Mayor Donahoe said the engineering profession was making a vital contribution to the well-being and progress of freedom loving countries. He was introduced by Nelson Mann, president of the Halifax Branch, E.I.C., who along with John E. Clarke, M.E.I.C., newly elected president of the Association, was co-chairman of the annual banquet.

Mr. Clarke, the new president, is divisional engineer, Provincial Department of Highways, Middleton, N.S. Serving the Association with him will be the following officers: vice-president, M. L. Baker, M.E.I.C., associate professor of mechanical engineering, Nova Scotia Technical College; past-president, G. J. Currie, M.E.I.C.; senior civil and hydraulic engineer, Nova Scotia Light and Power Co. Ltd.; secretary-treasurer, J. D. Kline, M.E.I.C.

Councillors of the Association are: V. M. Coy, M.E.I.C.; M. F. Dean, M.E.I.C.; G. H. Burchill, M.E.I.C.; and J. W. MacDonald, M.E.I.C., representing the Halifax area; C. M. Anson, M.E.I.C., Sydney; L. D. Wickwire, M.E.I.C., Liverpool; L. F. Kirkpatrick, M.E.I.C., Amherst; J. R. MacQuarrie, M.E.I.C., Malagash.

Among the guests attending the dinner were Hon. Alistair Fraser, Lieutenant Governor of Nova Scotia, Premier Angus L. Macdonald, Dr. F. H. Sexton, former president of Nova Scotia Technical College, and Dr. A. E. Cameron, president of Nova Scotia Tech.

E. Whitman, chairman of the examining board of the Association reported an increase of 50 members during the past year. Dr. F. H. Sexton, Wolfville, chairman of the professional relations committee, advocated that engineers take an active part in public relations and join in community activities.

A guest of honour at the annual banquet was W. E. Jefferson, former chief engineer of Maritime Telegraph and Telephone Company, and now an Anglican clergyman at his native Granville Ferry. He was presented with a desk set.

## Capital Available

The general secretary has been asked to recommend some manufacturer in Canada who could use to advantage some additional capital for expansion purposes. The amount might be anything up to one million dollars.

The inquirer suggests that he would be interested in an industry that has to do with the manufacture of some form of power equipment — motors, generators, turbines, engines and so on.

If you are interested write to the general secretary marking the envelope "Confidential".

# 1953 E.I.C. Membership Directory

## Errata

(*Continued from March issue*)

With the completion and distribution of our 1953 Membership Directory, a small number of errors have come to light. Naturally, these are very much regretted, but since the work had to be done under pressure against time, a certain number of mistakes were almost inevitable.

For the convenience of all members we are printing below a further list of names as they should have appeared in the Alphabetical Section. For errors in the Geographical Section the necessary correction is simply noted. — EDITOR.

### Honorary Members—Page IX:

**MACKENZIE, C. J.,** J. 1911, A.M. 1914, M. 1920, Hon. M. 1947.

### Alphabetical List:

**BRAKENRIDGE, Chas.,** Consltg. Engr., 3450 West 3rd Ave., Vancouver, AM'15. M'19.

**BROWN, Joseph,** Detroit '43. Wks. Engr., C.I.L., Copper Cliff, Ont. J'48. M'52.

**BULLER, F. H.,** McGill '23. Schenectady '31. Analytical Engr. General Electric Co., 1 River Road, Schenectady 5, N.Y. S'20. AM'31. M'40.

**CAMPBELL, R. M.,** Queen's '48. Mech. Engr., C. D. Howe Co., 1421 Atwater Ave., Montreal. Mail: 6390 Clanranald Ave. S'48. J'50.

**CHOQUET, J. A.,** Ecole Poly. '48. Assoc. Prof., Ecole Polytechnique, 1430 St. Denis St., Montreal. Mail: 10540 St. Charles St., Ahuntsic, Que. S'44. J'50.

**GORING, G. R.,** McGill '39. Mech. Engr., Steel Co. of Can. Ltd., Montreal. Mail: 7272 Somerled Ave. M'45.

**HARTMANN, N. L.,** Stuttgart '24. Dsgnr. Q.H.E.C., Montreal. Mail: 6941 31st Ave., Rosemount, Que. AM'38. M'40.

**JEMMETT, D. M.,** Queen's 13. Prof. of Elec. Engrg., Queen's Univ., Kingston, Ont. AM'21. M'40.

**KRUG, F.,** Pres., International Power Co., 244 St. James St. W., Montreal. M'50.

**McKINNEY, A. D.,** Gen. Sales Mgr., All-Steel Buildings Ltd., Harbour Comm. Bldg., Toronto. M'50.

**SCHENKER, Leo,** London '42. Tor. '50. Resch. Assoc., Univ. of Michigan, Ann Arbor, Mich. Mail: Apt. 3, 415 Nob Hill Place. M'50.

**ZAVITZIANOS, Demetrius,** Athens '48. Fld. Engr., Piggott Constrn. Co., 1250 Bay St., Toronto. Mail: 11 Kingsdale Ave., Willowdale, Ont. J'52.

### Geographical List:

Add under United States of America, Page 196: Newark, N.J., Member, T. E. Smith.

Delete above name from New Orleans, La.

Correct under Winnipeg Branch, Page 179: Norwood (Members) H. S. Beethman.

Correct under Kingston Branch, Page 185: Kingston (Members) D. M. Jemmett.

# The President Visits the Western Branches

**These photos show something of the warmth accorded him, but more pictures will appear later.**

Winnipeg

Above left. The president greets University of Manitoba students. Left to right: L. Austin Wright, G. B. Williams, of the Winnipeg Branch executive, R. G. Nicholls, prize winner; Ross L. Dobbin; G. Newman, president of the student section; R. D. Vopni, senior stick.

Above right. At the McArthur power development. Left to right: H. M. White, President Dobbin, D. M. Stephens, J. W. Sanger, J. R. Rettie, Dr. Wright, Dick Noonan.

Below, a meeting at Pine Falls, Man. Front row, left to right: J. W. Sanger, D. M. Stephens, Don Munroe, Mr. Dobbin, Lorne McLure, J. Saldat. Second row: Roy Fowler, J. R. Rettie, Frank Morton, L. A. Wright, Don Miller, H. W. White, Dick Noonan, Jack Cook, Tom Benn, Al Hayman, Wally Popiel, W. Jonat, Ted Cates.

## Brandon

Above left. The head table, left to right: Mayor J. A. Creighton, Mrs. Koropatnick, the president, Chairman Jack Koropatnick, Jerry Williams, Mrs. Cook, and the president's sister, Mrs. J. A. Creighton.

Above right. From extreme left, and around the front of the table: Len Stevenson, Angus Laughlin, Mrs. and Mr. John Harrison, Miss M. Karnous, William Taciuk, and George Brodie.

Right. The president gets a send-off at the station.

---

## Regina

The head table: G. W. Parkinson, P. M. Sauder, of Lethbridge, Miss Mary Young, Dean I. M. Fraser, of Saskatoon, Mr. Dobbin, Allan Tubby, Saskatoon, Stewart Young, Mrs. Robert Reid, North Battleford, E. Mason, Trail; Mrs. G. W. Parkinson, E. L. Smith, Edmonton.

Below left: President Dobbin presents the certificate of honorary membership to Stewart Young. Mr. Young's daughters, Miss Mary Young and Mrs. Robert Reid look on with interest.

At the Regina meeting, J. McD. Patton (left), and L. A. Thornton.

## Trail

The four pictures above are a composite of the head table at the banquet held at Tadanac Hall. From left to right, first row: N. H. Booth, secretary-treasurer; Mrs. W. K. Gwyer, Dr. C. H. Wright, chairman, Trail Committee of Technical Societies, Mrs. E. B. Broadhurst, R. W. Diamond, Mrs. Molly Willis, President Dobbin, E. B. Broadhurst, Mrs. R. W. Diamond, E. Mason, councillor, Mrs. C. H. Wright, Rev. W. Kennedy, president, Trail Ministerial Association, Mrs. E. Mason, Mrs. N. H. Booth and W. K. Gwyer, chairman-elect.

Membership dinner, Trail Hotel. Left to right: W. Lawrie, A. F. Brooks, W. G. Small, J. V. Rogers, K. L. Broe, L. Ayre, T. W. Lazenby, G. C. Laycock, L. Fransen, E. Busby, H. P. Hamilton, F. Jackson.

Luncheon at Nelson. Left to right: N. H. Booth, J. P. Coates, D. Fairbanks, President Dobbin, E. B. Broadhurst, G. Fyke, E. M. Styles, H. T. Miard.

---

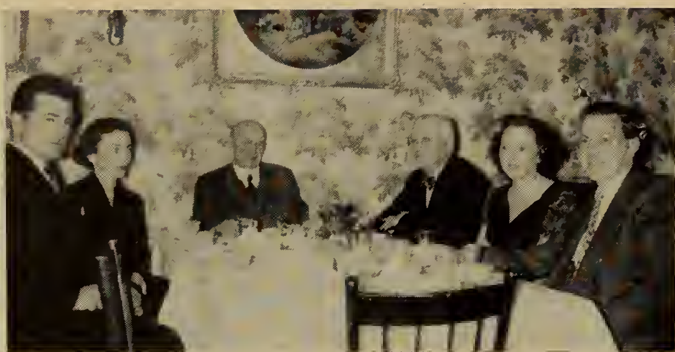
On the opposite page. The president at Kemano. First group: Karl Roestad, Alcan resident engineer, Kemano, Mr. Dobbin, N. L. Hinkson, B.C. International Engineering. Second group: J. R. Goff, W. L. Inglis, Steve Butte, and J. R. Carson, of B.C. International Engineering, and the president (second from right).

## Vancouver Island

The president visited the engineers' school at Chilliwack. Back row: Lt.-Col. Kellough, H.Q., B.C. Area, Vancouver; Lt.-Col. Berry, commanding officer, I Field Engineer Regiment; Major Hough, officer commanding, Trades Training Squadron; Major Ball, chief instructor. Front row, left to right: Eric Hartley, chairman, Vancouver Branch, R. L. Dobbin, Peter Jones, secretary of the Branch, and Lt.-Col. D. W. Cunnington.

Victoria. Below, right to left: A. G. Ballantyne, G. Simmons, of B.C. Engineering Society; R. W. Siddall, Architectural Institute, Mrs. J. A. W. Izard, W. A. Bowman, R. L. Dobbin, Mrs. Bowman.

Victoria. Left to right: Mrs. R. Murray, G. E. Macpherson, Miss Dawn Josephs, Mrs. R. C. Thurber, R. C. Thurber, Mrs. L. C. Johnson, R. Murray.



Victoria. Left to right: G. C. Stewart, Mrs. G. C. Stewart, Col. B. Ripley, E. Jamieson, Mrs. J. G. Ford, Mr. J. G. Ford.

Kemano *(See opposite page for caption)*

## Calgary

The president goes "Western". The branch presents him with a white 10-gallon hat. The rough and ready cowhands are W. A. Smith (left) and H. M. Hunter.

Luncheon meeting. Left to right: K. G. Evans, the president, R. Underhill, and L. A. Wright.

---

## Saskatoon

Left to right: Mrs. Weir, Mrs. McAskill, R. L. Dobbin, Mrs. Munro, Mayor McAskill, G. N. Munro.

With the Saskatchewan Council. Front row, left to right: A. Tubby, past-chairman, R. Peterson, J. Jonsson, R. Bing-Wo. Back row: G. N. Munro, chairman, Pres. Dobbin, Dean Fraser, W. G. McKay, W. R. Staples, E. C. B. MacNabb. Standing: W. M. Berry, A. F. G. Carroll.

## Vancouver

In foreground: Reg. G. Smalley. Back of table, left to right: Hugh Ritchie, R. H. Garrett, E. T. Winslow, Maj.-Gen. J. P. MacKenzie, Col. W. G. Swan.

Left to right: A. C. R. Yuil, R. E. Wilkins, Robert Douglas, Richard Walkem, N. C. Sherman.

# *Thirty-five Years Ago*

**Comment on the *JOURNAL* of April 1919**

The April, 1919, *Journal* announced the personnel of the special committee to draft a model engineers' licensing law. It was made up of R. F. Uniacke, Ottawa; Arthur Surveyer, Montreal; A. R. Decary, Quebec; C. C. Kirby, Saint John; C. E. W. Dodwell, Halifax; Willis Chipman, Toronto; N. L. Somers, Sault Ste. Marie; J. M. Leamy, Winnipeg; F. H. Peters, Calgary; R. J. Gibb, Edmonton; A. G. Dalzell, Vancouver; E. R. Gray, Hamilton; and G. D. Mackie, Saskatchewan. Good advice to this committee was given by a correspondent signing himself "The Opposition"— "Messrs. Committee, don't be afraid to talk salaries."

Council looked with a dim eye on a proposal, emanating from Toronto, to establish a Canadian Institute of Electrical Engineers. John Murphy, W. A. Bucke and Julian C. Smith were appointed to deal with this matter and to consider how the Institute could be made "still more attractive for electrical and mechanical engineers". Later *Journals* probably referred to this matter again, but we can say that the proposal came to nothing.

### Higher Salaries

Black-faced type emphasized the editorial announcement that the "Government (proposes) to establish a higher basis of salaries for engineers . . . All the influence we possess should be used in this cause." Also the editor published a schedule of salaries proposed by the American Association of Engineers, ranging from $9,000-$15,000 for chief engineers down to $1,200-$1,440 for tape men. The starting salaries for 1953 graduates averaged about $3,400; to reach that figure under the schedule just quoted one would have had to be in the chief draftsman class.

"An Experienced Transitman" complains in a letter that his salary is only $1,200 a year, and thinks the Institute should do something about it, which, of course, it was doing. Another correspondent rather took the Institute to task for accepting advertisements in its employment section offering what he considered to be inadequate salaries. "Do you not think that the *Journal*, and thereby the profession, is being cheapened in the public eye by this . . . Why not refuse such advertising?" As a matter of fact the Institute has refused such advertisements — many of them.

The text of a memorial to the Prime Minister, Sir Robert Borden, and his cabinet was printed, praying that "the Federal Government recognize the paramount value as a national asset of its highly educated and trained men and utilize to a greater extent men of engineering knowledge and training, especially in an executive capacity on commissions dealing with all affairs where engineering or construction is involved." The intent was clear and laudable, even if the language was a little confused.

The beginning of the Institute's international affiliations were laid by the appointment of H. H. Vaughan, John Murphy and G. H. Duggan as a committee to explore the possibilities of closer relations with the engineering societies of the United States.

### Technical Papers

The longest paper in this April *Journal* was one by J. L. Busfield, "The Mount Royal Tunnel", a detailed description of the work from the inception of the idea until the operation of the first train. Many members of the Institute were associated with this project—S. P. Brown, W. E. Joyce, H. T. Fisher, J. D. K. Stewart and the author himself.

J. A. Burnett's "Locomotive Coaling Plants" was a paper no engineer would bother to write today, primarily because he would have nothing to say. Coal-burning locomotives will soon be so few that they will attract more attention than the biggest diesels do now; most of those remaining will probably be preserved as museum exhibits.

Another and more important paper was "Notes on the Test of a Girderless Floor", by Peter Gillespie and T. D. Mylrea. The floor tested was one of the 12 in the new Eaton factory in Toronto. Notable in the paper was the inclusion of all the experimental data, for "great difficulties were encountered by the writers when attempts were made to check the published results of others who had conducted similar building tests. In some cases, full data as to the structure and a mere summary of the results were given. In others, rather more complete results of the tests were given, but with an entire omission of . . . the structural features." Perhaps there is a lesson here for technical writers, even for our own.

It is papers like that that established the flat-slab floor as a safe and economical one, which has become so commonplace that the ability to design it is a tool of every concrete structural engineer. Although it has been replaced to some extent by other types, the old flat-slab floor is still a competitor.

How many civil engineers of this generation ever heard of "Trautwine"? His engineers' pocketbook was the engineers' Bible when the writer of these notes was a student. This April *Journal* announced the twentieth edition, in which "the rules relating to the ellipse have been modernized, extended and rewritten. A new isogenic chart is shown and the table of azimuths of Polaris have been revised."

E. S. M. Lovelace presented some "Suggested Harbour Improvements for Greater Montreal". He would have built a submerged dam from Varennes to the downstream end of the Island of Montreal, raising the low water level about ten feet and drowning out St. Mary's Current. To pass the dam, there would have been two locks at the Varennes end, each 1,000 feet long and 100 feet wide. Time lost in passing the locks would have been more than recovered by time saved in navigation above the dam. Part of the scheme was a combined railway and highway bridge following the crest of the dam, a river crossing which was badly needed at the time this paper was written. The whole scheme was stated not to be likely to make the flood situation in the Montreal area worse.

Another part of Mr. Lovelace's project was a canal from the St. Lawrence at Montreal to the Richelieu at St. Jean; "it is not proposed to give (the canal) a greater sectional area than that found on the existing canal system on the St. Lawrence River, nor a depth greater than 14 feet."

This paper stirred up more discussion than is often the case. F. W. Cowie, then chief engineer of the old Montreal Harbour Commission, thought Mr. Lovelace was sanguine in expecting his scheme to eliminate

St. Mary's Current and damned the whole project with faint praise. J. A. Jamieson regretted "that Mr. Cowie is so entirely satisfied over our harbour, as this attitude does not look very hopeful for future progress."

Like so many projects advocated by those who have made their study a hobby, Mr. Lovelace's efforts did not lead to any tangible results; however, he probably enjoyed its preparation. A paper of this speculative kind is good for us now and then.

#### The Branches

Council approved the formation of the Niagara Peninsula Branch. It sent a telegram to the Acting Prime Minister supporting the adoption of daylight saving time. The writer finds that he was reappointed to the Board of Examiners and Education, much more active in 1919 than it has since become; only one of his colleagues at that time is still living.

Reports from the Toronto Branch told of a meeting at which the topic of discussion was "What the Institute Can Do". Among the suggestions made were that only those with university educations should be allowed to call themselves engineers, that the Institute should take more interest in public affairs, that each branch should operate an employment bureau, that a fair salary scale for each province should be established and that no member of the Institute should be eligible for office unless he had attended a minimum number of the meetings of his branch each year.

All branches were actively debating the subject of legislation to govern the practice of engineering and a wide variety of views were expressed, ranging from approval of rigid—and probably unworkable—acts, to *laissez faire.* Most branches were also busy at this time instructing their representatives on the Institute's model licensing law committee.

The *Journal* offered its pages free of charge to any ex-service man seeking employment. Perhaps as a straw in the wind, it carried an advertisement for an instrument man for the Algoma Central and Hudson Bay Rly. at $1,800 a year and living expenses, a rather better salary than that complained of by "An Experienced Transitman" in the letter quoted earlier.

The atmosphere of the times was well shown by the tags in unfilled spaces at the bottoms of columns, "Have YOU employed a returned soldier?"

# The ASME Boiler Code

### Interpretations

The Boiler Code Committee meets monthly to consider "Cases" where users have found difficulty in interpreting the Code. These pass through the following procedure (1) Inquiries are submitted by letter to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.; (2) Copies are distributed to Committee members for study; (3) At the next Committee meeting interpretations are formulated to be submitted to the ASME Board on Codes and Standards, authorized by the Council of the Society to pass upon them; (4) They are submitted to the Board for action; (5) Those which are approved are sent to the inquirers and are published in Mechanical Engineering.

The following Case Interpretations were formulated at the Committee meeting January 22, 1954.

#### Case No. 1181

Interpretation of Par. P-112(c)

***Inquiry:*** Paragraph P-112(c) makes stress relief of carbon and carbon-molybdenum steel mandatory in thicknesses appreciably less than those currently permitted under other sections of the Code. May these thicknesses be increased?

***Reply:*** It is the opinion of the Committee that under Par. P-112(c) the following need not be stress-relieved:

(1) Carbon steel in thicknesses less than ¾ in.

(2) Carbon-molybdenum steel with carbon not exceeding 0.20% in thicknesses less than ½ in.

#### Case No. 1182

Special Ruling

***Inquiry:*** Is it permissible to construct unfired pressure vessels of ferrous* material fabricated by fusion welding for service at operating temperatures below −20°F. when the weld filler metal has lower mechanical properties than the base metal?

***Reply:*** It is the opinion of the Committee that weld filler metal having lower mechanical properties than those of the base metal may be used for the construction of pressure vessels, when made of ferrous materials to operate at temperatures below 20°F. with the following provisions:

(1) Materials and design of such vessels shall meet the requirements of Section VIII of the Code with particular reference to the requirements of Pars. UG-84, UCS-65, UCS-66, UCS-67 and UHA-51.

(2) The welding requirements of Section IX shall be met except as specifically exempted in (3).

(3) The room temperature tensile strength of the weld, as determined by the reduced section tensile test made to qualify the welding procedure as prescribed in Section IX, shall be not less than 90 per cent of the minimum specified tensile strength of the base metal.

(4) The stress value to be used for design purposes shall be 90 per cent of the room temperature stress value of the base metal.

CAUTION: It is recommended that the tensile strength of the weld, as determined by the reduced section tensile test be greater than the yield strength of the base metal as given in the mill test reports.

*As used herein ferrous materials include carbon, low-alloy, and high-alloy steels.

#### Case No. 1173

Special Ruling

***Inquiry:*** Will unfired pressure vessels fabricated by fusion welding under the applicable rules of Section VIII, 1952 edition, meet the intent of the Code if the base material is a nickel-molybdenum wrought material, which is now under consideration by the appropriate ASTM Committee, having the following composition:

| | |
|---|---|
| Molybdenum per cent | 26.00 to 30.00 |
| Iron, per cent | 4.00 to 7.00 |
| Vanadium, per cent | 0.20 to 0.60 |
| Silicon, max., per cent | 1.00 |
| Phosphorus, max., per cent | 0.04 |
| Sulphur, max., per cent | 0.03 |
| Manganese, max., per cent | 1.00 |
| Chromium, max., per cent | 1.00 |
| Carbon, max., per cent | 0.12 |
| Cobalt, max., per cent | 2.50 |
| Other, total, max., per cent | 0.50 |
| Nickel | Remainder |

***Reply:*** It is the opinion of the Committee that the nickel-molybdenum alloy described in the Inquiry may be used for the construction of unfired pressure vessels according to the applicable rules of Section VIII, 1952 edition, subject to the following conditions:

(1) The mechanical properties of the material are not less than given in Table 1.

(2) Fabrication is by fusion welding using filler metal complying in composition with the base material.

(3) The welding requirements and applicable paragraphs of Section IX, 1952 edition, apply except that the tensile strength of the reduced section specimen shall be not less than the specified tensile strength of the base material.

(4) Fusion welded butt joints shall be examined radiographically for their full length as prescribed in paragraph UW-51 when the plate or vessel wall thickness at

**Table 1. Mechanical Properties of Material**

| Thickness Inches | Tensile Strength p.s.i. | Yield St. p.s.i. 0.2 per cent offset | Elongation in 2" per cent minimum |
|---|---|---|---|
| up to 3/16......... | 115,000 | 50,000 | 45 |
| over 3/16 to ¾..... | 100,000 | 45,000 | 40 |
| over ¾ to 1½...... | 90,000 | 45,000 | 35 |

the welded joint exceeds 3/8ths of an inch. All fusion butt joints regardless of thickness shall be examined by the fluid penetrant method.

(5) The following maximum allowable stress values are used in applying the design rules where reference is made to Table UNF-23:

Metal temperatures not exceeding, degree F.

| 100 | 200 | 300 | 400 |
|---|---|---|---|
| 22,000 | 20,000 | 20,000 | 20,000 |

or

| 500 | 600 | 650 |
|---|---|---|
| 20,000 | 20,000 | 20,000 |

(6) In view of the fact that this alloy does not undergo a marked drop in impact resistance at low temperatures, no additional requirements are specified for temperatures down to −325°F., (See Par. UNF-65.)

(7) The joint efficiency factors, inspection and testing comply with the applicable paragraphs of Section VIII, 1952 edition.

(8) The minimum thickness after forming of any plate subject to pressure shall be 3/32". (See Par. UG-16(c) for permissible undertolerance.)

(9) Bolting materials shall comply in composition with the base material or one of the grades of steel bolts listed in Table UCS-23. The allowable stress values for nickel-molybdenum alloy bolts shall be as follows:

Metal temperatures not exceeding, degree, F.

| 100 | 200 | 300 | 400 |
|---|---|---|---|
| 8,000 | 8,000 | 7,600 | 7,200 |

| 500 | 600 | 650 |
|---|---|---|
| 7,000 | 6,800 | 6,800 |

**Add non-mandatory appendix:**

Heat treatment including stress relief of welded vessels is neither required nor prohibited. When maximum corrosion resistance is required, it may be advisable to heat treat in such a manner as to place all carbides in solution. For such service it is recommended that the vessel be heated to the range 2,100 deg. F. to 2,150 deg. F. and held for not less than 1 hour per inch of thickness. Quench all parts of the vessel uniformily and as rapidly as possible in water or air. The material should be cooled through the range from 1,800 deg. F. to 1,100 deg. F. in not more than 10 minutes. In order to avoid incipient fusion and the consequent decrease in corrosion resistance. heating above 2,150 deg. F. should be avoided.

(2) Welding techniques that will preserve the corrosion-resistant properties of the alloy should be used. In general, welding should be performed using stringer bead techniques with little or no weaving of the welding electrode or rod.

## Proposed Revisions and Addenda to Boiler and Pressure Vessel Code

As need arises, the Boiler Code Committee entertains suggestions for revising its Codes. Revisions approved by the Committee are published here as proposed addenda to the Code to invite criticism.

In the following the paragraph numbers indicate where the proposed revisions would apply in the various sections of the Code.

Comments should be addressed to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.

### Power Boilers, 1952

***Par. P-23.*** Revise title to read Thickness of Headers and Piping, also revise paragraph (g) to read:

When a steel pipe or header is pierced with tube holes, the maximum allowable stress in the ligaments in pounds per square inch shall not exceed the values given in Table P-7 and the maximum allowable pressure shall be computed using the formula in this paragraph with the value for S multiplied by the ligament efficiency factor E,(P-192 and P-193) or weld efficiency factor E, (P-102) whichever is lower, and otherwise in accordance with the rules in Par. P-180(c).

***Table P-15.*** Proposed revision, Table P-15 is available from the Boiler Code Committee.

***Par. P-180(c).*** Delete the last sentence of the second paragraph.

Replace the last paragraph with the following:

Inside backing strips when used at longitudinal welded joints shall be removed and the weld surface prepared in accordance with Par. P-102(h) (2a). Inside backing rings may remain at circumferential welded seams of headers provided such construction complies with the requirements of Par. P-112.

Add the following as a *cautionary note:*

For constructions operating in the range where creep and stress rupture strength govern the selection of stresses, it is desirable to remove all weld reinforcement.

***Par. P-102(h) (2).*** Revise to read (2) (a); designate second paragraph as (2) (b) revising new (h) (2) (b) by insertion of phrase "except as restricted by Par. P-180(c)" after reference to Par. P-101(d) (5) in the third line.

***Table P-7.*** Revise to read:

SA-268-47, Grades TP-405, TP-410 and TP-430, add the same stress values as given for Table UHA-23 in the September, 1953 issue of "Mechanical Engineering". Delete the following specifications: SA-158, SA-206, SA-280, SA-315, SA-83 (lap-welded pipe and tubes) and SA-157.

The following changes in grade designations should be made:

| *Specifications* | *Old Grade Designations* | *New Grade Designations* |
|---|---|---|
| SA-213 | T13 | T5b |
| | Y14 | T3b |
| SA-335 | P5a | P5 |
| | P16 | P7 |
| | P17 | P9 |
| SA-182 | F17 | F9 |
| | F2 | F12 |
| | F8 | F304 |
| | F8m | F316 |
| | F8t | F321 |
| | F8c | F347 |

The following are in error in the present Table P-7 and should be corrected:

(1) Note (1) should apply to SA-299 since this steel may graphitize when held at temperatures in excess of 800°F. for prolonged times.

(2) Since there is only one grade in SA-192, "Grade A" is superfluous and should be deleted.

(3) The caption "Electric Resistance Welded Alloy Steels" when applied to SA-249 is erroneous and should be changed to "Welded Alloy Steels."

(4) The nominal composition of SA-217, WC4 should be changed from Ni-Cr-1-Mo to Ni-Cr-½ Mo.

Additional revisions are given in table, revisions to Table P-7 available from the Boiler Code Committee.

### Unfired Pressure Vessels, 1952

***Table UCS-23.*** The revised table is available from the Boiler Code Committee.

***Table UHA-23.*** The revised table is available from the Boiler Code Committee.

***Table UCS-27.*** SA-83 should be deleted. The revised Specification A-83-52T covers Seamless Steel Boiler Tubes only, therefore, the lap-welded grades should be deleted.

Note (3) should be changed to read "Only (silicon) killed steel shall be used above 900°F."

***Par. UA-6(b) (2)***—Revise the introductory phrase to: "(2) Heads of the type shown in Fig. UA-6(b), (No joint efficiency is required)."

Delete "E" in formula (a) making it read:

(a) Head thickness, $t = \frac{5PL}{6S}$

***Par. UA-6(b) (3)***—Revise the introductory phrase to: "(3) Heads of the type shown in Fig. UA-6(c), (No joint efficiency factor is required)."

Delete "E" in formula (a), making it read:

(a) Head thickness, $t = \frac{5PL}{6S}$

***Par. UA-6(b) (4)***—Revise the introductory phrase to: "(4) Heads of the type shown in Fig. UA-6(d), (no joint efficiency factor is required)."

Delete "E" in formula (a), making it read:

(a) Head thickness, $t = \frac{5PL}{6S}$

***Par. UW-11(a)***—Add at the end of the paragraph the parenthetical clause: "(See Par. UW-52 for spot examination)."

***Par. UG-80***—Revise to read: UG-80 Permissible Out-of-Roundness of Cylindrical Shells.

(a) Internal Pressure. The shell of a completed vessel shall be substantially round. The difference between the maximum and minimum inside diameters at any cross section shall not exceed one per cent of the diameter at the cross section under consideration. The diameters may be measured on the inside or outside of the vessel. If measured on the outside the diameters shall be corrected for the plate thickness at the cross section under consideration (see Fig. UG-80.2).

When the cross section passes through an opening the permissible difference in inside diameters given above may be increased by two per cent of the inside diameter of the opening.

(b) External Pressure: The shell of a complete vessel to operate under external pressure shall meet the following requirements at any cross section:

(1) The out-of-roundness limitations prescribed in (a).

(2) The maximum plus-or-minus deviation from the true circular form, measured radially on the outside or inside of the vessel, shall not exceed the maximum permissible deviation "e" obtained from Fig. UG-80.1. Measurements shall be made from a segmental circular template having the design inside or outside radius (depending upon where the measurements are taken) and a chord length equal to twice the arc length obtained from Fig. UG-29.2. The value of $t$ shall be determined as follows:

(a) For vessels with butt joints, *t* is the nominal plate thickness, less corrosion allowance;

(b) For vessels with longitudinal lap joints the permissible deviation *e* may be increased by the nominal plate thickness, less corrosion alloyance;

(c) Where the shell at any cross section is made of plates having different thicknesses, *t* is the nominal thickness of the thinnest plate, less corrosion allowance.

(c) (Delete (c) as these rules now apply to completed vessels).

(d) New (c). No change.

(e) New (d). The dimensions of a completed vessel may be brought within the requirements of this paragraph by any process that will not impair the strength of the material.

(f) New (e). No change.

(g) New (f). No change.

(h) New (g). An example illustrating the application of these rules for a vessel under external pressure is given in Appendix L (Par. UA-271).

***Fig. UG-80.1.***—Revise the title to read: "Maximum Permissible Deviation from a Circular Form "e", for Vessels Under External Pressure."

NOTE: Dr. Bergman has suggested that the ordinate-values in Fig. UG-80.1 be changed from $t/d_o$ to $D_o/t$ to agree with the charts for shells.

If this is approved the ordinate-values in Fig. UG-29.2 should be changed in a similar manner.) Revised Fig. UG-80.1 and UG-29.2 are attached as Appendix III.

***Fig. UG-80.2.***—Revise the title to read: "Examples of Differences between Maximum and Minimum Diameters in Cylindrical Shells."

Change previous reference from ASA B.16e-1939 and ASA B.16e6-1949 to ASA B.16.5 in the following paragraphs: UG-34.1; UCS-8(b); UCS-9(b); UA-6(b) (1) and (b) (2).

NOTE: This reference change also applies to Par. P-27(f) in Section I.

The following are corrections to revisions as contained in December 11th Minutes:

Change reference from Par. UG-36(e) to UG-36(c) (3) in the following places:

Par. UW-14 (new (c) and (d) ).
Par. UG-37(a).
Par. UG-39(a).

and the change specified under Par. UG-36(c) (a) should be to Par. UG-36(c) (c) (3) (a).

Change addition to Par. UG-41(c) as follows:

> "For obround openings, consideration shall also be given to the strength of the attachment joint on one side of the plane transverse to the parallel sides of the opening which passes through the center of the semicircular end of the opening.

---

# Elections and Transfers

At the meeting of Council held in Montreal, Que., on Friday, March 26th, 1954, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

*Members:*

K. Aanonsen, *Montreal*
D. F. Aitkens, *Whitehorse*
E. Alzner, *Montreal*
D. B. Annan, *Hamilton*
G. B. Asselstine, *Sarnia*
E. S. Babinszki, *Calgary*
A. Bernups, *Montreal*
J. Burgoin, *Whitehorse*
A. K. Campbell, *Marathon*
W. W. Carey, *New York*
A. E. Chalmers, *Peterborough*
J. R. Cooper, *Welland*
A. Dabrowski, *Montreal*
A. O. Dehm, *Montreal*
H. K. Frymann, *Quebec*
A. Gall, *Kemano*
H. J. Gough-Cooper, *Deep River*
B. W. Hamer, *Ottawa*
C. S. Hedrei, *Montreal*
A. M. Hollum, *Arvida*
V. D. Hunter, *Toronto*
S. G. Jackson, *Saint John*
J. L. Kellermann, *Toronto*
F. H. Lypaczewski, *Montreal*
P. B. Macfarlane, *Montreal*
D. E. McCulloch, *Montreal*
J. McDonald, *Ottawa*
S. Machachey, *Deloro*
J. E. Margison, *Toronto*
A. H. Pengilly, *Hamilton*
E. S. Robinson, *Quebec*
S. P. Sahgal, *Toronto*
J. D. Scott, *Whitehorse*
H. C. Schwinner, *Arvida*
J. M. Sharp, *Ottawa*
W. N. Simmons, *Brockville*
R. W. Stephenson, *Niagara Falls*
H. H. Stewart, *Kingston*
J. D. Trevithick, *Regina*
N. S. Troth, *Penticton*
J. T. Truman, *Lindsay*
B. Ulrich, *Quebec*
H. W. Umphrey, *Montreal*
H. A. van Iterson, *Toronto*
J. E. Vercoe, *Kingston*
W. V. Zinn, *London, Eng.*
G. A. Zulauf, *Quebec*

*Juniors:*

C. T. Aitken, *Montreal*
A. H. Austin, *Trail*
J. F. Best, *Kitchener*
J. W. Black, *Ottawa*
W. G. Brown, *Madsen, Ont.*
B. C. Cameron, *Brockville*
W. S. Cullens, *Montreal*
D. de Pretis, *Montreal*
A. F. Inderwiek, *Armstrong*
E. M. Johnson, *Trail*
K. E. Kummant, *Peterborough*
J. Looyestein, *Vauxhall*
S. A. Luciani, *Shawinigan F.*
W. J. Luciani, *Shawinigan F.*
E. N. MacKay, *Quebec*
M. I. Qureshi, *Lindsay*
J. H. C. Scrimgeour, *Peterborough*
R. H. Shepherd, *Sarnia*
D. H. Snow, *St. Lambert*
B. L. Theriault, *Hawkesbury*
K. D. H. Willcocks, *Windsor*
G. C. Willeumier, *Montreal*

*Transferred from the class of Junior to that of Member:*

G. C. Baker, *Kentville*
G. W. Bernard, *Calgary*
D. W. Blair, *Toronto*
R. S. D. Browning, *Beauharnois*
C. J. Carter, *Fort William*
J. A. Clow, *Calgary*
D. B. Collings, *Springfild*
H. C. Douglas, *London*
L. C. Galloway, *Hamilton*
A. L. Gourley, *Brantford*
J. L. Halter, *Red Rock*
A. M. Hurter, *Montreal*
R. M. Johnson, *Ottawa*
J. E. Keough, *Sarnia*

# News of Other Societies

The Montreal Road Laboratories of the **National Research Council** of Canada in Ottawa, are holding an Open House on May 26, 27, 28, 1954.

Invitations may be obtained upon request to R. E. Simmons, N.R.C., Ottawa.

---

Professor John Bland of McGill University is chairman of the convention committee for the annual assembly of the **Royal Architectural Institute** of Canada in Montreal, May 11-14, 1954.

---

The 37th annual conference and exhibition of the **Chemical Institute of Canada** (18 Rideau Street, Ottawa 2) will take place at the Royal York Hotel, Toronto, June 21-23, 1954.

---

The annual meeting of the **Canadian Electrical Association** for 1954 is scheduled for June 24-26, at the Manoir Richelieu, Murray Bay, Que.

---

The annual meeting of the **American Society for Testing Materials** (1916 Race Street, Philadelphia 3, Pa.) and exhibits of testing apparatus and technical photography, will take place at Chicago, Ill., June 13-18, in the Sherman and Morrison Hotels.

---

The **American Institute of Chemical Engineers** (120 East 41st St., New York 17) announces a special meeting on nuclear energy, at the University of Michigan, Ann Arbor, June 20-25, 1954.

---

The conference on Solid State Physics in Engineering Education, to be held at the Carnegie Institute of Technology, June 21-25, 1954, will be open to engineering and physics teachers. It is sponsored also by the American Society for Engineering Education, the National Science Foundation, and the University of Illinois. Information can be obtained from John W. Graham, Carnegie Institute of Technology, Pittsburgh, Penn.

The **American Institute of Electrical Engineers**, North Eastern District, will hold a meeting in Schenectady, N.Y., May 5-7, 1954. The Program has been issued by the A.I.E.E., 33 West 39th St., New York 18, N.Y.

---

The University of California has made an advance announcement of the 1954 Heat Transfer and Fluid Mechanics Institute, June 30 to July 2. Information can be obtained from Harold A. Johnson, Division of Mechanical Engineering, University of California, Berkeley 4, Calif.

---

The third convention of the **Panamerican Union of Engineering Associations** (UPADI), will be held in Sao Paulo, Brazil, August 3-7, 1954.

---

The ACHEMA XI, chemical apparatus and equipment exhibition and convention will be held in Frankfurt am Main, Germany, May 14-22, 1955.

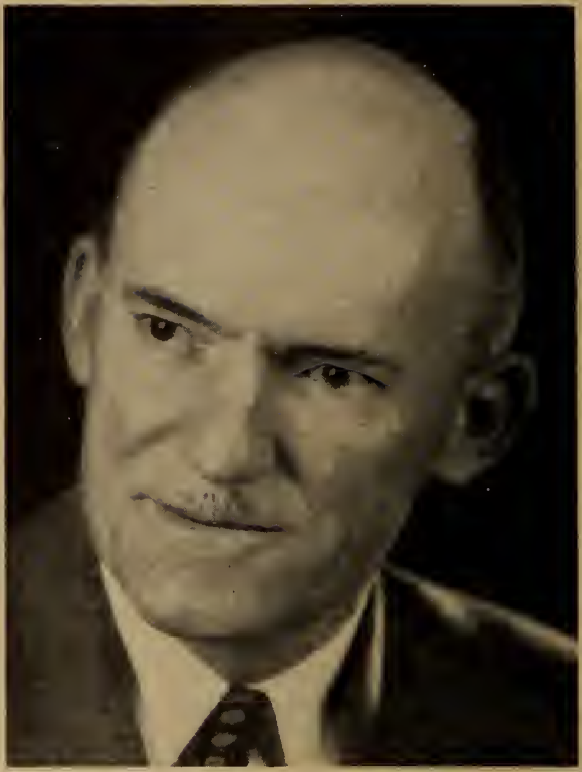
# Donald McGregor Stephens, M.E.I.C.

## President

of

## The Engineering Institute of Canada

## 1954



The president of the Engineering Institute of Canada this year is a real Westerner. He is Donald McGregor Stephens, born in 1903 near Reston, Manitoba, educated in the public and high schools of that province and of Saskatchewan and a civil engineering graduate of the University of Manitoba, where he was president of the engineering undergraduate society in his final year. Before entering the university, Mr. Stephens attended the provincial normal school for a year, taught school in various western towns and was occasionally employed as a construction worker and farm hand, so that he is not unfamiliar with manual labour. Following graduation, he did graduate work for a year in economics and hydraulics at Manitoba.

Like most engineering students he spent his summers in the field; he served on various surveys in northern Manitoba and in 1933 joined the permanent staff of the provincial Department of Mines and Natural Resources, serving as deputy minister of the department from August, 1938, to May, 1951. During these years he was concerned with fur rehabilitation measures, water conservation schemes, mining road projects, forest management and many other programs.

In addition to his regular duties as deputy minister, he served on two committees under reference to the International Joint Commission and having to do with boundary water matters, and on another international engineering board dealing with problems which had arisen with respect to the Souris River. Mr. Stephens also represented his province on the Prairie Provinces Water Board until 1951.

When the Government of Canada set up a Committee on Reconstruction in 1941, Mr. Stephens was selected to represent the western provinces on the subcommittee on construction projects under the chairmanship of K. M. Cameron, M.E.I.C., then chief engineer of the Department of Public Works of Canada. He also represented the prairie provinces on the Federal Government's Forest Insects Control Board until appointed to the Manitoba Hydro-Electric Board.

One of the major problems during the Red River flood of 1950 was to anticipate the probable water levels, and Mr. Stephens organized an emergency flood forecasting unit for this purpose, using personnel drawn from various engineering organizations in Manitoba. The activities of this unit attracted considerable favourable comment. He was then selected to represent Manitoba on the Greater Winnipeg Dyking Board, which put a million cubic yards of fill into its emergency dykes in the summer of 1951, beside building 26 pumping stations to handle Winnipeg drainage in time of flood.

In July, 1948, it was decided by the province to develop 114,000 hp. at Pine Falls, so Mr. Stephens was appointed chairman of an engineering board in charge of all phases of the work. This responsibility was transferred to the Manitoba Hydro-Electric Board when it was set up in May, 1951, with Mr. Stephens as chairman and general manager, the position he now holds. Other work initiated by the Board under his direction is the 80,000-hp. McArthur project and a 60,000-kw. steam station.

Since 1948 Mr. Stephens has also been chairman of the Manitoba section of the Winnipeg River Interprovincial Advisory Board which is responsible for the co-ordination of power development on that watershed by Manitoba and Ontario. In 1952 when the Hydro-Electric Board secured control of the Winnipeg Electric Co., Mr. Stephens became president and general manager of the reorganized company.

When one has read thus far, one will no doubt feel that Mr. Stephens has been and is a busy man. Nevertheless he has found time to take an active interest in Institute and other professional affairs. He was chairman of the Winnipeg Branch of the Institute in 1942, a councillor of the Institute from 1946-49 and vice-president of the Association of Professional Engineers of Manitoba in 1953. He is also a member of the Institute of Public Administration of Canada, of the Canadian Institute of International Affairs and of our sister organization, the Canadian Institute of Mining and Metallurgy.

Mr. Stephens is married to the former Irene I. White; they have four children, three sons and a daughter.

We are sure all members will join the *Journal* in wishing Mr. Stephens all success as president of the Institute; it is evident from his background that he will maintain the high order of administration which has marked the terms of his predecessors.

# Newly Elected Officers of the Institute

**At the Annual Meeting, the president, three vice-presidents and twenty-four councillors will take office. They will serve with others whose terms of office continue. The complete list of the Council will appear in the next issue of the *Journal*.**

**B. G. Ballard,** M.E.I.C., vice-president of the Institute representing the Province of Ontario, is director of the Radio and Electrical Engineering Division of the National Research Council.

Mr. Ballard graduated in electrical engineering from Queen's University in 1924. He attended a graduate engineering course of Westinghouse Electric and Manufacturing Company in East Pittsburgh and in 1925 he entered the engineering department of that company, where he remained for the next five years. In 1930

**B. G. Ballard,** M.E.I.C.

he joined the National Research Council of Canada and assumed charge of the electrical engineering laboratory. In 1948 he was made director of the Radio and Electrical Engineering Division.

During the war Mr. Ballard's activities were devoted mainly to defence work and in particular to the development of mine sweepers for enemy magnetic mines and the protection of ships against these mines. In recognition of his contributions in this field, he was awarded the Order of the British Empire in 1946.

Mr. Ballard is a past councillor and a past chairman of the Ottawa Branch of the Institute; a past chairman of the Ottawa Section of the American Institute of Electrical Engineers; a senior member of the Institute of Radio Engineers; and a member of the Association of Professional Engineers of the Province of Ontario and of the Professional Institute of the Civil Service of Canada. He joined the Engineering Institute in 1931 as an Associate Member, transferring to Member in 1940. He received the Ross Medal of the Institute in 1948 for his paper "Recent Canadian Radar".

**J. O. Martineau,** M.E.I.C., assistant chief engineer of the Department of Roads of the Province of Quebec, has been elected vice-president of the Institute to represent the Province of Quebec.

Mr. Martineau was born at Quebec City, and studied surveying at Laval University and civil engineering at Queen's University, graduating as a bachelor of applied science in 1915. After serving in Canada with the Fifth Company of the Canadian Engineers, he entered the service of the Department of Roads in 1916. In his present position he is also in charge of technical information, research and statistical information.

From 1936 to 1942 Mr. Martineau was a member of the Soil Investigation Committee of the U.S. National Research Council. He is presently a member of the

**J. O. Martineau,** M.E.I.C.

Associate Committee on Soil and Snow Mechanics of the National Research Council of Canada, and a member of the N.R.C. sub-committee on "muskeg".

Mr. Martineau is a member of Queen's Alumni Association and was chairman of the Quebec Branch in 1944. He is member of the Institute of Traffic Engineers; the Portland Cement Association; the Association of Asphalt Paving Technologists; and the Canadian Good Roads Association. He was a councillor of the Corporation of Professional Engineers of Quebec from 1940 to 1944; a provincial representative on the Dominion Council of Professional Engineers in 1942-43.

After serving actively in the Quebec Branch of the Engineering Institute of Canada, he was elected its chairman in 1945, and in 1950 was elected councillor of the Institute representing the Quebec Branch. He joined the Institute as a Member in 1935.

**N. B. Eagles,** M.E.I.C., has been elected vice-president of the Institute to represent the Maritime Provinces.

Mr. Eagles graduated from the University of New Brunswick in 1935, with the degree of B.Sc. in electrical engineering. He served in the R.C.A.F. during the same year as a provisional pilot officer. In 1936 he became associated with the City of Moncton as assistant department head in the electrical department.

He obtained a leave-of-absence in 1941 to accept a position as instructor in the

**N. B. Eagles,** M.E.I.C.

British Commonwealth Air Training Plan. After instructing for two years, he was appointed assistant chief ground instructor at the Elementary Flying Training School at Neepawa, Manitoba.

In 1944 Mr. Eagles returned to his former position with the City of Moncton, and in 1947 was transferred to the city engineer's office as assistant to the city engineer. He was appointed street commissioner and assistant engineer in 1948. In 1949 he became a registered professional civil and electrical engineer in the Province of New Brunswick, and during that year he was promoted to the position of assistant city engineer of the City of Moncton.

Mr. Eagles has been active in engineering affairs. In 1951 he was elected to the council of the Association of Professional Engineers of the Province of New Brunswick for a three-year term of office. During the past five years he has served on the executive of the Moncton Branch of the Institute. He was chairman of the Moncton Branch during 1950-51, and a councillor in 1952-53. He had joined the Institute in 1935 as a student, transferring to Junior in 1940 and to Member in 1942. He has served as vice-president for New Brunswick, of the Maritime Branch of the American Waterworks Association.

**H. A. Marshall,** M.E.I.C., industrial sales representative for Imperial Oil at Sydney, N.S., has been elected to represent the Cape Breton Branch on the Council of the Institute.

Mr. Marshall was born at Dartmouth, N.S. He received a B.Sc. degree from Dalhousie University in 1941, and went to Nova Scotia Technical College where he received a B.Eng. degree in 1943 in mechanical engineering. From 1943 to 1945 he was an engineer officer with the

Royal Canadian Navy. He was attached to the Directorate of Fuel, and served as port fuel officer at St. John's, Nfld., after following a lubrication course at the N.S. Naval Engineering Experimental Station

H. A. Marshall, M.E.I.C.

at Annapolis, Md. In 1945 he joined the Imperial Oil Limited, Maritime division, as an industrial sales and service engineer. He has worked in Halifax, Saint John and Sydney, advising industry on matters of lubrication.

Mr. Marshall was chairman of the Cape Breton Branch in 1952. He has taken an active interest since 1938 when he joined as a Student at Dalhousie. He transferred to Junior in 1943 and to Member in 1946.

Mr. Marshall is on the executive of the Mining Society of Nova Scotia. He is also a member of the Rotary Club of Glace Bay.

**John L. Cavanagh,** M.E.I.C., of New Glasgow, Nova Scotia, will represent the North Nova Scotia Branch on the Council of the Institute.

Mr. Cavanagh is president and general manager of the Malagash Salt Company Limited and a director of the Bank of Canada.

Born at New Glasgow, Mr. Cavanagh was educated in New Glasgow public

J. L. Cavanagh, M.E.I.C.

schools, at Dalhousie University and Nova Scotia Technical College. He graduated in mining engineering in 1911.

For three years he was employed as a mining engineer for the Wabana iron mines of the Nova Scotia Steel and Coal Company Limited. Following this he served as a captain in the Canadian Engineers from August 1914. He joined the Malagash Salt Company as a mine manager on completing his military service in 1918, and since 1947 has been president and general manager of the Company.

Mr. Cavanagh is a member of the New Glasgow Rotary Club; a member and past president of the Association of Professional Engineers of Nova Scotia, and a member of the Canadian Institute of Mining and Metallurgy. His support has also been given to the Engineering Institute, which he joined as a member in 1940.

**W. D. G. Stratton,** M.E.I.C., has been elected a councillor of the Institute to represent the Moncton Branch.

He is a past chairman of the Moncton Branch and a member of the council of the Association of Professional Engineers for the Province of New Brunswick.

Mr. Stratton is district airway engineer for the Maritime District, Department of Transport, Air Services Branch, at Moncton, N.B.

Born in Saint John, N.B., he received his early education there. He graduated in civil engineering from the University of New Brunswick in 1929 and then worked for several years with the Bell Telephone Company at Ottawa and Montreal. From 1934 to 1935, he was inspector of drilling and dredging with the Dominion Department of Public Works at Saint John, and from 1936 he acted as resident engineer for the New Brunswick Highway Division.

In 1940 he joined the civil aviation branch of the Department of Transport at Saint John, N.B., as resident engineer, and in 1949 was appointed district airway engineer at Moncton, N.B.

Mr. Stratton joined the Institute as a Student in 1929, transferring to Junior in 1936, to Member in 1940.

**E. C. Bannerman,** M.E.I.C., will represent the Northern New Brunswick Branch on the Council of the Institute.

Mr. Bannerman is plant engineer for the Bathurst Power and Paper Company, Bathurst, N.B.

W. D. G. Stratton, M.E.I.C.

Born and educated at Sydney, N.S., he went on to Mount Allison University and Nova Scotia Technical College. He received a B.Sc. degree in mechanical engineering in 1930.

He spent three years in engineering sales for Wm. Stairs Son & Morrow, Halifax. He

G. Demers, M.E.I.C.

went to the Dominion Steel and Coal Company then, working from 1933-41 in the maintenance, construction and engineering department.

He was overseas from 1941-1945 with the R.C.E.M.E., serving in England, the Mediterranean and in North West Europe. He returned to the Iron and Steel Division of "Dosco". He joined the Bathurst Power and Paper Company in 1946.

Mr. Bannerman has been on the executive of the Northern New Brunswick Branch since its inauguration in 1953. He joined the Institute as a Member in 1947.

**G. Demers,** M.E.I.C., consulting engineer, will serve on the Council of the Institute representing the Quebec Branch.

Mr. Demers is from Montreal, a graduate in civil engineering from the Ecole Polytechnique, class of 1935. He worked for a time with the Roads Department of the Province of Quebec, first as resident engineer and then as division

E. C. Bannerman, M.E.I.C.

engineer at Carlton, Quebec. In 1939 he took charge of the office of Zachée Langlais, consulting engineer, in Quebec. He opened his own consulting engineering office in Quebec in 1942 and has since been practicing as such.

Mr. Demers is a vice-president of the Corporation of Professional Engineers of Quebec. His support of the Quebec Branch of the Institute has been extensive. He served on the executive in 1950 and 1951, and was elected Branch chairman in 1952. He joined the Institute in 1936 as a Junior, transferring to Member in 1946.

**G. N. Martin,** M.E.I.C., combustion sales engineer of Dominion Bridge Company Limited, Lachine, Que., will serve on the Council of the Institute representing the Montreal Branch. He is a former chairman of the Branch.

Mr. Martin was born at Lachine, Que., receiving his primary education at the Mont St. Louis College and graduating from the Ecole Polytechnique in 1934. The greater part of his engineering career has been spent with the Dominion Bridge Company Limited which he joined in 1935.

From 1938 to 1940, however, he was in England, first with the International Combustion Limited, and then with Central Electricity Board, for the purpose of gaining experience in the boiler field. He was also released from Dominion Bridge for two years during the war for special work with the Aluminum Company of Canada Limited.

Mr. Martin is a member of the Corporation of Professional Engineers of Quebec, the Canadian Boiler Society, the American Boiler Manufacturers' Association, the American Society of Heating and Ventilating Engineers and The American Society of Mechanical Engineers. He joined the Engineering Institute as a Junior in 1937, transferring to Member in 1944. He won the Institute's Phelps Johnson Prize in 1942, and served as vice-chairman of the Montreal Branch in 1952, and as Branch chairman in 1953.

**R. B. Wotherspoon,** M.E.I.C., has been elected to the Council of the Institute representing the Montreal Branch.

Born at Port Hope, Ontario, Mr. Wotherspoon attended Trinity College School, and in 1935 graduated from the Royal Military College at Kingston. He then spent two years in England training in the Royal Engineers, British Army, at the School of Military Engineering and Cambridge University. On his return, he was for three years an assistant superintendent for The Steel Company of Canada's drop forge works at Gananoque, Ontario.

This was followed by six years of war service with the Royal Engineers, during three years of which he was on loan to the Ministry of Supply for work in the armaments inspection and tank design departments.

**R. B. Wotherspoon, M.E.I.C.**

Mr. Wotherspoon became a project engineer with Dominion Textile Company in Montreal in 1946. In January 1953 he joined the Aerocrete Construction Company. On March 1, 1954 he started in a new position as engineer on the new Tyrelene fibre project of the Imperial Chemical Industries of Canada, at Montreal.

Mr. Wotherspoon's service to the Montreal Branch has been great. He was secretary-treasurer from 1949-1952. He joined the Institute as a Junior in 1939, transferring to Member in 1947.

**G. N. Martin, M.E.I.C.**

**D. Ross-Ross,** M.E.I.C., has been re-elected to the Council of the Institute to represent the Cornwall Branch.

Mr. Ross-Ross is from Montreal, where he studied at Wyckem House, Macdonald College Day School, and McGill University, graduating in mechanical engineering in 1917.

He joined the Royal Canadian Navy that year, and after a year at sea was placed in charge of all engine room instructional work at H.M.C. Dockyard, Halifax, in June, 1918. He taught in Central Technical School, Toronto, for a time in 1919 before joining Dominion Rubber Company in 1920. He worked as an industrial engineer and as assistant mechanical superintendent of the Company until 1925, when he went to the Howard Smith Paper Mills Ltd., as a specialist on steam problems. He became chief industrial engineer in 1930 for the Howard Smith Paper Mills Ltd., and associated companies, taking charge of cost accounting of the Company in 1931, and of the purchasing department in 1932. During the war, on loan from his work, he performed numerous duties at Cornwall. He was personnel supervisor for the Cornwall Division in 1941-1946 and for several years was chairman of the Personnel Committee of the Fine Paper Industry. In 1946 he resumed his prewar position of chief industrial engineer, in charge of industrial engineering of all mills and job evaluation.

He has done consulting work in the past for Empire Cotton Mills Ltd., for Allied War Supplies Corporation, Canadian Car Munitions Ltd., and some other companies.

Mr. Ross-Ross has published approximately 15 papers on such subjects as industrial engineering, steam generation and consumption in the pulp and paper industry, maintenance cost control, and personnel work.

Mr. Ross-Ross was elected chairman of the Cornwall Branch at its inauguration in 1946. He joined the Institute as a Student in 1916, transferring to Junior in 1918, to Associate Member in 1921, to Member in 1933. He has been on the Council since 1950, representing the Cornwall Branch. He is also a member of the Association of Professional Engineers of Ontario.

His active support is given, also, to public educational projects. He has been a trustee of the Cornwall Public Library for 10 years. He was chairman of the Township of Cornwall Public School Area Board in 1952, and vice-chairman in 1953. He also served for four years as a trustee of the Cornwall Public Schools Board.

**Dr. J. J. Green,** M.E.I.C., chief of Division "B" of the Defence Research Board, and scientific adviser to the Chief of the Air Staff of the Royal Canadian Air Force, will serve on the Council of the Institute as representative of the Ottawa Branch. He is a past-chairman of the Branch.

Dr. Green was born in Portsmouth, England. He received his early education

**D. Ross-Ross, M.E.I.C.**

at the Portsmouth Municipal College, from which he graduated with a B.Sc. degree as an external student of London University.

In 1926 he proceeded to London University — Imperial College of Science and Technology — Royal College of Science, graduating in 1928 with first class honours in physics, B.Sc. (London) and A.R.C.S. degrees. He received the Imperial College Governors' Prize in physics awarded annually to the first student on the graduating list.

Post-graduate study and research in aeronautical engineering at the Imperial College followed, during which time Dr. Green held a Busk studentship in aeronautics and later a Beit fellowship in scientific research. He received the D.I.C. degree from this College in 1929 and a Ph.D. (engineering-aeronautics) degree from London University in 1930.

From 1930 to 1943 Dr. Green was on the staff of the Division of Mechanical Engineering of the National Research Council, latterly as head of the aerodynamics section.

In 1943 he was commissioned as squadron leader in the R.C.A.F. and appointed chief research engineer at the R.C.A.F. Test and Development Establishment in Rockcliffe. That same year he received the M.B.E. for valuable public service in the field of scientific research, and two years later the King's Commendation for valuable service in the air.

Dr. Green was appointed chief research aeronautical engineer of the newly-formed Air Transport Board in 1945, and was responsible for technical studies and advice to the Board until 1949 when he was appointed to his present position.

He was elected to Fellowship in the Royal Aeronautical Society in 1948, and two years later, he was named a Fellow of the Institute of the Aeronautical Sciences.

Dr. Green learned to fly in 1934 and took advanced flying training with the R.C.A.F. During his war service as chief research engineer at the Test and Development Establishment, he continued to fly on test pilot duties. He has taken an active part in civil flying, serving a term as president of the Ottawa Flying Club, and treasurer of the Royal Canadian Flying Clubs Association.

Dr. J. J. Green, M.E.I.C.

His professional career has been concerned with testing, research and development in aeronautics, and since his appointment to the Defence Scientific Service, his responsibilities and interests have been extended to include the field of armaments, as well as other technical subjects of growing interest and importance to defence.

Dr. Green has contributed a number of papers to the *Engineering Journal.* Others have appeared in the *Philosophical Magazine*, the Reports and Memoranda of the Aeronautical Research Council (England), *The Canadian Journal of Research*, the *Royal Aeronautical Society Journal*, and the *Journal of the Aeronautical Sciences*.

Dr. Green's membership in the Institute dates from 1945. Meanwhile he has been associated closely with the work of the Institute serving on the Ottawa Branch executive, and as its chairman.

**A. R. Hailey,** M.E.I.C., will continue to represent the Peterborough Branch on the Council of the Institute.

As supervisor, motor control engineering, of Canadian General Electric, at Peterborough, Mr. Hailey supervises design and drafting of large induction motors, high speed synchronous motors and generators, exciters, welding generators and welding electrodes. He received this appointment following company reorganization in January 1954. He had previously been manager of engineering for the Induction Motor Department, an appointment received in March 1953.

Born at Vancouver, B.C., Mr. Hailey attended the University of British Columbia, where he received a B.A.Sc. degree in electrical engineering in 1941. Upon graduation he accepted employment with Canadian General Electric in Peterborough in the test course. In 1942 he was appointed a design engineer in what is now the motor and generator engineering division, Peterborough Works, and has since then been closely associated with the design of d-c. rotating machinery and synchronous motors and generators.

Mr. Hailey joined the Institute as a Junior in 1942, becoming a Member in 1949. His service to the Institute has been extensive, as will be indicated by a list of the offices he has held: chairman of the Junior Section of the Peterborough Branch, 1943, secretary-treasurer of the Branch, 1946, chairman of the meetings and papers committee, 1948, chairman of the Branch, 1949, councillor, 1952-1953. He has also served as secretary-treasurer of the Canadian General Electric Test Alumni Association, and is a Member of the Association of Professional Engineers of Ontario.

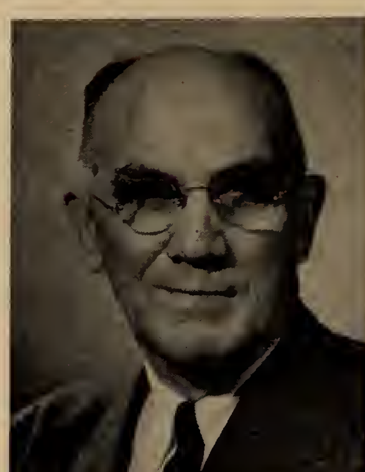
A. R. Hailey, M.E.I.C.

**John G. Hall,** M.E.I.C., district manager and director of the Combustion Engineering Corp. Ltd., in Toronto, has been elected a councillor of the Institute.

Mr. Hall is from Cornwall, Ont., where he received his elementary and high-school education. He studied mechanical engineering at McGill University, Montreal, receiving the degree of B.Sc. in 1921.

After following a student apprenticeship course at the Grand Trunk Railway, Mr. Hall worked for the Back River Power Company, Montreal. Joining Combustion Engineering Corp. Ltd., in 1924, he worked in the Winnipeg Office from 1924-1927; in the Montreal Office from 1927-1940.

He has been in Toronto since 1940. There Mr. Hall has taken an active interest in the work of the Institute. He served on the Toronto Branch executive in 1949-50; as vice-chairman in 1952 and as chairman in 1953. He joined the Institute in 1919 as a Student, transferring to Associate Member in 1924, to Member in 1931.



John G. Hall, M.E.I.C.

**Paul E. Buss,** M.E.I.C., who has been representing the Niagara Peninsula Branch on the Council since 1946, has been re-elected for a fifth term.

Mr. Buss, president of Spun Rock Wools Ltd., Thorold, Ont., is originally from Three Rivers, Michigan. He received his engineering education at the University of Michigan.

During World War I, he served with the United States Army Engineers in France. Mr. Buss was employed on the engineering staff of Provincial Paper Limited on construction of the first sulphate plant at the head of the lakes at Port Arthur, Ont. He later worked on the engineering staff of Dominion Engineering Works, and for a number of years was plant engineer at the Thorold division of Provincial Paper Limited. During 1932-33 he and his brothers carried on experiments in developing the new process for producing rock wool by the spinning method. He is now president of Spun Rock Wools Limited at Thorold.

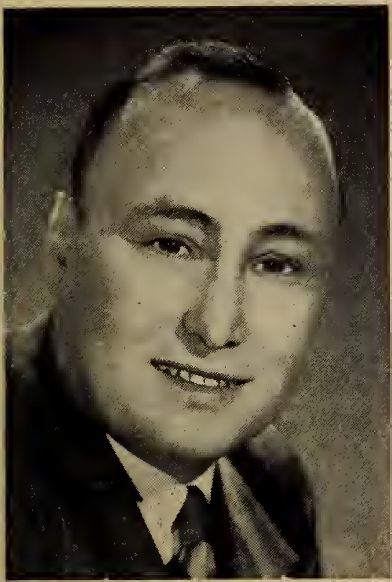
Mr. Buss joined the Institute as an Associate Member in 1927 becoming a Member in 1940. His helpful association with the work of the Institute dates back to 1931 when he was elected secretary-treasurer of the Niagara Peninsula Branch. He was chairman of the Branch in 1935.

P. E. Buss, M.E.I.C.

**M. A. Montgomery,** M.E.I.C., has been re-elected as councillor representing the Kitchener Branch of the Institute. Mr. Montgomery is sales manager of Canadian Blower and Forge Company, Kitchener.

Born in Prince Albert, Sask., he studied mechanical engineering at the University of Saskatchewan, graduating with a B.Sc. degree in 1934. He was a sales engineer for Sarco Canada Ltd., Toronto, from 1935 to 1937.

He joined the Canadian Blower and Forge Company Limited sales staff in 1937 in the Montreal District. From 1942 to 1945 he served as an engineer officer in the Royal Canadian Navy, Construction Directorate. Returning to Canadian Blower and Forge Company Limited, he moved to Kitchener where he held the position of assistant sales manager for engineering



M. A. Montgomery, M.E.I.C.

products. He was appointed sales manager in August, 1951, and in January, 1952, he was appointed to the board of directors of the Company.

Actively associated with the Engineering Institute, he was elected the first chairman of the Kitchener Branch, on its inauguration in 1950. He represented the Branch on the Council in 1952-53. He joined the Institute in 1938 as a Junior, transferring to Member in 1949. He is also a member of the Kitchener Chamber of Commerce, the Association of Professional Engineers of Ontario, and the Gyro Club.

**Norman A. Eager,** M.E.I.C., vice-president and general manager of the Burlington Steel Company Limited at Hamilton, Ontario, will represent the Hamilton Branch on the Council of the Institute. He is a past chairman of the Branch.

Mr. Eager is a director of his Company. In 1952 he was appointed to the Hamilton Advisory Board of the Huron and Erie Mortgage Corporation and the Canada Trust Company. He is also a director of the Pilot Insurance Company.

Born at Montreal, Que., he received his engineering education at McGill University where he obtained the degree of B.Sc. in 1922, and at Cornell University where he received his M.C.E. degree the following year. On graduating, he worked for the Church Ross Construction Company in Montreal, after which he was a design and sales engineer for the Canadian Vickers Company. In 1926 he joined the Shawinigan Water & Power Company with whom he worked for fifteen years, being appointed to the position of power sales research engineer. In 1940 he went with the Burlington Steel Company, Hamilton, Ont., as assistant sales manager. He was appointed sales manager in 1944.

Mr. Eager joined the Institute as a Junior in 1925, transferring to Associate Member in 1934 and becoming a Member in 1940. In addition to his considerable service to the Institute, he has been active in the Canadian Construction Association, and the Canadian Institute of Steel Construction.

**Frederic Alport,** M.E.I.C., will be a member of the Institute's Council, representing the Huronia Branch.

It was largely with Mr. Alport's help that this Branch was formed during 1953 and inaugurated in September 1953, and he was the first chairman. He has been a Member of the Institute since 1940.

Born in Orillia, he received his early

Frederic Alport, M.E.I.C.

education there. He studied civil engineering at the School of Applied Science of the University of Toronto.

He worked for the National Transcontinental Railway on location for six years before returning to the University, where he obtained a B.A.Sc. with honours in 1913, specializing in sanitary and municipal engineering.

He did land survey work in British Columbia, and qualified in 1914 as a Dominion Land Surveyor, and a Manitoba Land Surveyor.

During the first World War Mr. Alport served in France with the Canadian Engineers, as staff captain of the 4th Canadian Engineers Brigade. He was

N. A. Eager, M.E.I.C.

awarded the Military Cross, and was twice mentioned in despatches.

On returning from military service Mr. Alport worked on construction for Stone and Webster, and with Holbrook, Cabot and Rollins, New York; with George A. Fuller, of New York, and with Patrick McGovern, Inc., of New York. Joining the firm of Curran and Briggs, Toronto contractors, in 1934, he was construction superintendent in charge of road work and bridges. He went to the Department of Public Works in 1934, working in Toronto as an assistant engineer, and going to Halifax as a senior assistant engineer in 1938. In 1936 he received the degree of Civil Engineer from the University of Toronto.

The Department of National Defence employed Mr. Alport as a consulting engineer to the director of Naval Service. He was on loan from the Public Works Department, which later stationed him in Ottawa. There he acted as representative of the Department on the Lake of the Woods Control Board, and has handled administrative work of the Northwest Territories, including the Yellowknife projects. He was a member of the special committee of three appointed by the Minister of Transport to study and report on the St. Lawrence deep water channel from Montreal to the sea. In 1946 Mr. Alport was awarded the Order of the British Empire for distinguished service.

Mr. Alport went into private practice in Orillia, in 1947, specializing in harbour works, tunnels, foundations, water supply and sewage disposal.

**Edwin W. Dill,** M.E.I.C., of Polymer Corporation Limited, has been re-elected as councillor of the Institute, representing the Sarnia Branch.

Mr. Dill graduated in mechanical engineering with the degree of B.A.Sc. from the University of Toronto, class of 1928. In the early years of the war, he was engaged on general plant engineering with the Welland Chemical Works, an important explosives manufacturing plant in the Niagara Falls area. He left there in 1924 to work on the design of the steam and power plant for Canada's new synthetic rubber industry, in the office of the designers, H. G. Acres and Co. On completion of construction he assumed the position of steam and power plant superintendent. Two years ago, Mr. Dill left the more strictly engineering phases of industry to go into industrial relations work and is now assistant manager of the

E. W. Dill, M.E.I.C.

Industrial Relations Division, of Polymer Corporation Limited.

Mr. Dill's efforts on behalf of the Engineering Institute have been effective. He was one of a committee of three appointed to inquire into the feasibility of forming a branch in Sarnia; and he is a charter member of the Sarnia Branch, serving on the executive for several years and as vice-chairman. He has served on the Council since 1952. He joined the Institute as a Student in 1929, transferring to Associate Member in 1938, and to Member in 1940. Active in local civic affairs, Mr. Dill has served on the Sarnia Hospital Board of Commission as a member and as chairman. Mr. Dill contributed greatly to the efforts in getting construction started on a modern new hospital which is to receive its official opening in March of this year.

**C. W. Boast**, M.E.I.C., of Kapuskasing, Ont. has been elected to the Council of the Institute to represent the North Eastern Ontario Branch.

Mr. Boast was born at Richmond, Que., and graduated from McGill University in civil engineering in 1917.

Following graduation, he accumulated experience on varied civil and mechanical engineering projects in both Canada and the United States, principally in design and construction of industrial buildings, concrete storage and power dams and materials handling equipment. He became associated with the pulp and paper industry in 1921 when he joined the Kimberley-Clark Corporation of Neenah, Wisconsin. He is now chief engineer of Spruce Falls Power and Paper Company Limited, an associate company of Kimberley-Clark, at Kapuskasing.

Mr. Boast has been associated with the Institute since graduation, transferring to Associate Member in 1922, and to Member in 1940. He is also a member of The Association of Professional Engineers of Ontario.

C. W. Boast, M.E.I.C.

**D. C. Holgate**, M.E.I.C., manager of the Sault Structural Steel Company Limited, has been re-elected a councillor of the Institute representing the Sault Ste. Marie Branch.

Born in Montreal, he attended Acadia University, receiving a B.A. degree in mathematics in 1935. He attended McGill University in Montreal, graduating in 1938 with the degree of B.Eng. in civil engineering.

He joined the staff of Dominion Bridge Company Limited in Toronto in 1939, and was transferred to the Sault Structural Steel Company Limited, a subsidiary, in 1941. The company recently announced his appointment as manager.

Mr. Holgate was secretary-treasurer of the Sault Ste. Marie Branch in 1947, and chairman in 1949. He joined the Institute in 1942 as a Junior, transferring to Member in 1947. He is also a member of the Association of Professional Engineers of Ontario.

**C. P. Haltalin**, M.E.I.C., of the Winnipeg Electric Company has been elected a

D. C. Holgate, M.E.I.C.

Councillor of the Institute representing the Winnipeg Branch.

Mr. Haltalin was born in Winnipeg, and ireceved his general education at Daniel McIntyre Collegiate. He attended the University of Manitoba, graduating in 1929 with the degree of B.Sc. in electrical engineering.

His association with the electric utilities

C. P. Haltalin, M.E.I.C.

commenced soon after graduation, when he worked on substation design under E. V. Caton, M.E.I.C., then chief engineer of electric utility, at the Winnipeg Electric Company. His advancement can be traced in a list of the positions he has held: junior engineer, assistant electrical engineer, supervisory engineer, and chief electrical engineer. In 1953 he was appointed manager of the operating division of Winnipeg Electric Company.

Associated with the work of the Engineering Institute for many years, Mr. Haltalin was chairman of the Winnipeg Branch in 1945. He joined as a Student in 1927, transferring to Associate Member in 1934 and to Member in 1940. He is a member of the Winnipeg Kiwanis Club.

**Junius Jonsson**, M.E.I.C., has been elected a councillor of the Institute to represent the Saskatchewan Branch.

Mr. Jonsson was born and educated in Iceland. He came to Canada in 1900, and from 1901 until 1908 he was assistant to the late H. B. Proudfoot, D.L.S. During this time he worked in Manitoba, Saskatchewan and Alberta on timber birth sur-

Junius Jonsson, M.E.I.C.

veys, townsite surveying, bridge and subway location surveys and waterpower surveys.

He joined the engineering staff of the city of Saskatoon in 1908, under Chipman and Power, consulting engineers, who at that time were installing the public utilities for the city. He later became assistant city engineer and held that position until 1921. From 1921 to 1953 he was city engineer and superintendent of utilities for the City of Prince Albert. He retired in 1953.

Mr. Jonsson joined the Engineering Institute of Canada, as an Associate Member, in 1920 and became a Member in 1938. He has served on the executive of the Association of Professional Engineers of Saskatchewan and is a member of the Western Canada Water and Sewage Conference.

**H. R. Hayes**, M.E.I.C., has been elected to represent the Calgary Branch on the Council of the Institute.

Mr. Hayes is the general supervisor of standards at the Head Office of Burns & Co. Limited in Calgary. He was first employed by this meat packing firm in 1937 as supervisor at the Edmonton Plant. In 1940 he was promoted to his present position which deals with the administration of the cost control plan in the company's seven plants. This includes plant layout, operating methods, procedures, and schedules primarily from the economic standpoint. He sits on the company's committee for union negotiations, as well as acting in an advisory capacity for subsidiary companies. He was closely associated with the team who developed the company's pension insurance and welfare plans.

Originally from Gleichen, Alta., Mr. Hayes graduated in 1934 from the University of Alberta with an honours degree of B.Sc. in civil engineering and was awarded the prize of the Association of Professional Engineers of Alberta. Following graduation, he returned to the maintenance of way department of the Canadian Pacific Railway where he had been employed previously as an undergraduate. His early engineering work with the Railway was with the water service branch. He was subsequently employed as transitman at Calgary, Lethbridge, Edmonton and Medicine Hat.

He served as chairman of the Calgary Branch of the Institute in 1951-52, and on the executive in two previous years, as well as being chairman of the program committee.

**J. M. Campbell**, M.E.I.C., has been elected to represent the Lethbridge

H. R. Hayes, M.E.I.C.

J. M. Campbell, M.E.I.C.

Branch on the Council of the Institute.

Mr. Campbell was born and educated in Dumfermline, Scotland. He trained as an engineer in Scotland with the Fife County Council, as a pupil to the road surveyor and master of works, and he came to Canada in 1907.

He worked for the Canadian Pacific Railway at Souris, Man., from 1907, and became a division engineer at Kenora, Ont. in 1912. During World War I, from 1916-1919, he served as lieutenant with the 12th Battalion Canadian Railway Troops in France.

Returning to the C.P.R. after the war he continued his remarkable career in railway engineering in Western Canada. He served the company as division engineer in Winnipeg, Moose Jaw and at Lethbridge. Mr. Campbell retired from the position of division engineer at Lethbridge in 1952.

Mr. Campbell's association with the Institute dates from 1920, when he became an Associate Member. He transferred to Member in 1940.

**N. J. Allison,** M.E.I.C., of the International Pipe Line Company in Edmonton and chairman of the Edmonton Branch of the Institute has been elected to the Council of the Institute representing the Edmonton Branch.

Mr. Allison was born in Paisley, Scotland. He received his formal education at Paisley Grammar School, Strathallan School, the Paisley Technical College in Scotland and the Liverpool Technical College in England. He is the holder of the British Board of Trade Extra First Class Certificate, and the British Board of Trade First Class Motor Certificate.

He served his apprenticeship as engineer in the shops and drawing office of Thos. Reid & Sons in Paisley, and the Fairfield Shipbuilding & Engineering Co. Ltd. in Glasgow, Scotland.

In 1927 he was employed by Blue Star Line (1920) Ltd. of London as seagoing engineer in charge of watch on steam reciprocating, turbine and diesel-engined ships, as well as on refrigeration machinery. Six years later he returned to Thos. Reid & Sons in Paisley as draughtsman on design of marine auxiliaries. In 1934 he joined the Anglo-Iranian Oil Co. Ltd. as assistant engineer on the oil processing plant construction and general oil field maintenance in Iran. The following year he entered Kuwait Oil Co. Ltd. as mechanical engineer in Kuwait on general construction, maintenance and development of a new field.

In 1940 he joined the Royal Indian Naval Reserve in New Delhi as equipment officer at Naval Headquarters. He was responsible for speeding shipbuilding for the Royal Indian Navy, modifying internal arrangements of ships and planning shore bases. During 1942-1944 he was in charge of planning construction and of operating the landing craft base at Bombay and of training personnel required for that base.

In 1944 he returned to Anglo-Iranian Oil Co. Ltd. and served as field engineer at Gach Saran, and superintendent engineer at Kuwait, Masjid-i-Sulaiman, Lali, Haft Kel, White Oil Springs and Ahwaz fields. By 1947 he became fields mechanical engineer responsible for mechanical engineering, construction and maintenance, including welding and mobile plants in all oil fields in Iran.

He entered the producing department of Imperial Oil Limited in 1948 as construction and maintenance engineer. He has been in his present position since February, 1949.

In addition Mr. Allison has recently joined the Royal Canadian Naval Reserve with the rank of commander (E) and has been appointed engineer officer of H.M.C.S. *Nonsuch*.

Mr. Allison is a member of the Institute of Marine Engineers, and of the Institution of Engineers and Shipbuilders in Scotland, and of the Association of Professional Engineers of Alberta.

As a member of the executive of the Edmonton Branch, and as chairman in 1953, Mr. Allison's interest in the work of the Institute has been effective. He joined as a Member in 1948.

**S. H. de Jong,** M.E.I.C., has been elected as councillor of the Institute representing the Vancouver Branch.

Mr. de Jong is associate professor in the Department of Civil Engineering at the University of British Columbia. He is in charge of surveying instruction.

He was born at East Kildonan, Man. and graduated from the University of Manitoba in 1931 with a B.Sc. degree in civil engineering. He received his M.Sc. degree from this university in 1940.

Mr. de Jong was associated from 1927-1931 with the Engineering Department of the Manitoba Good Roads Board and from 1931 to 1935 he was employed as a demonstrator in the civil engineering department of the University of Manitoba. He then worked on topographical survey with the Department of Mines and Resources.

In 1941 he joined the staff of the University of Toronto, Department of Civil Engineering, as a demonstrator and lecturer. He went to the University of British Columbia in 1945.

Mr. de Jong's summer work has included a variety of experience, as a designing draughtsman for H. G. Acres and Co., on reinforced concrete design of the Shipshaw power plant, on the staff of the City Planning Board of Toronto, and as a designer of power plant sub-structures for the Ontario Hydro. He has done topographic surveys for the Department of Lands and Forests of B.C., and for the Department of Mines and Resources. He has carried out miscellaneous land survey and private practice in professional engineering work since 1950. He contributed a technical article to the Engineering Journal in June 1943.

Mr. de Jong is a special examiner for the Board of Examiners, Dominion Land Surveyors; a member of the Canadian Institute of Surveying and Photogrammetry and of the American Society of Photogrammetry.

He has been an active member of the Institute, serving as secretary-treasurer of the Toronto Branch from 1941 to 1945, and chairman of the Vancouver Branch in 1951. He joined the Institute in 1936 as a Junior, transferring to Associate Member in 1937, and to Member in 1940. He is also chairman of the Vancouver Branch of the Community Planning Association of Canada.

N. J. Allison, M.E.I.C.

S. H. de Jong, M.E.I.C.

# *Personals*

## News of the Personal Activities of Members of the Institute

**C. W. West,** M.E.I.C., director of canal services of the Department of Transport, has been appointed deputy minister succeeding J. C. Lessard, who has retired.

In his new position he will have jurisdiction over marine services, canal services, steamship inspection, steamer operation, St. Lawrence ship channel, all administrative branches and the special projects branch of the department.

Mr. West is an honour graduate of the University of Toronto in hydraulic engineering, class of 1915.

During the first World War he served with the Canadian Infantry and the Canadian Engineers. After demobilization he was appointed senior assistant and then division engineer in charge of construction of sections 3, 4 and 4b of the Welland Ship Canal in the Department of Railways and Canals.

In 1933 he organized the operation staff of the Welland Ship Canal and became the first superintending engineer, which position he held until 1947 when he was transferred to Ottawa as director of canal services.

**David B. Steinman,** M.E.I.C., New York City consulting engineer, has retired from his office and membership on the State Board of Examiners for Professional Engineers on which he served for more than 24 years. His retirement also marks the completion of 25 years of leadership in the State Society during which period he founded the National Society of Professional Engineers and helped to secure the enactment and strengthening of engineers' registration laws.

**D. A. Livingston,** M.E.I.C., of Vancouver. B.C., has been appointed engineer of construction on the extension of the Pacific Great Eastern Railway southward through West Vancouver.

Mr. Livingston, who has worked on railway projects from one end of Canada to the other, spent six years planning and building the Quebec North Shore Labrador line.

He is a Life Member of the Engineering Institute.

**W. A. James,** M.E.I.C., was recently appointed chief engineer of Imperial Tobacco Company of Canada, Limited.

A graduate of McGill University in civil engineering, class of 1927, and a past student of the Massachusetts Institute of Technology, Mr. James has been in the employ of this company for 25 years. He has risen through various branches of the engineering department, and prior to his present appointment, was chief construction engineer since 1945.

Mr. James is a member of the Association of Professional Engineers of Ontario and of the Corporation of Professional Engineers of Quebec.

**Dr. D. R. Stanley,** M.E.I.C., partner in Associated Engineering Services Ltd., consulting engineers, Edmonton, presented a paper at a convention of the American Society of Civil Engineers, in Atlanta, Georgia, in February, 1954. He spoke on research work which he conducted on water filtration using radioactive tracers.

Dr. Stanley is a graduate of the University of Alberta in civil engineering, and received master of science and doctor of science degrees from Harvard University.

**Dr. G. G. Meyerhof,** M.E.I.C., has been appointed to the position of supervising engineer in the Montreal office of the Foundation of Canada Engineering Corporation Limited.

He has also recently been awarded the Research Medal of the Institution of Structural Engineers, England, for his foundation research and its application to structural design. Dr. Meyerhof presented a paper on these studies to the Montreal Branch of the Engineering Institute in January, 1954, and this was published in the *Engineering Journal* in February, 1954.

**E. A. Kelly,** AFFIL. E.I.C., manager of Sault Structural Steel Co. Limited, since 1940, will work with the Company in a consulting capacity. Having been with the Dominion Bridge organization for 50 years, his industrial experience and intimate knowledge of the growing Northern Ontario area will continue to be of service. Mr. Kelly's successor as manager is D. C. Holgate, M.E.I.C.

**Stirling Ross,** M.E.I.C., B.C. Telephone Company staff engineer, has retired after completing 50 years of service in the telephone industry.

Mr. Ross was born in Renfrew, Ont. He went to work for the Northern Electric Company "in the days when it was considered ridiculous to telephone across the street when you could walk, and when telephone men earned about 17 cents an hour".

Mr. Ross joined the B.C. Telephone Company in Vancouver in 1909 and during the next 43 years played a major role in the design and installation of all central office exchange equipment in the company's system.

Starting as switchboard installation foreman, Mr. Ross was made superintendent of switchboard construction in 1922, and in 1924 was appointed equipment engineer. In 1944 he assumed the dual position of equipment and building engineer, and a year ago was appointed a staff engineer in charge of special projects. As equipment and building engineer, he was largely responsible for the design and erection of all company buildings between 1944 and 1951.

Mr. Ross was a member of the Point

E. A. Kelly, Affil.E.I.C.

Stirling Ross, M.E.I.C.

FAG

Grey School Board of which he was the last chairman before amalgamation in 1929, and of the Point Grey Town Planning Commission. He played an important part in the construction of various schools in that area. Among these was the Point Grey Junior High School.

Mr. Ross organized B.C. Chapter 53 of the Telephone Pioneers of America and served as its first president.

He is a member of the Professional Engineers of British Columbia.

**J. A. Tod,** M.E.I.C., supervising engineer for the Kitchener-Galt-Guelph section of the Bell Telephone Company of Canada, has been elected chairman of the Kitchener Branch of the Engineering Institute for the coming term.

Mr. Tod was born at Neepawa, Man. He received his general education at the high school in Newmarket, Ont., and afterwards entered the University of Toronto where he received his B.A.Sc. degree in civil engineering in 1943. While attending university he was employed during the summer months as instrumentman on road construction and on plant layout work. He also worked with the Canadian National Railways in Montreal.

Upon graduation he joined the Royal Canadian Engineers and served as works officer at Sydney, Windsor and Halifax, N.S. He was subsequently posted to Ottawa as staff officer with the Directorate of Works and Construction. In 1946 he was discharged with the rank of captain.

He then joined the Bell Telephone Company of Canada in London, Ont., where he was employed on outside plant engineering. He was appointed to his present position in 1953.

Mr. Tod is a charter member of the Kitchener Branch and has served on the executive since its inauguration, his more recent office being that of vice-chairman in 1952-53.

**Herbert E. Pawson,** M.E.I.C., has retired as commercial manager of Power Corporation. He had completed 30 years of service with Southern Canada Power Company and Power Corporation.

Mr. Pawson was active in the Canadian Electrical Association, and served as its president in 1947-48.

**R. E. Hayes,** M.E.I.C., manager of the engineering department of The General Supply Company of Canada Ltd., has been elected chairman of the Ottawa Branch of the Engineering Institute.

Mr. Hayes is a native of Ottawa. After attending Lisgar Collegiate, he entered McGill University, graduating with a B.Sc. degree in engineering in 1924.

R. E. Hayes, M.E.I.C.

For a year and a half after graduation was employed on the sales staff of Messrs. Peacock Brothers Limited in Montreal. Then in May, 1925, he joined the staff of the engineering department of the head office of The General Supply Company of Canada Ltd. in Ottawa.

Mr. Hayes is a member of the Corporation of Professional Engineers of Quebec, and of the Association of Professional Engineers of Ontario.

**E. G. Carty,** M.E.I.C., general executive assistant in the Department of Transport, retired recently after almost 40 years of service with the government.

Born in Dublin, Ireland, Mr. Carty received his preliminary education in private schools. He attended the City Guilds of London Technical College from which he obtained diplomas in mechanical and electrical engineering. Mr. Carty was awarded a Yarrow scholarship by the Institution of Engineers, following which he attended evening classes at Liverpool University. He received his associate membership in the Institute of Civil Engineers in 1907, and the following year his B.Sc. degree in engineering with first class honours from the University of London.

He came to Canada in 1907 and was first associated with the general contracting firm of MacArthur Perks Co. Ltd. of Ottawa in connection with the Georgian Bay Ship Canal project. In 1913-14 he was assistant engineer with the 31-Mile Lake water scheme of the City of Ottawa.

After serving first with the Naval Intelligence and later as captain in the Canadian Expeditionary Forces in World War I, Mr. Carty was associated for different periods with the Department of the Interior, as assistant engineer in the Grand Trunk Railway, and with the Civil Service Commission on arbitration valuations. In 1921 he joined the Department of Railways and Canals which later formed part of the Department of Transport on its formation in 1936.

Mr. Carty is a Life Member of the Engineering Institute.

**Robert Cheyne Eddy,** M.E.I.C., sales manager and director of George Eddy Company Limited, has been appointed chairman of the Northern New Brunswick Branch of the Engineering Institute.

R. C. Eddy, M.E.I.C.

Mr. Eddy was born in Bathurst, N.B. After graduating from the local high school in 1936, he entered the University of New Brunswick for one year before proceeding to Queen's University where he received the B.Sc. degree and medal in 1941.

After graduation he undertook post graduate work at the University of Michigan and at Queen's University, but interrupted these studies to join the Royal Canadian Engineers in 1942. Serving with the 18th Field Company in 1944, he was severely wounded during operations in Holland. For his part in the action near Caen he was awarded the Military Cross. After convalescence in England, he returned to Canada as an instructor in June, 1945.

Mr. Eddy spent the following winter as lecturer in the chemical engineering department of Queen's University. He then entered the family business in Bathurst, N.B., and is at present sales manager and director of George Eddy Company Limited.

Mr. Eddy is also a director of Eddy Hardware Limited, Raworth and Mollins Limited, Bathurst Broadcasting Co. Ltd., the Maritime Lumber Bureau and the Canadian Forestry Association. He is a past-president of the New Brunswick Retail Lumber Dealers' Association, and a member of the Bathurst School Board.

In 1953 Mr. Eddy helped to establish the Northern New Brunswick Branch of the Engineering Institute. He holds the honour of having been elected its first chairman.

**H. C. Fitz-James,** M.E.I.C., vice-president of Pacific Coast Pipe Company Limited of Vancouver, B.C., has retired.

Mr. Fitz-James joined Pacific Coast Pipe Company Limited in 1908 and shortly afterwards was named manager. In 1915 he was appointed vice-president of the firm.

After schooling in Canada and England, Mr. Fitz-James' early career began with his apprenticeship on a large sailing ship and a trip around the world. This was followed by a seven-year period in South Africa, part of which he spent as assistant underground mine surveyor with De Beers Consolidated Mines Limited in Kimberley, and part in Rhodesia.

Mr. Fitz-James returned to Canada in 1907, and after a short term on maintenance engineering with the Canadian Pacific Railway Company in Revelstoke, B.C., he joined Pacific Coast Pipe Co. Ltd. His activities have taken him on many trips to Eastern Canada and parts of the West Indies.

He is a Life Member of the Engineering Institute and has always shown an active interest in its meetings.

**Murray H. Prescott,** M.E.I.C., has been named to the post of senior public health engineer with the sanitation division of the Saskatchewan Department of Public Health.

Mr. Prescott was born in Saskatoon and was educated in that city, graduating from the University of Saskatchewan with a B.Sc. degree in civil engineering.

After graduation he enlisted in the Canadian Army and served as a training officer with the Royal Canadian Engineers.

At the close of the war he joined the engineering staff of the City of Swift Current, becoming city engineer in 1949.

He went to Regina in 1951 and was associated there with an engineering firm on municipal consulting work on sewer and water installation. Prior to his present appointment, Mr. Prescott was a resident engineer on pipeline construction with the Buffalo Pound project.

**Herbert P. Sisson,** M.E.I.C., assistant division engineer with the Ontario Department of Highways in Port Arthur, retired recently after completing 46 years in government service.

Mr. Sisson was born at Bethany, Ont., and was educated in eastern Canada. After a brief teaching career, he joined the Department of Public Works in 1908 as a bridge foreman, and was later transferred to duties in the roads department. When the departments of Public Works and Northern Development were amalgamated in 1923, Mr. Sisson was appointed road and bridge superintendent.

The Department of Highways took over the Department of Northern Development several years later and Mr. Sisson was made assistant divisional engineer, a post which he held until his recent retirement.

During the past few years most of his time was devoted to bridge work and public parks. He supervised the building of Bailey bridges across the Steel River and Little Pic River between Terrace Bay and Marathon.

Mr. Sisson is a charter member of the Thunder Bay Municipal League, and the Association of Professional Engineers of Ontario.

**Robert L. Dunsmore,** M.E.I.C., president of Champlain Oil Products Limited in Montreal, has been elected chairman of the Montreal Branch of the Engineering Institute.

Mr. Dunsmore was born at Seaforth, Ont. He received his early education at the Collegiate Institute at St. Thomas, Ont., after which he obtained his B.Sc. degree in civil engineering from Queen's University in 1915. Previous to graduation, Mr. Dunsmore was employed in the Ontario Forestry Service, the Geodetic Survey of Canada and the Department of Public Works.

During the first war Mr. Dunsmore served as a major with the Royal Canadian Engineers, spending four and a half years overseas. He was awarded the Military Cross for gallantry.

**R. L. Dunsmore, M.E.I.C.**

In 1919 he joined the Imperial Oil Company at Sarnia, Ont., as assistant engineer, becoming assistant master mechanic in 1920. He was made engineer in charge of construction of the Calgary refinery two years later, and assistant superintendent there in 1923.

Mr. Dunsmore became assistant superintendent of IOCO refinery in 1925 and the following year was appointed superintendent of the Talara (Peru) refinery of the International Petroleum Co. Ltd., becoming general superintendent within the next three years.

In 1930 Mr. Dunsmore returned to Canada to become superintendent of the Imperial Oil Company in Halifax. He remained in this position until 1944 when he was appointed manager of the company's Montreal refinery.

During the second war Mr. Dunsmore served as director of fuel for the Royal Canadian Navy with the rank of commander. He was also appointed assistant director of plans.

In 1946 he was named co-ordinator of manufacturing for International Petroleum Co. Ltd., and three years later he was appointed president of Champlain Oil Products Limited.

Mr. Dunsmore is a past vice-president of the Engineering Institute, and a past chairman of the Halifax Branch.

**Leslie B. Allan,** M.E.I.C., has been appointed commissioner of works for the municipality of Metropolitan Toronto which now functions as an autonomous municipality under legislation passed by the Ontario legislature last year.

Mr. Allan received his degree in civil engineering from the University of Toronto in 1911. As a student he was employed as a draughtsman, timekeeper and inspector with the Department of Works, and on joining the department in 1913 on a permanent basis, he was made assistant to the divisional engineer. A year later he became assistant

L. B. Allan, M.E.I.C.

superintendent of construction on day-labour work. After three years' service as a major with the 1st battalion of the Canadian Railway Troops, he returned to his position as superintendent, and in 1919 was made superintendent of construction.

In 1928 he was promoted to the position of first assistant engineer in the roadway section, and the following year was made engineer in charge of the section.

Early in 1946 he became principal assistant engineer of the department, and in 1947 was promoted to the position of deputy city engineer. Three years ago he succeeded the late Murray A. Stewart as commissioner of works and city engineer.

Mr. Allan is a member of the Association of Professional Engineers of Ontario.

**Don N. Cooke,** M.E.I.C., manager of the Soft Water Supply Limited, has been elected chairman of the London Branch of the Engineering Institute for 1954-55.

Mr. Cook was born at Tilbury, Ont. He received his general education at the Tilbury Public and Continuation Schools and the Chatham Collegiate Institute. After receiving his B.A.Sc. degree in electrical engineering from the University of Toronto in 1935, he was for three years illuminating engineer with The Holophane Company Limited in Toronto. In 1939 he joined Johnston-Turner Electric Repair and Engineering Co. Ltd. in London, Ont., as sales engineer.

He joined the Royal Canadian Ordnance Corps in 1940 and served as C.R.E.M.E. successively with the 2nd Canadian Corps Troops, the 2nd Canadian Infantry Division and the 5th Canadian Armoured Division. He subsequently became D.D.M.E. with the 1st Canadian Corps and then with the 2nd Canadian Corps, becoming officer commanding of the 1st Canadian Base Workshop. After service in the United Kingdom, Italy and North West Europe, he was discharged in November 1945 with the rank of colonel.

Since his return to Canada he has been manager of Soft Water Supply Ltd. in London.

D. N. Cooke, M.E.I.C.

**Professor William Bruce,** M.E.I.C., has been promoted from associate professor to professor of mechanical engineering by McGill University.

Professor Bruce is a native of Falkirk, Scotland. He obtained his under-graduate and graduate training at the University of Toronto.

In 1946 he joined the staff of McGill University as assistant professor, and was named associate professor in 1949.

**Gordon W. Ross,** M.E.I.C., manager of the apparatus division of Canadian General Electric Company Ltd., has been elected chairman of the Cape Breton Branch of the Engineering Institute for 1954-55.

G. W. Ross, M.E.I.C.

Mr. Ross was born at Cabino, Que., and received his general schooling at Edmundston, N.B. In 1942 he obtained his B.Sc. degree in electrical engineering from the University of New Brunswick.

Upon graduation he entered the Canadian General Electric Company's test course, and in the fall of 1943 he joined the Royal Canadian Air Force. Upon his discharge as a navigator, he returned to the Canadian General Electric Company. In 1946 he was transferred from the lighting department at head office to the Ottawa office as lighting specialist.

Mr. Ross was then sent to Sydney in 1947 on industrial sales. In his present position as manager of the apparatus division, he is responsible for the sales in Cape Breton and Newfoundland of industrial items such as transformers, switchgear, motors and hoist drives.

**John P. Watts,** M.E.I.C., has been elected chairman of the Peterborough Branch of the Engineering Institute for the term 1954-55.

Mr. Watts was born in London, England, and came to Canada as a child with his parents in 1912.

He received his general education at Haileybury, Kitchener - Waterloo and Kingston schools, and graduated with a B.Sc. degree in electrical engineering from Queen's University in 1936.

Upon graduation he undertook the Canadian General Electric test course at Peterborough. In 1938 he joined the wire and cable department as an engineer and became division engineer of that department in 1948. Two years later he was appointed manager of product planning, and only recently he was named engineering manager in the wire and cable department.

Mr. Watts is a member of the American Institute of Electrical Engineers and of the Association of Professional Engineers of Ontario.

In 1952 he served as secretary-treasurer of the Peterborough Branch of the Institute, and the following year as chairman of its meetings and papers committee.

John P. Watts, M.E.I.C.

**W. T. Butler,** M.E.I.C., administrative assistant to the director of research of Abitibi Power and Paper Co. Ltd., has been elected chairman of the Sault Ste. Marie Branch of the Engineering Institute.

Mr. Butler was born at Calgary, Alta. He received his general schooling in Winnipeg and Montreal, and in 1940 obtained his B.Eng. degree in chemical engineering from McGill University.

Immediately upon graduation Mr. Butler entered Howard Smith Paper Mills Limited as assistant mill chemist in the Beauharnois division.

W. T. Butler, M.E.I.C.

During the war Mr. Butler served for four years with the Canadian Armoured Corps in the 17th Duke of York's Royal Canadian Hussars and the 4th Princess Louise Dragoon Guards in England and central Mediterranean areas.

At the close of the war he returned to Howard Smith Paper Mills Limited as chief mill chemist in the Beauharnois division.

In 1947 Mr. Butler joined Abitibi Power and Paper Co. Ltd. as technical control superintendent at the Sault Ste. Marie division. Since 1952 he has occupied the positions of senior chemical engineer, and latterly, administrative assistant to the director of research.

Last year Mr. Butler served as vice-chairman of the Sault Ste. Marie Branch of the Institute.

He is a member of the technical section of the Pulp and Paper Association and of the Technical Association of the Pulp and Paper Industry.

**John E. Clarke,** M.E.I.C., has been transferred as divisional engineer with the Nova Scotia Department of Highways and Public Works from Bridgewater, N.S. to Middleton, N.S.

Mr. Clarke is a graduate of Acadia University, class of 1929.

He has been elected president of the Association of Professional Engineers of Nova Scotia for 1954-55.

**K. Madsen,** M.E.I.C., has been appointed town engineer for Grande Prairie, Alta.

A native of Denmark, Mr. Madsen came to Canada in the late 'twenties. He was associated for some time in engineering work for the Province of Alberta, and during the past year has been conducting a private practice in Calgary.

Mr. Madsen is a graduate in civil engineering of the University of Alberta, class of 1950.

**H. G. Russell,** M.E.I.C., is now supervisor of planning and training with the California Texas Oil Company in New York.

He is a 1940 chemical engineering graduate of McGill University.

**T. J. Carbone,** M.E.I.C., has been appointed township engineer of the Township of McKim in Sudbury, Ont.

He was previously associated with the Mascioli Construction Company in Timmins, Ont.

Mr. Carbone is a graduate in civil engineering of the University of Toronto, class of 1934.

**L. T. Baird,** M.E.I.C., has been transferred by Storms Contracting Co. Ltd from Petawawa, Ont. to Toronto.

He was formerly associated with Foundation Company of Canada Ltd at Owen Sound, Ont.

Mr. Baird received his B.A.Sc. degree from the University of Toronto in 1934.

**G. P. Webb,** M.E.I.C., is now attached to the power and transformer sales section of the apparatus division's marketing department of the Canadian General Electric Company in Toronto. He will subsequently be transferred to Guelph, Ont., where the company's new transformer works is located.

Mr. Webb graduated from London University in 1952.

**Wattan S. Panesar,** M.E.I.C., has been transferred by R.C.A. Victor Company Limited from Montreal to Prescott, Ont.

Mr. Panesar graduated in chemical engineering from the University of British Columbia in 1935.

**J. R. O'Grady,** M.E.I.C., is now project engineer with Dow Chemical of Canada Limited in Sarnia, Ont.

He was previously associated with Canadian International Paper Co. Ltd in Temiskaming, Que.

Mr. O'Grady is a 1946 graduate of Queen's University in civil engineering.

**Denis Temple,** M.E.I.C., is now associated with the St. Lawrence Cement Company in Quebec City.

He was previously with the architectural services department of Atomic Energy Limited at Deep River.

**Denis Temple, M.E.I.C.**

Mr. Temple is a 1934 graduate of the Imperial College of Science and Technology in London, and is a member of the Institute of Civil Engineers.

**D. James Wardle,** M.E.I.C., has been appointed assistant manager of the Ottawa branch of Terminal Construction Co. Ltd.

He was formerly resident engineer with Defence Construction Ltd. in Camp Borden, Ont.

**F. J. McDiarmid,** M.E.I.C., is general manager of Powertronic Equipment Limited in Toronto.

He was formerly project engineer with the Department of Defence Production in Ottawa.

Mr. McDiarmid is a graduate in mechanical engineering of Queen's University, class of 1933.

**A. A. Goldes,** M.E.I.C., is now structural engineering associate with Messrs. Shore & Moffat, Toronto architects.

He was formerly design engineer with Dominion Bridge Co. Ltd. in Winnipeg, Man.

Mr. Goldes is a 1941 engineering graduate of Witwatersrand University.

**Marcel R. Gingras,** JR.E.I.C., has joined Daly & Morin Limited in Verdun, Que.

He was previously associated with Merck and Company Ltd. in Montreal.

Mr. Gingras is a graduate in chemical engineering of McGill University, class of 1944.

**Robert G. Curry,** JR.E.I.C., has joined The Foundation Company of Canada Ltd. at Levack, Ont. He was previously connected with McNamara Construction Co. Ltd.

Mr. Curry graduated in civil engineering from Trinity College, Dublin.

**Capt. J. J. Kane,** R.C.E.M.E., Jr.E.I.C., has been promoted from the rank of lieutenant. Capt. Kane, previously adjutant in the 23rd Infantry Brigade Workshop of R.C.E.M.E., has been posted to Korea.

Capt. Kane is a 1947 mechanical engineering graduate of Queen's University.

**J. Philip Shnier,** Jr.E.I.C., formerly with American Texolite Corporation in Paterson, N.J., is now connected with the Fabrikoid division of Canadian Industries Limited.

He is a graduate of the University of Oklahoma in chemical engineering, class of 1947.

**D. Zavitzianos,** Jr.E.I.C., has joined the structural design department of General Engineering Company Limited at Willowdale, Ont.

He was formerly field engineer with Pigott Construction Co. Ltd. in Toronto.

Mr. Zavitzianos graduated in civil engineering from Athens National Technical University in 1948.

**G. R. Carruthers,** Jr.E.I.C., is now engineer at the Quebec Works of Canadian General Electric Company Limited in Quebec City.

He was previously foreman of the company's relay department in Peterborough, Ont.

Mr. Carruthers graduated in electrical engineering from McGill University in 1948.

**G. R. Dargis,** Jr.E.I.C., is fleet superintendent for Steinberg's Wholesale Groceterias Limited.

He was formerly associated with Sorel Industries, Sorel, Que.

Mr. Dargis graduated in mechanical engineering from the Nova Scotia Technical College in 1948.

**Glebe Kravetz,** Jr.E.I.C., has recently joined The Prepakt Concrete Company in Cleveland, Ohio. His first assignment with this company will be in connection with the Kitimat-Kemano project in British Columbia.

Since his arrival in Canada in 1951, Mr. Kravetz has been associated with the soil engineering department of The Foundation Company of Canada Limited.

Mr. Kravetz is a 1949 civil engineering graduate of Ecole Speciale des Travaux Publics, Paris.

**G. A. Boire,** Jr.E.I.C., has been appointed division sales supervisor of Imperial Oil Limited in St. John's, Newfoundland.

During the past three years Mr. Boire has served as sales representative in Montreal, as industrial sales representative in Quebec City, and as resident manager in the North Shore area.

Mr. Boire graduated in mechanical engineering from McGill University in 1949.

**W. T. Clarke,** Jr.E.I.C., has been appointed Ontario field manager of Construction Borings Limited in Toronto.

Until recently he was employed as district manger by Gunite & Waterproofing Ltd. in Montreal.

He received his B.Eng. degree in civil engineering from McGill University in 1949.

While in Montreal, Mr. Clarke was an active member of both the Engineering Institute and the Corporation of Professional Engineers of Quebec, having served on the executive of the Junior Section of the Institute, and as chairman of the Committee for the

Young Engineer of the Corporation of Professional Engineers.

**C. L. Wild,** Jr.E.I.C., is associated with Brook Motors Limited at Leicester, England.

He was formerly associated with A. R. Williams Co. Ltd. in Toronto.

Mr. Wild graduated in electrical engineering in 1949.

**M. M. Williams,** Jr.E.I.C., has joined Calgary Power Limited in Calgary, Alta.

Mr. Williams was formerly connected with Montreal Engineering Company Ltd.

Mr. Williams received his civil engineering degree with honours from the Nova Scotia Technical College in 1947, and his mechanical engineering degree with honours from the same college in 1949.

**Capt. G. L. O'Brien,** R.C.E.M.E., Jr.E.I.C., has been posted from the engineering camp at Vedder Crossing, B.C., to the Aberdeen Proving Grounds, Maryland, U.S.A.

Capt. O'Brien graduated in mechanical engineering from the University of Saskatchewan in 1949.

**Richard M. Cook,** Jr.E.I.C., has been transferred by Ferranti Electric Limited from Ottawa to the research department in Toronto.

Mr. Cook graduated from the University of British Columbia in engineering physics in 1949.

**W. Donald Paton,** Jr.E.I.C., is structural design engineer with C. C. Parker & Associates Ltd. in Hamilton, Ont.

He was formerly design engineer with Pre-Compressed Concrete Engineering Co. Ltd. in Montreal.

Mr. Paton graduated in civil engineering from the University of Toronto in 1950.

**F. F. Newton,** Jr.E.I.C., has joined Canadian Bechtel Limited in Sarnia, Ont.

He was previously associated with Burns & Dutton Ltd. in Calgary, Alta.

Mr. Newton graduated in civil engineering from McGill University in 1950.

**A. Koropatnick,** Jr.E.I.C., is now associated with the Manitoba Hydro-Electric Board at Lac du Bonnet, Man.

He was previously with the engineering department of the water resources branch of the Department of Resources and Development.

Mr. Koropatnick is a 1950 civil engineering graduate of the University of Manitoba.

**R. K. Vail,** Jr.E.I.C., has been transferred by E. G. M. Cape and Company from the R.C.A.F. Station, Greenwood, N.S. to Toronto, Ont.

Mr. Vail is a 1950 graduate of the Nova Scotia Technical College.

**M. G. Brown,** Jr.E.I.C., is now patent examiner at the Dominion Government Patent Office in Ottawa.

He was formerly design engineer with the Mathews Conveyor Company of Port Hope, Ont.

Mr. Brown graduated in mechanical engineering from the University of British Columbia in 1950.

**J. E. L. Murphy,** Jr.E.I.C., is now employed as sales representative in the textile fibres division of Canadian Industries Limited in Toronto.

Mr. Murphy was previously technical assistant in the company's nylon division in Kingston, Ont.

He is a graduate of the University of Toronto in chemical engineering, class of 1950.

**Lieut. J. W. Lelacheur,** R.C.E.M.E., Jr.E.I.C., is now Area EME Newfoundland Area and Officer Commanding of the 19th Company, R.C.E.M.E.

Lieut. Lelacheur is a 1950 graduate in mechanical engineering of the Nova Scotia Technical College.

**S. G. Frost,** Jr.E.I.C., has accepted the position of assistant research officer in the building research division's building code section of the National Research Council in Ottawa.

He was formerly connected with Canadian Celanese Ltd. in Drummondville, Que.

Mr. Frost graduated in civil engineering from McGill University in 1950.

**W. J. Swanson,** Jr.E.I.C., is now townsite engineer for Pacific Mills Limited at Ocean Falls, B.C.

He was previously associated with Foundation Co. of Canada, Ltd.

Mr. Swanson received his B.Sc. degree in civil engineering from the University of British Columbia in 1951.

**Michael J. Nugent,** Jr.E.I.C., is now with the air conditioning department of Canadian General Electric Co. Ltd. in Montreal.

He was formerly with the same department in Toronto.

Mr. Nugent graduated in mechanical engineering from the Nova Scotia Technical College in 1951.

**W. A. S. Marshall,** Jr.E.I.C., is superintendent of construction with R. Timms Construction and Engineering Limited of Welland, Ont. He was previously employed as an estimator and as field engineer by the same firm.

Mr. Marshall graduated in civil engineering from the University of Toronto in 1951.

**Robt. H. Regimbal,** Jr.E.I.C., is with the Victor division of the Radio Corporation of America in Camden, N.J. He is at present in the antenna design section of television transmission and is employed on the design of television VHF and UHF networks.

He was formerly connected with Canadian Electronics Aviation in Montreal.

Mr. Regimbal graduated in civil engineering from Ecole Polytechnique in 1951.

**H. C. Rynard,** Jr.E.I.C., has been transferred by H. G. Acres & Co. Ltd. from Niagara Falls, Ont. to Labrieville, Que.

He is a graduate in civil engineering of the University of Toronto, class of 1951.

**Thos. E. Smith,** Jr.E.I.C., has joined M M. Dillon and Co. Ltd., consulting engineers in London, Ont.

He was previously associated with Atlas Steels in Welland, Ont.

Mr. Smith graduated in electrical engineering from the University of British Columbia in 1951.

**E. W. Owen,** Jr.E.I.C., has been appointed assistant distribution and planning engineer for the Ottawa Hydro-Electric Commission.

Before assuming this position, Mr. Owen was associated with the power transformer engineering department of Canadian General Electric Company Limited.

Mr. Owen graduated as an electrical engineer from the University of Manitoba in 1951.

**Jean-Claude Gregoire,** Jr.E.I.C., has joined Southern Canada Power Co. Ltd. in Montreal.

Mr. Gregoire is an honours graduate in electrical engineering of Laval University, class of 1951.

**G. J. Maier,** Jr.E.I.C., has been transferred as petroleum engineer by Hudson's Bay Oil and Gas Company Limited from Calgary to Drumheller, Alta.

Mr. Maier is a 1951 graduate in petroleum engineering of the University of Alberta.

**F. A. Dobson,** Jr.E.I.C., has joined McColl Frontenac Oil Co. Ltd. as a design engineer.

He was previously plant engineer with Welland Electric Steel Foundry Ltd. in Welland, Ont.

Mr. Dobson is a 1951 mechanical engineering graduate of the Nova Scotia Technical College.

**Gordon A. Dysart,** Jr.E.I.C., is now electrical engineer with Donnacona Paper Company Limited at Donnacona, Quebec.

He was formerly associated with McColl Frontenac Oil Co. Ltd. in Montreal.

Mr. Dysart obtained his B.Eng. degree from McGill University in 1951.

**Wm. M. Fraser,** Jr.E.I.C., is an assistant field engineer with The Bechtel Corporation of San Francisco, Calif.

He was formerly associated with Canadian Bechtel Ltd. in Hope, B.C.

Mr. Fraser is a graduate in civil engineering of McGill University, class of 1952.

**George B. Nelson,** Jr.E.I.C., is a plant engineer with Lever Brothers Limited, Toronto.

He was formerly design engineer at Spruce Falls Power and Paper Co. Ltd. in Kapuskasing, Ont.

Mr. Nelson graduated in mechanical engineering from the University of Toronto in 1952.

**L. E. Dickinson,** Jr.E.I.C., is supervisor of quality control in the power products division of Canadian Westinghouse Company Ltd. in Hamilton, Ont.

Mr. Dickinson graduated in mechanical engineering from the University of British Columbia in 1952.

**J. A. Cowlin,** Jr.E.I.C., is an engineer with the Municipality of Saanich, B.C., and is located in Victoria, B.C.

Mr. Cowlin was previously with Consolidated Mining and Smelting Company Limited at Trail, B.C.

He graduated from the University of British Columbia in civil engineering in 1952.

**Ronald G. Foxall,** Jr.E.I.C., has joined Canadian Forest Products Limited at Port Mellon, B.C., as plant engineer.

He was recently associated with the research and development department of the Canadian National Railway.

Mr. Foxall graduated in civil engineering in 1952 from the University of British Columbia.

**E. J. Macfarlane,** Jr.E.I.C., has been transferred by the Shawinigan Water and Power Company from Three Rivers, Que., to Thetford Mines, Que.

Mr. Macfarlane has been associated with this company since his graduation in 1952 in electrical engineering from Queen's University.

**John Westaway,** Jr.E.I.C., has been transferred by Canadian Westinghouse Co. Ltd. from Hamilton, Ont., to the Forcacava power installation in Brazil where he will assist in the installation of four generators in the new underground development.

Mr. Westaway is a 1952 graduate of Queen's University in mechanical engineering.

**Gerald A. Sweeney,** Jr.E.I.C., has joined the Aluminum Company of Canada Ltd. in Montreal.

Mr. Sweeney graduated in electrical engineering from the University of Manitoba, class of 1952.

**R. R. Carwardine,** Jr.E.I.C., is employed as an estimator and general job superintendent in the commercial and industrial construction firm of George A. Crain & Sons Ltd. in the Ottawa area.

Mr. Carwardine has been associated with this company since his graduation in civil engineering from McGill University in 1952.

**H. Debicki,** Jr.E.I.C., has joined the Welland Ship Canals division of the Department of Transport at St. Catharines, Ont.

He was formerly employed as assistant civil engineer with Teagle & Sons of Toronto.

Mr. Debicki is a graduate of the University of London, class of 1952.

**J. E. Dooley,** Jr.E.I.C., is at present at Metropolitan Vickers Electrical Co. Ltd., Manchester, England, specializing in the study of steam and gas turbines as part of his Athlone Fellowship.

Mr. Dooley is an honours graduate in mechanical engineering of the University of Toronto, class of 1952.

**Ross Thompson,** Jr.E.I.C., has been transferred by the Aluminum Company of Canada Ltd. from the general electrical engineering department in Montreal to the electrical conductors division of the Aluminum Laboratories at Kingston, Ont.

He is a 1952 graduate in electrical engineering of the University of British Columbia.

**Martin S. P. Reszetnik,** Jr.E.I.C., is a design engineer with the City of Waterloo, Ontario.

Mr. Reszetnik graduated from McGill University as a civil engineer in 1953.

**R. J. Chapman,** S.E.I.C., is now employed as industrial engineer with Kawneer Canada Limited in Toronto.

He was previously associated with John Inglis Co. Ltd. in Toronto.

Mr. Chapman is a 1953 graduate in mechanical engineering of the University of Manitoba.

**D. N. Dastur,** S.E.I.C., has joined the consulting engineering firm of James F. MacLaren in Toronto, Ont.

Mr. Dastur is a 1953 graduate in civil engineering of the University of Toronto.

**E. R. Armstrong,** S.E.I.C., has joined Light Weight Aggregates of Canada Ltd. in Calgary, Alta.

Mr. Armstrong is a ceramics engineering graduate of the University of Saskatchewan, class of 1953.

**Michael R. Thompson,** S.E.I.C., has returned from England and is now in the employ of Price Brothers & Co. Ltd. at Kenogami, Que.

Mr. Thompson is a graduate in mechanical engineering of the University of Toronto, class of 1953.

**Cyril R. Elliott,** S.E.I.C., has been appointed junior resident engineer with the highways division of the Department of Public Works in St. John's, Nfld.

He was previously with the Willatt Engineering and Surveying Company at Port aux Basques, Nfld.

Mr. Elliott graduated in civil engineering from the Nova Scotia Technical College in 1953.

**John Robt. Jenkins,** S.E.I.C., is assistant field engineer with the Petroleum and Natural Gas Conservation Board at Lloydminster, Alta.

Mr. Jenkins graduated in chemical engineering from the University of Alberta in 1953.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Gordon McLeod Pitts,** M.E.I.C., member of the Montreal architectural firm of Maxwell and Pitts and vice-chairman of the Montreal city executive committee, died suddenly at his home on March 1, 1954.

Mr. Pitts was born in Fredericton, N.B., on March 10, 1886. He attended elementary and high school in Fredericton and Ottawa, and then entered McGill University, where he obtained his B.Sc. degree with honours in structural engineering in 1908, his M.Sc. degree in 1909, and his B.Arch. degree in 1916.

He began his engineering and architectural career as a draughtsman for The Peoples Gas Supply Company in Ottawa in 1906, as an engineer with Canadian Pacific Railways in 1907, and as an engineer with the Trans-Continental Railway in Ottawa in 1908.

G. McL. Pitts, M.E.I.C.

In 1909 he served on the staff of McGill University and during that same year was employed as an engineer with P. Lyall and Sons Construction Company, where he remained until he joined George Fuller and Company in 1912.

Mr. Pitts was superintendent on construction for the Montreal High School in 1913-14, served again on the McGill University staff in 1915-16, and during the next three years was assistant to John A. Pearson, architect for the reconstruction of the parliament buildings.

He then joined the firm of Edward and W. S. Maxwell and four years later formed the partnership of Maxwell and Pitts. In the following years he participated in architectural and engineering services on such projects as the Chateau Frontenac in Quebec City, the Dominion Express Building in Montreal, the National Bridge Works and the Connaught Park development.

In 1942 he was appointed a member of the McGill board of governors and was later named as one of its representatives on the Montreal city council. He served as chairman of the university's site planning committee and in 1946 was made an honorary life member of the Graduates' Society after being "continuously active in the affairs of the society for 30 years."

His roles in the city administration included serving as vice-chairman of the Town Planning Committee and of the Montreal Transportation Research Committee, and chairman of the Special Bridge Committee.

He was the author of "Transportation in Canada", "Planning the Canada of Tomorrow", and other articles on post-war planning and housing.

Mr. Pitts was a Fellow of the Royal Institute of British Architects and Canadian representative on its council. He was a Fellow of the Royal Architectural Institute of Canada of which he was past-president. He served as president and councillor of the Province of Quebec Association of Architects and was awarded the Association "Medal of Merit". He was a member of the Architects' Registration Council of the United Kingdom, and of the Corporation of Professional Engineers of Quebec.

He joined the Engineering Institute of Canada as a Student in 1908, transferring to Associate Member in 1914, and to Member in 1938. Always active in Institute affairs, he served as chairman of the Committee on Consolidation, and as chairman of the Radio Broadcasting Committee. He was elected councillor of the Institute representing the Montreal Branch in 1941-42 and 1942-43.

## Letter to the Editor:

The obituary columns of the *Journal* will be carrying news of the untimely death of Gordon McLeod Pitts, engineer and architect. May I have the privilege of adding a footnote to your notice, about a contribution of Mr. Pitts to the Institute which may be unknown to most of the younger members.

Recent discussions, especially in Ontario, of the possible uniting of the various engineering organizations in Canada will have reminded older members of the similar movement of exactly twenty years ago. It was in 1934 that the Committee on Consolidation was appointed by the Institute. Its name proved to be unfortunate but the interest which it generated within the profession in all parts of Canada was remarkable.

The Committee prepared a plan of union for the Institute and the professional associations. Although agreed to by all the groups consulted throughout Canada, it failed to win the necessary two-thirds majority vote on ballot to the Institute membership, by a critically few votes. Progress has been made along the lines then suggested, as the several cooperative agreements and recent discussions demonstrate, but the advance has been slow indeed compared to the high hopes of 1936.

Gordon Pitts was the chairman of that Committee on Consolidation. For two years it was his principal professional interest. He devoted to its work his abundant energies and an immense amount of time and effort. As secretary of the Committee, I was perhaps able to see more intimately than other members the full extent of the contribution of Mr. Pitts and to appreciate the devotion to the Engineering Institute which alone activated his work.

The legacy of that work can be seen today. Although in more recent years, University and civic duties claimed most of his interest, even his natural disappointment at the result of the "Consolidation" effort in no way dimmed his interest in and concern for the Engineering Institute.

We had often talked of writing up together the story of the developments of 1934 to 1936 now that the passage of the years gives proper perspective to all that then transpired. That joint task can not now be carried out but when the story is recounted in full it will be clear to all that Gordon Pitts made a great contribution to the advancement of the engineering profession in Canada.

Robert F. Legget, M.E.I.C., C.I.S.C.,
Ottawa

# Employment Service

THIS SERVICE is operated for the benefit of members of The Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.

NOTICES appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.

REPLIES to advertisements should be addressed to File No. 000, Employment Service, The Engineering Institute of Canada, 2050 Mansfield Street.

INTERVIEWS with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged by appointment.

## SITUATIONS VACANT

### CHEMICAL

CHEMICAL ENGINEER with rubber experience to sell rubber chemicals and compounds for Canadian manufacturer in Eastern Ontario and Quebec. Salary and profit sharing. Opportunity for an aggressive sales minded man. File No. 4764-V.

CHEMICAL GRADUATE with experience, preferably sales, in metal cleaning, electroplating and/or painting. This is a salaried position plus expenses, commission and annual bonus. Firm also provides a liberal retirement insurance and hospitalization program. Location working out of Toronto. File No. 4783-V.

SAFETY ENGINEER required by large research organization at Ottawa. A graduate in engineering (Chemical Engineering preferred) or chemistry from a University of recognized standard is required. Must be physically fit and have several years' industrial experience in technical work. Some safety engineering experience desirable. Willingness to learn, good judgment, ability to co-operate and tact in dealing with people are very important. Duties include investigation of accidents, fires, and potential health hazards in the laboratories. and the recommendation of safety measures; co-operation with the scientific, medical, plant engineering and personnel office staffs; the preparation of reports and maintenance of statistics; as well as other related work. Initial salary up to $5,150.00 per annum depending on qualifications. Apply by letter giving full details of education and experience File No. 4798-V.

### CIVIL

THE TOWNSHIP OF TORONTO requires a graduate civil engineer to act as an assistant engineer in their engineering department on design and construction work in connection with water and sewer systems. Applicants should have from 2 to 4 years experience on water and sewer work. Apply stating age, qualifications and salary expected. File No. 4792-V.

RECENT GRADUATES IN civil engineering for employment in Southern Ontario as sales representatives of national manufacturer and erector of steel construction products. Preparatory training course provided. File No. 4793-V.

REQUIRED GRADUATE civil engineers for specialized work in soil mechanics and foundation engineering. Graduate soils work desirable. Locations: Montreal and Toronto with some travelling. File No. 4794-V.

GRADUATE CIVIL ENGINEER wanted for municipal work in Alberta and Saskatchewan. Please submit details of experience and when available. Experience in water and sewer utility construction preferred. File No. 4811-V.

CIVIL ENGINEER required for Ontario Government to take charge under direction, of the administration of The Provincial Aid to Drainage Act throughout the Province. Should have experience with land assessments and understand the municipal drainage act. Position requires mostly office administration work, but some contact work with municipal officials throughout the Province is required. Full employee privileges available, including three weeks vacation, a day and one-half per month illness credit, and superannuation. Interested parties should apply in own handwriting giving full particulars of age, education and especially experience in the type of work to be performed. Salary can be set to suit qualifications of successful applicant. File No. 4812-V.

CIVIL ENGINEER registered professional engineer with experience in municipal engineering required by firm of consulting engineers. Applicants must be capable of making detailed designs and supervising field crews. Work will be in Alberta from Edmonton office. Address all applications giving full details of qualifications, experience, references and salary required to File No. 4814-V.

ASSISTANT CITY ENGINEER required as first assistant of the City Engineer to assist in administration of the department involving planning, co-ordinating and supervising of various municipal projects including construction and maintenance of roadways, works, bridges, sewers, sewage disposal, garbage collection and disposal, traffic control and related work. University graduate in civil engineering and preferably considerable varied administrative and supervisory municipal engineering experience in the above noted work. Location Edmonton, Alberta. Apply not later than April 30-54. File No. 4816-V.

CIVIL ENGINEER, University graduate in civil engineering of at least three years experience after graduation, capable of performing under general supervision the following work: Preparation of reports, hydraulic investigations, structural analyses, design of dams, pipelines, tunnels, surge tanks, power houses and similar structures, supervise draughting and undertake same where required. Previous experience in hydro-electric field desirable. Location British Columbia, salary range $325-$475 per month. File No. 4828-V.

APPLICATIONS FOR THE POSITION OF TOWN ENGINEER, for the Town of Dauphin in Manitoba, population 6,500. Engineer to have charge of construction and maintenance of streets and sidewalks, gravity water system and sewage disposal plant. Applicants will require to state qualifications and experience, furnish references and state the earliest possible date on which duties will be assumed. File No. 4829-V.

### ELECTRICAL

FIELD ENGINEERS preferably with electrical background by oil well service company operating in Western Canada. Five months training period. Comprehensive employee benefits. Work is substantially in the field for initial years with irregular hours. Age limit of 28 preferred. Engineers will be based in active oil exploration area of Western Canada. Well established company active throughout world. Inquiries welcomed. File No. 4754-V.

ELECTRICAL ENGINEER required to fill position as Senior product engineer with long established and expanding company manufacturing rectifiers and distribution equipment for public utilities. Must have proven technical and administrative ability to assume responsibility for all design, development and product engineering and supervision of engineers, technicians and draughting staff. File No. 4756-V.

ASSISTANT PROFESSOR required in the department of electrical engineering of University located in Maritime Provinces. Preferably Canadian, under 35, and with at least two years experience. The course involves D.C. machinery A.C. circuits and introductory electronics. File No. 4760-V.

ELECTRICAL ENGINEER bilingual, required for system planning studies of rapidly expanding utility located in P.Q. Duties will involve problems of distribution, transmission and hydraulic generation. Educational requirements: graduation in electrical engineering, from a recognized university and from 3 to 7 years experience preferably in a utility or allied field. Employee benefits include: pension, group insurance, and hospitalization plan. In reply please give age, marital status, summary of experience and salary required. File No. 4781-V.

GRADUATE ELECTRICAL ENGINEER required for new plant in Ontario. Applicants should have experience in the telephonic communications field. Company is engaged in the manufacture of telephone dial switching equipment and associated apparatus such as telephone relays etc. The work involves the following detailed engineerings. The preparation of specifications detailing each item of equipment to be supplied for a particular installation. The preparation of exchange drawings to be used by installers in the installation of equipment. File No. 4784-V.

POWER PLANT ENGINEER required for large industrial concern near Montreal to take care of high pressure steam plant turbo-generators and refrigeration. Only those having both practical experience and technical knowledge need apply. State age, experience, and salary expected. File No. 4795-V.

ELECTRICAL ENGINEER required by paper company located in Eastern Canada. Young graduate with some experience not necessarily in paper mill. File No. 4799-V.

ELECTRICAL ENGINEER required by hydro commission in Ottawa. Should have at least 4 years experience in urban electrical distribution, and to act as an assistant to the distribution engineer. File No. 4801-V.

SALES ENGINEER required by well established and highly respected company in the field of scientific illumination. Duties, after a specific training period of approximately two years duration, will involve the sale of prismatic lighting units and the discussion of lighting applications with architects, consulting engineers and electrical contractors, officials of industrial and commercial firms, municipal and hydro offices. Qualities of personality, diligence, and dependability along with a sincere desire for a permanent career in the lighting industry are of prime importance. File No. 4807-V.

ELECTRICAL ENGINEER, university graduate in electrical engineering for investigation and design under supervision of electrical transmission and distribution systems. Work consists of: field survey and report on distribution projects, engineering planning, preparation of cost estimates and bills of material, and general routine having to do with transmission and distribution projects. This is a junior position offering good opportunity for experience in transmission and distribution engineering. Location British Columbia. Salary range $250-$325 per month. File No. 4828-V.

ELECTRICAL ENGINEER, university graduate in electrical engineering with at least two years experience after graduation, capable of performing under general supervision the following work: Planning, and design of high voltage switching and transformer stations and electrical portion of generating stations, both hydro and diesel, specification of electrical apparatus and preparation of bills of material; supervise draughting and undertake same where required. Previous experience in electrical power apparatus, relays, etc., and their application with utility or at manufacturer's factory desirable. Location British Columbia. Salary range $300-$475 per month. File No. 4828-V.

ELECTRICAL ENGINEER required, preferably with aviation experience. The work will consist of designing modifications to aircraft power supply and control systems, dictated by airline service and maintenance requirements. It will further include the supervision of drawing preparation and the writing of modification instructions for the maintenance department. The job will include periodic report writing, equipment surveys, the writing of test schedules and general, service and liaison for the various departments within the company. Job is of a permanent nature with the salary range depending entirely upon the qualifications of the applicant. File No. 4833-V.

### MECHANICAL

INDUSTRIAL ENGINEER required by large organization. Applicants should be preferably graduate engineers in mechanical. The age range could be from 25 to 40 and the duties involved will be engineering studies of manufacturing operations for the purpose of improving operating methods, equipment material handling, etc. Experience in time study for the establishment of production standards for large incentives, would be a decided advantage. Due to rapid expansion opportunities for advancement are excellent. Starting salaries range from $4,000 to $6,500 depending on qualifications and experience. File No. 4762-V.

MECHANICAL ENGINEER required by air conditioning and ventilating contractor in Montreal. Duties to include field supervision and estimating. Man must be familiar with sheet metal work and installation of air-conditioning equipment. Must be bilingual. File No. 4767-V.

GRADUATE MECHANICAL ENGINEER, 23 to 28, interested in sales, to work as assistant in general engineering and sales department of growing engineering company. Company specializes in aircraft parts and industrial work. Location Montreal. Please write giving full details. File No. 4772-V.

TWO RECENT ENGINEERING graduates, preferably mechanical required by large beverage company for plant work in Toronto and Montreal. File No. 4766-V.

MECHANICAL ENGINEER graduate of a Canadian college and registered professional engineer with 15 years experience in design of pressure vessels, pressure piping, for work in Windsor, Ontario. Salary ranges between $8,000. and $10,000. depending on qualifications. Please write giving full details including experience, age, references, etc. An interview will be arranged. File No. 4769-V.

PROFESSOR OF MECHANICAL and head of mechanical engineering department required by the University of Roorkee founded in 1949 as the first technical university in India. Roorkee is about 100 miles north of Delhi. Applicant should be a mechanical engineer with a sound background of modern mechanical science. He should have a high academic qualification preferably Ph.D. or D.Sc. The direction of specialization is not important. Age preferably not under 38-40 years. Duration of appointment minimum two years preferably three. Living accommodation provided and free medical attention. File No. 4780-V.

INSTRUCTOR OF MECHANICAL engineering to teach mechanical drawing and assist in mechanical engineering laboratory courses. Preference will be given to an applicant with experience in the field of machine shop practice and industrial engineering, who would have an opportunity to develop courses in this field. Location University of B.C., Vancouver. File No. 4791-V.

MECHANICAL ENGINEER required by plant engineering branch of large research organization at Ottawa. Applicants should be B.Sc. graduates in mechanical engineering with at least three years' experience in the design of heating and ventilating of offices and industrial buildings. Duties include the preparation of drawings and specifications for heating and ventilating, and the assistance in the design, layout, and adjustment of refrigeration and air conditioning equipment. Initial salary up to $5,750 depending on qualifications. Apply by letter giving full details of education and experience. File No. 4798-V.

MECHANICAL ENGINEER as assistant superintendent required in a modern yarn spinning mill in the City of Granby, Que. The position calls for the services of a mechanical engineer between 24 to 32 years of age who is primarily interested in production and plant engineering. Previous textile experience is not necessary but manufacturing experience including staff supervision would be of advantage. Complete details of the position will be provided during a personal interview. Applicants are requested to outline their qualifications in detail, incorporating in their reply their home address and a telephone number through which they can be contacted during the day. File No. 4802-V.

MECHANICAL ENGINEER required by manufacturer in Montreal of air handling, automatic control equipment, etc., to act as sales engineer. Applicant should have some experience, not necessarily sales work. Excellent offer. File No. 4806-V.

PROFESSIONAL ENGINEER preferably mechanical but not necessarily required by real estate organization. Age 40 to 50 years with experience where work would result in the greatest general knowledge of different types of industry, or allied work. Ability to meet and sell senior industrial executives. Group commission plan. Applicant will be trained to become assistant manager of the department. Location Toronto, a knowledge of the Toronto area would be helpful. File No. 4821-V.

MECHANICAL ENGINEER REQUIRED BY LARGE world-wide industrial organization. Experienced design engineer on heavy forging operations. Applicant should be between 30 and 45 years of age and have a sound knowledge of manufacturing methods. Position with Head Office of company situated in Toronto. Salary in accordance with the responsibility of the position. File No. 4824-V.

MECHANICAL ENGINEER required by architectural firm in Winnipeg. Must be able to handle design for heating, ventilating and plumbing equipment for a wide range of building types. Excellent opportunity with a young progressive firm for the right man. Write giving full details of training and experience. File No. 4826-V.

MECHANICAL ENGINEER $6,420 to $7,200 department of public works, Ottawa. Details and application forms at your Civil Service Comm. Office, National Employment Office, Post Office and University Placement Office. Quote competition No. 54-1202. File No. 4805-V.

### MISCELLANEOUS

GEOLOGISTS OR GEOLOGICAL engineers with a minimum of 5 years experience in geological exploration in Western Canada and/or Northwestern U.S. required by consulting firm. Must be qualified to assume complete responsibility of large exploration projects involving photogeological techniques. Occasional field work only. Top salary to qualified applicants. File No. 4758-V.

UNIVERSITY GRADUATE in electronics or applied physics required to act as assistant (technical) to the sales manager of a medium sized company engaged in the development and manufacture of advanced defence apparatus and systems. To draft specifications, prepare technical requests, edit instruction manuals, catalogues, price lists, etc. Work is concentrated in Montreal. However, there is a possibility of frequent travel mainly in Quebec and Ontario. File No. 4763-V.

YOUNG CIVIL OR mechanical engineer required by a pulp and paper company in Quebec. Applicant should have a minimum of three years experience in engineering and maintenance preferably in the pulp and paper industry. Applicant should be fluent in either French or English and should be able to get along in both. Replies should outline qualifications, experience, age and salary expected. File No. 4768-V.

SALES ENGINEER required by firm located in Montreal. Applicant should be acquainted with combustion lines, have sales experience, entries to architects, consulting engineers. This position could be either full or part time on a commission or drawing account basis or other arrangements could be made after discussion. File No. 4771-V.

MACHINERY MANUFACTURERS' agents require sales engineer preferably bilingual to cover Quebec and S. Ontario. In applying indicate knowledge of previous sales experience and territory covered. File No. 4776-V.

THREE ENGINEERS REQUIRED by manufacturer of multiwall kraft bags and related paper products, 1954 graduates to 6 years of experience. Training period in Montreal. Subsequent work in variety of locations. File No. 4777-V.

CHEMICAL OR MECHANICAL engineer required for coal preparation research. Experience in coal cleaning, especially with driesson cyclones and dense media desirable but not essential. Starting salary will depend on training and experience and will be in a bracket of $4,000 to $5,000 per annum plus cost of living bonus based on the consumer's index. The present bonus approximates $300 annually. Apply with all particulars, recent photo and addresses for reference. File No. 4778-V.

ENGINEER REQUIRED BY manufacturer located in Maritime Province planning to enlarge research facilities. Applicant should have been connected with the chip board companies in Europe and have sufficient technical knowledge and related experience to proceed along certain lines of development. File No. 4782-V.

CHIEF ENGINEER and director required by structural engineers Toronto. Applicants must be structural engineers specialized in design and full control of drawing office for many years in position of entire responsibility for the design of work of great magnitude in both reinforced concrete and structural steel. Suitable age between 35 and 45. File No. 4785-V.

CIVIL ENGINEER required by private consultant located in Ontario. Requirements are at least five years experience engineering. Preference will be given to applicant having commission as land surveyor. Salary $4,500.00. Please state age, education and experience to fullest extent and ability. File No. 4786-V.

SENIOR ENGINEER, quality control university graduate in engineering physics, electrical engineering or mathematics and physics, majoring in electronics. 5 years experience in radio manufacturing preferably in a technical function. Knowledge of shop methods and inspection practice. Familiarity with all types of radio technical equipment. Knowledge of radar and especially in testing. File No. 4787-V.

ENGINEER REQUIRED with experience in structural steel for design and sales work, by steel fabricator in Montreal. Salary open depending upon qualifications. File No. 4790-V.

DESIGN ENGINEERS, experienced in the engineering design of aircraft instruments and accessories or equivalent industrial products, required to join a small progressive company located in Montreal. Excellent working conditions and benefit plans. Apply outlining qualifications and salary expected. File No. 4796-V.

SALES ENGINEER required to join a small progressive company located in Montreal. Experienced in the field of aircraft, radio, instruments, electrical accessories or oxygen equipment. Permanent positions. Apply outlining qualifications and salary expected. File No. 4796-V.

GRADUATE ENGINEER to fill the position of Plant engineer, and should have some product design and cost estimating experience. Plant maintains press, foundry, plating, wire forming, etc., facilities. Location Province of Quebec. File No. 4797-V.

THE COMMUNITY PLANNING ASSOCIATION of Canada invites applications for the principal staff position in its national office. Applicants should have a general knowledge of community planning and municipal affairs, and must have an ability to prepare information and publications on planning subjects in non-technical language. Applicants need not possess professional qualifications as planners. The salary will be commensurate with the qualifications and experience of the person appointed. File No. 4800-V.

SALES ENGINEER for field work to represent manufacturers agency selling original and maintenance equipment used in mines, paper mills and heavy industry. Company operating in Northern and Northwestern Ontario, also Northwestern Quebec. Progressive training for suitable applicant. Technical, mechanical maintenance or mill experience desirable. Submit record of education, experience, references and photograph, to File No. 4803-V.

CHEMICAL OR MECHANICAL ENGINEER with from two to five years experience on industrial maintenance work. The position is in the maintenance department working as a project engineer on projects on the maintenance of the buildings and equipment of the plant, including some design work in the nature of alterations and improvements. Location P.Q. File No. 4808-V.

CIVIL OR MECHANICAL sales engineer required by manufacturer's agent for a complete new line of diesel explosion pile drivers and explosion transfers in all provinces. This is an opportunity with great prospects for a man familiar with construction work. Applicants should be capable of giving technical advice on machines and attachments for construction work. Applicants should also be able to plan a sales programme on a province wide basis. Reply giving full particulars including references in first letter. File No. 4809-V.

SENIOR DESIGNER required for work on steam boilers and associated equipment. Applicants should have 3 to 5 years recent experience in this field. The work will include the detailed handling of contracts, and the design work necessary for the preparation of proposals and specifications. The applicant should be conversant with heat transfer as it relates to steam power equipment. A knowledge of work on pressure vessels and heat exchangers will be desirable. Location Toronto. File No. 4810-V.

QUALITY CONTROL SUPERVISOR required in Montreal. A Canadian manufacturer of fibres, adhesives and plastics is seeking a graduate engineer with industrial experience in quality control and knowledge of statistical methods. This key position with a future requires a man with ability to plan, organize and supervise all of our quality control activities and to carry out liaison work with our American parent companies. Bilingual required. Salary will be negotiated. All inquiries and applications will be treated in confidence. Please send a complete resume of your educational background, work experience, personal data and references etc. to File No. 4813-V.

FEDERAL CIVIL SERVICE requires a number of engineers for employment as patent examiners at Ottawa to undergo training in patent law and patent regulations in force in Canada, and then to assume the responsibility for the examination of applications for patents in the field of engineering with a view to making recommendations for the award or denial of patents. The desirable qualifications include a bachelor's degree in applied science with specifications in mechanical, chemical or electrical engineering from a university of recognized standing. File No. 4815-V.

ENGINEERS ARE REQUIRED by the International Economic and Technical Co-Operation Division, Ottawa, Canada, for the Government of India. Mechanical and Civil graduate engineers with particular experience in connection with hydro-electric design, preferably for high dams, having had responsible charge of the work of design groups involving supervision of planning and scheduling work of subordinates and of the execution and adequacy of designs. The Bhakra-Nangal project is a multi-purpose river valley development scheme for harnessing Sutlej River waters to extend irrigation. File No. 4817-V.

SALES ENGINEER required by a growing organization in the compressor and compressed air equipment field. Area would be South Central Ontario. Straight salary basis. File No. 4818-V.

U.N.E.S.C.O. HAS BEEN requested for assistance in recruiting suitable candidates for vacant university professorships abroad. Burma: agronomic chemistry and soil chemistry. India: economics, civil, mechanical and electrical engineer. Indonesia: technological subjects. Israel: hydraulics and/or sanitary engineering, electrical (Electronics and telecommunication), mechanical, mathematics, general mechanics, and oscillations, metallurgy, aircraft structures, aircraft propulsions (applied aerodynamics). Turkey: electro-technics hydraulics (power), roads and communications. construction and building materials. Uruguay: construction of buildings. Venezuela roads and communications, hydraulics (construction), building material and soils. File No. 4819-V.

MANUFACTURER OF complete line of industrial, electrical motor control equipment has just completed a new plant in Galt, Ontario. Competent sales engineers are required for Ontario and Quebec territories. Applicants should have electrical, mechanical or engineering business training. File No. 4820-V.

SALES ENGINEER is required by a prominent Canadian electronics manufacturer. This man must be a recent graduate in physics, engineering physics or chemistry and have sales experience or aptitude. The product is a wide range of high quality electronic research and control equipment and the sales territory includes all Quebec industrial centres with headquarters in Montreal. Reply should include details of age, experience and education. A recent photograph should be included if possible. File No. 4822-V.

ENGINEER REQUIRED WITH experience in methods and standards. Applicant should have a good technical and work shop training with a knowledge of time study. Location Ontario. Manufacturer of machine tools. File No. 4823-V.

STRUCTURAL ENGINEER with a few years experience for consulting office in Montreal. Inside and outside work, design, calculation. drawing and supervision. File No. 4825-V.

THE PAKISTAN INDUSTRIAL DEVELOPMENT Corporation invites applications for position of works manager for their paper mills at Chandraghona. File No. 4827-V.

SENIOR DRAUGHTSMAN: for structural and civil. Draughtsman capable of working up final design drawings from engineering sketches and preparing bills of material for structural and civil projects. Where required he shall be capable of checking or supervising the work of other draughtsmen. Work includes arrangement and details of dams, penstocks, power plants, buildings, etc., including detailing of structural steel, reinforced concrete and piping. Also plotting of maps from field notes. Requires good draughting ability and sound knowledge of work. Location British Columbia. Salary range $250-$325 per month. File No. 4828-V.

INTERMEDIATE DRAUGHTSMAN: for structural and civil. Draughtsman capable under moderate supervision of carrying out the work or parts thereof described for senior draughtsman. Requires draughting ability with fair knowledge of work. Salary range: $200-$275 per month. Location British Columbia. File No. 4828-V.

INTERMEDIATE DRAUGHTSMAN: STATION ELECTRICAL. Draughtsman capable under moderate supervision of working up final electrical station arrangements from engineering sketches, preparing bills of material, switchboard and similar wiring diagrams, and selection of cable and conduit to code requirements. Work includes general arrangement and electrical drawings for hydro and diesel generating stations, substations. Requires draughting ability and basic familiarity in arrangement and wiring of electrical apparatus. Location British Columbia. Salary range $200-$275 per month. File No. 4828-V.

JUNIOR DRAUGHTSMAN: Station Electrical. Draughtsman capable under supervision of carry out work or parts thereof described above for intermediate draughtsman. Requires some experience in electrical wiring diagrams. Location British Columbia. Salary range: $150-$200 per month. File No. 4828-V.

MEMORIAL UNIVERSITY OF NEWFOUNDLAND, St. John's, invites immediate applications for the following position to take effect in September, 1954. Assistant or Assistant Professor in the Department of Engineering. The duties would include lecturing and laboratory supervision. The subjects of instruction are drawing, surveying and mechanics. The university has a liberal pension scheme and a generous sabbatical leave programme. Appointments are provisional for the first two years. Travel expenses to a maximum of $750.00 will be paid. Immediate applications or requests for information should be sent by airmail with curriculum vitae and names of three references. File No. 4830-V.

## SITUATIONS WANTED

BILINGUAL MECHANICAL INDUSTRIAL graduate engineer, age 42 with personality and experience, presently employed. Seeks opportunity where diplomatic ability, technical knowledge could be used in supervisory capacity. All offers considered. File No. 140-W.

SANITARY ENGINEER, Civil engineer, B.Sc., Queen's 1948, M.A.Sc., U. of Toronto 1949, P.Eng., Jr.E.I.C., age 29, single. Four and a half years practical experience in municipal and sanitary engineering. Was chief municipal engineer for one and a half years responsible for design and development of waterworks and sewage projects. Also experienced in supervision of construction of various municipal projects, as well as in administration of a municipal engineering department. Presently employed as design engineer dealing with sewage treatment plants, water works projects, sewer designs, roads and pavements. Am seeking a responsible position, preferably with a firm of consulting engineers where individual initiative, hard work and proven ability will be recognized. Am a member of the Canadian Institute on Sewage and sanitation and the American Waterworks Association. File No. 250-W.

CIVIL ENGINEER AND land surveyor, M.E.I.C., 26 years of varied experience abroad and Canada, in: railroad, airport, road, dam, watersupply, irrigation, building, factory construction and related survey of layouts and location. In charge of survey parties and supervising and directing construction. Service with the Royal Engineers in the Middle East and East Africa. Married, bilingual. Seeks responsible position in Ontario or Quebec, where experience will be of value. File No. 489-W.

MECHANICAL ENGINEER, M.E.I.C., with apprenticeship and university background available for responsible position, on reasonable notice. Interested in representing manufacturers wishing to develop and service markets in Canada or abroad. Experience includes design, construction and maintenance in the pulp and paper industry; several years handling sales of power plant equipment. Working knowledge of French and German. Free to travel. File No. 2642-W.

MECHANICAL ENGINEER, graduate 1944, single, age 34, with experience in mechanical and industrial engineering. Administrative and supervisory experience with responsibility at management level. Assistant plant manager, maintenance supervisor, plant engineer and industrial engineer in welding industry, heavy equipment, printing industry. Cost study, wage incentives, production control, plant layout, and time study. Seeking opportunity to join progressive firm in engineering, production or plant. File No. 2920-W.

ELECTRICAL ENGINEER, Jr.E.I.C., P.Eng., B.Sc. (EE), Manitoba 1950, age 30, married, one child. 1½ years experience on induction motor design. Over 2 years experience in the supervision of transformers. Also gained experience in the specifying and supervision of installation of new testing equipment. Interested in securing a responsible position in Western Canada with either a manufacturing firm, a utility, or a governmental branch, preferably in Regina or Winnipeg. Available on one month's notice to present employer. Complete qualifications upon request. File No. 3309-W.

GRADUATE MECHANICAL ENGINEER, Sask. 1948, Jr.E.I.C., married, R.C.A.F. veteran. Three years experience in production control, method analysis, time study, cost control and industrial relations. Also some experience in steel mill maintenance. Three years experience on construction jobs supervising mechanical installations including heating, ventilating and plumbing trades, boiler installation, water treatment and mine installations. Desires position with firm requiring above mechancal experience and/or opportunities for design with consultant firm, preferably in central Canada. File No. 3516-W.

MECHANICAL ENGINEER, Queen's 1944, M.E.I.C., P.Eng., married, age 34, eight years experience as plant engineer, including planning, design, erection and maintenance on process steam, refrigeration, air conditioning systems, seeks employment in plant engineering, preferably, but not necessarily, in smaller city or town in Ontario or Western Canada, with growing company. Available on three months notice. References include present employer. File No. 3935-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.Eng., 1950 honours graduate, age 27, married. One year's experience in the operation and administration of a small railway system including some supervision of personnel. Three years experience on layout and design of machinery utilizing air, hydraulic and electrical power supplies, and the setting up of controls for same. I have been responsible for the planning, layout, design and field installation of equipment in several large plants. Interested in a position involving design and development work, production engineering or plant engineering with the opportunity to take on responsibility. File No. 3975-W.

ENERGETIC YOUNG civil engineer, M.E.I.C., P.Eng., single. Varied heavy construction experience: pulpmill, steam and diesel plants, docks, houses, barracks, hangars, runways, highways, sewer and water systems, surveying. Finishing assignment as resident engineer on $16,000,000 project. Available for responsible position, field or office. File No. 4015-W.

ELECTRICAL ENGINEER, Jr.E.I.C., P.Eng., 1949 graduate. Experience undergraduate, 3 years electronics. Postgraduate, 1 year electronics, 2 years steam power plant operation, 2 years construction, operation and maintenance of hydro-electric plants, transmission and distribution systems, substations. Age 32, married, 1 child. Desire change of location. File No. 4124-W.

ELECTRICAL ENGINEER Jr.E.I.C., B.A., Sc., U.B.C. 1950. Age 29, married, 2 children. Two year graduate training course with large electrical manufacturer. 14 months pulp and paper experience including maintenance and new installations. Desires position with more responsibility. File No. 4153-W.

CHEMICAL ENGINEER, Queens' 1949, Jr.E.I.C., veteran, 33, married. Three years supervisory experience in the development, control and production phase of a large chemical plant. Desire the same type of experience in another manufacturing field. Canadian or Foreign. File No. 4166-W.

CIVIL ENGINEER M.Sc., M.E.I.C., P.Eng. (Ont.), graduated 1947 is available. First class designer of all types of modern structures, inventive, enterprising and with flair for structures involving complex statistical problems. File No. 4173-W.

MECHANICAL - CHEMICAL ENGINEER, (M.Eng. Dresden-Karlruhe) M.E.I.C., P.Eng. Former lecturer at McGill. 15 years experience as plant engineer and assistant manager in heavy industrial and chemical plants. Process and design for chemical plants. Bilingual. Single. Location anywhere. File No. 4183-W.

CIVIL ENGINEER B.A.Sc., P.Eng., Jr.E.I.C., seeks position with contractor or manufacturer. Five years concentrated experience civil and mechanical design, estimating, supervision. Am interested in position with opportunities in Ontario. Presently employed. Available upon reasonable notice. File No. 4191-W.

MECHANICAL ENGINEER, B.Sc., University of Saskatchewan, 1950. Jr.E.I.C., age 28, married. Have been doing plant engineering work since graduation. Desire position with opportunity, location not important. File No. 4328-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng., power option, McGill, 1950. Age 32, bilingual, single. Post graduate experience includes two year industrial training course and engineering sales work with large electrical manufacturing company. Also possesses B.Sc. in physics and background of diversified experience. Presently following evening courses in business administration. Desires position with responsibility. Apply to File No. 4343-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Que. and Ont.), married, age 30, presently employed, with 8 years experience ranging from construction of residential, industrial and commercial buildings; design of timber structures including glue laminated members; considerable purchasing cost accounting, job liaison, estimating, and responsibility for complete execution of contracts, desires position where diversified abilities may be best utilized leading to future advancement in responsible position. File No. 4254-W.

CHEMICAL ENGINEER, 1945 graduate M.E.I.C., P.Eng. (Ont.) with several years work in anodizing, lacquering, plating, plastic and metal-spraying, phosphatizing, electropolishing. Particular consideration of corrosion problems in the chemical beverage, textile industry. Has practical experience in managing as well as laboratory work in the field of analyzing and material testing. Did extensive research on chemical durability of lacquers and on adhesion of metals and paints on aluminum and steel. Desires a position in a plant or in a developing and research laboratory. File No. 4359-W

ELECTRICAL ENGINEER, Jr.E.I.C., P.Eng., McGill, 1951, power option, seeks employment in construction or manufacturing line. Maintenance and construction experience. Presently employed as resident electrical engineer on large project for a firm of consulting engineers. Location no object. File No. 4202-W.

GRADUATE ENGINEER, B.Sc. Mining Engineer, University of Leeds, England, 1954, Jr.E.I.C. Age 25, married, one child. 18 months experience in municipal and general civil engineering, 8 months mechanical drafting. Desires change to position with a future. File No. 4207-W.

ELECTRICAL ENGINEER, B.A.Sc. (UBC, 1951), age 29, experience: design and development of induction motors, power stations, high voltage switchgear, surveys of manufacturing and test facilities, training course with large manufacturer; desirous of improving present position; supervisory, administrative, junior executive jobs preferred. File No. 4239-W.

ELECTRICAL ENGINEER, B.E. (University College Dublin) Associate Member Institute of Civil Engineers of Ireland. Age 34, married, with children. Nine years experience with electricity supply organization. Experience mainly in electrical distribution design and construction overhead and underground networks. Arriving Canada March or April. Seeking interviews for position as distribution engineer. Location unimportant. File No. 4400-W.

CIVIL ENGINEER, B.E. (National University of Ireland), Jr.E.I.C. Two years experience in structural steel design; 6 months with Canadian structural firm; also worked for short time on traffic survey. Presently employed (Montreal) in job requiring very little engineering training. Desires position offering experience in various branches of municipal engineering. Taking course leading to A.M.I. Mun.E. Location of little importance. Available on reasonable notice. Age 23, married. File No. 4401-W.

ELECTRICAL ENGINEER, B.Eng. (Hons)., M.A.Sc., M.E.I.C., P.Eng., age 35 married and presently completing eighth year as Professor of Electrical Engineering. Has taught many different courses on senior and graduate level with emphasis in power. Broad general experience in construction, public utility work and as a naval officer. Has done considerable consulting work of general nature. Seeks appointment which should offer a broad challenge in keeping with background proferred. File No. 4402-W.

DIPLOMA ENGINEER, Mechanical, P.Eng., M.E.I.C., with comprehensive technical knowledge, creative ability and 18 years experience in design and manufacture of diversified machinery and devices such as power shovels, hydraulic presses, aircraft engines, pumps, machine tools, electric automatic controls, welded products, as well as experience in organizing and managing plants with up to 5,000 workers, economical minded with mature judgment, at present engaged in machine tool development seeks a position with a progressive company where his past experience could be utilized best. File No. 4403-V.

CIVIL ENGINEER, B. of Sc. in Eng. M.E.I.C., P.Eng., Danish citizen, age 46, married seeks responsible position with future possibilities. Over twenty years experience in all sorts of heavy construction: roads, concrete pavings, excavation, dikes, sewers, reinforced concrete: bridges, piles, buildings, hangars. Design. Fully familiar with administration and thoroughly experienced in preparation, organization and supervision of construction. Preferably in larger city. Available on approximately one month's notice. Future possibilities will be considered more than starting salary. File No. 4409-W.

PROFESSIONAL ENGINEER (Ont.) B.Sc. (E.E.) U. of Manitoba, veteran, age 28, married 2 children, Canadian Westinghouse Training course. Nearing completion of post-graduate work in Business Administration, consisting of evening classes leading to M. Com. Presently employed as project engineer responsible for co-ordination of all phases of manufacture of projects. Desire responsible position in administration or production. File No. 4404-W.

CIVIL ENGINEER, B.Sc., Jr.E.I.C., now employed with 3 years' foreign experience, construction and structural design (reinforced concrete) and one year Canadian experience in building construction and draughting (not in structural design) is seeking a junior position with prospects in structural design, preferably in Toronto. File No. 4407-W.

ELECTRICAL ENGINEER, Jr.E.I.C., U. of Alberta, 1949, veteran, age 33, married. 1½ years in industrial and commercial construction, 3 years design and development of power plants for large communication company. Experienced in electrical controls. Prefer Alberta or B.C. but willing to locate anywhere if work is interesting and has advancement possibilities. File No. 4411-W.

CHEMICAL ENGINEER, S.E.I.C., Jr.C.I.C., B.Sc. (Queen's 1952) single, age 22, desires position with responsibility in industry or technical sales. Three years summer employment in the paper industry. Have two years municipal engineering administrative experience working with senior executives and meeting the public. Location headquarters preferred in E. Ontario. File No. 4414-W.

SANITARY ENGINEER, M.A.Sc. University of Toronto as of April 1954, S.E.I.C., B.Sc. (C.E.) University of Manitoba 1952. One year's experience in building construction. Desires position offering experience in sanitary or Public Health Engineering. Location immaterial. Available beginning of May. File No. 4415-W.

OVERSEAS POSITION preferred by graduate chemical engineer, Jr.E.I.C., McGill 1949, war veteran. Considerable experience in mechanical work such as all phase of design fabrication and erection of heavy structural, plate and mechanical products. Also process plant experience and considerable customer contact experience. Presently employed in a supervisory capacity. File No. 4416-W.

MECHANICAL ENGINEER, B.Sc. 1st class hons. Ph.D. (Durham) G.I. Mech.E., married, age 24, recently arrived from England seeks position in development or production. Experience includes 18 months in general engineering and 3 years supervision and direction of a research project in the field of applied thermodynamics. Training includes stress analysis, gas and fluid dynamics and industrial management. Has also had experience in writing and editing reports and publications. Available immediately, location anywhere. File No. 4417-W.

MECHANICAL ENGINEER, Jr.E.I.C., 1950 graduate, Toronto, veteran, 32, single, some research experience, over three years in chemical industry on project and design work, involving process and services equipment and piping, instrumentation and building construction, including some estimating, purchasing, expediting and inspection. Desires position of greater responsibility in similar work or in maintenance work of a general nature. File No. 4418-W.

CIVIL ENGINEER, B.Sc. C.E. U.N.B. 1950, Jr.E.I.C., age 30, married. 4 years experience as construction engineer on highways, including reinforced concrete bridges. 2 years in charge of building construction, including sewage disposal systems, water supply, etc. One year as design engineer of municipal street layout, landscaping, etc. Available on short notice anywhere in Canada. File No. 4419-W.

CIVIL ENGINEER, D.L.C. Hons. (Civil Engineering), M.E.I.C., P.Eng. (Ont.), Grad. Inst. Struct. Eng., awaiting election to A.M.I.C.E., age 23, single. 6 years experience on construction of dry dock and deep-water quay, power station, airfields, bridges, roads and railways, survey, design of steel-piled cofferdams, track layout and construction schemes. Responsible for supervision of layout, construction, concrete inspection, pile-driving, underwater drilling, pressure grouting, test boreholes, diving operation, measurement of quantities and cost reports. Presently employed as area engineer on construction of chemical plant. Desires position of responsibility suitable to past experience. Location — anywhere in Canada. File No. 4420-W.

ADMINISTRATIVE ASSISTANT, B.Eng., Jr.E.I.C., McGill, age 26. Experience includes time and methods study, job classification and plant engineering. Presently graduate student in business administration at University of Toronto. Desires position as staff assistant to an executive in a company in Toronto. Available in May. File No. 4421-W.

MECHANICAL ENGINEER (McGill-1951), Jr.E.I.C., single, age 27. At present attending Graduate School of Business Administration (Western). Two years experience in engineering department of a newsprint mill, layouts, maintenance, reports, budgets, field work and 4 summers varied experience in construction, manufacturing, etc. Seeking employment with medium or small sized manufacturing concern. Location preferably Ontario. Available mid-May. File No. 4423-W.

MECHANICAL ENGINEER, bilingual, M.E.I.C., P.Eng., age 41, M.Sc. 1938 veteran, presently employed. 16 years diversified technical experience in Air Force and industry, including 6 years Canadian experience in design and maintenance of steel mill equipment, structural steel, piping, handling equipment, transmissions, plant layouts, reinforced concrete, building, etc., desires position requiring initiative, organizing and supervisory ability. File No. 4425-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng, Nova Scotia Technical College 1952. Age 28, married, one child. Presently engaged as electrical inspector with corps of engineers, U.S. Army on defence projects in Labrador. Duties include diesel and steam power plants, power transmission and distribution facilities and the installation of electrical equipment in connection with extensive P.O.L. distribution. Have open mind regarding position offered. Foreign location preferred. Available upon reasonable notice to present employer. File No. 4428-W.

CIVIL ENGINEERING GRADUATE (B.Sc. St. Andrews University, Scotland) 1953, with some field experience, desires position anywhere in Canada. File No. 4429-W.

ENGINEERING PHYSICIST, M.Sc. (Physics) Delft U. (Netherlands) 1950, B.Sc. (Electrical Engineering) 1936, 7 years service and sales engineering of medical X-ray equipment, 2 years development of X-ray tubes, 3 years electrical and electronic instrumentation in university lab, 4 years representation of large European manufacturer of radio and electronic equipment, electron tubes and electronic components in national and international electro technical standardization committee. Experienced secretary of international technical conferences, good specification writer, fluent English and German, working knowledge of French. Married, three daughters. Detailed resume on request. Interview preferably in first week of April. Location Western Canada or Southern Ontario. File No. 4430-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.A.Sc., University of British Columbia 1951, single, age 35. Seeks position in communications in British Columbia. Two years experience in meteorology and marine and aviation radio communications prior to graduation. Post graduate experience; 1¾ years of development, production, and maintenance engineering in quartz crystals manufacture; 1 year development work on microwave equipment. File No. 4431-W.

MECHANICAL ENGINEER, P.Eng., G.I. MechE., single, age 27. Experience: 2 years general workshop practice including overhaul of steam and diesel engines and factory machinery repair. 18 months machine and structural design and draughting. Desires work on production or plant maintenance in Montreal or B.C. File No. 4436-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng., age 32, married, bilingual. Seven years varied experience in electric generation and distribution. Some familiarity with relays. Good mathematical background. Desires opportunity to train as relay engineer with large utility. Would consider attending G.E. or Westinghouse relay course and willing to sacrifice for this opportunity. Location no object. File No. 4437-W.

ELECTRICAL ENGINEER, M.E.I.C., A.M. I.E.E., British, 37 years of age, with considerable experience in the design and development of naval and associated installations, also in testing of all types of shipboard equipment and preparation of test programmes, data, etc.; and also having considerable experience of servo mechanisms and other remote control devices, including railway power signalling systems; having been responsible at various times for preparation of specifications, quotations, purchase orders, estimates, etc.; and having supervised the activities of junior engineers, draughtsmen, technicians and electricians in various capacities; seeks a lucrative and responsible post in August, 1954. Will serve anywhere, and would be fully prepared to travel extensively, if necessary. Seeking a post which will lead to a senior position and permanency. File No. 4441-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng., married. 20 years experience industrial equipment layout, mills crushing plants, smelters, handling equipment, design and supervision of design and construction. Two years plant engineer. Location preference Toronto area. Desires position in engineering office as supervisor or assistant in plant layout and design. File No. 4442-W.

CIVIL ENGINEER, M.Sc., 1931, Technical University of Warsaw, A.M.I. San.E., war veteran, age 48, 15 years experience in hydraulic works, water supply and sewerage, formerly residing in Great Britain and nearly one year in Canada. Seeks position with a municipality or a firm which offers a good opportunity for advancement. Location secondary, available in two weeks notice. File No. 4443-W.

MINING ENGINEER, P.Eng., in Alberta, M.E.I.C., Jr.C.I.M.M., graduate 1951, age 30, married, veteran. Practical experience in steel work in shipyards, carpentry, contracting and sales. 2 years experience in geophysics for major oil company. Experience in water and sewerage systems and mining exploration. Highest references. Very versatile. Desires permanent position with responsibility and advancement. Preferably in Alberta. File No. 4445-W.

CIVIL ENGINEER, M.E.I.C., B.Sc. Eng. U.K. P.Eng., Ontario, veteran Royal Navy, married, age 30, five years experience (approximately one year in Canada), layout and design of roads, storm and sanitary sewers, some design of reinforced concrete and steel bridges and structures, desires responsible position where above experience an asset. Available on one month's notice. Location immaterial. File No. 4447-W.

ELECTRICAL ENGINEER, Jr.E.I.C., 31, McGill 1950, P.Eng. (Ontario), 3½ years experience in electrical layout and design of plant distribution and services and design of automatic sequencing control for process equipment in automotive industry, desires work with consulting firm or industry with diversified and interesting work. File No. 4448-W.

ENGLISH CIVIL ENGINEER, B.Sc. (Hons.) A.M.I.C.E., aged 27. Hoping to emigrate to Canada with wife in May, desires responsible job in connection with the design of water supply and sewage schemes in which he has experience. Would also consider site control work in this field and would prefer to work in Vancouver district although other facts considered. File No. 4449-W.

CIVIL ENGINEER (M.Sc., P.Eng.), University of Warsaw, Poland, age 41, presently employed. Twelve years successful experience in structural designing, which includes 8 years of site supervision. Seeks opening with progressive firm. Specialist in prestressed concrete. Bilingual. Three years Canadian experience as senior designer. Available on short notice. File No. 4450-W.

CONSTRUCTION ENGINEER, M.E.I.C., age 45; no dependents. 30 years general construction and mechanical experience, 21 since graduating, 10 years sales. Now completing an operation. Free to travel or relocate anywhere, Canada or foreign. Prefer north country, frontier or foreign —general construction—townsite—supervisory. File No. 4451-W.

CIVIL ENGINEER, S.E.I.C., B.Eng. McGill 1953, with construction and field work experience, seeks position in the field preferably on construction. Single, willing to work anywhere in Canada. File No. 4452-W.

CIVIL ENGINEER, Jr.E.I.C., N.S.T.C. 1952, veteran, age 28, married. Approximately one year experience in surveying and drafting for road construction job, and one year working with municipal type of construction and maintenance. Seeks employment with either consultant engineer, municipal engineer, or town planner, doing calculations, designing, and drafting. The possibility of technical experience derived is of paramount importance. File No. 4454-W.

CIVIL ENGINEER, N.S.T.C., 1949, M.E.I.C., P.Eng., provincial land surveyor of Nova Scotia and New Brunswick, age 27, veteran, married, 2 children. Experience survey of naval base construction; instrumentman on construction of train boat gypsum disposal plant, topographical survey; resident engineer on construction of services for 100 houses project; 3 years resident engineer on highway construction, both subgrade and pavement; 1 year office engineer on materials takeoff, ordering, and control; 1 year design of industrial buildings, municipal services, specification writing, project supervision. Present work expected to terminate in May. Prefer construction or associated work with a good future. File No. 4455-W.

EXPERIENCED CONTROL ENGINEER, B.Sc. electrical engineering, Laval University 1947. One year post graduate studies in servomechanisms electronics and network theory, Ohio State University. Age 30, married. Six years experience in U.S.A. on design and development of control systems such as autopilots, remote flight control systems, speed and voltage regulators for inverters and air turbine driven alternators. Also design experience on magnetic amplifier, circuits. Canadian citizen desires to return to Canada and will consider any reasonable opening with Canadian firm. Would prefer position involving both administrative and technical duties and a certain amount of travel. Preferred location Montreal area. File No. 4461-W.

MECHANICAL ENGINEER (Technikum Winterthur, Switzerland, grad. 1949), 29, married. Experience in welding, design and estimating of pressure vessels, platework, piping. Completely familiar with ASME and API codes, high pressure water tube boilers. Capable of supervision desires responsible position in office or shop, vicinity of Edmonton, Calgary or Vancouver. File No. 4465-W.

CIVIL ENGINEER, Jr.E.I.C., now interested in broadening his background. Five years experience in surveying for many purposes, including construction and pulp and paper manufacture. Very much interested in design. Available April 30th. File No. 4466-W.

CIVIL AND STRUCTURAL ENGINEER, M.A., Cambridge University, graduated 1947, professional Engineer (Ontario). Jr.E.I.C., 6½ years experience civil and structural engineering in industry, consulting engineering and research. First class administrator with considerable organizational experience. Expert in structural analysis and design in both steel and concrete. Specialist in prestressed concrete. Presently employed in Toronto, and would prefer to remain there, or would represent Canadian organization in England. Position of responsibility required, where good use can be made of organizational ability and where there is opportunity for advancement. File No. 4467-W.

MECHANICAL ENGINEER, married, age 43, M.I.M.E., Ch.Eng., attached to Dutch Merchant Navy during second world war. Twenty-five years experience in construction, operation and maintenance of high pressure steam plants, turbo generators, diesel engines and refrigeration plants. Available on one month's notice. File No. 4468-W.

CIVIL AND SOIL MECHANICS ENGINEER, Jr.E.I.C., B.Sc. with post graduate studies. Age 34, married, 3 children, R.C.A.F. veteran. 6½ years experience. Experienced in organizing soil mechanics laboratories, lab testing, interpretation of laboratory results. Slope and slide investigations. Supervision of drilling and foundation investigations for dams, buildings, highways. Earth and concrete materials investigations. Retaining walls, earth and concrete dams. Tunnelling in clay. Deep shafts in clay and gravel. Studies in open channel flow. Reinforced concrete. Reports, design and supervision of construction. Mathematically inclined. Some knowledge of German. Available after May 15th. File No. 4469-W.

BRITISH GRADUATE (Electrical) 45 years of age, married, 1 child, 5 years in Canada; P.Eng. M.A.I.E.E., M.E.I.C., etc., formerly specialist in electric traction but very adaptable and with wide experience in other engineering realms; has initiative, pleasing personality, good contact man; possesses diploma in salesmanship; good liaison engineer, correspondent, writer of specifications, reports and articles; highest references, desires scope for advancement; now resident near Montreal. File No. 4470-W.

GRADUATE MECHANICAL ENGINEER, 34 years of age desires position where high quality design work is appreciated. Experience as follows: Internal combustion engines, 3 years; chemical plant machinery, 3 years; agricultural machinery, 2 years, at present mining equipment. File No. 4471-W.

MECHANICAL ENGINEER SASK. 1947, Jr.E.I.C., P.Eng. (Que.), age 31, with 7 years experience sales and application heating, ventilation and air-conditioning with large Canadian firm. Industrial consulting and public building mechanical specifications. Desires position with consulting engineers or architects. Location Ontario or Western Canada. Available on reasonable notice to present employer. File No. 4472-W.

ELECTRICAL OR MECHANICAL SALES. P.Eng. S.E.I.C., B.A.Sc., U.B.C., mechanical 1951 Graduates test course with C.G.E. One year preparing for outside sales, over one year successfully selling full range of electrical power apparatus in Toronto and Western Ontario for large nationally known electrical manufacturer. Experience with steam turbines, pumps and various other types of mechanical equipment. Excellent executive valuation report, together with business and education resume sent on request. Desire position leading to outside sales work or managerial position with progressive company in British Coulmbia or Alberta. File No. 4473-W.

RESPONSIBLE POSITION WANTED by graduate chemical engineer, McGill 1949. Presently employed by pulp mill engineers, supervising field and layout work. Veteran, age 32, with industrial and direct selling experience. Has proven initiative and willing to accept responsibility. Desires position providing executive training and a challenge. File No. 4474-W.

ELECTRICAL ENGINEER, graduate 1949, power and machinery, Edinburgh, Scotland. M.E.I.C., Grad. I.E.E., Whitworth Prizeman, married, two children. 5 years electrical engineering apprenticeship. 3 years electrical draughting. 3 years electrical engineer. Experience on rural and urban distribution; construction, maintenance and operation; H.V. and M.V. lines, cables, substations and associated gear; estimating, profile surveying, pressure testing, fault location etc. Also inspection, testing and maintenance of all types industrial electrical machinery and cabling in paper mills, quarries and other industry; ie. generators, motors, switchgear, transformers, elevators etc. Desires employment on either distribution work, plant maintenance or with consulting engineer, commencing beginning of September. File No. 4475-W.

CHEMICAL ENGINEER B.A. 1937, B.A.Sc. 1939, U.B.C., P.Eng. (Ont.), member of the Chemical Market Research Association, married with 2 children desires responsible position in chemical or allied industry. Diversified experience in explosives, pulp and paper and plastics. Most interested in development type of work or production. Well experienced in preparation of reports on markets and economics. Resume of experience on request. File No. 4476-W.

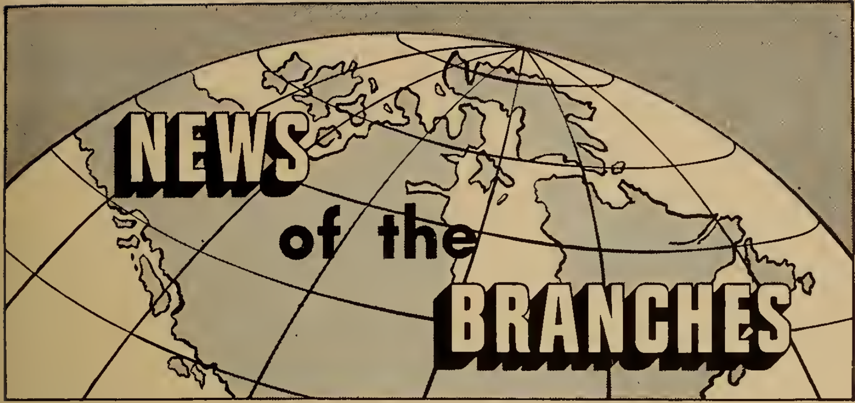
CIVIL ENGINEER, P.Eng., Jr.E.I.C., with two years experience in reinforced concrete, detailing and design. Seeks part time employment in Montreal area. File No. 4477-W.

MECHANICAL ENGINEER, graduate Nova Scotia T.C. 1946, M.E.I.C. and eight years experience in design, application and installation of heating, ventilating, air conditioning and combustion equipment. Desires change of employment where past experience could be best utilized. Location preferred Ontario or Quebec. File No. 4478-W.

EXECUTIVE MANAGEMENT career development desired by Chemical Engineer, M.E.I.C., age 37, married, no children. Strongest capabilities are organization, administration, adaptability, and effective contacts. Successful and well-rounded experience in operations, technical control, research and development, and management techniques in major manufacturing industry. Seeks challenging opportunity as manager, assistant, or equivalent, with progressive enterprise willing to delegate responsibility upon proof of ability. File No. 4482-W.

MECHANICAL ENGINEER, M.E.I.C., graduate of Delft Institute of Technology, Holland. 20 years experience, particularly in boiler houses, steam and condensate handling, instrumentation, watertreatment, air handling, plant layouts. Also office management, business administration, sales promotion. Seeks senior position with manufacturing concern, consultants or sales organization. Sound Canadian practice. Bilingual. Location anywhere in Canada. File No. 4483-W.

MECHANICAL ENGINEER, 1947, P.Eng., M.E.I.C., with 6 years experience as sales engineer handling mining, contracting, industrial and pulp and paper machinery, desires position of expanded responsibility in sales field or with mechanical maintenance department of industry. 34 years old, married. File No. 4484-W.



**Activities of the Forty-seven Branches of the Institute and abstracts of papers presented at their meetings**

## Brockville

J. G. Kerfoot, m.e.i.c.,
*Secretary-Treasurer*

J. F. Preston, jr.e.i.c.,
*Branch News Editor*

***The First Meeting***

On Tuesday, March 2, the Brockville Branch held its first meeting in the Manitonna Hotel. Brigadier Quilliam, retired British Army officer, gave an interesting lecture on the Middle East. This was a very timely topic in view of the situation that presently exists in that part of the world. After the speech there was a lively question period and the brigadier gave excellent answers to all questions. At the conclusion a buffet supper was served.

The total turnout amounted to thirty-one members, including one who came from Cardinal. It is hoped that there will be a better turnout for the meeting to be held on March 24.

## Lethbridge

R. D. Hall, jr.e.i.c.,
*Secretary-Treasurer*

Paul Harding, jr.e.i.c.,
*Branch News Editor*

***Joint Meeting***

The annual joint dinner meeting of the Association of Professional Engineers of Alberta, and the Lethbridge Branch E.I.C. was held at the Marquis Hotel, Lethbridge on January 29, 1954.

The chairman of the meeting was J. J. Hanna, president of the A.P.E.A. Other out of town officials of the Association present included J. F. McDougall, registrar and A. E. McDonald, executive secretary.

L. A. Thorssen, vice-president of the association introduced the guest speaker, Donald Cameron, director of extension, University of Alberta.

In his address, Mr. Cameron stated that there is an increasing realization on the part of business and industry that if they are to meet the challenge of today they must equip themselves as well as they can.

The tremendous technological advances of recent years have presented a social challenge to business men, Mr. Cameron said. In order to keep up with the changes, many are finding it necessary to go back to school, he said, noting the great increase in short courses now being offered by the University of Alberta.

Mr. Cameron noted the rapid technological advances made by Russia in the past 37 years and told the engineers to "remember that what Russia has done China will do in the same period of time." India would follow them and then other countries which had formerly been regarded as backward.

This "ferment" in the undeveloped countries, he said, was beginning to have a great impact on the thinking of business and of individuals.

There's a need for special preparations for business men to deal with changes in technology and in the impact of government in the world today.

Many were worried about "big government," he said, "but we must recognize that in the kind of world in which we live the impact of government is liable to be greater than less. We must learn how to get along with it and to control it."

The realization of business that special training is needed to meet the new challenges has led to the formation of the six-weeks Banff School of Advanced Management and to the numerous short courses offered by the university.

The Banff School, he said, was set up as a practical course for business-men with practical experience. Most of the work is done by the case and seminar method giving the men experience in working out actual business problems.

Lecturers, he said, are leaders in their fields and attempts are made to get teachers with practical as well as academic experience.

The school has pioneered in providing courses on the general economic climate in which business is conducted. Top economic advisors in the Department of Trade and Commerce and the Bank of Canada are engaged to teach these courses.

Other courses teach the functions of an executive, marketing, human relations in industry, labor relations, and other business functions, Mr. Cameron said.

Mayor A. W. Shackleford welcomed out of town guests on behalf of the city. He praised the work of engineers but urged them to become more public relations conscious to let the public know the work they were doing.

Dave Cramer, chairman of the Branch, thanked Mr. Cameron on behalf of the Association and Branch members for his very interesting and educational talk.

Dinner music was supplied by the Brown's Orchestra, and W. Kergan favoured the meeting with two solo numbers. Community singing was ably led by R. S. Lawrence.

## Newfoundland

M. A. Foley, m.e.i.c.,
*Secretary-Treasurer*

***Electric Motors in Industry***

The regular monthly meeting of the Newfoundland Branch of the Engineering Institute of Canada was held at Memorial University on Monday, January 11, 1954.

The Branch chairman, C. Knight, introduced the evening's special speaker, Wm. Watson, manager of Canadian General Electric in Newfoundland, who spoke on "The Application of Electric Motors and Their Controls in Industry." He began by outlining the factors governing the selection of the proper motor for any particular application. These are: the source of power available; the size of the load; the starting torque requirements; the speed required; the conditions under which the motor will operate; how it is to be connected to the load; the type of mounting; the ambient temperature; the type of thrust; the accelerating time and the frequency of starting and stopping to which the motor will be subjected. The speaker emphasized that for economy and availability a standard motor should be used whenever possible.

Mr. Watson continued by describing the characteristics of the principal types of a.c. motors, the sub-divisions

## Note

**It was necessary to withhold much of the Branch News received for this issue because of the great amount of space devoted to technical papers. The news items withheld will appear in the May *Journal*.—Editor.**

of each type and the various applications of each. He then described the controls that should be used with induction motors, wound rotor motors and synchronous motors and for different applications of each.

Mr. Watson concluded his talk by telling of the difficulties encountered in motor starting where the power supply is limited as is the case in some of the smaller communities in Newfoundland. He emphasized that in all cases the largest motor should not draw more power than one-quarter of the generator rating and that generators should always be equipped with automatic voltage regulators.

The vote of thanks extended the speaker by C. Henry was heartily endorsed by the meeting.

Following adjournment, supper was served by members of the Engineers' Wives Club.

## North Eastern Ontario

C. D. McCulloch, Jr.E.I.C.,
*Secretary-Treasurer*

***Hon. T. P. Kelly Is Guest Speaker***

The North Eastern Ontario Branch held a meeting on December 12, 1953, at which the Hon. T. P. Kelly, minister of Mines for Ontario was the guest speaker. The meeting was held in the Hotel Iroquois in Iroquois Falls. A total of forty-five members and their wives attended the meeting.

G. M. Lyon, branch chairman conducted the business portion of the meeting and called on A. A. Kidd, M.E.I.C., of Cochrane, to introduce the guest speaker.

Mr. Kelly spoke of the progress made in natural resource industries in Northern Ontario. He referred to the rapid growth of the pulp and paper and mining industries in the north. He commented on the part that the railways and highways have played in this development. Mr. Kelly stated that behind all this progress has been the engineer and that the history of achievement in Northern Ontario has been a story of engineering endeavour.

The speaker was thanked by W. B Hall, M.E.I.C., of Iroquois Falls.

## Saint John Branch

L. L. Marshall, Jr.E.I.C.,
*Secretary-Treasurer*

H. S. Cleave,
*Branch News Editor*

***Joint Meeting***

Members of the Saint John Branch were hosts to the Association of Professional Engineers of New Brunswick, Jan. 28, when a dinner meeting was held at the Admiral Beatty Hotel.

Guest speaker of the evening was Brigadier T. Eric Snow, O.B.E., C.D., who spoke on Camp Gagetown. Augmenting his talk with maps Brig. Snow spoke of the many factors that had made the Gagetown area the logical site of this tremendous camp.

Brig. Snow was introduced by Col. D. F. Seely and thanked by J. M. Redding.

During the evening toasts were proposed to the Association of Professional Engineers of New Brunswick and to the E.I.C.

The Association Scholarship was awarded to E. C. Garland, an engineering student at U.N.B., by J. M. M. Lamb, president of the Association.

R. M. Richardson, chairman of the local branch presided.

Head table guests included: W. M. Brennan, S. W. Emmerson, T. D. Horsler, R. D. C. Clarke, D. O. Turnbull, Brig. T. Eric Snow, R. M. Richardson, J. M. M. Lamb, H. Clair Mott, H. W. MacFarlane, V. M. Blackett, and K. V. Cox.

***Col. Grant Is Guest Speaker***

Col. L. F. Grant, field secretary of the E.I.C. was guest speaker at the Feb. 26 meeting of the Saint John Branch. His subject "The Saint Lawrence Seaway," presented from the historical, rather than the technical point of view was illustrated by slides.

An interesting question and answer period followed the talk.

The meeting was held at the Admiral Beatty Hotel with R. M. Richardson presiding.

On behalf of the members L. S. Mundee thanked Col. Grant.

# LIBRARY NOTES

## Additions to the Institute Library

**Reviews — Book Notes — Abstracts**

## BOOK REVIEW

**Proceedings of the general discussion on heat transfer, 11th-13th September 1951.** London, Institution of Mechanical Engineers, New York, American Society of Mechanical Engineers, 1952. 496 pp., illus., $7.50 (U.S.).

Arranged on a co-operative basis by the Institution of Mechanical Engineers and The American Society of Mechanical Engineers in New York, the object of these general discussions was to review developments in the knowledge of the principles of heat transfer, and in the design of apparatus making use of such knowledge.

A total of ninety-three papers were presented in all. These have been divided into five convenient sections:

1. Heat transfer with change of state.
2. Heat transfer between fluids and surfaces.
3. Conduction in solids and fluids.
4. Radiation, instrumentation, measurement techniques, and analogies.
5. Special problems such as heat transfer in turbine blade cooling, in liquid metals, in gas turbines, and in piston engines, the mercury boiler, and so on.

A total of fifty co-operating institutions took part in the discussions, including the Conference of Engineering institutions of the British Commonwealth, and the Conference of Representatives from the Engineering Societies of western Europe and the United States of America, established in nineteen forty-six and nineteen forty-eight respectively.

The international understanding obviously arising from this meeting was in itself very gratifying to all delegates. But besides this, the ever-increasing importance of heat transfer in the realms of chemistry, petroleum and coal for the higher performance of equipment in industry and the need of more accurate design of equipment made from both costly and scarce materials was a very great incentive.

Discussions and communications are included in the volume, and there is an excellent introduction, and account of the opening dinner. The closing technical session is reported in the last eight pages, made up of discussions of certain points noted during the session which seemed to call for further consideration.

Papers are listed in the table of contents, and authors and participants and subject index follow the text at the back.

This will be an invaluable volume for all our members interested in heat transfer in any of its aspects. E.K.

## BOOK NOTES

**Prepared by the Library**

**The Engineering Institute of Canada**

*Book notes marked by an asterisk have been provided through the courtesy of the Engineering Societies Library in New York.

***The atomization of liquid fuels.** E. Giffen and A. Muraszew. Toronto British Book Service, 1953. 246 pp., illus., $7.25.

This book, based on a survey of published information, is an attempt to picture the whole process by which an initially continuous liquid jet is broken up into a great number of small droplets—a process widely used with liquid fuels for internal combustion engines and furnaces. It deals with the process of disintegration; characteristics of fuel sprays and the effect on these of the atomizer, the liquid, the gaseous medium and injection pressure; the theory of the swirl atomizer; and experimental study methods.

**Ceiling unlimited: the story of American aviation from Kitty Hawk to supersonics.** Lloyd Morris and Kendall Smith. Toronto, Macmillan, 1953. 417 pp., illus., $7.25.

Opening in December nineteen hundred and three, the collapse of the Samuel Pierport Langley's aerodrome into the Potomac river, followed by an account of Wilbur and Orville Wright's epic eight hundred and fifty-two foot flight in fifty-nine seconds, is the reader's introduction to the past half century of flying in the United States.

The Curtiss exhibition flight of nineteen nine, Harriet Quimby, the first American licenced woman pilot of nineteen twelve, Byrd's flight over the North Pole, in nineteen twenty-six, the Lindbergh flight of nineteen twenty-seven, Amelia Earhart's North Atlantic solo flight in nineteen thirty-nine, up to the faster than sound flight by Captain Yeager in nineteen forty-seven, and the combat landing by helicopter in Korea in nineteen fifty-one, all are covered in this quite readable account of American flying progress.

The illustrations are most interesting, photographic both old and new, and, for reference purposes the book is excellently indexed.

***The control of quality in melting and casting.** Institute of Metals. Symposium, March 1953. London, The Institute, 1953. 88 pp., illus., $2.50. (Monograph and report series, No. 15).

These six Institute of Metals papers numbers 1448-1453, with discussion, as presented at a symposium in March nineteen fifty-three cover in the first paper the principles of technical control in metallurgical manufacture, and in the five succeeding papers, the control of quality in the melting and casting of brass ingots and billets, of copper and its high conductivity alloys, of zinc and zinc alloy slabs and billets, of aluminum alloys, and of magnesium alloys.

They are reprinted from the Journal of the Institute of Metals—Ed. note.

**Design for decision.** I. D. J. Bross. Toronto, Macmillan, 1953. 276 pp., $4.75.

Have you ever come across a series of planned decisions for given situations? Do you want to cease cerebrating altogether, and let George, the Super Decision Maker, think for you, with his electronic brain?

Yes, decisions are now being worked out statistically, and rules are being evolved for solutions to situations.

This is a serious presentation, in its way, and chapter heads range from the history and nature of decision; prediction, probability and rules for action, to models and sampling, and statistical inference and techniques.

## LIBRARY REGULATIONS

### Hours

Mon.–Fri. . . . . . . . . 9 a.m. - 5 p.m.
Saturdays . . . . . . 9 a.m. - 12 noon

### Bibliography and Reference Service

Short subject bibliographies are compiled on request. When placing these requests, please give as much detail and background information as possible.

### Borrowing

Books, periodicals, pamphlets and films may be borrowed for two weeks at a time. All books included in the Library Notes Section of *The Engineering Journal* are available for loan. **A fine of 25c per day is charged for each day borrowed items are retained beyond the two-week period.**

A library deposit of $5.00 at par in Montreal is required, for which two items may be borrowed at a time. Temporary deposits (30 days or less) $10.00. Books are sent anywhere in Canada, and carrying charges are payable by the member concerned.

### Ordering

Any book or pamphlet may be ordered through the library. All publications of affiliated societies, whether books, pamphlets, or periodicals, should be ordered through the library, as reduced rates are applicable on these to all members. Except in the case of library deposits **please make no payments in advance.** Non-members may consult the library, but may not borrow material. Please address all requests to **The Library.**

A classified bibliography of thirty-eight entries, and an index, increase the usefulness of this strange volume.

**Economic controls and defense.** D. H. Wallace. New York, Twentieth Century Fund, 1953. 260 pp., $2.00 (U.S.).

"The leading questions, still unanswered, are: when is a crisis extreme enough to require controls, and what controls are called for?"

The principal idea in this book is to deal with the problems presented through the use of direct controls in a long defense period. The possibilities and dangers of varying degrees of government controls, over materials, wages, manpower, rationing, and price control are all considered and thoughtfully discussed, and a chapter on basic problems and policies is included, by J. M. Clark, Professor emeritus of political economy at Columbia university.

The principles considered in these pages make food for thought for any country.

**Engineering thermodynamics.** B. E. Short et al. New York, Harper, 1953. 467 pp., diagrs., $6.00 (U.S.).

Essentially a textbook, the material in this volume was collected to be of use to second year students at the University of Texas, in the heat power and thermodynamics course. It presupposes knowledge of calculus, engineering, mechanics, and elementary chemistry and physics.

For practical study purposes, changes from the usual order of presentation will be noted, chiefly that the properties of solids, liquids and vapors are discussed before those of ideal gases, and entropy is introduced early as a basic property and working tool.

Problems are included with each chapter and the book is well indexed.

**The Financial Post survey of mines, 1954.** Toronto, Financial Post, 1953. 382 pp., $3.00.

The 1954 edition of the Financial Post survey of mines reviews the developments in Canadian mining in 1953, and forecasts a continuation of the record-making expansion of that year for 1954.

The new and expanding projects contributing to this record output are mentioned: Labrador-Quebec iron ore, Lynn nickel, Eldorado's Ace uranium mine, Steep Rock, Beaverlodge, and many others.

There is an interesting list of the price range of Canadian mining stocks and of metals during the year. The major part of the book consists of a list of the mining companies in Canada, arranged by province. Information is given relating to capital, earnings, dividends, output, ore reserves, developments, etc., primarily intended for investors who may wish to assess the value of their holdings, either present, or intended.

A very useful section is devoted to maps of Canadian mineral areas, showing the holdings of the different companies.

***Housing and building in hot-humid and hot-dry climates.** Washington, D.C., Building research advisory board, 1953. 177 pp., illus., pa. $6.00 (U.S.). (Research conference report No. 5).

The four sessions of this conference dealt respectively with the following subjects: the problem of living in hot environments, architectural design for hot climates including bioclimatic requirements, structural features and the performance and properties of materials, mechanical problems such as cooling and dehumidification. Many of the papers present considerable detailed technical information.

**International brewers' directory: in collaboration with authorities and brewery associations.** Zürich, Verlag für wirtschaftsliteratur G.m.b.H., 1950. 504 pp., $12.00.

Here is something different but quite important in the realm of books of interest in engineering circles.

With text in English, French and German, and arranged alphabetically by continents, the volume also contains a front index, which lists the countries concerned alphabetically.

Following the list of brewers and addresses, is a list of suppliers, a technical French/German lexicon, and English/German lexicon, comparative tables of liquid measures and weights, and a list of Brewers' and Maltsters' Associations, arranged alphabetically by country.

This is rather a unique volume, and is handled on this continent by the Swiss American Advertising Company in New York, who also have a Montreal agent.

**International rubber directory: in collaboration with associations and authorities.** Zürich, Verlag fur wirtschaftsliteratur G.m.b.H., 1953. 416 pp., $12.00.

Published by the same firm as the Brewers' Directory, this volume is also trilingual, having all information in German, French and English.

The compilers differentiate between natural and synthetic rubber, and list them completely separately.

As in the brewers' directory, also, continents are listed, and countries alphabetically indexed, under manufacturers of rubber goods, and manufacturers of synthetic rubber.

Schools and research laboratories, professional organizations, and professional journals are also listed, and again, vocabularies in German/English/French; English /German/French and French/German/ English.

This publication should be of great interest to a large number of our members.

**Introductory circuit theory.** E. A. Guillemin. N.Y., Wiley, 1953. 550 pp., diagrs., $8.50.

Intended primarily as a text book for second year students, the author presents in this volume, an introductory treatment of electric circuit theory (i.e., linear, passive, lumped, finite and bilateral).

Steady state and transient circuit analysis are clearly considered, as is also the introduction to synthesis procedures.

Graphical interpretations and computational aids are included. There are also problems at the ends of chapters, and the volume is indexed.

Our student members should be most interested.

**Manual on rock blasting.** K. H. Frankel, ed. Stockholm, Aktiebolaget Atlas Diesel; Montreal, Canadian Copco, Dorval. varied paging, $15.00.

Numerous small and relatively limited publications are available on blasting in certain areas illustrating individual technical methods.

It is hoped that this manual, however, published by Atlas Diesel, in four languages in parallel column, English, French, German and Swedish, will be accepted as a standard international textbook for all types of blasting problems.

All papers included are based on actual experiences of the contributing authors, which should make it of universal practical value. Also, the loose-leaf format is purposely flexible, so that papers on new processes may be added from time to time.

At the present time, the book is divided into eight sections, namely: Geology; Terminology; Rock Blasting Methods; Planning and practical results; Compressed air supply; Drill steels; Explosives, charging, firing; Ventilation. It is indicated that further headings will be added as more papers are included.

Photographic and diagrammatic illustrations are numerous throughout the text, one of special interest being folded diagrams of Alpine tunnels with statistical details as to construction.

It is estimated that this volume will fill a great need in the blasting field.

Further papers, as published, will be distributed in Canada by Canadian Copco in Dorval, a suburb of Montreal.

**Materials for product development, 1953: proceedings of the Basic Materials conference held in conjunction with the first Basic Materials exposition in New York, June, 1953.** New York, Clapp & Poliak, 1953. 265 pp., illus., $7.50.

T. C. DuMond, the editor of Materials and Methods, and chairman of this conference, opens with an introductory paper on the role of engineering materials to-day.

Following this, the papers are arranged by general subject under the following headings: Economics of engineering materials; High strength with low weight; High- and low-temperature service; Atomic energy; Electrical and electronic service; Materials selection and specification; Coordination in selection of materials.

Questions and answers are included with most of the papers. As each one is presented by a specialist in the field, personal practical experience greatly enhances the informational value of the whole volume. The speakers throw out suggestions, ask questions regarding possible further uses of particular materials, and answer queries from the audience.

Being so very up-to-date, and so very practical, this book should prove of great value to all our members interested in both proven and potential uses of new materials.

**Metal machining.** L. E. Doyle. New York, Prentice-Hall, 1953. 511 pp., illus., $10.00.

It has been said that the purpose of engineering is to create useful goods and services, to make them better, cheaper and more abundant. Metal machining makes most engineering projects possible, in that it is the basis for all manufacturing, both for the creating of metal products, and the creating of machines to produce products metal or otherwise.

Tools which have been devised and designed for more accurate methods of cutting and forming metals are called

machine tools. Metal machining indicates the work done by them. The purpose of all machining is to finish surfaces as required.

This volume is logically divided into types of machines and their operations. Each chapter has questions at the end, some have questions and problems, and some also carry, in addition, a bibliography.

The book is excellently indexed, and should be a mine of information, particularly for our student members.

***Modern electroplating.** Edited by A. G. Gray. New York, Wiley, 1953. 503 pp., $8.50.

A complete revision of the Electrochemical Society's publication issued with the same title in nineteen forty-two. Almost all important plating processes are discussed from both the practical and theoretical points of view with information given on principles, constituents of baths, operating conditions, maintenance and control, preparation of basis metals, and finishing of deposits. A chapter is included on the plating of uncommon metals.

**Newnes electrical pocket book,** 12th ed. London, Newnes, Toronto, British Book Service, 1953. 391 pp., figs., $2.00.

This twelfth edition of the Newnes electrical pocket book includes several new sections, and some of the existing ones have been revised. The new sections are on the subjects of atomic energy, ultra-violet lamps, radiant heat drying and cold pressure butt welding, especially for aluminum and copper.

The Pocket book includes a certain amount of theoretical groundwork, and space is given to descriptions of the circuits and principles of various types of electrical apparatus. The inclusion of these technical descriptions, together with the information provided in the tables and illustrations should make this a very handy reference book for those who are concerned with various types of electrical equipment and apparatus.

**Normblatt-Verzeichnis 1953: ein Katalog aller deutschen Normen und Normblatt-Entwurfe.** Berlin, Deutsche Normenauschuss, 1953. 344 pp., $2.00.

In response to requests from our members, we are pleased to announce the acquisition of this German list of standards.

The main portion of the volume is arranged by subject, and by the Universal Decimal Classification, which also includes number of pages and date of publication.

Standards published by other organizations and accepted by DIN are listed, with identifying letters.

This is followed by a numerical index, and a complete alphabetical index by key word.

This should prove a most useful volume to a large number of our readers.

**Our neighbour worlds.** V. A. Firsoff. New York, Philosophical library, 1953. 336 pp., illus., $6.00.

Opening with a very readable scientific explanation of the adjacent universe, the author of this volume then presents the facts of the case as now accepted with regard to potential interplanetary travel.

"With such 'orbital bases' and fuel dumps as stepping stones a space-ship could hop from one gravitational orbit to another, be refuelled under way and have enough puff left to reach Mars, Venus, and perhaps venture farther afield. Space stations and fuel dumps could, of course, be established also at the other end of the run, and Mars at least has two excellent ones provided by nature in the form of its tiny moons. Phobos and Deimos. Some planetoids and minor satellites of Jupiter may likewise be used for this purpose."

Possible space suits are described with details as to design and specifications based on present scientific knowledge.

The whole book makes fascinating reading, is not too far fetched, and contains bibliographical references to further reading on each phase of the subject.

**Outline of executive development.** Lee Stockford, comp. Pasadena, California Institute of technology, 1953. 46 pp., pa., $2.00 (U.S.) (Bulletin no. 23).

Every company is faced with the problem of the choice of executives, and these days many companies, especially the larger ones which may have plants or offices in various parts of the country, are turning more and more to a regular program for the training and selection of suitable men and women.

This outline, which was used as a basis for discussion at the 1953 Summer conference on executive development, was evolved from the highlights of discussions at similar Conferences held in 1951 and 1952.

The notes are broken down into various sections. First are considered the reasons for establishing an executive development

program, then points are given on organization planning and policies, and the initiation of a program, and the items to be included. These cover such things as job description, personal qualifications to be considered, rating, selection, executive traits, and executive environment."

Ideas are given for a training program and of the final goals to be achieved.

A useful list of selected references is also included.

**Pensions and profit sharing.** Composite authors and the editorial staff of the Bureau of National Affairs. Washington, The Bureau, 1953. 272 pp., $5.50 (U.S.).

Recognizing the need of the executive for basic background information for the proper appraisal of pension and saving plans and consideration of employees, this volume has been prepared by individuals each a specialist in his own field.

Features of present day pension plans, tax and legal aspects and their financing are all discussed. This is followed by costs and cost experiences, bargaining on pensions, and administration and human relations with all their implications and suggestions.

Footnotes and references are included, as well as actual cases being cited, and tables presented, and the book is indexed.

This book is different and worthy of consideration by management executives.

***Pipe and tube bending.** P. B. Schubert. New York, Industrial Press, 1953. 183 pp., illus., $5.00 (U.S.).

A practical manual describing the common methods and the operating characteristics of the equipment used in the bending of ferrous and non-ferrous pipe and tubing. The formulas employed for various degrees of bend, and tables for the minimum radii of bends are given. An appendix on tubing classification is included.

**Proceedings of symposium on prestressed concrete statically indeterminate structures.** London, Cement and Concrete Association, 1953. 180 pp., diagrs., 25/-.

This Symposium on prestressed concrete was organized by the Prestressed concrete development group and the Cement and concrete association with the object of enabling engineers to express their views on continuous, statically indeterminate structures, of which few have been built in England. This book consists of the seven papers presented at the Symposium, together with the closing remarks of F. G. Thomas who summed up the Proceedings, and a list of those taking part in the symposium.

The papers deal with various aspects of the problem of continuity in prestressed concrete construction, ranging from theoretical analysis to actual experimental work on interconnected prestressed beams. The practical examples given of actual continuous statically indeterminate structures include both bridges and buildings.

Many of our members will be interested in this book, especially in view of the Conference on prestressed concrete recently held in Toronto, and of the fact that two of the papers are by Yves Guyon and Professor Gustave Magnel.

**Static electrification—a symposium held in the Institute of Physics, March 1953.** London, The Institute, 1953. 104 pp., illus., 25/-. (British journal of applied physics, Supplement No. 2).

Early in 1951 it was proposed to the Board of the Institution of physics that a monograph should be published on the generation and effects of static electricity. It was decided, however, that it would be advisable to hold a conference first at which all aspects of the subject could be discussed. The papers presented at the Conference, held in March 1953, are published in this supplement to the British journal of applied physics.

The papers are grouped in three sections: the general principles of the generation and dissipation of static electricity, useful applications of static electrification, and harmful effects.

The conference was opened by Professor F. L. Vick who gave a general lecture on contact electrification, and one session was devoted to electrostatic machines, consisting principally of two papers dealing with machines for the production of high energies, and machines capable of supplying useful power.

The section on harmful static electrification includes papers on its dispersal from places where it might cause explosions, for example, hospital operating rooms, from places where the quality of a product might be affected, or from where it might cause damage.

These papers probably present the most comprehensive account of the work in this field, and also serve to show the gaps which still exist in the knowledge of the subject. The book should be of interest to many of our members.

**Steelwork in building.** W. B. Scott. London, Spon; Toronto, British Book Service, 1952. 203 pp., diagrs., $5.00.

This volume scarcely needs an introduction after the explanation that it is a commentary on the British Standard Specification on the use of structural steel in building.

The revision of standards for the design of structural steelwork in building came into effect with the revision of British Standard 449 in nineteen forty-eight, and the almost simultaneous publication of a Code of Practice (C.P. 113), entitled "The structural use of steel in buildings".

Amendment number one to British Standard 449, issued in July nineteen forty-nine (P.D. 929) is also considered. The standard is reproduced in its entirety, and comments, criticisms and discussions are included.

The detailed index will be a great assistance in using the volume which will be practically a necessity on the desk of any engineer engaged in this type of work.

**Stress concentration design factors.** R. E. Peterson. New York, Wiley, 1953. 155 pp., charts, spiral binding, $8.50.

A statement of the United States Navy Bureau of Aeronautics quoted in the Preface to this book states: "While minor improvements in fatigue life may be accomplished merely by changing material, few serious fatigue difficulties have been completely corrected in this way. Such difficulties are almost always traceable to improper design, fabrication, and maintenance . . . By studying stress concentration factors much can be learned about how to produce designs that are superior from the standpoint of resistance to repeated loads and how to evaluate approximately the influence of various geometric features."

It is the purpose of this book to give the designer information which will help him to improve his design calculations to reduce the danger of failure. That there is this concern with improving detail design and engineering drawing is also shown in the publication by the British standards institution of a revised standard on the subject, No. B.S. 308, reviewed elsewhere in these Library Notes.

The first chapter deals with definitions and design relations, and succeeding chapters discuss the various design elements, grooves and notches, shoulder fillets, holes in plates or shafts, etc. The Appendices give stress relations for members with single groove or notch, application of Mohr theory for fatigue of brittle materials, derivation of relation for limited number of cycles and derivation of combined stress relations.

There are many charts showing stress concentration in the various elements, as well as diagrams in the text.

The book is essentially a working tool, and not a textbook. A complete list of contents introduces the text, and a list of symbols is included. The graphical figures at the back are thumb indexed for speedy reference, and the spiral binding allows the book to be flat while open and in use. It also has a bibliography of one hundred and seventy-four items.

**Technology of engineering materials.** B. R. Hilton. London, Lange Maxwell; Toronto, Butterworth, 1953. 389 pp., diagrs., 36/-.

As the proper function, reliability, safety and life of any structure or a part of it is dependent upon the materials used in its construction, the technology of engineering materials is a very important subject.

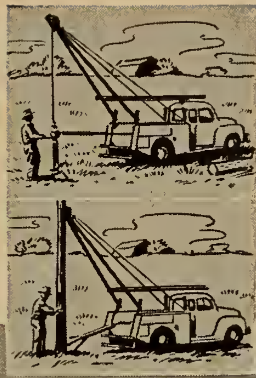
In this volume the number of chapters has been kept to a minimum, and a logical arrangement of material under pattern making and foundry work is followed by the preparation, production, and treatment of ferrous and non-ferrous metals. The chapters are divided into numerous sections, with running headings, and specific references can be checked in the detailed index.

Questions are included with each chapter, and forty-six pages of glossary add further to the value of this excellent book.

**UHF television antennas and converters.** Allan Lytel. New York, Rider, 1953. 118 pp., illus., $1.80.

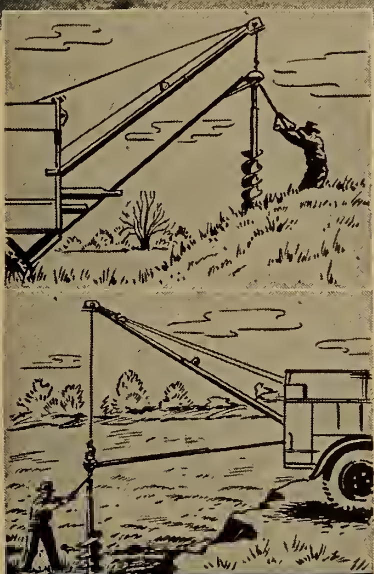
The purpose of this book is to explain in simple terms the function and operation of the UHF conversion systems which are appearing on the market in increasing numbers. It explains the complete UHF installation from the antenna to the receiver, and is intended also for the serviceman or dealer who has to answer customers' questions regarding the various types of UHF converters.

# TEL-E-LECT



## DIGS THE HOLE SETS THE POLE

*WHERE AND WHEN YOU WANT IT*



OPERATES FROM A TWO MAN UTILITY BODY

## REACHES UP SLOPES
## REACHES DOWN GULLIES
## REACHES OVER MUD

Now you can cut days and dollars off every pole installation job. With a Tel-E-Lect Digger-Derrick, two men can handle the digging and pole setting from a small KING "F" type Utility Body as well as with heavier line construction body. The Tel-E-Lect reaches the hard-to-get spots (12-20 feet) away from the truck. Slopes, gullies, ditches and mud are no problem when you have a Tel-E-Lect. Derrick can fold back over truck when not in use—raises to working position in 30 seconds. Complete control is from truck cab. Second man acts only as Auger guide. Auger is carried on truck in convenient brackets. It may be attached and ready to dig in less than 2 minutes. The crew can set-up, dig the hole, set the pole and be ready to move away in less than 10 minutes.

*Write to us today for illustrated literature on this amazing utility tool.*

KING *Trailers* A NAME THAT CARRIES WEIGHT

**TRUCK ENGINEERING LIMITED**

**Woodstock, Ontario**

*See our exhibit at the International Trade Fair, Coliseum, Toronto, May 31st-June 11th*

There are various types of converters, ranging from the single-channel device to complete tuners which can cover the whole band. In the book, the units are grouped according to function—for example, all the single-channel units are described in one chapter, with details given of several commercial units, their operation and circuits. Full range converters are similarly treated in another chapter.

Other chapters discuss transmission lines, antennas and converter circuits. The Appendix lists various types of UHF test equipment produced by the different manufacturers.

**Welding, brazing and metal cutting.** E. Molloy, ed. London, Newnes, Toronto, British Book Service, 1953. 192 pp., illus., $3.50.

This volume, compiled under the editorship of E. Molloy, by a staff of technical experts in collaboration with several leading British firms, deals with the various methods of welding metals: electric arc (including Argonarc), electric resistance, gas welding, brazing and bronze welding, and also chapters on gas and arc methods of cutting metals are included.

The aim of the book is to help those engaged in, or studying, welding, brazing and metal cutting to master the techniques of the different hand and machine methods employed. Many illustrations, and much tabular information, are included.

The layout and methods employed in quantity welding as found in British shipyards and automobile factories are outlined in two chapters, and the final chapter discusses hard facing with "Stellite".

## STANDARDS REVIEWED

**Canadian standards, Canadian standards association, National research building, Ottawa, Canada.**

**C.S.A. C21-1953—Control cable for electrical power plant equipment,** 2nd ed. 75c.

This specification covers single- and multiple-conductor cable for the control of electrically-operated power equipment and metering circuits operating at potentials not exceeding 600 volts. The various types of insulation and covering which may be used are listed, but it is noted that for single-conductor types, rubber insulated and braid-covered cable is the normal type, whilst for multiple conductor types, the cable is usually rubber-insulated with lead outer covering, or thermoplastic-insulated with thermoplastic outer covering.

The specification covers the material, stranding and insulant to be used in conductors, the various means used to identify them, and their construction, including lay-up, fillers, binding tape, and covering.

This second edition supersedes the first which was issued in 1927. It covers new constructions, and includes the use of thermoplastic as well as rubber-insulated conductors. Polychloroprene and thermoplastic coverings have also been added.

**C.S.A. C22.2 No. 51-1953—Construction and test of armoured cables and armoured cords,** 4th ed. $1.25.

This fourth edition of the standard covers essential requirements and minimum standards for the construction and

# Progress *is no accident...*

Fifty-five years ago The Shawinigan Water and Power Company was incorporated. At that time the Company had no customers and no markets. By many the entire undertaking was considered risky and foolhardy.

That was fifty-five years ago.

For three bleak years the Company worked in the midst of a wilderness, engaged in the development of the water power at Shawinigan Falls and the direct transmission of electricity to Montreal over what was to be the longest and highest-voltage transmission line in America.

The rest is history.

In 1903, two 5,000 horsepower generators were placed in operation at Shawinigan Falls. Today, 43 generators in eight plants within our 16,000 square mile territory are capable of producing 1,562,700 horsepower to serve more than 200,000 homes, farms, stores and industries in the province of Quebec.

Today, the power generated and transmitted by the Company is the life-blood of scores of urban and rural centres. It is a factor in attracting new industries to this great Province of ours . . . in raising our standard of living and in developing Quebec's incalculable natural wealth.

In 1898, "Shawinigan" knew that progress would be no accident . . . and that impossibilities would recede as experience advanced.

That is why "Shawinigan" looks ahead today with the same unfailing confidence in Quebec and its people that it had fifty-five years ago.

CHEMICALS • ENGINEERING
The Shawinigan
WATER AND POWER CO.
ELECTRIC POWER

associated and subsidiary companies

test of armoured cables and armoured cords for use in lighting circuits in accordance with the rules of Part I of the Electrical code. The requirements are based on test and field experience, and are subject to revision.

The specification details the material, joints and sizes, fibrous covering, polarity identification, and lay-of-twist requirements for insulated conductors of armoured cables and armoured cords. Details are also given for fillers and lead coverings.

There are tables showing the minimum thickness of the metal strip used for the armour, for the minimum internal diameter and the nominal external diameter of armour, the minimum weight of single-strip steel armour, and of aluminum armour. Details are given of the size of the armour, its weight, the tension which it should be capable of withstanding, the amount of elongation permitted, flexibility, and dielectric strength. The methods of test for the last four are also given.

**C.S.A. A82.30-1953—Gypsum plastering, interior furring and interior lathing. $1.50.**

"Following the development of the C.S.A. A82.20 Series (Gypsum) and the C.S.A. A82.40 Series (Lime) in 1949 and 1950, requests were received from several groups, including Government Departments, for the preparation of a Standard covering Gypsum plastering and its allied constructions, Interior Furring and Interior Lathing. Accordingly, an appropriate Committee was appointed late in 1951."

The preliminary work was based on British Imperial Standard CP 211 and American Standards Associations Standards A42.1 and A42.4, but a new format and more detailed arrangement have been developed. The differences in the chemical and physical characteristics of some of the Canadian materials concerned has necessitated the development of new sections with the new requirements.

The Specification describes minimum acceptable standards only, and other materials and methods may be used if their load-bearing and other physical characteristics are at least equivalent to that of those described.

The section on interior furring covers both wood and metal furring. Gypsum, fibreboard, wood and metal lath are included in the section on Interior lathing, as are solid plaster partitions.

The sections on gypsum plastering include labour, materials, services, equipment and scaffolding.

**C.S.A. C22.2 No. 95-1953—Construction and test of arc-welding cable. 75c.**

This is No. 95 of a series of approvals specifications issued by the Canadian standards association under Part II of the Canadian electrical code. The specification applies to rubber or polychloroprene-sheathed electrode holder cable intended for use with arc welders in accordance with the rules of Part I of this Code.

Details are given for the conductors used, materials, sizes, number of strands, lay-of-twist, splices and separator.

The materials to be used for the sheath are listed, and a table given of the physical properties, and there are sections on physical test apparatus and procedure, and accelerated aging tests and procedure. A table gives the over-all diameter of the finished cable. The markings to be used are also specified.

**British Standards British standards institution, 2 Park Street, London, W.1. British standards are available from the Canadian standards association, National research building, Ottawa, Canada.**

**B.S. 2061: 1953—Phosphor bronze spring washers for general engineering purposes. 2/6.**

This British Standard for spring washers manufactured from phosphor bronze supplements that for steel spring washers, B.S. 1802.

Although these washers have a more restricted field than the steel type, they have a definite advantage where resistance to corrosion, non-magnetic or similar distinctive properties are required.

The range of nominal sizes for the three types in the tables, i.e. single coil, square and rectangular sections and double coil, varies from 10 BA to ¾ in. for the first and 6 BA to ¾ in. for the other two.

A number of manufacturing and testing requirements are given and the highly important feature of the material is provided for by a complete analysis of the phosphor bronze.

The general adoption of the range of wire sections presented in this new specification would be of immense assistance to the manufacturers of spring washers in that they would thus be enabled to reduce, considerably, the large number of different sections they have been compelled to carry in the past.

With the exception of the aircraft industry, for which the washers are not intended, users in the wide field of general engineering will find in this Standard and its companion, B.S. 1802, spring washers eminently suitable for all normal sizes and requirements.

**B.S. 308: 1953—Engineering drawing practice.** 10/6.

The engineer enjoys the advantages of expressing his ideas through the medium of the drawing, which is basically a universal engineering language, though its vocabulary is still somewhat limited and its grammar rather indefinite.

Any progress towards a universal drawing practice is, therefore, of profound importance to engineers, and the publication by the British Standards Institution of a new and far more comprehensive edition of B.S. 308—Engineering drawing practice—is undoubtedly a prominent milestone on the road towards such a world-wide understanding.

The need for a new standard was particularly felt during the second World War, when munition manufacture had to be sub-contracted to works of all kinds in all parts of the country, and indeed all over the world. The equipment available varied from the finest precision machine tools installed in ultra-modern shops to second-hand plant of doubtful age in back street garages. In these circumstances it became more and more evident that the dimensioning and tolerancing of many engineering drawings, however well they conformed to accepted standards, did not always ensure that components would assemble or function correctly. Not only were dimensions applied without proper regard to the functional requirements, but far too much reliance was placed on workshop discretion or "know-how" by the omission of tolerances on a large proportion of dimensions, and by an almost universal failure to provide any guidance whatever in regard to surface finish or to accuracy of geometrical form, e.g., straightness, flatness, parallelism, squareness, concentricity, symmetry and position.

These difficulties led to the formation in 1944 of an Inter-Services Committee on Dimensioning and Tolerancing of Drawings. This Committee was responsible for the publication in 1948 of the manual. Dimensional analysis of engineering designs, which laid down a number of fundamental principles which have, in general, been applied in the drafting of the new B.S. 308. In the later stages of the work of the Inter-Service Committee, several members of the B.S.I. Drawing Office Practice Committee were co-opted, and in 1949 a document on Dimensioning and tolerancing was presented to the B.S.I. Committee with the suggestion that it should be widely circulated to obtain the views of engineers and particularly of industry.

This document was accordingly issued as a draft of B.S. 308 Part II: 1949, but had a very cold reception. Some of the practices recommended aroused strong opposition from industry, and the manner in which the subject was presented did not commend itself to the majority. There was evidence, however, that even the strongest opponents recognized that most of the principles involved were basically sound.

It was therefore decided to make an entirely new approach to the subject, and a B.S.I. Sub-Committee was formed in September, 1950 to undertake a complete revision of B.S. 308:1943, including a detailed consideration of the dimensioning and tolerancing aspect.

The new B.S. 308 is divided into two sections. Section One (General Practice) is based on the previous B.S. 308:1943, but while the section has been amplified in some respects, it has been considered advisable to confine the standard to recommended principles and methods to be followed in the preparation of engineering drawings. Subjects such as architectural drawings, survey plans, graphs, reproductions of drawings, and the nature and handling of drawing materials have been excluded, as such matters are more fully and appropriately dealt with in other British Standards. For these reasons it has

been considered appropriate to alter the title of the standard from Engineering drawing office practice to Engineering drawing practice.

Section Two (Dimensioning and tolerancing) is entirely new, and presents a great advance in the technique of drawing statement. It lays down a number of general principles, of which the most important are that the drawing should define the finished product as required by the designer, and that dimensions which affect the function of the product should be expressed directly on the drawing. It also deals with ways of indicating dimensions, tolerances and notes on drawings, and with the dimensioning of common features, including a special section on the difficult subject of tapers.

The latter portion of the standard is devoted mainly to the principles and methods of expression of Geometrical tolerances for straightness, flatness, parallelism, squareness, angularity, symmetry, concentricity, roundness and position. By the judicious application of these methods, it will be possible in future to define precisely acceptable limits of geometrical form, instead of relying on individual judgement or conjecture.

The standard concludes with the dimensioning and tolerancing of profiles, and the indication of machining and surface finish. It is worthy of mention that the "tick" symbol (√) has been chosen to denote machining. It is also used as a vehicle for surface finish indication, and, as such is already American standard practice. Canada and the International organization for standardization (I.S.O.) are also likely to adopt it in the near future.

The whole standard is profusely illustrated by diagrams, and a number of typical drawings are appended to illustrate the principles and practices recommended.

The standard soon to be published by the Canadian Standards Association will agree with B.S. 308 in its essentials, and Australia has also expressed the intention to follow it. Further, the American standards association has been working for more than a year on proposals for dimensioning and tolerancing. In the Continental field, many of the basic principles and practices of B.S. 308 have been adopted for inclusion in a proposed I.S.O. Standard.

**B.S. 1133: Section 19: 1953 — Packaging Code. Use of desiccants in packaging. 3/-.**

The deterioration of the contents of packages is of concern to all packers, but in particular to exporters. Metal goods are liable to corrode in damp and humid climates, and materials such as textiles, leather and paper are subject to other forms of deterioration. Some articles can be given protective treatment during manufacture, and others can be protected by the application of corrosion preventives, and by other means. Some, however, such as delicate instruments, cannot be given any such treatment, and for these it is essential to ensure that the humidity within the package remains reasonably constant.

The type of packaging which achieves this is known as a desiccated package, and this method is dealt with fully in this new British Standard.

This section describes the method, deals with factors governing the choice of desiccant, the determination of the quantity needed and other general packaging considerations.

The new section completes that part of the Packaging Code which deals with protection of contents against deterioration.

**B.S. 1568: 1953 — Magnetic tape sound recording and reproduction for programme interchange. 2/6.**

The British Standards institution has recently issued a revision of B.S. 1568: the new standard being entitled Magnetic tape sound recording and reproduction for programme interchange.

The Standard specifies the requirements for recording on magnetic tape and of the associated recording and reproducing equipment which are necessary for the successful interchange of recordings for broadcasting or similar purposes.

The recording and reproducing characteristics are those adopted by the Comité Consultatif Internationale Radiophonique, (C.C.I.R.)

One of the new features in the revised standard is that it specifies dimensions for an adapter to allow European machine fitments to accept the N.A.B. (National Association of Radio and Television Broadcasters of America) type of hub, thus enabling both European and American tape recordings to be played on the same machine.

# BUSINESS & INDUSTRIAL BRIEFS

*A Digest of Information*

## Appointments and Transfers

**Sales Office Transfer.**—Dow Chemical of Canada, Limited, has changed its Western district sales office from Regina to Winnipeg. The new address is—Confederation Building, 457 Main Street, Winnipeg 1, Manitoba.

●

**General Motors Diesel Limited.** — Robert E. Hunter, director of sales of General Motors Diesel Limited, London Ont., recently announced the appointment of Ronald J. Beath as London sales manager and Harold F. Shepherd as parts manager.

●

**Steel Fabricating Group.** — James A. Gairdner, chairman of the board of the Bridge and Tank Company of Canada, Limited, announces the appointment of Alex B. Hill as president. The new organization designed to provide nation-wide steel fabricating service to Canadian industry, unites the operation of Hamilton Bridge Co. Ltd., and Vulcan Iron and Engineering Ltd., Vulcan, Ford-Smith Ltd., Ford-Smith Machine Co. Ltd., and Vulcan Machinery and Equipment Ltd.

H. O. Jones, formerly general manager of Vulcan Iron and Engineering Ltd., has been elected vice-president of that company with head office in Winnipeg.

●

**Automatic Electric Staff Appointments.**—C. R. Hughes, president of Automatic Electric Sales (Canada) Ltd., announces three staff appointments to supervise the company's sales activity from coast to coast. C. L. Littler is named manager for telephone sales; R. C. Fawcett, manager for carrier sales; and E. E. Hucal, manager for communication wires and cable sales.

●

**Douglas Robinson, Q.C.**—Appointment of Douglas Robinson, Q.C., as a vice-president of Canadian Oil Companies, Limited, is announced.

Mr. Robinson originally set up Canadian Oil's legal department and has served in recent years as general counsel and secretary of the company.

●

**John S. Thorp.**—W. A. Shapland, president of Innes Equipment Quebec Limited, construction and road building equipment suppliers, announces the appointment of John S. Thorp as vice-president. Mr. Thorp joined the company as manager in September, 1952.

●

**Robertson-Irwin Limited.**—The appointment of Frank C. Manchee as marketing manager is announced by Robertson-Irwin Limited, Hamilton, Ont., manufacturers of building and industrial metal products. Mr. Manchee has served as a member and chairman of various specification and building code committees in Ottawa, and was formerly manager of the technical sales division of Canadian Gypsum Co., Ltd.

●

**Canadian Arsenals Limited.**—The appointment of Brigadier Frederick Campbell Wallace, president of Canadian Pittsburgh Industries Limited, as a mem-

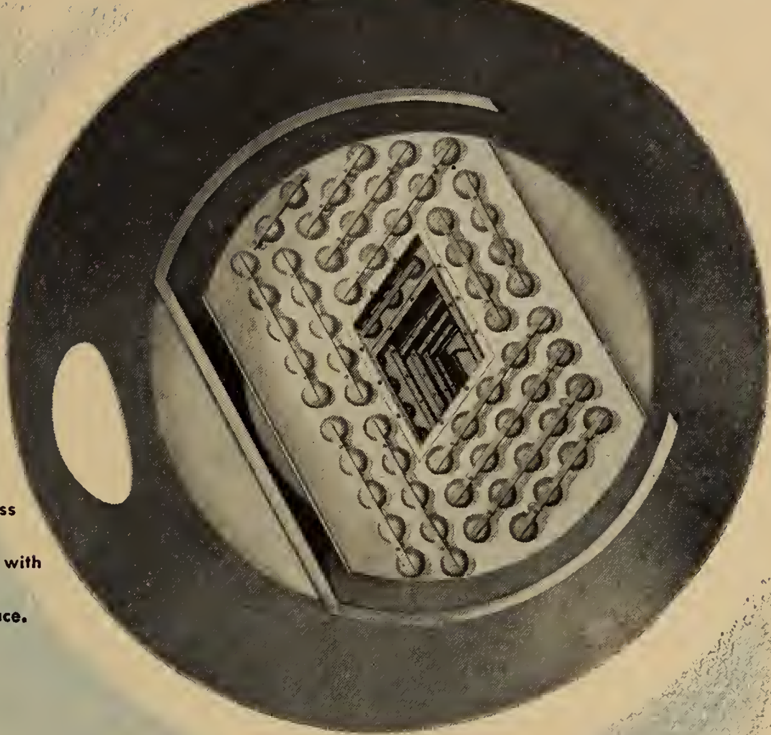
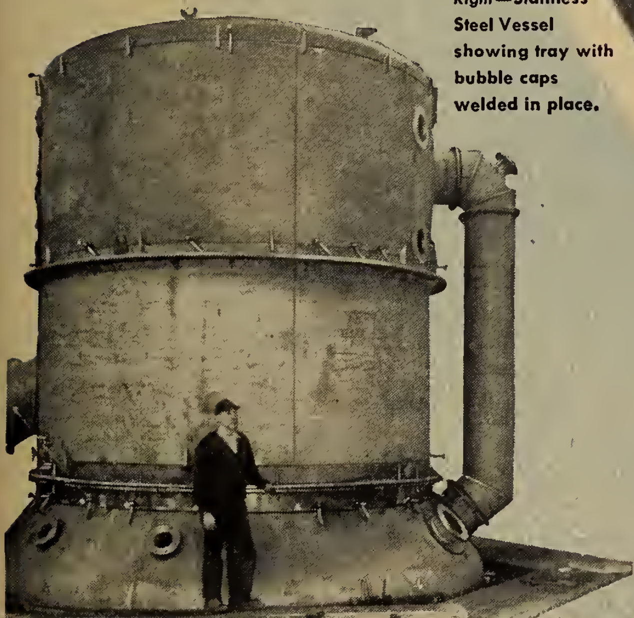
# Stainless Steel Vessels



*Right*—Stainless Steel Vessel showing tray with bubble caps welded in place.



The manufacture of stainless steel vessels is a specialized business demanding considerable metallurgical experience, faultless workmanship and the employment of the most modern equipment for the close control of every stage of fabrication. Dominion Bridge—Canada's oldest steel fabricators—have long been recognized as a leader in this specialized field.

Constant research, unrivalled technical resources and exacting standards of workmanship are inherent features of the Dominion Bridge platework service.

ber of the Board of Directors of Canadian Arsenals Limited, has been announced by the Right Honourable C. D. Howe, Minister of Defence Production. Brigadier Wallace, whose appointment was made final at a meeting of the Board on March 9th, replaces Roy G. Peers whose resignation as a director of the Crown Company was recently announced.

**Sales Appointments.** — Announcement has been made by Babcock-Wilcox and Goldie-McCulloch Limited, Galt, Ont., of two important appointments in their sales department. H. E. G. Dupuy, formerly manager of the company's western sales office in Calgary, has been appointed manager of eastern branch sales with offices in Montreal. Mr. Dupuy succeeds R. E. MacAfee who is retiring.

J. R. Harvey has been appointed manager of western sales with offices in Calgary, Alta.

(*Continued on page 536*)

*(Continued from page 534)*

**Canadian Marconi Company.** — J. J. Kingan, General Manager of Canadian Marconi Company in Montreal, has announced the appointment to the company's research staff of Leslie L. Hill. He will hold the position of senior research physicist.

•

**R. V. Glaysher.**—Canadian Johns-Manville Co., Ltd., announces the appointment of Robert Vernon Glaysher as industrial products specialty salesman for the Toronto area. Mr. Glaysher will replace Noel Lavell, who has left the company to take up residence in the United States.

•

**John Inglis Company, Limited.**—Two new appointments in the general engineering division of John Inglis Co., Ltd., have been recently announced. W. A. Montgomery has been appointed general manager and K. S. LeBaron is to be general sales manager.

•

**Canadian General Electric Co., Ltd.**—Two appointments within the industrial products division of Canadian General Electric Company have been announced by vice-president J. S. Keenan, general manager of the division.

A wire and cable department has been established within the division with W. H. Prevey appointed as manager.

R. M. Love has been appointed manager of the construction materials department.

•

**E. R. Carter.** — E. R. Carter has been appointed warehouse manager, Ontario division, of the Dominion Bridge Company, Limited, it has been announced by G. P. Wilbur, vice-president and manager of the Ontario division. He succeeds the late E. E. Woods.

In his new duties, Mr. Carter will be responsible for the supply of plain steel requirements to the many industrial customers of Dominion Bridge.

•

*(Continued on page 538)*

E. R. Carter

*(Continued from page 536)*

**Canadian Resins and Chemicals Limited.** — R. J. Southwell, general sales manager of Canadian Resins and Chemicals Limited since 1948, has been appointed a vice-president of the company, it was announced recently by V. G. Bartram, president. Head office of the company is in the Shawinigan Building in Montreal, and the plants are in Shawinigan Falls.

●

**Canadian Westinghouse.** — Ralph E. Hendershot has been appointed sales manager of the Canadian Westinghouse Company's lamp-tube division. Formerly manager of manufacturing services in the company's electronics division, Mr. Hendershot has been engaged in lamp-tube operations for the greater part of his 19 years association with Westinghouse.

●

**Bamfords Diesel Distributor Appointed.** — International Selling Corporation of New York has been appointed exclusive distributor of the Bamfords slow-speed diesel engines in the United States, Canada and Mexico, it was recently announced by Bamfords Ltd. of Uttoxeter, England. Plans are now being made by International Selling Corp. for extensive territorial distribution utilizing established diesel sales and service agencies throughout the North American countries.

●

## New Equipment and Developments

**Canadian Industries Limited.** — The entire operations of C.I.L. will be continued in two new companies. In one of these Imperial Chemical Industries Limited of the United Kingdom will be the principal shareholder and E. I. du Pont de Nemours and Co. of the United States in the other.

The new company in which I.C.I. will be the principal shareholder will be known as Canadian Industries (1954) Limited and it will be headed H. Greville Smith, now president of C.I.L. The new operating company in which Du Pont will be the principal shareholder will be known as Du Pont Company of Canada Limited. Its president will be Herbert H. Lank, now a C.I.L. vice-president.

The manufacturing operations of C.I.L. will be allocated so that the agricultural chemicals, chemicals, explosives and ammunition, paints and coated fabrics, and plastics departments (including the business of polythene resin flake), will be transferred to C.I.L. 54. The films and textile fibres department comprising the business of nylon and cellophane will be transferred to Du Pont of Canada.

●

**Canadian Subsidiary.**—Bulldog Electric Products Co., Detroit, Mich., recently announced the formation of a Canadian subsidiary, Dominion BullDog Limited, with plant and office located at 80 Clayson Road, Toronto, Ont., for the manufacture and sale of BullDog electric prod-

*(Continued on page 540)*

MAKING THE THINGS THAT MAKE THE THINGS YOU NEED

# gives you a real interest in CANADIAN VICKERS

No matter what your station in life, you are living a better life than your grandparents. Greater comforts and more leisure to enjoy them; better food with less preparation; better fabrics to keep you warm or cool; better care for the unfortunate sick . . . in every way, you live a better life.

This is due mostly to the wonderful machines which produce the good things of life at great speeds and in huge quantities thus lowering costs and raising the standard of living of all Canadians. And this fact gives you a real interest in Canadian Vickers Limited because Canadian Vickers designs and builds the machines that manufacturers use to make the things that help you live the good life.

Mining machinery that processes raw ore into the metal of which so many good things are made; Chemical Process Equipment needed to produce plastics or nylon and other fabulous fabrics; Industrial Boilers, Paper Machinery . . . machinery and equipment of every kind to make the good things that you enjoy. And more, Canadian Vickers builds ships and ships' engines that enrich Canada by carrying Canadian goods throughout the world. Yes, you live a better life because of the machinery, equipment and ships made by . . .

CANADIAN VICKERS LIMITED MONTREAL

IF INDUSTRY NEEDS IT . . . CANADIAN VICKERS BUILDS IT . . . BETTER

(*Continued from page 538*)
ucts in Canada. Robert R. Farrell, of Hamilton, is vice-president and general-manager of the Canadian subsidiary, and James H. Wilson of Toronto, is secretary-treasurer and general sales manager.

**Robertshaw-Fulton Controls Company.**—Robertshaw-Fulton Controls Company has recently announced the incorporation of a wholly-owned subsidiary to be known as Robertshaw-Fulton Controls (Canada) Limited. Plans for Canadian manufacture and distribution of selected lines of the company's products are well underway. The plant of Robertshaw-Fulton Controls (Canada) Limited will be located in the Toronto area.

Robertshaw-Fulton is a manufacturer of thermostats for domestic gas ranges, water heater thermostats and automatic pilots. It also supplies a substantial volume of thermostats for electric ranges and other home appliances, automotive thermostats, and electronic recorders and controllers. The company also produces bellows and bellows assemblies.

**The Asbestos Industry Expands.**—In an official statement, Hon. Tancrede L'Abbe summarized plans for an immediate outlay of $20 millions on a new producing unit in Canada's asbestos industry.

The new mine is located below the water of Black Lake in Megantic County. The lake will be drained to turn the deposits into an open-pit project.

The project will involve the removal of Black Lake itself and the creation of a new lake approximately one mile and a half downstream. The first mill to be erected at the property would have an output of 5,000 tons daily. This initial mining-milling operation would provide permanent employment for 400-500 workers.

The project has been launched by United Asbestos Corporation, and the additional investment to bring it to production, estimated at $15 millions to $20 millions was being made by American Smelting and Refining Company. The Canadian and American companies would operate jointly.

**Anti-Seize Thread Compound.**—A new high temperature thread compound that protects against the welding action of threaded connections subjected to prolonged exposure to extreme heat has been developed by Crane Packing Company, Limited, of Hamilton, Ont. Known as "Thred-Gard", it is said to eliminate seizing and galling at operating temperatures up to 1200 degrees F. The compound is non-hardening and acts as a lubricant to allow easy disassembly of threaded connections, even after lengthy service under the most severe conditions.

**Construction.** — Drayton Construction Equipment Limited, a new Canadian company in the construction field is now in operation. Located at 58 Pelham Avenue, Toronto 9, Ontario, the new company will specialize in sales and service of a complete line of equipment for the mixing, placing and compacting of concrete on construction jobs and for the manufacture of pre-cast concrete products in plants.

In addition to its own line of Drayton dumpers, bin batchers, weighbatchers and mono-rail equipment, the company will also distribute, throughout Ontario, weatherill front-end and overloading shovels, Ace hoists and immersion concrete vibrators, and Trianco block-making machines.

**New Contact Welding Electrode Available from C.G.E.**—A new contact electrode providing high-speed welding and great operator appeal is available from Canadian General Electric Company's apparatus division.

Best suited for work on mild and medium carbon steel, the new rod is ideal for welding machinery, low pressure storage tanks, and light structural work.

It is suitable for many welding operations requiring AWS classes E6012 and E6020 electrodes.

The relative high-speed quality of the new electrode was established in the G-E welding research laboratory, where engineers conducted a series of actual work tests. Results showed that the new product consistently produced a higher rate of weld footage than conventional electrodes.

Encased in a rutile-type covering enriched with iron powder the new electrode can be used effectively on horizontal and flat position fillets and laps, single and multiple pass butts, and deep

(*Continued on page 542*)

(*Continued from page 540*)

grooves and cover passes on multiple-pass butt welds.

Since the electrode is of the contact type, less physical effort is expended in welding. For the same reason, less welding skill is required of the worker.

The contact electrode develops up to 80 per cent less spatter than other welding rods, and resultant weld slag is easily removed by a light tap.

●

**Injector Tip Concentricity Gauge.**—To check concentricity between the injector tip and injector nut after assembly, an injector tip concentricity gauge has recently been added to its line of Diesel service tools by the Kent-Moore Organization, Detroit.

Bearing the catalogue number J 5119, the gauge is applicable to injectors used in General Motors Series 71 Diesel engines.

To insure correct clearance between the injector spray tip and the cylinder-head injector hole tube with the injector properly installed, the spray tip must be concentric to the injector nut within 0.008 in.

The "run-in" of the injector spray tip may be measured by placing the assembled injector in the gauge, then setting the dial indicator at zero, and rotating the injector in a complete circle and noting the total reading.

If the total indicator reading is greater than 0.008 in., the injector should be removed from the gauge, the injector nut loosened, the spray tip re-centered, the injector nut tightened, and the "run-out" re-measured.

Orders should be addressed to the Kent-Moore Organization, Inc., 5-105 General Motors Building, Detroit 2, Michigan.

●

**Stelco New Blast Furnace.**—The additional pig iron capacity provided by the new 1,400 ton per day blast furnace of The Steel Company of Canada, Limited, Hamilton, now assures a permanent supply of iron for the foundry trade.

Stelco "Easymelt" pig iron owes a fine reputation to the fact that one control exists over the production from the source of raw materials to the finished pig.

Grades being produced are No. 1 foundry, No. 2 foundry, malleable bessemer and special grades to specification all well below the .05% maximum sulphur permitted by the American Iron and Steel Institute. Stocks of regular grades are being maintained to service the needs of the trade more adequately.

Further details may be secured upon contact with the company's sales divisions in Hamilton and Montreal.

●

**Compressible Liquids.** — Revolutionary, compressible liquids known as Wales Comproils used in Wales hydra springs have just been made available by the Hydra spring division of Wales-Strippit of Canada Ltd., Hamilton, Ontario, specialists in machines and compressible liquids.

This new development combines the new principle of liquid compressibility at ultra high pressures with lubricity. One of the widest uses of Wales Comproils is in cushioning applications. These Wales Comproils also have varied usage in hydraulic systems.

For complete information on Wales Comproils, write to the Hydra Spring Division, Wales-Strippit of Canada, Ltd., 1105 Main St., E. Hamilton, Ontario.

●

**Shawinigan 56th Annual Report.** — A 40 page document with illustrations in full color is the form of the Shawinigan Water and Power Company's 1953 report.

The cover picture of this report is an aerial view, in full color, of the company's development at Shawinigan Falls on the St. Maurice River. Page one has a reproduction of a painting by the Canadian artist Franklin Arbuckle, R.C.A., O.S.A. "The artist has caught in remarkable perspective the 240-mile sweep of the St. Maurice from the Laurentians to its juncture with the St. Lawrence at Trois-Rivieres."

A feature of the report is a section entitled "20 Years of Progress", which in a series of statistical charts shows the company's expansion since 1933. The comparative balance sheet for the past 10 years shows assets of $304,455,-000 at the end of 1953, compared with $187,501,000 in 1944.

●

**Heating Controls.**—A new line of simplified home heating controls for all makes of domestic oil burners is available from Canadian General Electric Company's appliance control sales, component products department.

The line includes nine devices: A room thermostat, master control with bimetallic helix, flame detector and companion master control, transformer relay, fan and limit control, temperature limit control, water immersion temperature control and steam pressure control.

According to the manufacturer, all are designed for fast, easy installation and fewer-service call-backs. They may be mounted in any position without levelling.

●

**Gas Turbines for Industrial Use.** — Engine weight of only ½ to 1 lb. per

(*Continued on page 544*)

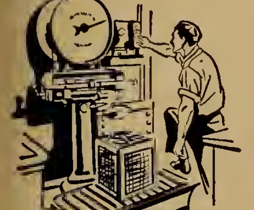
# the Chemical Engineer and FAIRBANKS-MORSE

In the centre of Canada's industry, in great oil refineries, pharmaceutical houses and other chemical plants . . . there you will find the Chemical Engineer . . . designer, operator, consultant. His work is close to the roots of industrial progress, for few industries operate successfully without the benefit of his knowledge.

In the twentieth century's mechanization the engineer is a key figure, harnessing and converting to man's most expedient use the basic elementals of our world . . . seeking new processes . . . new manufacturing techniques, which can enrich our daily living.

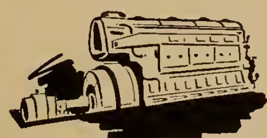
In the development of Canada's chemical and allied industries, Fairbanks-Morse has played an important role. Through sixteen branches the "Departmental Store for Industry" supplies all types of machine tools, industrial supplies, and materials handling equipment; Fairbanks-Morse scales, Diesel engines, pumps and electrical equipment; steam goods, railway and contractors' and automotive equipment.

THE CANADIAN
**FAIRBANKS-MORSE**
COMPANY LIMITED
Sixteen Branches Across Canada



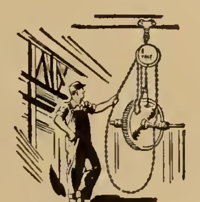
Fairbanks-Morse Scales built for every weighing purpose

Fairbanks-Morse Centrifugal Pumps at work in the field



Marine and Stationary Diesel engines and electrical equipment

Thor Industrial Precision-Built Electric and Pneumatic Tools



Yale Hand and Electric Hoists for every industrial requirement

(*Continued from page 542*)

horsepower, as against 10 to 15 lbs. per horsepower for a comparable diesel, is one of the outstanding features of Turbomeca engines, the first gas turbines for industrial use to be marketed in Canada.

The new engines manufactured by Blackburn and General Aircraft Ltd. of England, and distributed in Canada by Field Aviation Company Ltd. of Oshawa, Ontario, cover a power range of 150 to 400 horsepower. Similar engines with up to 1,000 lbs. thrust are also produced by the English company for powering jet aircraft. Every engine will operate without modification on kerosene, diesel oil or gasoline.

Shaft drive Turbomeca engines, either with single shaft or separate power turbines, are suitable for powering generators, boats, tractors, pumps, etc. The separate power turbine engine is in itself an efficient torque converter which eliminates the use of a clutch or change speed gear box. Their light weight, quick starting and compactness (one man can lift a complete 250 horsepower turbine) make these easily portable engines ideal for many auxiliary and emergency power applications.

●

# Publications

**For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.**

**Please mention *The Engineering Journal* when writing.**

**Alchem's New Publication.**—The Alchem Ltd. of Burlington, Ontario, recently issued the first publication of their new house organ, Alchem News, to be published quarterly in the interests of the field of boiler water treatment.

The first issue presents a brief history of the organization. Included also is a typical case history of treatment of feed and boiler water for relatively small plants operating at low pressure.

A list is presented of recent articles dealing with feedwater treatment problems. These articles are available by request from the company.

●

**New Gradall Service Manual.**—A liberally-illustrated manual devoted to the maintenance, servicing and repair of its mobile, multi-purpose earthmoving and construction machine has just been issued by the Gradall Division of the Warner & Swasey Company, Cleveland, Ohio.

The 28-page manual includes a quick-reference guide to good Gradall maintenance and incorporates up-to-the-minute service recommendations and suggestions covering the company's improved Model M-2460.

Copies are available from the Warner & Swasey Company, 5701 Carnegie Ave., Cleveland, Ohio.

●

**Moisture Control in Compressed Air.**—"Moisture Control in Compressed Air", is the title of a new 4-page brochure, discussing types and quantities of impurities and methods for their removal.

Information is set forth in a manner easy to read and understand. The Vi-speed method, units, and dessicant are clearly described along with results that can be anticipated. Copies are available from Van Products Co., 3736 West 12th Street, Erie, Pa.

●

**Aluminum Uses.**—A feature article in the Alcan Ingot, house-organ of the Aluminum Company of Canada, describes the versatile uses of aluminum in the construction of The Manufacturers Life Insurance Building in Toronto. Another article entitled "Sprinkler Irrigation for Better Crops", by H. D Ayers, asst. professor of agricultural engineering, Ontario Agricultural College, Guelph, Ont., outlines the advantages of the irrigation. Development of lightweight portable aluminum alloy pipe has played a big part in this.

Correspondence should be addressed to The Aluminum Company of Canada, Limited, c/o Department of Information, 1700 Sun Life Building, Montreal, Que.

●

**Better Drilling.**—"The Guide Book for Better Drilling" is a manual recently issued by the Canadian Blower & Forge Co. Ltd., Kitchener, Ont. The manual contains basic information on types of drills; twist drill materials; definitions and twist drill points with illustrative drawings.

Statistical tables on speeds, feeds and required lubricants for the drilling of all materials are also included and arranged for handy reference.

The manual is being distributed by Canadian Blower & Forge Co., Ltd., and may be obtained by writing to the company on your letterhead.

●

**Transmission Belting.** — An illustrated 16-page booklet on transmission belting has been issued by mechanical goods division, of the Dominion Rubber Company, Limited.

The booklet discusses factors to be considered in the proper selection of transmission belting for best performance. Types of transmission belt drives are shown, and necessary formulae and tables are given for the specification of an appropriate transmission belt for any particular set of operating conditions. The booklet also gives information on the complete line of Dominion transmission belts.

Copies of the booklet are available upon application to any Dominion Rubber Company branch office.

●

**Kellog Publication.**—How combination processing can slash more than 20 percent from investment costs in building today's new oil refineries is revealed in Kellogram No. 1 (1954) just published by the M. W. Kellogg Company, New York City.

Combination processing means the integration of a number of different refining steps into a single, continuous, centrally-controlled operation without intermediate storage.

A detailed analysis of these savings is presented in the Kellogram. The booklet is available from Kellog's Refinery Process Division, 225 Broadway, New York 7, N.Y.

●

**Making Colour Work.**—How colour can be used to improve the skill, health, comfort and morale of people in working areas is explained in an illustrated booklet published by the paint and varnish division of Canadian Industries Limited.

Entitled "Making Colour Work", the publication deals with the psychological effects certain colours have on people. It shows examples of scientific colour conditioning in industrial plants, schools, hospitals, offices, hotels, restaurants and institutions.

One section explains "brightness engineering"—the correct relationship between light reflective values of different surfaces within the field of vision in any working area. Emotional reaction to colour, colour complementation, the safety colour code and use of colour in the identification of piping systems are also dealt with.

The booklet is available from any district office of the C.I.L. paint and varnish division across Canada or by writing the Paint and Varnish Division, P.O. Box 10, Montreal, Que.

●

**A New Bulletin on Wheelco Instruments.**—A new bulletin F 5633-1, describing the complete line of Wheelco instruments for industrial process control application is now available. Of special interest is a discussion of the Wheelco electronic link, a simple no-contact linkage between the precision, direct measuring unit and the automatic control and recording system which gives instantaneous control and recording action. Also included in the new bulletin is a brief description of the flameotrol. Write the

(*Continued on page 548*)

Municipal waterworks pumping station control panel. System includes automatic level control of elevated water tank, water flow and pressure records and instruments to assist operator in continuously checking clear-well level and pump suction pressures.

(*Continued from page 546*)

Wheelco Instruments Division, Barber-Colman Company, Rockford, Illinois for your free copy of this catalogue.

●

**Air Classifier.**—Hardinge Company, Inc., York, Pennsylvania, has just published Bulletin AH-449 describing the new line of Hardinge "Gyrotor" air classifiers, a four-page booklet which illustrates the operational details of the new classifier plus its operational advantages over the conventional types, and flow sheets showing various applications. The Gyrotor is used for continuous separation or sizing, of a mixture of coarse and fine air-borne particles in a closed circuit dry grinding operation, or in any moving stream of air-solids mixture.

●

**Generator Alignment.**—A new method for aligning generators, turbines, shafts, bearings, etc. by means of optical instruments has been developed by the Farrand Optical Co., Inc. in co-operation with the Consolidated Edison Company of New York. A brochure issued briefly describes the new method as contrasted with the old and indicates the extent of time saving that can be accomplished.

A comprehensive bulletin No. 815 contains more detailed information and lists instruments and accessories. This bulletin is available upon request from the Farrand Optical Co., Inc., Bronx Blvd. and East 238th St., New York 70, N.Y.

●

**Piping and Fitting.**—A new 304-page fittings catalog and piping handbook has recently been announced by Ladish Co. of Canada Ltd., Brantford, Ont. It gives detailed dimensional data and specifications on complete line of controlled quality seamless welding pipe fittings, forged ASA flanges, large diameter and tema flanges as well as screwed and socket welding fittings. The catalog includes a 56 page technical data section. Copies may be obtained by writing to Ladish Co. of Canada Ltd., Brantford, Ontario.

●

**Atomic Energy.** — A newsletter about Canadian development of atomic energy for peacetime use is issued monthly by Isotope Products Limited, Box 127, Oakville, Ont. The newsletter describes developments of atomic energy uses in medical fields and in industry. Detailed procedures on specific problems that have arisen and their solution are given in this interesting newsletter. The letter also includes a section about people in the atomic industry.

●

**Air-Quenching Clinker Cooler.**—A 24-page bulletin released by the Canadian Allis-Chalmers Ltd. describes how a six-way saving can be effected in cement, lime and chemical industries through use of the company's shaking grate cooler.

A description of design features of the air-quenching cooler is included in the bulletin along with data on how a unit can be installed with little or no plant remodeling expense. A graph is provided to permit the plant operator to determine for himself how much fuel saving he can obtain by installing an Allis-Chalmers air-quenching clinker cooler.

Copies are available on request from Canadian Allis-Chalmers, Box 37, Montreal, Que.

●

**Exploring for Oil by Radioactivity.**—Upon request, the Radiac Co. Inc., 489 Fifth Avenue, New York City 17, New York, will furnish free literature concerning the use of geiger and scintillation counters in the exploration for oil by means of radioactivity association technique.

The following reprints are available: "Radioactivity in Geophysical Oil Search," Oil Forum, March 1953. "Now They're Hunting Oil with Atomic 'Guns'," Popular Mechanics, June 1953; and "Atomic Tools Seen Opening New Era in Geological Exploration," Texas Oil Journal, October, 1952.

●

**Ultrasonic Test Instruments.**—An illustrated 4-page folder just issued by Brandon Instruments, Inc., presents in organized form all the essential data necessary to an intelligent selection of the ultrasonic thickness-measuring instrument best suited to a particular problem or set of problems.

Copies of the Ultrasonic Specifications Folder are available on request from Brandon Instruments, Inc., 430 Fairfield Avenue, Stamford, Connecticut; or from their Canadian representatives, Messrs. Electrodesign, 209 St. Paul St. West, Montreal, Que.

*Quebec.*

*A paper presented before the 68th Annual General and Professional Meeting of the Engineering Institute of Canada, Quebec City, May 12-14, 1954.*

The power development here described was built in the severe climate of the Labrador plateau, where only the months of June to September were frost-free. Dependable stream flow and maximum floods had to be estimated from records of rivers on adjacent watersheds and adjusted to the climate and geography surrounding the site.

Practically the entire tonnage of supplies and equipment was delivered to the site by airlift, on a scale never before attempted in Canada. Alternative earth dam designs had to be provided for placing fill on frozen foundations, though earth dams were actually built under summer conditions.

Choice of the site, determination of suitable installed capacity, equipment selected and methods of construction are discussed, as well as special measures taken for utilizing local aggregates and fill materials.

This paper describes the design and construction of the power plant built at Menihek in Labrador on the Ashuanipi River, to serve the new iron-ore mining centre of the Iron Ore Company of Canada near Knob Lake. The geographical location of Menihek is shown on Fig. 1. Preliminary investigations of possible sites for the power development were begun in 1950. Construction was commenced at Menihek in 1951 and the project will be completed ready for power production in mid-summer 1954.

Two features make this development unusual: the dam for the power project serves also as the bridge and approaches required by the railway to cross the wide Ashuanipi River, and a 330-mile air lift was necessary to transport men, supplies and equipment from Seven Islands during most of the construction period.

The new railway from Seven Islands to Knob Lake, the St. Marguerite power development near Clarke City, and the docks and loading facilities at Seven Islands were being built by the same contractor at the same time as the Menihek power project. The progress and difficulties of these other major undertakings, but more particularly the railroad, had a considerable influence on most stages of the work at Menihek with regard to the availability of construction equipment.

To suit the railway construction program, the Ashuanipi river-crossing over the dam had to be ready by the end of 1953. Work at Menihek was planned with that vital obligation constantly in mind. In fact, the dam and bridge girders were ready on December 10, 1953, sixteen days before the track-laying parties reached the south end of the earth dam, and twenty one days before tracks were laid across the river bridge.

The Labrador plateau has a severe climate. Temperatures ranging between 47 degrees below zero in winter, and 85°F. in summer were recorded at Menihek. High winds and the long season of cold weather had a profound effect on construction. Only the months from June to September are considered to be reasonably free from frost conditions.

Full protective measures had to be taken to permit placing of concrete under winter conditions in order to meet the scheduled date for completion of the work. The remote location and difficult access to the site constituted perhaps the greatest of all the problems on this project, and reference is made later to the arrangements for transport.

The assessment of load requirements at the mines was based on the assumption that an annual output of 10,000,000 tons of ore would require about 4,500 hp. for mining equipment, with mining operations taking place between the months of May and October.

At this time of year the mining settlement would require about 2,500 hp., but the extra heating and lighting load during the winter would result in a fairly balanced total demand throughout the year. After considering all relevant factors, an initial installation of 12,000 hp. in two units was finally chosen, with provision for adding a further 12,000 hp. in the future.

### Selection of Site

There are no suitable smaller rivers or high-head possibilities in the Knob Lake area which could be used at low cost for the comparatively small amount of power required in the mining area. Among the possible power sites investigated were Eaton Canyon and the Lower Gorge about 75 miles west of the Knob Lake camp, on the Kaniapiskau River. Both are magnificent power sites, where upwards of 1,000,000 hp. could be developed.

These large sites however, are not practical for the generation of small amounts of power. The cost of the diversion works would be high. So much frazil ice would be created throughout the winter by rapids upstream that the operation of small power plants would be difficult. It was felt that the development of these valuable sites should be de-

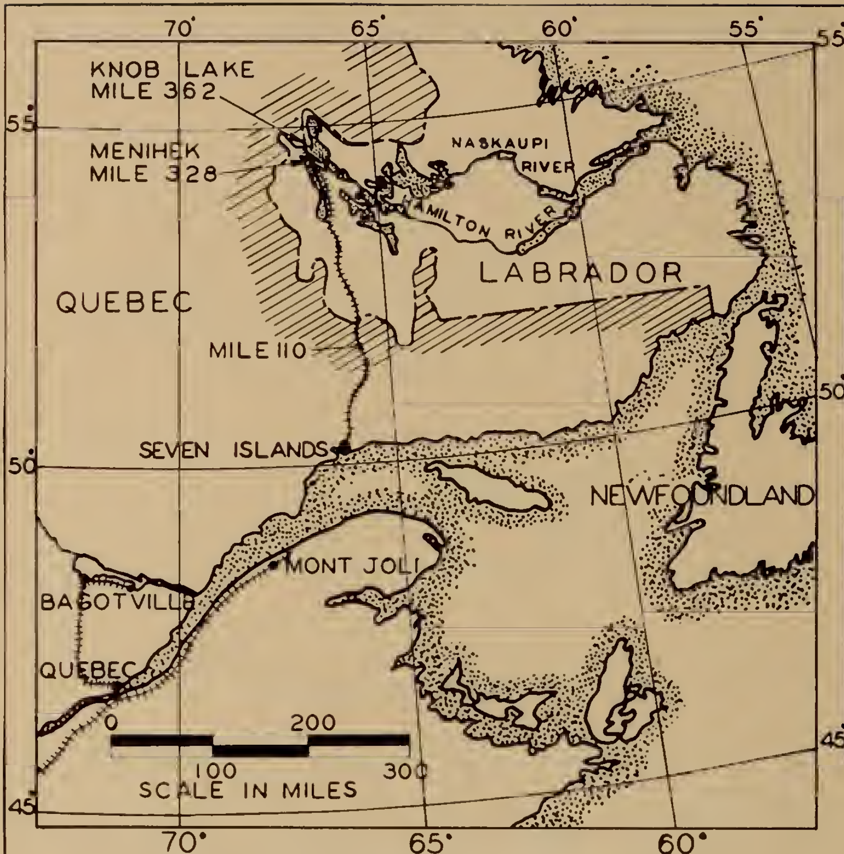

Fig. 1. The geographical location of Menihek.

ferred until enough power is required to justify their use on a major scale.

The railroad from Seven Islands to Knob Lake had to cross the Ashuanipi River in any case, and a suitable low head site existed where the line was to cross the river below the outlet of the Menihek Lake. The site offered several advantages:

(1) Ample storage could be created on Menihek Lake for an initial development of 12,000 hp., and additional storage could be made available at lakes in the headwaters if required later.

(2) The power potential of the river was considerably more than the immediate mining needs, so that development could be extended to meet future load growth.

(3) The power plant would be approximately 28 miles from the load centre at Knob Lake. The transmission line would in general run parallel to the line of the railroad which would thus provide access for construction and line maintenance.

(4) The concrete dam for the development would serve as a railroad bridge across the river, while the earth-fill dam would carry the railroad grade alongside the storage reservoir.

(5) Material for a homogeneous type earth-fill dam was available at the site.

The main disadvantages of the Ashuanipi were that it is a large river for the amount of power initially required, and prior to construction of the railway it was difficult to reach except by air. This, together with the low head available in this country of low relief, makes the first development expensive. Against this must be credited the economic advantage of combining the power project with the approaches and bridge for the railway crossing of the river.

### Physical Features of the Ashuanipi River Watershed

The Ashuanipi River, some 260 miles in length, forms one of the main tributaries of the Hamilton, Labrador's major river. Its main source is Ashuanipi Lakes, from whence it flows in a northerly direction for some 160 miles before veering sharply to the east to join the Hamilton River at Sandgirt Lake.

On the north and west its drainage area forms a portion of the boundary between Labrador and the Province of Quebec. The watershed is bounded on the south by a series of rivers flowing into the St. Lawrence River, and on the north by rivers flowing into Ungava Bay.

The country through which it flows is relatively flat, sparsely wooded, and has many lakes and swamps. Above Menihek Lake the river is more or less a series of large lakes, joined by rapids. The drainage area above the power plant is approximately 9,040 square miles.

### Description of Site

From Menihek Lake, with an area of 88 square miles, the Ashuanipi River flows through a series of rapids and small lakes (Fig. 2), dropping 32.3 feet in 3½ miles. The fall from Menihek Lake to the outlet of Range Lake was 13.5 feet, and a further drop of 14 feet occurred in approximately 3,300 feet from the outlet of Range Lake to Stoney Bay. The terrain on either side of the river is flat and rises slowly from the river's edge, so that long, low dykes were required at both ends of the river dam to raise the water level in Menihek Lake.

The bedrock is generally altered siltstone, overlain by varying thicknesses of unconsolidated glacial debris, some of which was suitable for earth-fill construction. Gravels are practically non-existent in the area. The rock at the powerhouse site on the north bank is a lamprophyric dyke, and contains thin veins of iron pyrite. Rock on the south bank is extremely fine grained altered siltstone.

Both types of rock are very dense, their specific gravities being 2.69 and 2.68 respectively, and water absorption figures were less than 1 per cent in each case. Loss due to 15 cycles of sodium sulphate tests was 0.26 per cent for rock at the powerhouse site and 1.12 per cent for rock on the south bank.

Table I—Ste. Marguerite and Outardes Rivers' Data

| River | Years Obs. | Drainage Area Square Miles | c.f.s. | Runoff c.f.s. per Square Mile | Runoff Inches on Drainage Area |
|---|---|---|---|---|---|
| Ste. Marguerite | 8 | 2,270 | 5,210 | 2.30 | 31.2 |
| Outardes | 27 | 6,300 | 14,000 | 2.22 | 30.2 |

## Water Supply

Due to lack of stream flow records on the Ashuanipi and adjacent rivers, it was necessary to estimate the probable run-off of the Ashuanipi from records of temperature, precipitation, and run-off records of the nearest rivers on which this data was available, adjusted to the climate and geography of the Labrador plateau. These records cover the Ste. Marguerite and the Outardes, which rise to the south west of the Ashuanipi and flow into the St. Lawrence River, and the Hamilton River on which partial records are available.

Table I lists data on the Ste. Marguerite and Outardes Rivers.

The mean run-offs from Table I, in terms of inches on the drainage areas, were then equated to the precipitation records nearest the source and, alternatively, nearest the mouth of the river to obtain the ratio of precipitation to run-off at two points on each river. Thus, an estimate of the ratio of average precipitation to run-off on both rivers could be made. The results of these calculations are shown in Table II. A run-off to precipitation ratio of 0.80 was selected for the Ashuanipi River.

The minimum annual precipitation on the Ashuanipi was taken as the lowest recorded at Sandgirt Lake, Knob Lake and Ashuanipi, giving a total of five years of records. The minimum recorded was at Knob Lake at 25.99 inches. Table III is a tabulation of the maximum, minimum and mean precipitation at selected points in Labrador and Quebec.

From Table III, it is apparent that the coast of Labrador and Quebec is a region of relatively high rainfall. Inland over the height of land the annual precipitation decreases. The minimum annual precipitation of 25.99 inches in the Ashuanipi district is equivalent to 20.80 inches, or 1.5 c.f.s. per square mile run-off at a run-off to precipitation ratio of 0.80.

At a minimum annual run-off of 1.5 c.f.s. per square mile, the dependable flow of the Ashuanipi River with 100 per cent regulation and a drainage area of 9,040 square miles above the power site would be approximately 13,500 c.f.s.

From a study of the temperature and snowfall data and a knowledge of the climate in the Ashuanipi area, the winter flow was estimated to extend from October 1 to May 31. From October 1 the run-off was assumed to be governed by the rate of lowering of the lakes, the lower-

### Table II—Ratio of Average Precipitation to Run-off

| River | Precipitation Gauge | Mean Runoff Inches on D.A. | Mean Precipitation Inches | Ratio Runoff to Precipitation | Mean Ratio Runoff to Precipitation |

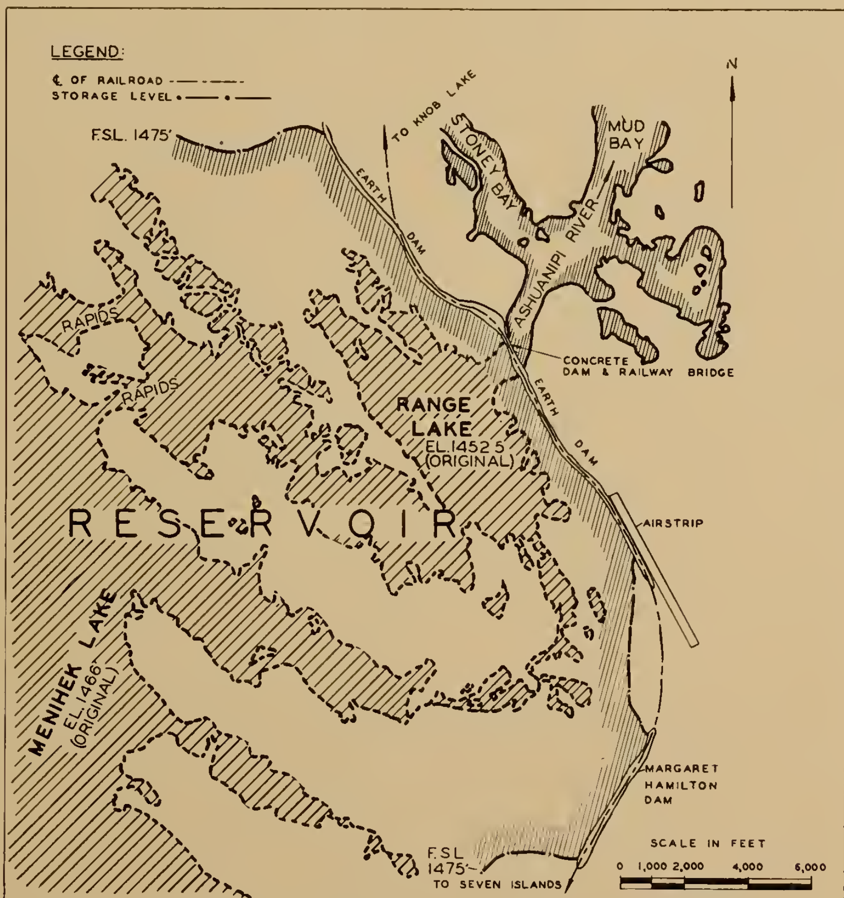

Fig. 2. The Menihek Lake area.

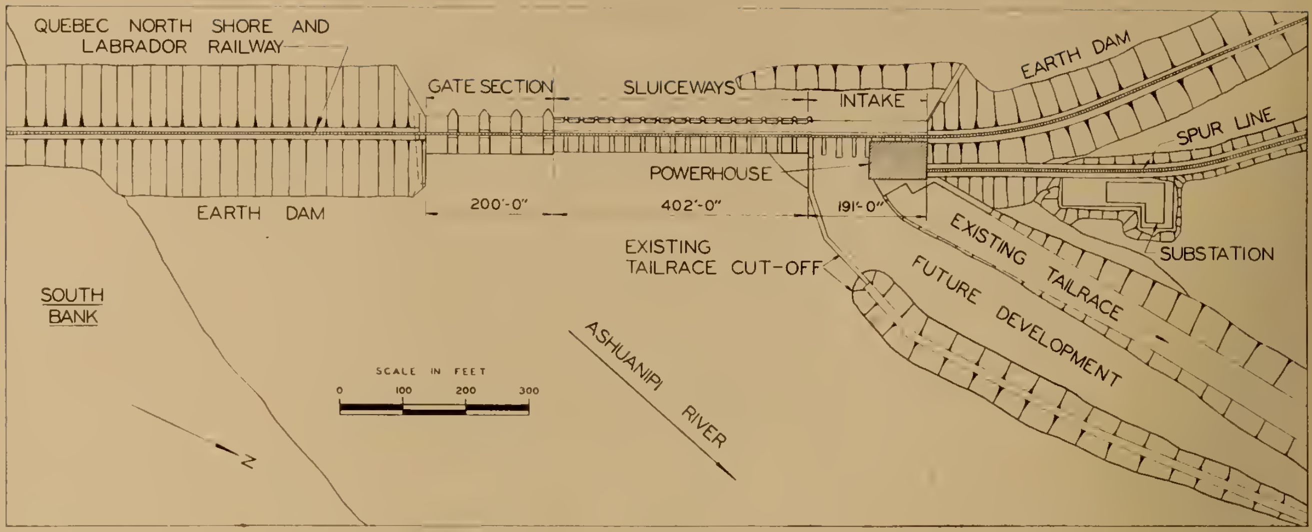

**Fig. 3. The general layout of the concrete dam and powerhouse.**

ing of the water table and the outflow from bogs, etc. The general shape of the hydrograph should thus be exponential.

Two points on the curve were determined from the discharge measurements at Muskrat Falls on the Hamilton River of 18,500 c.f.s. on January 1, 1949; and 9,800 c.f.s. on April 18, 1949. These are approximately in the ratio of 2 : 1, therefore assuming a minimum flow on the Ashuanipi of 0.25 c.f.s. per square mile (2,260 c.f.s.) on April 18, the flow on January 1 would be 0.50 c.f.s. per square mile (4,520 c.f.s.). The remainder of the hydrograph was then estimated from a plot on a logarithmic graph.

From the above analysis the dependable flow from October 1st to May 31st was estimated at 1,017,900 c.f.s. days. At a minimum annual run-off of 1.5 c.f.s. per square mile, the total annual run-off is equal to 4,940,000 c.f.s. days. Thus, the flow from June 1st to September 30th would be 3,922,000 c.f.s. days or a mean flow of 32,150 c.f.s.

The minimum flow may occur in May coinciding with the highest monthly load. With the storage full on May 1st, the minimum May natural flow augmented by five feet head of storage from Menihek Lake would give a regulated flow in excess of 6,500 c.f.s.

### Flood Flow

The lack of discharge measurements on the Ashuanipi and adjacent drainage basins makes the forecasting of flood flows difficult. In view of the wide, flat drainage basin with relatively large lake area, it is safe to assume the peak flow is below that experienced on the Ste. Marguerite or the Outardes Rivers. The maximum run-off on the Outardes in twenty-seven years of record is 15.0 c.f.s. per square mile. Commander G. H. Desbarats, Water Bureau Engineer, St. John's, Newfoundland, estimates the flood flow in the Hamilton at Muskrat Falls at 8.7 c.f.s. per square mile. Assuming 8.7 c.f.s. per square mile flood run-off on the Ashuanipi at Menihek Rapids, the flood flow would be 78,000 c.f.s. However, due to the uncertainty of the assumptions that had to be made to arrive at this figure, the adopted spillway capacity was 150,000 c.f.s., which is equivalent to 16.6 c.f.s. per square mile.

### Head and Power Available

The effective head between Menihek Lake and Mud Bay varied between 25 feet when the river was in flood, to 32.3 feet at times of minimum flow. The 4.8 feet of head between Stoney Bay and Mud Lake could only be obtained by a long, costly rock cut, which reduced the economic head to 27.5 feet.

With an estimated minimum winter flow of 2,260 c.f.s. this head could develop about 5,000 continuous horsepower which was insufficient to meet the load requirements. It was decided to raise Menihek Lake nine feet above low water level, to elevation 1,475. This is the highest elevation to which the lake could be raised without running into excessive railway grades and adding materially to the cost of the earth-fill dam.

While the head and storage so obtained were more than those needed at the present time, it was considered desirable to go to the ultimate storage elevation now rather than at a later date, when the work required to raise the head would be considerably more costly and would entail an interruption to railway service.

By raising the lake elevation to 1,475 and excavating the plant tailrace for a water elevation 1,441, a head of 29 feet at flood flow and 34 feet at minimum flow with the lake at full supply elevation was obtained. With full supply level at 1,475 feet, five feet of drawdown is possible without running into ice trouble at the plant intakes.

During the month of May when the load may reach a peak of 9,850 hp., the minimum river flow supplemented by the storage water drawn from the upper five feet of the lake would average 6,810 c.f.s. throughout the month. At the minimum average head of 31.5 feet at this time of year, 17,000 continuous horsepower could be produced during the month, or 28,000 horsepower at a load factor of, say, 60 per cent. The 100 per cent estimated regulated flow of 13,500 c.f.s. available on the river is equivalent to 34,000 continuous horsepower, or 56,000 horsepower at 60 per cent load factor.

### Structures and Equipment

The general layout of the concrete dam and powerhouse is shown in Fig. 3. The powerhouse is located in the cove on the left bank of the river some 1,300 feet below Range Lake. By reason of the site chosen, work on the powerhouse substructure could proceed uninterrupted by the seasonal changes in river flow.

A cross section through the intake and powerhouse is shown in Fig. 4. The powerhouse building is a steel framed structure with walls of asbestos sheeting on the inside of which asbestos fibre insulation has been sprayed to a thickness of two inches. Four hand operated gates are installed at the draft tube outlets.

The clear gate openings at the intakes are 15 feet by 17 feet. Each of the four headgates weighs nine tons, and is of the fixed axle roller type with electrical and manual hoisting gear. Heaters are fitted to the gate guides. Four more intake passages closed off by steel bulkhead gates and stoplogs have been constructed on the south side of the powerhouse. Thus the plant at some future date can conveniently be doubled in capacity.

The powerhouse accommodates two 6,000 hp., 150 r.p.m. fixed blade propeller type turbines, operating under a head of 34 feet. Power is generated at 6,900 volts by two 5,000 kva. generators and stepped up by two 5,000 kva. transformers for transmission to Knob Lake, a distance of approximately 30 miles, initially at 66 kv. and later at 115 kv.

The spillway, having a total capacity of 150,000 c.f.s., consists of four sluice gates 35 feet long and 26 feet high, each weighing 42 tons, as well as seventeen stoplog sluiceways each 18 feet wide. The gates, roller paths and sealing surfaces are electrically heated. The design of the sluice gates made allowance for an ice load of 5,000 pounds per lineal foot acting one foot below water surface level, which varies between elevation 1,475 and 1,470.

One set of stoplogs for the large gate openings is handled by an electrically operated hoist, running on a monorail beam fixed to brackets on the upstream side of the gate towers. A travelling gantry handles bulkhead gates and logs in the stoplog sluiceway section.

The earth dam with crest elevation 1,480 extends northward from the powerhouse for 6,800 feet to meet the 1,480 contour. To form a continuous dyke to elevation 1,480 south of the river section of the dam, two lengths of earth dam were required totalling 13,200 feet in length, the southern part being known after the nearby lake as the Margaret Hamilton dam.

After running for three miles on the dam, the railroad to Knob Lake branches off midway along the northern section of the earth dam. Designs for the earth dams are shown in Fig. 5. Lack of gravel for pervious embankments dictated the selection of a homogeneous type of dam.

Uncertainty in the delivery dates of suitable construction equipment made it necessary to be prepared for placing fill on frozen foundation material at the Margaret Hamilton dam. It was also necessary to provide for building the river section of the earth-fill dam during freezing temperatures, to ensure having the grade ready for the railroad. However, it was possible to avoid cold weather construction, and the earth dams were placed under summer conditions to the designs in Fig. 5 which are marked "As Constructed".

### River Diversion

A diversion channel on either side of the river between Range Lake and Stoney Bay would have entailed a large quantity of excavation, and it was therefore decided that all diversions during construction would be made in the width of the river, maintaining low head conditions to prevent flooding the low land on both banks.

Coffer-dam work was commenced in August 1951 to construct a line

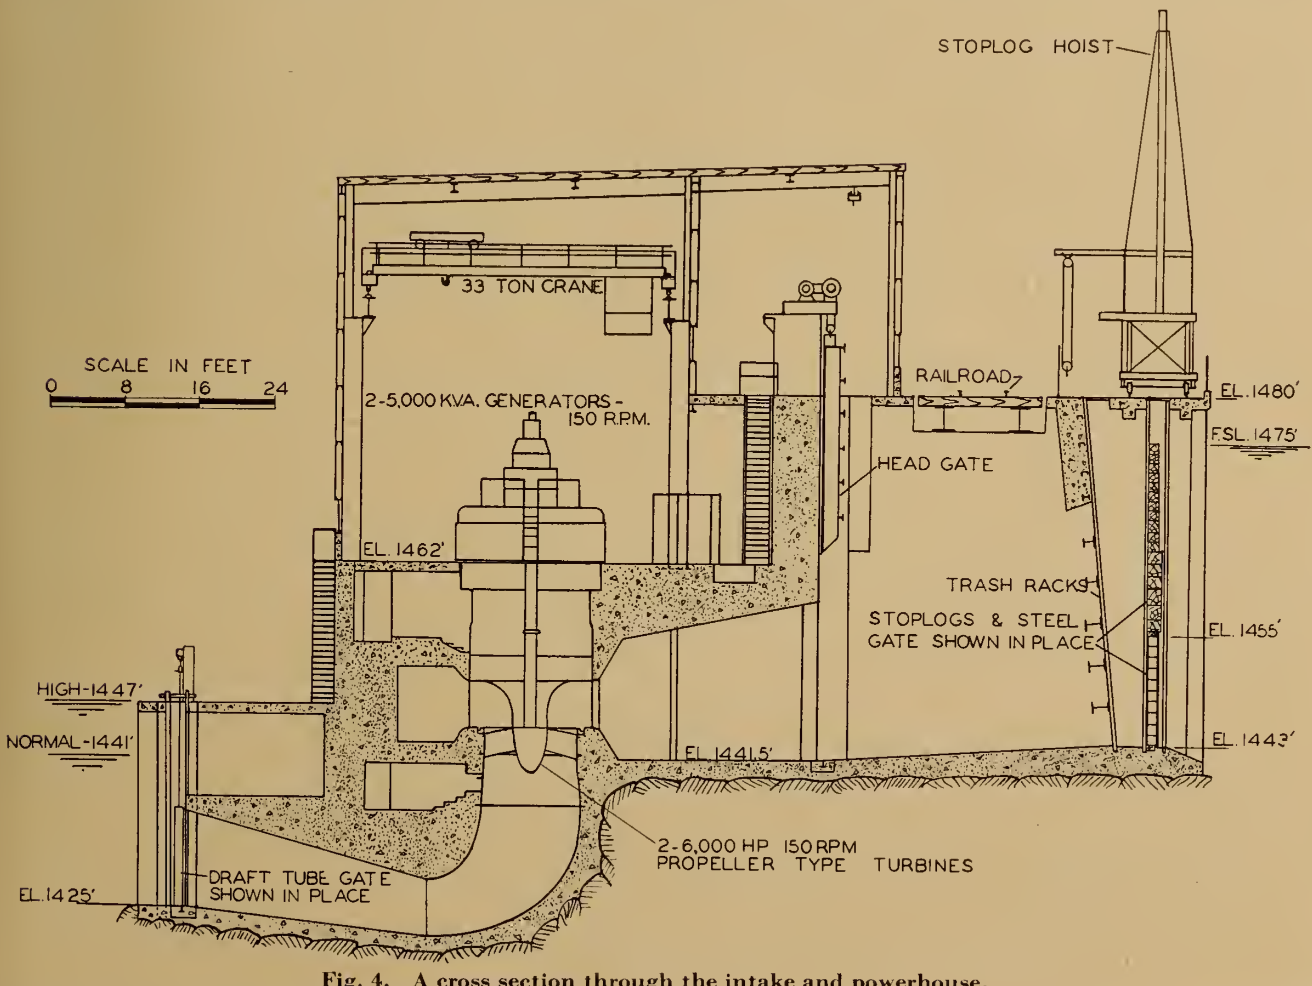

**Fig. 4. A cross section through the intake and powerhouse.**

Winter construction of the coffer-dams.

of rock-filled timber crib piers across the river. Water flowing between the piers was controlled by means of stoplogs. A timber bridge was built over the coffer-dam to give access to the airstrip on the south bank. However, an early spring thaw and a rainfall of 1½ in. in May 1952, resulted in an exceptionally heavy run-off, the peak flow at the damsite being estimated at 75,000 c.f.s.

Contrary to reports from those who had observed previous spring run-off conditions in the area, a rapid breakup moved the ice out of Range Lake. Huge rafts of ice swept down on the coffer-dam bridge, causing extensive damage and loss of the access to the south bank.

It was possible to seal off the stoplog sluiceway area, and by the end of the year all but one of the piers in this section had been completed. The concrete ogee sluiceways between the piers were omitted at this stage, to provide maximum spill capacity the following year when the remaining part of the dam was being constructed.

A further high flow of 32,000 c.f.s. occurred in October 1952, which was approximately twice the usual flow for that time of year. This delayed resumption of the coffer-dam work, and it was not until December that the flow fell below 10,000 c.f.s.

The upstream coffer-dam designed for overflow conditions in the spring flood was repaired and pushed southwards at elevation 1,455 across the river. At the same time the river flow was diverted through the stoplog sluiceway section. Six 50-foot spans of Bailey bridging erected upstream of the concrete piers, maintained access.

Some rock excavation in the central sluice gate area was completed before the 1953 spring flow overtopped the coffer dam as expected. In view of the size of the ice rafts seen the previous year, it was deemed prudent to build an earth-fill dyke to shield the concrete piers in the stoplog sluiceways from impact—a hazard occurring only during the construction period.

The maximum spring flood in May 1953 was estimated at 41,500 c.f.s., i.e. about 34,000 c.f.s. less than in the previous year. Break-up of ice in Range Lake took place gradually, and there was no large ice run. As soon as the falling river stage permitted, the rock-fill coffer-dam upstream of the sluice gates and earth dam was raised to elevation 1462, and water was diverted through the stoplog sluice section.

When the sluice gate section had been poured the upstream coffer-dam was removed, allowing water to flow between the sluice gate piers. Finally each sluiceway opening in the stoplog sluiceway section was unwatered in turn, to permit placing of concrete in the sluiceway ogees. This was done by fixing stoplogs temporarily in construction slots formed in the upstream and downstream ends of the piers.

### Concrete

Preliminary investigations for concrete aggregates indicated the presence of small deposits of sand and gravel in the river bed below the dam site, also on the shore line of Range Lake south of the camp, and in the ridge west and south of the airstrip. All of this was of poor quality due to tannic acid contamination, and sufficient total quantity was not found within reasonable hauling distance.

The search was then widened over a large area, and a sand deposit was discovered on the shore of Menihek Lake some 7½ miles from the job. This material was somewhat deficient in fines and called for a long, costly haul, but was otherwise satisfactory.

Samples of bedrock from the powerhouse site and the south shore of Ashuanipi River were tested for coarse aggregate. The rock tended to break into flat, sharp particles when crushed, and the samples from the powerhouse site, identified as dactic lava, contained varying amounts of iron pyrite.

By the fall of 1951 it was evident that no first class concrete aggregate existed in the Menihek area, and the best choice had narrowed down to a low ridge in Stoney Bay which, although largely comprised of dactic lava similar to that in the powerhouse site, also contained excellent quartzitic stones from the glacial drift. Once more the tannic acid contamination was found to be high.

Tannic acid in the soils and gravels is a common difficulty in many parts of Quebec Province, were the vegetation is largely restricted to moss and coniferous trees. This acid has been responsible for much poor concrete in the past.

Usually the concentration of acid decreases with depth in the gravel pits, and can be avoided by wasting several feet depth of the gravel. However, in the long shallow deposit at Stoney Bay there was no improvement with depth, or in the gravels excavated below the water level in Stoney Bay.

Considerable experimental work was done in the laboratory to find a means of neutralizing the tannic acid. Best results were obtained with large admixtures of hydrated lime which would have been costly to transport. In general, however, a practical method for making good concrete with any other admixture was not developed, due chiefly to relatively insoluble compounds formed by the tannic acid reacting with the iron oxides prevalent in this area.

Loss of the coffer-dam bridge in May 1952 made rock from the south side of the river and sand from Menihek Lake inaccessable. Tests were therefore concentrated on the Stoney Bay materials, establishing finally that even though the tannic acid could not be washed out with water, the greatest acid concentration was in the finer particles.

It was found that satisfactory aggregate could be made by scrubbing and crushing the larger stones to the required proportions, and by washing all aggregate below ⅜ inch size and wasting the finer particles. A deficiency in sand sizes then had to be made good by a sand-roll operation.

Aggregate from the pit was passed through a rotating drum scrubber. The ⅜ inch and smaller material was then put through a screw type washer, in which process practically all sand passing 30 mesh sieve was wasted as too highly contaminated. The remaining washed sand was fed once, and on occasions twice, through sand rolls. The 2 inch aggregate by-passed the impact crusher, which dealt with larger material up to 10 inch stones.

Sand recovered from the washer had a Fineness Modulus of about 4.0, and by use of sand rolls this was reduced to about 3.3. Each day the sand from the Eagle washer was tested for tannic acid, and where there were signs of contamination, the sand was re-washed before being passed through the sand rolls. Two high-speed 4 inch water pumps supplied some 80,000 gallons per hour to the washing operation.

The batching of aggregate and cement for concrete was by weight, and a typical mix for concrete having a minimum compressive strength of 3,000 pounds per square inch at 28 days, had a cement to aggregate ratio of 1 to 7.1 by weight and a water cement ratio of 0.60. A total of 31,000 cubic yards of concrete was placed in the works.

### Earth Dams

The prior claim of the important railway construction work progressing northwards from Seven Islands during the construction period at Menihek made it difficult to obtain enough suitable construction equipment, particularly for excavating and hauling earth and rock. After May 1953, however, adequate equipment became available, and the earth-dam work was completed on time.

The whole of the earth-fill dam, nearly four miles in length and containing 650,000 cubic yards of compacted material, was placed between May and October 1953, the rate of placement of material reaching a maximum of 46,000 cubic yards per week. Work was conducted on a 24-hour basis, and the average force of equipment in use at any particular time was:

North Bank

1—Tractor with sheepsfoot roller (TD 14)
1—Tractor - spreading (TD 14)

As previously mentioned, weather conditions at the time of construction made it possible to adopt the designs in Fig. 5 marked "As Constructed". The transverse sand drains were placed at depressions crossing the axis of the earth dam, and the vertical sand filter was formed as a continuous drain in the dam where the head of water on the dam exceeded 10 feet.

The method of placing the filter was to spread and roll the earth fill across the full width of the dam in six to eight-foot lifts, excavating a trench in each lift with a ⅝ cubic yard backhoe and back filling with sand. It was decided to postpone placing the gravel facing, essential to prevent weathering on the downstream face, until suitable material could be brought to the site by rail in a later construction season.

Boulders from the river bed in the dam area were used for the downstream toe of the earth-fill dams, and rock for rip-rap on the upstream face was either quarried from outcrops or taken from the tailrace excavation. The total quantity of rock toes and rip-rap amounted to 64,000 cubic yards.

### Transportation

The magnitude of the problem of obtaining access to the site is apparent from an inspection of Fig. 1. When construction operations began in 1950, the nearest railheads were at Bagotville on the Saguenay River and at Mont Joli on the south shore of the St. Lawrence River. There were no roads anywhere in this part of Canada except a few local ones at the small and widely scattered settlements around the coast.

The dock and warehouse facilities at Seven Islands provided the base from which the great enterprise of the railway and power developments stemmed. Construction plans for work at Menihek, which is 330 miles north of Seven Islands, and at other camps along the line to be taken by the railway, relied upon an airlift operation carried out on a scale never before attempted in Canada. In this respect the power project at Menihek can claim to be unique.

Except for the comparatively small tonnage hauled on tractor-drawn sleighs in the winters of 1952 and 1953, the job at Menihek was wholly supplied by air transport. About 11,000 tons of supplies and equipment were flown to the site. At the peak period in the summer of 1953, cargo planes were making over 100 flights each week to Menihek airstrip, with a weekly total of about 600 tons.

All the cement requirements at Menihek (approximately 186,000 bags) were transported to the site by air, with a peak of 8,570 bags being flown in one week. Unloading crews and air crews became so proficient with cement loads that DC-3 aircraft were on the ground less than ten minutes on turn around.

In the winter of 1952, 580 tons of stores and construction equipment arrived at Menihek on tractor-drawn sleighs. Seventy tons had travelled overland the entire 330 miles from Seven Islands, and 510 tons had been carried by air for the first part of the journey and transported the last 167 miles by tractor-drawn sleighs.

# 7,000 Ton Forging Press

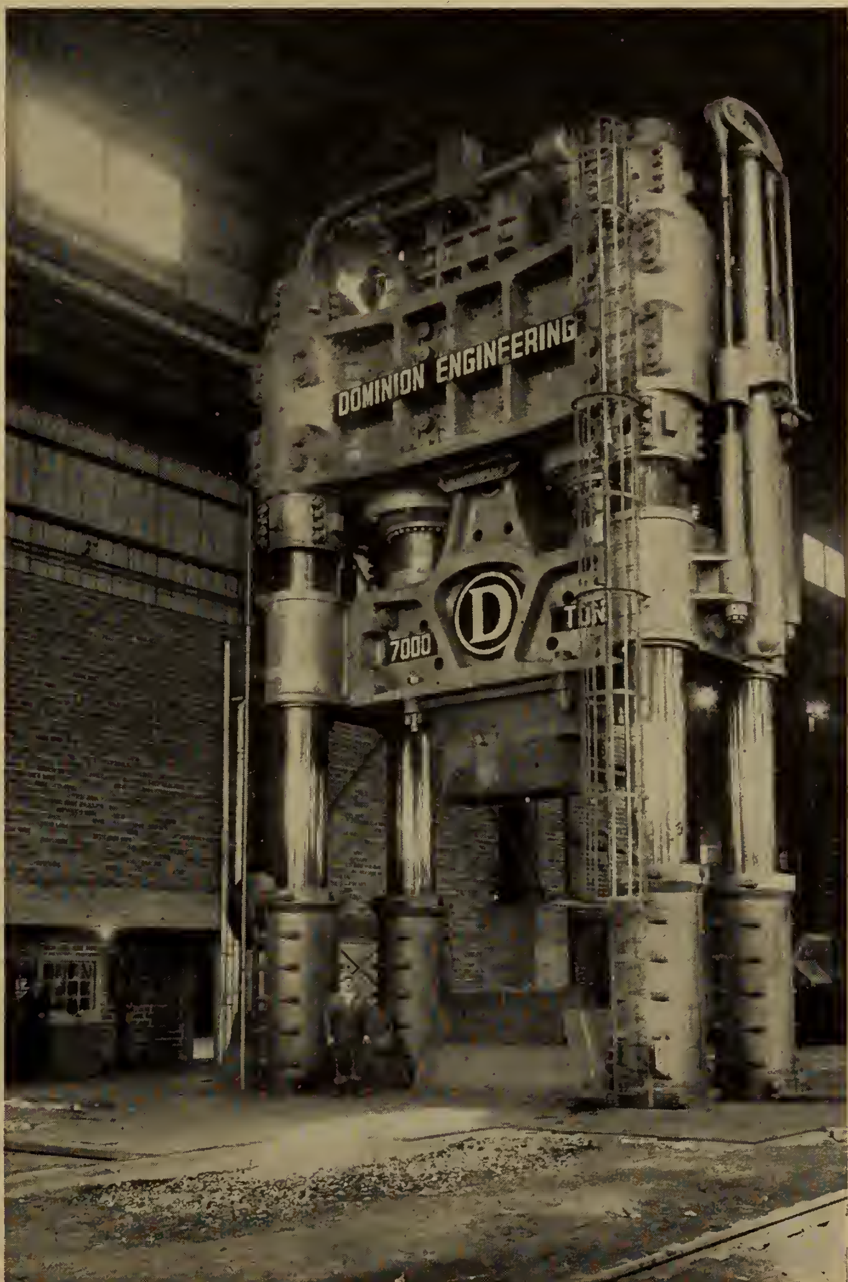
*by*

Hans Ulmann, M.E.I.C.

*Chief Engineer, Industrial Division, Dominion Engineering Works, Limited, Lachine, Quebec.*

*A paper presented before the 68th Annual General and Professional Meeting of the Engineering Institute of Canada at Quebec City, May 12th to 14th, 1954.*

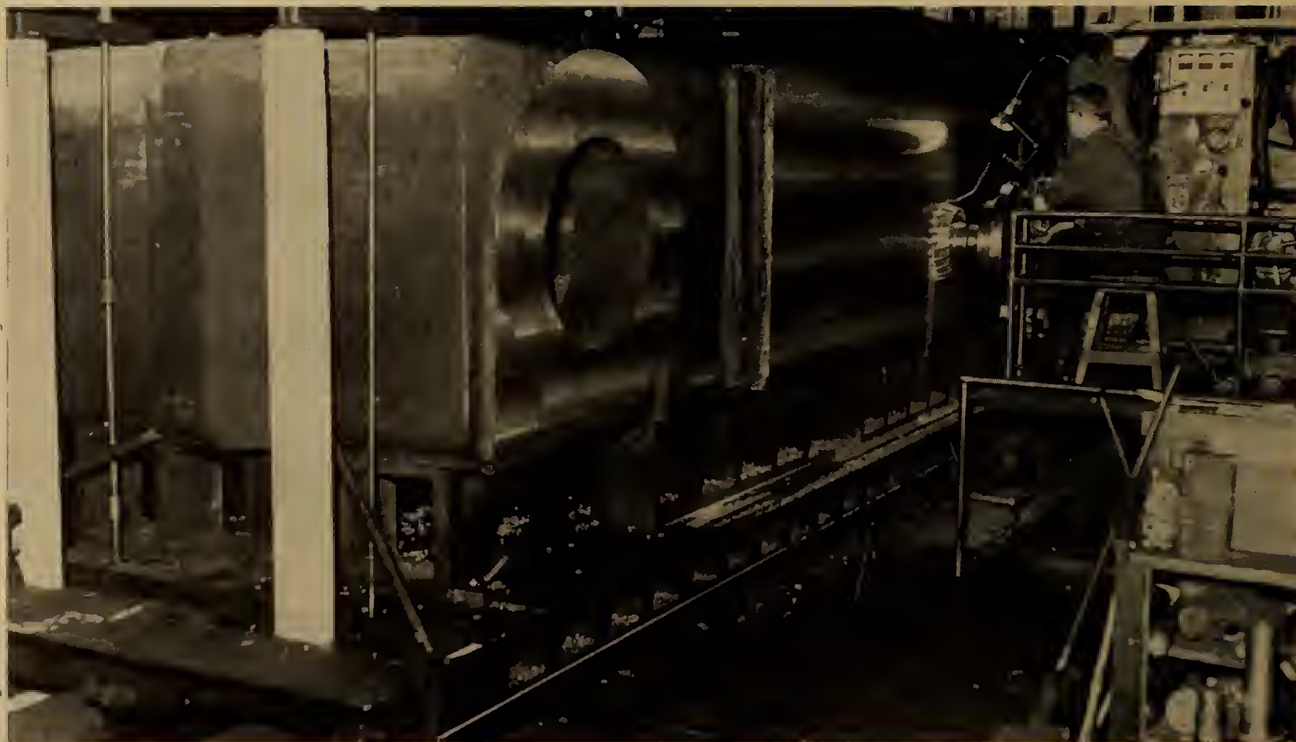
The 7,000 ton forging press described in this paper was designed for production of large ingots and billets, as well as for forming heavy plate. It is thus particularly suitable for Canadian industrial and defence production, and makes a significant contribution to Canada's productive independence. The author notes its rigidity, and discusses thread design, pressure fluid, pumps, accumulator and valves. The simplicity of operation is emphasized.



In the period since the end of the war, hydraulic presses, and particularly large forging presses, have caught the imagination of the public. The important role played by these tools in the manufacture of aircraft became almost common knowledge, especially when the unit capacity rose to 50,000 tons and more, and the costs began to affect defence appropriations of public funds.

The availability of the hydraulic press for the fabrication of steel forgings is less spectacular but even more important. Specifications as to size, weight and strength of steel and its alloys grow tougher to meet the requirements for modern machine elements, such as steam and gas turbine rotors or propeller hubs for aircraft engines. It is thus timely to discuss Canada's large forging press installation at Trenton Steel Works Limited, Trenton, Nova Scotia.

The forging plant installation consists of the 7,000 ton press, complete forging tools, mandrel stands and racking equipment for moving the tools in and out of the press. The power unit includes three triple plunger-type pumps for supplying high pressure fluid to the press, each



Machining of a bottom crosshead casting.

driven by a 1,000 hp. synchronous electric motor through a speed reducing unit.

A dead weight loaded accumulator is included for storing medium pressure fluid, for operation of auxiliary equipment and press return, storage tanks, valves and, of course, operator's control stand and operating control gear. The plant is further equipped with a 75-ton manipulator and a 75-ton overhead travelling crane for handling the large forgings, which are heated in a new oil fired furnace.

#### Step towards Canadian Productive Independence

The press and its power plant are modest in comparison with the 25,000, 35,000 and 50,000 ton giants in the U.S.A. and other countries. Yet it is a giant in its own right, for it has many features incorporated which make it particularly suitable for Canada's industrial and defence requirements. It is a big step forward on the road to productive independence. This country's needs are as varied as in any other, although they may be smaller quantitatively and would not warrant a special press of such magnitude and costs for every type of major product.

The press is, therefore, arranged for a variety of uses. It is designed primarily to work on large ingots and billets. These require not only diameter reduction by forging, but also shortening of length by upsetting to achieve the specified metallurgical qualities, hence the high daylight of 20 ft. and the long working stroke of 10 ft. The press is secondly arranged for forming heavy plate, such as armour plate of moderate thickness. This is the reason for the wide spread of the columns, which have centre spacings of 20 ft. sideways and 8 ft. front to back.

The wide range of application which this press must cover called for large overall dimensions, thus the machine is unique, and should be rather compared with a 14 to 20,000 ton unit. The press stands about 45 ft. above the operating floor, and has a depth of 12 ft. below the floor. It occupies, including the tool racking devices, 54 by 80 sq. ft. floor space and has a total weight of about 1,500 tons not counting the equipment in the pump room.

This press is of the down stroking, open column type, having two single acting plunger type rams for the power stroke. It has an inverted T ram-crosshead, arranged for guidance in the top entabulature and on the four columns. The return stroke is obtained by means of push-back cylinders, fitted to the top crosshead and equipped with single acting rams and connecting members to the moving crosshead. The press is oil-operated by direct pumping at 6,000 lb. per sq. in. into the main cylinders and by 2,500 lb. per sq. in. pressure from the dead-weight accumulator in the push-back cylinders.

#### Design and Assembly

The design and manufacture was completely carried out by our company, in Lachine, except for the purchase of large steel castings and forgings, pumps and motors, and smaller standard auxiliary equipment. The mechanical design and hydraulic layout are based on well proven methods dating as far back as the 1860's and 1880's, when Sir Joseph Whitworth and Davy Brothers of England perfected the press to a lasting and dependable tool.

Indeed, a study of modern presses shows that time has brought no marked improvement in principle or basic design. Leading designers are still divided with regard to the type of hydraulic power plant for driving presses. The choice is more of an economical problem than a technical one. After full investigation it was decided that direct pumping was preferable for the Trenton installation, rather than indirect pumping through air-loaded accumulators.

This press is noteworthy because of its size, versatility and ease of manipulation which involved many design and manufacturing problems. Its distinction is due also to the use of modern auxiliary equipment and the employment of oil in the main hydraulic circuit. Material procurement for such a large press was not easy during the busy days of 1951 and 1952. The company was forced to go far afield to find suppliers who could meet the required delivery dates. The moving crosshead of T shape was cast at Sheffield, England. Top and bottom entabulature castings came from Le Creusot, France. Other important castings came from well-known Canadian foundries, including our own in Lachine.

The accompanying illustrations indicate the large size of the component parts, as well as the big tools and handling equipment required for fabrication. It can be readily understood that neither height nor lifting power was available for complete shop assembly of the press, and that sub-assemblies had to suffice. The weights of the assembled top, moving and bottom crossheads are 300, 120 and 400 tons respectively. The first and final assembly was made at the site and, to the credit of the builders and erection crews the parts went together without a hitch.

### Rigidity Important

One of the first requirements for a well-operating press of such magnitude is permanent rigidity. All major bolting and tie rods are shrunk in place to clamp component parts into one solid body, which cannot separate and move at the joints under any stress or abuse short of breaking. Heavy usage is inseparable from forging plants, not only due to the rugged men at work, but more so due to heat, shockloads and scale dust. Auxiliary equipment is, therefore, extra heavy, and all guide and bearing surfaces are extra large to reduce the rate of wear.

Rigidity is most important for protection of the seals in the main cylinders against excessive side load and wear. Any side sway of the top entabulature, or non-parallel movement of the ram crosshead in relation to the base, causes misalignment of the rams and side thrust on the packing. The packing is of the automatic chevron or V type. The rams press on the horizontal legs of the T head through sphere shaped bearer plates. This arrangement provides considerable self-alignment and reduces the sidethrust.

The top and bottom crossheads are inherently very stiff bodies. The weakest links in the whole frame as to rigidity are the columns. They, and the means for clamping them to the heads, require special consideration. Our company's practice for all presses is to pre-shrink the columns to the fixed crossheads. This is done by heating the portion of the column inside the heads with steam for temporary elongation, and by setting of the nuts to a suitable distance apart, which results in a clamping effect corresponding to about 150 per cent rated load when the assembly has cooled off.

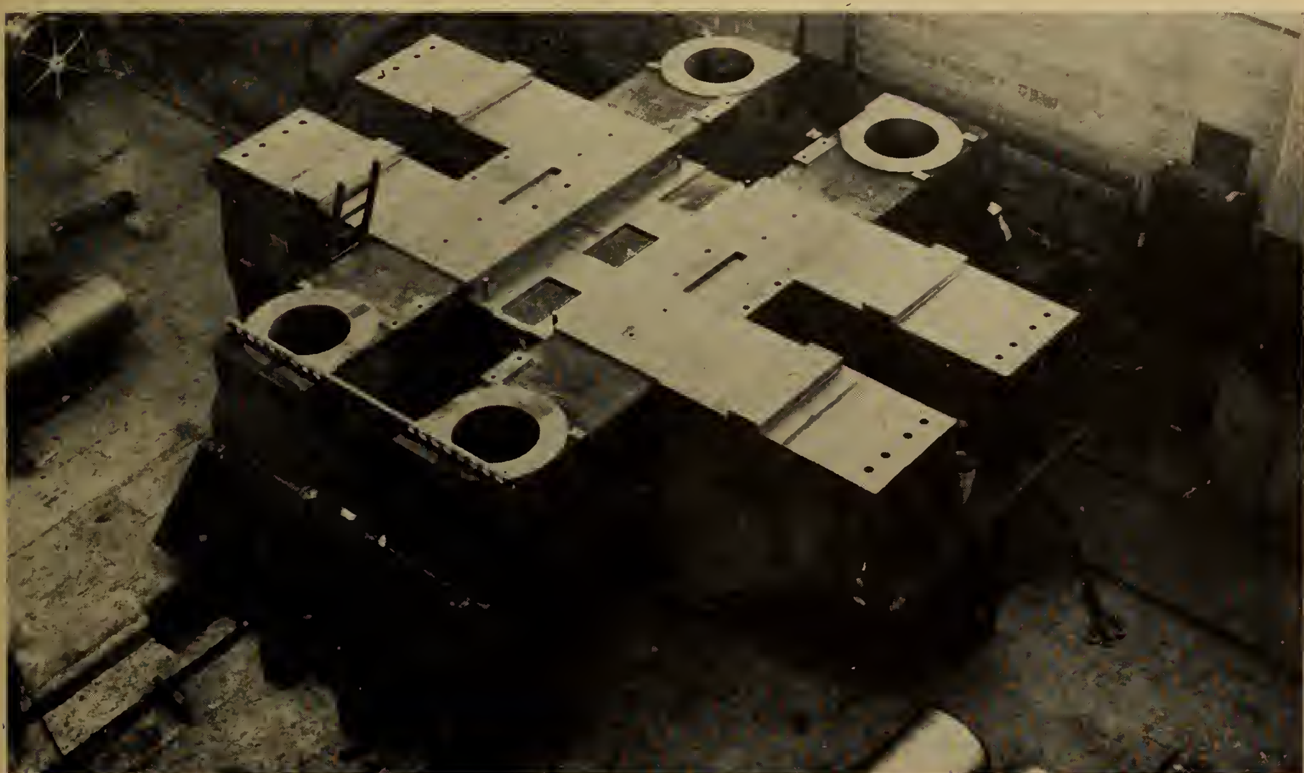
Many years of operating experience with all kinds of presses has shown that the above method of column mounting is notably free of column breakage.

Each column is 55 ft. long, 30 in. diameter, hollow bored to function also as piping for the oil flow from the bottom to the top of the press. This feature eliminates separate piping, which would be large, cumbersome and would require special precautions with regard to strains due to heat and pressure expansions, and particularly to press sway which occurs when forging eccentrically.

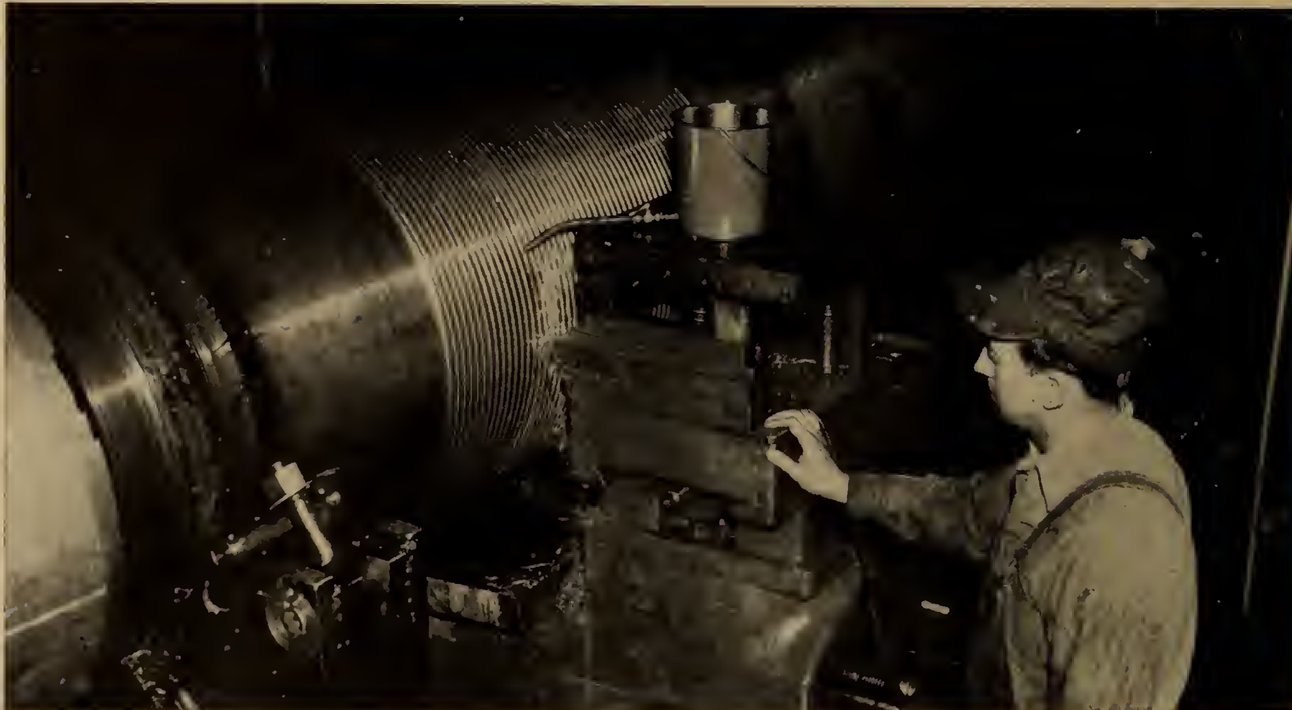
### Thread Design

Each column nut is of cast steel, in halves bolted together, 30 in. long, weighs 5 tons and needed much thought regarding permissible stress and strain in the threads. Our field experience with large threads for forging press applications was limited at the design stage to 16 in. diameter of standard ACME form. It is well known that, in standard nuts, only a few bottom threads engage the bolt due to compression and elongation of the two parts. Obviously, there must be a limit for geometric step-up when employing the same material at the same nominal stress. This is because the shear strain would increase at the critical places proportionately to size, and would eventually cause failure due to excessive stress concentration.

This problem has been solved by the press industry for high powered units in various ways, which however are not generally published. In



**Shop assembly of bottom crosshead.**



Machining of column thread.

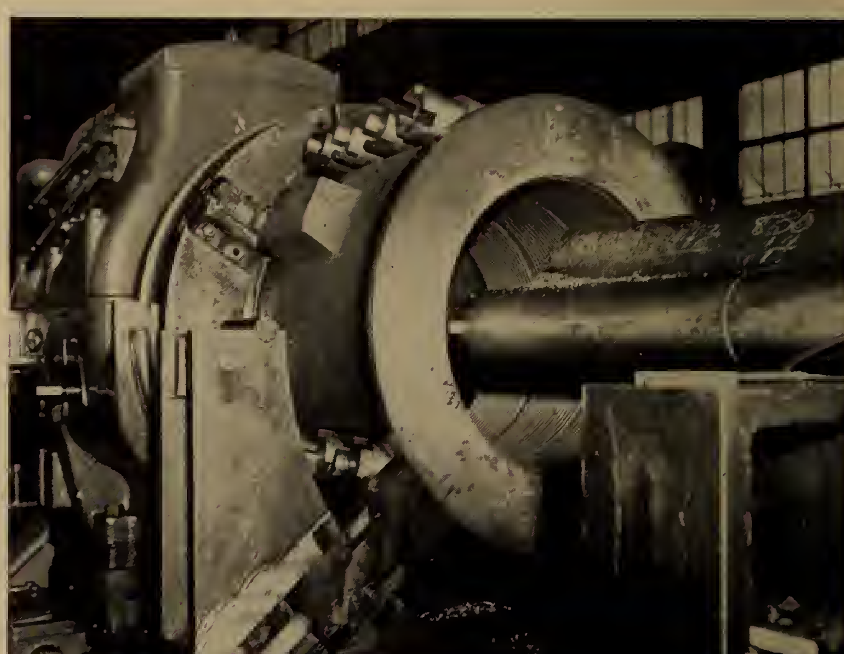
some cases the thread design was abandoned, in other cases a modified thread was adopted. A possible correction for spreading the load over the length of a standard unit would be a progressively varying pitch of the column thread.

The equivalent, except for certain reservations, could be readily obtained on lathes with normal lead screws, by machining on the column an ACME thread with tapering pitch diameter, and on the nut with constant diameter. Thread dimensions and taper would be chosen so that the unstressed assembly would have no clearance at the top of the nut, and towards the bottom progressively increasing clearance of calculated amounts, which would be taken up under load. This type of correction is surprisingly large for 30 in. threads, and would be applicable only on very coarse threads, with well rounded fillets at the root. Its purpose is to cope with the large beam stress at the small end of the taper, where the pitch diameter of nut and column differ most.

The engineers, after consideration of all aspects of the problem, including existing material and shop facilities, adopted another type of thread modification in the nuts, combined with standard threads on the columns. The thread in each nut is divided by an undercut into three portions of equal length. The top portion is standard, the middle portion has the working face relieved a constant amount at normal pitch, and the bottom portion the same of a larger amount.

The relief is chosen so that the column engages progressively from the top for each third of nominal load, the next lower set of threads near the bottom of each portion. It should be noted that this method is a compromise, and that the pitch of all threads in the lower portions of the nut and column differ by various amounts, due to deformations upon loading the portions above. The modifications, however, are calculated so that the strain in these 30 in. diameter threads would be similar to the strain in existing 16 in. diameter threads. Consequently stress concentrations would be no more than is presently in successful use.

Prestressing of the columns and the nuts improves the sway stability, and prevents any relative movement between the nuts and crossheads. The static friction between these members resists the shear force set up by the column in reaction to the



Machining of column nut.

moment due to eccentric forging. Secondly, the intimate contact between the nut and column threads restrains the expansion of the column inside the nut, which would otherwise occur because of the loop tension set up by the oil pressure, and cause relative movement and eventual wear between these parts. Thirdly, prestressing protects against fatigue failures.

#### Advantages of Oil Pressure Fluid

As already mentioned, the pressure fluid is oil. It has many advantages over water, although it is more compressible and often considered inflammable. Many years operation of the war-time 2,000 ton forging press at Trenton and of the scores of oil-operated, high-speed shell forging presses working hot metals, have shown that the danger of fire is practically non-existent. This is especially true if an inert heavy oil is used and the machinery is reasonably well maintained.

The compressibility of oil may introduce some time lag between operating phases, additional to the time lag caused anyway by expansion of piping and pressure vessels. On the other hand, this compressibility breaks the sharpness of front of pressure waves in the system and, thus, permits compensation for the time lag by faster valve action. When discharging water under high pressure through partially opened valves and orifices one always finds cavitation, and eventually cavitation damage such as pitting, cutting and erosion.

Oil may cavitate too, but in all these years not a valve or any other part has come to our attention that showed signs of damage as mentioned above for water. Oil has the advantage of lubricating moving parts of its own circulation system, and of protecting the surfaces against deterioration. This is quite contrary to the action of water. Oil absorbs air readily and foams easier than water, but this is not much of a drawback in a direct pumping system.

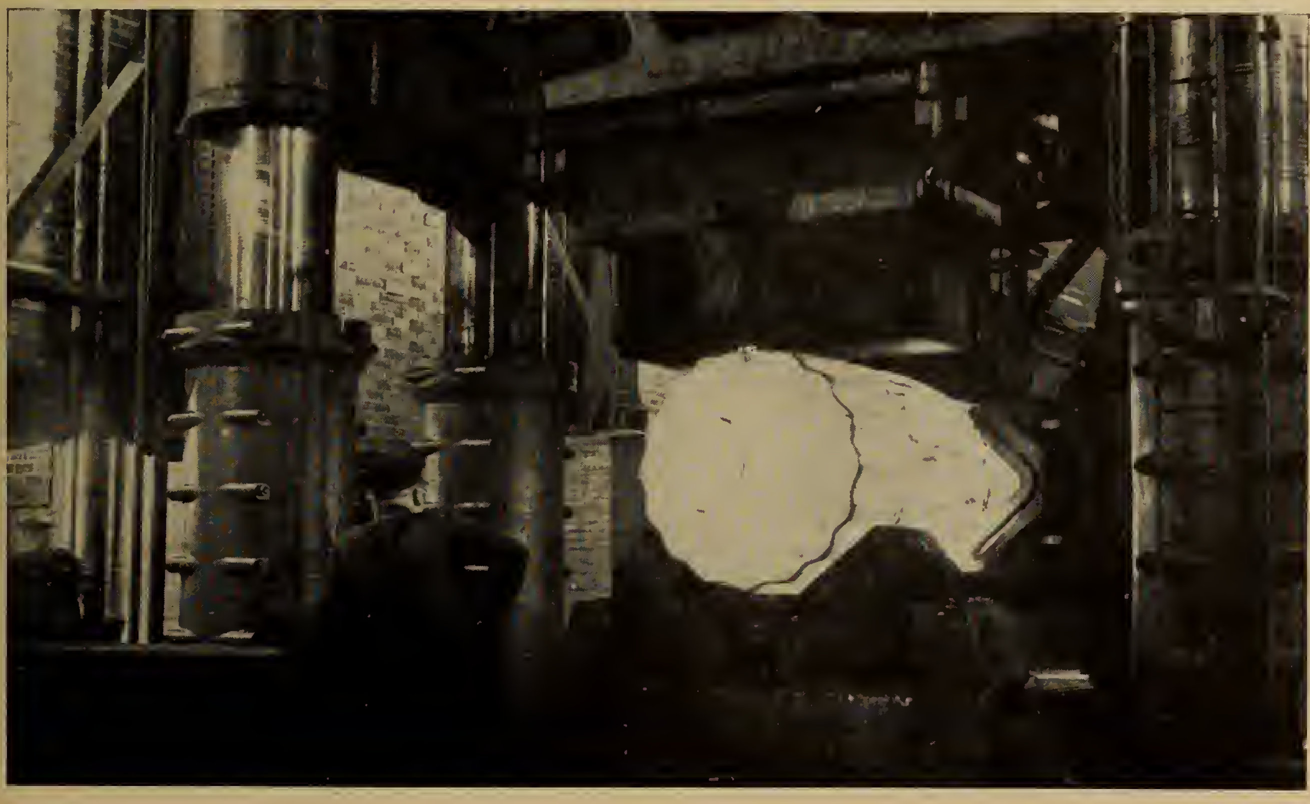
Many years ago it was discovered that a steady force at moderate penetrating or squeezing speed produces better forgings than impact blows, hence the modern use of presses rather than steam hammers. The rating or tonnage of presses is determined by the maximum size of ingots or billets, and by the type of forging operation, such as upsetting. It should be noted that the rating covers the upper limits and not necessarily the bulk of production, which may be much smaller pieces. The forging speed is in direct proportion to the pump capacity. Metallurgical consideration and sensitivity of the press control do not usually limit the maximum rate of forging, which may be as high as 15 to 20 f.p.m. The chosen rates of forging are more often limited to lesser speeds by economical aspects.

#### Power Plant

The economy of the largest press in a forge shop is subject to many items, such as availability of smaller units, flow of work or down time, first cost and maintenance, reheating costs of forgings or amount of work done between heats, price of sudden and short-timed power. Considerations like these and many more have a direct bearing on the size and type of power plant, and consequently on the squeezing speed of the press in particular.

The hydraulic power plant of the 7,000 ton press is similar to the existing 2,000 ton plant. The maximum forging speed with all three pumps in operation is a moderate 8 f.p.m. The rated approach speed of 50 f.p.m. and the return of 35 f.p.m. provide a fairly short time for completion of each forging cycle. They also suffice for planishing. These ratings are neither startling nor overmodest, but provide a plant which fulfills the aim of the project at reasonable expense.

The main hydraulic system forms a closed circuit, with a reservoir pressurized to 30 lb. per sq. in. by means of compressed air. This feature provides for positive pressure in the piping, surge suppressors and prefill valves on the top of the press. It is sufficient to prevent any



**Forging.**

local pressure drop below atmosphere, when the main rams fall by gravity during approach stroke and planishing operation, and drag with them the long column of oil from the reservoir to the top of the press.

The three main pumps are of the fixed displacement plunger type, each having a capacity of 270 Imp. gal. per min. and 6,000 lb. per sq. in. maximum working pressure. Each pump is equipped with valve boxes for spring loaded suction and discharge checks, relief valves, and manifolds for direct connection to the reservoir and the main valve, which directs the flow to the press or to exhaust.

The pumps are arranged for operation in parallel. The main valve may be set by means of pilot control for oil delivery to the press from one, two or all three units. This provides for the choice between three pressing speeds at the convenience of the forgemaster and his operators. The third pump automatically delivers oil to the accumulator during the periods of press return and press holding.

#### Accumulator

The dead weight loaded accumulator has a working capacity of 135 Imp gal. at 2,500 lb. per sq. in. pressure. It supplies oil for the pilot valve service, press return and racking equipment for the anvil and mandrel stands. It consists essentially of a stationary ram, supported in a foot flange on the foundations, and an inverted cylinder carrying the ballast tank. The total weight of the moving parts is about 405 tons, while the stroke is 10 ft. The ballast is made up of relatively long sections of steel rails and pig iron, which are horizontally stacked so that they do not shift and burst the tank open when it bumps against the stops.

At the speed of 35 f.p.m. press return the accumulator weight drops at the rate of 44 f.p.m., which corresponds to 340 ft. tons kinetic energy for the dead weight alone. Obviously, there are limitations as to weight, speed and rate of energy dissipation, which have a direct bearing on the practicable capacity of the accumulator. Special shock absorbers, compressibility of the oil, expansion of the system and leakage passing valves and rams function as dashpot, and soften the blows when a pilot operated valve stops the flow to the push-back rams.

The volume of oil flowing from the accumulator to the press at rated press speeds is larger than the third pump can supply during the available periods of time. The shortage of oil is made up by a separate 150 h.p. pump. This delivers oil directly and independently of press operation into the accumulator system, at a rated capacity of about 85 Imp. gals. per min. It was more expedient to install this pumping unit than to reduce the push-back cylinder volume to the capacity of the main pump, and to compensate correspondingly with a pressure increase from 2,500 to 3,500 lb. per sq. in. Standard auxiliary equipment and operating experience for such elevated pressures were, at the time of press construction, not available for hydraulic control gear.

The moving ballast tank provides for automatic control of accumulator refill by operating limit switches at the ends of the working stroke. Solenoid operated pilots actuate full flow valves, which direct the pump discharge to the accumulator or to exhaust. A mechanical trip operates a safety valve in case the normal devices fail. Failing this, a further rise of the weight would uncover exhaust ports and spill any additional oil. The same safety valve also automatically isolates the accumulator in case of a pipe line break. It directs pump delivery to exhaust whenever a predetermined pressure loss across the valve occurs, which may be due to excessive flow or surge.

The accumulator and push-back cylinders are equipped with fixed orifices at the main pipe connections for throttling of the oil passage. These orifices allow full pressure to be transmitted at rest, for quick acceleration of the masses and for reducing the effective pressure automatically when desired speed is attained. The headloss through these orifices is a source of heat in the oil, which, however, is in this installation of little importance. Of more importance is danger of cavitation, which causes gases in the oil to come out of solution, makes the oil foam and thus become highly compressible. This danger is largely overcome with special orifices having a number of small holes of 10 to 15 diameter length.

Hydraulic friction maintains high pressure at the orifice inlet, and thus restricts formation of cavities during orifice discharge into a low pressure zone.

The duty of these orifices is twofold. The total effect is chosen so that the rated speed of press return is obtained. The individual effects are chosen for limitation of the rate of free fall of accumulator weight and press ram crosshead to about 200 to 120 per cent of rated top speed respectively, in case of a pipe failure. The inherent hydraulic losses in the system should be small relative to the losses of the orifices, in order to obtain adequate effect of the latter for protection of the installation.

#### Valves and Fittings

Difficulties of interconnection between component parts of a hydraulic system including sections rated at 6,000 lb. per sq. in. pressure and up to 810 Imp. gal. per min. flow are generally not appreciated. Each item is large, heavy, costly to fit and to make leakproof. It is, therefore, expedient to cluster as many valves as practicable together into one valve body, and to reduce the number of external connections to a minimum.

The main pump by-pass valves with necessary pilots, checks and interconnections, and the accumulator main control valve, are in this manner grouped together in one block of forged steel measuring 39 in. x 28 in. x 23 in., and weighing about 3¼ tons. Similarly, the cam operated pilot valves are arranged in one steel body. The method and sequence of valve operation for press control and accumulator supply is patented.

The flange connections of the 6,000 lb. per sq. in. lines are sealed with neoprene "O" rings and leather back-up rings, which protect the former against extrusion if the metallic contact between mating parts should be imperfect. The flanges of the 2,500 lb. per sq. in. lines are sealed with "O" rings only, and the 30 lb. per sq. in. lines with ordinary gaskets. The installation was made without loss of oil and remained free of leaks under all operating conditions.

Without going into too many details, it may be of interest to note that the 6,000 lb. per sq. in. pipe line of 3 in. wall thickness, 9¾ in. inside diameter and 36 ft. length was fabricated from wartime surplus stock of naval guns. The right-angle fittings at the ends of this line are machined out of forged steel blocks. They connect to the main by-pass valve and the bottom of one column which leads the oil to the top of the press. The connection to the two main cylinders is made up of movable fittings over a manifold. This arrangement provides for self-alignment, and protects the piping against strain due to deflections of the cylinders and top entabulature under load.

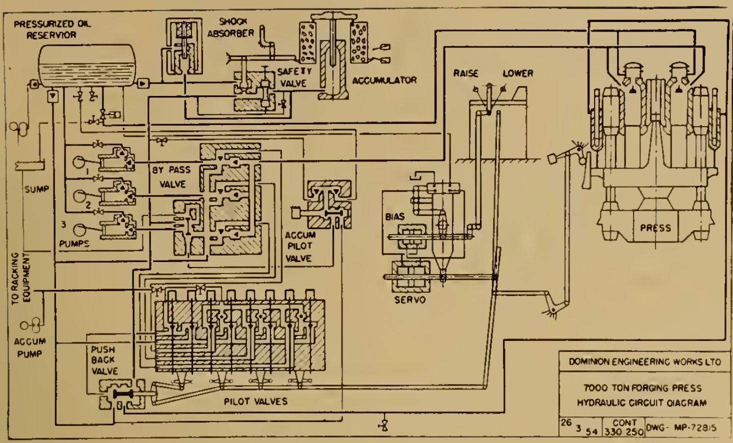


Diagram of hydraulic circuit.

Oil flows at the rate of over 5,000 Imp. gals. per minute from the reservoir into the two main cylinders during the rapid approach stroke of the press. It returns at the rate of 3,500 during the raising stroke. Pressure rise, and drop due to quick arrest and acceleration of the oil flow are minimized by a surge suppressor on top of each main cylinder. These are tanks with spring-loaded domes, and are equipped with spring and pressure cylinder operated prefill valves. These valves are checks which open automatically on pressure differential across the valve or pressure in the push-back cylinders. They close on ram contact with the forging and build-up of pressure in the main cylinders. Each surge tank is connected to one of the columns which form part of the 14 in. piping to the reservoir.

### Simple Operation

The operation of this powerful press is extremely simple. Movements of the press-ram up and down, or holding it stationary, are achieved by means of one single hand lever. It actuates a 3-way valve serving a servo piston, which provides the power for operation of the control gear through a floating lever. One fulcrum of this lever moves in conformity with the ram by means of cam and follower. This restores the control gear and servo valve to neutral at any press-ram elevation corresponding to the preset position of the hand lever.

Operation of the hand lever is restricted by a bias piston, which is pressurized in parallel with the servo piston. It exerts a restrictive force proportional to the pressure differential in the servo, thus, providing for a feel in the hand of press movement. It also restores the servo valve to neutral and stops the press to holding position upon release of the hand lever. The control gear consists principally of cam operated pilot valves and a pressure operated push-back valve, which are linked together and to the floating lever. The pilot valves and push-back valve are co-related by a second floating lever.

The complete mechanism provides for a sensitive control of the press ram movement, from creeping to rated top speeds at each phase of the pressing cycle and holding at any ram elevation. A large dial, with hands which are rotated by the moving press ram, is in front of the operator. The graduation of the dial corresponds to the stroke of the ram in quarter inches and the sweeping hands indicate position, direction and speed of the ram.

### Tooling

The tooling for a 7,000 ton forging press is necessarily heavy. Anvil stands, upsetting blocks, etc., require a large footing area and considerable height for spreading adequately the concentrated load on the forging over the supporting members. The press is therefore equipped with powerful racking mechanisms, one for transverse operation and one for longitudinal. The former is used for adjustment of the anvil stands. The latter is for moving mandrel stands and generally heavy equipment in and out of the press between working position and a place accessible to the overhead crane. The racking devices are arranged below floor level. These consist of horizontal double-acting cylinders, secured to the press frame. Pistons with rods attached to drawbars and heavy plates carry the tools and slide on suitable ways. Each racking device has 15 ft. stroke, and is operated by oil pressure from the accumulator and controlled by a four-way valve from the pulpit. √

## MENIHEK POWER DEVELOPMENT

(*Continued from page 556*)

The winter haul in February and March of 1953 was organized on a larger scale. By that time it was possible to convey stores and equipment by rail as far as Mile 110, and from that point 969 tons completed the journey to Menihek overland. A further 938 tons were hauled on sleighs to Mile 134 and were then lifted by cargo planes to Menihek. Transportation of the heavy hydraulic and electrical equipment was deferred until completion of the railway to Menihek.

The camp and storage facilities at Menihek were sited on the north side of the river to adjoin the principal part of the construction works. Unfortunately, the air strip was on the south side, which necessitated hazardous hauling over the ice of Range Lake in the winter and barge transportation during open water conditions. As a consequence, the arrival of stores by air did not bring the problems of transport to an end.

It was not until the upstream cofferdam and Bailey bridge had been completed after the spring flood of 1953, that a continuous road access existed between the north and south banks of the river at Menihek.

### Acknowledgements

The Menihek project was constructed for the Iron Ore Company of Canada, for whom Montreal Engineering Company, Limited, were the engineers responsible for the designs and supervision of construction. The contractors were the group known as C.M.M.M.K. comprising Cartier Construction Company Ltd., McNamara Construction Company Limited, Mannix Ltd., and Morrison-Knudson Company of Canada Ltd.

Donald Inspection Ltd. carried out tests on the suitability of aggregates for concrete, and of soils for the earth dams. They also gave advice on the design of concrete mixes and performed concrete strength tests.

The author acknowledges with thanks the permission of W. H. Durrell, general manager of the Iron Ore Company of Canada, to present this paper and reproduce photographs taken during the progress of the work. √

# NATURAL RESOURCES and THE ENGINEER

*by*

J. L. Van Camp

*General Manager,*
*Canadian Forestry Association,*
*Montreal, Quebec.*

Many of our members are concerned directly or indirectly with our natural resources, but know little about any except those with which they have to deal. More co-operation among all interested professions is indicated to the end that such resources may be intelligently developed. Mr. Van Camp's paper, delivered at the Quebec Annual Meeting on May 13, 1954, is a survey of the present state of affairs in this field and an account of some co-operative ventures in it which have worked out well.

Canada is one of the few nations possessing such an abundance of natural resources that Canadians still tend to be careless with these gifts. We accept this bounty as freely as we do the air that surrounds us. Abundance has tended to lull us into a state of complacency, not fully justified by the physical state of our soils, waters, forests, wildlife, or even of the air we breathe, in many portions of Canada.

The time is ripe for all educated and thinking citizens of this country to take full stock of its situation. We may then use our best training and ability to improve the resources which we have and to meet demands which will steadily be made upon them by increasing population and industry.

In this brief paper time requires us to limit the subject to renewable natural resources. This does not in any way imply neglect of the large section of our economy based upon minerals and other nonrenewable natural resources. Also, it is to be understood that the people of Canada, our greatest natural resource, will be always in the forefront of our consideration. The resources we shall discuss, therefore, include soils, waters, forests, fish and game, and the recreational and aesthetic uses made of our natural resources by the Canadian public and by our visitors.

#### Engineers Need Versatility

The professional life of most engineers is spent in the development, improvement, manufacture or transport of our natural resources. This is especially true of the engineer engaged in hydro-electric development, in soil or irrigation works, or in the forest industries. It is almost equally true, however, of the engineer engaged in the construction of roads, buildings or mechanical equipment, because such construction is generally for the development or use of products of our basic natural wealth.

The specialist tends to concern himself with projects in hand, rather than with the consideration of fundamentals, or with future problems. The highway engineer, for instance, is rightly concerned with the mechanical and cost factors involved. The transport of millions of dollars' worth of raw material over his highway to a pulp mill assures a vital flow of cellulose to the mill. However, the larger program is not his personal responsibility, and frequently it fails to enter his thinking.

#### Basic Training

Basic training in college allows little time to develop a nation-wide viewpoint. The necessity of crowding detailed technical training into

the scant space of four or five years on a college campus is paramount.

I hesitate to discuss factors in the training and background of an engineer, but may perhaps be permitted to express some opinions because a forester has close association with engineers during his own training. In his first two years, the forestry student spends much time with students in civil engineering in surveying and drafting courses. He also takes some of the basic courses in geology, mineralogy, and sometimes soil science that the engineering students receive. Beginning with his third year, he becomes increasingly concerned with land management, including the growth and management of crops of trees. The young engineer likewise begins to specialize about then. The tendency to continue a specialized interest after graduation, sometimes during his entire professional career, frequently prevents the technical graduate from fully understanding the work of his neighbours. The necessity for making use of knowledge and experience from other professions has been graphically brought home to the forester within the past twenty-five years. Radical improvements in forest management have come about through the application of mechanical methods to logging and lumbering, to fire protection and to the manufacture of pulp, paper and other forest products.

It has been aptly said that the medal for the greatest progress in forestry in North America during the past quarter of a century might well be given to the inventor of the crawler tractor. This is undoubtedly true. Crawler tractors have revolutionized the making of roads. Logging of otherwise inaccessible timber tracts has resulted from lower access costs. In addition, crawler tractors, with the bulldozer blades, have revolutionized forest fire fighting, from the pine lands of the southern United States, to the northern interior of British Columbia. Advances in mechanical loading of pulpwood; the use of aircraft, including helicopters, in aerial forest surveys; and many other uses of mechanized equipment in forestry have contributed to this revolution. Ten thousand power saws are in regular use. Such is the present situation in an industry once dominated by the horse-drawn vehicle and the lumberjack with an axe and a hand saw.

Almost the same results may be seen in agriculture. It is quite unlikely that the grandfather of the present farmer would know how to do the chores on his home farm, if he were suddenly brought back after an absence of fifty years. Whereas he used to light a kerosene lantern to carry a milk bucket to the barn, he would now have to connect and operate a complicated milking machine. He would need to start electric motors to operate the feed grinders, perhaps after having adjusted the automatic thermostat for the oil burner in the farmhouse. Confronted with the modern tractor, combine, corn picker or silo filler, he would be completely baffled. His ten-year-old great-grandson operates some of these mechanized farm devices with ease and ability.

These conditions are sincere tributes to the contributions made by engineers in the development of our natural resources of soils, waters and forests. Real credit is due them for improvements in the efficiency

and the economies in our farm and forest operations, by the development and use of special mechanical equipment.

#### Conception of Opportunities Necessary

A full conception of the opportunities still waiting in natural resource industries is a valuable asset to the engineer. A prime requirement in salesmanship is a good knowledge of the customer's needs, plus the ability and ingenuity to satisfy these needs better than they have been cared for previously. Inherent in this service to the customer, in the case of natural resources, is also the need for realization of the perishable, but renewable, nature of these resources. Appreciation of the biological factors involved is useful. A knowledge of the purely mechanical and physical forces with which the engineer is accustomed to deal is necessary, but not *all* that is necessary. The absence of one factor in an equation makes the solution difficult or perhaps impossible.

The close relationship between natural resources and engineering is shown in the work of many chemical and mechanical engineers. Their part in using wood raw materials was described in the John Stadler Memorial Address (1), given by Dr. John S. Bates, M.E.I.C., before the fortieth meeting of the Technical section of the Canadian Pulp and Paper Association. Dr. Bates stressed the opportunities available to foresters and engineers for greater production and wider utilization and for a guarantee of perpetual returns from the forests of Canada.

In a paper by C. E. Rogers (2), given at the same meeting, it was shown that in sulphite pulping, a shift from calcium-base to magnesium-base is one profitable method of recovering organic solubles, to avoid stream pollution. Col. J. H. Jenkins outlines several methods for closer utilization of wood at a profit (3). Adoption of improved methods would help conserve our raw materials. Opportunities are available to the engineer-forester-biologist group for research in and application of these methods.

#### Social and Community Interests

A relevant item on training was recently brought to my attention by Dr. J. B. Challies, M.E.I.C. The item to which I refer is from the winter issue of the "Report" of the Renssalaer Polytechnic Institute (4). It is about to attempt a broadening of the social and community interests training of its students to improve their capabilities as leaders. These qualifications are needed by engineers and scientists, the "Report" states, because scientific men have to a large degree created our present civilization. They will therefore increasingly be required to take the lead in explaining the altered society in which we live. They must also assist in managing it for the benefit, and even the continued existence, of their fellow-men in this country and in other parts of the world.

President Livingstone W. Houston, of Renssalaer, states that a group plan of organization has been devised, to produce graduates more highly qualified to enter an era of increased responsibility for engineers and scientists. The program decentralizes academic authority. There are now four key administrators, operating a number of departments. Those departments dealing with engineering form one group, a second deals with science, another with general studies and a group including architecture makes up the fourth. Group heads report directly to the dean of the faculty.

> "Conserving and improving our land and water resources is high priority business for all of us . . . Such a program is indispensable to maintaining and improving our standard of living as we make the future secure for a growing America."
>
> *President Dwight D. Eisenhower.*

I am certain that those of you who are concerned with engineering education have considered similar proposals and have perhaps already taken some steps along these lines. The objectives are desirable. Future engineers and scientists must be equipped as far as possible with perspectives which will fit them more readily into participation in the affairs of their communities and of the world at large. Engineers and scientists may then assume the full responsibilities of leadership which are theirs.

This may be a good place to leave the subject of broader training for professional people. It has been debated, discussed and experimented with in many countries and in every educational institution of any consequence. One point which should be emphasized is the advantage of some biological knowledge and appreciation in the training and equipment of engineers. This need is becoming increasingly felt by certain foresters, especially those who specialize in logging engineering or production in mills or in industry. They recognize a lack of first-hand, daily contact with the dynamic natural processes to be found in every acre of Canadian land or water.

It may be that one of the best places to instill this living knowledge in the consciousness of the citizens of Canada is in the schools, through what we call "conservation education". Detailed and specialized knowledge in biology is not required. The appreciation that nature has been functioning for millions of years, and is a partner who pays dividends when we work with her, may help us to use her laws and long-developed patterns. A head-on collision with natural laws is seldom profitable.

Recognition of the importance and value of this type of training is given in a recent item from Roberts Mann, an educator who works in the heart of Chicago. He provides a glimpse of nature's wonders and values for the citizens of one of our great asphalt jungles. Thirty-five thousand acres in the Cook County Forest Preserves, which Chicago has been far-sighted enough to maintain within easy reach of the 'Loop', are his classroom. Nature Bulletin No. 374 (5) contains as clear a statement of a desirable program as I have seen condensed into four paragraphs.

#### Cooperation

The Engineering Institute of Canada is fortunate in having a strong national organization, supported by equally strong branch units in most of the important centers of the country. Such an organization performs two distinct functions for its membership. The maintenance of national standards and objectives and coordination of activities in the various provinces across Canada come first. The second, but equally important function, provides for frequent meetings of engineers from a given locality. Improvement of professional knowledge and information on the problems and interests of their fellow engineers are thus achieved.

An additional activity of many branches is the introduction of guest speakers from other branches or territories, or even from neighbouring countries, when opportunity affords. I am especially interested in the program followed by some branches of the Engineering Institute whereby speakers from other professions address the members. Such action helps provide first-hand knowledge for E.I.C. members of activities and objectives paralleling those of the engineering profession.

I have occasionally had the good fortune to speak before branches of the Engineering Institute of Canada, particularly in our western provinces. The keen interest taken in forest conservation topics and the wealth of questions following an illustrated talk on this subject have been most revealing.

#### Popularly Written Books Needed

There is apparently a real need for a popularly written, factual account of Canada's natural resources. Such a booklet should be available for quantity distribution through schools, libraries, colleges and other outlets. The booklet would be useful not only in Canada, but also in the United States and in other parts of the world, including all sections of the British Commonwealth, where information about Canada is chiefly remarkable by its scarcity.

A booklet prepared by a member of the Engineering Institute was the outstanding publication in this field. "Canada's New Northwest" (6) was developed and written in cooperation with Dr. Charles Camsell, M.E.I.C., by M. W. Maxwell, M.E.I.C., former chief of Industrial Development for the Canadian National Railways. As a bulletin available from the Queen's Printer, the publication gave useful economic data on the soils, waters, forests, minerals, wildlife and tourist resources of northern Alberta, British Columbia and the Northwest Territories. Information was accurate to 1946. The booklet was in such demand that the original supply was soon exhausted; it has not been reprinted.

A project strongly recommended is to have this booklet revised. A limited number of inquiries have already been made by the executive committee of the Canadian Forestry Association as to the possibility of such a reprint. Two have appeared. Bringing "Canada's New Northwest" up to date from the statistical standpoint and having it reprinted would be worthwhile, but this would leave the rest of Canadian resources undescribed.

Perhaps an all-Canadian resources report might be considered for joint development by the Engineering Institute of Canada, the Canadian Chamber of Commerce, agricultural and forestry organizations and other interested organizations. Writing the text would require coordination of existing information from many government departments and industrial organizations. The result in popular form, of reasonable length for publication and well edited, would be a valuable work.

The successful conclusion of the recent National Resources Conference in Ottawa (7) indicates organizations which might be grouped in such a worthwhile project. If these suggestions are developed, the Engineering Institute has a real opportunity to contribute a public service. Information on resources is useful to E.I.C. members, the Canadian public and our friends abroad.

Something of this sort was suggested as long ago as 1940 by Dr. J. J. O'Neill, M.E.I.C., in an address to the Geological Section of the Royal Society of Canada and again in 1951 in his presidential address to the same society. Also the Committee on Reconstruction, headed by Principal F. Cyril James, of McGill University, in its report to the Federal Government pressed for the collection and publication of data on our natural resources.

> "The forests of Canada are one of our greatest national assets and their conservation and use for the benefit of Canadians, present and future, is of great importance to all citizens everywhere."
>
> *"Alexander of Tunis"*.
>
> September 25, 1950.

#### Cooperation

Examples of cooperation among professional groups in various parts of Canada are not lacking. One which comes to mind is a series of joint meetings over the past two years between the professional foresters and the professional agrologists of Saskatchewan. The question of land use, especially in areas newly colonized or under consideration for such development, is vital to both groups and to the public. Land use studies *in advance* of colonization are most important. They have equal influence on the activities of foresters, agriculturalists and every other section of the general public.

Our agricultural lands are not unlimited. In a recent statement by P. O. Ripley (8), Chief of the Division of Field Husbandry at the Central Experimental Farm, Ottawa, the remaining undeveloped agricultural land in Canada is listed as approximately seven per cent of our land total. This includes land which will become available for cultivated crops, or for pastures and grazing lands.

To consider this problem in advance and thus to avoid many of the mistakes made in older sections of the country, the two Saskatchewan professional groups have met in conference and in field meetings. They have attempted to find a working definition of true forest soils and of those economically suitable for cultivated crops or pastures.

From the agricultural standpoint the problem is two-fold. There is a constant demand by young Canadian farmers for land which they may purchase and use. The home farm can be subdivided only for one or two generations, and still permit economic management. With increasing population and despite heavy population trends toward the cities, there is still a demand for agricultural land for our younger citizens. In addition, we accept immigrants, many of whom have a great land hunger. They frequently have the agricultural training and background to make a success under favorable circumstances.

The second half of the problem is to prevent people from clearing and attempting to cultivate land which is too rough, stony, infertile or too far removed from markets to make successful farming possible.

Foresters are also deeply concerned with land-use planning. In many cases clearing of timber in new territories is done without supervision. This raises problems which are far reaching in extent. If the land is not suited for permanent agriculture, clearing timber removes an actual or potential forest crop. Unwise clearing of such lands is often accompanied by settlers' fires, frequently spreading far beyond the point of origin. Tremendous injury to forests, soils, waters, game and recreation results. These disasters recur, reducing the values otherwise produced by forest-type land, which occupies such a high percentage of Canada's land.

The meetings in Saskatchewan

brought two groups of serious-minded citizens into alignment, where before there had been mutual suspicion. In some cases there had even been a feeling that one group was in direct opposition to the other. It was soon discovered that each was equally concerned with good land use. Studies by competent soil scientists, reporting on new areas before they are opened to agricultural settlement or forest operations, are welcomed.

No agronomist wishes to initiate new agricultural rural slums. Likewise, no forester invites additional problems by recommending retention of large tracts of timber on soil which is fundamentally and economically suitable for cultivated crops or pasture. The problems still awaiting him in the immense areas of true forest land in Canada are sufficiently pressing, and will require generations for satisfactory solution. On agricultural soils a percentage of tree cover for soil and water protection is desirable, and helps produce wood crops as well. The area of agreement here is well established.

#### Coordination With All Citizens

The consideration of coordination between professional groups leads automatically to consideration of the need for cooperation with all citizens. The development and permanent operation in full production of all our natural resources, including the minerals, which are treated so sketchily here, is a national requirement. Long-range planning inside municipal areas, and for our larger agricultural and nonarable regions, requires the best thought and most complete cooperation on the part of all Canadian citizens.

Water has long been known as a universal solvent. It is at least a factor of universal importance to all citizens during every day of their existence. The latter part of this paper may therefore well be devoted to comment on a few phases of water management, as one reason for participation and leadership by engineers in community, provincial and national programs, transcending mere professional employment.

#### *Water Management*

In southern Ontario, studies have been made of what may be called "small water-sheds," although they may cover several hundreds of square miles in some of the fifteen areas already examined. The Ontario Department of Planning and Development has been instrumental in establishing conservation authorities, which are legal entities, with representation from each municipality concerned. Boundaries are defined by the drainage basins of certain selected rivers or streams. In Ontario a river valley authority deals with all the land from which water drains into a river, such as the Saugeen or the Grand, from its ultimate sources to its discharge point into one of the Great Lakes.

The reason for intensive studies and increased intensity of land management in these areas was originally the need to solve extremes of water flow. These follow the familiar pattern; excessive floods in springtime and a chronic shortage of water or severe drought conditions in summer. Following the initial period of gathering data on soils, forests, waters, fish and game, recreation, history, population and business and industry for each area by members of the Department of Planning and Development, an intensive period of education is undertaken. Land owners and the voters are shown the extent and seriousness of the problems. Remedies well within their powers and their ability to pay are presented.

Much has been accomplished in these areas to reduce the primary problem of floods. Changing to better farming methods and reversing the trend of forest and woodlot devastation have helped start a restoration of soil moisture reserves. Slowing down the run-off, thus reducing the intensity of spring floods, and increasing infiltration, to alleviate summer drought conditions, go far toward restoring original natural water regimes.

The professional men most useful in these early developments are the engineer, the agriculturalist and the forester. The first structures built are usually flood-control dams, requiring comparatively large outlays of municipal, provincial and federal funds. These are recognized however, as only one factor in the rehabilitation of the river valley. Progress is most rapid where every land owner is conscious of his responsibility and improves his land-use practices as quickly as possible. Improved practices include systems of crop rotation, which have been recommended by agricultural representatives and extension workers from agricultural colleges for over a quarter of a century. Such comparatively simple things as cultivating on the contour instead of up and down the slope; the maintenance of cover crops; longer rotations; reduction of rapid run-off; and increased percolation of water into the soil are stressed in conservation authority programs. Areas which have been denuded of trees, and those found unsuitable for agricultural crops or pasture, are replanted. Existing woodlands, an equally important factor, are brought to full production and full water-holding capacity by removing livestock-grazing, fire, over-cutting or other hindrance.

It is a remarkable fact that good common sense, applied to the use of each acre of land, will, in the course of time, repair the mistakes of generations of land abuse. Good land management likewise reduces the necessity of large engineering projects for flood control. Natural vegetative cover and forest-soil infiltration reduce the peaks of the water cycle and check silting, erosion and flood damage.

An article (10) in the January, 1952, issue of the *Journal* of the Engineering Institute, brings out some of the values of vegetative cover. This doctrine is becoming increasingly well known in river valley authority areas, and in other territories where good agricultural and forest management information is accepted and put into practice by land owners.

The Canadian Forestry Association has popularized a program of forest land management called "Canadian Tree Farms". (11) Interest and action are stimulated by local committees, in the interest of improved production from tree farms. These are well-managed areas of privately-owned woodland, which receive special recognition by signs, certificates and ceremonies. Tree farms develop by community enterprise, to which local professional foresters contribute their services. They inspect prospective tree farms and advise on timber management and marketing. Other public-spirited citizens, such as newspaper editors and the radio station managers, give publicity to the program and enlist new participants. Education in the schools and through field trips is supported by trade organizations, civic clubs, and other interested groups. Farmers and owners of woodland are induced to join and to improve their standards of forest management and timber marketing under the stimulus of making more money in the process. A feeling of civic pride also enters into this type of cooperative effort. It is hoped that tree farming in Canada will in time be comparable to the program which now includes 27 million acres of this type of forest land in the United States.

#### Stream Pollution

Reverting to the subject of water, the need for professional leadership in the preservation of our water supplies is a prime responsibility of engineers. Prevention of stream pollution, through good city planning and engineering, and the provision of plentiful supplies of pure water for private citizens and Canadian industry are two phases of water management which affect us all. There are, of course, others as well, not mentioned here.

Prevention of stream pollution has been well covered in a paper recently given by Carson (12) in an address before the 1954 annual meeting of the Ontario Federation of Anglers and Hunters. Other studies and reports abound. The Canadian Chamber of Commerce lists some references in a news bulletin issued during 1952 (13).

Cities within range of mountain or hill country may develop large reservoirs the water of which does not need treatment. Most of us, however, use filtered water from streams. Unless these streams are large, comparatively clean and likely to remain so, we find water shortage and water purification problems greatly aggravated. If upstream management of these drainage areas is not practiced, as suggested in the discussion of river valley authorities, the future is not promising.

#### Forest Management

Illustrating partnership between forest management and the hydraulic engineer is the 30-year record of the city of Seattle, operating over 90,000 acres of forest land, on which their water supply originates. One of the most recent articles on this subject appeared in "The Timberman" for March, 1954 (14), and places understandable emphasis on the forest management practiced successfully on the watershed of the Cedar River.

Of the 91,500 acres in King County, Washington, the United States Forest Service operates 23 per cent, while the city owns 72 per cent or over 65,000 acres of the total. Five per cent is privately-owned. Even this small percentage of privately-owned land is being gradually reduced, as logged-over areas are traded for Forest Service land outside the unit.

Operations on the west coast are conducted under the Cedar River Logging Agreement, adopted in 1954. Orderly harvesting of the old growth timber is planned over a 40-year period. Every precaution is taken to avoid fire; injury from this cause has been kept to a minimum. Tops and branches from logging are left on the ground to decay and create additional organic material, filtering the rainfall into the soil and reducing surface run-off.

About 10 per cent of the area after logging requires artificial planting. This is done immediately with seedling trees from a two-acre forest nursery maintained within the area. However, over 90 per cent of the area reseeds naturally, producing continuous tree crops from the young growth left when the mature trees are removed. Trees and water are a dual return from the land.

The Cedar River reservoir area is designed to supply the water needs of a city of two million, which is looking some distance into the future life of Seattle. Nevertheless, this is the direction in which we must be looking, particularly if our future is directed by capable, professionally trained leaders with a full sense of civic responsibility. Engineers are taking an increasingly active part in making improvements over the wasteful methods of the past, which reduced our lands, forests, waters and soils below their full productive capacity. The ideal of permanent full production from each acre of land for the greatest possible benefit to the largest number of people, is a goal of the engineer, as it is of the forester, the agriculturalist, the wildlife manager and even the average citizen. Few will recognize this objective as fully as do the members of the Engineering Institute. They are trained and are dedicating their skills and abilities to the betterment of this magnificent and still resource-rich country, in which we Canadians have the supreme good fortune to be living.

# Rotary Wing Aircraft Development

*by*

Everett B. Schaefer

*Chief Technical Engineer, Canadair, Limited, Montreal, Quebec.*

Call it "Flying banana", "Whirly bird", or what you like, the helicopter seems destined to fill a gap in air transportation which the fixed wing craft cannot fill. Its development has been rapid since the late war and commercial operation of helicopters is about at its beginning, so far with promising results.

In this paper, Mr. Schaefer reviews the history of rotary wing aircraft, describes present machines in general terms and makes a few cautious predictions as to their future.

The story of man's struggle to conquer the third dimension and to achieve controlled flight is a matter of common knowledge. The fixed wing type of aircraft has benefited from the research and development efforts of individuals, corporations and government agencies, and is now accepted as an efficient transportation vehicle and a powerful military weapon. Ranges have increased to the point where trans-continental and trans-oceanic flights are every day affairs. Flight speeds have increased to the point where military fighters are exceeding the speed of sound in diving, and research aircraft have exceeded sound speed in level flight. Aircraft efficiencies have reached the level where it is possible for the commercial operators to show a profit.

The fixed wing aircraft has made great progress since the time of the Wrights and, with the advent of turbine type engines, further progress may be expected. This type of craft has, however, shortcomings that restrict its operation in varying degrees.

Since the stationary wing depends on forward velocity through the surrounding air for the generation of lift, the fixed wing craft demands a ground run to reach the speed required to get off the ground. Similarly, a landing must be made in a glide wherein the aircraft speed must not be allowed to drop below wing stall speed before ground contact is made. Thus the fixed wing craft requires airport runways which vary in length from 3,000 to 10,000 feet.

Fixed wing craft have not, however, completely satisfied man's desires because of certain operating restrictions, such as:

1. Requirements for large airports for take-off and landing.
2. Inability to rise and descend vertically.
3. Inability to hover at any altitude and over a fixed point.
4. Inability to maneuver in all three planes in a confined area.
5. The potential crash hazard due to loss of engine power.

In the quest for improvement of the flying machine and in mitigation of the operating restrictions enforced by the fixed wing, the rotary wing principle holds out some measure of promise.

### Direct Lift Flight History

The earliest experiments in flying were along the line of a direct lift machine, as opposed to the somewhat simpler problem of flying with forward speed.

The truth of the Greek myth of Icarus, whose wings melted when he approached the sun is subject to some doubt. A factual story is that of the flight experiments of Leonardo da Vinci (1452-1519), among whose astounding talents was a brilliant engineering mind. Da Vinci conducted extensive research on direct lift by means of the ornithopter (flapping wing) and the aerial screw principles. One authority states that the first successful flight of a heavier-than-air powered machine was made in 1784 with a model helicopter devised by two French scientists, Launoy and Bienvenu. This model had two co-axial rotors made of bird's feathers and was driven by springs. The next recorded milestone was the appearance of the first full scale helicopter to leave the ground carrying a pilot. This occurred in 1907; the machine was designed by the French aeronautical engineer, Louis Breguet.

The Von Baumhauer 1930 helicoper was the forerunner of today's single rotor machine. Up to 1930 most designs depended upon multi-rotors to overcome reaction torque compensating tail-rotor.

The Breguet 1936 helicopter with co-axial rotors was the most successful of the type up to then. This machine set all helicopter world records until the advent of the Focke-Achelis FW-61 in 1937; the FW-61 records were: altitude, 11,243 feet; flight duration, one hour twenty minutes; speed, 76 m.p.h. This machine is generally accepted as being the first fully controllable helicopter.

Sikorsky, beside designing and constructing a memorable series of fixed wing aircraft, had an interest in helicopters dating back to 1900. By 1910 he had built two experimental machines and in 1939 produced his famous VS-300, which set a new endurance record of one hour thirty-two minutes. Sikorsky settled upon the single rotor and torque compensating tail rotor similar to those of the Von Baumhauer of 1930.

A German engineer, Anton Flettner, developed the Flettner 282, in 1939, the first helicopter to use two closely intermeshing rotors. This machine was put into quantity production during the war, but little is known of its accomplishments. During the war an Austrian designer, Doblhoff, produced the first jet-powered helicopter with pressure jets at the tips of the rotor blades for driving power. The first true twin-engined transport type helicopter was the Kellett XR-10 with 65-foot diameter, closely intermeshing rotors, carrying ten passengers and flown in 1947.

Canada entered the historical picture with the first helicopter to be designed, built, and flown here, a three-place single rotor craft developed by Bernard Sznycer and Selma Gottlieb, in 1947.

#### The Autogiro Era

The autogiro of the 1920's and 30's was not a true vertical lift machine, but certainly has a place in any general discussion of rotary wing aircraft development. It was in effect an intermediate step between the fixed wing type and pure helicopter and the work carried out on the theories and principles governing the behavior of rotors in forward flight has been profitably applied to the helicopter.

The autogiro's rotor blades were not power driven; rather, the autorotative forces generated on the blades by the air stream caused rotation and thereby the generation of rotor lift. The aircraft then had to be in forward motion to have rotor rotation. Since the aircraft had a normal propeller to produce forward motion, the take-off procedure consisted of taxiing around the field until the rotor was up to speed and then making the take-off. Landing was accomplished by gliding. The early machines all had fixed wings in addition to the rotor, but on some of the later models these were left off.

The guiding genius of the autogiro was the Spanish engineer, Juan de la Cierva, who began his work in 1920. His early attempts were unsuccessful, because the use of rigid rotors with fixed blade angles induced problems of unequal lift forces as the blades swept through a rotation. De la Cierva hit upon the idea of mounting the blades on

horizontal hinges at the hub, thus permitting them to flap, thereby equalizing the lift moments on advancing and retreating blades of the rotor. The rotary wing field owes a great deal to Cierva's work.

Other pioneers in the field were Raoul Hafner, who developed a system for blade pitch control that applies to the helicopter, and E. Burke Wilford, who developed a gyroplane with cyclic pitch control that also applies to the helicopter.

The final development of the autogiro was an important one from the viewpoint of progress to the direct lift helicopter. The machines up to this time had to taxi around the field to get the rotor up to speed for a take-off. In final form, the autogiro did possess some ability for vertical ascent. This was accomplished by clutching the forward drive motor to the rotor, speeding up the rotor with zero lift setting thus storing kinetic energy, and, after uncoupling the motor drive, utilizing the stored energy to provide a short duration lifting force by advancing the angle of the blades to a high lift position. Once off the ground, the aircraft propeller put the craft into forward motion and kept the rotor in motion by auto-rotative forces. This was a significant step forward toward the practical helicopter.

### The Helicopter Today

There is more diversification in the appearances of the various helicopters flying today than is noticeable in conventional fixed wing craft. One of the reasons for this is the newness of the art. Each of the possible rotor configurations has attracted supporters and it is natural to have experimental machines produced for demonstration. It is also natural to expect that the field will narrow down to no more than two or three basic configurations as superior characteristics are clearly demonstrated.

Common rotor configurations are:

1. Single rotor—tail rotor.
2. Dual rotors—lateral arrangement.
3. Tandem rotors.
4. Dual rotors—intermeshing.
5. Co-axial rotors.

The two types most usually seen are the single rotor with tail rotor and the tandem rotors machines. All late Sikorsky models are of the single rotor—tail rotor type. All late Piasecki models are of the tandem rotors type. Bell designed all of its small machines with single rotor—tail rotor configurations, but the latest large Bell antisubmarine helicopter for the U.S. Navy is of the tandem rotors type. In the United Kingdom Bristol has paralleled Bell's practice, a small helicopter of the single rotor—tail rotor type and a large machine with tandem rotors.

To place some relativity on the expressions large and small Table 1 of dimensions, powers and weights has been prepared for several helicopters now flying.

The performance of most present day helicopters is limited in comparison to the fixed wing types, particularly with regard to forward speed and range. Of the craft listed in the table, the ranges run about 200 miles and the cruising speeds in the order of 75 to 90 m.p.h. As a matter of interest, in September, 1953, high speed records of 146.7 m.p.h. and 22,289 feet altitude were set.

The helicopter has some remarkable achievements to its credit, a great many of which have been publicized, and most of which could not have been realized by the use of any other craft. Of interest is the work done in British Columbia by Okanagan Helicopters, Ltd., in conjunction with the construction of Alcan's Kitamat Project. The instances cited are eye-opening.

1. Site survey; a possible 3-year job by usual means accomplished in 10 days.
2. Triangulation for a water tunnel; estimated to take a ground crew of 12 two seasons, done with helicopters in 6 weeks.
3. Establishing camps, and supplying them before the snows had run off.
4. A Bell 47D record:

| | |
|---|---|
| Trips.......... | 235 |
| Number of passengers.... | 352 |
| Passenger weight | 65,364 lb. |
| Baggage weight. | 9,043 lb. |
| Freight weight.. | 48,478 lb. |
| Flying time..... | 135:10 hr. |

5. A Sikorsky S-55 record:

Freight weight.. 100,089 lb.
Flying time..... 54:45 hr.

Beside the numerous civil applications of the helicopter, the military services have found it invaluable for a variety of purposes, e.g., evacuation of the wounded, supply, search and rescue, troop transport, and communication and liaison.

The civil aviation side of the picture has been growing steadily. In addition to carrying mail from airport to downtown post offices in Los Angeles, Chicago and New York, passenger shuttle services are now being operated in New York between Idlewild, La Guardia and Newark airports. In Europe, Sabena Airlines of Belgium, has inaugurated a helicopter operation serving such routes as

Brussels-Antwerp-Rotterdam....... 70 miles
Brussels-Arlon-Luxembourg-Sarrebrük........ 185 miles
Brussels-Lille....... 65 miles
Brussels-Liege-Cologne-Bonn............ 130 miles

In the United Kingdom British European Airways is active in the field of helicopter shuttle service and Trans-Canada Airlines are seriously studying the potentialities of helicopter service. The extent of interest in the United States may be gauged by the fact that a total of 46 helicopter route applications have been filed with the Civil Aeronautics Board.

The interest of the airlines has been whetted by the possibilities of the helicopter both for airport to city center travel and for short line community service. Some of the salient features desired by the operators are:

1. Operating costs at a low enough level to make reasonable fares possible.
2. Passenger capacity ranging from 30 to 50, depending on the route assignment.
3. A range of 200 to 300 miles carrying fuel reserves and maximum payload and making six intermediate stops.
4. Ability to take-off and land in areas from 300 to 400 square feet.
5. Speed as high as possible, consistent with good economy, with 150 to 160 m.p.h. a desirable goal.
6. The choice of engine type, i.e., turbine or reciprocating, to be left to the manufacturer, but for passenger transport a helicopter must be multi-engined and will require single-engine safe flight characteristics.
7. To be commercially profitable the helicopter service should be able to operate in weather conditions comparable to those that the fixed wing aircraft can now tolerate. This means anti-icing protection and blind flying capabilities similar to those of fixed wing craft.
8. Cabin ventilation and cooling will be necessary because of the helicopter's low level and up and down type of operation.
9. Quiet operation; this is a dual problem since both inside cabin and external noise must be considered. The problem of external noise is particularly important, since the helicopter is expected to operate in and out of crowded terminals.
10. Appearance: one airline official has put forward the sensible suggestion that the external appearance of the helicopter should not "amuse, confuse and frighten passengers".

At this point it is of interest to see what the designers are planning for

**Table 1. Helicopter General Specifications**

| Manufacturer | Model | Rotor Arrangement | Rotor Diameter | Gross Weight Lbs. | No. of Passengers | No. of Engines | H.P. per Engine |
|---|---|---|---|---|---|---|---|
| Bell | 47 | Single | 35′ | 2,350 | 3 | 1 | 200 |
| Bell | YH-12 | Single | 47′ 6″ | 6,600 | 8–10 | 1 | 600 |
| Bristol | 171 | Single | 48′ 6″ | 5,200 | 4 | 1 | 525 |
| Bristol | 173 | Tandem | 48′ 6″ | 10,600 | 15 | 2 | 525 |
| Piasecki | HRP-2 | Tandem | 41′ | 7,225 | 10 | 1 | 600 |
| Piasecki | H-21 | Tandem | 44′ | 13,250 | 22 | 1 | 1,425 |
| Sikorsky | S-51 | Single | 49′ | 5,300 | 2 | 1 | 450 |
| Sikorsky | S-55 | Single | 53′ | 6,835 | 10–12 | 1 | 600 |

supply to the civil market. In the class of larger machines, the Bristol 173 is now flying experimentally and is the first British multi-engine helicopter. It has been designed for internal service in the United Kingdom and is somewhat smaller than present thoughts indicate as desirable. The cabin has accommodation for 13 passengers and a freighter version is possible with a cargo capacity of 650 cubic feet. A later version of the Bristol 173, the MK3, recently made its appearance; the craft has now sprouted wings. This is a development toward what may be termed the "compound helicopter"; the purpose is to relieve the rotor of some of its lift requirements in forward flight and thereby to increase forward speed capabilities.

Another recent British design proposed by Saunders-Roe follows the idea of the compound type by including a fixed wing in addition to the rotors, and then goes one step further by adding a ducted fan installation for forward propulsion. This machine is planned to accommodate 40 to 50 passengers.

The Fairey Aviation Co. is reported to have received a contract for a 40-passenger compound helicopter in which a five-blade rotor is jet driven, and which also has two turbo-prop engines, mounted in nacelles under the fixed wings, driving forward propulsion propellers.

In the United States the pure helicopter, the Piasecki YH-16 transporter, has made several flights. This machine is cloaked in military secrecy as to exact details, but something has been published, so naturally educated guesses have been made as to its civil potential. Published dimensional data are:

| | |
|---|---|
| Fuselage length..... | 78 ft. |
| Overall length with rotors turning..... | 134 ft. |
| Diameter of rotors.. | 82 ft. |
| Gross weight....... | over 15 tons |

Accommodation is listed for the military version as "40 combat troops, 32 litters, or 3 jeeps". In the first prototype, two reciprocating engines of 1,650 b.h.p. each are located in a compartment under each rotor. The rotors are interconnected at all times. The second prototype is to be powered with turbo-prop engines rated at 2,750 equivalent shaft horse power each. The third machine may have higher powered turbo-prop engines rated at 3,750 effective shaft horse power each.

The Air Transport Association's Helicopter Committee, reporting on the probable characteristics of an airline version of the YH-16, estimates as follows:

| | |
|---|---|
| Engines, turbo-prop type. | |
| Number of passengers | 50 |
| Gross weight........ | 45,000 lb. |
| Cruising speed....... | 150 m.p.h. |
| Payload............ | 10,500 lb. |
| Range.............. | 230 miles |

Another large machine, designed by the Sikorsky Division of United Aircraft, is in process of manufacture. This, too, is a military helicopter, XHR2S, and only a small amount of data is released. The machine follows the company design trend by utilizing a single five-blade rotor with a tail rotor. The first version will be powered with two 1,800 b.h.p. engines (reciprocating type) mounted in nacelles at the outboard ends of stub wings located above the fuselage. The A.T.A. Helicopter Committee estimates that this machine in a civil version would show the following general data:

| | |
|---|---|
| Engines, turbo-prop type. | |
| Number of passengers | 50 |
| Gross weight........ | 34,000 lb. |
| Cruising speed....... | 160 m.p.h. |
| Payload............ | 10,000 lb. |
| Range.............. | 200 miles |

Another possible entrant into the commercial field might develop from the Bell. Navy anti-submarine helicopter, the XHSL. A Bell Aircraft Corp. spokesman in a recent interview stated that an airline version of this machine in the 20 to 25 passenger capacity was possible.

From the interest displayed by airline operators, the experience now being gained by helicopter commercial operations and the appearance of large size military machines capable of commercial adaptation, it does not appear too rash to expect airline operation of helicopters in the 1960's.

The possible impact of successful helicopter airline operation upon the field of air transport can be viewed as an important supplement rather than as a threat to the airlines system. The A.T.A. report hints at the probable airline business expansion possibilities by the use of supplemental helicopter services in the statement, "The helicopter has two major advantages: To operate from smaller terminal areas than fixed-wing aircraft, and to fly at very low speed. These will permit air transportation to expand into fields where the airplane cannot now compete."

A more recent A.T.A. long range forecast of airline traffic growth in the U.S. is quoted in Table 2.

The projected helicopter estimates include multi-engine machines on non-commutation, non-airtaxi intercity carriage only.

**Table 2. Forecast of Airline Traffic Growth**

| Year | Millions of Passengers | | |
|---|---|---|---|
| | Fixed Wing Aircraft | Helicopters | Percent of Total Carried by Helicopters |
| 1960 | 39.4 | 6.1 | 13.4 |
| 1965 | 40.6 | 18.2 | 31.0 |
| 1970 | 45.5 | 22.2 | 32.9 |

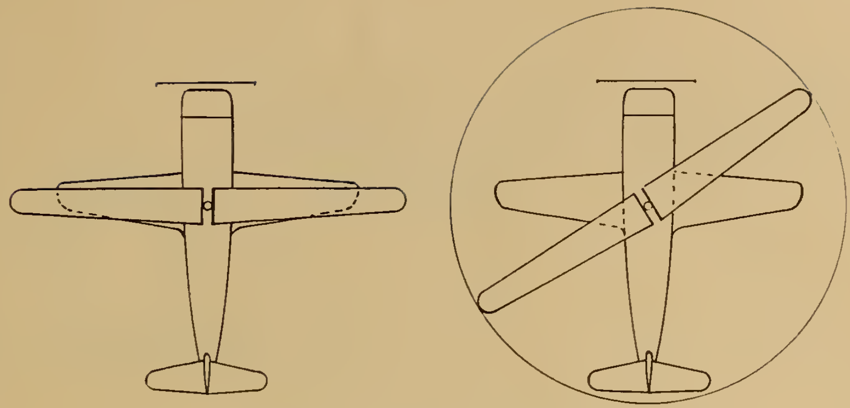
Rotors Converting to Props.

### Convertible Aircraft

A comparison of the general performance characteristics of the fixed wing aircraft and the helicopter quickly indicate some of the advantages and disadvantages of each. The A.T.A. Helicopter Committee report shows such a comparison as given in Table 3.

The fixed wing craft shows to advantage in two qualities, high speed and flight stability. In the others the helicopter has the advantage.

The comparison can be extended to cover two other important items. The first is the matter of range with full payload and there, of course, the fixed wing types excel for the longer ranges. The other consideration is one of safety in case of complete loss of power. Here the fixed-wing suffers in comparison, in that it must glide at fairly high approach speeds and cannot be as selective in choice of emergency landing areas as the helicoper, which, by virtue of lower required forward speeds in glide for autorotation of the lifting rotor(s) and touch down forward speeds approaching 0 m.p.h., possesses an additional measure of safety.



**Rotor Converting to Fixed Wing.**

**Table 3. Comparison of Helicopter vs. Fixed Wing Transport**

| Item | Fixed Wing Now | Helicopter | |
|---|---|---|---|
| | | Now | Foreseeable Future |
| Minimum Speed...... | 75 m.p.h. | 0 m.p.h. | 0 m.p.h. |
| Maximum Speed..... | 600 m.p.h. | 120 m.p.h. | 200 m.p.h. |
| Takeoff and Landing Area Length...... | 7,000 ft. | 150 ft. | 300–400 ft. |
| Maximum Climb Gradient......... | 5° | 90° | 90° |
| Stability............ | Good | Not yet Satisfactory | Expected to be Satisfactory |
| Maneuverability...... | Limited | Good | Good |

**Table 4. Comparison of Performance and Other Characteristics**

| Item | Helicopter | Convertiplane | Fixed Wing |
|---|---|---|---|
| Vertical Ascent......... | Yes | Yes | No |
| Hover................. | Yes | Yes | No |
| Vertical Descent........ | Yes | Yes | No |
| Overall Range.......... | Short | Greater than Helicopter, Less than Fixed Wing | Maximum Possibility |
| Cruise Speed........... | Limited | In Ultimate Form Equal to Fixed Wing | Maximum Possibility |
| Short Range Payload (50-mile City Center to City Center)...... | Maximum | Less than Helicopter | Cannot Operate |
| Medium Range Payload (300-500 Miles City Center to City Center) | Less than Convertiplane | Maximum | Cannot Operate |
| Medium Range Payload (Airport to Airport).. | Least | Less than Fixed Wing | Maximum |
| Long Range Payload (Airport to Airport).. | Cannot Operate | Less than Fixed Wing | Maximum |
| Airport Requirements... | Cleared Area only 400 sq. ft. | Cleared Area only 400 sq. ft. | Prepared Runways 3,000–7,000 ft. |

It is but natural then that designers consider ways and means of combining the advantages of each type into one machine. This is the basis for the convertible aircraft, sometimes called a "convertiplane". A recent definition of this type of craft states, "A convertiplane is an aircraft with fixed wing area sufficient to provide most efficiently the lift required at cruising speed and altidude, with a power driven rotating-wing system to provide lift for slow speed flight, take-off and landing."

In essence then, a convertiplane is a cross between the fixed-wing and pure helicopter types of craft. It has both a fixed-wing and a rotary-wing system or some combination thereof. The compound helicopter, previously mentioned is a step in this direction.

A comparison, Table 4, in which certain performance and other characteristics of the three basic types of aircraft (fixed-wing, helicopter and convertiplane) are shown in very general terms, serves to illustrate the potential of each.

The convertiplane is not merely a designer's dream, but is an idea in process of approaching reality. In the United States the Air Force has

# Unified Standards for Limits and Fits

*by*

Rowland Hill

*Manufacturing Standards Engineer,*
*Northern Electric Co. Ltd.,*
*Montreal, Quebec.*

The author, who attended the Conference for the Unification of Engineering Standards held at Ottawa in 1945 as one of the Canadian delegates, has taken an active part in the work of the Canadian committee and the ISO and ABC Conferences since that time. In this paper he discusses the various national standard systems, and how they are fitted into the New Unified Standard through ABC agreements.

In the manufacture of engineering assemblies it is essential that the individual parts shall fit together with a pre-determined amount of either clearance or interference, in order that these assemblies will function in the manner required by the designer. It is also essential, especially if these parts are to be manufactured on a quantity, or mass production basis, to provide suitable tolerances and limits for the individual parts, so that they can be manufactured economically, and yet will, on assembly, produce a fit which will give the desired performance.

Suitable tolerances, limits, and allowances can, of course, be selected on a purely arbitrary basis, instead of being based on a suitable standard, and such methods have been used for many years by American and Canadian industry. There are, however, many advantages to be gained by standardization in this field. For this reason the new Unified Standards for Limits and Fits represent a new tool for engineers and designers.

Of the various standards in existence, the Newall System, published in 1902, was one of the first. Great Britain published a standard BS164 in 1924; the United States published a temporary standard, B4a, in 1925, which has since been abandoned. The International Standardizing Association (ISA) published a metric standard ISA Bulletin No. 25, in Jan. 1941, based partly on a German standard published in 1926. This ISA standard is widely used in Europe, and to some extent has been used also in Great Britain. It was translated into English (and converted to inches) for study purposes by the ASA committee in 1942.

Some individual companies have adopted modifications of these standards, or have set up other simple systems for their own use. However, none of these systems were considered satisfactory for use as a unified standard, yet no attempt was made by the ABC countries (America, Britain, Canada) to prepare a unified standard until the results of the lack of a common understanding were brought out so forcibly during the second world war.

This subject was discussed at the Ottawa Conference for the Unification of Engineering Standards in 1945, and since that time has been actively pursued by the standards bodies of the three countries. This culminated in an ABC agreement covering the technical details for unified standards, which was reached at the ABC Conference in New York in June 1953.

This article explains some of the deficiencies found in the existing systems; the criteria adopted by the ABC conference for a unified system; and how the ABC agreements, based on these criteria, form the technical basis on which the American, British and Canadian Standards on Limits and Fits are being, or have been, built.

#### Benefits of Standardization

The chief advantages to be gained by the standardization of limits and fits for engineering and manufacturing are as follows:

1. To facilitate the selection of fits, by providing a range of practical fits to cover all general needs, from which a suitable fit can be selected for any specific application. The alternative is to select fits on an arbitrary basis, or to use such ambiguous terms as working fit, or running fit, thus leaving the actual design to the tool maker or producer.
2. To facilitate the specification of fits, by providing a symbolic means of designating fits which can be used on design sketches, or for general identification.
3. To reduce the number of tools

and gages required, by producing fits by combinations of a small number of standard holes and shafts.

4. To promote understanding of specifications, by providing part of the common engineering language which is necessary to enable us to manufacture to other than our own drawings or specifications, or to understand and enjoy the technical literature, especially between the English-speaking countries.

### Some Fundamental Definitions

Realizing that there must be a common understanding of the terms used if a standard is to be effective and useful, one of the first actions of the ABC Conference in 1945 was to reach agreement on definitions of technical terms used in limits-and-fits engineering. These are still under study by the committees, and some minor changes may yet be made, but in the meantime they have been published both in the United States (ASA B4.1–1947) and in Canada (CSA B97-1948).

A few of these terms, which are essential to the proper understanding of this article, and to the evaluation of limits-and-fits standards, are defined below or are illustrated in Figures 1 to 3. Figure 1 also illustrates the derivation of the tolerance zone diagram, as used to illustrate engineering fits.

### Grade, Type, and Class

These terms, which are illustrated in Figure 4, are used in these standards in a somewhat restricted sense, as follows:

*Grade* refers to the relative magnitude of the tolerances and hence to the quality of the work.

*Type of fit* refers to the use to which the fit is to be put in a general way, such as running, clearance, interference, etc. This is explained in more detail under 'Criteria'.

*Class of fit* refers to the relative amount of the clearance or interference for each type of fit. Thus each type of fit is divided into a number of classes.

*Unilateral Tolerance* is a tolerance which is applied all in one direction from the design size, e.g. .250 + .005 − .000. The design size is normally the maximum metal size, which is the minimum size for a hole and the maximum for a shaft, and the tolerance is applied plus for the hole and minus for the shaft.

*Bilateral Tolerance* is a tolerance

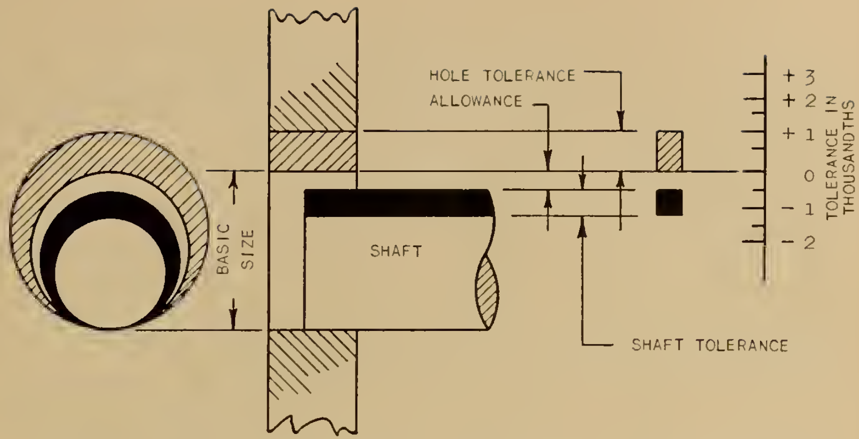

**Fig. 1. Clearance fit, and the derivation of the tolerance zone diagram.**

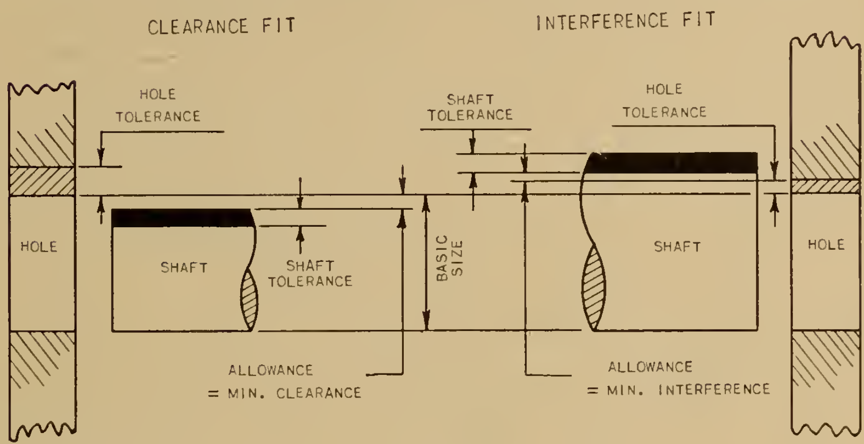

**Fig. 2. Fits in a basic hole system.**

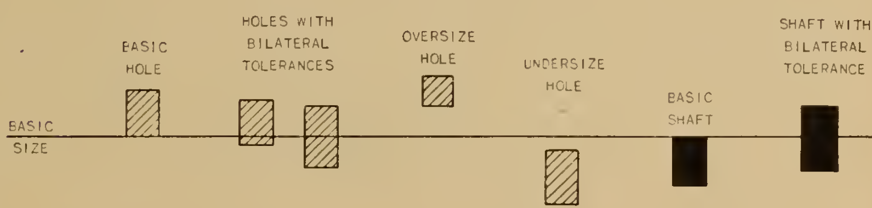

**Fig. 3. Tolerance zones for various holes and shafts.**

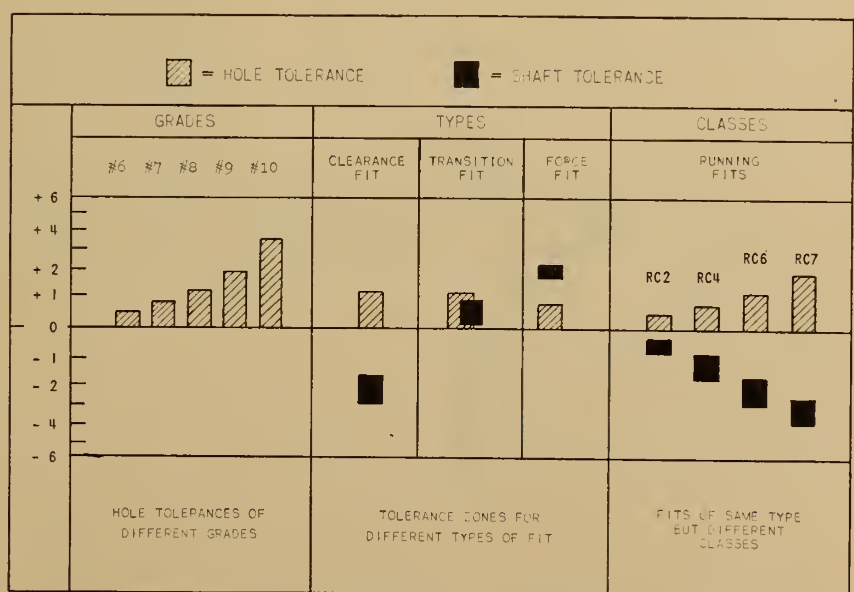

**Fig. 4. Grade, type, and class.**

**Table 1—Criteria for a New System**

As accepted at the ABC Conference in New York in June 1952

1. The system should include tables of allowances and tolerances which will permit a choice of fits suitable for practically all applications which are likely to be encountered in practice, from a loose clearance to a heavy shrink fit.
2. The system should cover a wide range of sizes, and be equally useful for the design of small instruments or large power equipment.
3. All values should be based on logical formulae, so that the ranges can be extended or values checked whenever necessary.
4. The formulae should be so designed that any particular class or grade will represent a similar quality, or result in similar performance, throughout the range of sizes.
5. The fits should be equally applicable for interchangeable manufacture or selective assembly, as conditions warrant.
6. The least number of tables and classes of fit, consistent with adequate coverage of normal requirements, should be provided, for simplicity or presentation and use.
7. While designers should be free to choose whatever class of fit they desire for any particular application, some assistance should be provided to enable a suitable choice to be made in cases where experience may be lacking.

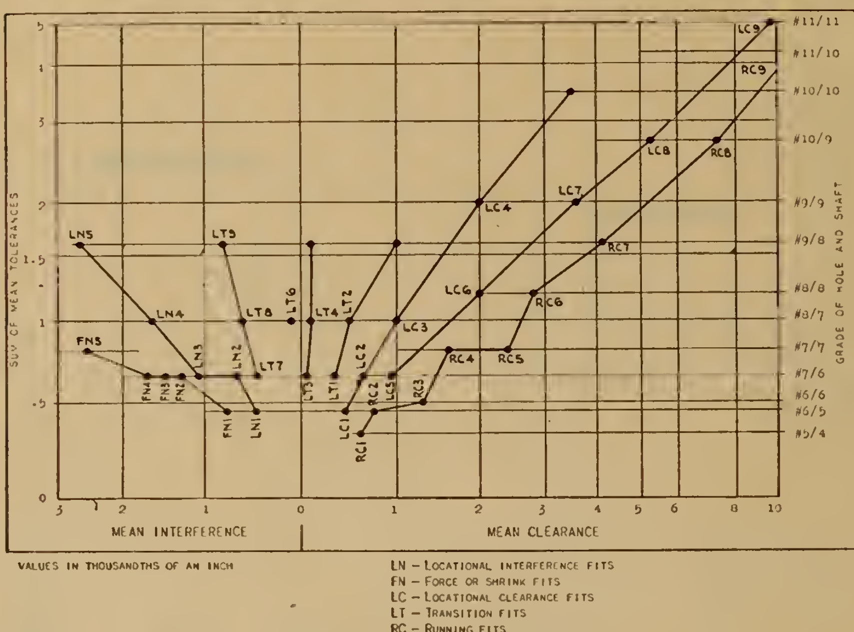

**Fig. 5. A series of standard fits.**

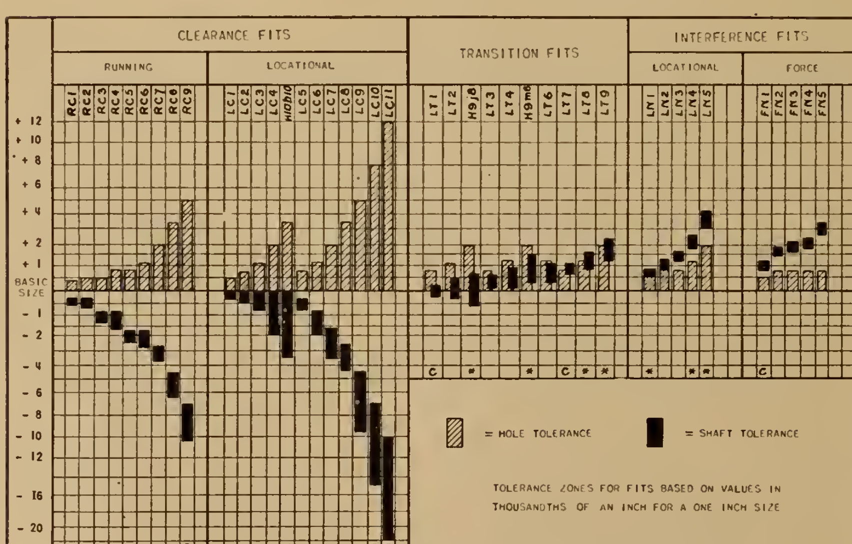

**Fig. 6. A series of standard fits in the basic hole system.**

All of these fits are included as standard fits in the ABC agreements, except those marked "C", which are additional fits in the Canadian standard, and those shown with an asterisk, which have to be derived from the formulae, or from the tables of hole and shaft tolerances, when required.

which is applied in both directions from the design size, though not necessarily equally in both directions, e.g. .250 ± .003 or .250 + .004 − .002.

*Basic Hole* (*or Shaft*) A basic hole is one in which the minimum size is equal to the basic size, and the tolerance is applied unilaterally in a plus direction. Similarily a basic shaft is one where the maximum shaft is the basic size, and the tolerance is applied in a minus direction.

*Hole* (*or Shaft*) *Basis System.* A hole-basis system is one using standard holes, which vary only in the amount of the tolerances, and various fits are obtained by varying the size of the shafts. The hole tolerances may be either unilateral or bilateral, but when basic holes are used it is known as a basic-hole system. Similarly, a shaft-basis system uses standard shafts and varying holes, and, when basic shafts are used, would be known as a basic-shaft system.

### Preferred System

A basic-hole system is generally preferred, because holes are usually produced with fixed-size tools and plug gages, and are more difficult or costly to produce in slightly varying sizes than are shafts, which are normally turned or ground.

There are many specific cases, however, when a bilateral hole tolerance is preferable, for example, when holes are produced with standard drills or reamers, which may wear slightly and produce undersize holes; or when a shaft-basis system is preferable, for example, where two different fits have to be produced on the same shaft. For this reason a standard, to be satisfactory for general use, should provide means for converting fits from one basis to another.

### Criteria for a Unified Standard

Soon after the ABC Conference in 1945, the Canadian Committee compiled a series of criteria for a satisfactory system to meet modern requirements, and these were accepted at the ABC Conference in New York in 1952 as a basis for determining the acceptability of the proposed ABC Agreements. These criteria, shown in Table 1, are discussed in more detail below.

Under Criterion 1, the system should include tables of allowances and tolerances which will permit a choice of fits suitable for practically all applications likely to be encountered in practice. The fits required to cover all engineering requirements can be conveniently divided into five types. For each of these types a series of classes of fit are required, ranging from precision fits to fits with large tolerances and allowances.

Adequate coverage would be given by about 9 to 12 classes for each of the clearance and transition fits, and about 5 for the interference fits. Figure 5 shows such a series of standard fits, which gives good coverage of the engineering field for most purposes. Each fit is here represented by the average hole and shaft tolerance, and the average clearance or interference. Figure 6 shows these same fits in a basic hole system, in the form of tolerance zone diagrams.

The five types of fit are:

1. *Running or Sliding Fits.* These are fits which provide clearance necessary to achieve the desired running or sliding characteristics, with suitable lubrication allowances. The tolerances are small, and the allowances increase slowly with increased diameter, in order to maintain the desired running qualities.
2. *Locational Clearance Fits.* These are essentially static fits, running from snug fits for parts requiring accuracy of location, to the loose fastener fits, where freedom of assembly is of prime importance. They have greater tolerances than running fits, and the clearances increase faster with diameter in the larger sizes.
3. *Transition Fits.* These are a compromise between clearance and interference fits, for applications requiring accuracy of location, but either a small clearance or interference is permissible.
4. *Locational Interference Fits.* These are used for parts requiring rigidity and alignment, where accuracy of location is important but control of bore pressure is not. Such fits are not intended to transmit frictional loads between mating parts by virtue of the tightness of fit.
5. *Force or Shrink Fits.* These are interference fits characterized by maintenance of constant bore pressure throughout the range of sizes. The interference varies directly with the diameter, and the tolerances are small to maintain the resulting pressures within reasonable limits.

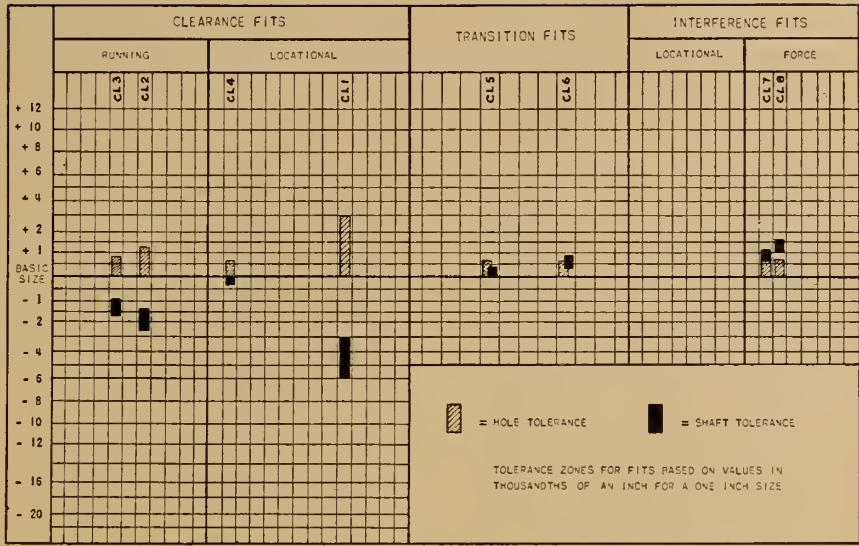

**Fig. 7. Fits in American tentative standard B4a-1925.**

This chart includes all of the fits in the American Tentative Standard B4a-1925, arranged in the appropriate spaces for comparison with Figure 6.

**Table 2—Recommended Fits in a Basic Hole System Provided by Various Standards.**

| Standard | Clearance Fits | | Transition Fits | Interference Fits | | Total |
|---|---|---|---|---|---|---|
| | Running Fits | Locational or Static Fits | | Locational Fits | Force or Shrink Fits | |
| American B4a—1925 | 3 | 1 | 1 | — | 3 | 8 |
| British BS 164—1924 | 13 | 19 | 19 | 5 | — | 56 |
| British BS 1916—1953 | 11 | 14 | 13 | 5 | 19 | 62 |
| Canadian B97—1954 | 9 | 11 | 6 | 5* | 5 | 36 |
| ISO (Metric) | 11 | 14 | 13 | 5 | 19 | 62 |
| Newall System (Bi-lateral Holes) | 2 | 4 | 1 | 5 | — | 12 |

*Three of the locational interference fits are not included in the tables in the present edition, but the formulae are included in the appendix, and values can thus easily be calculated.

**Table 2A—Standard Fits under Criterion No. 2.**

| Type of Fit | Designation Symbols | Number of classes of fit provided |
|---|---|---|
| Running or Sliding Fits | RC1 to RC9 | 9 |
| Locational Clearance Fits | LC1 to LC11 | 11 |
| Transition Fits | {LT1 to LT4, LT6 to LT7} | 6 |
| Locational Interference Fits | LN1 to LN5* | 5 |
| Force or Shrink Fits | FN1 to FN5 | 5 |
| | | TOTAL 36 |

*Three of these are not given directly in the tables, and have to be determined by the formulae.

Under Criterion 2, the system should cover a wide range of sizes and be equally useful for the design of small instruments or large power equipment. Most of the existing standards cover a range up to 8 to 25 inches, but to fully cover the needs of modern industry it was considered necessary to extend this up to 200 inches.

Under Criterion 3, all values should be based on logical formulae, so that ranges can be extended or values checked whenever necessary. Formulae are required for the calculation of both tolerances and allowances, and are required to achieve two purposes:

1. To provide a series of values based on size: (a) for each grade of tolerance, and (b) for each class of fit.

2. To provide (a) a series of grades of tolerance, and (b) a series of classes for each type of fit, from very small tolerances and allowances for precision fits, to large values for rough work or heavy fits.

The first of these is the function of the basic part of the formulae, which has to be designed to meet the requirements of criterion 4. The second purpose may be taken care of by modifications to the basic formulae, and by using a series of factors applied to the basic formulae, to give suitable steps between grades and classes. This provides uniform coverage of the whole engineering field. It has been found that steps of 60 per cent between grades of tolerance, and 60 to 100 per cent between classes of fit, provide about the ideal coverage for most purposes.

Under Criterion 4, the formulae should be so designed that any particular class or grade will represent a similar quality, or result in similar performance, throughout the range of sizes. For tolerances, the formula should therefore approximate the rate of increased difficulty of maintaining the required accuracy with increasing size. This will vary due to machine errors and adjustments, tool wear, material variations, measurement errors, deformation or inaccuracies of gages, temperature variations, and different processes.

Obviously, to be accurate, this would require a complicated formula, which would be different for each manufacturing process. However, as we are only trying to produce a series which will represent *similar* quality throughout the range, the practical solution is to find a formula which will represent the approximate average variations in different processes. Such a formula is that provided in the ABC agreements for the range up to 20 inches, which is

$$G(.52\sqrt[3]{D} + .01D)$$

where D = the mean diameter in inches, and G = a factor for each grade.

Likewise formulae for allowances are a compromise for average conditions. Formulae for running fits have to include allowances for measurement errors, lubrication, and temperature variations. Force or shrink fits should increase almost in direct proportion to diameter, like the old rule-of-thumb of .001 in. per inch, in order to maintain constant assembly stress. Locational fits are less critical and the formulae should more nearly approach the tolerance formula.

**Table 3—Preferred Basic Sizes**

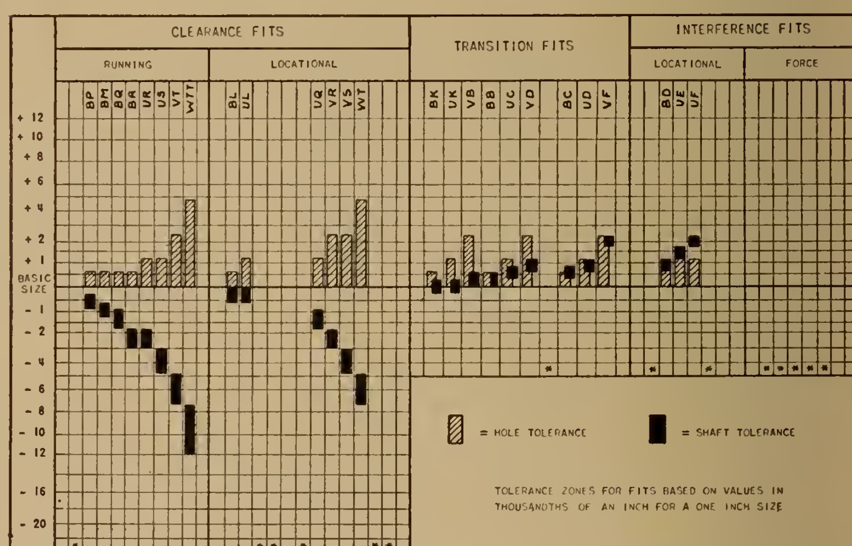

**Fig. 8. Basic hole fits in British standard BS-164.**

This is a selection of fits from the Old British Standard which most nearly correspond to those in figure 6. There are others in this standard, with more or less impractical tolerances, but none, in the basic hole system, which would fill the spaces shown with an asterisk*.

Under Criterion 5, the fits should be equally applicable for interchangeable manufacture or selective assembly, as conditions warrant. The coarser fits are all suitable for interchangeable manufacture. The more precise fits are more difficult to control, and may be more economically produced, especially when quantities are small, by matched fits or selective assembly. The method of adapting these precise fits to selective assembly or matched fits should be explained in the standard.

Under Criterion 6, the least number of tables and classes of fit, consistent with adequate coverage of normal requirements, should be provided, for simplicity of presentation and use.

One of the chief criticisms of the

ISO system was the fact that there were such a large number of possible combinations of holes and shafts, that selection of a suitable fit was difficult, and the benefits of standardization were partly lost. About the maximum number of fits required to give adequate coverage would be those shown in Figs. 5 and 6.

Under Criterion 7, while designers should be free to choose whatever class they desire for any particular application, some assistance should be provided to enable a suitable choice to be made in cases where experience may be lacking.

Freedom of choice appears to be more or less inherent in all of the old standards, but the American Tentative standard B4a specified actual speeds and journal pressures. This was felt to be too restrictive, as the fits could certainly find a much wider application than indicated by the values given. On the other hand, the other standards gave practically no guidance as to the applications for which the various fits were suitable.

### Existing Standards

Let us now examine briefly some of the existing standards, and see wherein they failed to meet the criteria set up by the committee. Prior to the advent of the ABC Agreements and the Unified Standards, the four best known systems used in the English speaking countries were: the British Standard BS164-1924; the American Tentative Standard B4a-1925; the Newall System, used chiefly in Great Britain; and the ISA (now ISO) metric system, used generally throughout Europe. The number of basic hole fits provided by each of these standards is shown in Table 2.

### American Tentative Standard B4a—1925

This standard provided only eight classes of fit, four clearance fits, two transition fits, and two interference fits. These are shown in Fig. 7, and a comparison with Fig. 6 will indicate the serious lack of fits in this respect. These fits were all on a basic-hole system, with no provision for other hole-basis or shaft-basis fits. They covered a range of zero to 8½ inches, except that heavy force and shrink fits were extended up to 136 inches.

The formulae used were simple, but for this reason failed to some extent to maintain the same quality level or operating characteristics throughout the range of sizes for any one class. Thus it failed to meet Criteria Nos. 1, 2 and 4 in particular, and to some extent Nos. 5 and 7 also. It also failed to give preferred sizes and tolerance values, or a series of grades of tolerance for general use.

It seems fair to say that this tentative standard was never accepted by American Industry, it has been little used, and was therefore abandoned in 1947, when it was decided to work on a new standard. It was an attempt at simplification of the problem, but resulted in over-simplification to the extent that there was not sufficient choice of fits to meet the needs of industry. Moreover, it lacked the flexibility necessary to provide special fits for special applications.

### British Standard BS164—1924

This British standard has been widely used in Great Britain since it was published in 1924, but has had to share its position with the Newall system, which is more simple, and more recently with the ISO system, which is somewhat more comprehensive.

It is based on the system of providing a series of holes and shafts, from which numerous fits can be produced. There are 4 holes with unilateral tolerances, 4 holes with bilaterial tolerances, 3 oversize holes, and a series of 14 shafts. Any of these holes and shafts can be combined, but the fits produced with unilateral holes are not the same as those produced with bilateral or oversize holes. No provision is made for shaft-basis fits, and no preferred basic sizes or tolerances are given.

If we consider only the fits in the basic-hole system of which there are 56 possible combinations, as shown in Table 3, we find that only 26 can be used to form a useful series of fits. These are shown in Fig. 8. The other 30 combinations are of no practical value, because they are either too close to the fits shown in Fig. 8, or because the tolerances on one part would be too precise or too coarse for the allowance and tolerance on the mating part. At the same time, a comparison between Figs. 6 and 8 shows that there are several gaps, for which no suitable fits exist in BS164.

Thus this standard fails to meet Criteria Nos. 1 and 6; it also fails to meet No. 2, because it covers the range only up to 25 inches; it fails to meet Nos. 3 and 4 because there is only one formula, which is not completely satisfactory for tolerances, yet it also has to serve for clearances and interferences for all classes of fit. It fails to meet No. 7, because little or no guidance is given for specific applications.

### Newall System

The Newall System is a very simple one, which has been used to a small extent in Great Britain. It is a bilateral hole-basis system, in which the tolerances and allowances can be reversed if desired to produce a bilateral shaft-basis system. There are two standard holes, and six standard shafts. Fits are produced by using either of the holes with any one of the shafts, thus producing a total of only 12 fits.

This standard therefore fails to meet Criterion No. 1, because there are insufficient fits in the system. For this reason it covers only a very

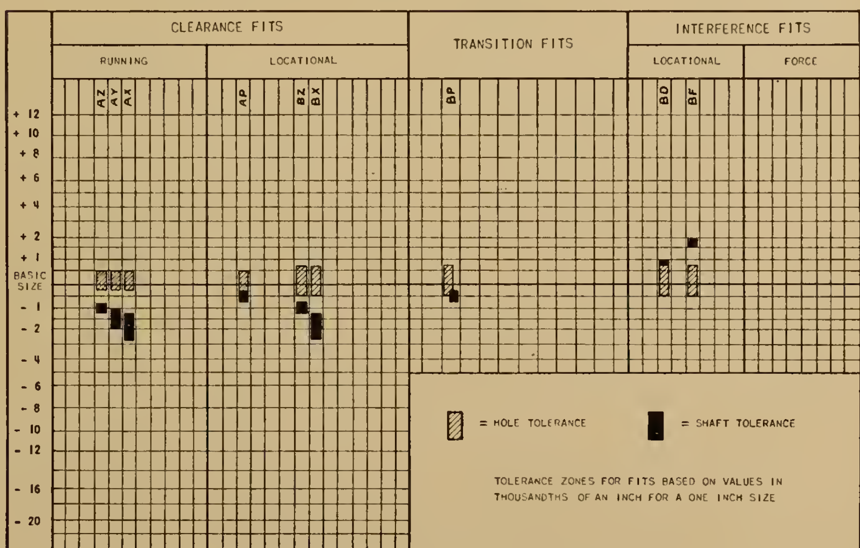

**Fig. 9. Fits in the Newall System**

There are three other fits in the Newall system, but they are very similar to fits shown above, and do not help to fill in the gap between this chart and Figure 6. Note that hole tolerances are all bilateral; there are no basic holes in this system.

limited field, and does not begin to be adequate as a general engineering standard. It also does not meet Criterion No. 2, because it only covers a range up to 12 inches.

It fails to meet Criteria Nos. 3 and 4 because it is not based on logical formulae, and each grade or class does not represent similar quality or operating performance throughout the range of sizes. It even fails to meet Criterion No. 6, because although there are 12 fits in the system, only 9 of these are needed for the limited range covered by the standard, as shown in Fig. 9, the other 3 being too close to one or other of these nine fits to be of any practical value.

### ISO System

The ISA Standard, which was developed between 1926 and 1940, and published as ISA Bulletin No. 25 in January 1941, was taken over by the International Standards Organization following World War II, and is now known as the ISO system. It is the most comprehensive of the older standards, and was intended to cover the needs of all conceivable applications within its size limitations.

It is based on a series of 16 grades of tolerance, of which about half are suitable for fits, the balance being either very precise, and intended for gage work, or very coarse tolerances for purposes other than fits. It includes a series of 21 holes, each with a different allowance, which can be made in any one of the tolerance grades; and a similar series of 21 shafts.

This permits fits to be produced in an almost limitless number of combinations (actually over 100,000), either on a hole or a shaft basis, although the basic hole system is referred to as the preferred method. This multiplicity of possible combinations, or fits, has caused much confusion in attempts to use the system. In most cases the reaction has been to reject the system as being too complex without giving it further study.

However, it should be realized that many of the combinations give identical fits; that many are quite impractical and would never be considered; and that it was intended that each industry or user would select a few fits suitable for their particular needs, and standardize on these fits. Some attempt has been made to give preferred holes and shafts, but the resulting number of fits is still more than necessary.

The ISO system therefore meets Criterion No. 1 fairly well; and also

These fits are illustrated in Figures 6 to 9. Fits shown in the British standard BS 1916 are identical with corresponding fits in Canadian standard B97. Other fits are nearest equivalents.

*Fits shown with an asterisk are not included in the tables of the standard fits, and have to be derived as explained in the appendix to the standard.

**Table 6—Description of Running Fits.**

As described in Canadian Standard B97—1954

Running and Sliding Fits

Running and sliding fits represent a special type of clearance fit. These are intended to provide a similar running performance, with suitable lubrication allowance, throughout the range of sizes. The clearances for the first two classes, used chiefly as slide fits, increase more slowly with diameter than the other classes, so that accurate location is maintained even at the expense of free relative motion.

These fits may be described briefly as follows:

RC 1 Close Sliding Fits are intended for the accurate location of parts which must assemble without perceptible play.

RC 2 Sliding Fits are intended for accurate location, but with greater maximum clearance than class RC 1. Parts made to this fit move and turn easily but are not intended to run freely, and in the larger sizes may seize with small temperature changes.

RC 3 Precision Running Fits are about closest fits which can be expected to run freely, and are intended for precision work at slow speeds and light journal pressures, but are not suitable where appreciable temperature differences are likely to be encountered.

RC 4 Close Running Fits are intended chiefly for running fits on accurate machinery with moderate surface speeds and journal pressures, where accurate location and minimum play is desired.

RC 5, RC 6 Medium Running Fits are intended for higher running speeds and/or for heavy journal pressures.

RC 7 Free Running Fits are intended for use where accuracy is not essential, and/or where large temperature variations are likely to be encountered.

RC 8, RC 9 Loose Running Fits are intended for use where materials made to commercial tolerances are involved such as cold rolled shafting, tubing, etc.

Criterion No. 3, because values are based on logical formulae. It fails to meet Criterion No. 4, because the formulae cannot be used to extend the ranges satisfactorily from zero to say 200 inches, although they have been used to establish some of the values in the Unified Standards.

The system also fails to meet Criterion No. 2, because the range covered is only .04 to 19.69 inches. Yet ISO have already reached some measure of agreement on values below .04 and over 20 inches, and these will no doubt be incorporated in the ISO standard within the next few years. It also fails to meet No. 6, because of the multiplicity of fits as mentioned above; and No. 7 because the system gives very little guidance in the choice of fits for specific applications.

### ABC Agreements

The general acceptance of any one of these systems would have resulted in reaping some of the benefits of standardization, but none of them are entirely satisfactory as a unified standard for the reasons already explained.

These deficiencies were recognized by the standardizing bodies of the ABC countries when discussions were started during World War II. The ground work was laid for a new series of national standards at the Conference for the Unification of Engineering Standards (where the Unified Screw Thread was born), held at Ottawa in 1945.

Subsequent work and study resulted in a draft for a complete new standard by the Canadian committee in 1950, which overcame practically all of the objections of the older systems, and met the ideals set up by the committee. This standard represented an entirely new system.

It was then agreed however, that as the ISO system contained such a wide range of tolerances, holes, and shafts, and was so extensively used in other parts of the world, it should be possible to select suitable values from this range to meet at least some of the requirements of the new standards. While the new standards might be set up in an entirely different manner, the final hole and shaft limits for any particular fit would then agree closely with standard limits in the ISO system.

After further study by the three countries, agreement was finally reached on a series of values and other technical details, and this agreement was adopted at an ABC Conference in New York in February 1953.

It was found that the ISO formulae were more simple than those developed by the Canadian Committee. While they could not be used to cover the complete range desired, they were reasonably satisfactory for a limited range. This limited range is covered by the agreements, and modified formulae are used to extend the ranges beyond these limits.

The ABC Agreement includes the following:

1. A series of preferred basic sizes from 0 to 20 inches.
2. A series of preferred tolerance values from .0001 to .060 inches.
3. A series of definitions applying to limits and fits.
4. A graded series of fundamental tolerances, covering the range from .04 to 19.69 inches.
5. A series of 8 running fits, covering the range .04 to 9.85 inches, and 19 other fits covering the range .04 to 19.69 inches.
6. A series of hole and shaft limits, given in an appendix, from which other special fits can be derived.

It is intended that these technical details will form the basis of each of the three national standards, but each of the countries is free to extend the range of sizes, or to add other fits and further data as desired.

### The New Unified Standards

The American committee B4 have not yet completed their new standard, but when published it will undoubtedly be along similar lines to the Canadian Standard.

The new British Standard BS1916—1953 was published last year. This standard is based on the method of providing a series of standard holes and shafts, which are then combined to produce various fits. It is thus similar to the ISO system and uses the same symbol system. However, all of the fits in the ABC agreements can be pro-

Hole and Shaft limits are applied algebraically to the basic size to obtain the limits of size for the parts. All dimensions are in inches.

duced in this manner, as well as numerous additional fits.

The new Canadian Standard B97-1954 is essentially the same as the draft of the new standard drawn up in 1950, but with values and other details adjusted in conformity with the ABC agreements. It includes all of the fits in the agreements, plus a few additional ones to more adequately cover the field. The range has been extended up to 200 inches. The basic hole system has been adopted as standard, and the tables are based on this system. Rules and designation symbols are included for identical fits on (1) a bilateral hole basis, (2) a basic shaft system, and (3) matched assembly fits, as well as other special fits.

Let us therefore look in more detail at the main provisions of this standard, which are as follows:

1. A series of definitions, as agreed at the ABC conference in 1945.
2. The ABC series of preferred basic sizes, from which the basic size of mating parts should be chosen. These are given in Table 3.
3. A series of basic tolerances and allowances, as given in Table 4.
4. A series of standard fits, of the five types described in the discussion of Criterion No. 1. The number of classes of fit of each of these types provided in the standard are shown in Table 2A. Equivalent fits in the other standards are shown in Table 5.
5. A description of the standard fits, which aids in the selection of suitable fits for specific applications. The descriptions of running fits from the CSA standard are reproduced in Table 6.
6. Tables of limits for all of the standard fits, showing the limits of clearance or interference, and the tolerance limits for the holes and shafts. A portion of these tables are given in Table 7, Running Fits, and Table 8, Force or Shrink Fits.
7. The standard also gives a table of grades of tolerances, a table showing grades produced by various machining processes, and in the appendixes, (A) a table of standard limits for holes and shafts, (B) corresponding fits in the Canadian and British standards, and (C) Derivation and formulae for allowances and tolerances.

#### Using the Standard

The designer, in selecting a fit for a certain application would proceed as follows. First, he would establish the basic size, giving preference to values in the table of preferred sizes, (Table 3). We will consider that 1 in. is chosen, and that a mechanism is being designed which must run freely, yet must have very small bearing play. The designer looks over the descriptions of running fits, and probably with some experience with other similar mechanisms, he chooses a close running fit, RC4.

On his design sketch, or specification, he merely writes 1 in.-RC4, referring to the assembled bearing and shaft, as shown in Figure 10, or as shown for other examples in Figure 11. Or, if he wishes to use bilateral holes, or a basic shaft fit,

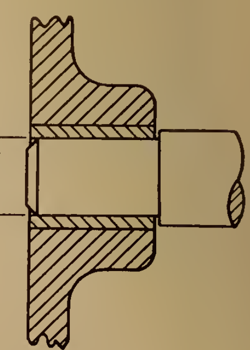

Fig. 10. Design sketch for an RC4 running fit.

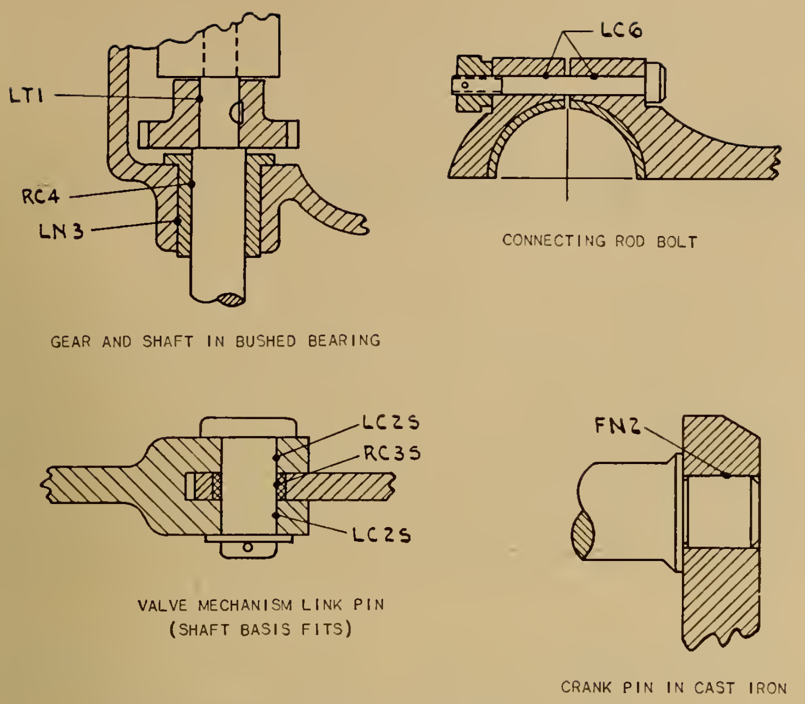

**Fig. 11. Typical design sketches using the new fits.**

he can specify exactly the same fit in either of these systems by writing 1 in.-RC4B or 1 in.-RC4S respectively, as explained in the standard for modified fits.

Next, the draftsman, in making the drawings of the individual parts, looks up the table in the standard (see Table 7) and finds that the hole limits are − 0 + .0008, and the shaft limits − .0008 − .0016. Therefore on the part drawings he specifies: Hole 1.0000 in. + .0008 in. and Shaft .9992 in. − .0008 in.

The toolmaker or producer makes the parts to these limits, knowing that the desired fit will then be automatically produced. Moreover, as the 1 in. + .0008 in. hole, which is a basic hole with a grade 6 tolerance, is also used for 12 other fits in this standard, he most likely has a standard plug gage of this size with which the hole can be checked. That is all there is to it!

This review may have seemed somewhat complicated, but it merely illustrates the complexities that had to be studied by the committees, and which have been built into the standard. Using the standard is an entirely different matter, for it has been designed to meet all of the general requirements of industry, yet has been made as simple to use as standards engineers have been able to contrive. √

---

## Rotary Wing Aircraft Development

(*Continued from page 575*)

in progress convertible aircraft design studies by three major firms. The latest reports indicate good possibilities that prototype construction and experimental test flying of all three may follow the studies.

A convertible aircraft may assume a variety of design forms, but of these two essentially different types have received most consideration. In each of these and in keeping with the definition, there would be sufficient fixed wing area to provide most, if not all, of the lifting force at forward cruising speed. Two are (1) those with a rotating-wing system which either becomes an idling or stopped rotor, a fixed wing or a retractable rotor. In any of these the forward thrust is provided by a device other than the lifting rotor, and (2) those with a rotor system adapted for 90° shaft rotation to provide forward thrust in level flight.

The pros and cons of the many possible variants of convertible aircraft design contain subject matter for volumes of discussion and interesting though the subject may be, this particular discussion can only be an introduction to an intriguing possibility that remains to be explored and exploited.

### Rotary Wing Aircraft Future Possibilities

An historical summary such as this can touch only upon the high spots of a subject, and must bypass some of the interesting controversial items. The review indicates that in spite of very early efforts, the rotary wing craft has achieved some measure of success and public interest in only the last 10 to 15 years. It is intriguing, then, to speculate as to what the future may hold for this class of air vehicle.

It may be expected that the military services will expand their respective fields of operation with rotary wing aircraft and will be the means of encouraging development of all the promising variants in design. Civil application will grow rapidly along the line of the experimental postal service pattern already set by operations in the United States and abroad.

Short line commuter service is just now beginning under restricted operational conditions and will grow rapidly as more efficient and multi-engine machines become available. The airport to city center operation must follow. The large multi-engine types considered necessary before civil scheduled passenger operation can become a reality is on the horizon.

The old tried and true reciprocating engines may power early civil models, but turbine type engines are bound to find application to rotary wing craft because of inherent advantages.

The compound helicopter, with some fixed wing in addition to the rotor or rotors, constitutes the most likely configuration for craft requiring higher cruising speeds and greater ranges. It seems likely that the further development of this type will be along the lines of turbo-prop engines for forward propulsion propellers with engine compressor air bleed for pressure-jet rotor tip drive for the take-off, approach and landing portions of the flight. This is the approach to the convertible aircraft which, too, will have its application.

The future of rotary wing aircraft presents an attractive picture, and plenty of interesting, difficult work. The goals are worth attaining. √

# THE ASME BOILER CODE

In the July 1952 issue of *Mechanical Engineering*, the ASME commenced publication in serial form, of a history of events leading up to the present ASME Boiler Code, from the first development of boilers in the 18th Century. This history, continued through some ten issues, was prepared by Arthur M. Green, Jr., of Princeton University.

As a preface to the regular publication in current issues of *The Engineering Journal*, of Boiler Code Regulations, this history has been presented in condensed form. It has appeared in several issues of the *Journal*, of which this is the last.

## VI. Times of National Emergency and War, 1941-43

#### Fusion Welding of Copper

So many difficulties were encountered in arranging revisions to Paras. U-67, U-69(b) and (e) U-70(a) and (e) and U-71(a) on welding of copper and copper alloys, that in May, 1941, it was recommended they be withheld. Interpretations for metals most needed at that time, namely monel metal and deoxidized copper, were recommended, and inquiries and replies were formulated, referring to Paras. U-69 and U-70. Cases 934 and 935 were formally approved in June, 1941.

#### Standard Qualification Procedure —Section IX

The American Welding Society adopted the Standard Qualification Procedure in April, 1941, and at the Boiler Code Committee meeting of May, 1941, differences were brought to its attention. A Special Committee recommended adoption in June. Its progress report was accepted and the final form was then referred to the Executive Committee, with power to act. The final form was adopted in August, 1941, as Section IX of the Code, to replace the rules which had existed. Due to certain changes in tables and diagrams, an interpretation was prepared which would be published, permitting optional use of Section IX in place of the Appendix and certain paragraphs of the Code.

#### Penetrameter Setting

The General Fire Extinguisher Co., which found difficulty in placing a penatrameter inside small pipes in radiographing joints with the capsule inside the pipe, appealed in September, 1941, the refusal of permission to place the instrument on the outside of the pipe beneath the film. With approval of the Special Committee on Radiographic Examination, the Boiler Code Committee permitted the penetrameter to be placed on the film side of the pipe joints, provided certain requirements were satisfied.

Due to a great number of gammagraphs of welded pipes having irregularities which had a definite effect on the image of the hole, it was recommended to enlarge the small holes to 3/32 for gamma rays. The reply (Case 976) permitted this for use with gamma rays, since the 1/16 hole was intended for X-rays.

#### Tube Holes Through Welds

In May, 1942, on recommendation of the Special Committee to report on Tube-Holes through Welds, Case 850, permitting tube holes within ¼ inch of the welds, was annulled. Recommendation was made that permission be granted to place tube-holes in welds. This (Case 971) formed the basis for new wording of Paras. 105-C and U-74 as they appeared in the 1943 editions. The minutes of the Boiler Code Committee for September 11, 1942, stated that the Executive Committee had approved the report of the Special Committee on the Insertion of Tube Holes through Welds of Boiler Drums submitted in June, and they considered Case 971 should be released without further action.

#### Revision of Section VIII

Discussion took place in January, 1942, on the need for revision of Section VIII, on the perplexing problems resulting from the two Codes for Unfired Pressure Vessels, (ASME and API-ASME), war conditions, and the need of time by the Committee and industry to reorganize, clarify and simplify the rules. The Committee voted that, in view of the existing emergency, the proposed revision of Section VIII be received as a progress report, and distribution be limited to the Committee. The Conference Committee reconsidered their former action of January, and changed it to permit distribution to those who requested a copy of the report. In March the Executive Committee annulled former action, and voted that a notice be published in Mechanical Engineering that the draft was ready for distribution, a 60-day limit being set for criticism.

#### Banded Pressure Vessels

A new design of pressure vessel for extremely high working pressures was presented to the Executive Committee in August, 1941, by the Babcock & Wilcox Co. Eleven such vessels were in service and four were being built for use in Pennsylvania. All were approved by State authorities. The Company asked if these vessels met Code requirements and, if so, asked that they might be stamped with the Code symbol. The Executive Committee voted that the vessels might be stamped under provisions of Paras. U-1(b) and U-69.

This action was announced to the Committee in September, 1941, and an interpretation of an inquiry was suggested by the Executive Committee. A Special Committee was appointed to consider this case in relation to other forms of banded vessels, as well as other variations. The Special Committee to formulate the reply covering vessels built by Babcock & Wilcox and the A. O. Smith Corp., pointed out that since pressure limits had not been increased, and as the pressure on the larger vessels exceeded the upper limit of Section VIII, the Special Committee should be discharged. The Executive Session later decided to recommend to the open session the same day that a new Special Committee be approved.

The rules were again considered in October, 1943, and the Special Committee reported no agreement had been reached. They believed the whole question should be considered by the main Committee. After discussion, prestressing was approved, and the question of temperature variation was decided to be the same as in solid vessels. Members were invited to communicate criticisms to the Special Committee. This completed the work reported on Rules for Layer or Banded Vessels for 1943.

#### Welded Locomotive Boilers

It will be recalled that the construction of an experimental welded locomotive, authorized by the ICC for the D. and H. Railroad Co., was reported in April 1937. The granting of permission was accompanied by provisions; (1) approval by the Mechanical Division of the Association of American Railroads (2) welded boiler to be tested under ASME Code for Welded Boilers (3) operation as a stationary boiler for six weeks (4) when in locomotive service, welded joints to be inspected every three months the first year, every 6 months the second year, etc. (5) no other welded boiler to be used in railway operation till experimental boiler was proved satisfactory.

The Committee on Locomotive Construction had been asked in July, 1935, to consult locomotive builders as to inauguration of a preliminary study on the merits of fusion-welded locomotives for general use. A Committee representing the D. and H. Ry., the Boiler Code Committee, and a number of locomotive manufacturers met in January, 1936, and approved the design, later submitting it to the Bureau of Locomotive Inspection of the ICC. The latter agreed to approve construction.

The boiler was built by the American Locomotive Co., and after passing all the prescribed tests was put into service. After seven years of service no defects had developed. At the Committee Meeting of October, 1941, it was announced that such construction met the intent of the Code. The inquiry and reply (Case 951) was approved by letter ballot. In February 1941, rules were proposed for welding of locomotive boilers which had been submitted to the Committee and to the Subcommittee on Boilers for Locomotives. The rules consisted of fifteen paragraphs, L-101 to L-115. Later, Para. L-116 was added.

#### Welded-in Staybolts

Changes were proposed in provisions of the Code for welded-in staybolts, as well as plug and slot-welded stay plates, by the Subcommittee on Unfired Pressure Vessels, in April, 1942. These included Para. U-41(b) and (c). These changes were approved.

#### Miscellaneous Welding Details

In February, 1942, headers of superheaters, water walls and economizers were included in Para. P-112 and structures for fusion-welding of circumferential joints. The Hammer Test required by Paras. P-109 and U-77 on the joints of X-rayed fusion-welded vessels was deleted from Para. P-109, and waived in Para. U-77. Backing ring requirements for circumferentially welded seams of pipes were discussed at the Committee Meeting of June 1941. Revisions of September and December, 1941, were adopted. Suggested revisions for qualifications for operators were dropped by action of the Executive Committee in August, 1943.

The welding of dissimilar metals was considered in February, 1942, and the inquiry and permissive reply were referred to the AWS Conference Committee for review. The report was approved in May, 1942, as Case 972, permitting fusion-welding of two Code metals if procedure and operators were qualified under Section IX and all tests had been applied.

A revised copy of Rules for Repairs by Fusion-Welding was reported at the November, 1940, meeting of the Committee, and further revised in March, 1941. The revised rules were considered liberal, but the Special Committee was prepared to sanction work being done without rules, if they did not conflict with the Code. The Committee voted that the Rules were suitable for the purpose intended.

In January, 1943, Qualifications for Procedure of Machine Welding and Welding Operators was discussed relative to Case 992, as Section IX referred to manual welding. The Committee voted to refer the subject of machine welding qualifications under Section IX to the Subcommittee on Welding and the AWS Conference Committee. Oxyacetylene pressure welding was proposed in March, 1942, in an inquiry from Alco Products, in which the metal plates were pressed together and brought to a plastic condition for welding. In June, 1942, the inquiry and reply were altered and the final revised inquiry and reply to this Case 973 were approved. The use of air for testing certain riveted vessels by Para. U-64(b) was discussed in March, 1942, and the extension to welded vessels to be tested under Para. U-77 was developed. This resulted in Para. U-64(f) for the use of air in testing vessels which could not resist the weight of water for the hydrostatic test.

#### Section IX—Welding Qualifications—1941 Edition

Section IX was issued in December, 1941, as a book of 48 pages without index. It limited its scope to manual applications of arc- and gas-welding processes with those ferrous metals which in their unwelded condition would meet the requirements of the prescribed guided-bend test. It assumed the manufacturer or contractor had an organization familiar with the various welding codes, and was capable of designing, engineering and supervising welded construction.

Part I, Procedure Qualifications, contained Paras. Q-101 to Q-110. Part II, Operator Qualifications, included Paras. Q-201 to Q-212. Table Q-5, Grouping of Materials for Procedure, was rearranged and enlarged from that of the 1940 edition, Table VA-8. The so-called Appendix, Recommended Forms of Procedure Specifications, referred to Carbon Arc Welding, Metal Arc Welding and Oxyacetylene processes. Specification S-63 (later SA-233), Iron and Steel Arc Welding Electrodes, ASTM-A-233-40T, listed ten different classes of electrodes to be used in different welding positions with their tensile strengths and elongations, with and without stress-relief. This S-63 was the first real specification for weld metal used in the ASME Boiler Code.

In this Section IX, figures Q-1(a) to Q-27 were given with no text matter, and were arranged to show forms of the different test specimens and their preparation. In the 1940 Edition these figures had been scattered throughout the Appendix. The "groove" weld of Section IX was the "butt" weld of the 1940 edition.

#### Miscellaneous—Safety Valves

At the meeting of January, 1941, of the Special Committee on Safety Valve Requirements, it was decided to ask water relief valve manufacturers to co-operate for agreement on data which they could supply for determining requirements for valves in the Code. The Revisions of safety valve requirements of the Heating Boiler Code were approved for publication in June, 1941. They were changed and reported together with changes for water relief valves in September 1951. Minor changes were made in February and May, 1942, before issuance of the Section in September 1943.

#### Department of Justice, Para. P-322.

The inquiry into precedures of the Boiler Code Committee by the U.S. Department of Justice, mentioned in a previous instalment, resulted in a number of conferences during the early part of 1941. In February three members of the Committee met at Washington with two Dept. of Justice officials. The investigation had resulted from complaints that the Code restricted inspection to insurance companies, and from reports that some of these had declined to make inspection for certain small manufacturers.

The visitors stated they had never heard of a refusal for such a reason. The Department had been informed that the Code was State law in some cases. The requirement of the Code was then explained, as well as the requirements of the first model laws of Massachusetts in 1909 and 1913. The Department officials made certain suggestions for changes in the Code, and various aspects of the situation were discussed. The Code members gave assurance that the Committee would give careful consideration to the Department's recommendations.

#### Shop Inspection

A special meeting of the Committee for discussing shop inspection was held in March, 1941, with members of the Conference Committee present. Two questions were presented: (a) whether inspection laboratories should be permitted to authorize application of the Code Symbol to a Code pressure vessel, and (b) whether inspectors in the employ of owners or purchasers should be so authorized.

A summing up of predominating opinion of those present was:

(1) Inspection must be provided so the Code Symbol would retain significance.

(2) Prevention of use of the Symbol by others than those authorized to maintain at least present standards of inspection.

(3) Retention by the Committee of authority to delegate or rescind power to other groups to qualify and appoint inspectors.

(4) Establishment of requirements that must be fulfilled before an inspector could be employed to inspect and authorize use of the Symbol.

(5) Action to be taken to delegate to the National Board the power to qualify and appoint inspectors under procedures established under item (4).

A joint special meeting of members of the Boiler Code Committee and the Conference Committee, and 16 guests and non-committee members of Subcommittees, was held in May, 1941, to consider a revision of Para. P-332(b), Inspectors, which would include inspecting corporations under certain provisions, including the paragraph requiring qualification by examination.

Supervisors of inspection for Cities and States indicated their problems, and members from the petroleum industry gave their experiences and opinions regarding inspection. The main trend of opinion seemed to favor retention of the present requirement. After discussion it was announced the subject of revision would be studied by the Committee.

#### Department of Justice

At a summer meeting in August, 1941, of the Executive Committee, a slightly modified formulation of different parts of Para. P-322, Inspection, Data Reports, and Stamping, approved by the Committee, was presented and approved. This was in the form published in the 1943 edition of Section I. In October 1941, a letter was presented by the Secretary of the ASME, Mr. C. E. Davies, stating that on September 22, Fowler Hamilton and Walter Powell of the Department of Justice had met with him and read the letters of the Committee. In response to his request for advice as to the next step, they stated that they would close their file by writing a memorandum of the conference, saying there seemed no need for further action. The Case, Mr. Davies, said, could therefore be considered closed.

#### Special Committee on Rules for Dished Heads

Following discussion of Case 892, a new Special Committee on Dished Heads was appointed in May, 1940. The Committee commenced to set up formulas for heads in December, 1940, and reported some to them in February, 1941, and in October, 1942. Members at the latter meeting expressed the view that actions on revisions should be based on tests and not solely on theory. Others stated they believed the present rules were perfectly safe. No action was taken to change the Code rules, however, Para. U-75 was amended in March, 1943.

A letter from F. A. Page of California in September, 1941, asked permission to use spherically dished heads, attaching a ring to give proper thickness for bolting. After discussion, Mr. Page was advised that the construction was possible under the rules, and that a Special Committee would prepare the rules. In October, 1942, an inquiry and reply for a proposed case was reported, giving shapes and methods of forming three such heads. Although no action was taken at the meeting, members were asked to study the report before the next meeting in December. After deferring action in January and February, the report for spherically dished heads was adopted with several modifications in March, 1943, and became Case 997.

#### Federal Housing Administration

Following many questions asked by the Federal Housing Administration about elements of the Code for Low Pressure Heating Boilers, R. K. Thulman of the Authority expressed the view before the meeting of January, 1941, that, while the FHA wished to keep quality good, any code specified should be very flexible. The Committee replied that it did not approve any manufacturer, but merely formulated rules that the manufacturer must adhere to.

Replying to inquiries of March and June, 1941, from the FHA, the Subcommittee on Heating Boilers replied that: (1) The Code Committee could not undertake to investigate individual designs, (2) The Committee had not the personnel or funds to investigate non-Code steel heating boilers, (3) The Code did make a difference between tube and plate construction, and (4) separate sections were not made on small boilers, as design was largely independent of boiler size. These replies were approved for transmittal to the FHA. In September, 1941, the Committee pointed out that the Code should be amended to cover their questions, or a separate Code covering boilers for residences only would be necessary. This was referred to the Executive Committee.

### Allowance for Static Head

The effect of static head with relief valves near the lower levels of a boiler or vessel containing liquids was considered in February, 1941. This led to the addition of Para. U-2(b), calling for valves to be placed in the vapor space, while additional valves might be placed below the liquid level and set at a higher pressure. Para. U-19(a) was amended to define maximum working pressure as maximum pressure at the top of the vessel in its normal position.

### Boiler Assembly in the Field

An inquiry regarding the application of the Code Symbol Stamp (Case 944) was considered by the Committee in September, 1941. This was referred to a Special Committee, and was discussed in August, September and December of 1941, and again in February and March, 1942. In March, 1942, the form of approved reply authorized the use of a special assembly, stamp or use of the regular Code stamp by one who held such, with certain other provisions.

After further discussions with the Special Committee in January and February, 1943, regarding questions and replies, Instructions to Holders of Assembler Code Symbol Stamps were approved in September, 1943. The important parts were: (1)when erection was supervised by the manufacturer during erection and the erector was only the supplier of labor, the erector need not fill out any paper. (2) When a knocked-down boiler was supplied complete by one manufacturer and assembly was by an independent agency, the manufacturer would furnish complete data reports except regarding hydrostatic tests, which would be filled in by the assembler. (3) The manufacturer of parts would execute the data reports and apply the proper Code Symbol stamp in the shop to the parts. The manufacturer of other parts must supply data sheets to be placed on master data reports (4) after completion of hydrostatic test the Stamp would be applied after authorization of a qualified inspector, and (5) the assembler would obtain the required data reports for distribution to the proper parties.

### Special Laboratories for Testing Safety Valves

Tests for relieving capacities for safety valves were performed at the Ohio State University. In October, 1942, the Manning Maxwell and Moore Laboratory was approved for testing valves up to 25,000 lb. per hour and 600 p.s.i. The approval of the Crane Company laboratory was referred to the Executive Committee and to the Special Committee on Safety Valve Requirements.

### Safety Heads with Relief Valves

A letter relating to the location of a safety head beneath the relief valve was presented to the Committee in October, 1941. The installation proposed was for use on a dipthenyl oxide (Dowtherm) vaporizer. The question related to the ability of such an arrangement to meet Code requirements for Power Boilers and Unfired Pressure Vessels. After discussion, the matter was referred to a Special Committee for further study and conference with the proponents.

The Special Committee reported in March, 1942, that it had endeavored to provide interconnections between valves and safety heads, and revisions of safety valve requirements, to accomplish this. Following an investigation with various chemical companies, the Special Committee pointed out in September, 1942, that the Codes had made no distinction between vessels, contents of which were harmless, and those of a toxic or inflammable nature. Their report suggested that the emergency relief device be considered in one of four stated ways, and proposed changing the number of Para. U-10 to U-9 and adding a new Para. U-10 providing for emergency pressure relief.

Further discussion occurred in October, 1942. The National Board of Boiler and Pressure Vessel Inspectors had expressed the opinion that the head might be used as a supplementary protective device if the vessel had the regular Para. U-2 safety devices. The subject was again referred to the Special Committee and the Special Committee on Safety Valve requirements.

### Vessels Under External Pressure

That some low pressure vessels under internal pressure may become subject to external pressure under condensation of their contents, was brought before the Committee in October, 1941. This question together with the out-of-roundness requirement was referred to the Special Research Committee on Vessels under External Pressure. This special committee reported in March, 1942, that out-of-roundness limits should remain unchanged, and later, that no further work could be done on the chart of Fig. U-19, other than to plan an addition for the so-called Revision of Section VIII. It suggested use of a safety factor of 4. Many vacuum vessels were then being built with a safety factor of 5. Figure U-19 appeared as Fig. U-22 in the 1943 edition for the same metals, except for two which had been removed from Section II.

### Rules for Bolted Flange Connections

Revision of the Rules for Bolted Flange Connections of the 1940 edition, Paras. U-18 to U-24, were reported by the Special Committee in December, 1941, after careful study. It was published in "*Mechanical Engineering*" for February 1942. The Special Committee met in March, 1942, but there was so much disagreement that further reports were held up until agreement could be obtained. In September, 1942, revised and new paragraphs were presented, and Paras. UA-18 to UA-24 were approved. New rules contained enlarged Paras. UA-18 and UA-19. Changes or additions were made in Paras. UA-20, UA-21, UA-28, UA-23 and UA-24.

### Rules for Pressure Piping

The fact that in limiting the application of the Code "to pipe connections up to and including valves required by the Code", which now included practically all the main steam piping, was called to the attention of the Committee in October, 1941, by the Pipe Fabrication Institute. The Institute's Executive Committee formally asked the Boiler Code Committee to amend its rules, and to accept the American Standard Code for Pressure Piping as authority for the whole field of piping. A letter of suitable reply with mention of co-operation was authorized, copy to be sent to the National Board.

A letter from the National Board of Boiler and Pressure Vessel Inspectors was presented in February, 1942, commenting on the letter to the Institute, and suggesting that the situation would be clarified by revising the Code so that valves on each outlet of a boiler would not be necessary. Further conferences were suggested with the ASA Sectional Committee B-31, in an endeavor to eliminate differences of opinion. It was also suggested that the Pipe Fabrication Institute and Sectional Committee B-31 should appoint representatives to confer with the Boiler Code Committee, to consider the whole question of feed piping. The Committee voted to take no further action on the National Board's suggestion, but to consider the suggestion of further conferences and the conference of representatives to consider feed piping.

A Report comparing the provisions of the ASME Code and the ASA Code for pressure piping was presented to the Committee in September, 1942. In February, 1943, the Committee voted to drop the matter of co-ordinating the two Codes. At the Executive Session of March, 1943, the Executive Committee recommended the appointment of certain committee members to a joint ASME-ASA Co-ordinating Committee on the design of pressure parts common to their codes and standards.

A Conference on Rules for Piping, Valves and Fittings was held at the Committee meeting of June, 1943, between it and representatives of the Stone and Webster Engineering Corporation and the Associated Factories Mutual Insurance Co. After hearing from the guests the Committee discussed the matter, and it was mentioned that a Joint Conference Committee on Piping Codes and Standards had been formed. The Committee took no action at this meeting.

### Separately Fired Superheaters

In Case 991 reconsidered in January, 1943, the Committee gave its opinion that separately fired superheaters, not integral with a boiler, were fired pressure vessels and within the scope of code requirements from inlet to outlet flange, including all piping valves and safety devices. No stop valve was required at the outlet of such superheaters.

### Work of the Boiler Code Committee

The Special Committee on the Work of the Boiler Code Committee reported in February, 1942. Its report followed in general that discussed in a previous chapter. It gave the results of its study of the complaint about the great number of addenda and interpretations since issuance of the 1931 edition of the new Welding Rules, and recommended that these be continued as the needs of the industry indicated, but that an effort be made to restrict them to a minimum to meet the need.

It also made suggestions for more efficient conduct of meetings and work of the Committee, and suggested improvements in relation to procedure, committee reports, interpretations, revisions, hearings and meetings. Its report contained standard forms of letters of reply to indefinite questions, semi-commercial questions, and to requests for approval of designs. The Special Committee also reported on the membership of certain committees, and recommended the dropping of certain members who did not attend meetings.

### Shells, Tubes and Pipes

Paras. P-180(a) and U-20, dealing with thickness of shells for internal pressure, were considered for revision in April, 1941, because of Case 899. Para. U-20(c) became para. U-20(e). A new Section was added, Non-Ferrous Tubes and Pipe, External Pressure. The transfer of the Lamé formula equivalent from Para. P-180(b) as item (2) of Para. U-20(a) was suggested at the March meeting. A Special Committee was appointed to study the simplified formula presented by Mr. Boardman.

Three different recommendations were referred to a Special Committee. This Special Committee reported that Paras. P-14 and U-14 should be identical, and that Para. 180(a) should remain unchanged as far as the lamé formula was concerned. In July, 1942, as polling of the main Committee members showed that on none of the revisions of Paras. P-180(a), (b), Paras. U-20(a) and (b) and U-78(g) were a majority in favor of them. This indicated that changes should be made. In April, 1942, a new Para. U-20(b) on Spherical Shells was adopted with a formula for the determination of thickness. This was approved by Committee action in June, 1943.

### Action of War Production Board

In March, 1942, WPB Limitation order L-42 Schedule III (B) (3) required elimination of gage cocks, and in May the Committee advised the Plumbing and Heating Section of the Board that two or more gage cocks were necessary on heating boilers to determine the water level in case the water glass was broken (Paras. H-62 and H-115). The ASME did not feel justified in allowing their symbol on boilers not so equipped. In June, 1942, the Simplification Branch, Bureau of Conservation, W.P.B., contended the Code required piping and valves of feedwater lines to be of American Standard for 25 per cent in excess of maximum allowable pressure. The Chairman of Sectional Committee B-16(c) recommended the elimination of this 80 per cent rating. The reply to the W.P.B. explained why this factor should not be altered.

## 1943 Editions of Sections of The Code

### Section I—Power Boilers

The foreword of the 1943 Edition of Section I followed in general those of past years, but had the following sentence added: "Where an inquiry is not clearly an interpretation of the rules nor a problem of application on administration, it may be considered both by the Boiler Code Committee and the National Board." In the preamble, an added paragraph called attention to the fact that "the Code does not contain rules to cover all details of design and construction. Where complete details are not given it is intended that the manufacturer, subject to the approval of the authorized inspector, shall provide details of design and construction which are as safe as otherwise provided by the Rules of the Code."

Important changes were as follows: Para. P-1(a) Selection of Materials, was enlarged to permit limited use of small parts, cast, forged or rolled, for which it was difficult to obtain identified materials. The number of specifications available for steel plates in Para. P-2 was increased to nine. Designating symbols were changed from S- to SA- followed by the ASTM number. Materials of Para. P-3 contained four new materials for pipes or tubes. Para. P-9 listed one new (c) listed copper and brass pipe. Para. P-11 had four new specifications. Tables of Paras. P-15 and P-16 were altered, and P-17(b) was revised. Para. P-22 had a sentence added. Para. P-23 was greatly enlarged to provide for heavy pipe, and Para. P-23(j) was added. Para. P-24 was rewritten and enlarged.

Paras. P-101 to P-115 contained new sub-paragraphs, and there were many referénces to the new Section IX, Welding Qualifications. A few changes were made to Para. P-102, notably P-102(h), (h) (4) (a) to (b), (h) VIII, (x) (12b) and (h13). The list of available materials in Para. P-103 was increased to 34, and Para. 105(c) was revised. New Paras. P-108(c-4 and 5) were added. Para. P-109 was now entitled Hydrostatic "Test", as the hammer test was eliminated.

Para. P-112(a) now included superheaters, waterwalls and economizers. Para. P-112(d) was added. A new Para. P-115 was added. A new formula for working pressures was added to Para. P-180(a). A new formula was added in Para. P-195 and some of the lettered paragraphs were expanded or altered. Paras. P-198 to P-248 were practically unaltered, except for part of Para. P-200. Para. P-250 permitted seal welding of tube ends, and Para. P-251 permitted sealing after rolling.

Paras. P-253 to P-267 remained the same as in the 1940 edition, but some of the figures were changed. Additions were made in Para. P-268(a). Para. P-271 limited the range of setting of pressure to safety valves for saturated steam, and a note was added in Para. P-274. Other than an addition to Para. P-281(a) no further changes were made in Paras. P-269 to P-290. Changes were made in Paras. P-291 to 298. In Paras. P-299 to P-322 a new Figure P-40 and a new Para. P-299(b) were added. Two new paragraphs were added to Para. P-300 and others altered or reworded.

Paras. P-323 to P-339 were not altered, except for deletion of hammer test and enlargement of Paras. P-331 to P-334 while some changes were also made in Para. P-332, (a) (b) and (c). Para. P-332 (d) was greatly enlarged. Paras. P-332(e) and (f) were added.

The Appendix was reduced in size to 30 pages. Para. A-47 was deleted and Para. A-125 was added. This volume, with its index and Section VI, covered 218 pages in contrast with the 254 pages of the 1940 edition.

### Section II—Material Specifications

The 1943 edition of Section II of 426 pages bore the date March, 1944. In it, the new form of listing of Specifications by the ASTM designating numbers, in place of the former "S" number, was used. The list was followed by an alphabetical index of the important parts of the title. This new arrangement was a great improvement over that used in 1943.

### Section III—Boilers of Locomotives

The great addition to Section III was the inclusion of Rules for the Fusion Process of Welding, Paras. L-101 to L-115, by which boilers not subject to federal inspection could be fabricated by fusion welding under ASME Boiler Code requirements. In Paras. L-1 to L-84 there were few changes, notably in Paras. L-14(b) and L-82(a) (b) and (c) (d) and (f). The contents of the new sections on Paras. L-101 to L-110 have been mentioned previously.

### Section IV—Low Pressure Heating Boilers

The preamble of Section IV was enlarged by three new paragraphs; (1) limitation of capacities of domestic water heaters and range boilers, (2), recommendations for use of safety valves on all vessels for storing water, and (3) provision for details of design and construction as safe as otherwise provided in the Code. Paras. H-69 to H-83 was the same as in the 1940 and 1943 editions, except for the addition of one material, SA-30.

Few changes had occurred in other portions. A new Para. H-38(b) was added. Para. H-43 was enlarged, and reference to the diaphragm type of valve was deleted. Para. H-45 was omitted. Paras. H-46, -47 and -48 were placed under different headings and enlarged. Paras. H-49 and -50 of 1940 were omitted. The marking of valves and the restriction on its application as given in Paras. H-51 and H-53 remained practically unaltered, except for tests approved in Para. H-52. Para. H-52 and Tables H-6 and 7 were omitted.

Para. H-61 permitted a transparent material other than glass for water gages. Para. H-68 was altered. Part 2, Cast Iron Boilers, fixed maximum pressure at 15 p.s.i. from steam and 160 p.s.i. for water not over 250 F., as previously. The portion of Part 2 dealing with safety and water relief valves was a repetition of Paras. H-43 to -64.

The unchanged Para. H-118 differed from its counterpart Para. H-65. Paragraphs on stamping were almost the same as Paras. H-68(a) and H-120(a) and were identical in sub paragraphs (b) (c) and (d). The Form H-1 and the Appendix Paras. HA-1 to HA-11 were unchanged. This edition contained 45 pages and an index of 4 pages.

### Section V—Miniature Boilers

The issuance of Section IX, Welding Qualification, in 1941 removed Paras. MA-1 to -24 and four pages of commended forms of procedure from the Appendix of the Miniature Boiler Code, and made reference to Section IX necessary in Para. M-4(c). One specification was added, SA-30. Para. M-4(d) was added. Para. M-11 was enlarged. An addition to Para. M-19 provided for the omission of the hammer impact test when the vessel had been stress-relieved. Inspection requirements, Para. M-20, were altered for agreement with those of the other sections of the Code. Inspections were required during construction and after completion. Inspectors should be qualified state, municipal or insurance company inspectors. The use and intent of the Data Report, M-20(d), was explained more fully, as was also true of paragraphs (f) and (d). The use of the marking "ASME" or "ASME, Std". was prohibited unless so specified in Para. M-20(b). The Appendix contained only Approval of New Materials under Paras. MA-1 to MA-7 this with index of 1½ pages made a book of 16 pages.

### Section VI—Rules for Inspection

Section IV was published as usual in the same volume as Section I, Power Boilers. There had been no changes during this period. This section comprised 14 pages with three inserted sheets, Forms P-5, -6, and -7 for inspection reports. The index was contained with that for Section I and the Appendix in 12 pages at the end of a 218 page volume.

### Section VII—Care of Power Boilers

After the review of the 1940 edition, it was found that no changes were necessary. Thus the 1943 edition was identical with the previous edition, with exception to some changes in sequence of the several divisions.

### Section VIII—Unfired Pressure Vessels

The greatest change in Section VIII was removal of a large part of the Appendix dealing with fusion-welding to Section IX of the Code, reducing the previous 187 pages to 152 pages. The preamble preceding Para. U-1 was enlarged to exclude vessels under pressures exceeding 2,500 to 3,000 p.s.i., and to provide for action under approval of an authorized inspector when the Code did not contain rules for the design of some part. Para. U-1(a) now excluded vessels with pressures of 15 p.s.i. or less, and deletions were made. Vessels of 5 cubic feet capacity were exempted from the requirement of Para. U-65, Inspection, but provision was made for inspection if desired.

Para. U-1 also required safety devices. Para. U-2(b) was added, and Para. U-2(d) was new. Para. U-12(a) was enlarged. Para. U-13(a) gave two additional plate materials, U-13(e) listed four additional materials and Para. U-13(f) was added. Para. U-13(h) (3) specified maximum stresses. Para. U-17 was changed, and a new paragraph U-17(b) Under-Tolerance, was added additions to Para. U-19 fixed maximum working pressures. New formulae were given in Para. U-20(a), while U-20(e) gave a new formula for internal pressure. Para. U-20(f) was added.

Para. U-36(a) to (z) was altered as reported for the 1943 edition of Section I. Para. U-36(h) was omitted. Paras. U-37(c) and (d) had been introduced into the Unfired Pressure Vessel Code of 1940. Additions were made to Para. U-41(b) (1-8) and (c) (1-7). Para. U-59 was identical with that of 1940, except for slight changes in U-49(a) and (p) and Fig. U-10. Hydrostatic tests were described in Para. U-64, and Para. U-65(f) was added. A new Para. U-66(d) was added. A new Para. U-67(b) required the use of Section IX except as provided elsewhere, while (c) referred to tests.

Figure U-16, previously deleted, was restored. Para. U-68(i) required all vessels built under requirements of Para. U-68 to be stress-relieved, and (j) required stamping. Para. U-69 was considerably changed, and some paragraphs were omitted since they were included in Section IX. Para. U-70 described a third type of vessel for storages of gases or liquids at pressures not exceeding 200 p.s.i. and temperatures not over 250° F., but unavailable for use with lethal gases or liquids.

Para. U-70(d) (1) qualified operators to weld U-70 vessels. Para. U-71 increased materials from 14 to 36. Para. U-72 contained a clarification in U-72(f). Para. U-73 was reworded. Para. U-74 was altered to permit reinforced holes to be machine-cut through the stress-relieved weld seam. Stress relieving in Para. U-76 was greatly enlarged. The hammer test was eliminated under certain conditions in Para. U-77. Para. U-78 was unchanged. Paras. U-91 to U-96 were practically unchanged. but Paras. U-97 to U-109 were deleted. No changes were made in Paras. U-110 to U-114.

Para. U-120 increased available materials from 14 to 17, and the paragraphs to the end of this part of the Code, Para. U-138, were unchanged. In Paras. U-140 to -144 the upper limit of temperature was changed to -20° F. A change was made in Para. U-142(f). The Appendix was altered by additions. Fig. UA-1 was placed after Tables UA-1. A new Table UA-6 and new Tables UA-8(a) were added. Table UA-8(b) was changed, and two new figures, UA-3 and UA-4 replaced old Fig. UA-2. A new formula was added in Para. UA-100. This 1943 edition of Section VIII, with index, made a book of 152 pages.

#### Section IX—Welding Specifications

The Specification for Iron and Steel Welding Rods was omitted from the 1943 edition of Section IX, as it had been placed in Section II of the Code as Specification SA-223. Another Specification SA-251 was added. Except for a few changes in the list of Specifications mentioned in Table Q-5, the principal change in the 1943 edition from that of 1941 was the introduction of Form Q-1, with references to it in Paras. Q-110 and -212 and the omission of the Specifications. This made a book of 40 pages. There was no index.

#### API-ASME Code

A new EW Section, Design and Construction of Fusion Welded Vessels Subject to External Pressure, was added. New charts and other charts from Section VIII appeared, as well as figures from the Power Boiler Code. The arrangement of Section EW made a complete unit by references under EW numbers and titles EW-311 to -319 and EW-226 to -337 to the same numbered paragraphs bearing the letter W, and became requirements of this division without printing them again.

A note was added to the introduction, stating that pending development of provision for use of alloy steel plates, such plates as had been accepted by the Committee for use in Section VIII would be permitted, using 1.25 times the stresses in Table U-2 of Section VIII. The American War Standard for Pressure Temperature Ratings for Steel Pipe Flanges Fittings and Valves were accepted, and ASME Cases 896, 959, 978 and 985 were approved for use.

The major changes from the third printing were the addition of Section EW, the increase in the number of acceptable materials, a new table of stresses to replace a former chart, revision of a paragraph on bolted flange connections, and sectioning of welds. Appendixes on peening, sectioning formulas for vessels under external pressure, with bibliography, were added.

As eight of the ten members of the Joint Committee were also members of the Boiler Code Committee, it is readily understood that alterations to one Code would affect the other Code in a similar manner. √

## Roads

Roads are the keys that will unlock the strongbox of Canada's vast natural resources, C. W. Gilchrist, managing director of the Canadian Good Roads Association, Ottawa, told the Mississippi Valley Conference of State Highway Departments at the 45th Annual meeting in Chicago in March.

The speaker sketched the history of highway development in Canada from the early military and colonization roads down to the "number one" highway project in the country today. There were tremendous difficulties to overcome in building the Trans-Canada Highway, the speaker said, because much of it had to be hewn out of virgin wilderness. It would not be completed for some years, but he found it paradoxical that "a country that can maintain its own atomic reactor and build jet engines does not yet have a trans-continental highway".

The provinces of Canada were building roads as fast as money and manpower would permit but were still falling far behind the demands, the speaker said. Under such conditions there was not a very coherent and comprehensive policy on developmental roads.

He cited the building of the 384-mile Mackenzie Highway from Grimshaw, Alberta into the Northwest Territories as one example of Dominion-Provincial co-operation on a developmental project. The road cost $4 million, 48 per cent of which was paid by the federal government, the rest by the province of Alberta. This road opened the country for development.

Mr. Gilchrist emphasized the importance of roads in defence.

## Guidance in the High School

A new publication on guidance for high school students, written by Canadians for Canadians has appeared recently. It is titled "After High School — What ?"

The publication is unique in several ways. First of course it is wholly Canadian. Then it is probably the shortest treatise on the subject ever published in booklet form. It is the first publication ever turned out jointly by several institutes and associations. It is distributed without charge (35,000 copies first printing), the whole cost including mailing being borne by the organizations represented on the committee. It is printed in French as well as English. It covers both engineering and science.

Guidance is a subject on which the Institute and many other societies as well, have shown an interest for many years. The first effort organized on a Dominion-wide basis, was carried out by the Institute's committee on the Training and Welfare of the Young Engineer starting in 1939 under the chairmanship of the late Harry F. Bennett. Subsequently through the offices of the Wartime Bureau of Technical Personnel, the committee was expanded and changed in name to include representatives of the Canadian Institute of Mining and Metallurgy and the Chemical Institute of Canada. Over 400 counsellors were appointed across Canada.

In its present form the committee is known as the Canadian Committee on Counselling in Engineering and Science, and now includes in its membership representatives of the provincial professional associations. Under this title the committee has undertaken a greater activity and a more intensive effort in order to help the high school student reach a decision as to what he should do on graduation.

It is this committee which has published "After High School — What ?" Distribution has been made to high schools and to counsellors. From all reports the booklet fills an urgent need. As the cost of this whole endeavour has been borne by the members of the participating organizations, every member of the Institute may feel a personal interest in it. It is his money that has made it possible. Through the committee he is participating in the essential work of counselling.

Recognition of the merits of the booklet has come from the Engineers Council for Professional Development. The chairman of their Guidance Committee has asked (and received) permission to adapt the material to United States conditions, and to republish it. ECPD is the principal publisher of material of this kind in the United States. The Canadian Committee is pleased with this tribute and is glad to cooperate through ECPD with the great engineering organizations of our neighbours over the border.

Perhaps it is only fair to the pioneers in the counselling field, to observe that this new publication which is different and better in every way, is not the first to be published for Canadian high school and university students. Back about 1940 the Engineering Institute through its Committee on the Training and Welfare of the Young Engineer, published the booklet, "The Profession of Engineering in Canada". This too was distributed without charge. It too was printed in French and English. Over 50,000 copies were placed in 10 years time with schools and universities.

This acknowledgement of the work of an earlier committee is made, not to discount in any way the greater work of the joint committee, but rather to give credit to those who pioneered the field in Canada and laid the foundations for the broader, more comprehensive effort of the combined organization. It is so easy to forget the past.

Although the new publication has been well received, and will do a great work, perhaps its greatest value will be that it is the product of a combined effort — an effort that indicates the steadily increasing determination of all engineering organizations in this country to work together for the common good. There lies the real value.

## Cover Picture

The cover picture dramatically shows a 7,000-ton forging press in operation at Trenton, Nova Scotia.

The press is described in the paper "7,000 Ton Forging Press" by Hans Ulmann, M.E.I.C., beginning on page 557 of this issue.

# A Presidential Message

My first words to the membership of The Engineering Institute of Canada in my new capacity must be words of humble but grateful appreciation for the high honour that has been conferred upon me. Humility and gratitude are the more keen when I reflect upon the calibre of men who have been elected to the Presidency of the Institute in the past.

While the Institute has many functions to fulfil, perhaps the most important of these is to provide the "forum" where minds can meet for the interchange and discussion of views and experience in matters pertaining to the profession and practice of engineering. It is through the operation of this "forum" principle of interchange and discussion that professional people build up a body of tested technique and practice; it is through this method that engineers retain their links with the past while keeping abreast with that which is new; it is through this "forum" principle, through the process of interchange and discussion, that we achieve the homogeneous out of what would otherwise be heterogeneous.

Through Branch and Section meetings, through regional and national professional conferences, through the pages of the *Journal* and by maintaining for its membership the closest contact with professional engineering organizations in other parts of the world, The Engineering Institute of Canada seeks to encourage the widest application of this "forum" principle and to provide many meeting places where the "stuff" of our profession may be freely exchanged.

With the present almost startlingly rapid rate of discovery in the fundamental sciences, and with ever greater efforts being directed toward research into the application of these sciences, engineers are being constantly called upon to examine and to test radically new methods and materials. This they do, and always with the prayer that they may not too hastily abandon the "old" nor be too tardy in applying the "new".

In such dynamic times as these this particular function of our Institute — to provide the "forum", to arrange the meeting places and to facilitate the interchange of views and experience in matters pertaining to the profession and practice of engineering in Canada — is perhaps more important than it has ever been. With more Members, more Branches, more Sections, with larger *Journal* coverage, and with closer international affiliations, the Institute is in a better position to contribute to the performance of this function than at any time in its long and distinguished history.

H. W. Stephens

*President*

# Colonel By and Ottawa

Few national capital cities owe their foundation so definitely to one man as does Ottawa to Lt. Col. John By of the Royal Engineers. In the early years of the city's history, this was clearly recognized, since the small settlement on the Ottawa used to be known as Bytown. Today, however, there is little in Ottawa to remind the citizen or to inform the visitor of the debt owed to its founder. This is an omission which is as unfortunate as it is surprising.

The change in name, from Bytown to Ottawa, was made almost a century ago. The new name was proclaimed on January 1st, 1855, following the enactment of the necessary legislation by the government of Upper and Lower Canada at Quebec City on 18th December 1854. These are dates the centenary of which will be suitably celebrated by the Corporation of the City of Ottawa and by citizens generally. What occasion could be more fitting than this to make public recognition of the service rendered by Colonel By not only to Ottawa but to Canada as a whole, in the founding of what is now the national capital?

Many cities have to dig deep into their historical records in order to find one or more individuals who may be claimed as founders. There are few important cities of the New World which have not honoured such founders either by public monument or by the use of their names. But all that Ottawa has today in honour of Colonel By is a cube of granite bearing a faint inscription, the pedestal of a monument planned but never erected. Probably not one citizen in a thousand knows even of this strange relic, hidden as it is near a flowerbed beneath the Confederation Bridge. And yet it is all that can be found in honour of Colonel By in the city the site of which he selected, and the first buildings of which he erected.

It was to supervise the building of the Rideau Canal, as part of a new military route between Montreal and Kingston that By was sent to Canada. The Duke of Wellington had interested himself in the project; he may even have selected the Colonel for his onerous task since he had served in the Peninsular War as well as having spent some time in Canada, during which he had assisted with the construction of the Citadel in Quebec City.

It was in May 1826 that he arrived to take up his duties as superintendent of the building of the Rideau Canal. At that time, Hull was a small village at the foot of the Chaudiere Falls, a few settlers only having established clearings in the bush that still surrounded the southern shore of the Ottawa River. Soon after selecting the site of the flight of locks which were to form the entrance to the Canal, Colonel By arranged for the first clearing of land on what are now Parliament Hill and Major Hill Park.

On this wonderful site, now the head of the nation's capital, buildings soon appeared, a workshop (still, happily, in existence), a barracks (where the Parliament Buildings now stand), a residence for Colonel By (where the Chateau Laurier may now be seen), a stable and even a bake-house. These stone buildings formed the nucleus around which the little settlement gradually grew, soon dividing into "Upper Town" and "Lower Town", eventually to become the Ottawa of today.

The full story of the Canal is a long one; suffice it to observe here that it was a masterpiece of civil engineering even though carried out for strictly military reasons. It was intended to provide a safer route between Montreal and Kingston for military personnel and supplies than that afforded by the St. Lawrence River. Although fortunately never needed for such wartime purposes, it proved to be a potent factor in the opening up of Eastern Ontario, and had an unexpected national significance.

In little more than five years, the Canal was finished, the first steamer passing through in May 1832. The achievement of constructing this waterway through almost 140 miles of virgin bush, with its many dams, locks and rock channels, almost on schedule and at a cost which today appears fantastic (less than £800,000), shows clearly what a great engineer and how able an administrator Colonel By was. And yet, four days before the triumphal first passage from Ottawa to Kingston, he was recalled to England not to receive the honours which he had so justly earned but to face a Parliamentary Committee of Inquiry.

The conclusion today is inescapable that By was the victim of what can only be called "political buck-passing" for he was completely exonerated by the Committee just as all other inquiries into the progress of the work had vindicated and endorsed his work and his administration. All available local records show also that he was a man of sterling character and of an unusually kindly disposition.

Worn out, however, by the strain of the inquiry, in poor health due to all the rigours he underwent in the building of the Canal, and beyond doubt disappointed at the ignominy and neglect from which he suffered in England, he died at the relatively early age of 54 at Shernfield Park in the lovely village of Frant in Sussex, England, where he lies buried.

Ottawa has perpetuated the neglect these many years but now has a singularly appropriate opportunity for making amends. The engineers of Canada, and of Ottawa in particular, have a special interest in being associated with the official recognition that it is hoped may now be given to Colonel By. They have indicated this interest by the setting up of a special Colonel By Memorial Committee (under the auspices of the Ottawa Branch of the Engineering Institute of Canada). After much study, the Committee is of the opinion that a fitting memorial would be a fountain located in the triangular garden plot between the Chateau Laurier and the Union Station.

Such a memorial, bearing a suitable inscription, and located (as it would be) close to the site of Colonel By's own house and in the centre of the area where his workyard was once the scene of such great activity, would seem to be a modest enough memorial to one who was not only a fine soldier, a great engineer and a Christian gentleman, but also the founder and planner of Ottawa, the national capital of Canada.

R. F. Legget, M.E.I.C.

# Correspondence

***Anniversary at University of New Brunswick***

Mr. R. L. Dobbin, President:

The University of New Brunswick on Tuesday last held its annual Founder's Day ceremony which this year commemorated the one hundredth anniversary of the founding of engineering instruction at this institution. I believe you are aware of this event and that Dr. John B. Stirling, your immediate past president, was the guest speaker. Mr. Charles Weyman, the president of your local branch, was on the platform and at the conclusion of the ceremonies presented to the University a very fine clock which the Engineering Institute of Canada has given to mark the occasion of the University's Centenary of Engineering.

The Senate of the University of New Brunswick has asked me to express the thanks of the University for this very fine gift and to say how much we appreciate your recognition of this event which we feel is something of a milestone in the history of engineering instruction in Canada. We have just begun construction of a Memorial Student Centre and when this building is completed, I know we shall have a spot in which to place the clock.

With kindest regards, I am,

Yours most sincerely,

Colin B. Mackay,
President,
University of New Brunswick.

---

## ACI's Jubilee

Among the most useful, though not most high-hat, technical societies on this continent is the American Concrete Institute — ACI to its friends. About the only qualification for membership, aside from the ability to pay its modest annual fees, is that one should not hate concrete. This generous membership policy has brought together in its ranks some 6,200 engineers, architects, contractors, cement manufacturers, steel suppliers, concrete machinery makers and others whose interest in concrete varies from the highly theoretical to the severely practical. Perhaps this catholic range has made it easier for ACI to compile, and win acceptance for, the many standards it has developed in its fifty years of life, standards which certainly have been a major factor in promoting the use of concrete.

It was in October, 1904, that a small group met at the Louisiana Purchase Exhibition — the St. Louis World's Fair — to organize the National Association of Cement Users, with the original intention of trying to improve the quality of concrete blocks. However, before organization was completed the objectives of the group had been extended to cover all phases of the concrete industry. Because its name did not truly represent this wider purpose, it was changed in 1913 to The American Concrete Institute.

ACI's annual meeting of February 22-26, 1954, in Denver was its fiftieth, so naturally a good part of its program was given over to papers with historical backgrounds, but there were numerous timely technical papers and committee reports, too. A contribution from Canada was "One Hundred Thirty Foot Precast Concrete Hangars", by Otto Safir, of Safir Engineering Consultants, Ltd., Vancouver. This hangar was built for the RCAF and no member weighed more than a ton. Canada also contributed a film, "Namao", based on precast concrete practice here.

We have not room to list all the papers and reports; they dealt with most aspects of concrete, with much emphasis on prestressing, which one observer remarked "has become something of a fad with many" in the United States. All the papers and reports will, we suppose, appear in ACI's *Journal*, published at 18263 West McNichols Road, Detroit 19, Mich.

One of the most interesting and useful features of ACI's annual meetings is the research session. This consists of a series of short talks — eight or ten minutes each — on new work going on in concrete research. No record of the talks is kept, so speakers are willing to discuss what they are doing long before they are ready to write formal papers on their work. This year, T. C. Clendenning, of the Hydro-Electric Power Commission of Ontario, spoke on work which the Commission is doing on the early strength of concrete.

Canadian engineers have always taken a good deal of interest in ACI: R. B. Young, M.E.I.C., is one of its past presidents and this year Hugh C. Ross, M.E.I.C., was elected a director for a three-year term. There were 29 Canadians registered at the Denver meeting, including the following members of the Institute: N. A. Lawrence, Edmonton; Guy R. Rinfret, Montreal; Raymond P. Gauthier, Ottawa: M. B. Pierce, Regina; H. I. King, Prof. M. W. Huggins, R. B. Young, Alex. E. Chernick, Morgan H. Price and Hugh C. Ross, Toronto; John H. Swerdfeger, West Vancouver; and J. B. Striowsky, Winnipeg.

H. C. Ross, M.E.I.C.

## *Thirty-five Years Ago*

Comment on the *JOURNAL* of May 1919

May, 1919, should go down in Institute history as a red-letter month, for the *Journal* of that date carried the draft of the long awaited, much discussed model "Act Respecting the Engineering Profession", submitted by the committee appointed following the resolution of the just previous Ottawa annual meeting. The committee had its photograph taken in session; in the *Journal*'s cut we note E. E. Brydone-Jack, Winnipeg, and H. R. McKenzie, Regina, whose names were not on the original committee roster.

Although Council was ordered by the Ottawa resolution to submit this draft to letter ballot of the members of the Institute, at its meeting of April 22, 1919, it pondered the question of whether or not it should "send a letter of transmittal giving advice to the members" along with the ballot. It finally put off any decision until the opinions of absent members of Council could be obtained.

Editorial comment on the draft was brief, but naturally in strong support of it. It emphasized the point that "members of the Institute are given no preference whatsoever in the proposal, while the expense of the meeting is being borne entirely by the Institute; that is, the Institute is unselfishly working in the interests of the whole profession. Other organizations in Canada, comprising professional engineers, will no doubt appreciate the work of the Institute in this connection." Let us hope they did.

The Calgary Branch took up the cudgels on behalf of engineers in the Civil Service, by publishing copies of letters it had addressed to three M.P.'s from the west. It cited several cases of obvious injustices, e.g., men with ten or twelve years of experience were drawing only $1,200 a year and being given assistants who were rated at $1,500 to train. Its letters state that "engineers and technical men are woefully underpaid at the present time, not only by the Government, but by all employers . . . In the Government service worse unfairness seems to exist, which should first be corrected, and then the salaries of engineers should be considerably raised."

Notwithstanding the generally low salary level of the times, there seem to be glimmers of improvement. The Kipawa Fibre Co. advertised for a "first-class draftsman and office engineer" and offered $2,100 a year, plus transportation to Temiskaming. Among openings in the Civil Service were the positions of agricultural engineer (irrigation) at $1,600; designing mechanical draftsman, not necessarily a graduate, at $2,400-$2,700; and an office engineer, a graduate with three years' experience, at the same salary as that offered for the draftsman. Apparently it didn't pay to go to college.

One might contrast with these the average salaries just reported as received by mid-year graduates of Cooper Union, New York, $4,400 for day students and $5,180 for evening students. The difference is probably due to the fact that evening students are older and more mature than day students and, as they work during the day, have more experience as well.

The *Journal* published occasional outstanding papers then as it tries to do now. To the writer's notion, R. M. Wilson's "Design of Hydro-electric Plants for Combatting Ice Troubles" was such a paper. Although it was mostly confined to a discussion of methods found successful for dealing with ice at the Cedars Rapids plant on the St. Lawrence above Montreal, it contained a good deal of general information applicable to any plant.

As is often the case, the discussions were as valuable as the paper itself. Perhaps the most interesting was contributed by John Murphy, who spoke from his long experience in fighting ice at hydro-electric plants on the Ottawa at Ottawa. We have no means of knowing whether he discovered the fact that ice, frazil particularly, will not stick to a surface if the temperature of that surface is a fraction of a degree, even a thousandth, above 32°F. If not, he certainly was the first engineer to make use of it. As long ago as 1904, he was advocating the heating of critical equipment to avoid ice troubles.

If memory serves correctly, it was about 1912 that Mr. Murphy showed the writer a steam-heated trash rack at one of the Ottawa plants, and only a year or two later that he had worked out a successful and economical scheme for heating trash racks electrically. Rejected as unorthodox and impracticable at first, his ideas gradually found acceptance, though in 1919 they were still regarded askance by some. We have learned a good deal about ice and its behaviour since Mr. Murphy's time, but he had much to do with putting our thinking on the right track.

The May, 1919, *Journal* not only gave Mr. Murphy a forum in which to sound off on ice, but it also published a paper by him on "Railway Electrification". Those whose memories go back that far will recall that there was a serious coal shortage during the last years of the first world war; disastrous results were averted only by government control and even then conditions were bad enough. The certain effects of a real coal famine gave Mr. Murphy a hook upon which to hang strong arguments for the electrification of railways.

In 1919 it took six pounds of coal to produce one locomotive horsepower hour; at the same time, a good steam station could produce a horsepower hour on no more than about three and a half pounds. Canada's railways then used 9 million tons of coal a year, 30 per cent of the country's production. To haul it, they had to use rolling stock and motive power that otherwise could have been producing revenue. The overall efficiency of a good locomotive was only three or four per cent.

Fuel economy, plus the many other advantages of electric traction — low repair costs and standby charges, regenerative braking, little track punishment, etc. — were sure, in Mr. Murphy's opinion, to compel railway electrification in the not distant future. His views were supported by W. G. Gordon (Canadian General Electric Co., Ltd.) and F. H. Shepard (Westinghouse Electric & Mfg. Co.) in shorter papers also published in this *Journal*.

Everybody knows what has actually happened. Except under special conditions — tunnel operation, for example — railway electrification has not made the progress in America that Mr. Murphy anticipated. The reason? — the diesel locomotive, of course, made possible economically by the decreased cost of oil as compared to that of coal and by some other factors. The diesel locomotive has many of the advantages of its electrical brother plus some of its own, not the least of which is that it can operate over railways as they are, requiring no expensive electrical distribution systems.

For engineers needing to take a "cure", the *Journal* obligingly abstracted a bulletin of the Mines Branch giving the properties of most of the mineral springs of Canada from Abenakis Springs in Quebec to Harrison Hot Springs in British Columbia, saying that "it is probable that Canadian waters will be found equal in every respect to any of the famous European waters". However, the *Journal* dared not trespass on medical territory by venturing to suggest which springs should be patronized, according to one's malady.

Another news note said that the Newfoundland Government had been advised to relay the track of its railway, operated by the Reid Newfoundland Co., with heavier steel for its entire length from St. John's to Port aux Basques, remarking that its gauge would also no doubt be changed to standard at the same time. However, in 1952, when the writer spent four months in the newest province, narrow gauge was still in use and the Canadian National Railways were struggling to operate the line with some efficiency.

Politics in the best sense showed up in the report of the Saint John Branch, which put itself on record as "favouring the League of Nations . . . a constructive idea . . . (All) must personally uphold . . . co-operative ideals . . . for world government . . . (Or) the League of Nations cannot be a lasting success." Has the Institute or any of its branches ever endorsed the United Nations in a similar way?

Wireless telephony was demonstrated for the first time in Canada at a meeting of the Ottawa Branch, with Lt. Cmdr. Edwards as demonstrator. "Gramophone records . . . (broadcast) the characteristic sounds of a submarine running on the surface and submerged, as compared with the sounds of other vessels."

"Water from Shoal Lake was turned into the Winnipeg mains on Saturday morning, April 15th (1919). This completes the Greater Winnipeg Water District project, which was one of the largest on the continent."

Among the personals we note that "C. J. Mackenzie, who recently returned from overseas, has resumed his duties as professor of civil engineering at the University of Saskatchewan" and that "Maj. C. C. Lindsay . . . has been appointed assistant engineer of the Reclamation Branch in the Department of the Interior." All members of the Institute will recognize Dr. Mackenzie as the recently retired head of Canada's atomic energy project. Maj. Lindsay is now a consulting engineer in Montreal and has been active in Institute affairs.

It was also noted that Ivan E. Vallée had been appointed chief engineer and director of railways in the Department of Public Works and Labour of Quebec and also engineer of the Public Services Commission; he is still with the province. As a coincidence, the *Journal* also carried the obituary of Mr. Vallée's father, Louis André Vallée, who entered the Quebec provincial service in 1862 and at his death occupied the positions to which his son had just been appointed.

The May, 1919, *Journal* carried 107 pages of text and 12 pages of advertising, a ratio that would make our present advertising department feel that it was a failure.

# The ASME Boiler Code

## Proposed Revisions and Addenda to Boiler and Pressure Vessel Code

As need arises, the Boiler Code Committee entertains suggestions for revising its Codes. Revisions approved by the Committee are published here as proposed addenda to the Code to invite criticism.

In the following the paragraph numbers indicate where the proposed revisions would apply in the various sections of the Code.

Comments should be addressed to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.

***Par. P-268.*** Openings and Reinforcements.(1) Revise to read as follows:

P-268(a) Scope:

(1) The rules in this paragraph apply to all openings in shells, headers or heads except as otherwise provided in (2) and (3).

(2) Openings in a definite pattern, such as for tube holes, may be designed in accordance with the rules for ligaments in Par. P-192 and P-193, provided the diameter of the largest hole in the group does not exceed that permitted by the chart in Fig. P-34.

The notations given in Fig. P-34 are defined as follows:

P = maximum allowable working pressure, pounds per square inch.

d = maximum allowable diameter of opening, inches.

D = outer diameter of the shell, inches.

t = actual thickness of the shell, inches.

S = maximum allowable stress value, pounds per square inch, taken from Table P-7.

$$K = \frac{PD}{1.6St} \quad (A)$$

$$K = \frac{PD}{1.82St} \quad (B)$$

Formula (A) shall be used with shells and headers designed to the rules in Par. P-180(b). Formula (B) shall be used with shells and headers designed to the rules in Par. P-180(c).

(3) (a) No calculations need be made to determine the availability of reinforcement. Single openings in shells or headers, whose I.D. is not less than four times the diameter of the opening and which satisfy the following conditions:

(1) Welded attachments not larger than 2-in. pipe size.

(2) Threaded, studded, or expanded connections in which the diameter of the hole in the vessel wall is not greater than 2-in. pipe size.

(3) (b) Calculations demonstrating compliance with P-268(c) shall be made for single openings not covered in (3) (a).

P-268(b) Shape, Size and Location of Openings:

(1) Shape of Openings(2): (a) Openings in the cylindrical sections of a vessel should be circular, elliptical, or obround.(3) All openings in formed heads shall preferably be circular, but if not circular shall be elliptical. When the long dimension of an elliptical or obround opening exceeds twice the short dimension, the reinforcement across the short dimension shall be increased as necessary to provide against excessive distortion due to twisting moment.

Footnote 1. The rules governing openings as given in this Code are based on the stress intensification created by the existence of a hole in an otherwise symmetrical section. They are based on experience with vessels designed with safety factors of 4 and 5 applied to the ultimate strength of the shell material. External loadings such as those due to the thermal expansion or unsupported weight of connection piping have not been evaluated. These factors should be given attention in unusual designs or under conditions of cyclic loading.

Footnote 2. The opening made by a pipe or a circular nozzle, the axis of which is not perpendicular to the vessel wall or head, may be considered an elliptical opening for design purposes.

Footnote 3. An obround opening is one which is formed by two parallel sides and semicircular ends.

(b) In special cases, openings may be of any other shape than those given in (a), but when they are of such proportions that their strength cannot be computed with assurance of accuracy, or when doubt exists as to the safety of a vessel with such openings, the part of the vessel affected shall be subjected to a proof hydrostatic test as prescribed in Par. P-247.

(2) Size of Openings: (a) Properly reinforced openings in cylindrical and spherical shells are not limited as to size and shall comply with the provisions which follow, and with the additional provisions given under (2) (b).

(b) The rules for reinforcement of openings apply to openings not exceeding the following dimensions: (See Footnote 4).

For vessels 60 in. diameter and less:— ½ the vessel diameter but not over 20 in.

For vessels over 60 in. diameter:— 1/3 the vessel diameter, but not over 40 in.

Footnote 4. Larger openings should be given special attention and may be reinforced in any suitable manner at least complying with the intent of the Code rules. It is recommended that the reinforcement provided be distributed close to the opening. (A provision of about two-thirds of the required reinforcement within a distance of ¼ d on each side of the finished opening is suggested.) Special consideration should be given to the fabrication details used and inspection employed on critical openings: reinforcement often may be advantageously obtained by use of heavier shell plate for a vessel course or inserted locally around the opening; welds may be ground to concave contour and the inside corners of the opening rounded to a generous radius to reduce stress concentrations; magnetic particle or fluorescent penetrating oil weld inspection may be used when radiographic examination is not practical. The degree to which such measures should be used depends on the particular application and the severity of the intended service. Appropriate proof testing may be advisable in extreme cases of large openings approaching full vessel diameter, openings of unusual shape, etc.

(3) Openings in or Adjacent to Welds: Any type of opening permitted in these rules may be located in a welded joint. Such opening shall meet the requirements of Par. P-105(c).

P-268(c) Reinforcement Required for Openings in Shells and Formed Heads:

(1) General — The rules in this subparagraph apply to all openings other than flanged-in openings in formed heads covered by Par. P-195, openings in flat heads covered by Par. P-268(d), and openings covered in Par. P-268(a) (2) and (a) (3) (a).

Reinforcement shall be provided in amount and distribution such that the area requirements for reinforcement are satisfied for all planes through the center of the opening and normal to the vessel surface. For a circular opening in a cylindrical shell, the plane containing the axis of the shell is the plane of greatest loading due to pressure.

(2) Area Required—The total cross-sectional area of reinforcement, A, required in any given plane for a vessel under internal pressure shall be not less than

$$A = d \times t_r \times F$$

where d = the diameter in the given

plane of the finished opening inches;

$t_r$ = the required thickness of a seamless shell, header or blank head computed under the rules of the Code for the designated pressure, inches, except that

(a) When the opening and its reinforcement are in a torispherical head and are entirely within the spherical portion, $t_r$ is the thickness required for a seamless hemispherical head of the same radius as that of the spherical portion.

(b) When the opening and its reinforcement are in an ellipsoidal head, in which one half of the minor axis is equal to one-quarter of the inside diameter, and are located entirely within a circle the center of which coincides with the center of the head and diameter of which is equal to 80% of the shell inside diameter, $t_r$ is the thickness required for a seamless hemispherical head of radius equal to 90% of the inside diameter of the shell.

F = 1.00 when the plane under consideration is on the longitudinal axis of a shell and for heads. For other planes in a shell or header the value of F shall be determined from Figure P-34(a).

(P-268(d) Reinforcement Required for Openings in Flat Heads:

(1) Flat heads that have an opening with a diameter that does not exceed one-half of the head diameter or shortest span, as defined in Par. P-198, shall have a total cross-sectional area of reinforcement not less than that given by the formula:

$$A = 0.5d \times t$$

where d is defined in Par. P-268(c) and t in Par. P-198.

(2) Flat heads that have an opening with a diameter that exceeds one-half of the head diameter or shortest span, as defined in Par. P-198, shall be designed as a flange in accordance with accepted Rules for Bolted Flange Connections.

(3) As an alternative to (1), the thickness of flat heads may be increased to provide the necessary reinforcement by using 2C in place of C in formulas for calculating head thickness in Par. P-198. Except for the types of construction shown in (g) and (h) of Fig. P-21, the value of 2C to be used in the formulas need not exceed 0.75.

P-268(e) Limits of Reinforcement.

(1) The boundaries of the cross-sectional area in any plane normal to the vessel wall and passing through the center of the opening within which metal must be located in order to have value as reinforcement are designated as the limits of reinforcement for that plane.

(2) The limits of reinforcement, along the vessel wall, shall be at a distance, on each side of the axis of the opening, equal to the greater of the following:

(a) The diameter of the finished opening.

(b) The radius of the finished opening plus the thickness of the vessel wall, plus the thickness of the nozzle wall.

(3) The limits of reinforcement, measured normal to the vessel wall, shall conform to the contour of the surface at a distance from each surface equal to the smaller of the following:

(a) 2½ times the shell thickness

(b) 2½ times the nozzle-wall thickness, plus the thickness of any added reinforcement exclusive of weld metal on the side of the shell under consideration.

(4) Metal within the limits of reinforcement that may be considered to have reinforcing value shall include the following:

(a) Metal in the shell and the nozzle wall over and above the thickness required to resist pressure. The area in the shell available as reinforcement is the larger of the values of $A_1$ given by the formulas,

$$A_1 = (Et - Ft_r)\, d$$

or

$$A_1 = 2(Et - Ft_r)\,(t + t_n)$$

where $A_1$ = area in the excess thickness in shell or head available for reinforcement, square inches,

E = 1 when an opening is in the solid plate or when the opening passes through a circumferential joint in a shell (exclusive of head-to-shell joints); or

E = the longitudinal joint efficiency when any part of the opening passes through any other welded joint,

t = thickness of shell or head, inches,

$t_r$ = required thickness of the shell or head to resist pressure as defined in Par. P-268(c), inches,

$t_n$ = thickness of nozzle wall, inches,

d = diameter in the plane under consideration of the finished opening, inches,

F = factor from Figure P-34(a) (See P-268(c) (2) ),

$t_{r_n}$ = required thickness of nozzle wall to resist pressure, inches, found by the formula used for $t_r$ in Par. P-180, omitting the 0.1″ additive thickness or "C" factor.

(b) Metal added as reinforcement, and metal in attachment welds.

P-268(f) Strength of Reinforcement:

(1) Material used for reinforcement shall have an allowable stress value equal to or greater than that of the material in the vessel wall, except that material of lower strength may be used, provided the area of reinforcement is increased in inverse proportion to the ratio of the allowable stress values of the two materials to compensate for the lower allowable stress value of the reinforcement. No credit may be taken for the additional strength of any reinforcement having a higher allowable stress value than that of the vessel wall. Where vessels are designed to Par. 180(b) and similar paragraphs, the allowable stress value is to be taken as equivalent to 0.8 times the values shown in Table P-7.

(2) On each side of the defined in Par. P-268(e) (3), the strength of the attachment joining the vessel wall and reinforcement or any two parts of the attached reinforcement shall be at least equal to the smaller of:

(a) The strength in tension of the cross-section of the element of reinforcement being considered, or

(b) The strength in tension of the area of the unfinished opening, including any rivet or stud holes, in the shell or head based on $t_r$ less the strength in tension of the reinforcing area which is integral in the vessel wall as permitted by Par. P-268(e) (4).

(3) The strength of the attachment shall be considered for its entire length on each side of the plane defined in Par. P-268(e).

(4) For detailed requirements for welded, and riveted construction see Par. P-268(h).

P-268(g) Reinforcement of Multiple Openings:

(1) When any two adjacent openings which require reinforcement are spaced at less than two times the distance defined in Par. P-268(e) (2) so that their limits of reinforcement overlap, the two openings (or similarly for any larger group of openings) shall be reinforced in accordance with Par. P-268(c), with a reinforcement that has an area equal to the combined area of the reinforcement required for the separate openings. No portion of the cross-section shall be considered as applying to more than one opening, or be evaluated more than once in a combined area.

(2) Two adjacent openings shall have a distance between centers not less than 1-1/3 times their average diameter.

(3) When a group of openings is reinforced by a thicker section butt-welded into the shell or head, the edges of the inserted section shall be tapered as prescribed in Par. P-104(d).

(4) When a shell or drum has a series of holes in a definite pattern, the net cross-sectional area between any two finished openings within the limits of the actual shell wall excluding the portion of reinforcing part not fused to the shell wall, shall equal at least 0.7F of the cross-sectional area obtained by multiplying the center to center distance of the openings, by the required thickness of a seamless shell, where the factor F is taken from Fig. P-34(a) for the plane under consideration, see Fig. P-37(a). The Journal regrets that space requirements did not permit reproduction of these illustrations.

P-268(h) Methods of Attachment of Pipe and Nozzle Necks to Vessel Walls:

(1) General—Nozzles may be attached to the shell or head of a vessel by any of the methods of attachment given in this paragraph, except as limited in Par. P-268(a) (3) (b).

(2) Welded Connections—Attachment by welding shall be in accordance with the following requirements:

(a) Sufficient welding shall be provided on either side of the plane through the center of the opening parallel to the longitudinal axis of the shell to develop the strength of the reinforcing parts through shear or tension in the weld, whichever is applicable. The strength of the groove welds shall be based on the area subjected to shear or to tension. The strength of fillet welds shall be based on the area subjected to shear (computed on the minimum leg dimension). The inside diameter of a fillet weld shall be used in figuring its length.

(b) The allowable stress values for groove and fillet welds and for shear in nozzle necks, in percentages of stress value for the vessel material are as follows:

| Nozzle Wall Shear | Groove-Weld Tension | Groove-Weld Shear | Fillet Weld Shear |
|---|---|---|---|
| 70% | 74% | 60% | 49% |

NOTE:—These values are obtained by combining the following factors: 87½% for combined end and side loading, 80% for shear strength of weld metal, and following efficiency factors:

| | |
|---|---|
| Nozzle Wall in shear | 80% |
| Groove Weld in tension | 85% |
| Groove Weld in shear | 68% |
| Fillet Weld in shear | 55% |

(c) Reinforcing plates and saddles of nozzles attached to the outside of a vessel shall be provided with at least one telltale hole (Maximum size ¼ in. pipe tap) that may be tapped for a preliminary compressed air and soapsuds test for tightness of welds that seal off the inside of the vessel. These telltale holes shall be left open when the vessel is in service.

(d) the location and minimum size of attachment welds shall conform to the requirements shown for typical examples in Figure P-36. The symbols used in Figure P-36 are defined as follows:

$t$ = thickness of vessel shell or head, inches,

$t_n$ = thickness of nozzle wall, inches,

$t_e$ = thickness of reinforcing element, inches,

$t_w$ = dimension of partial-penetration attachment welds (fillet, single-bevel, or single-J), measured as shown in Fig. P-36, inches,

$t_c$ the smaller of ¼ inch or 0.7 $t_n$. (Inside corner welds may be further limited by a lesser length of projection of the nozzle wall beyond the inside face of the vessel wall).

$t_{min}$ = the smaller of ¾ inch or the thickness of either of the parts joined by a fillet, single-bevel, or single-J weld, inches.

$t_1 \times t_2 = 1\frac{1}{4}\ t_{min}$, measured as shown in Figure P-36, inches. $t_1$ or $t_2$ not less than 1/3 $t_{min}$ or ¼ inch.

(e) All welding shall be equivalent to that required under the rules in Pars. P-101 to P-111, inclusive or in Par. P-112. Radiographic examination of attachment welds may be omitted except as specifically required in other paragraphs of this Code, and except for Inserted-Type Nozzles.

(3) Riveted Connections—Attachment by riveting shall be in accordance with the following requirements:

(a) Openings for nozzles and other connections shall be far enough away from any main riveted joint so that the joint and the opening reinforcement plates do not interfere with one another.

(b) Welded connections which require stress-relieving and which are attached to vessels having seams of riveted construction shall be fabricated and stress-relieved prior to the making up or attachment of the courses by riveting. If they do not require stress-relieving and are attached after riveting, the welds shall be located at a distance from the riveted seam at least equal to the outside diameter of the attachment weld plus four times the thickness of the shell plate.

(c) Openings for pipe connections to vessels having riveted joints may be made by inserting pipe couplings or similar devices, not exceeding 3 in. pipe size, in the shell or heads and securing them by welding, provided the welding is performed by welders or welding operators who have been qualified under the provisions of Section IX of the Code for the welding position and type of joint used.

(d) For nozzle fittings having a bolting flange and an integral flange for riveting, the thickness of the flange attached to the pressure vessel shall not be less than the thickness of the neck of the fitting.

(e) The strength of rivets in tension in a flanged frame or ring riveted to the outside of a vessel shall be at least equal to that required to resist the load due to the maximum allowable working pressure with a factor of safety of 5 computed as follows:

(1) For outside calking the load shall be equal to the area bounded by the outside calking multiplied by the maximum allowable working pressure;

(2) For inside calking (and with no outside calking) the load shall be equal to the area bounded by the inside calking multiplied by the maximum allowable working pressure.

(f) The rivets attaching nozzles shall be so spaced as to avoid the possibility of the shell plate or the nozzle flange failing by tearing around through the rivet holes. An example illustrating the method of calculations is given in Par. A-70.

(4) Studded Connections—Connections may be made by means of bolt studs. The vessel shall have a flat surface machined on the shell, or on a built-up pad, or on a properly attached plate or fitting. Drilled holes to be tapped for straight threads shall not penetrate within ¼ of the wall thickness from the inside surface of the vessel unless at least the minimum thickness required as above is maintained by adding metal to the inside surface of the vessel. The threads shall be full and clean and shall engage the stud for a length of at least 1½ stud-diameters. Studded connections shall meet the requirements for reinforcement. No credit for reinforcement shall be allowed for any areas attached by studs only.

(5) Threaded Connections—Pipes, tubes, and other threaded connections that conform to the ASA Standard for Pipe Threads (ASA B2.1-1945) may be screwed into a threaded hole in a vessel wall provided the pipe engages the minimum number of threads specified in Table P-12 after allowance has been made for curvature of the vessel wall. A built-up pad or a properly attached plate or fitting may be used to provide the metal thickness and number of threads required in Table P-12 or to furnish reinforcement when required:

**Table P-12. Minimum Number of Pipe Threads for Connections**

| Size of pipe connection. in. | ½ & ¾ | 1, 1¼ & 1½ | 2 | 2½ & 3 | 4–6 | 8 | 10 | 12 |
|---|---|---|---|---|---|---|---|---|
| Threads engaged | 6 | 7 | 8 | 8 | 10 | 12 | 13 | 14 |
| Min. plate thickness required, in inches | 0.43 | 0.61 | 0.70 | 1.0 | 1.25 | 1.5 | 1.62 | 1.75 |

Threaded connections larger than 3-inch pipe size shall not be used when the maximum allowable working pressure exceeds 100 p.s.i. This 3-inch pipe-size restriction does not apply to plug closures used for inspection openings, end closures, and similar purposes.

(6) Expanded Connections—A pipe tube, or forging not exceeding 6 in. in outside diameter may be attached to the wall of a vessel by inserting through openings complying with Par. P-268(a) and expanding into the shell, in accordance with the requirements of Paragraphs P-251 and P-252.

P-268(i) Nozzle Neck Thickness—The thickness of a nozzle neck used in a reinforced opening shall not be less than the thickness required for the applicable loadings, but in no case less than the smaller of the following:

(1) The thickness of the shell or head;

(2) The thickness of standard-wall pipe (ASA B36.10-1950) for pipe nozzles or the required minimum thickness of a tube nipple based on 600 p.s.i. internal pressure.

P-268(j): Unless specifically allowed otherwise, all connections after being attached by fusion welding shall be stress-relieved.

Fusion-welded connections may be added to a vessel after it has been stress-relieved, without requiring stress-relief provided:

(1) The diameter of the attachment opening in the vessel wall does not exceed that allowed for an unreinforced opening, or does not exceed 2 in., whichever is smaller;

(2) The inside and outside attachment welds do not exceed 3/8-in. throat dimension.

This provision does not apply to those connections so placed as to form ligaments in the shell, the efficiency of which will affect the shell thickness. Such added connections shall be stress-relieved.

P-268(k) Fig. P-36 illustrates some types of fusion-welded connections which are acceptable.

When end faces of nozzle or manhole necks are to remain unwelded in the completed vessel, these end faces shall not be cut by shearing unless at least 1/8-in. of additional metal is removed by any method that will produce a smooth finish.

P-268 (1) Typical examples of the application of the above rules are presented in Pars. A-65 to A-70.

### Other Code Revisions due to Revised Par. P-268

Remove lettered paragraph reference but leave "P-268" reference in the following locations:

(1) Par. P-108(b).
(2) End of Par. P-112(c).
(3) Par. P-194(b).
(4) Par. P-194(f).
(5) Par. P-195(d).
(6) Par. P-195(k).
(7) Par. P-259.
(8) Par. P-260.

Other Rivisions:

(1) Par. P-195(d)—Delete "In the application . . . (all the way to) . . . referred to in Fig. P-37 and Par. P-268(g)."

(2) Par. P-195(k)—Add words in parenthesis "(Opening with inherent reinforcement)" after "Unreinforced openings" in the first line. Revise reference to Fig. P-35 to Fig. P-34.

(3) Par. P-198(b)—Replace entirely by "OPENINGS: Openings shall be designed in accordance with the rules in Par. P-268."

(4) Paragraphs A-65 to A-70, examples to be revised to indicate construction in accordance with revised Par. P-268.

(5) Par. P-105(c)—Add words in parenthesis "(Opening with inherent reinforcement)" after unreinforced holes" in first line.

Edmonton. President Dobbin presents Institute prize to third year engineering student K. Dudman of the University of Alberta. From left to right: President Dobbin, Mr. Dudman, Dean R. M. Hardy, and N. J. Allison, Branch chairman.

Moose Jaw. Left to right: E. C. B. Macnabb, P. L. Graham, E. K. Dokken, L. Cockerel, L. Austin Wright and Mr. Blacksten.

Lethbridge (at left). Left to right at head table: A. L. H. Somerville, Deputy Mayor Black, P. M. Sauder, Mrs. Kirkpatrick, R. L. Dobbin, Branch Chairman David Cramer, and L. Austin Wright.

Lethbridge (at right). Left to right around the table: A. J. Branch, Mrs. Branch, N. H. Bradley, Mrs. Bradley, P. H. Walker, Mrs. Walker, K. M. Lissel, Mrs. Lissel, Mrs. Wilson, L. M. Wilson.

Yukon. The general dinner meeting. Seated at the head table are Mrs. H. W. Love, John L. Phelps, Mrs. M. C. Sutherland-Brown, President R. L. Dobbin, Lt.-Col. M. C. Sutherland-Brown, Mrs. J. L. Phelps, Brigadier H. W. Love, Mrs. A. C. L. Adams, and Lt. K. J. Baker.

# 1953 E.I.C. Membership Directory

## Errata

*(Continued from April issue)*

With the completion and distribution of our 1953 Membership Directory, a small number of errors have come to light. Naturally, these are very much regretted, but since the work had to be done under pressure against time, a certain number of mistakes were almost inevitable.

For the convenience of all members we are printing below a further list of names as they should have appeared in the Alphabetical Section. For errors in the Geographical Section the necessary correction is simply noted.—Editor.

**KIELLAND, Axel,** McGill '45. Prodn. Offr. Dept. of Defence Production, Ottawa. J'52. M'52.

**LEGGET, R. F.,** Liverpool '25 and '27. Dir., Divn. of Bldg. Resch., N.R.C., Ottawa. Mail: 531 Echo Dr. J'29. AM'31. M'40.

**LITSTER J. C.,** Alta. '30. Appln. Engr., C.G.E., 1350 Castlefield, Toronto. Mail: 47 Norton Ave., Willowdale, Ont. M'52.

**McKIBBIN, Col. K. H.,** R.M.C. '36, Queen's '38. D.N.D. (Army), Ottawa. Mail: 512 Driveway. S'35. J'41. M'43.

**SCOTT, Lt. Col. C. A.,** Toronto '09. Comm., Cdn. Red Cross Society, B.C. Div., 1235 West Pender St., Vancouver. AM'20. M'40.

**STIDWILL, G. B.,** Queen's '32. Asst to Mgr., Howard Smith Paper Mills, Cornwall, Ont. M'48.

**STIDWILL, L. P.,** Queen's '43. Consltg. Civil Engr., 168 Pitt St., Cornwall. Mail: P.O. Box 1001, Cornwall, Ont. M'48.

**TAYLOR, Ord. Cmdr., George,** Manchester '24. Dir. Engrg. Standards and Naval Specifications, McCoy Bldg., Ottawa. Mail: 288 Carling Ave. M'48.

**TEMPLEMAN, G. E.,** Retd., 147 Strathearn Ave., Montreal West, AM'19, M'27.

# Elections and Transfers

At the meeting of Council held at Kingston, Ontario, on Friday, April 30, 1954, a number of applications were presented for consideration and on the recommendation of the Admissions Committee the following elections and transfers were effected:

*Members:*

W. W. Ashworth, *Brockville*
V. S. Buckler, *Winnipeg*
L. H. Carreau, *Ottawa*
T. A. Crosier, *Winnipeg*
J. L. Darimont, *Whitehorse*
D. D. Dunbar, *Kamloops*
R. D. Jamieson, *Brockville*
G. J. Jouven, *Montreal*
O. O. Junker, *Calgary*
G. F. P. Layne, *Montreal*
R. B. Leeming, *Montreal*
V. A. Mirkovich, *Arvida*
H. B. Mooers, *La Tuque*
E. Quayle, *Montreal*
L. G. Throssell, *Australia*
N. D. Woollings, *London*

*Juniors:*

D. G. Cowan, *Shawinigan Falls*
G. W. King, *Montreal*
M. Masse, *Montreal*
E. W. Mercer, *Summerside*
A. A. Roesch, *Cold Lake*
W. G. Speirs, *Edmonton*

*Transferred from the class of Junior to that of Member:*

W. A. Armstrong, *Berlin, N.H.*
D. E. Beek, *Mindemoya*
R. M. Campbell, *Montreal*
R. S. Cornell, *Montreal*
W. H. George, *Jasper*
J. Gregory, *Edmonton*
R. H. Hales, *London, Eng.*
H. P. Hershman, *Montreal*
J. B. Hicks, *Victoria*
J. S. Hubley, *Shediac, N.B.*
E. J. Klohn, *Vancouver*
G. R. LaBoissiers, *Beauharnois*
D. A. Lamont, *Peterborough*
A. G. Lane, *Montreal*
C. E. Leonoff, *Vancouver*
A. Olynyk, *Montreal*
E. C. Orford, *Hays, Alta.*
S. Rabin, *Montreal*
D. L. Ryan, *Trenton*
E. E. Sutton, *Peace River*

The following Students were admitted:

*University of Toronto*

H. N. Atkins — C.P.J. Korzeniowski
J. A. Becker — D. F. Pearson
T. J. Clerke — F. Schaeffer
D. J. Cox — J. G. Smale
H. H. F. Eisler — B. S. Szabo
J. L. Forster — B. P. Wallace
P. Geiger

*Nova Scotia Technical College*

E. C. Barrett — M. Gonzalez
M. Brake — D. M. MacInnes
W. A. Clarke — A. R. MacKenzie
E. A. De Coste — G. R. Pond

*University of New Brunswick*

R. O. Costar — M. J. Hassell
J. R. Dean — K. G. Wilson

*University of Alberta*

D. Albrecht — D. B. Smith
N. F. Budgen — J. F. Tod
D. J. Marsden — K. R. Walker

*Royal Military College*

W. H. Jopling — M. C. Schofield
W. C. Moffatt — D. P. Sexsmith

*McGill University*

R. Kingstone — G. A. R. Prentice
L. Kolisnyk

*Mount Allison University*

F. L. Henderson — P. W. Ross

*Memorial University*

J. E. Kean — R. T. Parsons

*Queen's University*

D. I. Gallagher

*University of Ottawa*

J. Griffon — J. Muldenna

*Carleton College*

J. Belanger

*St. Mary's University*

R. J. M. Mansour

**Applications through Associations:**

By virtue of the co-operative agreement between the Institute and the Associations of Professional Engineers, the following elections and transfers have become effective:

Alberta

*Members:*

K. M. Millar — G. Olson

*Junior to Member:*

J. A. Barnes — T. D. Lusted
J. I. Lessard

Saskatchewan

*Members:*

R. C. Cheyne — E. B. Moysey
N. P. Elphinstone — J. Runcie
R. E. Lawrence — R. L. Slavin
O. R. Mann — J. L. Townley

*Student:*

L. Lee — O. Rapp

*Junior to Member:*

M. E. Stadnyk — O. L. Symes

Nova Scotia

*Member:*

D. T. Bayer

*Junior to Member:*

W. J. P. Chaffey — G. E. Mason
C. H. Hood

*Student to Member:*

F. J. MacDonald

Quebec

*Members:*

P. R. Browning — A. U. Wastvind
J. Stoddart

*Juniors:*

E. J. Arnold — G. S. Conger
T. C. Arnold — L. W. Frech

# News of Other Societies

Over 1,500 engineering educators will attend the annual meeting of the **American Society of Engineering Education** on June 14-18 at the University of Illinois, Urbana, Ill.

The meetings will include conferences sponsored by the Engineering College Administrative Council and the Engineering College Research Council, which are two component organizations of the ASEE.

There will be over 100 individual conference programs arranged by divisions, committees and councils of the Society. Members of the Engineering Institute who wish to attend the Conference should write to Professor Robert K. Newton, ASEE Housing Chairman, University of Illinois, Urbana, Illinois, for information and reservations.

**The American Society of Civil Engineers** (33 West 39th St., New York 18) will hold the 1954 spring meeting on June 14 – 19, at the hotel Chalfonte-Haddon Hall, Atlantic City, N.J.

# NEWS OF THE ASSOCIATIONS & CORPORATION

**Information received through co-operation with the provincial organizations**

## Nova Scotia

The following report presented by Dr. F. H. Sexton, as chairman of the Professional Relations Committee for the Nova Scotia Association of Professional Engineers gives a good idea of the effort being made by the Nova Scotia Association in the interests of Professional Engineers.

Associated with Doctor Sexton on the committee were the following: G. D. Anderson, G. T. Clarke, W. A. Devereau, D. F. Kirk, C. N. Murray, F. C. Morrison, and J. P. Vaughan.

### Report of the Professional Relations Committee

During the year no special cases were referred to the committee for investigation, nor was any definite action requested by the Council of the Association.

#### *Better Public Relations Needed*

The committee has long been aware of the need of better public relations for the profession. This is not suggesting that there is any antagonism on the part of the public toward the engineer, either singly or in groups. Nothing could be further from the fact. The public marvels at the ingenious machines and the great works constructed by the engineer, and vicariously glows with satisfaction at the great material progress that is being achieved by modern science and technology. However, it does not know, nor does it seem interested in either the man who plans and carries out the advances nor in his status in society. Part of this indifference and ignorance is due to the fact that engineering has achieved the professional level so recently, and partly to the engineer himself.

The word engineer was commonly used in the last century to describe the man at the throttle of the thundering locomotive, the whirring steam engine of the power plant, or the thudding engines of the steamboat. Even today the same word is generally used in Great Britain to designate all the skilled mechanics who operate machine tools, build ships, or follow many other so-called engineering trades. In the popular mind it is still associated with a vocation or trade. It does not carry the implication that it is a profession on the same level as the ministry, law, or medicine. The engineer is generally regarded as a super mechanic, but is not accorded the social prestige of a person with university training with a high code of ethics, who is basically devoted to human service. The works of the engineer overshadow the man.

#### *"Silent Service Is Not Enough"*

The engineer has not put forth any great amount of effort to dispel the popular misconceptions of his profession. It is sad to state that often he himself does not hold a sufficiently high opinion of his own calling. If this is the case, he certainly cannot win from those outside it the regard it deserves. His general attitude is one of humility. This is a worthy one when we consider that he must feel this way in face of the great forces of nature which he tries to control and direct for the good of mankind. It is not right, however, for him to be similarly humble when in contact with other men. He seems to have a distinct inferiority complex when mixing socially or in a business way with other people. This may be due to the fact that he seems to regard their knowledge as superior to his own. He has a bad reputation for talking shop endlessly with his own kind and shutting up like a clam with others. In the face of rapidly changing science and technology, it is natural that the engineer should devote a great deal of effort to keeping abreast of the advance. It is not justifiable, however, that he should fill all the compartments of his mind with details of his work. He ought to widen his interests, knowledge, and sympathies if he is to lead a significant and wholesome life. A materialistic philosophy of life is a weak and narrow foundation upon which to erect a satisfactory structure of enjoyment and service in a beautiful and entrancing world.

The wisdom of the bulletins which you have received under the title of *"Silent Service is not Enough"* must have been approved by most of you, if not by all. These have been in the hands of the members for a whole year, but there is not much evidence that the advice has been generally followed. In looking over the advertisements of the engineering firms in the leading provincial newspapers, I have observed only one who has used the significant title of P.Eng. after his name. Where members have been mentioned in the news, this abbrevation has been absent in almost every case. When will we drop this attitude of false modesty and regard the title of P.Eng., not as a means of emphasizing a personal distinction, but as a duty to secure a public recognition of a noble profession?

#### *Professional Titles*

There is a growing general custom for people with professional titles to use them freely. I feel sure we do not criticize persons who habitually proclaim their callings by adding the abbreviations of M.D.C.M., R.N., C.A., and Q.C., after their names. Through constant repetitions we all know what they mean, and we respect their implications. Engineering today has the largest membership of any of the professions, but it has not yet received the public recognition that it deserves. I doubt if our members would be able to recognize the full titles that are expressed by the following abbreviations: A.R.S.M., D.I.C., L.S.P., D.C.E., K.S.A., B.L.S., L.R.S.M. Yet most of these have been earned by a course of training at least as rigorous and advanced as that for a Bachelor of Science of Engineering. They also imply as great a degree of ability and intellect. If our members would be as careful to use our proud title, our recognition and prestige would soon be established because of our great numbers.

There are several outstanding engineering projects being carried out in Nova Scotia at present. A few articles about them have appeared in the press, but these have been mere statements of progress based mainly on interviews with the contractors. There is not the least doubt that the greatest interest lies in the engineering features of these costly construction enterprises. Why haven't the engineers taken the opportunity to give the public some stories about how the works were planned; in what manner they are different from other bridges and causeways; why the causeway across the Strait of Causo was chosen instead of a bridge or a tunnel; the gigantic machinery that is being employed; how the work is being carried out? The public has an insatiable curiosity to know how things are made and how they are done. It would not be of any interest to give all the boring technical details which an engineer imposes on the attention of his fellows in an address at a professional meeting. There are, however, thrills and romance in a story of how a mountain is being moved, and stone blocks the size of a motor truck being dumped into thirty-fathom depths of the sea. All an engineer has to do is to sift out the aspects of the work that are of significance to other people, and tell them to a reporter. The latter will write the story and be glad to tell it. It seems that the fault lies in the neglect of the engineer to discover what is newsworthy in his efforts and to share it with the public. Until he does this, the recognition of the profession will remain under the traditional bushel.

The committee endorses wholeheartedly the recommendations set forth in the series of leaflets that have come to you under the caption *"Silent Service is not Enough"*. The matters are presented in a far better way than the committee could have done it, because the authors are experts in this complex area of public relations. We recommend that the leaflets be read again, and that our members make serious and continuous efforts to carry out the instructions set forth therein.

*Engineers and Architects*

During the year the secretary circulated a copy of a code of practice that had been jointly agreed upon by the architects and engineers of the State of Massachusetts. This is a highly desirable move, because the dividing line of competence and responsibility between the two in many types of construction is so uncertainly marked. There have been some unethical practices on the part of both professions in the past. Engineers have planned structures on a purely functional basis when beauty should also have been incorporated into the design. Architects have specified technological equipment and services that should have been selected by engineers. Both have availed themselves of the free services and advice of manufacturers for equipment and material whose applications fell outside their practical experience. Each has at times employed technicians instead of registered professional engineers in the preparation of portions of specifications dealing with matters outside of their full knowledge and experience. Happily, both professions are recognizing the undesirability of these practices, and are cooperating to wipe out unethical lapses and put all their planning and supervision on a high professional plane. In this province there has been appointed a joint committee of the two associations which is engaged in securing higher standards. It is very helpful to have the definite code of the architects and engineers in Massachusetts as a guide.

*Lectures Commended*

The committee wishes to express its commendation of the effort of the Halifax Branch of the Engineering Institute in providing a series of lectures on subjects of importance to the practising engineer. They are planned to broaden his field of knowledge and interest and to awaken his desires for a fuller culture. Such efforts are praiseworthy under the present pressures of duty and the tendency toward specialization among all professional persons. It is to be hoped that the program of subjects will be widened and deepened in each succeeding winter, until it covers the full range of the humanities, science, current affairs, and the principal divisions of knowledge necesary for significant living.

The committee is concerned with any effort it can make to maintain and improve the status of every individual member and the prestige of the profession as a whole. It believes that the engineer has lifted his calling to a remarkably high level by the works of members alone. Business and industry are competing for the men with the highest training in applied science from the moment they appear from the universities with their diplomas freshly signed. Every year sees a largely increased number moving into the most responsible executive positions in our corporations. This state of affairs should be seized upon by all and every one of us to strive for adequate recognition and the deserved prestige of the profession as a whole. Let us each give our best efforts toward this goal.

F. H. SEXTON,
*Chairman*

## New Brunswick

### Transfer Fee Abolished

Letters were read from Alberta, British Columbia, Ontario, and Quebec Asociations regarding their policy of not collecting transfer fees. The following motion was adopted:

"That the New Brunswick Association, as of this date, March 12, 1954, abolish the policy of collecting the transfer fees from members of other provincial Associations or Corporation who transfer their membership to this Association. This being done to further in every way possible the free interchange of registered engineers from province to province in Canada."

### Licenses Issued

The secretary's action in issuing licenses to the following was approved: C. O. Whitman, Montreal; H. A. Anderson, Cleveland; K. R. Rybka, Toronto; K. E. Whitman, Halifax; W. P. London, Niagara Falls; R. A. H. Hayes, Niagara Falls; C. A. E. Fowler, Halifax; T. M Keogh, Toronto; J. Price, Windsor.

### Joint Finance Committee

Prof. E. E. Wheatley and R. C. Eddy were appointed as the Association's representatives on the Joint Finance Committee.

The Council met with Dr. L. A. Wright, Dr. E. O. Turner, R. M. Richardson, and I. M. Beattie for a discussion of the changes in the Joint Agreement. All agreed that the proposed changes in the agreement were the proper thing.

## Quebec

### The Retiring President's Message

This first opportunity to write a message to Professional Engineers through the *Engineering Journal* is particularly appreciated as it coincides with the change in officers of the Corporation of Professional Engineers of Quebec.

At the end of his term, when he can no longer be brought to task for his sins, a retiring president likes to make some personal observations. I propose to make the most of my opportunity by doing a little preaching.

When nations band together in a common cause—somewhere a harsh voice will chant "Imperialism!!"

When provinces are called upon for a united effort, the voice cries "Dictatorship!!"

When organizations pool their efforts, the howl is "Regimentation!!"

If men put their shoulders to a single wheel—"Skullduggery!!"

These harsh words are effective. Without further evidence or argument, they make us back away from a possible threat to our freedom. But before we discard suggestions for united action, let us mentally substitute the word "Co-operation!!" for the harsh slogans of the thoughtless critics.

This simple substitution sheds an entirely different light on our contemplation of the efforts of men to work together.

We hear so much these days of evil designs on our freedom that we are inclined to forget the part that co-operation has played in the good things we possess.

But how can we tell which is "co-operation" and which is "skullduggery!!"?

Why is that fellow pushing his plausible plan?

What are his (ulterior no doubt) motives?

It seems to me that we can consider proposals more objectively and analytically if we spend less time looking for motives and more time considering merits.

What does all this have to do with engineering?

We have today some most important problems of co-operation to solve in our profession. We must be sure, therefore, that we are in the mood to consider them on a proper engineering basis and that the harsh words are reduced to their proper importance.

We are a giant young profession and we are free and independent in our thinking.

True we must be independent thinkers if we are to build better buildings and machines, but we sometimes carry our independence too strongly into our thinking about our purely professional problems.

For example:

We are inclined to be pro this engineering organization and anti that.

We tend to be interested only in the technical and not in the professional.

We will worry about the problems of one branch of engineering (our branch) and show no interest in the problems of others.

We will gaily make rules and regulations in one province without considering the effect on others.

But we are growing up. We can no longer fulfil our duty as a profession unless we increase our strength and usefulness through closer inter-organization co-operation and unity.

There is a need for co-ordinated laws, rules and procedures on matters affecting the movement of engineers from province to province.

There is a need for uniform high standards of admission to practise.

There is a need for greater freedom for the professional engineer to practise his profession.

There is a need to strengthen those fine institutes that work for the advancement of our engineering knowledge.

There is a need for united action and policy on efforts to improve the calibre and position of the engineer in his community.

These needs are recognized.

Already, there have been a large number of fine acts of co-operation for our greater strength. There is a growing movement for greater unity of action in the profession.

It becomes important, therefore, that every engineer take an increasing interest in co-operation. He should study each new proposal objectively and on its merits, but with a will to achieve results through co-operation. He must be most careful not to be led astray by harsh or careless slogans.

This new industrial age in Canada demands a bigger and a better engineering contribution. We may rejoice that engineers are responding by a movement for greater unity and co-operation. It is a sign of maturity. It shows that our profession is ready to strengthen its organization so that we may increase our contribution to the welfare of the public.

R. F. SHAW,
*President*

### Félicitations les plus sincères

Je suis heureux de pouvoir me joindre au Président de la Corporation en offrant mes félicitations les plus sincères à l'Engineering Institute of Canada pour l'excellente initiative qu'elle a prise d'accorder des colonnes de son journal aux associations provinciales.

Ce geste aura pour résultat de resserrer les liens qui unissent les sociétés techniques et les associations professionnelles d'ingénieurs et contribuera sûrement à la réalisation de notre idéal à tous: une profession forte et unie capable de remplir pleinement ses devoirs et obligations envers son pays et ses membres.

La Corporation des Ingénieurs est heureuse par conséquent d'offrir son concours aux éditeurs de l'Engineering Journal pour faire connaître aux membres des associations et sociétés soeurs le point de vue et les opinions des ingénieurs du Québec sur les problèmes fondamentaux qui concernent la profession et de publier dans ces colonnes des nouvelles susceptibles d'intéresser nos confrères des autres provinces.

LEOPOLD NADEAU.
*Secrétaire général*

### Engineers' Right To Design Industrial Buildings Challenged

Can an engineer legally design an industrial building in Quebec? For years this question has been debated and fought over by engineers and architects around the conference table, before the courts and in the legislature.

The courts have stated that there is no clear answer to this question on the basis of existing Acts and that although a certain field of activity is clearly reserved to members of one or the other of the two professions, there exists between these fields a no-man's land where both groups can only practice at their own risk, and where each case would have to be decided by the courts on its own merits.

This is a most unsatisfactory situation and the Corporation is of the opinion that the lack of confirmation of the obvious right of the engineer to design industrial buildings is one of the most serious single deterrents to the proper and full development of engineering in Quebec, leaving the Quebec engineer in a position inferior to other engineers the world over.

For the third time within eight years, the Corporation recently submitted to the Quebec Legislature a proposed amendment to the Professional Engineers' Act which would have clearly confirmed the right of the engineer to control and direct the design of industrial buildings without denying this same right to architects.

The proposed amendment was submitted to all the professional and trade organizations except the P.Q.A.A.) which were directly or indirectly interested. Not one of these groups voiced any opposition; on the contrary, a large majority were openly favorable and many actively supported our request. It should be noted particularly that the Canadian Manufacturers' Association representing the people for whom industrial buildings are designed and erected and the Canadian Construction Association representing the contractors who build these buildings both actively supported the proposed amendment. This indicates that the public whom we serve considers the engineer well qualified to design industrial buildings. As expected, the only opposition came from the Province of Quebec Association of Architects.

Unfortunately, the legislature decided to reject the proposed amendment for reasons which are not quite clear as yet.

### Practice of Engineering by Corporations

One of the major problems presently being considered by the Corporation is the complex question of the practice of engineering by corporate firms, partnerships, registered firms, etc. and the use made by these organizations of the words "Engineer" or "engineering" in their names or as a title or designation in their advertisements.

In the past the Corporation had tolerated the use of the title "Engineer" by corporate firms owned or managed by professional engineers or employing professional engineers, although under the Professional Engineers' Act, this title is reserved exclusively to individuals who are members of the Corporation.

However, this practice having led to serious abuse in recent years, our Council has reached the conclusion that the Corporation would not be properly fulfilling its main duty to the public if the practice was allowed to continue. In addition, there is evidence that the prestige of the profession may be adversely affected.

Consequently it has been decided to request all corporate firms presently using the title "Engineer", as applied to the firm, in their advertisements, to discontinue this practice in the best interest of the profession and of the public which it serves.

Many firms have already undertaken to comply with this request on a voluntary basis and in a remarkable spirit of cooperation.

In addition, a committee has been appointed to carry out a thorough study of the other parts of the problem as well as to make a complete survey of the policies adopted by other engineering organizations throughout Canada and the United States on this subject.

---

## Manitoba

### Officers Elected

Gerald B. Williams, chief engineer, Highways Branch, for the Province of Manitoba and a member since 1939 of the Association of Professional Engineers of Manitoba, is the newly elected president of that body.

He succeeds Major J. L. Charles, chief engineer, western region, for the Canadian National Railways. Major Charles, who gained considerable military engineering experience in two wars, is largely responsible for the construction of the Hudson's Bay Railway and the newly built Lynn Lake Railway.

Mr. Williams, past president of the Engineering Alumni Association, member of the Motor Carrier Board, and chairman of the Canadian Good Roads Association Observer Committee for A.A.S.H.O. on test roads, now undertakes the new responsibility for guiding the affairs of the Association in 1954.

The officers elected to the executive council of the association at the General Annual Meeting, January 21, 1954, and those remaining from 1953 are: vice-president, J. Hoogstraten, professor of Civil Engineering, University of Manitoba; councillors, J. L. Charles, past president; C. L. Fisher, chief engineer,

**Gerald B. Williams**

Armco Drainage and Metal Products of Canada Ltd.; G. W. Moule, contract engineer, Winnipeg City Hydro-Electric System; D. M. Stephens, chairman and general manager, Manitoba Hydro-Electric Board and president-elect of the Engineering Institute of Canada.

C. S. Landon, a member of council for the past 21 years was re-elected as secretary-treasurer and registrar of the Association. Mr. Landon is well known in engineering circles, and has an excellent record of service to the Association and its members.

### Engineer's Grading

In a recent poll of the members of the Association, by the executive council, a grading for engineers and a recommended minimum salary for each grade was determined. Further to this, at the last annual meeting, a petition signed by 46 members and submitted at an earlier meeting was introduced. This petition asked that a schedule of minimum salaries be edited in booklet form and distributed to the members. After a short discussion this matter was referred to a special meeting of council to be held not later than March 31, 1954.

### P. O'Donnell Burke-Gaffney Honored

A bronze miniature bison, symbol of the Province of Manitoba and mounted on a marble base with a silver plate suitably engraved, was presented to P. O'Donnell Burke-Gaffney as a token of esteem and affection from the council and members. Mr. Burke-Gaffney, formerly sales engineer, Johns Manville Co. Ltd., was one of the original founders and a past president of the Dominion Council, and had been member, registrar, and president, of the Association of Professional Engineers of Manitoba.

The Association's representative to the Dominion Council meeting to be held in Toronto, May 28, 1954, Professor J. Hoogstraten, was asked to agree to a proposed amendment to the Dominion Council Constitution by the B. C. Association which if adopted, would remove the upper limit of the assessment which can be made on any member association and thus provide sufficient funds to establish a permanent secretary for that body.

The Association was happy to participate again in "The Kipling Ritual" and Professor Hoogstraten, vice-president of the Association, made a speech of welcome to the graduating class.

The newly appointed publicity chairman of the Association is A. W. Greenberg, structural designer, Green Blankstein Russell and Associates, Architects and Engineers.

---

## Saskatchewan

### New Officers Elected

New officers elected at the Annual Meeting of the Association held in Regina on February 18, 1954, were:

President: G. N. Munro, associate chief engineer, PFRA, Regina.

Vice-President: W. R. Staples, assoc. prof. in Mechanical Eng., University of Saskatchewan, Saskatoon.

Councillors: W. M. Berry, chief, hydrology division, PFRA, Regina; W. G. McKay, consulting engineer, Underwood, McLellan & Associates, Saskatoon; E. C. B. Macnabb, division engineer, CPR, Moose Jaw.

The newly elected officers will also sit as executive members on the Saskatchewan Branch of The Engineering Institute of Canada.

F. E. Estlin, manager of the Canadian General Electric Co., Regina, was appointed to represent the Association on the Saskatchewan Branch of The Engineering Institute of Canada.

Allan Tubby, past-president, was appointed to represent the Saskatchewan Association on The Dominion Council of Professional Engineers.

### Transfer Fee Abolished

The Saskatchewan Association has now abolished the transfer fee of members in good standing in other provincial Associations, to become effective in 1955. This action could not be made effective immediately as it required an amendment to the By-Laws which has to be ratified by the Legislature.

Other provincial associations which have abolished their transfer fees now include Alberta, British Columbia, Ontario, Quebec, and New Brunswick.

### Institute President Visits Saskatchewan

Ross L. Dobbin, president of The Engineering Institute of Canada, visited members in Regina on February 5, Prince Albert on March 11, and Saskatoon on March 12. Successful dinner meetings were held in all cities. Mr. Dobbin presented addresses on his trip to the Coronation as an official representative of the Institute.

### Uniform Examination Syllabus Accepted

For those wishing to qualify as professional engineers by examination, the Saskatchewan Association has now accepted the Syllabus of Examinations which is presently being used by the Corporation of Quebec and the Associations in Ontario and British Columbia. This is another step towards uniform requirements by all registration bodies in Canada.

---

## Alberta

### Annual Meeting and Convention

There was a total attendance of approximately 230 members at the noon luncheon which was addressed by Prof. Robert A. Sutermeister from the School of Business Administration, University of Washington, Seattle. The banquet in the evening was addressed by J. R. White, president of Imperial Oil Limited.

During the afternoon forum discussions, the proposal of J. Herbert Smith, past president of the Ontario Association, was given much consideration. After considerable discussion of the topic the meeting unanimously passed the following resolution:

"It is the opinion of this meeting that the plan for unity proposed by J. Herbert Smith, past president of the Association of Professional Engineers of Ontario, should receive consideration by the incoming Council of the Association and that this Council should do all it can to bring about a union of the Dominion Council and the Engineering Institute of Canada."

### Officers Elected

The ballot for the election of officers and councillors resulted in the following being elected:

President: L. A. Thorssen.

Vice-President: T. D. Stanley.

Councillors elected for a two year term were: L. H. McManus, H. H. Beach, R. C. MacPherson and E. W. Christian.

The continuing councillors are: Prof. J. A. Harle, A. W. Howard, J. I. Strong, and R. D. Livingstone.

J. J. Hanna will continue on Council as past president.

At the Council meeting immediately following the Annual Meeting, Dean R. M. Hardy was again appointed Dominion Council representative and P. M. Sauder was again appointed E.I.C. Council representative. J. Graham Dale was reappointed Faculty Council representative and deputy registrar. J. F. McDougal was reappointed registrar.

---

## British Columbia

### Engineers and Unions

The new Labour Relations Act was greeted by the Association with mixed feelings when it was found that it contained part of the recommendations contained in the brief submitted to the Minister of Labour in December by the Association. That part exempts all professional engineers from provisions of the act. We were not successful, however, in obtaining exemption for engineers-in-training.

The definition of an employee in the new Labour Relations Act is as follows, "Employee" means, a person employed by an employer to do skilled or unskilled manual, clerical, or technical work, but does not include: (a) a manager or superintendent, or any other person who, in the opinion of the board: (i.) exercises management functions; or (ii.) is employed in a confidential capacity in matters relating to labour relations; (b) a member of the medical, dental, architectural, engineering or legal profession, qualified to practise under the laws of the Province of British Columbia, and employed in his professional capacity; (c) a person serving an indenture of apprenticeship under the "apprenticeship act"; (d) a person employed in domestic service, agriculture, horticulture, hunting, or trapping."

The first recommendation made by the Association in its brief to the Minister of Labour was that part (b), as above, be included in the Act. The second recommendation was that (c) should read "a person serving an indenture of apprenticeship under the "apprenticeship act" or is training for the medical, dental, architectural, engineering or legal profession, and is enrolled as such with the British Columbia registering body for that profession."

Representations were made to the Minister of Labour again after the bill was first brought forward in the House so that engineers-in-training might also be exempted under the Act, but in this we were not successful.

### Agricultural Engineers

For some time Council has been concerned about the question of graduates in agricultural engineering. A number of these men have been accepted as engineers-in-training in the past four years, but in the past when they applied for registration they have been advised they would have to write certain examinations in order to qualify depending upon the branch of engineering in which they applied, and whether or not they had any post-graduate courses. This was occasioned by the fact that there was no agricultural engineering branch provided for, and that these graduates were required to register in either mechanical or civil engineering.

Recently, Council asked Professor T. L. Coulthard, who is in charge of the Department of Agricultural Engineering at the university, to attend a Council meeting and discuss this matter with them. As a result of this meeting, Council finally decided that registration should be granted to graduates in agricultural engineering provided that an engineering report or thesis is submitted which is approved by Council upon the recommendation of either the Mechanical or Civil Board of Examiners.

This means that those agricultural engineering graduates, who previously applied for registration and were required to write examinations in either civil or mechanical engineering, now qualify simply by the submission of a report satisfactory to the Board of Examiners in either of these two branches, and the attainment of the four years of satisfactory engineering experience.

### Minimum Salaries

On the recommendation of the Ontario Association and Quebec Corporation and after a review by our salaries committee and council. the following changes have been made in our recommended schedule of minimum salaries:

| | |
|---|---|
| Grade I | $3,600 |
| Grade II | 4,440 |
| Grade III | 5,340 |
| Grade IV | 6,300 |
| Grade V | 7,560 |
| Grade VI | 10,080 |
| Grade VII | 13,800 |
| Grade VIII | 21,000 |

A new booklet is being prepared and will be available around May 15.

### Toastmasters' Club

This year we have had many requests for speakers for various P.T.A. Groups on the subject of engineering. In order to provide sufficient speakers, we have called upon the recently formed Toastmasters' Club on two occasions to provide speakers for us. In this connection C. P. Jones spoke to the Lynn Valley P.T.A. on Wednesday, March 17 and E. S. Hare spoke to the King George P.T.A. in Vancouver on April 14. Although not a member of the Toastmasters' Club A. H. Ashworth also assisted us by speaking to the North Star P.T.A. in North Vancouver, on March 17 on Municipal Engineering.

In addition to these the writer has spoken to the Prince of Wales P.T.A., to engineering students, and to students of Lord Byng High School and North Burnaby High School.

### New Members

The following have recently complied with all requirements for registration as Professional Engineers in British Columbia, and are duly registered as members of the Association of Professional Engineers of B.C.:

**Abrahamson, Carl W.,** mining, assistant resident engineer, Aluminum Company of Canada Limited, Kemano, B.C.

**Bowman, Ronald F. P.,** civil, general manager, Pacific Great Eastern Railway Vancouver, B.C.

**Campbell, John G.,** metallurgical, production superintendent, Kitimat works, Aluminum Company of Canada Limited, Kitimat, B.C.

**Confortin, John C.,** civil, transitman, Canadian Pacific Railway Company, Nelson, B.C.

**Gall, Allan,** mechanical, B.C. International Engineering Co. Ltd., Kemano, B.C.

**Klohn, Earle J.,** civil, soils engineer, Ripley & Associates, Vancouver, B.C.

**Killam, Cecil G.,** chemical, chief chemist, B.C. Electric Company, Vancouver, B.C.

**Lea, Edgar R.,** geological, resident geologist, Cia Minera Aguilar S.A., El Aguilar, Prov. de Jujuy, Argentina, S.A.

**Linderholm, Bo. Anders O.,** mechanical, designer, Sandwell & Company Limited, Vancouver, B.C.

**Logie, John S.,** mechanical, chief engineer, Burrard Dry Dock Company, North Vancouver, B.C.

**MacKay, Thomas W.,** mechanical, president, Thos. W. MacKay & Son Ltd., Vancouver, B.C.

**Newmarch, Thomas F. R.,** chemical, engineer, Department of Technical Services, Powell River Company Limited.

**Nixon, George M.,** electrical, 1351 Oakwood Crescent, Norgate Park, North Vancouver, B.C.

**Scott, Wm. B.,** civil, construction engineer, Halse-Martin Construction Co Limited, Vancouver, B.C.

**Thompson, Mavor S.,** civil, estimator, Dominion Construction Co. Ltd., Vancouver, B.C.

**Vakomies, Pete J.,** chemical, project engineer, Sandwell & Company Limited, Vancouver, B.C.

**Wate, George K.,** chemical, Technical Services Department, Powell River Company Limited.

### Temporary Licence Renewals

The following were granted renewals of their Temporary Licences to the dates indicated:

**Bausch, Karl McK.,** electrical, chief electrical engineer, Power Division, Bechtel Corporation, San Francisco, California. Expires: September, 1954.

**Burns, Russell W.,** geological (petroleum), chief geologist, Union Oil Co. of California, Calgary, Alberta. Expires: September 28, 1954.

**Evans, John M.,** civil, chief engineer, Standard Oil Company of British Columbia Limited, San Francisco, California. Expires: September 30, 1954.

**Falconer, Wilbert L.,** geological, managing director, Ponder Oils Limited, Calgary, Alberta. Expires: April 26, 1955.

**Folger, Anthony,** geological (petroleum), senior geologist, DeGolyer & MacNaughton, Dallas, Texas. Expires: September 30, 1954.

**Fontaine, Edward A.,** electrical, Stone & Webster Service Corporation, New York 4, New York. Expires: September 26, 1954.

**Galbraith, Frederic McI.,** geological mine geologist, Columbia Iron Mining Company, Cedar City, Utah. Expires: September 26, 1954.

**Landes, Robert Wm.,** geological (petroleum) exploration manager, Imperial Oil Limited, Calgary, Alberta. Expires: March 2, 1955.

**Liesemer, George E. G.,** chemical, Central Leduc Oils Limited, Calgary, Alberta. Expires: March 19, 1955.

**Miller, Victor C.,** geological, consulting geologist and photogeologist, Calgary, Alberta. Expires: September 30, 1954.

**Rambo, Wm. H.,** structural, consulting engineer, Portland, Oregon. Expires: September 22, 1954.

**Richelsen, Walter A.,** mining, consulting engineer, Seattle, Washington. Expires: September 5, 1954.

**Spivak, Joseph,** geological, chief geologist, Socony-Vacuum Exploration Co., Calgary, Alberta. Expires: March 22, 1955.

**Stephens, Edward C.,** geological, mining geologist, Spokane, Washington. Expires: September 19, 1954.

**Troxell, Richart L.,** structural, chief engineer, American Marietta Company, Chicago, Illinois. Expires: October 18, 1954.

**Wardle, James M.,** civil, consulting engineer, Ottawa, Ontario. Expires: March 18, 1955.

**Wright, Paul C.,** Jr., geologist (petroleum) chief engineer, Western Natural Gas Company, Houston, Texas. Expires: September 30, 1954.

*Secretary,* L. C. SENTANCE, c/o Canadian Westinghouse Co. Ltd., Hamilton, Ont.

# Personals

## News of the Personal Activities of Members of the Institute

**Dr. Lillian Gilbreth,** Hon.M.E.I.C., of Montclair, New Jersey, received on April 7 in Chicago the George Washington Award for her "outstanding contribution to engineering and management, and for unselfish devotion to problems of the handicapped."

The award, a top engineering honour, which for the first time has been presented to a woman, was made by the Western Society of Engineers and the American Societies of Electrical, Mining, Civil and Mechanical Engineers. Less than 20 men have so far been presented the award. Four of these have been Herbert Hoover, Henry Ford, Orville Wright and Charels F. Kettering.

**Dean Kenneth F. Tupper,** M.E.I.C., has resigned the deanship of the Faculty of Applied Science and Engineering at the University of Toronto. His resignation will become effective June 30, 1954.

This announcement was made recently by President Sydney Smith who paid tribute to the outstanding leadership which Dean Tupper has given to the faculty, saying that he has won the high regard of his staff, students and graduates. At the same time he has always been more than a "faculty" man, having participated in the general affairs of the University, especially through his active membership on the Hart House Board of Stewards.

Dean Tupper succeeded Dr. C. R. Young as head of the science and engineering staff of the University in 1949, after serving previously as director of the engineering division of the atomic energy project at Chalk River.

He received his early education in Saskatoon and Calgary, and graduated with a B.Sc. degree in mechanical engineering from the University of Toronto in 1929. In addition, he was granted a M.Sc. degree in aeronautical engineering by the University of Michigan in 1938.

During the war he was one of a mission of three of the National Research Council to go to England to study jet propulsion, and when the Canadian Crown company, Turbo Research Limited, was formed to work in the field of jet propulsion, he became its chief engineer.

Then after this company was absorbed by Avro (Canada) Limited, Dean Tupper went to Chalk River where he was appointed director of the engineering division in 1947.

**Dr. R. R. McLaughlin,** M.E.I.C., head of the department of chemical engineering of the University of Toronto, has been appointed to the deanship of the Faculty of Applied Science and Engineering, succeeding Dean K. F. Tupper.

Dr. McLaughlin attended St. Andrew's College and the University of Toronto where he received his B.A.Sc., M.A.Sc., M.A. and Ph.D. degrees. He also held a fellowship in England at the Lister Institute in 1929-30

He joined the staff of the University of Toronto in 1926 as a research assistant in the department of chemical engineering. He then held successive appointments as lecturer, assistant professor, associate professor, professor, and then head of the department. In addition, he served as chairman of the physical and biological sciences division in the School of Graduate Studies.

A diligent and productive scientist, Dr. McLaughlin has been continually active in research. He has been the author of a large number of articles in scientific periodicals, and in 1945-46, served as president of the Chemical Institute of Canada.

Dr. McLaughlin will be the sixth dean of the engineering faculty at the University of Toronto. Professor John Galbraith was principal of the old school of Practical Science from its foundation in 1878 until 1906, when it became a faculty of the university. He was dean of this faculty from 1906 until his death in 1914. W. H. Ellis served as dean during the first World War, and Brigadier-General C. H. Mitchell succeeded him from 1919 until 1941, when Dr. C. R. Young was appointed to this post.

**Harold A. Cooch,** M.E.I.C., chairman of the board of Canadian Westinghouse Company Limited of Hamilton, and **J. Alexander Walker,** M.E.I.C., of the consulting firm of Walker and Graham of Vancouver, have been appointed members of the Federal District Commission. This announcement was made recently by Prime Minister St. Laurent who explained that the Commission is responsible for carrying out the national plan to beautify Ottawa.

Messrs. Cooch and Walker, whose term on the Commission will continue until December 31, 1958, are replacing B. K. Sandwell of Toronto, and William H. Warren of Victoria.

Mr. Cooch has been closely identified for more than 40 years with movements to promote the growth of the electrical industry, while Mr. Walker has been working with the Vancouver Town Planning Commission since 1944.

**William R. Way,** M.E.I.C., vice-president in charge of generation and transmission of the Shawinigan Water and Power Company, has been awarded a fellowship in the American Institute of Electrical Engineers.

Mr. Way's citation noted his contributions to the electrical industry "in the administration of utility engineering and operating practices and intersystem collaboration."

He is a former vice-president of the American Institute of Electrical Engineers.

**C. G. Kingsmill,** M.E.I.C., formerly chief engineer of Defence Construction Limited, has returned to his civilian post

### Councillor for Halifax

**J. Winston MacDonald,** M.E.I.C., assistant chief engineer with Nova Scotia Light and Power, Company, Limited, has been elected councillor of the Institute representing the Halifax Branch. This information was not available for the April issue section on new officers of the Institute.

J. Winston MacDonald, M.E.I.C.

Mr. MacDonald was born at Balmoral Mills, Colchester County, Nova Scotia. He received his general schooling at Pictou Academy after which he entered Dalhousie University where he obtained his B.Sc. degree in physics in 1929. Two years later he received his B.Sc. degree in electrical engineering from the Nova Scotia Technical College.

Previous to graduation, Mr. MacDonald was engaged during the summer months of 1929 and 1930 on construction work with Canadian Westinghouse Company, Limited at Paugan Falls, Quebec, and on installation of substation equipment with Nova Scotia Light and Power Company, Limited.

Since graduation he has worked with Nova Scotia Light and Power Company, Limited. He has been associated mainly with public utility engineering and particularly thermal power development in Nova Scotia and New Brunswick. He was appointed to his present position in 1949.

Mr. MacDonald has been active in the work of the Institute in Halifax, becoming chairman of the Branch in 1952. He presented a paper at the annual meeting of the Institute, at Halifax, in 1953, on the subject of Steam Generation of Power in Nova Scotia. He is at present an E.I.C. representative on the International Electrotechnical Commission's Steam Turbine Committee. In addition, he is a member of the council of the Association of Professional Engineers of Nova Scotia.

with Angus Robertson Limited in Montreal.

Mr. Kingsmill, a mechanical engineering graduate of the University of Toronto, class of 1924, was chief engineer of the power development division of the Quebec Hydro-Electric Commission before joining Angus Robertson Limited in 1952.

**H. W. Tate,** M.E.I.C., assistant general manager of the Toronto Transit Commission, has retired to engage in private engineering practice, but for a limited period will continue as consulting engineer to the Commission to complete outstanding subway settlements and to assist in consolidation of the metropolitan transit system.

Mr. Tate has been associated with the Commission since 1920, and has been prominently identified with track rehabilitation, reconstruction and extension work which has been carried out since the Commission undertook the responsibilities of the Toronto Railway Company.

In 1952 he served as president of the Canadian Transit Association.

**D. C. R. Miller,** M.E.I.C., has recently been appointed to the position of general manager of Dow Corning Silicones Limited in Toronto.

A native of London, England, Mr. Miller received his early schooling in that country and in Scotland. He came to Canada in 1931 and that year entered the University of Toronto where he obtained his degree in mechanical engineering in 1935.

Upon graduation he joined the Duplate Canada Limited in Oshawa, Ont., and has been associated with this firm or one of its related companies ever since.

After serving as production superintendent and plant engineer at the branch factory in Windsor, Ont., for two years, he was sent to England in 1938 to study three new developments: an Italian method for making glass fibres, British manufacturing methods of all types of safety glass, and the newly-developed acrylic transparent sheets. On his return to Canada he designed and operated the equipment for making glass fibres by the Modigliani method. This was the first fibre glass to be produced commercially in Canada. He also installed and operated a department for forming transparent plastic sheets, and his company was again the first in Canada in this field, due mainly to the requirements of military aircraft.

In 1939, upon an arrangement with Owens-Corning Fiberglas Corporation for Canadian manufacturing rights on their process, the Fiberglas Canada Limited was formed, and Mr. Miller became the new company's first employee. After many weeks at the Newark, Ohio plant, studying manufacturing processes, he subsequently installed and operated in Oshawa the first equipment in Canada for making fine glass textile fibres.

Early in 1941 Mr. Miller was transferred on loan to the newly-formed Canadian government company, Research Enterprises Limited, which was established to manufacture optical glass and optical instruments mainly used for fire control instrument purposes, and later for the manufacture of radar equipment. Mr. Miller's position was that of production superintendent of optical shops, and as such he was responsible for the quantity and quality of production of the optical grinding and polishing department and for the assembly of all

D. C. R. Miller, M.E.I.C.

optical instruments. In March 1944 he was promoted to the position of department head in the range finder and binocular departments.

At the war's end, Mr. Miller returned to Fiberglas Canada Limited in Toronto. He presented a thesis in 1947 to the University of Toronto which covered one phase of his wartime work. It was entitled "The Wartime Production of Precision Optics in Canada", and for it he was granted the professional degree of Mech.E.

In 1949 he was appointed manager of the silicone sales division of the company. Then early in 1954, the rapidly growing business necessitated the setting up of a separate company, Dow Corning Silicones Limited, and Mr. Miller was appointed to his present position.

**J. A. de Bondy,** M.E.I.C., has been appointed vice-president of Welland Electric Steel Foundry Limited of Welland, Ont. He will be located at the firm's Montreal office.

A Toronto consulting metallurgist, Mr. de Bondy was formerly Toronto manager of Wilkinson Linatex Co. Ltd. of Montreal.

He is a member and a past councillor of the Canadian Institute of Mining and Metallurgy, a past president of the Electric Metal Makers' Guild, and a past chairman of the Manitoba chapter of the American Society of Metals.

R. G. Barbour, M.E.I.C.

**R. G. Barbour,** M.E.I.C., has been appointed vice-president and managing director of T. Pringle & Son Limited of Montreal.

Mr. Barbour received his electrical engineering degree from the University of New Brunswick in 1924 and his master's degree from the same university in 1927. Before joining T. Pringle & Son Limited as chief electrical and mechanical engineer, he was employed with the Canadian General Electric Company and with the Aluminum Company of Canada on construction and operation.

He has been general manager of T. Pringle & Son Limited since 1952.

**M. L. Zirul,** M.E.I.C., district engineer of the water rights branch of the British Columbia Department of Lands and Forests in Kamloops, B.C., has been elected chairman of the Central British Columbia Branch of the Engineering Institute.

Mr. Zirul was born in North Vancouver, B.C., where he received his elementary education. He then attended the University of British Columbia, graduating in civil engineering in 1941.

Upon graduation he joined the Dominion Water and Power Bureau (now the Water Resources Division) of the Department of Resources and Development of Canada. Until 1944 he was responsible for obtaining stream flow

M. L. Zirul, M.E.I.C.

measurements for streams in the Kootenay district of British Columbia.

He then joined the Powell River Company at Powell River, B.C., as field engineer on construction work, and was later appointed design draughtsman on building design in connection with the installation of the hydraulic barker mill.

From 1946 until 1949 he was assistant district engineer with the water rights branch of the Department of Lands and Forests in Nelson, B.C., and later he was transferred to Kamloops, B.C., in the same capacity. He was appointed to his present position in 1950.

Mr. Zirul served as secretary-treasurer of the Central British Columbia Branch in 1950-51, and was a member of the executive in 1952-53.

**L. M. Hunter,** M.E.I.C., has been appointed to the board of directors of Coca-Cola Limited as a vice-president with direct responsibility for all the physical plant properties of the company and of the home office engineering and production activities.

FISCHER
THE OLDEST BALL AND BALL BEARING MANUFACTURERS IN THE WORLD
FAG
Available from Stock

THRUST BEARINGS: Ball and Roller
FISCHER BEARINGS (CANADA) LIMITED
Head Office · · · 240 Fleet St. E.
TORONTO, ONTARIO

A 1936 civil engineering graduate of Queen's University, Mr. Hunter joined the engineering staff of Coca-Cola Limited at the head office in Toronto. He then served in various capacities in the engineering department until 1942 when he was named manager of the engineering and production departments of the company.

**S. V. Antenbring,** M.E.I.C., senior mechanical design engineer in the engineering division of Imperial Oil Limited in Sarnia, Ont., has been named chairman of the Sarnia Branch of the Engineering Institute.

Mr. Antenbring was born in Winnipeg, Man., and after attending the St. Johns Technical High School there, he undertook civil engineering study at the University of Manitoba, graduating with a B.Sc. degree in 1937. Afterwards he was employed for a short time with Sherritt Gordon Mines Limited.

He then joined Imperial Oil Limited in November, 1937 and has since been associated with this company apart from

S. V. Antenbring, M.E.I.C.

the period of May 1941 to October 1945 during which he served with the Royal Canadian Air Force in the aeronautical engineering branch.

At the close of the war Mr. Antenbring returned to Imperial Oil Limited where he was employed on maintenance and construction work at the Sarnia refinery until July 1952 when he was appointed to the position of senior mechanical design engineer in the engineering division.

Mr. Antenbring is a member of the Association of Professional Engineers of Ontario.

**I. Emery Szasz,** M.E.I.C., is now president of Hayes-Durham Forgings Ltd. of Montreal, Que. He was formerly the company's chief engineer and production manager.

Mr. Szasz is a 1923 mechanical engineering graduate of Berne University, Switzerland.

**W. A. Wheten,** M.E.I.C., superintendent of industrial engineering in the power products division of Canadian Westinghouse Company Limited in Hamilton, has been elected chairman of the Hamilton Branch of the Engineering Institute.

Mr. Wheten was born in Saskatoon, Sask., and received his elementary education there. In 1938 he obtained his B.Sc. degree in civil engineering from the University of Saskatchewan.

He then joined the Prairie Farm Rehabilitation Administration as a field engineer on water development, and two years later became assistant engi-

W. A. Wheten, M.E.I.C.

neer with the Department of National Defence (R.C.A.F.) on airport construction. During the period 1941-1946 he served as technical armament officer in the Royal Canadian Air Force, becoming attached to the aeronautical inspection directorate as inspector of explosives in 1942.

Upon his discharge he became irrigation engineer for the Government of Ceylon, and as such, was placed in charge of a large land development scheme employing a staff of 1,500.

Mr. Wheten joined Canadian Westinghouse Company Limited in 1950 as manufacturing engineer. A year later he was promoted to the position of superintendent of industrial engineering in the apparatus division, and in 1953 he was named to his present position as superintendent of industrial engineering in the power products division.

**William Arthur Bowman,** M.E.I.C., designing and structural engineer with the British Columbia Department of Public Works in Victoria, has been elected chairman of the Vancouver Island Branch of the Institute for the term 1954-55.

Mr. Bowman was born at Port Arthur,

W. A. Bowman, M.E.I.C.

Ont. He received his general schooling at the Hudson Public and the Port Arthur Collegiate Institute after which he continued his studies at the University of Manitoba, graduating with a B.Sc. degree in 1942.

During the summer months of his university course Mr. Bowman served as rodman and chainman with the Ontario Department of Highways and with the Canadian National Railways, and as construction inspector with C. D. Howe Co. Ltd. in Port Arthur.

After service with the Royal Canadian Engineers during the war, he joined the C. D. Howe Company in Port Arthur in 1946 as a structural designer. The following year he was transferred by the company to Vancouver, B.C., as a resident engineer.

In 1949 he joined the British Columbia Department of Public Works in Victoria as an engineer in training, and the next year was appointed to his present position.

Mr. Bowman is a member of the Association of Professional Engineers of British Columbia.

He served as secretary-treasurer of the Vancouver Island Branch of the Institute in 1951.

**B. Kelimbet,** M.E.I.C., has joined the mechanical and engineering division of the Public Works Department of the City of Montreal. He was formerly employed by the Johns Manville Company in Asbestos, Que.

Mr. Kelimbet is a 1932 graduate in electrical engineering of the Institute of Technology of Warsaw.

**Joseph A. D'Angelo,** M.E.I.C., has been named supervisor of the manufacturing budget department in the new engine plant of the Ford Motor Company of Canada in Windsor, Ont.

He was formerly employed in the company's time standards and methods section of the industrial engineering department.

Before joining this company, he was associated with National Heating Products Sales Ltd. in Montreal.

Mr. D'Angelo graduated in electrical engineering from the University of Manitoba in 1946.

**Major F. J. Sergi,** C.A.O.R.E., M.E.I.C., who has just completed a course in the Russian language at the Army Language School in California, has been posted to the Royal Military College at Kingston, Ont.

Mr. Sergi graduated in mechanical engineering from McGill University in 1941.

**H. W. Klassen,** M.E.I.C., has been transferred by Angus, Butler & Associates Ltd., from Edmonton to Calgary where he will serve as manager of the Calgary branch of the firm.

Mr. Klassen joined the company in 1952 after having been associated as office manager with Phillips, Stewart and Phillips in Saskatoon, Sask.

Upon graduation from the University of Saskatchewan in mechanical engineering in 1944, Mr. Klassen served with the R.C.E.M.E.; and after the war, he was attached to the University of Saskatchewan as instructor and demonstrator.

**E. R. Welsh,** M.E.I.C., has been appointed general manager of Rice Machine Services Ltd. in Calgary, Alta.

Mr. Welsh graduated in mechanical engineering from the University of Saskatchewan in 1948. After graduation he was employed for five years by Alchem Limited, water treatment engineers, during which time he served in Toronto, Calgary and Montreal.

Mr. Welsh joined Rice Machine Services Ltd. as office manager in 1953.

**Heino Loo,** M.E.I.C., has recently joined the firm of C. B. K. Van Norman and Associates of Vancouver as structural engineer.

He was formerly associated with B.C. International Engineering Co. Ltd. in Vancouver.

Mr. Loo received his B.Eng. degree in structural engineering from Tallin Engineering College in Estonia in 1942.

**R. H. Persson,** M.E.I.C., previously resident engineer with the Prince Albert National Park for the Saskatchewan Department of Resources and Development, is now with Jasper National Park for the Department of Northern Affairs and National Resources.

He is a graduate in civil engineering of the University of Saskatchewan, class of 1948.

**P. G. Campbell,** M.E.I.C., has recently been named resident engineer on the Manitou Falls development of the Ontario Hydro-Electric Power Commission on the English River.

Until his present appointment he was division engineer at Niagara Falls, Ont.

Mr. Campbell received his B.Eng. degree in civil engineering from the Nova Scotia Technical College in 1943.

**Alex G. A. Piercey,** M.E.I.C., has joined the Kamloops refinery of Royalite Products Limited in British Columbia.

He was previously chief chemical

Ralph F. Harrison, Jr.E.I.C.

engineer with the Madison Natural Gas Company in Turner Valley, Alta.

Mr. Piercey received his B.Sc. and M.Sc. degrees in chemical engineering from the University of Alberta in 1936 and 1938, respectively.

**D. G. Ross,** M.E.I.C., is a contract manager of Pentagon Construction Co. Ltd. in Montreal.

He was formerly in private engineering practice in Halifax, N.S.

Mr. Ross received his B.Sc. degree from Dalhousie University in 1922.

**Ralph F. Harrison,** Jr.E.I.C., has been appointed sales manager of the molded plastics section of the Canadian General Electric Company's chemical department. He is located in Cobourg where the company's molded plastics manufacturing facilites are situated.

A graduate in mechanical engineering of Queen's University class of 1947, Mr. Harrison joined the Canadian General Electric Company on its test course at Peterborough that same year. On completion of the test he was assigned to the Cobourg works where he gained experience in plastics manufacturing. He was later transferred to the company's chemical department at head office. Previous to his present appointment he was the company's molded plastics sales representative in the Quebec district.

He is a member of the Association of Professional Engineers of Ontario and of the Society of Plastic Engineers.

**Jean Dumas,** Jr.E.I.C., is now a research officer with the Canadian Armament Research and Development Establishment of the Defence Research Board at Valcartier, Que.

He was previously engaged in post graduate study at the Massachusetts Institute of Technology.

Mr. Dumas received his degree in electrical engineering from McGill University in 1948.

**S/L I. G. Duncan, R.C.A.F.,** Jr.E.I.C., is now chief technical officer at the 22 AC and W R.C.A.F. Squadron in Halifax, N.S. He was previously located with No. 1 GP Headquarters in Montreal.

S/L Duncan received his B.Sc. degree in electrical engineering from the University of Manitoba in 1948.

**W. A. Armstrong,** Jr.E.I.C., is now associated with Brown Company in Berlin, N.H.

He was previously an industrial engineer with Aluminum Company of Canada Ltd. in Arvida, Que.

Mr. Armstrong is a 1948 graduate in mechanical engineering of Queen's University.

**Phil Stamatopoulos,** Jr.E.I.C., has returned to Greece where he will be employed for at least two years.

Mr. Stamatopoulos, a graduate of McGill University in metallurgical engineering in 1949, was formerly associated with the Atlas Asbestos Company in Montreal.

**R. W. Lye,** Jr.E.I.C., is attached to the switchgear and industry control division of Canadian General Electric Co. Ltd. in Peterborough, Ont.

Mr. Lye graduated in electrical engineering from the University of Manitoba in 1949.

## Errata

**Jack C. Morris,** Jr.E.I.C., was mentioned in the January and March issues as having been associated with Canadian Copco Limited and with Carter Construction Co. Ltd. in Toronto. He has never been in the employ of these two companies.

Mr. Morris, a graduate of the University of Toronto in 1951, is a partner in the firm Speckert-Morris Engineering, with headquarters in Markham, Ont. He was associated previously with Sandvik Canadian Limited and Bailey Meter Co. Ltd.

**Merle George Brown,** Jr.E.I.C., who was recently appointed patent examiner with the Dominion Patent Office in Ottawa, was confused in the April *Journal* with **Mervyn Grant Brown,** JR.E.I.C., design engineer with the Mathews Conveyor Company in Port Hope, Ont.

Merle George Brown is a 1952 graduate in mechanical engineering of the University of Manitoba, while Mr. Mervyn Grant Brown is a 1950 mechanical engineering graduate of the University of British Columbia, and has been associated since graduation with the International Nickel Company in Copper Cliff, Ont., and with the Mathews Conveyor Company in Port Hope, Ont.

**Julius A. Krantzberg,** JR.E.I.C., is employed by Truscon Steel Company of Canada Ltd. in Montreal and is engaged in the designing and detailing of reinforcing steel for concrete.

He was previously associated with the Welland Ship Canal staff of the Department of Transport in Ottawa.

Mr. Krantzberg is a graduate of McGill University in civil engineering, class of 1949.

**O. J. Gratton,** JR.E.I.C., is now company engineer with J. D. Campbell & Company in Montreal.

He was formerly associated with Cimentationes Franki de Mexico.

Mr. Gratton received his B.A.Sc. degree in civil engineering from Ecole Polytechnique in 1949.

**Howard R. Lumsden,** JR.E.I.C., has joined the engineering division of Imperial Oil Limited in Montreal.

He was previously associated with Fraser-Brace Terminal Constructors and with the Aluminum Company of Canada.

Mr. Lumsden is a 1949 graduate in civil engineering of McGill University.

**R. J. Trafford,** JR.E.I.C., has been transferred by Dominion Tar & Chemical Co. Ltd. from Montreal to Toronto.

Mr. Trafford is a graduate in chemical engineering of the Nova Scotia Technical College, class of 1950.

**H. W. Grant,** JR.E.I.C., is plant engineer with Standard Aero Engines Limited of Winnipeg, Man.

He was previously associated with the Royal Canadian Air Force in Clinton, Ont., and in Winnipeg, Man.

Mr. Grant is a 1950 electrical engineering graduate of the University of Manitoba.

**Norman Batt,** JR.E.I.C., is now employed on the supervisory staff of the Winnipeg Electric's hydro-electric power plant at Seven Sisters Falls, Man.

He was formerly in the plant maintenance engineering department of the Ford Motor Company in Windsor, Ont.

Mr. Batt graduated in electrical engineering from the University of Manitoba in 1950.

**Donald Smith,** JR.E.I.C., has been transferred by Otis Elevator Company Ltd. from Hamilton to Ottawa.

He has been associated with this company since graduation in electrical engineering from the University of Toronto in 1950.

**P. M. Morency,** JR.E.I.C., is acting supervising engineer with the Rimouski cable project of Canada Wire and Cable Co. Ltd.

He was previously in the company's Toronto and Montreal offices.

Mr. Morency is an electrical engineering graduate of Laval University, class of 1950.

**Jas. C. Browning,** JR.E.I.C., is now refinery manager for Royalite Products Ltd. in Coleville, Sask.

Before joining this company he was employed as refinery superintendent with Refinery Operations Ltd. in Coleville, Sask.

Mr. Browning graduated in 1950 with a B.A.Sc. degree in chemical engineering from the University of British Columbia.

**Robert B. Hill,** JR.E.I.C., has been appointed industrial engineer of the Canada Iron Group of Canada Iron Foundries Limited.

He was formerly planning engineer with Taylor Forbes Limited in Guelph, Ont.

Mr. Hill received his B.A.Sc. degree in engineering and business from the University of Toronto in 1950.

**Wm. E. Blakely,** JR.E.I.C., is now party chief with the National Geophysical Company in Calgary, Alta.

Mr. Blakely is a 1950 graduate in engineering physics of the University of Alberta.

**S. G. Frost,** JR.E.I.C., has recently joined the national building code section of the building research division of the National Research Council.

He was formerly associated with Canadian Celanese Limited in Drummondville, Que.

Mr. Frost received his B.Eng. degree in civil engineering from McGill University in 1950.

**B. G. Bartlett,** JR.E.I.C., is at present an engineer with the Provincial Construction Company on the Woodward's Stores in the New Westmount Shopping Centre in Edmonton, Alta.

He was previously associated with Poole Engineering Co. Ltd. in Edmonton.

Mr. Bartlett is a civil engineering graduate of the University of Alberta, class of 1950.

**Walter S. Zaruby,** JR.E.I.C., is a mechanical engineer in the production department of the Shell Oil Company in Edmonton, Alta.

He received his degree in engineering and business from the University of Toronto in 1952.

**Clive D. McCord,** JR.E.I.C., is a well-site geologist with the Socony Vacuum Exploration Company in Edmonton, Alta.

A 1951 graduate in geology of the University of British Columbia, Mr. McCord has been associated with Link & Nauss Limited, Calgary, and with Crown Silver Mines, New Hazelton, B.C.

**R. L. White,** JR.E.I.C., until recently a graduate industrial trainee with the Allis-Chalmers Manufacturing Company in Milwaukee, Wis., is now with Canadian Allis-Chalmers Ltd. in Montreal.

He is a graduate in mechanical engineering of Queen's University, class of 1951.

**Bernard G. King,** JR.E.I.C., is employed as project engineer with B. Perini & Sons, Canada Ltd. in Ottawa.

He was formerly with the C. D. Howe Company as field engineer in the radio and electrical engineering laboratories in Ottawa.

Mr. King is a civil engineering graduate of McGill University, class of 1952.

**N. D. Ross,** JR.E.I.C., is now industrial sales engineer for Imperial Oil Limited, and is located in Lennoxville, Que.

A graduate of Queen's University in mechanical engineering in 1952, Mr. Ross was previously lubrication sales engineer with the company in Toronto.

**Lt. B. F. Simons,** S.E.I.C., is now located in Kingston, Ont., at the Royal Canadian School of Signals at Vimy Barracks.

Lt. Simons attended the Royal Military College in Kingston, Ont.

**R. L. M. Lord,** S.E.I.C., has joined Dominion Tar and Chemical Company as a process engineer.

Before graduating from Michigan

**Richard L. M. Lord, S.E.I.C.**

State College in chemical engineering in 1953. Mr. Lord was employed during the summers with Canadair Limited, Michigan State Landscaping Department, Michigan State Highway Department, and with the Canadian Pacific Railway at the Cote St. Luc yards in St. Laurent, Que.

**Wm. Bermingham,** S.E.I.C., is now superintendent of Bermingham Construction Ltd. in Hamilton. Ont.

He was previously associated with Pigott Construction Ltd. in Hamilton.

Mr. Bermingham is a 1952 graduate of the Royal Military College in Kingston.

**J. D. Henderson,** S.E.I.C., is with H. H. Angus & Associates, Toronto consulting mechanical and electrical engineers. He is presently engaged on design of ventilating and air conditioning systems for public and industrial buildings.

He graduated from the University of Saskatchewan in mechanical engineering in 1953.

**D. A. Panabaker,** S.E.I.C., is presently employed as a junior geophysicist with Western Geophysical Company of Canada at Edson, Alta. He was previously located in Virden, Man.

Mr. Panabaker graduated in civil engineering from Queen's University in 1953.

**G. Lexier,** S.E.I.C., has joined the toll switching department of the equipment engineering division of Alberta Government Telephones in Edmonton.

He was formerly associated with the Manitoba Telephone Company in Winnipeg.

Mr. Lexier graduated in electrical engineering from the University of Manitoba in 1953.

**John I. Adams,** S.E.I.C., formerly with the Preload Company of Canada in Regina, Sask., is now with Canada Gunite Co. Ltd. in Calgary, Alta.

**Ansley V. Bagnell,** S.E.I.C., is now sales engineer with the industrial division of Lounsbury Co. Ltd. in Moncton, N.B.

He was formerly associated with Modern Construction Ltd. in Moncton, N.B.

**Arthur L. Hooker,** S.E.I.C., formerly project engineer with Northern Construction Company & J. W. Stewart Limited in Goldbridge, B.C., has joined the staff of D. H. Burnett, civil engineer and British Columbia land surveyor in Burnaby, B.C.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Adam Cunningham,** M.E.I.C., chief engineer of Price Brothers & Company, Limited in Kenogami, Quebec, died suddenly on April 21, 1953.

Mr. Cunningham was born in Edinburgh, Scotland, on August 23, 1897. Upon completion of his general education at the George Watson College, he served a five-year apprenticeship with West End Engine Works Co. Ltd., mechanical engineers and millwrights specializing in papermaking machinery in Edinburgh. During this period he was employed in the patternshop, machineshop and the fitting and erecting shops. At the same time he received technical training at the Heriot Watt College.

From 1917 until 1920 he served with the Imperial Army, first with the R.A.S.C. mobile workshops in Palestine, and then with the Egyptian Expeditionary Force in base heavy repair workshops in Alexandria, Egypt. He was discharged with the rank of mechanical staff sergeant.

He then entered the University of Edinburgh where he received his B.Sc. degree in mechanical engineering with honours in 1923.

Upon graduation he served one year as lecturer in engineering mathematics and mechanical engineering drawing at Ramsey Technical College during the evening, and at the same time, during the day, he was employed as draughtsman with MacTaggart, Scott & Co. Ltd., hydraulic and electrical engineers at Loanhead, Scotland. In the latter position he was engaged on the design of hydraulic operating gear for dock gates and hydraulic aircraft cranes supplied to the British Admiralty.

Mr. Cunningham came to Canada and in August, 1924, joined the staff of the record department of Price Brothers & Company, Limited, Kenogami Paper Mills. Eight months later he became assistant to the mechanical superintendent of the company's Riverbend mill. Following a slow-down in Riverbend operations, due to the depression, he was transferred to Kenogami in 1933 to

Adam Cunningham, M.E.I.C.

resume his activities in the mechanical department.

He resigned this position in 1936 to accept an appointment with the Ontario Paper Company in Thorold, Ontario, but returned to Kenogami as plant engineer in 1937. He was promoted to the position of chief engineer of the paper division in January, 1944, and to that of chief engineer of the company in July, 1952.

Mr. Cunningham was very active in the civic affairs of the Lake St. John District. He was on the instructional staff of the Wartime Machine Shop Training Program, and also worked untiringly for the Hobby Shop Amateur Theatricals as well as on various committees of the Canadian Legion. He was chairman of the Kenogami Protestant School Board for many years.

Mr. Cunningham served as councillor of the Institute representing the Saguenay Branch for the term 1945-46. He joined the Institute as a Junior in 1925, transferring to Associate Member in 1927, and to Member in 1940.

**Flying Officer Kristjan Marteinn Eyolfson, D.F.C., R.C.A.F.,** JR.E.I.C., was killed in an aircraft crash about ten miles west of Shawville, Quebec on November 10, 1953.

Flying Officer Eyolfson was born in Leslie, Saskatchewan, on May 18, 1917. After receiving his general education at Rose Vale and Leslie, he enlisted with the Royal Canadian Air Force. In recognition of his outstanding service overseas, he was awarded the Distinguished Flying Cross.

Upon his discharge at the close of the war, he entered the University of Saskatchewan and obtained his B.Eng. degree in electrical engineering there in 1950.

Upon graduation he joined the Geological Survey at the Victoria Museum in Ottawa, but in April, 1951, he returned to the Royal Canadian Air Force with which he completed courses of instruction in Prince Edward Island, Texas and Florida. He was then posted to North Bay, Ontario, as an instructor in the officers' training unit, and in September, 1953, he was appointed navigator radar leader in the No. 445 All Weather Fighter Squadron, the first of its kind in Canada.

Flying Officer Eyolfson joined the Engineering Institute as a Student in 1949, transferring to Junior Member in 1952.

**Ronald Emeric Nugent,** JR.E.I.C., outside plant engineer with the Bell Telephone Company of Canada in Sherbrooke, Quebec, died on February 20, 1954.

Mr. Nugent was born at Salisbury, New Brunswick on December 14, 1929. After receiving his general education at Salisbury High School, he entered St. Francis Xavier University in 1947 where he studied for three years before undertaking civil engineering study at the Nova Scotia Technical College. He obtained his B.Eng. degree in 1952.

During the summer months of his university course he served as assistant engineer with T. C. Gorman (N.S.) Limited and as instrumentman with the construction department of St. Francis Xavier University.

Upon graduation Mr. Nugent joined the Bell Telephone Company of Canada as outside plant engineer in Sherbrooke, Quebec, which position he held at the time of his death.

Mr. Nugent joined the Engineering Institute of Canada as a Student in 1951, and was transferred to Junior Member in 1954.

# Employment Service

**THIS SERVICE is operated for the benefit of members of The Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.**

**NOTICES appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.**

**REPLIES to advertisements should be addressed to File No. 000, Employment Service, The Engineering Institute of Canada, 2050 Mansfield Street.**

**INTERVIEWS with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged by appointment.**

## SITUATIONS VACANT

### CHEMICAL

CHEMICAL GRADUATE with experience, preferably sales, in metal cleaning, electroplating and/or painting. This is a salaried position plus expenses, commission and annual bonus. Firm also provides a liberal retirement insurance an hospitalization programme. Location working out of Toronto. File No. 4783-V.

A CHEMIST WITH a B.Sc. degree in chemistry or better with good background in organic chemistry, preferably with one or two years' experience in the pulp and paper industry, but not an absolute requisite. Duties include special analytical work, experimentation on cooking and bleaching of kraft base pulp, also on development of by products. File No. 4835-V.

GRADUATE CHEMIST REQUIRED TO BE trained as assistant to chief chemist. Plant located at Cardinal in Ontario in one of Canada's oldest food industries. Forward all details of experience, education, with pictures, and anticipated salary to File No. 4837-V.

CHEMICAL ENGINEERS required for research and development department of large world wide organization with plant located in Montreal. Duties to do development work on various products made from fibres or adhesives. This work will consist of improving our present operations and finding new methods of processing. A certain amount of research work on developing new products will be undertaken. File No. 4844-V.

LECTURER OR ASSISTANT professor of chemical engineering required to give unit operations course with laboratory and design calculations course to junior and senior year classes. Time available for graduate study and research. Industrial experience desirable but not requisite Salary dependent upon qualifications. Apply Nova Scotia Technical College, P.O. Box 1000, Halifax, Nova Scotia. File No. 4851-V.

### CIVIL

CHIEF ENGINEER and director required by structural engineers Toronto. Applicants must be structural engineers specialized in design and full control of drawing office for many years in position of entire responsibility for the design of work of great magnitude in both reinforced concrete and structural steel. Suitable age between 35 and 45. File No. 4785-V.

CIVIL ENGINEER required by private consultant located in Ontario. Requirements are at least five years experience engineering. Preference will be given to applicant having commission as land surveyor. Salary $4,500.00. Please state age, education and experience to fullest extent and ability. File No. 4786-V

RECENT GRADUATES IN civil engineering for employment in Southern Ontario as sales representatives of national manufacturer and erector of steel construction products. Preparatory training course provided. File No. 4793-V.

REQUIRED GRADUATE civil engineers for specialized work in soil mechanics and foundation engineering. Graduate soils work desirable. Locations: Montreal and Toronto with some travelling. File No. 4794-V.

THE COMMUNITY PLANNING ASSOCIATION OF CANADA invites applications for the principal staff position in its national office. Applicants should have a general knowledge of community planning and municipal affairs, and must have an ability to prepare information and publications on planning subjects in non-technical language. Applicats need not possess professional qualifications as planners. The salary will be commensurate with the qualifications and experience of the person appointed File No. 4800-V.

GRADUATE CIVIL ENGINEER wanted for municipal work in Alberta and Saskatchewan. Please submit details of experience and when available. Experience in water and sewer utility construction preferred. File No. 4811-V.

CIVIL ENGINEER required for Ontario Government to take charge under direction, of the administration of The Provincial Aid to Drainage Act throughout the Province. Should have experience with land assessments and understand the municipal drainage act. Position requires mostly office administration work, but some contact work with municipal officials throughout the Province is required. Full employee privileges available, including three weeks vacation, a day and one-half per month illness credit, and superannuation. Interested parties should apply in own handwriting giving full particulars of age, education and especially experience in the type of work to be performed. Salary can be set to suit qualifications of successful applicant. File No. 4812-V.

CIVIL ENGINEER. Registered professional engineer with experience in municipal engineering required by firm of consulting engineers. Applicants must be capable of making detailed designs and supervising field crews. Work will be in Alberta from Edmonton office. Address all applications giving full details of qualifications, experience, references and salary required to File No. 4814-V.

STRUCTURAL ENGINEER with a few years experience for consulting office in Montreal. Inside and outside work, design, calculation, drawing and supervision. File No. 4825-V.

CIVIL ENGINEER, University graduate in civil engineering of at least three years experience after graduation, capable of performing under general supervision the following work: Preparation of reports, hydraulic investigations, structural analyses, design of dams, pipelines, tunnels, surge tanks, power houses and similar structures, supervise draughting and undertake same where required. Previous experience in hydro-electric field desirable. Location British Columbia, salary range $325-$475.00 per month. File No. 4828-V.

APPLICATIONS FOR THE POSITION OF TOWN ENGINEER, for the Town of Dauphin in Manitoba, population 6500. Engineer to have charge of construction and maintenance of streets and sidewalks, gravity water system and sewage disposal plant. Applicants will require to state qualifications and experience, furnish references and state the earliest possible date on which duties will be assured. File No. 4829-V.

CIVIL ENGINEER required for bridge design in a large transportation company with headquarters in Montreal. File No. 4850-V.

### ELECTRICAL

SALES ENGINEER required by well established and highly respected company in the field of scientific illumination. Duties, after a specific training period of approximately two years duration, will involve the sale of prismatic lighting units and the discussion of lighting applications with architects, consulting engineers and electrical contractors, officials of industrial and commercial firms, municipal and hydro offices. Qualities of personality, diligence, and dependability along with a sincere desire for a permanent career in the lighting industry are of prime importance. File No. 4807-V.

ELECTRICAL ENGINEER, university graduate in electrical engineering with at least two years experience after graduation, capable of performing under general supervision the following work: Planning, and design of high voltage switching and transformer stations and electrical portion of generating stations, both hydro and diesel, specification of electrical apparatus and preparation of bills of material; supervise draughting and undertake same where required. Previous experience in electrical power apparatus, relays etc., and their application with utility or at manufacturer's factory desirable. Location British Columbia. Salary range $300-$475.00 per month. File No. 4828-V.

ELECTRICAL ENGINEER, university graduate in electrical engineering for investigation and design under supervision of electrical transmission and distribution systems. Work consists of:

field surveys and reports on distribution projects, engineering planning, preparation of cost estimates and bills of material, and general routine having to do with transmission and distribution projects. This is a junior position offering good opportunity for experience in transmission and distribution engineering. Location British Columbia. Salary range $250-$325.00 per month. File No. 4828-V.

ELECTRICAL ENGINEER required, preferably with aviation experience. The work will consist of designing modifications to aircraft power supply and control systems, dictated by airline service and maintenance requirements. It will further include the supervision of drawing preparation and the writing of modification instructions for the maintenance department. The job will include periodic report writing, equipment surveys, the writing of test schedules and general, service and liaison for the various departments within the company. Job is of a permanent nature with the salary range depending entirely upon the qualifications of the applicant. File No. 4833-V.

ELECTRICAL ENGINEER bilingual, required for system planning studies of rapidly expanding utility located in P.Q. Duties will involve problems of distribution, transmission and hydraulic generation. Educational requirements: graduation in electrical engineering, from a recognized university and from 3 to 7 years experience preferably in a utility or allied field. Employee benefits include: pension, group insurance, and hospitalization plan. In reply please give age, marital status, summary of experience and salary required. File No. 4781-V.

GRADUATE ELECTRICAL ENGINEER required for new plant in Ontario. Applicants should have experience in the telephonic communications field. Company is engaged in the manufacture of telephone dial switching equipment and associated apparatus such as telephone relays etc. The work involves the following detailed engineerings. The preparation of specifications detailing each item of equipment to be supplied for a particular installation. The preparation of exchange drawings to be used by installers in the installation of equipment. File No. 4784-V.

ELECTRICAL ENGINEER required by paper company located in Eastern Canada. Young graduate with some experience not necessarily in paper mill. File No. 4799-V.

ELECTRICAL APPLICATION ENGINEER to specify and aid electric utilities in selection of a wide range of distribution power and other electrical apparatus. Work will include high voltage system studies, relay studies, distribution studies, preparation of proposals and specifications, and conference work on application problems with generating and distribution electric utilities. A sound engineering background and some years of experience required. Experience in selling would be a definite advantage. Location would be Southern Ontario but should be willing to travel. File No. 4847-V.

### MECHANICAL

PROFESSOR OF MECHANICAL and head of mechanical engineering department required by the University of Roorkee founded in 1949 as the first technical university in India. Roorkee is about 100 miles north of Delhi. Applicant should be a mechanical engineer with a sound background of modern mechanical science. He should have a high academic qualification preferably Ph.d. or D.Sc. The direction of specialization is not important. Age preferably not under 38-40 years. Duration of appointment minimum two years preferably three. Living accommodation provided and free medical attention. File No. 4780-V.

INSTRUCTOR OF MECHANICAL engineering to teach mechanical drawing and assist in mechanical engineering laboratory courses. Preference will be given to an applicant with experience in the field of machine shop practice and industrial engineering, who would have an opportunity to develop courses in this field. Location University of B.C. Vancouver. File No. 4791-V.

MECHANICAL ENGINEER required by plant engineering branch of large research organization at Ottawa. Applicants should be B.Sc. graduates in mechanical engineering with at least three years' experience in the design of heating and ventilating of offices and industrial buildings. Duties include the preparation of drawings and specifications for heating and ventilating, and the assistance in the design, layout, and adjustment of refrigeration and air conditioning equipment. Initial salary up to $5750 depending on qualifications. Apply by letter giving full details of education and experience. File No. 4798-V.

MECHANICAL ENGINEER as assistant superintendent required in a modern yarn spinning mill in the City of Granby, Que. The position calls for the services of a mechanical engineer between 24 to 32 years of age who is primarily interseted in production and plant engineering. Previous textile experience is not necessary but manufacturing experience including staff supervision would be of advantage. Complete details of the position will be provided during a personal interview. Applicants are requested to outline their qualifications in detail, incorporating in their reply their home address and a telephone number through which they can be contacted during the day. File No. 4802-V.

MECHANICAL ENGINEER $6,420 to $7,200 Department of Public Works, Ottawa. Details and application forms at your Civil Service Comm. Office, National Employment Office, Post Office and University Placement Office. Quote competition No. 54-1202. File No. 4805-V.

SALES ENGINEER for field work to represent manufacturers agency selling original and maintenance equipment used in mines, paper mills and heavy industry. Company operating in Northern and Northwestern Ontario, also Northwestern Quebec. Progressive training for suitable applicant. Technical, mechanical maintenance or mill experience desirable. Submit record of education, experience, references and photograph, to File No. 4803-V.

PROFESSIONAL ENGINEER preferably mechanical but not necessarily required by real estate organization. Age 40 to 50 years with experience where work would result in the greatest general knowledge of different types of industry, or allied work. Ability to meet and sell senior industrial executives Group commission plan. Applicant will be trained to become assistant manager of the department. Location Toronto, a knowledge of the Toronto area would be helpful. File No. 4821-V.

MECHANICAL ENGINEER REQUIRED by architectural firm in Winnipeg. Must be able to handle design for heating, ventilating and plumbing equipment for a wide range of building types Excellent opportunity with a young progressive firm for the right man. Write giving full details of training and experience. File No. 4826-V.

ENGINEER REQUIRED BY large beverage company located in Montreal with experience in all types of material handling. Top salary to right man with all benefits. Mechanical preferred, age 35-45 years, bilingual if possible. File No. 4834-V.

MECHANICAL SALES ENGINEER wanted by substantial American company manufacturing wrought iron pipe, flat rolled products, electric alloy steel. Applicant should be bilingual, between 25 and 35 years of age in a liaison capacity to discuss specification creations with architects and consulting engineers. Applicant should have a mechanical engineering degree or engineering background and must own a car. Excellent opportunity for qualified man. Salary commensurate with qualifications. File No 4841-V.

DESIGN ENGINEER WITH minimum eight years' experience in gear design and automotive transmissions. Age 45 or under. Must be creative and willing to do actual design work on board. File No. 4842-V.

DESIGN ENGINEER WITH minimum eight years experience in the design of farm tractors or other farm equipment. Age 45 or under. File No. 4842-V.

DESIGN ENGINEER WITH minimum eight years' experience in the design of internal combustion engines, preferably as applied to tractors. Age 45 or under. File No. 4842-V.

DESIGN ENGINEER with minimum eight years' experience in hydraulics preferably as applied to tractors. Age 45 or under. File No 4842-V.

PLANT FACILITIES ENGINEER required for a major appliance manufacturer. Graduate mechanical engineer with a minimum of 3 years machine design and a sound knowledge of electrical welding and substations. A challenging position is offered to a person capable of initiating and carrying through cost reduction, machine and process improvement including working with maintenance supervisors on installation and maintenance. Age to 45. Salary commensurate with ability. File No. 4845-V.

POWER PLANT EQUIPMENT sales engineer, mechanical graduate of Canadian university, wanted to form own company to sell and later to assemble in Eastern Canada, power plant controls and instruments. Prominent American manufacturers launching extensive expansion program of sales and service in Canada. Several years experience in sales to power plants or in operating steam plants essential. Any personal capital advantageous. File No. 4849-V.

### MISCELLANEOUS

MACHINERY MANUFACTURERS' agents require sales engineer preferably bilingual to cover Quebec and S. Ontario. In applying indicate knowledge of previous sales experience and territory covered. File No. 4776-V.

THREE ENGINEERS REQUIRED by manufacturer of multiwall kraft bags and related paper products, 1954 graduates to 6 years experience. Training period in Montreal. Subsequent work in variety of locations. File No. 4777-V.

CHEMICAL OR MECHANICAL engineer required for coal preparation research. Experience in coal cleaning, especially with driesson cyclones and dense media desirable but not essential Starting salary will depend on training and experience and will be in a bracket of $4,000 to $5,000 per annum plus cost of living bonus based on the consumer's index. The present bonus approximates $300 annually. Apply with all particulars recent photo and addresses for reference. File No. 4778-V.

ENGINEER REQUIRED BY manufacturer located in Maritime Provinces planning to enlarge research facilities. Applicant should have been connected with the chip board companies in Europe and have sufficient technical knowledge and related experience to proceed along certain lines of development. File No. 4782-V.

POWER PLANT ENGINEER required by large industrial concern near Montreal to take care of high pressure steam plant turbo-generators and refrigeration. Only those having both practical experience and technical knowledge need apply. State age, experience, and salary expected. File No. 4795-V.

SALES ENGINEER required to join a small progressive company located in Montreal. Experienced in the field of aircraft, radio, instruments, electrical accessories or oxygen equipment. Permanent positions. Apply outlining qualifications and salary expected. File No. 4796-V.

DESIGN ENGINEERS, experienced in the engineering design of aircraft instruments and accessories or equivalent industrial products, required to join a small progressive company located in Montreal. Excellent working conditions and benefit plans. Apply outlining qualifications and salary expected. File No. 4796-V.

GRADUATE ENGINEER to fill the position of Plant Engineer, and should have some product design and cost estimating experience. Plant maintains press, foundry, plating, wire forming, etc. facilities. Location Province of Quebec. File No. 4797-V.

CHEMICAL OR MECHANICAL ENGINEER with from two to five years experience on industrial maintenance work. The position is in the maintenance department working as a project engineer on projects on the maintenance of the buildings and equipment of the plant, including some design work in the nature of alterations and improvements. Location P.Q. File No. 4803-V.

SENIOR DESIGNER required for work on steam boilers and associated equipment. Applicants should have 3 to 5 years recent experience in this field. The work will include the detailed handling of contracts, and the design work necessary for the preparation of proposals and specifications. The applicant should be conversant with heat transfer as it relates to steam power equipment. A knowledge of work on pressure vessels and heat exchangers will be desirable. Location Toronto. File No. 4810-V.

QUALITY CONTROL SUPERVISOR required in Montreal. A Canadian manufacturer of fibres, adhesives and plastics is seeking a graduate engineer with industrial experience in quality control and knowledge of statistical methods. This key position with a future requires a man with ability to plan, organize and supervise all of our quality control activities and to carry out liaison work with our American parent companies. Bilingual required. Salary will be negotiated. All inquiries and applications will be treated in confidence.. Please send a complete resume of your educational background, work experience, personal data and references etc. to File No. 4813-V.

FEDERAL CIVIL SERVICE requires a number of engineers for employment as patent examiners at Ottawa to undergo training in patent law and patent regulations in force in Canada, and then to assume the responsibility for the examination of applications for patents in the field of engineering with a view to making recommendations for the award or denial of patents. The desirable qualifications include a bachelor's degree in applied science with specialization in mechanical, chemical or electrical engineering from a university of recognized standing. File No. 4815-V.

ENGINEERS ARE REQUIRED by the International Economic and Technical co-operation Division, Ottawa Canada for the government of India. Mechanical and Civil graduate engineers with particular experience in connection with hydroelectric design, preferably for high dams, having had responsible charge of the work of design groups involving supervision of planning and scheduling work of subordinates and of the execution and adequacy of designs. The Bhakra-Nangal project is a multi-purpose river valley development scheme for harnessing Sutlej River waters to extend irrigation. File No. 4817-V.

SALES ENGINEER required by a growing organization in the compressor and compressed air equipment field. Area would be South Central Ontario. Straight salary basis. File No. 4818-V.

U.N.E.S.C.O. HAS BEEN requested for assistance in recruiting suitable candidates for vacant university professorships abroad. Burma: agronomic chemistry and soil chemistry. India: economics, civil, mechanical and electrical engineer. Indonesia: technological subjects. Israel: Hydraulics and/or sanitary engineering, electrical (Electronics and telecommunication), mechanical, mathematics, general mechanics, and oscillations, metallurgy, aircraft structures, aircraft propulsions (applied aerodynamics). Turkey: electro-technics hydraulics (power), roads and communications, construction and building materials. Uruguay: construction of buildings. Venezuela: roads and communications, hydraulics (construction). building material and soils. File No. 4819-V.

MANUFACTURER of complete line of industrial, electrical motor control equipment has just completed a new plant in Galt, Ontario. Competent sales engineers are required for Ontario and Quebec territories. Applicants should have electrical, mechanical or engineering business training. File No. 4820-V.

SALES ENGINEER is required by a prominent Canadian electronics manufacturer. This man must be a recent graduate in physics, engineering physics or chemistry and have sales experience or aptitude. The product is a wide range of high quality electronic research and control equipment and the sales territory includes all Quebec industrial centres with headquarters in Montreal. Reply should include details of age, experience and education. A recent photograph should be included if possible. File No. 4822-V.

ENGINEER REQUIRED WITH experience in methods and standards. Applicant should have a good technical and work shop training with a knowledge of time study. Location Ontario. Manufacturer of machine tools. File No. 4823-V.

THE PAKISTAN INDUSTRIAL DEVELOPMENT Corporation invites applications for position of works manager for their paper mills at Chandraghona. File No. 4827-V.

INTERMEDIATE DRAUGHTSMAN; STATION ELECTRICAL. Draughtsman capable under moderate supervision of working up final electrical station arrangements from engineering sketches, preparing bills of material, switchboard and similar wiring diagrams, and selection of cable and conduit to code requirements. Work includes general arrangement and electrical drawings for hydro and diesel generating stations, substations. Requires draughting ability and basic familiarity in arrangement and wiring of electrical apparatus. Location British Columbia. Salary range $200-$275. per month. File No. 4828-V.

JUNIOR DRAUGHTSMAN; Station Electrical. Draughtsman capable under supervision of carrying out work or parts thereof described above for intermediate draughtsman. Requires some experience in electrical wiring diagrams. Location British Columbia. Salary range: $150-$200 per month. File No. 4828-V.

SENIOR DRAUGHTSMAN: for structural and civil. Draughtsman capable of working up final design drawings from engineering sketches and preparing bills of material for structural and civil projects. Where required he shall be capable of checking or supervising the work of other draughtsmen. Work includes arrangement and details of dams, penstocks, power plants, buildings, etc., including detailing of structural steel, reinforced concrete and piping. Also plotting of maps from field notes. Requires good draughting ability and sound knowledge of work. Location British Columbia. Salary range: $250-$325 per month. File No. 4828-V.

INTERMEDIATE DRAUGHTSMAN: for structural and civil. Draughtsman capable under moderate supervision of carrying out the work or parts thereof described for senior draughtsman. Requires draughting ability with fair knowledge of work. Salary range: $200-$275 per month. Location British Columbia. File No. 4828-V.

MEMORIAL UNIVERSITY OF NEWFOUNDLAND, St. John's, invites immediate applications for the following position to take effect in September, 1954. Assistant or assistant professor in the Department of Engineering. The duties would include lecturing and laboratory supervision. The subjects of instruction are drawing, surveying and mechanics. The university has a liberal pension scheme and a generous sabbatical leave programme. Appointments are provisional for the first two years. Travel expenses to a maximum of $750.00 will be paid. Immediate applications or requests for information should be sent by airmail with curriculum vitae and names of three references. File No. 4830-V.

THREE DESIGN engineers required by department of Transport Ottawa. Structural, electrical, mechanical to design and develop program for new airport terminal buildings, across Canada, and also modifications to existing terminal buildings. File No. 4832-V.

MECHANICAL OR CIVIL engineer with a minimum five years up to ten year's experience to undertake work supervising installations, etc., which would be engineered in our engineering department. File No. 4835-V.

CHEMICAL OR MECHANICAL ENGINEER required by the research department of a large organization. Excellent opportunity for a progressive engineer who is interested in acquiring a sound industrial training and is capable of eventually assuming a responsible position. Preference will be given to an engineer with one to three years practical experience in an engineering or research field. Please write giving full details including experience, age, references, etc File No. 4836-V.

SENIOR PLANNER REQUIRED by suburban planning board, London, Ontario, for preparing physical phases of comprehensive plan and supervising routine subdivision and zoning work. Graduate in planning, civil engineering or architecture preferred. Salary in accordance with experience and training. State qualifications, references and salary expected to File No. 4838-V.

PATENT FIRM long established in Ottawa has a vacancy for young engineer, preferably chemical or electrical. Some experience in patent matters is desirable but not essential. Replies should outline qualifications and experience and should state age and marital status. File No. 4839-V.

THREE TECHNICAL SALES TRAINEES required to understudy various positions throughout the sales organization which include inside representative, field salesman, technical serviceman, sales administrator. Graduate from Canadian university '52, '53 or '54 Location Toronto initially, could be located in any one of six major Canadian cities. File No. 4840-V.

SALES DEVELOPMENT engineer, mechanical, civil or metallurgical required for sales force of long established fabricating plant. Experience in pulp and paper mill or mining field an asset. Location Montreal with considerable travelling. File No. 4843-V.

CHEMICAL OR MECHANICAL ENGINEER, recent graduate required by oil company in Montreal. Age limit 25-32. Preferably bilingual and car owner. Salary depending upon qualifications. File No. 4846-V.

ENGINEERING LIBRARIAN required to operate technical library with staff of seven, serving aircraft engineering department of 750 personnel. Applicants should have an aeronautical engineering degree or the equivalent aeronautical engineering experience, library training and direct experience in the operation of a technical library. Replies should indicate training and experience in detail, and salary requirements File No. 4848-V.

RESEARCH ENGINEER required by Saskatchewan Department of Mineral Resources, $326-$397 per month. Recent graduate in ceramic, chemical or geological engineering; to carry out lab. and pilot scale experimental work, field exploration, and economic surveys dealing with the non-metallic or industrial minerals of the province. Good pension plan and conditions of employment. For further information and application forms contact the Public Service Commission, Legislative Building, Regina. File No. 4852-V.

## SITUATIONS WANTED

BILINGUAL MECHANICAL INDUSTRIAL graduate engineer, age 42, with personality and experience, presently employed. Seeks opportunity where diplomatic ability, technical knowledge could be used in supervisory capacity. All offers considered. File No. 140-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. (E.E.) McGill 1950, age 26, single, bilingual, C.G.E. test course graduate, 6 months transformer designs, 2½ years assistant electrical superintendent on construction of industrial plant. Desire work of permanent nature with responsibilities commensurate with experience. File No. 385-W.

CIVIL ENGINEER AND land surveyor, M.E.I.C., 26 years of varied experience abroad and Canada, in: railroad, airport, road, dam, watersupply, irrigation, building, factory construction and related survey layouts and location. In charge of survey parties and supervising and directing construction. Service with the Royal Engineers in the Middle East and East Africa. Married, bilingual. Seeks responsible position in Ontario or Quebec, where experience will be of value. File No. 489-W.

ELECTRICAL ENGINEER, Jr E.I.C., B.Eng. (McGill '50), age 26, married, since graduation employed by firm manufacturing pulp and paper mill machinery with experience including design, production and engineering sales. Desires responsible position with electrical firm offering an opportunity to specialize in the electrical power field. Location Montreal preferred but will consider locating anywhere in Canada. File No. 730-W.

STRUCTURAL STEEL DETAILER REQUIRES immediate employment anywhere in Canada; now in Toronto. Long term preferred, short term accepted. Have capacity for checking, supervision, estimating, and sales. Contract tenders submitted. M.E.I.C., P.Eng. (Que.) File No. 1935-W.

GRADUATE ENGINEER, B.A.Sc., M.E.I.C., P.Eng (Ont.), seeks technical development work as assistant to works manager or chief engineer of medium sized company. Experience includes office work and training course with Canadian electrical manufacturer, for years in Canadian patent office, and ten years varied work on technical phases of design, development and manufacture of domestic refrigeration and other products. Recent aptitude testing confirms suitability for this type of work. Present earnings $7,500. File No. 1958-W.

MECHANICAL ENGINEER, M.E.I.C., with apprenticeship and university background available for responsible position, on reasonable notice. Interested in representing manufacturers wishing to develop and service markets in Canada or abroad. Experience includes design, construction and maintenance in the pulp and paper industry; several years handling sales of power plant equipment. Working knowledge of French and German. Free to travel. File No. 2642-W.

PUBLIC UTILITY ENGINEER, nine years experience, water, hydro, gas, sewerage. Present contract expires June 1954. Supervising $3 million project including preparation rate structure, construction, design, purchasing. Canadian, aged 40, married. B.A.Sc., M.E.I.C., C.E., P.Eng. Desires position as public utility engineer or staff consultant anywhere in Canada. File No. 2466-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng. (Que.), 8 years experience including 3½ years with a telecommunications manufacturing concern, checking mechanical design, supervision of prototype work and liaison with factory. Interested in obtaining position with responsibility and scope for advancement, preferably in electronic or allied industry. Apply in writing to File No. 2829-W.

MECHANICAL ENGINEER, graduate 1944, single, age 34, with experience in mechanical and industrial engineering. Administrative and supervisory experience with responsibility at management level. Assistant plant manager, maintenance supervisor, plant engineer and industrial engineer in welding industry, heavy equipment, printing industry. Cost study, wage incentives, production control, plant layout, and time study. Seeking opportunity to join progressive firm in engineering, production or plant. File No. 2920-W.

ELECTRICAL ENGINEER, Jr.E.I.C., P. Eng., B.Sc. (EE) Manitoba 1950, age 30. married, one child. 1½ years experience on induction motor design. Over 2 years experience in the supervision of transformers. Also gained experience in the specifying and supervision of installation of new testing equipment. Interested in securing a responsible position in Western Canada with either a manufacturing firm, a utility, or a governmental branch, preferably in Regina or Winnipeg. Available on one month's notice to present employer. Complete qualifications upon request. File No. 3309-W.

GRADUATE MECHANICAL ENGINEER, Sask. 1948, Jr.E.I.C., married, R.C.A.F. veteran. Three years experience in production control, method analysis, time study, cost control and industrial relations. Also some experience in steel mill maintenance. Three years experience on construction jobs supervising mechanical installations including heating, ventilating and plumbing trades, boiler installation, water treatment and mine installations. Desires position with firm requiring above mechanical experience and/or opportunities for design with consultant firm, preferably in central Canada. File No. 3516-W.

MECHANICAL ENGINEER, Jr.E.I.C., P. Eng., B.E. 1950, single, age 27, bilingual, presently employed as assistant chief engineering draughtsman with wide responsibilities, 30 months diverse experience prior to graduation in pulp and paper and automotive industries. Seeking position with increased responsibility, would consider overseas assignment. File No. 3931-W.

MECHANICAL ENGINEER, Queen's 1944, M.E.I.C., P.Eng., married, age 34, eight years experience as plant engineer, including planning, design, erection and maintenance on process steam, refrigeration, air conditioning systems, seeks employment in plant engineering, preferably, but not necessarily, in smaller city or town in Ontario or Western Canada, with growing company. References include present employer. Available for interviews and employment June 15th. File No. 3935-W.

MECHANICAL ENGINEER, Jr.E.I.C., P. Eng., 1950 honours graduate, age 27, married. One year's experience in the operation and administration of a small railway system including some supervision of personnel. Three years experience on layout and design of machinery utilizing air, hydraulic and electrical power supplies, and the setting up of controls for same. I have been responsible for the planning, layout, design and field installation of equipment in several large plants. Interested in a position involving design and development work, production engineering or plant engineering with the opportunity to take on responsiblity. File No. 3975-W.

EMPLOYERS are you looking for a potential future executive in production or management? Ambitious professional engineer (electrical) with the following qualifications desires change of employment with future possibilities of primary importance McGill 1951, age 26, married, C.G.E. test course, wire and cable engineering, presently employed as assistant project engineer with large chemical manufacturer. File No. 4014-W.

ENERGETIC YOUNG civil engineer, M.E.I.C., P.Eng., single. Varied heavy construction experience: pulpmill, steam and diesel plants, docks, houses, barracks, hangars, runways, highways, sewer and water systems, surveying. Finishing assignment as resident engineer on $16,000,000 project. Available for responsible position, field or office. File No. 4015-W.

CHEMICAL ENGINEER, McGill 1950, Jr. E.I.C., P.Eng., 3½ years experience in control, development and operation. Desires permanent position with promising future. Development work preferred, but would consider other offers. File No. 4042-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.A. Sc., U.B.C. 1950. Age 29, married, 2 children. Two year graduate training course with large electrical manufacturer. 14 months pulp and paper experience including maintenance and new installations. Desires position with more responsibility. File No. 4153-W.

CHEMICAL ENGINEER, Queen's 1949, Jr.E.I.C., veteran, 33, married. Three years supervisory experience in the development, control and production phases of a large chemical plant. Desire the same type of experience in another manufacturing field. Canadian or Foreign. File No. 4166-W.

CIVIL ENGINEER M.Sc., M.E.I.C., P.Eng. (Ont.), graduated 1947 is available. First class designer of all types of modern structures, inventive, enterprising and with flair for structures involving complex statical problems. File No. 4173-W.

MECHANICAL - CHEMICAL ENGINEER, (M-Eng. - Dresden-Karlruhe) M.E.I.C., P.Eng. Former lecturer at McGill. 15 years experience as plant engineer and assistant manager in heavy industrial and chemical plants. Process and design for chemical plants. Bilingual. Single. Location anywhere. File No. 4183-W.

CIVIL ENGINEER B.A.Sc., P.Eng., Jr.E.I.C., seeks position with contractor or manufacturer. Five years concentrated experience civil and mechanical design, estimating, supervision. Am interested in position with opportunities in Ontario. Presently employed. Available upon reasonable notice. File No. 4191-W.

ELECTRICAL ENGINEER, Jr.E.I.C., P.Eng., McGill 1951, power option, seeks employment in construction or manufacturing line. Maintenance and construction experience. Presently employed as resident electrical engineer on large project for a firm of consulting engineers. Location no object. File No. 4202-W.

ELECTRICAL ENGINEER B.A.Sc. (UBC, 1951), age 29, experience: design and devlopment of induction motors, power stations, high voltage switchgear, surveys of manufacturing and test facilities, training course with large manufacturer; desirous of improving present position; supervisory, administrative, junior executive jobs preferred. File No. 4239-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Que. & Ont.), married, age 30, presently employed, with 8 years experience ranging from construction of residential, industrial and commercial bldgs.; design of timber structures including glue laminated members; considerable purchasing cost accounting, job liaison, estimating, and responsibility for complete execution of contracts, desires position where diversified abilities may be best utilized leading to future advancement in responsible position. File No. 4244-W.

GRADUATE MECHANICAL ENGINEER, married, with family, requires employment. Diversified industrial experience. Purchasing, maintenance and machinery shop practice. Sound business training. Experience includes heating, sheet metal industries and general machinery equipment. Bilingual. Has good personality, enthusiastic, keen business acumen. Desires employment on production, sales or engineering administration. Location Montreal area. Available immediately. File No. 4300-W.

MECHANICAL ENGINEER, B.Sc. university of Saskatchewan 1950. Jr.E.I.C., age 28, married. Have been doing plant engineering work since graduation. Desire position with opportunity, location not important. File No. 4328-W.

CHEMICAL ENGINEER, 1945 graduate M.E.I.C., P.Eng. (Ont.) with several years work in anodizing, lacquering, plating, plastic and metal-spraying, phosphatizing, electropolishing. Particular consideration of corrosion problems in the chemical beverage, textile industry. Has practical experience in managing as well as laboratory work in the field of analyzing and material testing. Did extensive research on chemical durability of lacquers and on adhesion of metals and paints on aluminum and steel. Desires a position in a plant or in a developing and research laboratory. File No. 4359-W.

CIVIL ENGINEER, B.E. (National University of Ireland), Jr.E.I.C. Two years experience in structural steel design; 6 months with Canadian structural firm; also worked for short time on traffic survey. Presently employed (Montreal) in job requiring very little engineering training Desires position offering experience in varous branches of municipal engineering. Taking course leading to A.M.I. Mun.E. Location of little importance; available on reasonable notice. Age 23, married. File No 4401-W.

CIVIL ENGINEER, B. of Sc. in Eng., M.E.I.C., P.Eng., Danish citizen, age 46, married. Seeks responsible position with future possibilities. Over twenty years experience in all sorts of heavy construction: roads, concrete pavings, excavation, dikes, sewers. Reinforced concrete: bridges, piles, buildings, hangars. Design. Fully familiar with administration and thoroughly experienced in preparation, organization and supervision of construction. Preferably in larger city. Available on approximately one month's notice. Future possibilities will be considered more than starting salary. File No. 4409-W.

MECHANICAL ENGINEER, B.Sc 1st class hons. Ph.D. (Durham), G.I. Mech.E., married, age 24. Recently arrived from England, seeks position in development or production. Experience includes 18 months in general engineering and 3 years supervision and direction of a research project in the field of applied thermodynamics. Training includes stress analysis, gas and fluid dynamics and industrial management. Has also had experience in writing and editing reports an publications. Available immediately, location anywhere. File No. 4417-W.

CIVIL ENGINEER, D.L.C. Hons. (Civil Engineering), M.E.I.C., P.Eng., (Ont.), Grad. Inst. Struct. Eng., awaiting election to A.M.I.C.E., age 28, single. 6 years experience on construction of dry dock and deep-water quay, power station, airfields, bridges, roads and railways, survey, design of steel-pile cofferdams, track layout and construction schemes. Responsible for supervision of layout, construction, concrete inspection, pile-driving, underwater drilling, pressure grouting, test boreholes, diving operation, measurement of quantities and cost reports. Presently employed as area engineer on construction of chemical plant. Desires positioan of responsibility suitable to past experience. Location, anywhere in Canada. File No. 4420-W.

ADMINISTRATIVE ASSISTANT, B.Eng., Jr.E.I.C., McGill 1952, age 26. Experience includes time and methods study, job classification and plant engineering. Presently graduate student in business administration at University of Toronto. Desires position as staff assistant to an executive in a company in Toronto. Available in May. File No. 4421-W.

MECHANICAL ENGINEER, bilingual, M.E.I.C., P.Eng., age 41, M.Sc. 1938, veteran, presently employed. 16 years diversified technical experience in Air Force and industry, including 6 years Canadian experience in design and maintenance of steel mill equipment, structural steel, piping, handling equipment, transmissions, plant layouts, reinforced concrete, building, etc., desires position requiring initiative, organzing and supervisory ability. File No. 4425-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng., Nova Scotia Technical College 1952. Age 28, married, one child. Presently engaged as electrical inspector with corps of engineers, U.S. Army on defence projects in Labrador. Duties include diesel and steam power plants, power transmission and distribution facilities and the installation of electrical equipment in connection with extensive P.O.L. distribution Have open mind regarding position offered. Foreign location preferred. Available upon reasonable notice to present employer. File No. 4428-W.

CIVIL ENGINEER GRADUATE (B.Sc. St. Andrews University, Scotland) 1953, with some field experience, desires position anywhere in Canada. File No. 4429-W.

ENGINEERING PHYSICIST M.Sc (Physics) Delft U. (Netherlands) 1950, B.Sc. (Electrical Engineering) 1936, 7 years service and sales engineering of medical X-ray equipment, 2 years development of X-ray tubes, 3 years electrical and electronic instrumentation in university lab, 4 years representation of large European manufacturer of radio and electronic equipment, electron tubes and electronic components in national and international electro technical standardization committees. Experienced secretary of international technical conferences, good specification writer, fluent English and German, working knowledge of French. Married, three daughters. Detailed resume on request. Interview preferably in first week of April. Location Western Canada or Southern Ontario. File No. 4430-W.

ELECTRICAL ENGINEER, Jr.E.I C., B.A. Sc., University of British Columbia, 1951. Single, age 35. Seeks position in communications in British Columbia. Two years experience in meteorology and marine and aviation radio communications prior to graduation. Post graduate experience; 1¾ years of development, production, and maintenance engineering in quartz crystals manufacture; 1 year development work on microwave equipment. File No. 4431-W.

MECHANICAL ENGINEER, P.Eng., G.I. Mech E., single, age 27. Experience: 2 years general workshop practice including overhaul of steam and diesel engines and factory machinery repair. 18 months machine and structural design and draughting. Desires work on production or plant maintenance in Montreal or B.C. File No. 4436-W.

ELECTRICAL ENGINEER, M.E.I.C.| P.Eng Age 32, married, bilingual. Seven years varied experience in electric generation and distribution. Some familiarity with relays Good mathematical background. Desires opportunity to train as relay engineer with large utility. Would consider attending G.E. or Westinghouse relay course and willing to sacrifice for this opportunity. Location no object. File No. 4437-W.

ELECTRICAL ENGINEER, M.E.I.C., A.M.I.E.E., British, 37 years of age, with considerable experience in the design and development of naval and associated installations, also in testing of all types of shipboard equipment and preparation of test programmes, data, etc.; and also having considerable experience of servo mechanisms and other remote control devices, including railwaypower signalling systems; having been responsible at various times for preparation of specifications, quotations, purchase orders, estimates, etc.; and having supervised the activities of junior engineers, draughtsmen, technicians and electricians in various capacities; seeks a lucrative and responsible post in August 1954. Will serve anywhere, and would be fully prepared to travel extensively, if necessary. Seeking a post which will lead to a senior position and permanency. File No. 4441-W.

MECHANICAL ENGINEER, M.E.I.C., P.Eng., married. 20 years experience industrial equipment layout, mills crushing plants, smelters, handling equipment, design and supervision of design and construction. Two years plant engineer. Location preference Toronto area. Desires position in engineering office as supervisor or assistant in plant layout and design. File No. 4442-W.

CIVIL ENGINEER, M.Sc., 1931, technical University of Warsaw, A.M.I.San.E., war veteran, age 48, 15 years experience in hydraulic works, water supply and sewerage, formerly residing in Great Britain and nearly one year in Canada. Seeks position with a municipality or a firm which offers a good opportunity for advancement. Location secondary, available in two weeks notice. File No. 4443-W.

MINING ENGINEER, P.Eng. in Alberta, M.E.I.C., Jr.C.I.M.M., graduate 1951, age 30, married, veteran Practical experience in steel work in shipyards, carpentry, contracting and sales. 2 years experience in geophysics for major oil company. Experience in water and sewerage systems and mining exploration. Highest references. Very versatile. Desires permanent position with responsibility and advancement. Preferably in Alberta. File No. 4445-W.

ELECTRICAL ENGINEER, Jr.E.I.C., 31, McGill 1950, P.Eng. (Ontario), 3½ years experience in electrical layout and design of plant distribution and services and design of automatic sequencing control for process equipment in automotive industry, desires work with consulting firm or industry with diversified and interesting work. File No. 4448-W.

ENGLISH CIVIL ENGINEER B.Sc. (Hons.) A.M.I.C.E., aged 27. Hoping to emigrate to Canada with wife in May, desires responsible job in connection with the design of water supply and sewage schemes in which he has experience. Would also consider site control work in this field and would prefer to work in Vancouver district although other facts considered. File No. 4449-W.

CIVIL ENGINEER (M.Sc., P.Eng.), University of Warsaw, Poland, age 41, presently employed. Twelve years successful experience in structural designing, which includes 8 years of site supervision. Seeks opening with progressive firm. Specialist in prestressed concrete. Bilingual. Three years Canadian experience as senior designer. Avaiable on short notice. File No. 4450-W.

CONSTRUCTION ENGINEER, M.E.I.C., age 45; no dependents. 30 years general construction and mechanical experience, 21 since graduation, 10 years sales. Now completing an operation. Free to travel or relocate anywhere. Canada or foreign. Prefer north country, frontier or foreign-general construction — townsite — supervisory. File No. 4451-W.

CIVIL ENGINEER, S.E.I.C., B.Eng., McGill 1953, with construction and field work experience, seeks position in the field preferably on construction. Single, willing to work anywhere in Canada. File No. 4452-W.

CIVIL ENGINEER, Jr.E.I.C., N.S.T.C. 1952, veteran, age 28, married. Approximately one year experience in surveying and drafting for road construction job, and one year working with municipal type of construction and maintenance. Seeks employment with either consultant engineer, municipal engineer, or town planner, doing calculations, designing, and drafting. The possibility of technical experience derived is of paramount importance. File No. 4454-W.

CIVIL ENGINEER, N.S.T.C., 1949, M.E.I.C., P.Eng., provincial land surveyor of Nova Scotia and New Brunswick, age 27, veteran, married, 2 children. Experience survey of naval base construction;

instrumentman on construction of train boat, gypsum disposal plant, topographical survey; resident engineer on construction of services for 100 houses project; 3 years resident engineer on highway construction, both subgrade and pavement; 1 year office engineer on materials takeoff, ordering, and control; 1 year design of industrial buildings, municipal services, specification writing, project supervision. Present work expected to terminate in May. Prefer construction or associated work with a good future. File No. 4455-W.

EXPERIENCED CONTROL ENGINEER, B.Sc. electrical engineering, Laval University 1947. One year post graduate studies in servomechanisms, electronics and network theory, Ohio State University. Age 30, married. Six years experience in U.S.A. on design and development of control systems such as autopilots, remote flight control systems, speed and voltage regulators for inverters and air turbine driven alternators. Also design experience on magnetic amplifier circuits. Canadian citizen desires to return to Canada and will consider any reasonable opening with Canadian firm. Would prefer position involving both administrative and technical duties and a certain amount of travel. Preferred location Montreal area. File No. 4461-W.

MECHANICAL ENGINEER (Technikum Winterthur, Switzerland, grad. 1949), 29, married. Experience in welding, design and estimating of pressure vessels, platework, piping. Completely familiar with ASME and API codes, high pressure water tube boilers. Capable of supervision desires responsible position in office or shop, vicinity of Edmonton, Calgary or Vancouver. File No. 4465-W.

CIVIL ENGINEER, Jr.E.I.C., now interested in broadening his background. Five years experience in surveying for many purposes, including construction and pulp and paper manufacture. Very much interested in design. Available April 30th. File No. 4466-W.

CIVIL AND STRUCTURAL ENGINEER, M.A., Cambridge University, graduated 1947, Professional Engineer (Ontario), Jr.E.I.C., 6½ years experience civil and structural engineering in industry, consulting engineering and research. First class administrator with considerable organizational experience. Expert in structural analysis and design in both steel and concrete. Specialist in prestressed concrete. Presently employed in Toronto, and would prefer to remain there, or would represent Canadian organization in England. Position of responsibility required, where good use can be made of organizational ability and where there is opportunity for advancement. File No. 4467-W.

MECHANICAL ENGINEER, married, age 43, M.I.M.E., Ch.Eng., attached to Dutch Merchant Navy during second world war. Twenty-five years experience in construction, operation and maintenance of high pressure steam plants, turbo generators, diesel engines and refrigeration plants. Available on one month's notice. File No. 4468-W.

CIVIL AND SOIL MECHANICS ENGINEER, Jr.E.I.C., B.Sc. with post graduate studies. Age 34, married, 3 children, R.C.A.F. veteran. 6½ years experience. Experienced in organizing soil mechanics laboratories, lab testing, interpretation of laboratory results. Slope and slide investigations. Supervision of drilling and foundation investigations for dams, buildings, highways. Earth and concrete materials investigations. Retaining walls, earth and concrete dams. Tunnelling in clay. Deep shafts in clay and gravel. Studies in open channel flow. Reinforced concrete. Reports, design and supervision of construction. Mathematically inclined. Some knowledge of German. Available after May 15th. File No. 4469-W.

BRITISH GRADUATE (Electrical), 45 years of age, married, 1 child, 5 years in Canada; P.Eng., M.A.I.E.E., M.E.I.C., etc., formerly specialist in electric traction but very adaptable and with wide experience in other engineering realms; has initiative, pleasing personality, good contact man; possesses diploma in salesmanship; good liaison engineer, correspondent, writer of specifications, reports and articles; highest references, desires scope for advancement; now resident near Montreal. File No. 4470-W.

GRADUATE MECHANICAL ENGINEER, 34 years of age desires position where high quality design work is appreciated. Experience as follows: Internal combustion engines—3 years, chemical plant machinery—3 years, agricultural machinery—2 years, at present mining equipment. File No. 4471-W.

MECHANICAL ENGINEER SASK. 1947, Jr.E.I.C., P.Eng. (Que.), age 31 with 7 years experience sales and application heating, ventilation and air-conditioning with large Canadian firm. Industrial consulting and public building mechanical specifications. Desires position with consulting engineers or architects. Location Ontario or Western Canada. Available on reasonable notice to present employer. File No. 4472-W.

ELECTRICAL OR MECHANICAL SALES. P.Eng. S.E.I.C., B.A.Sc., U.B.C., mechanical 1951. Graduates test course with C.G.E. One year preparing for outside sales, over one year successfully selling full range of electrical power apparatus in Toronto and Western Ontario for large nationally known electrical manufacturer. Experience with steam turbines, pumps and various other types of mechanical equipment. Excellent executive valuation report, together with business and education resume sent on request. Desire position leading to outside sales work or managerial position with progressive company in British Columbia or Alberta. File No. 4473-W.

RESPONSIBLE POSITION WANTED by graduate chemical engineer, McGill 1949. Presently employed by pulp mill engineers, supervising field and layout work. Veteran, age 32, with industrial and direct selling experience. Has proven initiative and willing to accept responsibility. Desires position providing executive training and a challenge. File No. 4474-W.

ELECTRICAL ENGINEER, graduate 1949, power and machinery, Edinburgh, Scotland. M.E.I.C., Grad. I.E.E., Whitworth Prizeman, married, two children. 5 years electrical engineering apprenticeship. 3 years electrical draughting. 3 years electrical engineer. Experience on rural and urban distribution; construction, maintenance and operation; H.V. and M.V. lines, cables, substations and associated gear; estimating, profile surveying, pressure testing, fault location etc. Also inspection, testing and maintenance of all types industrial electrical machinery and cabling in paper mills, quarries and other industry; i.e. generators, motors, switchgear, transformers, elevators etc. Desires employment on either distribution work, plant maintenance or with consulting engineer, commencing beginning of September. File No. 4475-W.

CHEMICAL ENGINEER B.A. 1937, B.A.Sc. 1938, U.B.C., P.Eng.(Ont.), member of the Chemical Market Research Association, married with 2 children desires responsible position in chemical or allied industry. Diversified experience in explosives, pulp and paper and plastics. Most interested in development type of work or production. Well experienced in preparation of reports on markets and economics. Resume of experience on request. File No. 4476-W.

CIVIL ENGINEER P.Eng., Jr.E.I.C., with two years experience in reinforced concrete, detailing and design. Seeks part time employment in Montreal area. File No. 4477-W.

MECHANICAL ENGINEER graduate Nova Scotia Technical College 1946 M.E.I.C. Eight years experience in design, application and installation of heating, ventilating, air conditioning and combustion equipment. Desires change of employment where past experience could be best utilized. Location preferred Ontario or Quebec. File No. 4479-W.

EXECUTIVE MANAGEMENT career development desired by Chemical Engineer, M.E.I.C., age 37, married, no children. Strongest capabilities are organization, administration, adaptability, and effective contacts. Successful and well-rounded experience in operations, technical control, research and development, and management techniques in major manufacturing industry. Seeks challenging opportunity as Manager, Assistant, or equivalent, with progressive enterprise willing to delegate responsibility upon proof of ability. File No. 4482-W.

MECHANICAL ENGINEER, M.E.I.C., Graduate of Delft Institute of Technology, Holland. 20 years experience, particularly in boiler houses, steam and condensate handling, instrumentation, water treatment, air handling, plant layouts. Also office management, business administration, sales promotion. Seeks senior position with manufacturing concern, consultants or sales organization. Sound Canadian practice. Bilingual. Location anywhere in Canada. File No. 4483-W.

MECHANICAL ENGINEER, 1947, P.Eng. M.E.I.C., with 6 years experience as sales engineer handling mining, contracting, industrial and pulp and paper machinery, desires position of expanded responsibility in sales field or with mechanical maintenance department of industry. 34 years old, married. File No. 4484-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng. (Alberta), age 35, single. 5 years general engineering training with one of the largest electrical manufacturers in U.K., 3 years mechanical design in light engineering works, 4 years in oilfields and refinery abroad on installation, erection, and maintenance of electrical and mechanical plant which included pumps, air compressors, A.C. and D.C motors, steam and diesel power plants, power distribution and lighting. Desires position in construction or in which experience can be utilized. Location anywhere. File No. 4489-W.

INDUSTRIAL ENGINEER, Mechanical engineering degree, age 38, with fifteen years experience in light industry on: manufacturing methods, time and motion study, process engineering, production control, factory engineering, administrative engineering and production supervision, available immedately. File No. 4493-W.

HARVARD BUSINESS SCHOOL and Toronto engineering and business graduate seeks marketing position with a manufacturer of consumer goods. Presently employed outside Canada with a similar firm. Prefer Southern Ontario basing. Age 25, married. File No 4494-W.

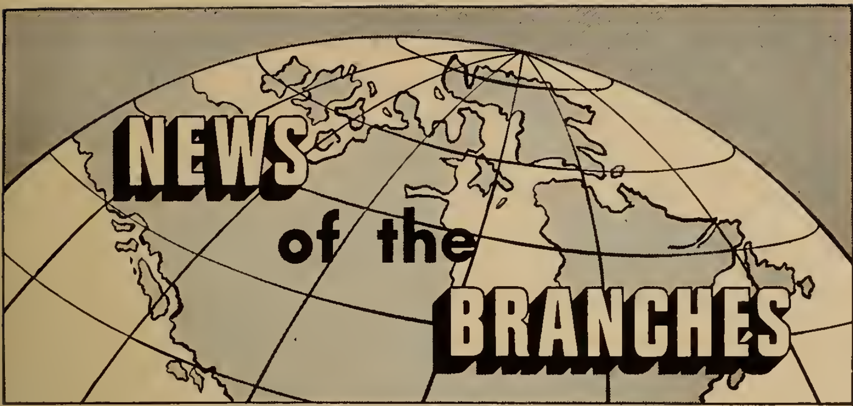
PROFESSIONAL ENGINEER with 20 years experience in chemical production. Seeks management position in chemical oil or allied industries. Experience includes labour relations, safety, cost control, preventive maintenance, supervisory training and policy draughting. Location immaterial presently in Toronto. File No. 4496-W.

MECHANICAL ENGINEER, graduate 1951, Jr.E.I.C., single, age 24, experience in materials handling, and pulp and paper desires position with opportunity for advancement. File No. 4498-W.

MECHANICAL ENGINEER, graduate, A.M.I.M.E., A.M.I.E.T., government certificate, 15 years experience design and development field work, oil refinery, material handling plants, installations, machinery grainery, conveyors, elevators, construction, structural steel, reinforced concrete, docks, timber structure. Knowledge of Spanish, Italian, Arabic little French, desires employment South America, Peru. Age 36, Canadian citizen. Past experience also includes report writing, drafting, estimates, civil engineering. Presently employed Engineering and Research Department. Salary secondary to opportunity for advancement. Free to travel anywhere at short notice. File No. 4499-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., P.Eng., age 38, married, veteran. Eight years industrial experience, mainly in chemical plant design including pressure vessels, high measure piping, material handling, steel-and reinforced concrete construction, steel fabrication, etc. and cost estimating. Also some construction and some maintenance experience. Desire employment with responsibility and with future possibilities. Preferable location Alberta. File No. 4503-W.

GRADUATE ENGINEER, B.E. Mechanical and Electrical, Sydney University, Australia, 1943. Age 32, single, 4 years experience plant engineering, construction, steel industry, sugar, hydro-electric industry. Interested in position; design, development production engineering or plant engineering; inventive. File No. 4504-W.



**Activities of the Forty-seven Branches of the Institute and abstracts of papers presented at their meetings**

## Border Cities

R. J. Trinder, jr.e.i.c.,
*Secretary-Treasurer*

W. Dave Donnelly, m.e.i.c.,
*Branch News Editor*

**Auxiliary Celebrates Second Anniversary**

The E.I.C. Auxiliary, Border Cities Branch, has completed its second successful year, with four 'interest' groups showing great progress for the year, and with membership increasing in each. The groups take part in leathercraft, smocking, bowling and bridge.

On January 29 the Auxiliary enjoyed a very informative and interesting talk on "Civic Affairs", by Alderman Mrs. Cameron Montrose. The ladies were invited to the Branch meeting of March 4, to hear Dr. Lillian Gilbreth.

The May meeting was held on the 19, at Jeanne Mance Nurses' Residence at which time Dr. S. Hardie Campbell spoke to the group. His subject was "The Eastern Arctic Region". Dr. Campbell gave a very colourful talk supplemented by slides on his experiences as ship's doctor on the "C. D. Howe". A silver collection was presented to the Cancer Fund.

The next meeting was held on November 10 at the Jeanne Mance. For entertainment at this meeting Mr. Hillman and Mr. Morris of the Canadian Cancer Society showed three films. A silver collection was taken and given to the Cancer Fund.

The annual dinner-dance for the President's visit was held at Beach Grove Golf Club on November 25. A large crowd was in attendance for a very enjoyable occasion.

The Auxiliary is planning on a bursary for a young second year engineering student. As it is not a money-making organization, the proposal was adopted that dues, after having accumulated to the amount of $100.00, be used for this purpose.

Membership in the Auxiliary is 91, and 9 members have moved out of town during the year.

On January 28, 1954, the second annual meeting was held and the slate of officers for this year was presented, as follows: president, Mrs. R. T. Waddington; first vice-president, Mrs. J. W. Greason; second vice-president, Mrs. W. D. Donnelly; recording secretary, Mrs. J. Donald; corresponding secretary, Mrs. D. G. Jamieson; treasurer, Mrs. D. S. Brown; publicity convenor, Mrs. A. G. Ackerman; group convenor, Mrs. A. Robinson, councillors, Mrs. P. S. Dewar, Mrs. C. G. R. Armstrong, Mrs. J. C. Hoba.

At this meeting the members enjoyed a very interesting film called "Packaged Power", presented by the Aluminum Company of Canada.

## Belleville

C. H. Lusk, jr.e.i.c.,
*Secretary-Treasurer*

E. L. Littlejohn, jr.e.i.c.,
*Branch News Editor*

**Branch Meeting, February**

The Belleville Branch of the Engineering Institute of Canada held its regular meeting at the Masonic Temple on February 8, with 46 members and guests present.

C. Whittemore as chairman, welcomed the members and guests to the meeting. A. E. Argue spoke briefly to the Branch on the possibility of undertaking a second Professional Development Course for the Junior engineers. S. Sillitoe then asked for an expression of opinion from the members regarding a resolution passed by the executive, stating that we are in favour of the amalgamation of the Association of Professional Engineers and the Engineering Institute of Canada. This resolution was passed unanimously.

E. G. Gurnett then spoke briefly to thank the engineers for their co-operation in the recent Belleville Hospital campaign for funds. He stated that they had more than reached their goal.

**Shell Moulding**

"Shell Moulding" was the topic of W. A. Campbell's address to the Belleville Branch of the Engineering Institute of Canada. Mr. Campbell is the sales development manager of the Bakelite Company of Canada.

Shell moulding is the term applied to a new method of casting metals. It is a process by which a synthetic resin mixed with a foundry sand is cast on a hot metallic pattern. The resin melts and acts as a binder for the sand, thus forming a shell on the hot pattern. The original process was developed in Germany by Johannes Croning in 1944. After the war the process became available to all countries. The physical metallurgist supervisor of the New York Naval Station, Brooklyn, N.Y., Bernard Ames, has this to say for shell moulding:

> In the past few years, shell moulding has been recognized as one of the major technical advancements in the foundry industry. It is perhaps the first basic change in the method of mould construction since the inception of the foundry art.

Mr. Campbell pointed out that with this new method, a better casting could be made, costing less money and holding dimensional tolerances to closer limits than with the present green sand methods.

Mr. Campbell was introduced by G. A. Bradford and thanked by J. Lawn.

**General Meeting**

At the regular meeting of the Belleville Branch of the Engineering Institute of Canada held on Monday, March 8, 1954, at the Masonic Temple, a capacity crowd heard D. H. Sharpe, project engineer of the C. D. Howe Construction Company, describe the Seven Islands iron ore development. This talk was of particular local interest since a large proportion of the machinery to be used was made in Belleville at the Stephens Adamson Company.

This development, which is a joint project of Canadian and American mining companies and known as the Iron Ore Company of Canada, is expected to be in operation in July, 1954. The project involved the building of the longest railway of the century on the North American continent, 360 miles of steel; it involved the building of shipping facilities, power plants, and air fields.

It was pointed out that due to weather conditions, actual mining operations could only be carried out for 5½ months of each year, while shipping would be open for 8 months.

Mr. Sharpe illustrated his talk with slides and the film, "Up The Line in '53". The speaker was introduced by Jim Young, sales manager of the Stephens Adamson Company, and thanked by A. D. Janitsch.

## Newfoundland

M. A. Foley, m.e.i.c.,
*Secretary-Treasurer*

**Labrador's Development Discussed**

A joint meeting of the Newfoundland Branch of the Engineering Institute of Canada, The Association of Professional

Engineers of Newfoundland and The Newfoundland Branch of the Canadian Institute of Mining and Metallurgy was held at Memorial University on January 28. The speaker of the evening was W. R. Durrell, general manager of the Iron Ore Company of Canada. The chairman for the evening was William Watson, vice-chairman of the Newfoundland Branch of the Engineering Institute of Canada. Mr. Durrell was introduced by Claude House, deputy minister of mines for the province of Newfoundland.

Mr. Durrell began by giving his listeners a brief history of the discovery of iron ore in Quebec and Labrador—where ore was first discovered in 1929 by Dr. Gill and Dr. Jacobs at Ruth Lake but it was not until 1936 that the first concessions of 20,000 square miles of Newfoundland territory and 3,900 square miles of Quebec territory were obtained.

Mr. Durrell's own connection with the enterprise began in 1947 when he was asked to build the air strip at Knob Lake. It was at first considered almost economically impossible to build a railroad from the north shore of the St. Lawrence through about three hundred and fifty miles of extremely difficult country to the iron ore deposits at Knob Lake.

By 1950 the geologists under Dr. Reddy and Dr. Moss had discovered four hundred and eighteen million tons of direct stripping high grade ore. The result was that the interested companies, five of the larger steel producing companies of North America, united to form the Iron Ore Company of Canada.

By October, 1950, the work on the railway was started and equipment was brought in. The first one hundred miles of railway were so exceedingly difficult with the high hills, deep river valleys, sheer cliffs and quicksands, that it took one and a half years to complete the section.

Fourteen air strips were built along the route of the railway as all equipment and men had to be flown in. So far, air transport alone had cost the company ten million dollars but the cost per pound for air freight has been reduced from an initial cost of 75 cents per pound to five cents per pound today. The company now operates twenty-two planes and two helicopters.

About ninety miles of the railway remained ungraded last fall and additional equipment was brought in to complete it before winter. The grading of these last ninety miles was completed in December.

The speaker reported that it is hoped to start stripping the ore in March and to start mining in May. All the mining will be open pit. The mining equipment, 34 ton trucks and electric shovels, will be brought in on the completed railway. The railway is designed to handle thirty-six million tons a year. The annual output of the mines for the first few years will be ten million tons a year. Mining will be limited to six months of the year, however, stripping will commence a month before and continue a month after the mining operations.

Two million tons of ore, Mr. Durrell said, will be stock-piled at Seven Islands so that the shipping season can be three months longer than the mining period.

Mr. Durrell pointed out that the railway could play an important part in opening up Labrador. Grand Falls on the Hamilton River, which has a potential of four million horsepower, is only ninety miles from the line. He felt sure that the railway would eventually push further northward and he advised young engineers to keep an eye on developments in Labrador.

At the conclusion of the address E. Dickinson, president of the Association of Professional Engineers of Newfoundland, moved a vote of thanks to Mr. Durrell.

## Montreal

R. J. Harvey, M.E.I.C.,
*Secretary-Treasurer*

J. A. Paget, M.E.I.C.,
*Publicity Chairman*

**Prestressed Concrete**

At a joint meeting of the Province of Quebec Association of Architects and the Montreal Branch on February 1, Professor G. Magnel addressed a capacity audience on the subject of Prestressed Concrete.

Professor Magnel, a noted author and international authority on concrete design, has made many fundamental contributions to the research and literature on prestressed concrete. The author discussed recent additions to theory, the design problems of fixed and continuous members, the corrosion problem, and the effect of bonding forces on the stress distribution in steel and concrete in regions of high wire curvature such as are found at the supports of continuous members.

Professor Magnel emphasized that the choice between steel, reinforced concrete and prestressed concrete for a particular structure should be decided on the basis of maximum economy and service for its expected life.

Meeting arrangements were by J. E. Hurtubise; R. H. Quintal served as chairman.

**Annual Students' Night**

On February 4 the Junior Section of the Montreal Branch held their Annual Students' Night in the Institute Auditorium.

The judges were J. P. Dagenais of the Bailey Meter Co., Professor T. Pavlesack of McGill and Louis Trudel of Shawinigan Water & Power. The first contestant was G. I. Fekete of fifth year mechanical engineering at McGill who spoke on "Aircraft Design".

The second speaker was D. Grimes of fifth year civil engineering at McGill who spoke on "Sheet Piling".

The third speaker was R. Takacs who is in his fifth year at Ecole Polytechnique. He spoke on "Problem Relatif et Abris Anti-Bombe".

Jean Morin, who is in his fifth year at Ecole Polytechnique, was the fourth speaker. He spoke on "A Temporary Power House on the Bersemis River".

A film on town planning was exhibited while the judges were deliberating. The first prize of fifteen dollars was awarded to Mr. Grimes and the second prize of ten dollars to Mr. Morin.

The judges congratulated Mr. Morin on his proof that he was truly bilingual.

All contestants were awarded a year's subscription to the Engineering Journal.

3M COMPANY

## ABRASIVES

Hundreds of firms have slashed production costs by converting to "3M" Abrasive Belts. Industry after industry is proving how faster-cutting, longer-lasting "3M" belts produce finer finishes on forgings and castings. Ask for "3M" Technical Service recommendations on how to increase *your* production.

NAME ..............................

POSITION ..............................

COMPANY ..............................

ADDRESS ..............................

Montreal Branch annual dinner dance. The head table, Colonel H. G. Thompson, Mrs. Hammerschmid, Dean Henri Gaudefroy, Mrs. Shaw, I. R. Tait, Mrs. Frost, Dr. J. B. Stirling, Mrs. Dunsmore, Dr. A. W. Trueman, guest speaker; R. L. Dunsmore, branch chairman; Mrs. Tait, C. E. Frost, Mrs. Stirling, R. F. Shaw, Mrs. Gaudefroy, Mr. G. N. Martin, Mrs. Thompson, L. J. Hammerschmid.

Left: Major Davies, representing the Military Engineers' Association, Mrs. Sutherland, Mrs. Davies, Dr. Sutherland, of the Canadian Institute of Chemistry, Mr. and Mrs. R. L. Dunsmore. Right: Mr. and Mrs. Bolton are received by Mrs. Dunsmore, Dr. Trueman, and Mr. and Mrs. I. R. Tait.

The meeting chairman was Pierre DeGuise, S.E.I.C., of Ecole Polytechnique.

#### Electrical Design

On February 8 a joint meeting of the E.I.C. and the A.I.E.E. heard A. A. Moline, manager of the power products division of Canadian Westinghouse, describe the mechanical side of power equipment design. The speaker pointed out that after the U.S.A., Canada ties with the United Kingdom for second place in total electrical power production and is exceeded only by Norway in per capita production. He said that Canadian problems usually involve very large outputs and can only be solved effectively by a professional staff backed by adequate research facilities.

Mr. Moline described some of the design criteria in conventional and umbrella type generators, including the manufacturing problems resulting from size, weight, and magnetic forces. Passing on to the features of hydrogen cooled synchronous condensers, the speaker mentioned the gains to be had in better cooling of transformers and steam driven generators.

In the small equipment Mr. Moline mentioned the dynamic problems of circuit breaker mechanisms some of which had an interrupting time of two or three cycles and a total time of 10 to 12 cycles.

Mr. Hawril thanked the speaker on behalf of the chairman, E. V. Leipoldt, and the 81 engineers in attendance.

Meeting arrangements were by R. E. Grout.

#### Ladies' Film Night

On Tuesday, February 9, the following films were shown: "Underground East," courtesy Imperial Oil Limited; "Story of Cellophane," courtesy Canadian Industries Limited; "Way Over the Mountain," courtesy Goodyear Tire & Rubber Co.; "Le Mans 52," courtesy Shell Oil Co. of Canada Ltd.

On February 11 the Ladies Film Night featured: "The Peribonka Power Development," courtesy The Aluminum Co. of Can. Ltd.; "Newfoundland Scene," courtesy Imperial Oil Limited. On February 9 meeting arrangements were by E. S. Yuill and P. J. Kunster was chairman.

The February 11 meeting arrangements were by L. Creighton and C. G. Kingsmill was chairman. Dr. Gordon Thomas introduced the second film.

#### Sources of Management Material

On February 11 the Ladies' Film section sponsored a most interesting panel discussion on "Preferred Sources of Management Material". With J. Edgar Dion, management engineer, as moderator, the panel consisted of A. J. Gregory, supervisor of engineering methods, Northern Electric Co. Ltd.; T. I. Lumby, personnel assistant, Canadian National Railway; T. E. Mather, woodland cost accountant, Consolidated Paper Corporation; and E. Skutezky, methods analyst, Northern Electric Co. Ltd.

Mr. Skutezky opened the discussion by stating that the universities were the best place to find potential leaders in business and industry.

Mr. Mather, the second speaker, maintained that all-round ability and enough curiosity to find out about the other fellow's problems were the most important requisites for good management material, and therefore non-technically trained people, were also a good

# the Mechanical Engineer and FAIRBANKS-MORSE

The Mechanical Engineer is the vitally important link between planning and the actual production of all manner of things. It is his responsibility to design the tools and the machines which will ultimately provide improvements in the products we use today, and the variety of new equipment and goods which our constantly progressing economy expects tomorrow.

Not only is there a strong strain of ingenuity and inventiveness in the Mechanical Engineer . . . there is also a pride in precision and craftsmanship. The product of his thinking is frequently new in concept, but it is also functional to the *n*th degree, because he knows his job.

As the "Departmental Store for Industry" Fairbanks-Morse industrial supplies are the direct result of the Mechanical Engineer's skill. The many features incorporated in equipment manufactured by us and by our suppliers are examples of Mechanical Engineering at its best.

THE CANADIAN

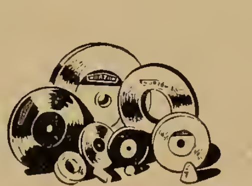
**FAIRBANKS-MORSE**

COMPANY LIMITED

Sixteen Branches Across Canada

Fairbanks-Morse Scales built for every weighing purpose

Metal and woodworking machinery for every purpose



Norton Grinding Wheels and Industrial Abrasive Products

Yale Hand and Electric Hoists for every industrial requirement

FM54-71T

source from which potential managers could be obtained.

Mr. Lumby declared that the primary source of managerial talent was within the ranks of the organization itself, and that the secondary source was other organizations or outside companies.

Mr. Gregory, the last speaker, said that the sound analytical training of the engineer made him ideally suited for the solution of the complex problems facing managers, but that the danger confronting many younger engineers was the fact that the tendency toward specialization was leaving many men without the broad training necessary for senior executive positions.

A lively question and discussion period followed. Meeting arrangements were made by G. H. Hoganson and W. C. M. Luscombe was chairman.

#### Annual Dinner Dance

On February 19 the Annual Dinner Dance of the Montreal Branch was held in the Rose and Windsor rooms of the Windsor Hotel, having been organized in the usual competent manner by the Entertainment Committee. After a pleasant dinner Mr. Dunsmore introduced the head table guests and briefly explained the nature of the work done by each of the committees. Dr. J. B. Stirling then introduced A. W. Trueman, Commissioner of the National Film Board, guest speaker of the evening. Mr. Trueman, a well known educator, traced the development of the National Film Board's distribution system, which had about eighty district agents before the war, to the present organization which handles many more films with half the staff.

The secret was the fully democratic Film Council Movement and the growth of film libraries. A film council consists of a group of interested citizens in the community which arranges for the renting or purchasing of films and their exhibition before interested community groups. The choice of films for rental is a true expression of local interest and serves as the principle guide for the National Film Board in its production planning.

Mr. Trueman assured his audience that he had never detected any tendency for the board to become a propaganda agency for the government in power.

Dean Henri Gaudefroy thanked the speaker and pointed out that he was still an educator in a broader sense. At the suggestion of Leo Scharry, Entertainment Committee chairman, the gathering adjourned to the Rose ballroom. A reception line was formed for those wishing to meet head table guests.

During the meal in the Windsor room a duet moved from table to table playing requests and attracted much favourable comment from the 220 dinner guests. An additional 210 guests arrived for the dance.

#### The National Housing Act

"Home Ownership and The National Housing Act" was the title of a talk given on February 15 to the Junior Section by J. C. Paradis, Quebec regional supervisor of Central Mortgage and Housing Corporation. Mr. Paradis began his talk, to an audience which exceeded the seating capacity of the Mansfield Street Auditorium, by explaining the history of the National Housing Act.

The film "Pride of Possession" with commentary by Kate Aitken was shown

## Montreal Section Annual Golf Tournament

*Date:* Wednesday, June 9, 1954

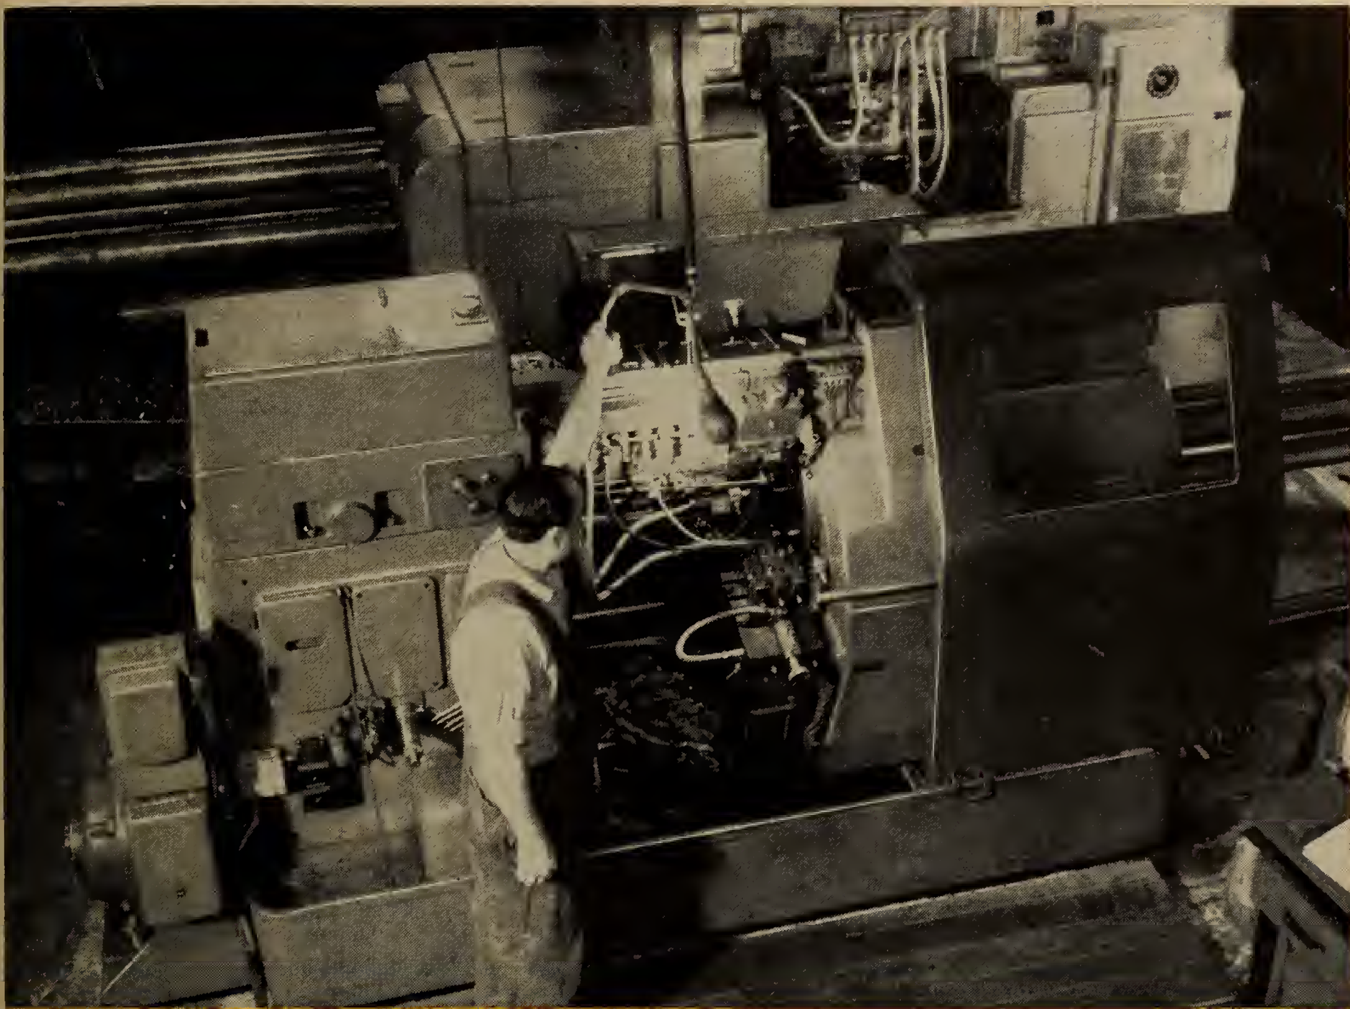
*Place:* Lakeshore Golf & Country Club Inc.

*Time:* Starting at 1 p.m. Dinner at 6.30 p.m.

*Price:* Green Fees, $2.00. Dinner, $3.00 (gratuities included)

*Tickets Available:* Leo Scharry (E.I.C.), Re. 3-5334. Pierre Bournival (C.P.E.Q.), Pl. 9486. E.I.C. Headquarter, Pl. 5078

This golf tournament is jointly sponsored by the Engineering Institute of Canada and The Corporation of Professional Engineers of Quebec



and the speaker explained the likely changes that were to be expected after the new Act became law. Mr. Paradis dealt in a realistic manner with the difficulties facing a prospective home owner and supplied detailed information concerning the economics of home ownership and the basis on which loans were granted. An interesting discussion followed the meeting.

The meeting was arranged and conducted by G. L. MacLean, Jacques Soucy and J. M. Weintraub of the Junior Section.

###### Recovering Nickel, Copper and Cobalt

Professor F. A. Forward, professor of metallurgical engineering at the University of British Columbia, gave a very interesting account of the ammonia pressure leach process for recovering nickel, copper and cobalt developed by him for handling Sherritt Gordon concentrate. The process is adaptable to continuous or batch production and begins with a pressurized ammonia leach using air for agitation. After a number of stages it produces nickel as a powder together with copper sulphide and cobalt concentrate in a form suitable for the further refining required to produce commercial metal. The process has been carried through the pilot plant stage and Sherritt Gordon are building a full scale plant which will soon supplement Canada's critical nickel supplies.

**North Eastern Ontario Branch Dinner at Cochrane Legion Hall. Left to right: D. Williams, chairman of the Kapuskasing Section, Mrs. C. D. McCulloch, Mrs. G. M. Lyon, President Dobbin, Branch chairman, G. M. Lyon, Mrs. G. Eastward, and M. D. McLean, chairman Iroquois Falls Section.**

The meeting chairman was T. T. Anderson and H. G. Burbidge made the arrangements for this meeting which took place February 25.

C. D. McCulloch, Jr.E.I.C.,
*Secretary-Treasurer*

###### The President's Visit

On January 26, 1954, the Branch was host to President R. L. Dobbin. Mr. Dobbin was accompanied by J. A. Ogilvy, assistant field secretary.

The president was met at Porquis Junction by G. M. Lyon, Branch chairman and after a short rest toured a portion of Abitibi's Iroquois Falls mill. President Dobbin kindly consented to talk to the engineering staff of the Iroquois Falls mill. He spoke of engineering achievement in the Maritimes and the urgent need for engineering "know how" to assist in the development of Newfoundland.

For the benefit of non-members, Mr Ogilvy briefly outlined the work of the Institute with special reference to professional development.

Following the president's visit to Iroquois Falls, he was driven to Cochrane where the branch meeting took place. A short executive meeting was held in the Cochrane Town Hall Council Chambers. Following the executive meeting a branch dinner meeting was held at which President Dobbin met the branch members and their wives.

Following dinner President Dobbin spoke of his impressions of the coronation. His speech was followed by a short business meeting.

President Dobbin remained in Cochrane overnight and was driven to the airport the next day to catch the plane for North Bay.

## Niagara Peninsula

*Branch News Editor*

#### Dinner Meeting January 28

On January 28, 1954, the Niagara Branch of the Engineering Institute of Canada held an outstanding dinner meeting at the Rose Villa Inn, near Welland.

A. J. Bennett was presiding chairman, and A. Shames introduced the guest speaker, who was H. R. Summer, radio-systems engineer of the Bell Telephone Company of Canada. Mr. Summer spoke on the recent developments in long distance telephone transmission.

The initial telephone carrier circuits were capable of carrying 20 telephone conversations per wire. High frequency losses in these carriers led to the development of 100 pair cable, where two 100 pair cables served one circuit from east to west. A load increase would allow as much as twelve carriers per pair. However, high frequency loss was again effective.

Later developments resulted in the co-ax cable which could handle 600 message circuits. With the growth of television it was found that the four meg-cycles exceeded the capacity of three meg-cycles of the co-ax cable and was not too satisfactory. High frequency losses determined the need for booster stations at three to four mile intervals. Ensuing advances in radio tubes and antennae indicated that the TD2 system was most economical and met requirements. The TD2 relay was adopted as a frequency modulated system operating in super high frequency range of 3700 to 4200 meg-cycles.

#### TV and Message Circuits

This band, 500 meg-cycles in width bears five channels, each channel being 20 meg-cycles wide, with 40 meg-cycles between channels. This capacity gives six alternate east channels and six west channels. Each channel carries one television program or 600 telephone long-distance message circuits. These channels are directed through towers at 30 to 40 mile intervals, each tower being 25 to 212 feet in height. A series of these towers have been erected from Buffalo to Toronto, Ottawa and Montreal. At present there are two channels in use over the length of this circuit.

Channels from Toronto to Montreal carry two-way TV and message circuits, whereas due to radio propagation between Toronto and Buffalo two channels are required to permit one way communication from Toronto to Buffalo for TV purposes. As yet there is no call for Canadian program transmission to the United States but the circuits are available.

The two-way circuit from Toronto to Montreal has repeater stations, consisting of towers bearing 4 antennae each. These antennae, with reflectors, weigh one ton. Two transmission and two receiving antennae constitute one tower station.

A signal received on channel A is taken down the tower by wave guide to a receiver, which converts super-high frequency down to intermediate frequency. The intermediate frequency is amplified $10^6$ times and converted back to its receiving frequency, plus 40 meg-cycles. The final output power of transmitters is ½ watt.

The signal is sent up the wave guide to a delay lens antenna which has an effective radiating power of 2500 watts. The signal is transmitted over 30 to 40 miles to the next repeater station.

Due to the high efficiency of the delay lens antenna of this system, all radio energy is transmitted in a very narrow beam, having a horizontal angle of 2 degrees at its half power point, and a vertical angle of 1½ degrees.

Relay stations are normally unattended and operate automatically. In the event of a breakdown in the apparatus, a signal is sent along a land line to the repeating station to search the 42 possible points of trouble. The equipment starts a process of scanning the 42 trouble sources, ranging from power failure through to a door being left open. A signal reports the trouble back to the central point, where an operator dispatches a repair crew to the scene.

At present one channel is being used for CBC television programs from Toronto to Montreal. One other circuit has 121 long-distance telephone circuits in operation.

#### Micro-Wave Demonstration

Following Mr. Summer's review of high frequency transmission a demonstration, using a transmitter and a receiver of 10,000 meg-cycles, revealed that the properties of micro-waves in super-high frequency range are comparable to light waves.

A demonstration showed how micro-waves differ from light waves in that they pass through materials like wood, but are stopped **by metal.**

## Nipissing and Upper Ottawa

R. A. Booy, jr.e.i.c.,
*Secretary-Treasurer*

E. A. Watson, m.e.i.c.,
*Branch News Editor*

#### Guests of Abitibi

Fifty-seven members and friends of the Nipissing and Upper Ottawa Branch of the Engineering Institute of Canada were guests of the Abitibi Power and Paper Company at Sturgeon Falls on Wednesday evening, February 10, 1954. The meeting was conducted by James Miller, vice-chairman of the Branch in the absence of the chairman, Robert Dye

Following dinner A. L. Farnsworth, manager of the Abitibi plant, and E. G. Heslop, assistant manager, described briefly the processes in both the corrugated and hardboard mills.

Contrasting the production of the corrugated paper with that of newsprint for which only spruce and balsam are used, Mr. Farnsworth stated that twenty-one varieties of trees supplied wood to the mill. Sawmill waste is also used. These factors made possible the operation of the Sturgeon Falls' mill where previously its operation as a newsprint mill was uneconomic. A large proportion of the wood is obtained from farmers in the Sturgeon Falls district and is trucked to the mill in four foot lengths.

Mr. Heslop outlined the steps in the manufacture of Abitibi hardboard. This material also makes use of all the species of wood found in this district, many of which had little or no value previously. The process and much of the equipment to manufacture this product is unique in many respects, and all design was by Abitibi's own engineering staff. Mr. Heslop also paid tribute to the operating staff all of whom were recruited in Sturgeon Falls for their part in placing this new plant in successful production.

Later the engineers were conducted on tours of both plants and all were especially impressed with the manufacturing operations in the hardboard mill. Jack Cooper expressed the engineers' appreciation and thanks to Mr. Farnsworth.

*Branch News Editor*

***Yves Guyon Is Guest Speaker***

The February meeting of the Quebec Branch was held on February 5, at the Faculty of Sciences Building of Laval University.

The French engineer, Yves Guyon,

an internationally famed authority on prestressed concrete, was the guest speaker. After briefly outlining the general principles upon which this new construction technique rests the speaker described various projects throughout the world, the design of which was based on this new theory. He also demonstrated how the use of prestressed concrete could afford considerable savings in the case of isostatic structures; in the case of hyperstatic structures, however, further studies and research work will have to be completed before the extent of the savings can be accurately predicted.

The meeting was under the chairmanship of George Demers who introduced Mr. Guyon to the audience. The usual thanks were expressed on behalf of the Branch by its newly elected president Gilles Sarault.

## Saguenay

C. C. Louttit, jr.e.i.c.,
*Secretary-Treasurer*

**Joint Meeting**

A joint meeting was held with the Saguenay Region of the Corporation of Professional Engineers of Quebec on Wednesday, January 27, 1954, at the Saguenay Inn, Arvida, at 8.30 p.m.

The first section of the meeting was devoted to the transaction of business pertaining to the Saguenay Branch of the E.I.C. under the chairmanship of G. K. Clement, P.Eng., m.e.i.c. Several new members were welcomed to the E.I.C.

Plans for the Students' Guidance meetings were announced and the members were urged to attend with a view to answering questions raised by the students.

**"A Plan for Unity"**

The Branch executive at their last meeting passed a motion recommending to the Saguenay Region of the C.P.E.Q. that a joint letter be sent to the president and secretary of the E.I.C. and all the Profesisonal Associations across Canada, with copies to E.I.C. councillors and others designated by the Saguenay Region, C.P.E.Q., recommending that the article "A Plan For Unity" by J. H. Smith, published in "The Professional Engineer," journal of the Association of Professional Engineers of Ontario, be given careful consideration as a method of supplementing the unity of Canadian engineers and recommending that a committee be set up to study the matter. This has been approved by the executive of the Saguenay Region of the C.P.E.Q. and the letter will be issued shortly.

**Nominations**

Nominations for the Branch Nominating Committee were called for and the following members agreed to serve: Messrs. L. Laventure, P.Eng., jr.e.i.c., S. T. Solinski, P.Eng., jr.e.i.c., and J. Ward, P.Eng., m.e.i.c.

Executive appointees to the Committee are Messrs. K. W. Campbell, P.Eng., m.e.i.c., and E. R. Coulthart, m.e.i.c. The proposed change to Section 2b of the Branch By-laws was approved. The letter ballot necessary for the final approval will be sent out along with the ballot for Branch elections.

The second section of the meeting was devoted to the transaction of business pertaining to the Saguenay Region of the C.P.E.Q. under the chairmanship of H. J. Butterrill, P.Eng., m.e.i.c.

**Corrosion Engineering**

The final part of the meeting was the presentation of a paper entitled "Corrosion Engineering in an Industrial Organization" by J. F. Hirshfeld, vice-president of the Hinchman Corporation, Detroit. Mr. Hirshfeld was unable to attend because of sickness so the paper was presented by F. A. Dagg, P.Eng., m.e.i.c.

Corrosion engineering is a relatively new field in importance as it is only in recent years that we have had an understanding of the processes of corrosion. Corrosion is an electrolytic or electrochemical process and is a reaction between a metal and its environment. In general its tendency is to return a metal to its natural state. The function of the corrosion engineer is to recognize, combat and prevent corrosion.

The corrosion engineer is an engineering specialist with a background of processing, manufacturing, construction or whatever field he may be working in, plus specialized knowledge about corrosion itself. Corrosion control is a continuous process and is classed as preventative maintenance. Corrosion can result in fires, explosions, interruptions of production and other serious failures and losses, so that its control is of

primary importance. Corrosion engineers should influence choice of design and materials on any new construction as well as choice of process, methods and standards in existing plants. Inspection, records and testing are amongst the various techniques used by corrosion engineers to control corrosion.

After the paper a colour film entitled "Corrosion in Action" was shown. This film was excellent and graphically showed results of corrosion as well as illustrating schematically and experimentally the technical processes by which corrosion occurs and can be prevented.

Following the film there was a discussion period with Messrs. Dagg and Butterill answering many questions dealing with corrosion. The meeting was adjourned at 11.00 p.m. at which time coffee and sandwiches were served.

#### Student Guidance

Two Students' Guidance meetings were held jointly with the Saguenay Regions of the Chemical Institute of Canada and the Corporation of Professional Engineers of Quebec. The first in French on February 5, at the Ecole Ste. Bernadette under the chairmanship of L. Simard, P.Eng. and the second in English, under the chairmanship of G. K. Clement, P.Eng. m.e.i.c., at the Saguenay Inn on February 19, 1954.

For each of these meetings a panel is formed of six to eight members representing the various fields of endeavour open to those who take university training in the sciences and engineering. Each member of the panel speaks for five minutes describing the general requirements, the activities and the future in his own field. This is followed by a question and answer period during which the panel and the other members answer questions raised by the students. At the close of the formal period refreshments are served, over which the students may informally discuss any points with the members.

These meetings were highly successful and it is planned to extend them next year.

#### Students' Night 1954

The advance publicity for Students' Night held on February 18 promised that it would be different this year—and it certainly was. Instead of the students being invited to hear a speaker provided by the Branch, the branch members were invited to hear the students being put through their paces!

A panel of seven students, representing each of the major engineering courses were put through a variety of tests by the Inquisitor-in-Chief, W. H. M. ("Monty") Laughlin. These tests included two minute talks on subjects of professional interest, spelling tests and tests of general knowledge. This highly exacting program was drawn up and judged by Tom Dembie. Cash prizes in various amounts were awarded to the panel members. In addition, questions were fired at the students in the audience, the rewards for correct answers being free student memberships in the E.I.C. The chairman of the Civil Engineering Club of the University of Toronto was awarded a special cash prize as the members of his club had the best percentage attendance.

At the end of the proceedings, the student panel turned the tables on the inquisitors and fired questions at a panel of Branch members. The evening concluded with coffee and doughnuts being served and the operation of the '1954 Employment Clinic' ably conducted by J. Ogilvy, assistant field Secretary. Every member of the large number who attended agreed that this was one of the most successful and enjoyable meetings that he had attended.

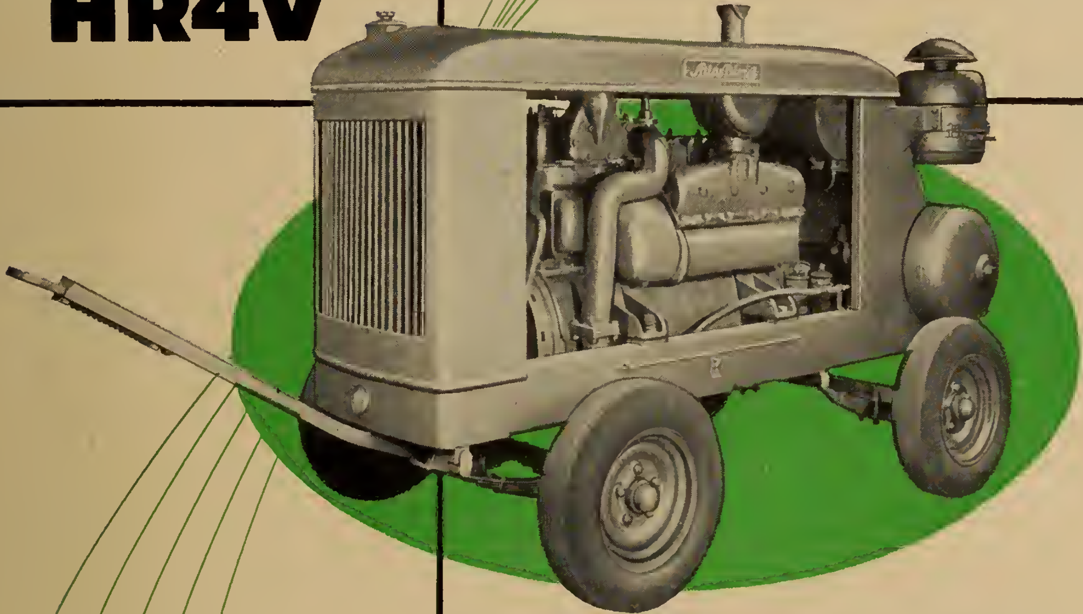
#### Atomic Energy

F. W. Gilbert, manager of the Reactor Operations Division, Atomic Energy of Canada Ltd. visited the Branch on Thursday, March 4, and delivered a most interesting paper entitled "Mountain Climbing with Atomic Energy Engineers". The title was based on an analogy drawn between the force that prompts men to climb mountains and the force that drives engineers to the solution of problems. Mr. Gilbert's particular mountain is the development of economical power from nuclear fission.

The problem in the design of a reactor using uranium as a fuel is the control and conservation of neutrons emitted by the unstable portion of

# The ATLAS COPCO HR4V

## The things we've left OUT make this the best portable on the market!



The parts that give most trouble on conventional compressors have been eliminated on the Atlas-Copco HR4V Portable. Its powerful diesel engine has no auxiliary drives, no valves, no valve gear or camshafts, no clutch . . . *and not even an electrical system*. A sure-fire powder cartridge starts it instantly, even in cold weather. The Atlas-Copco HR4V Portable is lighter than ordinary 210 cfm compressors, yet it has a capacity of 236 cfm at a speed of only 1000 rpm.

Additional features: Water-cooled two-stage cross-head type compressor with two-stroke diesel engine. Monoblock design—this means ONE crankcase, ONE crankshaft, ONE cooling system, ONE lubrication system. Fuel pump is direct-coupled to the crankshaft. Give it a practical test right on your own job now with our rental-purchase plan. Write, phone, or wire our nearest office. We guarantee delivery, service *and performance*.

**NO ELECTRICAL SYSTEM**
**NO AUXILIARY DRIVES**
**NO VALVES IN DIESEL ENGINE**
**NO VALVE GEAR OR CAMSHAFTS**
**NO CLUTCH**

uranium—$U^{235}$. Various types of reactor have been devised—the rod type in which $U^{235}$ and $U^{238}$ are present in the form of "rods" or "slugs"—the "slurry" type in which a slurry consisting of a mixture of uranium in heavy water is pumped through a boiler to remove the energy—and the "fast" reactor which is best described as a controlled atomic bomb. The paper described many of the other problems facing the atomic energy engineer.

A short film was also shown which described the problems involved in the repair of the NRX reactor at Chalk River.

The large audience was most appreciative of the trouble taken by Mr. Gilbert in preparing this most interesting paper.

### Civil Section

I. B. Henderson, M.E.I.C.,
*News Editor*

**Sir Adam Beck Power Development**

The following is an extract from an address given to the Civil Section of the Engineering Institute of Canada at a meeting held February 11, 1954, in the auditorium of Canadian Westinghouse Co. Ltd.

The speaker, R. H. Self, M.E.I.C., P.Eng., generation construction engineer for the Hydro-Electric Power Commission of Ontario was introduced by Frank Hutton, resident engineer, Board of Transport Commissioners.

Mr. Self showed slides and gave an informal talk on the stages of tunnel construction for the 1.6 million horsepower Sir Adam Beck No. 2 power development at Niagara Falls, Ontario.

The two tunnels, 51 ft. excavated diameter and 5.2 miles in length, were driven through sedimentary rock utilizing a harder limestone formation as a protective cover. Five shafts were driven in order to construct these tunnels, the deepest of which was 330 ft. The arch wall was supported by steel ribs of an "I" section at 4 ft. centres together with steel lagging and timber blocking. These steel sections were left in place when the concrete lining was poured and no additional reinforcing steel was used. The steel logging and timber blocking was removed wherever possible.

The tunnel was mucked out by means of 2½ yd. electric shovels loading into trucks and thence by skips up the shafts to the surface. The exhaust from these trucks was filtered to remove noxious gases. In the initial stages a ventilating shaft was carried up to the heading in order to provide sufficient fresh air. When the tunnel was holed through, the natural ventilation was sufficient.

The three foot thick concrete lining was poured in three stages. Curbs at the side of the tunnel were poured and then by means of a travelling invert screed utilizing these curbs, the invert was formed and finished by hand steel trowelling. Finally, the main arch of the tunnel was concreted using the travelling form mounted on rails situated on the previously formed curbs. Pours were made connectively for the full length of the 80 ft. form and no construction joint was provided between consecutive pours.

In order to inspect and maintain the tunnels, five pumps were installed which are capable of dewatering one tunnel in approximately one week. At the exit of the tunnel, a trapezoidal section was found necessary due to the unstable nature of the ground. This section leads into a rectangular open cut canal. It is interesting to note that whilst the trapezoidal section by its very nature had to be concreted, the open cut canal was not. It was found that in this instance to keep the friction loss to a minimum without paving the sides, it only required additional excavation in the order of a few feet, this is less costly than concreting the sides and base. This information was obtained from models which were used extensively on this project and considerable savings in costs were effected. It was found from scale models that certain rock excavation which was at first thought necessary in the forebay was not required, and the costs were reduced accordingly.

The project started in 1951 and is now well under way, the first generator being scheduled for service this spring.

The thanks of the Civil Section were extended to the speaker by D. C. Bryden, chief engineer of the Winnipeg City Hydro.

The meeting was held under the chairmanship of W. B. White, assistant engineer, Canadian National Railways.

# LIBRARY NOTES

## Additions to the Institute Library

**Reviews — Book Notes — Abstracts**

## BOOK REVIEW

**Design and construction of general hospitals.** United States department of health, education and welfare public health service. New York, F. W. Dodge Corp., 1953. 214 pp., illus., $12.00 (U.S.)

In theory, an architect and an engineer should be able to combine and construct a hospital. But the idea, as expressed by Mr. Everett S. Jones, the vice-president of The Modern Hospital Publishing Company, presents a more practical suggestion — "The best therapeutic measure for the flat feet and frazzled nerves of hospital workers would be a requirement that any architect planning a hospital don an orderly's uniform and work for two weeks on a nursing unit. Needed too was an appreciation by architects and hospital administrators of the great contribution to be made by department heads, nurses and other hospital workers to the functional planning knowledge of those designing our hospitals."

With this in mind the United States public health service with the co-operation of such groups as the American Hospital, Psychiatric, Public Health and Tuberculosis Associations, have produced the detailed information contained in this book.

Maintaining that every hospital design should be uniquely adapted for individual requirements, the material is consequently presented only as a guide for basic planning.

It is divided roughly into four sections, namely, Schematic plans, Design and Construction, Elements of the General Hospital and "Equipment lists".

Detailed discussions of hospital planning problems, from site to equipment, including costs of specialized details of construction, are followed by detailed solutions for individual departments and rooms.

The second half of the book is devoted to architects' plans, divided as to type, with running page headings, equipment cost tables, equipment supply lists, area charts for acute general hospitals, a classified bibliography and index.

This book is rather unique in its field, and merits the considered attention of all of our readers in any way interested in hospital and residence construction. E.K.

> The English edition of Guyon's **Prestressed Concrete,** was erroneously listed in these pages as having 150 pages. It carries 543 pages, and is priced in Canada at $12.00.

## BOOK NOTES

**Prepared by the Library**
**The Engineering Institute of Canada**

* Review provided through the courtesy of the Engineering Societies Library in New York.

**The casting of non-ferrous ingots.** Leslie Aitchison and Voya Kondic. Toronto, Burns and MacEachern, 1953. 370 pp., diagrs., $9.25.

The authors state that the aim of this volume is to deal with the problems of ingot-making in all the commercial non-ferrous metals and their alloys, and to present the subject as a single entity.

Numerous branches of metallurgy are concerned with ingot-casting, and this work has been limited therefore to the central topic of casting ingots, and a moderate knowledge of metallurgy is assumed on the part of the reader.

It is divided into three parts: 1) Theoretical background; 2) Metallurgical aspects, and 3) Production aspects.

Bibliographies are purposely not included, because "we believe that our digestion of the publications and our presentation of the contemporary knowledge should relieve our readers from the necessity of referring to the original sources which we have consulted exhaustively."

References are made in some chapters to standard general works, or to a body of research reports.

Block letter and dark type heading and sub-headings contribute greatly to ease of use, and the book is indexed.

**Cybernetics: circular causal and feedback mechanisms in biological and social systems.** Heinz von Foerster, ed. New York, Josiah Macy, jr. foundation, 1953. 184 pp., $4.00 (U.S.).

The fact that this is the ninth conference on cybernetics is indicative of the growing popularity and possibilities of this relatively new science for promoting meaningful communication between scientific disciplines.

Because of the rapidly advancing knowledge in wide varieties of fields, an increasing number of people are coming to recognize the potentialities of cybernetics as an effective means for the exchange and dissemination of this new information.

New scientific jargon is kept to a minimum and so keen are the participants on the furthering of their ideas and discussion, that the transactions of each meeting are published and sold at cost. The meetings are informal and the discussions lively, and illustrations, figures, charts and accurate bibliographies are contributed by the various professions represented.

These multi-professional conferences are sponsored by the Josiah Macy Jr. Foundation.

**Elements of radio,** 3rd ed. Abraham Marcus and William Marcus. New York, Prentice-Hall, 1953. 771 pp., diagrs., $6.00 (U.S.).

The information contained in this volume, and the method of its presentation, is such as to make it of maximum value to a teacher giving a one year introductory course in radio.

The first chapter deals with the basic crystal receiver, and those following show the progressive and cumulative development right up to the cathode ray tube.

Questions and problems accompany each chapter, and classroom demonstrations are provided at the end of the text, as well as a good detailed index.

**Flying saucers from outer space.** D. E. Keyhoe. Toronto, McLeod, 1953. 276 pp., $3.50.

"O.K., you're flying an F-94 jet, with a radar operator behind you. You're on a routine patrol. Ground Control Intercept calls you. They've got an unknown on their radar, which is a surveillance type, with a longer range than yours. Their tracks show the unknown is making tight turns and speeds too high for any aircraft. So they give you the word — it's a UFO" (unidentified flying object). And there is an official standing order on sighting these craft "Intercept — but don't shoot!"

When asked point blank, "What do you personally think?", a major in the United States Air Force shook his head, and said, "You can't ignore the testimony of competent pilots. We don't know the answers, but we're making a careful investigation".

On May second, nineteen fifty-three, a British Comet crashed, with forty-three persons aboard, and the wreckage was strewn about for five square miles. There was no time for the pilot even to flash a distress signal. "The comet had been hit by an unidentified flying body".† Laugh if you like, we think rather you will be baffled, fascinated, and very curious.

This is the first of a number of similar titles we hope to present to you in these pages. All of them are available on loan from the library, or may be purchased through the library, or from your local bookseller.

**Handbook of probability and statistics with tables.** R. S. Burington and D. C. May. Sandusky, Handbook publishers, 1953. 332 pp., diagrs., $4.50 (U.S.).

To provide a convenient handbook of information not otherwise readily available in one volume is the purpose of this book. It is divided into two main parts. The more important formulas and definitions of elementary statistics and probability theory are first summarized. Section two follows with tables of distributions and other quantities.

As a handbook of information, it will be of use both to the statistically trained user, and also to the reader without this detailed background.

There is a very full subject index, a separate index of names, and numerous tables.

***Industrial electronics.** R. Kretzmann. New York, Elsevier press, 1953. 236 pp., diagrs., $5.50 (U.S.).

† This case has since, of course, been re-opened for further investigation. (Ed. note.)

Written primarily for the engineer engaged in supervising or maintaining electronic equipment, this book presents the fundamentals of electronic control. Part I discusses vacuum and gas-filled tubes and their circuits; Part II describes practical electronic devices such as control relays, timers, motor control devices, and many special applications.

**Industrial wastes: their disposal and treatment.** Willem Rudolfs, ed. New York, Reinhold, 1953. 497 pp., illus., \$9.50 (U.S.) (ACS monograph no. 118).

Although edited by Willem Rudolfs, chairman of the department of sanitation, New Jersey Agricultural Experiment Station, at Rutgers University, this volume is really a compilation of the work of seventeen contributors. Each one is a specialist in his own field, and the subjects treated cover disposal problems in such industries as meat packing, leather, pulp and paper, coal, water, and radio-active wastes.

Full details of the physical chemical and biological aspects are considered with each type of problem, the principal stress being placed on treatment.

Extensive references are included with each chapter, and the book is well indexed.

This is a very popular subject with our members, and this addition to the information field should be most welcome.

**Marine steam boilers.** J. H. Milton. Toronto, British Book Service, 1953. 256 pp., illus., \$5.50.

Although intended primarily for the marine engineer who is already qualified, this book has also been written for those who are studying for the United Kingdom Ministry of Transport Marine certificate examinations.

There are many types of marine boilers in use, and in this book an attempt has been made to cover the subject in a practical manner, and it deals with the various types of boiler in general use in vessels.

The historical and theoretical development of the marine boiler, and the material used in construction are discussed, as is the actual construction. Tank, water-tube, composite and exhaust gas and forced-circulation boilers are considered, as are steam generation and boiler mountings and examinations. A final chapter enumerates the Classification Society's Rules, together with observations on each.

**Modern pumps.** E. Molloy, ed. Toronto, British Book Service, 1953. 240 pp., illus., \$4.25.

There are so many types of pump in operation today that it is useful to find a comprehensive review of them in one volume. The first five chapters of this book deal with the principles of pumping, and pumping layouts. Also considered are the three main classes of pumps, reciprocating, centrifugal and rotary, and their installation, maintenance and repair.

The remaining five chapters are concerned with pumps from the view point of their applications, and the choice of a pump for any particular use. Applications dealt with in detail are boiler feeding, the mining and oil industry, and well and bore-hole pumps. There is also a chapter on pumps for special purposes, including sewage, drainage, irrigation, and general contractors' work, and pumps for special liquids.

There are seventeen tables in the Appendix showing such things as friction loss in cast-iron pipe, suction lift for various temperatures, the weight of water at different temperatures, steam pressure, temperature and weight, barometric pressure corresponding to various altitudes, pressure of atmospheres in pounds per square inch, specific gravity of liquids, and other relevant subjects.

**The mystery of other worlds revealed.** Willy Ley, et al. Toronto, Saunders, 1953. 144 pp., illus., $4.50.

Space travel is rapidly assuming a place of attention in the scientific world, and the possibility of its reality coming daily closer.

Of a number of space travel and flying saucer books recently received in the library, this is of the more spectacular type, in that it includes pictures of fanciful biological specimens of life on other planets.

The whole is really a compilation of magazine articles, with excerpts and illustrations ranging in type from the Journal of the British Interplanetary Society to Mechanix Illustrated.

The co-operation of Paramount Pictures is indicated in their contributions of scenes from their film War of the Worlds, based on H. G. Wells' novel.

Present developments being as they are, the children may find all of this less fantastic than do our regular readers.

**Pressure vessel manual,** 4th ed. K. O. Siemon. Ann Arbor, Edwards bros., 1953. 284 pages, diagrs., $3.85 (U.S.).

Originally copyrighted in 1940, 1941 and 1942, the code requirements of this volume have since been revised and brought up to date with the 1950 edition of the A.S.M.E. Code, and the 1951 edition of the A.P.I. - A.S.M.E. Code for unfired pressure vessels. This has concerned principally changes in design formulas for cylindrical shells and heads, and some data relating to flange design.

Principal materials of construction are discussed and physical properties and fabricating characteristics of the different metals, always having in mind the needs of the designer of process equipment.

References are included with most chapters, and the book is indexed.

**Principles and practice of radar,** 4th ed. H. E. Penrose and R. S. H. Boulding. Toronto, British Book Service, 1953. 795 pp., illus., $10.00.

First published in 1949, this book is now in its fourth revised and enlarged edition. These frequent revisions are obviously necessary with the increasingly exacting requirements of modern radar installations.

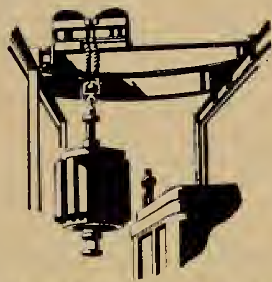
Information on microwave radar has been emphasized and enlarged, with a corresponding diminution of longer wave length instruction. The chapter on feeder systems has been entirely rewritten with greater stress being placed on coaxial feeders and waveguides than to open wire feeders. Microwaves and their special problems are dealt with, and additional circuits for special purposes have been added. Some electrical symbols used differ from those in the United States, but the meaning is clear from the context.

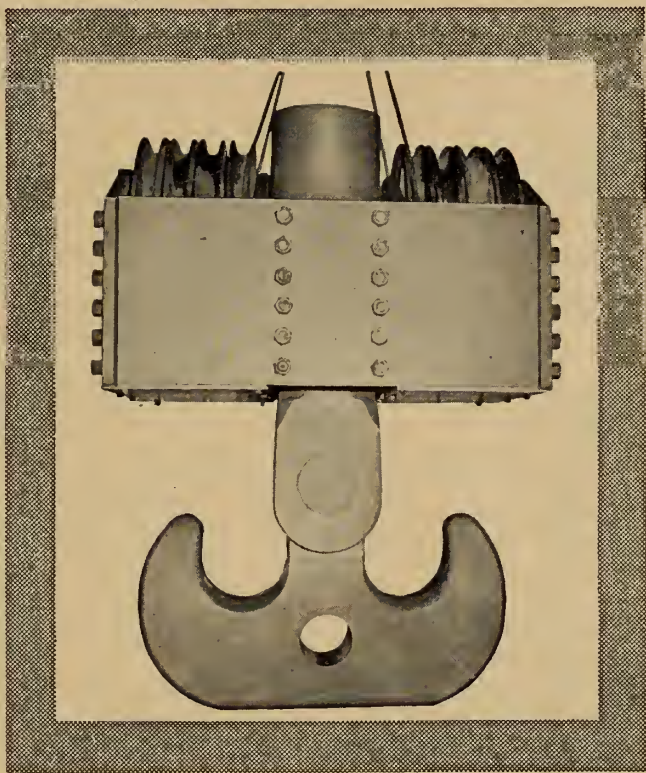
There is an excellent detailed index.

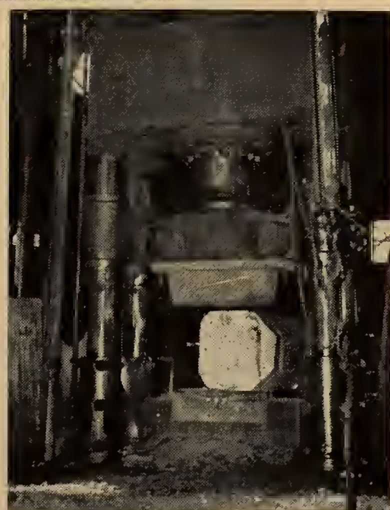
**Renewing our cities.** M. L. Colean. New York, Twentieth Century Fund, 1953. 181 pp., illus., $2.50 (U.S.).

"Worn out and static urban districts are now an old story, but the question of how they came to be, why they persist, and how to get rid of them still remains . . . A city, unless it has ceased to function . . . is always in transition . . . Because of this there can be no final once-and-for-all answer to the city's problems."

However, in spite of this statement, this volume does present a thorough discussion of the problem as a whole.







Opening with the growth of a problem, the ensuing sections, Slums and renewal, Renewal and its problems, What is being done, and Looking forward, follow in logical sequence.

Source footnotes accompany the text, and photographic illustrations are used to clarify certain points of congestion, handling of traffic, parking facilities, etc., and constructive proposals and suggestions are included in the chapter Looking Forward.

The book is well indexed, and should be a timely publication for a large number of our members.

**Retirement and the industrial worker: prospect and reality.** Jacob Tuckman and Irving Lorge. New York, Columbia University, bureau of publications teachers college, 1953. 105 pp., $2.75 (U.S.).

Published as a research study of the Institute of adult education, two major problems are dealt with in this treatise: 1) The function of adult education in community development and 2) Studies in personal adjustment to stress points in adult life. Good co-operation from the Institute of psychological research has been a great aid in the compilation of the material.

The volume is well worked out and developed, opening with a discussion of the problem of retirement and advancing to pressure of age and work, attitude of the individual and of the family to retirement, and the actual retirement.

The appendix contains interview schedules, and bibliography, and should be of great interest to a large group of our readers.

**Small motors and transformers; design and construction.** E. Molloy, ed. Toronto, British Book Service, 1953. 176 pp., diagrs., $3.50.

"It is the purpose of this book to provide, in a convenient form, sufficient data to enable any engineer to undertake the design, construction and rewinding of small motors and dynamos, and the design and construction of small motor transformers for a wide variety of purposes."

A.C., D.C., universal and fractional horse power, and squirrel cage induction motors are all considered, along with the design and construction of small power transformers.

The presentation is practical, and the illustrations excellent.

**Toxic solvents.** Ethel Browning. Toronto, Macmillan, 1953. 168 pp., $3.00.

"For the purpose of this publication an organic solvent may be broadly defined as an organic liquid in which substances can be dissolved without changing their chemical properties."

The increasing use of solvents for industrial purposes correspondingly increases danger to operatives handling them. The large number of deaths in industry due to this toxicity led the British government to appoint a committee to investigate the whole problem, under the direction of the author of this volume, Dr. Ethel Browning. The object of the publication is to present this information in a readable form. Special attention has been given to fields of action, chemical properties, and potentialities for injury of these chemicals, and fairly detailed descriptions of physiological effects.

The arrangement of the text proper is classified according to type of solvent.

"Precautions against health hazards" follows this, and then a glossary of medical terms, and an index.

It should be of particular appeal to works managers, chemists, engineers, and safety officers.

# *Save* TIME, MONEY, MANPOWER with BRUSHMASTER®

## the Brush Cutting Power Saw

Brushmaster, the leader in its field, has been adopted by thousands of Canadian and U.S. companies to reduce brush cutting costs . . . every day Brushmaster is being discovered as the answer to a new and tough brush problem.

Brushmaster is being used for cutting surveyors' lines and roadside brush; thinning timber stands; improving woodlots; swamping in pulp and paper industry; clearing dam sites, land and irrigation ditches; removing brush from power, telephone and oil pipe line right-of-ways . . . portages; maintaining parks and golf courses; thinning plantations and weeding young stands of inferior species; making fire breaks and clearing railroad right-of-ways; cutting ski trails and bridle paths. Brush clearing contractors find it their handiest tool.

Brushmaster is precision-engineered for safety and tough commercial use. With it one man can do the work of at least six handcutters—it pays for itself in 10 to 15 days.

*INVESTIGATE BRUSHMASTER ECONOMY TODAY!*

Sliding a precast concrete purlin into position.

General view of one of the concrete structures.

# One of the Largest PRESTRESSED CONCRETE roof structures ever built

**Central Ordnance Depot, Cobourg, Ont.**
**Features a Roofing Surface of 420,000 Square Feet**

In the construction of four army warehouses at the Central Ordnance Depot, Cobourg, Ont., which was under the direction of the Royal Canadian Engineers, only prestressed concrete girders were used. A total of 150 girders of the continuous prestressed type, each one hundred feet long, were selected for the main parts, with 36 supported beams of 50 foot lengths, for the truck aisle sections. In addition 2100 precast concrete purlins and 420 cast-in-place concrete columns, at 50 and 25 foot centre distance, were used to erect the structural frame of the buildings.

By prestressing concrete its tensile strength is substantially increased, thus permitting the use of longer spans in the construction of buildings and bridges. FREE literature on request.

Prestressed concrete roof structures by Pre-Compressed Concrete Engineering Company Limited, Montreal and Toronto.

## A Digest of Information received by The Editor

## Appointments and Transfers

**Donald H. McLaren.**—Donald H. McLaren, vice-president, of the Foundation Company of Ontario Limited, has been appointed chief engineer of Defence Construction (1951) Limited. Mr. McLaren is being made available on loan, he succeeds C. G. Kingsmill, who is returning to Angus Robertson Limited.

●

**Duncan W. Fraser.**—The retirement of Duncan W. Fraser as chairman of the board of directors of Montreal Locomotive Works, Ltd., was announced recently to be effective on April 30th.

Mr. Fraser has been associated with Montreal Locomotive continuously for 50 years, and is currently a director of American Locomotive. He has also served as director of Canada Iron Foundries, Ltd., and Dominion Steel and Coal Company, Ltd.

●

**Canadian General Electric.** — W. F. Smith, becomes manager of the new component products division which was recently established within the industrial products division of Canadian General Electric Company. The new department replaces the former industries department.

●

**Cominco.**—A. G. Robertson has been appointed superintendent of concentration for the Consolidated Mining and Smelting Company of Canada Limited. Mr. Robertson will continue to act as superintendent of the Sullivan concentrator, Kimberley, B.C. and will also be responsible for the technical direction of all other Cominco concentrators.

●

W. T. Allen

**Automatic Electric Sales Appointments.**—C. R. Hughes, president of Automatic Electric Sales (Canada) Ltd., recently announced the following staff appointments:

R. W. Robb, formerly supervisor of telephone sales in Toronto becomes Winnipeg district manager with headquarters at 115 Phoenix Bldg., Winnipeg.

W. R. Boast, previously engaged in sales and field work in Montreal is named Toronto district manager.

C. H. Beggs, in charge of telephone sales in the Montreal district, becomes Montreal district manager with headquarters at 54 Decarie Blvd., Ville St. Laurent, Montreal 9.

L. C. Kelly, in charge of telephone sales at Vancouver, becomes Vancouver district manager with headquarters at 527 West 8th Avenue, Vancouver.

●

**W. T. Allen.** — H. E. Cole, executive vice-president and general manager, Trane Company of Canada Limited, announced the appointment of W. T. Allen as franchise holder of the London territory effective April 1.

Mr. Allen, a successful sales representative in this territory for several years, now becomes manager of the company's branch office in London.

●

**English Electric.**—John Michael Sowry has been appointed executive assistant to H. E. Style, president of the John Inglis Co. Ltd., and the English Electric Company of Canada Limited.

**Toronto Iron Works Limited.** — The appointments of John C. Udd of Montreal as director and Arthur J. LeBlanc as general manager have been announced by G. E. Ellsworth, president of the Toronto Iron Works Limited. Mr. Udd's appointment as director of Central Bridge Company Limited was also announced.

**Wallaceburg Brass Limited.** — J. A. Burgess, vice-president of Wallaceburg Brass Limited, recently announced the formation of a new company, Wallaceburg-Singer Limited, set up to manufacture hot brass pressings in Canada. Head office is in Wallaceburg, Ontario. Mr. Burgess is vice-president and general manager.

**Northern Electric.**—Powerlite Devices Limited, announces the appointment of Northern Electric Company Limited as its exclusive distributor of Powerlite Street Lighting Equipment in the Dominion of Canada. This will include the well-known Powerlite line of incandescent luminaires, new mercury vapor luminaires, brackets and ornamental street lighting standards. A new fluorescent street lighting luminaire is now available for use with the new T12 rapid start lamp. Photoelectric controllers and relays are also included in the arrangement.

**Bepco Canada Limited.**—Bepco Canada Limited has announced the appointment of Jack H. Crisp as publicity manager. Mr. Crisp was previously employed by Cables, Conduits and Fittings Limited, St. Johns, Que., in the capacity of advertising manager.

*(Continued on page 666)*

# New Equipment and Developments

**Flexible Cylinder Arrangement.** — A new line of Oxweld stationary manifolds, introduced by Dominion Oxygen Company, features advantages that enable the user to realize the many economies of a dependable and continuous gas supply. Centralization of gas supply, by means of manifolds and feed lines, saves time and money for those who use large quantities of compressed gases. Manifolding the cylinders reduces floor space requirements, cuts labour costs, eliminates many handling and maintenance costs, and increases production by providing a continuous flow of industrial gases at controlled pressures.

This new line offers a wide choice of both single-regulator and dual-regulator manifolds.

In the dual-regulator series the reserve bank of cylinders picks up the gas load automatically — with no interruption of service — when the usable supply in the operating bank of cylinders is exhausted.

The single-regulator series has one pressure regulator to control flow of gas from both cylinder banks, and change-over from depleted to reserve bank is done manually. Separate control valves allow the use of one bank at a time or both at once.

Both series include manifolds for use with oxygen; water-pumped inert gases, such as nitrogen and argon, or water-pumped air; oil-pumped inert gases or air; high-pressure fuel gases, such as hydrogen; and liquified petroleum gases. All manifolds mount against a wall or on floor supports in any size or shape room. They are approved and listed by both Underwriters Laboratories, Inc., and Factory Mutual Laboratories.

●

**Listing Symbol.**—Underwriters' Laboratories of Canada has recently announced to its subscribers the development of a Listing Symbol for use in advertising and other printed matter covering listed products. The symbol will provide a convenient method whereby a manufacturer may inform the public that the product described in published advertisements, catalogues, and other literature, has been tested by the Laboratories and is listed under one of its inspection services.

The symbol is available in four official variations and the use of each is governed by the type of inspection service under which a product is listed.

The first three forms of symbol are similar in design, consisting of two concentric circles with the letters "ULC" enclosed within the inner circle and a definitive statement in the space between the inner and outer circles. A single circle enclosing the letters "ULC" comprises the fourth form of symbol.

Form I, which constitutes the basic design, includes the statement "Listed by Underwriters' Laboratories of Canada" and may be used universally in printed matter covering products listed under any of the several inspection programs. Form II is identical to Form I, except that substitution of the word

*(Continued on page 670)*

TRANSF.2D.
C B A

(*Continued from page 666*)

"labelled" for the word "listed" confines this design for use only in connection with products listed under label service. Form III is specifically intended for use on the package or carton in which a labelled product is packed and the statement appearing thereon is worded accordingly.

# Publications

**For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.**

**Please mention *The Engineering Journal* when writing.**

**Elevators.**—Automatic Programs Selection, Automatic Elevatoring, and an Electronic Detector which initiates door reversal by "sensing" the presence of a passenger are the titles of three booklets recently issued by the Otis Elevator Company.

Basic traffic programs and features of automatic and semi-automatic operation, are discussed. Also available is a list of Otis contracts for automatic electronics elevators. Address correspondence to the Otis Elevator Company Limited, Hamilton, Ont.

●

**Power Transformers.**—A new bulletin prepared by Reliance Electric & Engineering (Canada) Limited which gives useful data on how to select power transformers is now available. Selection data is given in terms of the latest standard specifications of the Canadian Standards' Association on power transformers. The bulletin attempts to show the economies of selecting standard equipment and points out what makes a power transformer special.

A discussion is included on the merits of selecting single phase or three phase units. The bulletin also describes the various types of cooling power transformers. It is available from the company at Welland, Ont.

●

**Rolling Doors.**—Three Bulletins about rolling wood doors, and rolling steel doors have been issued by G. Brady & Co. Ltd. Included are detailed drawings of the installation, and illustrations of some typical applications.

The bulletins are available from David C. Orrock and Co., 1405 Bishop Street, Montreal 25, Quebec, Canadian representative of the company.

●

**Turbo Blowers and Compressors.** — The latest Brown Boveri publication is a special brochure on "Turbo Blowers and Compressors". This publication should be of considerable interest to plant and design engineers in chemical, mining and engineering industries where large volumes of oil free compressed air or other gases are required.

Address inquiries to Brown Boveri (Canada) Limited, 1015 Beaver Hall Hill, Montreal 1, Que.

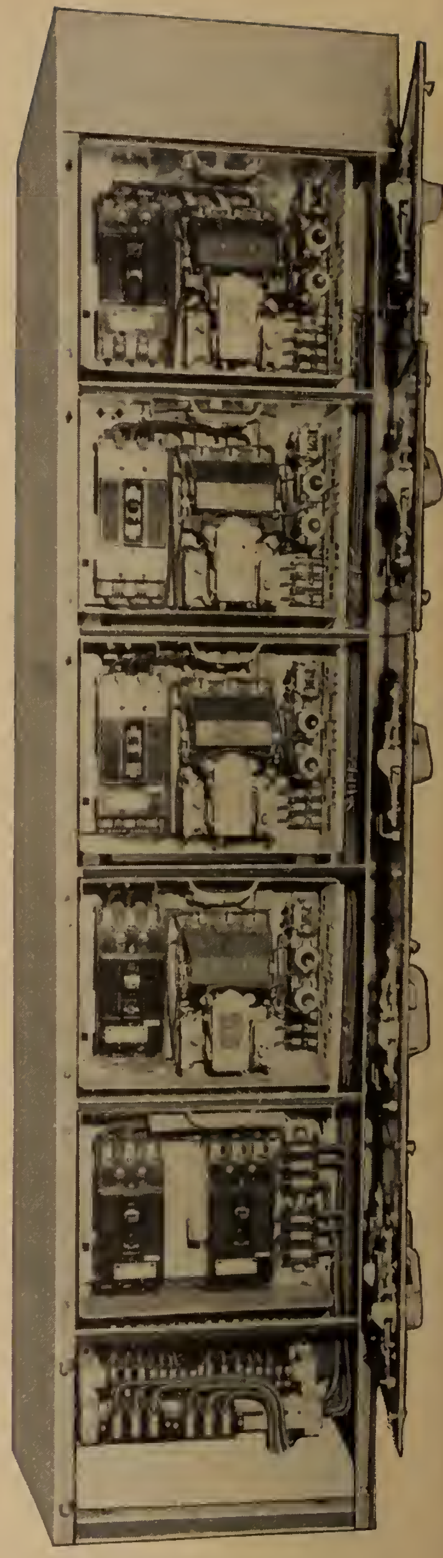
# A CONTINUOUS VERTICAL WIRING TROUGH

## FOR UNMATCHED

# WIRING CONVENIENCE



Continuous Vertical Wiring Trough

It takes a continuous, vertical wiring trough to make a control center *really* easy to wire — which is exactly what you get in Westinghouse design.

Removable side baffles in each starter unit simply slide out to provide free access from wiring trough to terminal boards.

Removable support bars between the starter units are easily released, eliminating the tedious job of fishing wires through blind spaces.

By removing side baffles and support bars you create a *continuous* wiring trough — unobstructed from top to bottom — providing ample hand room for an easier, faster wiring job.

Consider *all* the advantages of this new control center! New, Magna-Grip "plug-in" connectors for greater operating simplicity; standardized, modular dimensions for unmatched flexibility; interlocking handles and "tilt position" disconnect for extra safety. These are random examples. The complete story is in Booklet B-5621. For your copy write to Canadian Westinghouse Company Limited, Hamilton.

# CONTROL CENTERS

During those years of the war when the Japanese threatened to get a footing in Alaska — in fact, did get a toehold there — the Alaska Highway was much in the public eye. Now interest in it has subsided considerably, except among those in Alberta, British Columbia and the Yukon whom it serves. The 1,221 miles of it in Canada, rechristened the "Northwest Highway System" poses problems of maintenance and development of most interesting character; these are what Brigadier Love discusses in this paper, delivered before the Vancouver Branch on October 15, 1953.

# The Northwest Highway System

*by*

Brigadier H. W. Love, O.B.E., C.D., M.E.I.C.

*Commander, Northwest Highway System, Canadian Army.*

The object of this paper is to give a picture of the problems of maintaining the Northwest Highway System and the engineer organization and management, or, in military terms, "the administrative aspects" of the task. An appreciation of the geography and topography, the connecting transport systems and particularly of the distances involved, is essential to a proper understanding of the problem.

### Physical Features

The Canadian portion of the Alaska Highway extends from Dawson Creek, B.C., Mile 0, to the Yukon-Alaska Border, Mile 1221.4. (Fig. 2.) Included in the Army's responsibility are eight airfield access roads: Fort St. John, Beatton River, Fort Nelson, Smith River, Watson Lake, Teslin Lake, Aishihik and Snag. These total 220 miles. In addition, the Army maintains seven emergency landing strips immediately adjacent to the main road at Miles 148, 223, 507, 722, 843, 1013 and 1096.

The Army is also responsible for the Haines Cut-Off Road from the Yukon-Alaska border to its junction with the main highway, approximately 117 miles. This road, the Northwest Highway System (NWHS) operates in summer only, opening in May or June and closing in October or early November, depending on weather conditions. The airfields, other than the emergency landing strips, are maintained by

Fig. 1. Slims River, Mile 1059, is one of the typical glacier-fed streams crossed by the Alaska Highway. The crossing in the foreground is part of the pioneer road and the existing crossing is located three miles downstream. Identifiable in the background are mountains of the St. Elias Range including Mount Logan (El. 19,850 ft.) to the right, Mount Vancouver (El. 15,700 ft.) just left of the center, and Mount Hubbard (El. 14,950 ft.) to the extreme left.

**Fig. 2. Map of the Northwest Highway System.**

the RCAF and the Department of Transport.

The Highway is served by two railways, the Northern Alberta Railway (Edmonton to Dawson Creek), and the Whitepass Railway (Skagway, Alaska, to Whitehorse). It is served by two provincial highways from the South—Edmonton to Dawson Creek and the Hart Highway in British Columbia from Prince George to Dawson Creek. It joins the Alaska Road System at the border at Mile 1221.4. The McKenzie Highway from Grimshaw, Alberta, to Hay River, is also an important feature in northern transportation, but there is no interconnection between the NWHS and the McKenzie basin. The Canol Road from Norman Wells to Mile 836 on the NWHS was abandoned in 1945. Yukon and British Columbia communities are gradually being connected to the Alaska Highway.

Throughout the 1,600 miles of road operated by NWHS, there is a wide range of topography, soils and climatic conditions. From Mile 0 to Mile 360 the soil is almost uniformly silt and decomposed shale, with long stretches of flat ground overlaid with muskeg up to 25 feet deep. The rivers are characteristically meandering, silt laden, sluggish in low water, but still capable of sudden high floods, since they originate in the Rocky Mountain ranges to the west and south. The geology is similar to that of the Prairies. Oil and gas exist in quantity in the Fort St. John area and are suspected almost everywhere in the area north and east of the Rockies.

From Mile 360 to about Mile 490, the highway crosses the northwest end of the Rocky Mountain Range. (Fig. 3.) This is the only section of the highway which is actually mountainous. It is characterized by numerous small, but torrential, streams which are subject to flash floods, by rock cuts and narrow stretches, but also by predominantly good road building material. The summit at Mile 393 is 4,200 ft. above sea level, the highest point on the highway.

**Fig. 3. Mile 409, a typical section of the highway traversing the Rocky Mountains.**

From the Lower Liard River crossing at Mile 496 to about Mile 660, the highway traverses the Liard Plateau, a region of low mountains with some sections of very poor drainage, particularly along the Liard River itself. The soil here is silt and clay and causes a great deal of frost trouble — icing on side hills during the winter and innumerable frost heaves in the breakup. Here also some of the lowest temperatures are experienced and the heaviest snow fall is recorded. Much trouble is experienced from ice and drift wood in the many small streams during the spring.

From the Liard Plateau the road crosses the Cassiar Mountains — the Northern projection of the Stikines — the Nisutlin and Teslin Plateaus, and then the Coast Mountain Range, low here, to the edge of the St. Elias, about Mile 1,016, the Haines Junction. The Coast Mountains branch northward here and the St. Elias extend to the west and slightly northward into Alaska. This stretch has generally similar conditions to the Liard Plateau, but better soil and fewer difficult flood channels. In this area begins the first permafrost, but it is generally widely scattered and in small patches only. (See Fig. 1.)

From Haines Junction to Mile 1,170 the highway parallels the Kluane Range of the St. Elias Mountains, crosses three rivers of major size and glacial origin — Slims River, Donjek River and White River, — and many short, but torrential, flood channels. Here again in the vicinity of the mountains the soil is generally good sandy gravel with adequate binder readily available. This is the section which has given NWHS the most flood trouble in the past three seasons. There have been 60 washouts in a 70-mile stretch and five bridges lost, all overnight. It is relatively easy to restore traffic because of the readily available material. Permafrost throughout this area is frequent, but not continuous and occurs mainly on north-facing slopes and in the few stretches where the soil is silty.

North of Mile 1,170 and to the Alaska border the road leaves the St. Elias Mountains and crosses the White River Plateau, which is generally flat, almost completely muskeg and almost continuous permafrost. This is an interesting portion of the road from the maintenance point of view, because of the muskeg condition and the permafrost. This plateau is also very cold, being sheltered from the Pacific Ocean influence; Snag Airfield has recorded 83.6°F below zero.

### Soil Problems

Despite the permafrost which is met in the North, the Army's most vexing soil problems exist at the southern end of the road, which is geologically similar to the Prairies. The Bear Paw silts or shales are the chief cause of the troubles. There are numerous cases of bridge abutments and piers moving from soil pressures and innumerable side hill slides, large and small. (Fig. 4.) The soil is non-cohesive and if loaded will not stand for long even at a flat slope. In places the Army is faced with finding a location completely free from side hill slopes to avoid sliding.

The effect of these soils on abutments is largely the result of insufficient knowledge of conditions. There is little doubt that the failures could have been avoided by placing clean material in major fills and in back fills behind bridge abutments. Presumably, the rush to complete the road prevented a complete study of the problem. Also the use of unsatisfactory material in many places was expedient, because of the long hauls required to get good fill. With intimate knowledge of the ground, NWHS has managed to find usable gravel in most places, with a maximum haul of 5 to 10 miles. In one stretch of 45 miles straddling a good-sized mountain, however, there is a complete absence of usable rock.

A wide range of attempts has been made to stabilize these soils by drainage, growth of long-rooted grasses, reducing slopes to one in three or flatter, and so on. None of these has been wholly successful. The Army is presently trying out electro-osmosis stabilization under the advice of Dean R. M. Hardy, M.E.I.C., of the University of Alberta, in an attempt to avoid the costly replacement of the existing fills behind bridges. Elsewhere on the highway, the predominant soil problem is to find the best possible surfacing material. In some cases, pit-run material can be used right from the crusher, without adding binder. In others, binder must be added; this is usually done by applying it to the road in a thin layer and mixing it into the surface by blading. The Army has not so far contemplated the undoubtedly best, but expensive, method of grading and mixing materials to give a theoretically ideal surface.

There is remarkably little trouble which can be attributed directly to permafrost. During initial construction, the United States Army engineers, with no previous knowledge of this phenomenon, attempted to ditch a considerable stretch of the highway at the north end and, of course, ran into difficulties. In some places the road sank 10 to 15 feet, as the permafrost table was lowered by the penetration of heat through the ditches. NWHS has benefited from their experience and from subsequent study of the problem. In 1951, a cut was made extending 30 feet into permafrost off the north approach of the Donjek bridge. Four to five feet of clean fill was placed as a subgrade over this cut, and while the surrounding side hill has gradually receded, the road surface itself has remained sound. Although NWHS anticipated that it would have to refill this approach periodically for perhaps three or four years, it has apparently placed the correct amount of insulation to retain the permafrost table stable at the bottom of the cut.

Occasionally it is necessary to drive piles into permafrost. While this is slow, it is readily done with a steam jet. The pile follows the jet down with a minimum of driving and freezes into position, giving a very solid foundation. Some of the original timber trestle bridges have pile bents resting on frost lenses. Occasionally, the over burden is eroded by a flash flood and the frost melts out with awkward results on the structure. Such defects are gradually being corrected, as the original temporary bridges are replaced.

### Bridge Problems

Some of the bridge problems which result from the soil have already been mentioned. These mainly concern the smaller permanent bridges built during the original highway construction. There is a total of 171 bridges of 20-foot span or over, 32,000 lineal feet in all, and of these 44 are permanent, including those with treated timber trusses. Soil pressures have resulted in the cracking of abutment walls, in a few cases in the cracking of concrete piles under the abutments, and in three cases, in the cracking of the tops of piers from horizontal thrust transmitted through the girders. None of these are very difficult to repair once soil condition has been corrected. Of the remaining permanent bridges, only the largest has been a serious problem. This is the 2,267-foot suspension bridge over the Peace River at Mile 35. (Fig. 5.)

The north pier of this bridge rests on shale, which disintegrates when

**Fig. 4 Gardiner Creek Bridge, Mile 358, illustrates the extent of soil movement.**

exposed to water action. Excessive scour exposed this foundation rock in the spring flood of 1948, the water velocity being accentuated by an unfortunate circumstance. An attempt was apparently made to salvage the sheet piling used as a coffer dam when the pier was built, but the salvage was incomplete and left in a distorted condition several sections which served to funnel the current into the toe of the footing. Movement was first observed in the pier during the summer of 1948 and subsequent boring and diving revealed that a cavity some 8 feet deep extended under the toe of the pier for a distance of some 25 feet. This was corrected by driving another coffer dam, dewatering after placing jacks under the toe of the pier, and pouring new concrete to fill the cavity and extend the footing below the calculated maximum scour depth. This work was completed in the summer of 1949.

After the 1951 high water, it was discovered that scour was again occurring to a point dangerously close to the new footing level. This was corrected during the 1951-52 winter by placing some 2,000 yards of precast concrete blocks, poured in grain sacks. To date this has served to prevent further scour.

The original movement of the footing was not corrected and the north tower is out of line at the top, 190 feet above water level, by some 20 inches. The pier also rotated outwards, or toward the center of the stream, causing a visible bow in the tower legs. Obviously, these two movements created unwelcome stresses in the tower legs and cables, which are being closely watched. The conclusions of the original designers, the engineers of the Public Roads Administration in Washington, and of the NWHS consultant, Dr. P. L. Pratley, M.E.I.C., of Montreal, are that these stresses are not serious, though further movement may make them so.

A minor, but interesting, fault occurred in the cables of the Peace River bridge and also in those of the Lower Liard Bridge, which is the only other suspension bridge. The hanger clamps were made with sharp edges at the points where the cables pass through them; continuous vibration in the cables resulted in wear and the snapping of single strands of the cable at the hanger points. This was corrected by placing wooden clamps at the center points between each pair of hangers, so that the cable vibration was damped sufficiently to prevent further wear.

The temporary bridges range in size from a 2,326-foot trestle at Mile 804, Nisutlin Bay, (Fig. 6,) to single-span timber trestles scattered throughout the highway. These have been classified according to condition and remaining economic life and it is proposed to replace them on a long-term program. There are four bridges now under contract; that at Nisutlin Bay, which will be reduced to a 1,916-foot bridge, consisting of seven 250-foot through truss spans and two 70-foot girder spans; a 500-foot-span bridge across the Yukon River at Mile 898, and two smaller ones across the Rancheria River at Miles 687 and 721. Subsequently, NWHS hopes to carry out, by contract, the replacement of the Slims River Bridge, which is now a timber trestle 1,217 feet long in the center of a long causeway across the flood plain of the Slims River. This is a three-phase job involving, first, the construction of guide banks to canalize the river, which now changes its channel frequently from one side to the other of the flood plain; second, the construction of a temporary crossing; and, finally, dismantling the present bridge and constructing the new one on the center line of the causeway.

The completion of these five bridges by contract will, according to present planning, put the Army in a position where the gradual replacement of all remaining temporary bridges can be accomplished over a long period with its own forces, supplemented now and again by contract as necessary.

There are, of course, numerous locations where it is at present unsound to put in permanent structures. These are in the flash-flood areas close to the mountains, where a sudden high-level melt will bring down a rapid flood, carrying with it huge quantities of gravel and silt. Frequently the smaller creeks dam themselves off and take a new course a mile or more from their former channel. After each flash flood, it is normal to have to find names for one or two new bridges and to find one or two others with

**Fig. 5. The Peace River bridge at Mile 35, with an overall length of 2,267 feet, the centre span being 930 feet.**

dry stream beds under them. Ultimately, NWHS hopes to effect stream control well upstream of the bridges. Until then, rough timber bridges will continue to be used for replacement.

The bridge replacement program envisages the use of standard steel or concrete spans of 250, 100, 60 and 40 feet and NWHS is attempting to develop a standard, light, precast concrete deck slab. Also under construction is a completely precast concrete bridge which was made in Calgary (Fig. 7). Surprisingly, this structure so far compares favourably in cost, in spite of the apparent waste in shipping sand and gravel as well as cement over the distances involved.

### Road Location

Another major task with which NWHS is attempting to deal on a long-term basis, is the gradual improvement of the highway to the equivalent of Trans-Canada Highway specification. The original intention was to follow a specification considerably higher than the Trans-Canada. When the magnitude of the job became apparent, this was rapidly changed and those sections of the road which were completed to the design alignment and grade were, in fact, done very closely to Trans-Canada specifications. However, in 1943 when the strategic situation in Alaska and the Aleutians altered, and the highway lost its immediate urgency, it was decided to avoid the further cost of completing the road to the established standard and simply to improve the original pioneer trail to an acceptable two-way route. This has left some 800 miles of sub-standard road, of which approximately 160 miles require complete relocation.

The portions requiring complete relocation are, rather naturally, those in the most difficult locations. Over the past several years reasonably complete studies of the best routes have been made. It is proposed during the coming year to make a start in the Prophet River section, which is probably the most difficult on the highway. There is no good soil anywhere. This area presents the worst traffic bottleneck and the most expensive maintenance, due to slides. Further progress in improvement depends, of course, on government policy. It is probable that the NWHS will be permitted to carry on with gradual improvement, since it is readily demonstrated that the work proposed will, in the long run, reduce maintenance costs to an extent which will amortize the cost of the new work in a period varying from 15 to 20 years. Further, the volume of traffic is increasing annually and the accident rate in the badly designed sections is high in comparison with that on the good stretches of road.

**Fig. 6. Nisutlin Bay trestle, Mile 804; ice damage each spring requires continual maintenance.**

### Maintenance Problems

In this category are included all the recurring commitments required to preserve the road in its present condition. The most important, of course, are the day to day blading of the surface, the periodic replacement of surface material and the maintenance of drainage.

The surface is kept in better condition than is normal for gravel roads of the provinces. A gravel road traversing such long stretches of uninhabited country is essentially a through highway, and military as well as civilian freight considerations require that it be capable of carrying uninterrupted traffic at a reasonable speed. Further, the amount of blading done is justified by a reduction in the major repair costs which would occur if NWHS permitted the road to rut or its surface to deteriorate unduly from any cause.

Resurfacing aims to replace the surface material once in five years as a minimum. In practice, certain sections require replacement more frequently; in some places in the vicinity of Fort St. John, Fort Nelson and Whitehorse, where there is a great deal of local traffic, the frequency may be as high as once in three years. More frequent replacement is required in the badly located sections, where more gravel is thrown off and the surface takes a heavier pounding because of numerous sharp turns and grades.

Ditch and shoulder maintenance presents a wide range of conditions. In the best sections it can be carried out with an ordinary motor grader; others require pull graders or scrapers and a few sections in muskeg have no proper ditches, but require special treatment to lower the water table generally in the vicinity of the road.

There is a total of some 7,800 culverts. During the original construction, the majority were built of poles cut in the vicinity of the road. Most of these have now been replaced by corrugated iron and wood-stave pipe culverts for the smaller sizes and by built-up creosote timber culverts for the larger. There are also a large number of 10-foot to 20-foot single-span bridges. In a number of locations, where non-cohesive silts cause considerable trouble with short-span bridges, the Army is contemplating replacement of the present structures with steel plate culverts up to 12 feet in diameter. If these can be obtained at a reasonable cost, it can appreciably reduce the maintenance commitment for small bridges.

Winter maintenance on the whole is easy. Generally speaking, the highway traverses areas of light precipitation and snow clearing can be done with motor graders. In the Fort St. John area and in the section north of Haines Junction, where the road is relatively high, blizzard conditions occasionally prevail and require rotary and "V" plows. The road has only once been closed because of snow conditions, when an erring foreman allowed his equipment to become snowed in at the Fort St. John airfield. The winter surface is maintained with two to three inches of hard packed snow, which remains tacky in cold weather and gives an ideal driving surface. In the fall and again in the spring there is a period of two or three weeks when slopes exposed to the sun are apt to be slippery at midday, but this condition is of short duration and so infrequent that it can be dealt with by sanding.

The only serious problems which occur during the winter result from icing; in very cold weather ground water flowing beneath the surface is frequently arrested by the deep penetration of frost and may develop sufficient pressure to burst through the surface. It then spreads out over the surface in an evergrowing glacier. This occurs most frequently on side hills and in permafrost areas where ground water flow cannot divert itself downward. The frequency and severity of icing is almost completely dependent on the conditions of freeze-up, that is, on the moisture content of the soil at freeze-up. One outstanding example, which has not yet been completely corrected, occurs on the Haines Road just south of the Junction. Here a sheet of ice 8 to 12 feet deep has at times covered a half mile of road. Methods of control depend greatly on the local circumstances, but, in principle, are based on reducing the trouble to a small area and removing water by means of a narrow deep channel to a culvert and away to the low side of the road, so that the icing may develop harmlessly away from the highway. Sometimes a simple ditch will accomplish this; sometimes the ditch requires to be covered to provide insulation, making, in effect, a very long culvert; sometimes the flow must be allowed to build up, by erecting barriers along the ditch and continually raising them as the icing develops.

The working season is, of course, relatively short. In the southern part of the road, gravel crews usually start shortly after the middle of May, when the pits thaw out sufficiently to permit crusher operation. In this area the winter close-down occurs early in November. At the northern end, some pits are not workable until July and start to freeze up about the middle of October. In general, 130 productive working days is a good average.

**Organization**

The maintenance work on the highway is controlled by a senior highway superintendent, with a staff in Whitehorse, through three highway superintendents, each responsible for approximately one-third of the highway. The southern area extends from Dawson Creek to Mile 496, the central area from 496 to Whitehorse, and the northern area from Whitehorse northward. Each area is subdivided into sections varying from 50 to 90 miles in length, depending on the local conditions and the emergency landing strips and access roads. Each section crew comprises a foreman and five or six operators, with a mechanic. They live in a small camp roughly in the center of their section, and carry out all routine maintenance. Resurfacing, pulling shoulders, reshaping ditches, etc., is performed by special roving crews under the direction of the area superintendent. Special roving crews are also used for routine bridge maintenance, culvert replacement, sign painting and so on.

Major bridge repair, bridge replacement and road relocation work is carried out by a military unit which is based in Whitehorse and operates throughout the length of the highway. In principle, basic maintenance and recurring work is carried out by civilians under military direction and new work or major repair is done by soldiers in order to obtain training.

Supporting this engineer activity are military units, again based in Whitehorse, for the supply of fuel, food, materials and equipment and the repair of equipment. These units are larger than the organization which would be required for the maintenance of the highway only, as there are other military commitments which they also support.

Basically, the center of control and management of the highway is at Whitehorse, with main installations located there, supplemented by a railhead installation at Dawson Creek for the receipt and onward movement of equipment and materials and a second major workshop at Mile 295, near Fort Nelson. In addition to this, there are three small workshop detachments at Mile 0 (Dawson Creek), Mile 635 (Watson Lake), and Mile 1,083 (Destruction Bay). Other than the technical engineering aspects of the highway operation, probably the most interesting and complex problem is that of balancing reserves of equipment with workshop capacity and spare parts holdings. Some bad mistakes can be made in excess provision of reserve equipment on the one hand and, on the other, attempting to hold enough spares and have sufficient workshop capacity to keep all equipment on the road in usable condition all the time.

There is a basic allotment of equipment to each maintenance section, a small reserve controlled by each area superintendent and a large pool controlled from Whitehorse, with which roving crews are equipped, major repair and new construction jobs supplied and as reserves for emergencies. The disposition of this equipment is planned in the fall for the following work season, and is coordinated with the winter output of the workshops, so that the right equipment will be available at the right time and place. It costs 10 cents a ton-mile or in round figures $200 per 100 miles to move a heavy piece of equipment. Consequently, an error in planning or in establishing the coming season's program, or the failure to anticipate adequately the possibility of an emergency, such as a flood, may waste several thousands of dollars by requiring an unplanned move of equipment.

Similarly, it requires a nice judgment on the part of all concerned to resist the constant pressure to have more and more equipment in operation by building up workshop capacity and spare parts holdings to the point where the overhead gets out of proportion. The Northwest Highway System has some 650 pieces of heavy equipment, including 75 motor graders, 56 heavy tractors and 36 power shovels. To maintain this, some 40,000 items of spare parts are held. This figure is high because of the impracticability of standardizing makes under government procurement. The delivery time for spare parts from manufacturers throughout North America is rarely less than 45 days and for special equipment sometimes six to nine months. Thus, it is easily seen how rapidly holdings can get out of line with true economy.

NWHS equipment is precisely similar to the standard construction equipment used throughout North America. In the past, particularly shortly after the Second World War, some military pattern equipment, particularly dump trucks and load carrying vehicles, were tried out on the highway, mainly because they were available at relatively low cost from stocks held by the Army. They have been found to be inferior to the product produced by the trade. This highway task is no different from any other; military vehicles are designed primarily for different conditions and particularly for cross-country performance, which is not required and which reduces the vehicle capacity. Further, mechanics, military and civilian, are more familiar with the standard makes. Many of the military patterns are obsolete or obsolescent and therefore spare parts are no longer readily available.

Winter operation is, of course, expensive because of the need for special lubricants and because of excessive wear and breakage. However, there is no requirement for modification of equipment or vehicles in winter use on the highway, except for the provision of larger capacity heaters and radiator protection. Normally, 30° below zero is the lower limit of operations, since at that temperature breakage becomes excessive and the output per man hour is so low as to be uneconomical.

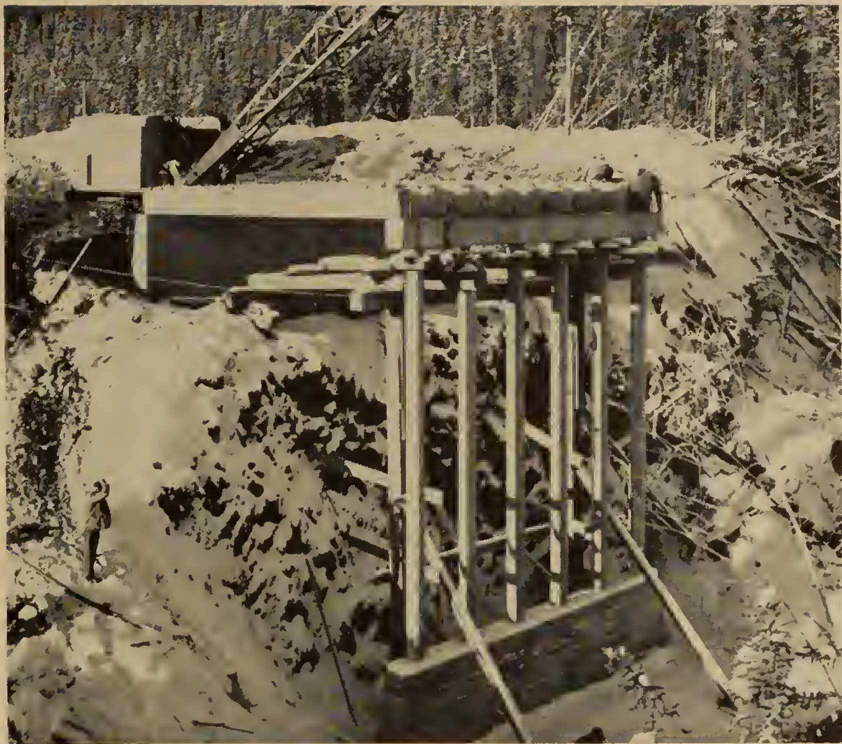

**Fig. 7. The first precast concrete bridge to be constructed on the Alaska Highway located at Mile 457; the precast members were made in Calgary.**

#### Long-Term Programming

It has been said in dealing with bridging and road location that the work on the highway has been planned ahead. In fact, all the presently foreseeable work has been reduced to three programs; one which is a recurring unavoidable commitment for resurfacing; one which envisages the replacement of all the bridges which are now temporary, over a period of some 20 years, which will allow the retention of each bridge to the end of its anticipated economic life; and the third which envisages the relocation of the 160 miles of the road which are now below the Trans-Canada Highway standard. Added to this latter is a further program of minor relocations and curve and grade adjustments for the remaining 640 miles which were not originally built to the design standard. The completion of the bridging and relocation programs, of course, depends on government policy. Nevertheless, assuming the continuation of the road as a main highway, the Northwest Highway System is now in a position to proceed with this work on a planned basis in priorities in a manner which will retain the usable life of each structure and gradually develop the highway to its full traffic capacity. Once the four bridges now under contract are completed and the Slims River Bridge has been initiated, it is anticipated that all the remaining work can be completed with NWHS's own forces over a period of 15 to 20 years. The earlier completion of these programs would require considerably more contract work.

#### Future Development

Before the construction of the Highway, and neglecting the relatively small amount of traffic carried by air, all freight and passenger movement into the Yukon and Alaska was carried by sea from west coast ports to Skagway and thence by Whitepass Railway, or to the South Alaska ports. In the Yukon and in northern British Columbia, further distribution was accomplished by water transport on the major river systems. The sea route is still the most economical method of bringing bulk materials into the northern part of this area. Until recently, and even after the construction of the highway, it has been cheapest to ship by sea to Skagway and rail to Whitehorse, and distribute along the road from Whitehorse northward and southward roughly as far as Mile 600. The economical means of transportation for the southern portion of the road below Mile 600 is by rail to Dawson Creek and thence by road.

Recently, however, it has been found that there are some changes occurring in this pattern. Perishable commodities and any items requiring special packaging for sea transport can now be delivered anywhere along the road more cheaply through Dawson Creek than by sea. Thus there is a trend towards road transport, both in Army operations and in the ordinary commercial transactions both in the Yukon and Alaska. Sea transport will probably always be most economical for heavy items which do not require special packaging. With this increase in freight movement there is a corresponding increase in passenger traffic on the highway; the over-all increase is approximately 25 per cent per year.

A good deal of the movement, of course, is military, either direct, or commercial movement induced by military activity in Alaska. The Alaska Road Commission is nearing completion on a program of paving the main road network in that territory, and it is often asked when the Canadian portion of the highway will be paved. Such a development is very far in the future. While it would be pleasant for summer driving to remove the dust hazard, the gravel surface is at present only taking a small portion of its capacity. The cost of paving has been estimated at upwards of $75,000 per mile, mainly because of high material and labour costs, and the experience of the Alaska Road Commission is that maintenance costs do not decrease but, in fact, slightly increase after paving. √

# Transistors

## and

# The Electrical Industry

*by*

E. L. R. Webb *and* P. A. Redhead

*Head of Air Force Section* *Research Officer,*

*National Research Council, Ottawa*

Although only about eight years old, transistors, the "mighty midgets" of electronics, have already made a place for themselves in divers fields and it is evident that they are going to be widely used to replace vacuum tubes. This paper, presented at the Quebec Annual Meeting, May, 1954, describes the transistor and its manufacture and use in language any engineer can understand.

The transistor was invented by Bardeen and Brattain of the Bell Telephone Laboratories and was first made public in 1948. Since then much research and development effort have been expended in producing improved transistors and in designing circuits to use them. The development of transistors in the laboratory has been rapid, but their quantity production and use in commercial equipments has not kept pace with these advances.

Transistors are now not widely used, except in Bell Telephone equipment and by some hearing-aid manufacturers. This situation is due in part to the fact that transistors have only recently become available in quantity and that since their characteristics are radically different from those of vacuum tubes, a complete re-education of all circuit designers is mandatory.

The transistor has the advantage of small size, extremely low power consumption, since no heater power is required, and long life, though this latter virtue requires some qualifications. These factors make the transistor eminently suitable for low power, light-weight, portable equipment.

Recent developments have produced transistors capable of controlling relatively large amounts of power and it is clear that the transistor will shortly be used in power control circuits and industrial electronic equipment.

In the light of the presently possible uses of transistors in communication and computer circuits and the future uses of transistors in higher power circuits, it appears worth while to review briefly the present status of transistor development. It is hoped that this review will stimulate consideration of some of the possible future uses of transistors in electrical and electronic engineering.

### Principles of Operation of the Transistor

The transistor is an active semiconductor device which may be used to amplify signals or to generate various waveforms. One method of connecting a point contact transistor is shown in Fig. 1.

The material most generally used is germanium; other materials show transistor action, but this paper will be restricted to the discussion of germanium. Germanium can be prepared as "p" or "n" type by the addition of suitable impurities. This nomenclature indicates the sign of the charge on the majority of the charge-carriers in the material. In n-type material the charge carriers are electrons, in p-type material the charge carriers are positive holes.

Consider only the junction type

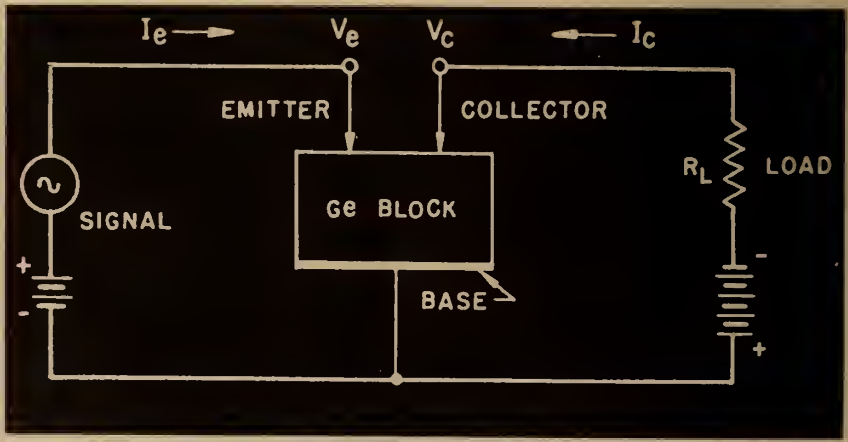

Fig. 1. Schematic circuit for amplification of an a-c. signal.

of transistor (Fig. 2). In this type the emitter and collector currents are almost equal and thus the following analogy with a triode may be drawn.

| *Transistor* | | *Vacuum Triode* |
|---|---|---|
| Emitter | = | Cathode |
| Base | = | Grid |
| Collector | = | Anode |

This analogy should not be used too rigorously, but it is useful in giving a simple picture of transistor operation. It is seen that the base electrode acts like a grid to control the current flowing in at the emitter and out at the collector in a p-n-p transistor. For an average low-power transistor, typical operating conditions might be:

| | |
|---|---|
| Collector voltage, | −1.0 volt |
| Collector current, | 0.5 ma. |
| Emitter voltage, | 1.0 volt |
| Emitter current, | 0.5 ma. |

In power transistors, higher voltages are used and the currents may be an ampere or more.

The circuit resistances and the current gains obtainable are shown in Table I, for the three different connections of a junction transistor, for a load resistance of 10,000 ohms and a generator resistance of 1,000 ohms.

**Table 1. Circuit resistance and current gains.**

| Connection | Resistance, ohms Input | Output | Current gain |
|---|---|---|---|
| Grounded base = Grounded grid . . | 70 | 880,000 | 0.96 |
| Grounded emitter = Grounded cathode | 850 | 67,500 | 24 |
| Grounded collector = Cathode follower . | 200,000 | 80 | 25 |

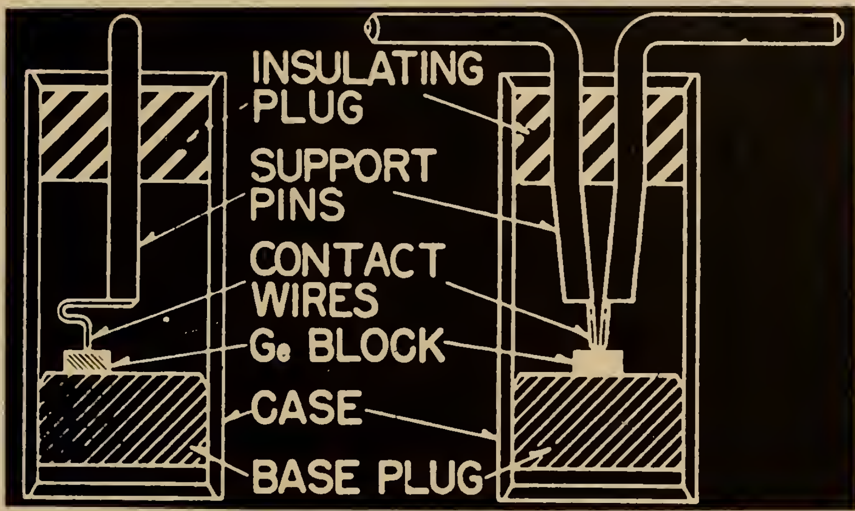

**Fig. 3. Cross sections of a point contact transistor.**

### Types of Transistor

Various general categories of transistors are now well established and they will be briefly discussed in the approximate order of their development.

***Point Contact Type***

The point contact transistor was the first type made available, as the Bell Telephone Laboratory Type "A". It consists of two wire electrodes, sharpened to chisel shaped points pressing on a wafer of germanium (Fig. 3). The point contact type has been superseded in many applications by the junction type, which has more reproducible characteristics and a lower noise figure. However, the point-contact type can have high current gain and a frequency response up to about ten megacycles. It is particularly suitable for switching applications.

***Junction type***

Two entirely different methods of manufacture lead to the "diffused junction" and "grown junction" types of transistor. These two methods of manufacture will be discussed later; at the moment the properties of junction transistors in general will be considered.

In the junction transistor of the p-n-p type a region of the n-type germanium is sandwiched between two regions of p-type material (Fig. 4). The p-type regions are the emitter and the collector, respectively, and the n-type region is the base. N-p-n junction transistors are also in use; here the types of material in the three regions have been reversed.

The large area contacts involved permit higher power dissipation than in point contact transistors. Recently junction transistors have been built in the laboratory capable of dissipating 50 watts. This indicates that the transistor will shortly invade the high power field which

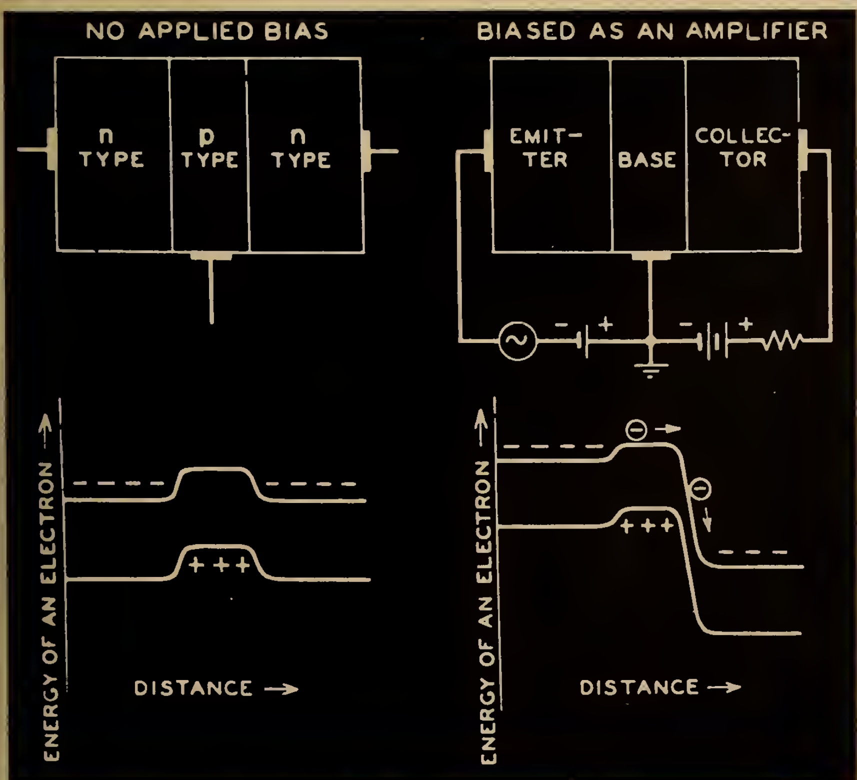

**Fig. 2. N-p-n structure and energy relationships.**

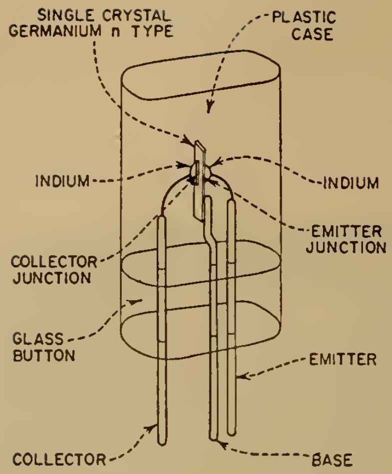

**Fig. 4. Diagram of a junction type transistor**

has, up to now, been the exclusive province of the vacuum tube.

The low power junction transistor can be made extremely small; early models in plastic capsules were no larger than the head of a match.

***Photo-transistors***

A p-n junction in germanium is strongly photosensitive and this property has been used to construct photo-transistors. These units are extremely small ($\frac{1}{4}$ x $\frac{1}{16}$ x $\frac{3}{8}$ in.) and rugged and have a high sensitivity (30 ma/lumens for light of 2,450° Kelvin colour temperature) (Fig. 5). These units are being extensively used in the Bell Telephone long-distance dialling system.

***Surface-barrier transistors***

Surface-barrier transistors are a recent development of the Philco Company. These transistors consist of a thin wafer of germanium, 0.006 in. thick, with two pits on opposite sides of the wafer in which are deposited the material forming the emitter and collector electrodes (Fig. 6). These pits and the deposited electrodes are formed by electrolytic etching and subsequent electroplating with a suitable electrolyte. The final thickness of the germanium is about 0.0002 in. between the two electrodes.

Owing to the extreme thinness of the base region of the germanium between emitter and collector, this type of transistor is capable of handling only small powers, but will operate satisfactorily to very high frequencies. Present surface-barrier transistors have been operated up to 70 megacycles per second. The method of manufacture of these transistors may lend itself to quantity production within closely controlled limits.

Numerous other specialized types of transistors have been developed such as the tetrode transistor, field effect transistor, etc., but are not yet in wide use.

**Methods and Techniques of Construction**

Transistor methods of manufacture are changing rapidly. Present techniques are not entirely suitable for quantity production and much research effort is going into investigating new methods that will permit quantity production of transistors with closely controlled characteristics.

However, in spite of the fact that these methods may shortly be outmoded, it may be of interest to discuss some current manufacturing methods to illustrate the techniques involved, some of which are new to the electronics industry, and which raise interesting problems for the production engineer to solve.

***Germanium production***

The first step in the manufacture of transistors is the production of extremely high purity germanium. The chief source of germanium on this continent is germanium dioxide, obtained as a by-product of zinc refining. The oxide is reduced to the metal by heating in an atmosphere of hydrogen. The germanium now has a volume resistivity of 1.5 to 3 ohm cms., but is not yet pure enough for transistors; it is further purified by "zone refining". After this process the germanium has a volume resistivity of 50 ohm cms. Pure germanium has a volume resistivity of 60 ohm cms.

Zone refining is accomplished by placing the germanium in a pure graphite crucible and slowly pulling the crucible through a series of induction heating coils, so that the germanium is alternately melted and solidified. The impurities in the germanium move towards the rear end of the ingot.

The result of the zone refining process is a germanium bar of very high purity except at one end, where the impurities are concentrated. The impurities in the germanium are now about 1 part in $10^8$, a very high purity indeed. This figure indicates the scrupulous care necessary to avoid contamination and is many times greater than

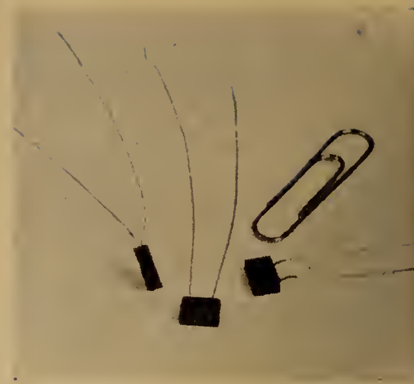

**Fig. 5. Photo-transistors.**

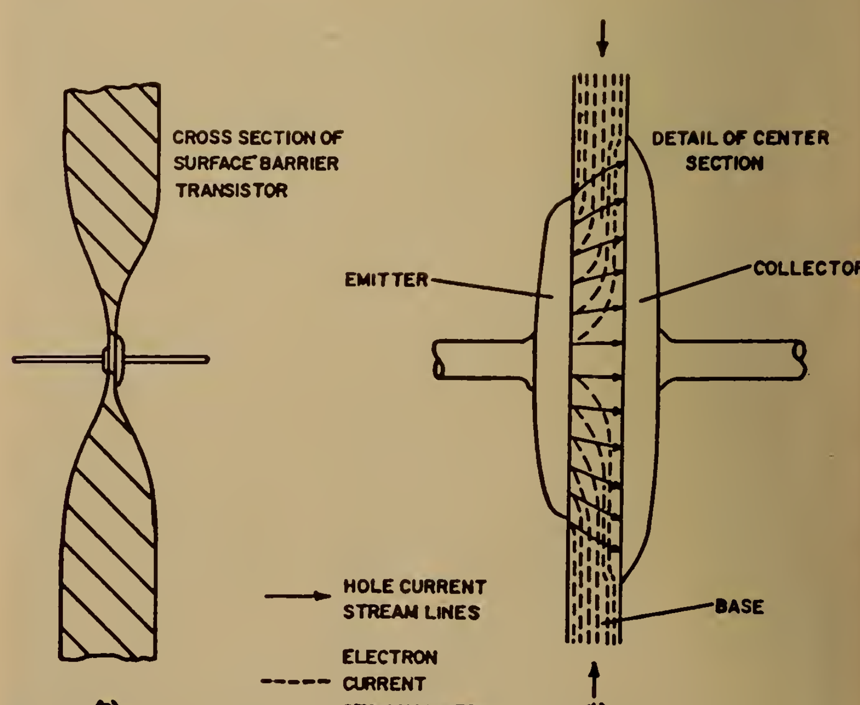

**Fig. 6. (a) Cross section of surface barrier transistor. (b) Detail of centre section.**

the purity necessary in any other mass produced product.

The bar of germanium is now formed into a single crystal and the required amount of impurities added in a vertical crystal growing machine (Fig. 7). The zone-purified germanium is melted in a hydrogen atmosphere and a small single crystal of germanium, called the "seed" is placed on the surface of the melt by means of a mechanically driven rod.

The rod is rotated and withdrawn slowly from the melt, the molten germanium crystallizes around the seed and forms a single crystal about one-half inch in diameter and six to eight inches long. This process takes several hours. These bars are then sawn up into small pieces about 0.45 inches square by 0.010 inches thick for point contact transistors, and 0.1 inch square by 0.005 inches thick for junction transistors.

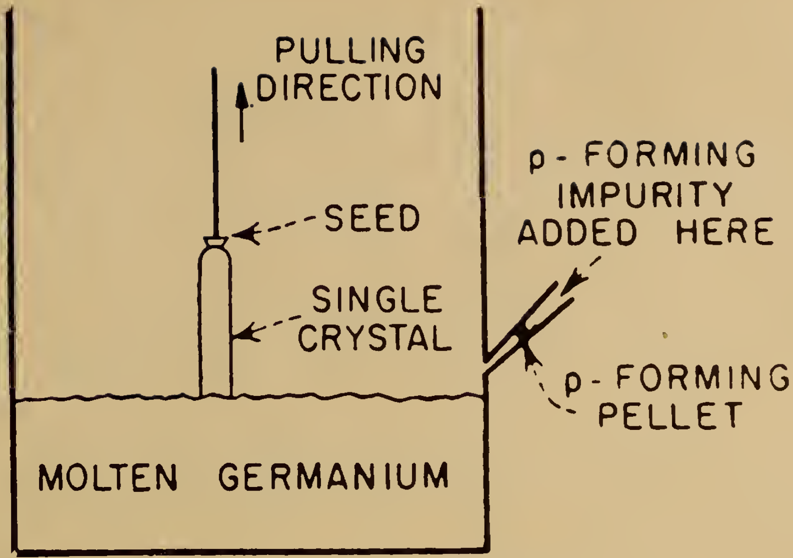

**Fig. 7. Crystal growing machine.**

***Making point-contact transistors***

The square pellet of germanium is etched to produce a smooth surface and soldered to the supporting base. The pellet and base assembly is then acid cleaned.

The preformed emitter and collector assembly is now brought into contact with the germanium wafer in a suitable jig and a slight pressure applied. The electrode spacing is about 0.0015 in. and is held to ±0.000125 in. The completed unit is encapsulated, to be discussed later, and is put through an electrical forming process. This consists in discharging a capacitor across the terminals several times.

***Making diffused-junction transistors***

The same germanium material is used as for the point contact types, though the wafers are usually slightly larger and thinner. The thickness of the wafer is critical and must be held to ±0.00025 in.

The emitter and collector electrodes are small pellets placed on either side of the germanium wafer; the pellets are 0.015 in. thick, the emitter pellet is 0.015 in. in diameter and the collector pellet is 0.045 in. in diameter. For p-n-p junctions indium pellets are used, for n-p-n junctions lead-antimony is used. These pellets are placed on the germanium and the whole assembly is heated in a hydrogen atmosphere. The indium diffuses into the germanium to form the emitter and collector regions. Connections are then made to the emitter, collector and base, and the unit is encapsulated.

***Making grown junction transistors***

In this type the n-p-n junction is made during the crystal growing process. The germanium in the melt is normally n-type; as the crystal is slowly withdrawn, a small pellet of suitable impurity is dropped into the melt causing the formation of a layer of p-type material. As soon as the p-type layer has formed, a further pellet of material is added which over-compensates the initial impurity and causes the melt to become once more n-type.

On withdrawing the crystal completely, a layer of p-type material about 0.002 in. thick is found, sandwiched between two portions of n-type germanium. The crystal is sawn up into small wafers and connections made to the three regions, the p-type region being the base connector.

The production of grown-junction transistors is not readily adaptable to large quantity requirements.

***Encapsulation***

It has been found that transistors deteriorate rapidly when exposed to minute amounts of water vapour or other contaminants. These contaminants act on the surface of the germanium and destroy transistor action.

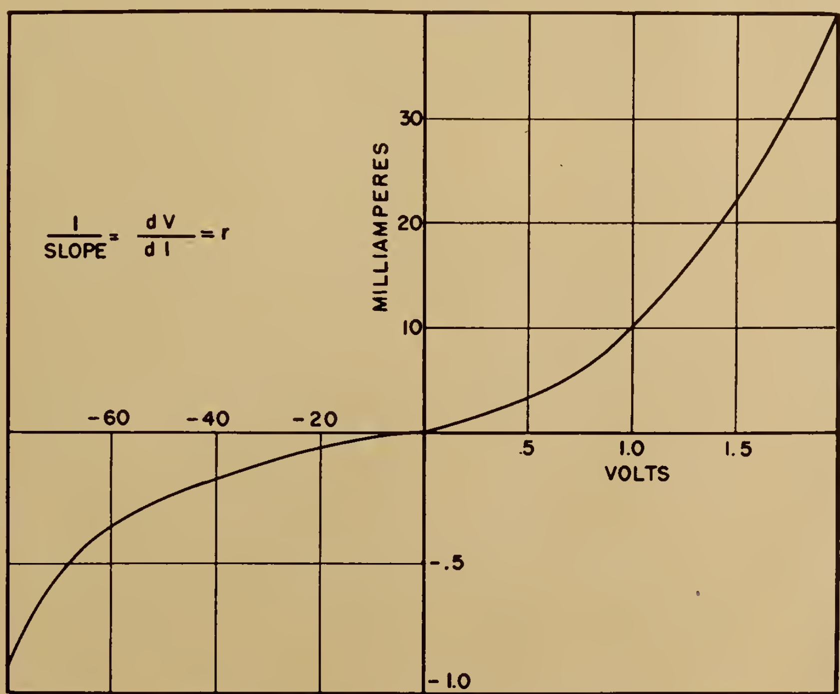

**Fig. 8. Characteristic curve for a typical semi-conductor diode.**

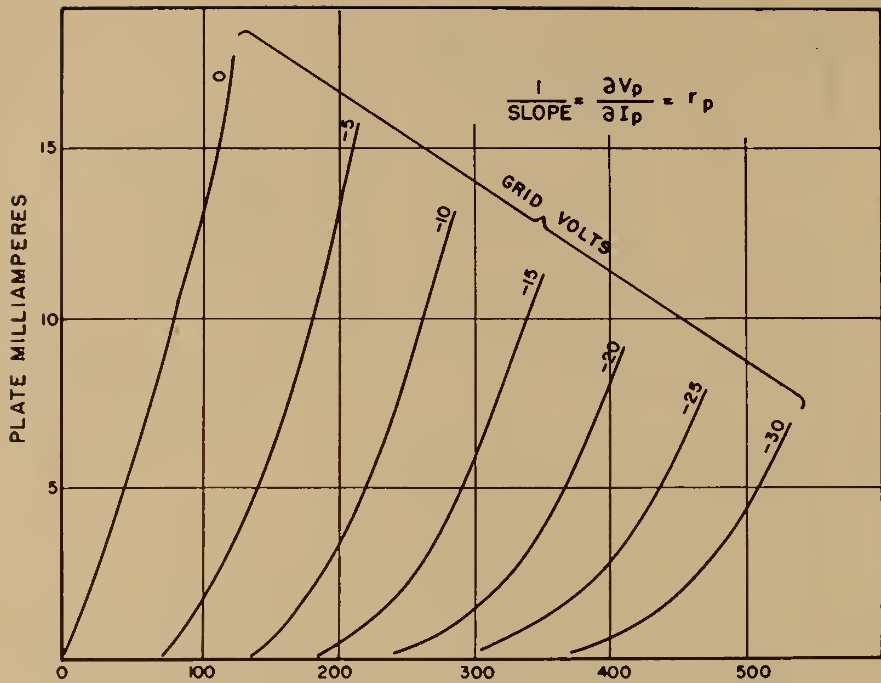

Fig. 9. 6C4 characteristics

Early commercial transistors were encapsulated in various types of plastic cements. None of these plastics is completely satisfactory in preventing the penetration of the minute quantities of water which will produce deterioration in the transistor, thus plastic encapsulated transistors are not recommended where long life is required.

Better quality transistors are nowadays hermetically sealed in metal or glass envelopes in an inert gas. Some transistors are also being evacuated; this precaution is well worth while when extended life and constancy of characteristics are desired.

*General remarks on manufacturing techniques*

From the foregoing descriptions it can be seen that the manufacture of transistors is no simple matter. The processes involved have many features which are entirely new to mass production. Rigorous cleanliness; the minute size of component parts, requiring manipulation under the microscope; and the extremely small and critical dimensions involved are the chief problems.

Of the present types, the diffused junction and the surface-barrier transistor are probably the most suitable for mass production. Automatic machinery for the production of transistors is being developed, but owing to the small dimensions and close tolerances involved, the problems are very difficult. Much remains to be done in the design of automatic machinery for these precision operations.

### Electrical Description

Interesting and necessary as the manufacturing technology is, the end product is not very useful unless put to work. The transistor being an electronic device, it requires an electrical description so that the designer may intelligently incorporate it into his circuits.

Unfortunately, the electrical description of a transistor is more complicated than that of a simple vacuum tube. In the case of the general (non-linear) two terminal network, a full description involves only one voltage and one current, possibly as functions of frequency; this current and voltage can be associated with one of the two available terminals, the other being taken as the reference. A typical e-i characteristic might look like Fig. 8.

The negative grid vacuum triode may be considered to be a degenerate case of the general three terminal network in which the input current may be neglected. However, the description must include an input voltage. A typical set of plate characteristic curves are shown in Fig. 9. Although convenient for reading off mutual conductance as a slope, the corresponding grid family does not contain any essentially new information, but is merely a restatement.

In the case of the three terminal transistor, because of the usually low input impedance, the full decription requires two voltages and two currents. The situation is further complicated by the possibility of choosing any one of three terminals as the reference terminal and, of course, it can be made worse by using two reference terminals, one for voltage, another for current. Believe it or not, this has been done.

Unlike the vacuum triode, where the simplest physical picture indicates the flow of plate current being controlled by the grid voltage, the transistor appears to be a current controlled device.

The early workers chose to use that terminal known as the "base" as the reference electrode; a typical set of emitter and collector characteristics is shown in Fig. 10. Initially, there was no general agreement as to definitions of polarity nor as to whether abscissas should represent voltage or current, and so characteristic curves appeared in a confusing variety of arrangements.

The one chosen here agrees with vacuum tube conventions and with present-day transistor practice. Since $r_{11}$ is substantially constant in this case, manufacturers usually quote a nominal value for it and for $r_{12}$ and omit the emitter characteristic. A value for

$$a = \left.\frac{d\,I_c}{d\,I_e}\right|_{V_c}$$

is usually given numerically because of the practical impossibility of determining it accurately from the collector curves.

The foregoing applies directly when the transistor is used in the common base connection, corresponding to the grounded grid connection in tubes, which is not the most usual connection. Recently, manufacturers have shown a tendency to publish characteristics based on the use of the emitter as the common or reference terminal, in which case the curves appear as in Fig. 11. Some suppliers give both characteristics (Figs. 10 and 11) and, in addition, sufficient numerical information about input impedance and/or branches of an equivalent circuit, to give a fairly complete picture.

### Applications and Limitations

Until recently the only transistors available have been low power units capable only of handling powers of the order of 50 milliwatts, or about 1/100 that of common vacuum tubes. There are now available fairly reliable vacuum tubes in the 5 to 50 watt class.

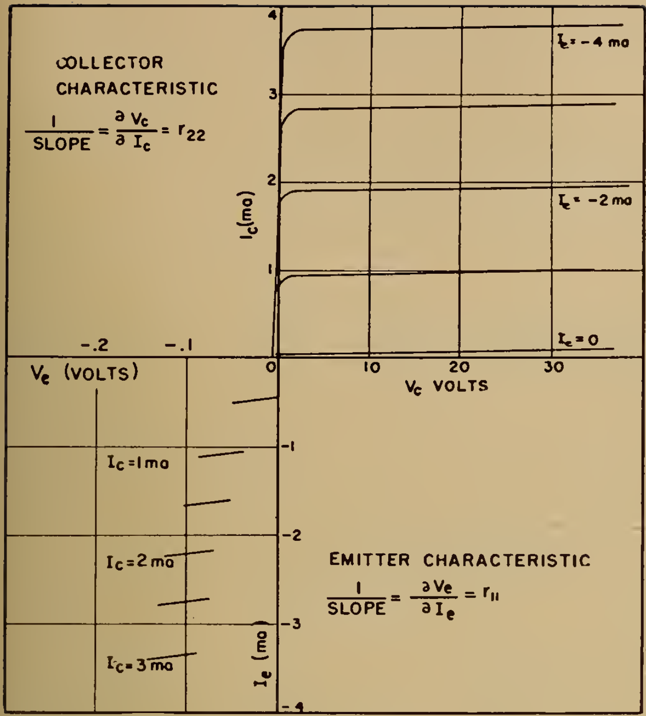

Fig. 10. (left) Emitter and collector characteristics for a fictitious n-p-n junction transistor.

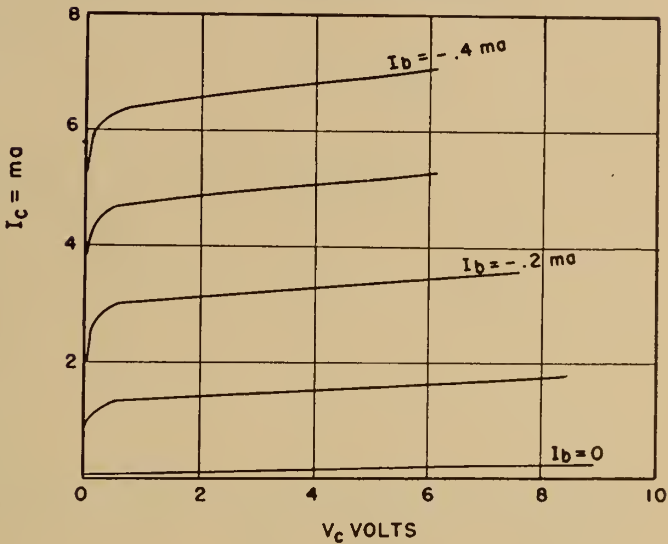
Fig. 11. (right) Collector characteristics for a fictitious n-p-n junction transistor common emitter connection.



This does not necessarily mean that tubes are always used at full rating; in fact, a great many operate far below their thermally imposed limits. However, there is a stage in almost every device, usually near the output limits, beyond which 5 to 50 watt tubes are not usually operated. Thus it would appear that until power transistors are economically available, transistors will tend to be used in hybrid, tube-transistor equipments.

The application of transistors has been slowed by the fact that they differ significantly from vacuum tubes and new ranges of associated components have had to be developed. For example, the impedance levels are generally much lower and new coupling devices are needed. Also, because transistors can be operated at power levels 1/1000 that of tubes, ordinary audio transformers are simply too big and hence have prohibitive losses when used with transistors.

Perhaps the greatest single advantage of the transistor is that it operates cold, i.e., has no filament or heater and from this fact derive several subsidiary advantages:

1. No heater power required, therefore no hum.
2. Has no warm-up time; operates instantly when the voltage supplies are turned on.
3. No failure from heater burnout.
4. Freedom from microphonics and shock.
5. Possibility of long life.
6. Reduced cooling problem when used in large numbers in compact assemblies, e.g., in computers. This should tend to offset their limitations due to temperature sensitivity; although in one known case miniature mechanical refrigeration was included in the package, perhaps to protect the transistors from their environment as much as from themselves.

Another fundamental advantage is the possibility of producing twin transistors alike in all respects except for polarity, an impossibility with vacuum tubes. This is called "complementary symmetry" and gives rise to new circuit arrangements with important savings in associated components and improved performance (linearity).

The first useful applications to take advantage of the portability, low-power, low microphonics, no hum properties, centre around audio preamplifiers, special microphones and hearing aids. Although the high noise level inherent in many early transistor designs proved a serious limitation, reasonably low noise units are now available.

Almost every electronic organization of any size has a back-room group devoted to developing the use of transistors in some aspect or other, e.g., transisterized communication system, electric organs, phonograph amplifiers, etc., but very few have a product on the market today. Perhaps the biggest single user is the organization that first produced the transistor, the Bell System. However, there are at least a dozen manufacturers of transistors in the United States, a similar number in Britain and Europe and one or two here in Canada.

Secondary effects on industry include the provision of new ranges of components suitable for use with transistors, the stimulation of the sale of standard items, such as microscopes and electron microscopes, and the development of new high precision production machinery.

The principal limitations of present transistors lie in their temperature sensitivity, which will be overcome by the use of new materials, in high noise figure, in limited speed of response, and in low power handling capability; the last named limitation is rapidly disappearing.

All the activity alluded to earlier cannot have failed to have some impact on the electrical industry up to the present, but nothing like what it will have when the transistor becomes as readily available as the vacuum tube.

Were one asked to pick the field in which transistors have the greatest potential use, one would say in computers, particularly if transportable or even airborne computers on a large scale are desired, where one could pack several hundred units into a cubic foot, consuming only a few tens of watts of power. √

*A paper presented before the 68th Annual General and Professional Meeting of The Engineering Institute of Canada at Quebec City, May, 1954.*

# Manufacturing Processes for a New Cement Plant

*by*

Dr. Bernard Ulrich, M.E.I.C.

*General Manager*
*St. Lawrence Cement Company Ltd.,*
*Quebec, Que.*

European ideas and Canadian methods have been merged to produce a cement plant, soon to go in operation near Quebec City, which differs in many aspects from the standard Canadian practice. In this paper the author discusses cement production in many countries of the world, and tells of the many new ideas incorporated in its design. He shows that it is not merely a reproduction of existing Canadian plants, but embodies features which should be of interest to designers of cement plants or plants for storing any powdered or granular materials.

Only five miles from Quebec City on the north shore of the mighty St. Lawrence river, in the municipality of Villeneuve, a new cement plant is presently being constructed in something like record time.

This plant is of interest for several reasons:

1. It is the major construction enterprise going on in the Quebec City district to-day.
2. It will give rise to an industry essential to the Canadian economy, if it is considered desirable for Canada to be self sufficient in cement production.
3. It incorporates several unique features in design, believed to represent the most up-to-date solutions to certain problems confronting cement making. These same problems, however, are also common to the chemical and allied industries in general.
4. It has been designed and is being built under an extremely tight schedule. One of the definitions of an engineer is "one who can construct for $10 something which others can only do for $20." In this case, every day's delay in construction means a loss of profits in operation. This fact has motivated all our planning and expediting. The results to date have amazed everyone concerned . . . consultants and contractors, as well as the author himself.

According to the Dominion Bureau of Statistics, expenditures on construction of this plant represent 95 per cent of the total being spent on construction at present in Quebec City district. The capacity of the plant will be 1,500,000 bbls. or 6,000,000 bags per annum. Its estimated cost is $13,000,000.

With this plant in production, the present capacity of all Canadian cement plants will be increased by 7 per cent. Cement consumption in Canada in 1953 was 18 per cent higher than in the preceding year. If this rate is to continue, and there appears to be evidence that it will, Canada needs to add at least one new plant like the Villeneuve plant every year.

### Organization

Before discussing the unusual design features, it is proposed to outline the conception and planning of the project to date, and then explain the problems underlying the solutions arrived at.

A Swiss concern is providing the technical and financial background for this enterprise. The Quebec plant is the first constructed by this group in North America. They have interests, however, in 21 cement plants on all the continents other than Australia.

The group sent an engineering staff to Quebec who had experience in several European cement plants. This staff is responsible for the whole project, from layout to final operation. There was close co-ordination between this staff and the Canadian consulting engineers on the design details.

Every industrial processing plant has to consider construction primarily from a utility point of view. It is therefore sometimes not too easy to get a satisfactory architectural effect for the exterior. Some attention has been given to the architectural features. The objective of our engineers was to obtain an attractive exterior without incurring extra cost.

It was, of course, a big venture for our engineering staff to relocate from Europe to Canada. They needed time to familiarize themselves with Canadian methods, but the engineers, who are all young, came over with open minds, and readily accustomed themselves to Canadian conditions and methods.

The merging of European ideas and Canadian methods has been an interesting experience for these men, and it is believed that a plant which differs in several ways from standard Canadian practice will be of interest to the profession generally. Although methods of cement manufacture are similar on both sides of the Atlantic, they differ in a number of important details.

### Planning

It is believed that the prime requisite of any efficient enterprise is careful planning. The proof of good planning lies in a close and well co-ordinated schedule. It is the responsibility of management during construction to offer sufficient incentive to the contractors to get the work done on time. It is the responsibility of the engineering staff to remove any bottlenecks.

With these principles in mind, the first step was decentralisation of responsibility for planning the various phases of the work in order to get the basic information to make a master schedule. Frequent meetings were and are being held between staff and contractors. Contracts have been let on a firm-price basis, with attractive bonuses for early completion.

Another important part of the policy was the determined effort to avoid delays in the issue of drawings to the field, and in revising drawings, with a view to avoiding costly and time-consuming delays. With this in mind, full detail drawings (some 1,300 in number) were all prepared before the main construction began. Only foundations (and two non-processing buildings) were built during this design period.

On the completion of the drawings, a system was put into force making it about as difficult to get approval for a revision to a contract drawing, as it is to get a rebate from the income tax authorities. This was perhaps hard on the perfectionists, but vital for keeping the time schedule. As the drawings progressed, the construction schedule was prepared, key dates from which were incorporated into the contract documents. Finally expeditors were put on the job and any indications of possible delays receive immediate attention and action.

### General Flow Sheet

#### *Raw Materials*

The new Quebec plant is a wet process plant. Raw materials are right at the site. Two raw materials enter into the processing: One is a limestone containing about 81 to 86 per cent of $CaCO_3$. The other is a shale containing oxides of aluminium, silicas, iron and some calcium carbonates. To get the right composition of cement, 91 per cent of limestone is mixed with 9 per cent of shale. The excavation of these materials is quite an ordinary problem.

#### *Initial Grinding*

The raw materials go through a 42-in. gyratory crusher, and then through an impactor crusher which brings the size of materials down to ¾ of an inch. Two vibrating screens are located in the flow, so that the fines will flow to the storage bin and the material over ¾ inch diameter will return to the impactor crusher. This arrangement of crushers in a closed circuit is standard procedure today.

It is important to get the correct composition of all raw materials, limestone, shale and additives as exactly as possible. For this reason, the ball-mills will be fed by Waytrol feeders. The slurry is produced in two ball-mills of 8-ft. diameter and 32 feet length. Each unit is driven with a 900-hp-motor. After passing through the mills, the slurry is pumped into two slurry basins, which act as storage mixing tanks for producing homogeneity in the composition of the raw materials.

#### *Kiln Department*

In the next department, the slurry is burnt to cement clinker in a rotary kiln, which has a diameter from 11 ft. 6 in. to 13 ft. 2 in., and which is 402 ft. long. The kiln has a slope of 4 per cent. The slurry is brought in at the higher end, and flows against the fire of pulverised coal from the other end, where the temperature is about 2,700° F. The output of the rotary kiln will be

**This picture of the St. Lawrence Cement Plant was taken on May 7, 1954. It shows:— at extreme right—crushing plant foundations; right centre—construction of smoke stack; centre—foundations of slurry basins and erection of steel shell, columns for crane rail beam of storage hall, scaffolding ready for the whole length, slurry mill bin walls poured, temporary storage shed, and workshop and offices already occupied; extreme left—foundations and platform of packing station completed, column form work started. Railway siding ready to receive trains with material in the yard.**

about 4,500 bbls. per day. The burnt cement clinker leaving the rotary kiln is cooled in an air quenching cooler, and then reduced to a size of about 5/8-in. in a gyratory crusher.

The rotary kiln will have, as far as is known, one of the highest outputs on this continent. The biggest kiln ever built is in a Belgian plant in Obourg, near Brussels. This kiln is 539 ft. long, and produces 7,600 bbls. per day. This installation went into operation last year, and may be considered an outstanding achievement in the history of cement plants.

### *Finish Grinding*

Next comes the finish grinding department, where the cement clinker is first mixed with 4 to 5 per cent of gypsum. There are two ball-mills of 10-ft. diameter and 28 ft. long, driven by a 1,200 hp motor. The whole installation is working in a closed circuit with air separators, which take away the fine cement and send back the rougher part. The finished cement from this department is transported to the shipping department by compressed air in a pipeline. In the shipping department are twelve silos, from which cement may be loaded in bags or in bulk. The plant has facilities for loading cars and trucks. The port of Quebec is only four miles from the plant.

Let us now discuss three problems not confined to cement making, but of general interest in many industries and, therefore, to a number of engineers. These three problems are:

1. What is the most efficient way to homogenize a slurry ?
2. How far can dust be recovered and how can it be best utilized or reintroduced into the process ?
3. Which is the most efficient arrangement of a packing station for material in powder or granular form ?

### Homogenizing the Slurry

The first problem, namely to get slurry mixed and homogenized in the most efficient way, is most important for a cement plant. The raw materials may be weighed exactly, but it is impossible to get an exact composition without a slurry basin, where the slurry is homogenized and where corrections can be made. Before we can reach a practical solution, we must consider the theory. With a given number of slurry basins there are two main ways to arrange the flow of the slurry: One arrangement is in parallel, and the other one in series.

### *Slurry Basins in Parallel*

Let us first consider the parallel arrangement. This problem is easily understood if we compare, for instance, one slurry basin of a volume V, with four slurry basins each of which has a volume 1/4 V, so that the total volume in both cases is V. Suppose a certain amount of liquid is added and taken away from the slurry basins, that this amount will be the same in both cases, and therefore the four small slurry basins will each have one-fourth of the added liquid.

It is easy to understand that under these circumstances the efficiency of homogenization in both cases is exactly the same. The conclusion is that it would not be reasonable to consider parallel slurry basins, since one big slurry basin will do exactly the same work, and will be cheaper than a number of smaller units.

### *Slurry Basins in Series*

For slurry basins in series, we may compare the efficiency for homogenization for 1, 2, 3 and 4 basins. It may be assumed that the total volume of the basins in each group will be the same, and that the amount of liquid fed and taken away, per unit of time, is the same too.

### *One or Two Basins Give Best Results*

It can be shown that the average variation of slurry is at its lowest if there are only one or two slurry basins. The curve clearly shows an increase in the average variation if the number of basins is increased. The conclusion, then, can only be that one or two slurry basins will give the highest efficiency in homogenization, while a large number of slurry basins results in lower efficiency at higher cost.

The arrangement of slurry basins in cement plants on this continent is standardized. Usually, there is a group of four or more blending tanks. The slurry is mixed and homogenized in these blending tanks and chemically tested. To get the right composition of slurry, contents of three or four tanks are mixed together in certain proportions. This mixed slurry then goes into two slurry basins. An arrangement like this one needs at least six units, with all necessary mechanical and electrical equipment.

The Quebec plant will have only two units, and should give at least the same result. Much research work has been done in connection with this problem. It was found that the best way to get a constant composition of slurry is to control the calcium carbonate content right in the mill, where the slurry is produced. Afterwards two slurry basins containing production of about fifty hours are sufficient to eliminate the variations.

The maximum difference in the content of calcium carbonate in our raw material has been found plus or minus 3 per cent from the average. The average variations of the slurry leaving the basins will be 8/100 of one per cent. In practice, we accept a tolerance of 1/10th per cent, and therefore the mixing effect of the slurry basins will be usually sufficient. The theory of slurry basins is an example that sometimes, in production, the simplest way is also the best.

### Dust Recovery

The next problem is the recovery and economical use of dust. For most people a cement plant means production of much dust leaving the chimney with smoke gases. It is a fact that the problem of dust is a serious one for a number of plants. An investigation made in eleven cement plants showed the importance of this problem. The plant with the lowest percentage of dust production, compared with the production of cement, has 6 per cent dust. The plant with the highest production has 52 per cent dust.

This latter plant loses, therefore, about a third of the raw materials with the dust, and only two-thirds are transformed into cement. The average of dust production in these eleven plants is 19.2 per cent of cement production. The importance of dust depends naturally on the location of the plant. The problem may be less important for a plant in a desert region like Egypt, for example.

The same may be the case for a cement plant in nearby Lebanon. This plant, too, is not in a populated area, and natives there may be less allergic to dust than in the western part of the world.

The estimated dust production of the new Quebec plant will be 20 per cent, or about 50,000 tons a year. This dust production would be sufficient to cover a circle around the plant of one mile diameter, with four inches of dust in a year. Obviously, no people in the area would accept such a situation. The new plant is situated between four villages, which have together some 20,000 inhabitants. Therefore, the problem of dust control had been studied carefully.

The electrostatic precipitators developed on both sides of the Atlantic really do wonders in dust recovery. One new cement plant in Holland, for instance, which belongs to the Holderbank Group, went in operation in 1951 with a new electrostatic precipitator, guaranteed for a dust recovery of 99.4 per cent.

In practice, the efficiency was even higher than the guaranteed figure, and measurements over a long period proved that the efficiency is 99.7 per cent. This is one of the best performances a machine as complicated as a dust recovery unit has ever reached. The dust output of the five chimneys of this plant is very small.

The new cement plant in Quebec will have an electrostatic precipitator combined with multiclones. The guaranteed figure for dust recovery is about 99 per cent.

### Reintroduction of Dust

The highly efficient recovery of dust is no more a problem in technology. But it is still a problem to utilize this dust economically. Most plants reintroduce their dust in the slurry. This doesn't work very satisfactorily, because more water has to be added, which then has to be evaporated in the kiln. Moreover, the fine dust tends to produce more dust in the kiln, so that the operation becomes a vicious circle.

A new way to reintroduce dust has been used in the plant in Holland already mentioned. This plant had serious troubles, and was not able to reintroduce all the dust they produced into the kiln. Sometimes necessity may be the mother of invention. The engineers tried to introduce the dust into the kiln, not from the feed end, but with the pulverized coal from the discharge end.

They have been successful in their experiment, and the invention of blowing in the dust with the coal and of smelting it in the fire, so that it can't go through the kiln stack, may be considered as one of the most interesting developments in cement industry. The reintroduction of dust shows that it is sometimes possible to turn a serious defect into an economical advantage for a plant. This principle will be applied in the new Quebec plant.

### Packing Station

Usually, a packing station is composed of two parts: One part is the cement silos for the storage of the finished cement. The other part is a packing house, where the cement is filled in bags and is loaded into trucks or cars.

For example, in a cement plant near Capetown in South Africa, the cement silos are on one side of the packing station and the packing house is on the other. This arrangement may be considered as a standard throughout the world, but it has a serious disadvantage. A lot of transportation equipment is needed to bring the cement from the bottom of the silos up to the packing house. A costly arrangement of pumps, screw conveyors, bucket elevators and other equipment is needed to transport the cement from the mills to the packing house.

An engineer who made a special study of this problem thought the easiest way for any transport is by the use of gravity. For this reason, he took the cement silos and located them on top of the packing house. With this arrangement, there was no need for material handling equipment. All cement can be mixed and conveyed under gravity.

This idea, which seems at first to be impractical, has since been developed and has given very satisfactory results. A cost study has been made between a packing station with the usual arrangement, and one where the silos are on top of the packing house. The new arrangement with silos on the top is about 20 per cent cheaper to build and equip, and saves about a third in operation cost.

The packing station at Quebec consists of three similar units. Each unit has four silos and one bag-filling machine. In case of extension of the plant, one unit or more may be added. These units are entirely independent from each other operationally. An addition, therefore, is easy to build, and no changes in existing installations will be involved.

On one side of the packing station are the railway tracks, on the other is the road for trucks. Shipments can be made from each of the three units, in bulk and in bags. The capacity for bag shipment is about 3,600 bags or 900 bbls. per hour. The capacity for bulk shipment is nearly five times as high.

There are twelve silos in reinforced concrete, each with 35 ft. interior diameter, and 42 ft. high. The weight of one silo, filled with cement, is about 1,500 tons. The silos are supported by only three columns. The walls of the silos will therefore be subject to considerable torsion. The problem of a high circular wall serving as a beam from column to column was a most interesting one for our civil engineers, and has been studied carefully.

But it is to be expected that a cement plant would foster advertising for the application of reinforced concrete. It is believed that this new arrangement of a packing station may be not only of interest for cement plants, but for any plants storing powdered or granular products.

These examples were taken from design, in order to show that this new cement plant in Quebec is not merely a reproduction of another plant, but incorporates new ideas which may be of interest to engineers in this and other industries.

### Climate Influences Design

Some people may think that the production of cement is more or less standardized, and that there are no new developments. This is entirely wrong. Every cement plant is different from another, and every plant has to be adapted to the local circumstances. A plant in Canada has quite different characteristics to a plant in Florida.

For example, at a cement plant in South Africa, near Johannesburg, there is no frost and little rain. Installations are mostly uncovered in the open air and the plant is generally adapted to the local conditions in South Africa. By contrast, in a cement plant in Holland, the rotary kiln is entirely covered. Here there is frost in wintertime and a fairly heavy rainfall.

These two plants belong to the same cement group, and illustrate how engineers have to consider different local conditions. It may be mentioned here, that all buildings in the new Quebec plant are connected by means of galleries, so that a man can go from one department to another without any exposure to bad weather. This is important in wintertime.

There is a certain temptation for engineers in cement plants to realize some outstanding construction in reinforced concrete. An interesting application of reinforced concrete design appears in a cement plant in Switzerland, which went into operation in 1953. It is entirely constructed in reinforced concrete. The plant presents a pleasantly harmonious appearance, and is located in scenic countryside near the lake of Geneva.

In the Dutch plant mentioned above the storage hall is a shell construction only 2½ in. thick. The span in one direction is 86 ft., in the other 80 ft. The roof construction is also interesting.

# Canada's Super Tankers

*by*

W. H. White, *Naval Architect, and*
R. W. McGilvray, *Chief Engineer, Design,*
*Davie Shipbuilding Limited, Lauzon, Que.*

Production of the two 28,000 ton tankers discussed in this paper has given a Canadian shipyard the opportunity of showing that Canada's shipbuilding facilities have made rapid strides since pre-war days, and have raised the prestige of shipbuilding in Canada in the eyes of all maritime nations. Detailed descriptions of the hull, equipment and methods of construction are given by the authors.

During October, 1951, negotiations commenced between Davie Shipbuilding Ltd. and the Andros Shipping Co. with a view to the construction of a 28,000 ton super tanker, similar to the Bethlehem type. This project had previously been discussed with the Canadian Maritime Commission and had won their support.

At that time it appeared beyond the wildest of hopes that these negotiations would result in an order being placed for such a vessel, but in December, 1951, a contract was signed between these two companies for the construction of one 28,000 ton tanker, with a sixty day option for a second vessel. The order for the second vessel was placed in January, 1952.

This put Canadian shipbuilding on the front page, for the post war era, in the eyes of our cousins across the border, and gave to a Canadian shipyard the opportunity of proving that Canada's shipbuilding facilities had made rapid strides since pre-war, and could compete on a much larger scale than had previously been foreseen. This paper details the technical features of these tankers and deals with the problems and organization entailed in their construction.

### Building Berth

As these vessels are 175 feet longer than any previous vessel built by the company, considerable thought and planning was needed to determine the ideal building berth. Much of this had already been looked into prior to signing, as obviously it would mean large scale capital expenditure.

Proposals for extending the launchways beyond the lower limit then existing were first considered. Eventually it was decided that excavation at the upper end of the ways and re-routing of railway tracks, coupled with a 125 foot extension of one of the crane runways, would considerably improve the lifting facilities. This would also provide better launching conditions.

The maximum weight of these vessels on the building berth being some 8,000 tons, it was necessary to check the fill at the berth and introduce concrete footings in way of the keel blocks.

### Shop Facilities for Steel Work

The steelwork shop facilities, while quite adequate for all previous construction, had to be carefully checked to determine whether lifting facilities and door openings were adequate for the larger prefabricated sections. It was decided to convert one large steel storage shop to a fabricating shop, thus giving 29,000 square feet of additional fabricating space, allowing a much larger volume of work at one time.

The use of fluted bulkheads called for a hydraulic press of greater capacity than that available. Time did not permit awaiting delivery, so shipyard personnel set about designing and building the press required for this work. This piece of equipment proved to be invaluable during construction of the tankers, as well as on other vessels since.

### Welding Equipment and Operators

A study of available welding equipment both manual and automatic, disclosed the need of many more welding machines. It also called for maximum possible use of automatic welding equipment, in order to meet scheduled progress. The lack of qualified welding operators for peak demands made it necessary to set up a welding school, to train operators and have them classed by the relevant authorities.

### Pipe Shop Work

As one would expect, one of the major items in tanker construction is adequate pipe shop facilities to handle the amount of pipe work, which exceeds that handled during average cargo or passenger vessel construction. Existing facilities proved fairly adequate with the exception of the welding of carbon molybdenum pipe, which called for a special procedure, expert welding and X-raying of each weld, and annealing. This problem was readily overcome.

### Engine Installation Facilities

Early investigation must always be made with regard to engine installation, bearing in mind lifting facilities, how much ship space should be left open, etc. With a tanker, this problem was aggravated by the weight of machinery to be handled. Discussions took place

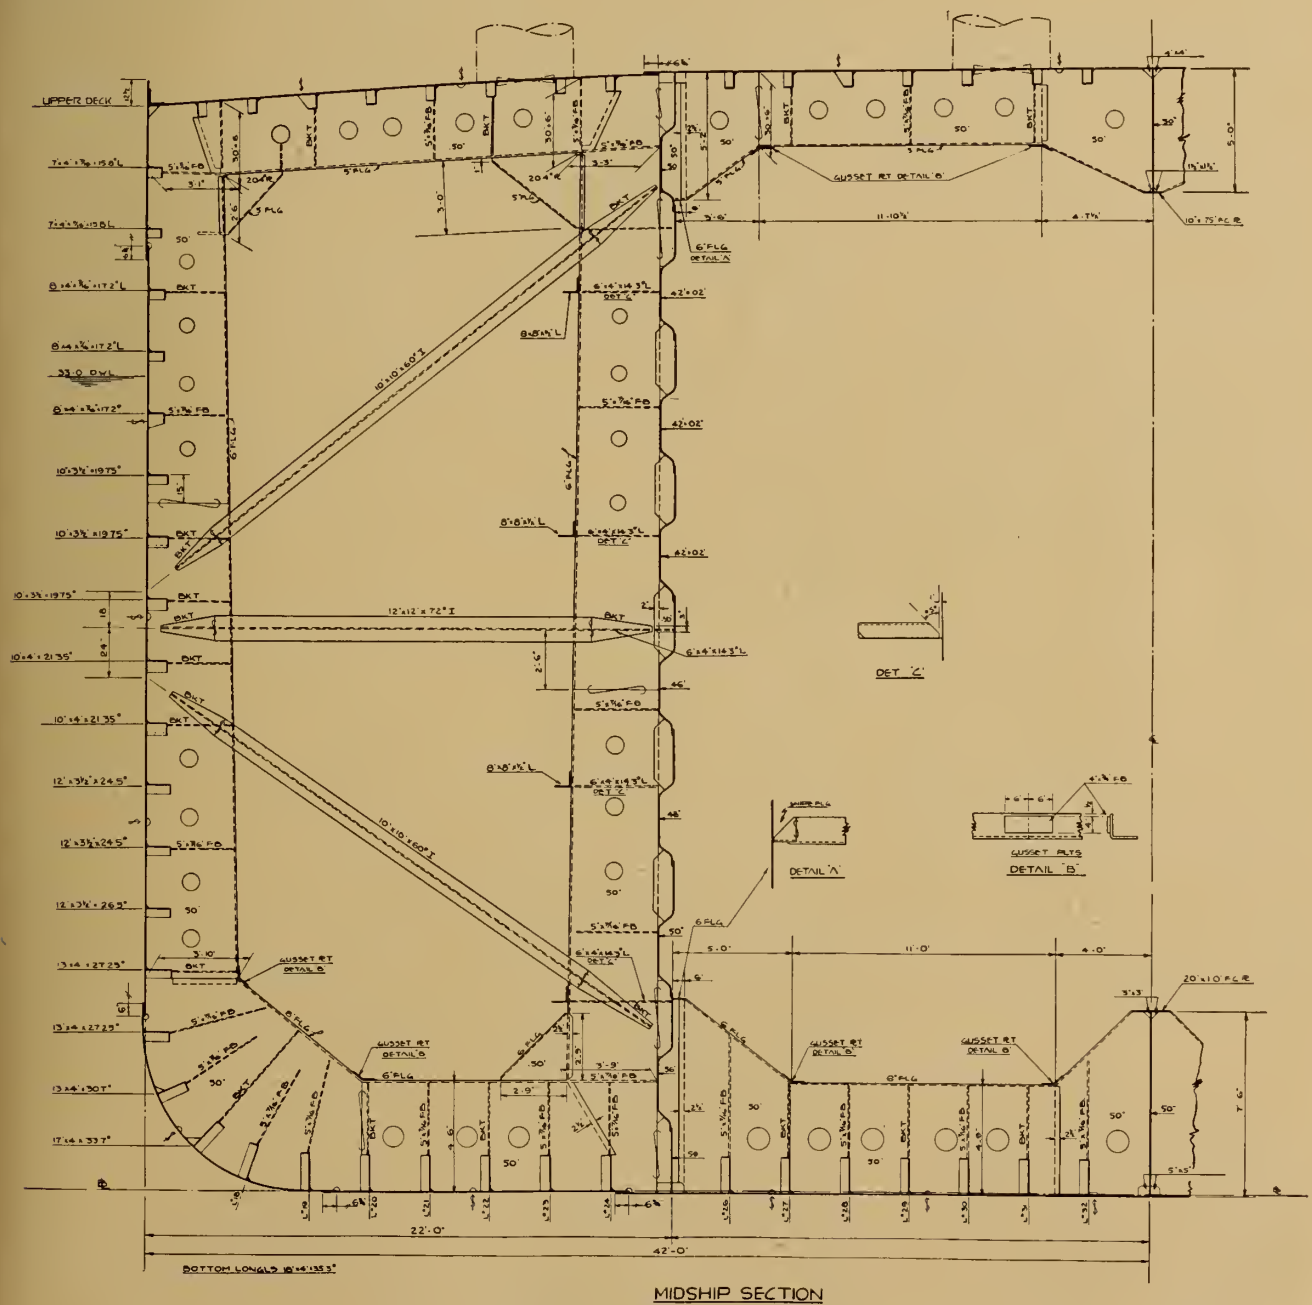

**Fig. 2. Midship section of S.S. Andros Venture.**

between machinery manufacturers and shipyard officials to determine best possible methods of handling, and also the degree of care to be exercised. Careful early planning greatly reduced the work of installation.

### Drawing Office Work

The technical work entailed in the construction threw a heavy load on the drawing office personnel. The main engines and much of the auxiliary equipment was changed from that for Bethlehem type tankers. This necessitated a new engine room layout, and changes to piping systems throughout the engine room, new seating plans, checking of technical features on all auxiliaries relative to the main machinery, etc.

Changes to steering gear, deck equipment, ventilation systems and accommodation layouts, and changes to steel construction plans to suit shipyard methods and new requirements, all needed careful study to achieve the most economical vessel from both the shipowner's and shipbuilder's point of view.

All material and equipment had to be ordered with despatch, in order to meet scheduled construction commitments. The drawing office, working in conjunction with the purchasing department, was often sorely tried to keep up with these commitments. However, the only complaint received was that the shipyard stores were bulging at the seams. A tribute for a job well done!

There were many other items requiring careful and speedy planning. The keel of the first vessel, the "Andros Venture", was laid on September 25, 1952. Nine months later, on July 3, 1953, this vessel was launched. It was handed over to the owner in November, 1953, after a construction period of only thirteen months. Canada's first super tanker has now completed three successful round trips between the United States and the Persian Gulf. Her sister ship the "Andros Fortune" will shortly go on trials prior to being handed over to the owners.

## PART I

### General Description

The principal technical characteristics of the 28,000 ton tankers are as follows:

| | |
|---|---|
| Length Overall | 624 ft. 7½ in. |
| Length between perpendiculars | 595 ft 0 in. |
| Breadth (moulded) | 84 ft. 0 in. |
| Depth (moulded) | 44 ft. 0 in. |
| Draft (extreme) | 33 ft. 3⅝ in. |
| Corresponding displacement | 36,410 tons |
| Deadweight | 28,070 tons |
| Cargo oil capacity (100% full) | 240,400 barrels |
| Dry cargo capacity (bale) | 65,300 cubic feet |
| Power-steam Turbines | |
| Normal | 12,500 shp @ 100 rpm |
| Maximum | 13,750 shp @ 103 rpm |

These vessels are "three island types", in other words the deck erections consist of a poop, bridge and forecastle. They have a curved raked stem and a cruiser stern. Propulsion machinery is located at the after end driving a single five-bladed propeller. The actual oil cargo space takes up a total of 370 feet of the vessel's length. This is divided by two longitudinal and nine transverse oiltight bulkheads, into a total of 30 cargo oil tanks.

Forward of the cargo oil tanks the vessel is divided into compartments such as the fore peak, chain locker, boatswain's stores, carpenter's shop, dry cargo spaces, deep tank for fuel oil or water ballast, and transfer pump room. The after portion contains the pump room, engine and boiler room, fuel oil bunker tanks, and aft peak and steering gear compartment.

The total complement carried is thirteen officers and thirty-one crew. Accommodation is provided in the bridge house for the captain, deck officers, quartermasters and radio operators, in addition to the wheelhouse, chart room, radio room, hospital, etc. The engineer officers, steward and crew, etc., are located aft in the poop enclosure and the poop deckhouse.

The main propulsion machinery consists of a geared steam turbine of 12,500 shaft horsepower (normal), driving the propeller at 100 r.p.m. through double reduction gears and line shafting. Steam condition at the boiler superheat outlet is 600 psig @ 850°F., and at turbine throttle is 585 psig @ 840°F.

The entire plant is designed to operate at an all purpose fuel rate of 0.54 lbs/shp/hr. The main boilers are water-tube type, arranged for burning oil under forced draught and fitted with superheaters, desuperheaters, waterwalls, economizers, steam type air heaters, and automatic combustion controls. The boiler feed system is the deaerating type, with two stages of feed heating.

The main electrical plant consists of two 400 k.w.—450 volt alternating current, geared turbo-generator sets, complete with all necessary auxiliaries and switchboards. An emergency 75 k.w.—450 volt a.c. diesel generator is provided for emergency lighting, etc., and dead ship starting. The cargo oil pumping system consists of four turbine driven centrifugal pumps with a combined capacity of 14,000 gallons per minute, and four steam driven reciprocating cargo oil stripping pumps.

These vessels, their equipment and propelling machinery have been constructed under the special survey of the American Bureau of Shipping, Lloyd's Register of Shipping, and to the requirements of the Canadian Board of Steamship Inspection for carrying petroleum products in bulk with a flash point below 150°F.

### Steel Structure

The total steel required for a vessel of this size and type is about 8,000 tons. The transverse sections (pages 689, 691) show the type of construction. The vessels are all welded construction excepting for 14 rivetted seams running fore and aft in the shell plating and the upper deck. These rivetted seams serve as crack arresters. All steel used for plating is American Bureau special weldable quality steel, with a low carbon content.

The main hull structure, inway of the cargo oil tanks, is framed longitudinally. Size of frames varies from 18 in. x 5 in. angles cut from channel sections at the bottom, to 7 in. x 4 in. angles at the upper deck level. Framing forward and aft of the cargo oil tanks is transverse. Deck framing of the upper deck inway of the main hull is longitudinal. The forecastle, poopdeck and upper deck inway of the forward and after peaks are transversely framed.

The shell and decks, bulkheads, inner bottom and deck erections were designed for maximum prefabrication within the limits of shop handling and lifting facilities. Generally speaking the limiting factors are an overall size of 40 ft. x 40 ft. or a lift of 30 tons.

A double or inner bottom, with an intact watertight tank top, is fitted inway of the machinery space only. This inner bottom is of cellular construction, with solid floors and longitudinal girders. It is divided into five tanks for ballast by watertight divisions, watertight or oiltight pockets being arranged as required for propulsion machinery, lube oil sumps, sea chests, and fathometer space.

Oiltight bulkheads dividing the cargo oil space are the "Frear fluted" or corrugated type. This type is particularly adaptable to oil tankers due to the form of the vessels, the weight saved and reduction in labour involved. In the

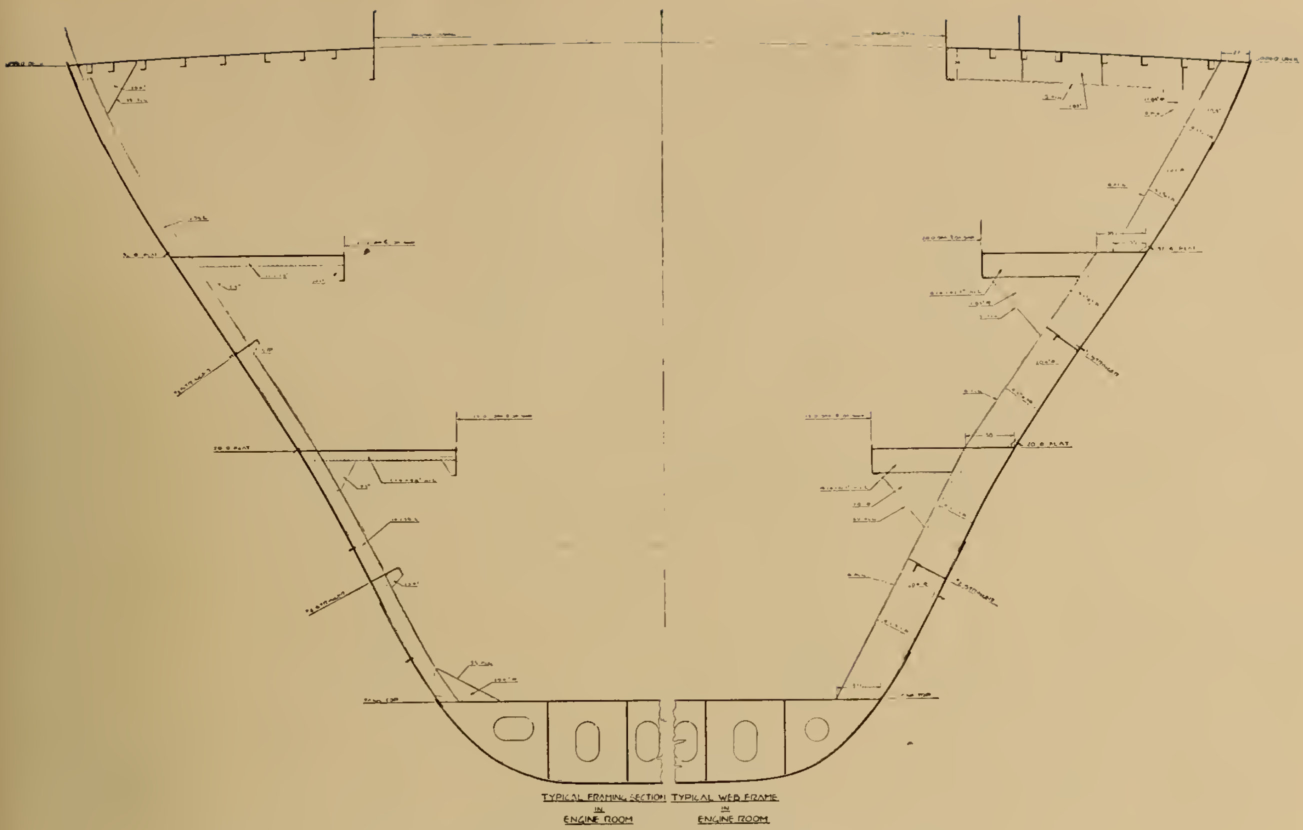

**Fig. 3. Typical framing section in engine room.**

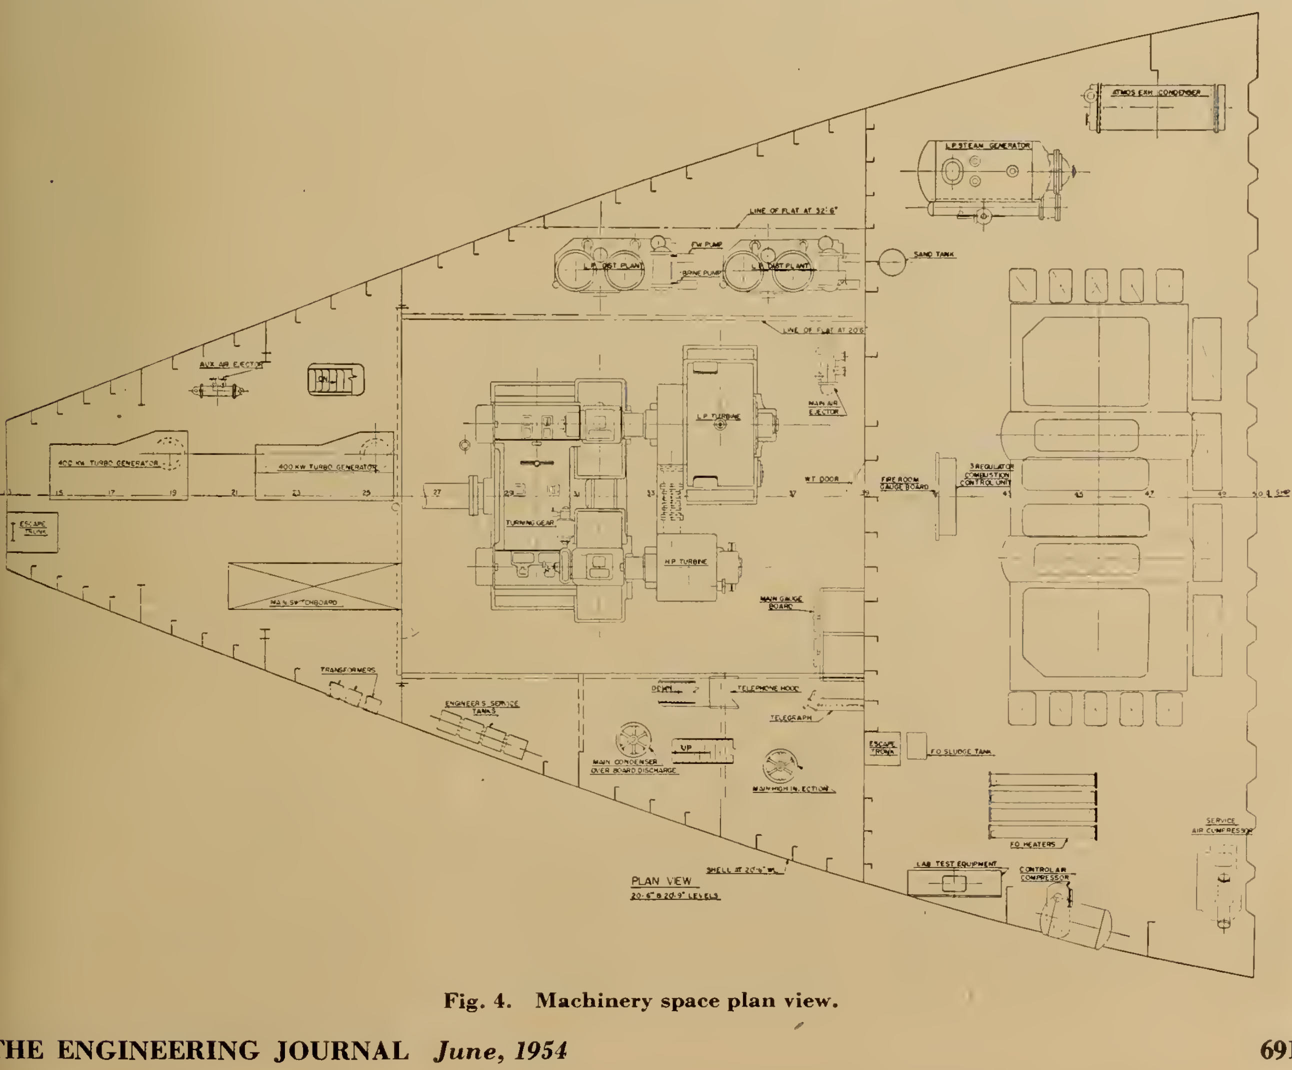

**Fig. 4. Machinery space plan view.**

case of the 28,000 ton tankers 130 tons of steel were saved on each vessel due to the use of "fluted" bulkheads. Bulkheads elsewhere are of the conventional type with flat plating and toe welded angle stiffeners.

Particular attention has been paid to the design of the super structure to obtain a pleasing appearance. The sternframe is cast steel made up in three sections, the total weight being 51.84 tons. The upper section of the stern frame is arranged to form the base of the rudder trunk and the centre section is bored to suit the tail shaft. The rudder is of balanced streamlined form of double plate construction on a cast steel frame. The rudder stock is of forged steel.

### Deck Equipment

The steering gear is of the four-ram electro-hydraulic type, the rams being driven by a Heleshaw pump. Two pumps are provided, one either to serve as a standby or to provide additional power for quick manoeuvring. The steering gear is controlled by a telemotor steering control stand located in the wheelhouse, with an extension to a steering stand on the wheelhouse top. A trick wheel control is provided in the steering gear compartment for local control. A steering stand on the poop deckhouse top is connected to this trick wheel, with connecting shaft and clutch for emergency steering from the aft end of the vessel.

In addition to the telemotor control, a gyro-pilot system is provided, the control unit being located in the wheelhouse and the power unit in the steering gear compartment. This installation provides automatic or hand steering from the wheelhouse independent of the hydraulic telemotor system. The steering gear is capable of moving the rudder from hard-over to hard-over through 70° in 30 seconds, using one pumping unit, and in 20 seconds using both pumping units, and at full speed of 16.75 knots.

The anchor windlass is a horizontal spur geared type driven by a two-cylinder steam engine. Wildcats are fitted suitable for the 2 11/16 in. diam., stud link cable, and warping heads for general use when mooring. The windlass can lift both anchors together with 40 fathoms of chain at a speed of 30 feet per minute.

Two bower anchors weighing 16,345 lbs. each are fitted, and one spare weighing 13,895 lbs. The anchors are stowed in cast steel hawse pipes. A stream anchor weighing 5,915 lbs. is also provided. The anchor chain is 2 11/16 in. dia. steel di-lok stud link chain. Two lengths of 165 fathoms are fitted, made up of 15 fathom shots or lengths joined together with detachable links.

Three deck winches are installed, two on the upper deck and one on the poop deck aft. These are driven by two-cylinder horizontal steam engines, each arranged with warping heads fitted on extended shafts. Each winch develops a line pull of 16,000 pounds at 100 feet per minute. The forward winch is provided for the 5-ton derrick and general warping duties, the midship winch serves the four 4-ton derricks and general warping duties, and the after winch is for warping duties only. The 4-ton derricks fitted amidships are for general use, such as oiling at sea, handling of hoses, storing ship, etc.

Hatches 14 ft 10 in. x 18 ft. 0 in. are fitted on the forecastle deck and the upper deck servicing the dry cargo space forward, the forecastle deck hatch-cover being of watertight hinged steel construction, and the upper deck hatch covers of wood. The hatches are served by a single 5-ton derrick for general cargo handling.

One feature worthy of special note is the cargo oil tank hatch covers fitted on the "Andros Venture". These covers are all aluminum of welded construction, thus reducing the weight to approximately one third of similar steel hatch covers, of great assistance with regard to handling.

### Accommodation Spaces

The entire accommodation spaces have been designed with a view to reducing the fire hazard to a minimum. Marinite has been used for all divisional bulkheads, except where steel bulkheads are fitted, also for all sheathing in ship's side or deckhouse sides and for ceilings where fitted. All furniture is of steel construction and deck coverings are either magnesite, ceramic tile or quarry tile. This feature of reducing the fire hazard whilst important on any vessel, is even more important in the case of an oil tanker, where any fire carries with it the danger of an explosion.

All spaces where bulkheads or decks are exposed to the weather, are insulated for comfort with 2 in. mineral wool type insulation, or as in the case of toilet spaces and C.O.2. rooms, with 1 in. sprayed asbestos.

Spacious and comfortable cabins are provided for all officers and the crew. The captain's quarters on the upper bridge deck consist of his stateroom, office, and bathroom. The chief engineer's quarters on the poop deck aft are similar to the captain's. All officers have single cabins well furnished, bathrooms being arranged between two cabins, except in the case of the chief officer and 2nd engineer who have private bathrooms.

A tastefully decorated lounge located on the poop deck is provided for the use of the officers during their leisure moments. The officers' mess, with seating accommodation for eighteen, is located adjacent to the galley on the portside of the after end of the poop deck. This mess is served from the officers' pantry.

The crews' quarters are located aft on the upper deck. Each cabin is shared by two men, but as usual in tankers, their cabins are far more spacious than the average cargo vessel. Separate toilet spaces are provided for engine department, deck department, and the steward's department. The crew have a recreation room on the upper deck aft on the starboard side.

The crews' messing space is located adjacent to the galley on the port side of the poop deck aft. This space is divided off to accommodate ten petty officers and stewards, and twenty-two crew members. The mess space is served from the crew's pantry.

The galley has been arranged on modern lines, and is complete with an electric range, electric bake oven, steam tables, steam kettle, refrigerator, dough trough, cook's table, and stainless steel dressers and sinks. The officers' pantry is equipped with a refrigerator, coffee urn, stainless steel dresser and sinks and all necessary glass racks, dish racks, etc. The crew's pantry is equipped similar to the officers' pantry.

The hospital located on the bridge deck amidships is fitted with five berths, lockers, settee, desk and chair. A bathroom is located just forward of the hospital. Space is also provided for a ship's office, linen lockers, service lockers, steward's stores, laundry, etc.

### Navigating Equipment

Complete and up-to-date navigation equipment is fitted on these super tankers. Gyro compass equipment consisting of a master gyro fitted in the gyro room on the navigating bridge; two steering repeaters—one in the wheelhouse and one on the wheelhouse top; two bearing repeaters, one at the radio

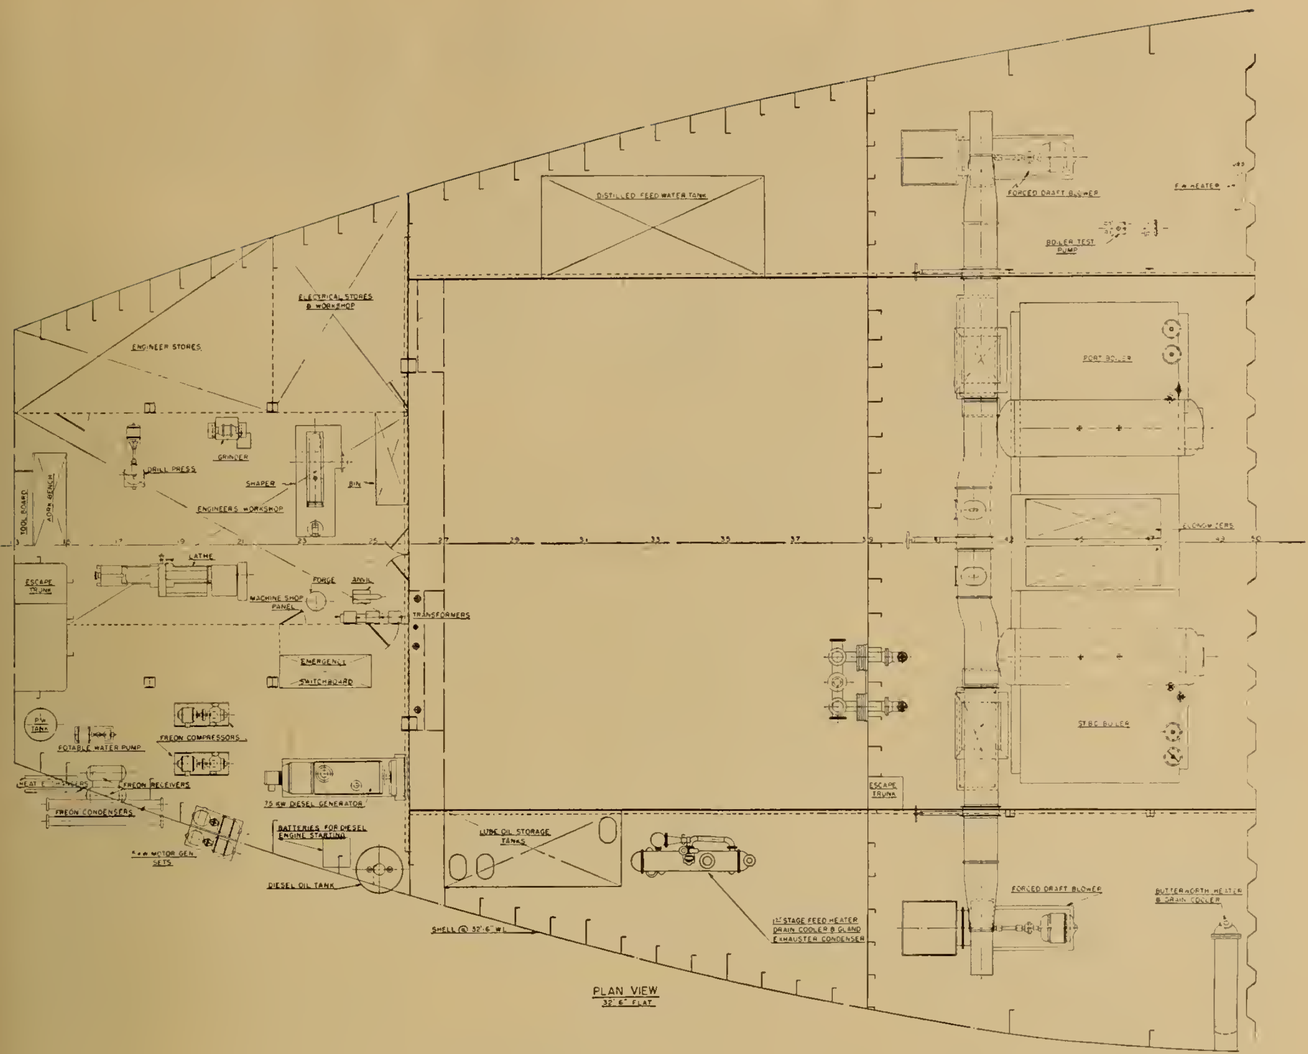

Fig. 5. Machinery space plan view.

direction finder in the chart room and one on the wheelhouse top. A gyro pilot system for hand electric steering and gyro automatic steering is also installed in the wheelhouse.

The usual magnetic compasses are fitted consisting of a liquid compass at the wheelhouse top, one in the wheelhouse and one at the aft steering position on the poop deck. An automatic course recorder is fitted in the chart room, along with an I.M.R. 20. direction finder and echo sounder recorder.

The telegraph system is the electrical self-synchronous type, one system being provided for the engine orders consisting of a 12 in. transmitter-indicator in the wheelhouse, and a 16 in. transmitter-indicator for repeat back at the engine room control station. An indicator is also provided in the boiler control station. A separate system is provided for transmission of docking orders, one transmitter indicator being fitted in the wheelhouse and one at the poop deck aft.

Indicators, electrically operated, are provided for indicating shaft revolutions and direction and also for rudder angle indication, these indicators are located in the wheelhouse. An 18 in. 1000-watt searchlight mounted on the wheelhouse top and controlled from the wheelhouse, and a 12 in. 1000-watt signalling searchlight are also provided. A radar unit is installed in the wheelhouse.

The radio transmitting and receiving equipment is housed in the radio room on the upper bridge deck, this equipment consists of a main transmitter, medium frequency—I.M.R. 51, 400 w. output; a high frequency transmitter, type 53, 400 w. output; an emergency transmitter, type 61, 50 w. output, an all-wave receiver, type 54; and an emergency receiver, type I.M.R. 60.

Such items as leads man's platform, navigation lights, flags, a mechanical sounding machine, fog horn, ships bells, morse light and voice tube system between engine room and wheelhouse, etc., are provided as usual on vessels of this class, thus completing a very modern installation.

### Lifesaving

The lifesaving equipment, which complies with the latest Convention Requirements, consists of 2—32 person lifeboats, and 2—21 person lifeboats, one of the 21 person lifeboats being motor propelled. These boats are located on the upper bridge deck and the poop deckhouse top, giving a lifesaving capacity of 53 persons on each side of the ship.

Eighteen lifebuoys, nine equipped with lights, are distributed around the decks, and a life preserver is provided for each person on board. A line throwing apparatus is provided for use in lifesaving, this consists of a mounted type line throwing gun with line containers, lines, powders, charges, projectiles, etc.

### Heating and Ventilation of Accommodation Spaces

Natural ventilation, by means of cowl supply ventilators or gooseneck and mushroom type exhaust ventilators, is provided to such spaces as the dry cargo hold forward and aft pump rooms, passageways in accommodation spaces, toilet spaces, store rooms and cofferdams.

Mechanical ventilation is provided in all living quarters, the hospital, messrooms, gyro room, radio room, chart room, galley, pantries, dry stores and laundry. The rate of supply for all living quarters is about fifteen air changes per hour.

The mechanical supply is taken care of by four centrifugal fans, three centrifugal fans are provided together with a streamline exhaust unit for the mechanical exhaust systems. Three of the centrifugal supply fans are used to provide heated air, or air at atmospheric temperature, to the accommodation spaces, one supplying air amidships and two supplying air to the after spaces. The other fan provides air to the galley, food handling and meat cutting rooms, and store rooms aft.

All supply fans are fitted with steam air heaters on the inlet side, capable of raising the ambient air from 0°F. to 75°F. as necessary. The heaters are controlled by thermostats in the trunking at the discharge side of the fans, set at 75°F.

One centrifugal exhaust fan is utilized to exhaust air from the toilets and W.C.'s amidships, and one is used for similar services aft. The third fan provides exhaust ventilation from the cordage room, steering gear compartment and the meat handling room.

The streamline exhaust unit is used to exhaust air from the galley, drawing from a canopy fitted over the range, etc. The ventilation system is designed to provide for possible installation of air conditioning at a later date.

### Main Turbines and Gearing

The main propelling machinery consists of a cross-compound, double-reduction, turbine-gear set. The turbine set is comprised of a high-pressure turbine and a low-pressure turbine, having a continuous combined normal rating of 12,500 shp. at 100 r.p.m. when operating with steam at 585 psig. 840°F. total temperature, and an absolute back pressure of 1.5 inches mercury. The maximum rating of the set is 13,750 s.hp. at 103.2 r.p.m.

A reversing element for astern operation is included in the forward end of the low-pressure turbine. When operating astern the set may be run continuously at speeds not in excess of 70 r.p.m.

The turbines are of the impulse type throughout. There are eight stages of blading sections in the high-pressure unit and in the ahead section of the low-pressure unit. There are two stages in the reverse element. The ahead steam flows aft through the high-pressure turbine, through a cross-over pipe to the low-pressure turbine, and then exhausts downward to the condenser.

With the high-pressure turbine operating at 6,540 r.p.m. and the low-pressure turbine at 4,128 r.p.m., the propeller shaft speed is 100 r.p.m. This low propeller speed is achieved by coupling the rotor of each turbine to a double reduction gear. The speeds of the two turbines are separately reduced to the same value by a pinion and gear arrangement, so that the turbines drive a common low speed gear coupled to the propeller shaft.

Three connections are provided for the extraction of steam from the turbines for supply to the low-pressure steam generator, feed water heating, boiler combustion air heating, distilling plant operation and several other auxiliary services, as later described.

The control of steam to the turbines is effected at a manoeuvring valve and steam strainer manifold, mounted on the engine room bulkhead, and operated by means of handwheels at the control station. The manifold consists of ahead and astern throttle valves, an astern guardian valve and the steam strainer.

Close adjustment of steam flow to the high-pressure turbine is accomplished by a turbine-mounted set of three hand control valves. Each valve controls the steam flow through a group of nozzles in the first stage of the high-pressure turbine, and permits adjustment of the total first-stage nozzle area to suit any particular operating condition. By proper adjustment of the hand valves, the turbine can be operated with the main throttle valve wide open over a range of power, thereby reducing the throttling losses to a minimum.

Independent operation of either the high-pressure or the low-pressure turbine is possible, in case of emergency, by permitting the inoperative turbine to stand idle and to place the other turbine in operation. This is accomplished by disconnecting the defective unit, altering the position of a tee-piece in the crossover piping and fitting blank plates and piping. For operation with the low-pressure turbine disconnected, a blank plate is inserted between the crossover pipe and the inlet to the low-pressure turbines.

The tee-piece is connected to the exhaust casing, allowing the steam to enter the condenser. With the high-pressure turbine out of operation, the high-pressure outlet to the low-pressure turbine is blanked off, and the tee-piece connected to the desuperheated steam supply. An orifice plate is located in this line to reduce the pressure to that of the normal crossover pressure.

The turbine glands are of the steam-sealed labyrinth type; the glands being provided with sealing and vapour leak-off pockets. The sealing steam supply is piped directly to the steam-seal regulator from the auxiliary steam line. The steam-seal regulator consists of two steam valves, a spring-loaded pressure relay, an oil controlled pilot valve and a bellows assembly.

The oil, which serves as an operating medium for the regulator, is led to the pilot valve from the lubricating oil service pumps. During normal sea operating conditions, the steam supply to the packing is automatically shut off and the steam from the high-pressure packing is permitted to flow to the low-pressure packing.

Steam, in excess of that required to seal the low-pressure packing, is piped from the high-pressure packing through a valve to the low-pressure turbine. Should the pressure in the system fall, the regulator opens to supply steam to the sealing system. Vapours from the glands are removed to the gland exhaust condenser, by means of a motor-driven centrifugal fan.

Safety devices include an oil-operated governing system, designed to limit the shaft speed to 118 r.p.m. and to afford protection against low lubricating oil pressure. A sentinel valve is mounted on the exhaust casing of the low-pressure turbine to give warning of excessive exhaust back pressure.

The reduction gear is of the two-pinion, double-helical, articulated type. The rotating elements of the gear consist of two first-reduction pinions, two first-reduction gears, two second-reduction pinions and one main gear. The pinions are made from solid forgings; the first-reduction gears and the main gears are fabricated of steel.

The end play of each first-reduction gear is limited by thrust bearings at the forward and after end of the gears. The propeller thrust, in both the ahead and astern directions, is absorbed in a pivoted, segmental-type thrust bearing located at the forward end of the main gear.

### Main Boilers

The main steam generating plant consists of two "D" type steam generators. Each unit includes a two drum, bent tube boiler section, side and rear waterwalls, convection type superheater and an extended surface economizer. A desuperheater for supply of low-temperature auxiliary steam, is installed below the normal water level of the steam drum.

A steam air heater, consisting of a removable assembly of U-tube finned elements mounted in an airtight casing, is attached to the top of the windbox inlet for preheating the air before it enters the burner registers. The heater is capable of heating air from 100°F. to 270°F., when supplied with steam at 63 psia, and at a temperature of 405°F.

Four oil fuel burners are installed in the front wall of the furnace of each boiler. The burners are of the mechanical atomizing type. Steam-operated, valve-in-head soot blowers, designed to operate at full boiler pressure and desuperheater outlet temperature, are installed to serve the boiler section, superheater and economizer tubes.

An electrically-operated combustion control system is arranged to regulate the fuel and air supply, in accordance with the demand for steam, by maintaining the pressure at the superheater outlet of each boiler within predetermined limits. The ratio of fuel to air on each boiler is also maintained.

The burner header pressure is automatically prevented from falling below the minimum for safe operation, regardless of the number of burners in service.

Two horizontal, centrifugal, forced draught blowers, driven by two-speed squirrel cage motors, are provided. Each fan has sufficient capacity for both boilers at normal evaporation. The blowers take suction from the boiler room and discharge through the air heaters to the boiler front air castings. The ducts are arranged to permit operation of one or two blowers with two boilers and one or other blower when only one boiler is steaming. Inlet vane controls are fitted at the blowers.

Due to the weight of the completed boiler being in excess of our lifting capacity, the boiler materials were furnished "knocked-down" and erected on board ship. This erection work included all cutting and expanding of boiler and superheater tubes, casing work, installation of brickwork, etc. The manufacturer provided a supervisory staff.

### Low Pressure Steam Generator

A low-pressure steam generator in the boiler room supplies steam to and receives condensate from all services which may be considered to be subject to oil contamination. The danger from this oily condensate is thus confined to the contaminated system and the main boiler feed is completely isolated.

The low-pressure steam generator is a steam heated low-pressure boiler or steam transformer. It has a rated output of 35,000 pph. of steam at 120 psig. when the steam supply is 300 psig. Steam is supplied to the tube nest from the desuperheated steam system through a regulating valve, designed to maintain the output steam at 120 psig.

Bled steam from the high-pressure extraction point is used as the heating medium at sea when tanker services are not in use. The tube nest drains are led to a drain cooler and discharged to the de-aerating feed heater.

### Electrical Generating Plant

The electrical system is of the alternating current type at 60 cycles, single or three phase as required; 450 volts distribution is provided for power requirements, 230 volts for galley and laundry services and 118 volts for lighting, fractional horsepower motors, etc. A 120 volts, 2-wire, direct current system is available for special services.

Power for the electrical auxiliaries and ship's lighting is supplied from the two turbo-generators during normal conditions. For emergency purpose and cold ship starting, a diesel generator is provided. Provision is made for automatic starting of the emergency set upon failure of voltage at the main switchboard.

Each turbo-generator has an output of 400 kw., 450 volts and 60 cycles. Steam is delivered to the turbines at 585 psig., 840°F., total temperature and exhausts into individual condensers at 28½ inches vacuum. The turbines are of the impulse type, have six stages of blading and run at 10,059 r.p.m. The turbine shaft is directly connected to the reduction gear.

The reduction gear is of the single-helix, single reduction type, and reduces the turbine speed to the generator speed of 1,200 r.p.m. The synchronous generator and 7.5 kw. 120 volt d-c. exciter are two individual machines, and are of the self-ventilated type with drip-proof enclosure.

Each unit is equipped with a constant speed governor of the oil relay type, and protective devices to shut off steam on overload and an alarm system to warn the operator of low lubricating oil pressures. Each unit has an individual lubricating oil system, with heat-exchangers.

The engine driving the 75 kw., 450 volts, 3 phase 60 cycle emergency generator is of the four cycle, high-speed type. The unit is complete with batteries for cold starting and with radiator type heat exchanger. Two 5 kw., 120 volt compound wound, direct current generators, each driven by a 7½ hp. induction motor supply power to the gyro compass and echo sounder.

Three switchboards control and distribute the power. The main switchboard services the turbo generators output and an emergency board is connected to the diesel set and the motor generator sets. The third switchboard is for forward ship's service and emergency distribution.

### Main Condenser and Air Ejectors

The main condenser is bolted directly to the exhaust flange of the low-pressure turbine. It is of the

**Table 1 — Boiler Design Data**

| | Normal | Maximum |
|---|---|---|
| Superheater outlet pressure — psig | 600 | 600 |
| Superheater outlet temperature — °F. | 850 | 865 |
| Total evaporation, each boiler — lbs°hr. | 47,500 | 65,000 |
| Superheated steam, each boiler — lbs°hr. | 44,000 | 47,000 |
| Desuperheated steam, each boiler — lbs°hr. | 3,500 | 18,000 |
| Feed temperature to economizer — °F. | 250 | 250 |
| Air temperature to burners — °F. | 265 | 270 |
| Efficiency — per cent. | 88.0 | 87.5 |
| $CO_2$ in uptake — per cent | 14 | 14 |

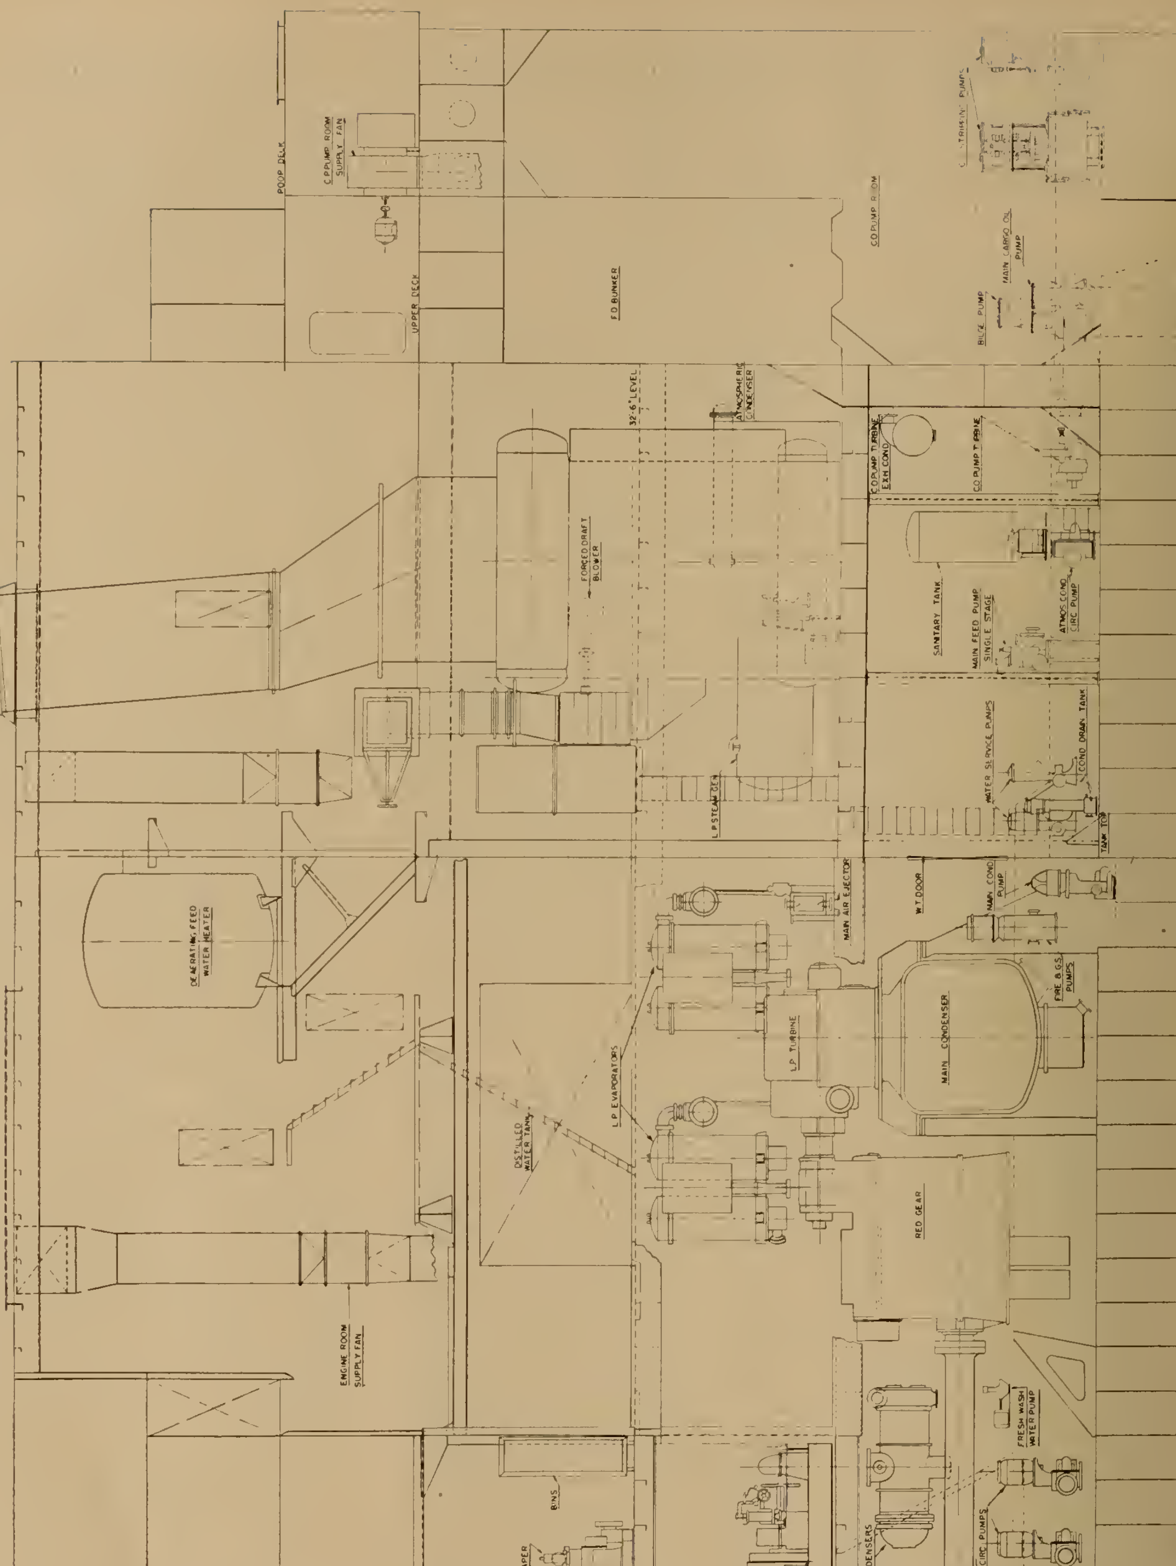

**Fig. 6. Machinery space port elevation.**

straight tube, reheating, surface type, with two passes of circulating water and an air cooling section and condensate hotwell. The shell is of welded steel construction, the water chests of cast iron, the tube sheets of rolled naval brass and the tubes of 70-30 copper nickel.

The effective outside tube surface is 12,500 sq. ft. Design conditions ensure the maintenance of an absolute condenser pressure of 1½ in. mercury, when, with a cleanliness factor of 85 per cent and a sea water temperature of 75°F., the rated normal ahead power is being developed.

The air ejector is a steam jet, twin element, two stage type, mounted on surface inter and after condensers. The operating steam is taken from the desuperheated steam range at a pressure of 275 psig. The inter and after condensers are circulated by the main condensate pump.

The main condenser is circulated by means of sea water from the main circulating pump which is a vertical, two-speed, motor-driven, single stage, centrifugal unit. Branches from the discharge line are led for circulation of the lubricating oil coolers and in an emergency, to cargo pump exhaust condensers.

The sea water enters the suction main from high and low injection valves. A connection is provided for emergency bilge pumping. In the event of failure of the main pump, circulating water is available from the cargo pump condenser circulating pump.

#### Auxiliary Condensing Equipment

Each turbo-generator has its own condenser, which is served by individual condensate pumps, circulating pumps and air ejectors. The pumps are cross connected so that either pump can be used on either condenser.

The cargo oil pumps exhaust to a single-pass, atmospheric condenser which is circulated by its own circulating pump. The shell is vented to atmosphere through a large vent pipe, designed to handle full steam flow, should the circulator fail.

Oily exhaust from reciprocating machinery, and pumps and drains from oil heating coils, are led to a combined atmospheric condenser, drain inspection tank and hotwell. Condensation takes place in the atmospheric condenser. The condensate flows by gravity to the inspection tank and to the hotwell which serves as storage for the feed pumps for the low-pressure steam generator. Circulation of the condenser is by the cargo pump turbine circulator in port and the water service system at sea.

#### Propulsion Shafting and Propeller

The propulsion shafting design created a problem because of the necessity of reducing the effect of torsional vibrations. The problem is of particular importance in vessels of this design, where the machinery is located aft and the ship has a large length-by-breadth ratio.

Critical conditions may occur which may induce excessive vibrations over the working shaft speeds. The object was to check the system inertias and their influence upon the location, in the speed range, of the one, two and three node critical frequencies.

The tailshaft was increased from 24-in. to 26-in. diameter, to suit standard shafts being fitted in other vessels operated by the shipowner. By adopting a five bladed propeller and using a smaller intermediate shaft of higher tensile steel than that normally considered, the two and three node criticals were found to be far above the maximum operating revolutions.

The one node critical was calculated to be at 58.9 r.p.m.; thus giving a theoretical absence of objectionable vibrations in the power range of approximately 3,000 s.hp. to the overload of 13,750 s.hp.

The shafting from the main gear to the propeller is in two lengths. The forward length, or intermediate shaft, has solid flanges and runs on a self-lubricated, steady bearing of cast iron. The bearing is lined with white metal on the lower bearing surface, and has white metal end bands on the cap.

The shaft has an electrical torsionmeter unit, mounted at the forward end for measurement of horse power. The propeller shaft has a solid inboard coupling and a centrifugally cast composition liner is fitted to extend throughout the sterntube bearing surfaces. The propeller end is tapered and fitted with a forged steel key and nut.

A spare tailshaft, complete with liner, is stowed in the aft end of the lower engine room. The propeller is five bladed, cast solid of manganese bronze with a diameter of 21 ft. 6 in and a pitch of 17 ft. 8 in.

#### Distilling Plants

The two salt water distilling plants are of the low-pressure, double-effect type with external distilling condenser, air ejector condenser and distillate cooler. For normal sea operation, steam is supplied to the first stage heating section from the low-pressure turbine bleeder at about 7 psia. Under this condition either plant can produce 6,000 gallons of fresh water per twenty-four hours.

When bled steam is not available, or when operating at reduced power, arrangements are provided to supply auxiliary steam at 5 psig., to the first stage heating section; the capacity of each plant then increases to 12,500 gallons per twenty-four hours.

The evaporator units of the first and second effects are identical and completely interchangeable. They comprise a deeply corrugated monel heating section, arranged in cylindrical form, and surrounded on the outside by sea water.

Above the evaporation section is a cyclonic separator where the major amount of entrained liquid particles are separated by centrifugal force. On top of the cyclonic separator is a steam dome, where final separation takes place by reversal of flow and impingement.

The vapour passes from the steam dome of the first effect shell to the basket heating section of the second effect evaporator, via a vapour feedwater heater. The drains from the second effect steam chest are led to a flash chamber in the bottom of the distillate condenser, where they mix with the condensate of the vapour from the second effect shell.

The vapour from the second effect shell passes to the distilling condenser. The condensed vapour combines with the second effect steam chest distillate at the bottom of the flash tank and is pumped by the distillate pump, through the distillate cooler, by way of a solenoid operated valve, designed to dump any contaminated water to bilge, and pass only pure distillate to the ship's service tanks.

The two-stage separation of the vapours, in each effect, results in fresh water with a salinity not exceeding 0.25 grains of sea water per gallon. The distillate cooler, distilling condenser and air ejector condenser are circulated with sea water from the ship's water service pump. About 25 per cent of the sea water passes through the supplementary heating sections in the distiller condenser and feeds the evaporator shells in parallel.

Automatic float valves control the rate of feedwater into the bottom of the cyclonic separator, where further heating drives off the carbon dioxide gases, with the vapour, before the degasified feed goes down the downtakes to the evaporator section.

Brine from the first effect shell is led to the second effect shell, the rate of flow being adjusted by a control valve. This gives a feed rate to the first effect equal to twice the amount of fresh water made from both effects. The bottom blow-off from the second effect shell is connected to the brine pump and discharges overboard. Salt concentrations of 1.5/32 NDS are maintained in the evaporator.

The vacuum in the system is maintained by a single pass steam jet air ejector. The non-condensable gases are taken from a specially baffled section in the distiller condenser. The vacuum is reflected throughout the entire evaporator plant via vent lines and interconnected vapour pipe, the degree of vacuum at all locations being dependent upon heat balances and ambient conditions.

#### Refrigeration Plant

A direct expansion type refrigeration plant, designed for use with freon-12 refrigerant and having a capacity of approximately 2.5 tons of refrigeration, is installed in the upper part of the engine room.

The plant is capable of maintaining the specified temperature in the refrigerated compartments and will freeze 300 pounds of ice per 24 hours. A cold water tank having a capacity of 26 gallons is provided for drinking water. Provision is made for the three 6 cubic feet domestic boxes to be cooled from the main refrigerating system.

The compartments are as follows:

(a) A poultry and meat room having a volume of 1,734 cubic feet, maintained at a temperature of zero degrees fahrenheit.

(b) A chill room having a volume of 1,901 cubic feet, maintained at 35 degrees fahrenheit.

The refrigeration machinery consists of two water-cooled compressor-condenser units, one being arranged to act as a standby. Automatic temperature control by means of thermostatically operated liquid line solenoid valves is provided for each compartment, domestic box, scuttle-butt and ice-maker.

An automatic condenser water regulating valve with a three valve by-pass is provided to control the flow through the condenser and maintain constant condensing or high-side pressures with fluctuating water temperature. For defrosting, hot gas connections are provided for the poultry and meat room. The usual safety devices and automatic shut-offs are provided.

#### Feed Cycle and System

The specification requirements for overall power plant efficiency called for a designed all-purpose fuel rate of 0.54 pounds of fuel per shaft horse power per hour (based on oil at 18,500 B.t.u. per lb.).

The feed cycle is arranged with two stages of heating on the low-pressure side of the feed pump. The sole heat gain on the high-pressure end of the cycle takes place in the economizer. A simplified flow diagram illustrating the cycle for normal sea operation is included with the drawings.

The basic design of the cycle follows the Bethlehem arrangement but the application of the turbines required a complete review of flows and temperatures. The turbine water rate for the Davie vessels is slightly in excess of that for the Bethlehem turbines but the use of the Maxim distilling plant offsets the slight loss of economy due to the main turbine change. The selection of the three extraction conditions was made on the basis of General Electric data and our own heat balance calculations, and the ultimate cycle proved to be within the specified economy.

The feed system is arranged on the closed principle with de-aerating feed heater. The main condensate pumps, one working and one for standby duty, take suction from the condenser hotwell and discharge through the air ejector condensers, drain cooler, gland exhauster condenser and first stage heater to the de-aerator.

The condensate pumps are vertical motor driven, two stage, centrifugal units. The pumps are designed on the submergence control principle, thereby eliminating the necessity of float gear, etc. A hand operated make-up valve makes recirculating water available in emergency or when manoeuvring.

Each turbo-generator exhausts to its own condenser. The two auxiliary condensate pumps are arranged so that each pump can service either condenser hotwell. As in the case of the main condensate pumps, the auxiliary pumps have similar design features. The pumps draw from the hotwell and discharge through the auxiliary condenser air ejectors to the main feed line ahead of the drain cooler. The low-pressure feed water heater combines with the drain cooler and gland exhaust condenser in a single combined unit.

The de-aerating feed heater is installed in the upper level of the engine room casing. It is of the direct contact type, with integral vent condenser and fixed orifice type steam atomizer. There is a large storage space of approximately 2,200 gallons. Float gear provides automatic regulation of water level by means of air operated spill and make-up valves. The spill valve opens on an increase in water level and by-passes excess condensate to the distilled water tank.

Should the water level fall, the make-up valve opens. This valve is fitted on a discharge line from the distilled water tank to the drain collecting tanks. In addition to the spill valve there is an air operated overflow valve which opens when the water level in the de-aerator reaches a high level. The heater outlet is led directly to the main feed pumps.

Automatic boiler feed control is provided by means of a two element type feed water regulator for each boiler and a feed pump governing system. A multi-cell electrical salinity indicator of the detector and alarm type is installed to measure concentrations of sea water salt from 0-10 grains per gallon, and to give visible and audible warning when the salinity in any one cell exceeds 0.25 grains per gallon.

There are three main feed pumps each capable of handling full boiler loads. They are horizontal, single stage, single suction units, driven by a single stage, axial flow, impulse turbine. The pumps deliver direct to the economiser inlet.

All clean drains are led to a steam and fresh water drain collecting system, which includes a drain collecting tank of 200 gallons capacity fitted in the fathometer space. Two drain transfer pumps are arranged to draw from the collecting tank and deliver to the condensate system. The pumps are automatically started by means of a float operated switch. One pump is in use while the other acts in a standby capacity.

The contaminated exhaust steam and condensate is led from such services as heating steam, cargo heating, boiler fuel heating, butterworth heater and drain cooler, lubricating oil heaters and tank coils, reciprocating pumps, etc., to a steam condenser and observation tank. Condensate from the observation tank is led through a drain cooler to the low-pressure steam generator.

#### Steam and Exhaust Systems

The distribution of steam is divided as follows:—

(a) High-pressure, superheated steam at 600 psig. and 850°F. total temperature drives the main propulsion turbines and the 400 kw. electric generator turbines.

(b) Main boiler desuperheated

steam is used for the following drives and services:—

*At full boiler pressure*

Main feed pump turbines.
Fire and butterworth pump turbine.
Cargo oil pump turbines.
Emergency steam to low-pressure propulsion turbine.

*At reduced pressures*

Main and auxiliary air ejectors.
Low-pressure steam generator tube nest.
Distilling plant air ejectors.
Make-up feed injector.
Turbine steam seal regulator.
Make-up steam for feed heating.
Whistle steam.
Soot blowing.

(c) Low-pressure steam generator steam is used, under normal conditions, as follows:—

Steam driven deck auxiliaries.
Stripping and bilge pumps in cargo room.
Oil heating services (heaters and coils).
Butterworth heater.
Comfort heating.
Low-pressure generator feed pumps.
Steam to fire smothering.
De-icing sea valves.
Fresh water heater—domestic uses.

(d) Bleeder steam from the main turbine system is led in three separate stages as follows:—

(i) *High-pressure Turbine 5th expansion bleeder (115 psig.).* This extraction supplies steam to the low-pressure steam generator tube nest during normal operating conditions.

(ii) *High-pressure Turbine 8th expansion bleeder (42 psig.).* Steam is supplied to the boiler air heaters and the de-aerating feed water heater.

(iii) *Low-pressure Turbine 5th expansion bleeder (7.9 psig.).* Steam to first stage feed heater and low pressure distilling plant.

The exhaust from the main turbines, generator turbines and main cargo pump turbines are led to their respective condensers. The main feed pump turbines and the turbine of the fire and butterworth pump exhaust at 15 psig. back pressure to the auxiliary exhaust range.

The exhaust range combines with the intermediate bleeder steam main and is used as the heating medium

for the de-aerator and steam air heaters and for turbo-generator condensers when the pressure exceeds 20 psig. and to atmosphere when the pressure exceeds 25 psig. Exhaust from deck and engine room reciprocating machinery is led to the contaminated system.

### Lubricating Oil System

The main turbines and gearing are lubricated by a gravity type system. The equipment for the system includes two vertical, rotary, motor-driven service pumps which take suction from the double bottom sump tank, through a duplex magnetic strainer and discharge to gravity tanks through a duplex strainer and oil coolers. Each pump and cooler is capable of handling the maximum requirements of the system. Two gravity and settling tanks are installed in the engine room casing.

Each tank contains a six-minute supply of oil for the main units as a reserve in case of pump failure. Float-operated alarms are fitted to warn the engineer should the oil level drop. As the gravity tanks are used for settling the oil, they are fitted with heating coils to aid in the collection of sludge. The heating coils also serve to preheat the oil to its safe operating temperature before the propulsion unit is operated.

Two centrifugal lubricating oil purifiers, fitted with steam heaters and built-in suction and discharge pumps, are arranged for continuous and batch purification. The lubricating oil system also includes two oil storage tanks of 750 gallons capacity each, and one 3,000 gallon used oil tank.

Connections are provided for gravity filling of the reduction gear sump tank, turbo-generator sump tanks and the daily service tanks from the storage tanks. Used oil in the system can be pumped from the main sump tank and discharged into drums via the filling connections on the poop deck house top.

### Cargo Oil Pumping

Ten centre tanks and twenty wing tanks are provided for the carriage of cargo oil or ballast. Provision is made for boiler fuel oil to be carried in the after pair of wing tanks.

The thirty tanks are divided into four groups, each group being normally serviced by its own 14 inches filling and suction main and cargo oil pump. This arrangement permits four grades of cargo to be carried at the one time.

Provision is made for positive separation of the groups, by means of spectacle flanges provided in the pump room headers and two-valve protection provided at each group connection. When carrying one grade of cargo, arrangements are provided for connecting any group of tanks with any cargo pump.

Cargo oil suction and filling mains and a smaller stripping main run fore and aft through the cargo tanks, and are connected to the centre and wing tanks by athwart ship piping and valves. Two athwartship headers are located in the pump room, one connected across the suction and filling mains, and the other across the stripping main.

Each cargo main and stripping main is connected to corresponding deck mains by risers which permit either filling or discharging. The deck mains run forward from the pump room to individual headers located amidship.

For ballasting port and starboard sea chests and cross connecting piping are provided; this permits the cargo tanks to be ballasted or pumped out by means of either the cargo or stripping pumps. In addition to discharging directly overboard, the stripping pumps are arranged to discharge either to deck or to the after centreline cargo tank. The stripping process is thus consolidated, each pump discharging to this tank, which in turn is pumped out by one of the main cargo pumps.

A tank cleaning system is provided. Sea water is heated to approximately 180°F. in a steam heater, and is discharged to the deck fire main by a turbine-driven pump. A nozzle is connected to the fire main by means of a specially grounded hose, and lowered into the tanks through a deck manhole. The high-pressure jet of hot water is arranged to contact all parts of the tank and the oily water is then pumped by the stripping pump.

Each cargo oil tank is vented automatically to atmosphere whenever vapour pressure within the tank becomes excessive, or whenever a slight vacuum is caused in the tank due to falling liquid head. This is accomplished by leading individual lines from each tank to a common vent header, and installing a pressure-vacuum relief valve in each line, set at 2 psig. and 1 psi. vacuum.

The escape risers from the vent headers are led up the masts and are provided with flame arresters at the top. To prevent liquid from being discharged from the top of the mast, a relief valve set at 1 psig. is installed at the base of each riser.

Heating grids are fitted to all cargo oil tanks on a ratio of one square foot of heating surface per 100 cubic feet of cargo oil. The grids are formed from continuously welded pipe and fittings with flanged connections only as required for removal of sections. Some 34,000 feet of piping is fitted for cargo oil pumping and heating.

### Miscellaneous Pipe Systems

Boiler fuel is carried in forward and aft deep tanks and, in emergency, in No. 10 cargo oil wing tanks. Transfer of oil from tank to tank is possible by means of a motor-driven transfer pump, located in the machinery space and a steam-driven reciprocating pump located in the forward pump room. Filling connections are located on the main deck amidships.

The fuel oil service pumping equipment consists of two motor-driven, vertical rotary pumps, each of sufficient capacity to handle both boilers at maximum evaporation.

Heating takes place in four horizontal, extended surface type heaters, two of which have sufficient capacity to heat the oil required for normal operation from 90°F. to 250°F. Three heaters are required for maximum evaporation. Each pump takes suction through a simplex basket type strainer and discharges through duplex strainers. A fuel meter of the positive displacement type is provided. Diesel oil for the emergency generator and boiler lighting-up is stored in a 460 gallon tank.

Bilge pumping is divided into three separate systems, one for the forward spaces, one for the pump room aft and one for the machinery spaces. Steam-driven reciprocating pumps serve the forward space and the pump aft.

The machinery spaces are pumped by a motor-driven bilge and ballast pump located in the boiler room, and by a motor-driven fire and general service pump located in the engine room. The main circulator has a connection for emergency bilge pumping. The two motor-driven pumps are primed by means of two priming pumps, one a stand-by, mounted on a common sealing water tank and connected to a vacuum tank.

Hydro-pneumatic systems are provided for wash water, flushing water and drinking water. Hot water is available at all washbasins, etc., and cold drinking water is led to fountains throughout the accommodation and at the engine room control station.

Two separate systems of compressed air are installed, one to supply air to pneumatic tools, hydro-pneumatic tanks and ships' general service, the other to supply the air-operated controls. Each system includes a motor-driven compressor and receiver.

### Fire Extinguishing Systems

Fire alarm and extinguishing systems are provided consistent with the service involved, and complying with the requirements of the regulatory bodies. A complete carbon dioxide fire protection system is fitted, providing for alternative bilge flooding protection to the machinery spaces and total flooding protection of the cargo oil pump room.

The system is manually controlled from outside the protected spaces, and includes the necessary pressure-operated alarm sirens to warn personnel of an emergency. Pressure operated switches are installed to de-energize the mechanical ventilation system in any one space in the event of fire. A steam smothering system protects the following spaces (a) all fuel and cargo oil tanks, (b) lamp and paint rooms.

A salt water fire main, complete with the required branch lines and fixtures is installed. The system is served by the engine room motor-driven fire pump, the pumps in the boiler room and the forward pump room steam-driven fire pump.

The fire main is divided into three sections (aft, midship and forward) by suitable valves, so that, if any portion of the fire main is damaged, this section can be cut-out and the other sections connected by hose.

In addition, fire fighting equipment such as axes, portable extinguishers, sand boxes, hose and nozzles are fitted.

### Conclusion

The work entailed in engineering this large project was considerable. Machinery and equipment had to be ordered with the minimum of delay to co-ordinate with the severe delivery schedule. The main propulsion unit differed greatly from the type previously fitted in vessels of the class, with the result that the engine room machinery was almost completely rearranged. Space was at a premium, and a careful study of machinery and piping layouts was made.

The assistance rendered us by the engineering staff of the General Electric Co. was of much value, particularly so with respect to heat balance, foundations, shafting torsionals and the numerous problems related to piping systems. The early stages coincided with a period when materials were in short supply, due to defence projects having priority.

The problems associated with the installation of a turbine/gear set of this size commence with the arrival of the parts. The larger sections had to be stored outdoors, and elaborate precautions were taken to prevent corrosion damage to the working parts. The build up of the set from the lower gearcase through the turbine end calls for careful checking and alignment procedure. This work is carried out in circumstances which are far from ideal.

In the later stages all auxiliary machinery pipe systems, electrical apparatus, etc., are subjected to rigorous tests to prove their suitability prior to dock trials. The dock trials are full-dress rehearsals of the ultimate sea trials. It was found that running basin trials, at the light draft necessitated by dock conditions, presented many unexpected vibration problems.

The sea trials of the first tanker proved highly successful, a speed of 16.75 knots being attained at full power with the vessel ballasted down to the load water line, the designed efficiency of the entire plant being met and in some cases even surpassed. The successful operation of the "Andros Venture" over six months is looked upon with great pride by the builders. It is felt that the prestige of shipbuilding in Canada has been boosted in the eyes of all maritime nations by this achievement. √

## MANUFACTURING PROCESSES FOR A NEW CEMENT PLANT

(*Continued from page 687*)

Each new plant may present an excellent opportunity for an engineer to do creative work. This creative work will be a product of his experience, his industry and his imagination. Every new plant brings problems and new solutions, and no one is the same as another. That is why the work of an engineer and his profession may be considered so fulfilling.

### Acknowledgments

The author desires to pay tribute to the efficiency and drive of all the contractors concerned for the difficult part they have played in keeping within an extremely tight construction schedule. √

# British Aviation Interests in Canada Expand

This information made available to *The Engineering Journal* by The Society of British Aircraft Construction

Recent months have seen a considerable expansion in the capacity of the Canadian aircraft industry and in particular of those companies which are associated with the British industry.

Two new factories have recently been formally opened (Bristol and Dowty), work is well ahead in two more (Rolls-Royce and Lucas-Rotax) and a third, Avro Canada, has invested 17½ million dollars in acquiring an existing factory from the Canadian Government. A big extension to another factory (Faireys) is nearly complete, and a further expansion is planned. De Havillands of Canada are also expanding.

Altogether there are about 40 companies closely associated with parent companies in Great Britain. Five of the Canadian companies are Members of the Society of British Aircraft Constructors, which has eleven Commonwealth Members altogether.

The expansion of these aviation companies in Canada goes hand in hand with Canada's policy of procuring strategic defence material from her own continent—as well as the ordinary day-to-day after sales service given to all aircraft overseas by British manufacturers.

### Aircraft Companies Expand

In detail, the expansion of these various companies is as follows:—

The de Havilland Aircraft Company of Canada, long-established as aircraft designers and producers, will be moving soon from their old Downsview plant to a new 600,000 sq. ft. factory nearby.

The Fairey Aviation Company of Canada, a comparative newcomer, are building an extension to their factory near Halifax, Nova Scotia, of some 208,000 sq. ft. and a further possible 160,000 sq. ft. is also planned.

Avro Canada, now in full production with the *CF 100* all-weather fighter and the *Orenda* jet engine, have bought up the Government factory near Toronto, plus tools and equipment, where the *Orenda* is produced.

### New Engine Factories

Rolls-Royce is the latest British company to expand its Canadian interests—with a new large factory near Montreal for the servicing and, eventually, the production of jet engines. The first stage in this program will be the servicing of *Nene* jet engines built in Britain for a Canadair-built trainer, next the assembly of components and testing in Canada, and the final stage the complete manufacture of engines on the spot, using local materials and sub-contractors throughout.

A large new factory for the overhaul and repair of engines has also been built by Bristol Aeroplane Engines to supplement their existing factory at Vancouver. The new factory of 85,000 sq. ft. near Montreal handles about 75 engines a month, giving the Bristol organization in Canada a total capacity of some 130-140 engines a month.

### Equipment Makers Expand Too

Dowty Equipment of Canada recently formally opened a 60,000 sq. ft. factory at Ajax, Ontario, 20 miles east of Toronto, and another important new accessory factory is also in action at Scarborough, near Toronto—the Lucas-Rotax plant. This has a floor space of some 120,000 sq. ft. and is to employ

# FROM MONTH TO MONTH

**Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers**

## Confederation

Herewith is the report of the special committee appointed by Council to study the proposals for cooperation between the provincial professional bodies and the Institute. The report is a comment on the proposals, a recommendation as to the personnel of a national committee of the Institute to carry out further studies, and terms of reference for the committee.

This report was presented by J. B. Stirling at the meeting of Council held in Kingston on April 30, and was approved unanimously. It has been discussed further at the annual meeting by the branch officers, at the business meeting and by Council. As well the members of the committee and certain alternates who were at the annual meeting in Quebec, were called to the first meeting of the committee by R. E. Heartz, the chairman, on Friday, May 14.

In addition to those named in the report, the following have been added by the committee in order to widen the representation—Eric Hinton, Newfoundland, and Ronald B. Smith, Prince Edward Island. A representative is to be appointed in Trail, British Columbia.

Copies of the report have been mailed to all members of the committee, to branch secretaries and to councillors. With its appearance in the *Journal* it will now be in the hands of every member.

Correspondence on the report may be mailed to R. E. Heartz, 2050 Mansfield Street, Montreal.

### The Engineering Institute of Canada

#### Co-operation Within the Profession

***Report from the Nominating Committee***

The proposal of J. Herbert Smith to study the relationship between The Engineering Institute of Cannada and the provincial professional organizations, and their functions, with the idea of developing a better set-up for the profession, must be accepted as a challenge and an opportunity. The development of complete co-operation and the elimination of overlapping and duplication is an objective that should be approved universally throughout the profession.

It must be recognized that some engineers will not approve (at least in the beginning) any fundamental change in the existing organizations. They may be prompted by loyalty to one organization or by a prejudice against another. They must be convinced eventually that proposals for co-operation deserve their support. Above all they must not be aggravated into active opposition against the proposals.

Profiting by the mistakes of the past, we must handle this opportunity with every consideration. Care must be taken to think out a practical and sensible set-up. Each step must be made firm before the next one is attempted, so that when we come to the end of our deliberations we will be on undeniably solid ground.

It is important to bring about improved conditions as soon as possible, but the passing of time is of less importance than ultimate success. Let us not waste time, but let us weigh well every consideration.

Before negotiating with other bodies, the Institute should have a clear understanding of all the circumstances, which should lead to definite proposals as to how this much desired co-operation can best be brought to pass. Progress will be more rapid if all the problems are considered and their solutions determined, before joint negotiations are started. This same procedure would appear to be best for other organizations as well.

In examining the proposal there appear to be a few clearly defined angles from which it must be regarded. First consideration should be to determine how it would affect the public interest. What are the advantages and the disadvantages?

The next consideration should be the interests of the members of the Institute. What are the advantages

## Cover Picture

The cover picture shows Imperial Oil's Ioco refinery, opened on September 16, 1953 after an 18-month reconstruction program, which raised the plant's capacity to 22,500 barrels a day. New installations included atmospheric and vacuum distillation units and the first fluid catalytic cracking unit in British Columbia.

and disadvantages from their point of view?

When all these aspects have been studied and the results put together in a report, they should be submitted to Council for approval. At that point Council should arrange to discuss the whole matter with the provincial professional associations.

### *Terms of Reference*

In studying procedures to bring about the desired co-operation or unity of effort, there are certain questions which must be answered. The answers should be the basis of the report to Council—the terms of reference.

The list of questions is as follows:

1. (a) Should the federation be integral (corporate unity) or (b) joint. (Each organization a separate entity but operating together under a joint undertaking), or (c) combination of both?
2. Should the Council of the Institute be controlled (a) solely through the association or (b) by a council composed of appointed representatives of each association and a corresponding number elected at large or (c) as at present?
3. *Membership*—Should the Institute receive members (a) by direct application or (b) exclusively through the associations or (c) a combination of both? What will happen to Honorary Members, Life Members, paid up Members, Affiliates and Students?
4. Should there be any compulsion, i.e., should all members of associations be required to belong to the Institute, and vice versa, or should these second memberships be optional?
5. *Branches*—Will they be (a) branches of the associations or (b) branches of the Institute?
6. *Financing*—Should the Institute receive a fee (a) direct from each member or (b) indirectly through the associations?
7. *Money, funds and reserves*—It seems logical if not essential, that all provincial associations retain their own funds as at present, but what will happen to ownership and control of Institute assets such as Headquarters premises, education fund, prize funds, reserves and cash balances?
8. *Publications*—Should the Institute (a) control the *Journal* and retain the revenue from it? or (b) should it be directed by the associations and the profit dispensed by the associations perhaps to reduce the joint fee?
9. *Headquarters Services—Employment*—Will this continue to be operated (a) through H.Q. or (b) through the associations or (c) both?

   (b) *Library*—Presumably this will operate as before, but the point should be covered in the report.

   (c) *Accounting*—This will be answered when the previous questions are answered.

   (d) *Records*—Will the Institute (a) maintain its own membership records and stencils or (b) will mailing be done through associations?

The committee recommend that a national committee be established and propose the following persons for it:

Nova Scotia: J. R. Kaye, Halifax.

New Brunswick: E. O. Turner, Fredericton.

Quebec: Hector Cimon, Quebec; I. R. Tait, Montreal; R. E. Heartz, Montreal; L. J. Hammerschmidt, Montreal; H. Gaudefroy, Montreal; R. L. Dunsmore, Montreal; G. M. Dick, Sherbrooke.

Ontario: D. Ross-Ross, Cornwall; T. Foulkes, Ottawa; J. J. Green, Ottawa; H. R. Sills, Peterborough; S. Sillitoe, Belleville; R. Harvey Self, Toronto; E. R. Graydon, Toronto; J. F. MacLaren, Toronto; C. D. Carruthers, Toronto; J. G. Hall, Toronto; W. S. Wilson, Toronto; W. E. Brown, Hamilton; J. S. Ellis, Niagara Falls; J. A. Vance, Woodstock; B. B. Hillary, Sarnia.

Manitoba: C. L. Fisher, Winnipeg.

Saskatchewan: Allan Tubby, Saskatoon.

Alberta: T. D. Stanley, Calgary.

British Columbia: H. T. Libby, Vancouver; M. L. Wade, Kamloops.

**Executive**

Quebec: R. E. Heartz—Chairman, Montreal; I. R. Tait, Montreal; R. L. Dunsmore, Montreal; Hector Cimon, Quebec; G. M. Dick, Sherbrooke.

Ontario: W. S. Wilson, Vice-Chairman, Toronto; D. Ross-Ross, Cornwall; S. Sillitoe, Belleville; J. J. Green, Ottawa; E. R. Graydon, Toronto; J. F. MacLaren, Toronto; C. D. Carruthers, Toronto; W. E. Brown, Hamilton.

The foregoing does not preclude consideration of any other relevant matters, or other members being added to the committee.

Respectfully submitted,

R. L. Dobbin,
I. R. Tait,
J. B. Stirling.

Note: (a) This report was approved and accepted by the Council of the Institute at Kingston, on April 30th, 1954.

(b) The committee will be known as The National Committee on Confederation of the Profession of Engineering in Canada (Short title "Committee on Confederation").

Montreal, May 4th, 1954.

# The Senior of All Engineering Institutions Loses Its Secretary

Members of the Institution of Civil Engineers in Canada and many members of the Engineering Institute as well will be shocked to hear of the sudden death of E. Graham Clark who for the last seventeen years has been secretary of that great Institution.

Mr. Clark has been in the service of the Institution for forty years, and in that period has done a tremendous work for the Institution and for the profession. His services and his pleasant disposition have won for him the warm esteem of all with whom he came into contact in the course of his work.

Many Canadians will recall having met Mr. Clark in the fall of 1952 when he along with the president of his society and the presidents and the secretaries of the other great British Institutions, were guests of the Engineering Institute of Canada for a short tour in this country.

Mr. Clark was a great friend to the Engineering Institute. His knowledge of conditions in Great Britain and in other parts of the world as well, was of great assistance to the Institute through the secretariat and through certain committees as well.

Mr. Clark was due to retire from his post on May the first, but he had been asked to remain a few months longer until his successor would be able to take over the full burden. As well Mr. Clark was an important part of the organization of the Conference of Commonwealth Engineering Institutions which is to meet in London, England, on May 24th of this year. He will be sadly missed around the conference table.

The Council of the Institute has sent to the president of the Institution their deepest sympathy and it is certain that the members of the Institute who have had the opportunity of knowing this great man will join with the Council not only in expressing their sympathy to the Institution itself but also to Mr. Clark's family.

## How Foolish Can We Be?

In today's world where everyone is overburdened with controls, regulations and legislation, there are a lot of iniquities brought about by attempts to set up regulations that cover every (well almost every) possible condition or combination of events. Over the years legislation is cut, patched, stretched and shrunk, until finally one end of a sentence may well contradict the other end.

Recently a member of the Institute has called the attention of Headquarters to the working of a tariff regulation which comes into that category. The situation is this. This student went to the United States to get a Ph.D. degree in electrical engineering. It was his intention to return to Canada to teach. As the end of the two years study approached he made inquiries at Ottawa as to the conditions which would apply to his return.

He was stunned to be told that he would be allowed a customs exemption of only $100 per adult person—the same as is allowed any Canadian who has been in the United States forty-eight hours. Now the serious part of all this is that the student is married and has a child. Naturally he had to set up house while he was there and acquire all the gear that goes with such a project. And now he has to pay full customs duty on every single thing he owns (except for the two allowances of $100 each).

When he reported this situation to the Institute it seemed so fantastic that the general secretary was certain there had been a mistake. However an exchange of letters with various officers in the Department of National Revenue—including the minister himself—brought out all too clearly the fact that that was the law and no one was prepared to do anything about it.

Now here is a pretty situation. We have a brilliant young Canadian who has spent two precious years of his life (and a lot of money) preparing himself for high level service in Canada. He has had tempting offers to stay in the United States but he wants to spend his life in Canada. The customs regulations require him to pay at one time as customs duties so much money, that it is likely he cannot finance it. Not many students have cash on hand for such purposes.

Now what is likely to happen? Canada will lose this man who would be worth almost his weight in gold, to Canada. The government regulations will force him to become a foreigner—will deny him the right to live and practice his profession in Canada. The need for such men here is one of the most urgent that Canada has ever known.

The irony of it is that if he were a foreigner, coming here for the first time, even without his valuable education, he would be allowed to bring in all his belongings free, as settlers' effects or as a landed immigrant.

Surely some place along the line, someone can do something to prevent this completely silly thing from happening, but who he is or where he is the Institute does not know. It is evident that this piece of legislation is completely wrong for a case like this. Surely in the beginning no one even intended it to work such a hardship on anyone, and without any sign of compensating values for anyone elsewhere.

How foolish can we be!

## Dominion Council Elects President

Professor William Lister Sagar, M.E.I.C., was elected president of the Dominion Council of Professional Engineers, at the 17th annual meeting of the Council, held in Toronto, May 26-28, 1954.

William L. Sagar, M.E.I.C.

The president of the Association of Professional Engineers of Ontario, and professor of civil engineering at the University of Toronto, Professor Sagar succeeds, as president of the Council, another well-known engineer and educator, Dean R. M. Hardy, of the University of Alberta.

Executive officers of the nine provincial associations of professional engineers attended the meeting, which dealt with a wide diversity of legislative topics, primarily designed to establish uniformity of registration and legislation for professional engineers across Canada. Representatives of various professional organizations attended, also, with I. R. Tait, M.E.I.C., Montreal, and B. G. Ballard, M.E.I.C., Ottawa, representing the Engineering Institute of Canada.

The Dominion Council concluded its 3-day meeting by "strongly opposing any trend towards unionization of engineers in both Canada and the United States". The opinion was voiced that professional bodies should be able to effectively represent their members.

The council was advised that a uniform syllabus of examinations for the registering of professional engineers now was in force across Canada, and that a free movement of engineers across the country was possible in most cases, without the payment of additional provincial fees in order to practice.

With a view to bringing about unity within the engineering profession in Canada, the council appointed a special committee to discuss a plan for confederation with the Chemical Institute of Canada, the Engineering Institute of Canada and the Canadian Institute of Mining and Metallurgy.

The incoming president of the Dominion Council also expressed his confidence in the value of a liaison program, recommended by T. Carr Forrest, whereby information would be exchanged by United States and Canadian engineering bodies. Mr. Forrest is president of the U.S. National Society of Professional Engineers.

It was announced that the next annual meeting of the Dominion Council will be held in St. John's, Newfoundland, in May, 1955.

## A New Wrapper

Starting with the June issue members may have noticed that the appearance of the envelope which each month brings *The Engineering Journal* to them has been changed considerably. The staff of the

*Journal* hope that it finds favour with all members.

The change was made for two reasons—the first and perhaps the more important being that the former envelope had turned out to be too light for the work it had to do. It is not considered good business to spend a lot of money and take a lot of time preparing a well-printed and well-turned out publication only to have it delivered in a tattered and shabby envelope.

While the weight of the paper was being changed it was decided to change the colour also. Judging from the samples the new envelope should be a great improvement on the old one.

Incidentally, certain changes in the *Journal* itself are planned in the near future. Some new departments will be added, and there will be changes in the typography. However, none of these proposals has gone far enough yet to give the membership details. But the story will be written in these columns in the not too distant future.

# Correspondence

### So You Would Like to Be an M.P.?

This correspondent asks for anonymity behind some initials. This is granted, but it is believed many members will not agree with this sentiment. The ***Journal*** will be glad to print comments, either for or against.—Ed.

The Editor:

Every now and then somebody arises to blast engineers for their lack of interest in public affairs, specifically for their reluctance to run for elective office. I do not believe that engineers deserve this criticism any more than a good many other citizens, as I shall try to show. It is only because our critics are generally engineers themselves that we hear so much from them. Perhaps plumbers and plasterers, bakers and bus drivers are just as much taken to task, but few of us are in touch with such people and so we are ignorant of what is going on in their collective minds.

The biggest stumbling block to one with an impulse to enter politics is economic. Look at the make up of the House of Commons and what do you find? Most of its members are self-employed — lawyers, doctors, owners of businesses and the like. Some of them may have to accept a cut in their ordinary incomes when they enter the House, but they are assured of an occupation to which to return when they retire from political life or when their constituents decide to replace them with others of more appealing political philosophies.

The plight of the salaried man is quite different. A candidate for major political office is — perhaps I should say "ought to be" — drawn from the highest bracket of character, education and good sense which the population affords. Any such person is bound to be an important cog in his organization and no employer is going complacently to let him drop out or partly drop out of his place for an indefinite period. The recent increase in parliamentary stipends may stimulate some of the younger and more adventurous to exchange their business positions for those of elected office, in the hope they will last long enough in the political arena to qualify for parliamentary pensions, but it is not likely to change the outlook of older men. Security has become too much of a fetish to be lightly forsaken and political life in a democracy such as ours is notoriously insecure.

This economic condition is not peculiar to engineers. It affects every salaried man in the same way and there is no prospect that it is going to change. So long as it continues, there will be no great rush to public life, of the people affected by it.

It has been said many times that the qualities instilled into one by engineering training and experience are those that are needed badly by our legislators. No doubt the engineer's habit of thought could well be more freely applied to public questions to advantage, but it must also be recognized that some of these selfsame habits are handicaps in government as we know it.

For example, engineers are impatient with delay; they want to get on with the job. They marshal the facts, study them, arrive at a decision and then act at once. The whole process, though it may involve commitments of millions of dollars, takes a relatively short time as compared to the long drawn out palaver which precedes so much political action. The engineer is vocal enough when he has something worth saying, but he has scant patience with talk for its own sake and a good deal of political oratory seems to be of this sort.

He is still less patient with cranks. He cannot bring himself willingly to listen to those who expound lunatic theories, whatever they may be. He will listen respectfully enough until he is convinced of the absurdity of the theory advanced, after that he wants none of it. But in politics he will have to listen to a good deal of such talk, ranging from the promotion of schemes that are completely impossible to those which are merely impracticable, perhaps because they cannot be put into effect in a democracy, perhaps because they are quite beyond the country's means.

Of necessity more and more engineers are becoming interested in people as well as in things, but still their interest is generally limited to certain classes of people — their co-workers of all grades, their clients, those from whom they buy — in short, to those with whom they come into close and regular contact. Not many have any great interest in the fisherman and the farmer at one end of the scale and of the princes of the church, let us say, at the other. But the interest of the occupant of a political niche must be all embracing; it must be a lively and personal interest in each of his constituents, and also *ought* to cover the country.

No engineer worthy of the title believes in reaching major political ends by the distribution of patronage. Thanks to an excellent and well administered civil service system, petty patronage has been pretty well done away with in Canada, but there seems little doubt that governments at every level, no matter what their political stripe, still placate their followers by the judicious use of patronage, whether it be by the construction of public works, some of it unneeded, or by the appointment to public office sometimes of other than the best qualified candidates. This may be and perhaps is one of the prices we have to pay for the privilege of living under conditions that suit us best, but such things irk the engineer. He objects to it not only on moral grounds but because it is generally inefficient and he hates inefficiency.

In spite of valiant attempts on the part of the universities and on his own, to overcome the handicap, the engineer is still a rather dumb individual. He will talk to another engineer freely enough, or perhaps turn out a top-hole report for his boss or his client, but he is quite unenthusiastic about addressing an ordinary audience on an ordinary topic. He seldom feels strongly enough on any non-technical matter to produce an article about it worth reading. Yet, if he gets into political life, he will find that most of the questions he will have to consider are outside his usual sphere, and that he must have convictions about them and express those convictions.

And a good many years of observation have convinced me — it may be heresy — that engineers are not familiar enough with what, for lack of a better term, are often called "cultural subjects". How many, without necessarily being themselves musicians, know anything about music ? How many have any coherent idea of world history ? For that matter, how many here have a really good knowledge of Canadian history ? How many have ever learned a foreign language just for the pleasure of reading its literature ? In the bilingual province of Quebec, how many English-speaking engineers have even a passable knowledge of French ? I could fill a page with questions like these. I am afraid that we must own up that we do not have the backgrounds we should have for public life.

Of course, there are exceptions. Some engineers have shed lustre on the profession in the political field. Names that will occur to us at once are those of the Hon. C. D. Howe and the Hon. Robert H. Winters. Notwithstanding their conspicuous successes, I am forced to conclude that the chances of engineers making any great reputations for themselves in the political field are slim, so long as economic conditions are as they are and so long as they themselves remain without substantial changes in temperament and training. Sorry!

FDR

**Ottawa Branch Expresses Gratitude**

February 18, 1954.

Mr. W. K. Brasher, C.B.E.,
Secretary,
Institution of Electrical Engineers,
London, England.

At the annual meeting of the Ottawa Branch of the Engineering Institute of Canada held on January 21, 1954, the members of the Branch were informed of the action being taken by the three British Institutions to maintain Colonel By's grave in good condition and appropriate to its surroundings in the churchyard at Frant. The members were most touched by this generous undertaking and a motion was passed that, as the retiring chairman of the Branch, I should write formally to the three Institutions to thank them on behalf of the membership of the Branch for the action they are taking in this matter.

I know from Dr. Austin Wright that we are particularly indebted to you personally because you made all the detailed arrangements, including transportation, for Mayor Whitton and Mr. Dobbin to visit Colonel By's last resting place. I know, too, that this involved a preliminary trip on your part in order to interview the vicar and make sure that everything went well.

You may know that the Ottawa Branch is anxious to see some permanent memorial to Colonel By in the City of Ottawa. We have a subcommittee, of which I am the chairman, that is presently looking into ways and means of honouring Colonel By's memory. At the same time we have taken an interest in the possibility of raising funds in Ottawa to help the restoration work which is urgently required in the old church at Frant. The question has been referred to the Colonel By Chapter of the Imperial Order Daughters of the Empire and to Bishop Jefferson of the Ottawa Diocese.

J. J. Green, M.E.I.C.
Ottawa, Ont.

# H.E.P.C. and Concrete Reseach

One can hardly pick up a newspaper today without finding in it something about research, usually medical, and sometimes highly embellished or inaccurate. It is natural that medical research should attract the public eye, but there is much other research of importance going on that does not find its way into the press; often it is little known except by workers in the field that it covers. Nevertheless, it is calculated to give the citizen more for his money, either in improvements in existing materials and procedures, or by substituting better ones for them.

The researches in concrete which were started many years ago by the Hydro-Electric Power Commission of Ontario are designed to save Ontario people money by enabling the Commission to give them better, more dependable and cheaper service. The Commission's program along these lines was well described in a recent address of Dr. W. P. Dobson, M.E.I.C., to the National Concrete Products Association; Dr. Dobson is research consultant to the Commission.

Perhaps his address can best be summarized by devoting a paragraph or two to each of the principal topics he discussed:

1. An electronic device, the "Sonoscope", developed by the Commission's technicians, detects minute cracks in concrete and is of great value in studying the deterioration of concrete structures.

2. Tests of aggregates for chemical reactivity are regularly made; so far not even a moderately reactive material has been found.

3. Freezing and thawing tests are carried out with completely automatic equipment.

4. Wetting and drying effects and the effect of sulphate ground water are being studied.

5. Fly ash as a partial replacement for cement in mass concrete has been studied with successful results, largely because it may result in the saving of money and because the Commission will have a large supply of it from its steam stations in Toronto and Windsor.

6. Tests of cements from Canadian mills are made at regular intervals to check their quality; there are differences in the cements at early ages, but after six months there is little to choose among them.

7. Test methods are being improved; a better sulphur capping material for concrete compressive specimens has been developed.

8. The newer types of deformed steel reinforcing bars have been tested. Other studies seem to show that much of the reinforcing in certain areas in gravity dams may safely be omitted.

9. Much work has been done on precast concrete; precast wall panels have been used to some extent and an investigation of precast poles is under way.

10. Prestressed concrete is coming in for much attention. Precast, prestressed concrete floor slabs have been used with good results and beams made of an assembly of concrete blocks mortared together and prestressed by cables lying in grooves in the blocks have been used for 17-foot roof beams. Many questions have had to be answered — the effect of cable lay on bond, the kind of mortar

to be used between the blocks and around the cables, etc.

11. The thermal and elastic behaviour of concrete is under study.

12. Ice pressures are being investigated; the maximum observed to date is about 7,000 lb. per lin. ft.

13. Pressures on concrete forms have received attention, as influenced by rate of filling, slump, temperature and character of mix.

We understand that the results of some of the completed projects may be obtained by applying to the Commission.

# C.C.A. Tells Government

One of the virtues of our democratic form of government is that any organization may present its views to Parliament and to the Cabinet with assurance that at least it will receive a courteous hearing, but, of course, no guarantee of action. Ministers and Members must have to listen to so many crackpot suggestions that it should be something of a pleasure for them to receive a brief such as the one presented on February 22, 1954, by the Canadian Construction Association, representing a thousand firms and thirty affiliated organizations right across the country.

We have never made a count of our members who are connected, directly or indirectly, with the construction industry, but we are sure that it is large enough to warrant our publishing a fairly extensive abstract of the C.C.A. brief.

### Construction is Big Business

Last year it is estimated that the value of construction in Canada exceeded $4½ billions and that it gave direct employment on the average to some 468,000 and indirectly to an even larger number employed in manufacturing, selling and transporting an extremely wide variety of construction materials and other items used on the job-sites. In terms of money, the operations of the Federal Government and of the construction industry are on about the same level.

Much of today's construction program consists of large projects connected with our transportation, steel, aluminum, hydro-electric power, oil, gas, chemical and other basic industries. With the supply situation now in balance, with construction costs relatively stable and with competition keen throughout the industry, conditions are distinctly in the owners' favour.

### Housing

The brief made reference to the fact that the Association had been invited to testify before the Banking and Commerce Committee of the House of Commons concerning the proposed amendments to the National Housing Act. Advantage was taken of this invitation and a brief was presented on February 25.

This dealt with a number of matters, mainly of a non-engineering nature, which for this reason will not be discussed in detail in this report.

### Highways

The subject of Canada's road system received a good deal of attention at the C.C.A.'s recent 36th annual meeting and the statement adopted at its 1953 convention was re-endorsed. While the roads programs undertaken by provincial governments in recent years have reached record proportions, the backlog of road requirements both present and potential is steadily increasing. Experience with the Trans-Canada Highway has proved conclusively that Federal-Provincial joint action in the execution of highway projects may take place in cooperative fashion and still maintain provincial rights.

The Trans-Canada Highway Act provides for the availability of federal funds until 1956; as yet there has been no commitment on the part of the Federal Government either to the extension of existing agreements or to federal investment in other roads of national importance.

The vital importance of interprovincial and international highways and of roads designed to develop our natural resources, especially in the north, to enlarge our tourist trade and to meet strategic requirements is apparent. Failure to meet needs for road facilities will seriously restrict the scope of our national development. It is therefore recommended that:

1. Federal appropriations be made available to the provinces for use in the improvement of Canada's main highway network, following a procedure similar to the Trans-Canada Highway dollar-for-dollar arrangement.
2. A joint program be carried out with respect to international connections, access roads to undeveloped areas, approaches to national parks, railway-highway grade separations, etc., in accordance with regional needs.
3. All provinces receiving federal aid conform to minimum standards, in keeping with traffic volumes and geographic needs.
4. The use of federal aid continue to be optional to the provinces and that authority over the administration of road projects remain under provincial highway departments.

It is also recommended that a National Highways Commission be established to coordinate the planning, financing and construction of roads of national importance, to administer federal funds aiding such projects, to facilitate the exchange of roadbuilding and traffic control knowledge and to promote highway safety activities.

### Tendering Practices

The Association once again endorses a policy of coordination and centralization of responsibility and control of construction projects under a general contractor to eliminate delays caused by divided responsiblity and to save time and money. The General Contractors' Section and the Trade Contractors' Section of the C.C.A. have established a joint committee to discuss relationships between the two groups. This joint committee expects to produce a *Guide To Better Bidding Practices*, which it is hoped, will be endorsed by the Royal Architectural Institute of Canada and by the Engineering Institute.

Endorsation was also given to the policy of calling for competitive tenders on all construction work involving public funds and of the public opening of these tenders, except when work falls in the secret or emergency categories. The privilege of attending such tender openings is much appreciated by contractors, as there bidders are quickly advised as to their standing. This is most helpful, for it enables decisions to be made without delay concerning equipment movements and whether to tender on other projects. It also is an indication to future bidders that their tenders will be fairly considered. From the owner's standpoint, public tender openings constitute , good public relations and tend to encourage greater competition and better prices.

A problem that was the subject of

a special resolution adopted at the 36th convention is one of long standing. While it is the practice of federal agencies, when calling for tenders on construction projects, to furnish certain information concerning subsoil conditions, there is always a clause in the specifications stating that none of this information is guaranteed. Getting accurate subsoil information by each tenderer is impracticable, because this would cause unnecessary expense and because it is usually impossible to make the necessary tests and borings in the time allowed for the preparation of tenders. It is urged that an amendment be made to Federal Government specifications and contracts to provide that the necessary subsoil information shall be furnished and that, in the event that the actual conditions vary from the conditions described in the specifications, an equitable adjustment with the contractor will be made.

### Public Works Program

Labour organizations and others participating in recent discussions on unemployment have advocated that the Federal Government inaugurate an increased public works program as an emergency measure. While the fact that there were twenty tenders submitted recently for a $1.2 million project testifies to the degree of competition existing in the construction industry and to the eagerness of contractors to bid, it is not felt that a large-scale program over and above that contemplated in the present estimates should be undertaken for the prime purpose of solving the present unemployment problem.

Construction activity brings about even more off-site employment in a wide range of supporting industries than on-site employment in actual construction operations. This fact makes investment in construction desirable in times of a general decline in business activity. With a high volume of construction anticipated this year, it is doubtful that a substantial increase in the public works program would affect the present seasonal unemployment factor or help the textile, marine, agricultural equipment and other industries currently beset with unemployment problems.

### Labour Relations

The Association has for a number of years advocated that the Federal Government amend its labour relations legislation to require the use of secret ballots, under the supervision of electoral officers or other public officials of a similar status, when trade unions vote on strike action. Work stoppages may affect the wellbeing of large sections of our population, so it is important that votes concerning strike action do, in fact, represent the voters' personal feelings and considered thinking. The protection afforded to voters by secret ballot on important issues is, of course, fundamental to democratic principles and is also contained in the labour relations legislation of the Federal Government and of all provincial governments dealing with the certification of trade unions as collective bargaining agents, the acceptance of arbitration awards or the authorization of payroll deductions. In addition, four provinces have legislation providing for the use of the secret ballot when trade unions vote on strike action. It is strongly urged that similar action be taken by the Federal Government. It might be added that, while lockouts are relatively uncommon, employers are more than willing to follow secret ballotting practices in cases where group agreements exist with trade unions. Indeed, contractors requested this procedure in connection with a lockout on the West Coast in 1952.

The Association takes this opportunity of reiterating its stand opposing any amendments to the Industrial Relations and Disputes Investigation Act which would provide for the voluntary revocable check-off of union dues as a legal right. The Association is also strongly of the opinion that the Unemployment Insurance Fund should not be used for the payment of benefits to those unemployed due to illness or injury, as this would constitute a health insurance scheme quite foreign to the purpose of unemployment insurance legislation.

### St. Lawrence Seaway

The leadership displayed by the Federal Government with regard to the St. Lawrence Seaway is to be highly commended and it is to be hoped that the prospect of a start on the Seaway this year will be realized. In view of the many delays that have been encountered because of the hesitancy of the United States to participate in a joint project, and because of the contribution that the project will make in the development of Canada, this project is especially Canadian in nature. It is strongly urged that the resources of the Canadian construction industry, including engineering, manpower, materials and contracting facilities, shall be used to the full in its execution.

### Special Tariff Arrangements Concerning Construction Equipment

The Department of National Revenue permits the importation of construction equipment on a temporary basis, when suitable equipment is not available in this country, upon payment of 1/60th of the normal tariff and sales tax for each month that the equipment is in Canada. Similarly, permission may be given to import used vehicles in cases where it is claimed that suitable units are not available in Canada, notwithstanding Tariff Item 1215. These concessions are available to both Canadian and foreign construction companies, but because the latter may obtain and dispose of specialized equipment more readily and because they may purchase equipment and borrow money more cheaply, the tariff concessions are, on balance, detrimental to Canadian contractors and to manufacturers and distributors of construction equipment. The practice of the Department of National Revenue in referring applications for tariff concessions of this nature to the C.C.A. office to check on the availability of the equipment in question is appreciated; the number of applications has decreased considerably recently, as the supply of construction equipment in Canada has increased substantially. A resolution adopted by the Association at its 36th convention urges the Federal Government to refrain from granting tariff concessions of this nature, unless required as war or emergency measures.

## BRITISH AVIATION INTERESTS IN CANADA EXPAND

*(Continued from page 702)*

about 1,500 people in the production of items such as turbo-starters, electric starters, magneto parts, etc.

There is also the small but well-equipped factory of Godfrey Engineering Company Limited in Quebec, producing pressurization equipment for the latest Canadian-built aircraft.

Finally, there is Field Aviation at Oshawa, Ontario, an associate of the Hunting Group of Companies. This organization is responsible for extensive servicing work on RCAF aircraft, and also for sheet-metal and other sub-contracted detail work. √

# *Thirty-five Years Ago*

## Comment on the *JOURNAL* of June 1919

It is not possible to introduce much variety into these excursions into the past of the *Journal*; the contents of the old issues simply do not provide any material for it. Month after month the central topics are the licensing of engineers and their salaries, and the *Journal* for June, 1919, is no exception. True, there are papers of varying degrees of excellence, but it is quite obvious that the thoughts of the members of the Institute were then concentrated on matters other than technical.

It is hard for today's readers, most of them of a younger generation, to realize how important some control of the engineering profession and better salaries seemed to members of that period. Now that nine out of the ten provinces have regulated the practice of engineering for so long that it might well be from the beginning of time, and also now that, if not so high as some think they should be, the incomes of engineers have increased to figures astronomical by 1919 standards, we are prone to forget that this condition of things was not brought about without much hard work in which the Institute was the leader.

Reactions to the publication in May, 1919, of the model act began to appear in this *Journal*. The personal opinions of some of the prominent members of the day—R. W. Leonard (president), H. E. T. Haultain (vice-president), William Pearce, G. H. Duggan, F. H. Peters, H. H. Vaughan, L. B. Elliott, A. Gray, James H. Kennedy, J. G. Sullivan and L. A. Thornton—ranged from enthusiastic to somewhat qualified approval of the model act.

Only two of the branches had got around to reporting their attitudes on the matter. The Toronto Branch "heartily approved of the proposed act." The Montreal Branch reported the results of a questionnaire which it had sent to its members. The replies to some of its questions are interesting enough to warrant giving them here. (See table on this page.)

Present regulations of the provincial associations conform pretty closely to the opinions expressed in this questionnaire.

Some 70 M.P.'s were reported as willing to support any movement for better salaries in the Civil Service. The Civil Service Commission, hitherto regarded as the stumbling block in the campaign, was now said to be guiltless of any wish to keep salaries down, as it had to accept the recommendations of department heads in such matters. Several branches reported committees at work on fair salary schedules. A "Superintendent of a Government Department" wrote in to add his to the complaint of low Civil Service salaries, but thought it would be a long and tough job to get them improved.

Council finally decided that it would not send out individual "letters of advice" with the letter ballot on the model act, but that the letter of transmittal from the model act committee should be published in the *Journal* and that a pro-and-con circular should be sent to all members with the ballot. For this purpose, it appointed a committee consisting of Walter J. Francis, Arthur Surveyer, H. H. Vaughan, G. H. Duggan and R. A. Ross.

This letter of transmittal is almost as important as the draft of the act itself. It said, "It may be assumed that there is no opposition . . . on the part of any engineer in Canada to the basic principle . . . Every branch has expressed itself . . . as . . . desirous of obtaining legislation . . . The engineer has as good . . . a claim to recognized status . . . as the doctor (or) lawyer . . . it must be made apparent . . . to the public that the (act) . . . would redound . . . to the benefit of the community at large . . . (It should) be uniform for all provinces, so far as reasonably possible; . . . it should be acceptable to every individual engineer and to every engineering and technical organization . . . The outstanding feature of the draft is . . . the incorporation in each province of an entirely new body to be called "The Association of Professional Engineers of . . ." (This) offers the only . . . solution of the problem . . . Its object is to forestall adverse criticism and . . . to eliminate jealousy and opposition that might reasonably exist by the apparent . . . assumption . . . of control of the machinery . . . on the part of the . . . Institute . . . or by any other . . . organization."

For the first time the issue of unionization appears. A copy of a circular letter advocating the formation of a draftsmen's union was presented to Council and information of a similar notice was received from a Toronto member. Council "received" these; perhaps later we shall find that it took some action.

The Institute's relations with the Canadian Engineering Standards Association were made still closer by the acceptance by the latter of our two specifications for steel railways and highway bridges. The C.E.S.A. secretary at that time was R. J. Durley, later to become secretary of the Institute and to serve it faithfully for many years.

The *Journal* "fillers" ranged over a wide field as they do now. A translation from the *Electrotechnische Zeitschrift* predicted that the voltage of electrical transmission lines would not increase much beyond the then level of about 100,000 volts and says that 200,000 volts is the "further limit". It was sure that high-tension, direct-current transmission was just around the corner.

The *Journal's* masthead in 1919 carried the names of the Board of

Management—the president, the vice-president and five councillors—the editor (the secretary) and sixteen "associate editors".

As one result of the fuel shortages during the war, referred to in the May 1919 *Journal*, considerable interest had been aroused in the utilization of peat. As usual with any new development, this project had enthusiastic proponents, among whom was Ernest V. Moore. His paper in this *Journal*, "The Production of Peat Fuel", is a good summary of the situation in Canada in 1919. With over 37,000 square miles of peat bogs, many close to centres of population, it is no wonder that there was much interest in peat for the fuel purposes for which it was fitted—autumn and spring usage in furnaces, in cooking, in fire places and in some types of stoves, such as the Quebec heater.

According to Mr. Moore, it was hopeless to try to dry peat artificially or to squeeze the moisture out of it; air drying was the only economically possible method. The problem, then, boiled down to one of materials handling—excavation, spreading on the drying ground, recovery from this ground, storage and the loading of railway cars.

This paper was based largely on Mr. Moore's experiences with the peat plant at Alfred, Ont., Mechanically, this plant seems to have been successful; its troubles were mostly financial. However, it did produce a considerable tonnage of dry peat, which was sold in Ottawa and in Montreal and the quality was good. The writer burned some of it during the war years.

"Peat, Oil and Gas Fuel", by B. J. Forrest, also appeared in the June, 1919, *Journal*. This paper argued that the use of peat as a gas producer fuel or its processing by destructive distillation were promising. A ton of peat would yield 20,000 to 80,000 cubic feet of gas, according to the calorific power desired, and a long list of byproducts including coke, ammonium sulphate, tars and acids, useful as chemical bases. Most of Mr. Forrest's material was drawn from European sources and he quoted copiously from various reports and magazine articles. In short, his paper was a compilation, a type at which the *Journal* is today inclined to look askance.

Hanbury A. Budden in "Patents and Engineering" found a good deal to complain of: ". . . an Englishman cannot get a copy of a Canadian patent without sending to Canada, and even then only a typewritten one . . . In indices, the proof reading should be accurately done, but this is far from being the case . . . The revenue of the Canadian Patent Office . . . for . . . 1918 . . . (showed a credit) balance of $101,051.93 which was . . . merged in the Consolidated Fund . . . This brings me to another point . . . the injustice . . . of the present system, whereby the Patent Office makes a large annual profit out of the fees paid by inventors. It is merged in the ordinary returns of the country and (is) . . . a . . . tax on the cerebral activity of . . . men who are usually by no means overburdened by wealth . . . Reconstruction is now the important question and our patent system is one that calls for immediate action if we are to take our place among up-to-date nations."

The position of petroleum engineer, a graduate with three years' experience in the geology of Alberta and Saskatchewan, was advertised at $2,700 and the governors of the University of Manitoba were looking for a professor of civil engineering at $3,500. Somebody wanted an electrical engineer at "$3.00—$3,600"—quite a range!

---

# Canadian Engineers Unexcelled Anywhere In World

*Recently while visiting the Adam Beck Generating Station No. 2 at Niagara Falls with Dr. Sydney Smith president of the University of Toronto, the Ontario Hydro chairman made some remarks that will warm the cockles of the heart of all Canadian engineers. It is too bad these comments, coming as they do from a man who has every reason to know what he is talking about, cannot be brought to the attention of a lot of people in Canada who seem to believe that engineering services must be imported if they are to be good. The* Journal *has in mind specifically several individuals and organizations that might benefit materially by heeding to Mr. Saunders (Ed.)*

Canada's remarkable progress within recent years, and her present status as one of the world's greatest and most progressive nations, can be attributed in large measure to her highly developed engineering profession, Ontario Hydro Chairman Robert H. Saunders stated recently.

Paying wholehearted tribute to Canadian engineers, whom he described as "one of our most valuable and least publicized resources", Mr. Saunders referred to the phenomenal development of the country from coast to coast. The ambitious programs of new construction now being undertaken right across the country were referred to as dynamic examples of the skill and ingenuity of engineers, helping to build a still greater nation.

"Our Niagara project is prodigious in every sense of the word", the Chairman commented, "and it is being carried forward with such high efficiency that it should be a source of pride to all Canadians. It was planned, designed and undertaken by Canadian engineers, and it leaves no doubt of the standing they have attained in their field—second to none!" Mr. Saunders had warm praise for Hydro's technical staff, who have pioneered in the fields of engineering, construction and research. "We have approximately 900 professional engineers and assistants on our staff," the Chairman stated, "and all of them are making a vital contribution to our progress. I could refer specifically to many who are regarded as pre-eminent in their particular spheres and whose advice and guidance are sought by outside organizations. At this time, I would like to single out three University of Toronto alumni who are carrying a tremendous share of responsibility: Dr. Richard L. Hearn, our General Manager and Chief Engineer; Dr. Otto Holden, Assistant General Manager-Engineering; and Gordon Mitchell, Project Manager at Sir Adam Beck-Niagara No. 2. They are, in my opinion, making an outstanding contribution to the life and welfare of all those who live in this Province."

"We at Hydro are convinced that we could not have made such remarkable progress with our power development, frequency standardization and other major programs without the direction and advice of our own engineers," Mr. Saunders added. "We like to draw to the attention of our people the reputation and standing of Hydro engineers—men who are dedicating themselves to the service of a publicly-owned enterprise. We believe that they should be recognized and that is why we have established a policy of naming many of our great projects in their honour." The Chairman referred to large

Hydro installations which already bear the names of outstanding Canadian engineers and builders:

*Sir Adam Beck*-Niagara Generation Station No. 1 and No. 2. (Sir Adam was the first Chairman of Ontario Hydro, serving from 1906 to 1925).

*Detweiler* Transformer Station, near Kitchener. (Daniel N. Detweiler was the "Committee of One" who did much to sponsor the Hydro movement."

*Richard L. Hearn* Generating Station, Toronto (Canada's largest steam generating station—named in honour of the Commission's General Manager and Chief Engineer).

*Otto Holden* Generating Station, Ottawa River (named in honour of Hydro's Assistant General Manager-Engineering).

*A. W. Manby* Transformer Station and Service Centre, at Islington (named in honour of Hydro's Assistant General Manager-Administration).

*E. V. Buchanan* Transformer Station, near London (named as a tribute to the former General Manager of the London Public Utilities Commission).

*J. Clark Keith* Generating Station, Windsor (Canada's second largest steam plant—named in honour of Mr. Keith who has served for many years as General Manager of the Windsor Utilities Commission).

*R. H. Martindale* Transformer Station, Sudbury (named in tribute to the former Manager and Secretary of the Sudbury Hydro-Electric Commission).

*Ross L. Dobbin* Transformer Station, Peterborough (named in tribute to the former General Manager of the Peterborough Public Utilities Commission).

*George W. Rayner* Generating Station, Mississagi River—named in honour of the President of Rayner Construction Limited).

Mr. Saunders emphasized that these are but a few of the names that should go down in Canadian history as an inspiration to future generations. "Their contribution to Canadian achievement and expansion will be more fully realized with the passing of time," he stated. "Knowing that we have at our service the finest minds in the engineering field, we may rest assured that no job will be beyond our reach if it will serve our people. We have full confidence in our ability to carry forward almost staggering programs of development, and that is why we are anxious to get ahead with the St. Lawrence project. I cannot express too often, and too strongly, my high personal esteem and admiration for Canadian engineers and, in particular, those on the staff of Ontario Hydro," he emphasized. "They represent still greater progress for our Province and our country."

# The ASME Boiler Code

### Interpretations

The Boiler Code Committee meets monthly to consider "Cases" where users have found difficulty in interpreting the Code. These pass through the following procedure (1) Inquiries are submitted by letter to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.; (2) Copies are distributed to Committee members for study; (3) At the next Committee meeting interpretations are formulated to be submitted to the ASME Board on Codes and Standards, authorized by the Council of the Society to pass upon them; (4) They are submitted to the Board for action; (5) Those which are approved are sent to the inquirers and are published in Mechanical Engineering.

The following Case Interpretations were formulated at the Committee meeting March 5, 1954.

**Case No. 1116-3**
(Reopened)
Special Ruling

The Boiler Code Committee is considering annulling Case No. 1116-3 (Reopened) (Special Ruling); and comments are welcome.

**Case No. 1181**
Interpretation of Par. P-112(c)

***Inquiry:*** Paragraph P-112(c) makes stress-relief of carbon and carbon-molybdenum steel mandatory in thicknesses appreciably less than those currently permitted under other sections of theCode. May these thicknesses be increased?

***Reply:*** It is the opinion of the Committee that under Par. P-112(c) the following need not be stress-relieved:

(1) Carbon steel in thicknesses less than ¾ in.

(2) Carbon-molybdenum steel with carbon not exceeding 0.20% in thicknesses less than ½ in.

**Case No. 1183**
Special Ruling

***Inquiry:*** When copper, copper silicon alloy, 90-10 copper nickel alloy and 70-30 copper nickel alloy plates, sheets, pipes, tubes and shapes conforming to an approved specification are used for the construction of vessels to be used for external pressure, under what rules shall they be designed and fabricated?

***Reply:*** It is the opinion of the Committee that copper, copper silicon alloy, 90-10 cupro nickel and 70-30 cupro nickel plates sheets, pipes, tubes and shapes that conform to an approved specification may be used for the construction of external pressure vessels and the vessels may be stamped with the Code symbol providing the following requirements are complied with:

(1) The applicable rules in the 1952 edition of Section VIII of the Code covering vessels under external pressure when constructed of nonferrous materials shall be adhered to.

(2) The thickness of shells and heads and the required moment of inertia for stiffening rings shall be determined from the charts in Fig. UNF-28.9 for Annealed Copper Type DHP; Fig. UNF-28.10 for Annealed Copper Silicon Alloys Type A and C: Fig. UNF-28.11 for Annealed 90-10 Copper Nickel Alloy; and Fig. UNF-28.12 for Annealed 70-30 Copper Nickel Alloy and Par. UNF-30. The above mentioned figures are available from the Committee.

**Case No. 1184**
Special Ruling

***Inquiry:*** May annealed aluminum bronze Alloy D seamless condenser tubing with chemical analysis and mechanical properties in accordance with SB-169-52 (plate material) and otherwise conforming to requirements for condenser tubing as given in SB-111-52 be used in the construction of unfired pressure vessels to Section VIII of the 1952 ASME Code?

***Reply:*** It is the opinion of the Committee that annealed aluminum bronze Alloy D, seamless condenser tubing conforming to chemical analysis and mechanical properties of SB-169-52 and otherwise conforming to requirements for condenser tubing as given in SB-111-52 may be used in the construction of unfired pressure vessels to the 1952 Section VIII.

The design stresses for aluminum bronze SB-169, Alloy D plate as shown in Table UNF-23 may be used for aluminum bronze Alloy D condenser tubing.

### Proposed Revisions and Addenda to Boiler and Pressure Vessel Code

As need arises, the Boiler Code Committee entertains suggestions for revising its Codes. Revisions approved by the Committee are published here as proposed addenda to the Code to invite criticism.

In the following the paragraph numbers indicate where the proposed revisions would apply in the various sections of the Code.

Comments should be addressed to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.

**Unfired Pressure Vessels, 1952**

***Par. UG-80.*** Revise to read:

UG-80 Permissible Out-of-Roundness of Cylindrical Shells.

(a) Internal Pressure. The shell of a completed vessel shall be substantially round. The difference between the maximum and minimum inside diameters at any cross section shall not exceed one per cent of the nominal diameter at the cross-section under consideration. The diameters may be measured on the inside or outside of the vessel. If measured on the outside the diameters shall be corrected for the plate thickness at the cross-section under consideration (see Fig. UG-80.2).

When the cross-section passes through an opening the permissible difference in inside diameters given above may be increased by two per cent of the inside diameter of the opening.

For vessels with longitudinal lap joints the permissible difference in inside diameters may be increased by the nominal plate thickness.

(b) External Pressure. The shell of a complete vessel to operate under external pressure shall meet the following requirements at any cross section:

(1) The out-of-roundness limitations prescribed in (a).

(2) The maximum plus-or-minus deviation from the true circular form, measured radially on the outside or inside of the vessel, shall not exceed the maximum permissible deviation "$e$" obtained from Fig. UG-80.1. Measurements shall be made from a segmental circular template having the design inside or outside radius (depending upon where the measurements are taken) and a chord length equal to twice the arc length obtained from Fig. UG-29.2. The value of $t$ shall be determined as follows:

(a) For vessels with butt joints, $t$ is the nominal plate thickness, less corrosion allowance;

(b) For vessels with longitudinal lap joints the permissible deviation $e$ may be increased by the nominal plate thickness.

(e) Where the shell at any cross-section is made of plates having different thicknesses, $t$ is the nominal thickness of the thinnest plate, less corrosion allowance.

(c) Delete (c) as these rules now apply to completed vessels.

(d) New (c). No change.

(e) New (d). The dimensions of a completed vessel may be brought within the requirements of this paragraph by any process that will not impair the strength of the material.

(f) New (e). No change.

(g) New (f). No change.

(h) New (g). An example illustrating the application of these rules for a vessel under external pressure is given in Appendix L (Par. UA-271).

***Fig. UG-80.1.*** Revise the title to read: Maximum Permissible Deviation from a Circular Form "$e$", for Vessels under External Pressure.

***Figs. UG-29.2 and UG-80.1.*** Revise figures to show ordinate values of $D_o/t$ instead of $t/D_o$.

***Fig. UG-80.2.*** Revise the title to read: Examples of Differences between Maximum and Minimum Diameters in Cylindrical Shells.

***Par. UA-6(b)(2).*** Revise the introductory phrase to read:

(2) Heads of the type shown in Fig. UA-6(b), (No joint efficiency factor is required).

Delete $E$ in formula (a) making it read:

(a) Head thickness, $t = \frac{5PL}{6S}$

***Par. UA-6(b)(3).*** Revise the introductory phrase to read:

(3) Heads of the type shown in Fig. UA-6(c), (No joint efficiency factor is required).

Delete $E$ in formula (a), making it read:

(a) Head thickness, $t = \frac{5PL}{6S}$

***Par. UA-6(b)(4).*** Revise the introductory phrase to:

(4) Heads of the type shown in Fig. UA-6-(d), (No joint efficiency factor is required).

Delete $E$ in formula (a) making it read:

(a) Head thickness, $t = \frac{5PL}{6S}$

# 1953 E.I.C. Membership Directory

## Errata

*(Continued from May issue)*

With the completion and distribution of our 1953 Membership Directory, a small number of errors have come to light. Naturally, these are very much regretted, but since the work had to be done under pressure against time, a certain number of mistakes were almost inevitable.

For the convenience of all members we are printing below a further list of names as they should have appeared in the Alphabetical Section. For errors in the Geographical Section the necessary correction is simply noted. — EDITOR.

### Honorary Members—Page IX:

**ALLAN, J. A.**, M. 1941, Hon. M. 1952.

**DOANE, F. W. W.**, S. 1887, A.M. 1889, M. 1892, Hon. M. 1952.

**KERRY, J. G. G.**, S. 1888, A.M. 1894, M. 1904, Hon. M. 1952.

### Alphabetical List:

**BARBOUR, Ronald G.**, N.B. '24 and '27. Gen. Mgr., T. Pringle & Son Ltd., 485 McGill St., Montreal. M.'51.

**CAMPBELL, J. A.**, Tor. '35. Distbn. Engrg. Supt., Northern Electric Co. Ltd., 759 Victoria Sq. (Rm. 40), Montreal. M.'52.

# News of Other Societies

The third convention of UPADI, **The Panamerican Federation of Engineering Associations,** will take place in Sao Paulo, Brazil, August 2 to 6, 1954.

The program will allow discussion of the administration of the Federation, as well as sessions on legislation, relationships, and technical matters coming under the attention of UPADI. Some of the questions to be reported upon are: highlights on professional ethics; trends regarding a World Engineering Council; interchange of teachers; co-ordination of technical congresses; interchange of technical information on engineering education.

The Institute, as a member of UPADI will be represented, and the Journal will carry a report of this important international meeting.

---

A three-day semi-annual meeting of the **American Society of Heating and Ventilating Engineers** (62 Worth Street, New York 13) will start on June 28, 1954. Headquarters will be the New Ocean House, Swampscott, Mass.

The second western regional conference of the **Chemical Institute of Canada** (18 Rideau Street, Ottawa 2), will be held in Vancouver, B.C., September 10-11, 1954.

There will be a Summer Institute on Nuclear Physics in Engineering Education at the Northwestern University, September 7-11, 1954. Open to physics and engineering educators, and with attendance limited to 150 persons, the conference is sponsored by the American Society for Engineering Education, the American Institute of Physics, the National Science Foundation, and Columbia and Northwestern Universities. For information write to Professor Robert L. Young, Technological Institute, Northwestern University, Evanston, Illinois.

The **Institute of the Aeronautical Sciences** (2 East 64th Street, New York 21) will sponsor a meeting in Seattle, Washington, August 9-11, 1954, on the subject of turbine-powered air transportation.

The **Town Planning Institute of Canada**, at the annual meeting on May 7, 1954, elected the following officers: president, Dr. E. G. Faludi, M.E.I.C., vice-presidents, P. Alan Deacon; and T. D. LeMay; secretary-treasurer, R. Norman Dryden.

C. A. Wright, of the Canadian General Electric Company was elected chairman of the Montreal Branch of **The American Institute of Electrical Engineers**, in June, at the annual meeting of the group.

**The American Society of Refrigerating Engineers** will hold a semi-annual meeting at Seattle, Washington, July 11-14, 1954.

The fall meeting of the **American Society of Mechanical Engineers** (29 West 39th St., New York 18) is scheduled for September 8-10, at the Hotel Schroeder, Milwaukee, Wis.

The next congress of the **International Federation for Housing and Town Planning** will take place in Edinburgh, Scotland, September 20-26, 1954. Information can be obtained from the secretary-general of the Federation, Paleisstraat, The Hague, Holland.

*The Pines, Digby, N.S.*

# *Maritime Professional Meeting*

*of*

The Engineering Institute of Canada

*and*

The Associations of Professional Engineers

*of*

Newfoundland, New Brunswick and Nova Scotia

The professional engineers of the Maritimes will meet together again this year at Digby, N.S. The committee extends an invitation to all engineers and their wives to attend this popular meeting.

On Thursday and Friday morning, September 9 and 10, professional sessions will be held, with papers being presented on subjects of interest to Canadian engineers.

The remainder of the time will be spent in sports, recreation, entertainment and any other holiday fare that suits the individual taste.

Guest luncheon and dinner speakers will include Premier Smallwood of Newfoundland; D. M. Stephens, president, E.I.C., Prof. W. L. Sagar, president of Dominion Council of Professional Engineers.

Watch for complete program and details of registration and reservation in the July issue of the *Journal* but plan now to attend the Maritime Professional Meeting.

# NEWS OF THE ASSOCIATIONS & CORPORATION

**Information received through co-operation with the provincial organizations**

## Quebec

### 1953 Salary Survey

The Corporation conducts an annual survey of salaries among its members primarily to obtain an indication of the general trend of engineers' salaries from year to year and to gather valuable information which may help us in rendering assistance to engineers and employers in the determination of fair remuneration.

We reproduce herewith a chart prepared by Dr. Huet Massue from the analysis of returns to our questionnaire.

The large number of returns (50 per cent of members residing in Quebec) and other observations indicate without doubt that the figures obtained are truly representative of the remuneration of professional engineers of Quebec.

According to the 2,250 answers to the salary survey questionnaire sent to the 5.000 members of the Corporation in 1953, the remuneration of Quebec engineers fluctuate within wide limits. Not only do salaries fluctuate according to years of experience, but they also vary considerably among engineers with comparable years of practice.

The accompanying chart shows, for example, that the median salary of Quebec engineers starts at $3,730 after one year of practice and reaches about $9,000 after 30 years and more. As years of experience increase, the spread between the lower and upper 10 per cent range of salaries increases from about $1,200 after one year of experience to about $10.000 after 20 years. After 20 years of experience, there are still 10 per cent of the engineers earning less than $5,200, the middle 50 per cent earning between $6,200 and $11,500, and the upper 10 per cent more than $15.000.

### Corporation's Annual Meeting

The Corporation held its annual meeting in Montreal on April 24th. The highlight of this year's meeting was the inauguration of an art exhibit consisting exclusively of paintings by professional engineers of Quebec; among the 90 paintings assembled for this show were portraits, landscapes, seascapes and others and the general quality of the work astonished all those who viewed the exhibit. The Montreal Star commented that "Not only is the Corporation of Professional Engineers of Quebec serving the nation through its engineer members, the theme of its annual meeting, but it is contributing to the nation culturally".

### Georges Demers Elected President

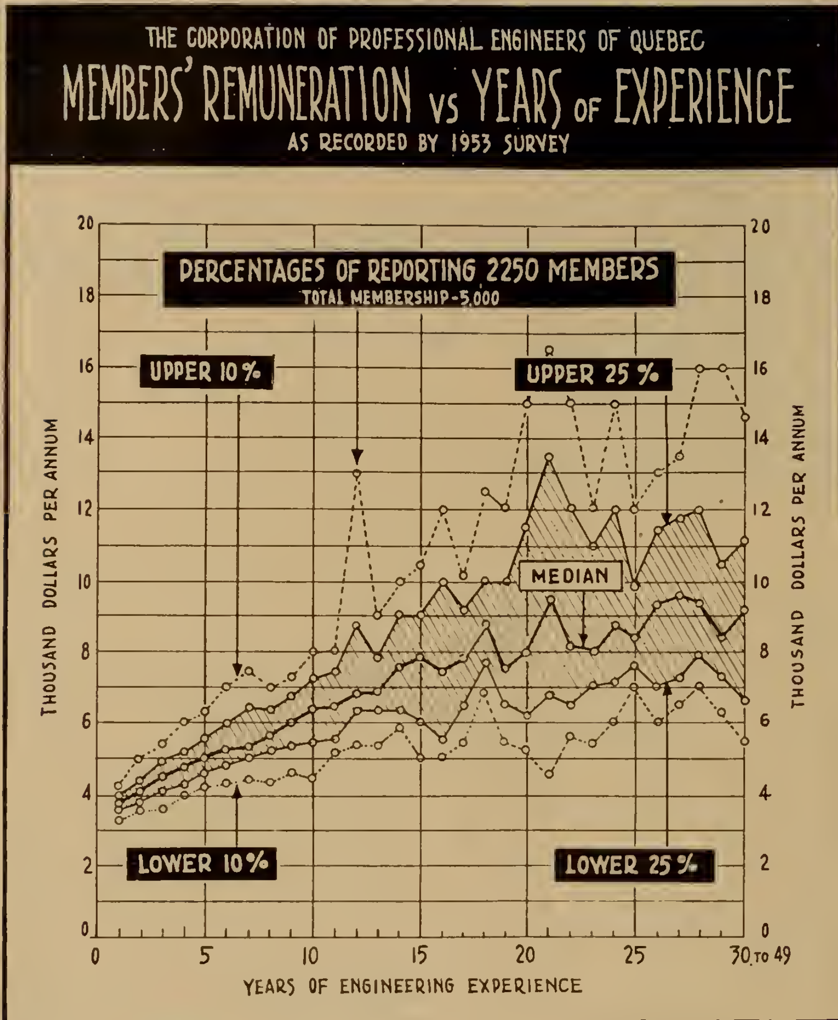
During the business meeting Mr. Georges Demers was elected President for the year 1954-55. Born in Montreal in 1912, Mr. Demers graduated as Civil Engineer from the Ecole Polytechnique of Montreal in 1935 and followed postgraduate courses at l'Ecole des Ponts et Chaussées in Paris in 1937.

After a few years with the Roads Department of the Province of Quebec as resident engineer and district engineer, he joined the office of Zachée Langlais, Consulting Engineer in 1939 and finally set up his own consulting practice in Quebec City in 1942, specializing in municipal and other civil engineering works of all types.

In addition to a very successful practice, Mr. Demers has managed to be active in many engineering and other groups and has served his profession well through his numerous activities. He is a member of Council of the Engineering Institute of Canada and of the Society of Industrial and Cost Accountants of Quebec, and a member of the Board of Trade, the Association of Civil Engineers of France, the American Water Works Association and many others. He is married and has six children.

Other officers elected are G. Lorne Wiggs, vice-president; T. A. Monti, honorary secretary-treasurer; D. C. MacCallum, R. A. Phillips, R. F. Shaw, D. Wermenlinger and R. Painchaud, councillors.

**Georges Demers (left), of Quebec City, is greeted as new president of the Corporation of Professional Engineers of Quebec by retiring president R. F. Shaw of Montreal. Seated, left to right: Mrs. Shaw, J. D. Coleman, past president of the National Society of Professional Engineers and guest speaker, Mrs. Demers.**



# Ontario

## Salary Survey

A sub-committee of the Professional Status Committee was appointed in January 1953 to investigate and report on matters affecting the remuneration of salaried engineers. Included within the scope of the sub-committee's activities are surveys of members' salaries, along the lines of those which have been conducted annually by the Association since 1945. The results of the December 1953 survey, reflect the guidance during its first year in operation of the Sub-Committee on Remuneration of Salaried Engineers.

Six meetings of the Sub-Committee were held between its inception and the time questionnaire forms were sent out last November.

Believing that the Association can perform a major service to engineers and their employers by providing accurate and up-to-date statistical information, concerning the current market for engineering services, the Sub-Committee concluded that the most practical and useful form in which such information can be supplied, initially, is a series of curves relating the salaries of professional engineers to years of experience.

The Sub-Committee then gave consideration to the sort of information that should be collected in the surveys. Noting certain factors having a bearing on remuneration to be of much greater significance than others, it designed a questionnaire form which sought to obtain information pertaining to:

(a) Field of employment—

(1) Industrial — including mining, consulting, crown companies.

(2) Utility — privately and publicly owned.

(3) Civil Service, Municipal, and Educational.

(b) Type of Work—

(1) Executive — administrative.

(2) Supervisory.

(3) Non-supervisory.

(4) Non-supervisory — Sales.

A final count reveals that 6,641 replies were received to questionnaires mailed in November. This represents a return from 70.8 per cent of the Association's membership resident in Ontario at the beginning of the year.

Chart I is a graphical presentation of the annual earnings of Association members at the time the survey was taken, in December 1953.

Certain trends are also discernible from the chart. The slope of the median line during the first 7 years after graduation shows a steeper rise than during any similar succession of ensuing years. This may be indicative of a general improvement with regard to engineering salaries during the post-war years. Note the "flat" between classes with 7, 8, and 9 years of experience, indicating the situation that existed between 1944 and 1946 when salaries were "pegged". Note also the "hollow", reflected at all levels, indicating the situation with respect to the classes that graduated into the Depression of 1929. Now, after the passage of a quarter of a century, the earnings of those men still reflect the economic chaos of the time.

### Serving Canada

Accompanying the April issue of "The Professional Engineer" all members received a copy of a booklet entitled "Serving Canada".

Conceived and produced by the Association's Public Relations Committee late in 1953, the purpose of the booklet is to provide vocational guidance counsellors and interested secondary school students with a brief and attractive story of the professional engineer. It refers to the early days of the profession, the present-day needs and the challenge of the future. It also tells of the education that is required to become an engineer and why, as a profession, engineering provides both a challenge and an opportunity of "Serving Canada".

The booklet has been submitted to the Minister and officials of Ontario's Department of Education, who signified their approval of its contents and purpose by arranging for its distribution among the Principals and Guidance Officers in all secondary schools in the province. Since that distribution was made the Association has received numerous requests from schools and individuals for extra copies. We feel that its purpose is being achieved to a highly satisfactory degree.

### New Regulations

It sometimes takes several years to accomplish changes in government regulations. For at least four years regulations made under The Theatres Act, have been under fire because the manner in which the regulations were worded made it impossible for professional engineers to design theatres.

The new regulations state:-

"Subject to subregulation 4, the plans shall be prepared and certified by a registered member of—

(a) the Ontario Association of Architects,

or

(b) the Association of Professional Engineers of the Province of Ontario".

---

# British Columbia

## Public Relations

Announcement is expected to be made soon of the appointment of a new public relations consultant to succeed Margaret Ecker Francis who was public relations consultant for the Society until April 30 of this year.

The Public Relations Committee has recently interviewed a number of prospects and hopes that the new consultant will be closer to a full time employee of the Society. It is intended to place more emphasis on the program of personal approach to members and to those employing professional engineers. It is also hoped that the new consultant will be able to keep up the excellent job which Mrs. Francis did in obtaining favourable newspaper releases.

As soon as the new consultant is appointed arrangements will be made for him to visit various parts of the province and meet as many members as possible.

### New Assistant Registrar Appointed

Douglas W. Russell, has been appointed assistant registrar of the Association to succeed Hugh M. McManus. He is 29 years of age and is married. He was born in Russell, Manitoba where he received his high school education. During the last war he served in the R.C.A.F. and entered the Faculty of Applied Science at the University of B.C. in 1946 graduating in 1950.

From 1950 until 1952 Mr. Russell was employed by Swan, Rhodes and Wooster, consulting engineers of Vancouver. Since June of 1952 he has been with the B.C. International Engineering Company Limited in Vancouver engaged in hydro-electric design work.

Mr. Russell will assume his new duties on June 1 and it is hoped that he will soon have an opportunity to meet many of the members of the Association.

### Employment of Foreign Engineers

Council recently instructed the registrar to write to the premier of the province of British Columbia asking that consideration be given in the future to natural resources of the province being exploited by firms from outside the province and that local professional engineers be employed on the projects. The following letter was sent to the premier:-

"Dear Sir:

For some time this Association has been concerned regarding the number of engineers from outside the province and outside Canada who have been coming into the province to supervise the development of our natural resources. This situation is not as serious now as it was two or three years ago, when there were several large projects under way, all under the direction of American engineers, but it is a problem which may come up again in the future. This letter is intended to bring the matter to your mind in the event that further developments are being considered.

Many of the members of the Association felt in the past that our own engineers, who did so much work in earlier years to make some of these recent large scale developments possible, were being overlooked. It was felt that many of them are as well, or better, qualified to participate in this development work as those who are imported from outside Canada.

Further, past experience has proved that when the design of these projects is carried out by outside engineers, who are not familiar with our provincial or Canadian manufacturing and supply facilities, there is a natural tendency for them to specify equipment and products from their own country, the equivalent of which is often available locally, but is unknown to the designer.

Thus not only do our local engineers not participate to the extent desired, but many business firms and individuals are overlooked which might otherwise successfully contribute to the development of these projects.

For this reason, we wish to request that in the future, when the Government enters into agreements with companies which will be developing the natural resources of the province, provision should be made that these companies give first preference to the use of local professional engineers."

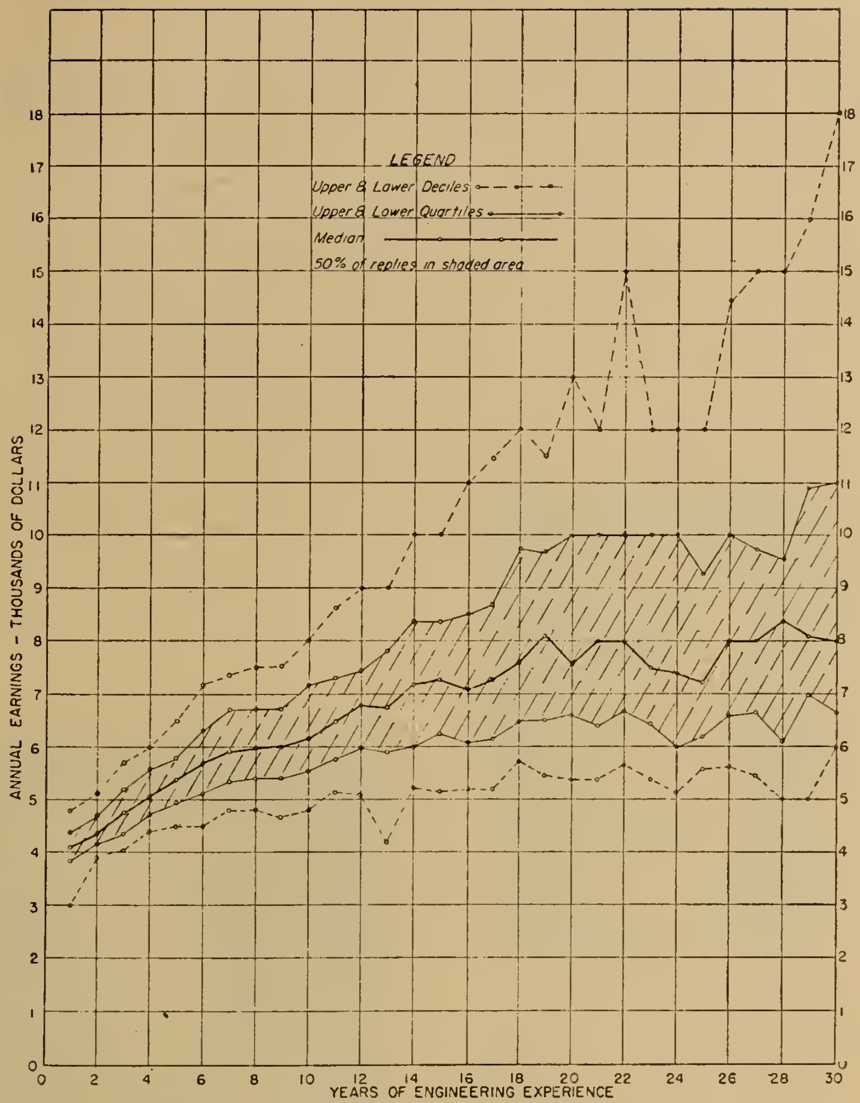


**Chart 1. The Association of Professional Engineers of the Province of Ontario. Remuneration vs. years of experience.**

### New Members

The following have recently complied with all requirements for registration as professional engineers in British Columbia, and are duly registered as members of the Association of Professional Engineers of B.C.

**Baker, George J. W.,** civil, chief engineer, overseas department, John Laing & Son Limited, Vancouver, B.C.

**Christoffersen, Per T.,** civil, design engineer, J. H. Read & Associates, Consulting Engineers, Vancouver, B.C.

**Forrester, Andrew G.,** forest, resident engineer, B.C. Forest Products, Shawnigan Lake, B.C.

**Goff, Harford S. H.,** electrical, B.C. Electric Co. Limited, Vancouver, B.C.

**Hamersley, Hugh L. S.,** civil, assistant hydraulic engineer, Water Rights Branch, Victoria, B.C.

**Hunt, Hugh M.,** civil, designer, Phillips, Barratt & Partners, Consulting Engineers, Vancouver, B.C.

**Jack, Peter S.,** mining, research metallurgist, Britannia Mining & Smelting Co., Britannia Beach, B.C.

**Menzies, Morris M.,** geological, field geologist, Noranda Exploration, Limited, Vancouver, B.C.

**Newbury, Edward Wm.,** electrical, field electrical engineer, B.C. Power Commission, Nanaimo, B.C.

**Patterson, John Wm.,** mining, inspector of mines and resident engineer, Prince Rupert, B.C.

**Rolston, William H.,** civil, manager, Vancouver branch, Associated Engineering Services Limited, Vancouver, B.C.

**Spence, Robert A.,** civil, assistant professor in civil engineering, University of B.C., Vancouver, B.C.

**Tupper, Victor M.,** mechanical, liaison engineer, Galbraith & Sulley, Vancouver, B.C.

**Webber, Eugene D.,** civil, assistant municipal engineer, District of North Vancouver, B.C.

### New Temporary Licences

The following were recently granted Temporary Licences to the dates indicated:-

**Blair, S. M.,** mechanical, president, Canadian Bechtel Limited, Toronto, Ontario. Expires: Mach 3, 1955.

**Hunt, Albin D.,** geological, geologist, Canada Southern Oils Limited, Calgary, Alberta. Expires: May 4, 1955.

**Park, John D., Jr.,** mechanical, construction engineer, Standard Oil Company of British Columbia Limited. Expires: September 3, 1954.

### Temporary Licence Renewals

The following were recently granted renewals of their Temporary Licences to the dates indicated:-

**Alliger, Jerald,** geological (Petroleum), manager, Geophoto Services Limited, Calgary, Alberta. Expires: May 4, 1955.

**Beach, Hugh H.,** geological, chief geologist, Texaco Exploration Co., Calgary, Alberta. Expires: April 26, 1955.

**Charles, William W., Jr.,** geological (petroleum), chief geologist, Central Leduc Oils Limited, Calgary, Alberta. Expires: April 22, 1955.

**McLaren, George R.,** mining, consulting engineer, Toronto. Expires: April 12, 1955.

**Nauss, Arthur Wm.,** geologist (petroleum), partner, Link and Nauss Limited, Calgary, Alberta. Expires: October 16, 1954.

### Engineers In The News

**J. H. Toms** has been transferred by Stone & Webster Canada Limited to Toronto where the firm is supervising construction of a new brewery for Molson's Brewery (Ontario) Limited. He was formerly located at Waneta where this firm was constructing the Waneta Power Plant for the Consolidated Mining & Smelting Co. of Canada Limited.

**R. F. Pearce** is now with Sherritt Gordon Mines Limited at Fort Saskatchewan, Alberta. He was formerly with the South African Cyanamid (Pty.) Limited at Johannesburg, South Africa.

**R. W. Robertson** is now with Smith Bros. and Wilson of Vancouver. He was formerly with Silver Standard Mines.

**B. D. Bohna** is at present in Cairo attending the bid evaluation of a proposed crude oil pipeline to be built from the Suez to Cairo to supply fuel for the Egyptian railways. Mr. Bohna is a partner of the firm B. D. Bohna, J. L. Miller, and Company.

**A. G. Westaway** has been promoted to the position of plant engineer with the Clayburn Company Limited at Abbotsford, B.C.

**W. R. Smith** is now with the Radar Pneumatics and Engineering Co. Limited in Vancouver. He was formerly with Conveyair Company Limited of North Vancouver.

**A. H. Whistler** is now on the engineering staff of the Shell Oil Company at the refinery in Vancouver. He was formerly with Heat and Power Engineering Services Limited of Vancouver.

**A. Walisser** is now working with the Provincial Department of Public Works on the Pattullo bridge approach in New Westminster. He was formerly with Phillips, Barrat and Partners, Consulting Engineers of Vancouver.

**S. J. Hunter** has joined the staff of Geco Mines Limited in Ontario. He was formerly with Reeves MacDonald Mines Limited, at Remac, B.C.

**E. Muna** has accepted a position with the B.C. Power Commission as assistant civil engineer. He was formerly with the B.C. International Engineering Co. at Kemano, B.C.

**F. J. Bennett** has recently accepted a position with the B.C. Power Commission in their transmission and distribution section. He was formerly with the Powell River Comapny at Powell River, B.C.

**A. G. Nicholls** is now with the Bramwell Construction Company. He was formerly with H. A. Simons Limited, consulting engineers in Vancouver.

**H. P. Pfeifer** is now with Gibbs and Hill, at Bogota, Columbia where he is working on a team of experts evaluating the utility systems in that country. He was formerly with B.C. International Engineering Co. at Kemano.

**S. C. Maplethorp** is now with the Canadian Pacific Railway Co. at Nanaimo. He was formerly with the planning department of the City of Vancouver.

**W. Parkinson** is now resident engineer with the Water Resources Division of the Department of Northern Affairs and Natural Resources at Nelson, B.C.

**H. M. Anderson** is now with the B.C. Forest Service at Horseshoe Bay where he is assistant engineer on the right of way clearing of the P.G.E. Railway between Horseshoe Bay and Squamish. He was formerly with the B.C. Forest Products at Port Renfrew, B.C.

**S. Hogg,** president of Western Bridge and Steel Fabricators Limited, Vancouver, has been appointed director White Pass and Yukon Corporation.

**A. H. W. Busby** has accepted a position with the Anglo-American Corporation of South Africa as assistant consulting mechanical and electrical engineer. He was formerly superintendent of engineering and research development of the Consolidated Mining and Smelting Co. of Canada Ltd. at Trail. Before his departure from Trail, Mr. Busby was commended by the City Council for the time and energy he devoted to community service during his stay in that city. He recently resigned as president of the Trail and Rossland District Boy Scout's Association. He was a member of the Chamber of Commerce Council, Rotary Club, the Canadian Legion and Vice-President of the Trail Arts and Crafts Society.

**J. A. Walker** has been appointed British Columbia representative on the Federal District Commission responsible for carrying out the development of Ottawa as the national capital.

**T. A. G. Beeching** has accepted a position with B. C. International Engineering Company at Kemano. He was formerly with A. E. Simpson, consulting engineer, Vancouver.

**D. S. Rae** has accepted a position with the Howe Sound Pulp Company at Port Mellon, B.C.

**Dr. Joseph Burr Tyrrell, 95 (right), is awarded the Engineer's Medal by Prof. G. B. Langford of the University of Toronto, on behalf of the Association of Professional Engineers of Ontario at its Annual Meeting in Toronto. One of the country's eminent geologists, Dr. Tyrrell's explorations of the west before the turn of the century led to the discovery of the vast coal and oil resources of that area. He is the fourth man to receive the medal since it was struck in 1945.**

# Institute Awards

At the banquet which concluded the sixty-eighth annual general and professional meeting of the Institute, the award of honorary memberships and of prizes and awards of the Institute was announced. Presentations were made to those honorary members and award winners who were present on this occasion, and remaining presentations will be made on other appropriate occasions.

## Honorary Members

The Institute has awarded honorary memberships this year to three distinguished engineers. They are, **LeRoy Fraser Grant,** formerly associate professor of engineering, Queen's University, Kingston; and field secretary of the Engineering Institute of Canada; **Lewis Ketcham Sillcox,** vice-chairman of the board of directors, New York Air Brake Company, and president of the American Society of Mechanical Engineers; and **Omond McKillop Solandt,** chairman of the Defence Research Board, Ottawa, Ontario. The citations which accompany the awards are as follows:

### *LeRoy Fraser Grant, Hon, M.E.I.C.*

The young engineers of Canada have good reason to know the name of LeRoy Fraser Grant. His consistent dedication to

Lt.-Col. L. F. Grant, Hon.M.E.I.C.

their welfare is well known to those who in recent years enthusiastically followed the professional development courses which he introduced in Canada. Originating, of course, in his association with students at Royal Military College and Queen's University as a professor, his interest became a most profitable service to the Institute when he assumed the duty of chairman of the Committee on the Training and Welfare of the Young Engineer. He was long one of the Institute's representatives on the Engineers' Council for Professional Development, and as the present chairman of this international body, he brings a still wider vision to his work for young people.

Colonel Grant—widely and affectionately known as Leary—was born in Toronto. He was educated at St. Alban's School and Royal Military College from which he graduated with honours in 1905. In 1926 while teaching at R.M.C. he received the degree of B.Sc. with honours from Queen's University. The honorary degree of D. és Sc. was conferred on him at Quebec by Laval University.

The first of many military posts which he filled with distinction was an appointment with the Royal Canadian Artillery in Halifax in 1905. Here he was one of two officers to take over the defences of Halifax from the Imperial forces. Resigning from the Army in 1907 he worked in British Columbia for seven years, first with the Grand Trunk Pacific Railway at Prince Rupert, and later with the consulting firm, Ducane, Dutcher and Company in Vancouver. At the outbreak of war in 1914 he was granted a commission as captain and adjutant in the Canadian Overseas Railway Construction Corps. Two years later he transferred to the 5th Battalion Canadian Railway Troops as second in command with the rank of major. He was three times mentioned in despatches.

After the war, Major Grant returned to British Columbia and worked until 1921 for the provincial Department of Lands and Surveys on the Southern Okanagan Irrigation Project. Then he returned to Royal Military College as an instructor in engineering. Two years later he became associate professor, an appointment he retained until 1940 when he re-entered the Canadian Army. While at R.M.C. he commanded the 32nd Field Battery, and later the 9th Brigade, Canadian Field Artillery. He was promoted to lieutenant-colonel in 1937. In 1940 he was appointed general staff officer, first grade, for Military District No. 3, Kingston, remaining in that post until retired in 1944. He then went to Queen's University as a special lecturer and was appointed associate professor engineering in 1946.

Colonel Grant became the field secretary of the Engineering Institute on retiring from Queen's in 1949. He has since crossed Canada several times, renewing acquaintances, making friends for the Institute and helping in the organization of new branches and sections.

A special feature of his work has been meeting with engineers in locations where there is no branch. These he calls his "orphans".

Colonel Grant was chairman of the Kingston Branch in 1925, and its secretary-treasurer from 1928 to 1937. He was a councillor in 1938, 1939 and 1940, and one of Ontario's vice-presidents in 1943 and 1944. His term as president in 1947 was one of the most constructive in the Institute's history.

Colonel Grant is one of our "senior engineers" who has made an enviable name for himself in many fields—as an engineer, a teacher, an administrator, a yachtsman, a military officer and perhaps greatest of all as a gentleman. The Institute has had few members as lovable and loyal as he.

### *Lewis Ketcham Sillcox, Hon.M.E.I.C.*

Lewis Ketcham Sillcox of Watertown, N.Y. is the president of the American Society of Mechanical Engineers—an American engineer of distinction who retains an interest in Canada, aroused years ago when he was associated for a time with our railway industry. He has been for thirty years a summer resident of Canada at his home in the Georgian Bay area. And he has been a member of the Institute almost thirty years.

Dr. Sillcox, honorary vice-chairman of the board of the New York Air Brake Company, has spent his entire career in the railroad industry. He has been one of the active but unassumingly influential engineers who have contributed immensely to the development of improved methods of railway-power application, and the

Dr. L. K. Sillcox, Hon.M.E.I.C.

control of railway trains. During the past twenty-five years Dr. Sillcox has been responsible for developing the brake-cylinder release valve which eliminates hand bleeding of retained air in standing frieght cars; improved sanding methods for rail conditioning; the brake-pipe flowmeter which registers brake-pipe pressure in freight and passenger trains irrespective of main supply head pressure; and basic brake types. He also sponsored the designing of several types of aircraft hydraulic pumps now found on practically all current military aircraft and the latest commercial aircraft.

Dr. Sillcox was born in Germantown, Pa. He graduated from Trinity School in New York, attended L'Ecole Polytechnique in Brussels for a year, and started as an apprentice in the shops of the New York Central Railroad. Two years later he came to Canada. Here he was a shop engineer for Canadian Car and Foundry Company in Montreal, and a mechanical engineer for Canadian Northern Railway in Toronto.

Returning to the United States in 1916, he was a mechanical engineer with the Illinois Central Railroad, and in 1918 became general superintendent of motive power with the Chicago, Milwaukee and St. Paul Railway. Since 1927 he has been first vice-president of the New York Air Brake Company. In 1947 he was made a director of the Company, the following year was elected executive vice-president, and in 1953, honorary vice-chairman of the board. He also serves in the capacity of an executive officer of the board of several large companies.

Many American universities have called upon Dr. Sillcox to lecture on subjects relating to railway practice and applied mechanics. His teaching and his extensive writings have been of great value to the railroad-transportation field. He is honorary curator of transportation of the Baker Library of Harvard University, and a trustee of Clarkson College. He has received honorary degrees in science from Clarkson College, in engineering from Cumberland and Purdue Universities, and in laws from Syracuse University.

An honorary member of A.S.M.E., Dr. Sillcox holds various grades of membership in the leading professional and technical societies in the United States and abroad; he takes an active part on the advisory councils of numerous educational and cultural institutions, and honorary societies; and maintains memberships in many social clubs and fraternal associations.

The A.S.M.E., when awarding him the gold medal for distinguished service in engineering and science in 1943, justly described him as a "pre-eminent learned technologist—lover of wisdom—inspirer of men", and now it is the privilege of Canadian engineers to add their mark of recognition to the achievements of this great man.

### *Omond McKillop Solandt, Hon.M.E.I.C.*

Omond McKillop Solandt is a Canadian whose stature in the international scientific world is well known and well documented. Early in World War II, Canada was able to provide a young scientist whose abilities could direct themselves into the new fields of research made urgent by a serious situation we all remember vividly.

**Dr. O. M. Solandt, Hon.M.E.I.C.**

Dr. Solandt was born in Winnipeg. He obtained his B.A. degree in biological and medical sciences in 1931 from the University of Toronto. Then, after two years in post-graduate research under Dr. C. H. Best in the Department of Physiology, he received his M.A. degree. He took his doctorate from the faculty of medicine in 1936 "with honours not exceeded by any other student in the history of this school", according to Dr. Best.

Dr. Solandt went to England for a year to do research on experimental pathology at Cambridge. This was followed by a year of internship at the Toronto General Hospital, and post-graduate work at the London Hospital. The M.C.R.P. was conferred on him in London in 1939, and he took a position in the Department of Physiology at Cambridge as a member of the teaching staff, and was subsequently named a Fellow of Trinity Hall.

Remaining in England at the outbreak of World War II, Dr. Solandt directed the South-West London Blood Supply Depot until 1941. He founded the Medical Research Council's Physiological Laboratory at the Armoured Fighting Vehicle School at Bovington, and became actively engaged in research concerned with tank design and the physiological problems peculiar to tank personnel.

This work led to the investigation of important tank gunnery problems by Operational Research Group, established by Dr. Solandt in 1942. In May, 1944 he became superintendent of the Army Operational Research Group.

Dr. Solandt joined the Canadian Army in February, 1944 as a lieutenant-colonel and was appointed acting colonel in May, 1944. He continued as director of the Army Operational Research Group until 1945, when he was chosen to direct the Operational Research Division of the South East Asia Command. His appointment was that of scientific advisor to Admiral Lord Louis Mountbatten, then commander-in-chief, S.E.A.C. The cessation of hostilities made it unnecessary for him to assume this post, and Dr. Solandt returned to England. He was later sent to Japan by the War Office as a member of the Joint Military Mission evaluating the effects of the atomic bomb.

Returning in 1946 to the Department of National Defence in Ottawa, Dr. Solandt undertook the planning of a permanent defence research organization in Canada. The result was the formation of the Defence Research Board in 1947. He became the first chairman, and the scientific member of the Chiefs of Staff Committee and Defence Council. He accompanied Sir W. G. Penney, chief scientist in charge of the United Kingdom's first atomic explosion test, to Australia in the autumn of 1952, and participated in the trial at the Monte Bello Islands.

Dr. Solandt has received a number of honours for his outstanding service. Among them are the Order of the British Empire, the U.S. Medal of Freedom, with Bronze Palm, the honorary degree of D.Sc. from the University of British Columbia, Laval University, the University of Manitoba, McGill University, and the honorary degree of LL.D. from Dalhousie University. To these the Engineering Institute of Canada is pleased to add its highest honour.

## Julian C. Smith Medals

Established by a group of friends of Julian C. Smith, president of the Institute in 1928, to commemorate his memory within the Institute, it is awarded for achievement in the development of Canada, an objective always close to the heart of Mr. Smith.

This year two awards have been made—to **Richard Ellard Carden Chadwick,** M.E.I.C., chairman of board of the Foundation Company Limited, and president of the Foundation of Canada Engineering Corporation Limited; and to **Douglas Stewart Ellis,** M.E.I.C., dean of the faculty of applied science, and professor of civil engineering, Queen's University, Kingston. The citations which accompany these awards, as given by the general secretary, are as follows:

### *Richard Ellard Carden Chadwick, M.E.I.C.*

Richard Ellard Carden Chadwick is chairman of the board and director of the Foundation Company of Canada Limited, and president and director of Foundation

**R. E. Chadwick, M.E.I.C.**

of Canada Engineering Corporation Limited.

Mr. Chadwick was born in Toronto, and was educated at Upper Canada College and graduated from the School of Practical Science of the University of Toronto in 1906.

After teaching at the University for two years, he worked with the city engineer's department in Toronto until 1911. Speaking parenthetically I would like to confess that I was one of the students into whose thick heads he tried to drive some elementary knowledge of design and draughting. Shortly thereafter, when he was bridge engineer for the City of Toronto, I was his entire office and field staff, a second ordeal to which no man should have been subjected. Shortly thereafter he commenced his long and distinguished career with the Foundation Company.

He started in Montreal as superintendent and engineer. Subsequently he became superintendent of the Winnipeg District; eastern district manager, and manager and acting chief engineer in Montreal. He also served as chief engineer of the Foundation Company of New York. In 1924 he organized the Foundation Company of Canada Limited as a subsidiary of the United States company. He was its vice-president and general manager and later its president. In 1929 he obtained control of the company for Canadian interests and ever since, under his presidency, it has been a wholly Canadian-owned and operated company.

He retired in 1952 from the presidency but in 1953 became the first president of Foundation of Canada Engineering Corporation Limited.

In his forty-three years with the Foundation Company, and particularly in the twenty-five since he severed its connection with the American company, Mr. Chadwick has built an organization which has completed over $500,000,000 worth of construction contracts from St. John's to Victoria and from the American border to Resolute Bay. He has organized a group of subsidiaries all of which are leaders in their fields. They have offices in six Canadian cities, and it is worthy of special note that the Foundation Company is one of the few Canadian companies with an American subsidiary.

Mr. Chadwick joined the Institute as an Associate Member in 1913, transferring to Member in 1921. He was treasurer of the Institute in 1944 and 1945.

Surely here is a man worthy of recognition for his "achievement in the development of Canada."

D. S. Ellis, M.E.I.C.

***Douglas Stewart Ellis, M.E.I.C.***

The dean of the Faculty of Applied Science of Queen's University, Douglas Stewart Ellis, first became associated with Queen's in 1903 as a student. Now we have the opportunity to recognize, by the award of this medal, the contribution of a distinguished educator and engineer to Queen's, and to Canada.

"Doug" Ellis was born at Cobourg, Ontario, and moved to Kingston in 1893 when his father was appointed principal of the Kingston Collegiate Institute.

He won a B.A. degree in mathematics at Queen's in 1907, an M.A. degree in 1908, and a B.Sc. in civil engineering in 1910. He was one of the original members of the 5th Field Company established at Queen's in 1909 for undergraduates.

After graduation he worked for the International Waterways Commission, and during 1913-1914 was an engineer for the Commission of the St. Lawrence Ship Channel.

During the First World War he served with the 6th Field Company, Royal Canadian Engineers. In February 1917 he received his majority and was first in command of the company. He was mentioned in despatches and in 1918 was awarded the D.S.O. For a year after the war he remained in England as brigade major attached to headquarters units, and as chief instructor of the Canadian School of Military Engineering. During this time he was promoted to the rank of lieutenant-colonel.

Returning to Queen's in 1919, he applied for leave to attend Cornell University where he obtained the degree of M.C.E. Back again at Queen's University, he remained on the teaching staff, being appointed head of the civil engineering department in 1941. He was appointed dean of the Faculty of Applied Science in 1943.

As a consulting engineer Dean Ellis worked for a number of years for the Hydro-Electric Power Commission of Ontario and for the Ontario Government. He was for two years chairman of a board of three engineers appointed by the Federal Government to study the most effective means of crossing the Straits of Canso.

This Queen's student whose support was to be of such great help to the Institute joined this organization in 1909. He was a councillor in 1929, 1941 and 1942, and he has served on numerous committees.

Today in every nook and cranny of this broad Dominion and in numerous other places around the world, there are engineers who with great profit to themselves have passed through the hands of this man whom we honour tonight. They will join with us in the happiness which is ours in publicly acknowledging Doug Ellis' great "achievements in the development of Canada."

## Gzowski Medal

***Presented each year for the best paper on a civil engineering subject***

***Egil Mikkelsen Rensaa, M.E.I.C.***

Egil Mikkelsen Rensaa of Edmonton, Alberta, was awarded the Gzowski Medal for his paper "The Cracking Problem in Reinforced Concrete Buildings". This paper was published in the November 1953 issue of the *Journal*.

Mr. Rensaa is a partner in the Edmonton consulting engineering firm of Main, Rensaa and Minsos.

He was born in Astafjord, North-Norway. After completing his elementary education, he entered Bergen Technical School from which he graduated in 1925 as a civil engineer. While in Norway he gained experience in railway surveying and ship building draughting before coming to Canada in 1926 where he entered the employ of Canadian National Railways as a designer of dams and water supplies, and subsequently as resident engineer. He studied at the University of Manitoba, receiving B.Sc. and M.Sc. degrees in 1933 and 1937. From 1934 to 1936 he worked with the Department of Public Works of Canada as a designer of bridges and wharfs, and as a resident engineer.

He then returned to Norway where he became associated with the Norwegian State Railways. During this period he was occupied with the structural design of bridges, buildings, dams, power plants, wharfs, paper mills and civil defence structures.

He returned to Canada in 1947 and opened a private practice as consulting engineer in Edmonton, Alberta. In 1948 he entered into partnership with T. C. Main, M.E.I.C., to form a general consulting engineering firm under the name of Main and Rensaa, and a year later Messrs. Rensaa and Main formed a new company with a third associate, A. O. Minsos, an architectural consultant. The firm has developed a system of precast reinforced concrete framework which has been used for several large buildings.

E. M. Rensaa, M.E.I.C.

Mr. Rensaa has written a number of articles for Canadian and Norwegian engineering publications dealing with structural theory and practice.

He is a member of the Association of Consulting Engineers of Canada, the American Concrete Institute, and the Associations of Professional Engineers of both Alberta and Ontario.

Mr. Rensaa joined the Engineering Institute of Canada as an Associate Member in 1932, transferring to Member in 1940.

## Duggan Medal and Prize

***Awarded for papers dealing with the use of metals for structural or mechanical purposes***

***Leo Schenker, M.E.I.C.***

Leo Schenker, until recently a research associate at the University of Michigan, was awarded the Duggan Medal and

Leo Schenker, M.E.I.C.

Prize for his paper, "Analysis of Building Frames by Limit Design", which appeared in the March 1953 issue of the *Journal*.

Mr. Schenker was born in Vienna, Austria. Upon completion of his general studies at the Kilburn Grammar School in London, England, he entered the University of London (Battersea Polytechnic) from which he graduated with first class honours in civil engineering in 1942. He was awarded the Wells Gold Medal, given annually to the top ranking engineering graduate.

After graduation, until early 1946, he served as engineer officer in the Royal Air Force and was discharged with the rank of flight lieutenant.

For the next two years he was in charge of a small London machine shop engaged in turning and pressing metal components.

Mr. Schenker then came to Canada where he joined the Hydro Electric Power Commission of Ontario in Toronto as assistant research engineer. During a period in 1949-1950 he studied toward his M.A.Sc. degree at the University of Toronto, having been granted a fellowship by the Canadian Institute of Steel Construction.

In the summer of 1952 he was invited to the University of Michigan to take part in a research project on building connections, a subject with which he had become familiar while working on his master's thesis. He worked at the same time toward his Ph.D. degree, specializing in the effects of shockloading on tall structures. His research is now completed and he is to receive his degree this year. He has returned meanwhile to Toronto.

Mr. Schenker is a member of the Association of Professional Engineers of Ontario. He joined the Engineering Institute of Canada as a Member in 1950.

## Ross Medal

***Awarded for papers on electrical engineering subjects.***

***Milton Eaton, M.E.I.C.***

Milton Eaton, electrical engineer for Shawinigan Chemicals Limited and consultant on electric boilers for the Shawinigan Water and Power Company, was awarded the Ross Medal for his paper, "Improvements in Electrode Boilers", published in the May, 1953 issue of the *Journal*.

Mr. Eaton was born at Whitewater, Manitoba. After receiving his general education he proceeded to McGill University where he graduated with a B.Sc. degree in electrical engineering in 1921.

Upon graduation he joined the Shawinigan Engineering Company, at Shawinigan Falls. In October, 1922 he was placed in charge of the electrical department of Canadian Electro Products Company Limited which in 1927 was incorporated under the name of Shawinigan Chemicals Limited.

This is the second time that Mr. Eaton has received an Institute award. In 1933 he won the Gzowski Medal for his paper, "Automatic Operation of Electric Boilers".

He has been active in the work of the Engineering Institute, has been chairman (1948-49) and councillor (1951-52) for the St. Maurice Valley Branch. He joined the Institute as a Student in 1920, transferring to Associate Member in 1925, and to Member in 1940. He has also been chairman of the St. Maurice Valley Section of the American Institute of Electrical Engineers.

**Milton Eaton, M.E.I.C.**

## Plummer Medal

***Awarded for the best paper on a metallurgical subject***

***John S. Moloney***

John S. Moloney, design engineer with Polymer Corporation Limited in Sarnia, Ontario, was awarded the Plummer Medal for his paper, "Fluid-born Solid Particles with Particular Reference to Solid Fuel for Internal Combustion Engines". The paper was published in the April, 1953 issue of the *Journal*.

**J. S. Moloney**

Mr. Moloney received his B.A.Sc. degree in mechanical engineering from the University of Toronto in 1945. The paper which received the Plummer award was the thesis submitted as partial requirement for his M.E. degree which he obtained from the National University of Ireland in 1949.

He worked for two years, 1945-47, in the laboratory, Mechanical Engineering Division, National Research Council, Ottawa. An interest in philosophy led him to take night classes in Ottawa, and also to undertaking the study of philosophy for a year in Dublin, Ireland. He stayed in Dublin for a second year to take advantage of an opportunity to do research for a master's degree in engineering. The subject of his research was the possibility of a practical efficient heat engine using cheap solid fuel-coal. During his stay in Europe, he made two trips to the continent, visiting England, France, Spain, Switzerland and Italy. Mr. Moloney returned to Canada in 1950 and worked in Brantford, Ont., with the Cockshutt Plow Company. He worked for about 1½ years in the Gas Dynamics Laboratory of McGill University at St. Anne de Bellevue, Que., going to Polymer Corporation, at Sarnia, early in 1953 to do engineering design work.

## Leonard Medal

***Awarded for papers on mining subjects.***

Leonard Medals have been awarded to **Clement Matthew Anson**, M.E.I.C., and to the late **Charles Blair Archibald**, M.E.I.C., for their paper, "Treasure under the Atlantic" which described in the August 1953 issue of the *Journal* the Wabana Mines in Newfoundland which are the world's only iron ore mines under the sea.

***Clement Matthew Anson, M.E.I.C.***

Clement Matthew Anson, vice-president and general manager of Dominion Iron and Steel Limited in Sydney, Nova Scotia, was born in England and moved to Australia at an early age. He received his preliminary schooling there and at the age of fifteen began his career in the steel industry. After four years' work he came to Canada in 1920 to enter McGill University. While at McGill he was elected president of the Students' Branch of the Canadian Institute of Mining and Metallurgy and president of the Science Undergraduates' Society. He received his B.Sc. degree in metallurgy in 1925.

The same year he joined the Dominion Steel and Coal Corporation as a labourer in the blast furnaces. Within two years he became assistant blast furnace superintendent, and then successively assistant mills superintendent, and assistant general superintendent. In 1931 he was appointed assistant general manager. He was named general manager of steel operations in 1940 and vice-president and general manager in 1952.

Mr. Anson is a director of Dominion Iron and Steel Limited, Dominion Wabana Ore, Limited, James Pender & Company Limited, and the Sydney and Louisburg Railway Company.

His valuable support has been given to professional and educational activities. He joined the Engineering Institute as an Associate Member in 1931, transferring to Member in 1940. In 1946 and 1947 he served as vice-president of the Institute for the Maritime Region. The Julian C. Smith Medal of the Institute, for achievement in the development of Canada, was awarded to him in 1951.

He is a member of the British Iron and Steel Institute and of the American Iron and Steel Institute. He is on the boards of governors of Nova Scotia Technical College, and of the Nova Scotia Research Foundation.

**C. M. Anson, M.E.I.C.**

***The late Charles Blair Archibald, M.E.I.C.***

Charles Blair Archibald, who died at Sydney, Nova Scotia on March 14, 1954, was born in Pictou, Nova Scotia on October 25, 1889.

He received his early education at Truro schools and Colchester Academy, after which he entered the Royal Military College in Kingston, Ontario from which he graduated in 1910.

One year previous to graduation he was employed on track construction by the Intercolonial Railway, and after graduation he joined the Nova Scotia Steel and Coal Company, Limited at New Glasgow where he worked on the design of conveying machinery, ore pockets and buildings. In November of 1910 he was engineer in charge of the company's construction at Wabana, Newfoundland. The following year he returned to New Glasgow where he was engaged in designing and erecting conveying machinery and running a survey. He was subsequently transferred to Wabana as engineer in charge of construction and machinery erection.

In May, 1912, Mr. Archibald was appointed mechanical superintendent for the company at Wabana and assumed the responsibility of all mechanical and electrical installation and construction. Three years later he was named chief engineer at Wabana and was placed in charge of the civil, mechanical and electrical departments as well as mine surveying.

Mr. Archibald was appointed general manager of the company's iron ore operations at Wabana in 1918, and in 1922 he became manager of both the Nova Scotia Steel and Coal Company, Limited and Dominion Steel and Coal Corporation Limited iron ore operations, with headquarters in Wabana.

In December, 1948 he retired from the post of manager at Wabana and became chief mining engineer for Dominion Iron and Steel Limited in Sydney, Nova Scotia.

Mr. Archibald joined the Engineering Institute as a Student in 1910, transferring to Associate Member in 1917 and to Member in 1940.

## John Galbraith Prize

***Awarded for the best paper presented by a Junior in the Ontario vice-presidential zone.***

***Frank Stanley Gue, Jr. E.I.C.***

Frank Stanley Gue, manufacturing engineer in the Power Products Division of Canadian Westinghouse Company Limited in Hamilton, Ontario, was awarded the John Galbraith Prize for his paper, "Moral Responsibilities of the Engineer".

Mr. Gue was born in Edmonton, Alberta. After receiving his pre-matriculation education there, he served for one year as control operator with Radio Station CJCA in Edmonton, after which he joined the Royal Canadian Air Force as a wireless mechanic.

At the close of the war he served as radio counterman for a year with Radio Supply Company. The following year he obtained his matriculation and entered the University of Alberta, graduating with distinction in electrical engineering in 1951. During the summers of his university course he was employed as telephone-telegraph technician with Canadian National Telegraphs.

F. S. Gue, Jr.E.I.C.

Mr. Gue joined Canadian Westinghouse Company Limited as an engineering apprentice, and in 1953 was appointed to his present position in the manufacturing methods department of the Power Products Division.

Mr. Gue joined the Engineering Institute of Canada as a Student in 1950, transferring to Junior Member in 1951.

# Personals

## News of the Personal Activities of Members of the Institute

**William L. Sagar,** M.E.I.C., was elected president of the Dominion Council of Professional Engineers, at the 17th annual meeting in Toronto, May 26-28, 1954.

Professor Sagar is also serving this year as president of the Association of Professional Engineers of Ontario. He is professor of civil engineering at the University of Toronto, where he has been a member of the faculty since 1937; and previously had served there as a sessional lecturer. He also does private consulting work dealing with the building of large industrial plants, bridges and other structures. He is an authority on soil mechanics and construction materials.

He worked in the construction field, in the earlier years of his career, as a contractor, and on testing and inspection of general construction materials. Later he was employed on the construction of several of Toronto's well-known buildings, taking part also in the building of the Humber River bridge. He served as foundation consultant on various projects for the Imperial Oil Company refinery at Sarnia.

A veteran of both World Wars, and holding the rank of lieutenant-colonel in the R.C.E.M.E., he is one of the oldest members in point of service of the Association of Professional Engineers of Ontario, his membership dating back to 1923, the year after the Association was formed. He became an Associate Member of the E.I.C., in 1926, transferring to Member in 1940.

**B. G. Ballard,** O.B.E., M.E.I.C., director of the Radio and Electrical Engineering Division of the National Research Council of Canada, has also been named vice-president (scientific). He fills the position left vacant when Dr. E. W. R. Steacie became president.

In 1930 Mr. Ballard was appointed to the National Research Council staff in the Division of Physics, and during the following ten years he gradually built up the electrical engineering section.

This work became extremely important during the war when Mr. Ballard's efforts included the development of mine sweepers and other means of protecting ships against enemy magnetic mines. The resulting equipment was used on both coasts as well as on the high seas, and this work was recognized in 1946 by the award of the Order of the British Empire.

The electrical engineering section was amalgamated with the radio branch of the Division of Physics and Electrical Engineering, and Mr. Ballard was named as assistant director of that division in 1946. This research expanded rapidly and a full division on radio and electrical engineering was established in 1948, with Mr. Ballard as director. It is now one of the largest divisions of the National Research Council.

Mr. Ballard was elected a vice-president of the Engineering Institute this year. His biography was included in the April issue.

### Treasurer of E.I.C. for 1954

**Charles H. Jackson,** M.E.I.C., president of Atlas Asbestos Co. Ltd., of Montreal, has been appointed treasurer of the Engineering Institute for 1954.

Mr. Jackson graduated from the University of Toronto in 1923, and after a wide experience in the construction field, joined the engineering department of Canadian Industries Limited in 1929. In 1934 he was transferred to the ammunition division at Brownsburg, Que., where he was made production manager, and in 1938, manager of the ammunition division with headquarters in Montreal

In 1946 he joined the Atlas Asbestos Co. Ltd., of Montreal, and he was vice-president in charge of manufacturing prior to his appointment as president in 1953.

Charles H. Jackson, M.E.I.C.

Mr. Jackson joined the Institute in 1928 as a Junior, transferring to Associate Member in 1935, and to Member in 1940.

**S. G. Bennett,** M.E.I.C., president of Beardmore and Company, and a vice-president of Canada Packers Limited, was recently re-elected president of the Royal Agricultural Winter Fair.

After receiving his B.A.Sc. degree from the University of Toronto in 1914, Mr. Bennett studied political economy at Oxford, after which he joined the Royal Engineers with whom he served with distinction from 1914 until 1918.

At the close of the war he joined the engineering staff of the University of Toronto, where he served for six years before entering business.

Mr. Bennett is one of Canada's leading Scotch Shorthorn cattle breeders.

**H. E. Cunningham,** M.E.I.C., has been appointed a vice-president and manager of the paper division of Dominion Engineering Company Limited in Montreal.

A graduate of McGill University, Mr. Cunningham has been with the company since 1934, and has occupied successively the positions of assistant chief engineer, and chief engineer and manager of the company's paper division.

**Col. Ibbotson Leonard, D.S.O., V.D.,** M.E.I.C., director of E. Leonard and Sons, Ltd. of London, Ont., and chairman of the board of the Canada Trust Company and the Huron and Erie Mortgage Corporation, has resigned as president of the London Health Association, a position he has filled for 29 years.

After announcing his resignation at a recent meeting, Col. Leonard was immediately elected honorary president —the first honorary president the association has had.

Lt.-Col. Gordon J. Ingram, O.B.E., V.D., was elected president by acclamation to succeed Col. Leonard.

**Air Commodore C. F. Johns, M.B.E.,** M.E.I.C., has been appointed as special assistant on construction engineering to the Minister of National Defence for a two-year term.

Air Commodore Johns is president and general manager of Tribune Press Limited in Sackville, N.B.

**W. G. Sharp,** M.E.I.C., manager of Sharp's Theatre Supplies Limited in Calgary, Alta., has been elected chairman of the Calgary Branch of the Engineering Institute.

Mr. Sharp was born at Indian Head. Sask. He attended public schools in Vancouver, B.C., and high school in Didsbury, Alta., after which he received his B.Sc. degree in electrical engineering from the University of Alberta in 1933

During the summer months of his university training he was associated with W. H. B. Sharp in the operation of a number of theatres and a theatre supply business in Calgary, and he was employed in general theatrical management and maintenance of equipment.

After graduation he was placed in charge of installation of equipment, including arc lamps, rectifiers, projectors and sound equipment for theatres supplied by Sharp's Theatre Supplies in Alberta, eastern British Columbia, and western Saskatchewan.

In May, 1944, when the company disposed of its theatres, Mr. Sharp took over the operation of the supply business.

He is a member of the Association of Professional Engineers of Alberta, and a member of the Calgary Chamber of Commerce.

**Jules Armand Beauchemin,** M.E.I.C., has announced the formation of a new Montreal firm of consulting engineers specializing in the field of municipal engineering and public utilities under the name of J. A. Beauchemin & Associates.

**J. A. Beauchemin, M.E.I.C.**

Mr. Beauchemin was previously a partner in the firm of Beauchemin & Hurter which has recently been dissolved.

He received his degree in civil engineering from Ecole Polytechnique in 1911, and began his career as assistant resident engineer with Richelieu River Improvements. He was subsequently appointed engineer with the Department of Public Works in Ottawa, and with Riordon Co. Ltd. which is now the Gatineau Power Company.

In 1921 he became chief engineer with the Donnacona Paper Company and six years later he founded and became the first manager of the Town of Dolbeau, Lake St. John, Que.

Mr. Beauchemin was appointed personnel manager of Consolidated Paper Corporation in Port Alfred, Que., and was later named resident engineer on the construction of the Wellington Street Tunnel in Montreal, and the Honore Mercier Bridge.

Previous to his association with the firm of Beauchemin & Hurter, Mr. Beauchemin was chief engineer with the Provincial Electricity Board of Quebec.

He is a past-chairman of the Montreal Branch of the Engineering Institute and a past-councillor representing the Montreal Branch. He is also a past-president of the Alumni Association of Ecole Polytechnique.

**W. H. Beaton,** M.E.I.C., is now an associate in the consulting engineering firm of J. A. Beauchemin & Associates of Montreal. He was until recently a project engineer on public utilities with Stadler Hurter & Company attached to the affiliated firm of Beauchemin & Hurter.

He was previously resident engineer on the construction of an extension to James MacLaren Co. Ltd. at Masson. Que., and he also served as a field engineer with Columbia Cellulose Co. Ltd. in Prince Rupert, B.C.

Mr. Beaton is a graduate in civil engineering of McGill University, class of 1947.

**W. H. Beaton, M.E.I.C.**

**H. Lapointe,** Jr.E.I.C., has become an associate in the new consulting engineering firm of J. A. Beauchemin & Associates of Montreal.

Until recently he was a project engineer on municipal works for the firm of Beauchemin & Hurter. He was previously associated with the Aluminum Company of Canada, and he also worked as a field engineer for the City of Verdun, Que., for the construction firm of Dufresne Engineering, and for the Quebec Roads Department.

Mr. Lapointe graduated in civil engineering from McGill University in 1951.

**H. Lapointe, Jr.M.E.I.C.**

**J. I. Carmichael,** M.E.I.C., has been appointed manager of Fort Erie Construction Limited in Fort Erie, Ont.

He was formerly executive assistant to the president and plant manager of Fleet Manufacturing Limited in Fort Erie.

Mr. Carmichael is a 1936 mechanical engineering graduate of Queen's University.

**A. M. Thurston,** M.E.I.C., has been appointed chief engineer of the engineering division of Canadian Aviation Electronics Limited in Montreal.

Previous to his new appointment, Mr. Thurston served as development engineer with the Shawinigan Water and Power Company, as research and consulting engineer with the Canadian

A. M. Thurston, M.E.I.C.

Marconi Company, as manager of a refrigeration, heating, ventilating and air conditioning firm, and as plant manager of the Dominion Electrical Protection Company.

Mr. Thurston received his degree in electrical engineering from McGill University in 1936 and his master's degree in physics from the same university in 1948.

During the war he served with the R.C.A.F. as signals officer and navigator.

Mr. Thurston is a member of the Corporation of Professional Engineers of Quebec, the Sigma Xi (Research) of McGill University, and the Canadian Association of Physicists.

**Harry E. Miller,** M.E.I.C., district engineer for the Department of Public Works in Charlottetown, P.E.I., retired in December, 1953, after almost fifty years of service with the Department.

Mr. Miller received his early education in Charlottetown and was appointed to the staff of the Department in 1907. He was named assistant engineer following the first war, and in September, 1937, he was appointed district engineer, and served in that capacity for 16 years.

**J. Antonisen,** M.E.I.C., of the Lakehead Branch was present at the meeting of March 15 when President Ross L. Dobbin visited the Branch.

Mr. Antonisen gave a vote of thanks to the president. This has been his customary contribution to the program of the presidents' visits for the past 15 years.

Active for his 85 years, Mr. Antonisen is a former city engineer of Port Arthur, Ont.

**V. K. Mason,** M.E.I.C., has been appointed chief engineer with B. Perini & Sons Canada Limited in Toronto, Ont.

He is a graduate of McGill University in civil engineering, class of 1942.

**Lt. Cmdr. R. A. Grosskurth, R.C.N.,** M.E.I.C., has been appointed deputy manager of the electrical engineering department of the H.M.C. Dockyard at Esquimalt, B.C.

He was formerly assistant command electrical officer on the Atlantic Coast, and electronics instructor at the H.M.C. Electrical School, H.M.C.S. *Stadacona* in Halifax, N.S.

**L. G. Chavignaud,** M.E.I.C., has been named general manager of Bryan Mountain Coal Co. Ltd. in Robb, Alta.

He was formerly general manager of mining operations for the North Western Coal and Oil Limited in Robb.

Mr. Chavignaud has been in the coal mining business for the past 33 years and has held executive positions with Luscar Coals Limited, Cadomin Coal Company and McLeod River Hard Coal Company (1941) Limited.

**Harvey Carruthers,** M.E.I.C., has opened offices under the firm name of Harvey Carruthers Limited, sales engineers, in Vancouver, B.C.

He was formerly district manager of Bingham Pump Co. Ltd. in Vancouver.

Mr. Carruthers is a graduate of the University of British Columbia, class of 1940.

**P. W. Bishop,** M.E.I.C., is engineer with Cementation Company (Canada) Limited in Vancouver, B.C., and is in charge of all engineering for the company in the territory from Winnipeg to the Pacific coast.

He was previously marine terminal engineer with Canadian Pacific Railways in Victoria, B.C.

Mr. Bishop is a civil engineering graduate of the University of New Brunswick, class of 1942.

**W. B. Jackson,** M.E.I.C., has been appointed division engineer for Canadian National Railways in London, Ont.

Born in Vancouver, B.C., Mr. Jackson was educated at Vancouver schools and at the University of British Columbia and the University of Alberta, where he received his degree in civil engineering in 1945.

He joined the Canadian National Railways as an instrumentman on the St. Lawrence Division at Montreal in 1945, becoming assistant engineer there in 1946. He then served in this same capacity at the Montreal terminals, the St. Jerome Division, and at the Laurentide and Levis divisions. In 1948 he was appointed assistant division engineer in the Levis Division, and two years later, division engineer at Cochrane, Ont.

Mr. Jackson saw service in World War II, rising from sapper to lieutenant with the R.C.E.

He is a member of the Corporation of Professional Engineers of Quebec and of the American Railway Engineering Association.

**R. E. McMillan,** M.E.I.C., has joined Canadian Comstock Company Limited as electrical engineer in St. Catharines, Ont.

A graduate of McGill University in electrical engineering, class of 1926, Mr. McMillan has been associated with the Saguenay Power Co. Ltd., the Aluminum Company of Canada Ltd., the Canadian International Paper Company, R. A. Hanright of St. Catharines, and H. G. Acres and Company of Niagara Falls.

**C. D. Dies,** M.E.I.C., has been transferred by the Canada Cement Company from Belleville, Ont., to Fort Whyte, Man., as construction engineer.

Mr. Dies graduated with a B.Sc. degree in metallurgy from Queen's University in 1943.

**H. J. Petursson,** M.E.I.C., is now regional construction engineer with Central Mortgage and Housing Corporation in Winnipeg, Man.

Mr. Petursson graduated with a B.Sc. degree from the University of Manitoba in 1930.

**W. J. Dyne,** M.E.I.C., has recently joined the Atomic Energy of Canada Ltd.

He was formerly on the staff of Canadian Western Natural Gas Company.

Mr. Dyne graduated in mechanical engineering from Lughborough University in 1946.

**Leopold Tessier,** M.E.I.C., is now associated with Paul Pelletier, Montreal construction engineer.

He was formerly a designer with the Quebec Streams Commission in Montreal.

**John B. Newman,** M.E.I.C., has joined Anglo Electromatic Elevator Co. (Canada) Ltd. in Toronto, Ont.

He was formerly associated with the Roelofson Elevator Company in Toronto.

**E. G. deWolf,** M.E.I.C., has been transferred as works manager from the Prairie Salt Company in Unity, Sask., to Dominion Salt Company Limited in Sarnia, Ont.

Mr. deWolf is a graduate of the Nova Scotia Technical College in mining engineering, class of 1944.

**Cecil G. Mills,** M.E.I.C., recently joined the engineering staff of the Winnipeg Electric Company in Winnipeg, Man.

He was previously associated with the B.C. Electric Railway Company. Mr. Mills graduated from McGill University in electrical engineering in 1926.

A. O. Drysdale, M.E.I.C.

**A. O. Drysdale,** M.E.I.C., assistant superintendent of Canada Cement Company Limited, has been elected chairman of the Belleville Branch of the Engineering Institute.

Mr. Drysdale was born in Ottawa, and received his schooling at the Glebe Collegiate there. In 1941 he obtained his B.Eng. degree in mining engineering from McGill University. While attending McGill, he was employed during the summer months by Dome Mines Ltd., with Dr. G. W. H. Norman on a Dominion geological survey, and by Omega Gold Mines Ltd.

Upon graduation Mr. Drysdale entered Canada Cement Co. Ltd. as a plant engineer. Five months later he joined the Army, serving overseas with the First Canadian Army, and as officer commanding of R.C.E.M.E. Third Canadian Infantry Brigade Workshop, the First Canadian Army Troops Workshop and the Fourth Canadian Armoured Troops Workshop. While overseas he also attended during 1943 the Royal College of Military Science in England. He was discharged in 1946 with the rank of major.

He then returned to Canada Cement Co. Ltd. as assistant superintendent of the company's Montreal East No. 1 plant. Four years later he was transferred to the company's No. 5 plant in Belleville, Ont.

Mr. Drysdale is a member of the Association of Professional Engineers of Ontario and of the Royal Canadian Electrical Mechanical Engineer Corps Association.

**F. R. Denham,** M.E.I.C., has joined the staff of the production tool standards section of Ford Motor Company of Canada Ltd. in Windsor, Ont.

He was previously defence scientific service officer with Canadian Armament Research and Development Establishment at Valcartier, Que.

Mr. Denham received his B.Sc. degree in mechanical engineering from the University of Durham in 1950, and his Ph.D. degree from the same university in 1953.

**J. O. Hulbert,** M.E.I.C., has been appointed zone engineer with Canadian Oil Refineries Ltd. at Corunna, Ont.

He was formerly associated with Foundation Company of Canada Ltd. in Toronto, Ont.

Mr. Hulbert holds the higher national certificate in mechanical engineering.

**D. K. Partington,** M.E.I.C., is now construction superintendent with Wells Construction Company in Saskatoon, Sask.

He was previously resident engineer with Underwood & McLellan in Saskatoon.

Mr. Partington graduated from the University of Saskatchewan in civil engineering in 1949.

**Wm. I. Phemister,** M.E.I.C., was recently named assistant to the executive vice-president of Electric Tamper & Equipment Co. Ltd. in Lachine, Que.

He was formerly chief of draughting and lofting with A. V. Roe (Canada) Ltd. in Toronto.

Mr. Phemister graduated with a B.Sc. degree in mechanical engineering from Queen's University in 1940.

**L. V. Roberts,** M.E.I.C., has been appointed Canadian manager of Brookhirst Switchgear Limited in Toronto, Ont.

Mr. Roberts was formerly on the staff of Canadian Controllers Ltd. in Toronto.

**J. W. Southin,** M.E.I.C., has been appointed resident engineer for H. A. Simons Ltd. of East Texas Pulp and Paper in Silsbee, Texas.

He was previously chief engineer with the Frobisher Company at Kampala, Uganda, British East Africa.

**R. W. Stephenson,** M.E.I.C., has joined the staff of Racey, MacCallum and Associates, Ltd. in Montreal.

He was previously associated with the Hydro-Electric Power Commission of Ontario in Niagara Falls, Ont.

Mr. Stephenson graduated in mining geology from the University of Toronto in 1949.

**G. R. Pritchard,** M.E.I.C., has been transferred recently by John Inglis Company Limited from Calgary, Alta., to Toronto, Ont., where he will occupy the position of manager of Worthington products sales for the company's general engineering division.

Mr. Pritchard received his electrical engineering degree from the university of Manitoba in 1937.

**J. F. McInnis,** M.E.I.C., has joined the Bowaters Shoutherns Paper Company in Calhoun, Tenn.

He was previously associated with the Quebec North Shore Paper Company in Baie Comeau, Que.

Mr. McInnis graduated from the Nova Scotia Technical College in mechanical engineering in 1941.

**D. W. Laird,** M.E.I.C., has been named branch manager of Defence Construction (1951) Limited in Winnipeg, Man.

He is a 1942 civil engineering graduate of the University of Manitoba.

**George A. Bird,** M.E.I.C., is now associated with Defence Construction (1951) Ltd. in Moncton, N.B.

He was formerly in the employ of Central Mortgage and Housing Corporation.

Mr. Bird is a graduate in civil engineering of the University of New Brunswick, class of 1949.

**A. A. Kenwood,** M.E.I.C., has joined Oland Construction Limited as estimator in Lethbridge, Alta.

He was previously in the employ of Meech, Mitchell & Associates in Lethbridge.

Mr. Kenwood is a graduate in civil engineering of McGill University, class of 1949.

**Donald D. Dick,** M.E.I.C., is now with the Harmac Pulp Division of MacMillan & Bloedel Company Limited in Nanaimo, B.C.

He was previously associated with the H. A. Simons Company in Vancouver, B.C.

Mr. Dick is a 1949 civil engineering graduate of the University of Alberta.

**L. B. Rose,** Jr.E.I.C., is now woodlands development engineer with Abitibi Power and Paper Co. Ltd. in Toronto, Ont. He was previously attached to the company's woods department in Iroquois Falls, Ont.

Mr. Rose received his B.A.Sc. degree in civil engineering from the University of Toronto in 1947.

**Harvey M. Kolesar,** Jr.E.I.C., has joined the staff of the general engineering department of the Mountain States Telephone and Telegraph Company in Denver, Colorado.

He was previously with the Bell Telephone Co. of Canada, Ltd. in Toronto, Ont.

Mr. Kolesar graduated in civil engineering from the University of Toronto in 1947.

He is the former secretary-treasurer of the Toronto Branch of the Institute.

**John S. Flavelle,** Jr.E.I.C., has joined the pulp and paper machinery division of John Inglis Co. Ltd., as a sales engineer in Toronto, Ont.

He was previously associated with the Canadian International Paper Company in Hawkesbury, Ont.

Mr. Flavelle graduated in mechanical engineering from the University of Toronto in 1948.

**G. N. McLellan,** Jr.E.I.C., is now an engineer in the design section of the engineering division of Imperial Oil Limited in Sarnia, Ont. He was previously an assistant resident engineer.

Mr. McLellan graduated in chemical engineering from the University of British Columbia in 1948.

**Donald J. Bird,** Jr.E.I.C., has joined MacDonald Construction Ltd. in Halifax, N.S. He was previously associated with Cameron Contracting Limited in Halifax.

Mr. Bird graduated in civil engineering from the Nova Scotia Technical College in 1948.

**R. W. McNeill,** Jr.E.I.C., has been appointed power equipment supervisor with the Alberta Government Telephones in Edmonton.

---

Mr. McNeill graduated in electrical engineering from the University of Alberta in 1948.

**J. L. McGregor,** Jr.E.I.C., is now assistant project engineer with the Hydro-Electric Power Commission of Ontario in Toronto, Ont.

He was previously electrical supervisor for the company's eastern central region in Belleville, Ont.

Mr. McGregor graduated in electrical engineering from the University of Alberta in 1948.

**Michael Price,** Jr.E.I.C., has been appointed project engineer with Foundation Company of Canada Limited in Toronto, Ont.

He is a civil engineering graduate of the University of Birmingham, class of 1948.

**J. A. Pettis,** Jr.E.I.C., has been appointed parks engineer with Yoho, Glacier and Mt. Revelstoke National Parks at Field, B.C., by the Department of Northern Affairs and National Resources.

Mr. Pettis graduated in civil engineering from the University of Alberta in 1948.

**R. T. Crawford,** Jr.E.I.C., has recently accepted the position as engineer in the home office construction department of Burns and Company Limited in Calgary, Alta.

He was previously connected with the Hudson Bay Mining and Smelting Company in Flin Flon, Man.

**A. W. Rae,** Jr.E.I.C., is presently employed as project engineer with General Foods Limited in Toronto, Ont.

Before joining this company he was industrial and sales engineer for Engineering Industries Co. Ltd.

Mr. Rae is a mechanical engineering graduate of the Nova Scotia Technical College, class of 1949.

**James Eric Cullen,** Jr.E.I.C., has been promoted from chemist to general superintendent of Davis Leather Co. in Newmarket Ont.

Mr. Cullen is a graduate in chemical engineering of Queen's University, class of 1949.

**L. W. Anderson,** Jr.E.I.C., has been appointed supervisor of the amplitude modulation group for the engineering products service and installation division of the engineering products department of R.C.A. Victor Co. Ltd. in Montreal.

Mr. Anderson graduated in electrical engineering from the University of Alberta in 1949.

**George Nagel,** Jr.E.I.C., is D. and C. group supervisor of the Canadian Comstock Company in Windsor, Ont.

Mr. Nagel graduated in mechanical engineering from the University of Saskatchewan in 1949.

**S. A. Germaniuk,** Jr.E.I.C., is now construction engineer with Brown and Root Limited in South Edmonton, Alta.

Mr. Germaniuk is a graduate in mechanical engineering of the University of British Columbia, class of 1949.

**P. A. Inglis,** Jr.E.I.C., is now a structural engineer with Stock, Ramsay and Associates in Regina, Sask.

He was formerly associated with H. G. Acres and Company in Niagara Falls, Ont.

Mr. Inglis received his B.Sc. degree from the University of Toronto in 1949.

**John A. Sample,** Jr.E.I.C., is presently employed as a computer with Texaco Exploration Co. Ltd. in Innisfail, Alta.

Mr. Sample graduated in electrical engineering from the University of Saskatchewan in 1949.

**D. Chmara,** Jr.E.I.C., has joined the staff of the University of Toronto as an instructor in mining engineering.

He was formerly a supervisor with Fleet Manufacturing Co. Ltd. in Fort Erie, Ont.

Mr. Chmara graduated in mining engineering from the University of Toronto in 1949.

**J. P. Kot,** Jr.E.I.C., has joined Giffels and Vallet of Canada Ltd. in Windsor, Ont.

He was previously associated as hydro engineer with Price Brothers and Company at Kenogami, Que.

Mr. Kot is a graduate in electrical engineering of the University of Saskatchewan, class of 1949.

**H. L. Bachman,** Jr.E.I.C., has joined the staff of the transmission department of the B.C. Electric Commission in Vancouver, B.C.

He was previously associated with the Manitoba Telephone System in Winnipeg, and Canadian Westinghouse Co. Ltd. in Hamilton, Ont.

Mr. Bachman graduated in electrical engineering from the University of Manitoba in 1949.

**F. B. Matthews,** Jr.E.I.C., has been transferred by Maloney-Crawford Tank and Service Co. Ltd. from Tulsa, Oklahoma, to Calgary, Alta.

Mr. Matthews graduated in chemical engineering from the University of Alberta in 1949.

**Allan A. Park,** Jr.E.I.C., has joined Dominion Bridge Co. Ltd. in Winnipeg, Man., as structural designer.

He was previously associated with Standard Iron and Engineering Works Ltd. in Edmonton, Alta., as an estimator.

Mr. Park received his B.Eng. degree in mechanical engineering from McGill University in 1949.

**T. W. Kitchen,** Jr.E.I.C., is now a pulp inspector in the employ of McMillan & Bloedel (Alberni) Ltd. in Port Alberni, B.C.

Mr. Kitchen graduated in chemical engineering from the University of Alberta in 1949.

**C. G. Saunders,** Jr.E.I.C., has been appointed assistant superintendent of garages and equipment for the Ontario Department of Highways in Toronto, Ont.

Mr. Saunders received his B.Sc. degree in mechanical engineering from Queen's University in 1951.

**Maurice Lavallee,** Jr.E.I.C., has been recently appointed industrial commissioner of the Gatineau Power Company in Ottawa.

Mr. Lavallee received his B.A.Sc. degree in electrical engineering from Laval University in 1948. He joined the company the same year.

**K. J. Newbert,** Jr.E.I.C., is now project engineer for Saskatoon and Dundurn

Maurice Lavallee, Jr.E.I.C.

with Defence Construction (1951) Ltd.

He was previously associated with Central Mortgage and Housing Corporation in Saskatoon, Sask.

Mr. Newbert received his B.Sc. degree from the University of Saskatchewan in 1950.

**J. Milner,** Jr.E.I.C., is managing director of his own business, Oilfield Engineering Services Ltd. in Edmonton, Alta.

Mr. Milner graduated in chemical engineering from the University of Alberta in 1950.

**Kenneth D. Stephenson,** Jr.E.I.C., has joined the staff of Canadian Potteries in St. John, Quebec.

He was previously ceramic engineer and assistant plant superintendent with Hamilton Porcelains Ltd. in Brantford, Ont.

Mr. Stephenson is a graduate in ceramic engineering of the University of Toronto, class of 1950.

**V. K. Jameson,** Jr.E.I.C., has been appointed works manager of the Dominion Tar and Chemical Company in Vancouver, B.C. He was previously assistant works manager for the company in Trenton, Ont.

Mr. Jameson graduated in mechanical engineering from the University of Saskatchewan in 1950.

**C. R. Langer,** Jr.E.I.C., is now design engineer with Cowin & Co. Ltd. in Winnipeg, Man.

Mr. Langer graduated in civil engineering from the University of Manitoba in 1950.

**A. F. Roberts,** Jr.E.I.C., is now mine engineer with Cochenour Willans Gold Mines Ltd. at Cochenour, Ont.

He was previously associated with Giant Mascot Mines Limited at Spillimacheen, B.C.

Mr. Roberts received his B.A.Sc. degree in mining engineering from the University of British Columbia in 1951.

**F/Lt. Victor Swanberg, R.C.A.F.,** Jr.E.I.C., has been promoted from the rank of flying officer, and is now located with the First Air Division R.C.A.F. Headquarters, at Metz, France.

He was previously with the Second C.M.U. Unit at Calgary, Alta.

Mr. Swanberg is a graduate in civil engineering of the University of Alberta, class of 1951.

**R. Noel,** Jr.E.I.C., is a designer and development engineer in acoustics with the R.C.A. Victor Division in Camden, N.J.

He was formerly a research scientist in the electronics laboratory of Defence Research Telecommunication Establishment in Ottawa.

Mr. Noel graduated in civil engineering from Ecole Polytechnique in 1951.

**D. Murray,** Jr.E.I.C., has joined the engineering department of the City of Edmonton.

He was formerly connected with Peale Construction Co. Ltd. in Edmonton.

Mr. Murray graduated in mechanical engineering from the University of Manitoba in 1951.

**A. Gordon Shugg,** Jr.E.I.C., has been appointed district engineer for General Motors Diesel Limited in Calgary, Alta. He has served as service repair engineer in London, Ont., since 1952.

A. Gordon Shugg, Jr.E.I.C.

Mr. Shugg graduated from the University of British Columbia in mechanical engineering in 1950.

**Wm. T. Haggert,** Jr.E.I.C., has joined the staff of Engineering Associates (Western) Ltd. in Vancouver, B.C., as director.

He was previously with International Engineering Co. Ltd. in Vancouver.

Mr. Haggert graduated in electrical engineering from the University of British Columbia in 1951.

**H. L. Knappett,** Jr.E.I.C., is now an engineer in the production engineering department of the Ford Motor Company of Canada in Windsor, Ont.

He was formerly a manufacturing engineer with Canadian Westinghouse Co. Ltd. in Hamilton, Ont.

Mr. Knappett graduated with a B.A.Sc. degree in mechanical engineering from the University of British Columbia in 1951.

**J. C. D. Mallet-Paret,** Jr.E.I.C., has joined the Alberta Government Telephone system in Edmonton, Alta. He was formerly associated with Picker X-Ray of Canada Ltd. in Montreal, Que.

Mr. Mallet-Paret is a graduate of the University of British Columbia in electrical enginering, class of 1951.

**F. H. Papke,** Jr.E.I.C., is now with the production control department of Wm. E. Coutts Company in Toronto, Ont.

He was formerly with the planning department of E. S. & A. Robinson (Canada) Ltd. at Leaside, Ont.

Mr. Papke graduated with a B.A.Sc. degree in engineering and business from the University of Toronto in 1951.

**H. B. McLenaghan,** Jr.E.I.C., has joined Structural Engineering Services as structural engineer in Calgary, Alta.

He was previously associated with J. A. Lamb, an engineer and Alberta land surveyor in Calgary.

Mr. McLenaghan received his B.Sc. degree in civil engineering from the University of Manitoba in 1952.

**F/O J. M. Lepage, R.C.A.F.,** Jr.E.I.C., has been posted to No. 1 Air Division Headquarters at Metz, France.

F/O Lepage is a graduate in civil engineering of Laval University, class of 1952.

**G. A. Gorman,** Jr.E.I.C., is now assistant engineer in the soils section of the Hydro-Electric Power Commission of Ontario in Toronto.

He was formerly soils engineer with Construction Borings Ltd. in Toronto.

Mr. Gorman graduated in civil engineering from the University of Toronto in 1951.

**J. R. Finlay,** Jr.E.I.C., has joined General Steel Wares Limited in London, Ont., as industrial engineer.

He was formerly associated with Dominion Bridge Company in Winnipeg, Man.

Mr. Finlay graduated in mechanical engineering in 1951 from the University of Manitoba.

**Andrew Frame,** Jr.E.I.C., is now sales engineer with English Electric Company of Canada.

He was formerly associated with the Canadian Westinghouse Company on the graduate student training course for engineers in Hamilton, Ont.

Mr. Frame graduated in electrical engineering from the University of Toronto in 1951.

**Ronald T. McLaughlin,** Jr.E.I.C., is now junior design engineer in the department of planning and works of the City of Ottawa.

He was formerly assistant research officer with the National Research Council in Ottawa.

Mr. McLaughlin graduated in civil engineering from Queen's University in 1951, and undertook post-graduate work at the California Institute of Technology in Pasadena, Cal.

**Thos. B. Macauley,** Jr.E.I.C., has joined the staff of C. D. Howe Company Limited in Montreal, Que.

He was previously associated with the McGill University Gas Dynamics Laboratory in Ste. Anne de Bellevue, Que.

Mr. Macaulay graduated from McGill University in mechanical engineering in 1951.

**Douglas H. Keen,** Jr.E.I.C., has recently joined the Steel Company of Canada Limited in Hamilton, Ont.

Mr. Keen graduated in mechanical engineering and business from the University of Toronto in 1951.

**Clifford F. Jardim,** Jr.E.I.C., has joined Phillips Electrical Works Ltd. in Toronto, Ont.

He was formerly with Canadian Industries Ltd. in Maitland, Ont.

Mr. Jardim graduated in electrical engineering from McGill University in 1952.

**M. B. Ferman,** Jr.E.I.C., has joined the staff of Superior Masonry Products Ltd. in Lethbridge, Alta.

He was previously associated with Burns and Dutton Concrete and Construction Co. Ltd. in Calgary, Alta.

Mr. Ferman graduated in civil engineering from the University of Alberta in 1952.

**E. H. Gilliatt,** Jr.E.I.C., is now instrumentman in the division engineer's office of Canadian National Railways in Campbellton, N.B.

He was previously an engineer in training with the company in Montreal.

Mr. Gilliatt graduated in civil engineering from the Nova Scotia Technical College in 1952.

**Chas. T. Wale,** S.E.I.C., has been promoted to the position of district manager of the B.C. Power Commission at Merritt, B.C. He previously held the position of assistant district manager in Port Alberni, B.C.

Mr. Wale is a graduate of the University of British Columbia in mechanical engineering, class of 1953.

**Wm. G. L. McAllister,** S.E.I.C., is now plant engineer with National Gypsum (Canada) Ltd. in Dingwall, N.S.

Mr. McAllister graduated from the Nova Scotia Technical College in mining engineering in 1953.

**H. Orlando,** S.E.I.C., has joined the staff of the Ontario Department of Highways at Hamilton, Ont.

Mr. Orlando graduated in civil engineering from the University of Toronto in 1953.

**Andre Chamberland,** S.E.I.C., is now an engineer on the staff of the Town of Plessisville, Quebec. He was previously assistant engineer for the Town of Drummondville, Que.

Mr. Chamberland graduated in civil engineering from Laval University in 1953.

**S. P. J. Dubeau,** S.E.I.C., is now a designer of electrical equipment with the Department of National Defence in Ottawa, Ont.

He was previously associated with Canadian Westinghouse Co. Ltd. in Granby, Que.

**Christopher G. M. Kirby,** S.E.I.C., has recently joined the technical staff of the temperature and radiation section of the physics department of National Research Council.

He was previously associated with the Montreal Engineering Company on the construction of Price Brothers and Company Ltd. power project at Chute des Georges.

**P. Francois Bisson,** S.E.I.C., has joined the staff of the engineering department of the Ste. Anne Pulp and Paper Company in Beaupre, Que.

**F. W. Parsons,** S.E.I.C., has joined the Iron Ore Company of Canada at Knob Lake, Que.

He was formerly associated with Standard Lime Co. Ltd. at St. Marc des Carriers, Que.

**L. E. Packham,** S.E.I.C., has joined the staff of A. V. Roe Canada Ltd. in Toronto.

## Visitors to Headquarters

**C. E. Howard,** M.E.I.C., Ottawa, Ontario, April 27, 1954.

**Alan E. Cameron,** M.E.I.C., Halifax, Nova Scotia, April 29, 1954.

**R. C. T. Stewart, M.E.I.C., Halifax, Nova** Scotia, May 5, 1954.

**E. Mason,** M.E.I.C., Trail, British Columbia, May 7, 1954.

**W. T. Butler,** M.E.I.C., Sault Ste. Marie, Ontario, May 13, 1954.

**R. R. Colpitts,** M.E.I.C., Moncton, New Brunswick, May 26, 1954.

**E. R. Jacobsen,** M.E.I.C., Sao Paulo, Brazil, June 4, 1954.

**W. O. Richmond,** M.E.I.C., Vancouver, British Columbia, June 4, 1954.

**George M. Dick,** M.E.I.C., Sherbrooke, Quebec, June 9, 1954.

**Marjorie Peebles,** Vancouver, British Columbia, June 11, 1954.

**A. Peebles,** M.E.I.C., Vancouver, British Columbia, June 11, 1954.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Paul Roderick Gransaull,** M.E.I.C., of St. Augustine, Trinidad, B.W.I., died on October 5, 1953.

Mr. Gransaull was born at St. Joseph, Trinidad, on January 15, 1881. After attending public and private schools, he served his apprenticeship for six years with H. R. Marwood, M.I.C.E., resident engineer for the Trinidad Government Railways. During that time he was engaged in the preparation of drawings, specifications and tracings; leveling, the taking of small surveys, setting out, supervising and measuring up work.

In 1904 he came to Canada where he joined the staff of Canadian Pacific Railways as topographer. During the following years he was employed as instrumentman with the Atlantic Quebec and Western Railway, as transitman with Canadian Pacific Railways at Moose Jaw, Saskatchewan and at the Winnipeg terminals, and as resident engineer at Souris, Manitoba and at Winnipeg. He was transferred to Edmonton, Alberta, in 1914.

In 1915 Mr. Gransaull returned to his native island of Trinidad and became assistant district engineer for the Siparia Railway Extension in St. Joseph. He moved to Port of Spain where he was employed as an engineering contractor and manufacturers' agent in 1921, and seven years later he was appointed general manager of the Palo Seco Oilfields in Palo Seco, Trinidad. In 1935 Mr. Gransaull was employed in Tunapuna, Trinidad, as road officer for the Tacarigua Local Road Board. He retired from active engineering work in 1949.

Mr. Gansaull joined the Engineering Institute of Canada as a Student in 1905, transferring to Associate Member in 1911 and to Member in 1940. In 1952 he was granted Life Membership in the Institute.

**Clayton Dewitt Dean,** M.E.I.C., former comptroller of taxation with Imperial Oil Limited, died at his home in Toronto on March 26, 1954.

Mr. Dean was born in Decewsville, Ontario, on June 28, 1888. After completing his elementary education, he attended the University of Toronto, where he received his B.A.Sc. degree in 1911.

During the summer months of his university training he was employed with the Grand Trunk Pacific, the Canadian Northern Railway, and Imperial Oil Limited.

After graduation he joined Imperial Oil Limited on a permanent basis as draughtsman and designer in Sarnia, Ontario. In 1912 he became engineer in charge of the company's construction at Fort William, Ontario, and a year later, he was appointed assistant to the chief engineer and the mechanical superintendent there. By 1916 he held the position of technical and process advisor to the directors on construction and manufacturing matters.

Mr. Dean was named vice-president and manager of Imperial Pipe Line Company Limited in 1928, and was appointed comptroller of taxation in 1933. He retired in 1950 after completing about 40 years of service with the company.

Mr. Dean was active in devising safety measures for loading and unloading trucks, one of which is the familiar use of ground chains on gasoline trucks to equalize static electricity, making it possible to transport gasoline on city streets with safety. He also made the first comprehensive analysis of cracking from large scale runs, as well as initial developments on vacuum distillation for improving lubricating oils.

Mr. Dean joined the Engineering Institute of Canada as an Associate Member in 1919, transferring to Member in 1940.

**James R. Paget,** M.E.I.C., president of Assiniboia Engineering Company Limited in Calgary, Alberta, died suddenly in Calgary on November 3, 1953.

Mr. Paget was born in Sundridge, Ontario, on January 21, 1884. After completing his high school education, he began his engineering career in 1902 as a rodman on construction work with the Canadian Pacific Railway. Two years later he became transitman on the construction of the company's double track between Winnipeg and Fort William.

During 1906 and 1907 he served as assistant city engineer at Monterey, Mexico, but returned afterwards to Canadian Pacific Railway construction work as instrumentman.

In 1908 he was appointed resident engineer in charge of the construction of the division yards at Watrous and Biggar on the Grand Trunk Railway. Two years later he was named assistant engineer in charge of a Canadian Pacific Railway location party which ran 1,460 miles of preliminary survey and 940 miles of located line in Saskatchewan, Alberta and British Columbia.

In 1914 he became resident engineer on construction, and two years later he was appointed assistant engineer in charge of field work on the Winnipeg aqueduct. In this latter position he constructed the cavity and pressure sections of the aqueduct, as well as the valve chambers and ventura meters. He served as locating engineer from 1919 until 1921 in the running of 620 miles of preliminary line and 218 miles of located line for the Canadian Pacific Railway, and in 1921 he became transitman on maintenance of way with the Medicine Hat subdivision.

In 1922 Mr. Paget entered into private practice and was engaged in making surveys and estimates on irrigation projects in Alberta and Montanna.

Mr. Paget in 1932 became president of the Assiniboia Engineering Company which has been engaged in contracting work in Ontario and Saskatchewan.

He entered into semi-retirement in December, 1952, and was active only in an advisory capacity for Assiniboia Construction Company Limited who took over the work of his own company, namely Assiniboia Engineering Company Limited and J. R. Paget and Company at that time.

He was a member of the Association of Professional Engineers of Saskatchewan.

He joined the Engineering Institute of Canada as an Associate Member in 1920, transferring to Member in 1940.

**Eric Morrell Coles, D.F.C.,** M.E.I.C., vice-president of Canadian Westinghouse Company Limited, vanished in his personal aircraft on April 12 while on his way to Vancouver, accompanied by his wife. The last message received from the Westinghouse executive came from 13,000 feet over the City of Seattle when Mr. Coles reported to ground control

**Eric Morrell Coles, M.E.I.C.**

that the engine had cut out. It is presumed that the aircraft crashed in the waters of Puget Sound.

Mr. Coles was born in London, England, on December 2, 1895. He received his early education in Vancouver public and high schools, and after a year at the University of British Columbia, he interrupted his course in 1915 to join the Royal Flying Corps. He proceeded overseas with the rank of lieutenant. When this branch of the Service was later changed to the Royal Air Force, Mr. Coles was subsequently promoted to the rank of captain and flight commander. He took part in more than one hundred bomber operational flights, and at the age of 21, was decorated with the D.F.C. for his service.

At the close of the war he resumed his studies at the university and graduated in 1922 with a B.A.Sc. degree in mechanical engineering. Immediately afterwards he was appointed an instructor and later, an assistant professor of electrical engineering by the University of British Columbia.

Mr. Coles joined the Canadian Westinghouse Company in 1926 as a design engineer in the synchronous motor and generator section of the engineering department and, in 1928, he was placed in charge of all patent activities of the company. He was named assistant to the vice-president in 1937; the assistant to the president in 1939; and vice-president in 1940.

After World War II was declared the training of sufficient numbers of flying personnel became a pressing problem for the Allies. The Empire Air Training Plan was launched and Mr. Coles' knowledge and experience in this field proved invaluable. At that time he was a vice-president and director of the Hamilton Flying Club and worked tirelessly in the training of fledgling pilots. He became vice-president of No. 10 Elementary Flying School and made a major contribution to the school's fine wartime record.

In 1944 he was appointed vice-president and director of engineering of the Canadian Westinghouse Company, and in 1948 he was elected a director of the company. Later positions were those of vice-president in charge of planning and development, and vice-president and general manager of the apparatus division.

Mr. Coles was a member of the American Institute of Electrical Engineers, the Association of Professional Engineers of the Province of Ontario, the Canadian Manufacturers Association, the Canadian Electrical Manufacturers Association, the Canadian Standards Association, and the Hamilton Chamber of Commerce.

He joined the Engineering Institute as a Student in 1922, transferring to Associate Member in 1926, and to Member in 1940.

**Walter James Poyner,** M.E.I.C., staff assistant and production manager of the Canada Starch Company in Cardinal, Ontario, died in the Brockville General Hosiptal on March 13, 1954, as a result of injuries sustained in a head-on collision near Iroquois on March 12. He and his wife had been motoring to Cornwall to attend the dinner-dance of the Cornwall Branch of the Engineering Institute.

Mr. Poyner was born in Montreal, Quebec, on August 2, 1915. After attending public school in Cartierville, Quebec, he went to West Hill and Westmount high schools in Montreal, and afterwards to McGill University where he graduated with a B.Sc. degree in chemical engineering in 1938.

Upon graduation he joined the Canada Starch Company and spent three years as a student engineer at the Pekin and Argo plants of the Corn Products Refining Company in Illinois. On his return he was appointed refinery superintendent in charge of manufacturing and refining of glucose, sugar, syrup and edible oil. Then, in 1947, he was named production manager and staff assistant, and as such, was responsible for the scheduling and co-ordinating of production in all departments, and for the supervising of warehousing, shipping and the operation of the plant railroad.

Mr. Poyner served as president and director of the Cardinal Consumers Co-operative Store. He was an active badminton and tennis player and also participated in many of the theatrical presentations of the Brockville Theatre Guild.

Mr. Poyner joined the Engineering Institute of Canada as a Member in 1952.

# Employment Service

**THIS SERVICE is operated for the benefit of members of The Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.**

**NOTICES appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.**

**REPLIES to advertisements should be addressed to File No. 000, Employment Service, The Engineering Institute of Canada, 2050 Mansfield Street.**

**INTERVIEWS with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged by appointment.**

## Situations Vacant

### CHEMICAL

A CHEMIST WITH a B.Sc. degree in chemistry or better with good background in organic chemistry, preferably with one or two years' experience in the pulp and paper industry, but not an absolute requisite. Duties include special analytical work, experimentation on cooking and bleaching of kraft base pulp, also on development of by products. File No. 4835-V.

GRADUATE CHEMIST REQUIRED TO BE trained as assistant to chief chemist. Plant located at Cardinal in Ontario in one of Canada's oldest food industries. Forward all details of experience, education, with pictures, and anticipated salary to File No. 4837-V.

CHEMICAL ENGINEERS required for research and development department of large world wide organization with plant located in Montreal. Duties to do development work on various products made from fibres or adhesives. This work will consist of improving our present operations and finding new methods of processing. A certain amount of research work on developing new products will be undertaken. File No. 4844-V.

CHEMICAL ENGINEER, required 1954 graduate with pulp and paper experience. Investigation of paper quality or production problems on both laboratory and mill scale, analysis of test date, development of test methods, etc. Working under the divisional chemist. File No. 4864-V.

### CIVIL

GRADUATE CIVIL ENGINEER wanted for municipal work in Alberta and Saskatchewan. Please submit details of experience and when available. Experience in water and sewer utility construction preferred. File No. 4811-V.

CIVIL ENGINEER required for Ontario Government to take charge under direction, of the administration of The Provincial Aid to Drainage Act throughout the Province. Should have experience with land assessments and understand the municipal drainage act. Position requires mostly office administration work, but some contact work with municipal officials throughout the Province is required. Full employee privileges available, including three weeks vacation, a day and one-half per month illness credit, and superannuation. Interested parties should apply in own handwriting giving full particulars of age, education and especially experience in the type of work to be performed. Salary can be set to suit qualifications of successful applicant. File No. 4812-V.

CIVIL ENGINEER, registered professional engineer with experience in municipal engineering required by firm of consulting engineers. Applicants must be capable of making detailed designs and supervising field crews. Work will be in Alberta from Edmonton office. Address all applications giving full details of qualifications, experience, references and salary required to File No. 4814-V.

CIVIL ENGINEER required for bridge design in a large transportation company with headquarters in Montreal. File No. 4850-V.

ASSISTANT CHIEF ENGINEER wanted for large construction company. Applicant must have thorough knowledge and experience in reinforced concrete design capable of estimating building of road construction and all branches of general construction work. Excellent salary to the right man. Good prospects for the future. Do not apply unless you are thoroughly experienced. File No. 4853-V.

CIVIL ENGINEER REQUIRED by the technical co-operation service department of Trade and Commerce, Ottawa. Canada, to serve in Burma. The union of Burma has plans for an expansive scheme in Hydro Electric development. The engineer should be Canadian and will act as special advisor to the chairman of the Burmese electricity supply board to review the designs and specifications and supervise general construction. Salary would be in the range of $14,000 to $17,000 per annum. Free furnished accommodations, cost of internal travel, free hospital and medical treatment. File No. 4857-V.

CIVIL ENGINEER required, preferably recent graduate of McGill University with at least one year's experience in the field. Will be sent to U.S.A. for two months to study the methods of operation, after which time he would be attached to Montreal office. Applicant must be Canadian. File No. 4860-V.

ENGINEER CIVIL PREFERABLY, wanted for young progressive construction company. Preferably one with experience in sewage and water supply as well as cement work as we are specializing more in this line of work. When replying, please state age, graduation and experience. File No. 4865-V.

### ELECTRICAL

SALES ENGINEER required by well established and highly respected company in the field of scientific illumination. Duties, after a specific training period of approximately two years duration, will involve the sale of prismatic lighting units and the discussion of lighting applications with architects, consulting engineers and electrical contractors, officials of industrial and commercial firms, municipal and hydro offices. Qualities of personality, diligence, and dependability along with a sincere desire for a permanent career in the lighting industry are of prime importance. File No. 4807-V.

ELECTRICAL ENGINEER with several years experience required mainly with experience on production engineering of electronic equipment. Salary would commensurate with the applicant's experience and qualifications. File No. 4862-V.

THREE ELECTRICAL ENGINEERS to work on progress reports, the study of time costs, coding for time and equipment reports for large construction job located in Labrador. File No. 4867-V.

SENIOR ELECTRICAL ENGINEERS required by contractor working in Labrador. Applicants should be fully familiar with the installation of equipment for power plants. File No. 4867-V.

TORONTO MANUFACTURER requires a designer for aircraft electrical systems: A.C. and D.C. generators and motors, regulators and protective devices. A degree in electrical engineering or equivalent in design experience is essential as work includes basic design calculations. Familiarity with A.N. specifications a real asset. Reply with full particulars and salary required to File No. 4870-V.

ELECTRONIC ENGINEERS required for attractive positions. Degree in electrical engineering or equivalent, 5 to 10 years general experience with 1 to 5 years specific radar experience. Supervisory ability, able to maintain liaison and work efficiently under pressure. Canadian citizenship or British nationality a requisite. Attractive employee benefits. File No. 4874-V.

### MECHANICAL

MECHANICAL ENGINEER $6,420. to $7,200, department of Public Works, Ottawa. Details and application forms at your Civil Service Comm. Office, National Employment Office, Post Office and University Placement Office. Quote competition No. 54-1202. File No. 4805-V.

PROFESSIONAL ENGINEER preferably mechanical but not necessary required by real estate organization. Age 40 to 50 years with experience where work would result in the greatest general knowledge of different types of industry, or allied work. Ability to meet and sell senior industrial executives. Group commission plan. Applicant will be trained to become assistant manager of the department. Location Toronto, a knowledge of the Toronto area would be helpful. File No. 4821-V:

ENGINEER REQUIRED BY large beverage company located in Montreal with experience in all types of material handling. Top salary to right man with all benefits. Mechanical preferred. Age 35-45 years, bilingual if possible. File No. 4834-V.

DESIGN ENGINEER WITH minimum eight years' experience in gear design and automotive transmissions. Age 45 or under. Must be creative and willing to do actual design work on board. File No. 4842-V.

DESIGN ENGINEER WITH minimum eight years' experience in the design of farm tractors or other farm equipment. Must be creative and willing to do actual designing on the board. Age 45 or under. File No. 4842-V.

DESIGN ENGINEER WITH minimum eight years' experience in the design of internal combustion engines, preferably as applied to tractors. Age 45 or under. Must be creative and willing to do actual design work on board. File No. 4842-V.

DESIGN ENGINEER with minimum eight years' experience in hydraulics preferably as applied to tractors. Age 45 or under. Must be creative and willing to do actual design work on board. File No. 4842-V.

PLANT FACILITIES ENGINEER required for a major appliance manufacturer. Graduate mechanical engineer with a minimum of 3 years' machine design and a sound knowledge of electrical welding and substations. A challenging position is offered to a person capable of initiating and carrying through cost reduction, machine and process improvement including working with maintenance supervisors on installation and maintenance. Age to 45. Salary commensurate with ability. File No. 4845-V.

POWER PLANT EQUIPMENT sales engineer, mechanical graduate of Canadian university, wanted to form own company to sell and later to assemble in Eastern Canada, power plant controls and instruments. Prominent American manufacturers launching extensive expansion program of sales and service in Canada. Several years experience in sales to power plants or in operating steam plants essential. Any personal capital advantageous. File No. 4849-V.

CHIEF MECHANICAL ENGINEER, salary up to $7,200. required by Department of National Defence, Ottawa. Details and application forms at your nearest Civil Service Commission office, National Employment Office and University Placement Office. Quote Competition No. 54-1204. File No. 4855-V.

MECHANICAL ENGINEER required in mechanical department to teach machine design and physical metallurgy among other subjects. Applicant should have his M.S. in M.E. The faculty rank of the position will depend upon the qualifications of the person engaged. A properly qualified individual can expect to be the head of the department in 4 or 5 years. One with less experience will be given a contract as an instructor or assistant professor. File No. 4863-V.

MECHANICAL ENGINEER required by outstanding worldwide industrial organization engaged in research and development in the field of aero and thermodynamics. Excellent opportunity for graduate engineer and preferably one who has specialized in thermodynamics. File No. 4875-V.

MECHANICAL ENGINEER, one with 2 or 3 years experience preferred but not essential, for modern sulphate pulp mill, located north shore Lake Superior on C.P.R. main line and highway 17. New attractive Townsite, housing or firts class hotel accommodation at subsidized rates. Good recreation facilities and benefit plans. Well established engineering department offering good future and working conditions, five day week. Write giving full particulars to File No. 4879-V.

MISCELLANEOUS

THREE SALES ENGINEERS required by manufacturer of multiwall Kraft bags and related paper products. 1954 graduates to 3 years of experience. Training period in Montreal. Subsequent work in variety of locations. File No. 4777-V.

CHEMICAL OR MECHANICAL ENGINEER with from two to five years experience on industrial maintenance work. The position is in the maintenance department working as a project engineer on projects on the maintenance of the buildings and equipment of the plant, including some design work in the nature of alterations and improvements. Location P.Q. File No. 4808-V.

SENIOR DESIGNER required for work on steam boilers and associated equipment. Applicants should have 3 to 5 years recent experience in this field. The work will include the detailed handling of contracts, and the design work necessary for the preparation of proposals and specifications. The applicant should be conversant with heat transfer as it relates to steam power equipment. A knowledge of work on pressure vessels and heat exchangers will be desirable. Location Toronto. File No. 4810-V.

QUALITY CONTROL SUPERVISOR required in Montreal. A Canadian manufacturer of fibres, adhesives and plastics is seeking a graduate engineer with industrial experience in quality control and knowledge of statistical methods. This key position with a future requires a man with ability to plan, organize and supervise all of our quality control activities and to carry out liaison work with our American parent companies. Bilingual required. Salary will be negotiated. All inquiries and applications will be treated in confidence. Please send a complete resume of your educational background, work experience, personal data and references etc. to File No. 4813-V.

FEDERAL CIVIL SERVICE requires a number of engineers for employment as patent examiners at Ottawa to undergo training in patent law and patent regulations in force in Canada, and then to assume the responsibility for the examination of applications for patents in the field of engineering with a view to making recommendations for the award or denial of patents. The desirable qualifications include a bachelor's degree in applied science with specialization in mechanical, chemical or electrical engineering from a university of recognized standing. File No. 4815-V.

ENGINEERS ARE REQUIRED by the International Economic and Technical cooperation Division, Ottawa Canada for the government of India. Mechanical and Civil graduate engineers with particular experience in connection with hydroelectric design, preferably for high dams, having had responsible charge of the work of design groups involving supervision of planning and scheduling work of subordinates and of the execution and adequacy of designs. The Bhakra-Nangal project is a multi-purpose river valley development scheme for harnessing Sutlej River waters to extend irrigation. File No. 4817-V.

SALES ENGINEER required by a growing organization in the compressor and compressed air equipment field. Area would be South Central Ontario. Straight salary basis. File No. 4818-V.

U.N.E.S.C.O. HAS BEEN requested for assistance in recruiting suitable candidates for vacant university professorships abroad. Burma: agronomic chemistry and soil chemistry. India: economics, civil, mechanical and e ectrical engineer. Indonesia: technological subjects. Israel: hydraulics and/or sanitary engineering, electrical (Electronics and telecommunication), mechanical, mathematics, general mechanics, and oscillations, metallurgy, aircraft structures, aircraft propulsions (applied aerodynamics). Turkey: electro-technics hydraulics (power), roads and communications, construction and building materials. Uruguay: construction of buildings. Venezuela: roads and communications, hydraulics (construction), building material and soils. File No. 4819-V.

MANUFACTURER OF complete line of industrial, electrical motor control equipment has just completed a new plant in Galt, Ontario. Competent sales engineers are required for Ontario and Quebec territories. Applicants should have electrical mechanical or engineering business training. File No. 4820-V.

SALES ENGINEER is required by a prominent Canadian electronics manufacturer. This man must be a recent graduate in physics, engineering physics or chemistry and have sales experience or aptitude. The product is a wide range of high quality electronic research and control equipment and the sales territory includes all Quebec. Industrial centres with headquarters in Montreal. Reply should include details of age, experience and education. A recent photograph should be included if possible. File No. 4822-V.

ENGINEER REQUIRED WITH experience in methods and standards. Applicant should have a good technical and work shop training with a knowledge of time study. Location Ontario. Manufacturer of machine tools. File No. 4823-V.

STRUCTURAL ENGINEER with a few years experience for consulting office in Montreal. Inside and outside work, design, calculation, drawing and supervision. File No. 4825-V.

THE PAKISTAN INDUSTRIAL DEVELOPMENT Corporation invites applications for position of works manager for their paper mills at Chandraghona. File No. 4827-V.

THREE DESIGN engineers required by department of Transport Ottawa. Structural, electrical, mechanical to design and develop program for new airport terminal buildings, across Canada, and also modifications to existing terminal buildings. File No. 4832-V.

MECHANICAL OR CIVIL engineer with a minimum of five years up to ten year's experience to undertake work supervising installations, etc., which would be engineered in our engineering department. File No. 4835-V.

SENIOR PLANNER REQUIRED by suburban planning board, London, Ontario for preparing physical phases of comprehensive plan and supervising routine subdivision and zoning work. Graduate in planning, civil engineering or architecture preferred. Salary in accordance with experience and training. State qualifications, references and salary expected to File No. 4838-V.

PATENT FIRM long established in Ottawa has a vacancy for young engineer, preferably chemical or electrical. Some experience in patent matters is desirable but not essential. Replies should outline qualifications and experience and should state age and marital status. File No. 4839-V.

THREE TECHNICAL SALES TRAINEES required to understudy various positions throughout the sales organization which include inside representative, field salesman, technical serviceman, sales administrator. Graduate from Canadian University '52, '53 or '54. Location Toronto initially, could be located in any one of six major Canadian cities. File No. 4840-V.

SALES DEVELOPMENT engineer, mechanical, civil or metallurgical required for sales force of long established fabricating plant. Experience in pulp and paper mill or mining field an asset. Location Montreal with considerable travelling. File No. 4843-V.

CHEMICAL OR MECHANICAL ENGINEER, recent graduate, required by oil company in Montreal. Age limit 25-32. Preferably bilingual and car owner. Salary depending upon qualifications. File No. 4846-V.

ENGINEERING LIBRARIAN required to operate technical library with staff of seven, serving aircraft engineering department of 750 personnel. Applicants should have an aeronautical engineering degree or the equivalent aeronautical engineering experience, library training and direct experience in the operation of a technical library. Replies should indicate training and experience in detail, and salary requirements. File No. 4848-V.

LECTURER OR ASSISTANT professor of chemical engineering required to give unit operations course with laboratory and design calculations course to junior and senior year classes. Time available for graduate study and research. Industrial experience desirable but not requisite. Salary dependent upon qualifications. Apply Nova Scotia Technical College, P.O. Box 1000, Halifax, Nova Scotia. File No. 4851-V.

RESEARCH ENGINEER required by Saskatchewan Department of Mineral Resources $326-$397 per month. Recent graduate in ceramic, chemical or geological engineering; to carry out lab. and pilot scale experimental work, field exploration, and economic surveys dealing with the non-metallic or industrial minerals of the province. Good pension plan and conditions of employment. For further information and application forms contact the Public Service Commission, Legislative Building, Regina. File No. 4852-V.

CIVIL AND/OR MECHANICAL engineer required by a firm of consulting engineers in Western Ontario. Preference given those with experience in municipal engineering and sewage treatment plant design, or commercial and industrial building design. This position can lead to an interest in the firm if qualifications are sufficient. All replies treated with strict confidence. Please provide complete outline of experience and background with first letter. File No. 4854-V.

RESEARCH PHYSICIST or engineer required by the Pulp and Paper Research Institute of Canada to take charge of a long-range project now being initiated on the fundamentals of mechanical pulping, i.e. the factors governing the mechanical separation of paper making fibres from wood. Necessary qualifications will include a post-graduate physics or engineering degree with emphasis on mechanics and mathematics; experience in planning, executing, and reporting research projects, and the ability to confer with mill staffs on the practical data pertinent to the problem. Salary will be commensurate with training and experience. File No. 4856-V.

ENGINEER REQUIRED by paper board converter organization manufacturing a wide variety of cardboard containers and special packaging. Duties include a considerable amount of machine design and in addition to investigate a preventative maintenance program to cover all production equipment. Applicant should be prepared to continue on as assistant engineer in the engineering department. Salary would be based on qualifications. The location will be London, Ontario. File No. 4858-V.

PRODUCTION MANAGER required for manufacturers of aluminum doors and windows. Someone experienced in this phase of work would be appreciated, but not absolutely necessary. Applicant should be 30 years of age or over and bilingual. Salary is open, depending upon qualifications. File No. 4861-V.

CHIEF PLANT ENGINEER required for a senior position. Applicant must be a graduate engineer with extensive experience on design and construction of office and plant buildings and plant mechanization and be capable of planning and guiding the work of a large department. File No. 4866-V.

GRADUATE CHEMICAL or mechanical engineer required preferably with three to four years chemical plant experience to act as project and assistant to the chief engineer. Plant is situated 40 miles west of Montreal. Duties will involve about 50% of the time on bottling and packaging installations, maintenance, cost studies and methods improvements, project engineering involving estimates, upkeep and installation of boiler house operations, grain handling and milling distillation, and ware housing, and including all services, such as air, water and steam. File No. 4868-V.

MECHANICAL OR MINING ENGINEER required by small expanding sales engineering company backed by large financial organization, handling conveyors, belts, transmission equipment and related items to mines, quarries, and larger industrial organizations. Applicant should be 25-35 be prepared to travel in Ontario and Quebec, operate from Montreal primarily and later to open Toronto office. Salary and commissions with travelling paid, set on incentive basis, with no top limit. Average man should earn minimum $6,000.00. State qualifications and availability. File No. 4869-V.

SENIOR TIME STUDY engineer required by a progressive plant in south western Ontario. A production engineer 28 to 35 years of age to head their time study department. Applicants should state experience, age and salary expected. File No. 4871-V.

ASSISTANT TO HEAD OFFICE sales division manager required by well established Montreal Engineering and manufacturing firm. A man between 25 and 35 to assist in industrial marketing with emphasis on technical applications and sales supervision. Must have a minimum of five years experience, with particular reference to sales application in electronic and mechanical fields. Graduate engineer preferred; but not essential provided adequate background exists. Analytical and visualization aptitudes along with clarity of written expression are most essential. File No. 4872-V.

SALES ENGINEER wanted by established transformer manufacturer, for Montreal district. Bilingual preferred. State age, education, experience and salary required. File No. 4873-V.

MEMORIAL UNIVERSITY OF NEWFOUNDLAND, St. John's, invites immediate applications for the following position to take effect in September 1954. Assistant or Assistant Professor in the Department of Engineering. The duties would include lecturing and laboratory supervision. The subjects of instruction are drawing, surveying and mechanics. The university has a liberal pension scheme and a generous sabbatical leave programme. Appointments are provisional for the first two years. Travel expenses to a maximum of $750.00 will be paid. Immediate applications or requests for information should be sent by airmail with curriculum vitae and names of three references. File No. 4830-V.

FOUNDRY METALLURGIST required by large manufacturing concern in Montreal, operating steel cast iron and bronze foundries. Experience desirable but not essential. File No. 4876-V.

SENIOR ELECTRONIC ENGINEER with degree in physics or electronics from a recognized university with at least five years experience in electronic circuit design. British subject preferred. Salary commensurate with ability. Send resume to File No. 4877-V.

## Situations Wanted

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. (E.E.) McGill 1950, age 26, single, bilingual, C.G.E. test course graduate. 6 months transformer designs. 2½ years assistant electrical superintendent on construction of industrial plant. Desire work of permanent nature with responsibilities commensurate with experience. File No. 385-W.

ELECTRICAL ENGINEER, Jr.E.I.C. B.Eng. (McGill '50), age 26, married, since graduation employed by firm manufacturing pulp and paper mill machinery with experience including design, production and engineering sales. Desires responsible position with electrical firm offering an opportunity to specialize in the electrical power field. Location Montreal preferred but will consider locating anywhere in Canada. File No. 730-W.

STRUCTURAL STEEL DETAILER REQUIRES immediate employment anywhere in Canada; now in Toronto. Long term preferred, short term accepted. Have capacity for checking, supervision, estimating, and sales. Contract tenders submitted. M.E.I.C., P.Eng. (Que.) File No. 1935-W.

GRADUATE ENGINEER, B.A.Sc., M.E.I.C., P.Eng. (Ont.) seeks technical development work as assistant to works manager or chief engineer of medium sized company. Experience includes office work and training course with Canadian electrical manufacturer, for years in Canadian patent office, and ten years varied work on technical phases of design, development and manufacture of domestic refrigeration and other products. Recent aptitude testing confirms suitability for this type of work. Present earnings $7,500. File No. 1953-W.

PUBLIC UTILITY ENGINEER, nine years experience, water, hydro, gas, sewerage. Present contract expires June 1954. Supervising $3 million project including preparation rate structure, construction, design, purchasing. Canadian, aged 40, married. B.A.Sc., M.E.I.C., C.E., P.Eng. Desires position as public utility engineer or staff consultant anywhere in Canada. File No. 2468-W.

MECHANICAL ENGINEER M.E.I.C., P.Eng. (Que.) 8 years experience including 3½ years with a telecommunications manufacturing concern, checking mechanical design, supervision of prototype work and liaison with factory. Interested in obtaining position with responsibility and scope for advancement, preferably in electronic or allied industry. Apply in writing to File No. 2829-W.

ELECTRICAL ENGINEER Jr.E.I.C., P.Eng., B.Sc. (E.E.) Manitoba 1950, age 30, married, one child. 1½ years experience on induction motor design. Over 2 years experience in the supervision of transformers. Also gained experience in the specifying and supervision of installation of new testing equipment. Interested in securing a responsible position in Western Canada with either a manufacturing firm, a utility, or a governmental branch, preferably in Regina or Winnipeg. Available on one month's notice to present employer. Complete qualifications upon request. File No. 3309-W.

GRADUATE MECHANICAL ENGINEER, Sask. 1948, Jr.E.I.C., married, R.C.A.F. veteran. Three years experience in production control, method analysis, time study, cost control and industrial relations. Also some experience in steel mill maintenance. Three years experience on construction jobs supervising mechanical installations including heating, ventilating and plumbing trades, boiler installation, water treatment and mine installations. Desires position with firm requiring above mechanical experience and/or opportunities for design with consultant firm, preferably in central Canada. File No. 3516-W.

MECHANICAL ENGINEER, Jr.E.I.C., P. Eng., B.E. 1950, single, age 27, bilingual, presently employed as assistant chief engineering draughtsman with wide responsibilities, 30 months diverse experience prior to graduation in pulp and paper and automotive industries. Seeking position with increased responsibility would consider overseas assignment. File No. 3931-W.

MECHANICAL ENGINEER, Jr.E.I.C., P. Eng., 1950 honours graduate, age 27, married. One year's experience in the operation and administration of a small railway system including some supervision of personnel. Three years experience on layout and design of machinery utilizing air, hydraulic and electrical power supplies, and the setting up of controls for same. I have been responsible for the planning, layout, design and field installation of equipment in several large plants. Interested in a position involving design and development work, production engineering or plant engineering with the opportunity to take on responsibility. File No. 3975-W.

EMPLOYERS are you looking for a potential future executive in production or management? Ambitious professional engineer (electrical) with the following qualifications desires change of employment with future possibilities of primary importance McGill 1951, age 26, married, C.G.E. test course, wire and cable engineering, presently employed as assistant project engineer with large chemical manufacturer. File No. 4014-W.

CHEMICAL ENGINEER, McGill 1950, Jr. E.I.C., P.Eng., 3½ years experience in control, development and operation. Desires permanent position with promising future. Development work preferred, but would consider other offers. File No. 4042-W.

CHEMICAL ENGINEER, Queens' 1949, Jr. E.I.C., veteran, 33, married. Three years supervisory experience in the development, control and production phases of a large chemical plant. Desire the same type of experience in another manufacturing field. Canadian or Foreign. File No. 4166-W.

MECHANICAL - CHEMICAL ENGINEER, (M-Eng.-Dresden-Karlruhe) M.E.I.C., P. Eng. Former lecturer at McGill. 15 years experience as plant engineer and assistant manager in heavy industrial and chemical plants. Process and design for chemical plants. Bilingual. Single. Location anywhere. File No. 4183-W.

CIVIL ENGINEER, B.A.Sc., P.Eng., Jr E.I.C., seeks position with contractor or manufacturer. Five years concentrated experience civil and mechanical design, estimating, supervision. Am interested in position with opportunities in Ontario. Presently employed. Available upon reasonable notice. File No. 4191-W.

MECHANICAL ENGINEER, M.E.I.C., graduated, married, sound Canadian practice, twenty years experience includes: design, estimating in piping, heating, ventilation, air conditioning, refrigeration plumbing, steam and powerplant installations. Experience in manufacturing industry, foundry, boilers, pressure vessels, pumps, compressors, valves, shopwork, paper and pulp industry construction. Capable for administrations, organizing, supervision, sales. Desire a position of responsibility suitable to past experience with possibilities for advancement. Location in Montreal. Available on one month's notice. File No. 4211-W.

MANAGEMENT ENGINEER, M.E.I.C., age 39, family. Queen's 1936, B.Sc. (Hon.) mechanical, P.Eng. (Ont.). Seventeen year's industrial experience, eight years in aircraft, three years in bus and five years in miscellaneous sheet-metal manufacture; last year spent in light construction industry operating own business. Experience includes all phases of factory operation as well as top level general management assignments. Good record in organization work, labor relations and product development through all phases of design, tooling, material and production control, sales cost accounting and management control. Seeking management career opportunity, any location domestic or foreign with Southern Ontario preferred. Available on short notice. File No. 4219-W.

ELECTRICAL ENGINEER, B.A.SC. (UBC, 1951), age 29, experience: design and development of induction motors, power stations, high voltage switchgear, surveys of manufacturing and test facilities, training course with large manufacturer; desirous of improving present position; supervisory, administrative, junior executive jobs preferred. File No. 4239-W.

1943 GRADUATE IN CIVIL ENGINEERING University Berlin, age 34, married, 2 children. Specialization in hydraulics, 7 years experience in design of navigable waterway, dams, locks and hydro power stations, hydraulic research and hydraulic laboratory work, and also river regulations and water supply. File No. 4244-W.

CIVIL ENGINEER, Jr.E.I.C., P.Eng. (Que. & Ont.), married, age 30, presently employed, with 8 years experience ranging from construction of residential, industrial and commercial bldgs.; design of timber structures including glue laminated members; considerable purchasing cost accounting, job liaison, estimating, and responsibility for complete execution of contracts, desires position where diversified abilities may be best utilized leading to future advancement in responsible position. File No. 4254-W.

SALES ENGINEER, graduate mechanical engineer, married with family, good personality, initiative, keen business acumen, very adaptable, bilingual, 10 years diversified technical sales experience, general machinery equipment, sheet metal, ball bearings, heating equipment, experience in all types of material handling, desires position with opportunity. Available on short notice. File No. 4300-W.

CHEMICAL ENGINEER, 32, B.A.Sc. (Hon), P.Eng., Jr.E.I.C., veteran, 1½ years process and quality control supervision, 2½ years process development in cellulose products, lacquers and solvent recovery, 3 years business experience, desires responsible position preferably in Southern Ontario, supervisory and/or technical. File No. 4391-W.

CIVIL ENGINEER, D.L.C. (Hons), M.E.I.C., P.Eng. (Ont.); G.I. Struct. E., awaiting election to A.M.I.C.E. Age 28, single. 6 years experience on construction of dry dock and deep-water quay, power station, air fields, bridge, roads, railways; surveys, design of steel piled cofferdams, track layout and construction schemes. Responsible for supervision of layout, construction, concrete inspection, pile driving, under-water drilling, pressure-grouting, test boreholes, and diving operations. Measurement of quantities and cost reports. Presently employed as area engineer on construction of chemical plant. Seeks position of responsibility suitable to past experience. Location anywhere in Canada. File No. 4420-W.

ELECTRICAL ENGINEER, M.E.I.C., A.M. I.E.E., British, 37 years of age, with considerable experience in the design and development of naval and associated installations, also in testing of all types of shipboard equipment and preparation of test programs, data, etc.; and also having considerable experience of servo mechanisms and other remote control devices, including railway power signalling systems; having been responsible at various times for preparation of specifications, quotations, purchase orders, estimates, etc.; and having supervised the activities of junior engineers, draughtsmen, technicians and electricians in various capacities; seeks a lucrative and responsible post in August, 1954. Will serve anywhere, and would be fully prepared to travel extensively, if necessary. Seeking a post which will lead to a senior position and permanency. File No. 4441-W.

MECHANICAL ENGINEER, M.E.I.C., P. Eng., married. 20 years experience industrial equipment layout, mills crushing plants, smelters, handling equipment, design and supervision of design and construction. Two years plant engineer. Location preference Toronto area. Desires position in engineering office as supervisor or assistant in plant layout and design. File No. 4442-W.

CIVIL ENGINEER, M.Sc., 1931, technical University of Warsaw, A.M.I. San.E., war veteran, age 48, 15 years experience in hydraulic works, water supply and sewerage, formerly residing in Great Britain and nearly one year in Canada. Seeks position with a municipality or a firm which offers a good opportunity for advancement. Location secondary, available in two weeks notice. File No. 4443-W.

GRADUATE MECHANICAL ENGINEER, McGill 1950, with master of business administration degree, University of Michigan 1954, looking for a career with a progressive company. Three and a half years experience in industrial engineering and also summer work in several industries. Would want to start in production or industrial engineering work. File No. 4444-W.

MINING ENGINEER, P.Eng. in Alberta, M.E.I.C., Jr.C.I.M.M., graduate 1951, age 30, married, veteran. Practical experience in steel work in shipyards, carpentry, contracting and sales. 2 years experience in geophysics for major oil company. Experience in water and sewerage systems and mining exploration. Highest references. Very versatile. Desires permanent position with responsibility and advancement. Preferably in Alberta. File No. 4445-W.

ELECTRICAL ENGINEER, Jr.E.I.C., 31, McGill 1950, P.Eng. (Ontario), 3½ years experience in electrical layout and design of plant distribution and services and design of automatic sequincing control for process equipment in automotive industry, desires work with consulting firm or industry with diversified and interesting work. File No. 4448-W.

ENGLISH CIVIL ENGINEER B.Sc. (Hons.) A.M.I.C.E., aged 27. Hoping to emigrate to Canada with wife in May, desires responsible job in connection with the design of water supply and sewage schemes in which he has experience. Would also consider site control work in this field and would prefer to work in Vancouver district although other facts considered. File No. 4449-W.

CIVIL ENGINEER (M.Sc., P.Eng.), University of Warsaw, Poland, age 41, presently employed. Twelve years successful experience in structural designing, which includes 8 years of site supervision. Seeks opening with progressive firm. Specialist in prestressed concrete. Bilingual. Three years Canadian experience as senior designer. Available on short notice. File No. 4450-W.

CONSTRUCTION ENGINEER, M.E.I.C., age 45; no dependents, 30 years general construction and mechanical experience, 21 since graduating, 10 years sales. Extensive public speaking, lecturing and public relations experience. Now completing an operation. Free to travel or relocate anywhere, Canada or foreign. Prefer north country, frontier or foreign—general construction, townsite, supervisory, public relations. File No. 4451-W.

CIVIL ENGINEER, S.E.I.C., B.Eng. McGill 1953, with construction and field work experience, seeks position in the field preferably on construction. Single, willing to work anywhere in Canada. File No. 4452-W.

CIVIL ENGINEER, Jr.E.I.C., N.S.T.C. 1952, veteran, age 28, married. Approximately one year experience in surveying and drafting for road construction job, and one year working with municipal type of construction and maintenance. Seeks employment with either consultant engineer, municipal engineer, or town planner, doing calculations, designing, and drafting. The possibility of technical experience derived is of paramount importance. File No. 4454-W.

CIVIL ENGINEER, N.S.T.C., 1949, M.E.I.C., P.Eng., provincial land surveyor of Nova Scotia and New Brunswick, age 27, veteran, married, 2 children. Experience survey of naval base construction; instrumentman on construction of train boat, gypsum disposal plant, topographical survey; resident engineer on construction of services for 100 houses project; 3 years resident engineer on highway construction, both subgrade and pavement; 1 year office engineer on materials takeoff, ordering, and control; 1 year design of industrial buildings, municipal services, specification writing, project supervision. Present work expected to terminate in May. Prefer construction or associated work with a good future. File No. 4455-W.

EXPERIENCED CONTROL ENGINEER, B.Sc. electrical engineering, Laval University 1947. One year post graduate studies in servomechanisms electronics and network theory, Ohio State University. Age 30, married. Six years experience in U.S.A. on design and development of control systems such as auto-pilots, remote flight control systems, speed and voltage regulators for inverters and air turbine driven alternators. Also design experience on magnetic amplifier. Circuits. Canadian citizen desires to return to Canada and will consider any reasonable opening with Canadian firm. Would prefer position involving both administrative and technical duties and a certain amount of travel. Preferred location Montreal area. File No. 4461-W.

MECHANICAL ENGINEER (Technikum Winterthur, Switzerland, grad. 1949), 29, married. Experience in welding, design and estimating of pressure vessels, platework, piping. Completely familiar with ASME and API codes, high pressure water tube boilers. Capable of supervision desires responsible position in office or shop, vicinity of Edmonton, Calgary or Vancouver. File No. 4465-W.

CIVIL ENGINEER, Jr.E.I.C., now interested in broadening his background. Five years experience in surveying for many purposes, including construction and pulp and paper manufacture. Very much interested in design. Available April 30th. File No. 4466-W.

CIVIL AND STRUCTURAL ENGINEER, M.A., Cambridge University, graduated 1947, professional engineer (Ontario) Jr. E.I.C., 6½ years experience civil and structural engineering in industry, consulting engineering and research. First class administrator with considerable organizational experience. Expert in structural analysis and design in both steel and concrete. Specialist in prestressed concrete. Presently employed in Toronto, and would prefer to remain there, or would represent Canadian organization in England. Position of responsibility required, where good use can be made of organizational ability and where there is opportunity for advancement. File No. 4467-W.

MECHANICAL ENGINEER, married, age 43, M.I.M.E., Ch.Eng. attached to Dutch Merchant Navy during second world war. Twenty-five years experience in construction, operation and maintenance of high pressure steam plants, turbo generators, diesel engines and refrigeration plants. Available on one month's notice. File No. 4468-W.

CIVIL AND SOIL MECHANICS ENGINEER, Jr.E.I.C., B.Sc. with post graduate studies. Age 34, married, 3 children. R.C.A.F. veteran. 6½ years experience. Experienced in organizing soil mechanics laboratories, lab testing, interpretation of laboratory results. Slope and slide investigations. Supervision of drilling and foundation investigations for dams, buildings, highways. Earth and concrete materials investigations. Retaining walls, earth and concrete dams. Tunnelling in clay. Deep shafts in clay and gravel. Studies in open channel flow. Reinforced concrete. Reports, design and supervision of construction. Mathematically inclined. Some knowledge of German. Available after May 15th. File No. 4469-W.

BRITISH GRADUATE (Electrical) 45 years of age, married, 1 child, 5 years in Canada; P.Eng. M.A.I.E.E., M.E.I.C., etc., formerly specialist in electric traction but very adaptable and with wide experience in other engineering realms; has initiative, pleasing personality, good contact man; possesses diploma in salesmanship; good liaison engineer, correspondent, writer of specifications, reports and articles; highest references, desires scope for advancement; now resident near Montreal. File No. 4470-W.

GRADUATE MECHANICAL ENGINEER, 34 years of age desires position where high quality design work is appreciated. Experience as follows: Internal combustion engines 3 years, chemical plant machinery 3 years, agricultural machinery 2 years, at present mining equipment. File No. 4471-W.

MECHANICAL ENGINEER, SASK. 1947, Jr.E.I.C., P.Eng. (Que.), age 31, with 7 years experience sales and application heating, ventilation and air-conditioning with large Canadian firm. Industrial consulting and public building mechanical specifications, desires position with consulting engineers or architects. Location Ontario or Western Canada. Available on reasonable notice to present employer. File No. 4472-W.

ELECTRICAL OR MECHANICAL SALES. P.Eng., S.E.I.C., B.A.Sc., U.B.C., mechanical 1951. Graduates test course with C.G.E. One year preparing for outside sales, over one year successfully selling full range of electrical power apparatus in Toronto and Western Ontario for large nationally known electrical manufacturer. Experience with steam turbines, pumps and various other types of mechanical equipment. Excellent executive valuation report, together with business and education resume sent on request. Desire position leading to outside sales work or managerial position with progressive company in British Columbia or Alberta. File No. 4473-W.

RESPONSIBLE POSITION WANTED by graduate chemical engineer, McGill 1949. Presently employed by pulp mill engineers, supervising field and layout work. Veteran, age 32, with industrial and direct selling experience. Has proven initiative and willing to accept responsibility. Desires position providing executive training and a challenge. File No. 4474-W.

ELECTRICAL ENGINEER, graduate 1949, power and machinery, Edinburgh, Scotland. M.E.I.C., grad. I.E.E., Whitworth Prizeman, age 29, married, two children. 5 years electrical engineering apprenticeship, 3 years electrical draughting, 3 years electrical engineer. Experience on rural and urban distribution, construction, maintenance and operation, H.V. and M.V. lines, cables, substations and associated gear, estimating, profile surveying, pressure testing, fault location, etc. Also inspection, testing and maintenance of all types industrial electrical machinery and cabling in paper mills, quarries and other industry, i.e. generators, motors, switchgear, transformers, elevators, etc. Desires employment on either distribution work plant maintenance or with consulting engineer, commencing beginning of September. File No. 4475-W.

CHEMICAL ENGINEER B.A. 1937, B.A.Sc. 1938, U.B.Sc., P.Eng. (Ont.), member of the Chemical Market Research Association, married with 2 children desires responsible position chemical or allied industry. Diversified experience in explosives, pulp and paper and plastics. Most interested in development type of work or production. Well experienced in preparation of reports on markets and economics. Resume of experience on request. File No. 4476-W.

CIVIL ENGINEER P.Eng., Jr.E.I.C., with two years experience in reinforced concrete, detailing and design. Seeks part time employment in Montreal area. File No. 4477-W.

MECHANICAL ENGINEER graduate Nova Scotia Technical College 1946 M.E.I.C. Eight years experience in design, application and installation of heating ventilating, air conditioning and combustion equipment. Desires change of employment where past experience could be best utilized. Location preferred Ontario or Quebec. File No. 4479-W.

SENIOR MECHANICAL ENGINEER B.Sc., P.Eng., M.E.I.C., age 41 years. Member A.S.M.E., A.S.H.V.E., A.S.R.E., over twenty years experience in air conditioning, heating and ventilating, piping, plumbing, refrigeration design and installation, waterworks and sewerage plant, workshops and plant layout, buildings, roads, and utilities and fully experienced in all mechanical and steam power plant boilers, pumps, hot water systems, design, specifications installation, maintenance and planned maintenance desires an engineering appointment anywhere in Canada, U.S.A. or on overseas projects. Previous experience as resident engineer on very large projects overseas, on construction of varied type jobs on contract basis for government departments. Further particulars will gladly be forwarded to interested employers. File No. 4481-W.

EXECUTIVE MANAGEMENT career development desired by Chemical Engineer, M.E.I.C., age 37, married, no children. Strongest capabilities are organisation, administration, adaptability, and effective contacts. Successful and well-rounded experience in operations, technical control, research and development, and management techniques in major manufacturing industry. Seeks challenging opportunity as Manager, Assistant, or equivalent, with progressive enterprise willing to delegate responsibility upon proof of ability. File No. 4482-W.

MECHANICAL ENGINEER, M.E.I.C., Graduate of Delft Institute of Technology. Holland. 20 years experience, particularly in boiler houses, steam and condensate handling, instrumentation, water treatment, air handling, plant layouts. Also office management, business administration, sales promotion. Seeks senior position with manufacturing concern, consultants or sales organization.

Sound Canadian Practice. Bilingual. Location anywhere in Canada. File No. 4483-W.

MECHANICAL ENGINEER, 1947, P.Eng., M.E.I.C., with 6 years experience as sales engineer handling mining, contracting, industrial and pulp and paper machinery, desires position of expanded responsibility in sales field or with mechanical maintenance department of industry. 34 years old, married. File No. 4484-W.

ELECTRICAL ENGINEER, M.E.I.C., P. Eng. (Alberta), age 35, single, 5 years general engineering training with one of the largest electrical manufacturers in U.K., 3 years mechanical design in light engineering works, 4 years in oilfields and refinery abroad on installation, erection, and maintenance of electrical and mechanical plant which included pumps, air compressors, A.C. and D.C. motors, steam and diesel power plants, power distribution and lighting. Desires position in construction or in which experience can be utilized. Location anywhere. File No. 4489-W.

INDUSTRIAL ENGINEER, Mechanical engineering degree, age 38 with fifteen years experience in light industry on: manufacturing methods, time and motion study, process engineering, production control, factory engineering, administrative engineering and production supervision, available immediately. File No. 4493-W.

HARVARD BUSINESS SCHOOL and Toronto engineering and business graduate seeks marketing position with a manufacturer of consumer goods. Presently employed outside Canada with a similar firm. Prefer Southern Ontario basing. Age 25, married. File No. 4494-W.

ADMINISTRATOR, PROFESSIONAL ENGINEER experienced in chemicals production, management and training with definite sales potentials, plus some sales training and experience. Seeks challenging opportunity, in technical sales or service, leading to sales management in chemical or pharmaceutical firm. Presently in Toronto, will locate anywhere. File No. 4496-W.

MECHANICAL ENGINEER, graduate 1951, Jr.E.I.C., single, age 24, experience in materials handling, and pulp and paper desires position with opportunity for advancement. File No. 4498-W.

MECHANICAL ENGINEER, graduate, A.M.I.M.E., A.M.I.E.T., government certificate, 15 years experience design and development field work, oil refinery, material handling plants, installations, machinery grainery, conveyors, elevators, construction, structural steel, reinforced concrete, docks, timber structure; knowledge of Spanish, Italian, Arabic, little French, desires employment South America, Peru. Age 36, Canadian citizen. Past experience also includes report writing, drafting, estimates, civil engineering. Presently employed Engineering and Research Department. Salary secondary to opportunity for advancement. Free to travel anywhere at short notice. File No. 4499-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., P.Eng., age 38, married, veteran. Eight years industrial experience, mainly in chemical plant design including pressure vessels, high measure piping, material handling, steel and reinforced concrete construction, steel fabrication, etc. and cost estimating. Also some construction and some maintenance experience. Desire employment with responsibility and with future possibilities. Preferable location Alberta. File No. 4503-W.

GRADUATE ENGINEER, B.E. Mechanical and electrical, Sydney University, Australia, 1948. Age 32, single, 4 years experience plant engineering, construction, steel industry, sugar, hydroelectric industry. Interested in position; design, development production engineering or plant engineering; inventive. File No. 4504-W.

CHEMICAL ENGINEER Jr.E.I.C., 27, graduated from University of Toronto 1950. Four years experience in the protective coatings industry dealing with plastics, paints, varnishes, and waxes. Engaged in sales, supervisory and research capacities. Presently employed but seeking a more challenging position. Would consider other fields than protective coatings if sufficiently interesting. File No. 4505-W.

ELECTRICAL ENGINEER, Australian citizen, age 39, single. Associate Member of Institution of Engineers Australia and Member of Association of Professional Engineers Australia. Desires position with a supply authority whilst establishing professional status in Canada. Twenty years experience in Electrical industry, 14½ with supply authorities in Australia and 1¼ with consultants and construction engineers Great Britain. Experienced in design, construction, maintenance and operation of distribution works, substations and thermal station electrical installations. Experience up to 66KV. Field experience on 275 KV general line construction British electricity authority. File No. 4506-W.

CIVIL ENGINEER S.E.I.C., P. Engineer located in Montreal desires evening work in draughting, design etc. File No. 4507-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. Manitoba 1950, married, 2 children. Age 30. Seeks position in electrical utility or plant maintenance in industrial concern. 4 years in transformer design, production and test. Some sales. Western Canada preferred. File No. 4508-W.

ELECTRICAL ENGINEER, Jr.E.I.C., P.Eng. (Ont.) B.A.Sc. 1948, M.A.Sc. 1951, U.B.C., age 28, married, one year on design of substation layout and control with a large public utility prior to receiving M.A.Sc. Completed industrial training and sales course with a large electrical manufacturing company. Experience in application and manufacture of low voltage air circuit breakers, power fuses and grounding resistors. Design of metalclad switchgear control circuits and layout of wiring diagrams. Also teaching experience. Desires position requiring initiative, organizing and supervisory ability with opportunity for advancement. File No. 4509-W.

ELECTRICAL ENGINEER B.Sc. Queens 1951; power option; Jr.E.I.C., P.Eng. aged 26, married, one son, and am a veteran. Employed since graduation by large chemical company. Have had varied experience in mechanical design, plant start-up trouble shooting and in electrical maintenance. Some experience with pneumatic instrumentation. Good knowledge of electronics through signal corps and amateur radio. Have done electrical estimating on minor plant projects. Would like to further electrical training through position with construction company installing generation equipment, or with consulting engineer on design and layout of plant power distribution systems. Location no object. Will send transcript of education, details of work background and references on request. File No. 4510-W.

CIVIL ENGINEER, honours graduate, of Glasgow University, with two years of construction experience, desires position in design office or on construction. Single, willing to work anywhere in Canada. File No. 4514-W.

CHEMICAL ENGINEER S.E.I.C., Laval 1953, presently working for the Defense Research Board with chemical engineering group. Age 25, married, one year experience. I would be glad to meet possible employers at any time. File No. 4515-W.

CIVIL ENGINEER, Manitoba 1952, Jr.E.I.C., age thirty, married, one child. Presently employed by oil company on work becoming more the province of petroleum engineer desires employment with consultant or contractor on heavy construction or municipal projects. Five summers experience in highway and drainage construction, bituminous and concrete paving as instrument man and resident engineer. Location immaterial. File No. 4518-W.

MECHANICAL ENGINEER seeks senior executive position in chemical or allied industry, or firm of consulting engineers. 12 years experience in the financial and engineering side of large scale plant expansions in the chemical industry. Excellent knowledge of the following processes: ammonia, methanol, urea, formaldehyde, chlorine, wood saccharification, alcohol distillations, 5 years experience in dyestuffs including complete design and erection of services and maintenance workshop. Superintendent planning engineer in charge of drawing office of 40 men, reorganization of engineering department of large concern. Excellent references, bilingual, graduate 1942, M.E.I.C. File No. 4519-W.

ELECTRICAL ENGINEER, M.E.I.C., P. Eng., with 3 years urban distribution experience and CGE test course in switch gear, motor generator, installation and transformers seeks post with utility, involving generation, transmission and distribution. Present salary in power transformer engineering sales $350 per month. File No. 4525-W.

EUROPEAN CIVIL ENGINEER would accept some part time work in structural designing. File No. 4526-W.

AGRICULTURAL ENGINEER, M.E.I.C., U. of S. 1945 available December 1, 1954. 4 years teaching experience, 3 years research engineer for Sask. Research Council. Thoroughly acquainted with automotive and internal combustion equipment. Age 38, married. File No. 4527-W.

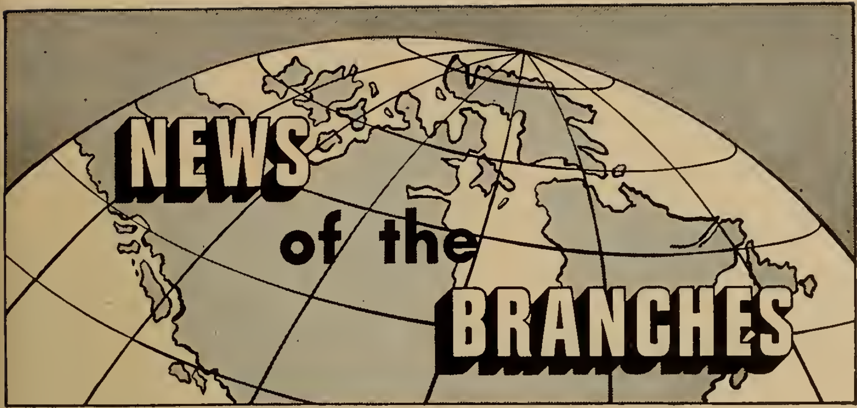
ELECTRO - MECHANICAL ENGINEER, P.Eng. (Ont.) membership several English Professional Institutions. 2 years post graduate course in servo-mechanisms and control equipment. Practical experience of electro-hydraulic mechanisms. Desires position in administrative capacity. Minimum salary $7,000 per year. File No. 4528-W.

STRUCTURAL ENGINEER, A.M.I. Struct E., P.Eng., desires responsible position in the Hamilton area. Experienced in the competitive design of light and heavy industrial and commercial structures and road and rail bridges. Eight years and three years English and Canadian experience respectively. At present employed in Hamilton. File No. 4529-W.

CIVIL ENGINEER graduate of U. of Latvia in Riga 1926. 18 years experience in railroad, road, reinforced concrete and structural steel constructions. Seeking position in any part of Canada. File No. 4530-W.

ELECTRICAL ENGINEER, graduated Norwegian University 1950, age 30, married. Experience: 2 years design and development of hydro-power station and lighting engineer, 1 year as a sales engineer. Available immediately, location anywhere. File No. 4531-W.

CIVIL ENGINEER (European), graduate Polish University College, London, Jr. E.I.C., age 41. Married. Seven years experience (including two years in Canada) in design, draughting and supervision of all sorts of engineering structures, buildings, industrial plants, bridges and earthworks. Will accept position in line with his experience. Location preferred Montreal or Southern Ontario. Available on reasonable notice. File No. 4532-W.



**Activities of the Forty-seven Branches of the Institute and abstracts of papers presented at their meetings**

## Corner Brook

B. C. McGrath, Jr.E.I.C.,
*Secretary*

**September Meeting**

The meeting was held on Tuesday, Sept. 15, 1953 in the Conference Room of Bowater's Nfld. Pulp and Paper Mills, and was called to order at 8.30 p.m. E. Hinton occupied the chair.

The following members were present: Messrs. Hinton, Hughson, Read, Langins, St. George, Tibbo, Butler, Green, McGrath.

The minutes of the meeting of June 28, 1953, were read by the secretary. On motion by Mr. Hughson, seconded by Mr. Tibbo, the minutes were adopted as read.

On motion by Mr. Hughson, seconded by Mr. Green, the appointment of B. C. McGrath as the new secretary was adopted. Mr. Read was nominated as treasurer. There being no further nominations Mr. Read was appointed by acclamation.

The chairman read the letter of resignation of the vice-chairman. On motion by Mr. Hughson, seconded by Mr. Tibbo, the secretary was instructed to write the vice-chairman and regretfully accept his resignation and wish him much success in his future work.

On motion of Mr. St. George, seconded by Mr. Butler, Mr. Hughson was nominated as vice-chairman and member of the nominating committee, the position vacated by Mr. Franklin. Mr. Hughson was elected by acclamation.

**Unity**

A letter from the Association of Professional Engineers of Newfoundland was read re the proposed agreement between these two organizations and their unwillingness to have such agreement at the present time. A discussion followed and it was decided to let the matter stand for the present.

**November Meeting**

On Nov. 20, 1953, the meeting of the Corner Brook Branch came to order in the Conference Room of Bowaters Nfld. Pulp and Paper Mills with W. R. Hughson in the chair.

The minutes of the previous meeting were circulated and adopted after correction on motion by K. Bulins and seconded by E. Langins.

A short report was made by W. Read on the president's visit. A vote of thanks was extended to the Entertainment Committee.

Due to the small number of members present and the absence of the chairman of the Branch it was decided to postpone decisions on some of the business brought up by the acting secretary.

## Eastern Townships

W. J. Sutherland, M.E.I.C.,
*Secretary-Treasurer*

J. Brisson, Jr.E.I.C.,
*Branch News Editor*

**Telephone and Television**

On March 5 forty members of the local branch listened to a talk given by Lucien Moise of the Bell Telephone Co. of Canada Ltd. The speaker's subject was the simultaneous carrying of telephone conversations and television programs over microwave radio equipment.

He started by explaining that just like sound, pictures could be transmitted over wires by converting them into electrical impulses by means of a photocell. He pointed out that the first research in that field was undertaken by a German scientist Dr. Paul Nipkow in 1884. He illustrated the theory by using the Nipkow disc, an apparatus developed by this scientist.

Following this he explained how microwaves could replace wires in the transmission of long distance conversations. "Our experience shows," said Mr. Moise, "that the joint use of a radio relay system for telephone and television is advantageous for all concerned."

He concluded his talk by giving a demonstration with two miniature microwave towers transmitting both telephone conversations and radio programs.

At the end of the meeting H. Gardner, superintendent of Crows Nest Pass Coal Co. of Fernie, B.C., brought us greetings from Western Canada.

The meeting was presided over by Gaston Masse, vice-chairman of the branch.

## Edmonton

P. M. Butler, M.E.I.C.,
*Secretary-Treasurer*

K. Provost, M.E.I.C.,
*Branch News Editor*

**The President's Visit**

The president of the Institute R. L. Dobbin, visited the Edmonton Branch from March 2 to March 4 and was greeted by members of the Edmonton Branch Executive on his arrival. On March 3, the president had a busy schedule which included a press interview at his hotel suite, luncheon as guest of the Alberta Association of Professional Engineers and a visit to the University. That evening he addressed a dinner meeting of the local Branch.

On the 4th day of March, the executive of the Edmonton Branch discussed current problems with the president during luncheon at the Edmonton Club. Following a tour of Edmonton, Mr. Dobbin was guest of the Engineering Students Society at their annual banquet.

In his address to the members of the Edmonton Branch, Mr. Dobbin described his trip to Britain as representative of the Engineering Institute of Canada at the Coronation.

Engineering progress and opportunities in Canada were outlined briefly. Mr. Dobbin told of the progress being made by Premier Smallwood in Newfoundland and of the need for engineers there. All across Canada, Mr. Dobbin observed technical developments were continuing at an ever-increasing pace, giving new opportunities to engineers.

The president, in conclusion, expressed his pride in the engineering profession and his belief that the public also was proud of the work engineers are doing in developing Canada.

C. A. Davidson thanked the president for his address and expressed the appreciation of the Edmonton Branch for his work.

## Halifax

K. F. Marginson, M.E.I.C.,
*Secretary-Treasurer*

F. H. Tremain, M.E.I.C.,
*Branch News Editor*

A meeting of the Halifax Branch was held on the evening of February 22 in the auditorium of the Sea Gull Club.

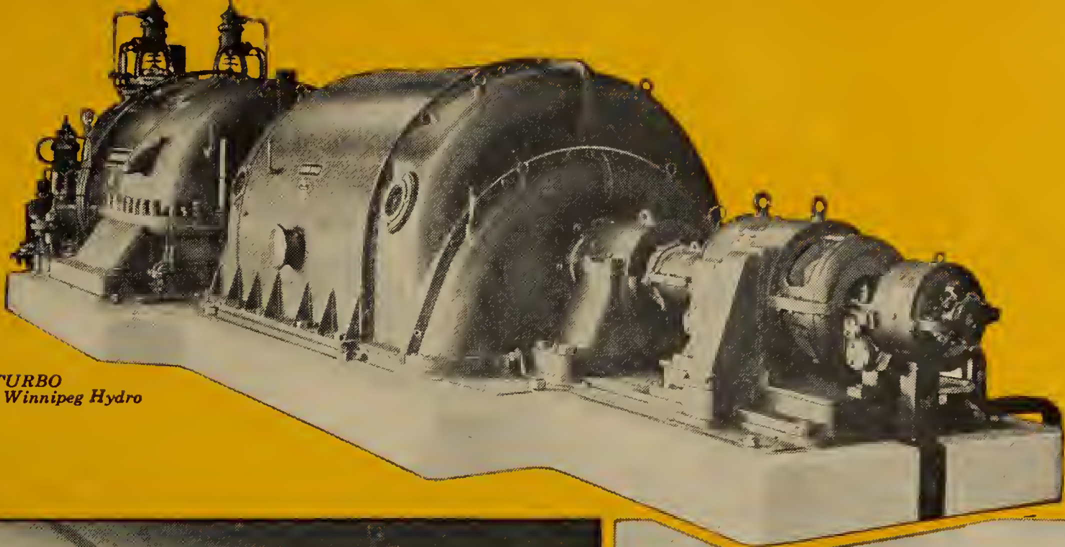
The senior class of engineers from the Nova Scotia Technical College were the guests of the Halifax Branch at this meeting.

A. H. Roy, a senior student at N.S.T. gave a report on the students activities at the annual meeting of the Institute which was held in Halifax in May, 1953.

The E.I.C. certificate, which is awarded annually to the student of highest standing in his final year and for his activities with students in connection with engineering society affairs was presented to George Haviland Martin.

**Canadian Engineering Achievements**

The highlight of the evening was a very interesting, illustrated, address by the E.I.C. Field Secretary, Dr. L. F. Grant. His subject was "Canadian Engineering Achievements Over the Past 100 Years." Dealing chiefly with



15,000 KW STEAM TURBO GENERATOR, City of Winnipeg Hydro Electric System.

*MODERN SUBSTATION SWITCHBOARD, Hydro-Quebec.*

*POWER LINE CARRIER COMMUNICATION EQUIPMENT, serving systems up to 400 KV.*

*CANADA'S FIRST GAS TURBINE POWER PLANT— enroute for erection at Canadian Utilities Ltd. plant, Vermillion, Alberta.*

# BROWN BOVERI

GORDON RUSSELL Ltd., Vancouver
GENERAL EQUIPMENT Ltd., Halifax

transportation: including canals and waterways, railways and highways; Dr. Grant spoke about the achievements on the St. Lawrence and Niagara Canals which have opened a waterway to the heart of the continent.

The meeting closed with a social period which was enjoyed by the 85 members and students present.

#### March Meeting

A buffet supper meeting was held at the Nova Scotian Hotel on Thursday, March 18. Approximately 60 members were present to enjoy an interesting illustrated talk on "Petroleum Refinery Modernization" by J. C. Maguire, chief process engineer, engineering division of the manufacturing department, Imperial Oil Limited, Sarnia, Ontario.

This talk was of particular interest to the Halifax Branch as Imperial Oil Limited, is at present engaged in an extensive modernization program of their plant at Imperoyal, Dartmouth, N.S.

The chairman of the Branch, O. Nelson Mann, introduced the new secretary-treasurer, K. F. Marginson, of the engineering staff at Dalhousie University.

It was announced that the April meeting would be a joint meeting with the Military Engineers of the Halifax area.

## Hamilton Branch

N. A. Parry, Jr.E.I.C.
*Secretary-Treasurer*

F. S. Gue, Jr.E.I.C.,
*Branch News Editor*

#### Air Defence in Canada

The February meeting of the Hamilton Branch featured an address of keen interest to the membership from both the engineering and citizenship points of view. Air Vice Marshal A. L. James, Air Officer Commanding, Air Defence Command, spoke on "Air Defence in Canada" to an attentive group in the Fireside Room, Westdale Hotel.

AVM James listed the RCAF's responsibilities as threefold: Defence of North America; Fulfillment of NATO obligations; Provision of a nucleus for RCAF expansion if necessary in time of war.

He stated that Canada in 1954, for the first time in her history, is faced with a threat to her national security, lying as she does athwart the path across which the titans in any future war would trade punches. The pat saying that "The best defence is a good offense" was given as leading to Hitler's downfall, since he stubbornly refused to acknowledge that the offensive must be mounted from a secure base. Air Defence of Canada is designed to secure that base.

The state of preparedness, mobility, and power of Canada's air force was illustrated by the reference to the successful flying of the First Air Division, by entire wings, across the Atlantic. The first time such an operation had ever been attempted with equipment like the F86.

The difficulty of the present day air defense problem was underlined when AVM James said that heavy bombers today would have to be intercepted and destroyed in weather in which World War II aircraft would not even have taken off. In addition, the atom bomb now makes it profitable for an aggressor to suffer a much higher rate of attrition than before. The defenders must aim for 100 percent interception and destruction.

Close dovetailing of the U.S. and Canadian efforts was stressed. AVM James indicated that international co-operation here was remarkable, with a flexible interlocking control which might find U.S. aircraft under the direction of a Canadian just as readily as the Canadian pilot might find himself under the direction of an American.

AVM James paid high tribute to the work of the reserve and volunteer observer personnel, and stated that, judging by the cross-section of the "younger generation" he sees in his work, the safety of Canada is in good hands.

The speaker was introduced by Group Captain D. Annan, of the RCAF Auxiliary, who pointed out in his remarks that all 10 of the senior officers of the RCAF are engineers.

AVM James was thanked by Frank Milne.

## Kingston

D. R. Graham, M.E.I.C.,
*Secretary-Treasurer*

G. D. Burwash, Jr.E.I.C.,
*Branch News Editor*

#### Joint Dinner Meeting

The annual joint dinner meeting of the Kingston branches of the Chemical Institute of Canada and the Engineering Institute was held in Wallace Hall, Queen's University on March 23.

The guest speaker was Robert Legget, director of building research, National Research Council, Ottawa. His topic was "The Report of the Royal Commission of National Development in the Arts, Letters and Sciences". In part the speaker criticized the report for its lack of references to engineering and the applied sciences. In fact of the 400 pages of the report only 25 are devoted to a discussion of the place of the sciences in Canada today, and of the 130 pages of conclusion exactly half a page was enough to contain the recommendations on science.

The report contains many plaintive pleas for the stimulation and strengthening of the humanities in Canada while there were almost incidental references to the physical aspects of Canadian life and development.

Mr. Legget said it was misleading to blame technological advance, which had brought such untold benefits in its train, for admitted cultural defiiciencies.

The speaker was introduced by Dr. S. D. Lash and thanked by S. H. Rochester. Chairman of the meeting was Dr. R. C. Spooner.

## Huronia

L. Morgante, Jr.E.I.C.,
*Secretary-Treasurer*

On Feb. 24 last a meeting was held of the Huronia Branch of the Engineering Institute of Canada in the Y.M.C.A. in Orillia. Some thirty engineers were present.

#### Mine Equipment

H. C. Knight manager of the Dorr Company in Canada showed two very interesting films each of which lasted about half an hour. One film was entitled the "Dorr Way." This excellent film in color traced the history of the company showing how it had it's beginnings in California; H. V. N. Dorr started as a mill superintendent in a small California gold mine and realized that technological improvements were necessary in the separation of liquids from solids. As a result he invented the Dorrco thickener and the Dorrco classifier of which there are several types, all of which were adequately described in the film. The film went on to show how this equipment is now used the world over in a tremendous number of industries such as gold, copper, zinc, lead, fertilizer, pulp and paper, chemical industry, and sewage disposal. We understand this film cost one hundred thousand dollars to produce and it is certainly recommended for other engineering groups.

#### Pure Water

The second film was entitled "Pure Water", recently produced in Holland. This film shows the necessity of adequate sewage disposal plants to stop the wide spread of putrefaction in our natural water courses.

Following these two films a short talk was given by Mr. Knight in which he pointed out that his company is very largely an engineering organization. They have some nine hundred employees scattered the world over and about 1/3 of these are engineers. They do not undertake manufacturing themselves but do design plants and make recommendations.

Many questions were asked during this meeting regarding sewage disposal problems. All concerned realized the necessity of doing more in the way of proper sewage disposal now that shortages of labor and material no longer exist.

## Lakehead

G. E. Cook, M.E.I.C.,
*Secretary-Treasurer*

H. Penner, Jr.E.I.C.,
*Branch News Editor*

#### Motor and Trolley Coaches

On Thursday, February 19 at Trinity Church Hall, some 30 members and guests of the Lakehead Branch heard a very interesting talk by Lloyd B. Walker, divisional engineer of the Canadian Car Plant in Fort William.

Mr. Walker touched on only one of many possible topics, namely production of motor and trolley coaches. He compared bus designs here with those in Britain, pointing out that Canadian and American design preferred the semi rigid type of chassis where the side walls of the bus carried load bending movements. The similarities and differences of bus design to motor car design formed an interesting basis of comparison. Theoretical calculation was of necessity the basis of design said Mr. Walker, but to be of any value theory must be used in conjunction with experience. It was very humorously pointed out that someone has said that design of bus springs was an art not a science. Since that time said Mr. Walker he too had become a patron of the arts.

The talk was illustrated by an excellent film showing the Canadian Car's plants and an assembly line tour at the Fort William plant. The speaker was introduced by W. D. Beckett and thanked by W. C. Byers.

#### President's Visit

On Monday, March 15, the Lakehead Branch was favoured by the long deferred visit of Ross L. Dobbin, E.I.C. president. The president was to have come to the Lakehead in January on the westward leg of his journey across Canada but failed to put in an appearance due to flight cancellation.

Mr. Dobbin arrived on Sunday night, and spent Monday at the Lakehead. The day's activities included a morning meeting and luncheon of the Lakehead Branch executive. Topics discussed included the possibility of a Regional Meeting at the Lakehead in 1955 and the "Plan for Unity" brought forward by J. H. Smith, former APEO president. The Lakehead group has for a long time been a supporter of a scheme for a joint agreement.

After lunch the president spoke to a group of students at the Lakehead Technical Institute, who are in their first year of engineering. Some 40 members turned out to a dinner meeting and heard the persident's account of his travels to England during the coronation and his almost completed visits to the 48 branches of the E.I.C. across Canada. G. S. Halter, branch chairman, presided at the meeting. Mr. Dobbin was introduced by D. I. Nattress, a personal friend of the president. J. Antonisen moved the vote of thanks to the speaker.

With reference to the above, Mr. Antonisen, former city engineer, has moved the vote of thanks to the visiting presidents for the past 15 years. Mr. Antonisen is now 85 years old, is quite active physically and mentally.

## Lethbridge

R. D. Hall, Jr.E.I.C.,
*Secretary-Treasurer*

***President's Dinner Banquet***

On February 10, 1954, the Lethbridge Branch held their President's Dinner Banquet at the Marquis Hotel under the chairmanship of D. Cramer. The entertainment was under the direction of E. A. Lawrence. Following a singsong the group was entertained by Howard Ritchie (Mr. Magic) and vocal selections by Dorothy Cameron, Mary Thomson and Janet McLeod. Acting Mayor, Cliff Black welcomed the president to the city of Lethbridge.

The speaker was introduced by P. M. Sauder. Mr. Dobbin gave a very descriptive and entertaining talk on his trip to the Coronation. The garden parties were attended by African Chieftains, Arab Sheiks, Indian Princes and many other representatives of the British Empire in their varied native costumes. The Premiers of all the Dominions were represented. With the Coronation Ceremony starting at 2.30 p.m. the guests were supposed to be in Westminster Abbey between 6 and 7 a.m. Two books were given each guest, one containing the order of service and the other a list of people in the procession.

Mr. Dobbin emphasized the role played by the engineers in the preparation for the Coronation. The electrical engineers did a wonderful job in installing the public address, television and radio system throughout the Abbey. The microphones were toned to suit various types of speakers and for various distance from the microphones. The stands along the Procession route were designed so that the materials used for construction could be dismantled and used again since no nails were used.

President Dobbin finished his talk by expressing his admiration for the English people who are loyal (not in a loud way) and for the great pageantry which only a nation like England could exhibit. The president was thanked by N. H. Bradley.

The secretary of the Engineering Institute, Dr. L. Austin Wright, commented favorably on the existence of the engineers' wives club and the idea of having a small concert before the meeting. Dr. Wright explained about the employment in Canada of American consulting engineering firms for jobs that could be done by Canadian engineers. The solution of this problem is getting more complicated unless Canadian employers of engineers realize the full capability of the Canadian engineer.

## London

D. M. Jenkins, M.E.I.C.,
*Secretary-Treasurer*

C. H. Osborne, M.E.I.C.,
*Branch News Editor*

***Dr. T. A. Boyd Guest Speaker***

Dr. T. A. Boyd, research consultant, research laboratories division, General Motors Corporation, was guest speaker for the February meeting. Dr. Boyd's subject "Trail Blazing in Industry Today" described the advancement of industrial products and production methods as a result of research program being carried on by many companies. The new Research Development Centre of the G.M.C. situated north of Detroit is an example of the extent of a research program adopted by a large industry.

The March meeting was a joint meeting of the Engineering Institute and the Professional Association. The presence of two executives of the Professional Association, Professor W. L. Sagar, president, and T. M. Medland, executive director, drew a large attendance.

President Sagar gave an enlightening address on the topic "Can Activities of the Engineering Profession be Centred in One Body." He summarized the functions of the Ontario Association and illustrated the feasibility of the combination of the E.I.C. and the Provincial Associations in a single body.

Mr. Medland, enlarged on the functions of the Association and pointed out the encouraging advancement in public recognition of the engineer.

## Montreal

R. J. Harvey, M.E.I.C.,
*Secretary-Treasurer*

J. A. Paget, M.E.I.C.,
*Publicity Chairman*

***120 K.V. Cable***

"120 KV Cable Installed at Montreal" was the title of a paper given on March 1, by D. M. Farnham, chief engineer, engineering design division, Quebec Hydro-Electric Commission before a joint meeting of the E.I.C. Montreal Branch and the local branch of the American Institute of Electrical Engineers. Mr. Farnham introduced into Canada insulated cables above 69 KV rating and was responsible for the use of the first 120 KV aluminum sheathed oil filled cable in Canada. He described how part of Montreal's growing electrical requirement is supplied by four cables strung under the Jacques Cartier Bridge. The four cables measure nearly 19 miles in length. One of these, capable of carrying 120,000 volts, was the first of its kind in Canada, he said. It was protected by two layers of metal, with nitrogen gas between the layers for insulation and to prevent deterioration. The cable weighed 12 pounds per foot and could withstand temperatures from 35 degrees below zero to 100 degrees above. It was made of a special alloy to prevent damage by vibration. The meeting chairman was J. M. Sharpe and meeting arrangements were by W. H. Fong.

#### *Concrete Mixtures*

"Modern Developments in Concrete Mixtures" was the topic of a panel discussion held on March 2 before the Montreal Branch. The moderator was V. Wilson, M.E.I.C., and the panel consisted of C. Cartier, Laboratoire Industrielle, D. O. Robinson, M.E.I.C., Canada Cement Company and F. MacNaughton, Milton Hersey Co. The panel discussed the modern theory of mix design, mixing, batching and placing and the physical properties of hardened concrete. Meeting arrangements were by R. J. Kane.

#### *The Engineer and Patents*

On March 4 Alan Swabey of Alan Swabey and Co., patent attorneys, addressed the Montreal Branch on the subject "The Engineer and Patents". Mr. Swabey stated that although ninety percent of the patent applications filed in Canada come from abroad, several Canadian companies now have patent departments. The speaker felt that the clause in Canadian Patent Law making it necessary for a patent holder to manufacture in Canada within three years or run the risk of having to grant compulsory licences was largely responsible for the rapid development of the Canadian television industry. The speaker included among his points on patents the following:

1—Time limits on obtaining a patent are important and should be investigated immediately when a patent is considered to be desirable.
2—The patent office libraries in Washington and Ottawa are a very valuable source of technical data on all technology.
3—Firms paying patent licence fees should check regularly to be certain that they are actually using that portion of the process covered by the patent in effect.
4—The name of the true inventor should appear on the patent even though others do much of the necessary development work.
5—The simplest Canadian patent costs about $225.00 to obtain depending on the prominence of the attorney and the amount of time he has to spend on the work.
6—Canadian government contractors are protected against infringement claims in connection with their work for the government.
7—A product such as insulin which is being presented to humanity should still be patented by the inventor or the first person to improve the process substantially will get control.

In conclusion the speaker pointed out:

1—That engineering thinking and patent thinking are poles apart.
2—That a little knowledge in the patent field may be quite valuable if it leads to prompt investigation.
3—Patents are here to stay because they help develop Canadian manufacturing facilities.

The chairman was W. C. M. Luscombe, meeting arrangements were by D. P. J. McDonald. The attendance was seventy-three.

### Niagara Peninsula

H. C. L. Joe, Jr.E.I.C.,
*Secretary-Treasurer*

J. H. Saldat, Jr.E.I.C.,
*Branch News Editor*

#### *Plant Tour*

March 18, 1954, was the day the Niagara Branch of the Engineering Institute of Canada was treated to an outstanding plant tour by the English Electric Company of Canada, Limited, St. Catharines, Ontario.

From 3 to 5 p.m. the members of the Engineering Institute of Canada were conducted through the large departments of electrical manufacturing and assembly lines. The members witnessed the stacking of cores for some of the largest transformers being built today.

The assembly lines for tiny transformers gave an indication of the wide range of transformer work the company is capable of handling.

A tour of the switchgear department revealed advanced designs in the field of electrical controls. The cabinets are imported from England and the installation of the latest Canadian-made switchgear results in a finished switchboard.

The motor plant, as with the transformer and switchgear departments, maintains an elaborate testing and inspection department.

When the tour ended at about 5 p.m. it was evident that the fusegear, generating equipment, power transformers, rolling mill drives, and switchgear are products which every Canadian could be proud of.

***Dinner Meeting***

Following the plant tour, the members met at the Queensway Hotel, St. Catharines, for a dinner meeting.

A. J. Bennett, M.E.I.C., was the presiding chairman. D. O. D. Ramsdale, M.E.I.C., sales manager of the English Electric Company of Canada, Limited, introduced the guest speaker for the evening. H. C. Tucker, contracts manager, was the guest speaker. Mr. Tucker spoke on "The English Electric Company of Canada, Limited." He described how the Canadian company was formed and pointed out that the company now has plants in such places as Preston, Bradford, Stafford, Liverpool, Toronto, Montreal, South Africa, Australia, etc. It has become one of the few companies capable of supplying both electrical and hydraulic equipment for almost any job.

The company employs some 500,000 people the world over; approximately 800 of those being in the St. Catharines plant alone.

P. Pasquet extended a vote of thanks to Mr. Tucker and the English Electric Company of Canada for a most enjoyable afternoon and evening.

Approximately 50 members attended the plant tour and dinner meeting.

## Northern New Brunswick

L. L. Marshall, M.E.I.C., *Secretary-Treasurer*

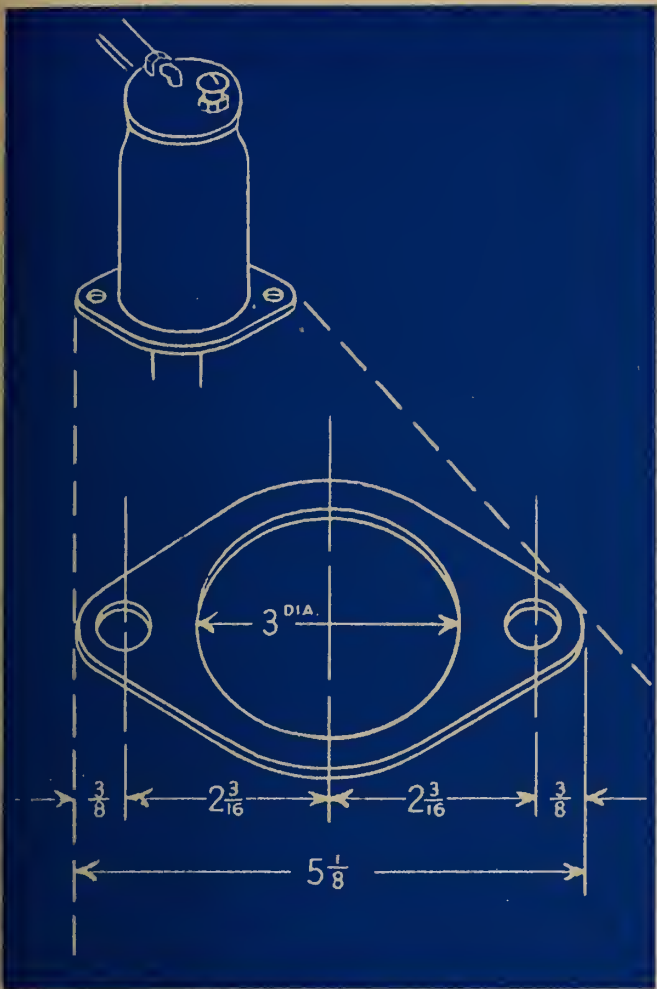
R. W. Rankine, Jr.E.I.C., *Branch News Editor*

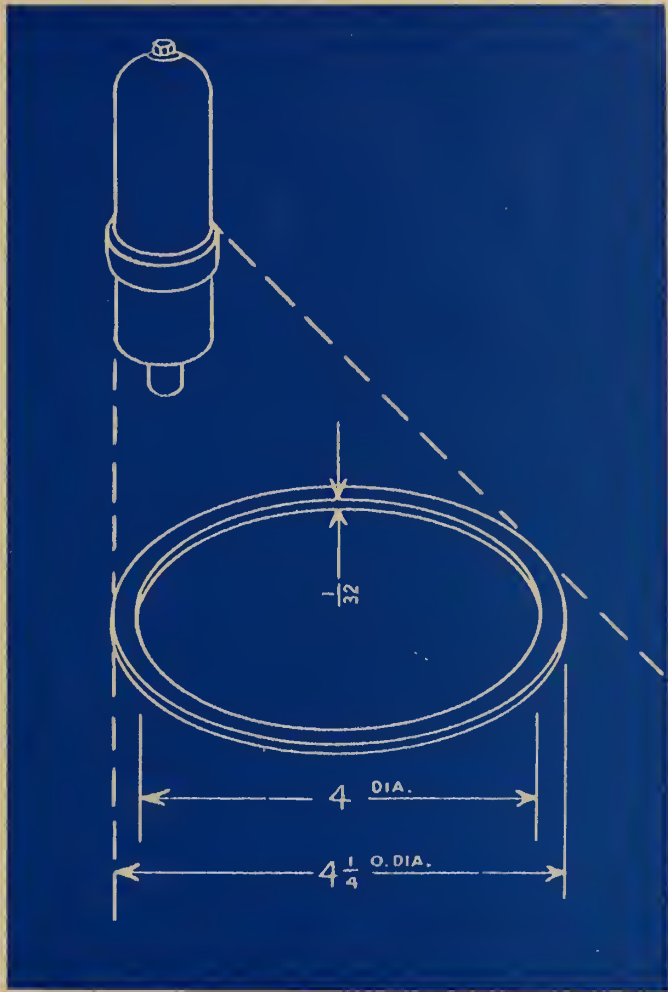
***Engineering Institute Meets***

The Northern New Brunswick Branch of the Engineering Institute of Canada held its first general meeting of 1954 on February 4 in the Gloucester Hotel at Bathurst.

***St. Lawrence Seaway***

Following a short business meeting the first speaker was Col. L. F. Grant, past president, and at present Field Secretary of the E.I.C., who gave an informative talk on the history of the St. Lawrence seaway and some of the problems involved. Col. Grant stressed the point that a 1941 agreement between Canada and the United States providing that the portion of the seaway constructed in the international section of the St. Lawrence should be constructed in the United States under American direction, had been rejected by the United States, and that on Nov. 4, 1952, Canada had informed the U.S. government that she considered the agreement to be null and void. Historically the St. Lawrence canals have been the responsibility, and under the control of





# *New fiber gasket*

## won't dry out or shrink

Glue-glycerine saturants normally are fugitive. When they leave a plant fiber gasket material, a gasket gets dry, shrinks, and usually leaks. In storage, it may distort and become unusable.

That's what a tractor manufacturer discovered when the fiber gasket in the engine governor shown at left above brought complaints from the tractor's users. Oil had leached out the gasket's glue-glycerine binder, causing gasket failure.

After testing several materials, tractor engineers solved the problem with an entirely new gasket material — Armstrong's Accopac®. Accopac's binder is rubber latex. It's non-extractable and non-volatile, so Accopac can't dry out, shrink, or crack in service. Field tests on Accopac CS-301 showed it positively prevented oil leaks at the governor flange. So, when Accopac went into production, complaints stopped.

Accopac helped this manufacturer solve a production problem, too. The oil filter ring shown at right had to be stored for several months. Many of these gaskets warped so badly they became unfit for use.

Accopac gaskets are now used for this sealing job, too, because their dimensions and performance are virtually unaffected by variations in temperature and humidity. They still fit even after months of storage.

Accopac's excellent dimensional stability and high, even compressibility have brought this new fiber material wide acceptance in a variety of sealing jobs. Today Accopac is used in thousands of applications — in pumps, aircraft, automatic washers — wherever there's a need for efficient sealing at low cost.

**FREE 24-PAGE GASKET MANUAL** — For full information on Accopac and other Armstrong's gasket materials, see the 1954 edition of "Armstrong's Gasket Materials." It has 24 pages of specification information, data on cost reduction, gasket tolerances, etc. For a personal copy, write Armstrong Cork Canada Limited, Industrial Division, 6911 Decarie Boulevard, Montreal, P.Q.

# ARMSTRONG'S ACCOPAC

Canada, as those above Lake Erie have been the responsibility of the United States. Col. Grant continued by saying that if the United States does join Canada in the construction of the seaway and if the 1941 agreement is upheld, it will mean that the seaway, which began as a Canadian project and upon which Canada has spent a considerable sum of money, will be largely under American control.

#### "The Big Jib"

The second speaker for the evening was A. Lee-White of Gill and Company Ltd., Saint John, N.B., who gave a short talk and showed a very interesting film on "The Big Jib", the largest walking dragline in the world. This machine took four years to design and build and cost about $1,500,000, as it is a protype of its kind. Powered by 3,000 horsepower in electric motors its working weight is 1,650 tons, about that of a destroyer, and its 20 cubic yard bucket rotates at a 260 foot radius of discharge. The dragline moves to its operating location by means of two eccentrically mounted walking legs. In particular the film dealt with the fabrication of the jib, which is 282 feet long and took two years to assemble.

After the meeting was adjourned the members and guests enjoyed refreshments.

#### Canada's National Parks

At the luncheon meeting held in the Chateau Laurier on March 11, 1954, Lt. Col. C. G. Childe, E.D., B.Sc., superintendent, National Historic Parks and Sites of the Department of Northern Affairs and National Resources, gave an interesting talk on "National Parks of Canada—An Engineer's Impression". A resume is as follows:

"When the first transcontinental railway, the Canadian Pacific, was being pushed forward from the plains of what is now Alberta through the Rockies, members of a survey party discovered the hot mineral springs at Banff that are now among the great attractions of that famous resort, and subsequently filed claims under the provisions of the Dominion Lands Act. Fortunately, the Government of the day, with most commendable foresight, decided not to permit development of the springs by private enterprise, and instead chose to preserve them as a public possession by passing, in November, 1885, an Order in Council reserving to the Crown an area of ten square miles surrounding the springs. The wording of this Order in Council, is interesting in view of later developments:

"There have been discovered several hot mineral springs which promise to be of great sanitary advantage to the public, and in order that proper control of the lands surrounding these springs may remain vested in the Crown, the said lands in the territory including said springs and in their immediate neighborhood, be and they are hereby reserved from sale or settlement or squatting."

#### Banff

In 1887, the Parliament of Canada established Rocky Mountains Park, comprising 260 square miles surrounding the hot springs. The area of the park was subsequently greatly enlarged and re-named Banff Park. It now comprises 2,564 square miles, or an area greater than that of Prince Edward Island.

#### The System of National Parks

From this beginning Canada's system of national parks has evolved. There are now 17 national and 11 national historic parks, which range in size from a few acres to hundreds of square miles, their aggregate area being in excess of 29,000 square miles. National Parks are located in every province except Quebec and Newfoundland; national historic parks in all but British Columbia, Alberta, Prince Edward Island and Newfoundland. Last year visitors to the national parks numbered well over 3,000,000, and that was an increase of 463,000 over the previous year.

The parks are administered by the National Parks Branch of the Department of Northern Affairs and National Resources, under the authority of the National Parks Act and Regulations made thereunder. Annual expenditure in the parks is now in the order of $7½ million, the annual revenue about $1 million

#### Established by Parliament

National parks may be established only by Act of Parliament amending the existing National Parks Act. Several have been so established since 1930, when the Act was passed, including Prince Edward Island, Cape Breton Highlands and Fundy. In the establishment of new parks it has been the policy to require the Government of the province concerned to take the initiative by offering a clear title to the area under review. Following receipt of such an offer it is examined by an officer of the department to ascertain whether or not it measures up to National Parks standards. If in the affirmative, the necessary legislation is passed by Canada, free from all encumbrances. The new area is then formally established by Act of Parliament, and its administration and development carried on by the National Parks Branch.

#### National Historic Parks

An outstanding feature in the development of national parks has been the establishment of the National Historic Park, of which, there are 11 at present. The National Parks Act permits the Governor in Council to set apart any land, the title to which is vested in the Crown in right of Canada, to commemorate an historic event of national importance. Thus the following have been established and are being maintained as national historic parks:

**Niagara Peninsula Dinner and Plant Tour**

**(Left), the head table, left to right: Paul E. Buss, councillor for Niagara Peninsula Branch; Harold E. Treble, vice-chairman; Harold C. Tucker, English Electric Company of Canada Limited; Arthur J. Bennett, chairman; Donald O. D. Ramsdale, sales manager of English Electric Company; P. A. # Finest equipment for any handling problem

For 70 years, MORRIS engineers have been investigating and solving Materials – Handling problems – problems just like **yours!** They draw on the vast, diversified wealth of experience gained through these years of meeting the needs of both light manufacturing and heavy industry.

All this thought, engineering skill and research has gone into every item in the MORRIS line, be it overhead, jib and gantry cranes, trolley conveyors, ash elevators or portable hoists and monorail systems.

When you contact the Head Office in Niagara Falls or the Sales-Service Offices at Montreal, Hamilton or Toronto, you will get prompt, courteous, on-the-job consultation on your **specific** materials-handling problems. This is **professional** advice, but rendered without obligation.

Comprehensive manual on all types of MORRIS Cranes and Hoists available on request. Simply write Department H, Herbert Morris Crane & Hoist Company Ltd., Niagara Falls, Ontario.

**MORRIS INDUSTRIAL CRANES** are smooth-running, fast-moving units easy to service and maintain. Available in wide speed selection for each motion and full range of lifting-capacity combinations.

**MORRIS ELECTRIC ROPE HOISTS** Lighter, faster. Detachable, enclosed motor operated from 110-volt, pushbutton station. Automatic, electro-mechanical braking. Strong, guarded rope sheaves. Easy, grease-gun lubrication.

**MORRIS ELECTRIC CHAIN HOISTS** are extremely adaptable to all conditions. Require no special wiring. Just hang up, plug into the nearest electric socket and start lifting. Available also for 3-phase current supply.

**MORRIS CHAIN-HOISTS,** although almost 40% lighter in weight, sacrifice none of the inherent strength or safety of former designs. Rugged performers under all conditions. Conform to modern preference for portability with durability.

MORRIS

# CRANES & HOISTS

**The HERBERT MORRIS CRANE & HOIST COMPANY LIMITED**

*Niagara Falls, Ont., Branch Offices: Toronto, Montreal and Hamilton*

1. The Fortress of Louisbourg, on Cape Breton Island, Nova Scotia, Massive ruins of the French city and fortifications captured by the British in 1745 and 1758.
2. Fort Anne, at Annapolis Royal, Nova Scotia, which changed hands many times during the wars between the French and British in the 17th and 18th centuries.
3. Port Royal, eight miles from Fort Anne, where an exact replica of the Habitation of des Monts and Champlain of 1605 has been rebuilt on the original site, the first European settlement in North America, north of Florida.
4. Fort Beausejour, midway between Amherst, Nova Scotia, and Sackville, New Brunswick.
5. and 6. Forts Chambly and Lennox, on the River Richelieu, south of Montreal, P.Q.
7. Fort Wellington, Prescott, Ontario.
8. Fort Malden, Amherstburg, Ontario.
9. Lower Fort Garry, near Winnipeg, Manitoba.
10. Prince of Wales's Fort, Churchill, Manitoba.
11. Fort Battleford, Battleford, Saskatchewan.

It is expected that Halifax Citadel, on which the department has expended several hundred thousand dollars in the last three years on restoration, will shortly become a national historic park.

#### Engineering in Development

Engineering plays a major role in the development of a park, in locating, constructing and maintaining highways, roads to open up especially scenic areas, fire trails and telephone lines for forest protection. The total mileage of motor highways in the parks is about 750, of which about one-half is hard surfaced; the remainder surface treated asphaltic oil or calcium chloride. Secondary roads total 170 miles, fire and park trails about 3,000 miles, and forest telephone lines about 1,300 miles.

The life of a park engineer is interesting and varied. Besides roads and highways he may be called on to supervise construction, operation and maintenance of public works and utility services within the park, such as domestic water supply, sewerage, telephone, electric power, streets, street lighting, fire protection, bridges, wharves, campgrounds, and supervision and, where there are townsites in the park, he may have to be building, plumbing and electrical inspector."

Two films, one showing the Banff-Jasper Highway and the other the Fundy National Park, half way between St. John and Moncton, N.B., were presented.

Col. Childe was introduced by the chairman, R. Hayes and thanked by L. Shearer.

### Saguenay

C. C. Louttit, jr.e.i.c.,
*Secretary-Treasurer*

#### Taxation

"Taxes and You—From Rags to Rags" was the subject of an address Tuesday, March 16, by W. G. Donnelly of Alcan Property Department, Arvida, before the Saguenay Branches of the Engineering Institute of Canada and the Corporation of Professional Engineers of Quebec at the Saguenay Inn.

Mr. Donnelly, whose recent work in the field of taxation includes the preparation of a brief for the Tremblay Commission, gave a very comprehensive talk based on his personal impressions and observations.

Without elaborating on income taxes, the high-lights of the tax structure were described with reference to the history and development of the system and the responsibilities and fields of taxation of the three levels of government, federal, provincial and municipal. Taxation is very intimately tied up with the structure and obligations of government. As these change as occasioned by the times, technology, population shifts and other factors, the tax structure must similarly change so that government can continue to meet its financial responsibilities. This process of change sets up stresses in the tax structure, and since in our Canadian tax system there are three levels of government all dealing with the same taxpayer the process of change is considerably slower and more difficult than in a monolithic system consisting of only one taxing authority. Our three level system has advantages over a one level system insofar as it promotes local independence as well as a national consciousness. Therefore, in operation, the system because of conflicting interests becomes one of compromise.

### The Basis of Tax Structure

The British North America Act of 1867 set up the basis of Canada's government and tax structure. The federal government while free to tax in any field was specifically given the right to various direct and indirect taxes notably tariffs and customs which had been a major source of revenue in those days but are no longer of such relative importance today. The provincial taxation field was set up of direct taxes of lesser importance to enable the provinces to meet the obligations of social welfare with which they were entrusted.

Direct taxes are defined as taxes demanded of those who are directly affected, such as retail sales tax, excise tax or income tax, while indirect taxes are passed on or "hidden" taxes such as federal sales tax.

Subsequent to the passage of the B.N.A. Act, because of a reluctance on the part of the provinces to exercise their perogatives of entering the direct taxation fields, and to enable the provinces to balance their social welfare budgets, a system of federal subsidies to the provinces was begun. The basis of this system was rather complicated and amounted to 80 cents per head up to a population of 400,000 in an effort to balance all provincial budgets under a uniform rate. After various modifications, the federal subsidy program was discontinued in 1893 when the provinces entered the field of direct taxation.

### Rowell-Sirois Commission

During the 20th century as their responsibilities increased with the changing nature of Canada's economy, the provinces entered more and more into the direct taxation fields, which had hitherto been unexploited, until finally after the First World War and the depression of the early thirties, the tax system could keep up no longer and basic changes were required. Accordingly a Royal Commission, the Rowell-Sirois Commission, was constituted and brought in its report in 1940. This report was of profound importance and represented the first attempt at permanently solving the inherent weaknesses in Canada's tax structure as set up by the B.N.A. Act. Its recommendations were relatively radical and leaned essentially towards centralization.

The war intervened before any of these recommendations could be implemented and throughout the war years a temporary series of federal-provincial agreements enabled the provinces to get by. Essentially, these agreements consisted of federal grants to the provinces, in return the provinces rented various taxing powers to the federal government. In 1945, a federal-provincial conference was held at which the Rowell-Sirois recommendations and the continuation of the wartime agreements were discussed. While this conference was not successful as far as making one agreement with all the provinces was concerned, by 1947 all but two of the provinces had entered into separate agreements with Ottawa. In 1951 Ontario joined the fold, and at the present time only Quebec has not such an agreement. It is difficult to say whether these tax rental agreements are good or bad as there are good arguments both pro and con.

### Municipal Responsibilities

Municipal government in Canada began with the incorporation of Quebec in 1832 and Toronto in 1834, and the first system of local government was established in 1840. In Quebec at the present time there are 76 municipalities and 34 chartered cities, both groups with taxing powers, while all other cities and towns fall under the cities and towns act. Counties have no taxing powers. Municipalities both urban and rural are governed by councils elected by the proprietors and in general derive their income from property, retail sales and public utilities taxes.

Particularly, since the last war the municipalities have been very hard pressed to meet their obligations. While the federal and provincial shares of the tax dollar both percentagewise and in terms of of buying power have increased, the municipal share has decreased on both counts, despite disproportionately larger municipal obligations to be met. This imbalance has had to be met temporarily by subsidies, and a Royal Commission, the Tremblay Commission is presently sitting to attempt to find a more permanent solution to the problem. Various trends have contributed to the present imbalance, amongst these the population shift away from the cities, the accent on more and more social services and our automobile habits causing the need for more and better roads.

### Education

In the field of education which is one of the major municipal responsibilities these defects in the municipal tax structure are very obvious. Education in Quebec is administered by about 1700 protestant and catholic school boards and central boards. Revenue is derived by a 1 per cent sales tax and by property taxes on immovable property including industrial property but excluding religious, charitable or educational property. School boards are elected by the property owners, and funds are prorated between the protestant and catholic boards on the basis of population. The school boards have in general been subject to the same trends and factors as the municipal councils and as a result have just as little money. Provincial grants have to date been the only means of preventing deficits from becoming too great. Some of the trends which have contributed to this serious situation are the population shift to urban areas, the raising of the minimum compulsory education level to 14 years of age, general prosperity with the result that children can be kept in school longer, increasing emphasis on specialized courses which require more elaborate equipment such as laboratories, gymnasia, etc., and trends to decrease the ratio of pupils per teacher or classroom.

In recent attempts to provide more revenue for municipal and educational purposes various taxes such as work taxes, taxes on industries which exploit some national resources, and taxes on certain industries whose employees use certain municipal facilities have been levied. Certain of these taxes are discriminatory in that they penalize success, size, duplicate other taxes and do not apply equally to all industries.

In conclusion, Mr. Donnelly stated that the tax structure would continue to change along with the political, technological and social development of our country, and that unless we, the taxpayers, who pay all taxes in the final analysis scrutinize and control these changes, it would not be unlikely that the trend of the past would continue and that a greater and increasingly greater portion of the citizen's dollar would go into taxes of various sorts in the years to come.

## Sudbury

George Fleming, M.E.I.C.,
*Secretary-Treasurer*

T. C. Robertson, M.E.I.C.,
*Branch News Editor*

The large attendance at the March dinner meeting of the Sudbury Branch of the Engineering Institute of Canada held at the Granite Club showed the interest of the members in "Members Night". The speakers of the evening, R. H. Moore, Hugh MacKinnon and A. D. Finlayson were introduced by R. H. Charlap, A. D. McAdam and H. S. Stavang respectively.

### Mine Hoists

"Bob" Moore, chief mechanical and electrical engineer of Falconbridge Nickel Mines Ltd., outlined his trip to Sweden to obtain first hand information on Koepe or friction mine hoists. Leaving from New York he travelled by plane to Prestwick, Scotland, by way of Gander, Newfoundland, and thence on to Stockholm, the city built on islands.

He described many interesting sidelights such as the Vigeland Park at Oslo with its sculpture figures in stone and bronze, depicting life from childhood to old age, and his trip to Stravanger by train which in 3 hours passes through 156 tunnels, the longest one being 10 miles long. The wide use of concrete in place of steel, the punctuality of the electric railways and the absence of complete shaft timbering in mine shafts were other generalities which Mr. Moore discussed.

### Hoisting Scheme

The Koepe hoisting scheme is a system whereby the hoisting rope is passed over the driving sheave located in the headframe, much like a belt. At the ends of this rope the conveyances are attached and a tailrope is added below for continuous balance of the moving system. This idea was originated by Carl Friedrick Koepe back about 1876 and has developed along with the drum winder hoist in speed, depth and pay load. The hoisting ropes are designed with a higher rope safety factor than is used in this country and are thus much larger in diameter than those used in Canada. In order to overcome the twisting effect of the ropes and also to make the rope lighter to handle, four ropes in parallel are commonly used today. He cited an instance where 4 - 1½" ropes in parallel were used to hoist a 13 ton payload from a depth of 4200 ft. The hoist was powered by a 4250 h.p. motor.

Mr. Moore pointed out that the saving in power due to the balancing effect of the tail ropes could be obtained by adding a tail rope to our drum winder hoists but the lower inertia of the moving parts of the Koepe hoist to be accelerated would lead to considerable saving. The hoisting trend was to automatic operation and most hoists were pushbutton controlled as in the usual building elevator.

At the close of his address Mr. Moore showed some slides depicting Koepe hoists.

### Weather Forecasting

The second speaker, Hugh MacKinnon of the Sudbury Hydro Electric Commission, explained the compilation of the weather map and how it is used as a basis for weather forecasting.

Weather observations are taken simultaneously at prearranged synoptic hours in strategic locations over an extended area of approximately one-fifth of the earth's surface. These weather phenomenon are then coded according to an international code and transmitted to a central office where in the short period of one hour and ten minutes a comprehensive synopsis of existing world wide weather conditions is mapped. This map is then analysed and by the application of known reactions the weather trend can be predicted with remarkable accuracy.

During the war years when weather information was extremely valuable to our war effort, Mr. MacKinnon explained that enemy occupation, the radio silence of ships at sea, etc., made it impossible to obtain the complete picture. This hampered them to a considerable extent in forecasting during this time.

The speaker explained just how different air masses are formed at various altitudes and showed how their origin, whether tropical or polar, could effect our weather in the temperate zone when considered in conjunction with the pressure distribution. The pressure distribution would determine the wind direction and thus the movement of these masses. When the frontal zones of these air masses meet or move up or down, as determined by the pressure, various weather conditions would result.

### Synoptic Charts

Mr. MacKinnon then showed synoptic charts for three consecutive days to depict the pattern of pressure distribution, air masses, and frontal zones that occurred across the North American continent and explained the general movement of the weather picture from chart to chart with particular reference to the frontal disturbance which brought the rain, sleet and snow storm to Southern Ontario during the middle of February.

### Concrete Mixtures

The last speaker, A. D. Finlayson of the engineering staff of The International Nickel Co. of Canada Ltd., spoke on the control and design of concrete mixtures. All too often, stated Mr. Finlayson, the design of concrete is left to Antonio and his cement mixer who in many cases is fortunately not too bad. The noted Belgian engineer Prof. G. Magnel remarked recently that the poor quality of concrete produced by contractors in the United States is one of the greatest obstacles in the way of more common use of prestressed concrete in that country.

Throughout his address Mr. Finlayson used as an example the design and control of the concrete of the foundation for the chimney presently being constructed at Copper Cliff by the International Nickel Company.

The value of the water cement ratio as a factor affecting the strength and durability of the concrete, the methods used to obtain the moisture content of the aggregate and the difficulties encountered in the winter months due to the variations caused by steam heating were explained and some of the test equipment used was shown. Mr. Finlayson outlined the economy of a proper aggregate which would give a concrete with a uniform strength to resist weathering. The use of pit gravel which might possibly be 25 per cent stone when a correct aggregate might be 60 percent stone proved to be poor economy when the amount of cement and the strength of the concrete were considered.

The slump tests applied and the variations found in this test were outlined. The smaller the slump the better the concrete but, of course, the harder to work. In Europe where concrete is generally of a higher quality, concrete is designed for no slump.

After a question period Kelvin Sproule thanked the speakers and the meeting adjourned.

## Winnipeg

C. S. Landon, M.E.I.C.,
*Secretary-Treasurer*

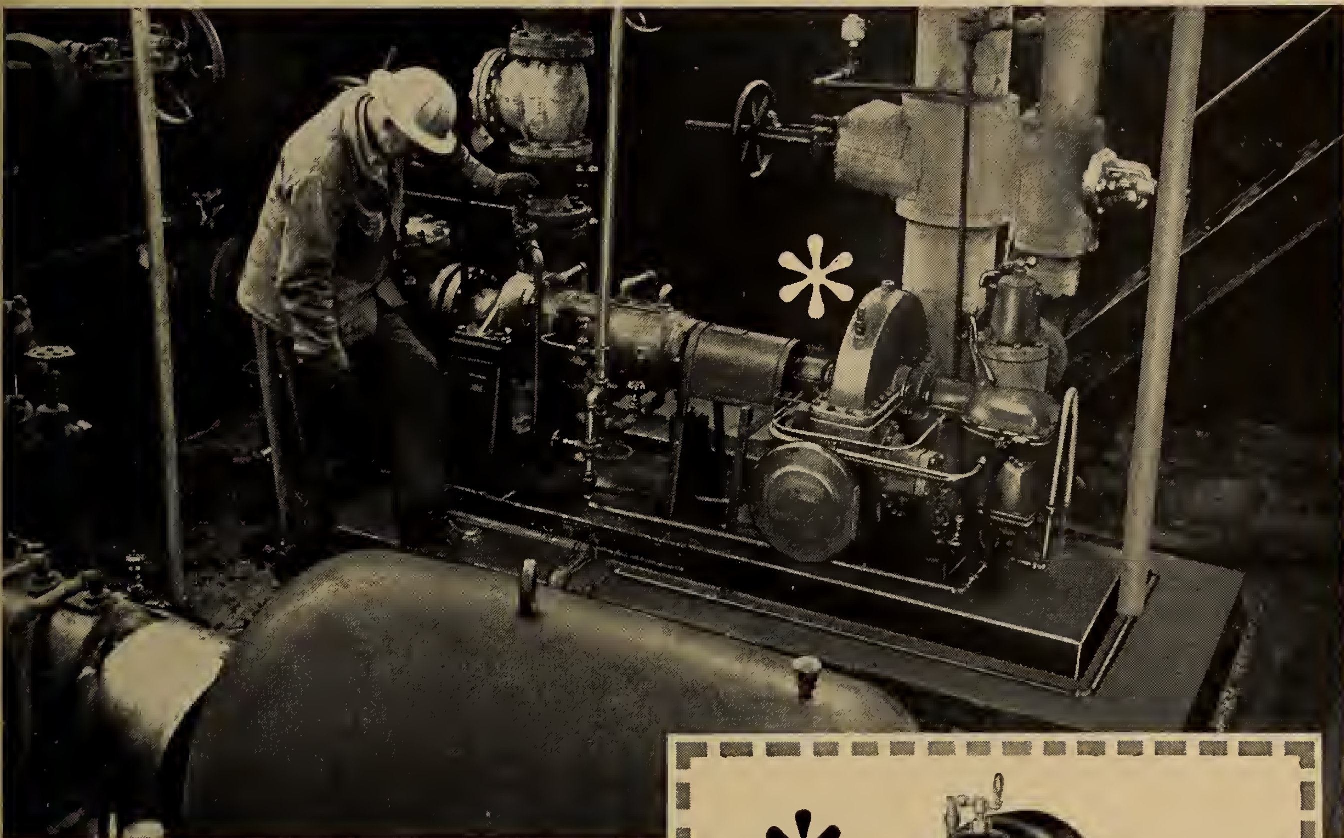
W. Victor Morris, M.E.I.C.,
*Branch News Editor*

### Prizes Presented

At a meeting of the Winnipeg Branch held on March 18 under the chairmanship of Professor J. Hoogstraten, three prizes were presented to fourth year engineering students of the University of Manitoba for theses written during the summer of 1953.

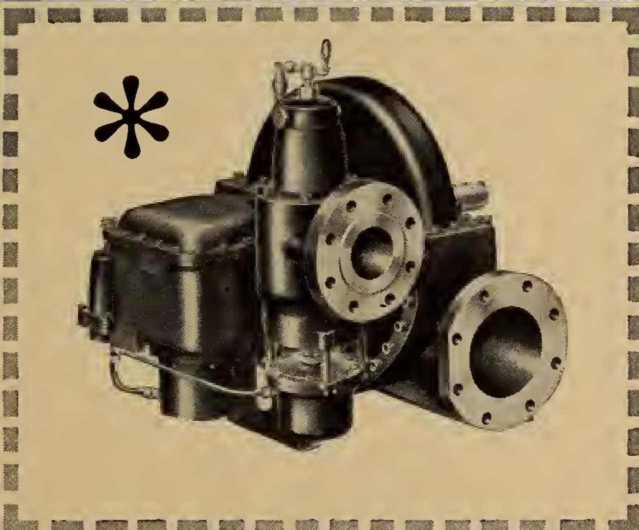
# New Mechanical Turbines

## offer special features at no extra cost



Refinery process foreman adjusts pump valve. This Type DP-20, 125 hp turbine increased by 75% the oil thru-put of this pump which supplies oil for the refinery's distillation unit. Total daily thru-put of pump equals former capacity of two.

• G-E Type DP turbines—incorporating many superior design features—set a new standard in mechanical-drive turbines, yet they're priced no higher than conventional machines. Two G-E big-turbine features are . . . "built-in" hydraulic governing, for a much wider speed range with greater accuracy of control than is possible with standard type governors . . . plus pressure-oiled bearing for constant, positive lubrication. Many other features exclusive with the Type DP are added to give maximum performance and reliability, plus low maintenance. Standardization keeps initial costs low . . . permits easy interchanging of parts and fast replacement. Get the complete story on G-E Type DP Turbines by contacting your nearest C-G-E sales office.



*Type DP Turbine* . . . one of the new C-G-E line of improved mechanical-drive turbines for pumps, compressors, blowers. Sturdy construction and safety features fit them ideally for many petroleum industry applications.

**GENERAL ELECTRIC MECHANICAL-DRIVE TURBINES**

*APPARATUS DIVISION*

AAD-101

**CANADIAN GENERAL ELECTRIC COMPANY LIMITED**

At the joint meeting of the Winnipeg branches of the E.I.C. and I.R.E. (left to right): Prof. N. A. Williams, chairman Electrical Section E.I.C., A. J. Groleau, chief engineer, Toll Area, Bell Telephone Co. Montreal, J. Greenaway, Chairman, I.R.E.

Yukon Branch executive with President R. L. Dobbin. Left to right: F/L. G. H. Hicks, treasurer, John L. Phelps, secretary, President Dobbin, Lt.-Col. M. C. Sutherland Brown, chairman, Brigadier H. W. Love, Lt. K. J. Baker.

The civil engineering prize was presented to Arnold B. Bjornsson for his thesis, "A Discussion on the Use of Cantilever Trusses in the R.C.A.F. Standard Maintenance Hangar and Workshops". Mr. Bjornsson was introduced to the members by Professor W. F. Riddell, chairman of the university's civil engineering department.

Professor N. A. Williams, chairman of electrical engineering, introduced the winner in the electrical engineering department, Ernest Bridges, whose thesis title was "General Supervisory Control Equipment of the Winnipeg Electric System".

Ronald G. Nicholls, student in mechanical engineering, was introduced by Professor N. M. Hall, chairman of the mechanical engineering department, who remarked that he was very pleased to see that Mr. Nicholls, a mechanical student, had done such a commendable job on a civil engineering subject, "A Study of Bearing Piles as Applied to the Alcan Project at Kitimat, British Columbia".

On behalf of the faculty of engineering and architecture Dean A. E. Macdonald thanked the Engineering Institute for the encouragement given to students to write summer theses.

#### Gas Turbines

Following the presentation of prizes, J. S. Quill of Schenectady, New York, spoke to the members of the application of gas turbines to the pumping of gas through pipe lines. This particular subject holds special interest for engineers in this part of the country at this time in view of the possibility that natural gas from Alberta will soon be piped to and through Winnipeg.

Mr. Quill is with the industrial engineering section of General Electric Company, at Schenectady. His talk was accompanied and illustrated by a series of coloured slides showing a number of installations of gas turbines in gas pipelines and in other applications. After the swiftly-paced, entertaining, and informative talk, a discussion period followed, during which Mr. Quill answered questions and enlarged upon points of particular interest to the Winnipeg members.

### ELECTRICAL SECTION

G. Flavell, Jr.E.I.C.,
*Section News Editor*

#### Circuit Breakers

D. F. Amer, engineer in charge of high voltage switchgear, Reyrolle & Company Limited, Durham, England, spoke to a gathering of the electrical section on February 4. His paper entitled "A Review of British Air-blast, Dead Tank, Oil Break and Porcelain Clad Small Oil Volume Circuit Breakers for 66 k.v. and Above".

Mr. Amer described, with the aid of slides, the general construction of the three different types of breaks in question, pointing out the features of each type and the theory behind certain points of construction.

The performance characteristics of the three types were then compared under the following conditions:

1. Normal load breaking
2. Small inductive currents
3. Breaking capacitive currents
4. Breaking short circuit currents
5. Automatic reclosing
6. Asynchronous load breaking
7. Resistence switching

Mr. Amer briefly outlined the factors affecting insulation in the three types of breakers, brought about by oil and air contamination due to arc products.

The location and application of current transformers for protection was discussed in detail in each case.

#### Future Developments

Commenting on future developments for circuit breakers, Mr. Amer felt that larger testing stations would help engineers design simpler, more efficient and higher capacity circuit breakers, but up to the present time, testing station capabilities have lagged behind the increase of available fault power in supply networks.

The attending members expressed their gratitude to Mr. Amer for his very fine paper.

The meeting adjourned for refreshments.

#### TD-2 Microwave Link

A joint meeting of the I.R.E., Winnipeg Section, and the E.I.C., Electrical Section on February 17, was attended by over 250 people, which included visitors from the Canadian National and Canadian Pacific Telegraphs and the Manitoba Telephone System.

Mr. Groleau, chief engineer of toll area for the Bell Telephone Company in Montreal, presented a paper describing the microwave system linking Buffalo, Toronto, Ottawa and Montreal.

The system which has been in service about a year and a half operates on a 4000 megacycle frequency and will ultimately carry 12 channels, each channel having a capacity of a TV channel or 480 telephone circuits. At the present time there are facilities for one video and one telephone channel each way between Toronto, Ottawa and Montreal, and dual frequency between Toronto and Buffalo for diversity operation of 1 - one-way video and 1 - one-way telephone channel. Only 98 of the 480 circuits available in the channel are in use, with a total of 170 to be used later this year. The system will be able to handle colour TV when available.

#### Preparatory Engineering Work

With the aid of slides Mr. Groleau outlined the preparatory engineering work that was necessary, and described the field tests carried out, using mobile transmitting and receiving stations and portable towers.

Mr. Groleau described the inspection and servicing routine set up for maintenance of the unattended relay point.

Tube troubles have been minimized by the use of a controlled inspection program and due to specially designed tubes. The sample shown was a 4000 megacycle triode using a grid wire of .0003 inches in diameter. The tubes cost between $200.00 and $300.00 each.

Mr. Groleau concluded by summerizing the advantages of microwave systems, such as, the one he described, but clearly pointed out that microwave could only be economical under certain conditions and applications, and it is not intended to replace land-time communication.

Following an interesting discussion, Mr. Groleau was accorded a vote of thanks by those in attendance.

### Toronto

L. F. Bresolin, Jr.E.I.C.,
*Secretary-Treasurer*

H. Fealdman, Jr.E.I.C.,
*Branch News Editor*

#### The St. Lawrence Seaway

Colonel L. F. Grant, E.I.C. Field Secretary, discussed the question of the St. Lawrence seaway from economical, historical and political standpoints before a joint meeting of the Toronto Branch and the Canadian Institute of Mining and Metallurgy on Friday March 19. This meeting, which was held in the Northgate Hotel, was preceded by dinner, and Colonel Grant's address came as a fitting climax to an enjoyable evening.

After having traced the historical development of navigation on the St. Lawrence and the Great Lakes, Colonel Grant stated that the plan now before the House of Representatives for joint U.S. and Canadian participation in the seaway which provided for the international section to be built on the U.S. side, would deprive Canada of her historic control of the St. Lawrence to the sea. The Canadian Government had served notice to the U.S. that Canada was prepared to go ahead on her own and Colonel Grant urged that this be carried out. Such an undertaking, in relation to the country's economy would be simple when compared to the achievement of the construction of the Welland canal in 1833.

Colonel Grant also voiced some personal objections to the seaway, in that he was not assured that the Maritime Provinces would not be harmed economically, that the C.N.R. would suffer, and that beauty spots would be destroyed and small peaceful communities would be turned into large cities. He also felt that it was not fair to ask the country, as a whole, to bear the cost which should be paid for by toll charges on shipping. This should be insisted upon, despite heavy pressure which would be brought to bear by the shipping companies.

## Yukon

JOHN L. PHELPS, M.E.I.C.,
*Secretary-Treasurer*

K. J. BAKER, JR.E.I.C.,
*Branch News Editor*

***President's Visit***

On March 5 the newly formed Yukon Branch was honoured by a five day visit from the president, Mr. Dobbin. All efforts were made to try to show him as much of our territory as the short stay would allow.

Mr. Dobbin stayed at the home of Lt. Col. and Mrs. M. C. Sutherland Brown and on the night of his arrival was entertained, along with the branch executives and their wives, at a buffet supper at their home.

***A Busy Schedule***

The next morning Mr. Dobbin, with the branch chairman Lt. Col. M. C. Sutherland Brown and branch secretary John Phelps toured the Whitehorse area showing him all the points of interest in the army and air force installations. After lunch at the Officers' Mess, a further tour was made to the local museum and utility plants.

In the evening a banquet for all members, branch affiliates and their wives was held at the Whitehorse Inn ballroom. Because of the large attendance Mr. Dobbin was able to meet about 90 percent of the membership. A very interesting talk on the Coronation was given by Mr. Dobbin after dinner.

The following day, Mr. Dobbin, Lt. Col. M. C. Sutherland Brown, J. L. Phelps and the United Keno Hill Mines Co. road superintendent D. Finlayson, drove to the United Keno Hill Mines property at Elsa Camp, a distance of 256 miles almost due north of Whitehorse, to be the guests of C. E. White, M.E.I.C., the general manager. This brought Mr. Dobbin to within 130 miles of the Arctic Circle.

On the way to Elsa the party stopped at the Yukon Coal Mines at Carmacks for lunch and then were guests for tea at the home of Mr. and Mrs. Barwise. Mr. Barwise is foreman of the new four million dollar hydro plant of the Northwest Power Commission which was completed last year to supply electric power to the Mayo mining area.

Monday, March 8, Mr. White and his staff showed the group through his mine and mill. It will perhaps be of interest to the E.I.C. members to know that this property is now the largest silver producer in Canada as well as one of Canada's most northerly mines.

***Joint Meeting***

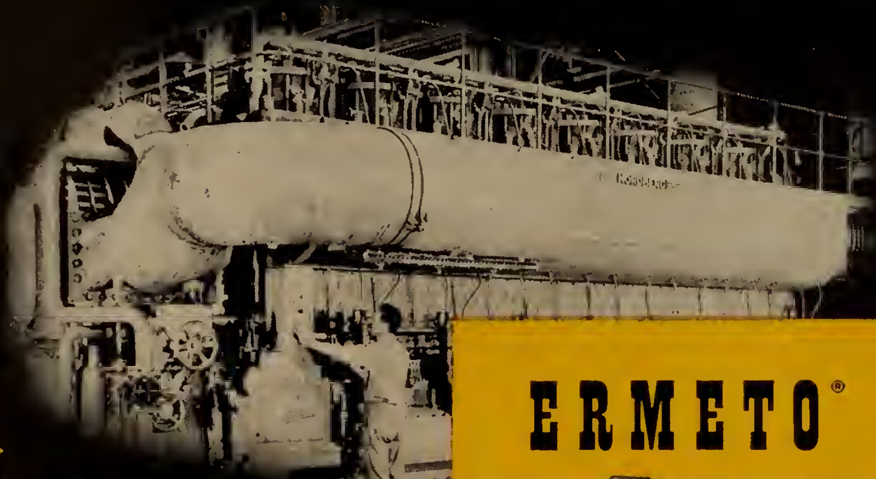
Monday night Mr. Dobbin and Mr. White presided over a joint E.I.C. and C.I.M.M. meeting which was attended by about 20 engineers and their wives. Engineers from all the other mines in the area turned up at the meeting to hear and meet Mr. Dobbin.

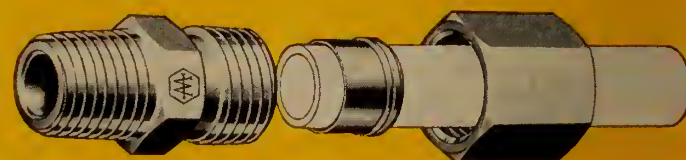
Tuesday, the party went to the town of Mayo where Mr. Dobbin flew to the historic City of Dawson. Due to shortage in time Mr. Dobbin was not able to visit Dawson but was flown over the city and the various creeks of '98 fame were pointed out to him.

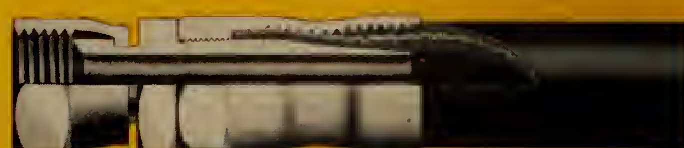
The party then flew back to Whitehorse where Brig. H. W. Love, M.E.I.C., gave a stag dinner at the Officers' Mess for the branch executives, the Commissioner of Yukon and Dean Hardy, M.E.I.C., of the University of Alberta.

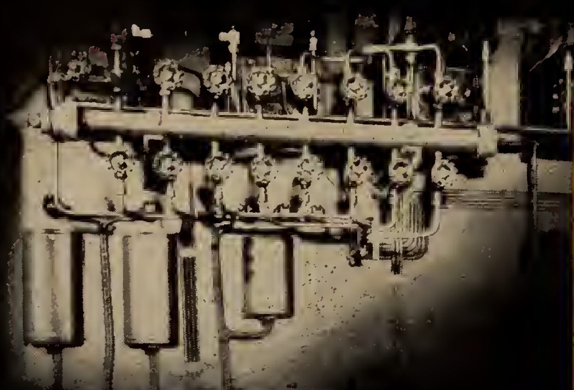
The next morning, March 10, Mr. Dobbin returned via CPA to Edmonton.

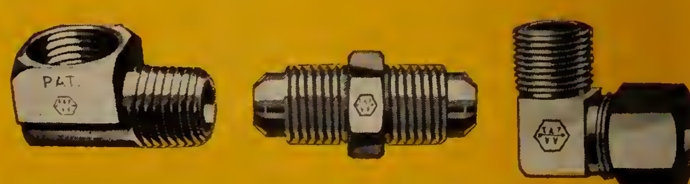
It must be recorded that it was through the visit of a past president, Col. L. F. Grant, that the Branch was formed in 1953. It is interesting to note that Mr. Dobbin was the first president to visit the Branch. The honour and pleasure of his visit was enjoyed.











PAT.

**Reviews — Book Notes — Abstracts**

## BOOK REVIEW

**Résistance des matériaux, théorique et expérimentale. Vol. 1, Théorie de l'élasticité et des structures élastiques.** R. L'Hermite. Paris, Dunod; Montreal, Fomac, 1954, 860 pp., figs., $33.60.

During the past twenty years, strength of materials, theories of elasticity, of plasticity, and of stability have made great strides.

In an effort to bring together in one work as much of this scattered information as possible, we now have the first of our proposed volumes by Monsieur L'Hermite.

This volume is devoted primarily to theories of elasticity in two and three dimensions, elastic structures, flexion and torsion, bent slabs, and shells.

It is definitely not intended as a textbook, but is written for specialists, constructors, and physicists who wish to enlarge their point of view, and keep up with modern developments in their subject.

Theories have been condensed to a minimum, and principles of methods and results have been stressed.

Bibliographies are in the form of footnotes and collectively will prove an invaluable source for more detailed reference material. However, the author states that he has not included additional books on the same subject. They are all books he has already referred to in the text.

Running page headings and bold type paragraph titles are an invaluable help to quick reference.

The latter are repeated in the detailed table of contents at the front of the volume. An alphabetical author list, and subject index follows at the back.

The whole is a scholarly presentation, arranged for maximum usefulness for reference or for full reading, and will be an invaluable contribution in its field.

E.K.

## BOOK NOTES

**Prepared by the Library**
**The Engineering Institute of Canada**

*Book notes marked by an asterisk have been provided through the courtesy of the Engineering Societies Library in New York.

**Bibliography of rivers and harbors and related fields in hydraulic engineering.** R. S. Rowe. Princeton, University, Dept. of civil engineering, Rivers and harbors section, 1953. 407pp.

This bibliography contains over six thousand references in many languages covering books, reports, monographs, handbooks, etc., but does not include articles in periodicals, or abstracts, the majority of the listings have been taken from the Library of Congress catalogue.

The entries are divided into nine sections: hydraulic engineering, rivers, harbours, canals and inland navigation, interoceanic canals, reclamation, flood dams and reservoirs, water power and water supply engineering. Each of these sections is further divided into smaller topics. In addition to general listings for the subjects, there are, in the majority of sections, entries for specific rivers, harbours, canals, etc. There are author and subject indices, the latter listing mostly specific geographic features.

This bibliography should prove very useful to all those connected in any way with the important field of hydraulic engineering.

**Blazing Alaska's trails.** A. H. Brooks. Washington, Arctic Institute of North America, 1953. 528 pp., illus., $4.50 (U.S.).

Published jointly by the University of Alaska and The Arctic Institute of North America, this is a posthumous publication of the work of the late A. H. Brooks, formerly head of the United States Geological Survey work in Alaska. It is edited by B. L. Fryxell, with a foreword by John C. Reed, of the Arctic Institute.

Detailed information includes climate, topographical formation and geology, flora and fauna, history, economic, political and cultural, and both Russian and American exploration and occupation.

Although there is no bibliography as in such, a few bibliographical footnotes are included, and there is a detailed index.

**Britain's atomic factories.** K. E. B. Jay. Ottawa, United Kingdom Information office, 1954. 100 pp., illus., $1.25.

In England, just as the name Harwell is synonymous with atomic energy reresearch, so Risley is synonymous with atomic energy production. This report traces in outline the story of Risley from its inception in 1946, through the design and construction of its three factories, to the present day when they are all in production. There is also a final chapter giving plans for the future, and the possibilities of producing power from nuclear fission.

Although written primarily for the layman, the report should also be of great interest to both scientists and engineers, particularly as details are given of the actual production side which involved the design and construction of engineering works of what must necessarily be a new type. The report emphasizes the use made of engineers, ". . . wherever one goes at Risley one encounters an engineer . . . Every operation except the purely administrative and clerical is controlled and usually performed by an engineer because only by so doing is it possible to ensure that the engineering point of view prevails". Reference is made to the special training programme instituted in connection with the work, and to the part that younger engineers are playing in the development — the average age of those employed being just over thirty.

This report, written by a member of the Division of atomic energy, together with that published some time ago in activities at Harwell, make very interesting reading.

**Canadian conference on prestressed concrete.** Toronto, University Press, 1954. Irreg. paging, spiral binding, $2.50.

Designed as a concise review of prestressed concrete for Canadian engineers, architects, and builders, each paper at this conference was prepared by a specialist in the particular field, including Professor Magnel, from the University of Ghent.

Topics covered include why we use prestressed concrete, strain gauge tests on beams, introduction to the theory, control of quality, steel for use, significant features, statistical indeterminacy, reports on research, and a discussion of the world's largest concrete beams.

## LIBRARY REGULATIONS

### Summer Hours

Mon.–Fri. . . . . . . . . 9 a.m. - 5 p.m.
Closed all day Saturday

### Bibliography and Reference Service

Short subject bibliographies are compiled on request. When placing these requests, please give as much detail and background information as possible.

### Borrowing

Books, periodicals, pamphlets and films may be borrowed for two weeks at a time. All books included in the Library Notes Section of *The Engineering Journal* are available for loan. **A fine of 25c per day is charged for each day borrowed items are retained beyond the two-week period.**

A library deposit of $5.00 at par in Montreal is required, for which two items may be borrowed at a time. Temporary deposits (30 days or less) $10.00. Books are sent anywhere in Canada, and carrying charges are payable by the member concerned.

### Ordering

Any book or pamphlet may be ordered through the library. All publications of affiliated societies, whether books, pamphlets, or periodicals, should be ordered through the library, as reduced rates are applicable on these to all members. Except in the case of library deposits **please make no payments in advance.** Non-members may consult the library, but may not borrow material. Please address all requests to **The Library.**

# *4 good men on a 1-man job*

**THREE AREN'T HELPING MUCH** on this valve repair job. They're a good molding press crew with nothing to do because a valve failed. But their time and production loss is raising the cost of this valve mighty high.

Here's one of the reasons for insisting on dependable quality in every valve, no matter how obscure, how seldom operated. Here's where production tallies, as well as maintenance reports, can show the fallacy of buying valves on price alone.

The thrifty buyer knows the risk of sacrificing quality in face of mounting labor costs. He's aware how even brief shutdowns can multiply those high costs fast. He chooses Crane Quality for the assurance it gives of dependability and value in all piping equipment.

*For complete information on the right Crane quality valves for your particular requirements—ask your Crane representative—Crane Branch—or write:*

**CRANE LIMITED**

General Office: 1170 Beaver Hall Square, Montreal

# CRANE

VALVES • FITTINGS • PIPING
PLUMBING • HEATING

NATION-WIDE SERVICE THROUGH BRANCHES, WHOLESALERS and PLUMBING AND HEATING CONTRACTORS

Most speakers have included bibliographical references with their papers, and the whole is well illustrated, with both diagrams and photographs.

***Construction methods and machinery.** F. H. Kellog. New York, Prentice-Hall, 1954. 415 pp., illus., $10.00 (U.S.).

In this book the principles of scientific management are applied to construction work. Part one treats planning of operations, control of work for maximum production, and economics of equipment-selection, costs, depreciation, etc. Part two discusses the fundamentals and economical utilization of machinery for power, transportation, hoisting and conveying, and pumping. In the third part—about half the book—methods of conducting scientific operations are described and evaluated.

***The design of dams.** A Bourgin, tr. by F. Fergusson. Toronto, Pitman, 1953. 344 pp., figs., $9.00.

Part I of this translation from the French is an introductory summary of the basic formulas and theories. Part II is a thorough exposition of the well-established design procedure for gravity dams. Part III discusses in considerable detail the mainly theoretical methods of design of arch dams. And part IV deals briefly with counterfort and hollow dams. It is extensively illustrated by diagrams and graphs.

***Design in structural steel.** J. E. Lothers. New York, Prentice-Hall, 1953. 454 pp., figs., $10.00 (U.S.).

With its emphasis on real structures and practical problems of design in steel, this text will be useful to both practicing engineers and students. It begins with consideration of structural members and connections, covers base-plates, built-up beams and plate girders, roof trusses, and industrial building bents, and concludes with a chapter on steel bridges. Many practical problems are given.

**Diesel engine design,** 2nd ed. Toronto, British Book Service, 1953. 415 pp., diagrs., $7.50.

"The Diesel engine, like all other heat engines, converts the latent heat energy of the fuel into mechanical work. The heat in the fuel is released by combustion and is transferred to a working substance. The Diesel engine is classed as an internal combustion engine because this working substance actually takes part in the process of combustion."

As the Diesel engine is concerned with this conversion of heat into energy, chapters on thermodynamics and combustion problems are included. The dynamics of the connecting rod crank mechanism are also investigated, and a solution to facilitate treatment of the crank shaft as a continuous beam.

Worked examples for eight-mass torsional vibration and four-mass balancing problems are also considered, and further analysis of these can be had through bibliographical references, which are included with some of the chapters, and also at the end of the text.

**Electrical year book,** 1954 ed. Manchester, Emmott, 1954. 360 pp., diagrs., tables, 3/–.

In addition to mathematical tables showing such things as areas and circumferences of circles, squares, etc., this Year book contains tables of British standard Whitworth bolts and nuts, and screw threads.

The various articles in the Year book cover many topics connected with electrical engineering, including electrical calculations, space heating, switch gear and switchboards, electric wiring, meters and measuring instruments, etc. There are completely new sections on electrical equipment in automobiles, and on safety precautions in the use of portable electric tools. Other sections have been revised.

This 1954 edition of the Year book should be a useful addition to any library reference shelf.

**Electro-magnetic machines.** R. Langlois-Berthelot; Lieut.-Col. H.M. Clarke, tr. London, Macdonald, 1953. 535 pp., illus., 65/–.

This book was originally published in French, and due to war conditions, has only just come out in an English edition.

The author, in addition to directing one of the most modern and best equipped high voltage laboratories in Europe, is chief research engineer for production and transformer equipment at L'Electricité de France, and professor of Electrical Engineering at L'Ecole Supérieure de Paris.

He has divided his work into six parts, considering questions common to the different classes of transformers and rotating machines.

Part one deals with the various types of machine.

Part two — The general constitution and stenography.

Part three — The machine as seen by the designer responsible for the creation of the machine, and how it will answer the demands of industrial physics.

Part four — The machine as seen by the engineer who must define its working conditions.

Part five — A general outline of abnormal conditions theory, i.e. harmonics, unbalance, transients.

Part six — General discussion of flux, reactive power, industrial research, etc.

An appendix deals with elementary basic algebraic problems.

Unfortunately, the index is poor. However, the general format of the volume is excellent, and the logical arrangement of the information makes for ease of consultation.

***Elements of electrical engineering,** 6th ed. L. Cook and C. Carr. New York, Wiley, 1954. 682 pp., diagrs., $6.75.

This standard textbook is intended as a short course for electrical students and for non-electrical students in college. The extensive coverage, arranged to be used and combined as required, is divided as follows: fundamentals of electric and magnetic circuits; basic relations for electrical machines; d-c. machinery; a-c. circuits; a-c. machinery; instruments, electronics, special applications.

***Elements of statistics.** H. C. Fryer. New York, Wiley, 1954. 262 pp., $4.75.

A textbook for an introductory course in probability and statistics. The book aims to give the student a background in elementary methods, probability, and frequency distributions, and an introduction to sampling now in common use.

**Essentials of engineering thermodynamics.** H. J. Stoever. New York, Wiley, 1953. 279 pp., figs., $4.50.

This is a basic undergraduate introductory text book, condensed from the nineteen hundred and fifty-one title Engineering Thermodynamics.

It is conveniently divided into three parts, dealing successively with the first and second laws of thermodynamics, and then the application of the principles and methods developed.

In keeping with its identity as a class room text, problems are included, and an appendix of basic tables.

**Exécution du béton précontraint.** L. Bourgine. Paris, Editions Eyrolles, 1954. 116 pp., illus., $4.00.

Besides the preparation of prestressed concrete, a perhaps even more important part of the construction job is the way the mixture is used. And this is the angle stressed by the author in this little volume.

Copious detailed photographs accompany the text, and clearly defined sections and paragraph headings greatly facilitate its use.

It will be a small, but most valuable addition to the field.

**Fabricated materials and parts: a comparison of cost and design factors.** T. C. Du Mond. New York, Reinhold, 1953. 332 pp., illus., $6.50 (U.S.).

The author of this volume is also editor of MATERIALS AND METHODS. A considerable amount of the information contained first appeared in a special section of METALS AND ALLOYS, and later in more detail entitled Fabricated Materials and Parts in MATERIALS AND METHODS.

The object of this publication is to bring together in one volume all the important information which must be considered in deciding what method of production best meets the needs of the individual making the decision.

The book is well illustrated, and logically arranged, but the index is brief.

**The Firestone story; a history of the Firestone Tire and Rubber Company.** Alfred Lief. Toronto, Whittlesey House, 1951. 437 pp., illus., $4.50.

The Firestone Tire and Rubber Company was founded in 1900, and this history of its first fifty years covers the period from the horse-and-buggy days to the present. The development of rubber tires, from the first solid one used on carriages to the various types now used on many kinds of vehicles, is outlined, and the growth of the company to meet changing conditions is shown. The author had free access to the archives of the company, and the book will be of interest to those connected with the rubber industry, or interested in the commercial history of the United States.

***Fourth symposium (international) on combustion, September 1952.** Baltimore, Williams and Wilkins, Toronto, Burns and MacEachern, 1953. 926 pp., diagrs., $7.00.

The range of topics of the papers presented in this symposium was limited in order to place emphasis on the physical aspects of combustion, treated from both experimental and theoretical standpoints. The one hundred and twelve papers are broadly classified under the following headings; flammability; ignition; laminar combustion and detonation waves (fifty papers); cellular flames and oscillatory combustion; turbulent flames; quenching, flash back, and blow-off; stabilization by flame holders; fuel jets; burning of fuel droplets; combustion in rockets and engines; and survey papers.

**Glossary of terms used in petroleum refining.** New York American petroleum institute, Division of refining, 1953. 188 pp., $6.00 (U.S.).

The petroleum industry has its own colloquial and technical terms, just as any other industry, and although this glossary does not attempt to give authoritative definitions, it is a valuable tool for those in the industry. The definitions are taken from published sources, such as technical dictionaries and encyclopedias. There is an Appendix giving both Pitman and Gregg shorthand outlines of the terms in the Glossary, very useful for any secretary in the petroleum industry.

***The growth of integrated oil companies.** G. McLean and W. Haigh. Boston, Harvard Business School, Division of Research, 1954. 728 pp., figs., $12.00 (U.S.).

The emergence of large integrated oil companies as the predominant form of organization in the oil industry is the subject of this study. Part one depicts the structure of the industry in nineteen hundred and fifty; part two discusses the technological, economic and business factors which resulted in integration; part three analyzes seven representative companies to determine differences in structure and in managerial policies; part four examines the position of the small refiners in the industry.

**Guide to audio reproduction.** David Fidelman. New York, Rider, 1953. 232 pp., illus., $3.50 (U.S.)

The aim of this book is to present an introduction to the principles and techniques of sound reproduction, and is intended for those who are familiar with the basic principles and components of electronic circuits, but who are not specialists in electronics or audio. A minimum of mathematics has been used in the text.

The book begins by outlining the principles of high fidelity reproduction of sound, and shows the application of the principles to audio systems. Also covered are the basic theory of sound and musical instruments, the design and construction of amplifiers, loudspeakers and cabinets, and their location in a room.

This book should be of use to all those interested in sound reproduction, both the amateur and professional.

***Hydraulique technique.** Charles Jaeger. Paris, Dunod; Montreal, Fomac, 1954. 510 pp., $21.50.

Beginning with a section on fundamental hydraulic principles, this text has three subsequent major sections on steady flow, unsteady flow, and flow in underground strata. Particular attention is paid to basic hydrodynamic equations, open-channel flow, surge tanks, and water hammer. An appendix discusses experimental values for hydraulic calculations dealing with the effect of bends and other physical conditions.

**Industrial inorganic analysis.** R. S. Young. Toronto, British Book Service, 1953. 368 pp., diagrs., $7.25.

Presented in alphabetical order of chemical names, the author has prepared this volume primarily for the use of the industrial analytical chemist. But it is also hoped that it will be of use to the younger analytical chemists in inorganic chemical industries and in the mining and metallurgical field.

Each section includes a short discussion of the material being considered, its properties etc. This is followed by general procedure, and special procedure, and a list of bibliographical references.

The whole text is followed by three and one half pages of general bibliography and an author and subject index.

**An introduction to railway engineering.** R. A. Inglis. Toronto, British Book Service, 1953. 200 pp., diagrs., $4.25.

Subtitled "A short textbook of the theory and practice of railway surveying, construction and signalling for the use of students and civil engineers", this volume will also be a handy office reference book.

Surveying, construction and signalling are considered in the three general divisions of the volume.

The section on surveying is confined to methods and processes essential or peculiar to railway work. Railway construction is roughly limited to earthworks, trackwork and track construction. Signalling deals only with the methods currently in use with British Railways.

A two and one-half page bibliography comprises the references, and the book is well indexed.

**Introductory soil mechanics and foundations.** G. B. Sowers and G. F. Sowers. Chicago, Soiltest Inc., 1951. 284 pp., illus., $5.25 (U.S.).

The importance of soil mechanics in the fields of design and construction problems is receiving more and more recognition as time goes on.

Necessary pre-requisites for a study of this text are a knowledge of geology, and of applied mechanics; an understanding of

# The odds are against when you take a on second-rate

## If the springs you buy aren't up to par your product's reputation is the loser!

Constant failure of a single moving part can quickly offset the valuable time and good engineering which goes into the manufacture of your product . . . and may often result in lower sales. Can you afford to gamble with the good name of your product when Wallace Barnes will provide the engineering skill and expert design service required to produce the spring *best suited* to your needs? At Wallace Barnes you benefit not only from engineering services, laboratory testing and unequalled facilities . . . but you gain as well from the manufacturing knowledge accumulated through association with 10 sister plants in the U. S. A. Remember, price tags are no guide to quality! The way to be *certain* of a first-rate spring is to specify Wallace Barnes!

*Coil and flat springs . . . wire forms . . . clips, clamps, small stampings . . . in quantity or small orders.*

**Wallace Barnes**

structural design, and an appreciation of construction procedures.

The authors of the book make no claim to originality, but have freely drawn on the results of the work of world known specialists in the field.

The nature and physical properties of soils, soil deposits, seepage, drainage and frost action, foundation, earth pressure, fills and subgrades, and stability of earth masses, all are considered.

Problems and bibliographies are included, and also a list of nomenclatures and symbols, and the book is indexed.

**Maintenance engineers' pocket book,** E. Molloy, ed. Toronto, British Book, Service, 1953. 256 pp., diagrs., $3.00.

Another in a series edited by E. Molloy, this useful pocket book is intended for engineers in charge of the maintenance of all types of plant in factories, workshops, etc. It is a revision of the Plant engineer's pocket book, and is divided into five sections: Regulations (British) affecting the maintenance engineer; sources of power; transmission of power; plant and equipment; and essential services. The subjects dealt with in these sections include a-c. and d-c. motors, steam engines and boilers, roller chain drives, pumps, compressed air equipment and lighting. Much of the material is given in tabular form.

***Materials and processes,** 2nd ed. J. F. Young. New York, Wiley, 1954. 1,074 pp., figs., $8.50.

This book aims to present, in a single volume, a broad study of the materials and manufacturing processes employed by engineering designers, and thus to provide information directly useful in the selection of materials. It is intended for classroom use and for engineers who wish an overall picture. In addition to the general revision new chapters have been added on metallographic examination, statistical methods, and various non-metallic materials.

**Mechanical world year book,** 1954 ed. Manchester, Emmott, 1954. 264 pp., diagrs., tables, 3/6.

The 1954 edition of this useful Year book contains two new sections, namely a review of progress in the steam cycle and the performance of steam turbine plants, and an article on metal finishing, in addition to sections on patenting procedure, fuel and lubricating oils, machine tools, steam boilers, mechanical press work, etc.

There are many tables, a list of selected British standards relating to mechanical engineering, and a short classified buyers' guide.

**Les moteurs électriques à puissance fractionnaire.** C. G. Vienott. Paris, Dunod; Montreal, Fomac, 1954. 538 pp., figs., $20.25.

Originally published in New York by McGraw-Hill, under the title FRACTIONAL HORSE POWER ELECTRIC MOTORS, this volume will now be most welcome to French engineers in the electrical field.

The author describes existing types, the power required, what their potentialities are, and instructions for their repair.

Although primarily written to serve the needs of the installation, maintenance and repair man, it will also be of value and interest to everyone interested, from the mechanically minded, to the salesman.

The typical detailed French table of contents is a joy to use, and the alphabetical index at the back further enhances the book's usefulness.

***Nuclear moments.** N. F. Ramsey. New York, Wiley, 1954. 169 pp., figs., $5.00.

The first four chapters present introductory material and definitions, descriptions of interactions, methods for measuring nuclear moments, and a summary of significant results in the field and their relation to nuclear theory. These chapters are reprinted from the author's section of volume one of "Experimental Nuclear Physics" edited by E. Segre. The last third of the book is new material on applications to chemistry and solid state physics.

**The physical chemistry of melts: a symposium on molten slags and salts.** London, Institution of Mining and Metallurgy, 1953. 106 pp., figs., 15/–.

These six papers, plus an introduction and general discussion, compose a symposium on the nature of molten slags and salts held by the Nuffield Research Group in extraction metallurgy, London, twentieth of February, nineteen fifty-two.

Both the text of the paper, and the discussion, are included in each instance, and they cover construction and surface tension of silicates, liquid oxides, molten slags, and heats of mixing in the system ferrous oxide-silica in the liquid state.

References are included with each paper, which adds further to this small but important volume.

**Principles and practice of management,** ed. E. F. L. Brech. Toronto, Longmans, Green, 1953. 752 pp., folded charts, $9.00.

The field of management is becoming more and more complex with the development of systems and modern methods of thinking.

This work, the first of its kind to be published, dealing with the subject as a whole, is divided into four parts, each written independently by a specialist in the field.

Distribution, Production, Personnel and Control are the headings of the four main parts. Each one is clearly arranged under separate chapters and headed paragraphs, and carries a bibliography.

Besides these sections, the editor himself discusses Management in Principle in the introduction, and Management in Practice in the conclusion, all followed by a general bibliography on management and a good index.

Numerous folded charts serve as an additional attraction.

The usefulness of this work in practically all branches of engineering and production can scarcely be overestimated.

**Proceedings of Athabasca oil sands conference, September 1951.** Edmonton, Oil sands project, 1951. 371 pp., illus., $2.50.

The Government of Alberta arranged the Oil sands conference in 1951 for the purpose of studying the factors affecting development of the Athabasca oil sands, and this book contains a verbatim report of the papers presented there, and the discussions arising from them.

The conference was divided into four sections, and in each section papers were given by experts in the various fields. The four sections dealt with geology of the sands formation, possible mining methods, separation of the oil from the sand, and its refining and transport to markets.

There is a list of references at the end of each paper, and the report should be of great interest to all of our members connected with the oil industry.

***The radio amateur's handbook,** 1954 ed. West Hartford, American radio relay league, 1954. 788 pp., illus., $3.50 (U.S.).

This standard manual of amateur radio communications covers the entire field from the fundamentals to the latest techniques in equipment, design and construction. The considerable amount of technical data provided includes a comprehensive, up-to-date section of vacuum-tube data tables. The advertising section contains condensed manufacturers' catalogs. As usual, the new edition has been revised to conform to current practice, notably the chapter on v.h.f. receivers.

**Refuse collection and disposal for the small community.** U.S. Public Health service and American public works association. Chicago, American public works association, 1953. 39 pp., illus., $2.00 (U.S.).

The aim of this report is to present operational and cost data connected with establishing and providing sanitary refuse practices in a small community in such a way that they may be applied in specific cases.

Storage, collection and the various methods of disposal of refuse are covered and there is also a section on methods of financing an efficient garbage system.

The Appendices include a bibliography of articles, books, pamphlets and films on the subject, and model ordinances governing refuse storage, collection and disposal.

**Saben's commercial directory and handbook of Uganda, 1953-1954.** Kampala, Uganda, Saben, 1953. 432 pp., maps in pocket, 25/.

This new edition of Saben's Uganda directory presents a great deal of information in a very compact form about a part of the world with which the majority of people are little acquainted.

The first section of the directory deals with the geography, history and government of the country, and also includes a bibliography of books about Uganda and East Africa. The directory section lists in alphabetical order the towns and villages, giving a few words of information about each, and then lists the holders of Post Office boxes in each place, together with their telephone numbers. There is a list of companies doing business in Uganda, and the section devoted to finance, freights and customs has paragraphs on banking, company law, income tax, freight rates, customs duties, etc.

Information is given on the agriculture, industry and commerce of the country, and there is also data on communications, hotels, and other items of interest to the traveller or tourist. Also included in the book are maps of Uganda and the surrounding territories.

This Directory will be very useful to all those who have any interests in Uganda, and will prove a valuable reference book.

**Shell moulding.** London, Machinery publishing co., 1953. 94 pp., illus., $1.00. (Yellow back No. 34).

Shell moulding is a method of casting which is as yet not very extensively used. However, as it is applicable to practically any metal, its use will probably increase.

This book presents a selection of the information available on shell moulding, much of it having already appeared in the periodical Machinery. The principles of the technique are explained, as are the methods by which a number of firms in both the United Kingdom and the United States have put it into use.

The various topics covered are the principles and advantages of shell moulding, mould making, patterns, shell making, shell moulding machines, preparations for pouring gates and runners, high-quality castings, and light alloy castings.

This latest volume in the "Yellow Back" series issued by the Machinery Publishing Company should prove of value to all those interested in metal casting.

***Spending for industrial research, 1951-1952.** DeW. C. Dearborn and others. Boston, Harvard business school, 1953. 103 pp., $2.50 (U.S.).

Summarized quantitative information is given including scale of expenditures for research and development by industrial firms and variations of such expenditures among firms by industry and size. There are many tables analysing total cost of research, broken down into cost per research worker, cost of research, classification by types and size of industry, and research financed by Federal Government.

***Statics and strength of materials.** R. H. Trathen. New York, Wiley, 1954. 506 pp., diagrs., $7.50.

While the coverage of this book is similar to that of existing texts, the arrangement of material differs in presenting statics and strength of materials as a unit. The primary emphasis is on principles but throughout the text illustrative problems indicate methods of applying principles to the solution of engineering problems.

**Sudbury basin: the story of nickel.** D. M. LeBourdais. Toronto, Ryerson, 1953. 210 pp., illus., $3.00.

In November of eighteen eighty-three the first work train reached Sudbury. In eighteen eighty-seven the Canadian Pacific Railway which owned the site, had it surveyed. In eighteen ninety-three, having attained the thousand population status of a town, it was incorporated. Within the next few years public utilities were added, and it now boasts a population of forty thousand people besides fifteen thousand in the surrounding areas.

"Thus Sudbury epitomizes the evolution of a Canadian frontier community into an important city, which has occurred within the life span of many now living in the district".

From these first faltering beginnings, the author tells the story of the gradual discovery and development of the numerous ores and metals in the Shield, of the companies and personalities who financed and developed them and the pioneer faith and courage it took to achieve this.

Sudbury Basin will be of interest not only to the mining enthusiast and business man, but also to anyone interested in the growth and development of this country and its future potentialities.

***Thermionic valves.** A. H. W. Beck. Toronto, Macmillan, 1953. 570 pp., $10.25.

A comprehensive, theoretical account of the behavior of thermionic high vacuum devices, intended as an introduction to current research and a reference work for the practising engineer. The first of three parts deals with the fundamental physics of thermionic emission; the second considers the general theory of fields and electron motions related to charged conductors; and the last and longest section applies this material to various classes of tubes. Microwave tubes receive special attention.

***Timber; its structure and properties,** 3rd ed. H. E. Desch. Toronto, Macmillan, 1953. 350 pp., illus., $3.00.

Written in non-technical language for the user of wood, this summary of modern wood technology consists of four parts: Parts I, II, and III cover structure and classification, gross features and identification, and the physical properties of wood; Part IV, on wood utilization, deals with seasoning, defects, pests, preservation methods, timber grading, and briefly with wood as an engineering material.

***Traité théorique et pratique des engrenages. Volume I; théorie et technologie,** 2nd ed. G. Henriot. Paris, Dunod; Montreal, Fomac, 1954. 394 pp., figs., $15.75.

Volume one of this treatise on gears and gear design contains a review of fundamentals, an analysis of gear types and the generation of gear profiles, a study of gear interaction, and detailed treatment of tooth calculations and corrections. It suggests methods for improving gear quality and discusses both ordinary and epicycloidal geartrains.

***The Van Nostrand chemist's dictionary.** M. Honig and others, eds. Toronto, Van Nostrand, 1953. 761 pp., $12.00.

Although of primary interest to chemists, engineers may find need of definitions of some of the eleven thousand terms in this semi-encyclopedic work. The definitions vary from a few words to several paragraphs, and effective cross-indexing is provided by printing all listed words and topics in bold-face wherever they appear.

**Waves, tides, currents and beaches: glossary of terms and list of standard symbols.** R. L. Wiegel. Berkeley, Engineering Foundation, Council on wave research, 1953. 113 pp., illus., $1.00 (U.S.).

This glossary lists terms relating to waves, tides, currents and beaches as used by workers in the field of physical oceanography. The definitions are clear and concise, and include cross references. There are photographs and diagrams illustrating some of the terms.

A list of standard symbols and their definitions is included, and there is a useful bibliography of the reference sources used in compiling the glossary.

**World almanac and book of facts for 1954.** New York, New York World-Telegram and Sun, 1954. 896 pp., $1.00 (U.S.).

A wealth of information is condensed into a very compact form in this 1954 edition of the World almanac. There is a chronology of the events of 1953, both international and American, and a selection of the outstanding events of previous years is given.

There are lists of noted names of all nationalities, authors, poets, composers, historians, statesmen, actors, artists, of geographical and astronomical information, sports events, etc.

The major portion of the Almanac is devoted to the United States, and information is given on its government, history, population, laws, judiciary, etc. There are also political, economic and physical descriptions of the individual states, and of countries outside the United States.

The World almanac is a useful addition to the library or office reference shelf.

**The year that made the day.** London, British Broadcasting Corporation, 1953, 79 pp., illus., $1.50.

Here is the British Broadcasting Corporation's own account of the planning and preparation which went into the broadcasting and televising last June of the Coronation Service in Westminster Abbey, and the processions through London.

Although the Corporation had a year in which to prepare, when one reads how much planning had to be done, this period does not seem any too long. Details are given of the various ways in which the location of microphones and cameras was arranged, and of the complicated system of connecting circuits and lines which had to be set up.

There are many photographs, including some taken from the television screens. There are also photographs of the engineers, commentators and cameramen responsible for the broadcasts.

This little book should be of great interest to many of our members, especially in view of the joint meeting held by radio with the members of the Institution of electrical engineers when the Coronation broadcasts were the subject of the papers presented.

## BOOKS RECEIVED

**Aide-mémoire Dunod travaux publics,** 67e ed. C. Mondin. Paris, Dunod; Montreal, Fomac, 1954. 2 vols., figs., $2.25 each vol.

**Analyse matricielle des réseaux électriques.** P. Le Corbeiller, tr. par G. Lehr. Paris, Dunod; Montreal, Fomac, 1954. 124 pp., figs., $4.50.

## STANDARDS REVIEWED

**ASTM specifications, American society for testing materials, 1916 Race Street, Philadelphia 3, Pa.**

**ASTM standards on paper and paper products and shipping containers (with related information),** pa., $2.50.

Sponsored by Committee D-6 on Paper and paper products, and Committee D-10 on Shipping containers, this publication brings together the ASTM standard and tentative specifications, test methods, and definitions of terms relating to paper and paper products, and shipping containers.

The six specifications cover absorbent laminating paper for electrical insulating and vulcanized fibre sheets, rods, and tubes used for electrical insulating, filter paper for use in chemical analysis, waterproof paper for curing concrete, quicklime and hydrated lime for cooking of rags in paper manufacture, and quicklime for sulphite pulp manufacture.

Methods of test for paper include tests to show: absorption of water and writing ink by bibulous paper, cellulose, cadmium, zinc, etc., in paper, strength, smoothness, stretch, etc., of paper.

The Appendices list four proposed methods of test. These are for: bacteriological examination of paper and paperboard, smoothness of paper, wax pick test for surface strength of paper, and tensile strength of paraffin wax.

**ASTM standards on petroleum products and lubricants.** Pa. $6.00.

The November 1953 edition of this compilation includes in their latest form, most of the ASTM specifications, test methods, and definitions widely used in this field. (The tests for knock rating of engine fuels and certain standards for measuring and sampling are issued in special manuals and not included in this compilation.).

Prepared by ASTM Committee D-2 on Petroleum products and lubricants, this edition provides in a convenient manner 146 ASTM standards, including 130 test methods, 10 specifications, 1 classification of diesel fuels oils, 3 definitions of terms relating to petroleum, specific gravity, and rheological properties of matter, 2 recommended practices: one for the purchase of uninhibited mineral oil for use in transformers and in oil circuit breakers, and one for designating significant places in specified limiting values, and other material.

Groups of standards cover broad classifications of petroleum products: crude petroleum, butadiene, motor and aviation fuels, petroleum solvents and naphthas, diesel fuels, distillate burner fuels, kerosine and illuminating oils, lubricating oils, turbine oils, electrical insulating oils, plant spray oils and petroleum sulfonates, lubricating greases, and petrolatums and paraffin waxes. Included also are standard specifications for ASTM thermometers and ASTM hydrometers, and test method standardization of etched-stem liquid-in-glass thermometers.

New tentative methods of test are included for: effect of grease on copper, lead in new and used greases, leakage tendencies of automotive wheel bearing greases, water washout characteristics of lubricating greases, sampling liquefied petroleum gases, sulfur in petroleum products and liquefied petroleum gases by the $3O_2$—$O_2$ lamp method, vapor pressure of liquefied petroleum gases, unsaturated light hydro-carbons (silver-mercuric nitrate method) polarographic determination of tetraethy lead in gasoline, API gravity of petroleum and its products (hydrometer method) and specific gravity of petroleum and its products (hydrometer method).

New appendices cover, in addition to report of Committee D-2 on Petroleum products and lubricants, proposed methods of test for functional life of ball bearing greases, chlorine in lubricating oil, sodium in residual fuel oil by flame photometer, weathering test for liquefied petroleum gases, analysis of graphite under consideration by Research Division XII on graphite tests—other items cover recommended practices for applying precision data given in ASTM methods of test for petroleum products and lubricants, and proposed changes in the ASTM Manual of engine test methods for rating fuels (1952 edition) for the elimination of the bouncing pin.

A high percentage of the material included in the earlier edition has been revised and eleven of the methods are new. The specifications and tests that have been revised contain a brief explanation in footnote form of changes incorporated since the previous edition. A new section has been added giving a summary of changes made in ASTM standards on petroleum products and lubricants in 1953.

**ASTM standards on textile materials (with related information)** pa., $5.25.

This 1953 compilation of ASTM standards on textile materials brings together in compact, readily usable form, the ASTM specifications, test methods, and tolerances widely used in this field.

Prepared by ASTM Committee D-13 on Textile materials, this edition gives in their latest form 105 ASTM standards, including 80 test methods, seventeen specifications, two definitions of terms relating to textile materials, three tolerances for filament yarns (acetate—nylon—rayon) three recommended practices: one for interlaboratory testing of textile materials—another for designation of linear density of fibers, yarns, and other textile materials in universal units—and one for designation of yarn construction, and other material.

Groups of standards in this compilation cover: asbestos, bast and leaf fibers, cotton, glass textiles, rayon, acetate and silk, wool, pile fabrics (carpets), felt, and general fibers, fabrics, yarns, threads and cordage. Also identification, qualitative, and quantitative analysis, and resistance to insect pests and microorganisms. General test methods cover testing machines, humidity, and inter-laboratory testing.

New tentative methods of test are included for: average fiber diameter of wool tops by porous plug tester; alkali-solubility of wool; relaxation and felting shrinkage in laundering of stabilized knit wool fabrics, tensile strength of wool fiber bundles, yarns containing wool, recovery of textile fabrics from creasing, using the vertical strip apparatus, maturity of cotton fibers (random sample-sodium hydroxide swelling method); cross-sectional characteristics of cotton fibers; strength of cotton fibers (flat bundle method); number of neps in cotton fibers.

New appendices cover, in addition to report of Committee D-13 on Textile materials, proposed methods of test for: identification of finishes on textiles, and recovery of textile fabrics from creasing using the roller pressure apparatus, another item covers recommendations for the establishment of standard moisture content for wool and its products.

**British standards, British standards institution, 2 Park Street, London, W. 1. British standards are available from the Canadian standards association. National research building. Ottawa. Canada.**

**British standards 1953 yearbook.** 12/6.

The 1953 edition of the above has recently been published and gives a list of the 2,000 British Standards current at the end of March 1953, with a brief description of the subject matter of each. A comprehensive index simplifies reference.

The yearbook gives the usual information on the membership of the General Council, the Divisional Councils and the Industry Standards Committees, together with the names of the representatives on the main Special Committees and Advisory Committees.

For the first time, the Yearbook gives a list of the British Standards under which the Institution's certification trade marks are used, while particulars of the work in hand of all the Industry Standards Committees are also given.

The Yearbook is essential to all those engaged in industry and commerce if they are to keep up-to-date with the increasing momentum of practical standardization and simplification.

**B.S. 1916, Part 4: 1953 — Guide to the selection of fits.** 7/6.

The publication of this Guide to the selection of fits fulfils the promise given in B.S. 1916, Part 1, to provide reliable data in the form of recommended tolerances which can be used for a wide variety of standard applications.

The introduction of a new limits and fits system is inevitably a long-term project and many users, faced with the wide choice of fits in Part 1, might feel that a long period of experiment was necessary before they could decide which tolerances to adopt as standard. Reference to Part 2, with its selection of clearance, transition and interference fits for many typical applications, should go far to solve this problem as well as minimizing the possibility of differing tolerances and allowances being chosen to meet the same design problem.

The guide is fully illustrated and includes much useful information regarding the various grades of fit, the accuracy which can reasonably be expected from various manufacturing processes, etc. It also contains tables of Preferred fractional and decimal inch sizes, the use of which is indispensable to true standardization.

The recommendations given in the guide are based on the results of investiga-

tions carried out with the co-operation of a number of engineering firms and organizations. It is recognized that some requirements are not yet adequately covered and an early revision of the guide to include more material is envisaged.

In order that it may be as practical and helpful as possible, users are earnestly requested to submit to the Institution their comments, criticisms and constructive suggestions for consideration by the responsible committee. Any information supplied will be treated confidentially and will be of great assistance in rendering this guide of real value to industry.

Observations should be addressed to the Director, British Standards Institution.

**B.S. 2051: Part 1: 1953 — Copper and copper alloy capillary and compression tube fittings for engineering purposes.** 3/-.

This is a new British Standard relating to three types of tube fittings for engineering purposes of sizes ranging from 1/8 in. to 1 in. inclusive, for use in conjunction with copper, copper alloy and other suitable tubing, viz:

a. Capillary fittings in which the joint is made by the flow of solder by capillarity along the annular space between the outside of the tube and the inside of the socket of the fitting, the size of this annular space being dimensionally accurate within close limits.

b. Compression fittings, Type 'A', in which the joint is made by the compression of a ring or sleeve or part of the fitting, on to the outside wall of the tube.

c. Compression fittings, Type 'B', in which the joint is made by the compression of a manipulated portion of the tube at or near its end against true faces of the body of the fitting or against a loose ring or sleeve within the fitting.

This standard does not attempt the complete dimensional standardization of any of the types of fittings, since the variety in the designs and methods of production already established by the various manufacturers makes any such attempt impracticable. Without seeking to limit the individual refinements of design, which are the distinctive feature of the proprietary product, this standard does, however, lay down such dimensions and requirements as are essential to ensure satisfactory installation and performance.

The fittings covered by this standard are for use with tubes designated by their outside diameters in inches and fractions of an inch.

**B.S. 2060: 1953 — Copper alloy globe valves for general purposes.** 4/-.

This is the first of a series of British Standards for copper alloy valves for general purposes. It is intended that this series will be followed by others for ferrous valves for general engineering use.

This standard specifics requirements for rating, design and manufacture, materials, dimensions, tests and marking for copper alloy globe, angle and oblique (or 'Y') valves with rising stem, inside or outside screw, with flanged or screwed ends, of Classes 100, 125, 150, 200 and 250 for a range of nominal sizes from ¼ in. to 3 in.

**B.S. 2062: 1953 — Gear hobs.** 5/-.

This British Standard will, it is felt, be of considerable use in the gear industry generally. It has long been recognized that the sizes of hobs for general purposes should be restricted in number and their limits of accuracy closely defined. The present specification covers in Part 1 the range 1 to 50 D.P. for general purpose hobs intended for the production of gears complying with the basic rack tooth profile given as Fig. 5 of B.S. 436: 1940. Three grades of accuracy are specified as follows:—

A. Precision ground hobs
B. Ground hobs
D. Unground hobs

and the tolerances in Table 4 are in close agreement with those of the American Gear Manufacturers' Association.

A useful addition to the specification is given in Appendix B which lists the sizes of hobs with taper bores and of taper arbors in current use in industry.

At the request of manufacturers and users of turbine gears, Part 2 has been added, with Table 5 setting out limits of *accuracy only* for hobs intended for the production of gears complying with B.S. 1807: 1952 Gears for turbines and similar drives, Part 1: Accuracy. This table is based on the specification issued by the Mechanical Engineering Research Laboratory of the Department of Scientific and Industrial Research for the Accuracy of gear cutting hobs for marine turbine and similar drives, and which has been in use for several years.

It must be noted that Part 2 does *not* cover tooth form design.

**B.S. 2066: 1953 — Balata belting.** 2/6.

This standard specifies requirements for balata belting used for power transmission purposes and other load bearing applications, e.g. straps and slings.

This standard also specifies details of the fabric, impregnation, balata content, quality of balata, etc., and includes appendices giving details of methods for testing. Additionally, appendices are included concerning working conditions and information to be given with the enquiry or order.

**B.S. 806: 1954 — Ferrous pipes and piping installations for and in connection with land boilers.** 10/6.

This British Standard supersedes the 1942 edition. It applies to the design and construction of the ferrous pipework connecting a land steam boiler to engine, turbine or industrial plant and all auxiliary pipework in connection therewith, together with the pipes and pipe fittings forming parts of such installations for:

a. pipes of any bore where the pressure exceeds 50 lb./sq. in.
b. pipes over 10 in. bore for steam at pressures up to and including 50 lb./sq. in.

This standard does not apply to the use of carbon steel where the temperature exceeds 900°F., or to the use of alloy steel where the temperature exceeds 975°F.

The scope of this Standard has been extended to provide for developments which have taken place in pipework installation practice, notably in the use of alloy steels.

Material specifications are included for:

Class A —Cold drawn seamless carbon steel pipes.
Class B & C—Hot finished seamless carbon steel pipes.
Class D —Hydraulic lap-welded carbon steel pipes.
Class E —Roll lap-welded carbon steel pipes.
Class F —Butt-welded carbon steel pipes.
Class M—Cold drawn seamless molybdenum steel pipes.
Class P —Cold drawn seamless chromium molybdenum steel pipes.
Class Q —Hot finished seamless chromium molybdenum steel pipes.

Sections deal with:

(i) Design requirements.
(ii) Procedure to be observed in the manipulation and fabrication of alloy steel pipes.
(iii) Construction including the attachment of flanges.

This Standard also contains Appendices covering inter alia:

(i) Young's modulus for steel pipes.
(ii) Percentage elongation on various gauge lengths.
(iii) Diameters and thicknesses of steel pipes applicable to this Standard.
(iv) Pressures in safety valve discharge piping.
(v) Examples of reinforcement of multiple branches.

**Canadian standards, Canadian standards association, National research building, Ottawa, Canada.**

**C.S.A. A123 Series — Asphalt and tar roofing materials.** Set $6.50. Each 50c.

Here gathered into one folder are the sixteen specification in the series on Asphalt and tar roofing materials. These cover asphalt shingles, roofing and siding, coal-tar saturated roofing felt and asbestos felts, coal-tar pitch, and woven cotton fabrics saturated with bituminous substances for use in waterproofing. The final specification lists methods for testing asphalt insulating siding surfaced with mineral granules.

**C.S.A. C68(A)-1953 — Paper-insulated power cable "solid" type,** 2d ed. $2.00.

This second edition replaces that issued in 1940. The first edition was scheduled for revision in 1948 when it was decided that changes should be made so that the specification would represent up-to-date engineering practice.

The specification is intended to apply to all sizes and classes of impregnated, paper-insulated, lead-covered cable, "solid" type, which is to be used for the transmission and distribution of electrical energy, as customarily installed under average conditions. The specification does not cover "Special purpose" cables.

The specification covers rated and operating voltages, conductors, insulation, shielding and sheath. Also described are the various tests for cable: conductor resistance, high voltage insulation resistance, ionization, and bending.

There are fifteen tables included in the specification showing: preferred voltage ratings and conductor sizes, tensile strength, thicknesses of insulating, etc.

The first Appendix gives a table showing maximum conductor temperature for emergency operation. The other two give a high-voltage time test, and tests which may be conducted after installation.

**C.S.A. C22.2 No. 105 — 1953 — Construction and test of electrical equipment for woodworking machinery.** 75 cents.

This Specification applies to electrical equipment used on, or in close connection with, woodworking machinery for general industrial use. It does not cover small machines used for domestic or hobby purposes, certain portable tools which come within the scope of CSA Specification C22.2 No. 71, Portable electric tools, or equipment which is located where it will not be affected by dust or wood chips.

The Specification covers construction requirements, including motors, controls and conductors, marking requirements, and tests.

# Business & Industrial Briefs

## A Digest of Information received by The Editor

## Appointments and Transfers

**Combined Enterprises.**—M. O. Simpson, chairman and president of Combined Enterprises Ltd., announces the purchases by that company of Hamilton Gear and Machine Co., Ltd., Toronto. Mr. Simpson stated that except for certain executive appointments and for representation on the board of directors there would be no major changes in the organization or commercial policies of Hamilton Gear.

**Douglas A. Jones**

The executive appointments of the company are: M. O. Simpson, president; M. O. Simpson Jr., executive vice-president; Frank G. East, general manager; Robt. H. Hoppe, secretary; Hugh C. Hay, treasurer and assistant secretary. The directors of Hamilton Gear are: F. G. East, H. C. Hay, M. O. Simpson Jr., and H. C. Walker, Q.C.

●

**Robertson-Irwin Limited**—The appointments of Douglas A. Jones as manager, contract sales division; and Frank C. Manchee as manager, line sales division; have been announced by T. A. Irwin, president Robertson-Irwin Ltd. The head office of this company is located at Hamilton, Ont.

●

**Wakefield Lighting Limited.** — Ralph A. Yates, Toronto, vice president and general manager of Wakefield Lighting Limited, London, Ont., announces these additions to the company's sales-engineering staff. Pacific Distributing Co. Limited, Vancouver, B.C. will represent Wakefield under the direction of E. W. Thompson, sales manager. A. H. R. Louden, Edmonton, Alberta, will be in charge of that area. J. W. Henson, will represent the company in Toronto. Official opening of the London plant at 395 Wellington Road, South, took place April 27.

●

**Russell Construction Limited.** — The Toronto firm of Russell Construction Company Limited has been purchased by Russell Construction Limited a newly formed subsidiary of Balfour Beatty and Co., (Canada) Ltd. The new firm has taken over a staff of wide experience which includes J. H. Russell, M.E.I.C., head of the marine and foundation department.

The new organization was incorporated on April 1. The board of directors will consist of Colin A. Campbell, president; Andrew B. Sharp, vice-president and managing directors; and Carl C. Graupner, secretary-treasurer.

**A. C. Wickman (Canada) Limited.** — A. C. Wickman (Canada) Ltd., have been appointed Canadian agents for the line of material testing machines and balancing machines manufactured by the European firm of Losenhausenwerk, Dusseldorf.

The best known machines of Losenhausenwerk are the universal testing machines with hydraulic pulsators and the universal fatigue testing machines for testing under fluctuating and alternating loads.

●

**Canadian Westinghouse Company Limited.** — H. H. Rogge, president, Canadian Westinghouse Company, Limited, announces the consolidation of the company's electrical apparatus and consumer division under two administrative executives. J. W. Kerr has been appointed general manager of the apparatus products group, and J. D. Campbell has been appointed general manager of the consumer products group.

The following divisions of the company compose the apparatus products group: the power products division, the industrial products division, and the B. F. Sturtevant Company of Canada Limited. The consumer products group includes the appliance division, the television-radio division, the lamp-tube division, the electronics division, the lighting division, and the Canadian Westinghouse Supply Company Limited.

●

## New Equipment and Developments

**New Plant Operations.** — Dominion Oxygen Company, division of Union Carbide Canada Limited, have commenced operations at their new plant located at Edmonton.

The plant will supply Dominion oxygen and Prest-O-Lite acetylene to the Alberta market.

●

**Catalytic Device for Diesel Exhaust.** — A catalytic muffler that effectively reduces the noxious and irritating components of 4-cycle diesel engine exhausts has been developed by Oxy-Catalyst, Inc., Wayne, Pa.

The new device, called the diesler, attaches directly to the engine exhaust manifold and burns by catalytic action the noxious carbon monoxide and odorous hydrocarbon fumes in exhaust gases. In industries such as mining this will permit more widespread use of 4-cycle diesel equipment underground or in enclosed areas. Now in production, the first model has been operating successfully for over three months.

●

**Mill Bearings.**—Heavy duty roller bearings, especially designed for the severe operating conditions found in steel mills, mines, and foundries have been added to the line of bearings manufactured by Link-Belt. To withstand heavy loads and severe impacts the steel housing has heavy sections, a rugged base and cap, plus large studs, dowels and mating surfaces. Ready inspection of the bearing

(*Continued on page 805*)

(*Continued from page 802*)

is possible by removing the housing cap. Additional information, including dimensions and load ratings, is available in Link-Belt book No. 2565. Requests should be sent to the company at P.O. Box 173, Station "H", Toronto.

●

**Metal-clad Switchgear.**—A new standard line of metal-clad switchgear, ranging in ratings from 2400 to 13,800 volts, 150 to 500 mva, has been announced by the Canadian General Electric Co., Ltd., apparatus division.

The new line offers many new and improved design features, although it retains the same general arrangement of major components.

One of the most important aspects of the new equipment line, is that in introducing the new design improvements, all industry standards have been retained.

One of these new design improvements is in the magne-blast circuit breaker, in which a maximum number of parts are interchangeable among breakers of different ratings. Another feature is that wheels are now an integral part of each circuit breaker, eliminating the need for transfer trucks. In addition, the control relay is now mounted on the breaker.

A new and improved insulating material having excellent flame-retardant, dielectric and anti-hygroscopic properties is used throughout the breaker. Its use serves to localize damage which may occur if abnormal conditions produce breakdowns.

Another design improvement simplifies the breaker elevating mechanism. The new positive-acting mechanical interlocking provide faster raising and lowering of the breaker. All elevating mechanisms are driven by a motor, which is demountable for hand crank operation, and is controlled by a safety interlocked control system. Downward movement of the breaker from vibration is prevented by an anti-creep devise.

Cable entrance facilities are interchangeable from top to bottom entry.

●

## Publications

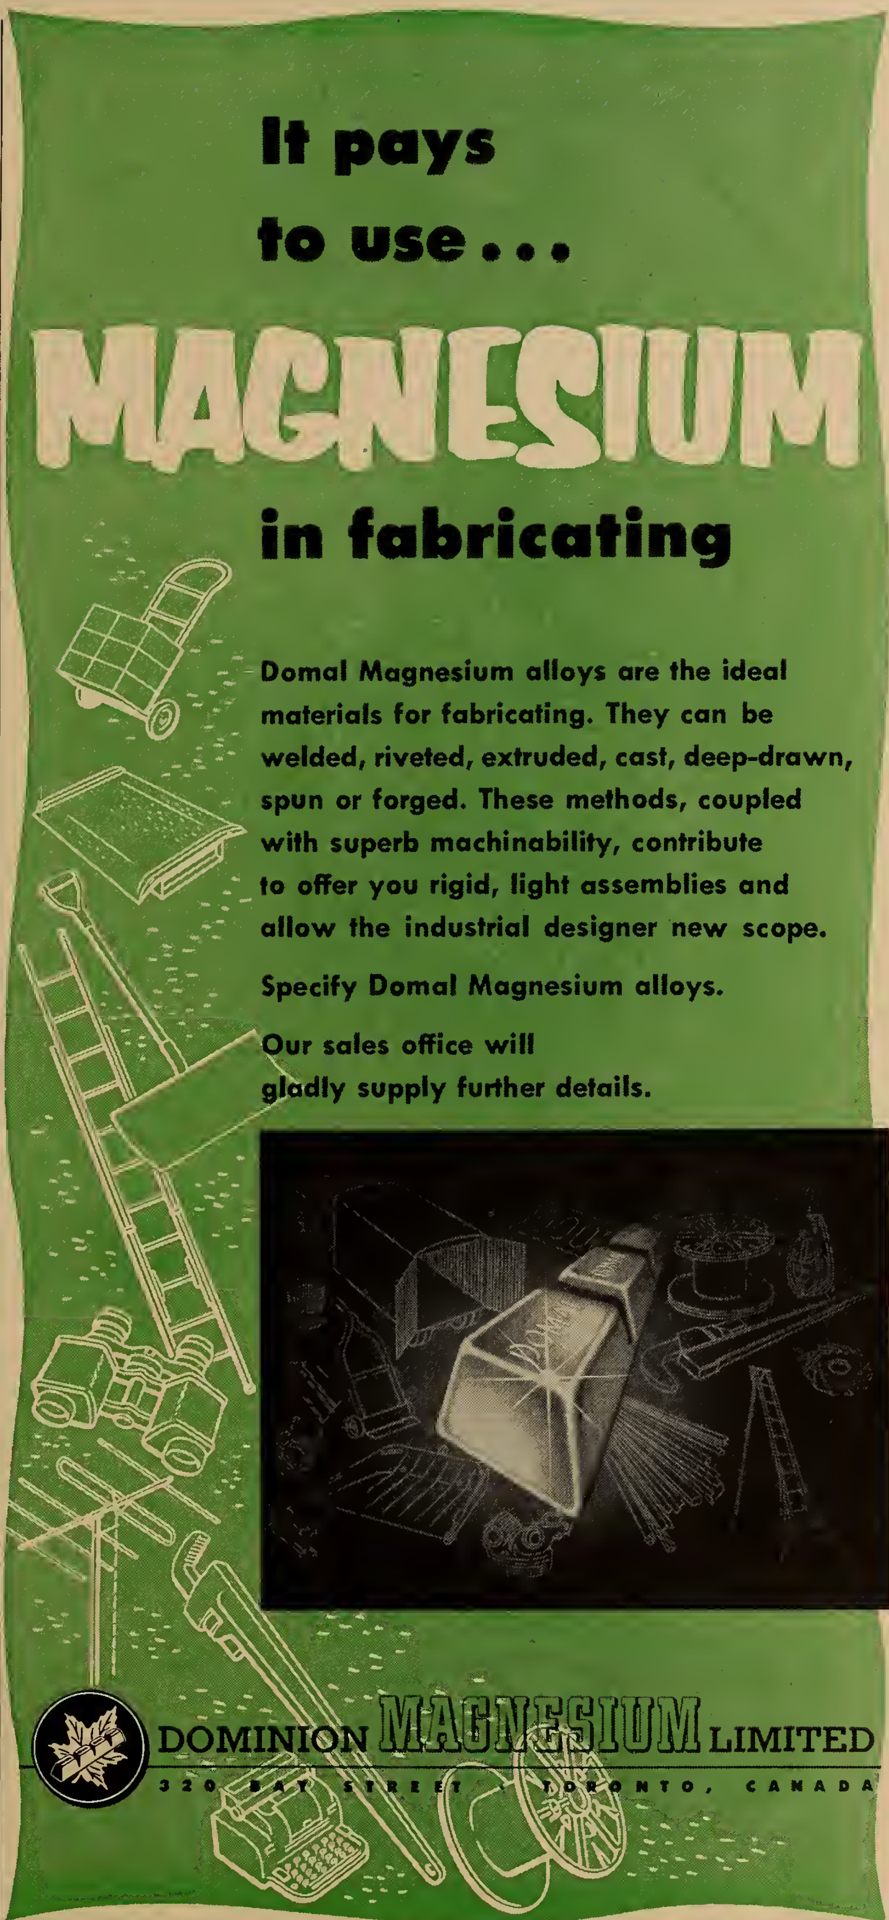
**For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.**

**Please mention *The Engineering Journal* when writing.**

**Road Joint Devices.** — For the first time, information covering a full range of road joint devices for concrete highways and airstrips has been presented in a single comprehensive bulletin by the Richmond Screw Anchor Co. Inc. of 830 Liberty Avenue, Brooklyn 8, N.Y. This new bulletin shows devices to meet all concrete pavement joint needs from the least expensive dowel baskets to the finest complete load transfer assemblies.

Copies of the bulletin and price lists needed by contractors are available by sending a postcard requesting the Road

(*Continued on page 808*)



# Professional Cards

# Professional Cards

(*Continued from page 805*)

Devices Catalogue to the above mentioned company.

**Metallurgy.** — The Metlab Digest is published by Canadian Westinghouse Company's metallurgical laboratories to assist people whose daily work borders on the metals field. This includes electrical engineers, supervisors and foremen and many other classifications of employees. Readers who would be interested in receiving each issue of this monthly booklet may do so by writing to the public relations department at Canadian Westinghouse, Hamilton, Ontario.

**Corrosion-Resistant Cast Alloys.**—Designers of equipment exposed to chemicals and corrosive environments will be interested in obtaining a reprint of the article "Cast High Alloys" by E. A. Schoefer, executive vice-president of the Alloy Casting Institute, Mineola, New York. This article originally appeared in the October 1953 issue of Chemical Engineering, and is now available from ACI headquarters.

In the article, Mr. Schoefer defines corrosion-resistant cast high alloys, designates the types, discusses individual alloy characteristics, compares cast and wrought alloys, and describes the physical and mechanical properties. A table of the ACI corrosion-resistant cast alloy classifications is included, along with tables showing the standard designations, chemical compositions, and physical and mechanical properties.

**Gyratory Crusher Bulletin.**—Engineering features of "Superior" primary and secondary gyratory crushers are described in a new bulletin released by Canadian Allis-Chalmers Limited.

The bulletin tells how the crushers' flexibility permits meeting a broad range of operating conditions.

Included in the bulletin is a performance table, a selection of product curve, a formula for determining horsepower requirements, a table of average work index values according to types of materials and dimension tables for primary and secondary gyratory crushers.

Copies of the bulletin, 07B7870, are available on request from Canadian Allis-Chalmers Limited, Box 37, Montreal, Quebec.

**Painting Specifications.** — A 22-page manual of general painting specifications for the guidance of architects and engineers has been prepared by the paint and varnish division of Canadian Industries Limited.

The first part of the manual deals with the preparation of surfaces that may be encountered in painting interiors and exteriors of industrial and business buildings. In the second section, exact painting specifications are given for each type of surface.

Architects and engineers may obtain the manual from the division's district offices across Canada or by writing the Paint and Varnish Division, P.O. Box 10, Montreal, Que.

**Portable Temperature Indicators.**—A new 8-page Bulletin A-3-3, just issued by The Foxboro Company of Foxboro, Mass., describes two portable temperature indicators, the potentiometer indicator and the resistance thermometer. Described in detail are operating adjustments, features of design, test circuits, measuring elements and instrument specifications.

Copies of the Bulletin A-3-3 will be sent on request from Peacock Brothers, sales agents in Canada, Ville LaSalle, P.Q.

**Steel Roof Decks.**—Westeel Products Limited have just produced a catalogue on their new, improved steel roof deck.

The catalogue contains all essential data on the new deck with safe load table, application and installation details, a section on roof insulation and illustrations of typical installations. A copy of the catalogue may be obtained by sending a request on your letterhead to your nearest Westeel plant or office. Ask for Steel Roof Deck Catalogue No. 42.

and

# Engineering in Quebec

*by*

Jean-Paul Drolet, M.E.I.C.

*Chief, Technical Information Service,*
*Department of Mines of Quebec,*
*Quebec, P.Q.*

*A paper presented at the Annual General and Professional Meeting of the Engineering Institute of Canada, at Quebec City, May 1954.*

Anybody who reads the newspapers knows that mining development in Quebec over the past four or five years has been extensive and that some of the projects are really very large. But not many outside the mining industry itself realize to what extent these developments have called upon the talents of engineers other than those specializing in mining itself. Mr. Drolet's paper gives an up-to-the-minute picture of the more important of these projects. It is published by permission of the deputy minister, Department of Mines, Quebec.

By way of introduction to the topic of this paper it is necessary to present briefly some of the more salient facts relating to the economy of the Province of Quebec, which is now experiencing a period of development proportionate to the wealth of its natural resources.

The province is the largest in Canada, comprising all that part of North America lying east of Hudson Bay, except Newfoundland and the Maritimes. It covers approximately 600,000 square miles, of which more than half constitutes New Quebec, formerly known as Ungava Peninsula, which was annexed to the province in 1912 (Fig. 1).

This vast area has been recognized to consist of three topographic units; the Laurentian Plateau, the Saint Lawrence Lowlands and the Appalachean Region. The first of these, lying entirely within the Canadian Shield, covers more than nine-tenths of the area of Quebec and is occupied by rocks of Precambrian age.

Although the total area of the province may seem impressive, the livelihood of its people, up to 25 years ago, was derived from the long, narrow strip of cultivated lands on either side of the Saint Lawrence River. Quebec's agricultural domain is difficult to estimate, but it is safe to say that, out of its total area of 335 million acres, only approximately 35 million acres are suitable for agriculture, i.e., about 10 per cent of its surface, of which only two thirds are now occupied. Mechanization and electrification of farms and the growing establishment of small industries in rural areas have been the main factors behind the steady upward trend of agricultural production during the last twenty years.

On the other hand, the Province of Quebec has been well compensated for its farming limitations. As far as 52° north latitude there are extensive stands of hard and soft woods. These commercial forests provide an enormous source for the lumber trade and for a large-scale pulp and paper industry, which is the most important in Canada and affords employment for a large proportion of the population. A long established fishing industry along the 2,000 miles of coastline skirting the Gulf of St. Lawrence, especially in the Gaspé peninsula and in the Magdalene Islands, yields revenue and commercial trade for a part of the population.

Quebec's streams (of which, incidentally, there are 23 more than 100 miles long) have an estimated hydro-energy potential of over 17 million horse-power. At the present time, with only a fraction of this energy harnessed (7,700,000 hp., representing 52 per cent. of the total capacity developed in Canada) the province, on the basis of population, possesses electric installations greater than those of any other country.

### Extent of the Mining Industry

Mining is already an imposing industry in Quebec and one of the leading factors in its economy, whether the steadiness of its growth, the widespread nature of its operations or the diversity and value of its production be considered. While many readers are undoubtedly acquainted with the achievements of this industry, this paper will nevertheless review its phenomenal expansion due to the recent discovery and exploitation of new fields and will expound the role of engineering (Fig. 2) in this development.

#### *The Early Days*

Although some small-scale mining ventures date back to the early days of Quebec's history, they were confined to the populated areas, while the more favourable geological formations to the north were unknown except to the occasional trapper, some missionaries and a few prospectors.

At the beginning of this century a little iron was produced from the bog ore deposits near Trois Rivieres, using wood as fuel. Some placer gold was recovered from the streams of the Chandiere Valley south of Quebec City; phosphate, magnesite, graphite, feldspar, mica and talc were quarried in the area north of Ottawa; and asbestos and copper were mined from shallow pits in the Eastern Townships.

In addition to these, small quantities of building materials extracted from quarries situated close to the centres of population were the only mineral substances produced. Prospecting in western Quebec near the Ontario border began later, and farmers established around Lake St. John and in the Gaspé Peninsula reported occurrences of iron and copper minerals. On the north shore of the St. Lawrence, near Natashquan, the heavy black sands were also attracting some attention, (Fig. 3).

### *Past and Present Value*

The total value of this early mineral production was recorded as $2½ million for 1900; this represented about five per cent of the grand total for all Canada. The next twenty-five years saw this figure increase to $25 million and to-day, a quarter of a century later, the annual value of the mineral production is averaging well over a quarter of a billion dollars. Since the beginning of recorded production, the cumulative value for Quebec's mining industry is in excess of $3 billion (Fig. 4).

Important changes are noticeable in the graph. Not so long ago metals represented only a small fraction of the total value, while industrial minerals, mostly asbestos, and building materials made up almost 95 per cent of the total value. The higher production of metals, mostly gold, copper and zinc, has changed this situation, so that in 1953 metals and industrial minerals each represent approximately 40 per cent, while building materials account for 20 per cent of the total (Fig. 5).

The bulk of the mineral production comes from the mining areas of Rouyn, Malartic and Bourlamaque and from the asbestos region of the Eastern Townships. But there are also many other mines in less known localities that make substantial contributions to the province's output. These mines and quarries are located all the way from Calumet Island in the Ottawa River to the Allard Lake area on the north shore of the St. Lawrence. There are also numerous isolated producers, such as the Barvue mine in the Amos district, the Beattie-Duquesne mine in the Duparquet district, the Normetal mine near the Ontario border, the Belleterre mine in the center of Témiscamingue, the Anacon lead mine in the Montauban region, the Ascot and the Weedon mines in the Sherbrooke region, and the Consolidated Candego mine near Marsoui in the Gaspé peninsula.

### *Future Prospects*

It is safe to say that a 50 per cent increase in the value of production will most likely be established in the next five years, as a result of new mining projects now being brought to the production stage. It looks as if the Province of Quebec will record its second quarter of a billion a year of production in but a small fraction of the time which went into the establishing of the first.

Much of this expansion will stem from the New Quebec iron ore development and the Gaspé project, but other ventures also hold considerable promise. Aside from plans

Fig. 1. Geological sketch-map of Quebec.

Fig. 2. Mineral map of Quebec at the beginning of the century.

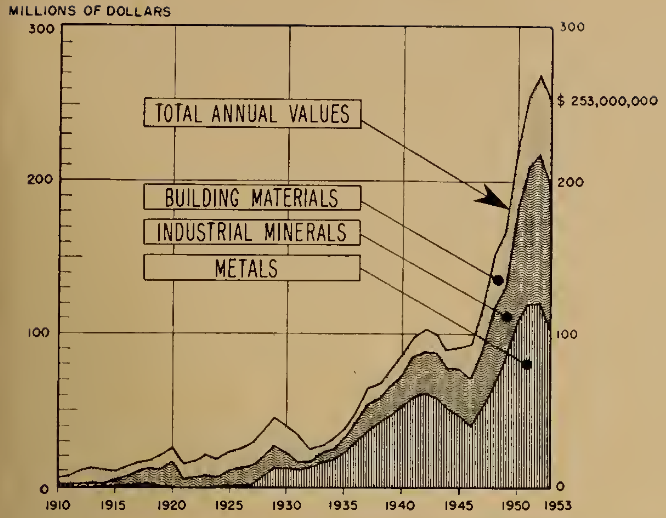

**Fig. 3. Values of Quebec's annual mineral production, 1910-1953.**

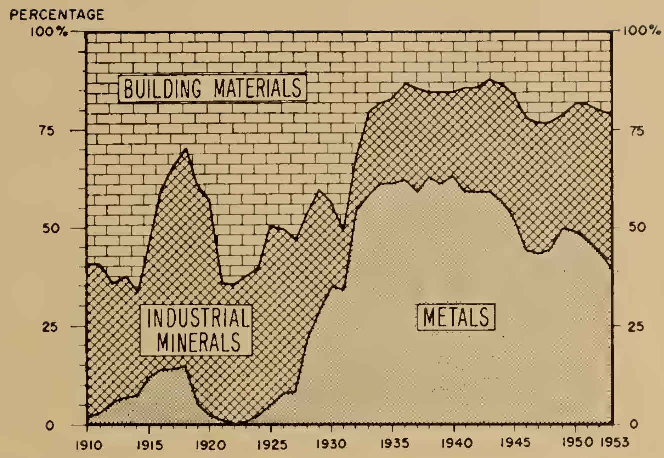

**Fig. 4. Relative values of the three classes of minerals produced in Quebec, 1910-1953.**

for expanded production and increased output from the already established mining areas, important mining developments are taking place which assure not only higher production figures, but also entail some of the largest engineering projects ever to have taken place in Quebec. Among them are the building of railroads, mine roads and bridges, the harnessing of new hydro-electric power, the establishment of mining villages, even the drainage of a lake and the relocation of a long established city in the heart of a mining center, and much other work necessary to promote the mining industry. These engineering projects contribute greatly to the expansion of the Province and are sometimes proportionally greater than the mine operations themselves.

### Principal Engineering Projects

*New Quebec*

The most important mining and engineering development now in progress is bringing to the production stage the large iron ore deposits of New Quebec (Fig. 6) located in what has been termed by geologists the "Labrador Trough". The greater part of this iron formation, which has been traced for nearly 500 miles with an average width of about 45 miles, lies in New Quebec. Furthermore, it is not in a trough or a depression, so a more appropriate designation for it would be "New Quebec Iron Range".

In one particular section of the range, reserves have been proven to exceed 417 million tons of high-grade iron ore, underlying an over-

* PRELIMINARY ESTIMATES

**Fig. 5. Distribution of the value of Quebec's 1953 mineral production**

**Fig. 6. Map of New Quebec iron range, showing locations of mining companies.**

Fig. 7. Principal coal, iron ore and steel areas in relation to New Quebec iron deposits.

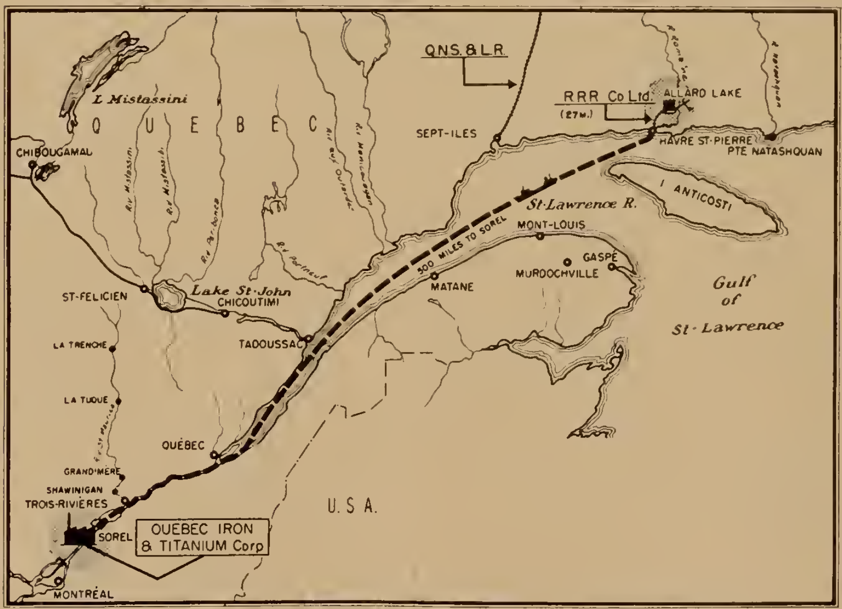

Fig. 8. Index map of ilmenite development, Allard Lake and Sorel.

burden of an average thickness of only eight feet. Mining this ore will be the least difficult of the many problems affecting operations, since all ore will be drawn entirely from open-pits.

Today the entire iron ore production of Canada is from the Bell Island mines of Newfoundland, the Steep Rock range of Northwestern Ontario, the Michipicoten range in the Sault Ste. Marie region of Ontario, and several operations on the British Columbia coast. Within the next three months, however, the Iron Ore Company of Canada will start delivering iron ore from its properties located 360 miles north of Sept Iles.

Although the ballasting of the railroad is not yet complete, the last spike was driven on February 12, 1954, when the continuous line of steel reached Shefferville, the new mining village at Knob Lake. With the final installations of this vital avenue of transportation, one of the largest engineering projects undertaken in North America for many years will be brought to a successful conclusion, according to schedule. The completion of this 360-mile line connecting Shefferville with a port on the St. Lawrence is an important milestone in Quebec's mining development. In a few years, this property alone will be mining and shipping about twice as much iron ore as is presently being produced in Canada (Fig. 7).

Although there will be limited production at the beginning, approximately one million tons during 1954, next year should see five million tons shipped with the rate gradually increasing to ten million by 1957. This tonnage will be maintained until the St. Lawrence Seaway is completed. The recent decision of the Canadian Government to proceed alone with the St. Lawrence Seaway will greatly remedy the acute postwar electric power shortage in Ontario and will supply the final link in the now almost complete navigable chain.[1]

Fear of injury to some branches of Canada's economy from this seaway have been somewhat exaggerated, but there is the strategic factor to be considered. At present the American steel industry is receiving ore from South America, Africa and other lands. Experience has made it clear that sea routes become very hazardous and even completely closed in times of hostilities. In such an event, the economy of Canada and of the United States may have to depend upon steel produced from the ore of mines located in comparatively safe inland sites.

Until the St. Lawrence Seaway is completed, iron ore from New Quebec will move by sea directly to the Philadelphia area (1,370 miles from Sept Iles) and to the Sparrows Point area (1,550 miles), where it will serve both seaboard and inland steel mills. Some ore will also be shipped by water to Contrecoeur, near Montreal, for trans-shipment through the existing canal system to Lake Erie ports (Ashtabula is 480 miles from Montreal), or shipped by rail from Montreal to the Pittsburgh steel centres.

The transportation problem arising from the great distances over which ore must be shipped before reaching market and the shortness of the transportation season constitute almost the only unfavourable factors for the New Quebec deposits. By way of compensation, however, there are many favourable factors. The ore is easily accessible; it occurs in flat, rolling beds at least 300 feet thick, easily worked by open-pit methods for many years to come; moreover, the ore is a high-grade hematite.

In the surrounding country the hydro-electric power facilities are plentiful. The total power necessary for the entire development will be provided from two sources. The first power plant will be ready in time for the movement of ore in August 1954. For the mine operations, the Iron Ore Company of Canada is completing a hydro-electric development at Menihek Rapids on the Ashuanipi River, a tributary of the Hamilton River. The plant, located about 26 miles from the mine, will have an initial capacity of 12,000 hp. in two units, under a 34-foot head, and an ultimate capacity of 24,000 hp. The 110 kv. line, operated initially at 66 kv., will supply the power necessary for the power shovels of the mine and for heating and lighting purposes in the new community, which is expected to have about 500 families in a few years.

At the south end of the railway line, the Ste. Marguerite Power Company is constructing a two-unit hydro-electric plant on the Ste. Marguerite River. Each unit will have a capacity of 8,500 hp. under a head of 98 feet. The plant is located at Sixty-one Falls, seven miles above the mouth of the river, whence a 19-mile, 44-kv. line has been built to Seven Islands, the site of the ore company's dock loading installation. This energy will also be shared by the Gulf Pulp and Paper Company at Clarke City.

### *Ilmenite Development*

On another new frontier, Allard Lake, some 400 miles northeast of

[1] On May 6, 1954, the United States House of Representatives voted the American participation to the Seaway project, as well as to the hydro-electric development of the State of New York.

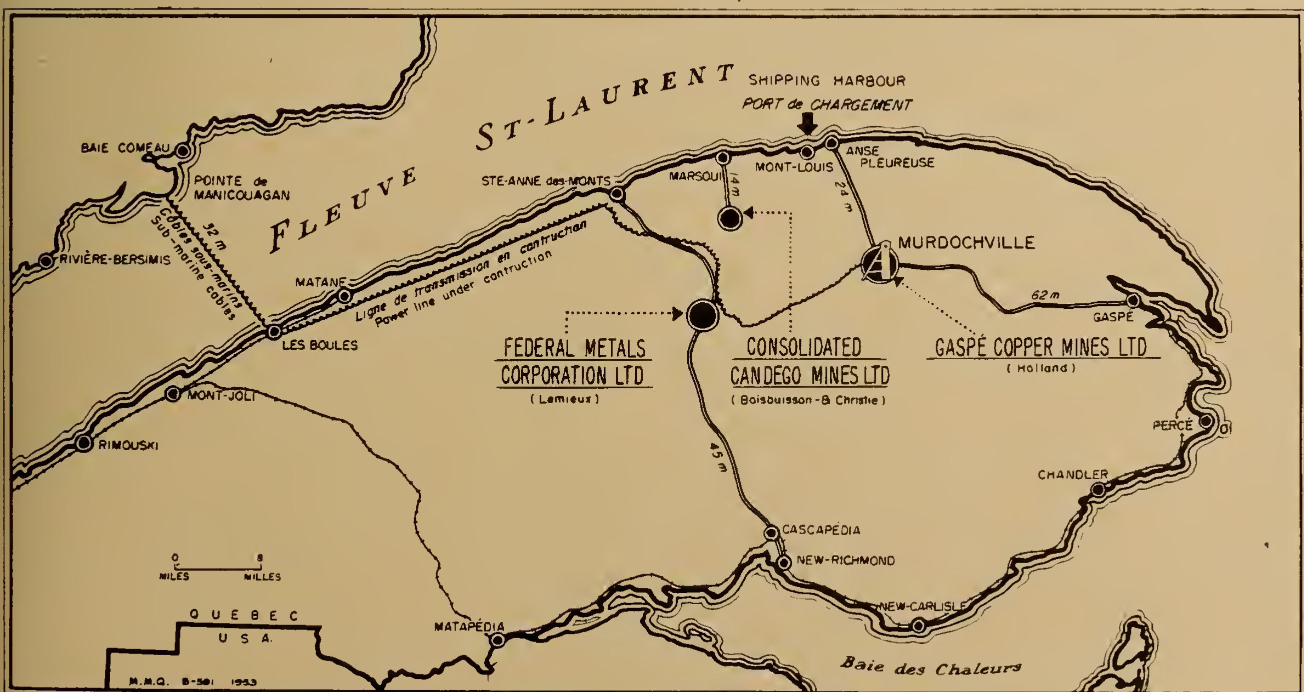

**Fig. 9. Index map of Gaspé mines.**

Quebec City (Fig. 8), a huge program to develop what is probably the world's largest and richest ilmenite deposit has almost been completed. This project includes a 27-mile railway built by the Romaine River Railroad Co., Ltd., to carry ore from Allard Lake to harbour facilities at Havre St. Pierre and the construction by the Quebec Iron and Titanium Corporation of a smelter to treat the ore at Sorel, on the south shore of the St. Lawrence, midway between Trois Rivières and Montreal.

The presence of ilmenite in this district was first reported by the Quebec Department of Mines following a geological reconnaissance survey in 1941. In this report occurrences of anorthosite rocks were mentioned, some very rich in ilmenite, and many prospectors attached much importance to these discoveries. The small showings found at the beginning and the complex metallurgical problems involved in the treatment of the ore discouraged many from further exploration. A development project was then established as a joint venture by the Kennecott Copper Corporation and the New Jersey Zinc Company. Geological and geophysical surveys, exploration and diamond drilling have indicated up to now over 137 million tons of ilmenite, running about 35 per cent titanium oxide and 40 per cent iron.

A new method of electric smelting was then devised to process the ore and a smelter built at Sorel. The 27 miles of railway was pushed through to the ore deposits at Allard Lake and dock and handling facilities were erected both at Havre St. Pierre and at Sorel.

As is the case with the iron deposits in New Quebec, although on a much smaller scale, not only access by rail, but also sources of power had to be provided for this project, particularly at Sorel where large quantities of electrical energy have become necessary. In spite of the great number of water-power sites along the St. Lawrence north shore, diesel electric power is used for all phases of the mining operations. The central station at Havre St. Pierre terminal, equipped with three 375 kva. generators, supplies power to the mine site and to dock facilities, as well as to the village which adjoins the company property at Havre St. Pierre. At the present time, hydro-electric power could be made available in this area only by undertaking a costly new development, an expenditure not warranted on account of the relatively small amount of energy required. Diesel generated power is consequently fairly competitive with hydro power. Furthermore, the mining at Allard Lake is a seasonal operation and oil delivery costs are relatively low. The shipping season extends from the beginning of May to the middle of November.

With an eventual capacity of 350,000 tons of ore per year, the smelter at Sorel will consume large amounts of power in the largest electric furnaces of their type in the world, each being able to treat 300 tons of ore per day. For an adequate power supply, a new 37-mile transmission line across the St. Lawrence direct to the site from its already existing circuits, and a new substation have been constructed by the Shawinigan Water and Power Company for the initial 160,000 hp. necessary. Any additional supply will be procured from the new La Trenche development on the St. Maurice River.

This project of treating ilmenite ore at the Sorel smelter from the world's largest deposits is one of the biggest metallurgical experiments in this country. From this complex ore, two products are obtained; iron and steel ingots and slag containing 70 per cent titanium oxide. With all five furnaces in operation at various capacities and on a variable schedule during 1953, about 300,000 tons of ore were treated for a production of 100,000 tons or iron and steel and over 125,000 tons of titanium oxide slag.

Production of iron presented no great problem, although sulphur elimination required some attention, but the production of the black slag, now in good demand in the pigment industry, has stimulated engineering ingenuity. Although the future potential for titanium metal is enormous, on account of its strength, its light weight and its resistance to corrosion, this project is not concerned with its production. Nonetheless, if an economical process is worked out for producing the metal from ilmenite, the Province of Quebec will obviously be a major producer.[2]

[2]On April 29, 1954, Mr. J. A. Fuller, president of Shawinigan Water and Power Company announced that his company had succeeded in making high grade titanium metal by an electrolytic process, and is now planning to expand this work into a larger, semi-commercial pilot plant as the next step toward fully commercial production. The company believes that, by this electrolytic process, it will be possible to make titanium on a commercial scale at prices substantially lower than have been possible heretofore.

***Gaspé Project***

On the headwaters of the York River in eastern Gaspé, there is another large-scale enterprise under way (Fig. 9). Here, Gaspé Copper Mines, a subsidiary of Noranda Mines, Ltd., has undertaken the development of a copper deposit, ore reserves of which are estimated at 70 million tons grading 1.3 per cent copper, with presumably other large reserves close at hand. Backed by these reserves, Gaspé Copper is developing a new mine, building a concentrating plant with an initial capacity of 6,500 tons a day, the largest initial milling rate ever to be attempted in Canadian mining, and a smelter capable of producing 125 tons of metallic copper daily.

From its inception, the Gaspé project has presented an unusual diversity of engineering problems. It was truly an undertaking started from scratch, so isolated was the site of the workings, so thick the surrounding forest and so rugged the area to be explored. In any terms, this work has been a massive project right from the beginning.

Once more after the prospector had found the first minerals, and the geologist had outlined the favourable formations, drilled the property and determined the extent of the mineralization, the land surveyor and the engineer were called upon to map the terrain and make plans for the many and diversified developments that such a mining enterprise involves. In view of the rapid growth and the permanency of the installations, every problem pertaining to the establishment of this new mining industry and of a community in the middle of the wilderness presented challenges.

Aside from the mining operations themselves and the erection of a modern townsite to meet the needs of the 4,000 people who will reside there, the chief problems confronting Gaspé operators were transportation facilities and the provision of adequate hydro-power.

During 1952, the Quebec Department of Mines completed the 62-mile, all-weather, first-class gravel highway from the town of Gaspé to the site of the mine in Holland township. Since the beginning of operations, this road has been the only serviceable year-round lifeline to Murdochville, the new community. By the time the concentrator starts to operate in October of this year, Murdochville will have another means of access. In co-operation with the interested company, the Department of Mines is completing a new 24-mile road to Anse Pleureuse on the south shore of the St. Lawrence, thus giving a ready access to Mont Louis, four miles west, where a port exists and where wharf facilities will be built by the Federal Government. Although there already exists a harbor with excellent facilities at Gaspé, the Mont Louis site is much nearer to the smelter and its use could do much for the economy of surrounding country. Besides the outgoing anode copper to be shipped to the refinery in Montreal, Mont Louis will be the receiving port for all supplies, especially bunker oil for use in the smelting furnaces. Eventually there will also be concentrates coming in from other mines for customs treatment at the new smelter. There is as yet no railroad servicing this area, since the railway goes only to Matane.

The next demand on the engineer was to make available the necessary power for this mine-smelter project whose needs will be around 12,000 hp. when the smelter starts to operate in March, 1955, and eventually 17,000 hp. when in full operation.

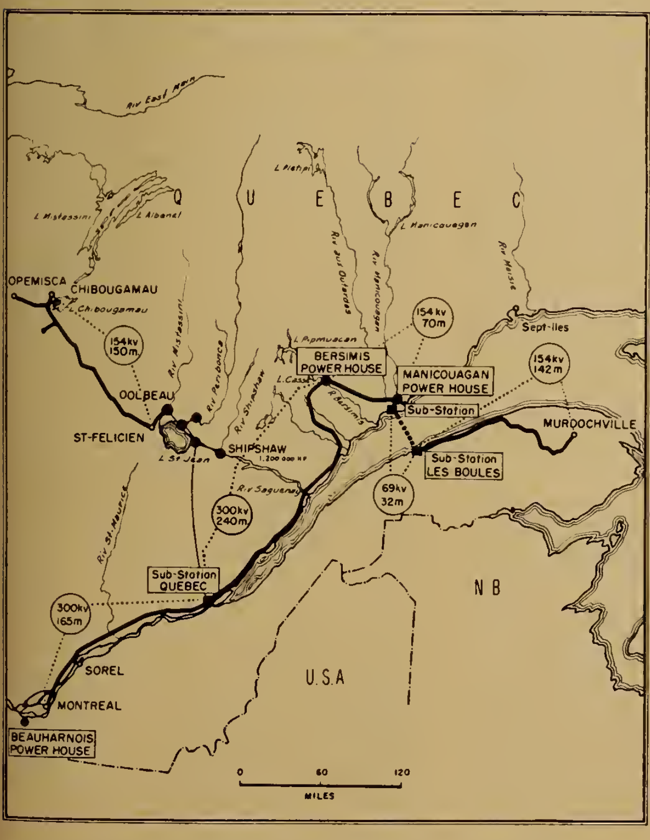
Considering the actual and future needs for this particular region and also for the rest of the province, very few known hydro-power sites in the whole peninsula could be developed to the extent of the Bersimis. The needs of the Gaspé project helped spur the start of this major hydro-electric development by the Quebec Hydroelectric Commission.

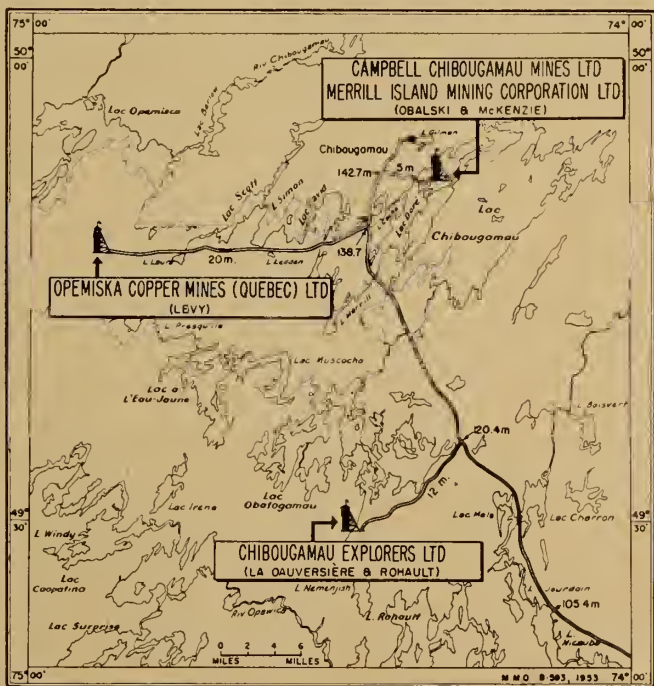
At Lake Cassé, some 90 miles upstream from the mouth of the Bersimis River, on the north shore of the St. Lawrence River, a dam 2,500 feet long and 200 feet high is being erected to form a reservoir comparable in size to the Lake St. John or to the Gouin reservoirs. (Fig. 10). A tunnel, nearly eight miles long and 36 feet in diameter, the second longest tunnel of its kind in the world, will channel the impounded waters to the Bersimis power house, built under a mountain. The head of 875 feet will produce a total of 1,200,000 hp. from eight 150,000-hp. generating units. These will be the most powerful single units in existence and are scheduled to come into operation as follows: two units in 1956 (300,000 hp.), one each in 1957 and 1958, and the remaining four (600,000 hp.) by 1961.

The Bersimis plant will serve industrial, commercial and residential customers in many parts of the province and will also provide substantial additions to Quebec's present grid. One 300,000-volt transmission line will reach the Quebec area, some 240 miles southwest from Bersimis, where the Shawinigan Water and Power Co. will take 400,000 hp., one-third of the Bersimis capacity, for distribution over its widespread system. A second line of the same voltage will continue to Montreal to help serve its highly industrialized area.

A third line will go southeast and reach the lower St. Lawrence and the Gaspé peninsula. This is probably the most difficult part of the distribution project, and for the present, the most directly concerned with the mining industry. It involves the construction of four submarine cables of 69,000 volts capacity, which will cross the St. Lawrence between Pointe aux Outardes and Les Boules, a distance of 32½ miles, the longest underwater gap in the world to be bridged by power. Incidentally, these 4½-inch cables are being manufactured by the Canada Wire and Cable Co., Ltd., a Noranda subsidiary, in a plant specially built for the purpose at Rimouski.

From a tie-in at Les Boules, the new power gateway, a 142-mile transmission line will deliver power to the mining site of Gaspé Copper and to a few other industries of the peninsula through the Lower St. Lawrence Power Company. The power for this line, which will be completed in 1954, will be purchased initially from the Manicouagan Power Co., but will be supplied ultimately from Bersimis.





Left: Fig. 10. Bersimis hydro-electric development in relation to the Gaspé and Chibougamau mining areas.

Right: Fig. 11. Index map of the principal metal mines in the Chibougamau region.

The Gaspé Copper project has also given renewed impetus to many other mineral explorations, besides the producing Consolidated Candego Mines, in the Marsoui area, and the noteworthy prospect of Federal Metals Corporation Limited, in the Cascapedia River area. The establishment of such a large producing mine in a new area is always the incentive to finding and developing other mines. There are many excellent mine-making possibilities in adjacent sections of Gaspé.

*Chibougamau Area*

Probably one of the most active areas in the province during recent years has been the Chibougamau region (Fig. 11), which covers roughly 25,000 square miles in favourable geological formations of similar nature to those encountered in the Abitibi area, located about 150 to 200 miles southwest. According to estimates prepared by interested companies, reserves of the Chibougamau area now amount to ten million tons, having a total value of over $100 million. The development of this new district is a typical example of the difficult operational and economic problems that the mining industry has to face.

One of the earliest mining areas to be investigated, Chibougamau has been subjected to short periods of concentrated attention that rapidly died out, owing for the most part to the high costs of operation resulting from its remote location and the lack of cheap hydro-electric power. In the recent development of Chibougamau, however, both problems were courageously tackled.

A new highway, stretching for 150 miles from St. Félicien, in the Lake St. John district, has changed the situation by solving one problem. This highway, completed in 1950 by the Department of Mines at a cost of $4 million, was built largely on faith in the ability of engineers to cope with mining problems peculiar to the Chibougamau area, as there was no assurance of producing mines at the time the construction was planned or even when it was started.

As an immediate result of this ready means of access, ore bodies have been proven or indicated at many properties, and this new mining district finally achieved its goal of actual production in December, 1953, when the first producer, Opemiska Copper Mines, swung into operation. Three other potential mines at present form the backbone of the district. They are Campbell Chibougamau Mines, Ltd., Merrill Island Mining Corporation and Chibougamau Explorers, Ltd. Because some of these properties are widely separated from one another, secondary roads had to be built linking them to the main Chibougamau highway. All these are standard roads having a 24-foot gravelled roadbed and in one case a causeway of 3,500 feet was built to connect Merrill Island in Doré Lake to the mainland. With all year-round, easy access to Chibougamau, developing companies are finding that costs of operation are in the same range as those experienced in other producing districts of the province.

Another phase of the transportation problem is now under consideration; the Chibougamau railway, a project that has been discussed for many years is getting close to becoming a reality. (Fig. 12) At the present time, considering Opemiska Copper in production with a 400-ton mill and Campbell Chibougamau Mines with a 1,700-ton plant under construction, it seems evident that substantial savings could be made by shipping out concentrates by rail rather than by truck, as is now being done. Freight costs could be reduced by more than one-third. A regular freight volume is gradually building up to make the area attractive for a railway. Two alternative routes are proposed. One would be southeastward, following roughly the present highway to St. Félicien, on Lake St. John, and would provide an inexpensive means of transporting ore concentrates direct to the new nickel-copper smelter and refinery to be built at Chicoutimi by the Eastern Smelting & Refining Company at an estimated cost of $8 to $10 million. This new smelter, with a rated capacity for treating 200 tons of nickel-copper concentrates and 200 tons of copper concentrates daily, will be located in an area where both water and railway transportation and power are readily available.

The other route would go southwestward through a zone of volcanic and sedimentary rocks of the Temiscamian subprovince, which is attractive as a potential area for the occurrences of ore minerals. The railway would then swing south to Beattyville, a distance of about 160 miles from Chibougamau. This latter route would provide the most direct way to the Noranda smelter; this railway, via Beattyville and Barraute, would reduce by one half the distance via Lake St. John.[3]

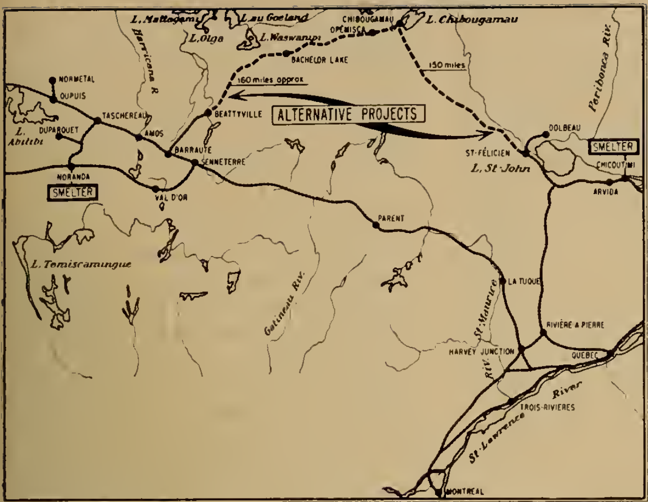
The other problem faced by engineers in Chibougamau has been, and still is, power. According to the plans of the Quebec Hydro, hydro-electric power is expected to reach the Chibougamau area at the beginning of 1955, thereby giving an impetus to mine-making plans, for it will mean costs lower than those of the present diesel-generated supply. Clearing right-of-way for the 154,000-volt transmission line from St. Félicien has already started; it will follow the new 150-mile highway. A tie-in at Dolbeau, already connected with the Saguenay River power system of the Aluminum Co. of Canada, will bring the initial supply to this mining area.

As already mentioned, the Quebec region will be supplied with a 300-kv. line from Bersimis, thus permitting Lake St. John energy (Chute Savane, Chute du Diable, Isle Maligne and Shipshaw) now serving Quebec City area to be used primarily for local needs and the surplus to be diverted to Chibougamau. In other words, the energy now supplied to Quebec by the Lake St. John power system will gradually cease as it is replaced by the new supply from Bersimis. The major engineering project at Bersimis is therefore indirectly responsible for cheaper power in the Chibougamau region.

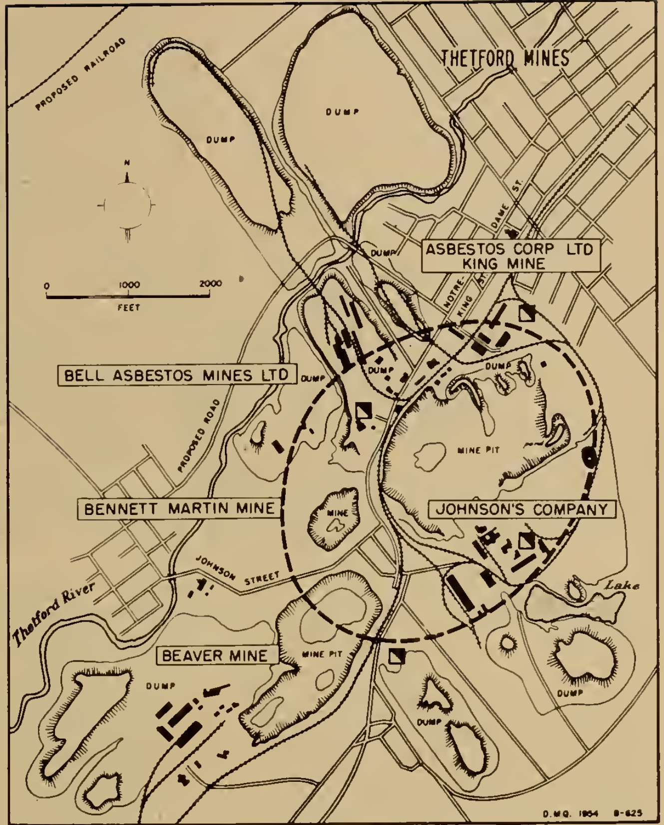
***Thetford Mines—Black Lake Region Relocation at Thetford Mines***

The asbestos mining industry of Quebec is centered about the Thetford-Black Lake and Asbestos districts in the Eastern Townships. These remarkable deposits have been producing asbestos fibre for nearly seventy-five years, and this industrial mineral is the largest single item in the table of Quebec's mineral production. Several million tons of rock are extracted each year with amazing efficiency; in some operations, more than 10,000 tons of rock are mined, transported and treated every day. The average content in Quebec's deposits as now mined is well over 5 per cent of fibre. In round figures, it may be said that approximately 900,000 tons of fibre is shipped yearly at an average value of $90 per ton.

[3]The Canadian Government has announced (the bill authorizing construction was passed on May 11 in the House of Commons) that the Canadian National Railways will proceed immediately with the construction of the 150-mile railroad connecting Caché Lake, near Chibougamau, with Beattyville, in the Barraute area. This railroad should be completed by the summer of 1956. The other route between Chibougamau and St. Felicien will be built later.



**Left: Fig. 12. Alternative railway projects for the Chibougamau area.**



**Right: Fig. 13. Map of the relocation program at Thetford Mines.**

The demand for asbestos depends, of course, almost entirely on world markets. Business conditions in many countries have been more competitive during recent years, especially in the United States, where most of Quebec's production goes, and also in Europe. With the invasion of the market by Russian asbestos shorts, the outlook is for slightly lower production. Never-the less, the long-term picture is bright on account of the numerous industrial uses which are steadily being developed and because of the steady demand in long-established markets.

The picture of the asbestos mining expansion and improvement program underway in Quebec is very impressive. At Asbestos, Canadian Johns-Manville is building a new mill to replace its present plant and is converting its Jeffrey mine, the world's largest, to underground operations; at Vimy Ridge, Asbestos Corporation is readying a new mine and treatment plant with a rated daily capacity of 5,000 tons; in the Black Lake area, Johnson's, Ltd. has completed a 4,000-ton daily capacity plant to replace its old mill, while in the same area, the American Smelting and Refining Company is going ahead with plans to place the properties of United Asbestos Corporation in production at an estimated cost of $25 millions. This project will also involve a great engineering feat, the drainage of Black Lake.

Although open-pit mining is still practised on some of the properties, the economic limit of depth for others has been reached, and an underground method known as "block caving" is now in use, entailing engineering achievements of the highest order. In this block-caving method of mining, no timber supports can be used underground because of the undesirable splinters which wood leaves in the final asbestos product; all underground openings of a permanent nature have to be supported by steel and concrete. Mill tailings are placed as fill over the subsiding, mined-out blocks and, although this fill does prevent sudden collapses of ground, it does not stop a gradual shattering and movement of the rock surrounding the mine workings.

In the Thetford Mines area, the Bell mine, the King mine (Asbestos Corporation) and the Johnson's mine, were operated by open-pit methods until about twenty years ago, when the depth of the workings and the lack of surface space first forced the King mine to go underground. Shortly afterwards, the Johnson's mine was obliged to do likewise. The Bell mine remained as an open-pit operation until 1951, when the differing depths of mining of the three contiguous properties brought about mutual difficulties, because of boundary subsidence of portions of the upper mines into the lower ones. In addition, operations having been carried out to deeper and deeper horizons, a stage had been reached where surface subsidence was also creating much concern, preventing at the same time the mining of big blocks of excellent ore.

It became evident that part of the surface facilities would have to be relocated. Even as far back as 25 years ago, a survey of a relocation project was prepared, but circumstances did not permit its realization until recently. To allow for the co-ordination of mining operations of these three major asbestos producers in Thetford Mines area, a major relocation program has now been undertaken (Fig. 13). The project consists of the clearing away of all surface establishments bordering and covering the area affected by present and planned mining operations of the Bell mine, the King mine (Asbestos Corporation) and the Johnson's mine. The entire cost of the relocation program, which is expected to be well over $5 millions, is to be met by the three companies involved, in proportion to the ore reserves which the project will make available to each.

According to the estimates, the

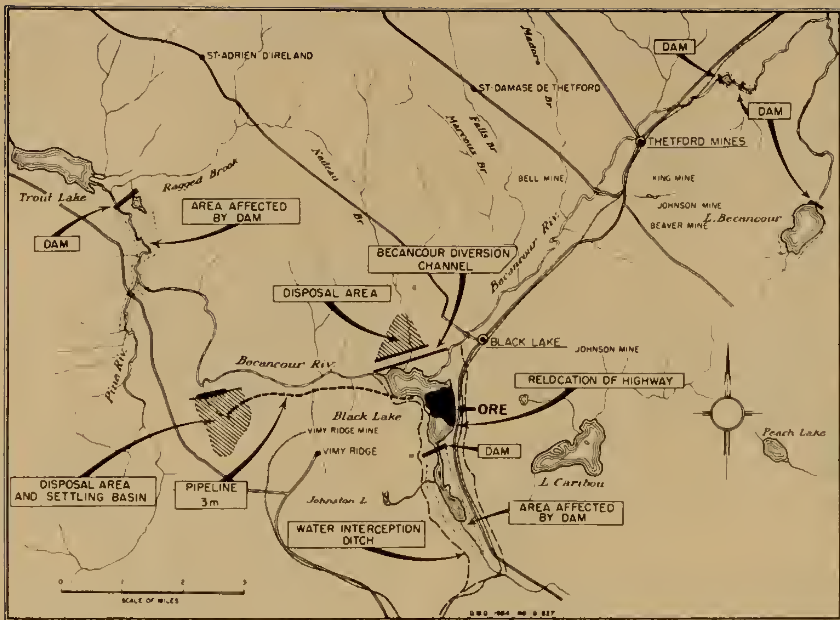


Fig. 14. Black Lake drainage scheme.

whole project will take ten to twelve years to complete, but to date almost 75 per cent is already done; the relocation of railway facilities and city communications, which are by far the most important items of the project, should be completed by 1955. Work was commenced last August, and the new line of the Quebec Central Railway should be opened to traffic by November of this year.

This project comprises a lengthy railway detour and the building of railway bridges, a new station, a freight shed, and a marshalling yard. In addition, two new city streets will have to be opened, new water mains will have to be laid, and sewerage lines will have to be changed. Considerable reorganization is also required for power lines, and telephone and telegraph systems must be modified. About 100 dwellings and business establishments have to be removed and relocated.

This project will eliminate further obstruction and ensure economic mining of this major orebody for many years to come.

### *Drainage of Black Lake*

Among the important engineering projects pertaining to the mining industry, must be mentioned the recent decision of Lake Asbestos of Quebec, Ltd., a subsidiary of the American Smelting and Refining Company, to put into production the United Asbestos Corporation property beneath Black Lake and also provide for the construction of a mill of 4,000 tons daily capacity.

As a result of a substantial amount of underground working and test drilling, positive ore reserves under Black Lake are conservatively estimated at 50 million tons grading 7 per cent of asbestos fibre. Because of the nature of the rock, it is believed that only a small portion of the ore could be mined by underground methods even if the lake were drained and some of the mud were removed.

In order to permit mining operations by open-pit methods, it will be necessary to remove the 30 million cubic yards of clay, sand, gravel and glacial till that are covered by 50 feet of water. This

Fig. 15. Principal mine roads built by the Department of Mines of Quebec.

Fig. 16. Mining villages in Quebec.

mud will be removed by means of hydraulic dredging and pumped through a pipe line to a suitable disposal and settling basin located three miles away.

The project (Fig. 14) calls for the diversion of the Becancour River which empties into the northeast corner of the lake. To take care of streams flowing into the lake a diversion channel, as well as interception ditches around the lake and a dam at the south end, will have to be built. This dam will also serve to accumulate the water necessary for dredging operations and will act as a safety measure for the surrounding interception ditches.

The Sherbrooke-Thetford Mines highway will have to be relocated for a distance of approximately a mile and a quarter on a line between the lake and the railroad, which is about 1,000 feet from the shore.

To compensate in some measure for the loss of the natural regulating effect of Black Lake, a dam will be erected at the east end of Trout Lake and the impounded waters will form a new lake. Other dams will be erected at the discharge of Lake Becancour and on the Becancour river at a point east of Thetford Mines in order to regulate the flow of the river, particularly during flood periods.

Such engineering projects will involve expenditures of many millions of dollars during the next three years, the period estimated as necessary for the completion of the whole undertaking. On the other hand, it will make available a new mineral deposit for the province, one that was discovered by the prospector, developed by geologists and mining men, but brought into operation by the skill of the engineers who have to tackle this intricate, large-scale hydraulic enterprise, whereas the handling of millions of cubic yards of lake bottom silt will bring the civil and soil mechanics engineer prominently into the picture.

#### Other Projects

Among the principal engineering developments in the field of non-metallic industrial minerals in the province must be mentioned the recent completion by Dominion Magnesium, Ltd., of a plant at Beauharnois for the manufacture of ferrosilicon, which in turn is used in the production of metallic magnesium. The Aluminum Company of Canada also produces magnesium by the electrolytic process at its Arvida plant, from brucite drawn from Wakefield, Quebec.

In Villeneuve, east of Quebec City, the St. Lawrence Cement Company is erecting a cement plant with an estimated annual capacity of a million and a half barrels. The tentative operation date is September, 1955.

A new phosphorus plant at Varennes, between Sorel and Montreal on the south shore, built by the Electric Reduction Company, came into production last year. The eventual capacity of the plant will be from 35 to 50 million pounds of phosphorus annually, using imported phosphate rock from Florida as raw material and domestic quartz as flux.

A new sulphur-iron sinter plant is being established in Welland, Ontario, for the treatment of Noranda pyrite, using a new process developed by the company. The reserves of pyritic ore at Noranda mines exceed 100 million tons. Noranda has also decided to put into production the MacDonald mines, where reserves of pyritic ore are estimated at nine million tons. A new 1,500-tons-per-day mill will also be erected at the property.

Canadian Refractories, Ltd., has built a plant at Marelan, 13 miles south of Kilmar, with a daily capacity of 200 tons of refractory bricks. This capacity exceeds that of all such plants in the United Kingdom.

Finally, much could be said about the aluminum industry of this province, which accounts for an annual production of 500,000 tons of metal in the four smelters at Arvida, Ile Maligne, Shawinigan and Beauharnois. Although depending on imported raw materials, this industry has established in Quebec the largest aluminum reduction plant in the world and has served to develop hydro-electric capacity of over 2½ million hp. in the Saguenay valley.

#### Conclusion

And so, everywhere in the province, engineering is closely associated with the finding and the development of new mineral deposits. In this great area, other mines must be sought far afield, or under overburden, or underwater. Accessibility to undeveloped mining areas has for many years been a problem in which the Department of Mines has shown much interest. Major highways, as well as secondary roads or even simple access roads (Fig. 15) have been widely built, while mining villages (Fig. 16) have been established according to the best town planning practice for the welfare of the mining population.

Such is the shape of the economy of the Province of Quebec, a large undeveloped area in which to seek for new natural resources, blessed with abundance of hydropower energy, with favorable rock formations and with a growing manufacturing industry, backed by a competent labor force and the proximity of satisfactory markets.

For its part, the mining industry of Quebec can contemplate its actual accomplishments with satisfaction and look to the future with confidence.

# The Location and Construction of The Quebec North Shore and Labrador Railway

by

B. M. Monaghan, M.E.I.C.

*Assistant Chief Engineer,*
*Quebec North Shore and Labrador Railway,*
*Seven Islands, Que.*

This paper covers the location and construction of the Quebec North Shore and Labrador Railway in the provinces of Quebec and Newfoundland (Labrador). The railway originates at Sept Iles, Quebec, and runs 358 miles almost due north, passing through the western part of Labrador to Schefferville, Quebec. It is a subsidiary of the Iron Ore Company of Canada, formed to develop the rich iron ore deposits in the Knob Lake region of Quebec and Labrador. The railway will transport ore from the mining area to a loading dock at Sept Iles, Quebec.

The project undertaken by the company consists of two hydro electric plants, ore loading and storage facilities, a mooring and loading dock, two townsites, railway maintenance crew facilities, communications and signal installations, the development of the mining area and the building of the railway. The cost of the railway and its rolling stock comprises about half that of the entire project.

> It is a long time since a railway was built from scratch in Canada, but now we have a new one, described in this paper presented at the recent E.I.C. Annual Meeting in Quebec City. The reconnaissance for it has already been discussed in a paper which we published in April 1954, so it is quite fitting that Mr. Monaghan should tell the rest of the story here. Its isolation and the climate of Quebec's north shore made the job not an easy one, yet it was completed well within schedule and without any major difficulties, thanks to skilful planning and management.

Construction of the railway has required the movement of 15,000,000 cu. yd. of material, plus an additional 6,000,000 for tote roads, airports, etc. To build the grade it was necessary to construct 11 temporary airports and install 18 major construction camps. An airlift was inaugurated which in three years completed 15,000,000 ton miles of flying.

Loaded trains will move southbound against a maximum compensated grade of 0.4 per cent and will return northbound empty against a 1.35 per cent grade, compensated. There are 693 curves from 0° 15′ to 8° 0′ of which 450 are less than 3°. The major drainage structures are 19 bridges with a total length of 4,736 ft., of which the Moisie River bridge, of steel lattice-girder construction 705 ft. long and 155 ft. high, is the largest. There are 22 passing sidings and one intermediate yard at Oreway, Mile Post (MP) 186. Trains will be operated under centralized traffic control. The south switch at each siding is power operated and the north switch is spring activated. Empty trains will take the siding.

It is expected that the railway will go into operation in August, 1954, and that 1,500,000 tons of ore will be moved to the sea by December. About 1956 the railway will begin to transport 10,000,000 tons of ore per year. This is three times the present annual production of iron ore in Canada and about one-tenth the present annual production of ore in all North America.

The ore will be transported in trains of 100 cars, each car carrying 85 long tons; four diesel electric locomotives of 1,500 hp. each will supply power. Ten million tons per year will require seven trains per day each way during the ore hauling season, which is expected to last 165 days, from June 1 to November 15. The trains will unload into a stock piling yard in Sept Iles through a car dumper of 8,000 tons per hour capacity into a ship loading dock of 6,000 to 8,000 tons per hour capacity.

The reconnaissance surveys for the route were made in 1945 and 1946 by D. A. Livingston, M.E.I.C., *The Engineering Journal* April 1954. Location surveys were also undertaken by Mr. Livingston in 1947, 1948 and 1949, and completed in 1950. Construction started in the fall of 1950 and was completed in December, 1953. The track reached Schefferville on February 13, 1954.

### Surveys

A railway survey consists of three distinct operations—reconnaissance to determine possible routes, preliminary survey to gather information and to select the proper route, and location survey to lay out the results of the first two surveys on the ground for construction purposes.

#### Reconnaissance

A reconnaissance is a survey of an area, not of a particular route. In making the reconnaissance for the Q.N.S. & L. Ry., Mr. Livingston obtained standard Canadian Government topographic map sheets of the area, each covering 4° of longitude by 2° of latitude, and to a scale of 8 miles to the inch. These maps showed the planimetry of the area and the drainage, but no elevations. What appeared to be the most feasible routes between termini were laid out in these maps for study. By inspection, several were eliminated immediately being either too long or containing poor alignment, or having unfavourable grades. As the country is well drained and contains well defined stream courses, the choice was limited to two or three valleys.

The choice of valley in turn was governed by the established grade limits. The best line is generally available on or along a valley floor, because confluent creeks can be crossed at grade level, eliminating large valley fills, and because the general alignment is usually better. A good argument in favour of such a location is that the flow of water is there and has probably found the best route.

Through the lake and muskeg country the drainage is sluggish, almost eliminating grade as a consideration in the choice of a possible route. Here a line was chosen for its shortness and lack of heavy curvature. The lakes themselves and small rock ridges, which occasionally expose themselves in the muskeg plain of the Labrador plateau, constituted the major natural barriers to be circumvented.

During the conduct of the reconnaissance survey information was secured regarding the elevations of the termini and on ruling grades; barometric or fly levels of all summits, passes and lakes, both in the valleys and in their head waters, were also determined. Elevations of the various streams were taken at frequent intervals, waterfall heights were noted, with their approximate distance from some reference point. Stream profiles were plotted and used for grade determinations.

Descriptions of the various types of terrain and their composition were made as the survey progressed. Different types of materials vary widely in excavation cost and the presence of certain types of material could upset an otherwise sound construction scheme.

Reconnaissance plans and profiles of the various possible routes were plotted when all information was available and the most desirable routes were then picked out. A flight of aerial photographs was taken along w[illegible]as considered the most suitable d[illegible]tion.

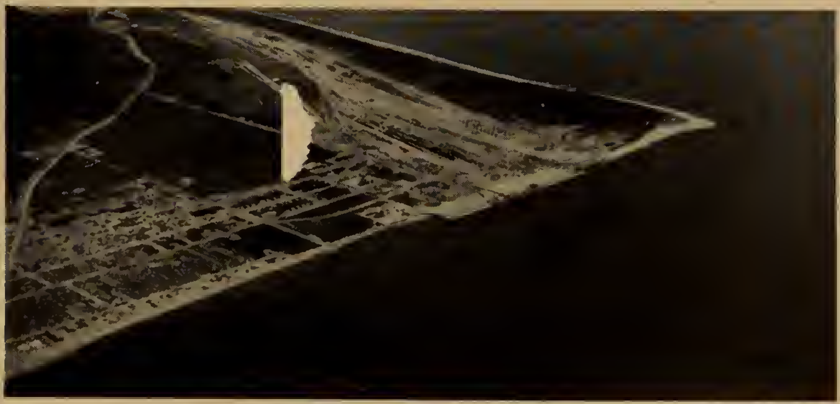
#### Preliminary Survey

Preliminary surveys were started during the summer of 1947. These were run in accordance with standard survey practice to an accuracy of about 1 in 1,000.

The preliminary survey consisted of a series of courses along the proposed route, chained, with stations marked on the ground at chainage pickets each 100 feet and deflection angles taken at each change of direction. This series of courses is usually referred to as "the line". Levels were carried along the line determining the elevations of each station and establishing bench marks at quarter-mile intervals. The leveller in passing took note of the size and location of creeks for culvert size, the average diameter of timber growth in the vicinity and the classification of material which the line passed over. These notes were transferred to a profile of the line.

The topography of a strip three to five hundred feet wide was taken. The topographer's notes were either in the form of slope readings laterally from each station, or as a contoured strip drawn in his

**Rock cut, typical of some of the country through which the railroad passes.**



Sept Iles Terminal area.

field notebook. He located the position of all primary topographical features adjacent to the route and defined lake shores, stream courses, etc. with respect to the line.

Each day as the field information was assembled a field draftsman plotted the line by means of latitudes and departures. The topography was sketched in and details gathered as the field work progressed were added. Projections of the possible routes could then be plotted on this plan, conforming to specifications as to grade, curvature and alignment. Depending on the accuracy of the survey, a profile taken from this projection represented closely what would be obtained in the matter of excavation quantities, size of structures, etc., should the route in question be used.

Profiles of the line were plotted to a scale of 1 in. to 400 ft. horizontally and 1 in. to 20 ft. vertically. Plans were plotted to a scale of 200 ft. to the in., with a contour interval of 5 ft. in relatively smooth sections and 10 ft. in the more precipitous areas.

#### Final Location Survey

The preliminary survey provided the basis for location planning. As the survey advanced, various trial lines were laid out on the plans and profiles taken off to determine the most economical route. When the most favourable location had been determined on paper, the line was run in on the ground. Some revisions in this line were frequently necessary. If time permitted, the locating engineer made these corrections, if not, the resident engineer on construction made them when laying out the centre line for clearing.

#### Specifications for Final Location

The specifications to which the survey of the Q.N.S. & L. Ry. were run called for a minimum compensated grade southbound of 0.4 per cent and a maximum compensated grade northbound of 1.35 per cent. 8° curves were the maximum allowed.

The first surveys of the railway route were run on a maximum grade basis of 0.4 per cent southbound and 1.9 per cent northbound, both grades compensated for curvature. At this time steam power was contemplated as the prime mover and the use of the 1.90 per cent grade was to take full advantage of the pusher service required in a short section of the Wacouno River territory. The minimum grade available in this valley south of M.P. 75 exceeded that which could be negotiated by a train returning empty with its full complement of cars.

It was decided in 1949 to use deisel-electric power on the railway. This power could move the northbound empty 100-car trains over the 1.9 per cent grade satisfactorily, but the braking capacity of a loaded train was found to be such that a 1.35 per cent compensated grade was the maximum that it could descend safely.

The maximum degree of curvature was established in view of the fact that a train moving around an 8° curve at 35 m.p.h. requires 4 in. of super elevation. Milage 0 to 165 was located on the principle of curvature and grade versus yardage, and miles 166 to 358 on the principles of distance versus yardage.

The grade rises to el. 300 above sea level in the first 55 miles and to el. 1,600 in the next 41 miles. Most of the heavy grading and all the curvature over 6° are contained in this section. The summit, el .2,056, is reached at M.P. 149. Across the Labrador Plateau elevations vary from 2,056 to 1,550 and at the south end of Knob Lake, where the line crosses the Quebec boundary, the elevation is 1,665.

#### Survey Methods

The survey work was done during 1947 to 1950, inclusive. Generally two field parties were used, both summer and winter, with a short tie-up at break-up in the spring and freeze-up in the fall.

The distinct types of topography —the precipitous, well-drained Moisic River watershed and the northern Labrador plateau—made it possible to divide the survey into two types of operation, summer and winter, and to make full use of the advantages of each. The crews equipped for summer operation generally moved by canoe or by boat on the larger lakes, while crews on winter operation depended on dog teams for their transportation. Thus it was possible to do the river sections in the summertime with canoe service. The muskeg section, difficult to manoeuvre upon in the summertime, when frozen over provided an

One of the airstrips in service during 1952. Mile 163 construction camp and grade, left foreground.

excellent surface for dog team operation.

### Field Crews

The field parties, usually two in number, operated continuously regardless of weather changes, modifying their equipment to suit seasonal requirements. Each party consisted of from 18 to 24 men. A typical field party was organized into a working unit with personnel as follows:

- Locating engineer.
- Transitman.
- Leveller
- Draftsman
- 2 Topographers and rodmen.
- Head chainman.
- Rear chainman.
- Stakeman.
- 2 Axemen.
- Cook and assistant.
- 3 Canoemen.

During the winter the canoemen became dog-drivers, and a woodcutter and a night fireman were added to the crew. Living quarters for a crew of this size were canvas tents of either the "A" or pyramid types, with preference for the pyramid tent, because of ease of erection and uniform heating; it also requires only one pole, a factor especially appreciated in this land of short, heavy spruce.

With a well balanced party as listed, the survey can proceed in an integrated manner, such that each day's work is completed by the end of that day, leaving no overlap. On a preliminary survey this means that all angles and courses have been measured and checked, and levels and topographic coverage of the line completed. On a location survey the curves will also have been run in.

Considerable effort must be expended on co-ordination of the various sections of the crew in order that work may proceed without stoppages. An experienced crew can complete the survey over all the line cleared in a day through a moderate growth of timber. On preliminary line it is necessary that the locating engineer keep his local reconnaissance far enough ahead so that there is no delay from that source. The field notes should be plotted each night and on the following day by the draftsman. A continuous contour plan and profile, showing all topographic features relative to the line, are kept as already mentioned.

Fortunately the two definite types of terrain encountered in this project allowed field work to be organized to accommodate seasonal differences. The precipitous river valleys adjacent to the St. Lawrence were easier to contend with in summer—snow covered slopes are difficult to work on—but the relatively flat lake country lent itself to both summer and winter work.

A hindrance in the lake regions was the prevalence of strong northwest winds which made canoe travel difficult and sometimes impossible, leaving men marooned for two or three days at a time. To overcome this obstacle large flat bottom boats built of plywood were used. These were constructed in sections at Sept Iles, flown in to the lakes and erected. They were from 36 to 43 ft. long and 5 or 6 ft. wide. Each could carry a load of about four tons with a one-foot draft. They were powered by standard 8 and 10 hp. outboard motors, and averaged about 7 m.p.h. loaded. With these boats, two to a party, it was possible to move a complete camp and food supply in one trip, requiring a minimum of men released from line duties.

During the winters dog teams were used with sleighs or "comatiks", as they are known locally. Four dogs were hitched as a team to each sleigh, Eskimo fashion, and on hard packed trails were expected to pull a 400-pound load.

Camp moving equipment in the winter consisted of 30 dogs and 7 sleighs. These were supplemented by five 9 ft. toboggans drawn by hand. The tents, baggage and food supply weighed about three tons.

**Laying tracks on the bridge at Mile 12. The largest between Moisie River and Knob Lake.**

This load was usually divided so that part of it could be moved before or after the main move day.

Mail and supplies arrived each week from Sept Iles by aircraft. At least a week's reserve of food was maintained which sufficed to cover any period of bad weather or mechanical delay in aircraft service. This safety cache was moved ahead periodically when the airplane was available.

Two full-sized crews were used summer and winter, with a smaller crew doing special work where required. During the summer of 1950, ten crews were put in the field to check and complete remaining location for the contract estimate.

Daily production of the field crews varied considerably. In the steep river valleys a half-mile to a mile a day was considered good work. On the Labrador plateau crews averaged two miles per day in the field. A total of 1,507 miles of line was run from 1949 to 1952.

### Geology

The line as constructed follows the valleys of the Moisie, Nipissis and Wacouno Rivers to M.P. 130, where it crosses to the headwaters of the Magpie River, which it follows to M.P. 150. From M.P. 150 it follows the east sides of Ashuanipi and Menihek Lakes to M.P. 330, where it crosses the Menihek Rapids, thence across the grain of the country to M.P. 358 at Schefferville.

The Sept Iles yard and the first ten miles of the railway are located on a portion of the Champlain plain. Starting at M.P. 10, the railway crosses a series of low marine terraces just prior to reaching the rugged Laurentian uplands at M.P. 12. Here it crosses the Moisie River and follows its east side to its junction with the Nipissis River at M.P. 28. There it follows the east side of the Nipissis to M.P. 56, where it enters the Wacouno River gorge, which it follows to its head at M.P. 130.

The rock in these river valleys is composed of an ancient gneiss complex of early Precambrian age, which has been intruded by igneous rocks varying in composition from acidic to basic. The rocks are largely granite gneiss and are part of the oldest exposures on the earth's surface. These valleys have been heavily glaciated and, particularly in their lower courses, have wide, graded bottoms floored with Champlain sea silts and sands in the Moisie and lower Nipissis and sands of glacial origin in the upper Nipissis and Wacouno. Where possible the line follows the bottoms of these valleys, but frequently in the narrow rugged stretches it clings to the valley sides high above the river.

North of M.P. 150 the route enters the Labrador plateau and follows the east side of the north-draining Ashuanipi and Menihek Lake chains to M.P. 330. Near M.P. 258 the right-of-way enters a great geological unit known as the "Labrador Trough". The Labrador Trough is made up of a variety of highly-folded and faulted sediments and volcanics of late Precambrian age which have been intruded by rocks varying in composition from granites to serpentinites. The bedrock along the right-of-way between M.P. 258 and M.P. 265 has been interpreted to consist of shales and quartzites which have been intruded by gabbro. Between M.P. 265 and the Howells River, approximately M.P. 338, the bedrock consists entirely of shales and slates. North of M.P. 338 into Knob Lake the right-of-way crosses a great variety of sediments, including dolomites, chert breccia, quartzites, iron formation, shales and slates. A few minor diabase dikes are known to cut these sediments.

### Aerial Photographs

A single flight of aerial photographs was taken along the reconnoitered proposed route of the railway during the summer of 1945. An individual photograph of this flight covered approximately six miles east and west and three miles north and south. Extensive use was made of these photographs in locating the line on the ground and in planning survey operations. Inasmuch as the majority of the locating work had to be done on the ground, contoured plans were not drawn from these photographs. Two attempts were made to use aerial photography for location surveys in the Wacouno and Moisie River sections, but, due to ruggedness of terrain and unsatisfactory control, these failed. It is the author's opinion that, had a topographic strip map along the proposed right-of-way been prepared, including an area ten miles each side of the centre line, to be used for preliminary investigations, considerable costly grief could have been saved the field parties. The aerial photographs were particularly useful in the muskeg section, where differentiation among the various types of coverage determined, within limits, where the line was to be located. During the construction period they were most useful in determining the location of borrow and ballast pits.

### Construction

The contract for the construction of the railway was awarded to a group of contractors, Cartier-McNamara-Mannix-Morrison-Knudsen, familiarily known as "C.M.M.-M.K.", on September 21, 1950. The completion date for grading was set for June 20, 1954. This was later advanced to December 31, 1953.

The main items in the contract specified the movement of 15,000,000 cu. yd. of material; building 19 bridges, 5 of steel and 14 timber trestles; and excavating two tunnels, one 2,206 ft. long and the other 761 ft. long; the laying of 440 miles of rail; and spreading of 2,200,000 cu. yd. of ballast. The steel bridges were fabricated and erected under a subcontract.

The contract provided that the railway would purchase all materials and equipment for construction of the project and would provide air transportation for these materials

**TABLE I: Cubic Yards of Material Moved in Construction of Q.N.S. & L. Railway and Terminals**

| Mile Post to Mile Post | 1951 | 1952 | 1953 | Total |
|---|---|---|---|---|
| 2-40 | 4,152,415 | 436,935 | | 4,589,350 |
| 40-100 | 588,320 | 2,243,276 | | 2,831,596 |
| 100-150 | 74,250 | 674,977 | 299,288 | 1,048,515 |
| 150-200 | | 800,000 | 1,222,869 | 2,022,869 |
| 200-250 | | | 1,384,269 | 1,384,269 |
| 250-300 | | | 1,572,233 | 1,572,233 |
| 300-358 | 1,235,868 | | 308,967 | 1,544,835 |
| Sept Iles Terminal | 435,000 | | 88,500 | 523,500 |
| Knob Lake Terminal | | | 180,881 | 180,881 |
| Airports & Tote Roads | 1,315,000 | 2,030,000 | 2,655,000 | 6,000,000 |
| Total | 7,800,853 | 6,185,188 | 7,712,007 | 21,698,048 |
| Grade Track Miles Completed | 103 | 106 | 231 | 440 |

and personnel where necessary; the contractor would furnish men and supervision, do all grading, etc., lay the track and ballast it. For this he was to be paid a fixed fee.

The contractor's program for construction was as follows:

1950—Buy and move equipment into place; commence construction of grade on south end and excavation of tunnel at M.P. 12.

1951—Construct grade to M.P. 70, complete tunnel and Moisie River bridge and lay rail to about M.P. 50.

1952—Complete grading on 85 per cent of line and lay track to M.P. 190.

1953—Complete grading and track laying and 500 lift-miles of ballasting.

1954—Complete ballasting and clean up work necessary for safe operation.

Table I shows how well this program was followed.

Construction progress was controlled by the speed at which men, machines and supplies could be moved into place. Airports and tote roads were built to facilitate this movement. A winter tote road to Knob Lake was opened during the winters of 1952 and 1953. Tractor trains and trucks moved freight along this road. Their cargo was made up of piling both steel and wood, bridge timber and ties, fabricated steel sections for the Menihek power project, equipment for the Knob Lake development and any other material unsuitable for handling by air. The cost of winter maintenance and the heavy snowfall made winter haulage as expensive as flying. A comparatively small tonnage was moved this way.

As sections of the railway between airstrips were completed, freight was staged from Sept Isles to airport by train for delivery by aircraft to final destination. As construction advanced, so did the base at which the aircraft were loaded.

North of M.P. 200 the right-of-way follows the Ashuanipi, Whitman, Molson and Menihek Lakes for 130 miles. These stretches of water were used to transport fuel and supplies, using open boats built on the site. The total tonnage of freight moved by this operation during 1953 was 165,527 tons.

In all there were 13 airstrips in operation along the right-of-way, including the ones at Sept Isles and Knob Lake. Douglas DC3's were the major type of aircraft used, with a Lancaster and a Fairchild C119 Packet used for short period only. In 1953, 18 planes, including bush aircraft, and two helicopters were fully employed in the transportation of men and materials. In addition, some contract flying was used for transportation of steel and cement. As much as 6,000 tons of air freight was handled in a single month. The helicopters were used for supervision and ambulance work.

**TABLE II: Volume of Passengers and Freight Handled During Construction by Airlift.**

| Year | No. of freight aircraft | Passengers | Freight ton-miles flown |
|---|---|---|---|
| 1950 | 2 | 1,686 | 606,280 |
| 1951 | 6 | 22,246 | 2,425,547 |
| 1952 | 8 | 45,178 | 5,691,581 |
| 1953 | 10 | 69,590 | 6,539,782 |
| TOTAL | | 138,700 | 15,263,190 |

### Air Lift

Supplies and equipment were brought in by boat from Montreal during the open season on the St. Lawrence from April 15 to December 15, or later. All bulky materials were scheduled to arrive so that full use was made of water shipping. A total of 482,000 net tons were moved into Sept Iles by boat from 1950 to 1952. Requirements during the winter were shipped to Mont Joli by rail and flown from there to Sept Iles and north. Mont Joli and Sept Iles are 145 air miles apart.

Seven pounds of camp supplies and food per day were required to keep a man in the field.

### Equipment

The equipment used on the project was limited in size by transportation requirements. As types of earthwork and excavation varied

**Break through at south portal of tunnel at Mile 12.**

along the line, it was necessary to buy many different types of machines for the different jobs. A compromise was reached between size for transportation and type for work.

The major pieces of equipment on the job during 1953 were as follows:—

58 shovels
31 tractor drawn scrapers, 6 to 22 cu. yd. capacity
21 self-propelled scrapers, 10 cu. yd. capacity
180 tractors
200 trucks, 4 to 30 cu. yd. capacity
33 dumptors.

The above list does not include small machines, jeeps, automobiles, etc., and many other odd pieces of essential equipment. The cost of equipment in use by 1953 totalled $9,800,000 owned and about $1,000,000 rented.

#### Winter Overhaul

During 1951 and 1952 most of the heavy earth moving machinery was used at inaccessible points north of Sept Iles. For this reason, when December, 1952, came around, a lot of heavy repairs were required on these machines. To accomplish this work two large sheds, to be used ultimately for winter storage of the diesel locomotives, were converted to tractor, truck and dumptor repair shops. An assembly line operation was established and each unit was taken down and completely rebuilt. The shovel unit repairs were made in the future locomotive repair shop.

Equipment was brought to the end of steel on the winter tote road and then by rail to Sept Iles. A rapid turn around on the machinery brought in for repairs was required, in order that it might arrive back on the job before the spring breakup ruined the tote roads.

Minor repairs were made in the field by special crews. When engine or transmission changes were necessary, complete assemblies were shipped out from Sept Iles and the old unit returned there.

During the summer of 1953 the overhaul base was moved to M.P. 224, where machine, motor repair and welding shops were constructed.

#### Earth Moving

Aside from minor special construction problems, two main types of work were carried out to complete the job. The first was the construction of the line through the Moisie, Nippisso and Wacouno River valleys, where considerable yardage of solid rock had to be moved. The second was over the muskeg section from M.P. 150 to M.P. 345, where fill material and borrow were scarce and difficult to find. The most difficult situation faced was construction through the muskeg. This was considerably accentuated because of its distance from the source of supply of construction materials.

#### Rock Work

Rock work was completed during 1951 and 1952, using shovels for loading and short haul equipment, such as dumptors and trucks, for moving. The major portion of this work lay between M.P. 12 and M.P. 17. More than 1,000,000 cu. yd. of solid rock were excavated in this section. Compressors, jack hammers, wagon drills and dynamite were used to open the cuts. A total of 600 tons of dynamite was used on the project for rock excavation. As this section was located at the south end of the project, it was a bottle neck around which everything going north had to be moved. Near this end airports were built at M.P. 22, 28, 35, 55, 80 and 134 during the winter and summer of 1951. A summer tote road was also built to M.P. 17 via the west side of the Moisie River, but, as this was located on silty and clay formations, considerable difficulty was encountered in maintaining it through the summer season.

#### Clays and Silts

Although the area through which the railway is built is made up primarily of crystalline Canadian Shield rocks, surface materials to a depth of several feet have been deposited by glaciation and marine invasion. Frequently, throughout the first 100 miles the grade encounters these deposits. Fortunately, the majority of these deposits is made up of sand or of coarse, gravelly material, but some are marine clays and silts. These were difficult to work in. In the presence of water they become fluid and unstable. The excavated material was unsuitable for fill and had to be wasted.

A severe break through of silty material occurred at M.P. 12, when a portion of the roof of the south portal of the tunnel gave way. Approximately 60,000 cu. yd. flowed down through the opening and out the south portal at the time of the break and an additional 40,000 cu. yd. were moved by means of hydraulic jetting to clean the hole out well enough to install a concrete cap.

These same silts have caused some difficulty in track maintenance. Alternate freezing and thawing force moisture into the material and considerable flow occurs on the cut faces. This flow moves out under the track or mingles with the ballast and frost heave occurs. The drainage ditches through these cuts must be cleaned frequently.

While the rock excavation was a job concentrated in a relatively short section of the grade and requiring heavy excavation machinery, the muskeg operation was spread out over 200 miles and required the use of light mobile equipment mounted on mats.

#### Muskeg

Much of the land area of the Labrador region is covered with organic deposits known as "muskeg". It varies in depth from a few inches to 10 to 12 feet. In places it may go deeper, but the average soundings recorded during the location of the route were three to four

Finished track; rock ballast to be placed later.

feet. The line was relocated where depths of over four feet were found. The texture of the muskeg over which the railway was built varied considerably. Generally, all the organic materials were unsuitable for construction purposes.

A typical muskeg cross section consisted of a layer of moss two or three inches thick, overlaying a root-filled, woody, fibrous layer 6 to 8 inches thick lying on a layer of black muck. The muck layer varied from a matter of inches to two or three feet. Underlying this much glacial till matrix is found. Generally, this is a tightly packed formation of sand or gravelly sand with the occasional occurrence of silt.

In constructing the grade over this section of the country it was found that excavating the organic covering where the ditches were to be, and then piling up the material from the till base, gave sufficient material for the base of the grade. This provided a haul surface for the scrapers and trucks to work on to build the remainder of the fills. This in effect is what the construction program turned out to be.

Crews, especially trained, worked ahead of the main construction force with ditching dynamite, opening up a drainage pattern to allow the excess water to move off. The sticks of dynamite were planted in the organic surface and exploded by propagation. A total of about 68 tons of dynamite was used to open up 90,000 ft. of ditch. Later, small draglines piled the sandy gravel material from the ditch bottoms on the grade centre line. After draining, this material was spread by a bulldozer and then the scrapers, DW 10's and trucks moved into complete the grade.

### Track Laying

As successive sections of the grade were completed, track laying forces brought the rail up close behind the grading forces, at times so close that a keen rivalry developed between the two crews.

The track laying machine consisted of a burro crane distributing the rails from specially built truck cars. These cars were made of regular railway trucks supporting a frame constructed of rails, with a coupling arrangement at both ends. This allowed them to be taken down rapidly when their rail load was distributed, and to be set off to the side to allow the next car in line to move up behind the crane. These cars carried about 54 rails each. They were picked up each night when the track laying train was ready to return to its home siding for reloading.

**TABLE III: Track Laying and Ballast Schedule**

| Year | Track laid—Miles | | | Ballast lifting |
|---|---|---|---|---|
| | Main line | Yards, spurs, sidings | Total | |
| 1950 | | 5.0 | 5.0 | |
| 1951 | 11.0 | 5.3 | 16.3 | |
| 1952 | 97.2 | 15.6 | 112.8 | 76 |
| 1953 | 222.9 | 29.5 | 252.4 | 264 |
| 1954 | 25.4 | 8.0 | 33.4 | |
| *1954 | | 20.1 | 20.1 | 387 |
| TOTAL | 356.5 | 83.5 | 440.0 | 727 |

*To be completed 1954.

Enough ties to hold the rail in place were spread at night from the tie cars by dumptors over the estimated length of the following day's laying. A minimum of track fastenings and bridle rods were also laid out. The remainder of the ties and the plates were distributed from the work train following the burro. These were put in place by crews following the train. Spiking was done with air hammers and the joints were tightened with gasoline driven bolting machines.

Track laying was completed to Knob Lake in February, 1954.

### Ballasting

Ballasting operations were commenced in 1951, but, since little track was laid, distribution was limited. During the summer of 1952 ballasting operations were carried out from pits at M.P. 22 and 48; 76 lift miles were completed. 1953 saw considerable expansion in the ballast operation. Pits at M.P. 48, 85 and 134 were operated continuously from May to October. A total of 264 lift-miles were distributed. Ballasting was commenced again in January from a pit at Mile 290 and an average of about 75 cars a day was distributed up to the end of March.

Suitable deposits of material in convenient locations for ballasting were found, occurring in eskers at various points along the route. Most of it was suitable as found for first and second lifts. Three crushers with a combined capacity of 600 cu. yd. per hour, or the theoretical equivalent of 150 cars per 10-hour shift, are being installed to provide uniform material for the final ballast lift. First and second ballast lifts will be completed this year. The rock ballast finish will be placed over a five-year period.

### Drainage Openings

Galvanized culvert pipe fabricated by a subcontractor was used in all drainage openings, except where bridges were required. This pipe was rolled by a portable mill, and supplied on location in the 24-, 36- and 48-in. diameter sizes. The pipe sheets and rivets were moved into the main construction camps by air, rolled and assembled into various lengths and moved out onto the grade as required. Where larger diameter pipe—60-, 84-, 96-, 108-, 140- and 144-inch—were necessary, multiplate type culverts were installed. Multiplate pipe was supplied in ready rolled sheets forming segments of the circumference of the pipe and was bolted together in the field.

Using this system of assembling culverts on the site, considerable shipping space on aircraft and boats was saved and handling of the materials in unassembled form was speedier and more efficient than trying to move ready rolled pipe.

A total length of 16.5 miles of pipe was installed in the grade during construction.

### Climate

One of the most difficult obstacles to overcome was the weather. Summer temperatures may reach +100°F., winter temperatures may go down to —55°F. The annual precipitation in the Sept Iles region averages about 44 inches. This varies as one moves northward. The annual precipitation on the Labrador Plateau averages 36 inches, slightly less than on the sea coast. The annual snowfall in the interior averages about 48 in., lying undisturbed in the forest.

The summer rainfall in Labrador is not unusual in quantity, but the number of days on which there is some rain is numerous. During the summer season of 1949 of 126 days there were 91 days on which rain fell.

Construction crews building grade with earth that was wet when excavated experienced considerable trouble in getting the grade stabilized. In most sections of the country the grade was the only road available for the movement of machines, materials and men; as a result a great deal of work was required to maintain the grade after it was built.

#### Communications

Communications played an important part in expediting the work of construction. This service was supplied by the subsidiary flying company at each airstrip, where a radio control tower was installed. In addition to the airports, each construction camp was equipped with a radio capable of reaching the main substation. As the rail head moved north, teletype service followed and was usually available at the airstrip closest to the north end of steel.

#### Yardage Reports

Engineering records of the work done were compiled daily, transmitted to Sept Iles and assembled in the chief engineer's office. These reports listed the equipment in operation; if not in operation, gave the reason; and, using a rated production for the machines, gave the yardage moved for the day. At the end of each week the resident engineers measured the actual yardage moved and submitted this figure in the form of a report. The rated capacity of the machines in use was checked by these measurements.

In addition to the daily and weekly reports, a report was returned at the end of each month, covering all work done on the grade, and including culvert materials, bridge materials, timber, etc., used in grade structures. The monthly report only was used in the distribution of construction costs.

#### Engineering

The engineering on grade construction was handled by a chief engineer, an assistant chief engineer, four district engineers and resident engineers as required, usually about twelve.

Each resident's crew was made up of a transitman, two levelmen, two rodmen, two chainmen and an axeman. Crews working ahead of the construction force were equipped with cook and camp facilities. Jeeps, canoes and boats were used for transportation. The district engineers often used float equipped aircraft to move from camp to camp. A resident's territory varied in length from five to twelve miles.

Resident engineers staked out the work to be done as construction advanced. First, the centre line was established for the clearing crews. When clearing was completed, slope stakes for grading were set. If drainage openings were required, culvert invert stakes, or bridge abutment stakes, were set. When construction was complete, the grade was restaked and final grade stakes were put in for the top finish.

As grading in each residency was completed the centre line was re-established for the track laying crew. An engineer and crew were supplied with the track laying gangs to establish centre line for them daily. This was necessary because a grader was used to refinish grade just ahead of track laying.

For future reference, hubs were driven into the grade well beneath the surface at beginnings and ends of curves and at points along the tangents.

Ballast lift stakes were supplied to the ballasting crews by the engineering forces. The stakes were planted at every station (100 feet) on tangent and at half-station intervals around the curves. These stakes showed present track level, first-lift level and second-lift level.

#### Conclusion

The Quebec North Shore and Labrador Railway has now been completed. In August, 1954, a new industry on the shores of the St. Lawrence will come to life when iron ore starts to move from New Quebec and Labrador down the railway to Sept Iles and out to blast furnaces in Canada, the United States and Europe. This railway will move the frontier of civilization across the north land of Quebec and Labrador as the Canadian Pacific Railway did across the west more than half a century ago.

#### Acknowledgements

The author wishes to express his sincere appreciation for the help and the constructive criticisms offered by Messrs. W. H. Durrell, C. E. McManus, J. W. Burford, J. A. Little and R. A. Sharwood, who made the writing of this paper possible and to Messrs. D. A. Livingston, M.E.I.C., and F. C. Wardwell, Drs. A. E. Moss, J. Gustafson and E. Henderson and Professor K. B. Woods, who supplied much of the information.

# Discussion

W. M. Treadgold, M.E.I.C.[1]

Mr. Monaghan is to be congratulated on the presentation of the excellent paper on the railroad construction in Labrador and Quebec. This railroad has been constructed for a distance of 360 miles into an unknown country, for the purpose of developing the natural resources, on a scale and high standard that has not been surpassed by any other railroad at any time. The project has involved not only the construction of the railway but also building of hydro-electric plants, ore loading and storage facilities, mooring and loading dock, townsites and signal installations, all completed in record time. Hitherto in opening up undeveloped areas the practice was to construct a railroad as cheaply as possible when finances were limited in order to meet operation expenses and fixed charges. Then as traffic increased, improvements in line, grade and operations could be effected with the increased earnings. This first class railway has been constructed in record time and will operate to capacity for many long years and be financially secure—something that has not characterized many of the railways in this or other countries.

[1] Department of Civil Engineering, University of Toronto.

The line has been constructed with an operating season of 165 days, and with an ultimate capacity of 10,000,000 tons of ore, handled by 7 trains of 100 85-ton cars per day each way operated by diesel electric locomotives and centralized traffic control. Maximum grades are all compensated for curvature which does not exceed 8° with half the curvature being under 3°.

As to actual construction, one is struck by the amount of heavy equipment used and transported into a wilderness and the methods employed in dealing with drainage and with muskeg which was very severe. The opening up of drainage ditches and the use of drag lines to make up the grade, the use of galvanized culvert pipe rolled and fabricated on the ground, multiple and multiplate culverts, thus saving shipping space on aircraft and boats, are all very interesting phases of the work, apart from the heavy tunnel and bridge construction amid severe weather conditions.

As the writer suggests, a greater use of aerial photographs to be used for preliminary investigations would have helped greatly and facilitated subsequent work in the final location of the line, giving much infor-

# Industry, Engineers and The First Five Years of Professional Development

*by*

Dr. L. F. Grant, Hon.M.E.I.C.

I feel honoured by being invited to give the opening address to this conference.

As I am here in the capacity of chairman of the Engineers' Council for Professional Development, which I shall hereafter refer to as "ECPD", I shall confine myself to a discussion of *The First Five Years of Professional Development,* commonly known as the Monteith Report, and, as it is expected that out of this meeting will grow one of the courses which that report contemplates, I think it well to tell you something of its history.

The ECPD was formed with the idea of developing the engineer in successive phases, and not of developing the profession. The first of its objects was to give adequate counselling in schools to boys who were considering entering engineering colleges; the second was to examine and accredit the various curricula offered throughout the country to see whether they were thoroughly efficient. Now, having dealt with the boy before he goes to college, and having tried so far as is possible to make sure that the young man's college course is a satisfactory one, we come to the third of the ECPD objects, and this is the one with which we are concerned today, which is development after graduation. In this for a long time we made no progress. I myself was chairman of a committee working to this end in Canada and for several years did my utmost to try to find out what the profession can do for the young engineer, entirely without success.

What does he want? He wants a better job, and by that I do not, of course, mean simply more pay, but work that will constantly be a challenge to the best that is in him, that will call upon him to improve his professional knowledge, his outlook on affairs outside of the profession, and he wants to increase his usefulness to society in general and to his employer in particular. Obviously, for any organization to help him along such lines is a difficult task. When in the course of time I became the Canadian representative on the ECPD committee in charge of this project, I found that, whereas I had been trying for three or four years in Canada to effect some result and had got nowhere, the ECPD, had been trying for a much longer time and had got to exactly the same place.

Finally in 1949, the then chairman of the ECPD, Mr. James Parker of your own Detroit-Edison, said that he was tired of talking about this plan, that he would have a survey and a report made from which a program could be designed and implemented, and that if it were not possible to implement this program, the ECPD should throw in its hand and decide that the project was beyond its powers.

The engineer who was chosen to make the survey and report was Dr. A. C. Monteith of Westinghouse. Dr. Monteith assembled a very competent committee of men who, as the foreword states, "were active engineers, busy in their fields of endeavour, but anxious to help the rising generation attain full professional stature". Could one give any finer tribute to a group of engineers than those words? I am glad to have this opportunity of expressing my admiration for and gratitude to them for the work they did. The report was a voluminous one as you can see.

The headings under which the *First Five Years of Professional Development* are discussed, are:

1. Orientation and training;
2. Continued education of graduate engineers;
3. Integrating the young engineer into his community;
4. Registration of the young engineer;
5. Self-appraisal methods for evaluating characteristics in engineering;
6. Reading list.

Dr. Grant, the chairman of the Engineers' Council for Professional Development, was the keynote speaker at E.C.P.D.'s College-Industry Conference in Detroit, January, 1954.

He is the field secretary, and a past-president of the Engineering Institute.

In order to produce this report a systematic survey was made of the training given by 54 companies in the United States, which the committee classified as:

(a) Small: those which normally employ five new young engineers every year;
(b) Medium: those which normally employ from five to twenty-five;
(c) Large: those which normally employ more than twenty-five new graduates, running in some cases into the hundreds.

Beside these 54 companies the committee surveyed a number of others, though less completely.

In nearly every case the big companies have some sort of formalized course, given in the company's time and at the company's expense. Some of the medium class are doing the same, but very few of the smaller ones are. It must be remembered, however, that in the small concern the young engineer will often obtain personal advice and direction, which may well be as valuable as the more systematic courses which the larger companies are able to undertake. But obviously there are many young engineers who do not have the opportunity of receiving any such beneficial training.

From the beginning it was realized that the project must have the support and co-operation of industrial leaders as well as of educationalists. It is a pleasure to say that every assistance possible was given Dr. Monteith's committee by the industries interviewed, that this assistance has since been continued, especially in Cincinnati where the first course is now being held, and that the presence of so many industrialists here today gives further evidence that industry recognizes the need for further training of engineers if they are to make the most of themselves, not only for their own benefit, but for that of their employer.

The report recognizes that all too many young men, when they graduate, fall into what has been called "the post-college slump", as a result of being removed from the affectionate care and sympathetic encouragement which they receive, especially at examination time, from us professors, and being then pitchforked into employment, where the employer has the peculiar and heretical notion that the young man ought to be able to do something for himself. Some effort is needed at this stage to remind him that education is a continuing process — I apologize for using this shop-worn cliché, but we do not seem to be able to get away from it — and that he has at least part of the responsibility for making himself more useful to his employer if he is to advance in professional responsibility and achievement.

Training thus becomes a triple partnership among industry, education, and of course, the young man himself. The constant support and the constructive and helpful criticism which the ECPD receives from industry is most encouraging.

When the Monteith Report was presented to the annual meeting of the ECPD at Cleveland in October, 1950, it met with unanimous approval; the question then became, "How is it to be implemented?" The main difficulty was to obtain a competent director. After some delay the Council was very fortunate in obtaining the services of Professor Cornelius Wandmacher of the University of Cincinnati, who, after two years of hard preliminary work, inaugurated the first course in October, 1953. The details of that program will be explained later, so I am going to touch on only two or three points.

The studies which are proposed are *mainly* those of engineering, and they may, if pursued long enough, lead to a master's degree. Even if the student does not want to go so far as that, he will be able to refresh and extend his engineering knowledge and to do some work on a post graduate level. This part of the project is necessarily the responsibility of engineering teachers.

Now what can engineers in industry, and industrialists in general do to help in this program? Well, they are, so to speak, the ultimate consumers of the product of engineering colleges, a product which to the industrialist is only raw material, or at least only partially processed material. You industrial men can teach the young engineer what industry expects of him; you can show him how his university education must be implemented by application and by practical experience, and you can give him that knowledge of industrial problems and their solution, which the college cannot do. How welcome such instruction will be is illustrated by the remark of one young man who was a member of a group for whom I arranged a somewhat similar course. He said to me, "We have been listening to professors for four years, now we should like to hear from the man who is actually doing the work", for which admirable opinion I congratulated him warmly.

The study of labour relations, of company finance and management, of the many problems with which industry is faced, must also form part of such a course, and here industrialists are best fitted to give instruction.

Again, the young engineer does not always appreciate his duties to his profession and to the community, and this is recognized by the Monteith Report in Points 3 and 4, *Integrating the Young Engineer into his Community*, and *Registration for the Young Engineer.*

Finally, it was found that nearly every company gave in its training something outside of engineering, something which had as its object the development of the young engineer as a man, or to use an old-fashioned expression of which I am very fond, "a man of parts", by giving him some of those things which he did not get at college, or which, if he did, he was inclined to disregard as not being exactly engineering. Included may be such things as a better mastery of the spoken and written word; a knowledge of current affairs, both national and international; political economy; possibly, as we have tried in Canada, some introduction to the appreciation of philosophy, of art, of music, and of literature, or even of the social graces.

The young men who participate in a course such as is proposed, both on its technical and non-technical sides, will, I am sure, develop professionally as engineers, as citizens and as men of parts, so that they may in time attain to Bacon's splendid ideal as expressed in the preface to his "*Maxims of the Law*", in those rolling Elizabethan periods of which he was such a master:

> I hold every man a debtor to his profession; from the which as men of course do seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and ornament thereunto. √

## LABRADOR RAILWAY — Discussion

(*Continued from page 828*)

mation about the area to be traversed.

Railroad construction is very necessary in opening up undeveloped sections of this country and making the natural resources available, and will not likely be replaced by other forms of transportation. This is shown by such presently contemplated construction as the I.C.O. Railway—360 miles, Chibougamau —300 miles, Lynn Lake—160 miles Kitimat Development—100 miles.

These roads are all being constructed on the basis of high grade construction and operation. Canadian railways are now offering courses covering construction and maintenance as they are extremely anxious to get technical men. Evidently these men are not available and it seems too bad that courses in railroad engineering are being neglected by the various universities and that the possibilities of the many phases of railroad construction and operation are not emphasized in the courses open to the student.

The paper by Mr. Monaghan will be read with much interest and study by members of the Institute and should be an eye opener to all engineers as to methods and extent of work in opening up new country for development. √

# "Progress of Engineering Science" Part 4

From the London Quarterly Review, October, 1863

ART I.—1. *Lives of British Engineers*. By Samuel Smiles, 3 vols. 8 vo. London, 1862.
2. *Proceedings of the Institute of Civil Engineers*, 1842 to 1863.
3. *Sir W. Armstrong's Address delivered at the Meeting of the British Association at Newcastle*, 1863.

October, 1863 — Queen Victoria has recently celebrated the twenty-fifth anniversary of her accession, the American civil war is at its height, Confederation is nearly four years from birth, and the "London Quarterly Review" publishes an article on the "Progress of Engineering Science" by an unknown author.

At first, we thought of trying to digest this article, with frequent quotations, but have come to the conclusion that the flavour of the original would be wholly lost by any interference with its continuity and so have decided to publish it in full in four instalments. We hope our readers may enjoy as much as we have the relaxing rhythm of the writer's Victorian prose, the profundities of his rhetoric, his prophesies — right and wrong — his comments on current engineering projects and his breathless admiration for the engineers of his day.

To turn the author's pounds sterling into 1953 Canadian dollars, multiply by fourteen.

Part 1 of this item appeared in the November 1953 issue; Part II, December 1953; Part III, March 1954; Part IV is the conclusion.

In the early ages of engineering experience, tunnels seemed far more formidable undertakings than bridges. Men could face what they saw, and undertake what they could calculate; but it was another thing to burrow into the bowels of the earth to encounter rocks or quicksands, or it might be springs and moving clays, and all this in darkness, and in ignorance of what might come next. All these things are now become perfectly understood, and the mode of making them settled. There have, in fact, been more than eighty miles of tunnels excavated for railways in this kingdom alone under every variety of circumstances and difficulty, and at an average cost of only 15*l.* per foot forward. The experience so gained has been such that were it now proposed to execute a new tunnel under the Thames, there are twenty contractors who would be ready to undertake it, and could carry it through. The first, indeed, would hardly have been found so difficult of execution, had it not been carried too near the bottom of the river, where the soil was only recent sediment and rubbish.

We have become so familiar with these wonders that it is curious to look back on the interest and excitement caused by an attempt to carry a roadway under the Thames, and still more to turn to what occurred less than one hundred years ago (in 1766), and mark the incredulity and the ridicule which were displayed when Brindley proposed to cut the Harecastle Tunnel in Staffordshire. Yet this was only nine feet wide by twelve feet high, and 2,880 yards long; and as the highest summit of the hill through which it was cut is only 190 feet above the tunnel, it could be and was worked by means of fifteen shafts from above. Even this tunnel took eleven years to execute, and at times its daring projector almost despaired of success, nor did he live to see it completed. Compare this with the great tunnel under Mount Cenis, nearly five times its length,* and at a depth of an English mile (1,600 metres) below the summit, so that shafts being impossible it has to be worked wholly from the ends, and so far as can be ascertained, through hard rock the whole way; yet there is no reason to suppose that it will take longer than Brindley's tunnel to execute. But the remarkable fact is that no one seems to doubt the success of the undertaking, and any one attempting to ridicule its projectors would only render himself ridiculous. Yet though none doubt the practicability many doubt the expediency of the undertaking; the truth being that since it was commenced railway engineering has made such progress it is by no means clear that it would not have been better to keep on the surface of the earth and climb the pass, steep though it might be, than to excavate a tunnel so unavoidably expensive as this one must prove.

It may appear a strange assertion, but it is nevertheless true, that timidity is the cause which has hitherto most retarded the progress of railways. Men hesitated long in employing them, because they were afraid that the smooth wheels would not have sufficient hold on the smooth rails to enable them to draw. They were afraid to join their rails for fear the expansion would cause them to rise and twist; but the most curious thing is that long after the introduction of the present system they were afraid the locomotive could not climb gradients so steep as 1 in 100. The consequence was that ropes with stationary engines were employed—engineers wasted their time and their shareholders' money in inventing atmospheric traction and fifty other devices to get over this difficulty. At last they tried—and now any one may see the locomotive coming from Oldham to Manchester, dragging very heavy trains up an incline of 1 in 27, which is about the slope of Ludgate Hill; and in America, in some of the mountain passes of Virginia, they rise 1 in 17 and 1 in 20, the latter being the slope of

* The tunnel is to be as nearly as may be 40,000 feet long, and is estimated to cost 50*l.* per foot forwards, or two millions sterling.

Holborn Hill, which tasks our local traffic so severely; more even than this, it is asserted that the locomotive has actually scaled an incline of 1 in 10 with a load greater than its own weight.* This is probably a steeper slope than any turnpike road we have. Whether it is an expedient or economical mode of employing engines to use them in dragging loads up such steep slopes is another question, not so easily answered;† but it proves that the capabilities of the railway system for extension are unlimited. For though on all main lines where the traffic is great and the trains heavy and frequent, no expense should be spared to obtain easy gradients, still on branch and local lines, where loads are light and trains few, any gradient that will do for carriage traffic will do for the rail. It is also found that where the country undulates and the inclines are not long, there is really no great expenditure of power in working them, the ease with which the downward slope is descended going far to compensate for the exertion required in ascending. It is when the slope is long and continuous that the powers of the engine are most severely tasked; yet even in that case, great things may be accomplished.

One of the first great lines on which this discovery was utilized was the line over the Semmering pass in the Noric Alps on the line joining Vienna and Trieste. The ascent on the north side is 13¼ miles long, in the course of which 1,325 feet are ascended on an average of 1 in 47, and in one place the gradient is 1 in 40, and in addition to this the curves are so sharp and the construction of so expensive a nature that to work it and keep it in repair absorbs the whole profits of the line. The descent on the other side to Murzuschlag is on the back of the slope, nearly straight, and with a uniform gradient of 1 in 50 is worked with facility and without great additional expense.

The Bhore Ghât incline, which has just been completed on the line from Bombay to Central India, is a more formidable and more extraordinary piece of engineering than even this. It is 15¾ miles in length, and the height surmounted is 1,831 feet, so that the average is 1 in 48, or about the same as the Semmering; but for one mile and a half it is 1 in 37, and for 8 miles 1 in 40. The amount of tunnelling, bridging, and embanking on the Indian line is such that the cost was 1,100,000*l.*, or upwards of 68,000*l.* per mile, which is as near as may be the cost of the other. This railway has one advantage over its Alpine competitor—that all the heavy traffic is down the incline, and the trains may go up the Ghât either empty or only partially laden, whereas on the Austrian line the heavy traffic is towards the port and up the incline.

As before mentioned, the Americans work some inclines with a steeper gradient than even these, but never so long or of so permanent a character. But it is now proposed to cross the Simplon by a railway, and before long Innspruck will be connected with Verona—so that it can hardly be said that any mountain chain which has been traversed by roads is inaccessible to the steam horse. Even the Himalayas might be so traversed; and if a hundred years hence some unborn Brunel be called upon to make designs for the Lahore and Ladak Junction Railway, and find himself forced to tunnel through the ridge—it will not be that the engine could not climb a pass even 18,000 feet above the level of the sea, but that the perennial snows of those regions would form so unsuitable and so unsatisfactory a foundation for his permanent way.

No very recent statistics have been published which would enable us to state precisely what number of miles of railway are made or making, or what they have cost, but it is certainly no exaggeration to say that a sum larger than our National Debt has been spent on these undertakings in the Old World during the last thirty years; and there is no reason to suppose that that sum will not be doubled during the next thirty, if peace continues and commercial prosperity advances with the same rapid strides that it has been taking latterly. Already almost every capital in Europe is united directly or indirectly with every other, except Constantinople; and even the stolid indifference of the Turk cannot long save "old Stamboul's walls" from being profaned by the scream of the railway whistle.

When Russia has completed the junction of the Baltic with the Black Sea and the Caspian, which she is now engaged upon, there will remain two great enterprises which the next few years will probably see undertaken, if not accomplished. As soon as the Americans are tired of fighting, they will set about connecting the Pacific with the Mississippi; and, notwithstanding the immense tracts of prairie that separate the two, they will no doubt accomplish it. The task of the Old World is to join the Indian lines with those of Europe. Political difficulties and the ignorant bigotry of the three great Mahomedan states of Afghanistan, Persia, and Turkey may retard this; but whether it is done through Turkey or Russia, there are no engineering difficulties that could not be easily overcome, nor would the capital be long wanting if the way were only open. Even if this were done, it is probable that the heavy goods traffic would still follow the route by the Cape; but it would be a revolution the importance of which we can hardly guess at, if the stream of commercial intercourse were again turned into the channels in which it flowed from the time of Alexander the Great to the downfall of the Roman empire.

As might be expected, the conception of these great works soon led to a corresponding increase of dimensions in the stations and all the minor adjuncts of railway traffic. Twenty years ago we looked with wonder at the great halls of Padua and Westminster, though the former is only eighty-four feet span, and the latter sixty-eight, and were astonished at the boldness of their construction. But now we regard with indifference two such halls as those which compose the station of the Great Northern Railway at King's Cross, 105 feet wide, 800 long, and 91 high; and even such a roof as that of the Lime-street station at Liverpool, 152 feet wide, does not excite astonishment. Even now it is only the engineer who knows how difficult the task is—or rather was—that sees anything to be surprised at in the great roof of the station at Birmingham, 864 feet long, and at one end 212 feet wide, without any internal supports. Yet this roof, which is perfectly stable, was erected at a cost of 1*l.* 8*s.* 6*d.* per square yard, and promises to answer for many a long day all the purposes for which it was intended. As a general rule these works have been carried out in too great haste to allow of careful artistic elaboration, and with too much of a feeling that even the largest were only suited to present wants, and would require extension hereafter. They are thus

---

* 'Minutes of Proceedings of Institute of Civil Engineers,' vol. xviii. p. 51.

† At 36 miles per hour the resistance in rising 1 foot in 100 is doubled thus: —
Resistance in dead level 224 lbs. to ton of load
" 1 in 100 448 lbs.
or, in other words, an engine that can drag 200 tons at a certain speed on a level, can only draw 100 tons at 1 in 100, and so on in proportion.

open to adverse criticism: but it is an immense gain to have conquered space; to know that there is no practical limit to the extent of our roofs, and consequently that a largeness of parts may be introduced into our buildings, which cannot fail to have a beneficial effect on the art of design.

While this splendid career has been opening for railways, their elder sisters, the canals, have been falling into neglect and decay. Yet it is only a century ago that the success which attended Brindley's first effort in this direction excited as much enthusiasm, and gave rise to as much controversy, as the railway projects of George Stephenson did in our day. They were nearly as successful then, and answered perfectly the purposes for which they were designed. But it is curious to mark how little the means of communication which then existed between the countries even of Europe sufficed to bring the nations together. The Canal of Languedoc, 148 miles in length, uniting the Mediterranean and the Atlantic, had been commenced in 1661, and completed in twenty years, nearly a century before Brindley put forward his modest schemes. Yet both in the Parliament and out of doors these were treated as visionary and impossible; and no one seems to have known how much greater works had been executed in France before his day. Now, on the other hand, if a form of bridge or of chair is invented in America, or introduced in India or Australia, it is discussed in Great George-street within a month of its application, and is either rejected or added to the stock of engineering knowledge.

Had railways been invented a century earlier, it is probable that nine-tenths of our canals would never have been excavated; though they do possess qualities that railways cannot compete with, and in flat countries, where water is abundant, they will probably always hold their own. They get rid of friction to even a greater extent than the rail; and the lifting is done by water-power—very simply and economically applied in locks—never by the tractive power, the canal being always a dead level. But, on the other hand, a boat passing through a canal has to displace a quantity of water equal to her own immersed section every time she moves her own length; and, unless this is done very slowly and gradually, the expenditure of power becomes enormous. The locks too are an inevitable cause of delay, and in an active age, where time is so valuable, this inherent vice of slowness is fatal to the system, in all but exceptional cases.

Notwithstanding this the French are now busily engaged in one of the greatest canal undertakings ever attempted. They are occupied in piercing the Isthmus of Suez, by a ship-canal, 190 feet at the surface in the narrowest part, and 28 feet in depth. Properly speaking, however, it can hardly be called a canal —it is, as the French call it, "Un Bosphore"; an extension, in fact, of the Red Sea to the Mediterranean without any locks. Now that Mr. Hawkshaw has ascertained that the shores of the Mediterranean are firm enough to support the piers of Port Said, it is shown that there is no engineering difficulty to prevent its execution; and there seems no reason for doubting the dictum of so competent an authority that it can be executed in five years from this time, at an expense of ten millions sterling. Whether it will pay or not is another question. Few, except perhaps the projectors, fancy it will: but it is the realization of an idea of the Great Napoleon, it is believed to be a wound in the cuirass of England, and it gives the French a footing in Egypt; which, in their eyes, may be more valuable objects than dividends to shareholders. Perhaps they are right, but it is not the mode to encourage the investment of capital in similar undertakings. This, and the manifest absurdity of digging canals to accommodate steam-boat traffic, have probably shelved for ever the cutting of the Isthmus of Panama, which used long to be looked upon as a sister project. The progress of the railway system is making it every day more apparent that one or two good railways will amply suffice for the class of traffic that will come across the American, as well as the African Isthmus, and at one-tenth part of the expense; while the improvements in sailing and steam-vessels are daily rendering the voyage round the Southern capes less and less objectionable. One railroad has already been constructed to connect the Atlantic with the Pacific, and there will no doubt be others before long. These will answer the purposes of all the traffic we can now foresee at a far less expense, and with far more certainty and rapidity than a ship-canal, even supposing that a ship-canal could be executed at the same expense as the Suez Folly. The science and skill of modern engineers could, no doubt, conquer the difficulties of this route as easily as that of Suez if it were worth while, but it is probable that the one would be of as little advantage to commerce as the other, and it therefore will hardly be attempted.

Generally speaking the aqueduct bridges that carry canals are not graceful structures, the depth of the trough of the canal rendering the superstructures too heavy for the arches. Almost the only exception is the Pont-Cysylltau, on the Chester and Ellesmere canal, where the water is carried in an iron trough on upright piers; and this form might be made even more pleasing if it were ever to be employed again, though the opportunity will hardly be now afforded for trying it

A more pleasing form of aqueduct was that which the old Romans used for conveying drinking or irrigation water. The invention of cast-iron pipes has nearly abolished this form in modern times, though one very large but very ungraceful specimen of the class has been built across the Manhattan river, to bring water into New York; and the French have erected the finest modern specimen of the class at Roquefavour, to bring the waters of the Durance to Marseilles and its neighbourhood. The modern bridge is avowedly a copy, but with greatly increased dimensions, of the old Roman Pont du Gard, built for the same purpose in its immediate neighbourhood. The modern bridge is 1289 feet long, the ancient only 882, and 265 feet high, as against 137. Both are in three tiers of arches, one above the other, but there is a largeness of parts in the old example that goes far to restore the equilibrium. The central arch in the Roman bridge is 80 feet, that in the French only 49; and the whole design shows that though the Romans might be our inferiors in constructive skill, they were our masters in all that related to architectural conception. The Roquefavour aqueduct is only a pretty screen stretching across an opening in the hills. The Pont du Gard is a grand mass, worthily uniting the two sides of a rocky valley. But so it is with almost all our works. The constructive and the artistic branches of the profession are divorced from one another, and practised by different sets of men calling themselves by different names, and fancying they belong to different professions and have different objects in view. Till they unite, and work harmoniously together, we cannot hope to see beauty united with the grandeur we have just been describing.

Wonderful as many of the things are which have been alluded to above, perhaps the most wonderful thing of all is the electric telegraph. And it seems destined to have about as much influence in bringing the ends of the world together as even steam-navigation or the rail. It is however, the youngest of engineering inventions, and consequently the least perfect.

Hardly more than twenty years have elapsed since the first little experimental line from London to Slough forced itself into notice by assisting in the capture of the murderer Tawell, and since then what progress has been made ? Not only is it easy to converse with every important place in England, but messages can be sent to every capital in Europe, and answers received in an incredibly short space of time. Once it was possible to communicate with America, and it probably will be so again before the year 1864 changes its index. Already the Atlantic Telegraph Company have received tenders from eight different firms, any one of whom is competent to the task, and some of these tenders are so favourable that one of them will, no doubt, be accepted; if so, London and New York may be within speaking distance again before twelve months are over, and this time with every chance of their connexion being permanent, so great has been the improvement in the manufacture of submarine cables, and so extensive the experience of the mode of laying them. While this is being debated, a cable has left England which is destined to unite Calcutta with London, and which in all probability will accomplish this object ere long. But communication with any point in the North American coast must embrace also New Orleans, and the whole of that continent; our communication with Calcutta extends by an easy link to Singapore, and from Singapore to Canton and Batavia; and from the latter place there is no difficulty in reaching the Australian continent. It may thus be that before many years are over we may see recorded in the morning's 'Times' events that happened at Sidney, or Shanghae, or San Francisco on the previous day. Surely this is a wonder and a triumph of scientific skill if anything ever was; and surely the men who do these things are giants!

Mr. Smiles has profoundly studied, and has happily delineated in his lucid and instructive biographies, that remarkable succession of gifted minds which has, not by lucky guesses, but by incessant labour and by lifelong thought, gradually erected that noble example of the dominion of man over the earth—the science of Engineering: and we are proud to know that there are men yet among us who can wield the arms of "the invincible knights of old," and who will leave no meaner memory behind them.

Beside the admiration which the works of our great engineers excite from the grandeur of their conception or the mechanical skill displayed in their execution, they have still another merit as worthy of the attention of the philosophical inquirer as either of these. They are the best and most complete examples that exist in modern times of an art carried out on scientific principles, and according to those processes by which alone success has hitherto been, or, so far as we can see, ever will be achieved in any art. From the days of old Sir Hugh Myddelton to the present time the only question with an engineer, after mastering the conditions of the problem put before him, was how he could most efficiently carry out the work with the most suitable materials, and within the limits of the means at his command. In doing this the engineers have eagerly appropriated every scientific discovery, and availed themselves of every new invention. They have always used the materials best adapted for their purposes, and in the mode in which most work could be got out of them. They have never looked backwards to the exploded forms of ancient days, but always acknowledged the age in which they lived, trying to outstep even its rate of progress.

In this respect the engineers contrast singularly with the architects, who form the other branch of one and the same profession. The latter, instead of following out principles, are content to copy forms, rarely thinking of what is really best under the circumstances. It is sufficient for them to know that a thing was done by some other people in some bygone day, and without thinking how social circumstances may have changed or the arts progressed since that time; if it has been done before, it ought, according to their creed, to be done again. They aim at restoring an artistic heptarchy in the midst of the progress of the nineteenth century.

The principles which the engineers are following out are indentical with those which taught the Egyptians how to erect the wondrous temples which still adorn the banks of the Nile, by the use of which the Greeks perfected their architecture, and which enabled the masons in the Middle Ages to erect those cathedrals and castles which we still admire so much. In all other ages but this the principles of architecture were as well understood and as fixed as those of engineering. They were, in fact, identical; and it was just as easy to ascertain then what was the best design for a cathedral or a mansion, as it is now to know what is the best form of a ship or the best mode of building a bridge.

The consequence of this divergence of principle is that the architects are quarrelling over Greek mouldings and Gothic pinnacles, and dreaming of reproducing the elegance of classical times, or the blundering enthusiasm of the Middle Ages, while the engineers are spanning our rivers with structures such as the world never saw before—bridging our valleys with viaducts, arching under our mountains, and roofing acres for stations. They are, in fact, executing a series of works that throw everything hitherto done into the shade: but all this, unfortunately, without that touch of higher art which is alone wanted for perfection; and this simply because the building profession is divided against itself. Because its two branches are conducted on different principles they cannot work together. The engineers cannot forego theirs because they are the only principles which men of common sense can follow; so, unless the architects will consent to forego some of their archæological fancies, and work harmoniously with the engineers, we may be condemned to live in the midst of ugliness for ever. It is only this reunion that is wanted to perfect the works described above, and it ought to be easy of accomplishment. The architects themselves would delight in the change. It is the public who are their employers who do not see the necessity for it, and cannot understand its bearing. When once the fact is appreciated we shall surpass all preceding ages in architecture, as we have done in engineering; and if the engineers can only force this fact on public attention they will have done a greater service than in bridging the Menai Straits, or in tunnelling through the Alps. To call architecture back within the domain of logic and of common sense is what is most wanted on the part of the engineers to complete the services which they have rendered and are rendering to mankind. √

Branch Officers Conference.

# 68th

# Annual General Meeting

### Convened at the Chateau Frontenac, Quebec, P.Q., May 12, 1954

## THE BUSINESS MEETING

The Sixty-Eighth Annual General Meeting of The Engineering Institute of Canada was convened in the Ball Room of the Chateau Frontenac, Quebec, on Wednesday, May 12, 1954, at ten thirty a.m., with president R. L. Dobbin in the chair.

The minutes of the Sixty-Seventh Annual General Meeting, as published on pages 866 to 870 in the July 1953 *Journal*, were taken as read and approved.

#### Nominating Committee 1954

The general secretary announced the membership of the Nominating Committee of the Institute for the year 1954 as follows:

*Chairman:* C. M. Anson, Sydney, N.S.

| *Branch* | *Representative* |
|---|---|
| Amherst | C. L. Archibald |
| Belleville | F. D. Adsett |
| Border Cities | C. G. R. Armstrong |
| Brockville | ............ |
| Calgary | C. E. McNevin |
| Cape Breton | C. N. Murray |
| Central British Columbia | R. L. Bigg |
| Corner Brook | J. L. Barron |
| Cornwall | H. E. Meadd |
| Eastern Townships Branch | Geo M. Dick |
| Edmonton | B. Willson |
| Fredericton | Horace G. Hughson |
| Halifax | M. L. Baker |
| Hamilton | W. E. Brown |
| Huronia | B. C. Lamble |
| Kingston | J. W. Brooks |
| Kitchener | M. A. Montgomery |
| Kootenay | E. L. Baird |
| Lakehead | A. J. Mickelson |
| Lethbridge | N. H. Bradley |
| London | D. D. C. McGeachy |
| Lower St. Lawrence | Roger Thomas |
| Moncton | M. T. K. Leighton |
| Montreal | E. B. Jubien |
| Newfoundland | D. L. Cooper |
| North Nova Scotia | Clyde F. Cameron |
| Niagara Peninsula | C. G. Cline |
| Nipissing and Upper Ottawa | T. C. MacNabb |
| North Eastern Ontario | G. M. Lyon |
| Northern New Brunswick | F. H. B. Chisholm |
| Ottawa | W. R. Meredith |
| Peterborough | B. Ottewell |
| Port Hope | E. M. Wynn |
| Prince Edward Island | H. R. Miller |
| Quebec | C. H. Boisvert |
| Saguenay | P. Schopflocher |
| Saint John | H. S. McCleave |
| St. Maurice Valley | M. Eaton |
| Sarnia | J. E. Harris |
| Saskatchewan | Edward J. Durnin |
| Sault Ste Marie | R. A. Campbell |
| Sudbury | R. H. Moore |
| Toronto | J. F. MacLaren |
| Vancouver | Hugh T. Libby |
| Vancouver Island | H. D. Dawson |
| Winnipeg | T. E. Storey |
| Yukon | H. W. Love |

#### Honorary Memberships

The general secretary reported that the following had been elected to honorary membership in the Institute and that certificates would be presented at the annual banquet or on some appropriate later occasion:

LeRoy Fraser Grant, B.Sc., D.Sc., formerly associate professor of engineering, Queen's University, and at present field secretary for the Institute.

Lewis Ketcham Sillcox, D.Sc., D.Eng., LL.D., Vice-chairman, Board of Directors, New York Air Brake Company, and at present, President, American Society of Mechanical Engineers, New York.

Omond McKillop Solandt, O.B.E. M.A., D.Sc., LL.D., Chairman, Defence Research Board, Ottawa.

#### Awards of Medals and Prizes

The general secretary announced the various awards of the Institute as follows stating that the formal presentation of these would be made

**Presentations of honors and medals: Upper Left: D. S. Ellis receives a Julian C. Smith Medal; right: The president presents the Gzowski Medal to E. M. Rensaa. Lower left: The Leonard Medal is awarded to C. M. Anson; right: L. K. Sillcox receives his certificate of honorary membership.**

at the annual banquet of the Institute on May 14:

*Julian C. Smith Medals*—"For achievement in the development of Canada" to—Richard Ellard Carden Chadwick, Chairman of the Board, Foundation Company of Canada, Montreal, Que. and to Douglas Stewart Ellis, Dean of the Faculty of Applied Science and Professor of Civil Engineering, Queen's University, Kingston, Ont.

*Gzowski Medal*—"For papers on a civil engineering subject" to—E. M. Rensaa, Edmonton, Alta., for his paper "The Cracking Problem in Reinforced Concrete Buildings".

*Duggan Medal and Prize*—"For papers dealing with the use of metals for structural or mechanical purposes". to—L. Schenker, Ann Arbor, Michigan for his paper "Analysis of Building Frames by Limit Design".

*Leonard Medal*—"For papers on mining subjects" to—C. M. Anson, Sydney, N.S. and C. B. Archibald, Sydney, N.S. for their paper "Treasure under the Atlantic".

*Plummer Medal*—"For papers on chemical and metallurgical subjects" to—J. S. Moloney, Sarnia, Ont. for his paper "Fluid-Borne Solid Particles with Particular Reference to Solid Fuel for Internal Combustions Engines".

*Ross Medal*—"For papers on electrical engineering subjects" to—M. Eaton, Shawinigan Falls for his paper "Improvements in Electrode Boilers".

*Prizes to Juniors*—"For papers presented by Juniors of the Institute in the vice-presidential zones".

*John Galbraith Prize* (Province of Ontario) to—F. S. Gue, Hamilton, Ont. for his paper "Moral Responsibilities of the Engineer."

### Report of Council, Report of Finance Committee, Financial Statement and Treasurer's Report

On the motion of P. C. Ahern, seconded by M. McMurray, it was resolved that the report of Council, the report of the Finance Committee, the financial statement and the treasurer's report be accepted and approved.

### Reports of Committees

On the motion of R. F. Shaw, seconded by J. A. McCrory, it was resolved that the reports of the following committees be taken as read and accepted: Employment Conditions, Legislation, Publications, Papers, Library and House, Board of Examiners, Membership, Admissions, Library Report, Employment Service, Prairie Water Problems, Professional Interests, The Young Engineer, Report of Field Secretary, Life Members Committee, Canadian Chamber of Commerce, Canadian Standards Association.

### Branch Reports

On the motion of W. O. Horwood, seconded by M. L. Baker, it was resolved that the reports of the various branches be taken as read and approved.

### Amendments to the By-laws

On the motion E. D. Gray-Donald, seconded by R. E. Hayes, it was resolved that in accordance with By-law No. 81, the proposed revisions to the by-laws for purposes of clarification and simplification, which have already been approved by a majority of the Council, by a majority of the branch executives and published in the December 1953 *Journal*, be approved by this annual general meeting.

### Committee on Confederation

The president stated that at the meeting of the Council and the branch officers conference there had been a long discussion on the work of the recently appointed Committee on Confederation. He stated that the discussion was related principally to the personnel of the committee and the matter of timing. Mr. Dobbin announced that a meeting of the committee would take place on Friday, May 14, in Salon 1, at twelve thirty p.m. Mr. Heartz, the chairman, would be present to handle the meeting.

The president stated further that copies of the report which set out the terms of reference and the personnel of the committee were available throughout the hall and requested that members should avail themselves of a copy.

Later, at the request of Mr. Coke, the president asked the general secretary to read to the meeting the entire report of the nominating committee. This was done.

At the conclusion of the reading of the report, Mr. Paterson referred to a resolution which had been passed by the Council meeting and which appears in the minutes of that meeting. This was noted. (See pages 703 and 704 of the June 1954 *Journal* for report on Committee on Confederation).

**Retiring President Dobbin welcomes the incoming president D. M. Stephens.**

### Election of Officers

The general secretary presented the list of the newly elected officers of the Institute as follows:

*President*

D. M. Stephens, Winnipeg, Man.

*Vice-Presidents*

| | |
|---|---|
| Province of Ontario | B. G. Ballard, Ottawa, Ont. |
| Province of Quebec | J. O. Martineau, Quebec, Que. |
| Maritime Provinces | N. B. Eagles, Moncton, N.B. |

*Councillors*

| | |
|---|---|
| Vancouver Branch | S. H. deJong |
| Calgary Branch | H. R. Hayes |
| Edmonton Branch | N. J. Allison |
| Lethbridge Branch | J. M. Campbell |
| Saskatchewan Branch | Junius Jonsson |
| Winnipeg Branch | C. P. Haltalin |
| Sault Ste. Marie Branch | D. C. Holgate |
| Northeastern Ontario Branch | C. W. Boast |
| Huronia Branch | F. A. Alport |
| Sarnia Branch | E. W. Dill |
| Hamilton Branch | N. A. Eager |
| Kitchener Branch | W. R. Roberts |

**Left: L. F. Grant receives his certificate of honorary membership. Right: R. E. C. Chadwick receives his Julian C. Smith Medal.**

The Panels. Left "Air Pollution Control": Left to right: Dr. Morris Katz, Dr. E. A. Watkinson, Prof. E. A. Allcut, R. L. Broad, J. G. Hall. Right: The Management Panel. Left to right: J. B. White, Dr. Lillian M. Gilbreth, C. A. Peachey, A. M. MacKenzie, E. A. Perry.

|---|---|
| Niagara Peninsula Branch | P. E. Buss |
| Toronto Branch | J. G. Hall |
| Peterborough Branch | A. R. T. Hailey |
| Ottawa Branch | J. J. Green |
| Cornwall Branch | D. Ross-Ross |
| Montreal Branch | G. N. Martin |
| | R. B. Wotherspoon |
| Quebec Branch | George Demers |
| Northern New Brunswick Branch | E. C. Bannerman |
| Moncton Branch | W. D. G. Stratton |
| Halifax Branch | J. W. MacDonald |
| North Nova Scotia Branch | J. L. Cavanagh |
| Cape Breton Branch | H. A. Marshall |

### Vote of Thanks to Quebec Branch

On the motion of G. M. Dick, seconded by E. R. Smallhorn, it was unanimously resolved that a hearty vote of thanks be extended to the members and officers of the Quebec Branch in recognition of their hospitality and activity in connection with the sixty-eighth annual general meeting.

### Vote of Thanks to Retiring Officers

On the motion of G. Dionne, seconded by E. F. Carson, it was unanimously resolved that a hearty vote of thanks be extended to the retiring president and members of Council in appreciation of the work they have done for the Institute during the past year.

The meeting adjourned at 11.30 a.m.

# The Professional Meeting

On May 12, 13, and 14 engineers from across Canada met in Quebec City for the 68th Annual Meeting of The Engineering Institute. A full technical and business program coupled with the hospitality of French-Canada made this meeting a remarkable success. The meeting now takes its place among the "bigger and better" in Institute history; indicative of our growing country.

Registration began slowly on Tuesday but by Friday afternoon it had reached an all-time high with a total of 1,000 registrations. This included 700 members. Junior representation at the meeting was practi-

The A.S.M.E.—E.I.C. International Council: Standing: T. Chandler, vice-president A.S.M.E., D. D. Panabaker, chairman of the Ontario section A.S.M.E.; L. Austin Wright, general secretary E.I.C., J. G. Hall, councillor, Toronto Branch E.I.C., C. E. Davies, secretary A.S.M.E. Seated: L. K. Sillcox, president A.S.M.E., D. M. Stephens, president E.I.C., G. N. Martin, secretary A.S.M.E.—E.I.C. International Council.

At the President's Dinner. J. B. Stirling, F. P. Shearwood, A. J. Grant, R. L. Dobbin, A. R. Decary, J. A. Vance, L. F. Grant, President-elect D. M. Stephens.

cally double that for the previous year while student attendance was four times that in 1953.

The Annual General Meeting on Wednesday morning officially opened the program. "Muriel's Room" opened the reception before the dinner on Wednesday evening. The dinner was an event which literally filled the Ball Room to overflowing. Gilles E. Sarault, chairman of the Quebec Branch acted as chairman at this function and his skilful use of both languages was admired by all. The speaker of the evening was Ross L. Dobbin, retiring president of the Institute.

**Past-president A. J. Grant, Hon.M.E.I.C., receives a birthday cake from President Dobbin at the dinner on Wednesday.**

**J. M. Hector Cimon, M.E.I.C., signing the golden book of Laval University after receiving an honorary degree of Doctor of Science from the University. Witnessing the signing are Archbishop Maurice Roy, Chancellor of the University and Abbé Jacques Garneau, assistant secretary of the University.**

A very special event was observed at this dinner. Past President (1930: 31) Alex J. Grant, Hon. M.E.I.C., was presented with a birthday cake in recognition of his 91st birthday. Mr. Grant could well be called "Mr. Engineering Institute" since he has been an active member for 63 years.

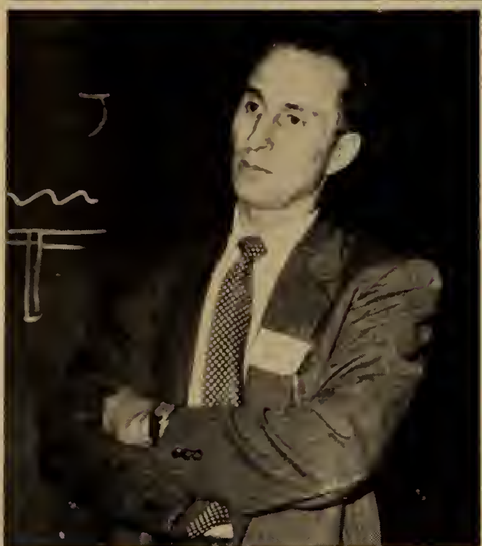
A boat trip and plant visit to Davie Shipbuilding Limited on Thursday afternoon gave everybody a pleasant break from the business and technical part of the meeting. "Muriel" and music-makers accompanied the merry-makers and an old-fashioned square dance stole the show. As the boat passed under the famed Quebec Bridge a truck and train were passing over the bridge, and in a clear sky an aeroplane made its way westward. By coincidence or design, a fitting tribute.

On Thursday evening Laval University held a special convocation to confer an honorary degree of Doctor of Science on J. M. Hector Cimon, M.E.I.C. Again the dual culture of our country was evident and added to the solemnity of the occasion.

Following the convocation weird sounds emitted from the Ball Room. Dr. H. LeCaine of the National Research Council gave a demonstration lecture on electronic music. The audience, though interested, were thankful that this was only a demonstration because in the words of Dr. LeCaine music can reach an "all time low" with the electronic "thing". Talking robots and the never never land of the comic strip may not be too far in the future.

The banquet on Friday evening was the highlight of that day and of the meeting. A novel and pleasant addition to the hospitality shown by the local committee was the presentation of corsages to all "out-of-town" ladies. Sincere thanks to the local committee for its good work. The committee was made up of:

| | |
|---|---|
| Gilles E. Sarault | Chairman |
| Guillame Piette | Vice-Chairman |
| Roger Desjardins | Secretary |
| P. A. Duchastel | Entertainment |
| P. E. A. Vincent | Finance |
| J. H. R. Rioux | Information |
| L. P. Bonneau | Meeting Arrangements |
| Louis Trudel | |
| B. O. Baker | "Muriel's Room" |
| J. P. Drolet | Publicity |
| J. St. Jacques | Reception |
| L. P. Bonneau | Technical Papers |
| G. Galibois | Transportation |
| A. C. deLery | Visits |
| Mme. G. E. Sarault | Ladies (Engineers' Wives Association) |



BASE

**Speakers at the technical sessions: Left to right: P. A. Redhead, F. H. Keast, W. A. Messervey.**

### The Technical Program

The technical program was the largest presented at any meeting of the Institute. It included a total of 28 technical papers and two panel discussions, and agreed with the policy of emphasizing subjects pertinent to the area in which the meeting is held. The program nevertheless was national in its coverage of interesting engineering achievements and developments.

Though the program appeared to be well received it must be noted here that the technical sessions were not as well attended as in previous years.

Most of the papers presented have already been prepared for printing in the *Engineering Journal.* Some have appeared in the April, May, and June issues. The others will follow in future issues of the *Journal.*

Two subjects were placed before panels for open discussion. The first, "Air Pollution Control", had on the panel Dr. E. A. Watkinson, Dr. Morris Katz, M.E.I.C., J. G. Hall, M.E.I.C., and R. L. Broad, M.E.I.C. Professor E. A. Allcut, M.E.I.C., presided. The second subject was "Management Techniques — How Can They be Used to Better Advantage?" The members of this panel were Dr. Lillian M. Gilbreth, Hon. M.E.I.C., A. M. MacKenzie, M.E.I.C., E. A. Perry, M.C.I.M., and J. B. White. The chairman was C. A. Peachey, M.E.I.C.

### The Banquet

As usual the banquet and dance on Friday night was the feature event of the meeting. Some 800 people attended. This, together with the presentation of prizes and medals made the banquet a huge success.

The guest speaker, Dr. C. J. MacKenzie, Hon. M.E.I.C., opened his address with this sentence. "Engineers do not think or reflect much about age and our profession is relatively young in mere years, but in our corporate life span there have occurred most of those great discoveries and movements which have shaped the material world of today, and engineers have been either responsible or intimately involved in all phases of this progress." He then traced the history of engineering as a profession from the time of the first recognized Civilian engineer to our present complex set-up, and pointed out what this change has meant to our country. In closing he said "We need not apologize for the heritage we are passing on to the next generation, but I for one cannot help envying them the opportunities for high adventure which the last half of the 20th century will offer to the enterprising young engineers of tomorrow." The induction of the new president, Donald McGregor Stephens, concluded the program.

Guests at the head table are identified in the photographs on page 842 of this issue.

### The Reception and Dance

The reception by the president after the banquet was informal.

**On the opposite page. Speakers at the technical sessions. Top row left to right: J. Y. Doran, Jean-Paul Drolet, B. M. Monaghan, J. G. Inglis. 2nd row left to right: Hans Ulmann, R. L. Dunsmore introducing W. H. White and R. W. McGilvray, J. E. Sproule. 3rd row left to right: J. L. de Stein, Capt. H. Ross Smyth, J. L. Van Camp. 4th row left to right: R. B. Steel, A. G. Lester, C. G. Kingsmill, L. A. W. East, R. A. Fairburn, Bernard Ulrich.**

**Dr. C. J. MacKenzie, guest speaker at the Banquet.**

**Head table at the Banquet; Left to right: D. M. Stephens, president elect, The Engineering Institute of Canada; G. E. Sarault, chairman, Annual Meeting Committee; Mrs. J. M. Lamb; J. F. McDougall, registrar, Association of Professional Engineers of Alberta; Group Captain C. L. Ingles, Royal Canadian Air Force; Mrs. A. T. Hurter; Georges Demers, president, Corporation of Professional Engineers of Quebec; A. Turner Bone, vice-president, Canadian Construction Association; Mrs. C. L. Ingles; R. E. Jamieson, president, Canadian Standards Association; L. F. Grant, chairman, Engineers' Council of Professional Development. Second row, left to right; Madame Y. R. Tasse; Wilfrid Hamel, His Worship the Mayor of Quebec; G. D. Floyd, vice-president, American Institute of Electrical Engineers; Mrs. W. L. Sagar; Irving R. Tait, vice-president, The Engineering Institute of Canada; Madame Onesime Gagnon; Lewis K. Sillcox, president, American Society of Mechanical Engineers; C. J. Mackenzie, president, Atomic Energy Control Board; The President, R. L. Dobbin. Third row, left to right: D. V. Terrell, president, American Society of Civil Engineers; Mrs. Lewis K. Sillcox; Msgr. Ferdinand Vandry, Rector Magnificus, Laval University; Mrs. D. M. Stephens; The Hon. Oncsime Gagnon, Minister of Finance, Province of Quebec; B. F. Dodge, vice-president, American Institute of Chemical Engineers; Mrs. L. F. Grant; C. C. Huston, president, Canadian Institute of Mining and Metallurgy; Madame Georges Demers; R. M. Hardy, president, Dominion Council of Professional Engineers. Fourth row, left to right: A. T. Hurter, president, Association of Consulting Engineers of Canada; Madame G. E. Sarault; Captain J. Deane, Royal Canadian Navy; W. L. Sagar, president, Association of Professional Engineers of Ontario; Mrs. I. R. Tait; J. M. Lamb, president, Association of Professional Engineers of New Brunswick; Mrs. J. F. McDougall; Colonel W. A. Capelle, Canadian Army; Max L. Baker, vice-president, Association of Professional Engineers of Nova Scotia; Y. R. Tasse, president, Chamber of Commerce of Quebec.**

This way of receiving was inaugurated in Vancouver two years ago and because of its success has been continued. The incoming president, Mr. Stephens, and his wife; and the outgoing president, Mr. Dobbin, were there. Mr. Sarault, chairman of the Quebec Branch, and Mrs. Sarault were also present.

Immediately after the banquet "Muriel's Room" was opened to all guests and the Ball Room was cleared for the dance. The evening was thoroughly enjoyed by everybody, including some two hundred young people who arrived after the banquet for the dance.

### The President's Dinner

The president's dinner was held at the Garrison Club on the evening of Tuesday, May 11. This annual occasion allows the president to bring together those officers who have held office during the year. President Dobbin thanked them for the kindnesses extended during the presidential tour.

Past-Presidents A. R. Decarie ('27), F. P. Shearwood ('34), L. F. Grant ('47), J. A. Vance ('50), and J. B. Stirling ('53) spoke about various phases of Institute development and the importance of it to the engineer. Dr. Stirling presented the retiring president with the book "Half Hours with Famous Scientists". The introduction of president-elect D. M. Stephens concluded the dinner.

### Students' Conference

The ninth Conference of Students met all day Tuesday, May 11. These are delegates from the degree granting universities in Canada, and R.M.C., who are brought together annually as guests of the Institute. In this way the Institute seeks to maintain contact with engineers of the future. D. C. MacCallum presided.

Among the resolutions passed by this conference were: "That the E.I.C. be requested to continue distributing one free copy of the *Journal* to all students in one undergraduate year; and in order to stimulate interest in the Institute, the conference recommends that this issue contain material of student interest such as the counselling service, loan fund, and scholarships."

"That in order to create a better understanding between Canadian cultures, the conference recommends to the E.I.C. that more French language papers be published in the *Journal.*"

These interesting resolutions are indicative of the work that is done by the students. Delegates present were:

Carl R. Johnson, University of British Columbia.

James Tod, University of Alberta.

Baine A. Holmlund, University of Saskatchewan.

M. P. Schioler, University of Manitoba.

Grant E. Sims, University of Manitoba (Observer).

J. N. Rossall, University of Toronto.

W. C. Moffatt, Royal Military College.

J. D. Fowler, Queen's University.

R. L. Wright, McGill University.

Pierre DeGuise, Ecole Polytechnique.

Claude Pouliot, Laval University.

Eric C. MacNearney, Nova Scotia Technical College.

C. C. Atkinson, University of New Brunswick.

### Council Meetings

Council met twice during the week. The "old" council met in the Jacques Cartier Room on Tuesday, May 11. There were 42 councillors and guests present representing 22 branches. Mr. Dobbin presided at this meeting.

The second meeting, traditionally known as the first meeting of the "new" Council, was held on the morning of Thursday, May 13. There were 40 present representing 25 branches.

Mr. Stephens, in taking over his first meeting of the Council, expressed his appreciation to the councillors and members of the Institute for appointing him to this high office. To his mind the Engineering Institute and engineers were synonymous and the progress of Canada was closely allied to the work of the engineer.

Council expressed its appreciation to the members of the Quebec Branch for the interest taken in setting up and carrying out a program that met the needs of everyone.

### Branch Officers' Conference

The Branch Officers' Conference was held on Tuesday, May 11. R. L. Dunsmore, chairman of the Montreal Branch presided and R. J. Harvey, Montreal branch secretary, did the secretarial duties.

The conference began in the morning and continued in the afternoon with a joint meeting of council and branch officers. The purpose of this was to thoroughly discuss "Confederation". A progress report about confederation appeared in the Month to Month section of the June issue of the *Journal.*

**At the dinner on Wednesday. Left to right: R. L. Dobbin, G. E. Sarault, the Hon. Onesime Gagnon, Dr. Lillian M. Gilbreth.**

**The ladies enjoy morning coffee.**

# Canadian Engineers

# at

# Work

*Address of the retiring president, Ross L. Dobbin, delivered at the 68th Annual General and Professional Meeting of the Engineering Institute of Canada at Quebec City, May, 1954.*

In the last year the Engineering Institute of Canada has given me a wonderful opportunity to observe Canadian engineers at work in all sections of the Dominion.

I have spent my time travelling through Canada from coast to coast and even to the Arctic Circle, by air, rail, motor, steamship and even by dogsled. Of all the visits I made the highlight was the trip to England to represent the Institute at the Coronation of Her Gracious Majesty Queen Elizabeth the Second. My reception by the engineers of England was indeed a wonderful experience. The distance covered was tremendous—a total of 35,000 miles. It would scarcely be fair, however, to give you the impression that this has been all work, for I have enjoyed a round of banquets, entertainment, the meeting of people from all walks of life and the making of new friends. It is at this point, then, that I want to thank all those who have extended their hospitality to me in so many different ways. They have made my term in office a pleasant and a memorable one.

The people I visited belonged to every branch of the Institute and to many unofficial groups as well. They include the engineering students in every university in Canada, and students in many pre-engineering colleges. During my visits with them I discovered that the engineers of Canada are very socially-minded; I enjoyed meeting both the members and their ladies—especially the ladies. As an observant bachelor I was amazed by

Karsh, Ottawa

**Ross L. Dobbin, M.E.I.C.**

their attractiveness and the excellence of their dress, no matter how rough the living conditions might be on that particular project. Canadian engineers are a lucky group of men.

### Size and Problems

My travels have impressed me with the size of our country, and even more with the problems such size has created for us. Our Institute is a widespread society, and close cohesion is necessary to promote the strength it needs. To some extent the problem is overcome by liaison between headquarters and the branches, coupled with frequent visits by the president and other officials, but greater unity is needed if Canadian engineers are going to make the best of the opportunities available to them. The Institute is growing stronger in activities and relations with the general public, and thus enjoys great prestige. All these conditions lead me to believe that the Institute must consider carefully and sympathetically the proposals for greater co-operation.

I have referred to the opportunities and problems before Canadian engineers. One of the most important factors is the extent of Canada's natural resources. At the risk of labouring the obvious, I shall remind you of them. Within the borders, this country has untold and unknown quantities of all base metals: iron, copper, lead and uranium, not to mention the huge deposits of oil and natural gas in the West. The world is hungry for these resources, and their wise development is a task for our engineers. For too long we have left their development to engineers of other countries. Here is our opportunity—and our challenge.

### Progress

It is encouraging to find Canadian engineers and engineering contractors everywhere in the Dominion, not only producing raw materials but adapting them for the use of mankind as well. Having seen every major construction project in Canada, I can say, with considerable pride, that these same Canadians have made a success of the projects they have undertaken. It is gratifying to add that most of these engineering developments have been staffed by Canadian engineers and built by Canadian engineering contractors — a significant sign of our progress both as a profession and as a nation. We have been overly modest in the past; it is evident that Canadian engineers rank with the best in the world and are capable of any kind of work, particularly the work to be done in Canada.

Perhaps a quick survey of some of the developments from coast to coast will be of more value to you than further generalizations on the vague subject of "opportunity".

*Newfoundland*

In Newfoundland, for example, the newest province is taking its proper place in the Dominion as a producer. At present Newfoundland has two main industries: pulp and paper, represented by the largest mill of this type in the world, and also the famous iron ore mine on Bell Island. In the years immediately ahead, Newfoundland will be one of the leading producers of raw materials for the world, for it has within its boundaries all types of base metals as well as the pulp and paper products already mentioned.

*Labrador*

At Knob Lake in Labrador I found new iron mines situated in a most barren part of the country. One of its greatest problems, naturally, is that of transport, but a large number of Canadian engineers are engaged, not only in operating the mines, but also in pushing three hundred and fifty miles of railroad through unexplored and unmapped country. This is a major project of tremendous importance, but hard and dangerous labour is necessary for its ultimate success.

*Nova Scotia and New Brunswick*

In Nova Scotia, our engineers are using their skill and ingenuity to help the coal mines produce at a much lower cost, thus providing a larger market for their product. The most outstanding improvement I noticed was the mechanization of operations, including the ingenious mechanical miner, designed and built by Canadians.

In New Brunswick, too, recent discoveries of almost all the base metals have greatly increased the activity of engineers, and provide a promising field for future development.

*Quebec and Ontario*

The largest project in Quebec, is the Birsimis power development, now well under way. When it is finished, it will supply over one million kilowatts of electrical power to a large area of northern Quebec, and also by cable across the St. Lawrence to cities on the south bank of the river. The giant power plants of northeastern Quebec are supplying the industries in the province with the power they need to produce even greater quantities of aluminum and associated products. The Quebec of small villages and an agricultural economy is giving way to a highly industrialized province.

The Hydro Electric Power Commission of Ontario has an immense project nearing completion at Niagara Falls, but it is the northern part of Ontario with which I was most impressed. This section is well-known for its mines, but a major industry is now developing in uranium, and the pulp and paper industry is continuing to expand.

*Manitoba and Saskatchewan*

Winnipeg is rapidly becoming one of the largest industrial concentrations in Canada. Manitoba has developed power plants in response to the demand, and another factor has been introduced. Oil in the south-west corner of the province is having a great effect on the provincial economy, and the arrival of natural gas from Alberta will undoubtedly boost the province even more.

Saskatchewan, as yet, has little to offer in the line of engineering developments. It is still an agricultural province with no large industrial projects in operation, but here too, oil will play a great part shortly.

*Alberta*

Alberta tells a startling story. Of all the provinces in our Dominion this one is forging ahead most rapidly. The discovery of oil and natural gas, and their subsequent development is nothing short of phenomenal.

Gazing from an upstairs window of the Macdonald Hotel in Edmonton, I could see sprawling oil refineries everywhere, and the beginning of the long pipe line which delivers oil to Ontario. At luncheons and in the lobby of the hotel, I heard many interesting discussions on the possibilities of exporting natural gas from this province, 2,500 miles east of Ontario. Such an undertaking would be immense in its nature and provide endless scope for engineering talent.

*British Columbia*

Kemano and Kitimat are the largest construction projects in British Columbia. The former is remarkable for its unique underground power house and penstock—a new technique which is a great contribution to the sciences of power plant construction. At Kitimat a vast plant is being constructed to produce aluminum, while the plan of the city built to house the plant workers is in itself a remarkable achievement. In a survey of British Columbia, Trail cannot go unmentioned. Here there are new power developments and a steady expansion in smelting and manufacturing capacities. It is of itself an industrial empire.

*Yukon*

Development is going on in the Yukon territories as well. Engineers are busy maintaining and improving the Alcan highway, its artery to the south, and also developing mines in the far north which will use the highway to transport their products to markets all over Canada and North America. It is in this section in particular that new opportunities exist, for the immense resources of northern Alberta and the Yukon are as yet almost untouched. Here countless hundreds of engineers will find a suitable background for their professional careers.

**Unity is Strength**

From coast to coast a challenge exists for Canadian engineering, a challenge to take over completely the industrial resources of our country and develop them both wisely and fully. Canada is bursting at the seams with potentialities, and men of courage and vision are needed to see that these potentials are realized. Our Institute is the focal point of our profession, and as such can be a source of strength, not only to ourselves, but to our country. Its greatest problem is this: to ensure the full development of our nation, The Engineering Institute of Canada must aid in welding together the various groups of engineers throughout the Dominion into only one large body. Already steps have been taken in this direction, but final realization will depend on patience, intelligence, and a spirit of compromise. The problem is complicated but not insoluble. In unity there is strength, and that strength is needed, not alone for the engineering profession, but also for the good of the nation in whose destiny we play such an important role.

# From Month To Month

**Notes of the Institute and Other Societies, Comments and Correspondence, Elections and Transfers**

## Third Commonwealth Conference

The Conference of Engineering Institutions of the British Commonwealth, meets every four years. The third meeting was held in London, England, from May 24 to June 4. The president and the general secretary were present to represent the Engineering Institute.

All the nations of the Commonwealth were represented and the list included: New Zealand which was represented by the president, R. S. Maunder, and past-president P. R. Angus of the New Zealand Institution of Engineers; Australia, represented by the president, C. W. Candy, and the secretary C. H. D. Harper of the Institution of Engineers; India by president Major-General H. Williams and Prof. M. S. Thacker of the Institution of Engineers; South Africa by C. W. J. A. Sandrock, president of the South African Institution of Civil Engineers; L. T. Campbell Pitt, president of the South African Institution of Mechanical Engineers; Prof. G. R. Bozzoli, vice-president the South Africa Institute of Electrical Engineers, and A. J. Adams secretary of both the electricals and the mechanicals.

The three "home" institutions, had presidents and past-presidents to represent them, on various occasions. For the Civils there was W. P. Shepherd-Barron, president, and A. S. Quartermaine, V. A. M. Robertson and the newly appointed secretary A. McDonald.

The Institution of Mechanical Engineers were represented by R. W. Bailey, president, A. C. Hartley, past-president and the secretary Brian Robbins.

The Institution of Electrical Engineers had as their representatives Harold Bishop, president, J. Eccles, a past-president, B. H. Leeson, vice-president, and W. K. Brasher, secretary.

For the first time North and South Rhodesia were represented by an observer, T. W. Longridge, and at the conclusion of the long agenda the Rhodesian Institution of Engineers was admitted to membership in the Conference.

In all, between delegates and alternates there were 28 participants in the business sessions with many more added for the social events.

The business sessions took place alternately in the beautiful council rooms of the three home institutions. In fact all the arrangements were in competent hands of the officers of these organizations. Every detail was determined in advance and carried out precisely as planned—much to everyone's enjoyment and satisfaction.

A weekend in the country which included a visit to Oxford and a stay in the Shakespearean country was the outstanding social event. Lunches and dinners were held every day at world famous restaurants, hotels and clubs. Cambridge University also was on the itinerary for a one-day visit.

The concluding event was a formal dinner at the Savoy Hotel, which gave the leaders of delegations an opportunity to thank their hosts.

When the location for the 1958 conference was up for consideration, Mr. Stephens urged upon the group the advantages of coming to Canada, but Australia also held out an attractive picture. Eventually it was agreed unanimously that Australia be selected. Consideration of currency problems for those in the Sterling areas was an important factor in reaching the decision. "Hard" dollars are still hard to get, and finally Canada agreed reluctantly that Australia should be chosen.

The business matters discussed and conclusions reached are subject to approval of the various councils before being announced, but they included relations with UNESCO, and engineering conferences in Europe, United States and South America; training in the United Kingdom for overseas graduates; trade union activities; registration for engineers in countries where it is not now in operation; the requirements of the Commonwealth for engineers; the need of stimulating in the minds of young men an interest in an engineering education; conservation of natural resources;

## Cover Picture

The cover picture is from the Quebec annual meeting. Delegates were on hand from the Canadian Universities, to present and discuss the views of the engineering student. Front row, left to right: Pierre De Guise, Ecole Polytechnique; Carl R. Johnson, British Columbia; Claude Pouliot, Laval; Eric C. MacNearney, N.S.T.C.; back row: Baine A. Holmlund, Saskatchewan; C. C. Atkinson, New Brunswick; Grant E. Sims, Manitoba; J. N. Rossall, Toronto; M. P. Schioler, Manitoba; R. L. Wright, McGill; W. C. Moffatt, R.M.C.; James Tod, Alberta; and J. D. Fowler, Queen's.

A meeting of the Third British Commonwealth Conference in session. W. P. Shepherd-Barron, presiding, with G. V. Burns at his left. Seated, from left counter clockwise around the table: T. W. Longridge, P. R. Angus, R. S. Maunder, G. R. Bozzoli, L. T. Campbell Pitt, A. J. Adams, C. W. J. A. Sandrock, A. S. Quartermaine, V. A. M. Robertson, W. K. Brasher, H. Bishop, B. G. Robbins, R. W. Bailey, M. S. Thacker, H. Williams, L. Austin Wright, D. M. Stephens, C. H. D. Harper, C. W. Candy. Mr. F. Jervis Smith is seated at centre table, with a reporter at his left.

public relations; professional recognition; reciprocal privileges for members of all institutions; education and the need of more uniform standards between universities and countries; training of apprentices and technicians as aides to engineers; relationship with non-professional organizations; abstracting services; the work of technical committees; codes of practice; and so on. It was a long agenda which required 12 half-day sessions to settle (or nearly settle) all the points.

Conferences such as this are of great significance for the development of the profession and in the promotion of good international relations. Leadership is required urgently today in world affairs. The usefulness and strength of the British Commonwealth of Nations was never more needed than now, and in such matters the engineer must accept a great responsibility. It is the belief of those who followed this conference for two weeks, that much was accomplished that will contribute to these worthy objectives.

Details of resolutions and recommendations will be published in the *Journal* after their approval by the Council of the Institute.

# Consulting Engineers' Meeting

Embarking on a new policy of holding a meeting and dinner coincident with the annual meeting of the Engineering Institute of Canada, the Canadian Association of Consulting Engineers had Dean D. V. Terrell of Lexington, Ky., as guest speaker at their dinner on May 13 at the Chateau Frontenac, Quebec City. Dean Terrell proved to be most entertaining and reminded one of the late Will Rogers. He is dean of the college of engineering at the University of Kentucky and the president of the American Society of Civil Engineers. It was his first visit to Quebec and he shared the enjoyment of the ex-

Part of the head table at the Consulting Engineers' dinner: Left to right, E. A. Cross, R. L. Dobbin, Dean D. V. Terrell, the speaker, A. T. Hurter, D. M. Stephens and J. A. Friedman.

perience with a large audience of members who were also present for the Institute meeting.

Just prior to the dinner a well-attended general meeting was held, with President R. T. Hurter in the chair. The Association's full program of work was discussed and plans made to carry it out.

During the course of the dinner, Life Membership was bestowed on five surviving Charter Members of the Association, in recognition of their valuable work as founders of the organization.

The Association's aim is principally the promotion of excellent business relations of its members and their clients, sound engineering practice, maintenance of a high professional standard, interchange of information and business experience, and promotion of cordial relations with architects, and with federal, provincial and municipal bodies.

Membership in the Association is limited and has strict requirements. Eligibility is determined by age (over 35), membership in good standing in the Engineering Institute of Canada and in the Corporation or the provincial Associations of Professional Engineers, occupation in the independent practice of the profession and attainment of a high reputation.

# Athlone Fellows, 1954

It is a yearly pleasure for the Institute to congratulate the young Canadian engineers fortunate enough to have been chosen Athlone Fellows.

These young men will spend the next two years in Great Britain, either at a university (Group A) or in industry (Group B). They will have a splendid opportunity to contribute something toward bringing the engineers of Great Britain and of Canada still closer together, while adding to their own competence, an opportunity of which it is certain they will make the most. It is even rumoured that some of them make the closest possible connections abroad by marrying British girls.

This year twenty-eight 1954 graduates will make up Group A; ten less recent graduates are included in Group B. Twenty-four of the total are Students or Juniors of the Institute; to them the Institute offers its very special felicitations here. It has also written each of them to convey its congratulations individually and to call attention to some privileges in the British Institutions which are theirs by virtue of their membership in the Institute.

There is no doubt but that this group will measure up to the high standards set by its predecessors. Equally, there is no doubt but that these young Canadian engineers will come back to us with minds broadened by two years of immersion in the stream of civilization as it flows in Britain, perhaps no better than our own, but different. Even if they do not acquire one atom of additional technical ability —which is unthinkable—they will still be better engineers for their experiences, and more likely to develop into the kind of citizens this country needs, as does all the world.

This is the list of the 1954 Athlone Fellows and the institutions from which they graduated:

### Group "A"

Anthony Hector Roy, S.E.I.C., B.E. (mechanical), Nova Scotia Technical College; Ronald Stanwood Butcher, S.E.I.C., B.E. (mechanical), Nova Scotia Technical College; Richard Charles Ballanse, S.E.I.C., B.SC. (civil engineering), University of New Brunswick; Earl Joseph Grant, S.E.I.C., B.SC. (civil engineering), University of New Brunswick; Michel Gendron, S.E.I.C., B.SC. (civil engineering), Laval University; J. M. Dessureault, B.A.SC. (engineering metallurgy), Laval University; L. Z. Rousseau, B.A.SC., Laval University; Jacques E. Marleau, S.E.I.C., B.A.SC. (engineering metallurgy), Ecole Polytechnique; Jean Paul Cossette, S.E.I.C., B.Eng. (electrical and mechanical), Ecole Polytechnique; J. J. Jonas, B.SC. (engineering metallurgy), McGill University; Charles E. Brabant, S.E.I.C., B.SC., B.Eng. (engineering physics), McGill University; George Zames, S.E.I.C., B.SC. (engineering physics), McGill University.

J. L. Eyre, B.A.SC. (mechanical engineering), University of Toronto; R. T. Rhodes, B.A.SC. (engineering and business), University of Toronto; D. S. Shaw, B.A.SC. (engineering and business), University of Toronto; Ian Joseph MacDonald, S.E.I.C., B.SC. (mechanical engineering), Queen's University; John Gibson Pike, S.E.I.C., B.SC. (mechanical engineering), Queen's University; John Laurence Seychuk, S.E.I.C., B.SC. (civil engineering), University of Manitoba; John William Godfrey, S.E.I.C., B.SC. (electrical engineering), University of Manitoba; Roy Allen McDougald, S.E.I.C., B.SC. (mechanical engineering), University of Manitoba; Barclay George Jones, S.E.I.C., B.SC. (mechanical engineering), University of Saskatchewan; P. M. Wright, B.SC. (civil engineering), University of Saskatchewan; G. C. Oates, B.A.SC. (mechanical engineering), University of British Columbia; Norman George Davies, S.E.I.C., B.A.SC. (engineering physics), University of British Columbia; J. A. McNish, B.A.SC. (electrical engineering), University of British Columbia; G. V. Ward, B.A.SC. (electrical engineering), University of British Columbia; W. W. Klingbeil, B.SC. (civil engineering), University of Alberta; David Gilmour Dawson, S.E.I.C., B.SC. (electrical engineering), University of Alberta;

### Group "B"

Maurice Poupard, S.E.I.C., B.A.SC. 1953 (mechanical engineering), Ecole Polytechnique; Robert Russel Elliot, JR.E.I.C., B.Eng. 1951 (electrical), McGill University; Francis Maguire Corbett, JR.E.I.C., B.Eng. 1949 (electrical), McGill University; Earl Lundy Pearson, S.E.I.C., B.SC. 1953 (mechanical engineering), University of Manitoba; J. R. B. Steacie, B.Eng. 1951 (electrical), McGill University; L. R. Turner, B.SC. 1953 (chemical engineering), Queen's University; John Stewart Ellis, JR.E.I.C., B.SC. 1948, Queen's University, M.Eng. 1949 (civil), McGill University; David Lindsay Stewart Bate, JR.E.I.C., B.A.SC. 1948 (engineering physics), University of Toronto; Philip James Dowling, JR.E.I.C., B.A.SC. 1951 (civil engineering), University of Toronto; H. C. Pettigrew, B.A.SC. 1952, University of Toronto.

# Work Habits

In 1931, when our President was an undergraduate at the University of Manitoba, he had a hand in starting *The Slide Rule*, designed to be the voice of the student engineers there. Apparently this publication, like a good many student activities that necessarily suffer from lack of continuity of management, has had its ups and downs. The number before us is Volume 20, Number 1, and we gather that it is the first issue that has appeared in four years.

This issue should be of special interest to Institute members because it contains an article by President D. M. Stephens discussing work habits, which contains a good deal of common sense and which could be read with profit by every engineering student and, indeed, by a good many engineers who have left student days long behind them.

After agreeing that to do well in an engineering course of study is not easy, Mr. Stephens goes on to say:

"The chap to whom all subjects come most easily at university is sometimes a disappointment to himself and his friends after he leaves the university. The student who finds it necessary to work hard is frequently found to do rather well in the profession. While it would be dangerous to oversimplify this sort of thing, I think sometimes you can find the explanation in the fact that one man could do well at the university in spite of poor work habits and that the other had been forced to form good ones. A less brilliant, but systematic, worker will often surpass the brilliant dawdler . . . Of course, when you have the chap with the brilliant mind *and* the good work habits, then you really have something!

"Your professors will tell you that it is practically impossible to *teach* good work habits. I think they are right in this and that these habits of work must be *learned* rather than taught. I have noticed a few things about the men whose work habits I have most admired and which will bear passing on. They seldom *half* work. They work while they are at it. They seem to carry their work to some logical resting place before they stop . . . When they get on the right track they are hard to stop . . . If there is some particular angle of a subject which they do not quite understand . . . they go out and meet that particular angle or subject head on and master it . . . While they may start one job, or perhaps several, before they finish one that had been started earlier, you will find that they follow a rule that calls for each job to be completed according to some sort of timetable . . . They like a good stiff pace and they seem to have more spring in their mental stride on that account. Other folk like the briskness of these people and that same springing mental stride and so they often select them as leaders. You will find these same work habits showing up in their play . . . or in the social or professional functions which they organize.

"Some of the men of whom I am thinking are not too conscious of their particular work habits and so they might find it difficult to tell us just when and where they had formed them. My own guess would be that most engineers who have these work habits formed them in a basic sort of way during their undergraduate days. They became good students then and have remained so ever since."

# Resources Conference

The important Resources Conference, which took place in Ottawa April 22-23, 1954, is attracting much attention in its follow-up stages, according to J. L. Van Camp, general manager of the Canadian Forestry Association, and secretary of the Resources Conference Committee.

This meeting, announced in the *Journal's* March issue, gained the desired co-operation of press, radio and television, and the great interest of the Canadian public. A statement has been issued by the Canadian Forestry Association, which is a summary and evaluation of the conference:

### Summary of Conclusions

***Objectives:***

The Conference was called to focus attention upon the need for the best possible planning, toward the full use and perpetuation of all Canada's renewable natural resources. It was also intended to provide accurate informative documents prepared by leaders in each group, to be made available to delegate organizations for distribution to their membership. We hope that you will take advantage of this material whenever questions are raised by your membership regarding conservation and use of renewable resources.

This first general Conference on all renewable resources dealt with principles, objectives and needs. It is expected that action for implementation of the principles will come from subsequent conferences, where action is not already being taken.

***Accomplishments:***

The Conference brought together over 200 high-level delegates from responsible national organizations and government departments. The information available to delegates was mutually helpful in broadening their knowledge of Conservation.

Presentation of carefully considered statements, and discussions on forestry, agriculture, wildlife and recreation by outstanding leaders from every section of Canada, brought out new suggestions and useful comment.

***Plans Resulting from the Conference:***

That the Conference should be a focal point for dissemination of information on a national scale was strongly approved by the delegates. It was also strongly urged that definite accomplishments be attempted, in line with suggestions made to the Conference.

Present plans for release of information by the sponsoring organizations include:

1. this informal summary
2. distribution of mimeographed copies of the summary papers (presented on the afternoon of April 23rd) and
3. printed publication of the full papers and discussion from Conference sessions.

Practical action to be investigated, on suggestions made to the Conference, include a proposal for re-establishment of a National Commission of Conservation; implementation of the Canada Forestry Act for forest fire protection; a full scale Federal Department of Forestry, extension of present national agricultural programs into new areas, and improved research and action on wildlife and recreational programs.

A continuing Committee will investigate and report progress on actions favoured by the Conference.

The final Conference record will be read with interest. As Mr. Van Camp wrote in the June issue of "Forest and Outdoors", "this record should be a valuable milestone in the consideration of Canadian Resources as they now are, and as they should be in the eyes of these leaders of business and industry and representatives of the educational and public service organizations and their hundreds of thousands of members."

The *Journal* will be printing more about the Conference and about the permanent benefits derived from this review of Canada's renewable resources. With the C.F.A. and the E.I.C., the sponsoring bodies were the Agricultural Institute of Canada, the Canadian Chambers of Commerce and the Canadian Institute of Forestry.

# Canadian Standards Association Meeting at Vancouver

The annual meeting of the Canadian Standards Association was held in Vancouver on April 14. General Manager W. R. McCaffrey reported that membership, including individual, co-opted, associated and honorary members, now stood at 1536. Sustaining memberships, which include industrial and technical associations, provincial departments, municipalities and commissions, now totalled 930, an increase of 85 during the past year.

Revenues for the year included the annual grant from National Research Council of $20,000, sums from sustaining members totalling $60,450 and $40,732 from sales of CSA publications, he said. The combined budget of the Association and its two subsidiaries, the CSA Approvals Division and the Canadian Welding Bureau was close to 1¼ million dollars during the past year, or six times what it was in 1939, a figure outstanding in the matter of budgets of national standardization organizations throughout the world.

Addressing the meeting, Dean R. E. Jamieson, president of the Association, told members that organizations such as CSA strengthen the bonds across Canada. The CSA is not a government organization. It is a completely autonomous body incorporated under the Dominion Companies Act, he pointed out.

Its specification committees are Canada-wide in scope, and an endeavour is made to keep their memberships truly representative industrially and geographically. The formulation of a standard specification calls for close co-operation, with much give-and-take. Such co-operation is the backbone of all CSA work in achieving acceptable national standards.

In connection with the wood products and lumber industry, he continued, representatives from all over Canada had produced some of the most important publications in the list. The CSA Standard on Douglas Fir plywood, published in 1953, already had a circulation of over 13,000 copies. Publications relating to the electrical industry and electrical inspection services, the manufacture and inspection of boilers, the safety codes for elevators and the operation of woodworking machinery were other projects of wide application all across the country.

Codes for control of radio interference, safety regulations for power line crossings, design and construction standards for bridges and steel and concrete buildings, have found qualified committeemen ready to lend a hand in developing specifications. When it is remembered that these specifications depend for their success on voluntary acceptance and adoption, it is evident that their value lies in the extent to which they enjoy distribution and use, he added.

The CSA is the Canadian member of ISO, the International Organization for Standardization, and of IEC, the International Electrotechnical Commission. Members of ISO are the national standards bodies of thirty-four nations, some of them behind the iron curtain. In addition, CSA maintains close contact with the national standards bodies of the British Commonwealth, and maintains active liaison with many committees of ASA, ASTM, ASME, AIEE and other United States organizations.

The CSA Approvals Division at Toronto is receiving more than twice as many applications for testing and certification as it did four years ago. Its growth has been such that construction has been commenced on a new building in the outskirts of Toronto for its accommodation. The Canadian Welding Bureau, also at Toronto, certifies welding operators, supervisors and shops as meeting the requirements of the Association's various welding Codes. An important feature is the correspondence courses it operates for instruction in the principles, practice and supervision of welding.

A year ago, a new set of by-laws for the Association had been adopted. Their basic feature is that the work of administering CSA policy and business is placed in the hands of a board of directors, while technical procedure leading to adoption of standards is placed under a technical council. These by-laws extend full voting privileges to all CSA members resident in Canada and make them elegible for election as directors. Elections are held every two years, the next to be held in 1955.

In conclusion, Dean Jamieson emphasized that the successful operation of CSA has always depended, and will continue to depend, on co-operation from industry, governments, and by scientific bodies and educational institutions. The roots and the life of its specification work lie in its specification committees, who originate the drafts, come to an agreement on their clauses, and produce the specifications. The Association, and the people of Canada, he said, owe a great debt to this body of men.

---

# Ontario Division

The Ontario Division of the Engineering Institute of Canada recently elected a new slate of officers to continue the work of co-ordinating the Institute's activity in Ontario.

Dr. A. E. Berry, Toronto, is the chairman; G. R. Henderson, Sarnia, vice-chairman; Major-General G. R. Turner, Ottawa, treasurer; G. H. Rogers, Toronto, secretary.

C. D. Carruthers, Toronto, was chairman of the Nominating Committee.

---

# Correspondence

***Foundation Studies***

Editor,
Engineering Journal

In the paper on Recent Studies of Foundation Behaviour by Dr. G. G. Meyerhof, M.E.I.C., in your February issue, the following statement appears: "Where piers or piles pass through clay and rest in underlying cohesionless material, the adhesion of the clay to the shaft can be added to the toe resistance corresponding to the embedment of the toe in the cohesionless soil".

It is not clear just what this means but if it is intended to imply that the supporting power of the pile is the combined effort of the point resistance in the non-cohesive soil and the frictional resistance of the shaft in the clay, then as an unqualified statement it is incorrect.

Due to the very large difference in the modulus of elasticity of the pile and of the surrounding soil unless there can be an appreciable movement of the "toe" of the pile the skin friction cannot be mobilized. In the case of end bearing piles when the point rests on rock or some other firm stratum no friction should be taken into account. Even a dense sand is sufficient to prevent the necessary incipient movement to mobilize the skin friction. For sand in the loose state, it is possible that some friction might be mobilized.

On the other hand, when piles are driven through some water-saturated clays which are structure sensitive, the clay in the vicinity of the pile is remolded. This causes an increase in the rate of consolidation which in turn produces a downward drag on the pile so that the point resistance has not only to support the load at the top of the pile but also the weight of the immediately surrounding soil. In such cases the friction between the soil and the pile is downward. An effect which accompanies this phenomenon is that a space is produced below the sole of the footing. If this space be not filled with water, wooden piles have been known to rot at the top. They should of course be treated to prevent this type of failure.

I. F. Morrison, M.E.I.C.,
Prof. of Applied Mechanics,
University of Alberta,
Edmonton.

---

Dear Mr. Editor:

In thanking Prof. I. F. Morrison for his interest in the author's paper, Dr. G. G. Meyerhof would like to point out that the ultimate load bearing capacity of foundations (including piers and piles) depends mainly on the strength properties of the soil and not on the deformation characteristics of the soil and foundation. The ultimate bearing capacity can thus for all practical purposes be estimated from the theory of plasticity (limit design) irrespective of the deformation characteristics, and the theoretical maximum résistance of piles is the sum of point resistance and skin friction. [1, 2]

The results of numerous pile loading tests in uniform soils are in agreement with this theory[2] and they show that the full skin friction is mobilized at about one-quarter to one-half of the penetration required for the maximum point resistance. Since even in soft clays the full skin friction of piles is mobilized at a penetration of an inch or so, while in a dense sand the maximum point resistance requires a penetration of several inches[3] and on rock a penetration of about an inch[4], it follows that in practice the skin friction is always fully mobilized before the point resistance.

It is well known that when piles are driven into sensitive clays, a negative (downward acting) skin friction is produced temporarily, which decreases the allowable load governed by settlement considerations but does not affect the ultimate bearing capacity. This is shown by pile loading tests on such clays[2] and would be expected because the downward movement of the soil is negligible compared with the downward movement of the pile under the superimposed ultimate load.

Dr. Meyerhof considers therefore that the statement, to which Professor Morrison refers is correct on both theoretical and practical grounds as far as the ultimate bearing capacity of piers and piles is concerned.

# N.R.C. Holds "Open House"

Marking the recent opening of the new building for the Division of Radio and Electrical Engineering, an event which had brought a new phase in the life of N.R.C., a three-day period of "Open House" was held at its Montreal Road site, four miles east of Ottawa by the National Research Council, May 26 to 28, 1954.

Founded in 1917, N.R.C. has two functions; to stimulate all phases of scientific research in Canada, and to link science with industry. In 1925 small scale laboratory work was started, while larger scale research began in 1932 on Sussex Street with four divisions; Physics and Engineering, Biology and Agriculture, Chemistry, and Research Information. In 1936 the Division of Mechanical Engineering was established, and in 1939 a new building site for it was acquired on the Montreal Road.

In 1947 the Division of Building Research was established, and in 1953 a new building to house this division was opened. A separate Division of Applied Chemistry was also established, and a new building for it was opened in 1952. In 1947 the Division of Radio and Electrical Engineering was set up, and this year a new building was opened for it on a new 250 acre site across the road from the site of the other engineering buildings.

On each of the three days the various Division buildings were open to visitors for inspection for periods of some six hours. To those who attended with a view to obtaining an overall view of N.R.C. activities, only a superficial examination of each project was possible within the time allotted. Those interested in certain particular phases would of course spend more time on them.

While space permits only a brief synopsis of the research projects being carried out by each division, a few of the more outstanding or spectacular exhibits seen in each should be mentioned.

### Division of Mechanical Engineering

The Division of Mechanical Engineering is concerned with work on mechanics and structures, thermodynamics, aerodynamics, hydrodynamics, naval architecture, and also with combustion and lubrication. In its various laboratories, this division has on display samples of the kinds of work it is doing.

The post war development of aviation in Canada and the general world situation produced an urgent need for increased effort in aeronautical research for defence, and a co-ordinated plan for the improvement of facilities available for such work. To meet this need the National Aeronautical Establishment was organized in 1950, comprising the aeronautical laboratories of the Division of Mechanical Engineering and increased flight research facilities at Uplands. The Establishment provides for a closer integration of the requirements for military and civil aeronautical research and development.

Here visitors could observe tests of aircraft models in wind tunnels, to determine stability and carrying capacity of aircraft; structural tests on airframes and components; operation of airborne recorders, gyroscopes, de-icing control systems; shops where aircraft models are made; displays of the principles of the jet engine and jet engine icing.

Demonstrations were given in the High Speed Aerodynamics Laboratory of models in the supersonic wind tunnel, simulating speeds of 3,000 miles per hour; formation of shock waves at the speed of sound and measurement of forces acting on missiles at speeds up to 1,000 miles per hour. Equipment was on exhibit for wing de-icing, for determining ash deposits on jet engine blades and for starting tests on jet engines at high altitudes.

In the Low Temperature Laboratory, behaviour of Arctic vehicles, clothing and equipment under extreme sub-zero temperatures could be observed. Tests in the Fuels and Lubricants Laboratory of viscosity of 10° motor oil at normal and extreme low temperatures, showed that at −40° to −60° even this lighter oil becomes as thick as grease.

Other exhibits included one for rain-making by the seeding of vapour clouds with dry ice, and tests to determine the best materials for low-friction dog-sled runners. Compressors for creating cold air for these tests are rated at 950 horsepower, sufficient to make 70 tons of ice daily at −85°.

In the Hydraulic Laboratory, the model testing basin assists naval architects on problems of hull and propeller design. The basin, 450 ft. long and 25 ft. wide, is equipped to test models and full scale ships, to determine their characteristics. Investigations of problems arising in the design of harbours, river training works, navigation locks, log chutes and spillways are carried out. Currently a model of the Cornwall Island section of the St. Lawrence Seaway is under construction.

#### Division of Applied Chemistry

The major function of this division is long-term research on the development of Canadian natural resources. Investigations of more immediate practical bearing include: chemical engineering studies, research on textiles, the chemistry and corrosion of metals, development of more efficient processes for producing chemicals from natural gas, the properties and uses of natural and synthetic polymers, the applications of colloid chemistry and uses of rain repellents.

Demonstrations were being carried out on refining of ethylene; cleaning dust from wheat; drying grain and sawdust; a pilot plant for extracting oil from Alberta tarsands; on fundamental rubber research; spectrometry of gases; spectrography of metals; measurement of corrosion and pitting; demonstrations of rain repellents for aircraft windshields; mixing, vulcanizing, and testing of rubber and preparation of foam rubber; metallurgical chemistry; and catalysts, to mention only a few.

#### Division of Building Research

This Division is aimed at providing research services for the Canadian building industry. Projects are in progress on heating, building materials, soil mechanics, snow mechanics, and fire research. Work has been done on heating and ventilating buildings in the north, on the Winnipeg flood damage, the construction of the Toronto Subway, house foundations on permafrost in the Mackenzie River Valley, and the revision of the National Building Code.

The building contains a very complete laboratory for all tests, on materials such as cement, concrete mortar, bricks, sand, and on corrosion, electrical resistance and sound reflection. Tests on dwelling insulation were being conducted with test huts, and on basementless houses, as well as structural loading tests on house frames.

Demonstrations of the behaviour of quicksand as a foundation material were being given, and of loading tests on building frames. A fire research truck was on exhibit equipped with fire resistant clothing, resuscitation equipment and various instruments for determining causes of fires. Displays of air photos of Northern Canada, of Divisional publications and of the National Building Code were presented.

#### Division of Radio and Electrical Engineering

This Division is normally devoted to a broad program of basic research and engineering development. A large part of the effort is devoted to defence projects. The remainder of the Division's program comprises chiefly vacuum tube research, dielectric research, electrical engineering and servomechanism studies, radio astronomy, electro-medical research, and the application of radar techniques to navigational problems.

Aside from the periodical lectures and demonstrations in the auditorium and balcony of various electrical phenomena, museums of early telegraph, telephone and radio equipment were on display. Demonstrations of radio-astronomy and determination of the sources of experiments for determining and preventing grain dust explosions; high frequency heating for bonding layers of plywood; and for h.f. coils used in diathermy and for sterilizing beer. An exhibit and explanation of the manufacture and use of transistors were presented.

Various applications of radar, such as echo-sounders, navigation, fog alarm control, flight computers, beacon receivers, were explained. Exhibits of electromedical devices, frequency measuring equipment, electronic measuring apparatus and electronic music were also on display.

---

## International Science Centers Established

*This information provided by the Co-operative Research Foundation*

Each year increasing numbers of scientific visitors have been coming to the United States to pursue academic studies, to participate in research projects being carried out in institutional or industrial laboratories, or to survey technical projects of U.S. industry.

Many visiting scientists do not have long established contacts with United States scientists and scientific institutions. In order to meet this need for contacts, the Cooperative Research Foundation, with the cooperation of the National Academy of Sciences-National Research Council, has evolved a program to establish and operate international science centers which will serve visiting scientists and engineers in those areas of the United States where there is a concentration of scientific endeavor and which consequently receive the greatest number of scientific visitors from abroad. The primary objective of this program is to stimulate direct working relationships between U.S. scientists and their colleagues in other parts of the world.

The centers are to be established with the cooperation of state or local academies of science and will provide local facilities for scientific visitors, especially those whose visits to the United States are sponsored by private interests. The main functions of the centers will be: (1) to facilitate contacts between the visiting scientists and scientific personnel in the region; (2) to serve as a coordinating agency for international scientific activities in the region; (3) to offer such assistance to visiting scientists as other institutions may not be equipped to give.

The first of the international science centers was established several months ago in San Francisco with the cooperation of the California Academy of Sciences. It has already begun to receive visitors from abroad and is receiving enthusiastic support from scientific interests in the San Francisco Bay region.

In October, 1953, Council of the New York Academy of Sciences voted to join the Cooperative Research Foundation in organizing and establishing a New York International Science Center. Space for the Center has been made available in the headquarters of the New York Academy. It is hoped that this second center can begin serving visiting scientists and engineers in the New York area early next year. In addition to the San Francisco and New York centers, nine others are contemplated. Each center will seek to evolve an active program which will encourage local scientific and engineering societies, foundations, research laboratories, universities, and industry to cooperate in its activities.

Scientists visiting the San Francisco Bay region are invited to call at the San Francisco International Science Center, which is located in the Morrison Planetarium, California Academy of Sciences, Golden Gate Park. The Center is open on weekdays from 9:00 a.m. to 5:00 p.m. and may be contacted by telephone on BAyview 1-7314 or DAvenport 2-5245.

# Year of Promise in Civil Aviation

This year promises to be an outstanding year for civil airliners built in Britain, not through development of new prototypes of the designs of gas-turbine powered airliners, but because many of the plans based on existing designs will begin to bear fruit.

One important prototype will make its appearance this summer. This is the "Comet 3", the ultimate stage in the development of the basic "Comet" design which first took shape on the drawing board soon after the war. Into the "Comet 3" has gone all the experience of the special problems of jet airliner construction gained from the development of the "Comet" 1 and 2.

However, the main emphasis this year will be on production. The assembly lines will produce "Comet" jet and Vickers "Viscount" propeller-turbine airliners to fill orders from overseas airlines, and to expand the network of air routes on which gas-turbine airliners are now operating. Towards the end of the year production of the long-range Bristol "Britannia" propeller-turbine airliner will begin.

These three types form a pattern in which each is complementary to the other. "Comet" design is based essentially on luxury accommodation and an express speed of travel. The "Comet 1", powered by four de Havilland "Ghost" centrifugal-flow jet engines, carries 36 passengers at a cruising speed of 490 m.p.h. over maximum stage lengths of 1,500 miles. In the "Comet 1A" fuel capacity is increased to give a range of about 1,750 miles, with a seating capacity of 44.

The "Comet 2" is a slightly larger and more powerful version of the design. Four Rolls Royce "Avon" axial-flow jet engines of about 7,000 pounds thrust give it extra power as well as lower fuel consumption which raises its maximum stage length to 2,500 miles with the same seating capacity as the "Comet 1A".

The "Comet 3" takes the basic design and "stretches" it in size, range and power. It will use more powerful "Avon" engines, giving it a cruising speed of 500 m.p.h. and, with extra fuel tanks fitted on the wing leading edge, a range of 2,500 miles. The fuselage will be lengthened by 17 feet, giving capacity for between 58 and 76 passengers. This airliner will almost certainly introduce jet passenger service across the North Atlantic.

The Vickers "Viscount" (series 700) is essentially a [illegible]m-range aircraft, hence it is [illegible]ned for lower speeds, lower [illegible]cude and economical fuel consumption. Its power units are four Rolls Royce "Dart" propeller-turbine engines, which give the "Viscount" a cruising speed of 310 m.p.h. over maximum stage lengths of 1,500 miles. Normal seating capacity is 48, but variations on interior layout take its capacity up to 62.

The "Viscount" series 800, now under development, will have more powerful engines and a longer fuselage to accommodate from 66 to 82 passengers. This is for ranges of about 1,100 miles and will be in production next year.

The propeller-turbine Bristol "Britannia" provides slower but more economical services for tourist-class passengers over the long ranges covered by the Comet. With four Bristol "Proteus" engines, the Britannia "Mark" 100 will carry up to 92 passengers at 350 to 400 m.p.h. over ranges of 3,500 miles. There are two versions, the "Mark" 250, which carries 87 passengers and 10,000 pounds of freight, and the "Mark" 300 to carry 104 passengers.

Provisions for the production of all three were made in anticipation of the orders already placed and in preparation for the demand which the industry expects.

The de Havilland Aircraft company has two production lines of its own for the "Comet" series, and has provided a third line by arranging for another firm, Short Brothers, to produce the "Comet" under subcontract. This will mean that production of the "Comet 3", beginning in 1956, will reach a rate of 70 a year by 1958.

Vickers have turned an entire factory over to producing the "Viscount" at a rate of four a month by next year. The Bristol company is aiming to produce four Britannias a month by 1956.

In addition designs are already well advanced for airliners of the 1960 period onwards. All are based on the critical North Atlantic route on the principle that the airliner designed to economically meet these exacting conditions can fit into any other long range routes.

---

# The ASME Boiler Code

### Interpretations

The Boiler Code Committee meets monthly to consider "Cases" where users have found difficulty in interpreting the Code. These pass through the following procedure: (1) Inquiries are submitted by letter to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.; (2) Copies are distributed to Committee members for study; (3) At the next Committee meeting interpretations are formulated to be submitted to the ASME Board on Codes and Standards, authorized by the Council of the Society to pass upon them; (4) They are submitted to the Board for action; (5) Those which are approved are sent to the inquirers and are published in Mechanical Engineering.

The following Case Interpretations were formulated at the Committee meeting April 28, 1954.

#### Case No. 1130

Special Ruling

Interpretations of Parrs. H-29, H-62 and H-115 should be annulled since this Case was written at the time brass was in short supply and allowed the use of cast-iron instead of brass for wash-out plugs in steam heating boilers, there is no shortage of brass now.

#### Case No. 1175

Special Ruling

***Inquiry:*** May low-carbon, high-nickel steel plate, conforming to requirements of Specification SA-353 be used in the construction of unfired pressure vessels under Section VIII? Such vessels would be used for service below −20F.

***Reply:*** It is the opinion of the Committee that low-carbon, high-nickel steel plate conforming to Specification SA-353, may be used in the construction of unfired pressure vessels provided the rules of design, fabrication and inspection of the Unfired Pressure Vessel Code, Section VIII, 1952 are followed, with the following additional provisions:

(1) Specifications — The low-carbon, high-nickel steel plate shall conform to Specification SA-353.

(2) Welding — The welding requirement shall conform to the requirements of Section IX. The classification of the material under Table Q-11.1 shall be P-10.

> "The reduced-section tension specimen shall have a tensile strength that is not less than the minimum of the specified tensile strength of the base material or of the weaker of the two if materials of different specified minimum tensile strength are used, except where Case No. 1182 provides for the use of weld metal at room temperature of lower strength than the base metal, in which case the weld metal shall

satisfy the requirements of Case No. 1182."

(3) Radiography — All longitudinal and circumferential joints shall be double-butt welded and radiographed.

(4) Thermal Stress-Relief — Stress Relieving shall be performed after fabrication by gradually and uniformly heating the vessel to a temperature between 1025F. and 1085F. holding for a minimum of two hours for thickness up to one inch; plus a minimum of one hour for each additional inch of thickness and cooling in still atmosphere to a temperature not exceeding 600F. The heating and cooling rates shall be in accordance with Section VIII.

(5) Allowable Working Stress — The allowable working stress values shall be 22,500 psi except as otherwise provided in Case No. 1182 for weld metal of lower strength than the base metal.

(6) Allowable Temperature — The material may be used at temperatures below −20F.

### Case No. 1185

Special Ruling

***Inquiry:*** Since aluminum alloys GS-11A-T6 and clad GS-11A-T6 are acceptable materials for vessels constructed in accordance with Section VIII and welding qualification are included in the 1953 edition of Section IX, is it permissible to construct vessels of these materials by welding and, if so, what allowable stress values are to be used?

***Reply:*** It is the opinion of the Committee that vessels of aluminum alloys GS-11A-T6 and clad GS-11A-T6 may be constructed by welding provided (1) the applicable rules of Section VIII are followed, (2) the qualification requirements of Section IX are met (3) the stress values in the following table are used where reference is made to stress values in Table UNF-23.

### Case No. 1186

Special Ruling

***Inquiry:*** In view of the urgent need for new rules for openings and reinforcement may the proposed revisions to Par. P-268 which were published in the May, 1954 issue of *Mechanical Engineering* be used for constructions to the Power Boiler Code?

***Reply:*** It is the opinion of the Committee that in view of the need for these new rules for present day designs and since the basic theory is currently being used for constructions to the Unfired Pressure Vessel Code, the proposed revisions to Par. P-268 may be used for constructions to the Power Boiler Code.

### Case No. 1187

Special Ruling

***Inquiry:*** In designing a cylindrical jacketed vessel with staybolts between the jacket and inner shell, would it be permissible to calculate the jacket thickness by using the formula for cylindrical shells under internal pressure? This formula may require less thickness than the one for stayed surfaces when low pressures or small diameters are involved.

***Reply:*** It is the opinion of the Committee that when a jacket extends completely around a cylindrical vessel, the jacket thickness shall be calculated by the formula for cylindrical shells under internal pressure in Par. UG-27(c), and also by the formula for braced and stayed surfaces in Par. UG-47(a), and that the greater of the thicknesses thus obtained shall be used.

#### *Annulment of Cases*

All the Cases that refer to the 1949 Section VIII, Code for Unfired Pressure Vessels are to be annulled effective January 1st, 1955. This refers to the first sixty-nine pages to the Case Interpretation Booklet published February 1st, 1953.

| Alloy and Temper | Specification Number | Maximum allowable stress values for metal temperatures not exceeding deg. F. 100 | 150 | 200 | 250 | 300 | 350 | 400 |
|---|---|---|---|---|---|---|---|---|
| GS-11A-T6 and Clad GS-11A-T6 | SB-178, SB-273 SB-274 | 6000 | 5900 | 5700 | 5400 | 5000 | 4200 | 3200 |

## Proposed Revisions and Addenda to Boiler and Pressure Vessel Code

As need arises, the Boiler Code Committee entertains suggestions for revising its Codes. Revisions approved by the Committee are published here as proposed addenda to the Code to invite criticism.

In the following the paragraph numbers indicate where the proposed revisions would apply in the various sections of the Code.

Comments should be addressed to the Secretary of the Boiler Code Committee, ASME, 29 West 39th Street, New York 18, N.Y.

### Power Boilers, 1953

***Table P-15.*** Revise the "Notes" to read:

(1) Adjusted pressure ratings for steam service at saturation temperature corresponding to the pressure derived from tables 2 to 15 inclusive of ASA Standard B16.5-1953.

(2) Pressures shown include the factor for boiler feed and blow-off line service required by Pars. P-299(d) and P-310(c).

(3) Class A ratings apply to welding ends, ring joints, small tongue and groove facing with any type gasket, large tongue and groove facing with any type gasket, except flat solid metal, and other facings with gaskets which result in no increase in bolt load or flange moment over those previously mentioned. Class B ratings apply to all facings and gaskets not specifically listed under Class A.

### Material Specifications, 1953

The Boiler Code Committee has approved adding to Section II the following new specifications:

***Plates***

SA-7-53T, Steel for bridges and buildings.
SA-129-53T, Open-Hearth iron plates of flange quality.
SA-201-53T, Carbon-Silicon steel plates of intermediate tensile ranges for fusion welded boilers and other pressure vessels.
SA-202-53T, Chromium-Manganese-Silicon alloy steel plates for boilers and other pressure vessels.
SA-203-53T, Nickel-Steel plates for boilers and other pressure vessels.
SA-204-53T, Molybdenum-Steel plates for boilers and other pressure vessels.
SA-212-53T, High tensile strength Carbon-Silicon steel plates for boilers and other pressure vessels.
SA-225-53T, Manganese-Vanadium steel plates for boilers and other pressure vessels.
SA-285-53T, Low and intermediate tensile strength Carbon-Steel plates of flange and firebox qualities (Plates 2 in. and under in thickness).
SA-299-53T, High tensile strength Carbon-Manganese-Silicon steel plates for boilers and other pressure vessels.
SA-300-53T, Steel plates for pressure vessels for service at low temperatures.
SA-301-53T, Chromium-Molybdenum steel plates for boilers and other pressure vessels.
SA-302-53T, Manganese-Molybdenum steel plates for boilers and other pressure vessels.
SA-353-53T, Low-Carbon, High-Nickel steel plates for pressure vessels.

***Tubular Products***

SA-178-53T, Electric-resistance-welded steel and open-hearth iron boiler tubes.
SA-213-53T, Seamless alloy steel boiler, superheater and heat exchanger tubes.
SA-226-53T, Electric-resistance-welded steel boiler and superheater tubes for high-pressure service.
SA-250-53T, Electric-resistance-welded Carbon-Molybdenum alloy-steel boiler and superheater tubes.
SA-335-53T, Seamless Ferritic alloy steel pipe for high temperature service.
SA-369-53T, Ferritic alloy steel forged and bored pipe for high-temperature service.

***Stainless Steel***

SA-193-53aT, Alloy steel bolting materials for high temperature service.
SA-194-53T, Carbon and alloy steel nuts for bolts for high-pressure and high-temperature service.
SA-213-53T, Seamless alloy steel boiler, superheater and heat exchanger tubes.
SA-249-53aT, Welded austenitic stainless steel boiler, superheater, heat exchanger and condenser tubes.
SA-271-53, Seamless austenitic Chromium-Nickel steel still tubes for refinery service.
SA-320-53T, Alloy steel bolting materials for low temperature service.

***Forgings and Miscellaneous Materials***

SA-182-53T, Forged or rolled alloy steel pipe flanges, forged fittings and valves and parts for high temperature service.
SA-193-53aT, Alloy-steel bolting materials for high temperature service.
SA-194-53T, Carbon and alloy steel nuts for bolts for high pressure and high temperature service.
SA-307-53T, Steel machine bolts and nuts and tap bolts.
SA-320-53T, Alloy steel bolting materials for low temperature service.
SA-354-53T, Quenched and tempered alloy steel bolts and studs with suitable nuts.

***Nonferrous Materials***

SB-178-53T, Aluminum and aluminum-alloy sheet and plate for pressure vessel applications.
SB-234-53T, Aluminum-alloy drawn seamless tubes for condensers and heat exchangers.
SB-273-53T, Aluminum and aluminum-alloy bars, rods and shapes for pressure vessel applications.
SB-274-53T, Aluminum and aluminum-alloy pipe and tube for pressure vessel applications.

**Low-Pressure Heating Boilers**

***Preamble.*** Delete entire present Preamble and substitute the following:
These rules are divided into two sections, Part 1 applying to steel plate boilers and Part 2 to cast iron boilers. The code does not contain rules to cover all details of design and construction. Where complete details are not given, it is intended that the manufacturer, subject to the approval of the authorized inspector, shall provide details of design and construction which will be as safe as otherwise provided in these rules.

***Par. H-1(2)*** — Revise to read:
To hot-water heating and hot water supply boilers to be operated at pressures not exceeding 160 psi and temperatures not exceeding 250 deg. F.;

***Par. H-1(4)*** — Add as a new paragraph:
Except as provided in H-1(5) the following classifications are considered not to be within the jurisdiction of this section of the code.

(a) Hot water supply boilers which are directly fired with oil, gas or electricity when none of the following limitations is exceeded.

A heat input of 100,000 btu. per hour.
A water temperature of 200 deg. F.
A nominal water containing capacity of 120 gallons.

***Par. H-1(5)*** — Add as a new paragraph:
All hot water supply boilers including those exempted in H-1(4) shall be equipped with ASME approved safety devices of proper type and size.

**Heating Boilers, 1952**

Delete Pars. H-62 and H-115 because there is no further need for trycocks on heating boilers as it is felt they can operate safely without them.

# *Thirty-five Years Ago*

## Comment on the *JOURNAL* of July 1919

Thirty-five years ago the *Journal* for July, 1919, devoted eight pages of its somewhat limited text content to reprinting in full a schedule of "Compensation for Engineers" that had recently been adopted by the American Association of Engineers. There is, of course, no point in quoting it here in detail; a few excerpts will serve to show its general tenor. The salaries suggested were for "continuous employment . . . with steady advancement in rank and pay . . ." For seasonal employment, such as on construction, "the pay should be such as to amount to about half pay for the necessarily idle season . " and for temporary positions it "should be about 50% above the schedule."

This document first classifies engineers by their specialties—architectural, highway, municipal, public utility, public commission, railway, rural, public improvement, structural or mechanical, telephone and telegraph. Engineers in sales were ignored; perhaps selling was considered non-engineering work, which it certainly is not now. And the engineering teacher was evidently not worthy of a place in the scale. Today other omissions may be noted, but most of them are less real omissions than engineering positions which have developed since this schedule was submitted.

Each branch of engineering was subdivided into positions varying in responsibility from top to bottom. For example, there were 13 classifications of highway engineers, each with its duties carefully specified, but 47 kinds of telegraph engineers, suggesting that the schedule was the work of a zealous, but perhaps somewhat unbalanced committee. It may fairly be said that a schedule written in more general terms and with less attempt to cover the whole field of engineering in minute detail might have been more influential. No matter how representative and expert the committee, it is foolish to think that it could have covered all kinds of engineers, or have dealt with those it did cover with equal skill, either then or now.

A few random examples will suffice to show the general level of salaries recommended: chief highway engineer, $8,000-$10,000: city engineer of a large city, $12,000-$15,000; designing engineer, $5,000-$7,000; general manager (technical) of power utility, $5,000-$8,000; draftsman, $1,800-$3,000; surveyor, $12.50-$20.00 per day. Inflated to 1954 dollars, these rates do not seem out of the way.

The July, 1919, *Journal* is, of course, still promoting the model engineers' licensing act, but there was a lull in activity in this matter at that time. Some Juniors and Students objected to the proposed act because they felt that it might encourage employers to fill minor engineering positions with men without technical training. In a letter to the editor, Mr. C. C. Kirby said, "The students and juniors of the profession should be advised to rely upon their ability to perform their work more efficiently than untrained persons, to obtain employment . . . in the lower stages of the profession, rather than seek protection by legislation, which no other profession enjoys." Another correspondent thought that setting up provincial associations would "impair the usefulness" (polite for "ruin") of the Institute and so proposed that "provincial divisions" of the Institute should become the licensing bodies. Of course, time has proven his fears groundless.

The Niagara Branch wanted Clause i, Section 7, struck out of the act. This clause provided that assistants working under a professional engineer and responsible to him only, should not be considered to be professional engineers.

Letters from six M.P.'s were published, all supporting the campaign for better pay for engineers in the Civil Service. It was also noted that the Acting Minister of Trade and Commerce "has given notice of . . . the bill providing for the reclassification of the Civil Service . . . (which) will . . . straighten out some of the present difficulties."

The Council meetings reported in this number of the *Journal* were concerned almost wholly with routine matters. We do note, however, that "Ross Leonard Dobbin, B.A.Sc., in full charge of water supply and design, Peterboro Utilities Comm., Peterboro, Ont." was advanced to the grade of Member, and that "Thomas Richardson Loudon, B.A.Sc., (Univ. of Toronto) of Victoria, B.C., since May, 1916, Major with C.E.F., 2nd in Command, 1st Batt., Ry. Troops, at present, C.R.C.E., Mil. Dist. No. 11," was also promoted to Member. The first will be recognized as president of the Institute in 1953-54, and the second as Professor T. R. Loudon, who was instrumental in training aeronautical engineers for the R.C.A.F. in 1940-45.

About 70 Montreal members gave Gen. C. H. Mitchell, C.B., C.M.G., D.S.O., a dinner at the Ritz Carlton Hotel to welcome him home from overseas service and to celebrate his appointment as dean of the Faculty of Applied Science and Engineering at the University of Toronto. The banquet menu was most "posh", engraved, with a portrait of Gen. Mitchell and with all his honours set forth at length. On arrival in Toronto, he was given "an informal dinner by the Engineers' Club and the Engineering Institute of Canada . . ."

There were three papers published in July, 1919. The longest and principal one was "The Bloor Street Viaduct, Toronto, Ontario," by

Thomas Taylor. This was a most complete description of the two three-hinged steel arch bridges forming the improvement, a single span across the Rosedale ravine and a multiple span over the Don River and valley. The designer showed commendable foresight in providing for future lower decks in both bridges "as part of a subway system, should the development of the city render (it) desirable." Toronto now has its subway, of course, but so far has not made use of these provisions.

Considerable space in this paper was given to the design and manufacture of the concrete used in footings, piers, abutments, deck, etc. Aggregates and cement were carefully tested, but there was no mention of the quantities of water used in the various trial mixes, a factor which today would be considered of paramount importance. Strengths of standard cylinders made during construction ran from 1,690 to 3,005 p.s.i. for 1:2½: 5 concrete, and from 1,150 to 3,395 p.s.i. for 1: 2¾: 5½ concrete, covering a wider range than would probably be considered satisfactory today.

Quinlan & Robertson, Ltd., of Montreal, were the general contractors for the Don bridge, while the steel work was fabricated and erected by the Hamilton Bridge Co., Ltd. The Dominion Bridge Co., Ltd., furnished and erected the steel for the Rosedale bridge; the rest of the work on this bridge was done by the Raymond Construction Co., Ltd. The author was designing and construction engineer.

In another paper, Mr. Lawrence J. Burpee, its Canadian secretary, asked, "What Is the International Joint Commission?" and answered his own question by outlining the genesis, powers and activities of the Commission. He said it was created because the ways of conventional diplomacy were "too leisurely".

"A question . . . arises at some point on or near the International boundary . . . The local authorities have no power of jurisdiction. The injured parties (let us assume they are Canadian) appeal to Ottawa. The case, cumbered with red tape, travels deliberately through several . . . departments; rests . . . for weeks in the file baskets of (some) officials; is referred back and forth . . .; finally moves on to the Governor-General's Office, and is sent overseas to the Colonial Office in London. Thence it takes its dignified way to the Foreign Office, and back across the Atlantic to the British Ambassador in Washington. The Ambassador takes the matter up with the Secretary of State . . . and the weary process of red tape is repeated . . ."

A short paper, "Overhead and General Costs in Manufacturing," by Thomas R. Deacon, tried, successfully we think, to bring home to engineers the fact that the total cost of any product was made up of far more than merely the cost of material and labour. Mr. Deacon's points were illustrated by a number of homely anecdotes, of which we like this one "A . . . foundryman . . . offered to install cost systems for his local competitors at his own expense, as it cost him far more trying to meet their inaccurate estimates, based on inaccurate cost data, than it would . . . for him to hire cost experts for all of them."

This paper seems to have been the first dealing with the economics of engineering ever published in the *Journal*. It was certainly not the last, as engineers became more and more conscious that money was one of their materials, too.

---

# News of Other Societies

The second western regional conference of the **Chemical Institute of Canada** (18 Rideau Street, Ottawa 2) will be held in Vancouver, B.C., September 10-11, 1954.

---

Officers of the **Canadian Fan Manufacturers' Association** (P.O. Box 275, Windsor, Ont.) are: president, C. W. Johnson, vice-president of Canadian Sirocco Company; vice-president, K. W. Fraser, M.E.I.C., general manager of B. F. Sturtevant Company of Canada Limited; secretary-treasurer G. W. McCormick, Jr.

---

Meetings of the **American Institute of Chemical Engineers** (120 East 41st St., New York 17, N.Y.): September 12-16, 1954, Glenwood Springs, Colorado, Hotel Colorado; the annual meeting, New York City, December 12-15, 1954, Statler Hotel.

---

The University of Connecticut has announced the fourth annual management conference sponsored by its School of Business Administration, and the New England chapters of the **Society for the Advancement of Management**, August 20-28, 1954. Information and program are available from Harold E. Smalley, University of Connecticut, Storrs, Connecticut.

---

The 27th annual meeting of the **Federation of Sewage and Industrial Wastes Associations** (325 Illinois Bldg., Champaign, Ill.) is arranged for October 11-14, 1954, at Cincinnati, Ohio.

---

There will be an international meeting on technique of ships and navigation in Naples, Italy, under the sponsorship of the **National Council of Research** and other naval and marine engineering associations. Information about this meeting, called for the second fortnight of September, 1954, can be obtained from the Secretaria del Congresso di Scienza della Nave e della Navigazione, presso Mostra D'Oltremare, Napoli, Piazza Campi Flegrei.

---

## MARITIME PROFESSIONAL MEETING

Digby Pines—Sept. 8, 9, 10, 11, 1954

**Registration and Room Reservation Card**

Last name........................ Full Christian names........................

Address........................

Firm........................ Position........................

Accompanied by........................

(Give full names........................

and addresses)........................

Accommodation required........................ All rooms with twin beds and bath

Time of arrival........................ Date........................ By { car / bus / train / boat

**This tab can be used for registration. Clip it and send it by August 16, 1954, to: W. V. Lodge, M.E.I.C., P.Eng. P.O. Box 460, Halifax, N.S.**

# *Maritime Professional Meeting*

of the Maritime and Newfoundland Branches of the Engineering Institute of Canada and The Associations of Professional Engineers of Newfoundland, New Brunswick and Nova Scotia.

## *September 8, 9, 10, 11, 1954, The Pines, Digby, N.S.*

### Ladies' Program

The ladies will be welcome at all functions on the general program. In addition, special entertainment has been arranged by the Ladies' Committee.

•

**Registration:**

Wednesday, 2.30 P.M. to 9.00 P.M.

Thursday, 10.00 A.M. to noon

Advance—You can use the tab on the opposite page to register. Just clip it and send it to W. V. Lodge, M.E.I.C., P.Eng., P.O. Box 460, Halifax, N.S.

**Hotel:**

Convention rate at The Pines is $12.00 per person per day double, and $14.00 single, including meals. All rooms have twin beds and bath. It will be necessary for two guests to occupy each room. Assignment of rooms will be made by the Registration Committee.

**Dress:**

Dress informal.

**Fees:**

Registration fee will be $7.00 for members and $3.00 for ladies. These fees include all costs except golf, swimming and hotel.

**Transportation:**

Delegates planning to take the attractive boat trip across the Bay of Fundy on the S.S. Princess Helene, should obtain full particulars from Canadian Pacific agents. Early reservations are recommended.

## *Program*

### Wednesday, September 8

2.30 P.M. Regional Meeting of E.I.C. Council

9.00 P.M. Operation Night Cap

### Thursday, September 9

8.15 A.M. Early Bird Breakfast

10.00 A.M. Professional Sessions

"Some Industrial Applications of Fluid Drive"
Antony Vickers, Executive Director, Fluidrive Engineering Co. Limited, Isleworth, Middlesex, England.

"Gas Turbines"
Author to be announced.

1.00 P.M. Luncheon

Addresses by Mayor G. E. Morehouse, of Digby, N.S., W. L. Sagar, President of the Dominion Council, and D. M. Stephens, President of E.I.C.

2.45 P.M. Sports and Recreation

6.30 P.M. Reception

7.30 P.M. Dinner

Address by Allan MacEachen, M.P. for Richmond-Inverness, Federal Government.

10.00 P.M. Grand Ball

### Friday, September 10

10.00 A.M. Professional Sessions

"St. Lawrence Waterways"
S. W. Fairweather, Vice-President, Canadian National Railways.

"Atomic Power"
John Convey, Director, Mines Branch, Department of Mines and Technical Surveys, Ottawa.

1.00 P.M. Luncheon

Address by Leslie Roberts, Author

2.30 P.M. Golf Tournament

6.30 P.M. Reception

7.30 P.M. Dinner

Address by The Hon. J. R. Smallwood, Premier, Newfoundland.

10.00 P.M. Old Time Dance

### Saturday, September 11

As you like it.

# NEWS OF THE ASSOCIATIONS & CORPORATION

**Information received through co-operation with the provincial organizations**

## Nova Scotia

### Appreciation

The Association of Professional Engineers of Nova Scotia appreciates the privilege of receiving space in *The Engineering Journal* for a presentation of the activities of the Association.

For some time it has been the wish of Council to provide the membership at large with more information with respect to the work of the Council. It is the hope that the column in *The Engineering Journal* will help supply information which may be of interest.

### Syllabus Studied

A study of the Ontario, Quebec, and British Columbia Syllabus has been undertaken by the examining board of the Association, and in general the Syllabus seems to be satisfactory. However, some problems with respect to the cost of examinations need to be solved. Professor M. L. Baker, Vice-President of the Association, has made inquiries regarding this subject while attending Dominion Council Meeting at Toronto.

### Transfer Fee and Unity

The Transfer Fee for a member in good standing in any other provincial association or the corporation has been abolished when transferring his membership from such an association to the Nova Scotia Association.

A discussion of the J. Herbert Smith "Plan for Unity" was directed by Councillor J. W. MacDonald and Vice-President, Professor M. L. Baker. These two men were particularly qualified to lead the discussion because of their recent contact with members attending the E.I.C. Annual Meeting at Quebec.

The Association's prize to a Nova Scotia Technical College graduate has been increased by double the present amount.

### Officers Appointed

It is a pleasure to announce the following appointments:

Secretary-Treasurer and Registrar: J. D. Kline.

Dominion Councillor: President J. E. Clarke.

Representative on E.I.C. general council: Professor A. E. Flynn.

Representatives on Joint Finance Committee: W. H. Noonan and G. F. Bennett.

Members of Examining Board: W. A. Devereaux, K. E. Whitman, G. D. Stanfield, M .F. Dean, M. R. Foran and G. H. Burchill.

Nominating Committee: D. J. MacNeil, G. J. Currie, J. E. Clarke, Ira P. Macnab and J. D. Kline.

Executive Committee: J. E. Clarke, M. L. Baker, G. J. Currie, J. W. MacDonald and V. M. Coy.

Professional Relations Committee: Dr. Sexton, chairman, and C. N. Murray, F. C. Morrison, W. A. Devereaux, G. T. Clarke, G. D. Anderson, J. P. Vaughan and D. F. Kirk.

## Quebec

The address delivered by the new president at the Annual dinner of the corporation.

Dear Fellow Members:

I am happy to express to every one of you my most sincere thanks for the honour you have conferred upon me by electing me President of the Corporation of Professional Engineers of Quebec. I shall interpret this high consideration as a mark of confidence and with the special collaboration of Council I intend to do my utmost this year to prove worthy of it.

My first ambition would be to succeed in enhancing the prestige of the engineer. This I consider an imperative need over and above the satisfactory solution of the numerous professional problems which confront us.

If the profession is to be true to itself it is necessary that each member be endowed with precise scientific knowledge as well as with unquestionable moral values. Hence we need to limit the practice of the profession to people possessing these qualifications.

It is therefore necessary for the safeness of his profession that the engineer practise according to these principles and that he derive all the merit and the prestige accruing from his work; it is conversely necessary that no one else but he may do so.

As you can see this leads us to action respecting our Act in its present form to prevent further illegal practice and breach of ethics.

Your Council wishes to undertake this task immediately and feels that it can be successful only with the assistance of all the members of the Corporation. I have noted, for instance, that ideas vary considerably as to what constitutes a profession, practice of the profession, engineering work, professional services, and that as a result, our Act is given different interpretations by various individuals or groups, each believing itself to be right.

To clarify this situation, your Council has retained the services of a legal advisor who will attend all its meetings. We are confident that his knowledge will serve the purpose of establishing a better understanding of the profession in order to eventually increase the prestige of the engineer.

In closing I would like to assure you that your Council will seek, by every means, to co-operate with other engineering organizations of the country; and more particularly with those interested in setting up a "Plan for Unity of Engineers". A similar collaboration will be pursued with all other professions who work in fields closely allied to engineering.

GEO. DEMERS,
*President.*

## Ontario

### Dominion Council Annual Meeting

On May 26 to 29 the Ontario Association was privileged to act as host to the Dominion Council of Professional Engineers, gathering in Toronto for its Annual Meeting under the Chairmanship of Dean R. M. Hardy, of the University of Alberta. Each of the eight Provincial registering bodies was represented by either its president, vice-president or a past-president.

Such meetings—and this was the seventeenth Annual Meeting of Dominion Council—are productive of much that is worth while to the profession in Canada. What might take months to settle by correspondence can often be brought to a satisfactory conclusion during a few minutes conversation around a table. Provincial viewpoints are broadened to embrace the whole of Canada. From the interchange of ideas at Dominion Council there is being built a substantial foundation to the engineering profession in Canada.

#### Representatives of Sister Bodies

A very satisfying feature of the 1954 Annual Meeting of Dominion Council was the attendance of representatives of sister bodies and Government. Among Canadian technical bodies were The Engineering Institute of Canada, the Canadian Institute of Mining and Metallurgy, and the Chemical Institute of Canada, and from the Federal Civil Service Commission, its Chief of the Professional Examination Division, G. A. Blackburn. Dominion Council was further honoured by the presence of officers of leading professional engineering bodies in the United States—the National Council of State Boards of Engineering Examiners, the National Society of Professional Engineers and the Engineers Council of Professional Development, the last being represented by its chairman and a member of our own Association, Col. L. F. Grant.

#### Achievements

Very concrete evidence of the achievements of Dominion Council in its work of promoting greater uniformity in professional matters across the Dominion is to be found in the latest edition of the recommended Schedule of Minimum Salaries for Professional Engineers. A glance at the cover will reveal that the Schedule is published with the endorsation of eight of the nine Associations and the only reason the ninth was not included was that at the time of printing the results of a poll of the members on the matter were not complete.

The Syllabus of Examinations, now in use by our Association, bears the seals of two other provincial bodies and when the next edition is printed it is probable that this number will be doubled. Officers and members of past Dominion Councils must take considerable satisfaction in the fruits of their efforts.

#### The Consultant Is Well Qualified

While the professional engineer in Canada is gradually receiving the additional recognition which he desires and deserves, there still remain a number of persons in municipal administration, in industry, and even in the ranks of the profession itself who believe that industrial buildings are not within the scope of professional activity of the engineer.

To many, too, of the general public the term "Consulting Engineer" is associated with sewers, waterworks, roads and bridges. If, however, it is a proposed building that is under consideration will they turn immediately to the consulting engineer? All too frequently the answer is in the negative.

Where does the professional engineer fit into the picture as to design of industrial structures? Let us examine a few of the problems involved:

1. Consideration of process and flow with studies to produce the most efficient layout.
2. Examination of the site with regard to topography, transportation, provision for expansion, drainage and services; the examination of the soil, design of drainage and services, roads, parking lots, curbs, gutters, landscaping, and treatment of industrial waste, if necessary.
3. Structural design, plan, elevations, and details.
4. Design of process steam or heating plant, with distribution.
5. Design of any required ventilating or air conditioning system.
6. Design of electrical services and distribution.
7. Layout of machinery and equipment with connections.
8. Design of conveying or other special machinery or equipment.

Relative to the above, preliminary studies and sketches must be made and estimates prepared. Finally, the production of working drawings and specifications make it possible to obtain competitive bids and award a contract.

Analysis of items 1 to 8 will show clearly that all are engineering problems best solved by civil, mechanical and electrical engineers.

A firm of consulting engineers, by reason of the combined training and experience of its principals and staff, is best able to design an industrial plant in part or whole and to supervise the construction.

What about the aesthetic side, someone will ask. The art exhibit shown at the recent annual meeting of the Association surely indicates that the professional engineer is not lacking in artistic ability.

To those with industrial problems or who contemplate the building of new plants or extensions to existing ones we need have no hesitation in stating that the Canadian consulting engineer is well qualified to handle the job and to save money for his client.

## Saskatchewan

#### Minimum Salaries Approved

At a Council meeting held April 20, the Association approved of a Schedule of Minimum Salaries. This schedule is now endorsed by professional associations in Alberta, British Columbia, New Brunswick, Newfoundland, Nova Scotia, Ontario, Quebec, and Saskatchewan. Copies may be obtained from the Registrar's office.

#### Minimum Consulting Fees Adopted

The Saskatchewan Association has adopted a Schedule of Minimum Fees for professional engineering services, for an interim period of one year. This schedule was drawn up by a committee

**The executive of the Association of Professional Engineers of Newfoundland. Front row, left to right: M. A. Foley, secretary-treasurer, registrar; E. L. Ball, president; C. A. Knight, vice-president. Back row: Councillors W. Watson, C. H. Conroy, J. Breakey, E. Dickinson, immediate past president, E. M. Martin. Missing: Councillors E. Hinton, H. B. Carter, J. M. Hopkins, D. A. Poynter. The membership of the Association now stands at 104.**

headed up by Prof. A. Michalenko of the University of Saskatchewan, Saskatoon.

### Atomic Power Committee

J. W. Tomlinson, a member of the Saskatchewan Association, and general manager of the Saskatchewan Power Corporation, has been named to an advisory committee on atomic power being formed by the federal government. The committee is to consist of senior executive officers of all power commissions and corporations in Canada. The committee would keep those producing power in Canada informed of the progress in developing feasible atomic power production.

Trade Minister C. D. Howe announced formation of the committee in a statement on atomic power in the House of Commons on June 2.

## Alberta

### President's Report

The following report was presented at the 34th Annual Meeting of the Association of Professional Engineers of Alberta, held at Calgary, March 27, 1954:

### Growth of the Association

The reports presented to you by the Chairmen of our various committees and by our representatives on other organizations have given you a broad picture of the work carried on by the Association during the past year. It has been a year of continuing steady growth in membership, which we believe was greatly assisted by the tour which our Executive Secretary made last summer to many outlying points where engineers are stationed. We feel that this work of making contact with engineers who often have no other chance to hear personally about their Association is well worth while, and is appreciated by the members visited.

In spite of increased expenditures, you have heard that our net income added to surplus amounted to $778.40. This indicates the higher income from increased fees and from growing membership, but it also reflects the careful administration of our funds by the Council and efficient management by our Registrar and Executive Secretary.

Many other matters engaged the attention of your Council at its seven regular meetings and three special meetings. Most of these have been mentioned in the various issues of your paper, "The Alberta Professional Engineer," and particularly in the review given in the January, 1954 issue. I need not elaborate on some of these at this time as they will be dealt with at the Forum Sessions this afternoon. However, some others should perhaps be mentioned to bring you up to date.

### Legislation

A proposed revision of The Alberta Boilers' Act was issued for the consideration of all concerned, but after representations from various sources, including our Committee, had been made, the Department decided to hold the Bill over for one year. This will allow more study of the proposals and a better opportunity for everybody interested in the Act to make further representations.

### Co-operation and Uniformity

It has been encouraging to note the progress made in friendly relations and in co-operation between the various Associations of Professional Engineers. Uniformity in examination requirements and qualifications for membership is gradually being reached. One example of improvement in relations has been the recent dropping of the transfer fee between a number of the associations and it is hoped that this will be extended to all the associations in the near future. As a result of this willingness to co-operate it would appear that there is now a possibility that the "Plan for Unity" suggested by J. Herbert Smith, P.Eng., Past President of the Association of Professional Engineers of Ontario, or some similar plan, will have a chance for success. Personally, I sincerely hope that this will be the case. It has always been a matter of regret that the Engineering Profession has not had one strong single organization to speak for the entire profession. This matter will be dealt with in "The Forum" this afternoon.

### Engineers Welfare

The Salary Survey will also be discussed at the Forum. There is a great deal of work involved in such a survey and it takes months to complete. Some of our members were perhaps a little disappointed that the results could not be made available to them sooner than was the case, but every effort was made to complete the survey as rapidly as possible.

In the matter of Salary Negotiations by groups of our Members, I should like to assure all our members that your Council is most desirous of giving every assistance possible. There are usually two stages necessary. First, job descriptions must be written up and all the positions classified by grades. Then the second stage can be started to negotiate salary ranges for each grade. How far the Association should go in assisting members in such negotiations is a question upon which the Council will welcome your opinions and directions. The breadth of our membership is possibly a cause of difficulty in dealing with this problem. We accept the principle that every engineer should enjoy a salary comparable with other salaries paid for similar work in the same area. But we do not only have members who are employees on salary, we also have members who are managers and employers, and members who are consultants. We can easily become involved in delicate and embarrassing situations.

### Public Relations

The status of our Profession is always of concern to all of us. It has seemed to me that our standing in our communities will be commensurate with the parts which we play in those communities. If we accept responsibility for, and give leadership in community activities our prestige among our fellow citizens will rise. The number of engineers taking part in service clubs, giving of their time and effort on committees and boards for community projects, charitable institutions, athletic associations, Chambers of Commerce, churches and so forth is increasing. We should every one accept opportunities to play our part in these activities. Unfortunately we may not always be known as engineers. But that recognition, I believe, will come, and we can assist by making it known that we are engineers.

That is a good beginning, but I feel that we have an obligation to go further. Some of us should offer to serve on city or municipal Councils, on School Boards, or even become politically minded and run for the Provincial Legislature or for Parliament. Many of us cannot afford the time for these things, but consider how many of us reach retirement age in good health, and with a wealth of training and experience. Men like C. D. Howe and others have blazed the trail. Many more of us should be willing to follow. This, I feel, is the surest way to raise the standing of our Profession.

It has been a pleasure during the past year to work in the Association with so many men whose ability, friendliness, and efforts on behalf of the Profession I so greatly admire. The co-operation and support and advice of all Members of Council and of the Registrar and Executive Secretary have been outstanding. I deeply appreciate these things and am grateful for the year's experience, and the honor which you did me when you elected me President.

J. J. Hanna,
*President*

***The Maritime Professional Meeting***

of The Engineering Institute and the Associations of Professional Engineers of Nova Scotia, New Brunswick and Newfoundland.

September 8, 9, 10, 11, 1954.

***The program is on page 857 of this issue***

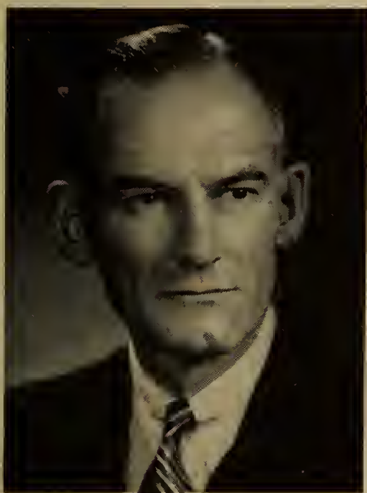
# Personals

**News of the Personal Activities**

**of**

**Members of the Institute**

**K. F. Tupper,** M.E.I.C., until recently dean of the Faculty of Applied Science and Engineering at the University of Toronto, has been appointed president



K. F. Tupper, M.E.I.C.

of Ewbank & Partners (Canada) Limited of Toronto. The new Canadian company is associated with Ewbank & Partners Ltd. of London, England, thermal and electrical engineering consultants, well known in Britain, the Middle East and other parts of the world.

Mr. Tupper has been with the National Research Council and Turbo Research Limited, engaged on the research and design of gas turbines. In 1947 he became director of the engineering division of the atomic industry project at Chalk River. Two years later he was appointed to his post at the University of Toronto.

The new company will operate in close association with Crippen Wright Engineering Limited, engineering consultants in the hydro and civil engineering fields in Vancouver, B.C.

**G. L. Macpherson,** M.E.I.C., has been recently elected a director of Imperial Oil Limited.

General manager of the company's refining operations in Toronto, Mr. Macpherson graduated in mechanical engineering from the University of Toronto in 1920 and entered Imperial Oil Limited as a draughtsman in 1922 in Sarnia where he was employed on the designs for the company's Calgary refinery.

In 1930 the company sent him to the Massachusetts Institute of Technology to study advanced details in refinery design, and on his return he was engaged in the development of refinery equipment.

He was appointed assistant chief engineer in 1937 and six years later, he was named chief engineer, and subsequently manager of the engineering and development division. He became general manager of the company's manufacturing operations in 1949. One of his jobs during World War II was helping to build and set in operation the Polymer Corporation plant at Sarnia.

Mr. Macpherson is a past-president of the Association of Professional Engineers of Ontario. He has also served as chairman of the Sarnia Branch of the Institute and as councillor representing that Branch.

**A. Eric Rankine,** M.E.I.C., was elected a director of Racey, MacCallum and Associates Limited at the annual meeting of the company in May, 1954, and

A. Eric Rankine, M.E.I.C.

has moved to Toronto to direct the operation of the Toronto office.

He is a graduate of Glasgow University in both mechanical and electrical engineering. After serving a post-graduate apprenticeship with Metropolitan Vickers Electric Co. Ltd., he was for some years area engineer for Shell Mex Brazil Ltd.

Upon his arrival in Canada in 1952, Mr. Rankine joined the firm of Charles Warnock and Company Limited which he subsequently left to become one of the original members of his present company when it was formed later that year.

Mr. Rankine is a member of the Association of Professional Engineers of Ontario, and an associate member of the Institution of Electrical Engineers of Great Britain.

**W. Sefton,** M.E.I.C., has been appointed to the position of chief engineer and director of W. V. Zinn & Associates Ltd., consulting engineers in Toronto.

W. Sefton, M.E.I.C.

Previous to this appointment Mr. Sefton was senior engineer supervising design with C. D. Howe Co. Ltd. in Montreal. Some of the projects on which he was employed were the Seven Islands Terminal for the Labrador Quebec Iron Ore scheme, grain elevators, docks and general structural work.

Mr. Sefton graduated from the University of London in 1938 and served with the Royal Engineers with the rank of captain during World War II in the United Kingdom, Africa, Italy and the Middle East. He was wounded at Anzio and was mentioned in despatches.

His earlier engineering experience in the United Kingdom included much structural design on industrial projects. He also served as resident engineer on the construction of a $50 million atomic factory.

Mr. Sefton, who is an authority on concrete shell roofs, delivered a paper on this subject to the Montreal and Ottawa Branches of the Institute, as well as to the Province of Quebec Architects Association. He has devised the only fully precast prestressed type of shell.

Mr. Sefton is an associate member of the Institute of Civil Engineers, the Institution of Structural Engineers, and the American Society of Civil Engineers.

**W. P. Ferguson,** M.E.I.C., has been appointed president and general manager of Peacock Brothers Limited of Montreal. He was previously general sales manager.

W. P. Ferguson, M.E.I.C.

Mr. Ferguson received his engineering degree from McGill University in 1924 and has been with Peacock Brothers since that time. He was in charge of the Toronto and Sydney offices, and was a director and western manager of the company in Vancouver before coming to Montreal in 1947.

**Robert W. Johnstone,** M.E.I.C., has been appointed a vice-president of the Foundation Company of Canada Limited.

Mr. Johnstone came to Canada in 1925 from Scotland where he received his training as a civil engineer. During his long service, Mr. Johnstone has been responsible for the construction of a number of major projects in the commercial, industrial and mining fields in Ontario.

Mr. Johnstone, who is also a vice-president of the Foundation Company of Ontario Limited, is a member of the Association of Professional Engineers of Ontario, a fellow of the Royal Institution of Chartered Surveyors, a member of the Royal Sanitary Institute, and a member of the Toronto Board of Trade.

**Lt.-Col. W. D. Kirk, O.B.E.,** M.E.I.C., chief engineer and a director of E. G. M. Cape and Company, has recently been appointed a vice-president of the company.

Lt.-Col. Kirk received his B.Sc. degree from Queen's University in 1928.

Lt.-Col. W. D. Kirk, M.E.I.C.

He entered E. G. M. Cape and Company in 1935 as resident engineer on a Montreal Harbour project.

During World War II he served with the R.C.E., and was awarded the O.B.E in 1945.

Lt.-Col. Kirk was appointed chief engineer of E. G. M. Cape and Company in 1949.

**James S. Whyte,** M.E.I.C., **chief engineer** of Shawinigan Chemicals Limited at Shawinigan Falls since 1927, has been appointed a vice-president of the company in charge of engineering.

Mr. Whyte will continue to make his headquarters at Shawinigan Falls, but will act also as consultant to the engineering department of Midwest Carbide Corporation which is associated with Shawinigan Chemicals, in connection with its carbide plants at Keokuk, Iowa, and Pryor, Oklahoma.

Born near St. Thomas, Ont., Mr. Whyte was educated there and at Queen's University where he received his degree in electrical engineering in 1914. After two years in the Cobalt

J. S. Whyte, M.E.I.C.

and Porcupine mining areas of Ontario, he came to Montreal to join Canadian Electro Products Company, at that time a newly-organized direct subsidiary of Shawinigan Water & Power, and later in 1916 he was transferred to Shawinigan Falls for the construction of its plant.

A year later he was put in charge of the construction of a war plant for American Electro Products at Shawinigan, and then was transferred to Canada Carbide Company. He was appointed chief engineer of the combined companies when Shawinigan Chemicals was formed 27 years ago.

Mr. Whyte is a member of the Corporation of Professional Engineers of the Province of Quebec.

**G. E. Sarault,** M.E.I.C., has been elected chairman of the Quebec Branch of the Engineering Institute for the term 1953-54.

He was born in Montreal and attended Mont St. Louis College there, and later McGill University where he received his electrical engineering degree in 1934.

During the summer months of his university course he was employed by Beauharnois Power Construction Company, the Laurentian Forest Protection Association, and Canadian Electronics. Upon graduation he joined Northern Electric Company Limited where he remained until 1938 when he entered the Canadian Broadcasting Corporation as engineer in charge of the CBF transmitter. The following year he was named CBC regional engineer for the Province of Quebec.

G. E. Sarault, M.E.I.C.

Mr. Sarault continued in that capacity until 1942 when he joined the staff of Laval University, becoming head of the department of electrical engineering. At the same time he served as a consultant and subsequently formed the firm of Tasse, Sarault and Associates, specializing in the electrical, heating and ventilating fields.

In 1953 he resigned his position as director of the electrical engineering department of Laval University, but has continued to serve on the staff as professor.

Mr. Sarault served as vice-chairman of the Quebec Branch of the Institute in 1953. He is a member of the Corporation of Professional Engineers of the Province of Quebec.

**Professor H. R. Theakston,** M.E.I.C., head of the department of engineering of Dalhousie University, has been awarded the honorary degree of Doctor of Engineering by the Nova Scotia Technical College.

Professor Theakston joined the faculty at Dalhousie University in 1921 as assistant professor of engineering and engineer-in-charge of buildings and grounds. He became professor of engineering in 1929 and head of the department in 1946.

He is a member of the Association of Professional Engineers of Nova Scotia, the American Society for Engineering Education, the Canadian Standards Association, and the senates of Dalhousie University and the Nova Scotia Technical College.

**Dr. Ira P. Macnab,** M.E.I.C., general manager of the Public Service Commission in Halifax, N.S., has been granted the degree of Doctor of Engineering by the Nova Scotia Technical College at its recent convocation.

Dr. Macnab is a past-president of the Association of Professional Engineers of Nova Scotia, the Dominion Council of Professional Engineers and the Engineering Institute.

He is a member of the executive of the Nova Scotia Accident Prevention Association, the board of the Children's Hospital and the board of governors of the Nova Scotia Technical College. He is at present serving his second term as president of the Halifax Board of Trade.

**Donald F. MacIsaac,** M.E.I.C., of Halifax, president of the Atlantic Construction Company and Industrial Machinery Company Limited, was awarded the honorary degree of Doctor of Laws at the post-centenary convocation of St. Francis Xavier University on May 26.

Mr. MacIsaac, a native of Dunmore, Antigonish County, graduated from St. Francis Xavier University in 1909. He subsequently studied at Pennsylvania University where he received his B.Sc. and C.E. degrees.

He is a member of the Association of Professional Engineers of Nova Scotia and of the Canadian Construction Association.

In the Halifax area he has engaged in the work of hospital administration and is a member of the Nova Scotia Housing Commission. He is a member of the board of governors of St. Francis Xavier University and a former president of its Alumni Association.

**Professor F. H. Sexton,** M.E.I.C., president emeritus of the Nova Scotia Technical College was awarded the honorary degree of Doctor of Laws by St. Mary's University at its recent convocation.

Professor Sexton received his early education in New Hampshire and his degree of B.Sc. from the Massachusetts Institute of Technology in 1901. In the years that followed he lectured at the Institute, at Dalhousie University and at the Nova Scotia Technical College.

He was employed for two years as research metallurgist with the General Electric Company in Schenectady, N.Y., and later was appointed assistant professor of mining engineering at Dalhousie University.

In 1907 he was appointed president of the Nova Scotia Technical College and director of technical education for Nova Scotia. He retired in 1947.

Professor Sexton was awarded the Julian C. Smith Medal by the Engineering Institute in 1944. He has served as president of the Mining Society of Nova Scotia, the Canadian Education Association and the Nova Scotia College of Art. He also served as chairman of the Curriculum Revision Committee of the Nova Scotia Department of Education and was a director of the Nova Scotia Research Foundation and a member of the provincial advisory committee on vocational education. He is now a member of the board of governors of the Nova Scotia Museum of Science.

**J. T. Dyment,** M.E.I.C., director of engineering for Trans-Canada Air Lines, was awarded a fellowship in the Royal Aeronautical Society at the annual general meeting recently held in London, England.

The honour is bestowed each year on an aviation expert who has contributed to the technical development of air transportation.

Mr. Dyment is a native of Barrie, Ont., and an engineering graduate of the University of Toronto. Before joining TCA in 1938, he was associated with the Ford Engineering Laboratories at Dearborn, Mich., the aeronautical division of the Department of National Defence, and the Dominion Department of Transport.

Since 1945 he has been a member of the technical committee of the International Air Transport Association and has been chairman of two symposia dealing with turbine power and helicopters.

He served as chairman of the Winnipeg Branch of the Institute in 1943, and in 1945 was awarded the Gzowski Medal of the Institute for his paper "The Engineering Selection of an Airline Aeroplane".

W. K. Gwyer, M.E.I.C.

**W. K. Gwyer, M.B.E.,** M.E.I.C., assistant manager of the engineering division of Consolidated Mining and Smelting Company of Canada Limited in Trail, B.C., has been elected chairman of the Kootenay Branch of the Engineering Institute.

Mr. Gwyer was born in Vancouver B.C., and obtained his elementary education in Penticton, B.C. He then entered the Universitv of British Columbia where he received his B.A.Sc. degree in civil engineering in 1936.

Previous to graduation he was employed as instrumentman on highway location and topographical survey.

In 1936 he served as superintendent of road construction with E. J. Ryan & Associates. Two years later he became superintendent of construction on National Defence projects for Northern Construction Company and E. J. Ryan Ltd.

Mr. Gwyer served with the Royal Canadian Air Force from 1940 until 1945. During that time he was navigator-pilot and O/C of Experimental Flying at E.C.F.S., England. He was later created a Member of the British Empire.

In the five years following the war Mr. Gwyer was associated with the firm of Stevenson and Kellogg Limited and was engaged in plant layout, time, method and organization studies, job evaluation, as well as standard cost and budgetary control installations.

He joined Consolidated Mining and Smelting Company of Canada Limited in Trail, B.C., as assistant to the construction superintendent in 1950. In 1953 he was appointed assistant manager of the company's engineering division.

**Jean P. Carriere,** M.E.I.C., has been appointed chief engineer of the development engineering branch of the Department of Public Works.

This announcement was made by Public Works Minister R. H. Winters, M.E.I.C., who stated that the position of chief engineer of the development engineering branch has been newly created to give more direct supervision over work which has become the responsibility of the Department following the change in Cabinet portfolios last September.

Mr. Carriere has had experience as an engineer in both government and private practice. He was born in Hull, Que., and was educated at College Notre Dame, and Ecole Technique in Hull, and at LaSalle Academy and the University of Ottawa.

He served in various engineering capacities with the Department from 1929 to 1940 in Ottawa, and in the Districts to Rimouski, Montreal, Quebec and London, Ont.

In 1940 he was posted overseas as an officer with the Royal Canadian Engineers. Upon his return to Canada in 1942, he attended the War Staff course and later became a member of its staff. He went overseas again in 1943 and took part in the invasion of Europe as engineer in charge of construction of defence airfields. His final appointment in the field was that of deputy chief engineer for the First Canadian Army, and as such, he carried special responsibility for the construction of bridges across the Rhine and its tributaries. For his war services he was created an Officer of the Order of the Crown by Belgium, and Chevalier de la Legion d'Honneur by France. He was also awarded the Croix de Guerre avec Palme by the French Government.

In 1945 he was discharged with the rank of brigadier, and returned to his position in the engineering branch of the Department of Public Works at Ottawa, remaining there until early 1946 when he resigned from his position

**J. P. Carriere, M.E.I.C.**

to become chief engineer for the City of Hull, Que.

During the following three years he was a member of the National Capital Planning Committee and a member of its various sub-committees.

He was appointed chief engineer of Dufresne Engineering Co. Ltd. of Montreal in 1949, and since 1951, has served as chief engineer of Collet Freres Ltd. in Montreal.

Mr. Carriere is a member of the Corporation of Professional Engineers of the Province of Quebec.

**E. K. Cumming,** M.E.I.C., president of Cumming Galbraith Limited, has been elected chairman of the Edmonton Branch of the Engineering Institute.

Mr. Cumming was born in Cayley, Alta., and received his early education there and at Nanton. He began his engineering course at the University of Alberta and completed his two final years at McGill University, graduating with a B.Eng. degree in mechanical engineering in 1944.

He then served as an engineer lieutenant with the Royal Canadian Naval Volunteer Reserve in the European area, after which he was appointed instructor in mechanical engineering at the University of Alberta, and at the same time supervisor of building construction at the university.

In 1948 he formed Cumming Galbraith Limited to handle the supply of heating, ventilating and air conditioning equipment for the C. A. Dunham Company, the Canadian Sirocco Company, and Powers Regulator Company of Canada Ltd.

Mr. Cumming is a director of several

**E. K. Cumming, M.E.I.C.**

other Alberta companies. He is a member of the Association of Professional Engineers of Alberta, and is at present chairman of the Association's Public Relations Committee.

**Dugald Cameron,** M.E.I.C., president of Dugald Cameron Associates Limited in Malton, Ont., and director of Thomas C. Wild Machinery (Canada) Limited, has been appointed vice-president and managing director of Dexion (Canada) Limited.

Mr. Cameron has been connected with the steel industry for over 30 years. He received his engineering training in Scotland before coming to Canada in 1923. He is a member of the Association of Professional Engineers of Ontario.

**R. B. Spence,** M.E.I.C., has been appointed general sales manager of Canadian Vickers Limited in Montreal. Before his recent appointment he was assistant sales manager of the company.

Mr. Spence is a graduate in chemical engineering of the University of Toronto, class of 1948.

**John B. Stirling,** M.E.I.C., has been elected president of the Montreal Better Business Bureau for the year 1954-55. He succeeds Romuald Bourque, M.P.

**J. G. G. Kerry,** HON. M.E.I.C., has completed 60 years of corporate membership in the Engineering Institute this year. A partner in the consulting engineering firm of Kerry & Chace Limited, Mr. Kerry retired from active engineering work in 1939. Before his retirement he was president of the Northumberland Paper & Electric Company, president of Seymour Electric Power Company and associated companies, and president of Quinte & Trent Valley Power Company. He was also secretary of Boundary Investments Limited.

Mr. Kerry joined the Canadian Society of Civil Engineers as a Student in 1888, transferred to Associate Member in 1894, and became a full Member in 1904. He was granted Honorary Membership in the Institute in 1952.

Mr. Kerry was awarded the Gzowski Medal of the Institute for his paper "The Winter Temperature Cycle of the St. Lawrence Water" which appeared in the January, 1946 issue of the *Journal.*

**Gaston Masse,** M.E.I.C., superintendent of the gas and electricity department of the City of Sherbrooke, Que., has been elected chairman of the Eastern Townships Branch of the Engineering Institute.

Gaston Massé, M.E.I.C.

A native of Sherbrooke, he received his elementary education at local schools and St. Cesaire College, after which he obtained his B.A. degree from St. Charles Borromée Seminary in 1926. In 1931 he graduated with a B.Sc. degree in electrical engineering from McGill University.

During his first two years after graduation Mr. Massé was on the staff of Crepeau and Cote, consulting engineers, and on the staff of the Provincial Road Department.

In 1933 he entered the gas and electricity department of the City of Sherbrooke. He was appointed general superintendent of the department in 1939.

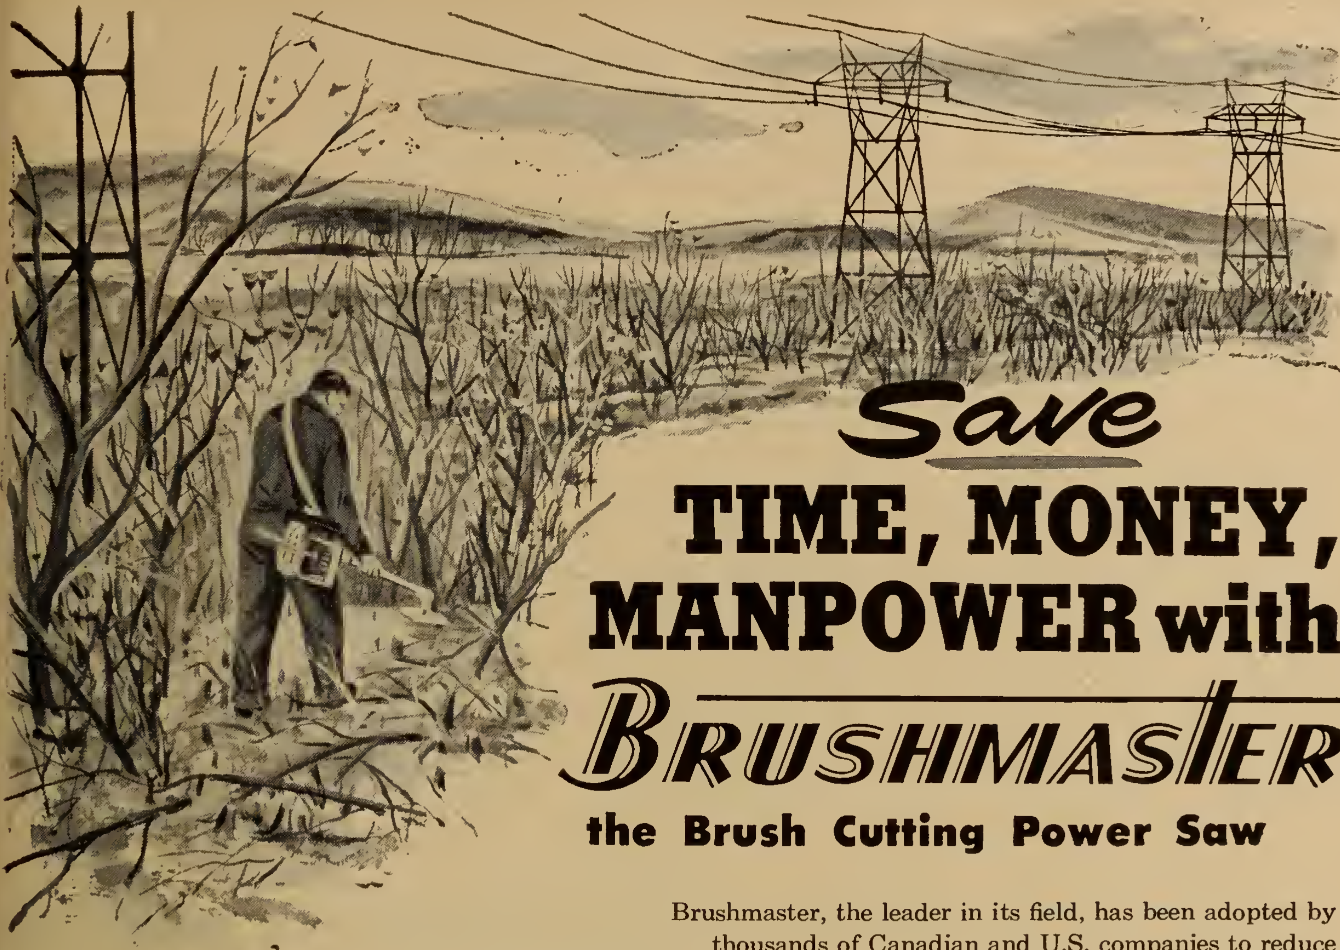
Mr. Massé is a member of the Corporation of Professional Engineers of Quebec, and of Les Fusilliers de Sherbrooke.

**A. H. W. Busby,** M.E.I.C., has resigned his position as superintendent of engineering research and development with Consolidated Mining and Smelting Company of Canada Limited in Trail, B.C., to join the Anglo American Corporation of South Africa, Ltd., as assistant consulting mechanical and electrical engineer.

Mr. Busby completed his apprenticeship with General Electric Company in Birmingham in 1918, and served with the Royal Air Force during 1918 and 1919 before entering the University of Birmingham where he received his degree in mining engineering in 1923.

He was electrical research engineer with the British Mines Department before coming to Canada in 1924 and joining the electrical department of the Consolidated Mining and Smelting Company in Trail, B.C.

Since 1927 he has occupied successively the positions of assistant superintendent of the electrolytic department of the zinc plant, senior research assistant in the research department, senior research engineer and supervisor of the instrument and physical testing division, superintendent of physical research, and superintendent of engineering research and development.



# *Save* TIME, MONEY, MANPOWER with BRUSHMASTER®

## the Brush Cutting Power Saw

Brushmaster, the leader in its field, has been adopted by thousands of Canadian and U.S. companies to reduce brush cutting costs . . . every day Brushmaster is being discovered as the answer to a new and tough brush problem.

Brushmaster is being used for cutting surveyors' lines and roadside brush; thinning timber stands; improving woodlots; swamping in pulp and paper industry; clearing dam sites, land and irrigation ditches; removing brush from power, telephone and oil pipe line right-of-ways . . . portages; maintaining parks and golf courses; thinning plantations and weeding young stands of inferior species; making fire breaks and clearing railroad right-of-ways; cutting ski trails and bridle paths. Brush clearing contractors find it their handiest tool.

Brushmaster is precision-engineered for safety and tough commercial use. With it one man can do the work of at least six handcutters—it pays for itself in 10 to 15 days.

*INVESTIGATE BRUSHMASTER ECONOMY TODAY!*

**BRUSHMASTER®**
*is now saving*
**TIME, MONEY, MANPOWER**
*for these firms . . .*

Hydro Quebec • Canadian Pacific Railway • Northern B.C. Power • Ontario Hydro Electric Power • Shawinigan Water & Power • Southern Canada Power • Canadian National Railways Shawinigan Engineering Co. • Canadian International Paper • and many others.

Trims limbs neatly . . . quickly.

Cuts trees up to 8" in diameter.

Ideal for hard-to-reach places.

Mr. Busby is a member of the Association of Professional Engineers of British Columbia, the National Association of Corrosion Engineers, the Instrument Society of America, and the Society of Experimental Stress Analysis.

He is a past-chairman of the Kootenay Branch of the Engineering Institute. In 1949 he was awarded the Gzowski Medal of the Institute for his paper "Localized Overheating in the Wall of a High Pressure Vessel and its Effect on Rupture Strength".

**J. T. Turnbull,** M.E.I.C., who recently retired as district highway engineer of the New Brunswick Department of Public Works in Fredericton, has been appointed engineer for the Parish of Simonds, N.B.

Mr. Turnbull's engineering career dates back to 1903 when he joined the staff of Canadian Pacific Railways in the Lake Superior region.

He was transferred to Saint John, N.B., in 1910 and was engaged on a right-of-way survey for the company. Three years later he went into private practice with D. R. Smith, M.E.I.C., now city engineer of Woodstock, Ont., and from 1917 to 1920 he worked with the Saint John Dry Dock Company.

His 28 years with the Department of Public Works began in 1926.

Mr. Turnbull is a past-president of the Association of Professional Engineers of New Brunswick.

**A. D. Harris,** M.E.I.C., formerly chief maintenance engineer in the manufacturing division of Ford Motor Company of Canada Limited in Windsor, Ont., retired from the company at the end of 1953.

Mr. Harris joined the company in 1922 and during that time filled a number of key engineering positions.

In 1935 he was moved to New Zealand where he spent two years supervising the construction of a new plant for the Ford Motor Company of New Zealand.

He became acting head of the engineering department at Ford of Canada in 1941 and chief plant engineer the following year.

**J. M. King,** M.E.I.C., has been appointed general manager of the J. J. Turner Company of Peterborough, Ont.

A graduate in metallurgical engineering of the University of Toronto, Mr. King has been engaged in a series of manufacturing and engineering projects with Canadian General Electric Company Limited since 1940.

He is a member of the council of the Association of Professional Engineers of Ontario, and a past-chairman of the Peterborough Branch of the Engineering Institute.

**S. H. Lassman,** M.E.I.C., is now an associate in the Montreal consulting engineering firm of Mendel, Brasloff, Lassman and Sidler.

Previous to joining the company, initially known as Mendel & Brasloff, in 1951, Mr. Lassman was employed by A. D. Ross & Co.

He is a graduate in electrical engineering of the University of New Brunswick, class of 1945.

**Andrew Ferguson,** M.E.I.C., is now associated with Alumina Jamaica Limited in Jamaica, B.W.I.

Before his transfer to Jamaica he was on the staff of the general engineering department of Aluminum Company of Canada, Ltd. in Montreal.

Mr. Ferguson received his B.Sc. degree in mechanical engineering from the University of Glasgow in 1924.

**V. R. Currie,** M.E.I.C., formerly commissioner of works in Kingston, Ont., is now with the engineering department of the City of Ottawa.

Mr. Currie has been commissioner of works in Kingston since 1949.

He is a graduate of Queen's University, class of 1923, and had been formerly associated with the Department of Transport.

**A. E. Hanson,** M.E.I.C., is now director of works for the City of Saint John, N.B.

He was previously parish engineer for the Parish of Simonds, N.B.

Mr. Hanson is a 1929 graduate in civil engineering of the University of New Brunswick.

**John McLellan,** M.E.I.C., has been appointed chief of engineering sales by Standard Iron and Steel Works Limited in Toronto.

He was previously structural checker with Dominion Bridge Co. Ltd. in Toronto, Ont.

**J. A. Campbell,** M.E.I.C., has been promoted to the position of manager of distribution planning for Northern Electric Co. Ltd. in Montreal. He was previously distribution engineering superintendent.

Mr. Campbell graduated in electrical engineering from the University of Toronto in 1935.

**E. J. Bartley,** M.E.I.C., is now supervising electrical engineer with Foundation of Canada Engineering Corporation Limited in Toronto, Ont.

He was previously employed in the plant engineering sub-division of Ford Motor Co. of Canada Limited in Windsor, Ont.

Mr. Bartley is an electrical engineering graduate of the University of Toronto, class of 1941.

**David Beattie,** M.E.I.C., has been appointed sales engineer in the Toronto office of Powerlite Devices, Limited, according to a recent announcement by Dudley S. Young, M.E.I.C., vice-president of the company.

Mr. Beattie is an honour graduate of the University of Toronto in engineering physics, class of 1949, and has been affiliated with the James R. Kearney Corporation as a sales engineer in both Ontario and British Columbia for the past four years.

**David Beattie, M.E.I.C.**

During the war he served with the Canadian Army and gained considerable experience with military radar equipment.

He is an associate member of the American Institute of Electrical Engineers, and a member of the Association of Professional Engineers of Ontario.

**H. S. Marmorek,** M.E.I.C., has been appointed assistant works manager with Radio Engineering Products Ltd. in Granby, Que.

He was formerly supervisor of production control with the Canadian General Electric Company in Montreal.

Mr. Marmorek received his B.A. and M.A. degrees in mechanical science from Cambridge University in 1940 and 1944, respectively.

**John R. Cooper,** M.E.I.C., is design engineer with the Standard Steel Construction Company, a branch of the United Steel Corporation in Welland, Ont.

Before joining this company he was associated as design engineer with the Dominion Bridge Company in Lachine, Que.

Mr. Cooper is an associate member of the Institute of Structural Engineers.

**V. M. Wallingford,** M.E.I.C., previously with Anglo-Canadian Pulp and Paper Mills Ltd. in Quebec City, has joined the staff of Mannix Limited in Montreal, Que.

Mr. Wallingford is a graduate in civil engineering of the University of Toronto, class of 1944.

**E. B. Wilkins,** M.E.I.C., has been appointed district airway engineer in Lethbridge, Alta., by the Department of Transport.

He was previously resident engineer on the Department's runway evaluation program in Lethbridge.

Mr. Wilkins graduated in civil engineering from the University of Alberta in 1943.

**E. Klug-Andersen,** M.E.I.C., has been transferred by the Foundation Company of Canada as resident engineer to Hamilton from Sault Ste. Marie where he had been employed as design and structural engineer.

Mr. Klug-Andersen received his M.Sc. degree in civil and structural engineering from the Technical University of Denmark in 1947.

**Camille Le Clair,** M.E.I.C., of Toronto, has recently combined his consulting practice and his engineering research organization under the firm name of Le Claire Engineering Company. Mr. Le Clair will continue as sole proprietor.

He is a member of the Institution of Mechanical Engineers.

**Robin R. Jackson,** M.E.I.C., has joined the radio and electrical engineering division of the National Research Council in Ottawa, having completed his studies at the Graduate School of Engineering of the Carnegie Institute of Technology.

Mr. Jackson is a graduate in electrical engineering of the University of Alberta, class of 1944.

**Ralph T. Morgan,** M.E.I.C., has accepted a year's contract with the United States Air Force at Goose Bay, Labrador, Que.

He was formerly plant engineer with Zwicker and Company Limited in Lunenburg, N.S.

Mr. Morgan is a mechanical engineering graduate of Queen's University, class of 1944.

**L. J. Laflamme,** JR.E.I.C., is now associated with Montreal consulting engineer Paul Pelletier.

He was previously on the staff of the Quebec Streams Commission.

Mr. Laflamme is a graduate in civil engineering of McGill University, class of 1947.

**Wm. John Hodge,** JR.E.I.C., is sales representative with Kawneer Canada Limited in Winnipeg, Man.

Prior to accepting this position, he was associated with Canadian Brown Steel Tank Company Limited in Brandon, Man.

Mr. Hodge graduated from the University of Manitoba in 1948 in civil engineering.

**A. M. Thomson,** JR.E.I.C., is now employed as a sales engineer by Canada Cement Company Limited in Ottawa, Ont.

He was previously associated with Canadian Brazilian Services in Toronto, Ont.

Mr. Thomson is a graduate in civil engineering of the University of Saskatchewan, class of 1948.

**E. G. Hachborn,** JR.E.I.C., is design engineer on the staff of the department of public works for the City of Kitchener, Ont.

He was previously research assistant in the sanitary engineering department of Cornell University.

Mr. Hachborn in an honours civil engineering graduate of Queen's University, class of 1948.

**Clive Bennett,** JR.E.I.C., has been transferred by C. D. Howe Co. Ltd. from Port Arthur, Ontario to Quebec City.

Mr. Bennett received his B.Sc. degree from London University in 1949.

**F. C. Hamata,** Jr.E.I.C., is now in the construction division of Ensign Stores Limited in Calgary, Alta.

He was formerly project engineer with Missouri Valley Dredging in installing a submerged pipeline under the Fraser River near New Westminster, B.C.

Previous to this he was associated as construction supervisor with Braid, LeBrun and McKinnon, in Bowidji, Minn.

Mr. Hamata is a graduate in civil engineering of the University of Manitoba, class of 1949.

**Thos. E. Wilson,** Jr.E.I.C., is now sales engineer with Cumming Galbraith Ltd. in Calgary, Alta.

Mr. Wilson graduated in mining engineering in 1949 from the University of Alberta.

**J. C. S. Bloomer,** Jr.E.I.C., formerly on the staff of Montreal Locomotive Works Ltd. in Montreal, is now associated with Canadian General Electric Co. Ltd. in Montreal.

Mr. Bloomer is a 1949 graduate in electrical engineering of the Nova Scotia Technical College.

**Wm. A. H. McCorquodale,** Jr.E.I.C., has accepted the position of electrical engineer in the maintenance engineering department of the Ford Motor Company of Canada in Windsor, Ont.

He was formerly employed by Northern Electric Co. Ltd. in Montreal, Que.

Mr. McCorquodale graduated in electrical engineering from the University of British Columbia in 1949.

**Jean Paul Lavigne,** Jr.E.I.C., is now on the staff of the building inspection department of the City of Montreal.

Mr. Lavigne graduated in civil engineering from Ecole Polytechnique in 1949.

**A. S. Malmgren,** Jr.E.I.C., is now production engineer with Malmgren Implement Co. (Manitoba) Ltd.

He was formerly methods improvement engineer with Canadian Industries Ltd. in Brownsburg, Que.

Mr. Malmgren is a graduate in mechanical engineering of the University of Manitoba, class of 1949.

**R. Cohen,** Jr.E.I.C., is now supervisor of process and material engineering with Canadian General Electric Co. Ltd. in Montreal.

He was formerly with the Department of Mines and Resources in Ottawa Ont.

Mr. Cohen is a chemical engineering graduate of McGill University, class of 1950.

**C. R. Hannah,** Jr.E.I.C., is an assistant engineer with James F. MacLaren Associates in Saint John N.B.

He was formerly road engineer for the City of Saint John, N.B.

Mr. Hannah is a 1950 graduate of the University of British Columbia in civil engineering.

**Lieut. L. G. Holtby, R.C.N.,** Jr.E.I.C., is now attached to the trials section of electrical engineering of the Chief Directorate in Ottawa.

He was previously electrical officer at the Naval Armament Depot in Halifax, N.S.

Lieut. Holtby graduated with a B.A.Sc. degree in electrical engineering from the University of British Columbia in 1950.

**Walter Kruchowski,** Jr.E.I.C., has joined Stock, Ramsay & Associates of Regina, Sask.

Walter Kruchowski, Jr.E.I.C.

He was previously design engineer with Foundation Engineering Ltd. in Toronto, Ont.

Mr. Kruchowski graduated from McGill University in electrical engineerin 1950.

**Wm. Edward Turner,** Jr.E.I.C., is employed as Alberta Land Surveyor by the Simpson Elevation Company.

He was formerly on the engineering staff of the City of Calgary, Alta.

Mr. Turner graduated in civil engineering from the University of Alberta in 1950.

**Capt. S. Thomson, R.C.E.,** Jr.E.I.C., has been transferred from the Directorate of Engineering Development at Ottawa to the headquarters of the Northwest Highway System at Whitehorse, Yukon.

Capt. Thomson graduated from the University of Toronto in civil engineering in 1950.

**E. J. M. Crawley,** Jr.E.I.C., is now sales engineer with Rogers Majestic Electronics Limited in Calgary, Alta.

He was previously associated with Canadian Electronics Ltd. as communication engineer in Edmonton, Alta.

Mr. Crawley graduated in electrical engineering from the University of Alberta in 1950.

**Frederick P. Gordon,** Jr.E.I.C., is now with the Aluminum Company of Canada at Kemano, B.C.

He was previously associated as field engineer with Vancouver Iron Works in Vancouver, B.C.

Mr. Gordon graduated in mechanical engineering from the University of British Columbia in 1950.

**David R. Hughson,** Jr.E.I.C., has joined Turnbull Elevator Co. Ltd. in Toronto, Ont., having completed his post-graduate study at the Harvard Business School.

Mr. Hughson is a graduate of the University of Toronto in electrical engineering, class of 1951.

**R. B. McCormack,** Jr.E.I.C., is now on the staff of the flight test engineering department of Trans-Canada Air Lines at Dorval, Que.

He was formerly on the engineering staff of Canadian Pratt & Whitney Aircraft Ltd. in Longueuil, Que.

Mr. McCormack is a civil engineering graduate of McGill University, class of 1951.

**Fred Booth,** Jr.E.I.C., has been appointed sewer engineer with the Department of Works of the City of Toronto.

Mr. Booth graduated in civil engineering from the University of Toronto in 1951.

**M. Storrier,** Jr.E.I.C., is at present associated with the Iron Ore Company of Canada at Knob Lake, Que.

He was formerly assistant to the equipment engineer of Hudson Bay Mining & Smelting Co. Ltd. at Flin Flon, Man.

Mr. Storrier graduated in mining engineering from McGill University in 1951.

**Gerard Hackett,** Jr.E.I.C., is a mechanical engineer on the staff of the Quebec Power Company in Quebec City.

He was formerly with J. T. Wing Co. Ltd. in Windsor, Ont.

Mr. Hackett graduated in mechanical engineering from McGill University in 1951.

**Michael O. Jones,** Jr.E.I.C., has been transferred by the Ford Motor Company of Canada from Windsor, Ont., to the Geelong subsidiary in Australia for an indefinite period.

In his new position he will be assistant to the general superintendent of the manufacturing division and will be handling special assignments. While in Windsor he was facilities engineer of the overseas operations division.

Mr. Jones graduated with a B.A.Sc. degree in mechanical engineering from the University of British Columbia in 1951, after which he entered the A. V. Roe Canada Limited in Malton, Ont., as development engineer in the gas turbine division.

**M. G. Colvin,** Jr.E.I.C., has been named chief field engineer with Canadian Kellogg Co. Ltd. in Winnipeg, Man.

He was previously job engineer with W. M. Barnes Co. of Canada Ltd. in Oakville, Ont.

Mr. Colvin is a graduate in civil engineering of the University of Toronto, class of 1951.

**J. A. Brenchley,** Jr.E.I.C., has joined the plastics department of Canadian Industries Limited as sales representative.

Before joining the company, he undertook post-graduate study at the Graduate School of Business of the University of Western Ontario.

He is a mechanical engineering graduate of McGill University, class of 1951.

**Yvan Montcalm,** Jr.E.I.C., has been appointed sales engineer of Powerlite Devices Limited in the Montreal office.

A native of Montreal, he spent most of his early years in Three Rivers, Que. He graduated in electrical engineering from McGill University in 1951.

Mr. Montcalm was previously associated with the Quebec Power Company as distribution engineer for Quebec City, and prior to that, he was with the Shawinigan Water & Power Company where he completed the company's graduate engineer training course.

Mr. Montcalm is a member of the Corporation of Professional Engineers of Quebec and of the Illuminating Engineering Society.

**Antonio Chabot,** S.E.I.C., is now associated as sanitary engineer with the Department of National Health and Welfare in Moncton, N.B.

He was formerly on the staff of Canadian National Railways.

Mr. Chabot is a graduate in civil engineering of Laval University, class of 1953.

**Wm. J. Watson,** S.E.I.C., recently joined the engineering staff of the construction and building supplies firm of M. F. Schurman Co. Ltd. in Summerside, P.E.I.

He was previously with the Ontario Hydro-Electric Power Commission in Niagara Falls and Toronto.

Mr. Watson graduated in civil engineering from McGill University in 1953.

**M. Luciuk,** S.E.I.C., is now a geophysical operator trainee with Imperial Oil Limited in Edmonton, Alta.

Mr. Luciuk graduated in engineering physics from the University of Saskatchewan in 1953.

**J. L. Y. Marguis,** S.E.I.C., has joined the staff of the Quebec Hydro Commission in Montreal, Que.

Mr. Marguis received his B.Eng. degree in electrical engineering from McGill University this year.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

## John Morrice Roger Fairbairn, President, 1921

**John Morrice Roger Fairbairn,** M.E.I.C., retired chief engineer of the Canadian Pacific Railway, and a past-president of the Engineering Institute, died at his home in Westmount, Que., on May 27, 1954, after a long illness.

J. M. R. Fairbairn, M.E.I.C.

Mr. Fairbairn was born in Peterborough, Ont., on June 30, 1873. He received his early education in Peterborough and in London, Ont., and graduated in civil engineering from the School of Practical Science (University of Toronto) in 1893. He was awarded the degree of Doctor of Science by the same university in 1921.

During the summer months of his university course in 1891 and 1892 he was employed on railway location surveys and plans for the Irondale, Bancroft and Ottawa Railway, and as leveller and topographer on the Peterborough, Parry Sound and Sault Ste. Marie Railway.

Upon graduation in 1893, he was associated for four years with the Departments of the Interior, Railways and Canals, and Militia and Defence. He went west in 1897 to become principal assistant to the late Charles A. Stoess on land grants and mining claim surveys in the Slocan district of British Columbia. A year later he engaged in surface and underground surveys of various mining properties, and at the same time acted as city engineer of Kaslo, B.C. Having served his apprenticeship with Mr. Stoess, he passed the necessary examinations and became a licensed land surveyor for British Columbia. Mr. Fairbairn then entered private practice as a civil and mining engineer and provincial land surveyor at Kaslo and Greenwood, B.C.

In April, 1900, he joined the construction department of the Canadian Pacific Railway as leveller on grade reduction surveys between Winnipeg and Fort William, and in August of that year, when the work was shut down, he returned to the Department of Railways and Canals as engineer in charge of section 3 of the Simcoe-Balsam Lake division of the Trent Canal. In August, 1901, he returned to the Canadian Pacific Railway and remained with the company until his retirement on January 1, 1939. During that time he occupied the positions of principal assistant to the district engineer in Montreal, division engineer in Ottawa, assistant engineer in the chief engineer's office in Montreal and acting district engineer. Then in 1906 and 1907 he served as district engineer of the Ontario district and district engineer of the Quebec district. A year later he was appointed principal assistant engineer in the chief engineer's office in Montreal, and in 1910, engineer maintenance of way. The following year Mr. Fairbairn became assistant chief engineer of eastern lines, and three years later, assistant chief engineer of the entire system. He was appointed chief engineer in 1918, a position he occupied continuously for over 20 years.

When Mr. Fairbairn joined the company it had only about 8,500 miles of railway line. He played a major part in building the mileage to more than 17,000. During his time as chief engineer, the company spent approximately two hundred million dollars on construction for which Mr. Fairbairn was responsible.

His work during this period not only gained him a wide reputation as an engineer, but it included much public-spirited activity in professional and international matters. In 1929 he represented his company at the World Engineering Congress in Tokyo, Japan, where he also headed the Canadian delegation to the World Power Conference. He served as vice-president and a member of Council of the Engineering Institute of Canada, and was elected its president in 1921. He was president of the American Railway Engineering Association in 1925. He was a member of Council of the Institution of Civil Engineers and served as chairman of its Canadian Advisory Board. He was awarded honorary membership by the American Society of Civil Engineers, and served as chairman of that society's Canadian Membership Committee. He was also an honorary life member of the Canadian Engineering Standards Association.

When World War II broke, Mr. Fairbairn came out of retirement to become director of works and buildings for the Army under Col. J. L. Ralston. In 1941 he was appointed to the position of director of works and buildings for the Naval Service of the Department of National Defence in Ottawa.

In 1945 Mr. Fairbairn was awarded the Sir John Kennedy Medal of the Engineering Institute for his outstanding contribution to the field of engineering.

He joined the Engineering Institute as an Associate Member in 1899, and transferred to Member in 1908. On January 1, 1947, he attained Life Membership in the Institute.

**Norman Marr,** M.E.I.C., director of the engineering and water resources branch of the Department of Resources and Development, died suddenly at his home in Ottawa on April 20, 1954.

Mr. Marr was born at Walkerton, Ont., on June 29, 1890. Upon completion of his public and high school education, he undertook civil engineering study at the School of Practical Science, (University of Toronto), graduating in 1910. In 1912 he obtained his B.A.Sc. degree from the University of Toronto. He received his C.E. degree from the same university in 1922.

Mr. Marr gained experience as a student during the summer months of his university training as a chainman on a land survey in Manitoba, as a rodman on a waterworks extension survey in London, Ont., as a leveller on a Quebec Eastern Railroad preliminary survey, and as an instrumentman with the Transcontinental Railway at Cochrane, Ont.

Upon graduation he became assistant engineer with C. H. and P. H. Mitchell, consulting engineers on the construction of La Colle Falls hydro-electric development in Prince Albert, Sask.

In 1913 he joined the Department of Railways and Canals as engineer in charge of construction on sections 4 and 5 of the Trent Canal at Campbellford. Five years later he was appointed senior hydraulic engineer in the water power and reclamation service of the Department of the Interior, and in 1926 he was named chief hydraulic engineer. He was appointed director of the engineering and water resources branch of the Department of Resources and Development in 1952, and at the time of his death had completed 36 years of government service.

Mr. Marr was a key figure in the lengthy negotiations with the United States in connection with the development of the St. Lawrence Seaway project. He served on numerous committees and boards dealing with international waterways problems and was widely known both in Canada and the United States. He was a member of the

Norman Marr, M.E.I.C.

Inter-Departmental Committee which negotiated the St. Lawrence power development agreement signed in Washington on June 30, 1952. For many years he was a member and honorary secretary of the Canadian committee of the World Power Conference, a body dealing with the development of various power sources. He also represented Canada at the International Lake Superior Board of Control, the International Niagara Board of Control, the International Massena Board of Control, and he served as a consultant to the Canadian Temporary Great Lakes—St. Lawrence Basin Committee. He was a member of the Professional Institute of the Public Service of Canada.

Mr. Marr served as chairman of the Ottawa Branch of the Engineering Institute in 1945 and as councillor representing the Ottawa Branch in 1946. He joined the Institute as a Student in 1909, transferring to Junior in 1911, to Associate Member in 1916, and to Member in 1928. In January, 1951 he attained Life Membership in the Institute.

**George Hemmerick,** M.E.I.C., general sales manager, assistant treasurer and assistant secretary of Dow Chemical of Canada Limited, died suddenly at his office in Toronto on April 14, 1954.

Born at Conestoga, near Kitchener, Ont., on April 29, 1891, Mr. Hemmerick received his early education there before entering Queen's University where he graduated in civil engineering in 1916. During his summer holidays previous to graduation he was employed by Hollinger Gold Mines Ltd. at Timmins, Ont.

After graduation, Mr. Hemmerick began his engineering career as a municipal engineer in western Canada. While in the west he spent some time teaching mathematics. He returned to the east and in 1922 took a post-graduate course in economics at Queen's University.

Mr. Hemmerick subsequently became construction engineer for E. G. M. Cape Company Limited in Quebec and afterwards moved to Ontario as field engineer with the Department of Highways.

He joined Dow Chemical of Canada Limited as a sales engineer in 1926. From that time he represented the company in Canada on all of its products, and early in World War II, when the company built the styrene unit for Polymer Corporation, he was placed in charge of construction and the ensuing operations. When Dow Chemical of Canada Limited formed its sales organization, he became the first sales manager.

He was a member of the Canadian Good Roads Association, the Canadian Manufacturers Association, the Society of the Plastics Industry, and an active supporter of the Queen's Alumni.

Mr. Hemmerick joined the Engineering Institute as a Student in 1916, transferring to Associate Member in 1918, and to Member in 1940.

**George Herbert Gillett,** M.E.I.C., manager of the apparatus division of the Canadian General Electric Company's Pacific district in Vancouver, was killed instantly on April 8, 1954, in a crash between a westbound Trans-Canada Air Lines plane and a Harvard trainer over Moose Jaw, Sask. He was returning home to Vancouver from an apparatus division sales conference which had taken place in Toronto earlier that week.

G. H. Gillett, M.E.I.C.

Mr. Gillett was born in Westmount, Que., on January 17, 1902. After completing his general education at Wykeham House and Westmount High School, he entered McGill University in 1920 and obtained his B.Sc. degree in electrical engineering four years later.

In 1924 he undertook the Canadian General Electric Company's test course in Peterborough, Ont., and in September, 1925, entered the industrial control engineering department there. The following year he was transferred to Toronto as an engineer in the transformer engineering department, and he later became engaged in the preparation of transformer estimates and propositions.

Mr. Gillett was transferred to Montreal as sales engineer in 1928. In 1949 he was promoted to the position of sales manager of the apparatus division of the Montreal district and was responsible for the company's heavy electrical equipment for utilities and industry throughout the Province of Quebec. In 1953 he was appointed to the position he held at the time of his death.

He was a past-president of the Electrical Club of Montreal and a Member of the American Institute of Electrical Engineers, the Montreal Board of Trade, and the Corporation of Professional Engineers of the Province of Quebec.

Mr. Gillett joined the Engineering Institute as a Student in 1924, transferring to Associate Member in 1936, and to Member in 1940.

**Frank Harvey Barnes,** M.E.I.C., supervisor of metallic ammunition and empty shot shell operations for Canadian Industries Limited in Brownsburg, Que., died on March 9, 1954.

Mr. Barnes was born in Port Hope, Ont., on November 27, 1890. After completing his public and high school education, he entered McGill University where he received his B.Sc. degree in mechanical engineering in 1912.

During his summer vacations while attending university and for two years after graduation, Mr. Barnes served as an apprentice in the shops and roundhouses of the Canadian Pacific Railway.

He then became shop foreman at the Dominion Arsenal in Quebec. Within three years he was promoted to the position of mechanical superintendent and production manager with full responsibility for plant operation, maintenance and tool design. He remained in that position until 1920 when he joined the Laurentide Company in Grand'mere, Que., as assistant to the head of the planning department. In 1921 he was appointed shop superintendent for the Canadian Brill Company in Preston, Ont., where he was in full charge of all steel construction on street railway cars.

Mr. Barnes went into business for himself in 1923 during which time he operated an auto electric service station in Oshawa, Ont. A year later he became plant manager for Thomas Watson Limited of Woodstock, Ont., where he was in charge of the plant and the design of new machines. Within the same year he accepted the position of designer on paper machinery with Charles Walmsely and Company Limited in Longueuil, Que. In 1926 Mr. Barnes joined the Northern Foundry and Machine Company as designing engineer, and a year later, was appointed to the position of designing engineer and assistant manager. He remained with this company nine years, during which time he became chief engineer and general superintendent.

In 1935 Mr. Barnes joined the engineering department of Mathews Conveyor Co. Ltd. in Port Hope, Ont., and was associated with this firm until 1939 when he was appointed to the British Supply Board as inspector on three shell contracts. In 1940 he became superintendent of production for Defence Industries Limited in Brownsburg and Verdun, Que., and in 1945, was appointed to the position which he held at the time of his death.

Mr. Barnes joined the Engineering Institute of Canada as an Associate Member in 1928 and transferred to Member in 1940.

**Alexander Stirling Ross,** M.E.I.C., former B.C. Telephone Company staff engineer who retired less than five months ago after completing 50 years of service in the telephone industry, died suddenly in hospital in Waltham, Mass., on April 26, 1954.

**Stirling Ross, M.E.I.C.**

Mr. Ross was born in Renfrew, Ont., in 1887. He began his engineering career with the Northern Electric Company in 1904, and five years later went to Vancouver, B.C., where he joined the B.C. Telephone Company as switchboard installation foreman on the first addition to the old Seymour exchange.

Mr. Ross was appointed superintendent of switchboard construction in 1922, and two years later, was named equipment engineer. In 1944 he assumed the dual position of equipment and building engineer, and in 1953, was appointed staff engineer in charge of special projects. As equipment and building engineer, he was largely responsible for the design and erection of all company buildings.

Mr. Ross was a member of the Point Grey School Board, and was its last chairman before its amalgamation with the City of Vancouver in 1929. He was also a member of the Point Grey Town Planning Commission, and played an important part in the construction of various schools in that area. He was a member of the Association of Professional Engineers of British Columbia. He also organized the B.C. Chapter 53 of the Telephone Pioneers of America and served as its first president.

Mr. Ross joined the Engineering Institute of Canada as a Member in 1946.

**Frederick Crease,** M.E.I.C., provincial plant superintendent of the Manitoba Telephone System in Winnipeg, Man., died suddenly on January 28, 1954.

Mr. Crease was born in Taunton, Somerset, England, on March 4, 1889. Previous to coming to Canada in 1910, he was employed by the National Telephone Company in England.

Since joining the staff of the Manitoba Telephone System, Mr. Crease had held various appointments and was due for retirement within a few months.

During the first World War he served overseas with the 203rd Battalion of the Royal Winnipeg Rifles.

Mr. Crease was one of Winnipeg's earliest amateur radio operators. When

**Frederick Crease, M.E.I.C.**

radio broadcasting was in its infancy, he constructed a number of receiving sets which were among the best of their kind built in Winnipeg. At that time it was the practice to pick up programs from distant stations and feed them via telephone lines to a local station which rebroadcast them for the benefit of listeners whose sets were good only for short-range reception. Much of this service was furnished by Mr. Crease.

His interests ranged from radio to photography and included wood-working and the reading of technical literature. In his chosen field of telephony his knowledge and sound training were widely recognized.

Mr. Crease was a member of the Association of Professional Engineers of Manitoba, the Telephone Pioneers of America and the Manitoba Electrical Association.

He joined the Engineering Institute of Canada as a member in 1952.

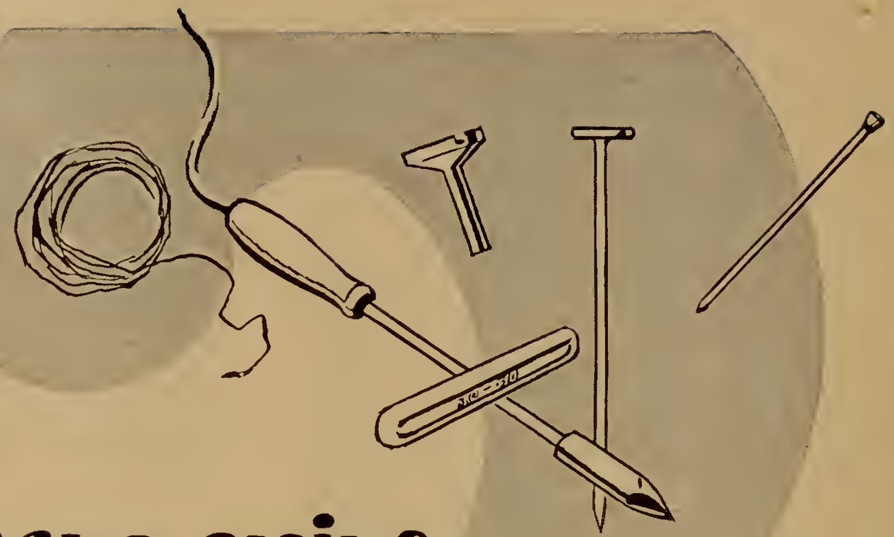
**Rupert Don Baugh, M.M.,** Jr.E.I.C., general production comptroller of Dominion Structural Steel Limited in Montreal, was killed instantly in the Trans-Canada Air Lines aircraft and Harvard trainer collision over Moose Jaw, Sask., on April 8, 1954. Mr. Baugh was on his way from his home in Beaconsfield, Que., to visit a sister in Vancouver, B.C.

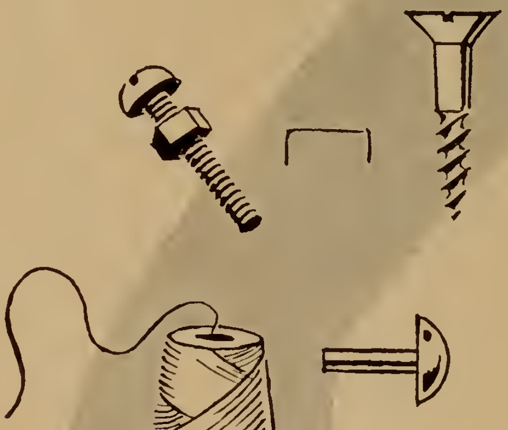
Mr. Baugh was born at Moosomin, Sask., on December 4, 1915. He attended the Moosomin Collegiate Institute and then served with the Canadian Army before and during World War II. From 1939 until 1945 he was stationed in Canada, England and on the Continent, and was awarded the Military Medal for gallantry.

In 1946 he entered McGill University and graduated with a B.Eng. degree in civil engineering in 1949. During the summer of 1947 he was employed as instrumentman with the Quebec Hydro-Electric Commission, and the following summer he served as assistant construction engineer with Central Mortgage & Housing Corporation.

He joined the staff of Dominion Structural Steel Limited in Montreal on May 10, 1949, and was employed in various engineering capacities until he recently assumed the position of general production comptroller.

Mr. Baugh joined the Engineering Institute of Canada as a Student in 1948 and transferred to Junior Member in 1951.





# Employment Service

**THIS SERVICE is operated for the benefit of members of The Engineering Institute of Canada and for industrial and other organizations employing technically trained men—without charge to either party. It would be appreciated if employers would make the fullest use of these facilities to list their requirements—existing or estimated.**

**NOTICES appearing in the SITUATIONS WANTED column will be discontinued after three insertions. They will be reinstated, on request, after a lapse of one month.**

**REPLIES to advertisements should be addressed to File No. 000, Employment Service, The Engineering Institute of Canada, 2050 Mansfield Street.**

**INTERVIEWS with the Institute Employment Service, 2050 Mansfield Street, Montreal—Telephone PLateau 5078—may be arranged by appointment.**

## SITUATIONS VACANT

### CHEMICAL

A CHEMIST WITH a B.Sc. degree in chemistry or better with good background in organic chemistry, preferably with one or two years' experience in the pulp and paper industry, but not an absolute requisite. Duties include special analytical work, experimentation on cooking and bleaching of kraft base pulp, also on development of by products. File No. 4835-V.

GRADUATE CHEMIST REQUIRED TO BE trained as assistant to chief chemist. Plant located at Cardinal in Ontario in one of Canada's oldest food industries. Forward all details of experience, education, with pictures, and anticipated salary to File No. 4837-V.

CHEMICAL ENGINEERS required for research and development department of large world wide organization with plant located in Montreal. Duties to do development work on various products made from fibres or adhesives. This work will consist of improving our present operations and finding new methods of processing. A certain amount of research work on developing new products will be undertaken. File No. 4844-V.

LECTURER OR ASSISTANT professor of chemical engineering required to give unit operations course with laboratory and design calculations course to junior and senior year classes. Time available for graduate study and research. Industrial experience desirable but not requisite. Salary dependent upon qualifications. Apply Nova Scotia Technical College, P.O. Box 1000, Halifax, Nova Scotia. File No. 4851-V.

RESEARCH ENGINEER required by Saskatchewan Department of Mineral Resources $326-$397 per month. Recent graduate in ceramic, chemical or geological engineering; to carry out lab. and pilot scale experimental work, field exploration, and economic surveys dealing with the non-metallic or industrial minerals of the province. Good pension plan and conditions of employment. For further information and application forms contact the Public Service Commission, Legislative Building, Regina. File No. 4852-V.

CHEMICAL ENGINEER required, 1954 graduate with pulp and paper experience. Investigation of paper quality or production problems on both laboratory and mill scale, analysis of test date, development of test methods, etc. Working under the divisional chemist. File No. 4864-V.

CHEMICAL ENGINEER required in Montreal with a fairly extensive knowledge of the theory of thermo dynamics as well as chemical training. Some experience in the compressed gas or allied industry would be interesting but not essential. The duties will involve some chemical analysis and in addition, general engineering duties connected with plant construction and development as well as plant operation and method improvements. File No. 4881-V.

GRADUATE CHEMICAL ENGINEER from Canadian University required by manufacturer of organic chemical products. Attractive opening in new project located in Ontario. Several years of practical experience in production and process development is required. File No. 4900-V.

CHEMICAL ENGINEER required to fill position of managing engineer in a newly incorporated Canadian company. Organization is engaged in the process of plating non-ferrous products. Age 28-35 and should have experience in cost and production control, to be able to work with sales and also be interested in development work on new products. File No. 4902-V.

### CIVIL

CIVIL ENGINEER required for bridge design in a large transportation company with headquarters in Montreal. File No. 4850-V.

ASSISTANT CHIEF ENGINEER wanted for large construction company. Applicant must have thorough knowledge and experience in reinforced concrete design capable of estimating buildings, road construction and all branches of general construction work. Excellent salary to the right man. Good prospects for the future. Do not apply unless you are thoroughly experienced. File No. 4853-V.

CIVIL ENGINEER REQUIRED by the technical co-operation service department of Trade and Commerce, Ottawa, Canada, to serve in Burma. The union of Burma has plans for an expansive scheme in Hydro Electric development. The engineer should be Canadian and will act as special advisor to the chairman of the Burmese electricity supply board to review the designs and specifications and supervise general construction. Salary would be in the range of $14,000 to $17,000 per annum. Free furnished accommodations, cost of internal travel, free hospital and medical treatment. File No. 4857-W.

CIVIL ENGINEER required preferably recent graduate of McGill university with at least one year's experience in the field. Will be sent to U.S.A. for two months to study the methods of operation, after which time he would be attached to Montreal office. Applicant must be Canadian. File No. 4860-V.

ENGINEER CIVIL PREFERABLY, wanted for young progressive construction company. Preferably one with experience in sewage and water supply as well as cement work as we are specializing more in this line of work. When replying, please state age, graduation and experience. File No. 4865-V.

QUALIFIED ENGINEER required as principal Ahsanullah Engineering College, Dacca, Pakistan. Candidate should possess a good honours degree in civil engineering from a recognized University. He must have enough practical experience of actual execution of large projects, and their organization, and teaching and administrative experience in a recognized engineering institution. Candidate should preferably be 45 years of age or thereabouts. Further information apply File No. 4878-V.

THE CITY OF MONCTON, N.B., invites applications from engineers preferably with municipal experience, for service in the city engineers office. In reply please give details of experience, including any service with H.M. Forces and indicate salary required. File No. 4887-V.

GRADUATE CIVIL ENGINEER for company in Brazil as technical assistant for chief planning. Age around 40, with 5 years experience in: 1) preparing and completing preliminary and basic studies and layouts of hydro electric developments for consideration as to technical and economic feasibility, 2) analysing and evaluating hydrological topographical and geological data with relation to power development studies, 3) determining survey work required. Position requires engineer of maturity and judgment with teaching experience and leadership ability. File No. 4888-V.

CONSTRUCTION DEPARTMENT of prominent oil company with headquarters in Maritimes requires experienced man to supervise construction of bulk plant facilities and pipelines. Position has an excellent potential. Please write details, and if possible enclose photo. File No. 4889-V.

ASSISTANT CITY ENGINEER required in Guelph, Ontario. The work includes responsibility for all technical and contract work and the direction of two instrument men under the general supervision of the City Engineer. The engineering department supervises all public works and waterworks construction and maintenance. The job offers a good variety of experience in a rapidly growing city. Applicants must be graduate civil engineer with at least one year of municipal or equivalent experience. File No. 4903-V.

PLANNING DIRECTOR wanted to organize and take charge of the Metropolitan Planning Office of Greater Victoria, British Columbia. Salary $6,000. City Planning experience essential and formal training desirable. Energy, tact and pleasing personality absolutely essential. Apply with full particulars and references to the Secretary, Capital Region Planning Board of B.C., City Hall, Victoria, B.C., by July 19. File No. 4907V.

### ELECTRICAL

ELECTRICAL ENGINEER with several years experience required mainly with experience on production engineering of electronic equipment. Salary would commensurate with the applicant's experience and qualifications. File No. 4862-V.

TORONTO MANUFACTURER requires a designer for aircraft electrical systems: A.C. and D.C. generators and motors, regulators and protective devices. A degree in electrical engineering or equivalent in design experience is essential as work includes basic design calculations. Familiarity with A.N. specifications a real asset. Reply with full particulars and salary required to File No. 4870-V.

ELECTRONIC ENGINEERS required for attractive positions. Degree in electrical engineering or equivalent, 5 to 10 years general experience with 1 to 5 years specific radar experience. Supervisory ability, able to maintain liaison and work efficiently under pressure. Canadian citizenship or British nationality a requisite. Attractive employee benefits. File No. 4874-V.

---

## ENGINEERS WANTED

**Prominent Oil Company with headquarters in Maritimes has openings for two engineers.**

**(1) Construction Dept. — Experienced man to supervise construction of bulk plant facilities and pipelines.**

**(2) Lubrication Dept. — Mechanical engineer to be trained in doing lubrication surveys and selling same.**

**Each of these positions has an excellent potential. Please write details, and if possible enclose photo. File No. 4889-V.**

---

GRADUATE ELECTRICAL ENGINEER required with at least five years experience preferably on electric motors and control, switchgear, and similar apparatus. He should be familiar with modern manufacturing methods as applied to this type of equipment, also capable of directing a small number of junior engineers and draughtsmen. He should have a personality which would enable him to readily contact customers' engineers for the purpose of discussing engineering problems in connection with the above products. This position will provide an excellent opportunity to establish in new division of one of the largest companies in Canada and the U.S.A. File No. 4885-V.

ELECTRICAL ENGINEER (Electronics) required by major world-wide electronics organization. Present opening for a fully experienced electrical engineer to do project development work on monochrome T.V. The successful candidate must have a minimum of 3 years in T.V. receiver design and 10 years in electronics in general. Salary will be commensurate with ability. Reply in writing, stating details of age, experience, education and salary desired. All applications will be held in strictest confidence. File No. 4892-V.

---

## Assistant Professor

**Applications are invited for the positions of Assistant Professor of Civil Engineering and Assistant Professor of Applied Mechanics, duties to commence on September 1, 1954. Salary $4000.00 plus a cost-of-living bonus of about $300.00; the annual increment is $250.00. Duties will include teaching and research. Confirmation in the appointment will be subject to the satisfactory completion of a probationary period of two years. Applications should be addressed to the Dean, Faculty of Engineering, University of Alberta, Edmonton, Alberta, Canada, and should give personal data, details of training and experience, the names of three referees, and be accompanied by a recent photograph. Closing date August 1, 1954.**

---

JUNIOR ELECTRICAL ENGINEER — single, 25 to 30 years of age with 1-5 years experience in metering department of a large public utility or manufacturer. Location Rio de Janeiro, Brazil. File No. 4898-V.

### MECHANICAL

DESIGN ENGINEER WITH minimum eight years' experience in gear design and automotive transmissions. Age 45 or under. Must be creative and willing to do actual design work on board. File No. 4842-V.

DESIGN ENGINEER WITH minimum eight years experience in the design of farm tractors or other farm equipment. Must be creative and willing to do actual designing on the board. Age 45 or under. File No. 4842-V.

DESIGN ENGINEER WITH minimum eight years' experience in the design of internal combustion engines, preferably as applied to tractors. Age 45 or under. Must be creative and willing to do actual design work on board. File No. 4842-V.

DESIGN ENGINEER with minimum eight years' experience in hydraulics preferably as applied to tractors. Age 45 or under. Must be creative and willing to do actual design work on board. File No. 4842-V.

---

## Junior Electrical Engineers

**Electric Utility has opening for two junior electrical engineers or engineering graduates in Halifax, N.S. The work will provide opportunities for advancement along both technical and administrative lines. Applicants should hold a University degree and have not over three years' post-graduate experience.**

**Apply direct to—**

**Mr. Norman T. Smith,**
**Manager,**
**Nova Scotia Light and Power Company, Limited.**

---

PLANT FACILITIES ENGINEER required for a major appliance manufacturer. Graduate mechanical engineer with a minimum of 3 years machine design and a sound knowledge of electrical welding and substations. A challenging position is offered to a person capable of initiating and carrying through cost reduction, machine and process improvement including working with maintenance supervisors on installation and maintenance. Age to 45. Salary commensurate with ability. File No. 4845-V.

POWER PLANT EQUIPMENT sales engineer, mechanical graduate of Canadian university, wanted to form own company to sell and later to assemble in Eastern Canada, power plant controls and instruments. Prominent American manufacturers launching extensive expansion program of sales and service in Canada. Several years experience in sales to power plants or in operating steam plants essential. Any personal capital advantageous. File No. 4849-V.

CHIEF MECHANICAL ENGINEER, salary up to $7,200. required by Department of National Defence, Ottawa. Details and application forms at your nearest Civil Service Commission office, National Employment Office and University Placement Office. Quote Competition No. 54-1204. File No. 4855-V.

MECHANICAL ENGINEER required in mechanical department to teach machine design AND physical metallurgy among other subjects. Applicant should have his M.S. in M.E. The faculty rank of the position will depend upon the qualifications of the person engaged. A properly qualified individual can expect to be the head of the department in 4 or 5 years. One with less experience will be given a contract as an instructor or assistant professor. File No. 4863-V.

MECHANICAL OR MINING ENGINEER required by small expanding sales engineering company backed by large financial organization, handling conveyors, belts, transmission equipment and related items to mines, quarries, and larger industrial organizations. Applicant should be 25-35, be prepared to travel in Ontario and Quebec, operate from Montreal primarily and later to open Toronto office. Salary and commissions with travelling paid, set on incentive bases, with no top limit. Average man should earn minimum $6,000.00. State qualifications and availability. File No. 4869-V.

gauges. Canadian background required Location in Montreal. Write giving full details of training experience and state salary desired. File No. 4884-V.

MECHANICAL ENGINEER required in the lubrication department of prominent oil company with headquarters in Maritimes to be trained in doing lubrication surveys and selling same. Position has an excellent potential. Please write details and if possible enclose photo File No. 4889-V.

MECHANICAL ENGINEER required in Edmonton, Alberta, who has graduated from a recognized Canadian university and who has about five (5) years experience in a chemical plant or refinery. He will deal mostly in equipment used in the manufacture of petrochemicals and synthetic fibres. Duties will consist of general engineering, which will include design, layout, estimating and some administration. Must be able to handle project work and general plant engineering problems File No. 4891-V.

MECHANICAL ENGINEER required who has had practical experience in structural design. He will be required for commercial vehicle designing particularly. This is a good opportunity with a sound future. Location Ontario. File No. 4893-V.

### MISCELLANEOUS

THREE SALES ENGINEERS required by manufacturer of multiwall Kraft bags and related paper products. 1954 graduates to 3 years of experience. Training period in Montreal. Subsequent work in variety of locations. File No. 4777-V.

THREE DESIGN engineers required by Department of Transport, Ottawa. Structural, electrical, mechanical to design and develop program for new airport terminal buildings, across Canada, and also modifications to existing terminal buildings. File No. 4832-V.

MECHANICAL OR CIVIL engineer with a minimum of seven years up to ten years' experience to undertake work supervising installations, etc., which would be engineered in our engineering department. File No. 4835-V.

THREE TECHNICAL SALES TRAINEES required to understudy various positions throughout the sales organization which include inside representative, field salesman, technical serviceman, sales administrator. Graduate from Canadian University '52, '53 or '54. Location Toronto initially, could be located in any one of six major Canadian cities. File No. 4840-V.

SALES DEVELOPMENT engineer, mechanical, civil or metallurgical required for sales force of long established fabricating plant. Experience in pulp and paper mill or mining field an asset. Location Montreal with considerable travelling. File No. 4843-V.

CHEMICAL OR MECHANICAL ENGINEER, recent graduate required by oil company in Montreal. Age limit 25-32. Preferably bilingual and car owner. Salary depending upon qualifications. File No. 4846-V.

ENGINEERING LIBRARIAN required to operate technical library with staff of seven, serving aircraft engineering department of 750 personnel. Applicants should have an aeronautical engineering degree or the equivalent aeronautical engineering experience, library training and direct experience in the operation of a technical library. Replies should indicate training and experience in detail, and salary requirements. File No. 4848-V.

CIVIL AND/OR MECHANICAL engineer required by a firm of consulting engineers in Western Ontario. Preference given those with experience in municipal engineering and sewage treatment plant design, or commercial and industrial building design. This position can lead to an interest in the firm if qualifications are sufficient. All replies treated with strict confidence. Please provide complete outline of experience and background with first letter. File No. 4854-V.

RESEARCH PHYSICIST or engineer required by the Pulp and Paper Research Institute of Canada to take charge of a long-range project now being initiated on the fundamentals of mechanical pulping, i.e. the factors governing the mechanical separation of paper making fibres from wood. Necessary qualifications will include a post-graduate physics or engineering degree with emphasis on mechanics and mathematics; experience in planning, executing, and reporting research projects, and the ability to confer with mill staffs on the practical data pertinent to the problem. Salary will be commensurate with training and experience. File No. 4856-V.

ENGINEER REQUIRED BY paper board converter organization manufacturing a wide variety of cardboard containers and special packaging. Duties include a considerable amount of machine design and in addition to investigate a preventative maintenance program to cover all production equipment. Applicant should be prepared to continue on as assistant engineer in the engineering department. Salary would be based on qualifications The location will be London, Ontario. File No. 4858-V.

PRODUCTION MANAGER required for manufacturers of aluminum doors and windows. Someone experienced in this phase of work would be appreciated, but not absolutely necessary. Applicant should be 30 years of age or over and bilingual. Salary is open, depending upon qualifications. File No. 4861-V.

CHIEF PLANT ENGINEER required for a senior position. Applicant must be a graduate engineer with extensive experience on design and construction of office and plant buildings and plant mechanization and be capable of planning and guiding the work of a large department. File No. 4866-V.

FOUNDRY METALLURGIST required by large manufacturing concern in Montreal, operating steel cast iron and bronze foundries. Experience desirable but not essential. File No. 4876-V.

SENIOR ELECTRONIC ENGINEER with degree in physics or electronics from a recognized university with at least five years experience in electronic circuit design. British subject preferred. Salary commensurate with ability. Send resume to File No. 4877-V.

LECTURER REQUIRED in an expanding department. Subjects economic geology, geomorphology, stratigraphy, M.A. desirable. University year September 15 to

May 15. Salary range $2500 to $3000. File No. 4880-V.

ENGINEER REQUIRED by consulting firm located in Calgary, Alberta, minimum 5 years experience in sales and foundations with some post graduate training. Applicant should state age, summary of experience and salary expected. File No. 4883-V.

GRADUATE CHEMICAL OR mechanical engineer required with two to five years experience on industrial maintenance work. As project engineer duties include the maintenance of the buildings and equipment of the plant, including some design work in the nature of alterations and improvements. Location Province of Quebec. File No. 4885-V.

YOUNG ENGINEER either mechanical or electrical to assist in the design and manufacture of blue printing and white printing. Location Ontario. File No. 4894-V.

TWO INSTRUCTORS required to divide the following subjects: tool design, manufacturing analysis, metrology, engineering drawing and strength of materials: applicants should have a genuine interest in teaching at the junior college level and have had some industrial experience. They should be professional engineers with either a degree or the Higher National Certificate. These positions lead to a permanent appointment in the Ontario Civil Service providing a three week annual vacation, adequate superannuation and sick leave benefits. File No. 4895-V.

CANADIAN SALES REPRESENTATIVE, preferably a professional engineer required with successful sales record to industrial organizations. Must have knowledge of materials handling, dust collection and fume disposal equipment. Work can be undertaken in conjunction with other activities if desired. Exclusive territory. File No. 4896-V.

STRESS ENGINEER, graduate in mechanical or civil engineering, with two or three years experience in stress analysis of steel structures and machinery. Required by manufacturer in the Montreal area, opportunity for varied experience in the stress analysis of heavy machinery and structures. Salary commensurate with experience. File No. 4897-V.

A CIVIL OR MECHANICAL engineer preferably with knowledge of soil mechanics and some practical experience to work on the engineering aspects of snow and ice research, especially on field studies of ice and snow. A Physicist or Engineering Physicist with M.Sc. or Ph.D. degree to assist with the research program. Positions are in connection with the completion of special laboratory facilities for snow and ice research in the new building, Research Centre, Ottawa. Salaries will depend on training and experience. The opening provides challenging opportunities in a new field of work. File No. 4899-V.

YOUNG ENGINEERS for industrial engineering training in the textile industry in Ontario. Besides technical ability work will require ability to sell ideas and to deal successfully with mill personnel. Replies should outline experience, age and salary expected. File No. 4901-V.

CHEMICAL ENGINEER required to fill position of managing engineer in a newly incorporated Canadian company. Organization is engaged in the process of plating non-ferrous products. Age 28-35 and should have experience in cost and production control, to be able to work with sales and also be interested in development work on new products. File No 4902-V.

NATIONAL RESEARCH COUNCIL CANADA rquires at Ottawa a health and safety engineer under direction, to develop a program of safety consciousness throughout the laboratories of the Council. The duties will include the investigation of potential accident and health hazards, accidents and fires, and the recommendation of safety measures. Graduation in Engineering, chemistry or physics, from a university of recognized standing is required; must be physically fit, and have several years' experience in technical work, safety engineering experience desirable but not essential. Initial salary will depend on qualifications. Apply to the Employment Officer, National Research Council, Sussex Street, Ottawa 2, Ontario, giving full details of qualifications and experience. File No. 4908-V.

MECHANICAL ENGINEER M.E.I.C., P.Eng. (Que.), 8 years experience including 3½ years with a telecommunications manufacturing concern, checking mechanical design, supervision of prototype work and liaison with factory. Interested in obtaining position with responsibility and scope for advancement, preferably in electronic or allied industry. Apply in writing to File No. 2829-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.Eng., interested in design or development work in I.C. engine, automotive or similar field or in instrumentation and control. Available on one month notice to present employer. File No. 3460-W.

MECHANICAL ENGINEER Jr.E.I.C., single, age 26, N.S.T.C., 1951. Seeking position with insurance underwriters or in some branch of sales. Experience in building construction, design of manufactured gas installation and presently employed as fire survey engineer. File No. 3903-W.

MECHANICAL ENGINEER, Jr.E.I.C., P.Eng., B.E. 1950, single, age 27, bilingual, presently employed as assistant chief engineering draughtsman with wide responsibilities, 30 months diverse experience prior to graduation in pulp and paper and automotive industries. Seeking position with increased responsibility, would consider overseas assignment. File No. 3931-W.

EMPLOYERS are you looking for a potential future executive in production or management? Ambitious professional engineer (electrical) with the following qualifications desires change of employment with future possibilities of primary importance. McGill 1951, age 26, married, C.G.E. test course, wire and cable engineering, presently employed as assistant project engineer with large chemical manufacturer. File No. 4014-W.

CHEMICAL ENGINEER, McGill 1950, Jr. E.I.C., P.Eng., 3½ years experience in control, development and operation. Desires permanent position with promising future. Development work preferred, but would consider other offers. File No. 4042-W.

MECHANICAL ENGINEER, M.E.I.C., graduated, married, sound Canadian practice, twenty years experience includes: design, estimating in piping, heating, ventilation, air conditioning, refrigeration plumbing, steam and powerplant installations. Experience in manufacturing industry, foundry, boilers pressure vessels, pumps, compressors, valves, shopwork, paper and pulp industry construction. Capable for administrations, organizing, supervision, sales. Desire a position of responsibility suitable to past experience with possibilities for advancement. Location in Montreal. Available on one month's notice. File No. 4211-W.

MANAGEMENT ENGINEER, M.E.I.C., age 39, family, Queen's 1936, B.Sc. (Hon) mechanical, P.Eng. (Ont.). Seventeen year's industrial experience: eight years in aircraft, three years in bus and five years in miscellaneous sheet-metal manufacture; last year spent in light construction industry operating own business. Experience includes all phases of factory operation as well as top level general management assignments. Good record in organization work, labor relations and product development through all phases of design, tooling, material and production control, sale s cost accounting and management control. Seeking management career opportunity, any location domestic or foreign with Southern Ontario preferred. Available on short notice. File No. 4219-W.

1943 GRADUATE IN CIVIL ENGINEERING, University Berlin, age 34, married, 2 children. Specialization in hydraulics, 7 years experience in design of navigable waterway, dams, locks and hydro power stations, hydraulic research and hydraulic laboratory work, and also river regulations and water supply. File No. 4244-W.

CHEMICAL ENGINEER, 32, B.A.Sc. (Hon), P.Eng., Jr.E.I.C., veteran, 1½ years process and quality control supervision, 2½ years process development in cellulose products, lacquers and solvent recovery, 3 years business experience, desires responsible position preferably in Southern Ontario, supervisory and/or technical. File. No. 4391-W.

# SITUATIONS WANTED

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. (E.E.) McGill 1950, age 26, single, bilingual, C.G.E. test course graduate. 6 months transformer designs. 2½ years assistant electrical superintendent on construction of industrial plant. Desire work of permanent nature with responsibilities commensurate with experience. File No. 385-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Eng. (McGill '50), age 26, married, since graduation employed by firm manufacturing pulp and paper mill machinery with experience including design, production and engineering sales. Desires responsible position with electrical firm offering an opportunity to specialize in the electrical power field. Location Montreal preferred but will consider locating anywhere in Canada. File No. 730-W.

STRUCTURAL STEEL DETAILER REQUIRES immediate employment anywhere in Canada; now in Toronto. Long term preferred, short term accepted. Have capacity for checking, supervision, estimating, and sales. Contract tenders submitted. M.E.I.C., P.Eng. (Que.) File No. 1935-W.

GRADUATE ENGINEER, B.A.Sc., M.E.I.C., P.Eng. (Ont.) seeks technical development work as assistant to works manager or chief engineer of medium sized company. Experience includes office work and training course with Canadian electrical manufacturer, four years in Canadian patent office, and ten years varied work on technical phases of design, development and manufacture of domestic refrigeration and other products. Recent aptitude testing confirms suitability for this type of work. Present earnings $7,500. File No. 1958-W.

PUBLIC UTILITY ENGINEER, nine years experience, water, hydro, gas, sewerage. Present contract expires June, 1954. Supervising $3 million project including preparation rate structure, construction, design, purchasing. Canadian, aged 40, married. B.A.Sc., M.E. I.C., C.E., P.Eng. Desires position as public utility engineer or staff consultant anywhere in Canada. File No. 2466-W.

MECHANICAL ENGINEER M.E.I.C.,, with apprenticeship and university background available for responsible position, on reasonable notice. Interested in representing manufacturers wishing to develop and service markets in Canada or abroad. Experience includes design, construction and maintenance in the pulp and paper industry, several years handling sales of power plant equipment. Working knowledge of French and German. Free to travel. File No. 2642-W.

GRADUATE MECHANICAL ENGINEER, McGill 1950, with master of business administration degree, University of Michigan 1954, looking for a career with a progressive company. Three and a half years experience in industrial engineering and also summer work in several industries. Would want to start in production or industrial engineering work. File No. 4444-W.

CONSTRUCTION ENGINEER. M.E.I.C., age 45; no dependents, 30 years general construction and mechanical experience, 21 since graduating. 10 years sales. Extensive public speaking, lecturing and public relations experience. Now completing an operation. Free to travel or relocate anywhere. Canada or foreign. Prefer north country, frontier or foreign — general construction, townsite, supervisory, public relations. File No. 4451-W.

GRADUATE MECHANICAL ENGINEER, 1952, Jr.E.I.C., married, age 30, with varied maintenance experience on high pressure equipment in the chemical industry, electrical repair for a mining company and some industrial engineering experience. Desires employment on plant maintenance or field supervision of industrial equipment installation and alteration. Location preferably in Ontario. File No. 4453-W.

ELECTRICAL ENGINEER, graduate 1949, power and machinery, Edinburgh, Scotland. M.E.I.C., grad. I.E.E., Whitworth Prizeman, age 29, married, two children. 5 years electrical engineering apprenticeship, 3 years electrical draughting, 3 years electrical engineering. Experience on rural and urban distribution; construction, maintenance and operation; H.V. and M.V. lines, cables, substations and associated gear; estimating, profile surveying, pressure testing, fault location, etc. Also inspection, testing and maintenance of all types industrial electrical machinery and cabling in paper mills, quarries and other industry; i.e. generators, motors, switchgear, transformers, elevators, etc. Desires employment on either distribution work, plant maintenance or with consulting engineer, commencing beginning of September. File No. 4475-W.

SENIOR MECHANICAL ENGINEER, B.Sc., P.Eng., M.E.I.C., age 41 years Member A.S.M.E., A.S.H.V.E., A.S.R.E., over twenty years experience in air conditioning, heating and ventilating, piping, plumbing, refrigeration design and installation, waterworks and sewerage plant, workshops and plant layout, buildings, roads, and utilities and fully experienced in all mechanical and steam power plant boilers, pumps hot water systems, design, specifications installation, maintenance and planned maintenance desires an engineering appointment anywhere in Canada, U.S.A. or on overseas projects. Previous experience as resident engineer on very large projects overseas, on construction of varied type jobs on contract basis for government departments. Further particulars will gladly be forwarded to interested employers. File No. 4481-W.

ELECTRICAL ENGINEER, M.E.I.C., P.Eng. (Alberta), age 35, single, 5 years general engineering training with one of the largest electrical manufacturers in U.K., 3 years mechanical design in light engineering works, 4 years in oilfields and refinery abroad on installation, erection, and maintenance of electrical and mechanical plant which included pumps, air compressors, A.C. and D.C. motors, steam and diesel power plants, power distribution and lighting. Desires position in construction or in which experience can be utilized. Location anywhere. File No. 4489-W.

INDUSTRIAL ENGINEER, mechanical engineering degree, age 38, with fifteen years experience in light industry on: manufacturing methods, time and motion study, process engineering, production control, factory engineering, administrative engineering and production supervision, available immediately. File No. 4493-W.

HARVARD BUSINESS SCHOOL and Toronto engineering and business graduate seeks marketing position with a manufacturer of consumer goods. Presently employed outside Canada with a similar firm. Prefer Southern Ontario basing. Age 25, married. File No. 4494-W.

ADMINISTRATOR, PROFESSIONAL ENGINEER, experienced in chemicals production, management and training with definite sales potentials, plus some sales training and experience. Seeks challenging opportunity, in technical sales or service, leading to sales management in chemical or pharmaceutical firm. Presently in Toronto, will locate anywhere. File No. 4496-W.

MECHANICAL ENGINEER, graduate 1951, Jr.E.I.C., single, age 24, experience in materials handling, and pulp and paper desires position with opportunity for advancement. File No. 4498-W.

MECHANICAL ENGINEER, graduate, A.M.I.M.E., A.M.I.E.T., government certificate, 15 years experience design and development field work, oil refinery, material handling plants, installations, machinery grainery, conveyors, elevators, construction, structural steel, reinforced concrete, docks, timber structure. Knowledge of Spanish, Italian, Arabic, little French, desires employment South America, Peru. Age 36, Canadian citizen. Past experience also includes report writing, drafting, estimates, civil engineering. Presently employed Engineering and Research Department. Salary secondary to opportunity for advancement. Free to travel anywhere at short notice. File No 4499-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., P.Eng., age 38, married, veteran. Eight years industrial experience, mainly in chemical plant design including pressure vessels, high measure piping, material handling, steel-and reinforced concrete construction, steel fabrication, etc. and cost estimating. Also some construction and some maintenance experience. Desire employment with responsibility and with future possibilities. Preferable location Alberta File No. 4503-W.

GRADUATE ENGINEER, B.E. Mechanical and Electrical, Sydney University, Australia, 1948. Age 32, single, 4 years experience plant engineering, construction, steel industry, sugar, hydro-electrical industry. Interested in position; design, development production engineering or plant engineering; inventive. File No. 4504-W.

CHEMICAL ENGINEER, Jr.E.I.C., 27, graduated from University of Toronto 1950. Four years experience in the protective coatings industry dealing with plastics, paints, varnishes, and waxes. Engaged in sales, supervisory and research capacities. Presently employed but seeking a more challenging position. Would consider other fields than protective coatings if sufficiently interesting. File No. 4505-W.

ELECTRICAL ENGINEER, Australian citizen, age 39, single, Associate Member of Institution of Engineers, Australia, and Member of Association of Professional Engineers, Australia. Desires position with a supply authority whilst establishing professional status in Canada. Twenty years experience in Electrical industry, 14½ with supply authorities in Australia and 1¼ with consultants and construction engineers, Great Britain. Experienced in design, construction, maintenance and operation of distribution works, substations and thermal station electrical installations. Experience up to 66KV. Field experience on 275 KV general line construction British electricity authority. File No. 4506-W.

CIVIL ENGINEER, S.E.I.C., P.Engineer, located in Montreal desires evening work in draughting, design etc. File No 4507-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. Manitoba 1950, married, 2 children. Age 30. Seeks position in electrical utility or plant maintenance in industrial concern. 4 years in transformer design, production and test. Some sales. Western Canada preferred. File No. 4508-W.

ELECTRICAL ENGINEER, Jr.E.I.C., P. Eng. (Ont.), B.A.Sc. 1948, M.A.Sc. 1951, U.B.C., age 28, married, one year on design of substation layout and control with a large public utility prior to receiving M.A.Sc. Completed industrial training and sales course with a large electrical manufacturing company. Experience in application and manufacture of low voltage air circuit breakers, power fuses and grounding resistors. Design of metalclad switchgear control circuits and layout of wiring diagrams. Also teaching experience. Desires position requiring initiative, organizing and supervisory ability with opportunity for advancement. File No. 4509-W.

ELECTRICAL ENGINEER, B.Sc. Queen's 1951; power option; Jr. E.I.C., P.Eng., aged 26, married, one son, and am a veteran. Employed since graduation by large chemical company. Have had varied experience in mechanical design, plant start-up, trouble shooting and in electrical maintenance. Some experience with pneumatic instrumentation. Good knowledge of electronics through signal corps and amateur radio. Have done electrical estimating on minor plant projects. Would like to further electrical training through position with construction company installing generation equipment, or with consulting engineer on design and layout of plant power distribution systems. Location no object. Will send transcript of education, details of work background and references on request. 4510-W.

CIVIL ENGINEER, honours graduate, of Glasgow University, with two years of construction experience, desires position in design office or on construction. Single, willing to work anywhere in Canada. File No. 4514-W.

CHEMICAL ENGINEER, S.E.I.C., Laval 1953, presently working for the Defence Research Board with chemical engineering group. Age 25, married, one year experience. I would be glad to meet possible employers at any time. File No. 4515-W.

CIVIL ENGINEER, Manitoba 1952, Jr. E.I.C., age thirty, married, one child. Presently employed by oil company on work becoming more the province of petroleum engineer, desires employment with consultant or contractor on heavy construction or municipal projects. Five summers experience in highway and drainage construction, bituminous and concrete paving as instrument man and resident engineer. Location immaterial. File No. 4518-W.

MECHANICAL ENGINEER seeks senior executive position in chemical or allied industry, or firm of consulting engineers. 12 years experience in the financial and engineering side of large scale plant expansions in the chemical industry. Excellent knowledge of the following processes: ammonia, methanol, urea, formaldehyde, chlorine, wood saccharification, alcohol distillations. 5 years experience in dyestuffs including complete design and erection of services and maintenance workshop. Superintendent planning engineer in charge of drawing office of 40 men, reorganization of engineering department of large concern. Excellent references, bilingual, graduate 1942, M.E.I.C. File No. 4519-W.

ELECTRICAL ENGINEER, M.E.I.C., P. Eng., with 3 years urban distribution experience and CGE test course in switch gear, motor generator, installation and transformers seeks post with utility, involving generation, transmission and distribution. Present salary in power transformer engineering sales $350 per month. File No. 4525-W.

EUROPEAN CIVIL ENGINEER would accept part time work in structural designing. File No. 4526-W.

AGRICULTURAL ENGINEER, M.E.I.C., U. of S. 1945 available December 1, 1954. 4 years teaching experience, 3 years research engineer for Sask. Research Council. Thoroughly acquainted with automotive and internal combustion equipment. Age 38, married. File No. 4527-W.

ELECTRO - MECHANICAL ENGINEER P.Eng. (Ont.), membership several English Professional Institutions. 2 years post graduate course in servo-mechanisms and control equipment. Practical experience of electro-hydraulic mechanisms. Desires position in administrative capacity. Minimum salary $7,000 per year. File No. 4528-W.

STRUCTURAL ENGINEER A.M.I., Struct. E., P.Eng., desires responsible position in the Hamilton area. Experienced in the competitive design of light and heavy industrial and commercial structures and road and rail bridges. Eight years and three years English and Canadian experience respectively. At present employed in Hamilton. File No. 4529-W.

CIVIL ENGINEER graduate of U. of Latvia in Riga, 1926. 18 years experience in railroad, road, reinforced concrete and structural steel constructions. Seeking position in any part of Canada. File No. 4530-W.

ELECTRICAL ENGINEER, graduated Norwegian University 1950, age 30, married. Experience: 2 years design and development of hydro-power station and lighting engineering, 1 year as a sales engineer. Available immediately, location anywhere. File No. 4531-W.

CIVIL ENGINEER (European) graduate Polish University College, London, Jr. E.I.C., age 41. Married. Seven years experience (including two years in Canada) in design, draughting and supervision of all sorts of engineering structures, buildings, industrial plants, bridges and earthworks. Will accept position in line with his experience. Location preferred Montreal or Southern Ontario. Available on reasonable notice. File No. 4532-W.

CIVIL ENGINEER, member E.I.C., A.C.I., graduate University of Pennsylvania, U.S.A., bilingual, married, 2 children, 18 years varied experience abroad and in Canada. Last 9 years specialized in design and supervision of reinforced concrete and steel structures of all types. Seeking permanent position where technical skill and experience would be of value. Available on reasonable notice. File No. 4533-W.

CIVIL ENGINEER, graduate of technical university of Norway, 1949, age 30, married, no children. 3 years experience in structural engineering and two in construction. Desires position in construction engineering. Free to travel, but would prefer to be in eastern provinces. File No. 4534-W.

CIVIL ENGINEER, B.Sc., Jr.E.I.C., 1950 grad., R.C.A.F. veteran, age 34, married with 2 children. Have had extensive experience in plant maintenance, administration and design. Now wishes to broaden experience and would be interested in a responsible position in the field surveying or general field engineering. Will be available July 15th File No. 4538-W.

CIVIL ENGINEER, B.Sc., U.B.C., 1951, Jr. B.C.P.E., Jr.E.I.C., age 25, 3 years heavy construction experience having responsible work in layout and construction supervision during the excavation and construction of an underground power house and power tunnels. Seeks position in design office or responsible field position where experience will be of value. Preferably in Montreal or vicinity. File No. 4539-W.

MECHANICAL & INDUSTRIAL ENGINEER, graduate, 1937; M.E.I.C., P.Eng., A.S.M.E., age 45, married, now employed as plant manager, wishes to locate outside Quebec. Reason plant closing. Seasoned senior engineer with vast mechanical experience in paper making, construction and the steel industries. Well qualified for the positions of plant manager, chief engineer, plant engineer, mechanical superintendent, etc. Seeks a position in a reliable company where application and effort will be rewarded with advancement, peace of mind, and permanency in order to establish a home. File No. 4540-W.

ELECTRICAL ENGINEER, B.E., M.E.I.C., 12 years of experience in responsible positions including operation and testing of AC and DC machinery, design and supervision of construction of transmission lines, overhead and underground distribution systems, and substations, also system planning, report writing, economic studies, budgeting, staff supervision, etc. Desires position with increasing responsibility. Excellent references. Available on suitable notice to present employer. File No. 4541-W.

CHEMICAL ENGINEER 33, veteran, graduate with five years wide experience in mechanical, chemical and electrical engineering, presently employed by plant manufacturers in Scotland, available for employment in Canada in August, 1954. Desires responsible position in planning, plant or production engineering, or industrial research and development work. Resume and references on request, languages, locality no barrier. File No. 4542-W.

CIVIL ENGINEER, P.Eng., M.E.I.C., with extensive experience in design and detailing of R.C. structures. Seeks part time employment in Toronto area. File No. 4544-W.

MECHANICAL ENGINEER, Jr.E.I.C., Polytechnique, 1953 P.Eng., equivalent of 4 years in plumbing and heating business as an apprentice, service man, design, estimate, sales and surveillance of complete plumbing and heating system for a contractor in Eastern Townships. Seeks employment in similar work preferably in Eastern Townships or Montreal but would locate anywhere. Married, one child, 26 years old, bilingual. File No. 4548-W.

CHEMICAL ENGINEER, M.A. (Hons. Engineering), Cambridge University, England; A. F. Inst. of Petroleum, 28, married, recently arrived from England. Four years service with Royal Engineers as survey officer in the Middle East. Three and a half years supervisory experience in control, development, and maintenance of various types of petroleum refinery plants. Desire responsible position anywhere in Canada. File No. 4551-W.

CHEMICAL ENGINEER, M.E.I.C., P.Eng., Toronto 1942, married. 12 years industrial experience in chemical plant project supervision, process equipment and piping design and fabrication. Seeks position with chemical company on new projects supervision or with process plant design engineering and construction company. File No. 4552-W.

ELECTRICAL ENGINEER, McGill 1953, S.E.I.C., presently employed, seeks position which calls for judgment, initiative and willingness to accept responsibility. Over two years varied experience (including summer work) in switchgear, rotating equipment, household appliances, sales, and drafting. Location Montreal. File No. 4553-W.

PROFESSIONAL ENGINEER, Jr.E.I.C., B.A., B.A.Sc., Athlone Fellow '52, age 27, bilingual. Post graduate studies in engineering production and management principles, Birmingham University, England. One year experience in construction, Canada; and one year experience with manufacturing concern. Seeks employment in the Montreal area preferably. Available for work at the beginning of September. File No. 4554-W.

ELECTRICAL AND MECHANICAL ENGINEER, B.A. (Eng.), A.M.I.E.E., British, aged 44, family; seeks administrative, sales or consulting engineering post, any location not involving prolonged separation from family. Twenty-two years technical sales of heavy electrical plant, generation with all types of prime mover, distribution, application. Newly arrived from five years in Brazil as technical chief, selling and supervising diesel and diesel alternator installations. File No. 4555-W.

GEOLOGIST, SOILS ENGINEER and Surveyor, M.E.I.C., P.Eng., age 41, 18 years experience in geological and geophysical exploration (oil, coal, chromium, tin, iron), glacier research, soil mechanics (foundations, airports, hydrology, laboratory), diamond drilling, terrestrial and aerial photogrammetry, photogeological interpretation. 8 years consultant in Europe. Very experienced alpinist. Seeking responsible position with occasional field work in Western Canada, preferably Calgary. Permanently employed. File No. 4556-W.

MECHANICAL ENGINEER, Jr.E.I.C., 1949 N.S.T.C., age 28, married with children desires a responsible position with an energetic company. Experience in general mechanical design, standardization, cost reduction, shop supervision, personnel administration and manufacturing methods. Interested in manufacturing, sales or design. File No. 4557-W.

ELECTRICAL ENGINEER, Jr.E.I.C., N.S. T.C., 1952, age 23, single. Interested in all fields of electrical engineering activity and willing to take responsibility and apply himself. Presently in second year of graduate student training course with large and reliable Canadian manufacturer of electrical equipment. Experience includes one year in transmission and distribution departments of hydro-electric utility. Some accounting experience. Desires position in Canada and would give special consideration to Newfoundland as as a location. File No. 4558-W.

MECHANICAL ENGINEER, Jr.E.I.C., graduate N.S.T. College 1951. Experience includes 1 year research work and 2 years mechanical design. Interested in position in plant engineering maintenance or design. Preferably located in Montreal area. File No. 4559-W.

ELECTRICAL ENGINEER, Jr.E.I.C., B.Sc. (Maths. and Chem.), Acadia University 1949, B.E. Nova Scotia Technical College, 1952. Age 27, married. Experience: One year as engineer in distribution department of small electrical utility; presently taking Westinghouse Graduate Training Course. Desires position offering scope for learning and advancement with smaller company or utility. File No. 4560-W.

CONSTRUCTION ENGINEER, B.Sc. (1943) M.E.I.C., A.M.I.C.E., A.M.I. Struct. E., 11 years experience. Seeks responsible position. Has held the following positions: General superintendent, assistant project engineer estimator. Experienced on light and heavy construction excavation water mains, sewers, concrete etc. Married, 33 year old, bilingual. File No. 4561-W.

## Belleville Branch

E. L. Littlejohn, Jr.E.I.C.,
*Branch News Editor*

C. H. Lusk, Jr.E.I.C.,
*Secretary-Treasurer*

### Annual Meeting

The Belleville Branch of the Engineering Institute of Canada held its Annual Meeting on April 12 at the Masonic Temple with approximately 50 members and guests present.

A. O. Drysdale was elected chairman of the Branch. Other officers elected were A. D. Janitsch, vice-chairman, H. T. Floyd, E. L. Littlejohn, and C. H. Lusk. Continuing in office were J. C. R. Punchard, A. E. Argue, and T. E. Flinn. S. Sillitoe will act as Councillor for the Branch on the main executive Council of the Institute.

T. E. Flinn as chairman of the committee arranging for a Professional Development Course, presented a short report on the progress of his committee.

The film, "Man With a Thousand Hands", was shown, which depicted the construction of the Aluminum Company of Canada's development at Kitimat.

### Management and Administration

Mr. Drysdale then introduced the speaker, Professor J. A. Coote of McGill University.

Prof. Coote addressed the Branch regarding further training for engineers in management and administration. He pointed out that wherever there were two people working together, there was a problem of administration. He also pointed out that as time passes, engineers become less and less concerned with technical things and more and more concerned with administrative matters. This was a satisfactory situation since administrative jobs demand greater remuneration. When an engineer becomes an administrator, he becomes concerned with human relations; problems far more complex than technical problems. Therefore, the good engineer-administrator must broaden his outlook if he is to become a good executive.

The professor spoke with the hope of interesting the Branch in sponsoring a course from McGill on management and administration. A committee, headed by T. E. Flinn, is investigating the possibilities of running such a course in Belleville.

## Brockville Branch

J. G. Kerfoot, M.E.I.C.,
*Secretary-Treasurer*

John F. Preston, Jr.E.I.C.,
*Branch News Editor*

### Dinner Meeting

The people of eastern Ontario can look forward to a bright industrial future H. D. Rothwell, Ontario Hydro liaison engineer for the St. Lawrence power project told the meeting of the Brockville Branch of the Engineering Institute of Canada in the Hotel Manitonna on March 24. But, Mr. Rothwell qualified, the bright future will require the advantages of the St. Lawrence power project and the determination of the people.

Mr. Rothwell told the engineers that the St. Lawrence was the last major source of hydro-electric power in Ontario that lies within economical transmission distance of the centre of population.

"If Ontario is to continue to develop and expand, the province needs supplies of energy in ever-increasing amounts," Mr. Rothwell pointed out, suggesting that the St. Lawrence project was the answer.

"It is one of our cheapest sources of energy yet untapped," he explained.

Saying that this area was blessed with excellent water, highway and railway facilities, plus an oil pipeline and possible natural gas pipeline, Mr Rothwell felt eastern Ontario had a bright future.

"People in this area can look forward to changes in this part of the province in the next 25 years that will astound even the most pessimistic," Mr. Rothwell stated.

The speaker outlined the history of hydro in Ontario and spoke of the future possible uses of natural gas and atomic energy as sources of power.

The speaker was introduced to the meeting by John F. Preston and thanked by J. E. Pickering, both employees at C.I.L., Maitland.

Over 85 engineers attended the dinner-meeting which was presided over by Fred Walsh, vice-chairman of the Institute.

During the dinner reports were heard from the Branch's councillor, Harold Brewer, on recent council meetings held in Montreal, and from Bob Powell, program chairman, who announced the tentative date for the next meeting.

### Engineering Committee

Chairman Walsh announced the formation of an Engineering Committee by the Brockville Chamber of Commerce, which he will head, and asked the members of the Institute to assist in engineering problems when called upon. The committee is to act in an advisory capacity only.

### May Dinner Meeting

Colonels Sagar and Medland of the Association of Professional Engineers of Ontario were guests at the dinner meeting of the Brockville Branch held on May 18 at the Manitonna Lodge. After being introduced by Rex Davey the president of the Association, Col. Sagar, presented a strong case for the national unification of Canadian engineers.

The plan, introduced by last year's Association President H. Smith, calls for the formation of a permanent body sitting at Ottawa empowered to speak for Canadian engineers and to bring the industrial engineer more into the public eye. This plan is expected to be of great interest to the Ontario Provincial Association because of the large concentration of industry in this area. Colonel Sagar emphasized the unofficial nature of his talk and the fact that he spoke only on the personal level as yet but urged those present to think of the plan amongst themselves.

He hoped that the day would come in the not too distant future when the provincial bodies from across Canada could present a concrete proposal for discussion by the members. "Many obstacles remain to be hurdled," he said. "but already the spirit of compromise between the several Associations and the Engineering Institute is paving the way for more detailed proposals."

A spirited discussion period followed during which the Association Executive Director, Colonel Medland added to the president's remarks.

The visitors were thanked on behalf of the Engineering Institute by Bob Tivy of Automotive Electric. After refreshments and further discussion of this important subject, the meeting adjourned.

## Edmonton

P. M. Butler, M.E.I.C.,
*Secretary-Treasurer*

K. Provost, M.E.I.C.,

## Huronia

L. Morgante, Jr.E.I.C.,
*Secretary-Treasurer*

G. A. Antenbring, M.E.I.C.,
*Branch News Editor*

**Plant Tour**

A meeting of the Huronia Branch was held in Owen Sound on May 7, for the purpose of touring the plant of the William Kennedy and Sons Limited, and to hear talks on Kennedy products by two of the company's personnel.

Arrangements were made to conduct visitors through the company's West Machine Shop, where the machining operations are carried out. Here it was possible to observe work in process on many of the firm's diversified products.

Visitors were also shown the facilities in the steel, bronze and iron foundries, where all the castings are manufactured for machining and assembly on the firm's premises. A substantial volume of work is done in the manufacture and sale of rough castings.

After the tour, C. R. Stones, chief engineer, gave a paper entitled "Kennedy Products for the Pulp and Paper Industry". He outlined the firm's development since it was founded in 1857 and its gradual expansion into the field of pulp and paper treating machinery. Brief descriptions were given of the company's grinders, sulphate washers, pulpmasters, stockmakers, agitators, and paper machine drives.

S. A. Scott, manager of the company's Falk division described the company's association with the Falk Corporation of the U.S.

## Hamilton

N. A. Parry, Jr.E.I.C.,
*Secretary-Treasurer*

F. S. Gue, Jr.E.I.C.,
*Branch News Editor*

**Students' and Juniors' Night**

The Hamilton Branch Annual Students' and Juniors' Night was held Thursday, March 18. It featured the presentation of four technical papers in a competition which has come to be keenly anticipated by the Hamilton membership, offering as it does an interesting variety of technical topics.

Winner of the Past-Chairmen's Prize of $50 was Frank Gue, Jr.E.I.C., with a paper titled "Some Aspects of Canadian Westinghouse Company Practice in Generator Coil Manufacture." The electrical, mechanical, and maintenance problems encountered in the manufacture of windings for high-voltage synchronous machines were outlined, and a brief description of three prominent present day insulations (micafolium, asphalt bonded, and "thermalastic") was given.

Second prize of $35 was taken by B. A. Warren, Jr.E.I.C., with his paper "Murdochville—Building Canada's New Mining Town." The problems of establishing a modern, comfortable townsite in the middle of the virgin bush in the heart of the Gaspe were dealt with capably and often whimsically in this interesting paper.

D. B. Williamson, Jr.E.I.C., outlined the economic and technical factors which have, in the past few years, greatly increased the number of broadcast transmitters operating by remote control. He gained third prize with his paper "The Unattended Operation of Broadcast Transmitters."

K. J. Reekie, Jr.E.I.C., delivered a well-prepared discussion of "Waterworks Construction and Maintenance."

On behalf of the Judges' Committee, W. A. Dawson, past-chairman, congratulated the contestants. W. A. Wheten chairman, commented upon the importance to both the local and national bodies of this type of activity among the younger engineers.

**Joint Meeting**

In a joint meeting with the A.I.E.E., on April 23, the Hamilton Branch was privileged to hear an address by J. B. MacNeill, consultant on switchgears for the Westinghouse Electric Corporation, who spoke on "Switchgear Development."

Mr. MacNeill, who was born in Prince Edward Island, had much to interest his Canadian audience. He began by outlining the protective devices which were largely either primitive or non-existent 60 years ago. The early plants at the Falls were the first polyphase system designed for power transmission, and were almost defenceless against short circuits; the only course open was to shut the station down until the fault cleared.

Progress was traced from the crudities of fuses which were more of a menace than a safety device, through unsatisfactory trials with air circuit breakers, to the present highly refined and dependable oil breakers. The rising curves of kva. and kv. rating steepening steadily through the years, at present have reached 25 million kva. at 330 kv.; a power flow which can be interrupted in the time it takes a penny to drop one half inch, with reclosure in a quarter second. In the design stage are breakers designed for 30 million kva. at 440 kv., or about 10 times the power of the entire Sir Adam Beck No. 1 Generating Station in the Niagara Gorge.

The speaker was introduced by J. W. Kerr, general manager, power products division, Canadian Westinghouse.

On May 8, the Branch enjoyed the hospitality of the Ford Motor Company at Oakville during an extensive tour of the new manufacturing facilities. Almost 500 members attended, a record turnout for a gathering of this kind.

The Ford tour concluded the regular meeting schedule of the Hamilton Branch for the 1953-54 season.

## Kingston

D. R. Graham, M.E.I.C.,
*Secretary-Treasurer*

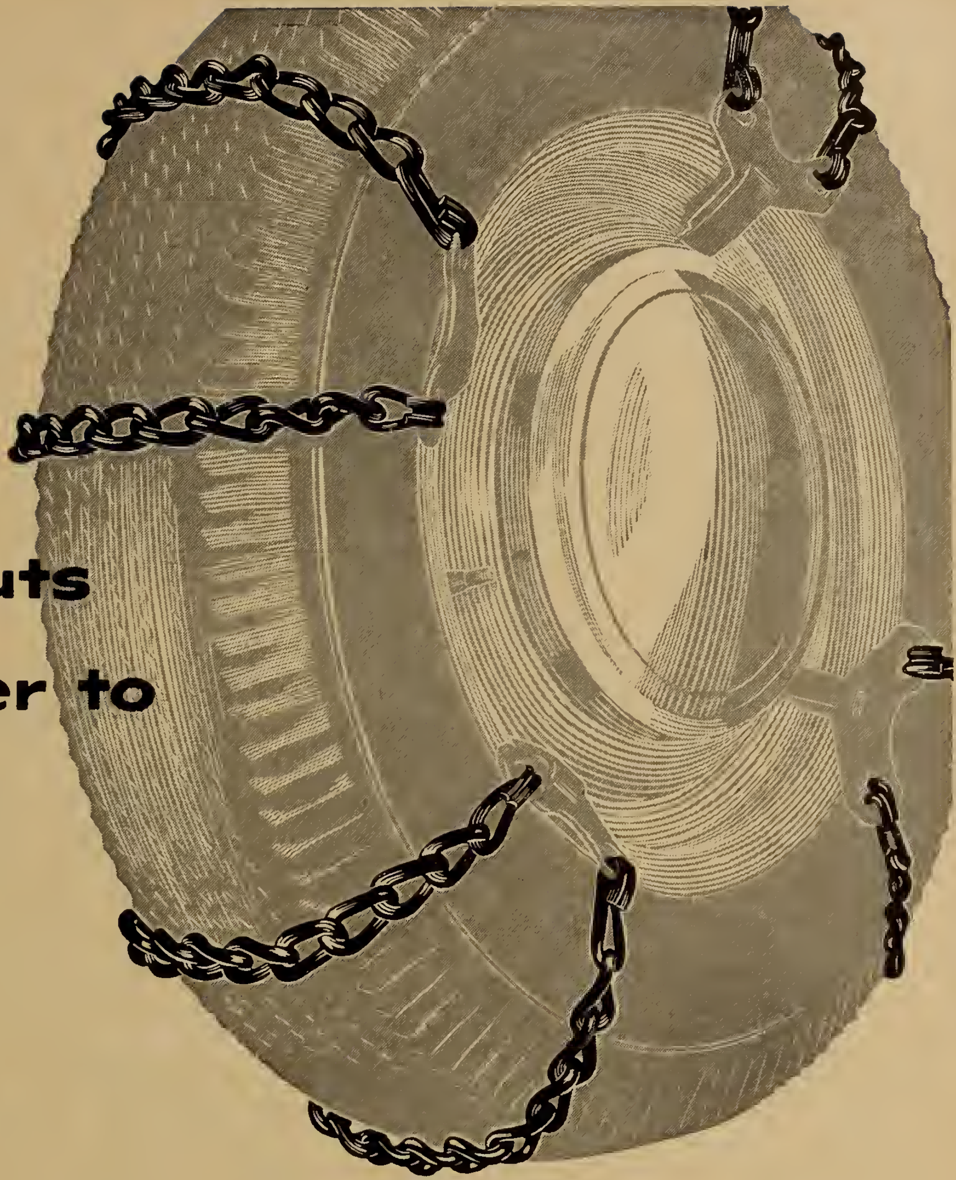
G. D. Burwash, Jr.E.I.C.,
*Branch News Editor*

**April Meeting**

The April meeting of the Kingston Branch was held in conjunction with the Kingston Metallurgical Society in the R.C.E.M.E. officers' mess at Barriefield on April 20.

The guest speaker was Dr. D. F. Gibbons of the Royal Military College. His topic was "Plastic Deformation of Metals". Dr. Gibbons is presently a Defence Research Board Fellow in physics at the Royal Military College. He was introduced by Dr. J. Reekie, R.M.C., chairman of the Metallurgical Society and thanked by A. E. Hyde of Aluminium Laboratories, Kingston.

**Members of the Toronto and Hamilton Branches visit the Ford Motor Company at Oakville, Ontario.**



## Lakehead

G. E. Cook, M.E.I.C.,
*Secretary-Treasurer*

H. Penner, Jr.E.I.C.,
*Branch News Editor*

***Lynn Lake Railroad***

"On Wednesday, April 7, the Lakehead Branch met at the Port Arthur Armouries to hear J. L. Charles, M.E.I.C., chief engineer of the Western Region of the C.N.R., speak on the Lynn Lake Railroad. The talk covered all phases of the location and construction of the 144 mile railroad from Sherridon, Manitoba, to the Sherritt-Gordon Mines Limited new nickel-copper mine at Lynn Lake, 120 miles away by air. This talk is to be the subject of a paper in the Engineering Journal in the near future.

A movie taken by the CNR as the job progressed illustrated the various aspects of the work. One of the most interesting of these was the crossing of the Churchill River. This was done with three separate steel spans.

After the movie, the group took time out for refreshments. Following this Mr. Charles answered a number of questions by various members. R. B. Chandler thanked the speaker.

***Wive's Association***

Members discussed the formation of an Engineers' Wives Association at the Lakehead. Most members were of the opinion that it was an excellent idea and Mr. Charles stated that the Engineers' Wives Association formed in Winnipeg was very successful and very active.

***A. F. Telfer Speaker***

"On Wednesday, April 28, the Lakehead Branch met to hear A. F. Telfer, public relations officer for the Canadian Standards Association, speak on industrial standardization and the functions of the C.S.A. G. S. Halter, branch chairman, introduced Mr. Telfer, who is a native of Collingwood, Ontario, and a graduate of Toronto, Osgoode Hall. Since 1948 he has been executive assistant to the advisory committee of the C.S.A.

Mr. Telfer cited many examples of the use and importance of standards even outside the scientific field. A good deal of the credit for the rapid transition of Canada from a primarily agricultural country to one of the world's important industrial nations should go to standardization of products and practices in industry.

Standardization and mass production have made possible great reductions in the price of consumer goods.

***C.S.A.***

Mr. Telfer explained that the C.S.A. is a voluntary non-profit organization, supported by manufacturer's and retailer's groups. Although it receives an annual grant from the National Research Council and works in fairly close conjunction with this body, the C.S.A. is not a government organization. Many of its recommendations and specifications governing safety have been incorporated in by-laws and have thus become law.

W. D. Beckett extended the thanks of the group to Mr. Telfer for his very interesting talk.

## Lethbridge

R. D. Hall, Jr.E.I.C.,
*Secretary-Treasurer*

***Supper Meeting***

Saturday, March 20, 1954, the Lethbridge Branch of the Engineering Institute of Canada held their monthly supper meeting. Entertainment was provided as a piano-violin duet by Mr. and Mrs. George Brown. The soloist for the evening was George Gowlland, Jr.

The speaker for the evening was Ray Miles and was introduced to the group by city engineer, J. C. Neufeld.

***Science and Imagination***

Mr. Miles, representing the Armco Drainage and Metal Products, discussed the rapid progression of scientific discoveries in the last twenty-five years. The tremendous advance in technical inventions has made our generation practically immuned to surprises. When scientists claim today that they will fly to the moon before the end of the twentieth century, people do not consider the proposed feat an impossibility or even an improbability.

Mr. Miles prompted the engineers to continue to use their imagination and

initiative to develop new devices which will help to increase our standard of living. Proof of the continued advancement in Canada is the St. Mary Dam Development in the Lethbridge area, the Frobisher project in the Yukon, the St. Lawrence Seaway and the Kitimat project in British Columbia. With this recent advancement Canada has grown rapidly resulting in an increase in population and in the standard of living. The engineering profession is destined to play an important role in this present revolution.

Mr. Miles was thanked by William Mills.

## Lower St. Lawrence

Jean R. Menard, M.E.I.C.,
*Secretary-Treasurer*

### Annual Meeting

On April 24, the engineers of the Lower St. Lawrence were hosts at a social evening held at the Hotel St. Louis, Rimouski. A cocktail was served at 6.30 p.m., followed by a banquet and a dance attended by some 50 persons.

Brigadier Maurice Archer, M.E.I.C., vice-president of the National Harbour Board was guest speaker at the banquet. He described the economical look of the St. Lawrence River, its maritime traffic from the Great Lakes to the Atlantic Ocean and its future development, the St. Lawrence seaway. He also spoke about the hydro-electrical development in the international zone of the river.

### Film Presentation

On May 2, some 15 engineers attended a presentation of five films at the Curling Club. The local plant of Canada Wire and Cable presented two films related to the construction of cables. Also three films on construction of roads, bridges and sea-walls were shown. These latter films were loaned to our Branch by Georges Demers, M.E.I.C., who had them mailed to him by "La Société des Ingénieurs Civils de France"

## Moncton

V. C. Blackett, M.E.I.C.,
*Secretary-Treasurer*

### Halifax Harbour Bridge

The construction of the Halifax harbour bridge, which when completed, will be the largest bridge structure in the Maritime Provinces, was the subject of an address given by the designer, Dr. P. L. Pratley, at the final branch meeting of the year, held in the dining hall of the Moncton Curlers Association.

R. T. Sansom, chairman of the branch, presided. The attendance was a record for branch technical meetings.

The speaker prefaced his remarks by telling of two early attempts to build low-level bridges across the narrows connecting Halifax harbour and Bedford basin. One was destroyed by fire, the other by storms.

The structure, now under construction, will be a suspension bridge with a total span of 1,447 feet. It will accommodate highway traffic between Halifax and the town of Dartmouth now either carried by ferries or routed around Bedford basin. The estimated cost of the structure is ten million dollars. It is expected the bridge will be in use in 1955 once arrangements on the Halifax side have been completed to take care of the traffic problem which even now looms on the horizon.

A detailed study of the project was given in two films narrated by Hugh Pratley, son of the speaker, and resident engineer on the bridge construction.

Following the address, a buffet luncheon was served and an informal discussion held.

## Montreal

R. J. Harvey, M.E.I.C.,
*Secretary-Treasurer*

J. A. Paget, M.E.I.C.,
*Publicity Chairman*

### Plastic Laminates

Plastic Laminates was the topic of a paper presented on Tuesday March 9 to the E.I.C. Montreal Branch by H. M. Brazener, technical superintendent of Arborite Company Limited. The speaker described the different grades of paper and types of resins used to obtain the physical properties and colours of modern laminates. Mr. Brazener then went on to describe the cutting, stacking, press curing, sanding and trimming of the laminate during manufacture.

A summary of the electrical, physical and fabricating properties of laminates was given and many interesting samples of commercial products made of laminates were displayed.

Industrial products including gears, bearings, etc., form a small part of the market. Decorative laminates getting their colour from the top layer of paper, their strength from the lower layers, and their durability from a high quality surface of transparent resin, form the bulk of production. The meeting chairman was E. S. Yuil and Stewart Lockhead thanked the speaker.

### Materials Handling

On March 10 a forum on this subject was held at a joint meeting of the Montreal Branch and the Montreal Chapter of the American Materials Handling Society. The chairman of the discussion was Emile Dupré, and the panel consisted of W. A. Meddick, Elwell Parker Electric Co., E. A. Byrne, American Monorail Co., Ollie Haynes, Island Equipment Corporation, and George Hanhauser, Fab-Weld Corporation. C. B. Elledge, president of the American Institute of Material Handling was also present, and acted as the first speaker. He stated that the Institute consisted of 70 member companies in the U.S.A. who co-ordinated many of their activities for the purpose of advancing the science of material handling. Much of its work is concerned with education and the sponsoring of symposiums between buyers and sellers of equipment so that economical purchasing on the part of the buyer will result and handling costs will be reduced.

### Trucks

W. A. Meddick, the second speaker, discussed industrial trucks, high-lift trucks, and fork trucks, and the economic factors involved when selecting power-driven trucks or trucks pushed by manual labour. He also discussed the relative merits of gasoline driven and electrically driven trucks for several different applications.

### Overhead Equipment

E. A. Byrne's topics included monorails, hoists and overhead cranes. He pointed out that overhead equipment was flexible and versatile. Its main advantages are that it saves floor space and is readily available to all of the floor area underneath it. Methods of controlling and powering overhead equipment and the approximate maximum load capacity of each type of equipment were also discussed.

### Conveyors

The fourth speaker was Mr. Haynes, who spoke on conveyors. He stated that there were three main types of conveyor: gravity, belt or chain, and fixed bed, and that the conveyor played a fundamental part in mass production factories and chemical plants where a continuous steady flow of material is required.

He also discussed roller bearing life in conveyors and its improvement in recent years, and the use of light metals such as aluminum and magnesium in conveyor construction.

### Floor Equipment

Mr. Hanhauser, the last speaker, discussed trailers, skids, fork trucks, floor industrial trucks, and racks, and provided the audience with some up-to-date figures on the cost of some of these articles in the United States. A large audience attended this meeting which was sponsored by the transportation section. Meeting arrangements were made by J. D. Sylvester.

### Atomic Energy

On March 11, Doctor Huet Massue, M.E.I.C., a director of the crown company Atomic Energy of Canada Ltd., gave an illustrated address on the subject "Atomic Energy". Doctor Massue introduced the subject by discussing the present-day uses of radio isotopes in medical work, welding, X-ray inspection, and control, etc., and by briefly discussing the various forms of atomic power such as the atom bomb and Nautilus submarine.

Doctor Massue then went on to discuss the supply, cost, and the method of production of power in various parts of the world today, and pointed out that if the increasing demand for power in certain areas continues, hydro electric power resources will soon be used up and it will have become necessary to resort to steam plants using coal, oil, or nuclear power. He stated that the cost per kilowatt-hour of power derived from coal had been reduced by a factor of about 6 since coal was first used for power generation, and that the same kind of reduction in the price of power derived from atomic energy could certainly be expected. Atomic energy, therefore, will probably become a major source of power in the future, especially if supplies of coal and oil fall off, and the demand for power increases rapidly. P. E. Gagnon of Quebec City acted as chairman, and meeting arrangements were made by J. E. Hurtubise.

### Power Plant Instrumentation

On March 15 an illustrated talk on power plant instrumentation for load frequency and line bias control was given to a joint E.I.C., A.I.E.E. meeting by W. H. Sissons, power utilities and industrial manager, Brown Instrument Division, Minneapolis-Honeywell Co. The slides illustrated the basic electronic principles used by the company to measure temperature, pressure, electrical potential, amperage, power etc. Slides showed the two phase selsyn system and its application in several types of instruments. The methods of load frequency and the line bias control were described. The meeting chairman was P. P. Vinet and meeting arrangements were by J. R. Holmes. About eighty engineers attended the meeting.

*Stainless Steel Trains*

On Thursday, March 18, Benjamin Labaree, chief engineer of the railway division of the Budd Company of Philadelphia, gave an illustrated lecture on the stainless steel transcontinental coaches now under construction for the Canadian Pacific Railway. The order for 173 cars of several types, including dome cars and sleepers was placed late last spring. Delivery will commence twelve months after placement of the order.

The speaker acknowledged the contribution by Canadian industry of couplers, draft gear, and furnishings amounting to a considerable part of the cost. Mr. Labaree showed graphs depicting the increased use of stainless steel cars because of their superior strength, light weight and low maintenance. He stated that a locomotive limited to six old cars could pull seven Budd cars due to their lighter weight. A Budd car is 38 percent lighter than a modernized steel car although the comparison is not quite as favourable when high strength steel cars of recent design are used as a basis.

Sixty-five people attended the meeting which was arranged by H. N. Young. The meeting chairman was J. D. Sylvester and C. Mitchell thanked the speaker.

*The Engineer and Nuclear Developments*

On Tuesday, March 23, a panel consisting of J. L. Gray, A. J. Mooradian, Dr. D. C. Brunton and Dr. Leo Yaffe with Dr. L. Theismeyer as moderator discussed the impact of nuclear developments on the engineering profession in Canada.

Mr. Mooradian, senior supervisor of Process Engineering of A.E.C.L. at Chalk River dealt with the type of engineer most useful in nuclear work. Twenty-six percent of Chalk River engineers were operational staff in the reactor and extraction branches. Reactor staff included graduates of engineering physics, metallurgy and chemical engineering courses, while the extraction branch employed chiefly chemical graduates. Another 26 percent of Chalk River engineers were employed in the development department chiefly on processing problems. Most of these were chemical engineers. The remaining 48 per cent of the engineers were of various types engaged in service and design.

Mr. Mooradian said that, since in any forseeable program there would always be more problems to investigate than engineers to work on them, technical intuition will be required to find the most profitable course of action.

Dr. D. C. Brunton, president Isotope Products Ltd., one of the three or four firms in North America and the only firm in Canada concerned with atomic applications, followed Mr. Mooradian. Dr. Brunton divided current and potential isotope applications into two categories: Bulk radiation uses: and Irradiated isotope uses. In the first category were:

1—The cobalt bomb for beam therapy.
2—Sterilization and pasteurization which would require excessively large sources by today's standards.
3—Control of insects in grain requiring sources only 1 percent of the above but still large.
4—Catylitic action by large sources. Polymerization by radiation produces a different effect than heat polymerization.

In the second category come:

1—Tracer and thermapeutic uses of radio active iodine and other elements.
2—For measuring density, homogenity and thickness of materials like paper webs, moving steel sheet, uncured rubber, loose powders and other hitherto unmeasurable materials thereby making their production more readily subject to automatic control.
3—Radiographing of welded vessels by the "one shot method" now pays for itself in steel savings.

Dr. Brunton was followed by Mr. Gray, vice-president in charge of administration and operations at Atomic Energy of Canada Ltd. Mr. Gray said that Canada's participation in atomic work is directed toward power production. He visualized a program aimed at producing 100,000 k.w. of experimental capacity for Southern Ontario by 1960 followed by 7,000,000 k.w. of atomic power capacity by 1980.

He estimated that 25 percent of the cost of the first power reactor would be engineering with this figure dropping to 15 for the next and 10 percent for succeeding reactors. At $9000.00 per year per man this would mean that present manpower of 150 men engaged in reactor design would rise to 200 by 1958, remain steady until 1970 then jump to 700 by 1972 and reach 1400 by 1980.

These men would be employed by one or two closely knit organizations. Engineering requirements were four engineers to one draftsman in the early stages of a project and this changed to a ratio of one engineer to one draftsman. Thus for 200 total staff 100 would be engineers split as follows: 47 percent mechanical, 32 percent civil, 13 percent chemical and 8 percent electrical.

Mr. Gray said that in atomic work heavy industry would be asked for close tolerances on large parts, freedom from leaks, and, for heavy water reactors, economy of contents in heat exchangers and other apparatus. He said that the development facilities of Canadian industry were practically non existent but that large firms developing such facilities could anticipate atomic work.

In reply to a later question Mr. Gray said that 16 engineers of the 150 men he said were engaged in reactor design were at Chalk River and most of the others were with the C. D. Howe Co. Ltd. in Montreal.

Dr. Leo Yaffe, special lecturer in Radio Chemistry at McGill followed Mr. Gray and described what he felt were the educational requirements for atomic work. He deplored the apparent shortage of graduate students and said that it might have unfortunate results. Dr. Yaffe described in some detail the courses in atomic work offered by various universities.

Dr. L. Theismeyer thanked the speakers and concluded the evening. Meeting arrangements were by H. G. Burbridge.

#### The Coal Industry

Lionel A. Forsyth, president of Dominion Steel and Coal Corporation, addressed the Montreal Branch on March 25. His discussion was concerned primarily with the coal industry in Nova Scotia.

He stated that coal is still the most important single source of energy in our economy, being, the source of about half our total power requirements. Mr. Forsyth stated that Canada is now burning about one-third more coal than in the immediate prewar years, but there is about 1½ tons of imported coal for each ton of Canadian coal burned. The industry is now in the position where it cannot compete with foreign oil and coal in a large part of the Canadian industrial and domestic market, and the only way to maintain the industry and employment for its workers is to continue the existing Dominion Government subsidy.

Increasing government subsidies is not the solution to the industry's problems at present, and much can be accomplished by improving methods of mining, processing, and transportation.

Mr. Forsyth also discussed the possibility of burning the Nova Scotia coal in locomotives powered by coal-burning gas turbines, which could probably operate more economically than diesel equipment. However he stated that the chances of introducing coal-burning equipment at the present time are not great since both railways are in the process of replacing steam engines with new diesel equipment.

The meeting was sponsored by the management section. Arrangements were made by M. J. Oldershaw, G. H. Hoganson acted as meeting chairman, and A. M. Thurston thanked the speaker.

#### Atomic Reactors

Arthur G. Ward, a senior physicist with Atomic Energy of Canada Ltd. at Chalk River, spoke on "Control of Atomic Energy Reactors" at a joint meeting with the A.I.E.E. on March 29.

Mr. Ward described four classifications of neutrons and their significance He defined the effective multiplication factor, K, the main operating parameter. He outlined the method of control and stressed how delayed fission neutrons and photo neutrons from the heavy water facilitate the control problem and stabilize the reactor. He told also of the reactor's inherent thermal stability as an increase in temperature brings about a decrease in reactivity.

Another problem is the xenon poison effect, a condition which prevents the restart of a reactor for several hours after shutdown due to one of the fission products being an isotope of xenon with a very high neutron capture cross-section and a half life of several hours. Once this isotope has formed some time after a shutdown, it is impossible to restart the reactor until the xenon has decayed.

Meeting arrangements were by A. G. Moore who also acted as chairman and thanked the speaker.

#### Ore Handling at Seven Islands

On March 30 Mr. D. H. Sharp, a project engineer with the C. D. Howe Co. Ltd. described the ore handling facilities at Seven Islands to a meeting of the Montreal Branch E.I.C. Since mining operations at Knob Lake are limited to 5½ months of the year and shipping is spread over an 8 month period, storage facilities for ore must be provided at the port of Seven Islands in addition to the ore loading facilities.

Crushed ore arrives at Seven Islands in 115 car trains carrying about 10,000 long tons each. Each train is pulled by four 1,600 h.p. diesel locomotives. The ore cars are sorted by grade of contents in a classification yard at Seven Islands.

The ore handling equipment which is capable of loading or stock piling at a maximum rate of 8,000 long tons per hour consists of two duplicate conveyor systems, one of which may be run without the other.

An extensive system of electrical interlocks protects the equipment against operator errors or accidents due to the stoppage of one unit in a chain of equipment. The plant at Seven Islands, for which the C. D. Howe Co. Ltd. are consulting engineers, will cost between $20,000,000 and $30,000,000. The machinery alone will amount to four or five million dollars.

Mr. Sharp's lecture was illustrated with slides. A motion picture of the construction of the Q.N.S. & L. Railroad to Seven Islands was also shown. Meeting arrangements were by W. Sefton and R. H. Quintal acted as chairman.

#### Gas Turbines

On April 1 Mr. Kerez, an application engineer with Brown Boveri of Baden, Switzerland, gave an illustrated lecture on gas turbine operating experience with particular reference to the Beznau Power Station. Brown Boveri favours open cycle gas turbines because their performance is most readily predicted. They can guarantee 3,000 to 4,000 hours of operation before shutdown for maintenance using oil firing but their experience with coal burning units has been poor. Gas turbines require no cooling water and are competitive with water power and steam power for peak load plants of moderate size. The space requirement is about 70 percent of that for a steam plant of the same rating. The company installed their first commercial gas turbine in 1935. The speaker mentioned two such installations in Switzerland and one in a South American cement plant. The gas turbines at Beznau are of 27,000 and 13,000 k.w. capacity. Meeting arrangements were by P. J. Kunstler and R. S. Griffiths was chairman. The attendance was about one hundred.

## Niagara Peninsula

G. W. T. Richardson, jr.e.i.c.,
*Secretary-Treasurer*

J. H. Saldat, jr.e.i.c.,
*Branch News Editor*

#### Atomic Energy

J. L. Gray of the Atomic Energy of Canada Ltd., spoke to the members of the Niagara Peninsula Branch about atomic energy developments in Canada on April 22, 1954 at the Red Casque Inn in Niagara Falls.

Mr. Gray graduated in mechanical engineering from the University of Saskatchewan in 1935 and has been associated with the atomic energy program since 1948.

He pointed out that the most important phase of Canada's atomic program is in the study, design, and building of reactors and that two research reactors have been built in Canada. The first power reactor design is expected to be complete within a year.

Mr. Gray believed that power reactors will compete with steam but it may be some time before hydro plants are replaced. The present cost of a power reactor is about 100 times the price of an equivalent steam plant. The lecture was illustrated with slides.

A. J. Bennett was chairman, W. A. Scott introduced the speaker and J. H. Ings thanked Mr. Gray for the interesting talk.

## Nipissing and Upper Ottawa

D. K. Campbell, jr.e.i.c.,
*Secretary-Treasurer*

#### April Meeting

The regular April meeting of the local Branch of the Engineering Institute of Canada was held Wednesday evening at White Oakes Inn, Temiskaming. There were twenty-seven members and guests present for the dinner which was followed by a short business meeting. The feature of the meeting was the presentation of short talks on engineering practice by four of the members.

#### Propeller Performance

J. F. Kennedy of the engineering department, Canadian International Paper Company, talked about propeller performance on bush type aircraft. In particular, the difficulties in finding substitutes for the discontinued Hamilton Standard propellers used on Canadian Pacific Airlines Fairchild 71C aircraft were presented.

#### Relaying Schemes

A. T. McKerrall, meter and relay engineer of the Ontario Hydro explained the different relaying schemes in use for protection of the eight $600,000.00 generators at the Otto Holden Generating Station, near Mattawa. This concise explanation of modern protective relaying was of particular interest to the electrical engineers present.

#### Factory Maintenance

J. R. Lewis, engineering department of C.I.P., presented a thought provoking talk on factory maintenance problems. He outlined the probable method of attack by an "old time" engineer which was characterized by very little inspection work and delegated responsibility for maintenance and repair to small labour units located throughout the plant. Its advantages were the intimate knowledge of the machines by the group responsible and good personnel relations and job interest. The centralized and highly organized "modern" maintenance program was characterized by separate inspection groups, volumous records and a centralized repair crew who had been divorced from a personal interest in the machines they repair. In summing up, Mr. Lewis tried to show that the combination of the best points of both systems with the elimination of the faults of each would give the best results.

**Railway Freight Yards**

T. C. Macnabb, ass't. district engineer, C.P.R., addressed the meeting on the subject "Railway Freight Yards". He first reviewed the types of yards to be found here and in Europe and gave their distinguishing characteristics. With the use of diagrams, the latest method of breaking up the yard into distinct areas of receiving, classifying and departure was explained. The design of the new Montreal freight yard, in which Mr. Macnabb participated, was explained. The mechanical retardation devices, signals and switching for this type of yard were described.

The meeting was adjourned at 11.30 p.m.

## Northern New Brunswick

L. L. Marshall, m.e.i.c.,
*Secretary-Treasurer*

R. W. Rankine, jr.e.i.c.,
*Branch News Editor*

**Industrial Instrument Display**

A general meeting of the Branch was held at Dalhousie, N.B., on February 23, 1954. Some 45 members and guests were present.

The meeting was arranged in conjunction with the Minneapolis-Honeywell Regulator Company Ltd. who presented an industrial instrument display from 10 a.m. until 10 p.m. at the Chaleur Inn. Members of the Branch were also invited to visit the New Brunswick International Paper Company mill in Dalhousie.

During the evening dinner was served at 7.30 and a short business meeting followed. The speaker for the evening was Otto Cepella of Minneapolis-Honeywell who gave a talk entitled "Automatic Controls". Mr. Cepella illustrated his talk by slides and dwelt mostly on the principal types of process instruments. The clear and concise explanations given were received with particular interest by those present.

Assisting Mr. Cepella was Henry Marks of the same company who discussed briefly the reasons for choosing either pneumatic or electric operation of process controlling instruments.

## Ottawa

G. A. Sutherland, m.e.i.c.,
*Secretary-Treasurer*

C. E. Howard, m.e.i.c.,
*Branch News Editor*

**Urban Transit**

"The Place of the Trolley Coach in Urban Transit", was the subject discussed by L. W. Birch, transportation engineer of the Ohio Brass Company, at the luncheon meeting in the Chateau Laurier on March 24, 1954.

Mr. Birch, a railway and transit consultant, predicted that streetcar and track maintenance costs in Ottawa will bring a demand within the next 10 years for conversion either to motor bus or trolley coach operation. The speaker chose a 10 year period for his streetcar estimate because of calculations he has made on the cost of operating trolley buses.

In his statistical comparisons, Mr. Birch did not give figures for streetcar operation but it was intimated they were economically sound on routes of greater passenger density than the majority of those in Ottawa.

The trolley bus—motor bus comparison was based on six items of cost of operation, as follows:

(a) Transportation (includes wages, tickets, etc.)
(b) Maintenance
(c) Fuel

(d) Administration
(e) Depreciation (including interest)
(f) Taxes

Assuming that the comparison is between a trolley bus and a motor bus of the same seating capacity and type, the transportation item was identical in each case and could be cancelled out. It was stated that oddly enough the sum of the two items, administration and taxes is almost identical for both types of vehicles according to studies made by the Dominion Bureau of Statistics and the A.T.A. These two items were eliminated for comparison.

#### Variable Costs

The variable costs, maintenance, fuel and depreciation were discussed fully. D.B.S. figures were quoted to the effect that trolley bus costs in these categories in 1951 in Canada totalled 17 cents a mile, motor bus costs 24 cents. This meant that the average cost of operating a trolley bus in one of the 15 Canadian cities which uses them was about 7 cents cheaper per mile than operating a motor bus.

A comparison of maintenance cost figures in the years 1938 to 1952, of 14 companies which operated both types of vehicles showed a continuous advantage in favour of the trolley bus, including cost of overhead wires. This figure increased from 2 cents a mile to about 4 cents, as the motor bus fleets wore out. The trolley bus was the more durable and the main reasons for lower maintenance cost was the smaller amount of labour necessary to keep it in repair.

With regard to fuel, electricity cost per trolley bus mile in Ottawa was now 4.5 cents; per motor bus mile it was 4.9 cents. This ratio was generally true across Canada and was likely to increase in favour of the trolley bus if electricity costs fell because of new hydro developments.

For bookkeeping purposes, on depreciation and interest some companies considered the life of the trolley bus to be 15 years; of the motor bus 10 years. Mr. Birch thought 15 years a conservative estimate for a trolley bus. He said a fleet of trolley buses has been operating in Columbus, Ohio for 19 years and Chicago is still running a few 1930 buses. Mr. Birch used 16 years in his calculations.

The figures given for depreciation cost per mile were 6 cents for the motor bus and 4 cents for the trolley bus. Depreciation of the overhead wires added 7/10 of a cent to the latter figures.

The speaker was introduced by Roland Hayes, chairman, and thanked by H. Welch of Ottawa.

## Saint John

John A. B. Brenan, M.E.I.C.,
*Secretary-Treasurer*

H. M. McCleave, Jr.E.I.C.,
*Branch News Editor*

#### The Engineering Act

A. N. Carter, Saint John barrister, was guest speaker at the regular meeting of the Saint John Branch, held March 26, at the N.B. Telephone Company Building.

Mr. Carter spoke on the engineering act of the Province, pointing out that its main aim was to establish standards for engineering work and to protect the people of the province.

The Act, passed in 1920, has been amended twice, each time requiring the approval of the legislature. Because some members of the legislature are suspicious of granting special privileges, it is difficult to modify the act properly.

Mr. Carter pointed out that there could be two types of acts. One would be of a general definition and the other particular. Difficulties are present in both acts. The particular type may not include new fields which develop due to the advance of technology, while the general act may be too broad. However, the speaker felt that it would be preferable to retain the particular definition and add new types rather than turn to a general definition.

In general, Mr. Carter felt that if the act was working in practice revision would not be necessary.

H. Townsend on behalf of the gathering, thanked Mr. Carter for his most interesting talk.

The film, "Exploring with X-rays," was shown by F. L. Doty. Refreshments brought the meeting to a close.

## Saguenay

C. C. Louttit, Jr.E.I.C.,
*Secretary-Treasurer*

#### Joint Meeting

A joint meeting of the Saguenay Branch of the Engineering Institute of Canada and the Saguenay Region of the Corporation of Professional Engineers of Quebec was held at 8.15 p.m. Tuesday, March 30, 1954, in the auditorium of Aluminium Laboratories Limited in Arvida. Thirty-four members of both societies attended.

J. E. Dyck, introduced Mr. G. Demers, councillor and vice-president of the C.P.E.Q. through whose efforts the three films shown at the meeting were obtained from Europe. The three films shown were:

1) "Reconstruction du Pont de Villeneuve (in French, black and white, sound) showing the construction of a prestressed concrete highway bridge across the Seine River.

2) "Percee en Foret Equatoriale de la Route Douala Edea" (in French, colour, sound) showing the construction of a 125 mile highway through jungle in French West Africa.

3) "Nouvelles Techniques de Construction des Jetees Maritimes" (in French, black and white, sound) describing hydraulic laboratory experiments dealing with the effects of wave action on piers and jetties.

All three films were very interesting and highly informative. Mr. Schopflocher, thanked Mr. Demers for making the films available for the meeting and expressed the group's appreciation of his efforts. The meeting adjourned at 10.30 p.m.

#### Aluminous Cements

A joint meeting of the Engineering Institute of Canada, Corporation of Professional Engineers of Quebec and the Chemical Institute of Canada was held at the Saguenay Inn on Wednesday, April 14, 1954. The guest speaker was Dr. T. D. Robson, technical manager of the Lafarge Aluminous Cement Co., London, England, whose topic was "Special Properties of Aluminous Cements." Sixty members of the societies were present. G. K. Clement presided and introduced the speaker.

Dr. Robson stated that the original reason for the development of aluminous cement was to obtain a cement with a higher magnesium sulphate resistance than portland cement. Upon development the aluminous cement was found to have the desirable property of being rapid hardening. This property has been used to good advantage ever since, commencing with gun emplacements in France during the first World War.

Dr. Robson had a series of slides describing the manufacture and uses of aluminous cements and used them as the basis of his talk.

#### Advantages

Dr. Robson described some of the advantages of using aluminous cement for its fast hardening properties and pointed out that aluminous cement concrete does not contain free lime and is therefore free of the troubles associated with it, such as the corrosion of aluminum, lead, etc., buried directly in the concrete.

The cement can also withstand very high heat and is suitable for the manufacture of refractories for temperatures to 1200° F. Aluminous cements also possess a very high resistance to thermal shock and are therefore used where spillage of hot metals might occur, in locations of high radiant heat and in molten metal casting runways.

The speaker was thanked for his very excellent talk by E. A. Woods, chairman of the Saguenay Section of the Chemical Institute of Canada.

## Sudbury

George Fleming, M.E.I.C.,
*Secretary-Treasurer*

T. C. Robertson, M.E.I.C.,
*Branch News Editor*

J. W. Kirk was guest speaker at the dinner meeting of the Sudbury Branch of The Engineering Institute of Canada held at the Granite Club on April 8, 1954. Introduced by Frank Destefano, Mr. Kirk, a graduate of Queen's University in 1944, travelled widely in the Dominion of Canada and South America before becoming district manager of The International Water Supply Company at London, Ontario.

#### Deep Water

In his introductory remarks to the coloured film "Deep Water" Mr. Kirk explained that ground water supplies for industries and private use was one of the renewable resources of the country and yet little was known about it. However, its importance was increasing yearly. Aside from the fact that it provided a constant supply, ground water also possessed important advantages such as constant quality and temperature the year around.

With reference to the Sudbury district Mr. Kirk stated that the 3.3 million gallons per day at present being used was backed by a known supply of 6 million gallons and he expected that an additional 6 million gallons would be proven in the near future.

#### The Earth's Surface

The film "Deep Water" pictured the surface of the earth as 2/3 ocean bed and that even the so-called dry land was not really dry but only a covering on a vast system of underground lakes and rivers. The source of this underground

system was rainfall gathered in pockets by the porous layers of the earth's crust. Since the various strata are usually tilted there are outcrops which yield very large water supplies.

To obtain a supply for home use is a comparably easy task but when a continuous flow of millions of gallons is required the problem develops into one requiring much engineering skill and scientific ability. Each job is an individual problem and the why, when, where and how as to location, type of well, and equipment to be used has to be answered.

As to the location, a study of the geophysical formation of the earth coupled with preliminary tests such as resistivity measurements precede the drilling of a test well.

After the well is completed a final test is made by pumping at a given rate for a definite period and noting the drop in the water level. This determines what is known as the "cone of influence" and accurate prediction of the output is calculated.

A lengthy question period followed after which Peter Semler thanked the speaker and the meeting adjourned.

***Annual Meeting***

The Annual Dinner-Dance and General Meeting of the Sudbury Branch of The Engineering Institute of Canada was held May 7, 1954, in the Italian Hall, Copper Cliff. At the close of the dinner W. J. Ripley, the retiring chairman, told of the year's work. He was pleased with the number that had attended the meetings throughout the year stating that the attendance per membership ranked very high in comparison with other branches. He attributed the success of the year to the hard work of his supporting staff and complimented them highly for their work.

Geo. Fleming, secretary-treasurer, then read the financial report which showed a favourable year's operation. J. Smith of the paper's committee, W. Miller of the entertainment committee, H. M. Whittles of the membership committee and L. Lane of the educational committee then spoke briefly of the year's work in their respective divisions.

The election of officers for the '54-55 season resulted as follows: F. A. Orange, chairman; W. S. Black, vice-chairman; H. M. Whittles, resident committeeman; W. B. McCallum, non-resident committeeman. F. A. Orange outlined his aims for the ensuing year and asked for the continued co-operation of the membership.

The retiring officers were thanked by R. Eaton for a job well done. The formal meeting then adjourned and dancing was enjoyed by all.

## Toronto

L. F. Bresolin, Jr.E.I.C.,
*Secretary-Treasurer*

H. Fealdman, Jr.E.I.C.,
*Branch News Editor*

***Vertical Transportation***

A. W. Paulson, of the Otis Elevator Co., New York, discussed the subject of vertical transportation before a joint meeting of the Toronto Branch, and the Toronto branch of the American Institute of Electrical Engineers on Thursday, April 1.

Mr. Paulson, who has been with the Otis Elevator Co. for 29 years and is now chief engineer, has made many notable contributions in the field of elevator controls and has had a great deal to do with the development of the elevator which thinks for itself! This development and the description of the complicated electronics which make up the brain of the elevators provided the subject matter for a most interesting and fascinating lecture.

***Management Panel Discussion***

Problems facing the engineer in management were discussed by a panel of experts which assembled before a very large audience on Thursday, April 22 last. The organizer and moderator of the panel was C. E. Potter, M.E.I.C., assistant to the vice-president, Angus Robertson Ltd. Considerable interest was shown in this program, judging from the number of questions fired at the panel.

***Visit to Ford, Oakville, Ont.***

About 220 members of the Toronto Branch joined with a similar number from the Hamilton Branch on Thursday, May 6, last, to spend a very enjoyable evening at the new assembly plant of the Ford Motor Company at Oakville, Ontario which is said to be the largest industrial building under one roof in Canada. Members were able to see the complete assembly of Ford and Meteor cars from start to finish with evident fascination.

After the tour, refreshments were very kindly provided by the Ford Motor Co.

## Winnipeg

C. S. Landon, M.E.I.C., *Secretary-Treasurer*

W. Victor Morris, M.E.I.C., *Branch News Editor*

**April Meeting**

N. S. Bubbis, general manager, greater Winnipeg Water and Sanitary Districts, spoke to the Winnipeg Branch of the Engineering Institute of Canada on Thursday, April 22, on the topic "The Greater Winnipeg Sanitary District and River Pollution Abatement".

**Sewage Disposal History**

Mr. Bubbis gave a brief history of sewage disposal in the Greater Winnipeg Area, first describing the development of the combined system of sewer drainage. When this created certain nuisance conditions during the drought years in the early '30s, the Greater Winnipeg Sanitary District was organized to undertake the treating of sewage in this area.

The speaker then went on to outline the various methods of sewage treatment, describing the primary system of treatment which is now used by the district and which uses the diluting capacity of the water in the Red and Assiniboine Rivers in the process. He also explained that further treatment known as "secondary" or "tertiary" treatment can be given the sewage where necessary but that this was much more expensive and he illustrated the difference in costs between the various degrees of treatment.

He then outlined the basis of design used by the district's first consultant, the late W. S. Lea, and described both the original installation and the additional structures that were presently being constructed under the district's plan of extensions.

**Industrial Wastes**

In relation to the matter of industrial wastes, Mr. Bubbis pointed out that up to the present, there was one point to which sufficient thought in zoning had not been given, namely: the location of wet industries. That is, industries which use a considerable quantity of water in their processing and which in turn produce an appreciable amount of waste that has to be disposed of.

Mr. Bubbis concluded his remarks by stating that a realistic approach should be adopted towards the solution of this problem. "The facts of the matter are that we are living in an area that is growing and just beginning to develop industrially. Our rivers are natural resources that should serve the best use of the greatest number. While we don't want them to be turned into open sewers on the one hand, we certainly don't want to set up such extreme standards that would add a tremendous financial burden to the community and prevent further industrial development." He pointed out that for every one hundred thousand dollars spent on capital account for screening and pumping stations, it would cost eighteen thousand dollars per year for debt charges, maintenance and operating costs.

The address was illustrated with slides. G. B. Williams introduced the speaker and the vote of thanks was delivered by Prof. A. J. Carlson.

### Civil Section

I. B. Henderson, M.E.I.C., *Section News Editor*

The Civil Section of the Winnipeg Branch of the Engineering Institute of Canada held a meeting on Thursday, March 25, 1954, in the auditorium of the Canadian Westinghouse Ltd. J. B. Striowski was chairman in the absence of W. White. The minutes were adopted as read on motion of N. S. Bubbis, seconded by F. Thompson.

**Kemano-Kitimat**

A one hour colour film, owned and produced by International Harvester Co. was shown, picturing the construction of the aluminum development at the delta of the Kitimat River and the Kemano Power project in British Columbia, 400 miles north of Vancouver. Each phase of this project would be remarkable in itself, combined they form probably the largest development of its kind ever undertaken.

**Lift Slab Construction**

Following the presentation of this picture classic, C. V. Antenbring, president and manager of Cowin and Co. Ltd. showed some twenty slides which he had made of the use of the Youtz Slick lift slab method of construction. This method was developed between the years 1946 and 1948 by Philip Youtz and Tom Slick and has been used in the construction of such structures as a two-storey Trinity University building and a Naval Barracks building.

F. R. Lount and Son have the exclusive rights to this patented process in Canada. It is, however, available to contractors at a rental cost in the neighbourhood of 25 cents per square foot of slab area.

The Youtz Slick method was first used in Winnipeg in the construction of an apartment building in 1950, and then on several projects in 1952 and the years following. The nurses' residence, started in 1953, was the highest building to be constructed by this method. The slabs were first lifted to the head of normal steel columns, then the columns were extended and the process repeated. The steel columns for this job were designed by Prof. J. Hoogstraten of the University of Manitoba. Slab design is standard except that a thicker section is desirable, and the re-steel must be carefully positioned. Spans run at about twenty feet in either direction. A variation from the normal will be the construction of a grandstand at Portage la Prairie this summer. In this instance, one side only of the slab will be raised to provide the inclined floor for the seats.

A question period followed the presentation of the slides. H. B. Brehaut led off with a query as to relative costs, using the lift slab method vs. the normal poured in place method. It appeared that the savings in forming were offset by the increased slab thickness and stronger columns required, so that costs were about equal. However, it was thought that some saving resulted in the trades being able to move in sooner than would ordinarily be possible.

N. S. Bubbis asked if any design problems were inherent in the method. The reply was to the effect that the architect must design specifically for this type of construction in that he must have the symetric column layout and a minimum of large openings (such as stair wells, etc.). Otherwise the design was normal. Prof. Herriot made a remark that was answered by stating that the jacks and their controls were patented. Their application was limited only by the 12 jacks and control console being the only unit currently available in Winnipeg. The jacks and console are available to contractors at a rental, as mentioned earlier.

The speaker was thanked on behalf of the section by W. Taylor of Supercrete Ltd., and the meeting adjourned for coffee in the Westinghouse canteen.

### Electrical Section

G. Flavell, Jr.E.I.C., *Section News Editor*

**April Meeting**

The Civil Section of the Winnipeg Branch of the Engineering Institute of Canada met in Canadian Westinghouse auditorium on Thursday evening, April 8, 1954, under the chairmanship of Mr. B. Striowski.

The speaker of the evening, Leon T. Eliel, was introduced by F. S. Duckley, sales manager of Aero Surveys Limited, Vancouver.

**Aerial Surveys**

Mr. Eliel, vice-president, Fairchild Aero Surveys, Inc., Los Angeles, Cal. and managing director, Aero Surveys Limited, Vancouver, B.C., has personally developed many new devices to improve the art of surveying from the air. He has served as technical advisor to various governments, and written many articles on his hobby and business of aerial surveying. The paragraph on this subject in the Encyclopedia Britannica is attributed to him.

Mr. Eliel spoke briefly of early exploration, the marvelous achievements of men penetrating the unknown without maps or guidance of any kind, the surprising accuracy of the crude maps they drew of their travels.

Today one of the latest bits of exploration wizardry was developed here in Winnipeg by Prof. G. M. Brownell, chairman of the Geology Dept. and Prof. R. W. Pringle of the Physics Dept. of the University of Manitoba. This device, the scintillometer, is used all over the world in the search for uranium. Weighing about four pounds, the instrument is sensitive to gamma radiation and is used both on the ground and in the air to measure the change in intensity of radiation as it is moved across the face of the earth's surface.

**Types of Aircraft Used**

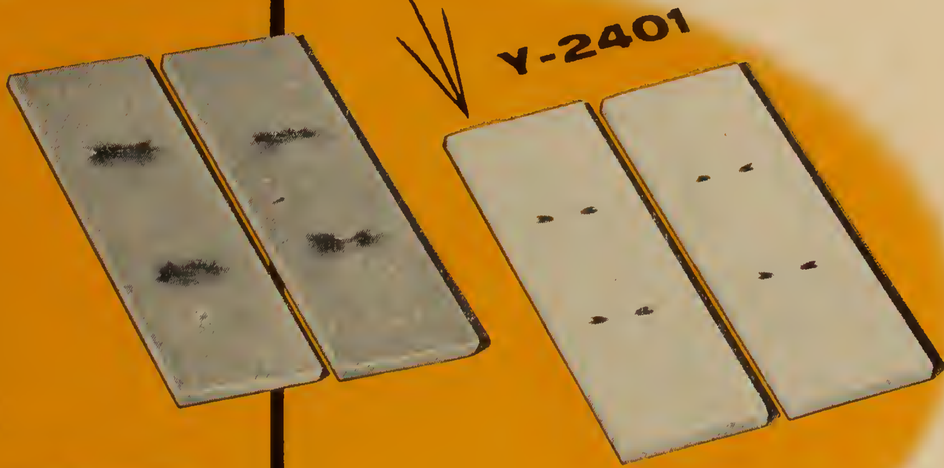
The prospector on foot, in one day, covers a very narrow strip of ground that may be traversed by air in one hour. Many types of aircraft are available for this purpose. The helicopter is the ideal unit to deliver men and supplies to otherwise inaccessible spots and for detailed surveys of small areas in rugged terrain. Its use is limited to such work, however, by its high first cost, high maintenance costs, slow speed (100 m.p.h.) and small range (100 to 200 mi.).

Fixed wing craft stay aloft for longer periods (a whole day), fly at speeds up to 300 m.p.h. and are more economical to operate.

Medium and larger Ansons are favorites. The small Cesna is a good craft for low flying. Beachcraft and Lodestars are others used in this work.

The B-17 can fly all day at 30,000 ft. and is used for economy on large jobs

# this NEW and significantly superior Phenolite Laminated Plastic



Here's a test showing the superior arc resistance of this new melamine-polyester material—Y-2401 by name. All samples were subjected to 5 arcs of 15 KV, 30 milliamps, through a $\frac{3}{8}$" gap at a rate of 113 arcs per minute. Note how Y-2401 (two samples at right) showed only minor burns whereas Standard Grade XX phenolic material (at left) was deeply carbonized across the arc, resulting in conducting paths.

## EXCELS IN ARC RESISTANCE
## ...IN MACHINABILITY
## ...IN ELECTRICAL PROPERTIES

With an ordinary band saw, operator saws out a Y-2401 part to be used in an oil circuit recloser.

In sections up to $\frac{3}{8}$", Y-2401 can be shaped by shaving dies as illustrated upper left.

(Center) Y-2401 drills cleanly, without chipping or cracking. Drill tools last longer without resharpening.

Here's the circuit breaker assembly with the Y-2401 parts in place. (Note how this assembly is composed almost entirely of various grades of versatile Phenolite.)

In test after test, this new high pressure laminate actually *created* new standards of performance. The illustration above shows how this new paper base-melamine Phenolite goes beyond current grades in arc resistance.

But that's only a start! Y-2401 does away with the difficult-to-machine aspects formerly encountered with melamine laminates. It can easily be punched, sawed, drilled, turned and milled to close tolerances. And being non-brittle, it can be rough-blanked much closer to final dimensions, thus reducing waste of stock and effecting lower machining costs.

Y-2401 has excellent dielectric strength, good moisture resistance and low dissipation factor. Combine all its good points, and you have the "just-right" insulation material for use in transformers, circuit breakers, switch bases, supports for sliding contacts; in radar, television and radio; in many other critical electrical applications. Available in 39" x 47" sheets, of thicknesses ranging from $\frac{1}{32}$" to 1".

**DETAILED DATA YOURS FOR THE ASKING**—*Write for Technical Data Sheet on Phenolite Grade Y-2401. Contains complete listing of its properties and possibilities. Gives all other information for thorough evaluation. Address Dept. AB-7.*

PHENOLITE
Laminated PLASTIC

*Also manufacturers of Vulcanized Fibre, Peerless Insulation, Vul-Cot Waste Baskets, Materials Handling Equipment, and Textile Bobbins*

**NATIONAL**
**FIBRE COMPANY OF CANADA, LTD.**
ATLANTIC & HANNA AVES., TORONTO • 1411 CRESCENT ST., MONTREAL

The P-38 Lightning converted to carry two people is favoured. Dacotahs are used extensively by other firms and although they have a lower ceiling than the B-17 there are compensating advantages.

In Canada, Mr. Eliel said, aerial surveys are employed in many fields, including timber cruising, water power development and the search for oil.

#### Methods

The methods used in aerial survey are fundamentally simple, says Mr. Eliel. A 50 thousand square mile area is covered in strips by the aircraft flying back and forth. These strips overlap each other thirty per cent and are therefore automatically stereoscopic, and contouring is possible. Various instruments are used, ranging in price from $300.00 to 50 or 60 thousand dollars each. The commonly used Multiplex costs from 5 to 10 thousand dollars. Say it is desired to make a map of 1:1000 scale. Pictures are taken at say 1,000 feet centres, each of which has 2/3 of its area appearing on adjoining pictures. The film is projected at the same angle as that from which the picture was taken with projectors set up at 1/1000 of the field centres (in this case 1/1000 of 1000 equals one foot.) Thus the original view is re-created at 1/1000 of the original size. Various devices are used to scale the detail. A stereoscope with the right eye piece shaded red and the left blue, is used to separate the two images.

A slotted template, consisting of a pencil having a disc above it with a point of light, is used to trace the contours. In use the template is raised until the light touches the ground at the calculated contour height. The light with screen is then raised to the next contour height and the process repeated. A planimeter is used to trace streams, etc.

Aero surveys have been made in the following countries: Canada, Mexico, Guatemala, Panama, Equador, Holland, Ceylon, Afghanistan, Rhodesia, Libya, Colombia, Australia, British Guiana, India, U.S. Alaska, Cuba, Honduras, Venezuela, Peru, Burma, Cyprus, Kenya, Italy, Sumatra, China, and New Guinea.

#### Question Period

A question period followed this address in which several facts were brought out. When the surveying plane is travelling its strip it may have to head into a cross wind. In such a case the camera is turned in its mount to keep in line with the actual direction of flight. Some pilots become so sensitive to this drift that they are able to automatically correct for it and stay on course. In Canada it is customary to employ a navigator whose whole job is to keep the aircraft on course. A device known as a sun compass is sometimes used. The instrument is sighted on the desired line of travel, and adjusted so that sunlight falling on two photo electric cells connected to galvanometers generates no current. A slight divergence from course causes a current to be induced in one of the galvanometers telling the pilot to correct his course right or left.

By this means the pilot will not be more than one-half mile from his correct position at the end of a run. As already mentioned, the pictures are lapped laterally on the average about 30 percent. Over mountainous country the overlap would be considerably more.

#### Favourable Weather Necessary

Because this work can only be carried out under the most favourable conditions, weather prediction plays a tremendous part in the financial success or failure of a project. For instance, in Panama one good photographic day is worth 100 thousand dollars to the aerial photographer. Accordingly, each days "take" is developed and checked for omissions, etc., as soon as possible. Usually a field laboratory accompanies the expedition. On a New Guinea job, where there were no such facilities, a pilot performed the wonderful feat of flying 14 days, 20 to 30 rolls of film, without having his pictures developed. Although the strips had not been flown concurrently and he had had to remember the limits of previous strips, not a single gap was found when the pictures were developed.

#### Sirran-Radar System

The Sirran system of survey is being used more and more. The Sirran-Radar-means for blind flying have been adapted to survey work. An electrical signal travelling at 186 thousand miles per second is reflected from two ground stations. The time taken for this signal to return to the aircraft is a measure of the distance the plane is from the two ground stations. The Sirran dials are photographed with each ground picture and locate it accurately. A Sirran survey controlled net (not contoured) is currently being made across Canada.

Contour interval is dependent upon the function of the plan for which the survey is being made. For city surveys of scale 1" to 500' the usual contour interval is five feet. Some are made at two foot intervals.

Timber surveys are often at 25' contours. The largest plan scale survey by Aero Surveys was 1" to 20' with 1' contours and on the other extreme is a 1/250,000 scale topographical map with contours of 50', 100' and 200', depending on terrain.

The speaker was thanked on behalf of those present by John D. Anderson, division engineer, Canadian Pacific Railway Company.

The meeting adjourned for refreshments and further informal discussion.

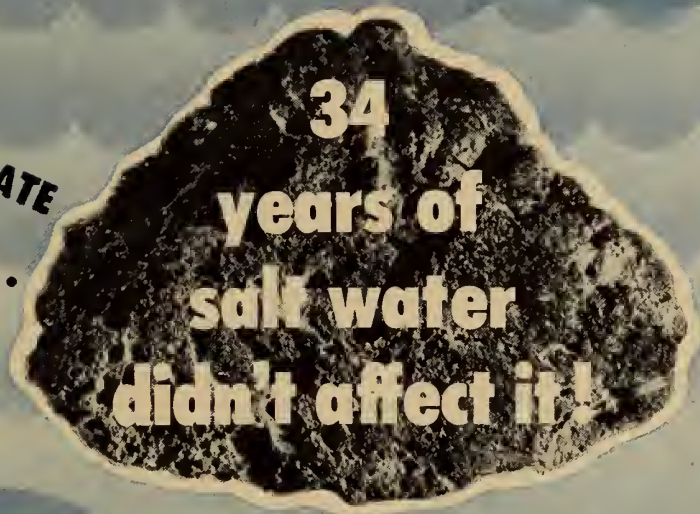
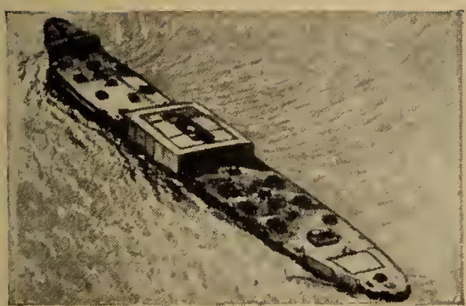
**"HAYDITE"***
**THE LIGHTWEIGHT AGGREGATE**
**SO DURABLE . . .**





Near Galveston, Texas rests the hull of the "HAYDITE" concrete ship "Selma" launched in 1919 and beached some years later. For 35 years the "HAYDITE" concrete in the hull had endured thousands of cycles of wetting and drying. In 1953, physical examination showed that "... the concrete was in excellent condition and the reinforcing steel showed no deterioration whatsoever even though in most places it had only 5/8 inch cover".

"HAYDITE" aggregate is a pure iron-bearing high silica-alumina lorain shale, produced in rotary kilns at temperatures exceeding 2000° Fahrenheit. This intense heat burns out all foreign matter, and causes an explosive expansion of the shale creating myriads of microscopic, totally-enclosed non-interconnecting air bubbles, each in its own vitreous shell. This is "HAYDITE"—a remarkably durable lightweight aggregate (concrete made with "HAYDITE" aggregate weighs 33% less than sand and gravel concrete) that is chemically inert, has amazing strength, and is highly resistant to both fire and humidity.

**Let us tell you about "HAYDITE" for poured-in-place structural reinforced concrete; for precast roof and floor slabs; for roof and floor fill; for refractory concrete; for guniting applications, and for building blocks.**

## Additions to the Institute Library

**Reviews — Book Notes — Abstracts**

### BOOK REVIEW

**Les terrains perméables.** 2e éd. A. Mayer. Montreal, Fomac, 1954. 148 pp., figs., $4.40.

Many members of the Engineering Institute will remember with pleasure the visit to Canada in the summer of nineteen fifty-three of Dr. Armand Mayer of Paris. Dr. Mayer was able to speak with a number of groups throughout Canada, and attended the annual meeting of the Institute in Halifax.

Dr. Mayer is not only a well-known consultant in the field of foundation engineering and soil mechanics, but has published also many papers and two books in this field of work. His first book, "Sols et Fondations", was published in nineteen thirty-nine and was one of the earliest contributions to the literature of soil mechanics.

A second edition of another of his books has recently been published in a well-known series of French technical text books. The title, as given above, does not give a true indication of its contents. As an English title "Groundwater" would be a more accurate guide to the interesting treatment which this book contains of the theory and practice of dealing with the movement of groundwater in permeable soils.

It is always interesting to see the approach made to a technical subject by those trained in different countries, since much can be learned by such international exchange of ideas. In Dr. Mayer's book, for example, it is significant to note the close attention which is paid to the theory of groundwater movement, in preference to the more practical approach in corresponding books published in North America.

The volume under review starts with a general discussion of the occurrence of groundwater, although little is said about the determining geological conditions. A discussion of the principles of laminar flow follows, and this is applied to various groundwater conditions. It is a little surprising to find only two pages devoted to the subject of flow nets and their calculation and determination by electrical means.

A treatment of wells and bore holes follows, together with a discussion of the corresponding flow patterns, and this leads to a brief discussion of the various methods of dealing with groundwater construction by means of well points, sheet piling, injections, etc. The concluding chapters deal briefly with infiltration problems and drainage.

The book is clearly written and well presented. It includes a brief bibliography, but the contents of this list are probably the most surprising feature of the book. Twenty-five references are given, of which ten are American, five German and ten French. There are no cross-references to the text. It is surprising to find no reference to Tolman's well-known handbook and to see listed no one of the many publications of Dr. O. E. Meinzer.

Correspondingly, the European references will be new to many readers in North America. It is hoped that by the publication of this review of Dr. Mayer's book in a Canadian journal another step may be taken towards bridging this unfortunate gap which still exists between the engineering practice of Europe and that of North America.

Ottawa.

### BOOK NOTES

**Prepared by the Library**
**The Engineering Institute of Canada**

*Book notes marked by an asterisk have been provided through the courtesy of the Engineering Societies Library in New York.

***Absorption towers.** G. A. Morris and J. Jackson. Toronto, Butterworth, 1953. 159 pp., figs., $5.00.

Simple types of laboratory absorption equipment are considered first as a starting point for the design of full-scale packed towers. Special attention is paid to the transfer unit method, to mechanical features of design, and to economic factors. Absorption involving chemical reactions is also treated, and a collection of calculations is included to illustrate applications of design methods. There is a glossary and a list of references.

**Aide-mémoire Dunod. I Métrologie appliquée (méthodes et instruments de mesures),** 2e. éd. M. Denis-Papin et J. Vallot. Paris, Dunod; Montreal, Fomac, 1954. 300 pp., figs., $2.25.

Issued as a companion volume to Métrologie Générale, this aide stresses the essential principles of modern electronic metrology, and will be of use both to professional engineers and to students. It is also well indexed.

**Aide-mémorie Dunod. 2 Travaux publics.** Ch. Mondin. Paris, Dunod; Montreal, Fomac, 1954. v. I, 234 pp.; v. 2, 256 pp., figs., $2.25 ch. tome.

Two more convenient handbooks in the Aide-mémoire series, these will be of value to architects, and contracting and consulting engineers as well as to students in any way interested in civil engineering and public works.

***Annual report on the progress of rubber technology, volume 17, 1953.** T. J. Drakeley, ed. Cambridge, Heffer, for the Institution of the Rubber Industry, 1953. 173 pp., 21/-.

As in previous years, a general statistical and historical review is followed by surveys written by specialists, of significant advances in the various fields. Essentially, the publication is a selective and critical summary of the literature, including patents.

***Les applications pratiques des rayons infrarouges,** 3e. éd. Maurice Déribéré. Paris Dunod. Montreal, Fomac, 1954. 435 pp., illus., $16.65.

The major part of this book is devoted to practical applications of infrared radiation: photography; industrial heating and drying processes; photoelectric cells; and physiologic and therapeutic applications. The introductory chapters deal with basic aspects: the production of infrared to practical applications of infrared radiation; separation of diverse radiations; and the transmission, reflection, and absorption of infrared.

### LIBRARY REGULATIONS

#### Summer Hours

Mon.–Fri. . . . . . . . . 9 a.m. - 5 p.m.
Closed all day Saturday

#### Bibliography and Reference Service

Short subject bibliographies are compiled on request. When placing these requests, please give as much detail and background information as possible.

#### Borrowing

Books, periodicals, pamphlets and films may be borrowed for two weeks at a time. All books included in the Library Notes Section of *The Engineering Journal* are available for loan. **A fine of 25c per day is charged for each day borrowed items are retained beyond the two-week period.**

A library deposit of $5.00 at par in Montreal is required, for which two items may be borrowed at a time. Temporary deposits (30 days or less) $10.00. Books are sent anywhere in Canada, and carrying charges are payable by the member concerned.

#### Ordering

Any book or pamphlet may be ordered through the library. All publications of affiliated societies, whether books, pamphlets, or periodicals, should be ordered through the library, as reduced rates are applicable on these to all members. Except in the case of library deposits **please make no payments in advance.** Non-members may consult the library, but may not borrow material. Please address all requests to **The Library.**

## *Squeezing the HIGH out of Mr. Overhead*

***RIGHT NOW,*** a lot of plants are giving Mr. Overhead a thorough going over. And while in many areas nothing can be done about high costs, in others a little figuring may show big chances for economy.

Take piping maintenance for instance. At today's labour rates, the cost of servicing inferior and obsolete piping equipment is higher than ever. But it can be reduced—quickly—with better quality equipment that also strengthens your guard against production losses.

Thrifty buyers know this—that's why they insist on Crane Quality equipment. They know it assures longer life, greater dependability, lower ultimate cost . . . and that Crane provides the best selection for the piping needs of every industry.

*For complete information on Crane quality valves to meet your particular requirements, ask your Crane Branch, or write*

**CRANE LIMITED**

# CRANE

VALVES • FITTINGS • PIPING
PLUMBING • HEATING

NATION-WIDE SERVICE THROUGH BRANCHES, WHOLESALERS and PLUMBING AND HEATING CONTRACTORS

***Applied electronics,** 2d ed. T. S. Gray. New York, Wiley, 1954. 881 pp., $9.00.

Explains the physical phenomena involved in electronic apparatus, the way these combine to determine the nature and limitations of electronic devices, the applications common to several branches of electrical engineering, and the final part covers semi-conductor devices, primarily the transistor. The text has been revised in line with current developments, the material on the transistor and its applications is new, and the bibliographies have been brought up to date.

**Architectural lettering for plans and ornamental design.** A. E. Burke and T. C. Buss. Chicago, American Technical Society, 1953. 187 pp., illus., $6.50 (U.S.).

The author of this book states that "good architectural lettering . . . should communicate thought and express feeling."

No matter how good a flair for design a prospective letterer may have, a knowledge of the fundamentals is necessary for its execution.

Lettering should be designed to be in keeping with the product or article to be advertised or announced, or the idea presented in a name.

This book develops these ideas, explaining and illustrating methods, mediums and tools from the simplest, to the more ornate types.

It will be an excellent volume for the library shelves of all architects and draughtsmen, and the multitude of people in many walks of life interested in lettering or poster production.

***Billings and water power in Brazil.** A. J. Ackerman. New York, American Society of Civil Engineers, 1953. 129 pp., illus., $7.00 (U.S.).

An account of the career of one of the foremost hydroelectric engineers. There is a brief mention of his construction work in the United States, Spain, and for the Navy in the first World War, and more detailed information on his work on the hydroelectric systems of Rio de Janeiro and São Paulo.

**Clay mineralogy.** R. E. Grim. Toronto, McGraw-Hill, 1953. 384 pp., illus., $10.80.

In this volume the author has attempted to summarize available data on the various clay minerals whose identities have been reasonably well established. He has not, however, included the aluminum and ferric iron hydrate minerals found in some clay materials.

The text covers the classification, nomenclature and structure of the clay minerals, and their origin and occurrence. Also considered are shape and size, properties, ion exchange, changes taking place on heating, and X-ray diffraction data.

Although there is no bibliography, there are numerous bibliographical footnotes and references at the ends of the chapters.

This book should prove of value not only to geologists, but also to manufacturers of ceramics and paper, oil engineers, construction engineers, agriculturists, and others concerned with the properties of the earth.

***The closed die forging process.** P. E. Kyle. Toronto, Macmillan, 1954. 140 pp., illus., fold., diagrs., $1.50.

A description of drop forging processes of possible use as supplementary reading for engineering courses in forging, metal processing, and machine design, and also as a review of the processes for design engineers and users of forgings. The essential steps in producing drop forgings are outlined and some of the uses of closed die forgings are discussed. Fundamentals of hot working and the properties of forged metals are also covered. A glossary of forging terms is appended.

**Étude de la lubrification et calcul des paliers.** Lucien Leloup. Paris, Dunod; Montreal, Fomac, 1954. 296 pp., figs., $9.50.

An analytical study of the hydrodynamic theory of lubrication of plain bearings, with special attention to friction effects, but restricting the treatment to static load conditions. Both partial and full bushings are treated, distribution and circulation of the oil are considered, and film characteristics are taken into account. Calculations of dimensions, temperatures, and friction coefficients are carried out for several cases.

**Flying saucers have landed.** Desmond Leslie and George Adamski. London, Werner Laurie, 1953. 232 pp., illus., 12/6.

Definitely a fabulous type of exposée of flying saucers, this book is divided into two parts.

The first one hundred and seventy pages are written by Desmond Leslie. He records innumerable authenticated cases of flying saucers seen both in the air from the ground, in the air from planes, by both passengers and pilots, and landed on the earth.

He compares their fantastic, but sometimes silent, sometimes musical, speed through the air (officially recorded and up to 42,000 miles per hour, but the average speed being 10,000 to 15,000 miles per hour) to the secret of the atmosphere as presumably discovered by the ancient dwellers of Poseidonis and Atlantis.

George Adamski, a cafe keeper on the grounds of Mount Palomar observatory writes the second part of the book. He it is who claims to have seen and talked with a man from another planet. His hobby is watching and photographing flying saucers and a number of his photographs are reproduced here.

Stuff and nonsense ? If you dismiss it as that, well, we think you may probably find yourself a back number in a few years time. But we know you will miss a lot of fun.

The Daily Sketch in London, says of this volume. "An amazing book, to understate matters. If Adamski and the six companions who swore an affadavit to this Space Man encounter are not trying to pull off a gigantic hoax, then this is quite possibly the greatest story ever."

***Heating, ventilating, air conditioning guide, 1954.** New York, American Society of Heating and Ventilating Engineers, 1954. 161 pp., diagrs., fold. maps, $10.00 (U.S.).

Chapters on a wide range of topics are grouped under the following broad headings: fundamentals, human reactions, heating and cooling loads, combustion and consumption of fuels, systems and equipment, special systems, and instruments and codes. Important changes have been made throughout in accord with recent developments, and a chapter on residential summer air conditioning has been added.

***Heat resisting steels and alloys.** C. G. Conway. Toronto, British Book Service, 1953. 160 pp., $5.00.

This is a compilation of data giving the high temperature properties of commercial steels and alloys produced in the United Kingdom and the United States. The steels and alloys are grouped in six classes: carbon, low alloy and martensitic steels; bolt steels; valve steels; U.S. cast steels; standard austenitic steels; and special heat-resisting steels and proprietary alloys. Given for each class are typical composition, common uses, advantages and disadvantages, graphical and tabular creep data, and physical and mechanical properties.

**Le matériel de travaux publics, t.2 Engins de terrassement,** 2ème partie. R. Pagni et al. Montreal, Fomac, 1954. 102 pp., figs., $7.90.

This volume considers vehicles used principally for earthwork, including caterpillar and pneumatic tractors, scrapers, dump trucks, belt conveyors of various types, road rollers, and rooters.

Information is given on the various types of machine, and the work for which they are best suited, and also on the characteristics of the material which is to be worked. Much of this information is given in tabular form, and there are also illustrations of the types of machine under discussion.

The book is really a compilation of material which previously appeared in La Technique Moderne-Construction.

**Prestressed concrete design and construction.** F. Walley. London, H.M.-S.O., 1953. 279 pp., illus., figs., $5.00.

The author of this book, who is employed by the Ministry of Works in Great Britain, has drawn on his experience and on his discussions with British and European designers in writing this book. His aim is to present in a simple way the principles upon which the design and manufacture of prestressed concrete units are based.

After brief chapters on the history and development of prestressed concrete, and the methods of prestressing, the author discusses the actual design problems, dealing principally with statically indeterminate structures, although one chapter is concerned with special design problems. Other chapters cover the behaviour of prestressed concrete under load, materials and allowable stresses, losses in prestressing, pre- and post-tensioning, and various tests on prestressed concrete units. Several systems and methods of design are discussed, namely Freyssinet, Magnel-Blaton and Lee-McCall.

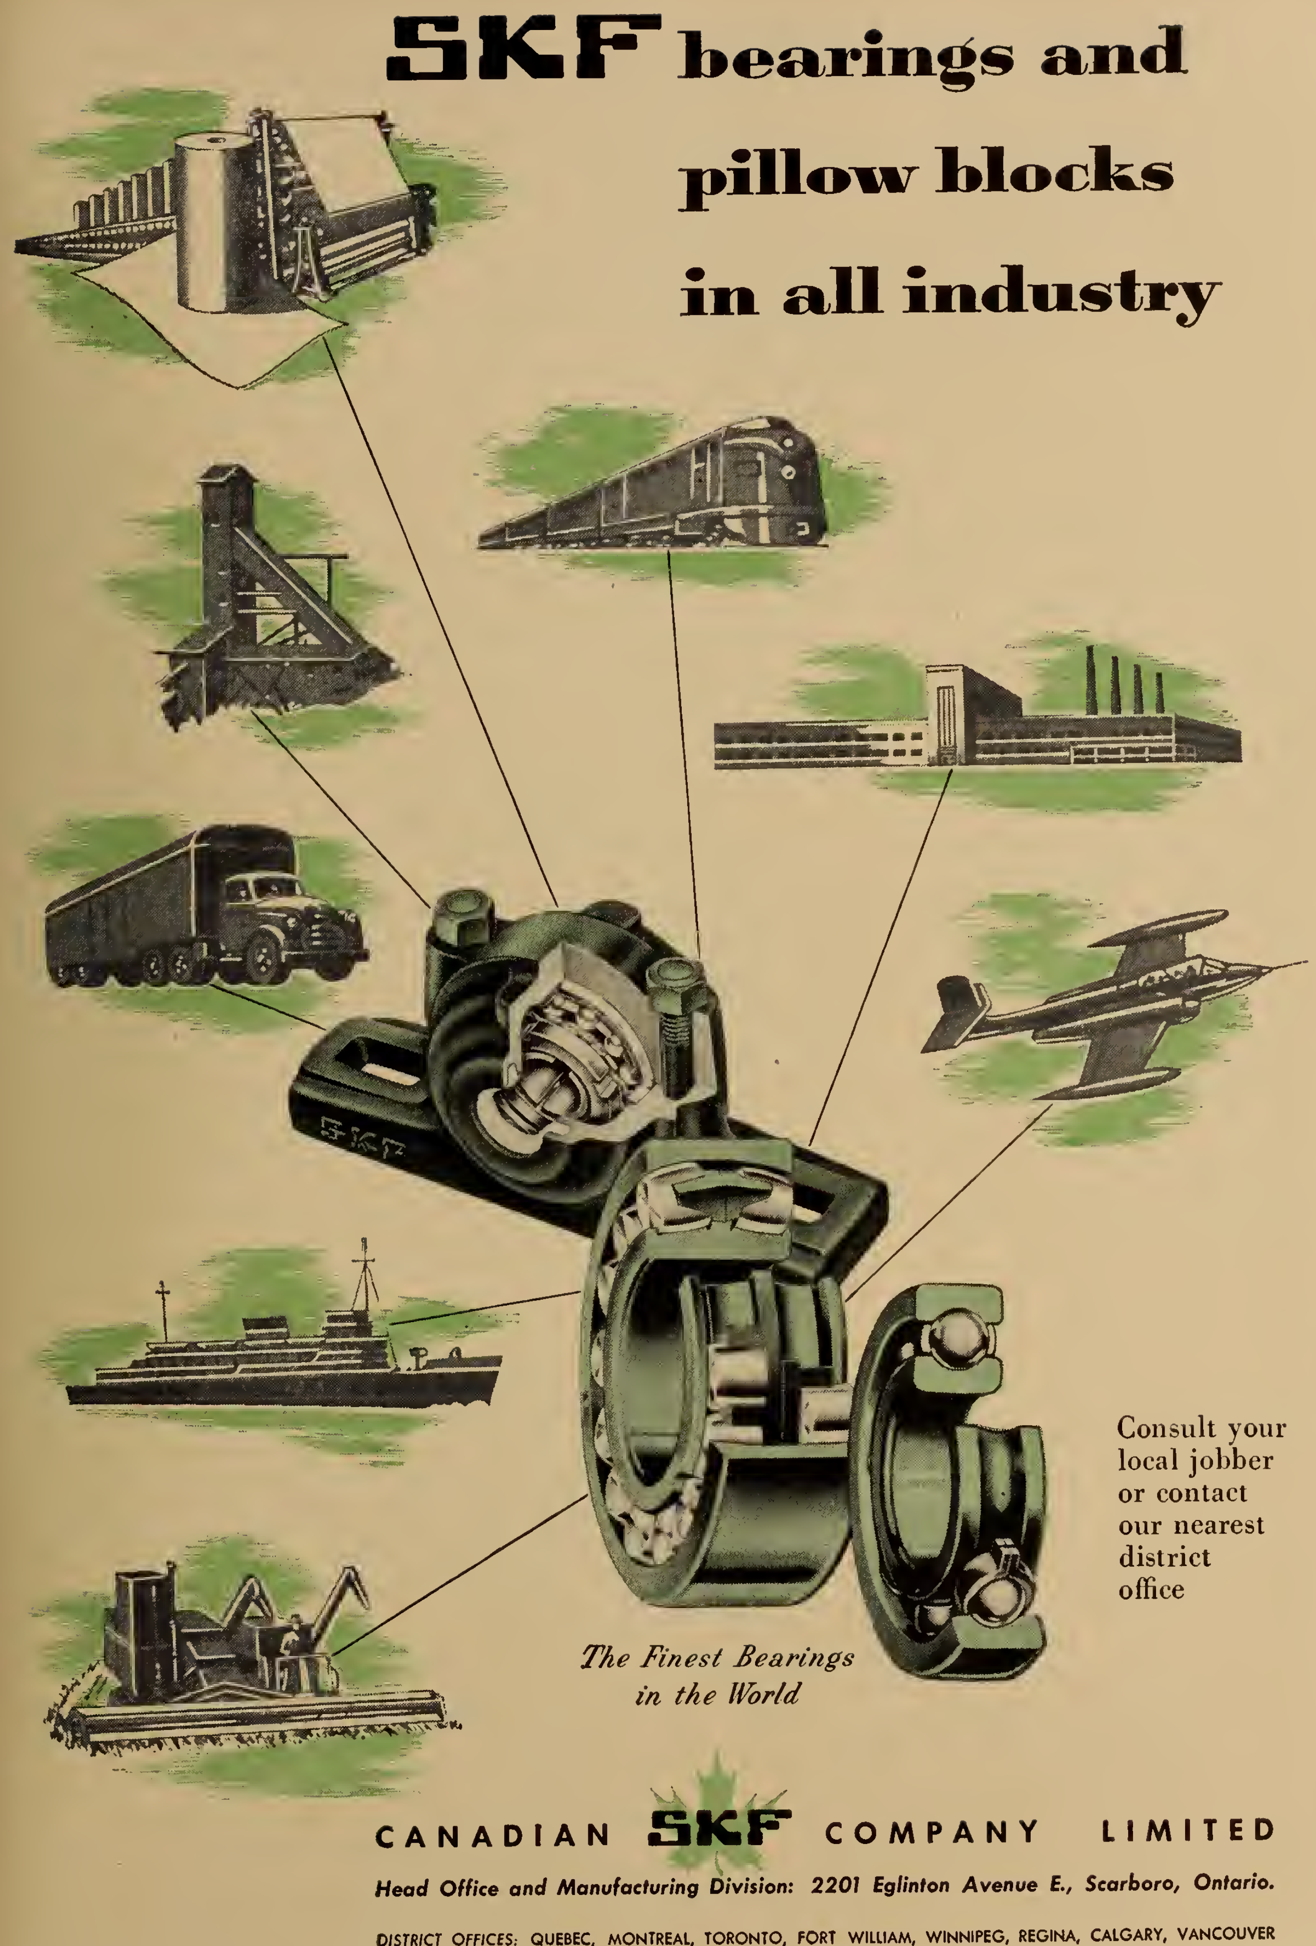
The work is illustrated with many diagrams, photographs and tables, and there is also a bibliography of works referred to in the text. This book will be of great interest to all members connected in any way with prestressed concrete construction, whether they are designers or students.

***Probability and information theory, with applications to radar.** P. M. Woodward. Toronto, McGraw-Hill, 1953. 128 pp., $5.40.

One of a series of monographs reporting on research in electronics and applied physics, this volume presents the essentials of probability and information theory in a condensed form. The first two chapters review probability theory and waveform analysis and noise, while the third summarizes the fundamentals of information theory. Chapters four and five deal with problems of detecting signals in noise, and the last three chapters are devoted to a mathematical treatment of radar along the lines suggested in the preceding pages.

**Radio troubleshooting guide book,** Volume 1, J. F. Rider and J. R. Johnson. New York, Rider, 1954. 156 pp., illus., $2.40. (U.S.).

Intended primarily for the service technician, this book discusses the various



SKF bearings and pillow blocks in all industry
Consult your local jobber or contact our nearest district office
The Finest Bearings in the World
CANADIAN SKF COMPANY LIMITED
Head Office and Manufacturing Division: 2201 Eglinton Avenue E., Scarboro, Ontario.
DISTRICT OFFICES: QUEBEC, MONTREAL, TORONTO, FORT WILLIAM, WINNIPEG, REGINA, CALGARY, VANCOUVER

defects which cause trouble in radio receivers. It is divided into three parts, superheterodyne receivers, fundamental troubleshooting and common symptoms and remedies. Many wiring diagrams and illustrations are included.

**Receiving tube substitution guide book,** 2nd supplement. H. A. Middleton New York, Rider, 1954. 41 pp., illus., 99 cents. (U.S.).

This second supplement to the Receiving tube substitution guidebook is concerned primarily with tubes found in television receivers, and considers both receiving and picture tube substitutions. The supplement also includes a cumulative index listing all the tubes mentioned in the original volume and the first and second supplements.

**Reinforced concrete water towers, bunkers, silos, and gantries.** W. S. Gray. 3rd ed. rev. by G. P. Manning. London, Concrete publications, 1953. 223 pp., illus., $2.80.

This third edition has been revised by G. P. Manning, after the death of the author in 1947, although he states in his preface that such revisions as he has made take the form of additional notes, rather than actual textual alterations.

The book deals with the design of water towers, bunkers, silos and gantries in reinforced concrete, and also covers such related topics as wind stresses, aids in estimating, apparatus for handling and discharging materials, and notes on construction of the structures. Appendices give the Institution of Civil Engineers code of practice, and working stresses and specifications.

There are many illustrations, diagrams and tables. This book should prove very useful to all those concerned with the design of this type of structure in reinforced concrete.

**Space travel.** K. W. Gatland and A. M. Kunesch. New York, Philosophical library, 1953. 205 pp., illus., bibliographics, $4.75 (U.S.).

Like a reservation on a space ship to Mars?

Working from the opposite point of view to that of FLYING SAUCERS HAVE LANDED, this volume tells of developments in space travel from Earth to some other planet.

Tracing the development of rockets from the earliest times to the present, the writers develop their theme to guided missiles and artificial satellites, the problems of atmospheric pressure and of suitable clothing to combat pressures as estimated by present day scientists.

Both authors are experts in their field, but the language is not so technical as to be beyond the understanding of the interested reader.

Detailed illustration of potential and actual developments are included, and additional reading is listed in a three page bibliography at the back.

This should appeal both to the space travel enthusiasts, and to the skeptics.

**The synchronous induction motor.** J. Griffin. London, Macdonald, 1954. 136 pp., diagrs., 18/-.

"The synchronous induction motor is basically a machine designed to start as a wound-rotor induction motor and to run synchronously, combining the excellent starting properties of the induction motor with the high efficiency and the desirable power factors obtainable with the synchronous machine." Although invented in 1900, little has been written about it, and the author's aim in this volume is to provide an overall review of present day practice, with special reference to the various developments which have occurred since the last important survey of the motor, which, according to the bibliography in this book was in 1922, although other articles on the subject have since been written.

This book should be of interest to practising engineers and to students, as it deals with the theory of the cylindrical-rotor type of synchronous machine, and correlates the induction and the synchronous methods of operation of polyphase alternating current machines.

**TV troubleshooting and repair guidebook,** volume 2. R. G. Middleton. New York, Rider, 1954. 156 pp., illus., $3.30 (U.S.).

Another in the series of guidebooks issued by this publisher, this volume presents further information on the troubleshooting and repair of television sets. It deals with front-ends, picture i-f amplifiers, video amplifiers, sound i-f amplifiers and detectors, and audio amplifiers. The book is well illustrated with photographs and diagrams, and will be useful to all those interested in trying to repair their own television sets.

**Technical aspects of sound,** volume 1. E. G. Richardson, ed. Houston, Elsevier, 1953. 544 pp., diagrs., $11.00 (U.S.).

The contributors to this volume were all chosen as being experts in their own fields, and are drawn from England, the United States, Holland and Germany.

The aim of the book is to cover the technical aspects of acoustics and present a survey of the applications of this branch of physics.

This volume deals with the sonic range, and airborne sound. It is divided into six sections: acoustic measurements and materials, acoustics of buildings, noise, speech and hearing, sound reproduction and the analysis and synthesis of sound and the design and performance of musical instruments. The second volume, to appear later this year, will cover the ultrasonic range and its applications, including underwater transmission.

There are extensive bibliographies at the end of each section, and this book will be very useful to all our members interested in all the various aspects of sound.

**Technologie professionnelle d'électricité.** Raymond Merlet. 2e éd. Paris, Dunod. Montreal, Fomac, 1954. 386 pp., illus., $3.95.

Brought completely up to date in this its second edition, dated nineteen fifty-four, this volume treats of incandescent, luminescent, fluorescent, and electric arc lamps, photo electric cells, electric computers, and the installation of numerous types of telephone bells and intercommunication systems.

It is illustrated and has a detailed table of contents.

**Theory of machines.** B. B. Low. Toronto, Longmans, 1954. 472 pp., figs., $4.50.

Originally published under the title Engineering Mechanics, in nineteen forty-two, this book was re-issued three times, and is now being published in a completely revised form with a new title.

Eight additional chapters have been added, and information includes the analytical treatment of brakes, and the theory given for brakes with external-contracting pivoted shoes. The level of the book is the average university engineering course.

Exercises are included at the ends of the chapters, and in some cases, a short bibliography; there is a brief index.

**Le titane et ses composés dans l'industrie.** Maurice Déribéré. 2e éd. Paris, Dunod, Montreal, Fomac, 1954. 278 pp., figs., $7.75.

Originally a very rare and costly metal, titanium is now recognized for its many commercial uses, both in metallurgical techniques and dielectrics, and in steel and numerous alloys.

These uses are fully discussed in this volume, so as to make it of value not only to engineers and metallurgists, but also to industrialists, craftsmen, technicians and sanitary engineers.

## BOOKS RECEIVED

Bibliography No. 14—Automobile parking in the United States. (Publication No. 297). Current road problems, No. 9-3R—Recommended practice for snow removal and treatment of icy pavements

**United States. Dept. of health, education, and welfare:**

Engineering enrollments and degrees, 1953. (Circular No. 387).

## STANDARDS REVIEWED

**American welding society, 33 West 39th Street, New York 18, N.Y. D10.2-54T - Recommended practices for repair welding of cast iron pipe, valves and fittings. (Tentative)** 50 cents.

The repair of iron castings by welding has now become an established means of economically reclaiming them. This condition is the result of carefully worked out procedures to assure that the defects have been removed and replaced by sound weld metal. These Recommended practices, just published by the American welding society, give practical details of the repair methods which should be used.

Materials covered include gray iron, white cast iron, chilled cast iron, malleable iron, alloy cast iron and nodular cast iron. The welding processes for which procedures are given include are welding with nickel electrodes, mild steel electrodes, cast iron electrodes and copper-base electrodes; oxy-acetylene welding and braze welding; and carbon arc welding. This publication tells how to prepare a casting for welding: veeing, preheat, etc. It also tells what postweld heat treatments are required and describes the effects of welding on castings.

These Recommended Practices are equally applicable to all castings, although written specifically for pipe, valves and fittings.

**American society for testing materials, 1916 Race Street, Philadelphia 3, Pa. Specifications and tests for electrodeposited metallic coatings. pa. $1.85.**

This publication has been compiled to bring together in convenient form for the use of the industry all of the ASTM Specifications and methods of test pertain-

ing to electrodeposited metallic coatings on metals.

ASTM Committee B-8 on Electrodeposited metallic coatings and the American electroplaters' society prepared jointly the specifications and tests in this latest edition. The AES is officially represented on Committee B-8, which includes in its personnel many of the country's leading authorities representing those concerned with production of the coatings and use of the materials thus treated. The committee has followed closely a number of various research projects and has participated and sponsored atmospheric and other exposure tests.

The book contains: Specifications for electrodeposited coatings: zinc on steel, cadmium on steel, nickel and chromium on steel, nickel and chromium on copper and copper-base alloys, nickel and chromium on zinc and zinc-base alloys, lead on steel, chromate finishes on electrodeposited zinc, hot-dipped galvanized and zinc diecast surfaces. Methods of testing: local thickness of electrodeposited coatings, salt spray (fog) testing, Recommended practices for: chromium plating on steel for engineering use, preparation of the following, low-carbon steel for electroplating, high-carbon steel for electroplating, zinc-base die castings for electroplating, copper and copper-base alloys for electroplating, and preparation of and electroplating on aluminum alloys and stainless steel.

**British standards, British standards institution, 2 Park Street, London, W.1. British standards are available from the Canadian standards association, National research building, Ottawa.**

**B.S. 376: Part 2: 1954—Railway signalling symbols. Wiring symbols and written circuits, 2nd ed. 12/6.**

The revision of Part 1 of this British standard 'Schematic symbols' was published in 1951.

The publication of the revision of Part 2 now brings this British standard up to date.

It includes railway signalling symbols for wiring diagrams and written circuits and also explains a system of labelling wires in such a manner that each wire can be readily identified with that shown on the circuit diagram.

Notes and recommendations on the nomenclature for wiring diagrams, written circuits and the labelling of wires are included, together with examples of common combinations.

In drafting written circuits it is important that there shall be no doubt to which terminal of a piece of apparatus a wire is connected and the method of ensuring this is shown.

The symbols included in this standard are for railway signalling systems and are not intended for power lines, commercial electrical engineering machinery or telecommunications.

This British standard should prove invaluable to all those connected with railway signalling.

**B.S. 638: 1954—Arc welding plant and equipment, 3rd ed. 7/6.**

The British standards institution has recently published the above revised British standard. It deals with both d-c. and a-c. equipment and includes requirements for heavy duty multiple arc a-c. equipment for heavy constructional work, which was previously dealt with in the war emergency B.S. 1071. The basis of rating used in the two previous issues of this British standard has been retained and the only major modification is the introduction of maximum hand welding current which, together with a definition of arcing time factor, should enable the user to select with greater accuracy the correct capacity of welding plant or a given duty. Provision is made for a type of single operator plant, which, when operated at a lower arcing time factor than that assumed in the standard rating, can be used to supply currents in excess of the maximum continuous hand welding current. Such plant is required to be fitted with a warning plate stating the value of this maximum current.

**B.S. 907: 1954 — Dial gauges for linear measurement (excluding lever type).** 3/–.

This is a revised edition of this standard.

Dial gauges are among the most widely used of engineers' precision tools and many developments in design have taken place since B.S. 907 was first published in 1940. The present revision takes account of this in specifying standards of performance and incorporates a number of modifications which experience of working to the previous standard has shown to be desirable. It also makes provision for the back plunger type of dial gauge now in very general use.

In English measure, two types of dial graduations are provided for: those divided unto units of 0.001 in. (sometimes subdivided into half units of 0.0005 in.) and known as one-thousandth inch gauges, and those divided into units of 0.0001 in. and known as one-ten-thousandth inch gauges.

In metric measure, the standard is confined to dials graduated in units of 0.01 mm.

Recommended dimensions, methods of testing and notes on the care and use of dial gauges are given in appendices.

**B.S. 1193: 1954 — Sizes of sensitized material for recording instruments.** 2/6.

The British standards institution has recently published British Standard 1193: 1954 which supersedes B.S. 865: 1939 as well as B.S. 1193: 1945. The perforation pitch of the 70 mm. film previously dealt with in B.S. 865 has been brought into line with that for the other film sizes.

Another new feature in this edition is the inclusion of 80 mm. films used in mass radiography; this size is suggested as the preferred standard for future recording apparatus requiring a width of film of the order of 70-120 mm.

In addition, the method of specifying dimensions for perforated material has been revised to conform to the method of measurement used in their production.

**Canadian standards, Canadian standards association, National research building, Ottawa, Canada.**

**C.S.A. B97-1954 — Limits and fits for engineering and manufacturing,** 2nd ed., $2.50.

This Specification, replacing B97-1948, Part I, is a considerably enlarged edition and includes complete data on the selection of fits between plain (non-threaded) parts as well as definitions and revised preferred basic sizes and tolerances.

The Specification was prepared by the CSA Committee on Limits and Fits organized in 1945 to participate in the Conference on unification of engineering standards held in Ottawa in September of that year and attended by representatives from the Standards bodies of Great Britain, the United States and Canada.

The first edition published in 1948 covered definitions, preferred basic sizes and tolerances as agreed upon at the 1945 Conference. The second edition is the result of continued study by both Civilian and Defence Service representatives from Canada, Great Britain and the United States. Further Conferences were held in 1950 and 1952 and, in 1953 at New York, agreement was reached at an ABC (America-Britain-Canada) level covering the range of sizes .040 to 20 inches.

This second edition includes all fits agreed to by the three countries at the 1953 Conference and has been extended to specify fits for the size range 20 to 200 inches.

It is believed that the majority of industrial applications will be covered by the fits specified and that the Standard will have wide application in industry.

**C.S.A. C22.2 No. 14 — 1953 — Construction and test of industrial control equipment for use in ordinary (non-hazardous) locations, 3d** ed., $1.00.

This Specification replaces the second edition issued in 1942 (re-affirmed in 1949) and applied to control and protective devices for industrial electrical equipment, including motors, generators and heating apparatus, for potentials up to and including 2,500 volts between conductors on ungrounded systems and 4,500 volts between conductors on grounded neutral systems, and intended to be employed in accordance with the Rules of Part I of this Code.

In this new edition general requirements, construction, marking, and tests are thoroughly covered. The Specification is intended for use in ordinary (non-hazardous) locations.

**C.S.A. C22.2 No. 18 — 1953 — Construction and test of outlet boxes, conduit boxes and fittings, 2d ed.** $1.25.

This second edition replaces the first which was issued in 1934. Its title has been changed, and its scope has been enlarged to include additional box types and associated fittings. This Specification applied to metal boxes not exceeding 100 cubic inches in volume, designed to be employed in accordance with the rules of Part I of this Code. It includes not only devices which are known to the trade as "outlet boxes", and "conduit boxes" but also includes armoured-cable boxes, concrete boxes, flexible-non-metallic-tubing boxes, floor-outlet boxes, flush-device boxes, junction boxes, non-metallic sheathed-cable boxes, pull boxes, extension rings, covers, threaded and threadless fittings, cable and conduit straps, clamps and hangers, entrance caps, connectors for wire and cable, locknuts, bushings, and reducing washers. The devices are intended for use in non-hazardous locations.

The Appendix lists coating requirements for ferrous materials used in a metal box.

**C.S.A. C22.2 No. 53 — 1953 — Construction and test of electric washing machines, 2d ed. $1.00.**

This Specification applies to portable and stationary electrically-operated domestic and commercial clothes-washing and dish-washing machines equipped with motors and/or controls, and with or without water heaters, for potentials of 600 volts or less between conductors, designed to be employed in accordance with the rules of Part I of this Code.

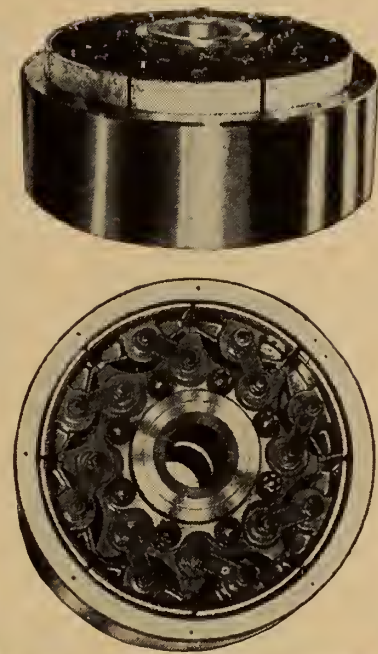
It includes conventional gyrator-and-wringer machines, oscillating-tub machines, semi- and fully-automatic clothes- and dish-washing machines and extractors of the centrifugal type.

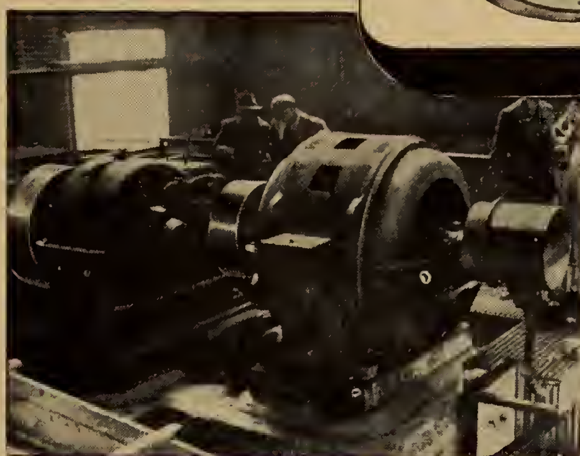
This Specification does not cover dry-cleaning equipment for hazardous locations.

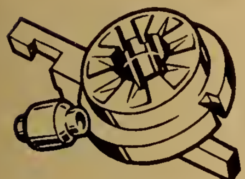
"TWIFLEX"

# SHOCKLESS power transmission

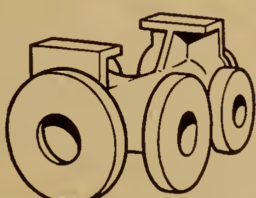
This Automatic Clutch and Flexible Coupling combines in one simple mechanism a centrifugal clutch with adjustable engaging speed and a very efficient flexible coupling with no backlash. TWIFLEX couplings *eliminate* torsional vibrations, excessive torque peaks, prolonged high starting current, and provide *shockless* power transmission for compressors, generators, travelling cranes, pumps, crushers, etc. Easily installed. Manufactured at Guelph in sizes from fractional to 5000 H.P. Write for literature and selection data to Dept. EJ3.







Sheepbridge powder metal division is designed for high speed production of powdered metal parts in brass, bronze, iron and steel, giving high precision parts at low unit cost.



Sheepbridge produces castings of mild, stainless, heat resisting steels and nickel base alloy by cement, shell, centrifugal and conventional methods at competitive prices.

## Appointments and Transfers

**Walter A. Cole.**—To coordinate Canadian General Electric Company's sales in the expanding telecommunication's market, Walter A. Cole has been appointed Manager, microwave sales, in the company's electronic equipment department.

Mr. Cole is responsible for the sale of microwave radio systems, telephone and telegraph wire line and radio carrier multiplex equipment and associated products and services, including supervisory control telemetering and teletype equipment.

Philip D. Wallace

**English Electric.**—J. M. Hahn has been appointed works manager of the English Electric Company of Canada Limited.

Mr. Hahn has been associated with the John Inglis Company since 1941 and joined the English Electric Company in 1950. Since then he has spent two years with the English Electric Company in their various works in England.

**New Address.**—The new address of W. W. Timmins and Company Ltd., is 51 Hillside Avenue, Montreal 6, P.Q.

**Reliance Electric.**—Formerly associated with the Toronto office of Reliance Electric & Engineering (Canada) Limited, Philip D. Wallace recently became sales engineer for the company's Calgary office.

**C. A. Dunham Co. Ltd.**—A. J. Dickey, president of the C. A. Dunham Company Limited, has announced two new staff appointments. R. E. L. Johnson becomes vice-president in charge of manufacturing, and R. M. Mitchell becomes vice-president in charge of sales.

**Lloyd S. Jamieson.**—The appointment of Lloyd S. Jamieson as general manager, Robertsteel (Canada) Limited, is announced by T. A. Irwin, president. Mr. Jamieson was formerly assistant general manager of the company.

**Canadian Westinghouse Company Limited.** — A. A. McArthur, has been appointed manager of the Canadian Westinghouse Company's power products division. He formerly held the post of sales manager for that division.

Lloyd S. Jamieson

# PLATEWORK

*There is more than one kind of platework!*

Two of the three illustrations represent examples of *steel* platework . . . completely fabricated by welding, with techniques pioneered in Canada by Dominion Bridge. By continuous research and development, the Company has maintained a premier position in the welding industry.

Any of our 13 plants stands ready to solve *your* platework problems—large or small.

ILLUSTRATED: *Above: Continuous welded girder bridge, believed to be the longest of its type in the world.*

●

**Ferranti Electric Appointment.** — Ferranti Electric Limited announces the appointment of Thomas C. Good, to their Montreal sales office. Mr. Good will assist C. E. Begin, Quebec district manager of the company.

●

**Canadian General Electric.** — W. F. Wansbrough has been appointed manager of Canadian General Electric's major appliance department, according to an announcement by W. G. Ward, general manager of the company's appliance division.

Mr. Wansbrough's headquarters are in the company's Montreal Works at 5781 Notre Dame Street East, Montreal.

●

# New Equipment and Developments

**Canadian Aviation Electronics, Ltd.**— C.A.E.'s new plant in Montreal was officially opened by Rt. Hon. C. D. Howe at a ceremony held at the plant on June 15. The new plant is designed to produce many types of precision devices and to provide facilities for the installation, maintenance, repair and modification of electronic equipment.

C.A.E. is an all-Canadian company which provides electronic products for the armed forces, the exploitation of natural resources, manufacturing industries, agriculture, medicine and science, for Canada and many other countries throughout the world.

●

**Compressed Air Floodlight.**—An ingeniously designed compressed air driven floodlight, is now being offered by Canadian Copco Ltd., Dorval, P.Q.

Fitted with a 12 volt 150 watt bulb and reflector, this portable light gives a wide field of illumination and is unusually suitable for road work and other operations where electrical power is not available. For underground work, and especially where mine gas may be present, it provides a degree of safety not possible with electric lighting. The air supply to the ball mounted turbo generator is conducted through the pressure insulated reflector chamber and should the lens be broken, the pressure ceases and the generator stops immediately. Excessive voltage variations are prevented by a special reducing valve which keeps the generator running at constant speed regardless of pressure changes in the primary air supply.

Identified as Copco-Atlas TGB-41, the floodlight weighs 22 pounds, consumes only 32 c.f.m. air and can be operated on any pressure from 60 to 100 lbs. per sq. in.

●

**Dominion Bridge Boilers Now Made in Vancouver.** — Fully equipped facilities for the manufacture of a complete range of low pressure heating boilers are now available at the Vancouver plant of Dominion Bridge Company Limited.

The Vancouver plant will fabricate the range of Robb-Victor Boilers, originally developed by the Robb Engineering Works Limited, which has been manufacturing boilers in Canada for over 100 years. This plant will also manufacture the Scotch Dry Back Boiler, including a "package unit" recently developed at the Lachine Works of the Dominion Bridge Company from this type.

●

**Construction Equipment**—Innes Equipment Limited, 930 Millwood Road, Toronto, and Innes Equipment Quebec Limited, 55 Decarie Blvd., Montreal, have been appointed to sell and service the Michigan line of excavator cranes and tractor shovels, products of the Construction Machinery Division of Clark Equipment Company, according to an announcement by Clarence E. Killebrew, Clark vice-president.

Innes Equipment Limited will handle the Michigan line in the entire province of Ontario. Innes Equipment Quebec Limited, will handle the equipment in the entire province of Quebec.

●

**Chemists; New Ideas.** — Any chemist with a new idea, a new material, a new device or a new observation waiting for fame and fortune is invited to submit it to the 8th National Chemical Exposition for its Chemical Trail Blazers' Exhibit.

Since 1944, the exhibit has been part of the biennial national show, which

this year will be held in the Chicago Coliseum, October 12 to 15. Space is made available free for any kind of chemical novelty and all the hopeful chemist need do is send his request for space to Dr. Paul E. Fanta, Trail Blazer chairman, at the Illinois Institute of Technology, Chicago 16.

●

**Material Handling.** — The introduction to the Canadian market of the Scheidt "Grapple", an effective material-handling device, is announced by Joy Manufacturing Company (Canada) Limited, Galt, Ontario. The "Grapple" is a multi-tined digging bucket, suspended in the conventional manner from a crane boom or similar machine support when used to handle loose material on normal applications.

For example broken rock and ore, scrap metal, gravel and similar material, can be handled quickly and effectively by the unit, which is available in wide-tine style, providing full closure of the bucket; medium-tine style, providing effective containment of average sized material; and narrow-tine style, for handling coarse material.

●

**Electric Motors Built to New Standards.**—Canadian General Electric Company recently unveiled the first polyphase induction motor to be built to the new revised standards of the Canadian Electrical Manufacturers Association. The motor was displayed for the consumer public at the Canadian International Trade Fair.

For the consumer, the new C.G.E. motor means a smaller, lighter, more compact power plant for less money.

It was agreed that no Canadian motor manufacturers would offer their versions of the new frame size for sale in Canada until July, 1954, and that an interval of five months should elapse between each succeeding consecutive frame size offering. It is expected that in due course all members of the C.E. M.A. will follow the new standards, although it is non obligatory.

●

**Bulldog Electric Affiliated.** — Affiliation of their parent companies in the United States recently will not affect individual organization or sales operations of Eastern Power Devices Limited and BullDog Electric Products Co. (Canada) Ltd., it was announced in a joint statement issued here today by W. J. Gilson, Eastern Power Devices Limited, president, and R. R. Farrell, vice-president of BullDog Co. (Canada) Ltd.

Closer co-operation between the Canadian companies to improve their service to this country's electrical market is under study, however. Shop facilities of both plants will be made available to each on a broad co-operative basis.

●

# Publications

**For copies of the publications mentioned below please apply to the publishers at the addresses given in the items.**

**Please mention *The Engineering Journal* when writing.**

**Apparatus for Industry.** — A 14-page catalogue describing General Electric motors, motor control, adjustable speed drives, welding equipment and accessories—has been released by the apparatus division of Canadian General Electric Company.

The well-illustrated, two-colour catalogue offers easy reference to this representative group of apparatus products built to meet the specifications of Canadian industry. Designated AAD 24801, the catalogue is available on request from Apparatus Division, Canadian General Electric Company, 212 King Street West, Toronto.

●

**Welding Text and Reference Book.**— A new book, "Metals and How to Weld Them"—by T. B. Jefferson, Editor, The Welding Engineer, for the welding operator, supervisor, instructor, engineer, designer, and manager; explains in clear, logical, readily understood steps the structure and properties of metals and how to weld them. Covers the fundamentals of metallurgy and their significance for welding metals. Gives procedures for welding mild, medium and high carbon steel, alloys, cast iron, hardfacing, stainless and high chromium steels, austenitic manganese steels, tool and die steels; how to make good welds, trouble shooting, welding terms and useful data. 322 pages, over 170 drawings, photographs and tables; stiff board, cloth covered binding, gold embossed, price $2.50 per copy. Lincoln Electric Company of Canada Limited, 179 Wicksteed Road, Leaside (Toronto 17), Ontario.

●

**V-Belt Catalogue.** — An up-to-date V-Belt catalogue has been made available by the industrial products division of B. F. Goodrich in Canada.

B.F.G. patented Grommet belts in standard and high capacity constructions are highlighted in the free booklet. New horsepower rating tables permit the design or re-design of V-belt drives at reduced cost.

For further information on this release, write Press-radio Relations Representative, B. F. Goodrich, Kitchener.

●

**Nickel and Nickel Alloys.**—Three new Canadian listings of current technical publications available from The International Nickel Company of Canada, Limited describe the contents of a total of 294 pieces of literature on the uses of nickel and nickel alloys.

List "A" is of particular interest to Canadian production men, design engineers, metallurgists and metal users. It describes 156 publications dealing with nickel alloy steels, stainless steels, nickel brasses and bronzes, nickel cast irons and nickel plating. Industries in which these nickel alloys are used include the aircraft, automobile, petroleum, pulp and paper, mining, glass, electrical, machine tool and shipbuilding industries. Applications discussed range from light tubing to heavy gears and castings.

List "B" describes 116 current publications on uses of monel, "R" monel, "KR" monel, "S" monel, nickel, duranickel, low carbon nickel, inconel, inconel "X" and incoloy. In addition to information on general applications, several of the publictions in List "B" give technical information on the engineering properties, and corrosion and heat-resisting characteristics of these alloys. There are publications of particular significance to those with special training in architecture, chemistry, electricity and electronics, food processing, furnace and heat treating, hospitals, leather tanning, transportation and power fields.

The third of the new Canadian lists available, List "D", describes 22 publications on the properties and applications of ductile iron. Among these are publications on the hardening characteristics, wear properties and heat treatment of ductile iron, and its application to engineering, casting, gear materials, farm implements, heavy machinery, forgings, waterworks construction and joining.

Copies of either of these three new lists, "A", "B", and "D" are available without charge from The International Nickel Company of Canada, Limited, Room 1815, 25 King Street West, Toronto 1.

●

**Gear Units.**—A new Gear Unit Bulletin has been issued by Dominion Engineering Company Limited, P.O. Box 220, Montreal.

The 40 page illustrated book describes new designs and an extended range of sizes, including high speed units. In conjunction with technical data the booklet also contains rating and dimension tables for all units. When writing request Bulletin No. 368-53.

●

**H. R. C. Fusegear**—An article on "What the H.R.C. fuse means to the electrical contractor" is the main feature in the May-June issue of The English Electric Company of Canada Limited's magazine 'Spotlight'. It is by R. J. A. Behan, the company's fusegear specialist.

The article points out the advantages, from the point of view of reliability in operation, and economy in purchasing, installation and maintenance of the H.R.C. fuse. The fuse is a revolutionary device which provides an inexpensive and effective means of protecting equipment against destruction from electrical faults and protecting operators from the hazards of explosions of inadequately rated interrupting devices. Requests should be addressed to the company at St. Catharines, Ontario.

●

**Rubber Products Industry.** — Reprints of an article from Chemistry in Canada, on the "Rubber Products Industry of Canada", are now available.

This 11-page article outlines the story of the rubber products industry in Canada from its background to its personnel. Topics covered in detail include: rubber products, rubber and plastics, exports and imports, raw materials, rubber reinforcing agents, rubber chemicals, other chemicals, production techniques, and research and development.

Copies are available without charge, from The Chemical Institute of Canada, 18 Rideau Street, Ottawa, 2, Ontario.

# Canadian Hydro Electric Developments on The Niagara River

by

Dr. R. L. Hearn, M.E.I.C.

*General Manager,*
*Ontario Hydro Electric Power Commission,*
*Toronto, Ont.*

This paper, presented before the 68th Annual Meeting at Quebec City, sketches the early history of power development on the Canadian side of the Niagara River and records the early discussions regarding public ownership of power leading up to the creation of the Ontario Hydro Electric Power Commission in 1906.

The main features and the construction of the Sir Adam Beck-Niagara Generating Stations Numbers 1 and 2 are described and compared. When completed in 1956, the Sir Adam Beck-Niagara G.S. No. 2 will have a total capacity of 1,260,000 hp.

The history of the Niagara River and Falls dates back some 200,000 years to the ice age, when glaciers thickly covered the Great Lakes area. As the glaciers melted and retreated, vast lakes and drainage systems developed which were the forerunners of the present-day geography of Southern Ontario.

The Falls themselves and, in fact, the upper Great Lakes, owe their existence to the hard limestone strata which forms the Niagara river bed and the crestline of the Falls. This hard rock formation has prevented Lake Erie from draining completely into Lake Ontario.

Following the scoring and gouging of the earth's crust, the glaciers melted. A lake was formed in the Erie basin, which found an outlet over the Falls to Lake Ontario. Most of the Upper Lakes water flowed down the Ottawa River, which extended far up the St. Lawrence valley.

When the level of this body of water fell below the divide of the Ottawa, large volumes of water began to flow over the flats of what are known as the St. Clair and Detroit rivers. So today, the Niagara River is "backed" by a large natural headpond, comprising four lakes formed by the glaciers—Superior, Huron, St. Clair and Erie.

Dependability of flow is an extremely important factor in determining the value of a river with respect to the production of hydro-electric power. In this regard the Niagara River, with its vast storehouse of water to draw upon, ranks with the best, as indicated by the comparative table (daily mean flows):

*St. Lawrence River*—Outstanding for its dependability and uniformity of flow, with a maximum to minimum flow in the ratio of less than 2:1.

*Niagara River*—Maximum to minimum ratio of flow, excluding diversion factor, is 3:1.

*Ottawa River*—Maximum to minimum flow ratio is 12:1.

*Columbia River*—Maximum to minimum ratio of flow is 28:1.

### Industrial Progress Hinges on Electricity

In the latter part of the nineteenth century, industry in southern Ontario faced a crisis; where to find a cheap dependable source of power to keep the wheels of industry turning. The timber line was fast receding, and it had become uneconomical to haul wood for steam operated plants. Coal from the United States was too costly for sound operation.

Even the use of localized water-power plants to produce electricity was not entirely satisfactory, since their output was confined to a small radius, and the denuding of the forests meant heavy spring run-offs with consequent low water flows for the rest of the year.

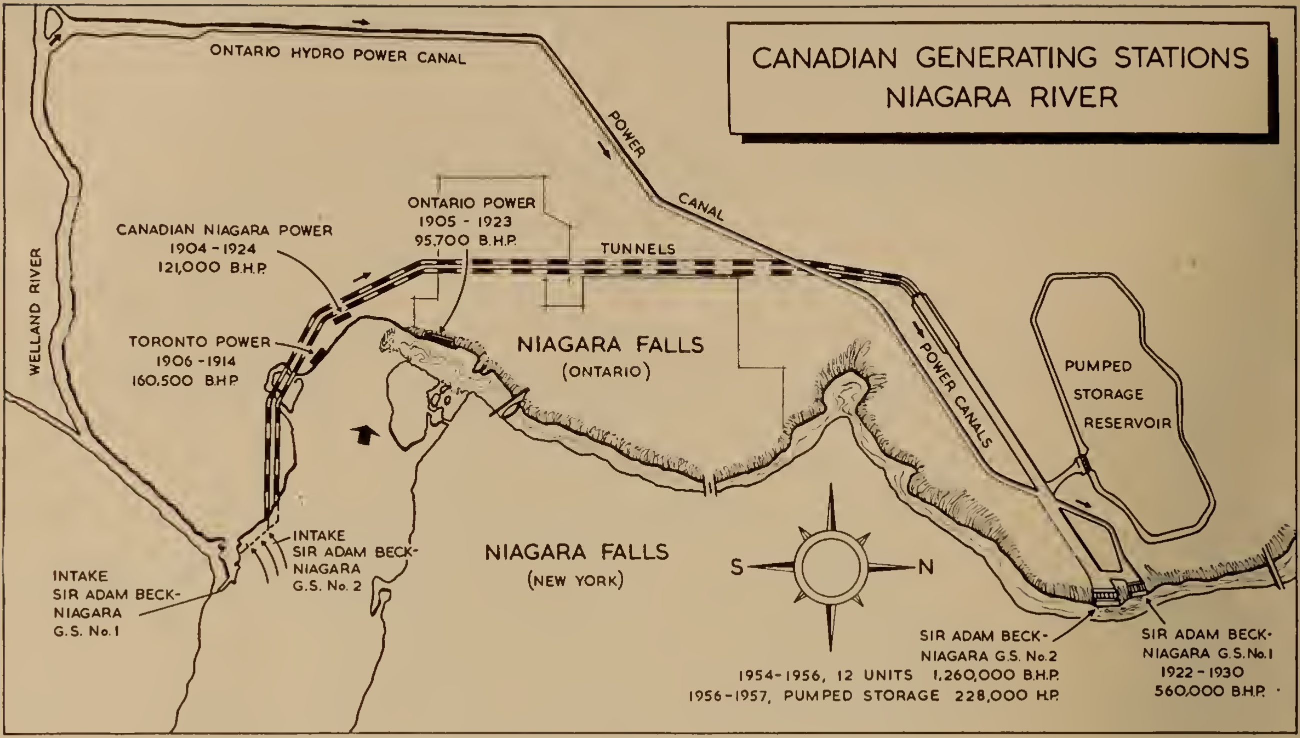
The answer to future progress was the utilization of dependable river flows, such as the Niagara River, to produce electricity and transmit it to the growing manufacturing centres. For more than 60 years, the waters of Niagara have been used to generate the electricity which has been one of the chief factors in the economic strength and growth of Ontario.

In order to ensure the best use of Niagara waters for power production, and to maintain the scenic beauty of the Falls, various treaties have been signed between the United States and Great Britain, and Canada.

### International Boundary Waters Treaties

The Boundary Waters Treaty of 1909-1910 was signed between Great Britain and the United States. As it relates to Niagara, this treaty permitted, for power purposes, the permanent daily diversion from the Niagara River above the Falls of 20,000 cubic feet of water per second to the United States, and of 36,000 cubic feet per second to Canada.

During World War II, Ontario Hydro obtained an additional 5,000 c.f.s. of water for power purposes at Niagara Falls through the Long Lac-Ogoki diversions. Additional temporary diversions were obtained



through an exchange of letters between Canada and the United States of America in the years 1941 1944 and 1948.

These temporary diversions amounted to 15,500 c.f.s.,—2,500 c.f.s. of which was available only during the non-navigation season,—and enabled the Commission to operate all of the plants on the Canadian side to their maximum capacity. It might be mentioned that the power companies on the United States side of the Niagara River also obtained additional diversions under temporary permits, to enable them to operate their plants at full capacity.

In order to maintain a proper pool level above the Falls, a submerged weir was built just below Chippawa and above the Rapids, during the years 1942 to 1944. This submerged weir assisted in maintaining the level of the Grass Island Pool, even at times of increased diversion for power purposes. At the same time it increased the flow over the American Falls, thus enhancing the scenic effect considerably.

After the cessation of hostilities, negotiations were entered into by Canada and the United States with a view to revising the 1909 Treaty to permit re-development of power on both the Canadian and American sides of the Niagara River. These negotiations resulted in the signing at Washington on February 27, 1950, of a new treaty known as the Niagara Diversion Treaty.

The significant feature of the new treaty was that, instead of a definite amount of water being designated for power as in the 1909 Treaty, a definite flow over the Falls was stipulated to preserve and enhance their scenic beauty. The balance after allowance for domestic, sanitation and navigation purposes is allowed to be diverted for power production,—50 per cent to each country,—exclusive of the 5,000 c.f.s. Ogoki diversion which belonged entirely to Canada.

When the 1950 Treaty was ratified on October 10, 1950, Ontario Hydro was in a position to start immediately on the redevelopment of the Niagara River with the construction of the Sir Adam Beck-Niagara Generating Station No. 2, the details of which will be covered later in this paper.

#### First Diversion of Water for Power Purposes

The first diversion of water for power purposes on the Canadian side was the small plant constructed in 1893, to operate the International Railway Company's electric line from Chippawa to Queenston. This plant was operated under a head of 62 feet, with an ultimate capacity of 3,000 hp. in 2 units. In 1932, on the expiration of the 40-year lease, the railway was dismantled and the plant abandoned.

At the turn of the twentieth century, hydro-electric power development at Niagara Falls on the Canadian side received a tremendous impetus when three large power stations were in the course of construction at the same time, namely, those of the Canadian Niagara Power Company, the Ontario Power Company, and the Electrical Development Company.

#### Canadian Niagara Power Company

The Canadian Niagara Power Company was the first to begin construction operations in 1901. The plant has an operating head of approximately 135 feet. Between 1904 and 1924 eleven vertical type units were placed in service, with an installed capacity of 121,000 horsepower.

This plant followed the same design as the Adams plant of the Niagara Falls Power Company on the American side. The water is obtained from the Niagara River by means of a gathering weir, and is carried to the water turbines by penstocks at the bottom of the wheel pit. The discharge from the draft tube is taken back to the Niagara River by a long tail-race tunnel.

#### Ontario Power Company

The Ontario Power Company in 1900 acquired a charter granted by the Dominion Parliament in 1887, and began work in July, 1902.

The design used by this company for its development showed a radical departure from the two plants mentioned earlier. While water was diverted from the Niagara River by a gathering weir, it was carried underground across country from this point through three pipelines, 6,500 feet long, to the top of the escarpment just below the Canadian Falls and from there down through penstocks to the power house, situated on the bank of the river below the Falls.

By this arrangement, the Ontario Power Company was able to obtain an operating head of 180 feet. The present equipment in this plant consists of 15 units,—the horizontal type with double runner turbine units. The rated capacity of the plant is 195,700 horsepower. In August 1917, the station was purchased by Ontario Hydro.

The plant is of particular engineering interest, as it was on this development that one of the largest steel conduits, 18 feet in diameter, was installed. The second pipeline was one of the largest oblate reinforced concrete pipes ever constructed in Canada. The third pipeline, put in as an emergency measure during World War I, is one of the largest wood stave lines in the Dominion. This 13-foot diameter wood stave pipe was covered with concrete on the outside, and is still operating. The steel bands of the wood stave pipe are being used for taking the tension, and the concrete on the outside is used for water tightness and stability.

It was for this development that the late R. D. Johnson invented, designed and installed the first Johnson differential surge tank in the world. It was also for this plant that he designed and installed the Johnson differential valve, and designed and built one of Canada's largest reinforced concrete tanks at that time.

The Ontario Power Company plant has an interesting historical background. It was twice flooded with water and ice, caused by ice jams in the Niagara River. The last flooding occurred in January 1938, when the ice below the Falls reached a level some 58 feet above normal at the south end of the plant. It was at that time that the Upper Steel Arch Bridge was destroyed.

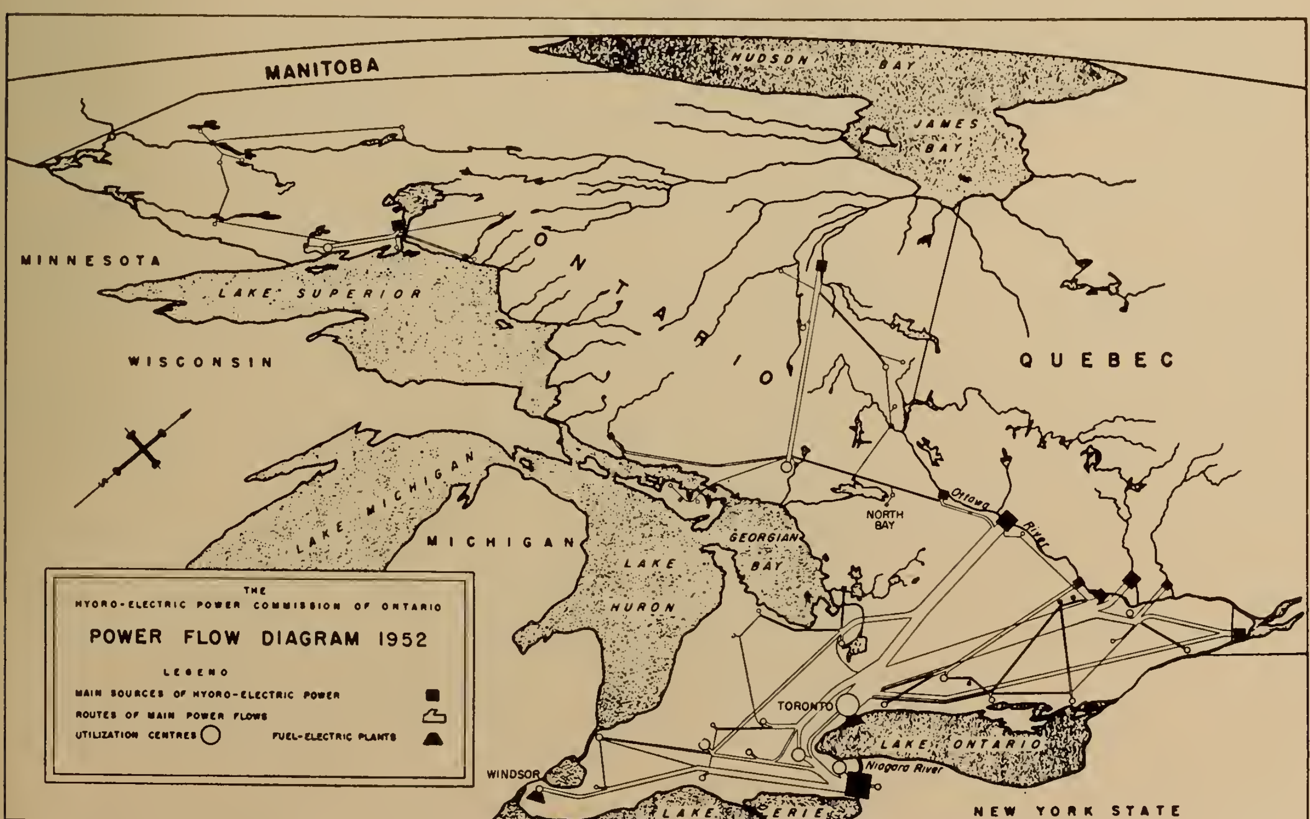
#### Electrical Development Company

The Electrical Development Company plant, later the Toronto Power Development, was built simultaneously with the Canadian Niagara and the Ontario Power Company developments. Work began in 1903 with the installation of the eleventh and final unit in 1914. This plant is the same type as the Canadian Niagara. It is situated just upstream with an operating head of 137 feet, and has an installed capacity of 160,500 horsepower.

The Electrical Development Company was leased by the Toronto Power Company in 1908, and was operated by them until acquired by the Ontario Hydro in 1922. Since that date it has been known as the "Toronto Power" plant. It was from the Toronto Power Company, incidentally, that the city of Toronto first received electricity generated from the waters of the Niagara River.

While Niagara was being harnessed by these three companies, industrialists and leading businessmen in Toronto and Western Ontario were advocating methods whereby this power could be generated and transmitted to the industrial centres in Southern Ontario at economical rates, and thus provide energy for industrial expansion and the improvement in the living conditions of the people.

On February 17, 1903, in the Y.M.C.A. Hall, (Berlin) Kitchener, 67 persons gathered to discuss the idea of public ownership of hydroelectric power. These men included



**Above: Exterior view of Canadian Niagara Power Company, a private power company located on the upper Niagara River.**
**Below: Interior view of the generating room of the Canadian Niagara Power Plant.**

representatives from manufacturers' associations, boards of trade and municipal councils of municipalities.

This was the first meeting, in connection with the power movement, attended by Adam Beck who, at the time, was Mayor of London and a member of the Ontario Legislature, as well as a prominent manufacturer in his own right. From the time he appeared as a supporter of the low-cost power movement, he assumed a position of leadership.

As a direct result of the efforts of these men who led a general movement on behalf of cheaper hydro-electric energy, The Hydro-Electric Power Commission of Ontario was created by a special act of the Provincial Legislature in 1906.

#### Ontario Hydro Delivers Niagara Power to Southern Ontario Municipalities

On May 4, 1908, fourteen municipalities made the first Hydro contract for a total of 26,235 horsepower. Those municipalities were Kitchener, Hespeler, Galt, Preston, Waterloo, New Hamburg, Toronto, London, Guelph, Stratford, St. Thomas, Woodstock, St. Marys, and Ingersoll.

This municipal enterprise was begun by purchasing power by public tender from existing companies which had extensive plants already erected at Niagara Falls. Consequently, in 1908, the Commission on behalf of the municipalities, entered into a contract with the Ontario Power Company for the supply of 100,000 horsepower at 12,000 volts at $9.40 per horsepower-year up to a load of 25,000 horsepower, after which the price would be $9.00 per horsepower-year.

The Commission proceeded to build transformer stations and transmission lines for the distribution of this power to the contracting municipalities, and by the end of 1910, approximately 1,000 horsepower was being distributed to a number of municipalities.

This small load increased until by 1915 the Commission reached the limit of its contract with the Ontario Power Company for 100,000 horsepower. The Commission arranged for additional power supply from the Canadian Niagara Power Company of 50,000 horsepower and from the Toronto Power Company of over 25,000 horsepower.

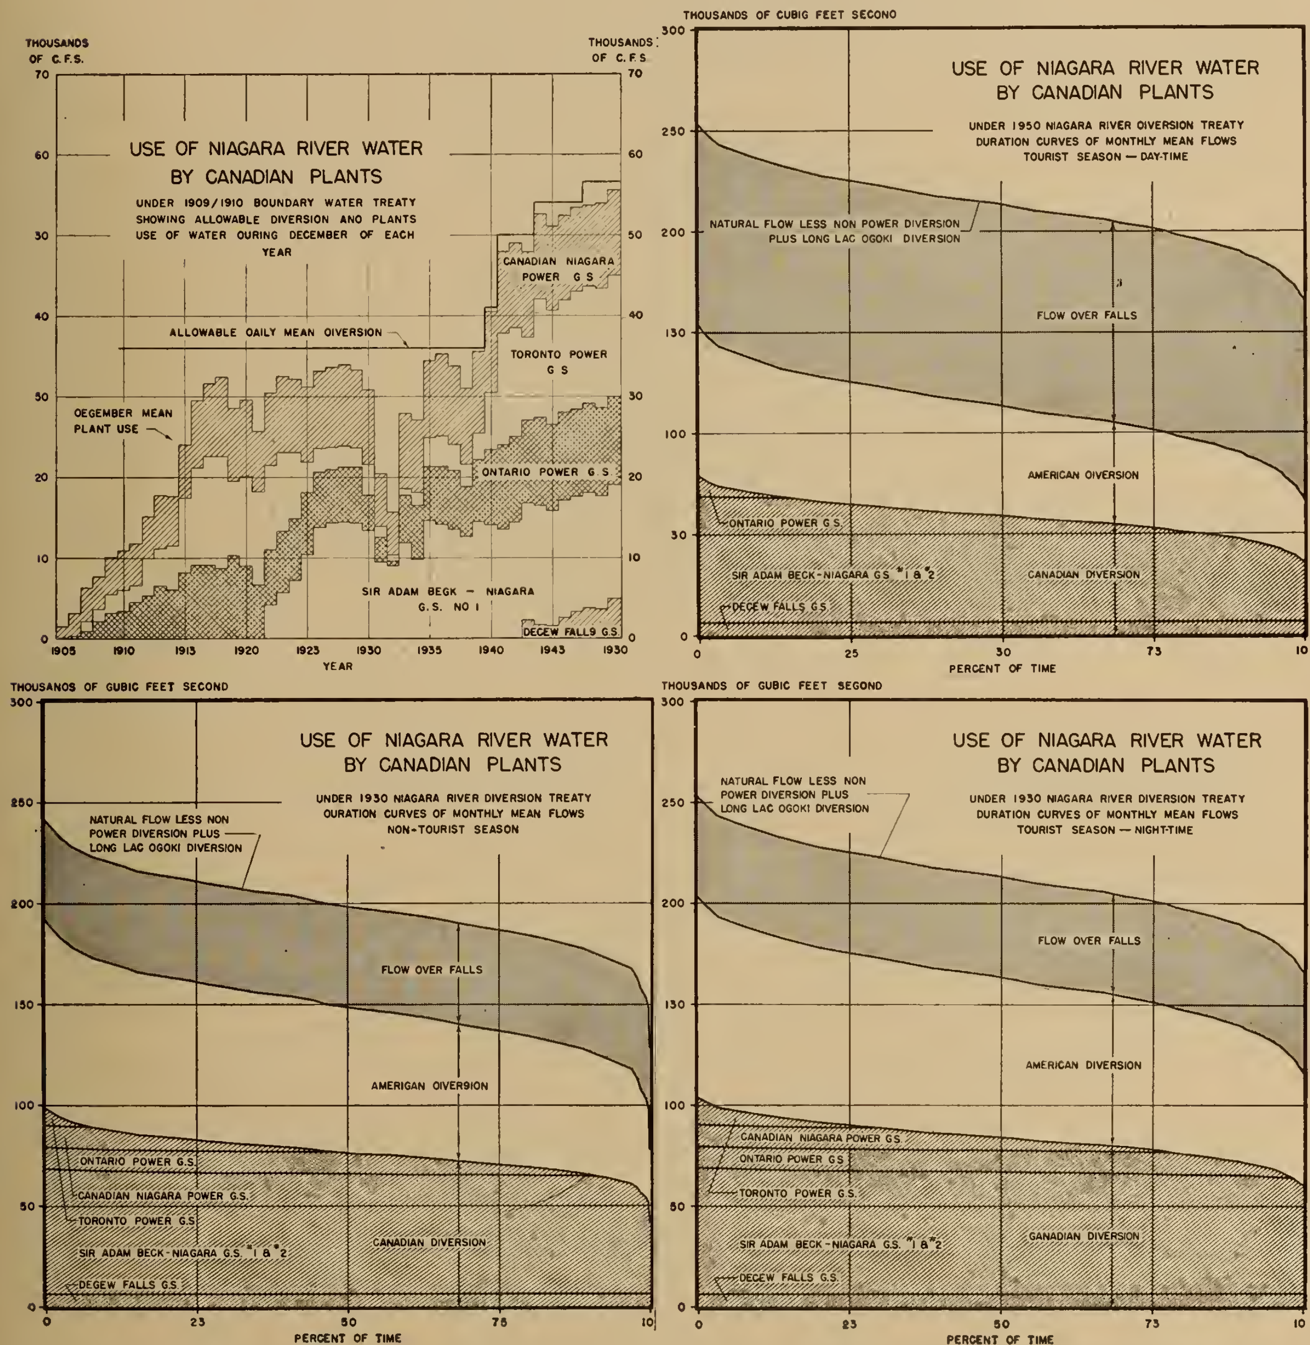
#### Queenston Development

In 1914, Ontario Hydro first considered a power development at Niagara Falls that would use the maximum economical head between Lake Erie and Lake Ontario. As a result of these studies construction of the Queenston-Chippawa Development, now known as Sir Adam Beck-Niagara Generating Station No. 1, was started in 1917. The first units were put into operation in 1922 and the tenth unit in 1930. At the time this plant was built, it was the largest hydro-electric development in existence.

The general scheme of development comprises an intake structure at the junction of the Welland and Niagara Rivers at the town of Chippawa. At this point, water is drawn from the Niagara River through the intake, and into the Welland River whose flow was reversed for four miles.

From this point, a canal was constructed across country on the west side of the city of Niagara Falls and through the township of Stamford to a point on the Niagara escarpment, a mile south of Queenston. The 8½-mile long canal was

**Above: Composite view of the Sir Adam-Beck Niagara Generating Station No. 2 on the left, and the original Sir Adam-Beck No. 1 plant.**
**Below: Interior view of the generating room at the Sir Adam-Beck Niagara No. 1 plant.**



**The upper left graph shows the use of water of the Niagara River by Canadian plants during the period 1905 to 1950 and the allowable diversion under the Boundary Waters Treaty 1909/1910. The amount of water in thousands of c.f.s. used by each plant is shown by the areas below the line identified with the name of the plant.**

**The other diagrams show the monthly mean flow of the Niagara River and the allowable use of this water under the 1950 Niagara Diversion Treaty, during the daytime in the tourist season, during night-time in the tourist season and during the non-tourist season.**

**Table I — Comparison of Various Elements in Plants No. 1 and No. 2**

| | *Sir Adam Beck-Niagara G.S. No. 1* | *Sir Adam Beck-Niagara G.S. No. 2* |
|---|---|---|
| Intake | Open type—Bulk head. Length 630 feet. | 2—slot type. 500 feet long. |
| Waterways | 4 miles of Welland River enlarged and flow reversed. 8½ miles canal through earth and rock. Capacity 16,000 c.f.s. | 2 tunnels—concrete lined 45 ft. finished diameter. 5½ miles long. 2¼ miles of open cut, 185 ft. to 200 ft. wide. Depth of water—approx. 25 ft.-30 ft. Capacity 20,000 cfs. each. |
| Gate House | 550 long. 10 plate steel penstocks. Units 1-5 —16 ft. tapered to —14 ft. diam. 6-10—16 ft. diam. | 16 units—length 880 ft. 16 plate steel penstocks approximately 492 ft. long. 19 ft. diam. |
| Power House | 590 ft. long. 135 ft. wide 10 units—52,500—58,000 hp. Transformers inside. Low and high tension switching in back part of generating station. High tension voltage 130,000. | 1150 ft. long. 63 ft. wide 16 units—105,000 hp. Transformer outside—back of generating station. High voltage switching outside located between forebays of No. 1 and No. 2 stations, on escarpment above power house. Voltage—220,000. |
| Earth Excavation | 13,300,000 cu. yd. | 5,834,000 cu. yd. |
| Rock Excavation | 4,700,000 cu. yd. | 11,417,000 cu. yd. |
| Concrete | 500,000 cu. yd. | 1,907,000 cu. yd. |
| Earth and Rock Removal | Earth and rock removal by electric and steam shovels by means of railway equipment. | Earth and rock removal by means of electric and gas shovels and truck equipment. |
| Time | Time required for construction for first units in operation 4½ years. | Time required for construction first units in operation—3½ years. |
| Total Installed Capacity | 560,000 hp. | 1,680,000 hp., in main generating station; 236,000 hp. in pumping generating station. |
| Maximum Number Employed | Approx. 10,000. | 7,000 |
| Work Week | 6 days. | 5 days |
| Work per shift | 10 hours. | 9.6 hrs. tunnel worker. 8.8 hrs. surface worker. |
| Cost | $76,900,000. | Including pumped storage, estimated at $343,700,000. |

one of the largest hydraulic power canals when constructed, and in its design presented many interesting hydraulic problems.

The units in the power station vary from 52,500 to 58,000 horsepower, and are of the vertical type. At time of installation, they were the largest hydraulic generating units ever constructed. A few years later, however, the Niagara Falls Power Company on the American side put in some 70,000 horsepower units. Power generated in the Queenston plant is sent as far west as Windsor and Sarnia, a distance of 240 miles.

It will be noted, in studying this power station, that the transformer and low-and high-tension switching are all enclosed in the back part of the power station. During the past 32 years since this plant was built, there has been quite a radical change in the switching and transformer layout. These elements of the station now have been placed outside, to eliminate the hazards present with an inside installation.

Further details of this plant may be obtained readily from many earlier publications. It should be noted, however, that in laying out this plant, Ontario Hydro engineers were able to develop it under a gross head of 300 feet out of a possible 326 feet, which is the normal difference in level between Lake Ontario and Lake Erie. The type of turbine and generator setting used in the plant set the pattern that is used today in practically all large hydraulic generating plants.

On the completion of the Queenston-Chippawa Development, further developments in the Niagara River were not possible with the amount of diversion permitted under the 1909 Treaty referred to earlier. It was not until the 1950 Treaty was ratified that Ontario Hydro could start on further development on this famous Niagara River.

**Sir Adam Beck-Niagara G.S. No. 2**

In spite of an all-system expansion program, begun in 1945, Ontario Hydro found itself in a situation where even the completion of the development of Ontario's share of the Ottawa River would not be sufficient to take care of the Province's rapidly growing power demands brought about by the phenomenal industrial expansion and increase in population. In addition, the development of the St. Lawrence was still tied up in red-tape and international political differences, and could not be started in time to supply these growing demands for additional power.

Therefore, the Commission in the Fall of 1950, immediately on ratification of the latest Niagara Treaty, put the wheels in motion for the development of the Sir Adam Beck-Niagara Generating Station No. 2. Work was started in the Fall of 1950 on the preparation of the roads and camps, and actual construction of the development itself was started in the early Spring of 1951.

It is expected that the first unit will be generating power by April 30, 1954, and that five units will be in operation at the end of this year. Six additional units will be in operation in 1955 and another one in January, 1956, making a total of twelve 105,000 horsepower units, or an installed capacity of 1,260,000 horsepower.

When the construction work on this plant was originally laid out, it was planned to install one intake, one tunnel with a capacity of 20,000 c.f.s., an open section of canal which could carry 40,000 c.f.s. or the capacity of two tunnels, and a headworks, penstocks and power works for six units. Work on this initial part of the development proceeded until mid 1952, when it was found that the power demands were growing so rapidly that it was necessary to set our sights higher.

It was decided to construct a second intake, a second tunnel and an additional six units, making twelve units in all. During 1953 the Commission amended the program of work at Sir Adam Beck-Niagara G.S. No. 2 to provide for a pumped storage scheme and later, when required, for four additional generating units.

**Pumped Storage**

A storage reservoir of about 15,000 acre-feet, and adjacent to the forebay, will be created by a dyke and a pump-turbine plant will be built to raise water to the reservoir. The pump-turbine plant will operate as a generating station when water is being discharged from the reservoir, and will have a capability of up to 170,000 kilowatts.

By virtue of this scheme, optimum use will be made of the Sir Adam Beck-Niagara Generating Stations, since the storage reservoir can be filled at night and the impounded water can be used during the daytime by generating units which would otherwise be idle because of increased flows of water over the Falls under terms of the Treaty. The pumped storage is expected to come initially into operation in the Fall of 1956, and to be completed in 1957.

The canal and forebay are now being enlarged and part of the headworks for the four additional units is being constructed. Later the powerhouse will be extended to accommodate the additional units. However, these four units will not be installed until high load-factor resources, such as the St. Lawrence project and thermal power plants, have been developed.

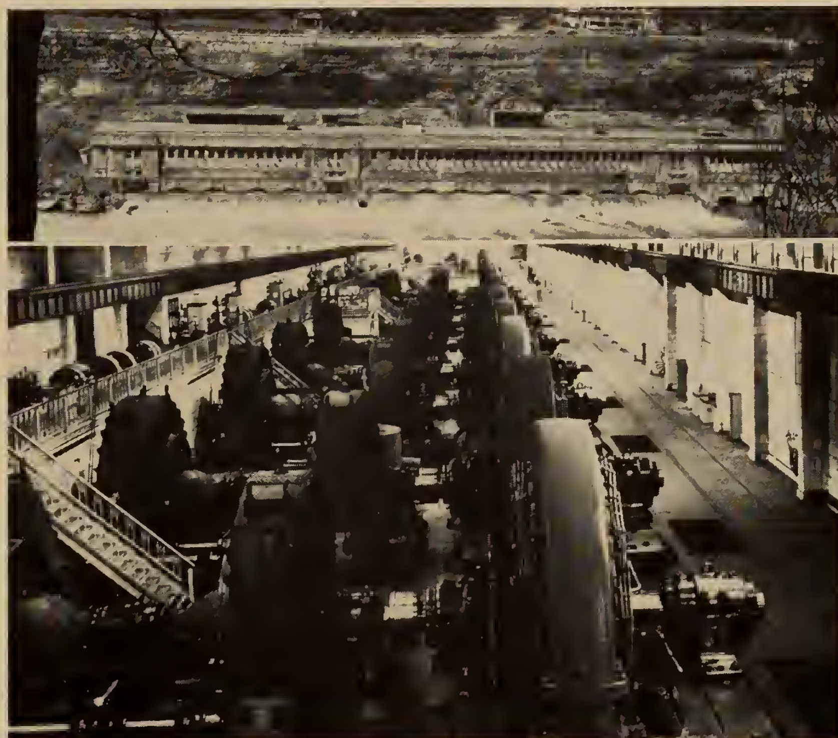
One of the features that made the pumped storage economical in connection with this development at Niagara Falls was the terms of the 1950 treaty that stated in part:

Required Flow over Falls
Tourist Season
April 1st to Sept. 15th—
8 a.m. to 10 p.m. = 100,000 c.f.s.
10 p.m. to 8 a.m. = 50,000 c.f.s.
Sept. 16th to Oct. 31st—
8 a.m. to 8 p.m. = 100,000 c.f.s.
8 p.m. to 8 a.m. = 50,000 c.f.s.
Non-Tourist Season
Nov. 1st to Mar. 31st = 50,000 c.f.s. at all times.

### The Slot-type Intake

There are some interesting engineering aspects in connection with the development of the Sir Adam Beck-Niagara Generating Station No. 2. The type of intake structure used for this development was first developed by the Commission and its Consultants, the late R. D. Johnson and P. Wahlman of New York, at the time the Sir Adam Beck-Niagara Generating Station No. 1 was designed, and was known as the Johnson-Wahlman slot type of intake.

It was an intake developed for the purpose of obtaining a large amount of water from a shallow river, such as the Niagara, at a minimum cost and with the ability to prevent surface ice, a very definite problem in the Niagara River, from entering the water conduits. This type of



Exterior view of the Ontario Power Plant, and an interior view of the generating room.

Above: Exterior view of the Toronto Power Plant.

Below: Generating room in the interior of the Toronto Power Plant.

intake was used by the writer when he was associated with the H. G. Acres & Company, Consulting Engineers, during the period 1925 to 1931.

This company, in collaboration with Messrs. Johnson and Wahlman, designed and supervised the construction of three such intakes: one was at Gordon Creek for the Riordan Paper Company at Temiskaming, Ontario. One was on the Grand River, New Brunswick, on the Grand Falls Development for the International Paper Company, now controlled and operated by the Gatineau Paper Company. The third was at Chelan, Washington, U.S.A. for the Washington Water Power Company on the Chelan River, a tributary of the Columbia River.

Intakes of this type were also constructed by the Shawinigan Water Power Company in Quebec, under the design and license of Mr. Johnson and the Montreal Engineering Company in Nova Scotia. Until the development of the Sir Adam Beck-Niagara Generating Station No. 2, Ontario Hydro had not found a development in which this intake was suitable and economical.

### Control Dam in the Niagara River

Looking ahead, to the full operation of the new plant and the development of the United States side of the River, it has been found necessary to construct a remedial dam in the Niagara River. This will be built just below the two intakes for the Sir Adam Beck-Niagara G.S. No. 2, in order to regulate the variations in the flow as prescribed by the Treaty.

It will also maintain the Grass Island Pool on the Niagara River, above the intakes, at a level that will enable the water to be withdrawn without affecting the levels on the upper stretches of the Niagara River itself. This 1,550-foot long dam consists of thirteen 100 ft. steel submersible gates of the Bascule type.

Another interesting phase of the design of the Sir Adam Beck-Niagara G.S. No. 2, was the twin concrete-lined tunnels, 5½ miles long, under the City of Niagara Falls. These tunnels were excavated at 51 feet diameter, and lined with concrete to a finished diameter of 45 ft.

The tunnels connect to the intake structures on the bank of the Niagara River, and carry the water under the City of Niagara Falls, underneath the canal of Sir Adam Beck-Niagara G.S. No. 1, and come to the surface at the Whirlpool Gorge on the west side of the canal feeding the Sir Adam Beck-Niagara G.S. No. 1. From this point to the forebay of the No. 2 plant, a distance of 2¼ miles, the waterway was constructed in open channel 200 feet wide.

Our studies indicated that the economical location for the power house of the Sir Adam Beck-Niagara G.S. No. 2 was to the south of the No. 1 station. This meant that the open canal for the No. 2 station had to cross the canal for the No. 1 plant approximately 3,000 ft. above the point where the No. 1 canal entered the No. 1 forebay.

Design studies also revealed that it was desirable and economical to operate hydraulically the forebays of both stations at the same operating level. To accomplish this, the two canals cross, and the forebays of the stations are connected through an open channel at the east end of the two forebays, close to the screen house of the two developments.

The design of the intake, the tunnel entrance and exit, the cross-over between the two canals, the cross-over between the two forebays, and the shape and dimensions of forebay No. 2, were finalized by model tests in the hydraulic laboratory constructed by the Commission outside of Toronto, and the hydraulic laboratory of the University of Toronto.

Details of the design of these features will be the subject of several papers that will be prepared by the staff of the Ontario Hydro for future presentation to the Institute.

It may be of interest to make a parallel comparison between these two stations, setting out the main features and the overall quantities of excavation, concrete and other materials used in the two developments. This comparison is shown in Table 1.

### Over 1¼ Billion Dollars Spent Since 1945

The frequency of the Sir Adam Beck-Niagara Generating Station No. 2 will be 60 cycles, while the Sir Adam Beck-Niagara Generating Station No. 1 operates at 25 cycles. With the completion of the major phase of the Niagara project in 1956, The Commission's dependable peak capacity will have been increased by 6,342,900 horsepower, or 144 per cent over the 1945 figure.

On the completion of the No. 2 station, the expansion program of the Commission since 1945, including the generating stations, the transmission lines and the substations necessary to deliver this power to the municipalities and the direct customers, will involve an expenditure of $1,266,000,000. A really formidable sum. This expenditure has been necessary to supply the people of the Province of Ontario with the electrical energy that they require for their industrial expansion, and for the needs of their homes and farms. √

# Transmission Lines from the Canadian Niagara Developments

by

J. E. Sproule, M.E.I.C.

*Consulting Transmission Engineer,*
*Hydro-Electric Power Commission of Ontario,*
*Toronto, Ont.*

This paper gives a history of power transmission lines built in Ontario, from the 10,000 volt lines in use at the beginning of the century, to the 230 kv. double circuit lines from the Sir Adam Beck-Niagara G.S. No. 2 development, being built today. The tenfold increase in the designed loads, from 20,000 kw. in 1910, to 200,000 kw. today, shows clearly the advances made in the design of transmission lines over a period of years. The paper was presented before the 68th Annual Meeting of The Engineering Institute of Canada at Quebec City in May, 1954.

The first electrical transmission line in the Niagara area to carry more than 10,000 volts was the 22,500-volt line from DeCew Falls to Hamilton, a distance of about 35 miles.

In 1897, The Cataract Power Company of Hamilton decided to proceed with the development of power at DeCew Falls. The project had been under discussion for years before this date, and the main problem was the transmission of power from DeCew Falls to Hamilton.

This presented a seemingly insurmountable obstacle, as no transmission of energy such a long distance for commercial purposes had been undertaken up to this time. The largest electrical concerns in Europe and America were consulted but the limitations of 10,000-volt transmission precluded undertaking the transmission of power by any of these companies. It is reported that Lord Kelvin advised that power could not be transmitted this great distance.

The power company did not feel warranted in going ahead with the project because of the high cost of transmission at 10,000 volts, and suggested a voltage of 22,000 volts. After about a year of discussion, the company consulted J. A. Kammerer of the Royal Electric Company of Montreal, who agreed to design and build the transformers for a working pressure of 24,000 volts. Power was initially turned on at the DeCew Falls plant on November 12, 1898. The transmission line was 2 phase, 4 wire, at 22,500 volts.

The route of the transmission line was from the powerhouse along a road due north to the Grand Trunk Railway, thence along the railway right-of-way to the substation inside the city limits of Hamilton. The conductors were 4 No. 1 medium hard drawn copper, supported on insulators on a 4-pin crossarm at 18-in. spacing.

"The pins were of a special design, holding the insulator 2 in. higher from the crossarm than standard practice, to avoid trouble from snow and sleet". This is a quotation from *The Electrical News* of December 1898, and shows that even at that early date engineers worked to standards. The pins were fastened to the crossarm with a wooden pin instead of being nailed, so as to use as little iron as possible.

Poles were 8 in. top, 35 ft. long, and the line was graded—that is, the contour of the wires was kept as even as possible by use of different heights of poles. Pole spacing was 90 ft. On the top of the poles was placed a galvanized iron barb wire, grounded at every pole by means of a metal plate for lightning protection. Below the power wires a 2-pin arm was placed, carrying 2 No. 10 galvanized wires for telephone. These wires were transposed at every fifth pole.

Interruptions to the customer received top priority even in these early days, as an incident related by one of the old-time operators indicates. He says, "on one occasion during a violent thunderstorm, lightning struck the transmission line and one of the wires was burnt off, falling on a farmer's wire fence. This completed the circuit and the power company placed a man on guard until repairs could be made, so that there was no interruption to the customer."

In 1905, the Canadian Niagara Power Company was distributing approximately 10,000 horsepower to Fort Erie and Buffalo at 12,000 volts.

### 60,000 Volt Line from Toronto-Niagara Power

In 1906, the Toronto-Niagara Power Company built a double

Fig. 1. T.N.P. power lines — 60,000, 44,000 and 99,000-volt lines.

circuit 60,000-volt pin-type line from Niagara Falls to Toronto, a distance of 75 miles, to carry the power developed by the Electrical Development Company at Niagara Falls. The towers had a base of 12 ft. x 14 ft., and were made up essentially of 2-A frames connected with bracing. Structures were about 46 ft. high, made of galvanized steel bolted together in the field (Fig. 1).

This transmission line crossed Burlington Beach. From the canal crossing to the Burlington shore, a distance of 1 mile, a 4-circuit rivetted tower was erected on the concrete base. These towers, eleven in all, were located on the edge of the lake, actually in the water at that time (Fig. 2).

The towers were 125 ft. high, and in 1952 the heads of the towers were revamped for suspension insulators. This is now part of the important 115-kv. double circuit line between Burlington T.S. and Hamilton Beach T.S., using 605,000 c.m. A.C.S.R. conductor.

This original T.N.P. company line had a standard span of 400 ft. with conductors made up of 6 strands of No. 6 copper on a hemp core. The total conductor was 190,-000 cm. in area. The line was divided into four sections practically equal in length for operating and patrol purposes. At the dividing points division houses were erected.

In each of the three division houses was installed a 60,000-volt lightning arrester, manufactured by a Canadian company. It contained 240 air gaps between brass cylinders, and 60 carborundum rods all in series from line to earth. The complete arrester was mounted on porcelain insulators and was 25 in. wide and 19 ft. long. The conductors were given four complete spirals in each section.

In 1913 a 90,000-volt line using pin-type insulators was built paralleling the original line. About 1928 the 90,000-volt insulators on a section of this line were replaced with a 110,000-volt pin-type insulator, and the line operated at the latter voltage for several years.

The insulator (Fig. 3) is essentially of tandem type with a 60,000-volt standard unit on top. In later years this insulator gave considerable trouble through flashover due to fog and moisture, especially in the early mornings. Its use has since been discontinued.

### New Triangular Tower

In 1906, the Ontario Power Company was distributing power locally and to Welland over 12,000-volt lines. They were also building duplicate 60,000-volt lines from Niagara to Rochester, a distance of 160 miles. This was considered the highest voltage practical at that time. The structures were triangular, the legs were 4½ in. wrought iron pipe with clamp joints. The conductors were 820,000 cm. aluminum slightly over 1 in. in diameter, supported on pin-type insulators weighing about 75 lbs., the largest in the district at that time.

The normal span was 550 ft. This Niagara-Rochester transmission line crossed the Niagara river at a low level just upstream from the site of Sir Adam Beck-Niagara G.S. No. 2 powerhouse. The crossing-span conductors were 2/0 copper. There were two spans per circuit, and they were arranged to operate singly or in parallel.

Upon inspection of the triangular towers shortly after purchase by the Ontario Hydro, it was found that the pipe legs were split in several places, mostly near the base or at obstructions in the pipe, apparently due to frost action. Clamps were

Fig. 2. T. N. P. Co. Towers, Burlington Beach.

installed over the split sections and an attempt was made to fill the pipes with concrete.

The injection of concrete was not very successful, as it was found later to have consolidated in lumps, leaving many sections empty. A close watch was kept on these towers for several seasons. The splitting seemed to have stopped, hence no other repairs were made. In 1921, before this line was re-insulated, the towers were tested and found satisfactory. The head of the tower was re-designed to carry suspension insulators and is operating today.

#### Initial Transmission by Ontario Hydro

From 1906 on, considerable thought was given to the insulation of transmission lines, and the disc insulator was developed, allowing for power transmission at higher voltages. At this time Ontario Hydro undertook to transmit power from Niagara Falls to Toronto, a distance of 88 miles, and around the "North Loop" to Kitchener (Berlin).

Berlin being the first municipality to receive hydro power, it was decided to build a 110,000-volt,

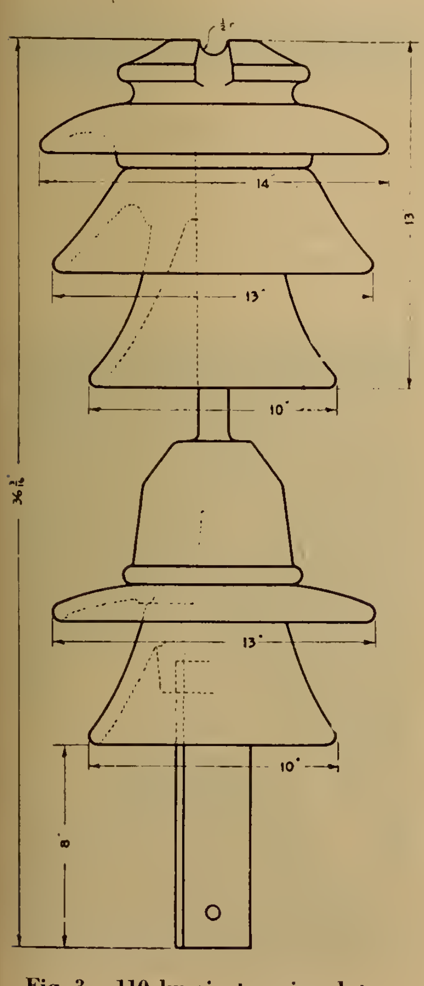


Fig. 3. 110-kv pin type insulator.

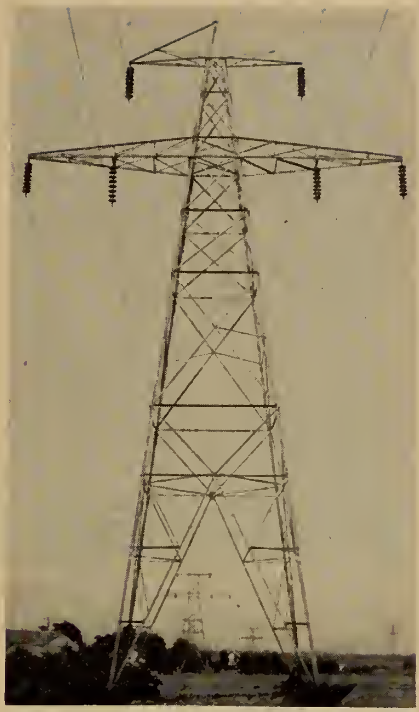

Fig. 4. McGuigan type 110-kv tower.

double circuit transmission line using disc insulators. At that time this system of lines, covering 250 miles, had the highest transmission voltage on the North American continent.

The tower was known as the "McGuigan" type (Fig. 4). The engineers were very conscious of lightning troubles and the tower, as originally designed, carried its conductors in triangular configuration. It had 5 ground wires, 3 on the top arm like an umbrella, and 2 on the second arm between the phases (Fig. 5).

It was soon found that these ground wires were more of a hazard than protection. The light conductors which were 4/0 and 3/0 aluminum, later changed to A.C.S.R. conductors, would blow into the ground wires, which were much heavier. This caused numerous outages and the ground wires were progressively eliminated, until one remained at the peak of the tower.

The insulator strings were made up of a series of eight discs. These were obtained in Germany and the U.S.A. These insulators operated satisfactorily until 1913. In May and June of that year numerous outages occurred, and the climax was reached one hot day in July when it was impossible to find 3 phases out of the 6 that would carry power.

As telephone lines were inoperative, it was necessary to get clearance, etc. over the Grand Trunk telegraph facilities, which were often a considerable distance from the transmission lines. All the staff was sent out on patrols to spot broken insulators. The first objective was to find 4 good discs in a string, since they would permit the line to operate. The insulators were subsequently replaced as soon as more modern types could be obtained.

The conductors on these lines were changed to 312,000 cm. A.C.-S.R. and 336,400 cm. A.C.S.R. in 1918. The joints at that time were made with twisted sleeves. In 1941, the original line from Niagara Falls to Dundas was removed. The towers were sold for scrap to help the war effort, and the conductors were used on a wood pole line to the Steep Rock Iron Mines in Northwestern Ontario. These conductors are still in use.

In 1915, the circuit from Niagara to Toronto was reinforced by the erection of another double circuit 110-kv. line, using a different type of tower (Fig. 6). This tower, known as the "AA" type (shown on the right) has the conductors in practically vertical configuration.

The conductors on this line from Niagara Falls to Dundas were 4/0 copper, strung at a maximum tension of 5,000 lbs. From Dundas to Toronto 6/0 copper conductors were specified, but copper was not available and the towers stood idle from 1915 to the end of World War I. In 1919, as the loads had increased considerably, it was decided to string 500,000 c.m. A.C.S.R. on these towers, the sags and tensions being adjusted to fit the spans.

#### Power from First Development at Queenston

In the period 1920-22, during the construction of the Queenston development, Ontario Hydro built several circuits, all 110-kv., to distribute

Fig. 5. Conductors swing in the wind.

the power generated at the development now known as Sir Adam Beck-Niagara G.S. No. 1. The first 110-kv. line connected the Queenston plant to the Hydro system at Niagara transformer station. This is a short tie-line through Niagara Falls, following the route of the 60-kv. Niagara-Lockport lines (Fig. 6). The tower was similar in design to the lines built in 1915, having a span of 550 ft. and conductors of 500,000 cm. A.C.S.R.

About this time transmission engineers were very conscious of a phenomena occurring when power conductors became coated with ice, causing the conductors to whip or "gallop" at certain periods. In many cases the loops would travel as much as 20 ft. vertically, and observers stated that one phase would be "galloping" and the others quiescent, or that all could be "galloping" at different periods of oscillation.

**Fig. 6. 60,000-volt line of O.P. Co. and 110,000-volt H.E.P.C.**

Hence, in the design of future circuits from this plant, the middle arm was given a 4 ft. off-set in an attempt to allow the conductors to pass one another when "galloping". The design and manufacture of insulators and hardware had progressed to such a degree that it was decided to increase span lengths, thereby obtaining a more economical transmission line.

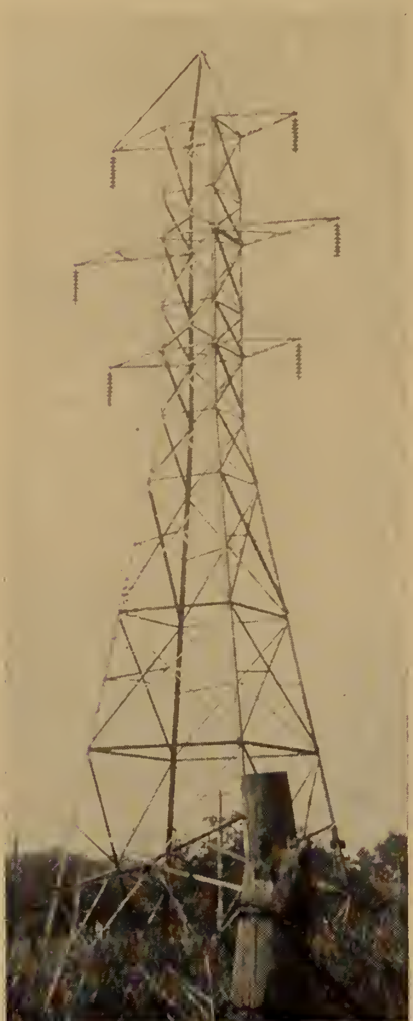

**Fig. 7. 1920 type tower.**

The "1920" type tower was developed (Fig. 7) with standard span length of 880 ft. and a conductor of 605,000 cm. A.C.S.R., under a maximum tension of 8,000 lbs. The normal load carried for this circuit was 50,000 kw.

The joints in the conductor were of the old type compressed joints, screwed together in the centre, the steel core being joined by the use of a twisted sleeve. Some of these joints have been removed but the majority are still in service.

#### Improved Clamps

As the spans were lengthened and the tension in the conductors raised, a satisfactory dead-end clamp became a problem. There were several designs on the market, most of which required the snubbing of the steel core separately. This meant the steel core would have to be removed from a certain portion of the conductor, snubbed around a snubbing post and the aluminum joined in the loops by use of parallel groove clamps or other connectors.

As difficulties had been experienced with parallel groove clamps and connectors, it was thought there would be a great advantage in having a clamp which did not require cutting the conductors at the dead-end towers. A long steel clamp was developed, with set screws on top (Fig. 8), which would develop the required tension with-

**Fig. 8. Steel dead-end clamp.**

**Fig. 9. Aluminum dead-end body.**

out snubbing the steel core, thus allowing the conductors to be continuous through the loop.

After a few years of service it was found that the conductors at the end of the clamp crystallized, and strands broke due to conductor fatigue caused by aeolian vibration. These dead-end clamps were later replaced by aluminum compression dead-end bodies, which had been developed in the interim (Fig. 9).

Over a period of years, vibration dampers had been investigated by various companies and others, but it was not until 1940, when Ontario Hydro's Research Laboratory developed the dumbbell dampers, that they were first erected on the Queenston line.

In 1929, a double circuit 110-kv. line from Queenston to St. Thomas was erected to take care of the load increase in the western section of the province. This line was designed for 1,056 ft. spans, using 605,000 c.m. A.C.S.R. conductors.

In general, it was the "1920" type tower, with an extension on the bottom to take care of the increased sag in the conductors, the tensions remaining as before at 8,000 lbs. It was found, however, that the head of this tower was not satisfactory for such long spans, consequently modern design provides more generous clearances for "galloping", etc., while retaining the same span length.

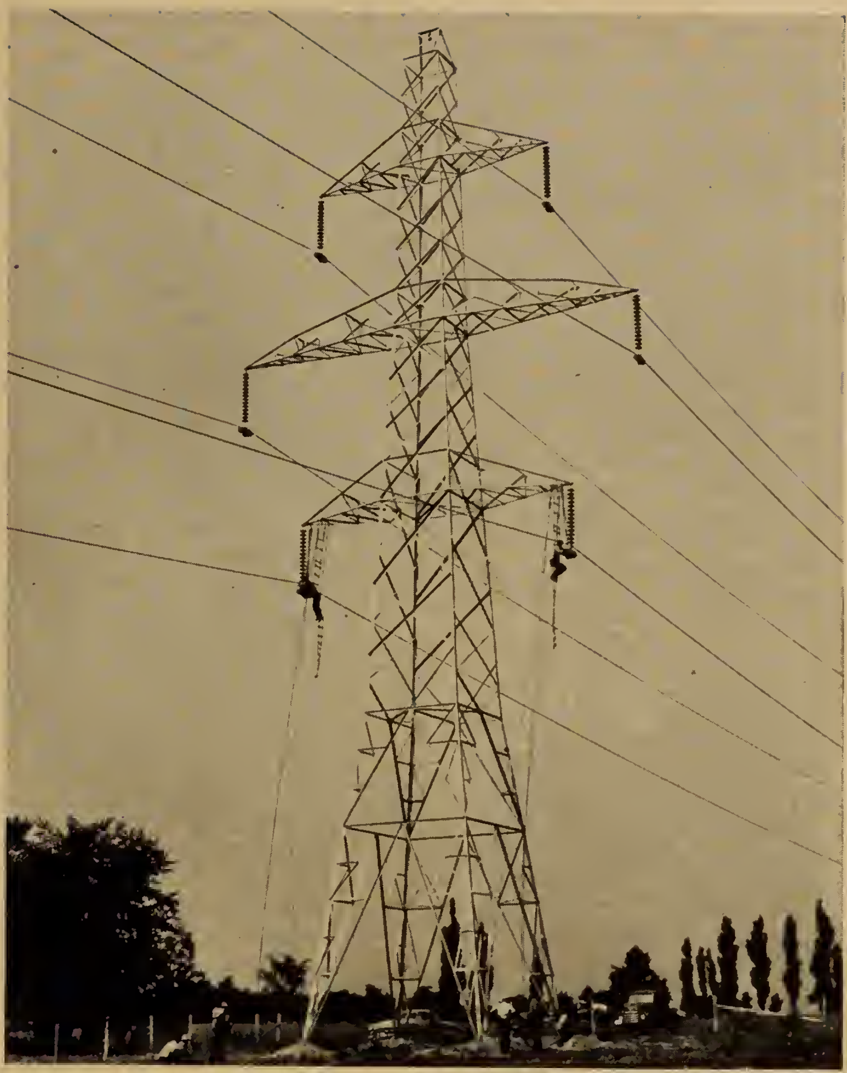

Fig. 10. 230-kv. double circuit tower.

**230,000 Volt Line from Sir Adam Beck-Niagara G.S. No. 2**

The transmission lines constructed from the Sir Adam Beck-Niagara G.S. No. 2 development will be operated at 230-kv. on double circuit towers. Five circuits will be presently erected, with an ultimate of seven. The power will be delivered by overhead lines from the powerhouse at river level to a switching structure on top, where the transmission lines will originate.

At present 3 double-circuit tower lines are under construction on a common right-of-way extending westwards from the switching station. The structures are spaced 111 ft. laterally near the plant due to congested right-of-way, and the spans decreased accordingly. The latter also gives greater ground clearances for roads crossing the right-of-way. The standard spacing is 125 ft. in open country with 1,000 ft. spans. The transmission lines extend to existing terminal stations, where the power is absorbed in the 115-kv. and 230-kv. network.

The conductors previously used on our 230-kv. lines had been standardized at 795,000 c.m. A.C.S.R. Due to the multiplicity of lines from this plant a study was made to arrive at an economical conductor size. It was found that by enlarging the conductors to 1,192,500 c.m. A.C.S.R. one circuit could be eliminated, the saving in losses paying carrying charges on the extra capital cost and also improving the voltage regulation. The larger conductors were specified, the normal load being of the order of 200,000 kw. The maximum conductor tension is 15,000 lbs. with a loading of ½ in. of ice and 8 lbs. of wind on the conductors.

The towers used on four of these circuits are similar to the 275-kv. line of the British grid (Fig. 10), with a slight revision in weight due to the extension of the middle arm to allow for movement of conductors under sleet conditions. The towers were designed and manufactured in England.

Whereas towers in this country are ordinarily made up of structural variety carbon steel (CSA Spec. G.40.4), these towers contain about 40 per cent of high tensile steel, thereby reducing the over-all weight by a considerable amount. The structure was designed for concrete footings, which have been slightly modified to fit our conditions. Footing resistances have been reduced below 25 ohms by the driving of ground rods in the bottom of the excavation, the ground rod being connected to the tower leg by a copper conductor.

It is interesting to note the design loads of the various transmission lines. The lines built in 1910 were designed to carry about 20,000 kw., the 1922 lines 50,000 kw.; and the 1953 lines 200,000 kw., or a tenfold increase, thus showing clearly the advances made in the design of transmission lines over a period of years.

# Discussion

**H. F. Beique, M.E.I.C.**[1]

I was particularly interested in noting that as far back as 1898, standards were already established in the electrical industry.

The establishment of these standards so far back has certainly not prevented progress in the industry. This is an excellent answer to those who nowadays oppose the establishment of standards on the grounds that they may delay progress.

Mr. Sproule has shown, I think, that a good many of the original transmission lines built in the early days are still useful; most of them have been modified, and the very early ones have become, in nearly every case, part of the distribution system.

The one transmission line device of the early days that did not seem to perform as well as the supports and the conductors, was the insulator. It is a fact that insulators on nearly all early transmission lines had to be replaced at one time or other due to weaknesses. We, of the electrical industry, should be grateful to the manufacturers for having fully overcome this very serious shortcoming.

The three double circuit tower lines issuing from the Sir Adam Beck No. 2 Station and now under construction, are quite modern in their design.

The conductors of 1,192,500-cir. mil. are certainly unusual in size. The use of high tensile steel to the amount of 40 per cent in these towers, to reduce overall weight, is certainly something quite new in this country. It will be interesting to watch the effect of strain and low temperatures on these members.

I imagine that this type of steel has been used in Europe under conditions corresponding to those met here.

While listening to Mr. Sproule's description of the evolution of transmission methods in Ontario, I could not refrain from recalling parallel developments in the Province of Quebec. The speaker will forgive me for bringing them out as he still has, I am sure, much interest in this province where he has built so many transmission lines.

Here in Quebec City, Mgr. Laflamme, professor of physics at the Séminaire de Québec, had been conducting electrical experiments since 1875. He managed to generate electricity by means of a steam engine and an Edison dynamo in Delisle's printing shop, located where to-day we see Laval's Monument, opposite the Post Office, just outside this building. He had copper wires strung from this shop to the University Promotion Hall and during a conference on March 1, 1884, he demonstrated the superiority of electric lighting over gas lighting which was then in use. This experiment proved also the feasibility of transporting this electric energy at some distance, and to the audience filling the hall, he predicted the hydraulic future of Montmorency and Chaudiere Falls.

As can be seen, Quebec was not far behind since the first hydro electric station in North America was installed in Appleton, Wisconsin, in the year 1882.

This very same year in which Mgr. Laflamme demonstrated the electric light, Quebec streets were lighted by means of arc lamps fed from steam units located in the Military Barracks, near St. John's Gate.

The following year, the first development at Montmorency Falls was started and in October 1887, electric energy was transmitted to Quebec for street arc lighting. In 1889, two 100-kva. generators of 1,000 volts, 130 cycles, single phase, were installed and power transmitted direct to Quebec City to light Quebec homes at 52 volts.

From 1893 to 1895, a new power house was built (to-day's location) and three 500-kw., 5,500-volt, 2-phase, generators were installed. They marked the start of 24-hour service. This was, at the time, the highest generating voltage on the continent.

In 1895 also, there was energized between St. Narcisse Power House and the City of Three Rivers, the first high voltage transmission line in Canada and in the British Empire. This line was 17 miles in length, carried a total of 1,200 h.p., at a voltage of 11,000 volts. It is from the copper conductor of this line that the CEA resuscitation medals are made.

In 1903, two transmission lines, 86 miles in length operating at a voltage of 50,000 volts were placed in service between Shawinigan Falls and Montreal, this distance and voltage being the highest in North America at the time.

Throughout this period, electrical engineers in Canada, the United States and many other countries, have been from the very start pushing back the frontiers of knowledge and creating new achievements on this vital problem of transmitting electrical energy from the generating plant to the user of electricity.

This is still true to-day. As we have seen from Mr. Sproule's remarks, new things are constantly being tried. Another good example of this, is the Bersimis project.

Great strides are being made in Europe, particularly so in Sweden, and there is no reason why this will not go on as long as our civilization is in progress.

Quebec province, being particularly gifted with hydro electric sites, is vitally interested in the problems of transmission due to the remoteness of the remaining sites. In the Province of Ontario, it is reasonable to believe that 220 kv. will be sufficient for many years, whereas here, already in the fall of 1956, the Bersimis lines will be put into service at 287 kv.

There seems to be no doubt that in all probability, we will see transmission lines at still higher voltages within many years.

Following the frequency change from 25 to 60 cycles in Ontario, one can well imagine that their high-voltage network system will be solidly interconnected with the one existing in this province, thus giving a power pool extending from Detroit on the Great Lakes to Bersimis and Gaspe on the Lower St. Lawrence; no doubt, to become one of the world's outstanding achievements towards the reliability and cheapness of electric power.

[1]General Superintendent, Power Division, Quebec Power Company.

**A. S. Runciman**[2]

It is interesting to note that poles were protected from lightning and power follow-up by galvanized iron barbed wire on the earliest constructed long lines. Pole grounding was adopted early by the Shawinigan Water and Power Company. The only alterations over the years have been the introduction of a tube in the ground lead which sets up hot air pressure when a flash occurs which assists in reducing the amount of follow-up current, even at times putting the arc to ground out without clearing the line. Some 18,000 of these tube grounded poles are in service—at the present time with no

**Theory of the Column Formula**

In the "theory of strength" the column problem has been attacked from many angles. For the most part the formulas derived and the theories expounded have been of little value to the design engineer. The beam-column, i.e., a column carrying transverse as well as axial loads, responds even less easily to mathematical treatment. In the field of design, various codes have set up empirical formulas, which the average engineer generally uses.

In March, 1941, *The Engineering Journal* published a paper entitled "Columns Subjected to Uniformly Distributed Transverse Loads," by Prof. J. A. Van den Broek, of the University of Michigan. This paper presents a simple, rational approach to the problem and establishes a highly practical design formula, based on the assumption that a column with uniformly distributed transverse loads has an elastic curve closely approximating a sine curve.

If $L$ is the length of the column, $\Delta$ is the transverse deflection at the centre, and the other symbols have the values assigned to them in Table I:

$$y = -\Delta \sin\frac{\pi x}{L} \quad . \quad . \quad . \quad . \quad . \quad (1)$$

Thus the moment:

$$M = P\left(\Delta \sin\frac{\pi x}{L}\right) + \frac{kwL}{2}x - \frac{kw}{2}x^2 \quad . \quad . \quad . \quad (2)$$

By elastic energy:

> In March, 1941, we published Columns Subject to Uniformly Distributed Transverse Loads, by Prof. J. A. Van den Broek, of the University of Michigan, in which the author derived a formula for such columns from purely theoretical considerations. In this paper, Mr. Paris describes experimental work which he has carried out and which proves that Prof. Van den Broek's formula is correct, and suggests means whereby it can be used in cases where the transverse loads are not uniformly distributed.

$$F\Delta = \int \frac{m\,M\,ds}{EI} \quad . \quad . \quad . \quad . \quad (3)$$

or

$$\left(EI - \frac{PL^2}{\pi^2}\right)\Delta = \frac{5}{384}kwL^4 \quad (4)$$

and the bending stress at the centre:

$$S = Ec\left(\frac{d^2y}{dx^2}\right) max. \quad . \quad . \quad . \quad . \quad (5)$$

$$= \frac{Ec\pi^2\Delta}{L^2} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (6)$$

with the elastic-limit stress at the centre:

$$S_1 = \frac{Ec\,\pi^2\,\Delta}{L^2} + \frac{P_1}{A} \quad . \quad . \quad . \quad (7)$$

Solving (4) and (7) for $P = P_l$ when $S = S_l$; and eliminating $\Delta$

$$P_1 = \frac{1}{2}\left[S_1A + P_{cr} - \sqrt{(S_1A - P_{cr})^2 + 5.0734\,kwEcA}\right] \quad . \quad . \quad . \quad . \quad . \quad (8)$$

which is Van den Broek's "Formula II".

From Formula II it is evident that, given the dimensions of the member, the properties of the material, and the transverse loading, the limit-elastic axial load may be easily computed.

**Table I: Symbols**

| | |
|---|---|
| $A$ | Cross-sectional area of the column. |
| $a$ | Distance from the pin end of the column to a concentrated transverse load. |
| $c$ | Distance from the centroidal axis to the extreme fiber of the cross section. |
| $E$ | Modulus of elasticity. |
| $e$ | Maximum strain, at the centre of the specimen. |
| $I$ | Moment of inertia. |
| $i$ | Radius of gyration. |
| $kw$ | Uniformly distributed transverse load. |
| $L$ | Length of column. |
| $M$ | Bending moment. |
| $P$ | Axial load. |
| $P_1$ | Axial load, in addition to transverse load, which induces elastic limit stress, $S_1$, in column. |
| $P_{cr}$ | Euler's load $P_{cr} = \frac{\pi^2 EI}{L^2}$ |
| $Q$ | A concentrated transverse load. |
| $Q_y$ | The maximum $Q$ that a column will support elastically with no axial load. |

$r$ Radius of the cylindrical heads.

$S_1$ Elastic limit stress in compression.

$x$ Co-ordinate length parallel to the length of a specimen.

$y$ Ordinate length transverse to the specimen.

$a$ $Q/Q_y$.

$\Delta$ Transverse deflection at the centre of the column.

Comparison with other methods of design with comparable accuracy shows the applicability of (8). The classical differential equations method yields a solution containing transcendental terms which must be solved by trial and error. Thus, ease of computation proves (8) to be readily applicable to design.

### Testing Theory

To obtain accuracy in testing, the rule to bear in mind is, in essence "simplicity". The most difficult problem in the testing of a beam column is to achieve simplicity in the loading apparatus. Second in difficulty is the problem of gauging.

Application of a uniformly distributed transverse load in unit form presented so many complications that the author rejected it and resorted to the device of applying two concentrated loads to achieve the same end. The axial loading was attained directly by mounting the ends of the specimen in hemi-cylinders (Fig. 1). By allowing accurately machined cylinders to roll freely on carefully ground, parallel surface plates, the axial load may be applied by moving the plates toward one another; the fact that no eccentricity is introduced when the cylinders roll is the outstanding characteristic of this method. This idea stems directly from the work of Van den Broek and his use of hemi-spherical heads for column testing. (See the "Evaluation of Aeroplane Metals", *Engineering Journal*, July, 1945.)

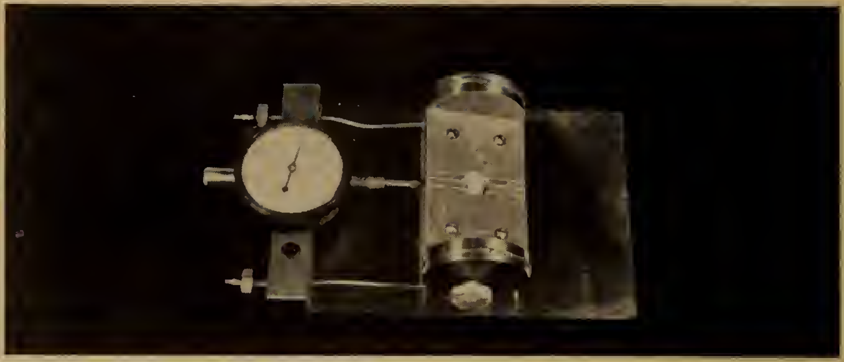

Fig. 1. Cylindrical test head used to attain a "pin-ended column" condition. Note cables used to transmit the reactions of the transverse loads.

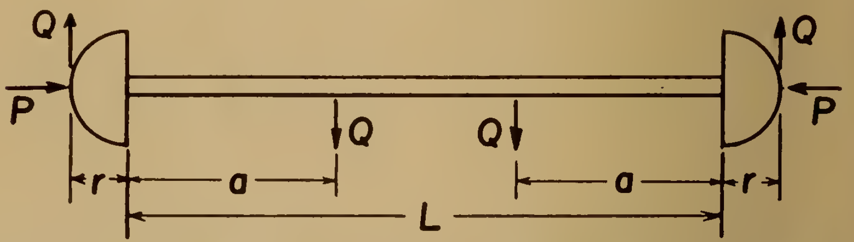

Fig. 2. Loading condition used to simulate a pin-ended column with uniformly distributed transverse loading.

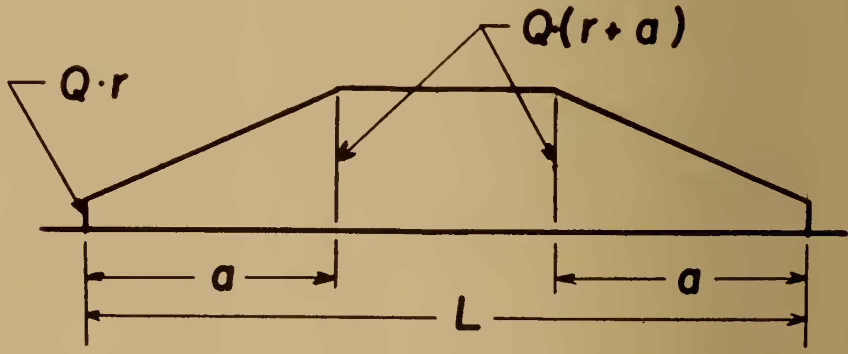

Fig. 3. Moment diagram for the transverse loading used in the tests.

#### *Application of transverse loading*

Since a uniformly distributed transverse load is symmetrical about the centre of the column, the two concentrated loads should be equal and be placed equidistant from their respective ends of the specimen. Applying these loads causes equal and opposite reactions between the heads and surface plates (Fig. 2).

There are two independent variables to consider in the application of this loading to a specimen. These variables are the load, $Q$, and the distance $a$. Having two variables, it is possible to satisfy two conditions. The conditions chosen were: (1) the moment at the centre should be the same as the moment of the simulated uniformly distributed load, and (2) the deflection at the centre should likewise be the same as the deflection produced by the simulated loading. The reason for this choice is that the centre is the cross section of attainment of elastic limit stress. The moment and the deflection at the centre are the controlling factors in this stress.

#### *Computing the values of a to be used*

Setting the moments at the centre of the beam equal:

$$M = Q(r + a) = \frac{kwL^2}{8} \quad . \quad . \quad (9)$$

or

$$Q = \frac{kwL^2}{8(r + a)} \quad . \quad . \quad . \quad . \quad . \quad . \quad (10)$$

Setting the deflections equal:

$$\Delta = \frac{Q}{EI}\left[\frac{rL^2}{8} + \frac{L^2a}{8} - \frac{a^3}{6}\right]$$

$$= \frac{5}{384}\frac{kwL^4}{EI} \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (11)$$

Substituting (10) into (11):

$$\frac{5}{384}\frac{kwL^4}{EI} = \frac{kwL^2}{8(a+r)EI}\left[\frac{rL^2}{8} + \frac{L^2a}{8} - \frac{a^3}{6}\right] \quad . \; . \; . \quad (12)$$

Solving (12) in terms of $a$ and $L$:

$$a^3 - \frac{L^2}{8}a - \frac{L^2}{8}r = 0 \quad . \; . \quad (13)$$

Given the length of the specimen and using a radius of one inch in the cylinders, $a$ can be computed for that length from (13). Knowing $a$ the proper load, $Q$, can then be computed from (10).

If one compares the properties of this loading with uniform loading, an elastic curve diagram shows the difference between the two elastic curves to be inconsiderable. Since the elastic curve for this loading is a good approximation and the moment and the deflection at the centre are defined to be exactly the same as in the case of a uniformly distributed transverse loading, a simple approximation of a complex loading has been successfully attained.

### *Gauging*

Little gauging was actually necessary to get the required data. The necessary requirements are fulfilled by knowing:

(a) The geometry of the system.
(b) The loads, transverse and axial.
(c) The stress at the centre of the specimen on the compression side.

These points are best brought out in the general procedure of running a test on a specimen. The transverse loads are applied first to simulate a particular uniformly distributed transverse load. Then the axial load is applied and increased until the stress at the centre of the column reaches the elastic limit stress. The axial load is then read, as it is the value, $P$, for the corresponding value, $kw$, in (8). By this method the author has tested a series of specimens of various lengths in order to check the Van den Broek beam-column formula. Thus, in the following data, the most accurately and most carefully found values will be those which are directly connected with this procedure.

The only other data included in this report are the transverse deflections of the centre of the column. The important point is that knowing this quantity and the loads, the stress at the centre of the column may be computed and used as a check on the strain indicator readings. The data may also be used to check the restraint in the testing heads. Neither of the computations has as yet seemed necessary, so they have been left out of this paper.

### Procedural Methods and Equipment

For the most part, the equipment used in tests on beam-columns must necessarily be somewhat specialized. The author was thus faced with the problem of building the necessary equipment. The choice of equipment was limited by many factors, so that accurate data might be gathered over a great range of lengths of specimens. The equipment chosen also defines the possible procedural methods of testing. Consequently, many ideas aiming at ease in construction were rejected in favour of those which attained simplicity in the procedure of testing.

The heads and surface plates were given first consideration in equipment design. Since the specimens to be tested were 5/16-inch square bar stock varying from 5 inches to 18 inches ($L/i = 55$ to 200) in length, the hemi-cylindrical heads were built from 2-inch diameter cold-rolled steel. The determining factors in this choice stemmed from a desire to avoid errors in axial load due to the weight of the upper head, approximately 2 pounds, and to provide for a rational solution of the equation involving $a$, $L$ and $r$. It should be noted in (13) that if $r$ is relatively large and $L$ becomes sufficiently small, the values of $a$ become imaginary. $2a$ must be less than or equal to $L$, and $a$ greater than zero to have a physically possible system. The length of the head cylinders was chosen at 4 inches in order that, under the highest axial loads (3,900 pounds), the deformation in the heads would be small enough to allow the heads to roll freely. As a further aid to freedom in rolling, the heads and surface plates were ground to within a ± .0002-inch tolerance. The 4-inch length of the heads was also sufficient to aid in ease of their alignment on the surface plates.

Next, the balancing of the transverse loads between the heads and surface plates was considered. It was decided to use 1/16-inch aircraft cables stretched between the end block on the surface plates to the heads. A groove was cut in the heads so that the cable could lie between the heads and the surface plates without impairing the rolling freedom of the heads. This feature made it possible to apply the transverse loads without applying any axial load, an important point in getting correct zeros during testing. A total of four of these cables was used, one to each end of each of the heads (Fig. 1).

The upper surface plate was then bolted to the machine and shimmed so that the ground surfaces of the plates were parallel. The bottom was not firmly attached, but fastened in place with one peg. This peg was ample to support the shear between the surface plate and the machine, but left the plate free to rotate. This arrangement eliminated the possibility of torsion in the specimens during tests. A slot 1/2-inch deep and exactly 5/16-inch wide was milled lengthwise in the centre of the head. Jaws were mounted in this slot which held the specimens in place. This proved a satisfactory arrangement. The jaws held the specimen from buckling sideways and the slot insured against eccentricities in the axial loads. The heads functioned properly throughout the tests. The only possible criticism is that the cables stretched slightly upon application of the transverse loads.

The next problem faced was the application of the transverse loads. Through a simple pair of clamps, using pointed thumb screws for bearing surfaces, the load was applied to points on the specimen which were centre punched to insure against slippage. These punch marks were on the longitudinal centre line of the specimen at a distance $a$ from each end. Cables were attached to the clamps and were run over ball-bearing sheaves. Calibrated weights were applied thereon to produce any desired transverse loading (Fig. 4). This rig functioned properly throughout the tests; errors due to it were found to be negligible.

An SR-4 strain gauge was used to measure the strain at the centre of the specimen (Fig. 5). This type of gauge proved its worth in convenience and accuracy of operation. Dial gauges, reading to 0.001-inch, were used to measure the transverse deflections and roll of the heads. A 0.0001-inch dial gauge was used to measure axial deflections. These dial gauges proved to be of insufficient reliability to warrant their use for anything but a rough check of other data.

### *General Procedure*

1. The specimens were placed on a surface plate to be checked for direction of buckling, due to initial curvature. This prediction of buckling direction aided in making the test with zero transverse loads,

because, in order to check the maximum compressive strain and have the dial gauges function correctly, the column had to buckle away from the gauges. In all specimens this buckling was correctly predetermined.

2. After applying the strain gauge and making the punch marks, the specimen was placed in the heads and aligned. This aligning included a three-dimensional check of all parts directly connected to the specimen. An axial load of approximately 500 pounds was then applied to insure the proper seating of the specimen in the head.

3. The loading crosshead of the testing machine was then raised so that the axial load was assuredly zero and the zero strain reading was taken. Axial load was then applied until it was just indicated by the movement of the SR-4 strain gauge. At this point all gauges were set at zero. The transverse loads were then added and the loading scale of the testing machine set at zero to account for them.

4. Axial load was then applied until the elastic limit stress was attained. At this time all gauges and loads were read and recorded.

5. All loads were removed and all gauges were again read to check the zeros.

This completed the test run for a single point shown on Fig. 6.

**Data**

The purpose in the taking of these data was to check the Van den Broek beam-column formula. For this one would need data over a large range of $L/i$ values and for a representative number of transverse loadings for each $L/i$ chosen. Also preferable would be the choice of some parameter such that these points would form curves on an axial load *vs* $L/i$ plot.

If $Q_y$ is the maximum transverse load which a single specimen can carry with zero axial load, and $Q$ is the transverse load to be applied, then let $\alpha$ be defined as the ratio of the two, or $Q/Q_y$. As an example, for a specimen 10 inches long, the maximum allowable transverse load was found to be 39.35 pounds, or $Q_y = 39.35$. Now, to choose the transverse loads to be applied to the specimen:

$$\text{If } \alpha = \frac{Q}{Q_y} = \frac{Q}{39.35} \quad \ldots\ldots \quad (14)$$

$$\text{Then } Q = 39.35\,\alpha \quad (\alpha = 0, \tfrac{1}{4}, \tfrac{1}{2}, \tfrac{3}{4}, 1) \quad . \quad (15)$$

These values of $\alpha$ were chosen to give a representative spread of points.

Equation (15) can now be solved for the five values of $Q$ at which the specimen should be tested. Using these same representative $\alpha$'s in the computation of the $Q$'s to be used for each specimen, one finds each $\alpha$ value defines a curve on an axial load *vs* $L/i$ plot. This was the method used in plotting Fig. 6.

***The $\alpha = 0$ curve, or $P_{cr}$ values***

In the checking of the Van den Broek beam-column formula one is actually interested in checking this formula for values of $\alpha$ not zero. In setting up the test method used, a positive check on geometric values and equipment would be advantageous. In this experiment this is

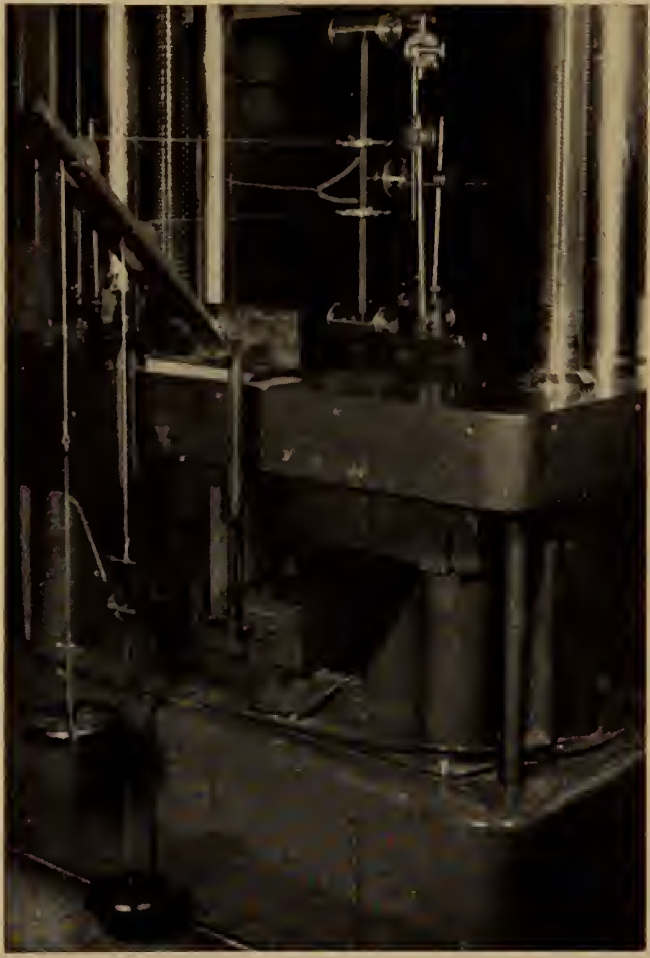

**Fig. 4. View of the test set-up showing the dead weight application of transverse loads.**

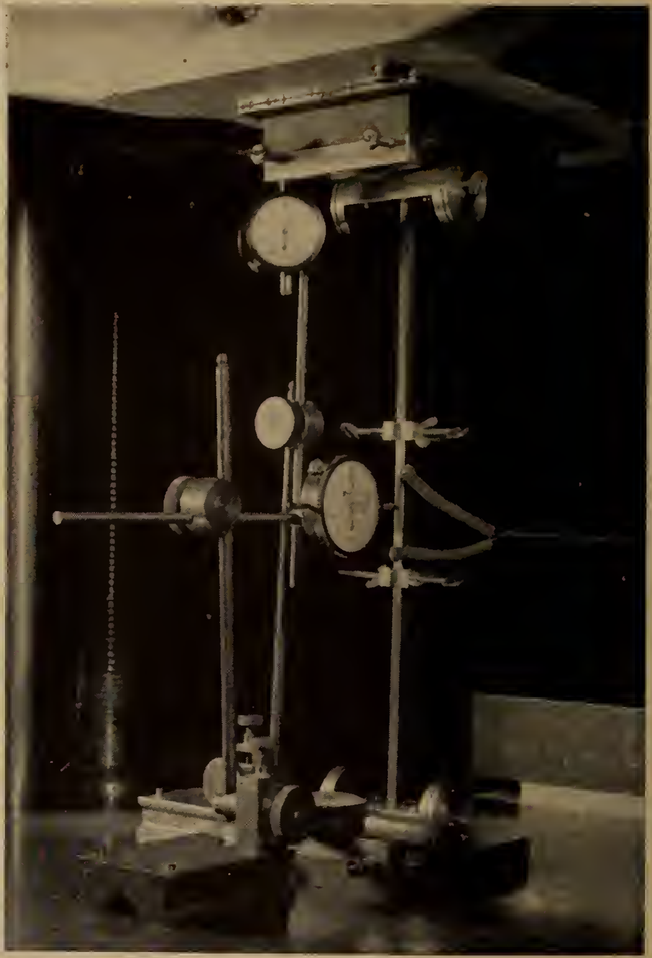

**Fig. 5. Specimen, heads, and gauging, ready to run a test.**

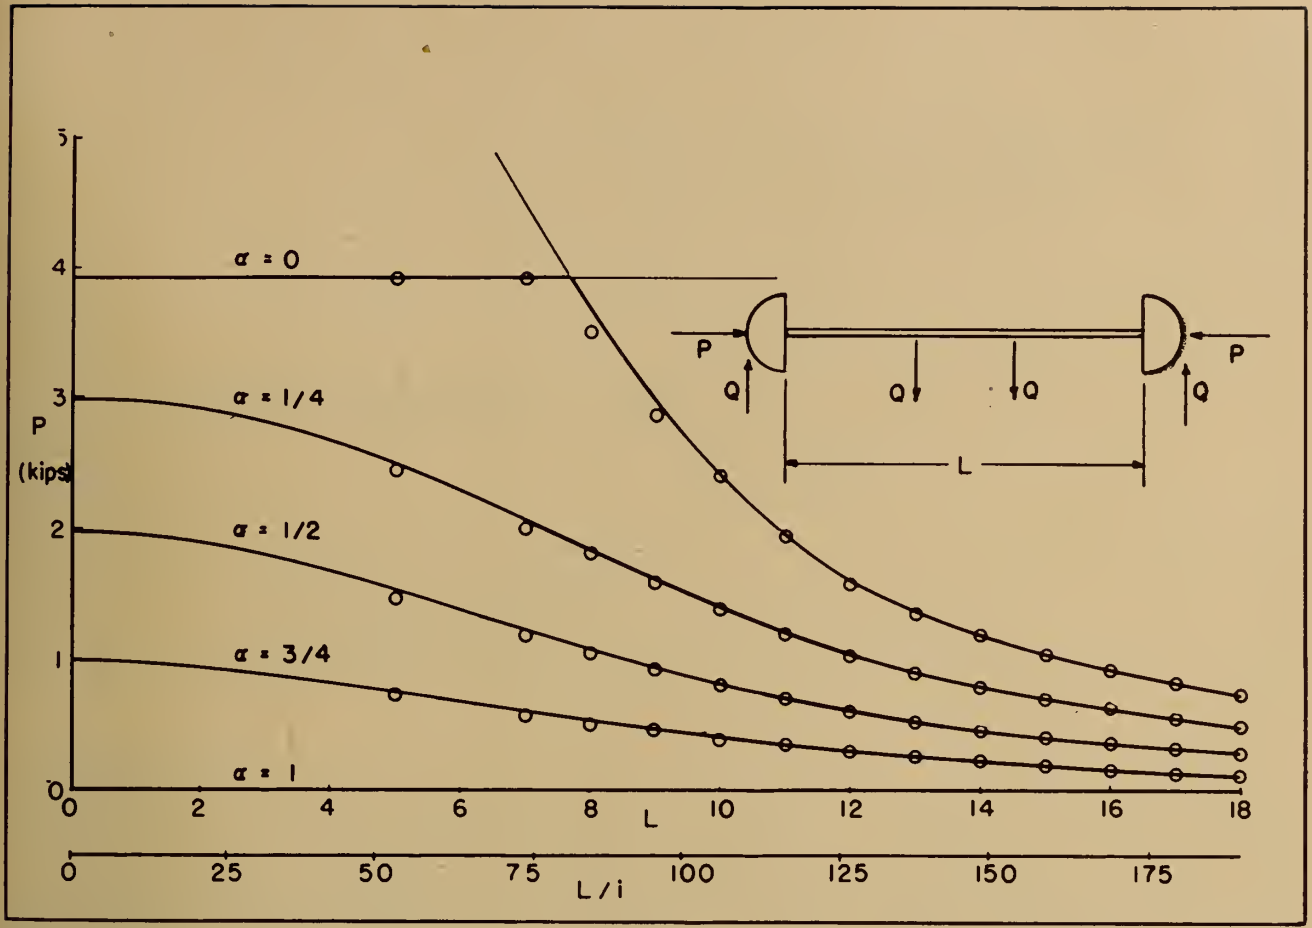

**Fig. 6.** **Beam-column curves (theoretical curves and experimental points) on 5/16″ sq. steel bars. Test data plotted to show close correlation with Van den Broek's formula. Note comparison with Euler's curve (α—0) as an indication of the attainment of pin ends and alignment.**

possible by merely checking each specimen for maximum axial load at $a = 0$, i.e., at no transverse loading. It can be readily seen that since Euler's loads, or the crushing loads, are the most critical values attainable in column tests, the errors in the maximum axial load attainable for any one specimen would be greater at $a = 0$ than for any other value of $a$. Thus, for any specimen one may check the maximum error due to a crooked specimen or alignment errors simply by looking at $a = 0$ in Fig. 6. The theoretical values of this point have already been well established as proven theory. These points have been included in the plot for this reason and show a good and simple check of the set-up used.

### Discussion of Errors

#### *Theory*

The Van den Broek beam-column formula has been shown to be in error only so much as the assumption of a sinusoidal elastic curve contributes to error. This error is shown to be negligible in Van den Broek's discussion of errors in his paper in *The Engineering Journal* of March, 1941. The purpose of this paper is to show it to be negligible by experimental data. Yet, Fig. 6 shows small errors between theoretical and experimental values from $L/i = 55$ to $L/i = 115$.

It may be noted that as the $L/i$ values become smaller, the error increases. As the length becomes smaller, the ratio of $r$, the radius of the head, to $a$ becomes increasingly larger. Most of the error in the simulated elastic curve is due to the $rQ$ end moment on the specimen; therefore, the error in the elastic curve is larger for low $L/i$'s. The author has computed a few of these errors due to simulated loading for the shorter specimens and has found that these errors would account for the errors shown in Fig. 6. This indicates that the errors shown in the figure are not errors in the Van den Broek formula, but errors in testing.

### Conclusions

The results of the tests, as well as Van den Broek's own analysis of the theory in his paper, show the errors of his beam-column formula to be small enough to be negligible in design. Its practicability, as compared to the usual or classic formulas, has been shown in his paper and in this work.

Here a method suggests itself whereby a design engineer might use this formula for transverse loadings other than uniform. A simple example is a beam-column with a concentrated load at its centre. By assuming the elastic curve to be sinusoidal, an analysis might be made to find an equivalent uniformly distributed transverse load. A set of tables might easily be made to give such equivalent loadings for many different actual loadings. These equivalent loads could be substituted in Van den Broek's formula to obtain results accurate within a few percent. Present design formulas often show a far greater range of error because of their empirical form.

### Acknowledgments

The author gratefully acknowledges his indebtedness to Prof. J. A. Van den Broek for proposing the problem and for his suggestions as to testing procedure, to my wife for her aid in the preparation of the manuscript, and to Mr. Milo Kaufman for assistance in constructing test equipment. √

# Underwater TV and Its Application

*by*
Captain H. R. Smyth
*Supervisor, Trials and Operations,*
*Radio and Electrical Engineering Division*
*National Research Council, Ottawa*

This paper, presented before the 68th Annual Meeting of the Engineering Institute of Canada, at Quebec, describes the development and trials of equipment which has been pioneering a new field in the application of a wired television system. It has provided a means of extending the vision of scientific personnel aboard a surface vessel, into the region below the surface, previously accessible only to trained divers. The main advantages of this device lie in its freedom from human limitations.

In the past, extensive use has been made of underwater photography. This has been accomplished by providing a diver with a camera to record the progress of underwater operations; by lowering cameras to inaccessible spots for recording; or by using cameras in a bathysphere.

In each of these cases, it was necessary to use divers, without whom there would be no guarantee that the views obtained would be satisfactory or useful. After the pictures were developed, it would be difficult to return to the exact spot for further views of importance. With an underwater television camera, however, the view in front of the camera is immediately available on the viewing screen on a surface craft. A continuous watch can be kept on any interesting subject, and the television screen may be photographed.

It is true that the quality of the picture suffers in transmission over the TV link, but improvement in the circuitry is resulting in better displays. We still suffer from line structure in the picture, and are considering the use of a camera attachment on the underwater unit, for use if better definition is desired.

The project was started in the fall of 1949 in the radio and electrical engineering division of the National Research Council. Although it was known that similar attempts had been made by the Americans to submerge a television camera at the Bikini atom bomb trials, information was not available as to the results. During the period of test of our unit, a British unit was used to identify the "Affray", a submarine that was lost at sea.

Due to pressure of other projects the underwater television program was given a low priority, and only one engineer and one technician were assigned to the development work. Design details for the camera casing were carried out by the mechanical design section and the drafting office. Practically all of the mechanical work was done in the sheet metal and machine shops of the division.

### Operating Principles of TV

A complete television system for the reproduction of optical images is referred to as a "chain". One of the most important links of this chain is the camera "head". In the head is located the camera tube or image orthicon. The heart of the whole system of wired television is the image orthicon camera tube.

The type 5820 was chosen for its very stable performance at all incident light levels on the object being televised, ranging from bright sunlight (several thousand foot-candles, to a deep shadow of 1 foot-candle or less). Commercially acceptable pictures can be obtained at incident light levels greater than about 10 foot-candles.

The photo-cathode used in this tube has a spectral response of high blue and green sensitivity, and good yellow and red sensitivity, with no response to infrared. The orthicon has three main sections, an image section, a scanning section and a multiplier section.

### Image Section

The image section contains a semi-transparent photo-cathode on the inside of the face plate, a grid to provide an electrostatic accelerating field, and a target which consists of a thin glass disc, with a fine mesh screen closely spaced to it on the photo-cathode side. Focussing is accomplished by means of a magnetic field produced by an external coil, and by varying the photo-cathode voltage.

Light from the scene being televised is picked up by an optical lens system, and focussed on the photo-cathode. This cathode emits electrons from each illuminated area in proportion to the intensity of the light striking the area. The streams of electrons are focussed on the target by the magnetic and accelerating fields.

On striking the target, the electrons cause secondary electrons to be emitted by the glass. The secondaries thus emitted are collected by the adjacent mesh screen, which is held at a definite potential of about 2 volts with respect to target voltage cutoff. Therefore, the potential of the glass disc is limited for all values of light and stable operation is achieved.

Emission of the secondaries leaves on the photo-cathode side of the glass a pattern of positive charges, which corresponds with the pattern of light from the scene being televised. Because of the thinness of the glass, the charges set up a similar potential pattern on the opposite or scanned side of the glass.

#### Scanning Section

The opposite side of the glass is scanned by a low-velocity electron beam produced by the electron gun in the scanning section. This gun contains a thermionic cathode, a control grid (grid No. 1) and an accelerating grid (grid No. 2). The beam is focussed at the target by the magnetic field of the external focussing coil and the electrostatic field of grid No. 4.

Grid No. 5 serves to adjust the shape of the decelerating field between grid No. 4 and the target, in order to obtain uniform landing of electrons over the entire target area. The electrons stop their forward motion at the surface of the glass. They are turned back and focussed into a five-stage signal multiplier, except when they approach the positively charged portions of the pattern on the glass.

When this condition occurs they are deposited from the scanning beam in quantities sufficient to neutralize the potential pattern on the glass. Such deposition leaves the glass with a negative charge on the scanned side and a positive charge on the photo-cathode side. These charges will neutralize each other by conductivity through the glass in less than the time of one frame.

Alignment of the beam from the gun is accomplished by a transverse magnetic field produced by an external coil located at the gun end of the focussing coil. Deflection of the beam is accomplished by transverse magnetic fields produced by external deflecting coils. The electrons turned back at the target form the return beam. This beam has been amplitude modulated by absorption of electrons at the target in accord with the charge pattern. The more positive areas of the charge pattern correspond to the highlights of the televised scene.

In order to scan the photo target in an orderly fashion, the pencil beam of electrons issuing from the fixed gun is deflected by electromagnetic "sweep" coils. This causes the free end to cross the target area in a series of horizontal lines, termed a "raster". In "interlaced scanning", two complete coverages of the screen are effected so that one raster or "field" lies in the dark spaces between the lines of the preceding field. This completes what is termed a "frame".

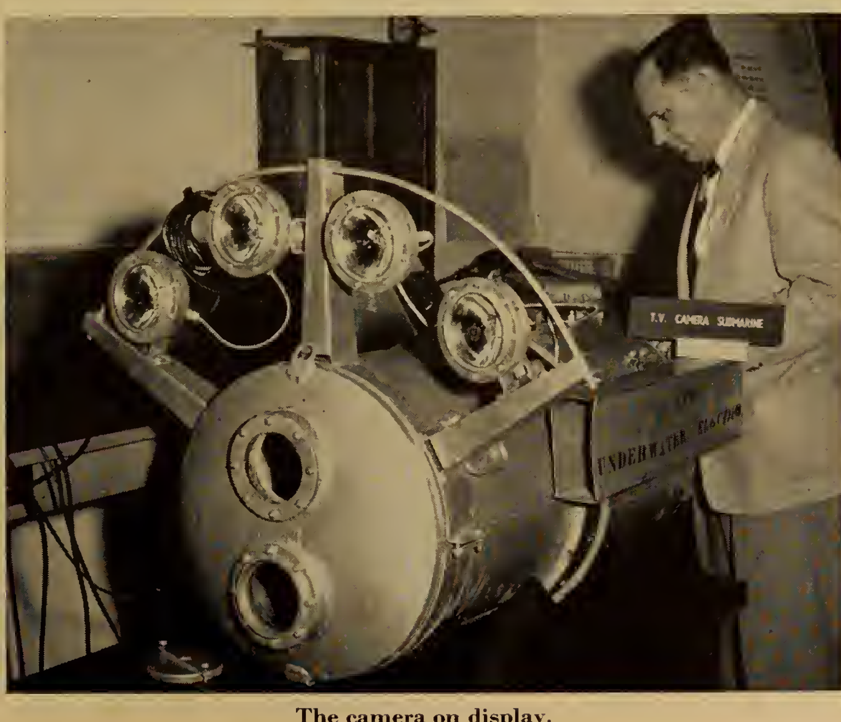
The process is "timed" in practice by electronic counters. These ensure that there are two hundred and sixty-two and one-half lines in one field, and exactly twice this number, i.e. 525 lines in one frame. The accurate timing of each line and each field by a short-duration synchronizing pulse, produces a stable picture. It is also necessary in TV systems to synchronize the sweeps to the primary power source, to prevent spurious shading effects in the picture. The television chain used underwater differs from studio equipment, principally in design of the camera.

The camera tube must be remotely operated from the control equipment over a much longer cable than had previously been attempted. This was complicated by the fact that, since the camera is housed in a casing, not easily opened for servicing, the circuits not essential to it were also placed at the remote position. Remote controls must be supplied over a common cable with the wires for the image orthicon without interfering with the televised picture. A stable counting and following circuit is also necessary to allow for wide frequency variations common to small sixty cycle motor-generator power supplies.

#### Multiplier Section

The return beam is directed to the first dynode of a five-stage electrostatically focussed multiplier. This utilizes the phenomenon of secondary emission to amplify signals composed of electron beams. The electrons in the beam impinging on the first dynode surface produce many other electrons, the number depending on the energy of the impinging electrons. These secondary electrons are then directed to the second dynode and knock out more new electrons. Grid No. 3 facilitates a more complete collection by dynode No. 2 of the secondaries from dynode No. 1.

The multiplying process is repeated in each successive stage, with an ever-increasing stream of electrons, until those emitted by dynode No. 5 are collected by the anode and constitute the current



The camera on display.

The camera in lowering position.

utilized in the output circuit. The multiplier section amplifies the modulated beam about 500 times. The multiplication so obtained increases the signal-to-noise ratio of the tube, and also permits the use of an amplifier with fewer stages.

It can be seen that when the beam moves from a less positive portion, the signal output voltage across the load resistor changes in the positive direction. Hence, for highlights in the scene, the grid of the first video-amplifier stage swings in the positive direction.

#### Description of TV Equipment

The main control unit provides blanking and synchronizing pulses for the system, together with an intermediate video amplifier for picture signals, and sweep currents for the deflection yoke of the image orthicon tube. The front panel is provided with controls for adjusting the electronic and optical focus of the pickup camera. Two meters indicate the focal position and aperture setting of the optical lens. Push-button selection of either a two-inch or a five-inch focal length lens is available on this panel.

A small steering unit is provided, with three-position switch handles that operate electric motors to direct and move the submerged camera. There are two display units, which contain a final video amplifier, a horizontal and vertical sweep generator, and a television cathode-ray tube. The smaller unit provides a picture three by four inches in size, and is used solely for making photographic records on sixteen-millimeter movie film.

The image on the screen is similar to a photographic "negative", so that when the recording film is put through a simple development process, it is available immediately for positive projection. The recording camera was designed so that its frames were synchronized with those on the TV screen, in such a way as to provide uninterrupted movie pictures. The size of the larger TV picture is six by eight inches, and is used for visual observations.

The camera head is a unit which measures approximately 6 by 6 by 20 inches. It contains a video preamplifier, three small electric motors, a number of electronic components and the image orthicon tube. A cylindrical drum was constructed to house and direct the camera when it is lowered into the water. The drum is built of one-eighth sheet steel, and is three feet long and eighteen inches in diameter. The longitudinal axis normally lies in a horizontal position.

The camera is mounted in a fixed position near the bottom of the drum, so that it can look through a glass port four inches in diameter in the front end. The weight of the camera is balanced by electric motors mounted near the bottom at the back end of the drum. Two of these motors are used for driving water propellers at the back of the housing, and one is used in a device for changing the inclination of the camera. Four sealed-beam spotlights are mounted outside the casing on a semi-circular plate, directly above the camera port.

This whole unit weighs three hundred pounds in air, but in water it has a positive buoyancy of about 10 pounds. It is sunk by means of a logging chain, which hangs vertically downward from the center of the cylinder. When a sufficient number of links rests on the bottom, the camera remains at some distance above the water bed. The buoyancy of the drum, its low center of gravity and the logging chain, all form a system which serves the same purpose as a tripod when used with photographic cameras.

The whole camera unit may be turned to the right or left about the axis of the chain, by means of one of the propellers. To incline the unit up or down, the center of gravity is shifted fore or aft by sliding a fifty-pound lead weight along the bottom of the housing by means of a motor-driven lead screw.

The camera is connected to the surface equipment by 500 feet of cable containing 28 wires. The weight of the cable in air is approximately six hundred pounds. In the water, it is buoyed by uniformly distributed floats that make it practically weightless.

It is a simple matter for one man to raise the camera to the surface from its maximum depth. The camera is moved from one position on the bottom to another, with the water propeller. If there is danger of stirring up mud, the unit can be moved by raising it to clear the bottom, and then towing it with the cable.

#### Field Trials in Fresh Water

The first successful field trials of the equipment were conducted in the Ottawa River in the fall of 1951. They were carried out with the aid of the N.R.C. experimental Vessel *Radell II*. The waters of the Ottawa are quite muddy, so vision under water was limited to about two feet, but close-ups of objects on the bottom could be recognized.

The trials were extended to the waters of the Rideau Canal system from Ottawa to Kingston, and also included Lake Ontario and Lake Erie. An amateur "frogman" from the Royal Military College in Kingston assisted in the examination of the old hulk of the HMS *Prince Regent*, which was scuttled as part of the Rush-Bagot Treaty about 1832. This hulk lay in the center of Deadmans Bay in 15 feet of water.

The oak ribs and collapsed planking were clearly visible, as well as many spikes, rock ballast, cannon ball and some cannon. The "frogman" assisted in manoeuvring the camera so the cable would not foul in the ribs of the ship. Further trials at Jones Falls in the Rideau River provided excellent views of fish life alongside the wharf. In Lake Erie, the equipment was used alongside a Department of Transport diver, who was examining the wharf piling at Kingsville.

Further trials were conducted in the fall of 1952. These were arranged through the co-operation of the National Research Council and the Federal Department of Resources and Development. Scientists of the Wildlife Service were particularly interested. They had first become aware of the NRC equipment from a footnote to an article on wired television in the *Reader's Digest* for January, 1952. They had hoped to apply this device to the solution of fish problems in the national parks. The operations were conducted at Lake Minnewanka near Banff, Alberta, from the boat *Peechee* owned by the national parks branch.

#### T.V. Camera Valuable to Scientists

Observations with this TV unit were carried out almost daily, at times ranging from five a.m. until after eleven p.m. A total of about 45 hours was spent in actual observation. The first reaction of the observers was one of enthusiasm as they viewed the bottom of the lake at 100 feet depth, with its sticks, stumps, and rocks.

Several types of observations were carried out. It was found, for example, that on one day, even at depths of 60 feet where the cylinder could not be seen from the boat, the amount of light available was such that artificial illumination was not required to examine the structure of the bottom. On another day the visibility even at depths of 30 feet was nil without the lights.

It was at first believed that some defect in the apparatus was responsible for the decrease in visibility, but it was soon realized that a strong wind had caused a considerable amount of "stirring up" along the shores, so that the water became quite turbid with suspended material. Further examination revealed that areas with gravel bottom did not suffer from such heavy turbidity.

Lake Minnewanka, with a native population of lake trout, had its surface level raised 64 feet in 1941 by construction of a dam for hydroelectric power development. Each winter the surface water level is drawn down about 35 feet. The main questions to be answered by this study were—to what depth do the lake trout spawn, and on what type of lake bottom?

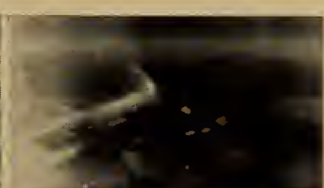
Since the original spawning grounds were now under deep water, the question arose whether these areas or other spawning areas were being used. Because of the drawdown during the winter each year, the spawning which takes place in shallow areas was considered to be lost. Since the young year-classes of lake trout were well represented in the population, successful spawning must have occurred after 1941.

The television tests enabled us to search rock beds for lake trout eggs. After we had learned to recognize lake trout eggs by actually dropping eggs in front of the camera and observing them, the equipment was taken to known spawning areas during spawning periods. Lake trout eggs were then seen lying on top of rocks and beside sticks in water to depths of about 80 ft.

Our problem of determining the extent of potential spawning areas in Lake Minnewanka, and their availability to lake trout, was much simplified by using this television chain.

Another problem was the examination and determination of the natural shelter for larval and smaller sizes of fish. Did this lake have the type of bottom favouring the survival of small fish, that is, with rocks and debris which afford them protection and shelter? The answer was

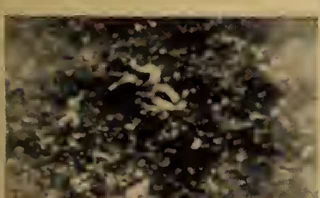
Rockfish



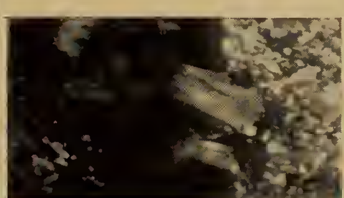
Ratfish

Herring

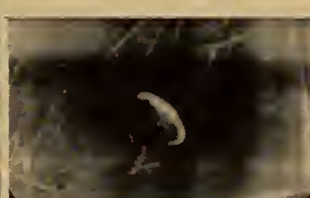
Sun-starfish



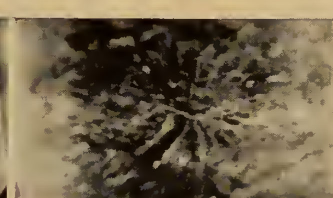
Brittle-starfish



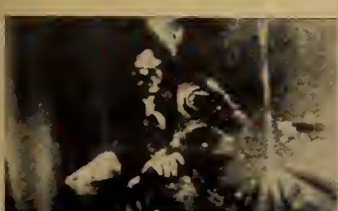
Sea anemone



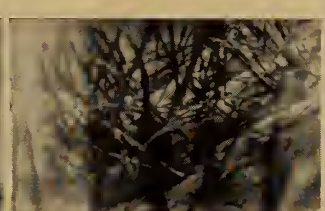
Jellyfish



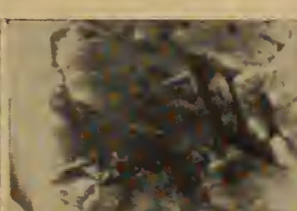
Tube worm



Diver on chain sling



Eel grass



Rocky bottom

Sea urchins

obtained simply by looking at the bottom structure. It had been assumed that erosion from recently flooded areas would have covered much of the lake bottom with sand and gravel, to the detriment of small fish.

Direct observation with underwater television showed that no such change had occurred. Many excellent shelters were seen along the shores and in the depths of the lake. This condition explained the large numbers of small fish in the lake, since the newly-hatched fry could immediately find many rocks, stumps and other debris to protect themselves from predation by larger trout.

Examination of the lake bottom by means of TV also made it possible to estimate the distribution of bottom fauna, which could not have been done by any other method. Evidence of feeding activity of fish was noted. Doubtless the scope and variety of observations will be greatly expanded by further experience.

#### Saltwater Trials

Later the Wildlife Service invited the director of the Pacific biological station at Nanaimo, B.C., to send a biologist to Banff to see the underwater television equipment in operation. This invitation was accepted, and as a result, permission was obtained through the Fisheries Research Board to extend the operations to the west coast. This afforded an opportunity of testing the TV camera in salt water and of viewing an unfamiliar ocean life.

The first underwater trials at Nanaimo were disappointing, due to continued interruption of observations when salt water entered the cable gland on the submersible housing. This led eventually to having the naval craft *Glendevon* transfer the TV team and equipment to the Pacific Naval Laboratories (a branch of the Defence Research Board, Ottawa), in Esquimalt. Scientific personnel here were already interested in the television device. Since the mechanical shops were quite familiar with deep water glands, a proper cable feed-through was hastily constructed.

Through close co-operation of the naval craft *Billow* and *Naden*, the possibilities of the underwater television were demonstrated to both civilian and naval personnel. After approximately two weeks at the naval dockyard, we were returned to the biological station. The equipment was transferred to the station's experimental ship the *Investigator* to carry on further trials for the scientific personnel interested in some particular phase of marine life.

One of the interesting biological experiments conducted aboard the *Investigator* was at Nanoose Bay, on a dark stormy evening in November, 1952. The ship was equipped with an echo-sounding instrument, used to locate a school of herring just outside the harbour. As the quieter waters in the bay were reached the echo-sounding record showed a solid school of fish, and it was decided to attempt to locate the fish with the TV camera. The anchor was dropped in ninety feet of water. The camera was lowered to the bottom where only a ratfish was seen.

Later, the lights on the camera were turned off and it was raised about thirty feet. When the lights were suddenly turned on, fish easily identified as herring were seen scattering off the TV screen. When the lights were turned off the depth recorder showed that the fish returned to the region immediately below the ship.

The trials had proven that the equipment was not only novel but also useful in the field of marine biology. In clear fresh water it could be used for study and identification of fish, such as bass and perch, at distances up to twenty feet from the camera. It allowed field limnologists to observe in detail the spawning grounds, and eggs of lake trout, as well as the bottom shelters for these fish.

In salt water, it had shown that lemon sole (a commercial fish living off muddy bottoms and not detected by echo-sounding techniques) could be seen, and indicated that a fish census could be made in this way before any particular area was opened for fishing. All forms of sea life were observed in their natural habitat for close observation by marine biologists.

It has also proven that it could be used in natural harbours, such as Esquimalt, for the inspection and maintenance of underwater gear, through observation of a deep sea diver. From an equipment standpoint, it had been found that the TV units were quite portable and could be operated from a 30 foot boat. The resolution of submerged objects was limited in most cases by suspended particles in the water, and not by the performance of the TV system. Although repeatedly dragged over rocky bottoms, the underwater camera was undamaged.

#### Many Uses in Fisheries Research

The possible uses for underwater TV in fresh water fisheries research are bounded only by one's imagination, and by limitations of equipment and environment. Field research has always been hampered by the fact that direct observation is difficult and often impossible. For this reason sampling techniques and analysis have formed the basis of previous observations.

For example, laboratory tanks are built to study physiological reactions of fish under such conditions as varying oxygen concentrations, temperatures and pressures. These studies can now be made by performing experiments with caged fish in their natural habitat, and observing them with TV.

Another age-old question which arises when fisheries biologists congregate is "Do fish sleep?" Recently, a Wisconsin diver found thousands of white perch lying quietly on the bottom of a lake. He proposes the theory that perhaps they escape predation in this manner. It seems but a simple task now to check this fact by extended TV observation over a much longer period than that possible by a diver.

Aquatic biologists have often doubted the efficiency and accuracy of their sampling devices. Such questions could be easily answered by setting a gill net in the lake and watching the net by television. It would be a simple matter to determine how many fish approach the net and turn away; how many pass around or over the top, and how many fish are not caught because the mesh size is too large. In other words, the efficiency of a net for sampling various species of fish could be estimated.

Similarly, while sampling a muddy bottom with an Eckman dredge, TV can show how much loss of mud there is in sampling the soft flocculent type of bottom, as compared to a harder clay-like bottom or a less cohesive sand or silt bottom. The efficiency of many underwater sampling devices could be determined visually.

The impounding of water by large power dams often produces challenging problems for the fisheries biologist. Annual fluctuations in the water levels may be of less importance than the fact that the spillways, sluice gates and turbines often take a large toll of the fish population. Because of the currents, direct observation near and around these structures becomes extremely dangerous or even impossible for a diver. Underwater TV would permit a look with no danger to human life.

#### Clam Crops and Fish Food

Clam harvesting is an extensive industry along the east and west coasts. One packing company alone employs 35 boats which do nothing but harvest clams. It is difficult to locate the clam beds in water up to 90 feet deep. The boundaries of the bed must be known in order to manage the harvest to best advantage. Underwater TV could probably be applied here with great success. It would seem feasible to study the clam population with a view to forecasting the future crop.

The penetration of natural light, an important physical aspect of aquatic study, could easily be determined by means of underwater TV. A series of coloured discs placed in front of the camera could reveal the range of vision possible by natural light, and the spectral composition of the light at a particular depth. Turbidity at any desired depth could be studied, as well as its effect on the transmission of light.

Another application is the study of aquatic organisms under winter ice cover. Little is known at present concerning the activity of fish, and the activity and distribution of bottom fauna during these periods. Television observations in areas of water with low dissolved oxygen concentration may make it possible to determine whether fish or other organisms can actually detect changes in oxygen content of water, or whether they blunder into areas of low concentration without suspecting it, and are thus killed.

The examination of the structure of lake and sea bottom areas as an entity *in situ* has been considered desirable by many workers. Direct observation is now possible. The determination of rate of deposition of the dead and dying planktonic and other detritus that "fills in" a lake is most important to the chemical-nutrient relationships in a lake. The relationships of these deposits at various depths and at different locations in a lake have received much attention, with limited success.

It may be simple now merely to place markers on a lake bottom and to observe these markers from time to time without any disturbance to the process of settling. Since the underwater unit is self-propelled and can be connected to the control and viewing units by very long cables, it is possible to investigate a large area of water without the use of a boat by locating the above-water units on shore.

Observations made by under water television have numerous advantages over those made by divers, who are limited by pressure, temperature, time and specialized biological knowledge. The element of danger to human life is eliminated also. Under water TV, however, has its own limitations, many of which may be overcome by future refinements.

In the year 1953 the television unit was frequently in use. Some changes to the equipment were needed. The amplifiers in the video channel were not satisfactory for the desired definition, and we also wished to change the design of the under water unit to make it more manoeuverable. However, pressure of demands kept the equipment unmodified during the year.

#### Experiments for the Navy

In May 1953, Naval Headquarters requested us to demonstrate for a group of officers interested in mine disposal work. The equipment was placed on board *Radel II* and moved to Big Rideau Lake. The navy provided two frogmen. The vessel was anchored in 50 feet of water and the TV equipment was lowered to the bottom. A large garbage pail was placed on the bottom, and an attempt made to locate it with the equipment. The ballast chain stirred up so much mud, that it had to be raised, until the mud settled.

The trial was then conducted with the mine (garbage pail) and TV equipment suspended about ten feet above the mud. The divers then pantomimed in front of the camera, and fiddled with the pail to assess the value of the equipment in passing instructions to a diver, from information available on the TV screen. The range of vision was limited to about 15 feet. Within that range details of work being carried out could be understood.

As a result of the trials in Big Rideau Lake, we were requested to carry out trials in Halifax for naval personnel. In August the *Radel II* arrived in Halifax and conducted trials for the following groups.

1. H.M.C. Torpedo Anti Submarine School.
2. Seaward Defence.
3. Naval Research Establishment.
4. Deep Sea Diving and Underwater Training School.
5. Mechanical Training Establishment.

Dock piling, rocks, shells, fish, seaweed, etc. in the area around Sandwich Wharf and McNabs Is. wharf were seen by the naval personnel. An attempt was made to view some harbour defense underwater equipment in a tideway, but the strong currents made the unit unmanageable, further confirming the necessity to redesign the original equipment.

#### Showings for Conventions and TV Networks

In September, we agreed to provide the equipment for demonstrations at the conventions of the American Fisheries Society and the Wild Life Conservation Society, in Madison, Wisconsin. The water of Madison Lake was not clear enough, nor were there sufficient fish available to provide a continuous display. The equipment was moved from the Madison University site to the fish hatchery compounds of the conservation department. This permitted continuous viewing of rainbow trout in the breeding area. Members attending the convention were enthusiastic about the display, and considered it had good prospects of providing them with another means of studying fish life.

Early in the year an attempt was made to broadcast a live program over the CBC from Montreal. The TV equipment was modified to accept control pulses from studio equipment. A broadcast of "Aqua-lung" equipment in use in the Y.W.C.A. swimming pool was considered a suitable subject. Initial rehearsals were excellent, and everything was under control until two minutes after the start of the program, then, due to a small leak in the housing of the camera unit, the lens changing mechanism started uncontrolled operation. The TV camera had to be eliminated from the program.

However, the necessary changes had been made in the equipment to link with standard broadcast studio equipment, and in November the equipment was again set up for a TV broadcast. This time it was in Chicago with the NBC. The stage was set in a training tank of the Great Lakes Naval Training Center.

Submarine nets were placed in the tank, and frogmen, equipped with underwater oxyacetylene torches, demonstrated the operation of cutting the nets. A steel plate was also cut with the torch under water. Three short separate broadcasts were made for each of three time zones across the country.

NBC engineers were pleased with the outcome of the broadcast.

### Applications Almost Unlimited

In addition to the underwater trials conducted with the equipment, trials of the equipment as a standard wired television served in two instances in our laboratories.

The jet engine test laboratory wished to use our equipment in the study of de-icing problems on the intake of a jet engine. This provided a ready means of viewing the de-icing cycle on a TV screen at a safe distance from the danger of an explosion or mechanical failure in the engine, and in a warm and quiet atmosphere. This work is normally done, by viewing the engine with mirrors and field glasses, from behind a steel guard partition. These trials were quite successful and a TV link will be provided for future tests of this kind.

The cosmic ray laboratory also found a practical use for the equipment. In practice a photographic plate with a thick emulsion is exposed to cosmic rays, by raising it in a balloon to great heights. The photographic plate so exposed contains microscopic tracks in the emulsion due to the passage of the rays.

Study of these plates is a tedious process. The plate must be viewed through a microscope, and records taken of the various tracks, as the microscope tangent screws are moved. There is another method of viewing the plate for study, by projecting the negative through the microscope into a viewing screen. This work must be done in almost total darkness, in order to obtain sufficient light on the screen for definition.

We co-operated with our cosmic-ray laboratory in carrying out trials with the TV link. The microscope projection unit was coupled to the image orthicon camera, and the reproduced picture was viewed on a cathode-ray tube. The result was successful. The intensification of the light through the image orthicon and the ease of setting the contrast of the display, produced a picture of the cosmic-ray tracks that could be viewed in a normally lighted room.

The ease in carrying out the analysis of the film was excellent. Strain on the eyes was much less, and the recording of observations could be carried out in a lighted room. The cosmic-ray laboratory are considering the purchase of a commercial unit to continue this work.

Dale of the National Research Council for design and advice; and Mr. J. P. Cuerrier of the Canadian Wildlife Service for observations and reports. Reference: RCA Tube Manual. √

## Discussion

(*Continued from page 944*)

pole damage from lightning being reported.

The tandum pin type insulator of the slightly different design is again in use on the Shawinigan system with reasonably satisfactory results. No trouble is experienced from the causes mentioned in the paper, fog and moisture. This construction, however, is not recommended except for special cases.

The injection of concrete into pipe structures has often been thought of and we understand is used in Europe, particularly in Switzerland. Evidently great care must be taken to fill the pipes if such processing is considered. Entrapped moisture in steel sections can be hazardous and cause unseen weakness. The conductor enlargement on the McGuigan type tower indicates that engineers were and still are prone to include excessive strengths in their designs which when carefully studied permits carrying larger than the originally proposed conductors. The outstanding example on the Shawinigan system is the Lake St. John-Quebec lines which we considered a good design for 135 kv. which operated at 165 kv. and with the conductors changed from 397,000 cir.mil. ACSR to 715,000 cir.mil. ACSR now operate at 230,000 volts with only minor changes to tower steel.

Mr.. Sproule's mention of disc insulators could well have included the American designer to whom credit is due, namely, A. O. Austin who still retains an active interest in insulator development. On the Shawinigan system approximately 5,000 of the 1910 type disc insulators are in service in their original strings.

The question of joints on ACSR conductors has been under study for many years. On account of the oxide formation on the aluminum heavy current deteriorates the conductor. Aluminum oxide is formed by the heat, thus increasing the resistance and in some cases causing failure of the joint. Modern joints are very carefully made, using the hydraulic press, but some of the older joints were not so well assembled and do cause trouble. A system of measuring the drop across the joint has been in use for two years on the Shawinigan system with satisfactory results. The drop testing device gives a precise reading of the millivolt drop over a joint which when compared with the drop over an equal length of conductor furnishes a ratio figure which, if less than one, gives assurance that the joint is good.

Comments on the use of double circuit lines can hardly be avoided. If one considers what happens when a span 1,100 ft. long is loaded with wet snow or ice with the adjacent span of the same conductor unloaded. Such a condition swings the suspension string approximately 1½ ft. in line direction which drops the loaded conductor by approximately 20 ft., thus permitting flashover with the other phase. Offsetting tower arms will improve this condition to some extent but with a certain wind pressure the conductors again line up. On the other hand horizontal construction is extremely safe and some lines of this design have been known to operate for many years with no outages at all from galloping or lightning troubles. Lightning, of course, is taken care of by first class grounding as indicated by the paper. The addition of continuous counterpoise has proven its worth.

Apologies are necessary for the length of this discussion, but such an interesting paper seems to warrant what we hope amounts to constructive discussion. √

The Editor invites discussion on papers appearing in the *Journal*

### POSSIBILITIES OF A CROSS-CHANNEL POWER LINK

Institution of Electrical Engineers, *The Engineer,* v. 197, iv. 5124, April 9, 1954, pp. 536-539.

#### Vancouver Island Cable Link

It may not be inappropriate to give a few details of the Vancouver scheme. It involves approximately 80 miles of 138 kv pre-impregnated, gas-filled submarine cable. The submarine crossing is in two parts. The longer, from the mainland to Galenaia Island, has a route length of about 15½ miles, and the shorter, from there to Vancouver Island, is about 4 miles. The link is completed by ordinary lines. For three of the shore ends the approach is steep and rocky, and for these situations the cables are to be reinforced with additional rock armour. The fourth land end comes in over shelving sandy ground. The maximum depth is about 100 fathoms. This gives us a pressure of 270 lb. per square inch.

The cable differs from the cable used for the English Channel trials largely in that it has the hollow conductor giving the gas channel. The end sheath clearance is dispensed with and the armouring in this instance is to be of galvanized steel wire rather than aluminium alloy wire. The charging pressure is 300 lb. per square inch in order to preserve at all depths a positive margin of internal pressure for the cable.

### HIGH DENSITY TUNGSTEN ALLOY

*The Engineer,* v. 197 (n. 5131), May 28, 1954, pp. 795-796.

It will be recalled that the basic alloy was first developed by the General Electric Company before the war in its attmpts to use tungsten instead of lead as a radium beam therapy shield. Apart from being too soft, lead was not ideal in other respects.

Tungsten, however, lacked many engineering qualities, had a very high melting point, and was largely unworkable. These difficulties, it was found, could be largely offset by mixing with the tungsten powder up to 10 per cent of nickel and other alloying powders which formed a liquid matrix at a relatively low temperature and filled the voids.

No other use for this alloy was anticipated at that time, but upon the outbreak of the last war it was realized that by its use the mass balances associated with aircraft control surfaces could be located internally thereby effecting a drag reduction. This remains the largest application of the metal.

A new series of alloys is being developed, with densities up to 18 g/c.c. and over, which is approaching the theoretical density of tungsten. All these alloys can be drilled, tapped, turned, ground or machined, and possess mechanical properties comparable with those of the existing alloy. The G.E.C. is also developing an alloy of high density, characterized by higher elongation, with no corresponding decrease in tensile strength.

Before the tungsten, nickel and other constituent powders of the alloy reach the processing plant they have to pass stringent specifications for their chemical and physical properties. They are then mechanically mixed, bonded with a paraffin wax binder, placed in a die, and compressed, pressures being about 5 tons per square inch. The compact is then heated at a carefully controlled low temperature. It is now in the "green" state, and sufficiently consolidated to stand further shaping. It is then placed in an electric muffle furnace in a hydrogen atmosphere and sintered at white heat, approximately 1,450 deg. Cent.

During the sintering process the compact shrinks by nearly 20 percent in volume, with a corresponding increase in density from 10-12 g/c.c. to the final density required. This decrease in volume must be accurately predetermined within close tolerances. Since it is calculable the original dies for the powder can be designed with precision for many required shapes or sizes of sintered product.

The density of the alloy becomes of prime importance in the design of telecurietharphy apparatus, in which very large quantities of radium—or more recently, radioactive cobalt—are used.

An illustration in the general medical field is provided by a larynx collar which has recently been constructed at the Christie Hospital and Holt Radium Institute at Manchester for treating cancer of the larynx. This machine, which is remote controlled and about the size of a large lathe, brings round the neck of a seated patient a heavy-thick lead collar in which are embedded twenty-eight gamma ray sources, containing a total of about 3 grammes of radium. The lead reduces the gamma ray intensity from each of these sources by a large factor in all directions except towards the patient's larynx, in which direction the lead has been cut away to give a radiation beam.

If this collar were made entirely of lead, in order to give adequate radiation protection for the chin, and head above and the shoulders and trunk below, it would be too tall to fit around the neck. The central lead portion of the collar has therefore been sandwiched between two machined pieces of G.E.C. Heavy Alloy, which, because of their higher density, give the required degree of protection with a thinner section, and at the same time provide a firm support for the comparatively soft lead.
