationally by the International Organization for Standardization (Technical Committee ISO/TC 19, Preferred Numbers) in New York, June 1952, and now published as ISO Recommendation No. 7. For the series R5 to R40, the ISO recommendation is in exact accord with the earlier agreement of the ISA, as given in ISA bulletin No. 11, 1935.

A special clause has been added explaining how supplementary series of any desired step ratio can be obtained directly from the principal series, provided the ratio corresponds with a preferred number. In this way the range of application of preferred number series is much extended.

**B.S. 2049: Part 1: 1953—Kerosine (paraffin) appliances for domestic use. Part 1: Burners, portable space heaters, cooking and boiling appliances. 10/-.**

As a result of the work carried out by a committee set up by the Ministry of Fuel and Power, the Petroleum Equipment Industry Standards Committee authorized the preparation of a British Standard for domestic appliances using kerosine as fuel. This, the first part of the standard, specifies general constructional, guarding and safety requirements of these appliances, and detailed performance tests. Numerous illustrations of typical burners and appliances are provided.

**Canadian standards, Canadian standards association, National research building, Ottawa, Canada.**

**C.S.A. 0116-1953—The physical properties of power and communication wood crossarms. $1.25.**

The requirements for power and communication wood crossarms are covered in this specification, which applies to suitable Canadian woods, and also Southern pine, in case it is found necessary in any instance to import crossarms.

The first part of the specification is concerned with the physical properties of wood crossarms, and in this section are listed the species from which crossarms may be made, the defects in the wood which are prohibited, and those which are permitted to a limited extent.

The second part deals with the manufacture and preservative treatment of crossarms, and includes specifications for pin and bolt holes, dimensions and tolerances, marking, conditioning, storing and ordering.

The appendices include illustrations of various types of knots, and drawings of typical details of crossarms.

**C.S.A. W48.2-1953—Corrosion-resisting chromium and chromium-nickel steel welding electrodes. $1.50.**

Developed primarily to classify high-alloy chromium and chromium-nickel welding electrodes, this Specification prescribes requirements for covered chromium and chromium-nickel steel electrodes yielding deposited weld metal in which chromium exceeds 4 per cent and nickel does not exceed 50 per cent.

The tests required by the specification are: The chemical analysis of weld metal; The fillet-weld test; and the all-weld-metal tension test. The requirements for these tests are given, as are methods of conducting them. The all-weld-metal tension test serves as a control of the uniformity of quality of the electrodes for the intended applications, and measures strength and ductility. The tension test requirements provide assurance of freedom from weld metal flaws, such as check cracks and serious dendritic segregations, which if present may cause failure in service. Any further tests which may be required for certain applications are to be agreed upon by the manufacturer and the purchaser.

# BUSINESS & INDUSTRIAL BRIEFS

## A Digest of Information received by The Editor

## Appointments and Transfers

**Peacock Bros.** — The Vancouver address of Peacock Brothers Ltd., has been changed to 1660 West 4th Ave., Zone 9. Telephone number remains the same, BAyview 3815-6.

**Canadian Marconi.**—Canadian Marconi Company has just announced the promotion of W. Ornstein to supervising engineer. In his new position Mr. Ornstein will be responsible for all engineering projects in the development of equipment in the mobile and marine communications field.

C. R. Hughes

**P. J. McGale.** — P. J. McGale has been appointed to special assignments at the head office of The B. F. Goodrich Rubber Company of Canada, Limited, it was recently announced by W. E. Ireland, vice-president and general manager, tire sales.

Mr. McGale was formerly London district manager. J. F. Horton has been appointed London district manager and C. E. Beauchamp succeeds Mr. Horton as bus-truck representative at London, Ontario.

**J. C. McCarthy.** — Robertshaw-Fulton Controls Company announces the appointment of Joseph C. McCarthy of Toronto as Canadian sales representative for the company's Robertshaw thermostat, American thermostat and Grayson divisions. Mr. McCarthy was formerly with Consumers' Gas Company and John Inglis Company, Ltd., Toronto.

**Trane Company.** — R. H. Fitzsimons, manager Hamilton Office, Trane Company of Canada Limited, announces the opening of a branch office in Kitchener, Ontario, for the purpose of serving that area with permanently located personnel.

The Kitchener office will be operated by Gordon T. Bockmaster.

**Automatic Electric Executive Changes.** — Concurrent with the general expansion of Automatic Electric Sales (Canada) Ltd., the directors announce effective January 1st, 1954, the election of Carman R. Hughes as president, and the appointment of Stuart C. Bird as general manager of the Company.

**D. C. R. Miller.** — D. C. R. Miller has been appointed general manager and director of the recently formed, new Canadian company, Dow Corning Silicones Limited. Mr. Miller was previously associated with the Dow Corning products division of Fiberglas Canada Limited through which the new company's products have been merchandised in Canada since 1945.

On February 1st the company moved into its new office and warehouse located on Tippet Road, fronting on No. 401 Highway, Wilson Heights, Toronto.

**T. P. Kirkham.** — Dunlop Tire and Rubber Goods Company, Limited, has

MECHANICAL DIVISION*
DOMINION BRIDGE
COMPANY LIMITED

***Other Divisions:** Structural Boiler, Platework, Warehouse

(*Continued from page 363*)

announced the appointment of T. P. Kirkham as sales manager, industrial rubber products division, Ontario.

●

**Stelco Sales Appointments.** — Lee T. Craig, vice-president, The Steel Company of Canada, Limited has announced the following appointments affecting the company's sales staff.

C. S. Kidd, formerly sales manager, pipe division, Montreal, moves to Canada Works, Hamilton, to fill the position of assistant general sales manager, wire, wire products and screw division. He will assist C. P. Short, general sales manager of that division. H. W. Stevens succeeds Mr. Kidd in Montreal as sales manager.

●

**Askania Representative.** — Askania Regulator Co., Chicago, announces the appointment of G. Albert Rice of Process-Instrument Systems Ltd. of Toronto as sales representative in Ontario and eastern Canada.

●

**L. R. Copp.** — Amalgamated Electric Corporation Limited announces the appointment of L. R. Copp to the position of sales supervisor duct systems. Mr. Copp joined the distribution equipment sales division of Amalgamated in 1946. In 1950 he transferred to the Toronto District Sales Division where he has served until his present appointment.

**T. P. Kirkham**

●

**Alchem Limited.** — R. C. Williamson, vice-president and general manager of Alchem Limited, announces the appointment of W. C. Heim as assistant general manager, and also the appointment of R. M. Gale as manager of the Railroad Department.

●

**J. H. Ross.** — Hamilton Gear and Machine Company, Limited, recently announced a new agent in Alberta. The representative is J. H. Ross and Company, Limited, with offices at Edmonton and Calgary.

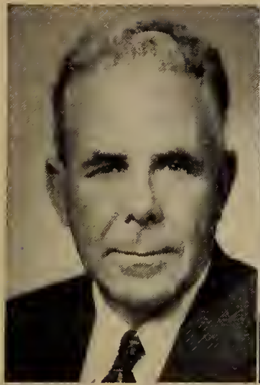
●

**West Kootenay Power & Light.**—The appointment of R. G. Anderson to the position of vice-president and general manager of the West Kootenay Power and Light Company, Limited, was announced by R. W. Diamond, president of the power company. At the same time Mr. Diamond announced that C. H. B. Frere has been elected a director and appointed solicitor. The retirement of A. L. Johannson and his resignation from the positions of vice-president and director were also announced.

●

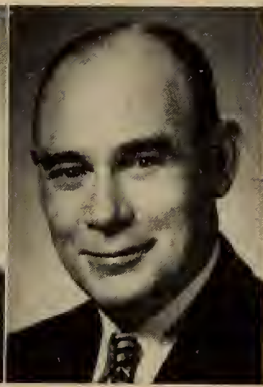
**Industrial Electronics.** — Industrial Electronics of Canada, Ltd., Toronto, Ontario, has recently become a subsidiary of Servomechanisms Incorporated, producers of electronic and electromechanical equipment, having three operating divisions in the United States. To accommodate the increased business which has already resulted from this affiliation, the company is now moving to new and larger quarters at 83 Torbarrie Road, Toronto 15, Ontario.

●



L. G. A. Hawkins

A. Sandilands



W. Mulroy

Also announced were the appointments of L. G. A. Hawkins as manager eastern region, A. Sandilands (see Personals) manager western region, and W. Mulroy as manager Pacific region.

●

**Reliance Appointments.**—J. M. Smeaton has been appointed manager of the new Winnipeg Branch of Reliance Electric & Engineering (Canada) Limited at Room 60, Electric Railway Chambers, Winnipeg. The new office will function as a sales and service depot for Reliance customers in north-western Ontario, Manitoba and Saskatchewan.

Appointment of C. G. Plaxton to the position of branch manager, St. Catharines office is also announced.

●

**Read Standard Corporation.** — Read Standard Corporation have recently announced the appointment of Laurie & Lamb Engineers of Montreal and Toronto as their sole representative in Eastern Canada for the sales and servicing of their heavy duty positive displacement axial flow blower and vapour pumps.

●

**Canadian Westinghouse.**—Three Montreal district appointments within the Canadian Westinghouse Company's district apparatus division have been announced by general manager E. E. Orlando.

C. H. Allen, formerly manager of industrial sales, has been named central station sales manager, succeeding W. O. Sorby (see Personals) who is transferred to Halifax as district sales manager.

G. W. Pettigrew has moved up to the post of industrial sales manager. He was formerly manager of agency and resales and C. F. MacNeil has now been appointed to that position.

A fourth appointment announced by the general manager of the Westinghouse district apparatus division is that of R. B. Carter as central station sales manager in Vancouver.

●

**Monsanto Canada Limited.** — The appointment, effective immediately, of Norman F. Smith and Russell B. Bridges as technical service representatives on plasticizers, Monsanto Canada Limited, was recently announced by Douglas D. Stokes, general sales manager of the company.

●

**Phillips Wires and Cables Appointments.**—T. A. Lindsay, vice president (sales) of Phillips Electrical Co. (1953) Ltd., announces the appointment of F. W. Barnhouse (see Personals) as sales manager (general), E. M. Lloyd as sales manager (specialties), and D. C. Brazier as manager central region.

D. C. Brazier

E. M. Lloyd

F. W. Barnhouse

# New Equipment and Developments

**Canadian Designs.** — Canada's showroom for designs of merit, the Design Centre, near Confederation Square in Ottawa, operated by the National Industrial Design Council and the National Gallery of Canada, has now been open for almost a year. It has been attracting a steady flow of visitors. During the first ten months, attendance was 28,862 or an average of almost one hundred a day.

It is open daily from 10.00 a.m. to 6.00 p.m. and on Sundays from 2.00 p.m. to 5.00 p.m. It offers exhibitions and displays of Canadian and international designs in manufactured products and a reading room stocked with the latest books and magazines on industrial design from Great Britain, the United States, Sweden, Germany, France, Italy and Japan.

●

**Catalytic Exhausts.** — The OCM catalytic exhaust is now available for factory installation on gasoline-powered lift trucks and tractors manufactured by Clark Equipment Company.

The catalytic exhaust oxidizes more than 95 per cent of the carbon monoxide and hydro carbons in the engine exhaust, converting them into harmless carbon dioxide and water vapor. In so doing, it removes the hazard of carbon monoxide and hydrocarbons when gasoline engines are operated indoors. The elimination of noxious gases improves employee morale and contributes to plant safety.

As an added benefit, a temperature indicator on the unit shows when the engine needs adjustment and can thereby decrease gasoline consumption. The noise level is equal to that of regular mufflers and back pressure is often less.

The catalytic exhaust can be used on any engine, mobile or stationary, as long as unleaded gas is used. Space requirements for installation of a unit are approximately the same as for the regular muffler which it replaces.

●

**Electrode for Welding New-Type Cast Iron.** — Specially designed for the welding of the new semi-ductile cast iron of the spheroidal graphite type is a recently introduced 55 per cent nickel alloy electrode. Pressure tests on pipes made from this material and joined together in lengths by welding with this electrode have shown that rupture takes place in the parent material and not in the weld. This electrode is also suitable for the making of strength welds in normal grades of cast iron.

The makers are also introducing a complete range of multi-operator welding plant and a duplex regulator capable of supplying two operators up to 350 amperes or one operator up to 700 amperes. Single and duplex regulators are available in the 200-350 ampere ranges and single type only in the 450 and 600 ampere ranges. New models of the company's well established 160, 250, 350 and 500 ampere oil-cooled single operator transformers incorporate a patent tap change switch of a new design. Firm: — Rockweld, Ltd., of Commerce Way, Croydon, Surrey, England.

●

**Industrial Changeover.**—A well-known name disappeared from the Canadian industrial scene on February 1st, when the Dominion Hoist & Shovel Co. Ltd., became the power, crane and shovel division of Dominion Engineering Works Limited. The name change is being made to conform with recent developments in the operations of the organization.

●

**Brass Valves and Fittings.**—A complete new line of brass valves and fittings is being introduced to the plumbing and heating industry by Dahl Brothers (Canada) Limited, Toronto. One feature is that many parts are hot pressed instead of cast, which eliminates the possibility of having pores in the material and, at the same time, ensures high precision and excellent finish and appearance. Distributors have been appointed in some districts.

●

**Allen-Bradley Canada Limited.** — An open-house party was held on Friday and Saturday, January 22 and 23, commemorating the official opening of the new Allen-Bradley plant at Galt, Ontario on January 25.

The factory and offices of the new plant, located at 135 Dundas Street, cover 45,000 sq. ft. of floor space. However, the property comprises 28 acres to provide room for future expansion. The Allen-Bradley line includes starters, relays, contactors and other motor control equipment. In the radio field, Allen-Bradley makes fixed and variable composition resistors, ceramic capacitors and ferrite parts.

●

**Hand-Operated Hydraulic Pump.**—A new hand-operated hydraulic pump has been developed by Chamberlain Industries, Ltd., of Staffa Road, Leyton, London, E.10., England, which can be supplied in standard form with or without pressure key and with a reservoir capacity of either half a gallon or two gallons, suitable for foot mounting.

The pumps, of extremely robust design, are constructed throughout from steel and it is claimed that they are absolutely free from leaks and that users will find that maintenance is almost unnecessary. The body consists of two plungers which deliver the maximum volume of oil under low pressure in order to move the ram up to its working position quickly, and then by means of a manual device the low pressure piston is automatically cut out and the pumping is continued at high pressure to a maximum of 5,000 pounds per square inch (352 kilograms per square centimetre).

From years of experience the manufacturers have appreciated the advantages of boring the body straight through to receive the pistons, thus ensuring that minute pieces of swarf do not become lodged in the machined oil-ways, resulting in hydraulic failure, whilst the pistons are of so rugged a character that it is almost impossible to damage them.

●

**Magamps Help Team a D-C and an Induction Motor.** — Westinghouse magnetic amplifiers helped solve a difficult rolling-mill problem for the Algoma Steel Corporation. A military application required billets rolled to a rather unusual precision. Finished billets were to be three inches on a side with the diagonal held to 1/64-inch tolerance. This was to be done in a six-stand mill in which the first five stands were gear driven by a 4000-hp. low-slip induction motor and the sixth by a 1000-hp d-c motor supplied through an ignition rectifier. The difficulty — to get these two motors to team together under all conditions of load and supply voltage. The a-c machine is much less sensitive to variations in a-c line voltage than the rectifier-supplied d-c machine.

To provide good speed harmony between the two motors a pilot generator was placed on the shaft of each motor. The output of these two pilots are compared and the result is fed to a two-stage magnetic amplifier, which also takes a-c voltage into account. The output of this regulating system operates on the phase-shifting circuit of the rectifier. This alters the voltage on the d-c motor to make its speed match that of its running mate.

●

**C.I.L. Expands.** — Expansion of the new polythene plant of Canadian Industries Limited at Edmonton to increase capacity by one-third was recently announced. Installation of additional equipment is expected to be completed by the end of 1954 at an estimated cost of $1,000,000, bringing the total cost to $15,000,000.

This plant, using ethane obtained from Alberta's gas as its basic raw material, will then have capacity to produce 16,000,000 pounds of polythene resin per year.

Construction of the Edmonton plant was started in April 1952. Now employing 230 persons, the plant went into production in November 1953 and initial shipments to customers were made in January 1954.

●

**International Harvester.** — International Harvester Company of Canada Limited has announced that an agreement has been made between the Heil Company of Milwaukee, Wisconsin and the International Harvester Company, Chicago, Illinois, for the manufacture of two wheel rubber tired tractor-scraper units for use in heavy construction work. The announcement was made jointly by Joseph F. Heil, president of the Heil Company and Harold T. Reishus, vice-president of International Harvester and executive head of International's industrial power division.

Under terms of the agreement, International acquires Heil patents, designs and manufacturing data covering two wheel rubber tired tractors. The agreement also includes an arrangement whereby the Heil Company will manufacture and supply two wheel tractors exclusively for the International Harvester Company until such time as International begins to manufacture the units themselves.

●

**Emission Microscope.**—A new Philips emission microscope is now under development and will soon be shown publicly in Canada according to R. G. Archer, manager, Scientific Department, Rogers Majestic Electronics Limited, Canadian distributors of Philips scientific products.

The new microscope will be a companion to the Philips EM-100 electron microscope which is now in use in Canada. It is being designed especially for metallurgical studies of metals and various metal oxides during heating.

●

**Portable Dust Collector.** — The new Standard Twin 92" portable cyclone dust collector offers peak efficiency in dust collection and tops in portability for 3,000-4,000 or 5,000 pound asphalt plants. The new unit is mounted on its own gooseneck trailer-type frame, and is available with or without running gear. It is designed for use with standard truck-size tires, thus permitting inter-change with other equipment. Operated with either Diesel engine or electric motor drive, the new portable cyclone dust collector is complete with large exhaust fan, dust return screw and fan stack with louver damper for maximum dust control. Complete unit meets all known state highway clearances. Manufactured by the Standard Steel Corporation of Los Angeles, California.

●

**Test Sieve Vibrator.** — To give quick and accurate and comparative sieve analyses and to free laboratory staff from a tedious operation for more skilled tasks Podmores (Engineers) Ltd., of Pyenest Street, Shelton, Stoke-on-Trent, England, has specially designed a test sieve vibrator. The machine is operated electro-magnetically, which eliminates all wearing and striking parts and the need for adjustment and lubrication. It is quiet in operation and the transference of vibration to the work bench is eliminated by anti-vibration mountings. The test sieve sleeve lawns are subjected to a rotational and vertical vibration which ensures quick and accurate results. The amplitude of the vibration is adjustable by means of a built-in controller but remains constant for any given setting. A time switch can also be built in to stop the test sieve after a pre-determined period of time. The machine can be arranged to take up to 10 eight-inch British Standard sieves.

●

**Bolt Saver.** — When replacements of special purpose bolts are not available immediately, many industrial managements may find it useful to turn to an ingenious and simple tool produced by Lawrence Edwards and Company Ltd., of Commercial Buildings, Oxford Street, Kidderminster, Worcestershire, England. For reconditioning threads on dirty or damaged bolts, this device is made to precision standards in best quality hardened and tempered steel. The bolt saver is opened like a book to receive the damaged bolt and it is, therefore, possible to deal with bolts which are damaged at the end. This is usually an impossibility with a conventional die. The reconditioning is done by clamping the tool shut and by withdrawing the bolt by unscrewing with a spanner. The bolt saver is available for internationally agreed standards of threads and will

deal with a full range of eight sizes from a quarter inch to three-quarters of an inch (6.3 to 18.9 millimetre) diameter.

**Plan Printer and Developer.** — A new machine that gives medium-fast output of good quality dye-lines which are printed and fully developed on the one machine has been produced by E. N. Mason and Sons, Ltd., Arclight Works, Colchester, England. The machine has been designed to make dye-line printing and developing almost effortless and it will deliver prints completely developed free from stain and odourless. Cut sheets or continuous rolls of sensitized material can be used and the operator does not need to stoop, bend or stretch during any part of the operation. Developing speeds of up to 12 feet (3.6 metres) per minute can be obtained. The machine is mobile, occupies only 15 inches by 64 inches (38 centimetres by 163 centimetres) of floor space, and is of clean, simple design and finished in hammered grey stoved enamel.

**Mid-Western Industrial Gas Limited.**— Mid-Western Industrial Gas Ltd. officially turned on natural gas supplies at the $19,000,000 Sherritt-Gordon nickel refinery, north of Edmonton at ceremonies held at the plant recently.

Ore supplies for the refinery's operations will be received by rail from mines at Lynn Lake in Northern Manitoba.

**Recording Instrument.** — A new portable recording instrument for obtaining a permanent record of alternating current and voltages is available from Canadian General Electric Company's apparatus division.

The new volt-ammeter, designated G-E type CF-7, combines features of a self-latching multirange hook-on current transformer and the simplicity of the type CF recorder in equipment suitable for indoor and outdoor applications.

It is expected to be particularly useful for checking loads on distribution lines, verifying motor loads, and in detecting overload circuits, transformers, motors, and other a-c apparatus.

**Fischer Bearings.** — Fischer Bearings Canada Limited, Toronto, has opened an office in Montreal at 6546 Upper Lachine Road.

Complete stocks of ball and roller bearings, pillow blocks, unground ball bearings and kilian casters will be kept available for quick delivery.

**First Overhead Line in East Africa.**— The first 132 kv overhead transmission line in East Africa is now being constructed for the Uganda Electricity Board by British Insulated Callender's Construction Company through their contracts office in Uganda.

This line of approximately 120 route miles is in two sections and runs westwards from Owen Falls to Kampala, the commercial centre of Uganda, and eastwards from Owen Falls to Tororo, a growing township near the Kenya border. These lines will transmit power from the Owen Falls Hydro-Electric station which is being built to harness the waters of the River Nile at Lake Victoria and which Her Majesty the Queen will officially open on April 29th during her visit to East Africa.

**Bristol Type 173 Helicopter.** — The prototype of the Bristol twin-engined, twin-rotor helicopter, known as the Type 173, Mark 1, recently carried out a successful series of trials at sea aboard the Royal Navy's aircraft carrier, HMS Eagle, The Bristol Aeroplane Company of Canada, announced recently.

The trials were designed to collect information on the behaviour of the large twin-rotor helicopter in varying conditions of deck motion; to test rotor blade behaviour, particularly during the stopping and the starting phases; to determine ease of manoeuvrability on the flight deck and to examine stowage problems below decks, all under varying conditions of deck, wind and ship motion.

**Canadian Aviation Electronics Limited.** —A revolutionary new storage battery, the nickel-cadmium type, only recently off the "secret-list" in the United States where it was originally developed, will be manufactured in Canada for the first time, at the Vancouver plant of Canadian Aviation Electronics Ltd.

U.B.C.-trained physicist David F. Manders, general manager of C.A.E., reports that a pilot operation is being established at the company's Cambie Street plant, and that introductory models of the new battery will be coming off the assembly line within two months.

**British Canadian Venture.** — One of Britain's largest firms in the engineering and construction industry with a unique organization, Balfour Beatty and Co. Ltd. has formed a Canadian subsidiary, Balfour Beatty Co. (Canada) Ltd., with temporary offices in Toronto.

The parent company, which already has permanent branches in South America, Malaya, East Africa and Iraq, has come to Canada with a view to collaborating with Canadian interests in the general expansion of utility and other development projects throughout the country.

**Steam Turbine.** — The recent installation of a 22,000 kilowatt Metrovick steam turbo generator for the Nova Scotia Light and Power Company in Halifax is the first of a series of Metropolitan Vickers installations to be made in Canada.

The Metropolitan Vickers Company operates in conjunction with the Canadian Westinghouse Company Limited who sell, install and service Metrovick units in Canada.

**Pipe Lines.**—Western Pipe Lines and Trans-Canada Pipe Lines Limited have merged their interests to bring Alberta's natural gas to Eastern Canada at the earliest possible date, it was recently announced by The Right Honourable C. D. Howe.

At the request of Mr. Howe, the two groups have held a series of meetings with him in Ottawa this week and have agreed to get together on a fifty-fifty basis to build a pipe line. The name of the company is to be Trans-Canada Pipe Lines Limited. Initially, there will be a twelve-man board of directors and a management committee, consisting of the president, who is yet to be named, Clint W. Murchison, Ray Milner, Frank A. Schultz and Alan H. Williamson.

**Water Pipe Contract.** — A major contract, amounting to over three million dollars has recently been awarded to

(*Continued on page 377*)

68th

ANNUAL MEETING

QUEBEC, QUE.

MAY 12, 13, 14, 1954

(*Continued from page 372*)

Dominion Bridge Company's Pacific Division, Vancouver, B.C., for the supply of 36 miles of 36 ins. steel water pipe from the Buffalo Pound Lake filtration plant to the city of Regina.

Dominion Bridge will manufacture the steel pipe from British plates in a section of its Vancouver plant. It will be made up into 40 ft. lengths with ends prepared for sleeve type couplings. All requirements of the American Waterworks Assn. standard specifications will be fully met.

The important operations of lining, coating and wrapping of the pipe will be carried out at Regina where Dominion Bridge Company will build a plant especially for this purpose.

●

**Mechanical Handling System.**—A new manufacturing plant for Canadian Mechanical Handling Systems Ltd., will be opened in Windsor in the next few weeks. The company maintains a sales office at 106 Adelaide St. W., Toronto, with Robert G. McKay as sales representative.

●

**English Electric Equipment at Kemano.** — "English Electric" equipment is to play its part in the huge Kemano-Kitimat power scheme of the Alcan project in Northern B.C. Recently arrived at the site was a large transformer and a 1-6,000 Kva output water-turbine driven alternator. Total weight of the alternator is 490 tons. It was shipped in units weighing from 27 to 41 tons.

●

# Publications

**For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.**

**Please mention *The Engineering Journal* when writing.**

**Graduate Training Featured.** — The January-February issue of 'Spotlight'—external house-organ of The English Electric Company of Canada Limited—carries an interesting article on the much-discussed subject of graduate engineer training and development.

The article emphasizes the need for more fully-trained engineers in Canadian industry, and details the scheme which is jointly operated by the John Inglis Co. Limited and English Electric.

It also outlines the training being offered to selected Canadian graduates on an English Electric Fellowship course in one of the company's several works in England.

Other features include stories on equipment going to Kitimat and into the northern latitudes of Canada.

●

**Aircraft and Ordnance Motor Bulletin.** —A new eight-page bulletin on the selection and application of aircraft and ordnance motors has been announced as available from the Canadian General Electric Company Limited, aviation equipment sales, 212 King Street West, Toronto, Ontario.

The booklet (GEC-988) contains photographs and diagrams of the equipment, explaining testing and application services, and gives estimating dimensions. Covering intermittent—and continuous-cycle motors, the publication includes operating and manufacturing data.

●

**Research and Control Instruments.**— A new 64-page reference book titled "Research and Control Instruments — X-ray and Analytical Equipment" is available from the research and control instruments Division. North American Philips Company, Inc., 750 South Fulton Avenue, Mount Vernon, New York.

In addition to X-ray diffraction, spectrometry and spectrography, the volume covers such components and accessories as tubes, rectifiers and cameras. It also has sections devoted to camera mounting brackets, film illuminators and measuring devices, and monochrometers.

●

**Stock List.**—A new stock list of distribution transformers is available from Ferranti Electric Limtied, Mount Dennis, Toronto 15, Ontario. An interesting graph shows the production rate and stock picture in one easy glance.

●

**Hydraulic Truck Dumper.** — Link-Belt Folder No. 2482, just released, provides information about the Link-Belt hydraulic truck dumper, with photographs and dimensional information.

A copy will be sent on request to the company at P.O. Box 173, Station "H", Toronto 13, Ont.

●

**Wrought Iron.**—For the first time in Canada a catalogue featuring standard wrought iron constructions is to be issued to the trade. The booklet, an attractive blue and white edition with a stiff cover, is being issued by Art Wire & Iron Co. Limited, 5 Carlaw Avenue, Toronto, Ontario, and will be in distribution within a few weeks.

●

**Forced Recirculation Steam Generator.**—A booklet describing the features of the 15-100 h.p. Clayton forced-recirculation steam generators is available from Construction Equipment Company, Limited, 180 Vallee Street, Montreal.

Space, weight, efficiency and installation are a few of the features highlighted. General data are also included.

●

**Westinghouse News.** — Westinghouse News, published every three weeks at Hamilton, Ontario, features in the January 28 issue "Division Faces Threat From Europe". The loss of factory manhours in 1954 due to orders lost to overseas competition is discussed and a remedy suggested.

All communications should be addressed to Bill Cockman, The Westinghouse News, Canadian Westinghouse Company Limited, Hamilton, Ontario.

●

**Canada's Growth.** — The Investment Dealers' Association of Canada, 170 Bay St., Toronto, is making available a handy little booklet designed to assist the individual in placing savings to the best advantage and suggesting how a share in Canada's growth can be secured. Three types of securities are discussed: those offering a high degree of safety of principal, those with a higher income as their chief appeal, and securities selected for their prospect of increase in value. The Association's service is also explained.

●

**Water Columns.** — New data unit No. 232 describes, illustrates, and gives specifications on Jerguson water columns. Principle of operation and features that assure positive alarm signals if boiler water falls too low or rises too high are explained.

The literature is available from Peacock Brothers Limited, P.O. Box 6070, Montreal, Que.

●

**Flexible Shafts.** — Engineering Bulletin No. 525 and a slide torque calculator shows how to select the correct size and type power drive flexible shafts for any application, maximum capacity—1,500 pound inches. Also given are the necessary data for the remote control of flexible shafts, maximum capacity—4,000 pound inches.

For the bulletin and the slide torque calculator, write Stow Manufacturing Co. of 150 Shear St., Binghamton, New York.

●

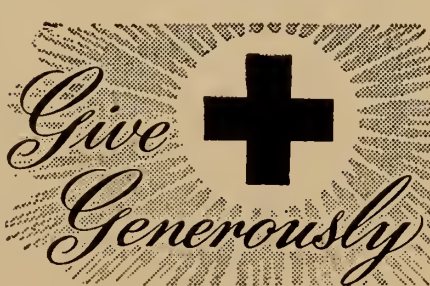
**Three Mode Controller.** — Specification Sheet 771 describes a new three mode stack type pneumatic controller, which incorporates proportional, automatic reset and rate action. Such control is particularly effective for the control of slow processes.

The new literature is available from Minneapolis-Honeywell Regulator Co. Ltd., Leaside, Toronto 17, Ontario.

●

**Concrete Form Work.**—General notes on plywood form construction; methods of framing and erecting forms; design data and tables; and deflection curves are given in a booklet entitled "Concrete Form Work", issued by the Plywood Manufacturers Association of British Columbia.

It is available from the association at 810 West Hastings Street, Vancouver 1, British Columbia.



# THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOLUME 37 MONTREAL, APRIL 1954 NUMBER 4

Price $6.00 a year in Canada, British Possessions, United States and Mexico. $7.50 a year in Foreign Countries. Current issues, 75 cents a copy, back issues from $1.00 per copy up. To members and affiliates, 50 cents a copy, $4.00 a year.—Authorized as second class mail, Post Office Department, Ottawa.

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

*A paper to be presented at the 68th Annual General and Professional Meeting of The Engineering Institute of Canada, at Quebec City, May 1954.*

This paper emphasizes the value of the advance studies and policy formation in the early "forties", permitting a start on design of the subway well in advance of construction. Functions of the Public Utilities Co-ordinating Committee are described. The careful co-ordination of the construction schedules, both with operating departments and with member groups of the Toronto Traffic Conference, is outlined. Standardization of plans, testing and inspection procedure, materials procurement, and the functions of the Records and Estimates Section are also discussed.

Controls for a project the size of the Toronto Subway are not necessarily complex, but to be effective they must extend from policy-making level to the field supervision.

Policy decisions of the Toronto Transit Commission are made by the Commission. The Commission was first established in 1921 by an Act of the Provincial Legislature, by which the City turned over to the Commission its rights and powers in connection with the construction and operation of transit facilities.

This Commission consisted of three members. On January 1, 1954, it was replaced by a five man Commission, under a new Act which extended the responsibility of the Commission to include all of the Toronto metropolitan area.

All policy decisions regarding the Subway can not be discussed in this paper, but the timing of the major decisions are of particular interest:

1942 — Report presented to the City of Toronto recommending subways as a solution to Toronto's traffic problem.

1943 — Norman D. Wilson, M.E.I.C., planning consultant, retained and a small staff set up to develop the basic plans.

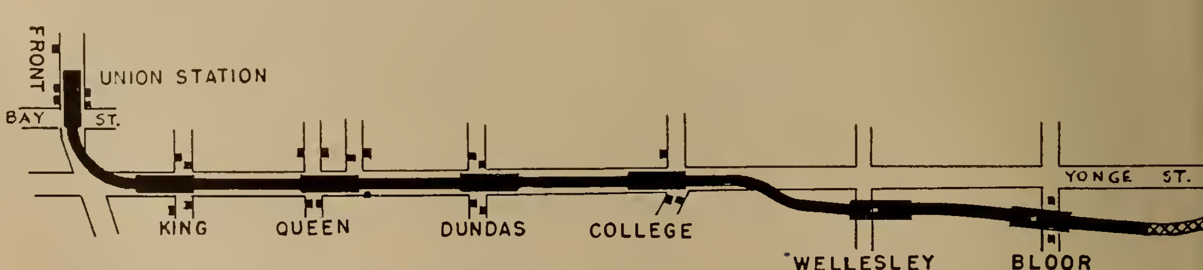
1944 — DeLeuw, Cather and Company retained to advise in the design of structure. Established Rapid Transit Department and approved budget for a staff of about forty. A. S. Mathers and John B. Parkin retained as consulting architects. Robert F. Legget, M.E.I.C., then on the staff of the University of Toronto, retained to advise on soil conditions.

1945 — Having been furnished with a report showing the location and characteristics of structures and cost of an initial system of subways, the Commission authorized the preparation of contract drawings for the Yonge Street Subway.

These early decisions to get on with the job were of great importance, as they permitted thorough investigation of many design aspects resulting in substantial savings. These savings would not have been accomplished if the decision to prepare contract drawings had been set aside until the time of construction was definitely known. The following example could illustrate this point.

Where the subway crosses Bloor Street just east of Yonge Street, one block north of Bloor Street the Bell Telephone Company have an exchange building containing several millions of dollars worth of equipment. It had been decided at an early date that this building could not be removed economically, and that alignment of the structure must be laid out to pass it.

Originally the subway passed to the west of the Bell Telephone Company building. However, further investigation of costs of right-of-way, subway structures, rearranging Bell cables, subway opera-



tion and surface car operation, all indicated that a better station could be developed at Bloor Street on an alignment east of the Bell Telephone Company building, at a saving to the Commission of approximately $500,000. Redesign of track was another instance of change in original plans, resulting in a saving in excess of $500,000.

Before construction started the Commission spent, for engineering and promotion, about $1,000,000 or roughly 2 per cent of the final cost of the job, but this sizable expenditure was more than equalled by savings in costs made possible by an early start on design.

#### Staff

The Commission approved the appointment of consultants, but the employment of a staff of engineers, draughtsmen and others required to develop plans and specifications was a function of the general manager, who delegated this responsibility to his staff. During the years 1944, 1945 and 1946, competent personnel were not easily acquired, particularly when the future of the project, and therefore the staff associated with it, was unknown.

After some months of attempts to employ experienced men with only moderate success, we embarked on a programme of employee training. Fortunately we had enough experience in the group to do a training job, and although most of those who were trained have left the Commission, the cost of training was returned, and were we faced with the same problem again we would not hesitate to follow this method of developing a staff.

By the end of 1944 we had an effective group of about forty employees working in the following sections: general office (clerical), general plans, structural, mechanical, architectural, and specifications and estimates. Electrical design was undertaken by the Commission's existing Electrical Department.

#### Utilities

The Yonge Street Subway was scheduled for completion of structures by the end of 1953. The work was completed generally in accordance with this schedule, as a result of careful scheduling of work and the willing co-operation of contractors, governmental and other authorities, companies, utilities affected, and suppliers of materials and equipment.

Co-operation, which is the key word in the story of job control, was sought by the Commission when the project was first contemplated. When problems of location were still at the discussion stage the Commission's proposals were informally discussed with officials of the City, Toronto Harbour Commissioners, Toronto Traffic Conference, Toronto Terminals Railway, etc.

One of the early meetings called to discuss the project was a special meeting of the Public Utilities Co-ordinating Committee. This committee (referred to as the P.U.C.C.) is made up of representatives of the Roadway, Sewer, Bridge and Waterworks Sections of the Works Department of the City of Toronto, the Bell Telephone Company, the Consumers' Gas Company, the Toronto Hydro Electric System, and the Toronto Transportation Commission.

The Committee prepares drawings showing the location of the various utilities occupying the streets, and the cost of making these drawings is shared equally by the members. The Committee meets under the chairmanship of the Deputy Commissioner of Works, and at these meetings many problems regarding the occupation of streets are resolved.

It was therefore most important to the Commission that this Committee be advised at a very early date of the Commission's plans for a subway on Yonge Street. At this meeting, and continuously thereafter, the Commission received the full support and co-operation of this Committee and the organizations represented.

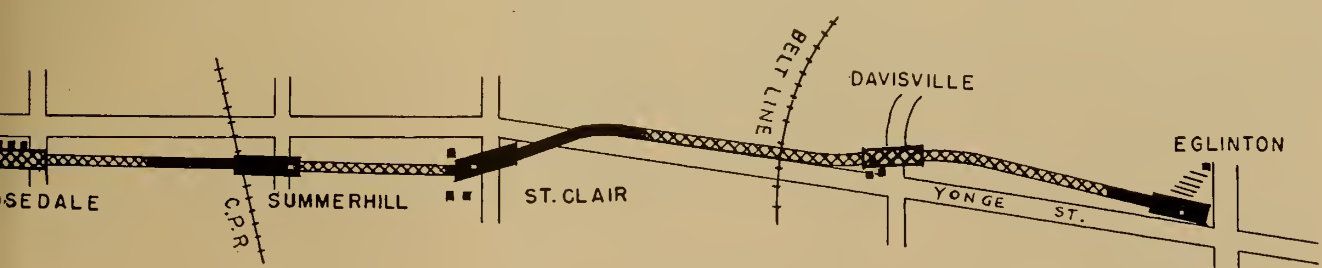
The maintenance and restoration of utilities during the construction of the Subway was probably one of the most important requirements of job control. It was known that subway excavation would dislocate sewers, watermains, gas mains, Bell Telephone cables, Hydro cables, C.P.R. and C.N.R. Telegraph services and the services of the Dominion Electric Protection Company.

Through the Public Utilities Co-ordinating Committee many discussions were held on methods of maintaining and restoring the various services. However, the plans showing the restored location of utilities were made by the staff of the Commission but approved by the members of the P.U.C.C.

To permit work to proceed without delay the Commission negotiated with each utility company, an agreement which set out those operations for which the Commission or its contractor would be responsible, and the method of payment. As a result of this co-operative planning and careful work on the part of the contractor, consumer complaints were practically negligible, although a slight mistake could have resulted in cutting of cables and leaving the downtown area without electric power or communication.

#### Co-ordination of Plans

While the Commission was developing plans for the subway, the City of Toronto Planning Board was actively engaged in preparing a master plan for the City. Through the co-operation of the Planning Board, arrangements were made for representatives of the Commission to attend such meetings as were necessary to make sure that the Commission's plans for improvement of services would not be in conflict with improvements proposed by the Planning Board.



#### Standard Plans

Early in the development of the project it was determined that all drawings should be made on sheets of standard sizes, multiples of letter size, so that they could be folded to accompany correspondence. Some special location study plans and profiles were the exceptions to this rule which was otherwise rigidly enforced.

To develop uniformity in drawings a standard practice manual for draughting was prepared which established such details as thickness of lines, size of letters, abbreviations, standard notations, etc. Early attention to these details helped to avoid errors and to produce a workable set of drawings.

To control the use of plans an effective filing system was established, and drawings were not released for reference without the approval of the head of the section which produced the plan, thus placing on that section head full responsibility for releasing those drawings only that were revised to-date of issue.

#### Specifications

Before undertaking the writing of specifications for this project, specifications written for many other similar projects were examined. It was the Commission's desire that subway structures be built in accordance with the highest accepted standards, and at reasonable cost. The specifications were therefore written with the intention of giving complete and accurate information regarding the design of structures to the tendering contractors, but leaving the contractor free to use his ingenuity with regard to construction methods.

In this regard, when the first set of contract drawings was completed, but before the project was scheduled for construction, most of the major Canadian contractors in the heavy construction field were invited to review the Commission's plans and specifications and discuss them with the Commission's engineers.

#### Supply of Critical Materials

During the post-war years many materials essential to subway construction were in short supply, and many critical materials were available with government approval only. Because subway construction would disrupt traffic in the downtown area, it could not be undertaken until material became available in the necessary quantities to maintain all contracts on schedule.

The timing of subway construction was therefore discussed with the proper authorities at Ottawa, and it was not until their assurance of co-operation was obtained that the first structural contracts were advertised for tender. The subway was never given priority classification by Ottawa, but every reasonable assistance was given the Commission at all times in the procurement of critical materials.

Before advertising the first structural contracts the Commission purchased 8,000 tons of structural steel required for the falsework and shoring. This avoided the delay in starting work which would have occurred if the contractor had placed the order after procuring the contract. Similarly, on Structural Contracts S-3, S-4 and S-5, sufficient steel for falsework and shoring to get the job started was purchased from European sources before these contracts were released for tender.

As the job progressed, material, particularly steel, instead of becoming easier to procure as anticipated, became much more difficult to obtain. Fortunately, the contractor on Contracts S-1 and S-2 had placed all orders for steel promptly, and through his own efforts procured the necessary steel to complete his contract.

As the work progressed on other contracts a shortage of reinforcing steel developed, and to avoid delay on this account the Commission purchased substantial tonnages of steel from Europe and the United Kingdom. This steel was purchased at a price much in excess of the controlled Canadian prices, and was made available to contractors to make up shortages in their Canadian deliveries at Canadian prices.

In order to reduce the quantity of reinforcing steel required to complete the subway structures, some structures such as retaining walls were re-designed to increase the volume of concrete and reduce the amount of reinforcing steel required.

To avoid delay in completion of the entire project on account of shortages in items other than steel, a very comprehensive quantity of critical materials and equipment was purchased by the Commission and furnished to the contractors. Some of these items purchased and supplied by the Commission are as follows:—

Brick
Cables
Insulated wire
Conduit
Electrical outlets
Supervisory equipment
Switchboards
Telephone equipment
Light fixtures
D.C. breakers
Pumps
Louvres and fans
Plumbing fixtures.
Cast iron pipe and fittings
Wrought iron pipe and fittings
Brass pipe
Fire equipment
Boilers and heating equipment
Shop equipment
Tile pipe
Reinforced concrete pipe
Corrugated sheet metal pipe
Hardware
Plumbing equipment
Partition tile

It might be of interest to mention that the storage of this material presented another problem which was handled by the Stores Section of the Commission's Treasurer's Department, which extended the existing storage areas and took over an abandoned substation to provide storage for some of this material.

#### Construction Schedules

At the time of undertaking the first contract, a comprehensive schedule for all contracts of the entire project was established showing date for completion of plans and specifications, date of advertising for tenders, date of commencement of work and the date of completion of work.

This schedule was, of course, a general control only, and each contract had its own schedule for its various phases. Of these, probably the most complex were the heavy construction contracts in the downtown section where almost every operation affected the downtown merchants and their customers.

Before the contractor could commence excavation on Yonge Street, the car tracks had to be removed. To permit their removal it was necessary to divert the Yonge cars to another street, and for this purpose a series of diversions using Church and Victoria Streets for north-south operation, and various east-west streets, were devised.

After the contractor had completed the first phase of his excavation and had replaced the timber deck, the street cars were restored to Yonge Street. To permit removal of the timber deck and back filling of the street, it was necessary to again divert the Yonge traffic to the diversion routes.

These diversions were not made until they had been carefully studied by the operating departments and brought to the attention of the Toronto Traffic Conference which is made up of representatives from the following:—

Toronto Board of Trade

Downtown Businessmen's Association
Ontario Motor League
Ontario Safety League
City Police Department
Toronto Transportation Commission
City Traffic Engineer
City Works Committee

By bringing the proposed diversions to the attention of the Conference, those most concerned were aware of the Commission's intentions. Although it was not possible to satisfy every requirement, a sincere and genuine effort was made by the Commission to avoid undue interruption to the street, and to provide service when it was essential.

For example, no traffic diversions on Yonge Street were permitted during the month of December on account of Christmas shopping. No traffic diversions were permitted on Front Street in the week before Christmas or Easter on account of heavy traffic at the Union Station. Long diversions were avoided during January and February, on account of the difficulty of travelling during the winter months.

After the plan of a diversion had been developed and reviewed by the Toronto Traffic Conference, it was then taken up with officials of the City departments affected—i.e. Police, Traffic and Fire. After obtaining these approvals the diversion was then advertised in the daily newspapers.

As well as diverting street car traffic, it was necessary to arrange alternate routes for the free-wheel traffic that normally used Yonge Street. These alternate routes were jointly planned by the Commission's Director of Development and Research and the City Traffic Engineer, and were included in the diversion plans.

### Testing and Inspection

The procurement of wide variety of materials for the project presented a problem in inspection and testing. Certain testing procedures were already established in the T.T.C., but it was decided to set up a separate Test and Inspection Section of the Rapid Transit Department.

A survey showed materials and equipment would be coming from coast to coast of North America, and from Europe and Great Britain. As there are a number of commercial inspection companies who maintain inspection services in principal industrial areas, the Commission called for tenders for inspection and testing of specified items. In this way inspection was assured when needed of such items as cement, steel, cast iron pipe, concrete pipe, vitreous pipe, rail and special work, etc.

All concrete in the subway structure was supplied to contractors from "Ready-Mix" plants. The cement, aggregates and mixes were all supplied to T.T.C. specifications. Continuous batching plant inspection and testing was maintained by commercial service, under the overall supervision of the Rapid Transit inspectors. In addition to this, on-the-job inspections took some 6,100 concrete test cylinders.

Where possible, materials were specified to Canadian Engineering Standards Association, British Standards Specifications, American Society for Testing Materials standards. An example of the diversity of inspection services is found in reinforcing steel. That material was made in Canada to C.E.S.A. specifications, in the United States to A.S.T.M. Code, and in Great Britain and Luxembourg to B.S.S. In each case our commercial testing service supplied certificates of inspection at the various mills.

Mechanical equipment such as pumps, fans, etc., were inspected and tested at the factories by the Rapid Transit Testing Section. This Testing Section also undertook to evaluate tests on paint suitable for an underground structure. Since conditions were more severe than found in most places in the country, a series of special tests were carried out to complement the specifications submitted by reputable paint makers.

### Assistance of National Research Council

Throughout the entire project the Division of Building Research of the National Research Council kept in close touch with the project, and for two years furnished a full-time engineer to make observations of job conditions and conduct certain tests. The assistance given the Commission by the National Research Council on the project was of great value to the Commission. The result of observations such as sub-soil conditions and behaviour of falsework under load will be of value to both owners and contractors on future construction projects.

### Records and Estimates

The Records and Estimates Section was formed to keep records of the progress reported by the Field Staff, calculate the amount of work completed, prepare monthly statements for payment, and estimate the cost of any modifications to the original contracts. The contracts were written on the basis of an approximate bill of quantities, against which the contractors submitted unit prices for each item; that is, a price for a cubic yard of excavation, or of concrete, or for a pound of structural steel, and so on, installed in place according to the contract drawings. Therefore a detailed and comprehensive record of all the construction work, providing a factual report of progress and expenditures, was required.

Questions on contract terms, affecting payments, were referred to this section. Useful modifications, frequently required by material shortages, were developed by the contractor's and the Commission's staffs. Therefore, in addition to maintaining records, this section had the responsibility for supervising payment on account of changes, setting rates on new items, and applying the control terms as required by these modifications. √

# Installation of Electrical Equipment

*A paper to be presented at the 68th Annual General and Professional Meeting of The Engineering Institute of Canada, at Quebec City, May, 1954.*

*by*

J. Y. Doran

*Electrical Engineer,*

*Toronto Transit Commission, Toronto.*

The most modern electrical equipment, embodying the most up-to-date safety devices, has been installed in the new Toronto Subway. In this paper the author deals with the distribution of auxiliary a-c. power, the lighting facilities for stations, tracks, yards and shops. The a-c. traction power distribution is described, including the calculation of a-c. power requirements. Details of substations and feeders are given, as well as for the supervisory control system, communications, the emergency alarm system, and the signal system including the dispatching of trains by automatic train dispatchers.

In the Yonge Street Subway, recently placed in operation by the Toronto Transit Commission, the double track main line is four and one-half miles in length. Approximately two thirds of this length is below ground, and the balance in open cut section. There are twelve passenger stations, each with five hundred foot loading platforms, and a storage yard and maintenance shops for the handling of over one hundred rapid transit cars.

In the construction of this underground railway system the installation of electrical equipment embraced a wide range of facilities for the distribution of auxiliary a-c. power, lighting, distribution of d-c. traction power, supervisory control, communication and signalling, each of which is of primary importance in the operation of the system.

#### Distribution of Auxiliary a-c. Power

The mechanical equipment in the subway includes escalators, drainage pumps, ventilating fans, sewage ejectors, heating units, and other miscellaneous devices with 25 hp. being the maximum capacity of any unit.

Auxiliary a-c. power for the operation of mechanical equipment, lighting and signalling is supplied at each passenger station by duplicate three phase, four wire, 120/208 volt, 60 cycle services, taken from the Toronto Hydro-Electric System's low-voltage network, where available, and at other locations, from separate feeders or transformer banks. In order to ensure as far as possible the continuity of supply to essential services, duplication is carried through main service breakers, secondary breakers, main busses and, in the case of lighting, branch feeder breakers and feeders to distribution panelboards.

The main a-c. switchboards are of totally-enclosed dead-front design, and incorporate two electrically operated main circuit-breakers, two manually operated secondary air circuit-breakers, main busses, distribution breakers, transfer relays and metering equipment.

The main a-c. breakers automatically transfer load from normal service to standby service in the case of failure of normal service. The distribution breakers on the main switchboard and all distribution panelboards in the subway are of the thermal or thermal-magnetic type.

The lighting panelboards are specially designed, with two sets of three phase busses in the same cabinet separated by insulating barriers. The lighting circuits are so arranged that alternate lights in any area are fed from different main bus, branch feeder and distribution panel bus.

At drainage sumps where two pumps are installed, each pump is supplied from a different main bus. Similarly at ventilating fan and signal supply locations each of the two units is supplied from a different main bus.

As the subway structure has been built for an expected long life, and as excessive moisture conditions were anticipated, stainless steel electrical metallic tubing and pull boxes, outlet boxes and distribution cabinets are used throughout the subway. In the train tubes exposed mineral insulated copper sheathed conductors are used for lighting and convenience outlet circuits.

A 125-volt stand-by battery, for the supply of emergency lighting and control circuits only, is installed at each passenger station, as a further guarantee against people being stranded below ground without light. Automatically regulated battery chargers of the selenium type are installed in association with each battery.

Service to Davisville Yard and Shops area is supplied by individual 550-volt and 120/208-volt three phase, 60 cycle services. The total connected auxiliary power load of the subway including shops is approximately 1,750 kilowatt and the expected average demand approximately 1,150 kilowatt.

#### Lighting

The lighting of Yonge Street Subway presented many problems peculiar only to this type of project. The lighting intensities had to be sufficient to present a bright and pleasant atmosphere to the underground locations. Elaborate precautions had to be taken to guarantee the continuity of light in the underground locations, in order to prevent any tendency of the public to panic in the event of a power outage.

The ever present dust and moisture conditions in a subway made special fixtures a necessity. In addition, the design and layout of the fixtures had to complement the modern architectural treatment of the stations. On the other hand, as about 6,000 fluorescent fixtures would be required for the job, an economical fixture in regard to initial cost, maintenance and operation, consistent with quality, was also a necessity.

### Illumination Levels

The lighting intensities in Toronto's subway are considerably lighter than those in general use in most other existing subways. The intensities for the various areas are as follows:—

| *Area* | *Foot Candles* |
|---|---|
| Control areas | 7.5-12.0 |
| Stairways and escalators | 10.0-12.0 |
| Passenger platforms | 7.5-12.0 |
| Long passages | 7.5-10.0 |
| Train tubes and open cut | 0.5- 1.0 |

In order to assist in the study of lighting levels, the Commission built a full scale model of one half of a typical mezzanine control area, complete with lighting, traffic control facilities, ceiling, floor and wall finishes.

### Choice of Light Source

Single-lamp fluorescent fixtures were selected for the main lighting source on the basis of long-life, high efficiency and low power consumption. The fluorescent fixture pattern also permitted the continuous row light source required by the architects. For all indoor locations except train tubes, the 40-watt T-12 hot cathode lamp is used. Starting does not present any problem in these locations, because the lighting units are in operation twenty-four hours a day and an average lamp life of at least 10,000 hours is expected.

In the tube areas and at all outdoor platform locations, 40-watt T-12 instant start lamps are used. This lamp is not as critical of voltage requirements and ambient temperatures as is the hot cathode lamp.

The choice of the standard bi-pin, 48-inch fluorescent lamp, so familiar to everyone, was made on the basis of initial cost, low replacement cost, satisfactory life, and requires only simple auxiliaries and permits economical fixture design.

In addition to the main lighting, emergency lighting circuits are installed throughout the subway which provide sufficient light to prevent any panic and to enable the public to leave the subway safely in the event of a power interruption.

The incandescent lamps were selected for emergency lighting because under normal conditions they operate on a-c., and only in the event of a power failure will they switch over automatically to the d-c. battery feed. A fluorescent unit to function on both a-c. and d-c. was deemed impractical.

Incandescent lamps were again the choice for the illumination of utility areas, i.e. heater rooms, switchboard rooms, etc. These lamps are installed in standard industrial type fixtures.

### Design of the Special Fixtures

Two basic types of fluorescent fixtures are used throughout all passenger areas of the subway. The first type is a single lamp, flush-mounted, recessed unit, commonly known as a troffer fixture, for use in control areas with acoustic tile ceilings. The second type is a single lamp, surface-mounted fixture for use on platforms, passages, tubes and other locations where direct mounting on concrete ceilings is required.

Owing to the anticipated long life of the lamps, a dust-tight fixture was desirable so that it would not be necessary to open the fixture for cleaning except at the time of relamping. Achieving the dust-tight feature in the troffer type was easily accomplished by adding necessary gaskets to a high quality standard commercial unit. Ribbed opal glass is used as the diffusing panel in the troffer fixture.

The surface fixture presented more of a problem. No commercial fixture available could meet the requirements of dust-tight construction, corrosion resistance, easy maintenance and, last but not least, present a pleasing appearance to satisfy the architects' aesthetic tastes. It was necessary to start from scratch and design a fixture that would embody all the foregoing requirements.

A fixture with a body of an extruded aluminum section with die cast aluminum end plates was developed. The shape of the base plate and glass frame side rails was such as to form a continuous hinge for the glassware cover. The use of molded ribbed opal glassware with good diffusion and light transmission characteristics was decided upon, together with anodized aluminum reflectors, gaskets, and locking devices.

The Commission's engineers produced drawings and specifications showing the basic requirements of the fixture, and tenders were invited for the supply of the required number of the various types of fixtures. The successful tenderer engineered the details of the fixture.

To maintain that very important appearance factor, a common housing design is used for both the fluorescent and the emergency incandescent units. This applies to both the troffer fixture and the surface type. In the incandescent units, five lamps are installed, four of which are fed from the a-c. source, and the fifth lamp in the centre is fed from the d-c. battery source in the event of power failure.

A one-foot incandescent fixture of the same cross section as the fluorescent fixture was produced to act as the emergency lighting unit in continuous row installations. Seven hundred fixtures of the troffer type and 5,300 fixtures of the surface type were required for the project.

Fig. 1. Lighting of a typical station.

Fig. 2. Lighting of a typical control area.

#### Fixture Location

All station platforms are 11 ft. 10 in. wide and five hundred feet long. A continuous row of the surface fluorescent fixtures is located three feet back of the edge of the platform and extending the full length. Every seventh one is the one-foot emergency unit. This arrangement provides a maintained average of 7.5 foot candles with 20 foot-candles at the point of loading.

The system of mounting and feeding these units is unique. A recess eight inches wide and two inches deep was left in the concrete ceiling of the platform. In this recess was installed a special two section wireway for the full 500 feet. One half of the wireway contains the a-c. supply feeders and the other half contains the feeders of the d-c. battery supply.

The fixtures themselves are mounted directly to the wireway by special nipples. This design was adopted to overcome a complex system of buried conduit and provide maximum flexibility in the longitudinal arrangement of the fixtures.

Between stations in the tube areas the surface type fluorescent fixture is mounted on the ceiling above the catwalk. These units are on 20 foot centres opposite the arches in the centre wall, and provide a maintained level of approximately one foot candle. An incandescent fixture of the vapourtight condulet design is installed every sixty feet for emergency lighting in the tube area.

Illumination for the control areas in the five downtown stations is provided by recessed troffer units built into the acoustic tile ceiling. The average mounting height for these areas is approximately eight feet, and the units are spaced to provide a maintained illumination of 7.5 foot candles.

For the control areas in the remaining stations both troffer and surface mounted fixtures are used, depending on the architectural design of the structure. In both control areas and platforms there is a system of illuminated signs fed from the d-c. source to direct the public to the stairways and exits.

#### Open Cut Lighting

In the open cut sections of the private right-of-way the standard street lighting luminaires are mounted at 25 feet on concrete poles located between the north and south bound running rails. Two units are installed on each pole, with the luminaire located over the running rails.

The pole spacing is approximately 140 feet. Supplementary lighting is provided under the numerous bridges by an enclosed incandescent fixture with a wide spread light pattern. All wiring in the open cut is underground and consists of plastic insulated cables buried directly in the ground and protected by tile cover slabs.

#### Davisville Area

The Davisville area of the Yonge Street Subway is the maintenance centre of the system. In this location is a modern building for the inspection and repair of the rolling stock used in the subway, together with buildings for the Way and Structures Department and a modern boiler plant for heating. A network of trackage provides for the movement and storage of the subway trains in the area.

The main lighting of all buildings is by two lamp, 48 inch industrial fluorescent fixtures with anodized aluminum reflectors. The fluorescent fixtures in the main shops are supported and fed by single phase trolley ducts suspended from a messenger. This arrangement provides a flexible and neat lighting layout.

In the wash bay area of the Rolling Stock Building, where the washing of the external surfaces of the subway trains is done, the fluorescent fixtures are of the enclosed vapour proof type, because of the excessive moisture conditions that may exist in this area.

The outside trackage at Davisville is illuminated by narrow and medium beam spread enclosed floodlights, on two sixty foot steel poles. Again all outside wiring is underground in a network of ducts below the surface of the yard.

#### Distribution of d-c. Traction Power

The Yonge Street Subway was designed to attain its ultimate capacity with a maximum service of eight car trains at a two minute headway, or thirty trains per hour in each direction. However, initial operation was planned with a peak load service of approximately sixty per cent of this maximum. The number of subway cars purchased and the facilities for the supply and distribution of traction power to these cars were based on initial service requirements, with provision for the future extension of these facilities when warranted.

The subway cars were designed for operation on an average of 550 volts, direct current, the same voltage as used by the surface streetcars and trolley coaches. The direct current is supplied from modern automatic rectifier substations, which also supply surface routes in their respective areas, and is distributed to subway cars by means of a positive contact rail.

#### Calculation of Power Requirements

The subway route is approximately four and one-half miles in length with twelve passenger stations and an average of 2.4 stops per mile. The weight of a fully loaded subway car is approximately 114,000 pounds, and each car is equipped with four 68 horsepower motors. A service with six-car trains at a 2.5 minute headway is proposed for initial operation, with an average of 30 second stops at intermediate stations.

Speed-time and current-time curves were drawn for northbound and southbound runs based on the physical characteristics of route, car characteristics supplied by manufacturer and proposed operation. From these curves it was computed that, for the combined runs, the average demand per car would be 102 kilowatts and the average consumption per car mile would be 6.7 kilowatt hours at the car including auxiliaries and electric heating during winter months.

It was also computed that 13.8 six car trains, exclusive of those laying over in terminals, or an average of 83 cars would be required in operation on the route to maintain a 2.5 minute headway. The total expected demand at the car would therefore be 83 cars at 102 kilowatts per car or 8,466 kilowatts.

The addition of calculated line and conversion losses to this figure resulted in a total expected a-c. substation demand of approximately 9,800 kilowatts. The average current of a six-car train was computed to be 1,110 amperes, with a maximum during acceleration of approximately 4,000 amperes. Similar calculations were made of expected loads on individual feeder sections to determine loading on individual substations.

#### Rectifier Substations

Direct current power is supplied to subway cars at an average of 550 volts from five substations located along route, with provision for the addition of one substation and the doubling of capacity of another substation when warranted by future requirements.

All of these substations are equipped with modern mercury-arc rectifier units including sealed glass bulb and sealed steel tank types. The standard size of rectifier adopted is a 1,250 kilowatt unit for Class III Railway Service, with an overload capacity of 150 per cent for two hours, or 300 per cent for five minutes following rated load.

Substations are of unattended type, and function completely automatically under normal operation. Over-riding control and supervision of the substation equipment from a central power dispatcher's office is provided by a modern supervisory control system. Sixty cycle, three phase power is supplied to substations at 13,200 volts by the Toronto Hydro-Electric System.

Outgoing direct current feeder breakers supplying the subway are of semi-high-speed type, with a capacity of 3,000 amperes and an interrupting capacity of a potential 150,000 amperes. Each breaker is equipped with impulse and rate-of-rise tripping devices, designed to distinguish between normal accelerating currents in excess of 5,000 amperes and short circuit currents at remote points on contact rail. The feeder breakers are also equipped with load measuring and automatic reclosing devices.

#### Sectionalization of Feeders

For the segregation of trouble and to facilitate maintenance, the contact rails on northbound and southbound tracks are each divided into six feeder sections, a total of twelve sections exclusive of the Davisville Yard, averaging .75 miles in length. Division points between feeder sections are arranged to coincide with locations of five intermediate crossovers installed to facilitate operation under abnormal conditions.

Each of the twelve feeder sections may be individually isolated, automatically due to overload conditions, by supervisory control from load dispatcher's office for maintenance or other purposes, or by the operation of one of the emergency alarm boxes spaced at regular intervals along the route in the event of emergency that makes it desirable to cut off power to the contact rail.

Each feeder section is normally fed at both ends, in most cases, by direct feeders from two adjacent substations. In other cases, they are fed firectly from substation at one end and indirectly, through tie breaker, from the adjoining feeder section at the other end. Tie breakers between the heavier loaded northbound and southbound feeder sections made it possible to take advantage of diversity of load between sections.

The Davisville Yard and Shop area is also divided into three feeder sections, separately fed from the Davisville substation. In addition, disconnecting switches are provided in the yard for the isolation of contact rail on individual tracks.

#### Positive Contacts and Return Rails

Power is distributed to the subway cars by means of a positive contact rail. The contact rail is of 150 pound mild steel with a conductivity equivalent to approximately 2,500 M.c.m. of copper. It is located 4 1/16 inches above and 22 inches outside of the running rail, for the most part on the left hand or inside, but at terminals with centre platforms and at crossovers on the right hand or outside.

The rail is mounted on dry process porcelain insulators at approximately eight foot centres. Expansion joints are provided at approximately 1,000 feet intervals. The rail is anchored midway between these expansion joints, but is allowed to move longitudinally between anchor points.

At frogs and crossovers in track, gaps are provided and inclined approaches installed on contact rail, enabling the current collectors on the cars to leave contact rail while passing over switch points and crossings and to then smoothly re-engage the contact rail.

Between separate feeder sections a gap is provided of sufficient length to prevent the bridging of sections by the front and rear current collectors on a car. The contact rail is thermit-welded, eliminating the ne-

**Fig. 3. A 600-volt d-c. breaker board in a typical automatic rectifier substation.**

cessity of bonded joints, except at expansion joints and gaps in rail where bonds are provided.

The contact rail is protected by an eight inch wide board mounted $3\frac{1}{2}$ inches above rail and supported, at same interval as contact rail, by steel forgings. This protection board is designed to prevent, as far as possible, accidental contact with rail and, in open cut sections, the formation of sleet on rail.

The negative return circuit is provided by one of the running rails of each track, the other rail of each track being insulated from the return rail for operation of signal circuits. Each return rail is of 100 pound cross section, with a conductivity equivalent to approximately 1,000 M.c.m. of copper. The running rails are also thermit-welded, eliminating the necessity of bonded joints except through special work.

In longer feeder sections the capacity of each return rail is reinforced by the installation of a 1,500 M.c.m. parallel copper feeder on the centre wall in the train tube, under the platform edge in stations, and in underground duct in open cut and crossover sections. The return rails and reinforcing feeders are bonded together at approximately 400 foot intervals through tunnel sections, and 800 foot intervals in open cut sections.

#### Feeders and Connections

Positive and negative feeder connections from substations to subway structure are provided by 1,500-M.c.m., plastic insulated cables run in underground conduit. In the subway structure actual connections between feeders and contact and return rails are made by 500 M.c.m. extra flexible, rubber insulated, neoprene jacketed cables, which are welded to the rails.

Two 1,500-M.c.m. positive cables, terminating in four 500-M.c.m. cables, are provided from each substation feeder breaker to the contact rail of each feeder section. The 1,500-M.c.m. negative cables from the substation bus terminate at a negative bus in the subway structure, from which reinforcing cables are run and from which connections are made to the return rail by 550-M.c.m. cable. Bonds around expansion joints and gaps in contact rail are provided by four 500-M.c.m. cables.

The insulation of 1,500-M.c.m. cables consist of 10/64 inches of PVC (polyvinol chloride). The insulation of 500 M.c.m., extra flexible cables consist of 6/64 inches of ozone resisting rubber plus a 5/64 inch neoprene jacket.

#### Car Current Collection

Each car of the subway train has its own traction motors, and collects its own power from the contact rail. There is no 600 volt train line or connection between the individual cars of a train. Four current collection devices are provided on each car, one on each side of both front and rear trucks, enabling the car to pick up power from contact rail mounted on either side of the track, and to retain contact while passing over short gaps in the contact rail at special track work.

Each current collection device consists of a malleable iron shoe, which slides along the top of the contact rail. The shoe is hinged to its support, and is pressed against the rail-head by an adjustable tension spring. Provision is made in the support of the shoe for vertical adjustment, to compensate for wheel and rail wear.

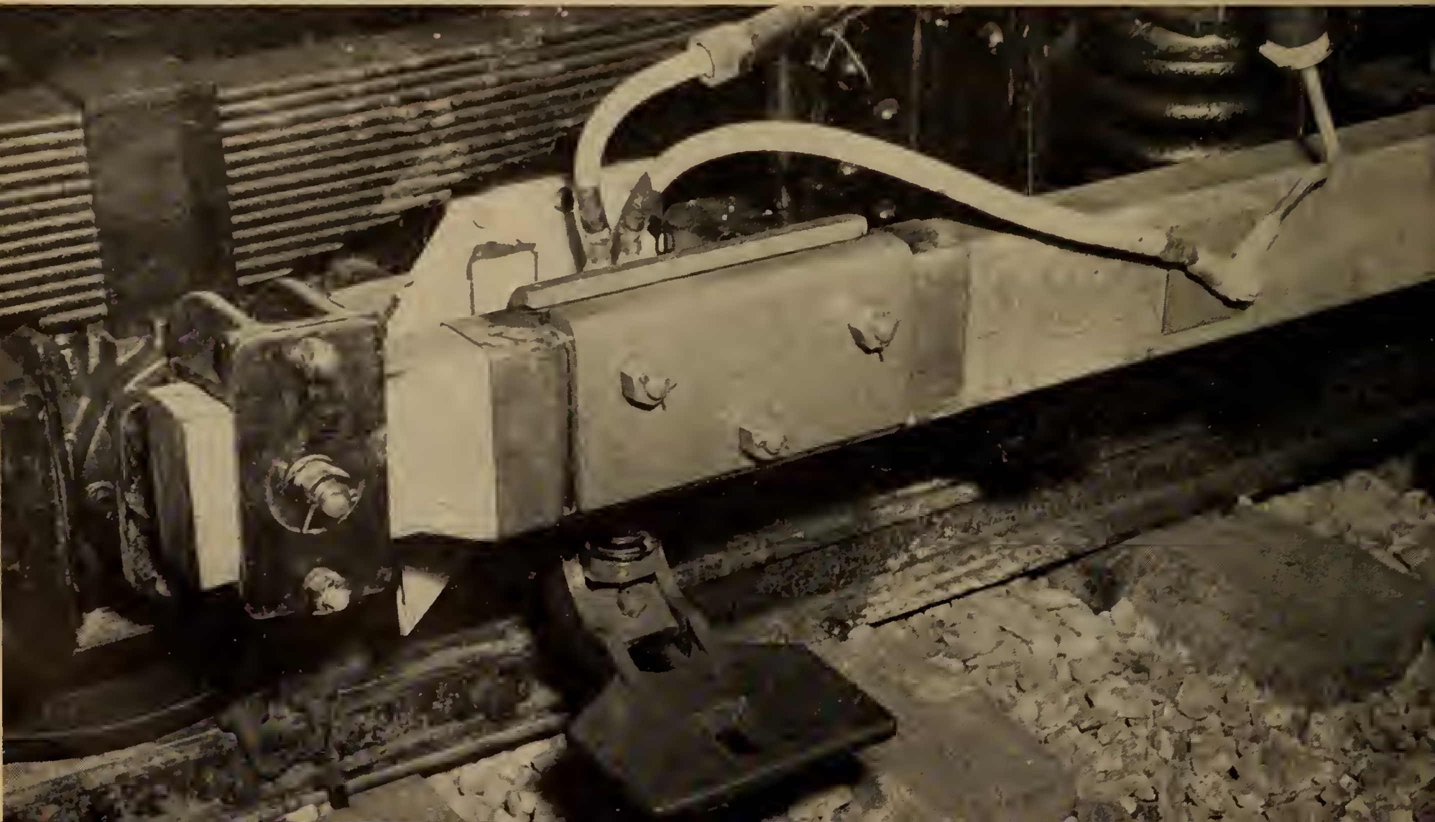
A fixed stop is provided to limit the maximum downward movement of shoe, and thus prevent it from making contact with the running rail or wayside equipment while not engaged with the contact rail. This stop also retains shoe at proper elevation to smoothly engage inclined approaches to the contact rail.

Each shoe is supported on a varnished ash beam, and adjacent parts of the truck are protected from flashing by insulating guards. The two shoes on each truck are connected by a conduit-enclosed cable and thence, by similar type connection, to the main and auxiliary fuses on the car underbody.

#### The Supervisory Control System

In order to keep pace with the steadily increasing traction power demands of the system as a whole, including the subway, a programme of installation of modern automatic rectifier substations is being carried out, while obsolete manually-operat-

Fig. 4. Current collecting device on subway car.



ed substations are being abandoned. The operation of the subway involves the use of auxiliary electrical equipment for lighting, drainage, ventilation and heating, in addition to that required for the distribution of traction power.

For centralized control and supervision of this equipment a supervisory control system of the coded-frequency type has been installed. The supervisory control system is divided into two distinct sections, one controlling equipment in traction power substations and the other traction and auxiliary power equipment in the subway.

The substation system, embracing twenty-three automatic rectifier substations supplying subway and surface routes, provides control and indication of the a-c. line, rectifier and d-c. feeder breakers. It provides indication only of incoming a-c. line potential, rectifier firing and lockout circuits, outgoing d-c. feeder breaker load measuring circuits and the semi-urgent alarm annunciator.

In addition it provides telemetering facilities for as-called-for indications of individual rectifier loads and d-c. bus voltage. Also included is continuous indication of individual substation loads and totalized substation load for the system.

The subway system provides control and supervision of electrical equipment in, and adjacent to, the twelve passenger stations along the route of the subway. For control purposes the subway has been divided into four zones of three stations each, with the supervisory equipment for each zone being located in the a-c. switchboard room of the middle station of the three served.

The system provides control and indication of traction power feeder breakers, reversible ventilating fans, off-peak station heaters and open-cut lighting. It provides indication only of the continuity of normal and emergency auxiliary power services, low emergency battery voltage, emergency lighting transfer contactor, high water level and pump motor overload at drainage sumps and supervision of the emergency alarm system.

The dispatching equipment for both the substation and subway supervisory control systems is located in a separate room of a building on the Commission's Hillcrest property, which is the approximate centre of the system as a whole. Features of the control room include fluorescent lighting, acoustic treated ceiling and temperature-controlled air conditioning.

The dispatching equipment is in the form of self-contained stand-up-to-operate cubicles. The substation cubicles are of the straight front type, arranged to form a U-shaped board. Bench type cubicles are used for subway control, complete with an electric map. The four zone cubicles are mounted side by side, so that a complete picture of the subway results, showing the condition and relative position of all auxiliary equipment, including the emergency alarm boxes.

Remote station supervisory control equipment of the free standing cubicle type is located in each of the automatic substations and at each of the four zone control centres in the subway.

One pair of interconnecting wires from the control room to each remote station equipment is all that is necessary for complete operation. However, an extra pair is run as a spare channel, in case of failure of the operating pair. A third pair is included to each substation for station load telemetering and totalizing purposes.

These control pairs are No. 19 B&S paper insulated, and form a part of multi-conductor lead covered cables installed for combined use with the private automatic telephone system. Double throw switches, mounted in each supervisory equipment cubicle, are utilized to facilitate quick transfer to the spare channel.

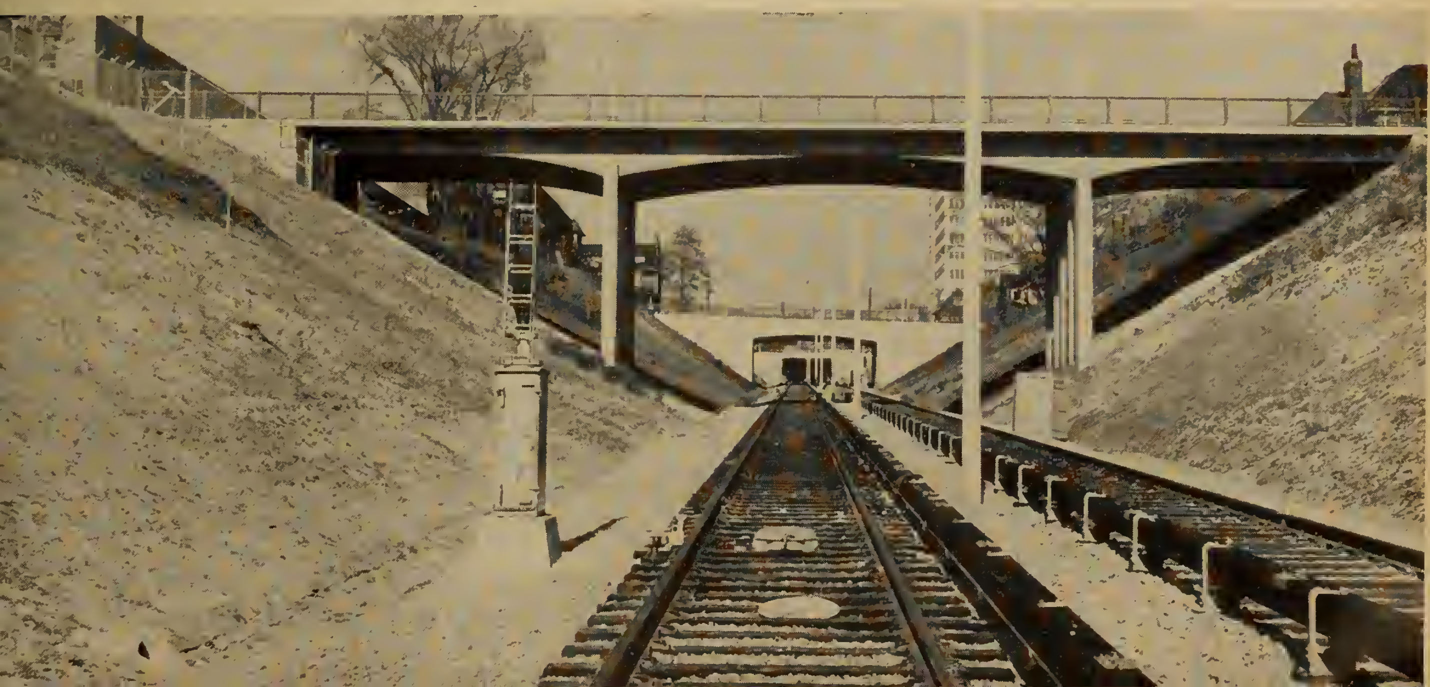
Except for the dispatch equipment signal-lamps which are a-c. fed, the supervisory system is operated entirely on 129 volt d-c. supplied by control or emergency batteries located in the substations, the zone control centres and at the control room. In case of failure of the signal lamp a-c. supply, provision is made for transfer to battery operated converters.

#### Auxiliary Equipment Control

The actual control of the subway auxiliary equipment is done by direct wire supervisory, from the zone control centres to remote supervisory boxes located adjacent to the controlled equipment, and containing all the necessary interposing and supervising relays.

In this system of supervisory control, a frequency code, made up of various combinations of four available frequency tones, is allotted to each desired device operation. To guard against possible splitting of a pulse causing a wrong operation, two pulses of the same frequency are never used consecutively in a

**Fig. 5. Typical open cut section showing the location of the contact rail and automatic block signal.**



code. Otherwise all combinations of the four frequencies, four at a time, are available for control functions.

The total number of different operations which may be performed is thus the product of the possible combinations or one hundred and eight. By increasing or decreasing the number of available frequencies or the number of frequencies used in each code, the maximum number of operations possible may be altered to suit the particular application.

The frequency tones are produced by a very stable electronic signal generator. The frequencies used are in the low audio range (200-450 cycles per second), and are carefully selected so as not to approach any possible power frequency harmonic.

A control escutcheon, for each device to be operated, is provided on the associated dispatch cubicle panel. On this escutcheon is mounted all the controls and indicating lamps associated with the complete operation of the device. The basic control escutcheon is comprised of a green lamp to indicate trip or off, a red lamp to indicate close or on, a two-position selector switch to select the desired position and a push-button to initiate the operation.

A white lamp is provided to indicate disagreement between the indication displayed and the actual condition of the remote device. The dispatch elements of the equipment are the signal generator to supply the four audio pulses, a signal divider to control the duration of each pulse and the push-button-selector switch combination to initiate the transmission of the frequency code.

The actual make-up of the codes is preset in the equipment. The remote station elements include four frequency-responsive relays for decoding of the transmitted signal, selector relays for selecting the proper interposing relay and the interposing relays themselves for final operation of the device.

To perform an operation the operator sets the control escutcheon selector switch assigned to the equipment whose operation is desired, and then presses the push-button. This starts the rotation of the signal divider which keys the signal generator, causing it to transmit a particular code of four frequency tones. At the remote station these are decoded by the frequency-responsive relays which operate the selector relays in sequence, thus operating the proper interposing relay.

The energizing of this relay operates the desired device. The action of position change of the device itself causes a checkback pulse to be sent while the push-button is still held down, thus changing the indication displayed at the control room to conform with the new condition of the device. The time elapsed during the operation is two seconds plus the operating time of the device.

The equipment provides indication of automatic operation of any of the remote equipment by the use of dispatch and remote station step switches and polarity-sensitive relays. Automatic reclosures of feeder breakers, which occur within the operating time of the supervisory control equipment, are indicated by a flashing of the associated red "close" lamp. Provision is made for checking the condition of all equipment under control at any time.

Self-supervision features of the equipment include supervision of the remote line, incomplete sequency indication and blackout of the board in the event of false indication.

#### The Emergency Alarm System

The Emergency Alarm System forms a part of the Subway Supervisory System and provides, at intervals of a few hundred feet throughout the subway route, means for the quick removal of the 600 volt traction power from the contact rail in the vicinity of each alarm box. Thus, in the event of an emergency such as a wreck or a fire, the motorman or other employee can quickly de-energize the contact rail so that the passengers can leave the train and walk safely to the nearest station.

The operation of an alarm box will cause the removal of power from the rails over a section extending at least to the far limits of the two passenger stations either side of the box location. A total of seventy-four alarm boxes are employed. The action taken to operate the boxes is similar to that used with the city fire alarm boxes. To facilitate the locating of the boxes in an emergency, each is identified by a blue light, the colour blue being used to avoid confliction with the signal system aspects.

The alarm circuit consists of a pair of normally open mercury contacts operated by a spring return lever in the box with a two wire interconnection to the particular supervisory zone centre where, by the use of multi-contact relays, the breaker tripping combinations are made.

Indication of box operation is executed by the supervisory control. It will appear at the control room in the form of an audible alarm and the illumination of a blue lamp on the subway control panel and on the electric map. From here the operator will be informed which box was operated, and where in the subway the trouble has occurred. The position change of the affected breakers will also be displayed.

A private telephone is provided at each alarm box location to connect with the supervisory operator, for explanation of the trouble so that he may take the proper action.

Due to the self-sealing feature of the alarm relays, momentary contact at the alarm box is sufficient to initiate a tripping sequence. Indication of an alarm box operation will be displayed at the control room until reset by the operator. This reset action will also return control of the breakers, so that they can be reclosed as the situation allows.

In the event of an alarm box lever jamming in the operating position, or in the case of a short on the interconnecting wires, the breakers can be reclosed after operation of the reset. The box indication will remain displayed, however, until the circuit has been cleared. Of the breakers tripped by this system, approximately half are feeder and tie breakers located in the various subway breaker rooms. The remaining breakers are located in the automatic substations which are close enough to the subway route for direct feed to the contact rails. These breakers are under control of the substation supervisory system.

The trip circuits are extended to the supervisory equipment in these stations where connections are made for proper breaker tripping execution. The system, being a part of the subway supervisory system, and similarly zoned, operates on 129 volt battery supply via the zone control centres. Ground detection to 100,000 ohms is provided on all trip circuit conductors.

#### Communications

To facilitate a high standard of communication between the various properties of the Commission, a complete 400 line private automatic telephone system has been installed, of which 136 are located in the subway. The system is of the selective talking, selective ringing dial type, and operates over an extensive multi-conductor lead-covered cable network shared by the supervisory control system. The conductors are No. 19 B&S double wrapped paper insulated.

An automatic switchboard complete with uniselector, group and final selector racks equipped for four hundred line circuits, is located in a separate room adjacent to the supervisory control room at Hillcrest. The room is kept dust-free by the use of a precipitron-fan unit. The various exchange equipment failure alarms are repeated in the supervisory control room for continuous supervision.

A feature of the exchange is the use of uniselector or pre-selector switches in place of the usual line finder types. In this system each line is provided with an individual line switch which hunts for and connects to an idle first selector when a call is made. This system is faster than the more commonly used line finder type.

The connection time, in itself, is not so important, but since few people check for dial tone, premature dialing will involve further time for re-dialing. In this equipment dial tone is almost coincident with the lifting of the telephone receiver, which makes for faster communication, an important feature particularly in the case of emergency calls.

Another feature of the equipment is the provision of conference facilities. Conference line circuits to certain telephone instruments, in addition to the system line pairs, provide a common talking line over which telephone conferences can be held.

### The Subway Signal System

In the operation of the Yonge Street Subway, trains of from six to eight cars will be used. A train of eight loaded cars weighs approximately 400 tons. Since its average speed will be in the region of 30 m.p.h. the minimum safe stopping distance is about 450 feet. Thus, in order to operate the service safely, a train operator must have warning of conditions at least 450 feet ahead.

In order to ensure this, a complete signal system has been provided. The basic unit of the signal system is the track circuit. One of the two rails on which the trains run is bonded continuously, throughout its length, to serve as a traction power return conductor. The other rail is divided into sections corresponding to safe braking distances for a train, each section being electrically insulated from the other by the insertion of insulated joints.

A low voltage alternating current is fed into both rails at the leaving end of each block and taken from the rails at the entering end through the coils of a double coil a-c. relay, which is thus energized. When a train enters the track circuit, the wheels and axles shunt the current from the relay, which consequently becomes de-energized. Contacts on the relay are used to control the aspects of the block signals.

At the beginning of each block a signal is located to govern entry to that block. These automatic block signals are of the three-aspect colour light type. A green light is for the "proceed" indication, a yellow light is for a "caution" indication, permitting a train to proceed prepared to stop at the next signal, and a red light is for "stop". The operation of these signals is automatic, the indication displayed being determined by the presence of trains in the various blocks.

In order to enforce obedience to signals displaying the "stop" indication, a train-stop machine is associated with each signal. This machine is mounted at track level at each signal location, and has an arm which is held in the "clear" position whenever the signal is green or yellow. When the signal is red, the arm is raised to a tripping position to contact a trip cock, which extends down from the front right-hand side of the leading car of all trains. Displacement of the trip cock initiates an emergency brake application, bringing the train to a stop.

A train in passing a signal is at once protected by having that signal display a red aspect. Since it is possible that a train may be stalled only a few feet beyond this signal, in order to provide a full block protection, the next signal to the rear must also display a red aspect.

Each signal then, is under control of its own block and the next one ahead also. It is thus evident that, in normal operation, a train approaches a red signal when two blocks to the rear of the train ahead; it approaches a yellow signal when three blocks to the rear, and at a distance of four blocks to the rear it will approach a green signal.

In line with modern signalling practice, the signals in Toronto's subway will be arranged to permit a train to proceed past an automatic red signal at restricted speed, after it has come to a full stop. This arrangement, known as automatic key-by, is for the purpose of allowing a train to close in on the train ahead at station stops or under abnormal operating conditions.

At certain locations where the physical conditions require speed restrictions to be enforced, special time controls are inserted into the signal circuits to ensure that trains traverse the section of line concerned at no more than the maximum safe speed limit shown. If this safe speed is not adhered to, the signal in advance of the trains will not clear and the train will be forced to stop.

### Interlocking Home Signals

At the Union and Eglinton Terminals, and in the Davisville Yard area, where track switches exist, as it is not always possible to provide the braking overlap necessary for the standard automatic signals, interlocking home signals are used. These signals consist of two three-aspect units and one single-aspect unit mounted one above the other.

The top unit displays an indication determined by the track occupancy ahead and conveys to the motorman the same information as the automatic block signal. The central unit indicates the route which is set up, green for principal or through route, yellow for secondary or divergent route or red for stop, when the top unit indicates stop. The bottom unit is a yellow aspect.

This last indication is the call-on signal, and is used for closing-in moves when the block and route signals are at stop, and the block is occupied. Again, automatic train stops will enforce obedience to the stop indication. However, at the interlocking signals, no provision for automatic key-by is made as the stop indication is absolute. Should a red-over-red-over-yellow call-on aspect be subsequently displayed, a manual release must be operated to clear the train stop before a train may proceed.

At certain locations, particularly in Davisville Yard, the delay occasioned by carrying out this procedure on a busy track would slow down traffic movements too much. In such cases the call-on displays a flashing yellow aspect, with the train stop in the clear position.

Interlocking dwarf signals display red or yellow aspects, and are provided to govern speed-restricted back-up moves within the yard and tail tracks. These signals are manually controlled and do not normally have train stops associated with them.

To facilitate emergency traffic movements, in the event of a blockage of the main track, crossovers controlled by electrically-locked hand-throw switch machines are provided at four locations along the subway route. Small control panels, in conjunction with the electric locks on the switch machines, ensure that movements through the crossover cannot take place unless all main track movements in the section concerned have been brought to a stop, or the area is clear of trains.

All main track switches other than those at the emergency crossovers are operated by means of electrical switch machines. The operating power used is 110 volts d-c.

Interlocking plants are located at Union and Eglinton terminal stations and at Davisville. The switch machines and signals at the Union plant are controlled by an interlocking machine located in the signal room at Union Station. The Davisville interlocking plant is controlled by a machine in a signal tower at the south end of the station east platform. The Eglinton terminal plant is also controlled from this tower.

The interlocking machines consist of a control board, upon which is displayed a representation of the track layout, showing switches and signals within the limits of the plant together with all the necessary indications. The track diagram is illuminated according to the track sections, to show the presence of a train as it approaches and moves through the plant. The setting up of switches and signals for the routes is done by the use of multi-position control keys provided on the diagram at each signal location.

A signal operator will be in attendance in the signal tower for operation of the Davisville interlocking. The Union and Eglinton areas will normally be under automatic control.

#### Automatic Train Dispatchers

As an added feature of the system, the dispatching of trains from the two terminals is to be done by the use of automatic train dispatchers. These units, developed by the Philadelphia Transportation Company, are electronic in principle. They consist of a length of 35 mm. film punched with holes, which are spaced according to the desired schedule times and driven at constant speed by a synchronous motor.

A light source and photo-electric relay unit, two rotary stepping switches and a repeat relay for connection to the signal system are incorporated in the unit. In operation the film, driven by the synchronous motor, is made to pass between the light source and the photo-electric relay unit. Two rotary stepping switches and a repeat relay for connection to the signal system are incorporated in the unit.

In operation the film, driven by the synchronous motor, is made to pass between the light source and the photo-electric unit. Each time a hole is encountered, the light source will be uncoverd, causing operation of the photo-electric unit. This in turn will cause one of the rotary switches to step one contact. Normally the two rotary switches are in step, holding the repeat relay in an energized condition.

The out-of-step condition of the switches now existing will cause the repeat relay to drop out, thus starting the time delay unit to obtain signal clearance for setting of the departure route. The departure of the train concerned from the terminal will cause the second switch to step one contact. This brings the switches back in step and picks up the repeat relay, in readiness for the next scheduled departure. The rotary switch under the control of the photo-electric unit is thus stepped ahead as a function of schedule time.

The other switch is caused to step only upon the departure of trains. In the event of a delay in service, the first switch will continue to step around according to the scheduled time, even though no trains are departing. The second switch will be left behind, and will not step during the delay. The trains, when they do arrive, are dispatched immediately, independent of the schedule.

When a sufficient number of trains have arrived and departed to bring the switches back in step, the repeat relay will again be picked up, and the last train to arrive will be dispatched on schedule. Means are provided for cancellation of the automatic dispatcher control, in the event of a serious tie-up, at which time dispatching can be done manually. The dispatcher units are designed for mounting close to the interlocking machines, with a multi-contact plug connection being made thereto.

**Fig. 6. Automatic train dispatcher.**

For convenience of maintenance all relays used in the system are of the plug-in type. Interlocking and signal control relays operate on 24 volts d-c. and switch indication relays on 110 volts a-c. Track relays which have two windings operate on 3 volts and 110 volts a-c. At the interlocking plant locations the relays are mounted on racks in the signal relay rooms. At all other locations the relays are housed in instrument cases, one case for each signal location.

The signal lamps operate on 12 volt a-c., supplied by small individual air-cooled transformers mounted in the signal head behind each colour lens. Signal line controls in the subway are carried in multi-conductor cables which, together with the 2 conductor a-c. and d-c. power cables, are run on messenger wire, on ceiling brackets and in underground ducting. In the open cut sections cables are buried in the sub-grade.

Electrical power equipment is located at each interlocking plant and at four intermediate points along the route. At each location, duplicate transformers feed 110 volts through an automatic transfer switch to the a-c. signal mains. Two rectifiers connected in parallel feed power to the d-c. signal mains at 24 volts. At the three interlocking power supply locations a 110 volt battery and charger is used for supply to the electric switch machines.

The a-c. signal mains feed the interlocking machine lights, all signal lights, train stops and the track circuits. The d-c. mains feed the relays at interlocking plants and all intermediate signal control relays. √

# Cars, Shops and Mechanical Equipment

*by*

J. G. Inglis

*Assistant Manager of Equipment, Toronto Transit Commission, Toronto, Ontario.*

*A paper to be presented at the 68th Annual General and Professional Meeting of The Engineering Institute of Canada, at Quebec City, May, 1954.*

In this paper the author discusses the rolling stock, listing the precautionary measures taken to insure safety. The shops and yards are described, and the mechanical equipment for heating, ventilation, escalators and drainage of the subway are explained.

In the construction of Canada's first subway the Toronto Transit Commission has drawn upon the knowledge and experience of a great many individuals and firms. It has sent representatives to study methods in effect in many cities of the world where rapid transit service is provided. It has collaborated with operating and manufacturing companies to obtain the most modern methods, equipment and plant for its patrons. And, as far as possible it has provided cars which combine efficiency, appearance, comfort, and above all, dependability and safety.

## Cars

The 104 cars for the Yonge Street subway of the Toronto Transit Commission were built in England. One hundred cars are of steel construction, whereas the last four utilize aluminum to the maximum practical extent, in order to determine if the economies due to lighter weight justify the additional first cost.

Significant dimensions of the cars are given below:

| | |
|---|---|
| Car Length—over bumpers | 57 ft. 1½ in. |
| Car length—over body | 55 ft. 7½ in. |
| Car width | 10 ft. 4 in. |
| Car height | 12 ft. 0 in. |
| Truck centres | 38 ft. 0 in. |
| Truck wheelbase | 7 ft. 0 in. |
| Wheel diameter—inches | 30 |
| Door openings—per car side | 3 |
| Door opening width | 3 ft. 9 in. |
| Door height | 6 ft. 4 in. |
| Seat capacity | 62 |

## Train Size

The cars are semi-permanently connected in pairs to form two-car units. This reduces both first cost and maintenance costs. Train size will vary with the traffic, up to a maximum of eight cars (four two-car units) which is the maximum number that can be accommodated at the 500-foot platforms provided at all subway stations. Operation of eight-car trains will accommodate some 40,000 passengers per hour in each direction.

### Car Body

The underframe, body and roof are of steel. The side panels are attached to the structure with countersunk rivets thus giving a smooth appearance. The floor is of ¼ in. rubber, laid on 1½ in. of cork fastened to a dovetailed steel sub-floor. This arrangement has excellent sound-deadening qualities. In addition, special sound-deadening paint is applied to the inner side of the exterior body panels, including a layer of fabric from floor to window bottom.

The seats, consisting of a combination of longitudinal and cross types, are arranged to provide adequate comfort, and rapid passenger movement at stations. The frames are of cast aluminum, to which is attached rubber latex cushions and rubberized hair seat backs, both covered with red plastic upholstery. A liberal supply of stanchions and ceiling-attached grab handles accommodate standing passengers.

There are three door openings, each of 45 in. clear width per car side. The sliding aluminum alloy doors are operated by pneumatic engines. Each abutting door edge is of rubber, and one leaf of each door opening in the closed position can be pulled open 4½ in. against a spring, in order to free any object that might get caught. Windows are arranged with the bottom half stationary and the top half movable vertically.

There is one driver's cab per car body, located at the coupling end. In effect this provides a two-car unit, 114 feet long with a cab at each end. This arrangement provides for double end operation, which is less expensive than it would be to provide underground turning facilities.

### Multiple-Unit Operation

The cars are equipped for multiple-unit operation. That is, in a train of any length, all cars are motor driven. When the controls in the leading car are operated, the motors or brakes of every car in the train respond simultaneously. This feature results in faster speeds, smoother and faster acceleration

Fig. 1. A southbound subway train shown as it emerges from Pleasant Portal, just south of St. Clair Ave.

and braking, and, in general, greater train efficiency.

#### The Guard

The guard is stationed in an unoccupied operator's cab on the platform side of the train. From this position he is able, by means of a full drop window, to view the station platform in both directions, and he has control of all the doors on that side of the train by means of push buttons.

#### Lighting and Heating

The lighting is provided by incandescent fixtures. The units are of the circular ceiling-recessed type, commonly used on modern street cars and trolley coaches. There are 47 fixtures in each car to provide an illumination of 18-20 foot-candles on the reading plane at 550 volts.

Forty-one of these lamps operate in 2 parallel circuits off the 600-volt power supply, while the remaining six are connected to the 50-volt supply from the storage batteries. In case of a power failure the battery-operated lights remain in operation to provide sufficient illumination.

Heating is furnished from underfloor current resistors of 30 kw. capacity over which air circulates to the car through seat pedestal louvres. Thermostatic control in three 10 kw. steps provides a temperature of 62-65° F. A combination of fresh and/or recirculated air may be obtained by adjusting the controls.

#### Propulsion and Braking Equipment

The four motors per car are rated at 68 hp. each, and are wound for 300-volt operation with two-in-series. The drive is by propeller shaft to a hypoid gear on each axle, similar to automotive practice and the P.C.C. car. This reduces the unsprung truck weight, thereby reducing noise and vibration.

Automatic acceleration is provided, with a choice of three rates under control of the operator. There are also three running positions: switching, series (half speed) and parallel (full speed). The maximum speed of an empty train on level track is approximately 50 m.p.h. although proximity of stations will seldom permit this speed to be attained.

The control is known as type PCM (Pneumatic Cam Magnetic), and is manufactured in England. It is very nearly identical with that used almost exclusively by the London Underground for many years. Its predominant characteristics are its compactness, simplicity and extreme reliability.

The car increases in speed from standstill by the cutting out of resistance placed in series with the motors. This is done by rotating a cam shaft automatically by pneu-

Fig. 2. A subway driver's cab showing the main controls and the indicating light panel.

Fig. 3. An interior view of the Davisville Shop.

matic pressure, the various cams operating electrical contactors. The control, and various low voltage devices are operated from a battery which is charged from a motor generator set.

The braking is by compressed air operating on brake shoes on the wheels. It is practically identical with that used on the London Underground System. The system is of the electro-pneumatic type, that is, the application and release of air to the brakes of each car is controlled simultaneously to all cars from the operator's position by electric wires.

This ensures that all brakes on a train operate simultaneously, and those on a long train as quickly as on a short one. In the unlikely event of a failure of the electric portion, the same functions can be performed—but not quite so rapidly —by straight pneumatic means.

A unique feature is a retardation controller. In principle, it is two mercury "U"-tubes located in each cab and having electrical contacts, which are made or broken by the movement of the mercury. It operates in two ways: (a) Initially, to prevent the application of more air if or when a predetermined braking rate has been obtained, and (b) further, to exhaust air if the rate tends to exceed the predetermined rate of braking as a train decreases in speed. Its chief purpose is to bring the train to rest as smoothly and as rapidly as possible.

The braking mechanism consists of two brake shoes per wheel with one brake cylinder per shoe, or eight per truck. Each cylinder has an automatic slack adjuster. This arrangement, which reduces the amount of brake rigging required, also reduces noise and vibration and increases the uniformity of braking.

#### Trucks

The trucks are manufactured by the car builder, and are similar to those used in London, except for the modifications needed to mount two propeller-shaft driving motors per truck instead of one axle-hung motor. The frame is of structural and cast parts, assembled by a combination of welding and riveting. Anti-friction journal bearings and 30-inch solid steel wheels are used.

The suspension system consists of leaf springs and double coil helical springs, suitably connected for maximum passenger comfort. Spring-loaded friction pads provide suitable damping. A screw adjustment compensates for wheel and rail wear to keep the floor height uniform.

Each truck has a third rail shoe on each side for current collection from the top surface of the contact rail. Also, there is a pneumatic trip cock on each leading truck, and it is engaged by a corresponding wayside track trip to effect an automatic emergency stop if a train should be operated past a red signal light.

#### Connections Between Trains

The two cars of each unit are held together mechanically by a coupling bar together with a suitable amount of cushioning or "draft gear". The electrical and pneumatic connections are made by means of multi-conductor cables and hose lines respectively. The two halves of a unit will not be uncoupled except in the case of major shop repairs or maintenance. They are not exactly similar, but consist of an *A* and a *B* car. The *A* or pneumatic car contains the air compressor, while the *B* or electric car contains a 50-volt storage battery and a battery charging MG set.

The coupling between any two units is by means of an automatic electro-pneumatic coupler. The coupling and uncoupling are accomplished by remote control from within the cab of the moving part of the train. The coupler transmits the mechanical forces, the pneumatic brake lines and the electrical control. The contacts of the electrical control are protected by a metal cover in the uncoupled position, the cover being pushed aside automatically as the couplers engage.

#### Summary of Safety Features

In an underground system where multiple-unit trains operate at high speeds, frequent headways, and with rapid rates of acceleration and braking, all precautions must be taken to ensure that a very high degree of safety is incorporated. For that reason, the chief safety features of the system are summarized below in order to show the care that has been given this important subject:

The line is protected with an automatic block signal system, equipped with wayside track trips and interlocking in the yards and terminals, all designed to prevent trains from coming in contact with each other.

A system of underground telephones together with adjacent push buttons, permits contact with supervisory forces and permits power to be cut off from any section of track with minimum delay.

Brakes will be applied automatically on a train if a driver attempts to pass a red signal,

**Fig. 4. Davisville yard and station. Taken looking north, this affords a good view of the shops, the station platform, and the signal tower.**

releases his hand from the controls has his train break in two, or a guard or passenger operates the emergency cord in any car.

A train cannot start until all doors are closed.

A system of battery lights provides adequate illumination in every car in case of failure of the power supply. Front and rear marker lights would automatically remain lit also under such conditions.

A system of pantograph gates and chains prevents passengers from falling on the track between cars, either from the platform or when walking from one car to another.

A train cannot be moved, or connected to another train, or disconnected from another train, unless there is an adequate supply of air for braking.

There are two independent means of applying the air brakes. The system used normally has an indicating light to show that it is in good condition, similarly for the retarder that provides the high and uniform rate of braking. Also, by using electricity to effect application and release of all cars in a train, a long train can have its brakes applied as quickly as a short one.

Each brake shoe has its individual brake cylinder, 16 per car. Thus, failure of one, or even several, would still leave a substantial proportion to bring a train to standstill.

An exterior red light over the centre door on each side of each car indicates when any side door of the car is open. Similarly when not lit it indicates that the doors are closed. Likewise a dual-light indicator in the driver's cab and and guard's cab gives a green indication when all side doors are closed.

The abutting door edges at each side door opening are protected by soft rubber. Also, one leaf of each pair can be shoved open manually by about $4\frac{1}{2}$ in., in case of an object becoming caught.

Marker lights at the front and rear of a train are lit automatically in the performance of other functions essential to train movement.

A system of spring buffers between cars provides an uninterrupted and smooth floor between cars, thus minimizing dangers of falling and of accidents.

All compressors start and stop simultaneously, thereby ensuring equal division of load.

Each car has a plainly visible fire extinguisher.

## Shops

An area of some fifteen acres adjacent to Davisville Station is devoted to the car storage area, the car maintenance building, the maintenance of way building and the heating plant. The car maintenance building, referred to as Davisville Shop, is of concrete, steel and brick construction, with precast concrete roof sections. East and west walls are of glass brick to permit maximum use of natural illumination.

Heating of the building is by ceiling-suspended blast heaters, each one thermostatically-controlled, supplemented by radiant heating in all pit floors, offices, washrooms, storerooms, locker and lunchrooms. Fluorescent lighting is used throughout, both for the general illumination and in the pits.

The two westerly shop tracks are separated by a wall from the rest of the building to form the car cleaning section. The first track contains an automatically-controlled motor-driven car washer, having brushes to wash both sides and the roof, as well as a detergent spray to be used when required. The entrance and exit doors of the wash track are under electric eye control. The second track is for car storage during the daily car interior cleaning.

The next two tracks are in the inspection section, have doors at both ends and will accommodate a total of four four-car trains. With pits of 56-inch depth below rail head and with the devil strip 32 inches below rail head, practically all underbody and truck inspection is done at eye level. Steel balconies at car floor height permit entrance to the cars for interior inspection.

In addition to fixed lights, the pits are equipped on 18-foot centres with outlets for electricity and compressed air. One of the pits in the inspection section has a water-wash dust-collecting unit by which dust can be blown off the underbody equipment and removed without creating dust in the surrounding shop air.

The wheel control section occupies the next two tracks, each track being over a pit and having capacity for four cars and containing a high-speed pit-located wheel grinder. The wheel grinders, of T.T.C. design and manufacture, will be used to maintain tread and flange contour, to control flange height and to grind out tread flat spots, all without removing wheels from the trucks.

This practice has been developed to a high degree on the Commission's surface cars, and is believed to be the only known case where control of the contour of subway car wheels will be maintained with the trucks and wheels in their normal position.

The repair section occupies the remaining three westerly tracks in the building. Two of them have 220-foot pits while the third, at floor level, is used for wheel and axle storage, truck repairs and motor changing, etc. A drop table serves all three tracks and provides means whereby truck replacement can be made rapidly. By spotting a train so that the defective truck is on the drop table, it may then be disconnected from the body and lowered on a carrier to a transverse track connecting with an underground truck storage area.

A floor-controlled motor-driven travelling crane is located above the wheel storage track and it, together with a hydraulic hoist at the end of the same track, provides adequate facilities for handling of heavy parts and for their transfer to and from an automotive truck in connection with the heavy repairs which will be done at Hillcrest.

There is no third rail power supply in the shop except in the car cleaning section where workmen are not in proximity to live parts. Instead, power to move and to test trains is by ceiling-mounted overhead conductors parallel to each track and from which hang insulated cables running on trolley wheels on the conductors. The lower end of the cable may be exposed when required for connection to a car for movement or test.

The boiler house is situated at the south of the yard, and supplies heat for the station and shop. Two stoker-fired boilers are fed from bins, in which coal is dumped directly from railway hopper cars on the siding above them.

The maintenance of way building is heated separately by an oil-fired boiler. It contains facilities for the receipt, storage and delivery of track parts, and for necessary repairs to them. Like the boiler house, it is connected with the belt line of the C.N.R. Beside it was built a permanent ramp for unloading the subway cars which were received mounted upon railway flat cars.

The yard has sufficient tracks for car storage, for movement to and from the running tracks, for increasing and decreasing train size at Davisville Station, for wyeing cars if required, and for the storage and movement of service cars.

This yard contains 19,000 feet of track and 41 switches, of which 16, affecting movement to and from the running track, are electrically-controlled from a signal control room overlooking the yard. Communication between the control room and the yard is by telephone and by an oral two-way communication system.

Fire protection of the yard is by fire monitor towers, augmented by hydrants. The fire alarm boxes throughout the area are connected with the Toronto Fire Department and the location of any alarm sent in is recorded in the signal control room for the attention and action of the operator there.

The contact rail in the yard is protected by a wooden cover board, as it is throughout the system, for the protection of workmen. A system of push buttons will disconnect the power from the entire area instantly, while various sections of the yard can be isolated individually by knife switch for maintenance or other purposes.

## Mechanical Equipment

### Heating

Heating by thermostatically-controlled forced hot air has been

**Fig. 5. An escalator at Queen Station.**

provided for all public areas in the surface stations. In the smaller of these stations the heat source is by hot water from off-peak 600-volt d-c automatic heating boilers, arranged to be cut off by supervisory control whenever traffic power demand reaches a predetermined value. In the larger stations or where steam heat is available, it is obtained from steam boilers.

All ticket booths and washrooms are electrically heated by hot air blown over resistance heaters under thermostatic control. Heating of the cars and repair shops is described in the corresponding sections. Heating of the public areas in the underground stations is considered unnecessary, due to the heat generated by the trains, lighting and passengers, also due to the protection and distance from the outside atmosphere.

#### Ventilation

Subway ventilation is necessary to dissipate, particularly in warm weather, the heat produced by trains, lights and passengers; to relieve blasts of air produced at stations by moving trains; to circulate air to provide moisture relief; and to exhaust objectionable fumes or smoke.

Moving trains produce in the tunnels a "piston action" which forces air ahead of them and produces most of the ventilation required. In the downtown tunnel section it was considered necessary to have openings to the surface at intervals of about 500 feet in order to dissipate the heat and to reduce air movement in the stations.

Accordingly, at both sides and both ends of each station in this area, vent shafts were provided to the surface. These are rectangular openings about 35-feet in vertical height, extending from rail level through manually-adjustable louvered openings in the wall and terminating in sidewalk gratings of 106 square ft. free openings.

Supplemental forced ventilation has been provided in the form of thirteen remote-controlled motor-driven reversible fans, each of 50,000 c.f.m. capacity, located in the tunnel side walls midway between stations. By means of closing or opening louvres in the vent shafts and operating one or more fans, it is possible to exhaust smoke or fumes from any section of the tunnel.

The fans are surrounded by louvres through which air flows when the fans are stopped, but which close automatically when the fans are started. Individual forced ventilation has been provided in all washrooms, ticket booths and battery rooms.

#### Escalators

Thirteen escalators have been installed at various stations in accordance with the amount of traffic or the lift involved. Provision has been made for the installation of others if found to be necessary.

Mounted on heavy steel trusses with drip pans beneath, and each with a capacity of from four to eight thousand persons per hour, the escalators are reversible to provide for changed traffic direction during the day. There are two widths, 32 and 48 inches, and the rise between nine and seventeen feet.

The escalators are equipped with all of the latest desirable features, including many safety devices. Emergency stop buttons are located at the upper and lower landings and also at the ticket booths. Also, an automatic stop will be made if any foreign object becomes lodged in the floor tread, or if any handrail or driving chain becomes slack or broken.

Mechanically-applied and electrically-released brakes on motor shaft and main drive shaft can make an almost instantaneous emergency stop. All steel is grounded to prevent the build-up of static electricity. The stainless steel covered balustrades and stainless steel trim are attractive in appearance and easy to maintain.

**Fig. 6. Looking up into the vent shaft at the north end of St. Clair Station platform.**

#### Drainage

The drainage system for the subway was designed and constructed to permit proper drainage of water from the usual sources, such as rain water from open vents and stairs, seepage through the structure; as well as the water from broken water mains, flooded streets, et cetera.

Floor drains and catch-basins are located so as to intercept water and direct it to a main which is usually from about 4 to 6 feet below the top of the subway rail. Manholes, spaced from 160 to 360 feet apart, provide for branch connections and cleaning. One manhole at each station is deeper than usual to provide for the collection of silt.

As the downtown portion of the subway is below the level of the city sewers, all drains in this area lead to sumps which are equipped with pumps to lift the drainage to the city sewers. Three underground pump rooms, located at track level about 3,000 feet apart have been provided for the Yonge subway. In addition, underground pump facilities were provided at the intersection of Queen and Yonge for a future Queen Street subway.

The pump rooms are rectangular structures 10 feet wide, 18 feet long and 12 feet high with a sump 9 feet deep. Each pump room has two pumps, and estimated emergency conditions governed the size and capacity of the pumps selected.

Two types were used: a 4-inch pump with a capacity of 500 U.S.g.p.m., and a 6-inch with a capacity of 750 U.S.g.p.m. The electric motors for the pumps range from 10 to 25 hp. each. The system is arranged for automatic operation, with the addition of a high water alarm and an emergency portable pump connection.

Staff washrooms at five stations are located below city sewer level and waste from these locations is pumped to the sewers by 2 inch pumps. The motors for these pumps are from ¾ to 1½ hp. √

# Reconnaissance of The Labrador Railway...1945

Seven Islands to Lat. N. 54°44′ Long. 66°42′ W.

*by*

D. A. Livingston, M.E.I.C.
*Vancouver, B.C.*

**Introduction**

It was a fortunate chance that brought the author of this paper back to Seven Islands at the time the president of the Institute and the general secretary visited there last September. Conversation with Mr. Livingston and others on the job indicated clearly that the story of the reconnaissance was an unusually interesting one, and so right on the spot, Mr. Livingston was "signed up" for it.

The form of the paper is unusual, but perhaps it makes a more dramatic presentation than would be the case with the usual style of writing. This is really just a series of extracts from a diary, but they are all joined together closely by the continuity of the story and the excitement of the adventure.

Mr. Livingston has made a very modest presentation of his story. There is much to be read between the lines, much that can be picked up from others who know what went on. If the story were told by someone else, emphasis would be placed on the author's performance, and credit would be allocated to him, which is missing completely from his own account. However, each reader can readily appraise the accomplishment as the story unfolds. —The Editor.

Proceeding to C.P.A. airbase at Lac des Rapides, Elev. 270, an eight-mile taxi trip from Seven Islands, I boarded pontoon-equipped Fairchild Plane 71, Hank Gates, pilot, and being airborne at 10.33 commenced an aerial reconnaissance for a standard gauge railway from tidewater to the iron ore deposits in Labrador.

I knew where I was going and what route I should follow but, even so I would have to feel my way. A study of the excellent aeronautical map sheets published by the Hydrographic Map Service at Ottawa showed the drainage system of the St. Lawrence north shore as far up as the height of land between the St. Lawrence and

The valley of the Wacouno River at Mile 55.

Hamilton drainage, as well as the Labrador country north thereof.

The main stream of this system and the one that looked the most promising was the Moisie, although any of its tributaries, the Nipissis, the Caopacho or the Taoti—might do just as well.

The plane was headed east to come over the Moisie, which we did at 10.41, at the lower end of the four-mile long Moisie Canyon and 12 miles from Pointe aux Basques, the proposed starting point of the railway. The river drops 50 feet in its course through the canyon and in places is not more than 200 feet wide, which would allow a good railway crossing. Continuing north up the Moisie to railway mileage 28 and the forks where the Nipissis joined the Moisie, we turned up the smaller stream at 10.53.

The Nipissis valley had good direction, a width of about a quarter of a mile and easy slopes to the valley sides. At 11.12 we came to the Wacouno River entering the Nipissis with good direction and followed its course up to Wacouno Lake, where we landed for lunch at 11.45, 10 miles from its south end. The barometer registered an elevation of 1,680 feet, and one hour later it read 1,720 feet.

| | |
|---|---|
| Assuming north end of Moisie Canyon as | 100 ft. |
| 15 miles of good water to Mile 30 at 4 ft. per mile | 60 " |
| MacDonald Rapids and Falls at Mile 30 | 50 " |
| Good water on Nipissis and Wacouno to Mile 58 at 5 ft. per mile | 150 " |
| Miles 58 to 75, 30 rapids and falls | 1,040 " |
| Miles 75 to 95, at 15 ft. per mile, including rapids | 300 " |
| | 1,700 ft. |

This elevation of 1,040 feet was arrived at by working back from Wacouno Lake to Mileage 75, using the rate of fall given over that distance.

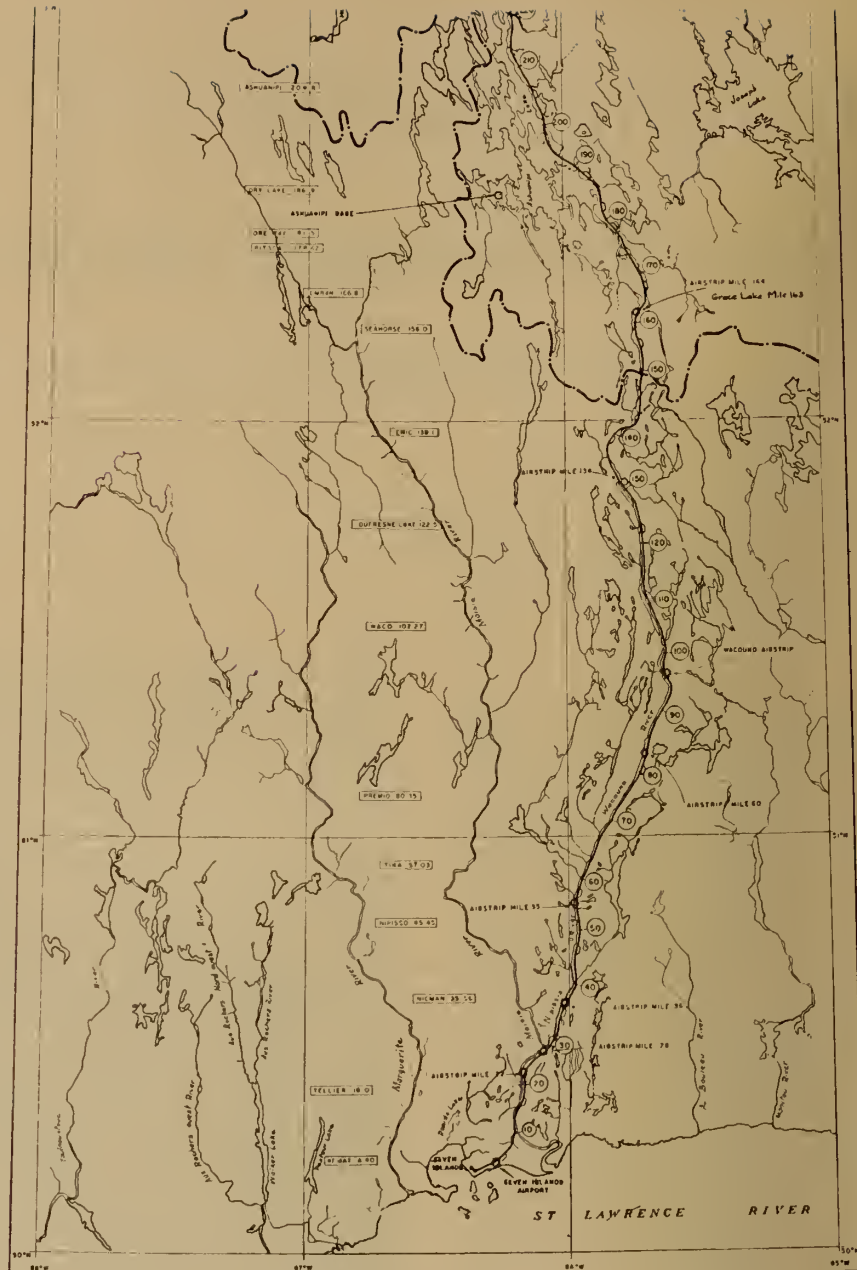
At 12.56 we were off Lake Wacouno and continued our course north. This lake is about a mile wide. We passed its north end at 13.07, proceeding up its drainage over St. Patrick and Ethel Lake. The latter drains north to the Moss River—thence we continued northerly and over the height of land into Labrador at 13.20.

Five minutes later we landed on a long narrow lake which we judged to be Lac de Dimanche and recorded an elevation of 1,680 feet; temperature 65°. At 13.43, we started back to Seven Islands, recrossing the divide. The small lakes thereon were all frozen over, making it impossible to land for an elevation, but on our way south we flew low and estimated the altitude as 1,900. The trip back was bumpy, the weather bright and warm. We came down on Lac des Rapides at 15.18, where the thermometer registered 63°.

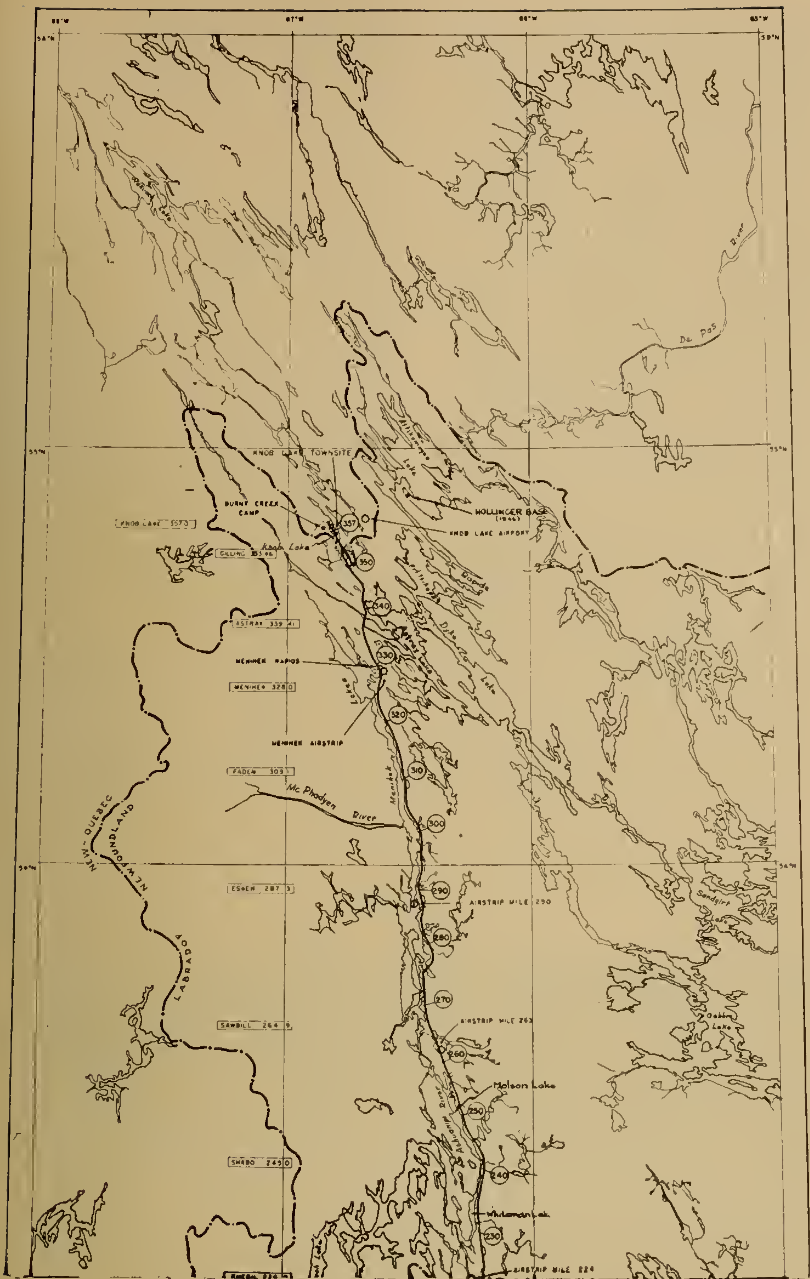
From the north end of Wacouno Lake to the height of land I had estimated a rise of 15 or 20 feet per mile. This would make the divide elevation about 2,200 feet. The mileage would be somewhere in the neighbourhood of 145 from tidewater.

On June 9, the country between Pointe aux Basques and the south end of the Moisie Canyon was examined. For the first 8 or 9 miles the country rose gradually to an elevation of 180 feet, the terrain being generally sand with some muskeg. Beyond that, as far as the canyon rock, about Mile 11, the terrain became heavier, much cut up by coulees and small streams. I expected that through the canyon considerable tunnelling would be encountered.

On account of various delays, especially lack of air transportation, nothing was done until June 16, when I boarded the Company's freighting plane at Lac des Rapides with pilot Brown and air engineer Harris. This was a Stranraer flying boat. It was heavily loaded with supplies for the geologist's base camp at Hollinger Lake. Its route was due north for 35 miles, where the Moisie River was crossed. From



The Route.



**The Route** (continued from the top of page 400).

there on it was to deviate slightly and follow my direction, so an idea of the Caopacho country could be obtained.

We were off the water at Lac des Rapides at 16.28 and at 16.50 came in sight of the Moisie River, which we followed up the the Caopacho mouth, when at 17.12 we turned up this stream on past its source at Lake Caopacho. At 17.49 we crossed the divide into Labrador at about the same place as on the trip of June 8, thence angling easterly to come over the east side of Ashuanipi Lake and so down the chain of lakes of the Ashuanipi River drainage, past the Menihek Lakes and north across Astray Lake where my reconnaissance observations ceased. We arrived at Hollinger Camp at 19.43. The camp consisted of log storehouse, bunkhouse and cook-house, 2 long sleeping cabins and 3 tent sleeping quarters.

This trip showed the Moisie River to be a tortuous semi-canyon with sharp bends and much tunnelling, with solid rock predominating. The Caopacho River was in a rocky box canyon for 25 miles above its junction with the Moisie, and had 40 rapids and chutes in that distance. Above this canyon the river valley gradually betters until in 8 or 10 miles it shows easy flats, sandy beaches along the lakes and altogether a more pleasant looking terrain. However, it had no superiority over the Wacouno route, and therefore was not considered.

After crossing the divide into Labrador the country becomes swampy with some low ridges and sandy islands. This condition continues to half way up Ashuanipi Lake, where it then becomes more or less easy north as far as the north outlet of Menihek Lake.

The railway would have to cross the divide somewhere between the Caopacho summit and that of the Embarrassee source, keep along the east side of the Ashuanipi drainage and cross it at the Slate Rapids north of Menihek, thence north and west crossing Howells River near its mouth, and on through some heavy work to its northern terminus in the vicinity of Lat. N 54° 44′, Long. 66° 42′ W.

As aerial reconnaissance of a railway route is not always satisfactory in a rough country, I decided to make a ground examination from the height of land to the proposed northern terminal. With this in mind I remained at Hollinger Lake Camp and prepared for such a trip by canoe.

Canoeman 22-year-old Armand Ferguson and I loaded our 17-foot square-end canoe with a 2½ hp. Johnson motor with sufficient gasoline, tent, tin stove, bedding and 2 weeks' supplies on the Stranraer flying boat, and at 15.25, June 19, set out for Grace Lake, arriving at 17.10. We set up camp on the east side about half way along the lake at Lat. N 52° 10′, Long. 65° 40′ W, the barometer registered 1,800 feet. The following morning we started south and in two miles came to the end of the lake. Grace Lake is 12 miles long and 1 mile wide. Here a river 100 feet wide flows in from the south with a rapid 1,000 feet long and a drop of 40 feet. We portaged the canoe up a steep hill to good water on which we ascended the current for 2 miles with an estimated rise of seven feet when we came to a rapid that fell 22 feet in a quarter mile. We left the canoe and ascended the hill on foot and saw the upper reaches of this stream full of rocks and fast water. We estimated the height of the divide near the source of this stream as 2,400 feet. We returned to our camp, loaded up our equipage and headed north for the Embarrassee River.

The country to the south of Grace Lake is rough and broken to the height of land and probably for some distance beyond. On the west side a ridge rises up 700 feet above lake level. The east is also high, but not so abrupt. It is about 300 feet above lake level on an easy slope and continues to rise for some distance beyond. At the north end of

Grace Lake a rapid commences and falls 30 feet in its mile length. Here we lined the canoe down and reached its foot, both wet to the waist, so made camp and changed to dry clothes.

*June 21:* We were on our way at 6.50. By noon, when we again changed to dry clothes, we were some 5 miles below Grace Lake and at the head of a mean-looking rapid full of large boulders 10 to 15 feet across. This rapid falls 8 feet and in the 5 miles we had come from Grace Lake, we had counted ten rapids that put us 75 feet below Grace Lake. After lunch it took us 'til 15.05 to get through this rapid. Three miles lower down a river 200 feet wide entered from the west. This would be Summit River, now about Mile 170 of the Q.N.S. & L. Railway. The Embarrassee River width above this junction is 200 feet. We stopped and camped on the west shore at 18.10, 4 miles above the entrance to Ashuanipi Lake.

*June 22:* We left our camping place of the previous night at 7.15 and proceeded down to Ashuanipi Lake on good water. Turning northwesterly we soon encountered a bad head wind and rough water. Having come through so many rapids our canoe was leaking badly so we landed on an island and proceeded to dry and patch the canvas covering which was badly cut and broken. The drop from Grace Lake would make Ashuanipi 1,725 feet elevation. By the time we had finished our task the wind had dropped, so we proceeded on our course having to make a detour through the west bay of the lake, it being the only water route that would allow us to get back to the east shore. Camping spots were scarce, but by 19.00 we found a suitable place in the narrow entrance to Northeast Bay, Lat. N 52° 40′, Long. 66° 07′ W.

*June 23:* We left our campsite at 6.20 and entered Northeast Bay where a strong wind was blowing. We lost considerable time with the outboard motor giving trouble, probably due to water in the gasoline. This overcome, we reached the east shore due east of our camp of the night before, where a small creek with an 8-foot rapid entered from a 6-mile long lake lying to the east of the main lake. This seemed to allow a passage for the railway from the Southeast Bay of Ashuanipi on good direction. We explored this route and found it satisfactory. It was while we were thus employed that the small supply plane we were to have a rendezvous with on June 22nd appeared, flew over us, continued on south, returned a half hour later down the middle of the lake and disappeared to the north.

We continued our trip north along the east Ashuanipi shore and made camp for the night half a mile north of the Fraingue River. From the mouth of the Embarrassee River to here the lake shore is generally low-lying, running inland some distance. The Fraingue River is 400 feet wide from its mouth to half a mile inland where it narrows to 80 feet at the foot of a rapid that rises on a 0.5% grade. Lake Ashuanipi and other lakes and streams encountered so far appeared to be at high water stage.

*June 24:* Today the country became slightly rougher, not materially increasing construction cost, but showing a departure from the low wet terrain. It being Sunday we made camp at noon at a gravel beach near the north outlet of Lake Ashuanipi on the west bank where a tumbledown winter trading post had been located. We fished, washed clothes and thought the supply plane might return.

*June 25:* We loaded up and left at 7.20 heading down the river which commences here and at 8.00 came to the head of a rapid. Before starting down it we landed and climbed the 75-foot high ridge and saw that the ground continued low in good direction northerly from Bob Ross Bay of Ashuanipi, suggesting the possibility of placing the railway line through to Whitman Lake on better direction than following the river would allow.

We returned to the river and ran the rapids with loaded canoe; the drop was 12 feet. We next ran riffles of 5 and 3 feet and at 9.40 we came to the next rapid, down which we lined the loaded canoe, arriving at the lower end some two hours later, both wet to the waist. This was of little consequence, as it had rained during our progress. The rapid falls 45 feet in its length of one mile. We stopped for lunch and changed to dry clothes.

According to the map we should now be through with rapids until we passed Whitman Lake, but we ran three more riffles, which made the total drop from Ashuanipi to Whitman Lake 102 feet.

The drizzling rain continued all day. We stopped at 16.45 and made camp on the east side of Whitman Lake one mile north of its south end. All our dunnage was now very wet. Canoe was leaking badly, making constant bailing necessary. The elevation of Whitman Lake is estimated at 1,600 feet.

*June 26:* We continued along the east shore of Whitman Lake and in one and a half miles we passed a creek entering from the east 25 feet wide.

The country along this shore is flat with a gentle rise to the east; from time to time low knolls appear. The timber is spruce with some tamarack, a few of which are 10 inches in diameter at the butt. At 9.00 we came to the north end of Whitman Lake and the start of a rapid which we lined and ran alternately. This rapid drops 40 feet and is approximately 1½ miles long. It took 1¾ hours to reach its foot where the river broadens to a circular lake about one mile across; at its outlet a bank of good gravel stands up 25 to 40 feet high.

Between Whitman and Molson Lakes the total drop is estimated as 54 feet, making the latter lake 1,540 feet elevation. The Miron River enters from the south-east at the south end of Molson Lake, showing a rocky rapid for at least half a mile back. Its channel is 500 feet wide where it enters the lake, but narrows to 200 feet in a quarter mile. At 12.00 we stopped for lunch and dried our clothes and bedding in the warm sun. At 14.30 we took to the canoe again.

A strong north-west wind was blowing, but we had shelter in the lee of an island until 1½ miles north of Talzie Lake Creek, where the lake widened and heavy waves striking full abeam threw water into the canoe and threatened to wet all our dunnage again. We went ashore, and, climbing a bare knoll about 700 feet inland, could see a parallel range of hills about 3 miles east across a valley. Large angular boulders lay strewn about although the flat nature of the ground still continued along the lake side.

Half way along Molson Lake the topography changes and the rocky knolls stand well out in the water. These are sometimes connected to higher ground inshore by a hogback as high as 40 feet. Grading costs would be increased here. We camped at the north end of Molson Lake at 18.00 within sight of the next rapid. In spite of the strong wind the sand flies and mosquitoes were bad.

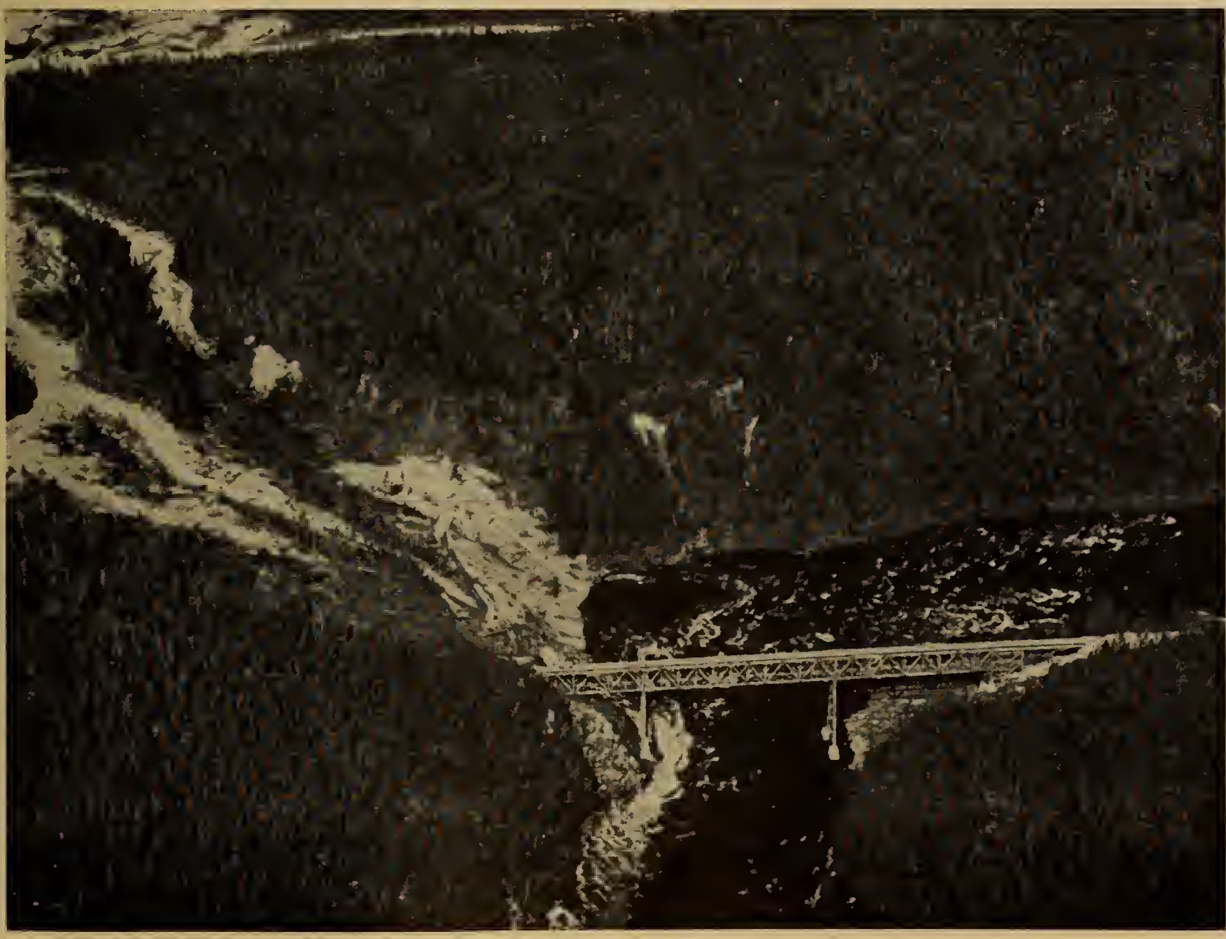
*June 27:* We explored the shores of Molson's north-east arm and found the terrain to be the same as we had seen on the previous afternoon. I noted it seemed to have the same characteristic along a low valley to the north, that might allow the railway route to avoid the muskeg along the river and to cross the Evening River some two or three miles east of its mouth on better ground.

We returned to camp, loaded up and started down the rapid. Running this rapid we came to a 5-foot drop, which we avoided by a short portage. We continued down, lining and running it alternately, to the lower end. This rapid falls 14 feet in a distance of ⅓ mile. A mile farther on we took a riffle of 2-foot drop. Again wet to the waist, we dried out at the noon fire. Leaving our lunch place we continued down the Ashuanipi River through a maze of channels and finally arrived at a widening where a south-east wind was strong enough to force us to land for two hours until it subsided somewhat. At 18.00 we were at the foot of a half-mile-long rapid having a 10-foot drop. Fifteen minutes later we came to another rapid of 17-foot drop down which we lined the canoe. Having made 20 miles that day, we stopped and made camp at 19.30 on the west bank of the river where we could see Evening Hill some ten miles directly east of us. The topography had changed little from that of Molson Lake, and earth work would run about the same cost per mile. Although we travelled 20 miles, we had come but 11 miles in a straight line. Sand flies were bad.

*June 28:* Leaving at 7.20, two hours later we came to a rapid of 6-foot drop. At noon we came out on Menihek Lake and stopped for lunch when the Stranraer plane appeared. We immediately launched the canoe and paddled in a circle to attract attention, but got no response although it passed directly overhead. We continued north along the east side of Menihek and at 14.30 the same plane appeared on the southbound course. Again we signalled but got no response. Our gasoline and food supply were now getting low, none having arrived as promised. We camped on the east shore about 3 miles south of a point opposite the mouth of the McPhadyen River and at approximately railway mileage 294. The drop between Molson and Menihek is estimated as 60 feet making the elevation 1,480 feet.

*June 29:* We were on our way at 7.00. The topography along the east shore, which had continued much the same from Molson Lake, changed to a ridge 100 feet high close to the shore, but with good alignment. Breaks occurred occasionally. The material ran from sandy slope to boulder covered hillsides; some solid rock would have to be considered also due to the large angular boulders hereabouts. Swampy flats were noticed where points ran out in the lake, but the hillside inland kept to a fairly straight course. This topography continued to within eight miles of the outlet of Menihek Lake. We camped 3 miles south of lake outlet.

*June 30:* At 7.00 we were on our way, having had our thirteenth and last straight meal of porridge. There now remained odds and ends of food such as macaroni and dessicated cabbage—water soaked. We arrived at the first rapid of Menihek Lake outlet, made a cache of surplus equipage such as tent, stove, empty grub box, etc., and portaged our canoe around the 8-foot-drop rapid. We next came to Slate Rapids where the river was 1,150



**Moisie River Bridge at Mile 12 (Rodrigrey).**

Waterfall at Mile 69.

feet wide and where the railway should cross to the west side of the river. The drop at Slate Rapids is 22 feet, down which we lined the canoe. Some 5 miles farther on we came to the head of Marble Lake, estimated elevation 1,445 feet, where we landed and cut a portage across three-quarters of a mile to Astray Lake. This saved some 20 or 25 miles of water route. We camped half-way across our portage for the night. The sand flies were bad here.

*July 1:* We had everything across the portage by noon and left the north end by paddle, as the motor was out of order. We became wind bound and camped on an island on Astray Lake at Lat. N 54° 34′, Long. 66° 34′ W. It came on to rain so we sheltered under a small tarp, and managed to keep dry, more or less. No attempt was made to estimate the elevation of Astray Lake, but it would be about the same as Marble Lake.

*July 2:* It was still raining, so we tried to fix our outboard motor with no success. At 9.00 we left, but could not buck the heavy wind. We landed and Ferguson took the canoe along the shore to fish, but got out of shelter and was blown down to the end of the bay. At dark the wind was still high, so we camped there for the night.

*July 3:* We had breakfast and were on our way by 4.45 and made good progress until 11.00, when we stopped for lunch at the south end of the main body of Lake Petitsikapaw, where a westerly wind was blowing so hard we dared not breast it. We turned easterly with the wind and made camp at 13.00 at Lat. N 54° 33′, Long. 66° 28′ W.

*July 4.* The high wind fell during the night and at 3.20 we were on our way making good progress toward the west shore of Petitsikapaw Lake till 5.30, when we came to North-West bay, where the rising wind got a full sweep. We started across the mile and a half of water, quartering the canoe into the wind, and by paddling when we were not baling, we managed to make headway, though very little, in the direction chosen. Our progress was due to the wind blowing against the side of canoe. We reached directly across from our starting point. Now in shelter we made better headway. At 8.00 we poled up a fast channel flowing from the east. This was evidently a wrong turning, as in an hour we could not recognize our position. However, we kept working north and eventually came to the narrow channel where there is excellent fishing. This channel empties out of Iron Arm. A rapid of 8 foot fall occurs here and here we upset our canoe. All our baggage floated down the swift current to the lake below. We righted the empty canoe and gathered our bedding with some difficulty, and returned to the scene of the upset, partly dried out our stuff and hung it on a line to finish, as it was a fine night. We stayed there till morning under the tarp, awakened in a drizzling rain, and found our stuff as wet as ever. We left our wet goods there and the motor at the bottom of the channel. We cut a portage through to the good water above and took the canoe over to Iron Arm, which we left at noon. With only eight miles to go to beach the canoe, we walked 2 miles over a 200-foot ridge, where we hoped to be able to signal Hollinger Camp. They heard us shouting across a mile of distance and picked us up by plane, which they taxied across the lake. We landed at Hollinger Camp about 18.30, with no food left and with only six matches.

## The Route

From Point aux Basques, Mile 0, near Seven Islands the line rises over a sand and muskeg flat to Mile 9, then passing over a rough 2 miles comes to the south end of Moisie Canyon where it follows the west bank with some tunnelling to Mile 14, and then crosses the Moisie to the east bank on a 250-foot steel bridge 50 feet above low water. It then follows the Moisie to Mile 28, where it enters the valley of the Nipissis and Wacouno, following up past Wacouno and St. Patrick Lakes to the St.-Lawrence-Ashuanipi divide at Mile 145. Here it enters Labrador territory, thence down the valleys of the Summit and Embarrassee Rivers to Ashuanipi Lake at Mile 180. Keeping to the east side of Ashuanipi, it follows down that drainage past Whitman, Molson and Manihek Lakes, where at Mile 328 it crosses

Moisie Canyon looking north.

to the west side of the Ashuanipi River at Slate Rapids at Lat. N 54° 28′, Long. 66° 37′ W. From Slate Rapids the line continues in almost the same direction to a crossing of Howells River about where it enters Astray Lake. Skirting the second bay of Astray, it follows up the drainage of Wishart Creek to an unselected northern terminus in the vicinity of Lat. N. 54° 44′, Long. 66° 42′ W at about Mile 350.

#### Grading

Commencing at Pointe aux Basques, the first 9 miles will be light work of 25,000 cu. yd. at an estimated cost of $1 per cubic yd. Miles 9 to 12 will run 35,000 cu. yds. of other material at $1.50 per cu. yd. The canyon section, all solid rock, should cost $2,000,000, Miles 11 to 14. Miles 14 to 90 would run 20,000 cu. yd. of solid rock and 20,000 cu. yd. of other material per mile. From Mile 90 to Mile 140 the quantities may be taken as 35,000 cu. yd. per mile at $1 per cu. yd.

North of the height of land, terrain becomes rough and broken to Mile 175, and will run 20,000 cu. yd. of solid rock at $3 and 20,000 cu. yd. of other material at $1.50 per cu. yd. For the next 105 miles to Mile 280, the average grading quantities may be taken at 10,000 cu. yd. of solid rock at $3 and 20,000 cu. yd. of other material at $1.50 per cu. yd. Beyond Mile 280 to Mile 334, the grading will average 30,000 cu. yd. per mile at $1.50 per cu. yd. For the final 16 miles of this line west of the Ashuanipi River, which was reconnoitered as an area, the grading may be taken as 40,000 cu. yd. per mile at a cost of $2.50 per cu. yd.

This covers the original grading quantities as presented with the 1945 report to my principals. At that time it was expected that the yearly outbound shipment would be 2,500,000 tons of ore, which would warrant no more than a cheaply built line with 10 or 12 degree curves, light ties and rails, and no elaborate signal system or high maintenance charges. Now (1953) the anticipated yearly output is said to be ten times that amount, which changes the whole construction picture. I might say, however, that the foregoing grading quantities had a contingency cost of 20% added. No guarantee was given that the terminal facilities at tidewater would be satisfactory, nor was the cost of this figured in the total estimate presented.

The possibility of water power development at the outlet of Menihek Lake was mentioned, as well as the easy storage of the vast amount of water in the many lakes of the Ashuanipi drainage.

**Side hill work along the Moisie River.**

The technique of railway reconnaissance can only be acquired through years of experience in railway location and construction. In estimating yardage quantities it is wise to go over a mile or so of the country, measure the required yardage in that mile, and, proceeding, estimate plus or minus amounts from the measured mile for each change of terrain encountered.

Aerial reconnaissance can be very deceiving. From the air, long sections of broken country resemble level prairie. Wide rivers look like narrow streams and so on. Nothing looks the same from the air as it does from the ground. The distance is shown by the time elapse recorded.

#### Grades

From the north end to the height of land the grades should not exceed 0.4% against loaded trains. The inbound grade should not be in excess of what would allow the same power that hauls the loaded train out, to take the empty cars back. This may require a pusher grade between Mile 64 and Mile 74, which only an instrumental survey can decide.

The route given is not claimed to be the only possible one or even the best. It is submitted as being a direct line of reasonable construction cost and fairly representative of what the cost would be of building a railway in this country.

It is recommended, if building the railway is decided upon, that considerably more preliminary exploration be done. This would apply particularly to the section which includes the height of land area between Quebec and Labrador, with a view to finding the lowest possible summit as well as easier work.

This twenty days ended the reconnaissance of what is now the Quebec, North Shore & Labrador Railway.

My recommendation for further exploration was followed, and the following summer in August and September, thirty-five days were spent, using canoe and plane. Two canoe men, Johnnie Mercier and Win Wright, gave excellent service, as did C.P.A. Pilot Johnny Dart. Valuable information was secured, as well as discovering Livingston Pass through the Labrador Highlands at Lat. N. 52° 07′, Long. 55° 42′ W.

Birds noticed in the Labrador Highlands were canaries, kingfishers, hawks, gulls, swallows, partridge, whisky jacks, plover, a small black duck white under its wings, and the Canada goose.

Some black bear were seen as well as two woods cariboo.

The timber is tamarack, birch and poplar with spruce predominating. Near the south end some sizable sticks were noticed that might be used for tie timber and at odd spots farther north six or eight inches at the butt would be a big tree, however, no attempt was made to survey this phase. √

# Welding Research
## in
# British Merchant Shipbuilding

*by*

R. B. Shepheard, C.B.E.

*Director,*

*The Shipbuilding Conference, London,*

*England*

This is the substance of the Adams Lecture, delivered before the American Welding Society at its Cleveland meeting, October 19, 1953.

It draws an excellent picture of the state of British research into welding as applied to shipbuilding investigations, many of which are equally applicable to riveted ships and to other similar structures. The extent of the work described will be a revelation to many and serves to show that British shipyards, with the support of Government agencies, the Classification Societies and others interested, do not intend to be left behind in shipbuilding, in which they have always been regarded as probably the World's leaders.

The use of welding in the building of merchant ships has steadily developed in Great Britain, but the change-over from riveting has been less abrupt than in the United States. Widespread and extensive modifications in shipyard layout and equipment have been effected in recent years. Figures 1-4 show representative examples of British welded construction for various types of merchant craft. These developments afford ample proof of confidence in the progress made possible by welded design in producing ships of improved performance and efficiency.

The very rapidity of the welding revolution in world shipbuilding has inevitably brought problems in its train, some unforeseen and distressing. Defects have been disclosed in certain welded ships, specially among those built during the war years. There have been tragic instances of hulls broken in two. Faults of less severity have included local fractures from hatch corners and at other discontinuities, these proving particularly troublesome at tanker bulkheads; and corrugations have developed in the bottom plating of transversely-framed dry cargo ships. In some cases, workmanship, welding and construction methods have proved unsatisfactory.

These deficiencies must be viewed in proper relation to the massive records of satisfactory service given by very large numbers of welded ships. They, nevertheless, present a challenge which has been vigorously met by extensive research and study, ranging from the properties of materials to all features of general and detail design and by constant vigilance throughout the building processes. As a result, the modern welded ship represents a great advance over her older sister, and has been released from the influence of riveted tradition.

These problems have permitted of no restricted national treatment; they are the concern of all maritime nations. This is exemplified by the exchange and co-operation which has been maintained since 1943 in welding research undertaken on one side of the Atlantic by the United States Board of Investigation and its successor, the Ship Structure Committee, and on the other side by the Admiralty Ship Welding Committee. This collaboration has proved of real benefit and has been enriched by many personal contacts and friendships.

This paper outlines some aspects of welding research affecting shipbuilding undertaken in Great Britain during recent years. The temptation has been resisted to include reference to other important spheres of research in which welded construction is incidental, but not a basic factor in the investigations.

#### Brittle Fracture in Mild Steel

The vital importance of adequate notch toughness at service temperatures in mild steel for welded shipbuilding was brought to light as a result of thorough investigations undertaken in the United States and in Great Britain, following failures in certain welded hulls built during the war years in the United States. No satisfactory explanation of all the features characteristic of these fractures was found "until the importance of notch brittleness in mild steel was realised. It was then evident that notch brittleness of some of the steel used in ships which had failed was a major factor in causing the trouble"(1).

Shipbuilders and classification societies were thus confronted with an unforeseen and complex problem calling for urgent remedial action. They enlisted the collaboration of steelmakers and metallurgists and research was intensified in many directions. As a result, much progress has been made and amendments to material specifications have been introduced, which have proved their effectiveness in screening out unsatisfactory material in welded ships built since the war.

Yet there remains much to learn; with the unremitting demands for heavier rolled material, especially for large tankers, it is imperative to continue research—and as a top priority.

The scope of the investigations in the United Kingdom can here be reviewed only very briefly. In 1945 Professor J. F. Baker prepared for the Admiralty Ship Welding Committee a "Statement of the Problem" and, at the suggestion of the Committee, a conference was called at Cambridge by the British Iron and Steel Research Association in October of that year(2). This was attended by a number of eminent experts; valuable ideas emerged and research interest was broadened. It was recognised that the phenomenon of brittle fracture, while by no means new, had assumed the greatest practical importance with the advent of the welded ship.

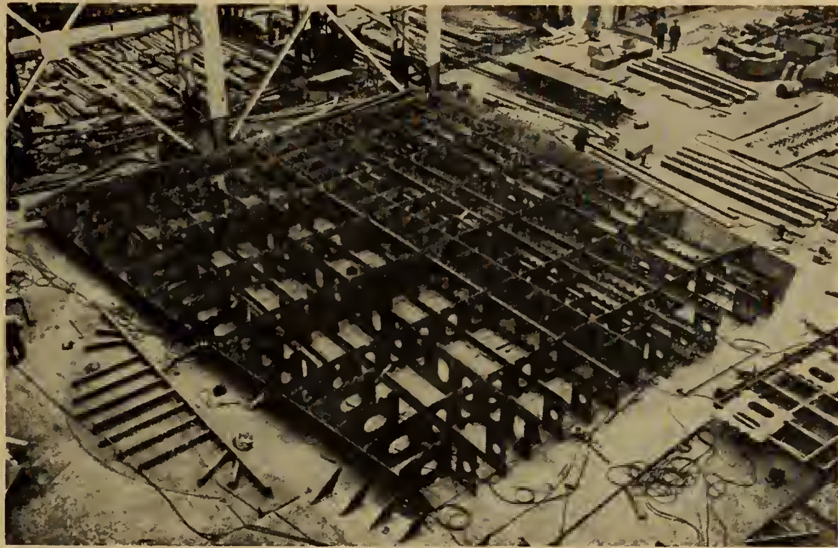


**Fig. 1. All-welded longitudinally framed double-bottom structure of cargo liner; three units; combined weight 71 tons.**

Attention was first directed to the chemical composition of the material which had failed. These steels complied with established test requirements, with which were associated control of sulphur, phosphorus and also, indirectly, of nitrogen, as recognised in normal good steel making practice. But the carbon content was high and the manganese unusually low. It was pointed out by Barr(3) that on the basis of impact tests over a range of temperatures, an increase in carbon tended to raise, while an increase in manganese tended to lower, the temperature of transition from ductile to brittle fracture. From this developed the recommendation that within the limits of composition determined by tensile requirements for mild steel, the ratio of manganese to carbon content should be of the order of about three to one, this also ensuring better weldability. This recommendation, translated into a specification requirement for plate material over ½ inch in thickness, effectively barred from further acceptance low manganese steels such as were produced in America and in some continental countries under wartime conditions. It was, nevertheless, realised that this additional control of analysis provided only a partial safeguard.

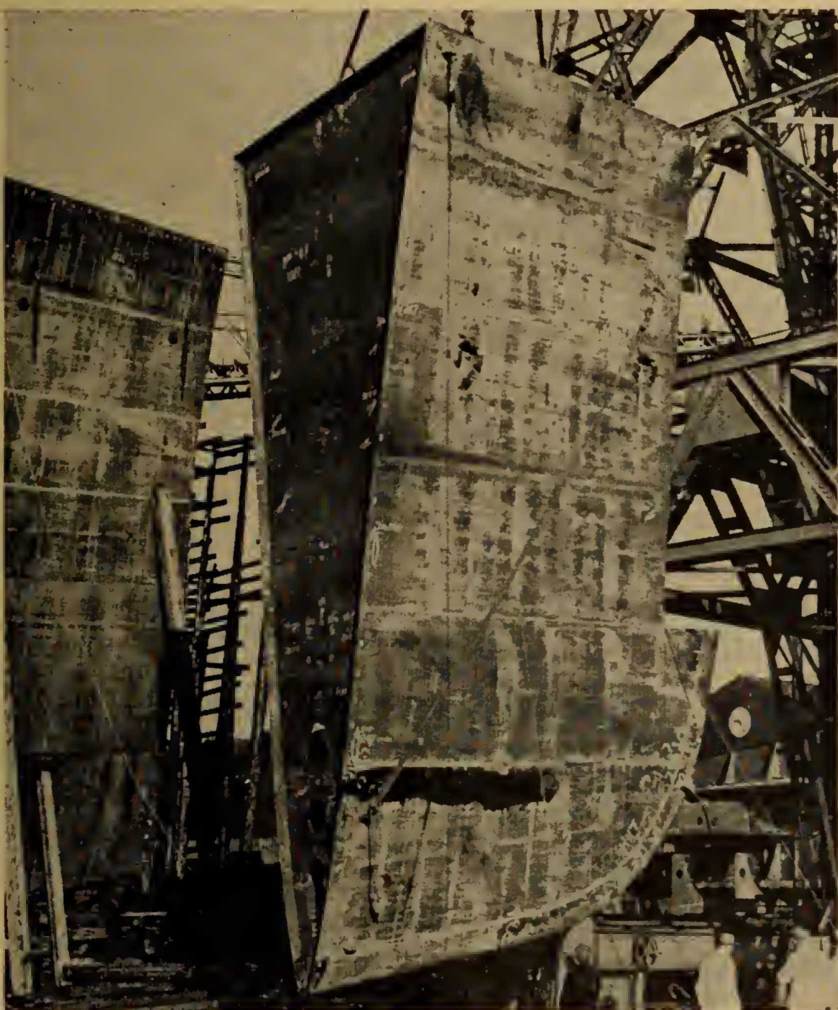

**Fig. 2. A 50-ton welded bow unit for passenger liner.**

Emphasis then turned to the structure of the steel. This is influenced by steelmaking practice in all its stages, including variations in composition, deoxidisation, mechanical treatment, temperatures of working, rates of cooling, directional effects, heat treatment after rolling and the thickness and volume of the finished product. B.I.S.R.A. set up an ad hoc committee to carry out a survey of the general level of notch ductility in British-made semi-killed ship plates. Following a pilot survey, a wider investigation has been completed on plates from five manufacturers. Triplicate Charpy V-notch impact tests at 0°C were made on about seven hundred plates, and the general level of notch ductility for thicknesses ranging from ½ to 1¼ inches from each works has been assessed by statistical analysis of the results. This has

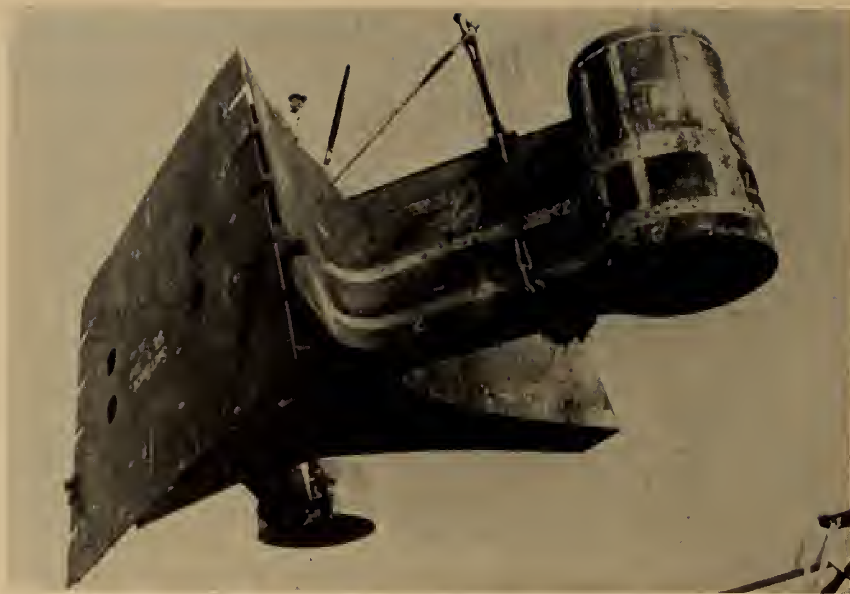

Fig. 3. Welded fabricated stern unit with shaft brackets carrying 42,000 shaft hp. Weight, 46 tons.

confirmed the known trend for notch ductility to decrease with increase in plate thickness. It has further disclosed differences between plates of equal thickness made by different manufacturers, the reasons for which are now being sought through a close examination of conditions of manufacture in each works(4). A study is also being made by B.I.S.R.A. of the effects of welding practices and of the susceptibility of mild steels to strain ageing.

Results have recently been published of a further investigation(5) on plates rolled in two mills, the first object being to determine the effect of plate thickness and production variables on the Charpy V-notch transition temperature for semi-killed steels, and the second to determine the general level of notch ductility of special qualities of mild steel. The general decrease of notch ductility with increasing thickness is attributed to higher rolling temperatures and slower rates of cooling. Some advantage is, therefore, to be expected from normalising the thicker plates. For the special quality steels, the effects of killing with the addition of silicon or of aluminium, and normalising, in addition to increasing the manganese-carbon ratio, have been compared; it would appear that to obtain a plate of high notch ductility at really low temperatures it is necessary to adopt a low carbon high manganese steel, normalised and killed with aluminium, although the latter greatly increases production costs (Fig. 5). It is clear also that special control of rolling and finishing temperatures has most beneficial effects, though this may give rise to practical difficulties.

The relation between laboratory tests and service failures has presented difficulties apparent from the early stages of investigation. Numerous forms of test pieces and methods of assessing notch ductility have been developed. Two types of test are being used in the United Kingdom to simulate service conditions and for the purpose of obtaining fundamental information on the conditions of initiation and propagation of fracture. Both use a full plate thickness, an impractibility in standard impact testing. In 1945 Tipper developed a simple notch tensile test bar for determining transition temperatures and to relate fracture appearance to ductility as measured by reduction in thickness(6). This test was the first developed in the United Kingdom which reproduced the characteristics of brittle fracture found in welded ships. The test has provided good correlation with service casualties, but it is desirable that the width of the test bar should not be less than two and a half times the thickness of the plate in order to obtain a sharp transition in the fracture appearance at a given temperature. Robertson has evolved a test in which a crack is initiated by impact; either a constant transverse stress is applied to a plate in which there is a temperature gradient or, alternatively, the material is maintained at a constant temperature(7, 8). Correlation between impact, Tipper notch tensile and Robertson tests is fairly satisfactory in assessing the temperature at which the change in properties occurs. Numerical agreement is, however, impractical due to the different criteria adopted.

The effect of dimensions in testing also renders comparison difficult between different forms of test. The magnitude of initiating discontinuities and of cracks in service must vary between wide limits, but the propagating fracture appears to have typical and constant form, when once established. In the small types of test specimen end effects form a large part of the fracture, thus masking its natural propagating form(9).

Interpretation of fracture surface markings has recently received attention by Boyd(10). He shows that the process of propagation of brittle fracture in a plate consists in the formation of a succession of disc-shaped cracks originating within the body of the material ahead of the main fracture front (Fig. 6). The envelope of the radiating fractures is parabolic, and the calculated orthogonal trajectories of the fracture fronts show good agreement with the inclination of chevron patterns measured on natural fracture surfaces. The theory can also account for the chevrons having the same shape in plates of different thicknesses and leads to the conclusion that the work done in propagating a fracture is a material constant, a finding in agreement with Robertson's conclusions.

A method has been devised for

Fig. 4. Welded 28-foot double-chine towing launch; lifting weight, 4 tons.

measuring the energy absorbed in creating unit surface area of a crack, by recording the temperature wave released when the local plastic work is converted into heat as fracture proceeds(11). This approach has indicated that for given materials and temperatures, the surface energy has stable minimum values.

The Admiralty Ship Welding Committee has given much attention to the choice of the most suitable test and criterion for assessing notch toughness. In the present state of knowledge, the Committee considers that it is desirable to select a single standard test to be used for quality control, and for this purpose recommends general adoption of the Charpy V-notch impact test(12). This proposal is in line with the practice of the National Bureau of Standards in its casualty investigations and has been endorsed by the International Institute of Welding. It has, however, been found that the methods by which the V-notch are machined can significantly affect the impact values, and more rigid specification of conditions for impact testing is therefore being considered. A great step forward would be achieved if an internationally accepted form of test were agreed upon. This should in no way hamper the development or use of other types of test for special or research purposes and it is hoped that such investigations will throw much needed light on the mechanism of fracture in steel.

More fundamental researches are also in hand. These include work on pure iron and pure iron alloys, which has been carried out by the National Physical Laboratory supported by B.I.S.R.A.(13). This has shown that the lower the content of certain elements in iron, the more significant do small amounts become, particularly in the presence of one another. Various studies are being made of fracture stresses in iron and other metal crystals(14, 15).

The Rules of Lloyd's Register were amended in 1949 to require for ship quality plate over ½ inch in thickness, a manganese content not less than two and a half times the carbon content. This provision, similar in effect to the American Bureau Class 'B' Specification, has involved little change in established practice since the war in the steel making world.

For main structural parts exceeding 1 inch in thickness in welded construction, the Society has further required that the properties and processes of manufacture of the

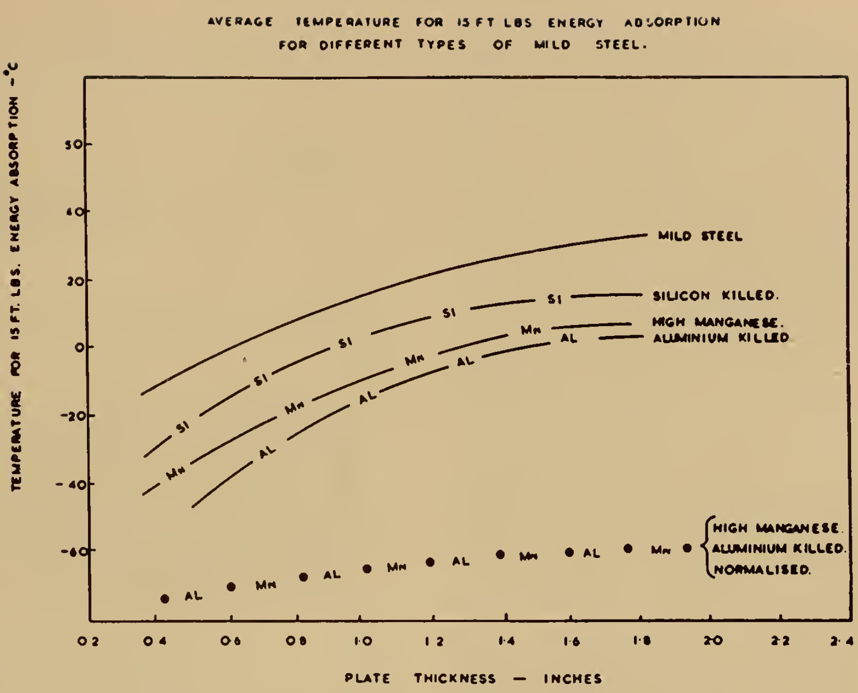

**Fig. 5. Comparison of mean-level of notch ductility for various qualities of mild steel plate rolled in one mill.** *(West of Scotland Iron and Steel Institute)*

steel used are to be specially approved for the purpose. This approach differs from that under the American Bureau Class 'C' requirements, no detailed specification for the heavy material having been laid down. Steelmakers in any country are invited to submit for approval a type of steel which they can readily and consistently produce and which, in their opinion, has adequate notch toughness in thicknesses greater than 1 inch. They are required to furnish full details of the proposed process of manufacture, including deoxidisation and rolling practice, limits of composition and details of any heat treatment. In accordance with the proposed process, plates are rolled in several thicknesses from actual casts. From these plates, notch bar impact tests are carried out over a range of controlled temperatures. From the data so furnished, the Society is able to assess the suitability of the material relative to other accumulated data. If considered satisfactory, approval is given on the understanding that the steelmakers maintain substantially the same analysis and process of manufacture and provide verification by periodic check impact tests. Routine notch testing from production is, however, not required by the surveyors. Steels so approved now number over 40 from 11 different countries. They represent a wide variation in manufacturing practices from semi-killed "run of the mill" to elaborate and costly types based on full-killing, grain control and special heat treatment. The system permits initiative and encourages development suitable to individual manufacturing conditions without imposing a stereotyped specification, but approval is based on direct assessment of notch toughness determined by physical tests over a range of temperatures. It is nevertheless envisaged that with increasing knowledge and experience further safeguards and modifications in requirements may be developed.

There remain outstanding problems in this field still unsolved. Among these are the determination of a suitable agreed criterion for the measurement of notch toughness which must be correlated with service requirements for ships' structures; and a more thorough understanding of the metallurgical effects controlling notch toughness, particularly its reduction with increased thickness and for steels of acceptable weldability. Technical answers are needed to these problems in order to attain the objective that only materials shall be used which are of adequate and consistent quality for their duties, at an appropriate cost.

#### Residual or Locked-up Stresses

How do we now regard locked-up stresses, which for so long were widely held to be mysteriously responsible for welded ship failures? In 1948 a study was made at the Engineering Department, Cambridge(16), of stresses in butt welded mild steel plates, especially when welded under severe restraint. This showed that high locked-up stresses, generally reaching the yield point, occurred in the immediate vicinity of the weld, even where no reaction stress, i.e., restraint, was present. It was demonstrated, moreover, that the magnitude and distribution of residual stresses could be greatly changed by small departures from established procedures, thus throwing doubt on the generally accepted belief that residual and reaction stresses could be controlled, provided correct welding procedures and sequences were followed. It emerged that cracking was due to lack of ductility in the weld metal on cooling and it was therefore necessary to follow well established practices in order to limit the amount of plastic deformation required of the weld metal.

Other theoretical and experimental work led to the conclusion that residual stresses could have no influence on the static carrying capacity of a structure provided the material behaved in a plastic manner, and provided that residual stresses did not result in elastic instability. Under certain conditions the presence of residual stresses must be considered to reduce the load factor for elastic instability(17).

It has also been shown that where no notch is present, high reaction stresses could not of themselves produce brittle fracture at temperatures below the transition temperature of the material. In more recent experiments(18), spontaneous fracture has been produced in specimens in which a severe notch was present, associated with high locked-up stresses, the material having been cooled to below its transition temperature. Wells has offered an explanation for this type of failure(19). He considers that, provided a notch is present before the weld metal cools, work hardening can take place at the bottom of this notch to raise the average residual stresses to the fracture strength of the material, thus initiating a brittle fracture which would then propagate at steadily diminishing average stresses depending on the crack length, under the influence of residual stresses alone, even if these were comparatively low.

It would seem, therefore, that residual stresses cannot be ignored in material which is notch brittle. Their potential danger can best be eliminated by ensuring a sufficient degree of notch toughness at service temperatures.

The Admiralty Ship Welding Committee has recently amplified its earlier findings on locked-up stresses in the following terms(12):

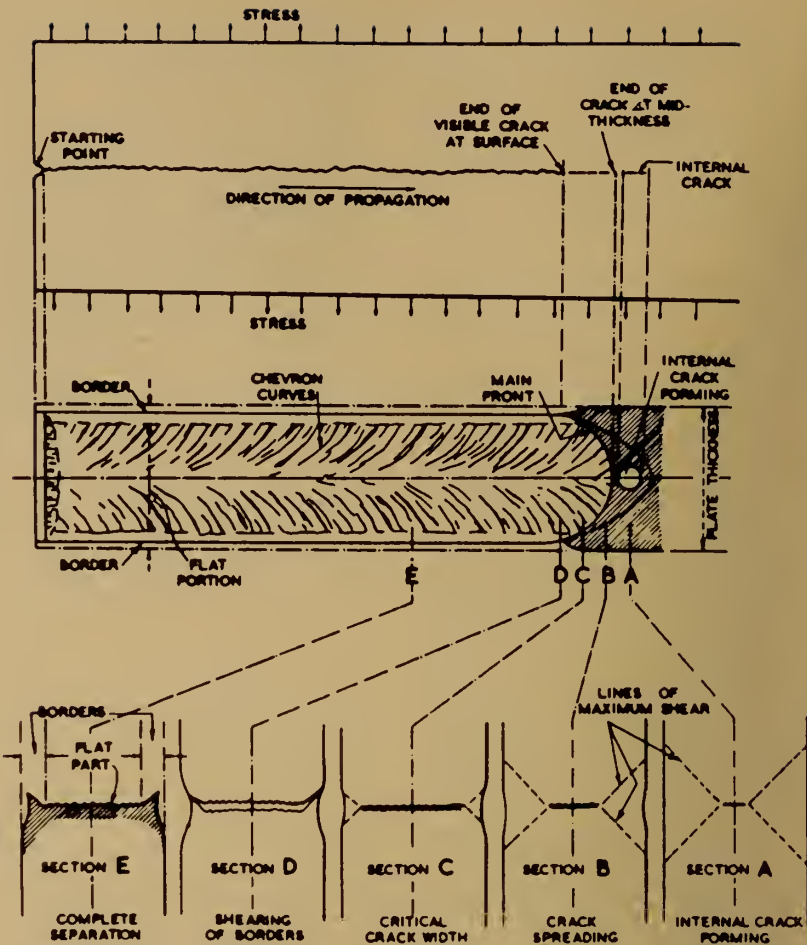

**Fig. 6. Features of plate fractures.** *(Engineering (10))*

(a) Regardless of the procedure, sequence of welding, or restraint, every welded structure, unless stress relieved, contains locked-up stresses which locally reach the yield point of the material.

(b) Continued researches have so far not revealed evidence that these locked-up stresses have adverse effects on the strength or reliability of welded ship's structures, provided that the material, including the weld, is in a notch-tough condition at the prevailing temperature.

(c) It is important to appreciate that undue restraint during fabrication may lead to cracking during or shortly after welding and unless such cracks are found and dealt with they may lead to serious failures in service.

### Aluminium Alloys and their Welding

Aluminium alloys are of great interest as structural shipbuilding materials, alternative to mild steel, though their use has naturally been restricted. Guidance in the choice of suitable alloys for marine purposes has been provided in the tentative requirements published by Lloyd's Register in 1947. These rules cover limits of compositions for both non-heat-treatable and heat-treatable alloys of the aluminium-magnesium and aluminium-magnesium-silicon types, the minimum physical properties required being 0.1 per cent proof stress, 8 tons/sq. inch; ultimate strength 17 tons/sq. inch, and elongation, 10 per cent on 8 inches. Much research has been carried out in Great Britain to improve the weldability of these alloys. While welding difficulties due to the corrosion resistant oxide film have been overcome by the inert gas processes, basic metallurgical factors are also involved, namely, gas reactions, cracking tendency, loss of alloying elements, loss of strength and reduction in corrosion resistance.

Gas porosity due to hydrogen picked up by the molten metal during welding occurs especially in the heat affected zone adjacent to the weld and is generally more troublesome in the aluminium magnesium alloys than in other types. Investigations by the British Non-Ferrous Metals Research Association(20, 21, 22) have suggested appropriate remedies. To eliminate hydrogen pores, which may also occur due to moisture held in the surface oxide film, the metal should be thoroughly cleaned before welding and electrodes or welding wire stored in dry conditions.

The Aluminium Development Association has systematically studied the factors affecting cracking of welds under the inevitable conditions of restraint(23). It has been found that in general a higher percentage of alloying elements in the filler metal, plus additions of grain refining elements, particularly titanium and boron together, greatly reduce the risk of cracking. In arc welding aluminium-magnesium alloys the loss of magnesium may be offset by using filler metal containing a higher proportion of this element than the parent metal.

In the heat affected zone the local increase in temperature results in significant reduction in strength of the heat-treatable alloys and to a lesser extent of the non-heat-treatable, when welded in the cold-worked condition. The heat affected zone may also exhibit some loss in corrosion resistance due to the redistribution of the constituents consequent upon heating to temperatures around the solidus. The metal may be susceptible to intercrystalline corrosion which is not normally observed in non-heat-treatable alloys containing less than about 4 per cent of magnesium.

There is now much experience in Great Britain in the production of aluminium-magnesium alloys; the most acceptable plate composition, taking into account all the above factors, appears to be a nominal 4¼ per cent magnesium alloy. This has been standardised as NP.5/6(24) and is now in wide commercial use. Latitude in range of composition permits manufacturers to select the most suitable for their production methods, and the desired mechanical properties may be obtained by varying the degree of cold working.

Alloy NP.5/6 possesses a good combination of strength and ductility. It can be hot worked with reasonable ease, readily formed cold in the shipyard, and local re-heating does not seriously affect its properties. Its welding characteristics are satisfactory and weld efficiencies exceeding 90 per cent are commonly obtained. With filler metal of the same basic composition (or nominal 5 per cent magnesium) resistance of the weld metal to corrosion is of the same order as that of the parent plate.

The British Welding Research Association has co-operated with the Electrical Research Association in work to study the electrical requirements for arc stability and the characteristics of welding circuits required for successful arc maintenance.

The experience of E.R.A. on the fundamental physics of heavy-current, high-voltage arc discharges has provided useful basic knowledge on the welding arc. This has been of particular value in leading to a full understanding of the electrical requirements of the Argon-arc welding process, and has resulted in the development of a simple electronic device which enables the welding of aluminium by this process to be successfully achieved at an open circuit voltage of 40 volts, r.m.s. using any type of welding transformer, and without any other form of arc stabilising device(25). Under certain conditions, through the use of a series capacitor, this figure has been reduced to 30 volts, r.m.s. The device (Fig. 7) provides a damped unidirectional pulse of about 250 volts peak lasting a few microseconds only, which is automatically timed to be injected at the beginning of each reverse polarity half-cycle. This ensures the re-ignition of the reverse polarity arc, and so, in practice, permits a reduction in the open circuit voltage to a value of the order of twice the arc voltage. As the short duration surges injected are of comparatively low voltage, radio interference, which always occurs with the commonly used spark injector, is completely eliminated. If touch starting is impracticable, then the low voltage surges can be readily converted into timed high voltage sparks to initiate the arc from cold, but once the arc has been started, the unit automatically reverts to the low voltage surges for arc maintenance. This device is of comparatively recent development, but it is anticipated that considerable use will be made of the equipment, which is now in the commercial stage. This would reduce the size and cheapen the cost of welding transformers, make welding safer, improve the power factor, and give better quality welding.

Work of a similar nature is also in hand on the characteristics of the inert-gas, metal-arc process. Criteria have been formulated for both alternating and direct current which will ensure a considerably greater degree of arc self-adjustment than is obtained in present practice. The criteria can be met either by suitable design of new welding plant or by the addition of auxiliary equipment to existing plant.

A detailed account of these investigations will be published in the near future.

#### Full-Scale Structural Tests on Welded and Riveted Ships

The Admiralty Ship Welding Committee has undertaken a programme of full-scale tests to throw light on the relative structural behaviour of welded and riveted ships. This programme developed in two stages; the first in still water, and the second under service conditions at sea. We were fortunate in Great Britain in having available certain classes of tankers and dry cargo ships practically identical in design, form and structural arrangements and of both welded and riveted construction. It is unlikely that such an opportunity will again occur.

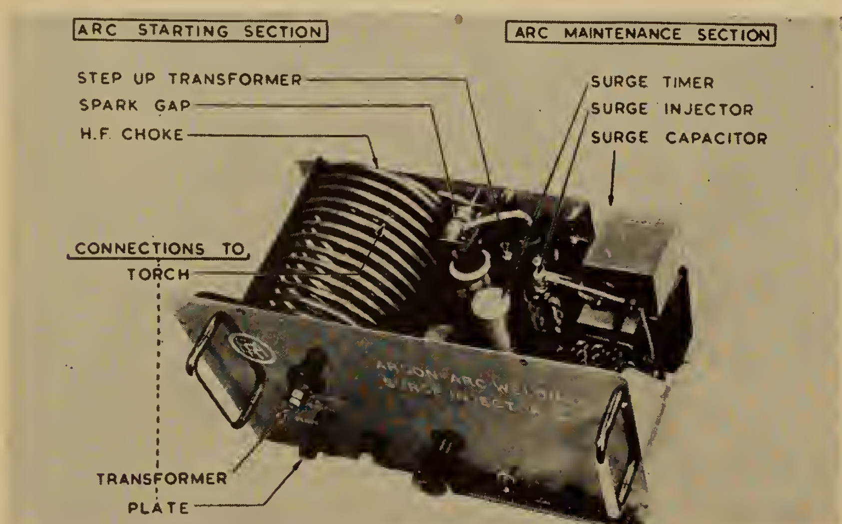

Fig. 7. Surge injector for argon-arc welding at low voltage.

In the first stage, two 12,000-ton (dead weight) tankers, the "Neverita" and "Newcombia", the one welded and other almost entirely riveted, were submitted in still water to a range of loadings applied by changes in ballasting of different tank spaces(26, 27). A large number of gauges were fitted to measure bending strains in addition to direct strains, and hence to derive heart of plate stresses. The gauges were arranged over a main section of the hull girder and also at selected positions to study local bending effects in plating panels and concentrations at discontinuities. Hull deflections were assessed by several methods.

The tests showed, over the rather severe range of bending moments applied, no significant differences for the two ships in general stress distribution and deflection in the main hull girder; the results corresponding, within limits of experimental error, to those predicted from conventional beam theory. No evidence was found of rivet slip nor support for a commonly held belief that welded ships are stiffer. High local stresses were observed at some positions, due to local bending of plating panels and to concentrations at openings and other discontinuities.

The tests also showed that longitudinal framing members contribute effectively with their associated plating under stressing due to longitudinal bending moments. This has provided valuable information in determining scantlings for longitudinal strength in tankers. It indicates that some variation is permissible between the relative areas of plating and longitudinals, which jointly provide the required sectional area of material in the bottom and top flanges of the hull girder. This variation, which is of great practical value in the choice of longitudinals, must be subject to limitations imposed by other considerations, both in actual plate thickness and in the scantlings of longitudinals. It is also important that adequate continuity and fixity be provided for the longitudinals in way of transverse bulkheads, and this is relatively easy of achievement in welded construction. Lloyd's Register Rules for Tankers, which were completely revised in June, 1950, and formulated for direct application to welded design, incorporate tabulation of main scantling requirements on the above basis.

With the experience from the above and other static tests, and following a "pilot" sea-going voyage in the Tanker "Niso"(28), the A.S.W.C. programme was then extended to the second and more ambitious stage of measuring stresses at sea. It was recognised that simultaneous recording of strains and deflections in a complex ship's structure in the constantly changing conditions at sea presented immense difficulty and that such records without accurate knowledge of the corresponding applied forces would be of little scientific value. An indirect approach to the problem was therefore adopted. The sea trials were planned primarily to determine the forces acting on the hull, a few strain gauges being fitted around the midship section for checking purposes only. Effort was concentrated on the provision of suitable equipment designed for synchronous recording, from which a complete evaluation of bending, twisting and shearing actions on the structure due to the sea at any moment could be deduced. Only one ship was required for these trials. Complementary to the measurements of forces at sea, the stress response of the two similar welded and riveted ships was to be determined in still water, when subjected to various conditions of loading. In the final stage, the results from the still water trials would be applied to the loads derived from the sea trials, in order to estimate the probable maximum stresses at sea for both the welded and riveted ships, the ultimate object of the tests.

For these trials the ships selected were two 10,000-ton dry cargo ships, one the welded "Ocean Vulcan", built in California, the other her riveted prototype the "Clan Alpine" built in Great Britain.

For the sea trials, the "Ocean Vulcan" was fitted with equipment specially designed to permit the determination of all forces acting on the hull at any instant. This included instruments for measuring direct wave pressure and instantaneous water line; accelerations; wind forces; angles of roll, pitch and yaw; ship's speed; engine speed and shaft torque; also longitudinal stresses at a section near midships. Altogether some seven hundred wave profile indicators and one hundred other instruments were installed, all arranged for remote synchronised reading at a central recording panel by photographic exposures twice per second.

The equipment was operated by a small experimental crew during eight round voyages in normal North Atlantic trading over a period of seventeen months, some two hundred days being on the open ocean. The weather experienced was of varying severity and full gales were encountered.

The complementary still water tests were made on the "Ocean Vulcan" and "Clan Alpine" in the River Fal under a large range of conditions. Loading was applied mainly by water ballast and for this purpose main bulkheads were reinforced to permit the holds and in some cases the 'tween decks to be filled; a special pumping system also being installed. The ranges of hogging and sagging moments and conditions imposing severe trim, torsion and heel called for most careful control during the whole period of tests to ensure the ship's safety. Comprehensive readings were made of direct and bending strains at main sections of the hull, at local discontinuities and openings, and in certain plating panels, together with records of the hull deflections.

The experimental work under this programme was completed early in 1948. Analysis of the immense volume of records has presented a lengthy and formidable task, which has been brought to completion under the supervision of F. B. Bull who, as leader of the experimental party, had been associated with the tests since their inception. A series of reports has been completed(29-33) and early publication is expected.

The detailed report(31) on the "Ocean Vulcan" sea trials, which has recently been published, includes a review of previous work on ocean waves and strain measurement at sea. The basic assumptions underlying the trials are discussed, the instrumentation described in detail, and also the methods adopted in reducing and presenting the results.

The main conclusions from these sea trials may be summarised as follows:—

The greatest recorded range of vertical longitudinal bending moments was 190,000 ton-feet corresponding to a stress range of 8 tons/sq. in. at the top of the sheerstrake amidships. From theoretical considerations the sagging moment constituted about 55 per cent of the total. This stress range is of course additive to the still water stresses on the hull.

The above range of bending moment was associated with waves 35 feet high and between 600 and 700 feet long. The greatest range of bending moment amidships occurs when the length of wave approximates to that of the ship, and according to oceanographic data the maximum height ever likely to occur for a wave of 416 feet, the ship's length, is about 35 feet. Under such conditions the maximum range of vertical bending moment would not exceed 260,000 ton-feet corresponding to a stress range at the sheerstrake of 11.0 tons/sq. in.

Horizontal longitudinal bending moments caused stresses, in some conditions, of similar magnitude to those due to concurrent vertical bending. The maximum range observed was 80,000 ton-feet corresponding to a stress range of 2½ tons/sq. in. at the sheerstrake amidships, and such ranges occurred when the ship's course was between 20° and 50° to the wave front. When longitudinal and vertical bending moments were in phase the stress range on one sheerstrake or bilge was very different from that on the other side of the ship(34), (Fig. 8).

Torsion moments were small and had little effect on the stresses in the hull girder.

Water pressures were closely in agreement with those predicted from the trochoidal theory. It was shown that for this ship in a seaway, dynamic terms in the determination of vertical longitudinal bending moments amidships tend to cancel each other. In consequence a reliable estimate of these bending moments for any particular wave length and height in head or following seas can be made from the assumption that the ship is in static equilibrium on the wave, provided the Smith correction is applied.

The relation of these conclusions to the detailed analysis from the still water tests of stress response in the welded and riveted sister ships is likely to throw strong emphasis on the effects of local stress concentrations.

It is hoped that this work, when finally available for critical study, will be found to have contributed usefully to our knowledge of the "way of a ship in the midst of the sea". While the A.S.W.C. is undertaking no further ship structural investigations, these figure prominently in the research programme of the British Shipbuilding Research Association.

Opportunity was taken during the structural trials on the "Ocean Vulcan" and "Clan Alpine" to carry out vibration tests on these two ships as part of the B.S.R.A. programme to develop new and to improve existing methods of calculating critical frequencies of ships' hulls and to obtain information on the effects of loading, depths of water and other conditions(35).

Vibrations were excited by a machine specially designed by Lloyd's Register mounted on the poop of each ship in turn. Records were obtained of critical frequencies and vibration profiles in various modes of vibration under widely different conditions of load distribution and displacement, and also in the case of the "Ocean Vulcan", in normal loaded service condition.

Among other results the tests showed that the critical frequencies in the two forms of construction were closely in agreement, when free from the influence of restricted depth of water. The welded ship, however, tended to have larger vibration amplitudes suggesting that structural damping is greater in the riveted ship.

### Test on Structural Components

Systematic full-scale testing of ships' structural members has been carried out since 1938 on a specially designed machine installed at Messrs. Colvilles Glengarnock Works. This work, originally undertaken by the Institute of Welding staffed by the British Corporation, under J. L. Adam, has been directed by B.S.R.A. since 1945, the experimental team now being provided by Lloyd's Register.

Comparative tests have been made on many varieties of single span mild steel specimens, 16 feet in length, both riveted and welded, consisting of one or three stiffeners connected to plate panels 24 or 72 in. in width, and subjected to lateral load, either uniformly distributed or simulating a pressure gradient. Stiffeners have ranged between 6 and 12 in. in depth, and include many different forms of rolled sections, and also flanged plates. The tests have explored the effects of various types and sizes of stiffener end connections and of the rigidity in attachment to the base structure. Aluminium alloy specimens with different forms of extruded sections have also been tested. Five detailed reports of these investigations have been published (36–40).

Results have clearly shown the advantages to be derived from the improved fixity of welded compared with riveted construction. This fixity significantly reduces both stress and deflection in welded stiffening members. At bulkheads, for example, in which the whole structure, including stiffeners, end brackets and boundaries is welded, it has been found that the strength modulus may, in general, be reduced by 15 per cent and even larger reductions in stiffness permitted. In deciding suitable reductions from riveted standards, it is most important to assess the effectiveness of "backing up" behind the stiffener ends.

Through analysis of the test data, working codes of practice have been formulated for deriving appropriate scantlings under a wide variation of particular conditions, e.g., span-depth ratio and type of end stiffener connections. With this experimental background, much saving in structural weight has been achieved, with proved efficiency in service.

The real improvements in design made possible through these investigations have necessarily been confined to structural components with single-span stiffening and under lateral loads only. A second machine has therefore been developed by B.S.R.A. for the testing of larger specimens subjected to axial as well as to lateral loads and for the study of continuous beams having one or two elastic supports in their length.

Lateral loads are applied through six 50-ton hydraulic rams adjustable for uniform or graded pressure over the test length of the specimen and

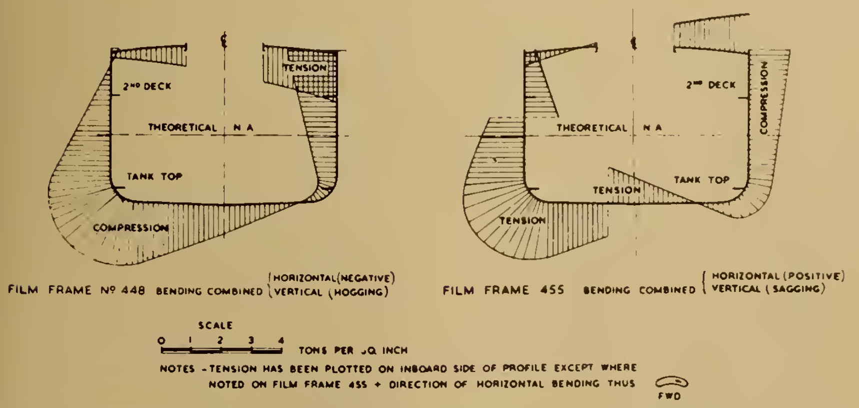

**Fig. 8. Examples of longitudinal stress distribution under combined horizontal and vertical bending moments.** (*Institution of Naval Architects* (34))

distributed uniformly across its width by levers or push rods. Axial loading is applied by three 200-ton, double-ended rams sufficient to develop an average stress in the size of units contemplated of the order of 8 to 10 tons/sq. in. tension or compression. Arrangements are incorporated for intermediate elastic supports to the specimen, dividing its span into two or three equal or unequal parts. Tie rods connect across girders on the test specimen to elastic couplings on the base plate of the machine. These couplings consist of high tensile, light alloy, leaf springs whose stiffness can be widely varied. This material has been chosen in preference to steel to take advantage of its low Young's modulus and consequent saving in bulk and weight.

This second machine is now in operation. Its versatility will permit methodical testing of specimens including vertically stiffened or corrugated bulkhead panels fitted with horizontal girders, stiffened panels of shell and deck plating and pillars subjected to side loads.

Many welded dry cargo ships have developed corrugations in the bottom plating between floors, an unforeseen defect which has necessitated awkward and costly repairs.

The bottom plating of these ships is slightly distorted during construction at the line of the transverse floors, due to thermal contraction at the connecting fillet welds. These deflections, though small, have evidently provided sufficient initial eccentricity to permit progressive unfairness and corrugation in the plating panels in service under repeated compressive loading combined with hydrostatic pressure.

This apparent sensitivity to what might have been considered a tolerable degree of unfairness in the plating is evidence of the increased compressive stresses to which the bottom structure of the modern cargo ship is subjected.

For better understanding of this defect, a series of tests has been undertaken to observe the difference in behaviour under compression of similar panels of plating in riveted and welded specimens representing full scale sections of ship's double bottom, and the effects of fitting fore and aft stiffening to the welded panels. This programme has been carried out by Lloyd's Register on behalf of B.S.R.A.

Five specimens have so far been tested, each 10 ft. wide by 7 ft. 6 in. in length and 3 ft. deep, constructed with four solid floors and bounded by two continuous longitudinal girders. For symmetry under test the top and bottom plates in each specimen have been made of the same thickness. Two specimens were riveted and two welded, each pair being of the same scantlings. Workmanship was to good shipyard practice. One welded specimen was subsequently reinforced at the test centre line by intercostal fore and aft stiffeners welded to the top and bottom plating and to the floors. The programme is being continued with other thicknesses of plating and alternative forms of panel stiffening.

Testing was carried out in a 1,250-ton machine at Messrs. Dorman Long's Middlesbrough Works. From these tests, the following general conclusions may be drawn. The deflection in plating panels between floors before loading in each case was larger in the welded than in the riveted specimen. The degree and pattern of initial deflection in the welded panels exerted major influence on their behaviour and load carrying capacity—the greater the initial deflection, the earlier the collapse of the panel. Failure of the welded specimens commenced when strain on the plate surface reached the yield point, but redistribution of the stress due to plastic flow in the panels enabled these to withstand a still greater load. Welding of the floors provided angular restraint at the plating boundaries, with consequently only a gradual increase in panel deflections. On the other hand, fixity at the floor connections to the riveted panels was slight or absent and the panels buckled suddenly. The efficiency of the plating panels, i.e., the ratio of the actual load carried by the deflected panel to that which would be carried by the same panel with a uniform stress equal to that at the longitudinal edges, remained high in the riveted panels under edge forces of the order likely to be experienced by a ship at sea. For welded panels the efficiency dropped under load, but due to restraint at the floors did not decline thereafter within the limits of the stresses imposed. Permanent set was observed in the welded specimens at a lower load than in the riveted. The fitting of an intercostal stiffener forming a panel breaker at the test centre line of a welded panel having substantial initial deflection (thus reducing the proportions of the panel boundaries from 4:1 to 2:1) restored the load carrying capacity of the panel, so that it was at least equal to that of an unstiffened panel with slight initial deflection.

Other investigations now in hand indicate that where transverse forces, corresponding to hydrostatic pressure, are applied to a series of plated panels subject to alternating loads in their plane, a build-up of plastic deformation can take place in a panel under what are normally straight elastic conditions.

Service experienced and experimental data have resulted in the requirement by Lloyd's Register of increased bottom plating thickness and fore and aft double bottom stiffening in transversely framed welded dry cargo ships.

Facilities for testing full-scale structures in Great Britain have recently been greatly extended by the completion of a special frame at the Naval Construction Research Establishment, Rosyth. This is in the form of a large box with internal dimensions of 69 ft. length, by 33 ft. width and 39 ft. height, a hinged door being fitted at one end for insertion of the test specimen (Fig. 9). The walls are of strong cellular construction designed so that the test specimen can be loaded by a series of 500-ton hydraulic rams which can be arranged at angles up to 45°. At each end forces of 2,000 tons can also be applied horizontally. This test rig is primarily intended to study the design of warship structures, but will also be available, provided defence requirements permit, for investigating merchant shipbuilding and other problems.

#### Fatigue Testing

In contrast to aircraft, there is little evidence that fatigue strength represents a basic criterion in the design of ships' structures. There are conflicting views on the form of test most suitable to reproduce the fluctuating loads to which hull components are subjected.

The resonance vibration method, which is also being adopted by the British Welding Research Association for testing other full-scale structures, has been applied in a series of fatigue tests on welded specimens consisting of a steel plate 10 ft. long and 2 ft. wide, stiffened by two toe-welded angle sections(41). Various welding and constructional details representative of shipbuilding practice were incorporated. A main feature of the work was to determine the effectiveness of different forms of reinforcement to butt welds in the angle stiffeners. It was found that under fatigue conditions these reinforcements tended to reduce the strength due to the discontinuities introduced and that the most effective connection was formed by direct butt welds of high quality.

Fatigue tests are particularly searching in assessing the effects of faults in welded joints and their possibilities are being explored in relation to acceptable radiographic quality. Exploratory tests undertaken by the Naval Construction Research Establishment on defective butt welds(42) have led to the development of a progressive programme by B.W.R.A. In the first instance, butt welds in ½ in. and 1¼ in. thick mild steel will be tested. Control tests are to be carried out on the plain plate material and the butt welded specimens will be prepared, both by manual and automatic arc welding, with square butt V, X and U edge preparations. Before investigating defective butt welds, the fatigue strength for two million cycles for each type of weld will be determined from specimens showing the highest possible radiographic quality.

This work will be undertaken in the large Losenhausen machine installed in the B.W.R.A. fatigue laboratory at Abington. This machine is designed for an alternating load range of 100 tons, which may be applied anywhere within the limits of 100 tons compression and 100 tons tension, on specimens up to 6 ft. in length.

#### Welding and Inspection

Methodical and informed supervision is essential to maintain good standards of workmanship in all stages from the preparation of material, in the actual process of welding and in the control of procedure and sequence. Shipbuilders now possess a wealth of experience supplementing the guidance circulated by the Admiralty Ship Welding Committee(43, 44) and the classification societies.

In Great Britain with its uncertain climate, control is greatly simplified when the work is carried out under cover. Automatic welding by submerged arc processes is rarely used on open berths. These have been important factors in the development of prefabrication in large units and panels, for which extensive changes in shipyard lay-out and lifting equipment have been made.

In welding long joints at the berth, such as those connecting large units, special precautions must be taken, particularly in thick shell and deck plating. To avoid risk of cracking, the heat gradient between the hot weld deposit and the mass of cold parent material should be reduced as far as possible. This is best ensured by the use of large deposits, and prewarming in cold weather is essential. There are still many advantages in fitting some longitudinal riveted joints in the larger welded ships.

Fig. 9. Testing frame for full-scale structural components.

Low hydrogen or basic coated electrodes possess valuable qualities, particularly in their resistance to cracking and high impact values at low temperatures. Their welding characteristics differ from those of other coated electrodes generally used for mild steel and with these welders need to become familiar. Special precautions are necessary to keep the welding rods dry and in some types there is a tendency to fuming. The merits of these electrodes are well recognised by shipbuilders and their use is being extended, especially for restrained conditions of welding.

Among the various methods for nondestructive testing(45) radiography has proved a most valuable shipyard technique for the control of welders, in the checking of procedures and for the examination of critically placed or restrained joints. A marked trend in the United Kingdom is towards the use of radio-active isotopes in place of X-ray apparatus. This has received great impetus through the production of these isotopes for industrial purposes at the Atomic Energy Research Establishment, Harwell. While isotopes of tantalum or cobalt are suitable for heavy work such as castings and forgings, iridium 192 which gives less intensity of radiation, has characteristics best suited for examining welds in ship's plating. This isotope is cheap, has a half life of about seventy days, and gives a good level of contrast, though the exposure time is naturally much longer than with X-ray. Precautions to protect personnel against exposure are thorough, but not restrictive.

#### Structural Design

For successful detail design of all parts of welded hulls, sharp discontinuities or notch effects in the contour or disposition of the material must be avoided to all practical limits. This is an established principle, but it is evident from experience that some local discontinuities which may lead to trouble have not yet always been sufficiently recognised. The eye of the designer and draughtsman must be specially trained to detect and to "smooth out" possible localities of concentration at which acceptable "average" design stresses may be greatly exceeded.

In general practice, well rounded hatch corners are now arranged in dry cargo ships and in tankers earlier undesirable details of framing structure and of bulkhead stiffening ending on "soft" plating have been eliminated. A fabricated sternframe is now designed with easy contours at its junction with the main hull at the oxter.

Over recent years significant changes have taken place in the general design of merchant ships. The modern dry cargo carrier is of finer form than the older deep sea tramp. The three-island coal burning type has been replaced by the two-deck or shelter-deck oil burner. There is consequently a trend towards increased weight, with decreased bouyancy at the ends. This is further accentuated in some of the faster cargo liners which also carry cargo in long forecastles and poops. Hogging moments in the loaded condition consequently tend to be more severe than those in cargo ships of a generation ago, for which sagging in ballast was the more critical condition(46). In many welded ships the resulting compressive stresses in the bottom plating have led to the development of corrugated plating between transverse floors, a defect to which reference has already been made. The tensile stresses in the strength deck call for most careful design, particularly at hatch corners and other openings. Experience and experiment clearly indicate the advantages in the modern dry cargo ship of framing the bottom and strength deck longitudinally over the midship half length. This arrangement, which also considerably reduces steel weight, is being increasingly adopted and is in line with the now universally recognised system of framing in ocean-going tankers.

In modern tankers, due to progress in general design, the ratio of tank length to ship length has been significantly increased. Loading can consequently be spread over a greater proportion of the ship's length with a beneficial reduction in sagging moments. The ample tank capacity available provides good flexibility in cargo distribution, but this must be carefully controlled, especially in the big ships, to avoid undesirable stressing in service. The important influence of judicious cargo distribution in minimising structural damage is increasingly recognised both for dry cargo ships and tankers and guidance to owners has been made widely available in recent years(47).

# A New Concept
## in
# Modern Office Building Construction

*by*

G. Lorne Wiggs, M.E.I.C.

*Senior Partner, Wiggs, Walford, Frost and Lindsay, Consulting Engineers, Montreal and Toronto.*

*A paper to be presented before the 68th Annual General and Professional Meeting of the Engineering Institute of Canada at Quebec, May 14th, 1954.*

Defining the types of office buildings to which it applies, this paper covers briefly the history leading to the development of a new concept in office building heating, cooling and air conditioning. The application of this new idea to two modern office buildings is described and illustrated. In order to present a complete account of these buildings, brief descriptions of the remainder of the electrical and mechanical equipment of each building are also included.

Like almost everything else, office building design and construction is constantly changing. These changes do not take place as rapidly as they do in other fields, nor are the new developments in office building design and construction nearly as striking, or even as noticeable, as elsewhere. Yet in the last twenty or thirty years, office buildings have undergone very appreciable changes, so much so that the requirements of a modern Canadian office building are now following definite new trends.

While the term "office building" may be applied to any building which houses one or more offices, the office buildings to which this paper is intended to apply are those large towering office buildings erected by their owners for their sole ultimate occupancy, such as those for the large insurance firms, for public utility companies or for other large corporations. They may also be those for occupancy in part by their owners and in part by numerous high class tenants, such as the large head office buildings erected by banks, trust companies or the like.

Certain large multistorey speculative office buildings, designed for exclusive or discriminating tenants, such as medical buildings, dental buildings and the like, may be treated practically as falling into the same class as the buildings mentioned. The remainder of the speculative buildings are intended for diversified tenants and various occupations, and are generally of cheaper construction. Because these are speculative undertakings, they are usually designed and built to minimum standards, and neither the designers nor the builders can afford to experiment with or adopt new, untried methods, materials or equipment. Consequently, this type of building does not fall within the purview of this paper.

It might be mentioned that speculative buildings are frequently erected with a minimum of financial resources and expenditures. For that reason architects' fees are kept to a minimum and consulting engineers fees are either kept very low or, in many cases, are not incurred at all. Thus the architects and such engineers as are retained for such work cannot afford to devote time to developing new ideas, or even to studying and passing on newly conceived ideas presented by others. They must therefore, of necessity follow well established construction practices, and must use materials and equipment with which they are familiar.

On the other hand, large office buildings are usually erected for owners with ample financial resources. Such owners want their own buildings mainly for their own use and convenience, but also for the publicity and prestige of fine, up-to-date and imposing buildings. These owners are able to afford the better architectural and engineering services, and are willing to have their architects and engineers investigate new methods, new materials and even try out entirely different concepts of design and construction.

In fact some owners are anxious to have their designers create striking and even dramatic constructional features, in order to obtain still greater publicity. As a result, the owner of the modern office building coming within the scope of this paper is the one who usually takes the lead in adopting new ideas, and in establishing them as a new standard for others to follow, even in the construction of other types of buildings.

### The Trends since the Early "Thirties"

Twenty-five years ago, when the author entered private practice as a consulting engineer, the electrical and mechanical equipment of office buildings appeared to have reached a common standard. Yet shortly thereafter, new inventions and new developments began to appear in this field. Those interested in recalling the developments in heating practice taking place about that time are referred to a paper presented by the author before the Montreal Branch in April 1932. But to recapitulate here, it may be of interest that twenty-five years ago, the unit heater and the convector were just being introduced.

About that time, individual, self-contained thermostatic radiator control valves were being commonly adopted for entire buildings. These have since proved to be unsatisfactory when so used, and have gradually gone into disrepute. Steam heating systems had just undergone a great change with the introduction of orifice plates in radiator valves, and with the development of a number of automatic control systems for controlling entire heating systems or sections of a large system.

With the advent of these controls, zoning the heating systems in large buildings then began to appear. Automatic humidifiers started to make their appearance. Radiant heating had been introduced into Canada by the author about that time, but was not to be adopted to any extent for another fifteen years or more. Air conditioning for human comfort, as opposed to air conditioning for industrial processes, had still to be introduced into Canada. As far as electrical equipment is concerned, the commercial fluorescent lighting units were then unknown, and were not commonly accepted for another decade or more.

In the last twenty-five years, Canada has gone through a great economic depression, a World War and the Korean war, emerging as one of the leading nations of the world. As a result, within the last five years, in Canada, office buildings of the type covered by this paper have increased in number, in size and probably in quality. The most predominant feature has been increasingly better and more comfortable office accommodation, with low operating and maintenance costs, and this without excessive construction costs.

Better accommodation is provided by more flexible and more convenient office arrangement, and by better facilities for telephone service and wiring for portable lamps and electrical office equipment of all kinds. More comfortable office conditions are now being furnished by better and more accurately controlled heating, better lighting, the common adoption of acoustic treatment, the more common acceptance of year-round air conditioning, or, at least, of much better mechanical ventilation.

It should be mentioned that better accommodation and greater economy is also being supplied by the more general use of insulation in the walls and in the roof construction, as well as by the use of new materials and different techniques with the older materials. It is not the purpose of this paper, however, to deal further with the architectural features of office buildings. It is restricted to the engineering features of modern office buildings.

In recent years great advances have been made in the engineering features of modern office buildings. The proportion of the building cost spent on the work designed by electrical, mechanical and structural engineers has gradually increased. As an example, in the last twenty-five years the cost of the electric work has risen from about 3½ per cent of the total cost to almost 10 per cent and the cost of the mechanical trades has gone from about 11 per cent to between 20 and 22 per cent. The introduction of light, insulated cladding in large panels in place of the traditional stone or brick exterior curtain walls will undoubtedly still further advance this trend.

Incidentally the complexity of the engineering work has increased very greatly, but before dealing further with the engineering of new office buildings, consider for a moment some of the developments which have taken place in recent years, and which have led up to present-day practice.

### Development of Radiant Heating

Having been interested in the subject for some years, though unable to obtain any technical data, the author made his first radiant heating attempt in a portion of a building in the spring of 1929. Before this system could be tried out elsewhere, the depression put a stop to practically all new building construction and so to further design of this system. A second small installation was made in the thirties but the advent of World War II prevented further installations.

During that war the author collected all the technical data available on radiant heating from England, the United States, France and Switzerland. Towards the end of hostilities, the author and his firm decided to concentrate on radiant heating and for this purpose entered into an agreement with the firm which not only pioneered and developed radiant heating and cooling in England, but had also built up what was practically a world-wide organization to promote and install it.

Starting in August 1944, the author's firm designed radiant heating installations for a variety of buildings, taking greater care with and expending much more time on the designs and supervision of the installations than the fees ever justified. The first important lesson learned from this was that radiant heating coils embedded in floor slabs were not nearly as satisfactory nor as economical as radiant heating coils embedded in the ceiling construction.

Thus ceiling type radiant heating installations were installed in, and proved successful in, a variety of buildings of all kinds and sizes. Then, after having proved the advantages of radiant heating in a few small office buildings, the author's firm was retained to design the electrical and mechanical services of a new head office building for the Dominion Textile Company in the spring of 1946.

It was decided to incorporate radiant heating and cooling combined with air conditioning in that building. At first it was intended to utilize pipe coils embedded in the ceiling plaster for the radiant heating and cooling. When the Dominion Textile Company decided to install acoustic treatment on the ceilings throughout the building however, it became apparent that such treatment would seriously interfere with the radiant heat emission from or absorption by the ceiling plaster.

### Aluminum Panels

Before the engineering drawings had proceeded very far, the Company decided not to proceed with the construction on Victoria Square, but to defer it until a more suitable site up-town in Montreal could be purchased. The work for this building was thus held in abeyance for about two years, during which time aluminum panels fabricated from perforated aluminum sheet came to the author's notice. These panels combined radiant heating and cooling with highly efficient acoustic treatment, and also provided for ventilation or air conditioning.

These panels had been invented by Gunnar Frenger of Norway, and in the summer of 1948 he provided us with a number of his panels for testing. In September 1948, the author's firm set up a research installation for testing the performance of these aluminum panels, both as radiant heating and cooling panels, in order to verify the Norwegian performance data. As a result of these tests, when early in 1949 we were instructed to proceed with the design of the new Dominion Textile Building on a site on Sherbrooke Street, it was decided to abandon pipe coils embedded in the plaster ceiling, and to adopt aluminum radiant heating and cooling panels.

About the same time, the engineering work for two large hospital additions was awarded to our firm, with the understanding that this system would be adopted in portions of them. Finally, about midsummer 1949, we entered into a contract for the electrical and mechanical engineering work of the monumental Manufacturers Life Insurance, Head Office Building in Toronto.

#### Extruded Panel Combines Services, Saves Air

Because of its extremely large size and because Charles S. Leopold, consulting engineer of Philadelphia, had then a pilot installation of radiant cooling in operation in New York, the author's firm retained Mr. Leopold to work as an associate on that project. Mr. Leopold and others in the United States had developed an extruded aluminum panel for radiant heating and cooling, which was being manufactured in the United States.

At the time this extruded panel had been developed further than the Frenger panel. Because of this, and due to the fact that the extruded aluminum panels had been proven by the pilot installation referred to, extruded panels were adopted for the Dominion Textile Building, the two hospitals and finally for the Manufacturers Life Building. The extruded aluminum panels used in these buildings were made in Canada. They are similar to those made in the United States, but differ slightly in the manner in which the copper pipes are embedded therein.

During the development of the design of the Manufacturers Life Building, Mr. Leopold suggested the idea of combining the radiant cooling panels with the fluorescent lighting units. Mr. Leopold and the author then developed the practical application of this idea, and incorporated it in the drawings. In this application the author originated the idea of utilizing instant start fluorescent lamps and of operating them at lower current rates than standard, to reduce the surface brilliancy of the tubes to the level where neither louvres nor diffusing glass is required to eliminate objectionable glare.

It should be pointed out that all or most of the sensible heat can be provided by direct radiant heating panels, while the sensible cooling can, for the most part, be done by radiant cooling. It follows that by combining radiant heating and cooling with air conditioning, the quantity of conditioned air can be reduced very appreciably. Thus instead of circulating the usual 1 c.f.m. to 2 c.f.m. per square foot of floor area required with conventional air conditioning, this system requires between 0.25 and 0.40 c.f.m. per square foot of floor area. It also follows that the air ducts and the air conditioning equipment may be reduced in size correspondingly and even the building may be made smaller.

Moreover, radiant heating and cooling combined with air conditioning provides a much greater flexibility in maintaining comfort despite variations in load, than is possible with the conventional air conditioning systems. Also office partitions may be moved without requiring any changes to the heating, cooling, ventilation and lighting installations. Thus was one of the most outstanding concepts of office buildings developed. The practical application of this development is best illustrated by reviewing the actual details of a few modern office buildings.

#### Dominion Textile Building

The new Head Office Building for the Dominion Textile Company Limited, designed by H. Ross Wiggs, F.R.A.I.C., architect, is a free-standing, eight storey building, having a two storey penthouse and a single storey basement. The building was erected on property which presently provides a large open parking space which can in future be used for the addition of a large wing. An exterior view is shown in Fig. 1.

The design and construction of the building are such that it takes into account not only the company's present needs, but endeavours to anticipate future needs of the company for a long time. It was designed so that, if needed, a future wing could be added to the rear of the building, converting the plan of the building into an H-shape. Inside the building the principle of flexibility has been paramount, and

**Fig. 1. The Dominion Textile Head Office Building.**

**Fig. 2. Typical installation of radiant panels under windows in Dominion Textile Building.**

care has been taken to provide for any possible office rearrangement made necessary by growth, new developments or rearrangement of offices.

The building has a structural steel frame. The floor system consists of precast aerocrete slabs, having a 3 in. fill of vermiculite concrete over these slabs to accommodate a system of steel underfloor ducts for electrical and telephone services. Plaster ceilings occur in the main entrance lobby, the executive offices, in all elevator lobbies, and wash rooms. The ceilings in all other office areas consist of perforated steel pans having mineral wool pads set on top of them, thus giving highly efficient acoustic treatment.

Like many other really modern buildings, this building is equipped with a radiant heating system. This installation goes a step further, however, in that the radiant panels are used not only for radiant heating in winter but are utilized as radiant cooling panels in summer. In fact, this was the first large office building constructed in North America having all of its offices equipped with radiant heating and cooling panels used in combination with year round air conditioning.

The radiant heating and cooling panels are extruded aluminum panels, exposed faces of which are smooth but have copper tubing embedded in annular projections on their backs. In winter, warm water is circulated through the copper tubing, with the result that the aluminum panels emit radiant heat. In summer, chilled water is circulated and the panels then absorb heat mostly by radiant heat transfer. The aluminum panels were extruded in Kingston, Ontario, finished to exact size and had the tubes inserted and expanded into them in Montreal. The radiant panels were installed under the windows, with one panel per bay, extending under two or three windows as required, as shown in Fig. 2. A section through the panel is shown in Fig. 3.

The radiant panels are connected to four separate zones, one being the north-west zone, the second the south-west zone, the third the south-east zone and the fourth the north-east zone. Each zone is provided with its own steam-heated convertor, circulating pump, and its own pneumatic controls. The latter are controlled by means of an electronic recorder-controller, actuated by means of a temperature-sensing element attached to the inside surface of the glass in a window of the zone controlled. The installation of the four convertors, circulating pumps and pneumatic controls is shown in Fig. 4.

The boiler room is located in the basement west of the garage, and contains two large steel, low-pressure steam heating boilers for heat-

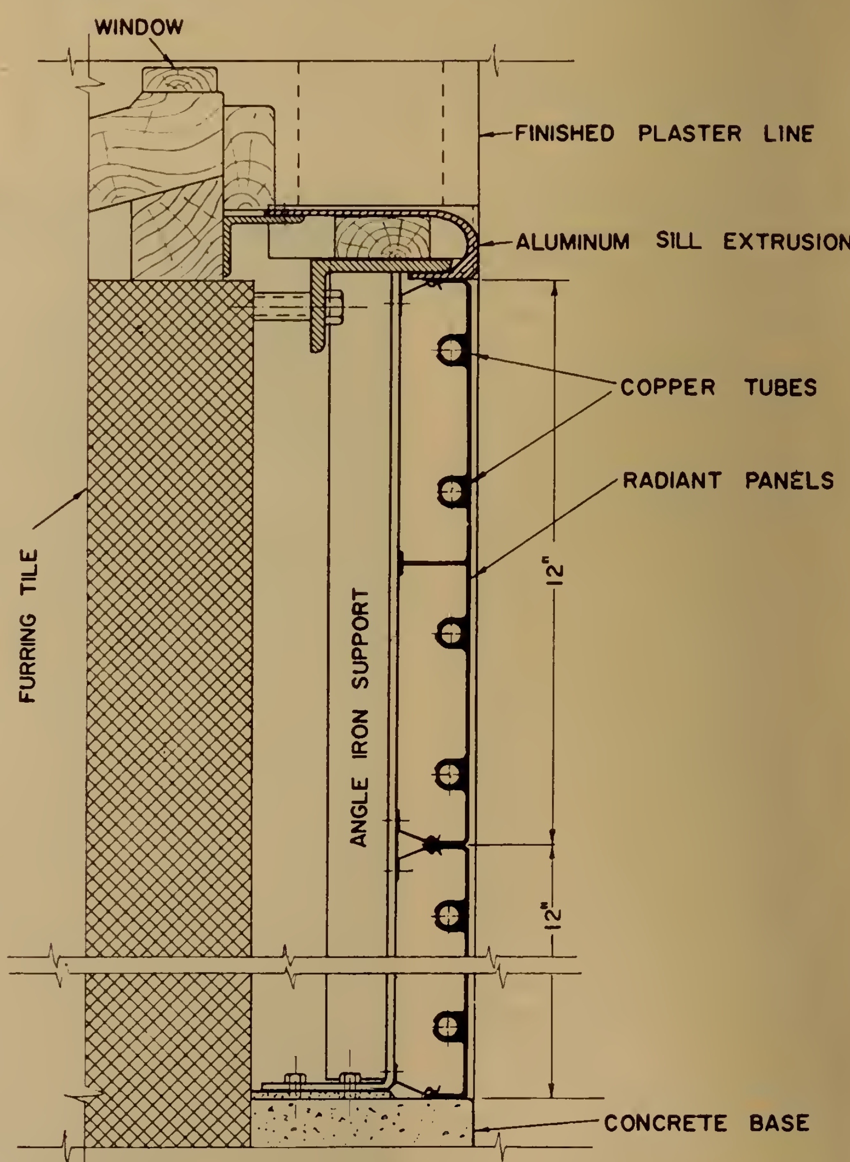

**Fig. 3. Section through radiant panels of a typical sill panel installation in Dominion Textile Building.**

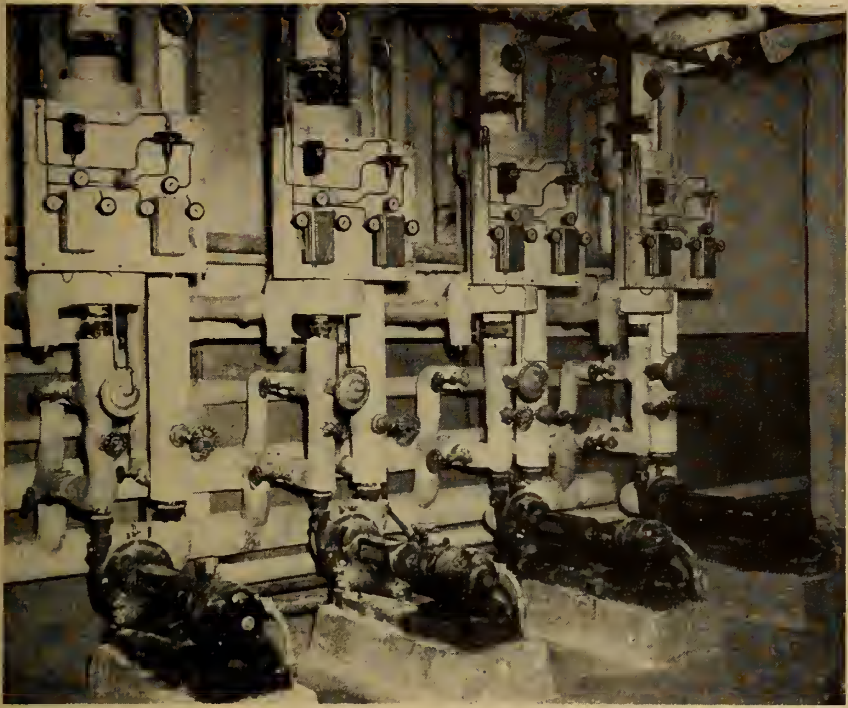

**Fig. 4. Installation of convertors, circulating pumps and pneumatic controls.**

ing the building, the domestic hot water, the ventilation heat load and provides steam for the cafeteria in winter. A small domestic type steel low-pressure steam heating boiler was provided to heat the domestic hot water, and to provide steam for the cafeteria in summer. The three boilers are oil fired, the two larger boilers being equipped with fully automatic horizontal rotary cup burners designed to burn No. 6 or bunker C heavy fuel oil, while the small boiler burns light furnace fuel oil, also automatically.

A centrifugal refrigerating unit is also installed in the boiler room, to chill the water for cooling the radiant panels in summer and to chill the water for the cooling coils in the air conditioning units. This unit has a capacity of 208 tons of refrigerating when operating at 5,300 r.p.m., when chilling water from 48.3° F. to 40° F., and when supplied with cooling water at 85° F. The cooling water is circulated through a forced-draft cooling tower located in the penthouse on the roof. Figure 5 shows the refrigerating unit with the cooling water circulating pump in the foreground.

#### Air Conditioning and Ventilation

The building is equipped with seven complete year-round air conditioning systems and a number of supply or exhaust mechanical ventilation systems. The air conditioning installation, like the radiant heating and cooling, is divided up into a number of systems or zones. As the sun moves around the building the temperature of the air supply in each system can be thus varied to suit the varying sun load and to suit the shading from the adjoining buildings.

For this reason there are four general air-conditioning systems, divided up slightly differently to the radiant heating and cooling installation. There are two systems along the south-west wall, one being along the front or north portion of that wall, and the second along the back or south section of the wall and about one-half of the south-east wall. The third system takes care of the offices along the north-west wall as well as those on the north half of the north-east wall. The fourth system looks after the south half of the north-east wall, as well as the east third of the south-east wall.

These four systems in general provide the air conditioning for all floors from the ground floor to the seventh floor, inclusive. An exception is the testing laboratory on the seventh floor, which has its own air conditioning system and refrigerating compressor moved from the previous building. The executive offices on the eighth floor have a separate air conditioning system, while the auditorium, the eighth floor has a separate system as well. The seventh air conditioning system is that for the cafeteria and kitchens in the basement.

Separate mechanical ventilation systems, designed to either exhaust only or to supply and exhaust air, are installed for such purposes as kitchen exhaust, toilet exhaust, transformer room supply and exhaust, and boiler room supply.

The fresh air for most of the building is drawn in on the tenth floor. There is a second fresh air inlet located at the fifth floor, which provides the fresh air supply for the cafeteria air conditioning system,

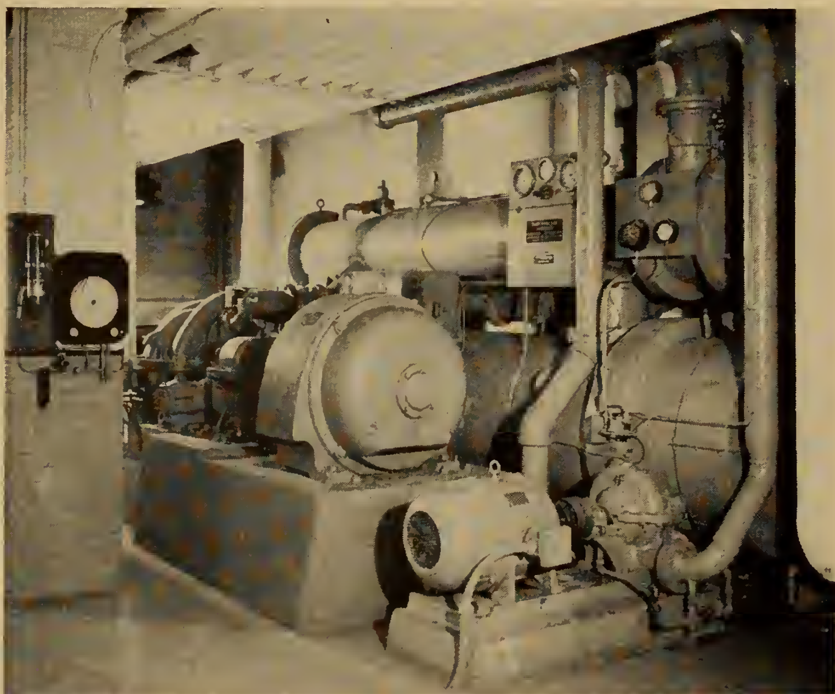

**Fig. 5. 208 ton centrifugal refrigerating unit in Dominion Textile Building.**

and for the ventilation system for the boiler room, garage and transformer room.

The seven air conditioning systems, with the exception of the cafeteria system, each consists of successively, an electronic air filter, a cooling coil, an air washer, reheating coils and a supply fan with the necessary control dampers, controls, etc. The unit for the cafeteria is the same as the above, but is not provided with an electronic air filter. Each of the systems, including the cafeteria systems, is also provided with a recirculation fan for recirculating about 90 per cent of the conditioned air circulated by the supply fan.

The air from the central air conditioning units is circulated through insulated metal ducts to circular ceiling diffusers, located about six feet away from the inside surface of the exterior walls, and spaced two diffusers per bay. For approximately each two supply diffusers there is provided one return grille. The return grilles are installed in the ceilings, and are placed 12 to 18 feet closer to the centre of the building than the supply diffusers.

The air supplied to the offices is in excess of that recirculated, so that the difference is mechanically exhausted to the atmosphere or finds its own way out to the atmosphere through windows, doors, etc. In this building the air to be exhausted flows from the offices into the corridors, where it flows to the toilets and coat rooms, from whence it is exhausted through the roof to the atmosphere.

### Automatic Temperature Control System

The system of automatic temperature and humidity control is just as ingenious as the unique heating and cooling installation. The subdivision of the radiant heating and cooling panels into four zones facilitates the control of the panels, according to the variations of outdoor temperature, wind and sun load on the various exposures. Also, the use of seven different air conditioning systems is an important aid to adequate temperature and humidity control in each area in the building.

The automatic regulation of the radiant panels is accomplished by an electronic master controller, activated by a temperature-sensing element secured to the inside surface of the window glass. The master resets one submaster aquastat, which in turn controls the temperature of the water in the panels when heating is required. It also resets a second submaster aquastat which controls the water temperature during the cooling season. This control, for both heating and cooling, produces results difficult and expensive to obtain with conventional regulation by room thermostats.

Fig. 6. Tabulating room in Dominion Textile Building showing radiant panels, diffusers and lighting units.

The automatic regulation of the seven air conditioning systems is equally interesting. Here, four master outdoor thermostats, two for each season, reset the submaster thermostats which are associated with several of the air conditioning systems. Those submaster thermostats, and other duct thermostats for each system, operate modulating steam valves, during the heating season, on the preheating and reheating coils.

During the cooling season, those instruments are automatically shifted to operate cold water valves on the cooling coils. Also, during both seasons, several automatically operated dampers are controlled to properly pass the air through or around the heating and cooling coils, in order to secure immediate response to the demands of the controlling instruments. Automatic humidity control for each system is accomplished, during both heating and cooling, by a humidistat in the air washer discharge. These humidistats operate valves which determine the moisture content of the air leaving the washer.

Construction of the Dominion Textile Building was started in May 1950, and was substantially completed in October 1951. Thus its equipment has now been used through three heating seasons and two summer seasons. In that time it has clearly demonstrated the great advantages of radiant heating and cooling, combined with air conditioning, due to this system's closer temperature control, greater comfort and reduction in drafts compared with the more conventional air conditioning installations.

### Manufacturers Life Building

The Head Office building of the Manufacturers Life Insurance Company, located in Toronto, was built in two stages. It consists of the original six storey building, with a new twelve storey addition erected right up against the rear of the original building so as to form a completely integrated single building. The original building was designed by Sproatt and Rolph, architects, and was completed in 1925. The new addition was designed by Marani and Morris, architects, together with Wallace and Carruthers as structural engineers, the author's firm as consulting electrical and mechanical engineers and Charles S. Leopold as associate consulting engineer.

The architects and engineers were instructed to design the new addition to blend in with the original portion, to maintain the feature of large, clear open floor spaces and to provide maximum flexibility of office arrangement, efficient operation and low maintenance costs. Additional requirements were good lighting, acoustic ceilings and year-round air conditioning. Furthermore, the design of the new addition had to be such that by renovating the original building in the same manner, the offices in both would be the same.

The completed building has a central core, surrounded by clear office space having 50 foot clear spans. The central core contains the elevators, wash-rooms and spaces for the vertical air ducts, plumbing stacks, and the heating, cooling and electrical risers. All floors have a clear ceiling height of 9 ft. 4 in. with a floor to floor height of 13 ft. 4 in.

Construction of the new addition was commenced in June 1950, shortly before the outbreak of the Korean war. Because of these hostilities and the resulting intense defence construction, considerable delay occurred in the erection of the new addition. As a result, the new addition was not completed and occupied until October 1952.

The staff then moved from the original building into the new portion and the original portion was rehabilitated. This was accomplished by removing its entire interior finish, as well as all of the existing electrical and mechanical services. The original portion was then furnished with the same electrical and mechanical services as the new portion, and was provided with the same interior finish. Like the new portion, it was also supplied with storm sash.

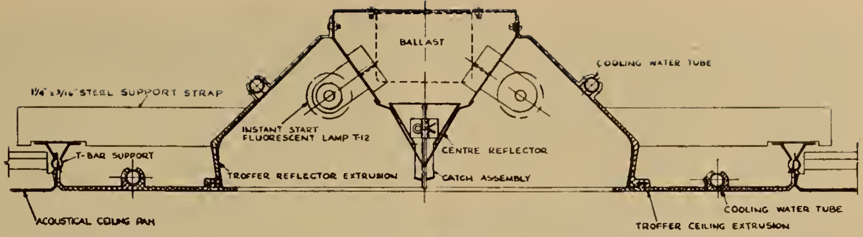

**Fig. 7. Section through luminaire for Manufacturers Life Building showing water-cooled reflectors and ceiling extensions.**

Like the Dominion Textile Building, the Manufacturers Life Building is equipped with a radiant heating and cooling system, combined with year round air conditioning. However, the latter differs from the former in that greater advantage has been taken of the radiant heating and cooling functions, with a corresponding reduction in the relative size and complication of the air conditioning equipment. In addition, the Manufacturers Life installation makes use of water-cooled fluorescent lighting units, and has radiant panels both in the ceilings and under the windows. As a result of the combination of these features with acoustic treatment it was necessary for the author's firm to plan and develop the entire suspended ceiling system.

The ceiling system combines radiant heating and cooling, recessed fluorescent lighting, acoustic treatment, and concealed sound or paging loudspeakers as well as diffusers and ducts for the supply of conditioned air. Of all these elements, experience had shown that the location of the radiant heating and cooling panels is not particularly critical. Neither is the location of the air supply diffusers and of the acoustic treatment. On the contrary, the location and spacing of the luminaires is fairly exact if uniform light intensity is to be obtained over the entire floor area.

Besides this, the placing of the luminaires was limited to a large extent by the window spacing. Finally, the spacing of the loud speakers for the sound system must be moderately uniform. Combining all the elements into a ceiling pattern which would be reasonably uniform in arrangement and of good appearance in large open areas, yet be adaptable and flexible enough to accommodate partition changes without these affecting the lighting, heating or cooling, or the ventilation, required very careful development of its component parts and precise planning of the whole.

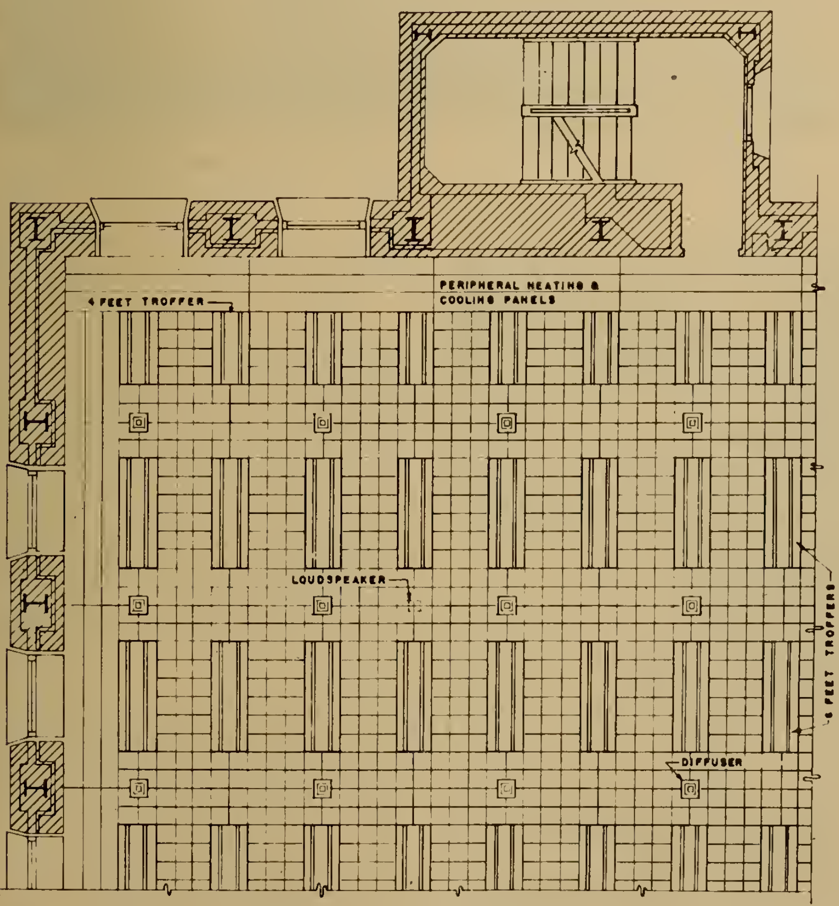

**Fig. 8. Reflected plan of corner of ceiling showing positions of peripheral panels, troffers and diffusers.**

### Ceiling System

In planning the ceiling system it was necessary, first to decide on the type, size and spacing of the lighting units and on the lamps for these units. It was decided to adopt recessed fluorescent luminaires, without louvres or glass panels, but equipped with instant-start fluorescent lamps so as to give the highest possible efficiency with lowest operating and maintenance costs. In order to obtain uniform lighting and an attractive pattern, it was found necessary to place the luminaires in rows on five foot centres, since the windows are on five foot centres.

Then, except along some exterior walls, in a few places surrounding the centre core and a portion of the original building, it was found that six foot units on ten foot centres best suited the floor plan. Where six foot units could not be utilized, the luminaires were reduced to four foot units. All these units are two-lamp units, using the same diameter fluorescent lamp in the two lengths.

After the exact positions of the luminaires had been fixed, a band of extruded aluminum radiant heating and cooling panels, generally three feet wide, was placed around the perimeter of each ceiling. These were for the purpose of supplying radiant heat to offset the heat loss through the walls in winter, and to provide radiant cooling to absorb the heat gain through the walls in summer. Following this, the location of the conditioned air supply diffusers was fixed by placing them in line with and between the ends of the luminaires, thus placing them on ten foot by ten foot centres.

In such large floor areas as occur in the Manufacturers Life Building, the heat given off by the occupants and the heat produced by the lamps can readily be taken care of in areas adjacent to exterior walls, but it is usually a problem difficult of solution in the large interior spaces. In this case, the problem was solved simply and effectively by the development of a luminaire having water-cooled reflectors to absorb the greater part of the heat emitted by the lamps and their ballast and water-cooled flat ceiling extensions forming part of the unit, to absorb the heat given off the occupants in its vicinity.

A section of this luminaire is shown in Fig. 7. The luminaire, including its two ceiling extensions, is exactly two feet wide with its edges turned up and so shaped that they can be inserted into and securely held in the T-Bar supports, which hold up the perforated steel acoustic ceiling pans. The remainder of the ceiling was then filled in with perforated steel acoustic pans, each 12 in. by 24 in. Each of these was covered with a pad of acoustic material, except those pans immediately below the loud speakers for the sound system. A reflected plan of a corner of the ceiling is shown in Fig. 8.

In addition to the radiant panels around the ceiling perimeters, a radiant panel is placed under each window. These sill panels provide radiant heating in winter and radiant cooling in summer, having been designed to offset primarily the radiation from the windows to the occupants in summer and from the occupants to the windows in

**Fig. 9. Typical window installation in Manufacturers Life Building.**

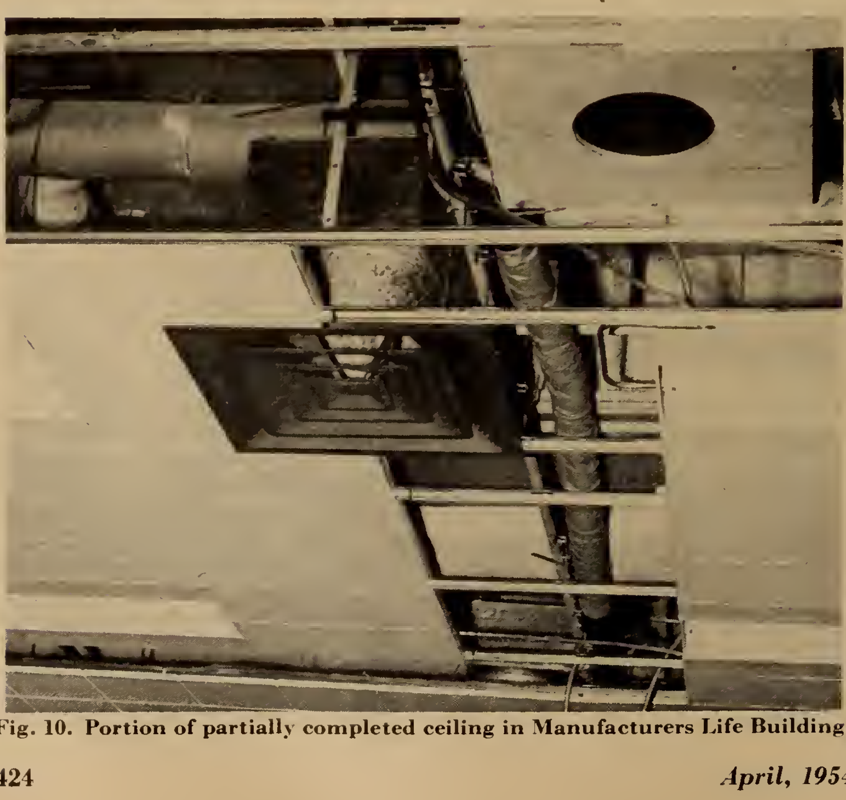

**Fig. 10. Portion of partially completed ceiling in Manufacturers Life Building.**

winter. The extruded aluminum stools fastened to the sill panels together, with the latter, serve in winter to offset the formation of down-drafts from the windows. Fig. 9 is a view of a typical window installation, showing the peripheral panels at the top of the picture and the sill panels below the windows.

The cooling coils in the luminaires were connected generally in series of four units and then connected all to one circuit. The coils in the peripheral and sill panels were connected in separate circuits, and then zoned according to the orientation of their adjoining exterior walls.

A portion of a partially complete section of the ceiling is shown in Fig. 10. In the lower portion of the picture, the six-foot luminaires may be seen on the left, the four-foot units on the right and the square diffusers between the troffers. At the top of the picture, the cooling water connections to the luminaire panels may be seen, as well as a loud speaker for the sound system.

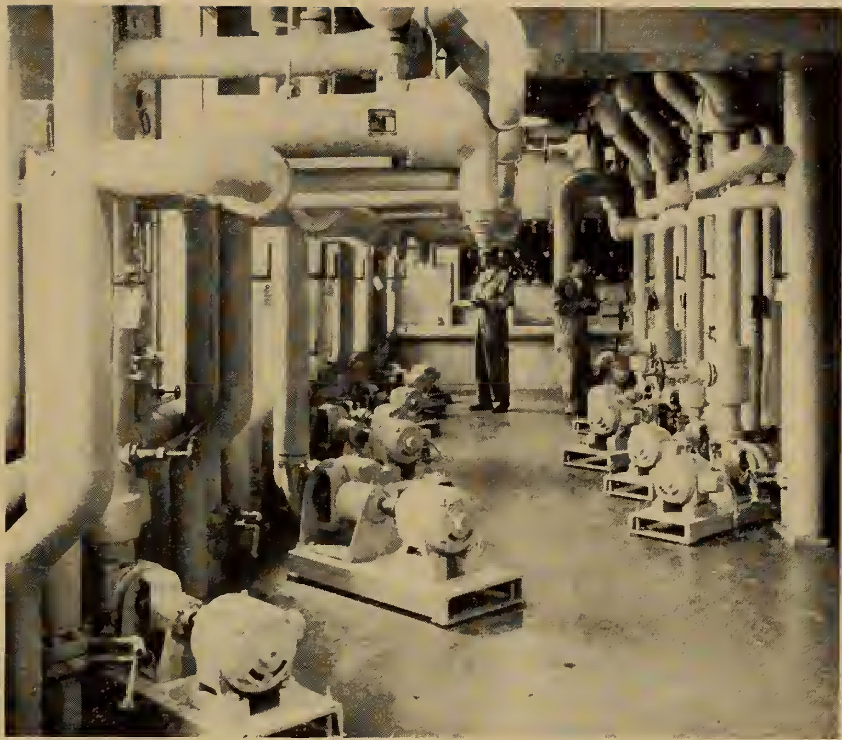

**Fig. 11. Heat exchangers, pumps and control valves on 11th floor equipment room of Manufacturers Life Building.**

### Air Conditioning System

The conditioned air-supply system is typical of any other first class air conditioning system for a large office building, with a few notable exceptions. The air circulated through the areas having cooling panels is only a small part of that which must be circulated in a conventional system. In general it amounts to about 0.4 c.f.m. per square foot of floor area in the interior part of the building, and between 0.6 c.f.m. and 1 c.f.m. per square foot of floor area along its perimeter.

Also the conditioned air in these areas is supplied at both a constant temperature of between 62°F. and 66°F., the year round, except during the night and for a short period each morning before the building is occupied, the air is kept at constant humidity the year round, except in those few places where booster-heaters are installed in the supply air ducts.

The entire radiant heating and cooling system and the conditioned air systems are controlled automatically by means of an elaborate and extensive control system. This is a pneumatic system, except for a few controls which are available only in electrical instruments, while appreciable use has been made of recorder-controllers. Each sill panel zone is controlled by a thermocouple held tightly up against the inner surface of the glass in the inside window. The windows are all double casement windows throughout the building.

The temperature of the water in each of the peripheral panel zones is controlled in summer by means of a solar compensator, which is a photo-electric cell mounted behind a plate of blue glass in a weatherproof box. One solar compensator faces east, one south and one west. In winter these panels are now controlled by the window compensators. The temperature of the water in the interior zone, which contains the troffer cooling, is controlled by means of a lighting load compensator, in turn activated by a current transformer connected to one of the main lighting feeders.

The boilers and the large refrigerating unit for the air conditioning are installed in a separate service building. The boiler plant consists of three oil-fired water tube boilers, each having a continuous rating of 7,500 lb. of steam per hour and operated at 30 lb. pressure. The refrigerating unit for the air conditioning is a single

# Fire Protection Aspects of Building Design

*by*

W. E. Emmerson, Jr.E.I.C., *and* D. R. Abbey, M.E.I.C.
*Fire Protection Division,*
*Underwriters' Laboratories of Canada, Toronto, Ont.*

*A paper to be presented at the 68th Annual General and Professional Meeting of the Engineering Institute of Canada, at Quebec City, May, 1954.*

Canada's fire losses are still too great. The better utilization of fire protection engineering by those directly concerned with the construction and maintenance of buildings is urged. An introduction to the application of the art of fire protection to building design is given, with additional remarks concerning the need for better construction specifications, better testing of materials for their ability to withstand the effects of fire, and better supervision of building construction, with fire protection in mind.

In 1952 the entire Canadian labour force worked nearly 14 hours to pay for recorded fire losses, most of which were needless. When one allows for unrecorded and indirect fire losses, it is safe to assume that each reader of this paper wastes almost a week annually working to pay for losses incurred by disregard or faulty application of the science of fire protection.

### Perspective of Fire Protection

Fire protection should be viewed in its true perspective. It has many times been said that fire protection is over emphasized by those in fire protection work. Rather, the authors of this paper feel that fire protection is not sufficiently emphasized by management and engineers. In the United States, 200 manufacturing and mercantile establishments are destroyed by fire each day (1).

Table I records losses in the United States in 1951 and 1952, the last two years for which figures are available, for six types of occupancies. The data are not available for similar losses in Canada.

Study of the data for 1951 and 1952 (4,5) with respect to cause reveals that sparks on roofs caused fires which resulted in losses of 23 million dollars and that the misuse of flammable liquids started fires that resulted in losses of 106 million dollars. These two hazards were selected because they are two of the most completely studied in fire protection engineering. Standards exist, which universally applied, should make fires of this nature a rarity.

In the last ten years, 974 people have died in major fires in Canada and the United States where highly combustible interior finish was the principal cause of fire spread (3). This figure does not include the uncounted and tragic number who perished by ones and twos in substandard housing. Many of the 974 persons were trapped in buildings which up to the moment of the fire were considered safe and well designed by all but the fire protection fraternity.

When considering fire protection, care must be taken to recognize and evaluate all the losses involved when fire strikes. Table II outlines some of the indirect losses revealed in a recent study.

The financial aspect of fire protection is not always viewed in its true light. Added fire protection is not considered justified by management unless it pays for itself by reductions in insurance rates in a few years time. If one considers fire insurance as a form of depreciation allowance against destruction by fire, it will be found that this new form of depreciation may approach and sometimes exceed depreciation for wear and obsolescence.

**Table I: Estimated Fire Losses in the United States for Six Occupancies (4,5)**

| Occupancy | 1951 | 1952 |
|---|---|---|
| Warehouses | $ 28,000,000 | $ 45,000,000 |
| Manufacturing establishments | 172,750,000 | 153,600,000 |
| Piers, inc. shipyards | 12,000,000 | 14,400,000 |
| Railroad properties, including rolling stock | 12,040,000 | 10,200,000 |
| Bulk oil storage, refineries | 18,300,000 | 16,500,000 |
| Power plants, pump houses | 6,450,000 | 3,730,000 |

### Scope of Fire Protection

The science of fire protection has been divided into four general fields of endeavour (11):

1. The prevention of the outbreak of fire.

2. The early detection of fire.

3. The prevention of the spread of fire from the area in which it originates.

4. The extinguishment of fire.

Because of the broad scope of fire protection, the authors have confined this paper to a review of the means of achieving these four objectives in the design of a new building, thereby providing an acceptable degree of protection against the ravages of fire. However, the importance of occupancy and maintenance of a building must be kept in mind at all times. A building, though safe when newly built, may become hazardous through changing occupancy and use.

### Characteristics of Fire

Prior to considering the means of achieving fire protection, a brief study of fire will be advantageous.

Fire has three basic characteristics, namely: involvement, intensity and interdiction.

"Involvement" is the volume or area of material which is involved in the fire. Within an unrestricted area, variation of involvement is governed by the rate of flame spread, the area of the exposed combustible surface and the movement of air currents. Extension of the fire to adjoining areas is controlled by the fire retardant qualities of walls, ceilings and floors, and is the paramount consideration in standards of fire resistant construction. The spread of fire from building to building is governed by the same factors as the spread between areas, with the spacing between building and the nature of roof covering materials as added factors.

On the subject of major scale involvement of large groups of buildings, Neale (8,10) states: "while fortunately the number of serious conflagrations seems to be decreasing, many of our cities still have the potentialities, and it only needs something unusual or something to go wrong at the wrong time to produce one."

The second characteristic of fire is "intensity," which is governed by the amount and nature of the combustibles involved. The severity of fire damage in any given area is related to the intensity, and therefore to the combustible content, of the area. The combustible content is usually determined by the nature of the materials and equipment present in the building, rather than by the materials used in the construction of the building itself. For example, files and furnishings usually contribute more to a fire than do walls, ceilings, floors, and other structural members.

For the third characteristic of fire, we have chosen the military term "interdiction". In this instance, it is the capability of fire to make an area uninhabitable. This capability of fire is responsible for its life hazard to occupants of the building and for its hampering effect upon the efforts of fire fighters. Such conditions are caused principally by smoke and gases liberated or produced. They can be lessened by adequate ventilation, which, unfortunately, accelerates fire spread or involvement.

### Tools of Fire Protection Design

In preparing for the possible onset of fire, the engineer has the following tools at his command:

1. Awareness of hazard.
2. Control of combustibility.
3. Fire barriers.
4. Explosion venting.
5. Alarm devices.
6. Extinguishing systems.
7. Co-operation with fire service.

#### Table II: Summary of Indirect Losses by Fire (9)

| Type | Details | Duration |
|---|---|---|
| Loss to community. | Income to workers. Taxes from property. Other income derived from business being located in community. | Continues until plant is rebuilt. May be permanent if business fails or relocates, both highly probable. |
| Loss of current sales. | Expansion to income is cut off, as well as present income. | Continues until sales volume recovers. |
| Inability to prove insured loss. | Inadequate record protection and incomplete records make loss difficult to prove, especially for finished goods. | |
| Destruction of irreplaceable objects. | Fire may destroy strategic materials, historical objects, and equipment of types which are not replaceable. | |
| Loss of drawings, jigs, etc. | Includes drawings and jigs owned by customers. This loss increases, because of delay in replacement. | Continues until plant resumes full production. |
| Building income loss. | Cost to tenant of seeking new quarters, cost to owner of lost rentals and, usually, lost tenants. | Continues until building is rebuilt and rerented. |
| Jeopardy to property of others. | Owner of building lost by fire may be held responsible for losses to property of others involved in fire. | |
| Loss due to continuance of fixed charges. | Interest on borrowed capital. Salaries to key executives and employees. Normal overhead. | Loss continues until full operation is resumed. |
| Loss in sale of equipment. | Forced sale price may not equal salvage value set by adjusters. | |
| Loss of credit. | Restricted income reduces credit. Insurance payments may be seized to cover old liabilities, preventing use for rebuilding. | Continues until former financial position is restored. |
| Loss of customers. | Inability to recover former customers forced to buy from another source. | Semi-permanent. |
| Loss of sales force. | Reduced income or inactivity may cause sales force to seek other employment. | Continues until plant resumes full production. |
| Loss of cumulative power of advertising. | Advertising programs may be extensive and useless if unable to deliver product as demand results. | Continues until programs can be stopped or production resumed. |

#### Awareness of Hazard

In most cases, the fire hazard of a proposed occupancy may be well defined and handled by:

(a) Segregation.
(b) Arrangement.
(c) Reduction.
(d) Safeguards.

By means of segregation, highly hazardous material or processes may be placed in a location such that, if they become ignited, material in adjoining areas will not become involved. It is readily admitted that it would be foolish to allow dynamite to be stored in the basement of a public building, but sometimes the suggestion that highly flammable materials be stored or handled in separate, protected areas is resented.

Arrangement is important for two principal reasons. As the National Fire Protection Association poster (7) states, "BIG PILE, BIG FIRE; SMALL PILE, SMALL FIRE". And by arrangement access may be provided to the hazard for extinguishment, and more important, exit from the area may be assured.

The most important method of handling a hazard is by partial or complete reduction. Why tolerate a severe fire hazard ? A hazard may be reduced by careful study of the conditions, followed by corrective steps. Use of a non-flammable, degreasing liquid or solution creates less fire hazard than does the use of a flammable one, even though protected. If a flammable liquid or solution *must* be used, every effort should be made to raise its flash point as high as practicable.

Should it be found necessary to use a hazardous process or material, proper safeguards must be provided. Safeguarding may be achieved by means of suitable manual or automatic fire extinguishing equipment. When such equipment is used, it must be designed to protect a hazard in all its phases. An example of complete protection being overlooked is the recent General Motors fire at Willow Run near Detroit. Although the dip tank at the source of the fire was protected, no protection was provided for the drip pans draining to the tank. This lack of adequate fire protection resulted in catastrophe.

#### Control of Combustibility

No material should be used in the structure or in the furnishings of a building, or be stored inside a building in any quantity, unless its combustibility is known to be acceptable.

The use of noncombustible material for the greater part of the construction and furnishings of a building reduces the chance of fire occurring. Should fire occur, the intensity of the fire within an area, and the danger of its spread between areas, will be greatly reduced.

For a measure of combustibility, use is made of the Fire Hazard Classification of Building Materials (8), which is based on three ratings:

(a) Flame spread.
(b) Fuel contributed.
(c) Smoke density.

A knowledge of the rate of flame spread is of prime importance in places of public assembly, where the potential hazard from panic may exceed that from fire many times over. The use of materials with abnormally high flame spread was the major factor in the large death tolls in the fires which occurred in the Cocoanut Grove night club in Boston and in the LaSalle Hotel in Chicago several years ago.

Fuel contributed is a measure of the amount of heat produced as the flame spreads along the surface of the material.

The importance of smoke density lies in the severe panic effect that smoke has on building occupants. Should the smoke contain toxic fumes, the effect upon the occupants may nullify all the advantages of decreased flame spread.

#### Fire Barriers

Regardless of the care and skill used in minimizing hazards and controlling combustibility, fires will result.

Fire barriers are used to break up a building into compartments, each of which is capable of confining a fire for a definite predetermined period. A fire is, as a result, isolated in one fire area. Although a passive form of fire defence, effective fire barriers have been the greatest single factor achieved to date in the control of fire losses.

The effectiveness of a fire barrier is determined by its fire retardant classification, which may be defined as the time interval for which a fire barrier will maintain its integrity, without structural failure, against the transmission of heat or flame under standard fire test conditions. The severity of fires has been studied thoroughly, and using the results gained, the standard fire test has been evolved.

In considering fire barriers, two elements of design must be kept in mind, parapets and openings. In many cases, fires which would normally be stopped by a fire wall, spread beyond the wall along combustible roof decks. Fire walls should, therefore, be extended above the roof as parapets whenever combustible roof decks are employed.

Another major weakness of many plans for fire barriers is found in the protection of the openings. A building is constructed for some useful purpose, for the achievement of which door-ways, vertical shafts, conveyor-ways, air conditioning ducts and many other openings are provided from fire area to fire area. These must be adequately protected.

A full study of protection of openings is beyond the scope of this paper. However, three points should be mentioned:

(a) Where fire doors and shutters are normally in the open position, provision must be made for dependable, positive closing in the event of fire.

(b) Doors in exit-ways should be capable of being readily opened after automatic closure, to permit evacuation of the area.

(c) Care should be taken to ensure that the frame and hardware carry the same fire rating as the door.

Published standards (2) for protection of openings are available, which if followed, provide an acceptable degree of protection.

In cases where solid forms of closure cannot be provided, some success has been achieved in the use of water sprays to protect openings in fire barriers.

#### Explosion Venting

In certain hazardous processes, accidental explosions may be anticipated within an enclosed area. It is necessary in the design and construction of a building to give attention to such an eventuality. Exterior walls must be provided which will vent an explosion. To accomplish this, windows that swing open or wall panels that collapse when subjected to a predetermined pressure differential should be installed. To safeguard the remainder of the building, interior walls, floors and ceilings must be of substantial explosion-resisting construction.

#### Alarm Devices

In the determination of reasons for fires spreading beyond control without apparent justification, delay in turning in an alarm was of major significance.

Alarm systems are divided into two classes: Local and Central station. The local systems are generally designed for alerting plant personnel, although they may have an auxiliary connection to the fire department. They may vary from local area alarms to completely supervised alarm systems with a signal receiving station at the plant fire hall or security office. The central station alarm system, which is operated by an outside firm, provides supervised 24-hour protection through employees of the organization operating the central station.

"Supervised" means providing ways of initiating a trouble signal in the event of deterioration or damage to the equipment, which would prevent the transmission of an alarm. This assures immediate detection of trouble. The detection elements of alarm systems in common use are:

(a) Fixed temperature thermostats.
(b) Rate-of-rise devices, actuated by an abnormal rate of temperature rise.
(c) Smoke detectors.
(d) Photoelectric flame perceivers.
(e) Frequency detectors, sensitive to the characteristic frequencies of flames.

In addition, sound detection systems using microphones are under study. These will respond to the typical sound of fire.

#### Extinguishing Systems

Extinguishing systems fall basically into two groups: Area and Local hazard.

The success of the automatic sprinkler system with all its variations in the protection of areas against fire is without peer. Properly designed and maintained, the sprinkler system is almost infallible. Little wonder then, at the faith shown by the weary traveller in the sprinkler protected hotel

"Now I lay me down to sleep,
Statistics guard my slumber deep.
If I should die, I'm not concerned,
I may get wet, but I won't get burned."

For the protection of local hazards especially flammable liquids, the following techniques, among others, are used:

(1) Carbon dioxide systems.
(2) Foam systems.
(3) Water spray.
(4) Combination foam and water spray.
(5) Dry chemical systems.

In general, local protection is so specialized that each individual case must be studied, and the protection designed to fit.

#### Co-operation with Fire Service

When a major scale fire is encountered, the professional fire fighters must attack the fire under conditions brought about by others. Any proposed building design should be studied to determine if accessibility for fire fighting operations is provided.

A fire cannot be fought if the firemen are unable to reach it with their hose streams. If a fire can be hit hard from close in, it can be extinguished more quickly. This cannot be done if the approach is hampered by falling structures and lack of passageways.

### Data Available for Fire Protection Design

#### Insurance Organizations

The rating boards of insurance organizations, of which there are at least ten in Canada, stand ready to provide authoritative data on various aspects of building design. In addition, they back up this data by application of rates based on well documented experience on losses expected. The Dominion Board of Insurance Underwriters in Canada and the National Board of Fire Underwriters in the United States publish standards to aid those interested in providing greater fire protection.

#### National Fire Protection Association

Through its published fire codes, handbook, standards and informative literature, the National Fire Protection Association makes available authoritative data on the suitability of materials, on the hazards of various operations and on standards of design and construction. A list of these publications is available from the Association's Headquarters at 60 Batterymarch St., Boston 10, Mass.

#### Lists of Nationally Recognized Testing Laboratories

In the general fire protection field, the *List of Inspected Appliances, Equipment and Materials*, published by the Underwriters' Laboratories of Canada, and the *Lists* of the Underwriters' Laboratories, Inc., are accepted as authoritative sources of information on the life, fire and casualty hazard characteristics of materials that have been tested and classified by these organizations.

#### Basic Research

As fire protection moves from the field of empiricism toward the realms of science, increasing data are becoming available in the basic literature under the authorship of men connected with such organizations as the National Research Council of Canada, the Joint Fire Research Organization in England and the National Bureau of Standards in the United States.

#### Specifications for Fire Resistant Construction

When architects and engineers specify materials to be used in construction, they specify them carefully from the standpoint of strength. Similar specifications must be used from the standpoint of fire resistance, if the expected performance under fire conditions is to be realized. Concrete blocks of a given size may look alike, but there may be wide variations among them in fire resistance. The fire resistance of walls incorporating such blocks may vary from less than one hour to more than four hours, depending on the design and mix used for the blocks, and, in particular, on the type of aggregate used in them.

Not only is it necessary to specify

Table III: Comparative Performance of Record Containers

| Condition of Contents | Labelled No. | Labelled Per cent | Unlabelled No. | Unlabelled Per cent |
|---|---|---|---|---|
| Condition of Contents: | | | | |

| 4-hr. rating | 5 | 100 | .. | .... | 5 |
| Unlabelled | 69 | 65.7 | 36 | 24.3 | 105 |

* No containers failed when exposed to rated exposure or less.

the materials to be used in construction carefully, but the method of assembly is important. Untried methods may result in distortion, cracking or buckling under fire conditions, even though the materials used are acceptable.

### Testing and Inspection in Fire Protection

The necessity for testing and inspection service in fire protection has often been questioned. One answer in their support is to be found in an analysis of the field records of insulated record containers, (6) which were subjected to fire exposure.

Table III reveals that 88.4 per cent of labelled containers, the design of which had been tested by actual fire tests and the construction of which had been inspected, preserved their contents; only 60.5 per cent of those manufactured without outside testing and inspection performed satisfactorily.

When one ignores those causes of damage to the contents which could not be blamed on the container, e.g., door open, and examines the data for containers which had been subjected to excessive exposure to fires, the picture becomes even more startling, as outlined in Table IV.

As noted previously, sparks on roofs are one of the major causes of fire losses. Roofing materials are available which have been tested under conditions simulating actual fire exposure. Production of these listed roofing materials is inspected to ensure continuing compliance with specifications. The spread of fire between buildings would be greatly reduced if the use of these roofing materials, which provide adequate exposure protection, were extended.

### Conclusions

The following conclusions appear to be justified:

1. Although progress has been achieved in the reduction of fire losses in Canada, the cost to the Canadian people is still too great.

2. The art of fire protection offers many solutions to the problem of fire losses. Such solutions are useless unless utilized by management and engineers in the design and maintenance of structures.

3. The same degree of care is necessary in the preparation of specifications for fire protection as is considered indispensable for other aspects of building construction.

### Acknowledgment

The authors wish to acknowledge the assistance of E. F. Tabisz, general manager, Underwriters' Laboratories of Canada, who contributed greatly to the preparation of this paper.

## A New Concept in Modern Office Building Construction

*(Continued from page 425)*

800 ton centrifugal unit, designed to cool 2,000 g.p.m. of water from 51.9°F. to 43°F., when supplied with condenser water at 85°F. An induced draft, spray filled cooling tower is installed on the roof of the service building to cool the condenser water.

### Operating Results

The new portion of the building was substantially complete in October 1952, and the staff occupied it that month. The original building was then rehabilitated and was occupied during the summer months of 1953. Thus the entire building was occupied during the hot spell which occurred at the end of August 1953, when the outdoor temperatures were reported by the Meterological Office in Toronto to have reached 100°F.

During the above periods, even though some adjustments were being made to the radiant heating and cooling and to the air conditioning, the results proved to be fully satisfactory. Little difficulty was experienced in obtaining both a close balance and close regulation of building temperatures. The comfort conditions maintained during the hot spell last summer were exceptionally good.

### Conclusion

While the installation in the Dominion Textile Building and that in the Manufacturers Life Building are basically rather similar, the latter is provided with a relatively much greater radiant panel area and with a relatively smaller and much simpler air conditioning installation. While the system in the Dominion Textile Building is very satisfactory, it is the author's opinion that the installation in the Manufacturers Life Building is still better, and that it has established a new standard in comfort conditioning which will be difficult to exceed. It is to be expected that this type of comfort conditioning will find wide use, and that further applications will lead to both more improvement and simplification of some of its details, including its controls.

# Modernization of NRC Impulse Testing Facilities

*by*

F. C. Creed, N. L. Kusters *and* W. J. Purvis
*Electrical Engineering Section,*
*National Research Council, Ottawa, Ontario.*

The Electrical Engineering Section of the National Research Council has recently replaced its fifteen year old high-voltage impulse generator with a new 1,200 kv. machine, designed and built by the Section's own staff. This is an account of the basis of design and of how some perplexing problems were met and solved. The new generator has already been used in the testing of a wide range of transformers and cables and in some purely experimental work. It is as up-to-date as any in existence.

The National Research Council entered the field of high voltage impulse work in 1938. Then the facilities consisted of a million-volt impulse generator, built by the staff, and a cold cathode, continuously pumped oscillograph for recording the shape of the generated wave. The outbreak of war prevented much use of this equipment until 1945; by then, pronounced advances had been made both in the design of impulse generators and in equipment for recording high speed transient wave forms. It was apparent that the impulse facilities at NRC would have to be drastically improved if the laboratory were to carry out the work for which it was intended.

The original impulse generator was based on Marx' circuit, in which a number of capacitors are charged in parallel and then switched into series by means of spark gaps. When this generator was built, the capacitors most readily available were of the rectangular type and had a voltage rating of only 50 kv., and since d-c power supplies with balanced outputs of ±50 kv. were obtainable, two capacitors were used in series for each stage of the generator.

During charging (see Fig. 1), the spark gaps act as open switches and all the stages of the generator are charged in parallel through the charging resistors, $R_c$. During this period, all the spark gaps, with the exception of the first and last have to withstand the full voltage to which the stages are charged; the first and last gaps, being to ground, have to withstand only half this voltage.

At the end of the charging period, the first gap breaks down to start the switching process. This breakdown can be initiated by some external means, or the gap can be so adjusted that it breaks down at a voltage slightly below that produced by the charging power supply. In the latter case, the breakdown takes place automatically as soon as the voltage across the first stage of the generator reaches a sufficiently high value; this method of operation is known as "uncontrolled", since the exact moment of breakdown is not determined by the operator.

When the first gap of the generator breaks down, one side of the first stage is grounded through the arc and, with the polarities shown in Fig. 1, the other side is raised in potential with respect to ground by one-half the stage voltage. Thus the voltage across the second gap of the generator is increased by 50 per cent in the ideal case; if this gap has been adjusted so that it will only just withstand the stage voltage, this increase is sufficient to break it down. The second stage of the generator is thus connected in series with the first by the arc, producing a large overvoltage on the third gap so that it also breaks down. This process continues until all the generator stages are connected in series. During this period, the high impedance charging resistors act as isolating resistors.

The spark gaps in the generator are usually sphere gaps, since they have to break down quickly when they are overstressed and this type of gap has a short time lag. These gaps have to be readjusted every time the charging voltage is changed since they must only just hold off the charging voltage. In the original NRC generator, each of the gaps had to be manually adjusted every time the charging voltage was changed. This was a long job, requiring the use of four grounding sticks, and even then the operator had to be cautious. It was obvious that the adjustment of all the gaps would have to be carried out together and safely if the generator were to be sufficiently adaptable; with the gaps arranged as shown in the photograph (Fig. 2), this was not easy. In addition, the most recent theory on impulse generators suggested that all the sphere gaps should be in line, so that each breakdown would illuminate the succeeding gaps and thus reduce the time taken for them to break down. It was apparent that the generator would have to be considerably modified to effect the required changes in the gaps.

The capacitor layout also suggested a complete redesign of the generator. The original generator was built with the capacitors on two

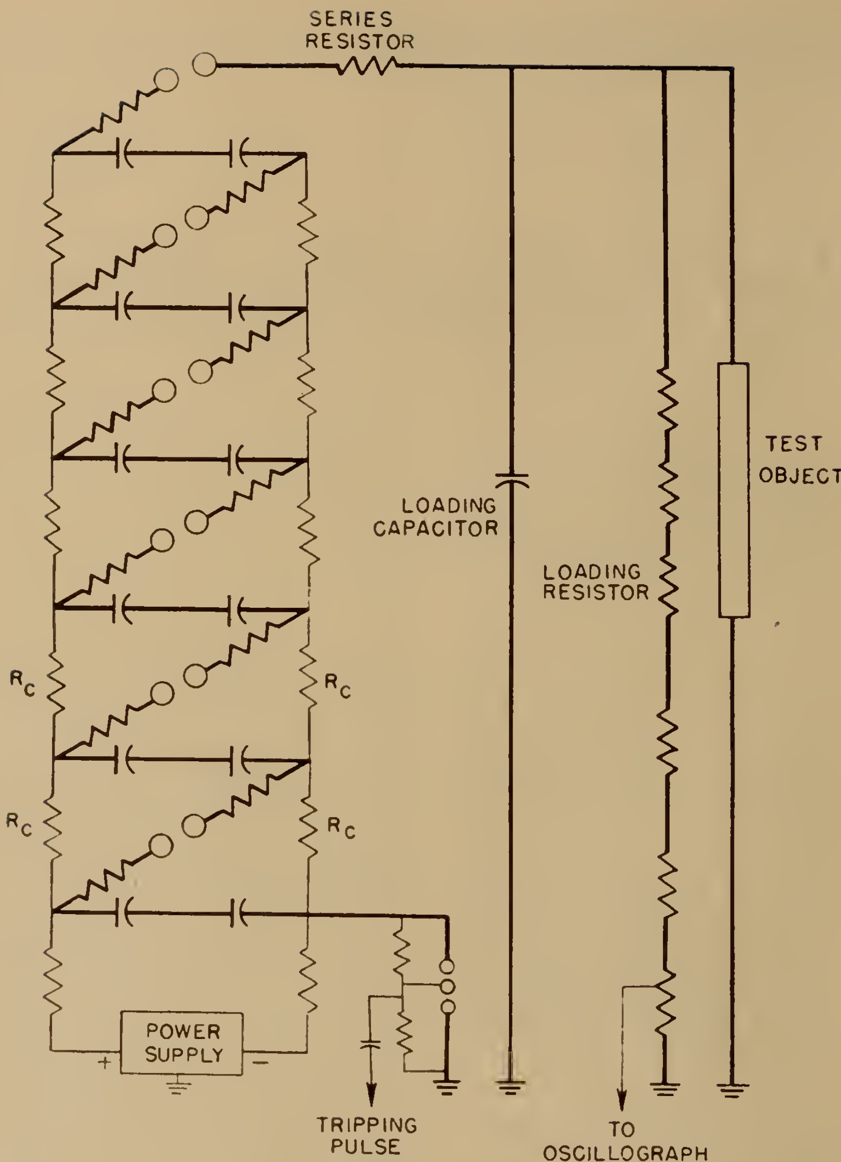

Fig. 1. Schematic of generators.

different levels. The lower level held the first two stages and the remaining stages were mounted on the higher one. During discharge all the capacitors are connected in series and the upper stages of the generator are at high potential, the last stage being at the highest, one million volts. It is imperative that this stage be some distance above the ground to provide the necessary insulation, but with the layout used in the original design, this stage was also distant horizontally from the first stage. This meant a long current path and consequently the inductance of the circuit was large. This made it difficult to generate very steep impulses without getting oscillations on the crest of the impulse wave.

The new impulse generator was therefore designed with the following points in mind:

1. The layout of the generator should be such that the inherent inductance in the circuit would be a minimum.
2. The adjustment of all the sphere gaps should be accomplished simultaneously by means of a motor drive, with remote control.
3. The generator arrangement should be such that the stages could be paralleled in as many ways as possible, so that the generator capacitance on discharge could be varied over a wide range to take care of all types of load.
4. The generator should produce the highest practicable impulse voltage for the space available, with provision for future expansion when space became available.
5. Safety devices should be introduced so that the operation and adjustment of the generator could be accomplished with minimum danger, both to the operating personnel and to others who might be in the vicinity.
6. The capacitors, spheres, and power supply of the old generator should be used in the new one, so that the cost of conversion would be kept to a minimum.
7. The design should be such that all the individual components could be manufactured in a small machine shop.

#### New Generator

Obviously, some form of vertical construction would have to be adopted to keep floor space to a minimum. Three types of construction available are shown in Fig. 3. In the "C-type" the two condensers of each stage form a semicircle and the stages are stacked one above the other. The gaps between stages are located in the open part of the C and run diagonally between the stages. The "figure-of-eight" construction is essentially two C's with their open sides facing and the gaps in the centre. The stages are stacked so that the even numbered stages are on one side and the odd numbered ones on the other; the gaps form diagonal connections across the

Fig. 2. The old generator.

generator so that the discharge path is in the form of a figure of eight. In the spiral type, the condenser layout is the same as for the figure-of-eight, but the gaps are between adjacent ends of the C's, so that the discharge path is a spiral up the generator.

The C-type of construction has the advantage of simplicity and accessibility, since all the sphere gaps are external. It would have been attractive if cylindrical capacitors with their terminals at opposite ends had been available, but with the can type capacitors on hand, this construction would have been wasteful of space because the case of the capacitor is at the same potential at both top and bottom and the space occupied by the capacitor is not available for insulation purposes. With the C-type of construction, this space is lost once every stage, whereas in both the figure-of-eight and the spiral constructions, this space is lost only once every two stages. Since the height of the capacitor was nearly equal to the space required between stages for insulation, the C-type of construction would have resulted in a generator nearly twice as high as that required by either of the other two.

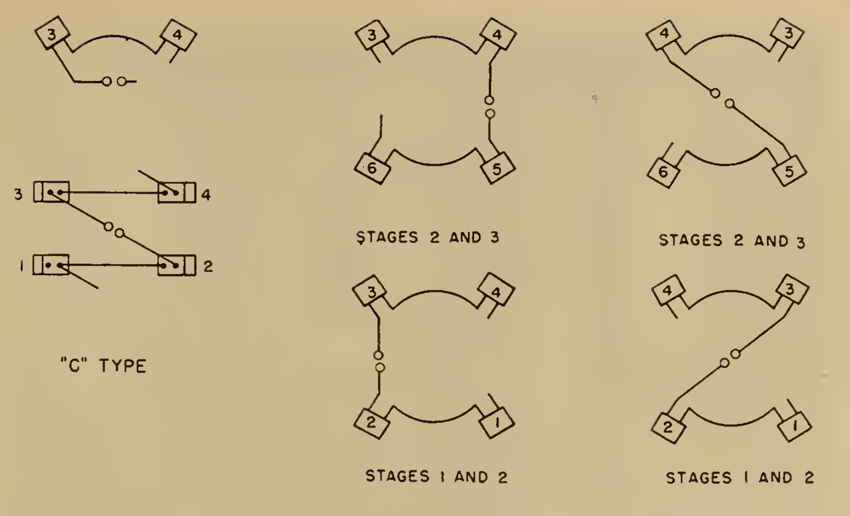

**Fig. 3. Three possible types of construction.**

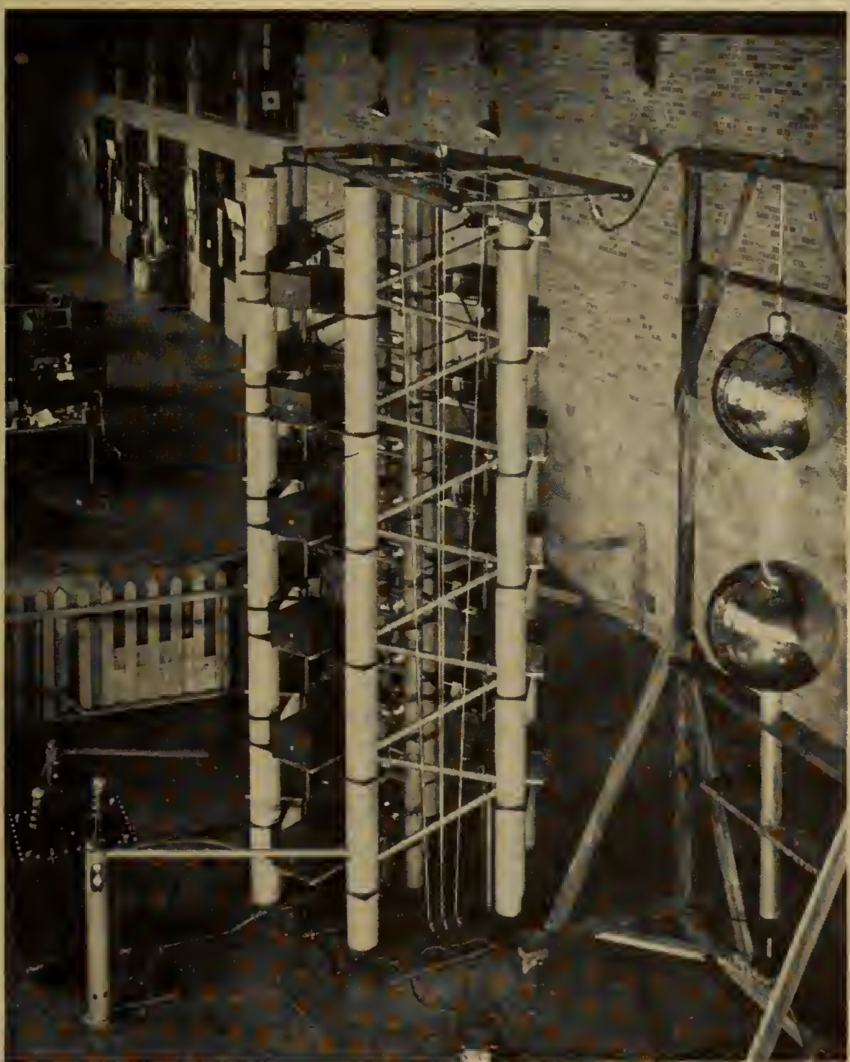

**Fig. 4. The new generator.**

#### Figure-of-Eight Construction

The figure-of-eight construction was chosen in preference to the spiral for two reasons. The spiral construction has a higher internal inductance than the figure-of-eight, because it is essentially a single layer solenoid with a diameter equal to that of the generator, whereas the figure-of-eight construction produces two solenoids, each having only one-half of the diameter of the spiral construction. The mechanical design of the figure-of-eight construction was also the simpler of the two, because it was practical to use only two columns for the sphere gaps, whereas it would have been necessary to use four with the spiral.

#### Electrical and Mechanical Considerations

Having decided on figure-of-eight construction, the design of the generator was governed by electrical and mechanical considerations. Electrically, it was necessary to provide sufficient insulation for the voltages involved and at the same time keep the discharge path as short as possible. Experience had shown that sufficient insulation would be obtained if the spacing of components was based on a design figure of 100 kv. per foot for d-c. voltages, and 100 kv. per 10 inches for impulse voltages. On this basis, preliminary design work indicated that the generator would have a height per stage of approximately 15 inches; since the laboratory height was 27 feet a twelve stage generator was decided upon. This appeared to be the optimum size, since it would enable the maximum number of series-parallel combinations to be used. The resulting generator has a

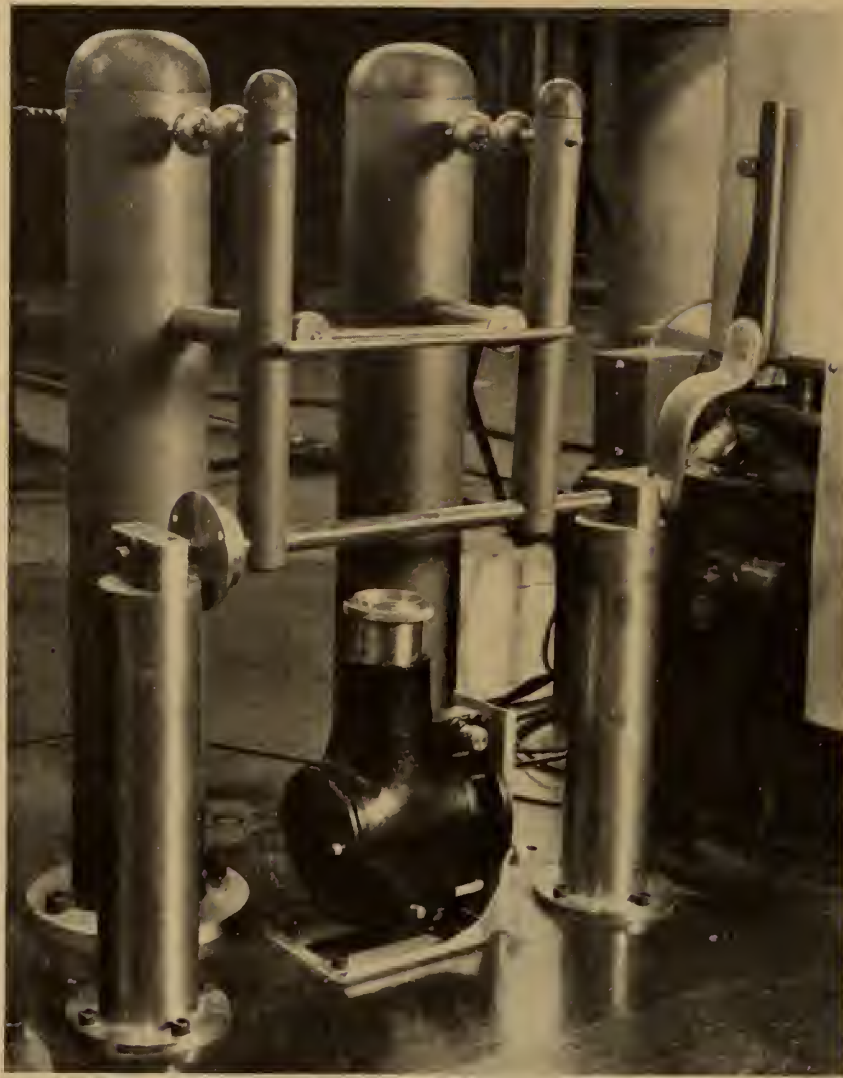

Fig. 5. Tripping mechanism: pin in main moving column at top right.

peak voltage of 1,200 kv., and, since the stage capacity is 0.25$\mu$f, the generator can deliver 15 kilowatt-seconds of energy.

Six columns were used to support the shelves for the capacitors. Four columns could have been used, but this would have required very substantial shelves and columns, whereas with six columns the mechanical strain was eased considerably, since a shelf then has to support only one capacitor. The shelves were staggered so that each capacitor was on a different level, thus producing the shortest possible electrical discharge path and at the same time simplifying the mechanical design. (Fig. 4).

The columns were made of 8 in. bakelite tubes with 1/8-in. walls. Each was built up of short lengths separated by bakelite shelves, 5/8-in. thick. These shelves had shallow circular grooves milled in them on both sides at each end to fit the ends of bakelite tubes of the columns. Holes were drilled through the shelves concentric with the milled grooves, to allow the passage of bakelite tie rods, running from the top of the generator to the base through the centres of the columns. In addition to the tie rods, the weight of the capacitors helped to anchor each shelf to the structure below.

The generator shelves enclose four sides of the generator, but leave two opposite sides open. In order to make the structure stable, diagonal struts were used as braces in the two open sides. These removable struts were made of bakelite tubing and were so arranged that they could be used to accommodate the charging resistors for the interstage connections. By housing the charging resistors in bakelite tubes they were protected from dust, an important consideration since the high voltages involved tend to precipitate dust upon them.

The last major item in the generator design was that of the sphere gap mount. This consisted of two additional bakelite columns installed inside the main generator structure. One of these columns was securely anchored at the top and bottom. The other was mounted in a bearing at the top and on a gear reduction unit at the bottom. The gear reduction unit was coupled to a reversible electric motor, so that the column could be rotated to adjust the sphere gaps by means of a remote control push button station in the generator control console.

Extending from the sphere gap columns at intervals equal to the spacing between stages were bakelite tubes, about 10 in. long. At the free ends of these tubes the spheres were mounted at right angles on short metal stubs, the spheres being connected to terminals on the sphere gap columns through series resistors inserted in the bakelite tubes. These series resistors were hollow and were so arranged that they could be shorted out individually by the insertion of a shorting rod from the column end, thus enabling the total series resistance to be adjusted. This resistance is used to damp out internal oscillations in the generator and also to provide a means for controlling the wave front of the generated impulse. The terminals on the sphere gap columns, which were connected to the appropriate capacitors, were designed so that each sphere gap arm could be connected to the ones above and below it so that the generator could be arranged in various series parallel combinations.

The bottom gap of the generator was different from the rest because it has two special conditions to meet. In the first place, the voltage across it is only half of that across the remaining gaps, because this gap is to ground instead of between stages. In addition, this gap has to control the tripping of the generator, since it is desirable for research purposes to have the generator "controlled".

#### Tripping the Generator

The method adopted for tripping the generator is the split-gap arrangement. In this system the gap consists of two gaps in series, each having only one-half of the gap voltage across it. To trigger the breakdown, a voltage impulse of about 8 kv. is applied to the centre electrode through a small coupling capacitor. This impulse overstresses one-half of the gap, depending on the charging polarity being used, and causes it to break down, putting the full gap voltage across the other half, which then breaks down and grounds one side of the first stage of the generator. During the charging period, the centre electrode is maintained at a potential midway between the two outer ones by means of a high resistance potential divider. This centre electrode actually consisted of two spheres connected together; one could have been used, but by using two the two halves of the gap can be physically separated, which simplifies the design, and at the same time enables the spark across one-half of the gap to illuminate the other half so that the time lag is kept to a minimum.

Since each half of this gap has to withstand only one-quarter of the voltage across all the other gaps, the spheres were made one-quarter the diameter of the main spheres, i.e., 2.5 cm. diameter, and the gap is kept to one-quarter the size of the main ones. In order to keep this 4:1 ratio in the gaps when the moving column is rotated, a special linkage is used to operate the movable spheres of the tripping gap. A peg was inserted in the main moving column which bears against the vertical arm shown in Fig. 5. The lengths of this arm and of that supporting the two movable spheres have been so adjusted that, when combined with the distance of the peg from the centre of rotation, a reduction in the gap opening of 4:1 is achieved.

The initial adjustment is carried out by closing the gaps until the gap indicator meter reads zero, and then adjusting the spheres until a cigarette paper will just pass between them. The gap indicator meter is simply a volt-meter mounted in the generator control console which reads the voltage on the movable arm of a variac geared to the movable sphere gap column in such a way that the variac voltage is maximum when the gap opening is maximum. The drive is spring loaded to eliminate backlash and the variac is equipped with limit switches to prevent the range of the equipment from being exceeded. An ultra violet lamp is also mounted at the base of the generator to irradiate the tripping gap so as to ensure that the time lag in the breakdown of this gap is kept to a minimum.

#### Obtaining the Output

The next problem was to obtain the output from the generator, since the output sphere gap is 16 feet from the floor and consequently not easily accessible. Provision had also to be made to shape the impulse wave generated, to the required 1.5-40 microsecond waveform. This is accomplished by charging a capacitor through a series resistance from the impulse generator to obtain a wavefront of 1.5 microseconds; a shunt resistance, connected across the capacitor, causes the voltage to decay to half value in 40 microseconds. The shunt capacitance required is of the order of 600-2,000 $\mu\mu$f, and consists of the capacitance of the test specimen, augmented if necessary by a loading capacitor of 700 $\mu\mu$f. About one-half of the series resistance is built into the sphere gap arms in the generator and the remainder is located after the last sphere gap.

To accommodate this last resistance, two bakelite arms, 10 feet long, extending outwards from the top of the generator, are used as outriggers for supporting the resistors. Two parallel metal shafts extend from one outrigger to the other, and these are fitted with brass pulleys. One of the external series resistors is housed in a bakelite tube on the top of the generator and is permanently connected between the output sphere gap and the inboard shaft, with provision made for shorting it out if necessary. The other three resistors are housed in a bakelite tube slung between the two shafts by a pair of ropes. These ropes have metallized ends, so that when the resistor is raised into position, its ends are connected to the shafts through the brass pulleys. The ropes run from the pulleys down the side of the generator to spring loaded take-up reels at the base, so that the resistor may be lowered to the floor. Two additional ropes are included, one of which is used for connecting external equipment to the output shaft and the other for supporting the shunt resistor, which is also used as a resistance voltage divider for measuring the output waveform.

The charging resistors are simple, single layer resistors wound with enamelled wire, and have a resistance of 10,000 ohms each. The series and shunt resistances are non-inductively wound and consist of two layers of resistance wire wound in opposite directions on the same former. The resistors in the sphere gap arms have a nominal resistance value of 11 ohms each, while the four remaining series resistors are each of 60 ohms. The shunt resistors are of 300 ohms each, eight of them being used when all twelve stages of the generator are connected in series; they are so designed that they can be arranged in series-parallel combinations whenever such arrangements are used for the generator stages, so that the shape of the wave tail is not altered.

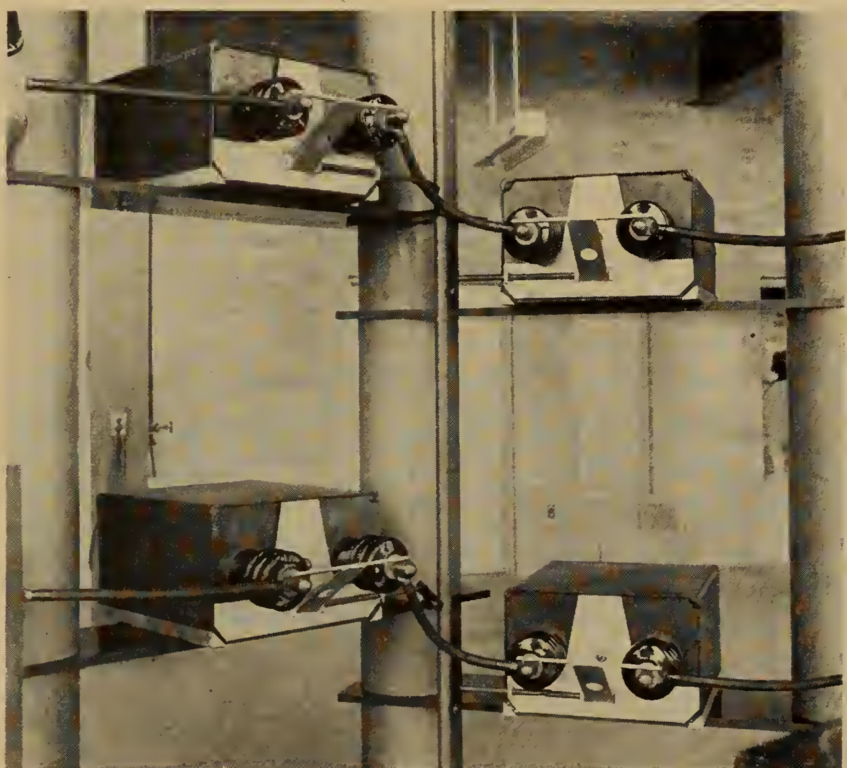

Fig. 6. Shorting devices: capacitors are shorted.

Fig. 7. Control console.

### Safety Features

The major problem involved in making the generator safe to operate was that of rendering the capacitors safe to touch when any work had to be done on the generator itself. This necessitated both short-circuiting and grounding, since the capacitors have a tendency to hold a considerable charge after they have been discharged, and even if shorted, a charge will appear on them after the short is removed. Two methods of discharging the capacitors have been installed. The first consists of a spring-loaded sphere gap to ground from each side of the charging unit. When the generator is being charged these gaps are held open by an electrically operated solenoid, but if the power fails, due to an interlock anywhere in the high voltage area being opened, the sphere gaps close and in so doing drain the charge off the generator capacitors through the charging resistors. These sphere gaps are equipped with interlocks to open the power supply to the charging unit if the gaps close, so that the gaps cannot put a short circuit on the charging unit. The time required for the grounding gaps to drain the charge off the generator is only about 1/25 of a second, so voltages are reduced to a safe value before anyone can enter the generator area.

The grounding gaps do not fully drain the charge from the generator, because the stages consist of two capacitors in series and each capacitor is so constructed that the case is midway in potential between the two electrodes. In addition, there is the possibility that an open charging resistor could cause a residual charge to be left on some of the capacitors. Consequently an additional safeguard has been introduced whereby all the capacitors are simultaneously shorted to their cases by means of a treadle at the base of the generator. To accomplish this, a pair of bakelite rods run vertically up through the generator, one rod being located on each side midway between the two capacitors of a stage. Each capacitor is equipped with a hinged device which allows a shorting bar to drop down across the two capacitor terminals and short them to the case. (Fig. 6). These are actuated by the vertical bakelite rods, and the system is arranged so that the shorting devices automatically fall into place by gravity when the treadle at the base is released. The rods are lifted simultaneously by means of the treadle whenever the generator is to be charged, and the mechanism is equipped with interlocks so that the generator charging circuit cannot be closed while the capacitors are shorted.

### Controls

All the controls for the generator are located in a console which is housed in a protective cage in a corner of the laboratory. This control console, which is shown in Fig. 7, is fed from the 110 volt, 60 cycle mains and supplies all the power required by the generator and the recording oscillograph. The console has two main functions to perform—it acts as distribution centre for the power required and also houses the various controls required to operate the equipment.

The first function, that of distributing power, has necessitated the introduction of various safety features, the most important of which are for the elimination of surges from the power lines. To accomplish this, all the lines entering or leaving the console are protected by thyrite discs, a separate disc being connected between each line and the frame of the console at the point at which the line enters or emerges.

Some of the power distributed by the console is supplied directly from the mains input, but that used for the oscillograph and the primary side of the generator charging unit is first fed through an electronic voltage regulator which stabilizes the a-c. voltage to ±0.1 per cent. With this arrangement, it is possible to preset the output voltage of the impulse generator accurately.

The control of the charging voltage for the generator is accomplished in two stages, one a coarse control and the other a fine one. The regulated a-c. is fed to a 20 ampere variac, which is used as the coarse control. Between the output of this variac and the primary of the charging unit, the secondary winding of a 110/10 volt transformer is connected in series as a voltage booster. The primary of this transformer is supplied from a small variac connected across the regulated a-c. so that the voltage boost can be varied from 0 to 10 volts for a fine control.

The 8 kv. pulse for tripping the impulse generator is generated in an electronic unit mounted in the base of the control console. This unit, which is controlled by a push button on the console panel, generates two pulses, one of which is a low voltage pulse for tripping the recording oscillograph, and the other is the 8 kv. pulse which is transmitted to the generator by means of a high voltage RF cable. The unit for generating these pulses is an elaborate one because it has been found necessary to provide a great deal of shielding and filtering to prevent the generator from injecting high voltage disturbances into the oscillograph tripping cable; in addition, there is a delay circuit which enables the oscillograph to be accurately synchronized with the generator, a necessary provision when very high speed sweeps are used.

The other controls consist of an electric timer, which is used to record the time elapsed during the charging period and which can be used as an automatic control to trip the generator after a preset charging time. In addition, there are the controls for operating the sphere gap adjusting mechanism, and the meters for recording the charging current and voltage and the sphere gap spacing.

Fig. 8. Oscillograph.

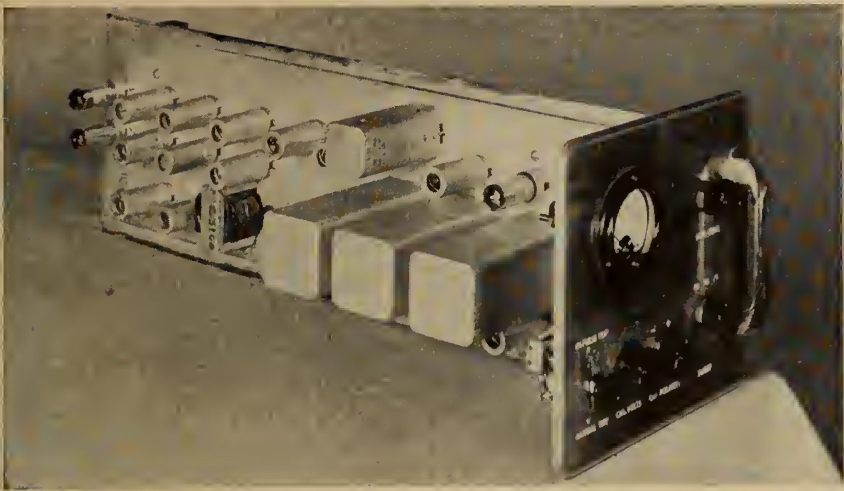

Fig. 9. A 60, 30, 10 microsecond sweep chassis.

### Oscillograph

The original oscillograph was a cold cathode, continuously pumped type, which gave a good record but was tedious to operate. The equipment was also bulky and required a separate shielded cage. Photographs of the wave form were taken by allowing the electron beam to impinge directly on a photographic film, which required the film to be inside the evacuated portion of the oscillograph and consequently, every time the film was changed, the vacuum seal had to be broken. Time was thus wasted in evacuating the oscillograph, and since sealed-off, hot cathode tubes had become available with sufficient intensity to enable the trace to be photographed with an external camera, it was decided to develop an oscillograph for impulse work employing this type of tube.

The tubes selected were the Dumont 5RP type, which employ post-deflection acceleration of the electron beam so that very high photographic writing speeds can be obtained with a high deflection sensitivity. The oscillograph was developed as a two-channel instrument, so that both current and voltage waveforms could be recorded simultaneously. This is especially useful for testing transformers, since current measurement provides one of the most sensitive methods for detecting faults.

The oscillograph was designed with two features in mind. In the first place, the two channels of the scope were to kept as independent as possible, so that different sweeps could be used in each; this would also enable one sweep to be delayed with respect to the other if desired. Since it was difficult to foresee exactly what facilities would be required for future work, the instrument was designed so that all of the sweep and power supply circuits could be easily removed, thus allowing new circuits to be developed as occasion arose and quickly interchanged with those already in the instrument. In this way, the oscillograph was kept relatively simple, yet at the same time could be easily adapted to record any other type of transient desired.

The first sweep chassis developed provided three sweep speeds, which would handle all the routine requirements of impulse testing. These were 60, 30, and 10 microseconds long, and were exponential in shape so that the beginning of the sweep was considerably faster than the end. In this way, both the wave front and the wave tail of the standard 1.5-40 impulse could be studied in detail. This type of sweep requires a complicated form of beam brightening, since the beam had not only to be turned on for the duration of the sweep, but the intensity had to be reduced for the slow portion of the sweep so that the photographic film is not overexposed. The system adopted was to turn the beam on fully for 15 microseconds, and to reduce the intensity after this period on an exponential having the same shape as that of the sweep waveform. An additional circuit was then used to blank the beam completely at the end of the various sweeps used. To keep the instrument simple, the sweep and beam intensifier circuits are mounted on the same chassis so that both can be removed or installed as a unit.

Figure 8 shows the completed oscillograph with a camera mounted over one of the cathode ray tubes and the other exposed. One of the 60, 30, 10 microsecond sweep circuits is shown in Fig. 9. This chassis also houses a special time calibrating circuit which generates a 1 megacycle sine wave in which every tenth cycle is amplified so that the one calibrator can be used for both the fast and slow ends of the exponential sweeps. A typical oscillogram is shown in Fig. 10.

### Use of the Equipment

The equipment has been used extensively for testing transformers and cables for industry and for research purposes. The transformers tested have ranged in size from the smallest rural type to one having a rating of 11,500 kva.; the cables tested have ranged from low voltage 2,500 volt cables to some having a voltage rating of 69 kv. Most of the research so far has been confined to investigating the factors affecting the accuracy of high voltage impulse measurements, with particular emphasis on the grounding of the equipment. In addition, some work has been done on the generator itself, in an effort to understand more fully the exact mechanism by which the switching process takes place. This work has already resulted in a considerable improvement in the operation of the generator and indicates that even more can be accomplished. √

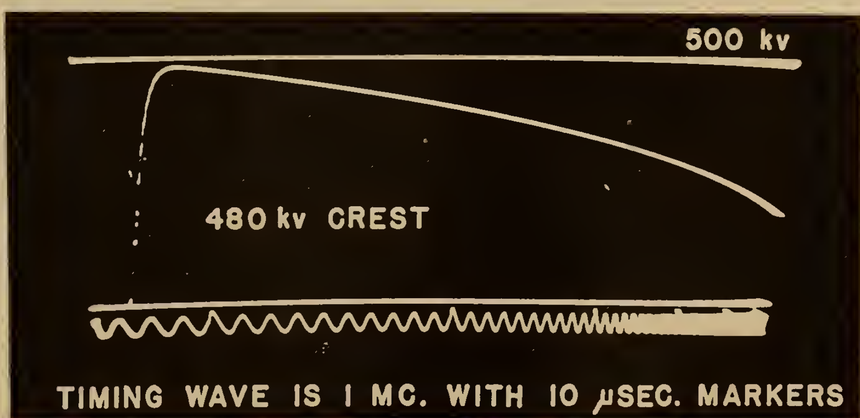

Fig. 10. A typical oscillogram.

# THE ASME BOILER CODE

In the July 1952 issue of *Mechanical Engineering*, the ASME commenced publication in serial form, of a history of events leading up to the present ASME Boiler Code, from the first development of boilers in the 18th Century. This history, continued through some ten issues, was prepared by Arthur M. Green, Jr., of Princeton University.

As a preface to the regular publication in current issues of *The Engineering Journal*, of Boiler Code Regulations, this history has been presented in condensed form. It has appeared in several issues of the *Journal*, of which this is the sixth. Due to the large technical content of this issue, space will allow for only a part of this final instalment. The history will be completed in the May *Journal*.

## VI. Times of National Emergency and War, 1941-1943

Because of increased demand for material for the Armed Services due to World War II, many requests were made for permission to use non-Code materials for pressure vessel construction in the period 1941-1943, especially in its latter years. In February, 1941, a clarification of Para. U-12(c), relating to the use of small cast forged or rolled parts carried in stocks for which there was no mill test, was urgent. It was felt this paragraph should permit a conference between inspector and manufacturer. The paragraph was altered and combined with U-12(a) to permit substitute materials approved by the inspector.

In March, 1941, the chief boiler inspector of California asked permission to use Class A steel for hot water supply tanks, built as ASME unfired vessels. Case No. 732 was reopened and the reply was changed to permit such tanks to be made of Class A steel. In April, requests were made to use SAE-1020 steel in place of S-7 material. In Case 931, the reply stated that, as a temporary expedient, materials covered in 11 named specifications might be used, provided properties of the samples were substantially those required.

In June, 1941, the use of a non-code wrought iron, ASTM A-42-39, was allowed for a fusion-welded unfired pressure vessel. Permission was also granted to use electric-arc, electric-resistance and atomic-hydrogen-welded tubing of S-52 material, with exclusion of grade T- 20, in place of stainless steel. In February, 1942, the Committee reduced the number of test plates required by Paras. P-102(a) and (b) and U-68(a) and (b) under certain restrictions. In February, plates used by universal or strip mills were permitted to be made of steels of four named specifications, during the emergency, while circumferential welds were allowed on headers of superheaters, waterwalls and economisers.

#### Reduction of Factor of Safety

Following a suggestion by two boiler companies that the factor of safety be reduced from 5 to 4 to conserve materials, a Special Committee set up in May, 1942, prepared a reply permitting this reduction with qualifying provisions. The same Special Committee reported the inquiry in June, 1942, asking whether stresses and joint efficiencies of Paras. U-68 and U-69 vessels could be increased over Code requirements in view of the emergency. The reply gave permission for increasing efficiencies under certain conditions, and directed that the Code symbol for such vessels be followed by the letters "NE". This Case was to be effective until annulled. This was approved in June 1942. Emergency Case 968 was again discussed in September, 1942, and changes were made amending the restrictions—Emergency Case 979 was re-opened in February, 1943, and changed to provide a method of determining the thickness of ferrous tubes and pipes for use in the formula of Para. U-20(c).

In April 1943 the Special Committee again considered Case 968 for design of drums and power boilers with higher stress and efficiency, suggesting steps which might lessen the difficulties in Pennsylvania. The revised form of reply was approved for publication with a note that Case 979 would be similarly modified. In June, 1943, Committee members objected to Cases 968 and 979, but after discussion the revised forms of reply were adopted. In September it was announced that publication of reopened Case 968 was held up due to objections, since the reply was not acceptable to Ohio and Pennsylvania as regards the pressure for hydrostatic tests. At this meeting this pressure was changed from two to 1½ times the maximum allowable working pressure.

#### Alternate Rules

The first Alternate Rules, Paras. P-400 to P-409, to incorporate Case No. 968 into the Code, were reported by the Special Committee in October, 1943. These were ordered published as proposed revisions of the Code. In November, 1943, the Special Committee proposed small changes to four of the paragraphs for classification, which were approved. This was approved in October, 1943, and in November the Secretary was directed to prepare proposed revisions for the Codes for Power Boilers, Boilers for Locomotives and Unfired Pressure Vessels for presentation in January, 1944. These rules did not appear in the 1943 edition of Sections of the Code, but were issued as Addenda.

### Emergency Alternate Specifications

In June, 1942, the M. W. Kellogg Co. asked permission to use provisions of an alternate specification for S-56 (ASTM-EA-216-41T) as they were unable to obtain S-56 material. The Committee considered that the provisions of the Alternate Specification met with the requirements of the Code. In September, 1942, two SAE Steels and seven NE bolting steels were approved for bolting material. In December, 1942, Case 981 was reopened and 14 Emergency Alternate Specifications were approved.

In February, 1943, Specifications SA-106-42T for Lap Welded and Seamless Pipe were adopted. In September, 1943, the Committee accepted the American-War Standard, Pressure-Temperature Rating of Cast Steel Pipe Flanges, Fittings and Valves (ASA-B16a5), asked for by the War Production Board because of the economy in the use of steel resulting from the use of the Standard. In November, 1943, it was reported that the general use of the standard indicated its acceptance by various industries, so that its approval by the Committee was unnecessary.

### Designation of Material Specifications

In February, 1942, the Subcommittee on Material Specifications recommended that in the 1943 Edition of Section II the specifications be designated by the "A" or "B" numbers of the ASTM equivalent but without the date, and that those which were not duplicates of ASTM Specifications, or represented a modification, such as S-4, retain their present S number.

### Clad Vessels

In December, 1940, the M. W. Kellogg Co. asked if an integral alloy-lined plate material would be allowed under the Code for Unfired Pressure Vessels, as Case No. 896 relating to the use of stainless materials was too limited. The proposed form of inquiry and reply approved by all the Special Committees, as well as information from references, were before the Committee at the meeting of February, 1941. The urgency of action was stressed. After a long discussion the matter was referred to the Special Committee on Clad Vessels for consideration and conference with interested parties.

Copper clad tubes for vertical boilers were considered in September, 1941, in connection with a request from the P. M. Lattner Mfg. Co. As Case No. 847 referred to such clad tubes of less than 1 inch in diameter, the request was granted. The Subcommittee was requested to prepare a suitable revision for the Code in accordance with its recommendation. In October, 1941, the revision to Para. P-22 in the 1943 edition was reported and adopted.

### Cast and Malleable Iron

The fact that Section II contained only one grade of malleable iron was called to the Committee's attention by the War Production Board in December, 1942. Many fittings used in steam piping were produced by the Cupola Process, and the inclusion of this lower grade was discussed. A Special Committee reported in March, 1943, that Cupola malleable iron was permitted by ASA specification for fittings, and by the Manufacturers Standardization Society of the Valve and Fitting Industry, and that these standards were used in the Code, Table A-11. Hence they recommended an inclusion of ASTM specification EA-20, but that no changes be made in Code requirements for this metal. Specification A-197-39 was adopted. Case No. 997 permitted cast iron cover plates of Para U-37(d) to be replaced by steel heads welded to an American Standard steel bolting ring, when heads were designed by designated formulas.

### Enameled Vessels

The limited nature of Rules for Enameled Vessels, Paras. U-97 to U-109, was brought to the attention of the Committee in June, 1941, by the A. D. Smith Corp. They believed enameling had developed so far that this part of Section VIII should be deleted. The Subcommittee on Unfired Pressure Vessels recommended deletion. The subject of deletion was again considered in January, 1942, and after consultation with manufacturers, this part of Section VIII was deleted by the Committee in March, 1942.

### Fabricated Pipe Bends

As no provision for construction of piping with 90° bends was contained in the Code, the inquiry and reply to Case 96 was proposed in February, 1942, for immediate use after Council approval. In March, 1943, additional paras P-23(j) and U-20(f) based on this case were adopted for the 1943 Edition of the Code.

### New Specifications

New Specifications approved for inclusion in Section II, were acted upon at various times to care for the art of vessel construction. The equivalent Emergency Specifications approved for use as meeting the intent of the Code were not placed in Section II, but manufacturers and designers used them as issued. The numbers of these specifications were as follows; SA-95, 106, 135, 176, 197, 214, 225, 226, 233, 240, 249, 250, 251, 261, and SB-75.

### Weld Metal Tests

In reply to an inquiry as to the way samples of the weld metal should be taken from a U-69 vessel with stainless steel plates, the Committee in February, 1941, advised that the weld metal analysis could be made from drillings from the welds of a finished vessel, adding that operators should qualify on the particular metals for which they would make welds.

### Reduced Number of Test Plates

In March, 1942, Case 961 was approved. The inquiry had sought reduction of the number of test plates under Paras. P-102(a) and U-68(a) and (b). The reply stated test requirements would stand, except when plates were made from one of six designated specifications under six conditions. The greatest reduction then allowed was 1 of 20 required by the Code.

### Interchangeability of Rods

Interchangeability of electrodes was discussed in February, 1941, The Westinghouse Company inquiry regarding Para. UA-31 was referred to the Executive Committee. The inquirer was informed that electrodes were interchangeable. A letter was presented at the May, 1941, meeting regarding the qualifying of operators when a change was made to rods of another manufacturer. The AWS Conference Committee, to whom the matter had been referred, referred the subject to its Committee on Standard Qualification Procedure. The chairman reported in December, 1942, that the difference between two electrodes was not so great as to produce a dangerous situation. The subject again arose in March, 1943. The Subcommittee on Welding and the AWS Conference Committee were in agreement that no change should be made in the Code. It was decided that a letter replying to the inquiry should not be sent. No further action was taken in 1943.

*Part VI to be continued in the May issue.*

# FROM MONTH TO MONTH

**Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers**

## "News of the Associations and the Corporation"

Under this heading a new section will appear in *The Engineering Journal*, starting with the May issue. It has been arranged through co-operation with the provincial organizations. The information will be provided directly by them, or will be extracted from their publications.

It has been the opinion of many members of the profession, that much of the news of the associations is of interest beyond the boundaries of the province. It was with this in mind that the Council of the Institute invited the associations to use the *Journal* as a means of informing engineers in all provinces of their activities. It is a matter of satisfaction and gratification that the associations so readily accepted the proposal. Indeed, it is a clear indication of the increasing desire for co-operation by all individuals and organizations concerned.

The Institute hopes that the new section will develop into an outstanding feature of the *Journal*, and that in some way it will aid in indicating the breadth of our nation, our opportunities and the universality of our interests within the profession.

## Money for Education

Believing that the proper teaching of engineering in the Province of Quebec requires adequate financing of universities, the Engineering Institute presented a brief to the Royal Commission of Inquiry on Constitutional Problems on March 10. The brief is published herewith.

The delegation that presented the brief consisted of I. R. Tait, vice-president of the Institute, J. B. Stirling, past-president of the Institute and chairman of the committee appointed by Council, and the general secretary. The committee which prepared the brief, in addition to Dr. Stirling, consisted of R. DeL. French and J. A. McCrory.

In addition to the brief, the delegation presented some further information along these lines:—

As the practice of engineering was so closely bound to the development of the province, it was possible that at the moment the engineering faculties were the ones for which additional financial support was more urgently needed than any other. If the universities were not able to expand to meet their increasing load, there would be an increasing shortage in engineering graduates.

According to one dean of engineering in Quebec, the salaries paid in Ontario for engineering teachers are $1,000.00 per year and more beyond those paid in Quebec. As well the Ontario professions were not subject to the 5 per cent sales tax and would not be subject to a provincial income tax such as that just established in Quebec. This gave the Ontario universities a great advantage over Quebec in securing and retaining good teaching staff.

The brief reads as follows:—

*To the Chairman and Members,*
*Royal Commission of Inquiry on Constitutional Problems.*

Gentlemen:

The Engineering Institute of Canada thanks the Commission for its invitation to submit a brief. The Institute hopes that this submission may in some degree illuminate one of the problems with which the Commission is faced.

The Institute is the major national professional engineering organization of Canada. Its objects cannot be better set forth than by quoting the statement of its aims which appears on the title page of each issue of its monthly *Journal*.

> "To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

From this quotation it is evident that the Institute is concerned with

### Cover Picture

the technical side of engineering, with the moral and material welfare of engineers and with the enhancement of their usefulness to the public.

In view of the national importance of engineering education, the Engineering Institute of Canada with a total membership of over 15,000, of whom about 5,000 reside and work in the Province of Quebec, is naturally interested in the welfare and status of the profession of this province. It is concerned that this province shall not suffer from a shortage of engineers and that its three great engineering faculties, L'Ecole Polytechnique, McGill University and Laval University, which have been in the forefront of engineering education in the past, shall be able not only to maintain their high standards, but to continue to develop in line with universities elsewhere and in keeping with the growth of the Province of Quebec and of Canada as a whole.

The phenomenal industrial development of this province during the last decade or so has required the services of more and more engineers. In fact, it is because such services were available that much of the development has taken place. If the province is to continue to progress in this direction, it must be assured of a continuing supply of adequately trained engineers.

A "continuing supply" implies that enough young engineers shall enter the profession here each year to replace those who have died or retired, plus enough to fill the positions made available by expanding industry. "Adeqately trained" means that these young men—and occasional young women—most of whom will be graduates of the three engineering faculties of this province, shall have received educations at least comparable with those which may be obtained elsewhere.

To maintain this supply of engineers it should be possible for any young person of promise and with the requisite academic qualifications to proceed to one of the province's engineering schools, even though having limited financial resources. To some extent this can now be done; both the universities and the province do help a limited number of such students, but more assistance is needed. It is not suggested that the student need be supported in luxury, merely that he be subsidized to the point where he can attend the university, instead of having to forego the opportunity for lack of means.

Training in engineering and in medicine are probably the two most costly to provide. Engineering education requires heavy investment in expensive equipment, which scientific advances frequently make obsolete long before it is worn out, and a high-calibre teaching staff, which must be well paid to be retained. Unless salaries attached to teaching positions are kept reasonably comparable to those paid in industry, the drift of capable teachers to industrial positions will be more marked than it is now, and then the universities will be in real trouble.

It is well known that of late the universities of this province have been unable to balance their expenditures with incomes limited to student fees, the returns on their endowments, etc. It is evident that the days when universities could hope to build up endowment funds from private gifts have passed, largely because heavy taxation has drained off the funds which used to be available for philanthropy. Income on invested funds has decreased. While industry is affording more and more financial assistance to the universities, income from this source is not likely to solve the universities' financial problems and it is uncertain, its amounts naturally depending upon the state of business. Some help may be expected from alumni, but perforce it will always be relatively small. Over and above their incomes from the sources mentioned, the major part of the extra funds needed must come from government.

Therefore, the Engineering Institute of Canada respectfully urges the Commission to study sympathetically the financial needs of the universities of the Province of Quebec to the end that the universities:—

1. May be able to assist more extensively, competent and needy students to acquire training in engineering.
2. May be able to keep the physical equipment of their faculties of engineering at the level of adequacy it should have for efficient teaching and for research.
3. May be able to maintain their engineering staffs satisfactorily, both in numbers and in competence.
4. And that some of those not now teaching engineering may be encouraged to start such courses, particularly for the junior years.

The Institute hopes that financial aid to these universities may be implemented without delay and that it may be guaranteed for as long as required. The needs of the universities are likely to increase steadily and their own ability to raise funds is not likely to improve. Therefore it is desirable that funds should be provided on a regular annual basis in accordance with the needs.

All of which is respectfully submitted to your honourable body by the Engineering Institute of Canada acting by authority of its Council and through its president and its secretary, whose signatures are affixed hereto.

Ross L. Dobbin
*President*

L. Austin Wright,
*General Secretary.*

Montreal, Quebec,
March 10, 1954.

# Correspondence

Dear Mr. Editor:

Am in receipt of your letter of January 14th and wish to thank the Council and yourself for the Life Membership. While I have not taken a very active part in Institute affairs since leaving Edmonton in 1943, I have enjoyed the associations when able to attend meetings. The many contacts I have made with prominent engineers through the Institute have been pleasing and instructive. More interest in contacts and exchange of useful knowledge would be helpful to young engineers, with less emphasis on "Union Affairs". I am glad the Institute leaves the latter to others.

Naturally, I am interested in the "Thirty-five Years Ago" items and was particularly pleased to see an item about my old associate J. G. LeGrand, an accomplished and humble gentleman, who was one of the leading bridge designers of his time. He designed every structure which was erected under his jurisdiction and was bold and original in his ideas. Would not have known that he played a leading part in design and construction of the Verdun fortifications, which played so great a part in the defense of France in the 1914-1918 scrap, if I had not asked him after seeing his plans in the 1922 Edition of the *Britannica.*

R. W. Ross, M.E.I.C.,
Winnipeg, March 6, 1954.

# Centennial at University of New Brunswick

### The Faculty of Engineering at the University of New Brunswick Celebrates Its One Hundredth Birthday

On a wintry day in February, 100 years ago, Prof. McMahon Cregan addressed a class of twenty-six prospective Engineers in the old Arts Building of the University of New Brunswick. This is believed to be the first course in engineering given in any Canadian University, and only a scant half dozen universities in the United States had introduced engineering instruction before that date.

By fortunate coincidence Founder's Day at the university, set by regulation, fell on February 15, 1954, one hundred years to a day, from the date of Prof. Cregan's first lecture. The Engineering Institute of Canada had no small part in the ceremonies. The Founder's Day orator was Dr. John B. Stirling, immediate past president of the Institute, and on behalf of the Institute, Mr. Charles E. Weyman, chairman of the Fredericton Branch, presented a handsome mantel clock, suitably engraved, to the president of the university, Colin B. Mackay.

Laurie Coles, president of the students engineering society, presents key to Dr. J. B. Stirling.

C. E. Weyman, chairman of the Fredericton Branch, E.I.C., presents President C. B. Mackay with an engraved clock.

Dr. Stirling's address was a masterly presentation of the early history of engineering education in Canada. His research into the events which led to the establishment of engineering instruction at the University of New Brunswick, and very soon after at McGill University, brought to light much interesting, and hitherto unpublished historical data.

Sir Edmund Head, Governor of New Brunswick from 1847 to 1854, and Governor-General of Canada from 1854 to 1861, has been recognized by university authorities as the man whose influence in the government of the day, made certain the introduction of engineering education. His support stemmed from his great respect for, and confidence in, his great friend, Dr. William Brydone Jack, then professor of mathematics, natural history and astronomy, and later president of the University of New Brunswick, from 1861 to 1875. Dr. Stirling noted the close connection between the establishment of engineering instruction at the University of New Brunswick and McGill University.

This came about through Sir Edmund Head's introduction in 1853, to William Dawson, then superintendent of education in Nova Scotia, and later esteemed principal of McGill. Dr. Stirling remarked, "Sir Edmund, who by this time was thoroughly indoctrinated by the views of William Brydone Jack, was deeply impressed by Dr. Dawson's views on educational reform . . .". Dr. Dawson, appointed by Sir Edmund Head, became principal of McGill on November 5, 1855. Dr. Stirling concluded this section of his address with the thoughtful observation," . . . it must be highly interesting to this audience to recall that two of New Brunswick's sons by adoption, Sir Edmund Head and William Brydone Jack, had a very marked influence on the institution of engineering in Lower Canada at McGill University".

It is claimed by some that Prof. Cregan's class of twenty-six prospective engineers, revitalized higher education in New Brunswick, and promoted the Act changing Kings College to the University of New Brunswick in 1859. It is noteworthy that Prof. Cregan's lectures were held in the fine stone Arts Building, built in 1828, which still dominates the university campus after 126 years.

Although engineering certificates or diplomas must have been granted between 1854 and 1862, the only one known to exist, is that granted to Henry George Clopper Ketchum in 1862. It is now preserved in the archives of the university, and Mr. Ketchum's name is found on the medal given each year to the civil engineering graduate with the highest standing in his final year.

Most of the early surveying instruments used at the university, are still in existence, and may be seen as museum pieces. A quadrant donated by Mrs. William Odell in 1846 is the oldest. The observatory built by William Brydone Jack in 1851 houses a six inch telescope, which at that time was one of the finest on the continent. A large Troughton & Simms theodolite, used by Dr. Jack in the 1850's, for meridian observations, is still intact. In this collection will be found also the massive and cumbersome theodolite used in running the boundary line between New Brunswick and Maine, following the Webster-Ashburton treaty.

Diplomas in engineering were granted up to and including 1898. In 1899 the first degree in civil engineering was granted. The degree was Baccalaureus in Arte Ingeniaria. (B.A.I.). In 1907 the degree was changed to Bachelor of Science in Civil Engineering. The first degree in electrical engineering was granted in 1910, and last year the university graduated the first class in mechanical engineering.

In 1900 the engineering faculty left the old Arts Building, and moved into the newly constructed Science Building, which is now the Civil and Mechanical Engineering building. We can well note the cost of this fine building in 1900, only $19,000. Forty-five years later, an addition, containing somewhat less floor space cost $90,000, a striking commentary on the increased cost of engineering education.

| "Muriel's Room" | Louis Trudel, B. O. Baker | Visits | A. C. deLery |

*Ladies . . . . . . . . . . . . . . Mme G. E. Sarault

***See separate program for ladies' events.**

## See the World's Largest Aluminum Plant and the Great Shipshaw Power Development!

**Special Post-Convention Trip**

**Arvida, Quebec, May 15-16**

The Saguenay Branch E.I.C. and the Aluminum Company of Canada Ltd. extend a cordial welcome to members of the Institute and their wives to visit Arvida at the conclusion of the Annual Meeting. Sleepers will leave Quebec shortly after midnight Friday, arriving at Arvida the following morning. They will leave Arvida Saturday evening for Montreal arriving there 9:55 a.m. E.D.T. — Extra fare, $15.85 plus berths.

***Attention - Members!***

Attendance at social functions will tax all available accommodation. Members are urged therefore to indicate their ticket requirements by completing and mailing advance registration cards well before the meeting. Tickets not paid for **will not be held after 4:00 p.m.** on the day of the function.

Banquet accommodation in the main room (Ball Room) will be guaranteed only to those who send the necessary remittance with their advance registration.

# *PROGRAM

## Wednesday, May 12th

**9:00 a.m. REGISTRATION —**

**St. Lawrence Room**

**10:30 a.m. — Ball Room**

ANNUAL GENERAL MEETING

**2:00 p.m. — Ball Room**

MINING DEVELOPMENT AND ENGINEERING IN QUEBEC

Jean-Paul Drolet, M.E.I.C.,
Chief Technical Information Dvn.,
Department of Mines, Quebec.

**Jacques Cartier Room**

THE IMPACT OF TRANSISTORS ON THE ELECTRICAL INDUSTRY

E. L. R. Webb, Head of Air Force Section, Radio & Electrical Engineering Division,
P. A. Redhead, Research Officer,
National Research Council, Ottawa.

**Committee Room**

7,000 TON FORGING PRESS AT TRENTON, N.S.

Hans Ulmann, M.E.I.C.,
Chief Engineer, Industrial Dvn.,
Dominion Engineering Works Limited,
Montreal.

**3:00 p.m. — Ball Room**

MANUFACTURING PROCESSES FOR A NEW CEMENT PLANT

Bernard Ulrich, M.E.I.C.,
General Manager,
St. Lawrence Cement Co.,
Quebec, P.Q.

**Jacques Cartier Room**

THE APPLICATION OF COMPUTORS TO INDUSTRY

W. J. M. Moore, M.E.I.C.,
Assistant Research Officer,
Radio & Electrical Engineering Division,
National Research Council, Ottawa.

**3:00 p.m. — Committee Room**

DEVELOPMENT OF AN AXIAL FLOW COMPRESSOR

F. H. Keast, Assistant Chief Engineer, Technical
A. V. Roe Canada Ltd., Malton, Ont.

**4:00 p.m. — Ball Room**

LOCATION AND CONSTRUCTION OF THE QUEBEC NORTH SHORE & LABRADOR RAILWAY

B. M. Monaghan, M.E.I.C.,
Assistant Chief Engineer,
Quebec North Shore & Labrador Railway, Seven Islands, P.Q.

**Jacques Cartier Room**

UNDERWATER TELEVISION AND ITS APPLICATIONS

Capt. H. Ross Smyth,
Supervisor, Trials & Operations,
Radio and Electrical Engineering Division,
National Research Council, Ottawa.

**Committee Room**

ELECTRONICS IN THE PAPER INDUSTRY

W. A. Messervey,
Pulp and Paper Application Engineer, Apparatus Division,
Canadian General Electric Co. Ltd.,
Peterborough, Ont.

**6:30 p.m. RECEPTION**

**7:00 p.m. DINNER —**

**Ball Room** — $4.00 per person.

Chairman: Gilles E. Sarault, M.E.I.C., Chairman, Quebec Branch

Speaker: Ross L. Dobbin, M.E.I.C., President, The Engineering Institute of Canada

(Dress Informal)

*Subject to minor changes.

## Thursday, May 13th

**9:00 a.m. — Ball Room**

JOB CONTROL OF THE YONGE STREET SUBWAY

W. H. Paterson, M.E.I.C.,
Chief Engineer,
Toronto Transit Commission.

**Jacques Cartier Room**

MENIHEK POWER DEVELOPMENT, LABRADOR.

L. A. Carey, Jr.E.I.C.,
Resident Engineer,
Montreal Engineering Company.

**Committee Room**

SOME FIRE PROTECTION ASPECTS OF BUILDING DESIGN

W. E. Emmerson, Jr.E.I.C.,
Division Engineer,
D. R. Abbey, M.E.I.C., Engineer,
Fire Protection Section,
Underwriters' Laboratories of Canada, Toronto.

**10:00 a.m. — Ball Room**

INSTALLATION OF ELECTRICAL EQUIPMENT IN THE YONGE STREET SUBWAY

J. Y. Doran, Electrical Engineer,
Toronto Transit Commission.

**Jacques Cartier Room**

HYDRO-ELECTRICAL DEVELOPMENT ON THE CANADIAN SIDE OF THE NIAGARA RIVER

R. L. Hearn, M.E.I.C.,
General Manager and
Chief Engineer,
Hydro-Electric Power Commission of Ontario, Toronto.

**Committee Room**

NATURAL RESOURCES AND THE ENGINEER

J. L. Van Camp,
General Manager,
Canadian Forestry Association,
Inc., Montreal.

**11:00 a.m. — Ball Room**

CARS, SHOPS AND MECHANICAL EQUIPMENT OF THE TORONTO SUBWAY

J. G. Inglis,
Assistant Manager of Equipment,
Toronto Transit Commission.

**Jacques Cartier Room**

CANADA'S SUPER TANKERS

W. H. White, Naval Architect,
R. W. McGilvray,
Chief Engineer, Design,
Davie Shipbuilding Limited,
Levis, P.Q.

**11:00 a.m. — Committee Room**

TRANSMISSION OF THE POWER DEVELOPED ON THE CANADIAN SIDE OF THE NIAGARA RIVER

J. E. Sproule, M.E.I.C.,
Consulting Transmission Engineer,
Hydro-Electric Power Commission of Ontario, Toronto.

**2:30 p.m. — Afternoon Tour**

For all visiting members and guests. Details of this will be announced in the final program.

*There will be no Technical Sessions on Thursday Afternoon.*

### HOTEL ACCOMMODATION AND TRANSPORTATION

All meetings and functions will take place in the Chateau Frontenac unless otherwise noted. Additional room accommodation has been arranged for at the Hotel Clarendon nearby.

Requests for room reservations should be made without delay, using the accompanying reservation card for this purpose. Single rooms are scarce and in most instances it will be necessary to share twin-bedded double rooms. It is better if sharing arrangements can be worked out in advance and indicated on the room reservation card.

All requests for reservations should be addressed to:—

*The General Secretary,*
*The Engineering Institute of Canada,*
*2050 Mansfield Street,*
*Montreal 2, Que.*

Reduced convention fares have been authorized for rail travel in Canada. A special fare certificate will be mailed to you from headquarters if requested on your registration card. This entitles you and members of your family to round-trip tickets at one and one-half times the one-way fare plus twenty-five cents.

Trans-Canada Air Lines have convention rates for parties of ten or more. Your local T.C.A. agent will gladly supply details.

No matter how you travel, be sure to make your reservations now to avoid disappointment.

*All Times are Eastern Daylight Saving*

### REGISTRATION

3:00 p.m. to 6:00 p.m. — May 11th
9:00 a.m. to 6:00 p.m. — May 12-14th
Members $5.00
Juniors $3.00 - Non-members $6.00
Ladies, guests of the Institute, speakers, authors and students — complimentary.

### "MURIEL'S ROOM"

The hospitality of "Muriel" will be extended, as usual, to all registered members, ladies and guests, thanks to the continued co-operation of Canadian industry.

**Registration Badges Must Be Worn**

*PLEASE NOTE*

*Prices for meals include gratuities and provincial tax. Tickets must be obtained in advance and refunds cannot be made less than three hours in advance of any function.*

## Friday, May 14th

**9:00 a.m.** — **Ball Room**

PERIBONKA POWER PLANTS

R. E. Heartz, M.E.I.C., President,
Shawinigan Engineering Company,
Montreal.

**Jacques Cartier Room**

INSTRUMENTING A NYLON INTERMEDIATES PLANT

F. G. Carson,
Chief Supervisor, Maintenance—Instrumentation.
Canadian Industries Limited,
Maitland, Ont.

**Committee Room**

RATIONAL DESIGN FOR BUILDING FRAMES

J. L. de Stein, M.E.I.C.,
Associate Professor,
Department of Civil Engineering,
McGill University, Montreal.

**10:00 a.m.** — **Ball Room**

KITIMAT POTROOM FOUNDATIONS

R. M. Hardy, M.E.I.C.,
Dean of Engineering,
University of Alberta,
Edmonton, Alta.

C. F. Ripley, M.E.I.C., Manager,
Ripley & Associates,
Vancouver, B.C.

**Jacques Cartier Room**

THE DEVELOPMENT OF A NEW CONCEPT IN MODERN OFFICE BUILDING CONSTRUCTION

G. Lorne Wiggs, M.E.I.C.,
Consulting Engineer, Montreal.

**Committee Room**

PHOTOGRAPHY IN ARMAMENT DEVELOPMENT

E. W. Greenwood—Superintendent,
Ballistics Wing,
Canadian Armament Research & Development Establishment.

**11:00 a.m.** — **Ball Room**

DESIGN AND CONSTRUCTION OF ALCAN'S KITIMAT TERMINAL WHARF

W. L. Pugh, M.E.I.C.,
Chief Engineer,
Aluminum Company of Canada Ltd., Montreal.

**11:00 a.m.** — **Jacques Cartier Room**

ARCTIC APPLICATION OF THE HEAT PUMP

J. B. Templeton,
Head, Engineering Section,
Defence Research Northern Laboratory, Fort Churchill, Man.

**Committee Room**

INSTRUMENTATION IN ARMAMENT DEVELOPMENT

E. J. Bobyn,
Canadian Armament Research & Development Establishment.

**2:00 p.m.** — **Ball Room**

TELECOMMUNICATIONS IN CANADA

A. G. Lester,
Assistant General Manager—Toll Area,
The Bell Telephone Company of Canada, Montreal.

**Jacques Cartier Room**

PANEL DISCUSSION — AIR POLLUTION CONTROL

**3:30 p.m.** — **Ball Room**

MANAGEMENT PANEL DISCUSSION

**6:30 p.m.** — **RECEPTION**

**7:15 p.m.** **THE ANNUAL BANQUET** — **Ball Room**

$5.50 per person
(including dance)

Chairman: Ross L. Dobbin,
President of the Institute.

Speaker: Dr. C. J. Mackenzie,
Hon. M.E.I.C.,
Ottawa.

Presentation of medals and prizes and introduction of the new president, D. M. Stephens, and new members of Council.

**10:00 p.m.** **ANNUAL DANCE — Ball Room**

$2.50 per person (dance only).

(Dress optional)

### RECEPTION

There will be an informal reception after the banquet when members and guests may meet the incoming and retiring presidents, the Chairman of the Quebec Branch, and their wives.

CENTENNIAL AT UNIVERSITY OF NEW BRUNSWICK

(*Continued from page 442*)

Much could be written of the years following the inauguration of engineering at the university. Many men have contributed the best years of their lives to the training of young engineers, not only in the Faculty of Engineering, but in the Faculties of Arts and Science. At this time however, it seems proper that our thoughts should turn to those men of courage and foresight, who one hundred years ago fostered our profession. May their fame endure forever.

EARLE O. TURNER,
*Dean of Engineering.*

# Association of Professional Engineers of Nova Scotia

Engineers today enter into activities promoted for community, national and international welfare, Mayor R. A. Donahoe, Q.C., commented at the annual banquet of the Association of Professional Engineers of Nova Scotia, held on January 29, at Halifax.
